WEST JACKSON HIGHWAY MASTER PLAN - FIGURE 6 LAND USE PLAN

REASONS FOR PROJECT REVISION:

The following are the reasons for revising the Original Project:

1. **To Reduce Traffic Impacts:** A draft cumulative traffic study was prepared for the four proposed master plans along the Jackson Highway corridor: West Jackson Highway Master Plan (Project Area), Jackson Township Specific Plan, Mather South Community Master Plan, and NewBridge Specific Plan. When that draft study was initially reviewed by County staff and the Project Applicants, it became evident that many factors contributed to the Original Project's identified traffic impacts, including the intensity of employment uses within the Project Area, roadway alignments, roadway widths and capacity, and projected transit usage. Following this draft study review, the County ran several scenarios through a traffic modeling program altering these factors by decreasing employment intensity, narrowing roadways, employing different land use arrangements, and using different transit headways (i.e., time span between bus arrival). The intent was to explore, as part of the early CEQA review process, how traffic impacts might be lessened through changes to any one of these variables. Ultimately, it became clear that the Project Area's employment intensity, which resulted in the attraction of numerous trips from outside the project area, was the project's most significant traffic driver. The Project Applicants then responded to this early determination by reducing the project employment intensity by changing predominately office uses to less intensive light industrial uses.

   To reduce traffic impacts on Bradshaw Road between Jackson Highway and Goethe Road, the Project Applicants have added a four-lane roadway connector between Routier Road at the Project's north boundary and the Mayhew Road extension near the Jackson Highway/Bradshaw Road intersection (see Plate NOP-5). This connector will function as a north-south alternative to Bradshaw Road and will provide traffic relief for Bradshaw. This connector will also provide another access for industrial and commercial uses along Bradshaw Road.

   Reducing employment intensity and adding the Routier Road connector are now reflected in the Revised Project. It is anticipated these changes will result in a substantial lessening of traffic associated with the Revised Project and substantial lessening of traffic along Bradshaw Road.

2. **To Reduce Air Quality Impacts:** The draft cumulative traffic study concluded that, as indicated, the Original Project attracted many employment-related vehicle trips from outside of the project. Those outside trips, in turn, resulted in increased regional VMT and a corresponding increase in GHG emissions. The reduction in the intensity of employment now proposed as part of the Revised Project should reduce the number of outside trips entering the Project Area, thereby reducing VMT and greenhouse gas emissions. This reduction should contribute to a better air quality situation as well as a lessening of those factors contributing to climate change.

3. **To Improve Transit:** The draft traffic study also analyzed the Original Project's transit system as part of a larger system serving the overall area. As a result of that

analysis, it became apparent that the transit system could benefit from more direct and efficient routes that would serve project residents while reducing lane miles. With those observations in mind, changes to the transit system were made that should result in the Revised Project's transit system reducing transit lane miles to 11 from the 25 in the originally proposed project while also locating 87% of the proposed Project's residential units within ½ mile of a transit route. Reducing the transit lane miles is significant as a means to reduce transit service redundancies and enable more direct transit routes, thereby creating a more efficient transit system. Also, the ½ mile figure is important because Sacramento County General Plan Policy LU-120 favors projects that locate residential development within ½ mile of transit service. This has been determined to be important to Sacramento County due to the fact that individuals living proximate to transit will utilize those services more frequently than those living farther away. The net result of increased transit ridership should be a lessening of air quality and greenhouse gas impacts.

4. To Reduce Biological Impacts

The Original Project featured land uses and roadways that would have adversely impacted biological features including jurisdictional wetlands and a native section of Morrison Creek. After identifying those impacts as part of the early CEQA review process, the County and the Project Applicants reassessed land use locations and worked to design alternative roadway alignments that would facilitate regional traffic flows without causing adverse impacts to biological resources. Specifically, the Revised Project avoids the following within the Project Area:

- Vernal pool resources in the Aspen 9 area which will be preserved as open space instead of designated for residential uses
- Crossing a native stretch of Morrison Creek at the southeast corner of Jackson Highway and Bradshaw Road
- An additional roadway crossing of Morrison Creek's realigned channel in the Aspen 6 and Granite 1 areas contemplated in the Original Project
- Crossing a Detention Basin and environmental corridor in the Aspen 6 area
- Impacts to a Wetlands and Vernal Pool Complex located in the Aspen 5/Granite 1 area
- Encroaching on the Morrison Creek preserve, located in the Vineyard 1 area, which was placed under a perpetual conservation easement grant to preserve open space and restored habitats as a component of mine reclamation

These changes should reduce the impacts to biological resources stemming from the Project.

5. To Increase Open Space: The Revised Project contains a greater amount of open space (inclusive of the Open Space/Urban Farm designation) than the Original

Project: 1,945.8 acres in the Revised Project vs. 1,583.4 acres in the Original Project. This change came after the Project Applicants identified areas in Aspen 4 South, Aspen 6, and Aspen 9 that were needed to increase drainage capacity and preserve biological resources. By designating those areas as open space in the Revised Project, environmental impacts associated with their urbanization will be avoided.

6. **To Avoid a Potential Noise Impact:** The Revised Project relocates the middle/high school and two elementary schools so as to avoid the Mather Airport Theoretic Capacity 60 CNEL noise contour. Initially, the middle/high school was planned for a location within the 60 CNEL noise contour, but the Elk Grove Unified School District, the school district serving the Project Area, expressed early in the CEQA review process a desire for the school to be located elsewhere so that students would enjoy a quieter environment. The Project Applicants accommodated the School District by rearranging land uses in a manner that caused the Middle/High School and two elementary schools to be located outside of the 60 CNEL line. Potential noise impacts related to the schools' location within the 60 CNEL line were accordingly avoided.

7. **To Improve Ground Water Recharge:** The Revised Project contains greater detention area which potentially contributes to groundwater recharge. Increasing groundwater recharge has been identified in the County of Sacramento's General Plan Policy CO-10 as an activity that should be supported as a means to improve water supply and benefit the environment.

In summary, the aforementioned modifications incorporated into the Revised Project are indicative of how the CEQA process resulted in improving the Project in a manner which should minimize its environmental impacts. Accordingly, it is anticipated the environmental analysis that follows the issuance of this NOP will reveal the Revised Project will result in a reduction in overall environmental impacts when compared to those which would have been associated with the Original Project.

PROJECT OPTIONS TO REVISED PROJECT (PREFERRED OPTION):

The applicants have requested analysis of four options for the Project with the preferred option being the Revised Project. Options 1, 2 and 3 were provided to assess variations in the Project and are not intended to be CEQA Alternatives. A CEQA Alternative is different than a Project Option in that the CEQA Alternative is intended to reduce environmental impacts associated with the Project. CEQA Alternatives will, however, be developed as part of the preparation of the EIR. Options 1, 2 and 3 are described below with the preferred option described as the Revised Project in previous sections of this NOP.

Option One to the Revised Project: Middle School/High School Site in District 1

The land use plan for Option One is similar to that of the Revised Project with the only difference being the location of the middle/high school site (see Plate NOP-12). Under Option One, the middle/high school in District 2 is replaced with residential and open space uses and moved to the west side of Vineyard Road and north of the Vineyard Road/Elder Creek Road intersection in District 1. The middle/high school site acreage has also been increased from 70 acres to 84 acres. When compared to the Revised Project, residential uses would decrease by 49.3 acres and employment uses will decrease by 10.4 acres.

Option Two to the Revised Project: Reduced Noise Contour With Middle/High School Site in District 2

Option Two proposes a land use plan that uses Mather Airport Master Plan's Forecast 60 dB CNEL line instead of Mather Airport's Theoretic Capacity 60 dB CNEL line. Using the Forecast line results in more land available for residential uses. It should be noted that Option Two is inconsistent with current General Plan policies related to airport planning and placement of new residential development within the 60 dB CNEL adopted by the County for planning purposes. As such, Option Two would require a General Plan Amendment. As shown in Plate NOP-13, this alternative would increase residential uses at the geographic center of the Project where employment uses were previously situated. When compared to the Revised Project, residential uses would increase by 371.1 acres, employment uses would decrease by 369.7 acres, commercial uses would decrease by 22.4 acres, and industrial uses acreage would not change. A fifth elementary school would also be included within District 1. Like the Revised Project, Option Two has the middle/high school site in District 2.

Option Three to the Revised Project: Reduced Noise Contour With Middle/High School Site in District 1

Option Three proposes a land use plan with reduced noise contours like Option Two (see Plate NOP-14). Like Option Two, Option Three will replace employment uses with residential uses at the geographic center of the Project and will have a fifth elementary school. Option Three is also inconsistent with current General Plan policies related to airport planning and placement of new residential development within the 60 dB CNEL adopted by the County for planning purposes, and would require a General Plan Amendment. Like Option One, Option Three has the middle/high school site in District 1. When compared to the Revised Project, residential uses would increase by 325.4 acres, employment uses would decrease by 369.7 acres, commercial uses would decrease by 22.4 acres, and industrial uses would not change.

RE: NOP DEIR West Jackson Hwy Master Plan (PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack,

The Sacramento County Department of Agriculture has reviewed the Revised Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan, released by the Department of Community Development. We have two main areas of concern. One concern is the close proximity of a proposed residential development to a long established commercial nursery, Village Nursery. The other is in regards to the middle/high school placement in Option 1 and Option 3 (See Plate NOP-12 and Plate NOP-14).

In Option 1 and Option 3, the Project Applicants, with input from the Elk Grove Unified School District, has proposed to place a middle/high school within a ¼ mile from a well-established commercial agricultural operation; Village Nursery. Village Nursery is located at 6901 Bradshaw Road, between Elder Creek Road and Florin Road. The business operation encompasses over 250 acres of propagation and growing grounds. The California Department of Pesticide Regulation is currently in the process of creating regulations that will require commercial agricultural operations within ¼ mile of a public K-12 school or daycare center, to provide notification of all agricultural pesticides used by that operation. The regulations will also restrict specific types of pesticide applications during normal school hours. Village Nursery applies pesticides to its nursery stock as part of its normal business practices. The placement of a public school within close proximity to an established agricultural operation will have negative impacts on the business and exacerbate the already existing conflict of pesticide use near schools. The Sacramento County Department of Agriculture finds the Revised Project Land Use Plan (Plate NOP-5) to be less impactful in regards to the placement of the middle/high school, as it locates the school approximately ½ mile from the commercial nursery.

As residential and urban uses encroach upon existing agricultural operations, complaints regarding pesticide use, odor, noise, or dust associated with accepted farming practices can create economic hardships for agricultural operations, sometimes making it difficult for them to stay in business. The West Jackson Highway Master Plan proposes low density residential (LDR) housing adjacent to the southeast area of the Village Nursery operation. Consistent with Sacramento County's General Plan (GP) Policy AG-3, we recommend that an open space buffer of a minimum of 500 feet be placed between the existing nursery operation and any proposed residential development to help mitigate any negative impacts to the nursery operation or potential future residents. We also recommend that the Project Applicants comply with GP Policy AG-4, ensuring that prospective buyers of homes in the area are alerted to locally accepted farming practices.

Respectfully,

Chrisandra J. Flores
Chief Deputy Agricultural Commissioner

Re: Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (Control No. PLNP2008-GPB-CZB-ZOB-00240)

Ms. Hack:

Thank you for sending the Butterfield-Riviera East Community Association (BRECA) the Notice Of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for (the) West Jackson Highway Master Plan (Control No. PLNP2008-GPB-CZB-ZOB-00240), dated February 15, 2017. Please note that the envelope we received was postmarked February 22, 2017, and likely received by us around February 24, 2017. Thus, 30 days after receipt of the NOP would be about March 26, 2017. These are our comments on the NOP.

BRECA is a membership-based, non-profit community organization. Our goals are to promote citizen involvement and to enhance the community. Our boundaries are Folsom Blvd. on the south, the American River on the north, the Mayhew Drain on the West, and Paseo Rio Dr. on the east.

Our primary concern is the potential impacts of traffic from the proposed West Jackson Highway developments on our community. We note that Bradshaw Road roughly bisects the West Jackson Highway area, and appears to be the shortest route to Highway 50 from that area. Also, Bradshaw Road would be utilized by people who desire to access the Butterfield Light Rail station, located a short distance west of Bradshaw Road on Folsom Blvd. Bradshaw Road is the shortest route from our community to Highway 50, and also the access to many shopping areas and other features (e.g. the Sacramento County Animal Shelter) near our community.

So, we recommend that the DEIR for the West Jackson Highway Master Plan include study and reporting of traffic impacts on all thoroughfares that access Highway 50 and/or Folsom Blvd. from the West Jackson Highway area. This would specifically include Bradshaw Road up to Folsom Blvd and any parts of Folsom Blvd. that are impacted. Cumulative impacts from other planned developments adjacent to the West Jackson Highway area should also be studied and reported.

Thank you for your attention to the above comments.

Should you with to contact BRECA, please contact James Morgan at jmorgan1@ix.netcom.com or Gay Jones at h2ogay@pacbell.net, or at the BRECA address, above.

Sincerely,

James Morgan

Notice of Preparation (NOP) for the West Jackson Highway Master Plan draft Environmental Impact Report (EIR)

Dear Ms. Hack:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the project referenced above. The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability. The Local Development-Intergovernmental Review (LD-IGR) Program reviews land use projects and plans through the lenses of our mission and state planning priorities of infill, conservation, and travel-efficient development. To ensure a safe and efficient transportation system, we encourage early consultation and coordination with local jurisdictions and project proponents on all development projects that utilize the multimodal transportation network.

This NOP is a revision of the 2013 NOP submitted by Sacramento County. Since that time, the Project Applicants and Sacramento County staff have modified the original project, as reflected in this current Notice of Preparation. The revised plan proposes 2,112 acres of residential units, approximately 1,310 acres of commercial, employment and industrial land uses, and approximately 1,767 acres in parks and recreational space. The plan limits are generally State Route (SR) 16 (Jackson Highway), Kiefer Boulevard and Goethe Road to the north, portions of Elder Creek Road and Florin Road to the south, the City of Sacramento to the west and Excelsior Road to the east. The following comments are based on the NOP.

Vehicle Miles Traveled (VMT)

A development of this scale has the potential to dramatically increase VMT on the SHS. Given that Caltrans current guidelines are in the process of being updated, a transportation impact study scoping

meeting with District staff could be used to discuss the most appropriate methodology for this analysis. It is suggested that the analysis provide the following:

1. Vicinity maps, regional location map, and a site plan clearly showing project access in relation to nearby roadways and key destinations. Clearly identify the SHS and local roads, intersections and interchanges, pedestrian and bicycle routes, car/bike parking, and transit routes and facilities should be mapped.

2. Project-related VMT including per capita use of transit, rideshare or active transportation modes and VMT reduction factors. The assumption and methodologies used to develop this information should be supported with appropriate documentation.

3. Schematic illustrations of walking, biking and auto traffic conditions at the project site and study area roadways, trip distribution percentages and volumes as well as intersection geometrics, i.e., lane configurations, for AM and PM peak periods. Operational concerns for all road users that may increase the potential for future collisions should be identified and fully mitigated, including nearby SHS interchanges and intersections. This includes SR 16 from the previously relinquished section to Sunrise Boulevard.

Multimodal transportation such as high frequency bus service and bike and pedestrian infrastructure can be considered to reduce VMT, along with other transportation demand management measures. The Master Plan should also consider incorporating walkable neighborhoods and a jobs/housing balance to help ensure VMT impacts to the SHS are minimized. Please also provide Synchro output for Length of Queue for all potential significantly impacted U.S. Highway 50 off-ramps.

Relinquishment

Caltrans has entered into discussions with the County of Sacramento and the City of Rancho Cordova to relinquish SR 16 between Watt Avenue and Grant Line Road. Should the relinquishment occur and the County take ownership of this facility segment, then Caltrans will have no approval role on any or all modifications to the segment relinquished to the County. However, should relinquishment not occur, or occur after construction of the West Jackson Highway Master Plan, Caltrans cannot approve any design changes that would not comply with the design standards set forth by the Highway Design Manual, and cannot approve facility modifications that are incompatible with the SR 16 Transportation Concept Report (TCR). Caltrans is available to discuss the Highway Design Manual requirements which include standards for multimodal facilities.

Amador County Impacts

The Amador County Transportation Commission has expressed concerns to Caltrans District 10 about the effects of the project and the associated Master Plans to interregional travel on SR 16. In coordination with Caltrans District 10, District 3 encourages SACOG and the lead agencies for the four Master Plans to coordinate on incorporating signal coordination, incident management, and travel demand management along with the new roadway, transit, and active transportation facilities to keep the highway working efficiently for all users. Including park and ride facilities and coordinating the existing

Amador Transit commuter service with planned Bus Rapid Transit and other transit, can work to reduce single occupant vehicle commute miles and reduce VMT.

Traffic Management Plan (TMP)

If it is determined that traffic restrictions and detours are needed on or affecting State highways, a TMP or construction Traffic Impact Study may be required of the developer for approval by Caltrans prior to construction. TMPs must be prepared in accordance with Caltrans' *Manual on Uniform Traffic Control Devices*. Further information is available for download at the following web address: http://www.dot.ca.gov/trafficops/camutcd/docs/CAMUTCD2014-Part6_rev1.pdf

Please provide our office with copies of any further actions regarding this project. We would appreciate the opportunity to review and comment on any changes related to this development.

If you have any questions regarding these comments or require additional information, please contact Alex Fong, Intergovernmental Review Coordinator at (916) 274-0566 or by email at: Alexander.Fong@dot.ca.gov.

Sincerely,

Eric Fredericks

RE: West Jackson Highway Master Plan, Revised Notice of Preparation

Dear Ms. Hack,

The City of Rancho Cordova Public Works Department appreciates the opportunity to comment on the subject revised NOP. We understand that planning for this project has been in progress for a few years and that the City was able to comment and participate in the initial noticing process in 2013. With that in mind, we have prepared the following comments based on the revised NOP. We hope to continue our strong working relationship as these projects move forward.

Generally, we are interested in the effects of the West Jackson development on the City of Rancho Cordova's transportation and public utility systems. Access to Highway 50, the RT Gold Line and the American River Parkway should be coordinated with City planning efforts. We hope to be able to work with you on the updates to the County General Plan Transportation Plan, the County Bikeway Master Plan, Urban Services Plan and the Zone 40 Water Supply Master Plan. Our intent in these discussions would be to create seamless multi-jurisdictional services.

The new 4 lane connection to the Old Placerville Road/Routier Road intersection is an example of where the City and County should coordinate on roadway sizing needs. The City is currently contemplating reducing Routier Road to a 2 lane facility and we would like to understand how the West Jackson 4-lane roadway connection impacts that proposal. We also have a plan that envisions Peter A. McCuen

Boulevard as a 4 lane roadway in its ultimate configuration. This NOP indicates that this road would be a thoroughfare (6 lanes).

We are encouraged by the West Jackson bikeway concept. The new facility connecting through the Mather Airport property will tie in nicely with our UP Railroad Spur Bike Trail project. We hope to continue coordinating our bikeway planning efforts.

Lastly, we would like to discuss how transit service can be coordinated. Access to the RT Gold Line will be important and we hope to integrate the City's transit service with your transit service plan. We also feel that with a large job base in Rancho Cordova that there may be opportunities to provide good transit connections between Rancho Cordova and West Jackson residents.

Our historical City/County coordination is highly valued by the City and we hope to continue these efforts.

Sincerely

Elizabeth Sparkman

SUBJECT: Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (Control Number PLNP2008-00240)

Dear Ms. Hack:

Thank you for including the City of Sacramento Department of Public Works in the NOP reviews process for the West Jackson Highway Master Plan DEIR. The proposed Project is located along State Route 16 (Jackson Highway). The Project boundaries are generally Jackson Highway, Kiefer Boulevard and Goethe Road to the north, portions of Elder Creek and Florin Road to the south, the City of Sacramento to the west and Excelsior Road to the east.

The City of Sacramento has been involved in the development of the scope of work for the traffic impact study for the project which will consider all possible impacts to City of Sacramento intersections and roadways. The scope of work should include city facilities on Jackson Road, Kiefer Boulevard, and Folsom Boulevard, 14th Avenue, S. Watt Avenue, Florin Perkins Road, and Power Inn Road within the City of Sacramento jurisdiction. Please ensure that the following intersections and roadway segments are included the in the study area:

1. S. Watt Avenue and Folsom Boulevard
2. S. Watt Avenue and Jackson Road
3. Power Inn Road and Folsom Boulevard

4. Power Inn Road and 14th Avenue
5. Jackson Road and Folsom Boulevard
6. Jackson Road and 14th Avenue (future)
7. Florin Perkins Road and Folsom Boulevard
8. Florin Perkins Road and Kiefer Boulevard
9. 14th Avenue Power Inn Road to Florin Perkins Road
10. 14th Avenue – Florin Perkins Road to Jackson Road

Please note that the City of Sacramento General Plan Mobility policies and goals should be considered while analyzing City's facilities. For example, the traffic impact study should assume the future extension of 14th Avenue and the realignment of Jackson Road within City of Sacramento.

We would like to be able to review any proposed mitigation measure to any city facility and be involved in the discussion regarding the preparation of the finance plan of this project, specifically regarding any improvements to be proposed within the City of Sacramento jurisdiction.

If you have any questions regarding these comments or require additional information, please contact Aelita Milatzo of my staff at (916) 808-1953 or by email at: amilatzo@cityofsacramento.org

Sincerely,

Samar Hajeer

Samar Hajeer
Senior Engineer

Other Business: Chairperson Jones requested that the West Jackson Highway Master Plan Revised Notice of Preparation (NOP) (Control No. PLNP2008-00240) be added to the agenda since the deadline for the comment period was approaching (May 26, 2017). She wanted the CPAC members to have the opportunity to provide comments on the revised NOP at the meeting. The following comments were noted for the preparation of the Draft EIR:

- Traffic and Cumulative Impacts – Concerns about impacts to US Hwy 50 and Bradshaw Road and how this will impact the Rosemont and Butterfield-Riviera East (BRECA) community area.
- Bike Trails – General concerns about the community being designed for walkability and bikeability rather than an auto-oriented development. Emphasis was placed on providing visible and safe ped/bike crossings that are controlled (signaled) and with appropriate lighting and timing constraints. Upgrading to Class A bike trails and not using bike tunnels were requested. Concern was expressed on how ped/bike crossings would be addressed for rural roads within the Jackson Highway corridor such as Elder Creek, Florin, and Excelsior Roads. CPAC members requested that SABA (Sacramento Area Bicycle Advocates) and BARC (Bicycle Advocates for Rancho Cordova) are included in public outreach and discussions related to biketrail connectivity, design, and crossings for this project (and other Jackson Highway Master Plan projects). The issue of biketrails and connectivity within the Master Plan projects has been an overall concern with the CORPAC members for several years.
- Parks – The project area has multiple park districts (Southgate and Cordova Rec and Park Districts). CPAC members requested appropriate land dedication for parks is achieved within the project area (appropriate level of parkland dedicated per population). They requested that the standards were either met or exceeded. They also requested the need for comments from all appropriate park and recreation agencies within the project area.
- Transit – CPAC members requested that public transit and access to transit be addressed in the Draft EIR. In general, CPAC members expressed concerns with all forms of connectivity within the plan area and adjacent master plans, including transit, pedestrian/bike, bridge, and sewer connectivity.
- Water – Questions were asked regarding where the water would come from to serve the proposed development, either through basins, overdraft, etc.. CPAC members requested a detailed origin of water sources be addressed in the Draft EIR. CPAC members also asked whether purple water pipes will be included as part of the plan.
- Mixed Use – Comment that the revised land use plan shows a large amount of low density residential development. Considering the market, is there more opportunity for mixed use development? This should be further evaluated for the plan area, since a small amount is designated on the revised land use plan.

CPAC members recommended that County staff compile NOP comments in an official document and submit to PER as part of NOP comments. The request was approved by all CPAC members (motion by M. Strella, seconded by E. Heath).

Cordova
Recreation & Park District

RE: Control Number PLNP2008-GPB-CZB-ZOB-00240 – West Jackson Highway Master Plan – Revised Notice of Preparation dated April 26, 2017
Comments by Cordova Recreation and Park District

Dear Ms. Hack,

The proposed West Jackson Highway Master Plan (WJHMP) is 5,913 acres. Approximately 2,845 acres of the WJHMP is within the boundaries of Cordova Recreation and Park District (the "District" or CRPD). The remaining WJHMP acreage is within the Southgate Recreation and Park District. None of the maps found in the Revised Notice of Preparation (rNOP) clearly illustrate the boundary separating CRPD and Southgate Recreation and Park District. A land use plan map that clearly illustrates the boundary between the park districts should be provided. This will allow a more thorough analysis of proposed dwelling units and Quimby park land dedication requirements for each District.

Comments on the original Notice of Preparation for WJHMP were submitted to the County by CRPD on October 17, 2013 (attached for reference). The comments below supplement earlier comments provided by CRPD.

District staff met with applicant representatives and County planning staff on March 23, 2017 to gather additional information while preparing comments on the rNOP.

Land Use
The District's adopted Level of Service (LOS) states 52% of the Quimby park land dedication should be in community park land. The WJHMP Land Use Plan dated April 5, 2017 does not currently show any community parks inside the CRPD boundary that are 15 acres or greater (the 15 acre or greater size was previously stated in the October 17, 2013 letter).

The District's "Preliminary District-wide Facility Distribution Plan" has identified a shortage of community park land in the new growth areas in the southwest quadrant of the District. Adequate community park land is needed to provide active program space as determined by the District's LOS. District Planning staff looks forward to working with the developer, other agencies and community to plan a park system in this project that will meet the needs of residents.

Eight of neighborhood parks shown in CRPD's boundaries are less than CRPD's two-acre minimum. This is contrary to the comments provided by the District on October 17, 2013. The undersized parks are most prevalent in the northwest quadrant of proposed District 1. They are shown very close together (some less than ¼ mile apart). The District prefers neighborhood parks in the four-acre range and spaced according to the ½ to ¾ mile service areas.

The land use summary tables found on "Figure 6 Revised Project Land Use Plan (preferred option)" do not accurately correspond the "park" land use designations shown on the right side of the map.

1. "Summary - District One" states 85.8 acres of park is provided. "Park" land use designations on the map add up to 66.1 acres. Clarify.
2. "Summary - District FPA-A" states 9.5 acres of park is provided. There are no "park" land use designations in that area of the map. Clarify.

The District does not accept Quimby park land encumbered with utility easements, storm drainage basins, wetlands and habitat areas that restrict development for recreational purposes. Where adjacencies of encumbered parcels exist the District is open to discussions about joint use agency programming and maintenance of encumbered parcels where adequate funding is provided in perpetuity. The District has not addressed open space, detention areas, wetlands, or habitat areas as part of this review.

Impacts of proposed parks on surrounding land uses should consider the full range of amenities that could be place on a park site as listed in Tables 3, 4 and 5 in the District's Cordova Recreation and Park District Park Impact Fee Nexus Study adopted April 8, 2014. Community Park facilities and District-wide facilities are eligible for placement in any community park.

Traffic and Transportation

At this conceptual level the land use plan does not illustrate all roadway types proposed for the project. District standards state community parks should have street frontage on two sides where a high school property can substitute for one street and neighborhood parks have street frontage on three sides where elementary school property can be substituted for one street.

Neighborhood park sites require on-street parking. Community park sites typically contain off-street parking but also benefit from the additional capacity provided by on-street parking.

Vehicular, pedestrian and multi-modal traffic impacts generated by park use should be considered. Public transit and multi-modal access to park sites should be encouraged. Placement of traffic signals and pedestrian crosswalks should be considered where community park facilities may generate significant volumes of traffic.

The District considers trails to be a transportation element and under the purview of other agencies. This scoping comment letter does not include analysis of proposed trails.

Noise

Noise generated by the Mather Airport negatively impacts outdoor active and passive recreation. Parks should be located outside of the 60 CNEL noise contour.

Hydrology and Water Quality:

Constructed park facilities including programmed sport fields should be above the 100 year flood plain. The District does not accept Quimby park land encumbered with utility and storm drainage basins.

The project technical studies should demonstrate there will be adequate domestic water into the future sufficient to irrigate athletic fields and provide turf in both neighborhood and community parks as a public resource in perpetuity. The District will consider connection to alternative water sources in the future on a case by case basis consistent with new conservation and codes requirements.

Topography and Soils

The Draft Environmental Impact Report (DEIR) should address restoring and repurposing previously mined land for urban purposes. The topography of proposed park sites must be suitable for active recreational programming (fairly level) and have the capacity for compliance with Americans with Disabilities Act. Visibility from street level is important for safety and security in the parks. The DEIR should address the suitability of soil on proposed park sites to sustain active parks and the need to import fertile soils and/or provide soil amendments to meet District standards.

Finance

The District's current fee per dwelling unit is $9,085 based on the inflation rate added since 2012. Sacramento County is currently processing a request by CRPD to adopt a District-wide Park Development Impact fee associated with a 2014 Nexus Study.

The District will review the draft Public Facility Finance Plan for compliance with the District's current adopted Park Impact Fee Nexus Study for development costs. At the appropriate time the District will provide current costs for maintenance of facilities, services, replacement costs associated with the park and recreation impacts of this development. The Urban Services Plan should address adequate funding for on-going impacts in perpetuity.

The District appreciates the County's commitment to planning environmentally responsible and sustainable communities and we look forward to future engagement in this project. Please continue to forward documentation related to this project to the District. Please don't hesitate to contact me if you have any questions.

Sincerely,

Laura L. Taylor

RE: West Jackson Highway Master Plan NOP Comments (PLNP 2008-00240)

Dear Ms. Hack,

The Cordova Recreation and Park District (CRPD) appreciates the opportunity to review and comment on the Notice of Preparation (NOP) for the West Jackson Highway Master Plan which is requesting entitlements for General Plan and Community Plan Amendments..

CRPD offers the following comments:

I. CRPD has established development impact fees which have been adopted by its Board of Directors. The fee per Dwelling Unit Equivalent (DUE) is $8,420 based on five acres per 1,000 residents. Park acreage in excess of five acres per 1,000 requires the fee per DUE be increased proportionately. Park acreage less than five acres per 1,000 will result in an in-lieu fee assigned per the ordinance of the land use authority.

II. Neighborhood Parks shall be located with neighborhood areas. They are 2 acres to 15 acres in size with passive programming and a service radius area of ½ to ¾ mile. They shall be bordered on three sides with residential street frontage (one side of residential street frontage may be substituted by elementary school frontage). The remaining property line shall be fenced by a 6' CMU split-face wall with a decorative cap when bordered with residential or commercial properties (this may be substituted by creek frontage if applicable). When adjacent to schools, decorative fencing with access gates shall be used on the property line. Neighborhood Parks shall not be located on lands that are unusable or not programmable.

III. Community Parks shall be centralized in villages and community areas. They are 15 acres or greater in size with active programming with a service radius of 1 – 1 ½ miles. They shall be bordered on two sides with residential street frontage and one side with connector roads (one side of residential street frontage may be substituted by high school or middle school frontage). The remaining property line shall be fenced by a 6' CMU split-face wall with a decorative cap when bordered with residential or commercial properties (this may be substituted by creek or lake frontage if applicable). When adjacent to schools, decorative fencing with access gates shall be used on the property

line. Community center buildings shall be located on or adjacent to Community Parks. Community Parks shall not be located on lands that are unusable or not programmable.

IV. District-Wide Facilities are facilities that serve the entire District (Office Complex, Corporation Yard) shall be constructed in centralized locations near to or on Community Park property.

V. Urban Plazas are parks that are urban in nature with a plaza-like feel and are acceptable in commercial and densely urbanized areas. They are eligible for Quimby credit and shall be reviewed and credited on a case-by-case basis.

VI. Lakes and Creeks – CRPD will not accept or maintain lakes or creeks. These are not eligible for Quimby Credit.

VII. Drainage Basins – CRPD will not accept or maintain any portion of a drainage retention/detention basin.

VIII. Landscape Corridors - CRPD will not accept or maintain landscape corridors.

IX. Trails – CRPD will only accept and maintain bike or pedestrian trails within park boundaries.

X. Quimby Credit for Pocket and Image Parks - CRPD will not accept parks under two (2) acres in size. Parks smaller than 2 acres should be maintained by an HOA or some other means.

XI. Facilities/Land Under High Voltage Utility Lines - CRPD will not accept facilities or land under high voltage utility lines.

XII. All park development must meet the standards as set forth and approved by the Cordova Recreation and Park District.

If you have any questions or concerns regarding this comment letter, please contact kfranklin@crpd.com or 916-842-3317.

Sincerely,

Kathleen Franklin, Park Planner
Cordova Recreation and Park District

RE: Response to Revised Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (Control Number PLNP2008-GPB-CZB-ZOB-00240).

Dear Ms. Hack:

The Sacramento County Department of Airports (SCDOA) is pleased to provide comment on the NOP for the EIR for the West Jackson Highway Master Plan. While the proposed development is consistent with the Land Use Compatibility Plan (LUCP) for Mather Airport (MHR), SCDOA has some concerns about the proposed project that we request be addressed in the EIR. Upon review of the NOP, SCDOA recommends the following items be reviewed for the benefit of the developers as well as future residents of this community.

SCDOA has commented on previous iterations of the West Jackson Highway Master Plan with concerns expressed regarding noise and hazardous wildlife attractants. SCDOA would refer Sacramento County Department of Planning and Review back to those comments. In regards to this revised project SCDOA has the following additional comments:

- The connection of Routier Road to the Mayhew Road extension appears to border the western boundary of Mather Airport. If any portion of that roadway will be constructed on Airport land, then the Airport and the FAA will need to approve any associated land sale/swap, or land use change for that property.

Thank you for considering our comments on this NOP. If you have any questions or concerns, I can be reached at (916) 874-0698

Best,

RE: REVISED NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR WEST JACKSON HIGHWAY MASTER PLAN

Dear Ms. Hack:

The Sacramento County Department of Community Development, Planning and Environmental Review Division referred the Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan to the Department of Regional Parks ("the Department") for comment.

The Department supports the addition of bikeways on Jackson Highway, Kiefer Road, and Excelsior Road to the West Jackson Highway Master Plan. See Figure 4, Bicycle Master Plan Amendment Exhibit on page NOP-21. This suggestion is consistent with the adopted Sacramento County Bicycle Master Plan (April 2011) and the January 2017 draft version of the West Jackson Corridor Trails Master Plan.

Thank you for the opportunity to comment.

Sincerely,

Jeffrey R. Leatherman, Director
Department of Regional Parks

Department of Water Resources
Michael L. Peterson, Director

SACRAMENTO COUNTY
WATER AGENCY

Including service to the Cities of
Elk Grove and Rancho Cordova

Date: March 6, 2017

To: Catherine Hack – Environmental Coordinator

From: Mike Huot – Principal Civil Engineer MH
Sacramento County Water Agency

Subject: Sacramento County Water Agency Comments on the Revised Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (Control Number: PLNP2008-GPB-CZB-ZOB-00240)

The Sacramento County Water Agency reviewed the subject document and has the following comments:

1. If changes in land use alter the needed water supply infrastructure, updates to the following documents could be required:
    a. Any affected draft Zone 40 Water Supply Master Plan amendments.
    b. Updating or amending the existing Water System Infrastructure Plan.

Sacramento County
827 Seventh Street, Room 225
Sacramento, California 95814

Subject: CEQA Comments: West Jackson Highway Master Plan, Notice of Preparation, SCH No.: 2013092021

Location: Sacramento County

Dear Ms. Hack,

Central Valley Flood Protection Board (Board) staff has reviewed the subject document and provides the following comments:

The proposed project is within Morrison Creek and Elder Creek, regulated streams under Board jurisdiction, and may require a Board permit prior to construction.

The Board's jurisdiction covers the entire Central Valley including all tributaries and distributaries of the Sacramento and San Joaquin Rivers, and the Tulare and Buena Vista basins south of the San Joaquin River.

Under authorities granted by California Water Code and Public Resources Code statutes, the Board enforces its Title 23, California Code of Regulations (Title 23) for the construction, maintenance, and protection of adopted plans of flood control, including the federal-State facilities of the State Plan of Flood Control, regulated streams, and designated floodways.

Pursuant to Title 23, Section 6 a Board permit is required prior to working within the Board's jurisdiction for the placement, construction, reconstruction, removal, or abandonment of any landscaping, culvert, bridge, conduit, fence, projection, fill, embankment, building, structure, obstruction, encroachment, excavation, the planting, or removal of vegetation, and any repair or maintenance that involves cutting into the levee.

Permits may also be required to bring existing works that predate permitting into compliance with Title 23, or where it is necessary to establish the conditions normally imposed by permitting. The circumstances include those where responsibility for the works has not been clearly established or ownership and use have been revised.

Other federal (including U.S. Army Corps of Engineers Section 10 and 404 regulatory permits), State and local agency permits may be required and are the applicant's responsibility to obtain.

Board permit applications and Title 23 regulations are available on our website at http://www.cvfpb.ca.gov/. Maps of the Board's jurisdiction are also available from the California Department of Water Resources website at http://gis.bam.water.ca.gov/bam/.

Please contact James Herota at (916) 574-0651, or via email at James.Herota@CVFlood.ca.gov if you have any questions.

Sincerely,

Andrea Buckley

Subject: Elk Grove Unified School District's Comments on the Revised Notice of Preparation of a Draft Environmental Impact Report for the West Jackson Highway Master Plan (PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack,

Elk Grove Unified School District (EGUSD) appreciates the opportunity to review and comment on the Revised Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the West Jackson Highway Master Plan.

EGUSD staff worked closely with the project applicants and County Planning Department staff to determine the appropriate number of school sites needed to serve the students anticipated to reside in the planned West Jackson Highway Master Plan community. Extensive collaboration also resulted in identifying, for the purposes of environmental analysis, school site locations that meet California Department of Education school siting criteria.

EGUSD acknowledges the project applicant's response to our concerns about the lack of a specifically located high school/middle school site on the land use plan released with the February 2017 NOP. We appreciate the revisions to the land use plan that identify for environmental analysis two feasible specific alternative locations for the middle school/high school site.

If you have any questions or would like to further discuss EGUSD's comments, please feel free to contact me at 916-686-7711.

Sincerely,

Kim Williams

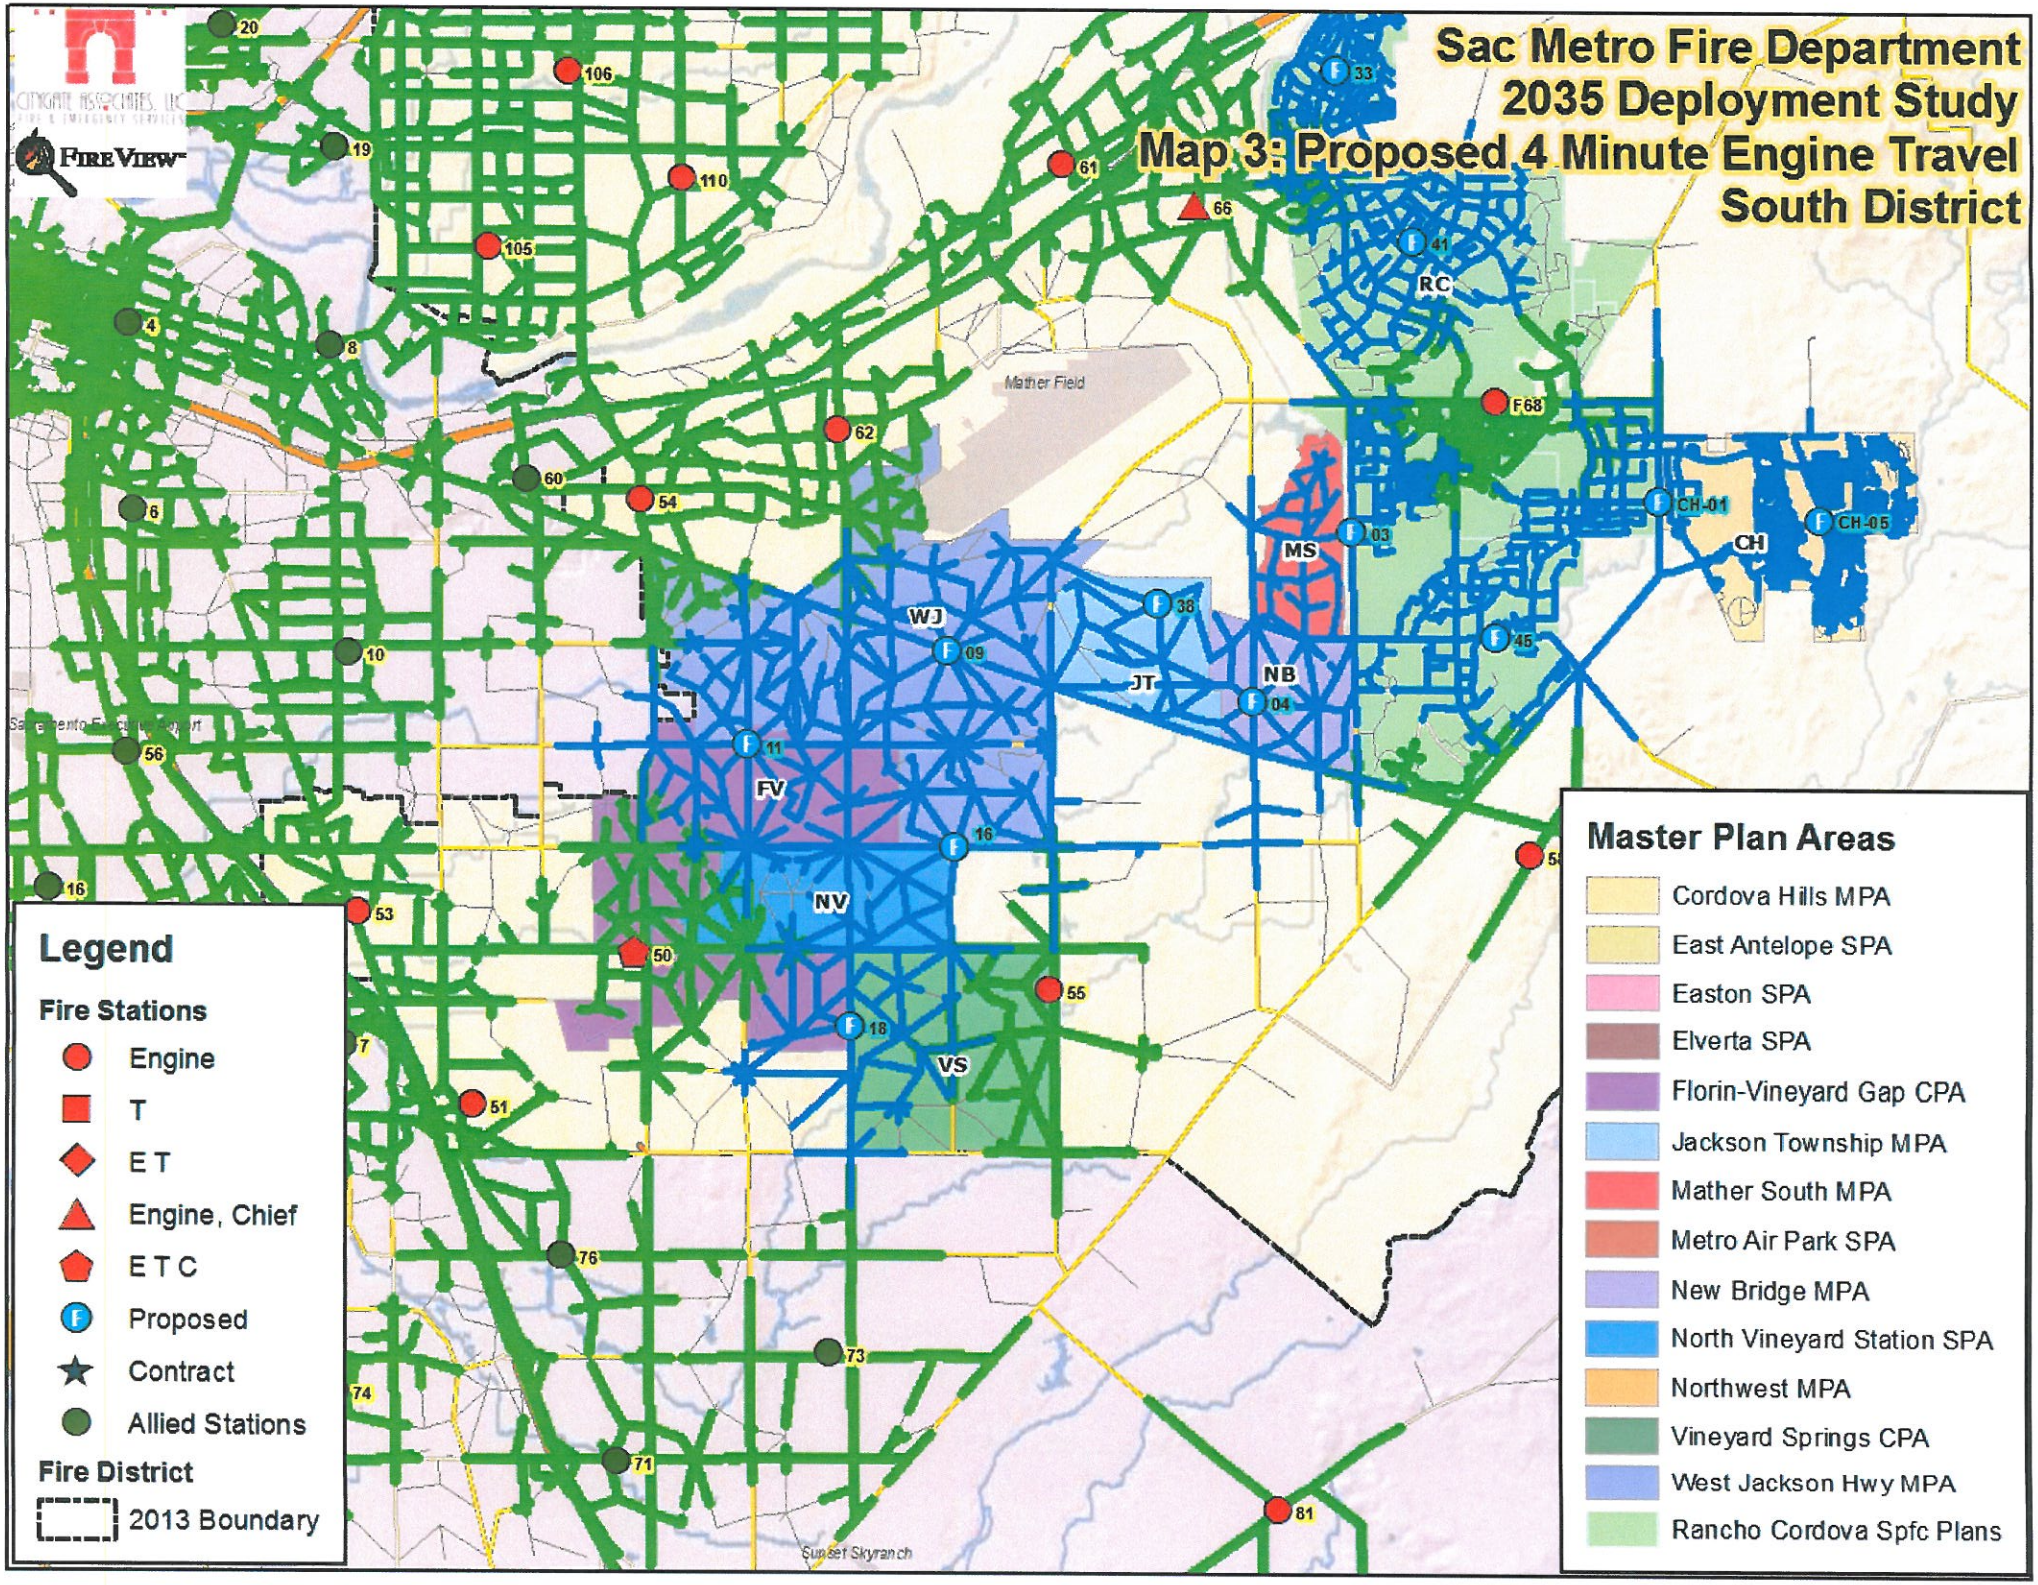
Subject: Comment Letter for West Jackson Highway Master Plan

Dear Ms. Hack:

Thank you for the opportunity to comment on the West Jackson Highway Master Plan (Project). The Sacramento Metropolitan Fire District (District) looks forward to working with the County and the Project proponents on this development.



In 2010, the District adopted a neighborhood-based fire company deployment plan, with response times, meeting national best practice recommendations. These response standards are in place to deliver good outcomes to keep serious, but still emerging, fires small and to rescue and treat the emergency's victims. For areas that have over 1,000 people per square mile (Suburban/Urban Areas), the District's standard 1st due travel time is four minutes with an overall reflex time of seven minutes. Given the Project's acreage and proposed land uses, the proposed development fits within the District's Suburban/Urban Area model.

In 2013, the District commissioned the Fire Department Growth Analysis (Growth Analysis) to anticipate the number and location of new fire stations that will be required to serve the Project and surrounding areas (See Attachment A). The Growth Analysis anticipated three new stations, Future Stations #9, #11 and #16, are needed to serve the Project. While Station #9 will primarily serve the Project, Stations #11 and #16 will also serve portions of the Florin-Vineyard Gap CPA, North Vineyard Station SPA and Vineyard Springs CPA.

If you have any questions, please feel free to contact me at (916) 859-4517 or via email at frye.jeff@metrofire.ca.gov.

RE: SCH#2013092021, West Jackson Highway Master Plan, Sacramento County

Dear Ms. Hack:

The Native American Heritage Commission has received the Notice of Preparation (NOP) for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd.(a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.**

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or

tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

a. A brief description of the project.
b. The lead agency contact information.
c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).
d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
   a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
   a. Alternatives to the project.
   b. Recommended mitigation measures.
   c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
   a. Type of environmental review necessary.
   b. Significance of the tribal cultural resources.
   c. Significance of the project's impacts on tribal cultural resources.
   d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
   a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
   b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
   a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
   b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have been already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
    a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions, please contact me at my email address: sharaya.souza@nahc.ca.gov.

Sincerely,

Sharaya Souza

RE: SCH#2013092021, West Jackson Highway Master Plan, Sacramento County

Dear Ms. Hack:

The Native American Heritage Commission has received the Notice of Preparation (NOP) for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd.(a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws**.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
   a. A brief description of the project.
   b. The lead agency contact information.
   c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).
   d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
   a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
   a. Alternatives to the project.
   b. Recommended mitigation measures.
   c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
   a. Type of environmental review necessary.
   b. Significance of the tribal cultural resources.
   c. Significance of the project's impacts on tribal cultural resources.
   d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
   a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
   b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
   a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of

open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have been already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Subject: RE: Revised NOP for West Jackson Highway Master Plan Request
Date: Friday, May 12, 2017 10:23:09 AM
Attachments: image001.png

Thanks, Tim. Caltrans District 3 does not have any additional comments from our letter sent on April 4, 2017.

Please provide our office with copies of any further actions regarding this project. We would appreciate the opportunity to review and comment on any changes related to this development.

Regards,

Subject: RE: Revised NOP for West Jackson Highway Master Plan Request

Alex,
The only change is the middle/high school site. The Project Plan and Option 2 has the middle/high school on a 70-acre site in District 2 while Option 1 and 3 has the school on a 84-acre site in District 1. The previous revised plan used asterisks for the middle/high school and did not delineate actual sites.

Subject: Revised NOP for West Jackson Highway Master Plan Request

Hi Tim,

I received the revised NOP for the West Jackson Highway Master Plan and I was wondering if you had a summary sheet that outlines the changes from the February 2017 NOP request? This would be very helpful for me so I can avoid reviewing the whole document again.

Thanks,

Catherine Hack, Environmental Coordinator
Department of Community Development
Planning and Environmental Review Division
827 7th Street, Room 225, Sacramento, CA 95814

Subject: Revised Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (Control Number: PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack:

Sacramento Regional County Sanitation District (Regional San) and the Sacramento Area Sewer District (SASD) have the following comments regarding the Notice of Preparation for the West Jackson Highway project:

SASD will provide local sewer service for the proposed project area. Regional San provides conveyance from local trunk sewers to the Sacramento Regional Wastewater Treatment Plant (SRWTP) through large pipelines called interceptors.

The Regional San Board of Directors adopted the Interceptor Sequencing Study (ISS) in February 2013. The ISS updated the SRCSD Master Plan 2000 is located on the Regional San website at http://www.regionalsan.com/ISS. The SASD Board of Directors approved the most current SASD planning document, the 2010 System Capacity Plan Update (SCP) in January 2012. The SCP is on the SASD website at http://www.sacsewer.com/devres-standards.html.

Regional San and SASD are not land-use authorities. Regional San and SASD designs their sewer systems using predicted wastewater flows that are dependent on land use information provided by each land use authority. Regional San and SASD base the projects identified within their planning documents on growth projections provided by these land-use authorities. Onsite and offsite environmental impacts associated with extending sewer services to this development should be contemplated in this Environmental Impact Report.

The proposed project lies within the SASD BR Jackson Trunk shed. Project proponents should work closely with SASD and Regional San Development Services to ensure proper connection to any existing SASD or Regional San facilities.

Customers receiving service from Regional San and SASD are responsible for rates and fees outlined within the latest Regional San and SASD ordinances. Fees for connecting to the sewer system recover the capital investment of sewer and treatment facilities that serves new customers. The SASD ordinance is located on the SASD website at http://www.sacsewer.com/ordinances.html, and the Regional San ordinance is located on their website at http://www.regionalsan.com/ordinance.

The SRWTP provides secondary treatment using an activated sludge process. Incoming wastewater flows through mechanical bar screens and then through a primary sedimentation process. This allows most of the heavy solids to settle to the

bottom of the tanks. These solids are later delivered to the digesters. Next, oxygen is added to the wastewater to grow naturally occurring microscopic organisms, which consume the organic particles in the wastewater. These organisms eventually settle on the bottom of the secondary clarifiers and are also delivered to the digesters. Clean water pours off the top of these clarifiers and is chlorinated, removing and inactivating any pathogens or other harmful organisms that may still exist. Chlorine disinfection occurs while the wastewater travels through a two-mile "outfall" pipeline to the Sacramento River, near the town of Freeport, California. Before entering the Sacramento River, sulfur dioxide is added to neutralize the chlorine.

The design of the SRWTP and collection system was balanced to have SRWTP facilities accommodate some of the wet weather flows while minimizing idle SRWTP facilities during dry weather. Regional San designed the SRWTP to accommodate some wet weather flows with onsite storage basins and interceptors designed to accommodate the remaining wet weather flows. The Central Valley Regional Water Quality Control Board (Water Board) issued an NPDES Discharge Permit in December 2010 (2010 Permit)-requiring Regional San to meet significantly more restrictive treatment levels for ammonia and nitrate by May 2021 and for pathogens by May 2023. Regional San began the necessary activities, studies, and projects to meet the new requirements with the adoption of the 2010 Permit. In April 2016, the Water Board issued an NPDES Discharge Permit (2016 Permit) which replaced the 2010 Permit while continuing the more restrictive treatment requirements and deadlines.

Regional San currently owns and operates a 5-mgd Water Reclamation (WRF) that has been producing Title 22 tertiary recycled since 2003. The WRF is located within the SRWTP property in Elk Grove. Regional San uses a portion of the recycled water at the SRWTP and the rest is wholesaled to the Sacramento County Water Agency (SCWA). SCWA retails the recycled water, primarily for landscape irrigation use, to select customers in the City of Elk Grove. Regional San currently does not have any planned facilities that could provide recycled water to the proposed project or its vicinity. Additionally, Regional San is not a water purveyor and any potential use of recycled water in the project area must be coordinated between the key stakeholders, e.g. land use jurisdictions, water purveyors, users, and the recycled water producers.

If you have any questions regarding these comments, please contact me at 916-876-9994

Sincerely,

Sarenna Moore

Subject: Revised Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (Control Number: PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack:

Sacramento Regional County Sanitation District (Regional San) and the Sacramento Area Sewer District (SASD) have the following comments regarding the Notice of Preparation for the West Jackson Highway project:

SASD will provide local sewer service for the proposed project area. Regional San provides conveyance from local trunk sewers to the Sacramento Regional Wastewater Treatment Plant (SRWTP) through large pipelines called interceptors.

The Regional San Board of Directors adopted the Interceptor Sequencing Study (ISS) in February 2013. The ISS updated the SRCSD Master Plan 2000 is located on the Regional San website at http://www.regionalsan.com/ISS. The SASD Board of Directors approved the most current SASD planning document, the 2010 System Capacity Plan Update (SCP) in January 2012. The SCP is on the SASD website at http://www.sacsewer.com/devres-standards.html.

Regional San and SASD are not land-use authorities. Regional San and SASD designs their sewer systems using predicted wastewater flows that are dependent on land use information provided by each land use authority. Regional San and SASD base the projects identified within their planning documents on growth projections provided by these land-use authorities. Onsite and offsite environmental impacts associated with extending sewer services to this development should be contemplated in this Environmental Impact Report.

Customers receiving service from Regional San and SASD are responsible for rates and fees outlined within the latest Regional San and SASD ordinances. Fees for connecting to the sewer system recover the capital investment of sewer and treatment facilities that serves new customers. The SASD ordinance is located on the SASD website at http://www.sacsewer.com/ordinances.html, and the Regional San ordinance is located on their website at http://www.regionalsan.com/ordinance.

The SRWTP provides secondary treatment using an activated sludge process. Incoming wastewater flows through mechanical bar screens through a primary sedimentation process. This allows most of the heavy organic solids to settle to the bottom of the tanks. These solids are later delivered to the digesters. Next, oxygen is added to the wastewater to grow naturally occurring microscopic organisms, which consume the organic particles in the wastewater. These organisms eventually settle on the bottom of the secondary clarifiers. Clean water pours off the top of these clarifiers and is chlorinated, removing any pathogens or other harmful organisms that may still

exist. Chlorine disinfection occurs while the wastewater travels through a two-mile "outfall" pipeline to the Sacramento River, near the town of Freeport, California. Before entering the river, sulfur dioxide is added to neutralize the chlorine.

The design of the SRWTP and collection system was balanced to have SRWTP facilities accommodate some of the wet weather flows while minimizing idle SRWTP facilities during dry weather. Regional San designed the SRWTP to accommodate some wet weather flows with the storage basins and interceptors designed to accommodate the remaining wet weather flows. The Central Valley Regional Water Quality Control Board (Water Board) issued an NPDES Discharge Permit to Regional San in December 2010.

In adopting the new Discharge Permit, the Water Board required Regional San to meet significantly more restrictive treatment levels over its current levels. Regional San began the necessary activities, studies, and projects to meet the permit conditions in August of 2014. Regional San must complete construction of the new treatment facilities to achieve the permit and settlement requirements by May 2021 for ammonia and nitrate and May 2023 to meet these pathogen requirements.

Regional San currently owns and operates a 5-mgd Water Reclamation (WRF) that has been producing Title 22 tertiary recycled since 2003. The WRF is located within the SRWTP property in Elk Grove. Regional San uses a portion of the recycled water at the SRWTP and the rest is wholesaled to the Sacramento County Water Agency (SCWA). SCWA retails the recycled water, primarily for landscape irrigation use, to select customers in the City of Elk Grove. It should be noted that Regional San currently does not have any planned facilities that could provide recycled water to the proposed project or its vicinity. Additionally, Regional San is not a water purveyor and any potential use of recycled water in the project area must be coordinated between the key stakeholders, e.g. land use jurisdictions, water purveyors, users, and the recycled water producers.

If you have any questions regarding these comments, please contact me at 916-876-9994

RE: West Jackson Highway Master Plan (WJHMP)
Control No. PLNP2008-GPB-CZB-ZOB-00240

Dear Ms. Hack:

The Rosemont Community Association has, for the present, the following comments on this proposal and revised notice of preparation (NOP). These comments are in no particular order and are not exhaustive of our concerns, but rather are offered with the intent of being on the record with concerns about this proposal and offering to continue to engage as it is refined and ultimately approved and built. We reserve the right to continue to offer comments and concerns as the project evolves and other issues with it arise.

TRAFFIC

As presented, we are far from convinced that the proposed traffic and transportation system will adequately handle the greatly increased traffic load, not just from this project but from the several projects to the east along Jackson south of Mather, and also the Aspen I project at Watt and Jackson, as well as the inevitably increasing traffic generated to the south toward and in Elk Grove. Already morning and evening commute traffic on both Bradshaw and Watt far exceeds the carrying capacity of those already improved roads, especially on Watt Ave. crossing the river and at the Hwy 50 interchange. Nothing in this proposal suggests that RT will be able to effectively service the expanded needs generated in this development, nor are other options suggested for traffic remediation. Rather, the existing traffic congestion will only be exacerbated, and we will all experience both adverse environmental as well as social and economic degradation. These concerns MUST be adequately addressed and remediated before any approvals are

issued. This proposal calls for novel and innovative solutions that could set a new high standard.

COMMERCE

As proposed, the WJHMP project will likely suck from Rosemont most of the little remaining commercial businesses we still have, as people opt to shop in the new more attractive commercial areas on our edge. So far we have seen no interest or ability by the County to take an active role in any economic development or redevelopment in the Rosemont community. Based on data from the 2010 census, we bleed $200 million dollars a year, largely because we have so few places to spend the money. We have an outdated retail center that has been two-thirds vacant for years, and much of our other commercial space is also empty. As a result, our community suffers both economically as well as socially, and is a less appealing place to live than it should be. With the proposed new developments on our border we can expect whatever business community we still have will disappear, or at best further deteriorate, unless we can organize a serious and effective economic development program here. So far this does not seem to be likely.

ENVIRONMENTAL CONCERNS

In addition to the concerns we have regarding traffic, we are concerned about other issues including the environmental impact of the project on air, water, and potentially noise. Given the location of the project what assurances are there that a significant area of it is not affected by the pollution plume from Mather AFB and Aerojet operations in the past? Is there sufficient water available to serve the new developments? What will be done to assure that quality water will be available at a reasonable price and that those customers in the new development (and similar existing developments) will have an effective say in that water service?

HOUSING, INFILL AND SERVICES

With all the concerns and policy efforts in recent years in the greater Sacramento region focused on urban infill and sprawl avoidance, this project seems not to have given sufficient consideration to these very real concerns. While the devil will be in the details when they are more fleshed out, this issue of housing density is a very real one for future generations and it must be satisfactorily addressed before this project proceeds. As presented it will, along with the other pending projects in the area, advance the urban sprawl and create more urban areas without the real ability to provide normal municipal level services. We already experience that deficiency in the existing urbanized areas abutting this project.

IMPACT ON EXISITING COMMUNITIES

The development of a project of this magnitude abutting a long existing community has the highly likely potential of creating a seriously negative impact on the older community. The new development will benefit from new development standards dealing with landscaping, design, and maintenance; funding mechanisms for these amenities as well as for parks, open space, and public facilities; and generally a fresh new appealing place for people to live and work. The older adjoining areas will pale by comparison and without the ability to protect and enhance themselves can be expected to suffer and deteriorate. Rosemont is determined to not let that happen. We will immediately begin exploring what options we have to protect and enhance our community. And based on conversations we have had with neighboring areas in a situation similar to ours, we expect they will be joining us in this exploration.

There are many other serious issues that are buried in the details of the WJHMP that will come out as further study is done by all parties. For the present, these points are our foremost concerns. We look forward to continuing to work with Stonebridge and Teichert, and soon Granite and the other property owners, to address these concerns. They have been most supportive neighbors over the years and we anticipate that excellent and positive relationship will continue as this project comes to fruition.

Thank you for the opportunity to offer these preliminary comments.

Re: Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (Control Number: PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack:

Thank you for inviting SACOG's comments on the Notice of Preparation of a Draft Environmental Impact Report for the West Jackson Highway Master Plan (PLNP2008-GPB-CZB-ZOB-00240). The West Jackson Highway Master Plan area is part of SACOG's 2016 Metropolitan Transportation Plan/Sustainable Communities Strategy (2016 MTP/SCS) and longer-term Blueprint Vision. The 2016 MTP/SCS projects 4,996 new homes and 1,859 new jobs by 2036 for the West Jackson area. Next year SACOG will begin its quadrennial update of the plan (scheduled adoption in 2020) and will be working with Sacramento County to determine if there is a need to update the projections for this area for the next MTP/SCS.

The 2016 MTP/SCS includes funding for a number of roadway improvements in the area of the West Jackson Highway Master Plan; however, there are a number of differences between what is included in the MTP/SCS by 2036 and what is shown on the Proposed Transportation Diagram included in the NOP. The Proposed Transportation Diagram includes several new arterials "Pre-2030" that are not included in the MTP/SCS. The road projects not included in the MTP/SCS include the proposed north-south arterial running through the center of the project, the proposed north-south arterial that is in between Bradshaw Road and Excelsior Road, and the extension of Kiefer Boulevard. Additionally, the Proposed Transportation Diagram includes a number of transit projects that are not included in the MTP/SCS. The MTP/SCS does not include the BRT along South Watt Avenue or Jackson Highway or any of the BRT/HI BUS routes shown on the Proposed Transportation Diagram.

In general, when planning for a new development area such as the proposed master plan, it is likely that the proposed plan will include transportation projects that are different from the MTP/SCS. While a master plan envisions the ultimate development of an area, the MTP/SCS is a financially constrained plan for a

particular period of time (20 or more years) that is subject to a transportation conformity requirement under the federal Clean Air Act. Therefore, it is important to note that new transportation projects that are regionally significant, such as new arterials, cannot be built if they are not in the MTP/SCS and the inclusion of new transportation projects in a master plan is not a guarantee that those transportation projects will be included in the MTP/SCS.

As noted earlier, SACOG will begin the update process of the MTP/SCS next year. With limited transportation funds available and the potential for stricter regional greenhouse gas emission targets, we are encouraging all of our member jurisdictions to identify their high priority areas for growth and transportation funding. We look forward to further discussions with the County as the MTP/SCS update process moves forward next year. Subject: Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the West Jackson Highway Master Plan (Control Number: PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack:

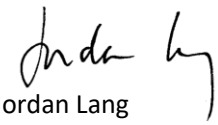
Thank you for the opportunity to comment on the subject NOP and on what environmental analysis will be presented in the DEIR.

The proposed project will cause a significant adverse effect on the environment if it will not adequately provide access by bicycle.

Adequate bicycle access within the project. The subject Master Plan envisions an extensive network of residential, commercial, recreational, and educational land uses. The DEIR must address the density and quality of bikeway facilities to be provided to ensure safe and comfortable bicycle access among these land uses. Bikeways must be comfortable for all ages and abilities of bicycle riders. For example, the project's internal bikeway network must provide access to school sites for children, to employment sites for workers, and to commercial sites for shoppers who live in the project's residential areas. The bikeway network should provide a low-traffic-stress bikeway connection within ¼ mile of every residence in the Master Plan area. This link provides a good explanation of the importance of measuring low-stress network connectivity: http://www.northeastern.edu/peter.furth/connectivity-of-low-stress-bicycle-networks/.

To address this potential impact, the DEIR should provide information on the configurations and usage patterns (typical traffic volumes and speeds) of the project's proposed roadways. Different types of roadways will require different types of bikeways to provide adequate safety and comfort to all types of bicyclists. For example, high speed arterials with volumes over 15,000 ADT and speeds over 35 mph will require buffered or separated bikeways to be considered bicycle friendly.



Adequate bicycle access to the project sites. The DEIR also should address the connections between the proposed bikeway network in the Master Plan area and bikeway facilities in surrounding areas. The connections are critical to provide adequate bicycle access to employment, shopping, educational, recreational, and transportation facilities in the surrounding areas. For example, bikeway facilities to be provide along and across the intersection of South Watt Avenue and Jackson Highway are critical for ensuring bicyclist access to the Light Rail Station at Folsom Boulevard. The DEIR must describe and analyze proposed bikeways through the proposed "high capacity intersections" along South Watt Avenue.

Please ensure that the subject DEIR addresses these 2 dimensions of adequate bicycle access.

SABA works to ensure that bicycling is safe, convenient, and desirable for everyday transportation. Bicycling is the healthiest, cleanest, cheapest, quietest, most energy efficient, and least congesting form of transportation.

Thank you for considering our comments.

Sincerely,

Jordan Lang

Subject: Revised Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the West Jackson Highway Master Plan
(Control Number: PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack:

The Sacramento Municipal Utility District (SMUD) appreciates the opportunity to provide comments on the Revised Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the West Jackson Highway Master Plan, released April 26, 2017. SMUD is the primary energy provider for Sacramento County and the proposed Project area. SMUD's vision is to empower our customers with solutions and options that increase energy efficiency, protect the environment, reduce global warming, and lower the cost to serve our region. As a Responsible Agency, SMUD aims to ensure that the proposed Project limits the potential for significant environmental effects on SMUD facilities, employees, and customers.

Recognizing that West Jackson Highway is one of several new growth areas being developed in approximately the same area of the County within a similar timeframe, it is our desire that the EIR for the West Jackson Highway Master Plan will acknowledge any Project impacts related to the following:

- Overhead and or underground transmission and distribution line easements. Please view the following links on smud.org for more information regarding transmission encroachment:
  - https://www.smud.org/en/business/customer-service/support-and-services/design-construction-services.htm
  - https://www.smud.org/en/do-business-with-smud/real-estate-services/transmission-right-of-way.htm
- Utility line routing
- Electrical load needs/requirements
- Energy Efficiency
- Climate Change
- Cumulative impacts related to the need for increased electrical delivery

Based on SMUD's review of the Revised West Jackson Highway Master Plan for the preferred option dated April 26, 2017, SMUD presumed that the estimated demand remains consistent with the preferred option dated January 31, 2017 (approximately 223 MW). The preferred option in the Revised West Jackson Highway Master Plan does not substantially change the estimated demand, nor does it substantially change the proposed sub-transmission facilities, distribution substation locations, and bulk substation location identified in the letter SMUD previously submitted in March 15, 2017.

Below is a list of potential sub-transmission and distribution substation electrical requirements, based on our review of the NOP; the electrical requirements are consistent with those identified in our letter dated March 15, 2017. An attached and notated copy of the West Jackson Highway Land Use Plan identifies the proposed sub-transmission routes, and proposed new and expanded distribution substation locations based on the revised land use plan. Please note that it also identifies a zone in which a new bulk substation might need to be sited and constructed adjacent to the existing transmission line corridor **(LOC 8)**. The expected need for a new bulk substation is the result of the cumulative load of the pending master plans for which preliminary information has been released to date (i.e., NewBridge, Jackson Township, Mather South, and West Jackson Highway). If the bulk substation is to be included within the West Jackson Highway Master Plan, the location is in close proximity of a proposed elementary school site. Furthermore, additional 69kV routes exiting the substation northerly to Jackson Road, southerly to Elder Creek Road, and easterly to Excelsior Road will be required.

- Expansion of the existing SMUD distribution substation located on the east side of Happy Lane approximately 1250-feet south of Old Placerville Road **(Loc 1)**; additional land, resulting in the expanded site totaling approximately 1.4-acres, is required to accommodate new electrical facilities. Please note that this site is adjacent to the master plan and would likely require the additional land from the adjacent E parcel.

- A new distribution substation near the southwest corner of Jackson Highway and Bradshaw Road (**Loc 2**); new distribution substations generally require a parcel that is approximately 250-feet-by-250-feet which is approximately 1.4-acres.

- A new distribution substation within FPA-A in the vicinity of Fruitridge Road and Hedge Avenue **(Loc 3)**; new distribution substations generally require a parcel that is approximately 250-feet-by-250-feet which is approximately 1.4-acres.

- A new distribution substation in the vicinity of Jackson Road and Vineyard Road/Rock Creek Parkway East **(Loc 4)**; new distribution substations generally require a parcel that is approximately 250-feet-by-250-feet which is approximately 1.4-acres.

- A new distribution substation within FPA-B in the vicinity of Elder Creek Road and Bradshaw Road **(Loc 5)**; new distribution substations generally require a parcel that is approximately 250-feet-by-250-feet which is approximately 1.4-acres.

- A new distribution substation in the vicinity of Excelsior Road south of Kiefer Road **(Loc 6)**; new distribution substations generally require a parcel that is approximately 250-feet-by-250-feet which is approximately 1.4-acres.

- A new distribution substation within FPA-C along the west side of Excelsior Road south of Elder Creek Road **(Loc 7)**; new distribution substations generally require a parcel that is approximately 250-feet-by-250-feet which is approximately 1.4-acres.

- Zone for potential bulk substation along the north side of the existing transmission line corridor **(Loc 8).**

- Installation of new sub-transmission (69 kV) electrical lines along the following existing/future roads:
  - Kiefer Rd
  - Happy Ln
  - Jackson Hwy
  - Excelsior Rd between Florin Rd and Kiefer Rd
  - Hedge Ave
  - Vineyard Rd between Florin Rd and unnamed road south of Jackson Hwy
  - Unnamed road between Vineyard Rd and Bradshaw Rd
  - Bradshaw Rd between unnamed road and Jackson Hwy

- Additional new sub-transmission (69 kV) routes may be required depending upon where the new distribution substations are sited.

- All sub-transmission electrical lines (69 kV) will be routed overhead in an easement outside the rights-of-way of on-site project streets.

- The existing dedicated substation at **Loc 9** will only be removed if the existing service is removed.

SMUD notes that the Revised NOP identifies the location for the proposed high school/middle school along Mayhew Road, where there is an existing double-circuit overhead 69kV line that must remain in place. Although existing 69kV facilities were not listed in our letter dated March 15, 2017, they were included in an attached exhibit. The attached and notated copy of the West Jackson Highway Land Use Plan identifies the following existing 69kV line routes:

- Mayhew Road, between Jackson Road and Elder Creek Road
- Kiefer Road, from Bradshaw Road easterly for approximately 700-feet
- Elder Creek Road, between Hedge Avenue and Excelsior Road
- Excelsior Road, between Elder Creek Road and Florin Road
- Knox Road, from Florin Road northerly for approximately 2,100-feet

SMUD appreciates the opportunity to be involved in the discussion of the above areas of interest as well as discussing any other potential issues. We aim to be partners in the efficient and sustainable delivery of the proposed Project. Please ensure that the information included in this response is conveyed to the Project planners and the appropriate Project proponents.

Environmental leadership is a core value of SMUD and we look forward to collaborating with you on this Project. If you have any questions regarding this letter, please contact Rob Ferrera at rob.ferrera@smud.org or (916)732-6676.

Ward Winchell

Dear Ms. Hack,

The Southgate Recreation and Park District (Southgate) appreciates the opportunity to comment on the revised notice of preparation (NOP) of the Draft Environmental Impact Report (DEIR) for the West Jackson Highway Master Plan issued February 15, 2017. The District previously submitted comments on an earlier iteration of this project in a letter dated October 16, 2013.

The proposed Master Plan is 5,913 acres in size and creates two district plan areas, district 1 and district 2 and three Future Planning Areas (FPA), A, B, and C. The Project is located along State Route 16 (Jackson Highway) east of the City of Sacramento. The Project boundaries are generally the City of Sacramento city limits to the west, Jackson Highway, Bradshaw Road, Keifer Boulevard, and Goethe Road to the north, Excelsior Road to the east and portions of Elder Creek and Florin Road to the south.

Approximately 3,068 acres (52%) of the West Jackson Master Plan Area are within Southgate's jurisdiction. This acreage includes residential, commercial, industrial, park, urban farm, and open space designations. The District is responsible for planning, operating, and maintaining parks, open spaces, landscape corridors, and recreational facilities within its boundaries.

The District requests that the following comments, which were approved by the Southgate Board of Directors at their May 2, 2017, meeting, be considered and included in the DEIR where applicable. Our comments are as follows:

Parks

The District would like to work with the development community, County, and regulatory agencies on identifying the most appropriate locations for all new parkland and associated recreation facilities. The number of park acres provided by the master plan should be no less than the current Quimby dedication requirement of 5 acres of parkland per 1,000 residents in the Southgate jurisdiction. The plan appears to propose more than the required Quimby dedication. A legal mechanism must be created to ensure the land will actually be dedicated as mitigation for the project.

The Summary of District One on the preferred land use plan (Figure 6) does not include the acres of parkland required in Southgate's jurisdiction. Files provided to Southgate indicate that approximately 45.88 acres of park land would be provided in the proposed preferred land use plan in District One within Southgate's area. Based on the number of proposed housing units, a minimum of 47.2 acres of parkland would be required in this area under current the Quimby factor. The preferred scenario should add at least an additional 1.32 acres of park land in District One within Southgate's jurisdiction.

Parks should be sited to encourage the greatest accessibility by residents on bike or foot and should not directly abut major thoroughfare roads. For example, the 27.6-acre park east of Mayhew Road is not located in the center of the residential land uses. Bike and pedestrian access to parks would be increased by shifting some of these park acres west to provide three neighborhood parks; one north of Elder Creek Road west of the California Central Traction Railroad and two southwest of Mayhew Road and Fruitridge road intersection. Neighborhood parks are 5-10 acres in size. Similarly, the proposed 6.6-acre park west of Bradshaw road, within the Mather noise contour, should be located in the center of the proposed housing to maximize access to the park. Lastly, the proposed 8-acre park adjacent to the elementary school should not be adjacent to a major thoroughfare road. The DEIR should analyze the potential health and safety impacts of locating parks immediately adjacent to major roadways, including exposure to poor air quality during exercise and increased hazards due to higher vehicle speeds at the park edge.

Land Use

The proposed Figure 6 identifies three FPAs without specifically indicating where the various land uses are proposed within those FPAs. Each alternative does, however, provide a very detailed summary of the specific land uses proposed within each FPA. In fact, many of the largest variations in each of the proposed land use alternatives occur within the FPA areas. If the specifics of each FPA are known, they should be identified on the map such that the full understanding and impact of the known land uses can be understood and analyzed in the DEIR. Furthermore, the FPAs border adopted community and specific plans. In order to properly plan trail and open space alignments and space parks appropriately, it is critical to understand the spatial distribution of the proposed land uses. In other words, if the DEIR makes any assumptions about specific land uses (open space, low-density residential, commercial, etc...) in the FPAs they should be identified on the map so that agencies responsible for providing services to these areas can properly plan the best means to provide services for these areas.

Open Space and Drainage

Southgate understands that this Project has designated approximately 1,368 acres as open space of which approximately 724 (53%) acres are within Southgate's boundaries. Southgate is interested in promoting park and recreational uses for open space lands wherever possible and is willing to accept

and maintain trail corridors and any associated open space preserves. Acceptance depends on the final requirements of the regulatory agencies related to these facilities and if adequate funding is available to pay for all costs associated with the repair, maintenance, and monitoring in perpetuity of trail corridors and any associated open space preserves. Southgate also supports identifying opportunities for joint use of detention basins and drainage corridors for recreation purposes.

Trails

The proposed Bicycle Master Plan Amendment exhibit (Figure 4) increases bicycle connectivity and is generally supported by Southgate. Southgate encourages a funding mechanism across the entire West Jackson Highway Master Plan area that would support trails of regional significance that span multiple jurisdictions. A regional funding mechanism could augment funding from individual local agencies in order to ensure consistency of construction and maintenance of regional trails. Southgate also supports identifying additional local connector trails that would serve to directly link parks, and provide off-street regional class 1 bike and pedestrian trail systems. The additional trail segments should be analyzed and included in the proposed bicycle master plan amendment exhibit and Southgate should be included in identifying trail alignments within our jurisdiction.

Specifically, Southgate suggests including a minimum of three additional regional trail segments in Figure 4. The Florin-Vineyard Community Plan identifies a class 1 trail along Hedge Avenue. This class 1 trail should be continued north to link to the proposed Rock Creek Parkway. This north-south connection could serve as the primary off-street connection for residents living in the broader Vineyard Community commuting downtown or accessing the American River bike trail. The plan should also provide a north-south segment linking the Elder Creek and Gerber Creek trail systems in the southeastern portion of the plan area. There is a drainage west of Excelsior Road that could serve as the logical connection. Linking the Elder and Gerber Creek trails would provide the community a 10-mile loop for running, biking, commuting, or other uses spanning four Community and Specific Plans; (Vineyard Springs Comprehensive Plan, Florin-Vineyard Community Plan, North Vineyard Station Specific Plan, and the West Jackson Highway Master Plan) in the heart of the Vineyard Community. The third link should connect to the intersection of Excelsior Road and Jackson Highway from the Elder Creek/powerline corridor trail. The proposed master plan north of Jackson Highway to the east of the West Jackson Highway Master Plan shows a drainage corridor and trail terminating on the northeastern side of Jackson Highway and Excelsior Road. A connection on the southwest side would further link regional trails. Southgate also notes that the Proposed Bicycle Master Plan may be using the incorrect line file for the Gerber Creek trail; the Existing Bicycle Master Plan exhibit appears to display the correct Gerber Creek trail.

Lastly, much of the land within the plan area has been mined. Mining often includes infrastructure such as roads, tunnels, and conveyor systems that pass underneath roadways. The bicycle plan should consider linking and using this infrastructure to avoid surface street crossings. Off-street, class 1, crossings could provide a true benefit to the trail system and encourage bicycle use as a safe means of transportation and recreation.

Southgate Recreation & Park District appreciates the County's consideration of the requests proposed in this letter. Southgate is willing to coordinate with the County and all related agencies to determine sufficient mitigation measures in order to minimize the effects of significant impacts and to maximize the availability of public services and recreational facilities throughout Southgate's jurisdiction.

Once again, the Southgate Recreation & Park District would like to thank the County for the opportunity to comment on the NOP of a DEIR for the West Jackson Highway Master Plan. Please continue to forward documentation related to this Project to Southgate. If you require additional information or assistance please do not hesitate to contact me at (916) 428-1171, ext. 21, or via e-mail at vking@southgaterecandpark.net.

Sincerely,

Vincent King

RE: Revised Notice of Preparation of a Draft Environmental Impact Report for West Jackson Highway Master Plan (CONTROL NUMBER: PLNP2008-GPB-CZB-ZOB-00240)

Dear Ms. Hack:

Thank you for the opportunity to comment on the Revised NOP of a DEIR for West Jackson Highway Master Plan (CONTROL NUMBER: PLNP2008-GPB-CZB-ZOB-00240).

WALKSacramento submitted comments on the original NOP on October 25, 2013, and many of the issues raised at that time are still relevant to the Revised NOP. We said in our previous letter

> *The NOP for the West Jackson Highway Master Plan indicates that "a Traffic Impact Study will be performed to examine the effects of proposed project development and facilities on area roadways." However, more than just area roadways may be affected by the proposed project - a transportation network that serves primarily car trips with wide and fast roads with few crossing opportunities increases the rates and severity of collisions for pedestrians and bicyclists.*
>
> *Further, land-use patterns can have a harmful impact on public health. Communities where daily destinations are not close to residences result in few, inconvenient or unsafe options for walking and biking, and the community members are at greater risk for inadequate physical activity, obesity and chronic diseases.*
>
> *WALKSacramento asks that the environmental impact report for the West Jackson Highway Master Plan consider the health and safety impacts to people resulting from the proposed community design, land uses, transportation facilities and circulation network.*

WALKSacramento reiterates our prior recommendations that the DEIR analyze the following:

- *Pedestrian and bicycle collision rates and severities that result from the choice of roadway widths and traffic speeds.*
- *Physical activity level, obesity and chronic diseases that result from the land-use pattern, specifically the distances to daily destinations.*
- *A "Major Roadway Downgrade and Mixed Land Use" alternative that reduces the lanes-miles of arterials and thoroughfares, incorporates a finer-grain grid of roadways having low speeds, short crossing distances and more crossing opportunities, and disperses the various land uses throughout the plan area.*

In addition the recommendations for analysis made above, WALKSacramento believes the following would improve the information provided by the DEIR and further reduce the traffic safety and health impacts of the project.

The revised project includes a new four-lane roadway that abuts the elementary school at the northwest corner of Fruitridge Toad and Mayhew Road. Larger roadways with more traffic and higher speeds do not support safe and pleasant walking and biking to schools, especially elementary schools. **We recommend the DEIR analyze pedestrian and bicycle collision rates and severity that may result from the proposed school site location.**

The revised project also relocates another elementary school and the Middle School/High School campus. **We recommend analysis of the potential for walking and biking to school comparing the locations as proposed versus locations that are more centrally located to residential densities and away from higher volume and speed roadways.**

In the Bicycle Master Plan Amendment included with the Revised NOP, a trail segment is located on east side of Bradshaw Road between the northern and southern Rock Creek Parkway intersections with Bradshaw Road. The east side of Bradshaw for that segment is designated Commercial, Open Space, and Employment, whereas the west side is designated Open Space and Open space/Urban Farm. There could be more pedestrian and bicycle points of conflicts with vehicles on the east side compared to the west side. **We recommend analyzing the impact of placing the trail on the west side of Bradshaw Road versus the east side.**

WALKSacramento is working to support increased physical activity such as walking and bicycling in local neighborhoods as well as helping to create community environments that support walking and bicycling. The benefits include improved physical fitness, less motor vehicle traffic congestion, better air quality, and a stronger sense of cohesion and safety in local neighborhoods.

Thank you for your consideration of these comments and recommendations.

Sincerely,

Chris Holm
Project Manager

Subject: West Jackson Highway Master Plan - Revised NOP
Date: Wednesday, March 1, 2017 10:34:56 AM

Mr. Kohaya,

I am a 5 year resident of Independence at Mather and just had an opportunity to review the above Revised NOP and have some comments and concerns to express regarding the new NOP. The first comment concerns the proposed HDR blocks across from the Sacramento Speedway and on Excelsior in between Jackson and Elder Creek. Many residents in HDR rely on public transportation - either the bus or the light rail - and this entire section of the project lacks any proper or even potentially proper infrastructure to meet the needs of this new HDR housing. This is why nearly all of the HDR in Rosemont and Rancho Cordova (two of the communities most impacted by this new development) south of Interstate 50 is located near Folsom Blvd where many of the light rail stations are. From my house in the middle of the Independence at Mather development it takes 7-10 minutes by car just to get to the nearest light rail station. The construction of Jackson and Excelsior both would make new bus infrastructure very difficult.

Excelsior, through our development, is already used as a thoroughfare for morning and evening commutes from who knows where - I suspect a lot of the residents in Vineyard and on the east side of Interstate 99 in Elk Grove to avoid the freeway - such that we had to put in several speed tables to reduce the dangerous nature of the commute. 15,000 new housing units in this proposed area will exacerbate that issue. Our community is fairly isolated due to all the protected wetlands around and many children and residents walk our neighborhood streets.

Prior to living in Mather, I resided in Rosemont for 4 years, so for the last 9 years I have been intimately familiar with the Jackson/Bradshaw intersection that much of this project revolves around. The intersection is congested as it is with nothing around there. I think the city might still be underestimating the amount of gridlock that will occur both from the economic development and the housing development. The traffic issue is not limited to that intersection or the length of Jackson as it is. Interstate 50 in the last couple of years has become more and more heavily congested between Bradshaw Road and Zinfandel Road heading to downtown in the morning and coming from downtown in the evening. The addition of new economic development that would route traffic down Bradshaw and Mather Field and Zinfandel from I-50 and the addition of 15,000 new housing units that would route traffic up those same streets to I-50 is going to grossly exacerbate the gridlock on that section of the freeway and well as the city streets getting to the freeway.

I understand that the area looks ripe for development as it has been largely empty and devoid of any development or production for years and years, and that this project if approved will go in phases and steps, but these are very serious concerns for those of us who have made this area our permanent homes (I'm only 34) and we need the planning commission to weigh the needs of development hand in hand with the living experience of both the new residents that would come to this plan and the current residents impacted by it.

Tim, thank you for taking the time to review my comments, I hope they are shared with the whole commission. If you'd like to discuss the matter with me any further I am happy to either via this e-mail or my phone number 916-848-9530. Again, thank you for your time.

WEST JACKSON HIGHWAY MASTER PLAN AIR QUALITY AND GREENHOUSE GAS TECHNICAL REPORT

SACRAMENTO METROPOLITAN
AIR QUALITY
MANAGEMENT DISTRICT

June 5, 2024

Julie Newton
Environmental Coordinator, Sacramento County
Planning and Environmental Review
827 7th street, Room 225
Sacramento, CA 95814

newtonj@saccounty.gov

Subject: **West Jackson Highway Master Plan**

Dear Mrs. Newton,

Thank you for providing the April 2024 West Jackson Highway Master Plan Air Quality and Greenhouse Gas Technical Report and the April 2024 Air Quality Mitigation Plan (AQMP) for the West Jackson Highway Master Plan.

By way of this letter, District staff are verifying that we have reviewed the West Jackson Highway Master Plan Air Quality and Greenhouse Gas Technical Report and find that it consistent with the District's CEQA guidance on greenhouse gas and air quality plans. The District also finds that the AQMP will, through on-site and off-site measures, achieve a 35 percent reduction in ozone precursors generated by mobile sources over the baseline project conditions.

Please contact me at rmuzzy@airquality.org or (279) 207-1139 if you have any questions regarding this verification of technical adequacy.

Sincerely,

Rich Muzzy

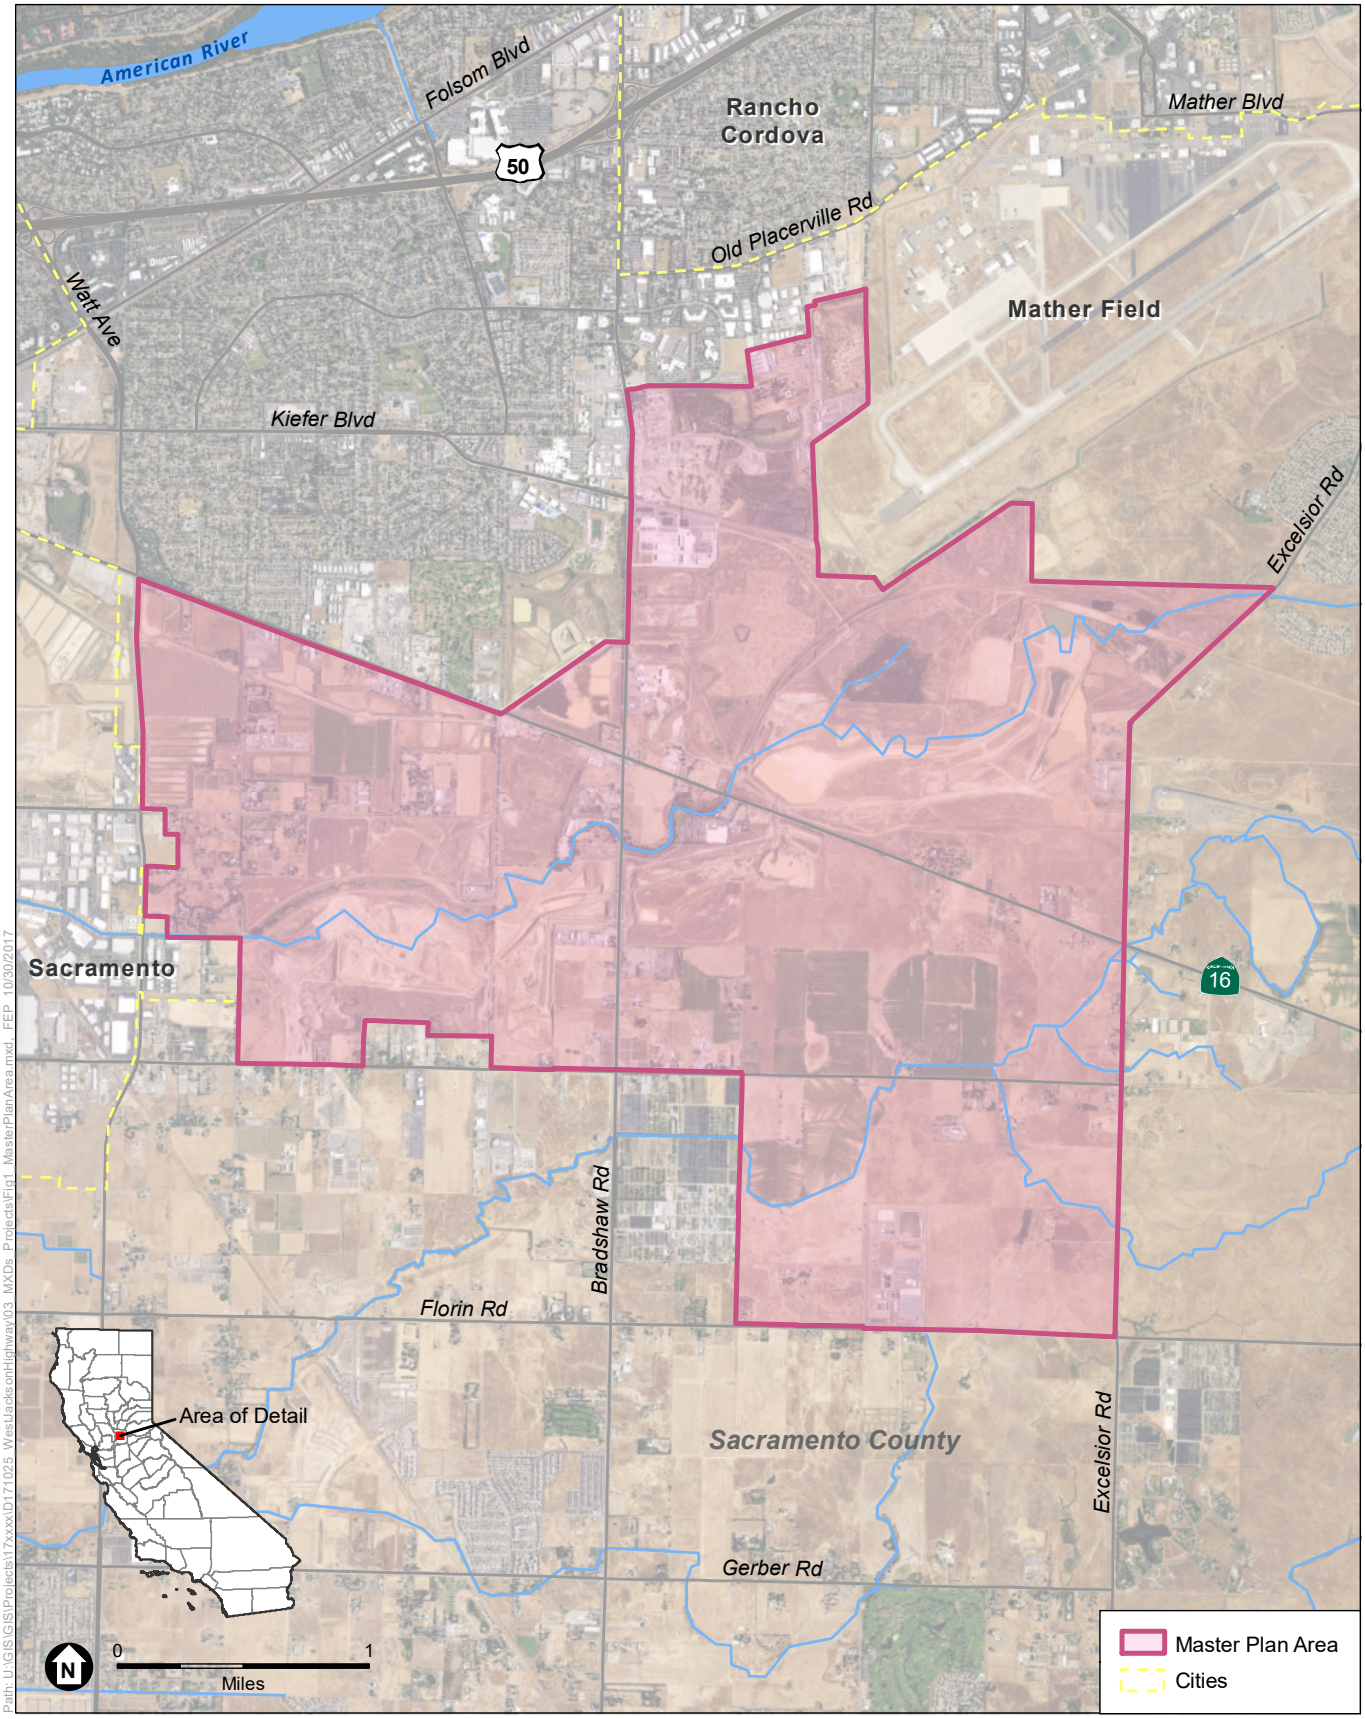
Appendix A. Supporting Data
Appendix B. Air Quality Mitigation Plan

CHAPTER 1
Introduction

This Air Quality and Greenhouse Gas Technical Report (report) assesses the potential air quality and greenhouse gas (GHG) impacts associated with construction and operation of the West Jackson Highway Master Plan (Master Plan, or project) and identifies feasible mitigation measures where appropriate.



The remainder of this chapter provides a brief project description. Chapter 2 assesses the potential air quality impacts associated with the Master Plan. Chapter 3 assesses the potential GHG impacts associated with the Master Plan. All supporting data have been provided in **Appendix A**. The accompanying Air Quality Mitigation Plan (AQMP) has been provided in **Appendix B**.

1.1 Project Description

Stonebridge Properties, LLC (a subsidiary of Teichert Land Company) and Granite Construction Company have initiated the Master Plan process for all land encompassed within the proposed Master Plan Area. The Master Plan Area boundaries are generally Jackson Highway (State Route 16), Kiefer Boulevard, and Goethe Road to the north, portions of Elder Creek Road and Florin Road to the south, the City of Sacramento to the west, and Excelsior Road to the east.

The existing properties within the Master Plan Area primarily include aggregate mining sites used for sand and gravel extraction, many of which have already been reclaimed. Due to these mining activities, the Master Plan Area has largely been bypassed by development. Although most of the mining is complete, some of the Master Plan Area continues to support various mining-related activities. In addition to these mining sites, the Master Plan Area is comprised of a mixture of rural residential, institutional, agricultural, commercial, and industrial properties located along State Route 16 (Jackson Highway) in the geographic center of Sacramento County.

The Master Plan has been designed to provide a mixture of residential, commercial, industrial, recreational, and employment nodes intended to reduce vehicle miles traveled (VMT) within the Master Plan Area and support the provision and use of transit alternatives. The Master Plan establishes a framework and strategy for all future land use within the Master Plan Area, including general land use and development standards, policies, land use allocations, infrastructure, and public service planning. Within the Master Plan, two District Area Plans are established, in addition to three Future Planning Areas (FPA's). District Area Plans primarily consist of properties owned by Stonebridge Properties, LLC and Granite Construction Company, while FPAs are comprised of non-participating property owners. **Figure 1** shows the Master Plan area.

SOURCE: Esri, 2015; Teichert, 2017; ESA, 2017

West Jackson Highway Master Plan

Figure 1
Master Plan Area

ESA

The District Area Plans establish specific land uses, policies and development standards for the properties within the District Area Plans. Although future land uses for the FPAs will be established in gross by the Master Plan, specific land uses, policies, and development standards for these areas are not provided by the Master Plan. While this analysis assumes the land use assigned to the FPAs (and associated estimated air quality impacts), it is anticipated that the landowners within the FPAs will either initiate Master Plan amendments or individual Specific Plans in the future and that additional air quality analysis will be required as part of the environmental review of those plans. Such future use must be consistent with the provisions of the Master Plan unless landowners within the FPAs apply for and have approved an amendment of the assigned land uses.

The proposed land uses for the Master Plan are presented in **Table 1-1**.

TABLE 1-1
MASTER PLAN LAND USES

Master Plan Land Use Type	CalEEMod Land Use Type	Acres	Land Use Values
Very Low Density Residential	Single Family Housing	115.6	230 dwelling units
Low Density Residential	Single Family Housing	1,955.1	9,774 dwelling units
Medium Density Residential	Condo/Townhouse	58.6	820 dwelling units
High Density Residential	Apartments Mid Rise	121.2	3,636 dwelling units
Mixed Use Residential	Apartments Mid Rise	112.5	2,024 dwelling units
Mixed Use Nonresidential	Strip Mall	112.5	1,225,125 square feet
Commercial	Regional Shopping Center	290.7	3,165,723 square feet
Employment	Office Park	543.3	7,099,844 square feet
Industrial	Industrial Park	154.4	2,017,699 square feet
School	Schools	132.0	1,149,984 square feet[a]
Park, Open Space, Urban Farm	City Park	2,101.0	-
Institutional	Place of Worship	98.9	3,288,780 square feet[b]
Arterial / Collector Roads	Other Asphalt Surfaces	229.8	-
Total Residential		*2,363.0*	*16,484 dwelling units*
Total Nonresidential		*3,775.0*	*17,947,155 square feet*[c]

NOTES:
a. A floor area ratio of 0.2 was used for schools.
b. A floor area ratio of 1.0 was used for institutional.
c. Total square footage includes schools and institutional, which are not reflected on the Master Plan's current land use plan.

This page intentionally left blank

CHAPTER 2
Air Quality

This section assesses the potential air quality impacts associated with construction and operation of the West Jackson Highway Master Plan and identifies feasible mitigation measures where appropriate.

2.1 Environmental Setting

Air quality is affected by the rate, amount, and location of pollutant emissions and the associated meteorological conditions that influence pollutant movement and dispersal. Atmospheric conditions (for example, wind speed, wind direction, and air temperature) in combination with local surface topography (for example, geographic features such as mountains and valleys), determine how air pollutant emissions affect local air quality.

The Master Plan Area is located within Sacramento County, California, which is under the jurisdiction of the Sacramento Metropolitan Air Quality Management District (SMAQMD). SMAQMD is the primary local agency with respect to air quality for all of Sacramento County. Sacramento County is within the Sacramento Valley Air Basin (SVAB), which also includes all of Butte, Colusa, Glenn, Shasta, Sutter, Tehama, Yolo, and Yuba Counties, the western portion of Placer County, and the eastern portion of Solano County.

2.1.1 Climate and Meteorology

The climate of the SVAB is Mediterranean in character, with mild, rainy winter weather from November through March and warm to hot, dry weather from May through September. Sacramento Valley temperatures range from 20 to 115 degrees Fahrenheit and the average annual rainfall is 20 inches. The topographic features giving shape to the SVAB are the Coast Range to the west, the Sierra Nevada to the east, and the Cascade Range to the north. These mountain ranges channel winds through the SVAB, but also inhibit the dispersion of pollutant emissions.

The predominant annual and summer wind pattern in the Sacramento Valley is the full sea breeze, commonly referred to as Delta breezes. These cool winds originate from the Pacific Ocean and flow through a sea-level gap in the Coast Range called the Carquinez Straits. In the winter (December to February), northerly winds predominate. Wind directions in the Sacramento Valley are influenced by the predominant wind flow pattern associated with each season. During about half the days from July through September, however, a phenomenon called the “Schultz Eddy”, which is a large isotropic vertical-axis eddy on the north side of the Carquinez Straits that prevents the Delta breezes from transporting pollutants north and out of the Sacramento Valley and causes the wind pattern to circle back south, which keeps air pollutants in the Sacramento

Valley. This phenomenon's effect exacerbates the pollution levels in the area and increases the likelihood of violating state or federal standards.

The vertical and horizontal movement of air is an important atmospheric component involved in the dispersion and subsequent dilution of air pollutants. Without movement, air pollutants can collect and concentrate in a single area, increasing the associated health hazards. For instance, in the winter, the SVAB typically experiences calm atmospheric conditions that result in stagnant air and increased air pollution. As a result, persistent inversions occur frequently in the SVAB, especially during autumn and early winter, and restrict the vertical dispersion of pollutants released near ground level.

2.1.2 Air Pollutants of Concern

Air pollutants of concern within the SVAB include certain criteria air pollutants and toxic air contaminants (TACs).

Criteria Air Pollutants

Criteria air pollutants are a group of six common air pollutants for which the United States Environmental Protection Agency (US EPA) has set ambient air quality standards. Criteria air pollutants include ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter (PM) in size fractions of 10 microns or less in diameter (PM_{10}) and 2.5 microns or less in diameter ($PM_{2.5}$), and lead. Most of the criteria pollutants are directly emitted. Ozone, however, is a secondary pollutant that is formed in the atmosphere by chemical reactions between nitrogen oxides (NOx) and reactive organic gases (ROG). In addition to the criteria air pollutants identified by the US EPA, California adds four criteria air pollutants (visibility reducing particulates, sulfates, hydrogen sulfide, and vinyl chloride).

Criteria air pollutants have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants, due to their presence in elevated concentrations in the atmosphere. Such pollutants have been identified and regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. These pollutants are regulated by the USEPA and are subject to emissions control requirements adopted by federal, state and local regulatory agencies. National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) for each of the criteria air pollutants and their effects on health are summarized in the *Regulatory Setting* section below. It must be noted that the ambient air quality standards—both federal and state—are expressed as airborne concentrations of various pollutants. Compliance with the standards is on a regional basis. In the SVAB, compliance is demonstrated by ongoing measurements of pollutant concentrations at nine air quality monitoring stations operated by the SMAQMD in Sacramento County. An exceedance of an ambient air quality standard at any one of the stations counts as a regional exceedance.

NAAQS and CAAQS have been set at levels considered safe to protect public health, including the health of sensitive populations such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage

to animals, crops, vegetation, and buildings. As explained by the California Air Resources Board (CARB), "An air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment."[1] That is, if a region is in compliance with the ambient air quality standards, its regional air quality can be considered protective of public health. The NAAQS are statutorily required to be set by the USEPA at levels that are "requisite to protect the public health," 42 U.S.C. § 7409(b)(1).[2] As such, the closer a region is to attaining a particular NAAQS, the lower the human health impact is from that pollutant.

Criteria air pollutants of concern in the SVAB include O_3, CO, PM_{10}, and $PM_{2.5}$, as concentrations of these pollutants are above state and/or national ambient air quality standards. Sulfur dioxide, lead, visibility reducing particulates, sulfates, hydrogen sulfide, and vinyl chloride concentrations are well below state and/or national ambient air quality standards and are not air pollutants of concern in the SVAB. **Table 2-1** lists the health effects associated with the criteria air pollutants of concern.

Ozone

As discussed above, O_3 is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving the O_3 precursors reactive organic gases (ROG), also referred to as volatile organic compounds (VOC) by some regulating agencies, and oxides of nitrogen (NO_X). The main sources of ROG in the SVAB are the evaporation of solvents, paints, and fuels; the main sources of NO_X are combustion processes (including motor vehicle engines). Ozone is referred to as a regional air pollutant because its precursors are transported and diffused by wind concurrently with O_3 production through a photochemical reaction process. Ozone can cause eye irritation, airway constriction, and shortness of breath, and can aggravate existing respiratory diseases such as asthma, bronchitis, and emphysema.

Carbon Monoxide

Carbon monoxide (CO) is an odorless, colorless gas usually formed as the result of the incomplete combustion of fuels. The single largest source of CO is motor vehicle engines; the highest emissions occur during low travel speeds, stop-and-go driving, cold starts, and hard acceleration. Exposure of humans to high concentrations of CO reduces the oxygen-carrying capacity of the blood and can cause headaches, nausea, dizziness, and fatigue, impaired central nervous system function, and angina (chest pain) in persons with serious heart disease. Very high concentrations of CO can be fatal.

TABLE 2-1
HEALTH AND ENVIRONMENTAL EFFECTS OF CRITERIA AIR POLLUTANTS OF CONCERN

Pollutant	Adverse Effects
Ozone	• People most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers. In addition, people with certain genetic characteristics, and people with reduced intake of certain nutrients, such as vitamins C and E, are at greater risk from ozone exposure. • Breathing ozone can trigger a variety of health problems including chest pain, coughing, throat irritation, and airway inflammation. It also can reduce lung function and harm lung tissue. Ozone can worsen bronchitis, emphysema, and asthma, leading to increased medical care. • Ozone affects sensitive vegetation and ecosystems, including forests, parks, wildlife refuges and wilderness areas. In particular, ozone harms sensitive vegetation during the growing season.
Carbon Monoxide	• Breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain. • At very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death. • Very high levels of CO are not likely to occur outdoors. However, when CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease. These people already have a reduced ability for getting oxygenated blood to their hearts in situations where the heart needs more oxygen than usual. They are especially vulnerable to the effects of CO when exercising or under increased stress. In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina.
Particulate Matter	• Particulate matter contains microscopic solids or liquid droplets that are so small that they can be inhaled and cause serious health problems. Such health effects including aggravating asthma and bronchitis, causing visits to the hospital for respiratory and cardiovascular symptoms, and contributing to heart attacks and deaths. Particles less than 10 micrometers in diameter pose the greatest problems, because they can get deep into your lungs, and some may even enter the bloodstream. • Fine particles ($PM_{2.5}$) are the main cause of reduced visibility (haze) in parts of the United States, including many national parks and wilderness areas.
Nitrogen Dioxide	• Breathing air with a high concentration of NO_2 can irritate airways in the human respiratory system. Such exposures over short periods can aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms. Longer exposures to elevated concentrations of NO_2 may contribute to the development of asthma and potentially increase susceptibility to respiratory infections. People with asthma, as well as children and the elderly are generally at greater risk for the health effects of NO_2. • NO_2, along with other oxides of nitrogen (NO_X), reacts with other chemicals in the air to form both particulate matter and ozone. Both of these are also harmful when inhaled due to effects on the respiratory system.

Particulate Matter

Particulate matter (PM) is frequently classified by particle size, where PM_{10} consists of PM that is 10 microns or less in diameter and $PM_{2.5}$ consists of the subset of PM_{10} that is 2.5 microns or less in diameter (a micron is one-millionth of a meter). PM_{10} and $PM_{2.5}$ represent fractions of particulate matter that can be inhaled into air passages and the lungs and can cause adverse health effects. Some sources of particulate matter, such as wood burning in fireplaces, demolition, and construction activities, are more local in nature, while others, such as vehicular traffic, have a more regional effect. Very small particles of certain substances (e.g., sulfates and nitrates) can cause lung damage directly, or can contain adsorbed gases (e.g., chlorides or ammonium) that may be injurious to health. Particulates also can damage materials and reduce visibility.

Large dust particles (diameter greater than 10 microns) settle out rapidly and are easily filtered by human breathing passages. This large dust is of more concern as a soiling nuisance rather than a health hazard. The remaining fine particulate matter, PM_{10} and $PM_{2.5}$, are a health concern particularly at levels above the federal and state ambient air quality standards. $PM_{2.5}$ (including diesel exhaust particles) has greater effects on health because these particles are small enough to be able to penetrate to the deepest parts of the lungs.

A large body of scientific evidence indicates that both long-term and short-term exposure to $PM_{2.5}$ can cause a wide range of health effects (e.g., aggravating asthma and bronchitis, causing visits to the hospital for respiratory and cardiovascular symptoms, and contributing to heart attacks and deaths).[3] According to CARB, both PM_{10} and $PM_{2.5}$ can be inhaled, with some depositing throughout the airways.[4] PM_{10} is more likely to deposit on the surfaces of the larger airways of the upper region of the lung while $PM_{2.5}$ is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation.[5] Short-term (up to 24 hours duration) exposure to PM_{10} has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits. The effects of long-term (months or years) exposure to PM_{10} are less clear, although studies suggest a link between long-term PM_{10} exposure and respiratory mortality and the International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer at certain exposures.[6] Short-term exposure to $PM_{2.5}$ has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days and long-term exposure to $PM_{2.5}$ has been linked to premature death, particularly in people

who have chronic heart or lung diseases, and reduced lung function growth in children.[7] According to CARB, populations most likely to experience adverse health effects with exposure to PM_{10} and $PM_{2.5}$ include older adults with chronic heart or lung disease, children, and asthmatics.[8] Children and infants are susceptible to harm from inhaling pollutants such as PM_{10} and $PM_{2.5}$ compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems.[9]

Nitrogen Dioxide

Nitrogen dioxide (NO_2) is a reddish-brown gas that is a byproduct of combustion processes. Automobiles and industrial operations are the main sources of NO_2. Aside from its contribution to ozone formation, NO_2 can increase the risk of acute and chronic respiratory disease and reduce visibility. NO_2 may be visible as a coloring component on high pollution days, especially in conjunction with high ozone levels.

According to the USEPA, NO_2 can potentially irritate airways in the human respiratory system.[10] Short-term exposures can aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms and longer exposures to elevated concentrations of NO_2 may contribute to the development of asthma and potentially increase susceptibility to respiratory infections. According to CARB, controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics.[11] In addition, a number of epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses.[12] Infants and children are particularly at risk from exposure to NO_2 because they have disproportionately higher exposure to NO_2 than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease.[13] CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for NO_2 and there is only limited information for nitric oxide and NO_X, as well as large uncertainty in relating health effects to nitric oxide or NO_X exposure.[14]

Other Criteria Air Pollutants

Other criteria air pollutants include SO_2 and lead, which are not air pollutants of concern in the SVAB. SO_2 is a combustion product of sulfur or sulfur-containing fuels such as coal and diesel. SO_2 is also a precursor to the formation of particulate matter, atmospheric sulfate, and atmospheric sulfuric acid formation that could precipitate downwind as acid rain. The maximum SO_2 concentrations recorded in the project vicinity are well below federal and state standards.

Leaded gasoline (phased out in the United States beginning in 1973), lead based paint (on older houses and cars), smelters (metal refineries), and manufacture of lead storage batteries have been the primary sources of lead released into the atmosphere. Lead has a range of adverse neurotoxic health effects, which puts children at special risk. Some lead-containing chemicals cause cancer in animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated. Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California.

Toxic Air Contaminants

Toxic air contaminants (TACs) are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TACs include both organic and inorganic chemical substances and may be emitted from a variety of common sources including gasoline stations, automobiles, diesel engines, dry cleaners, industrial operations, and painting operations. TACs of concern include diesel particulate matter (DPM) and asbestos.

Diesel Particulate Matter

The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Mobile sources such as trucks and buses are among the primary sources of diesel emissions, and concentrations of DPM are higher near heavily traveled highways and rail lines with diesel locomotive operations.

CARB identified DPM as a TAC in 1998, primarily based on evidence demonstrating cancer effects in humans. It is estimated that about 70 percent of total known cancer risk related to air toxics in California is attributable to DPM. More than 90 percent of DPM is less than 1 μm in diameter, and thus is a subset of $PM_{2.5}$; therefore, DPM also contributes to the same non-cancer health effects as $PM_{2.5}$ exposure. These include aggravating asthma and bronchitis, causing visits to the hospital for respiratory and cardiovascular symptoms, and contributing to heart attacks and deaths. DPM may also facilitate development of new allergies; a clinical study of human subjects has shown that diesel exhaust particles, in combination with potential allergens, may be able to produce new allergies that didn't previously exist.[15]

Regulation of diesel engines and fuels have decreased DPM levels by 68 percent since 1990. Furthermore, CARB estimates that emissions of DPM in 2035 will be less than half those in

[15] California Air Resources Board, 2019. Summary: Diesel Particulate Matter Health Impacts. Available: https://ww2.arb.ca.gov/resources/summary-diesel-particulate-matter-health-impacts. Accessed March 2023.

2010, even with increasing VMT.[16] Nonetheless, based on 2012 estimates of statewide exposure, DPM is estimated to increase statewide cancer risk by 520 cancers per million residents exposed over a lifetime.

Asbestos

Asbestos is a fibrous mineral and used as a processed component of building materials. Because asbestos has been proven to cause serious adverse health effects, including asbestosis and lung cancer, it is strictly regulated based on its natural widespread occurrence and its use as a building material. Exposure to asbestos fibers may result in health issues such as lung cancer, mesothelioma (a rare cancer of the thin membranes lining the lungs, chest and abdominal cavity), and asbestosis (a non-cancerous lung disease which causes scarring of the lungs).[17] When building materials containing asbestos are disturbed, asbestos fibers may be released. Asbestos is also naturally occurring in ultramafic rock (a rock type commonly found in California), but its occurrence at the project site has a low probability.[18]

2.1.3 Existing Ambient Air Quality

Nearby ambient air quality monitoring stations that are assumed to be representative of the ambient air at the project site are located in the Del Paso Manor neighborhood and at Branch Center Road. The Del Paso Manor neighborhood monitor measures and records concentrations of CO, O_3, PM_{10}, and $PM_{2.5}$, and is located approximately 4.8 miles northwest of the project site. The Branch Center Road monitor provides the nearest representative measurement of PM_{10}, approximately 0.1 miles northwest of the Master Plan area. **Table 2-2** presents a three-year summary of air pollutant concentration data collected at these monitoring stations for CO, O_3, PM_{10}, and $PM_{2.5}$, as well as the number of days the applicable standards were exceeded during the given year.

As described in Table 2-2, O_3 levels in the Master Plan vicinity have resulted in numerous violations of ambient air quality standards between 2020-2022. Concentrations of O_3 in the project vicinity exceeded the 1-hour state standard eleven times during the three-year study period and exceeded the 8-hour national standards thirty times.

Ambient air quality monitoring data for PM_{10} in the project area suggests that the 24-hour standard was exceeded 25 times in 2021 and six times in 2022. Regarding $PM_{2.5}$, the study area was estimated to have exceeded the 24-hour national standard approximately 28 times in 2020, five times in 2021 and ten times in 2022. The PM_{10} annual average standard was exceeded in 2020, 2021 and 2022. The annual average standard for $PM_{2.5}$ was exceeded in 2020.

TABLE 2-2
SUMMARY OF AIR QUALITY MONITORING DATA (2020-2022)

Pollutant	National / State Standard	2020	2021	2022
Ozone – Sacramento-Del Paso Manor Station				
Maximum 1-hour concentration, ppm	0.09 [a]	**0.120**	**0.110**	**0.092**
Number of days above State 1-Hour standard		4	7	0
Maximum 8-hour concentration, ppm	0.070 / 0.070	**0.085**	**0.091**	**0.073**
Number of days above National 8-Hour standard		10	17	3
Number of days above State 8-Hour standard		*	*	*
Respirable Particulate Matter (PM_{10}) – Branch Center Road #2 Station				
Annual average concentration, µg/m^3	20[a]	**33.2**	**24.2**	**21.8**
Maximum 24-Hour concentration (national/state), µg/m^3	150 / 50	**201.0/203.0**	57.0/**58.0**	55.0/**54.0**
Estimated number of days above National 24-Hour standard[c]		7.7	0.0	0.0
Estimated number of days above State 24-Hour standard[c]		*	25.4	6.0
Respirable Particulate Matter (PM_{10}) – Del Paso Manor Station				
Annual average concentration, µg/m^3	20[a]	*	*	**19.2**
Maximum 24-Hour concentration (national/state), µg/m^3	150 / 50	**188.0/190.0**	63.0/**63.0**	41.0/**51.5**
Estimated number of days above National 24-Hour standard[c]		**6.1**	*	2.0
Estimated number of days above State 24-Hour standard[c]		*	*	0.0
Fine Particulate Matter ($PM_{2.5}$) – Del Paso Manor Station				
Annual average concentration, µg/m^3	12.0 / 12.0	**14.6**	10.2	10.0
Maximum 24-Hour concentration, µg/m^3	35[b]	**147.3**	**90.0**	**42.3**
Estimated number of days above National 24-Hour standard[c]		28.1	5.0	10.3
Carbon Monoxide (CO) – Del Paso Manor Station				
Maximum 8-Hour concentration, ppm	9 / 9.0	2.1	1.1	*
Number of days above National or State 8-hour standard		0	0	0
Maximum 1-Hour concentration, ppm	35 / 20	2.2	1.3	*
Number of days above National or State 1-hour standard		0	0	0

NOTES:

Bold values are in excess of applicable standard.

ppm = parts per million; µg/m^3 = micrograms per cubic meter; * = insufficient data.

a. State standard, not to be exceeded.
b. National standard, not to be exceeded.
c. Particulate matter sampling schedule of one out of every six days, for a total of approximately 60 samples per year. Estimated days exceeded mathematically estimates of how many days concentrations would have been greater than the level of the standard had each day been monitored.

There have been no recorded exceedances of the state and national 1-hour and annual NO_2 standards and the state and national 1-hour and 8-hour CO standards during the three-year study period.

2.1.4 Odors

Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache). The ability to detect odors varies considerably among the population and overall is quite subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. Known as odor fatigue, a person can become desensitized to almost any odor and recognition only occurs with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.

The Master Plan includes an industrial land use category that would allow manufacturing, such as asphalt/concrete batch plants, that could contribute odors. In addition, the project could locate new receptors close to odors from existing nearby industrial uses.

2.1.5 Sensitive Receptors

Air quality does not affect individuals or groups within the population in the same way, and some groups are more sensitive to adverse health effects caused by exposure to air pollutants than others. Population subgroups sensitive to the health effects of air pollutants include the elderly and the young, those with higher rates of respiratory disease such as asthma and chronic obstructive pulmonary disease, and with other environmental or occupational health exposures (e.g., indoor air quality) that affect cardiovascular or respiratory diseases.

Land uses such as schools, children's day care centers, hospitals, and nursing and convalescent homes are considered to be the most sensitive to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress. Parks and playgrounds are considered moderately sensitive to poor air quality because persons engaged in strenuous work or exercise also have increased sensitivity to poor air quality; however, exposure times are generally far shorter in parks and playgrounds than in residential locations and schools, which typically reduces the overall health risk associated with exposure to pollutants. Residential areas are considered more sensitive to air quality conditions compared to commercial and industrial areas because people generally spend longer periods of time at their residences, with associated greater exposure to ambient air quality conditions. Workers are not considered sensitive receptors because all employers are required to follow regulations set forth by the Occupation Safety and Health Administration (OSHA) to ensure the health and well-being of their employees.

The nearest sensitive receptors to the Master Plan Area are primarily single family residences (both within and adjacent to the Master Plan Area), Rosemont High School, Sierra Enterprise

Elementary School, ABC School, Morgan Junior/Senior High School, Albert Einstein Middle School, Golden Empire Preschool, A.M. Winn Elementary School, George Washington Carver School of Arts and Science, Kitty Hawk School, Mather Youth Academy, and Mather Heights Elementary School

2.2 Regulatory Setting

Federal, state, and local agencies regulate air quality in California.

2.2.1 Federal

Criteria Air Pollutants

The United Stated Environmental Protection Agency (US EPA) is required by the federal Clean Air Act (CAA) to identify and establish National Ambient Air Quality Standards (NAAQS) to protect public health and the environment. The federal CAA identifies two types of NAAQS: primary and secondary. Primary standards provide public health protection, including protecting the health of sensitive populations such as asthmatics, children, and the elderly. Secondary standards provide public welfare protection, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

The US EPA has set NAAQS for six principal pollutants, called criteria air pollutants. These criteria air pollutants include O_3, NO_2, SO_2, CO, PM, and lead. The original indicator for PM was total suspended particulates; currently the standards are in terms of PM_{10} and $PM_{2.5}$. **Table 2-3** presents the current NAAQS (and state ambient air quality standards) and provides a brief discussion of the related health effects and principal sources for each pollutant.

The US EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant, based on whether or not the NAAQS had been achieved. The classification is determined by comparing actual monitoring data with the standards. "Unclassified" is defined by the federal CAA as any area that cannot be classified, on the basis of available information, as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant. Furthermore, an area may be designated attainment with a maintenance plan (also known as a maintenance area), which means that an area was previously nonattainment for a criteria air pollutant but has since been redesignated as attainment. These areas have demonstrated through modeling they have sufficient controls in place to meet and maintain the NAAQS.

The Sacramento region's attainment status for the criteria air pollutants are summarized in **Table 2-4** (state designations are also provided). The Sacramento region is considered a federal nonattainment area for O_3 and $PM_{2.5}$ and as an attainment-maintenance area for the federal CO and PM_{10} standards.

TABLE 2-3
STATE AND NATIONAL AMBIENT AIR QUALITY STANDARDS AND MAJOR SOURCES

Pollutant	Averaging Time	State Standard	National Standard	Major Pollutant Sources
Ozone	1 hour	0.09 ppm	---	Formed when reactive organic gases (ROG) and nitrogen oxides (NO_X) react in the presence of sunlight. Major sources include on-road motor vehicles, solvent evaporation, and commercial / industrial mobile equipment.
	8 hour	0.070 ppm	0.070 ppm	
Carbon Monoxide	1 hour	20 ppm	35 ppm	Internal combustion engines, primarily gasoline-powered motor vehicles.
	8 hour[a]	9.0 ppm	9 ppm	
Nitrogen Dioxide	1 hour	0.18 ppm	100 ppb	Motor vehicles, petroleum refining operations, industrial sources, aircraft, ships, and railroads.
	Annual Avg.	0.030 ppm	0.053 ppm	
Sulfur Dioxide	1 hour	0.25 ppm	75 ppb	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
	3 hour	---	0.5 ppm[b]	
	24 hour	0.04 ppm	0.14 ppm	
	Annual Avg.	---	0.030 ppm	
Respirable Particulate Matter (PM_{10})	24 hour	50 ug/m^3	150 ug/m^3	Dust and fume-producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind-raised dust and ocean sprays).
	Annual Avg.	20 ug/m^3	---	
Fine Particulate Matter ($PM_{2.5}$)	24 hour	---	35 ug/m^3	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning; Also, formed from photochemical reactions of other pollutants, including NO_X, sulfur oxides, and organics.
	Annual Avg.	12 ug/m^3	12.0 ug/m^3	
Lead	Monthly Ave.	1.5 ug/m^3	---	Present source: lead smelters, battery manufacturing and recycling facilities. Past source: combustion of leaded gasoline.
	Quarterly	---	1.5 ug/m^3	
Hydrogen Sulfide	1 hour	0.03 ppm	No National Standard	Geothermal power plants, petroleum production and refining
Sulfates	24 hour	25 ug/m^3	No National Standard	Produced by the reaction in the air of SO_2.
Visibility Reducing Particles	8 hour	Extinction of 0.23/km; visibility of 10 miles or more	No National Standard	See $PM_{2.5}$.
Vinyl chloride	24 hour	0.01 ppm	No National Standard	Polyvinyl chloride and vinyl manufacturing.

NOTES:

ppb = parts per billion; ppm = parts per million; ug/m^3 = micrograms per cubic meter.

a. A more stringent 8-hour carbon monoxide state standard exists around Lake Tahoe (6 ppm).
b. Secondary national standard.

TABLE 2-4
SACRAMENTO COUNTY ATTAINMENT STATUS

Pollutant and Averaging Time	Designation/Classification	
	State Standards	Federal Standards
Ozone (1-hour)	Nonattainment	No Federal Standard
Ozone (8-hour)	Nonattainment/Serious	Nonattainment/Severe
Carbon Monoxide	Attainment	Attainment/Maintenance
Nitrogen Dioxide	Attainment	Unclassified/Attainment
Sulfur Dioxide	Attainment	Unclassified
Respirable Particulate Matter (PM_{10})	Nonattainment	Attainment/Maintenance*
Fine Particulate Matter ($PM_{2.5}$)	Attainment	Nonattainment/Moderate
Lead	Attainment	Attainment
Visibility Reducing Particles	Unclassified	No Federal Standard
Sulfates	Attainment	No Federal Standard
Hydrogen Sulfide	Unclassified	No Federal Standard
Vinyl Chloride	Unclassified	No Federal Standard

NOTES:

CARB makes area designations for ten criteria pollutants (O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, lead, visibility reducing particles, sulfates, and hydrogen sulfide. CARB does not designate areas according to the vinyl chloride standard.

* Effective October 28, 2013, the U.S. EPA formally re-designated Sacramento County as attainment for the federal PM_{10} standard.

SOURCES:

1. California Air Resources Board, 2022. *Area Designation Maps*. Available: http://www.arb.ca.gov/desig/adm/adm.htm. Accessed December 15, 2022.

The federal CAA requires each state to prepare an air quality control plan referred to as a State Implementation Plan (SIP). The SIP is a living document that is periodically modified to reflect the latest emissions inventories, planning documents, and rules and regulations of air basins as reported by the agencies with jurisdiction over them. The US EPA has responsibility to review all state SIPs to determine if they conform to the mandates of the federal CAA and will achieve air quality goals when implemented.

Hazardous Air Pollutants

Federal laws use the term "Hazardous Air Pollutants" (HAPs) to refer to the same types of compounds that are referred to as TACs under State law. Currently, 187 substances are regulated as HAPs. The federal CAA requires the US EPA to identify National Emission Standards for Hazardous Air Pollutants (NESHAPs) to protect public health and welfare.

2.2.2 State

Criteria Air Pollutants

At the state level, the California Air Resources Board (CARB) oversees California air quality policies and regulations. California had adopted its own air quality standards (California Ambient

Air Quality Standards, or CAAQS) as shown in Table 2-2. Most of the California ambient standards tend to be at least as protective as NAAQS and are often more stringent.

In 1988, California passed the California Clean Air Act (CCAA) (California Health and Safety Code Sections 39600 et seq.), which, like its federal counterpart, called for the designation of areas as attainment or nonattainment, but based on state ambient air quality standards rather than the federal standards. The CCAA requires each air district in which state air quality standards are exceeded to prepare a plan that documents reasonable progress towards attainment. If an air basin (or portion thereof) exceeds the CAAQS for a particular criteria air pollutant, it is considered to be nonattainment of that criteria air pollutant until the area can demonstrate compliance. As indicated in Table 2-3, Sacramento County is classified as nonattainment and serious nonattainment for the 8-hour and 1-hour state ozone standards, respectively, and is nonattainment for the 24-hour and annual state PM_{10} standard.

Toxic Air Contaminants

The State Air Toxics Program was established in 1983 under Assembly Bill (AB) 1807. A total of 243 substances have been designated TACs under California law; they include the 187 (federal) HAPs adopted in accordance with AB 2728. The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) seeks to identify, quantify, and evaluate risk from air toxics sources; however, AB 2588 does not regulate air toxics emissions.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines. Further regulations of diesel emissions by the CARB include the On-Road Heavy Duty Diesel Vehicle (In-Use) Regulation, the On-Road Heavy Duty (New) Vehicle Program, the In-Use Offroad Diesel Vehicle Regulation, and the New Offroad Compression Ignition Diesel Engines and Equipment Program. All of these regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment.

In 2004, CARB adopted a measure to limit idling of diesel-fueled commercial motor vehicles. Heavy-duty diesel vehicles with a Gross Vehicle Weight Rating (GVWR) of 10,000 lbs. or heavier are prohibited from idling for more than 5 minutes within California's borders. Exceptions to the rule apply for certain circumstances.

Despite these reduction efforts, the CARB recommends that proximity to sources of DPM emissions be considered in the siting of new sensitive land uses. In April 2005, the CARB published *Air Quality and Land Use Handbook: A Community Health Perspective*. This handbook is intended to give guidance to local governments in the siting of sensitive land uses near sources of air pollution. Recent studies have shown that public exposure to air pollution can be substantially elevated near freeways and certain other facilities such as ports, rail yards and distribution centers. Specifically, the document focuses on risks from emissions of DPM, a known carcinogen, and establishes recommended siting distances of sensitive receptors. With respect to freeways, the recommendations of the report are: "Avoid siting new sensitive land uses within 500 feet of a freeway, urban roads with more than 100,000 vehicles per day or rural roads with 50,000

vehicles/day."[19] The CARB notes that these recommendations are advisory and should not be interpreted as defined "buffer zones," and that local agencies must balance other considerations, including transportation needs, the benefits of urban infill, community economic development priorities, and other quality of life issues. With careful evaluation of exposure, health risks, and affirmative steps to reduce risk where necessary the CARB's position is that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality can be compatible with protecting the health of individuals at the neighborhood level.

2.2.3 Local

Sacramento Metropolitan Air Quality Management District

The SMAQMD is the regional agency responsible for air quality regulation within Sacramento County. The SMAQMD regulates air quality through its planning and review activities and has permit authority over most types of stationary emission sources and can require operators of stationary sources to obtain permits, can impose emission limits, set fuel or material specifications, and establish operational limits to reduce air emissions. The SMAQMD regulates new or modified stationary sources of TACs.

All areas designated as nonattainment are required to prepare plans showing how the area would meet the air quality standards by its attainment dates. The following are the most recent air quality plans applicable to the area of the proposed projects:

- Sacramento Regional 2015 8-Hour Ozone Attainment and Reasonable Further Progress Plan[20,21]
- SMAQMD's Triennial Report and Air Quality Plan Revision[22]
- PM_{10} Implementation/Maintenance Plan and Redesignation Request for Sacramento County[23]

[19] California Air Resources Board, 2005. Air Quality and Land Use Handbook: A Community Health Perspective. April 2005. p. 4. Available at: http://forms.cupertino.org/inc/pdf/SR85/Exhibit%20G%20-%20CARB%20Air%20Quality%20and%20Land%20Use%20Handbook%202005.pdf Accessed December 22, 2022.

[20] Sacramento Metropolitan Air Quality Management District, 2023. Sacramento Regional 2015 8-Hour Ozone Attainment and Reasonable Further Progress Plan. October 17. Available: https://www.airquality.org/ProgramCoordination/Documents/Sacramento%20Regional%202015%20NAAQS%208%20Hour%20Ozone%20Attainment%20and%20Reasonable%20Further%20Progress%20Plan.pdf. Accessed March 2024.

[21] The 2023 Sacramento Regional Plan 2015 NAAQS 8-Hour Ozone Attainment & Reasonable Further Progress Plan was published August 22, 2023. Public hearings were held in September through October 2023 to consider adoption of the plan. The Sacramento Federal Nonattainment Area air districts hosted public hearings to consider this Plan in late 2023. After the air districts adopted the Plan, it was submitted to CARB who adopted it on October 26, 2023. The Plan was submitted to EPA for final reviews and approval.

- $PM_{2.5}$ Maintenance Plan and Redesignation Request[24]
- 2004 Revision to the California State Implementation Plan for CO[25]

The construction phases of the project would be subject to the applicable SMAQMD regulations with regards to construction and stationary equipment, particulate matter generation, architectural coatings, and paving materials. Equipment used during construction would be subject to the applicable requirements of the SMAQMD, including Regulation 2 (Permits), Rule 201 (General Permit Requirements); and Regulation 4 (Prohibitory Rules), Rule 401 (Ringelmann Chart/ Opacity), Rule 402 (Nuisance), Rule 403 (Fugitive Dust), Rule 404 (Particulate Matter), Rule 405 (Dust and Condensed Fumes), Rule 420 (Sulfur Content of Fuels), Rule 442 (Architectural Coatings), Rule 453 (Cutback and Emulsified Asphalt Paving Materials).

Furthermore, the demolition or renovation of any existing buildings and structures would be subject to Regulation 9, Rule 902 (Asbestos). Rule 902 is intended to limit asbestos emissions from demolition or renovation of structures and the associated disturbance of regulated asbestos containing material (RACM) generated or handled during these activities. This rule addresses the National Emissions Standards for Asbestos and adds requirements.

Sacramento Area Council of Governments

The Sacramento Area Council of Governments (SACOG) is the Metropolitan Planning Organization (MPO) for the proposed Project site. SACOG's jurisdiction covers six counties in the Sacramento region (El Dorado, Placer, Sacramento, Sutter, Yolo, and Yuba counties). One of the main responsibilities of SACOG is to maintain and develop comprehensive transportation planning for the region through Metropolitan Transportation Plans (MTPs) and Federal Transportation Improvement Programs (FTIPs). These transportation planning documents are intended to improve future transportation networks and options for residents. SACOG is tasked with determining conformity under the federal CAA for projects, plans, and programs. SACOG is responsible for the analysis of transportation activities to determine conformity with the federal CAA.

Metropolitan Transportation Plan/Sustainable Communities Strategy

SACOG's Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) is the long-range transportation plan for the region. The MTP/SCS designates the region using five "community types" (Center and Corridor Community, Developing Community, Established Community, Rural Residential Community, and Natural Resource Lands (Lands Not Identified for Development in the MTP/SCS Planning Period)).

[24] Sacramento Metropolitan Air Quality Management District, 2013. $PM_{2.5}$ Implementation/Maintenance Plan and Redesignation Request for Sacramento $PM_{2.5}$ Nonattainment Area. October 24, 2013. Available: https://www.airquality.org/ProgramCoordination/Documents/PM2.5%20Imp%20and%20Redesignation%202013.pdf. Accessed December 22, 2022.

[25] Sacramento Metropolitan Air Quality Management District, 2004. 2004 Revision to the California State Implementation Plan for Carbon Monoxide. July 22, 2004. Available: http://www.airquality.org/ProgramCoordination/Documents/1)%202004%20CO%20Maintenance%20Plan.pdf. Accessed December 22, 2022.

The MTP/SCS designates the footprint of the Master Plan area within a larger area designated as a Developing Community and a Transit Priority Area (TPA).[26] Developing Communities are described by SACOG as follows:

> *"Developing Communities are typically, though not always, situated on vacant land at the edge of existing urban or suburban development; they are the next increment of urban expansion. Developing Communities are identified in local plans as special plan areas, specific plans, or master plans and may be residential-only, employment-only, or a mix of residential and employment uses. Transportation options in Developing Communities often depend, to a great extent, on the timing of development. Bus service, for example, may be infrequent or unavailable today, but may be available every 30 minutes or less once a community builds out. Walking and bicycling environments vary widely, though many Developing Communities are designed with dedicated pedestrian and bicycle trails."*[27]

For TPA's in Sacramento County, such as the Master Plan area, the MTP/SCS shows a reduction in per-capita VMT compared to baseline conditions: "The proposed MTP/SCS land use and transportation changes decrease household-generated VMT in Sacramento County TPAs, relative to 2016, by 7.5 percent"[28] In addition, the MTP/SCS has the overall outcome of reducing mobile source emissions through compact growth patterns and proximity to transit:

> "*The location and pattern of the proposed MTP/SCS growth is important, because it impacts travel behavior and provides a means to determine the impact of future vehicle emissions in the proposed plan area. A compact growth pattern served by an efficient and diverse transportation system provides the foundation to reduce automotive travel and increase walking, bicycling, and transit use—all of which reduce individual vehicle trips and associated VMT. Reduced VMT and vehicle trips are directly linked to reduced regional criteria air pollutant emissions and TAC emissions from mobile sources."*[29]

The MTP/SCS is designed to identify areas within the region sufficient to house all of the forecasted population of the region. This is based on adopted local general plans, community plans, specific plans, and local policies and regulations. The MTP/SCS is not a growth-inducing document and does not regulate or control growth within the region:

> *"While the MTP/SCS is required to integrate land use and transportation planning, the plan recognizes and protects local land use authority. Under SB 375 and the MTP/ SCS, the region's cities and counties retain local land use authority over where future development occurs. The MTP/ SCS land use and transportation assumptions are built using local plans and in close coordination with planning and transportation staff*

29 *Ibid.*

around the region. The plan does not mandate any changes to local zoning rules, general plans, or processes for reviewing projects; nor can the plan act as a cap on development in any given jurisdiction."[30] *(Emphasis added.)*

The 2020 MTP/SCS does not presently fully account for all growth anticipated within the Master Plan area.[31] However, the MTP/SCS is updated every four years to include additional amendments to County and City General Plans and take into account approved projects and new specific plans, such as the Master Plan.

Sacramento County General Plan

The *Sacramento County General Plan Air Quality Element*[32] contains the following air quality goal and policies that would apply to the Master Plan.

GOAL: Improve air quality to promote public health, safety, welfare, and environmental quality of the community.

Policies

AQ-1: New development shall be designed to promote pedestrian/bicycle access and circulation to encourage community residents to use alternative modes of transportation to conserve air quality and minimize direct and indirect emission of air contaminants.

AQ-2: Support Regional Transit's efforts to secure adequate funding so that transit is a viable transportation alternative. Development shall pay its fair share of the cost of transit facilities required to serve the project.

AQ-3: Buffers and/or other appropriate mitigation shall be established on a project-by-project basis and incorporated during review to provide for protection of sensitive receptors from sources of air pollution or odor. The California Air Resources Board's "Air Quality and Land Use Handbook: A Community Health Perspective", and the AQMD's approved Protocol (Protocol for Evaluating the Location of Sensitive Land uses Adjacent to Major Roadways) shall be utilized when establishing these buffers.

AQ-4: Developments which meet or exceed thresholds of significance for ozone precursor pollutants as adopted by the Sacramento Metropolitan Air Quality Management District (SMAQMD), shall be deemed to have a significant environmental impact. An Air Quality Mitigation Plan shall be submitted to the County of Sacramento prior to project approval, subject to review and recommendation as to technical adequacy by the Sacramento Metropolitan Air Quality Management District.

AQ-5: Reduce emissions associated with vehicle miles travelled and evaporation by reducing the surface area dedicated to parking facilities; reduce vehicle emissions associated with "hunting" for on-street parking by implementing

30 Sacramento Area Council of Governments, 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy, adopted November 18, 2019, pp. 61. Accessed March 2023.

31 Glover, Tina. "RE: Growth Estimates Within West Jackson Highway Master Plan." Message to Dan Sloat. November 20, 2017. Email.

innovative parking innovative parking [SIC] solutions including shared parking, elimination of minimum parking requirements, creation of maximum parking requirements, and utilize performance pricing for publicly owned parking spaces both on- and off-street, as well as creating parking benefit districts.

AQ-6: Provide incentives for the use of transportation alternatives, including a program for the provision of financial incentives for builders that construct ownership housing within a quarter mile of existing and proposed light rail stations.

AQ-8: Promote mixed-use development and provide for increased development intensity along existing and proposed transit corridors to reduce the length and frequency of vehicle trips.

AQ-9: When park-and-ride facilities are requested by transit providers, the spaces provided for the park-and-ride facility may be counted as part of the total amount of parking required by the zoning code.

AQ-10: Encourage vehicle trip reduction and improved air quality by requiring development projects that exceed the SMAQMD's significance thresholds for operational emissions to provide on-going, cost-effective mechanisms for transportation services that help reduce the demand for existing roadway infrastructure.

AQ-11: Encourage contractors operating in the county to procure and to operate low-emission vehicles, and to seek low emission fleet status for their off-road equipment.

AQ-16: Prohibit the idling of on-and off-road engines when the vehicle is not moving or when the off-road equipment is not performing work for a period of time greater than five minutes in any one-hour period.

AQ-17: Promote optimal air quality benefits through energy conservation measures in new development.

AQ-19: Require all feasible reductions in emissions for the operation of construction vehicles and equipment on major land development and roadway construction projects.

AQ-20: Promote Cool Community strategies to cool the urban heat island, reduce energy use and ozone formation, and maximize air quality benefits by encouraging four main strategies including, but not limited to: plant trees, selective use of vegetation for landscaping, install cool roofing, and install cool pavements.

AQ-21: Support SMAQMD's particulate matter control measures for residential wood burning and fugitive dust.

2.3 Analysis, Impacts, and Mitigation

2.3.1 CEQA Significance Criteria

Impacts related to air quality are considered significant if the proposed project would result in the following:

- Conflict with or obstruct implementation of an applicable air quality plan;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard;
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The SMAQMD has developed significance thresholds to help lead agencies determine whether a project may have a significant air quality impact. Projects whose emissions are expected to meet or exceed the recommended significance criteria will have a potentially significant adverse impact on air quality.

In addition, CEQA Guidelines section 15126.2(a) states that the impacts of a proposed project should include discussion of "health and safety problems caused by the physical changes" associated with the project and should "analyze any significant environmental effects the project might cause or risk exacerbating by bringing development and people into the area affected." This issue is discussed in the *Impacts and Mitigation Measures* section below.

Criteria Air Pollutants

The SMAQMD has established mass emissions thresholds for O_3 precursors, NO_X and ROG, PM_{10}, and $PM_{2.5}$ because the Sacramento region does not meet the state and federal ozone and state particulate matter (PM_{10} and $PM_{2.5}$) ambient air quality standards. Emissions of O_3 precursors or PM from an individual project could contribute to an existing exceedance of the ozone standards. Construction activities are not likely to generate substantial quantities of CO because most construction equipment is diesel-powered and therefore has much lower CO emissions than gasoline vehicles (CO emissions are predominantly a result of gasoline fuel combustion).[33] However, increased traffic congestion could result in CO hotspots (exceedance of the CO ambient air quality standards). **Table 2-5** presents the applicable SMAQMD thresholds of significance.

[33] Sacramento Metropolitan Air Quality Management District, 2017. Guide to Air Quality Assessment in Sacramento County. Chapter 3 Construction-Generated Criteria Air Pollutant And Precursor Emissions. Last updated April 2020. Available: http://www.airquality.org/businesses/ceqa-land-use-planning/ceqa-guidance-tools. Accessed March 2023.

TABLE 2-5
SMAQMD CRITERIA AIR POLLUTANT THRESHOLDS OF SIGNIFICANCE

Pollutant	Construction Phase	Operational Phase
Oxides of nitrogen (NO_X)	85 maximum ppd	65 maximum ppd
ROG (VOC)	None	65 maximum ppd
PM_{10}	0 / 80 maximum ppd /14.6 tpy [a]	0 / 80 maximum ppd / 14.6 tpy*
$PM_{2.5}$	0 / 15 maximum ppd*	0 / 82 maximum ppd / 15 tpy*
CO	20 ppm (1-hour); 9 ppm (8-hour)	20 ppm (1-hour); 9 ppm (8-hour)

NOTES:

a. If all feasible Best Achievable Control Technology/Best Management Practices (BACT/BMP) are applied, then the threshold of significance is 80 maximum ppd and 14.6 tpy for PM_{10}, and 82 maximum ppd and 15 tpy for $PM_{2.5}$ for both construction and operational phases. To date, SMAQMD has not defined any BACT/BMPs for operational emissions from transportation projects. Consequently, these thresholds are used to evaluate operational emissions.

ABBREVIATIONS:

SMAQMD = Sacramento Metropolitan Air Quality Management District
ppd = pounds per day
tpy = tons per year
NOx = nitrogen oxides
ROG = reactive organic gases
VOC = volatile organic compounds
PM_{10} = particulate matter 10 microns or less in diameter
$PM_{2.5}$ = particulate matter 2.5 microns or less in diameter
CO = carbon monoxide
Ppm = parts per million

SOURCES:

1. Sacramento Metropolitan Air Quality Management District (SMAQMD), 2017. Guide to Air Quality Assessment in Sacramento County. Chapter 2 Appendix (Updated April 2020). Available: https://www.airquality.org/LandUseTransportation/Documents/CH2ThresholdsTable4-2020.pdf. Accessed March 2023.

Specifically, the project would have a potentially significant adverse impact on air quality if emissions:

- result in short-term (construction) emissions of NO_X above 85 maximum pounds per day (ppd);
- result in short-term (construction) emissions of PM_{10} above zero pounds per day without implementation of all best management practices (BMPs) and above 80 maximum ppd or 14.6 tons per year (tpy) after implementation of all BMPs;
- result in short-term (construction) emissions of $PM_{2.5}$ above zero ppd without implementation of all BMPs and above 82 maximum ppd or 15.0 tpy after implementation of all BMPs;
- result in long-term (operational) emissions of NO_X or ROG above 65 maximum ppd;
- result in long-term (operational) emissions of PM_{10} above zero pounds per day without implementation of all BMPs and above 80 maximum ppd or 14.6 tpy after implementation of all BMPs;
- result in long-term (operational) emissions of $PM_{2.5}$ above zero pounds per day without implementation of all BMPs and above 82 ppd or 15.0 tpy after implementation of all BMPs; or
- result in CO concentrations that exceed the 1-hour state ambient air quality standard (i.e., 20.0 ppm) or the 8-hour state ambient standard (i.e., 9.0 ppm).

Toxic Air Contaminants

The construction or operation of any project with the potential to expose sensitive receptors to substantial levels of TACs (such as DPM) would be deemed to have a potentially significant impact. More specifically, proposed stationary source projects that have the potential to expose the public to TACs in excess of the following SMAQMD thresholds would be considered to have a significant air quality impact:

- An incremental increase in cancer risk greater than 10 in one million at any offsite receptor; or
- Ground-level concentrations of project-generated TACs would result in a Hazard Index[34] greater than 1 at any offsite receptor.

In addition, based on the programmatic nature of the Master Plan, impacts associated with TACs will also be analyzed based on buffer zones between sensitive receptors and existing and proposed land uses that emit TACs in accordance with the recommendations provided in CARB's *Air Quality and Land Use Handbook: A Community Health Perspective*. For locating sensitive receptors (residences, schools, day care centers, and medical facilities) along a major roadway, SMAQMD has established a screening protocol whereby new residential uses located more than 500 feet from the nearest high traffic volume roadway (defined as a freeway or urban roadway with greater than 100,000 vehicles per day) would meet the CARB guidance distance and no further roadway-related air quality evaluations are recommended.[35]

A health risk assessment (HRA) is a quantitative analysis of a project's TAC emissions and the resulting health risks associated with exposure of nearby sensitive receptors to these TAC emissions. An HRA should follow the latest Air Toxics Hot Spots Program Guidance protocol from the Office of Environmental Health Hazard Assessment (OEHHA).[36] An HRA calculates health risks resulting from project construction and operations consistent with SMAQMD guidelines, using technical information from the SMAQMD, California Air Pollution Control Officer's Association (CAPCOA), CARB, Office of Environmental Health Hazard Assessment (OEHHA), and the USEPA. Consistent with guidelines and recommendations from these agencies, an HRA evaluates the estimated incremental increase in lifetime cancer risks from exposure to emissions of DPM[37] and $PM_{2.5}$ concentrations that would be emitted by project-related construction sources, including off-road construction equipment and on-road haul trucks,

34 Non-cancer adverse health risk, both for acute (short-term) and chronic (long-term) risk, is measured against a hazard index (HI), which is defined as the ratio of the predicted incremental exposure concentration from the proposed project to a published reference exposure level (REL) that could cause adverse health effects as established by Office of Environmental Health Hazard Assessment (OEHHA). The ratio (referred to as the Hazard Quotient [HQ]) of each non-carcinogenic substance that affects a certain organ system is added to produce an overall HI for that organ system.

36 Office of Environmental Health Hazard Assessment. 2015. *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments*. February. Available at http://oehha.ca.gov/air/hot_spots/hotspots2015.html. Accessed March 2023.

37 While DPM is a complex mixture of gases and fine particles that includes over 40 substances that are listed by the USEPA as hazardous air pollutants and by the ARB as toxic air, the DPM analysis will use PM10 emissions as a surrogate for DPM emissions, per OEHHA guidance.

and project-related operational sources, including diesel-powered emergency generators and vehicle traffic.

HRAs can either be screening-level analyses or refined assessment. The screening-level approach is appropriate to estimate the worst-case health risks associated with project construction and operations. If the screening-level HRA demonstrates that a significant health risk would occur from project construction and/or operations, a detailed HRA can be conducted using more refined models and methods. The HRA should consider both new onsite sensitive receptors and existing offsite sensitive receptors within the vicinity of the project (e.g. within 1,000 feet of project boundaries).

The HRA should also include an assessment of cumulative health risks by considering existing TAC sources in proximity of the project and its new onsite sensitive receptors using information provided by the SMAQMD. In the *California Building Industry Association v. Bay Area Air Quality Management District* case decided in 2015,[38] the California Supreme Court held that CEQA does not generally require lead agencies to consider how existing environmental conditions might impact a project's users or residents, except where the project would significantly exacerbate an existing environmental condition. Accordingly, exposure of sensitive receptors to substantial cumulative pollutant concentrations are applicable only to the extent that the Project significantly exacerbates existing air quality conditions. An impact is considered significant if the project would significantly exacerbate existing or future air quality conditions. However, according to the SMAQMD, the project-level threshold of significance for evaluating TACs generated by a project should also be used to determine whether a project's TAC emissions are cumulatively considerable, and the SMAQMD considers implementation of the project-level mitigation requirements to be sufficient for a finding of less than cumulatively considerable for cumulative impacts of TACs.

The SMAQMD recommends that lead agencies make an effort to obtain detailed project-specific information in order to accurately disclose all potential TAC-related impacts of a project. However, the District understands that the information needed to prepare a project-level HRA may not be available at the time of analysis, as is the case for the Master Plan.[39]

Odors

Odor impacts are addressed in a qualitative manner based on screening distances and odor complaints, as recommend in SMAQMD guidance. This includes a discussion of whether a project would result in excessive nuisance odors, or if proposed sensitive land uses would be exposed to substantial odors.

[38] *California Building Industry Association v. Bay Area Air Quality Management District,* 62 Cal.4th 369. Opinion Filed December 17, 2015.

[39] Sacramento Metropolitan Air Quality Management District, 2018. Guide to Air Quality Assessment in Sacramento County. Chapter 5: TAC Emissions. September. Available: http://www.airquality.org/businesses/ceqa-land-use-planning/ceqa-guidance-tools. Accessed March 2023.

2.3.2 Methods and Assumptions

Project-related air quality impacts fall into two categories: short-term impacts due to construction, and long-term impacts due to operations. First, during construction (short-term), the Master Plan would affect local particulate concentrations primarily due to fugitive dust sources and diesel exhaust. Under operations (long-term), the Master Plan would result in an increase in emissions primarily due to motor vehicle trips and on-site stationary and area sources. Area sources include emissions from landscaping equipment, natural gas combustion exhaust from water and space heating, and the use of consumer products.[40]

Construction

Modeling construction-related emissions requires detailed information about the construction schedule, the number and type of construction equipment used, the acreage of construction, the amount of asphalt paving conducted, and other information that cannot be known at the Master Plan-level stage. Therefore, the construction air quality analysis estimates impacts based on anticipated annual construction activity for all development types and does not reflect specific project types (e.g., residential housing, strip mall, office building) or specific project locations. The impact analysis includes general mitigation that will be applicable to all future construction projects. Future project-level analyses should utilize the SMAQMD screening methods to determine the appropriate level of analysis required.

Since the Master Plan will be built out based on market demand, the exact phasing of construction is unknown. It is anticipated that the buildout period would occur over 30 years based on the MTP/SCS economic analyses showing the overall anticipated development horizon for the region. A buildout period of 30 years is a conservative estimate given the size and amount of development allowed in the Master Plan. The Master Plan covers almost 6,000 acres of land and provides 16,484 residential units and over 13 million square feet of non-residential development. Other recently approved projects in the area such as the Mather South Master Plan and the NewBridge Specific Plan are not as large, covering 848 acres with 3,522 residential units and 1,095 acres with 2,915 residential units, respectively. As noted in the text above, the MTP/SCS contains a projected level of economic growth for the SACOG region and then estimates the number of new housing units to meet the employment levels that will support that economic growth.[41] Projected growth patterns (i.e., the location of growth) are estimates, only, and growth may occur in areas identified in the MTP/SCS or in other areas approved later by local agencies.[42] In addition, the "Future Planning Areas" for the Master Plan are likely beyond the 30-year horizon.

[40] For industrial sources, emissions associated with motor vehicle trips and area sources are included in the emission estimates. Stationary source emissions produced by industrial sources are not included in the estimates because such emissions vary substantially by industrial source type, which are unknown at the master plan stage of development. The Sacramento Metropolitan Air Quality Management District requires an air permit for stationary emission sources. Emissions would be evaluated at the time of stationary source permitting.

[41] Sacramento Area Council of Governments, 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy, adopted November 18, 2020, pp. 80.

[42] Sacramento Area Council of Governments, 2016 Metropolitan Transportation Plan/Sustainable Communities Strategy, adopted February 18, 2016, pp. 29 and pp. xxix.

It should be noted that actual construction activity, and associated emissions, will be driven by prevailing market conditions in any given year. Based on historical trends within Sacramento County, there are likely to be periods of intense construction in which multiple large development areas are undergoing concurrent construction, and periods of minimal construction activity in which the demand for construction abates. Consequently, it is infeasible and speculative to provide an accurate forecast of annual emissions throughout Master Plan buildout.

For this analysis, the first year of construction was modeled to approximate the worst-case construction emissions. Equipment used during the first year of construction would be equipped with engines that are expected to emit more criteria pollutant emissions than construction equipment used in later construction years. This is because construction equipment becomes cleaner over time as older, less efficient equipment is replaced through fleet turnover with newer, cleaner equipment that meets more stringent emission standards as required by CARB and the US EPA. Since the Master Plan would likely be built out over a 30-year period as discussed above, it is assumed that 1/30th of the proposed developments would be constructed in the year 2025. The following assumptions were used in CalEEMod to estimate emissions for year 1 (2025) construction activities.

- 1/30th of the total Master Plan development would be constructed in year 2025:
  - 192 total acres
  - 550 dwelling units
  - 240,000 square feet of commercial space
  - 150,000 square feet of retail space
  - 40,000 square feet of educational space
  - 70 acres of recreational space
  - 66,000 square feet of industrial space
  - 7.7 acres of parking area
- The number of default CalEEMod off-road construction equipment pieces and number of on-road haul truck trips were scaled up by a factor of 5 to account for the anticipated construction duration, equipment activity, and acreage of development within the Master Plan.

These assumptions capture the maximum amount of expected construction in any given year of buildout due to local utility and infrastructure limitations and projected market conditions. Practical limitations such as market demand for housing and office space and available contractors and pieces of construction equipment indicate that this amount of annual development is conservative. Development of the Master Plan could take much longer than 30 years. The Regional Housing Needs Allocation (RHNA) includes a maximum of 855 annually permitted

dwelling units (DUs) between 2021 and 2025;[43] 550 DUs assumed for construction year 2025 as indicated above represents nearly two-thirds (64 percent) of the total RHNA permitted units total, which is conservative given the large amount of development occurring in the County beyond that occurring for the Master Plan. SACOG's 2025 Blueprint MTP/SCS projects 278,000 new DUs from 2020 to 2050 for the entire SACOG region (six counties), or an average of 9,000 DUs per year; unincorporated Sacramento County areas are projected to develop 35,720 DUs from 2020 to 2050, or an average of 1,200 DUs per year; the Jackson West area is projected to develop 16,374 DUs from 2020 to 2050, or an average of 546 DUs per year.[44] This shows that the assumptions above for Master Plan construction in 2025 are reasonable and conservative.[45]

Using the methods contained in SMAQMD's *Guide to Air Quality Assessment in Sacramento County*, CalEEMod 2020.4.0 was used to estimate construction emissions for the Master Plan. The 2022 version of CalEEMod (v. 2022.1.0.0) was released May 27, 2022, and has several default inputs that are different from the 2020 version that would impact construction modeling results, including revised average trip lengths for worker, vendor, and haul trips, and changes to criteria pollutant emission rates for off-road construction equipment and on-road vehicles.[46] However, these changes would result in minor differences in the modeled criteria pollutant emissions and would not materially affect the air quality analysis.

However, SMAQMD currently approves the use of CalEEMod 2020.4.0 for CEQA compliance.[47] CalEEMod is an approved emissions inventory software program that allows the user to estimate criteria pollutant emissions from land use development projects. Land use input information came from the latest 2023 Master Plan land use plans. It is assumed that the Master Plan would require 500,000 cubic yards of soil import during the grading phase. This soil import assumption is based on the professional judgment of the project applicant based on review of the project conceptual grading plan and air quality experts at the time of Master Plan preparation and may be refined for project-specific evaluation of emissions for a specific development block in the future. Assuming the haul trucks used during project construction can carry 16 cubic yards of soil each and construction will be completed over a 30-year period, the first year of construction could result in 2,083 one-way haul truck trips associated with 16,667 cubic yards of soil. However, because the first few years of construction are likely to involve more grading and soil

43 In 2023 Sacramento County issued a total of 855 building permits for residential dwelling units, which is the maximum allowed annually in the County. import than later years, it was conservatively assumed that the first year of construction would move 1/10th of the total soil import or 50,000 cubic yards, which would result in 6,250 one-way haul truck trips. CalEEMod defaults for number of construction equipment per construction phase and daily worker and vendor trips were used. Additional information and model results for each of the analyses described above are presented in Appendix A.

Operation

The proposed developments under the Master Plan are assumed to be fully built-out in the year 2055. Since CalEEMod version 2020.4.0 only allows the user to enter operational years up to the year 2050, it was not possible to model an operational year 2055 in CalEEMod. Therefore, for this analysis, criteria pollutant emissions under the Master Plan were modeled for operational year 2050 using CalEEMod version 2020.4.0. This approach is conservative as emissions rates will likely be higher in 2050 than in 2055 due to continual improvements in vehicle technology, emission controls, and fuel efficiency. Although there are existing uses within the Master Plan area, criteria pollutant emissions for these uses were not modeled due to their limited number, and emissions from these uses would be minor. It is also conservative to assume zero emissions from existing uses because these emissions would be subtracted from Master Plan emissions to determine the net change in emissions from the Master Plan. Since construction of the Master Plan is anticipated to begin after 2024, it is assumed that all buildings will be constructed to 2022 Title 24 energy efficiency standards (which was adopted August 11, 2021). Future Title 24 requirements were not modeled because the specific requirements are not known this time. The 2022 energy efficiency standards require solar for all new single-family homes and for all multi-family buildings up to three stories.

For on-road vehicles, criteria pollutant emissions and GHG emissions were calculated using EMFAC2021 v1.0.2, which only allows the user to enter operational years up to 2050. Vehicle miles traveled (VMT) per speed bin were provided by DKS Associated (the traffic consultant) for the Master Plan.[48] On-road vehicle information was supplied in both the 2023 DKS VMT Analysis[49] and the 2023 Kimley Horn VMT Analysis[50]. Additional information and model results for each of the analyses described above are presented in Appendix A.

As noted above for construction, the 2022 version of CalEEMod was released May 27, 2022, and has several default inputs that are different from the 2020 version that would impact operational modeling results, including changes to criteria pollutant emission rates for architectural coatings, landscaping, and consumer product use for certain land uses.[51] However, these changes would result in minor differences in the modeled criteria pollutant emissions and would not materially

affect the air quality analysis. SMAQMD currently approves the use of CalEEMod 2020.4.0 for CEQA compliance.[52]

Air Quality Mitigation Plan (AQMP)

Sacramento County General Plan Policy AQ-4 requires that projects exceeding the SMAQMD operational threshold for ozone precursors (i.e., ROG and NO_X) prepare an Air Quality Mitigation Plan (AQMP), as recommended by SMAQMD. For projects that are included in the current State Implementation Plan (SIP), SMAQMD recommends a 15 percent reduction of ozone precursors from mobile-source emissions. For projects not included in the current SIP, SMAQMD recommends a 35 percent reduction of ozone precursors from mobile-source emissions.

For the Master Plan, only the land uses west of Bradshaw Road are included in the SACOG's MTP/SCS and therefore are included within the SIP. The land uses proposed under the Master Plan east of Bradshaw Road are not included in SMAQMD's SIP. SMAQMD's AQMP guidance does not specify a percentage reduction to use for projects partially accounted for in the SIP. By calculating the Master Plan's VMT included in the SIP, a "blended rate" mitigated reduction goal of 29 percent below an unmitigated scenario could be used to show consistency with regional air quality plans. This blended rate reduction goal was developed through coordination with County and SMAQMD staff and represents the amount of VMT for the Master Plan land uses west of Bradshaw Road compared to the total Master Plan VMT.[53] However, to provide a conservative analysis of the AQMP requirement for the Master Plan, a 35 percent reduction of ozone precursors from mobile-source emissions below an unmitigated scenario was used in the AQMP. In compliance with both the General Plan policies and SMAQMD guidance, the project has prepared an AQMP to define the processes by which emissions of ROG and NO_X would be reduced by 35 percent. The AQMP, including detail on and the derivation of the 35 percent reduction requirement, can be found in Appendix B.

2.3.3 Impacts and Mitigation Measures

Impact AQ.1: The Master Plan could conflict with or obstruct implementation of an applicable air quality plan. (*Significant and Unavoidable*)

The *Sacramento Regional 2015 8-Hour Ozone Attainment and Reasonable Further Progress Plan*,[54] which is the current ozone attainment plan for the region, addresses attainment of the

54 Sacramento Metropolitan Air Quality Management District, 2023. *Sacramento Regional 2015 8-Hour Ozone Attainment and Reasonable Further Progress Plan*. October 17. Available: https://www.airquality.org/ProgramCoordination/Documents/Sacramento%20Regional%202015%20NAAQS%208%20Hour%20Ozone%20Attainment%20and%20Reasonable%20Further%20Progress%20Plan.pdf. Accessed March 2024.

federal 8-hour ozone standard, while the *Triennial Report and Air Quality Plan Revision*[55] and the *2017 Annual Progress Report*[56] address attainment of the California 1-hour and 8-hour ozone standards. These are the latest plans issued by the SMAQMD, and they incorporate land use assumptions and travel demand modeling from SACOG.

According to the SMAQMD, land use development projects that exceed emissions of 85 lbs/day of NO_X during construction would have the potential to obstruct the success of the regional ozone attainment plans and would therefore be considered significant and require mitigation. Emissions of ROG and NO_X from construction are discussed below in Impact AQ.2. Both ROG and NO_X emission are expected to exceed the applicable significance thresholds as presented below; therefore, the Master Plan's construction impact would be considered significant.

For operations, land use development projects that exceed emissions of 65 lbs/day of ROG or NO_X during operational activities would have the potential to obstruct the success of the regional ozone attainment plans and would therefore be considered significant and require mitigation. In order to determine compliance with the applicable air quality plan with regard to operational emissions, the SMAQMD recommends comparing the project to the growth projections and VMT included in the MTP/SCS.[57]

According to the SMAQMD, a project should assess consistency with the SIP by asking the following question: "Would the project involve a change in a land use designation established by the applicable local land use plan and/or general plan?"[58] According to SACOG, the household population of the Master Plan's footprint within the MTP/SCS Developing Community area is expected to increase from 630 in 2012 and 720 in 2020 to 13,000 in 2036. Dwelling unit counts in the area are expected to increase from 270 in 2012 and 2020 to 5,400 in 2036. Employment counts in the area are expected to increase from 2,200 in 2012 and 2,300 in 2020 to 3,000 in 2036.[59] Assuming roughly half of the proposed development under the Master Plan is constructed by 2040, the Master Plan would result in more dwelling units than what was included in the SIP for 2040. In other words, full extent of Master Plan development is not included in SACOG's growth projections included in the current SIP. Therefore, the Master Plan would not be consistent with the growth projections of the SIP.

However, the SIP is updated every few years to incorporate new growth projections for the region. In addition, the FPAs are not likely to develop within this time horizon. However, if they

do, additional air quality analysis will be required as part of the environmental review of those FPAs to demonstrate compliance with applicable standards at that time. As discussed in Impact AQ.3 below, after full-build-out of the Master Plan, unmitigated operational emissions would generate ozone precursor (ROG and NO_X) emissions that would exceed the significance thresholds established by the SMAQMD and would therefore be considered significant for CEQA purposes. As such, if not mitigated, the ozone precursor emissions generated during future operations of the Master Plan could conflict with or obstruct implementation of applicable air quality plans.

When operational emissions exceed significance thresholds, the SMAQMD recommends the development of an AQMP to minimize impacts, with guidance and suggested measures included in the *Recommended Guidance for Land Use Emission Reductions Version 4.0 (for Operational Emissions).*[60] As previous discussed under the *Methods and Assumptions* section above, a "blended rate" mitigated reduction goal of 35 percent was used to show consistency with regional air quality plans.

An AQMP was prepared demonstrating that the Master Plan could achieve the applied 35 percent reduction in NO_X and ROG emissions from project-related mobile sources after all proposed design features have been implemented; the AQMP can be found in Appendix B. Specific features that reduce VMT are listed below. The corresponding CAPCOA greenhouse gas mitigation measures (T-xx), SMAQMD land use emission reduction measures (LUT-xx), and Sacramento County Final Draft Community Wide Climate Action Plan (CAP) measures (GHG-xx) are noted.

- Project is located in a suburban center within approximately 10 miles of the Sacramento downtown central business district and less than 5 miles from other existing high-density commercial/job center areas (LUT-2 and LUT-3).
- Project is located adjacent to other planned developments such that single-use trips are minimized, i.e., there are more pass-by and diverted trips (LUT-3 and LUT-4).
- Project provides a compact mix of land uses in close proximity to each other with a highly connected street and trail network (LUT-3).
- Housing density is better than 7 dwelling units per acre (LUT-1).
- Project design includes locating at least four schools within the project boundaries such that most students can walk to a local school (LUT-3 and LUT-4).
- Project design includes at least eight parks within the project boundaries such that residents can walk/bike to enjoy the parks (LUT -3 and LUT-4).
- Project design includes access to high frequency bus service that connects to the Watt/Manlove light rail station (LUT-5).
- Bus routes are signalized in order to avoid traffic delays (T-27).

[60] Sacramento Metropolitan Air Quality Management District, 2017. Recommended Guidance for Land Use Emission Reductions Version 4 (for Operational Emissions). November 30, 2017.

- Project design promotes a multi-modal system that makes public transit, walking, and bicycling viable and attractive travel choices for residents and employees. Features include:
  - Adequate bike parking at non-residential locations (T-34, T-47).
  - Showers/lockers and other end of trip facilities at non-residential buildings (T-10).
  - Long-term bike parking facilities (T-34, T-47).
- Project includes an extensive pedestrian path and trail system that is convenient and accessible from homes, school, parks, employment, and shopping (LUT-8).
- Pedestrian and bike paths minimize any barriers to pedestrian/bicycle use, (e.g., fences, berms and other impediments are eliminated where possible) (LUT-8, T-18, T-20).
- Project subsidizes bus rapid transit lanes (T-27).
- Project funding and design will result in bus headways of 15 minutes or better (T-26).
- Project includes joining a Transportation Management Association (TMA) funded through assessments. Although the project will include a TMA, no VMT reduction from the TMA has been calculated or included in the Traffic Study.[61]
- Project includes assessments for regional transportation improvements (T-27).
- Mandatory Community-Wide TMA participation.
- Electric bike share and scooter share (T-22-B, T-22-C).
- Additional sidewalks within the Project (T-18).
- Carpooling/rideshare (T-8).

As shown in **Table 2-6**, by implementing the design features proposed under the Master Plan, the Master Plan would meet and substantially exceed the 35 percent reduction target for ROG and NO_X. Although the full extent of the Master Plan development is not identified in the 2020 SACOG MTP/SCS, the Master Plan would meet the reduction targets for NO_X and ROG. However, since the full extent of the Master Plan development is not presently included in SACOG's growth projections that are relied upon in the SIP, the Master Plan would be inconsistent with the SMAQMD's air quality plans. In addition, both construction and operational emissions of ROG and NO_X exceed the SMAQMD's significance thresholds, as presented below in Impacts AQ.2 and AQ.3. Therefore, the Master Plan has the potential to obstruct the success of regional ozone attainment and this impact is considered **significant and unavoidable**.

Mitigation Measures

As discussed above, the AQMP for the Master Plan demonstrates a reduction in ozone precursors of significantly greater than 35 percent. Many key emission reduction measures suggested by the SMAQMD for inclusion in an AQMP are already included in the Master Plan design and traffic study, such as housing density, the diversity of land uses, travel time to employment centers, and accessibility to multiple modes of transportation (transit, bicycle, pedestrian). As shown in Table 2-6 above, these measures would result in an approximate 87 percent reduction on NO_X and an approximate 80 percent reduction in ROG. Thus, ozone precursor reductions as required by the recommended AQMP (29% reduction) would be met by the beneficial land use design characteristics and emission reductions associated with the Master Plan. This measure is included below.

> **Mitigation Measure AQ.1-1: Air Quality Mitigation Plan.** The applicant shall comply with AQMP Measure *TS: Traffic Study* in order to ensure a reduction in operational emissions exceeding 35 percent from unadjusted emissions of ozone precursors.
>
> **Mitigation Measure AQ.1-2: Electric Vehicle Charging Infrastructure.** Prior to the issuance of a certificate of occupancy for any project structure with parking, the project applicant shall demonstrate compliance with the most recently adopted version of the California Green Building Standards (CALGreen Code) Tier 2 voluntary electric vehicle (EV) charging requirements or the mandatory requirements of the most recently adopted version of the County of Sacramento building code, whichever is more stringent. The installation of all EV charging equipment shall be included on the project drawings submitted for the construction-related permit(s) or on other documentation submitted to the County.

The Master Plan would also be consistent with the County's General Plan, including goals and policies that apply to air quality impacts associated with the Master Plan. The Master Plan would

be consistent with all policies from the Air Quality Element, including AQ-1 (promote pedestrian/bicycle access) by improving pedestrian/bicycle access and circulation, AQ-2 (support regional transit) by developing four transit lines in the Jackson Corridor through the other regional master and specific plans, AQ-6 (incentives for the use of transportation alternatives) by incorporating higher density land uses and mixed uses along transportation corridors to help support transit use and by improving pedestrian/bicycle access and circulation, AQ-8 (promote mixed-use development) by providing mixed-use development along existing and proposed transit corridors, AQ-10 (encourage vehicle trip reduction) through all the actions identified above, AQ-11 (low-emission vehicles) by requiring construction equipment to reduce emissions through Mitigation Measures AQ.2-2 (new engine technology) and AQ.4-4 (Tier 4 construction equipment), AQ-17 (promote energy conservation measures in new development) by complying with all applicable energy efficiency code requirements including the use of solar in new residential development, and AQ-20 (promote Cool Community strategies) by implementing design guidelines that include requirements for landscaping that include tree plantings and encourage the use of cool pavement technologies. Therefore, the Master Plan would also be consistent with the County's General Plan.

Significance after Mitigation: As discussed above, the full extent of the Master Plan development is not included in SACOG's growth projections that are relied upon in the current SIP. Therefore, the Master Plan would not be consistent with the growth projections of the SIP.

For projects that are not considered in the SIP, the SMAQMD recommends determining whether the existing land use designation is part of a general plan and MTP/SCS that was adopted prior to the time that the most current SIP emissions baseline assumptions were developed. Since the entire Master Plan is not part of the MTP/SCS, which was adopted in 2020 after the current SIP was adopted in 2013, the Master Plan is not fully accounted for in the emissions budget contained in the SIP and is therefore inconsistent with the SIP. As such, the Master Plan is assumed to result in a substantial contribution to this significant air quality impact.

As discussed in the AQMP prepared for the Master Plan (see Appendix B), project design features, including housing density, housing variety, traffic and transportation, alone would reduce mobile source ROG and NOx emissions to below the applied 35 percent blended rate reduction target. Specifically, these design features would reduce mobile source NOx by 87 percent and mobile source ROG by 80 percent. This is a significant reduction in mobile source ozone precursor emissions as compared to unmitigated conditions.

The 2022 SIP shows that the air basin is on track toward meeting the ozone attainment goals; as a result of adopted State measures on projected 2032 emissions in the Sacramento Nonattainment Area, 2032 emissions are projected to be at or below the level needed to demonstrate attainment.[62]

[62] California Air Resources Board, 2023. Staff Report: CARB Review of the Sacramento Regional 2015 NAAQS 8-Hour Ozone Attainment and Reasonable Further Progress Plan . Available: https://ww2.arb.ca.gov/sites/default/files/2023-09/CARB%20Staff%20Report%20-%202023%20Sac%20Ozone%20SIP.pdf . Accessed March 2024.

Additionally, the Draft Environmental Impact Report for the 2020 MTP/SCS prepared a conformity analysis and determined the following:[63]

> *"The forecasted emissions for ozone, PM10 and CO associated with the proposed MTP/SCS are within the conformity budgets identified within the existing plans for each milestone year. Similarly, the forecasted emissions for PM10 and PM2.5 associated with the proposed MTP/SCS pass all interim emissions tests for all milestone years. Conformity provides the link between air quality and land use/transportation planning by linking the SIP and the proposed MTP/SCS. More prescriptively, the SIPs in the plan area provide the strategies that will be used to attain and maintain the NAAQS. Through conformity, the proposed MTP/SCS demonstrates that the region's land use and transportation system implement this strategy.*
>
> *…The proposed MTP/SCS supports continued reduction in criteria emissions from on-road mobile sources. The local air districts also report progress in implementing specific programs intended to reduce criteria emissions from on-road sources. The proposed MTP/SCS does not conflict with local air district programs, and includes programs and strategies that complement and support the local air district programs. The proposed MTP/SCS thus continues to facilitate local air quality planning efforts as part of the implementation of the applicable air quality plans."*

As discussed above, mobile source emissions associated with the Master Plan would not conflict with the SIP for the horizon year of 2040 because the traffic reduction variables built into the Master Plan design and locality result in an approximate 87 percent reduction on NO_X and an approximate 80 percent reduction in ROG, far exceeding the required ozone precursor reduction of 29% reduction. Therefore, although not presently accounted for in the MTP/SCS, the development proposed by the Master Plan and that is expected to occur through the MTP/SCS horizon of 2040, the Master Plan actually demonstrate an improvement (i.e. reduction) in the emissions budgets associated with the growth anticipated to occur and accounted for in the SIP.

Further, the Master Plan, in combination with the other regional Master Plans and Specific Plans currently in development (including Jackson Township, NewBridge, and Mather South), could reduce total VMT as well as per-capita VMT compared to conditions without implementation of these projects. The Master Plan will have a substantial number of new jobs and commercial land uses and will therefore change the regional travel dynamics as development occurs over time and jobs and commercial uses are placed in closer proximity to existing residential areas, reducing trip lengths and making regional travel patterns more efficient. When development under the Master Plan is placed into the future cumulative land use context, it is possible that trips would be shortened due to the closer proximity of retail/commercial and employment opportunities, which translates into reduced VMT as compared to the existing no-project conditions. In summary, the Master Plan, in combination with other cumulative development projects in the region, will result in a more complementary land use mix with higher densities and a better jobs/housing balance

63 Sacramento Area Council of Governments, 2019. MTP/SCS 2020 Draft Environmental Impact Report. Chapter 5 – Air Quality. Available: https://www.sacog.org/sites/main/files/file-attachments/sacog_deir_-_optimized.pdf?1569042224. Accessed April 2023. Final EIR certified November 2019. Final EIR available at: https://www.sacog.org/sites/main/files/file-attachments/feir_for_website.pdf?1573758194. Accessed April 2023.

that is anticipated to result in reduced VMT and per-capita VMT compared to the current regional average.[64]

While mobile source emissions would not conflict with the SIP, unless the full extent of the Master Plan development is accounted for in an updated MTP/SCS there remains a conflict with the adopted SIP. In addition, both construction and operational emissions of ROG and NO_X exceed the SMAQMD's significance thresholds, as presented below in Impacts AQ.2 and AQ.3. Therefore, the Master Plan has the potential to obstruct the success of regional ozone attainment plans. For these reasons, this impact would remain **significant and unavoidable**.

Impact AQ.2: Construction of the Master Plan would result in short-term emissions of NOx, PM_{10}, and $PM_{2.5}$. (*Less than Significant with Mitigation*)

Construction-related emissions arise from a variety of activities, including: (1) site preparation, grading, excavation, road building, and other earth moving activities; (2) travel by construction equipment and employee vehicles, especially on unpaved surfaces; (3) exhaust from construction equipment; (4) architectural coatings; and (5) asphalt paving.

Emissions of ozone precursors (including NO_X) are generated primarily by mobile sources and largely vary as a function of vehicle trips per day and the type, quantity, intensity, and frequency of heavy-duty, off-road equipment used.

Construction-related fugitive dust emissions would vary from day to day, depending on the level and type of activity, silt and moisture content of the soil, and the weather. In the absence of mitigation, construction activities may result in significant quantities of dust, and as a result, local visibility and PM_{10} concentrations may be adversely affected on a temporary and intermittent basis. In addition, fugitive dust generated by construction would include not only PM_{10}, but also larger particles, which would fall out of the atmosphere within several hundred feet of the site and could result in nuisance-type impacts.

Estimated unmitigated and mitigated construction emissions for the worst-case day during the first year of construction for the Master Plan are presented in **Table 2-7** and **Table 2-8,** respectively, and compared to the SMAQMD thresholds. As shown in Table 2-7, unmitigated construction emissions under the Master Plan are anticipated to exceed SMQAMD thresholds. Table 2-8 presents mitigated emissions with implementation of mitigation measures AQ.2-1, AQ.2-2, and AQ.2-3. With the implementation of these mitigation measures, mitigated construction emissions are anticipated to be below the SMAQMD threshold for all criteria pollutants, as shown in Table 2-8.

64 DKS Associates, 2023. *Memorandum: SB 743/ VMT Analysis – West Jackson Highway Master Plan*. September 25.

Worst-case	1,134	**166**	**23.5**	**7.8**	**4.5**	**3.2**
SMAQMD Thresholds[a]	None	85	0	0	0	0
Significant (Yes or No)?	N/A	**Yes**	**Yes**	**Yes**	**Yes**	**Yes**

NOTES: Project construction emissions were estimated using CalEEMod version 2020.4.0. See Appendix A for model outputs and more detailed assumptions.

Values in **bold** are in excess of the applicable SMAQMD significance threshold.

a. SMAQMD has established a zero emissions threshold for PM_{10} and $PM_{2.5}$ when projects do not implement their Best Management Practices (BMP).

ABBREVIATIONS:

SMAQMD = Sacramento Metropolitan Air Quality Management District
NO_X = nitrogen oxides
PM_{10} = particulate matter 10 microns or less in diameter
$PM_{2.5}$ = particulate matter 2.5 microns or less in diameter
ppd = pounds per day
tpy = tons per year

SOURCE: ESA, 2023; see Appendix A.

TABLE 2-8
MITIGATED WORST-CASE CONSTRUCTION EMISSIONS ESTIMATES
FIRST YEAR OF MASTER PLAN CONSTRUCTION (YEAR 2025)

Scenario	ROG (ppd)	NO_X (ppd)	PM_{10} (ppd)	$PM_{2.5}$ (ppd)	PM_{10} (tpy)	$PM_{2.5}$ (tpy)
Worst-case	1,133	37	21	5.6	1.6	0.6
SMAQMD Thresholds[a]	None	85	80	82	14.6	15
Significant (Yes or No)?	N/A	No	No	No	No	No

NOTE: Project construction emissions were estimated using CalEEMod version 2020.4.0. See Appendix A for model outputs and more detailed assumptions.

a. According SMAQMD guidance, if all feasible Best Achievable Control Technology/Best Management Practices (BMP) are applied, then the threshold of significance is 80 maximum ppd and 14.6 tpy for PM_{10}, and 82 maximum ppd and 15 tpy for $PM_{2.5}$ for construction phases.

ABBREVIATIONS:

SMAQMD = Sacramento Metropolitan Air Quality Management District
NOx = nitrogen oxides
PM_{10} = particulate matter 10 microns or less in diameter
$PM_{2.5}$ = particulate matter 2.5 microns or less in diameter
ppd = pounds per day
tpy = tons per year

SOURCE: ESA, 2023; see Appendix A.

According to the SMAQMD CEQA guidance, project-related construction emissions that exceed zero pounds per day of PM_{10} and $PM_{2.5}$ would result in a significant impact, unless all feasible Best Achievable Control Technology/Best Management Practices (BACT/BMPs) are implemented. As shown in Table 2-7, unmitigated PM_{10} and $PM_{2.5}$ emissions associated with both the Master Plan would exceed the SMAQMD's zero emissions significance threshold. Without the implementation of the SMAQMD's Enhanced Exhaust Control Practices and Construction Emission Control Practices, construction of the Master Plan would have a **significant impact**

related to construction emissions. However, actual emission and resulting impacts could ultimately be greater or less than those reported above depending on how actual buildout occurs.

As shown in Table 2-8, implementation of Measures AQ.2-1 and AQ.2-3 would reduce the impact associated with particulate matter emissions to a less-than-significant level by requiring the project applicant to comply with the SMAQMD's basic construction emission control practices (MM AQ.2-1) and SMAQMD's enhanced fugitive particulate matter dust control practices (MM AQ.2-3). These measures represent the feasible BACT/BMPs as defined by the SMAQMD for construction emissions of PM_{10} and $PM_{2.5}$. Also shown in Table 2-8, implementation of Measures AQ.2-1 and AQ.2-2 would reduce NO_X emissions associated with construction to a less-than-significant level. These measures would require the project applicant to comply with the SMAQMD's basic construction emission control practices (MM AQ.2-1) and SMAQMD's enhanced exhaust control practices (MM AQ.2-2).

Mitigation Measures

Mitigation Measure AQ.2-1: Basic Construction Emission Control Practices. County approval of any grading or improvement plans shall include the following Sacramento Metropolitan Air Quality Management District (SMAQMD) Basic Construction Emission Control Practices:

- Water all exposed surfaces two times daily. Exposed surfaces include, but are not limited to soil piles, graded areas, unpaved parking areas, staging areas, and access roads.
- Cover or maintain at least two feet of free board space on haul trucks transporting soil, sand, or other loose material on the site. Any haul trucks that would be traveling along freeways or major roadways shall be covered.
- Use wet power vacuum street sweepers to remove any visible track-out mud or dirt onto adjacent public roads at least once a day. Use of dry power sweeping is prohibited.
- Limit vehicle speeds on unpaved roads to 15 miles per hour (mph).
- Pave all roadways, driveways, sidewalks, parking lots as soon as possible. In addition, building pads shall be laid immediately after grading unless seeding or soil binders are used.
- Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes (as required by the state airborne toxics control measure [Title 13, Section 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site.
- Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment shall be checked by a certified mechanic and determine to be running in proper condition before it is operated.

Mitigation Measure AQ.2-2: Enhanced Exhaust Control Practices. County approval of any grading or improvement plans shall include the following Sacramento

Metropolitan Air Quality Management District (SMAQMD) Enhanced Exhaust Control Practices, including:

- Provide a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used an aggregate of 40 or more hours during any portion of projects to be developed under the Master Plan to the County and the SMAQMD. The inventory shall include the horsepower rating, engine model year, and projected hours of use for each piece of equipment. The construction contractor shall provide the anticipated construction timeline including start date, and name and phone number of the project manager and on-site foreman. This information shall be submitted at least 4 business days prior to the use of subject heavy-duty off-road equipment. The inventory shall be updated and submitted monthly throughout the duration of the Master Plan construction, except that an inventory shall not be required for any 30-day period in which no construction activity occurs.

- Provide a plan in conjunction with the equipment inventory, approved by the SMAQMD, demonstrating that the heavy-duty (50 horsepower or more) off-road vehicles to be used in the construction project, including owned, leased, and subcontractor vehicles, will achieve a project wide fleet-average 20 percent NOx reduction and 45 percent particulate reduction compared to the most recent CARB fleet average. Acceptable options for reducing emissions may include use of late model engines, low-emission diesel products, alternative fuels, engine retrofit technology, after-treatment products, and/or other options as they become available.

- Emissions from all off-road diesel-powered equipment used on the Master Plan site shall not exceed 40 percent opacity for more than three minutes in any one hour. Any equipment found to exceed 40 percent opacity (or Ringelmann 2.0) shall be repaired immediately, and the County and SMAQMD shall be notified within 48 hours of identification of non-compliant equipment. A visual survey of all in-operation equipment shall be made at least weekly, and a monthly summary of the visual survey results shall be submitted throughout the duration of the project, except that the monthly summary shall not be required for any 30-day period in which no construction activity occurs. The monthly summary shall include the quantity and type of vehicles surveyed as well as the dates of each survey. The SMAQMD and/or other officials may conduct periodic site inspections to determine compliance. Nothing in this measure shall supersede other SMAQMD or state rules or regulations.

- If at the time of granting of each building permit, the SMAQMD has adopted a regulation applicable to construction emissions, compliance with the regulation may completely or partially replace this mitigation. Consultation with the SMAQMD prior to construction will be necessary to make this determination.

Mitigation Measure AQ.2-3: Enhanced Fugitive Particulate Matter Dust Control Practices. County approval of any grading or improvement plans shall include the following Sacramento Metropolitan Air Quality Management District (SMAQMD) Enhanced Fugitive Particulate Matter Dust Control Practices as feasible to further reduce fugitive emissions.

Soil Disturbance Areas:

- Water exposed soil with adequate frequency for continued moist soil. However, do not overwater to the extent that sediment flows off the site.

- Suspend excavation, grading, and/or demolition activity when wind speeds exceed 20 mph.
- Install wind breaks (e.g., plant trees, solid fencing) on windward side(s) of construction areas.
- Plant vegetative ground cover (fast-germinating native grass seed) in disturbed areas as soon as possible. Water appropriately until vegetation is established.

Unpaved Road (Entrained Road Dust):

- Install wheel washers for all exiting trucks or wash off all trucks and equipment leaving the site.
- Treat site accesses to a distance of 100 feet from the paved road with a 6 to 12-inch layer of wood chips, mulch, or gravel to reduce generation of road dust and road dust carryout onto public roads.
- Post a publicly visible sign with the telephone number and person to contact at the lead agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. The phone number of the SMAQMD shall also be visible to ensure compliance.[65]

Significance after Mitigation: As shown in Table 2-8, after the implementation of the SMAQMD's Basic Construction Emission Control Practices (Measure AQ.2-1), Enhanced Exhaust Control Practices (Measure AQ.2-2), and Enhanced Fugitive Particulate Matter Dust Control Practices (Measure AQ.2-3), construction emissions of NOx, PM_{10} and $PM_{2.5}$ under the Master Plan would be reduced to below the SMAQMD's significance threshold for NOx, PM_{10} and $PM_{2.5}$. For these reasons, implementation of Measures AQ.2-1 through AQ.2-3 would reduce the impact of Master Plan construction emissions of NOx, PM_{10} and $PM_{2.5}$ to less than significant. Therefore, with implementation of mitigation measures AQ.2-1, AQ.2-2, and AQ.2-3, this impact would be **less than significant**.

Impact AQ.3: The Master Plan would result in long-term (operational) emissions of NOx, ROG, PM_{10}, or $PM_{2.5}$. (*Significant and Unavoidable*)

Over the long-term, the Master Plan would result in an increase in emissions of ozone precursors, ROG and NO_X, primarily due to project related motor vehicle trips and onsite area and energy sources (e.g., natural gas combustion for space and water heating, landscape maintenance, use of consumer products such as hairsprays, deodorants, cleaning products). The proposed developments under the Master Plan could be fully built-out in 2055. Since CalEEMod version 2020.4.0 and EMFAC2021 v1.0.2 only allows the user to enter operational years up to the year 2050 it was not possible to model an operational year 2055 in CalEEMod. Therefore, for this analysis, criteria pollutant emissions under the Master Plan were modeled for the full-buildout operational year of 2050 using CalEEMod and EMFAC2021, which are presented in **Table 2-9**

[65] Sacramento Metropolitan Air Quality Management District (SMAQMD). 2009. Enhanced Fugitive PM Dust Control Practices. Available: http://www.airquality.org/LandUseTransportation/Documents/Ch3EnhancedFugitiveDustControlFINAL12-2009.pdf. Accessed December 29, 2022.

(unmitigated emissions) and **Table 2-10** (mitigated emissions). Modeling assumptions and output files are included in Appendix A.

According to the SMAQMD CEQA guidance, project-related operational emissions that exceed zero pounds per day of PM_{10} and $PM_{2.5}$ would result in a significant impact, unless all feasible BACT/BMPs are implemented. The development proposed under the Master Plan will include BMP measures as part of its final design that is recommended by SMAQMD to reduce operational PM_{10} and $PM_{2.5}$ emissions.

These BMPs include compliance with mandatory measures in the California Building Energy Efficiency Standards and Green Building Code (Title 24, Parts 6 and 11), compliance with anti-idling regulations for diesel powered commercial motor vehicles, pedestrian infrastructure connectivity, and transit accessibility. Therefore, the SMAQMD's thresholds of 80 pounds per day and 14.6 tons per year for PM_{10} and 82 pounds per day and 15 tons per year for $PM_{2.5}$ would apply.

As shown in Table 2-9, the 2050 operational emissions of ROG, NOx, PM_{10} and $PM_{2.5}$ generated under the Master Plan would exceed the SMAQMD's significance thresholds. Therefore, operational emissions would result in a **significant impact**.

TABLE 2-9
UNMITIGATED MASTER PLAN 2050 OPERATIONAL EMISSIONS

Pollutant (unit)	SMAQMD Thresholds (unit)	Year 2050 Build-out Operation Emissions				
		Area Sources	Energy Sources	Mobile Sources	Total Emissions	Significant (Yes or No)?
ROG (ppd)	65 (ppd)	1,086	12	128	1,226	**Yes**
NO_x (ppd)	65 (ppd)	16	102	122	240	**Yes**
PM_{10} (ppd)[a]	80 (ppd)	8	8	414	429	**Yes**
$PM_{2.5}$ (ppd)[a]	82 (ppd)	8	8	105	120	**Yes**
PM_{10} (tpy)[a]	14.6 (tpy)	1	1.5	75	78	**Yes**
$PM_{2.5}$ (tpy)[a]	15 (tpy)	1	1.5	19	21	**Yes**

NOTES: Master Plan operational emissions estimates for summertime conditions were made using CalEEMod 2020.4.0. See Appendix A for details.

Several adjustments were made to the CalEEMod default assumptions that were not considered mitigation. First, mobile emissions were calculated outside of CalEEMod using EMFAC2021 and regional VMT information provided by DKS. In addition, the Title 24 electricity and natural gas energy intensity factors were updated to account for the 2021 Title 24 standards.

a. SMAQMD has established a zero emissions threshold for PM_{10} and $PM_{2.5}$ when projects do not implement their Best Available Practices. Since the Master Plan would implement all feasible Best Available Practices, the SMAQMD's mitigated thresholds are compared to the Master Plan's operational emissions.

As is described under Impact AQ.1, when operational emissions exceed significance thresholds, the SMAQMD recommends the development of an AQMP to minimize impacts of the project. According to the SMAQMD, projects with emissions that exceed the District's thresholds of significance must incorporate all feasible mitigation in the AQMP. As described under Impact AQ.1 and presented in the AQMP in Appendix B, using the SMAQMD Recommended Guidance for Land Use Emission Reduction, the percent reduction of ROG and NO_X after mitigation for the Master Plan are presented in Table 2-6 above.

Ozone-Related Health Risks

Given that ground-level ozone formation occurs through a complex photo-chemical reaction between NO_X and ROG in the atmosphere with the presence of sunlight, the impacts of ozone are typically considered on a basin-wide or regional basis instead of a localized basis. The SMAQMD has not established a significance threshold for ozone, but there are health-based ambient air quality standards for concentrations of ozone and not as the mass weight (e.g., pounds) of their precursor pollutants (i.e., NO_X and ROG). It is not necessarily the pounds of precursor pollutants that causes human health effects, but the concentration of resulting ozone or particulate matter. Meteorology, the availability of ozone precursors, the presence of sunlight, seasonal impacts, and other complex chemical factors all combine to determine the ultimate

concentration and location of ozone.[66,67] Since Project emissions would exceed the SMAQMD threshold for ROG and NO_X emissions, it is possible that Project ROG and NO_X emissions could result in an increase in ground-level ozone concentrations in proximity to the project area or elsewhere in the air basin, and impacts would be significant. Therefore, mitigation measures would be required and are further discussed below.

The health effects associated with emissions of criteria pollutants and ozone precursors are described in Chapter 2: Air Pollutants of Concern above. The main health concern of exposure to ground-level ozone formed from ROG and NOX, the ozone precursors, is the effect on the respiratory system, especially on lung function. As discussed above, the Project would generate criteria pollutant emissions of ROG, NO_X, and particulate matter during construction and operation.

SMAQMD Guidance to Address Friant Ranch

SMAQMD's Final Guidance, adopted in October 2020, is based on extensive air quality impact and health effects modeling. The health effect modeling performed in the Final Guidance uses a photochemical grid model (PGM) that accounts for the reactions of ROG and NOX in the atmosphere to form ground-level ozone. The PGM calculates concentrations of ozone and $PM_{2.5}$, which are then input into EPA's BenMAP health effects model. The BenMAP model is used by EPA to establish the concentration-based NAAQS, which are set to protect public health and safety. BenMAP relates ozone and $PM_{2.5}$ concentrations to incremental health effects. The Final Guidance includes screening tools in the form of excel spreadsheets that use project emissions of ROG, NOX, and $PM_{2.5}$ to estimate potential health effects as a result of an individual project's contribution of criteria air pollutants and ozone precursors to the SVAB. Although the tools are limited to these three criteria pollutants and precursors, the remaining criteria pollutant emissions are accounted for through the use of surrogate pollutants. The Final Guidance contains two screening tools, one for a "Minor Project" and another for "Strategic Area Projects." Strategic Area Projects are projects that generate emissions two to eight times greater than the maximum thresholds of significance (derived from identifying the greatest thresholds from air districts operating within the SVAB). Minor Projects are projects that generate emissions below the maximum thresholds of significance. Due to its size and levels of emissions, the Project is considered a Strategic Area Project.

For projects that exceed the maximum thresholds of significance, the Final Guidance recommends that the lead agencies use the Strategic Area Project Health Screening Tool; this tool was used to estimate potential health risk associated with the Project as the estimated operational emissions of ROG, NO_X, and $PM_{2.5}$ exceed SMAQMD thresholds. Within the SMAQMD Strategic Area Project Health Screening Tool, SMAQMD provided five potential strategic area project locations (5-Air-District Region) for use in the health effects screening modeling. The highest emission threshold

In the Supreme Court of California. Sierra Club, Revive the San Joaquin, and League of Women Voters of Fresno v. County of Fresno.

rate of ROG, NO_X, and $PM_{2.5}$ from the five districts is 82 pounds per day for the three pollutants. The Strategic Area Project Screening Model models two scenarios; twice the significant level (164 pounds per day) and eight times the significance level (656 pounds per day).[68] The Project's mitigated emissions of ROG, NOX and $PM_{2.5}$ would exceed 82 pounds per day, making the Strategic Area Project Screening Model the appropriate tool for evaluating the Project's contribution to regional health effects.

Strategic Area Project Health Screening Tool Results

Peak daily emissions of NOx, ROG, and $PM_{2.5}$ for operations of the Master Plan in 2050 are shown in Table 2-9. Based on the location of the Project, the Rancho Cordova strategic area source within SMAQMD's Screening Tool has been used. Project emissions for ROG of 1,226 pounds per day exceeded the maximum input value for the Screening Tool of 656 pounds per day, but NO_X and $PM_{2.5}$ were well below the maximum input values for the tool. Since the formation of ozone is limited by the available concentration of NO_X in the SVAB,[69] the tool was run using the project specific inputs for NO_X and $PM_{2.5}$, and the maximum input value of 656 pounds per day for ROG. Ozone-related health effects estimated using the Screening Tool are summarized in **Table 2-10**, below. $PM_{2.5}$-related health effects estimated using the Screening Tool are summarized in **Table 2-11**, below. Potential health risks are considered to be conservative, as peak daily emissions were used rather than average daily emissions. As noted in the Final Guidance, "each model generates conservative estimates of health effects, for two reasons: The tool's outputs are based on the simulation of a full year of exposure at the maximum daily average of the increases in air pollution concentration… [and] [t]he health effects are calculated for emissions levels that are very high."[70] Neither SMAQMD nor the County of Sacramento have adopted thresholds of significance for the assessment of health risks related to the emission of criteria pollutants. Furthermore, an industry standard level of significance has not been adopted or proposed. Due to the lack of adopted thresholds of significance, the health risks presented in **Table 2-11** and **Table 2-12** are presented for informational purposes and do not represent an attempt to arrive at any level-of-significance conclusions.

The Master Plan-related additional health incidences from ozone and $PM_{2.5}$ are minimal when compared with the background regional health incidences. For example, the 1.7 additional annual asthma-related emergency room visits associated with the $PM_{2.5}$ emissions compares to background incidences of asthma-related emergency room visits of 17,895 per year; the Master Plan represents only a 0.0095 percent increase. As another example, the approximate 4.4 annual incidences of mortality associated with the Master Plan compares to background mortality rate of 72,131 per year; the Master Plan represents a 0.006 percent increase.

SOURCES:

1. SMAQMD. 2020. Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District. April 2023.

As shown in Table 2-6 above, the Master Plan would achieve an 80 percent reduction in mobile source ROG emissions and an 87 percent reduction in mobile source NO_X emissions by implementing the design features proposed under the Master Plan and through implementation of mitigation measure MM AQ.1-2 (Electric Vehicle Charging Infrastructure). This is significantly greater than the required 35 percent reduction. However, even with achievement of the required 35 percent reduction in operational mobile source emissions, NO_X and ROG emissions associated with the developments proposed under the Master Plan would still exceed the SMAQMD threshold of 65 pounds per day as presented in Tables 2-9. Thus, this impact would remain **significant and unavoidable**.

Mitigation Measures

As discussed above, when operational emissions exceed significance thresholds, the SMAQMD recommends the development of an AQMP to minimize impacts. The AQMP for this Master Plan is included as Appendix B and incorporates all feasible mitigation for the Master Plan. The SMAQMD notes that an AQMP is focused on feasible mitigation, provided that the AQMP reduces ozone precursors below an unmitigated BAU project by 35 percent for the Master Plan. As indicated in Measure TS (Traffic Study) of the SMAQMD guidance, many key emission reduction measures suggested by the SMAQMD for inclusion in an AQMP are already included in the Master Plan design and therefore analyzed in the traffic study. According to DKS the SACSIM traffic model used for the Master Plan accounts for trip reductions associated with factors such as housing density, the diversity of land uses, travel time to employment centers, and accessibility to multiple modes of transportation (transit, bicycle, pedestrian).[71] Additional transportation design features, including TMA participation, were incorporated into the mitigated scenario modeling to compare to the unmitigated VMT from the default BAU CalEEMod run.

As shown in Table 2-6 above, the VMT-reducing measures built into the Master Plan design and locality along with implementation of mitigation measure MM AQ.1-2 (Electric Vehicle Charging Infrastructure) result in an approximate 87 percent reduction in NO_X emissions and an approximate 80 percent reduction in ROG emissions. Thus, ozone precursor reductions as required by the recommended AQMP (29% reduction) would be met by the beneficial variables associated with the Master Plan. Additional mitigation measures required to reduce this impact are listed below.

> **Mitigation Measure GHG.1-5: Greenhouse Gas Reduction Plan.** (See Impact GHG.1).
>
> **Mitigation Measure AQ.1-1: Air Quality Mitigation Plan.** (See Impact AQ.1).
>
> **Mitigation Measure AQ.3-1: Promote Use of Green Consumer Products**. To reduce ROG emissions associated with the project, the project sponsor shall provide education for residential and commercial tenants concerning green consumer products. Prior to receipt of any certificate of occupancy, the project sponsor shall develop electronic correspondence to be distributed by email annually and upon any new lease signing to residential and/or commercial tenants of each building on the project site that encourages the purchase of consumer products that generate lower than typical VOC emissions.

[71] Long, John. DKS Associates. November 6, 2014 phone conversation with Tim Rimpo, ESA, regarding SACSIM.

Mitigation Measure AQ.3-2: Operational Truck Emissions Reduction. The project sponsor shall incorporate the following measures into the project design and construction contracts (as applicable) to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with operational on-road trucks, along with the potential health risk caused by exposure to toxic air contaminants from operational on-road trucks. These features shall be submitted to the County for review and approval prior to the issuance of building permits and shall be included on the project drawings submitted for the construction-related permit or on other documentation submitted to the lead agency. ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions from project-related operational diesel trucks shall be reduced by implementing the following measures:

1. Equip all truck delivery bays with electrical hook-ups for diesel trucks at loading docks to accommodate plug-in electric truck transport refrigeration units (TRUs) or auxiliary power units during project operations.

2. Provide a notice on the lease to all new tenants or owners of the project or any portion thereof requiring any truck-intensive uses on the site, such as large grocery stores or distribution facilities with their own fleet of trucks, to use TRUs and auxiliary power units that are electric plug-in capable and trucks that use advanced exhaust technology (e.g., hybrid) or alternative fuels.

3. Encourage the use of trucks equipped with diesel TRUs to meet U.S. Environmental Protection Agency Tier 4 emission standards.

4. Prohibit TRUs from operating at loading docks for more than thirty minutes, and post signs at each loading dock presenting this TRU limit.

5. All newly constructed loading docks that are on a commercial or industrial property and can accommodate trucks with TRUs shall be equipped with electric vehicle (EV) charging equipment for heavy-duty trucks. This measure does not apply to temporary street parking for loading or unloading.

6. Require that all future tenants have a plan to convert their vehicle fleet(s) to zero emission vehicles (ZEVs) no later than 2050 or when commercially available. This would be a condition of all leases at the project site.

7. Prohibit trucks from idling for more than two minutes, and post “no idling” signs at the site entry point, at all loading locations, and throughout the project site.

8. A ZEV shall ordinarily be considered commercially available if the vehicle is capable of serving the intended purpose and is included in California’s Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project, https://californiahvip.org/ or listed as available in the US on the Global Commercial Vehicle Drive to Zero inventory, https://globaldrivetozero.org/. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such vehicles are commercially unavailable, the operator must submit documentation from a minimum of three (3) ZEV dealers identified on the californiahvip.org website demonstrating the inability to obtain the required ZEVs or equipment needed within 6 months.

Mitigation Measure AQ.3-3: Electric Landscaping Equipment. To reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with the project, only electric landscaping

equipment shall be used at the project site. No landscaping equipment powered by gasoline, diesel, propane, or other fossil fuels shall be used. The project applicant shall incorporate this requirement into the project design and tenant contracts (as applicable).

Mitigation Measure AQ.3-4: Best Available Emissions Controls for Stationary Emergency Generators. To reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with operation of any emergency generators that would be installed in the Master Plan area, the project applicant shall implement the following measures. These features shall be submitted to the County for review and approval, and shall be included on the project drawings submitted for the construction-related permit(s) or on other documentation submitted to the lead agency prior to the issuance of any building permits:

1. Permanent stationary emergency generators installed on-site shall have engines that meet or exceed CARB Tier 4 Off-Road Compression Ignition Engine Standards (California Code of Regulations Title 13, Section 2423). If the CARB adopts future emissions standards that exceed the Tier 4 requirement, the emissions standards resulting in the lowest ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions shall apply.

2. As non-diesel-fueled emergency generator technology becomes commercially available, and subject to the review and approval of the County of Sacramento fire department for safety purposes, non-diesel-fueled generators shall be installed in new buildings, provided that alternative fuels used in generators, such as biodiesel, renewable diesel, natural gas, or other biofuels or other non-diesel emergency power systems, are demonstrated to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions compared to diesel fuel.

3. For each new diesel backup generator permit submitted to air district for the proposed project, the project applicant shall submit the anticipated location and engine specifications to the lead agency for review and approval prior to issuance of a permit for the generator. Once operational, all diesel backup generators shall be maintained in good working order for the life of the equipment, and any future replacement of the diesel backup generators must be consistent with these emissions specifications. The operator of the facility at which the generator is located shall maintain records of the testing schedule and emergency operations for each diesel backup generator for the life of that diesel backup generator and shall provide this information for review to the County within three months of requesting such information.

4. A non-diesel-fueled emergency generator shall ordinarily be considered commercially available if the generator is capable of serving the intended purpose, is approved by the local fire department, and is available for commercial purchase and installation within California. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such generators are commercially unavailable, the operator must submit documentation from a minimum of three (3) non-diesel-fueled emergency generator dealers demonstrating the inability to obtain the required non-diesel-fueled emergency generators needed within 6 months.

Significance after Mitigation: The beneficial trip and daily VMT reduction measures that are built into the design and location of the Master Plan would result in substantial emission reductions of ozone precursors that would meet the requirements of an AQMP (MM AQ.1-1), which incorporates all feasible mitigation for the Master Plan. Implementation of mitigation measure MM

AQ.1-2 (Electric Vehicle Charging Infrastructure) would reduce emissions associated with passenger vehicles. Implementation of mitigation measure MM AQ.3-1 (Promote Use of Green Consumer Products) would reduce VOC and ROG emissions associated with consumer products. Implementation of mitigation measure MM AQ.3-2 (Operational Truck Emissions Reduction) would reduce emissions associated with operational trucks and transportation refrigeration units. Implementation of mitigation measure MM AQ.3-3 (Electric Landscaping Equipment) would reduce emissions associated with gasoline-powered landscaping equipment. Implementation of mitigation measure MM AQ.3-4 (Best Available Emissions Controls for Stationary Emergency Generators) would reduce emissions associated with any stationary emergency generators installed as part of the Master Plan. In addition, implementation of mitigation measure MM GHG.1-5 (Greenhouse Gas Reduction Plan) has the potential to reduce emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ as a co-benefit of reducing GHG emissions. For example, if the GHG Reduction Plan includes strategies that reduces on-road vehicle fuel combustion to reduce GHG emissions; such as by reducing VMT through improved or increased access to transit or by increasing the use of alternative-fuel and electric vehicles; then ROG, NO_X, PM_{10}, and $PM_{2.5}$ generated by project vehicles would also be reduced.

Despite these mitigation measures, operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ under the Master Plan would not be reduced to below the SMAQMD's significance thresholds. This is primarily because the Master Plan is a very large development project and merely based on its size exceeds the significance thresholds. If the Master Plan were built out as 30 individual land use projects, none of those projects would exceed the SMAQMD's significance thresholds. On a per-capita, per-dwelling unit, and per-square footage basis, the Master Plan is reasonably efficient in terms of criteria pollutant emissions.

For example, the criteria pollutant with the highest emissions is ROG at 1,204 pounds per day under mitigated conditions (see Table 2-10). If one were to conservatively assume that 100% of these ROG emissions were from residential uses, emissions would be 0.07 pounds ROG per day per DU. The Bay Area Air Quality Management District (BAAQMD) 2022 CEQA Air Quality Guidelines include screening tables for projects that are not likely to exceed the operational significance threshold of 54 pounds per day or 10 tons per year of ROG.[72]According to the BAAQMD's CEQA Guidelines, if a project meets these screening criteria, the project would not generate operational-related criteria air pollutants and/or precursors that exceed the thresholds of significance. For single family housing, a ROG efficiency metric per dwelling unit was estimated by taking the ROG threshold of significance (54 lb/day) and dividing by the screening value size. The result is an emission rate per dwelling unit for single family residential uses that could be considered less than significant. 54 pounds per day divided by 421 dwelling units equals 0.13 pounds ROG per day per dwelling unit. This is nearly double the 0.07 value for the Master Plan, which conservatively assumes 100% of ROG emissions originate from residential uses (the actual residential ROG emission rate would be much lower). This indicates that on a per-unit basis, the

[72] Bay Area Air Quality Management District. 2023. *California Environmental Quality Act Air Quality Guidelines*. Table 4-1. Updated April 2023. Available: https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines. Accessed January 2024.

Master Plan is more emission-efficient for ROG than those projects considered less than significant by the BAAQMD.

However, even after implementation of these mitigation measures, operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ under the Master Plan would not be reduced to below the SMAQMD's significance thresholds. Therefore, development associated with the Master Plan would result in significant operational ozone precursor emissions of ROG and NO_X which would exceed the SMAQMD thresholds of significance. In addition, development associated with the Master Plan would result in significant operational emissions of PM_{10} and $PM_{2.5}$ which would exceed the SMAQMD thresholds. Thus, operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ would be **significant and unavoidable**.

Impact AQ.4: Master Plan construction and/or operations could result in exposure of persons to substantial pollutant concentrations or result in a cumulative increase in toxic air contaminant exposure. (*Significant and Unavoidable*)

Carbon Monoxide (CO) Hotspots

CO has been a localized pollutant of concern in Sacramento although the level of concern has decreased substantially over the past decade. Concern over CO has declined due to the existing low concentrations[73] of CO throughout the greater Sacramento area, and because those concentrations are projected to further decline in the future as the vehicle fleet becomes cleaner and older vehicles are replaced. As shown in Table 2-2 above, CO levels in the Project Area are substantially below the federal and state standards. Maximum CO levels in recent years for which recorded data is available (2020-2022) are 2.4 ppm (one-hour average) and 2.1 ppm (eight-hour average) compared to the criteria of 20 ppm (one-hour average) and 9.0 ppm (eight-hour average).[74,75] Carbon monoxide decreased dramatically in the Air Basin with the introduction of the catalytic converter in 1975. No exceedances of CO have been recorded at monitoring stations in the Air Basin for some time and the Air Basin is currently designated as a CO attainment area for both the CAAQS and NAAQS, as shown in Table 2-4. For the Master Plan, the maximum hourly incremental increase in traffic volumes would be 20,000 vehicles per hour for the AM peak hour and 21,500 vehicles per hour for the PM peak hour.[76] These volumes are less than the SMAQMD CO screening level of 31,600 vehicles per hour at an affected intersection. Consequently, Master Plan operations would not result in or contribute to CO concentrations that exceed the California 1-hour or 8-hour ambient air quality standards. Thus, mobile-source emissions of CO would not result in or contribute substantially to an air quality violation; therefore, this impact is **less than significant**.

---

73 See air quality setting information above that discusses the current success statewide in reducing CO levels; there have been no recorded exceedances of the state and national 1-hour and 8-hour CO standards since the early 1990s.

Toxic Air Contaminants

Construction

Short-term construction activities would generate DPM, which is a TAC. The majority of DPM exhaust emissions that would be generated during construction would be from the use of diesel off-road equipment with a smaller amount generated by the use of heavy-duty trucks to deliver building material and equipment to the site. As discussed in the *Environmental Setting* section above, TACs are airborne substances that are capable of causing short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). Exposure to DPM (the primary TAC of concern for the Master Plan) can cause cancer in humans.

The dose to which receptors are exposed is the primary factor affecting health risk from exposure to TACs. Dose is a function of the concentration of a substance or substances in the environment and the duration of exposure to the substance. According to the Office of Environmental Health Hazard Assessment (OEHHA), health risk assessments should be based on a 9, 30, and/or 70-year exposure periods to determine the health risk to sensitive receptors from cancer or chronic noncancer health effects of TAC emissions (such as DPM). However, OEHHA also states that such health risk assessments should be limited to the duration of the emission-producing activities associated with the project, unless the activities occur for less than six months. Activities that would last more than two months, but less than six months, are recommended to be evaluated as if they would last for six months.[77] Since the construction of the Master Plan would be built out based on market demand, the specific duration and intensity of construction in different areas of the Master Plan is not known at this time. However, based on the size of the Master Plan and the anticipated intensity of construction, it is expected that off-road construction equipment could be operating near existing and future residences for a duration lasting longer than the two-month exposure period recommended by OEHHA. Although the basic construction emission control practices and enhanced exhaust control practices identified in Mitigation Measures AQ.2-1 and AQ.2-2 would reduce TAC emission form off-road equipment exhaust, construction of the Master Plan could expose existing and future sensitive receptors to TAC emissions that would be considered a **potentially significant impact**.

Operations

On-Site Operational Permitted Stationary Source Emissions

Long-term operation of Master Plan land uses could include the development of stationary sources that emit TACs. However, any stationary sources that may emit TACs would be subject to SMAQMD permitting and Toxics Best Available Control Technology (T-BACT) requirements. SMAQMD would assess such sources for potential health risk impacts based on their potential to emit TACs. If it is determined that the sources would emit TACs in excess of SMAQMD's applicable threshold of significance, T-BACT would be implemented to reduce emissions. If the implementation of T-BACT would not reduce the risk below the threshold, then SMAQMD would

[77] Office of Environmental Health Hazard Assessment (OEHHA). Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments. February 2015. Available at: https://oehha.ca.gov/media/downloads/crnr/2015guidancemanual.pdf Accessed March 2023.

deny the required permit. As a result, impacts associated with exposure of sensitive receptors to substantial toxic air emissions from stationary source operations would be **less than significant**.

On-Site Operational Mobile Source Emissions

On-site mobile sources of TAC emissions would primarily be associated with the operation of diesel-fueled school buses transporting students to and from the proposed schools, transit buses, and delivery trucks associated with proposed on-site commercial activities.

Emissions from buses can vary depending on various factors, including bus type, age, and maintenance, and the amount of time spent idling. Generally, children are more vulnerable than adults to air pollutants because of their higher inhalation rates, narrower airways, and less mature immune systems. In response to this concern, CARB adopted an Airborne Toxic Control Measure (ATCM) as part of the *Particulate Matter Risk Reduction Plan* specifically to deal with diesel emissions from school buses. This measure became effective July 16, 2003. The school bus-idling ATCM includes the following requirements:

- The driver of a school bus or vehicle, transit bus, or heavy-duty vehicle (other than a bus) shall manually turn off the bus or vehicle upon arriving at a school and shall restart no more than 30 seconds before departing. A driver of a school bus or vehicle shall be subject to the same requirement when operating within 100 feet of a school and shall be prohibited from idling more than 5 minutes at each stop beyond schools, such as parking or maintenance facilities, school bus stops, or school activity destinations. A driver of a transit bus or heavy duty vehicle (other than a bus) shall be prohibited from idling more than 5 minutes at each stop within 100 feet of a school. Idling necessary for health, safety, or operational concerns shall be exempt from these restrictions.
- The motor carrier of the affected bus or vehicle shall ensure that drivers are informed of the idling requirements, track complaints and enforcement actions, and keep track of driver education and tracking activities.

According to CARB, implementation of the above requirements by the applicable school district would eliminate unnecessary idling for school buses and other heavy-duty vehicles, thus reducing localized exposure to emissions of TACs and other harmful pollutants at and near schools and protecting children from unhealthy exhaust emissions.

In addition to the school bus-idling ATCM, CARB has adopted an idling-restriction ATCM for large commercial diesel-powered vehicles. In accordance with this measure, which became effective February 1, 2005, affected vehicles are required to limit idling to no longer than 5 minutes under most circumstances. Nonetheless, given that proposed onsite commercial land uses have not yet been specifically identified and given the potential proximity of nearby sensitive receptors, exposure of nearby on-site receptors to mobile-source TACs associated with commercial activities is considered a **potentially significant impact**.

Siting of New Sensitive Receptors to Existing and Future TAC Sources

The Master Plan would include proposed residences, schools, and parks. Because of the sensitivity of such uses, an assessment of compatibility with surrounding land uses with respect to TAC emissions is provided below.

The *Air Quality and Land Use Handbook: A Community Health Perspective,*[78] which is advisory rather than regulatory, includes the following recommendations that may apply to the project:

- Avoid siting new sensitive land uses within 500 feet of urban roads carrying 100,000 vehicles per day.
- Avoid siting new sensitive land uses within 300 feet of a large gasoline station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation is recommended for typical gasoline-dispensing facilities.
- Avoid siting new sensitive land uses within 300 feet of any dry-cleaning operation using perchloroethylene. For operations with two or more machines, provide 500 feet. For operations with three or more machines, consult the local air district. Do not site new sensitive land uses in the same building with dry-cleaning operations that use perchloroethylene.
- Obtain facility-specific information where there are questions about siting a sensitive land use close to an industrial facility, including the amount of pollutant emitted and its toxicity, distance to nearby receptors, and types of emissions controls in place.

In addition to the CARB recommendations listed above, SMAQMD has developed the Mobile Sources Air Toxics Protocol (MSAT Protocol) for evaluating health risks at sensitive receptors located within 2 kilometers of major roadways and railways.[79] Sensitive receptors include residences, schools, day care centers, and medical facilities. SMAQMD's protocol requires a health risk screening analysis if sensitive receptor is within 500 feet of a roadway that has traffic volumes exceeding 100,000 average daily traffic (ADT) using the district's Health Risk Mapping Tool. At build-out (cumulative plus project), the adjacent roadways would reach a maximum of approximately 50,390 vehicles per day (Kiefer Boulevard),[80] substantially below SMAQMD's criterion of 100,000 vehicles per day.

In addition, the Health Risk Mapping Tool does not include the majority of the Master Plan site, given that there are no roadways with more than 100,000 ADT nearby. The nearest roadway with over 100,000 ADT is the EL Dorado Highway West (Highways 50), located approximately over 5,300 feet to the north of the Master Plan site. The part of the Master Plan site included in the Mapping Tool are areas east South Watt Avenue south of Jackson Road and areas north of Kiefer Boulevard and east of Bradshaw Road. The maximum health risk for receptors in the northwest part of the project site between South Watt Avenue south of Jackson Road is an incremental increase in cancer risk of zero; the maximum health risk for receptors in the east part of the project site nearest Kiefer Boulevard is an incremental increase in cancer risk 6.6.[81] These values

78 California Air Resources Board, 2005. *Air Quality and Land Use Handbook: A Community Health Perspective.* April 2005. p. 4.

79 Sacramento Metropolitan Air Quality Management District, 2020. *Guidance Document for the Mobile Sources Air Toxics Protocol*. July. Version 1.3. Available at: http://www.airquality.org/Businesses/CEQA-Land-Use-Planning/Mobile-Sources-Air-Toxics-Protocol. Accessed August 2023.

80 Tokarski, David. DKS Associates. September 13, 2023 email correspondence with Brian Schuster, ESA.

81 Sacramento Metropolitan Air Quality Management District, 2023. Sacramento Metropolitan Air Quality Management District Mobile Sources Air Toxics Protocol Tool. Available: http://sacramentorisk.azurewebsites.net/. Accessed August 2023.

are below the SMAQMD health risk threshold of an incremental increase in cancer risk greater than 10 in one million.

Therefore, the mobile source health risks to land uses adjacent to Jackson Highway and Keifer Boulevard would be less than significant. All other roadways within the Master Plan Area would have daily traffic volumes that are less than volumes on Kiefer Boulevard. Consequently, health risks for sensitive receptors located near all roads within the Master Plan Area road network are expected to be **less than significant**.

Mitigation Measures

Mitigation Measure AQ.2-1: Basic Construction Emission Control Practices (See Impact AQ-2)

Mitigation Measure AQ.2-2: Enhanced Exhaust Control Practices (See Impact AQ-2)

Mitigation Measure AQ.2-3: Enhanced Fugitive Particulate Matter Dust Control Practices (See Impact AQ-2)

Measure AQ.4-1: CARB Land Use Siting Standards. The specific plan design guideline and development standards of the Master Plan shall include consideration of CARB's *Air Quality and Land Use Handbook: A Community Health Perspective* recommendations in land use siting. These include the following:

1. Avoid siting new sensitive land uses within 500 feet of urban roads carrying 100,000 vehicles per day.

2. Avoid siting new sensitive land uses within 300 feet of a large gasoline station (defined as a facility with a throughput of 3.6 million gallons per year or greater). A 50-foot separation is recommended for typical gasoline-dispensing facilities.

3. Avoid siting new sensitive land uses within 300 feet of any dry-cleaning operation using perchloroethylene. For operations with two or more machines, provide 500 feet. For operations with three or more machines, consult the local air district. Do not site new sensitive land uses in the same building with dry-cleaning operations that use perchloroethylene.

4. Obtain facility-specific information where there are questions about siting a sensitive land use close to an industrial facility, including the amount of pollutant emitted and its toxicity, distance to nearby receptors, and types of emissions controls in place.

Measure AQ.4-2: Project-Level Health Risk Assessment. To evaluate the potential for development in the Master Plan to expose existing and future sensitive receptors to toxic air contaminant (TAC) emissions from Master Plan construction (i.e., off-road diesel equipment), Master Plan operations (i.e. mobile sources), and existing sources (e.g. nearby stationary sources and roadways) that would result in a significant health risk, the project applicant shall prepare a health risk assessment (HRA) specific to each development under the Master Plan. The HRA shall be prepared by a qualified air quality analyst and submitted to the County of Sacramento for review and approval prior to start of construction. The HRA shall be prepared based on the latest methodology recommended by the Office of Environmental Health Hazard Assessment (OEHHA) and the Sacramento Metropolitan Air Quality Management District (SMAQMD). The HRA

shall evaluate, for each development under the Master Plan, the development's potential health risk impacts pursuant to SMAQMD CEQA guidelines and thresholds. Specifically, each HRA must evaluate the development's incremental increase in cancer risk, acute hazard index, chronic hazard index, and annual average concentrations of particulate matter in size fractions of 2.5 microns or less in diameter ($PM_{2.5}$) associated with the development's TAC emissions at all sensitive receptor locations within 1,000 feet of the development's boundaries. Impacts shall be identified by comparing health risks to the SMAQMD's current CEQA health risk thresholds (the current thresholds as of September 2023 are an incremental increase in cancer risk greater than 10 in one million or a hazard index greater than 1). The HRA must also identify all feasible mitigation measures to reduce the development's potentially significant impacts to less-than-significant levels. Any mitigation measures reported in the HRA shall be implemented by the applicant and enforced by the County of Sacramento.

Measure AQ.4-3: Clean Off-Road Construction Equipment. In order to reduce the impact of PM_{10} off-road equipment exhaust emissions during construction, the applicant shall ensure that all construction contracts stipulate the following:

1. ***Engine Requirements***.

    a. All portable engines, such as generators, shall be electric. If grid electricity is not available, propane or natural gas generators shall be used.

    b. Electric engines shall be used for all equipment that is commercially available as plug-in or battery-electric equipment, to the maximum extent feasible during each construction phase and activity. Portable equipment shall be powered by grid electricity if available. Electric equipment shall include, but is not limited to, concrete/industrial saws, sweepers/scrubbers, aerial lifts, welders, air compressors, fixed cranes, forklifts, and cement and mortar mixers, pressure washers, and pumps. To qualify for an exception, the Project applicant shall provide the County with evidence supporting its conclusion that electric equipment is not commercially available and shall use the next cleanest piece of off-road equipment in terms of DPM and $PM_{2.5}$.

    c. Engines that cannot be electrically powered must meet or exceed either U.S. EPA or CARB Tier 4 Final or cleaner engines, except for except as provided for below. Exceptions to the requirement for engines that meet Tier 4 Final emission standards shall include only select pieces of specialty equipment, such as those specified below, for which such engines may not be commercially available at the start of a construction phase requiring that equipment. Exceptions may be granted for certain pieces of equipment; examples include bore/drill rigs required for grading/shoring/excavation and for mobile cranes required for building construction. To qualify for an exception, the Project applicant shall provide the County with evidence supporting its conclusion that equipment meeting Tier 4 Final standards is not commercially available and shall use the next cleanest piece of off-road equipment in terms of DPM and $PM_{2.5}$.

    d. Engines shall be fueled with alternative fuels, including natural gas, propane, hydrogen fuel cell, and electricity, as commercially available and to the maximum extent feasible during each construction phase and activity

    e. Any other best technology available in the future may be included in the construction emissions minimization plan as substitutions for the above items a–

d, provided that the project sponsor submits documentation to the lead agency demonstrating that (1) the technology would result in comparable ROG, NOX, PM10, and PM2.5 emissions reductions and (2) it would not increase other pollutant emissions or exacerbate other impacts, such as noise. This may include new alternative fuels or engine technology for off-road equipment (such as electric or hydrogen fuel cell equipment) that is not available as of 2023.

f. Idling time for off-road equipment shall be limited to two minutes, except as provided in exceptions to the applicable state regulations regarding idling for off-road equipment. Documentation shall be provided to equipment operators in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit.

g. Construction operators shall be required to properly maintain and tune equipment in accordance with manufacturer specifications.

h. For the purpose of this mitigation measure, "not commercially available" is defined as either: (1) not being used for other large-scale projects in Sacramento County occurring at the same time; (2) cannot be obtained without significant delays to critical-path timing of construction; or (3) not available within the larger northern California region. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such equipment is commercially unavailable, the operator must submit documentation from a minimum of three (3) electric off-road equipment dealers demonstrating the inability to obtain the required electric equipment needed within 6 months.

2. ***Waivers***.

1. The electric engine requirements of above items 1.a and 1.b may be waived if electric power is infeasible at the project site. If the waiver is granted, the contractor must submit documentation that the equipment used for onsite power generation meets the requirements of items 1.c and 1.d.

2. The equipment requirements of item 1.c may be waived if: (1) the contractor does not have the required type of equipment within its current available inventory or has ordered such equipment at least 60 days in advance and has made a good faith effort to lease or rent such equipment but it is not available; (2) a particular piece of Tier 4 final off-road equipment is technically or financially infeasible; (3) the equipment would not produce desired emissions reduction due to expected operating modes; or (4) there is a compelling emergency need to use off-road equipment that is not Tier 4 Final compliant. If the waiver is granted, the contractor must use the next cleanest piece of off-road equipment that is commercially available, or another alternative that results in comparable reductions of ROG and DPM emissions.

3. The electric equipment requirements of above items 1.a and 1.b and the alternative fuel requirements of item 1.d may be waived if electricity or alternative fuels are not commercially available or the use of electricity or alternative fuels would negatively affect construction performance, void equipment warranties, or would result in additional DPM or $PM_{2.5}$ emissions compared to traditional fuels. For purposes of this mitigation measure, "not

commercially available" is defined as either: (1) not being used for other large-scale construction projects in Sacramento County occurring at the same time; (2) cannot be obtained without significant delays to critical-path timing of construction; or (3) not available within the larger northern California region. Sufficient documentation must be provided when seeking any waiver described above. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such equipment is commercially unavailable, the operator must submit documentation from a minimum of three (3) electric off-road equipment dealers demonstrating the inability to obtain the required electric equipment needed within 6 months.

Mitigation Measure AQ.4-4: Clean On-Road Construction Trucks. Heavy-duty on-road construction trucks shall comply with the following, which would reduce PM_{10} and $PM_{2.5}$ emissions:

1. ***Engine Requirements***.

   a. All on-road heavy-duty diesel trucks with a gross vehicle weight rating of 19,500 pounds or greater used at the project site (such as haul trucks, water trucks, dump trucks, concrete trucks, and vendor trucks) shall be model year 2020 or newer.

   b. Use alternative fuels as commercially available, such as natural gas, propane, hydrogen fuel cell, and electric vehicles or other fuels where the Project Applicant can provide evidence which suggests that PM_{10} and $PM_{2.5}$ emissions would be reduced compared to conventional diesel fuel.

   c. Any other best technology available in the future (i.e., not available as of 2023) may be used in lieu of or in addition to the above items 1.a and 1.b, provided that the Project sponsor submits documentation to the County demonstrating that (1) the technology would result in comparable PM_{10} and $PM_{2.5}$emissions reductions and (2) that such measures would not increase other pollutant emissions or result in other impacts, such as noise. This may include new alternative fuels for on-road trucks.

   d. Require the idling time for on-road vehicles be limited to two minutes, except as provided in exceptions to the applicable state regulations regarding idling for on-road vehicles. Documentation shall be provided to truck drivers in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit.

   e. An alternative-fueled and ZEV truck shall ordinarily be considered commercially available if the vehicle is capable of serving the intended purpose and is included in California's Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project, https://californiahvip.org/ or listed as available in the US on the Global Commercial Vehicle Drive to Zero inventory, https://globaldrivetozero.org/. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such vehicles are commercially unavailable, the operator must submit documentation from a minimum of three (3) ZEV dealers identified on the californiahvip.org website

demonstrating the inability to obtain the required ZEVs or equipment needed within 6 months.

2. ***Waivers***. The County may waive the alternative fuel requirements of item 1.b if alternative fuels are not commercially available or the use of alternative fuels is not technologically feasible, would void truck warranties, or would result in ROG, NO_X, PM_{10} and $PM_{2.5}$ emissions compared to traditional fuels.

These mitigation measures stipulate requirements and performance standards for future development projects under the Master Plan and therefore do not defer mitigation. Mitigation measures do not need to include exact quantitative performance standards, but do need to be at least partially effective even if they don't mitigate impacts to less-than-significant levels (Laurel Heights I, supra, 47 Cal.3d at p. 404; §§ 21051, 21100; Guidelines, § 15370.). The County has the discretion to modify these mitigation measures with equally or more effective measures as technology improves in the future, as long as these measures do not change a project's impacts (See Guidelines, § 15162, subd. (a)(3).) New technology and better mitigation measures, as they become available, should be encouraged

According to the California Supreme Court in *Sierra Club v. County of Fresno*, (2018) 6 Cal.5th 502 ("Friant Ranch"):

> *"Allowing future substitutions for equal or more efficient technology to mitigate a project's acknowledged significant effects promotes CEQA's goal of environmental protection and is not an impermissible deferral of mitigation or an abuse of discretion. It is simply a recognition that substitutions of adopted mitigation measures may be implemented to further minimize the Project's environmental impacts."*

The mitigation measures above allow for some improvements in technology over time and allow future development under the Master Plan to consider equally or more effective measures as technology improves in the future, subject to review by the County, and consistent with CEQA Guidelines Section 15162(a)(3).

Significance after Mitigation: Even with the implementation of Mitigation Measures AQ.2-1 through AQ.2-3 and AQ.4-1 through AQ.4-4, off-road construction equipment would operate for a duration exceeding the two-month exposure period recommend by OEHHA. Although Mitigation Measure AQ.4-2 would require that each applicant shall prepare an HRA specific to each development under the Master Plan to determine the potential proximity of nearby sensitive receptors to future TAC emission sources, the exact location of sensitive receptors and their exposure to future TAC emissions is currently unknown. For these reasons, construction of the Master Plan would result in the exposure of nearby existing and future sensitive receptors to TAC emissions that would be considered **significant and unavoidable**.

Impact AQ.5: Implementation of the Master Plan could result in exposure of substantial persons to other emissions, such as those leading to odors. (*Significant and Unavoidable*)

With regard to operations, no common sources of substantial nuisance odors, such as wastewater treatment facilities or waste-disposal facilities are proposed as part of the project. However, the Master Plan would include an industrial land use category that would allow manufacturing, such as asphalt concrete plants, that could contribute odors. It is currently not known whether new industrial facilities that may have sources of odorous emissions would be constructed in these areas. While commercial uses could provide uses that may include sources of odorous emissions (e.g., fast-food restaurants) that could be perceived as offensive to some individuals, it is assumed that the size, location, and construction of these facilities would not create significant odor impacts. In addition, these uses may also receive additional environmental analysis in the future, and it is speculative to determine what specific commercial uses would be constructed.

Regarding land use compatibility of locating sensitive receptors in proximity to existing sources of odor in the region, there are several potential sources in the vicinity of the Master Plan Area, including the Sacramento Rendering Company plant (about 2.25 miles to the east at 11350 Kiefer Boulevard, Mather, CA. 95830), Granite hot asphalt plant (within the northern portion of the Master Plan Area at 4291 Bradshaw Rd, Sacramento, CA 95827), Teichert hot asphalt plant (about 0.7 miles to the northwest at 9760 Jackson Rd, Sacramento, CA 95827), Florin-Perkins Landfill (approximately 0.75 miles to the west at 4201 Florin Perkins Road, Sacramento, CA 95826) and L & D Landfill (about 0.15 miles to the west at 8635 Fruitridge Rd, Sacramento, CA 95826). **Figure 2** presents these nearby potential sources of odors.

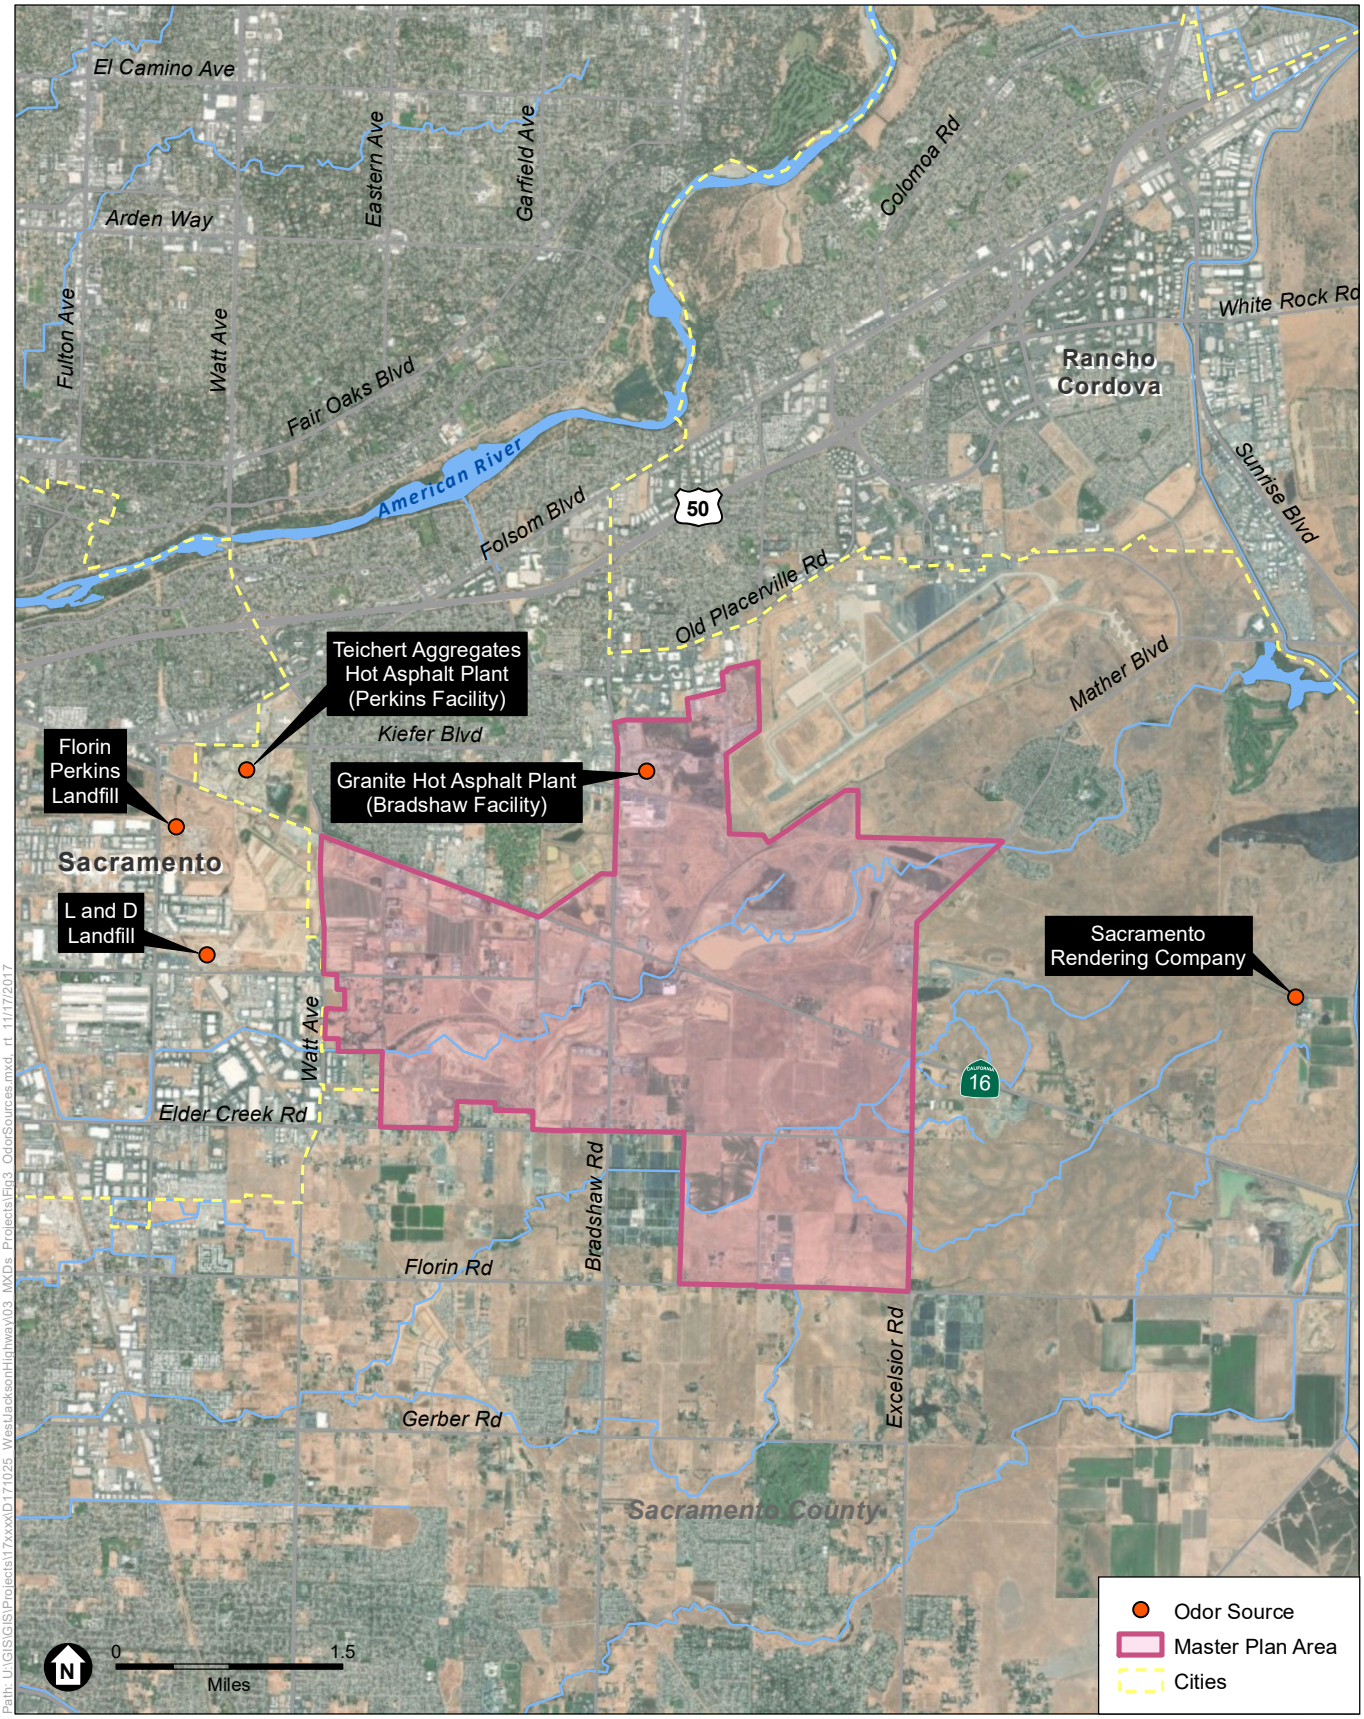
The SMAQMD enforces California Health and Safety Code §41700 prohibited discharge, and District Rule 402, Nuisance, which prohibits causing a public nuisance from odor. SMAQMD determines that businesses are a public nuisance for odor if they receive public complaints and are able to verify that the source is causing the odors. Both landfills handle primarily construction and demolition debris, which is not a source of substantial odors. According to SMAQMD, in the last three years (CY 2020-2023) the Florin-Perkins Landfill, Granite hot asphalt plant, and the L And D Landfill have had no public complaints and no notice of violations (NOVs).[82]

In the same time period, the Teichert hot asphalt plant has had 2 odor complaints and no NOVs. The Sacramento Rendering Company has received 287 odor complaints between 2020-2023, however the SMAQMD is precluded from enforcing odor nuisance at the facility due to the State of California Right to Farm Act.[83] These facilities are within the SMAQMD odor screening distances (2-miles for asphalt batch plants and 4-miles for rendering plants), and depending on whether these plants are still operational as the Master Plan is developed nearby, would be a source of potential nuisance odors. As noted in the NewBridge Specific Plan, the East Sacramento Ranch, which owns the land beneath the rendering plant, plans to relocate the plant to a more compatible area.[84] In addition, the prevailing annual wind direction in the Master Plan

[82] Sacramento Metropolitan Air Quality Management District Public Records Request for Odor Complains made on 9/8/2023. Odor Complaint List received on 9/15/2023.

[83] *Ibid.*

[84] County of Sacramento. 2020. NewBridge Specific Plan. Available: http://www.per.saccounty.net/Plansand ProjectsIn-Progress/Pages/NewBridgeSpecificPlan.aspx. Accessed April 2023.



Area is from the south and therefore the majority of the Master Plan Area would not be located directly downwind from the rendering plant or asphalt plants. However, since the future operational status of these plants is unknown and there have been substantial odor complaints associated with the facilities (289 total complaints as discussed above), the Sacramento Rendering Company plant and hot asphalt plants would represent potentially significant odor sources, and siting of new sensitive receptors under the project would be a significant impact.

Mitigation Measures

Mitigation Measure AQ.5-1: Odor Control. The applicant(s) shall implement the following measures to control exposure of sensitive receptors within the project site to odors generated by the Sacramento Rendering Company plant, Granite asphalt plant, and Teichert asphalt plant:

- The deeds to all properties located within the Master Plan Area that are within four miles of the rendering plant or two miles of either the Granite or Teichert hot asphalt plants would be accompanied by a written disclosure from the transferor, in a form approved by the County, advising any transferee of the potential adverse odor impacts from nearby odoriferous operations and requiring the transferee(s) to sign an acknowledgement that odors from the Sacramento Rendering Company plant or hot asphalt plant may be detectable at their property.

Significance after Mitigation: The measure included above would notify property owners of potential odor sources in the area as informational disclosure. However, mitigation is not available to reduce actual odor generation at facilities owned and operated by entities outside of the Master Plan applicant and developer control. Due to the substantial number of odor complaints associated with the off-site rendering plant and two complaints associated with the Teichert hot asphalt plant, and the proximity of the Master Plan Area to these odor sources, the potential nuisance odors that could affect on-site sensitive receptors would be considered **significant and unavoidable**.

Cumulative Air Quality Impacts

Impact AQ.6: Development and operation of the Master Plan would result in a cumulative increase of criteria pollutant emissions. (*Significant and Unavoidable*)

According to the SMAQMD guidelines, a cumulative impact occurs when two or more individual effects, considered together, are considerable or would compound or increase other environmental impacts. Cumulative impacts can result from individually minor but collectively significant impacts, meaning that a project's incremental effects are considerable when viewed in connection with the effects of past, current, and probable future projects. As shown in **Table 2-4**, Sacramento County is in nonattainment for several pollutants, including ozone (state and federal), PM_{10} (state), and $PM_{2.5}$ (federal). Therefore, project-related emissions for criteria pollutants that exceed the applicable threshold would be considered to contribute considerably to a cumulative impact. In other words, a project in Sacramento County that has direct air quality impacts is considered to significantly contribute to a cumulative air quality impact.[85]

Notably, CO concentrations (Impact AQ.4) associated with build-out (cumulative plus project) would be below the SMAQMD screening levels and would be less than significant.

The developments proposed under the Master Plan would directly result in significant impacts associated with operational emissions (Impact AQ.3), exposure of persons to substantial pollutant concentrations (Impact AQ.4), and exposure of substantial persons to objectionable odors (Impact AQ.5). Although implementation of mitigation measures would reduce these impacts, even after mitigation, the impacts would be **significant and unavoidable** and therefore cumulatively considerable and significant.

Comparison of Master Plan Emissions to Regional Emissions

CARB compiles emissions inventories for air basins in the state. Based on the most recent air basin data available from CARB, the anthropogenic (i.e., man-made) sources of emissions in the SVAB are summarized in **Table 2-13**. For comparison purposes, the estimated maximum daily emissions within the SVAB from implementation of the Master Plan are provided and compared to the air-basin-wide emissions.

[85] Sacramento County is the area over which SMAQMD has jurisdiction and is therefore the geographic area for cumulative impact analysis.

TABLE 2-13
EMISSIONS INVENTORY FOR SVAB COMPARED TO THE MASTER PLAN

Air Basin	Estimated Emissions (Tons per Day)				
	ROG	NO_X	CO	PM_{10}	$PM_{2.5}$
SVAB (2020)	**149.7**	**107.4**	**555.4**	**159.7**	**44.3**
Master Plan (2050) (average daily)[a]	0.1	0.1	2.2	0.2	0.1
Percent of Air Basin Total	0.04%	0.06%	0.4%	0.1%	0.1%

NOTES:

a. See Table 2-9. Converted to units of tons per day for comparison.

Mitigation Measures

Mitigation Measure AQ.1-1: Air Quality Mitigation Plan (See Impact AQ.1).

Mitigation Measure AQ.1-2: Electric Vehicle Charging Infrastructure (See Impact AQ.1).

Mitigation Measure AQ.2-1: Basic Construction Emission Control Practices (See Impact AQ.1).

Mitigation Measure AQ.2-2: Enhanced Exhaust Control Practices (See Impact AQ.2).

Mitigation Measure AQ.2-3: Enhanced Fugitive Particulate Matter Dust Control Practices (See Impact AQ.2).

Mitigation Measure AQ.3-1: Promote Use of Green Consumer Products (See Impact AQ.3).

Mitigation Measure AQ.3-2: Operational Truck Emissions Reduction (See Impact AQ.3).

Mitigation Measure AQ.3-3: Electric Landscaping Equipment (See Impact AQ.3).

Mitigation Measure AQ.3-4: Best Available Emissions Controls for Stationary Emergency Generators (See Impact AQ.3).

Mitigation Measure AQ.3-5: Offset Remaining ROG, NO_X, PM_{10}, and $PM_{2.5}$ Emissions (See Impact AQ.3).

Measure AQ.4-3: Clean Off-Road Construction Equipment (See Impact AQ.4).

Mitigation Measure AQ.4-4: Clean On-Road Construction Trucks (See Impact AQ.4).

Significance after Mitigation: These mitigation measures would result in substantial emission reductions of ozone precursors, including mobile source reductions that would meet the requirements of an AQMP, which together represent all feasible mitigation for the Master Plan.

However, even with these mitigation measures, operation of the developments proposed under the Master Plan would result in substantial criteria pollutant emissions, including particulate matter and ozone precursors, that would exceed the SMAQMD's thresholds of significance. Consequently, the direct criteria pollutant emissions for the Master Plan would remain **cumulatively significant and unavoidable**.

Impact AQ.7: The Master Plan would contribute to cumulative increases in toxic air contaminant exposure. (*Significant and Unavoidable*)

As discussed above in Impact AQ.4, exposure to TACs is generally a local phenomenon. The known major development projects within 1,000 feet of the Master Plan Area include the Jackson Township Master Plan (directly to the east of the project site), the Newbridge Specific Plan (to the east of the project site), the Florin-Vineyard Gap Community Plan (directly to the south of the project site), and the North Vineyard Station Specific Plan (to the south of the project site across Florin Road). The primary source of cumulative TACs (Master Plan plus other projects) would be associated with off-road construction emissions of DPM during construction activities for each of these developments and on-road vehicular traffic during long-term operations.

For construction, it is expected that off-road construction equipment would be operating near existing and future residences for a duration lasting longer than the two-month exposure period recommend by OEHHA. Consequently, construction of the Master Plan could expose existing and future sensitive receptors to TAC emissions that would be considered a potentially significant impact.

For operations, on-site mobile sources of TAC emissions would primarily be associated with the operation of school buses transporting students to and from the proposed schools, transit buses, and diesel-fueled delivery trucks associated with proposed on-site commercial activities. Given that proposed onsite commercial land uses have not yet been identified and given the potential proximity of nearby sensitive receptors, exposure of nearby on-site receptors to mobile-source TACs associated with commercial activities is considered a **potentially significant impact**.

Mitigation Measures

Mitigation Measure AQ.1-1: Air Quality Mitigation Plan (See Impact AQ.1).

Mitigation Measure AQ.2-1: Basic Construction Emission Control Practices (See Impact AQ.1).

Mitigation Measure AQ.2-2: Enhanced Exhaust Control Practices (See Impact AQ.2).

Mitigation Measure AQ.2-3: Enhanced Fugitive Particulate Matter Dust Control Practices (See Impact AQ.2).

Mitigation Measure AQ.3-2: Operational Truck Emissions Reduction (See Impact AQ.3).

Mitigation Measure AQ.3-4: Best Available Emissions Controls for Stationary Emergency Generators (See Impact AQ.3).

Mitigation Measure AQ.4-1: CARB Land Use Siting Standards (See Impact AQ-4).

Mitigation Measure AQ.4-2: Project-Level Health Risk Assessment (See Impact AQ-4).

Mitigation Measure AQ.4-3: Clean Off-Road Construction Equipment (See Impact AQ-4).

Mitigation Measure AQ.4-4: Clean On-Road Construction Trucks (See Impact AQ-4).

Significance after Mitigation: Off-road construction equipment would operate for a duration exceeding the two-month exposure period recommend by OEHHA. Although Mitigation Measure AQ.4-2 would require that each applicant shall prepare an HRA specific to each development under the Master Plan to determine the potential proximity of nearby sensitive receptors to future TAC emission sources, the exact location of sensitive receptors and their exposure to future TAC emissions is currently unknown. Implementation of Measures AQ.1-1, AQ.2-2 through AQ2.3, AQ.3-2, AQ.3-3, and AQ.4-1, AQ.4-3, and AQ.4-4, would reduce health risk impacts associated with the Master Plan, it cannot be guaranteed that such impacts would be reduced below the thresholds of significance for all developments under the Master Plan. Consequently, construction of the Master Plan would result in the exposure of nearby existing and future sensitive receptors to TAC emissions that would be considered **cumulatively significant and unavoidable**.

Impact AQ.8: Development and operation of the Master Plan would result in cumulative exposure of substantial persons to objectionable odors. (*Significant and Unavoidable*)

As described above in Impact AQ.5, implementation of the Master Plan is not expected to create additional common sources of substantial nuisance odors. However, industrial uses could include manufacturing, such as asphalt concrete plants, that could contribute significant odors; in addition, commercial uses may include sources of odorous emissions (e.g., fast-food restaurants) that could be perceived as offensive to some individuals. These uses may receive additional environmental analysis in the future and it is currently speculative to determine what specific commercial uses would be constructed. Despite the uncertainty of new odor sources, new residents could be exposed to existing odor sources. Therefore, the Master Plan may contribute to a cumulative odor impact through potential new odor sources and exposure of future receptors to both existing and new odor sources.

Mitigation Measures

Mitigation Measure AQ.5-1: Odor Control (see Impact AQ.5).

Significance after Mitigation: Mitigation measure AQ.5-1 would require that property owners be notified of potential odor sources in the area but would not eliminate the possibility of exposure to substantial nuisance odors. In addition, the Master Plan may contribute to an odor

impact through new industrial and commercial uses, such as asphalt concrete plants. In addition, the Master Plan would result in the introduction of substantial persons that could be adversely affected by existing odor sources. This impact would remain **cumulatively significant and unavoidable**.

CHAPTER 3
Greenhouse Gases

This section assesses the potential GHG impacts associated with construction and operation of the Master Plan and identifies feasible mitigation measures where appropriate.

3.1 Environmental Setting

"Global warming" and "global climate change" are the terms used to describe the increase in the average temperature of the earth's near-surface air and oceans since the mid-20th century and its projected continuation. Increases in GHG concentrations in the earth's atmosphere are thought to be the main cause of human-induced climate change. Certain gases in the atmosphere naturally trap heat by impeding the exit of solar radiation that has hit the earth and is reflected into space. This is sometimes referred to as the "greenhouse effect" and the gases that cause it are called "greenhouse gases." Some GHGs occur naturally and are necessary for keeping the earth's surface inhabitable. However, increases in the concentrations of these gases in the atmosphere during the last 100 years have decreased the amount of solar radiation that is reflected into space, intensifying the natural greenhouse effect, and resulting in the increase of global average temperature.

Potential global warming impacts in California may include, but are not limited to, loss in snowpack, sea level rise, more extreme heat days per year, more high ozone days, more forest fires, and more drought years. Secondary effects are likely to include the displacement of thousands of coastal businesses and residences, impacts on agriculture, changes in disease vectors, and changes in habitat and biodiversity.

3.1.1 Greenhouse Gases

Carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6) are the principal GHGs. When concentrations of these gases exceed natural concentrations in the atmosphere, the greenhouse effect may be intensified. CO_2, CH_4, and N_2O occur naturally, and are also generated through human activity. Emissions of CO_2 are largely by-products of fossil fuel combustion, whereas CH_4 results from off-gassing[86] associated with agricultural practices and landfills. Other human-generated GHGs include fluorinated gases such as HFCs, PFCs, and SF_6, which have much higher heat-absorption potential than CO_2 and are byproducts of certain industrial processes.

CO_2 is the reference gas for climate change because it is the predominant GHG emitted. The effect that each of the aforementioned gases can have on global warming is a combination of the mass of their emissions and their global warming potential (GWP). GWP indicates, on a pound-

[86] Off-gassing is defined as the release of chemicals under normal conditions of temperature and pressure.

for-pound basis, how much a gas is predicted to contribute to global warming relative to how much warming would be predicted to be caused by the same mass of CO_2. For example, CH_4 and N_2O are substantially more potent GHGs than CO_2, with GWPs of 25 and 298 times that of CO_2, respectively.

In emissions inventories, GHG emissions are typically reported in terms of pounds or metric tons of CO_2 equivalents (CO_2e). CO_2e are calculated as the product of the mass emitted of a given GHG and its specific GWP. While CH_4 and N_2O have much higher GWPs than CO_2, CO_2 is emitted in such vastly higher quantities that it accounts for the majority of GHG emissions in CO_2e, both from residential developments and human activity in general.

Global Emissions

Worldwide GHG emissions in 2021 were approximately 37.9 billion metric tons of CO_2e per year.[87] This includes both ongoing emissions from industrial and agricultural sources but excludes emissions from land use changes. Emissions of CO_2 from fossil fuel use and industrial processes account for 65 percent of the total, while CO_2 emissions from all sources account for 76 percent of the total GHG emissions. In 2021, the United States was the world's second largest emitter of CO_2, at 4,800 million metric tons (MMT) (China was the largest emitter of CO_2, at 12,500 MMT).

United States Emissions

GHG Emissions in the United States in 2021 were approximately 6,340 million metric tons of CO_2e, or 5,586 million metric tons of CO_2e after accounting for sequestration from the land sector.[88] Of the major sectors nationwide, transportation accounts for the highest volume of GHG emissions (approximately 29 percent), followed by electricity (approximately 25 percent), industry (approximately 24 percent), agriculture (approximately 10 percent), commercial buildings (approximately 7 percent), and residential buildings (approximately 6 percent). Between 1990 and 2021, total U.S. GHG emissions have decreased by 2.3 percent, from a high of 15.8 percent above 1990 levels in 2007.

State of California Emissions

California produced approximately 369.2 million metric tons of CO_2e in 2020.[89] Combustion of fossil fuel in the transportation sector was the single largest source of California GHG emissions in 2020, accounting for 36.8 percent of total GHG emissions in the state. This represents a

decrease of 35 million $MTCO_2e$ from 2019 likely associated with economic shutdowns that year. This sector was followed by the industrial sector (19.9 percent), the electric power sector (including both in-state and out-of-state sources) (16.1 percent), residential and commercial sectors (10.5 percent), agriculture sector (8.6 percent), and other high global warming potential and waste sectors (5.8 percent).[90]

Sacramento County Emissions

Sacramento County produced approximately 4.7 million metric tons of CO_2e in 2015, the most recent community-wide emissions inventory year. Electricity and natural gas used to operate, heat, and cool commercial, industrial, and residential buildings represents the largest source of GHG emissions, accounting for 41 percent of annual CO_2e emissions. The transportation sector accounted for another 36 percent of annual CO_2e emissions. The other CO_2e emissions sectors included in the inventory (with percent contributions reported in parentheses) were solid waste (7 percent), off-road vehicles (4 percent), agriculture (5 percent), high-GWP gases (5 percent), wastewater (<1 percent), and water-related (<1 percent).[91] **Table 3-1** presents the 2015 baseline GHG inventory for Sacramento County.

TABLE 3-1
SACRAMENTO COUNTY GHG EMISSIONS

Emissions Sector	2015 Baseline GHG Emissions ($MTCO_2e$)	Percent
Residential Energy	1,086,580	23%
Commercial / Industrial Energy	843,168	18%
On-Road Vehicles	1,695,127	36%
Off-Road Vehicles	196,769	4%
Solid Waste	352,909	7%
Agriculture	254,899	5%
High-GWP Gases	251,085	5%
Wastewater	27,253	<1%
Water-Related	15,222	<1%
Total	**4,723,011**	**100%**

NOTES: GHG = greenhouse gas; $MTCO_2e$ = metric tons of carbon dioxide equivalent; GWP = global warming potential

3.2 Regulatory Setting

The following sections provide federal, state, and local regulations for energy, GHGs, and global climate change. These agencies work jointly, as well as individually, to understand and regulate the effects of GHG emissions and resulting climate change through legislation, regulations, planning, policymaking, education, and a variety of programs.

3.2.1 Federal

Clean Air Act and U.S. Environmental Protection Agency "Endangerment" and "Cause or Contribute" Findings

The U.S. Supreme Court held that the United States Environmental Protection Agency (U.S. EPA) must consider regulation of motor vehicle GHG emissions. In *Massachusetts v. Environmental Protection Agency* et al., twelve states and cities, including California, together with several environmental organizations sued to require the U.S. EPA to regulate GHGs as pollutants under the CAA (127 S. Ct. 1438 (2007)). The Supreme Court ruled that GHGs fit within the CAA's definition of a pollutant and the U.S. EPA had the authority to regulate GHGs.

On December 7, 2009, the U.S. EPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA:

- ***Endangerment Finding:*** The current and projected concentrations of the six key GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations.
- ***Cause or Contribute Finding:*** The combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

Corporate Average Fuel Economy

In 1975, Congress enacted the Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to this law, EPA and the National Highway Traffic Safety Administration are responsible for establishing additional vehicle standards. In August 2012, standards were adopted for model years 2017 through 2025 for passenger cars and light-duty trucks.

In August 2018, EPA and the National Highway Traffic Safety Administration proposed maintaining the 2020 corporate average fuel economy and CO_2 standards for model years 2021 through 2026. The estimated corporate average fuel economy and CO_2 standards for model year 2020 are 43.7 miles per gallon (mpg) and 204 grams of CO_2 per mile for passenger cars and 31.3 mpg and 284 grams of CO_2 per mile for light trucks, projecting an overall industry average of 37 mpg, as compared to 46.7 mpg under the standards issued in 2012.

In September 2019, EPA finalized the Safer Affordable Fuel-Efficient Vehicles Rule Part One: One National Program and announced its decision to withdraw the Clean Air Act preemption

waiver granted to the State of California in 2013.[92] In March 2022, EPA reinstated California's waiver, restoring the state's authority to set and enforce more stringent standards than the federal government, including California's GHG emission standards and zero-emission vehicle (ZEV) mandate (87 *Federal Register* 14332–14379, March 14, 2022).

3.2.2 State

California Environmental Quality Act and Climate Change

Under CEQA lead agencies are required to disclose the reasonably foreseeable adverse environmental effects of projects they are considering for approval. GHG emissions have the potential to adversely affect the environment because they contribute to global climate change. In turn, global climate change has the potential to raise sea levels, alter rainfall and snowfall, and affect habitat.

Senate Bill 97

Senate Bill (SB) 97, signed in August 2007, acknowledges that climate change is a prominent environmental issue requiring analysis under CEQA. This bill directed the Governor's Office of Planning and Research (OPR) to prepare, develop, and transmit to the California Natural Resources Agency guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions, as required by CEQA, no later than July 1, 2009. The California Natural Resources Agency was required to certify or adopt those guidelines by January 1, 2010. On December 30, 2009, the Natural Resources Agency adopted amendments to the State CEQA Guidelines, as required by SB 97. These State CEQA Guidelines amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in draft CEQA documents. The amendments became effective March 18, 2010.

State CEQA Guidelines

The State CEQA Guidelines are embodied in the California Code of Regulations (CCR), Public Resources Code, Division 13, starting with Section 21000. The CEQA Guidelines were amended in 2018 by the Natural Resources Agency. State CEQA Guidelines section 15064.4 specifically addresses the significance of GHG emissions, requiring a lead agency to make a "good-faith effort" to "describe, calculate or estimate" GHG emissions in CEQA environmental documents. Section 15064.4 states that the GHG analysis should focus on the "reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change" which may be cumulatively considerable even if emissions are small relative to statewide, national, or global emission levels, and that the analysis should consider "a timeframe that is appropriate for the project" using "evolving scientific knowledge and state regulatory schemes." Section 15064.4 further states that the analysis of GHG impacts should include consideration of (1) the extent to which the project may increase or reduce GHG emissions, (2) whether the project emissions would exceed a locally applicable threshold of significance, and (3) the extent to which the project would comply with "regulations or requirements adopted to implement a statewide, regional, or local

[92] U.S. Department of Transportation and U.S. Environmental Protection Agency. One National Program Rule on Federal Preemption of State Fuel Economy Standards. September 19, 2019. Available: https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P100XI4W.pdf. Accessed September 2023.

plan for the reduction or mitigation of GHG emissions." The CEQA Guidelines also state that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program (including plans or regulations for the reduction of greenhouse gas emissions) that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located (State CEQA Guidelines section 15064(b)(3)). In addition, the recent revisions to the CEQA Guidelines state that significance determinations can be made based on statewide targets: "In determining the significance of impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is not cumulatively considerable." The State CEQA Guidelines do not, however, set a numerical threshold of significance for GHG emissions.

The CEQA Guidelines also include the following direction on measures to mitigate GHG emissions, when such emissions are found to be significant:

> Consistent with Section 15126.4(a), lead agencies shall consider feasible means, supported by substantial evidence and subject to monitoring or reporting, of mitigating the significant effects of greenhouse gas emissions. Measures to mitigate the significant effects of greenhouse gas emissions may include, among others:
>
> (1) Measures in an existing plan or mitigation program for the reduction of emissions that are required as part of the lead agency's decision;
>
> (2) Reductions in emissions resulting from a project through implementation of project features, project design, or other measures;
>
> (3) Off-site measures, including offsets that are not otherwise required, to mitigate a project's emissions;
>
> (4) Measures that sequester greenhouse gases; and
>
> (5) In the case of the adoption of a plan, such as a general plan, long range development plan, or plans for the reduction of greenhouse gas emissions, mitigation may include the identification of specific measures that may be implemented on a project-by-project basis. Mitigation may also include the incorporation of specific measures or policies found in an adopted ordinance or regulation that reduces the cumulative effect of emissions.
>
> (State CEQA Guidelines section 15126.4(a).)

Senate Bill 350

SB 350 (Clean Energy and Pollution Reduction Act of 2015) was signed into law on October 7, 2015, establishing new goals for clean energy, clean air, and GHG reduction goals for 2030 and beyond. SB 350 requires the following:

- Increase California's renewable electricity procurement goal under the RPS from 33 percent by 2020 to 50 percent by 2030,

- Double the energy efficiency of existing buildings by 2030; and
- Facilitate the growth of renewable energy markets within the western U.S. by reorganizing the California Independent System Operator (CAISO).

Senate Bill 100

On September 10, 2018, Governor Brown signed SB 100, establishing that 100 percent of all electricity in California must be obtained from renewable and zero-carbon energy resources by December 31, 2045. SB 100 also creates new standards for the RPS goals established by SB 350 in 2015. Specifically, the bill increases required energy from renewable sources for both investor-owned utilities and publicly-owned utilities from 50 percent to 60 percent by 2030. Incrementally, these energy providers must also have a renewable energy supply of 33 percent by 2020, 44 percent by 2024, and 52 percent by 2027. The updated RPS goals are considered achievable, since many California energy providers are already meeting or exceeding the RPS goals established by SB 350.

Senate Bill 1020

SB 1020, signed on September 16, 2022, revises SB 100 to require that renewable energy resources and zero-carbon resources supply 90 percent of all retail sales of electricity to end-use customers by December 31, 2035; 95 percent of all retail sales to end users by December 31, 2040; 100 percent of all retail sales to end users by December 31, 2045; and 100 percent of electricity procured to serve all state agencies by December 31, 2035.

Executive Order B-55-18

On September 10, 2018, Governor Brown signed EO B-55-18, committing California to total, economy-wide carbon neutrality by 2045. EO B-55-18 directs CARB to work with relevant state agencies to develop a framework to implement an accounting to track progress toward this goal. AB 1395 would codify this carbon neutral target.

Pavley Regulations and Fuel Efficiency Standards

In 2002, Governor Gray Davis signed Assembly Bill (AB) 1493, which required the CARB to develop and adopt, by January 1, 2005, regulations that achieve "the maximum feasible reduction of GHGs emitted by passenger vehicles and light-duty trucks and other vehicles determined by the CARB to be vehicles whose primary use is noncommercial personal transportation in the state."

To meet the requirements of AB 1493, the CARB approved amendments to the California Code of Regulations (CCR) in 2004, adding GHG emissions standards to California's existing standards for motor vehicle emissions. Amendments to CCR Title 13, Sections 1900 and 1961 (13 CCR 1900, 1961), and adoption of Section 1961.1 (13 CCR 1961.1), require automobile manufacturers to meet fleet-average GHG emissions limits for all passenger cars, light-duty trucks within various weight criteria, and medium-duty passenger vehicle weight classes (i.e., any medium-duty vehicle with a gross vehicle weight [GVW] rating of less than 10,000 pounds and that is designed primarily for the transportation of persons), beginning with model year 2009. For passenger cars and light-duty trucks with a loaded vehicle weight (LVW) of 3,750 pounds or less,

the GHG emission limits for model year 2016 are approximately 37 percent lower than the limits for the first year of the regulations, model year 2009. For light-duty trucks with an LVW of 3,751 pounds to a GVW of 8,500 pounds, as well as for medium-duty passenger vehicles, GHG emissions will be reduced approximately 24 percent between 2009 and 2016.

Because the Pavley standards (named for the bill's author, state Senator Fran Pavley) would impose stricter standards than those under the CAA, California applied to the U.S. EPA for a waiver under the CAA; this waiver was initially denied in 2008. In 2009, however, the U.S. EPA granted the waiver.

Executive Order S-3-05

In 2005, in recognition of California's vulnerability to the effects of climate change, Governor Schwarzenegger established EO S-3-05, which announced target dates by which statewide GHG emissions would be progressively reduced. These included a reduction of GHG emissions to 2000 levels by 2010; a reduction of GHG emissions to 1990 levels by 2020; and a reduction of GHG emissions to 80 percent below 1990 levels by 2050. As discussed below, the 2020 reduction target was codified in 2006 as Assembly Bill 32 (AB 32). However, the 2050 reduction target has not been codified and the California Supreme Court has ruled that CEQA lead agencies are not required to use it as a significance threshold. *Cleveland National Forest Foundation v. San Diego Association of Governments* (2017) 3 Cal.5th 497.

Assembly Bill 32

In 2006, the California Legislature adopted Assembly Bill (AB) 32 (Health and Safety Code Division 25.5), also known as the California Global Warming Solutions Act of 2006, with a focus on reducing GHG emissions in California to 1990 levels by 2020. This act defines GHGs as CO_2, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride and represents the first enforceable statewide program to limit emissions of these GHGs from all major industries with penalties for noncompliance. The law further requires that reduction measures be technologically feasible and cost effective. The California Global Warming Solutions Act assigned CARB the primary responsibility for reducing GHG emissions, by adopting rules and regulations directing state actions that would achieve GHG emissions reductions equivalent to 1990 statewide levels by 2020.

As required by the California Global Warming Solutions Act, CARB approved the 1990 GHG emissions inventory, thereby establishing the emissions limit for 2020, originally set at 427 $MMTCO_2e$, using the GWP values from the IPCC Second Assessment Report. CARB established the GHG emissions reduction target based on GWP values from the IPCC Fourth Assessment Report (AR4) and determined that the 1990 GHG emissions inventory and 2020 GHG emissions limit is 431 $MMTCO_2e$.

CARB approved the initial AB 32 Scoping Plan in 2008.[93] It approved the *First Update to the Climate Change Scoping Plan* (2014 Scoping Plan) in May 2014 and built upon the 2008 Scoping Plan with new strategies and recommendations.[94] In 2014, CARB revised the target using the GWP values from the IPCC AR4 and determined that the 1990 GHG emissions inventory and 2020 GHG emissions limit is 431 $MMTCO_2e$. CARB also updated the state's 2020 business-as-usual (BAU) emissions estimate to account for the impact of the 2007–2009 economic recession, new estimates for future fuel and energy demand, and the reductions required by regulation that were adopted for motor vehicles and renewable energy. CARB's projected statewide 2020 emissions estimate using the GWP values from the IPCC AR4 is 509.4 $MMTCO_2e$.

Therefore, under the 2014 Scoping Plan, the emission reductions necessary to achieve the 2020 emissions target of 431 $MMTCO_2e$ would be 78.4 $MMTCO_2e$, or a reduction of GHG emissions by approximately 15.4 percent.

Senate Bill 32 and Assembly Bill 197

In 2016, the California Legislature adopted Senate Bill (SB) 32 and its companion bill AB 197. SB 32 and AB 197 amended Health and Safety Code Division 25.5, and established a new climate pollution reduction target of 40 percent below 1990 levels by 2030, with provisions included to ensure that the benefits of state climate policies reach into vulnerable communities. In response to the 2030 GHG reduction target, CARB adopted the 2017 Scoping Plan.[95] The 2017 Scoping Plan outlines the strategies the state will implement to achieve the 2030 GHG emissions reduction target, which build on the Cap-and-Trade Program; the Low Carbon Fuel Standard; improved vehicle, truck, and freight movement emissions standards; increasing renewable energy; and strategies to reduce methane emissions from agricultural and other wastes by using it to meet California's energy needs. CARB's projected statewide 2030 emissions take into account 2020 GHG reduction policies and programs. The 2017 Scoping Plan also comprehensively addresses GHG emissions from natural and working lands of California, including the agriculture and forestry sectors. The adopted 2017 Scoping Plan includes ongoing and statutorily required programs and the continuation of the Cap-and-Trade Program. This Scoping Plan Scenario was modified from the January 2017 Proposed Scoping Plan to reflect AB 398,[96] including removal of the 20 percent refinery measure.

The 2017 Scoping Plan outlines the strategies the State of California will implement to achieve the 2030 GHG emissions reduction target. The 2017 Scoping Plan includes the Scoping Plan Scenario,

93 California Air Resources Board, 2008. *Climate Change Scoping Plan: A Framework for Change*. December 2008. Available: https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/document/adopted_scoping_plan.pdf. Accessed May 2022.

94 California Air Resources Board, 2014. *First Update to the Climate Change Scoping Plan: Building on the Framework.* May 2014. Available: https://ww2.arb.ca.gov/sites/default/files/classic/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf. Accessed January 2022.

95 California Air Resources Board, 2017. *California's 2017 Climate Change Scoping Plan.* November 2017. Appendix G. Available: https://ww2.arb.ca.gov/sites/default/files/classic//cc/scopingplan/scoping_plan_2017.pdf. Accessed December 2021.

96 AB 398 was enacted in 2017 to extend and clarify the role of the State's Cap-and-Trade Program through December 31, 2030. As part of AB 398, refinements were made to the Cap-and-Trade program to establish updated protocols and allocation of proceeds to reduce GHG emissions.

which CARB stated "is the best choice to achieve the state's climate and clean air goals".[97] Under the Scoping Plan Scenario, continuation of the Cap-and-Trade regulation (or carbon tax) is expected to cover approximately 34–79 $MMTCO_2$ of the 2030 reduction obligation.[98] The short-lived GHG strategy is expected to cover approximately 17–35 $MMTCO_2e$. The Renewables Portfolio Standard with 50 percent renewable electricity by 2030 is expected to cover approximately 3 $MMTCO_2$. The mobile-source strategy and sustainable freight action plan includes maintaining the existing vehicle GHG emissions standards, increasing the number of ZEVs, and improving the efficiency of the freight system, and is expected to cover approximately 11–13 $MMTCO_2$. Under the Scoping Plan Scenario, CARB expects that the doubling of the energy efficiency savings by 2030 would cover approximately 7–9 $MMTCO_2$ of the 2030 reduction obligation. The other strategies would be expected to cover the remaining 2030 reduction obligations.

The 2017 Scoping Plan also discusses the role of local governments in meeting the state's GHG reductions goals because local governments have jurisdiction and land use authority related to community-scale planning and permitting processes, local codes and actions, outreach and education programs, and municipal operations. Furthermore, local governments may have the ability to incentivize renewable energy, energy efficiency, and water efficiency measures.[99] The 2017 Scoping Plan encourages local governments to adopt climate action plans (CAPs) to address local GHG emissions sources. A summary of the GHG emissions reductions required under SB 32 is provided in **Table 3-2**, *Estimated Greenhouse Gas Emissions Reductions Required by SB 32*.

TABLE 3-2
ESTIMATED GREENHOUSE GAS EMISSIONS REDUCTIONS REQUIRED BY SB 32

Emissions Category	GHG Emissions ($MMTCO_2e$)
2017 Scoping Plan Update	
2030 No Action Taken Forecast ("Reference Scenario," which includes 2020 GHG emissions reduction policies and programs)	389
2030 Emissions Target Set by SB 32 (i.e., 40 percent below 1990 level)	260
Reduction below No Action Taken Forecast Necessary to Achieve 40 Percent below 1990 Level by 2030	129 (33.2 percent)[a]

NOTES: GHG = greenhouse gas; $MMTCO_2e$ = million metric tons of carbon dioxide equivalent; SB = Senate Bill

a. 389 – 260 = 129 / 389 = 33.2%

Assembly Bill 1279 and 2022 Scoping Plan

The Legislature enacted AB 1279, The California Climate Crisis Act, on September 16, 2022. AB 1279 establishes the policy of the State of California to achieve net zero GHG emissions as soon as possible but no later than 2045, and to achieve and maintain net negative GHG emissions

97 California Air Resources Board, 2017. *California's 2017 Climate Change Scoping Plan.* November 2017. Appendix G. Available: https://ww2.arb.ca.gov/sites/default/files/classic//cc/scopingplan/scoping_plan_2017.pdf. Accessed December 2021.

98 Ibid.

99 Ibid.

thereafter. Additionally, AB 1279 mandates that by 2045, statewide anthropogenic GHG emissions are to be reduced at least 85 percent below 1990 levels. SB 1279 also requires CARB to ensure that the Scoping Plan identifies and recommends measures to achieve carbon neutrality, and to identify and implement policies and strategies for CO_2 removal solutions and carbon capture, utilization, and storage technologies. It also requires CARB to submit an annual report on progress in achieving the Scoping Plan's goals.

The *2022 Scoping Plan for Achieving Carbon Neutrality* (2022 Scoping Plan), adopted by CARB in December 2022, expands on prior scoping plans. This plan responds to more recent legislation, outlining a technologically feasible, cost-effective, and equity-focused path to achieve the state's climate target of reducing anthropogenic emissions to 85 percent below 1990 levels by 2045 and achieving carbon neutrality[100] by 2045 or earlier.[101] The 2022 Scoping Plan outlines the strategies the state will implement to achieve carbon neutrality by reducing GHG emissions to meet the anthropogenic target, and by expanding actions to capture and store carbon through the state's natural and working lands and using a variety of mechanical approaches.

The major element of the 2022 Scoping Plan is the decarbonization of every sector of the economy. This effort requires the following key actions:

- Rapidly move to zero-emissions transportation for cars, buses, trains, and trucks.
- Phase out the use of fossil-fuel gas for heating.
- Clamp down on chemicals and refrigerants.
- Provide communities with sustainable options such as walking, biking, and public transit to reduce reliance on cars.
- Continue to build out solar arrays, wind turbine capacity, and other resources to provide clean, renewable energy to displace fossil-fuel–fired electrical generation.
- Scale up new options such as renewable hydrogen for hard-to-electrify end uses and biomethane where needed.

Despite these efforts, some amount of residual emissions will remain from hard-to-abate industries such as cement, internal combustion vehicles still on the road, and other GHG emissions sources, including high-GWP chemicals used as refrigerants.[102] The 2022 Scoping Plan addresses the remaining emissions by re-envisioning natural and working lands (such as forests, shrublands/chaparral, croplands, and wetlands) to ensure that they incorporate and store as much carbon as possible. However, the modeling for the 2022 Scoping Plan indicates that natural and

[100] *Carbon neutrality* means "net zero" emissions of GHGs. In other words, it means that GHG emissions generated by sources such as transportation, power plants, and industrial processes must be less than or equal to the amount of CO_2 that is stored, both in natural sinks and through mechanical sequestration. AB 1279 uses the terminology "net zero" and the 2022 Scoping Plan uses the terminology "carbon neutrality" or "carbon neutral." For purposes of the Draft 2045 CAP and this EIR, these terms mean the same thing and are used interchangeably.

[101] California Air Resources Board, 2022. *2022 Scoping Plan For Achieving Carbon Neutrality.* November 16, 2022. Available: https://ww2.arb.ca.gov/sites/default/files/2022-12/2022-sp_1.pdf. Accessed January 2023.

[102] California Air Resources Board, 2022. *2022 Scoping Plan For Achieving Carbon Neutrality.* November 16, 2022. Available at: https://ww2.arb.ca.gov/sites/default/files/2022-12/2022-sp_1.pdf. Accessed January 2023.

working lands, on their own, will not provide enough sequestration and storage to address all residual emissions. Therefore, it will be necessary to research, develop, and deploy additional methods of capturing CO2 that include pulling it from smokestacks of facilities, or drawing it out of the atmosphere itself and then safely and permanently utilizing and storing it.[103]

The 2022 Scoping Plan shows that the state must take unprecedented and substantial action to achieve its climate goals, far beyond anything CARB has considered in prior scoping plans. In CARB's own words, the 2022 Scoping Plan "is the most comprehensive and far-reaching Scoping Plan developed to date" and "[m]odeling for this Scoping Plan shows that this decade must be one of transformation on a scale never seen before to set us up for success in 2045."[104]

The 2022 Scoping Plan includes the Scoping Plan Scenario, which "builds on and integrates efforts already underway to reduce the state's GHG, criteria pollutant, and toxic air contaminant emissions by identifying the clean technologies and fuels that should be phased in as the state transitions away from combustion of fossil fuels." The 2022 Scoping Plan approaches decarbonization from two perspectives: (1) managing a phasedown of existing energy sources and technology and (2) ramping up, developing, and deploying alternative clean energy sources and technology over time. Under the Scoping Plan Scenario, the demand for liquid petroleum will decrease by 94 percent and total fossil fuels by 86 percent in 2045 relative to 2022.[105]

Additionally, carbon removal will be necessary to achieve net negative emissions to address historical GHGs already in the atmosphere. The 2022 Scoping Plan does not specify how the residual emissions will be removed, as this will require the development of new carbon capture and storage (CCS) and direct air capture (DAC) technologies, which will require governmental or other incentive support to overcome technology and market barriers.[106]

The 2022 Scoping Plan also discusses the role of local governments in meeting the state's GHG emissions reduction goals because local governments have jurisdiction and land use authority related to community-scale planning and permitting processes, local codes and actions, outreach and education programs, and municipal operations. The efforts of local governments to reduce GHG emissions within their jurisdictions are critical to achieving the state's long-term climate goals. Furthermore, local governments make critical decisions on how and when to deploy transportation infrastructure and can choose to support transit, walking, bicycling, and neighborhoods that allow people to transition away from cars; they can adopt building ordinances that exceed statewide building code requirements; and they play a critical role in facilitating the rollout of ZEV infrastructure.[107] The 2022 Scoping Plan encourages local governments to take

[103] Ibid.

[107] California Air Resources Board, 2022. *2022 Scoping Plan for Achieving Carbon Neutrality*. Appendix D, "Local Actions." November 16, 2022. Available at https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-appendix-d-local-actions.pdf. Accessed January 2023.

ambitious, coordinated climate actions at the community scale—actions that are consistent with and supportive of the state's climate goals.[108] These actions could include:

- Develop local CAPs and strategies consistent with the state's GHG emissions reduction goals.
- Incorporate state-level GHG emissions priorities into local governments' processes for approving land use and individual plans and individual projects.
- Implement CEQA mitigation, as needed, to reduce GHG emissions associated with new land use development projects.
- Leverage opportunities for regional collaboration.

Executive Order S-1-07

Executive Order S-1-07, signed by Governor Arnold Schwarzenegger in 2007, proclaimed that the transportation sector is the main source of GHG emissions in California, at over 40 percent of statewide emissions. The order established a goal of reducing the carbon intensity of transportation fuels sold in California by a minimum of 10 percent by 2020. It also directed the CARB to determine whether this Low Carbon Fuel Standard (LCFS) could be adopted as a discrete, early-action measure after meeting the mandates in AB 32. The CARB adopted the Low Carbon Fuel Standard on April 23, 2009.

In September 2018, CARB extended the LCFS program to 2030, making significant changes to the design and implementation of the program, including a doubling of the carbon intensity reduction to 20 percent by 2030.

Mobile Source Strategy

Implementing CARB's Mobile Source Strategy includes measures to reduce total light-duty VMT by 15 percent from the business-as-usual in 2050. The Mobile Source Strategy includes an expansion of the Advanced Clean Cars program (which further increases the stringency of GHG emissions for all light-duty vehicles, and 4.2 million zero-emission and plug-in hybrid light-duty vehicles by 2030). It also calls for more stringent GHG requirements for light-duty vehicles beyond 2025 as well as GHG reductions from medium-duty and heavy-duty vehicles and increased deployment of zero-emission trucks primarily for class 3 – 7 "last mile" delivery trucks in California. Statewide, the Mobile Source Strategy would result in a 45 percent reduction in GHG emissions, and a 50 percent reduction in the consumption of petroleum-based fuels.

Advanced Clean Cars II

In 2022, CARB approved the Advanced Clean Cars II Program for model years 2026–2035, which requires that all new passenger cars, trucks, and SUVs sold in California be zero emissions by 2035.[109] The regulation amends the ZEV Regulation to require an increasing number of ZEVs, and relies on advanced vehicle technologies, including battery-electric, hydrogen fuel cell

[108] Ibid.

[109] California Air Resources Board, 2023. *Advanced Clean Cars II Regulations: All New Passenger Vehicles Sold in California to be Zero Emissions by 2035*. Available at https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program/advanced-clean-cars-ii. Accessed April 8, 2023.

electric, and plug-in hybrid electric-vehicles, to meet air quality and climate change emissions standards, in support of Executive Order N-79-20.[110] This program also amended the Low-Emission Vehicle Regulations to include increasingly stringent standards for gasoline cars and heavier passenger trucks to continue to reduce smog-forming emissions.

Advanced Clean Trucks

On June 25, 2020, the air board adopted the Advanced Clean Trucks (ACT) rule, which requires truck manufacturers to transition from diesel vehicles to electric zero-emissions vehicles beginning in 2024, with the goal of reaching 100 percent zero-emissions vehicles by 2045.[111] The goal of the legislation is to help California meet its climate targets of a 40 percent reduction in GHG emissions and a 50 percent reduction in petroleum use by 2030, and an 80 percent reduction in GHG emissions by 2050. Truck manufacturers will be required to sell zero-emissions vehicles as an increasing percentage of their annual sales from 2024 through 2035. Companies with large distribution fleets (50 or more trucks) will be required to report information about their existing fleet operations in an effort to identify future strategies for increasing zero-emissions fleets statewide.[112]

Advanced Clean Fleets

On September 29, 2023, the Office of Administrative Law approved CARB's Advanced Clean Fleets (ACF) rule, which became state law on October 1, 2023. This regulation is part of CARB's broader strategy to accelerate the transition to zero-emissions medium- and heavy-duty vehicles. It complements the ACT regulation, focusing on reducing emissions and promoting zero-emissions vehicle adoption. The ACF regulation covers various fleet types, including drayage operations, government-owned fleets, and high-priority fleets, mandating ZEV adoption in phases. Key provisions include manufacturer sales mandates, requirements for drayage fleets to transition to ZEVs, and specific ZEV targets for high-priority and government fleets. The ACF regulation requires that manufacturers may sell only zero-emissions medium- and heavy-duty vehicles in California starting in 2036 and that high-priority fleets must purchase only ZEVs beginning 2024 and, starting January 1, 2025, must remove internal combustion engine vehicles at the end of their useful life, or that high-priority fleets must achieve 100 percent ZEVs by 2042.[113] The regulation is expected to significantly reduce emissions, benefit public health, and contribute to achieving climate goals.

Sustainable Freight Action Plan

Executive Order B-32-15 directed the State to establish targets to improve freight efficiency, transition to zero emission technologies, and increase the competitiveness of California's freight

[110] Ibid.

[111] California Air Resources Board, 2020. *California takes bold step to reduce truck pollution*. Available at https://ww2.arb.ca.gov/news/california-takes-bold-step-reduce-truck-pollution. Accessed October 2023.

[112] California Air Resources Board, 2021. *Advanced Clean Trucks Fact Sheet*. Available at https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-trucks-fact-sheet. Accessed December 2023.

[113] California Air Resources Board, 2023. *Advanced Clean Fleets Regulation Overview*. Available at https://ww2.arb.ca.gov/resources/fact-sheets/advanced-clean-fleets-regulation-overview. Accessed October 2023.

transport system. The targets are not mandates, but rather aspirational measures of progress towards sustainability for the State to meet and try to exceed. The targets include:

- ***System Efficiency Target*:** Improve freight system efficiency by 25 percent by increasing the value of goods and services produced from the freight sector, relative to the amount of carbon that it produces by 2030.
- ***Transition to Zero Emission Technology Target*:** Deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize near-zero emission freight vehicles and equipment powered by renewable energy by 2030.
- ***Increased Competitiveness and Economic Growth Targets*:** Establish a target or targets for increased State competitiveness and future economic growth within the freight and goods movement industry based on a suite of common-sense economic competitiveness and growth metrics and models developed by a working group comprised of economists, experts, and industry. These targets and tools will support flexibility, efficiency, investment, and best business practices through State policies and programs that create a positive environment for growing freight volumes and jobs, while working with industry to mitigate potential negative economic impacts. The targets and tools will also help evaluate the strategies proposed under the Action Plan to ensure consideration of the impacts of actions on economic growth and competitiveness throughout the development and implementation process.

California Transportation Plan 2040

The California Transportation Plan (CTP) 2040 provides a long-range policy framework to meet future mobility needs and reduce GHG emissions. The CTP defines goals, performance-based policies, and strategies to achieve maximum feasible emission reductions in order to attain a statewide reduction in GHG emissions.

The CTP 2040 recognizes that the Governor is committed to reduce by one-half current petroleum use in cars and trucks; increase from one-third to one-half the electricity derived from renewable sources; double the efficiency savings of existing buildings and make heating fuels cleaner; reduce the release of methane, black carbon, and other short-lived climate pollutants; and manage farm and rangelands, forests, and wetlands to store more carbon.

Transportation GHG reduction strategies within the CTP 2040 include demand management (including telecommuting/working at home, increased carpoolers, and increase car sharing), mode shift (including transit service improvements, high-speed rail, bus rapid transit, expanded bike and pedestrian facilities, carpool land occupancy requirements, and increased HOV lanes), travel cost (implement expanded pricing policies), and operational efficiency (incident/emergency management, Caltrans' Master Plan, ITS/TSM, and eco-driving).

Renewable Electricity Standards

SB 1078 (Chapter 516, Statutes of 2002) requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 20 percent of their supply from renewable sources by 2017. SB 107 (Chapter 464, Statutes of 2006) changed the target date to 2010. In November 2008, Governor Schwarzenegger signed Executive Order S-14-08, which expands the state's Renewable Portfolio Standard to 33 percent renewable power by 2020. In

September 2009, Governor Schwarzenegger continued California's commitment to the Renewable Portfolio Standard by signing Executive Order S-21-09, which directs the CARB under its AB 32 authority to enact regulations to help the state meet its Renewable Portfolio Standard goal of 33 percent renewable energy by 2020.

The 33 percent by 2020 RPS goal was codified in April 2011 with SB X1-2. This new Renewable Portfolio Standard (RPS) preempts the CARB 33 percent Renewable Electricity Standard and applies to all electricity retailers in the state, including publicly owned utilities (POUs), investor-owned utilities, electricity service providers, and community choice aggregators. SB 350 was signed in October 2015, and requires retail sellers and publicly owned utilities to procure 50 percent of their electricity from eligible renewable energy resources by 2030. Most recently, SB 100, signed by Governor Brown on September 10, 2018, increases the RPS requirement to 60 percent eligible renewables by 2030 and 100 percent by 2045.

Executive Order B-16-12

This executive order indicates that all State entities under the Governor's control support and facilitate the rapid commercialization of zero-emission vehicles. The order contains a target similar to Executive Order S-3-05 but focused on the transportation sector instead of all sectors. It stipulates that by 2050, virtually all personal transportation in the state will be based on zero-emission vehicles and that GHG emissions from the transportation sector will be reduced by 80 percent below 1990 levels. The order also indicates that the CARB, the California Energy Commission, the Public Utilities Commission, and other relevant agencies are ordered to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve the following:

- By 2015: The State's major metropolitan areas able to accommodate zero-emission vehicles, each with infrastructure plans and streamlined permitting; the State's manufacturing sector expend zero-emission vehicle and component manufacturing; an increase in the private sector's investment in zero-emission vehicle infrastructure; and the State's academic and research institutions contributing to zero-emission vehicle research, innovation and education.
- By 2020: The State's zero-emission vehicle infrastructure ability to support up to one million vehicles; the costs of zero-emission vehicles competitive with conventional combustion vehicles; zero-emission vehicles accessible to mainstream consumers; widespread use of zero-emission vehicles for public transportation and freight transport; and a decrease in transportation sector GHG emissions as a result of the switch to zero-emission vehicles; electric vehicle charging integrated into the electricity grid.
- By 2025: over 1.5 million zero-emission vehicles on California roads; easy access to zero-emission vehicle infrastructure in California; the zero-emission vehicle industry strong and sustainable part of California's economy; and California's vehicles displace at least 1.5 billion gallons of petroleum fuels per year.

Senate Bill 375

Signed into law on October 1, 2008, SB 375 supplements GHG emissions reductions from new-vehicle technology and fuel standards with reductions from more efficient land use patterns and improved transportation. Pursuant to SB 375, CARB approved GHG reduction targets in

February 2011 for California's 18 federally designated regional planning bodies, known as Metropolitan Planning Organizations. For the SACOG, CARB assigned a target of 19 percent per capita GHG reduction by 2035, compared to a 2005 baseline.

Green Building Code and Title 24

The California Energy Code (Title 24, Section 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California's energy consumption. The standards were not originally intended to reduce GHG emissions, but increased energy efficiency and reduced consumption of electricity, natural gas, and other fuels would result in fewer GHG emissions from residential and nonresidential buildings subject to the standard. These provisions include mandatory requirements for efficiency and design of energy systems, including space conditioning (cooling and heating), water heating, and indoor and outdoor lighting systems and equipment, and appliances. California's Building Energy Efficiency Standards are updated on an approximately three-year cycle as technology and methods have evolved. On August 11, 2021, the California Building Standards Commission approved the 2022 Energy Code for inclusion in the California Building Standards Code. This update builds on California's technological innovations and supports energy-efficient approaches to encourage building decarbonization, emphasize the use of heat pumps, strengthen ventilation standards, and extend the benefits of demand-flexible energy technology with the intention to enable California buildings to be responsive to climate change.

The California Green Building Standards Code (California Code of Regulations, Title 24, Part 11), commonly referred to as the CALGreen Code, is a statewide mandatory construction code that was developed and adopted by the California Building Standards Commission and the California Department of Housing and Community Development in 2008. CALGreen standards require new residential and commercial buildings to comply with mandatory measures under five topical areas: planning and design; energy efficiency; water efficiency and conservation; material conservation and resource efficiency; and environmental quality. CALGreen also provides voluntary tiers and measures that local governments may adopt which encourage or require additional measures in the five green building topics. The CALGreen Code is reviewed and updated on a three-year cycle. The most recent update was the 2022 CALGreen Code which took effect on January 1, 2023.

3.2.3 Local

Sacramento Metropolitan Air Quality Management District

California has 35 Air Pollution Control Districts (APCD) and Air Quality Management Districts (AQMD), many of which are currently addressing climate change issues by developing significance thresholds, performance standards, and mitigation measures. At this time, there are no adopted quantitative federal or state guidelines for GHG emission impacts. The Sacramento Metropolitan Air Quality Management District (SMAQMD) is the primary agency responsible for addressing air quality concerns in all of Sacramento County. SMAQMD also recommends methods for analyzing project-generated GHGs in CEQA analyses and offers multiple potential GHG reduction measures for land use development projects. SMAQMD developed thresholds of

significance to provide a uniform scale to measure the significance of GHG emissions from land use and stationary source projects in compliance with CEQA.[114] SMAQMD's goals in developing GHG thresholds include ease of implementation; use of standard analysis tools; and emissions mitigation consistent with the statewide GHG targets mandated by AB 32 of 2006.

SMAQMD published new CEQA guidance for the evaluation of GHG emissions in September 2020. The guidance provides lead agencies with a pathway to demonstrate that a project would not result in a cumulatively considerable contribution to global climate change. As indicated in SMAQMD's most recent guidance, projects subject to CEQA that are not subject to a qualified CAP may implement SMAQMD-vetted Tier 1 best management practices (BMPs) to reduce on-site GHG emissions. These Tier 1 BMPs include (1) designing projects without natural gas infrastructure and (2) constructing projects to meet the current California Green Building Standards Code (CalGreen) Tier 2 Standards with the amendment to upgrade electric vehicle (EV) parking spaces to EV ready rather than EV capable. EV capable means that the parking space is installed with a raceway and electrical panel capable of supporting an EV charging station. In addition to the raceway and panel, EV ready spaces have dedicated branch circuits, circuit breakers, and other electrical components to support future installation of charging stations, but do not include installation of the charger itself. If, following the application of Tier 1 BMPs, a project's GHG emissions are below a 1,100 metric tons of carbon dioxide equivalent per year ($MTCO_2e$/year) threshold, its contribution to global climate change would be considered less than significant. However, as a large or "inefficient" project as defined by SMAQMD, the use of Tier 1 BMPs would not be sufficient to reduce the Project's GHG emissions to a negligible level. Thus, the Project would be required to achieve a 15 percent reduction in VMT per resident from a regional average consistent with the Governor's Office of Planning and Research (OPR) guidance pursuant to Senate Bill 743. SMAQMD recommends several mechanisms to achieve applicable VMT reductions including, but not limited to, application of California Air Pollution Control Officers Association GHG-reduction strategies, incorporation of traffic calming measures, and promotion of zero-emission infrastructure such as bike lanes and pedestrian walkways.[115]

Sacramento Area Council of Governments

The Sacramento Area Council of Governments (SACOG) is the Metropolitan Planning Organization for the proposed Project site. One of the main responsibilities of SACOG is to maintain and develop comprehensive transportation planning for the region through transportation planning documents intended to improve future transportation networks and options for residents. SB 375, described above, requires MPOs to develop a Sustainable Communities Strategy (SCS) as part of their planning activities, which identifies policies and strategies to reduce GHG emissions from passenger vehicles to targets sets by the CARB.

[114] Sacramento Metropolitan Air Quality Management District, 2021. *Guide to Air Quality Assessment in Sacramento County*, Chapter 6: Greenhouse Gas Emissions. February. Available at https://www.airquality.org/LandUseTransportation/Documents/Ch6GHG2-26-2021.pdf. Accessed August 2023.

[115] Ibid.

Metropolitan Transportation Plan/Sustainable Communities Strategy

SACOG's MTP/SCS is the long-range transportation plan for the region. The MTP/SCS designates the region using five "community types" (Center and Corridor Community, Developing Community, Established Community, Rural Residential Community, and Lands Not Identified for Development in the MTP/SCS Planning Period).

The MTP/SCS designates the footprint of the Master Plan area within a larger area designated as a Developing Community and a Transit Priority Area (TPA).[116] Developing Communities are described by SACOG as follows:

> "*Developing Communities are typically, though not always, situated on vacant land at the edge of existing urban or suburban development; they are the next increment of urban expansion. Developing Communities are identified in local plans as special plan areas, specific plans, or master plans and may be residential-only, employment-only, or a mix of residential and employment uses. Transportation options in Developing Communities often depend, to a great extent, on the timing of development. Bus service, for example, may be infrequent or unavailable today, but may be available every 30 minutes or less once a community builds out. Walking and bicycling environments vary widely, though many Developing Communities are designed with dedicated pedestrian and bicycle trails*."[117]

For Developing Communities, such as the Master Plan area, the MTP/SCS shows a reduction in household-generated VMT per capita by 13 percent relative to 2016 in the year 2040[118]. This reduction is a result of land use changes, behavioral changes in choice of travel, and transportation investments. In addition, the MTP/SCS has the overall outcome of reducing mobile source emissions through compact growth patterns and proximity to transit:

> "*The location and pattern of the proposed MTP/SCS growth is important, because it impacts travel behavior and provides a means to determine the impact of future vehicle emissions in the plan area of the proposed MTP/SCS. A compact growth pattern served by an efficient and diverse transportation system provides the foundation to reduce automotive travel and increase walking, bicycling, and transit use—all of which reduce individual vehicle trips and associated VMT. Reduced VMT and vehicle trips are directly linked to reduced regional criteria air pollutant emissions and TAC emissions from mobile sources.*"[119]

[116] Sacramento Area Council of Governments, 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy, adopted November 18, 2019, Figure 3-5, p. 41, Figure 3-8, p. 52. Accessed August 2023.

[117] Sacramento Area Council of Governments, 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy, adopted November 18, 2019, pp. 40. Accessed August 2023.

Chapter 16: Transportation and Traffic. p. 16-51. Available: https://www.sacog.org/sites/main/files/file-attachments/ch._16_transportation_pdeir.pdf?1569040290. Accessed August 2023.

[119] Sacramento Area Council of Governments, 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy Draft Environmental Impact Report. Chapter 5: Air Quality. p. 5-54. Available: https://www.sacog.org/sites/main/files/file-attachments/ch._5_air_quality_pdeir.pdf?1569039959. Accessed August 2023.

The MTP/SCS is designed to identify areas within the region sufficient to house all of the forecasted population of the region. This is based on adopted local general plans, community plans, specific plans, and local policies and regulations. The MTP/SCS is not a growth-inducing document and does not regulate or control growth within the region:

> "*While the MTP/SCS is required to integrate land use and transportation planning, the plan recognizes and protects local land use authority. Under SB 375 and the MTP/ SCS, the region's cities and counties retain local land use authority over where future development occurs. The MTP/ SCS land use and transportation assumptions are built using local plans and in close coordination with planning and transportation staff around the region. The plan does not mandate any changes to local zoning rules, general plans, or processes for reviewing projects; nor can the plan act as a cap on development in any given jurisdiction.*"[120] *(Emphasis added.)*

Currently, the 2020 MTP/SCS does not fully account for all growth anticipated within the Master Plan Area.[121] However, the MTP/SCS is updated every four years to include additional amendments to County and City General Plans and consider approved projects and new specific plans, such as the Master Plan.

Sacramento County Climate Emergency Resolution

December 16, 2020, the Sacramento County Board of Supervisors adopted a Resolution declaring a climate emergency and directing the formation of a permanent Climate Emergency Mobilization Task Force. The resolution acknowledges the severe impacts of climate change on Sacramento County, including extreme heat, rising temperatures, droughts, wildfires, air pollution, health issues, disruptions to services and the economy, property loss, and more. The resolution sets a goal for Sacramento County to achieve carbon neutrality by 2030, aiming to eliminate greenhouse gas emissions and potentially sequester more emissions than produced. The resolution establishes a Climate Emergency Mobilization Task Force composed of climate experts to oversee climate emergency response planning and implementation across county departments. The resolution also calls for the County to implement a climate and sustainability plan that identifies and integrates current and future actions necessary to achieve an equitable, sustainable, and resilient economy and transition to a countywide carbon neutrality footprint by 2030.On June 11, 2023, the Sacramento County Board of Supervisors considered a revision to the resolution that would change the goal of carbon neutrality by 2030 to the year 2045 to align with AB 1279 and the 2022 Scoping Plan. Instead of approving or rejecting the suggested update, the board asked staff to present another version of the climate emergency declaration in early 2024. The board requested revisions including adding a requirement to measure progress on reducing emissions every five years.

[120] Sacramento Area Council of Governments, 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy, adopted November 18, 2019, pp. 61. Accessed August 2023.

[121] Glover, Tina. "RE: Growth Estimates Within West Jackson Highway Master Plan." Message to Dan Sloat. November 20, 2017. Email.

Sacramento County Climate Action Plan

The Sacramento County Board of Supervisors adopted the Climate Action Plan – Strategy and Framework Document (Phase 1 CAP) on November 9, 2011. The Phase 1 CAP provides a framework and overall policy strategy for reducing greenhouse gas emissions and managing the County's resources in order to comply with AB 32.[122] The Phase 1 CAP includes a GHG inventory for the unincorporated areas of Sacramento County for 2005, a GHG emission reduction target, and goals and implementation measures developed to help the County reach these goals. Reduction strategies address GHG emissions associated with transportation and land use, energy, water, waste management and recycling, and agriculture and open space. The County's primary goals related to transportation and energy use include the following:

- Increase the average fuel efficiency of County-owned vehicles powered by gasoline and diesel and encourage increased fuel efficiency in community vehicles;
- Increase the use of alternative and lower carbon fuels in the County-owned vehicle fleet and facilitate their use in the community;
- Reduce total vehicle miles traveled per capita in the community and region;
- Improve energy efficiency of existing and new buildings in the unincorporated county;
- Improve energy efficiency of operating County-owned infrastructure (roads, water, waste, buildings, etc.); and
- Decrease use of fossil fuels by transitioning to renewable energy sources.

On September 11, 2012, the Phase 2A CAP (Government Operations) was adopted by the County.[123] Neither the Phase 1 CAP nor the Phase 2A CAP are "qualified" GHG reduction plans pursuant to CEQA Guidelines section 15183.5(b), through which subsequent projects may receive CEQA streamlining benefits.

In 2016, the County began updating the communitywide CAP (Phase 2B CAP), but in late 2018, it was placed on hold pending in-depth review of CAP-related litigation in other jurisdictions. General Plan Policy LU-115 and associated Implementation Measures F through J of the General Plan Land Use Element identifies the County's commitment to a Communitywide CAP. This commitment was made in part due to the County's General Plan Update process and potential expansion of the Urban Policy Area to accommodate new growth areas. General Plan Policies LU-119 and LU-120 were developed with SACOG to be consistent with smart growth policies in the SACOG Blueprint, which are intended to reduce VMT and GHG emissions. In addition to reducing GHG emissions in Sacramento County, the CAP is intended to serve as a climate change resiliency plan to ensure that the County is prepared for the physical effects of climate change. In

[122] Sacramento County, 2011. *Climate Action Plan – Strategy and Framework Document*. Available at https://planning.saccounty.net/PlansandProjectsIn-Progress/Documents/Climate%20Action%20Plan/CAP%20Strategy%20and%20Framework%20Document.PDF. Accessed August 2023.

[123] Sacramento County, 2012. *Climate Action Plan: County Government Operations*. June. Available at https://planning.saccounty.gov/PlansandProjectsIn-Progress/Documents/Climate%20Action%20Plan/Government%20Operations%20CAP.pdf. Accessed August 2023.

2015, the County released an updated GHG inventory (see Table 3-1 above) and a Climate Change Vulnerability Assessment, which identified extreme heat and increased flooding as the most likely adverse impacts to Sacramento County.

The Phase 2B CAP was re-initiated in early 2020. In March of 2021, the draft Phase 2B CAP was released by the County for public review. In September 7 2021, a Final Draft CAP and Addendum to the 2030 General Plan EIR was released for public review. The County revised the CAP a second time and released the Revised Final Draft CAP and Revised Addendum to the 2030 General Plan EIR on February 17, 2022. These documents were presented at a Board of Supervisors workshop on March 23, 2022. The County received more than 85 comment letters on the Revised Final Draft CAP leading up to the Board workshop on March 23, 2022. Based on input from the Board of Supervisors during the September 27, 2022 hearing on the CAP, County staff are reviewing the numerous comments received and preparing responses to those comments.[124] As a result, another revision to the CAP is expected prior to adoption.

Based on the inventory and GHG reductions identified in the Phase 2B CAP, the County has set a goal of achieving a 4.0 metric tons of carbon dioxide equivalent per capita ($MTCO_2e$/capita) for 2030, resulting in an emissions limit of 3,674,904 $MTCO_2e$ (Sacramento County, 2022b).[125] As allowed under CEQA Guidelines Section 15183(b), lead agencies may choose to analyze and mitigate significant GHG emissions in a plan for the reduction of GHG emissions or similar document.

The analysis prepared in this EIR is based on the project-specific Air Quality Green House Gas Reduction Plan (AQGHGRP) because the CAP remains in draft form and has not been formally adopted by the County. As such, the CAP is not yet qualified for use in CEQA review.

Sacramento County General Plan

The *Sacramento County General Plan Air Quality Element*[126] contains the following goals and policies that would apply to GHG emissions associated with the Master Plan.

GOAL: Improve air quality to promote public health, safety, welfare, and environmental quality of the community.

Policies

AQ-1: New development shall be designed to promote pedestrian/bicycle access and circulation to encourage community residents to use alternative modes of transportation to conserve air quality and minimize direct and indirect emission of air contaminants.

[124] Sacramento County, 2023. *Climate Action Plan*. Available at https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/CAP.aspx. August 2023.

[125] Sacramento County, 2022. *Sacramento County Climate Action Plan*. August. Available at https://planning.saccounty.gov/PlansandProjectsIn-Progress/Documents/Climate%20Action%20Plan/Final%20Climate%20Action%20Plan.pdf. Accessed August 2023.

[126] Sacramento County, 2011. *Sacramento County General Plan Air Quality Element*, November 9, 2011.

AQ-2: Support Regional Transit's efforts to secure adequate funding so that transit is a viable transportation alternative. Development shall pay its fair share of the cost of transit facilities required to serve the project.

AQ-4: Developments which meet or exceed thresholds of significance for ozone precursor pollutants, and/or Greenhouse Gases (GHG) as adopted by the Sacramento Metropolitan Air Quality Management District (SMAQMD), shall be deemed to have a significant environmental impact. An Air Quality Mitigation Plan and/or a Greenhouse Gas Reduction Plan shall be submitted to the County of Sacramento prior to project approval, subject to review and recommendation as to technical adequacy by the Sacramento Metropolitan Air Quality Management District.

AQ-5: Reduce emissions associated with vehicle miles travelled and evaporation by reducing the surface area dedicated to parking facilities; reduce vehicle emissions associated with "hunting" for on-street parking by implementing innovative parking innovative parking solutions including shared parking, elimination of minimum parking requirements, creation of maximum parking requirements, and utilize performance pricing for publicly owned parking spaces both on- and off-street, as well as creating parking benefit districts.

AQ-6: Provide incentives for the use of transportation alternatives, including a program for the provision of financial incentives for builders that construct ownership housing within a quarter mile of existing and proposed light rail stations.

AQ-7: Implement a model trip reduction program for County employees which may include, but not be limited to, flexible and compressed work schedules, commuter matching services, telecommuting, preferential carpool/vanpool parking, carpool/vanpool and transit subsidies, and all other commute alternative incentives.

AQ-8: Promote mixed-use development and provide for increased development intensity along existing and proposed transit corridors to reduce the length and frequency of vehicle trips.

AQ-9: When park-and-ride facilities are requested by transit providers, the spaces provided for the park-and-ride facility may be counted as part of the total amount of parking required by the zoning code.

AQ-10: Encourage vehicle trip reduction and improved air quality by requiring development projects that exceed the SMAQMD's significance thresholds for operational emissions to provide on-going, cost-effective mechanisms for transportation services that help reduce the demand for existing roadway infrastructure.

AQ-11: Encourage contractors operating in the county to procure and to operate low-emission vehicles, and to seek low emission fleet status for their off-road equipment.

AQ-13: Use California State Air Resources Board (ARB) and SMAQMD guidelines for Sacramento County facilities and operations to comply with mandated measures to reduce emissions from fuel consumption, energy consumption, surface coating operations, and solvent usage.

AQ-16: Prohibit the idling of on-and off-road engines when the vehicle is not moving or when the off-road equipment is not performing work for a period of time greater than five minutes in any one-hour period.

AQ-17: Promote optimal air quality benefits through energy conservation measures in new development.

AQ-18: Require the recovery of chlorofluorocarbons (CFC's) when older air conditioning and refrigeration units are serviced or disposed.

AQ-19: Require all feasible reductions in emissions for the operation of construction vehicles and equipment on major land development and roadway construction projects.

AQ-20: Promote Cool Community strategies to cool the urban heat island, reduce energy use and ozone formation, and maximize air quality benefits by encouraging four main strategies including, but not limited to: plant trees, selective use of vegetation for landscaping, install cool roofing, and install cool pavements.

AQ-22: Reduce greenhouse gas emissions from County operations as well as private development.

The *Sacramento County General Plan Energy Element*[127] contains the following goals and policies that would apply to the Master Plan.

GOAL: It is the goal of Sacramento County to—

- **Reverse the historical trend of increasing per capita consumption of energy, and**
- **Shift toward using a greater share of renewable sources of energy, and**
- **Shift seasonal and daily peak energy demands to increase the load factor of electrical generating facilities, while**
- **Maintaining or enhancing the general standard of living, the level of employment, and the quality of the environment.**

Policies

EN-3: Encourage the conservation and rehabilitation of existing housing and the revitalization of older, more intensively developed neighborhoods in the urban area.

EN-5: Reduce travel distances and reliance on the automobile and facilitate increased use of public transit through appropriate land use plans and regulations.

EN-6: Actively support the efforts of the Regional Transit District to expand and upgrade service and attract an increasing percentage of travel.

EN-7: Expand existing programs and develop new programs which promote and encourage vanpooling and carpooling.

[127] Sacramento County, 2011. *Sacramento County General Plan Air Quality Element*, November 9, 2011.

EN-10: Continue implementation of the Bikeways Master Plan, and develop standards for neighborhood bikeways and pedestrian-ways, incorporating them into Neighborhood Planning Standards.

EN-12: Encourage industry located or locating in the Sacramento area to participate in co-generation of power.

EN-16: Promote the use of passive and active solar systems in new and existing residential, commercial, and institutional buildings as well as the installation of solar swimming pool heaters and solar water and space heating systems.

EN-17: Support the development and improvement of solar space cooling systems.

EN-19: Support the development and use of renewable sources of energy, including but not limited to biomass, solar, wind, and geothermal.

The *Sacramento County General Plan Land Use Element*[128] contains the following goals and policies that would apply to GHG emissions associated with the Master Plan.

GOAL: New development in existing communities, in new growth areas and improvements to existing buildings and housing stock that are designed and constructed to be energy efficient and incorporate renewable energy technologies where cost-effective and feasible.

Policies

LU-28: Encourage the development of energy-efficient buildings and communities.

LU-30: Whenever feasible, incorporate energy-efficient site design, such as proper orientation to benefit from passive solar heating and cooling, into master planning efforts.

GOAL: Habitat enhancement, open space protection, greenhouse gas emission reduction and cohesive urban design accomplished by Local, State, and Federal agency coordination.

Policies

LU-115: New development shall be designed to promote pedestrian/bicycle access and circulation to encourage community residents to use alternative modes of transportation to conserve air quality and minimize direct and indirect emission of air contaminants.

[128] Sacramento County, 2011. *Sacramento County General Plan Air Quality Element*, November 9, 2011.

3.3 Analysis, Impacts, and Mitigation

3.3.1 CEQA Significance Criteria

According to Appendix G of the CEQA *Guidelines*, a project would have a significant effect associated with GHGs if it would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

The California Air Pollution Control Officers Association (CAPCOA) considers GHG impacts to be exclusively cumulative impacts;[129] therefore, assessment of significance is based on a determination of whether the GHG emissions from a project represent a cumulatively considerable contribution to the global atmosphere. CEQA Guidelines Section 15064.4 gives lead agencies the discretion to determine whether to assess GHG emissions quantitatively and/or qualitatively. The guidelines do not establish a quantitative threshold of significance, but rather, lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including looking to thresholds developed by other public agencies or suggested by other experts (such as the CAPCOA) so long as any threshold chosen is supported by substantial evidence.

According to the SMAQMD's *Guide to Air Quality Assessment in Sacramento County (CEQA GUIDE)*, GHG emissions generated during project construction that exceed 1,100 $MTCO_2e$ per year represent a cumulatively considerable contribution to a significant cumulative environmental impact.[130] Since Sacramento County has not developed GHG significance thresholds applicable to construction, SMAQMD's annual GHG construction significance threshold of 1,100 $MTCO_2e$ is used to determine whether the Master Plan would result in a significant impact on GHG emissions during project construction. Sacramento County currently does not have an established significance threshold or draft standard to demonstrate a project's consistency with AB 1279 through 2045. Thus, for project operation, the threshold of significance is net-zero GHG emissions. This threshold does not establish a precedent for use for any other project within the County.

A significant impact would occur if the proposed project would conflict with applicable regulations, plans, and policies that were adopted to reduce GHG emissions that contribute to global climate change. This analysis considers the proposed project's consistency with applicable plans, policies, and regulations to reduce GHG emissions. Since it is assumed that the proposed Master Plan would not be built-out until the year 2055, the Master Plan must demonstrate

[129] CAPCOA, 2008. *CEQA and Climate Change: Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act*.

[130] Sacramento Metropolitan Air Quality Management District (SMAQMD), 2018. Guide to Air Quality Assessment. Chapter 6: Greenhouse Gases. Available: http://www.airquality.org/LandUseTransportation/Documents/Ch6GHGFinal5-2018.pdf. Accessed August 2023.

consistency with the statewide GHG reduction target established by AB 1279 (85 percent below 1990 levels and carbon neutrality by 2045).

Since CalEEMod version 2020.4.0 only allows the user to enter operations up to 2050, it was not possible to model an operational year 2055 in CalEEMod. Therefore, GHG emissions under the Master Plan were modeled for operational year 2050. This is a more conservative approach than using 2055 because emission rates will likely be higher in 2050 than in 2055 due to continual improvements in vehicle technology, emission controls, and fuel efficiency. Although there are existing uses within the Master Plan area, GHG emissions for these uses were not modeled due to their limited number, and emissions from these uses would be minor. It is also conservative to assume zero emissions from existing uses because these emissions would be subtracted from Master Plan emissions to determine the net change in emissions from the Master Plan.

3.3.2 Methods and Assumptions

Construction

Since the Master Plan will be built-out based on market demand, the exact phasing of construction is unknown. For this analysis, the first year of construction was modeled to approximate the worst-case construction GHG emissions. Equipment used during the first year of construction would be equipped with engines that would emit more GHG emissions than construction equipment used in later construction years. This is because construction equipment becomes cleaner over time as older, less efficient equipment is replaced through fleet turnover with newer, cleaner equipment that meets more stringent emission standards as required by CARB and the U.S. EPA. It is also because the construction of backbone infrastructure and site grading is expected to occur more intensely in earlier years to make the site ready for vertical development in later years, and grading/infrastructure construction typically requires larger, more powerful off-road construction equipment (such as excavators and graders) and heavy-duty haul trucks for soil import and export, which have greater emission rates than smaller equipment used for vertical construction such as cranes and forklifts.

Since the Master Plan is anticipated to be built out over a 30-year period, it is assumed that 1/30th of the proposed developments would be constructed in the year 2025. As discussed above, this is a conservative assumption given the scale of the Master Plan compared to other large developments planned for the County, the likelihood that the Master Plan would take longer than 30 years to build out, and the large proportion of regional development anticipated for the County that the Master Plan represents. Using the methods contained in SMAQMD's *Guide to Air Quality Assessment in Sacramento County*, CalEEMod 2020.4.0 was used to estimate construction emissions for the Master Plan. CalEEMod is an approved emissions inventory software program that allows the user to estimate criteria pollutant emissions from land use development projects. It is assumed that the Master Plan would require 500,000 cubic yards of soil import during the grading phase. Assuming the haul trucks used during project construction can carry 16 cubic yards of soil each and construction will be completed over a 30-year period, the first year of construction could result in 2,083 one-way haul truck trips associated with 16,667 cubic yards of soil. However, because the first few years of construction are likely to involve more grading and soil import than later years, it was conservatively assumed that the first year of construction would move 1/10th of

the total soil import or 50,000 cubic yards, which would result in 6,250 one-way haul truck trips. CalEEMod defaults for number of construction equipment per construction phase and daily worker and vendor trips were used. Additional information and model results for each of the analyses described above are presented in Appendix A.

The 2022 version of CalEEMod was released May 27, 2022, and has several default inputs that are different from the 2020 version that would impact construction modeling results, including revised average trip lengths for worker, vendor, and haul trips, and changes to GHG emission rates for off-road construction equipment and on-road vehicles.[131] However, these changes would result in minor differences in the modeled GHG emissions and would not materially affect the air quality analysis. SMAQMD currently approves the use of CalEEMod 2020.4.0 for CEQA compliance.[132]

Operation

The proposed developments under the Master Plan are anticipated to be fully built-out in 2055. As discussed above, since CalEEMod version 2020.4.0 only allows the user to enter operational years up to 2050, it was not possible to model an operational year 2055 in CalEEMod. Therefore, for this analysis, GHG emissions under the Master Plan were modeled for the operational year of 2050 using CalEEMod version 2020.4.0.

As noted above for construction, the 2022 version of CalEEMod was released May 27, 2022, and has several default inputs that are different from the 2020 version that would impact operational modeling results, including changes to GHG emission rates for energy use, landscaping, water consumption and wastewater treatment, and solid waste disposal.[133] The newest version of CalEEMod also includes a new calculation for refrigerant emissions and updated energy consumption estimates. However, these changes would result in minor differences in the modeled GHG emissions and would not materially affect the analysis.[134] SMAQMD currently approves the use of CalEEMod 2020.4.0 for CEQA compliance.[135]

GHG Sequestration and Land Use Change

Regarding long-term operation emissions at full buildout, the implementation of the Master Plan would result in a potential net addition in carbon sequestration capacity due to land use change

[131] ICF, Sacramento Metropolitan Air Quality Management District, Fehr & Peers, STI, and Ramboll, 2021. *Appendix H: Comparison to CalEEMod Version 2020.4.0*. [134] For example, the 2022 version of CalEEMod has updated natural gas consumption estimates, but the Master Plan will be all electric. The 2022 version of CalEEMod also uses an updated version of the EMFAC model for on-road emission rates, but mobile emissions for the Master Plan were modeled using EMFAC2021 outside of CalEEMod.

[135] Philley, Paul. Sacramento Metropolitan Air Quality Management District. September 6, 2023 telephone correspondence with Brian Schuster, ESA.

and the planting of new trees. The carbon sequestration credit from these activities was estimated using project-specific information provided by the Applicants and vegetation defaults provided by CalEEMod 2020.4.0. For the purposes of a conservative analysis of GHG sequestration, trees associated with open space parcels were excluded from the total to avoid double-counting credit from open space land use changes. **Table 3-3** shows the total number of new trees planted.

TABLE 3-3
NEW TREES PLANTED BY THE MASTER PLAN

Land Use Type	Total Acres	Trees Per Acre by Land Use Type	Percent New Trees Planted	Total New Trees Planted	New Street Trees Per Acre	Total New Street Trees Planted	Total New Trees Planted
SFR	2,071	14.5	90%	27,000	12	24,848	51,848

NOTES:

Land use change data were provided by the Project Applicant. GHG sequestration associated with land use change was calculated using CalEEMod 2020.4.0. Additional information and model results for each of the analyses described above are presented in Appendix A.

SOURCES:

1. ESA, 2023; see Appendix A.

Energy Sources

Regarding electricity-related GHG emissions, the Sacramento Municipal Utility District (SMUD) (the utility serving the Master Plan area) has not published their forecasted GHG intensity factors for the year 2050; thus, SMUD's published forecast of their 2045 GHG intensity factor (2 pounds CO_2 per megawatt hour) was used to model indirect GHG emissions associated with electricity.[136] Since construction of the Master Plan is anticipated to begin in 2025, it is assumed that all buildings will be constructed to 2022 Title 24 energy efficiency standards (which go into effect on January 1, 2023). Future Title 24 requirements were not modeled because the specific requirements are not known this time. The 2022 energy efficiency standards require solar for all new single-family homes and for all multi-family up to three stories. This covers all proposed residential buildings for the Master Plan.

Natural gas emissions from the Master Plan's buildings were calculated using CalEEMod defaults for the Master Plan's land uses. In addition, the Master Plan is proposed to be an all-electric development and thus does not include any natural gas infrastructure for future buildings. Therefore, direct GHG emissions associated with the Project's natural gas usage are not quantified as part of the analysis for the mitigated scenario. Using CalEEMod defaults, natural gas usage was converted to electricity usage and added to energy emissions to account for additional electricity used to replace the loss of natural gas.

Area Sources

Operational area emissions were estimated using CalEEMod defaults. Area sources include architectural coatings, consumer products, and landscape maintenance equipment. These emissions were calculated based on the square footage of all buildings and default model assumptions for reapplication rates.

Mobile Sources

For on-road vehicles, GHG emissions were calculated using EMFAC2021 emission factors for Sacramento County and VMT per speed bin data provided by DKS for the Master Plan. Additional information and model results for each of the analyses described above are presented in Appendix A.

Solid Waste

GHG emissions associated with the disposal of solid waste were calculated using CalEEMod. CalEEMod estimates GHG emissions generated from landfill gas that is not captured and not used for energy recovery (e.g., generating electricity). Default waste generation rates were used for each land use subtype. CalEEMod assumes that 94 percent of landfills recover the landfill gas; this default value was used in the modeling. CalEEMod also assumes that 75 percent of landfill gas is captured (the rest is emitted to the atmosphere). Landfill gas recovery systems can capture

[136] California Air Pollution Control Officers Association, 2021. *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*. Table E.4-4, pg. 685. December. Available at: https://www.caleemod.com/documents/handbook/full_handbook.pdf. Accessed August 2023.

over 90 percent, according to the U.S. EPA.[137] According to Sacramento County staff an average LFG capture efficiency of 77 percent is reasonable and conservative for the Sacramento region, based on estimates from CARB and SMAQMD.[138] As such, the CalEEMod default capture efficiency value of 75 percent was revised to 77 percent. This is estimated to reduce default landfill emissions by 1,287 $MTCO_2e$ per year.

Water and Wastewater

CalEEMod estimates the contribution of GHG emission associated with supplying and treating water and wastewater for each land use subtype. These emissions were calculated using defaults for indoor and outdoor water use and SMUD's 2045 GHG intensity factor.

3.3.3 Impacts and Mitigation Measures

Impact GHG.1: Construction and operation of the Master Plan could generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. (*Less than Significant with Mitigation*)

Based on the methods described above, annual GHG emissions during the first year of construction (2025)[139] were estimated to be approximately 4,370 $MTCO_2e$ per year for the Master Plan, as shown in **Table 3-5**. This would exceed the SMAQMD GHG significance threshold of 1,100 $MTCO_2e$ per year for construction emissions, resulting in a significant impact.

Operational GHG emissions under the Master Plan are presented in Table 3-5 and **Table 3-6** for the modeled buildout year of 2050. The Master Plan would result in an increase in direct GHG emissions primarily due to onroad vehicle trips, energy use (electricity and natural gas), and solid waste generation. Mitigated operational emissions from residential land uses and non-residential land uses are presented in **Table 3-7**. The Master Plan is proposed as an all-electric development and natural gas service would not be provided to structures in the area. Therefore, there would be no direct GHG emissions from energy associated with natural gas infrastructure. However, for purposes of this impact analysis, it was assumed under unmitigated conditions that the project would result in natural gas use and combustion.

[137] U.S. EPA, 2023. Landfill Gas Energy Project Data. July. Available at https://www.epa.gov/lmop/landfill-gas-energy-project-data. Accessed September 2023.

[138] Zuber, Jeremy. County of Sacramento Department of Waste Management & Recycling. September 13, 2023 email correspondence with Brian Schuster, ESA

[139] Construction emissions during the first year of construction in 2025 represent the year with the highest equipment emission factors, and therefore likely the highest annual GHG emissions (assuming even buildout of the Master Plan over 30 years). This is because construction equipment becomes cleaner over time as less efficient equipment are replaced through fleet turnover with cleaner equipment that meets more stringent emission standards. These emissions would occur annually.

TABLE 3-5
ANNUAL CONSTRUCTION GHG EMISSIONS UNDER THE MASTER PLAN ($MTCO_2E$ PER YEAR)

Construction	Project Construction GHG Emissions	SMAQMD's Annual GHG Threshold	Exceeds Threshold (yes or no)?
Master Plan	4,370	1,100	**Yes**

NOTES:
Construction emissions were estimated using CalEEMod 2020.4.0 for the first year of construction in 2025. Additional information and model results for each of the analyses described above are presented in Appendix A.

Sequestration credit from land use cover changes [c]	-13,525	-9,890	-13,525	-9,890
Total GHG emissions	*19,281*	*62,011*	*-3,601*	*18,234*

NOTES:

a. GHG emissions were calculated using the CalEEMod.2020.4.0 model. Mitigation measures modeled include all-electric buildings (no natural gas) and compliance with electric-vehicle requirements in the most recently adopted version of CALGreen Tier 2. Additional assumptions and data are included in Appendix A.
b. Mobile emissions for residential and nonresidential land uses were calculated based on a percentage split derived using project specific fleet mix by land use.
c. Sequestration credits from land use cover changes were distributed to residential and nonresidential land uses based on the portion of estimated building square footage for each land use type from total project building square footage. Residential land uses are estimated to be 24.5 million square feet and nonresidential land uses are projected to be 17.9 million square feet.

ABBREVIATIONS:

GHG = greenhouse gas
$MTCO_2e$ = metric tons carbon dioxide equivalent

SOURCES:

1. ESA, 2023; see Appendix A.

The following features that reduce operational GHG emissions would be included into the project design for the Master Plan as project design features, but are not considered mitigation measures:

- energy efficient street lighting fixtures;
- solar panel roofs;
- use of low VOC paints and products per SMAQMD rules and regulations;
- compliance with 2022 CALGreen Code, including mandatory energy efficiency measures;
- compliance with the 2022 Title 24 Energy Standards;
- restriction of wood-burning devices (i.e., only natural gas fireplaces permitted, if any); and
- water conservation measures (turf reduction [approximately 28 percent reduction from residential and 20 percent for parks] and irrigation controllers).
- conversion of existing maintained industrial supporting property to support different vegetation land use types
- planting of over 82,000 new trees

The Master Plan also includes numerous features that reduce VMT; these are listed in Chapter 2 Air Quality under Impact AQ.1.

For unmitigated conditions, a majority of the projected operational GHG emissions for the Master Plan area are from mobile sources (57 percent), followed by solid waste (21 percent) and energy (20 percent). As shown in Table 3-6 above, the Master Plan will exceed the net-zero threshold, which would be considered a **significant impact**. Therefore, mitigation is required to reduce operational GHG emissions below the net zero GHG threshold.

As shown in Table 3-7, after implementation of identified on-site mitigation measures and allowing for sequestration credit associated with land use cover changes throughout the Master Plan area, it is estimated that residential land uses would emit -3,601 $MTCO_2e$ total or -0.22 $MTCO_2e$ per DU and nonresidential land uses would emit 18,234 $MTCO_2e$ total or 1.02 $MTCO_2e$ per thousand square feet of development.

The mitigation measures below demonstrate how future development within the Master Plan area will be required to achieve a plan-wide reduction in GHG emissions to meet the net-zero GHG emissions threshold. Each future development project implemented under the Master Plan shall prepare a GHG Reduction Plan prior to the start of project construction activities. The Plan will document project-related GHG emissions, including the effect of GHG reduction measures and the net incremental emissions reductions required to achieve the County's GHG thresholds relative to the buildout year of each project. The Plan shall quantify how each future development will meet the net zero GHG emissions thresholds required at buildout. Implementation of the Plan for each future development project is intended to show how total Master Plan-wide GHG emission reductions by the year 2050 will meet the net-zero threshold.

Since the technology is not currently available to demonstrate a project's consistency with AB 1279's targets of reducing anthropogenic GHG emissions to 85 percent below 1990 levels and achieving carbon neutrality by 2045, it is not currently practical for individual development under the Master Plan to demonstrate consistency with AB 1279. However, for purposes of this analysis, the GHG reduction requirement for future development within the Master Plan area is net-zero GHG emissions by 2050.

Mitigation Measures

Mitigation Measure AQ.1-1: Air Quality Mitigation Plan (see Impact AQ.1)

Mitigation Measure AQ.1-2: Electric Vehicle Charging Infrastructure (See Impact AQ.1).

Mitigation Measure AQ.2-1: Basic Construction Emission Control Practices (See Impact AQ.1).

Mitigation Measure AQ.2-2: Enhanced Exhaust Control Practices (see Impact AQ.2)

Mitigation Measure AQ.3-2: Operational Truck Emissions Reduction (See Impact AQ.3).

Mitigation Measure AQ.3-3: Electric Landscaping Equipment (See Impact AQ.3).

Mitigation Measure AQ.3-4: Best Available Emissions Controls for Stationary Emergency Generators (See Impact AQ.3).

Mitigation Measure AQ.4-3: Clean Off-Road Construction Equipment (See Impact AQ.4).

Mitigation Measure AQ.4-4: Clean On-Road Construction Trucks (See Impact AQ.4).

Measure GHG.1-1: Construction GHG Emissions Reduction Measures. County approval of any grading or improvement plans shall include the following SMAQMD Construction GHG Emissions Reduction Measures where feasible, including:

- Improve fuel efficiency from construction equipment:
    - Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to no more than two minutes (5-minute limit is required by the state airborne toxics control measure [Title 13, sections 2449(d)(3) and 2485 of the California Code of Regulations]). Provide clear signage that posts this requirement for workers at the entrances to the site.
    - Maintain all construction equipment in proper working condition according to manufacturer's specifications. The equipment must be checked by a certified mechanic and determined to be running in proper condition before it is operated.
    - Train equipment operators in proper use of equipment.
- Perform on-site material hauling with trucks equipped with on-road engines (if determined to be less emissive than the off-road engines).
- Use alternative fuels for generators at construction sites such as propane or solar, or use electrical power, as feasible for each construction site and development project.
- Use a CARB approved low carbon fuel for construction equipment, such as renewable diesel, if commercially available and feasible for use in construction equipment for each construction site and development project (NOx emissions from the use of low carbon fuel must be reviewed and any increases in NOx through the use of low carbon fuel must be mitigated.)
- Encourage and provide carpools, shuttle vans, transit passes and/or secure bicycle parking for construction worker commutes.
- Reduce electricity use in the construction office by using compact fluorescent bulbs, powering off computers every day, and replacing heating and cooling units with more efficient ones.
- Recycle or salvage non-hazardous construction and demolition debris (goal of at least 75 percent by weight).
- Use locally sourced or recycled materials for construction materials (goal of at least 20 percent based on costs for building materials, and based on volume for roadway, parking lot, sidewalk and curb materials). Wood products utilized should be certified through a sustainable forestry program.
- Minimize the amount of concrete for paved surfaces or utilize a low carbon concrete option.
- Produce concrete on-site if determined to be less emissive than transporting ready mix and if feasible for each construction site and development project.
- Use SmartWay certified trucks for deliveries and equipment transport.
- Develop a plan to efficiently use water for adequate dust control.

Mitigation Measure GHG.1-2: Reduce Refrigerant Emissions. The project applicant shall use low-GWP refrigerants in heat pumps installed in residential and nonresidential buildings, such as for HVAC systems, water heaters, and refrigeration.

Mitigation Measure GHG.1-3: Preferred Parking for Alternative-Fueled Vehicles and Carsharing Vehicles. The project applicant shall promote the use of clean fuel-efficient vehicles through preferential (designated and proximate to entry) parking for ZEVs beyond regulatory requirements. The applicant shall reduce the need to have a vehicle (or second vehicle) by providing preferential (designated and proximate to entry) parking for ridesharing vehicles on-site beyond regulatory requirements.

Mitigation Measure GHG.1-4: Electric Vehicle Requirement for Carsharing Programs. The project applicant shall promote the use of ZEVs by requesting that any carshare program operator with vehicles provided on the project site include EVs within its carshare program.

Mitigation Measure GHG.1-5: Greenhouse Gas Reduction Plan. Prior to the approval of improvement plans or grading permits, each future development project implemented under the Master Plan buildout shall prepare a GHG Reduction Plan. The purpose of the plan is to document GHG emissions for each future development project, including emissions after project-specific GHG reduction measures are implemented on-site (such as solar installations or green building requirements), and to determine the net incremental emission reductions required to meet the net-zero threshold relative to the buildout year of each project. After project specific GHG reduction measures are implemented for residential development, emissions are reduced to -3,602 $MTCO_2e$ per year or -0.22 $MTCO_2e$ per year per dwelling unit (DU) and therefore achieve the net zero goal and do not require any further reductions. To achieve net zero GHG emissions for the Master Plan as a whole, for each future nonresidential project (Design Review) the GHG Reduction Plan shall demonstrate a fair-share reduction towards reducing project-wide GHG emissions by 18,234 $MTCO_2e$ per year or 1.02 $MTCO_2e$ per thousand square feet of development. A fair share contribution is to be made based on the and total nonresidential square footage proposed for development in any given Tentative Map or Design Review area compared to the entire area of development proposed within the Master Plan as a whole. For the purposes of this mitigation measure, areas not anticipated for development such as parks, open spaces, and agricultural land as well as areas previously developed, such as the existing electrical facility, are not included in the total development area. Therefore, the total development area is considered to be 16,504 DUs (residential) and 17,906 thousand square feet (nonresidential). Considering the total development area, a hypothetical 100,000 square foot nonresidential project would represent 0.56 percent of the total nonresidential development area and would be required to show a GHG emissions reduction or savings of 102 $MTCO_2e$ per year, which would represent 0.56 percent of the 18,234 $MTCO_2e$ per year reduction required for the nonresidential project area as a whole.

The GHG Reduction Plan shall quantify how the individual development will achieve these performance standards at the time of buildout of the project. The GHG Reduction Plan shall be submitted to and approved by the County's Environmental Coordinator and SMAQMD. If a project is built out and fully operational before 2050, the Plan for that project must show "Substantial Progress" as described by the Association of

Environmental Professionals[140] and quantify how the project will meet these performance standards.

The GHG Reduction Plan shall include a summary of all GHG-reduction measures that would be implemented by the project and shall include a commitment by each project developer to incorporate all available feasible GHG mitigation measures and emission reduction actions. If the project developer finds that any mitigation measures will not be feasible for the project, the plan shall clearly explain why such mitigation measures are considered to be infeasible. The GHG emissions estimate for the project shall include consideration of all GHG mitigation measures and emission reduction actions that will be implemented by the project and shall describe the approximate GHG emissions reductions that will be associated with each action and mitigation measure.

The GHG Reduction Plan shall include a detailed description of the GHG emissions footprint for all operational components of the approved project based on the best available operational and energy use data at the time of project approval and the latest and most up-to-date emissions modeling and estimation protocols and methods. The plan shall, at minimum, include the following elements:

1) ***Project GHG Emissions*** – The GHG estimates presented in the GHG Reduction Plan will be based on the emission factors for electricity and transportation engines commonly used at the time the Plan is completed, along with the incorporation of existing vehicle emission standards and building energy standards. Emission factors are likely to decrease over time as more renewable sources of electricity are used as required by SB 100 and SB 1020, as the vehicle fleet shifts to more low- and zero-emissions fuel sources, and as new future technology that cannot currently be anticipated is adopted. The initial project GHG emission estimates will be based upon final design, project-specific traffic generation, actual energy use estimates, equipment to be used on-site, and other emission factors appropriate for the project prior to construction.

   Upon completion of construction, each project shall conduct further analysis to determine the actual (or better estimate of) GHG emissions during the construction phase, and these GHG emissions calculations shall submitted to and approved by the Environmental Coordinator and SMAQMD. The updated construction GHG emissions shall be compared to the County's threshold of 1,100 $MTCO_2e$ per year. The GHG emissions for project operation shall be estimated based on the final design of the project and the current applicable emission factors (updated annually thereafter). Also following completion of construction, the GHG emissions for project operation shall be updated annually using the current applicable emission factors. Annual GHG reporting requirements are described in Mitigation Measure GHG-2.

2) ***GHG Emission Reduction Measures*** – The GHG Reduction Plan shall include GHG emission reduction strategies that shall, at minimum, be sufficient to reduce or offset the project's incremental GHG emissions to meet the 2050 net-zero threshold and shall be verifiable and feasible to implement over the project life. To demonstrate that this threshold is achieved, the GHG Reduction Plan shall demonstrate a fair-share reduction towards reducing project-wide GHG emissions by 18,234 $MTCO_2e$ per year or 1.02 $MTCO_2e$ per thousand square feet of development for nonresidential

[140] Association of Environmental Professionals. 2016. *Final White Paper, Beyond 2020 and Newhall: A Field Guide to New CEQA Greenhouse Gas Thresholds and Climate Action Plan Targets for California*. October 18. Available at https://www.califaep.org/climate-change. Accessed August 2023.

projects. Subject to potential review and modification by Sacramento County and SMAQMD, the plan shall include some or all of the following, depending on regulatory feasibility, technological feasibility, and availability:

a. *Compliance with Sacramento County Communitywide Climate Action Plan*: If Sacramento County has adopted a Revised Climate Action Plan (CAP), comply with the provisions of the CAP.

b. *Reduce Vehicle Miles Traveled*. Reduce VMT traveled by project residents and employees through implementation of reasonable and feasible design measures, such as:

    i. improve or increase access to transit;

    ii. increase access to common goods and services, such as groceries, schools, and daycare;

    iii. incorporate affordable housing into the project;

    iv. orient the project toward transit, bicycle and pedestrian facilities;

    v. improve pedestrian or bicycle networks, or transit service;

    vi. provide traffic calming;

    vii. provide bicycle parking;

    viii. limit or eliminate parking supply;

    ix. unbundle parking costs;

    x. provide parking cash-out programs;

    xi. implement roadway pricing;

    xii. implement or provide access to a commute reduction program;

    xiii. provide car-sharing, bike sharing, and ride-sharing programs;

    xiv. provide transit passes;

    xv. shifting single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services;

    xvi. providing telework options;

    xvii. providing incentives or subsidies that increase the use of modes other than single-occupancy vehicle;

    xviii. providing on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms;

    xix. providing employee transportation coordinators at employment sites; and

    xx. providing a guaranteed ride home service to users of non-auto modes.

c. *Promote Electric and Alternative-Fuel Vehicles*. Promote the use of alternative-fuel and electric vehicles through implementation of reasonable and feasible design measures, such as:

    i. develop and implement electric vehicle charging infrastructure plan;

    ii. install electric vehicle charging stations at residential and commercial buildings; and

iii. install electric vehicle charging and natural gas fueling stations at public facilities, such as at parking lots and retail centers;

d. *Minimize Energy Demand*. Construct and operate an environmentally sound project that minimizes electricity demand through implementation of reasonable and feasible design measures, such as:

i. exceed 2022 Title 24 Energy Efficiency requirements;

ii. electrify loading docks to reduce emission from engine idling of transport refrigeration units;

iii. install all-electric appliances, including water heaters and heating, ventilation, and air conditioning (HVAC) systems;

iv. implement indoor water use efficiency;

v. use energy efficient street lighting fixtures;

vi. include of electric vehicle parking infrastructure;

vii. institute a composting and recycling program in excess of local standards; and

viii. implement an Urban Forestry Management Plan to reduce the urban heat island effect.

e. *On-Site Renewable Energy Use*. During the design phase, conduct analysis to optimize on-site renewable energy use to reduce further reduce project GHG emissions, based on the site layout, environmental factors, and viable technology available. Specific actions may include:

i. On-site carbon-zero renewable energy capable of serving energy needs of any urban development within the project, including energy needed for streetlights, sewer pumps, drainage pumps, traffic signals, and water pumps.

ii. Residential photovoltaic systems designed to be scalable over time to accommodate varying energy demands.

f. *Renewable Power Purchase Agreement*. Procure renewable energy from off-site sources within California via purchases from one or more of the following, depending on regulatory feasibility and availability: (a) SMUD; (b) a community choice aggregator such as the joint SMUD agreement with Valley Clean Energy and the East Bay Community Energy; or (c) other renewable energy provider.

g. *Renewable Energy Certificates*.[141] Procure and retire Renewable Energy Certificates (also known as RECs, green tags, Renewable Energy Credits, Renewable Electricity Certificates, or Tradable Renewable Certificates) for projects or activities located in California.

[141] Renewable energy certificates, or RECs, represent one megawatt hour (MWh) of energy generated from a clean, renewable source, such as wind, solar, hydro, or certain types of renewable biomass. Since these renewable energy resources generate little to no carbon as they produce energy, they represent an indirect emission reduction, whereby a "clean" energy source "offsets" the demand for "dirty" fossil-fueled energy.

h. *Carbon Offsets*.[142] Procure and retire Carbon Offsets, in a quantity needed to achieve the appropriate threshold of significance for the project's buildout year. "Carbon Offset" means an instrument issued by an Approved Registry and shall represent the past reduction or sequestration of 1 metric ton of CO_2e achieved by a GHG emission reduction project or activity within California. "Approved Registry" means: (i) the Climate Action Reserve, the American Carbon Registry, the Verified Carbon Standard, or the Clean Development Mechanism or (ii) any other entity approved by CARB to act as an "offset project registry" under the state's Cap-and-Trade Program.

   i. Carbon offset standards: Carbon offset credits can result from activities that reduce, avoid, destroy or sequester an amount of GHG emissions in an off-site location to offset the equivalent amount of GHG emissions occurring elsewhere. For the purpose of Project mitigation, carbon offset credits shall consist of direct emission reductions or sequestration that are used to offset the Project's direct emissions. All carbon offset credits shall be purchased from a carbon offset registry approved by CARB, which at present include the following: the American Climate Registry, Climate Action Reserve, and Verra (formerly Verified Carbon Standard). The carbon offset credits shall be verifiable by the County and enforceable in accordance with the registry's applicable standards, practices, or protocols. The carbon offsets must substantively satisfy all six of the statutory "environmental integrity" requirements applicable to the CARB Cap-and-Trade Program, generally as set forth in both subdivisions (d)(1) and (d)(2) of California Health and Safety Code §38562: real, permanent, quantifiable, verifiable, enforceable, and additional. All offset credits shall be verified by an independent verifier who meets stringent levels of professional qualification (i.e., ANAB Accreditation Program for Greenhouse Gas Validation/Verification Bodies or a Greenhouse Gas Emissions Lead Verifier accredited by CARB), or an expert with equivalent qualifications to the extent necessary to assist with the verification. Without limiting the generality of the foregoing, in the event that an approved registry becomes no longer accredited by CARB and the offset credits cannot be transferred to another accredited registry, the project applicant shall comply with the rules and procedures for retiring and/or replacing offset credits in the manner specified by the applicable protocol or other applicable standards including (to the extent required) by purchasing an equivalent number of credits to recoup the loss.

   ii. Geographic location: Carbon offset credits shall be obtained from GHG reduction projects that occur in the following locations in order of priority to the extent available: (1) within proximity to the Master Plan site; (2) within Sacramento County; (3) within the Sacramento Valley Air Basin; (4) the State of California; and (5) the United States of America. Any offset credits used for mitigation are subject to the approval of the County.

[142] Carbon offsets, also known as VERs or CRTs (carbon reduction tons), represent the act of reducing, avoiding, destroying, or sequestering the equivalent of a ton of greenhouse gas (GHG) in one place to "offset" an emission taking place somewhere else. Offsets generally represent direct emission reductions or sequestration -- for example, the destruction of methane emitted from decaying manure at a dairy farm. So, they can be used to offset direct emissions, like those from Scope I in a company's footprint.

i. *Net-zero Warehouse Operations*. Incorporate measures to construct and operate net-zero warehouses within areas zoned for commercial, industrial, and employment uses by 2050 or when commercially available.

j. *Zero Emission Vehicles*. Utilize 100% zero-emission vehicle fleets for all future development within areas zoned for commercial, industrial, and employment uses by 2050 or when commercially available.

For purposes of this mitigation measure, "commercially available" is defined as either: (1) being used for other large-scale projects in Sacramento County occurring at the same time; (2) can be obtained without significant delays to critical-path timing of construction; or (3) available within the larger northern California region.

A zero emission vehicle (ZEV) shall ordinarily be considered commercially available if the vehicle is capable of serving the intended purpose and is included in California's Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project, https://californiahvip.org/ or listed as available in the US on the Global Commercial Vehicle Drive to Zero inventory, https://globaldrivetozero.org/. The County shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the County to make a determination that such vehicles are commercially unavailable, the operator must submit documentation from a minimum of three (3) ZEV dealers identified on the californiahvip.org website demonstrating the inability to obtain the required ZEVs or equipment needed within 6 months.

Each development project shall implement items a. through e. and progress through the remainder (items f. through j.) based on the options' physical and economic feasibility, as reasonably determined by each project applicant and the County, with low-cost options preferred over high-cost options. In the event that options have equivalent costs, options enumerated higher in the above list shall be selected by the project applicant over options enumerated later in the above list.

3) ***Implementation, Monitoring and Enforcement*** – On an annual basis, by March 1 of each year, the project developer shall submit a letter to the County Environmental Coordinator and SMAQMD confirming implementation of the emission reduction strategies listed in the GHG Reduction Plan. The letter shall also identify any changes or additions to the plan, including any recalculation of project emissions based on new information, incorporation of additional strategies, or changes in technology. If changes or additions to the plan are proposed, these shall be subject to review and approval by the County Environmental Coordinator and SMAQMD within 30 days.

   In addition, before the County issues the final Certificate of Occupancy for the first building constructed for each future development project implemented under the Master Plan, as laid out in the project developer's plan, the developer shall provide copies of GHG offset contracts demonstrating required purchases to the County Environmental Coordinator and SMAQMD. This will serve as documentation to fully enforce the provision that the project will result in net zero GHG emissions for the life of the obligation.

   The schedule of GHG reports and verification and validation activities shall be as follows:

Year Prior to Opening

1. Finalize total construction emissions based on method described in the GHG Reduction Plan and compare emissions to the County's significance threshold of 1,100 $MTCO_2e$ per year.
2. Estimate GHG emissions for projected energy consumption for annual operations based on the final design calculated using the method described in the GHG Reduction Plan and using updated applicable emissions factors.
3. Calculate GHG emissions to be mitigated for both construction and operations.
4. Implement GHG mitigation strategy identified for each year of project operations.
5. Publish the GHG Reduction Plan and submit to the Environmental Coordinator and SMAQMD.

Year 1 of Operation and On

1. Implement GHG mitigation strategy based on estimated emissions.
2. Refine GHG mitigation strategy as needed pending new technology and future mitigation options.

Significance after Mitigation: Implementation of Mitigation Measure GHG.1-1 would reduce GHG emissions during construction of the Master Plan by requiring contractors to implement SMAQMD's Construction GHG Emissions Reduction Measures. Implementation of Mitigation Measures GHG.1-2, GHG.1-3, and GHG.1-4 would reduce GHG emissions during Master Plan operations by reducing high-GWP GHG emission used in refrigeration systems and encourage the use of zero-emission and alternative fueled vehicles.

Implementation of Mitigation Measure GHG.1-5 would reduce GHG emissions during Master Plan operations by requiring new development to prepare a GHG Reduction Plan prior to the start of project construction activities and prepare an annual report documenting GHG emissions associated with the project. The Plan will document project-related GHG emissions, including the effect of GHG reduction measures, and the net incremental emissions reductions required to achieve the net-zero GHG threshold relative to the buildout year of each project. To demonstrate that this threshold is achieved, the GHG Reduction Plan shall demonstrate a fair-share reduction towards reducing project-wide GHG emissions by 18,234 MTCO2e per year or 1.02 MTCO2e per thousand square feet of development for nonresidential projects. As development occurs within the Project area, each project would be required to demonstrate how it will meet the net-zero GHG threshold relative to its buildout year, whether by on-site mitigation measures or by purchasing off-site carbon offsets. Mitigation Measure GHG.1-5 would ensure that Master Plan would achieve the net- zero GHG emissions standard, effectively resulting in zero net additional emissions. This is defined as the project's 30-year lifetime construction plus operational net new GHG emissions, compared to emissions associated with existing land uses that would be removed with the project over the lifetime of the project. This is a clear, quantitative performance standard. Mitigation Measure GHG.1-5 requires the project applicant to meet this standard through project

features and project-specific emission reduction strategies, along with GHG offset credits purchased through a CARB-accredited carbon registry.

The project applicant must demonstrate that this performance standard is achieved by submitting an annual report to the County and by submitting copies of GHG offset credit contracts. Also, if total lifetime project emissions from operations and construction were to exceed the total estimated in the GHG reduction plan, the applicant would offset the additional emissions when the County issues the final certificate of occupancy for each building to achieve the net-zero requirement. The modeling conducted for the EIR is highly conservative and likely overestimates emissions, predominantly because of its conservative assumptions about the Master Plan's construction and operational activities that would generate emissions, and also because the models used in the analysis did not incorporate a number of regulations, laws, and technology improvements that are either already adopted or approved, are proposed for adoption, or are likely to occur in the future.[143]

In addition, pursuant to AB 1279, the State of California is legally required to achieve net zero GHG emissions by 2045 or sooner. As a component of the State's GHG emissions profile in 2045, the Master Plan must comply with all laws and regulations adopted by CARB, CEC, and other state agencies to achieve AB 1279's target. While this does not ensure that the Master Plan would, in isolation, achieve net zero GHG emissions, it means that the Master Plan development must be accounted for in the state's net zero mandate and that future laws and regulations would contribute toward achieving net zero for the Master Plan.

Consequently, after implementation of all identified mitigation measures including Mitigation Measure GHG.1-5, the Master Plan would achieve net zero GHG emissions, and the impact would be **less than significant with mitigation incorporated**.

Impact GHG.2: The Master Plan could conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. (*Less than Significant with Mitigation*)

A significant impact would occur if the Master Plan would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment by conflicting with state goals and applicable regulatory plans and policies to reduce GHG emissions.

Sacramento County Climate Action Plan

The developments proposed under the Master Plan will be located within the jurisdiction of Sacramento County, which has an adopted a CAP Strategy and Framework document as discussed above in the Regulatory Setting section. The CAP Strategy and Framework document

[143] Among the specific approved regulatory requirements not accounted for in the modeling are CARB's Zero-Emission Vehicle Program (EO B-16-2012), CARB's Advanced Clean Fleets regulation, the California Department of Transportation/CARB California Sustainable Freight Action Plan, California's carbon-neutral goal by 2045 (AB 1279), and AB 630/CARB's Clean Cars 4 All program. Among the regulations and legislation proposed but not accounted for in the modeling are CARB's 2020 Mobile Source Strategy and Advanced Clean Cars II, CARB's Zero Emission TRU rule, CARB's Alternative Diesel Fuels regulation, CARB's Advanced Clean Trucks regulation, future updates to Title 24 energy efficiency standards, and CARB's Heavy-Duty Omnibus Regulation.

provides a framework and overall policy strategy for reducing greenhouse gas emissions and managing resources to comply with AB 32. It also highlights actions already taken to become more efficient and targets future mitigation and adaptation strategies. Goals in the CAP Strategy and Framework document relevant to the developments proposed under the Master Plan are focused on the transportation and land use and energy sectors and include the following goals:

- Reduce total VMT per capita in the community and the region.
- Improve energy efficiency of existing and new buildings in the unincorporated Sacramento County.

The developments proposed under the Master Plan would include energy efficient street lighting fixtures, solar panel roofs for all residential homes, and compliance with the 2022 CALGreen Code and 2022 Title 24 energy efficiency standards. Developments proposed under the Master Plan would include energy efficiency measures.

The Sacramento Area Council of Governments 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy

As discussed in Chapter 2 *Air Quality* above, assuming roughly half of the proposed development for the Master Plan is constructed by 2040, the Master Plan would result in greater dwelling units than what was included in the SACOG's 2020 MTP/SCS. Therefore, the Master Plan would not be consistent with the land use growth projections presently established in the SACOG MTP/SCS. Despite this inconsistency, GHG emissions would be reduced substantially with the AQMP through VMT reductions compared to project conditions through the many key emission reduction measures included in the Master Plan design and traffic study including housing density, the diversity of land uses, travel time to employment centers, and accessibility to multiple modes of transportation (transit, bicycle, pedestrian). In addition, as discussed above, the MTP/SCS shows a reduction in per-capita VMT compared to baseline conditions for TPA's in Sacramento County including the Master Plan area; this will result in reduced mobile source emissions: "As established in the proposed MTP/SCS, behavioral changes in choice of travel directly impacts mobile source emission generation projections and reduced VMT and trip numbers result in lower emissions."[144] The AQMP (see Mitigation Measure AQ.1-1 and Appendix B) demonstrates a 87 percent reduction on NO_X and a 80 percent reduction in ROG; a similar (i.e. 40-60 percent) reduction in mobile source GHG emissions would be expected. However, since the Master Plan development is not presently included in the 2020 MTP/SCS, the Master Plan would be inconsistent with the 2020 MTP/SCS.

Further, as discussed in Chapter 2 *Air Quality* above, the Master Plan, in combination with the other regional Master Plans and Specific Plans currently in development (including Jackson Township, NewBridge, and Mather South), could reduce total VMT as well as per-capita VMT compared to conditions without implementation of these projects. The Master Plan will have a substantial number of new jobs and commercial land uses and will therefore change the regional

[144] Sacramento Area Council of Governments, 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy Draft Environmental Impact Report. Chapter 5: Air Quality. p. 5-45. Available: https://www.sacog.org/sites/main/files/file-attachments/ch._5_air_quality_pdeir.pdf?1569039959. Accessed August 2023.

travel dynamics as development occurs over time and jobs and commercial uses are placed closer proximity to existing residential areas, reducing trip lengths and making regional travel patterns more efficient. When development under the Master Plan is placed into the future cumulative land use context, it is possible that trips would be shortened due to the closer proximity of retail/commercial and employment opportunities, which translates into reduced VMT as compared to the existing no-project conditions. In summary, the Master Plan, in combination with other cumulative development projects in the region, will result in a more complementary land use mix with higher densities and a better jobs/housing balance that is anticipated to result in reduced VMT and per-capita VMT compared to existing conditions.[145]

Sacramento County General Plan

The Master Plan would be consistent with the County's General Plan, including goals and policies that apply to GHG emissions associated with the Master Plan. The Master Plan would be consistent with all policies from the Air Quality Element, including AQ-1 by improving pedestrian/bicycle access and circulation, AQ-8 by providing mixed-use development along existing and proposed transit corridors, and AQ-11 by requiring construction equipment to reduce emissions through Mitigation Measures AQ.2-2 (new engine technology) and AQ.4-4 (Tier 4 construction equipment). The Master Plan would also be consistent with all policies from the Energy Element, including EN-5 by building higher density land uses and mixed uses along transportation corridors to help support transit use; EN-10 by building sidewalks and on-street (Class II) bike lanes on all collector, arterial and thoroughfare roadways; and EN-6 by developing four transit lines in the Jackson Corridor through the other regional master and specific plans. Therefore, the Master Plan would be consistent with the County's General Plan.

AB 1279

AB 1279, which was signed into law in September 2022, requires the State of California to achieve two things by 2045 or sooner: (1) net zero emissions and (2) a reduction in statewide anthropogenic GHG emissions of 85 percent below 1990 levels. AB 1279 requires CARB to ensure that the 2022 Scoping Plan, described further below, identifies and recommends measures to achieve carbon neutrality, and to identify and implement policies and strategies for CO2 removal and carbon capture, utilization, and storage technologies. This GHG analysis prepared for the Master Plan identified a significance threshold of net-zero emissions, which is consistent with the statewide target of net-zero emissions by 2045. In addition, as described further below, the Master Plan would be consistent with the applicable strategies included in the 2022 Scoping Plan that have been identified to help the state achieve an 85 percent reduction below 1990 levels by 2045 and carbon neutrality by 2045 as required by AB 1279. As discussed under Impact GHG-1, the Master Plan with implementation of mitigation measure GHG.1-5 would be designed to achieve net-zero GHG emissions compared to baseline levels, and the Master Plan would be consistent with AB 1279.

[145] Smith, Todd. Principal Environmental Planner, Sacramento County. Email correspondence with ESA on June 19, 2019.

CARB 2022 Scoping Plan

The 2022 Scoping Plan expands on prior scoping plans and recent legislation, such as AB 1279, by outlining a technologically feasible, cost-effective, and equity-focused path to achieve the state's climate target of reducing anthropogenic GHG emissions to 85 percent below 1990 levels and achieving carbon neutrality by 2045 or sooner.[146] To achieve carbon neutrality by 2045, the 2022 Scoping Plan contains GHG emissions reductions, technology, and clean energy mandated by statutes; reduction of short-lived climate pollutants; and mechanical CO2e capture and sequestration actions.

Elements of the Master Plan are proposed to address several relevant actions under the 2022 Scoping Plan, such as, but not limited to: increasing the use renewable energy and decreasing the use of oil and gas, expanding low-carbon technologies such as plug-in EV charging infrastructure and zero-emission vehicles, increasing carbon sequestration capacity through new open space land uses and trees, and reducing overall VMT through compliance with the TDM plan.

As discussed above under Impact GHG-1, the threshold of net- zero GHG emissions aligns with the statewide 2045 target as codified in AB 1279 and the 2022 Scoping Plan, and with implementation of mitigation measure GHG.1-5, the Master Plan would be designed to achieve net-zero GHG emissions compared to baseline levels. Therefore, the Master Plan would be consistent with the 2022 Scoping Plan.

Conclusion

Sacramento County currently does not have an adopted significance threshold to demonstrate a project's consistency with AB 1279 or the 2022 Scoping Plan, which established a statewide GHG reduction target of 85 percent below 1990 levels and carbon neutrality by 2045. Because Sacramento County currently does not have an established GHG intensity threshold for the year 2055 when the Master Plan is assumed to be built-out, a net-zero GHG emissions threshold was chosen for the purposes of this analysis. As shown in Table 6, with implementation of mitigation, operation of the Master Plan would generate GHG emissions that would exceed the net-zero threshold.

Therefore, developments proposed under the Master Plan would conflict with 2045 GHG reduction targets established by AB 1279 and the 2022 Scoping Plan. GHG emissions associated with the Master Plan would be considered a **significant impact**. Consequently, mitigation is required.

Mitigation Measures

Mitigation Measure AQ.1-1: Air Quality Mitigation Plan (see Impact AQ.1)

Mitigation Measure AQ.1-2: Electric Vehicle Charging Infrastructure (See Impact AQ.1).

[146] California Air Resources Board, 2022. *2022 Scoping Plan For Achieving Carbon Neutrality.* November 16, 2022. Available: https://ww2.arb.ca.gov/sites/default/files/2022-12/2022-sp_1.pdf. Accessed January 2023.

Mitigation Measure AQ.2-1: Basic Construction Emission Control Practices (See Impact AQ.1).

Mitigation Measure AQ.2-2: Enhanced Exhaust Control Practices (see Impact AQ.2)

Mitigation Measure AQ.3-2: Operational Truck Emissions Reduction (See Impact AQ.3).

Mitigation Measure AQ.3-3: Electric Landscaping Equipment (See Impact AQ.3).

Mitigation Measure AQ.3-4: Best Available Emissions Controls for Stationary Emergency Generators (See Impact AQ.3).

Mitigation Measure AQ.4-3: Clean Off-Road Construction Equipment (See Impact AQ.4).

Mitigation Measure AQ.4-4: Clean On-Road Construction Trucks (See Impact AQ.4).

Mitigation Measure GHG.1-1: Construction GHG Emissions Reduction Measures (See Impact GHG.1).

Mitigation Measure GHG.1-2: Reduce Refrigerant Emissions (See Impact GHG.1).

Mitigation Measure GHG.1-3: Preferred Parking for Alternative-Fueled Vehicles and Carsharing Vehicles (See Impact GHG.1).

Mitigation Measure GHG.1-4: Electric Vehicle Requirement for Carsharing Programs (See Impact GHG.1).

Mitigation Measure GHG.1-5: Greenhouse Gas Reduction Plan (See Impact GHG.1).

Significance after Mitigation: Implementation of Mitigation Measure GHG.1-1 would reduce GHG emissions during construction of the Master Plan by requiring contractors to implement SMAQMD's Construction GHG Emissions Reduction Measures. Implementation of Mitigation Measures GHG.1-2, GHG.1-3, and GHG.1-4 would reduce GHG emissions during Master Plan operations by reducing high-GWP GHG emission used in refrigeration systems and encourage the use of zero-emission and alternative fueled vehicles. With implementation of mitigation measure GHG.1-5, the Master Plan would achieve net-zero GHG emissions compared to baseline levels. Therefore, the Master Plan would be consistent with AB 1279 and the 2022 Scoping Plan. GHG emissions associated with the Master Plan would therefore be **less than significant with mitigation**.

9 Solid Waste

Municipal solid waste (MSW) is the amount of material that is disposed of by land filling, recycling, or composting. CalEEMod calculates the indirect GHG emissions associated with waste that is disposed of at a landfill. The program uses annual waste disposal rates from the California Department of Resources Recycling and Recovery (CalRecycle) data for individual land uses. If waste disposal information was not available, waste generation data was used. CalEEMod uses the overall California Waste Stream composition to generate the necessary types of different waste disposed into landfills. The program quantifies the GHG emissions associated with the decomposition of the waste which generates methane based on the total amount of degradable organic carbon.[49] The program will also quantify the CO_2 generated by the combustion of methane, if applicable. Default landfill gas concentrations were used as reported in Section 2.4 of AP-42. The IPCC has a similar method to calculate GHG emissions from MSW in its 2006 Guidelines for National Greenhouse Gas Inventories.

The amount of methane and CO_2 generated is calculated as:

$$Gen = DOC \cdot DANF \cdot 0.5$$

Where:

Gen = Amount of CO_2 or methane generated
DOC = Degradable organic carbon
DANF = Degradable anaerobic fraction (0.5)
0.5 = Assumes half anaerobic carbon is methane and other half is CO_2.

IPCC lists default values for the DOC in its 2006 Guidelines in Table 2.4.

The amount of methane and CO_2 emitted is calculated by assuming collection and destruction efficiencies. The user will be able to select if the landfill the waste is sent to has a landfill gas collection system. The collection efficiency will be assumed to be 75% if this is selected otherwise it will be 0%. The destruction efficiency is assumed to be 98%. The calculations take into account the oxidation of methane to CO_2 as it rises through the landfill. The methane and CO_2 emitted are described as:

$$Emit_{methane} = Gen \cdot [Collect \cdot (1 - destruct) + (1 - Collect) \cdot (1 - ox)]$$

$$Emit_{CO2} = Gen \cdot [Collect \cdot destruct + (1 - Collect) \cdot (ox) + 1]$$

[49] Landfill gas generation is dependent upon the amount, type, age and moisture content of the disposed waste. The USEPA has developed emission factors for landfill gas as specified in Section 2.4 of AP-42 which are incorporated in the LANDGEM model. This model uses a first order decay equation that will vary with time. However, there is no need to use a time-varying emissions model, as we are interested in total emissions of gases that could be emitted from a ton of waste. Therefore, instead of using the LANDGEM model, the volume of landfill gas from solid waste will be based on the total amount of degradable organic carbon.

Where:

$Emit_{methane}$ = Methane emitted per ton of green waste
$Emit_{CO2}$ = Carbon dioxide emitted per ton of green waste
Gen = Amount of CO_2 or methane generated
Collect = Collection efficiency of landfill gas (75%)
Destruct = Destruction efficiency of landfill gas (98%)
Ox = Oxidation efficiency of methane (10%)

The CO_2 emissions will be classified as biogenic emissions. The amount of methane emitted will be multiplied by its GWP to convert to CO_2e.

Other, inert waste	90	-	-	-	-	3	0 - 5	100	50 - 100

[1] The moisture content given here applies to the specific waste types before they enter the collection and treatment. In samples taken from collected waste or from e.g., SWDS the moisture content of each waste type will vary by moisture of co-existing waste and weather during handling.

[2] The range refers to the minimum and maximum data reported by Dehoust *et al.*, 2002; Gangdonggu, 1997; Guendehou, 2004; JESC, 2001; Jager and Blok, 1993; Würdinger *et al.*, 1997; and Zeschmar-Lahl, 2002.

[3] 40 percent of textile are assumed to be synthetic (default). Expert judgement by the authors.

[4] This value is for wood products at the end of life. Typical dry matter content of wood at the time of harvest (that is for garden and park waste) is 40 percent. Expert judgement by the authors.

[5] Natural rubbers would likely not degrade under anaerobic condition at SWDS (Tsuchii et al., 1985; Rose and Steinbüchel, 2005).

[6] Metal and glass contain some carbon of fossil origin. Combustion of significant amounts of glass or metal is not common.

Introduction

The Sacramento Metropolitan Air Quality Management District (SMAQMD) has developed guidance to mitigate operational emissions for projects subject to the California Environmental Quality Act (CEQA).[1] SMAQMD's guidance recommends that project applicants prepare an Air Quality Mitigation Plan (AQMP) for all projects that exceed SMAQMD's operational significance thresholds of 65 pounds per day for oxides of nitrogen (NO_X), 65 pounds per day for reactive organic gases (ROG), 80 pounds per day for particulate matter less than or equal to 10 microns (PM_{10}), and 82 pounds per day for $PM_{2.5}$.

In addition, Sacramento County General Plan Policy AQ-4 requires that:

> Developments which meet or exceed thresholds of significance for ozone precursor pollutants as adopted by the Sacramento Metropolitan Air Quality Management District (SMAQMD), shall be deemed to have a significant environmental impact. An Air Quality Mitigation Plan shall be submitted to the County of Sacramento prior to project approval, subject to review and recommendation as to technical adequacy by the Sacramento Metropolitan Air Quality Management District.

Operational emissions of NO_X, ROG, PM_{10}, and $PM_{2.5}$ from the West Jackson Highway Master Plan (Master Plan) are greater than the applicable SMAQMD significance thresholds identified above. Therefore, an AQMP has been prepared for the Master Plan.

Methodology

A reduction target is calculated based on the Master Plan's inclusion in the current State Implementation Plan (SIP). For projects included in the current SIP, the SMAQMD recommends a 15 percent reduction of NO_X and ROG mobile source emissions. For projects not considered in the SIP, the SMAQMD recommends a 35 percent reduction of NO_X and ROG mobile source emissions. For the Master Plan, only the land uses west of Bradshaw Road are included in the Sacramento Area Council of Government's (SACOG) Regional Transportation Plan (RTP) and are therefore included within the SIP. SMAQMD's AQMP guidance does not specify a percentage reduction to use for projects partially accounted for in the SIP. By calculating the Master Plan's vehicle miles traveled (VMT) included in the SIP, a "blended rate" mitigated reduction goal of 29 percent below an unmitigated scenario could be used to show consistency with regional air quality plans. However, to provide a conservative analysis of the AQMP requirement for the Master Plan, a 35 percent reduction of ozone precursors from mobile-source emissions below an unmitigated scenario was used in the AQMP. Therefore, a 35 percent reduction of NO_X and ROG mobile source emissions applies to the Master Plan. The SMAQMD has determined that this reduction in emissions will satisfy the "all feasible measures" mitigation requirement under CEQA. The reduction target is in tons per year.

[1] Sacramento Metropolitan Air Quality Management District (SMAQMD), 2020. *Recommended Guidance for Land Use Emission Reductions*, Version 4.2 (for Operational Emissions). Available at: https://www.airquality.org/LandUseTransportation/Documents/LandUseEmissionReductions4.2Final.pdf. Accessed April 2023.

An AQMP is considered to meet the reduction target when both of the following equations are true:

$$NO_X \text{ Reduction Target} \leq \text{Unmitigated Project } NO_X - \text{Mitigated Project } NO_X$$

$$\text{ROG Reduction Target} \leq \text{Unmitigated Project ROG} - \text{Mitigated Project ROG}$$

The SMAQMD guidance recognizes that site-specific traffic information is more relevant than information generated from a statewide model (identified as prerequisite *TS: Traffic Study* in the SMAQMD guidance). Traffic studies typically include calculation of internal trip capture, mix of uses, distance to job centers, and sometimes walking and cycling information. Information in the traffic study is used to create a mitigated project run. The quantity of mitigated emissions is compared to the reduction target, as described above.

Reduction Target

Mobile source emissions are traditionally the largest emissions component of land use development projects and plans. SB 743 is a policy aimed at reducing mobile emissions and uses VMT to evaluate a project's transportation impact. In response to the implementation of SB 743, Sacramento County has identified VMT significance criteria and set VMT efficiency thresholds categorized by land use type. VMT estimates provided in the traffic analysis conducted by DKS Associates account for all of the Master Plan's land uses, including for educational and institutional land uses even though trips to and from these land uses are mostly incorporated into the VMT for other land uses as pass-by trips, and these represent a small portion of total VMT and are largely internal trips.[2] Project specific VMT reductions are provided in both VMT analyses by DKS Associates and Kimley Horn.[3]

The VMT analysis conducted by DKS Associates shows that the Master Plan would meet the County VMT efficiency threshold for residential land uses and for industrial land uses but would not meet the thresholds for office/business land uses. However, as discussed below, the Master Plan would incorporate a Transportation Management Association (TMA) feature that would further reduce VMT per employee by 12.3 percent as shown in **Table B-1**, which would reduce the Master Plans overall VMT to be below the County threshold. The County's efficiency thresholds per land use type and the Master Plan's VMT are shown in **Table B-2** below.

California Air Pollution Control Officers Association (CAPCOA) Measure T-6, Mandatory Trip Reduction Program, is normally applied as a Project/Site-scale measure and thus is not combinable with the Plan/Community-scale measures T-18 and T-22.[4] However, in the case of the Master Plan, the TMA has been created that is allowed at the Plan/Community scale level and consists of a community-wide mandatory trip reduction program that will be required of all employers within the Master Plan. Under this program, non-residential property will be subject to

an annual County Service Area (CSA) fee that will be used for the TMA services and programs. Rideshare and carpool programs will be included. Because the TMA is considered a Plan/Community measure it can be combined with T-18 and T-22. The VMT reductions for these measures were provided by Kimley Horn.[5]

TABLE B-1
ADDITIONAL TRANSPORTATION MITIGATION

Measure	VMT Per Capita Percent Reduction	VMT Per Employee Percent Reduction
Mandatory Community-Wide TMA Participation	NA	-12.3%
Electric Bike Share (T-22-B)	-0.05%	NA
Electric Scooter Share (T-22-C)	-0.06%	NA
Adding Sidewalks (T-18)	-1.0%	NA
Total Percent Reduction	**-2.1%**	**-12.3%**
Total Percent Reduction for Combined Measures T-8 through 22-C	-1.1%	NA

NOTES:
Reported total reduction may not sum to table entries due to rounding.

TABLE B-2
VMT BY LAND USE THRESHOLDS

Land Use Type	Significance Criteria	County Thresholds	Master Plan VMT	Exceeds Threshold?
Residential	Project VMT per capita exceeds 85 percent of the regional average VMT per capita	>17.17 VMT per Capita	14.29 VMT per capita	No
Office/Business Professional	Project VMT per employee exceeds 85 percent of the regional average VMT per employee	>13.64 VMT per employee	**16.23 VMT per employee**	**Yes**
Industrial	Project VMT per employee exceeds the regional average VMT per employee	>16.4 VMT per employee	14.63 VMT per employee	No

ABBREVIATIONS:
VMT = vehicle miles traveled.
SOURCE: DKS 2023; Kimley Horn, 2023.

Although specific land uses would exceed the County VMT thresholds shown in Table B-2, the reduction in overall VMT would not exceed the County's net VMT threshold.[6] The percent reductions shown in Table B-1 above were applied to residential and nonresidential (office and

[5] Kimley Horn, 2023, *West Jackson Highway Master Plan Vehicle Miles Traveled Reductions*, November 20, 2023.
[6] Kimley Horn, 2023, *West Jackson Highway Master Plan Vehicle Miles Traveled Analysis*, November 20, 2023.

industrial) VMT based on the per-capita VMT metrics included in the Traffic Study to calculate a weighted average VMT reduction for total Master Plan VMT. The calculation is presented in **Table B-3** below. The Master Plan would result in an overall net VMT reduction when compared to the County's regional average VMT thresholds and would be consistent with SB 743.

CAPCOA establishes emission reduction caps on measures for which CAPCOA establishes a percent reduction (i.e., the T-xx measures) calculation. The cap for measures T-5 through T-13 is 45 percent and the cap for measures T-18 through 22-C is 10 percent. As shown in Table B-3, the caps are not exceeded.

TABLE B-3
CALCULATION OF VMT REDUCTIONS IMPLEMENTATION OF TRANSPORTATION MANAGEMENT ASSOCIATION (TMA)

Land Use Type	VMT Metric (daily)	Percent Reduction in VMT	Project VMT Reduction	Net VMT Compared to Threshold	Exceeds Threshold?
Residential	14.29	2.1%	-11,737	N/A	N/A
Office	16.23	12.3%	-31,587	N/A	N/A
Industrial	14.63	12.3%	-6,093	N/A	N/A
Total	**NA**	**5.3%**	**-49,417**	**-43,003**	No

Informational Quantitative Analysis

For informational purposes, emissions of NO_X and ROG for the Master Plan under the unmitigated baseline scenario were modeled using CalEEMod 2020.4.0 and EMFAC2021 following SMAQMD guidance.[7] While this is the SMAQMD's recommended method to determine a project's ability to meet mobile emissions reduction targets, it has limitations when applied to the size and scale of a development project such as the Master Plan. This is because the Master Plan has a regional effect on VMT through its influence on the entire County's land use balance and regional transportation network, among other things. Following the SMAQMD's traditional "business-as-usual" modeling approach using CalEEMod default values does not provide a reliable estimate of a master plan-level project's effect on mobile NO_X and ROG emissions.[8]

[7] Sacramento Metropolitan Air Quality Management District, 2021. *Recommended Guidance for Land Use Emission Reductions*, Version 4.3 (for Operational Emissions). February. Available at https://www.airquality.org/LandUseTransportation/Documents/LandUseEmissionReductions4.3Final.pdf. Accessed August 2023.

[8] Philley, Paul. Sacramento Metropolitan Air Quality Management District. February 21, 2024 and March 21, 2024 telephone correspondence with Brian Schuster, ESA.

For this informational analysis, a reduction target of 35 percent below the unmitigated scenario was used to determine compliance with SCAQMD's mobile source emission reduction requirement for projects. This reduction target is then applied to both NO_X and ROG unmitigated emissions to determine the reduction target in tons per year. The unmitigated baseline Master Plan emissions, target reduction percentage, reduction target, and mitigated emissions are presented in **Table B-4**.

As shown in this table, the Master Plan would result in a reduction of 117 tons per year of NO_X and 85 tons per year of ROG emissions after mitigation, which compares to the reduction target of 47 tons per year of NO_X and 37 tons per year of ROG. This represents an 87 percent decrease in NO_X and an 80 percent decrease in ROG. This reduction is due to much lower vehicle trips and total annual VMT for the Master Plan compared with default trips and VMT.

TABLE B-4
AIR QUALITY MITIGATION PLAN EFFECTIVENESS

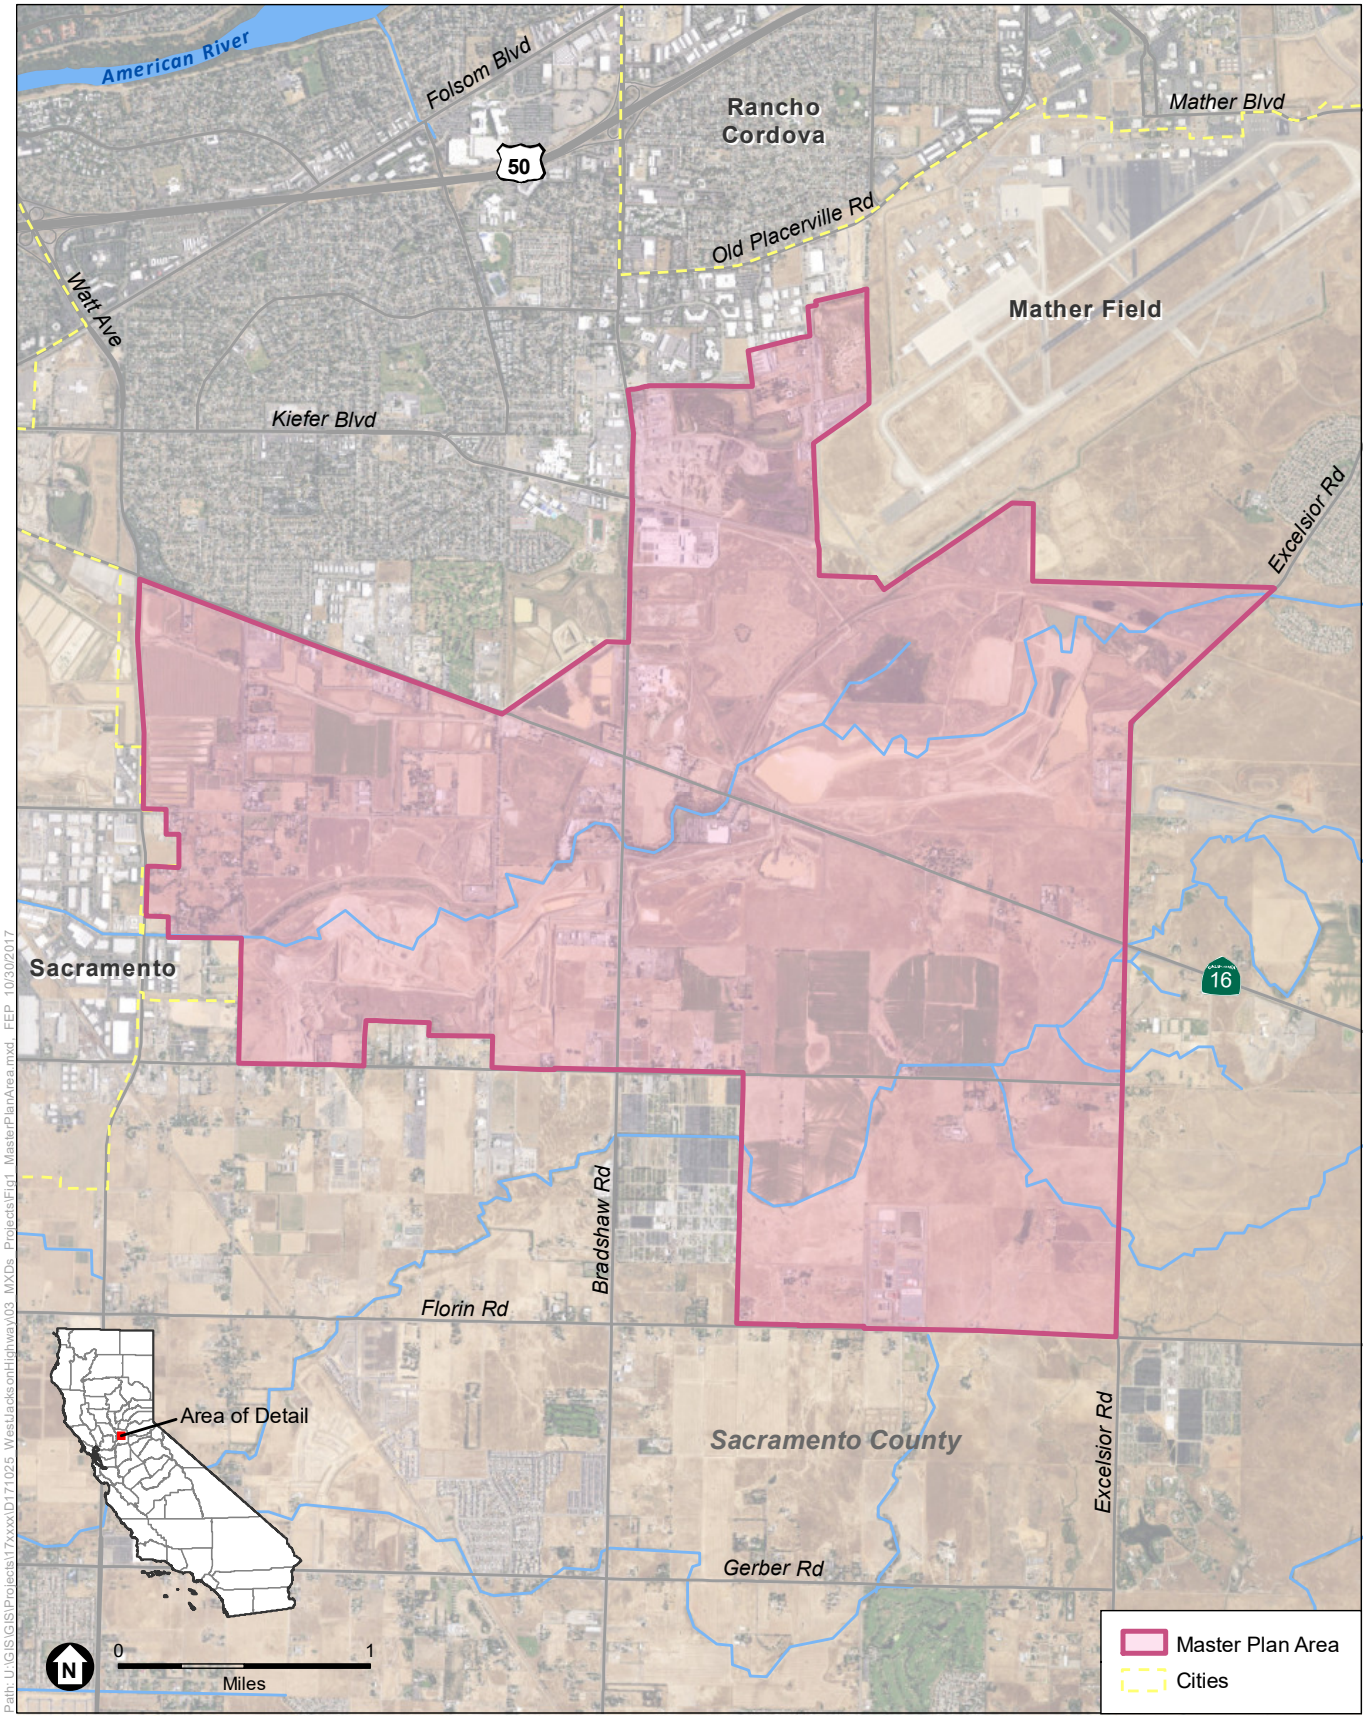
Condition	ROG, tons/year	NO_X, tons/year
Unmitigated Baseline Emissions	107	134
Mitigated Emissions	21	17
Reduction, Unmitigated minus Mitigated	85	117
Target Reduction Percentage from Baseline	**35%**	**35%**
Reduction Target	**37**	**47**
Meet Reduction Target?	Yes	Yes

ABBREVIATIONS:
NO_X = oxides of nitrogen
ROG = reactive organic gases

SOURCE: ESA, 2023

Mitigation

The trip and VMT estimates for the Master Plan were modeled using the SACOG SACSIM19 Activity Based Travel Demand Model. SACSIM accounts for several factors that reduce Master Plan VMT. These include:



- job accessibility (within a 30-minute drive or transit travel time);
- proximity to transit (distance to nearest light rail or bus station, in miles);
- availability of Class 1 and 2 bike lanes within and adjacent to the Master Plan;
- parameters that effect walking, including sidewalks and pedestrian paths and distances to transit, commercial, and related destinations;
- job and housing density (dwelling units and jobs per acre); and
- jobs and housing mix.

The reduction in vehicle travel and emissions of NOx and ROG are accomplished through many Master Plan project design features (PDFs) proposed by the Applicant. The Master Plan includes a transit subsidy as well as funding through CSA 10 for Trip Reduction Services (TRS) as a way to support these PDFs. The transit subsidy was arrived at through discussions with Sacramento Regional Transit (SacRT) staff and is included in the project's Urban Services Plan (USP). The subsidy supports the expense of a transit line from the Man Love Light Rail Station through the Master Plan Area and back (**see Figure 1**). The subsidy will be an annual fee to both residential and non-residential properties. The fee will be used by SacRT as the area is built out to provide appropriate transit services based upon density and funds. Services will increase over time until buildout which is planned to have 15-minute headways during the work week peak hours and 30-minute headways otherwise. The area will also be served in the cumulative by transit services planned for adjacent areas, such as the Florin Vineyard Area, Jackson Township, and Mather South and Newbridge.

The Transportation Reduction Services are also included as part of the Master Plan. They will be implemented through the USP as a mandatory CSA 10 assessment applied to both residential and non-residential development. These funds will be used by the County to contract for TRS services which will be available for both residents and employees in the plan area. TRS will be phased as development occurs and supported by transit funds generated from the Master Plan as it builds out, such that services are available to establish trip reduction behavior within Master Plan phases. TRS may include, but shall not be limited to, membership in a transportation management association (TMA), commute trip reduction, transit services, transit improvements, rideshare matching and vanpool coordination, commuter financial incentives, telework and/or flextime support, guaranteed ride home programs, parking management, shared parking coordination, special event transportation management, transportation access guides, wayfinding, and multimodal navigation tools.

The Master Plan also provides for an extensive Trail System that interlinks residents with schools, recreation, open space, retail services and adjacent communities (**see Figure 2**). The funding of the construction and maintenance of such facilities is included in the Plan's PFFP and the USP, respectively.

As noted above, these measures are potential components that could be included in the larger TRS but are not meant to serve as a required or complete list of such measures. Alternatives to these TRS may be considered by the County if it can be demonstrated that an equivalent reduction in VMT or transportation mode split, as documented in the project Transportation Report, can be achieved. The final TRS shall be developed in coordination with, and approved by, the County.

The features that reduce emissions include, but are not limited to, those listed below. Where applicable, the related CAPCOA greenhouse gas mitigation measures (T-xx), the SMAQMD land use emission reduction measures (LUT-xx), and the Sacramento County Final Draft Community Wide Climate Action Plan (CAP) measures (GHG-xx) are noted.[9,10,11] However, the CAPCOA, SMAQMD, and Sacramento County emission reduction percentages for the noted measures were not used; rather the Traffic Study VMT was used to calculate emissions. Note that the Traffic Study is SMAQMD pre-requisite measure TS – Traffic Study.

Location (T-1, T-2, GHG-22):

- Project is located in a suburban center within approximately 10 miles of the Sacramento downtown central business district and less than 5 miles from other existing high-density commercial/job center areas (LUT-2 and LUT-3).
- Project is located adjacent to other planned developments such that single-use trips are minimized, i.e., there are more pass-by and diverted trips (LUT-3 and LUT-4).

Density/Mix (T-1, T-2, T-3, T-4, GHG-22):

- Project provides a compact mix of land uses in close proximity to each other with a highly connected street and trail network (LUT-3).
- Housing density is better than 7 dwelling units per acre (LUT-1).

Internal Proximity (T-31-A, GHG-15, GHG-22):

- Project design includes locating at least four schools within the project boundaries such that most students can walk to a local school (LUT-3 and LUT-4).
- Project design includes at least eight parks within the project boundaries such that residents can walk/bike to enjoy the parks (LUT -3 and LUT-4).

Multi- Modal Efficiency (T-10, T-17, T-18, T-29, T-25, T-26, T-32, T-37, T-47, GHG-14, GHG-17):

- Project design includes access to high frequency bus service that connects to the Watt/Manlove light rail station (LUT-5).
- Bus routes are signalized in order to avoid traffic delays (T-27).
- Project design promotes a multi-modal system that makes public transit, walking, and bicycling viable and attractive travel choices for residents and employees. Features include:

9 California Air Pollution Control Officer's Association, 2021. *Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*, December 2021. Available at https://www.caleemod.com/handbook/index.html. Accessed August 2023.

10 Sacramento Metropolitan Air Quality Management District, 2021. *Recommended Guidance for Land Use Emission Reductions*, Version 4.3 (for Operational Emissions). February. Available at https://www.airquality.org/LandUseTransportation/Documents/LandUseEmissionReductions4.3Final.pdf. Accessed August 2023.

11 Sacramento County, 2022. *Final Draft Community Wide Climate Action Plan*, August 2022. Available at https://planning.saccounty.gov/PlansandProjectsIn-Progress/Pages/CAP.aspx. Accessed August 2023.

  - Adequate bike parking at non-residential locations (T-34, T-47).
  - Showers/lockers and other end of trip facilities at non-residential buildings (T-10).
  - Long-term bike parking facilities (T-34, T-47).
- Project includes an extensive pedestrian path and trail system that is convenient and accessible from homes, school, parks, employment, and shopping (LUT-8).
- Pedestrian and bike paths minimize any barriers to pedestrian/bicycle use, (e.g., fences, berms and other impediments are eliminated where possible) (LUT-8, T-18, T-20).

Transit Supportive (T-3, T-5, T-6, T-9, T-25, T-27, T-28, T-32, T-38; GHG-14, GHG-22):

- Project subsidizes bus rapid transit lanes on Jackson Highway (T-27).
- Project funding and design will result in bus headways of 15 minutes or better (T-26).
- Project includes joining a TMA funded through assessments. Although the project will include a TMA, no VMT reduction from the TMA has been calculated or included in the Traffic Study.
- Project includes assessments for regional transportation improvements (T-27).

Unmitigated ROG and NOx emissions from mobile sources were calculated using EMFAC2021 and VMT from the Master Plan VMT Analysis and Traffic Study. There are additional transportation related mitigation measures that are incorporated into the project design and operation and for which emission reductions have been quantified. These measures include the following (where applicable the CAPCOA mitigation measure has been cited, T-xx):

- Electric bike share and scooter share (T-22-B, T-22-C).
- Additional sidewalks within the Project (T-18).
- For Employees:
  - Mandatory Community-Wide TMA participation that was not included in the VMT Analysis (TBD).
  - Carpooling/rideshare (T-8).

The measures are separated by those that benefit residential-related transportation (VMT per capita) and those that benefit employee-related transportation (VMT per employee). Where applicable, the CAPCOA mitigation measure (T-xx) is also noted in the Table.

The following mitigation measures will also reduce ROG and NO_X emissions from operational mobile sources:

- **Mitigation Measure AQ.1-2: Electric Vehicle Charging Infrastructure (**see Air Quality and Greenhouse Gas Technical Report, Impact AQ.1**).**
- **Mitigation Measure AQ.3-2: Operational Truck Emissions Reduction (**see Air Quality and Greenhouse Gas Technical Report, Impact AQ.3).

- **Mitigation Measure GHG.1-4: Electric Vehicle Requirement for Carsharing Programs (**see Air Quality and Greenhouse Gas Technical Report, Impact GHG.1)**.**
- **Mitigation Measure GHG.1-5: Greenhouse Gas Reduction Plan (**see Air Quality and Greenhouse Gas Technical Report, Impact GHG.1)**.**

The following mitigation measures will reduce ROG and NO_X emissions from operational non-mobile sources:

- **Mitigation Measure AQ.3-1: Promote Use of Green Consumer Products (**see Air Quality and Greenhouse Gas Technical Report, Impact AQ.3).
- **Mitigation Measure AQ.3-3: Electric Landscaping Equipment (**see Air Quality and Greenhouse Gas Technical Report, Impact AQ.3).
- **Mitigation Measure AQ.3-4: Best Available Emissions Controls for Stationary Emergency Generators (**see Air Quality and Greenhouse Gas Technical Report , Impact AQ.3)**.**
- **Mitigation Measure GHG.1-4: Electric Vehicle Requirement for Carsharing Programs (**see Air Quality and Greenhouse Gas Technical Report, Impact GHG.1)**.**
- **Mitigation Measure GHG.1-5: Greenhouse Gas Reduction Plan (**see Air Quality and Greenhouse Gas Technical Report, Impact GHG.1)**.**

The Master Plan would achieve the County's VMT efficiency threshold per SB 743 for residential, office, and industrial targets with the incorporation of the project design features (PDFs) and mitigation measures listed above.

The above PDFs and mitigation measures represent all feasible measures to reduce ROG and NO_X emissions for a programmatic master plan development. Other large scale development projects within the County such as Jackson Township, Mather South, and NewBridge incorporated the same and/or similar measures to successfully achieve the ROG and NO_X percent reduction targets that were determined in their respective AQMPs. Because the Master Plan will incorporate the above PDFs and mitigation measures that are comparable to the PDFs and mitigation measures that were successfully incorporated to achieve AQMP targets for other large scale Sacramento County development projects, these PDFs and mitigation measures will ensure that the Master Plan will achieve its 35 percent reduction target.[12]

Air Quality Mitigation Plan Effectiveness

The Master Plan would meet the County's VMT efficiency thresholds and therefore be consistent with SB 743. The Master Plan would incorporate many design features and mitigation measures that would reduce both mobile non-mobile sources of ROG and NO_X, such as the mandatory community-wide TMA, no natural gas use, and electric vehicle charging infrastructure. In addition, the success of other large scale development projects in Sacramento County in achieving ROG and NO_X reduction targets through the implementation of similar project design

[12] Philley, Paul. Sacramento Metropolitan Air Quality Management District. February 21, 2024 and March 21, 2024 telephone correspondence with Brian Schuster, ESA.

features and mitigation measures ensure that the Master Plan will be able to achieve its 35 percent reduction target. Further, the traditional BAU modeling approach (presented for informational purposes) quantitatively shows that the 35 percent reduction target can be met with the implementation of project design features and mitigation measures (87 percent decrease in NO_X and 80 percent decrease in ROG). Therefore, the Master Plan's operational emissions would achieve the 35 percent emission reduction target for NO_X and ROG.

APPENDIX C

AIRPORT COMPATIBILITY REPORTS

June 29, 2022

Subject: Residential construction and testing requirements for West Jackson Master Plan residences constructed between the Mather Airport 60 and 65 dB CNEL Contours.

Dear Mr. Wiley,

Pursuant to your request, Bollard Acoustical Consultants, Inc. (BAC) has worked with HMMH to develop appropriate construction requirements for residences constructed between the 60 and 65 dB CNEL Contours. The intent of these requirements is to implement a process whereby the building plans for a specific floorplan are determined to achieve required noise level reductions, and once such determination is made, homes conforming to such building plans are deemed to comply with noise level reduction requirements. Through the collaboration between BAC and HMMH, the following specific measures are recommended for homes constructed between the 60 and 65 dB CNEL contours:

1. The master permit plan set for each floorplan type to be built between the 60 and 65 dB CNEL contours shall include the following:

    a. All exterior door and window assemblies of each residence shall provide a minimum STC rating of 32 ***and*** a minimum OITC rating of 28, respectively

    b. The exterior structural façade elements shall satisfy an OITC rating of at least 28. For example, exterior walls should achieve OITC 28 via an insulated 2x4 construction with gypsum board on the interior and siding over sheathing on the exterior.

    c. All structural façade elements should be properly installed to prevent any noise leakage. Construction plans shall include notes stating that exterior doors shall compress the seals when fully closed and locked with a deadbolt.

    d. Residential structures shall include positive flow ventilation systems designed to provide adequate fresh air circulation to allow all of the exterior windows and doors to remain closed to achieve the noise level reduction from aircraft operations.

2. The master permit plan set for each floorplan type to be built between the 60 and 65 dB CNEL contours, shall be reviewed by an acoustical consultant to ensure the designs will provide a minimum OITC rating of 25 for the exterior facades of habitable spaces of the residence. The findings of this review shall be provided to the County of Sacramento as a condition to issuance of building permits for homes conforming to a master permit set for a floorplan type.

3. In order to verify that homes are constructed in substantial conformance to a particular master permit plan set for a floorplan type and satisfy the design goal of achieving 25 dB Noise Level Reduction (NLR), post-construction acoustical testing shall be conducted in conformance with the methodology prescribed in the Acoustical Testing Plan for Mather Airport prepared by HMMH July 2022 (See Attachment 1).

4. Appropriate solar power capacity shall be provided to ensure compliance with the Title 24 to account for the need to keep windows closed for acoustic isolation.

Please contact BAC at (530) 537-2328 or paulb@bacnoise.com with any questions or comments regarding these recommendations.

Sincerely,

Bollard Acoustical Consultants, Inc.

Paul Bollard
President

1 Introduction

The Sacramento County's Airport Land Use Compatibility Plan and General Plan (Noise Element, NO-3) prohibits residential development inside the Community Noise Equivalent Level (CNEL) 60 dB contour as determined through a theoretical capacity analysis, which the Sacramento County Department of Airports (SCDA) updates periodically. With the recent update to the Mather Airport theoretical capacity analysis, the proposed West Jackson Master Plan Alternative 1C development would include residential properties within the CNEL 60 to 65 dB contour.

For federally funded airport residential sound insulation programs, the Federal Aviation Administration (FAA) guidelines suggest assigning an exterior level of CNEL 65 dB to all parcels within the CNEL 60 to 65 dB contour. To ensure that the interior CNEL is below 45 dB, with an appropriate margin of error, we would specify a design goal of 25 dB noise level reduction (NLR), which can be achieved with all structural façade elements having a minimum rating of Outdoor-Indoor Transmission Class (OITC) 25.

In accordance with Appendix R "Noise Compatibility Planning/Projects" of FAA Order 5100.38D Airport Improvement Program Handbook[1] (AIP Handbook), SCDA requires an Acoustical Testing Plan (ATP) and testing in accordance with the ATP to ensure the residential properties constructed within the CNEL 60 to 65 dB contour have a minimum average NLR of 25 dB.

The ATP conforms to "best-practices" utilized by industry professionals for over thirty years in sound insulation programs across the nation and includes acoustical testing methods for determining interior noise levels that are outlined in the FAA's adopted guidance[2] per Advisory Circular 150/5000-9A, *Announcement of Availability – Report No. DOT/FAA/PP/92-5, Guidelines for the Sound Insulation of Residents Exposed to Aircraft Noise*, issued in 1992[3]. The various steps outlined in the ATP also comply with requirements set forth in Table R-4 "Pre- and Post-Testing Criteria for Noise Insulation Projects" of Appendix R in the AIP Handbook.

The following sections provide detailed descriptions of the key components in implementing the ATP.

[1] FAA Order 5100.38D "Airport Improvement Program Handbook", Appendix R "Noise Compatibility Planning/Projects", effective date September 30, 2014.

[2] "Guidelines for the Sound Insulation of Residences Exposed to Aircraft Operations", which is attached to FAA Advisory Circular AC150/5000-9a

[3] FAA released an update in June 2022 for which there are modified testing requirements not included in this ATP.

2 Acoustical Testing

The acoustical testing program is to validate that the residential units constructed within the 60 to 65 dB CNEL contour achieves a minimum of 25 dB NLR to provide for appropriate interior habitable spaces from aircraft noise levels.

2.1 Measurement Methodology

Sound insulation measurements have historically been conducted using either an artificial noise source or actual aircraft noise events. An artificial noise source allows measurements to be made at the properties during a brief measurement period, independent from the reliance on aircraft over flights and without the need for multiple sound level meters to simultaneously measure aircraft noise in all habitable rooms.[4] The testing procedure described herein has been developed to accurately measure outdoor-to-indoor noise level reduction (NLR) of rooms.

The equipment required to complete the sound insulation measurements includes:

- Integrating sound level meter (with spectrum logging capability)[5]
- Loudspeaker (active or passive)
- Power amplifier (may be integrated with speaker)
- Signal generator (pink noise or simulated via graphic equalizer)
- Monopod for microphone
- Speaker tripod
- Power cables
- Digital camera
- Measuring tape

The testing procedures generally follow those outlined in the American Society for Testing and Materials (ASTM) Standard E966[6]. The methodology also conforms to good practice in sound insulation programs and the efficiency and flexibility of the testing procedures are enhanced using methods and theories from other sources such as Leo Beranek's "Noise and Vibration Control", which are applied in supplement to the ASTM standard to achieve the same level of overall accuracy in the testing process.

2.2 Measurement Procedures

The acoustical consultant shall use a field kit that includes a signal generator and public announcement (PA) type loudspeaker to produce a noise source of equal energy in each octave band or one-third octave band (referred to in the acoustics field as "pink noise") at an approximate overall sound level of 90 to 100 dB as measured at the exterior building façade under test.

---

[4] Defined in the AIP Handbook as living, sleeping, eating or cooking areas. Additional discussion is provided in Section **Error! Reference source not found.**

[5] Either octave band or one-third octave band capability is acceptable. This ATP provides methodology for either instrumentation.

[6] ASTM E966-10$^{\varepsilon 1}$ "Standard Guide for Field Measurements of Airborne Sound Attenuation of Building Facades and Façade Elements", with editorial changes in April 2011.

The loudspeaker will be positioned either on a tripod or placed on the ground unless there is compelling evidence that the roof/ceiling element of the room under test has the potential to contribute significantly to the interior sound level from aircraft operations. Examples of compelling reasons include: existence of weak elements within the roof/ceiling structure, such as sky lights; relatively light weight materials to make up the roof structure; limited airspace between the roof and ceiling; and limited or no use of insulation in the space between the roof and ceiling. In these instances, the speaker will be lifted above the roofline of the home to obtain both exterior façade and roof exposure through the use of an industrial grade hoisting device, such as a bucket truck, scissors lift or mobile crane.

The loudspeaker is directed at the room under test as required in the ASTM Standard E966, typically at a 45-degree incidence angle to minimize the application of adjustments to the data. The goal is to obtain a uniform sound field exposure of the entire exterior surface (façade) of interest, whether a single room or multiple rooms along the same facade. To obtain a uniform sound field along a wider area (testing of multiple rooms along the same façade) requires the speaker to be a greater distance from the façade at an increased volume as compared to the measurement of a single room.

The loudspeaker must be positioned such that the sound field at the façade of the room under test is as uniform as possible (± 2 dB along the façade of measurement) at a 45-degree angle of incidence. Corner rooms with two exterior facades should have both facades exposed simultaneously, with the direction of the speaker aimed at the center of only one of the facades. If only one façade is tested, it must be the least performing façade in terms of potential noise reduction. From the center of the façade, the perpendicular and the parallel distance to the speaker must be roughly equal.

At times the consultant may request that the roof/ceiling structure be tested to determine whether it is a major sound transmission path into a particular room. When measuring the acoustical performance of the roof/ceiling structure, the loudspeaker is placed over the roof such that the other structural elements (i.e., doors, windows, walls, etc.) are shielded from the sound field as much as possible. This often requires the use of a longer hoisting device than is necessary when the loudspeaker is placed over the yard.

With the loudspeaker placed to provide sufficiently uniform sound across the primary façade, octave band or one-third octave band sound level measurements are made both on the exterior and in the interior of the structure using both time and spatial averaging of sound levels. Additional measurements are conducted without the loudspeaker in operation to provide background or ambient sound levels.

2.2.1 Interior measurement method

Interior measurements occur to calculate the NLR for each room tested.

For interior room measurements, the microphone is swept in an elliptical or figure-8 pattern throughout the room volume for a minimum period of 20 seconds to measure the spatial average sound level (Leq) of the room. The microphone should, at all times, be at least 12 inches from sound transmitting elements (window, door, wall, vent, etc.) and from any hard reflective surfaces (e.g., walls, floor, and ceiling).

The interior room Leq is measured by sweeping the microphone as described above with the loudspeaker system turned on. The interior background Leq is measured by repeating the interior room Leq process, but with the loudspeaker system turned off. To ensure no contamination of the interior measurements conducted with the loudspeaker on, the background Leq measured with the speaker off must be at least 10 dB below the noise levels measured in each octave band or one-third octave band with the speaker turned on. To obtain this environment, household noise sources may need to be reduced or eliminated including pet noise, talking, and/or movements within the home and specific appliances or electronic devices may also need to be turned down, turned off or muted such as televisions, radios, phones,

ventilation (fan) systems, refrigerators and fish tanks. All household noise sources will be returned to their original conditions once the measurements are completed.

2.2.2 Exterior measurements methods

For exterior building façade measurements, the microphone is swept in a repeated "S" pattern for a minimum period of 20 seconds to measure the average exterior sound level (Leq) for the room or element of interest.

The exterior room façade Leq is measured by sweeping the microphone as described above with the loudspeaker system turned on. The exterior background Leq is measured by repeating the exterior facade Leq process, but with the loudspeaker system turned off. To ensure no contamination of the exterior measurements conducted with the loudspeaker on, the background Leq measured with the speaker off must be at least 10 dB below the noise levels measured in each octave band or one-third octave band with the speaker on.

There are three measurement methods which may be utilized to determine exterior sound levels. Any of the three methods may be used to determine the sound pressure level at the exterior building façade and these methods, when conducted as prescribed in the ASTM standard, will provide the same outdoor sound pressure level at the exterior facade of the structure under ideal conditions. The variety of methods for determining the outdoor sound pressure levels exist to provide flexibility since no one method can be used in all situations encountered in the field.

Each of the three methods are outlined below, in the preferred order of use.

(1) Flush method:

The flush outdoor measurement procedure[7] is outlined in the ASTM E966 standard. This method requires the microphone to be "very close" to the façade surface, but not so close that it is likely to touch the surface. The ASTM standard indicates that this measurement position requires a subtraction of 5 dB to account for the approximate doubling of the sound pressure (+6 dB) at the façade surface. The flush method is the most common and ideal method because of the ease to accomplish, applicability in most circumstances, assurance of the ability to measure similarly for pre- and post-construction conditions and repeatability of the measurement technique in the field.

(2) Nearby method:

ASTM E966 provides a second method for determining the outdoor sound pressure level: the nearby microphone method[8] with a 2 dB subtraction to the measured level to account for the reflection of sound energy from the façade and back to the microphone. This method requires the microphone to be 4 to 8 feet from the surface. This method also requires that the loudspeaker be positioned far away from the building façade (at least 40 feet) to minimize the increase in sound level associated with the measurement position being 4 to 8 feet closer to the speaker than is the façade. An additional adjustment factor of 1 dB should be subtracted from the measured exterior level to account for this effect.

[7] ASTM E966 Section 8.3.3 describes how to conduct the measurements and Section 8.5.3 provides required adjustments.

[8] ASTM E966 Section 8.3.2 describes how to conduct the measurement and Section 8.5.2 provides required adjustments.

(3) Free-field method:

The third technique, known as the free-field or calibration method[9], requires no adjustment as the measurement is conducted in an environment relatively free of reflective surfaces. The free-field method usually requires a separate speaker set up and measurement. To use the free field method, first measure the distance from the speaker to the façade during the interior room measurement. Then position the loudspeaker in a free-field environment over soft ground and measure the sound level at that same distance from the speaker by sweeping the microphone at the distance determined."

2.2.3 Measurement documentation

Digital photographs must be taken of the following:

- Exterior of each home to aid in identifying the property
- Loudspeaker positions and associated exterior façade areas under test
- Exterior elements that have noticeable product and/or installation defects
- Room interiors to document conditions in case noise modeling is undertaken or retesting is required

The digital camera must be set to the same date and time as the integrating sound level meter and all photographs must have a date and time stamp for reference. Data log sheets must also be completed (digital format is acceptable) that include, at a minimum, the following information:

- Airport code/identifier
- Address of property tested
- Resident last name or site name
- Site or parcel number (if known and applicable)
- Building number and unit number (multi-family only)
- Building floor number and unit type (multi-family only)
- Date and time of the measurements
- Initials of person(s) conducting the testing
- Description of rooms and elements tested
- Speaker set up (ground, tripod, or elevated)
- Noise-exposed room surfaces (façade, roof, or both)
- Exterior measurement method (flush, nearby, or free-field)
- A-weighted Leq noise levels, in dB, and corresponding SLM data file numbers (for interior background, interior test, exterior background, and exterior test)
- Sketch of floorplan, including all eligible rooms and noting all exterior elements
- Documentation on sketch of all loudspeaker positions, including reference distances

2.3 Calculation of Outdoor/Indoor Noise Reduction (OINR)

The Outdoor/Indoor Noise Reduction (OINR) of tested rooms and building elements are calculated from the measured exterior and interior sound levels in each octave band or one-third octave band, as outlined in ASTM E966. The OINR values are used to compute the outdoor-to-indoor Noise Level Reduction (NLR) of aircraft noise as measured in A-weighted decibels, denoted dB.

[9] ASTM E966 Section 8.3.1 describes how to conduct the measurement and Section 8.5.1 provides required adjustments.

The OINR values are computed for each tested eligible room by subtracting the interior noise level measured in each octave band or one-third octave band from the corresponding exterior sound level measurement. The exterior sound level data are first adjusted to account for the acoustic energy reflected from the building façade under evaluation, as outlined previously in report Section 2.2.2. The exterior and interior sound level data collected with the artificial noise source operating are likewise adjusted to account for the ambient acoustical energy measured with the noise source turned off. These are shown in the following equations.

The adjusted exterior level in each octave band or one-third octave band is:

$$L_{Ext\ Adj} = 10\log\left(10^{\frac{L_{Ext\ Measured}}{10}} - 10^{\frac{L_{Ext\ Background}}{10}}\right) - Adj_{Ref\ Energy}$$

The adjusted interior level in each octave band or one-third octave band is:

$$L_{Int\ Adj} = 10\log\left(10^{\frac{L_{Int\ Measured}}{10}} - 10^{\frac{L_{Int\ Background}}{10}}\right)$$

The OINR level in each octave band or one-third octave band is then determined by:

$$OINR = L_{Ext\ Adj} - L_{Int\ Adj}$$

The measurements may also be adjusted per ASTM E966 based on the angle of incidence of the noise source. The acoustical consultant typically attempts to position the loudspeaker to obtain an incident angle of 45 degrees for consistency, repeatability and efficiency as it requires no correction in the calculations. If a different angle-of-incidence is required, the consultant must apply the appropriate correction to the calculations as provided in ASTM E966.

2.4 Calculation of Noise Level Reduction (NLR)

NLR is a single number rating used for the comparison of the difference in outdoor-to-indoor noise levels. This number is typically used to judge the overall effectiveness of airport sound insulation programs.

The NLR of a room is dependent on the frequency (sound spectrum) content of the exterior noise source. For aviation sound insulation programs, the computed NLR values are determined using an appropriate aircraft noise source. The exterior aircraft source spectrum is also A-weighted to resemble human perception and to be consistent with FAA guidelines for assessing aircraft noise in communities.

The exterior aircraft noise spectrum was determined using the theoretical capacity analysis. The T-38A was estimated to be the greatest overall contributor to CNEL sound levels for departures from runways 22 L/R. Figure 1 and Table 1 present the octave band aircraft noise spectrum, normalized to an overall A-weighted sound level of 65 dB. Table 2 provides the corresponding one-third octave band sound levels.

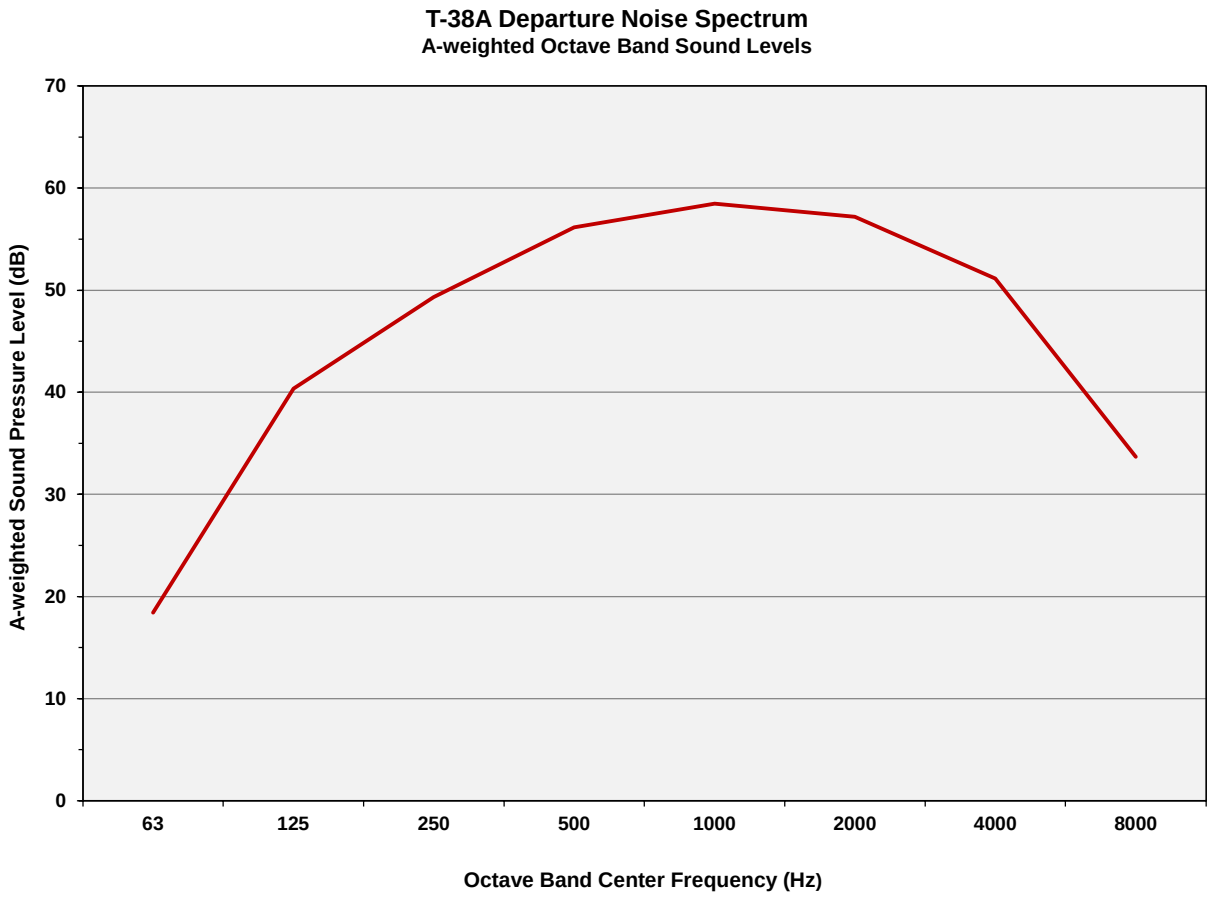

Figure 1. A-weighted Octave Band Aircraft Noise Spectrum

Table 1. A-weighted Octave Band Aircraft Noise Spectrum

Hz	63	125	250	500	1000	2000	4000	8000
dB	20.7	42.6	51.6	58.4	60.8	59.5	53.4	36.0

Table 2. A-weighted One-third Octave Band Aircraft Noise Spectrum

Hz	50	63	80	100	125	160	200	250	315	400	500	630	Hz
dB	11.4	14.7	21.0	30.9	38.2	42.4	42.3	47.3	49.9	52.4	52.4	54.9	dB
Hz	800	1000	1250	1500	2000	2500	3150	4000	5000	6300	8000	10000	Hz
dB	55.8	56.1	55.8	55.3	54.7	53.8	51.6	47.8	42.5	35.2	29.4	24.9	dB

The indoor A-weighted noise source spectrum for each tested eligible room in a structure is obtained by subtracting the measured OINR values from each corresponding octave band or one-third octave band of the exterior A-weighted aircraft source spectrum.

The overall A-weighted interior noise level is then obtained by summing the individual energies calculated for each octave band. The A-weighted NLR value for each tested room, based on the exterior aircraft spectrum, is computed from the difference between the overall outdoor and indoor A-weighted aircraft noise levels. This is shown in the following equations.

The exterior A-weighted total level is:

$$L_{Ext\ Total} = 10log \sum_{i=1}^{k} 10^{\frac{L_{Ext\ Noise\ Source\ Spectrum,i}}{10}}$$

The interior A-weighted total level is:

$$L_{Int\ Total} = 10log \sum_{i=1}^{k} 10^{\frac{L_{Ext\ Noise\ Source\ Spectrum,i} - OINR_i}{10}}$$

where "k" is the total number of octave or one-third octave bands used.

The NLR is then determined by:

$$NLR = L_{Ext\ Total} - L_{Int\ Total}$$

Table 3 presents an example of an octave band measurement calculation.

Table 3. Example Octave Band Measurement Calculation

	Octave Band Center Frequency								A-weighted Total
	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz	
Unweighted Measurement Data									
Exterior Background	67.3	66.2	58.4	50.2	48.5	45.6	39.8	34.2	**56.0**
Exterior Measurement (flush)	93.1	93.3	88.3	87.9	88.4	86.8	88.1	89.5	**95.1**
Exterior Adjusted	88.1	88.3	83.3	82.9	83.4	81.8	83.1	84.5	**90.1**
Interior Background	49.1	46.4	37.2	28.1	29.0	23.7	21.4	20.7	**35.6**
Interior Measurement	70.4	70.0	61.4	61.8	60.2	56.8	57.8	54.1	**65.8**

Outdoor-Indoor Noise Reduction (OINR)	**17.7**	**18.3**	**21.9**	**21.1**	**23.2**	**25.0**	**25.3**	**30.4**	
A-weighted Aircraft Sound Levels									
Exterior Noise Level	20.7	42.6	51.6	58.4	60.8	59.5	53.4	36.0	**65.0**
Interior Noise Level	3.0	24.3	29.7	37.3	37.6	34.5	28.1	5.6	**42.0**
								Noise Level Reduction (NLR):	***23.0 dB***

Under the "Unweighted Measured Data" section, the *Interior Background* shows the measured interior background octave band levels with the loudspeaker turned off and the A-weighted total. The *Interior Measurement* presents the measured interior octave band levels with the loudspeaker turned on and the A-weighted total. The *Interior Adjusted* provides the interior octave band levels with the measured background sound level contribution removed and the A-weighted total. The *Exterior Background* shows the measured exterior background octave band levels with the loudspeaker off and the A-weighted total. The *Exterior Measurement* shows the measured exterior façade octave band levels with the loudspeaker on and the A-weighted total. The *Exterior Adjusted* provides the exterior octave band levels with the measured background sound level and the façade reflected energy contributions removed and the A-weighted total. In this example, note that the octave band levels and the A-weighted totals both show the measurements with the speaker turned on being more than 10 dB louder than the background levels with the speaker turned off.

The OINR is then developed by subtracting the *Interior Adjusted* level from the *Exterior Adjusted* level for each octave band, as outlined in Section 2.3. Under "A-Weighted Aircraft Noise Source Spectrum" the OINR is subtracted from the *Exterior Spectrum* to obtain the *Interior Spectrum*. The A-weighted acoustical

energy totals of the *Exterior Spectrum* and the *Interior Spectrum* are subtracted to obtain the NLR value, shown on the last line of the example table.

2.5 Extent of Acoustical Testing

According to Appendix R of the AIP Handbook, FAA recommends testing between 10% and 30% of the potentially eligible parcels[10]. In order to verify that homes are constructed in substantial conformance to a particular master permit plan set for a floorplan type and satisfy the design goal of achieving 25 dB Noise Level Reduction (NLR), post-construction acoustical testing of the first home conforming to the master permit plan set for a floorplan type (typically the model home) and at least one additional home for each floorplan type randomly selected during each construction phase to ensure the homes all meet the acoustical goal.

[10] FAA Order 5100.38D Appendix R, Table R-4 "Pre- and Post-Testing Criteria for Noise Insulation Projects", c. "First Step – Initial Testing" Paragraph (3): "Once the sponsor has characterized the diversity of the residences in the noise contour, it will select a representative sample of each type of similarly-constructed residences for testing, which based on industry review is typically 10% to 30%."

3 Compliance Determination

SCDA will determine compliance based on the testing reports provided during each phase of construction. Residential structures with an average NLR of 25 dB or greater will be considered to have met the SCDA requirements for those within the 60 to 65 dB CNEL contour.

Introduction

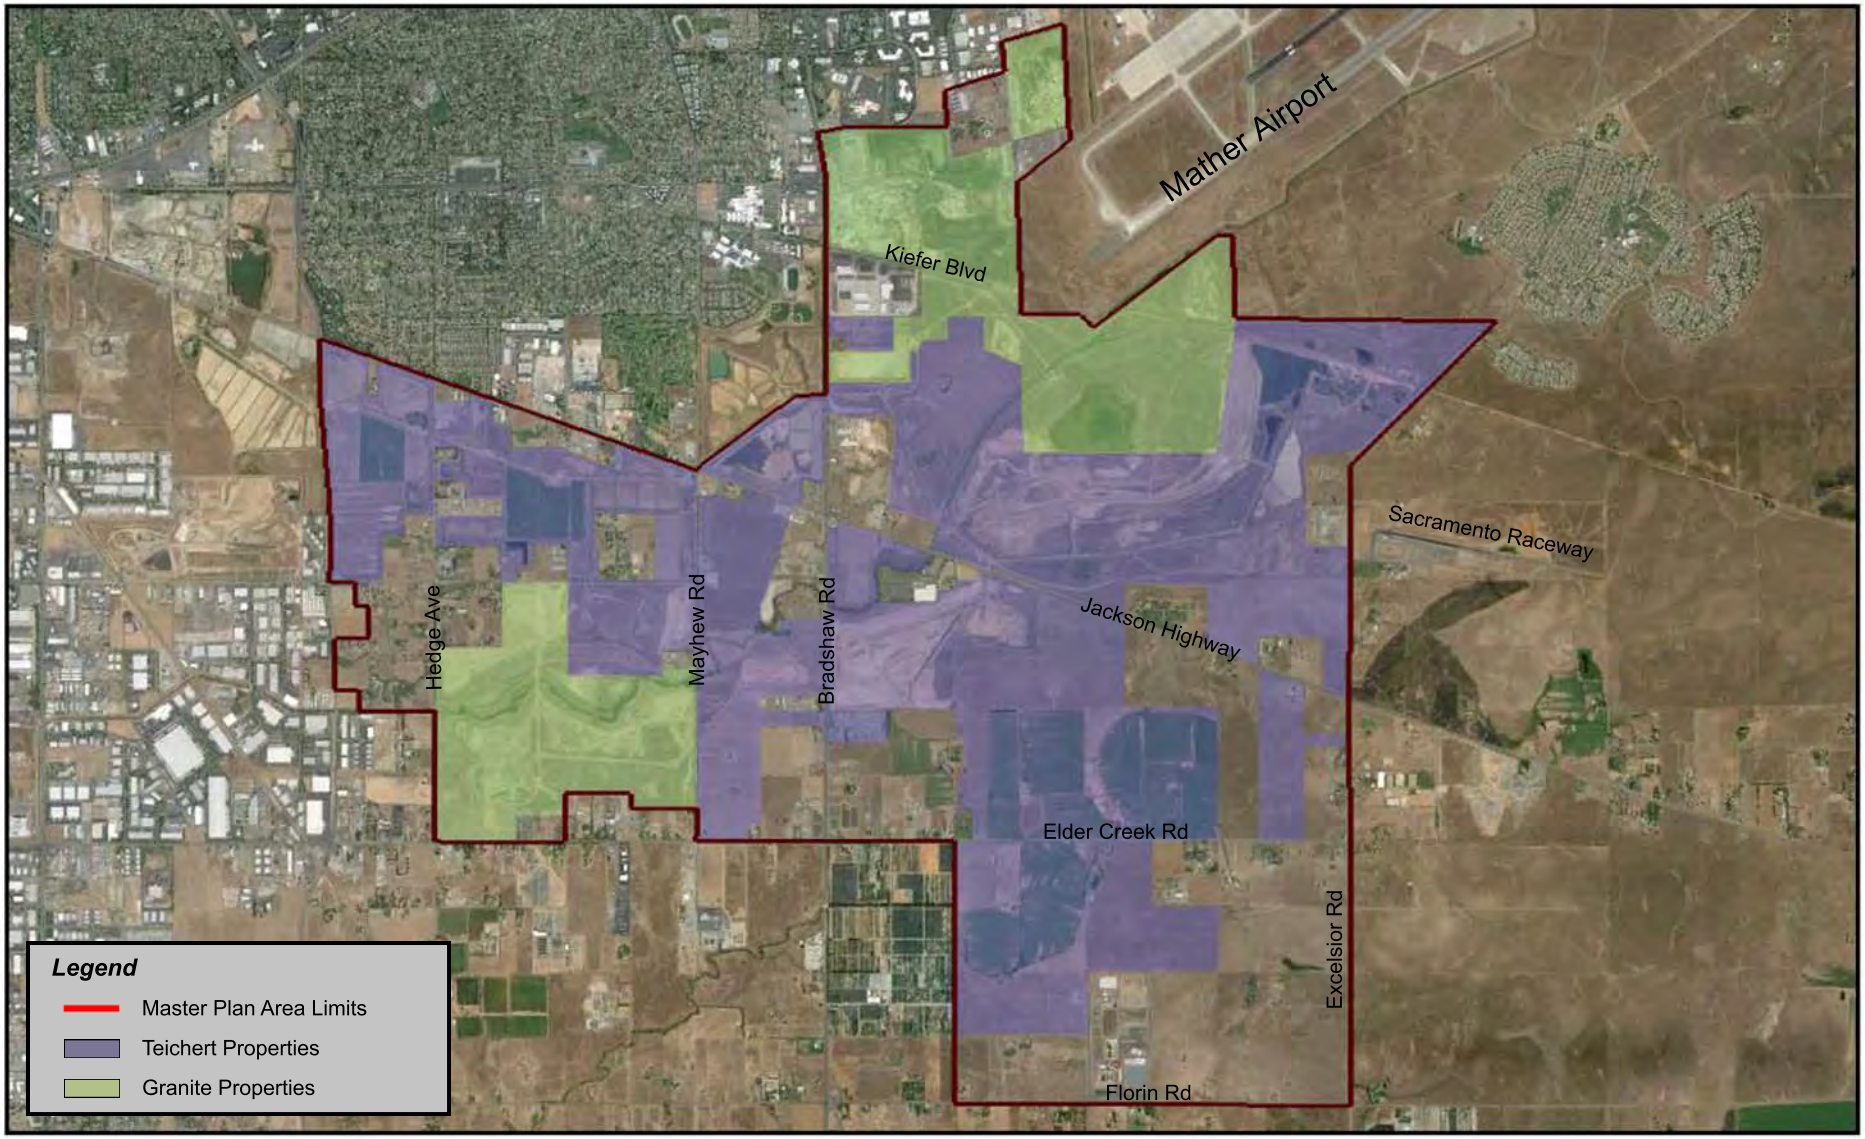
The West Jackson Highway Master Plan was initiated by the Sacramento County Board of Supervisors on April 17, 2012. In accordance with the requirements of General Plan Land Use Element Policy LU-119, Stonebridge Properties, LLC (Stonebridge Properties), a subsidiary of Teichert Land Co., and Granite Construction Company (Granite), a California corporation (Participating Properties) have initiated the Master Plan process for all land encompassed within the proposed Master Plan Area (referred to herein as the "Plan Area"). Stonebridge Properties and Granite have retained Bollard Acoustical Consultants, Inc. (BAC) to prepare this noise study report identifying existing noise sources within or affecting the Plan Area, quantifying baseline ambient noise and vibration conditions within the Plan Area, and identifying noise impacts and mitigation measures associated with development within the Plan Area. It is intended that information contained in this report will be utilized in the development of the Noise Section of the Environmental Impact Report (EIR) to be prepared for the Master Plan.

Of the entire 5,913± acres of the Plan Area, the Participating Properties collectively own 4,079± acres – Teichert owns 3,016± acres and Granite owns 1,063± acres (See Figure 1). Thus, Participating Properties represent 69% of the total Plan Area acreage. These properties primarily include aggregate mining sites used for sand and gravel extraction, many of which have already been mined and reclaimed. Although most of the mining is complete, some of the Participating Properties continue to support various mining related activities.

In addition to mining areas, the Plan Area is comprised of a mixture of rural residential, institutional, agricultural and industrial properties located along State Route 16 (Jackson Highway) in the geographic center of Sacramento County. The Plan Area boundaries are generally Jackson Highway, Kiefer Boulevard and Goethe Road to the north, portions of Elder Creek Road and Florin Road to the south, the City of Sacramento to the west and Excelsior Road to the east. As a result of the mining activities across the landscape since the 1930's, the Plan Area has largely been bypassed by development. Just over 80% of the Plan Area boundary abuts the existing Sacramento County Urban Policy Area and the Sacramento City Limits.

The Master Plan has been designed to provide a mixture of residential, commercial, recreational, farming, and employment nodes intended to reduce vehicle miles traveled (VMT) within the Plan Area and support the provision and use of transit alternatives. Some of the proposed land uses designations have components which could be noise-generating (industrial, active recreation areas parks and school playgrounds, commercial uses, etc.), whereas other uses have noise-sensitive components (residences, school classrooms and office interiors, etc.).

The project environmental document will consider the effects of noise generated by the project as well as noise impacting the project from sources unrelated to the Master Plan development. The Master Plan establishes a framework and strategy for all future land use within the Plan Area, including general land use and development standards, policies, land use allocations, infrastructure, and public service planning. Within the Master Plan, two District Area Plans (labeled as District 1 and District 2), are established, in addition to three Future Planning Areas (FPA's) (labeled as FPA A, B and C) (See Figure 2). District Area Plans primarily consist of



Participating Properties, while Future Planning Areas are comprised of non-participating property owners. Teichert's acreage is fully within District 1. Granite's acreage is fully within District 2.

The District Plans establish specific land uses, policies, design guidelines and development standards for the properties within the District Areas. Although future land uses for the FPAs will be established in gross by the Master Plan, specific land uses, policies, design guidelines and development standards for these areas are not provided by the Master Plan. It is anticipated that the landowners within the FPAs will initiate District Plans or Specific Plans in the future. Should the landowners in those areas contemplate changing existing land uses within the FPA, such future use must be consistent with the provisions of the Master Plan and undergo further analysis, including environmental review, when an entitlement application is submitted to the County.

Fundamentals and Terminology

Noise

Noise is simply described as unwanted sound. Sound is defined as any pressure variation in air that the human ear can detect. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second, called Hertz (Hz).

Discussing sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel (dB) scale was devised. The decibel scale uses the hearing threshold (20 micropascals of pressure), as a point of reference, defined as 0 dB. Other sound pressures are compared to the reference pressure and the logarithm is taken to keep the numbers in a practical range. The dB scale allows a million-fold increase in pressure to be expressed as 120 dB. To better relate overall sound levels and loudness to human perception, frequency-dependent weighting networks were developed. There is a strong correlation between the way humans perceive sound and A-weighted sound levels. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment for community exposures. All sound levels expressed in this section are A-weighted sound levels, unless noted otherwise. Definitions of acoustical terminology are provided in Appendix A.

Community noise is commonly described in terms of the “ambient” noise level, which is defined as the all-encompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level (L_{eq}), over a given time period (usually one hour). The L_{eq} is the foundation of the day-night average noise descriptor, and shows very good correlation with community response to noise for the average person.

The L_{dn} is based upon the average noise level over a 24-hour day, with a +10 dB weighting applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average, it tends to disguise short-term variations in the noise environment. Where short-term noise sources are an issue, noise impacts may be assessed in terms of maximum noise levels, hourly averages, or other statistical descriptors.

The perceived loudness of sounds and corresponding reactions to noise are dependent upon many factors, including sound pressure level, duration of intrusive sound, frequency of occurrence, time of occurrence, and frequency content. As mentioned above; however, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by weighing the frequency response of a sound level meter by means of the standardized A-weighing network. Table 1 shows examples of noise levels for several common noise sources and environments.

Table 1
Typical A-Weighted Sound Levels of Common Noise Sources

Loudness Ratio*	dBA	Description
128	130	Threshold of pain
64	120	Jet aircraft take-off at 100 feet
32	110	Riveting machine at operators' position
16	100	Shotgun at 200 feet
8	90	Bulldozer at 50 feet
4	80	Diesel locomotive at 300 feet
2	70	Commercial jet aircraft interior during flight
1	60	Normal conversation speech at 5-10 feet
1/2	50	Open office background level
1/4	40	Background level within a residence
1/8	30	Soft whisper at 2 feet
1/16	20	Interior of recording studio

* Each 10 dBA increase in sound pressure level equates to a doubling of loudness. For example, 70 dBA is twice as loud as 60 dB and 80 dBA is four times as loud as 60 dBA, etc.

Perception of Changes in Noise Levels

Table 2 is based upon recommendations made in August 1992 by Federal Interagency Committee on Noise (FICON) to provide guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these criteria have been applied to other sources of noise similarly described in terms of cumulative noise exposure metrics such as the L_{dn}.

Table 2
Significance of Changes in Cumulative Noise Exposure

Ambient Noise Level Without Project, Ldn	Increase Required for Significant Impact
<60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65 dB	+1.5 dB or more

Source: Federal Interagency Committee on Noise (FICON)

According to Table 2, an increase in noise from similar sources of 5 dB or more would be noticeable where the ambient level is less than 60 dB. Where the ambient level is between 60 and 65 dB, an increase in noise of 3 dB or more would be noticeable, and an increase of 1.5 dB or more would be noticeable where the ambient noise level exceeds 65 dB L_{dn}. The rationale for the Table 2 criteria is that, as ambient noise levels increase, a smaller increase in noise resulting from a project is sufficient to cause annoyance.

Single-Event Noise & Sleep Disturbance

A single event is an individual distinct loud activity, such as an aircraft overflight, a train or truck passage, or any other brief and discrete noise-generating activity. Because most noise policies applicable to transportation noise sources are typically specified in terms of 24-hour-averaged descriptors, such as Ldn or Community Noise Equivalent Level (CNEL), the potential for annoyance or sleep disturbance associated with individual loud events can be masked by representing the data as an average. A discussion of Single-Event noise effects relative to Sacramento County Noise Policy is included in the Criteria section of the report.

Berkeley Keep Jets Over the Bay

The analysis of single event noise effects under CEQA can be traced to a 2001 court case (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners of the City of Oakland* (2001) 91 Cal.App.4th 1344), which concerned a challenge to the proposed expansion of the Oakland Airport. The court required, in that context (i.e. an airport expansion), that the EIR address single-event noise and sleep disturbance effects on existing residents in the City of Berkeley. However, the court did not recommend an appropriate single event noise level standard to be employed.

Extensive studies have been conducted regarding the effects of single-event noise on sleep disturbance, with the Sound Exposure Level (SEL) metric being a common metric used for such assessments. SEL represents the entire sound energy of a given single-event normalized into a one-second period regardless of event duration. As a result, the single-number SEL metric contains information pertaining to both event duration and intensity. Another descriptor utilized to assess single-event noise is the maximum, or Lmax, noise level associated with the event. A problem with utilizing Lmax to assess single events is that the duration of the event is not considered.

There are currently on-going discussions regarding the appropriateness of using the SEL metric as a supplement or replacement for cumulative noise level metrics such as Ldn and CNEL, 24-hour noise descriptors. Nonetheless, because SEL describes a receiver's total noise exposure from a single impulsive event, SEL is often used to characterize noise from individual brief loud events.

Industry Guidance on Single Event Noise and Sleep Disturbance

The Federal Interagency Committee on Aviation Noise (FICAN) has provided estimates of the percentage of people expected to be awakened when exposed to specific SELs inside a home (FICAN 1997). However, FICAN did not recommend a threshold of significance based on the percent of people awakened. According to the FICAN study, 10% of the population is estimated to be awakened when the SEL interior noise level reaches 81 dBA. An estimated 5 to 10 percent of the population is affected when the SEL interior noise level is between 65 and 81 dBA, and few sleep awakenings (less than 5 percent) are predicted if the interior SEL is less than 65 dBA. The FICAN results focused on individual single-event sound levels but did not take into consideration how exposure to multiple single events affected sleep disturbance.

ANSI and the Acoustical Society of America (ASA) released a voluntary methodology to predict sleep disturbance in terms of the probability of awakening. ANSI's *Quantities and Procedures for Description and Measurement of Environmental Sound -Part 6: Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes*, July 2008, provides a method to predict sleep disturbance associated with noise levels in terms of indoor A-weighted sound exposure level (ASEL). The methodology was developed from about 10,000 subject-nights of observations primarily in homes near areas of routine jet aircraft takeoff and landings, railroads, roads, and highways. The methodology assumes that the individuals have no sleep disorders, normal hearing, and only applies to individuals over 18 years of age. The methodology also defines "disturbance" as being restricted to a behaviorally confirmed awakening.

While the FICAN has a recommended means of predicting awakenings from a single aircraft event, the new ANSI methodology further refines this approach by taking into account the time since the person fell asleep and the ability to identify the probability of being awakened from multiple aircraft events over the course of the entire night. However, research performed by BAC questions the accuracy of the ANSI methodology.

Although the FICAN and ANSI methodologies provide a means by which the potential for awakenings due to single events can be predicted, neither methodology provides a recommended target level for acceptable single-event noise or percentage of awakening. Further, there is no industry consensus establishing recommended target levels for acceptable single-event noise or percentage of awakening.

Sound Propagation

It is commonly understood that sound decreases with distance. But the propagation of sound is dependent on considerably more variables than distance alone. Those variables include the type of noise source (point, moving point, or line sources), the directionality of the noise source, the frequency content of the source (low frequency sound is absorbed in the atmosphere at a slower

rate than high-frequency sound and therefore "carries" farther), atmospheric conditions (wind, temperature, humidity, gradients), ground type (dirt, grass fields, concrete, etc.), shielding (structures, noise barriers, topography), and vegetation.

In the generally urban setting of the Plan Area, noise-sensitive receptors are located within fairly close proximity to noise sources. At short distances between the source and receptor, the effects of the atmosphere on sound propagation are diminished, as those effects become more pronounced at distances in excess of 300 feet.

For the purposes of assessing noise sources within the project area, traffic on public roadways are considered "moving point" sources. The sound level decay rate for this type of source is 4.5 dB per doubling of distance from the source. Stationary noise sources, such as the Granite Bradshaw aggregate plant, are treated as "point" sources. The sound level decay rate for point sources is 6 dB per each doubling of distance from the source.

Several of the Teichert and Granite parcels located within the Plan Area are former aggregate excavation sites, and are therefore depressed relative to surrounding ground elevation in many cases. This is important in that the nearby noise sources, such as adjacent roadways, are typically not visible from the depressed positions within these parcels. Because the former excavation embankments provide topographic shielding of adjacent traffic noise sources from the depressed positions, ambient noise levels within the depressed areas are considerably lower than locations at or near even grade with adjacent roadways.

Noise Mitigation Fundamentals

Any noise problem may be considered as being composed of three basic elements: the noise source, a transmission path, and a receiver. The appropriate acoustical treatment for a given project should consider the nature of the noise source and the sensitivity of the receiver. The problem should be defined in terms of appropriate criteria (Ldn, L_{50}, or Lmax), the location of the sensitive receiver (inside or outside), and when the problem occurs (daytime, nighttime, or 24-hour average). Noise control techniques should then be selected to provide an acceptable noise environment for the receiving property while remaining consistent with local aesthetic standards and practical structural and economic limits. Fundamental noise control techniques include the following:

Use of Setbacks

Noise exposure may be reduced by increasing the distance between the noise source and receiving use. The available noise attenuation from this technique is limited by the characteristics of the noise source, but is generally about 4 to 6 dB per doubling of distance from the source.

Use of Barriers

Shielding by barriers can be obtained by placing walls, berms or other structures, such as buildings, between the noise source and the receiver. The effectiveness of a barrier depends upon blocking line-of-sight between the source and receiver, and is improved with increasing the distance the sound must travel to pass over the barrier as compared

to a straight line from source to receiver. The difference between the distance over a barrier and a straight line between source and receiver is called the "path length difference," and is the basis for calculating barrier noise reduction.

Barrier effectiveness depends upon the relative heights of the source, barrier and receiver. In general, barriers are most effective when placed close to either the receiver or the source. An intermediate barrier location yields a smaller path-length-difference for a given increase in barrier height than does a location closer to either source or receiver.

For maximum effectiveness, barriers must be continuous and relatively airtight along their length and height. To ensure that sound transmission through the barrier is insignificant, barrier mass should be about 3-4 lbs. /square foot, although a lesser mass may be acceptable if the barrier material provides sufficient transmission loss. Satisfaction of the above criteria requires substantial and well-fitted barrier materials, placed to intercept line of sight to all significant noise sources.

Earth, in the form of berms, or the face of a depressed area, is also an effective barrier material. This project design makes extensive use of topography and site grading to serve as both visual and acoustic barriers to nearby traffic and some on-site noise sources associated with the Teichert Perkins facility.

There are practical limits to the noise reduction provided by barriers. For traffic noise, a 5 to 10 dB noise reduction may often be reasonably attained. A 15 dB noise reduction is usually difficult but sometimes possible to attain, but a 20 dB noise reduction is extremely difficult to achieve. Barriers usually are provided in the form of walls, berms, or berm/wall combinations. The use of an earth berm in lieu of a solid wall may provide additional attenuation over that attained by a solid wall alone due to the absorption provided by the earth. Berm/wall combinations offer slightly better acoustical performance than solid walls, and are often preferred for aesthetic reasons over solid barrier walls alone.

Site Design

Buildings can be placed on a project site to shield other structures or areas, to remove them from noise-impacted areas, and to prevent an increase in noise level caused by reflections. The use of one building to shield another can significantly reduce overall project noise control costs, particularly if the shielding structure is insensitive to noise. As an example, carports or garages can be used to form or complement a barrier shielding adjacent dwellings or an outdoor activity area. Similarly, one residential unit can be placed to shield another so that noise reduction measures are needed for only the building closest to the noise source. Placement of outdoor activity areas within the shielded portion of a building complex, such as a central courtyard, can be an effective method of providing a quiet retreat in an otherwise noisy environment. Patios or balconies should be placed on the side of a building opposite the noise source, and "wing walls" can be added to buildings or patios to help shield sensitive uses.

Another useful option in site design is the placement of relatively insensitive land uses, such as commercial uses, between the noise source and a more sensitive portion of the

project. Examples include development of a commercial strip along a busy arterial to block noise affecting a residential area. If existing topography or development adjacent to the project site provides some shielding, as in the case of an existing berm, knoll or building, sensitive structures or activity areas may be placed behind those features to reduce noise control requirements.

Building Design

When structures have been located to provide maximum noise reduction by site design or shielding, noise reduction measures may still be required to achieve an acceptable interior noise environment. The cost of such measures may be reduced by placement of interior dwelling unit features. For example, bedrooms, living rooms, family rooms and other noise-sensitive portions of a dwelling can be located on the side of the unit farthest from the noise source.

Bathrooms, closets, stairwells and food preparation areas are relatively insensitive to exterior noise sources, and can be placed on the noisy side of a unit. When such techniques are employed, noise reduction requirements for the building facade can be significantly reduced, although the architect must take care to isolate the noise impacted areas by the use of partitions or doors.

Noise Reduction by Building Facades

When interior noise levels are of concern in a noisy environment, noise reduction may be obtained through acoustical design of building facades. Standard residential construction practices provide 10 to 15 dB noise reduction for building facades with open windows, and approximately 25-30 dB noise reduction when windows are closed. Thus a 25 dB exterior-to-interior noise reduction can be obtained by the requirement that building design include adequate ventilation systems, allowing windows on a noise-impacted facade to remain closed under any weather condition.

Where greater noise reduction is required, acoustical treatment of the building facade is necessary. The greatest improvement in building façade noise reduction can typically be realized through specification of upgraded windows with higher Sound Transmission Class (STC) ratings.

Noise transmitted through walls can be reduced by increasing wall mass (using stucco or brick in lieu of wood siding), isolating wall members by the use of double- or staggered-stud walls, or mounting interior walls on resilient channels. Noise control for exterior doorways is provided by reducing door area, using solid-core doors, and by acoustically sealing door perimeters with suitable gaskets. Roof treatments may include the use of plywood sheathing under roofing materials.

Whichever noise control techniques are employed, it is essential that attention be given to installation of weather-stripping and caulking of joints. Openings for attic or subfloor ventilation may also require acoustical treatment; tight-fitting fireplace dampers and glass doors may be needed in aircraft noise-impacted areas.

Use of Vegetation

Trees and other vegetation are often thought to provide significant noise attenuation. However, approximately 100 feet of dense foliage (so that no visual path extends through the foliage) is required to achieve a 5 dB attenuation of traffic noise. Thus the use of vegetation as a noise barrier should not be considered a practical method of noise control unless large tracts of dense foliage are part of the existing landscape.

Vegetation can be used to acoustically "soften" intervening ground between a noise source and receiver, increasing ground absorption of sound and thus increasing the attenuation of sound with distance. Planting of trees and shrubs is also of aesthetic and psychological value, and may reduce adverse public reaction to a noise source by removing the source from view, even though noise levels will be largely unaffected.

In summary, the effects of vegetation upon noise transmission are minor, and are primarily limited to increased absorption of high frequency sounds and to reducing adverse public reaction to the noise by providing aesthetic benefits.

Noise-Reducing Paving Materials (Rubberized Asphalt)

Studies conducted for the Sacramento County Planning and Environmental Review Department and Transportation Department to determine the noise reduction provided by rubberized asphalt have been completed in recent years. Those studies indicate that the use of rubberized asphalt on two County roadways appears to have resulted in an average traffic noise level reduction of approximately 4 dB over that provided by conventional asphalt.

Vibration

Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that noise is generally considered to be pressure waves transmitted through air, while vibration is usually associated with transmission through the ground or structures. As with noise, vibration consists of an amplitude and frequency. A person's response to vibration will depend on their individual sensitivity as well as the amplitude and frequency of the source.

Vibration can be described in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration measures in terms of peak particle velocities (inches/second). Standards pertaining to perception as well as damage to structures have been developed for vibration in terms of peak particle velocity.

As vibrations travel outward from the source, they excite the particles of rock and soil through which they pass and cause them to oscillate. Differences in subsurface geologic conditions and distance from the source of vibration will result in different vibration levels characterized by different frequencies and intensities. In all cases, vibration amplitudes will decrease with increasing distance. The maximum rate, or velocity of particle movement, is the commonly accepted descriptor of the vibration "strength".

Human response to vibration is difficult to quantify. Vibration can be felt or heard well below the levels that produce any damage to structures. The duration of the event has an effect on human response, as does frequency. Generally, as the duration and vibration frequency increase, the potential for adverse human response increases.

According to the Transportation and Construction-Induced Vibration Guidance Manual (Caltrans, June 2004), operation of construction equipment and construction techniques generate ground vibration. Traffic traveling on roadways can also be a source of such vibration. At high enough amplitudes, ground vibration has the potential to damage structures and/or cause cosmetic damage (e.g., crack plaster). Ground vibration can also be a source of annoyance to individuals who live or work close to vibration-generating activities. However, traffic, including heavy trucks traveling on a highway, rarely generates vibration amplitudes high enough to cause structural or cosmetic damage.

Criteria for Acceptable Noise and Vibration Levels

Sacramento County

Sacramento County General Plan

The Noise Element of the Sacramento County General Plan contains policies pertaining to acceptable noise generation and exposure levels within the County. The policies contained within the County Noise Element which are pertinent to the evaluation of noise impacts due to and upon development within the Plan Area are reproduced below.

Traffic and Railroad Noise Sources

NO-1 The noise level standards for noise-sensitive areas of new uses affected by traffic or railroad noise sources in Sacramento County are shown in Table 3. Where the noise level standards of Table 3 are predicted to be exceeded at new uses proposed within Sacramento County which are affected by traffic or railroad noise, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 3 standards.

Aircraft Noise Sources

NO-2 Proposals for new development within Sacramento County which may be affected by aircraft noise shall be evaluated relative to the Land Use Compatibility for Aircraft Noise table contained in the County General Plan Noise Element. Development proposals which may be affected by aircraft noise from Mather Airport shall be evaluated relative to the Land Use Compatibility Plan prepared for Mather Airport dated February 2021, adopted herein by reference, as well as applicable footnotes in Table 4 of the General Plan Noise Element.

NO-3 New residential development within the 60 CNEL noise contours adopted by the County for planning purposes at any airport or Helipad within Sacramento County shall be prohibited unless exceptions set forth in General Plan Noise Element

Table 4 are found to be applicable. This policy is not applicable to Executive Airport.

Footnotes 2, 6 and 7 of General Plan Noise Element Table 4 state the following with respect to development of noise-sensitive uses within the Mather Airport noise contours:

2. Single family detached residential units within the 60-65 dB CNEL noise contours of the Mather Airport Policy Area may be considered a compatible use if: (a) approved by the Board of Supervisors upon completion of Sacramento County's master plan process, including demonstration of compliance with LU-119 and LU-120; (b) an evaluation of potential noise and safety impacts pursuant to CEQA has occurred and appropriate noise mitigation measures to reduce interior noise levels to 45 dB have been included in the environmental document and adopted as conditions of approval; and (c) all of the requirements in Footnote 8 below are met. Second residential units are a compatible use within all CNEL ranges, subject to the condition that the proposed second unit be consistent with the provisions of Section 65852.1 and 65852.2 of the California Government Code.

6. Compatible at Sacramento International Airport and Franklin Field only if the residential use is directly related to agricultural uses, such as dwelling units for the land owner, the owner's immediate family, or for employees. May be compatible at Mather Airport if approved by the Board of Supervisors as a component of a master plan and all criteria set forth in Footnote 2 above are satisfied. All residential units shall be designed to limit intruding noise such that interior noise levels do not exceed 45 CNEL, with windows closed, in any habitable room.

7. New residential uses within 60 CNEL are not compatible, with the exception of accessory residential dwellings on parcels zoned Agricultural, Agricultural-Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural or single family dwellings as set forth in Footnote 2 above. Except as provided in Footnotes 2 and 6 above, new residential development within the Mather Airport Policy Area boundaries but outside the 60 CNEL shall be subject to the following conditions:

    A. Provide minimum noise insulation to provide 45dB within new residential dwellings, including detached single family dwellings, with windows closed, in any habitable room.

    B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within the Mather Airport Policy Area.

    C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento and recorded with the Sacramento County Recorder and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within the Mather Airport Policy

Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of Mather Airport.

New residential development within the Mather Airport Policy Area outside the 65 dB CNEL but inside the 60 dB CNEL shall be subject to Conditions A through C above and a County-approved noise analysis and mitigation to reduce interior noise impacts to 45 dB with windows closed, in any habitable room.

NO-4 New residential development within adopted Airport Policy Area boundaries*, but outside the 60 CNEL**, shall be subject to the following conditions:

A. Provide minimum noise insulation to 45 dB CNEL within new residential dwellings, including detached single family dwellings, with windows closed in any habitable room.

B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within an Airport Policy Area.

C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento, recorded with the Sacramento County Recorder, and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within an Airport Planning Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of the subject Airport.

Exceptions: New accessory residential dwellings on parcels zoned Agricultural, Agricultural-Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural and between the 60 and 65 CNEL contours, shall be permitted within adopted Airport Policy Area boundaries, but would be subject to the conditions listed above.

** The relationship of the Mather Airport Policy Area to the West Jackson Highway Master Plan Area is illustrated on Figure 3. That figure indicates that the majority of the master plan area is located within the Mather Airport Policy Area. As a result, all new residential development within the WJHMP area east of Hedge Avenue would be subject to this General Plan Policy.*

*** The 60 CNEL contour adopted by the County for planning purposes are the "theoretical capacity" contours shown on Figure 4A. Figure 4B shows the portion of the WJMP area which is located within the 60 CNEL contours.*

Sacramento County Guidance on Single Event Noise Methodology

The Sacramento County General Plan Noise Element policies do not provide a noise standard specific to single-events. However, the County has determined that single-event aircraft noise exposure and associated sleep disturbance impacts are to be assessed in accordance with the Sacramento County General Plan Noise Element Policies NO-2 through NO-4 on aircraft noise. Those policies restrict new residential development to areas outside the 60 dB CNEL airport noise contours,

require noise insulation to ensure interior noise levels do not exceed 45 dB CNEL within residences, require notification that prospective buyers are located within an Airport Policy Area, and require that an avigation easement be recorded acknowledging the property is located within an Airport Planning Policy Area.

Non-Transportation Noise Sources

NO-5 The interior and exterior noise level standards for noise-sensitive areas of new uses affected by existing non-transportation noise sources in Sacramento County are shown by Table 4. Where the noise level standards of Table 4 are predicted to be exceeded at a proposed noise-sensitive area due to existing non-transportation noise sources, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 4 standards within sensitive areas.

NO-6 Where a project would consist of or include non-transportation noise sources, the noise generation of those sources shall be mitigated so as not to exceed the interior and exterior noise level standards of Table 4 at existing noise-sensitive areas in the project vicinity.

NO-7 The "last use there" shall be responsible for noise mitigation. However, if a noise-generating use is proposed adjacent to lands zoned for uses which may have sensitivity to noise, then the noise generating use shall be responsible for mitigating its noise generation to a state of compliance with the Table 4 standards at the property line of the generating use in anticipation of the future neighboring development.

Construction Noise

NO-8 Noise associated with construction activities shall adhere to the County Code requirements. Specifically, Section 6.68.090(e) addresses construction noise within the County.

Transportation Projects

NO-9 For capacity enhancing roadway or rail projects, or the construction of new Roadways or railways, a noise analysis shall be prepared in accordance with the Table 3 requirements. If projected post-project traffic noise levels at existing uses exceed the noise standards of Table 3, then feasible methods of reducing noise to levels consistent with the Table 3 standards shall be analyzed as part of the noise analysis. In the case of existing residential uses, sensitive outdoor areas shall be mitigated to 60 dB, when possible, through the application of feasible methods to reduce noise. If 60 dB cannot be achieved after the application of all feasible methods of reducing noise, then noise levels up to 65 dB are allowed.

If pre-project traffic noise levels for existing uses already exceed the noise standards of Table 3 and the increase is significant as defined below, feasible methods of reducing noise to levels consistent with the Table 3 standards should

be applied. In no case shall the long-term noise exposure for non-industrial uses be greater than 75 dB; long-term noise exposure above this level has the potential to result in hearing loss. A significant increase is defined as follows:

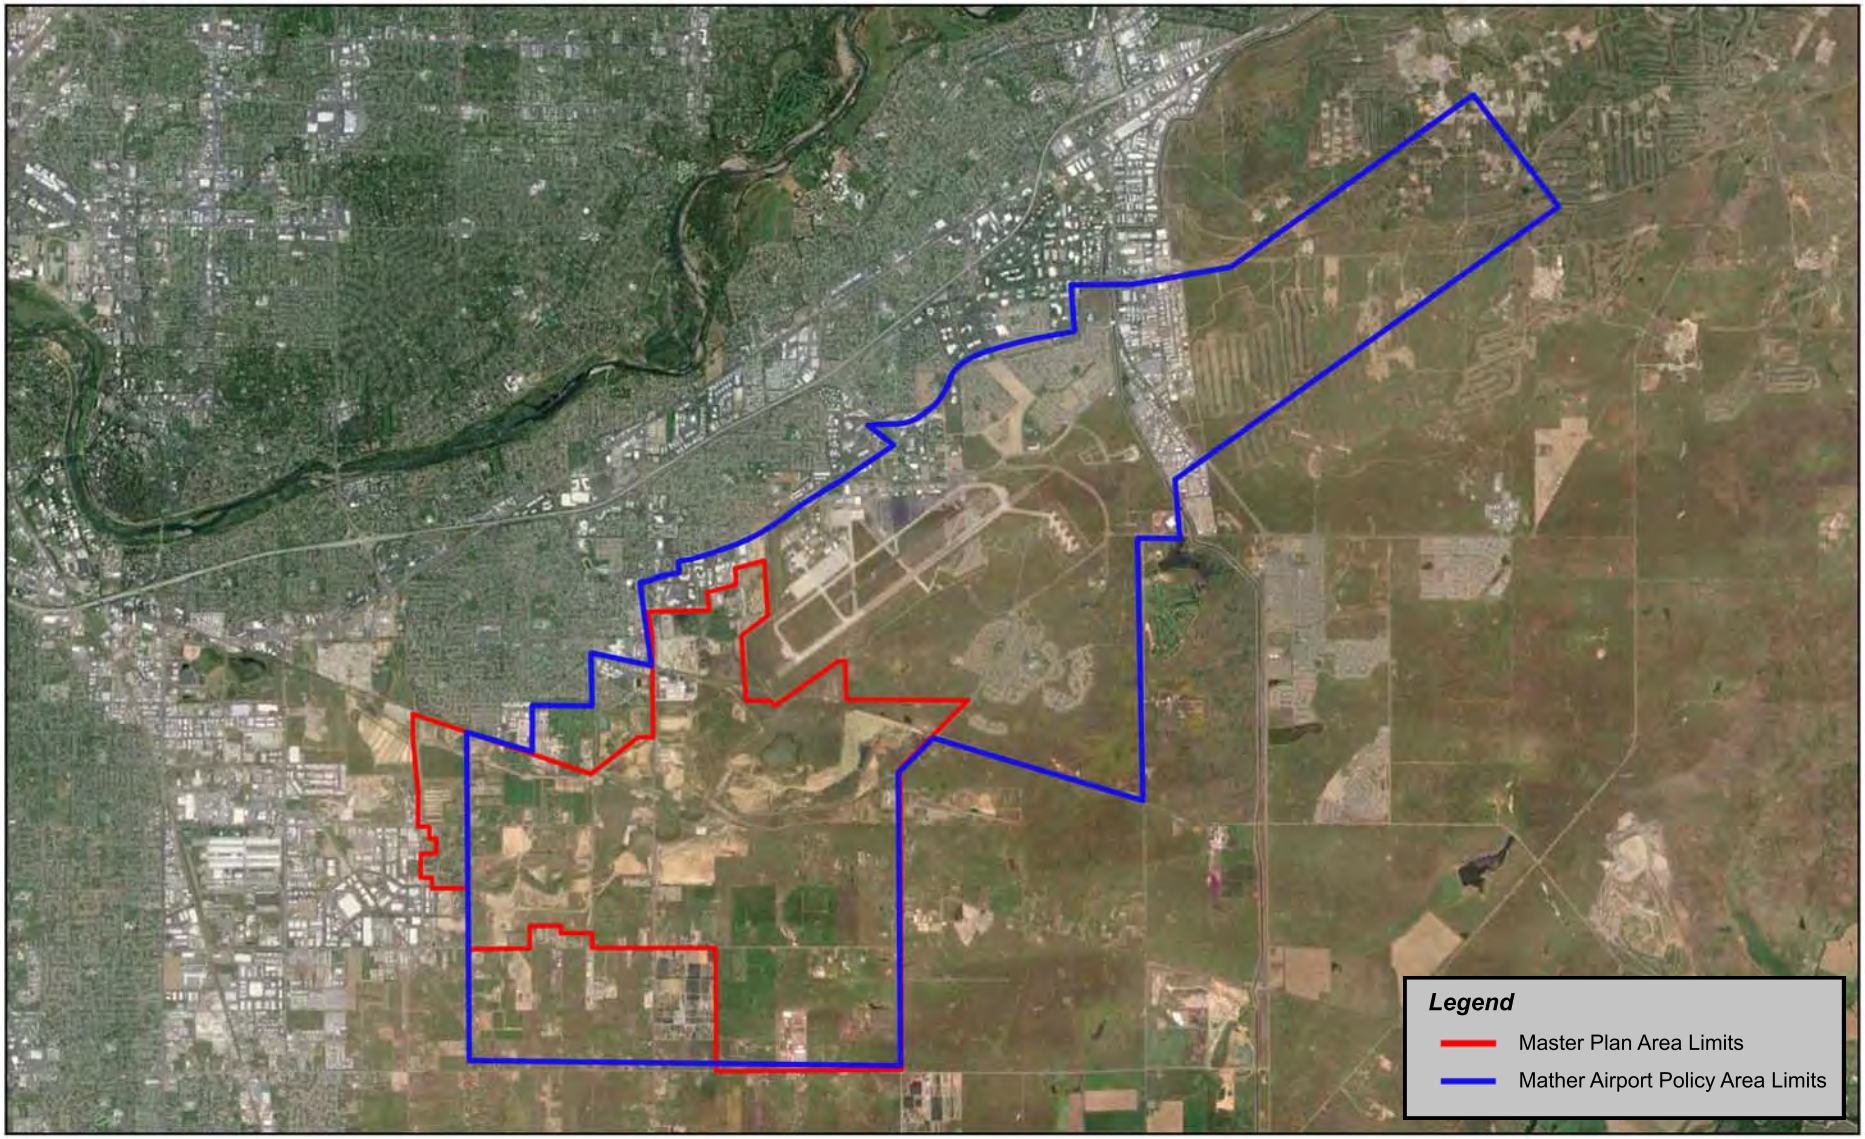
Pre-Project Noise Environment (Ldn)	Significant Increase
Less than 60 dB	5+ dB
60 - 65 dB	3+ dB
Greater than 65 dB	1.5+ dB

NO-10 For interim capacity enhancing roadway or rail projects, or the construction of new interim roadways or railways, it may not be practical or feasible to provide mitigation if the ultimate roadway or railway design would render the interim improvements ineffective or obsolete. An example would be a noise barrier constructed for an interim project which would need to be removed to accommodate the ultimate project. The following factors should be considered in determining whether or not noise mitigation will be implemented for interim projects, but in general, noise mitigation for interim projects would not be provided:

a. The severity of the impact

b. The cost and effectiveness of the mitigation.

c. The number of properties which would benefit from the mitigation.



d. The foreseeable duration between interim and ultimate improvements.

e. Aesthetic, safety and engineering considerations.

NO-11 If noise-reducing pavement is to be utilized in conjunction with a roadway improvement project, or if such paving existing adjacent to a proposed new noise-sensitive land use, the acoustical benefits of such pavement shall be included in the noise analysis prepared for the project.

Mather Airport Policy Area and Master Plan Area

BOLLARD
Acoustical Consultants

General Noise Policy

NO-12 All noise analyses prepared to determine compliance with the noise level standards contained within this Noise Element shall be prepared in accordance with Table 3.

NO-13 Where noise mitigation measures are required to satisfy the noise level standards of this Noise Element, emphasis shall be placed on the use of setbacks and site design to the extent feasible, prior to consideration of the use of noise barriers.

NO-14 Noise analyses prepared for multi-family residential projects, town homes, mixed-use, condominiums, or other residential projects where floor ceiling assemblies or party-walls shall be common to different owners/occupants shall be consistent with the State of California Noise Insulation standards.

NO-15 The County shall have the flexibility to consider the application of 5 dB less restrictive exterior noise standards than those prescribed in Tables 3 and 4 in cases where it is impractical or infeasible to reduce exterior noise levels within infill projects to a state of compliance with the Table 3 or 4 standards. In such cases, the rational for such consideration shall be clearly presented and disclosure statements and noise easements should be included as conditions of project approval. The interior noise level standards of Tables 3 and 4 would still apply. The maximum allowable long-term noise exposure permissible for non-industrial uses is 75 dB.

Exemptions

NO-16 The following sources of noise shall be exempt from the provisions of this Noise Element:

a. Emergency warning devices and equipment operated in conjunction with emergency situations, such as sirens and generators which are activated during power outages. The routine testing of such warning devices and equipment shall also be exempt provided such testing occurs during daytime hours.

b. Activities associated with events for which a permit has been obtained from the County.

Table 3
Noise Standards for New Uses Affected by Traffic and Railroad Noise
Sacramento County Noise Element

Land Use	Sensitive Outdoor Areas[a] dBA, L_{dn}/CNEL	Sensitive Interior Areas[b] dBA, L_{dn}/CNEL
Residential	65[e]	45
Transient lodging	65[c,e]	45
Hospitals, nursing homes	65[c,d,e]	45
Theaters, auditoriums, music halls	--	35[c]
Churches, meeting halls	65[c]	40
Office buildings	65[c]	45
School, libraries, museums	65[c]	40
Commercial Buildings	--	50[c]
Playgrounds, neighborhood parks	70	--
Industry	65[c]	50

Source: Sacramento County General Plan (2011)

Notes:

[a] Sensitive areas are defined in acoustic terminology section of the Noise Element.

[b] Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.

[c] Where there are no sensitive exterior spaces proposed for these uses, only the interior noise level standard shall apply.

[d] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.

[e] If this use is affected by railroad noise, a maximum (Lmax) noise level standard of 70 dB shall be applied to all sleeping rooms to reduce the potential for sleep disturbance during nighttime train passages.

Table 4
Non-Transportation Noise Standards
Median (L50) / Maximum (Lmax)[a]
Sacramento County Noise Element

	Outdoor Area[b]		Interior[c]
Land Use	**Daytime**	**Nighttime**	**Day & Night**
All Residential	55 / 75	50 / 70	35 / 55
Transient lodging[d]	55 / 75	--	35 / 55
Hospitals, nursing homes[e,f]	55 / 75	--	35 / 55
Theaters, auditoriums, music halls[f]	--	--	30 / 50
Churches, meeting halls[f]	55 / 75	--	35 / 60
Office buildings[f]	60 / 75	--	45 / 65
Commercial Buildings[f]	--	--	45 / 65
Playgrounds, neighborhood parks[f]	65 / 75	--	--
Industry[f]	60 / 80	--	50 / 70

Source: Sacramento County General Plan (2011)

Notes:

[a] The Table 4 standards shall be reduced by 5 dB for sounds consisting primarily of speech or music, and for recurring impulsive sounds. If the existing ambient noise level exceeds the standards of Table 4, then the noise level standards shall be increased at 5 dB increments to encompass the ambient.

[b] Sensitive areas are defined in the acoustic terminology section of the Noise Element.

[c] Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.

[d] Outdoor activity areas of transient lodging facilities are not commonly used during nighttime hours.

[e] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.

[f] The outdoor activity areas of these uses (if any), are not typically utilized during nighttime hours.

[g] Where median (L50) noise level data is not available for a particular noise source, average (Leq) values may be substituted for the standards of this table provided the noise source in question operates for at least 30 minutes of an hour. If the source in question operates less than 30 minutes per hour, then the maximum noise level standards shown would apply.

Sacramento County Code

Chapter 6.68 of the Sacramento County Code pertains to Noise Control and is referred to in this study as the Noise Ordinance. The purpose of the Noise Ordinance is to assess complaints of noises alleged to exceed the ambient noise levels. Further, it is declared to be the policy of the County of Sacramento to contain sound levels at their present levels with the ultimate goal of reducing such levels, when and where feasible and without causing undue burdens, to meet the noise standards set forth below. The following section provides the pertinent sections of the County Noise Ordinance.

6.68.070 Exterior Noise Standards

a. The following noise standards, unless otherwise specifically indicated in this chapter, shall apply to all properties within a designated noise area.

Noise Area	County Zoning Districts	Time Period	Exterior Noise Standard
1	RE-1, RD-1, RE-2, RD-2, RE-3, RD-3, RD-4, R-1-A, RD-5, R-2, RD-10, R-2A, RD-20, R-3, R-D-30, RD-40, RM-1, RM-2, A-1-B, AR-1, A-2, AR-2, A-5, AR-5	7 a.m.--10 p.m. 10 p.m.--7 a.m.	55 dBA 50 dBA

b. It is unlawful for any person at any location within the County of Sacramento to create any noise which causes the noise levels on an affected property, when measured in the designated noise area, to exceed for the duration of time set forth following, the specified exterior noise standards in any one hour by:

Cumulative Duration of the Intrusive Sound	Allowance Decibels
1. Cumulative period of 30 minutes per hour	0
2. Cumulative period of 15 minutes per hour	+ 5
3. Cumulative period of 5 minutes per hour	+10
4. Cumulative period of 1 minute per hour	+15
5. Level not to be exceeded for any time per hour	+20

c. Each of the noise limits specified in subdivision (b) of this section shall be reduced by five dBA for impulsive* or simple tone** noises, or for noises consisting of speech or music.

* "Impulsive noise" means a noise characterized by brief excursions of sound pressures whose peak levels are very much greater than the ambient noise level, such as might be produced by the impact of a pile driver, punch press or a drop hammer, typically with one second or less duration.

** "Simple tone noise" or "pure tone noise" means a noise characterized by the presence of a predominant frequency or frequencies such as might be produced by whistle or hum.

d. If the ambient noise level exceeds that permitted by any of the first four noise-limit categories specified in subdivision (b), the allowable noise limit shall be increased in five dBA increments in each category to encompass the ambient noise level. If the ambient noise level exceeds the fifth noise level category, the maximum ambient noise level shall be the noise limit for that category.

6.68.080 Interior Noise Standards

a. In any apartment, condominium, townhouse, duplex or multiple dwelling unit it is unlawful for any person to create any noise from inside his unit that causes the noise level when measured in a neighboring unit during the periods ten p.m. to seven a.m. to exceed:

1. Forty-five dBA for a cumulative period of more than 5 minutes in any hour;
2. Fifty dBA for a cumulative period of more than 1 minute in any hour;
3. Fifty-five dBA for any period of time.

b. If the ambient noise level exceeds that permitted by any of the noise level categories specified in subdivision (a) of this section, the allowable noise limit shall be increased in five-dBA increments in each category to encompass the ambient noise level.

6.68.090 Exemptions

The following activities shall be exempted from the provisions of this chapter:

a. School bands, school athletic and school entertainment events;

b. Outdoor gatherings, public dances, shows and sporting and entertainment events, provided said events are conducted pursuant to a license or permit by the County;

c. Activities conducted on parks, public playgrounds and school grounds, provided such parks, playgrounds and school grounds are owned and operated by a public entity or private school;

d. Any mechanical device, apparatus or equipment related to or connected with emergency activities or emergency work;

e. Noise sources associated with construction, repair, remodeling, demolition, paving or grading of any real property, provided said activities do not take place between the hours of eight p.m. and six a.m. on weekdays and Friday commencing at eight p.m. through and including seven a.m. on Saturday; Saturdays commencing at eight p.m. through and including seven a.m. on the next following Sunday and on each Sunday after the hour of eight p.m. Provided, however, when an unforeseen or unavoidable condition occurs during a construction project and the nature of the project necessitates that work in process be continued until a specific phase is completed, the contractor or owner shall be allowed to continue work after eight

p.m. and to operate machinery and equipment necessary until completion of the specific work in progress can be brought to conclusion under conditions which will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner;

f. Noise sources associated with agricultural operations, provided such operations do not take place between the hours of eight p.m. and six a.m.;

g. All mechanical devices, apparatus or equipment which are utilized for the protection or salvage of agricultural crops during periods of adverse weather conditions or when the use of mobile noise sources is necessary for pest control;

h. Noise sources associated with maintenance of residential area property, provided said activities take place between the hours of six a.m. and eight p.m. on any day except Saturday or Sunday, or between the hours of seven a.m. and eight p.m. on Saturday or Sunday;

i. Any activity, to the extent provisions of Chapter 65 of Title 42 of the United States Code, and Articles 3 and 3.5 of Chapter 4 of Division 9 of the Public Utilities Code of the State of California preempt local control of noise regulations and land use regulations related to noise control of airports and their surrounding geographical areas, any noise source associated with the construction, development, manufacture, maintenance, testing or operation of any aircraft engine, or of any weapons system or subsystems which are owned, operated or under the jurisdiction of the United States, or any other activity to the extent regulation thereof has been preempted by state or federal law or regulation;

j. Any noise sources associated with the maintenance and operation of aircraft or airports which are owned or operated by the United States.

6.68.100 Pre-Existing Industrial or Commercial Facilities – Transition Period

a. Any industrial or commercial facility in existence prior to July 1, 1976 shall be allowed a one-year period commencing on said date within which to comply with this chapter.

b. During said one-year period, all such facilities shall make reasonable efforts to be in compliance and to reduce noise which exceeds the standards specified in this chapter. Commencing at the end of one year after July 1, 1976, any such facility shall be subject to all applicable requirements of this chapter.

c. If any facility which is not in compliance by the end of said one-year period applies for a variance pursuant to Section 6.68.200, in deciding whether to grant a variance the hearing board shall take into account the extent to which the applicant has endeavored to reduce noise during said one-year period to meet the standards specified in this chapter.

d. This section applies only to a commercial or industrial facility already in existence or for which the work of improvement has commenced prior to July 1, 1976.

e. As used in this section “industrial facility” means any building, structure, factory, plant, premises or portion thereof used for manufacturing or industrial purposes, and “commercial facility” means any building, structure, premise or portion thereof used for wholesale or retail commercial purposes.

6.68.110 Schools, Hospitals and Churches

It is unlawful for any person to create any noise which causes the noise level at any school, hospital or church, while the same is in use, to exceed the noise standards specified in Section 6.68.070 or to create any noise which unreasonably interferes with the use of such institution or unreasonably disturbs or annoys patients in the hospital. In any disputed case, interfering noise which is ten dBA or more, greater than the ambient noise level at the building, shall be deemed excessive and unlawful.

6.68.120 Machinery, Equipment, Fans and Air Conditioning

a. It is unlawful for any person to operate any mechanical equipment, pump, fan, air conditioning apparatus, stationary pumps, stationary cooling towers, stationary compressors, similar mechanical devices, or any combination thereof installed after July 1, 1976 in any manner so as to create any noise which would cause the maximum noise level to exceed:

   1. Sixty dBA at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level;

   2. Fifty-five dBA in the center of a neighboring patio three to five feet above ground level;

   3. Fifty-five dBA outside of the neighboring living area window nearest the equipment location. Measurements shall be taken with the microphone not more than three feet from the window opening but at least three feet from any other surface.

b. Equipment installed five years after July 1, 1976 must comply with a maximum limit of fifty-five dBA at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level.

c. Equipment installed before December 17, 1970 must comply with a limit of sixty-five dBA maximum in sound level at any point at least one foot inside the affected property line and three to five feet above ground level by January 1, 1977. Equipment installed between December 16, 1970 and July 1, 1976 must comply with a limit of sixty-five dBA maximum sound level at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level.

6.68.130 Off-Road Vehicles

It is unlawful for any person to operate any motorcycle or recreational off-road vehicle within the County in such a manner that the noise level exceeds the exterior noise standards specified in Section 6.68.070.

6.68.140 Waste Disposal Vehicles

It is unlawful for any person authorized to engage in waste disposal service or garbage collection to operate any truck-mounted waste or garbage loading and/or composting equipment or similar mechanical device in any manner so as to create any noise exceeding the following level, when measured at a distance of fifty feet from the equipment in an open area.

a. New equipment purchased or leased on or after a date six months from July 1, 1976 shall not exceed a noise level of eighty dBA.
b. New equipment purchased or leased on or after forty-two months from July 1, 1976 shall not exceed a noise level of seventy-five dBA.
c. Present equipment shall not exceed a noise level of eighty dBA on or after five years from July 1, 1976.

The provisions of this section shall not abridge or conflict with the powers of the state over motor vehicle control.

A6.68.150 General Noise Regulations

Notwithstanding any other provisions of this chapter and in addition thereto, it is unlawful for any person to willfully make or continue or cause to be made or continued any loud, unnecessary or unusual noise which disturbs the peace and quiet of any neighborhood or which causes discomfort or annoyance to any reasonable person of normal sensitiveness residing in the area. The standards which shall be considered in determining whether a violation of the provisions of this section exists shall include, but not be limited to, the following:

a. The sound level of the objectionable noise;
b. The sound level of the ambient noise;
c. The proximity of the noise to residential sleeping facilities;
d. The nature and zoning of the area within which the noise emanates;
e. The density of the inhabitation of the area within which the noise emanates;
f. The time of day or night the noise occurs;
g. The duration of the noise and its tonal informational or musical content;
h. Whether the noise is continuous, recurrent or intermittent;
i. Whether the noise is produced by a commercial or noncommercial activity.

Noise Standards of Neighboring Jurisdictions

The West Jackson Highway Master Plan area is located entirely within Sacramento County. As a result, noise impacts upon development within the Plan Area are evaluated relative to the Sacramento County noise standards cited above. However, development within the Plan Area would result in increases in off-site traffic noise along roadways located in the Cities of Rancho Cordova, Folsom, Sacramento and Elk Grove. As a result, the transportation noise standards of those jurisdictions are included in this section for use in evaluating off-site traffic noise impacts associated with the project.

It should be noted that the standards of the neighboring jurisdictions are very similar, both in terms of absolute noise standards for residential land uses (60 dB Ldn) and criteria for assessing impacts relative to traffic noise increases. Each neighboring jurisdiction with the exception of the City of Rancho Cordova utilizes the FICON criteria for assessing significance of project-related noise level increases. The pertinent noise standards of the neighboring jurisdictions are provided below.

City of Rancho Cordova General Plan

Policy N.1.5 - Mitigate noise created by the construction of new transportation noise sources (such as new roadways or new light rail service) to the maximum extent feasible to comply with the City's standards. The City's standards are found in Table N-2 of the Noise Element and are reproduced below as Table 5.

Policy N.2.2 Ensure that operational noise levels of new roadway projects will not result in significant noise impacts.

Action N.2.2.1 Assess the significance of the noise increase of all roadway improvement projects in existing areas according to the following criteria:

A. Where existing traffic noise levels are less than 60 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

B. Where existing traffic noise levels range between 60 and 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +3 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

C. Where existing traffic noise levels are greater than 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +1.5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant.

Table 5
Maximum Transportation Noise Exposure
City of Rancho Cordova Noise Element of the General Plan

	Outdoor Activity Areas[1]	Interior Spaces	
Land Use	**L_{dn}/CNEL, dB**	**L_{dn}/CNEL, dB**	**L_{eq}, dB[2]**
Residential	60[3]	45	_
Residential subject to noise from railroad tracks, aircraft overflights, or similar noise sources which produce clearly identifiable, discrete noise events (e.g., the passing of a single train)	60[3]	40[5]	_
Transient Lodging	60[4]	45	_
Hospitals, Nursing Homes	60[3]	45	_
Theaters, Auditoriums, Music Halls	_	_	35
Churches, Meeting Halls	60[3]	_	40
Office Buildings	_	_	45
Schools, Libraries, Museums	_	_	45
Playgrounds, Neighborhood Parks	70	_	_

1. Where the location of outdoor activity areas is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use. Where it is not practical to mitigate exterior noise levels at patio or balconies of apartment complexes, a common area such as a pool or recreation area may be designated as the outdoor activity area.
2. As determined for a typical worst-case hour during periods of use.
3. Where it is not possible to reduce noise in outdoor activity areas to 60 dB L_{dn}/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB L_{dn}/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.
4. In the case of hotel/motel facilities or other transient lodging, outdoor activity areas such as pool areas may not be included in the project design. In these cases, only the interior noise level criterion will apply.
5. The intent of this noise standard is to provide increased protection against sleep disturbance for residences located near railroad tracks.

City of Folsom General Plan

The City of Folsom General Plan Noise Element establishes an exterior noise level standard of 60 dB L_{dn} at outdoor activity areas of residential land uses exposed to transportation noise sources (i.e., traffic). The intent of this standard is to provide an acceptable exterior noise environment for outdoor activities. The City of Folsom also utilizes an interior noise level standard of 45 dB L_{dn} or less within the interior spaces of habitable residential spaces. The intent of this interior noise limit is to provide a suitable environment for indoor communication and sleep.

City of Sacramento General Plan

The City of Sacramento General Plan Noise Standards are provided in Table 6 (Table EC 1 of the General Plan).

EC 3.1.1 Exterior Noise Standards

The City shall require noise mitigation for all development where the projected exterior noise levels exceed those shown in Table 6 (Table EC 1 of the General Plan), to the extent feasible.

Table 6
Exterior Noise Compatibility Standards for Various Land Uses

Land Use Type	Highest Level of Noise Exposure that is Regarded as "Normally Acceptable"[a] (L_{dn}[b] or CNEL[c])
Residential–Low Density Single Family, Duplex, Mobile Homes	60 dBA[d,e]
Residential–Multi-family	65 dBA
Urban Residential Infill[f] and Mixed-Use Projects[g]	70 dBA
Transient Lodging–Motels, Hotels	65 dBA
Schools, Libraries, Churches, Hospitals, Nursing Homes	70 dBA
Auditoriums, Concert Halls, Amphitheaters	Mitigation based on site–specific study
Sports Arena, Outdoor Spectator Sports	Mitigation based on site–specific study
Playgrounds, Neighborhood Parks	70 dBA
Golf Courses, Riding Stables, Water Recreation, Cemeteries	75 dBA
Office Buildings–Business, Commercial, and Professional	70 dBA
Industrial, Manufacturing, Utilities, Agriculture	75 dBA

Source: Governor's Office of Planning and Research, State of California General Plan Guidelines 2003, October 2003
a. As defined in the Guidelines, "Normally Acceptable" means that the "specified land use is satisfactory, based upon the assumption that any building involved is of normal conventional construction, without any special noise insulation requirements."
b. L_{dn} or Day Night Average Level is an average 24-hour noise measurement that factors in day and night noise levels.
c. CNEL or Community Noise Equivalent Level measurements are a weighted average of sound levels gathered throughout a 24-hour period.
d. dBA or A-weighted decibel scale is a measurement of noise levels.
e. The exterior noise standard for the residential area west of McClellan Airport known as McClellan Heights/Parker Homes is 65 dBA
f. With land use designations of Central Business District, Urban Neighborhood (Low, Medium, or High) Urban Center (Low or High), Urban Corridor (Low or High).
g. All mixed-use projects located anywhere in the City of Sacramento.

EC 3.1.2 Exterior Incremental Noise Standards. The City shall require noise mitigation for all development that increases existing noise levels by more than the allowable increment shown in Table 7 (Table EC 2), to the extent feasible.

Table 7
Exterior Incremental Noise Impact Standards for Noise-Sensitive Uses (dBA)
(Table EC 2 of City of Sacramento General Plan)

Residences and buildings where people normally sleep [a]		Institutional land uses with primarily daytime and evening uses [b]

50	5	50	9
55	3	55	6
60	2	60	5
65	1	65	3
70	1	70	3
75	0	75	1
80	0	80	0

SOURCE: Federal Transit Administration, *Transit Noise Impact and Vibration Assessment*, May 2006

a. This category includes homes, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.

b. This category includes schools, libraries, theaters, and churches where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material.

EC 3.1.3 Interior Noise Standards

The City shall require new development to include noise mitigation to assure acceptable interior noise levels appropriate to the land use type: 45 dBA L_{dn} for residential, transient lodgings, hospitals, nursing homes and other uses where people normally sleep; and 45 dBA L_{eq} (peak hour) for office buildings and similar uses.

City of Elk Grove General Plan

The City of Elk Grove General Plan (adopted October 2022) establishes maximum allowable noise exposure for residential uses affected by transportation noise sources of 60 dB Ldn exterior and 45 dB Ldn interior. For non-transportation noise sources the City's General Plan establishes hourly average performance standards of 55 dBA during daytime hours and 45 dBA during nighttime hours for typical noise sources not containing tonal, impulsive, repetitive, speech or music components. The City's standards for sources containing those components are 5 dB lower.

In addition, the City's General Plan Policy N-2-2 establishes the following CEQA thresholds for evaluating the significance of project-related noise level increases:

- Where existing ambient noise levels are less than 60 dB Ldn at the outdoor activity areas of noise sensitive uses, a +5 dB Ldn increase in noise levels shall be considered significant; and

- Where existing ambient noise levels range between 60 and 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +3 dB Ldn increase in noise levels shall be considered significant; and

- Where existing ambient noise levels are greater than 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +1.5 dB Ldn increase in noise levels shall be considered significant.

  Public roadway improvements to alleviate traffic congestion and safety hazards shall utilize FHWA noise standards to allow a reasonable dollar threshold per dwelling to be used in the evaluation and abatement of impacts.

Vibration Criteria

Sacramento County has no adopted vibration standards. As a result, Caltrans-recommended criteria are applied for this project, as described below. Human and structural response to different vibration levels is influenced by a number of factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. The Caltrans publication, *Transportation-and Construction-Induced Vibration Guidance Manual*, written for Caltrans by Jones & Stokes in June 2004, provides guidelines for acceptable vibration limits for transportation and construction projects in terms of the induced peak particle velocity (PPV). Those standards are reproduced below in Table 8.

Table 8
Vibration Criteria

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources[1]	Continuous or Frequent Intermittent Sources[2]
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
Historic and some old building	0.50	0.25
Older residential structures	0.50	0.30
New residential structures	1.00	0.50
Modern industrial/commercial building	2.00	0.50

Notes:
1. Transient sources create a single isolated vibration event.
2. Continuous/frequent intermittent sources include repetitive single events.

Current Caltrans research illustrates that there are different thresholds of perception for different types of vibration sources. Section XI(b) of Appendix G of the CEQA guidelines requires that a project result in exposure of persons to, or generation of, *excessive* groundborne vibration levels or groundborne noise levels, for the finding of a significant impact. The CEQA guidelines specifically mention “excessive” vibration, rather than just perceptible vibration. The general

range at which vibration from continuous or frequent intermittent sources exceeds acceptable levels for older structures is noted in Table 8 as being 0.3 – 0.5 in/sec ppv.

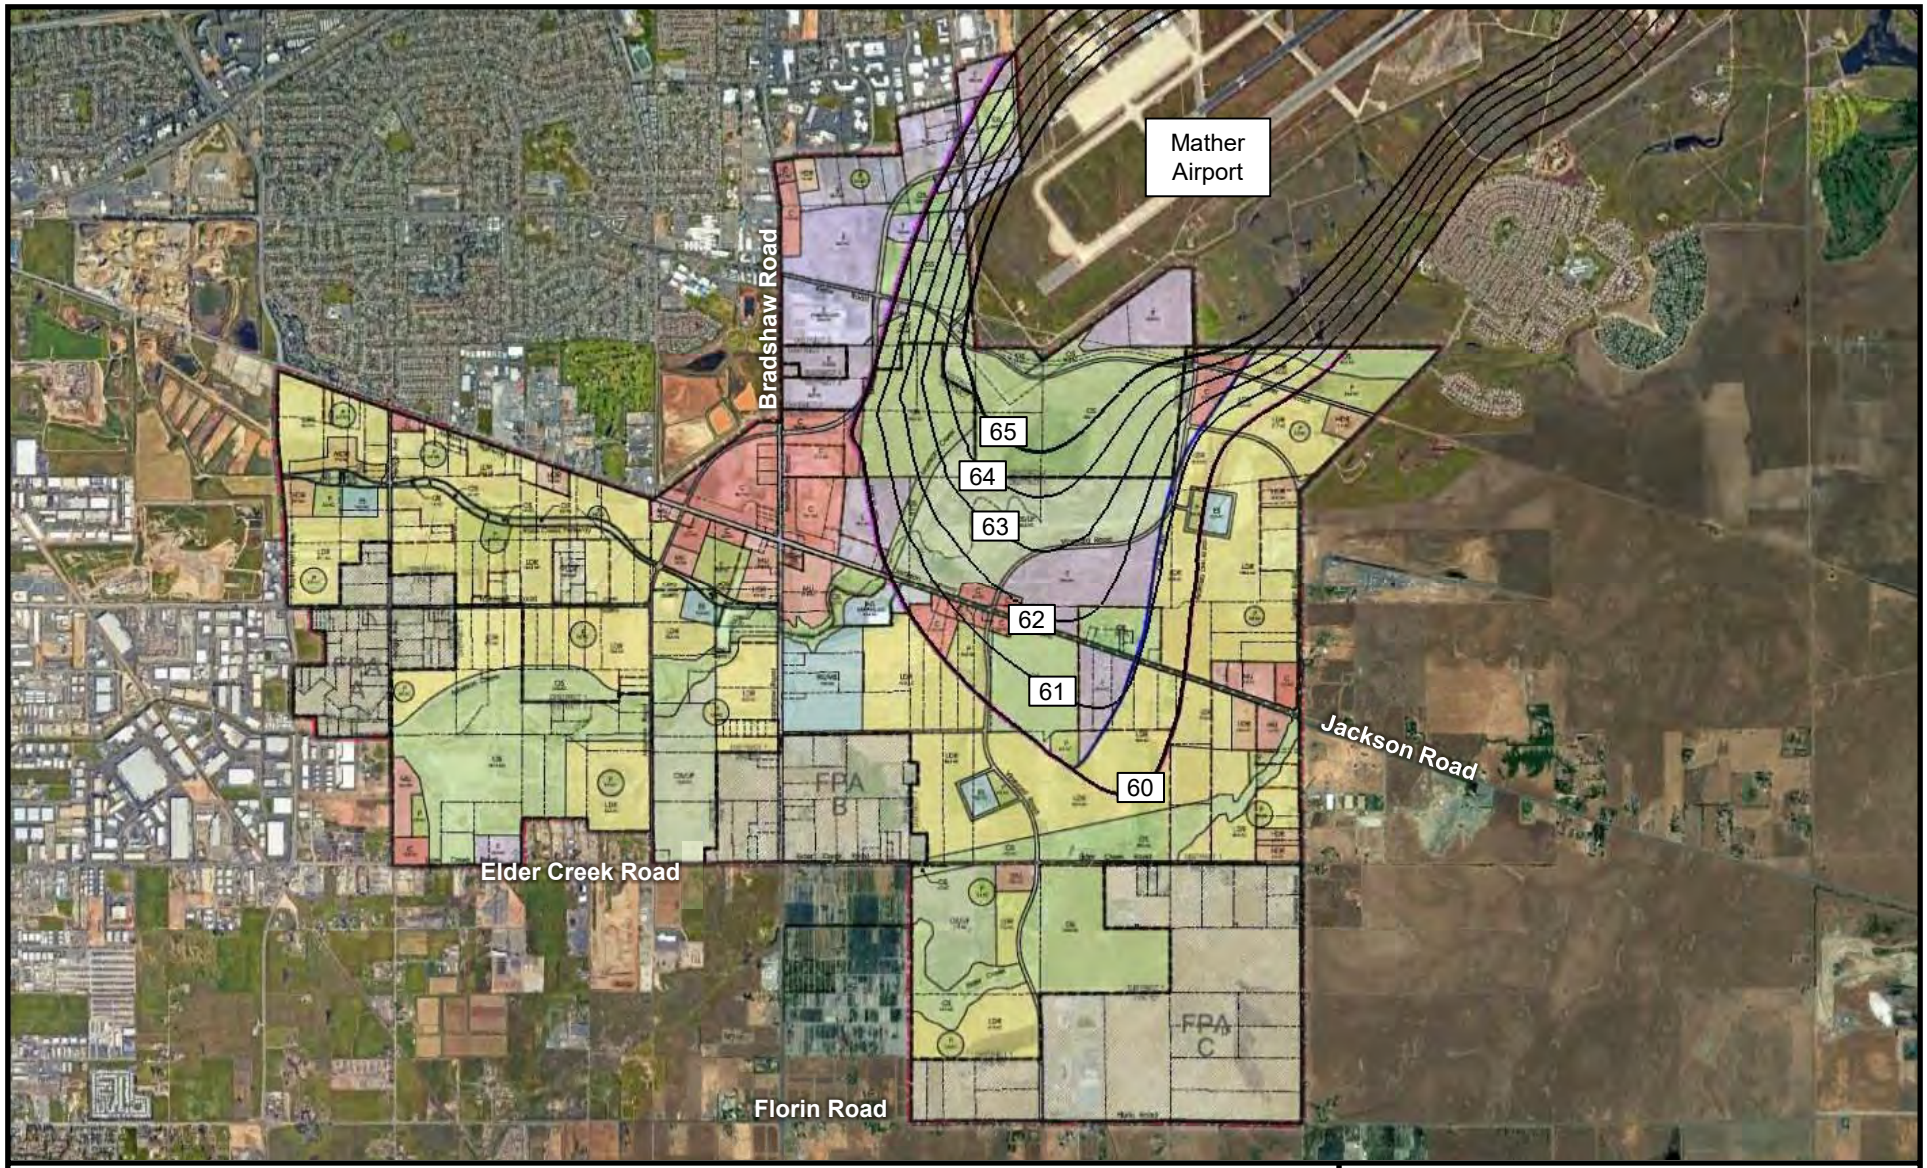
Existing (Baseline) Noise Environment

Master Plan Area

Overview of Existing Noise and Vibration Environment within the Master Plan Area

The existing noise environment within the overall Plan Area varies by location and is defined by a combination of noise sources. The most pervasive noise source affecting the Plan Area is surface traffic on Jackson Highway and major arterial roadways. The Plan Area is also affected by aircraft operations associated with Mather Airport and, to a lesser extent, activities at the Sacramento Raceway on Excelsior Road and construction materials facilities on Bradshaw Road. Aggregate excavation and reclamation activities on the Teichert and Granite properties also contribute to the ambient noise environment within the Plan Area, but in a considerably more localized fashion.

The existing vibration environment in the Plan Area is generally below the threshold of perception with the exception of locations very close (within 100 feet) to existing aggregate excavation and processing equipment and activities.



Methodology for Assessing Baseline Noise Environment within the Master Plan Area

At the Master Plan Level, aircraft noise exposure was quantified using published noise contour maps and traffic noise was modeled using the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA-RD-77-108).

Because noise generated by the Sacramento Raceway, Granite Bradshaw aggregates facility, and both Teichert and Granite excavation and reclamation activities primarily affects the District Area Plans within the larger Plan Area, those sources are evaluated later in this report at a more detailed District Plan Level.

Aircraft Noise Environment within the Master Plan Area

Mather Airport is located immediately adjacent to the northeastern boundary of the Plan Area, as indicated in Figure 1. To quantify the noise generation of the airport in terms of CNEL, the noise contours contained within the Airport Master Plan (Approved August 2022) were utilized, as well as the theoretical capacity noise contours developed for the Airport. The Mather Airport theoretical capacity noise contours are reproduced below in Figure 4A. Figure 4B shows the portion of the West Jackson Highway Master Plan area which is proposed for noise-sensitive (residential) development within the 60 CNEL Mather Airport contours.

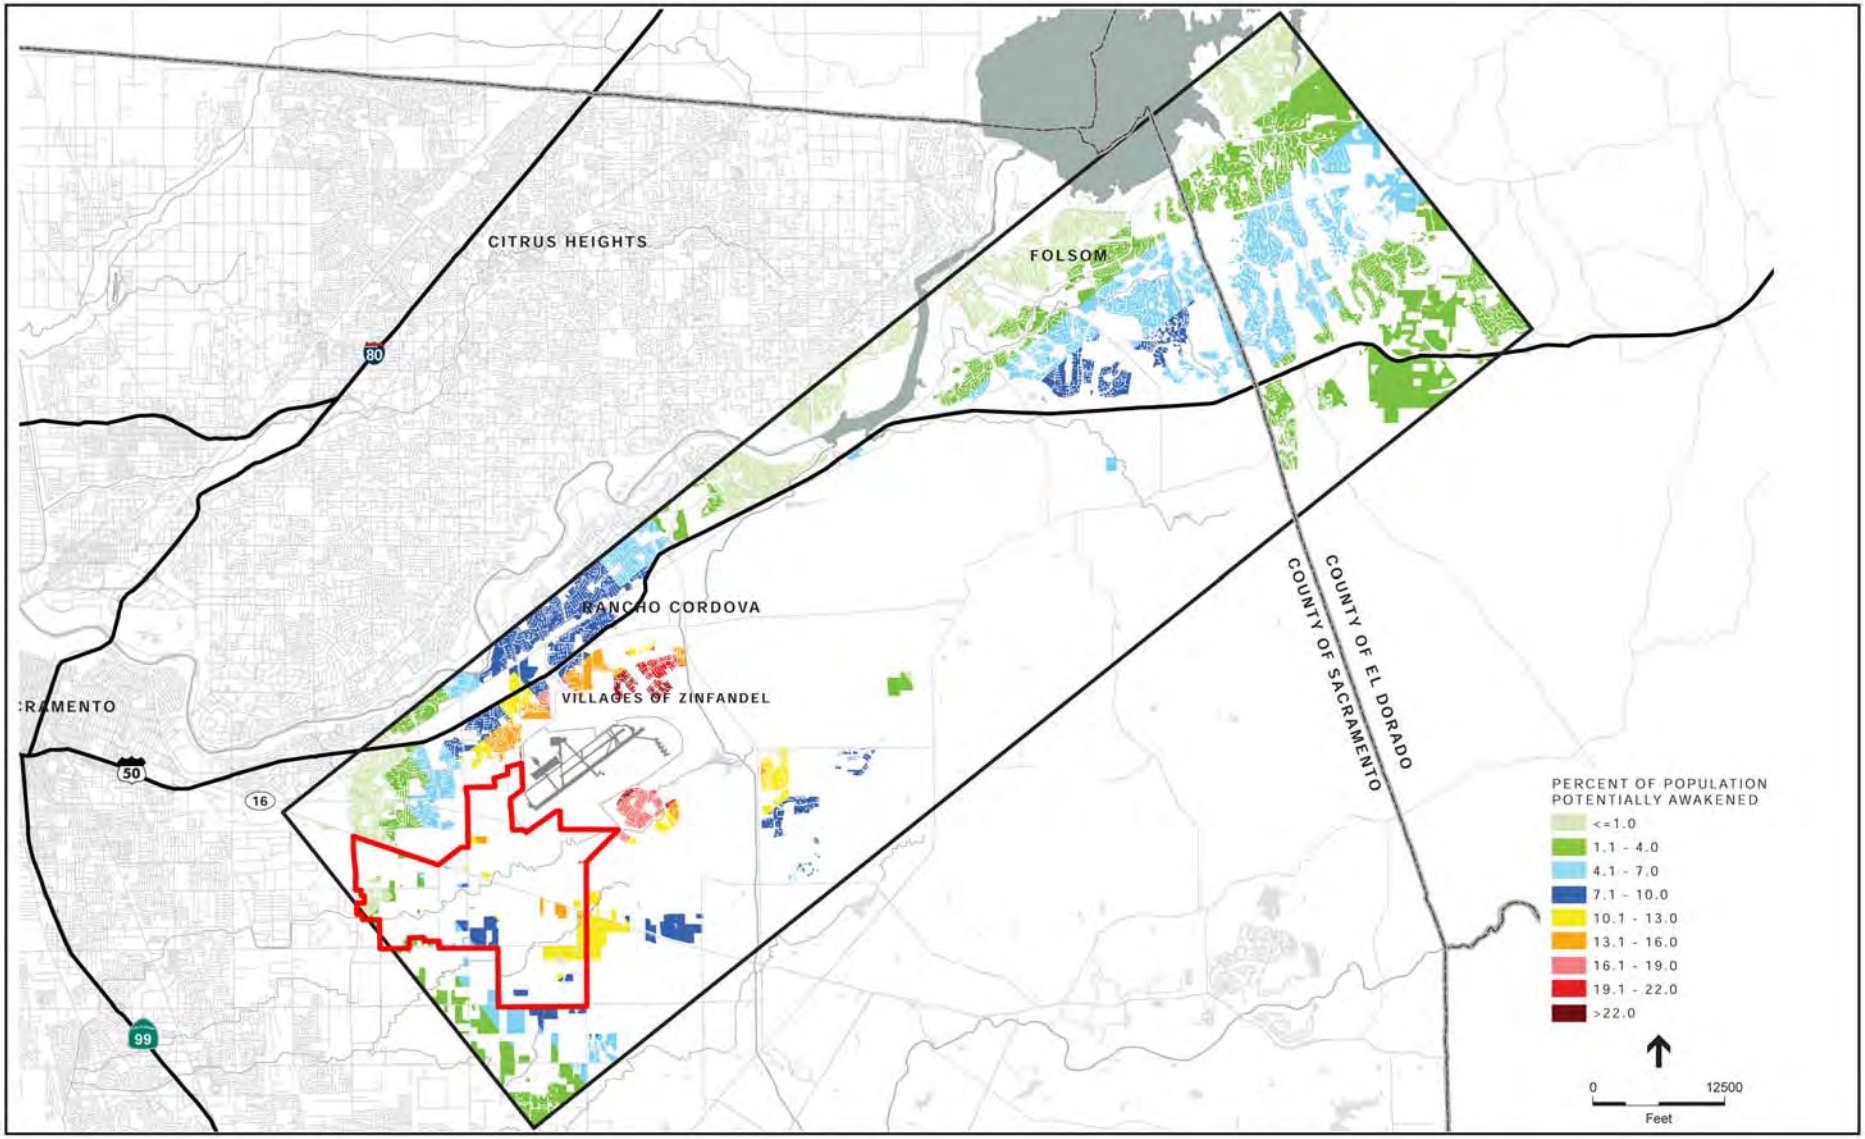
: Proposed Residential Uses within 60 dBA CNEL Contour



Single Event Environment within the Master Plan Area

Although the County has determined that single event noise exposure and associated sleep disturbance effects are appropriately addressed through application of General Plan Noise Element policies NO-2 through NO-4 regarding aircraft noise, the following information pertaining to aircraft single event noise is provided for disclosure purposes. Aircraft single events associated with individual aircraft arrivals or departures at Mather Airport currently occur over the Master Plan Area. The noise generation of such events are a function of several variables, including aircraft type, aircraft weight, and flight track. Consideration of aircraft single event noise is most relevant to the assessment of sleep disturbance impacts at residential areas proposed within the Master Plan Area.

In recognition of the fact that aircraft single events do occur in the area, a Mather Airport Nighttime Awakening Analysis was prepared by ESA in December 2013 (revised April 2014) as part of the Mather Airport Master Plan Update. This analysis utilized the ANSI methodology for prediction of sleep disturbance using the Integrated Noise Model (INM) files used to develop CNEL contours for the Mather Airport Master Plan. The awakenings analysis utilized an assumed 26 nighttime aircraft operations for the year 2035 proposed master plan project condition. Figures 5 and 6 show the predicted percent of population potentially awakened by nighttime single-event aircraft operations.

Existing General Traffic Noise Environment within the Master Plan Area

To describe noise levels because of traffic, the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The FHWA model is based upon the Calveno reference noise factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site.

Baseline FHWA Model inputs and results were provided by Sacramento County. Table 9 shows the predicted existing traffic noise levels at a reference distance of 100 feet from the roadway centerlines, as well as the distances to the unshielded L_{dn} contours. It should be noted that the Table 9 data are provided at the Master Plan level without adjustment for shielding by intervening topography or structures. As such, the Table 9 data should be considered conservative. The FHWA Model Inputs for baseline conditions are provided in Appendix D.

It should be noted that many portions of the Plan Area are former aggregate mining sites. As a result, these sites are substantially depressed relative to the local roadway network. That depression results in screening of roadway traffic at the future development sites, resulting in a substantial decrease in traffic noise exposure at the depressed locations. Figure 7 shows the depressed areas of the Plan Area based on preliminary site grading plans. Figure 7 is based on an overall site grading plan prepared by Wood Rodgers in January 2014 indicating mined areas which are below grade. It should be noted that Figure 7 is intended to generally identify locations within the Plan Area which were identified as being “below grade”, but that there may be considerable differences in the degree of depression of these areas relative to local roadways and Figure 7 does not account for future grading of specific project site within the Master Plan Area. In general, noise-sensitive land uses developed within substantially depressed areas can expect traffic noise levels on the order of 10-15 dB lower than the levels shown in Table 9.

District Area Plans

Overview of Existing Noise and Vibration Environment within the District Area Plans

Like the overall Master Plan Area, the existing noise environment within the two District Area Plans (District 1: mostly Teichert and District 2: mostly Granite) also varies by location and is defined by a combination of noise sources. In addition to the traffic and aircraft noise environment previously described in the Master Plan section of this report, the District Area Plans are also affected by a variety of localized noise sources. Such sources include the Sacramento Raceway, the Granite Bradshaw Aggregates facility, aggregate excavation and reclamation equipment, and small commercial/industrial activities on adjacent non-participating properties within the Plan Area.

As with the Plan Area, the existing vibration environment in the District Area Plans is also generally below the threshold of perception with the exception of locations very close (within 100 feet) to existing aggregate excavation and processing equipment and activities.

Methodology for Assessing Baseline Noise and Vibration Environments within the District Plan Areas

At the District Plan Levels, aircraft noise exposure was quantified using published noise contour maps and traffic noise was modeled using the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA-RD-77-108).

Noise generated by the Sacramento Raceway, Granite Bradshaw Aggregates facility, and both Teichert and Granite excavation and reclamation activities was quantified through a combination of noise level measurements and application of accepted noise prediction models. In addition, an extensive ambient noise survey, consisting of both long-term and short-term noise level measurements, was conducted within the District Area Plans to more specifically characterize the existing baseline noise environment in those areas.

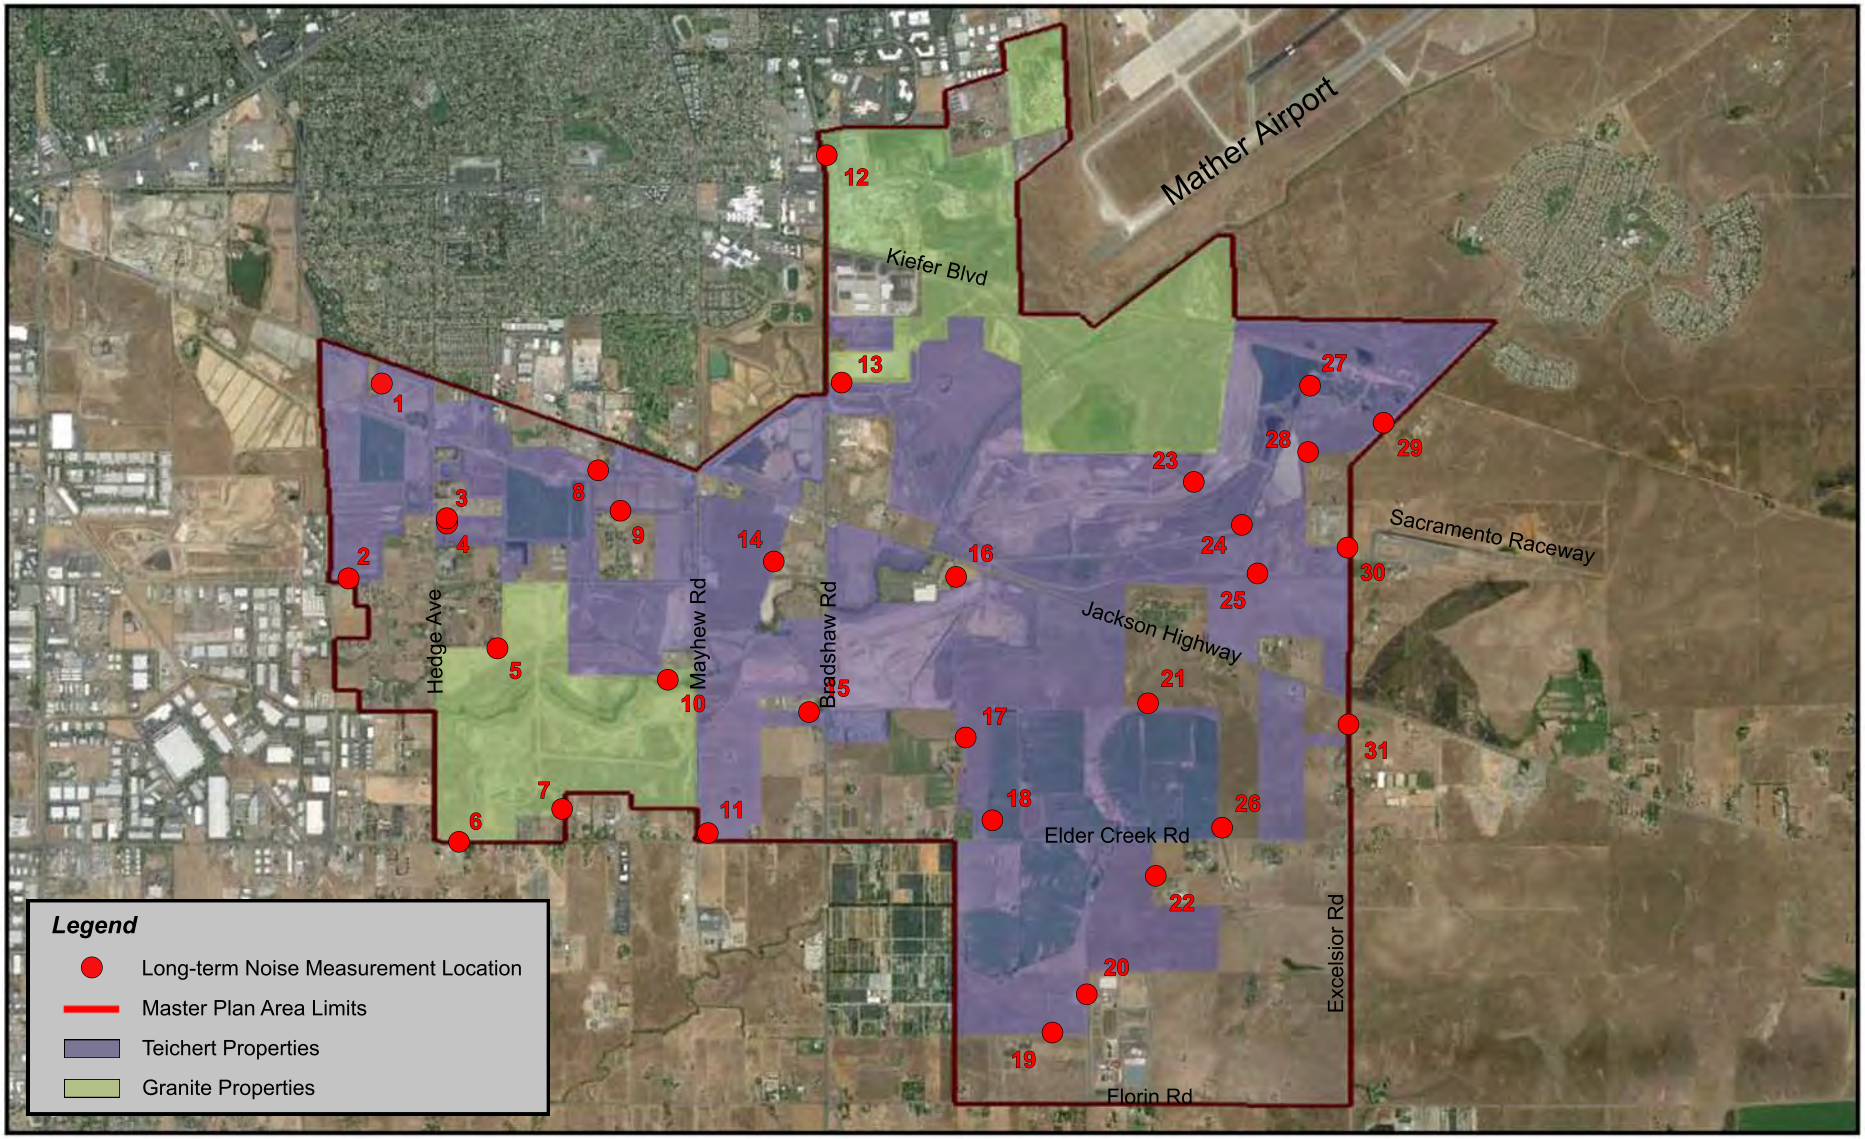
In addition to the extensive ambient noise measurement surveys, baseline vibration measurements were also conducted at several locations within the District Area Plans to quantify baseline vibration environments.

Existing General Ambient Noise Environment within the District Area Plans

To quantify the existing ambient noise environment with the District Area Plans, long-term (continuous) ambient noise level measurements were conducted at 31 locations within the District Area Plan Boundaries in 2013. Supplemental ambient noise monitoring was conducted at 6 of the long-term noise monitoring locations in 2017 and again in 2022 to verify that the 2013 data is still reasonably representative of current baseline ambient noise conditions within the District Areas.

The locations of the continuous noise monitoring sites are shown on Figure 8. In addition to the long-term noise monitoring program, short-term ambient noise level measurements were also conducted at several locations within the District Area Plan. The short-term monitoring sites were

selected to either supplement the long-term sites or because long-term monitoring was not possible at some locations. The short-term noise monitoring sites are identified on Figure 9.



Larson Davis Laboratories (LDL) Model 820, LXT and 831 precision integrating sound level meters were used for the long and short-term ambient noise level measurement surveys. The meters were calibrated before use with LDL Model CAL200 acoustical calibrators prior to use to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute.

The results of the long-term ambient noise measurement surveys are summarized in Table 10, with the short-term monitoring results provided in Table 11. Appendix B provides a graphical representation of the measured average and maximum noise levels measured at each long-term site for the 2013 surveys, Appendix C shows the ambient noise survey results for the 2017 surveys, and Appendix D shows the ambient noise survey results for the 2022 surveys.

The Table 10 and 11 data indicate that existing noise levels within the Plan Area vary, depending on location of the noise monitoring site relative to the major project area noise sources, and whether or not the monitoring sites are depressed in former aggregate mining areas. Inspection of the data for the depressed and non-depressed locations indicates that topographic shielding provided by the existing elevation differences results in traffic noise level reductions generally ranging from 10-15 dBA. This level of shielding is significant because it will greatly reduce the degree of traffic noise attenuation required at future noise-sensitive land uses proposed within the District Area Plan, or eliminate the need for additional noise mitigation measures altogether.

Aircraft Noise Environment within the District Area Plans

Mather Airport is located immediately adjacent to the northeastern boundary of the Plan Area, as indicated in Figure 4. To quantify the noise generation of the airport in terms of CNEL, the noise contours contained within the previous and recently adopted Airport Master Plans were utilized, as well as the theoretical capacity noise contours developed for the Airport. The Mather Airport noise contours are shown in Figures 4A and 4B.

The Mather Airport noise contours shown in Figures 4A and 4B indicate that the 60 dB CNEL contours extend well into both the Teichert and Granite District Area Plans.

Single Event Environment within the District Plan Areas

Although the County has determined that single event noise exposure and associated sleep disturbance effects are appropriately addressed through application of General Plan Noise Element policies NO-2 through NO-4 regarding aircraft noise, the following information pertaining to aircraft single event noise is provided for disclosure purposes. In addition to the 24-hour average aircraft noise contours shown on Figures 4A and 4B, which are presented in terms of Community Noise Equivalent Level (CNEL), noise from individual aircraft arrivals and departures will be audible within the District Plan Areas. Figure 6 illustrates the potential for awakenings based on a study prepared by ESA using the ANSI methodology.

Existing Traffic Noise Environment within the District Area Plans

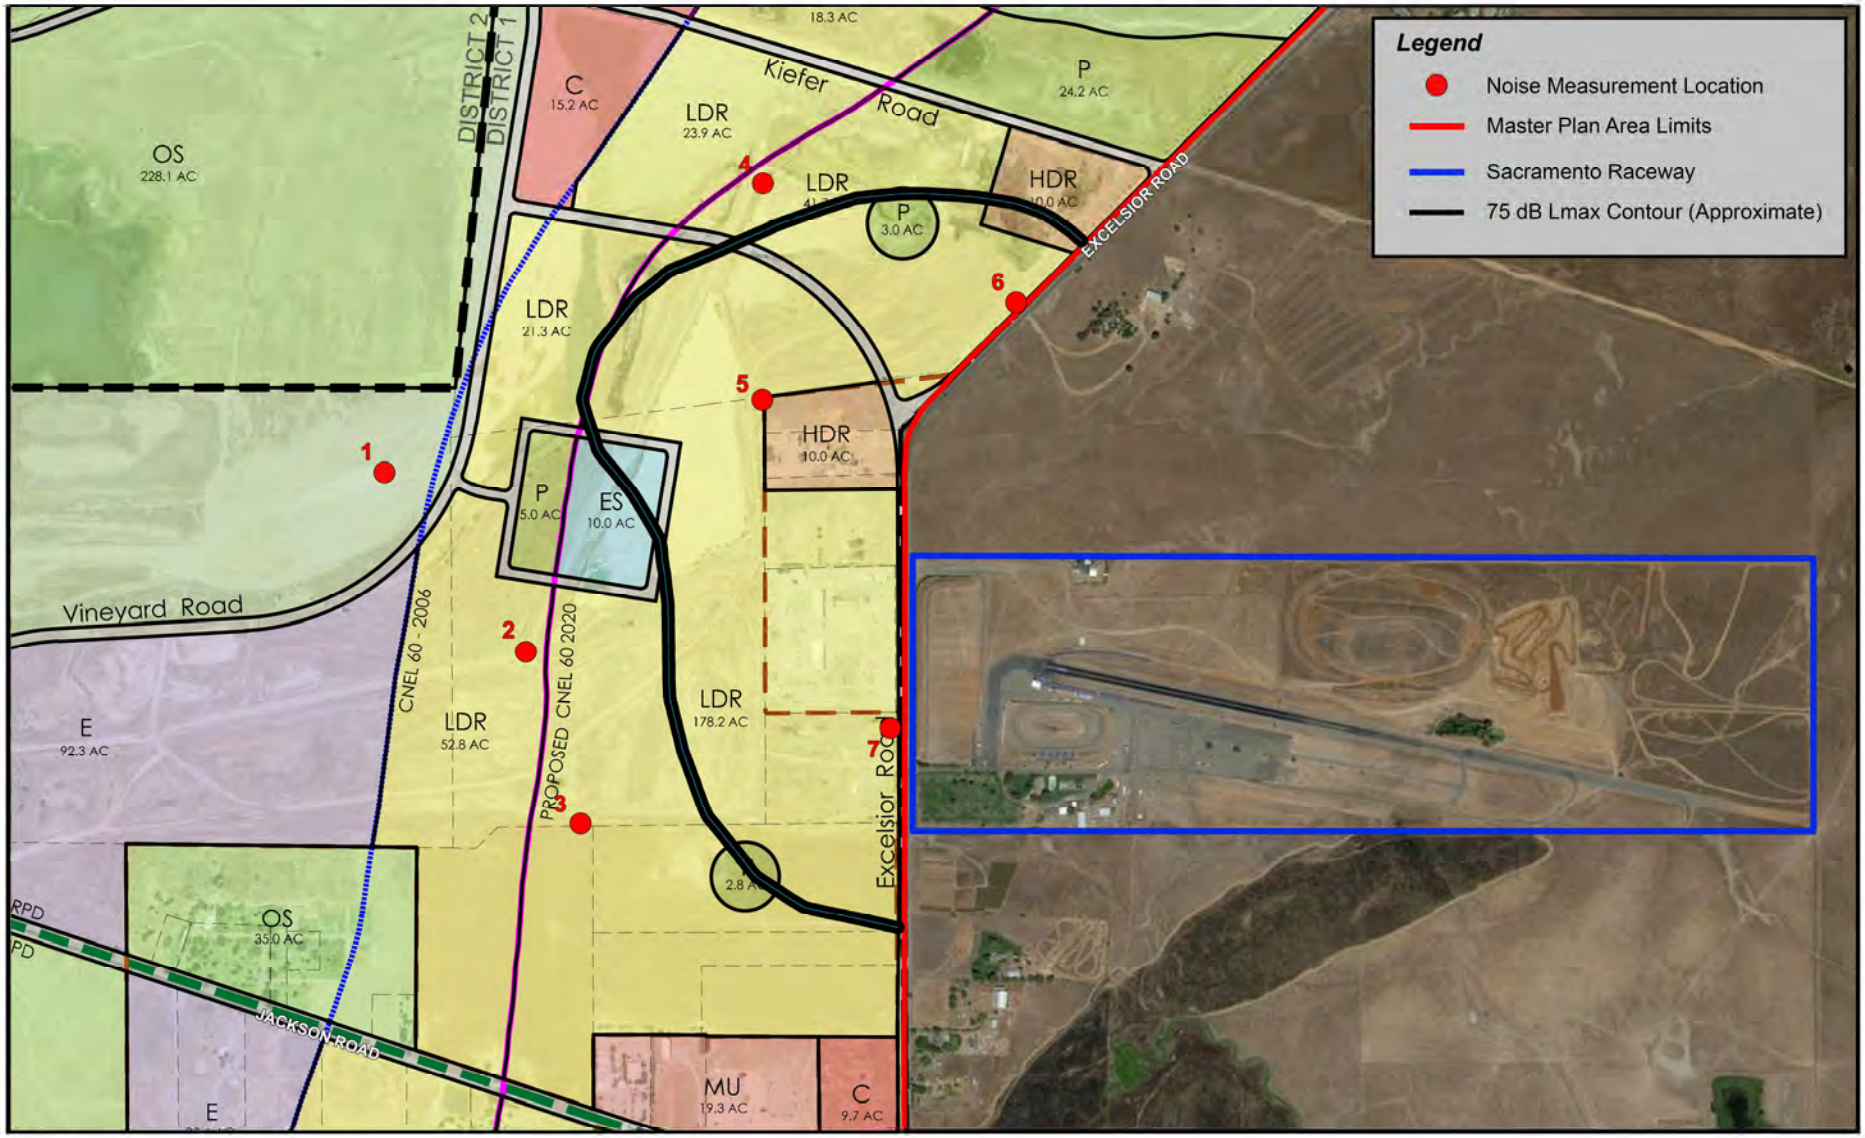
To describe noise levels caused by traffic, the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The FHWA model is based upon the Calveno reference noise factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site.

Baseline FHWA Model inputs and results were provided by Sacramento County. Table 9 shows the predicted existing traffic noise levels at a reference distance of 100 feet from the roadway centerlines, as well as the distances to the unshielded L_{dn} contours. It should be noted that the Table 9 data are provided at the Plan Area level without adjustment for shielding by intervening topography or structures. As such, the Table 9 data should be considered worst-case.

As noted previously in this analysis, many locations within the District Area Plans are former aggregate excavation areas and are, therefore, depressed relative to the surrounding roadways. Those areas subject to substantial depressions result in topographic shielding which was found to reduce traffic noise levels by approximately 10-15 dB.

Existing Sacramento Raceway Noise Environment within the District Area Plans

Sacramento Raceway is located on Excelsior Road, immediately east of the Plan Area as indicated in Figure 1. The Raceway facilities include a quarter mile drag strip, and a midget car and motocross dirt oval track. Racing typically takes place on Wednesday and Friday nights with occasional large events on weekends. It should be noted that the raceway is a non-conforming use which may not continue to operate through the buildout horizon of the Plan Area. In fact, raceway representatives have indicated that the raceway will likely be permanently closing in 2023.



During Governor's Cup races, maximum noise levels of 130 dBA were measured at a distance of 100 feet from the drag strip during Top Fuel Funny Car races. Maximum noise levels measured during Pro- Gas, Door-Slammer and Alcohol Dragster races registered between 100 and 120 dBA at the same location.

To quantify race-related noise levels during a typical race event, noise level measurements were conducted during the night of April 25, 2009 at the seven (7) locations shown on Figure 10. Measured noise levels varied depending on the class of vehicles being raced and by location. The results of the raceway noise monitoring were used to identify the approximate location of the 75 dB Lmax noise contour for the louder classes of vehicles raced that evening. That noise contour is provided on Figure 10.

The Figure 10 noise contour indicates that, if racing activities are to continue to occur in the future, a portion of the Teichert District Area Plan would be adversely affected by maximum raceway noise levels and development of noise mitigation measures would be required.

Existing Granite Bradshaw Aggregates Facility Noise Environment within the District Area Plans

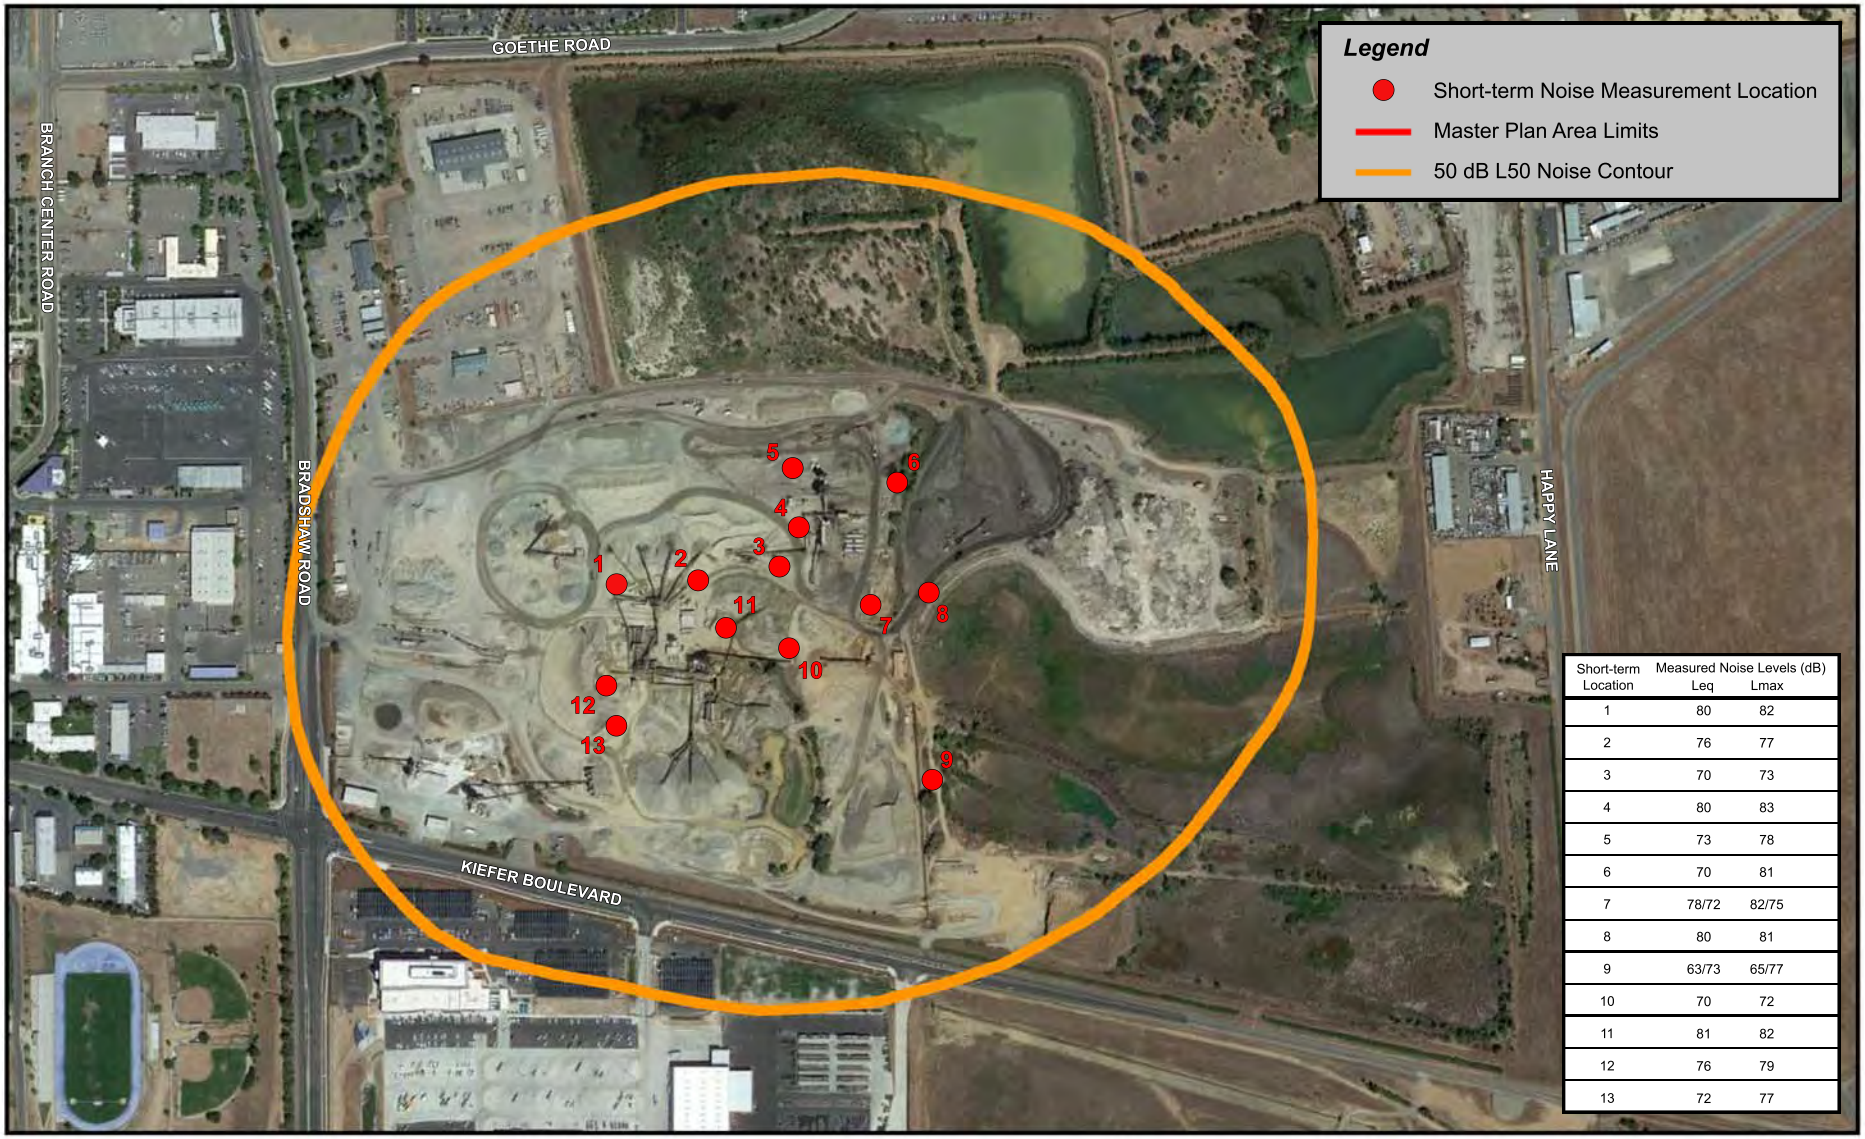
Granite operates an aggregate processing facility at the northeast quadrant of the intersection of Bradshaw Road and Kiefer Boulevard. The permitted facility consists of an aggregate processing plant (crushing, screening, washing, etc.), a smaller recycle plant, and an asphalt plant. A ready-mix plant previously operated at this location but has since been decommissioned. It may, however, be replaced in the future with another ready-mix plant.

To quantify the noise emissions of the Granite facilities, short-term noise level measurements were conducted at 13 locations on the Granite site on the morning of August 15, 2013. The noise measurement locations are identified on Figure 11A.

The noise measurement results were used to quantify reference noise levels in relatively close proximity to the various components of the facility for use in the subsequent evaluation of overall facility noise contour locations. Because the facility is substantially shielded in all directions by intervening topography (primarily tall aggregate stockpiles) and landscaping, the critical noise contour for the facility (50 dB median noise contour) is generally contained within the facility boundaries, as indicated on Figure 11B. The 50 dB median noise contour is considered the critical contour as it relates to the most restrictive nighttime noise level standard contained within the Sacramento County Noise Ordinance (6.68.070 Exterior Noise Standards).

The effects of the Granite facility on future development within the District Area Plan will be discussed in the impacts and mitigation measures section of this report.

Noise Generated by Ongoing Operation of Aggregate Conveyor Belt Operations within the District Area Plans



Ongoing aggregate excavation and conveyance of materials to the Teichert and Granite processing plants may continue to occur during development within the District Area Plans. The conveyors typically operate at the same times as the Teichert and Granite plants.

To quantify the noise emissions of the conveyor belt, BAC conducted noise level measurements at locations near the operating Teichert conveyor on April 29, 2009. The conveyor measurement results were used to identify the approximate locations of the 50 and 55 dB L50 noise contours for that equipment. The 55 and 50 dB L50 values represent the County of Sacramento Noise Ordinance daytime and nighttime noise level standards applicable to noise-sensitive receptors, respectively. Because the same conveyors are in operation as those tested in 2009, the above-described data remains applicable to the evaluation of conveyor noise levels for this project.

The noise measurements indicate that the 55 dB L50 noise contour is located approximately 350 feet from the operating conveyor, with slightly higher noise levels near conveyor transfer locations. The 50 dB L50 conveyor noise contour was calculated to be approximately 700 feet from the belt. Given these distances to the critical noise contours, consideration of noise mitigation measures for these sources will be necessary at such a time as project development encroaches within the 55 and 50 dB L50 noise contours. A discussion of noise mitigation recommendations will be provided in the Impacts and Mitigation measures section of this report.

Existing (Baseline) Vibration Environment

No appreciable sources of vibration were identified during BAC field surveys of the Plan Area and existing ambient vibration levels were subjectively evaluated as being below the threshold of perception. Nonetheless, to quantify baseline vibration levels in the Plan Area, a series of baseline vibration measurements were conducted at various locations within the Plan Area in 2013 as shown on Figure 12. Supplemental vibration surveys were conducted in 2017 to verify that the 2013 vibration data remain representative of current baseline vibration conditions within the Plan Area. The vibration measurement sites were selected to be generally representative of a variety of locations within the Plan Area. Due to the very low measured vibration levels at the 15 monitoring locations, it was determined that baseline vibration monitoring at additional sites was not warranted.

The vibration measurements were conducted using a Larson-Davis Laboratories Model HVM-100 Vibration Analyzer with a PCB Electronics Model 353B51 ICP Vibration Transducer. The test system is a Type I instrument designed for use in assessing vibration as perceived by humans, and meets the full requirements of ISO 8041:1990(E). Atmospheric conditions present during the tests were within the operating parameters of the instrument. A summary of the baseline vibration measurement results is provided in Table 12. The Table 12 data indicate that all measured existing vibration levels within the District Area Plans were well below the threshold of perception.

Standards of Significance Applied to this Project

The following standards of significance, which are based on the California Environmental Quality Act Guidelines (State CEQA Guidelines) in conjunction with adopted local noise policy and appropriate noise standards as described above, are applied to this project:

a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

For transportation noise affecting existing or proposed noise-sensitive land uses within the Plan Area, the noise standards of Table 3 are applied. For aircraft noise affecting proposed noise-sensitive development within the Plan Area the General Plan policies NO-2, NO-3 and NO-4, with recently amended footnotes to General Plan Noise Element Table 4 (provided above in criteria section of this report).

For Non-transportation noise sources affecting existing or proposed noise-sensitive land uses within the Plan Area, the noise standards of Table 4 are applied.

For the evaluation of speech interference and sleep disturbance impacts at future schools and residences proposed within the Plan Area, respectively, compliance with Sacramento County General Plan aircraft noise policies NO-2 through NO-4 is required.

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels.

For this assessment, a vibration level of 1 in/sec ppv is considered a criterion that would protect against significant architectural or structural damage. The general range at which vibration becomes distinctly to strongly perceptible is approximately 0.1 in/sec ppv.

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project.

Criteria for assessing the significance of project-related noise level increases in Sacramento County and neighboring jurisdictions (with the exception of the City of Sacramento) are as follows:

1. Where existing traffic noise levels are less than 60 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

2. Where existing traffic noise levels range between 60 and 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +3 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

3. Where existing traffic noise levels are greater than 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +1.5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant.

Criteria for assessing the significance of project-related noise level increases in the City of Sacramento are shown in Table 6.

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above level existing without the project.

A substantial temporary increase in noise levels is defined using the criteria shown above in threshold C. Because temporary increases in noise are commonly limited to construction activities, and because all Master Plan development activities would occur within Sacramento County, the different thresholds used in the City of Sacramento would not be germane to this threshold.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project to excessive noise levels.

The standards of the Sacramento County General Plan which are applicable to Mather Airport are used as the criteria for assessing aircraft noise impacts for this project. In addition, an interior SEL value of 65 dB is applied to the noise-sensitive interior areas of schools and residences proposed within the plan area.

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels.

No private airstrips were identified in the project vicinity so an evaluation of aircraft noise impacts associated with such facilities is not warranted for this project.

Impacts and Mitigation Measures: Existing Plus Project and Future (Cumulative) Noise Environments

Aircraft

Master Plan Area & District Area Plans

Existing Plus Project and Cumulative Aircraft Noise Levels

The locations of the Mather Airport noise contours would not be affected by development within the Master Plan Area as a whole, or specific development within the District Area Plans. As a result, the aircraft noise contours shown on Figure 4 reflect the theoretical capacity aircraft noise within the project area.

Impact 1: 24-hour Average Aircraft Noise Exposure at Proposed Residential Uses within the WJHMP Area.

Most residential development proposed within the WJHMP area is located outside of the Mather Airport 60 dB Ldn theoretical capacity (worst case) exterior noise contour. However, some residential development is proposed within the Mather Airport 60-65 CNEL noise contours. As a result, **this impact is considered significant**.

Mitigation for Impact 1:

A. All residential development proposed within the Mather Airport 60 CNEL noise contours shall include sufficient noise mitigation to satisfy the requirements of Sacramento County General Plan Policies NO-2, NO-3, and NO-4, including the footnotes to General Plan Noise Element Table 4.

B. Appendix J contains the Acoustical Testing Plan for Mather Airport for residences proposed within the 60-65 dB CNEL Mather Airport noise contours. This testing plan shall be followed to ensure satisfaction with the County General Plan policies pertaining to Mather Airport noise exposure within new residential developments.

Significance after mitigation: *Less than significant*.

Impact 2: 24-hour Average Aircraft Noise Exposure at Proposed School within the WJHMP Area.

According to the County General Plan Noise Element school uses are considered acceptable in aircraft noise environments up to 65 dB CNEL. Because no school uses are proposed within Mather Airport noise environments exceeding 65 dB CNEL, **this impact is considered less than significant**.

Mitigation for Impact 2: None Required.

Impact 3: Single-Event Aircraft Noise Exposure and Sleep Disturbance at Proposed Residences within the WJHMP Area.

As discussed earlier, the County has determined that single-event aircraft noise exposure and associated sleep disturbance impacts are to be assessed in accordance with the Sacramento County General Plan Noise Element Policies NO-2 through NO-4 on aircraft noise. Those policies, which are provided above in the criteria section, restrict new residential development to areas outside the 60 dB CNEL airport noise contours (unless specific policy conditions are met), require noise insulation to ensure interior noise levels do not exceed 45 dB CNEL within residences, require notification that prospective buyers are located within an Airport Policy Area, and require that an avigation easement be recorded acknowledging the property is located within an Airport Planning Policy Area.

Because prospective owners of residences constructed within the Airport Policy Area would be choosing to live in an environment where aircraft overflights occur, and because they would be properly notified of the presence of Mather Airport and, therefore, able to make an informed decision regarding purchasing a residence near an airport, and because interior noise levels must not exceed 45 dB CNEL within residences, Sacramento County has concluded that the satisfaction of the County's General Plan policies related to aircraft noise would ensure that no significant impacts occur with respect to aircraft single-event noise exposure and associated sleep disturbance. Therefore, **this impact is considered less than significant**.

Mitigation for Impact 3: None Required.

Traffic Noise

Master Plan Area & District Area Plans

Existing Plus Project Traffic Noise Levels

With development within the Master Plan Area as a whole, and specific development within the District Area Plans, traffic volumes on the local roadway network will increase. Those increases in daily traffic volumes will result in a corresponding increase in traffic noise levels. The FHWA Model was used with traffic input data provided by Sacramento County to predict existing and existing plus project traffic noise levels, and the project-related noise level increases. Table 13 shows existing versus existing plus project traffic noise levels on the regional roadway network. Appendix E contains the FHWA Model inputs for this scenario. The traffic noise levels shown in Table 13 were predicted at a normalized reference distance of 100 feet from the centerlines of the various project-area roadways. It is recognized that the actual distances from project area

roadways to existing and proposed future noise-sensitive land uses varies but the normalization of the traffic noise levels to a standard distance allows a more uniform comparison of traffic noise levels between existing and existing plus project conditions.

Impact 4: Project-Generated Traffic Noise Increases on Existing Receptors: Existing Plus Project

Impact 4 specifically relates to traffic noise impacts of development of the Project on existing sensitive receptors. See Impact 7 for specific discussion related to traffic noise impacts at sensitive receptors proposed as part of the WJHMP.

Development within the District Area Plans would cause increases in existing traffic noise levels on the local roadway network. A total of 171 existing roadway segments were evaluated (See Table 13), and it was determined that the project-related traffic noise level increase relative to existing traffic noise levels without the Project would range from -5.0 dB to +13.1 dB, with an average noise level increase of 1.6 dB Ldn. Of the 171 segments evaluated, the increase was considered to be substantial on 45 roadway segments. The criteria for determination of a substantial project-related increase in traffic noise levels is as follows:

- 5 dB increase where baseline levels are below 60 dB Ldn.
- 3 dB increase where baseline levels are between 60 – 65 dB Ldn.
- 1.5 dB increase where baseline levels exceed 65 dB Ldn.

A finding of a substantial traffic noise increase may or may not trigger a finding of significant noise impact. For example, if a roadway segment where a substantial increase has been identified has no existing noise-sensitive land uses developed adjacent to that roadway, then no impact would be identified. Similarly, if sensitive development is substantially shielded by either topography, structures, or soundwalls, it may reduce the baseline noise conditions at that receptor such that the threshold for a finding of significance increases from 1.5 dB to 3 dB or 5 dB. For example, where an increase of 1.5 dB would be considered significant for an unshielded residence with a baseline exposure exceeding 65 dB Ldn, the same 1.5 dB increase would not be considered significant if the baseline exposure at that same residence was reduced to less than 65 dB Ldn through shielding.

After identification of the roadway segment for which a substantial increase in traffic noise levels was determined to result from the project, additional analysis of those roadway segments was conducted to identify those segments containing residential or other noise-sensitive development, as well as segments containing existing sound walls. Table 14 contains the results of that additional analysis.

While it is recognized that the noise attenuation provided by existing noise barriers within the Plan Area will vary depending on many factors, for purposes of this assessment it was assumed that the barriers would

intercept line of sight between the traffic noise source and the sensitive receptor. The resulting noise attenuation provided by such a barrier is 5 dB or more. Although the attenuation by barriers would not affect the increase in traffic noise experienced at existing residences resulting from the project, it would lower the baseline noise condition of the receptor. In some cases, the application of a 5 dB decrease to the baseline noise exposure results in a decrease in the threshold for a finding of significant noise impacts.

As noted in Table 14, not all of the roadway segments identified as having a substantial project-related traffic noise increase contain impacted noise-sensitive receptors. In addition, not all segments with sensitive receptors are shielded by existing barriers. Table 14 indicates that development within the Master Plan Area would result in significant noise impacts along 21 roadway segments, and potentially significant noise impacts along an additional 5 segments. The reason some impacts are identified as "potentially significant" is because it is not clear if the sensitive receptors would benefit sufficiently from the presence of existing noise barriers to reduce the impact to a less than significant level. As a result, ***this impact is considered significant***.

Mitigation for Impact 4

The mitigation of impacts at existing sensitive receptors resulting from significant project-related traffic noise increases is frequently challenging because of a combination of limited mitigation options, constraints upon implementation of certain options, cost of implementation, and limited effectiveness of some options. Nonetheless, the following specific options for mitigation of off-site traffic noise impacts at existing noise sensitive receptors should be considered to the extent reasonable and feasible:

A. **Reduction in Traffic Volumes:** Because one of the most important factors in traffic noise generation is daily vehicle volume, a reduction in traffic noise levels can be achieved by reducing the overall volume of traffic which would be generated by the project. It should be noted, however, that a 3 dB reduction in traffic noise levels would require a 50% reduction in projected traffic volumes. So this measure would require a substantial decrease in traffic volume to achieve an appreciable decrease in traffic noise levels. As a result, it is unlikely that this measure would be a feasible means of fully mitigating this noise impact.

B. **Reduction in Vehicle Speeds:** Another factor in the generation of traffic noise is vehicle speed. Higher speeds translate to higher traffic noise levels. However, vehicle speed limits are set based on speed surveys, safety considerations, and other factors, and cannot be arbitrarily reduced to achieve lower traffic noise levels. As a result, this measure would not likely be a feasible means of mitigating this noise impact.

C. **Construction of Noise Barriers:** As noted in the discussion of noise mitigation fundamentals in the beginning of this report, appreciable reductions in traffic noise levels can be achieved through the construction of traffic noise barriers. However, at locations where openings or gaps in the barriers would be required for driveway openings or to maintain safe sight distances, the effectiveness of noise barriers is severely compromised. In addition, this measure would typically require construction of noise barriers on the property of the impacted receptor, rather than within a public right-of-way, so there is no guarantee the impacted receptor would agree to the construction of such barriers or that adequate space is available to construct a barrier. Furthermore, the construction of off-site traffic noise barriers could be extremely costly per benefitted receptor, potentially rendering this measure infeasible.

D. **Use of Setbacks:** A 4.5 dB decrease in traffic noise levels can be achieved for each doubling of distance between the roadway centerline

and affected residences. However, because the locations of existing residences which would be impacted by project-generated increases in traffic noise are fixed, as are the roadways of concern, this measure is not viable for existing residences.

E. **Noise-Reducing Pavement:** Noise-reducing pavement types, such as rubberized asphalt, have been shown to provide an appreciable noise level reduction relative to other pavement types (approximately 3-4 dB over conventional asphalt overlays). However, because the project-related increase in existing traffic noise levels exceeds 4 dB along many of the roadway segments analyzed in Table 13, the benefits of noise-reducing paving materials, even if feasible, would be insufficient to fully mitigate this impact. Nonetheless, at roadway segments where a 3-4 dB decrease in traffic noise levels would be sufficient to reduce this impact to a less than significant level, this mitigation alternative would be effective.

F. **Building Insulation:** As noted in the fundamentals section of this report, when interior noise levels are of concern, noise reduction may be obtained through acoustical improvement of building facades. The greatest improvement in building façade noise reduction can typically be realized through specification of upgraded windows with higher Sound Transmission Class (STC) ratings. Additional noise control for exterior doorways can be provided by replacing hollow doors with solid core doors and by acoustically sealing door perimeters with suitable gaskets.

Some of the aforementioned noise mitigation measures may be utilized to provide appreciable traffic noise level decreases. However, because such measures may be infeasible from a cost, engineering or safety standpoint, may not fully mitigate noise impacts, or could require the consent of the impacted receptor, the successful implementation of these measures cannot be guaranteed. As a result this impact is considered significant and unavoidable.

Significance after Mitigation: ***Significant and Unavoidable.***

Cumulative Traffic Noise Levels

With cumulative development of the region, including this proposed project and the three other Master Plan developments being considered concurrently with the West Jackson Highway Master Plan, traffic volumes on the local roadway network will increase. Those increases in daily traffic volumes will result in a corresponding increase in cumulative traffic noise levels. The FHWA Model was used with traffic input data provided by Sacramento County to predict future (cumulative) vs. Cumulative-No-Project traffic noise levels, and the project-related noise level increases. Table 15 shows the results of that analysis on the existing and future regional roadway network. Appendices G, H & I contain the FHWA Model inputs for the cumulative scenarios.

The traffic noise levels shown in Table 15 were predicted at a normalized reference distance of 100 feet from the centerlines of the various project-area roadways. It is recognized that the actual distances from project area roadways to existing and proposed future noise-sensitive land uses varies but the normalization of the traffic noise levels to a standard distance allows a more uniform comparison of traffic noise levels between cumulative and cumulative plus project conditions.

It should be noted that several of the roadways evaluated in Table 15 would not exist without the construction of the project. As a result, the predicted noise levels for cumulative plus project conditions are provided for those segments but there are no cumulative no project noise levels for those same roadways. In such cases the change and substantial increase indicators are identified as not applicable (N/A).

Impact 5: Project-Generated Traffic Noise Increase on Existing Receptors - Cumulative Plus Project

Development within the District Area Plans would cause increases in future (cumulative) traffic noise levels on the local roadway network. A total of 234 future roadway segments were evaluated (See Table 15), and it was determined that the project-related traffic noise level increase relative to future (cumulative) traffic noise levels without the project would range from -2.9 dB to +11.4 dB, with an average noise level increase of 0.8 dB Ldn. Of the 234 segments evaluated, the increase was considered to be substantial on 35 roadway segments.

As noted in Impact 1, a finding of a substantial traffic noise increase may or may not trigger a finding of significant noise impact. However, while not all of the 35 roadway segments identified in Table 15 as having a substantial project-related traffic noise increase contain impacted noise-sensitive receptors, several segments do contain unshielded residences. As a result, ***this impact is considered significant***.

Mitigation for Impact 5

The mitigation of cumulative traffic noise impacts at sensitive receptors resulting from significant project-related traffic noise increases is frequently challenging because of a combination of limited mitigation options, constraints upon implementation of certain options, cost of implementation, and limited effectiveness of some options. Nonetheless, the specific options identified in Mitigation Measure 4 should be considered to the extent reasonable and feasible. However, because such measures may be infeasible from a cost, engineering or safety standpoint, may not fully mitigate noise impacts, or could require the consent of the impacted receptor, the successful implementation of these measures cannot be guaranteed. As a result this impact is considered significant and unavoidable.

Significance after Mitigation: ***Significant and Unavoidable.***

Cumulative Plus-Project Traffic Noise Levels at Proposed Noise-Sensitive Uses

Land uses proposed within the District Area Plans have varying degrees of noise sensitivity. The most sensitive of the proposed land uses include residential (of all densities), and school uses (interior spaces only). To predict future traffic noise exposure at the proposed sensitive land uses within the District Area Plans, the information contained in Table 15 was utilized. Specifically, the roadways within the West Jackson Highway Master Plan Area were extracted from the Table 15 data in order to identify exposure at the land uses proposed adjacent to those roadways. Table 16 shows the future traffic noise levels and distances to the critical 65 dB Ldn traffic noise contours for the roadways adjacent to which noise-sensitive development is proposed.

Source: FHWA-RD-77-108 with inputs from Sacramento County
Note: Ldn values presented in red indicate roadway segments where the County's 65 dB Ldn exterior noise standard would be exceeded at a distance of 100 feet from the roadway centerline. If, however, the property adjacent to the roadway is depressed relative to the roadway, the shielding provided by the depression would reduce traffic noise levels by approximately 10-15 dB Ldn relative to those shown in this table. The precise degree of shielding will depend on the ultimate elevation of the ground containing noise-sensitive land uses relative to the roadway elevation.

Impact 6: Traffic Noise Levels at Sensitive Receptors Proposed Within the District Area Plans – Cumulative-Plus-Project

Development within the District Area Plans will have varying degrees of noise sensitivity. The most sensitive of the proposed land uses include residential (of all densities), and school uses. Where future traffic noise levels at proposed sensitive land uses within the District Areas Plans would exceed the Sacramento County General Plan noise standards applicable to sensitive land uses (Table 3), a finding of significant noise impact is made and mitigation measures must be considered.

The Table 16 data, which represent predicted future (cumulative plus project) traffic noise levels within the WJHMP Area, indicate that traffic noise levels are predicted to exceed the County's 65 dB Ldn exterior noise standard at a distance of 100 feet along 46 of the 92 roadway segments analyzed within the Plan Area. It should be noted, however, that several of the areas proposed for development within the District Area Plans are former aggregate excavation sites which are substantially depressed relative to the Master Plan areas roadways. This depression provides substantial shielding of traffic noise levels. Noise surveys conducted at such depressed locations within the District Plan Areas indicate that this shielding results in a traffic noise level reduction of approximately 10-15 dB

Ldn, depending on the relative elevations of the roadway and adjacent property.

Because none of the predicted future traffic noise levels shown in Table 16 exceed 75 dB Ldn at a reference distance of 100 feet from the roadway centerlines, it can be concluded that development occurring within the areas which are depressed relative to existing roadways would be shielded to levels below the County's 65 dB Ldn exterior noise level standard.

At proposed sensitive developments adjacent to new roadways or adjacent to roadways which are at the same relative elevation as the development site, such shielding would not necessarily be present. Because final site design and grading has not been completed, it is not possible to determine at this time whether noise impacts would actually occur along each of the roadway segments identified in Table 16 as exceeding 65 dB Ldn. However, because it is possible that noise-sensitive development could occur within the 65 dB Ldn noise contours adjacent to portions of these roadways, ***this impact is considered significant***.

Mitigation for Impact 6

When tentative maps and grading plans are available for specific residential and other noise-sensitive developments proposed within the District Area Plans, a project specific acoustical review should be conducted to ensure that appropriate noise mitigation measures are incorporated into the project design to achieve satisfaction with Sacramento County noise standards. The following general noise mitigation measures should be considered as potential noise mitigation options:

A. Building façade (window & glass door) improvements to ensure compliance with County Interior noise level standard within schools and residences.

B. Mechanical ventilation for all schools and residences to allow occupants of those structures to close doors and windows as desired for additional acoustical isolation.

C. Site design for school and residential uses to maximize the setback between roadways and proposed outdoor activity areas.

D. Shielding of outdoor activity areas of proposed multi-family residential uses from view of impacted roadway segments by intervening structures or topography.

E. Where possible, locate noise-sensitive land uses in areas which would be depressed relative to the impacted roadway segments.

F. Provide statements to prospective residences located adjacent to impacted roadway segments disclosing that the roadways are substantial noise sources and that variation in traffic conditions or atmospheric conditions can result in variations in perceived noise levels.

G. Consider construction of noise barriers to achieve compliance with County exterior noise standards only after all other feasible options have been considered.

Significance after Mitigation: ***Less than Significant.***

Non-Transportation Noise Sources

Master Plan Area & District Area Plans

Granite Aggregates Processing Facility

The existing Granite Aggregates processing facility located northeast of the intersection of Bradshaw Road and Kiefer Boulevard is located within Granite's District 2 Area Plan. The proposed use of the site currently containing the aggregate processing facility is identified in Figure 2 as being industrial uses. Until such time as the Granite facility ceases operations the noise generation of that facility is expected to generally remain at the current levels identified in Figure 11.

Impact 7: Impacts to Proposed Land Uses due to Ongoing Granite Aggregate Plant Operations

As noted previously, Granite operates an aggregates processing facility at the northeast corner of Kiefer Boulevard and Bradshaw Road. Granite's operations are expected to continue for the foreseeable future. Figure 11B shows the processing equipment locations and approximate location of the 50 dB L50 noise contour. The 50 dB contour is important in that it represents the most restrictive nighttime noise level standard contained within the Sacramento County Noise Ordinance. Existing Employment and open space uses to the south, and light-industrial (county corporation yard) and professional uses to the west of the Granite facility are not currently impacted by Granite operations. Changes in land use resulting from development of the Granite District Plan Area would consist of converting a portion of the frontage along Bradshaw Road into commercial uses, with additional employment uses generated to the immediate east, and 7 acres of high-density residential uses to the north. The 50 dB L50 noise contour shown on Figure 11B extends into the future commercial and high-density residential use areas to the north of the existing facility. As a result, if the Granite aggregate processing facility were to remain in operation after construction of those high-density residential uses, those residences could be adversely affected by noise if Granite's operations occur at night. As a result, **this impact is considered significant.**

Mitigation for Impact 7

Operations at the Granite aggregate processing facility may cease prior to the development of noise-sensitive land uses to the immediate north of that facility. However, if Granite operations continue when construction of high-density residential land uses to the north is complete and occupancy begins, then a detailed analysis of noise mitigation options would be required at the time specific development site and grading plans have been developed. That analysis would determine the most appropriate and feasible noise mitigation measures required to achieve compliance with the

County's noise standards at the proposed residential uses. Specific options for mitigation of the aggregate facility are as follows:

A. Agreement by Granite that no building permit may be pulled for residential units within 2,000 feet of the aggregate processing facility until plant operations have ceased, or otherwise reduced to levels in compliance with local noise standards.

B. Use of localized noise barriers, partial enclosures, or suspended acoustic curtain/barriers (to be funded and constructed by the developer of the future noise sensitive land use) to reduce noise at residential units to a state of compliance with County noise standards.

C. Lining of metal hoppers with urethane sheets (if consented to by the plant operator; to be funded and constructed by the developer of the future noise sensitive use).

D. Other actions at the aggregate processing facility, to be consented to by the operator and funded by the developer of the future noise sensitive use, that will reduce noise generated by the aggregate processing facility, as measured at residential sites within 2,000 feet of the facility, to levels in compliance with local noise standards.

E. Upgraded construction of the proposed residential structures. Typically, windows are the greatest source of sound transmission into a residence and a substantial improvement in acoustical isolation can be achieved from upgrading window assemblies alone.

Significance after Mitigation: ***Less than Significant.***

Sacramento Raceway

As noted previously, the Sacramento Raceway, which is located immediately east of the eastern WJHMP boundary, is an existing non-conforming use. It is also located within a separate Master Plan area where additional residential development is envisioned. Because of these factors, it is possible that the Raceway will not be in existence throughout the buildout of the WJHMP area. For the duration of time the raceway remains in operation at its current location, it is reasonable to conclude that the noise generation of that facility will continue at, or near, current levels.

Impact 8: Impacts on Proposed Land Uses due to Ongoing Sacramento Raceway Operations.

As noted previously, the Sacramento Raceway, located east of the WJHMP Area on Excelsior Road, is an existing non-conforming use. As such, and given the proposed development of the area upon which the raceway is

located in a parallel Master Plan Study currently being prepared, the future of the raceway is unclear. Nonetheless, should the raceway continue to be in operation at the time noise sensitive land uses are developed in the Teichert District Plan Area 1, racetrack operations would exceed the Sacramento County noise standards shown in Table 4. No impacts due to ongoing Sacramento Raceway operations are anticipated in Granite District Plan Area 2. Specifically, residences constructed within the 75 dB Lmax noise contour shown on Figure 10 would be exposed to maximum noise levels during certain raceway events which exceed the County's noise standard. As a result, **this impact is considered Significant**.

Mitigation for Impact 8

Given the non-conforming status of the raceway, it is unclear if the raceway would be required to implement mitigation to reduce raceway noise exposure at new residential uses proposed in the WJHMP Area. If it is determined that the Raceway must mitigate potential noise impacts upon the WJHMP development, a study would need to be commissioned by the Raceway to identify feasible options for such mitigation. If, on the other hand, the Raceway is to remain in operation and mitigation must be implemented by the WJHMP developers, additional analysis of site and grading plans would be required to develop such mitigation. The following general noise mitigation measures could be implemented to reduce Raceway noise levels at future residences within the WJHMP Area to a state of compliance with the Sacramento County daytime and nighttime Noise Ordinance standards of 55 and 50 dB, respectively:

A. Building façade (windows & glass doors) improvements to ensure compliance with County Interior noise level standards within residences.

B. Mechanical ventilation included in residential construction to allow residents to close doors and windows as desired for additional acoustical isolation.

C. Use of setbacks to maximize the distance between the raceway and proposed residential land uses.

D. Shielding of outdoor activity areas of proposed residential uses from view of the raceway by intervening structures or topography.

E. Design site grading so as to maximize the degree of natural shielding of raceway noise generation by intervening topography.

F. Provide statements to all prospective residences located in the Raceway vicinity disclosing that the raceway is a substantial noise source and that raceway events will result in substantial short-term variations in ambient noise levels.

G. Consider construction of noise barriers to achieve compliance with County exterior noise standards only after all other feasible options have been considered.

Significance after Mitigation: ***Less than Significant.***

Aggregate Excavation and Reclamation Activities

Many of the District Area Plan properties have already been excavated, others are engaged in excavation currently, while still others may be excavated in the future prior to buildout of the District Areas. Because excavated materials are transported to the Teichert and Granite aggregate plants via conveyor, the noise generation of these operations is highly localized to the areas near the excavation activities and locations adjacent to the conveyors. Until such time as aggregate excavation and reclamation is completed within the District Area Plans, the noise generation of those activities will likely remain at current levels, although the location of the noise generation will change as excavation and reclamation activities progress. Due to the lack of specificity regarding details of future noise-sensitive development near aggregate-related equipment and operations, this impact must be evaluated in greater detail at the tentative map stage.

Impact 9: Impacts on Proposed Land Uses due to Ongoing Conveyor Belt Operations

Ongoing aggregate excavation and conveyance of materials to the Teichert and Granite processing plants may continue to occur during development within the District Area Plans. The conveyors typically operate at the same times as the Teichert and Granite plants.

Conveyor noise level measurements indicate that the 55 dB L50 noise contour is located approximately 350 feet from the operating conveyor, with slightly higher noise levels near conveyor transfer locations. As a result, residential uses constructed within 350 feet of ongoing conveyor operations could be exposed to conveyor noise generation in excess of the County's 55 dB L50 exterior noise standard. If such construction were to occur within that distance, **this impact would be considered significant**.

Mitigation for Impact 9

Because it is possible that either Granite or Teichert conveyor belts could operate concurrently with residential construction within either District Plan Area, consideration of noise mitigation would be required for such development. Specific options for mitigation of conveyor noise to

acceptable levels at future residences constructed within the WJHMP Area are as follows:

A. Disclosure Statements.

All prospective residents of residences located within 350 feet of unshielded conveyors should be provided statements disclosing that operations of aggregate conveyors can and do occur during both daytime and nighttime hours, and that variations in those operations or atmospheric conditions can result in variations in perceived noise levels.

B. Relocation of Conveyor System.

At such a time as development of noise-sensitive land uses within the WJHMP Area is projected to encroach within 350 feet of operating conveyors, the conveyor system could be relocated, at the expense of the developer of the noise sensitive use, to a position further from the residences. While this measure would shift the noise impact zone of the conveyors further away from residences, it would not by itself decrease the actual noise generation of the conveyor system. As a result, eventually additional noise mitigation measures could be required as development moves closer to the relocated conveyor system.

C. Construction of Earth Berms and / or Noise Barriers Adjacent to the Conveyor System.

At such a time as residential development is projected to encroach within 350 feet of operating conveyors, an earth berm or solid noise barrier could be constructed adjacent to the conveyor system to further reduce conveyor noise levels, at the expense of the developer of the noise sensitive use. Such a barrier could take the form of an earthen berm, solid wall, or combination of berms and walls. The noise reduction provided by such a barrier would depend on the relative heights of the conveyor, top of barrier, and nearby residences, as well as the relative distances between the conveyor and noise barrier, and distance from noise barrier to receiver.

Significance after Mitigation: ***Less than Significant.***

Vibration Impacts

Master Plan Area & District Area Plans

Impact 10: Impacts associated with Project-Generated Vibration

Extensive field inspections and monitoring of baseline vibration within the District Plan Areas revealed no discernable sources of vibration which would adversely affect future sensitive land uses located within the project area. In addition, the project does not propose any appreciable sources of ongoing vibration, and short-term vibration generated by project construction activities would be at or below vibration levels currently generated by heavy Teichert and Granite excavation equipment. As a result, vibration impacts either due to the project, or upon the project, are not anticipated, and this **impact is considered less than significant.**

Construction Noise Impacts

Master Plan Area & District Area Plans

Impact 11: Impacts associated with Project Construction

During the construction phases of the project, noise from on-site construction activities, including infrastructure construction, grading, and development of a variety of land use types, would add to the noise environment in the project vicinity.

Activities involved in construction would typically generate maximum noise levels ranging from 85 to 90 dB at a distance of 50 feet (*Federal Transit Administration Noise and Vibration Impact Assessment Manual*, 2018, Table 7-1). Noise would also be generated during the construction phase by increased truck traffic on area roadways. A significant project-generated noise source would be truck traffic associated with transport of heavy materials and equipment to and from construction sites.

Provided construction activities occur between the hours of 6 am – 8 pm during weekdays, and 7 am – 8 pm on weekends, construction activities would be exempt from the provisions of the Sacramento County Noise Ordinance (6.68.090). Because on-site construction activities are proposed to adhere to the County's requirements, no adverse on-site or off-site construction noise effects are identified for this project and **this impact is considered less than significant.**

Appendix A
Acoustical Terminology

Acoustics The science of sound.

Ambient Noise The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.

Attenuation The reduction of an acoustic signal.

A-Weighting A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.

Decibel or dB Fundamental unit of sound. A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.

CNEL Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.

Frequency The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz.

IIC Impact Insulation Class (IIC): A single-number representation of a floor/ceiling partition's impact generated noise insulation performance. The field-measured version of this number is the FIIC.

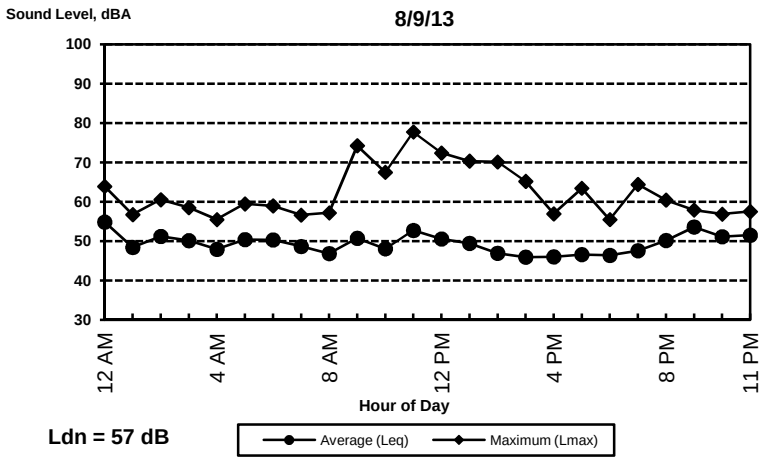
L_{dn} Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.

L_{eq} Equivalent or energy-averaged sound level.

L_{max} The highest root-mean-square (RMS) sound level measured over a given period of time.

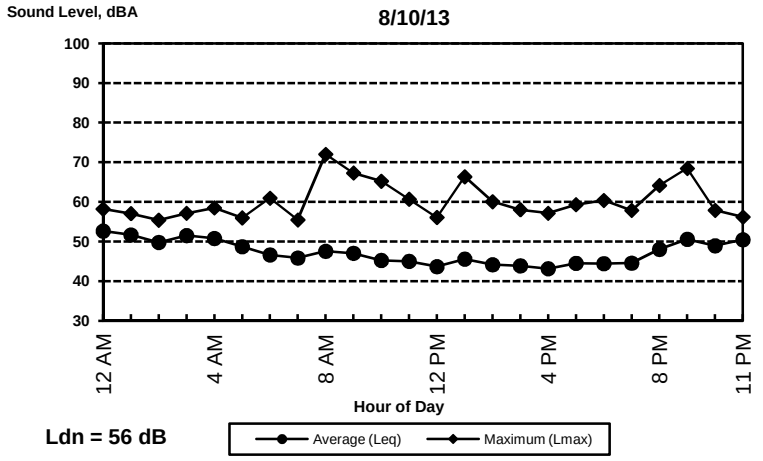
Loudness A subjective term for the sensation of the magnitude of sound.

Masking The amount (or the process) by which the threshold of audibility is for one sound is raised by the presence of another (masking) sound.



Noise Unwanted sound.

Peak Noise The level corresponding to the highest (not RMS) sound pressure measured over a given period of time. This term is often confused with the "Maximum" level, which is the highest RMS level.



RT_{60} The time it takes reverberant sound to decay by 60 dB once the source has been removed.

STC Sound Transmission Class (STC): A single-number representation of a partition's noise insulation performance. This number is based on laboratory-measured, 16-band (1/3-octave) transmission loss (TL) data of the subject partition. The field-measured version of this number is the FSTC.

1 Introduction

The Sacramento County's Airport Land Use Compatibility Plan and General Plan (Noise Element, NO-3) prohibits residential development inside the Community Noise Equivalent Level (CNEL) 60 dB contour as determined through a theoretical capacity analysis, which the Sacramento County Department of Airports (SCDA) updates periodically. With the recent update to the Mather Airport theoretical capacity analysis, the proposed West Jackson Master Plan Alternative 1C development would include residential properties within the CNEL 60 to 65 dB contour.

For federally funded airport residential sound insulation programs, the Federal Aviation Administration (FAA) guidelines suggest assigning an exterior level of CNEL 65 dB to all parcels within the CNEL 60 to 65 dB contour. To ensure that the interior CNEL is below 45 dB, with an appropriate margin of error, we would specify a design goal of 25 dB noise level reduction (NLR), which can be achieved with all structural façade elements having a minimum rating of Outdoor-Indoor Transmission Class (OITC) 25.

In accordance with Appendix R "Noise Compatibility Planning/Projects" of FAA Order 5100.38D Airport Improvement Program Handbook[1] (AIP Handbook), SCDA requires an Acoustical Testing Plan (ATP) and testing in accordance with the ATP to ensure the residential properties constructed within the CNEL 60 to 65 dB contour have a minimum average NLR of 25 dB.

The ATP conforms to "best-practices" utilized by industry professionals for over thirty years in sound insulation programs across the nation and includes acoustical testing methods for determining interior noise levels that are outlined in the FAA's adopted guidance[2] per Advisory Circular 150/5000-9A, *Announcement of Availability – Report No. DOT/FAA/PP/92-5, Guidelines for the Sound Insulation of Residents Exposed to Aircraft Noise*, issued in 1992[3]. The various steps outlined in the ATP also comply with requirements set forth in Table R-4 "Pre- and Post-Testing Criteria for Noise Insulation Projects" of Appendix R in the AIP Handbook.

The following sections provide detailed descriptions of the key components in implementing the ATP.

[1] FAA Order 5100.38D "Airport Improvement Program Handbook", Appendix R "Noise Compatibility Planning/Projects", effective date September 30, 2014.

[2] "Guidelines for the Sound Insulation of Residences Exposed to Aircraft Operations", which is attached to FAA Advisory Circular AC150/5000-9a

[3] FAA released an update in June 2022 for which there are modified testing requirements not included in this ATP.

2 Acoustical Testing

The acoustical testing program is to validate that the residential units constructed within the 60 to 65 dB CNEL contour achieves a minimum of 25 dB NLR to provide for appropriate interior habitable spaces from aircraft noise levels.

2.1 Measurement Methodology

Sound insulation measurements have historically been conducted using either an artificial noise source or actual aircraft noise events. An artificial noise source allows measurements to be made at the properties during a brief measurement period, independent from the reliance on aircraft over flights and without the need for multiple sound level meters to simultaneously measure aircraft noise in all habitable rooms.[4] The testing procedure described herein has been developed to accurately measure outdoor-to-indoor noise level reduction (NLR) of rooms.

The equipment required to complete the sound insulation measurements includes:

- Integrating sound level meter (with spectrum logging capability)[5]
- Loudspeaker (active or passive)
- Power amplifier (may be integrated with speaker)
- Signal generator (pink noise or simulated via graphic equalizer)
- Monopod for microphone
- Speaker tripod
- Power cables
- Digital camera
- Measuring tape

The testing procedures generally follow those outlined in the American Society for Testing and Materials (ASTM) Standard E966[6]. The methodology also conforms to good practice in sound insulation programs and the efficiency and flexibility of the testing procedures are enhanced using methods and theories from other sources such as Leo Beranek's "Noise and Vibration Control", which are applied in supplement to the ASTM standard to achieve the same level of overall accuracy in the testing process.

2.2 Measurement Procedures

The acoustical consultant shall use a field kit that includes a signal generator and public announcement (PA) type loudspeaker to produce a noise source of equal energy in each octave band or one-third octave band (referred to in the acoustics field as "pink noise") at an approximate overall sound level of 90 to 100 dB as measured at the exterior building façade under test.

---

[4] Defined in the AIP Handbook as living, sleeping, eating or cooking areas. Additional discussion is provided in Section **Error! Reference source not found.**

[5] Either octave band or one-third octave band capability is acceptable. This ATP provides methodology for either instrumentation.

[6] ASTM E966-10$^{\varepsilon 1}$ "Standard Guide for Field Measurements of Airborne Sound Attenuation of Building Facades and Façade Elements", with editorial changes in April 2011.

The loudspeaker will be positioned either on a tripod or placed on the ground unless there is compelling evidence that the roof/ceiling element of the room under test has the potential to contribute significantly to the interior sound level from aircraft operations. Examples of compelling reasons include: existence of weak elements within the roof/ceiling structure, such as sky lights; relatively light weight materials to make up the roof structure; limited airspace between the roof and ceiling; and limited or no use of insulation in the space between the roof and ceiling. In these instances, the speaker will be lifted above the roofline of the home to obtain both exterior façade and roof exposure through the use of an industrial grade hoisting device, such as a bucket truck, scissors lift or mobile crane.

The loudspeaker is directed at the room under test as required in the ASTM Standard E966, typically at a 45-degree incidence angle to minimize the application of adjustments to the data. The goal is to obtain a uniform sound field exposure of the entire exterior surface (façade) of interest, whether a single room or multiple rooms along the same facade. To obtain a uniform sound field along a wider area (testing of multiple rooms along the same façade) requires the speaker to be a greater distance from the façade at an increased volume as compared to the measurement of a single room.

The loudspeaker must be positioned such that the sound field at the façade of the room under test is as uniform as possible (± 2 dB along the façade of measurement) at a 45-degree angle of incidence. Corner rooms with two exterior facades should have both facades exposed simultaneously, with the direction of the speaker aimed at the center of only one of the facades. If only one façade is tested, it must be the least performing façade in terms of potential noise reduction. From the center of the façade, the perpendicular and the parallel distance to the speaker must be roughly equal.

At times the consultant may request that the roof/ceiling structure be tested to determine whether it is a major sound transmission path into a particular room. When measuring the acoustical performance of the roof/ceiling structure, the loudspeaker is placed over the roof such that the other structural elements (i.e., doors, windows, walls, etc.) are shielded from the sound field as much as possible. This often requires the use of a longer hoisting device than is necessary when the loudspeaker is placed over the yard.

With the loudspeaker placed to provide sufficiently uniform sound across the primary façade, octave band or one-third octave band sound level measurements are made both on the exterior and in the interior of the structure using both time and spatial averaging of sound levels. Additional measurements are conducted without the loudspeaker in operation to provide background or ambient sound levels.

2.2.1 Interior measurement method

Interior measurements occur to calculate the NLR for each room tested.

For interior room measurements, the microphone is swept in an elliptical or figure-8 pattern throughout the room volume for a minimum period of 20 seconds to measure the spatial average sound level (Leq) of the room. The microphone should, at all times, be at least 12 inches from sound transmitting elements (window, door, wall, vent, etc.) and from any hard reflective surfaces (e.g., walls, floor, and ceiling).

The interior room Leq is measured by sweeping the microphone as described above with the loudspeaker system turned on. The interior background Leq is measured by repeating the interior room Leq process, but with the loudspeaker system turned off. To ensure no contamination of the interior measurements conducted with the loudspeaker on, the background Leq measured with the speaker off must be at least 10 dB below the noise levels measured in each octave band or one-third octave band with the speaker turned on. To obtain this environment, household noise sources may need to be reduced or eliminated including pet noise, talking, and/or movements within the home and specific appliances or electronic devices may also need to be turned down, turned off or muted such as televisions, radios, phones,

ventilation (fan) systems, refrigerators and fish tanks. All household noise sources will be returned to their original conditions once the measurements are completed.

2.2.2 Exterior measurements methods

For exterior building façade measurements, the microphone is swept in a repeated "S" pattern for a minimum period of 20 seconds to measure the average exterior sound level (Leq) for the room or element of interest.

The exterior room façade Leq is measured by sweeping the microphone as described above with the loudspeaker system turned on. The exterior background Leq is measured by repeating the exterior facade Leq process, but with the loudspeaker system turned off. To ensure no contamination of the exterior measurements conducted with the loudspeaker on, the background Leq measured with the speaker off must be at least 10 dB below the noise levels measured in each octave band or one-third octave band with the speaker on.

There are three measurement methods which may be utilized to determine exterior sound levels. Any of the three methods may be used to determine the sound pressure level at the exterior building façade and these methods, when conducted as prescribed in the ASTM standard, will provide the same outdoor sound pressure level at the exterior facade of the structure under ideal conditions. The variety of methods for determining the outdoor sound pressure levels exist to provide flexibility since no one method can be used in all situations encountered in the field.

Each of the three methods are outlined below, in the preferred order of use.

(1) Flush method:

The flush outdoor measurement procedure[7] is outlined in the ASTM E966 standard. This method requires the microphone to be "very close" to the façade surface, but not so close that it is likely to touch the surface. The ASTM standard indicates that this measurement position requires a subtraction of 5 dB to account for the approximate doubling of the sound pressure (+6 dB) at the façade surface. The flush method is the most common and ideal method because of the ease to accomplish, applicability in most circumstances, assurance of the ability to measure similarly for pre- and post-construction conditions and repeatability of the measurement technique in the field.

(2) Nearby method:

ASTM E966 provides a second method for determining the outdoor sound pressure level: the nearby microphone method[8] with a 2 dB subtraction to the measured level to account for the reflection of sound energy from the façade and back to the microphone. This method requires the microphone to be 4 to 8 feet from the surface. This method also requires that the loudspeaker be positioned far away from the building façade (at least 40 feet) to minimize the increase in sound level associated with the measurement position being 4 to 8 feet closer to the speaker than is the façade. An additional adjustment factor of 1 dB should be subtracted from the measured exterior level to account for this effect.

[7] ASTM E966 Section 8.3.3 describes how to conduct the measurements and Section 8.5.3 provides required adjustments.

[8] ASTM E966 Section 8.3.2 describes how to conduct the measurement and Section 8.5.2 provides required adjustments.

(3) Free-field method:

The third technique, known as the free-field or calibration method[9], requires no adjustment as the measurement is conducted in an environment relatively free of reflective surfaces. The free-field method usually requires a separate speaker set up and measurement. To use the free field method, first measure the distance from the speaker to the façade during the interior room measurement. Then position the loudspeaker in a free-field environment over soft ground and measure the sound level at that same distance from the speaker by sweeping the microphone at the distance determined."

2.2.3 Measurement documentation

Digital photographs must be taken of the following:

- Exterior of each home to aid in identifying the property
- Loudspeaker positions and associated exterior façade areas under test
- Exterior elements that have noticeable product and/or installation defects
- Room interiors to document conditions in case noise modeling is undertaken or retesting is required

The digital camera must be set to the same date and time as the integrating sound level meter and all photographs must have a date and time stamp for reference. Data log sheets must also be completed (digital format is acceptable) that include, at a minimum, the following information:

- Airport code/identifier
- Address of property tested
- Resident last name or site name
- Site or parcel number (if known and applicable)
- Building number and unit number (multi-family only)
- Building floor number and unit type (multi-family only)
- Date and time of the measurements
- Initials of person(s) conducting the testing
- Description of rooms and elements tested
- Speaker set up (ground, tripod, or elevated)
- Noise-exposed room surfaces (façade, roof, or both)
- Exterior measurement method (flush, nearby, or free-field)
- A-weighted Leq noise levels, in dB, and corresponding SLM data file numbers (for interior background, interior test, exterior background, and exterior test)
- Sketch of floorplan, including all eligible rooms and noting all exterior elements
- Documentation on sketch of all loudspeaker positions, including reference distances

2.3 Calculation of Outdoor/Indoor Noise Reduction (OINR)

The Outdoor/Indoor Noise Reduction (OINR) of tested rooms and building elements are calculated from the measured exterior and interior sound levels in each octave band or one-third octave band, as outlined in ASTM E966. The OINR values are used to compute the outdoor-to-indoor Noise Level Reduction (NLR) of aircraft noise as measured in A-weighted decibels, denoted dB.

[9] ASTM E966 Section 8.3.1 describes how to conduct the measurement and Section 8.5.1 provides required adjustments.

The OINR values are computed for each tested eligible room by subtracting the interior noise level measured in each octave band or one-third octave band from the corresponding exterior sound level measurement. The exterior sound level data are first adjusted to account for the acoustic energy reflected from the building façade under evaluation, as outlined previously in report Section 2.2.2. The exterior and interior sound level data collected with the artificial noise source operating are likewise adjusted to account for the ambient acoustical energy measured with the noise source turned off. These are shown in the following equations.

The adjusted exterior level in each octave band or one-third octave band is:

$$L_{Ext\ Adj} = 10\log\left(10^{\frac{L_{Ext\ Measured}}{10}} - 10^{\frac{L_{Ext\ Background}}{10}}\right) - Adj_{Ref\ Energy}$$

The adjusted interior level in each octave band or one-third octave band is:

$$L_{Int\ Adj} = 10\log\left(10^{\frac{L_{Int\ Measured}}{10}} - 10^{\frac{L_{Int\ Background}}{10}}\right)$$

The OINR level in each octave band or one-third octave band is then determined by:

$$OINR = L_{Ext\ Adj} - L_{Int\ Adj}$$

The measurements may also be adjusted per ASTM E966 based on the angle of incidence of the noise source. The acoustical consultant typically attempts to position the loudspeaker to obtain an incident angle of 45 degrees for consistency, repeatability and efficiency as it requires no correction in the calculations. If a different angle-of-incidence is required, the consultant must apply the appropriate correction to the calculations as provided in ASTM E966.

2.4 Calculation of Noise Level Reduction (NLR)

NLR is a single number rating used for the comparison of the difference in outdoor-to-indoor noise levels. This number is typically used to judge the overall effectiveness of airport sound insulation programs.

The NLR of a room is dependent on the frequency (sound spectrum) content of the exterior noise source. For aviation sound insulation programs, the computed NLR values are determined using an appropriate aircraft noise source. The exterior aircraft source spectrum is also A-weighted to resemble human perception and to be consistent with FAA guidelines for assessing aircraft noise in communities.

The exterior aircraft noise spectrum was determined using the theoretical capacity analysis. The T-38A was estimated to be the greatest overall contributor to CNEL sound levels for departures from runways 22 L/R. Figure 1 and Table 1 present the octave band aircraft noise spectrum, normalized to an overall A-weighted sound level of 65 dB. Table 2 provides the corresponding one-third octave band sound levels.

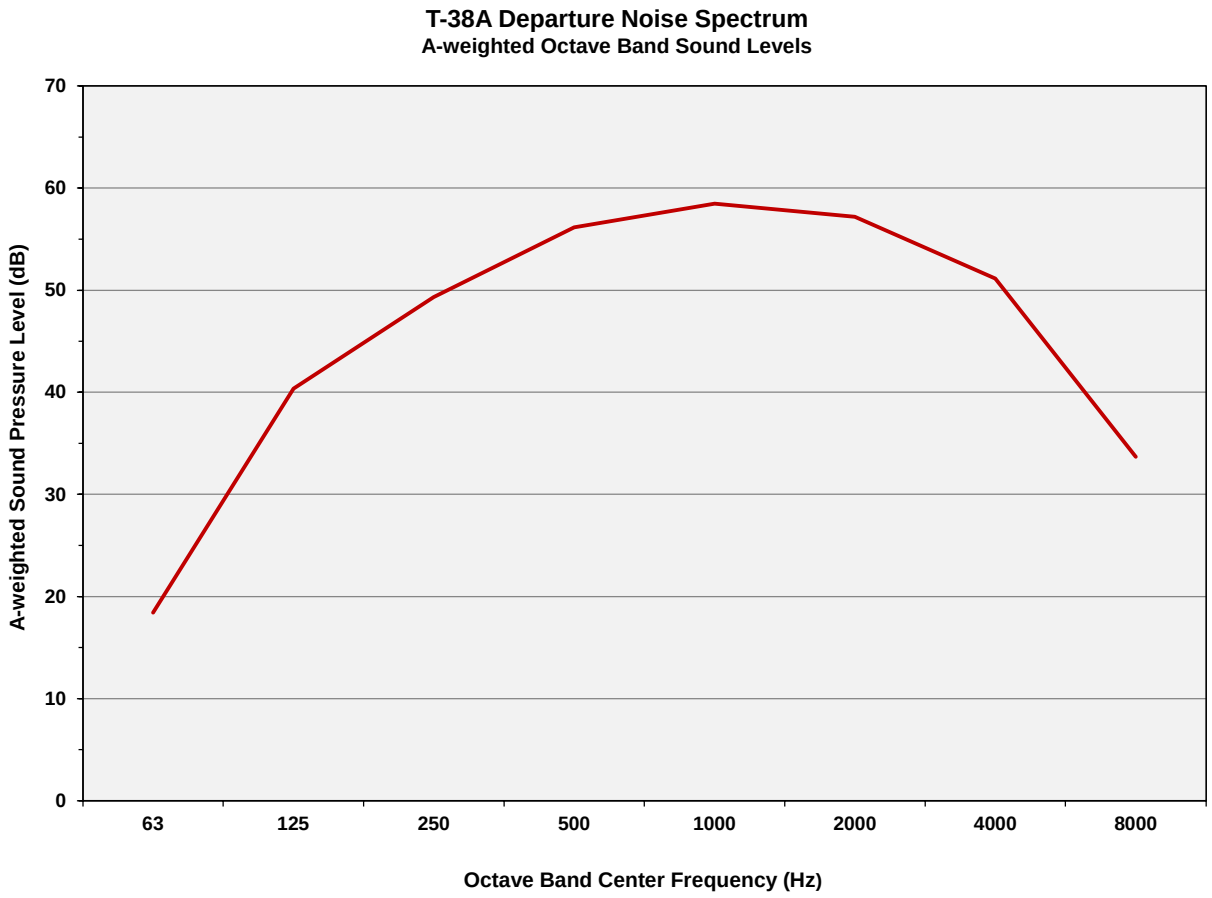

Figure 1. A-weighted Octave Band Aircraft Noise Spectrum

Table 1. A-weighted Octave Band Aircraft Noise Spectrum

Hz	63	125	250	500	1000	2000	4000	8000
dB	20.7	42.6	51.6	58.4	60.8	59.5	53.4	36.0

Table 2. A-weighted One-third Octave Band Aircraft Noise Spectrum

Hz	50	63	80	100	125	160	200	250	315	400	500	630	Hz
dB	11.4	14.7	21.0	30.9	38.2	42.4	42.3	47.3	49.9	52.4	52.4	54.9	dB
Hz	800	1000	1250	1500	2000	2500	3150	4000	5000	6300	8000	10000	Hz
dB	55.8	56.1	55.8	55.3	54.7	53.8	51.6	47.8	42.5	35.2	29.4	24.9	dB

The indoor A-weighted noise source spectrum for each tested eligible room in a structure is obtained by subtracting the measured OINR values from each corresponding octave band or one-third octave band of the exterior A-weighted aircraft source spectrum.

The overall A-weighted interior noise level is then obtained by summing the individual energies calculated for each octave band. The A-weighted NLR value for each tested room, based on the exterior aircraft spectrum, is computed from the difference between the overall outdoor and indoor A-weighted aircraft noise levels. This is shown in the following equations.

The exterior A-weighted total level is:

$$L_{Ext\ Total} = 10log \sum_{i=1}^{k} 10^{\frac{L_{Ext\ Noise\ Source\ Spectrum,i}}{10}}$$

The interior A-weighted total level is:

$$L_{Int\ Total} = 10log \sum_{i=1}^{k} 10^{\frac{L_{Ext\ Noise\ Source\ Spectrum,i} - OINR_i}{10}}$$

where "k" is the total number of octave or one-third octave bands used.

The NLR is then determined by:

$$NLR = L_{Ext\ Total} - L_{Int\ Total}$$

Table 3 presents an example of an octave band measurement calculation.

Table 3. Example Octave Band Measurement Calculation

	Octave Band Center Frequency								A-weighted Total
	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz

Under the "Unweighted Measured Data" section, the *Interior Background* shows the measured interior background octave band levels with the loudspeaker turned off and the A-weighted total. The *Interior Measurement* presents the measured interior octave band levels with the loudspeaker turned on and the A-weighted total. The *Interior Adjusted* provides the interior octave band levels with the measured background sound level contribution removed and the A-weighted total. The *Exterior Background* shows the measured exterior background octave band levels with the loudspeaker off and the A-weighted total. The *Exterior Measurement* shows the measured exterior façade octave band levels with the loudspeaker on and the A-weighted total. The *Exterior Adjusted* provides the exterior octave band levels with the measured background sound level and the façade reflected energy contributions removed and the A-weighted total. In this example, note that the octave band levels and the A-weighted totals both show the measurements with the speaker turned on being more than 10 dB louder than the background levels with the speaker turned off.

The OINR is then developed by subtracting the *Interior Adjusted* level from the *Exterior Adjusted* level for each octave band, as outlined in Section 2.3. Under "A-Weighted Aircraft Noise Source Spectrum" the OINR is subtracted from the *Exterior Spectrum* to obtain the *Interior Spectrum*. The A-weighted acoustical

energy totals of the *Exterior Spectrum* and the *Interior Spectrum* are subtracted to obtain the NLR value, shown on the last line of the example table.

2.5 Extent of Acoustical Testing

According to Appendix R of the AIP Handbook, FAA recommends testing between 10% and 30% of the potentially eligible parcels[10]. In order to verify that homes are constructed in substantial conformance to a particular master permit plan set for a floorplan type and satisfy the design goal of achieving 25 dB Noise Level Reduction (NLR), post-construction acoustical testing of the first home conforming to the master permit plan set for a floorplan type (typically the model home) and at least one additional home for each floorplan type randomly selected during each construction phase to ensure the homes all meet the acoustical goal.

[10] FAA Order 5100.38D Appendix R, Table R-4 "Pre- and Post-Testing Criteria for Noise Insulation Projects", c. "First Step – Initial Testing" Paragraph (3): "Once the sponsor has characterized the diversity of the residences in the noise contour, it will select a representative sample of each type of similarly-constructed residences for testing, which based on industry review is typically 10% to 30%."

3 Compliance Determination

SCDA will determine compliance based on the testing reports provided during each phase of construction. Residential structures with an average NLR of 25 dB or greater will be considered to have met the SCDA requirements for those within the 60 to 65 dB CNEL contour.

EXECUTIVE SUMMARY

StoneBridge Properties (a Teichert subsidiary) and Granite Construction are seeking approval from Sacramento County for a Master Plan to guide development within a 5,913-acre planning area along Jackson Highway (State Route 16). The West Jackson Highway Master Plan (WJHMP; Master Plan) area is located within 0.25-3 miles of Mather Airport.

The Master Plan would result in construction of residential and commercial uses with associated flood control facilities, schools, parks, urban farming and other uses in an area that mostly supports grasslands, seasonal wetlands, and active and reclaimed aggregate mining lands. Consistent with Federal Aviation Administration (FAA) regulations, StoneBridge and Granite have commissioned preparation of this Wildlife Hazard Assessment (WHA) to evaluate whether the developed Master Plan would increase the risk of bird-aircraft collisions, and determine what measures should be taken to minimize any increase. The draft proposal for the WHA process was reviewed and approved by Sacramento County Department of Airports, and this resulting analysis also will undergo Airports' review.

The WHA examined available information and evaluated potential bird-aircraft collision under existing conditions and the conditions to be created under the Master Plan. The analysis focused on 14 species and species groups considered to pose the greatest risk to aircraft ("potentially hazardous bird species"), selected based on 1) their size and resulting potential for aircraft damage, and 2) propensity to collide with aircraft determined from bird-aircraft collision data from Mather Airport, FAA's national collision data reporting and hazard assessment, and the authors' knowledge of species in the region. The WHA considered four main components of the hazard:

1. Land cover changes and associated changes in bird use;
2. The extent and conditions of stormwater flooding and associated bird use;
3. Frequencies of aircraft flights at various heights over the Master Plan area, existing bird aircraft collision information, and relative frequency of flights at various heights by potentially hazardous bird species; and
4. The potential for synergistic effects, whereby conditions created within the Master Plan area could result in increased travel by birds to and from the plan area that might cross aircraft flight paths.

Effects of land cover changes and flight heights were analyzed within 17 different subregions ("analysis areas") of the Master Plan area.

Land Cover Analysis

Relative levels of bird use were determined based on habitat quality and quantity in the Master Plan area as a whole and within individual analysis units. Species and species-group use was quantified by multiplying the species' relative abundances in various land cover types (on a scale of 0.0-1.0) by the area (in acres) occupied by the various land covers under existing and Master Plan conditions. The resulting quantities ("habitat units") added across all land covers showed, not surprisingly, that development of

substantial areas of grassland, wetlands, and agriculture, would reduce habitat value and expected use (by 20-58 percent) for 11 of the 14 identified potentially hazardous species.

Habitat values under the assumed 50-year build-out of the Master Plan would increase for three species groups that favor residential areas and the resulting urban forest conditions: Rock Pigeon and European Collared-Dove (by 12 percent), Cooper's and Red-shouldered Hawks (by 100 percent), and Yellow-billed Magpie and American Crow (by 12 percent). The increases in the hawks and corvids (magpie and crow) would not occur, however, until at least 20 years after trees are established in development areas, so would gradually increase over a period of 20-70 years.

Stormwater Management Effects

Under the Master Plan, stormwater would be more extensively managed to protect life and property. Stormwater flooding effects, analyzed as the conditions 48 hours after the peak of the 2-year and 10-year storm events, showed that the area inundated would decline as stormwater is conveyed, concentrated, detained, and evacuated through pumping. Overall, the area inundated after the 2-year event would decline by 83% and the area flooded after the 10-year event would decline by 84% compared to existing conditions.

Only six of the potentially hazardous bird species/groups make extensive use of flooded lands (Mute Swan, Canada Goose, ducks, gulls, and herons and egrets, and Bald Eagle). The decline in the amount and duration of flooding, along with the conversion of non-flooded areas to land covers with lower value for these species, demonstrates that the Master plan would substantially reduce risks associated with bird use of flooded lands compared to existing conditions.

Aircraft and Bird Flight Analysis

Aircraft flights were analyzed based on flights arriving and departing during November 15 to December 15, 2022. The rationale for choosing this period is described in Section 4.5.1. Flight paths provided by Sacramento Airports showed that aircraft flew over the Master Plan area for 27 flight hours over that one-month period (i.e., 54 min/day). No aircraft crossed above the Master Plan area at heights below 100 ft and only 1 percent of flight time (i.e., 32 sec/day) occurred at 100 to 500 ft. No flights below 500 ft occurred above 10 of 17 analysis areas within the plan area. Roughly half of flight-time was within 500-1,500 ft and the other half was above 1,500 ft.

Information on bird-aircraft collisions from Mather Airport showed a modest number of collisions (120 over 11 years). Unsurprisingly, most collisions occurred on or near the ground; species that spend most or all of their time on the ground comprised over half of the species identified during collisions. Thus, most collisions occurred near the ground during takeoff and landing, as would be expected, and thus not over the Master Plan area. Over three-fourths of species reported in Mather collisions were small (<500 g) and only 4 (4 percent) were large (>1,200 g). Nearly all large or moderate-sized species were considered potentially hazardous species in this WHA.

Flight characteristics estimated for potentially hazardous species showed that most flights of all species occurred below 100 ft, a height at which few aircraft flights occurred above the Master Plan area. Eight of

14 potentially hazardous species/groups flew at a moderate frequency at 100-500 ft, while the other six groups flew there at low frequency. Eight of the groups flew at low frequency at 500-1500 ft and six flew there at very low frequency. All species were judged to fly at very low frequency (6 groups) or not at all (7 groups) above 1,500 ft, except the Turkey Vulture which flew there at low frequency.

Synergistic Effects

Synergistic effects are defined by FAA as two or more land uses that together may pose additional hazards, such as by creating a flight corridor between bird feeding and resting areas. Synergetic effects were evaluated based on species' uses of various land covers and other habitat elements for nesting, roosting, and foraging activities. The focus was on whether species moved among different land covers for these activities and whether the land covers that are used by these species increased or decreased under the Master Plan. Eleven of 14 potentially hazardous species or groups were expected to move among different land covers for different uses. Nine of these species were considered less likely to engage in synergistic movements under conditions of the Master Plan than under existing conditions because the habitats they use would decline in abundance.

The Rock Pigeon, Turkey Vulture, and American Crow were initially identified as species that had potential to be involved in synergistic effects under the Master Plan. Further evaluation, however, suggests that such effects are unlikely. Rock Pigeons generally fly to agricultural lands which are located primarily east and south of the Master Plan area and Mather Airport. Pigeons also can be discouraged through building design. Synergistic uses by crows appear unlikely because the species would increase mainly during the breeding season (when distant movements don't occur) and removal of grassland and agriculture in the Master Plan areas would reduce long-distance winter movements to the site. Roosting by migrating and wintering vultures in the Sacramento region tends to be highly localized and focused on large, older trees. Roost establishment would not occur for 40-70 years when the urban forest matures or may not occur at all. If so, future measures to discourage roost development may be warranted.

Overall Effects of the Master Plan on Bird Aircraft Collision Risk

This WHA indicates that potential bird-aircraft hazard would be reduced overall and for most of the potentially hazardous species we identified. The species that are predicted to increase would do so over a period of decades as the urban forest in residential and commercial areas develops. Even those species that may increase would likely not pose substantial bird-aircraft collision hazards because of seasonality of susceptible behavior and the ability to apply measures to discourage use. With adopted mitigation measures, development of the Master Plan is expected to reduce bird-aircraft collision hazards to a low level that is below current levels.

1.0 INTRODUCTION

ECORP Consulting, Inc. prepared this WHA for the WJHMP in Sacramento County, California. This WHA was prepared in accordance with current industry standard (FAA) guidelines (FAA 2020) and in consultation with the Sacramento County Department of Airports (SCDA). The report addresses concerns about potential effects of land use changes on bird populations and thereby on potential for bird-aircraft collisions.

FAA reported that wildlife strikes to civil aircrafts in the United States killed more than 301 people and destroyed over 298 aircraft from 1988-2021 (Dolbeer et al. 2022). A total of 620 bird species were involved in FAA strike records, out of a total of 745 wildlife species. While only a small percentage of the 259,577 wildlife strikes analyzed within the 2022 report led to such dire outcomes, the FAA cites growing concerns due to wildlife strikes, and in particular the rebound of some relatively large-bodied bird species, such as the bald eagle (*Haliaeetus leucocephalus*), coincident with an increase in aircraft collisions with those species over time.

This WHA is intended to evaluate whether the proposed Master Plan (also referred to hereafter as Project) would significantly increase the potential risk of bird collisions with aircraft using Mather Airport above that which currently exists under pre-project conditions. The primary basis for evaluating potential bird-aircraft collision hazards is the presence of land covers (i.e., habitat types) attractive to bird species, and the interaction of aircraft and bird flight characteristics (Coccon et al. 2015).

2.0 MASTER PLAN AREA DESCRIPTION

The Master Plan consists of 5,913 acres, including several participating properties belonging to Teichert Construction (with StoneBridge Properties [StoneBridge] as its representing subsidiary) and Granite Construction (Granite) and other ownerships. Within the Master Plan area, Teichert and Granite own approximately 4,079 acres referred to collectively as the "participating properties". Three Future Planning Areas (FPA) also occur within the Master Plan, comprised of non-participating property owners (Figure 2-1). The future siting of land uses within the FPAs under the WJHMP build-out are yet to be determined. Therefore, they are not included in this analysis, although it is anticipated that similar requirements for evaluating and addressing wildlife hazards will be applied as future uses are proposed. The WJHMP plan area, excluding the FPAs and including all participating and non-participating properties in balance of the plan area, comprises the 4,895-acre area analyzed within this WHA (Figure 2-1), referred to hereafter as "Master Plan area" for simplicity.

2.1 Master Plan Area Location

The Master Plan area is located on the north and south sides of Jackson Road (State Route 16) in Sacramento County, California. The Master Plan area is generally bordered by South Watt Avenue to the west, the Rosemont community to the north, Mather Airport to the northeast, Excelsior Road to the east, and Elder Creek Road and Florin Road to the south. The entire Master Plan area occurs within a five-mile radius of Mather Airport (Figure 2-2). Much of the Master Plan area occurs within 10,000 feet of Mather Airport.

2.2 Master Plan Components

The Master Plan establishes a framework and strategy for all future land use within the plan area, including general land use and development standards, policies, land use allocations, infrastructure, and public service planning (Madrone 2018). The major components of the Master Plan include development of residential, commercial, industrial, employment facilities, parks, schools and farming areas. Within the Master Plan, two District Area Plans are established: District 1 and District 2. These District Area Plans establish land uses, along with policies and development standards, for the properties within their boundaries. The District Area Plans were defined in the biological report for the WJHMP (Madrone 2018) but are not addressed further in this WHA.

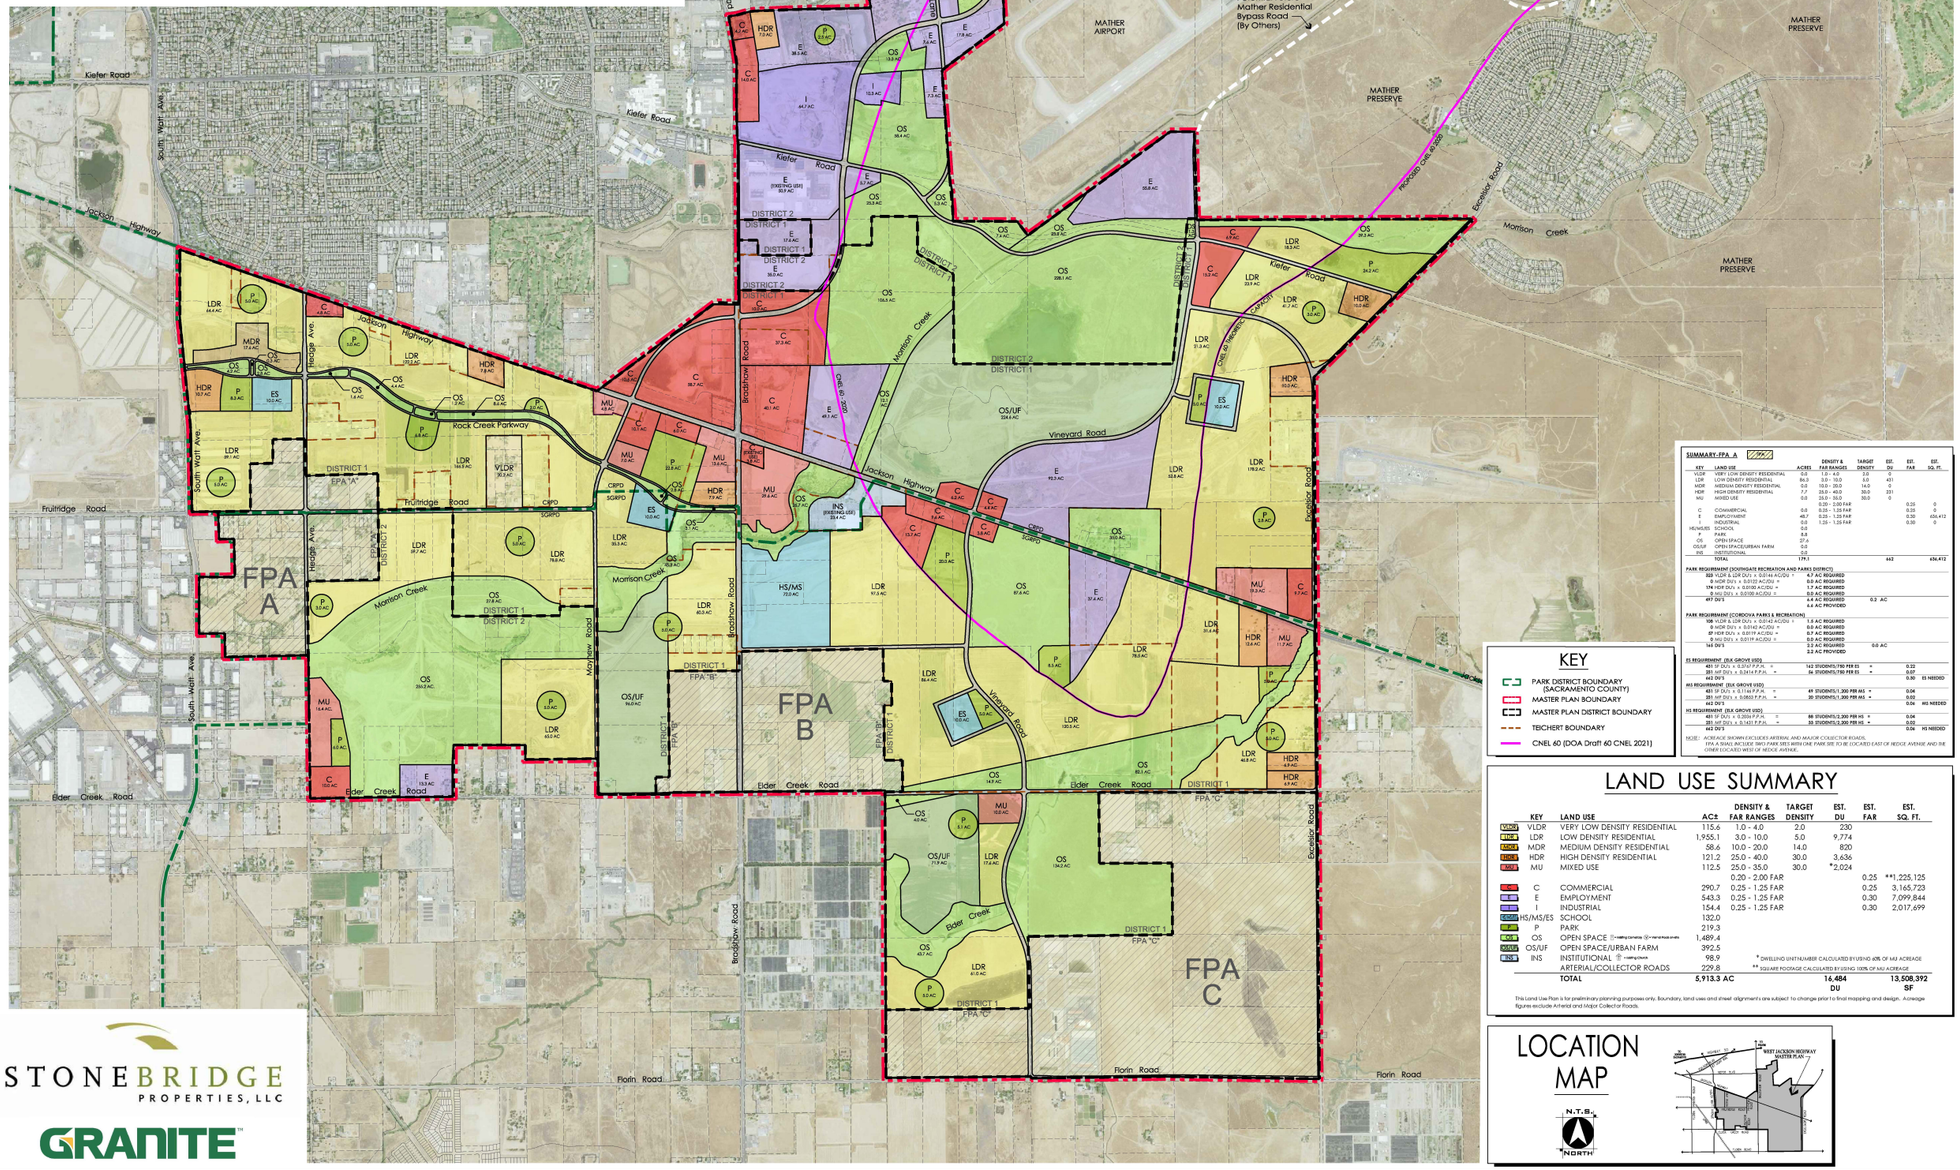
The Master Plan includes a variety of land uses, including residential areas at various densities, commercial, employment and industrial development, urban (mixed) farming, parks, schools, and flood management facilities (Figure 2-3).

3.0 REGULATORY CONTEXT

The County of Sacramento is the lead agency implementing the provisions of the California Environmental Quality Act (CEQA) to evaluate the impacts associated with implementation of the Master Plan. Concurrent with the CEQA process, the County Department of Planning and Environmental Review has required that the project applicants prepare a Wildlife Hazard Assessment to analyze bird-airstrike collision hazard change under the WJHMP buildout in accordance with current FAA guidelines.

3.1 Federal Aviation Administration Guidelines Overview and Summary

FAA provides guidance on certain land uses that have the potential to attract hazardous wildlife on or near public-use airports. FAA also requires airports that receive Federal grant-in-aid assistance, such as Mather Airport, to utilize these guidelines for projects within their boundaries. Moreover, it recommends that land-use planners and project developers use the FAA's guidance for privately owned or initiated projects on or near airports.



The FAA released its up-to-date guidance in the 2020 Advisory Circular (AC) 150/5200-33C, replacing the 2007 AC. This WHA was prepared in accordance with the 2020 FAA AC 150/5200-33C (referred to hereafter as "FAA Guidelines"). A summary of the substantive and relevant components of the FAA Guidelines is provided below.

The FAA issued Advisory Circular 150/5200-33C to provide guidance on certain land uses that have potential to attract hazardous wildlife on or near airports. The updated AC was issued on February 21, 2020, replacing AC 150/5200-33B (FAA 2007). This section of the WHA broadly summarizes the guidance in the AC that is relevant to the WJHMP. Section numbers used in the Circular are preceded by the letters "AC" and shown in italics to clarify their source as the AC.

Figure 2-3. Proposed Land Uses Under the West Jackson Highway Master Plan

2022-228 West Jackson Highway Master Plan

3.1.1 Purpose

The AC provides guidance on land uses that have potential to attract hazardous wildlife on or near public-use airports.

3.1.2 Applicability

While the AC is non-regulatory and thus not mandatory, the FAA recommends that airports that have received Federal grant assistance funding, are funded by the Passenger Facility Charge program, or are certified under Title 14 of the Code of Federal Regulations use these guidelines. FAA also recommends that the guidance be used by land-use planners and project developers with projects on or near public-use airports.

3.1.3 Background

This section includes an overview of the risks posed to aircraft by wildlife species, highlighting that species differ in their relative hazards. A ranking of the hazards posed by various wildlife species commonly involved in damaging strikes with aircraft in the U.S. was previously included but has been moved to AC 150/5200-32 (FAA 2013). It also notes that the AC provides guidance needed "to assess and address potentially hazardous wildlife attractants when locating new facilities and implementing certain land use practices on or near public-use airports."

3.1.3.1 AC Section 1. General Separation Criteria for Hazardous Wildlife Attractant on or Near Airports.

The AC states "When considering proposed land uses, operators and sponsors of airports certificated under Part 139, local planners and development must consider whether the proposed land uses, including new development projects, will *increase* wildlife hazards (emphasis added). Land use practices that attract or sustain hazardous wildlife populations on or near airports…can significantly increase the potential for wildlife strikes."

This section introduces separation criteria between airports and "land-use practices that attract hazardous wildlife." The guidance notes that 78 percent of aircraft strikes occur at heights under 1,000 feet and 90 percent occur under 3,000 feet above ground level.

3.1.3.2 AC 1.3. Airports Serving Turbine-Powered Aircraft

For airports serving turbine-powered aircraft (such as Mather Airport), "FAA recommends a separation of 10,000 feet for wildlife attractants identified as hazardous".

3.1.3.3 AC 1.4. Protection of Approach, Departure, and Circling Airspace

The FAA "recommends a distance of 5 miles between the closest point of the airport's Aircraft Operations Area (AOA) and the hazardous wildlife attractant." Additionally, it states "Special attention should be given to hazardous wildlife attractants that could cause hazardous wildlife movement into or across the approach or departure airspace."

The AOA is defined as: "any area of an airport used or intended to be used for landing, takeoff, or surface maneuvering of aircraft. An air operations area includes such paved areas or unpaved areas that are used or intended to be used for the unobstructed movement of aircraft in addition to its associated runway, taxiways, or apron." Approach and departure airspace is defined in the AC as "the airspace, within 5 statute miles of an airport, through which aircraft move during landing or takeoff."

3.1.3.4 AC Section 2. Land-Use Practices on or near Airports that Potentially Attract Hazardous Wildlife

AC 2.1. General

This introduction notes that "wildlife species and size of populations attracted to the airport environment vary considerably depending on several factors including land-use practices on or near the airport."

AC 2.3 Water Management Facilities

This section notes that "storm water facilities…associated retention and settling ponds...and ponds that result from mining activities often attract large numbers of potentially hazardous wildlife." It further states, "Development of new open water facilities within the separation criteria...should be avoided to prevent wildlife attractants. If necessary, land-use developers and airport operators may need to develop management plans, in compliance with local and state regulations, to support the operation of storm water management facilities on or near all public-use airports to ensure a safe airport environment." Also, the FAA recommends these plans be developed in consultation with a Qualified Airport Wildlife Biologist to minimize hazardous wildlife attractants.".

AC 2.3.2 New Storm Water Management Facilities

The FAA "recommends that storm water management systems located within the separations identified" (i.e., anywhere within 10,000 ft or within 5 miles of areas within approach and departure airspace) "be designed and operated so as not to create above-ground standing water. Stormwater detention ponds should be designed, engineered, constructed, and maintained for a maximum 48–hour detention period after the design storm and remain completely dry between storms".

The guideline also recommends "the use of steep-sided, riprap or concrete lined, narrow, linearly shaped water detention basins," and note that physical barriers, such as bird balls, wires grids, pillows, or netting should be used within ponds located on Airport properties to prevent access of hazardous wildlife to open water. Also, this section notes "All vegetation in or around detention basins that provide food or cover for hazardous wildlife should be eliminated. If soil conditions and other requirements allow, the FAA encourages the use of underground storm water infiltration systems because they are less attractive to wildlife."

In summary, section 2.3.2 recommends that off-airport storm water facilities located within takeoff and approach zones and less than 5 miles from an airport facility, be capable of being drained within 48-hours, and recommends use of steep-sided riprap lined, narrow ponds within this distance. It does not specifically recommend use of physical barriers for offsite ponds or other facilities.

AC 2.4.1 Existing Wetlands on or near Airport Property

The guidelines state "if wetlands are located on or near airport property, airport operators should be alert to any wildlife use or habitat changes in these areas that could affect safe aircraft operations."

AC 2.6 Agricultural Activities

While this section applies mainly to airport property, the guidelines assert "many agricultural crops can attract hazardous wildlife and should not be planted within the 10,000 ft and 5 mi of areas within approach and departure airspace) … corn, wheat, and other small grains in particular should be avoided".

AC 2.8.3 Structures

The guidelines assert "certain structures attract birds for loafing and nesting. Flat rooftops can be attractive to many species of gulls for nesting, hangars provide roosting / nesting opportunities for rock doves, towers, light posts and navigation aids can provide loafing / hunting perches for raptors and aircraft can provide loafing / nesting sites for European starlings, blackbirds and other species."

AC 2.8.4 Other Wildlife Attractants

This section acknowledges that there are other land uses or activities not addressed within the AC that may have the potential to attract hazardous wildlife.

AC 2.10. Synergistic Effects of Surrounding Land Uses

This section identifies potential synergistic effects as two or more land uses that together may pose additional hazards, such as by creating a flight corridor between bird feeding and resting areas and encourages evaluation of these effects.

AC 4.3. Other Land-Use Practice Changes

AC 4.3.4. Airports that have Received Federal Assistance.

"Airports that have received federal assistance are required by their grant assurances to take appropriate actions to restrict the use of land next to or near the airport to uses that are compatible with normal airport operations." The FAA recommends that airport operators to the extent practicable oppose off-airport land-use changes or practices within the 10,000-ft or 5-mile separations zones that may attract hazardous wildlife"; and that "failure to do so may lead to noncompliance with applicable grant assurances".

4.0 METHODS

This WHA was conducted by Wildlife Biologists Angela Haas and Daniel Airola (see Appendix A for preparers' relevant qualifications), in consultation with SCDA Wildlife Biologist David Jernigan, and other Airport personnel. The assessment evaluated existing and post-project bird–aircraft collision hazard level within the Master Plan area based on four major analyses:

- Changes in land cover between existing and post-project conditions, and the effects on the occurrence and abundance of potentially hazardous bird species;
- Comparison of the effects of stormwater flooding conditions between existing and post-project conditions under 2-year and 10-year storm event scenarios and the effects on use by potentially hazardous bird species;
- Patterns of aircraft flights over various portions of the Master Plan area, including frequency and heights of flights, the flight height of potentially hazardous birds, and the resulting potential for bird-aircraft collisions; and
- Potential synergistic effects of land-use changes that would occur under the Master Plan on the movements of birds between feeding, roosting, and nesting sites that may cross aircraft flightpaths.

These analyses were conducted separately to characterize the bird-aircraft hazards that occur within the Master Plan area under existing and post-project conditions. The results of these analyses were then integrated into an overall evaluation of changes from existing to post-project conditions to determine if the project would result in a net change in bird-aircraft collision hazard. Measures to reduce hazards were identified for areas where hazards were predicted to increase.

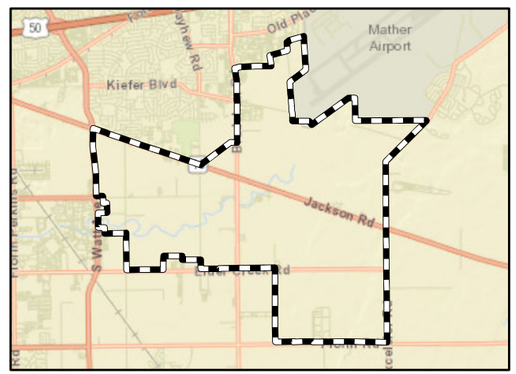
Details of each of these analyses are presented in the following sections.

4.1 Characterizing Regional Habitat Conditions

4.1.1 Regional Habitat Conditions

Regional habitat conditions were evaluated qualitatively using aerial images from Google Earth, and from WHA biologists' knowledge of the region from many years of field work and bird surveys and studies conducted in the area (see Appendix A for details). Additionally, the regional abundance of wetland habitats within the 10,000-foot and five-mile zones around Mather Airport were estimated using data from South Sacramento County Habitat Conservation Plan wetlands dataset (Sacramento County 2007) and the National Wetlands Inventory (U. S. Fish and Wildlife Service 2018). This information was used to provide a regional context for the Master Plan area and assist in evaluating potential synergistic effects.

4.1.2 Establishing Analysis Areas within the Master Plan Area



A set of 17 analysis areas were established within the Master Plan area (Figure 4-1) to provide meaningful "units" for describing the results of the analysis and to provide recommendations for mitigation actions based on anticipated implementation of the Master Plan. The analysis areas were used to display more localized differences in land use, use by potentially hazardous birds, aircraft flight frequency and heights, and resulting bird-aircraft hazards under existing and post-project conditions. The analysis area names were based on the names currently used by Teichert and Granite (Figure 4-1) but the analysis areas were expanded (indicated by the addition of a + sign in the name) to incorporate adjacent non-participating land ownerships.

Figure 4-1.
Analysis areas used in evaluating wildlife hazards for the WJHMP area.

4.1.3 Existing Habitat Conditions within the Master Plan Area

Existing habitat conditions within the Master Plan area were characterized using the following information sources:

- The long-term experience of WHA biologists working in the project area and similar areas in the surrounding region;
- A site reconnaissance field visit to all portions of the Master Plan area conducted November 18, 2022;
- The report, "Biological Resources Assessment for the West Jackson Highway Master Plan" (Madrone 2018), including current land uses, habitat designations, and wetlands and other mapped water features;
- Previous wildlife hazards assessments on bird-aircraft collision risk conducted in proximity to Mather Airport (Airola 2007a, b; Airola and Gibson & Skordal 2009; Airola and Lichtwardt 2014);
- Modeling of the extent of flooding within the Master Plan area during and following 2- and 10-yr storm events (Wood Rogers 2022; 2023); and
- General information on habitats within the South Sacramento County Habitat Conservation Plan (Sacramento County 2007).

Eleven land cover types that were considered biologically meaningful in characterizing bird use were identified to evaluate use under existing and post-project conditions. Land cover categories and their existing distributions within the Master Plan area were derived from the 25 land covers mapped by Madrone (2018; Table 4-1) and from the Master Plan land use categories (Figure 2-3; Table 4-2). Overall, eight land covers were present in both the existing and Master Plan (i.e., post-Project) conditions, three types (cultivated agriculture, mining areas, and drying beds) occurred only in existing condition, and three other types (residential, schools/parks, and urban farm) were unique to the Master Plan condition. (A small amount of rural residential use is included within the Commercial/Industrial designation.)

Table 4-1. Land Cover Types and Acreages Used in the Wildlife Hazard Analysis to Describe Existing Conditions for the West Jackson Highway Master Plan, with Constituent Land Cover Types as Designated by Madrone (2018)

WHA Land Cover Types	Area (acres)	Constituent Madrone Land Cover Types	Area (acres)

Notes: [a]ECORP included this acreage of older mining areas as restored annual grassland, based on examination of conditions in the field and on aerial imagery. Madrone (2018) quantified it as acreage of active mining in their report in one area but also showed it as restored annual grassland elsewhere.
[b]ECORP judged this acreage to be the area of active mining, based on highly disturbed conditions and lack of vegetation.
WHA = Wildlife Hazard Assessment

Table 4-2. Land Cover Types Assigned to Master Plan Land Use Categories for the Wildlife Hazard Analysis

WHA Land Cover Types	Area (acres)	Constituent Master Plan Land Uses
Annual Grassland/Seasonal Wetland	1,093	Open Space - areas containing natural and restored annual grasslands and seasonal wetlands
Channel/Ditch	39	Open Space - Constructed channels and adjacent wetlands, stream channels and ditches
Pond/Emergent Marsh	72	Open Space - areas with these land covers
Riparian Woodland	75	Open Space - areas with Riparian Woodland

Commercial and Industrial	1,095	Employment, Industrial, Institutional, Commercial
Schools/Parks	282	School, Park
Urban Farm	393	Open Space/Urban Farm

Notes: WHA = Wildlife Hazard Assessment

4.2 Identifying Potential Hazardous Bird Species

A list of bird species with the potential to occur within the Master Plan area was created using the following resources:

- A site reconnaissance field visit, the authors' studies in the region (Airola 2007a, b; 2011; Airola et al. 2021; Airola and Gibson & Skordal 2009; Airola and Lichwardt 2014; Airola 2019; Haas et al. 2020) and their personal knowledge of bird species occurrences and habitat associations in the region;
- California Natural Diversity Database review of species occurrences (Madrone 2018);
- eBird occurrences (ebird.org);
- References on birds in the Sacramento region, including the Sacramento Breeding Bird Atlas (Pandolfino et al. 2021) and articles published in the local ornithological journal *Central Valley Bird Club Bulletin/Central Valley Birds;* and
- Cornell University's Birds of the World accounts (https://birdsoftheworld.org/bow/home).

This list of potential species was organized into a smaller subset of species groups (i.e., ducks, gulls, crows and magpies) based on similarity of species behavior and ecology for the hazard analysis.

Characteristics used to identify potentially hazardous species/groups for detailed analysis of collision hazards resulting from the Master Plan implementation included likelihood to occur within the Master Plan area (based on habitat conditions and habitat use characteristics), body size (average species' mass from Sibley 2014), and likelihood to fly at higher (> 500 ft) altitudes. Behavioral ecology, including the

propensity of species to fly in flocks, also was considered. Selection of hazardous species/groups incorporated the FAA's (2013) findings that, the bird species groups with the most damaging strikes nationwide are waterfowl, gulls, and raptors and that FAA noted a strong correlation (R^2 = 0.81) between mean body mass and the likelihood of a strike causing damage to aircraft (Dolbeer et al. 2022).

In addition, this analysis considered the relative hazard score assigned to species/groups by the FAA in their composite ranking table (FAA 2013) and the frequency of reported collisions by aircraft using Mather Airport (http://wildlife.faa.gov/database.aspx). Using these factors, we assigned a qualitative hazard ranking to each species/group to determine which species should be included in the analysis, and which could be reasonably excluded due to lack of meaningful hazard. In general, species with small body size (< 150 grams [g]) and that spent most of their time at or near ground level were excluded (Appendix B).

4.3 Evaluating the Effects of Changes in Land Use under the Master Plan on the Abundance of Potentially Hazardous Bird Species

4.3.1 Overview of the Process Used to Evaluate and Compare Bird Use

Levels of use of the Master Plan area by potentially hazardous species, and comparison of species use under existing and post-project conditions were quantified using a modified version of the U. S. Fish and Wildlife Service's Habitat Evaluation Procedures program (U.S. Fish and Wildlife Service 1980). This methodology creates an index of species use and abundance ("habitat units") within various land covers (i.e., habitats) based on the quality and quantity of habitat present. Habitat units were calculated for each species/group based on the various amounts of land covers present under existing and post-project conditions.

4.3.2 Land Cover Suitability for Hazardous Bird Species

The hazard analysis method defines the suitability of each land cover types for each potentially hazardous species or group (i.e., habitat suitability index) on a scale of 0.0-1.0, as follows:

- 1.0 = high,
- 0.8 = high-moderate,
- 0.6 = moderate,
- 0.4 = moderate-low,
- 0.2 =low,
- 0.0 = absent.

The suitability ratings of the 11 different land covers were assigned for each species based on our knowledge of species-habitat relationships and previously cited sources (see Section 4.2).

4.3.3 Characterizing Habitat Values of WHA Analysis Areas and the Existing and Master Plan Scenarios

The land cover suitability ratings assigned to each land cover for each potentially hazardous species were multiplied by the acreage of each land cover type and then summed across land covers to generate a total habitat unit value for each species under both existing and post-project conditions. Habitat unit values were generated for each of the 17 WHA analysis areas to identify where various species would be expected to be most and least abundant. These totals were compared to determine the extent to which the Master Plan build-out would result in a net increase or decrease in habitat value, and thus abundance, for each species.

4.4 Evaluating Effects of Changes in Stormwater Flooding Regime on Bird-Aircraft Collision Hazard

Seasonally flooded land has the potential to attract certain birds in large numbers. Attracted species include a wide variety of waterbirds, including waterfowl (swans, geese, ducks), wading birds (herons, egrets), shorebirds (plovers, sandpipers), and other species. The degree of attraction of flooded areas to various species depends on the size and configuration of resulting water bodies, as well as their water depths and the underlying substrates. Vegetated areas, for example, are more attractive than unvegetated areas when they flood, because they provide vegetative (e.g., seed and fruit) and invertebrate foods, and sometimes fish, that certain species desire.

The degree of bird-aircraft hazards posed by flooding also depends on the duration of flooding. Shorter flood durations pose less risk than longer duration flood events. The size of flood events can also affect bird attraction. The sizes of floods are generally characterized by their frequencies. A 2-year flood (one that occurs on average every two years) is regular but not extensive. As the flood recurrence rate increases, the extent of flooding also increases. Bird responses to floods vary with intensity. Frequent low intensity floods tend to routinely attract birds from the immediate area. Floods of intermediate duration may attract larger numbers of birds, especially if the flood waters are not managed (i.e., evacuated). Very large flood events tend not to attract large numbers of birds to any one area simply because the water bird populations have so many options as to where they can go to forage or roost.

Our evaluation of flood effects on bird-aircraft collision risk used the modeled flooding conditions 48 hours after the 2-year and 10-year storm event as depicted by Wood Rodgers (2022, 2023). The flood hazard analysis evaluated resulting collision hazards posed by flooding primarily by considering the extent and duration of flooding, the factors that have the largest impact on potential waterbird use. Flood related collision risks were assessed qualitatively based on these factors for the existing and Master Plan conditions to determine if risks were likely to increase, stay the same, or decrease under the WJHMP.

4.5 Analyzing Aircraft and Bird Flight Heights and Resulting Potential for Collisions

In addition to the effects of land cover and flooding characteristics that may affect bird abundance and habitat use in the Master Plan area, the heights of aircraft flights and the flight heights of birds strongly influence the potential for collisions.

4.5.1 Aircraft Flight Characteristics over the Master Plan Area

SCDA maintains extensive records of aircraft flight paths and elevations because of high public concern about aircraft noise and public safety. SCDA provided a record of aircraft departure and arrival frequencies, locations, and heights over the Master Plan Area and surrounding areas during November 15-December 15, 2022, which we requested as representative of the pattern of flights using Mather Airport. This period was chosen for this WHA because it is a busy (i.e., high cargo) flight season for the airport that coincides with a period when flooded conditions and wintering waterbird species regularly occur.

Aircraft flight path data was used to summarize and display the frequency and altitude of flights over each of the 17 WHA analysis areas. Flight frequency was represented by points along each aircraft's flight path representing its location at 5-second intervals. The flight path points were then portrayed as the number of minutes per month of total flight time spent within several biologically meaningful flight height classes: 0-20 ft; 20-100 ft; 100-500 ft; 500-1,500 ft. (No flights from Mather Airport occurred at >1,500 ft over the Master Plan area.)

4.5.2 Bird Flight Heights

Little readily available systematic information exists on the frequency with which birds fly at different heights. Therefore, species biology and observation experience were used to assign relative frequencies of flights within the five designated altitude classes to potentially hazardous species. Because aircraft were never recorded flying at heights below 100 ft over the Master Plan Area (see Section 8.1), many species, mostly smaller passerines, were excluded initially as unlikely to fly above that height on a regular basis (see Appendix B). Species identified as potentially hazardous were evaluated based on their relative abundance and flight heights in relation to the frequency of aircraft flights at various heights to determine a generalized level of collision risk. We also considered the relationship between the land cover type and flooding condition and the species presence at a certain height, recognizing that as flight heights increase a species occurrence is less likely affected by land cover conditions below (i.e., because they have left from, and are going to, somewhere else).

4.5.3 Bird-Aircraft Collision Ratings and Records

Factors that affect the "hazard level" of a species include typical flight height and body mass. Most bird-airstrike collisions occur at less than 500 ft, and body mass is correlated with both the frequency of collisions and the likelihood of resulting damage to aircraft (Dolbeer et al. 2022). The FAA provides hazard level ratings for bird species based on the frequency of reported aircraft collisions. The rating is based on national data, so is affected by the overall abundance and geographic range of species (i.e., all else equal,

widespread and more abundant species are more likely to be struck than less common or more localized species). As a result, some species that occur in the Master Plan area are rated by the FAA (2013), but others that may have potential for collisions near Mather Airport are unrated (see Table 5-1 and Appendix B). We considered the FAA ratings for species when available, and applied ratings for some species to others that were unrated that we judged to have similar potential for collisions based on biological factors. For example, the FAA provided a rating for Red-tailed Hawk but not for Swainson's Hawk, so we considered the rating for Red-tailed Hawk to roughly apply to the Swainson's Hawk because of their generally similar life histories. We also considered records of local aircraft collisions in assigning collision risks to species within the Master Plan area. Bird airstrikes are an ongoing phenomenon at Mather Airport, and the County has reported systematic information on individual bird airstrikes at Mather for many years to the FAA's bird airstrike database (http://wildlife.faa.gov/database.aspx). We used the data from the period of 2012 to 2022 as a local data source to characterize bird-aircraft collision risk. The data had rather substantial limitations (discussed in detail in Section 8.2) and were therefore only used qualitatively in the analysis.

Notwithstanding the limitations in interpreting and applying FAA ratings and Mather collision reports, both provided information useful in identifying potentially hazardous species and in subjectively evaluating hazards.

4.5.4 Analysis of Net Change Bird-Aircraft Collision Hazards

Analyses of the changes in potential risks of bird-aircraft collisions were conducted for potentially hazardous species based on existing and post-project habitat conditions and resulting bird populations, in combination with information on aircraft flight heights and past information on bird-aircraft collisions in the area. These evaluations included assessment of the potential for collisions by birds with aircraft above the Master Plan area as a result of synergistic effects.

Existing bird hazard conditions were characterized partly based on the relative abundance of species at the project site. Relative abundance was scaled (from high to low) relative to the highest abundance of each species in local habitats and geographic areas. Species relative abundances in land cover types then became the basis for identifying changes in abundances of hazardous bird species under the conditions of proposed project.

To assess the net effects of the project, relative abundances of potential hazardous bird species were compared under the pre- and post-project conditions to identify those for which population levels were likely to increase. These species were then evaluated for their potential to pose a collision hazard to aircraft flying at known heights above the Master Plan area, to determine if the project would pose any net increase in aircraft collision hazard. Those species predicted by land cover modeling to increase under the proposed master plan, were evaluated in more detail to assess hazards, based on abundance, timing of occurrence, flight heights during various seasons, daily and seasonal movement patterns, and specific habitat use patterns.

4.6 Synergistic Effects

Synergistic effects are defined as those hazards created as a result of project conditions, in combination with other offsite conditions (FAA 2020). The relationship between post-project conditions within the Master Plan area and existing regional conditions were evaluated to determine if they could encourage bird flights to and from the site within the potential flight path and altitude of aircraft, and therefore result in increased hazard of airstrikes. Potential synergistic effects include the creation of nesting or roosting habitat that would attract birds that forage on offsite lands or the creation of foraging habitat onsite that would attract birds that roost or nest offsite. Positions of onsite and offsite habitat locations relative to one another were also considered to determine whether a bird theoretical flightpath would cross the Study AreaMaster Plan areaht and location that introduces a hazard.

5.0 IDENTIFICATION OF POTENTIALLY HAZARDOUS SPECIES AND THEIR LAND COVER SUITABILITIES

5.1 Potentially Hazardous Species

A total of 44 species and species groups were considered for inclusion in the analysis based on the potential species list generated per Section 4.2. For each species/group, a combination of body size, FAA relative hazard score (if available), and other relevant aspects of ecology and behavior were used to determine whether they would be analyzed as potentially hazardous (see Section 4.2 for further details). This process resulted in 14 species/groups identified as potentially hazardous to aircraft that are included for further analysis within this WHA (Table 5-1).

Table 5-1. Size and FAA Hazard Scores for Species Identified as Potentially Hazardous for West Jackson Highway Master Plan Wildlife Hazard Analysis

Species/Group	Body Size (g)[a]	Size Reference Species	FAA Relative Hazard Score	Hazard Score Reference Species	Flies in Flocks?	Notes
Mute Swan	10,000	–	NR	–	–	Large, non-native and increasing though control may prevent further increase
Canada Goose	4,500	–	57	–	Yes	Commutes between turf (to feed) and water bodies (resting)
Ducks	1,100	Mallard	27	Mallard	Yes	–
Rock Pigeon and Eurasian Collared Dove	270/200	–	14	Rock Pigeon	Yes	Collared Dove more sedentary and rural
Gulls	520	Ring-billed Gull	11	Ring-billed Gull	Yes	Mostly associated with rivers, lakes, and landfills.
Herons and Egrets	2,900/870	Great Blue Heron and Great Egret	26/17	Great Blue Heron and Great Egret	–	Nest mainly in riparian trees, foraging in wetlands and grassland
Turkey Vulture	1,830	–	63	–	Yes	Soars high during migration. Roosts in large trees, sometimes in urban parks.
Bald Eagle	4,325	–	48	–	–	Mostly forages at large water bodies, infrequently in open grasslands
Northern Harrier, White-tailed Kite	420/340	–	3	Northern Harrier	Yes	Kites form winter roosts, usually in winter areas
Red-shouldered Hawk, Cooper's Hawk,	630/450	–	NR	–	–	Hawk often soars high during spring courtship/territorial displays
Swainson's Hawk	855	–	NR	–	–	Nests in woodland, occasionally older residential areas. Forages in alfalfa, and other crops, less often in grassland
Red-tailed Hawk	1,080	–	19	–	–	Some high flight during courtship
Great Horned Owl and Barn Owl	1,400/460	–	14/5	Great Horned Owl	–	Neither species fly high
American Crow, Yellow-billed Magpie	450/155	–	11	American Crow	Yes	Crow is more abundant. Roosts in highly urbanized areas, forages in agricultural fields. Magpie associated with flowing water and turf or grazed grassland

Notes: [a]Bird masses from Sibley (2014). g = grams, NR = Not rated by FAA.

6.0 EFFECTS OF LAND COVER CHANGES ON BIRD-AIRCRAFT HAZARDS

This section describes and compares the land cover conditions and resulting levels of use under existing conditions and under the Master Plan.

6.1 Land Cover Conditions and Changes under the Master Plan

6.1.1 Land Cover in Existing Master Plan area

The Master Plan area is 10 to 70 feet above mean sea level. Jackson Road/Highway 16 is the major roadway that runs approximately east to west through the Study AreaMaster Plan areaominant land uses have been aggregate mining and agriculture.

Existing land cover conditions are quantified in Table 6-1 and shown in Figure 6-1 by WHA analysis area. The major land uses under existing conditions include:

- Disturbed aggregate mining areas, industrial yards and ponds, and drying beds;
- Developed lands including commercial, rural residential, and industrial uses and associated infrastructure;
- Constructed/restored lands including restored riparian woodlands and associated wetland features, annual grasslands with vernal pools and other wetlands and agricultural lands; and
- Undeveloped lands consisting of annual grasslands interspersed with vernal pools and other seasonal wetlands, channels, creeks and riparian woodland corridors, croplands including wheat and hay, and irrigated pastures for cattle grazing (Madrone 2018). Irrigated areas are managed intensively through periodic cultivation, irrigation, hay harvest, and livestock use.

6.1.2 Land Cover Conditions under the Master Plan

Under the Master Plan, much of the Master Plan area would be consist of residential and commercial uses (Figure 6-2, Table 6-2). Major changes to habitat on the Master Plan area that would affect bird populations include creation of substantial areas of commercial/industrial, residential, and parks and schools land covers.

Land cover under the Master Plan would change markedly, with conversion of all mining (708 ac), drying bed (153 ac), and cultivated agricultural (128 ac) land covers, and substantial amounts of grassland/seasonal wetland (1,614 ac) and pond/emergent (272 ac) converted to developed residential, commercial/industrial, urban farm, and parks/schools land uses (Table 6-3).

6.2 Changes in Use Levels by Bird Species in Response to Land Cover Changes

Uses levels (in habitat units) for potentially hazardous species and groups within Master Plan area analysis areas under existing conditions are presented in Table 6-4. Species use levels under the Master Plan are shown in Table 6-5.

Table 6-1. Area of Various Land Covers Under Existing Conditions within Analysis Areas for the West Jackson Highway Master Plan Wildlife Hazard Analysis

Changes in use levels by species between existing conditions and conditions under the Master Plan are shown in Table 6-6. The results show that habitat values and resulting use is expected to decline under the Master Plan for 11 (79 percent) of the 14 potentially hazardous species and species groups. Species declines are consistent with the declines in amounts of the habitats that they prefer. All wetland and grassland-associated species would decline, including waterfowl (swans, geese, and ducks), other water birds (herons and egrets, gulls), and raptors (eagles, hawks, owls). The declines in habitat values for these species and groups are substantial, ranging from 20-58 percent.

Use by three potentially hazardous species groups is anticipated to increase following implementation of the Master Plan: Rock Pigeon and Eurasian Collared Dove, Cooper's and Red-shouldered Hawks, and American Crow and Yellow-billed Magpie. Except for the collared-dove, which tends to occur primarily around rural residential compounds, these species occur in residential and/or commercial development areas, so the increase in these land covers could result in population increases and resulting increased potential for aircraft collision hazards. We discuss these species' habitat uses in more detail to refine the evaluation of hazards and suggest opportunities to reduce such risks through mitigation.

6.2.1 Rock Pigeon and Eurasian Collared Dove

The Eurasian Collared-Dove is a non-native species that arrived in the early 2000s. It is generally found in rural residential farmsteads and low-density residential areas and not in denser residential and commercial areas (Pandolfino 2020a, Pandolfino et al. 2021). In contrast, the Rock Pigeon tends to mostly favor densely developed areas, although they also are found in rural areas, where they often use barns. Pigeons also often fly long distances to feed in grasslands and agricultural fields (see Section 9, Synergistic Effects). Because of their messy habits, pigeons can be, and often are, controlled through architectural designs that do not create nesting and roosting niches and by discouraging human feeding of pigeons in urban areas and parks.

6.2.2 Cooper's and Red-shouldered Hawks

These species occupy lower-density older urban forests, as well as oak and riparian habitats in the Sacramento Region (Pandolfino et al. 2021). Red-shouldered Hawks often prey on non-native squirrels in urban parks. Cooper's Hawks feed more on small and mid-sized birds, including species attracted to bird feeders. Both species tend to stay low, from beneath the tree canopy or slightly above, except in late winter and spring when they soar higher to display territoriality and attract mates. The tendency to use older forest indicates that these species likely will not occupy newly created urban forests in residential areas until at least 15-20 years after trees are established (Airola 2019).

6.2.3 Yellow-billed Magpie and American Crow

The crow and magpie both occupy urban forest areas and urban parks and schools with turf. The magpie has declined substantially since the mid-2000s as a result of the arrival of West Nile virus and, unlike some other affected species, has not recovered (Pandolfino 2020b). Remnant populations in urban Sacramento, which are concentrated around larger parks with substantial amounts (>10 ac) of irrigated turf, appear to be stable and healthy (Airola et al. 2021).

[b] Declines in use levels are color-coded in blue; increases are color-coded in pink.
+ = additional non-participant lands are included in the area.

The species nests in loose colonies in tall trees mainly in parks adjacent to streams or rivers and turf areas, but may use lower density residential areas where lot sizes are >0.5 ac. They generally fly short distances between feeding and nesting areas just above the height of the tree canopy.

Crows also breed and forage within residential areas, parks, and near schools. During the breeding season, they nest in mid-size to large trees. They forage close to nesting areas and fly mainly from below to just above tree canopy height. In the non-breeding season, however, they form large groups that commute daily at greater heights between urban roost areas and rural foraging areas in grassland and agricultural lands (see discussion under Section 9. Synergistic Effects).

7.0 EFFECTS OF CHANGES IN FLOOD MANAGEMENT ON BIRD USE AND COLLISION HAZARD

7.1 Flood Conditions and Changes under the Master Plan

7.1.1 Wetland Conditions under Existing Conditions

The Master Plan area includes a total of 238 acres of wetlands and other water features (Figure 2-2, Table 4-1). Existing wetland and other features were characterized in more detail by Madrone (2018) including, from highest to lowest existing acreages, vernal pools (natural and constructed), followed by channels, constructed channels and adjacent wetlands, seasonal wetlands, and seasonal wetland swales. Marshes, ditches, constructed depressions and constructed seasonal wetland swales, and ponds also occur (Figure 2-2). Notably, this characterization of wetlands and water bodies does not describe areas temporarily inundated under flood conditions, which is addressed in this Section.

Two other existing land covers that can result in surface water and are prominent in acreage are drying beds and industrial ponds, which occur as part of the aggregate mining operations but not recognized as jurisdictional wetlands. Drying beds are shallow basins used to dispose of sediment washed from aggregate that is delivered to the basins in slurry form in layers of approximately 12 inches (Madrone 2018). These drying beds are filled rotationally resulting in different states from shallow turbid ponds to mudflats or dry beds (Madrone 2018). Once dry, the slurry is turned by a tractor and compacted. This cover supports little biological activity due to its disturbed nature and high sediment concentration when flooded, and as a result is essentially unused by birds for foraging, although some roosting occurs there.

Twenty-one industrial ponds receive industrial wash water via pumps or flows from excavated drainage ditches (Madrone 2018). Teichert Aggregates conducts continual maintenance of the ponds and ditches, including the removal of vegetation (Madrone 2018). Irrigated areas are managed intensively through periodic cultivation, irrigation, hay harvest, and livestock use.

For purposes of the WHA, we combined vernal pools and associated seasonal wetlands with annual grassland into a single land cover type because these habitats comprise an interdigitated system.

7.1.2 Flooding under Existing Conditions and the Master Plan

Under existing conditions, 48 hours after the two-year storm event 944 acres would be flooded (Figure 7-1, Table 7-1). Under a 10-year event, flooding increases to 1031 acres with more acreage flooded in deeper water classes (Figure 7-2, Table 7-2). Under the Master Plan, flooding would decrease dramatically, by >80 percent under the 2-year and 10-year events (Figures 7-3 and 7-4) due to the construction of drainage improvements, detention facilities, and drainage pump stations (Wood Rodgers 2022, 2023) .

Table 7-1. Flooded Area (in acres) by Depth Class under 2-Year and 10-Year Storm Events under Existing Conditions and the West Jackson Highway Master Plan

Water Depth Class (feet)	2-Year Event			10-Year Event		
	Existing Condition	Master Plan	Percent Change	Existing Condition	Master Plan	Percent Change

>1-2	163	28	-83%	4	31	671%
>2-5	183	26	-86%	179	26	-85%
>5-10	30	1	-97%	206	1	-100%
>10	3	0	-100%	94	0	-100%
Total:	**944**	**157**	**-83%**	**1031**	**163**	**-84%**

7.2 Changes in Bird Use in Response to Flood Conditions

Only six of the potentially hazardous bird species/groups (Mute Swan, Canada Goose, ducks, gulls, and herons and egrets, and Bald Eagle) are expected to use flooded lands (Table 5-2). The substantial reduction in the amount and duration of flooding under the Master Plan, along with the conversion of non-flooded areas to land covers with lower value for these species shows clearly that the aircraft collision hazard associated with use of flooded lands would decline compared to existing conditions.

8.0 AIRCRAFT ACTIVITY, BIRD FLIGHT HEIGHTS, AND BIRD-AIRSTRIKE CHARACTERISTICS

8.1 Aircraft Flights over the Project Site

In total, aircraft associated with Mather Airport flew above the WJHMP Master Plan area during departures and arrival for a total of 27 flight hours (1,636 min) over the November 15 to December 15, 2022 reference period (Table 8-1). These data indicate that, on average, a plane is flying over the Master Plan area for 1:08 hours/day. Based on these data, no planes flew below 100 ft above the plan area, presumably because the end of the airport runway is about 1,800 ft from the closest boundary of the Master Plan area. Only 1 percent of flight time was spent between 100 and 500 ft, and roughly half of flights were at 500-1,500 ft over the plan area and the other half were above 1,500 ft.

Master Plan analysis areas adjacent to and in front of the Mather Airport runway that had the most flights at lower elevations were Aspen V+, Fairbairn-Machida, Aspen VI+ West, Granite 1, and Aspen V South+ (Figure 8-1). Of these areas, all of Machida and some of Fairbairn, Aspen V+ West, Granite 1, and Aspen South+ would be developed.

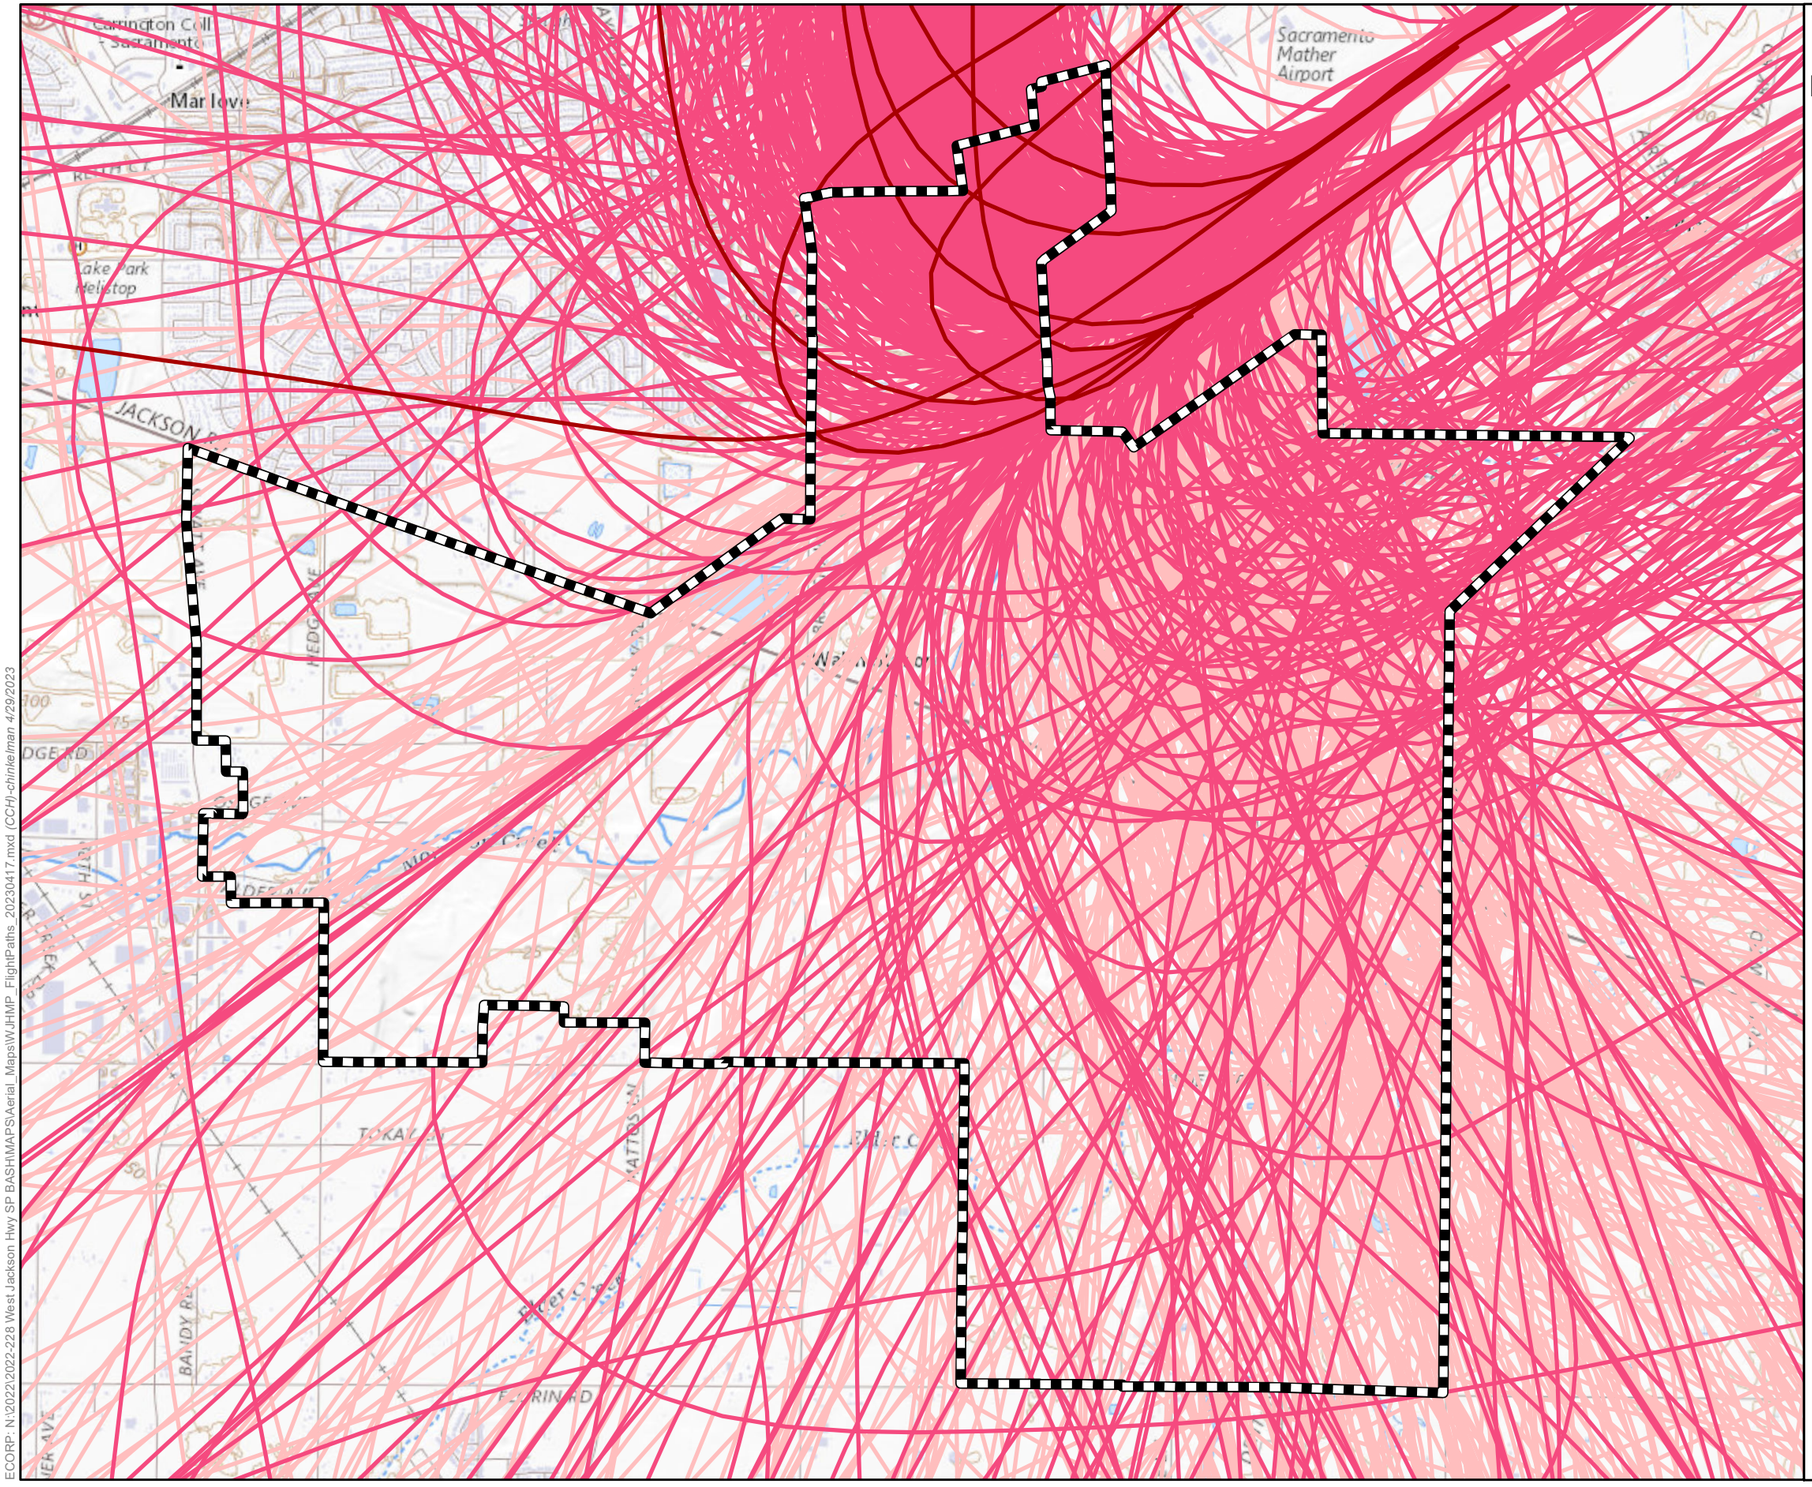

Figure 8-1.
Flight paths and heights from Mather Airport over the WJHMP area.

8.2 Mather Bird Airstrike Characteristics

The Mather collision database has several limitations for use in evaluating off-airport strike hazards. Most bird-aircraft collisions are known to occur at or near the ground during take-off and landing. For example, between 1990-2021, 71 percent of bird strikes occurred at or below 500 feet for both commercial transport and general aviation aircraft in the U.S. (Dolbeer et al. 2022). It is therefore likely that most of the reported collisions occurred at or immediately adjacent to the airport, and therefore the data are not

representative of collision risk over the Master Plan. Small sample sizes and imprecise identification of species involved in the collisions also hamper interpretation.

Characterization of patterns of bird strikes from data reported by Sacramento County Airports over 2012-2022 also are limited for several reasons. There is a relatively small sample size of 120 reports of bird strikes over an 11-year period (and average of 11 per year) and nearly one-third of the reported collisions are not identified to species (Table 8-2). Species identifications appear to have some inaccuracy, based on species reported that are not known to occur in the region (e.g., Gray-cheeked Thrush; Yellow-throated Warbler). Qualitative body sizes (small, medium, large) or birds involved in collisions are given, but without details on how these were determined and how much this varied based on who reported the strike.

In addition, only about half (62 out of 120) of the reports specify the height at which collisions occurred. Although most (but not all) reports include a description of where the strike occurred, many strike locations were deduced based on carcasses found on the ground during routine runway/taxiway inspections. The reports include species that were struck anywhere during flights by aircraft taking off from or landing at Mather Airport.

A total of 66,446 flights were reported to take off or land at Mather Airport during 2022. Therefore, collisions occurred during 0.017 percent (11/66,446) of flights. Only 72 birds involved in Mather-associated collisions were identified to species or species group. Species that typically spend most of their time on or just above the ground, including Horned Larks, sparrows, and the House Sparrow comprise 42 percent of collision reports, and many other primarily ground-foraging species (meadowlark, kestrel, thrush, Mourning Dove, and European Starling) comprise an additional 17 percent of collisions. Nearly one-third (32 percent) of collisions were reported to occur on the ground at Mather Airport, and an additional 25 percent occurred at heights below 100 ft.

Of 114 birds that Mather Airport personnel identified by size in collisions, 4 percent were large (>1,200 g; including one each of Snow Goose, Great Blue Heron, and Great Horned Owl and one identified species) and 20 percent were of medium size (500-1,200 g; gulls, hawks, owls). The remaining 76 percent were small (<500 g). All species that were involved in collisions that were identified as large and medium-sized by Mather Airport were included in this report as potentially hazardous species, except for the Snow Goose. Potentially hazardous species comprised 28 percent of reported collisions where species were identified (Table 8.2).

Table 8-2. Frequency of Reported Collisions by Bird Species with Aircraft Associated with Mather Airport, 2012-2022

Species[a,b]	Number of Reports	Percentage of Identified Species
Unidentified species	48	–
Horned Lark	17	24
Sparrows	11	15
Barn Owl	6	8
Western Meadowlark	6	8
Rock Pigeon	3	4
American Kestrel	3	4
Swallows	3	4
Great Blue Heron	2	3
White-tailed Kite	2	3
Swainson's Hawk	2	3
Hawk sp.	2	3
European Starling	2	3
House Sparrow	2	3
Great Horned Owl	1	1
Owl sp.	1	1
Red-tailed hawk	1	1
Red-shouldered Hawk	1	1
California Gull	1	1
Peregrine Falcon	1	1
Snow Goose	1	1
Mourning Dove	1	1
American Robin	1	1
Thrush Species	1	1
Western Sandpiper	1	1
Warbler sp.	1	1
Total	**120**	**–**

Notes: [a] Species in bold are treated as potentially hazardous species in this bird-airstrike hazard analysis.
[b] Underlined species are large (>1200 g).

8.3 Flight Heights of Potentially Hazardous Bird Species.

Relative frequencies of flights by potentially hazardous species in various height classes are shown in Table 8-3. All species spend the highest proportion of their time below 100 ft, a height at which no aircraft occur over the Master Plan area (Table 5.3-1). Use of areas within 100-500 ft, at which less than 1 percent of Mather Airport flight locations occur (Table 8-1), are used to a moderate extent by only about half of the species, mainly waterfowl, gulls, the Bald Eagle, buteo hawks, and crows, and at a low level by the other species. Bird use of areas at 500-1,500 ft, where nearly half of flights occur, was low or very low for all species. Heights above 1,500 ft, at which nearly half of flights occur, were considered unlikely to be used by half of the species and at a very low level by other species except the Turkey Vulture, where use at this height was rated as low.

Table 8-3. Relative Use of Various Height Classes by Potentially Hazard Bird Species for the West Jackson Highway Master Plan Wildlife Hazard Analysis

Species/Group	Flight Frequency at Various Heights (feet)				
	0-20	20-100	100-500	500-1,500	1,500-3,000
Mute Swan	High	Low	Low	Very Low	None
Canada Goose	High	High	Moderate	Low	Very Low
Ducks	High	High	Moderate	Low	Very Low
Rock Pigeon, Eurasian Collared Dove	High	High	Low	Very Low	None
Gulls	High	Moderate	Moderate	Low	Very low
Herons and Egrets	High	Moderate	Low	Very low	None
Turkey Vulture	High	High	Low	Low	Low
Bald Eagle	High	High	Moderate	Low	Very Low
White-tailed Kite, Northern Harrier	High	Moderate	Low	Very Low	None
Cooper's Hawk, Red-shouldered Hawk	High	High	Moderate	Very Low	None
Swainson's Hawk	High	High	Moderate	Low	Very Low
Red-tailed Hawk	High	High	Moderate	Low	Very Low
Great Horned Owl, Barn Owl	High	High	Low	Very Low	None
Yellow-billed Magpie, American Crow	High	High	Moderate	Low	None

Key to ratings:
High = Most of time spent at this height
Moderate = Regularly found at this height (i.e., daily)
Low = Infrequently found at this height
Very Low = Occurrence possible, but very rarely
None = Almost never expected to be seen at this height

8.4 Flight Height Hazard Analysis Conclusions

Interpreting the results of the aircraft collision and bird species flight height analyses is complicated by a lack of detailed collision reporting (see Section 8.2). However, several conclusions can be drawn. Nearly all aircraft flights associated with Mather Airport above the Master Plan area occur at heights above 500 ft, while most bird flight activity occurs below this height. Relatively few collisions (average of 9/yr) appear to occur with aircraft using Mather Field. Two-thirds of the species involved in collisions are small or medium sized (<150 g) and over half of the collision species forage on the ground and spend much of their time there. Thus, it is likely that many of the reported collisions occurred on or near Mather Airport where aircraft are flying close to the ground rather than over the Master Plan area or adjacent lands Also, as noted in the analyses of bird responses and to land use and flooding changes, most potentially hazardous species are likely to decline in abundance in the Master Plan area. Together, these factors suggest that collisions of avian species with aircraft above the Master Plan Area after plan buildout are likely to occur at low frequency and less often than under existing conditions.

9.0 SYNERGISTIC EFFECTS

Synergistic effects are defined by the FAA (2020) as hazards created as a result of project conditions, in combination with other offsite conditions (FAA Guideline 2.10, see Section 3.2). This section evaluates potential synergistic effects based on existing and post-project conditions created under the Master Plan in combination with surrounding lands, and how those changes could affect bird use patterns and potential bird-aircraft collision risk in and adjacent to the Master Plan area. Potential synergistic effects of project-related changes in land cover types or habitat elements (i.e., buildings, large trees, turf) could result in changes in attractiveness of the Master Plan area to birds that use surrounding lands. Birds using the site under post-project conditions also could be affected by future changes in external land uses, such that bird flights increase across aircraft flight paths. Synergistic effects are most likely to occur with species that travel between different breeding, roosting, and feeding sites, such as waterfowl, raptors, crows, and magpies.

9.1 Existing Regional Habitat Conditions

Regional habitat conditions and historical land-use provide a context for assessing the synergistic hazards associated with a project's land-use changes. Within a five-mile radius of the Mather Airport (i.e., the Airport Operations Area), major current land uses include:

- Mather Airport and airport development areas;
- Residential and commercial development and associated infrastructure;
- Major roadways including U.S. Route 50 to the north;
- Aggregate mining areas, industrial yards and ponds, and drying beds;
- The American River/American River Parkway and associated riparian areas, as well as other creeks and drainages and associated vegetation;

- Vernal pool grasslands and annual grasslands;
- Pastures irrigated for cattle grazing or hay production; and
- Agricultural fields and croplands.

The 5-mile area surrounding Mather Airport supports substantial areas of wetlands and other water features (Figure 2-2). These include channels and ditches; ponds and lakes; wetlands, swales and vernal pools; and riverine and riparian features (Figure 2-2).

9.2 Synergistic Effects

The potential for an increase in detrimental synergetic effects is based on evaluating species' uses of various land covers and other habitat elements for nesting, roosting, and foraging activities (Table 9-1). The assessment considered two factors that could result in movements among different land covers or habitats: the individual characteristics of the species (i.e., whether they move among different land covers for these activities) and whether the land covers that are used by these species increased or decreased under the Master Plan. Where changes in land uses in the Master Plan have the potential to create a synergistic concern, we then analyzed those effects by considering offsite conditions.

Table 9-1. Evaluation of Potentially Hazardous Species' Need for Consideration of Synergistic Effects, Based on Uses of Various Habitats for Nesting, Roosting, and Foraging

Species/Groups	Primary Habitats Used for Various Purposes			Synergy Components		Overall Synergy Concern Warranting Detailed Evaluation
	Nesting	Roosting	Foraging	Moves Regularly Between Different Habitats	Habitat Changes Under Master Plan (Table 6-6)	
Mute Swan	Ponds	Ponds	Ponds	No	Decrease	No
Canada Goose	Ponds	Ponds	Turf, grazed grassland	**Yes**	Decrease	No
Ducks	Ponds, ditches	Ponds	Ponds, rivers, agricultural fields	**Yes**	Decrease	No
Rock Pigeon and Eurasian Collared Dove	Buildings, trees	Developed Areas, farmlands	Developed Areas, farmlands	**Yes/No**	Increase	**Yes**
Gulls	Do not nest in Master Plan area	Ponds	Farmlands, grasslands, turf	**Yes**	Decrease	No
Herons and Egrets	Riparian Woodland	Riparian trees, wetlands	Wetlands, grassland	**Yes**	Decrease	No
Turkey Vulture	Do not nest in Master Plan area	Large trees	Grassland	**Yes**	**Increase**	**Yes**

Table 9-1. Evaluation of Potentially Hazardous Species' Need for Consideration of Synergistic Effects, Based on Uses of Various Habitats for Nesting, Roosting, and Foraging

Species/Groups	Primary Habitats Used for Various Purposes			Synergy Components		Overall Synergy Concern Warranting Detailed Evaluation
	Nesting	Roosting	Foraging	Moves Regularly Between Different Habitats	Habitat Changes Under Master Plan (Table 6-6)	
Bald Eagle	Do not nest in Master Plan area yet	Riparian trees	Ponds, rivers, grasslands	**Yes**	Decrease	No
Northern Harrier, White-tailed Kite,	Marsh, grassland (harrier) trees (kite)	Marsh, riparian trees	Grassland, wetland	**Yes**	Decrease	No
Red-shouldered Hawk, Cooper's Hawk,	Riparian Woodland, Residential (Urban Forest)	Riparian Woodland, Residential (Urban Forest)	Riparian Woodland, Residential (Urban Forest)	No	**Increase**	No
Swainson's Hawk	Residential (some in urban forest)	Residential (some urban forest)	Agriculture, grassland	**Yes**	Decrease	No
Red-tailed Hawk	Woodlands	Woodlands	grassland, agriculture	**Yes**	Decrease	No
Great Horned Owl and Barn Owl	Trees (Great Horned); Farm Buildings (Barn Owl)	Trees, Farm Buildings	Grassland, parks	**Yes**	Decrease	No
American Crow, Yellow-billed Magpie	Riparian Woodland, Residential (Urban Forest)	Urban Downtown (crow), Riparian Woodland, Urban Forest	Grassland, Turf, Residential	**Yes/No**	**Increase**	**Yes**

Of 14 potentially hazardous species and groups, 12 tend to move among different land covers or habitat elements during daily activities (i.e., breeding, roosting and/or foraging, Table 9-1). The Mute Swan, Eurasian Collared Dove, and Red-shouldered and Cooper's Hawks do not regularly use different land covers or habitat elements for daily activities. The Rock Pigeon can travel long distances from breeding and roosting areas to farm fields to forage. For the 12 species that exhibit daily movements, nine were considered to have reduced potential for synergistic effects under the Master Plan because the land covers and habitat elements that they use would be reduced (Tables 6-4, 6-5, 6-6, and 9-1). Application of these two factors to the list of potentially hazardous species indicates a potential for development of the Master Plan could have potential for adverse synergistic effects only for a few species: Rock Pigeon,

Turkey Vulture and American Crow. Potential synergetic effects for these species are analyzed in more detail below.

Synergistic effects depend on habitat characteristics both within and outside of the Master Plan area. Several Sacramento County guidance documents can be used to generally predict future land uses in the area surrounding the Master Plan area, and bird use patterns that result from the synergy between onsite and offsite lands. The Sacramento County General Plan was recently updated through the year 2030 (Sacramento County Planning and Community Development Department 2011). The draft General Plan identifies numerous adopted and pending development master plans in the Jackson Highway Planning Area. Under these plans, surrounding lands would consist of a variety of land uses, but overall, the intensity of developed uses and associated land cover can reasonably be expected to increase over existing conditions.

Creation of more developed area within the Master Plan area could create nesting opportunities for Rock Pigeons. The gradual growth of the urban forest could attract a variety of species for nesting and roosting (Table 6-6 and see Section 6-2), but species of greatest concern for synergistic effects are roosting Turkey Vultures and American Crows.

Rock Pigeons. The Rock Pigeon, characterized as a small species by SCDA, nests in both highly urbanized areas and in rural farmsteads, but generally avoids nesting in residential and suburban commercial areas. The species feeds in urban areas and open suburban areas (e.g., parks and schools), but also commutes long distances to feed on seeds in agricultural fields (especially wheat; Helix Environmental Planning 2019, D. Airola, pers. obs.). Potential for significant synergistic effects for this species is low for several reasons, besides its relatively small size. Breeding by Rock Pigeons can be discouraged through architectural design that avoids creating nesting habitat (see Section 10.5.2).

Turkey Vulture. Turkey Vultures nest primarily on cliffs and in boulder piles, and less often hollow logs, tree stumps, abandoned buildings A primary requirement is a low level of human disturbance. (Kirk and Mossman 1998). Vultures do not nest within the Master Plan area and would not be expected to do so under the conditions of the Master Plan. Vultures in the Sacramento Region tend to roost in woodlands, parks and some residential areas with many old (>80-years old) trees (Airola 2011). They are most abundant at roosts during fall migration but use roosts in smaller numbers during winter and during spring migration. Wintering birds move daily from roosts to grasslands where carrion is most abundant and then return in the evening.

The Master Plan area is unlikely to attract roosting vultures because roosts are a relatively rare phenomenon and used areas all have older, taller trees. As a result, the Master Plan development appears to be unlikely to create a synergistic hazard posed by Turkey Vultures movements. In fact, the reduction in grassland foraging habitat under the Master Plan is more likely to reduce synergistic effects compared to existing conditions. Measure to further reduce the potential for establishment of a vulture roost could include avoiding planting of trees that reach tall stature, especially at parks and schools, removing trees if they become attractive, and employing deterrence (e.g., drones) to discourage use.

American Crow. American Crows breed in natural riparian and oak woodlands and in residential areas. They feed in a variety of sites, including agricultural lands, grasslands, and residential areas. During the

breeding season, crows establish territories and remain within them to breed and feed young, so they do not travel extensively. During the non-breeding season, most of the region's crows (roughly estimated at 30-50,000) fly up to 10 miles from feeding areas to roost in Downtown Sacramento, presumably to avoid predators and take advantage of the "heat-island" effect (warmer night temperatures radiated from buildings and streets that heat during the daytime). Most of these roosting birds then leave the residential areas to feed in agricultural areas and grasslands.

The current morning and evening movements of crows would seem to pose a substantial hazard to aircraft, although no recent collisions have been reported (Table 8-2). Although creation of nesting habitat under the Master Plan could increase crow populations during the breeding season, this increase would not cause a synergistic hazard due to their site fidelity during this season. Importantly, the reduction of grassland habitat under the Master Plan would reduce the attraction to this area by wintering birds leaving the downtown Sacramento roost, thereby reducing a significant hazard. Some crows would be attracted to forage in turf areas under the Master Plan, but most of those birds would come from breeding areas within the Master Plan and would only partially offset the large decline in existing forging habitats in annual grasslands and seasonal wetlands.

10.0 OVERALL EVALUATION OF POTENTIAL CHANGES IN WILDLIFE HAZARDS TO AIRCRAFT UNDER THE MASTER PLAN

Overall hazards posed by bird-aircraft collisions are comprised of the effects of the four contributions to hazards addressed in this report. Those effects are summarized there, with an overall determination as to whether changes under the Master Plan would contribute to an increase or decrease in potential bird-aircraft collision hazard.

10.1 Changes in Land Cover under the Master Plan

Changes in land cover would reduce habitat value for, and expected use by, most potentially hazardous species. The two biggest drivers of this change would be the development of existing lands currently dominated by grassland and seasonal wetlands, and substantial reductions in amounts of wetlands and agriculture. Of the species that are predicted to increase, most (Cooper's and Red-shouldered hawk, American Crow, and Yellow-billed Magpie) would not increase for several decades until the urban forest matures. They generally remain at or below the canopy level except for the hawks, when they display in the spring. The Rock Pigeon can be managed to low population levels through architectural guidelines (to discourage nesting and roosting) and farm management practices to reduce their breeding and feeding there.

Given that most potentially hazardous species will decline, and those that will increase pose limited risk of collision, the change in land cover under Master Plan development is considered highly likely to *reduce* potential bird-aircraft collision hazards.

10.2 Changes in Bird Use as a Result of Changes in Flooding Regime

Development of the Master Plan and its intensified infrastructure to convey, concentrate, detain, and evacuate flood waters, will reduce the amount of area flooded 48 hours after the end of the 2-year and 10-year flood events by >80 percent from existing conditions. Only five of the potentially hazardous species/groups (swans, geese, ducks, gulls, and herons and egrets) are attracted to flooded conditions. Land use changes under the plan also will result in a decrease in aquatic bird species. Flood management and reduced flooding extent under the Master Plan therefore will substantially reduce potentially hazardous waterbird use of the Master Plan area compared to existing conditions. Thus, the flood-related bird-aircraft collision hazards is considered highly likely to decline under the Master Plan.

10.3 Aircraft and Bird Flight Analysis

Analysis of aircraft flight paths determined that no Mather-associated flight would occur below 100 ft over the Master Plan area, and only 1 percent of flights (representing an average of 32 sec/day of flight time) would occur between 100 and 500 ft. Nearly half of flights would occur at 500-1,500 ft and the other half at >1,500 feet. Collision data from Mather documented relatively few collisions (average of 9 per year) and most specie identified in collisions were mainly small ground dwelling and were struck on the ground (32 percent) or in the air below 100 ft (25 percent) during takeoff and landing. Evaluation of relative frequencies of bird flight heights showed that all species/groups of interest spend most of their time below 100 ft, and relatively few flights occurred above 500 ft. Those species that regularly fly at highest altitudes, such as Turkey Vultures, can be discouraged through urban forest management practices.

The flight and collision analysis suggests that collisions above the Master Plan area are likely few under current conditions and are unlikely to increase, and may even decrease, under conditions of the Master Plan.

10.4 Synergistic Effects

Eleven potentially hazardous species make movements between breeding, roosting and foraging habitats, creating the potential for synergistic effects (i.e., attractions that increase bird movements across aircraft flight paths). Use of the Master Plan area is expected to decline for nine of these species because of changes to less favorable habitat conditions.

Examination of the one of the two species, the American Crow, would increase in the breeding season when it is sedentary and thus poses no synergistic hazard, and the hazard of wintering birds commuting from downtown Sacramento roost to grassland foraging habitat would decrease under the Master Plan. Although establishment of wintering Turkey Vulture roosts in the maturing urban forest under the Master Plan could pose a hazard, suitable roosting habitat would not develop for decades and could be managed to eliminate use and resulting hazards.

In total, development of the Master Plan would reduce potential synergistic effects of hazardous bird species, primarily by replacing higher value habitats with lower quality habitats for most species.

10.5 Recommended Implementation Measures to Minimize Bird-Aircraft Collision Hazard

Notwithstanding the consistent conclusions that development under the Master Plan would reduce potential bird aircraft collision hazards, reasonable measures that could further reduce potential for collisions are warranted. The following measures are identified for consideration for incorporation into the Master Plan as project commitments.

10.5.1 Detention Basin Design and Management

Ensure that detention basins meet their design intent, to ensure that flood waters are capable of being evacuated within 48 hours of the end of flood events, subject to adequate capacity in receiving waters.

Design detention basins with steep sides to reduce the total area and the amount of shallow-flooded areas, which are most attractive to potentially hazardous waterbirds.

10.5.2 Architectural Design to Minimize Pigeon Nesting

Incorporate standard design elements into buildings that discourage nesting and roosting by pigeons, including avoiding flat surfaces (i.e., exposed beams) covered by eaves or roofing or niches that could serve as nesting sites. If nest sites are accidentally created in public buildings, install retrofitted measures to prevent nesting (e.g., netting, *spike-strips*).

If nesting areas are observed on public buildings, screen access to exclude pigeons and offer similar services to owners of private commercial buildings and residences.

Prohibit fountains and decorative small ponds in commercial areas, to avoid attracting Canada Geese and ducks.

10.5.3 Park and School Planning, Design, and Management

Although establishment of some irrigated turf at schools and parks is inevitable, minimize its use to the extent possible to discourage Canada Geese, crows and magpies, and other species.

Break up larger expanses of turf, such as at sports field, with trees to decrease their attractiveness to geese, gulls, and crows.

Preferentially locate sports fields and other areas with larger amounts of turf within the Master Plan area further from Mather Airport.

Do not construct any permanent or seasonal ponds within parks or other public use areas within 10,000 ft of the Airport, to avoid attracting Canada Geese and ducks (Helix 2019).

Avoid planting fruit bearing trees in schools, parks, road corridors, and residential areas, to avoid attracting crows and smaller fruit-eating species (i.e., robins, starlings, waxwings).

10.5.4 Urban Farm Management

Maintain, as intended, a diverse mixture of crops in urban farm areas, and avoid growing alfalfa, to avoid attracting concentrations of geese and raptors.

Design and manage barns and other farm buildings to avoid creating nesting areas for Rock Pigeons, Ravens, Barn Owls, and other structure-nesting birds.

10.5.5 Public Education and Outreach

The local Parks Department should establish regulations to discourage feeding of wildlife in parks to discourage use by Rock Pigeons and crows.

Local governments should provide educational information to residents and commercial to discourage and address pigeon nesting. Local code should prohibit the maintenance of homing pigeon lofts within 5 miles of the Airport.

10.5.6 Adaptive Management

Conditions that affect bird-aircraft collision hazards are bound to change over time. Aircraft and their flight patterns may change, and adjacent land use changes outside of the Master Plan cannot be fully anticipated. Bird populations will respond to development and the gradual maturation of the urban forest, as the WHA has addressed. Although the WHA considered the available information as carefully as possible, there is always some level of uncertainty. In addition, however, bird communities are dynamic and may change over time in response to new non-native species introductions, changes in geographic range and abundance in response to climate change and other factors, and adaptation of species to urban landscapes (e.g., Pandolfino et al. 2021). Therefore, a mechanism should be established to periodically review bird-aircraft collisions and to evaluate hazard conditions, and to adjust hazard minimization strategies as needed.

10.6 Final Conclusions Regarding Changes in Potential Bird Airstrike Hazard Resulting from the Master Plan

The risk of bird-aircraft collisions is not expected to significantly increase under the Master Plan. Changes in land use are expected to reduce the potential for hazards. Changes in resulting bird use are similarly expected to decrease. The flight and collision analysis demonstrated a relatively low risk with existing conditions, which may stay the same or decrease under the Master Plan. Synergistic effects are expected to decrease and or be mitigated by implementing minimization measures. Overall, the incidence of bird-aircraft collisions is not expected to increase, and rather is likely to decrease, as a results of the Master Plan buildout.

Appendix B – List of Excluded Species with Rationale for Their Exclusion

APPENDIX A

Qualifications of Wildlife Hazard Assessment Preparers

This report was prepared by Angela Haas and Daniel Airola in cooperation and consultation with personnel from Sacramento County Department of Airports (SCDA) and their Wildlife Biologist/Avian Hazard Manager David Jernigan. The proposed methodology for the analysis was presented and discussed with SCDA and input was incorporated into the methods used here. Authors' qualifications are provided below.

Angela Haas

Angela Haas is an avian ecologist with eight years' experience in bird identification and behavior, surveying, and monitoring. Angela received an M.S. degree in Ecology, Evolution, and Conservation from California State University Sacramento, where she conducted a thesis on Central Valley avian communities and habitat associations on lands adjacent to the West Jackson Highway Master Plan Master Plan area. She later published her findings in the Journal of Urban Ecology (Haas et al. 2020). Angela has led and conducted surveys of numerous bird species in a variety of habitats. She also has served as a Project Manager assisting clients with local, state and federal regulatory compliance at the nexus of wildlife habitat and urban development. She has assisted with analyzing project impacts, permitting and CEQA processes, and has developed and implemented bird species management plans.

Angela also regularly participates in voluntary research efforts, including conducting Short-eared Owl surveys over three years for the Western *Asio flammeus* Landscape Study. She also served as Lead Biologist on a Burrowing Owl conservation project that included creating habitat and nest success monitoring. She currently assists with year-round avian population monitoring with a local nonprofit.

Daniel Airola

Daniel Airola is a Certified Wildlife Biologist, ornithologist, and conservation planner with extensive knowledge of the distribution, abundance, and ecology of birdlife in the Sacramento region. He has 43 years of professional experience, mostly as a biological consultant in the Sacramento region. He has conducted numerous wildlife surveys, analyzed project impacts for environmental documents and permits, and developed conservation and habitat restoration plans. His airport-related work has included conducting four Wildlife Hazard Analyses for mining and development projects along Jackson Highway, including some of the same properties included in the West Jackson Highway Master Plan area. He also conducted studies and analyzed impacts for a major project, which did not proceed, to redesign the runway configuration at San Francisco International Airport.

Dan also runs an extensive research program on bird ecology, habitat relationships, and conservation. He has published over 80 scientific papers, mostly on raptors and songbirds in the Sacramento region, including Swainson's Hawk, Turkey Vulture, Osprey, Yellow-billed Magpie, Tricolored Blackbird, corvids (jays, crows), Purple Martins, and other songbirds. He serves as the editor of the journal *Central Valley Birds*, which regularly publishes articles on local bird status, distribution, ecology, and conservation. Dan also is an avid field ornithologist, birding regularly throughout the Sacramento region.

Subject: West Jackson Highway Master Plan, Wildlife Hazard Assessment Review (corrected December 21, 2023)

The proposed West Jackson Highway Master Plan (WJHMP) consists of a 5,913-acre planning area to be developed, which occurs within 0.25-3.0 miles from Mather Airport. The Master Plan would result in construction of residential and commercial uses with associated flood control facilities, schools, parks, urban farming and other uses in an area that mostly supports grasslands, seasonal wetlands, and active and reclaimed aggregate mining lands. The development will reduce the amount of area flooded 48 hours after the end of the 2-year and 10-year flood events by >80 percent from the existing conditions.

Consistent with Federal Aviation Administration (FAA) regulations, StoneBridge and Granite commissioned preparation of the Wildlife Hazard Assessment (WHA) to evaluate whether the developed Master Plan would increase the risk of bird-aircraft collisions and determine what measures should be taken to minimize any increase. The analysis focused on 14 species and species groups considered to pose the greatest risk to aircraft ("potentially hazardous bird species"), selected based on 1) their size and resulting potential for aircraft damage, and 2) propensity to collide with aircraft determined from bird-aircraft collision data from Mather Airport, FAA's national collision data report and hazard assessment, and the authors' knowledge of species in the region.

The Sacramento County Department of Airports (SCDA) has completed a thorough review of the West Jackson Highway Master Plan, Wildlife Hazard Assessment.

SCDA appreciates the thorough WHA developed for the proposed Master Plan. Our Wildlife team has reviewed the data and personal observations along with your team's interpretation of the data. We agree with most of the interpretations and observations, but the assessment is missing a thorough evaluation of bird species

such as European Starling, Brewer's Blackbirds and Cliff Swallows. While these species don't seem like they are much of a threat to aircraft safety because of their small size, the fact that they typically fly in very large flocks or in dispersed flocks within a small area, they do pose a substantial threat to aircraft safety. Both Brewer's Blackbirds and European Starlings are attracted to developed areas for both nesting and roosting. Cliff Swallows are also attracted to large buildings and waterway concrete box culverts/structures for nesting.

The WHA has pointed out that as each development in the Master Plan is designed, they will use architectural guidelines to discourage nesting and roosting and farm management practices to reduce their breeding and feeding. We greatly appreciate the effort to reduce bird attractants by modifying development designs. SCDA would like to comment on each development under the Master Plan as they are designed. In addition to structures, we would also like to comment on planned landscaping designs as landscapes can potentially create major attracts, that by themselves may not pose much of an attractant, but because of the synergistic effect relative to other open fields or structures could create new flight paths across Mather Airport.

SCDA also requests that the Master Plan owners develop a Wildlife Hazard Management Plan (WHMP) for the overall development. We understand the complexity of our request at this time, since none of the planned areas have design specifics. Other smaller developments near Sacramento International Airport have created successful WHMP's and are evaluated annually to ensure the Plan is effective. We envision the WHMP for WJHMP to be a living document, which will also be evaluated annually to verify that measures in the plan are maintaining the planned effectiveness to reduce wildlife attractants when possible. The plan should include provisions for the continuity of collaboration between the SCDA and the appropriate development representative (HOA provision?) in the event changes in wildlife activity in the project area create new or worsen existing hazards or in the event an increase in the frequency or severity of wildlife strikes to aircraft can reasonably be traced to conditions in the WHMP plan area.

SCDA appreciates the consideration the WJHMP team has given to our concerns regarding potential hazardous wildlife attractants near Mather Airport and the efforts undertaken in your planning to minimize them. SCDA Wildlife staff remains fully available to consult or otherwise assist in your development and revision of any WHMP, so please feel free to reach out to us for any reason.

Sincerely,

J. Glen Rickelton
Senior Airport Manager, Planning and Development
Sacramento County Department of Airports

1.0 INTRODUCTION

Teichert Materials (Teichert) conducted a biological resources assessment on approximately 682 acres of its Aspen VIII and IX Property (Property). Teichert proposes to mine approximately 357acres of the Property for aggregate (sand and gravel) resources (Project). Upon the completion of mining operations, the site will be reclaimed to open space annual grassland and/or irrigated pasture suitable for grazing. This report discusses the biological resources present on and potentially affected by the proposed Project. In addition, this report includes a summary of the applicable laws and regulations related to biological resources and the resource agencies responsible for their implementation.

Field surveys were conducted to identify existing biological resources present on the site and to determine if habitats present could support any special-status species. In addition, sensitive habitat areas (i.e., wetlands, riparian vegetation, trees, etc.) have been mapped and quantified using global positioning system (GPS) technology and aerial interpretation. Potential significant impacts that may occur to these resources as a result of the proposed Project are identified and mitigation measures are suggested to reduce impacts to less than significant.

1.1 PROJECT SITE LOCATION AND SETTING

The Property is located approximately 2 miles south of Mather Field and one-half mile east of Bradshaw Road in unincorporated Sacramento County (Figure 1). The site is located within a portion of the *Rio de Los Americanos Land Grant*, in Township 8 north, Range 6 east, Sections 27, 28, 33, and 34 of the USGS 7.5-minute series *Carmichael, California* quadrangle. Aspen VIII (Sacramento Co. Assessor's Parcel Numbers [APNs] 063-0180-005,-006 and 063-0160-001) consist of approximately 319 acres and Aspen IX (APNs 066-0020-006, 066-0030-001 and 066-0050-003) includes approximately 363 acres (Figure 2). The approximate center of the study area is located near Elder Creek Road at 38° 30' 39" North and 121° 19' 03" West within the Elder Creek Watershed. Elder Creek Road bisects the Property, with Aspen VIII to the north and Aspen IX to the south (Figures 2 and 3).

Existing habitat includes annual grasslands and irrigated pastures scattered with wetlands and other waters, including Elder Creek (Figure 3). The majority of the site is used as rangeland for livestock and irrigated pasture for forage production, interspersed with three separate rural residential homes. Current surrounding land uses include annual grasslands and grazing, rural residential homes, Bellevue and Arlington Cemeteries (a.k.a. Quiet Haven Memorial Park), a nursery facility (Village Nurseries), and a wastewater treatment facility (Vineyard Surface Water Treatment Plant).

1.2 PROJECT DESCRIPTION

Teichert is proposing to mine existing aggregate material (sand and gravel) on approximately 357 acres of the Property (Figure 4). The proposed Project will consist of aggregate removal and conveyance, as well as reclamation for agricultural (i.e., grazing and forage production) purposes (Teichert 2015a). The

Project is an extension of mining on Teichert's 'Aspen' properties, which have continuously supplied aggregate resources to Teichert's materials processing operations since the 1950s.

A timetable of 10 to 25 years is proposed to complete the Project, including all reclamation requirements. In general, mining will begin at the northern border of Aspen VIII and progress in a southerly direction toward Aspen IX. Two separate mine pits are proposed as part of the Project (Areas A and B) (Figure 4). The two areas are separated from Aspen IX by Elder Creek Road. Sequential activities in each area of operations include: removal of topsoil; removal of overburden; removal of aggregate material by scrapers, loaders, dozers and excavators; transport of material to Teichert's processing plant using an electrical conveyor system; and reclamation concurrent with mining.

Material mined from the site will be transported via conveyor belt to Teichert's Perkins processing plant, approximately 4 miles to the northwest (Figure 1). This conveyor will exit near the northwestern corner of Aspen VIII, where it will extend into the neighboring Aspen V-South Property to the north, before eventually tying into an existing conveyor system on a permitted mining area on Aspen V-South. As mining progresses southward, a conveyor tunnel will be constructed underneath Elder Creek Road to transport aggregate material mined from Area B (Aspen IX) (Figure 4). Once mining operations are completed, the conveyor line will be removed and its footprint reclaimed in accordance with the proposed reclamation plan for the Project. In addition to mining activities, Teichert proposes to improve an existing culvert that connects Elder Creek between the Aspen VIII and IX Properties from underneath Elder Creek Road (Figure 4). All ancillary elements and construction activities, including conveyor between Aspen VIII and Aspen V-South, tunnel under Elder Creek Road, and culvert replacement in Elder Creek, have been included as part of the Project (Figure 4).

1.3 PRESERVATION

The proposed Project would preserve approximately 90.63 acres, including 5.313 acres (or 8,368 linear feet) of Elder Creek (Figure 4). This preserve is intended to protect the entire stretch of Elder Creek on the Project Site. Much of Elder Creek is presently lacking riparian vegetation due to historic grazing pressures. Native trees have been proposed to be planted along a portion of the Preserve to mitigate for impacts to oaks and other trees as part of the Project (Teichert 2015c). Fencing of the preserve to restrict grazing, combined with additional planting of riparian vegetation, is intended to further protect and enhance existing conditions along Elder Creek.

1.4 RECLAMATION

The proposed end use for the Project Site after reclamation is open space annual grassland and/or irrigated pasture suitable for grazing (2015a). To achieve this end, overburden and topsoil will be placed and graded to provide an appropriate growing medium for the establishment of a protective vegetative cover and future forage use. Slopes will be reclaimed to no steeper than two feet horizontal to one foot vertical (2:1), with rounded edges in order to mimic surrounding landforms, and then seeded to prevent erosion. After reclamation slopes have been constructed, the pit floor will be completed and seeded

with an appropriate grassland or pasture seed mix selected for forage value. Reclamation of all mined areas will feature a total of approximately 66.3 acres of grassland slopes surrounding approximately 260.8 acres of annual grassland and/or irrigated pasture habitat within the reclaimed floor (Figure 5). Other areas, totaling approximately 32.7 acres, will also be restored back to grasslands (i.e., former stockpile areas, berms, future pads for road right-of-ways, etc.). In addition, approximately 14.2 acres of stormwater retention pond areas will be created on the pit floor to collect surface runoff, provide supplementary water sources for cattle, and protect surrounding land.

A Reclamation Plan (Plan) has been prepared for the Project pursuant to the California State Surface Mining and Reclamation Act (SMARA) of 1975 and associated regulations (updated January 2012) and the Sacramento County Code (Teichert 2015a). Included in the Plan are detailed descriptions of existing site conditions (including soils and hydrology), site-specific plans for soils removal/handling and erosion-control, protocols for vegetation establishment and protection (including noxious/invasive weed management), and specific monitoring and performance standards for revegetation success. The revegetation methods outlined in the Plan are intended to optimize the grazing quality of the Project Site and the aesthetic value of the area, while also providing foraging habitat for raptors and other species. In order to ensure long-term beneficial use of the site as proposed, a grazing management plan is also included in the Plan.

2.0 REGULATORY OVERVIEW

This section provides a brief summary of the federal, state, and local policies and regulations that are relevant to addressing the biological resources identified at the Project Site. Regulated or sensitive resources studied and analyzed herein include special-status plant and wildlife species, nesting birds and raptors, sensitive plant communities, jurisdictional waters and wetlands, and locally protected resources, such as native oak trees.

2.1 FEDERAL REGULATIONS

2.1.1 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) protects plants and animals that are listed as endangered or threatened by the National Marine Fisheries Service (NMFS) and United States Fish and Wildlife Service (USFWS). In general, NMFS is responsible for the protection of listed marine species and anadromous fish species, while other listed species are under USFWS jurisdiction. Section 9 of the FESA prohibits the taking of threatened or endangered wildlife, where taking is defined as "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct" (50CFR 17.3). The FESA prohibitions and requirements are different, however, for federally threatened or endangered plant species. For plants, the FESA prohibits the taking of threatened or endangered plants only from areas within federal jurisdiction, or if such take would result in a "knowing violation of any [State law or regulation]" (16 USC 1538). Therefore, in the absence of a federal nexus, a project does not require an incidental take permit pursuant to FESA for impacts to listed plants on private lands.

Under Section 7 of the FESA, federal agencies are required to enter into formal consultation with the USFWS and/or NMFS on proposed federal actions (i.e., actions authorized, funded, or carried out by federal agencies) if their actions could adversely affect a listed (or proposed) species or its critical habitat. Through consultation and the issuance of a biological opinion, the USFWS may issue an incidental take statement allowing take of the species that is incidental to an otherwise authorized activity, provided the activity will not jeopardize the continued existence of the species. Section 10 of the FESA provides for issuance of incidental take permits where no other federal actions are necessary provided a Habitat Conservation Plan (HCP) is developed.

2.1.2 Federal Clean Water Act, Section 404

The purpose of the Clean Water Act (CWA) is to "restore and maintain the chemical, physical, and biological integrity of the nation's waters." The U.S. Army Corps of Engineers (USACE) and the U.S. Environmental Protection Agency (EPA) regulate the discharge of dredged or fill material into Waters of the United States (Waters of the U.S.) under Section 404 of the CWA. The definition of "Waters of the U.S." includes all navigable waters; interstate waters and wetlands; all intrastate waters and wetlands that could affect interstate or foreign commerce; impoundments of the above-listed waters; tributaries of the above-listed waters; territorial seas; and wetlands adjacent to the above-listed waters. Wetlands are defined as those areas "that are inundated or saturated by surface or ground water at a frequency

and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 CFR 328.37b).

As part of the wetland delineation and verification process, the USACE will determine whether wetlands and other features in a Project Site are considered Waters of the U.S., and therefore regulated under Section 404 of the CWA. If a project would require the discharge of dredged or fill material into Waters, the proponent must seek a permit from the USACE. The USACE can issue an individual permit (for projects resulting in substantial impacts) or a general permit (i.e., Nationwide Permit [for those that result in only minimal individual or cumulative adverse effects]). The EPA also has authority over wetlands and may override a USACE permit.

2.1.2.1 Federal Clean Water Act, Section 401

Section 401 of the Clean Water Act requires any person applying for a Section 404 permit for activities resulting in a discharge into Waters of the U.S. to obtain a water quality certification from the Regional Water Quality Control Board (RWQCB). The goal of this program is to protect Waters of the U.S. by ensuring that waste discharged into these features meets state water quality standards. Because the water quality certification program is triggered by the need for a Section 404 permit and because both programs are a part of the Clean Water Act, the definition of "Waters of the U.S." under Section 401 is identical to the definition used by the Corps under Section 404 (above).

2.1.3 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) implements international treaties between the United States and other nations devised to protect migratory birds. The MBTA makes it unlawful to take any of their parts, eggs, and nests from activities such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit (i.e., rehabilitation, scientific collecting, etc.).

The list of migratory birds (50 CFR 10.13) includes nearly all bird species native to the United States. The Migratory Bird Treaty Reform Act of 2004 further defined species protected under the act and excluded all non-native species.

2.2 STATE REGULATIONS

2.2.1 California Fish and Game Code

2.2.1.1 California Endangered Species Act

The California Endangered Species Act (CESA) (California Fish and Game Code Sections 2050-2116) generally parallels the main provisions of the FESA, but unlike its federal counterpart, CESA pertains to state-listed endangered and threatened species. Section 2080 of the California Fish and Game Code prohibits the taking, possession, purchase, sale, and import or export of endangered, threatened, or candidate species, unless otherwise authorized by permit or in the regulations. Take is defined in

Section 86 of the Fish and Game Code as “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.”

CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW) to ensure that any action they undertake is not likely to jeopardize the continued existence of any endangered, threatened or candidate species, or result in destruction or adverse modification of essential habitat. CESA allows CDFW to authorize exceptions to the state's prohibition against “take” of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish and Game Code Section 2081).

2.2.1.2 Fully Protected Species

California Fish and Game Code Sections 4700 (mammals), Section 3511 (birds), Section 5050 (reptiles and amphibians), and Section 5515 (fish) designate certain species as “fully protected.” The State of California first began to designate species as “fully protected” prior to the creation of the CESA and FESA. Lists of fully protected species were initially developed to provide protection to those animals that were rare or faced possible extinction and included fish, amphibians and reptiles, birds, and mammals. Fully protected species, or parts thereof (e.g., feathers, wings, talons), may not be taken or possessed by any individual at any time. Furthermore, CDFW prohibits any state agency from issuing incidental take permits for fully protected species. CDFW may issue licenses or permits for take of these species for necessary scientific research or live capture and relocation pursuant to the permit.

2.2.1.3 Migratory Bird Species and Birds of Prey (Raptors)

Section 3503 of the California Fish and Game Code prohibits the take, possession, or needless destruction of the nests or eggs of any bird, except as provided by this code or any regulation made pursuant thereto. Additionally, Subsection 3503.5 protects all birds-of-prey (raptors) and their eggs and nests. These stipulations are similar to the federal MBTA and serve to protect nesting native birds. Section 3513 specifically prohibits the take or possession of any migratory nongame bird as designated in the MBTA.

2.2.1.4 Native Plant Protection Act

The Native Plant Protection Act (NPPA) prohibits the taking, possession, or sale within the state of any rare, threatened, or endangered plants as defined by the CDFW. The NPPA is administered by the CDFW and set forth in California Fish and Game Code Sections 1900-1913. The CESA (Fish and Game Code Sections 2050-2116) provided further protection for rare and endangered plant species, but the NPPA remains part of the Fish and Game Code.

2.2.1.5 California Streambed Alteration Notification/Agreement

Section 1602 of the Fish and Game Code requires a Streambed Alteration Agreement (SAA) be submitted to CDFW for “any activity that may substantially divert or obstruct the natural flow or

substantially change the bed, channel, or bank of any river, stream, or lake." CDFW must be notified prior to any such activities and will review the proposed action(s). If necessary, the CDFW will propose measures to protect affected fish and wildlife resources. The SAA is comprised of the final mitigation measure(s) and condition(s) mutually agreed-upon by the CDFW and the Applicant. Often, projects that require a SAA also require a permit from the USACE under Section 404 of the CWA. In these instances, the conditions of the Section 404 permit and the SAA may overlap.

2.2.2 Porter-Cologne Water Quality Act

The State Water Resources Control Board (SWRCB) and the local RWQCB have jurisdiction over "waters of the State" pursuant to the Porter-Cologne Water Quality Act (Porter-Cologne). "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state" (Water Code 13050 (e)).

Porter-Cologne requires any person discharging waste, or proposing to discharge waste, that could affect the quality of waters of the State to file a Report of Waste Discharge with the RWQCB. (Water Code 13260(a)). The RWQCB will either issue, or waive the issuance of, Waste Discharge Requirements (WDRs) for the proposed discharge which will include conditions on the discharge to ensure the protection of water quality. Through the WDR program, the RWQCB also regulates discharges to "isolated" water features which are not considered Waters of the U.S. under the Federal CWA. Porter-Cologne also requires compliance with the National Pollutant Discharge Elimination System (NPDES), including compliance with the California Storm Water NPDES General Construction Permit for discharges of storm water runoff associated with construction activities. General Construction Permits for projects that disturb one or more acres of land require development and implementation of a Storm Water Pollution Prevention Plan (SWPPP).

2.2.3 Species of Special Concern

Species of Special Concern (SSC) is a category used by the CDFW for those species which are considered to be indicators of regional habitat changes or are considered to be potential future protected species. SSC are defined by the CDFW as a species, subspecies, or distinct population of an animal native to California that are not legally protected under FESA, CESA, or the Fish and Game Code, but may be considered under CEQA Guidelines Section 15380.

2.2.4 California Rare Plant Ranks

The California Native Plant Society (CNPS) maintains the *Inventory of Rare and Endangered Plants of California* (CNPS 2014), which provides a list of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. Plant species meeting one of these criteria are assigned to one of six California Rare Plant Ranks (CRPRs). The rank system was developed in collaboration with government, academia, non-governmental organizations, and private sector botanists, and is jointly managed by CDFW and the CNPS. The California Rare Plant

Ranks are currently recognized in the California Natural Diversity Database (CNDDB). The following definitions of the CNPS California Rare Plant Ranks include:

- CRPR 1A – presumed extirpated in California and either rare or extinct elsewhere;
- CRPR 1B – rare, threatened, or endangered in California and elsewhere;
- CRPR 2A – presumed extirpated in California, but more common elsewhere;
- CRPR 2B – rare, threatened, or endangered in California but more common elsewhere;
- CRPR 3 – a review list of plants about which more information is needed; and
- CRPR 4 – a watch list of plants of limited distribution.

CRPR List 1A and 2A are presumed extirpated in California. In general, CRPR List 3 and 4 plants do not meet the definition of endangered, threatened, or rare pursuant to CEQA Section 15380; however, these species may be evaluated by the lead agency on a case by case basis to determine significance criteria under CEQA.

2.2.5 California Natural Diversity Data Base

The CDFW administers the California Natural Diversity Data Base (CNDDB), which maintains a list of special-interest plants, animals, and natural communities that occur within California. These particular species, natural communities, or habitat types are designated as sensitive because of their rarity (e.g., very localized distribution, few scattered occurrences) and/or because of some threat (e.g., development, off-road vehicles) to this specific habitat type. The purpose of these listings is solely informational; there is no regulatory protection of these species or communities afforded by these CNDDB listings. However, these species or communities may be evaluated by the lead agency on a case by case basis to determine significance criteria under CEQA.

2.2.6 California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires evaluations of project effects on biological resources, including species not protected on a federal or state list but may be considered rare or endangered if the species meets certain specified criteria (CEQA Guidelines Section 15380). These criteria follow the definitions in FESA, CESA, and Sections 1900-1913 of the Fish and Game Code, which deal with rare or endangered plants and animals. Section 15380 allows a public agency to undertake a review to determine if a significant effect on species that have not yet been listed by either the USFWS or CDFW (i.e., SSC) would occur. The public agency that takes the lead on a project (having review and approval authority over the project) is known as the Lead Agency. Other agencies involved in subsequent approvals or responsible for implementing mitigation identified in the environmental documents are called Responsible Agencies.

2.2.6.1 CEQA Significance Criteria

Section 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study checklist contained in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; or
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local content. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, state, or federal resource conservation plans, goals, or regulations. Other impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of an important resource on a population-wide or region-wide basis.

2.3 LOCAL REGULATIONS

2.3.1 Sacramento County Tree Preservation and Protection Ordinance

Sacramento County outlines requirements for the protection of oak trees in County Code 19.12. This policy and ordinance requires a project applicant to obtain authorization from the County for any project impacts which would encroach within the dripline of or destroy, kill or remove any “tree,” as defined, within the urban area of the unincorporated area of Sacramento County, or any property,

public or private. The ordinance defines "trees" as follows:

> "Any living native oak tree having at least one trunk of six inches or more in diameter measured four and one-half feet above the ground, or a multi-trunked native oak tree having an aggregate diameter of ten inches or more, measured four and one-half feet above the ground (dbh)."

2.3.2 Sacramento County General Plan

The County's Conservation Element of the General Plan contains goals and policies that provide direction regarding the conservation, maintenance, development, and utilization of natural resources. The Conservation Element addresses water resources, mineral resources, material recycling, soil resources, vegetation and wildlife, aquatic resources, terrestrial resources, and cultural resources. Most of these resources are protected and addressed in various federal, state, and local regulations and policies.

The General Plan does expand on the protection of other resources, including other native trees and riparian habitats. Specifically, Sacramento General Plan Policies CO-138 and CO-139 build on Sacramento County's Tree Preservation and Protection Ordinance by requiring that other native trees (e.g., California sycamore and California black walnut) also be protected or otherwise mitigated for in accordance with existing tree replacement policies and standards for native oaks. Sacramento General Plan Policy CO-140 further expands on tree protections by addressing tree canopy and other mitigation requirements for native oak woodlands, oak savannah and mixed riparian areas. Impacts to non-native tree canopy are addressed in the Urban Forest Management section of the General Plan under policies CO-145 and CO-146, which require mitigation for loss of non-native tree canopy as a result of development. Onsite mitigation for losses to tree canopy shall be carried out through the creation of mitigation areas equivalent to the acreage of canopy removed, with new tree canopy calculated using the 15-year shade values for tree species. If new tree canopy cannot be created onsite, a contribution may be made to the Greenprint fund in an amount proportional to the impacted tree canopy.

2.3.3 South Sacramento Habitat Conservation Plan

The South Sacramento Habitat Conservation Plan (SSHCP) is a regional approach to addressing development, habitat conservation, and agricultural lands within the south Sacramento County region, including the cities of Galt and Rancho Cordova. The specific geographic scope of the SSHCP includes U.S. Highway 50 to the north, Interstate-5 to the west, the Sacramento county line with El Dorado and Amador counties to the east, and San Joaquin County to the south. The SSHCP Study Area excludes the City of Sacramento, the City of Folsom and the Folsom Sphere of Influence, the City of Elk Grove, the Sacramento-San Joaquin Delta, and the Sacramento community of Rancho Murieta.

The SSHCP is currently in preparation and is undergoing environmental review (a working draft was released in 2010). The SSHCP will consolidate and enhance wetlands (primarily vernal pools) and upland habitats to provide ecologically viable conservation areas. It is also intended to minimize regulatory

hurdles and facilitate the permitting process for development projects. The SSHCP will cover 30 different species of plants and wildlife, including 10 that are state and/or federally-listed as threatened or endangered. The SSHCP will be an agreement between state/federal wildlife and wetland regulators and local jurisdictions, which will allow land owners to engage in the "incidental take" of listed species in return for conservation commitments from local jurisdictions. The options for securing these commitments are currently being developed and will be identified prior to adoption of the SSHCP. Sacramento County is partnering with the incorporated cities of Rancho Cordova, Galt, and Elk Grove, as well as the Sacramento Regional Sanitation District, Sacramento County Connector JPA (Joint Powers Authority), and Sacramento Water Agency to further advance the regional planning goals of the SSHCP.

2.3.4 Swainson's Hawk Mitigation Fee Program

During the environmental review process, the County Department of Planning and Environmental Review (PER) will determine whether a project impacts Swainson's hawk foraging habitat. If impact is determined, several options for mitigation will be suggested in the final environmental document. The Swainson's Hawk Mitigation program, administered by the Sacramento County Department of Planning and Community Development, is one of those options. The Ordinance (Chapter 16.130) was adopted by the Board of Supervisors in 1997. It allows projects which impact less than 40 acres of foraging habitat to pay a per-acre fee for those impacts. Projects impacting 40 acres or more of foraging habitat must provide land acceptable to the CDFW and the County. Land can be provided via fee title or conservation easement.

3.0 METHODS

The analysis presented in this document utilizes previously conducted wetland delineations, biological assessments, various published documents, personal communication with expert biologists, and recent on-site field surveys of the Project Site. The distribution of special-status species were primarily derived from the CNDDB records and various field survey efforts. The following provides a summary of existing documents related to the Project and describes the methodology for describing habitat communities and ascertaining likelihood of species occurrence.

3.1 WETLAND DELINEATION

A delineation of wetlands and other Waters on the Property was originally prepared by Foothill Associates in 2006. Following a site visit with the USACE in March 2009, ECORP Consulting, Inc. (ECORP) revised the delineation in November 2009 and March 2010. The USACE issued a preliminary jurisdictional determination (PJD) for the site on 28 June 2010. In April 2014, ECORP re-delineated portions of the site and submitted an updated delineation. Based on this recent delineation, the USACE issued a PJD on 03 June 2014. Areas outside the Property and within 250 feet were assessed by aerial determinations.

3.2 PRE-FIELD SURVEY INVESTIGATIONS AND LITERATURE REVIEW

A comprehensive literature review, based on the professional experience of contributing biologists within the region and elsewhere in California, has been conducted for the Project Site in order to develop the most accurate list of potentially-occurring special-status plant and animal species. In addition, using the Rarefind 5.0 (CDFW 2014) software program, a standard nine-quadrangle California Natural Diversity Data Base (CNDDB) report was generated for the study area (i.e., query of the U.S. Department of the Interior, Geological Survey 7.5-minute topographic quadrangle in which the study area is found as well as the immediate eight surrounding topographic quadrangles). The CNDDB contains extensive records for special-status species, as well as sensitive natural communities, which have been reported to the CDFW by a variety of sources, including researchers, landowners, field biologists and the public. Furthermore, because the CNDDB does not provide a comprehensive inventory of all sensitive species statewide, other sources of information on special-status species in California were also reviewed to determine if any special-status species not identified in the Rarefind 5.0 report have the potential to occur on the study area. These additional resources include:

U.S. Fish and Wildlife Service, Sacramento Field Office website – Official list of federal candidate, proposed, threatened, and endangered species having the potential to occur in the study area; generated on 15 March 2013 (USFWS 2013) and 07 April 2014 (USFWS 2014);

California Native Plant Society's Online Inventory of Rare and Endangered Plants of California – List of special-status species that may occur in the study area; generated on various dates between March 2013 (CNPS 2013) and August 2014 (CNPS 2014); and

eBird Data Base (http://ebird.org) (eBird 2014).

3.3 SPECIAL-STATUS SPECIES OCCURRENCE POTENTIAL

The potential for special-status plants and animals depends largely on the presence of specific habitat types on the Project Site. Habitat types identified in previous documents and recent field assessments were evaluated with known habitat requirements for each special-status species with potential to occur in the regional area. Each species' potential to occur on the Project Site was then assessed and ranked as either:

- Known to Occur – Taxon was observed at the Project Site during recent surveys.
- Likely to Occur – Taxon previously reported within or immediately adjacent to the site or otherwise expected to occur due to neighboring occurrences and substantial habitat on the Project Site.
- Could Occur – Suitable habitat is available at the site; however, there is little to no other indicators that the taxon might be present.
- Unlikely to Occur – Taxon is unlikely to be present due to poor habitat quality, lack of suitable habitat features, or known restricted current distribution that does not include the Project area.

A list of all special-status plant and animal species known or potentially known to occur within the Project vicinity is shown in Attachment A (Table A-1). For each species identified to have reasonable potential to occur (i.e., 'could occur') on the Project Site, additional biological data were provided to assist in field surveys and potential impact analyses. Information gathered included specific habitat requirements, known distribution, and regional occurrence(s).

3.4 FIELD SURVEY METHODS

Field surveys were conducted to document existing conditions of the site and assess the potential for habitats on-site to support special-status species (as listed in Table A-1). Surveys focused on rare plants (Teichert 2015b), but also included incidental observations of wildlife use and nesting species. Field surveys for special-status plants were conducted over a two-year period from March 2013 through August 2014 in accordance with the CNPS Botanical Survey Guidelines (CNPS 2001), the Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants (USFWS 1996), and the Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened, and Endangered Plants and Natural Communities (CDFG 2009). The survey study area was also extended outside the Project Site boundary to ensure all areas within 250-feet of the proposed mining footprint (i.e., proposed limits of disturbance) were examined to address potential indirect impacts to biological resources.

Specific survey dates were 25 March, 22 April, 06 and 27 May, and 20 June of 2013; and 14 March, 14, 23 and 24 April, 01 and 23 May, 19 June, and 14 July of 2014. The survey dates were established to focus on the range of flowering and identification periods for rare plants. Over the course of the 2-year survey period, Teichert's biologist B. Baba walked meandering transects across the entire Project Site.

Teichert's biologist J. Greer also accompanied B. Baba on some of the 2014 surveys. Survey transects were spaced at 15- to 50-foot intervals, depending upon the existing terrain, habitat types, vegetation cover, and structural complexity. Special attention was given where the habitat type was determined to be suitable and most likely to support special-status species (e.g., wetlands). Many areas consisted of irrigated pastures dominated by various pasture species and thus provided limited or no suitable habitat for most special-status plants.

3.5 ACCOMPANYING DOCUMENTS

3.5.1 *Special-Status Plant Species Survey Report, Teichert – Aspen VIII & IX (2014)*

A rare plant survey report was prepared for the Project Site, including a 250-foot setback area, by Teichert's biologist B. Baba (Teichert 2015b). The survey consisted of identifying all habitat types and vegetation communities, conducting protocol-level rare plant surveys, and compiling and inventory of all plant species observed at the site. Rare plants identified at the site were mapped using a GPS unit with sub-meter accuracy. Details of the rare survey methodology and data can be found in Attachment B of this document.

3.5.2 *Arborist Report, Teichert – Aspen VIII & IX (2014)*

An arborist survey of the Project Site was conducted by Teichert's biologist B. Baba and J. Greer (ISA Cert. #WE-10104A) on 23 April, 01 May, and 07 October 2014 (Teichert 2015c). The tree survey consisted of identifying, measuring, and mapping all trees 4 inches dbh or larger within and adjacent to (i.e., 150 feet) of the Project Site boundaries. Each tree was then assigned a unique identification number and evaluated for potential impacts as a result of the proposed Project. Details of the tree survey methodology and data can be found in Attachment C of this document.

4.0 EXISTING CONDITIONS

The Project Site consists of approximately 683 acres of land, including the conveyor alignment proposed in Aspen V-South. The majority of the site is utilized as rangeland for livestock and irrigated pasture for forage production. Some portions of the site have been dry farmed, primarily for wheat. Three separate rural residential houses and associated farm buildings also occur on the Project Site. Surrounding land uses include additional rangeland and rural residential homes, agricultural cropland, a nursery facility (Village Nurseries), two cemeteries (Arlington Memorial Cemetery and Bellevue Cemetery), and a wastewater treatment facility (Vineyard Surface Water Treatment Plant).

4.1 CLIMATE, TOPOGRAPHY, AND WATERSHED

Sacramento, as with the rest of California's Central Valley, is typical of a Mediterranean-type climate with hot, dry summers and cool, relatively wet winters. Average temperatures range from a low of 38°F in December to a high of 92°F in July (usclimatedata.com). Average annual precipitation is approximately 18.51 inches, with January usually the wettest month (usclimatedata.com).

The majority of the Project Site consists of historically leveled fields for both dryland grazing and irrigated pasture. Much of the remaining areas are characterized by relatively flat to rolling topography supporting comparatively undisturbed annual grasslands. The elevation of the site ranges from approximately 60 to 85 feet above mean sea level (MSL).

The Project Site is located within boundaries of the Morrison Creek and Elder Creek Watersheds (Figure 6). The Morrison Creek watershed encompasses approximately 200 acres in both Aspen VIII and IX, while the Elder Creek Watershed includes approximately 483 acres. Although Morrison Creek itself does not traverse the Project Site, its southern watershed boundary lies within the western portion of Aspen VIII and along the northwestern portion of Aspen IX before transitioning into the Elder Creek watershed to the south. Elder Creek occurs on both Aspen VIII and IX, whereby it enters Aspen VIII on the southeast and exits Aspen IX on the west (Figures 2 and 3). The creek is channelized throughout the Aspen VIII portion of the site, where it eventually enters an artificial expansion "pond" before flowing under Elder Creek Road and into Aspen IX. Once entering Aspen IX, the creek maintains its natural course before exiting the site on the west where it is once again channelized. Elder Creek originates near the intersection of Kiefer Boulevard and Eagles Nest Road and eventually discharges into Morrison Creek near Brookfield Drive in the City of Sacramento, approximately 8 miles west of the Project Site. Historically, Elder Creek was probably an ephemeral to intermittent watercourse, seasonally supported by winter precipitation and runoff from the surrounding uplands. Today, however, the majority of Elder Creek can be characterized as a semi-perennial creek fed primarily by runoff from ranches, residential areas, and irrigated pasture lands. Within the Project Site, Elder Creek is bordered by irrigated pastures, which are supported by a groundwater release and recycling system that provides year-round irrigation to fields. In this system, groundwater is first supplied to pastures during the early summer months and allowed to sheet across fields. This water eventually drains into a network of surrounding ditches and irrigation ponds for capture and reutilization, while excess irrigation runoff flows to Elder Creek.

4.2 SOILS

Natural Resources Conservation Service (NRCS) soil surveys for Sacramento County identifies six soil types within in the Project Site (NRCS 1993). The most predominant soil component is Red Bluff-Xerarents complex, 0 to 2 percent slopes, which is distributed throughout much the proposed mining area (Figure 7). Red Bluff loam, 0 to 2 percent slopes is the second-most predominant soil type on the Project Site (Figure 7). Other soil types include San Joaquin silt loam, 0 to 3 percent slopes; Kimball silt loam, 0 to 2 percent slopes; San Joaquin silt loam, leveled; and Hedge loam, 0 to 2 percent slopes (Figure 7). Detailed summaries of these soil types have been described in the original wetland delineation report prepared by Foothill Associates (2006).

4.3 HABITAT COMMUNITIES/VEGETATION

Presently, both annual grasslands and irrigated pastures dominate the landscape on the Project Site (Figure 3). Elder Creek appears on the USGS 7.5-minute series Carmichael and Elk Grove, California quadrangles as a solid blue line feature (perennial drainage) and traverses the Project area in a northeast to southwest direction (Figure 3). In addition, other wetland features are present at the site, including vernal pools, seasonal wetlands and swales, ephemeral drainages, freshwater marshes, ditches, and ponds (Figure 3). Scattered areas of riparian woodland habitat also exist along some of these wetlands (i.e., Elder Creek, ponds and ditches) (Figure 3). Other features on the Project Site include three rural residential homes and associated farm/equipment storage buildings. Dirt and graveled access roads to homes, farm buildings, and pastures are also present throughout the site.

4.3.1 Irrigated Pasture

Irrigated pastures, totaling 331 acres north of Elder Creek, are maintained by farming practices that supply irrigation to leveled areas via groundwater wells and recycled water from ponds and Elder Creek. These areas are both grazed by cattle and harvested for forage. A network of ditches and ponds are associated with the irrigated pastures (further discussed in Section 4.3.3.5). Common plant species occurring in irrigated pastures include tall fescue (*Festuca arundinacea*), Kentucky blue grass (*Poa pratensis* subsp. *pratensis*), ryegrass (*Festuca perennis*), dallis grass (*Paspalum dilatatum*), dense sedge (*Carex densa*), field sedge (*Carex praegracilis*), English plantain (*Plantago lanceolata*), white clover (*Trifolium repens*), shamrock (*Trifolium dubium*), cut-leaved geranium (*Geranium dissectum*), and yellow's owl's-clover (*Triphysaria versicolor* subsp. *faucibarbata*).

4.3.2 Annual Grassland

Annual grasslands on the Project Site are represented by both natural, undulating topography as well as historically leveled areas. This habitat community consists of 308 acres and includes grazing by cattle (Figure 3). Annual grasslands that maintain a natural topography and have not been leveled are generally located south of Elder Creek, within the southern and eastern portions of Aspen IX. Similar landscapes are also present near the northwestern corner and south-central portion of Aspen VIII. These areas consist of relatively flat to moderately rolling hills dominated by soft-chess brome (*Bromus*

hordeaceus), ripgut brome (*Bromus diandrus*), hare barley (*Hordeum murinum*), brome fescue (*Festuca bromioides*), longbeak filaree (*Erodium botrys*), perennial mustard (*Hirschfeldia incana*), winter vetch (*Vicia villosa* var. *varia*), common fiddleneck (*Amsinckia intermedia*), yellow star-thistle (*Centaurea solstitialis*), and bindweed (*Convolvulus arvensis*). Vernal pools and seasonal wetlands are common within these relatively undisturbed landscapes (further discussed in Sections 4.3.3.2 and 4.3.3.3.

Some grassland areas experience seepage from adjacent irrigated fields and ditches, contributing to semi-hydrophytic plants along these borders, including Mediterranean beard grass (*Polypogon maritimus*), toad rush (*Juncus bufonius*), Mediterranean barley (*Hordeum marinum* subsp. *gussoneanum*), annual hairgrass (*Deschampsia danthonoides*), and pennyroyal (*Mentha pulegium*). Other areas that were historically leveled and farmed but that are no longer irrigated are present along the western portions of Aspen VIII and northwest corner of Aspen IX. These areas are generally dominated by Mediterranean barley, hare barley, and ryegrass.

Trees are largely absent in annual grassland communities except along borders where other features exist (i.e., roads, ditches, etc.). Most trees on site are the result of ornamental landscape plantings around roads and residential homes. In addition, a cluster of large red gum eucalyptus trees (*Eucalyptus camaldulensis*) occurs within the western section of Aspen VIII near an existing cemetery.

4.3.3 Wetlands and Waters of the U.S.

A delineation of wetlands and other Waters of the U.S. for the Project Site was prepared by Foothill Associates in 2006. ECORP revised the delineation in November 2009 and March 2010 and again in March 2014 (ECORP 2009, ECORP 2010, ECORP 2014) as part of continued work on the Project (Figure 3). The USACE issued a preliminary jurisdictional determination (PJD) on 03 June 2014. Table 1 summarizes acreages of Waters by wetland type.

TABLE 1. WETLANDS AND WATERS OF THE U.S

Wetland Type	Aspen VIII (acres)	Aspen IX (acres)	Conveyor (acres)	Totals
Perennial Stream	2.351	3.064	----	5.415
Vernal Pool	0.988	6.243	0.029	7.260
Seasonal Wetland	2.195	3.486	0.060	5.741
Seasonal Swale	0.299	0.959	----	1.258
Freshwater Marsh	2.017	2.735	----	4.752
Ephemeral Stream	0.001	0.005	----	0.006
Pond	0.920	----	----	0.920
Ditch	1.756	0.688	----	2.444
Totals	**10.527**	**17.180**	**0.089**	**27.796**

The Project Site includes a total of 27.796 acres of wetlands, including a perennial stream, vernal pools, seasonal wetlands, seasonal swales, freshwater marshes, ephemeral streams, ponds, and ditches. Each

of the aquatic vegetation communities/Waters, including associated common plant species, are summarized below.

4.3.3.1 Perennial Stream (Elder Creek)

A total of 5.415 acres of perennial stream have been delineated on the Project Site (Figure 3). This includes approximately 8,470 lineal feet of Elder Creek. The creek is often bordered by wetland vegetation communities of various composition and cover depending on flow rates, duration of flow rates, and water depth. Common plants occurring along Elder Creek include knotgrass (*Paspalum distichum*), dallis grass, tall fescue, Kentucky blue grass, waxy mannagrass (*Glyceria declinata*), annual beardgrass (*Polypogon monspeliensis*), tall flatsedge (*Cyperus eragrostis*), Australian rush (*Juncus usitatus*), cattails (*Typha domingensis* and *T. latifolia*), common tule (*Schoenoplectus acutus* var. *occidentalis*), and creeping water primrose (*Ludwigia peploides* subsp. *peploides*). Riparian woody vegetation is rather limited throughout much of the creek, probably due to present and past grazing pressures. Trees consisting of Fremont cottonwood (*Populus fremontii* subsp. *fremontii*), black willow (*Salix gooddingii*), walnut (*Juglans hindsii*), and weeping willow (*Salix babylonica*) are scattered along portions of Elder Creek, particularly within the Aspen VIII site. This area of the creek also supports dense stands of Himalayan blackberry (*Rubus armeniacus*). While Elder Creek presently supports a biological system indicative of a perennial stream, it should be noted that this creek is hydrologically sustained from late-spring through summer by groundwater pumping and irrigation runoff from adjacent pastures.

4.3.3.2 Vernal Pools

Vernal pools are characterized as shallow depressions underlain by an impermeable geomorphic layer that captures and stores seasonal rainfall in its basin, losing water primarily through evaporation rather than drainage. Numerous pools, totaling 7.260 acres, occur throughout the undisturbed grassland areas of the Project Site (Figure 3). These vernal pools vary in maximum water depth between a few inches to 20 inches deep, and range in size from 0.001 to 1.075 acres. They are similar to other isolated, depressional seasonal wetland features at the site, but typically support a predominance of native vernal pool plants such as slender popcornflower (*Plagiobothrys stipitatus* var. *micranthus*), Carter's buttercup (*Ranunculus bonariensis* var. *trisepalus*), Fremont's goldfields (*Lasthenia fremontii*), smooth goldfields (*Lasthenia glaberrima*), Great Valley coyote thistle (*Eryngium castrense*), creeping spikerush (*Eleocharis macrostachya*), annual hairgrass, Mediterranean barley, white navarretia (*Navarretia leucocephala*), double-horned downingia (*Downingia bicornuta* var. *picta*), dwarf woolly-marbles (*Psilocarphus brevissimus*), field owl's-clover (*Castilleja campestris*), and Rosy Douglas' meadowfoam (*Limnanthes douglasii* ssp. *rosea*).

Vernal pool habitat supports breeding and foraging habitat for many aquatic invertebrates such as flatworms (Phylum Platyhelminthes), snails (*Helisoma* spp. and *Physa* spp.), dragonflies and damselflies (Order Odonata), predaceous diving beetles (Family Dytiscidae), aquatic beetles (Family Hydrophilidae), and various crustaceans (branchiopods, ostracods, copepods). These habitats also provide feeding areas and resting sites for migratory birds. The vernal pool fairy shrimp (*Branchinecta lynchi*) and vernal pool

tadpole shrimp (*Lepidurus packardi*), listed as threatened and endangered, respectively, pursuant to the federal Endangered Species Act, are also known to occur within several vernal pools on the Project Site and adjacent areas (C. Rogers, pers. observ.).

4.3.3.3 Seasonal Wetlands, Swales, and Ephemeral Drainage

The Project Site also supports numerous seasonal wetlands, swales, and ephemeral drainages, totaling 7.004 acres (Figure 3). Some of these seasonal wetlands follow a natural hydrologic pattern, whereby they are saturated (and partially inundated) in winter, but remain dry through summer. These wetlands occur in grasslands and are usually underlain by clay or a heavy clay loam and are very similar to vernal pools, but lack the species associated with vernal pools. Instead, these wetlands are frequently dominated by non-native wetland generalist plants, including ryegrass, Mediterranean barley, Mediterranean beardgrass, common hawkbit (*Leontodon saxatilis* subsp. *longirostris*), and hyssop loosestrife (*Lythrum hyssopifolia*). Some native plants include slender popcorn flower, annual hairgrass, toad rush, baltic rush (*Juncus balticus*), and iris-leaved rush (*Juncus xiphioides*). These wetlands, if inundated for sufficient periods, may also support the venal pool fairy shrimp.

In other instances, seasonal wetlands and swales are associated within irrigated pastures and affected by summer irrigation, remaining saturated or inundated for prolonged periods throughout the summer. These wetlands are saturated perennially and dominated by tall flatsedge, creeping spikerush, spatulaleaf loosestrife (*Lythrum portula*), creeping water primrose, willow weed (*Persicaria lapathifolia*), Mediterranean beardgrass, and waxy mannagrass.

4.3.3.4 Freshwater Marsh

Freshwater marshes, totaling 4.752 acres, are present at various locations throughout the Project Site (Figure 3). These wetland features are inundated or saturated for prolonged periods, and occur in conjunction with Elder Creek and other ditches receiving irrigation runoff during the summer months. Due to an extended saturation period, these areas are frequently occupied by perennial hydrophytes, including creeping spikerush, tall flatsedge, waxy mannagrass, willow weed, and creeping water primrose. Other common annuals include water pygmy-weed (*Crassula aquatica*), spatulaleaf loosestrife, and Mediterranean barley.

4.3.3.5 Ditches and Ponds

A network of ditches (2.444 acres) and ponds (0.920 acre) are scattered throughout irrigated pastures (Figure 3). The ditches collect irrigation runoff from pastures and eventually drain to ponds, from which irrigation water is redistributed back to the pastures. Ditches are frequently lined with various wetland plants including smartweed (*Persicaria lapathifolia*, *P. maculosa*, *P. hydropiper*, and *P. punctata*), creeping water primrose, slender centaury (*Centaurium tenuiflorum*), cattails, common tule, tall flatsedge, creeping spikerush, tapered rush (*Juncus acuminatus*), rice cutgrass (*Leersia oryzoides*), tall

fescue, dallis grass, mannagrass, and annual beard grass. One ditch in Aspen VIII was dominated by Sanford's arrowhead (*Sagittaria sanfordii*) (Teichert 2015b).

Ponds on site are relatively deep, and thus tend to lack vegetation. Pond levels may also fluctuate considerably depending on irrigation schedules and patterns. The edges of ponds are frequently vegetated with tall flatsedge, dallis grass, annual beard grass and Australian rush. In addition, Himalayan blackberry, Fremont cottonwood, willows (*Salix gooddingii* and *S. babylonica*), and valley oak (*Quercus lobata*) are often associated with nearby upland areas.

4.3.4 Riparian Woodland

Riparian woodland vegetation is limited to patches of narrow bands along Elder Creek and around the perimeter of existing ponds (Figure 3). Most of these species consists of Fremont cottonwood, willows, Himalayan blackberry, and California wild rose. Most of Elder Creek lacks riparian woodland vegetation, probably due to past and present grazing pressures. Existing ditches also lack riparian woodland species due to routine maintenance activities.

4.3.5 Ruderal

Ruderal vegetation is frequently associated with various equipment storage areas and access roads. In addition, disposal areas along ditches from maintaining them are frequently lined with ruderal species. Common ruderal plants at the site include field mustard (*Brassica rapa*), perennial mustard, radish (*Raphanus sativus* and *R. raphanistrum*), yellow star-thistle (*Centaurea solstitialis*), Italian thistle (*Carduus pycnocephalus*), pineapple weed (*Matricaria discoidea*), prickly lettuce (*Lactuca serriola*), English plantain, greenstem filaree (*Erodium moschatum*), and soft-chess brome.

5.0 SPECIAL-STATUS SPECIES AND SPECIES ACCOUNTS

Federal and State endangered species legislation gives special status to several plant and animal species known to occur in the vicinity of the Project Site. In addition, State resource agencies and professional organizations, whose lists are recognized by agencies when reviewing environmental documents (i.e., CRPR plants and SSC animals), have identified additional species as sensitive and occurring in the vicinity of the Project Site. Such species are referred to collectively as "special-status species." As provided in Attachment A (Table A-1), a list of special-status species known or potentially known to occur in the local region was compiled from records found in the literature review and database records in the CNDDB and CNPS Online Inventory. The table also contains specific information for each of the special-status species, including federal and State designations, biological and distribution information, survey (blooming or activity) period, and likelihood of occurrence on the Project Site. Figures 8 and 9 include the results of special-status species locations from the USGS 7.5-minute series *Carmichael, California* quadrangle and eight surrounding quadrangles. Sections 5.1 and 5.2 below further describe those species with potential to occur on the Project Site based on the presence of suitable habitat.

5.1 PLANTS

A number of special-status plants have been documented in the CNDDB to occur in the vicinity of the site, and habitat communities on-site represent potentially suitable habitat for a number of other regionally occurring special-status plants (Table A-1, Figure 8). Nine of those species were considered to have potential to occur on the Project Site. These include dwarf downingia (*Downingia pusilla*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii* subsp. *myersii*), slender Orcutt grass (*Orcuttia tenuis*), Sacramento Orcutt grass (*Orcuttia viscida*), and Sanford's arrowhead (*Sagittaria sanfordii*). One species was found during protocol-level plant surveys: Sanford's Arrowhead (Attachment A).

Dwarf Downingia (*Downingia pusilla*)

Dwarf downingia is not listed pursuant to either the federal or California Endangered Species Acts (ESAs); however, it is listed as a CRPR 2B species by the CNPS. Dwarf downingia is known from vernal pools and other seasonal wetlands. The species appears to occupy a range of pool sizes and depths, with most records indicating that the species prefers smaller and/or shallower vernal pools with comparatively 'flashy' hydrology (CNDDB 2014). The species will also frequently occupy ephemeral drainages and swales and the seasonally fluctuating vernal pool-like edges of stock ponds and seasonal marshes (Baba pers. obs.). Flowering typically occurs between March and May.

In California, the species' range extends from the northern San Joaquin Valley (Merced and Fresno counties) in the south through the Sacramento Valley to Tehama County in the north, generally below 500 feet elevation. It is also known from the Interior valleys on the Coast Range north of San Francisco (Napa and Sonoma counties). Most occurrences occupy a belt from Sonoma County to the southern

Sacramento Valley. Dwarf downingia, like some other members of the annual vernal pool flora, is also known from disjunct localities in Chile. There is one known occurrence of dwarf downingia within 5 miles of the Project Site (CNDDB Occurrence No. 54), approximately 4.9 miles to the south of the Project Site (CNDDB 2014). This population is located in vernal pools east of Waterman Road, between Sheldon Road and Bond Road in Elk Grove. The population is till presumed extant. Vernal pools, swales and hydrologically similar margins of seasonal marshes and ponds at the site are considered potential habitat for the species. Based on negative findings of protocol-level rare plant surveys conducted in March, April, and May 2013 and 2014 (Teichert 2015b), dwarf downingia is not expected to occur at the Project Site at this time.

Boggs Lake Hedge-Hyssop (*Gratiola heterosepala*)

Boggs Lake hedge-hyssop is listed as threatened by the California ESA. The CNPS also includes Boggs Lake hedge-hyssop as a CRPR 1B plant. The species blooms between April and June. The species occurs over a wide geographic area but is strictly associated with the vernal pool-type hydrologic cycle. Boggs Lake hedge-hyssop has been reported to grow in vernal pools and playa lakes, as well as seasonal stock ponds and fluctuating lake margins. Most occurrences are from well-developed large or deep vernal pools that exhibit more extreme, longer inundation periods, often where interspecies completion is lower.

Boggs Lake hedge hyssop was first collected in 1954 from Bogg's Lake in Lake County, California. Since that time, numerous additional occurrences have been recorded, ranging from the Modoc Plateau, through the Sacramento Valley, Inner North Coast Range, and central Sierra Nevada Foothills, south to Merced and Fresno Counties in the San Joaquin Valley Region. Most records are from Tehama and Modoc Counties and are associated with northern volcanic mudflow vernal pools of the northern Sacramento Valley and Modoc Plateau. There are six known occurrences of Boggs Lake hedge-hyssop within 5 miles of the Project Site (CNDDB 2014). The nearest known location is approximately 2.5 miles northwest of the site, at Mather Field (CNDDB Occurrence No. 84; CNDDB 2014). These plants were recorded growing in deeper vernal pools and still presumed extant. Vernal pools inundated for longer periods and the margins of seasonal marshes at the site are considered potential habitat for the species. Based on negative findings of protocol-level rare plant surveys conducted in April, May and June 2013 and 2014 (Teichert 2015b), Boggs Lake hedge-hyssop is not expected to occur at the Project Site at this time.

Hogwallow Starfish (*Hesperevax caulescens*)

Hogwallow starfish is not listed pursuant to either the federal or California ESAs; however, it is listed as a CRPR 4 species by the CNPS. Hogwallow starfish is typically associated with shallow vernal pools and seasonally saturated clay flats. The species has also been found from a fallow (formerly irrigated) pasture (LSA 2009).

Hogwallow starfish has a wide distribution throughout the Central valley and adjacent foothills from Tehama County south to Kern County. It has also been recorded in San Luis Obispo County. Flowering typically occurs between March and June. CRPR List 4 plants are not tracked by the CDFW, thus occurrence records for hogwallow starfish are not included in the CNDDB. A previous survey conducted by ECORP Consulting did identify a population of hogwallow starfish at the Piliken Ranch near Sloughhouse in eastern Sacramento County (ECORP 2007), approximately 10 miles southeast of the Project Site. This population was recorded growing in a rocky, sparsely vegetated upland area. B. Baba revisited this location in 2009 but only observed dwarf evax (*Hesperevax acaulis*). Some of the shallow vernal pools and seasonal wetlands at the Project Site are considered potential habitat for the species. Based on negative findings of protocol-level rare plant surveys conducted in March, April, May and June 2013 and 2014 (Teichert 2015b), hogwallow starfish is not expected to occur at the Project Site at this time.

Ahart's Dwarf Rush (*Juncus leiospermus* var. *ahartii*)

Ahart's dwarf rush is not listed pursuant to either the federal or California ESAs; however, it is listed as a CRPR 1B species by the CNPS. Ahart's dwarf rush grows in a variety of seasonal wetland type habitats, but appears to be restricted to acidic soils in vernal pool complexes. Although Ahart's dwarf rush has been recorded growing with more "deeply-adapted" vernal pool associates, most records indicate that the species prefers the margins of vernal pools or in swales and seasonal wetlands where hydrologic conditions are more "flashy." In addition, this species is also known to occur on gopher mounds along the margins of these wetlands (CNDDB 2014). Flowering generally occurs from late-March through May.

Presently, Ahart's dwarf rush is known from only 13 occurrences throughout the Great Central Valley. Populations are recorded from Tehama County in the north to Calaveras County in the south, with elevations ranging from 90 to 300 feet (CNDDB 2014). Most occurrences are from Butte and Sacramento County. The nearest known occurrence of Ahart's dwarf rush is approximately 1.8 miles northeast from the Project Site, at Mather Field just west of Eagles Nest Road (CNDDB Occurrence No. 8). These plants are located in shallow vernal pools and along vernal swales and still presumed extant (CNDDB 2014). Vernal pools inundated for longer periods and the margins of seasonal marshes at the site are considered potential habitat for the species. Considering the relatively close proximity of nearby populations and wide geographical range, Ahart's dwarf rush could be expected to occur at the site. Based on negative findings of protocol-level rare plant surveys conducted in March, April, and May 2013 and 2014 (2015b), Ahart's dwarf rush is not expected to occur at the Project Site at this time.

Legenere (*Legenere limosa*)

Legenere is not listed pursuant to either the federal or California ESAs; however, it is listed as a CRPR 1B species by the CNPS. Legenere grows in a variety of wetland habitats including vernal pools, seasonal marshes, floodplains of intermittent streams, and along the margins of cattle stock ponds. Legenere is associated with a wide range of physiographic/edaphic landscapes. Most records indicate that the species prefers the shallower areas of seasonal pools that are inundated for longer periods than average

and typically support at least some perennial species such as spikerush (*Eleocharis macrostachya*). Flowering typically occurs from April to June.

This species' range includes the northern Central Valley from Shasta to San Joaquin County and the Inland Coast Range from Lake to Santa Clara County. Populations are reported from 78 occurrences, ranging in elevation from less than 950 meters (CNDDB 2014). The majority of known extant records are concentrated in Solano and Sacramento counties, with other scattered occurrences in Alameda, Lake, Napa, Sonoma, San Mateo, Santa Clara, Placer, Yuba, and Shasta counties (Holland 1983; Platenkamp 1998; CNDDB 2014). The nearest known occurrence of Legenere is approximately 1.4 miles south of the Project Site (CNDDB Occurrence No. 29; CNDDB 2014). Two colonies were identified growing in vernal pools just south of Florin Road and 0.7 miles east of Excelsior Road. Vernal pools inundated for longer periods and the margins of seasonal marshes at the site are considered potential habitat for the species. Considering the relatively close proximity of nearby populations and wide geographical range, Legenere could be expected to occur within the Project Site. Based on negative findings of protocol-level rare plant surveys conducted in April, May and June 2013 and 2014 (Teichert 2015b), Legenere is not expected to occur at the Project Site at this time.

Pincushion Navarretia (*Navarretia myersii* subsp. *myersii*)

Pincushion navarretia is not listed pursuant to either the federal or California ESAs; however, it is listed as a CRPR 1B species by the CNPS. Pincushion navarretia is a strict vernal pool endemic, often occurring in pools with moderate to highly acidic soils (CNPS 2014). Based on known populations and those observed in eastern Merced County, the species was associated with the ancient, weathered alluvial terraces comprising the Valley Springs and Ione Geologic Formations (Dittes and Guardino 2001). Generally, pincushion navarretia is presumed to occupy smaller and/or shallower pools where hydrologic conditions may be more 'flashy.' The species may be seen flowering from mid-April through May (Dittes and Guardino 2001, CNPS 2014).

Presently, pincushion navarretia is known from 14 occurrences along the eastern portion of the Central Valley and adjacent Sierra Nevada Foothill from Placer County south to Merced County, between 60 and 1,100 feet elevation (CNDDB 2014). The nearest known location of this species is approximately 10.6 miles northeast of the Project Site, in the Department of Fish and Wildlife Phoenix Field Ecological Reserve (CNDDB Occurrence No. 3; CNDDB 2014). The species occurs in two pools within the south half of the Preserve and are still presumed extant. The smaller, shallow pools at Aspen VIII & IX are considered potential habitat for pincushion navarretia. Considering the relatively close proximity of nearby populations, this species could be expected to occur within the Project Site. Based on negative findings of protocol-level rare plant surveys conducted in April and May 2013 and 2014 (Teichert 2015b), pincushion navarretia is not expected to occur at the Project Site at this time.

Slender Orcutt Grass (*Orcuttia tenuis*)

Slender Orcutt grass is listed as threatened under the federal ESA and endangered under the California ESA. The CNPS also includes slender Orcutt grass as a CRPR 1B species. Slender Orcutt grass is found primarily in vernal pools on substrates of volcanic origin, but have also been found in places such as stock ponds and borrow pits. Orcutt grasses are strongly adapted to deeper vernal pools with more extreme hydrologic regimes. Interestingly, this species appears to be the least specific of Orcutt grasses with regard to specific habitats niches. This is confirmed by its occupation of a wider range of vernal pool sizes and vernal wetland types, as well as occurrences over a wider geographical range and landform types. Flowering may occur between May and September (usually May or June in the Central Valley), and sometimes October, making it one of the latest blooming members of the Orcutt grasses.

Slender Orcutt grass has been documented from 96 occurrences, which includes a wide range of elevations corresponding to its broad geographical range (CNDDB 2014). The lowest reported elevation is 88 feet in Sacramento County and the highest is 5,760 feet in Plumas County. The species is found from Modoc County south to Sacramento County, with large concentrations occurring in Tehama County and the Modoc Plateau Vernal Pool Region. The nearest documented occurrence of Slender Orcutt grass is approximately 2 miles south of the Project Site (CNDDB Occurrence No. 16), in a narrow vernal pool west of Laguna Creek (CNDDB 2014). The population is till presumed extant. The larger, deeper pools that remain inundated for extended periods at the site are considered potential habitat for Sacramento Orcutt grass. Considering the relatively close proximity of nearby populations, this species could be expected to occur at Aspen VIII & IX. Based on negative findings of protocol-level rare plant surveys conducted in May and June 2013 and May, June and July 2014 (Teichert 2015b), slender Orcutt grass is not expected to occur at the Project Site at this time.

Sacramento Orcutt Grass (*Orcuttia viscida*)

Sacramento Orcutt grass is listed as endangered under both the federal and California ESAs. The CNPS also includes Sacramento Orcutt grass as a CRPR 1B species. Sacramento Orcutt grass occurs primarily in large vernal pools that remain inundated for prolonged periods. Soils associated with this species tend to be strongly acidic and support a well-developed silica-iron hardpan layer approximately 2 to 10 feet below the surface. Many plants may only grow in years when seasonal rainfall is sufficient, particularly when rains begin in November and continue through the end of April. This plant is less likely to germinate in years of below-normal precipitation than other members of the Orcuttieae grasses. Flowering typically occurs in May and June.

Sacramento Orcutt grass is endemic to the southeastern Sacramento Valley, and has always been restricted to Sacramento County. It is known from only 12 occurrences, most of which are still presumed extant (CNDDB 2014). The recorded range of the species extends in a narrow band from just north of the American River near Orangevale to the vicinity of Rancho Seco Lake on Arroyo Seco Mesa, approximately 26 miles to the south. The nearest documented occurrence of Sacramento Orcutt grass is approximately 0.8 mile southeast of the Project Site (CNDDB Occurrence No. 20); however, this

population is presumed extirpated (CNDDB 2014). This occurrence was last observed in 1998 in a pool that is now a permanent marsh due to runoff from an adjacent nursery (CNDDB 2014). The nearest possible extant location is approximately 3.6 miles northeast of the Project Site (CNDDB Occurrence No. 17), in vernal pools on the Anatolia Preserve east of Sunrise Boulevard and north of Kiefer Boulevard (CNDDB 2014). The larger, deeper pools that remain inundated for extended periods at the site are considered potential habitat for Sacramento Orcutt grass. Considering the relatively close proximity of nearby populations, this species could be expected to occur at Aspen VIII & IX. Based on negative findings of protocol-level rare plant surveys conducted in May and June 2013 and 2014 (Teichert 2015b), Sacramento Orcutt grass is not expected to occur at the Project Site at this time.

Sanford's Arrowhead (*Sagittaria sanfordii*)

Sanford's arrowhead is not listed pursuant to either the federal or California ESAs; however, it is listed as a CRPR 1B.2 species by the CNPS. Sanford's arrowhead is associated with the shallow margins of small lakes and ponds and slow-moving sloughs, creeks, rivers, and canals. Numerous populations have also naturalized in ditches associated with irrigation and other drainage systems. Little is known regarding the biology or ecology of the species, although it appears to tolerate a wide range of freshwater marsh environments. Flowering typically occurs between May and August.

This species is widely distributed throughout the Central Valley between 0 and 2,200 feet. Sanford's arrowhead is documented from 93 occurrences and is presently known from Shasta to Kern County, with the majority of records occurring in Sacramento County (CNDDB 2014). A disjunct population also occurs near Crescent City in Del Norte County. The species is presumed to have been extirpated from much of its historic range in southern California (Orange and Ventura counties). A nearby population of Sanford's arrowhead occurs approximately 1.8 miles northwest of the Project Site (CNDDB Occurrence No. 25) (CNDDB 2014). Sanford's arrowhead was recorded at the Project Site during protocol-level surveys conducted in May and July 2014 (Teichert 2015b). Large populations of this species (2,000+ individuals) were observed growing within an irrigation ditch in Aspen VIII, near the western portion of the property (Figure 10). This ditch is fed by irrigation runoff from irrigated pastures to the east, before eventually emptying into a large irrigation pond on the northern project boundary (Teichert 2015b).

5.2 ANIMALS

A number of special-status animals have been documented in the CNDDB within the USGS 7.5-minute series *Carmichael, California* topographic quadrangle as well as the immediate eight surrounding quadrangles, and the habitats and vegetation communities found on-site represent potentially suitable habitat for a number of other special-status animal species (Table A-1, Figure 9). A total of nine invertebrates, one amphibian, one reptile, and nine birds were considered to have potential to occur on the Project Site. These include the blennosperma vernal pool andrenid bee (*Andrena blennospermatis*), an andrenid bee (*Andrena subapasta*), vernal pool fairy shrimp, mid-valley fairy shrimp (*Branchinecta mesovallensis*), hairy water flea (*Dumontia oregonensis*), Ricksecker's hydrochara (*Hydrochara rickseckeri*), venal pool tadpole shrimp, California linderiella (*Linderiella occidentalis*), valley elderberry

longhorn beetle (*Desmocerus californicus dimorphus*), western spadefoot toad (*Spea hammondii*), western pond turtle(*Emys marmorata*), white-tailed kite (*Elanus leucurus*), northern harrier (*Circus cyaneus*), Swainson's hawk (*Buteo swainsoni*), Ferruginous hawk (*Buteo regalis*), merlin (*Falco columbarius*), burrowing owl (*Athene cunicularia*), loggerhead shrike (*Lanius ludovicianus*), yellow-billed magpie (*Pica nuttallii*), and tricolored blackbird (*Agelaius tricolor*). Five species were observed during various field surveys in 2013 and 2014: white-tailed kite (perched in willow tree), northern harrier (foraging), Swainson's hawk (flyover), yellow-billed magpie (foraging), and tricolored blackbird (nesting in Himalayan blackberries).

5.2.1 Invertebrates

Blennosperma Vernal Pool Andrenid Bee (*Andrena blennospermatis*)

The blennosperma vernal pool andrenid bee is not listed pursuant to either the federal or California ESAs; however, it is tracked by the CNDDB due to its restricted habitat. The species is a solitary, ground-nesting bee that inhabits upland areas near vernal pools and specializes on the flowers in the *Blennosperma* genus (yellow carpet) (Leong, et al. 1995). Presence of this bee is reported in scattered locations where *Blennosperma* is found, along the edges of the Central Valley in Yolo, Solano, El Dorado, Sacramento and Tehama Counties, as well as near the base of the Coast Ranges in Contra Costa, Lake and Sonoma Counties (CNDDB 2014). The female bee collects and provisions *Blennosperma* pollen into ground nests, forming it into a ball onto which she lays a single egg. Bees are active through the bloom period of yellow carpet (late February through April), allowing a female to produce multiple ground nests. The next spring, adults emerge around the same time that *Blennosperma* begins blooming and the cycle repeats.

The blennosperma andrenid bee is dependent upon the presence of *Blennosperma* flowers, which occur in grasslands associated with vernal pools. The nearest occurrence for this species is approximately 10 miles to the southeast of the study area (CNDDB Element Occurrence No. 08), in a vernal pool complex near Sloughhouse (CNDDB 2014,). *Blennosperma* plants were not identified through any of the comprehensive spring surveys in the vernal pool and grassland habitats of the study area (Teichert 2015b); therefore, the blennosperma vernal pool andrenid bee is not considered to occur at the Project Site at this time.

Andrenid Bee (*Andrena subapasta*)

Similar to other andrenid bees, *Andrena subapasta* is a solitary, ground-nesting bee that specializes on native flowers endemic to vernal pool grassland habitats. It is not listed pursuant to federal or California ESAs, but is tracked by the CNDDB, as very little is known about this species. Records exist from the Sacramento Valley and foothill regions in Sacramento, San Joaquin, Placer and El Dorado Counties (CNDDB 2014). It is known to forage on a variety of native forbs, and has been observed to collect pollen from the flowers of sandwort (*Minuartia californica*), Johnny-tuck (*Triphysaria eriantha*) and California goldfields (*Lasthenia* spp.) (Rogers, pers. obs.; CNDDB 2014).

The nearest occurrence for this species is more than 5 miles north of the study area and is from 1954 (CNDDB Element Occurrence No. 03), in what is now a developed area of Fair Oaks near the American River (CNDDB 2014). The annual grassland habitat surrounding vernal pools within the study area may provide suitable habitat for *A. subapasta*, as several pools were noted to contain *Lasthenia fremontii* and *L. glaberrima* and other native flowering forb species during spring plant surveys (Teichert 2015b). Therefore, *A. subapasta* could occur within the study area.

Vernal Pool Fairy Shrimp (*Branchinecta lynchi*)

The vernal pool fairy shrimp is listed as threatened under the federal ESA. This species is usually found in vernal pools, but can also occur in association with other ephemeral wetlands including alkali pools, seasonal swales, and rock outcrops. Vernal pool fairy shrimp act as filter-feeders and are present in seasonal pools during the wet stage, hatching from cysts as soon as ponding occurs. Vernal pool fairy shrimp develop rapidly into adults, reaching sexual maturity in as little as 18 days (Helm 1998); although, Rogers (pers. obs.) observed this species reaching maturity in as little as 6 days under high temperatures. Maturation and reproduction rates of vernal pool crustaceans are controlled by water temperature and can vary greatly (C. Rogers, pers. obs.). Three to six hatches may occur within a season if rainfall patterns and conditions are favorable (Gallagher 1996; Helm 1998). Cysts typically remain dormant until the next rainy season, but can last in vernal pool substrate for many years. The species is an important food source for many other vernal pool animals, from aquatic beetles to toads and ducks.

The vernal pool fairy shrimp is distributed throughout the Central Valley, as well as at a small number of locations in the central Coast Ranges from Monterey County south to Santa Barbara County and in the South Coast Mountains in Riverside County (CNDDB 2014). There are 26 records for this species within 5 miles of the Project Site, with the nearest record existing approximately 0.6 mile to the east of the study area (CNDDB Element Occurrence No. 228) within natural vernal pools surrounded by grazed grassland (CNDDB 2014). Vernal pool fairy shrimp have also been observed from reconnaissance level special-status shrimp surveys conducted on Aspen IX by C. Rogers (EcoAnalysts 2006). Therefore, vernal pools and other seasonal wetlands and swales within the study area are considered to likely support vernal pool fairy shrimp.

Mid-valley Fairy Shrimp (*Branchinecta mesovallensis*)

The mid-valley fairy shrimp is not listed pursuant to the federal or California ESAs, but is tracked by the CNDDB. The species is closely related to the federally-listed vernal fairy shrimp and is limited to vernal pools, swales, and other ephemeral freshwater habitats in the Central Valley. Similar to the vernal pool fairy shrimp, the mid-valley fairy shrimp is a small, filter-feeding crustacean that experiences a rapid life cycle adapted to the filling and drying of its astatic seasonal wetland habitat, complete with the formation of cysts that are capable of lying dormant for many years until the return of appropriate hydrological conditions. Data from laboratory experiments indicate that the young of this species may have a higher tolerance for elevated water temperatures than other *Branchinecta* species (Helm 1998).

Mid-valley fairy shrimp have been found in habitats ranging from 0.001 to 0.5 acre in size, and typically utilize habitats shorter in duration than other *Branchinecta* species (Rogers, pers. obs.).

Records of this species are scattered from Sacramento, Solano, Contra Costa, Merced, Madera and Fresno Counties. There are eight known occurrences for this species within 5 miles of the study area. The nearest record is less than one mile to the northeast (CNDDB Element Occurrence No. 28), within a vernal pool/annual grassland complex south of Mather Regional Park and north of Jackson Road (CNDDB 2014). The vernal pools, swales, and other seasonal wetland habitats on site are considered suitable habitat for this species; thus, the species is considered to have potential to occur.

Hairy Water Flea (*Dumontia oregonensis*)

The hairy water flea is not listed pursuant to the federal or California ESAs, but is tracked by the CNDDB due to a restricted range and lack of specific habitat requirements. In general, the hairy water flea is described as a branchiopod crustacean found in vernal pools and similarly seasonally astatic wetlands. Three populations have been found in vernal pools in Jackson County, Oregon and two in California (Travis AFB, Solano County, and Sacramento County) (Santos-Flores and Dodson 2003; Van Damme & Dumont 2008; CNDDB, 2014; Rogers, pers. obs.). Vernal pools within the study area may provide suitable habitat for the hairy water flea. The only known record for this species in Sacramento County is located approximately one mile north of the study area (CNDDB Element Occurrence No. 01), from a vernal pool at Mather Field (CNDDB 2014). Therefore, the species is considered to have potential to occur at the Project Site.

Ricksecker's Hydrochara (*Hydrochara ricksecker*i)

Ricksecker's hydrochara is a relatively newly-discovered species and is currently not listed pursuant to the federal or California ESAs. Because there is very little information about this species and so few populations are known, it is tracked by the CNDDB. Ricksecker's hydrochara is entirely dependent upon vernal pool-type wetland ecosystems. Records suggest that this species occupies a variety of vernal pools, seasonal wetlands, and other ephemeral habitats below 1,000 feet, but may prefer deeper, long-lasting pools (Rogers, pers. obs.). Like the majority of Hydrophilid beetles, the Ricksecker's hydrochara is predatory in the larval stage and omnivorous as an adult. The larvae of this species will consume other insects, crustaceans, or amphibian larvae (Rogers, pers. obs.). Adults have been seen feeding on common frog-fruit (*Phyla nodiflora*), and dead insects and tadpoles (Rogers, pers. obs.).

This species was originally reported as endemic to the San Francisco Bay region, occurring in Alameda, Marin, San Mateo, and Sonoma Counties (Smetana, 1980). Recent collections have been made in Solano County at the Jepson Prairie Preserve, and from vernal pools in Sacramento, San Joaquin and Placer Counties (Rogers pers. obs.; CNDDB 2014). Larger vernal pools within the study area may provide suitable habitat for this species. The nearest occurrence record for this species is from an aquatic habitat located within a mile north of the study area at Mather Field (CNDDB Element No. 05; CNDDB 2014). Therefore, Ricksecker's hydrochara is considered to have potential to occur at the Project Site.

Venal Pool Tadpole Shrimp (*Lepidurus packardi*)

The vernal pool tadpole shrimp is listed as endangered by the federal ESA. This species inhabits a wide variety of seasonal wetlands, including vernal pools, ponded clay flats, alkaline pools, ephemeral stock ponds, and roadside ditches (Helm 1998; Rogers 2001; CNDDB 2014). Wetlands supporting vernal pool tadpole shrimp have included small (<25 square feet), clear, vegetated pools to highly turbid alkali scald pools to large (>100 acre) winter lakes (Helm 1998; Rogers 2001). These wetlands must dry out and be inundated again for their cysts to hatch. Most records are from larger, deeper vernal pools. Although maturation and reproduction rates of vernal pool crustaceans are controlled by water temperature and can vary greatly (Rogers, pers. obs.), it is estimated that the vernal pool tadpole shrimp take between 3 and 4 weeks to mature (Ahl 1991; King et. al. 1996). This species is relatively large in contrast to fairy shrimp, and covered in an oblong-shaped carapace that is molted as the crustacean grows. Due to their large size, the vernal pool tadpole shrimp is a favorite food source among a variety of animals, from frogs to herons. They are very active hunters, burrowing and swimming in pursuit of various prey items, such as rotifers, fairy shrimp, and tadpoles (C. Rogers, pers. obs.).

Vernal pool tadpole shrimp is a California Central Valley endemic species, with the majority of populations in the Sacramento Valley. There are 51 occurrences that have been recorded for this species within 5 miles of the study area (CNDDB 2014). The nearest record for this species is located approximately 0.5 mile to the north of the study area at Mather Field (CNDDB Element Occurrence No. 25), within natural vernal pools surrounded by annual grassland (CNDDB 2014). Vernal pools within the study area are considered suitable habitat for the vernal pool tadpole shrimp. Vernal pool tadpole shrimp have also been observed from reconnaissance level special-status shrimp surveys conducted on Aspen IX by C. Rogers (EcoAnalysts 2006). Therefore, vernal pool habitats within the study area are considered to likely support this species.

California Fairy Shrimp (*Linderiella occidentalis*)

The California fairy shrimp is the most widely distributed fairy shrimp in California. The species is not currently listed pursuant to federal or California ESAs, but, given continued threats to habitat, is tracked by the CNDDB. This species has been found on most land forms, geologic formations, and soil types supporting vernal pools and other seasonal wetlands throughout California, but tends to occupy relatively deep pools (Eriksen & Belk 1999). Similar to the vernal pool fairy shrimp, the California fairy shrimp is a filter-feeding Branchiopod that hatches from cysts in large numbers within vernal pool habitats.

Within the Central Valley, records for California fairy shrimp come from Shasta, Tehama, Butte, Yuba, Placer, Sacramento, and San Joaquin Counties. There are 38 known occurrences for this species within 5 miles of the study area, with the majority of these occurrences located immediately north of the site at Mather Field (CNDDB 2014). The nearest record for this species exists 0.6 mile to the east of the study area (CNDDB Element Occurrence No. 258), within natural vernal pools surrounded by grazed grassland (CNDDB 2014). This species has also been observed from reconnaissance level special-status shrimp

surveys conducted on Aspen IX by C. Rogers (EcoAnalysts 2006). Therefore, vernal pool and seasonal wetland habitats within the study area are considered to likely support California fairy shrimp.

Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*)

The valley elderberry longhorn beetle (VELB) is listed as threatened by the federal ESA. The VELB is entirely dependent upon its host plant, elderberry (i.e., *Sambucus* spp.). The elderberry shrub is primarily associated with riparian areas, but also occurs in grasslands, dredge tailings, and as isolated roadside shrubs. Most records indicate that the VELB occupies elderberry shrubs in association with other riparian vegetation. The VELB life cycle consists of four stages: egg, larva, pupa, and adult. Eggs are typically deposited within the bark crevices of live elderberry shrubs. Upon hatching, the larvae bore through the bark where they tunnel and feed in the pith of the stem for up to 2 years. Prior to pupating, the larvae bore back out of the stem (thereby creating the "exit hole") and then return into the stem to enter the pupil stage. Exit holes are more frequently found in trunks or branches between 2 and 7 inches in diameter, or at least 1.0 inch or greater in diameter at ground level (USFWS 1984). Between March and early June, about the same time the elderberries flower, VELB adults emerge from the exit holes. Adults feed on the leaves of elderberry shrubs and possibly the flowers. The life span of adults is unknown, but they are presumed to die after reproducing.

This taxon occurs at scattered locations in the Central Valley and adjacent foothills of the Sierra Nevada and Coast Ranges. At the time the VELB was federally listed, it was known from less than 10 locations along the American and Merced Rivers, and along Putah Creek (USFWS 1980). The known range now extends from southern Shasta County to Fresno County and across the Central Valley, with approximately 204 records (mostly based on exit holes) in existence (CNDDB 2014). The nearest occurrence record for this taxon is approximately 5.6 miles north of the Project Site (CNDDB Element Occurrence No. 01; CNDDB 2014). This occurrence is described as being located on elderberry shrubs within dense riparian habitat along the American River Parkway from River Bend Park up to the lower southeast shore of Lake Natoma. Considering the relatively close proximity of nearby populations and wide geographical range of elderberry shrubs, the VELB could be expected to occur within the study area. Focused surveys for elderberry shrubs were conducted on the Project Site as part of a rare plant survey, carried out over a two year period from March 2013 through August 2014 (Teichert 2015b). No elderberry shrubs were present on the Project Site (Teichert 2015b); therefore, the species is considered to have no potential to occur within the study area due to a lack of required habitat.

5.2.2 Amphibians

Western Spadefoot Toad (*Spea hammondii*)

The western spadefoot is not listed pursuant to the federal or California ESAs, but is designated by the CDFW as a California Species of Special Concern. The species primarily occurs in lowland habitats below 3,000 feet in elevation within or adjacent to washes, floodplains of rivers, alluvial fans, playas, and alkali flats. However, it also occurs in the foothills and mountains at a few locations at elevations up to 4,500

feet (Stebbins 1985, Morey 1988). Associated vegetative communities, where it occurs, include annual and perennial grasslands, open chaparral, pine-oak woodland, and lower montane conifer and mixed conifer forest with open areas comprised of short grasses and sandy or gravelly soil. Western spadefoot toads breed from February to May in temporary pools and drainages that form following winter or spring rains. Their eggs and larvae have been observed in a variety of temporary wetlands (CNDDB 2014). They have also been found in altered wetlands including vernal pools that have been disturbed by activities such as earthmoving, disking, intensive livestock use, and off-road vehicle use, and man-made wetlands such as artificial ponds, livestock ponds, sedimentation and flood control ponds, irrigation and roadside ditches, roadside puddles, tire ruts, and borrow pits (Fisher and Shaffer 1996, CNDDB 2014).

The species occurs in Sacramento County, but is largely localized to the southeastern portion of the County (south of Rancho Murieta) (CNDDB 2014). There are four records for this species within 5 miles of the study area. The nearest known occurrence to the Project Site is less than 4 miles away and near the intersection of Zinfandel Drive and Kiefer Boulevard (CNDDB Element Occurrence No. 167; CNDDB 2014). Western spadefoot was found in three vernal pools at this location, surrounded by annual grassland within Mather Field. Given potentially suitable breeding sites (e.g., vernal pools) and surrounding upland, it is considered to have potential for occurring within the Project Site.

5.2.3 Reptiles

Western Pond Turtle (*Emys marmorata*)

Western pond turtle is not listed pursuant to either the federal or California ESAs, but is designated by the CDFW as a California Species of Special Concern. This species is discontinuously distributed from western Washington State south to northwestern Baja California, but exists at numerous localities in the Central Valley of California. It occurs in a variety of fresh and brackish water habitats including marshes, lakes, ponds, and slow moving streams (Jennings and Hayes 1994). Although primarily aquatic, the western pond turtle will leave its aquatic habitats to reproduce, aestivate, or overwinter (Jennings and Hayes 1994). Deep, still water with abundant emergent woody debris, overhanging vegetation, and rock outcrops appears to be the preferred aquatic habitat of the species. Although adults are habitat generalists, hatchlings and juveniles require shallow water habitat with relatively dense submergent or short emergent vegetation in which to forage. Western pond turtles are typically active between March and November. Mating generally occurs from late April to early May and eggs are deposited between late April and early August (Jennings and Hayes 1994). Eggs are deposited within excavated nests in upland areas, within substrates that typically have high clay or silt fractions, usually in the vicinity of aquatic habitats (Jennings and Hayes 1994). The majority of nesting sites are located within 650 feet of the aquatic habitat. However, sites have been documented as far as 1,310 feet from aquatic habitat. Nests are typically located on a slope that is unshaded and at least partly south-facing. The slope of nest sites ranges up to 60˚, but is typically less than 25˚.

The pond within the northern portion of the Project Site may provide suitable seasonal or perennial aquatic habitat for western pond turtle. Furthermore, individuals may occasionally occur in Elder Creek. Most of the upland habitat within the study area is unsuitable for nesting given that it is in active agricultural use (including flood irrigation) each year. However, nesting may occur in small areas that are relatively undisturbed. This species has occasionally been observed at locations hydrologically connected to the lower Elder Creek watershed (Bumgardner pers. obs.) and occasionally in the adjacent Morrison Creek watershed (i.e., south of Mather Airport) (CNDDB 2014). There are two records within 5 miles of the project area, with the nearest occurrence located approximately one mile to the northwest of the site in Morrison Creek, below the confluence with the Mather Field drain (CNDDB Element Occurrence No. 433; CNDDB 2014). Therefore, it is considered to have potential to occur within the Project Site.

5.2.4 Birds

White-tailed Kite (*Elanus leucurus*)

White-tailed kite is not listed pursuant to either the federal or California ESAs. However, the species is fully protected pursuant to Section 3511 of the California Fish and Game Code. The species is a common resident in the Central Valley as well as most of the California coast (Dunk 1995). In northern California, white-tailed kites typically nest from March through June. Nesting occurs in large, dense-topped trees within riparian, oak woodland, savannah, and agricultural communities that are near suitable foraging areas (i.e., open grassland, oak savannah, emergent wetlands, and some row and field crops). The species has been observed regularly in small numbers throughout Sacramento County (Bumgardner pers. obs.).

A total of six occurrences exist within 5 miles of the study area for this species, with one occurrence recorded within the study area along Elder Creek (CNDDB Element Occurrence No. 27; CNDDB 2014). This occurrence is described as a nest located in a tree between pastures and fields. In addition, there are several eBird records for the species within 2 miles or less from the Project Site (eBird 2014). Therefore, white-tailed kite is considered to have potential for nesting within or immediately adjacent to the study area.

Northern Harrier (*Circus cyaneus*)

Northern harrier (*Circus cyaneus*) is not listed in accordance with either the federal or California ESAs. However, it is designated as a California Species of Special Concern by the CDFW (when nesting). It occurs from sea level to the mid-elevations of the Sierra Nevada where there is grassland, open rangeland, desert flats, or fresh or saltwater marsh. The species nests from April to September with peak activity occurring June through July. Nests are typically located on the ground in grassland, weedy fields, grain fields, or emergent marsh.

No nesting occurrences of this species in Sacramento County have been reported in the CNDDB; the nearest occurrence is at the Beale Air Force Base, approximately 40 miles to the north of the study area (CNDDB 2014). However, it has been observed to occur in small numbers throughout Sacramento County during the nesting season and there are multiple eBird records from June and July in Sacramento County (Bumgardner pers. obs.; eBird 2014). The species was also recently observed nesting in a grain field approximately one mile northwest of the site, just north of Morrison Creek (Baba and Bumgardner, pers. observ. 2015). Consequently, the species is considered to have potential to nest within the study area, particularly in fallow pastures with tall grass.

Swainson's Hawk (*Buteo swainsoni*)

Swainson's hawk (*Buteo swainsoni*) is listed as a threatened species pursuant to the California ESA. The species nests in western North America (i.e., Canada, western United States, and Mexico) and typically winters from South America north to Mexico. However, a small population has been observed wintering in the Sacramento-San Joaquin River Delta (England et al. 1997). In California, the nesting season for Swainson's hawk ranges from mid-March to late August. In the Central Valley, Swainson's hawks are known to nest within tall trees in a variety of wooded communities including, but not limited to, riparian, oak woodland, roadside landscape corridors, urban areas, and agricultural areas.

Swainson's Hawks have an unusual raptor diet, in that they are predominantly insectivorous, feeding on grasshoppers, dragonflies and crickets. During the breeding season, insects become less important and larger prey, such as rabbits, rodents and small reptiles, are incorporated as the main source of protein. Foraging habitat includes open grassland, savannah, low-cover row and field crops, and livestock pastures. In the Central Valley, Swainson's hawks typically feed on a combination of California vole (*Microtus californicus*), California ground squirrel (*Otospermophilus beecheyi*), ring-necked pheasant (*Phasianus colchicus*), passerine birds, and grasshoppers (*Melanopulus* spp.). The species is an opportunistic forager and will readily forage in association with agricultural mowing, harvesting, disking, and irrigating (Estep 1989). The removal of vegetative cover by such farming activities results in more readily available prey items for the species. According to a recent study by Swolgaard, et al. (2008), the most frequently used foraging habitats within the Sacramento-San Joaquin Delta region are irrigated hay fields, ruderal areas, and dryland grain fields, with the heaviest usage immediately after mowing, likely due to a temporal increase in prey availability due to the loss of vegetative cover. The least frequently used habitats were oak woodland, irrigated field crops, urban environments, and riparian and lacustrine areas. Habitat loss and degradation are often cited as likely factors contributing to declines in Swainson's hawk populations in California. Threats include loss of riparian forest as nesting substrate, together with similar losses of grassland and other open habitats (such as a vernal pool/seasonal wetland complexes), as well as conversion of field crops to unsuitable foraging cover (such as cotton, vineyard and orchard).

Tall trees along the boundaries of the study area provide potential nesting habitat for Swainson's hawk, and the annual grasslands and irrigated pastures provide potential foraging habitat for the species. The grazed, annual grassland habitat within the study area is considered to be of the highest foraging habitat

quality, as the vegetative cover here is maintained at relatively short levels (Swolgaard, et al. 2008). Though neither foraging Swainson's Hawks nor nests have been reported within the study area, nine nests have been reported to the CNDDB within 5 miles of the site, with the nearest record located approximately 2 miles southeast of the study area near Bradshaw Road (CNDDB Element Occurrence 2244; CNDDB 2014). This record is described as an active nest in a 40-foot tall native tree surrounded by fallow land. Therefore, the species is considered to have potential for nesting within or immediately adjacent to the study area.

Ferruginous Hawk (*Buteo regalis*)

The winter distribution of ferruginous hawks historically included Kansas, Colorado, California, and Nevada south to New Mexico. Wintering ferruginous hawk is not listed in accordance with either the federal or California ESAs, but is currently tracked by the CNDDB. The historic nesting distribution of the ferruginous hawk in North America included eastern Washington, southern Saskatchewan, southwestern Manitoba, and western North Dakota south to eastern Oregon, Nevada, northern and southeastern Arizona, northern and southwestern New Mexico, northwestern Texas, western Oklahoma, western Kansas, western Nebraska, and rarely northeastern California. Currently, ferruginous hawks occupy much of their former breeding distribution. However, they are now gone from southwestern Manitoba, southeastern Arizona, southwestern New Mexico, and northwestern Texas. Historically, a few pairs of ferruginous hawks were known to nest in extreme northeastern California in Modoc County (Grinnell and Miller, 1944), and a few pairs still nest in this region of the State (particularly the Fall River Valley of Shasta County). Ferruginous hawks begin to migrate into California in August or September and return to their breeding habitat in late February or early March. Expansive, open grassland is the primary wintering habitat of the species. The wintering distribution of the ferruginous hawk in California extends from the Oregon state line to the Mexican border, west of the Colorado Desert and east of the northern humid coastal belt. Though no ferruginous hawks have been reported within the study area, there are multiple winter eBird records for the species in Sacramento County (eBird 2014). Though most CNDDB occurrence records are from the far eastern portions of the County, records of this species exist within 5 miles of the Project Site (near Mather Airport). The nearest occurrence is located approximately one mile north of the study area, within annual grassland at Mather Field (CNDDB Element Occurrence No. 31; CNDDB 2014). Consequently, the species is considered to have potential to winter at the Project Site.

Merlin (*Falco columbarius*)

Merlin is not listed in accordance with either the federal or California ESAs, but the wintering distribution of this species is currently tracked by the CNDDB. The species breeds in Canada and Alaska and occurs in California as an uncommon migrant and winter resident (August through April). Suitable foraging habitat includes a wide range of open environments including sea coast estuaries, desert, open grasslands, and semi-open woodlands within which it can hunt from low perches. It feeds primarily on small birds (e.g., horned lark [*Eremophila alpestris*]). Consequently, the irrigated pastures and annual grasslands provide potential foraging habitat for the species.

There are no CNDDB records for this species in the vicinity of the study area, with the nearest record reported approximately 8.5 miles southeast at the Sacramento Regional Wastewater Treatment Plant Bufferlands, near Laguna Creek (CNDDB Element Occurrence No. 20; CNDDB 2014). This occurrence is described as open habitat, dominated by annual grassland and seasonal wetlands, interspersed with vernal pools and some riparian vegetation. In addition, there are multiple winter eBird records for the species in Sacramento County (eBird 2014). The nearest eBird records are from the Rosemont area of Sacramento County (less than 4 miles from the Project Site). Therefore, it is considered to have a potential for wintering within the Project Site.

Burrowing Owl (*Athene cunicularia*)

Burrowing owl is not listed pursuant to either the federal or California ESAs. However, it is designated as a California Species of Special Concern by the CDFW. It is a year-round resident in annual and perennial grasslands or other vegetation communities that support sparse or non-existent tree or shrub canopies, such as rolling hills, grasslands, desert floors, and open bare ground with gullies and arroyos. They can also inhabit developed areas such as golf courses, cemeteries, roadsides within cities, airports, vacant lots in residential areas, school campuses, and fairgrounds (Haug et al. 1993). The species typically uses burrows created by fossorial mammals, most notably the California ground squirrel, but may also use man-made structures such as cement culverts; cement, asphalt, or wood debris piles; or openings beneath cement or asphalt pavement (CDFG 2012). It has even been observed wintering in boulder piles (Bumgardner pers. obs.). The breeding season extends from approximately February 1 through August 31 (CBOC 1993; CDFG 2012).

Though no occurrences of this species have been recorded within the study area, multiple occurrences have been recorded in the CNDDB and eBird for the vicinity of the Project Site (CNDDB 2014, eBird 2014). The nearest of these occurrences is at Mather Field, approximately one mile north of the study area (CNDDB Element Occurrence No. 487), and is described as being grazed annual grassland with 16 active burrows and several individual birds observed over three different dates (CNDDB 2014). Though use of much of the study area for active agricultural operations (particularly irrigated grassland) precludes occupation by burrowing owls, California ground squirrel burrows are present within the site at scattered locations and could provide suitable roosting or nesting habitat for individuals. In addition, most of the study area (even the irrigated grasslands) is suitable as foraging habitat for the species. Consequently, it is considered to have potential to occur within the Project Site.

Loggerhead Shrike (*Lanius ludovicianus*)

The loggerhead shrike is not listed pursuant to either the federal or California ESAs, but is considered a California Species of Special Concern by the CDFW (when nesting). The species generally occurs in a variety of open grassland, oak savannah, shrubland, and other similar habitats where it feeds primarily on large insects (e.g., grasshoppers). However, the species may also occasionally take small reptiles, birds, and mammals. It nests in small trees and shrubs in open country with short vegetation such as pastures, old orchards, mowed roadsides, cemeteries, golf courses, agricultural fields, riparian areas,

and open woodlands (Yosef 1996). It has even been observed nesting in cattails (Bumgardner pers. obs.). Nesting typically occurs during March to June with young becoming independent during July or August. The nest is generally well-concealed on a stable branch in a densely-foliaged shrub or tree. Nest territories have been found to range in size from 11 to 40 acres (Miller 1931). In areas of year-round residence (such as much of lowland California) members of a pair are known to defend adjoining territories during the non-breeding season and then defend a single nesting territory comprised of the adjoining winter territories during the breeding season (Lefranc 1997).

The nearest CNDDB record for this species is in Alameda County (CNDDB 2014). Though no nesting occurrences of loggerhead shrike have been reported within the vicinity of the study area (CNDDB 2014), it has been observed nesting elsewhere in Sacramento County (Bumgardner pers. obs.). In addition, there are eBird records for the species for the peak nesting season in the County (eBird 2014). The nearest of these records are from the Rancho Cordova Golf Course (less than 2 miles from the Project Site) and areas immediately west of Sunrise Boulevard (eBird 2014). Clumps of landscape trees, as well as that of riparian scrub habitat along Elder Creek, may provide suitable nesting habitat, especially considering that existing annual grassland provides ideal foraging conditions. Therefore, it is considered to potentially nest within the Project Site.

Yellow-Billed Magpie (*Pica nuttallii*)

Yellow-billed magpie is not listed in accordance with either the federal or California ESAs, but is currently tracked by the CNDDB (when nesting or communally roosting). This endemic species is a year-long resident of the Central Valley and Coast Ranges from San Francisco Bay to Santa Barbara County. It builds large, bulky nests in trees in a variety of open woodland habitats, typically near grasslands, pastures, or croplands. Nesting occurs from February through July (CDFG 2005). It has shown to be particularly susceptible to West Nile Virus, which may have been the cause of death for thousands of individuals during the last decade.

Large trees along Elder Creek and associated with nearby residences provide potential nest and roost sites for the species. Though no occurrences of yellow-billed magpie are known from within the study area, there are many eBird records for the species from throughout Sacramento County. The nearest of these records is from the intersection of Elder Creek Road and Excelsior Road (less than one mile from the study area) (eBird 2014). Several yellow-billed magpies were observed to be foraging in the understory of landscape trees along Elder Creek Road during the 2014 rare plant surveys. Therefore, it could nest within the study area.

Tricolored Blackbird (*Agelaius tricolor*)

Tricolored blackbird (*Agelaius tricolor*) is listed as an endangered species pursuant to the California ESA. It was emergency listed by the California Fish and Game Commission on December 3, 2014. The emergency listing provides the full protection of the California ESA to the species immediately. This unheralded step (i.e., first emergency listing by the Commission) was considered necessary due to the

species precipitous decline (41% since 2011) and provides time for the Commission to consider a formal listing petition sometime in spring 2015. The emergency listing is valid for six months and can be renewed for six months if necessary. The basis for an emergency listing under California Fish and Game Code section 2076.5 is an "emergency posing a significant threat to the continued existence of the species."

The tricolored blackbird has one of the smallest ranges of any bird species in North America. Almost the entire population occurs year-round in cismontane California, with the Central Valley supporting the largest populations. However, small numbers occur in transmontane California (i.e., deserts and Great Basin), Oregon, western Nevada, Washington, and northern Baja California. Tricolored blackbird is not migratory over most of its range, but leaves northeastern California in fall and winter. Flocks become nomadic in fall seeking food. In winter flocks become more widespread from Marin to Santa Cruz counties and in the Sacramento River Delta. The breeding season for this species generally extends from mid-April into late July. Prospecting (i.e., searching for and visiting potential nest sites) typically occurs between early April and early June in the Sacramento area. Nesting colonies vary in size from about 50 nests to over 20,000 nests. Historically, tricolored blackbirds were found nesting in large to very large colonies (some estimated at over 100,000 nests) in areas with cattail or tule marsh habitats. However, with the decline in such habitats, the species now also nests in thickets of willow, Himalayan blackberry, grain fields, and tall herbs (especially species with spines or stinging hairs such as milk thistle and stinging nettle respectively). Foraging habitats are generally associated with open grassland, fields, and farm lands that provide high densities of prey species such as grasshoppers and butterfly larvae during the nesting seasons. Such foraging habitats are typically within 3 miles or less of the nesting colony. The species has been recorded as a nesting species in the CNDDB (2014) at several locations close to the Project Site. The nearest of these locations is less than 900 feet east of the eastern boundary of Aspen VIII. In addition, there are four existing colonies associated with small Himalayan blackberry stands located in the central and southeastern portions of Aspen VIII (Figure 10). As such, the species is known to nest on and immediately adjacent to the project site.

5.3 BIRDS OF PREY (RAPTORS)

All raptors including those species that are not considered as special-status species are protected under Section 3503.5 of the California Fish and Game Code. This latter section of the California Fish and Game Code provides protection to the nests and eggs of such species as well as individuals. Raptor species that are not considered as "special-status species" by CDFW but that occur in the vicinity of the Project Site include American kestrel (*Falco sparverius*), red-tailed hawk (*Buteo jamaicensis*), and red-shouldered hawk (*Buteo lineatus*) in the order Falconiformes, and great-horned owl (*Bubo virginianus*) and barn owl (*Tyto alba*) in the order Strigiformes (Bumgardner pers. obs.). It should be noted that American kestrel and barn owl are cavity or crevice nesters, whereas each of the other raptor species build stick nests. Nonetheless, suitable nesting locations for each of these species are limited to the larger trees in and immediately adjacent to the Project Site (typically with DBH larger than 15 inches). Though there is no evidence of nesting by raptors on the Project Site, nests are known from throughout this portion of Sacramento County. Consequently, given the presence of suitable nesting structure

within and immediately adjacent to the Project Site and known occurrences of other nesting raptors within the site vicinity, these species are considered to have potential for nesting at the site.

6.0 POTENTIAL IMPACTS TO BIOLOGICAL RESOURCES AND RECOMMENDED MITIGATION MEASURES

This section of the document addresses changes in the existing environmental baseline for biological resources (i.e., impacts) that may result from implementation of the Project and are considered significant consistent with Section 15065 and Appendix G of the CEQA Guidelines. Figure 10 shows the locations of sensitive species identified at the site, the various habitat communities, as well as the proposed boundaries of the mining and limits of disturbance. Also depicted in Figure 10 is the proposed area of preservation, totaling 90.63 acres, including Elder Creek. Figure 5 illustrates existing features upon completion of reclamation. Mitigation measures are provided to avoid, minimize, or otherwise compensate for the identified impacts where such measures are available.

It should be noted that no potential impacts are associated with the following criteria:

- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites; or
- conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Consequently, impacts associated with the above criteria are not analyzed in this document.

6.1 WETLANDS AND WATERS OF THE U.S.

A total of 27.796 acres of jurisdictional wetlands and Waters of the U.S. have been mapped within the Project Site (Table 2, Figures 3). The proposed Project will result in the loss of 5.282 acres of wetlands, including vernal pool, seasonal wetland, seasonal swale, freshwater marsh, perennial stream, ephemeral stream, pond, and ditch wetland habitats (Table 2, Figure 10).

TABLE 2. WETLAND IMPACTS SUMMARY

Wetland Type	Total Acres (Aspen VIII/IX)	Total Acres Impacted
Vernal Pool	7.260	0.597
Seasonal Wetland	5.741	1.500
Seasonal Swale	1.258	0.383
Freshwater Marsh	4.752	0.487
Perennial Stream	5.415	0.043
Ephemeral Stream	0.006	----
Pond	0.920	0.185
Ditch	2.444	2.178
Totals	**27.795**	**5.373**

Impacts to wetlands and other Waters of the U.S. that would occur with project implementation would result in a substantial adverse effect on federally jurisdictional Waters of the U.S., including wetlands, as defined by Section 404 of the CWA. These impacts would also constitute an adverse effect on waters of the State subject to the RWQCB jurisdiction. Additionally, these areas may be regulated by the CDFW and protected under the Sacramento County General Plan. Therefore, impacts to wetlands and other Waters are considered to be *significant.*

Mitigation Measures

Implementation of the following mitigation measures would reduce impacts from the proposed Project to a *less-than-significant* level.

MM-1 *Before conducting any grading, clearing, or excavation activity associated with the Project, Teichert shall obtain all necessary permits under Sections 401 and 404 of the CWA or the state's Porter-Cologne Act. Any wetlands or waters that would be lost or disturbed shall be replaced or created, restored, or enhanced on a "no-net-loss" basis in accordance with the USACE and the RWQCB policies. Any wetland creation or restoration proposed shall be at an acreage and location and by methods agreeable to the USACE, the RWQCB, and the County, as determined during the Section 401 and Section 404 permitting process. Alternatively, Teichert may choose to purchase wetland mitigation credits from a wetland mitigation bank that is authorized by the USACE.*

MM-2 *Water quality concerns during construction will also be addressed in a Section 401 water quality certification from the RWQCB. A Storm Water Pollution Prevention Plan (SWPPP) will also be required during construction activities. SWPPPs are required in issuance of a National Pollutant Discharge Elimination System (NPDES) construction discharge permit by the U.S. Environmental Protection Agency. Implementation of Best Management Practices (BMPs) during construction is standard in SWPPPs and water quality certifications. Examples of BMPs include stockpiling of debris away from regulated wetlands and waterways; immediate removal of debris piles from the site during the rainy season; use of silt fencing and construction fencing around regulated waterways; and use of drip pans under work vehicles and containment of fuel waste throughout the site during construction.*

MM-3 *In addition, a Streambed Alteration Agreement will be obtained from CDFW, pursuant to Section 1602 of the CDFW Code, for the installation of the culvert under Elder Creek Road, and any other activities affecting the bed, bank, or associated riparian vegetation of the stream. Teichert will coordinate with CDFW in developing appropriate mitigation, and should abide by the conditions of any executed permits.*

6.2 SPECIAL-STATUS SPECIES

Implementation of the proposed Project would result in both temporary (with reclamation), direct, and/or indirect impacts on a number of special-status plant and animal species. A discussion of those

species is provided below.

6.2.1 Loss of Habitat for and Individuals of Sanford's Arrowhead

Sanford's arrowhead was identified at the site through protocol-level rare plant surveys performed in 2014 (Teichert 2015b). Colonies were observed growing in two irrigated ditches near the western portion of the Aspen VIII property (Figure 10). A large population (2,000+ plants) occurs within an irrigated ditch, extending approximately 2,779 lineal feet in a south to north direction. A few additional plants were identified in a connected ditch running east to west along the northern border of an adjacent cemetery. The majority of Sanford's arrowhead would be directly impacted by the proposed Project, including approximately 2,278 linear feet of irrigation ditch supporting the plants. Other portions of the ditch not proposed to be disturbed by the Project would also expect to be indirectly impacted, since irrigation to existing pastures would likely cease through implementation of the Project. For these reasons, Project-related impacts to Sanford's arrowhead would be considered *significant*.

Mitigation Measures

Implementation of the following mitigation measures would reduce impacts from the proposed Project to a *less-than-significant* level.

MM-4 *Because all current populations of Sanford's arrowhead are supported through irrigation and farming practices at the site, no preservation of Sanford's arrowhead is proposed. Instead, Teichert shall transplant no less than 40 plugs (1ft x 1ft x 1ft), with no fewer than three individual Sanford's arrowhead plants per plug, to a preserved portion of Morrison Creek associated with the Granite Vineyard-Aspen III-South project area located approximately 1.5 miles west of the Project. Morrison Creek presently supports a similar hydrological regime to that where Sanford's arrowhead is currently growing and new occurrences of the species have been observed within a portion of the Morrison Creek channel approximately 2.5 miles northeast of the proposed transplant site (B. Baba, pers. obs.). The locations from which plugs are taken shall be selected randomly to assure the greatest potential genetic diversity of the source plants.*

MM-5 *Teichert shall monitor the transplanted Sanford's arrowhead to evaluate the efficacy of such transplantation as it relates to future mitigation efforts for this species. Monitoring shall occur for five consecutive years after transplantation and a final report submitted to Sacramento County PER and CDFW by October of the final year of monitoring. Teichert shall not be bound by any survivorship monitoring standards nor additional transplantation requirements given that all occupied habitat within Aspen VIII will be removed or impacted and no source material for additional transplantation will be available upon loss of the occupied onsite habitat.*

6.2.2 Impacts to and Loss of Habitat for Vernal Pool Invertebrates

An andrenid bee, vernal pool fairy shrimp, mid-valley fairy shrimp, hairy water flea, Rickesecker's hydrochara, vernal pool tadpole shrimp, and California linderiella occur in or utilize seasonally inundated depressions such as vernal pools, seasonal wetlands, and seasonal wetland swale. The vernal pool fairy shrimp, vernal pool tadpole shrimp, and California fairy shrimp have been observed from numerous vernal pools and seasonal wetlands at the Project Site (EcoAnalysts 2006). Based on these previous observations, Teichert has assumed that all suitable habitat (i.e., non-irrigated) for special-status vernal pool invertebrates within the affected area is occupied by vernal pool invertebrates.

Table 3 below summarizes the total acreage of habitat that the Project would affect, including potential indirect impacts. It should be noted that several seasonal wetlands are located in irrigated pastures and continuously affected by summer irrigation, remaining saturated or inundated for prolonged periods. These irrigated seasonal wetlands do not provide habitat for the special-status species invertebrates discussed above due to their extended hydroperiods.

TABLE 3. DIRECT AND INDIRECT EFFECTS ON SPECIAL-STATUS VERNAL POOL INVERTEBRATES

Potential Habitat	Total Acres (Aspen VIII/IX)	Direct Impacts (acres)	Indirect Impacts (acres)
Vernal Pool (non-irrigated)	*6.964	0.301	0.031
Seasonal Wetland (non-irrigated)	3.524	0.572	0.182
Seasonal Swale (non-irrigated)	0.362	0.021	0.047
Totals	**11.146**	**0.894**	**0.260**

*Note: 0.296 acre of vernal pools were field confirmed as irrigated based on recent observation with the USFWS

Implementation of the proposed Project would result in the loss of 0.894 acre of special-status vernal pool invertebrates, including the vernal pool fairy shrimp and vernal pool tadpole shrimp. There is also the potential for indirect loss of 0.260 acre of habitat. The direct and potential indirect impacts to 1.154 acres of habitat and potential mortality of these vernal pool invertebrates are considered to be *significant.*

Mitigation Measures

Implementation of the following mitigation measures would reduce impacts from the proposed Project to a *less-than-significant* level.

MM-6 *Teichert shall purchase vernal pool fairy shrimp and vernal pool tadpole shrimp conservation/mitigation credits from a USFWS-authorized conservation bank whose service area includes the Project. The purchase of conservation/mitigation credits shall be consistent with the requirements of the Programmatic Formal Endangered Species Act Consultation on Issuance of 404 Permits for Projects with Relatively Small Effects on Listed Vernal Pool Crustaceans within the Jurisdiction of the Sacramento Field Office, California (1-1-96-F-1). As such, preservation credits for vernal pool fairy shrimp and vernal pool tadpole*

shrimp shall be acquired at a compensation ratio of two vernal pool credits for every acre of suitable habitat directly or indirectly affected. Furthermore, creation credits for vernal pool fairy shrimp and vernal pool tadpole shrimp shall be acquired at a compensation ratio of one vernal pool credit for every acre of suitable habitat directly affected. All other provisions of the programmatic biological opinion also apply. Note that no compensation for seasonal wetlands created or affected by irrigation runoff is required given that these aquatic features are not considered suitable habitat for vernal pool fairy shrimp or vernal pool tadpole shrimp. The final acreage of affected suitable habitat for vernal pool fairy shrimp and vernal pool tadpole shrimp will be determined by the USFWS in the agency's determination that the Project can be addressed by the programmatic biological opinion. The above compensation will also address other special-status vernal pool invertebrates that have been determined to have some potential to occur on the Project Site (e.g., an andrenid bee, the mid-valley fairy shrimp, hairy water flea, Rickesecker's hydrochara, and California fairy shrimp).

Alternatively, Teichert may participate in a regional planning/conservation process, such as the proposed SSHCP that provides a mechanism to mitigate all biological impacts based on a standardized formula. Preparation of the SSHCP, a regional conservation plan, is currently in progress pursuant to Section 10 of the federal Endangered Species Act and Section 2800 of the California Fish and Game Code (Natural Communities Conservation Act of 1991).

6.2.3 Loss of Habitat for and Disturbance to Western Spadefoot

Western spadefoot has a patchy and localized distribution in Sacramento County, but is known from similar habitats less than 4 miles away at the Mather Field Vernal Pool Complex. Aquatic sites on the Project Site that are potentially suitable as breeding sites for western spadefoot include vernal pools, seasonal wetlands, and ponds. There are a total of 19.936 acres of such aquatic sites on the property. The Project would result in the permanent loss of 3.034 acres of these aquatic sites. Thus, the Project would reduce the reproductive potential and recruitment from these aquatic sites for western spadefoot (if utilized by the species).

The Project Site also supports 308.5 acres of annual grassland that could be occupied by western spadefoot during the non-breeding season (note that irrigated pasture/hay is not considered to be suitable terrestrial habitat). The Project would result in the temporary loss of 96.2 acres of such habitat. This loss is considered temporary given that reclamation activities would eventually restore those acres, in addition to potentially providing more acres of annual grassland through the conversion of irrigated to non-irrigated grasslands.

Lastly, an unknown number of western spadefoots could be disturbed, killed, or injured during earth-moving activities associated with the Project. The loss of individuals would also reduce the reproductive potential and recruitment of the species in the Project vicinity. The loss of suitable western spadefoot habitat and individuals is considered to be *potentially significant*.

Mitigation Measures

Implementation of the following mitigation measures would reduce impacts from the proposed Project to a *less-than-significant* level.

MM-7 *Teichert shall retain a qualified biologist to conduct focused surveys for western spadefoot in the potentially suitable aquatic sites on the Project Site (i.e., vernal pools, seasonal wetlands, and ponds) that could be directly affected by the Project. The surveys shall be conducted prior to each discrete phase of mining and include a minimum of three nighttime surveys for calling adults during the early breeding season and a minimum of three surveys for egg masses and larvae throughout the remainder of the breeding season (mid-February to mid-May). If no evidence of western spadefoot is found during the surveys, no further mitigation shall be required.*

If western spadefoot is found on the Project Site, Teichert shall purchase mitigation credits at a 1:1 compensation ratio for the total acreage of occupied western spadefoot aquatic habitat that would be permanently lost as a result of the Project. The mitigation credits shall be purchased from an authorized mitigation bank that includes the Project within its service area or is otherwise authorized by the CDFW to sell mitigation credits to Teichert for the Project.

6.2.4 Loss of Habitat for and Disturbance to Western Pond Turtle

Western pond turtle typically occurs in natural or semi-natural still or slow-moving aquatic sites. As such it sometimes appears in ponds, marshes, and slow-moving perennial drainages where there is water, basking sites, and food. The Project would result in the permanent loss of 0.676 acres of pond, marsh, and perennial drainage. However, this impact is considered to be *less-than-significant* given that reclamation on the Project Site would eventually create up to 14.2 acres of stormwater retention pond that could be occupied by the species and the entire reach of Elder Creek within the property will be within the proposed preservation area for the Project.

Given that the majority of western pond turtle nesting sites are located within 650 feet, and up to 1,310 feet, from aquatic habitat, much of the annual grassland within the Project Site is considered suitable nesting habitat. Thus, earth-moving activities within the Project Site could then result in the destruction of eggs or neonate turtles. It should be noted that neonate western pond turtles may overwinter in the nest, as individuals have almost never been observed in early fall (Holland 1985). They are believed to exit the nest during the following spring (Buskirk 1992). Therefore, a limited operating period (i.e., period when eggs or neonates could not be affected by ground disturbance) is not available for this species. The loss of eggs, neonates, or adults is considered to be *potentially significant.*

Mitigation Measures

The following mitigation measures would reduce the above potential impacts to a *less-than-significant* level.

MM-8 *Teichert shall retain a qualified biologist to conduct focused surveys for western pond turtle in the potentially suitable aquatic sites on the Project Site (i.e., ponds, marshes, and perennial drainages). The survey shall be conducted prior to each discrete phase of mining, be conducted no more than five days prior to the initiation of site preparation activities, and be focused on water bodies that are within 300 feet or less of the proposed activities. If western pond turtles are observed during the pre-construction survey, and a qualified wildlife biologist determines site preparation activities could harm the turtles, the biologist shall conduct salvage and relocation of the turtles downstream to suitable perennial aquatic habitat during the same day of their capture. The aquatic habitat to which the turtles are relocated shall be no less than one mile of the Project Site.*

MM-9 *All construction staff shall be aware of the potential to uncover western pond turtle nests during grading and earthmoving activities. Construction staff shall be advised, if turtle eggs are discovered during such activities, construction shall temporarily be halted and a qualified wildlife biologist contacted to salvage the eggs. Prior to arrival of the biologist, the outer boundaries of the egg scatter shall be flagged. The eggs shall then be covered with a small layer of sand or soil over the eggs (to prevent damage or overheating). The qualified wildlife biologist shall then salvage the eggs and transport them to a nearby wildlife rehabilitation center that has been approved in advance by the USFWS and CDFW. Release of any hatchling turtles from the wildlife rehabilitation center shall occur downstream within suitable perennial aquatic habitat that is no less than one mile downstream of the Project.*

6.2.5 Disturbance to Nesting White-tailed Kite or Swainson's Hawk

White-tailed kite and Swainson's hawk are both known to nest in the vicinity of the Project Site. Though there is no evidence to suggest that either of these species have nested within the Project Site, it is possible that nests could be sited in the larger trees on and adjacent to the site in the future. Consequently, should tree removal, as proposed for the Project, occur during the nesting season of these species (i.e., mid-March to late August), there is the potential for the loss of eggs or juveniles during the removal activities.

In addition, nesting pairs located within up to 0.25 miles of the Project Site could be adversely affected during mining-related vegetation removal or earthmoving associated with the Project. Such adverse effects are typically associated with noise and visual changes that distract individuals from being properly attentive to eggs or juveniles. As such, there is some potential for nesting pairs to be sufficiently disturbed that eggs or juveniles are abandoned or otherwise lost. These impacts are considered to be *potentially significant*.

Mitigation Measures

The following mitigation measure would reduce the above potential impacts to a *less-than-significant* level.

MM-10 *To avoid and minimize impacts to nesting white-tailed kite or Swainson's hawk, Teichert shall not initiate mining-related vegetation removal or earthmoving during the nesting season (February 15 through August 31). All initial vegetation removal and earthmoving shall occur between September 1 and February 14 to the extent feasible.*

Alternatively, if Teichert initiates mining-related vegetation removal or earthmoving between February 15 and August 31, surveys shall be conducted for nesting white-tailed kite and Swainson's hawk in all suitable trees that are within and out to 0.25 miles from the Project boundaries. The surveys shall be conducted by a qualified biologist immediately preceding initiation of each phase of mining-related vegetation removal or earthmoving on the Project site according to the following schedule: the first visit shall occur within 14 days prior to vegetation removal or earthmoving and the second visit shall occur within 3 days prior to vegetation removal or earthmoving.

If nesting individuals are found prior to initiation of mining-related vegetation removal or earthmoving in the year of the survey, a mining exclusion zone shall be established within 0.25 miles of the active nest(s) until a qualified biologist determines that the young-of-the-year are no longer reliant upon the nest.

Alternatively, Teichert may retain a qualified biologist to monitor any active nests that are within 0.25 miles or less from mining-related vegetation removal or earthmoving to determine if the individuals are exhibiting any behaviors that would suggest that nest failure could occur. If the qualified biologist determines that disturbance is sufficient to cause nest failure, all activities within 0.25 miles of the nest will be terminated until the young-of-the-year are no longer reliant upon the nest.

Under no circumstances shall mining-related vegetation removal or earthmoving be initiated within less than 500 feet of an active nest once nesting has begun. Note that no restrictions on mining-related vegetation removal or earthmoving are required in relation to active nests beyond 500 feet if nesting is initiated after active mining has begun.

6.2.6 Disturbance to Nesting Northern Harrier

Northern harrier is known to nest in grassland, weedy fields, grain fields, and emergent marsh. It is strongly suspected to nest in Sacramento County given the prevalence of sitings each year during the peak nesting season, and has recently been observed nesting in a nearby grain field northwest of the Project Site (Baba and Bumgardner, pers. observ. 2015). As such, it may nest in suitable habitat on the

Project Site (e.g., taller, denser grasses). Consequently, should mining-related vegetation removal or earth-moving associated with the Project occur during the nesting season of the species (i.e., mid-March to late August), there is the potential for the loss of eggs or juveniles during these activities.

In addition, nearby mining-related vegetation removal or earthmoving could result in noise and visual changes that distract individuals from being properly attentive to eggs or juveniles. As such, there is some potential for nesting pairs to be sufficiently disturbed that eggs or juveniles are abandoned or otherwise lost. These impacts are considered to be *potentially significant*.

Mitigation Measures

The following mitigation measure would reduce the above potential impacts to a *less-than-significant* level.

MM-11 *To avoid and minimize impacts to nesting northern harrier, Teichert shall not initiate mining-related vegetation removal or earthmoving during the nesting season (February 15 through August 31). All initial mining-related vegetation removal and earthmoving removal shall occur between September 1 and February 14 to the extent feasible.*

Alternatively, if Teichert initiates mining-related vegetation removal or earthmoving between February 15 and August 31, surveys shall be conducted for northern harrier in suitable nesting habitat within and out to 500 feet from the Project boundaries. The surveys shall be conducted by a qualified biologist immediately preceding initiation of each phase of mining-related vegetation removal or earthmoving on the Project site according to the following schedule: the first visit shall occur within 14 days prior to vegetation removal or earthmoving and the second visit shall occur within 3 days prior to vegetation removal or earthmoving.

If nesting individuals are found prior to initiation of mining-related vegetation removal or earthmoving in the year of the survey, a mining exclusion zone shall be established within 500 feet of the active nest(s) until a qualified biologist determines that the young-of-the-year are no longer reliant upon the nest. All exclusion zones shall be demarcated by security fencing.

Alternatively, Teichert may retain a qualified biologist to monitor any active nests that are within 500 feet or less from mining-related vegetation removal or earthmoving to determine if the individuals are exhibiting any behaviors that would suggest that nest failure could occur. If the qualified biologist determines that disturbance is sufficient to cause nest failure, all activities within 500 feet of the nest will be terminated until the young-of-the-year are no longer reliant upon the nest. Under no circumstances shall mining-related vegetation removal or earthmoving be initiated within less than 200 feet of an active nest once nesting has begun.

6.2.7 Disturbance to Other Nesting Raptors

Common raptors (i.e., species not designated as special-status species) that are known to nest near the Project Site include red-tailed hawk, red-shouldered hawk, American kestrel, great-horned owl, and barn owl. Most of these species nest in larger tree stands in the Project vicinity, but some individuals (especially red-tailed hawk and great-horned owl) may occasionally nest in "stand alone" trees. Consequently, should tree removal, as proposed for the Project, occur during the nesting season of these species (i.e., early February to late August), there is the potential for the loss of eggs or juveniles during the removal activities.

In addition, nearby mining-related vegetation removal or earthmoving could result in noise and visual changes that distract individuals from being properly attentive to eggs or juveniles. As such, there is some potential for nesting pairs to be sufficiently disturbed that eggs or juveniles are abandoned or otherwise lost. These impacts are considered to be *potentially significant*.

Mitigation Measures

The following mitigation measure would reduce the above potential impacts to a *less-than-significant* level.

MM-12 *To avoid and minimize impacts to other nesting raptors, Teichert shall not initiate mining-related vegetation removal or earthmoving during the nesting season (February 15 through August 31). All initial mining-related vegetation removal and earthmoving shall occur between September 1 and February 14 to the extent feasible.*

Alternatively, if Teichert initiates construction between February 15 and August 31, surveys shall be conducted for other nesting raptors (species not designated as special-status) in suitable nesting habitat within and out to 500 feet from the Project boundaries. The surveys shall be conducted by a qualified biologist immediately preceding initiation of each phase of mining-related vegetation removal or earthmoving on the Project site according to the following schedule: the first visit shall occur within 14 days prior to vegetation removal or earthmoving and the second visit shall occur within 3 days prior to vegetation removal or earthmoving.

If nesting individuals are found prior to initiation of mining-related vegetation removal or earthmoving in the year of the survey, a mining exclusion zone shall be established within 300 feet of the active nest(s) until a qualified biologist determines that the young-of-the-year are no longer reliant upon the nest. All exclusion zones shall be demarcated by security fencing.

Alternatively, Teichert may retain a qualified biologist to monitor any active nests that are within 300 feet or less from mining-related vegetation removal or earthmoving to determine if the individuals are exhibiting any behaviors that would suggest that nest failure could

occur. If the qualified biologist determines that disturbance is sufficient to cause nest failure, all activities within 300 feet of the nest will be terminated until the young-of-the-year are no longer reliant upon the nest. Under no circumstances shall mining-related vegetation removal or earthmoving be initiated within less than 200 feet of an active nest once nesting has begun.

6.2.8 Disturbance to Nesting or Roosting Burrowing Owl

Burrowing owl has not been documented within the Project Site. Nonetheless, potentially suitable nesting and roosting habitat for burrowing owl is provided by California ground squirrel burrows that are scattered throughout the Project Site and the species is known from other locations in the Project vicinity. As such, the species is could occur on the Project Site.

If burrowing owl occurs on the Project Site, individuals could be subject to entombment and mortality during mining-related vegetation removal or earthmoving. Adults may be able to escape such impacts, but eggs and juveniles could still be lost since they are unable to leave the nest burrow. Even if adults are not lost directly due to ground-disturbing activities, individuals could abandon eggs or juveniles in the nest burrow due to adjacent disturbances. This impact is considered to be *potentially significant*.

Mitigation Measures

The following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

MM-13 *A pre-construction burrowing owl survey shall be conducted by a qualified wildlife biologist prior to any mining-related vegetation removal or earthmoving (including rough grading conducted between January 1 and February 14 that is associated with implementation of MM-12).*

The pre-construction survey shall be conducted by a qualified biologist within 500 feet or less of proposed mining-related vegetation removal or earthmoving according to the methodology provided in the CDFG Staff Report on Burrowing Owl Mitigation (2012). All burrows or atypical refugia showing evidence of occupation by burrowing owls that are found during the survey shall be geo-referenced with a global positioning system (GPS) unit and mapped on an appropriate scale map of the Project Site (no smaller than 1 inch = 100 feet).

The results of the survey, including negative findings, shall be submitted to CDFW within three days of their conclusion. If burrowing owls are found during the nesting season (i.e., during February 15 through August 31), no ground disturbance shall occur within 250 feet of occupied burrows until a qualified biologist determines that fledging has occurred (i.e., the juveniles are no longer dependent upon the nest burrows). If burrowing owls are found

during the non-nesting season (i.e., September 1 through February 14) no ground disturbance shall occur within 160 feet of occupied burrows.

Alternatively, Teichert may retain a qualified biologist to conduct passive relocation of individuals from occupied burrows utilizing one-way doors for a minimum of three consecutive days (only during the non-nesting season). Once the occupied burrows have been cleared, Teichert may backfill the burrows. If passive relocation is utilized, Teichert shall also provide alternate natural or artificial burrows that are beyond 160 feet from the impact area and that are within or contiguous to a minimum of 6.5 acres of foraging habitat for each pair of relocated burrowing owls. One alternate natural or artificial burrow should be provided for each burrow that will be excavated in the Project impact area. Artificial burrow creation, if utilized, shall follow the guidelines in Trulio (1995) and the CDFG Staff Report on Burrowing Owl Mitigation (2012). Teichert shall be responsible for reporting all observations of burrowing owl to the CNDDB within ten (10) days of sighting.

6.2.9 Disturbance to Nesting Birds Protected Under the Migratory Bird Treaty Act

Other nesting birds have not been documented within the Project Site, but are to be expected. Most of these species, with the exception of introduced species, are afforded protection under the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code (particularly while nesting). Some of these species would nest in the onsite woody vegetation (i.e., trees and shrubs), but other species would nest on or near the ground (mostly in the non-irrigated, annual grassland). Consequently, should tree or other vegetation removal, as proposed for the Project, occur during the nesting season of these species (i.e., mid-February to late August), there is the potential for the loss of eggs or juveniles during these activities.

In addition, mining-related vegetation removal or earthmoving could result in noise and visual changes that distract adjacent nesting individuals from being properly attentive to eggs or juveniles. Consequently, there is some potential for nesting pairs to be sufficiently disturbed that eggs or juveniles are abandoned or otherwise lost. These impacts are considered to be *potentially significant*.

Mitigation Measures

The following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

MM-14 *Teichert shall rough grade all irrigated pasture/hay and non-irrigated, annual grassland within the mining boundary of the Project between September 1 and February 14 of the year in which mining starts to ensure that there is no available nesting habitat for species protected by the Migratory Bird Treaty Act in these onsite habitats (see restrictions associated with burrowing owl in MM-13).*

Alternatively, if mining-related vegetation removal or earthmoving is initiated between February 15 and August 31, a pre-construction nesting bird survey shall be conducted by a qualified wildlife biologist prior to any mining-related vegetation removal or earthmoving.

The surveys shall be conducted by a qualified biologist immediately preceding initiation of each phase of mining-related vegetation removal or earthmoving on the Project site according to the following schedule: the first visit shall occur within 14 days prior to vegetation removal or earthmoving and the second visit shall occur within 3 days prior to vegetation removal or earthmoving. The survey shall be conducted within all onsite habitats that could support nests and are within 120 feet or less of proposed mining-related vegetation removal or earthmoving. All active nests that are found during the survey shall be geo-referenced with a GPS unit and mapped on an appropriate scale map of the Project Site (no smaller than 1 inch = 40 feet). Data shall be collected for each active nest site and at a minimum shall include: (1) identification of nesting species; (2) description of nest site; (3) estimated nesting cycle status (i.e., time to nest completion, egg-laying, fledging, etc.); and (4) likelihood of nest failure from adjacent mining-related vegetation removal or earthmoving.

The results of the surveys, including negative findings, shall be submitted to CDFW within three days of their conclusion. If any active non-raptor bird nests are found onsite, Teichert shall develop and implement a plan for the protection of these nests, to be approved by CDFW, in a timely manner. The results of any protective measures instituted as a part of the protection and monitoring plan shall be provided to CDFW in electronic format within one week of implementation. Teichert shall be responsible for reporting all observations of threatened/endangered species or species of special concern to the CNDDB within ten (10) days of sighting.

All active nests found during the pre-construction survey shall be monitored at least twice per week to assess whether adjacent mining-related vegetation removal or earthmoving are adversely affecting the nest. If adverse effects are observed, all project-related activities within 120 feet of the nest shall be temporarily halted until fledging occurs (i.e., the juveniles are no longer dependent upon the nest).

No pre-construction nesting bird survey is required in areas within 120 feet of mining-related vegetation removal or earthmoving, if the activities are initiated prior to February 15 or after August 31.

6.2.10 Loss of Foraging Habitat for White-tailed Kite and Swainson's Hawk

White-tailed kite and Swainson's hawk are both known to nest in the vicinity of the Project Site. Consequently, foraging habitat associated with nearby nest territories for these species may include the

Project Site. Swainson's hawk utilizes both annual grasslands and irrigated pasture/hay as suitable foraging habitat. Approximately 331.1 acres of the Project Site was dedicated to irrigated pasture/hay in 2015, while 308.5 acres of the Project Site supported non-irrigated annual grassland. Another 14.265 acres of seasonal wetlands (i.e., vernal pool, seasonal wetland, and seasonal swale) occur on the Project Site and are suitable Swainson's hawk/white-tailed kite foraging habitat later in the breeding season (i.e., after dry-down). The Project would impact a total of 371.2 acres of potential Swainson's hawk/white-tailed kite foraging habitat, including 95.8 acres of annual grassland, 273.0 acres of irrigated pasture, and 2.4 acres of seasonal wetlands/vernal pools. The proposed reclamation includes restoring 359.8 acres to annual grassland and/or irrigated pasture. Furthermore, the proposed Project will mitigate for vernal pool and seasonal wetland habitats through the requirements of 404 permits.

White-tailed kite is a rodent specialist with 95 percent of the diet consisting of small rodents (especially California vole [*Microtus californicus*]). This latter prey species is abundant in both non-irrigated annual grassland and irrigated pasture/hay. As such, there is near 100 percent overlap in the suitable foraging habitat for Swainson's hawk and white-tailed kite on the Project Site. Impacts associated with the loss of suitable foraging habitat for Swainson's hawk are therefore similar for white-tailed kite. These impacts are considered to be *significant*.

Mitigation Measures

The following mitigation measures would reduce the above potential impact to a *less-than-significant* level.

MM-15 *Reclaim disturbed areas to suitable Swainson's hawk/white-tailed kite foraging habitat. Prior to commencing any site disturbing activities, Teichert will acquire temporary easement(s) over sufficient acreage to mitigate at a 1:1 ratio for the temporary loss of foraging habitat within a mining phase during the period between initial disturbance and final reclamation of that phase. The location of the temporary easement(s) and the management activities to be included therein shall be determined in coordination with Sacramento County PER and CDFW, and shall be based on the best available data for Swainson's hawk and white-tailed kite in Sacramento County. The acreage to be temporarily protected shall be, at a minimum, equal to that proposed to be disturbed for a particular phase(s). The temporary easement(s) for any given Project phase shall remain in place until onsite reclamation activities have fully reestablished, to the satisfaction of PER, suitable Swainson's hawk/white-tailed kite foraging habitat for the Project phase. If Teichert is unsuccessful in reestablishing suitable Swainson's hawk/white-tailed kite foraging habitat for any part of the Project, Teichert shall mitigate for the acreage that could not be re-established through one of the following approaches: (a) converting the temporary easement(s) to a permanent easement(s), (b) acquiring alternative lands to place into permanent easement(s) at a 1:1 ratio, (c) purchasing mitigation credits at a County-approved mitigation bank at a 1:1 ratio, or, (d) if the total acreage of Swainson's hawk/white-tailed kite foraging habitat that is permanently lost upon final reclamation is less than 40 acres, Teichert may choose to pay the per-acre impact fees as outlined in the Sacramento County Swainson's Hawk Mitigation Program. Teichert shall only be responsible for establishing a permanent easement(s)*

over acreage equal to the acreage on which suitable Swainson's hawk/white-tailed kite foraging habitat could not be reestablished upon final reclamation.

OR *Prior to commencing any site disturbing activities purchase permanent easement(s) over suitable Swainson's hawk foraging lands (1:1 ratio to account for any permanent loss of foraging habitat). The location of the easement(s) and the management activities to be included therein shall be determined in coordination with Sacramento County PER and CDFW, and shall be based on the best available data for Swainson's hawk and white-tailed kite in Sacramento County. Alternatively, Teichert may purchase credits for permanent loss of foraging habitat from an established mitigation bank authorized to sell Swainson's hawk foraging habitat credits and whose service area includes the Project. Any future projects occurring on Project Site shall be exempt from any additional mitigation pertaining to the loss of Swainson's hawk or white-tailed kite foraging habitat.*

6.2.11 Loss of Winter Foraging Habitat for Merlin and Ferruginous Hawk

Merlin and ferruginous hawk are known to winter throughout the Central Valley in small numbers (including in the vicinity of the Project Site). The loss of irrigated pasture/hay and non-irrigated annual grassland associated with the Project Site would result in a net decrease in the local foraging habitat for these species. Most of this net decrease in local foraging habitat would be temporary given that final reclamation associated with the Project would result in 359.8 acres of suitable habitat (i.e., annual grassland and/or irrigated pasture). In addition, merlin is a wide-ranging species and feeds primarily on various small avian species that tend to move over large areas (e.g., horned lark). Consequently, there is a substantial amount of suitable foraging habitat for the species within the Project vicinity and elsewhere each winter. Ferruginous hawk is also a wide-ranging species, and feeds mostly on small to medium-sized mammals (up to the size of black-tailed jackrabbit). There is also a substantial amount of suitable foraging habitat for this latter species within the Project vicinity and elsewhere each winter. Consequently, this impact is considered to be *less-than-significant*.

Mitigation Measures

No additional mitigation is required.

6.2.12 Disturbance to Nesting Loggerhead Shrike

Loggerhead shrike has not been documented nesting within the Project Site. However, it has been documented at nearby locations in Sacramento County during the nesting season. In addition, potentially suitable nesting and adjacent foraging habitat occurs on and immediately adjacent to the Project Site. Dense, woody vegetation (i.e., shrubs and trees) on the site could be used for nesting by the species, while the adjacent irrigated pasture/hay and non-irrigated annual grassland provides suitable foraging habitat. Adults are unlikely to be substantially disturbed from ground disturbing activities associated with the Project at any time other than the nesting season. However, during the nesting season, eggs or juveniles could be abandoned or otherwise lost due to adjacent disturbances

associated with mining-related vegetation removal and earthmoving. This impact is considered to be *potentially significant*.

Mitigation Measures

The following mitigation measure would reduce the above potential impact to a *less-than-significant* level.

MM-16 *To avoid and minimize impacts to nesting loggerhead shrike, Teichert shall not initiate mining-related vegetation removal or earthmoving during the nesting season (February 15 through August 31). All initial mining-related vegetation removal and earthmoving shall occur between September 1 and February 14 to the extent feasible.*

Alternatively if Teichert initiates mining-related vegetation removal or earthmoving between February 15 and August 31, surveys shall be conducted for nesting loggerhead shrikes in all suitable shrubs and trees that are within and out to 200 feet from the Project boundaries. The surveys shall be conducted by a qualified biologist immediately preceding initiation of each phase of mining-related vegetation removal or earthmoving on the Project site according to the following schedule: the first visit shall occur within 14 days prior to vegetation removal or earthmoving and the second visit shall occur within 3 days prior to vegetation removal or earthmoving.

If nesting individuals are found prior to initiation of mining-related vegetation removal or earthmoving in the year of the survey, a mining exclusion zone shall be established within 200 feet of the active nest(s) until a qualified biologist determines that the young-of-the-year are no longer reliant upon the nest.

Alternatively, Teichert may retain a qualified biologist to monitor any active nests that are within 200 feet or less from mining-related vegetation removal or earthmoving to determine if the individuals are exhibiting any behaviors that would suggest that nest failure could occur. If the qualified biologist determines that disturbance is sufficient to cause nest failure, all activities within 200 feet of the nest will be terminated until the young-of-the-year are no longer reliant upon the nest. Under no circumstances shall mining-related vegetation removal or earthmoving be initiated within less than 100 feet of an active nest once nesting has begun.

6.2.13 Disturbance to Nesting or Roosting Yellow-billed Magpie

Yellow-billed magpie has not been documented nesting or communally roosting within the Project Site. However, it has been documented at many locations throughout Sacramento County (as close as one mile from the Project Site). In addition, large trees along either Elder Creek or at nearby residences provide potential nest sites for the species. Therefore, the species could occur on the Project Site as a nesting species. Yellow-billed magpies prefer groves of trees (often near water) for communal roost

sites (typically in riparian woodland or forest). Given the lack of such habitat on or adjacent to the Project Site, the species is considered to have no potential to be impacted by the Project while communally roosting. However, during the nesting season, eggs or juveniles could be abandoned or otherwise lost due to adjacent disturbances. This impact is considered to be *potentially significant*.

Mitigation Measures

The following mitigation measure would reduce the above potential impact to a *less-than-significant* level.

MM-17 *To avoid and minimize impacts to nesting yellow-billed magpie, Teichert shall not initiate mining-related vegetation removal or earthmoving during the nesting season (February 15 through August 31). All initial vegetation removal or earthmoving shall occur between September 1 and February 14 to the extent feasible.*

Alternatively, if Teichert initiates mining-related vegetation removal or earthmoving between February 15 and August 31, surveys shall be conducted for nesting yellow-billed magpies in all suitable trees that are within 200 feet of the Project boundaries. The surveys shall be conducted by a qualified biologist immediately preceding initiation of each phase of mining-related vegetation removal or earthmoving on the Project site according to the following schedule: the first visit shall occur within 14 days prior to vegetation removal or earthmoving and the second visit shall occur within 3 days prior to vegetation removal or earthmoving.

If nesting individuals are found prior to initiation of mining-related vegetation removal or earthmoving in the year of the survey, a mining exclusion zone shall be established within 200 feet of the active nest(s) until a qualified biologist determines that the young-of-the-year are no longer reliant upon the nest.

Alternatively, Teichert may retain a qualified biologist to monitor any active nests that are within 200 feet or less from mining-related vegetation removal or earthmoving to determine if the individuals are exhibiting any behaviors that would suggest that nest failure could occur. If the qualified biologist determines that disturbance is sufficient to cause nest failure, all activities within 200 feet of the nest will be terminated until the young-of-the-year are no longer reliant upon the nest. Under no circumstances shall mining-related vegetation removal or earthmoving be initiated within less than 100 feet of an active nest once nesting has begun.

6.2.14 Disturbance to Nesting Tricolored Blackbird

Tricolored blackbird nests as a colonial species at scattered locations throughout Sacramento County where there is suitable nesting habitat (e.g., stands of cattail, tule, willow, California blackberry, Himalayan berry, wild rose, grain fields, milk thistle, stinging nettle, etc., that provide protection from

nest predators) adjacent to large open expanses of non-irrigated, annual grassland; irrigated pasture/hay; or alfalfa that support large numbers of prey species (e.g., grasshopper, butterfly larvae, etc.). The species is known to nest in four small Himalayan blackberry stands in the central and southeastern portions of Aspen VIII on the Project Site. It also has been documented nesting approximately 900 feet east of the eastern boundary of Aspen VIII and several other locations within 4 miles or less of the Project Site. Because tricolored blackbirds vacate nest sites at the end of the breeding season, adults are unlikely to be substantially disturbed from ground disturbing activities associated with the Project at any time other than the nesting season. However, during the nesting season, eggs or juveniles could be abandoned or otherwise lost due to disturbances associated with mining-related vegetation removal and earthmoving. This impacts are considered to be *significant*.

Mitigation Measures

The following mitigation measure would reduce the above impact to a *less-than-significant* level.

MM-18 *To avoid and minimize impacts to nesting tricolored blackbird, Teichert shall not initiate mining-related vegetation removal or earthmoving during the nesting season (February 15 through August 31). All initial mining-related vegetation removal and earthmoving shall occur between September 1 and February 14 to the extent feasible.*

Alternatively if Teichert initiates mining-related vegetation removal or earthmoving between February 15 and August 31, surveys shall be conducted for prospecting or nesting tricolored blackbird colonies in all potentially suitable Himalayan blackberry stands that are within and out to 250 feet from the Project boundaries. The surveys shall be conducted by a qualified biologist immediately preceding initiation of each phase of mining-related vegetation removal or earthmoving on the Project site according to the following schedule: the first visit shall occur within 14 days prior to vegetation removal or earthmoving and the second visit shall occur within 3 days prior to vegetation removal or earthmoving.

If nesting colonies are found prior to initiation of mining-related vegetation removal or earthmoving in the year of the survey, a mining exclusion zone shall be established within 250 feet of each active nesting colony until a qualified biologist determines that the young-of-the-year are no longer reliant upon the nest.

Alternatively, Teichert may retain a qualified biologist to monitor any active nesting colonies that are within 250 feet or less from mining-related vegetation removal or earthmoving to determine if the individuals are exhibiting any behaviors that would suggest that nest failure could occur. If the qualified biologist determines that disturbance is sufficient to cause nest failure, all activities within 250 feet of the nesting colony will be terminated until the young-of-the-year are no longer reliant upon the nest. Under no circumstances shall mining-related vegetation removal or earthmoving be initiated within less than 150 feet of an active nest colony once prospecting or nesting has begun.

6.3 PROTECTED TREES AND TREE CANOPY

The Aspen VIII and IX Arborist Report (Teichert 2015c, Attachment C) identifies a total of 102 trees, representing 17 species, within the Project boundaries or that could potentially be affected (i.e., dripline) by the proposed Project. A total of 3 valley oak and 9 California black walnut, representing 22.3 and 156.3 inches in diameter at breast height (dbh), respectively, were found to be of sufficient size to be protected by the Sacramento County Tree Ordinance (Chapter 19.12) and are proposed for construction removal.

In addition to native trees, the Sacramento County General Plan affords protections to mixed riparian and non-native tree canopy. A total of 1.814 acres of tree canopy, excluding invasive species (as identified and listed by the California Invasive Plant Council as 'Moderate' [Cal-IPC 2006]), were mapped within the survey study area. The majority of canopy consists of non-native, ornamental landscape trees (i.e., Modesto Ash, mulberry, red gum, etc.), with a small portion (0.469 acre) representing native mixed riparian forest. Approximately 1.574 acres (0.229 riparian forest and 1.345 other canopy) of the total tree canopy would be potentially impacted by the Project. The native mixed riparian canopy is dominated by Goodding's black willow and Fremont cottonwood trees, occasionally intermixed with valley oak or Northern California black walnut. Moreover, riparian areas were observed to host dense thickets of Himalayan blackberry and edible fig, both of which are classified as invasive weeds and were therefore excluded from canopy totals. Impacts to native trees (valley oak and California black walnut) and tree canopy are considered to be significant.

Mitigation Measures

Implementation of the following mitigation measures would reduce project-related impacts to protected trees and tree canopy to a *less-than-significant* level.

MM-19 *All potentially impacted native trees currently protected by Sacramento County's Tree Preservation Ordinance and policy CO-139 of the Sacramento County General Plan (i.e., locally native oaks and black walnuts) will be compensated for via the planting of one replacement seedling for every inch of trunk diameter removed within the preserved portions of Elder Creek. To mitigate for potential losses to native and non-native tree canopy, the resulting mitigation planting area shall meet or exceed the acreage of tree canopy removed. Teichert shall prepare a detailed tree mitigation planting plan to the Sacramento County PER prior to the removal of any trees on site. The tree mitigation plan shall illustrate planting locations and provide detailed descriptions on planting densities, species type, maintenance activities, and performance standards.*

MM-20 *In order to ensure no net loss of mixed riparian forest, project impacts to riparian canopy will be compensated for via the provision of native tree mitigation plantings (as described in MM-19) contiguous with Elder Creek, such that the tree mitigation planting areas meet or exceed the acreage of riparian canopy removed as a result of the Project*.

Teichert – Aspen VIII & IX Biological Resources Assessment
Special-Status Species Known or Potentially Known to Occur within the Project Vicinity

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
PLANTS				
FERRIS' MILKVETCH *Astragalus tener* var. *ferrisiae*	— / — / 1B	Vernally moist meadows, alkaline flats & fallow rice fields. Scattered throughout the Sacramento Valley region from Butte Co. south to Solano Co. Elev. <75 m.	April - May	Unlikely to Occur
ALKALI MILKVETCH *Astragalus tener* var. *tener*	— / — / 1B	Alkali meadows, vernal pools & playas, edges of salt marshes, & moist grassy flats. Western portion of Central Valley & San Francisco Bay area from Yolo Co. south to Merced, San Benito & Monterey Cos. Elev. < 60 m.	March - June	Unlikely to Occur
HEARTSCALE *Atriplex cordulata* var. *cordulata*	— / — / 1B	Generally alkali grassland, alkali meadow & alkali scrub. Occasional on margins of alkali pools. Western Central Valley from Glenn Co. south to Tulare & San Luis Obispo Cos. Elev. < 200 m.	April - Oct	Unlikely to Occur
BRITTLESCALE *Atriplex depressa*	— / — / 1B	Alkali flats, alkali scrub, alkali grassland & playas. Mostly western regions of Sacramento Valley from Glenn & Butte Cos. south throughout the San Joaquin Valley (Kern Co.). Elev. < 320 m.	May - Oct	Unlikely to Occur
SAN JOAQUIN SALTBUSH *Atriplex joaquiniana*	— / — / 1B	Alkali flats, alkali scrub, alkali grassland & playas. Western Central Valley & Inner South Coast Range from Glenn Co. south to San Luis Obispo Co. Elev. < 835 m.	April - Oct	Unlikely to Occur
VERNAL POOL SMALLSCALE *Atriplex persistens*	— / — / 1B	Deeper portions of large, alkaline vernal pools. Central Valley from Glenn Co. south to Tulare Co. Most occurrences in San Joaquin Valley. Elev. < 115 m.	June - Oct	Unlikely to Occur
HISPID BIRD'S-BEAK *Cordylanthus mollis* ssp. *hispidus*	— / — / 1B	Saline marshes, alkali flats & alkali vernal pools. Scattered locations throughout San Joaquin Valley. Also Solano & Alameda Cos. & near Rocklin in Placer Co. Elev. < 150m.	June - Sept	Unlikely to Occur
PALMATE BIRD'S-BEAK *Cordylanthus palmatus*	FE / SE / 1B	Saline alkali flats, alkali scrub & alkali grassland. Scattered locations in the Central Valley from Glenn Co. south to Fresno Co. Also Livermore Valley in Alameda Co. Elev. < 150 m.	May - Oct	Unlikely to Occur
DWARF DOWNINGIA *Downingia pusilla*	— / — / 2B	Vernal pools & swales, ephemeral drainages & margins of other seasonal wetlands. Central Valley from Tehama Co. south to Fresno Co. Also in valleys north of S.F. in Napa & Sonoma Cos. Elev. < 450 m.	March - May	Could Occur
TUOLUMNE BUTTON-CELERY *Eryngium pinnatisectum*	— / — / 1B	Swales, vernal pools, moist flats & ephemeral drainages. North-central Sierra Nevada Foothill & adjacent valley from Sacramento Co. south to Tuolumne Co. Elev. 70-900 m.	May - August	Unlikely to Occur
BOGGS LAKE HEDGE-HYSSOP *Gratiola heterosepala*	— / SE / 1B	Marshy lake margins, cattle ponds & in vernal pools. Central Valley & foothills from Shasta to Tulare Co. Also occurs in Lake Co., Modoc Plateau, & Oregon. Elev. < 1200 m.	April - Aug.	Could Occur
HOGWALLOW STARFISH *Hesperevax caulescens*	— / — / 4.	Vernal pools & seasonally saturated clay flats. Central Valley & adjacent foothills from Tehama Co. south to Kern Co. Also reported in San Luis Obispo Co. Elev. < 500 m.	March - June	Could Occur

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
AHART'S DWARF RUSH *Juncus leiospermus* var. *ahartii*	— / — / 1B	Vernal pools, swales & ephemeral drainages. Eastern Sacramento Valley from Tehama Co. south to Sacramento Co. Also found in Calaveras Co. Elev. 30-100 m.	March - May	Could Occur
LEGENERE *Legenere limosa*	— / — / 1B	Vernal pools, seasonal wetlands, drainages, & along margins of cattle ponds. Northern Central Valley (Shasta to San Joaquin Co.) & Inland Coast Range (Sonoma to Santa Clara Co.). Elev. < 880 m.	April - June	Could Occur
HECKARD'S PEPPERGRASS *Lepidium latipes* var. *heckardii*	— / — / 1B	Alkali flats and alkali grassland near the margins of vernal pools. Western Sacramento Valley from Glenn Co. south to Solano Co. Elev. < 200 m.	March - May	Unlikely to Occur
HOARY NAVARRETIA *Navarretia eriocephala*	— / — / 4	Seasonally wet flats, usually in heavy soil. Southeastern Sacramento Valley & northern & central Sierra Nevada Foothill from Yuba to Tuolumne Co. Elev. 100-400 m.	May - June	Unlikely to Occur
TEHAMA NAVARRETIA *Navarretia heterandra*	— / — / 4	Typically growing heavy soils, vernal pools, & drying flats. Scattered throughout northern California & southern Oregon. Elev. 30-1000 m.	April - June	Unlikely to Occur
BAKER'S NAVARRETIA *Navarretia leucocephala* ssp. *bakeri*	— / — / 1B	Vernal pools and ephemeral drainages. Western Sacramento Valley & northern Inland Coast Range from Glenn & Mendocino Cos. to Solano Co. Elev. < 1700 m.	April - July	Unlikely to Occur
MYER'S PINCUSHION NAVARRETIA *Navarretia myersii* ssp. *myersii*	— / — / 1B	Vernal pools, usually with acidic soils. E. Central Valley & adjacent Sierra Nevada Foothill from Placer Co. south to Merced Co. Elev. 20-330 m.	April - May	Could Occur
ADOBE NAVARRETIA *Navarretia nigelliformis* ssp. *nigelliformis*	— / — / 4	Vernal pools & vernally moist swales. Scattered locations from the Sierra Nevada Foothills, Central Valley & Inner South Coast Range. Elev. 90-1000 m.	April - June	Unlikely to Occur
SLENDER ORCUTT GRASS *Orcuttia tenuis*	FT / SE / 1B	Generally restricted to deeper vernal pools & other ephemeral wetlands with clay soils. Scattered from the Sacramento Valley north to the Modoc Plateau area. Also occurs in Lake Co. Elev. 30-1700 m.	May - Oct	Could Occur
SACRAMENTO ORCUTT GRASS *Orcuttia viscida*	FE / SE / 1B	Generally found in larger, deeper vernal pools. Known only in Sacramento County (from about Phoenix Field to approximately Rancho Seco). Elev. 30-100 m.	April - Sept	Could Occur
SANFORD'S ARROWHEAD *Sagittaria sanfordii*	— / — / 1B	Margins of small lakes and ponds and slow-moving sloughs, creeks, rivers, ditches, and canals. Widely distributed throughout the Central Valley from Shasta Co. to Kern Co. Elev. < 650m.	May - Aug	Known to Occur
SALINE CLOVER *Trifolium depauperatum* var. *hydrophilum*	— / — / 1B	Salt marshes, alkali meadows, & vernal pools. Central Western California (Sonoma Co. to San Luis Obispo Co.) & southwestern Sacramento Valley. Elev. < 300 m.	April - June	Unlikely to Occur
INVERTEBRATES				
ANDRENID BEE *Andrena subapasta*	— /—/CNDDB	Inhabits upland areas near vernal pools. Females collect pollen primarily from *Arenaria*, but also *Triphysaria eriantha* and *Lasthenia* flowers. Occurs in vernal pool grassland habitats in El Dorado, Placer, Sacramento and San Joaquin Cos.	Late Feb - early May	Could Occur

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
BLENNOSPERMA VERNAL POOL ANDRENID BEE *Andrena blennospermatis*	— /—/CNDDB	Bee is oligolectic on *Blennosperma*. Occurs in vernal pool grassland habitats where *Blennosperma* is found. Records include scattered locations along the edges of the Central Valley in Yolo, Solano, El Dorado, Sacramento & Tehama Cos., & near the base of the Coast Ranges in Contra Costa, Lake & Sonoma Cos.	Late Feb - April	Unlikely to Occur
CONSERVANCY FAIRY SHRIMP *Branchinecta conservatio*	FE/ — / —	Alkaline pools, vernal lakes & vernal pools that are typically large and/or relatively deep and moderately turbid. Known from several disjunct locations in the Central Valley from Tehama Co. south to Ventura Co.	Nov - May	Unlikely to Occur
VERNAL POOL FAIRY SHRIMP *Branchinecta lynchi*	FT/—/—	Vernal pools and swales from Jackson County near Medford, Oregon, throughout the Central Valley, and west to the central Coast Ranges.	Nov - May	Known to Occur
MID-VALLEY FAIRY SHRIMP *Branchinecta mesovallensis*	— /—/CNDDB	Vernal pools, swales, and other ephemeral freshwater habitats throughout southeastern Sacramento, Southern Sierra Foothill, San Joaquin, and Solano-Colusa regions.	Nov - May	Likely to Occur
Hairy water flea *Dumontia oregonensis*	—/—/CNDDB	First described in 2003 from three pools in Oregon, this species has since been reported from southern Sacramento Co., as well as from Solano Co. Little information exists regarding the species' habitat or life history requirements.	Nov - May	Could Occur
RICKSECKER'S HYDROCHARA *Hydrochara rickseckeri*	—/—/CNDDB	Known historically from pond habitats around the San Francisco Bay area. Vernal pools and other large seasonally inundated wetlands.	Nov - May	Could Occur
VERNAL POOL TADPOLE SHRIMP *Lepidurus packardi*	FE/—/—	Vernal pools, swales, and other ephemeral freshwater habitats from Shasta to Merced County, with the majority of populations occurring in the Sacramento Valley.	Nov - May	Likely to Occur
CALIFORNIA LINDERIELLA *Linderiella occidentalis*	—/—/CNDDB	Vernal pools, swales, and other ephemeral freshwater habitats from Shasta County south to Fresno County, across the Central Valley and some of the coast ranges.	Nov - May	Likely to Occur
VALLEY ELDERBERRY LONGHORN BEETLE *Desmocerus californicus dimorphus*	FT/—/—	The subspecies occurs at scattered locations in the Central Valley & adjacent foothills of the Sierra Nevada & Coast Ranges. The subspecies is entirely dependent upon its host plant (i.e., *Sambucus* spp.) and is only found where this shrub occurs (typically in riparian vegetation associations, but occasionally in isolated shrubs or stands of the plant).	Year-round (exit holes)	Could Occur
AMPHIBIANS				
CALIFORNIA TIGER SALAMANDER *Ambystoma californiense*	FT / ST / —	Restricted to large vernal pools, seasonal ponds, or stock ponds that hold water for at least 4 months during spring for breeding & larval development. Adult non-breeding habitat is generally grasslands & oak savannah. In Sacramento Co. known only from southeastern county (south of the Cosumnes River).	March - May	Unlikely to Occur

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
WESTERN SPADEFOOT *Spea hammondii*	—/—/ SSC	Restricted to vernal pools, seasonal wetlands, stock ponds, & quiet in-channel pools for breeding & larval development. Adult non-breeding habitat is generally grasslands. Known to occur within the Central Valley & surrounding foothills from Colusa Co. to Tulare Co. In Sacramento Co., known from southeastern county (mostly south of the Cosumnes River), but also at Mather Field vernal pool complex.	March - May	Could Occur
CALIFORNIA RED-LEGGED FROG *Rana draytonii*	FT/—/ SSC	Found mainly near ponds in humid forests, woodlands, grasslands, coastal scrub, and stream-sides with plant cover. Most common in lowlands or foothills along the California coast and surrounding the Central Valley. Only a handful of scattered populations within the Central Valley.	Jan – Feb	Unlikely to Occur
REPTILES				
WESTERN POND TURTLE *Emys marmorata*	—/—/ SSC	Found in ponds, reservoirs, or other slow-moving perennial aquatic habitats (e.g., sloughs, streams, and rivers). Loose soils in adjacent banks, grasslands, and open woodland for nesting.	March - Oct	Could Occur
GIANT GARTER SNAKE *Thamnophis gigas*	FT / ST / —	Found in marshes, low gradient streams and adjacent rice fields supported by perennial fresh water in the Central Valley. All credible occurrences in Sacramento County are west of State Route 99.	April - Sept	Unlikely to Occur
BIRDS				
AMERICAN WHITE PELICAN *Pelecanus erythrorhynchos* (nesting colony)	—/—/ SSC	California's nesting pelicans have been confined mainly to the Klamath Basin, within Siskiyou, Modoc and Lassen Cos. Historic breeding range includes the Central Valley, prior to large-scale urban and agricultural development. No nesting records exist for this species within Sacramento Co.	March - July	Unlikely to Occur
LEAST BITTERN *Ixobrychus exilis* (nesting)	—/—/ SSC	Breeds in tall emergent vegetation in marshes, primarily freshwater, less commonly in coastal brackish marshes and mangrove swamps. Breeding populations known from throughout California, including the Central Valley. In Sacramento Co., only known to occur in far eastern portion of county.	May – July	Unlikely to Occur
WHITE-FACED IBIS *Plegadis chihi* (nesting colony)	—/—/ CNDDB	This species nests at scattered locations in the Central Valley as well as elsewhere in California where there are dense, freshwater emergent wetlands. No breeding colonies known from Sacramento Co.	May – July	Unlikely to Occur
DOUBLE-CRESTED CORMORANT *Phalacrocorax auritus* (nesting colony)	—/—/ CNDDB	Breeding colonies are typically formed in clusters of large trees near water. Require aquatic bodies (lakes, ponds) large enough to support a mostly fish diet. Only records from Sacramento Co. are from the American River & the Delta region.	April – Aug	Unlikely to Occur

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
WHITE-TAILED KITE *Elanus leucurus* (nesting)	—/—/ CFP	Found throughout the lower elevation portions of California in low rolling grasslands with scattered oaks and river bottomlands or marshes adjacent to deciduous woodland. Requires grasslands, meadows, or marshes (for foraging) located near dense-topped trees (for nesting and roosting). Occurs throughout Sacramento County.	Year-round	Could Occur
NORTHERN HARRIER *Circus cyaneus* (nesting)	—/—/ SSC	Nests in tall grasses, marshes, and grain fields. Forages in open vegetation communities. Occurs throughout Sacramento County.	Year-round	Could Occur
BALD EAGLE *Haliaeetus leucocephalus* (nesting & wintering)	FD/ SE / CFP	Nests near large lakes, reservoirs, and rivers. Wintering occurs near these latter habitats as well as in rangelands and coastal wetlands. Occasional winter visitor in Sacramento County.	Oct - March	Unlikely to Occur
GOLDEN EAGLE *Aquila chrysaeto* (nesting & wintering)	—/—/ CFP	Nests on secluded cliffs, but may also use large, isolated trees. Hunts widely over open areas. Most records in Sacramento County are winter occurrences from the far eastern portions of the county.	Year-round	Unlikely to Occur
COOPER'S HAWK *Accipiter cooperii* (nesting)	—/—/CNDDB	Nests in dense riparian or oak woodland. Hunts and winters in wide variety of woodland and forest vegetation communities. Most nesting occurrences in Sacramento County are associated with riparian habitat along the larger rivers or large urban stands of trees.	May - July	Unlikely to Occur
SHARP-SHINNED HAWK *Accipiter striatus* (nesting)	—/—/ CNDDB	Nests in dense pole and small-tree stands of riparian and coniferous forest near water. Hunts and winters in wide variety of woodland and shrub vegetation communities. No nesting occurrences in Sacramento County have been documented.	May - July	Unlikely to Occur
SWAINSON'S HAWK *Buteo swainsoni* (nesting)	— /ST / —	Nests in large trees in riparian and oak woodland (sometimes single large oaks) adjacent to large open areas for hunting. Scattered throughout Sacramento County.	April - Sept	Could Occur
FERRUGINOUS HAWK *Buteo regalis* (wintering)	—/—/ CNDDB	Nests are usually built in tall trees along streams or rivers, or in junipers with a view of surrounding grassland. Cliffs, hills, boulders, and man-made structures are occasionally used as nest sites. Hunts in expansive, open vegetation communities. Winter visitor in small numbers throughout Sacramento County.	Oct - April	Could Occur
PRAIRIE FALCON *Falco mexicanus* (nesting)	—/—/ SSC	Nests on secluded cliffs, bluffs, or rock outcrops (particularly with southeastern exposure). Hunts in open terrain (grassland, oak savannah, and early succession stages of shrub and woodland habitats). Most records in Sacramento County are winter occurrences from the far eastern portions of the county.	April - Aug	Unlikely to Occur

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
American Peregrine Falcon *Falco peregrinus anatum* (nesting)	FD/ SD / CFP	Species occurs all over the world; in North America, breeds in open landscapes with cliffs (or skyscrapers) for nest sites. Can be found nesting at elevations up to 12,000 feet, as well as along rivers, coastlines, or in cities. Known from mountain & coastal regions throughout the state. No records for this species from the Central or Sacramento Valleys.	March – Aug	Unlikely to Occur
Merlin *Falco columbarius* (wintering)	—/—/ CNDDB	Occurs in a variety of low elevation, relatively flat habitats that include wooded areas, coastlines, open grasslands, savannah, and the periphery of lakes. It is less often found in open desert. It typically requires dense stands of trees for cover and roosting. It is most often found where there are substantial populations of small birds (the primary prey item). It is a regular winter visitor to Sacramento County.	Oct - March	Could Occur
Great Blue Heron *Ardea herodias* (nesting colony)	—/—/ CNDDB	Breeding colonies are located in trees near isolated swamps or on islands, or near lakes and ponds bordered by forests. Foraging habitat includes freshwater and saltwater wetlands/water bodies, as well as grasslands and agricultural fields. Known to breed in Sacramento Co. only along the American & Cosumnes Rivers & the Delta region.	March – May	Unlikely to Occur
Great Egret *Ardea alba* (nesting colony)	—/—/ CNDDB	Nesting colonies are located in large trees adjacent to bodies of water, such as lakes, ponds, marshes and estuaries. Foraging habitat includes a variety of wetland habitats. Known to breed in Sacramento Co. only along the American & Cosumnes Rivers & the Delta region.	April - May	Unlikely to Occur
Mountain Plover *Charadrius montanus* (wintering)	—/—/ SSC	Found patchily distributed as a wintering species in California where it occurs on relatively level lands with short grass, plowed or burned agricultural fields, and sprouting grain or alfalfa fields. Species tends to show high site fidelity and has never been recorded in Sacramento County.	Oct - March	Unlikely to Occur
Short-eared Owl *Asio flammeus* (nesting)	—/—/ SSC	Suitable nesting habitat is provided by freshwater and coastal marshes, coastal prairie and dunes, wet meadows, and dense grasslands. There is only a single nesting season record for Sacramento County (along Desmond Road in the south county).	April - July	Unlikely to Occur
Long-eared Owl *Asio otus* (nesting)	—/—/ SSC	Species requires grassland or other open spaces for foraging, as well as dense tall shrubs or trees for nesting and roosting. Scattered populations exist in the mountain and coastal regions of the state; no records exist for this species within Sacramento Co.	Feb - July	Unlikely to Occur
Burrowing Owl *Athene cunicularia* (burrow sites & some wintering sites)	—/—/ SSC	Nests and winters in low open grassland or other low, open habitats with abundant small mammal burrows. Forages in similar habitats.	Year-round	Could Occur

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
LOGGERHEAD SHRIKE *Lanius ludovicianus* (nesting)	—/—/ SSC	Utilizes shrubs and other dense, woody vegetation for nesting. Uses adjacent open vegetation communities for foraging. Occurs throughout Sacramento County in small numbers.	April - July	Could Occur
CALIFORNIA GULL *Larus californicus* (nesting colony)	—/—/ CNDDB	Breeds on islands in lakes or rivers in the Sierra Nevada & Cascade Ranges, & on the coast. Forages in a variety of habitats, from parking lots to farm fields to the open ocean. No nesting season records exist for this species in the Central or Sacramento Valleys.	May - July	Unlikely to Occur
WESTERN YELLOW-BILLED CUCKOO *Coccyzus americanus occidentalis* (nesting)	FT / SE / —	Species is restricted to cottonwood & willow-dominated riparian forests along large rivers. The majority of breeding population currently concentrated along upper Sacramento River. Extirpated from Sacramento Co. Only one historic record in the County, from the Sacramento River near the Delta.	June - Aug	Unlikely to Occur
YELLOW-BILLED MAGPIE *Pica nuttalli* (nesting & communal roosts)	—/—/ CNDDB	Found as a resident & wintering species throughout the lower elevation portions of California in grasslands, saltbush scrub, chaparral, oak savannah, & other open woodland types near water (generally where there are large trees with dense cover for nesting and roosts). Scattered throughout Sacramento County.	Year-round	Likely to Occur
PURPLE MARTIN *Progne subis* (nesting)	—/—/ SSC	Extremely localized & limited distribution along Central to North Coast, Sierra Nevada and Cascades, southern California mountains, & Sacramento. Nests mostly in old woodpecker cavities in tall, old, isolated trees or snags. However, the small population in Sacramento County appears to be limited to the drainage holes on the underside of bridges (mostly along the I-5, US 50, and I-80 corridors).	April - Sept	Unlikely to Occur
BANK SWALLOW *Riparia riparia* (nesting)	— / ST / —	Formerly found as a summer nesting species within a larger California distribution along the coast & adjacent to larger streams & rivers. Range is now concentrated along Central Valley streams & rivers. Species nests in vertical banks & cliffs with fine-textured sandy soils. No existing nesting habitat for the species occurs on the project site, but mining activities can create habitat that is sometimes then used by the species. There have been no occurrences of nesting in mining sites in Sacramento Co.	April - July	Unlikely to Occur
WILLOW FLYCATCHER *Empidonax traillii* (nesting)	— / SE / —	Breeds from southern British Columbia, Alberta, North Dakota, New York, & Maine south to central California, Nevada, Arkansas, & Virginia. Nests in riparian brush dominated by deciduous willows/shrubs. Nesting season records for the state limited to the Sierra Nevada & Cascades; no records exist within Sacramento Co.	May - Aug	Unlikely to Occur

Table A-1
Special-Status Species Known or Potentially Known to Occur within the Aspen VIII/IX Project Vicinity

Common Name *Scientific Name*	Status Fed/State/ Other	Habitat and Distribution	Survey Period	Potential For Occurrence
GRASSHOPPER SPARROW *Ammodramus savannarum* (nesting)	—/—/ SSC	Nests in dense, dry, expansive grasslands (sometimes with scattered shrubs). Forages in similar habitat. Species exhibits extreme site fidelity. In Sacramento Co. known only from southeastern county (mostly along Meiss Road).	April - July	Unlikely to Occur
SONG SPARROW (MODESTO POPULATION) *Melospiza melodia* "Modesto" (nesting)	—/—/ SSC	The Modesto Song Sparrow is found in areas containing extensive wetlands, such as the Sacramento-San Joaquin Delta. Prefers freshwater marsh & riparian forest habitats with available water, open areas for foraging & moderately dense vegetation cover for nesting. Known to occur in Sacramento Co. only from the Sacramento River & Delta region.	March - Aug	Unlikely to Occur
TRICOLORED BLACKBIRD *Agelaius tricolor* (nesting)	—/ SE / —	Nests in dense stands of emergent freshwater marsh, willow, blackberry, thistle, nettles, or grasses. Forages in grassland or rangeland providing an abundant source of food (e.g., grasshoppers or butterfly larvae) - often within at least three miles of the nest colony. Nesting colonies are scattered throughout Sacramento Co.	April - July	Known to Occur
MAMMALS				
PALLID BAT *Antrozous pallidus*	—/—/ SSC	Found as a resident in all desert, grassland, shrub, woodland, & forest habitats from sea level to approximately 6,000 feet. Day roosts are typically found in buildings, bridges, rocky outcrops, mines, caves, & trees. Night roosts are generally provided by bridges, mines, & caves. Only a small number of occurrences are known for Sacramento Co.	April - Sept	Unlikely to Occur
WESTERN RED BAT *Lasiurus blossevillii*	—/—/ SSC	Occurs at scattered locations throughout the lowland portions of California west of the Sierra Nevada crest and desert regions (typically in riparian forest or orchards). Roosting sites are found in tree or shrub foliage between 2 - 40 ft above ground (typically in large cottonwoods, sycamores, walnuts, and willows). In Sacramento County known from scattered occurrences throughout the county.	April - Sept	Unlikely to Occur
YUMA MYOTIS *Myotis yumanensis*	—/—/ CNDDB	Found in a variety of habitats (including coastal vegetation communities & urban areas) with nearby sources of water over which the species forages. Day roosts are found in caves, mines, buildings, or crevices. Night roosts are typically associated with bridges, buildings, & other man-made structures. In Sacramento Co. known from scattered occurrences throughout the county.	April - Sept	Unlikely to Occur
AMERICAN BADGER *Taxidea taxus*	—/—/ SSC	Found as a resident species at scattered localities throughout California (except in the coastal redwood region). Generally occurs in extensive, open habitats in the vicinity of abundant rodent populations. In Sacramento Co. known mostly from the far eastern portions of the county.	Year-round	Unlikely to Occur

SPECIAL STATUS CODE ABBREVIATIONS AND DEFINITIONS

FEDERAL

FE	Federally listed as Endangered
FT	Federally listed as Threatened
FPE	Federally proposed as Endangered
FPT	Federally proposed as Threatened
FC	Federal Candidate Species (former Category 1 candidates)
FD	Federally Delisted

STATE

SE	State listed as Endangered
ST	State listed as Threatened
SR	State listed as Rare
SD	State Delisted

Other

CFP	California Department of Fish and Wildlife designated “Fully Protected”
SSC	California Department of Fish and Wildlife designated “Species of Special Concern”
1A	California Rare Plant Rank - Presumed extinct
1B	California Rare Plant Rank - Rare or Endangered in California and elsewhere
2A	California Rare Plant Rank - Presumed extirpated in California, more common elsewhere
2B	California Rare Plant Rank - Rare or Endangered in California, more common elsewhere
3	California Rare Plant Rank - Plants About Which More Information is Needed, A Review List
4	California Rare Plant Rank - Plants of Limited Distribution, A Watch List
CNDDB	Species is tracked by the California Department of Fish and Wildlife’s “California Natural Diversity Database”

LIKELIHOOD OF OCCURRENCE DEFINITIONS

Known to Occur	Taxon was observed at the Project site during recent surveys.
Likely to Occur	Taxon previously reported within or immediately adjacent to the Project site or otherwise expected to occur due to neighboring occurrences and substantial habitat on the Project site.
Could Occur	Suitable habitat is available at the Project site; however, there is little to no other indicators that the taxon might be present.
Unlikely to Occur	Taxon is unlikely to be present due to poor habitat quality, lack of suitable habitat features, or known restricted current distribution that does not include the Project area.

Special-Status Plant Species Survey Report

July 2015

1.0 INTRODUCTION

This report presents the methods and results of special-status plant surveys conducted on Teichert Aggregates' (Teichert's) Aspen VIII and Aspen IX properties (Property). The Property, comprised of approximately 682 acres, is located in the unincorporated portion of Sacramento County (Figure 1). Teichert is proposing to mine existing aggregate material (sand and gravel) on approximately 357 acres of the Property (Project). The proposed Project will consist of aggregate removal and conveyance, as well as reclamation for agricultural (grazing) purposes. The Project is an extension of mining on Teichert's 'Aspen' properties, which have continuously supplied aggregate resources to Teichert's materials processing operations since the 1950s.

1.1 PROPERTY SITE LOCATION AND DESCRIPTION

The Property is located approximately 2 miles south of Mather Field in Sacramento County and includes two separate properties owned by Teichert, known as Aspen VIII (APNs 063-01800-005, -006 and 063-01600-001) and Aspen IX (APNs 066-0020-006, 066-0030-001 and 066-0050-003) (Figure 2). Material mined from the site will be transported via conveyor belt to Teichert's Perkins processing plant, approximately 4 miles to the northwest (Figure 1). This conveyor will exit near the northwestern corner of Aspen VIII, where it will eventually tie in with an existing conveyor system on Aspen V-South. This portion of conveyor between Aspen VIII and Aspen V-South (APN 063-0190-027) has been included as part of the Project (collectively, Project Site) (Figure 2). The Project Site is located in Township 08N, Range 06E, Sections 27, 28, 33, and 34 with a portion of Aspen VIII falling in the Rio De Los Americanos Land Grant (MDBM) of the "Carmichael, California" 7.5-minute quadrangle (U.S. Department of the Interior, Geological Survey 1981). The approximate center of the site is located at 38° 30' 39" North and 121° 19' 03" West within the Elder Creek Watershed.

Elder Creek Road bisects the two properties, with Aspen VIII occurring to the north and Aspen IX to the south. Elder Creek enters the Project Site from the east on Aspen VIII, where it was historically channelized, and eventually enters Aspen IX on the north following its natural course before exiting on the west. The Project includes mining the majority of the Aspen VIII site, as well as the northwestern portion of Aspen IX, north of Elder Creek. The Project also includes the installation of a larger culvert under Elder Creek Road to increase the capacity of flows under the road and of a turn lane south of Aspen VIII to accommodate trucks.

2.0 ENVIRONMENTAL SETTING

The Project Site consists of approximately 682 acres of land, including Elder Creek which traverses through the site in an east to west direction. The majority of the site is utilized as rangeland for livestock and irrigated pasture for forage production. Some portions of the site have been dry farmed, primarily for wheat. Three separate rural residential houses and/or associated farm buildings also occur on the Project Site. Surrounding land uses include additional rangeland and rural residential homes, agricultural cropland, a nursery facility (Village Nurseries), two cemeteries (Arlington Memorial Cemetery and Bellevue Cemetery), and a wastewater treatment facility (Vineyard Surface Water Treatment Plant).

2.1 CLIMATE, TOPOGRAPHY, AND HYDROLOGY

Sacramento, as with the rest of California's Central Valley, is typical of a Mediterranean-type climate with hot, dry summers and cool, relatively wet winters. Average temperatures range from a low of 38°F in December to a high of 92°F in July (usclimatedata.com). Average annual precipitation is approximately 18.51 inches, with January usually the wettest month (usclimatedata.com).

The majority of the Project Site consists of historically leveled fields for both dryland grazing and irrigated pasture. Moderate rolling hills also characterize the topography of the site on other areas. The elevation of the site ranges from approximately 60 to 85 feet above mean sea level (MSL).

The Project Site is located within boundaries of the Morrison Creek and Elder Creek Watersheds (Figure 3). The Morrison Creek watershed encompasses approximately 200 acres in both Aspen VIII and IX, while the Elder Creek Watershed includes approximately 483 acres. Although Morrison Creek itself does not traverse the Project Site, its southern watershed boundary lies within the western portion of Aspen VIII and along the northwestern portion of Aspen IX before transitioning into the Elder Creek watershed to the south. Elder Creek occurs on both Aspen VIII and IX, whereby it enters Aspen VIII on the southeast and exits Aspen IX on the west (Figures 2 and 3). The creek is channelized throughout the Aspen VIII portion of the site, where it eventually enters an artificial expansion "pond" before flowing under Elder Creek Road and into Aspen IX. Once entering Aspen IX, the creek maintains its natural course before exiting the site on the west where it is once again channelized.

Elder Creek originates near the intersection of Kiefer Boulevard and Eagles Nest Road and eventually discharges into Morrison Creek near Brookfield Drive in the City of Sacramento, approximately 8 miles west of the Project Site. Historically, Elder Creek was probably an ephemeral to intermittent watercourse, seasonally supported by winter precipitation and runoff from the surrounding uplands. Today, however, the majority of Elder Creek can be characterized as a semi-perennial creek fed primarily by runoff from ranches, residential areas, and irrigated pasture lands. Within the Project Site, Elder Creek is bordered by irrigated pastures, which are supported by a groundwater release and recycling system that provides year-round irrigation to fields. In this system, groundwater is first supplied to pastures during the early summer months and allowed to sheet across fields. This water eventually

drains into a network of surrounding ditches and irrigation ponds for capture and reutilization, while excess irrigation runoff flows to Elder Creek.

2.2 SOILS

The Natural Resources Conservation Service (NRCS) soil surveys for Sacramento County identifies six soil types within in the Project Site (NRCS 1993). The most predominant soil component is Red Bluff-Xerarents complex, 0 to 2 percent slopes, which is distributed throughout much the proposed mining area (Figure 4). Red Bluff loam, 0 to 2 percent slopes is the second-most predominant soil type on the Project Site (Figure 4). Other soil types include San Joaquin silt loam, 0 to 3 percent slopes; Kimball silt loam, 0 to 2 percent slopes; San Joaquin silt loam, leveled; and Hedge loam, 0 to 2 percent slopes (Figure 4). Detailed summaries of these soil types have been described in the original wetland delineation report prepared by Foothill Associates (2006).

2.3 EXISTING HABITAT AND PLANT COMMUNITIES

Presently, both annual grasslands and irrigated pastures dominate the landscape on the Project Site (Figure 5). Elder Creek appears on the USGS 7.5-minute series Carmichael and Elk Grove, California quadrangles as a solid blue line feature (perennial drainage) and traverses the Project area in a northeast to southwest direction. Foothill Associates conducted a wetland delineation for the Aspen VIII and IX Property in 2006 (Foothill 2006). ECORP Consulting, Inc. revised the delineation in November 2009 and March 2009 and again in march 2014 as part of the development of the proposed Project (ECORP 2009; ECORP 2010; ECORP 2014). The U.S. Army Corps of Engineers issued a preliminary jurisdictional determination (PJD) on 03 June 2014. A total of 27.795 acres of wetland and waters of the U.S. have been identified on the Project Site (Figure 5). These include a perennial stream (Elder Creek), vernal pools, seasonal wetlands and swales, an ephemeral drainage, freshwater marshes, ditches, and ponds (Figure 5).

Other features on the Project Site include three rural residential homes and associated farm/equipment storage buildings. Dirt and graveled access roads to homes, farm buildings, and pastures are also present throughout the site.

3.0 SPECIAL-STATUS PLANT SPECIES

Special-status plants are those that are legally protected under state and federal Endangered Species Acts (ESAs) or other regulations, or species that are considered sufficiently rare by the scientific community to qualify for such listing. These include the following:

- Plants listed or proposed for listing as threatened or endangered under the federal ESA or candidates for possible listing as threatened or endangered under the ESA (50 Code of Federal Regulations (CFR] §17.12);

- Plants listed or candidates for listing by the state of California as threatened or endangered under the California ESA (Fish and Game Code of California §2050 et seq.);
- Plants listed as rare under the California Native Plant Protection Act (Fish and Game Code of California §1900 et. seq.);
- Plants listed that meet the definition of rare or endangered under the California Environmental Quality Act (CEQA) §15380;
- Plants considered by the California Native Plant Society (CNPS) to be "rare, threatened, or endangered in California" (California Rare Plant Rank [CRPR]1A, 2B, 2A and 2B); and
- Plants listed by CNPS as plants about which more information is needed to determine their status, and plants of limited distribution (CRPR 3 and 4). In general, these plants do not meet the definition of endangered, threatened, or rare pursuant to CEQA §15380; however, these species may be evaluated by the lead agency on a case by case basis to determine significance criteria under CEQA.

4.0 METHODS

This section describes the methods used to conduct special-status plant surveys on the Project Site. All research and surveys were conducted over a two-year period.

4.1 PRE-FIELD SURVEY INVESTIGATIONS

Prior to field surveys, a preliminary list of special-status plants that have the potential to occur on the Project Site and are documented in the regional area was generated by a query search of existing databases and agency information, including:

California Natural Diversity Database (Rarefind Version 5) – Database query of special-status plant species and sensitive natural communities reported in the study area; generated on 05 March 2013 and 14 August 2014 (CNDDB 2014) (Figure 6). Query included the "Carmichael, California" 7.5-minute quadrangle and eight surrounding quadrangles;

U.S. Fish and Wildlife Service, Sacramento Field Office website – Official list of federal candidate, proposed, threatened, and endangered plant species having the potential to occur in the study area; generated on 15 March 2013 (USFWS 2013) and 07 April 2014 (USFWS 2014); and

California Native Plant Society's Online Inventory of Rare and Endangered Plants of California – List of special-status plants that may occur in the study area; generated on various dates between March 2013 (CNPS 2013) and August 2014 (CNPS 2014).

A list of all special-status plant species known or potentially known to occur on the Project Site is shown in Table A-1 in Appendix A. For each species (CRPR 1A, 1B, 2A, and 2B) identified as having a moderate to high potential to occur on the Project Site, phenological data and photographs were compiled prior to

field surveys. Specific information gathered included distribution, life cycles, habitat requirements, regional occurrence(s), representative photographs, and species keys. This information was referenced from the CNDDB data, individual treatments from Jepson Manual: Vascular Plants of California, 2nd ed. (Baldwin et. al. 2012), and photographs from the CalPhoto website.

4.2 SPECIAL-STATUS PLANT SPECIES OCCURRENCE POTENTIAL

The potential for special-status plants depends largely on the presence of specific habitat types on the Project Site. Reconnaissance-level field surveys were conducted on 18 March 2013, and again on 09 April 2014, to review resources (i.e., wetlands) that warrant additional or more focused surveys. Habitat types identified during the reconnaissance-level field assessments were evaluated with known habitat requirements for each special-status plant species with potential to occur in the regional area. Each species' potential to occur on the Project Site was then assessed and ranked as either:

- No Potential – species reported to have a current or historic range in the regional area, but does not occur on the Project Site due to the lack of required habitat for the species;
- Unlikely/Low Potential – species reported to have a current or historic range in the regional area, but has only marginal quality habitat on the Project Site (i.e., disturbed, fragmented, or otherwise degraded) or its presence cannot be completely discounted due to incomplete information on the taxon's distribution or habitat requirements;
- Moderate Potential – species reported to have a current or historic range in the regional area and moderate quality habitat on the Project Site;
- Present/High Potential – species previously reported from the site or otherwise expected to occur due to substantial habitat on the Project Site.

Based on review of the CNDDB and CNPS database searches, previously prepared biological reports for the Project Site and surrounding areas, and reconnaissance-level field surveys, it was determined the Project Site supports potential suitable habitat (moderate to high) for eight special-status plant species. These include dwarf downingia (*Downingia pusilla*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii* subsp. *myersii*), slender Orcutt grass (*Orcuttia tenuis*), Sacramento Orcutt grass (*Orcuttia viscida*), and Sanford's arrowhead (*Sagittaria sanfordii*). Detailed descriptions of these species and their potential to occur on the Project Site are provided in Appendix B.

Several other special-status plant species were identified in the database searches for the selected quadrangles. These species include Brandegee's clarkia (*Clarkia biloba* subsp. *brandegeae*), stinkbells (*Fritillaria agrestis*), Heckard's dwarf peppergrass (*Lepidium latipes* var. *heckardii*), California rose mallow (*Hibiscus lasiocarpos* var. *occidentalis*), and saline clover (*Trifolium hydrophilum*). These species did not have moderate to high potential to occur at the site due to the lack of specific habitat requirements on the Project Site, such as foothill woodland/grassland, chaparral, tidal marsh, saltwater marsh, or alkaline vernal pools and flats. Although there is a CNDDB record of Peruvian dodder (*Cuscuta*

obtusiflora var. *glandulosa*) within the nine quadrangle search area, this species was last seen in 1948 in Merced County and is thought to be extirpated.

It should be noted that focused surveys for Sacramento Orcutt grass and slender Orcutt grass were previously conducted by Foothill Associates in May 2008 (Foothill 2008). In addition, follow-up surveys of special-status plant species were conducted between March and July of 2010 by Teichert's biologist B. Baba (Teichert 2010). No rare plants were found during those surveys; however, a few remnant populations of Sanford's arrowhead may have existed in an irrigation ditch (Baba pers. observ. 2010). This ditch had been previously cleaned out by the farmer and positive identification could not be confirmed at the time.

4.3 FIELD SURVEY METHODS

Field surveys for special-status plants were conducted over a two year period from March 2013 through August 2014 in accordance with the CNPS Botanical Survey Guidelines (CNPS 2001), the Guidelines for Conducting and Reporting Botanical Inventories for Federally Listed, Proposed and Candidate Plants (USFWS 1996), and the Guidelines for Assessing the Effects of Proposed Projects on Rare, Threatened, and Endangered Plants and Natural Communities (CDFG 2009).

4.4 REFERENCE POPULATIONS

Prior to and during the timeframe when surveys of the Project Site were conducted, various reference populations were visited. Reference populations were used to evaluate the condition of specific phenological traits needed to identify plants in the field, such as flowering and fruiting times. Teichert's biologist B. Baba visited various known populations of Legenere, dwarf downingia, bractless hedge-hyssop, Ahart's dwarf rush, Sacramento Orcutt grass, and Sanford's arrowhead within the regional area between April 2013 and July 2014. These sites included Teichert's Lincoln property in Placer County, Teichert's Aspen VI and Grantline properties in Sacramento County, Phoenix Field Vernal Pools in Sacramento County, Mather Field Vernal Pools in Sacramento County, and Jepson Prairie Preserve in Solano County.

Visiting additional species and reference sites was not feasible because of the uncertain status of many previously known locations, the lack of precise information on the location and ownership of local populations, and the lack of access to local populations on private and preserved lands.

4.5 ON-SITE FIELD SURVEYS

To determine if special-status plant species occur on the Project Site, surveys were conducted throughout the Project area for all potentially occurring species (as listed in Table A-1, Appendix A). In addition, the survey study area was extended outside the Project Site boundary to ensure all areas within 250-feet of the proposed mining footprint (i.e., proposed limits of disturbance) were covered (Figure 5). Specific survey dates were March 25th, April 22nd, May 6th and 22nd, and June 20th of 2013 and March 14th, April 14th, 23rd, 24th, May 1st and 23rd, June 19th, and July 14th of 2014. The survey

dates were established to encompass the range of flowering and identification periods for all species, with particular emphasis on the special-status plant species. Over the course of the 2-year survey period, Teichert's biologist B. Baba walked meandering transects across the entire Project Site. Teichert's biologist J. Greer also accompanied B. Baba on some of the 2014 surveys. Survey transects were spaced at 15- to 50-foot intervals, depending upon the existing terrain, habitat types, vegetation cover, and structural complexity. Special attention was given where the habitat type was determined to be suitable and most likely to support special-status plant species (i.e., wetlands). Many areas consisted of irrigated pastures dominated by various pasture species and thus provided limited or no suitable habitat for most special-status plants.

Owing to variance in the phenology and habitat preference of various species, surveys were conducted over a period of several months. Earlier surveys of vernal pools were also conducted to determine which wetlands to revisit later in the season that could most likely support Sacramento Orcutt grass or slender Orcutt grass. All habitats present on the Project Site were surveyed thoroughly in order to properly inventory and document any potential occurrences of special-status plant species. All plant species observed during the survey period were recorded in the field and presented in Appendix C. Nomenclature used follows the Jepson Manual: Vascular Plants of California, 2nd ed. (Baldwin et. al. 2012).

5.0 EXISTING HABITATS AND PLANT COMMUNITIES

The majority of the Project Site consists of irrigated pastures and annual grasslands (Figure 5). Other habitats at the site include perennial stream (Elder Creek), vernal pool, seasonal wetland, swale and ephemeral drainage, ditches, ponds, riparian woodland, and ruderal. A brief summary of these habitats and plant communities are described below and shown in Figure 5. Representative photos of habitat types are also included in Appendix D.

5.1 IRRIGATED PASTURE

Irrigated pastures, totaling 331 acres north of Elder Creek, are maintained by farming practices that supply irrigation to leveled areas via groundwater wells and recycled water from ponds and Elder Creek. These areas are both grazed by cattle and harvested for forage. A network of ditches and ponds are associated with the irrigated pastures (further discussed in Section 5.7 below). Common plant species occurring in irrigated pastures include tall fescue (*Festuca arundinacea*), Kentucky blue grass (*Poa pratensis* subsp. *pratensis*), ryegrass (*Festuca perennis*), dallis grass (*Paspalum dilatatum*), dense sedge (*Carex densa*), field sedge (*Carex praegracilis*), English plantain (*Plantago lanceolata*), white clover (*Trifolium repens*), shamrock (*Trifolium dubium*), cut-leaved geranium (*Geranium dissectum*), and yellow's owl's-clover (*Triphysaria versicolor* subsp. *faucibarbata*).

5.2 ANNUAL GRASSLAND

Annual grasslands on the Project Site are represented by both natural, undulating topography as well as historically leveled areas. This habitat community consists of 308 acres and includes grazing by cattle (Figure 5). Annual grasslands that have not been leveled are generally located south of Elder Creek, within the southern and eastern portions of Aspen IX. Similar landscapes are also present near the northwestern corner and south-central portion of Aspen VIII. These areas consist of relatively flat to moderately rolling hills dominated by soft chess brome (*Bromus hordeaceus*), ripgut brome (*Bromus diandrus*), hare barley (*Hordeum murinum*), brome fescue (*Festuca bromioides*), longbeak filaree (*Erodium botrys*), perennial mustard (*Hirschfeldia incana*), winter vetch (*Vicia villosa* var. *varia*), common fiddleneck (*Amsinckia intermedia*), yellow star-thistle (*Centaurea solstitialis*), and bindweed (*Convolvulus arvensis*). Vernal pools and seasonal wetlands are common within these relatively undisturbed landscapes (further discussed in Sections 5.4 and 5.5 below).

Some grassland areas experience seepage from adjacent irrigated fields and ditches, contributing to semi-hydrophytic plants along these borders, including Mediterranean beard grass (*Polypogon maritimus*), toad rush (*Juncus bufonius*), Mediterranean barley (*Hordeum marinum* subsp. *gussoneanum*), annual hairgrass (*Deschampsia danthonoides*), and pennyroyal (*Mentha pulegium*). Other areas that were historically leveled and farmed but that are no longer irrigated are present along the western portions of Aspen VIII and northwest corner of Aspen IX. These areas are generally dominated by Mediterranean barley, hare barley, and ryegrass.

Trees are largely absent in annual grassland communities except along borders where other features exist (i.e., roads, ditches, etc.). Most trees on site are the result of ornamental landscape plantings around roads and residential homes. In addition, a cluster of large red gum eucalyptus trees (*Eucalyptus camaldulensis*) occurs within the western section of Aspen VIII near an existing cemetery.

5.3 PERENNIAL STREAM (ELDER CREEK)

A total of 5.415 acres of perennial stream have been delineated on the Project Site (Figure 5). This includes approximately 8,470 lineal feet of Elder Creek. The creek is often bordered by wetland vegetation communities of various composition and cover depending on flow rates, duration of flow rates, and water depth. Common plants occurring along Elder Creek include knotgrass (Paspalum distichum), dallis grass, tall fescue, Kentucky blue grass, waxy mannagrass (*Glyceria declinata*), annual beardgrass (*Polypogon monspeliensis*), tall flatsedge (*Cyperus eragrostis*), Australian rush (*Juncus usitatus*), cattails (*Typha domingensis* and *T. latifolia*), common tule (*Schoenoplectus acutus* var. *occidentalis*), and creeping water primrose (*Ludwigia peploides* subsp. *peploides*). Riparian woody vegetation is rather limited throughout much of the creek, probably due to present and past grazing pressures. Trees consisting of Fremont cottonwood (*Populus fremontii* subsp. *fremontii*), black willow (*Salix gooddingii*), walnut (*Juglans hindsii*), and weeping willow (*Salix babylonica*) are scattered along portions of Elder Creek, particularly within the Aspen VIII site. This area of the creek also supports dense stands of Himalayan blackberry (*Rubus armeniacus*) and California wild rose (*Rosa californica*). While Elder Creek presently supports a biological system indicative of a perennial stream, it should be noted

that this creek is hydrologically sustained from late-spring through summer by irrigation runoff from adjacent pastures.

5.4 VERNAL POOLS

Numerous vernal pools, totaling 7.260 acres, occur throughout the undisturbed grassland areas of the Project Site (Figure 5). These vernal pools vary in maximum water depth between a few inches to 20 inches deep, and range in size from 0.001 to 1.075 acres. They are similar to other isolated, depressional seasonal wetland features at the site, but typically support a predominance of native vernal pool plants such as slender popcornflower (*Plagiobothrys stipitatus* var. *micranthus*), Carter's buttercup (*Ranunculus bonariensis* var. *trisepalus*), Fremont's goldfields (*Lasthenia fremontii*), smooth goldfields (*Lasthenia glaberrima*), Great Valley coyote thistle (*Eryngium castrense*), creeping spikerush (*Eleocharis macrostachya*), annual hairgrass, Mediterranean barley, white navarretia (*Navarretia leucocephala*), double-horned downingia (*Downingia bicornuta* var. *picta*), dwarf woolly-marbles (*Psilocarphus brevissimus*), field owl's-clover (*Castilleja campestris*), and Rosy Douglas' meadowfoam (*Limnanthes douglasii* ssp. *rosea*).

Typical resident wildlife species associated with the vernal pools include various aquatic invertebrates and amphibians such as the Sierra chorus frog (Pseudacris sierra). The vernal pool fairy shrimp (Branchinecta lynchi) and vernal pool tadpole shrimp (Lepidurus packardi), listed as threatened and endangered, respectively, pursuant to the federal Endangered Species Act, are also known to occur within several vernal pools on the Project Site and adjacent areas (C. Rogers, pers. observ.).

5.5 SEASONAL WETLANDS, SWALES, AND EPHEMERAL DRAINAGE

The Project Site also supports numerous seasonal wetlands, swales, and an ephemeral drainage, totaling 7.005 acres (Figure 5). The majority of these seasonal wetlands follow a natural hydrologic pattern, whereby they are saturated (and partially inundated) in winter, but remain dry through summer. These wetlands occur in grasslands and are usually underlain by clay or a heavy clay loam and are very similar to vernal pools, but lack the species associated with vernal pools. Instead, these wetlands are frequently dominated by non-native wetland generalist plants, including ryegrass, Mediterranean barley, Mediterranean beardgrass, common hawkbit (*Leontodon saxatilis* subsp. *longirostris*), and hyssop loosestrife (*Lythrum hyssopifolia*). Some native plants include slender popcorn flower, annual hairgrass, toad rush, baltic rush (*Juncus balticus*), and iris-leaved rush (*Juncus xiphioides*). These wetlands, if inundated for sufficient periods, may also support the venal pool fairy shrimp.

In other instances, seasonal wetlands and swales are associated within irrigated pastures and affected by summer irrigation, remaining saturated or inundated for prolonged periods throughout the summer. These wetlands are saturated perennially and dominated by tall flatsedge, creeping spikerush, spatulaleaf loosestrife (*Lythrum portula*), creeping water primrose, willow weed (*Persicaria lapathifolia*), Mediterranean beardgrass, and waxy mannagrass.

5.6 FRESHWATER MARSH

Freshwater marshes, totaling 4.752 acres, are present at various locations throughout the Project Site (Figure 5). These wetland features are inundated or saturated for prolonged periods, and occur in conjunction with Elder Creek and other ditches receiving irrigation runoff during the summer months. Due to an extended saturation period, these areas are frequently occupied by perennial hydrophytes, including creeping spikerush, tall flatsedge, waxy mannagrass, willow weed, and creeping water primrose. Other common annuals include water pygmy-weed (*Crassula aquatica*), spatulaleaf loosestrife, and Mediterranean barley.

5.7 DITCHES AND PONDS

A network of ditches (2.444 acres) and ponds (0.920 acre) are scattered throughout irrigated pastures (Figure 5). The ditches collect irrigation runoff from pastures and eventually drain to ponds, from which irrigation water is redistributed back to the pastures. Ditches are frequently lined with various wetland plants including smartweed (*Persicaria lapathifolia*, *P. maculosa*, *P. hydropiper*, and *P. punctata*), creeping water primrose, slender centaury (*Centaurium tenuiflorum*), cattails, common tule, tall flatsedge, creeping spikerush, tapered rush (*Juncus acuminatus*), rice cutgrass (*Leersia oryzoides*), tall fescue, dallis grass, mannagrass, and annual beard grass. One ditch in Aspen VIII was dominated by Sanford's arrowhead.

Ponds on site are relatively deep, and thus pond centers tend to lack vegetation. Pond levels may also fluctuate considerably depending on irrigation schedules and patterns. The edges of ponds are frequently vegetated with tall flatsedge, dallis grass, annual beard grass and Australian rush. In addition, Himalayan blackberry, Fremont cottonwood, willows (*Salix gooddingii* and *S. babylonica*), and valley oak (*Quercus lobata*) are often associated with nearby upland areas.

5.8 RIPARIAN WOODLAND

Riparian woodland vegetation (approximately 1.091 acres) is limited to patches of narrow bands along Elder Creek and around the perimeter of existing ponds (Figure 5). Most of these species consists of Fremont cottonwood, willows, Himalayan blackberry, and California wild rose. Most of Elder Creek lacks riparian woodland vegetation, probably due to past and present grazing pressures. Existing ditches also lack riparian woodland species due to routine maintenance activities.

5.9 RUDERAL

Ruderal vegetation is frequently associated with various equipment storage areas and access roads. In addition, disposal areas along ditches are frequently lined with ruderal species. Common ruderal plants at the site include field mustard (*Brassica rapa*), perennial mustard, radish (*Raphanus sativus* and *R. raphanistrum*), yellow star-thistle (*Centaurea solstitialis*), Italian thistle (*Carduus pycnocephalus*), pineapple weed (*Matricaria discoidea*), prickly lettuce (*Lactuca serriola*), English plantain, greenstem filaree (*Erodium moschatum*), redroot pigweed (*Amaranthus retroflexus*), and soft chess brome.

6.0 PLANT SURVEY RESULTS

A total of 261 taxa of vascular plants were identified on the Project Site (Appendix C). Of these taxa, 113 are native, 125 are naturalized, and 23 are ornamentals planted as landscape. A total of 26 species are considered noxious or invasive weeds in California (Cal-IPC 2014; CDFA 2014). No federal or state-listed plant taxa were observed. No elderberry (*Sambucus nigra* subsp. *caerulea*) shrubs, specific host plant for the federally-listed *Threatened* valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) were found. One rare plant species was documented within the survey area: Sanford's arrowhead (Figure 7; Appendix E).

Sanford's arrowhead is listed as a CRPR List 1B.2 plant. This species is an aquatic perennial member of the water-plantain family (Alismataceae). Sanford's arrowhead is associated with the shallow margins of small lakes and ponds and slow-moving sloughs, creeks, rivers, and canals. Numerous populations have also naturalized in ditches associated with irrigation and other drainage systems. Little is known regarding the biology or ecology of the species, although it appears to tolerate a wide range of freshwater marsh environments. Sanford's arrowhead is widely distributed throughout the Central Valley between 0 and 650 meters. This species is presently known from Shasta to Kern Counties, with the majority of records occurring in Sacramento County. At the Project Site, large populations of Sanford's arrowhead (2,000+ individuals) were observed growing within an irrigation ditch in Aspen VIII, near the western portion of the property (Figure 7; Appendix E). Two individual plants were also observed in a connected ditch running east to west along the northern border of the adjacent cemetery. These ditches are fed by irrigation runoff from irrigated pastures to the east, before eventually emptying into a large irrigation pond on the northern project boundary. Common plants growing in association with the ditch and Sanford's arrowhead include tall flatsedge, creeping spikerush, creeping water primrose, waxy mannagrass, and rice cutgrass.

Sanford's arrowhead is expected to be impacted by proposed mining activities. The proposed limits of disturbance (active mining) include the majority of the ditch containing Sanford's arrowhead and will directly impact the largest and most dense populations of the plant. The remaining populations of Sanford's arrowhead extend to the northern end of the ditch, where mining will not occur, but are expected to be indirectly affected once farming practices no longer utilize and support irrigated pastures. Interestingly, all other ditches or ponds within the study area were not observed to contain Sanford's arrowhead. It appears that the particular ditch supporting Sanford's arrowhead in Aspen VIII is the most maintained (routinely cleaned out), thereby suggesting that the species can be prolific with certain disturbance or management activities.

Because multiple surveys have been conducted during the appropriate blooming periods when target species would have been identifiable, all other special-status plant species are considered to be absent from or unlikely to occur at the Project Site at this time. The results of protocol-level special-status plant species surveys are typically considered to be valid by the resource agencies for a period of 5 years, given that circumstances on the Project Site can be assumed to remain largely unchanged during this time period.

APPENDIX A

Teichert – Aspen VIII & IX Rare Plant Survey
Special-Status Plant Species Known or Potentially Known to Occur within the Project Vicinity

Table A-1

Special-Status Plant Species Known or Potentially Known to Occur at Teichert's Aspen VIII/IX Property

Species	Fed / CA / CNPS Status	Distribution	Habitat	Flowering Period	Habitat Suitability at Site
California androsace *Androsace elongata* ssp. *acuta*	- / - / 4.2	Scattered locations throughout California Elev. 15-2000m.	Annual herb typically on dry grassy slopes in a variety of habitats, including foothill and valley grassland.	March – June	Unlikely/Low Potential
Depauperate milkvetch *Astragalus paupercaulus*	- / - / 4.3	Northeastern Sierra Nevada Foothill from Shasta Co. south to Placer Co. Elev. 150-1200 m.	Annual herb usually found on open, vernally-moist, volcanic clays & grassy flats.	March – June	Unlikely/Low Potential
Ferris' milkvetch *Astragalus tener* var. *ferrisiae*	- / - / 1B.1	Sacramento Valley region from Butte Co. south to Solano Co. Elev. <75 m.	Annual herb of alkaline flats, vernally moist meadows, & fallow rice fields.	April – May	Unlikely/Low Potential
Alkali milkvetch *Astragalus tener* var. *tener*	- / - / 1B.2	Central Valley & San Francisco Bay area from Yolo Co. south to Merced, San Benito & Monterey Cos. Elev. < 60 m.	Annual herb of alkali meadows, vernal pools & playas, edges of salt marshes, & moist grassy flats.	March – June	Unlikely/Low Potential
Heartscale *Atriplex cordulata* var. *cordulata*	- / - / 1B.2	Western Central Valley from Glenn Co. south to Tulare & San Luis Obispo Cos. Elev. < 200 m.	Annual herb of alkali grassland, alkali meadow & alkali scrub. Occasional on margins of alkali pools.	April – Oct.	No Habitat Present
Brittlescale *Atriplex depressa*	- / - / 1B.2	Western Central Valley from Glenn & Butte Cos. South to Kern Co. Elev. < 320 m.	Annual herb occurring on alkali flats, alkali scrub, alkali grassland & playas.	May – Oct.	No Habitat Present
San Joaquin saltbush *Atriplex joaquiniana*	- / - / 1B.2	Western Central Valley & Inner South Coast Range from Glenn Co. south to San Luis Obispo Co. Elev. < 835 m.	Annual herb occurring on alkali flats, alkali scrub, alkali grassland, & playas.	April – Oct.	No Habitat Present
Vernal pool smallscale *Atriplex persistens*	- / - / 1B.2	Central Valley from Glenn Co. south to Tulare Co. Elev. < 115 m.	Annual herb found in the deeper portions of large, alkaline vernal pools.	June – Oct.	No Habitat Present
Hispid bird's-beak *Cordylanthus mollis* ssp. *hispidus*	- / - / 1B.1	Scattered locations throughout San Joaquin Valley. Also Solano & Alameda Cos. & near Rocklin in Placer Co. Elev. < 150m.	Annual herb inhabiting saline marshes, alkali flats, & alkali vernal pools.	June – Sept.	No Habitat Present
Palmate bird's-beak *Cordylanthus palmatus*	E / E / 1B.1	Central Valley from Glenn Co. south to Fresno Co. Also Livermore Valley in Alameda Co. Elev. < 150 m.	Annual herb of saline alkali flats, alkali scrub, & alkali grassland.	May – Oct.	No Habitat Present

Table A-1

Special-Status Plant Species Known or Potentially Known to Occur at Teichert's Aspen VIII/IX Property

Species	Fed / CA / CNPS Status	Distribution	Habitat	Flowering Period	Habitat Suitability at Site
Dwarf downingia *Downingia pusilla*	- / - / 2B.2	Central Valley from Tehama Co. south to Fresno Co. Also in valleys north of S.F. in Napa & Sonoma Cos. Elev. < 450 m.	Annual herb of vernal pools & swales, ephemeral drainages, & margins of other seasonal wetlands.	March – May	Moderate Potential
Tuolumne button-celery *Eryngium pinnatisectum*	- / - / 1B.2	North-central Sierra Nevada Foothill & adjacent valley from Sacramento Co. south to Tuolumne Co. Elev. 70-900 m.	Annual to perennial herb occurring in swales, vernal pools, moist flats, & ephemeral drainages.	May – August	Unlikely/Low Potential
Boggs Lake hedge-hyssop *Gratiola heterosepala*	- / E / 1B.2	Central Valley & foothills from Shasta to Tulare Co. Also occurs in Lake Co., Modoc Plateau, & Oregon. Elev. < 1200 m.	Annual herb found along marshy lake margins, cattle ponds, & in vernal pools.	April – Aug.	Moderate Potential
Hogwallow starfish *Hesperevax caulescens*	- / - / 4.2	Central Valley & adjacent foothills from Tehama Co. south to Kern Co. Also reported in San Diego Co. Elev. < 500 m.	Annual herb occupying vernal pools, vernal swales, & heavy clay soils.	March – June	Moderate Potential
Rose mallow *Hibiscus lasiocarpos* var. *occidentalis*	- / - / 1B.2	Sacramento Valley and the northern part of San Joaquin Valley. Most records are from the Sacramento River/Delta waterways. Elev. < 120m.	Perennial herb growing on the margins of freshwater marshes, wet riverbanks, and peat islands in sloughs.	June – Sept	Unlikely/Low Potential
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	- / - / 1B.2	Eastern Sacramento Valley from Tehama Co. south to Sacramento Co. Also found in Calaveras Co. Elev. 30-100 m.	Annual herb found in vernal pool, swales & ephemeral drainages.	March – May	Moderate Potential
Legenere *Legenere limosa*	- / - / 1B.1	Northern Central Valley (Shasta to San Joaquin Co.) & Inland Coast Range (Sonoma to Santa Clara Co.). Elev. < 880 m.	Annual herb of vernal pools, seasonal wetlands, drainages, & along margins of cattle ponds.	April – June	Moderate Potential
Heckard's peppergrass *Lepidium latipes* var. *heckardii*	- / - / 1B.2	Western Sacramento Valley from Glenn Co. south to Solano Co. Elev. < 200 m.	Annual herb occurring on alkali flats and alkali grassland near the margins of vernal pools.	March – May	No Habitat Present
Hoary navarretia *Navarretia eriocephala*	- / - / 4.3	Southeastern Sacramento Valley & northern & central Sierra Nevada Foothill from Yuba to Tuolumne Co. Elev. 100-400 m.	Annual herb of seasonally wet flats, usually in heavy soil.	May – June	Unlikely/Low Potential

Table A-1

Special-Status Plant Species Known or Potentially Known to Occur at Teichert's Aspen VIII/IX Property

Species	Fed / CA / CNPS Status	Distribution	Habitat	Flowering Period	Habitat Suitability at Site
Tehama navarretia *Navarretia heterandra*	- / - / 4.3	Scattered throughout northern California & southern Oregon. Elev. 30-1000 m.	Annual herb typically growing heavy soils, vernal pools, & drying flats.	April – June	Unlikely/Low Potential
Baker's navarretia *Navarretia leucocephala* ssp. *bakeri*	- / - / 1B.1	Western Sacramento Valley & northern Inland Coast Range from Glenn & Mendocino Cos. to Solano Co. Elev. < 1700 m.	Annual herb growing in vernal pools and ephemeral drainages.	April – July	Unlikely/Low Potential
Myer's pincushion navarretia *Navarretia myersii* ssp. *myersii*	- / - / 1B.1	Eastern Central Valley & adjacent Sierra Nevada Foothill from Placer Co. south to Merced Co. Elev. 20-330 m.	Annual herb found in vernal pools, usually with acidic soils.	April – May	Moderate Potential
Adobe navarretia *Navarretia nigelliformis* ssp. *nigelliformis*	- / - / 4.2	Scattered locations from the Sierra Nevada Foothills, Central Valley & Inner South Coast Ranges. Elev. 100-1000 m.	Annual herb occurring in vernal pools & vernally moist swales.	April – June	Unlikely/Low Potential
Slender orcutt grass *Orcuttia tenuis*	T / E / 1B.1	Scattered from the Sacramento Valley north to the Modoc Plateau area. Also occurs in Lake Co. Elev. 30-1700 m.	Annual grass generally restricted to deeper vernal pools & other ephemeral wetlands with clay soils.	May – Oct	Moderate Potential
Sacramento orcutt grass *Orcuttia viscida*	E / E / 1B.1	Known only in Sacramento County (from about Phoenix Field to approximately Rancho Seco). Elev. 30-100 m.	Annual grass generally found in larger, deeper vernal pools.	April – Sept	Moderate Potential
Sanford's arrowhead *Sagittaria sanfordii*	- / - / 1B.2	Widely distributed throughout the Central Valley from Shasta Co. to Kern Co. Elev. < 650m.	Perennial herb occurring along the margins of small lakes and ponds and slow-moving sloughs, creeks, rivers, ditches, and canals.	May - Aug	Present/High Potential
Saline clover *Trifolium depauperatum* var. *hydrophilum*	- / - / 1B.2	Central Western California (Sonoma Co. to San Luis Obispo Co.) & southwestern Sacramento Valley. Elev. < 300 m.	Annual herb of salt marshes, alkali meadows, & vernal pools.	April – June	Unlikely/Low Potential

APPENDIX B

Teichert – Aspen VIII & IX Rare Plant Survey
Species Accounts

Dwarf Downingia

Downingia pusilla

Federal Listing Status: None
State Listing Status: None
CNPS Rare Plant Rank: 2B.2

© 2012 Barry Baba

Dwarf downingia is an inconspicuous, annual member of the Bellflower family (Campanulaceae). Depending on location, plants are quite variable, with some growing as small-stature plants less than 3 centimeters tall and others producing sprawling stems up to 15 centimeters long. Floral characteristics are the most distinguishing features separating this rare species from other, more common downingia species. Unlike other species in the genus, dwarf downingia flowers are tiny (2.5 to 4 millimeters) and lack the strong bilateral symmetry characteristic of other *Downingia* flowers. Dwarf downingia flowers are creamy white to occasionally pale blue, with two small yellow spots near the throat. Flowering typically occurs from March through May. Like most *Downingia* species, it is almost impossible to identify to species without flowers.

This species is largely restricted to wetlands with a strict endemic of the vernal pool hydrologic cycle. The species appears to occupy a range of pool sizes and depths, with most records indicating that the species prefers smaller and/or shallower vernal pools with comparatively 'flashy' hydrology (CNDDB 2014). The species will also frequently occupy ephemeral drainages and swales and the seasonally fluctuating vernal pool-like edges of stock ponds and seasonal marshes (Baba pers. obs.). Dwarf downingia does not appear to be associated with any specific landforms or soil associations.

Dwarf downingia is documented from 127 occurrences in California's vernal wetlands, generally below 150 meters elevation (CNDDB 2014). In California, the species' range extends from the northern San Joaquin Valley (Merced and Fresno counties) in the south through the Sacramento Valley to Tehama County in the north. It is also known from the Interior valleys on the Coast Range north of San Francisco (Napa and Sonoma counties). Most occurrences occupy a belt from Sonoma County to the southern Sacramento Valley. Dwarf downingia, like some other members of the annual vernal pool flora, is also known from disjunct localities in Chile.

The nearest known occurrence of dwarf downingia is approximately 4.9 miles south-southwest from the site (CNDDB Occurrence No. 54) (CNDDB 2014). This population is located in vernal pools east of Waterman Road, between Sheldon Road and Bond Road in Elk Grove. The population is till presumed extant. Vernal pools, swales and hydrologically similar margins of seasonal marshes and ponds at the site are considered potential habitat for the species. Considering the relatively close proximity of nearby populations and wide geographical range, Dwarf downingia could be expected to occur at the site.

Boggs Lake Hedge-Hyssop

Gratiola heterosepala

© 2012 Barry Baba

Federal Listing Status: None
State Listing Status: Endangered
CNPS Rare Plant Rank: 1B.2

Boggs Lake hedge-hyssop is diminutive annual of the Plantain family (Plantaginaceae). This species grows erect with stems reaching 2 to 10 centimeters in height. The stems produce small, opposite leaves about 1 to 2 centimeters long, with the lower ones tending to be longer and leaner than the shorter and wider ones above. The upper leaves are also notably blunt at their tips. One to several tubular flowers are produced at the tips of stem, which are glandular puberulent. The flowers are pale yellow to white and only about 6 to 8 millimeters long. Blooming usually occurs in spring between April and June, depending on the specific location. This species is distinguished from the relatively common bractless hedge-hyssop (*Gratiola ebracteata*) by its more truncate leaves and yellow flowers. Boggs Lake hedge-hyssop also has shorter, unequal sepals that are fused at the base (Baldwin et. al. 2012).

Boggs Lake hedge hyssop is found in a wide geographic area but is strictly associated with the vernal pool-type hydrologic cycle. This species has been reported to grown in vernal pools and playa lakes, as well as seasonal stock ponds and fluctuating lake margins. Most occurrences are from well-developed large or deep vernal pools that exhibit more extreme, longer inundation periods, often where interspecies completion is lower. Associated species indicative of these longer inundated pools include hairy pepperwort (*Marsilia vestita*), quillwort (I*soetes* spp.), downingia (*Downingia* spp.), smooth goldfields (*Lasthenia glaberrima*), elatine (*Elatine* spp.), coyote thistle (*Eryngium castrense* and E. *vaseyi*), and bractless hedge-hyssop.

Boggs Lake hedge hyssop was first collected in 1954 from Bogg's Lake in Lake County, California. Since that time, numerous additional occurrences have been recorded, ranging from the Modoc Plateau, through the Sacramento Valley, Inner North Coast Range, and central Sierra Nevada Foothills, south to Merced and Fresno Counties in the San Joaquin Valley Region. Most records are from Tehama and Modoc Counties and are associated with northern volcanic mudflow vernal pools of the northern Sacramento Valley and Modoc Plateau.

The nearest known location of Boggs Lake hedge hyssop is approximately 2.5 miles of northwest of the site, at Mather Field (CNDDB Occurrence No. 84) (CNDDB 2014). These plants were recorded growing in deeper vernal pools and still presumed extant. Vernal pools inundated for longer periods and the margins of seasonal marshes ponds at the site are considered potential habitat for the species. Considering its wide distribution and relatively close proximity of nearby populations, Boggs Lake hedge hyssop could be expected to occur within the Project site.

Ahart's Dwarf Rush

Juncus leiospermus var*. ahartii*

Federal Listing Status: None
State Listing Status: None
CNPS Rare Plant Rank: 1B.2

© 2012 Barry Baba

Ahart's dwarf rush is an inconspicuous annual member of the Rush family (Juncaceae). Ahart's dwarf rush is a green to reddish grass-like plant reaching 2 to 10 centimeters tall. Each plant may produces one to several, erect, thread-like stems from a basal cluster of grass-like leaves. Each stem produces a single, tiny flower at the tip. The flowers are small (less than 0.5 centimeters) and consist of 6 to 10 dark brown, pointed scales, three stamens, and an ovary with a long three-branched style. Flowering generally occurs from late-March through May. Other small, common annual rushes that may co-exist with Ahart's dwarf rush include toad rush (*Juncus bufonius*), leafy-bracted rush (*Juncus capitatus*), and inch-high rush (*Juncus uncialis*). Ahart's dwarf rush is most easily distinguished from the others by its comparatively long style (very short in inch-high rush), simple stem (branched in toad rush), single terminal flower (axillary in toad rush and clustered at tip in leafy-bracted rush) and relatively short inflorescence bract (much longer in leafy-bracted rush).

Ahart's dwarf rush grows in a variety of seasonal wetland type habitats, but appears to by restricted to acidic soils in vernal pool complexes. Although Ahart's dwarf rush has been recorded growing with more "deeply-adapted" vernal pool associates, most records indicate that the species prefers the margins of vernal pools or in swales and seasonal wetlands where hydrologic conditions are more "flashy." In addition, this species is also known to occur on gopher mounds along the margins of these wetlands (CDFG 2014).

Presently, Ahart's dwarf rush is known from only 13 occurrences throughout the Great Central Valley. Populations are recorded from Tehama County in the north to Calaveras County in the south, with elevations ranging from 30 to 90 meters (CDFG 2014). Most occurrences are from Butte and Sacramento County.

The nearest known occurrence of Ahart's dwarf rush is approximately 1.8 miles northeast of the site, at Mather Field just west of Eagles Nest Road (CNDDB Occurrence No. 8). These plants are located in in shallow vernal pools and along vernal swales and still presumed extant. Vernal pools inundated for longer periods and the margins of seasonal marshes at the site are considered potential habitat for the species. Considering the relatively close proximity of nearby populations and wide geographical range, Ahart's dwarf rush could be expected to occur at the site.

Legenere

Legenere limosa

Federal Listing Status: None
State Listing Status: None
CNPS Rare Plant Rank: 1B.1

© 2012 Barry Baba

Legenere is an inconspicuous, annual member of the Bellflower family (Campanulaceae). This plant grows with sprawling stems that reach 10 to 30 centimeters in length. Its slender stems, which are produced underwater, often form roots along the lower nodes and eventually rise out of water or are left growing entangled within a mass of other vegetation. Due to its cryptic, delicate stature, the plant is notoriously overlooked and difficult to detect. Probably the most distinguishing feature of this plant is its cylindrical fruit capsule (about ½ to 1 centimeter long) that is present at the end of each elongated flower stalk, which may be as long as 3 centimeters. Most plants do not have any petals and are generally observed with just their narrowly, triangular-shaped sepals at the tip of each fruit capsule. Sometimes, however, tiny flowers are present and resemble other flowers in its family. If present, the flowers are white with a greenish-yellow center and are fused into a bilaterally symmetrical lobed corolla about 3 to 4 millimeters long. Flowering typically occurs from April to June.

Legenere grows in a variety of wetland habitats including vernal pools, seasonal marshes, floodplains of intermittent streams, and along the margins of cattle stock ponds. Legenere is associated with a wide range of physiographic/edaphic landscapes. Most records indicate that the species prefers the shallower areas of seasonal pools that are inundated for longer periods than average and typically support at least some perennial species such as spikerush (*Eleocharis macrostachya*).

This species' range includes the northern Central Valley from Shasta to San Joaquin Counties and the Inland Coast Range from Lake to Santa Clara County. Populations are reported 78 occurrences, ranging in elevation from less than 950 meters. (CNDDB 2014) The majority of known extant records are concentrated in Solano and Sacramento counties, with other scattered occurrences in Alameda, Lake, Napa, Sonoma, San Mateo, Santa Clara, Placer, Yuba, and Shasta counties (Holland 1983; Platenkamp 1998; CNDDB 2014).

The nearest known occurrence of Legenere is approximately 1.4 miles south of the site (CNDDB Occurrence No. 29) (CNDDB 2014). Two colonies were identified growing in vernal pools just south of Florin Road and 0.7 miles east of Excelsior Road. Vernal pools inundated for longer periods and the margins of seasonal marshes at the site are considered potential habitat for the species. Considering the relatively close proximity of nearby populations and wide geographical range, Legenere could be expected to occur within the Project site.

Pincushion Navarretia

Navarretia myersii subsp. *myersii*

Federal Listing Status: None
State Listing Status: None
CNPS Rare Plant Rank: 1B.1

Pincushion navarretia is an annual member of the Phlox family (Polemoniaceae). This plant has a distinctive characteristic in that it grows very prostrate, often appearing almost mat-like without stems. Although present, stems are typically less than 2 centimeters long. It produces long, thread-like leaves (4 to 8 centimeters) that radiate from the base of the inflorescence. The inflorescence is a cluster of numerous white, sessile, tubular flowers, each about 1 to 2 centimeters long. The species is may be seen flowering from mid-April through May (Dittes and Guardino 2001, CNPS 2014). Pincushion navarretia is most readily distinguished from the more common white-headed navarretia (*Navarretia leucocephala* subsp. *leucocephala*) by its low-growing stems and longer, tubular flowers.

Pincusion navarretia is a strict vernal pool endemic, often occurring in pools with moderate to highly acidic soils (CNPS 2014). Based on known populations and those observed in eastern Merced County, the species was associated with the ancient, weathered alluvial terraces comprising the Valley Springs and Ione Geologic Formations (Dittes and Guardino 2001). Generally, pincushion navarretia is presumed to occupy smaller and/or shallower pools where hydrologic conditions may be more 'flashy.' Associated species in these shallower pools or margins include annual hairgrass (*Deschampsia danthonioides*), Fremont's goldfields (*Lasthenia fremontii*), vernal pool popcornflower (*Plagiobothrys stipitatus*), coyote thistle (*Eryngium* spp.), wooly marbles (*Psilocarphus* spp.), and Sacramento Valley pogogyne (*Pogogyne zizyphoroides*).

Presently, pincushion navarretia is known from 14 occurrences along the eastern portion of the Central Valley and adjacent Sierra Nevada Foothill from Placer County south to Merced County, between 20 and 330 meters elevation (CNPS 2014). A more rare subspecies, small pincushion navarretia (*Navarretia myersii* supbsp. *deminuta*), is also known from the Coast Range in Lake County.

The nearest known location of this species is approximately 10.6 miles northeast of the site, in the Department of Fish and Wildlife Phoenix Field Ecological Reserve (CNDDB Occurrence No. 3) (CNDDB 2014). The species occurs in two pools within the south half of the Preserve and are still presumed extant. The smaller, shallow pools at Aspen VIII & IX are considered potential habitat for pincushion navarretia. Considering the relatively close proximity of nearby populations, this species could be expected to occur within the Project site.

Slender Orcutt Grass

Orcuttia tenuis

Federal Listing Status: Threatened
State Listing Status: Endangered
CNPS Rare Plant Rank: 1B.1

Slender Orcutt grass is an annual member of the distincitive Orcuttieae Tribe in the grass family (Poaceae). This plant grows loosely tufted with slender, erect stems reaching approximately 5 to 15 centimeters. The leaves grow to be about 1.5 to 2 millimeters wide and may appear bluish-green in color. The stems are sparsely hairy and covered with droplets of a sticky, highly aromatic exudate. This feature is common in other members of the Orcutt grasses. Individual spikelets of slender Orcutt grass are evenly spaced along the inflorescence axis, which comprises more than half the plant's height. Flowering may occur between May and September (usually May or June in the Central Valley), and sometimes October, making it one of the latest blooming members of the Orcutt grasses. Other distinguishing characteristics are its equally five-toothed lemmas and stems that are frequently branching from its upper nodes. This species is also less hairy than most other Orcutt grasses.

Slender Orcutt grass is found primarily in vernal pools on substrates of volcanic orgin, but have also been found in places such as stock ponds and borrow pits. Orcutt grasses are strongly adapted to deeper vernal pools with more extreme hydrologic regimes. Interestingly, this species appears to be the least specific of Orcutt grasses with regard to specific habitats niches. This is confirmed by its occupation of a wider range of vernal pool sizes and vernal wetland types, as well as occurrences over a wider geographical range and landform types.

Slender Orcutt grass has been documented from 96 occurrences, which includes a wide range of elevations corresponding to its broad geographical range (CNDDB 2014). The lowest reported elevation is 27 meters in Sacramento County and the highest is 1,756 meters in Plumas County. The species is found from Modoc County south to Sacramento County, with large concentrations occurring in Tehama County and the Modoc Plateau Vernal Pool Region.

The nearest documented occurrence of Slender Orcutt grass is approximately 2 south of the site (CNDDB Occurrence No. 16), in a narrow vernal pool west of Laguna Creek (CNDDB 2014). The population is till presumed extant. The larger, deeper pools that remain inundated for extended periods at the site are considered potential habitat for Sacramento Orcutt grass. Considering the relatively close proximity of nearby populations, this species could be expected to occur at Aspen VIII & IX.

Sacramento Orcutt Grass

Orcuttia viscida

© 2012 Barry Baba

Federal Listing Status: Endangered
State Listing Status: Endangered
CNPS Rare Plant Rank: 1B.1

Sacramento Orcutt grass is an annual member of the unique Orcuttieae Tribe in the grass family (Poaceae). As with other members of the tribe, Sacramento Orcutt grass is a relatively small-stature, densely tufted plant that grows 3 to 10 centimeters tall. This species appears almost bluish-green and is covered in dense, sticky hairs. As with the majority of the Orcuttieae grasses, this species produces aromatic resinous exudates at majority. Flowering typically occurs in May and June. Although the plant resembles other members of its tribe, Sacramento Orcutt grass is distinguished from the other species by its relatively long and unequal lemma teeth.

Sacramento Orcutt grass occurs primarily in large vernal pools that remain inundated for prolonged periods. Soils associated with this species tend to be strongly acidic and support a well-developed silica-iron hardpan layer approximately 2 to 10 feet below the surface. Many plants may only grown in years when seasonal rainfall is sufficient, particularly when rains begin in November and continue through the end of April. This plant is less likely to germinate in years of below-normal precipitation than other members of the Orcuttieae grasses.

Sacramento Orcutt grass is endemic to the southeastern Sacramento Valley, and has always been restricted to Sacramento County. It is known from only 12 occurrences, most of which are still presumed extant (CNDDB 2014). The recorded range of the species extends in a narrow band from just north of the American River near Orangevale to the vicinity of Rancho Seco Lake on Arroyo Seco Mesa, approximately 26 miles to the south.

The nearest documented occurrence of Sacramento Orcutt grass is approximately 0.8 mile southeast of the site (CNDDB Occurrence No. 20); however, this population is presumed extirpated (CNDDB 2014). This occurrence was last observed in 1998 in a pool that is now a permanent marsh due to runoff from an adjacent nursery (CNDDB 2014). The nearest possible extant location is approximately 3.6 miles northeast of the site (CNDDB Occurrence No. 17), in vernal pools on the Anatolia Preserve east of Sunrise Boulevard and north of Kiefer Boulevard (CNDDB 2014). The larger, deeper pools that remain inundated for extended periods at the site are considered potential habitat for Sacramento Orcutt grass. Considering the relatively close proximity of nearby populations, this species could be expected to occur at Aspen VIII & IX.

Sanford's Arrowhead

Sagittaria sandfordii

© 2014 Barry Baba

Federal Listing Status: None
State Listing Status: None
CNPS Rare Plant Rank: 1B.2

Sanford's arrowhead is an aquatic perennial member in the water-plantain family (Alismataceae). This emergent plant possesses linear to narrowly ovate leaves and typically grows 15 to 30 centimeters tall. Plants often grow densely and spread by underground rhizomes, which produce small spherical tubers at their tips. Separate male and female flowers are produced in three-whorled clusters, with the female clusters located basally. Relatively conspicuous, white petals (0.5 to 1 centimeter) are produced from May through August. The pedicels are also recurved rather than straight when in fruit (Baldwin et. al. 2012). Sanford's arrowhead is distinguished from its close relatives in that it does not possess sagittate (arrowhead-shaped) leaves.

Sanford's arrowhead is associated with the shallow margins of small lakes and ponds and slow-moving sloughs, creeks, rivers, and canals. Numerous populations have also naturalized in ditches associated with irrigation and other drainage systems. Little is known regarding the biology or ecology of the species, although it appears to tolerate a wide range of freshwater marsh environments. Most populations appear to have established by seeds, with existing colonies spreading mainly from rhizomes and tubers.

This species occupies a variety of freshwater marsh habitats and is widely distributed throughout the Central Valley between 0 and 650 meters. Sanford's arrowhead documented from 93 occurrences and is presently known from Shasta to Kern Counties, with the majority of records occurring in Sacramento County (CNDDB 2014). A disjunct population also occurs near Crescent City in Del Norte County. The species is presumed to have been extirpated from much of its historic range in southern California (Orange and Ventura Counties).

The nearest known occurrence of Sanford's arrowhead is approximately 1.8 miles northwest of the site (CNDDB Occurrence No. 25) (CNDDB 2014). These populations occur in two ponds at the Cordova Golf Course, just north of Jackson Road (Highway 16), and are still presumed extant. Existing ponds, irrigations ditches, marshes, and portions of Elder Creek are considered potential habitats for the species. Considering the close proximity of nearby populations and wide geographical range, Sanford's arrowhead could be expected to occur at the site.

APPENDIX C

Teichert – Aspen VIII & IX Rare Plant Survey
Flora Inventory

TEICHERT AGGREGATES

PERKINS – ASPEN VIII & IX
SACRAMENTO COUNTY

Flora Inventory
Spring/Summer 2013-14

LYCOPHYTES

ISOETACEAE (QUILLWORT FAMILY)

Isoetes orcuttii	Orcutt's quillwort

FERNS

AZOLLACEAE (MOSQUITO FERN FAMILY)

Azolla filiculoides	Water fern, Mosquito fern

MARSILEACEAE (MARSILEA FAMILY)

Marsilea vestita subsp. *vestita*	Hairy water-clover, Hairy pepperwort
Pilularia americana	American pillwort

GYMNOSPERMS

CUPRESSACEAE (CYPRESS)

*Calocedrus decurrens***	Incense cedar
*Sequoia semperivirens***	Redwood

PINACEAE (PINE FAMILY)

Pinus sp.**	Pine

MAGNOLIDS

LAURACEAE (LAUREL FAMILY)

*Cinnamomum camphora***	Camphor tree

ANGIOSPERMS, EUDICOTS

AMARANTHACEAE (AMARANTH FAMILY)

*Amaranthus albus**	Tumbleweed
*Amaranthus blitoides**	Procumbent pigweed
*Amaranthus retroflexus**	Redroot pigweed

ANACARDIACEAE (SUMAC OR CASHEW FAMILY)

*Pistacia atlantica**	Mt. Atlas mastic tree
Toxicodendron diversilobum	Western poison oak

APIACEAE (CARROT FAMILY)

*Conium maculatum**	Poison hemlock-thistle

* Non-native plants of California (Baldwin, B. G., D. H. Goldman, D. J. Keil, R. Patterson, T. J. Rosatti, and D. H. Wilken, editors. 2012. The Jepsom manual: vascular plants of California, second edition. University of California Press, Berkeley.)

** Ornamental, planted as landscape tree/shrub

Eryngium castrense	Great Valley coyote thistle

APOCYNACEAE (DOGBANE FAMILY)

Asclepias eriocarpa	Kotolo
Asclepias fascicularis	Narrow-leaf milkweed

ASTERACEAE (SUNFLOWER FAMILY)

*Anthemis cotula**	Dog-fennel
Carduus pycnocephalus subsp. *pycnocephalus**	Italian thistle
*Centaurea calcitrapa**	Purple star-thistle
*Centaurea solstitialis**	Yellow star-thistle
Centromadia fitchii	Fitch's spikeweed
*Cichorium intybus**	Chicory
*Cirsium vulgare**	Bull thistle
*Cotula coronopifolia**	Brass-buttons
*Dittrichia graveolens**	Stinkwort
Erigeron sp.	Horseweed
Gnaphalium palustre	Western marsh cudweed
*Helminthotheca echioides**	Bristly ox-tongue
Heterotheca grandiflora	Telegraph weed
Holocarpha virgata subsp. *virgata*	Sticky tarweed
*Hypochaeris glabra**	Smooth cat's-ear
*Lactuca serriola**	Prickly lettuce
Lasthenia glaberrima	Smooth goldfields
Lasthenia fremontii	Fremont's goldfields
Leontodon saxatilis subsp. *longirostris**	Common hawkbit
*Logfia gallica**	Daggerleaf cottonweed
Micropus californicus var. *californicus*	Cottontop
*Matricaria discoidea**	Pineapple weed
*Pseudognaphalium luteoalbum**	Common cudweed
Psilocarphus brevissimus var. *brevissimus*	Dwarf woolly-marbles
Psilocarphus tenellus	Slender woolly-marbles
*Senecio vulgaris**	Common groundsel
*Silybum marianum**	Milk thistle
*Soliva sessilis**	Common soliva, Field burrweed
Sonchus asper subsp. *asper**	Prickly sow thistle
*Sonchus oleraceus**	Common sow thistle
Wyethia angustifolia	Narrow-leaved mule's ear
*Xanthium spinosum**	Spiny cocklebur
Xanthium strumarium	Cocklebur

BETULACEAE (BIRCH FAMILY)

*Betula pendula***	European white birch

BIGNONIACEAE (TRUMPET-CREEPER FAMILY)

*Catalpa bignonioides***	Catalpa

BORAGINACEAE (BORAGE FAMILY)

Amsinckia intermedia	Common fiddleneck
Amsinckia menziesii	Small-flowered fiddleneck
Plagiobothrys greenei	Greene's popcornflower
Plagiobothrys stipitatus var. *micranthus*	Common vernal pool popcornflower

* Non-native plants of California (Baldwin, B. G., D. H. Goldman, D. J. Keil, R. Patterson, T. J. Rosatti, and D. H. Wilken, editors. 2012. The Jepsom manual: vascular plants of California, second edition. University of California Press, Berkeley.)

** Ornamental, planted as landscape tree/shrub

BRASSICACEAE (MUSTARD FAMILY)	
*Brassica rapa**	Field mustard, Turnip
*Capsella bursa-pastoris**	Shepherd's purse
Cardamine oligosperma	Western bittercress
*Hirschfeldia incana**	Perennial mustard
Lepidium nitidum	Shining peppergrass
Lepidium strictum	Prostrate peppergrass
*Raphanus raphanistrum**	Jointed charlock
*Raphanus sativus**	Radish
Rorippa curvisiliqua	Western yellow cress, Curvepod yellow cress
Rorippa palustris	Bog yellow cress
*Sisymbrium officinale**	Hedge mustard
CAMPANULACEAE (BELLFLOWER FAMILY)	
Downingia bicornuta var. *picta*	Doublehorn downingia
Downingia ornatissima var. *ornatissima*	Folded downingia
CANNABACEAE (HEMP FAMILY)	
*Celtis sinensis***	Chinese hackberry
CARYOPHYLLACEAE (PINK FAMILY)	
*Cerastium glomeratum**	Sticky mouse-ear chickweed
*Petrorhagia dubia**	Hairy pink
*Silene gallica**	Small-flower catchfly, Windmill pink
*Spergula arvensis**	Stickwort, Starwort
*Spergularia bocconi**	Boccone's sand-spurrey
*Spergularia rubra**	Red sand-spurrey
*Stellaria media**	Common chickweed
CHENOPODIACEAE (GOOSEFOOT FAMILY)	
*Chenopodium album**	Lamb's quarters
*Chenopodium murale**	Nettleleaf goosefoot
*Salsola tragus**	Russian thistle, Tumbleweed
CONVOLVULACEAE (MORNING-GLORY FAMILY)	
*Convolvulus arvensis**	Bindweed
Cuscuta howelliana	Vernal pool dodder
CRASSULACEAE (STONECROP FAMILY)	
Crassula aquatica	Water pygmy-weed
*Crassula tillaea**	Moss pygmy-weed, Mediterranean pygmy-weed
ELATINACEAE (WATERWORT FAMILY)	
Elatine brachysperma	Shortseed waterwort
EUPHORBIACEAE (SPURGE FAMILY)	
Croton setigerus	Turkey-mullein, Doveweed
FABACEAE (LEGUME FAMILY)	
Acacia sp.**	*Acacia*
Acmispon americanus var. *americanus*	Spanish clover
*Lotus corniculatus**	Bird's-foot trefoil

* Non-native plants of California (Baldwin, B. G., D. H. Goldman, D. J. Keil, R. Patterson, T. J. Rosatti, and D. H. Wilken, editors. 2012. The Jepsom manual: vascular plants of California, second edition. University of California Press, Berkeley.)

** Ornamental, planted as landscape tree/shrub

Lupinus bicolor	Miniature lupine
*Medicago polymorpha**	Common burclover
*Melilotus indicus**	Sourclover
Trifolium depauperatum var. *depauperatum*	Dwarf sack clover
*Trifolium dubium**	Shamrock
*Trifolium glomeratum**	Clustered clover
Trifolium gracilentum	Pinpoint clover
*Trifolium campestre**	Hop clover
*Trifolium hirtum**	Rose clover
Trifolium microcephalum	Small-head clover
*Trifolium repens**	White clover
Trifolium variegatum var. *variegatum*	Variegated clover, White-tipped clover
Vicia sativa subsp. *nigra**	Smaller spring vetch
Vicia sativa subsp. *sativa**	Spring vetch
Vicia villosa var. *varia**	Winter vetch

FAGACEAE (OAK FAMILY)

Quercus lobata	Valley oak
Quercus wislizenii var. *wislizenii*	Interior live oak

GENTIANACEAE (GENTIAN FAMILY)

*Centaurium tenuiflorum**	Slender centaury
Cicendia quadrangularis	Timwort

GERANIACEAE (GERANIUM FAMILY)

*Erodium botrys**	Longbeak filaree, Broadleaf filaree
*Erodium brachycarpum**	Short-fruit filaree, Whitestem filaree
*Erodium cicutarium**	Redstem filaree
*Erodium moschatum**	Greenstem filaree
*Geranium dissectum**	Cut-leaved geranium
*Geranium molle**	Dove's-foot geranium

HYPERICACEAE (ST. JOHN'S WORT FAMILY)

Hypericum perforatum subsp. *perforatum**	Klamathweed

JUGLANDACEAE (WALNUT FAMILY)

Juglans hindsii	Northern California black walnut

LAMIACEAE (MINT FAMILY)

Lycopus americanus	American bugleweed
*Marrubium vulgare**	Horehound
*Mentha pulegium**	Pennyroyal
Pogogyne zizyphoroides	Sacramento mesa mint
Trichostema lanceolatum	Vinegar weed

LIMNANTHACEAE (MEADOWFOAM FAMILY)

Limnanthes douglasii ssp. *rosea*	Rosy Douglas' meadowfoam

LINACEAE (FLAX FAMILY)

*Linum bienne**	Pale flax

* Non-native plants of California (Baldwin, B. G., D. H. Goldman, D. J. Keil, R. Patterson, T. J. Rosatti, and D. H. Wilken, editors. 2012. The Jepsom manual: vascular plants of California, second edition. University of California Press, Berkeley.)

** Ornamental, planted as landscape tree/shrub

LYTHRACEAE (LOOSESTRIFE FAMILY)

*Lagerstroemia indica***	Crape myrtle
*Lythrum hyssopifolia**	Hyssop loosestrife
*Lythrum portula**	Spatulaleaf loosestrife

MAGNOLIACEAE (MAGNOLIA FAMILY)

Magnolia sp.**	

MALVACEAE (MALLOW FAMILY)

*Malva nicaeensis**	Bull mallow
*Malva parviflora**	Cheeseweed

MONTIACEAE (MINER'S LETTUCE FAMILY)

Calandrinia ciliata	Red maids
Claytonia perfoliata subsp. *perfoliata*	Miner's lettuce
Montia fontana	Water chickweed, Blinks

MORACEAE (MULBERRY FAMILY)

*Ficus carica**	Edible fig
*Morus alba***	White mulberry

MYRSINACEAE (MYRSINE FAMILY)

*Anagallis arvensis**	Scarlet pimpernel

MYRTACEAE (MYRTLE FAMILY)

*Eucalyptus camaldulensis***	Red gum

OLEACEAE (OLIVE FAMILY)

Fraxinus 'Modesto'**	Modesto ash
Ligustrum sp.**	Privet
*Olea europaea***	Olive

ONAGRACEAE (EVENING PRIMROSE FAMILY)

Epilobium brachycarpum	Annual willowherb
Epilobium campestre	Smooth willowherb
Epilobium ciliatum ssp. *ciliatum*	Fringed willowherb, Northern willowherb
Epilobium torreyi	Torrey's willowherb
Ludwigia peploides subsp. *peploides**	Creeping water primrose

OROBANCHACEAE (BROOMRAPE FAMILY)

Castilleja attenuata	Valley tassels
Castilleja exserta subsp. *exserta*	Purple owl's-clover
*Parentucellia viscosa**	Yellow glandweed
Triphysaria eriantha subsp. *eriantha*	Butter-and-eggs, Johnny-tuck
Triphysaria pusilla	Dwarf owl's-clover
Triphysaria versicolor subsp. *faucibarbata*	Yellow owl's-clover

OXALIDACEAE (OXALIS FAMILY)

Oxalis pes-caprae	Bermuda buttercup

PAPAVERACEAE (POPPY FAMILY)

Eschscholzia californica	California poppy

* Non-native plants of California (Baldwin, B. G., D. H. Goldman, D. J. Keil, R. Patterson, T. J. Rosatti, and D. H. Wilken, editors. 2012. The Jepsom manual: vascular plants of California, second edition. University of California Press, Berkeley.)

** Ornamental, planted as landscape tree/shrub

PHRYMACEAE (LOPSEED FAMILY)

Mimulus guttatus	Common yellow monkeyflower
Mimulus tricolor	Tricolor monkeyflower

PLANTAGINACEAE (PLANTAIN FAMILY)

Callitriche heterophylla var. *heterophylla*	Varied leaved water starwort
Callitriche marginata	Winged water starwort
*Plantago lanceolata**	English plantain
*Veronica anagallis-aquatica**	Water speedwell
*Veronica persica**	Persian speedwell
Veronica peregrina subsp. *xalapensis*	Purslane speedwell

PLATANACEAE (PLANE-TREE FAMILY)

Platanus x. *acerifolia***	London plane-tree

POLEMONIACEAE (PHLOX FAMILY)

Navarretia leucocephala ssp. *leucocephala*	White-flowered navarretia

POLYGONACEAE (BUCKWHEAT FAMILY)

Polygonum aviculare subsp. *depressum**	Common knotweed
*Persicaria hydropiper**	Waterpepper
Persicaria lapathifolia	Willow weed
*Persicaria maculosa**	Lady's thumb
Persicaria punctata	Dotted smartweed
*Rumex acetosella**	Sheep sorrel
*Rumex conglomeratus**	Clustered dock
*Rumex crispus**	Curly dock
*Rumex pulcher**	Fiddle dock

RANUNCULACEAE (BUTTERCUP FAMILY)

Ranunculus aquatilus var. *hispidulus*	Fern-leaf water buttercup
Ranunculus bonariensis var. *trisepalus*	Vernal pool buttercup
*Ranunculus muricatus**	Spiny-fruit buttercup
Ranunculus sceleratus var. *sceleratus**	Cursed buttercup

ROSACEAE (ROSE FAMILY)

Malus sp.**	Apple
Prunus sp.**	Fruit tree
Pyrus sp.**	Pear
Rosa californica	California wild rose
*Rosa eglanteria**	Sweet-brier
*Rubus armeniacus**	Himalayan blackberry

RUBIACEAE (MADDER FAMILY)

Galium aparine	Goose grass
*Galium parisiense**	Wall bedstraw

RUTACEAE (CITRUS FAMILY)

Citrus sp.**	Citrus

SALICACEAE (WILLOW FAMILY)

Populus fremontii subsp. *fremontii*	Fremont cottonwood

* Non-native plants of California (Baldwin, B. G., D. H. Goldman, D. J. Keil, R. Patterson, T. J. Rosatti, and D. H. Wilken, editors. 2012. The Jepsom manual: vascular plants of California, second edition. University of California Press, Berkeley.)

** Ornamental, planted as landscape tree/shrub

*Salix babylonica***	Weeping willow
Salix gooddingii	Goodding's black willow
SAPINDACEAE (SOAPBERRY FAMILY)	
*Acer saccharinum***	Silver maple
SCROPHULARIACEAE (FIGWORT FAMILY)	
Limosella acaulis	Owyhee mudwort
SOLANACEAE (NIGHTSHADE FAMILY)	
Solanum americanum	White nightshade
ULMACEAE (ELM FAMILY)	
*Ulmus americana***	American elm
VERBENACEAE (VERVAIN FAMILY)	
Phyla nodiflora	Common lippia
VITACEAE (GRAPE FAMILY)	
Vitis sp.	Grape
ZYGOPHYLLACEAE (CALTROP FAMILY)	
*Tribulus terrestris**	Puncture vine

ANGIOSPERMS, MONOCOTS

AGAVACEAE (CENTURY PLANT FAMILY)	
Chlorogalum sp.	Soap plant
ALISMATACEAE (WATER-PLANTAIN FAMILY)	
*Alisma lanceolatum**	Lance-leaved water plantain
Alisma triviale	Northern water plantain
Damasonium californicum	Fringed water-plantain
Sagittaria sanfordii [1]	Sanford's arrowhead
ARACEAE (ARUM FAMILY)	
Lemna minor	Common duckweed
Wolffia brasiliensis	Brazilian watermeal
CYPERACEAE (SEDGE FAMILY)	
Carex densa	Dense sedge
Carex praegracilis	Field sedge
Cyperus eragrostis	Tall nutsedge
Eleocharis acicularis	Least spikerush
Eleocharis macrostachya	Creeping spikerush
Schoenoplectus acutus var. *occidentalis*	Common tule
JUNCACEAE (RUSH FAMILY)	
Juncus acuminatus	Tapered rush

[1] California Native Plant Society CRPR List 1B.2

* Non-native plants of California (Baldwin, B. G., D. H. Goldman, D. J. Keil, R. Patterson, T. J. Rosatti, and D. H. Wilken, editors. 2012. The Jepsom manual: vascular plants of California, second edition. University of California Press, Berkeley.)

** Ornamental, planted as landscape tree/shrub

Juncus balticus	Baltic rush
Juncus bufonius var. *bufonius*	Common toad rush
*Juncus capitatus**	Leafybract dwarf rush
Juncus uncialis	Inch-high rush
*Juncus usitatus**	Australian rush
Juncus xiphioides	Iris-leaved rush

JUNCAGINACEAE (ARROW-GRASS FAMILY)

Triglochin scilloides	Flowering-quillwort

LILIACEAE (LILY FAMILY)

Chlorogalum sp.	Soap plant

POACEAE (GRASS FAMILY)

*Agrostis avenacea**	Pacific bentgrass
*Aira caryophyllea**	Silver European hairgrass
Alopecurus saccatus	Vernal pool foxtail
*Anthoxanthum odoratum**	Sweet vernal grass
*Avena barbata**	Slender wild oat
*Avena fatua**	Wild oat
*Briza minor**	Little quaking grass
*Bromus diandrus**	Ripgut grass
*Bromus hordeaceus**	Soft-chess brome
*Crypsis schoenoides**	Swamp grass
*Cynodon dactylon**	Bermuda grass
*Dactylis glomerata**	Orchard grass
Deschampsia danthonioides	Annual hairgrass
*Echinochloa crus-galli**	Barnyard grass
*Elymus caput-medusae**	Medusa head
*Festuca arundinacea**	Tall fescue
*Festuca bromoides**	Brome fescue
*Festuca myuros**	Six-weeks fescue, Rattail fescue
*Festuca perennis**	Ryegrass
*Festuca pratensis**	Meadow fescue
*Glyceria declinata**	Waxy mannagrass
*Holcus lanatus**	Common velvet grass
Hordeum marinum ssp. *gussoneanum**	Mediterranean barley
Hordeum murinum ssp. *leporinum**	Hare barley
Hordeum murinum subsp. *murinum**	Wall barley
Leersia oryzoides	Rice cutgrass

TEICHERT – SACRAMENTO COUNTY

Arborist Report

July 2015

1.0 INTRODUCTION

This Arborist Report has been prepared for Teichert Aggregates, Inc.'s (Teichert's) Aspen VIII and IX site (Property) in Sacramento County, California. The Property is located approximately 0.5 mile south of Jackson Road (Highway 16) and 0.5 mile east of Bradshaw Road, and is bisected by Elder Creek Road (Figure 1). The purpose of this report is to present the results of a tree survey conducted for the Property, including information about the species, size, condition, and location of the trees on the property. This information will be used to evaluate project impacts and create appropriate mitigation pursuant to Sacramento County Code (Chapter 19.12 *Tree Preservation and Protection*) and policies of the Sacramento General Plan Conservation Element.

1.1 Project Overview

The Property is an approximately 682-acre site within unincorporated Sacramento County, of which Teichert proposes to mine approximately 357.3 acres for aggregate resources (Project) (Figure 2). Material mined from the site will be transported via conveyor belt to Teichert's Perkins processing plant, approximately 4 miles to the northwest (Figure 1). This conveyor will exit near the northwestern corner of Aspen VIII, where it will extend into the neighboring Aspen V-South Property to the north, before eventually connecting to an existing conveyor system on a permitted mining area on Aspen V-South. This portion of conveyor between Aspen VIII and Aspen V-South has been included as part of the Project (Figure 2). The Project also includes a conveyor tunnel that will be constructed underneath Elder Creek Road (Figure 2). In addition to mining activities, Teichert proposes to improve an existing culvert that connects Elder Creek between Aspen VIII and IX from underneath Elder Creek Road (Figure 2). All ancillary elements and construction activities, including conveyor between Aspen VIII and Aspen V-South, tunnel under Elder Creek Road, and culvert replacement in Elder Creek, have been included as part of the Project and, together with mining, amount to a total disturbance area of approximately 384.44 acres (Figure 2).

1.2 Regulatory Context

The Sacramento County Tree Preservation Ordinance and policies within the General Plan Conservation Element afford various protections to native vegetation and the urban forest. Requirements for the protection of native oak trees are found in Sacramento County Code 19.12. This policy and ordinance requires a project applicant to obtain authorization from the County for any project impacts which would encroach within the dripline of or destroy, kill or remove any "tree," as defined, with the urban

area of the unincorporated area of Sacramento County, or any property, public or private. The ordinance defines "trees" as follows:

> "Any living native oak tree having at least one trunk of six inches or more in diameter measured four and one-half feet above the ground, or a multi-trunked native oak tree having an aggregate diameter of ten inches or more, measured four and one-half feet above the ground (dbh)."

In addition to protection of oak trees, the Conservation Element of the Sacramento County General Plan includes policies that build on Sacramento County's Tree Preservation and Protection Ordinance. Specifically, CO-138 and CO-139 require that other native trees (California sycamore and California black walnut) also be protected or otherwise mitigated for in accordance with existing tree replacement policies and standards for native oaks (i.e., on an inch-by-inch basis). Sacramento General Plan Policy CO-140 further expands on native tree protections by addressing tree canopy and other mitigation requirements for native oak woodlands, oak savannah and mixed riparian areas. Impacts to non-native tree canopy are addressed in the Urban Forest Management section of the General Plan under policies CO-145 and CO-146, which require mitigation for loss of non-native tree canopy as a result of development.

For projects that will substantially impact or remove on-site or off-site trees, an arborist report is typically required as part of the Planning Application. Impacted trees are defined as all on-site and off-site trees meeting the County's criteria of a 'protected' tree that have canopies overhanging the site or that may be impacted by off-site project-related construction.

1.3 Existing Conditions

The Aspen VIII property (Sacramento Co. Assessor's Parcel Numbers [APNs] 063-0180-005,-006 and 063-0160-001) is an approximately 319-acre site bounded by Elder Creek Road to the south, Bellevue and Arlington Cemeteries to the west, and agricultural land (grazing) to the north and east (Figure 2). The Aspen IX property (APNs 066-0020-006, 066-0030-001 and 066-0050-003) is an approximately 363-acre site located immediately south of Elder Creek Road, 0.5 mile east of Bradshaw Road, 0.25 mile north of Florin Road and 0.5 west of Excelsior Road (Figure 2). Current land uses surrounding the site include rural residential, agricultural cropland, and rangeland. The topography of the site is generally flat with a few moderate rolling hills.

Several different biological communities occur on the Property, including irrigated pasture, annual grassland and wetland communities (Figure 3). Irrigated pasture habitat occurs over the majority of the site, totaling approximately 331.1 acres. A network of ditches and ponds are associated with the irrigated pastures. Common plant species include tall fescue (*Festuca arundinacea*), Kentucky blue grass (*Poa pratensis* subsp. *pratensis*), ryegrass (*Festuca perennis*), dallis grass (*Paspalum dilatatum*), dense sedge (*Carex densa*), field sedge (*Carex praegracilis*), English plantain (*Plantago lanceolata*), white clover (*Trifolium repens*), shamrock (*Trifolium dubium*), cut-leaved geranium (*Geranium dissectum*), and yellow's owl's-clover (*Triphysaria versicolor* subsp. *faucibarbata*).

Much of the remaining Property consists of annual grasslands, totaling approximately 308.5 acres. These areas consist of relatively flat to moderately rolling hills dominated by soft chess (*Bromus hordeaceus*), ripgut brome (*Bromus diandrus*), wall barley (*Hordeum murinum*), Mediterranean barley (*Hordeum marinum* subsp. *gussoneanum*), brome fescue (*Festuca bromioides*), ryegrass, longbeak filaree (*Erodium botrys*), perennial mustard (*Hirschfeldia incana*), winter vetch (*Vicia villosa* var. *varia*), common fiddleneck (*Amsinckia intermedia*), yellow star-thistle (*Centaurea solstitialis*), and bindweed (*Convolvulus arvensis*). Vernal pools and seasonal wetlands are common within these relatively undisturbed landscapes.

Trees are largely absent on the Property except along borders where other features exist (i.e., homes, roads, ditches, ponds, etc.). Most trees on site are the result of ornamental landscape plantings around roads and residential homes. Himalayan blackberry (*Rubus armeniacus*) and sweet briar (*Rosa rubiginosa*) brambles are also interspersed with trees throughout the site along fencelines, irrigation ditches/ponds, and portions of Elder Creek.

Wetlands identified and mapped on the Property include vernal pool, seasonal wetland, seasonal swale, freshwater marsh, perennial stream, ephemeral stream, stock pond and ditch (Figure 3). In addition, Elder Creek occurs on both Aspen VIII and IX, whereby it enters at the southeast corner of Aspen VIII and exits at the western boundary of Aspen IX (Figure 3). The creek is channelized throughout the Aspen VIII portion of the site, where it eventually enters an artificial expansion "pond" before flowing under Elder Creek Road and into Aspen IX. Once entering Aspen IX, the creek maintains its natural course before exiting the site on the west where it is once again channelized. The creek is essentially a perennial drainage that is hydrologically supported by irrigation runoff during the dry (summer) season.

Other features on the Property include three rural residential homes and associated farm/equipment storage buildings. Dirt and graveled access roads to homes, farm buildings, and pastures are also present throughout the Property.

2.0 TREE SURVEY REPORT- IDENTIFICATION, INVENTORY AND ASSESSMENT

2.1 Survey Methods

An aerial photo of the site was used to determine potential tree locations and to develop field survey maps. Trees were then surveyed on foot by Teichert biologists B. Baba and J. Greer (ISA Certified Arborist, Cert. #WE-10104A) on 23 April, 01 May, and 07 October 2014 to verify and map all trees located within and immediately adjacent to the proposed limits of disturbance. In general, surveys were focused to areas within the project boundary and roughly 150 feet of the proposed limits of disturbance. Adjacent private properties were not inventoried if their trees were determined to be well outside of potential impacts.

All trees with trunks equal to or greater than four inches in diameter were inventoried and mapped using a Trimble Juno global positioning system (GPS) unit with sub-meter accuracy. All recorded trees were closely examined to determine species type and their diameter at breast height (DBH). To determine DBH, a diameter tape was used to verify each trunk diameter at the industry standard of 54 inches above grade. In addition, dripline radius was assessed based upon the measurement from the trunk to the end of the longest lateral limb, which defines the protection zone of the tree.

The overall vigor of each tree was rated according to Table 1 (below). Vigor consists of a combined assessment of the health and structure of a tree. The health rating component considers factors such as the size, color, and density of the foliage; the amount of deadwood within the canopy; bud viability; evidence of wound closure; and the presence or evidence of stress, disease, nutrient deficiency, and insect infestation. The structural rating component reflects the trunk and branch configuration; canopy balance; the presence of included bark and other structural defects such as decay; and the potential for structural failure.

TABLE 1. ASPEN VIII & IX ARBORIST REPORT (2014) - TREE VIGOR RATING SYSTEM

Vigor Rating	Tree Health	Tree Structure
4	Healthy tree or shrub, free of signs and symptoms of disease. Leaf size, color, and density are typical for the species; buds are normal size, viable and abundant; current and past growth increments are better than average.	No wounds, cavities, decay, or indication of hollowness evident in the root crown, trunk, or primary and secondary limbs; no anchor roots exposed; no dead primary or secondary limbs present; there have been no major limb failures; limbs are not overburdened; branching structure appropriate for species.
3	Tree with moderate vigor, with very little evidence of stress or disease. Some thinning of crown and somewhat poor leaf color; buds are normal size and viable; current and past growth increments are generally average.	Average amount of deadwood/dieback with respect to the tree's size and growing environment; there have been no major limb failures; limbs are not overburdened; branching structure is appropriate for species; any callusing is vigorous; any decay is limited to small dead branches/stubs.
2	Tree in decline, with moderate evidence of stress, disease, nutrient deficiency, and/or insect infestation; epicormic growth evident; current and past growth increments below average; buds small and few; tree may be slow to callus around old wounds.	Dieback of medium to large branches; limbs slightly overburdened; branching structure and/or canopy balance moderately altered by the tree's growing environment; small to moderate wounds, cavities, decay, and indication of hollowness evident in the root crown, trunk, and/or primary and secondary limbs; some anchor roots may be exposed.
1	Tree in severe decline; most of the foliage is from epicormic growth; major evidence of stress, disease, nutrient deficiency and/or insect infestation; poor leaf color; buds unviable.	Dieback of scaffold branches and/or trunk; significant wounds, cavities, decay, and/or indication of hollowness evident in the root crown, trunk, and/or primary and secondary limbs; anchor roots exposed; limbs may be severely overburdened.
0	Tree is dead; no living tissue evident.	Extensive dieback evident, with branches completely dry and breaking easily; trunk and major limbs hollow; tree has lost all anchorage.

Data Collected

1. Tree tag number;
2. Species identification;
3. Location;
4. Trunk diameter at breast height (DBH);
5. Visual estimate of dripline radius ; and
6. Visual assessment for health and structural condition using a 0-4 scale, defined in Table 1.

2.2 Survey Results

A total of 102 trees, representing 17 species, were surveyed. The numbers and types of trees surveyed are shown in Table 2. Demographic data for each tree can be found in Appendix A, and the number and locations of each tree can be found in Figure 4.

TABLE 2. ASPEN VIII & IX ARBORIST REPORT (2014) TREE SPECIES SURVEYED

Common Name	Scientific Name	No. of Trees Surveyed
Goodding's black willow	*Salix gooddingii*	21
California black walnut	*Juglans hindsii*	9
Valley oak	*Quercus lobata*	5
Modesto ash	*Fraxinus velutina*	21
Fremont cottonwood	*Populus fremontii*	9
Red gum	*Eucalyptus camaldulensis*	10
Fruitless mulberry	*Morus alba*	13
Weeping willow	*Salix babylonica*	1
Chinese tallowtree*	*Triadica sebifera*	1
London plane tree	*Plantanus x hispanica*	1
Edible fig*	*Ficus carica*	2
Mount Atlas Mastic Tree	*Pistacia atlantica*	1
Camphortree	*Cinnamomum camphora*	1
Chinese pistache	*Pistacia chinensis*	3
Lemon	*Citrus x limon*	1
Prunus tree	*Prunus spp.*	2
Silver Maple	*Acer saccharinum*	1

*The California Invasive Plant Council classifies this tree as a "Not-Native Invasive" species with moderate status regarding potential impact to local native ecosystems.

Trees were scattered throughout the survey area, commonly along fencelines, roads, irrigation ditches, ponds and residential landscapes (Figure 4). The most frequently occurring species were Goodding's black willow and Modesto ash. Goodding's black willow trees are common California native trees that are usual colonizers of disturbed sites with a continuous water supply. All surveyed black willows exist adjacent to irrigation water sources, with the majority concentrated along an irrigation pond and connected ditches in the northwestern portion of Aspen VIII. Modesto ash trees, regularly planted as ornamental landscape/shade trees, are common along driveways/fencelines and around residential homes.

Other commonly occurring trees were red gum eucalyptus, fruitless mulberry, and Fremont cottonwood. Both the red gum and mulberry trees are not native and were most likely planted as landscape trees. The red gum trees form two large clumps in the northwest corner of the study area, near the Bellvue Cemetery. Mulberry trees were found scattered throughout the site along fencelines and around homes. Fremont cottonwood trees were also distributed throughout the site, usually in association with water sources. Similar to the black willow, Fremont cottonwood trees are native to the area and tend to behave as fast-growing, primary colonizers in areas with a constant water supply.

Both cottonwood and black willow trees will often form riparian scrub or forest habitat along the perimeters of riparian areas, usually in association with other species (such as black walnut and valley oak). Within the Aspen VIII and IX survey area, riparian forest tree canopy is generally lacking, represented only by small patches along an irrigation pond in the northwest corner of the study area and along various ditches and Elder Creek (totaling approximately 0.469 acre) (Figure 5). Additional riparian forest scrub was observed within the Elder Creek channel in the southeast portion of Aspen VIII. This was probably the largest riparian stand on the Property, but was not mapped due to its location well outside of the survey area. The riparian habitat in this area is generally dominated by Himalayan blackberry/sweet briar brambles interspersed with willow and cottonwood trees.

Outside of landscape and riparian areas, other frequently-encountered tree species were Northern California black walnut and valley oak. Black walnut trees were generally found to be growing as individuals along various fencelines, with the exception of one small stand mapped as part of riparian habitat just north of the intersection of Elder Creek and Elder Creek Road in Aspen VIII. Several valley oak trees were also found scattered within the survey area but did not form oak woodland canopy, existing instead either as isolated individuals or as understory saplings within riparian scrub habitat.

In general, trees surveyed within the Aspen VIII and IX property represent a random collection of species, the majority of which are considered ornamental landscape trees. The highest concentrations of trees were found in association with residential landscapes and generally constitute planted assemblages of ornamental species. Most surveyed trees were large, mature individuals of overall decent health but with poor structure, as is typical of older trees. In addition to age, a combination of neglect, ground disturbance and heavy browsing by livestock has likely contributed to poor structure. Notably, two caged trees (#42 and #76) were severely stressed and altered by browsing activity. Overall, the majority of large trees exhibited overburdened limbs, limb dieback and various forms of decay. Additionally, more than half (62) of the surveyed trees were multi-stemmed, with many trees showing evidence of included bark. One tree (#43) was found to be dead and was recorded as a standing dead snag.

Additional ornamental and landscape trees were observed within adjacent private properties to the west, south and east of the Project boundary, but were not accessible and thus not mapped. These trees are well outside of potential impacts and are protected by required setbacks.

2.3 General Recommendations

The proposed mining boundary and limits of disturbance include a total of approximately 383.68 acres. Of the 102 trees surveyed on the Property, 74 were found to be within or immediately adjacent to (i.e., with overhanging canopies) the proposed limits of disturbance and may be removed or otherwise disrupted as a result of Project activities (Figure 4).

A total of 14 protected trees (5 valley oak and 9 California black walnut) were found onsite to be of a sufficient size to be protected and regulated by the Sacramento County Tree Preservation Ordinance, 12 of which exist within the proposed limits of disturbance and may be impacted as a result of the project. For valley oak and black walnut trees that would be removed or indirectly impacted (i.e., ground disturbance within existing driplines), Teichert will comply with the Sacramento Tree Preservation Ordinance and Sacramento General Plan Policy CO-139 by replacing these trees on an inch-by-inch basis. Table 3 summarizes the total potential impacts to native protected trees by the proposed Project.

TABLE 3. POTENTIAL IMPACTS TO NATIVE PROTECTED TREES – ASPEN VIII AND IX (2014)

Common Name	Scientific Name	No. Trees	Total Inches DBH
California Black Walnut	*Juglans hindsii*	9	156.3
Valley Oak	*Quercus lobata*	3	22.3
		TOTAL:	**178.6**

Several patches of riparian forest scrub habitat were found sporadically distributed near water sources within the survey area, totaling approximately 0.469 acre (Figure 5). The total remaining native and non-native tree canopy—excluding invasive species—potentially impacted by the proposed project is approximately 1.345 acres (Figure 5). The removal of non-native invasive trees (i.e., Chinese tallow and edible fig) (Cal-IPC 2006) could be considered a benefit to future reclamation goals and the surrounding ecosystem. Sacramento General Plan Policies address losses to mixed riparian forest canopy (Policy CO-140) and other tree canopy (Policies CO-145 and CO-146) by requiring the creation of an on-site mitigation area equal in size to the acreage of canopy lost. Mitigation planting will be carried out on-site within preserved portions of Elder Creek. Table 4 summarizes the total potential impacts to tree canopy by the proposed project.

TABLE 4. POTENTIAL IMPACTS TO TREE CANOPY – ASPEN VIII AND IX (2014)

Canopy	Total Canopy of Surveyed Trees (Acres)	Total Canopy Potentially Impacted (Acres)
Riparian Forest/ Scrub Canopy	0.469	0.229
Other Canopy	1.345	1.345
GRAND TOTAL:	**1.814**	**1.574**

3.0 SUMMARY

A total of 74 trees, representing 1.574 acres of tree canopy, will be potentially impacted by the Project. Of these impacts, 12 are native trees (valley oak and Northern California black walnut), totaling 178.6 inches DBH, that are protected by the Sacramento County Tree Preservation Ordnance. Prior to Project impacts, Teichert will prepare a detailed mitigation plan addressing impacts to native protected trees (i.e., valley oak and black walnut) and other tree canopy loss (excluding invasive species), developed in accordance with County Ordinance, General Plan policies and final mitigation measures for the Project. The Mitigation Plan will include species to be planted, planting locations and densities, planting methods, a maintenance plan (e.g., for irrigation, weeds, and herbivory), and monitoring and performance requirements.

Tree Survey Data

TABLE A-1. ASPEN VIII & IX ARBORIST REPORT - TREE SURVEY DATA							
Tree ID#	**Common Name**	**Scientific Name**	**Health**	**DBH**	**No. Stems**	**Dripline Radius**	**Impact (Yes/No)**
1	Goodding's Black Willow	*Salix gooddingii*	3.0	20.2	1	20.0	Yes
2	Fremont Cottonwood	*Populus fremontii*	2.0	32.9	1	25.0	Yes
3	Valley Oak	*Quercus lobata*	4.0	5.2	1	4.0	Yes
4	Fremont Cottonwood	*Populus fremontii*	2.0	28.2	1	20.0	Yes
5	Valley Oak	*Quercus lobata*	3.0	13.0	3	4.0	Yes
6	Red Gum	*Eucalyptus camaldulensis*	2.0	34.5	1	20.0	Yes
7	Red Gum	*Eucalyptus camaldulensis*	3.0	46.7	2	30.0	Yes
8	Red Gum	*Eucalyptus camaldulensis*	3.0	31.1	1	30.0	Yes
9	Red Gum	*Eucalyptus camaldulensis*	4.0	34.8	2	30.0	Yes
10	Red Gum	*Eucalyptus camaldulensis*	4.0	48.5	2	20.0	Yes
11	Red Gum	*Eucalyptus camaldulensis*	3.0	24.5	1	30.0	Yes
12	Red Gum	*Eucalyptus camaldulensis*	3.0	14.2	1	20.0	Yes
13	Red Gum	*Eucalyptus camaldulensis*	4.0	21.6	2	10.0	Yes
14	Red Gum	*Eucalyptus camaldulensis*	3.0	10.1	1	6.0	Yes
15	Red Gum	*Eucalyptus camaldulensis*	3.0	20.5	1	12.0	Yes
16	Goodding's Black Willow	*Salix gooddingii*	1.0	8.0	1	6.0	No
17	Goodding's Black Willow	*Salix gooddingii*	3.0	30.0	4	10.0	No
18	Goodding's Black Willow	*Salix gooddingii*	2.0	13.0	2	5.0	No
19	Goodding’s Black Willow	*Salix gooddingii*	2.0	13.0	2	5.0	No
20	Valley Oak	*Quercus lobata*	4.0	9.1	1	8.0	No
21	Goodding's Black Willow	*Salix gooddingii*	3.0	11.0	2	6.0	No
22	Valley Oak	*Quercus lobata*	4.0	4.0	1	5.0	No
23	Goodding's Black Willow	*Salix gooddingii*	4.0	40.0	5	15.0	No
24	Goodding's Black Willow	*Salix gooddingii*	2.0	25.0	3	10.0	No
25	Goodding's Black Willow	*Salix gooddingii*	3.0	8.0	1	5.0	No
26	Goodding's Black Willow	*Salix gooddingii*	4.0	10.0	1	6.0	No
27	Goodding's Black Willow	*Salix gooddingii*	4.0	10.0	1	6.0	No
28	Northern CA Black Walnut	*Juglans hindsii*	3.0	7.1	1	7.0	Yes
29	Weeping Willow	*Salix babylonica*	3.0	16.6	1	10.0	Yes
30	Northern CA Black Walnut	*Juglans hindsii*	4.0	34.8	2	25.0	Yes
31	Northern CA Black Walnut	*Juglans hindsii*	3.0	8.0	1	6.0	Yes
32	Northern CA Black Walnut	*Juglans hindsii*	3.0	12.0	1	10.0	Yes
33	Northern CA Black Walnut	*Juglans hindsii*	4.0	11.7	2	10.0	Yes
34	Modesto Ash	*Fraxinus velutina*	0.0	0.0	1	0.0	Yes
35	Modesto Ash	*Fraxinus velutina*	1.0	59.5	2	30.0	Yes
36	Mulberry	*Morus alba*	1.0	12.5	4	5.0	Yes
37	Chinese Pistache	*Pistacia chinensis*	4.0	14.0	2	10.0	Yes
38	Edible Fig*	*Ficus carica*	4.0	13.0	3	8.0	Yes

*The California Invasive Plant Council classifies this tree as a “Not-Native Invasive” species with moderate status regarding potential impact to local native ecosystems.

1.0 INTRODUCTION 1
2.0 PROJECT LOCATION AND DESCRIPTION 1
2.1 District 1 Area Plan 2
2.2 District 2 Area Plan 2
2.3 Future Planning Areas 2
3.0 BIOLOGICAL AND WETLAND SETTING 2
3.1 Regulatory Setting 3
3.1.1 California Environmental Quality Act 3
3.1.2 Federal Endangered Species Act 3
3.1.3 State Endangered Species Act 4
3.1.4 Clean Water Act, Section 404 4
3.1.5 Clean Water Act, Section 401 4
3.1.6 California Water Code, Porter-Cologne Act 5
3.1.7 California Fish and Game Code Section 1600 – Streambed and Lake Alteration 5
3.1.8 California Fish and Game Code Section 3503.5 - Raptor Nests 5
3.1.9 Migratory Bird Treaty Act 5
3.1.10 County of Sacramento General Plan 6
3.1.11 South Sacramento Habitat Conservation Plan 6
3.1.12 Sacramento County Tree Preservation Ordinance (Sacramento County Code Chapter 19.12) 7
3.1.13 Sacramento County Swainson's Hawk Ordinance (Sacramento County Code Chapter 16.130) 7
3.2 Existing Conditions, Methods and Sources of Information 7
3.2.1 California Natural Diversity Database (CNDDB) Query 8
3.2.1.1 Special-Status Plants 9
3.2.1.1.1 Brandegee's Clarkia 9
3.2.1.1.2 Peruvian Dodder 9
3.2.1.1.3 Dwarf Downingia 10
3.2.1.1.4 Stinkbells 10
3.2.1.1.5 Bogg's Lake Hedge-Hyssop 10
3.2.1.1.6 Woolly Rose-Mallow 11
3.2.1.1.7 Ahart's Dwarf Rush 11
3.2.1.1.8 Legenere 11
3.2.1.1.9 Pin Cushion Navarretia 11
3.2.1.1.10 Slender Orcutt Grass 12
3.2.1.1.11 Sacramento Orcutt Grass 12
3.2.1.1.12 Sanford's Arrowhead 12
3.2.1.1.13 Saline Clover 13

3.2.1.2 Special-Status Invertebrates 13
3.2.1.2.1 Special-Status Vernal Pool Branchiopod Species 13
3.2.1.2.2 Andrenid Bees 13
3.2.1.2.3 Sacramento Valley Tiger Beetle 14
3.2.1.2.4 Hairy Water Flea 14
3.2.1.2.5 Valley Elderberry Longhorn Beetle (VELB) 14
3.2.1.2.6 Ricksecker's Water Scavenger Beetle 15
3.2.1.3 Special-Status Fish 15
3.2.1.3.1 Sacramento Perch 15
3.2.1.3.2 Central Valley Steelhead – Distinct Population Segment (DPS) 15
3.2.1.3.3 Central Valley Winter-Run and Spring-Run Chinook Salmon 16
3.2.1.3.4 Longfin Smelt 16
3.2.1.4 Special-Status Amphibians & Reptiles 16
3.2.1.4.1 Western Pond Turtle 16
3.2.1.4.2 Western Spadefoot Toad 17
3.2.1.4.3 Giant Garter Snake 17
3.2.1.5 Special-Status Birds 17
3.2.1.5.1 Cooper's Hawk 17
3.2.1.5.2 Tricolored Blackbird 18
3.2.1.5.3 Golden Eagle 18
3.2.1.5.4 Giant Egret 19
3.2.1.5.5 Great Blue Heron 19
3.2.1.5.6 Burrowing Owl 19
3.2.1.5.7 Ferruginous Hawk 20
3.2.1.5.8 Swainson's Hawk 20
3.2.1.5.9 White-Tailed Kite 20
3.2.1.5.10 Merlin 21
3.2.1.5.11 Song Sparrow – Modesto Population 21
3.2.1.5.12 Black-Crowned Night Heron 21
3.2.1.5.13 Double-Crested Cormorant 22
3.2.1.5.14 Purple Martin 22
3.2.1.5.15 Bank Swallow 23
3.2.1.5.16 Least Bell's Vireo 23
3.2.1.5.17 Yellow-Headed Blackbird 23
3.2.1.6 Special-Status Mammals 24
3.2.1.6.1 Hoary Bat 24
3.2.1.6.2 American Badger 24
3.3 Existing Site Conditions 24
3.3.1 Existing Site Conditions - Disctrict 1 Area Plan 24
3.3.1.1 Site History – District 1 Participant Properties 24
3.3.1.2 Site History – District 1 Non-Participant Properties 25

Appendix

Appendix A. Revised Project Land Use Plan - West Jackson Highway Master Plan

1.0 INTRODUCTION

The West Jackson Highway Master Plan was initiated by the Sacramento County Board of Supervisors on 17 April 2012. In accordance with the requirements of General Plan Land Use Element Policy LU-119, StoneBridge Properties, LLC, a subsidiary of Teichert Land Company (Teichert), and Granite Construction Company (Granite), a California corporation, (jointly referred to as the "Participating Properties") have initiated the Master Plan process for all land encompassed within the proposed Master Plan Area (Plan Area). Of the entire approximately **5,913 acres** of the Plan Area, the Participating Properties collectively own approximately **4,079 acres**: Teichert owns approximately **3,016 acres** and Granite owns approximately **1,063 acres.** Thus, Participating Properties represent 69% of the total Plan Area acreage. These Participating Properties include aggregate mining sites used for sand and gravel extraction, many of which have already been reclaimed. Some of the Participating Properties continue to support various mining related activities. In addition to mining areas, the Plan Area is comprised of a mixture of rural, residential, institutional, agricultural, commercial, industrial, and other properties located along State Route 16 (Jackson Highway) in the geographic center of Sacramento County (**Figures 1** and **2**).

The purpose of this document is to catalog biological resources, including wetlands and waters, special-status species, sensitive species, nesting raptors, landmark and native trees within the Plan Area. The level of detail in this document varies based on land ownership and participation in the Master Plan process, both of which affect the accessibility of individual properties. All properties within the Plan Area are evaluated at a level sufficient for Master Plan analysis, and Participating Properties are evaluated with greater detail sufficient for a District Area Plan/Specific Plan analysis.

2.0 PROJECT LOCATION AND DESCRIPTION

The Plan Area boundaries are generally Jackson Highway, Kiefer Boulevard, and Mather Airport to the north; portions of Elder Creek Road and Florin Road to the south; South Watt Avenue and the City of Sacramento to the west; and Excelsior Road to the east (**Figures 1** and **2**). Approximately 80% of the Plan Area boundary abuts the existing Sacramento County Urban Policy Area and the Sacramento City Limits. As a result of the mining activities, which have encompassed the landscape since the 1930's, the Plan Area has largely been bypassed for development.

The Master Plan has been designed to provide a mixture of residential, commercial, recreational, farming, and employment nodes intended to reduce vehicle miles traveled (VMT) within the Plan Area and support the provision and use of alternative transportation options. The Master Plan establishes a framework and strategy for all future land use within the Plan Area, including general land use and development standards, policies, land use allocations, infrastructure, and public service planning. Within the Master Plan, two District Area Plans (District 1 and District 2) are established, in addition to three Future Planning Areas (FPAs) (FPA-A, B and C). District Area Plans primarily consist of Participating Properties, while Future Planning Areas are comprised of Non-Participating Property owners (**Figure 3**).

The District Area Plans establish specific land uses, policies and development standards for the properties within Districts 1 and 2. Although future land uses for the FPAs will be established in gross by the Master Plan, specific land uses, policies, and development standards for each of these areas is not provided by the Master Plan. It is anticipated that the landowners within the FPAs will initiate District Area Plans or Specific Plans in the future. Should the landowners in those areas contemplate changing existing land uses within the FPAs, such future use must be consistent with the provisions of the Master Plan. Land uses envisioned within District 1 and District 2 are shown on **Figure 4**.

The total acreage of the Plan Area in this biological resources assessment approximately matches that depicted in the Land Use Summary on the Revised Project Land Use Plan - West Jackson Highway Master Plan (Land Use Plan) dated April 5, 2017 (**Appendix A**), which was submitted to Sacramento County for review in 2017. However, the acreage break-downs by District 1, District 2, and the FPAs vary slightly between the Plan Area and the Land Use Plan due to differing methodologies. Unlike the Land Use Plan, this biological resources assessment relies heavily upon interpretation of aerial photography to categorize landcover types as described below in Section 3.2 (Existing Conditions, Methods and Sources of Information), thereby resulting in minor acreage discrepancies.

2.1 District 1 Area Plan

The District 1 Area Plan (District 1) is approximately **3,651 acres** comprised of approximately **3,016 acres** owned by Teichert, and approximately **635 acres** of Non-Participating Property owners and roads as shown on **Figure 5**.

2.2 District 2 Area Plan

The District 2 Area Plan (District 2) is approximately **1,245 acres** comprised of approximately **1,063 acres** owned by Granite and **182 acres** of Non-Participating Property owners and roads as shown on **Figure 6**.

2.3 Future Planning Areas

The three FPAs as shown on **Figure 3** are comprised of approximately **1,018 acres**, all of which are controlled by a number of smaller parcels owned by numerous Non-Participating Property owners. FPA-A is approximately **189 acres**, FPA-B is approximately **232 acres**, and FPA-C is approximately **597 acres**. While it is anticipated that the landowners within the FPAs will initiate District Area Plans or Specific Plans in the future, the timing on such planning efforts is unknown at this time.

3.0 BIOLOGICAL AND WETLAND SETTING

This section is comprised of four main sub-sections: regulatory policies and law that may apply to development within the Plan Area; methods utilized to assess the biological resources within the Plan Area; existing site conditions within the Plan Area; and the baseline site conditions within the Plan Area. Existing conditions are defined as those conditions as they occur within the Plan Area at the time of publication.

Baseline conditions are defined as those conditions which will exist after full reclamation on all lands permitted for aggregate extraction.

3.1 Regulatory Setting

This section describes federal, state, and local laws and policies that are relevant to this assessment of biological resources within the Plan Area.

3.1.1 California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires evaluations of project effects on biological resources. Determining the significance of those effects is guided by Appendix G of the CEQA guidelines. These evaluations must consider direct effects on a biological resource within the project site itself, indirect effects on adjacent resources, and cumulative effects within a larger area or region. Effects can be locally important but not significant according to CEQA if they would not substantially affect the regional population of the biological resource. Significant adverse impacts on biological resources would include the following:

- Substantial adverse effects on any species identified as candidate, sensitive, or special-status in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife (CDFW) or the U.S. Fish and Wildlife Service (USFWS) (these effects could be either direct or via habitat modification);
- Substantial adverse impacts to species designated by the CDFW (2018) as Species of Special Concern;
- Substantial adverse effects on riparian habitat or other sensitive habitat identified in local or regional plans, policies, or regulations or by CDFW and USFWS;
- Substantial adverse effects on federally protected wetlands defined under Section 404 of the Clean Water Act (these effects include direct removal, filling, or hydrologic interruption of marshes, vernal pools, coastal wetlands, or other wetland types);
- Substantial interference with movements of native resident or migratory fish or wildlife species population, or with use of native wildlife nursery sites;
- Conflicts with local policies or ordinances protecting biological resources (e.g. tree preservation policies); and
- Conflict with provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plan.

3.1.2 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) of 1973 protects species that are federally listed as endangered or threatened with extinction. FESA prohibits the unauthorized "take" of listed wildlife species. Take includes harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such activities. Harm includes significant

modifications or degradations of habitats that may cause death or injury to protected species by impairing their behavioral patterns. Harassment includes disruption of normal behavior patterns that may result in injury to or mortality of protected species. Civil or criminal penalties can be levied against persons convicted of unauthorized "take." FESA enables the USFWS to authorize take of a listed species that is incidental to carrying out an otherwise lawful project when the impacts of the authorized take will be minimized and fully mitigated. In addition, FESA prohibits malicious damage or destruction of listed plant species on federal lands or in association with federal actions, and the removal, cutting, digging up, damage, or destruction of listed plant species in violation of state law. FESA does not afford any protections to federally listed plant species located on private lands with no associated federal action when those plant species are not also included on a state endangered species list.

3.1.3 State Endangered Species Act

With limited exceptions, the California Endangered Species Act (CESA) of 1984 protects state-designated endangered and threatened species in a way similar to FESA. For projects on private property (i.e. that for which a state agency is not a lead agency), CESA enables CDFW to authorize take of a listed species that is incidental to carrying out an otherwise lawful project where the impacts of the authorized take will be minimized and fully mitigated (Fish & Game Code Section 2081).

3.1.4 Clean Water Act, Section 404

Section 404 of the Federal Clean Water Act requires that a Department of the Army permit be issued prior to the discharge of any dredged or fill material into waters of the United States, including wetlands (waters). The U. S. Army Corps of Engineers (USACE) implements this program, with oversight from the U. S. Environmental Protection Agency. Waters of the United States include all navigable waters; interstate waters and wetlands; all intrastate waters and wetlands that could affect interstate or foreign commerce; impoundments of the above; tributaries of the above; territorial seas; and wetlands adjacent to the above. Typically, the USACE does not recognize as jurisdictional waters of the U.S. areas that are "*water-filled depressions created in dry land incidental to mining or construction activity, including pits excavated for obtaining fill, sand, or gravel that fill with water…*" [33 CFR 328.3(b)(4)(v)].

3.1.5 Clean Water Act, Section 401

Section 401 of the Clean Water Act requires any applicant for a 404 permit in support of activities that may result in any discharge into waters of the United States to obtain a water quality certification with the Regional Water Quality Control Board (RWQCB). This program is meant to protect these waters and wetlands by ensuring that waste discharged into them meets state water quality standards. Because the water quality certification program is triggered by the need for a Section 404 permit (and both programs are a part of the Clean Water Act), the definition of waters of the United States under Section 401 is the same as that used by the USACE under Section 404.

3.1.6 California Water Code, Porter-Cologne Act

The Porter Cologne Act, from Division 7 of the California Water Code, requires any person discharging waste or proposing to discharge waste that could affect the quality of waters of the state to file a report of waste discharge (RWD) with the RWQCB. The RWQCB can waive the filing of a report, but once a report is filed, the RWQCB must either waive or adopt water discharge requirements (WDRs). "Waters of the state" are defined as any surface water or groundwater, including saline waters, within the boundaries of the state.

3.1.7 California Fish and Game Code Section 1600 – Streambed and Lake Alteration

The Department of Fish and Wildlife (CDFW) is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, the Fish and Game Code, Section 1602, requires notification to CDFW of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state or local government agency, or public utility that proposes an activity that will:

- substantially divert or obstruct the natural flow of any river, stream or lake;
- substantially change or use any material from the bed, channel, or bank of any river, stream, or lake; or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

For the purposes of Section 1602, rivers, streams and lakes must flow at least intermittently through a bed or channel in order to be considered subject to CDFW jurisdiction. If notification is required and CDFW believes the proposed activity is likely to result in adverse harm to the natural environment, it will require that the parties enter into a Lake or Streambed Alteration Agreement (LSAA).

3.1.8 California Fish and Game Code Section 3503.5 - Raptor Nests

Section 3503.5 of the Fish and Game Code makes it unlawful to take, possess, or destroy hawks or owls, unless permitted to do so, or to destroy the nest or eggs of any hawk or owl.

3.1.9 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) prohibits the take, possession, import, export, transport, selling, purchase, barter, or offering for sale, purchase or barter, any native migratory bird, their eggs, parts, and nests, except as authorized under a valid permit (50 CFR 21.11.). Likewise, Section 3513 of the California Fish & Game Code prohibits the "take or possession" of any migratory non-game bird identified under the MBTA. Therefore, activities that may result in the injury or mortality of native migratory birds, including eggs and nestlings, would be prohibited under the MBTA.

3.1.10 County of Sacramento General Plan

The Conservation Element of the Sacramento County General Plan (under Policy CO-58) currently provides protection to various ecosystems. Specifically, it "ensures no net loss of wetlands, riparian woodlands, and oak woodlands." The General Plan also seeks to protect landmark and heritage trees (collectively referred to as "protected trees"). "Landmark trees" are defined as ones that are "especially prominent and stately." "Heritage trees" are defined as native oaks that exceed 60 inches in circumference. Policies CO-137, CO-138, CO-139, CO-140, and CO-141 encourage protection and preservation of landmark and heritage trees, and Policy CO-145 requires mitigation by creation of new tree canopy equivalent to the acreage of non-native tree canopy removed (County of Sacramento 2017).

3.1.11 South Sacramento Habitat Conservation Plan

The Final South Sacramento Habitat Conservation Plan (SSHCP) is a regional approach to addressing issues related to urban development, habitat conservation, and agricultural protection. The SSHCP consolidates environmental efforts to protect and enhance wetlands (primarily vernal pools) and upland habitats to provide ecologically viable conservation areas. The SSHCP covers 28 different species of plants and wildlife including 11 that are state or federally listed as threatened or endangered. The SSHCP is an agreement between state/federal wildlife and wetland regulators and local jurisdictions, which will allow land owners to engage in the "incidental take" of listed species under the FESA and CESA (i.e., to destroy or degrade habitat) in return for conservation commitments from local jurisdictions. The SSHCP and a related Aquatic Resources Program (ARP) will also set up an abbreviated process for U.S. Army Corps of Engineers permitting under Section 404 of the federal Clean Water Act. The geographic scope of the SSHCP includes U.S. Highway 50 to the north, Interstate 5 to the west, the Sacramento County line with El Dorado and Amador Counties to the east, and San Joaquin County to the south.

The SSHCP Study Area (SSHCP Study Area) excludes the City of Sacramento, the City of Folsom and Folsom's Sphere of Influence, the City of Elk Grove and Elk Grove's Sphere of Influence, the Sacramento-San Joaquin Delta, and the Sacramento County community of Rancho Murieta. Sacramento County is partnering with the incorporated cities of Rancho Cordova and Galt, as well as the Sacramento Regional County Sanitation District and Sacramento County Water Agency to further advance the regional planning goals of the SSHCP. The stated goals and objectives of the SSHCP are to create a Habitat Conservation Plan that:

- Ensures long-term viability to aid and enhance recovery of sensitive species in the SSHCP Study Area by protecting an adequate quality and quantity of habitat in an integrated manner.
- Accommodates development in appropriate sites with fair and reasonable mitigation cost structure.
- Protects agricultural lands and operations from constraints associated with the plan's implementation.
- Gains the trust of all stakeholders in the permitting process by providing certainty that their interests will be considered in a fair and predictable process.
- Relies on voluntary participation through incentives that make the HCP process preferable to the existing process.

- Provides a streamlined permitting process that reduces permitting cost to developers and taxpayers.
- Provides a comprehensive framework for use in linking plant and animal conservation with local land use programs, consistent with Sacramento County General Plan goals and policies.

3.1.12 Sacramento County Tree Preservation Ordinance (Sacramento County Code Chapter 19.12)

Sacramento County outlines their requirements regarding the protection of trees in County Code 19.12.060. The county code includes the following statement:

> "*No person shall trench, grade or fill within the dripline of any tree or destroy, kill or remove any tree as defined, in the designated urban area of the unincorporated area of Sacramento County, on any property, public or private, without a tree permit, or unless authorized as a condition of a discretionary project approval by the Board of Supervisors, County Planning Commission, Zoning Board of Appeals, the Zoning Administrator or the Subdivision Review Committee. (SCC 1400 § 23, 2008: SCC 480 § 1, 1981.)*."

Sacramento County Code (Section 19.12.040) defines trees as follows:

> *"Tree: As used in this chapter, a 'tree' shall mean any living native oak tree having at least one trunk of six inches or more in diameter measured four and one-half feet above the ground, or a multi-trunked native oak tree having an aggregate diameter of ten inches or more, measured four and one-half feet above the ground (dbh)."*

3.1.13 Sacramento County Swainson's Hawk Ordinance (Sacramento County Code Chapter 16.130)

Sacramento County has developed a Swainson's Hawk Mitigation Program, codified in Chapter 16.130 of the County Code, which provides an option for mitigating a project's impacts to Swainson's hawk foraging habitat. Under this program, mitigation can be satisfied by: (1) providing replacement foraging habitat or paying a fee if the impact is less than 40 acres; or (2) by providing replacement land if the impact is 40 acres or more. Other options for mitigating a project's impacts to foraging habitat generally involve working on an individual basis with CDFW.

3.2 Existing Conditions, Methods and Sources of Information

As discussed in the Project Description above, the Plan Area is comprised of District 1, District 2, and three FPAs. Assessment methodologies for existing conditions were driven by site accessibility, which in turn was driven by participation in the Master Plan process. All Non-Participant Properties within the Plan Area were evaluated remotely, based on the best available information, as described below.

Existing conditions biological resources assessments for District 1 and District 2 Participant Properties drew information from site visits, survey data, and/or previously prepared assessment reports involving site visits.

Rare plant surveys, detailed wetland delineations, biological assessments, and arborist reports are examples of sources of information for Districts 1 and 2. The majority of the landcover type acreage totals, excluding delineated wetlands and other waters of the U.S. (Waters), were primarily derived from the interpretation of aerial photography flown for the National Agriculture Imagery Program (NAIP) in 2016 and 2018 aerials provided by Google Earth Pro. The acreage totals for permitted mining areas, such as Vineyard, Aspen IV South, Aspen V South, Aspen VIII, Aspen IX, and Machida[1], were updated to reflect the latest conditions within these actively worked areas.

Existing conditions biological resources assessments for land controlled by Non-Participating Property owners within Districts 1 and 2 and for all three FPAs utilized biological baseline information derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerials and from observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

3.2.1 California Natural Diversity Database (CNDDB) Query

A record query of the California Natural Diversity Database (CNDDB) was conducted to identify all historic and extant occurrences of special-status species within a 10-mile radius of the Plan Area regardless of ownership. The resulting assessment considered species formally listed as threatened or endangered by USFWS or CDFW as well as those proposed for formal listing, candidates for federal listing, those classified as species of special concern by CDFW and "special animals." "Special animals" is a broad term used by CDFW and refers to all animal taxa tracked by the CNDDB. Also included were species considered to be or "fully protected" by the CDFW and plant species considered to be rare, threatened, or endangered in California by the California Native Plant Society (CNPS). These include species listed in California Rare Plant Ranks 1, 2, 3, and 4 of the CNPS Ranking System:

- California Rare Plant Rank 1A: Plants presumed extirpated in California and either rare or extinct elsewhere.
- California Rare Plant Rank 1B: Plants rare, threatened, or endangered in California and elsewhere.
- California Rare Plant Rank 2A: Plants presumed extirpated in California, but common elsewhere.
- California Rare Plant Rank 2B: Plants rare, threatened, or endangered in California, but more common elsewhere.
- California Rare Plant Rank 3: Plants about which more information is needed – a review list.
- California Rare Plant Rank 4: Plants of limited distribution – a watch list.

[1] Machida was technically exempt from the Surface and Mining Reclamation Act and therefore approved under a Sacramento County Grading Permit.

The CNPS Threat Rank is an extension that is added onto the California Rare Plant Rank (CRPR). It ranges from 0.1 to 0.3 and indicates the level of endangerment to the species with 0.1 representing the most endangered and 0.3 being the least endangered.

The following is an overview of the species that were listed in the CNDDB query as occurring within ten miles of the Plan Area, or were identified during surveys or ground-level observations. Brief descriptions of habitat requirements are also included. **Figure 7** is an exhibit displaying CNDDB occurrences within ten miles of the Plan Area, and **Figure 8** presents Critical Habitats and Vernal Pool Core Recovery Areas in relation to the Plan Area. Detailed species information is discussed within the Existing Site Conditions sections below.

3.2.1.1 Special-Status Plants

3.2.1.1.1 Brandegee's Clarkia

Brandegee's clarkia (*Clarkia biloba* ssp. *brandegeeae*) is a CRPR 4.2 plant. The species favors chaparral and cismontane woodland at elevations ranging from about 240 to 3,000 feet, but it is also often associated with roadcuts and switchbacks. Brandegee's clarkia is an annual herbaceous species, and it typically blooms from May to July.

There are no known CNDDB occurrences of this species within the Plan Area, and only one presumed extant occurrence within ten miles of the Plan Area, which is located approximately 8 miles to the northeast in the Folsom Lake State Recreation Area (CNDDB occurrence #79) (CNDDB 2018).

3.2.1.1.2 Peruvian Dodder

Peruvian dodder (*Cuscuta obtusiflora* var. *glandulosa*) is a CRPR 2B.2 plant. The CNDDB lists only six occurrences of Peruvian dodder within California with the most recent recorded in 1995. Peruvian dodder is a holoparasite meaning that it lacks chlorophyll and is entirely dependent upon its host species to provide nutrients. Peruvian dodder, which is strongly associated with freshwater marshes and swamps, is believed to parasitize members of several genera including *Alternanthera*, *Dalea*, *Lythrum*, *Polygonum*, and *Xanthium*. This annual vine blooms from June to October and is found between approximately 50 and 900 feet.

There are no known CNDDB occurrences of this species within the Plan Area and only one presumed extant occurrence within ten miles of the Plan Area, which is located approximately 7.5 miles to the southwest in Laguna Lake in Elk Grove. The CNDDB considers the identification of this specimen as questionable and recommends additional field work to confirm the presence of Peruvian dodder at this location (CNDDB occurrence #6) (CNDDB 2018).

3.2.1.1.3 Dwarf Downingia

Dwarf downingia (*Downingia pusilla*) is a CRPR 2B.2 plant that is strongly associated with vernal pools and other seasonally inundated features. Dwarf downingia is a diminutive herb currently threatened by urbanization, agriculture, grazing, vehicles, and industrial forestry. It prefers elevations ranging between 1 and 1,500 feet, and it blooms from March to May.

There are no known CNDDB occurrences of this species within the Plan Area; however, four presumed extant occurrences are located within ten miles of the Plan Area. The nearest is located approximately 5 miles to the southwest on the east side of Waterman Road between Sheldon and Bond Roads in Elk Grove (CNDDB occurrence #54) (CNDDB 2018). A non-CNDDB occurrence of this species was observed during 2016 rare plant surveys in the Vineyard South Mine Project site, which is located south of Vineyard I on the south side of Elder Creek Road (APN 066-0010-001) (WRA 2016). This occurrence has yet to be published by the CNDDB.

3.2.1.1.4 Stinkbells

Stinkbells (*Fritillaria agrestis*) is a CRPR 4.2 plant. Stinkbells, so named because of its strong odor, are a species of lily commonly associated with annual grasslands with heavy clay soils at elevations ranging from 30 to 5,100 feet. This species blooms from March to June and also favors other habitat types such as chaparral, cismontane woodland, and pinyon and juniper woodland. Stinkbells have also been documented on serpentine soils.

There are no known CNDDB occurrences of this species within the Plan Area; however, two presumed extant occurrences are located within ten miles of the Plan Area. The nearest is located approximately 6 miles to the north in Carmichael at the northeast corner of Winding Way and Hackberry Lane (CNDDB occurrence #11) (CNDDB 2018).

3.2.1.1.5 Bogg's Lake Hedge-Hyssop

Bogg's Lake hedge-hyssop (*Gratiola heterosepala*) is listed as endangered under CESA and is a CRPR 1B.2 plant. Though Bogg's Lake hedge-hyssop grows in vernal pools, it can also occur around the perimeter of lakes and ponds. This small annual herb is found between 30 and 7,800 feet, favors clay soils, and blooms from April to August.

There are no known CNDDB occurrences of this species within the Plan Area; however, nine presumed extant occurrences are located within ten miles of the Plan Area. The nearest is located approximately 1.25 miles to the east at Mather Field west of Eagles Nest Road (CNDDB occurrence #84) (CNDDB 2018).

3.2.1.1.6 Woolly Rose-Mallow

Woolly rose-mallow (*Hibiscus lasiocarpus* var. *occidentalis*) is a CRPR 1B.2 plant. It typically occurs on freshwater-saturated riverbanks and low peat islands located within sloughs, though woolly rose-mallow has also been observed growing in riprap on the sides of levees. Woolly rose-mallow is found at elevations below 395 feet, and it is strongly associated with the Delta watershed.

There are no known CNDDB occurrences of this species within the Plan Area; however, three presumed extant occurrences are located within ten miles of the Plan Area. All are located on the Stone Lakes National Wildlife Refuge approximately 9 miles to the southwest (CNDDB occurrence #189 through #191) (CNDDB 2018).

3.2.1.1.7 Ahart's Dwarf Rush

Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*) is a CRPR 1B.2 plant. It is an annual herb found between elevations of approximately 100 feet and 750 feet. Ahart's dwarf rush blooms from March to May and grows along the edges of seasonal wet habitats such as vernal pools and swales within Valley and foothill grasslands.

There are no known CNDDB occurrences of this species within the Plan Area; however, one presumed extant occurrence is located within ten miles of the Plan Area approximately 1.25 miles to the east at Mather Field west of Eagles Nest Road (CNDDB occurrence #8) (CNDDB 2018).

3.2.1.1.8 Legenere

Legenere (*Legenere limosa*) is a CRPR 1B.1 plant that is primarily associated with the bottoms of vernal pools. Legenere, which grows between 0 to 2,630 feet, is an annual herb. It blooms from April to June and is currently threatened by grazing and developments. Many historic populations of legenere are believed to have been extirpated.

There are no known CNDDB occurrences of this species within the Plan Area; however, twenty-six presumed extant occurrences are located within ten miles of the Plan Area. The closest is approximately 0.2 mile to the east at Mather Field (CNDDB occurrence #44) (CNDDB 2018).

3.2.1.1.9 Pin Cushion Navarretia

Pin cushion navarretia (*Navarretia myersii* ssp. *myersii*) is a CRPR 1B.1 plant that is associated with vernal pools and other seasonal wetlands associated with annual grasslands with clay soils. Pin cushion navarretia, which is an annual herbaceous species that is found between approximately 65 and 1,100 feet, typically blooms in April and May. It is currently threatened by development.

There are no known CNDDB occurrences of this species within the Plan Area and only one presumed extant occurrence within ten miles of the Plan Area. This is located approximately 9 miles to the northeast at the Phoenix Field Ecological Reserve (CNDDB occurrence #3) (CNDDB 2018).

3.2.1.1.10 Slender Orcutt Grass

Slender Orcutt grass (*Orcuttia tenuis*) is listed as threatened under CESA and endangered under FESA. It is found in vernal pools often with gravelly substrates at elevations generally ranging between 100 and 5,800 feet. Categorized as a CRPR 1B.1 plant, slender Orcutt grass is an annual herb, and its bloom period usually extends from May to October.

There are no known CNDDB occurrences of this species within the Plan Area; however, three presumed extant occurrences are located within ten miles of the Plan Area. The closest is approximately 1.3 miles to the south on the west side of Laguna Creek 0.2 mile east of Excelsior Road and 0.7 mile north of Dierks Road (CNDDB occurrence #16) (CNDDB 2018).

3.2.1.1.11 Sacramento Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is a CRPR 1B.1 plant that is listed as endangered under FESA and CESA. Like slender Orcutt grass, this herbaceous annual also favors vernal pool habitats, and it is found between elevations of 100 and 330 feet. Sacramento Orcutt grass typically blooms from April to July, though it has been occasionally known to bloom as late as September. It currently faces serious threats from agriculture, urbanization, and competition from exotic species.

There are no known CNDDB presumed extant occurrences of this species in the Plan Area; however, nine presumed extant occurrences are located within ten miles of the Plan Area. The closest is approximately 3 miles to the east on the Anatolia Preserve on the east side of Sunrise Boulevard (CNDDB occurrence #17) (CNDDB 2018).

3.2.1.1.12 Sanford's Arrowhead

Sanford's arrowhead (*Sagittaria sanfordii*) is listed as a CRPR 1B.2 plant by the CNPS. It generally occurs in shallow freshwater habitats associated with drainages, canals, and larger ditches that sustain inundation and/or slow moving water into early summer. Sanford's arrowhead is a perennial rhizomatous emergent species, and it blooms from May to October.

Colonies of Sanford's arrowhead were observed in two ditches in the western portion of Aspen VIII within the Plan Area (Teichert 2015). The majority of these colonies have been extirpated by permitted mining activities on Aspen VIII. This impact was mitigated pursuant to the Final EIR for the Aspen VII and Aspen IX Mining Use Permit.

3.2.1.1.13 Saline Clover

Saline clover (*Trifolium hydrophilum*) is listed as a CRPR 1B.2 plant by the CNPS. Saline clover is associated with saline marshes or vernal pools with alkaline soils in valley grasslands, though it has been documented as occurring near springs or seeps. Saline clover is an annual fleshy species typically found below 1,000 feet, and it blooms from April to June.

There are no known CNDDB occurrences of this species within the Plan Area; however, two presumed extant occurrences are located approximately 9.5 miles to the southwest near Stone Lakes (CNDDB occurrence #37 and #38) (CNDDB 2018).

3.2.1.2 Special-Status Invertebrates

3.2.1.2.1 Special-Status Vernal Pool Branchiopod Species

These species are strongly associated with vernal pools or other seasonally ponded fish-free aquatic features that sustain inundation during the winter before drying in the late spring. According to the CNDDB, fifteen occurrences of these species are located within the Plan Area (CNDDB 2018). These include five occurrences of vernal pool fairy shrimp *(Branchinecta lynchi*) and six occurrences of vernal pool tadpole shrimp (*Lepidurus packardi*), which are listed as threatened and endangered, respectively, under FESA. Also recorded are eight occurrences of California linderiella (*Linderiella occidentalis*) and two occurrences of midvalley fairy shrimp (*Branchinecta mesovallensis*), both of which are non-listed.

3.2.1.2.2 Andrenid Bees

The blennosperma andrenid bee (*Andrena blennospermatis*) is not a state or federal listed species; however, it has been assigned a State Ranking code of S2 by CDFW meaning that the species is imperiled because of extreme rarity due to very restricted range, very few populations, often 20 or fewer, steep declines, or other factors making it very vulnerable to extirpation from the state This ground nesting species collects pollen from the vernal pool flower, blennosperma (*Blennosperma nanum*), which it caches in several individual underground brood chambers. In each chamber the female deposits a solitary egg that will hatch and feed on the specially treated pollen ball. These bees forage in vernal pool habitat supporting blennosperma and burrow and nest in adjacent uplands.

There are no known CNDDB occurrences of this species within the Plan Area and only one presumed extant occurrence within ten miles of the Plan Area. This is located approximately 9 miles to the east near Sloughhouse (CNDDB occurrence #8) (CNDDB 2018).

Also listed as occurring within ten miles is the vernal pool andrenid bee (*Andrena subapasta*). It is not a state or federal listed species; however, it has been assigned a State Ranking code of S1S2 by CDFW. This means the State Ranking falls in between S1 - critically imperiled in the state because of extreme rarity (often 5 or fewer populations), or because of factor(s) such as very steep declines making it especially

vulnerable to extirpation from the state - and S2 - imperiled because of rarity due to very restricted range, very few populations, often 20 or fewer, steep declines, or other factors making it very vulnerable to extirpation from the state. This species is known to collect pollen from sandwort (*Arenaria* sp.), butter and eggs (*Triphysaria erianthus*), and goldfields (*Lasthenia* sp.) which grow in vernal pools or adjacent grasslands. Though its life cycle is poorly understood, other bees of this genus are solitary and burrow into the ground to cache collected pollen and lay eggs.

There are no known CNDDB occurrences of this species within the Plan Area and only one presumed extant 1954 occurrence within ten miles of the Plan Area. This is located approximately 6.5 miles to the northeast in what is now a developed area of Fair Oaks (CNDDB occurrence #4) (CNDDB 2018).

3.2.1.2.3 Sacramento Valley Tiger Beetle

The Sacramento Valley tiger beetle (*Cicindela hirticollis abrupta*) is not a state or federal listed species; however, it has been assigned a State Ranking code of SH by CDFW meaning that all California elemental occurrences are historical. The USFWS considers the species extinct. Its habitat consisted of fine to medium sand located on terraced flood plains.

There are no known CNDDB historic occurrences of this species within the Plan Area; and only one presumed extirpated occurrence within ten miles of the Plan Area. This is located approximately 8 miles to the northwest along the Sacramento River between Sacramento and West Sacramento (CNDDB occurrence #10) (CNDDB 2018).

3.2.1.2.4 Hairy Water Flea

Hairy water flea (*Dumontia oregonensis*) is not a state or federal listed species; however, it has been assigned a State Ranking code of S1 by CDFW meaning that the species is critically imperiled because of extreme rarity (often 5 or fewer populations) or because of factor(s) such as very steep declines making it especially vulnerable to extirpation from the state. The habits of this poorly understood species have not been thoroughly documented, though they are associated with vernal pools. In California, specimens have only been observed at Mather Airport, a small portion of which overlaps the Plan Area, and Travis Air Force Base (CNDDB occurrence #1) (CDFW 2018).

3.2.1.2.5 Valley Elderberry Longhorn Beetle (VELB)

The Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) is listed as threatened under FESA. It is associated exclusively with elderberry shrubs (*Sambucus* spp.) in the Central Valley and adjacent foothills. The beetle's life cycle consists of four stages: egg, larva, pupa and adult. Females deposit eggs on the bark. Upon hatching, the larvae burrow into the stems where they remain for as long as 2 years, after which they enter the pupae stage and transform into adults. This species most commonly occurs within or near riparian corridors comprised of willow (*Salix* spp.), cottonwood (*Populus fremontii* ssp. *fremontii*), wild grape (*Vitis californica*), and box elder (*Acer negundo*). Population densities are probably

naturally low (USFWS 1984), and it has been suggested based on the spatial distribution of occupied shrubs, that it has limited dispersal capabilities. Low densities and limited dispersal capabilities may result in vulnerability to the adverse effects of habitat fragmentation.

There are no known CNDDB occurrences of this species in the Plan Area; however, thirty presumed extant occurrences are located within ten miles of the Plan Area. The closest is approximately 2 miles to the north along the American River (CNDDB occurrence #282) (CNDDB 2018).

3.2.1.2.6 Ricksecker's Water Scavenger Beetle

The Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i) is not a state or federal listed species; however, it has been assigned a State Ranking code of "S2?" by CDFW meaning that the species is imperiled because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the state. The "?" denotes that the level of imperilment is less than "S2." The behaviors of this poorly understood species have not been thoroughly documented. They are believed to be scavengers and metamorphose from a predacious larval stage. This species favors shallow, weedy, freshwater habitats such as vernal pools, lakes, ponds, and slow moving streams. It is capable of flight, but its dispersal tendencies are not well documented.

Though no known CNDDB occurrences are documented directly within the Plan Area, the species has been observed at Mather Airport (CNDDB occurrence #5) (CDFW 2018).

3.2.1.3 Special-Status Fish

3.2.1.3.1 Sacramento Perch

Sacramento perch (*Archoplites interruptus*), which is a CDFW species of special concern, is the only native centrarchid (or sunfish) west of the Rocky Mountains. The species was once very abundant in lakes, sloughs, rivers, ponds, and drainages throughout the Central Valley, but has been adversely affected by habitat destruction and the introduction of non-native fishes. Exotic sunfish typically spawn in nests that the male builds and protects until the off-spring are free swimming. Conversely, the Sacramento perch usually spawns on unprepared substrate and provides no further parental care. This may result in a higher rate of predation of eggs.

There are no known CNDDB occurrences of this species in the Plan Area, and only one presumed extant occurrence within ten miles, which is situated approximately 9 miles to the west in Lake Greenhaven (CNDDB occurrence #4) (CNDDB 2018). The Plan Area potentially supports low quality habitat for this species.

.

3.2.1.3.2 Central Valley Steelhead - Distinct Population Segment (DPS)

The Central Valley steelhead DPS (*Oncorhynchus mykiss irideus*) is listed as threatened under FESA. It requires cold freshwater water courses with gravelly substrates for breeding. The young remain in freshwater

habitats foraging for a variety of terrestrial and aquatic invertebrates before migrating to estuarine and marine environments.

There are no known CNDDB occurrences of this species in the Plan Area; however, six presumed extant occurrences are located within ten miles of the Plan Area. The closest is approximately 2 miles to the north in the American River (CNDDB occurrence #5) (CNDDB 2018). The Plan Area does not support suitable habitat for this species.

3.2.1.3.3 Central Valley Winter-Run and Spring-Run Chinook Salmon

Two runs of Central Valley Chinook salmon (*Oncorhynchus tshawytscha*) are recorded as occurring within ten miles of the Plan Area. The first is the Central Valley spring-run, which is listed as threatened under FESA and CESA, and the second is the Sacramento River winter-run, which is listed as endangered under FESA and CESA. Both require cold freshwater water courses with gravelly substrates for breeding. The life cycle and habitat requirements of the Chinook salmon are roughly similar to those of the Central Valley steelhead with the young remain in freshwater drainages before moving to estuarine and marine habitats. Chinook salmon are the largest salmonids with individuals reaching 120 pounds.

There are no known CNDDB occurrences of this species in the Plan Area. The only presumed extant occurrence is approximately 8 miles to the west in the Sacramento Deep Water Ship Channel (CNDDB occurrence #7) (CNDDB 2018). The Plan Area does not support suitable habitat for this species.

3.2.1.3.4 Longfin Smelt

Longfin smelt (*Spirinchus thaleichthys*) is listed as threatened under CESA and is a candidate species under FESA. The Bay-Delta populations of longfin smelt are anadromous, though other populations are known to spend their entire life cycles in freshwater. The Bay-Delta population migrates upstream from brackish or marine waters to spawn in freshwater drainages, possibly during the night. Longfin smelt, which have a life cycle of approximately two years, die shortly after spawning. The majority of the young spend their first three months in fresh water before migrating to brackish or marine habitats.

There are no known CNDDB occurrences of this species in the Plan Area. The only presumed extant occurrence is approximately 8 miles to the west in the Sacramento River (CNDDB occurrence #14) (CNDDB 2018). The Plan Area does not support suitable habitat for this species.

3.2.1.4 Special-Status Amphibians & Reptiles

3.2.1.4.1 Western Pond Turtle

The western pond turtle (*Emys marmorata*) is a California species of special concern. Favored habitats include streams, large rivers and canals with slow-moving water, aquatic vegetation, and open basking sites. Although the turtles must live near water, they can tolerate drought by burrowing into the muddy beds of

dried drainages. This species feeds mainly on invertebrates such as insects and worms, but will also consume small fish, frogs, mammals and some plants. Western pond turtle predators include raccoons, coyotes, raptors, weasels, large fish, and bullfrogs. This species breeds from mid to late spring in adjacent open grasslands or sandy banks.

There is one known occurrence of this species within the Plan Area within Morrison Creek (CNDDB occurrence #433) (CDFW 2018). The ponds, channels, industrial ponds, as well as some of the ditches within the Plan Area may provide suitable habitats for this species.

3.2.1.4.2 Western Spadefoot Toad

The western spadefoot toad (*Spea hammondii)* is a California species of special concern. This amphibian is a nocturnally active animal and prefers to forage in grassland, scrub, and chaparral habitats for a variety of invertebrates such as insects and worms. This species breeds from January to May in vernal pools, pools in ephemeral stream courses, and other fish-free water features. Females commonly lay more than 500 eggs in one season. The tadpoles develop in 3 to 11 weeks, and must complete their metamorphosis before the temporary pools dry.

There are no known CNDDB occurrences of this species in the Plan Area; however, five presumed extant occurrences are located within ten miles. The closest is approximately 1 mile to the west near the junction of Kiefer Boulevard and Eagles Nest Road (CNDDB occurrence #167) (CNDDB 2018). The seasonal wetlands, vernal pools, and seasonal wetland swales, as well as other natural and constructed seasonal water features within the Plan Area may provide suitable breeding habitats for this species.

3.2.1.4.3 Giant Garter Snake

Giant garter snake (*Thamnophis gigas*) is listed as threatened under FESA and CESA. Giant garter snakes are generally associated with larger canals, irrigation ditches, and other semi-permanent to permanent aquatic sites with slow moving water and an abundance of emergent vegetation and basking sites

There are no known CNDDB occurrences of this species in the Plan Area; however, five presumed extant occurrences are located within ten miles, all of which are located west of State Route 99. The closest is approximately 8.5 miles to the southwest near South Beach Lake in the vicinity of Morrison Creek (CNDDB occurrence #147) (CNDDB 2018). Morrison Creek as well as some of the ditches and natural and constructed ponds may provide suitable habitat within the Plan Area for this species.

3.2.1.5 Special-Status Birds

3.2.1.5.1 Cooper's Hawk

Cooper's hawk (*Accipiter cooperii*), which is also known as the blue darter or chicken hawk, is a CDFW special animal. This raptor is an ambush predator that prefers to forage in or near wooded locations for birds,

domestic poultry, and small mammals. Cooper's hawks subdue prey by continuously squeezing with talon-equipped feet, and it has been observed on occasion drowning captured prey in water. This species nests in trees located in wooded areas typically 10 to 60 feet above ground level.

The CNDDB records no occurrences of Cooper's hawks within the Plan Area; however, this species was observed in the vicinity of the constructed emergent marsh on Granite I and Aspen VI, though it is unclear whether a nesting site was observed (Teichert 2013). Some of the riparian woodlands and adjacent annual grasslands within the Plan Area provide suitable nesting and foraging habitats, respectively.

3.2.1.5.2 Tricolored Blackbird

Tricolored blackbird (*Agelaius tricolor*) populations, which are currently in decline throughout the state, was listed as threatened under the California Endangered Species Act by the California Fish and Game Commission on 19 April 2018. Historically, colonies were established in freshwater marshes dominated by cattails (*Typha* spp.) and bulrushes (*Scirpus* or *Schoenoplectus* spp.). More recently, they have utilized non-native mustards (*Brassica* spp.), blackberries (*Rubus* spp.), thistles (*Circium* spp.), and mallows (*Malva* spp.) as nesting substrate. Since the 1980's, the largest colonies have been observed in the San Joaquin Valley in cultivated fields of triticale, which is a hybrid of wheat and rye often grown as livestock fodder. This current trend of nesting in active agricultural fields has further imperiled the species as nestlings typically have not fledged by the time the triticale is harvested.

The CNDDB records at least ten presumed extant occurrences of nesting colonies scattered throughout the Plan Area in Granite I, Aspen IV, Aspen V South, Aspens VI through IX, and FPA-C (CNDDB occurrence #177, #305-6, #349, #390, #483, #485, #499, #500, and #743) (CNDDB 2018). Four nesting colonies were also observed in the eastern portion of Aspen VIII in 2013-14 (Teichert 2015).

3.2.1.5.3 Golden Eagle

The golden eagle (*Aquila chrysaetos*) is afforded protection by CDFW as a species of special concern and a fully protected species. It is a very large solitary tree nesting raptor which feeds on mammals, carrion, and reptiles. Though its natural densities are generally believed to be low, it once was relatively common to the open areas of California. Today, the golden eagle is rarely observed in the Central Valley.

There is one known occurrence of this species within the Plan Area located southwest of Mather Field in Granite I, Aspen V, and Aspen VI between Kiefer Boulevard, Bradshaw Road, Jackson Highway, and Excelsior Road (CNDDB occurrence #135) (CDFW 2018). The open areas including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands provide suitable foraging habitats. The Plan Area is generally considered to be out of the breeding range of this species.

3.2.1.5.4 Great Egret

The great egret (*Ardea alba*) is considered a special animal by CDFW. This wading bird usually forages alone in shallow open water and wetlands for fish, amphibians, and aquatic invertebrates. The species has recovered from historic persecution by plume hunters, but destruction of wetlands, especially in the West where colonies are few and widely scattered, poses a current threat. Great egrets prefer breeding sites in or near open waters and wetlands.

There are no known CNDDB occurrences of rookeries for this species in the Plan Area; however, five presumed extant occurrences are located within ten miles. The closest is approximately 2 miles to the north along the south bank of the American River (CNDDB occurrence #2) (CNDDB 2018). The thicker riparian woodlands within the Plan Area may provide suitable breeding habitat for this species; the restored and undeveloped annual grasslands, croplands, restored agricultural lands, and numerous water features provide suitable foraging habitats.

3.2.1.5.5 Great Blue Heron

The great blue heron (*Ardea herodias*) is considered a special animal by CDFW. This wading bird forages in wetlands and shallow open waters for fish, aquatic invertebrates, small mammals, and amphibians. It usually nests in rookeries that are situated in wetlands or near open waters.

There are no known CNDDB occurrences of rookeries for this species in the Plan Area; however, five presumed extant occurrences are located within ten miles. The closest, which is at the same location as the great egret rookery described above, is approximately 2 miles to the north along the south bank of the American River (CNDDB occurrence #2) (CNDDB 2018). The thicker riparian woodlands within the Plan Area may provide suitable breeding habitat for this species; the restored and undeveloped annual grasslands, croplands, restored agricultural lands, and numerous water features provide suitable foraging habitats.

3.2.1.5.6 Burrowing Owl

Burrowing owl (*Athene cunicularia*) is a ground nesting raptor that is considered a species of special concern by CDFW due to declining populations in the Great Central Valley of California. They typically inhabit open grasslands and nest in abandoned ground squirrel burrows, cavities associated with raised mounds, levees, debris piles, or soft berm features.

There is one presumed extant CNDDB occurrence of this species within the Plan Area located southwest of Mather Field in Granite I, Aspen V, and Aspen VI between Kiefer Boulevard, Bradshaw Road, Jackson Highway, and Excelsior Road (CNDDB occurrence #487) (CDFW 2018). Some of the open areas, including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands may provide suitable foraging and nesting habitats.

3.2.1.5.7 Ferruginous Hawk

The ferruginous hawk (*Buteo regalis*) is considered a special animal by CDFW. This species winters in California from August or September to February or early March where it forages in grasslands, farmlands or other open areas. Favored prey primarily includes rabbits, ground squirrels or other small mammals, though they have been known to feed on birds, reptiles, and large insects. During the winter this large powerful buteo is relatively common throughout most of the state with the exception of the northwestern and northeastern corners of California. The breeding range in the U.S. extends from east of the Rocky Mountains to the Great Plains.

There is one presumed extant CNDDB occurrence of wintering/foraging ferruginous hawks within the Plan Area located southwest of Mather Field in Granite I, Aspen V, and Aspen VI between Kiefer Boulevard, Bradshaw Road, Jackson Highway, and Excelsior Road (CNDDB occurrence #31) (CDFW 2018). Though this species does not nest in the Central Valley, the open areas, including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands may provide suitable foraging and wintering habitats.

3.2.1.5.8 Swainson's Hawk

Swainson's hawk (*Buteo swainsoni*) is a raptor species currently listed as threatened under CESA. Breeding pairs typically nest in tall cottonwoods, Valley oaks, or willows associated with riparian corridors, grasslands, irrigated pastures, and croplands with a high density of rodents. The Central Valley populations breed and nest in the late spring through early summer before migrating to Central and South America for the winter. This species has been observed within the Plan Area (Teichert 2015).

There are no known CNDDB occurrences of this species in the Plan Area; however, 128 presumed extant occurrences are located within ten miles. The closest is approximately 0.2 mile to the north in Rosemont on the east side of Bradshaw Road and is surrounded by development (CNDDB occurrence #2205) (CNDDB 2018). The larger trees within the Plan Area may provide suitable nesting habitat while the open areas, including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands may provide suitable foraging habitats. This species has also been observed foraging in Aspen IX and Aspen IX (Teichert 2015).

3.2.1.5.9 White-Tailed Kite

White-tailed kite (*Elanus leucurus*), also known as black-shouldered kite, is a CDFW fully protected species. This non-migrating bird typically attains a wingspan of approximately 40 inches and feeds primarily on insects, small mammals, reptiles, and amphibians, which it forages from open grasslands. It builds a platform-like nest of sticks in trees or shrubs and lays 3 to 5 eggs, but may brood a second clutch if prey is abundant. The kite's distinct style of hunting includes hovering before diving onto its target.

This species has been observed within Aspen VIII and Aspen IX (Teichert 2015), and the CNDDB records one presumed extant occurrence of nesting within the Plan Area near the west side of Aspen VIX (CNDDB

occurrence #27) (CNDDB 2018). The larger trees within the Plan Area provide suitable nesting habitat while the open areas, including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands provide suitable foraging habitats.

3.2.1.5.10 Merlin

The merlin (*Falco columbarius*) is considered a special animal by CDFW. It has never been observed nesting in California, though it is a transient throughout most of the state, and wintering populations are known to occur in the Central Valley and along the coast. Merlins prefer to forage open areas with small clumps or groves of trees for roosting.

There are no known CNDDB occurrences of this species in the Plan Area; however, six presumed extant occurrences are located within ten miles. The closest is approximately 6.5 miles to the southwest in the Sacramento Regional County Sanitation District's Bufferlands (CNDDB occurrence #20) (CNDDB 2018). The restored and undeveloped annual grasslands, croplands, and restored agricultural lands provide suitable wintering and foraging habitats.

3.2.1.5.11 Song Sparrow – Modesto Population

The song sparrow – Modesto population (*Melospiza melodia*) is considered by CDFW as a species of special concern and is endemic to the north-central portion of the Central Valley. The Modesto population is generally associated with freshwater emergent marshes dominated by cattails (*Typha* spp.), riparian willows (*Salix* spp.) or tules (*Schoenoplectus* spp.). Nesting has also been observed within riparian forests of Valley oak (*Quercus lobata*) with dense understories of Himalayan blackberries (*Rubus armeniacus*). This species usually forages on the ground or in the leaf litter for seeds and small invertebrates.

There are no known CNDDB occurrences of this species in the Plan Area; however, four presumed extant occurrences are located within ten miles. The closest is approximately 8.5 miles to the southwest on the Stone Lakes National Wildlife Refuge (CNDDB occurrence #78) (CNDDB 2018). Though the Plan Area is outside of the known range of this species, which is strongly associated with the Sacramento River and the Sacramento-San Joaquin Delta, the riparian woodlands and constructed emergent marsh represent marginally suitable habitat for this species.

3.2.1.5.12 Black-Crowned Night Heron

Black-crowned night heron (*Nycticorax nycticorax*) is considered a special animal by CDFW. Most breeding colonies are associated with large wetlands, streams, rivers, marshes, mud flats, and the edges of lakes. Its diet consists mainly of fish, though earthworms, insects, crayfish, mussels, squid, amphibians, lizards, snakes, rodents, birds, eggs, trash, carrion, and plant materials are also commonly consumed. Black-crowned night herons defend their foraging territory and hunt usually alone at night. This species, like many heron species, is also a colonial tree nester.

There are no known CNDDB occurrences of rookeries of this species in the Plan Area; however, three presumed extant occurrences are located within ten miles. The closest is approximately 6.5 miles to the southwest at Fishhead Lake in the Sacramento Regional County Sanitation District's Bufferlands (CNDDB occurrence #16) (CNDDB 2018). Black-crowned night heron was observed in the vicinity of the constructed emergent marsh in Aspen VI and Granite I, though it is not known if this species was foraging or nesting (Teichert 2013). The thicker riparian woodlands within the Plan Area provide suitable breeding habitat for this species; the constructed emergent marsh, natural marshes, ponds and industrial ponds present suitable foraging habitats.

3.2.1.5.13 Double-Crested Cormorant

The double-crested cormorant (*Phalacrocorax auritus*) is considered a special animal by CDFW. This diving aquatic bird is the most widespread cormorant in North America. It prefers open water habitats such as ponds, lakes, rivers, estuaries, lagoons, and open coastlines where it forages for fish, amphibians, and crustaceans. It constructs nests near water in colonies on cliffs, rocks, or in trees.

There are no known CNDDB occurrences of nesting colonies of this species in the Plan Area; however, three presumed extant occurrences are located within ten miles. The closest is approximately 8 miles to the southwest in the Sacramento Regional County Sanitation District's Bufferlands along Morrison Creek (CNDDB occurrence #39) (CNDDB 2018). The thicker riparian woodlands within the Plan Area provide suitable breeding habitat for this species; the constructed emergent marsh, natural marshes, and ponds and industrial ponds present suitable foraging habitats.

3.2.1.5.14 Purple Martin

The purple martin (*Progne subis*) is considered a species of special concern by CDFW. This bird winters in South American and migrates to Mexico, the United States, and southern Canada to breed. It is a colonial nester and utilizes natural cavities such as hollow trees, cliffs, and abandoned woodpecker dens as well as created nesting sites such as bird houses or gourds. It feeds on winged insects which it catches on the fly, and it prefers open areas near lakes, ponds, marshes or other water features.

There are no known CNDDB occurrences of nesting colonies of this species in the Plan Area; however, ten presumed extant occurrences are located within ten miles. The closest is approximately 3 miles to the northwest where purple martins were observed nesting in the weep holes of the Highway 50 overpass at Redding Road between 65th Street and Howe Avenue (CNDDB occurrence #19) (CNDDB 2018). The thicker riparian woodlands within the Plan Area provide suitable breeding habitat for this species; the constructed emergent marsh and ponds and industrial ponds present suitable foraging habitats.

3.2.1.5.15 Bank Swallow

The bank swallow (*Riparia riparia*) is listed as threatened under CESA. This bird nests in colonies of two or three pairs to a few thousand in vertical cliffs and banks associated with riparian zones, lakes, and streams. The species is known to colonize human-made vertical banks or building structures.

There are no known CNDDB occurrences of nesting colonies of this species in the Plan Area; however, five presumed extant occurrences are located within ten miles. The closest is approximately 4.5 miles to the northwest along the south side of the American River upstream from Cal Expo near the Capital City Freeway bridge (CNDDB occurrence #94) (CNDDB 2018). The vertical banks in the mined areas of the Plan Area provide suitable breeding habitat for this species; the constructed emergent marsh, natural marshes and ponds and industrial ponds present suitable foraging habitats.

3.2.1.5.16 Least Bell's Vireo

Least Bell's vireo (*Vireo bellii pusillus*) is listed as endangered under CESA and FESA. This small bird is strongly associated with riparian corridors. Historically abundant in riparian woodlands throughout the Central Valley and low level riparian areas of southern California and northern Mexico, today it is generally restricted to southern California along lowland willow-dominated riparian areas. This insectivore, which gleans its prey from bark or leaves, winters in southern Baja California, Mexico in a variety of non-riparian habitats including palm groves, mesquite scrub, and hedgerows bordering agricultural fields and residential developments. In the Sacramento Valley, the species occurs as a vagrant during the breeding season.

There are no known CNDDB occurrences of this species in the Plan Area; however, one presumed extant occurrence is located within ten miles. The exact location of this 1877 occurrence is unknown, but it was probably collected in riparian vegetation along the Sacramento River in a currently developed area of the Sacramento region approximately 2 to 10 miles to the northwest (CNDDB occurrence #515) (CNDDB 2018). Though generally believed to be extirpated from the area, the riparian woodlands within the Plan Area provide suitable habitat.

3.2.1.5.17 Yellow-Headed Blackbird

The yellow-headed blackbird (*Xanthocephalus xanthocephalus*) is considered a species of special concern by CDFW. It nests in deeper portions of tule, bulrush, or cattail marshes than other blackbirds and typically breeds in California from April to June. Though some populations are known to over-winter in California, many migrate to Mexico and Costa Rica. Yellow-headed blackbirds feed on seeds and insects, and flocks are often observed in open areas such as grasslands and agricultural fields during migration.

There are no known CNDDB occurrences of this species in the Plan Area; however, one presumed extant occurrence is located within ten miles. Situated approximately 8.5 miles to the southwest probably along the Sacramento River, this poorly documented occurrence is based on eggs collected in 1899 (CNDDB occurrence #9) (CNDDB 2018). The constructed emergent marsh and natural marshes present suitable

nesting habitats while the open areas, including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands provide suitable foraging habitats.

3.2.1.6 Special-Status Mammals

3.2.1.6.1 Hoary Bat

The hoary bat (*Lasiurus cinereus*) is a considered a special animal by CDFW. It is believed to be one of the most widespread of all American bats with a range extending from Canada to central Chile and Argentina as well as Hawaii. Hoary bats prefer older large leaf species such as cottonwoods, willows, and fruit or nut trees for daytime roosts. This species is primarily crepuscular or nocturnal and requires open areas to hunt its main prey item, moths. The hoary bat is considered a forest/woodland species, and in California they are often associated with undisturbed riparian or stream corridors.

There are no known CNDDB occurrences of this species in the Plan Area; however, one presumed extant occurrence is located within ten miles. Situated approximately 9 miles to the northwest, this sparsely documented 1991 occurrence is based on written location data (CNDDB occurrence #137) (CNDDB 2018). The riparian woodlands provide suitable roosting habitat while the open areas, including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands provide suitable foraging habitats.

3.2.1.6.2 American Badger

American badger (*Taxidea taxus*) is considered a species of special concern by CDFW. This burrowing carnivorous mammal, which is solitary and very territorial, prefers to feed on small mammals, lizards, snakes, insects, and carrion. It has no known natural enemies and inhabits dry, open fields, grasslands, and pastures.

There is one known occurrence of this species within the Plan Area located southwest of Mather Field in Granite I, Aspen V, and Aspen VI between Kiefer Boulevard, Bradshaw Road, Jackson Highway, and Excelsior Road (CNDDB occurrence #73) (CDFW 2018). The open areas including the restored and undeveloped annual grasslands, croplands, and restored agricultural lands provide suitable habitats for this species.

3.3 Existing Site Conditions

3.3.1 Existing Site Conditions - District 1 Area Plan

District 1 is approximately **3,651 acres** comprised of approximately **3,016 acres** owned by Teichert, and approximately **635 acres** of Non-Participating Property owners and roads as shown on **Figures 3** and **5**.

3.3.1.1 Site History – District 1 Participant Properties

Most of the District 1 Participant parcels have been mined for aggregate and are situated as much as 15 to 40 feet below the topography of the surrounding un-mined lands. The majority of these parcels are

currently utilized in the continued processing of mined aggregate. One parcel directly south of Jackson Highway and east of Mayhew Road was mined then subsequently utilized as a commercial green waste composting facility, but has since been fallow. The perimeter of most mining areas has been planted with ornamental species such as oleander (*Nerium oleander*) and privot (*Ligustrum* sp.) though several native trees such as Valley oak (*Quercus lobata*) and walnut (*Juglans* sp.) are also present. Disturbed mining areas and ruderal habitats comprise most of District 1 and support filaree (*Erodium botrys*), soft chess (*Bromus hordeaceus*), rip-gut brome (*Bromus diandrus*), medusa head *(Elymus caput-medusae*), wild oats (*Avena fatua*), yellow star-thistle (*Centaurea solstitialis*), and common tarweed (*Holocarpha virgata*).

To offset the loss of vernal pools during aggregate mining in two of its properties, Aspen V and VI, Teichert implemented a compensatory mitigation project in October of 1996. As a result, numerous vernal pools were constructed within the Aspen V Participant Properties.

3.3.1.2 Site History – District 1 Non-Participant Properties

The majority of the District 1 Non-Participants are located along Jackson Highway or on the periphery of the West Jackson Highway Master Plan Boundary. Most of the District 1 Non-Participants have not been mined and are relatively close to their natural grades with the exception of several parcels near the Jackson Highway-Bradshaw Road intersection and small areas directly south of Aspen III. These lands predominantly represent undeveloped, developed, and agricultural lands.

3.3.1.3 Soils and Geology – District 1 Area Plan

According to the "Soil Survey of Sacramento County, California," nineteen soil map units occur within Participant Properties of District 1 (USDA 1993):

1. Columbia sandy loam, drained, 0-2% slopes, occasionally flooded (118);
2. Creviscreek sandy loam, 0-3% slopes (132);
3. Dierssen clay loam, deep, drained, 0-2% slopes (135);
4. Durixeralfs, 0-1% slopes (137);
5. Hedge loam, 0-2% slopes (157);
6. Hicksville loam, 0-2%, occasionally flooded (158);
7. Kimball silt loam, 0-2% slopes (164),
8. Kimball silt loam, 2-8% slopes (165);
9. Natomas loam, 0-2% slopes (181);
10. Pits (190);
11. Red Bluff loam, 0-2% slopes (191);
12. Red Bluff-Redding complex, 0-5% slopes (193);
13. Red Bluff-Xerarents complex, 0-2% slopes (195);
14. Redding gravelly loam, 0-8% slopes (198);
15. San Joaquin silt loam, leveled, 0-1% slopes (213);
16. San Joaquin silt loam, 0-3% slopes (214);

17. San Joaquin silt loam, 3-8 % slopes (215);
18. San Joaquin-Xerarents complex, leveled, 0-1% slopes (221); and
19. Xerarents-San Joaquin complex, 0-1% slopes (238).

Figure 9 is an exhibit displaying the soil map units within District 1.

3.3.1.4 Existing Landcovers – District 1 Participant Properties

District 1 Participant Properties presently encompass Mining Areas and Constructed/Restored Lands, as well as Developed and Undeveloped Lands. **Figure 10** (NAIP 2016) is a map displaying the existing landcover conditions within District 1 Participant Properties.

3.3.1.4.1 Mining Areas

Mining Areas consist of disturbed mining areas, drying beds, an abandoned parking lot, industrial yards, and industrial ponds. Disturbed mining areas have been and continue to be utilized for the extraction of aggregate. These areas typically exist as pits with sloped walls, access roads, conveyor belt pathways, and the areas along the pit rims where screen trees have been planted to mitigate impacts to the viewshed. The vegetation in areas subjected to mining activities is relatively sparse and can be best described as dominated by weedy annual grassland species. Vegetative screening located on the pit rims supports a narrow band approximately 10 to 20 feet wide of ornamental shrubs and trees. This habitat supports generalist species tolerant of non-native vegetated habitats such as mourning dove (*Zenaida macroura*), northern mockingbird (*Mimus polyglottos*), California quail (*Callipepla californica*), Anna's hummingbirds (*Calypte anna*), and house finches (*Haemorhous mexicanus*). Because these areas continue to be used as part of the on-going aggregate extraction process, the landscape is constantly in flux and routine maintenance of mining areas is an ongoing activity.

Drying beds are shallow basins that are used to dispose of sediment washed from aggregate delivered to the Perkins Plant site. The purpose of these beds is to fill the depressions created by previous mining activities and eventually bring these areas up closer to adjacent grade. The sediment is delivered to the basins in slurry form and spread over the previously mined "pit" areas in interval layers of approximately 12 inches. The basins are filled in a rotational sequence resulting in differing states of wetness, ranging from shallow turbid ponds to mudflats or dry beds. The slurry is allowed to dry until surface cracks appear. A farm tractor then turns the material over to facilitate continued evaporation. Once the material has dried, it is compacted to create engineered fill. Following compaction, the process is repeated with another layer of material. The drying beds are maintained at 90 percent compaction or greater.

An abandoned concrete parking lot is located on the parcel directly east of Mayhew Road. The site historically contained an aggregate mine and green waste composting facility, but neither operation is currently active. Earthmoving associated with mining activities created a large pit with an average elevation of roughly 30 feet, which is approximately 30 to 40 feet lower than the immediately surrounding areas.

Three industrial yards were constructed within the Participant Properties with two situated along Jackson Highway and a third located off of Hedge Avenue. All appear to be composed of compacted earth or gravel and are used as vehicle and equipment storage areas.
Twenty-one industrial ponds have been constructed within the previously mined areas of the District 1 Participant Properties. Industrial wash-water is either pumped directly into the industrial ponds, or it flows into the ponds by way of the excavated drainage ditches described below. The ditches not only convey wash-water, but in some cases also convey run-off from precipitation from the surrounding areas. Teichert Aggregates conducts continual maintenance of the ponds and ditches, including the removal of vegetation to maintain the integrity of the ponds.

In general, vegetation within the industrial ponds is limited to the banks and shallow vegetated margins. Woody riparian species such as Valley oak (*Quercus lobata*), cottonwood (*Populus fremontii*), black willow (*Salix nigra*), arroyo willow *(S. lasiolepus*), sandbar willow (*S. exigua*), and coyote brush (*Baccharis pilularis*) dominate the tree and shrub layer. The understory is typically dominated by such common species as Himalayan blackberry (*Rubus armeniacus*), hairy vetch (*Vicia villosa*), white sweetclover (*Melilotus alba*), sour sweetclover (*M. indica*), ripgut brome grass (*Bromus diandrus*), soft chess brome grass (*B. hordeaceus*), field mustard (*Brassica rapa*), and black mustard (*B. nigra*). In the shallower portions, emergent wetland vegetation occurs along the margins and is typically dominated by spike rush (*Eleocharis macrostachya*) and sandbar willow (*Salix exigua*).

3.3.1.4.2 Constructed/Restored Lands

Constructed/Restored Lands are previously mined areas that have been actively reclaimed or have remained idle long enough to allow the re-establishment of vegetation. These include restored riparian woodlands, agricultural lands, and annual grasslands containing constructed vernal pools, marshes, depressional seasonal wetlands, seasonal wetland swales, a low flow corridor, and channels with adjacent wetlands. The characteristics of these are similar to their corresponding natural habitat types, with the exception of the some of the constructed channels and surrounding restored riparian woodlands, which are still becoming established. Currently, existing restored agricultural lands are leased for hay production and have been farmed for several years in alfalfa.

3.3.1.4.3 Developed Lands

Developed Lands refer to manipulated or developed areas and include institutional parcels such as schools as well as commercial, residential, and industrial sites. These areas are collectively referred to as Commercial/Residential/Industrial/Institutional lands on **Figure 10** (NAIP 2016). These represent built-up areas occupied by buildings and associated structures such as driveways, sidewalks, parking lots, playgrounds, and landscaped areas. Paved roads and ditches are also included in this category.

Twenty-three ditches are located within District 1 Participant Properties. Several run parallel to roads and were designed to capture and convey road run-off. The rest, which are located within the disturbed mining areas, are regularly maintained to ensure that proper drainage occurs throughout these sites.

3.3.1.4.4 Undeveloped Lands

Undeveloped Lands refer to natural (at-grade) irrigated pastures and cropland as well as annual grasslands that contain channels, depressional seasonal wetlands, marshes, seasonal wetlands, riparian woodlands, seasonal riparian wetlands, seasonal wetlands swales, and vernal pools.

The majority of undeveloped lands are situated south of Jackson Highway, east of Mayhew Road, west of Excelsior Road, and north of Florin Road, though several smaller such parcels are scattered throughout the District 1 Participant Properties. The majority of these areas consist of annual grasslands composed of soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), rip-gut brome (*Bromus diandrus*), medusa head *(Elymus caput-medusae*), filaree (*Erodium botrys*), and perennial rye grass (*Festuca perennis*). Interspersed within the annual grasslands are numerous water features including vernal pools, depressional seasonal wetlands, seasonal wetlands, seasonal wetland swales, channels, marshes, seasonal riparian wetlands, and ponds.

Vernal pools, depressional seasonal wetlands, seasonal wetlands, seasonal riparian wetlands, and seasonal wetland swales are ephemeral water features that sustain long-term ponding and/or saturated soil conditions during and following periods of heavy precipitation in the wet-season. Additional water may be provided by surface sheet flow and subsurface discharge onto the perched water-tables or impermeable surfaces when present. Depressional seasonal wetlands and vernal pools represent small enclosed basins in the microrelief that allow for seasonal ponding, unlike seasonal wetland swales, which are linear sloping vegetated drainages that lack a defined bed and bank. Vernal pools support a higher level of plant diversity, particularly of native plants, than depressional seasonal wetlands, seasonal wetlands, or seasonal wetland swales. Hydrophytes, or water-loving plants, observed by Gibson & Skordal, LLC. (Gibson & Skordal) in 2010 within the vernal pools included coyote thistle (*Eryngium castrense*), slender popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), creeping spike rush (*Eleocharis macrostachya*), Carter's buttercup (*Ranunculus bonariensis* var. *trisepalus*), rush (*Juncus* sp.), rabbit's-foot grass (*Polypogon monspeliensis*), dove weed (*Croton setigerus*), Fremont's goldfields (*Lasthenia fremontii*), white-headed navarretia (*Navarretia leucocephala*), and smooth goldfields (*Lasthenia glaberrima*). Plants noted in the depressional seasonal wetlands, seasonal wetlands, and seasonal wetland swales included coyote thistle (*Eryngium castrense*), iris-leaf rush (*Juncus xiphioides*), Mediterranean barley (*Hordeum marinum*), and loosestrife (*Lythrum hyssopifolia*). Seasonal riparian wetlands are situated adjacent to Elder Creek, but lack the shrub and tree species typically associated with riparian corridors. These depressional features are likely flooded by near-by Elder Creek during times of high flows. The noted plants, which are dominated by herbaceous species, included perennial rye (*Festuca perennis*), coyote thistle (*Eryngium castrense*), Mediterranean barley (*Hordeum marinum*), prickly lettuce (*Lactuca serriola*), clustered dock (*Rumex conglomerates*), and hairy hawkbit (*Leontodon saxatilis*). Five ponds are located within the District 1 Participant Properties south of Jackson Highway, and all are constructed to facilitate the watering of several irrigated pastures. Freshwater marshes of broadleaf cattails (*Typha angustifolia*), and bulrush (*Schoenoplectus acutus*) occupy the shallower edges of the ponds and irrigation ditches (Gibson & Skordal 2010a, 2010c).

Several channels, most of which are ephemeral or intermittent, traverse this portion of the District 1 Participant Properties. All display a bed and bank with ordinary high water mark and the absence of terrestrial vegetation. The exceptions are Morrison Creek and Elder Creek, which are perennial and flow into the Sacramento River. Morrison Creek, portions of which are channelized, supports small corridors of riparian woodlands composed of Valley oak (*Quercus lobata*), walnut (*Juglans* sp.), willows (*Salix* spp.), blue oak (*Quercus douglasii*), poison oak (*Toxicodendron diversilobum*), and Himalayan blackberry (*Rubus armeniacus*). The herbaceous understory includes creeping wild rye (*Elymus triticoides*), fiddle dock (*Rumex pulcher*), wild oats (*Avena fatua*), winter vetch (*Vicia villosa*), Italian thistle (*Carduus pycnocephalus*), chickweed (*Stellaria media*), and rose clover (*Trifolium hirtum*). Several reaches of Elder Creek, near Elder Creek Road, appear to have been straightened. Some reaches of Elder Creek resemble seasonal wetland swales due to heavy growths of vegetation obscuring the ordinary high water mark. Perennial rye grass (*Festuca perennis*), Mediterranean barley (*Hordeum marinum*), clustered dock (*Rumex conglomeratus*), and curly dock (*Rumex crispus*) represent the majority of wetland species within these channels.

Croplands, which are situated in unmined areas, are typically utilized yearly and planted in dry crops such as wheat (*Triticum* sp.) and hay. The irrigated pastures, which are also located in unmined areas, provide forage for cattle and consist of wetter species such as perennial rye grass (*Festuca perennis*), tall flat-sedge (*Cyperus eragrostis*), bird's foot-trefoil (*Lotus corniculatus*), knotweed (*Polygonum aviculare*) loosestrife (*Lythrum hyssopifolia*), white clover (*Trifolium repens*), English plantain (*Plantago lanceolata*), and dallis grass (*Paspalum dilatatum*).

Table 1 summarizes existing conditions within the Participant Properties for District 1.

3.3.1.5 Existing Landcovers – District 1 Non-Participant Properties

The existing landcovers for lands controlled by Non-Participant Property owners within District 1 utilized information derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photos and observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

The District 1 Non-Participants currently encompass **Mining Areas** as well as **Developed** and **Undeveloped Lands**. **Figure 11** (NAIP 2016) is a map displaying the existing landcover conditions within District 1 Non-Participant Properties.

3.3.1.5.1 Mining Areas

Mining Areas consist of disturbed mining areas, industrial yards, and industrial ponds. Disturbed mining areas have been and continue to be utilized for the extraction of aggregate. These areas typically exist as

pits with sloped walls, access roads, conveyor belt pathways, and the areas along the pit rim where screen trees have been planted to mitigate impacts to the viewshed. The vegetation in areas subjected to mining activities is relatively sparse and can be best described as dominated by weedy annual grassland species. Vegetative screening located on the pit rims supports a narrow band approximately 10 to 20 feet wide of ornamental shrubs and trees. This habitat supports generalist species tolerant of non-native vegetated habitats such mourning dove (*Zenaida macroura*), northern mockingbird (*Mimus polyglottos*), California quail (*Callipepla californica*), Anna's hummingbirds (*Calypte anna*), and house finches (*Haemorhous mexicanus*).

Two industrial yards are within the Non-Participant Properties with one situated along Jackson Highway and a second located off of Hedge Avenue. Both appear to be constructed of compacted earth or gravel and are used as vehicle and equipment storage areas.

One industrial pond has been constructed within the previously mined areas of the District 1 Non-Participant Properties. It appears to be a relict of excavation activities associated with the mining operations.

3.3.1.5.2 Developed Lands

Developed Lands refer to heavily manipulated or built-up areas and include institutional parcels such as schools as well as commercial, residential, and industrial sites. These areas are collectively referred to as Commercial/Residential/Industrial/Institutional lands on **Figure 11** (NAIP 2016). Developed Lands also include associated structures such as driveways, sidewalks, paved roads, parking lots, playgrounds, landscaped areas, and ditches. Several ditches are located within the District 1 Non-Participant Properties and were designed to capture and convey road run-off.

3.3.1.5.3 Undeveloped Lands

Undeveloped Lands refer to naturally occurring (at-grade) annual grasslands that contain channels, depressional seasonal wetlands, marshes, ponds, riparian woodlands, seasonal wetlands swales, seasonal riparian wetlands, vernal pools, cropland, and irrigated pasture.

The majority of Undeveloped Lands are clustered in the eastern portion of the Plan Area near Excelsior Road. Most of these areas typically consist of annual grasslands likely composed of soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), rip-gut brome (*Bromus diandrus*), medusa head *(Elymus caput-medusae*), filaree (*Erodium botrys*), and perennial rye grass (*Festuca perennis*). Within the annual grasslands are numerous water features including vernal pools, depressional seasonal wetlands, seasonal riparian wetlands, seasonal wetland swales**,** channels, marshes, and ponds.

Vernal pools commonly support coyote thistle (*Eryngium castrense*), slender popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), creeping spike rush (*Eleocharis macrostachya*), Carter's buttercup (*Ranunculus bonariensis* var. *trisepalus*), rush (*Juncus* sp.), rabbit's-foot grass (*Polypogon monspeliensis*), dove weed (*Croton setigerus*), Fremont's goldfields (*Lasthenia fremontii*), white-headed

navarretia (*Navarretia leucocephala*), and smooth goldfields (*Lasthenia glaberrima*). Plants expected in the depressional seasonal wetlands, seasonal wetlands, and seasonal wetland swales include coyote thistle (*Eryngium castrense*), iris-leaf rush (*Juncus xiphioides*), Mediterranean barley (*Hordeum marinum*), and loosestrife (*Lythrum hyssopifolia*).

Located within the Non-Participant Properties are several ponds. All appear to have been created by excavation or the placement of earthen levees across natural drainages. Vegetative communities dominated by broadleaf cattails (*Typha angustifolia*), and/or bulrush (*Schoenoplectus acutus*) likely occupy the shallower edges of the ponds.

Numerous channels, most of which are ephemeral or intermittent, traverse the District 1 Non-Participant Properties. Channels typically display a bed and bank with ordinary high water mark and the absence of terrestrial vegetation. The exceptions are Morrison Creek and Elder Creek which are perennial. Morrison Creek flows to the west through Non-Participants off of Jackson Highway and Bradshaw Road before emptying into the Sacramento River while Elder Creek crosses Jackson Highway from north to south and merges with Morrison Creek southwest of the Plan Area. Morrison Creek supports small corridors of riparian woodlands. Riparian woodlands in Sacramento County are commonly composed of Valley oak (*Quercus lobata*), walnut (*Juglans* sp.), willows (*Salix* sp.), blue oak (*Quercus douglasii*), poison oak (*Toxicodendron diversilobum*), and Himalayan blackberry (*Rubus armeniacus*). The herbaceous understory may typically include creeping wild rye (*Elymus triticoides*), fiddle dock (*Rumex pulcher*), wild oats (*Avena fatua*), winter vetch (*Vicia villosa*), Italian thistle (*Carduus pycnocephalus*), chickweed (*Stellaria media*), and/or rose clover (*Trifolium hirtum*).

The croplands are typically utilized yearly and planted in dry crops such as wheat (*Triticum* sp.) and hay. The irrigated pastures provide forage for cattle and probably consist of wetter species such as perennial rye grass (*Festuca perennis*), tall flat-sedge (*Cyperus eragrostis*), bird's foot-trefoil (*Lotus corniculatus*), knotweed (*Polygonum aviculare*) loosestrife (*Lythrum hyssopifolia*), white clover (*Trifolium repens*), English plantain (*Plantago lanceolata*), and dallis grass (*Paspalum dilatatum*).

Table 2 summarizes existing conditions within the Non-Participant Properties for District 1.

3.3.1.7 Special-Status Species – District 1 Area Plan

The special-status species assessment drew information from site visits, survey data and/or previously prepared assessment reports involving site visits. Rare plant surveys, detailed wetland delineations, biological assessments, and arborist reports are examples of sources of information utilized, but not all Participant Properties were surveyed. For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

If reports or survey data were unavailable, assessments regarding presence of potential habitat were derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from

accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerials and observations of features from public areas.

3.3.1.7.1 Rare Plant and VELB Surveys – District 1 Area Plan

In 2006, ECORP Consulting, Inc. (ECORP) conducted rare plant surveys within the Aspen IV South parcel for the following species: dwarf downingia (*Downingia pusilla*), Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), woolly rose-mallow (*Hibiscus lasiocarpus*), Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), legenere (*Legenere limosa*), pin cushion navarretia (*Navarretia myersii* ssp. *myersii*), slender Orcutt grass (*Orcuttia tenuis*), Sacramento Orcutt grass (*Orcuttia viscida*), Sanford's arrowhead (*Sagittaria sanfordii*). ECORP concurrently conducted an elderberry (*Sambucus* sp.). Both surveys yielded negative results (ECORP 2008).

In 2010 Gibson & Skordal performed rare plant surveys in the following sections of the District 1 Participant Properties: Aspen II, Aspen III, Aspen III South, the northern Aspen V parcel, portions of Aspen V South, Aspen VII, Aspen VII South, and Mayhew. Target species included twelve special-status plants recorded by the CNDDB as occurring within the vicinity of these parcels. These included: Brandegee's clarkia (*Clarkia biloba* ssp. *brandegeeae*), dwarf downingia (*Downingia pusilla*), stinkbells (*Fritillaria agrestis*), Bogg's Lake hedge-hyssop (*Gratiola heterosepala*), woolly rose-mallow (*Hibiscus lasiocarpus*), Northern California black walnut (*Juglans hindsii*), Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*), legenere (*Legenere limosa*), pin cushion navarretia (*Navarretia myersii* ssp. *myersii*), slender Orcutt grass (*Orcuttia tenuis*), Sacramento Orcutt grass (*Orcuttia viscida*), and Sanford's arrowhead (*Sagittaria sanfordii*). No listed plants or elderberry shrubs were observed (Gibson & Skordal 2010a, 2010b).

Field surveys involving numerous field visits for special-status plant species were performed within the Aspen VIII and Aspen IX sites from March 2013 through August 2014 by Teichert Materials. Sanford's arrowhead (*Sagittaria sanfordii*) was observed within several ditches on the Aspen VIII site (Teichert Materials 2015). The majority of these colonies have been extirpated by permitted mining activities.

Figure 12 displays the areas where special-status plant and elderberry surveys were performed. For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.1.7.2 CNDDB Occurrences - Rare Plants and VELB – District 1 Area Plan

The CNDDB records one occurrence of special-status plants species within District 1 as well as three located within close proximity (CDFW 2018). No occurrences of VELB are listed by the CNDDB within District 1. The special-status plant occurrences include the following:

- In 2014 over 2,000 Sanford's arrowhead (*Sagittaria sanfordii*) plants were observed within an irrigation ditch in the Aspen VIII parcel (CNDDB occurrence #109).

- In 2013 Sanford's arrowhead (*Sagittaria sanfordii*) were observed less than a mile west within a drainage ditch paralleling a railroad track (CNDDB occurrence #110).
- The CNDDB records a 1989 occurrence of Sanford's arrowhead (*Sagittaria sanfordii*) directly north of Aspen III across Jackson Highway in man-made ponds within the Cordova Golf Course (CNDDB occurrence #25).
- Sacramento Orcutt grass (*Orcuttia viscida*) was observed less than one mile southeast of the Aspen VII parcel in 1998, but this occurrence is believed to be extirpated. The vernal pool identified as supporting this record has evolved into a marsh due to run-off from a nearby plant nursery (CNDDB occurrence #20).

Figure 13 is an exhibit displaying existing occurrences of special-status species plants in relation to District 1. A non-CNDDB occurrence of dwarf downingia was observed during 2016 rare plant surveys in the Vineyard South Mine Project site, which is located south of Vineyard I on the south side of Elder Creek Road (APN 066-0010-001) (WRA 2016). This occurrence has yet to be published by the CNDDB.

In summary, the appropriate habitat is potentially present within unsurveyed areas of District 1 to support the following species:

- Dwarf downingia (*Downingia pusilla*);
- Stinkbells (*Fritillaria agrestis*);
- Bogg's Lake hedge-hyssop (*Gratiola heterosepala*);
- Woolly rose-mallow (*Hibiscus lasiocarpus* var. *occidentalis*);
- Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*);
- Legenere (*Legenere limosa*);
- Pin cushion navarretia (*Navarretia myersii* ssp. *myersii*);
- Slender Orcutt grass(*Orcuttia tenuis*);
- Sacramento Orcutt grass (*Orcuttia viscida*);
- Peruvian dodder (*Cuscuta obtusiflora* var. *glandulosa*); and
- Sanford's arrowhead (*Sagittaria sanfordii*).

For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.1.7.3 Vernal Pool Branchiopod Surveys – District 1 Area Plan

Gibson & Skordal conducted protocol vernal pool branchiopod surveys during the 2009-10 and 2010-11 wet-seasons in the following areas: the eastern part of Aspen III (Gibson & Skordal 2010c, 2011), Aspen V South (North Parcel) (Gibson & Skordal (2010d, 2011a), Aspen VII South (Gibson & Skordal 2010e, 2011b), and Mayhew (Gibson & Skordal 2010f, 2011c). These areas were evaluated due to the fact that they had either been undisturbed by past mining activities, or in the case of the Mayhew property, there had been a lack of long-term maintenance. California linderiella (*Linderiella occidentalis*), vernal pool tadpole shrimp (*Lepidurus packardi*), and vernal pool fairy shrimp (*Branchinecta lynchi*) were observed within the Aspen VII South Study Area during both sampling seasons. California linderiella (*Linderiella occidentalis*) was observed

within the Aspen III Study Area during both sampling seasons. No target vernal pool branchiopods were observed within the Mayhew Study Area.

Additionally, vernal pool tadpole shrimp (*Lepidurus packardi*) were observed in a vernal pool near Jackson Highway within the Aspen VII Study Area during plant surveys in 2008 conducted by Gibson & Skordal. EcoAnalysts, Inc. also performed surveys on Aspen IX in 2006 and Aspen V, Aspen V South, and Aspen IV South in 2008; California linderiella (*Linderiella occidentalis*), vernal pool tadpole shrimp (*Lepidurus packardi*), and vernal pool fairy shrimp (*Branchinecta lynchi*) were present within the Aspen IX survey area; vernal pool tadpole shrimp (*Lepidurus packardi*) and vernal pool fairy shrimp (*Branchinecta lynchi*) were observed within the Aspen V and Aspen V South Study Areas (EcoAnalyst, Inc. 2006, 2008, 2008a, 2008b).

Aspen II, Aspen III, Aspen III South, Aspen IV South, Aspen V South, Aspen VI, Aspen VIII and portions of Aspen IX are continuously subjected to permitted earth-moving activities associated with ongoing aggregate mining operations. As such, most of these areas currently lack suitable vernal pool branchiopod habitat. **Figure 14** displays the areas where vernal pool branchiopod surveys were performed and where habitat is not present, and **Table 4** summarizes survey results and current site conditions. For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

Table 4. Branchiopod Survey Results and Current Site Conditions within District 1 Area Plan

Parcel	Results
Aspen II	No branchiopod habitat present due to on-going permitted mining operations
Aspen III (Surveyed Area)	California linderiella present
Aspen III (Unsurveyed Area)	No branchiopod habitat present due to on-going permitted mining operations
Aspen III South	No branchiopod habitat present due to on-going permitted mining operations
Mayhew	No branchiopods present
Aspen IV	No branchiopod habitat present due to on-going permitted mining operations
Aspen IV South	Surveyed, but currently no branchiopod habitat present due to permitted mining operations
Aspen V (North Parcel)	No branchiopods present
Aspen V (South Parcel)	Vernal pool tadpole shrimp and vernal pool fairy shrimp present
Aspen V South (North Parcel)	No branchiopods present

Table 4. Branchiopod Survey Results and Current Site Conditions - District 1 Area Plan, Cont'd

Parcel	Results
Aspen V South (Mined Area)	Surveyed, but currently no branchiopod habitat present due to permitted mining operations
Aspen VI	No branchiopod habitat present due to on-going permitted mining operations
Aspen VII	Vernal pool tadpole shrimp observed during plant surveys
Aspen VII South	Vernal pool tadpole shrimp, vernal pool fairy shrimp, and California linderiella present
Aspen VIII	No branchiopod habitat present due to on-going permitted mining operations
Aspen IX	Vernal pool tadpole shrimp, vernal pool fairy shrimp, and California linderiella present

Appropriate habitat is present within unsurveyed areas of District 1 for the following species: vernal pool fairy shrimp *(Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), California linderiella (*Linderiella occidentalis*), and midvalley fairy shrimp (*Branchinecta mesovallensis*). For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.1.7.4 Native and Non-Native Trees – District 1 Area Plan

In 2005, ECORP performed surveys to identify all native oak trees, non-native oak trees, and non-oak native trees (excluding cottonwoods and willows) within Aspen IV South with a DBH of 6 inches or greater. ECORP surveyed a total of 50 Valley oaks (*Quercus lobata*). The report acknowledges the presence of willows and cottonwoods as well as ornamentals, but does not quantify numbers of non-oaks (ECORP 2005).

Teichert Aggregates performed a preliminary oak tree survey on portions of Aspen V South in August of 2005. All native oaks with a single trunk DBH of 6 inches or multi-trunk trees with a combined DBH of 10 inches were included. A total of 47 Valley oaks (*Quercus lobata*) were recorded (Teichert 2005).

Since 2005, a total of 61 Valley oak (*Quercus lobata*) on Aspen IV South and Aspen V South were removed as part of permitted mining activities. As mitigation, Teichert Aggregates has successfully planted 351 Valley oak (*Quercus lobata*), 139 interior live oak (*Quercus wislizeni*), 19 California box elder (*Acer negundo*), and 30 Oregon ash (*Fraxinus latifolia*) on Aspen V South. An additional 13 Valley oaks (*Quercus lobata*), 6 interior live oaks (*Quercus wislizeni*), and 4 Oregon ash (*Fraxinus latifolia*) were also successfully planted on Aspen V (Teichert 2014a).

In 2010, Gibson & Skordal performed surveys within Aspen II, Aspen III, Aspen III South, Aspen IV, and Mayhew to identify all trees native to Sacramento County with a cumulative trunk diameter at breast height (DBH) of 6 inches or greater. (DBH is the trunk diameter approximately 4.5 feet above the ground while standing on the high side of the tree.) The results are listed below (Gibson & Skordal 2010g):

- Aspen II: 49 trees including one interior live oak (*Quercus wislizeni*), 2 Valley oaks (*Quercus lobata*), 10 Goodding's black willows (*Salix gooddingii*), one walnut (*Juglans* sp.), and 31 cottonwoods (*Populus fremontii*).
- Aspen III: 36 trees including one interior live oak (*Quercus wislizeni*), 11 Valley oaks (*Quercus lobata*), 5 Goodding's black willows (*Salix gooddingii*), 4 walnut (*Juglans* sp.), and 15 cottonwoods (*Populus fremontii*). Aspen III South: 12 trees including 2 interior live oaks (*Quercus wislizeni*), 5 Valley oaks (*Quercus lobata*), and 5 walnut (*Juglans* sp.).
- Aspen IV: 3 trees including one interior live oak (*Quercus wislizeni*) and 2 Valley oaks (*Quercus lobata*).
- Mayhew: 26 Valley oaks (*Quercus lobata*).

In 2014, Teichert Aggregates surveyed all trees with a trunk diameter greater than or equal to four inches at DBH on select portions of the Aspen V South, Aspen VIII and Aspen IX parcels. Teichert Aggregates surveyed a total of 102 trees including 21 Goodding's black willows (*Salix gooddingii*), 9 California black walnut (*Juglans hindsii*), 5 Valley oaks (*Quercus lobata*), and 9 Fremont cottonwood (*Populus fremontii*) as well as an additional 13 species of non-native landscape trees. **Figure 15** displays the areas where tree surveys were performed within the District 1 Participant Properties (Teichert 2014a). Of these, the following native protected trees have been removed as part of permitted mining activities within Aspen VIII and Aspen IX (Teichert 2015):

- 9 California black walnut (*Juglans hindsii*) – with a total DBH of 156.2 inches;
- 3 Valley oaks (*Quercus lobata*) – with a total DBH of 22.3 inches.

Impacts to tree canopies for Aspen VII and Aspen IX are as follows:

- 0.229 acre of Riparian Forest/Scrub Canopy;
- 1.345 acres of Other Canopy.

Based on interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography, the likelihood of occurrences of regulated trees within the unsurveyed areas of District 1 is high. For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.1.7.5 CNDDB Occurrences - Nesting/Foraging Raptors & Other Birds – District 1 Area Plan

According to the CNDDB, several occurrences of nesting birds are located within or in very close proximity to District 1 properties (CDFW 2018). These include the following:

- A pair of white-tailed kites (*Elanus leucurus*) was observed nesting in a tree within Aspen IX in 1990 (CNDDB occurrence #27).

- The Elder Creek colony of tricolored blackbirds (*Agelaius tricolor*), which was located within Aspen VII South and Aspen VIII, had been observed sporadically supporting nesting colonies from 1992 and to 2014 (CNDDB occurrence #306).
- A second Elder Creek nesting colony of tricolored blackbirds (*Agelaius tricolor*), which was located west of Aspen IX, had been first observed in 1993. The last active nesting colony was observed in 2015, though it may have failed (CNDDB occurrence #307).
- In 2015 three new tricolored blackbirds (*Agelaius tricolor*) nesting colonies were observed: one was located in Aspen V South (CNDDB occurrence #743). The other two were located south and east of Aspen VII South (CNDDB occurrence #499, #741).
- In 2014 several hundred tricolored blackbirds (*Agelaius tricolor*) were observed nesting in cattails growing in an industrial pond in the Aspen IV parcel (CNDDB occurrence #500).
- Tricolored blackbirds (*Agelaius tricolor*) were observed nesting in blackberry thickets on the south side of Morrison Creek within Aspen V South in 1994 and 2000 (CNDDB occurrence #305).
- Between 1990 and 2000 breeding colonies of tricolored blackbirds (*Agelaius tricolor*) occupied blackberry thickets on either side of Knox Road near the southeast corner of Aspen IX (CNDDB occurrence #177).
- In 1994 a small breeding colony of 15 adult tricolored blackbirds (*Agelaius tricolor*) was observed nesting in blackberry thickets north of Jackson Highway just southeast of Aspen VII; 500 were observed nesting at this location in 2012 (CNDDB occurrence #349).

The following CNDDB records are located within lands enclosed by Kiefer Boulevard on the north, Excelsior Road on the east, Jackson Highway on the south, and Bradshaw Road on the west (CDFW 2018):

- Sixteen active burrowing owl (*Athene cunicularia*) burrows were observed in 1991 (CNDDB occurrence #487).
- Several ferruginous hawks (*Buteo regalis*) and golden eagles (*Aquila chrysaetos*) were observed foraging annual grasslands in 1990-91 (CNDDB occurrence #31 and #135, respectively).
- About 300 adult tricolored blackbirds (*Agelaius tricolor*) were observed nesting in a cattail marsh in 1991. This occurrence was updated after 500-2,000 birds were observed foraging and possibly nesting in and around the constructed emergent marsh in Granite I directly north of the Aspen VI parcel in 2014-15 (CNDDB occurrence #390).

Many of these areas have since been highly altered and currently support disturbed mining areas and industrial ponds. **Figure 16** displays the above nesting/foraging bird occurrences in relation to the District 1 Participant Properties.

According to the document titled "Biological Resources Assessment – Aspen VIII & IX Project, Sacramento County, California" prepared by Teichert Materials in December 2014 and revised June 2015, several special-status bird species were observed within District 1 during associated field surveys performed in 2013 and 2014 (Teichert Materials 2015). These include the following:

- Four separate nesting colonies of tricolored blackbirds (*Agelaius tricolor*) were observed in blackberry thickets in Aspen VIII.
- Swainson's hawk (*Buteo swainsoni*) was observed foraging in Aspen VIII and Aspen IX.
- White-tailed kite (*Elanus leucurus*) was observed foraging in Aspen VIII and Aspen IX.

In addition to the above observed species, appropriate habitat is present within District 1 for the following birds:

- Cooper's hawk (*Accipiter cooperii*);
- Golden eagle (*Aquila chrysaetos*);
- Great egret (*Ardea alba*);
- Blue heron (*Ardea herodias*);
- Ferruginous hawk (*Buteo regalis*);
- Merlin (*Falco columbarius*);
- Song sparrow – Modesto population (*Melospiza melodia*);
- Black-crowned night heron (*Nycticorax nycticorax*);
- Double-crested cormorant (*Phalacrocorax auritus*);
- Purple martin (*Progne subis*);
- Bank swallow (*Riparia riparia*);
- Least Bell's vireo (*Vireo bellii pusillus*); and
- Yellow-headed blackbird (*Xanthocephalus xanthocephalus*).

For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.1.7.6 Other CNDDB Occurrences – District 1 Area Plan

The CNDDB records four occurrences of additional special-status species within or within close proximity to District 1. These include the following (CDFW 2018):

- Hairy water flea (*Dumontia oregonensis*) was collected in 2004 at Mather Field; very little information is available concerning this occurrence (CNDDB occurrence #1).
- A carcass of a juvenile American badger (*Taxidea taxus*) was discovered in 1991 within an area formerly controlled by Mather Airfield between Kiefer Boulevard, Bradshaw Road, Jackson Highway, and Excelsior Road (CNDDB occurrence #73).
- Western pond turtle (*Emys marmorata*) was observed in 1991 within a reach of Morrison Creek currently located in Aspen VI; this portion of Morrison Creek has been relocated to the west (CNDDB occurrence #433).
- Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*) was collected in 1997 at Mather Field east of Aspen VI; very little information is available concerning this occurrence (CNDDB occurrence #5).

Appropriate habitat for all of the above species is present within District 1. Surveys would be necessary prior to construction to ascertain the absence or presence of these species. **Figure 17** displays existing other CNDDB occurrences that do not fit into the groupings addressed above.

3.3.2 Existing Site Conditions - District 2 Area Plan

District 2 is approximately **1,245 acres** comprised of approximately **1,063 acres** owned by Granite and approximately **182 acres** of Non-Participating Property owners and roads as shown on **Figures 3** and **6**.

3.3.2.1 Site History – District 2 Participant Properties

Most of District 2 Participant Properties have been mined for aggregate and as a result are situated as low as approximately 30 to 40 feet below the topography of the surrounding un-mined lands. Most of these parcels primarily consist of disturbed mining areas and industrial ponds. Ruderal habitats such as disturbed mining areas and industrial ponds support filaree (*Erodium botrys*), soft chess (*Bromus hordeaceus*), rip-gut brome (*Bromus diandrus*), medusa head *(Elymus caput-medusae*), wild oats (*Avena fatua*), yellow star-thistle (*Centaurea solstitialis*), and common tarweed (*Holocarpha virgata*). The perimeter of the mining areas has been planted with ornamental species such as oleander (*Nerium oleander*) and privot (*Ligustrum* sp.) though several native trees such as Valley oak (*Quercus lobata*) and walnut (*Juglans* sp.) are also present.

3.3.2.2 Site History – District 2 Non-Participant Properties

Most of the District 2 Non-Participants are scattered on the periphery of the West Jackson Highway Master Plan Boundary near the west end of Mather Airport. A second small cluster is situated off of Elder Creek Road. Most of the District 2 Non-Participants have not been mined and are relatively close to their natural grades with the exception of several parcels near the southwest end of the Mather Airport runways.

3.3.2.3 Soils and Geology – District 2 Area Plan

According to the "Soil Survey of Sacramento County, California," eleven soil map units occur within Participant Properties of District 2 (USDA 1993):

1. Columbia sandy loam, drained, 0-2% slopes, occasionally flooded (118);
2. Hedge loam, 0-2% slopes (157);
3. Kimball silt loam, 0-2% slopes (164);
4. Natomas loam, 0-2% slopes (181);
5. Pits (190);
6. San Joaquin silt loam, leveled, 0-1% slopes (213);
7. San Joaquin silt loam, 0-3% slopes (214);
8. San Joaquin silt loam, 3-8 % slopes (215);
9. San Joaquin-Xerarents complex, leveled, 0-1% slopes (221);
10. Urban Land (227); and

11. Xerarents-Urban land-San Joaquin Complex, 0-5% slopes (240).

Figure 18 is an exhibit displaying the soil map units within District 2.

3.3.2.4 Existing Landcovers – District 2 Participant Properties

District 2 Participant Properties presently encompasses Mining Areas and Constructed/Restored Lands as well as Developed and Undeveloped Lands. **Figure 19** (NAIP 2016) is a map displaying existing landcovers within District 2 Participant Properties.

3.3.2.4.1 Mining Areas

Mining Areas in the District 2 Participant Properties consist of disturbed mining areas, processing facilities, an industrial yard, and industrial ponds. Disturbed mining areas have been utilized for the extraction of aggregate. These areas typically exist as pits with sloped walls, access roads, conveyor belt pathways, fences, and the areas along the pit rim where screen trees have been planted. The vegetation in areas subjected to mining activities is relatively sparse and can be best described as dominated by ruderal annual grassland species. Vegetative screening located on the pit rims supports a narrow band approximately 10 to 20 feet wide of ornamental shrubs and trees. This habitat supports generalist species tolerant of non-native vegetated habitats such as mourning dove (*Zenaida macroura*), northern mockingbird (*Mimus polyglottos*), California quail (*Callipepla californica*), Anna's hummingbirds (*Calypte anna*), and house finches (*Haemorhous mexicanus*). Because these areas continue to be used as part of the on-going aggregate extraction process, the landscape is constantly in flux and routine maintenance of mining areas is an ongoing activity.

An industrial yard is located along Happy Lane to the west of Mather Field. It is constructed of compacted earth or gravel and is used as a vehicle and equipment storage area.

Six industrial ponds are located within the mined areas of the District 2 Participant Properties. Woody species on the banks include Valley oak (*Quercus lobata*), cottonwood (*Populus fremontii*), black willow (*Salix nigra*), arroyo willow *(S. lasiolepus*), sandbar willow (*S. exigua*), Himalayan blackberry (*Rubus armeniacus*), and coyote brush (*Baccharis pilularis*). The herbaceous layer is typically dominated by common species such as hairy vetch (*Vicia villosa*), white sweetclover (*Melilotus alba*), sour sweetclover (*M. indica*), ripgut brome grass (*Bromus diandrus*), soft chess brome grass (*B. hordeaceus*), field mustard (*Brassica rapa*), and black mustard (*B. nigra*). Emergent vegetation occurs in the shallower portions, particularly along the margins, and is typically dominated by spike rush (*Eleocharis macrostachya*) and sandbar willow (*S. exigua*).

3.3.2.4.2 Constructed/Restored Lands

Constructed/Restored Lands are previously mined areas that have been actively reclaimed or have remained idle long enough to allow the re-establishment of vegetation. Within District 2 Participant Properties, these include restored riparian woodlands and constructed vernal pools, emergent marshes, and channels with

adjacent wetlands. Based on a review of aerial photography, the characteristics of these features are similar to their corresponding natural habitat types, with the exception of the constructed channels and surrounding restored riparian woodlands, which are still becoming established.

3.3.2.4.3 Developed Lands

Developed Lands refer to manipulated or developed areas and include institutional parcels such as schools as well as commercial, residential, and industrial sites. These areas, collectively referred to as Commercial/Residential/Industrial/Institutional lands on **Figure 19** (NAIP 2016), include buildings and accompanying features such as driveways, sidewalks, parking lots, and landscaped areas.

3.3.2.4.4 Undeveloped Lands

Due to the highly disturbed nature of District 2 Participant Properties, **Undeveloped Lands** refer to small areas of naturally occurring (at-grade) annual grasslands, riparian woodlands, and channels. Narrow tracts of annual grasslands are located along the east side of Hedge Avenue. These areas are unmined and are composed of soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), rip-gut brome (*Bromus diandrus*), medusa head *(Elymus caput-medusae*), filaree (*Erodium botrys*), and perennial rye grass (*Festuca perennis*).

Several channels, many of which have adjacent riparian woodlands, traverse District 2 Participant Properties. Most are ephemeral or intermittent, and all display a distinct bed and bank with ordinary high water mark and the absence of terrestrial vegetation. The exception is Morrison Creek, which is perennial and empties into the Sacramento River. The riparian woodlands are commonly composed of Valley oak (*Quercus lobata*), walnut (*Juglans* sp.), willows (*Salix* sp.), blue oak (*Quercus douglasii*), poison oak (*Toxicodendron diversilobum*), and Himalayan blackberry (*Rubus armeniacus*). The herbaceous understory typically includes creeping wild rye (*Elymus triticoides*), fiddle dock (*Rumex pulcher*), wild oats (*Avena fatua*), winter vetch (*Vicia villosa*), Italian thistle (*Carduus pycnocephalus*), chickweed (*Stellaria media*), and/or rose clover (*Trifolium hirtum*). **Table 5** summarizes the existing conditions within the District 2 Participant Properties.

Table 5. Landcover Types - Existing Conditions within District 2, Participants

Landcover Type	Acreage
Constructed/Restored Lands	
Constructed Channel and Adjacent Wetlands	11.9
Constructed Emergent Marsh	46.3
Restored Riparian Woodland	18.6
Constructed Vernal Pool	8.1
Undeveloped Lands	
Annual Grasslands	34
Channel	0.1

Table 5. Landcover Types - Existing Conditions within District 2, Participants, Cont'd

Landcover Type	Acreage
Undeveloped Lands	
Riparian Woodland	0.1
Developed Lands	
Commercial/Residential/Industrial/Institutional	139
Mining Areas	
Disturbed Mining Areas	675
Industrial Pond	122.7
Industrial Yard	7.2
Total	**1,063**

3.3.2.5 Existing Landcovers – District 2 Non-Participant Properties

The existing conditions for lands controlled by Non-Participant Property owners within District 2 were derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

The District 2 Non-Participants currently encompass Constructed/Restored Lands, Developed and Undeveloped Lands. **Figure 20** (NAIP 2016) is a map displaying existing landcovers within District 2 Non-Participant Properties.

3.3.2.5.1 Developed Lands

Developed Lands refer to heavily manipulated or built-up areas and include institutional parcels such as schools as well as commercial, residential, and industrial sites. These areas, collectively referred to as Commercial/Residential/Industrial/Institutional lands on **Figure 20** (NAIP 2016), include buildings and accompanying features such as driveways, sidewalks, parking lots, and landscaped areas.

3.3.2.5.2 Undeveloped Lands

Undeveloped Lands within the District 2 Non-Participant Properties refer to natural (at-grade) seasonal wetland swales, annual grasslands, and vernal pools. Interspersed within the areas of annual grasslands are vernal pools and seasonal wetland swales.

Vernal pools commonly support coyote thistle (*Eryngium castrense*), slender popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), creeping spike rush (*Eleocharis macrostachya*), Carter's

buttercup (*Ranunculus bonariensis* var. *trisepalus*), rush (*Juncus* sp.), rabbit's-foot grass (*Polypogon monspeliensis*), dove weed (*Croton setigerus*), Fremont's goldfields (*Lasthenia fremontii*), white-headed navarretia (*Navarretia leucocephala*), and smooth goldfields (*Lasthenia glaberrima*). Plants expected in the depressional seasonal wetlands, seasonal wetlands, and seasonal wetland swales include coyote thistle (*Eryngium castrense*), iris-leaf rush (*Juncus xiphioides*), Mediterranean barley (*Hordeum marinum*), and loosestrife (*Lythrum hyssopifolia*).

3.3.2.5.3 Constructed/Restored Lands

One feature within the Non-Participant Properties, a constructed channel and adjacent wetlands, has been classified under the category of Constructed/Restored Lands. It is situated within the annual grasslands just south of the Mather Airport runways and appears to have been straightened.

Table 6 summarizes the existing conditions within the District 2 Non-Participant Properties.

Table 6. Landcover Types - Existing Conditions within District 2, Non-Participants

Landcover Type	Acreage
Constructed/Restored Lands	
Constructed Channel and Adjacent Wetlands	0.2
Undeveloped Lands	
Annual Grasslands	17
Seasonal Wetland Swale	0.2
Vernal Pool	0.6
Developed Lands	
Commercial/Residential/Industrial/Institutional	130
Road	34
Total	**182**

3.3.2.6 Summary of Existing Landcovers – District 2 Area Plan

Table 7 summarizes existing conditions within both the Participant and the Non-Participant Properties within District 2.

Table 7. Landcover Types - Existing Conditions within District 2 Area Plan

Landcover Type	Acreage
Constructed/Restored Lands	
Constructed Channel and Adjacent Wetlands	12.1

Table 7. Landcover Types - Existing Conditions within District 2 Area Plan, Cont'd

Landcover Type	Acreage
Constructed/Restored Lands

Developed Lands	
Commercial/Residential/Industrial/Institutional	269
Road	34
Mining Areas	
Disturbed Mining Areas	675
Industrial Pond	122.7
Industrial Yard	7.2
Total	**1,245**

3.3.2.7 Special-Status Species – District 2 Area Plan

The special-status species assessment drew information from site visits, survey data and/or previously prepared assessment reports involving site visits. Rare plant surveys, detailed wetland delineations, biological assessments, and arborist reports are examples of sources of information utilized; however, large portions of the District 2 properties were not surveyed.

If reports or survey data were unavailable, assessments were derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and Google Earth Pro 2018 aerial photography and observations of features from public areas.

3.3.2.7.1 Rare Plant and VELB Surveys – District 2 Area Plan

No rare plant or elderberry surveys were performed throughout the majority of District 2 since the implementation of permitted aggregate mining activities, which occurred after 1998. The subsequent ground-moving activities associated with mining initially resulted in the loss of habitat for most special-status species plants known to occur in the general area; however, several constructed vernal pools are currently located within the Fairbairn South II and Granite I parcels, and potentially provide habitat for special-status species plants associated with seasonal wetlands (**Figure 19**) (NAIP 2016). Granite I also encompasses a large constructed emergent marsh and constructed channels and adjacent wetlands that provide potential habitat for listed hydrophytes.

The appropriate habitat is potentially present within unsurveyed areas of District 2 to support the following species:

- Dwarf downingia (*Downingia pusilla*);
- Bogg's Lake hedge-hyssop (*Gratiola heterosepala*);
- Woolly rose-mallow (*Hibiscus lasiocarpus* var. *occidentalis*);
- Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*);
- Legenere (*Legenere limosa*);
- Pin cushion navarretia (*Navarretia myersii* ssp. *myersii*);
- Slender Orcutt grass (*Orcuttia tenuis*);
- Sacramento Orcutt grass (*Orcuttia viscida*);
- Peruvian dodder (*Cuscuta obtusiflora* var. *glandulosa*); and
- Sanford's arrowhead (*Sagittaria sanfordii*).

For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.2.7.2 CNDDB Occurrences – Rare Plants and VELB – District 2 Area Plan

The CNDDB records no occurrences of special-status plants species within District 2; however, four are located within close proximity. These include the following (CDFW 2018):

- The CNDDB records an occurrence of Sanford's arrowhead (*Sagittaria sanfordii*) directly north of Jackson Highway in man-made ponds within the Cordova Golf Course (CNDDB occurrence #25).
- An occurrence of legenere (*Legenere limosa*) was recorded in 1999 to the east within lands south of the Mather Airport runways (CNDDB occurrence #44).
- In 2014 over 2,000 Sanford's arrowhead (*Sagittaria sanfordii*) plants were observed within an irrigation ditch in the Aspen VIII parcel(CNDDB occurrence #109).
- In 2013 Sanford's arrowhead (*Sagittaria sanfordii*) were observed less than a mile west within a drainage ditch paralleling a railroad track (CNDDB occurrence #110).

Figure 21 is an exhibit displaying existing occurrences of special-status plants in relation to District 2. A non-CNDDB occurrence of dwarf downingia was observed during 2016 rare plant surveys in the Vineyard

South Mine Project site, which is located south of Vineyard I on the south side of Elder Creek Road (APN 066-0010-001) (WRA 2016). This occurrence has yet to be published by the CNDDB.

3.3.2.7.3 CNDDB Occurrences - Vernal Pool Branchiopods – District 2 Area Plan

Appropriate habitat is present within District 2 for the following species: vernal pool fairy shrimp *(Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), California linderiella (*Linderiella occidentalis*), and midvalley fairy shrimp (*Branchinecta mesovallensis*). The CNDDB contains numerous records of vernal pool branchiopods in and around District 2 (CDFW 2018):

- Several occurrences of vernal pool fairy shrimp *(Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), California linderiella (*Linderiella occidentalis*), and midvalley fairy shrimp (*Branchinecta mesovallensis*) were documented between 1993 and 2002 within lands enclosed by Kiefer Boulevard on the north, Excelsior Road on the east, Jackson Highway on the south, and Bradshaw Road on the west. Subsequent to these records, portions of this area were heavily impacted by mining activities (CNDDB occurrence #21, #22, #39, #47, #50, #56, #57, #144, #175, #220, and #886).
- California linderiella (*Linderiella occidentalis*) and vernal pool tadpole shrimp (*Lepidurus packardi*) were also observed in 1993 and 1997 in a Non-Participant Property on the east side of Happy Lane (CNDDB occurrence #160 and #132, respectively).
- Between 1993 and 2010 numerous occurrences of vernal pool fairy shrimp (Branchinecta lynchi), vernal pool tadpole shrimp (*Lepidurus packardi*), and California linderiella (*Linderiella occidentalis*) have been reported on lands surrounding the Mather Airport runways (CNDDB occurrence #131, #160, #162, #282, #391, and #750).
- Vernal pool tadpole shrimp (*Lepidurus packardi*) were observed within constructed vernal pools within Granite I in 2010(CNDDB occurrence #21 and #50).
- Cysts for a *Branchinecta* species and California linderiella (*Linderiella occidentalis*) and were identified in 2000 during dry-season surveys within Vineyard (CNDDB occurrence #197).

For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance. **Figure 22** displays existing CNDDB vernal pool branchiopod occurrences in relation to District 2.

3.3.2.7.4 Native and Non-Native Trees

No tree surveys have been performed within District 2. Based on interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography, the likelihood of regulated trees within District 2 is high. For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.2.7.5 CNDDB Occurrences - Nesting/Foraging Raptors & Other Birds – District 2 Area Plan

According to the CNDDB several occurrences of nesting birds are located within or in very close proximity to District 2 (CDFW 2018). These include the following:

- Tricolored blackbirds (*Agelaius tricolor*) were observed nesting in blackberry thickets on the south side of Morrison Creek within Non-Participant Properties off of Bradshaw Road in 1994 and 2000 (CNDDB occurrence #305).
- In 1994 a small breeding colony of 15 adult tricolored blackbirds (*Agelaius tricolor*) was observed nesting in blackberry thickets north of Jackson Highway just southeast of Aspen VII; 500 were observed nesting at this location in 2012 (CNDDB occurrence #349).
- In 2010 a nesting pair of Swainson's hawks (*Buteo swainsoni*) was observed in a large eucalyptus tree on the intersection of Kiefer Boulevard and Bradshaw Road in very close proximity to one of the Bradshaw Road Non-Participants. The eucalyptus tree has since been removed (CNDDB occurrence #504).
- The Elder Creek colony of tricolored blackbirds (*Agelaius tricolor*), which was located within Aspen VII South and Aspen VIII, has been observed sporadically supporting nesting colonies from 1992 and to 2014 (CNDDB occurrence #306).
- A second Elder Creek nesting colony of tricolored blackbirds (*Agelaius tricolor*), which was located west of Aspen IX, had been first observed in 1993. The last active nesting colony was observed in 2015, though it may have failed (CNDDB occurrence #307).
- In 2015 three tricolored blackbirds (*Agelaius tricolor*) nesting colonies were observed: one was located in Aspen V South (CNDDB occurrence #743). The other two were located south and east of Aspen VII South (CNDDB occurrence #499, #741).
- In 2014 several hundred tricolored blackbirds (*Agelaius tricolor*) were observed nesting in cattails growing in an industrial pond in Aspen IV (CNDDB occurrence #500).

The following CNDDB records, which appear to have occurred in or in very close proximity to District 2 are located an area enclosed by Kiefer Boulevard on the north, Excelsior Road on the east, Jackson Highway on the south, and Bradshaw Road on the west:

- Sixteen active burrowing owl (*Athene cunicularia*) burrows were observed in 1991 (CNDDB occurrence #487).
- Several ferruginous hawks (*Buteo regalis*) and golden eagles (*Aquila chrysaetos*) were observed foraging annual grasslands in 1990-91 (CNDDB occurrence #31 and #135, respectively).
- About 300 adult tricolored blackbirds (*Agelaius tricolor*) were observed nesting in a cattail marsh in 1991. This occurrence was updated after 500-2,000 birds were observed foraging and possibly nesting in and around the constructed emergent marsh in Granite I directly north of the Aspen VI parcel in 2014-15 (CNDDB occurrence #390).

Figure 23 displays the above existing CNDDB nesting/foraging bird occurrences in relation to District 2.

In summary, appropriate habitat is currently present within District 2 for the following bird species:

- Cooper's hawk (*Accipiter cooperii*);
- Tricolored blackbirds (*Agelaius tricolor*);
- Golden eagle (*Aquila chrysaetos*);

- Great egret (*Ardea alba*);
- Blue heron (*Ardea herodias*);
- Burrowing owl (*Athene cunicularia*);
- Ferruginous hawk (*Buteo regalis*);
- Swainson's hawk (*Buteo swainsoni*);
- White-tailed kite (*Elanus leucurus*);
- Merlin (*Falco columbarius*);
- Song sparrow – Modesto population (*Melospiza melodia*);
- Black-crowned night heron (*Nycticorax nycticorax*);
- Double-crested cormorant (*Phalacrocorax auritus*);
- Purple martin (*Progne subis*);
- Bank swallow (*Riparia riparia*);
- Least Bell's vireo (*Vireo bellii pusillus*); and
- Yellow-headed blackbird (*Xanthocephalus xanthocephalus*).

For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.2.7.6 Other CNDDB Occurrences

The CNDDB records four additional occurrences of special-status species within or within close proximity to District 2 (CDFW 2018). These include the following:

- Hairy water flea (*Dumontia oregonensis*) was collected in 2004 at Mather Field; very little information is available concerning this occurrence (CNDDB occurrence #1).
- A carcass of a juvenile American (*Taxidea taxus*) badger was discovered in 1991 within an area formerly controlled by Mather Airfield between Kiefer Boulevard, Bradshaw Road, Jackson Highway, and Excelsior Road (CNDDB occurrence #73). A second occurrence based on a National Museum of Natural History specimen collected at an unknown date is located over 1 mile to the west (CNDDB occurrence #304).
- Western pond turtle (*Emys marmorata*) was observed in 1991 within a reach of Morrison Creek currently located in Aspen VI; this portion of Morrison Creek has been relocated to the west (CNDDB occurrence #433).
- Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i) was collected in 1997 at Mather Field east of Aspen VI; very little information is available concerning this occurrence (CNDDB occurrence #5).

Appropriate habitat for all of the above species is present within District 2. Surveys would be necessary prior to construction to ascertain the absence or presence of these species. **Figure 24** displays other CNDDB occurrences that do not fit into the groupings addressed above.

3.3.3 Existing Conditions for Future Planning Areas (FPAs)

Three Future Planning Areas (FPAs) as shown on **Figure 3** are comprised of approximately **1,018 acres**, all of which are controlled by Non-Participating Property owners. FPA-A is approximately **189 acres**, FPA-B is approximately **232 acres**, and FPA-C is approximately **597 acres**. While the landowners within the FPAs may initiate District Area Plans or Specific Plans in the future, the timing on such planning efforts is unknown at this time.

The existing landcovers for lands within the FPAs utilized information derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

3.3.3.1 Site History - FPAs

The three FPAs are located on the periphery of the West Jackson Highway Master Plan Boundary. FPA-A, which is composed of 62 parcels, is located east of the Fruitridge Road-South Watt Avenue intersection; the twenty-seven parcels making up FPA-B are situated north of the Elder Creek Road-Bradshaw Road intersection; and FPA-C is comprised of 25 parcels and can be found northwest of the Excelsior Road-Florin Road intersection. Unlike the District Area Plans, the FPAs have not been mined and are relatively close to their natural grades. These areas represent mostly undeveloped lands interspersed with developed and agricultural lands.

3.3.3.2 Soils and Geology - FPAs

According to the "Soil Survey of Sacramento County, California," twelve soil map units occur within Participant Properties of the FPAs (USDA 1993):

1. Durixeralfs, 0-1% slopes (137);
2. Hedge loam, 0-2% slopes (157);
3. Kimball silt loam, 0-2% slopes (164);
4. Red Bluff loam, 0-2% slopes (191);
5. Red Bluff-Redding complex, 0-5% slopes (193);
6. Red Bluff-Xerarents complex, 0-2% slopes (195);
7. Redding gravelly loam, 0-8% slopes (198);
8. San Joaquin silt loam, leveled, 0-1% slopes (213);
9. San Joaquin silt loam, 0-3% slopes (214);
10. San Joaquin silt loam, 3-8 % slopes (215);
11. San Joaquin-Durixeralfs complex, 0-1% slopes (216);
12. and San Joaquin-Xerarents complex, leveled, 0-1% slopes (221).

Figure 25 is an exhibit displaying the soil map units within the three FPAs.

3.3.3.3 Existing Landcovers – FPAs

The FPAs currently encompass Developed and Undeveloped Lands. **Figure 26** (NAIP 2016) is a map displaying existing landcover conditions within the three FPAs.

3.3.3.3.1 Developed Lands

Developed Lands refer to heavily manipulated or built-up areas and include institutional parcels such as schools as well as commercial, residential, and industrial sites. These areas are collectively referred to as Commercial/Residential/Industrial/Institutional lands on **Figure 26** (NAIP 2016). Developed Lands also include associated structures such as driveways, sidewalks, paved roads, parking lots, playgrounds, landscaped areas, and ditches. Three ditches are located within the FPAs. Two act as irrigation features and are associated with irrigated pastures south of FPA-B, while the third is a roadside drainage ditch on the north side of Florin Road in FPA-C.

3.3.3.3.2 Undeveloped Lands

Undeveloped Lands refer to natural (at-grade) annual grasslands that contain channels, depressional seasonal wetlands, marshes, seasonal wetlands, ponds, riparian woodlands, seasonal wetlands swales, and vernal pools. The majority of Undeveloped Lands are situated within FPA-C, although such lands also make up approximately half of FPA-A and FPA-B. These areas typically consist of annual grasslands likely composed of soft chess (*Bromus hordeaceus*), wild oats (*Avena fatua*), rip-gut brome (*Bromus diandrus*), medusa head *(Elymus caput-medusae*), filaree (*Erodium botrys*), and perennial rye grass (*Festuca perennis*). Interspersed within the annual grasslands are numerous water features including vernal pools, depressional seasonal wetlands, seasonal wetlands, seasonal wetland swales, channels, marshes, and ponds.

Common plants within vernal pools include coyote thistle (*Eryngium castrense*), slender popcorn flower (*Plagiobothrys stipitatus*), woolly marbles (*Psilocarphus brevissimus*), creeping spike rush (*Eleocharis macrostachya*), Carter's buttercup (*Ranunculus bonariensis* var. *trisepalus*), rush (*Juncus* sp.), rabbit's-foot grass (*Polypogon monspeliensis*), dove weed (*Croton setigerus*), Fremont's goldfields (*Lasthenia fremontii*), white-headed navarretia (*Navarretia leucocephala*), and smooth goldfields (*Lasthenia glaberrima*). Plants expected in the depressional seasonal wetlands, seasonal wetlands, and seasonal wetland swales include coyote thistle (*Eryngium castrense*), iris-leaf rush (*Juncus xiphioides*), Mediterranean barley (*Hordeum marinum*), and loosestrife (*Lythrum hyssopifolia*).

Twenty ponds are located within the FPAs, four of which were constructed to facilitate the watering of the irrigated pastures within FPA-B. The rest appear to have been created by excavation or the placement of earthen levees across natural drainages. Freshwater marshes consisting of broadleaf cattails (*Typha angustifolia*), and/or bulrush (*Schoenoplectus acutus*) may occupy the shallower edges of the ponds and ditches.

Several channels, most of which are ephemeral or intermittent, traverse the FPAs. All display a bed and bank with ordinary high water mark and the absence of terrestrial vegetation. The exception is Morrison Creek which is perennial and flows to the west through FPA-A before draining into the Sacramento River. Morrison Creek and small unnamed drainages in FPA-A support small corridors of riparian woodlands. These are likely composed of Valley oak (*Quercus lobata*), walnut (*Juglans* sp.), willows (*Salix* sp.), blue oak (*Quercus douglasii*), poison oak (*Toxicodendron diversilobum*), and Himalayan blackberry (*Rubus armeniacus*). The herbaceous understory may typically include creeping wild rye (*Elymus triticoides*), fiddle dock (*Rumex pulcher*), wild oats (*Avena fatua*), winter vetch (*Vicia villosa*), Italian thistle (*Carduus pycnocephalus*), chickweed (*Stellaria media*), and/or rose clover (*Trifolium hirtum*).

Croplands within the FPAs are usually utilized yearly and planted in dry crops such as wheat (*Triticum* sp.) and hay. The irrigated pastures provide forage for cattle and probably consist of wetter species such as perennial rye grass (*Festuca perennis*), tall flat-sedge (*Cyperus eragrostis*), bird's foot-trefoil (*Lotus corniculatus*), knotweed (*Polygonum aviculare*) loosestrife (*Lythrum hyssopifolia*), white clover (*Trifolium repens*), English plantain (*Plantago lanceolata*), and dallis grass (*Paspalum dilatatum*).

Table 8 summarizes landcover types present for the existing conditions within the FPAs.

Table 8. Landcover Types - Existing Conditions within Future Planning Areas

Landcover Type	Acreage
Undeveloped Lands	
Annual Grasslands	578
Channel	2.6
Cropland	27
Depressional Seasonal Wetland	0.3
Irrigated Pasture	27
Marsh	0.8
Pond	23.4
Riparian Woodland	4.6
Seasonal Wetland	0.6
Seasonal Wetland Swale	6.4
Vernal Pool	3.0
Developed Lands	
Commercial/Residential/Industrial/Institutional	321
Ditch	1.3
Road	22
Total	**1,018**

3.3.3.4 Special-Status Species - FPAs

Since no reports or survey data were available for the FPAs, all information was derived from the CNDDB and from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

3.3.3.4.1 CNDDB Occurrences - Rare Plants and VELB - FPAs

The CNDDB records two occurrences of special-status plant species as occurring near the FPAs (CDFW 2018):

- In 1998 Sacramento Orcutt grass (*Orcuttia viscida*) was observed approximately 0.25 mile east of FPA-C, but this occurrence is believed to be extirpated. The vernal pool identified as supporting this record has evolved into a marsh due to run-off from a nearby plant nursery (CNDDB occurrence #20).
- In 2014 over 2,000 Sanford's arrowhead (*Sagittaria sanfordii*) plants were observed within an irrigation ditch in the Aspen VIII parcel east of FPA-B (CNDDB occurrence #109).

Figure 27 is an exhibit displaying existing occurrences of special-status plants in relation to the FPAs. A non-CNDDB occurrence of dwarf downingia was observed during 2016 rare plant surveys in the Vineyard South Mine Project site, which is located south of Vineyard I on the south side of Elder Creek Road (APN 066-0010-001) (WRA 2016). This occurrence has yet to be published by the CNDDB.

.

Based on aerial photo interpretation, the appropriate habitat is potentially present within the FPAs to support the following species:

- Dwarf downingia (*Downingia pusilla*);
- Stinkbells (*Fritillaria agrestis*);
- Bogg's Lake hedge-hyssop (*Gratiola heterosepala*);
- Woolly rose-mallow (*Hibiscus lasiocarpus* var. *occidentalis*);
- Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*);
- Legenere (*Legenere limosa*);
- Pin cushion navarretia (*Navarretia myersii* ssp. *myersii*);
- Slender Orcutt grass(*Orcuttia tenuis*);
- Sacramento Orcutt grass (*Orcuttia viscida*);
- Peruvian dodder (*Cuscuta obtusiflora* var. *glandulosa*); and
- Sanford's arrowhead (*Sagittaria sanfordii*).

For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.3.4.2 CNDDB Occurrences - Vernal Pool Branchiopods - FPAs

According to the CNDDB, five occurrences of special-status vernal pool branchiopods were located within or in very close proximity to the FPAs (CDFW 2018):

- In 1992 California linderiella (*Linderiella occidentalis*) were observed in a roadside ditch near Elder Creek and Excelsior Road near FPA-C.
- In 1992 California linderiella (*Linderiella occidentalis*) were observed at two locations in roadside ditches along Florin Road in the vicinity of Bradshaw Road near FPA-C.
- In 1992 vernal pool tadpole shrimp (*Lepidurus packardi*) were observed in a vernal pool east of Excelsior Road east of FPA-C.
- In 1993 and 2006, vernal pool fairy shrimp *(Branchinecta lynchi*) and vernal pool tadpole shrimp (*Lepidurus packardi*), respectively, were observed in seasonal water features south of Florin Road.
- California linderiella (*Linderiella occidentalis*) were also observed just southeast of FPA-A in 2001.

Figure 28 displays existing CNDDB vernal pool branchiopod occurrences in relation to the FPAs. Based on aerial photo interpretation, appropriate habitat is present within the FPAs for the following species: vernal pool fairy shrimp *(Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), California linderiella (*Linderiella occidentalis*), and midvalley fairy shrimp (*Branchinecta mesovallensis*). For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.3.4.3 Native and Non-Native Trees

No tree survey data was available for the FPAs; however, based on interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography, the likelihood of regulated trees within FPA's is high. For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.3.4.4 CNDDB Occurrences - Nesting/Foraging Raptors & Other Birds - FPAs

According to the CNDDB, numerous occurrences of special-status bird species including raptors were located within or in very close proximity to the FPAs (CDFW 2018):

- In 1990, a pair of white-tailed kites (*Elanus leucurus*) was observed nesting in a tree located between FPA-B and FPA-C (CNDDB occurrence #27).
- Tricolored blackbirds (*Agelaius tricolor*) were observed nesting in blackberry thickets on the south side of Morrison Creek within Aspen V South in 1994 and 2000 (CNDDB occurrence #305).
- The Elder Creek colony of tricolored blackbirds (*Agelaius tricolor*), which was located within Aspen VII South and Aspen VIII, had been observed sporadically supporting nesting colonies from 1992 and to 2014 (CNDDB occurrence #306).
- A second Elder Creek nesting colony of tricolored blackbirds (*Agelaius tricolor*) was located west of Aspen IX and south of FPA-B and had been first observed in 1993. The last active nesting colony was recorded in 2015, though it may have failed (CNDDB occurrence #307).

- In 1994 a small breeding colony of 15 adult tricolored blackbirds (*Agelaius tricolor*) was observed nesting in blackberry thickets north of Jackson Highway southeast of Aspen VII and north of FPA-C; 500 were observed nesting at this location in 2012 (CNDDB occurrence #349).
- In 2000, a colony of nesting tricolored blackbirds (*Agelaius tricolor*) was recorded along Elder Creek along the north edge of FPA-C (CNDDB occurrence #306).
- From 1990 to 2000, a colony of nesting tricolored blackbirds (*Agelaius tricolor*) was observed along Knox Road within FPA-C and south of Aspen IX (CNDDB occurrence #177).
- In 2015 two tricolored blackbirds (*Agelaius tricolor*) nesting colonies were observed: one was located in Aspen V South(CNDDB occurrence #743), and the other was located in FPA-C near Aspen VII South (CNDDB occurrence #499).

Figure 29 displays the above existing CNDDB nesting/foraging bird occurrences in relation to the FPAs.

In summary, appropriate habitat is present within the FPAs for the following bird species:

- Cooper's hawk (*Accipiter cooperii*);
- Tricolored blackbirds (*Agelaius tricolor*);
- Golden eagle (*Aquila chrysaetos*);
- Great egret (*Ardea alba*);
- Blue heron (*Ardea herodias*);
- Burrowing owl (*Athene cunicularia*);
- Ferruginous hawk (*Buteo regalis*);
- Swainson's hawk (*Buteo swainsoni*);
- White-tailed kite (*Elanus leucurus*);
- Merlin (*Falco columbarius*);
- Song sparrow – Modesto population (*Melospiza melodia*);
- Black-crowned night heron (*Nycticorax nycticorax*);
- Double-crested cormorant (*Phalacrocorax auritus*);
- Purple martin (*Progne subis*);
- Bank swallow (*Riparia riparia*);
- Least Bell's vireo (*Vireo bellii pusillus*); and
- Yellow-headed blackbird (*Xanthocephalus xanthocephalus*).

For areas not surveyed, surveys may be deemed appropriate prior to initial site disturbance.

3.3.3.4.5 Other CNDDB Occurrences - FPAs

The CNDDB records two additional occurrences of special-status species within or within close proximity to the FPAs (CDFW 2018). These include the following:

- A carcass of a juvenile American badger (*Taxidea taxus*) was discovered in 1991, within an area formerly controlled by Mather Airfield between Kiefer Boulevard, Bradshaw Road, Jackson Highway, and Excelsior Road (CNDDB occurrence #73).

- A western pond turtle (*Emys marmorata*) was observed in 1991, within a reach of Morrison Creek currently located in Aspen VI; this portion of Morrison Creek has since been relocated to the west (CNDDB occurrence #433).

Appropriate habitat for all of the above species is present within the FPAs. Surveys would be necessary to ascertain the absence or presence of these species prior to the start of construction. **Figure 30** displays existing other CNDDB occurrences that do not fit into the groupings addressed above.

3.4 Baseline Site Conditions

CEQA requires that environmental impact reports (EIRs) identify the "baseline" conditions against which the significance of a project's impacts will be measured. In most cases, lead agencies analyze the impacts of the project based on conditions that exist at the time of publication of the Notice of Preparation for an environmental impact report. (See Existing Conditions discussion, above.) However, case law has clarified that in proper cases, use of projected or future conditions as an environmental baseline is appropriate where the lead agency determines, based on substantial evidence, that inclusion of an "existing conditions" analysis would be "misleading or without informational value." *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority*, Cal. Supreme Court Case No. S202828 (2013).

Several of the properties within Districts 1 and 2 are in the process of being mined and/or reclaimed pursuant to County-approved use permits and reclamation plans. Reclamation of mined properties is required to occur pursuant to the California Surface Mining and Reclamation Act (SMARA) and Teichert and Granite's obligation to reclaim these mined sites is secured by financial assurance mechanisms (sometimes taking the form of surety bonds).

Since all of the approved mining sites in Districts 1 and 2 will ultimately be reclaimed as described in the approved reclamation plans, measuring the impacts of the proposed Plan Area against existing conditions is not likely to yield information that will help Sacramento County or the public to fully understand the environmental impacts of the Plan Area. Accordingly, and as discussed in more detail below, for mining properties with approved reclamation plans, this report utilizes the land uses described in those plans as the appropriate baseline condition for analysis.

In addition, Teichert and Granite have obtained permits from federal and state agencies authorizing impacts to waters and habitat within several of their respective active mining/reclamation properties. Teichert and Granite have commenced constructing wetlands and other water features, and planting associated vegetation, on several of their properties within Districts 1 and 2 as mitigation for impacts to Waters. These mitigation projects are required pursuant to permits issued by the USACE. Moreover, like the reclamation plans, performance of these mitigation obligations is secured by either bonds, letters of credits, or endowments, and, as such, the work is guaranteed to occur. Therefore, this analysis assumes that these currently approved but not-yet-completed mitigation projects are in place and therefore comprise the baseline for analysis instead of the existing conditions on those sites.

Lastly, Teichert and Granite have also obtained authorizations from Sacramento County for the removal of native oaks within several of their respective active mining/reclamation properties. Subsequently, Teichert and Granite have commenced with the planting of native acorns, saplings and oak trees, as well as other native vegetation as mitigation for impacts to county-regulated trees and to enhance overall habitat quality.

3.4.1 Baseline Site Conditions - District 1 Area Plan

District 1 is comprised of approximately **3,651 acres**, consisting of approximately **3,016 acres** of land controlled by Teichert and approximately **635 acres** of Non-Participating Property owners and roads as shown on **Figures 3** and **5**. **Figure 3** identifies the areas where mining has occurred or is occurring as the "Aspen" projects.

3.4.1.1 Baseline Landcovers - District 1 Area Plan Participant Properties

The establishment of baseline conditions will result from the projected implementation of mining reclamation plans and mitigation plans for impacts to Waters. Upon the completion of the reclamation and mitigation plans for each of the mine sites, the District 1 Participant Properties will encompass Constructed/Restored Lands and Mining Areas as well as Developed and Undeveloped Lands. **Figure 31** (NAIP 2016) is a map displaying the baseline landcovers within District 1 Participant Properties.

3.4.1.1.1 Constructed/Restored Lands

Constructed/Restored Lands**,** both existing and future, are previously mined areas that have been reclaimed or have remained idle long enough to allow the re-establishment of vegetation. Within District 1 Participant Properties, reclaimed conditions include restored riparian woodlands, restored agricultural lands, restored annual grasslands, a constructed low flow corridor, portions of the Morrison Creek bypass channel, and tree/shrub mitigation. Additional constructed/restored features will include constructed ponds, vernal pools, depressional seasonal wetlands, channels, and seasonal wetland swales.

3.4.1.1.2 Developed Lands

Developed Lands refer to manipulated or built-up areas and include ditches and institutional parcels such as schools as well as commercial and residential parcels, industrial yards, and an abandoned parking lot.

3.4.1.1.3 Undeveloped Lands

Undeveloped Lands refer to annual grasslands that contain channels, depressional seasonal wetlands, marshes, seasonal wetlands, ponds, riparian woodlands, seasonal riparian wetlands, seasonal wetlands swales, vernal pools, and croplands in previously unmined areas.

Table 9 summarizes landcover types present for the baseline conditions within the District 1 Participant Properties.

Table 9. Landcover Types - Baseline Landcover Conditions within District 1, Participants

Landcover Type	Acreage
Constructed/Restored Lands	
Morrison Creek Bypass Channel	23.9
Restored Agricultural Lands	102
Restored Annual Grasslands	1,893
Constructed Channel and Adjacent Wetlands	6.7
Constructed Depressional Seasonal Wetland	0.2
Constructed Low Flow Corridor	91.8
Constructed Pond	109.3
Restored Riparian Woodland	45.8
Constructed Seasonal Wetland Swale	0.4
Constructed Vernal Pool	20.0
Tree/Shrub Mitigation	4.0
Undeveloped Lands	
Annual Grasslands	596
Channel	11.1
Cropland	15
Depressional Seasonal Wetland	3.0
Marsh	4.1

Developed Lands	
Commercial/Residential/Industrial/Institutional	14
Ditch	0.5
Road	4.0
Mining Areas	
Abandoned Parking Lot	5.3
Industrial Yard	2.1
Total	**3,016**

3.4.1.2 Baseline Landcovers - District 1 Non-Participant Properties

The baseline landcovers for District 1 Non-Participant Properties are the same as the existing landcovers. Baseline landcovers for lands controlled by Non-Participant Property owners within District 1 were derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

Table 10 summarizes landcover types present for the baseline (existing) conditions within the District 1 Non-Participant Properties.

Table 10. Landcover Types - Baseline Conditions within District 1, Non-Participants

Landcover Type	Acreage
Undeveloped Lands	
Annual Grasslands	210
Channel	2.4
Cropland	12
Depressional Seasonal Wetland	1.4
Irrigated Pasture	7.0
Marsh	0.9
Pond	1.8
Riparian Woodland	7.3
Seasonal Riparian Wetland	0.1
Seasonal Wetland Swale	1.7
Vernal Pool	4.8
Developed Lands	
Commercial/Residential/Industrial/Institutional	257

Industrial Yard	2.8
Total	**3,651**

3.4.2 Baseline Site Conditions - District 2 Area Plan

District 2 is approximately **1,245 acres** comprised of **1,063 acres** owned by Granite, and approximately **182 acres** of Non-Participating Property owners and roads as shown on **Figure 3**.

Existing conditions within the District 2 Participant Properties utilized information derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

3.4.2.1 Baseline Landcovers - District 2 Participant Properties

The establishment of baseline conditions will result from the projected implementation of mining reclamation plans and mitigation plans for impacts to Waters. Upon the completion of the reclamation and mitigation plans for each of the mine sites, the District 2 Participant Properties will encompass Constructed/Restored Lands, Undeveloped Lands, and Developed Lands. **Figure 32** is a map displaying the baseline landcover conditions within District 2 Participant Properties.

3.4.2.1.1 Constructed/Restored Lands

Constructed/Restored Lands are previously mined areas that have been reclaimed or have remained idle long enough to allow the re-establishment of vegetation. Within District 2 Participant Properties, restored conditions include annual grasslands, riparian woodlands, annual grasslands, and several constructed water features including portions of the Morrison Creek Bypass channel, Morrison Creek Realigned Channel (on Vineyard), a low flow corridor, ponds, emergent marsh, vernal pools, and channels.

3.4.2.1.2 Developed Lands

Developed Lands refer to manipulated or built-up areas and include institutional parcels such as schools as well as commercial, residential, and industrial sites.

3.4.2.1.3 Undeveloped Lands

Undeveloped Lands refer to a small undisturbed portion of riparian woodlands.

Table 12 summarizes landcover types present for the baseline landcover conditions within the District 2 Participant Properties.

Table 12. Landcover Types - Baseline Landcover Conditions within District 2, Participants

Landcover Type	Acreage
Constructed/Restored Lands	
Morrison Creek Bypass Channel	15.9
Restored Annual Grasslands	667
Constructed Channel and Adjacent Wetlands	13.1
Constructed Emergent Marsh	46.3
Constructed Low Flow Corridor	3.9
Constructed Pond	26
Restored Riparian Woodland	56.7
Constructed Vernal Pool	9.0
Undeveloped Lands	
Riparian Woodland	0.1
Developed Lands	
Commercial/Residential/Industrial/Institutional	225
Total	**1,063**

3.4.2.2 Baseline Landcovers - District 2 Non-Participant Properties

The baseline landcovers for District 2 Non-Participant Properties will be the same as the existing landcovers. **Table 13** summarizes landcover types present for the baseline (existing) conditions within the District 2 Non-Participant Properties.

Table 13. Landcover Types - Baseline Conditions within District 2, Non-Participants

Landcover Type	Acreage
Constructed/Restored Lands	
Constructed Channel and Adjacent Wetlands	0.2
Undeveloped Lands	
Annual Grasslands	17
Seasonal Wetland Swale	0.2
Vernal Pool	0.6
Developed Lands	
Commercial/Residential/Industrial/Institutional	130
Road	34
Total	**182**

3.4.2.3 Summary of Baseline Landcovers - District 2 Area Plan

Table 14 summarizes baseline landcovers within both the Participant and the Non-Participant Properties for District 2.

Table 14. Landcover Types - Baseline Conditions within District 2 Area Plan

Landcover Type	Acreage
Constructed/Restored Lands	
Morrison Creek Bypass Channel	15.9
Restored Annual Grasslands	667
Constructed Channel and Adjacent Wetlands	13.3
Constructed Emergent Marsh	46.3
Constructed Low Flow Corridor	3.9
Constructed Pond	26
Restored Riparian Woodland	56.7
Constructed Vernal Pool	9.0
Undeveloped Lands	
Annual Grasslands	17.0
Riparian Woodland	0.1
Seasonal Wetland Swale	0.2
Vernal Pool	0.6

Table 14. Landcover Types - Baseline Conditions within District 2 Area Plan, Cont'd

Landcover Type	Acreage
Developed Lands	
Commercial/Residential/Industrial/Institutional	355
Road	34
Total	**1,245**

3.4.3 Baseline Site Conditions - FPAs

The baseline landcovers for the FPAs will be the same as the existing landcovers. **Table 15** summarizes the landcover types for the baseline (existing) conditions within the FPAs. The baseline landcovers for lands within the FPAs utilized information derived from the interpretation of 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from accessible properties and public roads. Aerial photo interpretation developed by Sacramento County for the SSHCP was used to identify initial potential wetland resources and was adjusted based on 2016 NAIP and 2018 Google Earth Pro aerial photography and observations from public areas.

Table 15. Landcover Types - Baseline Conditions within Future Planning Areas

Landcover Type	Acreage
Undeveloped Lands	
Annual Grasslands	578
Channel	2.6
Cropland	27
Depressional Seasonal Wetland	0.3
Irrigated Pasture	27
Marsh	0.8
Pond	23.4
Riparian Woodland	4.6
Seasonal Wetland	0.6
Seasonal Wetland Swale	6.4
Vernal Pool	3.0
Developed Lands	
Commercial/Residential/Industrial/Institutional	321
Ditch	1.3
Road	22
Total	**1,018**

Special-Status Birds

- Bank Swallow
- Black-Crowned Night Heron
- Burrowing Owl
- Cooper's Hawk
- Double-Crested Cormorant
- Ferruginous Hawk
- Golden Eagle
- Great Blue Heron
- Great Egret
- Least Bell's Vireo
- Merlin
- Purple Martin
- Song Sparrow ("Modesto" population)
- Swainson's Hawk
- Tricolored Blackbird
- White-Tailed Kite
- Yellow-Headed Blackbird

Special-Status Amphibians & Reptiles

- Giant Garter Snake
- Western Pond Turtle
- Western Spadefoot

Special-Status Fish

- Chinook Salmon - Central Valley Spring-Run
- Chinook Salmon - Sacramento River Winter-Run
- Longfin Smelt
- Sacramento Perch
- Steelhead

Special-Status Plants

- Ahart's Dwarf Rush
- Boggs Lake Hedge-Hyssop
- Brandegee's Clarkia
- Dwarf Downingia
- Legenere
- Peruvian Dodder
- Pincushion Navarretia
- Sacramento Orcutt Grass
- Saline Clover
- Sanford's Arrowhead
- Slender Orcutt Grass
- Stinkbells
- Woolly Rose-Mallow

Special-Status Mammals

- American Badger
- Hoary Bat

Special-Status Invertebrates

- Blennosperma Andrenid Bee
- California Linderiella
- Hairy Water Flea
- Midvalley Fairy Shrimp
- Ricksecker's Water Scavenger Beetle
- Sacramento Valley Tiger Beetle
- Valley Elderberry Longhorn Beetle
- Vernal Pool Andrenid Bee
- Vernal Pool Fairy Shrimp
- Vernal Pool Tadpole Shrimp

APPENDIX F

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN AND MINIMIZATION MEASURES

5.4.1 General Avoidance and Minimization Measures

General AMMs are designed to avoid or minimize effects of Covered Activities on SSHCP land cover types and Covered Species.

Condition 1. Avoid and Minimize Urban Development Impacts to Watershed Hydrology and Water Quality

National Pollution Discharge Elimination System permits are issued by the Regional Water Quality Control Board to jurisdictions in the region, including the jurisdictions that are also SSHCP Land Use Authority Permittees (i.e., County of Sacramento, and Cities of Rancho

---

[16] In a situation like this, the Local Land Use Authority Permittee will suspend one or more local permits (e.g., grading permit, building permit) until compliance with terms of all SSHCP requirements is demonstrated.

[17] Post-construction monitoring by the Land Use Authority Permittee could continue for several years.

Cordova and Galt). The National Pollution Discharge Elimination System permit is issued to each of the Land Use Authority Permittees every 5 years, and is referred to as the Municipal Separate Storm Sewer System (MS4) permit. MS4 permits contain specific design measures required for all projects constructed within the region. The Stormwater Quality Design Manual for the Sacramento and South Placer Regions (Stormwater Manual) outlines planning tools and requirements to reduce urban runoff from new development and redevelopment projects within the region (Sacramento Stormwater Quality Partnership 2007). The Stormwater Manual is used as a general guidance document to aid with the selection, siting, design, operation, and long-term maintenance of stormwater quality control measures. The Stormwater Manual contains control measures intended to meet the standard of "reducing pollutants in urban runoff to the maximum extent practicable" set forth in the local agencies' MS4 permits issued by the Central Valley Regional Water Quality Control Board. AMM LID-1 (see below) is designed to ensure compliance with MS4 requirements by requiring Third-Party Project Proponents to minimize increases of peak discharge of stormwater and to eliminate or reduce runoff of pollutants.

Development Covered Activities may adversely alter watershed hydrology and degrade water quality, which, in turn, could diminish or eliminate the conservation benefits provided by the SSHCP Preserve System. Condition 1 is designed to conserve and/or rehabilitate on-site natural creeks and streams. This condition will require the provision of BMPs and low-impact development (LID) drainage control measures to ensure that runoff from developed lands will closely mimic the pre-development hydrograph and retain most pre-development hydrologic functions. Condition 1 will accomplish the hydrograph and hydrologic objectives through application of the listed AMMs to all UDA Covered Activities that occur at the parcel, subdivision, or master plan scale.

LID-1 (Stormwater Quality): When the size of a Covered Activity project exceeds the thresholds established by the State Water Resources Control Board (SWRCB) (see the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions, or future SWRCB-approved design manuals applicable to the Plan Area), incorporate stormwater management into site design to satisfy the requirements outlined in the most recent Stormwater Quality Design Manual for the Sacramento and South Placer Regions. Stormwater management may include groundwater recharge (LID-2) and natural site features (LID-3).

LID-2 (Groundwater Recharge): When siting SSHCP Preserves containing Riparian, Open Water, or Freshwater Marsh SSHCP land cover types, the Implementing Entity will prioritize locations that are suitable for groundwater recharge.

LID-3 (Natural Site Features): Incorporate preservation of a site's natural aquatic features (such as creeks and streams) into project design to retain natural hydrologic patterns and to retain habitat that might be used by Covered Species.

Condition 2. Avoid and Minimize Urban Development Direct and Indirect Impacts to Existing Preserves and SSHCP Preserves

Development Covered Activities adjacent to Preserves may adversely impact species that use the Preserve, and erode or eliminate the conservation benefits provided by the Preserve. Condition 2 seeks to avoid or minimize the following Covered Activity environmental stressors that may result in direct and indirect impacts to the SSHCP Preserve System:

- Alterations to landscape hydrology from new impervious surfaces may adversely affect natural communities in the lower watershed, the ecology of a Preserve, and/or downstream aquatic resources.
- Water runoff from development or from roadways directed into Preserves may introduce harmful substances into Preserves. Unseasonal and/or additional water entering a Preserve may eliminate vernal pools and other seasonal wetlands native to the region by converting them to low-functioning perennial wetlands.
- Development adjacent to Preserves may partially to fully remove the soil's "perched aquifer" (see Chapter 3) and reduce or eliminate the micro-watersheds that support the hydrology of vernal pools within the Preserve boundary. These changes may adversely affect the existing hydrologic regime of vernal pools by changing the timing, depth, and/or duration of vernal pool saturation and/or ponding, causing long-term changes to a suite of vernal pool functions. For example, changes to water chemistry could adversely affect species habitat. Although the vernal pools remain, the environmental conditions of the pools may no longer provide habitat for vernal pool Covered Species, or provide the benefit of other wetland functions (e.g., stormwater attenuation) compared to pre-project conditions.
- Introduction or proliferation of non-native or invasive plant and wildlife species may displace native species.
- Landscaping in the interface of a development and a Vernal Pool–Grassland Preserve often includes native or non-native trees and other plant species that are not found in California grasslands and, therefore, cannot survive on the Vernal Pool–Grassland Preserve border without intensive irrigation and cultivation. In addition to adverse effects from irrigation and landscape maintenance, adult trees may become landscape barriers that inhibit species movement and may act to isolate individual Preserves from the larger SSHCP Preserve System.
- Recreational use of Preserves near developed areas may compact soils, eliminate vegetation, impair hydrologic functions, introduce weeds or invasive plant species, and disturb plants and wildlife.

- Introduction of light, noise, or vibrations may disrupt normal nocturnal and diurnal cycles of native species.

AMMs associated with Condition 2 must be applied to all UDA Covered Activities that border an existing Preserve or planned SSHCP Preserve.

EDGE-1 (Compatible Land Uses): To the maximum extent practicable, development project Covered Activities will locate compatible land uses (e.g., designated open space such as parks and ball fields, detention basins, and other land uses with less-intensive human activity) in areas immediately adjacent to existing or planned Preserve boundaries. The compatible land use will provide additional buffering of Preserves from potential indirect effects of adjacent urban development. The soil surfaces in a compatible land use area may be re-contoured provided that the soil restrictive layer remains undamaged and most of the soil profile above the restrictive layer remains intact. The Land Use Authority will determine when it is not practicable to locate a compatible land use adjacent to existing or planned Preserve boundaries.

EDGE-2 (Single-Loaded Streets): To the maximum extent practicable, the design of Urban Development Covered Activities will locate single-loaded streets adjacent to existing or planned Preserve. The Land Use Authority will determine when single-loaded streets are not practicable.

EDGE-3 (Preserve Setbacks): Urban Development Covered Activities constructed adjacent to existing or planned Preserves must establish a minimum 50-foot-wide setback outward from the boundary of any existing Preserve or planned SSHCP Preserve. This minimum 50-foot-wide setback will function as a transition between Urban Development and the Preserve, and must be managed to maintain the natural community of vegetation present in the adjacent Preserve. As much of the setback as possible should remain in the same natural habitat as the Preserve.

However, as discussed in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA, where an existing or planned Preserve is adjacent to an existing roadway (e.g., collectors, arterials, thoroughfares), the 50-foot Preserve Setback will not be required, and any bicycle or pedestrian trail will be established in the road right-of-way. In addition, where a planned roadway crosses an existing or planned Preserve, no Preserve Setback will be required, and any bicycle or pedestrian trail will be established in the road right-of-way.

EDGE-3a (Setback Recreational Trails): Trails are best suited outside of the setback; however, certain types of recreational trails or facilities (e.g., benches, trash receptacles, shade structures, fencing) that can be constructed with minimum ground disturbance and in compliance with EDGE-7 may be allowed within a Preserve Setback, as specified in Section 5.2.5, Covered Activities in Preserve Setbacks in the UDA. Preserve Setback design must locate trails on the side nearest development, away from the Preserve boundary. Trails may be permeable or semi-permeable hiking trails or paved community trials. The maximum trail width will be 16 feet total, including 2-foot-wide shoulders. Post and cable fencing, split rail, or other open fencing will be installed adjacent to recreation trails to keep pedestrians on the trail.

EDGE-3b (Setback Firebreaks): If approved by the local authorities, the Preserve Setback trail may also be used as a firebreak. In instances where a trail cannot act as a firebreak, the firebreak will be located between the trail and the Preserve boundary (see Section 5.2.7). Firebreaks allowed inside the setbacks must be created by methods that will not disturb the soil's restrictive layer, such as mowing, minor scraping of surface vegetation, or shallow tilling, to comply with EDGE-7. Firebreak width within Preserve Setbacks is the minimum width needed to comply with applicable local codes.

EDGE-3c (Setback Shade Trees and Landscaping): To prevent potential impacts from irrigation water or from accumulation of leaf litter onto the grasslands or vernal pools of a Preserve, planting of shade trees or landscaping vegetation will be limited to the area of the Preserve Setback located between the recreation trail and the adjacent urban development (i.e., away from Preserves).

- Only drought-tolerant plant species will be planted. The planting pallet used for Preserve Setback landscaping will not include invasive plant species listed in the California Invasive Plant Council's (Cal-IPC) California Invasive Plant Inventory Database or listed in the Cal-IPC California Invasive Plant Watch List (see http://www.cal-ipc.org/paf/). Any shade trees planted along Preserve Setback trails will be native species that are found in California grasslands and that can survive in the Vernal Pool–Grassland border without long-term irrigation or fertilization (e.g., valley oak, black oak, blue oak, oracle oak). In general, no more than 30% of any 1,000-foot-long segment of a Preserve Setback trail will have canopy cover from tree plantings (to be consistent with maximum tree densities naturally found within native California grasslands and savanna).

- Drip irrigation will be allowed for a maximum of 5 years to establish shade trees or landscape vegetation between the recreation trail and adjacent urban development. The Implementing Entity has the discretion to allow irrigation to continue past 5 years if extenuating circumstances necessitate it (e.g., during a drought) and the continuance of irrigation will not affect the Preserve. Any irrigation systems located within Preserve Setbacks will be inspected quarterly to determine if such systems are affecting soils or vegetation not part of the intended plantings. Irrigation system repairs will be completed immediately if it is determined that the irrigation system is affecting vegetation or soil moisture not part of the intended tree planting.
- If, during annual monitoring of the adjacent Preserve (see Chapter 8), adverse indirect effects (e.g., leaf litter accumulation, irrigation runoff, plant encroachment) of the Preserve Setback's planted vegetation are detected, then the SSHCP Implementing Entity, the Preserve Manager, and the entity responsible for the Preserve Setback will identify appropriate adaptive management of the Preserve Setback tree or landscape plantings in accordance with the Preserve Setback Easement (see Section 5.2.5 and Chapter 9).

EDGE-4 (Locate Stormwater Control Outside Preserves): Roads, sidewalks, and other impermeable surfaces of Urban Development Covered Activities adjacent to existing or planned Preserves will slope away from Preserves and Preserve Setbacks or intercept drainage with swales or curbs and gutters to preclude drainage from entering Preserves and Preserve Setbacks. Stormwater flows must be directed away from Preserves and Preserve Setbacks and directed into stormwater control facilities inside the development (outside Preserves and Preserve Setbacks)[18] (see EDGE-6 for exception to EDGE-4 in certain SSHCP Linkage Preserves).

EDGE-5 (Stormwater Control in Preserve Setbacks): If trails are established in any Preserve Setback in compliance with EDGE-3, the trail must be sloped away from the Preserve, and rainwater leaving the trail surface must flow into an adjacent low-velocity bio-retention swale or cell to keep rainwater runoff and trail contaminants from entering the Preserve. Low-velocity bio-retention swales or cells are typically small linear features placed on one or both sides of a trail. As required by EDGE-3, trails and their adjacent bio-retention swales or cells must be located on the side of the Preserve Setback nearest development.

[18] Detention basins are allowed in some Linkage Preserves consistent with the requirements of EDGE-6. At the time of SSHCP preparation, seven Linkage Preserves with drainages are planned SSHCP Preserves: L1, L2, L4, L7, L8, L9, and L10 (see Section 5.2.7 and Section 7.5). Also see project-specific measures in Section 5.5.1.

EDGE-6 (Detention Basins in Linkage Preserves): Because planned SSHCP Linkage Preserves L1, L2, L4, L7, L8, L9, and L10 (see Section 7.5) surround natural creeks or streams that must receive stormwater from planned adjacent Urban Development Covered Activities, a limited number of stormwater detention basins will be allowed on those Linkage Preserves. Detention basins within Linkage Preserves (see Section 5.2.7) will be designed and constructed with fill material to build up the perimeter of the detention basin so as not to impact the soil restrictive layer (duripan or hardpan) and function of the soil perched aquifer. Detention basins within Linkage Preserves will capture stormwater flows and runoff, and will discharge water to the stream/creek or percolate collected water to the soil perched aquifer. Detention basin structures that collect stormwater entering the basin or convey stormwater leaving the basin must be designed to avoid and minimize effects to Covered Species habitat in the Linkage Preserve.

EDGE-7 (Hardpan/Duripan Protection): To protect the soil perched aquifer and the micro-watersheds supporting existing vernal pool hydrology, activities that have the potential to cut into, disrupt, or remove the soil's restrictive layer (hardpan or duripan) will not occur within Preserves or Preserve Setbacks. However, in certain circumstances, the Covered Activities defined in Section 5.2.6, Covered Activities in Stream Setbacks in the UDA, and Section 5.2.8, Covered Activities in the Laguna Creek Wildlife Corridor of the Preserve System, may result in punctures[19] or other minor disruptions of the soil hardpan or duripan if approved by the Implementing Entity and the Technical Advisory Committee according to the process described in Chapter 9 of the SSHCP. If a Covered Activity on a Preserve or Preserve Setback results in a puncture or other disruption to the soil hardpan or duripan, the puncture will be sealed using bentonite clay or other material that maintains the functionality of the soil's restrictive layer and associated perched aquifer.

EDGE-8 (Outdoor Lighting): All outdoor lighting in Urban Development Covered Activity projects will be designed to minimize light pollution into existing and planned Preserves, except where a Land Use Authority Permittee determines lighting is necessary for public safety or security. Minimization measures may include light fixture placement (e.g., as low to the ground as possible), lamp designs (e.g., shielding, low glare, or no lighting), directing light away from Preserves, or other means to avoid or minimize light pollution. The Third-Party Project Proponent will use the best information available at the time of project design to minimize effects of light pollution on target SSHCP Covered Species (e.g., western spadefoot (*Spea*

[19] Punctures may include small holes that penetrate the soil hardpan or duripan such as might occur when digging or drilling holes for the installation of fence posts, sign posts, or trees.

hammondii), Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), and Ricksecker's water scavenger beetle (*Hydrochara rickseckeri*)).

EDGE-9 (Livestock Access to Preserves): Urban Development Covered Activity projects that include on-site Preserves will include in their design an adequate number of access points and facilities for delivery and pick up of grazing animals (livestock), such that these activities will not significantly alter the Preserve's habitat and are consistent with the protection of livestock and protection of adjacent public property, and include adequate public safety measures.

EDGE-10 (Prevent Invasive Species Spread): Completed Covered Activities (including roads) will be maintained in a manner that avoids the spread of invasive species into Preserve and Open Space areas. Such maintenance measures will include the following:

- To prevent the transport of non-native invasive species onto Preserves, before bringing any equipment onto an SSHCP Preserve or Preserve Setback, equipment must be cleaned of mud, dirt, and plant material. Cleaning will occur in the infested area or another appropriate location as approved by a Plan Permittee.
- Mowing rotation will start in un-infested areas and move to infested areas.
- Invasive plant prevention techniques will be incorporated into maintenance plans.
- The SSHCP Implementing Entity will survey road shoulders, ditches, and rights-of-way that border SSHCP Preserves for invasive weeds or other exotic plant species. Where roadside weed infestations have reached a critical control point, the Implementing Entity or Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment.

Condition 3. Implement Construction Best Management Practices

AMMs associated with Condition 3 must be applied to all UDA Covered Activities.

BMP-1 (Construction Fencing): Orange construction fencing will be installed to ensure that ground disturbance does not extend beyond the allowed construction footprint (i.e., the limit of project construction plus equipment staging areas and access roads). Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will mark the outer boundary of any Preserve Setback or Stream Setback adjacent to or within the project site with orange construction fencing prior to ground disturbance. This fencing will remain in place until project completion, as identified by the Plan Permittee.

BMP-2 (Erosion Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will install temporary control measures for sediment, stormwater, and pollutant runoff as required by the Plan Permittee to protect water quality and species habitat. Silt fencing or other appropriate sediment control device(s) will be installed downslope of any Covered Activity that disturbs soils.

Fiber rolls and seed mixtures used for erosion control will be certified as free of viable noxious weed seed. As discussed in Section 5.4.2, Covered Species Take Avoidance and Minimization Measures, erosion controls installed in or adjacent to Plan Area modeled habitat for giant gartersnake (*Thamnophis gigas*), western pond turtle (*Actinemys marmorata*), California tiger salamander (*California tiger salamander*), or western spadefoot (see Chapter 3) must be of appropriate design and materials that will not entrap the species (e.g., not contain mesh netting). Regular monitoring and maintenance of the project's erosion control measures will be conducted until project completion to ensure effective operation of erosion control measures.

BMP-3 (Equipment Storage and Fueling): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will ensure that equipment storage and staging will occur in the development footprint only (not sited in any existing on-site Preserve, planned on-site Preserve, Preserve Setback, Stream Setback, or aquatic land cover type). Fuel storage and equipment fueling will occur away from waterways, stream channels, stream banks, and other environmentally sensitive areas within the development footprint.

However, certain equipment storage and fueling activities can be allowed on Preserves within habitat re-establishment/establishment sites (refer to Section 5.2.7) if no location outside of the site is available. If a Covered Activity results in a spill of fuel, hydraulic fluid, lubricants, or other petroleum products, the spill will be absorbed and waste disposed of in a manner to prevent pollutants from entering a waterway, Preserve, Preserve Setback, or Stream Setback.

BMP-4 (Erodible Materials): Plan Permittees and Third-Party Project Proponents implementing Covered Activities must not deposit erodible materials into waterways. Vegetation clippings, brush, loose soils, or other debris material will not be stockpiled within stream channels or on adjacent banks. Erodible material must be disposed of such that it cannot enter a waterway, Preserve, Preserve Setback, Stream Setback, or aquatic land cover type. If water and sludge must be pumped from a subdrain or other structure, the material will be conveyed to a temporary settling basin to prevent sediment from entering a waterway.

BMP-5 (Dust Control): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will water active construction sites regularly, if warranted, to avoid or minimize impacts from construction dust on adjacent vegetation and wildlife habitats. No surface water will be used from aquatic land covers; water will be obtained from a municipal source or existing groundwater well.

BMP-6 (Construction Lighting): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will direct all temporary construction lighting (e.g., lighting used for security or nighttime equipment maintenance) away from adjacent natural habitats, and particularly Riparian and Wetland habitats and wildlife movement areas.

BMP-7 (Biological Monitor): If a Covered Activity includes ground disturbance within Covered Species modeled habitat, an approved biologist will be on site during the period of ground disturbance, and may need to be on site during other construction activities depending on the Covered Species affected. After ground-disturbing project activities are complete, the approved biologist will train an individual to act as the on-site construction monitor for the remainder of construction, with the concurrence of the Permitting Agencies. The on-site monitor will attend the training described in BMP-8. The approved biologist and the on-site monitor will have oversight over implementation of Avoidance and Minimization Measures, and will have the authority to stop activities if any of the requirements associated with those measures are not met. If the monitor requests that work be stopped, the Wildlife Agencies will be notified within one working day by email. The approved biologist and/or on-site monitor will record all observations of listed species on California Natural Diversity Database field sheets and submit them to the California Department of Fish and Wildlife. The approved biologist or on-site monitor will be the contact source for any employee or contractor who might inadvertently kill or injure a Covered Species or who finds a dead, injured or entrapped individual. The approved biologist and on-site monitor's names and telephone numbers will be provided to the Wildlife Agencies prior to the initiation of ground-disturbing activities. Refer to species-specific measures for details on requirements for biological monitors.

BMP-8 (Training of Construction Staff): A mandatory Worker Environmental Awareness Program will be conducted by an approved biologist for all construction workers, including contractors, prior to the commencement of construction activities. The training will include how to identify Covered Species that might enter the construction site, relevant life history information and habitats, SSHCP and

statutory requirements and the consequences of non-compliance, the boundaries of the construction area and permitted disturbance zones, litter control training (SPECIES-2), and appropriate protocols if a Covered Species is encountered. Supporting materials containing training information will be prepared and distributed by the approved biologist. When necessary, training and supporting materials will also be provided in Spanish. Upon completion of training, construction personnel will sign a form stating that they attended the training and understand all of the Avoidance and Minimization Measures. Written documentation of the training must be submitted to the Implementing Entity within 30 days of completion of the training, and the Implementing Entity will provide this information to the Wildlife Agencies.

BMP-9 (Soil Compaction): After construction is complete, all temporarily disturbed areas will be restored similar to pre-project conditions, including impacts relating to soil compaction, water infiltration capacity, and soil hydrologic characteristics.

BMP-10 (Revegetation): Plan Permittees and Third-Party Project Proponents implementing ground-disturbing Covered Activities will revegetate any cut-and-fill slopes with native or existing non-invasive, non-native plants (e.g., non-native grasses) suitable for the altered soil conditions and in compliance with EDGE-2 and EDGE-8, if applicable.

BMP-11 (Speed Limit): Project-related vehicles will observe the posted speed limits on paved roads and a 10-mile-per-hour speed limit on unpaved roads and during travel in project areas. Construction crews will be given weekly tailgate instruction to travel only on designated and marked existing, cross-country, and project-only roads.

Condition 4. Avoid and Minimize Impacts that May Result from Implementation of Covered Transportation Projects

Urban Development transportation project and Rural Transportation Project Covered Activities, including bridge projects, can affect Covered Species. AMMs included for Condition 4 seek to avoid or minimize direct and indirect impacts that may result from construction of roadways or roadway improvements. Condition 4 applies to all transportation-related Covered Activities (see Sections 5.2.1 and 5.2.3).

Plan Permittees and Third-Party Project Proponents implementing Urban Development transportation or Rural Transportation Project Covered Activities must comply with the roadway siting, design, and construction AMMs described below.

ROAD-1 (Road Project Location): Road projects will be located in the least environmentally sensitive area to avoid, to the maximum extent practicable, impacts on Covered Species, Covered Species habitat, and waters of the United States. Road project alignments will follow existing roads, road easements, and rights-of-way, or be sited in disturbed areas to minimize habitat loss and additional habitat fragmentation.

ROAD-2 (Wildlife Crossing Structures): Road projects that are Urban Development Covered Activities (see Section 5.2.1) (including the Capital Southeast Connector, see Section 5.2.1.1) or are Rural Transportation Covered Activities (see Section 5.2.3) will include an adequate number of wildlife crossing structures, as depicted in Figure 5-10. An adequate number of wildlife crossing structures within the Urban Development Area (UDA) and outside the UDA will provide for continued dispersal and movement of native wildlife throughout the SSHCP Plan Area, as required by the SSHCP Biological Goals and Objectives (see Chapter 7).

The Plan defines "wildlife crossing structure" as a physical structure specifically designed or retrofitted to facilitate undercrossing for target wildlife species. The Plan further classifies wildlife crossings as hydrologic crossings and dry crossings. Hydrologic crossings are built where there is an existing stream, creek, or intermittent drainage to maintain existing hydrologic connectivity within the Plan Area. As described below, hydrologic crossings require specialized features to be built into the crossing structure, such as elevated platforms to allow wildlife to pass under a crossing structure when it is inundated with water. Dry wildlife crossings are built where there is no hydrologic feature but where a crossing is needed to provide for overland connectivity. SSHCP wildlife crossing structures may include structures such as bridges, arches, or box and pipe culverts.

Plan Permittees expect that future wildlife movement and dispersal within the UDA will occur almost entirely within the boundaries of the future interconnected SSHCP Preserve System (see Section 7.5). Therefore, wildlife crossings are needed wherever a roadway crosses (bisects) the conceptual SSHCP Preserve System (see Figure 5-10). Wildlife crossing structures inside the UDA will be sized to accommodate movement of a highly mobile native indicator species (i.e., coyote (*Canis latrans*)). By designing UDA wildlife crossing structures to meet the movement and dispersal requirements of coyote, the Plan Permittees anticipate that the crossing structure will also accommodate most native wildlife species that currently occupy the UDA (see Chapter 3).

The Plan Permittees expect that most of the Plan Area outside of the UDA will remain as Open Space over the 50-year Permit Term (see Chapter 4). Therefore,

the Plan Permittees expect that the Rural Transportation Project Covered Activities proposed outside the UDA will have a relatively small effect on the movement and dispersal of larger or more mobile native wildlife species, including coyote. Consequently, the Plan Permittees anticipate that the design of Rural Transportation Project Covered Activities outside the UDA will need to include wildlife crossing structures primarily where the Rural Transportation Project Covered Activities occur within California tiger salamander modeled habitat (see CTS-3 and also Chapter 3, Figure 3-16).

The design and location of wildlife crossing structures both inside the UDA and outside the UDA will be determined by collaboration between the Third-Party Project Proponent, the Land Use Authority, and the Implementing Entity. Crossing design will use the best available scientific and commercial information for the target species. The design of crossing structures will be based on demonstrated effectiveness of design for the target species when such information is available, or will be designed with a high level of certainty of success based on studies of similar taxa in similar environmental settings. The proposed wildlife crossing structures designs will be reviewed and approved by the Implementing Entity prior to final design.

The Implementing Entity will develop a Wildlife Crossing Maintenance Manual to be provided to the entity responsible for maintaining the wildlife crossing. The Wildlife Crossing Maintenance Manual will identify vegetation management, clearing of obstructions, and other techniques to maintain the desired movement and hydrologic connectivity, and to avoid effects to adjacent Preserves.

All SSHCP wildlife crossing structures in the UDA will include the following design elements:

- Open-bottom bridges or arches where the roadway crosses a river or stream. Where an open-bottom bridge or arch is used, the span of the crossing will be at least 1.2 times the bankfull width of the stream and span the banks to allow for dry wildlife passage along each side of the stream and to avoid or minimize piers or footings within the stream. (Bankfull width refers to the width of a stream channel at the point where over-bank flow begins during a flood event.)
- Any wildlife crossing structure that also maintains hydrologic connectivity will be designed to maintain pre-construction water capacity, depth, and velocity. The crossing structure will not restrict or impede normal flows or flood flows, unless a primary purpose of the structure is to manage such

flow(s). Wildlife crossing structures must be designed to provide a dry passage (e.g., a platform ledge) higher than flows for a 10-year storm event to allow wildlife to pass through an inundated crossing structure.

- Wildlife crossing structures in the UDA will be designed and sized to accommodate movement of at least medium-sized mammals (e.g., coyote). The opening must be at least 3 feet high and the crossing structure must have a minimum openness ratio of at least 0.4.
- Vegetation leading up to the entrance of a crossing structure and the substrate leading into and within the crossing structure will be natural and appropriate to provide for continuity of habitat, attract the target animal species for which the crossing is designed, and facilitate use of the crossing structure.
- A wildlife crossing under six-lane roads or larger will be designed to provide ambient light and temperature in the longer crossing structures (e.g., either by providing a larger opening or a grate at the top of the structure to improve the attractiveness of the crossing to certain Covered Species and wildlife that may hesitate to cross through dark, confined structures or one with a temperature gradient (Jackson and Griffin 2000)). If a road is less than six lanes in width, these designs will be optional.
- Lighting will not be placed at or near the entrance of a wildlife crossing structure to maintain natural ambient light conditions at night and to increase chances of wildlife use. However, a Land Use Authority Permittees may allow lighting if necessary for human health or safety.

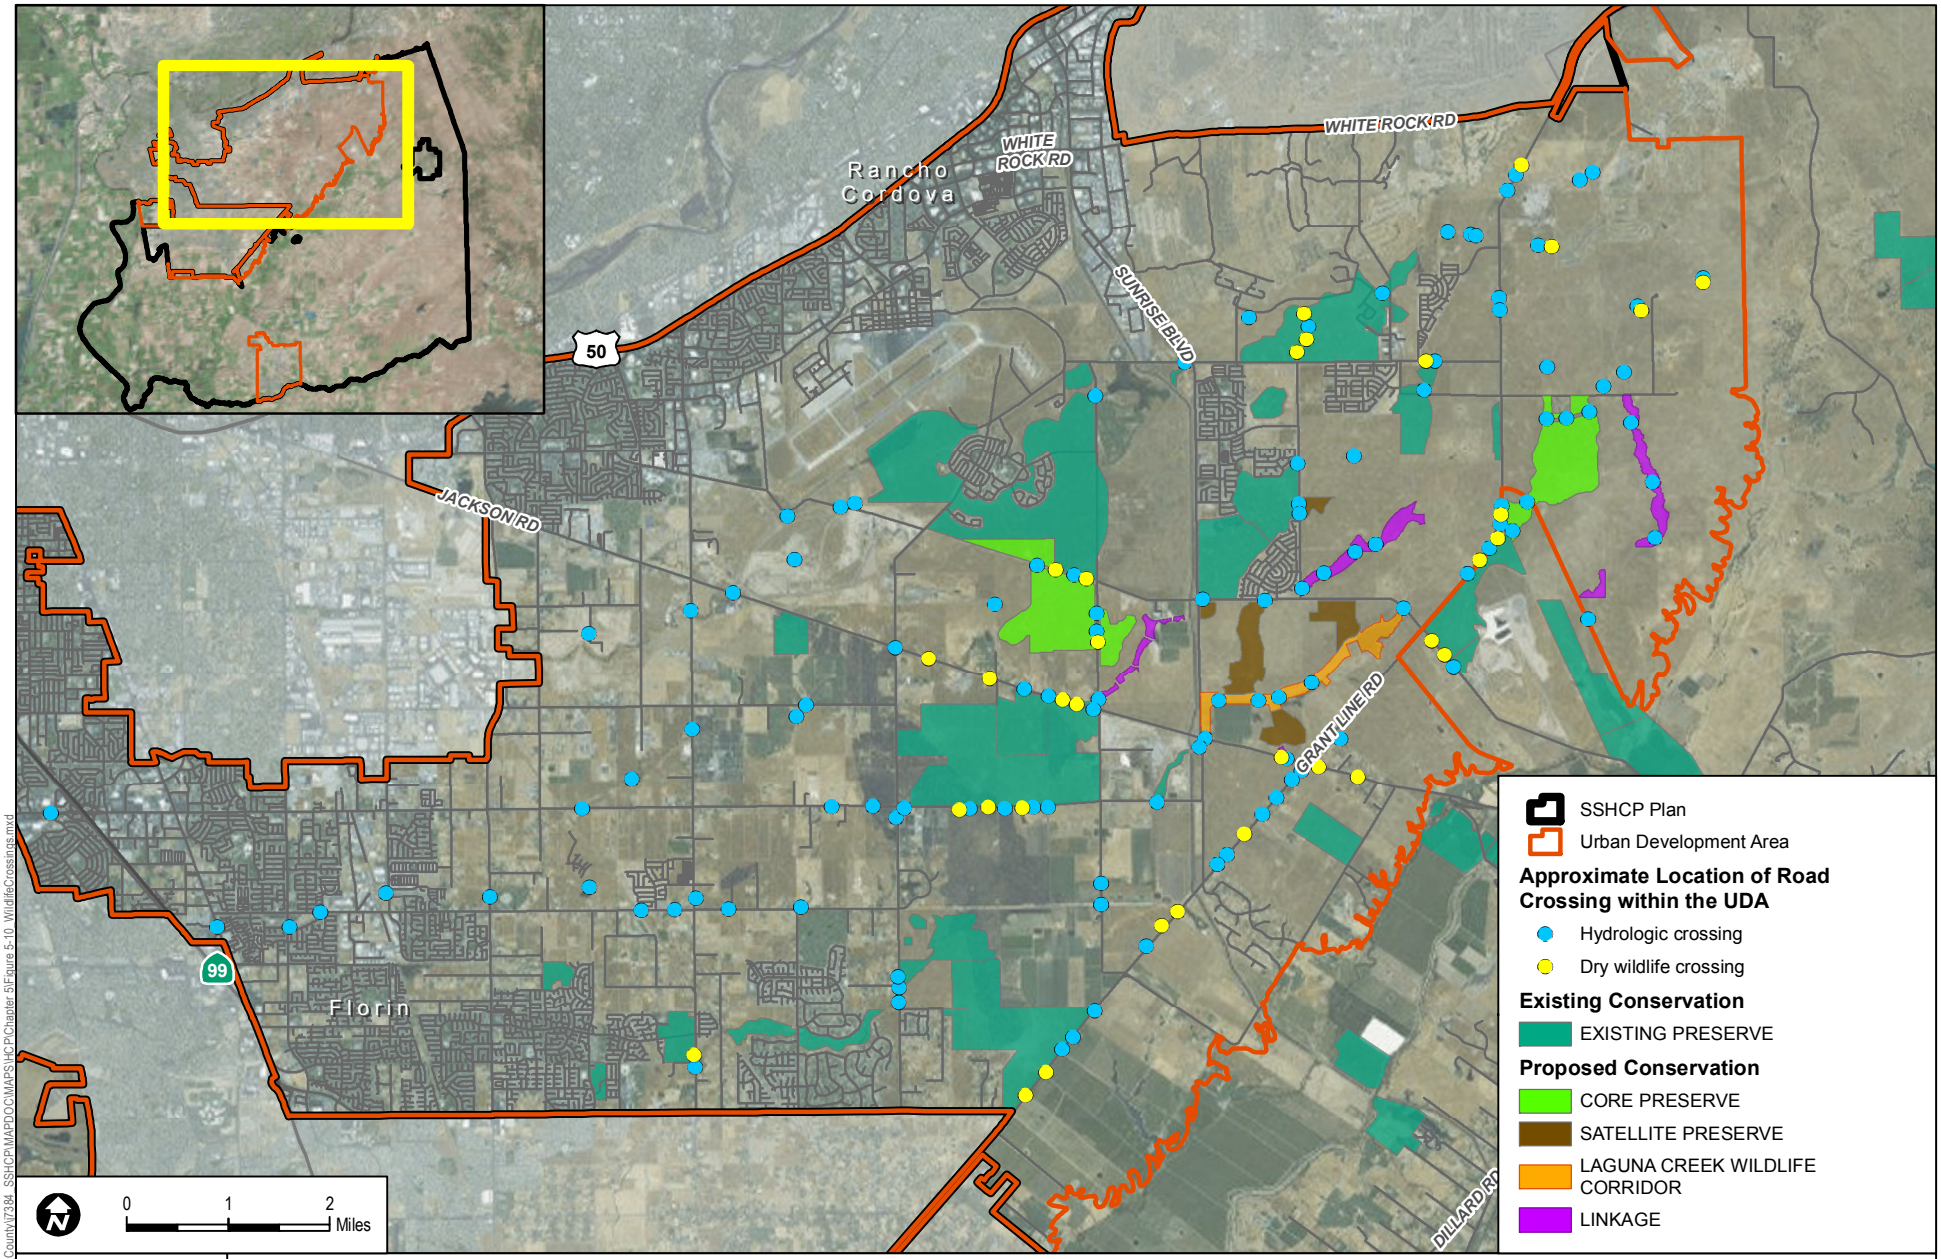
Outside the UDA, wildlife crossing structures may be required for California tiger salamander (refer to CTS-1), and could also be required for other native species.

ROAD-3 (Roadside Pesticide Use[20]): If pesticide use is necessary along roadsides, the appropriate SSHCP Permittee will ensure that the pesticide application strictly complies with the pesticide label and all other applicable federal, state, and local authorities pertaining to the use, safety, storage, disposal, and reporting of the pesticide. Where roadside weed infestations have reached a critical control point, the Implementing Entity or a Land Use Authority Permittee will apply the appropriate manual, mechanical, or chemical treatment. In addition, the Implementing Entity or appropriate Land Use Authority Permittee will post signs along road shoulders adjacent to sensitive areas that are within the SSHCP

[20] Use of pesticides (including rodenticides and herbicides) is not an SSHCP Covered Activity. However, pesticide use specified in Section 5.3 is an allowed land management tool, provided the pesticide application is otherwise legal and conforms to all conditions in Section 5.4.

Preserve System (e.g., California tiger salamander breeding ponds, endemic plant populations, vertebrates that rely on insects for part of their diet). The signs will identify pesticide use restrictions or other roadside maintenance restrictions.

Condition 5. Avoid and Minimize Impacts that Result from Public Use of Low-Impact Nature Trails in Preserves



Preserves within the UDA are likely to be surrounded by urban development. As discussed in Section 5.2.7, allowing limited use of SSHCP Preserves will help to foster a sense of community ownership and will provide an opportunity to educate the community about the natural resources to be protected within the SSHCP Preserve System.

Low-impact nature trails will be designed following the AMMs outlined below.

NATURE TRAIL-1 (Nature Trail Plan): A nature trail plan must be prepared for each Preserve where a trail is allowed by the Preserve Management Plan. Nature trails will be unpaved trails that vary in width depending on terrain and existing constraints, but will never exceed 4 feet in width. Where a trail crosses a swale, wooden walkways elevated to a height no greater than 2 feet will be installed. Trail improvements may include mowing vegetation to create or maintain a trail, minor grading to remove trip hazards, and signs providing directional and educational information. Public access to land acquired for preservation will be prohibited until a trail plan can be prepared by the Implementing Entity and approved by the Permitting Agencies. A trail plan will include the following:

- Maps identifying areas that contain sensitive habitats or species occurrences.
- Maps that show the location and footprint of proposed trails.
- Methods used to control public access.
- Trail and use monitoring methods, schedules, and responsibilities.
- Trail operation and maintenance guidelines and responsibilities.
- Clear triggers for use restrictions or closure based on sensitive biological indicators (e.g., seasonal closures of some trails on the basis of activity periods of Covered Species or sensitive species).

NATURE TRAIL-2 (Nature Trail Protection of Duripan): Nature trails will be sited and constructed so as not to interfere with existing soil duripan and the perched aquifer that support the existing hydrologic regime of the Vernal Pool–Grassland, and will not interfere with existing pool hydrology. Trails within Preserves will not be paved.

SOURCE: ESRI, County of Sacramento 2014, USFWS 2015

FIGURE 5-10

Wildlife Crossings

SOUTH SACRAMENTO HABITAT CONSERVATION PLAN

INTENTIONALLY LEFT BLANK

NATURE TRAIL-3 (Nature Trail Location): Nature trails will be located away from sensitive natural resources (e.g., vernal pools, riparian habitat, woodland habitat, Covered Species occurrences, raptor nesting sites, tricolored blackbird (*Agelaius tricolor*) colony sites). The Wildlife Agencies will determine the distance necessary to avoid impacts to sensitive natural resources.

NATURE TRAIL-4 (Biological Studies Prior to Nature Trail Design): Biological studies will be conducted within the area being considered for nature trail construction prior to project design. The studies will include land cover type mapping and focused species surveys and/or wetland delineations. The biological studies will include assessments of potential effects of trail construction on Preserve System resources, and recommendations for avoidance and minimization that may be incorporated into project siting, design, construction, and operation.

NATURE TRAIL-5 (Monitoring of Nature Trail Impacts): Impacts that could result from use of a nature trail within a Preserve will be monitored according to the Preserve Management Plan (Chapter 8) to ensure that uses do not conflict with the individual Preserve Management Plan. If use of a trail is found to conflict with the individual Preserve Management Plan, use of that trail will be discontinued until adjustments in the use can be made to reduce or eliminate conflicts. The Implementing Entity will make decisions about discontinuing or modifying use of a trail in consultation with the Preserve Manager or other applicable Preserve management agency or organization.

Condition 6. Avoid and Minimize Impacts When Re-Establishing or Establishing Wetlands

As discussed in Chapter 7, the Plan Permittees anticipate that 389 acres of Vernal Pool habitat will be re-established or established[21] within the Plan Area as part of the SSHCP Conservation Strategy. Although re-establishment or establishment of vernal pools is a Measurable Objective under this Plan, if not done correctly, the action could have an adverse impact on existing vernal pools.

RE-ESTABLISHMENT/ESTABLISHMENT-1 (Vernal Pool): Re-establish or establish Vernal Pool Wetland according to the following guidelines:

- Re-establishment will always take priority over establishment of vernal pools. Establishment will be permitted only after it has been determined that sites with the potential to re-establish vernal pools no longer exist in the Plan Area or cannot be acquired through a willing seller/buyer agreement.

[21] In the context of this Plan, "establish" is synonymous with "create."

- When possible, re-established or established sites will be located adjacent to an existing Preserve(s) to maximize connectivity and Preserve area.
- Re-establishment or establishment will not result in direct or indirect adverse impacts to the hydrologic regime of existing vernal pools. Vernal pool re-establishment or establishment actions will not remove more than 10% of any existing vernal pool watershed, as defined by the SSHCP LIDAR analysis (see Section 3.3 and Conservation Action VPI1.2 in Table 7.1).
- Vernal pool re-establishment will attempt to restore the historical density and range of vernal pool sizes to the maximum extent feasible using historical aerial photography of the site, if available. Where aerial photography of the site's historical conditions is not available, vernal pool re-establishment will include a range of pool sizes (area and depth) to accommodate the different habitat needs and life history characteristics of the vernal pool invertebrate Covered Species.
- Established vernal pools must be located on sites with vernal pool soils, defined as any Plan Area soil type where vernal pools currently exist.
- Established vernal pool sites will include a range of pool sizes to accommodate the different habitat needs and life history characteristics of the three vernal pool invertebrate Covered Species.
- The total density of vernal pools will not exceed 10% of the suitable soil areas in any vernal pool re-establishment and/or establishment site, unless it can be shown that the suitable areas of that site historically supported greater densities.
- Re-establishment or establishment may include inoculation when it is likely that no seed or cyst bank of vernal pool species remains at a site. Vernal Pool inocula will come from nearby vernal pools that are on the same geologic formation and soil type.

RE-ESTABLISHMENT/ESTABLISHMENT-2 (Vernal Pool Inocula Bank): Vernal pool re-establishment or establishment may include "soil inoculation" when it is likely that no seed or cyst bank of vernal pool species remains at a re-establishment or establishment site.

- During conversion of Urban Development Area vernal pools to a developed land cover type, project proponents will excavate and retain soil from vernal pools following protocols developed by the SSHCP Technical Advisory Committee (Chapter 9).

- Inocula applied in re-established or established vernal pools must be harvested from a vernal pool that is on the same geologic formation and soil type shown on the County General Soil Map as the re-establishment/establishment site. Geologic formations and soil types will follow U.S. Department of Agriculture Soil Conservation Service's 1993 Soil Survey of Sacramento County, California. Proposed off-site inocula sources must be approved by the Wildlife Agencies.

RE-ESTABLISHMENT/ESTABLISHMENT-3 (Re-Establishment/Establishment of Freshwater Marsh or Open Water Near Airports): During review of proposed re-establishment/establishment projects for freshwater marsh or open water on SSHCP Preserves, the Implementing Entity shall consider the potential for the location of the re-establishment/establishment projects to increase the risk of wildlife strikes or generation of ground fog at airports. If a re-establishment/ establishment project would result in (1) a net increase in open water or freshwater marsh acreage over baseline conditions[22] within 5 miles of Mather Field, Sacramento Executive Airport, or Franklin Field; or (2) replacement of open water/freshwater marsh habitat that is located 2 or more miles from Mather Field or Sacramento Executive Airport with open water/freshwater marsh habitat that is located less than 2 miles from those airports, a qualified biologist shall prepare a concise letter report. The letter report shall summarize the biologist's findings regarding (1) the species likely to use the re-established/established habitat, (2) a rough order of magnitude estimate on the peak number of birds that might use the re-established/established habitat, and (3) potential movement patterns for birds using the re-established/established habitat and whether they might cross through the airport safety zones (e.g., to reach foraging habitat or another wildlife attractant). The letter report will also provide recommendations to the Implementing Entity on how they could reduce any of the identified wildlife hazards if there are any feasible means to do so that would not conflict with the biological goals and measurable objectives of the Conservation Plan.

Condition 7. Avoid and Minimize Impacts to Streams and Creeks

AMMs associated with Condition 7 must be applied to all Covered Activities where a stream or creek is located within a project footprint.

[22] For purposes of establishing baseline conditions, Freshwater Marsh and Open Water acreages will be calculated using that version of the SSHCP Land Cover Type Map in existence as of the date that the SSHCP permit was issued to the Plan Permittees by the USFWS.

STREAM-1 (Laguna Creek Wildlife Corridor): A 150-foot setback measured from the top of the bank on both sides of the stream will be applied to Laguna Creek within the Urban Development Area (minimum 300-foot corridor width). If trails are located within the Laguna Creek Wildlife Corridor, the nearest edge of the trail will be located at least 80 feet from the top of the bank.

STREAM-2 (UDA Stream Setbacks): A 100-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all streams listed in Table 5-1 (see also Figure 2-4). If a stream reach supports woody riparian vegetation, the setback will be equal to the riparian edge plus 25 feet or will be the setback defined above, whichever is greater. If trails are located within the Stream Setback, the nearest edge of the trail will be located at least 50 feet from the top of the bank.

Table 5-1
Stream Setback Minimum Requirements in the Urban Development Area

Stream	Minimum Setback (from the Top of Bank Measured in Aerial Perspective) on Both Sides of the Stream
Elder Creek	100 feet
Frye Creek	100 feet or as depicted as part of the NewBridge development project hardline Preserve (see Appendix K)
Gerber Creek	100 feet
Morrison Creek	100 feet
Central Paseo	100 feet or as depicted as part of the Cordova Hills development project hardline Preserve (Appendix K)
Sun Creek	100 feet or as depicted as part of the Sun Creek development project hardline Preserve (see Appendix K)

STREAM-3 (Minor Tributaries to UDA Streams): A 25-foot setback measured from the top of the bank on both sides of the stream channel will be applied to all avoided first and second order tributaries to the streams listed in Table 5-1 and Laguna Creek. Refer to Objective W6 in Chapter 7 (Table 7-1) regarding avoided first and second order tributaries. Trails are not permitted within headwater ephemeral Stream Setbacks.

STREAM-4 (Minimize Effects from Temporary Channel Re-Routing): When an Urban Development Covered Activity temporarily re-routes a stream, creek, or drainage, the re-routing will be completed in a manner that minimizes impacts to beneficial uses and habitat. The following measures will be employed to minimize disturbances that will adversely impact water quality:

- No equipment will be operated in areas of flowing or standing water.
- Construction materials and heavy equipment must be stored outside of the active flow of any waters.

- When work within waters is necessary, the entire stream flow will be diverted around the work area.
- In the event of rain, the disturbed in-water work area will be temporarily stabilized before water body flow exceeds the capacity of the diversion structure. The disturbed water body will be stabilized so that the disturbed areas will not come in contact with the flow.
- Once construction is complete, all project-introduced material (e.g., pipes, gravel, cofferdam, sandbags) must be removed, leaving the water as it was before construction. Excess materials will be disposed of at an appropriate disposal site.
- All work areas will be effectively isolated from stream flows using suitable control measures before commencement of any in-water work. The diverted stream flow will not be contaminated by construction activities. Structures for isolating the in-water work area and/or diverting the stream flow (e.g., cofferdam, geo-textile silt curtain) will not be removed until all disturbed areas are cleaned and stabilized.
- Any flow diversion used during construction will be designed in a manner to prevent pollution and minimize siltation, and will provide flows to downstream reaches. Flows will be maintained to support existing aquatic life, riparian wetlands, and habitat that may be located upstream and downstream from any temporary diversion.
- All surface waters, including ponded waters, will be diverted away from areas undergoing grading, construction, excavation, vegetation removal, and/or any other activity that may result in a discharge to waters.
- All temporary dewatering methods will be designed to have the minimum necessary impacts to waters to isolate the immediate work area. All dewatering methods will be installed such that natural flow is maintained upstream and downstream of the diversion area. Any temporary dams and diversions will be installed such that the diversion does not cause sedimentation, siltation, or erosion upstream or downstream of the diversion area. All dewatering methods will be removed immediately upon completion of diversion activities.
- A method of containment must be used below any bridge, boardwalk, and/or temporary crossing to prevent debris from falling into the waters through the entire duration of a project.

- If temporary surface water diversions and/or dewatering are anticipated, the Third-Party Project Proponent will develop and maintain on site a surface water diversion and/or dewatering plan. The plan(s) must be developed prior to initiation of any water diversions and will include the proposed method and duration of diversion activities. The plan(s) must be made available to Central Valley Water Board staff upon request.
- When work in a flowing stream is unavoidable and any dam or other artificial obstruction is being constructed, maintained, or placed in operation, sufficient water will be allowed at all times to pass downstream to maintain beneficial uses of waters below the dam. Construction, dewatering, and removal of temporary cofferdams will not violate the turbidity, settle-able matter, pH, temperature, or dissolved oxygen requirements of any Water Quality Control Plan.
- Any temporary dam or other artificial obstruction will only be built from clean materials such as sandbags, gravel bags, water dams, or clean/washed gravel that will cause little or no siltation. Stream flow will be temporarily diverted using gravity flow through temporary culverts or pipes, or pumped around the work site with the use of hoses.

STREAM-5 (Design for Stream Channel Re-Routing, Widening, or Deepening): When an Urban Development Covered Activity alters a stream, creek, or drainage by re-routing, widening, or deepening a channel, the project design will include the following:

- The main channel of a re-routed channel will be free to migrate laterally over its active and terrace floodplain.
- Channel geometry (plan, profile, and cross-section) of the site will be appropriate for the watershed location and physical/hydrologic condition.
- Local, native materials will be used as fill material to the extent practicable.
- Bioengineering techniques will be used for construction and maintenance of bank stabilization. Bioengineered bank stabilization structures will use vegetation in combination with bank reshaping; biodegradeable geotextile materials; and, in some cases, a minimal amount of rock or wood to the extent practicable to dissipate erosive energy. Third-Party Project Proponents will consult a professional engineer when considering using bioengineering techniques.
- All re-routed, widened, or deepened streams are required to establish Stream Setbacks with minimum widths required under STREAM-1, STREAM-2, or STREAM-3. All re-routed, widened, or deepened streams must re-establish/

establish and maintain native Woody Riparian land cover and/or native Grassland Riparian land cover in the entire Stream Setback.

Condition 8. Avoid and Minimize Impacts to Covered Species from Utility and Utility Maintenance Covered Activities

AMMs associated with Condition 8 must be applied to all Covered Activities associated with construction and maintenance of infrastructure projects.

UTILITY-1 (Avian Collision Avoidance): Installation of new, or relocation of existing, utility poles, lines, and cell towers located within the Preserve System or within 1,000 feet of a Preserve boundary will be coordinated with the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife. The applicant or relevant utility/service provider will install utility poles, lines, and cell towers in conformance with Avian Powerline Interaction Committee (APLIC) standards for collision-reducing techniques, as outlined in Reducing Avian Collisions with Power Lines: State of the Art in 2012 (APLIC 2012), or any superseding document issued by the APLIC.

UTILITY-2 (Utility Maintenance on Preserves): Utility maintenance inside SSHCP Preserves and SSHCP Preserve Setbacks containing vernal pools will occur only when vernal pools have been dry for 30 days, except in emergency situations related to human health and safety.

UTILITY-3 (Trenchless Construction Methods): Where a pipeline or conduit crosses an existing or planned Preserve or will be located between adjacent Preserves (e.g., under a roadway that has a Preserve on both sides), trenchless construction methods will be used to minimize impacts to the existing soil profile (including impacts to a hardpan or duripan) to maintain the perched aquifer in Vernal Pool Grassland land cover type.

UTILITY-4 (Siting of Entry and Exit Location): The entry and exit locations for the trenchless construction method (see Utility-3) will be sited to avoid impacts to vernal pools and Riparian Woodland, and to avoid direct take of SSHCP Covered Species.

Condition 9. Avoid and Minimize Impacts That Might Result From Removing or Breaching Levees to Establish or Re-establish Riparian Habitat

LEVEE-1 (Preparation of Hydrologic Analysis): Prior to approving a draft Preserve Management Plan that includes (1) modifying or breaching an existing levee, or (2) would place a potential impedance to high-water event flood-flows on the water side of an existing levee (including new riparian vegetation plantings or

other new Preserve facilities), a hydrologic analysis will be conducted. The Preserve activity will only be implemented if the hydrologic analysis concludes that the activity will not result in a substantial increase in flood stage elevations or flood risk on lands outside the Preserve.

Condition 10. Avoid and Minimize Impacts That Might Result From Potential Residual Contamination of Preserves and Related Exposure of People to Such Hazardous Materials

HAZARDOUS MATERIALS-1 (Preparation of Phase I Environmental Site Assessment): Prior to the acquisition of a preserve site or implementation of a stream or riparian restoration project, a Phase I Environmental Site Assessment shall be conducted in general accordance with the American Society for Testing and Materials Standard Practice E1527-05. The purpose of this Environmental Site Assessment is to identify, to the extent feasible pursuant to the American Society for Testing and Materials Standard, recognized environmental conditions in connection with the potential site. The term "recognized environmental condition" means the presence or likely presence of hazardous substances or petroleum products on the property under conditions that may indicate an existing release, a past release, or a material threat of release of these substances to the property. If the Phase 1 Environmental Site Assessment indicates the presence of a recognized environmental condition, the Implementing Entity shall consider the following options.

- Determine that the acquisition/project can proceed on the basis that the Habitat Plan goals and objectives can be met on the site even with the presence of a recognized environmental condition.
- Conduct a Phase II Environmental Site Assessment, including soil and groundwater testing, to further study the potential for contamination to limit the Implementing Entity's management activities.
- If the results of the Phase I (or Phase II) Environmental Site Assessment indicate that the Habitat Plan goals and objectives cannot be met on the site, the Implementing Entity should not acquire the site.

HAZARDOUS MATERIALS-2 (Contingency Plan): As part of each Preserve Management Plan or site restoration plan, a Contingency Plan shall be prepared to address the actions that would be taken during construction in the event that unexpected contaminated soil or groundwater is discovered. The Contingency Plan shall include health and safety considerations, handling and disposal of wastes, reporting requirements, and emergency procedures. The Contingency Plan shall include a requirement that if evidence of contaminated materials is encountered

during construction, construction would cease immediately and applicable requirements of the Comprehensive Environmental Release Compensation and Liability Act and the California Code of Regulations Title 22 regarding the disposal of waste would be implemented.

5.4.2 Covered Species Take Avoidance and Minimization Measures

The following section describes measures to avoid or minimize effects of Covered Activities on specific SSHCP Covered Species. Species-specific AMMs include species surveys, pre-construction surveys, and construction monitoring. Most species-specific AMMs require that species surveys be conducted if Covered Species modeled habitat is within the proposed Covered Activity footprint or within a specified distance of the proposed Covered Activity. Section 3.4 provides maps and descriptions of modeled habitat for each Covered Species. The AMMs described below apply to Covered Activities when Covered Species modeled habitat or a Covered Species occurrence are at a project site. The Implementing Entity and Wildlife Agencies may update specific SSHCP AMMs over the Permit Term to provide the best and most appropriate protective measures for a Covered Species.

General Covered Species Take Avoidance and Minimization Measures

The following AMMs will apply to all Covered Activities that are required to implement Covered Species take AMMs.

SPECIES-1 (Litter Removal Program): A litter control program will be instituted for the entire project site. All workers will ensure that their food scraps, paper wrappers, food containers, cans, bottles, and other trash are deposited in covered or closed trash containers. All garbage will be removed from the project site at the end of each work day, and construction personnel will not feed or otherwise attract wildlife to the area where construction activities are taking place.

SPECIES-2 (No Pets in Construction Areas): To avoid harm and harassment of native species, workers and visitors will not bring pets onto a project site.

SPECIES-3 (Take Report): If accidental injury or death of any Covered Species occurs, workers will immediately inform the approved biologist or on-site monitor and site supervisor. The approved biologist or on-site monitor will phone the appropriate contact person at the Implementing Entity. The Implementing Entity will immediately contact the Wildlife Agencies by telephone. A memorandum will be provided to the Implementing Entity and Wildlife Agencies within 1 working day of the incident. The report will provide the date and location of the incident, number of individuals taken,

the circumstances resulting in the take, and any corrective measures taken to prevent additional take.

SPECIES-4 (Post-Construction Compliance Report): A post-construction compliance report will be submitted to the SSHCP Implementing Entity within 30 calendar days of completion of construction activities or within 30 calendar days of any break in construction activity that lasts more than 30 days. The report will detail the construction start and completion dates, any information about meeting or failing to meet species take Avoidance and Minimization Measures (AMM), effectiveness of each AMM that was applied at the project site, and any known project effects to Covered Species.

Rare Plants

PLANT-1 (Rare Plant Surveys): If a Covered Activity project site contains modeled habitat for Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii)*, Bogg's Lake hedge-hyssop (*Gratiola heterosepala)*, dwarf downingia (*Downingia pusilla)*, Legenere (*Legenere limosa*), pincushion navarretia (*Navarretia myersii)*, or Sanford's arrowhead (*Sagittaria sanfordii*), the Covered Activity project site will be surveyed for the rare plant by an approved biologist and following the California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or the most recent CDFW rare plant survey protocols. An approved biologist will conduct the field surveys and will identify and map plant species occurrences according to the protocols. See Chapter 10 for the process to submit survey information to the Plan Permittee and the Permitting Agencies.

PLANT-2 (Rare Plant Protection): If a rare plant listed in AMM PLANT-1 is detected within an area proposed to be disturbed by a Covered Activity or is detected within 250 feet of the area proposed to be disturbed by a Covered Activity, the Implementing Entity will assure one unprotected occurrence of the species is protected within a SSHCP Preserve before any ground disturbance occurs a the project site.

Sacramento and Slender Orcutt Grass

Sacramento Orcutt grass (*Orcuttia viscida*) is a federally and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Slender Orcutt grass (*Orcuttia tenuis*) is a federally threatened and state endangered species and is ranked by the California Native Plant Society as a California Rare Plant Rank 1B.1 species. Both Orcutt grasses are very rare, and the likelihood of finding new occurrences within the Plan Area is low. Due to their rarity, take of either of these species is not permitted under the SSHCP, with the exception of take related to Preserve management and monitoring (see Section 5.2.7, SSHCP Preserve System Covered Activities).

ORCUTT-1 (Orcutt Grass Surveys): If a Covered Activity project site is located within 1 mile of the Mather Core Recovery Area and contains the Vernal Pool land cover type, the project site will be surveyed for Sacramento and slender Orcutt grass by an approved biologist following California Department of Fish and Wildlife (CDFW) rare plant survey protocols (CDFG 2009) or most recent CDFW guidelines to determine if Sacramento and/or slender Orcutt grass is present. An approved biologist will conduct the field investigation to identify and map occurrences. See Chapter 10 for the process to conduct and submit survey information.

ORCUTT-2 (Orcutt Grass Protection): Where known or new Sacramento or slender Orcutt grass occurrences are found, they will be protected within an SSHCP Preserve that is at least 50 acres. The occurrence will be located interior to the Preserve at a distance of no less than 300 feet from the edge of the Preserve boundary. If a Third-Party Project Proponent encounters a previously undiscovered occurrence of Sacramento or slender Orcutt grass on a Covered Activity project site, the Third-Party Project Proponent will contact the Implementing Entity or Land Use Authority Permittee with authority over the project, who will coordinate with the Wildlife Agencies for written concurrence of avoidance to ensure that the project does not cause take of the species.

California Tiger Salamander

To avoid direct and indirect effects of Covered Activities on California tiger salamander (*Ambystoma californiense*), the following AMMs will be implemented.

CTS-1 (California Tiger Salamander Daily Construction Schedule): Ground-disturbing Covered Activities within California tiger salamander modeled habitat (Figure 3-16) will occur outside the breeding and dispersal season (occur after July 31 and before October 15), to the maximum extent practicable. If Covered Activities must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), construction activities will not start until 30 minutes after sunrise and must be complete 30 minutes prior to sunset.

CTS-2 (California Tiger Salamander Exclusion Fencing): If a Covered Activity must be implemented in modeled habitat (Figure 3-16) during the breeding and dispersal season (after October 15 and before July 31), exclusion fencing will be installed around the project footprint before October 15. Temporary high-visibility construction fencing will be installed along the edge of work areas, and exclusion fencing will be installed immediately outside of the temporary high-visibility construction fencing to exclude California tiger salamanders from entering the construction area or becoming entangled in the construction fencing. Exclusion fencing will be at least 1 foot tall and be buried

at least 6 inches below the ground to prevent salamanders from going under the fencing. Fencing will remain in place until all construction activities within the construction area are complete. No project activities will occur outside the delineated project footprint. An approved biologist must inspect the exclusion fencing and project site every morning before 7:00 a.m. for integrity and for any entrapped California tiger salamanders. If a California tiger salamander is encountered, refer to CTS-5, below. (However, the Implementing Entity may, with approval of the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW), determine that it is appropriate for a Covered Activity project to not implement CTS-2 for certain long and linear roadway Covered Activity projects if it appears that the exclusion fencing will likely trap individuals or cause more take of California tiger salamander than it would prevent.)

CTS-3 (California Tiger Salamander Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-16), an approved biologist experienced with California tiger salamander identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site for California tiger salamander every morning before 7:00 a.m., or prior to construction activities. As required by BMP-8 (Training of Construction Staff), the approved biologist will also train construction personnel on the required California tiger salamander avoidance procedures, exclusion fencing, and correct protocols in the event that a California tiger salamander enters an active construction zone. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-4 (Avoid California Tiger Salamander Entrapment): If Covered Activities must be implemented in modeled habitat, all excavated steep-walled holes or trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes or trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within California tiger salamander modeled habitat will be inspected for California tiger salamanders by the approved biologist prior to being moved. If a California tiger salamander is encountered, refer to CTS-5, below.

CTS-5 (California Tiger Salamander Encounter Protocol): If a California tiger salamander is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately (California Department of Fish and Wildlife (CDFW)

and U.S. Fish and Wildlife Service (USFWS)). Construction activities will be suspended in a 100-foot radius of the animal until the animal is relocated by an approved biologist with appropriate handling permits from the Wildlife Agencies. Prior to relocation, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the salamander, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to USFWS and CDFW immediately. Any worker who inadvertently injures or kills a California tiger salamander or who finds dead, injured, or entrapped California tiger salamander(s) must immediately report the incident to the approved biologist.

CTS-6 (Erosion Control Materials in California Tiger Salamander Habitat): If erosion control (BMP-2) is implemented within California tiger salamander modeled habitat (Figure 3-16), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that salamanders are not trapped (no monofilament). Coconut coir matting and fiber rolls with burlap are examples of acceptable erosion control materials. This limitation will be communicated to the contractor through use of special provisions included in the bid solicitation package.

CTS-7 (Rodent Control): CTS-7 only applies to projects that are within California tiger salamander modeled habitat (Figure 3-16) and on Covered Activities. Rodent control will be allowed only in developed portions of a Covered Activity project site. Where rodent control is allowed, the method of rodent control will comply with the methods of rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Western Spadefoot

To avoid direct and indirect effects of Covered Activities on western spadefoot (*Spea hammondii*), the following AMMs will be implemented.

WS-1 (Western Spadefoot Work Window): Ground-disturbing Covered Activities within western spadefoot modeled habitat (Figure 3-17) will occur outside the breeding and dispersal season (after May 15 and before October 15), to the maximum extent practicable.

WS-2 (Western Spadefoot Exclusion Fencing): If Covered Activities must be implemented in modeled habitat (Figure 3-17) after October 15 and before May 15, exclusion fencing

will be installed around the project footprint before October 15, and the project site must be monitored by an approved biologist following rain events. Temporary high-visibility construction fencing will be installed along the edge of work areas, and silt fencing will be installed immediately behind the temporary high-visibility construction fencing to exclude western spadefoot from entering the construction area. Fencing will remain in place until all construction activities within the construction area are completed. No project activities will occur outside the delineated project footprint. If a western spadefoot is encountered, refer to WS-6, below.

WS-3 (Western Spadefoot Monitoring): If Covered Activities must be implemented in modeled habitat (Figure 3-17) in the breeding and dispersal season (after October 15 and before May 15), an approved biologist experienced with western spadefoot identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place, and will inspect the project site daily for western spadefoot prior to construction activities. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western spadefoot enters an active construction zone (i.e., outside the buffer zone). If a western spadefoot is encountered, refer to WS-6, below.

WS-4 (Avoid Western Spadefoot Entrapment): If a Covered Activity occurs in western spadefoot modeled habitat (Figure 3-17), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western spadefoot modeled habitat will be inspected for western spadefoot by the approved biologist prior to being moved. If a western spadefoot is encountered, refer to WS-6, below.

WS-5 (Erosion Control Materials in Western Spadefoot Habitat): If erosion control (BMP-2) is implemented within western spadefoot modeled habitat (Figure 3-17), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that western spadefoots are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WS-6 (Western Spadefoot Encounter Protocol): If Covered Activities must be implemented in modeled habitat (Figure 3-17) during the breeding and dispersal season (after October 15 and before May 15), and a western spadefoot is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the western spadefoot within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service and California Department of Fish and Wildlife immediately. Any worker who inadvertently injures or kills a western spadefoot or who finds dead, injured, or entrapped western spadefoot(s) must immediately report the incident to the approved biologist.

Giant Gartersnake

To avoid direct and indirect effects of Covered Activities on giant gartersnake (*Thamnophis gigas*), the following AMMs will be implemented.

GGS-1 (Giant Gartersnake Surveys): If the SSHCP giant gartersnake modeled habitat maps (Figure 3-18) show that modeled habitat for giant gartersnake is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate giant gartersnake aquatic habitat within the project footprint and adjacent areas within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-18, giant gartersnake aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, agricultural ditches, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide these maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated giant gartersnake habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as giant gartersnake habitat is identified and fully avoided. Otherwise, Covered Activities must comply with GGS-2 through GGS-8, below. See Chapter 10 for the process to conduct and submit survey information.

GGS-2 (Giant Gartersnake Work Window): Covered Activities that do not fully avoid giant gartersnake modeled habitat (Figure 3-18) will be conducted during the snake's active

season. Construction and ground-disturbing activities will be initiated after May 1 and will end prior to September 15. If it appears that construction activities may go beyond September 15, the Third-Party Project Proponent or Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1. The Local Land Use Permittee and the Implementing Entity will discuss with the Wildlife Agencies additional measures necessary to minimize take.

GGS-3 (Giant Gartersnake Monitoring): If a Covered Activity is occurring in giant gartersnake modeled habitat (Figure 3-18), an approved biologist experienced with giant gartersnake identification and behavior will monitor the project site, including the integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for giant gartersnake prior to construction activities. If a giant gartersnake is encountered, refer to GGS-7. The approved biologist will also train construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a giant gartersnake enters an active construction zone (i.e., outside the buffer zone).

GGS-4 (Giant Gartersnake Habitat Dewatering and Exclusion): If construction activities will occur in giant gartersnake aquatic habitat, aquatic habitat will be dewatered and then remain dry and absent of aquatic prey (e.g., fish and tadpoles) for 15 days prior to initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to giant gartersnake. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent snakes from attempting to move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify the construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Giant gartersnake habitat outside construction fencing will be avoided by all construction personnel. The fencing and the work area will be inspected by the approved biologist to ensure that the fencing is intact and that no snakes have entered the work area before the start of each work day. The fencing will be maintained by the contractor until completion of the project. If giant gartersnake is encountered, refer to GGS-7, below.

GGS-5 (Avoid Giant Gartersnake Entrapment): If a Covered Activity occurs in giant gartersnake modeled habitat (Figure 3-18), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or

provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within giant gartersnake modeled habitat will be inspected for giant gartersnake by the approved biologist prior to being moved. If a giant gartersnake is encountered, refer to GGS-7.

GGS-6 (Erosion Control Materials in Giant Gartersnake Habitat): If erosion control (BMP-2) is implemented within giant gartersnake modeled habitat (Figure 3-18), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure snakes are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

GGS-7 (Giant Gartersnake Encounter Protocol): If a giant gartersnake is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the giant gartersnake within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a giant gartersnake or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

GGS-8 (Giant Gartersnake Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation. Refer to the U.S. Fish and Wildlife Service's (USFWS) Guidelines for the Restoration and/or Replacement of Giant Gartersnake Habitat (USFWS 1997), or the most current USFWS guidelines at the time of the

activity. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Western Pond Turtle

To avoid direct and indirect effects of Covered Activities on western pond turtle (*Actinemys marmorata*), the following AMMs will be implemented.

WPT-1 (Western Pond Turtle Surveys): If the SSHCP western pond turtle modeled habitat maps (Figure 3-19) show that modeled habitat for western pond turtle is present within a Covered Activity's project footprint or within 300 feet of a project footprint, then an approved biologist will conduct a field investigation to delineate western pond turtle aquatic habitat within the project footprint and within 300 feet of the project footprint. In addition to the SSHCP land cover types shown in Figure 3-19, western pond turtle aquatic habitat includes, but is not limited to, low-gradient streams and creeks, open water, freshwater marsh, and rice fields. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential sites and provide those maps to the Local Land Use Permittees and the Implementing Entity. Locations of delineated western pond turtle habitat must also be noted on plans that are submitted to a Local Land Use Permittee. The applicant will use this information to finalize project design. Covered Activities may occur throughout the year as long as western pond turtle habitat is identified and fully avoided. Otherwise, Covered Activities must comply with WPT-2 through WPT-9. See Chapter 10 for the process to conduct and submit survey information.

WPT-2 (Western Pond Turtle Work Window): Maintenance and improvements to existing structures may occur throughout the year as long as western pond turtle habitat is identified and avoided, and movement of equipment is confined to existing roads. Otherwise, construction and ground-disturbing Covered Activities must be conducted outside of western pond turtle's active season. Construction and ground-disturbing activities will be initiated after May 1 and will commence prior to September 15. If it appears that construction activities may go beyond September 15, the appropriate Plan Permittee will contact the Local Land Use Permittee and the Implementing Entity as soon as possible, but not later than September 1, to determine if additional measures are necessary to minimize take.

WPT-3 (Western Pond Turtle Monitoring): If a Covered Activity is occurring in western pond turtle modeled habitat (Figure 3-19), an approved biologist experienced with western pond turtle identification and behavior will monitor the project site, including the

integrity of any exclusion fencing. The approved biologist will be on site daily while construction-related activities are taking place in aquatic habitat or within 300 feet of aquatic habitat, and will inspect the project site daily for western pond turtle prior to construction activities. The approved biologist will also training construction personnel on the required avoidance procedures, exclusion fencing, and protocols in the event that a western pond turtle enters an active construction zone (i.e., outside the buffer zone).

WPT-4 (Western Pond Turtle Habitat Dewatering and Exclusion): If construction activities will occur in western pond turtle aquatic habitat, aquatic habitat for the turtle will be dewatered and then remain dry and absent of aquatic prey (e.g., crustaceans and other aquatic invertebrates) for 15 days prior to the initiation of construction activities. If complete dewatering is not possible, the Implementing Entity will be contacted to determine what additional measures may be necessary to minimize effects to western pond turtle. After aquatic habitat has been dewatered 15 days prior to construction activities, exclusion fencing will be installed extending a minimum of 300 feet into adjacent uplands to isolate both the aquatic and adjacent upland habitat. Exclusionary fencing will be erected 36 inches above ground and buried at least 6 inches below the ground to prevent turtles from attempting to burrow or move under the fence into the construction area. In addition, high-visibility fencing will be erected to identify construction limits and to protect adjacent habitat from encroachment of personnel and equipment. Western pond turtle habitat outside construction fencing will be avoided by all construction personnel. The fencing and work area will be inspected by the approved biologist to ensure that the fencing is intact and that no turtles have entered the work area before the start of each work day. Fencing will be maintained by the contractor until completion of the project. If, after exclusion fencing and dewatering, western pond turtles are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will discuss the next best steps with the Implementing Entity and Wildlife Agencies.

WPT-5 (Avoid Western Pond Turtle Entrapment): If a Covered Activity occurs within western pond turtle modeled habitat (Figure 3-19), all excavated steep-walled holes and trenches more than 6 inches deep will be covered with plywood (or similar material) or provided with one or more escape ramps constructed of earth fill or wooden planks at the end of each work day or 30 minutes prior to sunset, whichever occurs first. All steep-walled holes and trenches will be inspected by the approved biologist each morning to ensure that no wildlife has become entrapped. All construction pipes, culverts, similar structures, construction equipment, and construction debris left overnight within western pond turtle modeled habitat will be inspected for western pond turtle by the approved biologist prior to being moved.

WPT-6 (Erosion Control Materials in Western Pond Turtle Habitat): If erosion control (BMP-2) is implemented within western pond turtle modeled habitat (Figure 3-19), non-entangling erosion control material will be used to reduce the potential for entrapment. Tightly woven fiber netting (mesh size less than 0.25 inch) or similar material will be used to ensure that turtles are not trapped (no monofilament). Coconut coir matting and fiber rolls containing burlap are examples of acceptable erosion control materials.

WPT-7 (Western Pond Turtle Modeled Habitat Speed Limit): Covered Activity construction and maintenance vehicles will observe a 20-mile-per-hour speed limit within western pond turtle modeled upland habitat (Figure 3-19).

WPT-8 (Western Pond Turtle Encounter Protocol): If a western pond turtle is encountered during construction activities, the approved biologist will notify the Wildlife Agencies immediately. Construction activities will be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, the approved biologist will notify the Wildlife Agencies to determine the appropriate procedures related to relocation. If the animal is handled, a report will be submitted, including date(s), location(s), habitat description, and any corrective measures taken to protect the turtle, within 1 business day to the Wildlife Agencies. The biologist will report any take of listed species to the U.S. Fish and Wildlife Service immediately. Any worker who inadvertently injures or kills a western pond turtle or who finds one dead, injured, or entrapped must immediately report the incident to the approved biologist.

WPT-9 (Western Pond Turtle Post-Construction Restoration): After completion of ground-disturbing Covered Activities, the applicant will remove any temporary fill and construction debris and will restore temporarily disturbed areas to pre-project conditions. Restoration work includes such activities as re-vegetating the banks and active channels with a seed mix similar to pre-project conditions. Appropriate methods and plant species used to re-vegetate such areas will be determined on a site-specific basis in consultation with the Implementing Entity. Restoration work may include replanting emergent aquatic vegetation and placing appropriate artificial or natural basking areas in waterways and wetlands. A photo documentation report showing pre- and post-project conditions will be submitted to the Implementing Entity 1 month after implementation of the restoration.

Tricolored Blackbird

To avoid direct and indirect effects of Covered Activities on tricolored blackbird (*Agelaius tricolor*), the following AMMs will be implemented.

TCB-1 (Tricolored Blackbird Surveys): If modeled habitat for tricolored blackbird is present within a Covered Activity's project footprint or within 500 feet of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting or foraging sites are present within the project footprint and adjacent areas within 500 feet of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Within the Plan Area, potential tricolor blackbird nest sites are often associated with freshwater marsh and seasonal wetlands, or in thickets of willow, blackberry, wild rose, thistle, and other thorny vegetation. Tricolored blackbirds are also known to nest in crops associated with dairy farms. Foraging habitat is associated with annual grasslands, wet and dry vernal pools and other seasonal wetlands, agricultural fields (such as large tracts of alfalfa and pastures with continuous haying schedules and recently tilled fields), cattle feedlots, and dairies. The Third-Party Project Proponent will map all existing or potential nesting or foraging sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

TCB-2 (Tricolored Blackbird Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 500 feet of a project footprint if existing or potential nest sites were found during design surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and within 3 days of ground-disturbing activities, and within the proposed project footprint and 500 feet of the proposed project footprint to determine the presence of nesting tricolored blackbird. Pre-construction surveys will be conducted during the breeding season (March 1 through August 31). Surveys conducted in February (to meet pre-construction survey requirements for work starting in March) must be conducted within 14 days and 3 days in advance of ground-disturbing activities. If a nest is present, then TCB-3 and TCB-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and the Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

TCB-3 (Tricolored Blackbird Nest Buffer): If active nests are found within the project footprint or within 500 feet of any project-related Covered Activity, the Third-Party Project Proponent will establish a 500-foot temporary buffer around the active nest until the young have fledged.

TCB-4 (Tricolored Blackbird Nest Buffer Monitoring): If nesting tricolored blackbirds are present within the project footprint or within 500 feet of any project-related Covered

Activity, then an approved biologist experienced with tricolored blackbird behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place near the disturbance buffer. Work within the nest disturbance buffer will not be permitted. If the approved biologist determines that tricolored blackbirds are exhibiting agitated behavior, construction will cease until the buffer size is increased to a distance necessary to result in no harm or harassment to the nesting tricolored blackbirds. If the biologist determines that the colonies are at risk, a meeting with the Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will be held to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a tricolored blackbird flies into an active construction zone (i.e., outside the buffer zone).

TCB-5 (Timing of Pesticide Use and Harvest Timing on Agricultural Preserves): On SSHCP Agricultural Preserves, pesticides (including herbicides) will not be applied from January 1 through July 15.

Swainson's Hawk

To avoid direct and indirect effects of Covered Activities on Swainson's hawk (*Buteo swainsoni*), the following AMMs will be implemented.

SWHA-1 (Swainson's Hawk Surveys): If modeled habitat for Swainson's hawk (Figure 3-25) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a survey to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Nest sites are often associated with Riparian land cover, but also include lone trees in fields, trees along roadways, and trees around structures. Nest trees may include, but are not limited to, Fremont's cottonwood (*Populus fremontii*), oaks (*Quercus* spp.), willows (*Salix* spp.), walnuts (*Juglans* spp.), eucalyptus (*Eucalyptus* spp.), pines (*Pinus* spp.), and Deodar cedar (*Cedrus deodara*). The Third-Party Project Proponent will map all existing and potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

SWHA-2 (Swainson's Hawk Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present within a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites were found during initial surveys and construction activities will occur during the breeding season (March 1 through September 15). An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities to determine presence of nesting Swainson's hawk. Pre-construction surveys will be conducted during the breeding season (March 1 through September 15). If a nest is present, then SWHA-3 and SWHA-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

SWHA-3 (Swainson's Hawk Nest Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.25 mile disturbance buffer around the active nest until the young have fledged, with concurrence from the Wildlife Agencies.

SWHA-4 (Swainson's Hawk Nest Buffer Monitoring): If nesting Swainson's hawks are present within the project footprint or within 0.25 mile of any project-related Covered Activity, then an approved biologist experienced with Swainson's hawk behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting Swainson's hawks begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a Swainson's hawk flies into an active construction zone (i.e., outside the buffer zone).

Greater Sandhill Crane

To avoid direct and indirect effects of Covered Activities on greater sandhill crane (*Grus canadensis*), the following AMMs will be implemented.

GSC-1 (Greater Sandhill Crane Surveys): If modeled habitat for greater sandhill crane (Figure 3-22) is present within a Covered Activity's project footprint or within 0.5 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential roosting sites are present within the project footprint and adjacent areas within 0.5 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. Roosting sites within the Plan Area are often associated with flooded fields, seasonal wetlands, and freshwater marsh. The Third-Party Project Proponent will map all existing or potential roosting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Roosting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

GSC-2 (Greater Sandhill Crane Pre-Construction Surveys): Pre-construction surveys will be required to determine if active roosting sites are present within a project footprint or within 0.5 mile of a project footprint if existing or potential roosting sites were found during initial surveys and construction activities will occur when wintering flocks are present within the Plan Area (September 1 through March 15). An approved biologist will conduct pre-construction surveys within 15 days of ground-disturbing activities, and within 0.5 mile of a project footprint, to determine presence of roosting greater sandhill cranes. Pre-construction surveys will be conducted September 1 through March 15, when wintering flocks are present within the Plan Area. If birds are present, then GSC-3, GSC-4, and GSC-5 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

GSC-3 (Greater Sandhill Crane Roosting Buffer): If active roosting sites are found within the project footprint or within 0.5 mile of any project-related Covered Activity, the Third-Party Project Proponent will establish a 0.5 mile temporary roosting disturbance buffer around the roosting site until the cranes have left.

GSC-4 (Greater Sandhill Crane Visual Barrier): Greater sandhill cranes have low tolerance for human disturbance, and such disturbance has caused cranes to abandon foraging and roosting sites. Repeat disturbance affects their ability to feed and store energy needed for survival. If project-related activities occur within 0.5 mile of a known roosting site as identified by surveys conducted during implementation of GSC-1 or GSC-2, a visual barrier will be constructed.

GSC-5 (Greater Sandhill Crane Roosting Buffer Monitoring): If roosting sites are found within the project footprint or within 0.50 mile of any project-related Covered Activity, an

approved biologist experienced with greater sandhill crane behavior will be retained by the Third-Party Project Proponent to monitor the roosting site throughout the roosting season and to determine when the birds have left. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary disturbance buffer can only occur with the written permission of the Implementing Entity and Wildlife Agencies. If greater sandhill cranes are abandoning their roosting and/or forage sites, the approved biologist will have the authority to shut down construction activities. If roost abandonment occurs, the approved biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid harm and harassment of individuals. The approved biologist will also train construction personnel on the avoidance procedures, buffer zones, and protocols in the event that greater sandhill cranes move into an active construction zone (i.e., outside the buffer zone).

Western Burrowing Owl

To avoid direct and indirect effects of Covered Activities on western burrowing owl (*Athene cunicularia*), the following AMMs will be implemented.

WBO-1 (Western Burrowing Owl Surveys): Surveys within modeled habitat are required for both the breeding and non-breeding season. If the project site falls within modeled habitat, an approved biologist will survey the project site and map all burrows, noting any burrows that may be occupied. Occupied burrows are often (but not always) indicated by tracks, feathers, egg shell fragments, pellets, prey remains, and/or excrement. Surveying and mapping will be conducted by the approved biologist while walking transects throughout the entire project site plus all accessible areas within a 250-foot radius from the project site. The centerline of these transects will be no more than 50 feet apart and will vary in width to account for changes in terrain and vegetation that can preclude complete visual coverage of the area. For example, in hilly terrain with patches of tall grass, transects will be closer together, and in open areas with little vegetation, they can be 50 feet apart. This methodology is consistent with current survey protocols for this species (California Burrowing Owl Consortium 1993). Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If suitable habitat is identified during the initial survey, and if the project does not fully avoid the habitat, pre-construction surveys will be required. Burrowing owl habitat is fully avoided if project-related activities do not impinge on a 250-foot buffer established by the approved biologist around suitable burrows. See Chapter 10 for the process to conduct and submit survey information.

WBO-2 (Western Burrowing Owl Pre-Construction Surveys): Prior to any Covered Activity ground disturbance, an approved biologist will conduct pre-construction surveys in all areas that were identified as suitable habitat during the initial surveys. The purpose of the pre-construction surveys is to document the presence or absence of burrowing owls on the project site, particularly in areas within 250 feet of construction activities. To maximize the likelihood of detecting owls, the pre-construction survey will last a minimum of 3 hours. The survey will begin 1 hour before sunrise and continue until 2 hours after sunrise (3 hours total), or begin 2 hours before sunset and continue until 1 hour after sunset. Additional time may be required for large project sites. A minimum of two pre-construction surveys will be conducted (if owls are detected on the first survey, a second survey is not needed). All owls observed will be counted and their location will be mapped. Surveys will conclude no more than 2 calendar days prior to construction. Therefore, the Third-Party Project Proponent must begin surveys no more than 4 days prior to construction (2 days of surveying plus up to 2 days between surveys and construction). To avoid last-minute changes in schedule or contracting that may occur if burrowing owls are found, the Third-Party Project Proponent may also conduct a preliminary survey up to 15 days before construction. This preliminary survey may count as the first of the two required surveys as long as the second survey concludes no more than 2 calendar days in advance of construction.

WBO-3 (Burrowing Owl Avoidance): If western burrowing owl or evidence of western burrowing owl is observed on the project site or within 250 feet of the project site during pre-construction surveys, then the following will occur:

During Breeding Season: If the approved biologist finds evidence of western burrowing owls within a project site during the breeding season (February 1 through August 31), all project-related activities will avoid nest sites during the remainder of the breeding season or while the nest remains occupied by adults or young (nest occupation includes individuals or family groups foraging on or near the site following fledging). Avoidance is establishment of a minimum 250-foot buffer zone around nests. Construction and other project-related activities may occur outside of the 250-foot buffer zone. Construction and other project-related activities may be allowed inside of the 250-foot non-disturbance buffer during the breeding season if the nest is not disturbed, and the Third-Party Project Proponent develops an avoidance, minimization, and monitoring plan that is approved by the Implementing Entity and Wildlife Agencies prior to project construction based on the following criteria:

- The Implementing Entity and Wildlife Agencies approve of the avoidance and minimization plan provided by the project applicant.

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline nesting and foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl nesting and foraging behavior in response to construction activities.

If there is any change in owl nesting and foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer. Construction cannot resume within the 250-foot buffer until any owls present are no longer affected by nearby construction activities, and with written concurrence from the Wildlife Agencies.

If monitoring by the approved biologist indicates that the nest is abandoned prior to the end of nesting season and the burrow is no longer in use, the non-disturbance buffer zone may be removed if approved by the Wildlife Agencies. The approved biologist will excavate the burrow in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl to prevent reoccupation after receiving approval from the Wildlife Agencies.

The Implementing Entity and Wildlife Agencies will respond to a request from the Third-Party Project Proponent to review the proposed construction monitoring plan within 21 days.

During Non-Breeding Season: During the non-breeding season (September 1 through January 31), the approved biologist will establish a minimum 250-foot non-disturbance buffer around occupied burrows. Construction activities outside of this 250-foot buffer will be allowed. Construction activities within the non-disturbance buffer will be allowed if the following criteria are met to prevent owls from abandoning over-wintering sites:

- An approved biologist monitors the owls for at least 3 days prior to construction to determine baseline foraging behavior (i.e., behavior without construction).
- The same approved biologist monitors the owls during construction and finds no change in owl foraging behavior in response to construction activities.
- If there is any change in owl foraging behavior as a result of construction activities, the approved biologist will have authority to shut down activities within the 250-foot buffer.
- If the owls are gone for at least 1 week, the Third-Party Project Proponent may request approval from the Implementing Entity and Wildlife Agencies that an approved biologist excavate usable burrows and install one-way exclusionary

devices to prevent owls from re-occupying the site. After all usable burrows are excavated, the buffer zone will be removed and construction may continue.

Monitoring must continue as described above for the non-breeding season as long as the burrow remains active.

WBO-4 (Burrowing Owl Construction Monitoring): During construction of Covered Activities, 250-foot construction buffer zones will be established and maintained around any occupied burrow. An approved biologist will monitor the site to ensure that buffers are enforced and owls are not disturbed. The approved biologist will also train construction personnel on avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.

WBO-5 (Burrowing Owl Passive Relocation): Passive relocation is not allowed without the express written approval of the Wildlife Agencies. Passive owl relocation may be allowed on a case-by-case basis on project sites during the non-breeding season (September 1 through January 31) with the written approval of the Wildlife Agencies if the other measures described in this condition preclude work from continuing. Passive relocation must be done in accordance with the latest California Department of Fish and Wildlife guidelines for burrowing owl. Passive relocation will only be proposed if the burrow needing to be removed or with the potential to collapse from construction activities is the result of a Covered Activity. If passive relocation is approved by the Wildlife Agencies, an approved biologist can passively exclude birds from their burrows during the non-breeding season by installing one-way doors in burrow entrances. These doors will be in place for 48 hours to ensure that owls have left the burrow, and then the biologist will excavate the burrow to prevent reoccupation. Burrows will be excavated using hand tools only. During excavation, an escape route will be maintained at all times. This may include inserting an artificial structure into the burrow to avoid having materials collapse into the burrow and trap owls inside. Other methods of passive relocation, based on best available science, may be approved by the Wildlife Agencies over the 50-year Permit Term.

WBO-6 (Burrowing Owl Timing of Maintenance Activities): All activities adjacent to existing or planned Preserves, Preserve Setbacks, or Stream Setback areas will be seasonally timed, when safety permits, to avoid or minimize adverse effects on occupied burrows.

WBO-7 (Rodent Control): Rodent control will be allowed only in developed portions of a Covered Activity project site within western burrowing owl modeled habitat. Where rodent control is allowed, the method of rodent control will comply with the methods of

rodent control discussed in the 4(d) Rule published in the U.S. Fish and Wildlife Service's (2004) final listing rule for tiger salamander.

Covered Raptor Species

To avoid direct and indirect effects of Covered Activities on covered raptor species, the following AMMs will be implemented. This measure applies to Cooper's hawk (*Accipiter cooperii*), loggerhead shrike (*Lanius ludovicianus*), northern harrier (*Circus cyaneus*), and white-tailed kite (*Elanus leucurus*). The following AMMs do not apply to ferruginous hawk (*Buteo regalis*), as they do not nest in the Plan Area. The following AMMs also do not apply to Swainson's hawk or burrowing owl, as specific AMMs have been developed for these covered raptor species.

RAPTOR-1 (Raptor Surveys): If modeled habitat for a covered raptor species (Figures 3-20, 3-23, 3-24, or 3-28) is present within a Covered Activity's project footprint or within 0.25 mile of a project footprint, then an approved biologist will conduct a field investigation to determine if existing or potential nesting sites are present within the project footprint and adjacent areas within 0.25 mile of the project footprint. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. The Third-Party Project Proponent will map all existing or potential nesting sites and provide these maps to the Local Land Use Permittees and Implementing Entity. Nesting sites must also be noted on plans that are submitted to a Local Land Use Permittee. See Chapter 10 for the process to conduct and submit survey information.

RAPTOR-2 (Raptor Pre-Construction Surveys): Pre-construction surveys will be required to determine if active nests are present with a project footprint or within 0.25 mile of a project footprint if existing or potential nest sites are found during initial surveys and construction activities will occur during the raptor breeding season. An approved biologist will conduct pre-construction surveys within 30 days and 3 days of ground-disturbing activities within the proposed project footprint and within 0.25 mile of the proposed project footprint to determine presence of nesting covered raptor species. Pre-construction surveys will be conducted during the raptor breeding season. If a nest is present, then RAPTOR-3 and RAPTOR-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

RAPTOR-3 (Raptor Nest/Roost Buffer): If active nests are found within the project footprint or within 0.25 mile of any project-related Covered Activity, the Third-Party Project

Proponent will establish a 0.25 mile temporary nest disturbance buffer around the active nest until the young have fledged.

RAPTOR-4 (Raptor Nest/Roost Buffer Monitoring): If project-related Covered Activities within the temporary nest disturbance buffer are determined to be necessary during the nesting season, then an approved biologist experienced with raptor behavior will be retained by the Third-Party Project Proponent to monitor the nest throughout the nesting season and to determine when the young have fledged. The approved biologist will be on site daily while construction-related activities are taking place within the disturbance buffer. Work within the temporary nest disturbance buffer can occur with the written permission of the Implementing Entity and Wildlife Agencies. If nesting raptors begin to exhibit agitated behavior, such as defensive flights at intruders, getting up from a brooding position, or flying off the nest, the approved biologist/monitor will have the authority to shut down construction activities. If agitated behavior is exhibited, the biologist, Third-Party Project Proponent, Implementing Entity, and Wildlife Agencies will meet to determine the best course of action to avoid nest abandonment or take of individuals. The approved biologist will also train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a covered raptor species flies into an active construction zone (i.e., outside the buffer zone).

Western Red Bat

To avoid direct and indirect effects of Covered Activities on western red bat (*Lasiurus blossevillii*), the following AMMs will be implemented.

BAT-1 (Winter Hibernaculum Surveys): If modeled habitat (Figure 3-30) for western red bat is present within 300 feet of a Covered Activity's project footprint, then an approved biologist will conduct a field investigation of the project footprint and adjacent areas within 300 feet of a project footprint to determine if a potential winter hibernaculum is present, and to identify and map potential hibernaculum sites. Adjacent parcels under different land ownership will be surveyed only if access is granted or if the parcels are visible from authorized areas. If potential hibernaculum sites are found, the Third-Party Project Proponent will note their locations on project designs and will design the project to avoid all areas within a 300-foot buffer around the potential hibernaculum sites. Winter hibernaculum habitat is fully avoided if project-related activities do not impinge on a 300-foot buffer established by the approved biologist around an existing or potential winter hibernaculum site. See Chapter 10 for the process to conduct and submit survey information.

BAT-2 (Winter Hibernaculum Pre-Construction Surveys): If the Third-Party Project Proponent elects not to avoid potential winter hibernaculum sites within the project footprint plus a 300-foot buffer, additional surveys are required. Prior to any ground disturbance related to Covered Activities, an approved biologist will conduct a pre-construction survey within 3 days of ground-disturbing activities within the project footprint and 300 feet of the project footprint to determine the presence of winter hibernaculum sites. Pre-construction surveys will be conducted during the winter hibernaculum season (November 1 through March 31). If a winter hibernaculum is present, then BAT-3 and BAT-4 will be implemented. The approved biologist will inform the Land Use Authority Permittee and Implementing Entity of species locations, and they in turn will notify the Wildlife Agencies.

BAT-3 (Winter Hibernaculum Buffer): If active winter hibernaculum sites are found within the project footprint or within 300 feet of the project footprint, the Third-Party Project Proponent will establish a 300-foot temporary disturbance buffer around the active winter hibernaculum site until bats have vacated the hibernaculum and the Implementing Entity and Wildlife Agencies concur.

BAT-4 (Bat Eviction Methods): An approved biologist will determine if non-maternity and non-hibernaculum day and night roosts are present on the project site. If necessary, an approved biologist will use safe eviction methods to remove bats if direct impacts to non-maternity and non-hibernaculum day and night roosts cannot be avoided. If a winter hibernaculum site is present, Covered Activities will not occur until the hibernaculum is vacated, or, if necessary, safely evicted using methods acceptable to the Wildlife Agencies.

Re: Preliminary Geotechnical Report
West Jackson Highway Master Plan Area
Sacramento, California
Langan Project No.: 731611701

Dear Mr. Leachman and Mr. Molloy:

Langan Treadwell Rollo (T&R) is pleased to submit this report presenting the results of our preliminary geotechnical and geological consultation for the West Jackson Highway Master Plan (WJHMP) Area in Sacramento County, California. The WJHMP Area includes properties owned by Teichert Land Co. (Teichert) and Granite Construction Company (Granite) (collectively, the Participant Properties) as well as properties not owned by these companies (collectively, the Non-Participant Properties). The WJHMP Area is located south of Jackson Highway between South Watt Avenue and Excelsior Road and north of Jackson Highway between Mayhew and Excelsior Roads. The project encompasses approximately 5,913 acres.

The majority of the properties owned by Teichert and Granite are in various stages of gravel mining (active sand and gravel extraction areas, sedimentation ponds, drying beds, material conveyance, reclamation, etc.), scheduled to be mined in the near future, or not planned to be mined.

The results of our studies indicate the site conditions generally fall into one of two categories: 1) undisturbed areas, and 2) historically or actively mined areas. Undisturbed areas are underlain by native soil consisting of medium dense silty and clayey sand and very stiff sandy clay and sandy silt underlain by medium dense to very dense clayey sand with gravel and dense sandy gravel, which is in turn underlain by medium dense to very dense sand and silty sand with varying amounts of silt and clay.

Some of the mined areas have variable thicknesses of fill. The fill includes documented and undocumented fill, drying beds and sediment within wash water ponds. Documented fill typically consists of compacted stiff to hard clay, sandy clay, and clayey silts with varying amounts of sand. Undocumented or uncontrolled fill typically consists of clay, sandy clay, clayey silts with varying amounts of sand and variable stiffness/density and moisture content. Drying bed material is generally soft to medium stiff, wet, and considered to be moderately compressible. The fill and drying bed materials are underlain by native soil consisting of stiff to hard clay with varying amounts of sand, gravel and cobbles, and clay, and silt with varying amounts of sand, gravel, and cobbles, and layers of medium dense to very dense sand and silty sand with varying amounts of silt and clay.

Based on the results of this study, we conclude the primary geotechnical concerns affecting the design and construction of improvements within the Master Plan area are;

- the presence of undocumented fill,
- sediment in existing ponds,
- settlement of drying bed material and undocumented fill under the weight of new fill and building loads,
- slope inclination and potential for exposed granular layers in side slopes,
- and presence of expansive soil.

This report contains preliminary conclusions regarding subsurface conditions and soil characteristics at the site based on our review and interpretation of available reports and data. Detailed geotechnical studies should be performed during final design for proposed structures to be built on the properties. These studies could include subsurface exploration within the site, laboratory testing of representative soil samples, and engineering evaluations to develop geotechnical recommendations for the proposed structures.

We appreciate the opportunity to be of service to you on this project. If you have any questions, please call.

Sincerely,
Langan Treadwell Rollo

1.0 INTRODUCTION

This report presents the results of our preliminary geotechnical and geological consultation for the West Jackson Highway Master Plan (WJHMP) Area (Project) located in Sacramento County, California. The objective of our consultation is to provide geotechnical and geological information for preliminary planning and preparation of an Environmental Impact Report (EIR) for the Project. Numerous geotechnical and geological studies have been performed for portions of the Project and where available these reports were collected and reviewed; this report compiles data from several sources.

2.0 BACKGROUND

The Project encompasses approximately 5,913 acres and includes properties owned by Teichert Aggregates (Teichert) and Granite Construction Company (Granite) and properties owned by others (Non-Participant). Collectively, Teichert and Granite represent the Participant properties. As shown on Figure 1, the majority of the area is south of Jackson Highway between South Watt Avenue and Excelsior Road, the remainder of the area is north of Jackson Highway between Mayhew and Excelsior Roads. The Participant properties owned by Teichert include: Aspen 2, Aspen 3, Aspen 3 South, Aspen 4, Aspen 4 South, Mayhew Property, Aspen 5, Aspen 5 South, Aspen 6, Aspen 7, Aspen 7 South, Aspen 8, and Aspen 9 as shown on Figure 2. The Participant properties owned by Granite include: Bradshaw, Happy Lane, Fairbairn, Granite 1, Machida, and Vineyard 1, as shown on Figure 2. These properties are in various operational stages of gravel mining including: active removal of sand and gravel, processes associated with mining (sedimentation ponds, drying beds, material conveyance, reclamation, wetland mitigation, etc.). In addition, some Participant properties are un-mined (Aspen 4 South, Aspen 7, Aspen 7 South, Aspen 8, and Aspen 9). The non-Participant properties are not owned by either Teichert or Granite, and are not expected to be mined for the purposes of this report.

The elevation of the ground surface in the currently un-mined Participant and Non-Participant properties ranges from about 40 to 115 Feet[1], sloping gently towards the west. However, much of the WJHMP Area has previously been mined for aggregate resulting in the ground surface within the mined areas of the Participant properties being approximately 20 to 35 feet lower than the surrounding ground surface and roadways. Morrison Creek flows from the

[1] Elevations referenced to Mean Sea Level.

northeast boundary through mining areas to the southwest boundary of the site. Portions of Morrison Creek have been re-aligned to flow through a manmade channel that has been constructed as part of the reclamation operations for the mines.

3.0 PROJECT DESCRIPTION

The West Jackson Highway Master Plan was initiated by the Sacramento County Board of Supervisors on April 17, 2012. In accordance with the requirements of General Plan Land Use Element Policy LU-119, StoneBridge Properties, LLC, a subsidiary of Teichert Land Co., and Granite Construction Company, a California corporation ("Participant Properties") have initiated the Master Plan process for all land encompassed within the proposed Master Plan Area (referred to herein as the "Plan Area"). Of the entire 5,913± acres of the Plan Area, the Participant Properties collectively own 4,079± acres – Teichert owns 3,106± acres and Granite owns 1,063± acres. Thus, Participant Properties represent 69% of the total Plan Area acreage. These properties primarily include aggregate mining sites used for sand and gravel extraction, many of which have already been reclaimed. Although most of the mining is complete, some of the Participant Properties continue to support various mining related activities.

In addition to mining areas, the Plan Area is comprised of a mixture of rural residential, institutional, agricultural and industrial properties located along State Route 16 (Jackson Highway) in the geographic center of Sacramento County. The Plan Area boundaries are generally Jackson Highway, Kiefer Boulevard and Goethe Road to the north, portions of Elder Creek Road and Florin Road to the south, the City of Sacramento to the west and Excelsior Road to the east. As a result of the mining activities which have dominated the landscape since the 1930's, the Plan Area has largely been bypassed by development. Just over 80% of the Plan Area boundary abuts the existing Sacramento County Urban Policy Area and the Sacramento City Limits.

As illustrated by Figure 3, the Master Plan has been designed to provide a mixture of residential, commercial, recreational, farming, and employment nodes intended to reduce vehicle miles traveled (VMT) within the Master Plan Area and support the provision and use of transit alternatives. The Master Plan establishes a framework and strategy for all future land use within the Plan Area, including general land use and development standards, policies, land use allocations, infrastructure, and public service planning. Within the Master Plan, two District Area Plans are established, in addition to three Future Planning Areas (FPA's). District Area Plans primarily consist of Participant properties, while Future Planning Areas are comprised of

Non-Participant property owners (Figure 3). Teichert owns 3,106± acres within District 1. Granite owns 1,063± acres within District 2.

The District Plans establish specific land uses, policies and development standards for the properties within the District Areas. Although future land uses for the FPAs will be established in gross by the Master Plan, specific land uses, policies, and development standards for these areas are not provided by the Master Plan. It is anticipated that the landowners within the FPAs will initiate District Plans or Specific Plans in the future. Should the landowners in those areas contemplate changing existing land uses within the FPA, such future use must be consistent with the provisions of the Master Plan.

4.0 SCOPE OF SERVICES

Our services were performed in accordance with our proposal dated 15 May 2013. For Participant properties our services included reviewing available documents including: reports, test data, reclamation plans, maps, aerial photographs, aerial satellite imagery and surveys; performing a site reconnaissance and preliminary engineering analyses. For Non-Participant properties we reviewed available documents including: reports, maps, aerial photographs, aerial satellite imagery and surveys. The results of our studies are included in this summary report. This report *presents* the following:

- subsurface conditions (soil and groundwater)
- presence of naturally occurring hazardous soil and rocks (asbestos containing soil and rocks, radon potential, etc.)
- seismic hazards (ground shaking, fault rupture, liquefaction, settlements, slope displacements, etc.)
- stability evaluation of existing slopes (static and seismic)
- potential problematic soil conditions (sedimentation ponds, undocumented fills, etc.)
- appropriate ground improvement/mitigation techniques for identified hazards (if necessary)
- general ground surface settlement characteristics due to new and existing loads including fills and anticipated foundations

Subsurface explorations and developing detailed conclusions and recommendations for design and construction of the proposed developments was not included as part of our current scope of services. Detailed geotechnical studies should be performed during final design of each improvement proposed to be constructed.

5.0 PREVIOUS GEOTECHNICAL INVESTIGATIONS FOR PARTICIPANT PROPERTIES

Multiple geotechnical investigations were performed for portions of the project between 1979 and 2013. These geotechnical studies mainly addressed developing portions of the WJHMP Area for commercial and residential use, mining and reclaiming Participant properties including realignment of Morrison Creek. The quality of the data and scope of the information in these reports varies greatly including some locations with limited or no subsurface information.

The summary has been broken down into reports that pertain to General Site development (Table 1) and reports that pertain to Morrison Creek (Table 2).

5.1 General Site Development Reports

The reports addressing general site development (Table 1) provided conclusions and recommendations for Aspen 2, Aspen 3, Aspen 4, Aspen 5, Aspen 6, Aspen 7, Aspen 8, Mayhew, and Vineyard 1 properties. The conclusions and recommendations presented in the reports for Aspens 2 and 3, and Mayhew considered the construction of office, commercial, retail and residential developments as well as development of drainage to direct storm water to retention ponds and open space areas. The reports for the Vineyard 1 properties provided conclusions and recommendations for future residential developments.

Granite	Vineyard 1	*Geotechnical Engineering Evaluation Study, Proposed Quarry Reclamation, Development Area 1, Vineyard Aggregate Quarry, 9210 Fruitridge Road, Sacramento, California* by Consolidated Engineering Laboratories dated 3 July 2012.
		Geotechnical Engineering Evaluation Study, Proposed Mine Reclamation, Development Areas 2 and 3, Vineyard Aggregate Mine, 9210 Fruitridge Road, Sacramento, California by Consolidated Engineering Laboratories dated 6 November 2012.

5.2 Summary of Morrison Creek Reports

The reports addressing Morrison Creek Re-alignment (Table 2) provide information pertinent to construction of up to 40 foot high embankments composed of engineered fill. To mitigate potential slope instability, the reports recommend limiting slopes to no steeper than 2:1 (horizontal:vertical), limiting finished side slopes for mining pits to no steeper than 1.5:1 (H:V), and providing compaction requirements including placement of fill in 6-inch lifts to 90 percent

relative compaction at or near the optimum moisture content. The reports also indicated that portions of the realignment channel within Aspen 3 South and Vineyard 1 properties have been completed.

TABLE 2
Summary of Morrison Creek Geotechnical Studies

Property Owner	Report Area	Report Reference

		Geotechnical Investigation For Slope Evaluation, Morrison Creek Realignment Project, Sacramento County, California by Geocon Consultants, Inc. dated 6 February 2008.
		Final Supplemental Environmental Impact Report dated September 2012.
	Morrison Creek (north of Jackson Highway)	*Geotechnical Engineering Report, Teichert/Granite Mining and Reclamation Project, Sacramento County, California*, by Wallace Kuhl and Associates dated 14 August 1989.

5.3 Other Reports

In addition we reviewed excerpts of the original reclamation plans for the Bradshaw and Fairbairn properties. These reports were not described in the preceding sections since they were generally developed in conjunction with reclamation activities and were focused on returning mining properties into interim open space or agricultural uses.

6.0 SITE HISTORY AND AERIAL PHOTOGRAPH REVIEW

As described in Section 3.0 (Project Description) of this report, the Master Plan Area is characterized by Participant Properties and Non-Participant Properties. In most cases, Participant Properties have been owned and maintained by either Teichert or Granite for an extended period of time, with many of those properties undergoing numerous physical changes over the years related to on-going surface mining activities, as reflected by the summary presented in Sections 6.1,6.2, and 6.3. Non-Participant properties are not owned or maintained by either Teichert or Granite, and thus have generally not undergone surface mining activities.

As a result, aerial photography reveals a more subtle transition for many of these properties into agricultural, agricultural residential, commercial, industrial, and institutional land uses, as described in the following sections.

6.1 Aerial Photograph Review of Participant Properties

We reviewed historical aerial photos from the UC Davis collection, taken between 1937 and 1999. Both single and stereo-paired photos were reviewed; a table documenting the date, photo number and scales of the aerial photos reviewed is presented in Table 3. Digital satellite imagery was viewed for site activity after 1999.

TABLE 3
List of Reviewed Aerial Photographs

Date	Photo Number	Scale
10-10-1937	ABC46-22-27, -62-67, and ABC47-22-25	1:20,000
7-19-1953	ABC3K-61	1:20:000
9-9-1957	ABC60T-177-178, and ABC68T-21-23	1:20,000
5-19-1964	ABC2EE-61-62, 16-17, 92-94	1:20,000
6-28-1972	A400607-58-59, 172-173 and 176	1:40,000
4-20-1984	WAC84C8-84-86, 17-130-135	1:60,222
5-28-1992	WAC92CA22-149,151,180	1:31,680
4-13-1999	WAC99CA1-100	1:24,000

On the basis of our review of aerial photos of the Project area, it appears that light mining/grading activities began between 1937 and 1953 in Granite 1 and Aspen 6. Mining activity had increased by 1964 and continues today. The realignment of Morrison Creek north of Jackson Highway appears to have started between 1992 and 1999.

The 1937 photos indicate that no mining was in progress in the project area; however Mather Air Force Base (AFB) is in operation near the north end of the project site. The remainder of the area appears to be occupied by farms, associated structures and grasslands.

The 1953 set of photos was incomplete, consequently limiting our review of the project site to a few areas. However, mining operations appear to have begun in Granite 1, north of the original Morrison Creek alignment and near the eastern boundary between Granite 1 and Aspen 6.

In 1957, mining is evident in the northern portion of Granite 1 (triangular area immediately adjacent to the southern boundary of Mather AFB) and appears to be related to construction at the airfield, where the runway was being extended toward the southwest. A pond is evident along the eastern boundary of the triangular area, as well as stockpiled material in the southwest corner. Mining in the Granite 1 area was observed in the 1953 photo.

The 1964 photos indicate continued mining in Granite 1, and water has ponded in the southeast corner, where excavations appear deepest. Steep cuts bound the quarry along access roads to the south (proposed future alignment of Kiefer Road) and east. Processing plant structures are located toward the front of the property. In Aspen 5, the ground east of Morrison Creek appears to be potentially undergoing light mining or grading. The ground surface throughout the rest of the area appears to have been previously disturbed, and is possibly an inactive borrow area. There are several scattered areas with depressions, disturbed ground, a possible irrigation channel and generally hummocky terrain. Mining activity appears to have started in Aspen 5 and Aspen 6.

In 1972, the photos indicate mining has begun in the Bradshaw property. Mining in northern Granite 1 appears dormant, with some areas filled in and several access roads constructed across the site. Light borrow and other graded areas are visible in Granite 1, with one small but relatively deep excavation. In Aspen 5, the mined area south of the Machida property (see Figure 4) that was visible in the 1964 photos appears to have been mostly filled in, and more structures now occupy the property. Mining is in progress in Aspen 2, with a deep pit excavated adjacent to South Watt Avenue and terminating before Fruitridge Road.

The 1984 photos show the Bradshaw property being extensively mined. Some light mining has resumed in northern Granite 1. Aspen 2 appears to have been returned to agricultural use; fields are evident throughout most of the site. Mining is in progress in Aspen 3, within the area to the north of Fruitridge Road and east of Hedge Avenue. The mine appears to be accessed from Jackson Road. Grading has started at the southwest corner of Aspen 4. In Aspen 6, a pit has been excavated in the eastern portion of the site, behind residences along Excelsior Road.

A number of photos from the 1992 set were missing and therefore not all areas were viewed from that year. The available photos show ponds in the southeastern portion of the Bradshaw property. Mining is in progress in the area east of Bradshaw Road and north of the Machida property. Mining is also in progress in Aspen 4, with three ponds aligned along Bradshaw Road, which remain as their current configuration. Aspens 2 and 3 appear to both be in use as agricultural farmland. Photos showing the areas east of Aspen 3 and south of Jackson Road were not available for this year.

In the 1999 photo, a pond is visible in the western portion of Aspen 6, which appears to slightly overlap the boundary with Aspen 5. Extensive mining is in progress in both Aspen 6 and Aspen 5. In Aspen 6, a portion of Morrison Creek near Jackson Road has been realigned. A smaller pond can be seen in Aspen 5, and is located roughly in the middle of the property. This pond remains in its current configuration.

6.2 Digital Satellite Imagery Review of Participant Properties

To supplement our aerial photo review we reviewed available digital satellite imagery.

In 1993, larger ponds are visible at the southeastern corner of the Bradshaw property, with some two smaller ponds near the northwestern corner. Extensive mining on the Mayhew property is in progress.

In 1999, mining is in progress in Happy Lane, and appears to have started sometime between 1998 and 1999. With the exception of a non-Participant property, mining activities span the entire area east of Bradshaw Road and north of Jackson Road to the western portions of Granite 1 and Aspen 6; Morrison Creek has been realigned through these properties into its current alignment, and mining has started in the northern portion of Aspen 3 South.

The 2002 imagery shows a large portion of the Bradshaw property occupied by ponds, mostly located in the eastern half of the property and along the north, east and south property boundaries. These ponds appear to be in their current configurations and are separated in areas by embankments. Mining has extended east in Granite 1 and Aspen 6; ponds are visible adjacent to a conveyor belt in Aspen 6, just north of Jackson Road. Another small pond has appeared at the eastern boundary of Aspen 6, behind a non-Participant property along Excelsior Road. The original alignment of Morrison Creek is still visible traversing through the property. Grading for a conveyor belt system is seen extending from Aspen 6 into Aspen 5 South before turning west and extending into Aspen 4 South and terminating at Mayhew Road.

Aspen 4 is almost completely covered by four distinct ponds, all separated by levees. Mining is in progress in Mayhew and Aspen 3 South. Small ponds are visible in Aspen 3 and Aspen 3 South, located in small isolated areas.

6.3 Aerial Photograph and Digital Satellite Imagery Review of Non-Participant Properties

We reviewed aerial photographs and digital satellite imagery of the Non-Participant properties. The majority of Non-Participant properties have been primarily used for agricultural, agricultural residential and light commercial purposes. These areas have generally experienced no mining activities and except for new building construction, little change in topography has occurred to these properties.

Exceptions are the Non-Participant properties located to the southwest and the northeast of the intersection of Jackson and Bradshaw Roads. These properties appear to have experienced significant grading, mining and/or related mining activities.

The property located southwest of the intersection of Jackson and Bradshaw Roads is bound by Bradshaw Road to the east, Non-Participant properties to the north and south and Mayhew Property to the west. This property appears to have been an extension of Mayhew and experienced grading and/or mining activities starting prior to 1993. The activities at this property appear to have ceased around 2002 at about the same time as the Mayhew Property. Since 2004 the site appears to be used as a stockpile/storage yard for fill and construction related debris.

The property located northeast of the intersection of Jackson and Bradshaw Roads is bound by Bradshaw to the west, Non-Participant properties to the south and Aspen 5 to the north and east. Portions of this property appear to have been excavated prior to 1993 and have been used as a processing plant and stockpile site since.

7.0 FIELD RECONNAISSANCE OF PARTICIPANT PROPERTIES

On 28-30 August 2013, we conducted a general site reconnaissance of the Participant properties within the Project area that have been or are being mined. The purpose of the site reconnaissance was to observe the existing site conditions, with respect to the proposed land uses for the Participant properties within the WJHMP Area, and identify features such as ponds, areas of active mining or grading, slope instability, or other conditions that may potentially impact future proposed site developments. For clarity we have divided our

observations between Teichert owned properties and Granite owned properties. Our observations are presented on Figure 4 and summarized below. Detailed geologic mapping was not performed.

7.1 Teichert Properties

Aspen 2

The site is lower than adjacent street grades. The property appears to be in use for agricultural purposes and drying bed operations.

Site slopes were observed to be approximately 2:1 in most areas; with a few isolated areas inclined downward into the property at 1:1 and 1.5:1 inclinations. Slopes bordering ponds in the northern half of the property were observed to have erosional rills and some minor surficial slip-outs, with some scarps reaching the access road at crest of the slopes. Slip-outs were also observed above a small pond at the southeastern corner. Gradients on the access road appear to be inclined toward the ponds, potentially directing surface run-off toward them and contributing to slope erosion. Gradients on access roads at the southern half of the property were observed to be inclined away from the slopes; no erosional rills were observed on the slopes in this location. An irrigation channel along the toe of slope at the southeastern corner (at Fruitridge Road) has incised vertical banks, but no instability was noted on the slope above it.

Aspen 3

The majority of the site is below adjacent street grades. Drying beds are being used and contain varying amounts of water. Site slopes were observed to have inclinations of 2:1 or shallower, and appeared in relatively good condition. A section of slope at the northeastern corner of the site appears to have inclinations of approximately 1.5:1; a few slip-outs, deep rills and erosional scars were noted on the slope in this location.

Aspen 3 South

The majority of the property is currently below adjacent street grades, and mining is still actively occurring on the site. The realigned and elevated Morrison Creek extends across the property and appears to terminate just short of the southeastern corner; the embankment bounding the system along the north bank rises approximately 35 to 40 feet above adjacent

grades. A large pipe (dimensions not measured) extends through the base of the realigned creek channel embankment and appears to discharge to the south. No water was observed discharging from the pipe during our site visit. Fill has been placed roughly in the middle of the property, to the north of the new Morrison Creek alignment.

Vertical cut slopes up to approximately 20 feet tall were observed in several areas, including within close proximity to Mayhew Road, previous excavation areas around the site, and behind a non-Participant property along Mayhew Road; a top of cut failure was observed in this area. At the southeastern corner of the property, the base of the southern fill embankment confining the new creek system is eroded and incised. The configuration of the southern embankment in this area appears to be coincident with the original creek bank; fill for the new embankment may have been placed directly on top of the existing creek bank.

Aspen 4

This site is dominated by wash water ponds which serve the on-site prewash facility, which all appeared to be near capacity.

The embankments separating the ponds were observed to be steep and undercut in areas, with occasional deep rills. Some of the rills have been filled in with cobbles, and rip-rap has been placed along the banks of the northernmost pond. Slopes bordering the northwest limits of Aspen 4 were observed to be inclined at approximately 1.5:1, with numerous slip-outs and other erosional features.

Aspen 5

Active mining has not occurred in Aspen 5 for many years. However, mining related activities, such as the conveyor system transports materials through the site to the prewash facility west of Bradshaw.

Aspen 5 South

Active mining in the western half of the site was in progress during our site visit, resulting in excavations that extend below the adjacent street grade. A strip of undisturbed ground along

the western boundary is currently occupied by a parking area and construction trailers. The eastern half of the property appeared undisturbed. A pond is present near in the center of the property.

Slopes appeared to be inclined at approximately 2:1. Vertical cuts were observed along the limits of current mining activities at the southern property boundary. The pond banks were noted to be near vertical, with numerous surficial slip-outs and various erosional features.

Aspen 6

Most of Aspen 6 are lower than adjacent street grades, associated with previous mining activity. Grading was in progress during our site visit, and fill was being placed near the northern end of the property. Recent grading activity was also observed near the southwestern corner of Aspen 6. A portion of the realigned Morrison Creek extends through the site.

Shallow slip-outs were observed along the slope below Excelsior Road; a slope angle measurement taken in this area resulted in a slope inclination of approximately 1.3:1. Vertical cuts were observed in isolated areas around the site, mainly in areas of active grading.

Ponds with varying amounts of water were observed.

Mayhew

Site topography appears to be as depicted on the topographic survey, with most of the site below adjacent street grades. Inclinations between 1.75:1 and 2:1 were noted on slopes along the northern portion of the property, and 1.5:1 on slopes near the southwestern corner of the property. Minor rills were noted in each of these locations. Some erosion and sloughing was noted at the top of a short vertical cut at the northwestern corner. Pond locations were observed to be dry.

Aspen 4 South, Aspen 7, Aspen 7 South, Aspen 8, Aspen 9

Site reconnaissance visits were not made to Aspen 4 South, Aspen 7, Aspen 7 South, Aspen 8 and Aspen 9 since based on our review of aerial photographs and satellite imagery these areas generally have not been mined and have experienced little change to the topography or subsurface conditions.

7.2 Granite Properties

Bradshaw Property

Several areas around most of the property are lower than surrounding street grade elevations. Slopes bordering excavated areas around the site were observed to be inclined from approximately 1.5:1 (H:V) to greater than 2:1. We did not observe instability of the slopes. However, we did observe a crack at the crest of the southern embankment of the pond in the northeastern corner of the site. Significant amounts of fill have been placed to form pond embankments and backfill the former quarry excavation.

Happy Lane

Most of this property is dominated by a large wash water pond created at the base of the former sand and gravel mine. The slopes appeared to be inclined at 1.5:1 (H:V) as per the approved mine reclamation plan. Evidence of surficial creep and some shallow slip-outs were observed on south-facing slope. Subtle and discontinuous cracks were observed in the access road above this area. The area was used as a wash water pond, but contained little water during our site visit; however, a discharge pipe was noted at the southwestern corner of the pond, with a small amount of water trickling into the excavation.

Machida

The site is lower than the adjacent street grades. Site slopes appear to be inclined at 1.5:1 as per the approved Grading Plan. Erosional rills were observed on all sides, with several shallow but extensive slip-outs and deep erosional scars on the north-facing slope. These erosional features appear to be isolated to areas with granular material exposed in the slope faces.

Fairbairn

Most of the Fairbairn property was observed to be lower than adjacent street grades. Slopes appear to be inclined at 1.5:1 as per the approved mine reclamation plan and appeared to be in relatively good condition at the time of our visit.

Granite 1

Morrison Creek has undergone realignment through this property, and is currently confined within a reconstructed channel. Running water was observed within the realigned channel at the time of our site visit. A marsh was observed adjacent to the southern boundary of Granite 1.

Vineyard 1

Fill was being placed in the northern portion of the site during our visit. Material was being stripped at the southern end of the property and placed in the northern portion of the property. A portion of Morrison Creek has been realigned toward Hedge Avenue. The creek in this area has been constructed. The reconstructed Morrison Creek channel crests approximately 35 to 40 feet above the adjacent grades. At the time of our site visit, the creek had not yet been redirected into the new channel.

The outer bank slopes of the Morrison Creek Realignment are 2:1 (H:V) as per the approved improvement plans. The banks of the Morrison Creek Realignment gently slope toward the creek centerline.

8.0 SUBSURFACE CONDITIONS

The following sections describe the subsurface conditions below the Participant and Non-Participant properties. The information presented in the following sections is based on our review of the available documents, aerial photographs, our site reconnaissance and our experience in the vicinity of the project.

8.1 Subsurface Conditions – Participant Properties

The subsurface conditions at the site fall into two general categories which include 1) undisturbed areas and 2) historically or actively mined areas. Figure 4 shows the approximate locations of undisturbed soil areas, the mined areas, and documented features; fills, wash water ponds, drying beds, etc.

Undisturbed areas typically consist of native soil ranging from about 5 to 14 feet of medium dense silty and clayey sand and very stiff sandy clay and sandy silt underlain by medium dense to very dense clayey sand with gravel and dense sandy gravel. The sand and gravel layer varies in thickness, but is typically around 25 to 30 feet thick. The sand and gravel layer is underlain by

medium dense to very dense sand and silty sand with varying amounts of silt and clay. The native fine grained soil (silts and clays) generally have a low to moderate expansive potential.

Some of the mined areas are underlain by fill ranging from zero to approximately 41 feet. The fill includes documented[2] and undocumented fill, drying bed soil, wash water pond sediment, and temporary water pond sediment of varying thicknesses. Documented fill generally consists of compacted stiff to hard clay, sandy clay, and clayey silts with varying amounts of sand. On the basis of our review of the available documentation, the documented fills generally were compacted to a relative compaction[3] greater than or equal to 90%.

The drying bed material is processed and compacted, and is a documented fill; however, due to the process, the material is generally soft to medium stiff, wet, and considered to be moderately compressible under new loads from fill or foundations. The drying bed material has generally high moisture content and is typically saturated. Undocumented fill typically consists of clay, sandy clay, clayey silts with varying amounts of sand with variable stiffness or density and moisture. The drying bed material and sediment within the water ponds has low to high potential for expansion due to moisture content fluctuations. The fill and drying bed material is underlain by native soil consisting of stiff to hard clay with varying amounts of sand, gravel and cobbles, and clay, and silt with varying amounts of sand, gravel, and cobbles, which are interbedded with layers of medium dense to very dense sand and silty sand with varying amounts of silt and clay.

Based on our review of available groundwater data published by Sacramento County, and California Department of Water Resources, the groundwater table beneath the site is variable. The groundwater is generally shallower on the north side of the site and slopes down to the south/southwest. Based on our review of the available groundwater data from 1990 to 2010 the groundwater beneath the site varied from approximate elevation -59 to -10 feet Mean Seal Level (MSL) (corresponding to approximate depths of 30 to 100 feet bgs). The average groundwater elevation of the data reviewed is approximately -28 feet MSL (corresponding to a depth of 36 to 49 feet bgs).

---

2 Documented fills have been placed, compacted, observed, and tested during placement by a qualified testing agency or engineer.

3 Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM D1557-00 laboratory compaction procedure.

8.2 Subsurface Conditions – Non-Participant Properties

The Non-Participant properties, excluding the two properties northeast and southwest of the intersection of Jackson and Bradshaw Roads (Section 6.3) that appear to have undergone significant grading and/or mining activities, typically consist of undisturbed native soil. We anticipate the undisturbed native soil at these properties consists of about 5 to 14 feet of medium dense silty and clayey sand and very stiff sandy clay and sandy silt underlain by medium dense to very dense clayey sand with gravel and dense sandy gravel. The sand and gravel layer varies in thickness, but is typically around 25 to 30 feet thick. The sand and gravel layer is underlain by medium dense to very dense sand and silty sand with varying amounts of silt and clay. The native fine grained soil (silts and clays) generally have a low to moderate expansive potential.

No information was available for our review regarding the characteristics of the material below the below the two Non-Participant properties that appear to have undergone significant grading and/or mining. However, we anticipate a variable thickness of fill consisting of soil and construction debris is present. The fill is likely underlain by native soil consisting of stiff to hard clay with varying amounts of sand, gravel and cobbles, and clay, and silt with varying amounts of sand, gravel, and cobbles, which are interbedded with layers of medium dense to very dense sand and silty sand with varying amounts of silt and clay.

The groundwater level at the Non-Participant properties is anticipated to be consistent with the adjacent Participant properties described in the previous section.

9.0 REGIONAL SEISMICITY – PARTICIPANT AND NON-PARTICIPANT PROPERTIES

We evaluated the regional seismicity for the Project site. The information contained in the following sections is applicable to both the Participant and Non-Participant properties. The major active faults in the area are the Great Valley, Hunting Creek-Berryessa, and Concord-Green Valley Faults. These and other active faults in the vicinity of the project are shown on Figure 5. For each of the active faults, within 100 kilometers, the distance from the site and estimated mean characteristic Moment magnitude[4] [2007 Working Group on California Earthquake Probabilities (WGCEP) (2007) and Cao et al. (2003)] are summarized in Table 4.

[4] Moment magnitude is an energy-based scale and provides a physically meaningful measure of the size of a faulting event. Moment magnitude is directly related to average slip and fault rupture area.

TABLE 4
Regional Faults and Seismicity

Fault Segment	Approx. Distance from fault (km)	Direction from Site	Mean Characteristic Moment Magnitude
Great Valley 4a, Trout Creek	58.0	West	6.6
Great Valley 4b, Gordon Valley	60.0	West	6.8
Great Valley 5, Pittsburg Kirby Hills	62.0	West	6.7
Great Valley 3, Mysterious Ridge	65.0	West	7.1
Green Valley 6, Connected	75.0	West	6.8
Hunting Creek-Berryessa	76.0	West	7.1
Greenville Connected	84.0	Southwest	7.0
West Napa	89.0	West	6.7
Great Valley 7	90.0	South	6.9
Mount Diablo Thrust	95.0	Southwest	6.7
Total Calaveras	99.0	Southwest	7.0

The Coast Ranges-Central Valley Fault (Great Valley) system is characterized by a poorly defined series of thrust faults and blind thrust faults. The fault system is defined by diffuse seismicity, distinct geomorphic expression of mountain-front faulting, and seismic reflection profiles. The thrust system trends northwest-southeast and is believed to extend 640 kilometers, forming the western boundaries of the Sacramento and San Joaquin Valleys. In general, the fault system dips westward. An earthquake on the Coast Ranges-Central Valley Fault system could cause low to moderate seismic shaking at the project site. A number of large historic earthquakes have occurred on this fault system, including the 1892 Vacaville (M_w = 6.8), 1889 Antioch (M_w = 6.3), and the 1983 Coalinga (M_w = 6.5) earthquakes. Geologists have estimated a slip rate ranging from 0.2 to 3 mm/yr. Estimated moment magnitudes of earthquakes along the thrust fault system are between 6.0 and 6.7.

The Green Valley faults consist of a highly complex zone with a potential for either one major event or two smaller events to the northwest and southeast of Suisun Bay. A single event model involving a rupture along the Concord and Green Valley faults is estimated to be capable of producing an M_w 6.9 event every 180 years. An alternate model involves independent Concord and Green Valley fault ruptures that would produce a M_w 6.5 event every 110 years and an M_w 6.7 event every 150 years, respectively (USGS 2000).

The Mount Diablo blind thrust underlying the Livermore and Sycamore Valleys is the source of major fold structures, including the Mount Diablo and Tassajara anticlines (Unruh and Sawyer 1997). The folds and the underlying fault are assumed to be active because they deform late

Pleistocene and early Holocene sediments. The geometry and slip rate on the thrust are inferred largely from structural modeling, although the existence of the thrust is consistent with seismic reflection data from the southeastern Tassajara Hills (Unruh 2000). Unruh and Sawyer (1997) hypothesize that this system has formed a left-stepping transpressional step-over between the right-lateral Greenville and Concord-Green Valley faults, and propose a kinematic model in which slip on the Greenville fault is transferred via the Mount Diablo thrust to the Concord Fault. Present modeling results constrain estimates for the minimum slip rate on the Mount Diablo thrust to a range of 1.3 to 2.4 mm/yr.

10.0 DISCUSSIONS AND CONCLUSIONS FOR PARTICIPANT PROPERTIES

On the basis of our studies, we conclude there are no geological and geotechnical conditions that preclude the proposed land uses for the development of the Participant properties of the WJHMP Area. However, there are several issues that should be addressed in detailed geotechnical studies performed during final design of each improvement. These issues include:

- Seismic hazards (ground shaking, liquefaction, settlements, etc.)
- Settlement of new and existing fill due to new loads (weight of additional fill, foundations, etc.)
- Presence of undocumented fill, and soft/deleterious material in existing water ponds, embankments, and planned building areas
- Presence of moderately to highly expansive soil
- Demolition of existing improvements
- Slope steepness and potential for erosion of exposed granular layers in retention basin side slopes
- Relatively low permeability of fine grained soil that exists throughout the project
- Potential for the presence of naturally occurring hazardous soil
- New foundations
- Preliminary ground improvement techniques
- Construction considerations

These and other geotechnical issues as they pertain to the proposed development are discussed in following sections.

10.1 Seismic Hazards

10.1.1 Ground Shaking

The seismicity of the site is governed by the activity of the Great Valley, Hunting Creek-Berryessa, and Concord-Green Valley Faults. However, ground shaking from future earthquakes on any of the regional faults could be felt at the site. The intensity of earthquake ground motions at the site will depend upon the characteristics of the generating fault, distance from the rupture, magnitude and duration of the earthquake, and specific subsurface conditions. We judge ground shaking at the site during a major earthquake on one of the nearby regional faults will be low to moderate. To reduce the potential for damage associated with earthquake-induced ground shaking, new structures should be designed in accordance with the current California Building Code (CBC) seismic design requirements.

10.1.2 Fault Rupture

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no active faults have been mapped at the site. Therefore, we conclude that the risk for fault rupture at the site is low.

10.1.3 Liquefaction and Liquefaction-Induced Settlements

We have made a preliminary evaluation of the potential for seismic hazards at the site, such as those associated with soil liquefaction, lateral spreading,[5] and cyclic densification[6] to occur within the Master Plan Area. We used the results of our preliminary geotechnical investigation to evaluate the potential of these phenomena to occur. The results of our evaluation indicate that in general the fill and native soil at the site are not saturated and are sufficiently stiff and dense to resist soil liquefaction, lateral spreading, and cyclic densification with the exception of sediments in the wash water ponds. We anticipate that some of the sediments in the wash water ponds may consist of fine grained, loose silty sand and sand. We conclude the potential for seismic hazards at the site is low, except for the wash water ponds. The magnitude of

---

[5] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[6] Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is densified by earthquake vibrations, causing ground-surface settlement.

liquefaction induced settlement is dependent upon the thickness of liquefiable layers, engineering characteristics of the material, and level of ground shaking. At this time there is not sufficient data available to evaluate the magnitude of liquefaction induced settlements of the sediment in the wash water ponds.

10.2 Settlement

Settlements at the site will result from compression of the new fills due to self-weight, existing fill and underlying native material due to the weight of new fills and foundation pressures, and consolidation related settlement of the drying bed material and sediment in the wash water ponds. The magnitude and rate of settlement are dependent upon many factors including the amount of new fill placed, type of foundation system, foundation loads, and thickness of drying bed material, where present. Preliminary estimates of the magnitude and rate at which these settlements are estimated to occur at the site are discussed in the following sections.

10.2.1 Compression from New Fill

We estimated the amount of post construction settlement that may occur due to the placement of new fill. Within the project area we anticipate that fills be required to construct new roadways in portions of Mayhew, at the storm water pond in Aspen 5 South, portions of Aspen 6, with the maximum amount of fill on the order of about 35 feet in the Aspen 6 wash water pond. The proposed Vineyard Road realignment may also require fill in the Bradshaw, Fairbairn, Aspen 5 South, and Aspen 6 properties, with a maximum of about 25 feet of fill at the wash water pond in Aspen 6. Within the mined properties we anticipate site grades will be similar to their existing grades, and any fill placed will be relatively thin (less than 5 feet thick).

The magnitude of the actual post construction settlement will be related to the amount of new fill placed, whether or not the area is underlain by a drying bed and the compressibility of the underlying soil. Areas where new fill is placed on top of drying beds will have additional settlement due to consolidation of the drying bed material. Compression of new fill may range from ½ inch for fill up to 5 feet thick to about 5 inches for fill on the order of 35 feet thick. We anticipate that the majority of the compression will occur during and shortly following construction.

10.2.2 Drying Bed Consolidation Settlement

Drying beds are primarily located in Aspen 2, Aspen 3, Aspen 4 properties. As discussed above in Sections 8, the drying bed material is saturated and considered compressible. We anticipate that typical site grades over the drying beds will be raised approximately 5 to 20 feet, with some portions of the site requiring up to 30 feet of fill.

We anticipate the magnitude of consolidation settlement of the drying bed material due to the weight of the proposed fill may range from approximately 1.5 to 12 inches. The amount of settlement is dependent upon the thickness of drying bed material and amount of proposed fill. The rate at which the drying bed material will settle depends upon the thicknesses of the drying bed material and new fill.

10.2.3 Foundation Settlement

Additional foundation settlement will occur primarily from compression of new and existing fills, and from consolidation of drying bed material and wash water pond sediments (compressible material). Building foundations underlain by 15 or more feet of new fill are not anticipated to have significant additional settlement due to relatively light foundation pressures. The magnitude and rate of the foundation settlement will depend on the type of foundation, magnitude of foundation pressure, and thickness of the compressible material (if present). We estimate approximately ½ inch of total and differential settlement may occur in areas underlain by existing fill and native soil. Areas with less than 15 feet of new fill underlying building foundations and underlain by drying bed material may settle an additional ¼ to 2/3 inches. Differential settlement will vary dependent on location, and should be determined on a site specific basis following site specific geotechnical studies.

10.2.4 Estimating Total Settlement Magnitudes

The amount of settlement that will occur at a given location depends upon many factors including the amount of new fill placed, type of foundation system, foundation loads, and thickness of drying bed material (if present). The estimated settlements presented in the sections above consider only the individual material discussed. The total amount of settlement for areas where new fill will be placed over existing drying beds will be a sum of the compression of the new fill and native material and consolidation of the drying bed material. As discussed above the majority of this settlement is anticipated to occur shortly after construction.

10.3 Undocumented Fill and Disturbed Native Soil

The ability of the undocumented fills and disturbed Native soil to safely support planned structures should be evaluated on a case-by-case basis considering the results of site specific geotechnical studies. Depending upon the proposed structure, over excavation and re-compaction of the near surface material may be required, and that some additional settlement of the undocumented material may still occur.

10.4 Expansive Soil Considerations

The existing near-surface soil and the majority of fill at the site consists of sand, clay and silt with a low to moderate expansion potential. Some of the soil in the drying beds, and wash water ponds consists of sand, clay, and silt with moderate to high expansion potential. Moisture fluctuations in expansive soil could cause the soil to expand or contract resulting in deflection and potential damage to foundations, slabs, and pavements. Potential causes of moisture fluctuations include seasonal changes, drying during construction, and subsequent wetting from rain, capillary rise, and landscape irrigation. The actual expansion potential of the soil should be determined once the finished grades have been reached and/or the location of the new building has been determined. Where encountered, material with a high expansion potential should not be used as engineered fill below building foundations or near the finished ground surface.

Mat foundations or post-tensioned (P-T) slabs should be designed to resist movements associated with seasonal moisture changes. The appropriate design parameters should be provided as part of the site specific geotechnical studies for proposed structures.

10.5 Demolition of Existing Improvements & Ponds

Existing foundations, pavements, and underground utilities to be abandoned should be removed, and the resulting excavations properly backfilled. Existing wash water and temporary water ponds are likely to have soft compressible soil, vegetation and other deleterious material in them. Soft and deleterious material, if encountered, should be removed and properly disposed of. The ponds and resulting excavations should be properly backfilled.

10.6 Slope Stability

Based on our understanding of the proposed improvements, we anticipate that cut and fill slopes will be constructed as part of the site grading. Our site reconnaissance identified existing slopes that range from isolated regions with near vertical temporary cuts in actively

mined areas to 2:1 (horizontal:vertical) and shallower slopes throughout most properties within the site. The slopes range in height from around 5 feet to upwards of 35 to 45 feet. During our site reconnaissance, we observed slopes with inclinations of 1.5:1 or steeper also appeared to exhibit the most erosional features. Slopes at 2:1 appeared to be in good condition.

We analyzed the static and seismic slope stability using the existing grades and generalized subsurface data from our review of available reports of the site. We selected areas that represented the tallest and steepest slopes including temporary cut slopes that are vertical and 1:1 (H:V) and permanent fill slopes that are 1.5:1 and 2:1 (H:V). We performed our slope stability analysis using the program SLOPE W version 6.22 developed by GEOSLOPE International. Our analyses indicates that temporary vertical and 1:1 (H:V) slopes have a Factor of Safety ranging from 1.01 to 1.52 for static conditions. Permanent slopes in the range of 1.5:1 to 2:1 (H:V) have a Factor of Safety ranging from 1.65 to 1.88 for static conditions. Our seismic stability evaluation resulted in yield accelerations greater than 0.15 times gravity; and therefore we conclude that the risk of permanent lateral displacement of the slopes inclined at 1.5:1 (H:V) or shallower during a strong earthquake is low.

The minimum static factor of safety for permanent slopes should typically be 1.5 or greater. Temporary slopes designed for short-term stability may have lower values of factor of safety. The results of our analyses are consistent with earthwork construction practices that have taken place within the site and general vicinity for many years.

It should be noted that granular material (sand and gravel) exposed at the face of slopes may be susceptible to erosion and shallow surficial instability such as sloughing or slumping. These types of failures are expected to be generally less than 5 feet thick and pose no risk to the overall stability of the slopes; they can be mitigated by making the slope shallower, landscaping, installing slope armor such as rip rap, and/or by performing routine maintenance.

10.7 Low Permeability of Near Surface Soil

As discussed in Section 8.0, we anticipate the near surface soil to generally consist of silty and clayey sands, and sandy Clays and silts. The permeability and therefore the infiltration of surface water at the site will depend upon the characteristics and type of soil exposed at the ground surface. In general soil with a high silt and clay content have a lower permeability than soil that is primarily sand. We anticipate the permeability of the near surface soil will be relatively low throughout much of the site. Site specific infiltration testing should be performed for the design of storm water and Low Impact Development (LID) features.

10.8 Potential for the Presence of Naturally Occurring Hazardous Soil

We reviewed maps of the Sacramento Valley region provided by the USGS for the presence of naturally occurring asbestos containing soil, and natural radon potential. The USGS maps for the Sacramento County region indicate that the site has a low potential for naturally occurring asbestos containing soil and low potential for radon.

10.9 New Foundations

Preliminary design loads for buildings were not available at the time of this report. We anticipate the majority of new buildings will be two and three story commercial, office, school, retail, and mixed use or high density residential buildings, and single and two story wood-framed residential structures with relatively lightweight foundation pressures. Bridges associated with the backbone improvements are anticipated to be single span concrete structures.

On the basis of the results of our studies to-date, we conclude the buildings can be supported on stiffened shallow foundation systems such as post tensioned slabs (P-T slabs), conventional continuous and spread footings, and/or reinforced mat foundations. The appropriate foundation system should be determined in a location specific manner based on the results of site specific geotechnical explorations and studies for specific proposed structures.

Disturbed native soil and undocumented fill is typically not suitable for support of proposed residential and commercial buildings. We anticipate building pads planned for areas in disturbed native soil and undocumented fill may require over excavation and re-compaction to provide uniform support of new structures. In addition, lots and/or building pads spanning or located near cut/fill transitions may require additional over-excavation and fill placement to create acceptable transitions. An alternative to removal and re-compaction may be to improve the material using an appropriate ground improvement technique. Preliminary ground improvement techniques are discussed in Section 10. 10.

Tall or heavy structures (bridges and multi-story buildings) may require deep foundations (drilled shafts, driven or drilled piles). We anticipate bridges will be required for new roadways to span the realigned Morrison Creek and possibly Jackson Highway. Typical deep foundations for new bridges will likely be either driven piles or drilled piers.

Site specific geotechnical explorations and studies will be required to provide recommendations for the design of foundations once the structure (i.e. – building or road) types, locations and foundation loads become available.

10.10 Preliminary Ground Improvement Techniques

Ground improvement or supporting the proposed structures on deep foundations may be used as an alternative to removal and re-compaction. The most appropriate ground improvement technique will depend upon the many factors including characteristics of the materials present, desired performance, and anticipated foundation pressures. Ground improvement techniques are described in the following sections.

10.10.1 Pre-Consolidation with Temporary Surcharge and Vertical Drains or Lightweight Fill

Post-construction settlements may be reduced by pre-consolidating the drying bed material and/or using light weight fill to raise site grades or support proposed structures. Pre-consolidation uses a temporary surcharge and prefabricated vertical drains to accelerate consolidation settlements. Light weight fill, such as geo-foam or light weight Controlled Density Fill may be used to reduce the long term consolidation settlement of the proposed structures, and their influence on adjacent areas. The location, horizontal extents, and thickness of the light weight fill will depend upon the weight of the structures, amount of new fill required to raise site grades, location of the building relative to the improvement of concern, type of light weight fill, and the settlement tolerance of the improvements.

10.10.2 Soil Cement Mixed Columns

Soil cement mixed columns (SCMC) consist of mixing soil and cement using a specialized drill rig to create a column of strengthened soil. For mitigation of compressible soil, piers are typically installed at a spacing of approximately 8 to 10 feet center to center.

10.10.3 Drilled Displacement Columns

Displacement aggregate piers are a soil improvement method, which when installed at footing locations, densify the soil surrounding the pier and transfer the support of building loads through the piers to deeper more competent soil. They may be installed in a regular grid pattern to provide floor slab support if settlement of the floor slab is deemed unacceptable. Displacement aggregate piers are constructed by drilling a vertical shaft and

ramming/compacting thin, successive lifts of crushed aggregate in the open shaft, resulting in a very dense aggregate pier to support column and floor slab loads. Displacement aggregate piers are proprietary and trademarked by Geopier Foundation Company.

10.10.4 Densification (Deep Dynamic Compaction (DDC) and Rapid Impact Compaction (RIC)

Densifying the drying bed material to an acceptable degree may be performed using a technique such as Deep Dynamic Compaction (DDC) or Rapid Impact Compaction (RIC). Deep dynamic compaction, also referred to as heavy tamping, involves repeated tamping with heavy weights onto the ground surface. The weight is usually lifted and dropped by a conventional crane using a single cable with a free spool to allow a near free drop. The weights used for DDC may be concrete blocks, steel plates, or thick steel shells filled with concrete or sand. Weights up to 200 tons and drop heights up to 120 feet have been used.

RIC is typically performed using a track-mounted machine that imparts energy by dropping an approximately 7.5-ton weight from a controlled height, about one meter, onto a patented foot. The energy is delivered at a rate of 40 to 60 blows per minute. Typically RIC can improve the soil to depths of approximately 15 feet, although this depends on several issues such as soil type, degree of saturation, soil stiffness and other factors.

10.10.5 Rammed Aggregate Piers (RAP)

Aggregate Piers (Rammed, Vibro-displacement, Stone Columns, etc.) are installed by either drilling a hole or vibrating a probe in the ground and backfilling the void with densified aggregate. For mitigation of the compressible drying bed material, piers are typically installed at a spacing of approximately 8 to 10 feet center to center to reduce the magnitude of total and differential settlements of structures founded on improved soil.

10.11 Construction Considerations

Existing improvements to be abandoned at the site and soft weak and/or deleterious material in the existing ponds, and temporary water ponds should be removed and properly disposed of. The material removed from existing ponds is anticipated to be wet and difficult to work with and unlikely to support heavy equipment. Any loose or weak existing utility trench backfill material encountered during future site grading should be removed and replaced with properly compacted fill. Fill slopes constructed against existing slopes should be benched into the

existing slopes. The benches should be made only in competent stable material. Any existing weak or loose material should be removed prior to cutting the bench. Benches should be limited to a maximum vertical height of 5 feet and may be constructed as the fill slope is built.

If site grading is performed during wet weather, the exposed soil subgrade may become wet and difficult to compact. The grading contractor should be prepared to repair the weak and wet subgrade, if required.

Ground vibration due to soil improvement methods including DDC/RIC, and deep foundation installation such as driven piles, may damage buildings or other sensitive structures near the construction site. Vibration monitoring should be performed during these construction activities to measure vibrations and ensure that vibrations are maintained within acceptable levels.

11.0 DISCUSSIONS AND CONCLUSIONS FOR NON-PARTICIPANT PROPERTIES

On the basis of the results of our studies, we conclude there are no geological and geotechnical conditions that preclude the proposed land uses for the development of the Non-Participant properties within the WJHMP Area. However, there are several issues that should be addressed in detailed geotechnical studies performed during final design of each improvement. These issues include:

- Seismic hazards (ground shaking, liquefaction, settlements, etc.)
- Settlement of new and existing fill due to new loads (weight of additional fill, foundations, etc.)
- Presence of undocumented fill, and soft/deleterious material in ponds
- Presence of moderately to highly expansive soil
- Demolition of existing improvements
- Slope Stability
- Relatively low permeability of fine grained soil that exists throughout the project
- Potential for the presence of naturally occurring hazardous soil
- New Foundations
- Construction considerations

These and other geotechnical issues as they pertain to the proposed development are discussed in following sections.

11.1 Seismic Hazards

11.1.1 Ground Shaking

The seismicity of the site is governed by the activity of the Great Valley, Hunting Creek-Berryessa, and Concord-Green Valley Faults. However, ground shaking from future earthquakes on any of the regional faults could be felt at the site. The intensity of earthquake ground motions at the site will depend upon the characteristics of the generating fault, distance from the rupture, magnitude and duration of the earthquake, and specific subsurface conditions. We judge ground shaking at the site during a major earthquake on one of the nearby regional faults will be low to moderate. To reduce the potential for damage associated with earthquake-induced ground shaking, new structures should be designed in accordance with the current California Building Code (CBC) seismic design requirements.

11.1.2 Fault Rupture

Historically, ground surface displacements closely follow the trace of geologically young faults. The site is not within an Earthquake Fault Zone, as defined by the Alquist-Priolo Earthquake Fault Zoning Act, and no active faults have been mapped at the site. Therefore, we conclude that the risk for fault rupture at the site is low.

11.1.3 Liquefaction and Liquefaction-Induced Settlements

We have made a preliminary evaluation of the potential for seismic hazards at the site, such as those associated with soil liquefaction, lateral spreading,[7] and cyclic densification[8] to occur within the Master Plan Area. We used the results of our preliminary geotechnical investigation to evaluate the potential of these phenomena to occur. The results of our evaluation indicate that in general the native soil at the site are not saturated and are sufficiently stiff and dense to resist soil liquefaction, lateral spreading, and cyclic densification.

---

[7] Lateral spreading is a phenomenon in which surficial soil displaces along a shear zone that has formed within an underlying liquefied layer. Upon reaching mobilization, the surficial blocks are transported downslope or in the direction of a free face by earthquake and gravitational forces.

[8] Cyclic densification is a phenomenon in which non-saturated, cohesionless soil is densified by earthquake vibrations, causing ground-surface settlement.

11.2 Settlement

Settlements at the site will result from compression of the new fills due to self-weight, existing fill and underlying native material due to the weight of new fills and foundation pressures. The magnitude and rate of settlement are dependent upon many factors including the amount of new fill placed, type of foundation system, foundation loads. Preliminary estimates of the magnitude and rate at which these settlements are estimated to occur at the site are discussed in the following sections.

11.2.1 Compression from New Fill

We estimated the amount of post construction settlement that may occur in the Non-Participant properties due to the placement of new fill. We anticipate site grades will be similar to their existing grades, and any fill placed will be relatively thin (less than 5 feet thick).

The magnitude of the actual post construction settlement in the Non-Participant properties will be related to the amount of new fill placed. Compression of new fill is anticipated to less than ½ inch for fill up to 5 feet thick. We anticipate that the majority of the compression will occur during and shortly following construction.

11.2.2 Foundation Settlement

Additional foundation settlement will occur primarily from compression of new and existing fills. The magnitude and rate of the foundation settlement will depend on the type of foundation, magnitude of foundation pressure, and thickness of the compressible material (if present). We estimate approximately ½ inch of total and differential settlement may occur in areas underlain by existing fill and native soil. Differential settlement will vary dependent on location, and should be determined on a site specific basis following site specific geotechnical studies.

11.2.3 Estimating Total Settlement Magnitudes

The amount of settlement that will occur at a given location depends upon many factors including the amount of new fill placed, type of foundation system, and foundation loads. The estimated settlements presented in the sections above consider only the individual material discussed. As discussed above the majority of this settlement is anticipated to occur shortly after construction.

11.3 Undocumented Fill and Disturbed Native Soil

The ability of the undocumented fills and disturbed Native soil to safely support planned structures should be evaluated on a case-by-case basis considering the results of site specific

geotechnical studies. Depending upon the proposed structure, over excavation and re-compaction of the near surface material may be required, and that some additional settlement of the undocumented material may still occur.

11.4 Expansive Soil Considerations

The existing near-surface soil and the majority of fill at the site consists of sand, clay and silt with a low to moderate expansion potential. Moisture fluctuations in expansive soil could cause the soil to expand or contract resulting in deflection and potential damage to foundations, slabs, and pavements. Potential causes of moisture fluctuations include seasonal changes, drying during construction, and subsequent wetting from rain, capillary rise, and landscape irrigation. The actual expansion potential of the soil should be determined once the finished grades have been reached and/or the location of the new building has been determined. Where encountered, material with a high expansion potential should not be used as engineered fill below building foundations or near the finished ground surface.

Mat foundations or post-tensioned (P-T) slabs should be designed to resist movements associated with seasonal moisture changes. The appropriate design parameters should be provided as part of the site specific geotechnical studies for proposed structures.

11.5 Demolition of Existing Improvements & Retention Ponds

Existing foundations, pavements, and underground utilities to be abandoned should be removed, and the resulting excavations properly backfilled. Existing wash water and storm water retention ponds are likely to have soft compressible soil, vegetation and other deleterious material in them. Soft and deleterious material, if encountered, should be removed and properly disposed of. The ponds and resulting excavations should be properly backfilled.

11.6 Slope Stability

In general, since the Non-Participant properties are relatively level, we do not anticipate cut or fill slopes greater than a couple feet in height.

11.7 Low Permeability of Near Surface Soil

As discussed in Section 8.0, we anticipate the near surface soil to generally consist of silty and clayey sands, and sandy Clays and silts. The permeability and therefore the infiltration of surface water at the site will depend upon the characteristics and type of soil exposed at the ground surface. In general soil with a high silt and clay content have a lower permeability than

soil that is primarily sand. We anticipate the permeability of the near surface soil will be relatively low throughout much of the site. Site specific infiltration testing should be performed for the design of storm water and Low Impact Development (LID) features.

11.8 Potential for the Presence of Naturally Occurring Hazardous Soil

We reviewed maps of the Sacramento Valley region provided by the USGS for the presence of naturally occurring asbestos containing soil, and natural radon potential. The USGS maps for the Sacramento County region indicate that the site has a low potential for naturally occurring asbestos containing soil and low potential for radon.

11.9 New Foundations

Preliminary design loads for buildings were not available at the time of this report. We anticipate the majority of new buildings will be two and three story commercial, office, school, retail, and mixed use or high density residential buildings, and single and two story wood-framed residential structures with relatively lightweight foundation pressures.

On the basis of the results of our studies to-date, we conclude the buildings can be supported on stiffened shallow foundation systems such as post tensioned slabs (P-T slabs), conventional continuous and spread footings, and/or reinforced mat foundations. The appropriate foundation system should be determined in a location specific manner based on the results of site specific geotechnical explorations and studies for specific proposed structures.

Disturbed native soil and undocumented fill is typically not suitable for support of proposed residential and commercial buildings. We anticipate building pads planned for areas in disturbed native soil and undocumented fill may require over excavation and re-compaction to provide uniform support of new structures. In addition, lots and/or building pads spanning or located near cut/fill transitions may require additional over-excavation and fill placement to create acceptable transitions. An alternative to removal and re-compaction may be to improve the material using an appropriate ground improvement technique. Preliminary ground improvement techniques are discussed in Section 11.9.

Tall or heavy structures (bridges and multi-story buildings) may require deep foundations (drilled shafts, driven or drilled piles). Site specific geotechnical explorations and studies will be required to provide recommendations for the design of foundations once the structure (i.e. – building or road) types, locations and foundation loads become available.

11.10 Construction Considerations

Existing improvements to be abandoned at the site and soft weak and/or deleterious material in the existing retention ponds, wash water ponds, and temporary water ponds should be removed and properly disposed of. The material removed from existing ponds is anticipated to be wet and difficult to work with and unlikely to support heavy equipment. Any loose or weak existing utility trench backfill material encountered during future site grading should be removed and replaced with properly compacted fill. Fill slopes constructed against existing slopes should be benched into the existing slopes. The benches should be made only in competent stable material. Any existing weak or loose material should be removed prior to cutting the bench. Benches should be limited to a maximum vertical height of 5 feet and may be constructed as the fill slope is built.

If site grading is performed during wet weather, the exposed soil subgrade may become wet and difficult to compact. The grading contractor should be prepared to repair the weak and wet subgrade, if required.

Ground vibration due to soil improvement methods including DDC/RIC, and deep foundation installation such as driven piles, may damage buildings or other sensitive structures near the construction site. Vibration monitoring should be performed during these construction activities to measure vibrations and ensure that vibrations are maintained within acceptable levels.

12.0 ADDITIONAL GEOTECHNICAL SERVICES

Our conclusions are preliminary and are to be used for the feasibility and initial design studies. Detailed geotechnical studies should be performed during final design of each improvement. The studies should include subsurface exploration within the site, laboratory testing of representative soil samples to provide geotechnical parameters, and engineering studies to develop geotechnical recommendations specifically for the improvement(s).

13.0 LIMITATIONS

The conclusions presented in this report result from limited engineering studies based on our interpretation of the existing geotechnical conditions and available subsurface data. Actual subsurface conditions may vary. More detailed information concerning the proposed structures and site development is required to further refine design and foundation recommendations. If

any variations or unforeseen conditions are encountered during construction, or if the proposed construction will differ from that which is described in this report, T&R should be notified so that supplemental recommendations can be made.

Subject: West Jackson Highway Master Drainage Study – 4th Submittal (dated 12/02/2022) Comments

The Sacramento County Department of Water Resources (County DWR) has reviewed the subject master drainage study and found it to be technically sufficient to support the proposed drainage master plan and initial entitlements.

Additional analyses and details will be required to support eventual Tentative Maps and improvement plans. A general list of these additional requirements is provided in the aforementioned study and will be further described in the Conditions of Approval for the initial entitlements. Note that County DWR will provide Conditions of Approval after the required preliminary levee geotechnical study has been reviewed and approved.

In accordance with the Sacramento County Drainage Study Requirements document, prior to commencing work on subsequent drainage studies, contact County DWR to initiate the drainage study scoping process.

Please feel free to call if you have any questions.

Sincerely,

J. Luis Rodriguez, P.E., M.S., C.F.M.

1.0 Executive Summary

This drainage study has been prepared at the request of Stonebridge Properties, LLC and Granite Construction Company and submitted to the Sacramento County Department of Water Resources (SCDWR) in support of the West Jackson Highway Master Plan (WJHMP or Plan Area). The WJHMP encompasses approximately 5,913± acres of land along the Jackson Road corridor roughly between Watt Avenue and Excelsior Road, ultimately draining into portions of Morrison Creek and Elder Creek. The WJHMP includes a land plan that provides a balanced mixture of land uses that will foster a sustainable community and complement adjacent existing neighborhoods.

The purpose of this study is to assist SCDWR in the evaluation of existing conditions and the drainage and flood control facilities planned for WJHMP to support proposed development conditions. This study is a part of the Master Plan effort. As such this study is intended to satisfy the requirements of Sacramento County for a large-scale drainage master plan for the project. Design level detail that is normally associated with the review and approval of small lot tentative maps will accompany future entitlement efforts. Accordingly, this study addresses the following:

1. The existing regulatory environment.
2. The models employed and the assumptions and methodology utilized in the development of the models.
3. The results for the existing conditions analysis.
4. The planned internal project drainage improvements (e.g. detention basins and trunk drainage improvements).
5. The allowable discharges and on-site safety standards required for the planned conditions.
6. The planned conditions flood control improvements for the Morrison and Elder Creek systems.
7. A summary of how the planned project improvements achieve consistency with allowed discharge and design standards.

8. An analysis of how climate change could impact this analysis and how the master plan is resilient to the potential effects of climate change.

9. A discussion of future considerations, including operations and maintenance and probable costs.

This study demonstrates that the planned drainage and flood control facilities for the WJHMP maintain downstream drainage impacts at or below existing conditions and provide flood control that meets or exceeds 200-year standards for the Plan Area. Based on the current Sacramento County Hydrology Standards, this study presents sufficient detail to establish the backbone drainage and flood control system, pre-development (post-mining condition) and post development flows, flood control, and water quality.

Within the Plan Area, the mined areas (below grade of Morrison Creek) that historically gravity drained to Morrison Creek will utilize detention basins and pump stations to pump back into Morrison Creek at reduced flows compared to their historical predevelopment drainage flows. Some previously mined areas are planned to be filled above the floodplain to allow gravity drainage back to Morrison Creek.

In general, this study demonstrates how the project will:

1. Comply with the latest SCDWR requirements and appropriate engineering standard of care.

2. Establish hydraulic modeling of Morrison Creek.

3. Attenuate developed condition peak flows to predevelopment levels or show that increases in water surface elevations are within levee containment and freeboard requirements.

4. Reclaim portions of the Plan Area from the 100-year floodplain.

5. Identify the required levees and internal detention basins, pump stations and drainage systems necessary to provide a 200-year level of flood protection.

6. Accommodate Climate Change through resiliency.

2.0 Introduction

2.1 Project Location

The Plan Area is located in the southeast portion of Sacramento County, generally oriented along Jackson Road, and bound by Kiefer Boulevard and Goethe Road to the north, portions of Elder Creek Road and Florin Road to the south, the City of Sacramento to the west, and Excelsior Road to the east. Refer to **Figure 2.1: Project Vicinity** for the location of the project.

2.2 Purpose and Intent

Wood Rodgers has prepared this drainage study in support of the West Jackson Highway Master Plan (WJHMP) or Plan Area. The master plan encompasses approximately 5,913± acres of land along the Jackson Road corridor roughly between Watt Avenue and Excelsior Road. The Plan Area is tributary to portions of Morrison Creek and Elder Creek and includes large tracts of land that have been mined and reclaimed. The planned project proposes to reuse previously mined and reclaimed lands with a balanced mix of land uses that will foster a sustainable community and complement the adjacent existing neighborhoods.

This study has been prepared to accompany the planned master plan and provide technical analyses to support the transition of land uses and the WJHMP environmental study by evaluating and providing a description of the following:

1. The existing regulatory environment.
2. The models employed and the assumptions and methodology utilized in the development of the models.
3. The results for the existing conditions analysis.
4. The planned conditions internal project drainage improvements (e.g. detention basins and trunk drainage improvements).
5. The allowable discharges and on-site safety standards that will be required for planned conditions.

6. The planned conditions flood control improvements for the Morrison and Elder Creek systems.

7. A summary of how the planned project improvements achieve consistency with allowed discharges and design standards.

8. An analysis of how climate change could impact this analysis and how the master plan is resilient to the potential effects of climate change.

9. A discussion of future considerations, including operations and maintenance and probable costs.

While more detailed studies[1] will be required to accompany tentative map submittals, this report contains adequate analysis to support the environmental analysis and approval of the master plan. This study will provide estimates for the maximum allowable discharge into the receiving waterways, detention basins, and major drainage infrastructure in addition to setting forth planned improvements necessary to achieve a 200-year level of flood protection for the Plan Area.

2.3 Project Background

The WJHMP Master Plan Application was accepted by the Sacramento County Board of Supervisors on April 17, 2012. In accordance with the requirements of the County's General Plan Land Use Element Policy LU-119, StoneBridge Properties, LLC, a subsidiary of Teichert Land Co. (Teichert), and Granite Construction Company (Granite) (collectively, Participating Owners) have initiated the Master Plan process for all land encompassed within the planned Plan Area, encompassing 5,913± acres. The Participating Owners collectively own 4,079± acres – Teichert owns 3,106± acres and Granite owns 1,063± acres. Participating Owners and their land holdings have been provided common names for reference in this study. Refer to **Figure 2.2: Participating Properties**. The Participating Owners represent 69% of the total Plan Area acreage. These properties primarily include mining sites used for sand and gravel extraction, many of which have already been reclaimed. Although most of the mining is complete, some of the Participating Owners' properties continue to support various mining related activities. The mining

[1] Detailed studies at tentative map stage are intended to provide a localized drainage analysis to support planned internal street and grading design. Internal street and grading design will occur at tentative map stage.

activities have dominated the landscape since the 1930's. As a result, much of the Plan Area has largely been bypassed by development. Just over 80% of the Plan Area boundary abuts the existing Sacramento County Urban Policy Area and the Sacramento City Limits. In addition to mining areas, the Plan Area is comprised of a mixture of rural residential, institutional, agricultural, and industrial properties located along the Jackson Road corridor.

Today the extraction of the sand and gravel resources associated with the ancient alluvial channels is nearing completion, and the Plan Area is surrounded by existing and planned development. Current permitted sand and gravel resources found in mines in the Plan Area are expected to be depleted in approximately 10 years. As a result of the surface mining, many areas within the Plan Area are excavated lower than adjacent natural ground and the waterways which historically drained the area. Many of these excavated areas have no current drainage outlet and collect storm water runoff. The removal of storm water relies on the process of evaporation and infiltration. This drainage study identifies drainage needs based upon the remnant mining topography and a design solution that works in conjunction with the planned land uses for the Plan Area.

2.4 Regulatory Setting

The project must meet certain Federal, State and local standards with respect to mitigating flood impacts and providing storm water quality treatment. The following is a discussion of the regulatory programs which will affect this project.

Federal

FEMA - The Federal Emergency Management Agency (FEMA) oversees the National Flood Insurance Program (NFIP) and establishes the 1% annual chance floodplain for purposes of administering this insurance program, doing so in cooperation with local communities. This established floodplain cannot be increased without the acknowledgement of the communities involved, in this case the City of Sacramento and County of Sacramento, and without the notification of impacted property owners. Therefore, this Federal mapping standard establishes the threshold for downstream impacts and mitigation for the 1%

annual chance (100-year) storm[2]. It is important to note that FEMA's mapping can be corrected if better information establishing the existing flood hazard is made available to all parties.

Clean Water Act - The Federal government also establishes the standards for complying with the Clean Water Act through the National Pollution Discharge Elimination System (NPDES) under the US Environmental Protection Agency (USEPA). The USEPA has delegated the responsibility for administering and enforcing this program to the State of California and its Regional Water Quality Control Boards.

The Federal Aviation Administration (FAA) - FAA periodically provides updated guidance for airport operators related to the location and management of wildlife attractants such as landfills, agricultural facilities and stormwater management areas. The intent of the program is to prevent the formation of new bird habitat through frequent and prolonged inundation (flooding). The WJHMP will include detention storage for drainage, which can create new habitat if not drained properly. The criteria to prevent frequent and prolonged inundation is to evacuate, by gravity or pumping, the 2-year 24-hour event in less than 48 hours after rainfall has ceased. As larger events are considered less frequent, the evacuation of larger storms can be longer than 48 hours. For longer storm durations, the basin designs are anticipated to preclude habitat.

State

The State of California oversees the safety of dams and levees, and storm water and other pollutant discharges. The State establishes the standards for such facilities and discharges.

California Division of Safety of Dams (DSOD) – DSOD is responsible for defining a dam that falls under its purview and regulates the safety of structures which meet established minimum thresholds. There are currently no jurisdictional dams within the Morrison Creek watershed affecting the project. Sacramento County recently modified the spillway of Mather Lake to reduce the height of the previous dam and the lake's water surface elevation, therefore bringing it below the jurisdictional threshold of a dam. This existing mapped hazard for failure of the Mather Dam was defined by Sacramento County and can be identified to

[2] Refer to FEMA floodplain discussion in Section 9.3 and Figure 9.1: FEMA Floodplain Map.

all properties within the Plan Area. County Staff has raised the issue of planned detention areas within the Plan Area being modified in such a way as to be potentially considered a reservoir / dam in the eyes of the State. The project proponents will coordinate with County Staff and DSOD to ensure that no new dam structures are created as part of this project. Containment of detention areas is anticipated to fall under local design criteria. Refer to **Appendix L** regarding DSOD determination for the Granite 1 / Aspen 6 detention basin.

Folsom Dam failure inundation mapping shows the western portion of the Plan Area within the inundation zone as shown in **Figure 2.3: Folsom Dam Failure Inundation Map**. While the potential for dam failure is low, damage and potential loss of life is high. For the areas within the inundation zone, evacuation maps and rescue plans will be prepared prior to development within such inundation areas.

Central Valley Flood Protection Board (CVFPB) – CVFPB oversees the levees within the State Plan of Flood Control and has established the Urban Level of Flood Protection (ULOP) and the Urban Levee Design Criteria (ULDC) for the construction of levees to protect populations at risk. These standards establish the 200-year storm as the design event for determining levee design conditions[3]. While the levees that exist within the WJHMP today do not fall under CVFPB jurisdiction, when the WJHMP is developed the levees still in operation will need to meet State design criteria. Approval in the form of an encroachment permit from CVFPB is required before work is allowed within the regulated streams of both Morrison Creek and Elder Creek. Permits for work at bridges shall include conditions that meet the requirements of the ULDC. The ULDC document, which is referenced for this study, provides guidance for all critical levee design criteria including through-seepage, under-seepage, freeboard, and other criteria. This document is currently available online at: https://water.ca.gov/-/media/DWR-Website/Web-Pages/Programs/Urban-Levee-Design-Criteria--2012.pdf

State Water Resources Control Board (SWRCB) – SWRCB functions through regional boards, with the Central Valley Regional Water Quality Control Board (CVRWQCB) overseeing water quality programs for

[3] Subject to areas as shown in Appendix D: 200-Year ULOP Applicability Area of the Sacramento County Floodplain Management Ordinance, effective January 13, 2017.

the Plan Area. The County of Sacramento recently revised and approved the use of the Stormwater Quality Design Manual for the Sacramento Region in July 2018, to meet current CVRWQCB permitting requirements.

California Department of Fish and Wildlife (CDFW) – CDFW oversees the permitting process for the alteration of any lake or streambed that would potentially impact fish and wildlife or their habitat. If a project will substantially change the bed, channel, or bank of any river, stream, or lake or use the materials from a streambed, the developer must notify the CDFW and follow the conditions of a Lake and Streambed Alteration Agreement, if determined to be necessary by CDFW, pursuant to Section 1602 of the California Fish and Game Code to protect fish and wildlife resources. Even if the streambed is dry during construction, CDFW is responsible for ensuring that the streambed condition will not add erodible sediment to the environment, remove streambed habitat, or create conditions that are otherwise detrimental to the health of fish and aquatic mammal populations.

Local

Hydraulics & Hydrology - The County of Sacramento oversees all local considerations with respect to drainage, flooding and storm water quality. County staff has established extensive drainage and design criteria for assessing hydrology and hydraulics related to flood/drainage structures, with published rainfall and hydrologic parameters. These design standards and parameters can be found in the County's Hydrology Manual, which can be found online at:

http://www.waterresources.saccounty.net/Pages/DrainageManualVolume2.aspx

Improvement Standards - The design standards for sizing storm drainage infrastructure utilized as the basis for this study are per the County of Sacramento Improvement Standards. The Improvement Standards can be found online at:

http://www.engineering.saccounty.net/Pages/ImprovementStandards.aspx

Water Quality Treatment - Storm water quality mitigation is an ever-expanding requirement to ensure that streams, creeks and rivers do not degrade as a result of new development. Storm water quality not only

looks at pollutants generated from new development, but also the potential for runoff to worsen downstream erosion. Treatment of storm runoff deals primarily with removing pollutants generated from new development. Hydromodification and runoff reduction measures deal with limiting the release of runoff offsite, and demonstrating how the planned project will discharge under a range of storm conditions (frequencies and durations) without worsening erosion. In July of 2018, as required by the State's CVRWQCB, Sacramento County adopted a revised storm water quality design manual to address post-project water quality issues. This document is published online at:

http://www.beriverfriendly.net/newdevelopment/stormwaterqualitydesignmanual/

Low Impact Development (LID)

The drainage system(s) in the post-development condition is anticipated to incorporate Low-Impact Design and hydromodification principles where determined practical to reduce urban runoff, improve water quality, and implement the County's Municipal Storm Water Permit (MS4 Permit). Implementation will utilize the tool known as the Sacramento Area Hydrology Model (SAHM) by Clear Creek Solutions, Inc., dated March 2013. Low impact development measures are intended to be implemented at the project-level during subsequent entitlement processing and design. This master plan does not detail which LID facilities will be utilized or where they will be located, but assumes that these measures can and will be implemented within the framework laid out in this plan. Specific LID facilities are anticipated to be planned during subsequent entitlement applications.

2.5 Previous Studies

Wood Rodgers used other studies in preparation of this report. These studies are referenced below and indicated by reference number where applicable within the report:

1. Jackson Township Drainage Report, December 2017, prepared by Civil Engineering Solutions Inc.: This proposed 1,391± development, to the east of WJHMP, has submitted its application and prepared a drainage study. Part of the Jackson Township property drains naturally west towards the Granite 1 / Aspen 6 basin. The drainage study, including modeling, has been provided by Civil Engineering

Solutions for use in defining Jackson Township drainage areas and runoff parameters. This model is applicable to both Morrison Creek and Elder Creek watersheds. (**Reference 1**)

2. Drainage Report, Aspen 1, Prepared for City of Sacramento, California (May 2013), by Wood Rodgers: The total area of the Aspen I project is 232± acres located at the southwest corner of Jackson Road and South Watt Avenue. Aspen 1 is a planned mixed-use residential development within the City of Sacramento. This study provides hydrologic and hydraulic design of the onsite drainage system, as well as feasibility of utilizing reconfigured offsite retention east of South Watt Avenue to collect and store stormwater runoff from Aspen 1. (**Reference 2**).

3. Technical Memorandum: SMUD Corporation Yard Drainage Requirements, by Wood Rodgers (February 2011): The purpose of this technical memorandum is to size drainage facilities to serve the 51± acre SMUD Corporation Yard project, located east of Bradshaw Road and south of Kiefer Blvd. The offsite trunk drainage system from Kiefer Boulevard to Morrison Creek conveys flow from the SMUD project and adjacent properties. This technical memorandum is utilized to define the offsite flow into the Plan Area. (**Reference 3**).

4. Drainage Master Plan, Rio Del Oro dated August 2005 by Wood Rodgers, Inc: Rio Del Oro is a 3,828± acre Specific Plan located upstream within the City of Rancho Cordova. This study / document provides modeling and analysis for developed runoff conditions in the northern portion of the watershed of the upper Morrison Creek system. Runoff from the Rio Del Oro project flows to Morrison Creek. This study was utilized to establish baseline and ultimate developed conditions that affect runoff reaching the Plan Area. (**Reference 4**)

5. Drainage Master Plan, Montelena dated September 2007, prepared by Wood Rodgers: Montelena is a 252± acre project upstream within the City of Rancho Cordova. Montelena drainage runoff flows to Morrison Creek. This study / document provides modeling and analysis for baseline and ultimate developed runoff conditions in the southern portion of the upper Morrison Creek system. (**Reference 5**)

6. Elder Creek HEC-RAS Modeling, developed by Civil Engineering Solutions Inc, (updated 2018) for the Sacramento County Department of Water Resources: Initial model of Elder Creek watershed utilized as part of this analysis. No report was provided. (**Reference 6**)

2.6 Procedural Memoranda and Future Studies

The applicant team intends to develop a procedural memorandum to address FEMA 100-year flood protection, ULOP 200-year flood protection, and the County Floodplain Management Ordinance. The procedural memorandum will identify land areas subject to FEMA and ULOP flood plain conditions, specific conditions for those identified land areas, and required findings to be made. The conditions are anticipated to include those to meet FEMA standards, ULOP findings, and County requirements. The findings to be made include both General Plan Consistency Findings and ULOP Findings. The procedural memorandum will also address the timing and need for future studies and the process for addressing flood control facilities when obtaining subsequent approvals. It is anticipated that the Procedural Memoranda will be approved prior to or concurrent with the Master Plan.

Prior to the approval of building permits for development in areas that are subject to Morrison Creek flood inundation, an existing conditions Letter of Map Revision (LOMR) may be prepared and submitted to SCDWR and FEMA. The existing conditions model prepared as part of this study is anticipated to be utilized as part of the basis for the LOMR. This will result in the remapping of the Morrison Creek floodplain to reflect existing flooding conditions. As a result, subsequent Conditional Letter of Map Revision (CLOMR) applications can be processed without the need to re-evaluate the entire creek corridor. It is not intended to be a requirement of the applicant to submit an existing conditions LOMR prior to submittal of a CLOMR or LOMR-F. There are aspects of the plan area that are not subject to or are minimally influenced by Morrison Creek and may be developed without a comprehensive existing conditions FEMA floodplain update. It is important to note, that any development within floodplain areas shown on the effective FIRM will require a CLOMR or LOMR-F. This is applicable to both the Morrison Creek and Elder Creek floodplains.

With the submittal of tentative subdivision maps or other discretionary development applications, additional design detail will be required. This detail will show and locate proposed interior drainage infrastructure and provide a preliminary grading plan for all streets and pads. To support this higher level of design, future drainage studies are anticipated to accompany subsequent entitlement applications. It is anticipated that future drainage studies will do the following:

- Provide preliminary interior hydrology and hydraulics to establish preliminary sizing for storm drain conveyance systems in accordance with local design standards. It is anticipated that this will include modeling the 10-year design storm event in the channel and performing a Nolte analysis for storm drain systems.
- Delineate areas of high ground versus areas that may require additional flood protection.
- Show that proposed pads will have adequate freeboard from various flood events.
- Provide a location as well as higher level of detail for sizing of interior drainage basins and where applicable, pumping characteristics. Initial storage conditions for interior detention basins may need to be re-evaluated to comply with current SCDWR standards.
- Provide preliminary low impact design and hydromodification solutions as required by current design standards, including storm water quality design.
- Show consistency with allowed discharge and design standards as referenced in this report.
- For areas along Elder Creek, future analyses will have to rely on the latest approved HEC-RAS model of Elder Creek to demonstrate that the project does not cause adverse impacts. This will include the latest modeling of ultimate conditions drainage facilities and land use throughout the Elder Creek watershed.
- The Morrison Creek Zone 2-3 HEC-RAS model and Zone 1 HEC-RAS model may have to be combined to demonstrate that the project does not cause adverse impacts downstream.
- Investigate the suitability for the Aspen VI weir to function as a permanent structure.

- Provide a sensitivity analysis in HEC-RAS using the floating debris calculator and horizontal obstructions from the bottom of the channel in addition to the vertical obstructions evaluated in this report for levee design.

- Evaluate the full range of pump redundancy scenarios applicable to current SCDWR standards.

- An adequate creek monitoring station design and operation plan. This may include provisions for emergency pumping of detention while the creek is still above design thresholds as well as additional storage capacity for detention basins to provide a factor of safety as directed by SCDWR.

- Design of future road crossings at Rock Creek Parkway, Kiefer Boulevard, Vineyard Road, Mayhew Road, and Hedge Avenue need to avoid hydraulic interaction with the creek or additional detailed hydraulic analysis will need to be provided for review and approval.

- Where modelling in this drainage study shows that creek water surface elevations are not contained adjacent to proposed development, modelling may need to be revised to incorporate proposed grading from the tentative map.

- The drainage trunkline conveying flows from Jackson Township to the Aspen 6 / Granite 1 basin should be designed at the tentative map stage to adequately convey ultimate condition flows from the Jackson Township Drainage Study.

- Reassess flows from the planned Rio Del Oro drainage master plan to verify assumptions used in this drainage study are valid.

Nonetheless, the analysis and conclusions in this report are adequate for this planning level of analysis to show consistency with the design standards. It is important to note, that the project's Public Facilities Financing Plan (PFFP) will detail the fee programs and mechanisms for constructing the backbone improvements specified in this study. The anticipated fee program is intended to distribute and apportion drainage and flood improvement costs to those land use areas that benefit from the proposed improvements.

3.0 Modeling and Assumptions

This section provides an overview of the modeling utilized in preparing this study. The primary focus is on the modeling for Morrison Creek which was specifically developed for this work effort. Secondary emphasis is on the previously developed modeling for the watershed south of Florin Perkins Road as well as Elder Creek. Specifically discussed are the modeling inputs, including assumptions for land use, soil types, topography, water sheds and hydrology.

3.1 Purposes for which Model Employed

Define Existing and Planned Flooding Conditions

This study utilizes extensive modeling to ascertain the drainage and flood control environment for the following conditions:

- Existing[4] Flow and Water Surface conditions
- Post Project Interior Drainage Conditions
- Post Project Offsite Discharge and Flood Safety Conditions
- Ultimate Flow and Water Surface conditions

Each of these drainage conditions is important for the overall analysis contained in this report. To be specific: the existing flow conditions are employed to establish flows into the site which are then used to establish discharge volumes and potential flood hazards. Finally, post project drainage and flood conditions, following the construction of various project improvements, are considered to determine whether the allowed onsite and offsite discharges are acceptable as well as whether flood control standards are met. Next, ultimate buildout of the watershed is assumed to evaluate the ultimate flow and water surface conditions within Morrison Creek. Evaluating ultimate buildout included modifying hydrology consistent with planned development upstream of the project as well as incorporating results from previous drainage master plan studies for upstream developments.

[4] Existing conditions is considered as the time of the Notice of Preparation date of April 26, 2017.

The Aspen 8 and Aspen 9 post-mining condition model was used to evaluate flow and water surface conditions in Elder Creek including weir spills into the project area. Ultimate watershed build-out condition of Elder Creek was previously modeled to support the development of Jackson Township. Ultimate conditions for Jackson Township were compared with the existing conditions and post-mining conditions of Elder Creek and were found to create similar peak flows and peak water surface elevations along the reach of Elder Creek adjacent to the plan area. The maximum water surface elevations between the post-mining condition and ultimate conditions were used for preliminary design. This study assumes that each facility separately mitigating to existing flow conditions in Elder Creek will not have an impact on peak conditions in Elder Creek. Future analyses will have to consider the most current ultimate condition modeling along Elder Creek.

The modeling and results contained within this report are intended to clearly identify and substantiate that planned drainage and flood control improvements meet or exceed the desired levels of discharge and flood protection. **Section 5.0 Design Standards to be Achieved** set forth the permitted discharge and on-site design standards for the project, while **Section 7.0 Consistency with Allowed Discharge and Design Standards** illustrates how these standards are met through the implementation of planned improvements.

3.2 Modeling Programs Utilized

This study utilizes different modeling platforms as part of analyzing the project. These modeling programs are commonly utilized in the drainage industry to estimate and model hydrology and hydraulics. While this study develops a comprehensive model for a large portion of the Morrison Creek watershed, other existing models were also utilized as part of the analysis. All models provided by others have previously been reviewed by the County and are found to be accurate, complete, and acceptable to the various agencies having jurisdiction over the watershed.

Hydrology

Hydrologic modeling for Morrison Creek included the entire watershed upstream of Florin-Perkins Road using the SacCalc program, developed by Sacramento County. The SacCalc Program uses HEC-1 (a US Army Corps of Engineers hydrology program developed by the Hydrologic Engineering Center) to perform

calculations, develop runoff hydrographs for each drainage shed, and create Data Storage System files containing the resultant hydrographs. Other components such as weirs, junctions, detention basins and pumps are also included. Inputs in the watersheds are total area, mean elevation, length of longest water course, length of longest water course to centroid, slope, soil groups, and channel development.

Hydraulics – Morrison Creek

As part of this study, a comprehensive HEC-RAS model for the Morrison Creek watershed was developed by Wood Rodgers. The downstream terminus of this model is Florin-Perkins Road with various reaches extending upstream to approximately the Folsom South Canal. HEC-RAS modeling downstream of Florin-Perkins Road was provided by the City of Sacramento.

Hydraulics – Elder Creek

Civil Engineering Solutions developed a HEC-RAS model for SCDWR to represent existing flooding conditions along Elder Creek. The intent of this model was for a future submittal to FEMA to revise the published effective floodplain.

Hydraulics – Onsite

Hydraulic modeling for sizing onsite detention basins, pumping, and trunk storm drain was accomplished utilizing XPSWMM (2017) modeling software. Flows were generated for onsite developed conditions using SacCalc and inputted into XPSWMM by Wood Rodgers. The model utilizes an unsteady stage hydrograph[5] as the downstream boundary condition and inflow into the model as the upstream boundary condition. The software produces hydrographs that are utilized to establish flow and stage conditions throughout the Plan Area.

3.3 Assumptions: Pre-Mining Conditions

Prior to mining, land in the Plan Area drained by gravity through existing natural waterways. The pre-mining condition assessment helps to estimate the historical gravity runoff into the creek systems from undeveloped and unmined land within the WJHMP boundary. It is important to document the historical

[5] The unsteady stage hydrograph shows the water surface elevation varying over time at a particular location.

drainage patterns that once existed prior to mining as part of the consideration for the reestablishment of discharges to the creeks from these same lands in the future. For purposes of this study, the runoff occurring within the undeveloped mined areas today is assumed to be roughly equivalent to the undeveloped runoff that was occurring under pre-mining conditions. Therefore, the watershed analysis for currently mined areas will be used to characterize the volume of runoff that pre-mining conditions produced. For purposes of this master plan, it is recognized that the mined areas are allowed to drain back to the creek consistent with the pre-mining condition.

3.4 Assumptions: Existing Conditions

For purposes of defining existing hydrologic conditions, the Morrison Creek watershed was divided into four major zones described below and shown in **Figure 3.1: Drainage Zones**.

- Zone 1: Morrison Creek watershed downstream of the WJHMP
- Zone 2: Watershed within the WJHMP Plan Area.
- Zone 3: Morrison Creek watershed area upstream of the Plan Area and downstream of the Folsom South Canal.
- Zone 4: Morrison Creek watershed area upstream of the Folsom South Canal.

The sub-watershed delineations within Zones 2, 3 and 4 are show in **Figure 3.2: Watershed Map** and also provided in GIS format in **Appendix A**.

Land Use

In establishing inflow conditions and water surface elevations, various land uses were assigned to properties to establish the level of imperviousness and runoff present on each parcel. Wood Rodgers utilized the current parcel outlines and land use designations available from the County online GIS portal and reviewed the land use assignments for assessing runoff conditions. Wood Rodgers made a detailed comparison of available aerial photography and determined that much of the development present in the watershed did not match the zoned land use designations from a hydrologic and runoff perspective. Through examination of the aerial photography, Wood Rodgers used engineering judgement to assign

levels of imperviousness (percentage of land coverage) for each portion of the contributing watershed upstream and within the WJHMP.

Table 3.1: Existing Land Use by Zone for Morrison Creek provides a summary overview of existing land uses within the watershed for Zones 2, 3, and 4. The imperviousness assumed as present in the Morrison Creek watershed under existing conditions is documented in **Figure 3.3: Existing Conditions Watershed Imperviousness**.

Soils

Sacramento County has adopted the soil mapping and classifications published by Natural Resources Conservation Service (NRCS). The soils within the Morrison Creek and Elder Creek watersheds are derived from the latest NRCS data, shown in **Figure 3.4: Soil Conditions and Infiltration**. This figure

[6] Represents the total area within the Plan Area that lies within the Morrison Creek watershed. It excludes the Plan Area that lies within the Elder Creek watershed.

denotes where the NRCS data is not valid, due to inaccessible conditions during the soil survey or mining. These areas are assumed to be Class D soils, which are considered to produce the greatest rate of runoff. Additionally, adjustments to the soil classifications were made based on field observations of the soil types.

Topography

Topographic mapping representing the watershed under existing conditions is comprised of two primary topographic data sources. The first source is the LiDAR obtained in December 2015 for the area shown in **Figure 3.5: Watershed Topography**. The second source captures the remainder of the watershed upstream of the project is captured within the topographic data collected in 2008 by the California Department of Water Resources under the Central Valley Floodplain Evaluation and Delineation (CVFED) program. Both topographic sources were defined by the same company utilizing the same horizontal and vertical datums and accuracies. In general, the horizontal accuracy is +/- 0.1 feet using the North American Datum of 1983 (NAD83) California State Plane Zone 2 horizontal coordinate system. The vertical accuracy is +/- 0.3 feet using the North American Vertical Datum of 1988 (NAVD88) vertical datum. Downstream topography was not required by the SCDWR as hydrology and hydraulic modeling downstream was provided by the City of Sacramento.

Morrison Creek stream cross sections and structures were surveyed in 2015 and 2016 downstream of Excelsior Road. The stream cross sections between Excelsior Road and Folsom South Canal were extracted from CVFED LiDAR topography. The low-flow portion of the channels were modified to provide stream continuity between hydraulic structures represented within the approved FEMA models.

Watersheds and Hydrology

As identified above, the available topographic data and the County's database for existing underground storm drains were utilized to delineate drainage areas and flow directions. Field verification was performed, where appropriate, to identify existing culvert crossings that affect existing in-stream attenuation estimates and downstream peak flows.

Approximately 1,700 acres of land were identified as producing no storm runoff. This land, located north of White Rock Road, was previously dredged for gold in the early 1900's. Dredging of this land resulted in

a highly permeable landscape with topography that is self-contained with no storm runoff crossing White Rock Road. Nevertheless, SCDWR requested that this 1,700 acres of land located north of White Rock Road be included as part of the Morrison Creek watershed and assumed to discharge runoff according to its assigned land use. As a result, the soils from theses permeable landscapes were assigned a NRCS classification of Class A. The Class A designation assumes a lower runoff potential from the existing mining tailings but does allow future runoff to occur. Therefore, runoff from this watershed is included in the sizing of downstream facilities.

3.5 Assumptions: Post Project Interior Drainage

Interior project modeling was performed to evaluate the efficacy of the planned interior trunk drainage and detention basin improvements. These particular improvements are intended to manage appropriately and safely release the onsite drainage stemming from design storms. For the purposes of this study, planned flood improvements to the Morrison Creek and Elder Creek network are not defined as interior and are therefore not included in this section of the report. Rather, modeling assumptions for planned flood conditions in the Morrison Creek and Elder Creek systems are contained in Section 3.6 below.

The modeling performed for establishing interior drainage utilized SCDWR accepted SacCalc program for evaluating hydrology and the XP-SWMM modeling program for interior hydraulic analysis of detention basins and preliminary storm drain trunk layout. Where the creek flow impacts interior drainage facilities, the modeling described under Section 3.6 of this document is utilized to quantify creek overflows.

Table 3.2: Proposed Land Use by Zone (Morrison Creek Watershed) summarizes the land uses for proposed conditions within the Morrison Creek watershed.

General Shed Definition / Correlation

Urbanization typically increases the imperviousness of the soil, causing runoff to increase within a particular watershed. However, with proper design or mitigation, post-development peak flows can be reduced to match pre-development / existing conditions. One of the viable methods for reducing peak flows is the construction of detention or retention basins, where a portion of runoff volume is stored on a temporary basis, thereby reducing peak flows. This approach is planned for the Plan Area, where a total of twenty-six detention basins are anticipated, with seven of these detention basins requiring pumping facilities.

In order to simplify the modeling approach for the purposes of this study, the entire Plan Area in the Morrison Creek and Elder Creek watersheds has been broken into 18 sub-shed areas as shown in **Figure 3.6:**

[7] Represents the total area within the Plan Area that lies within the Morrison Creek watershed. It excludes the Plan Area that lies within the Elder Creek watershed. Plan area based on Land Use Alternative 1A dated January 17, 2022.

WJHMP Future Conditions Watersheds. These sub-sheds are named WJP# and WJG#, with "P" denoting pumped watersheds and "G" denoting gravity drained watersheds. The Morrison Creek corridor is designated as sub-shed WJG0. The total area of each individual sub-shed areas ranges between 21± acres and 1,372± acres. Sub-watershed boundaries were created based on the pre-development major roadways and other topographical features in order to facilitate the comparison of flows for both existing and post-development conditions. Within each sub-watershed, minor shed areas have been further delineated.

Post-development condition watersheds were developed and modified to represent future anticipated terrain separations and were utilized to establish pre-development shed boundaries. This was done to define and compare pre-development and post-development runoff.

Infiltration and Imperviousness

Infiltration and imperviousness are important parameters affecting the amount of surface runoff generated from a rainfall event. Proper definition of infiltration helps to estimate how much water is absorbed by the soil during a rainfall event. Water lost to the ground lessens the amount of surface runoff that must be carried through storm drainage systems. Proper definition of imperviousness within a watershed helps to estimate how much of the terrain is covered by impermeable materials, such as pavement. Impervious areas block rainfall from reaching underlying infiltrative soil.

The initial infiltration losses for the soils used in the hydrologic calculations are 0.10, 0.20, and 0.40 inches per hour for 100-year, 10-year, and 2-year storm events respectively. These losses were taken from Table 5-1 of the Sacramento City and County Drainage Manual, Volume 2: Hydrology Standards, December 1996. The constant losses used in the hydrologic calculations are dependent on the soil cover type and soil group. These losses can be found in Table 5-2 of the Sacramento City and County Drainage Manual.

Each land use type has a certain percentage of imperviousness as shown in **Table 3.3: Impervious Factors & Basin 'n' for Unit Hydrograph Lag Equation**. In a particular sub-shed, a composite percentage of imperviousness is calculated internally in the model based on the weighted area of each land use or cover type.

Table 5-2 does not contain infiltration rates for Soil Type A and includes a footnote that says Sacramento County does not contain significant areas of Type A soils. For this reason, all the soils labeled with Type A are modeled as Type B as this approach is more conservative, with the exception of soils north of White Rock Road. The Type A soils north of White Rock Road were modeled with a constant 0.3 inches per hour infiltration rate which is based on the minimum rate for Type A soils per NRCS Technical Report 55. Additionally, soil type labeled C/D in **Figure 3.4: Soil Conditions and Infiltration** is modeled as Type D, to be more conservative. **Figure 3.4** also shows unlabeled soil type with blue color designated as "Other". These unlabeled soil types are modeled as Type D. While detailed soil information has been gathered within the mining areas and limited portions of the watershed, most of these areas do not discharge to the creek system and therefore do not affect model results. For consistency, the soil information will reflect Sacramento County standards.

Lag Time

The lag time of a basin is required to calculate runoff hydrographs or the amount of runoff over a storm duration. The lag time was calculated using Basin "n" (or terrain roughness) in the hydrologic model. The Basin "n" values are shown in **Table 3.3: Impervious Factors & Basin 'n' for Unit Hydrograph Lag Equation.** This table shows the Basin "n" can be reduced by half as the sub-shed is channelized. With the shortened lag time, the speed of flow discharge increases through the watershed.

Table 3.3: Impervious Factors & Basin 'n' for Unit Hydrograph Lag Equation

Prior Improvements (Granite I / Aspen VI and Morrison Creek)

Significant mining activity within the Plan Area has occurred over the last several decades which has modified the landscape and drainage patterns of the watershed. The elevations of the mined areas were lowered below the main Morrison Creek channel, leaving the channel corridor elevation above the mining areas with embankments that function as levees. The mining resulted in the excavation of a large basin within the Granite 1 and Aspen VI mining areas, located just upstream of Jackson Road along the left bank of Morrison Creek, shown as shed WJP1 on **Figure 3.6: WJHMP Future Conditions Watersheds**. Prior to the Granite 1 / Aspen 6 basin being constructed, the flooding from the Morrison Creek watershed was stored in a shallow floodplain upstream of Jackson Road.

[8] Note is consistent with table as published by the County.

In the published FEMA Flood Insurance Study, the peak 100-year flow is reported as 2,755 cfs at Jackson Road and 2,855 cfs at the Central California Traction Railroad (just downstream of Watt Avenue). This FEMA study also reflects the watershed prior to construction of the Granite 1 / Aspen 6 basin.

With the construction of an overflow weir structure on the Granite I property and a large deeply excavated basin area, the 100-year peak flow in Morrison Creek at the Jackson Road crossing is approximately 633 cfs and approximately 833 cfs just downstream of Watt Avenue. The construction of the weir and basin were implemented to mitigate the impacts of channelizing and realigning Morrison Creek between two levees, which allowed for mining to proceed outside of the levees. The excess flow is now stored in the Granite 1 / Aspen 6 detention area, thus preventing it from contributing to peak flooding downstream. The original intent of the Granite 1 / Aspen VI mitigation was to prevent peak flow from increasing downstream due to planned mining activities. The constructed basin and weir structure were over-sized and likely improved downstream conditions In addition to capturing upstream runoff in the Granite 1 / Aspen 6 basin, the effects of mining activities in general reduce tributary contributions by lowering ground and preventing direct runoff from entering the creek via gravity flow. Overall, the Morrison Creek watershed has experienced reduced flows due to mining activities and the construction of the weir on Granite I and the detention basin within Granite I / Aspen VI.

As a result of the realigned channel and weir at the Granite 1 / Aspen 6 basin, flows have been reduced at the intersection of Jackson Road and Morrison Creek by approximately 75% during the 100-year event. As part of this study, post-development conditions include reclaiming a portion of creek flow capacity by pumping previously mined areas back into the creek. These areas were draining by gravity into the creek before mining occurred and can be allowed to drain back into the creek in a controlled manner and with increases in water surface elevation being contained within existing embankments.

Methodology

Reduction of Flow and Volume for Hydromodification

In most cases, undeveloped land naturally stores and infiltrates some amount of rainfall. As rainfall increases, the land can become saturated and forces additional rainfall to flow overland. When development occurs, this natural ability of the land to infiltrate early rainfall can be altered and facilities

which intercept storm runoff can be constructed to contain rainfall volume onsite and restore the pre-development storage capability. The development of the Plan Area is assumed to include similar runoff reduction measures; however, SCDWR does not accept the application of runoff reduction during larger storm events. It is anticipated that hydromodification will be evaluated with future planning efforts and was not considered in this analysis.

The approved Aspen 1 Drainage Study (Reference 2) within the City of Sacramento took into account hydromodification through LID features as part of the proposed flood control. This study removes the effects of LID features as a means of runoff reduction for the purposes of evaluating flooding and mitigation under developed conditions. The storage volume associated with LID features in the Aspen I development (in the City) equates to 1,513 cubic-feet per acre, which can be expressed as a depth of rainfall per acre of 0.42 inches. Refer to **Appendix B** for additional details.

Since SCDWR does not allow for the use of LID features that rely on infiltration or flow-through soil media for flood control, this analysis includes Aspen 1 flows that do not reflect the reduced rainfall. Furthermore, the Aspen 1 shed has been simplified as one lumped watershed using Sacramento County hydrology methods, approximating the detailed routing found in the City's modeling.

Detention Facilities

In most cases, a detention basin is planned at the downstream end of each shed to reduce peak flows to existing conditions. These basins were designed using XP SWMM software. The side slope of the basins are considered as three horizontal to one vertical (3:1). Most of the basin areas are assumed to be rectangular in shape. The downstream invert of the outfall (outlet) pipe is assumed to be one foot above the creek invert, unless otherwise specified. The length of the outfall pipe is assumed to be 100 feet unless otherwise specified. The bottom of the detention basin is assumed as the same invert elevation of the upstream end of the outfall pipe located within the basin. The slope of the outfall pipe is assumed to be 0.5% which translates to a typical detention basin bottom elevation of 1.5 feet higher than the creek flow line elevation. In many cases, multiple outfall pipes are considered instead of a single larger pipe, resulting in the inner pipe crown elevation lower than the peak Hydraulic Grade Line (HGL). Two additional levels of pipe outlets and weirs (for overflow) are also considered to mitigate the varying levels of outflow. For all

outlet pipes, a backflow prevention device (flap gate or other type of check valve) is considered in the XP SWMM models, to prevent the creek receiving waters from backflowing into the basins. The top of the basin elevation is set as the minimum elevation of the adjacent pads.

The bottom area of basins are designed to store the water quality volume within a one-foot depth with the assumption that the basins will be designed for dry-extended water quality treatment. This estimate is utilized to approximate a sufficiently large detention basin footprint to accommodate water quality treatment and hydromodification. To demonstrate that hydromodification requirements could be achieved, a SAHM model was set up to verify the sizing for the detention basin footprint. The SAHM model was utilized as a test case for two gravity basins to verify adequate sizing of the basins. To account for differing land use, one test case represents a watershed that is primarily composed of commercial and industrial land use while the second is primarily residential land use. The water quality volume calculations and SAHM model are included in **Appendix H.**

The actual depth will depend on the depth of the existing creek and the future proposed grade of the watershed tributary to the detention basin. The first one-foot of depth in the basins is considered as dead storage in this analysis. Detention basin depth in this study was estimated from the higher of the 100-year and 500-year storm event freeboard requirements. Although 36-hour and 5-day storm durations were analyzed, the 24-hour and 10-day storm event durations produced the highest water surface elevations. For gravity detention basins, the 24-hour storm event produced the highest water surface elevations and for pumped detention basins, the 10-day storm event produced the highest water surface elevations.

The stage hydrograph for Morrison Creek is obtained from the HEC-RAS (US Army Corps of Engineers hydraulic modeling software) model analyzed under this study. The stage hydrograph at Elder Creek is created from the peak water surface profile given in the modeling provided by Civil Engineering Solutions, included as part of **Appendix C**. The stage hydrograph establishes the changing tailwater conditions to which onsite detention must dynamically discharge. Since there are two sets of unknowns, such as the dimension of the detention basin and the outlet configurations, iterations are performed using the XP SWMM model to optimize output and basin geometry.

For ultimate conditions (full buildout within the watershed), detention basins were located according to existing planning studies / documents. For areas within the watershed that are open space now, but could be developed, detention basins mitigating peak flow to existing conditions are utilized. These detention areas are presumed to decrease peak flow but will add volume to runoff conditions.

Initial pump sizing leaves significant residual volume in the detention basins at the end of a 10-day event. Therefore, based on meeting Bird Aircraft Strike Hazard (BASH) requirements and discussions with SCDWR, the additional requirement of prolonged pumping (after a large event) should not last more than 30 days. After a 10-day storm simulation, storms of lesser degree are assumed to occur and contribute additional volume while the pump station is emptying the detention basin. Current Sacramento County standards do not define storms longer than 10 days. 30-day rainfall estimates and conservative runoff estimates were made, based on comparisons with Solano County depth / duration / frequency estimates, to account for inflow and outflow from each basin over the latter 20-day period. This approach was discussed with SCDWR for use in this study. The pumping rates were increased in basins where the basins were not empty after 30 days of rainfall. Compliance with BASH requirements must be reviewed and accepted by Sacramento County Airports during the design phase of the pumped basins. Any design features discussed in this report that are unacceptable to Sacramento County Airports will need to be modified to meet BASH requirements as well as the flood control objectives described in this report. All pumping will be regulated using monitoring stations in Morrison Creek at the outfalls of the pump station and pumping will be curtailed during peak flow conditions. The analysis for this design consideration is documented in more detail in **Appendix D**.

Detention Basin Starting Conditions

SCDWR requires that the starting water surface conditions for gravity and pumped detention basins be determined to account for the potential for residual volume to be present prior to the evaluation of a design storm event and to account for lost storage due to antecedent rainfall. The methodology provided by SCDWR establishes this starting condition by running a 2-year 10-day duration storm event through the designed system and using the ending water surface elevation from this event as the starting water surface for the flood events required under this master plan. This methodology is not a current Sacramento County

standard, but this approach, or a similar approach, is expected to be adopted in the future. Detention basin starting water surface elevations in future analyses will have to adhere to the adopted methodology at that time. These starting water surfaces are provided as supporting documentation for the modeling under **Appendix E**.

3.6 Assumptions: Planned Conditions Morrison Creek and Elder Creek Flood Control Modeling

This section sets forth the modeling considerations for flood control improvements for the Morrison Creek and Elder Creek systems under planned conditions.

Upstream and Downstream Development

This master plan effort evaluates the existing condition, planned conditions of the Plan Area, and ultimate development of the entire upstream watershed. The downstream watershed is modeled according to the current state of build-out (i.e., existing conditions at time of NOP). After discussion with SCDWR, this assumption was acceptable since any future downstream development would need to mitigate their own impacts. Portions of the upstream watershed, outside existing planning areas and currently undeveloped, are assumed to be 50% impervious consistent with SCDWR modeling standards. To mitigate for the potential of the undeveloped upstream properties to develop, detention facilities are utilized to mitigate peak flow. A significant portion of the upstream watershed is draining into either the Morrison Creek channel or the Elder Creek channel and flowing through the Plan Area. Some upstream mining areas do not flow downstream due to the mined topography. Land use and hydrologic conditions, defined in references identified in Section 2.5 were utilized to establish conditions for assessing runoff affecting the Plan Area. Several upstream watershed areas are unable to reach creek channels without passing through planned development areas within the Plan Area.

The conditions along Elder Creek are not anticipated to increase or change peak flow conditions after development is in place. With primarily gravity basins, future detention can be configured to maintain Elder Creek conditions as they exist today. Additionally, planned development and levees will not encroach into the existing Elder Creek floodplain. Due to these conditions, a LOMR along Elder Creek is not anticipated.

Methodology

HEC-RAS was utilized to evaluate the hydraulic conditions within the main creeks for both existing and post-project conditions using dynamic (unsteady) flow hydrology following Sacramento County hydrology standards. Under post-project conditions (existing plus project and ultimate) the HEC-RAS model was configured with one-dimensional cross sections representing the stream channels. The floodplain areas outside of the Plan Area were defined primarily by one-dimensional cross sections and storage areas. Within the Plan Area, the only "off-channel" area that is modeled using HEC-RAS is the weir flow into the Granite 1 / Aspen 6 basin. Flows generated under post-project conditions for the remaining developed areas within the Plan Area and offsite Jackson Township flows were modeled using XPSWMM. Hydrographs from the XPSWMM modeling effort were inputted into the creek corridors modeled in HEC-RAS.

For levee design considerations, pumping estimates, as well as sizing depressed detention areas receiving creek overflow, the HEC-RAS models were run for various flood frequencies and storm durations. The flood frequency and storm duration range from 2-year 24-hour to 500-year 10-day events per Sacramento County hydrology standards. Assumptions included the following:

- Each event assumes that the ending water surface of the 2-year, 10-day duration is the starting condition in each detention basin.
- Lateral weirs designed to convey flow out of the creek channel and into storage areas are assumed to operate with a weir coefficient of 2.0 for this level of analysis.
- Design roughness coefficients (manning's N values) were assigned to channels according to current SCDWR channel design standards, except for the reach of Morrison Creek between Hedge Avenue and Mayhew Road, which was designed with a roughness coefficient of 0.1 (per prior design requirement and concurrence with SCDWR). The river stationing for these reaches is shown in **Table 3.4: Manning's Roughness Coefficient for Morrison Creek Reaches**

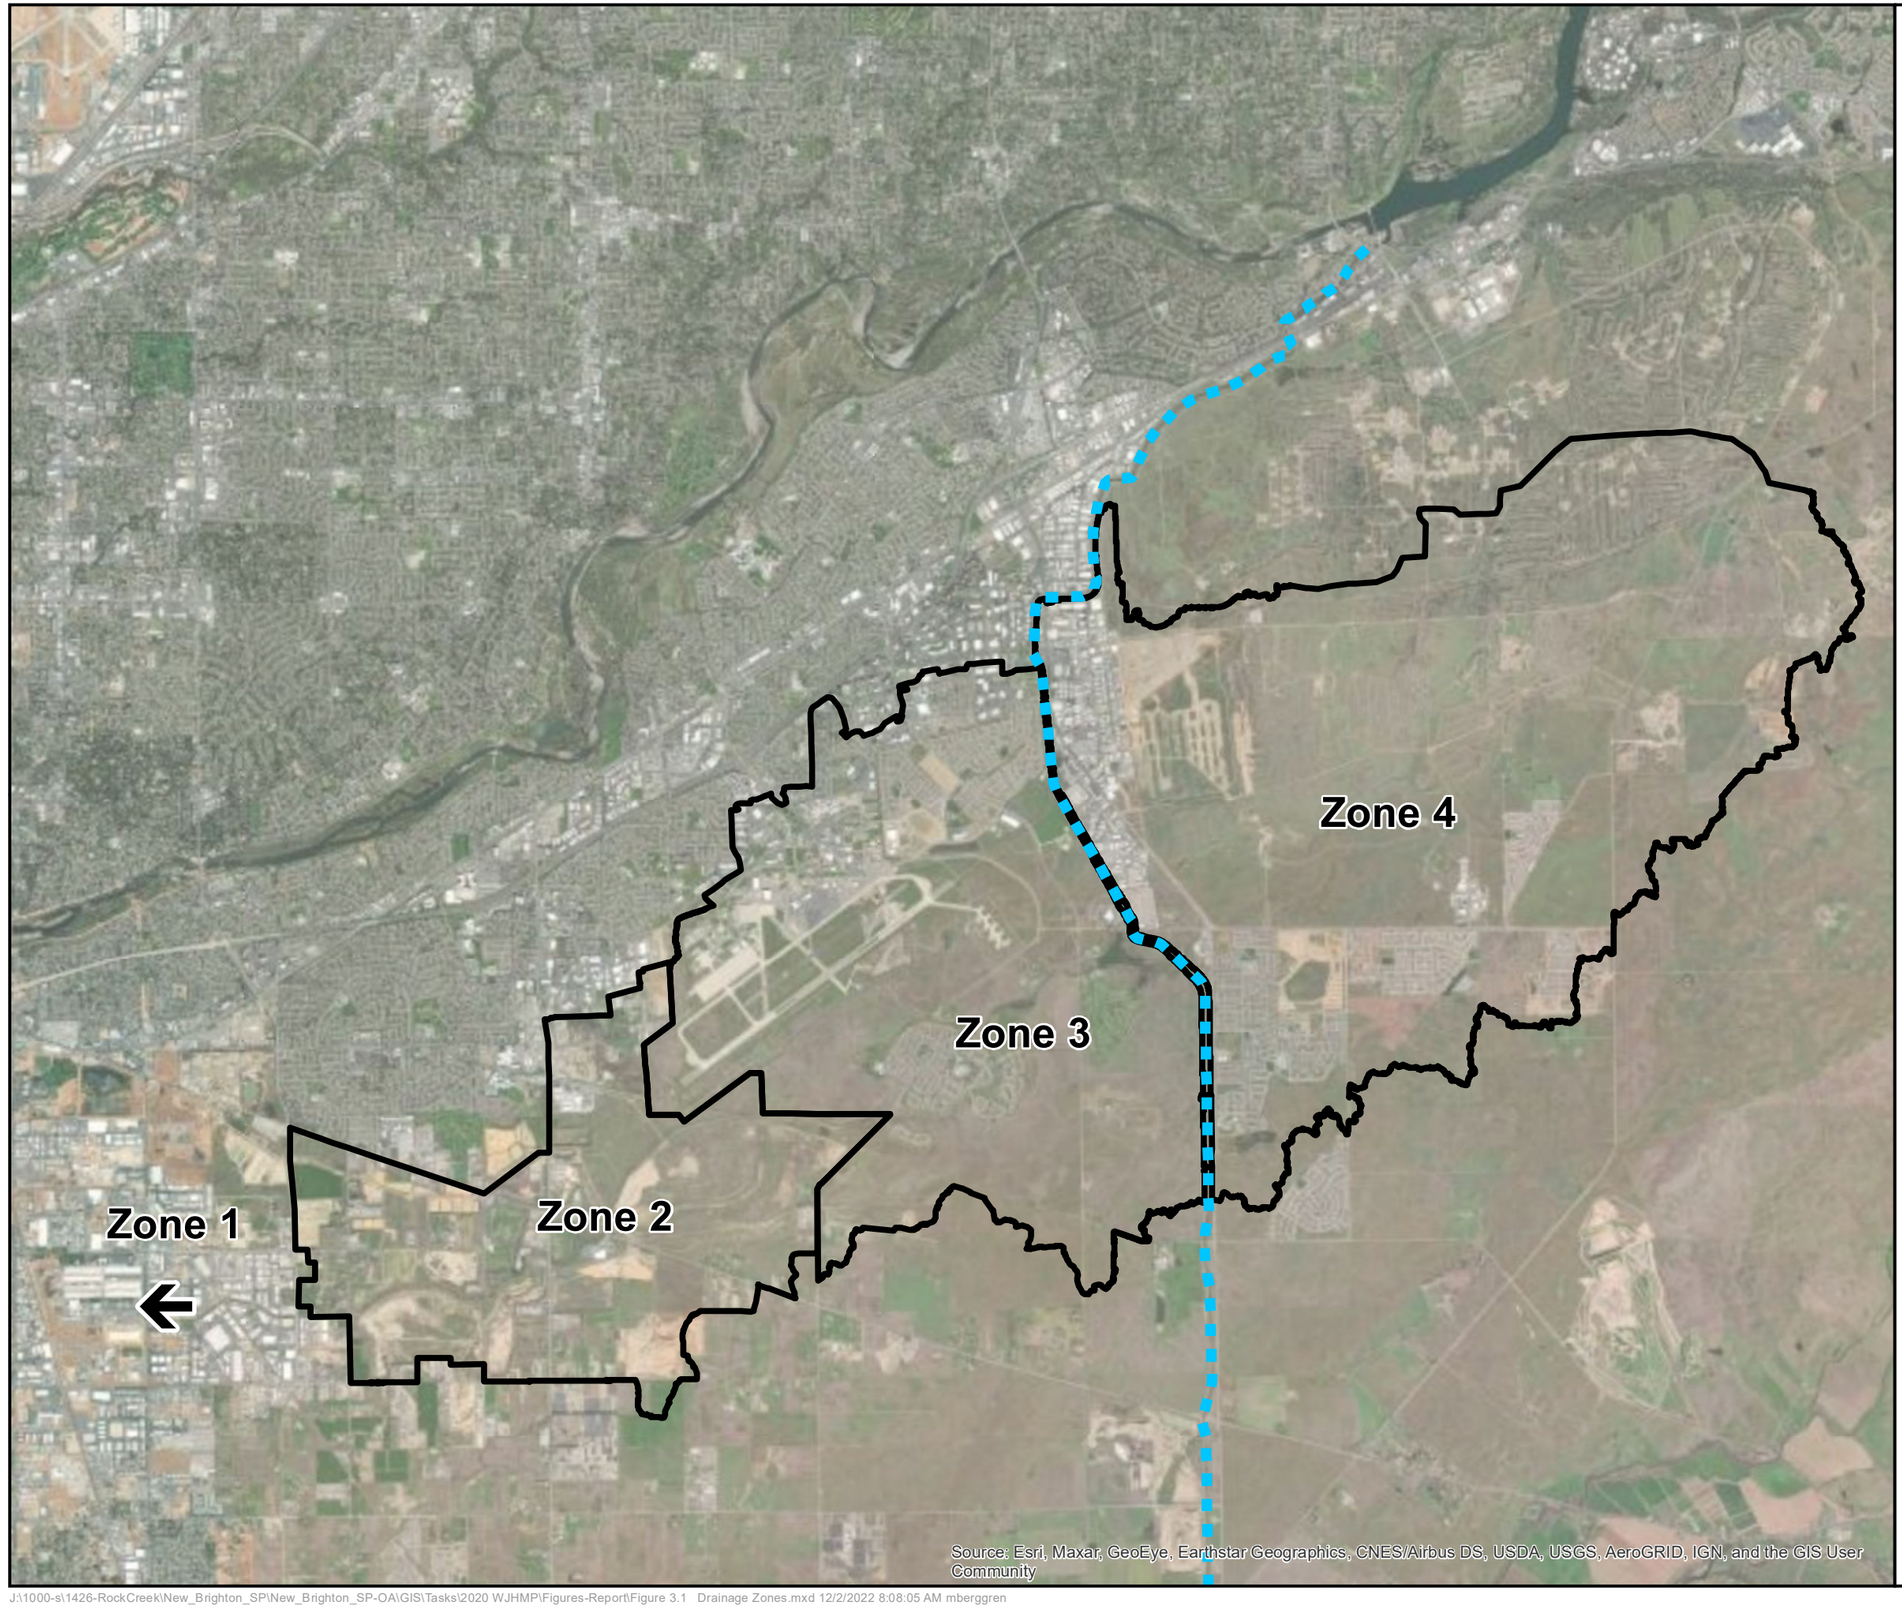

Table 3.4: Manning's Roughness Coefficient for Morrison Creek Reaches

Location	Upstream River Station	Downstream River Station	Roughness Coefficient
Upstream of Mayhew	22.8769 (mile)	10894.8	0.06
Mayhew to Hedge	10894.8	8332.998	0.10
Downstream of Hedge	8332.998	14.50822	0.06

The Plan Area contains temporary creek crossing structures which allow for the movement of vehicles and conveyor belts for mined material. For the purposes of representing the channel conditions, these temporary structures are treated as removed from the Morrison Creek channel upstream of Jackson Road. The removal of these structures results in minimal increase in flood conveyance capacity during larger events. This is substantiated by the Morrison Creek modeling. Model results are included as part of **Appendix E**.

FIGURE 3.6

4.0 Existing Conditions: Creek Flow & Stage

Existing Morrison Creek flows and water surface elevations within the channels in Zone 1 and Zone 2 are provided in **Table 4.1: Existing Conditions Morrison Creek Maximum Stage and Flow**, for applicable storm events. For each storm event the 24-hour storm duration produces the highest peak flows within Morrison Creek based on sensitivity analysis discussed later in this report. The 500-year storm was not modeled downstream (Zone 1) of Florin Perkins Road as maximum channel design considerations are determined with the 200-year storm.

The existing conditions Elder Creek system model was provided by Civil Engineering Solutions via SCDWR and has not been modified. A separate model was also provided by Cunningham Engineering that reflects the post-mining condition of the Aspen 8 and Aspen 9 mining areas. The details of this modeling condition are described in a Technical Memo by Cunningham Engineering included in **Appendix M.** Prior to the mining Aspen 8 and Aspen 9, there was a spill leaving the Elder Creek system which passes through the floodplain and storage areas of Morrison Creek before entering the Morrison Creek channel. Flow from this spill was not included in the Morrison Creek model, as excluding this flow produces a lower existing conditions flow in the creek and therefore requires larger mitigation, which is conservative. In Elder Creek, the cutoff of these existing spills due to mining operations are also reflected in the modeling. It was

[9] The 500-year event was not evaluated in Zone 1 due to absence of 500-year hydrological data. Downstream 500-year impacts to the creek are not required by SCDWR.

determined that this post-mining condition creates higher peak flows and water surface elevation in Elder Creek for determining preliminary basin sizing and levee heights compared with the existing conditions model. The existing floodplain spills will be mitigated through improvements to the creek crossing at Elder Creek Road and the construction of a weir that spills high creek flows into the Aspen 8 mining area. The proposed Elder Creek Road crossing improvement and Aspen 8 weir should be constructed prior to any WJHMP development within the Elder Creek watershed. No change to post-mining condition peak flows are planned as part of this plan.

4.1 Existing Conditions Floodplain

Absent planned improvements, the floodplains described in the following section would be approximate. If the floodplain is mapped by FEMA, it is anticipated to be mapped as a flood hazard area.

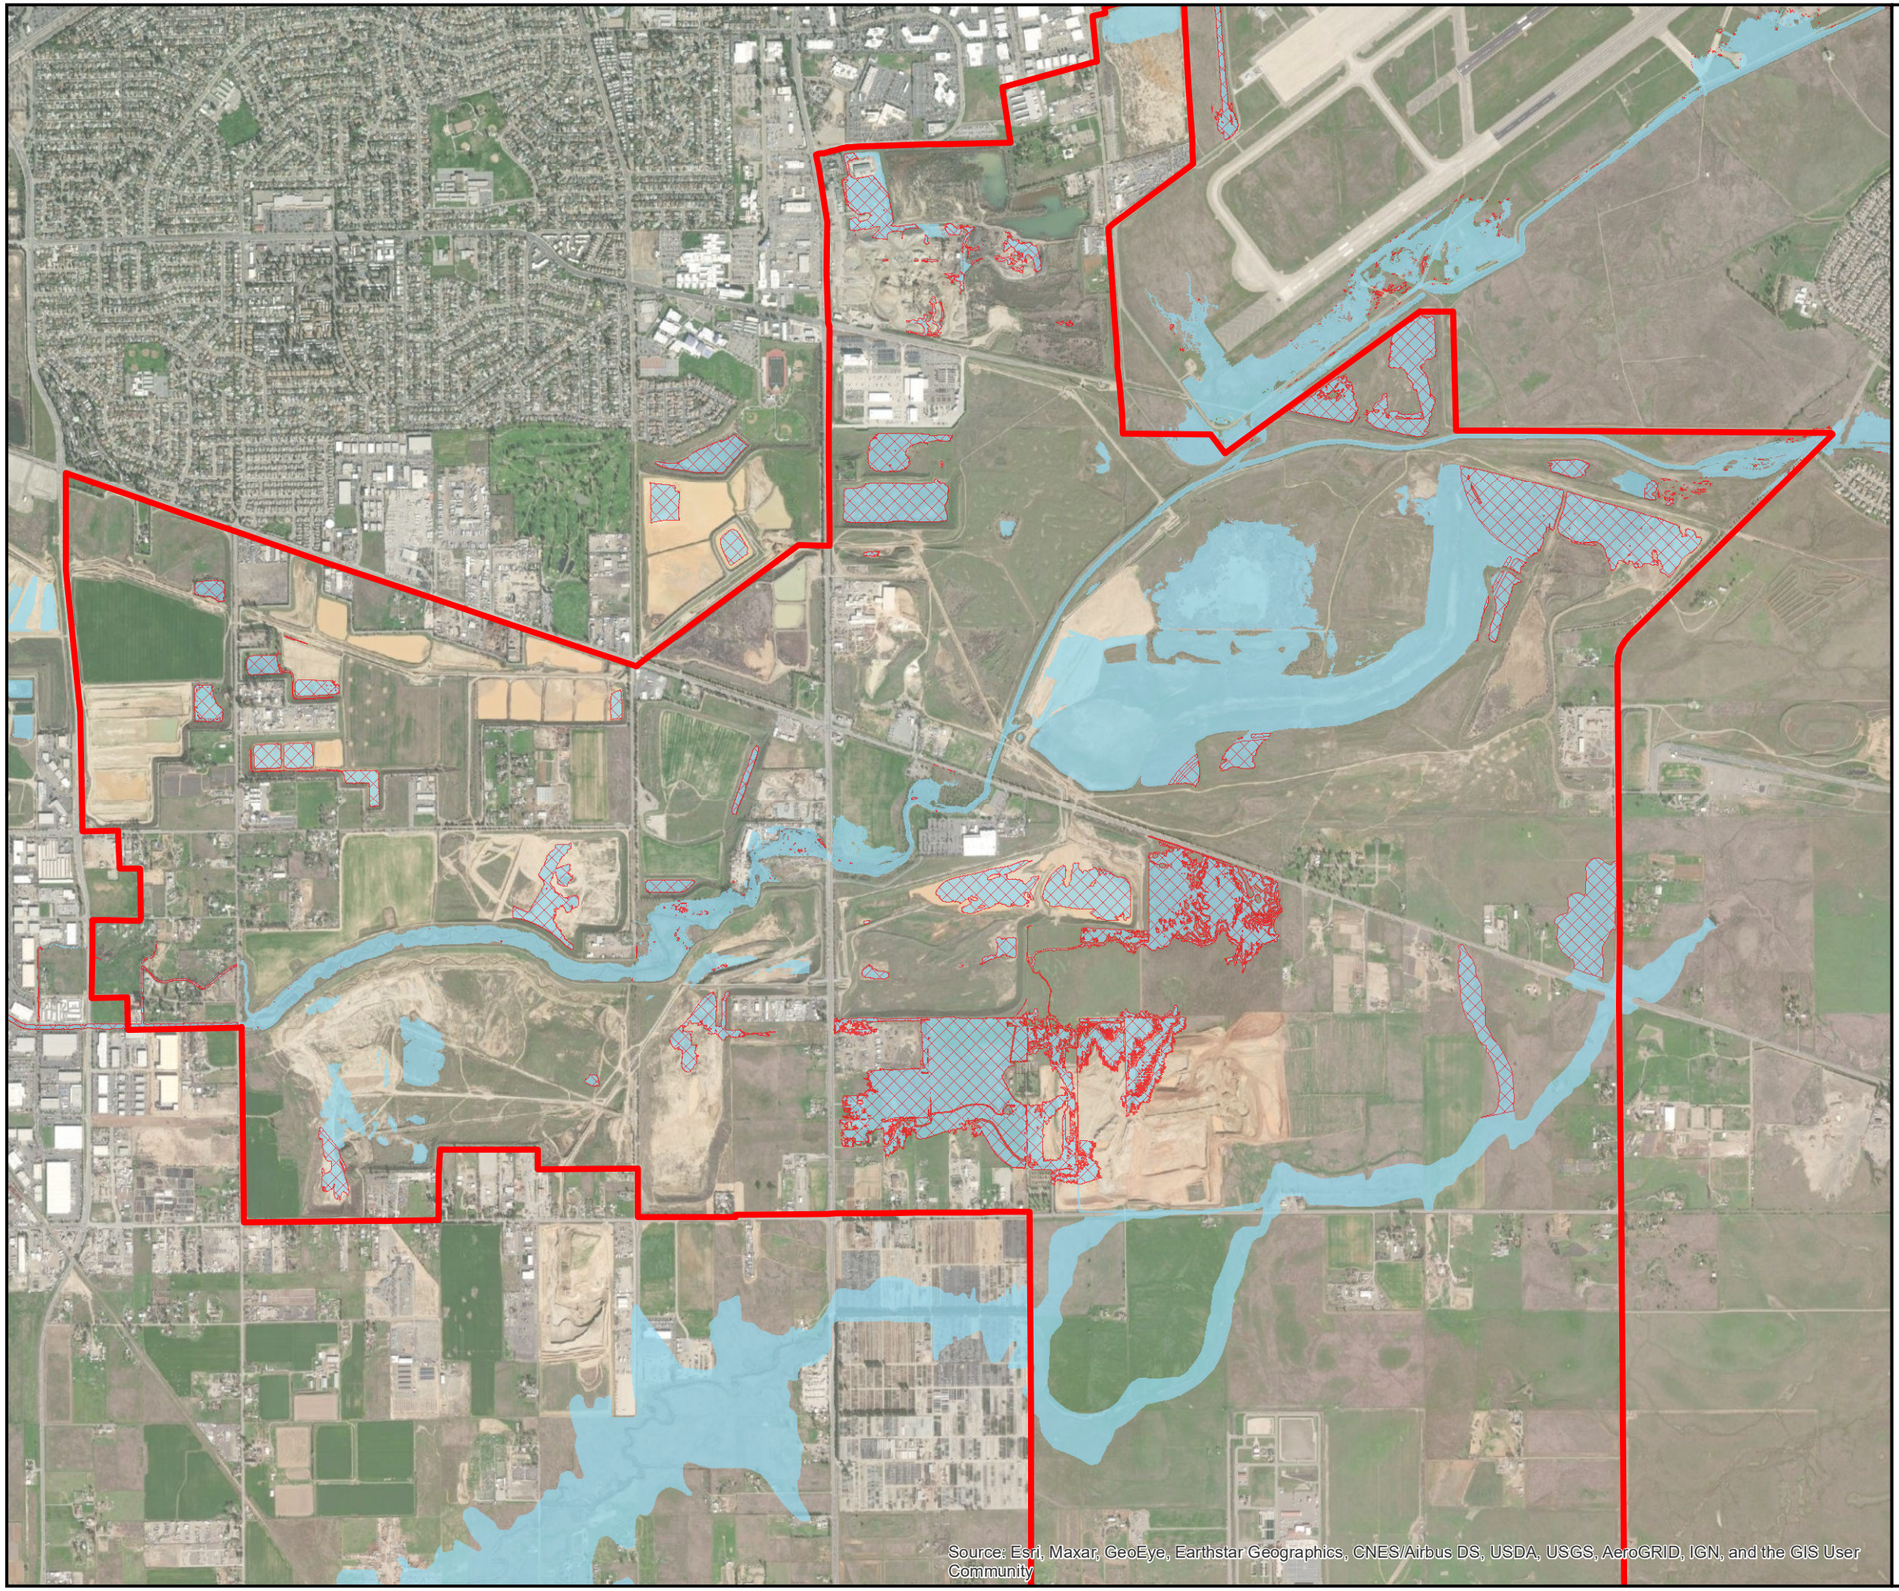
No Levee Failure Floodplain

Based on hydrology for the existing condition, flow was routed down the creek corridors. Modeling of Morrison Creek downstream of the Folsom South Canal and Elder Creek produced a 100-year floodplain assuming no levee failure. The existing condition floodplain, assuming no levee failure, is shown in **Figure 4.1: Existing Conditions 100-year Flooding - No Levee Failure Flooding**. The portions indicated as "floodplain removed" are portions of the existing floodplain or interim mining drainage facilities that will be removed with the planned project improvements.

The Excelsior Road bridge crossing over Morrison Creek does not have freeboard to the bridge deck for the 100-year design event under existing conditions. The creek does not overtop the bridge deck during the 100-year design event but does overtop the roadway northeast of the bridge. The bridge deck does overtop during the 200-year design event. The WJHMP project does not increase water surface elevations at this location, but future coordination with the Sacramento County Department of Transportation may require improvements to the crossing for emergency access concerns. Similarly, the Bradshaw Road bridge crossing over Elder Creek southwest of the project area overtops during the 100-year design storm event in existing conditions. The WJHMP project does not worsen hydraulic conditions at this crossing, but

future coordination with the Sacramento County Department of Transportation could necessitate improvements to the crossing for emergency access concerns.

Levee Failure Floodplain



For the purposes of this master planning effort, the existing conditions floodplain that was established based upon the model result (**Figure 4.1**) was modified to take a conservative approach. Therefore, for the purposes of this study, the existing conditions levee failure floodplain is defined by projecting the Morrison Creek and Elder Creek water surface elevations, without consideration of existing levees and the containment of flow within those levees. This mapping technique is only applied within the Plan Area boundary and is considered extremely conservative and not representative of actual conditions as flood volume is not evaluated under this projection. **Figure 4.2: 100 Year Flooding - County Projection** illustrates the existing floodplain within the Plan Area utilizing this method. This analysis is not intended for purposes of establishing the existing condition but was requested by SCDWR.

FIGURE 4.2

5.0 Design Standards to be Achieved

Outlined below are the design standards utilized in assessing the project's drainage and flood control facilities. These design standards have been derived from the regulatory documents as described in Section 2.4 Regulatory Setting.

5.1 Interior Design Standards (pumped detention basins)

2-year 24-hour volume discharged to creek in less than 48 hours

Although not a County standard, this criteria is anticipated to support BASH abatement efforts. Meeting this objective does not automatically fulfill BASH requirements and compliance with BASH requirements must be reviewed and approved by the Sacramento County Airport System prior to development.

100-year 10-day flood containment with three feet of freeboard

While not specifically a County standard, standard engineering practice for pumped detention basins is to maintain the 100-year, 10-day storm event with three feet of freeboard to adjacent pads.

500-year 10-day flood containment with no freeboard

While not specifically a County standard, standard engineering practice for pumped detention basins is to maintain the 500-year, 10-day storm event not to exceed adjacent pad elevations.

Pump Station design with pump redundancy and backup power

In order for the floodplain to be considered removed by FEMA, the standard of practice is for pumped basins to require redundancy pump(s) and backup power. The backup pump is intended to provide redundancy and be sized to equal the largest duty pump. **Table 5.1: Pump Station Design Criteria** shown below was provided by SCDWR for future design of pump stations. Based on discussions with SCDWR, the percent failure may be adjusted if the number of duty pumps is increased.

Table 5.1: Pump Station Design Criteria
Source: Sacramento County, Department of Water Resources

Frequency	Duration	Pump Operation	Peak Water Surface Criteria
10-year	All durations	Pumps 1 and 2 Operating	For pipe design and setting on elevation for 3rd pump
100-year	24 and 36 hours	All pumps operating	Minimum 1 foot freeboard in basin (designated flooding storage areas)
100-year	5 and 10 day	All pumps operating	Minimum 1 foot freeboard in basin (designated flooding storage areas)
100-year	24 and 36 hours	50% of pumps not operating	Not to exceed 1 foot over the street gutter flowline
100-year	5 and 10 day	50% of pumps not operating	Not to exceed 1 foot over the street gutter flowline
100-year	24 hour	No pumps operating	Not to exceed finished floor elevations (goal)
500-year	All durations	All pumps operating	Not to exceed pad elevations

Notes:
1. All scenarios do not include the low flow pump operation
2. 50% of pumps not operating; assumes that 2 of the 4 pumps (3 primary and 1 back up) are not operating.
3. Run all scenarios with and without climate change factors applied to rainfall or flow.

5.2 Interior Design Standards (gravity detention basins)

Mitigation of 2-year, 10-year, and 100-year outflows to creek

Hydromodification as required by the County's Hydromodification Management Plan developed in 2011 and revised in 2013 will require a range of flow mitigations. Per discussion with SCDWR, the analysis of hydromodification objectives for each detention basin was not required at this level of analysis. Rather, at this level of analysis, the 2-year, 10-year, and 100-year is mitigated. Additionally, an example detention basin was used to show that the design approach used in this study would not preclude hydromodification objectives in further studies.

100-year flood containment with 1.2-feet of freeboard

As required by County of Sacramento, Improvement Standards, section 9-1-G, the 100-year water surface level must maintain at least 1.2 feet of freeboard to the building pads of proposed structures.

100-year flood containment with 1-foot of freeboard within gravity basin

While not specifically a County standard, standard engineering practice for gravity detention basins is to maintain 1-foot of freeboard within gravity basins for the 100-year storm event.

Overflow release to creek for larger storms

Consistent with standard engineering practice for gravity drainage systems, larger storm events will overland flow into adjacent receiving water bodies.

5.3 Levee Design Standards

Meet all California Urban Levee Design Criteria (ULDC) and Urban Level of Protection (ULOP)

Requirements relating to levee design are regulated by the State. These levee criteria are specifically required per State ULDC and ULOP requirements including containment of the 200-year flood with 3-feet of freeboard. The ULDC also states:

> *Debris loading on bridges must be considered. Bridges with less than 3 feet of clearance above the (design water surface elevation) DWSE may experience extraordinary debris loading that must be evaluated in addition to typical pier/bent debris loading. The evaluation should include historic and potential debris transport in the stream, an analysis of loading on the bridge, and analysis of backwater impacts on the DWSE in the vicinity of the bridge.*

Meet the requirements of 44 CFR 65.10, for mapping of areas protected by levee systems

Federal code of regulations defines specific requirements for levee design to map areas protected by levees as outside of the special flood hazard area.

5.4 Allowed discharges

Maintain all design flow capacities and freeboard requirements for the 200-year flood event through all downstream County / City flood containment (levee) facilities

Existing levees are considered to be regulated by ULDC and ULOP as previously discussed.

No increase to 100-year and 200-year peak flow for downstream areas unless flow is contained within the existing conveyance facilities

Post-development conditions include reclaiming a portion of creek flow capacity by pumping previously mined areas back into the creek. These areas were draining by gravity into the creek before mining occurred and can be allowed to drain back into the creek in a controlled manner and with increases in water

surface elevation being contained within existing embankments. While not a specific standard, it is criteria stipulated by SCDWR in discussions regarding downstream capacities.

5.5 Hydromodification and Storm Water Quality

Meet County of Sacramento requirements to comply with the State Water Resources Control Board's MS4 permit

County requirements are stipulated in the Sacramento Region's Stormwater Quality Design Manual, dated October 2017 for both hydromodification and storm water quality. At this level of analysis, specific details relating to hydromodification and storm water quality are not included in this Master Drainage & Flood Control Study but are anticipated to be accommodated within individual watersheds as onsite facilities during future entitlement stages as required for tentative mapping. However, a conceptual model was tested for the purpose of demonstrating that the detention basin footprints presented in this report are adequate. See **Section 7.5** for this analysis.

6.0 Planned Project & Model Results

The project provides for the repurposing and redevelopment of formerly mined properties. In order to achieve the planned redevelopment for both the mined areas and areas at grade, new drainage infrastructure is required. This section provides a description of the planned project and summarizes the modelling results.

6.1 Development Project Description

Design Vision

The existing condition of the project site provides numerous opportunities to create a land use plan and accompanying drainage improvements that can capture, treat, and detain stormwater. These opportunities benefit the Plan Area and downstream property owners, including Sacramento County and the City of Sacramento. As illustrated by **Figure 6.1: WJHMP Land Use**, the planned land use plan includes a variety of unique features which include:

- Open Space: Extensive open space opportunities within the Plan Area. The Plan Area contains approximately 1,850 acres of open space which has been designed to provide opportunities for detention, water quality and groundwater recharge.

- Preservation of Morrison and Elder Creeks: Morrison and Elder Creeks have been incorporated into the overall project, resulting in an extensive creek and recreational system that traverses the Plan Area while providing flood protection for the Plan Area and downstream property owners.

- Rock Creek Parkway: This parkway has been designed as a long linear roadway and drainage system capable of capturing, treating, and conveying stormwater runoff to local detention basins prior to reentering the Morrison Creek system. Proposed treatment mechanisms will be determined during subsequent entitlement efforts related to the preparation of tentative maps.

- Granite 1 / Aspen 6 Weir and Detention basin: The weir and detention basin located near the northeast portion of the property has been designed to remove a portion of peak flows from Morrison Creek. The peak flows enter the detention basin through the weir prior to pumping back into the Morrison Creek system. The removal of peak flows has been demonstrated to significantly reduce flows downstream in Sacramento County and the City of Sacramento, while providing opportunities to pump drain discharges from within the Plan Area back into the system.

- Interconnected Detention Basins. As a result of the former mining activities which have shaped the Plan Area, future conditions feature detention basins which help capture and treat stormwater prior to being discharged back to the Morrison and Elder Creek system, resulting in treated storm water runoff and reduced downstream flows.

- Efficient stormwater delivery and storage network. The master drainage system features a trunk drainage conveyance system that includes culverts which are designed to distribute stormwater flows to a concentrated network of detention basins. This system provides a focused number of detention basins and planned pump stations which provide a multitude of benefits which include reduced Bird Airstrike (BASH) hazards in the vicinity of Mather Airport, reduced capital outlays for

construction, and significant reductions in the long-term maintenance costs that accompany detention basins and pump stations.

Plan Area Land Use

Planned condition land uses within the Plan Area are comprised of a mixture of land uses including residential, mixed-use, commercial, industrial, institutional, employment, open space, park and educational as shown in **Figure 6.1: WJHMP Land Use** and **Table 6.1** below.

Table 6.1: Plan Area Planned Land Use Summary
Source: West Jackson Highway Master Plan, Land Use Plan 1A, by Wood Rodgers, dated January 17, 2022.

Land Use		Area (acres)	Target Density (DU/acre)	Estimated Dwelling Units (DU)	Estimated Square Feet (SF)
VLDR	Very Low Density Residential	115.6	2.0	230	
LDR	Low Density Residential	1,768	5.0	8836	
MDR	Medium Density Residential	58.6	14.0	820

OS/UF	Open Space / Urban Farm	392.6			
INS	Institutional	98.9			
	Arterial / Collector Roads	230.8			
Total		5,913.3		15,495 DU	16,148,999 SF

Future Planning Areas

The Plan Area consists of three future planning areas. These planning areas represent non participating land owners, but were required by the County to be part of the Plan Area. For purposes of this study, and consistent with the anticipated allocations identified on the project land use plans, planned land uses have been assigned to each of these planning areas. Since each future planning area is required to submit its own Master Plan amendment or Specific Plan prior to initiating development, it is anticipated that additional floodplain studies will be required prior to development within these future planning areas. For the purpose

of this study, the future plan areas are assigned a percent impervious of 50% without specifying the exact location of development. The following describes the general location of each Future Planning Area:

- Future Planning Area A: South of Fruitridge Road and west of Hedge Avenue and is within the Morrison Creek watershed. The future planning area includes low density residential, high density residential, employment, parks, and open space land uses.

- Future Planning Area B: North of Elder Creek Road and east of Bradshaw Road is within the Morrison Creek watershed. The future planning area includes low density residential, high density residential, a school, parks, and open space land uses.

- Future Planning Area C: North of Florin Road and south of Elder Creek Road within the Elder Creek watershed. The future planning area includes very low density residential, low density residential, high density residential, commercial, industrial, a school, parks, and open space land uses. This area also includes an institutional land use which consists of the Vineyard Water Treatment Plan owned by the County.

Offsite Land Use

For the purposes of developing cumulative build-out conditions for upstream properties, the design team worked with Sacramento County and the City of Rancho Cordova to identify known, approved, and/or in-progress development, and associated land uses. These land uses were identified and then evaluated in accordance with current SCDWR hydrology standards, which dictate that unencumbered open space designations within the watershed and the County Urban Services Boundary are to reflect a 50% level of imperviousness. In addition, certain open space areas within the upstream watershed were designated as not developable due to their identification as closed solid waste landfills. Previous modeling from the preliminary 2005 Rio Del Oro Drainage Master Plan and Montelena Drainage Master Plan were used to evaluate ultimate condition flows from Zone 4. These studies maximized detention basin discharges to the capacity of the Folsom South Canal over chutes. The 2005 Rio Del Oro Drainage Master Plan is being reevaluated at the time of this study. As the existing 2005 study fully utilizes the capacity of the over chutes it is not anticipated that a revised design could increase flows from those evaluated in this study. However,

outflows from the approved Rio Del Oro Drainage Master Plan will be evaluated when available to confirm this assumption. Based upon this analysis of upstream properties, cumulative build-out land use conditions for upstream properties in Zones 3 and 4 are shown on **Figure 6.2: Ultimate Land Use - Zones 3 & 4**.

Land Use Alternatives

The project currently proposes three master plan land use alternatives. This master drainage study evaluates Alternative 1A (dated August 31, 2021) for the purposes of this drainage analysis. Alternatives 1B and 1C are also considerations for the master plan's land use. The following is a summary of the primary difference for each land use alternative:

- Alternative 1A: Includes development of Rock Creek Parkway through Aspen 6 with residential land uses east of the current Mather Airport noise contour. This alternative proposes a setback levee along Rock Creek Parkway to provide protection for uncontrolled flows from Morrison Creek in case of failure of the levee or weir along the Granite 1 / Aspen 6 detention basin.

- Alternative 1B: Omits Rock Creek Parkway through Aspen 6 while keeping residential land uses east of the current Mather Airport noise contour. This alternative proposes utilizing a combination of high ground within Aspen 6 and a setback levee along the development edge to protect low lying areas. This alternative provides more area for Granite 1 / Aspen 6 detention to inundate and results in less impervious area.

- Alternative 1C: Includes development of Rock Creek Parkway through Aspen 6 and allows for residential uses east of the current Mather Airport Nosie Contour (and west of a draft noise contour currently under consideration). Similar to alternative 1A, this alternative proposes a setback levee along Rock Creek Parkway to provide protection for uncontrolled flows from Morrison Creek in case of failure of the levee or weir along the Granite 1 / Aspen 6 detention basin.

Both Alternatives 1B and 1C will produce less runoff than 1A due to less intense land use. Therefore, for the purposes of developing this Master Drainage & Flood Control Study, only alternative 1A is evaluated.

6.2 Description of Interior Drainage Improvements

For the purposes of this report, the following section has been developed in order to describe and illustrate the interior drainage improvements for each sub-shed within the Plan Area. Sub-sheds within the Plan Area have all been designed to include trunk drainage facilities and detention basins that are designed to either gravity drain or pump collected drainage.

Runoff from each shed at different storm events for both existing and proposed conditions is calculated using SacCalc modeling as described in Sections 3.2 and 3.5 of this report. For the purpose of simplicity in comparison, the shed boundary and the flow path is assumed the same for both existing and proposed conditions. Seven design storm events are considered to calculate runoff from the sub-watersheds:

- 2-year-24-hour
- 10-year-24-hour
- 100-year-24-hour
- 100-year 10-day
- 200-year 24-hour
- 500-year-24-hour
- 500-year 10-day.

Interior Watersheds

The following describes each watershed within the Plan Area. For a summary of the planned watershed facilities and detention storage operations under varying storm conditions refer to **Figure 6.3** through **Figure 6.19.** See **Figure 7.1: Interior Drainage Summary** for an overall summary.

Watershed WJP1

Watershed WJP1 is approximately 1,393 acres and comprised of lands tributary to the Granite 1 / Aspen 6 detention basin, located north of Jackson Road and east and south of the Morrison Creek channel system.

This watershed includes a portion of the Jackson Township development that is upstream of the Project. **Figure 6.3** schematically depicts the planned local storm drainage facilities draining into the planned detention area. This includes a portion of watershed located between the two main Morrison Creek tributaries in a roughly triangular parcel (referred to as the Granite 1 Triangle), just south of the Mather Airport. This portion of WJP1 is anticipated to be filled to an elevation above the maximum 500-year 10-day peak detention water surface elevation. The developable portion of Aspen 6 is intended to be protected by a setback levee and/or high ground. In the rare event that the water surface elevation rises above the 500-year storm event, the basin could provide an additional 7.9-feet of storage prior to overtopping Jackson Road at approximate elevation 63.9. The top of levee and/or high ground is assumed to be at elevation 65.9 which allows for one foot of flow over Jackson Road and another foot of freeboard to top of levee.[10]

A portion of the upstream Jackson Township project drains west under Excelsior Road and into the WJP1 detention basin area, which will be pumped back into Morrison Creek near Jackson Road. The crossing under Excelsior Road is currently a 27-inch arch culvert and a triple 42-inch circular culvert crossing is proposed in the Jackson Township drainage study. The project includes linear detention that was modeled as an approximately 2,900-foot channel with a 130-feet top width at the 100-year 24-hour water surface elevation. This channel was simplified as a detention node in the XPSWMM modeling using the total channel volume from the HEC-RAS output tables. The outflows from Jackson Township should be re-examined during the tentative map phase of the WJP1 watershed. The Jackson Township modeling indicates that Excelsior Road currently overtops during flooding events and drainage facilities on the project site would need to accommodate these flows prior to proposed improvements to the crossing indicated in the Jackson Township Drainage Study.

The Granite 1 / Aspen 6 detention basin still has active earthwork and several assumptions were made to determine the available storage capacity of the basin. The stage-storage relationship may need to be re-evaluated at the tentative map level to confirm that the basin has adequate capacity.

[10] As no design standard exists for this scenario, Wood Rodgers consulted with County DWR regarding an appropriate amount of freeboard and depth of flow crossing over Jackson Road. Since the Granite 1 / Aspen 6 basin would need to fill beyond capacity for an overtopping of Jackson Road, this approach is considered conservative.

Refer to **Section 6.3** for discussion regarding a catastrophic Mather Dam failure.

Watershed WJP2

Watershed WJP2 is approximately 366 acres and comprised of lands ultimately tributary to Morrison Creek but that do not drain under existing conditions. A significant portion of this watershed is open space preserved for environmental mitigation and will not be developed. These lands must be able to fill and drain to maintain vernal pool conditions; however, excess flow must be pumped away to protect developing areas within the watershed which are lower than the vernal pools. The north side of Morrison Creek will require a certified levee to protect this area prior to development of this watershed with urbanized land uses.

Figure 6.4 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJP3

Watershed WJP3 is approximately 1,305 acres and comprised of lands tributary to the mined area known formerly as Aspen 4 south, which is labeled as sub-watershed area WJP3 in **Figure 6.5**. This includes the development of Aspen 1 to the west of the Project. The planned detention basin is located just south of the Morrison Creek channel, immediately east of Mayhew Road. This entire watershed is located south of Jackson Road. Several mined areas to the north of Morrison Creek will be regraded, and planned runoff will be conveyed through culverts under Morrison Creek to the planned detention basin. An unlined channel along Rock Creek Parkway will convey the runoff from Aspen 1 as well as the onsite watersheds north of Morrison Creek to the culvert crossing under Morrison Creek. The channels will be approximately 15 feet deep and bounded by the Rock Creek parkway lanes. The channel was assumed to have 4:1 side slopes and an 8-foot bottom width. The major roads of Hedge Ave and Mayhew will be kept at the existing grade– which is well above the planned grading for the development and the channel– and will necessitate maximum culvert lengths of approximately 936 feet and 500 feet, respectively[11]. It is anticipated that final

[11] Refer to technical memorandum title West Jackson Highway Master Plan – Proposed Long Culverts by Wood Rodgers, dated February 14, 2022. It is anticipated that the lengths as shown will not be allowed by SCDWR. For the purposes of this master plan effort, they remain as part of the modeling efforts as they produce conservative modeling results.

gravity culvert configurations, grading, and lengths will be determined during entitlement design. While the land use master plan alternatives anticipate that the drainage corridor would fit between the lanes of Rock Creek parkway, the land use plan may need to be revised in the tentative map to include a drainage corridor outside of Rock Creek Parkway that conforms with entitlement grading plans. Approximately half of the watershed is located east of the detention basin on the same side of Morrison Creek. This area will also drain to an unlined channel that will cross under Bradshaw Road. The channel is approximately 10-feet deep with side slopes of 3:1 and a bottom width of 8-feet. Similar to the channel along Rock Creek Parkway, the land use plan will need to be revised for this area to include this drainage corridor. These drainage corridors must be designed to satisfy SCDWR requirements for maintenance and public safety. The storm water within the detention basin will be pumped back into Morrison Creek near Mayhew Road. **Figure 6.5** depicts the contributing watershed and the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJP4

Watershed WJP4 is approximately 555 acres and is comprised of lands tributary to the Vineyard 1 detention basin, located on the north and south sides of Morrison Creek between Hedge Avenue and Mayhew Road. The portion of the watershed located north of the creek will be conveyed under the creek via culverts[12] to the detention basin. The storm water within the detention basin will be pumped back into Morrison Creek near Hedge Avenue. This watershed will also receive runoff from existing development located north of Elder Creek Road. This area currently drains by gravity northward into the mined area via a channel approximately 1,650 feet east of Hedge Avenue.

Figure 6.6 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

[12] Refer to technical memorandum title West Jackson Highway Master Plan – Proposed Long Culverts by Wood Rodgers, dated February 14, 2022 for anticipated crossing mitigation alternatives.

Watershed WJP5

Watershed WJP5 is approximately 387 acres and is tributary to Elder Creek. The watershed is a pumped basin with all runoff draining to an excavated detention basin area located within the Aspen 8 and Aspen 9 mining area. The Aspen 8 mining operations will result in a 166-acre watershed shift from Morrison Creek to Elder Creek. The watershed shift will not result in flow increases to Elder Creek as the additional runoff will be detained and pumped out at a relatively low rate. The size of the WJP5 detention basin is not anticipated to be increased as the additional flow will be detained in a large open space basin reclaimed from mining operations. This open space area is within a participant property. While mining operations are permitted, they have not been completed, so the final elevation of the basin is not yet defined. As part of the mining permit, the crossing of Elder Creek[13] under Elder Creek Road is planned to increase in size. A weir structure is planned to spill high flows in Elder Creek into the planned detention area to mitigate impacts from the mining operations, which include the removal of floodplain storage and cutting off a basin transfer of floodwaters from Elder Creek to Morrison Creek. Available capacity within the WJP5 detention basin considers inflow from the weir. The detention basin is located just south of Elder Creek Road and upstream of the Village Nurseries property, which is southeast of Bradshaw Road and Elder Creek Road.

Figure 6.7 depicts the planned / estimated local storm drainage facilities draining into the planned detention area

Watershed WJP6

Watershed WJP6 is approximately 148 acres and is located north of Kiefer Road and east of Bradshaw Road. While this is a planned pumped basin, it is intended to drain via planned and an existing pipeline located along Bradshaw Road which is described below as part of watershed WJG2.

Figure 6.8 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

[13] Refer to technical memorandum title West Jackson Highway Master Plan – Proposed Long Culverts by Wood Rodgers, dated February 14, 2022 for anticipated crossing mitigation alternatives.

Watershed WJG1

Watershed WJG1 is approximately 137 acres and is tributary to Morrison Creek by gravity discharge. The watershed is located within the Plan Area immediately west of Mather Airport, north of Jackson Road. These lands will be at elevations above the peak Morrison Creek water surface conditions and can be discharged without pumping. The open space portion of this watershed adjacent to Morrison Creek is not ideal for detention due to the close proximity to the runway at Mather Airport. Due to this constraint, several onsite detention basins will be placed in sub-watersheds prior to entering a new drainage trunkline in Happy Lane and continuing along the proposed Kiefer Boulevard before discharging to Morrison Creek. The watershed contains a sub-watershed, WJG106, with a pumped upstream detention basin which conveys the northern portion of the watershed.

Figure 6.9 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG2

Watershed WJG2 is approximately 202 acres and includes lands along the east and west side of Bradshaw Road and north of Morrison Creek. The watershed drains to the existing gravity pipeline under Bradshaw Road. It also conveys flows from a private pump station serving the existing SMUD facility located just southeast of the intersection of Bradshaw Road and Kiefer Boulevard. The WJP2 basin, described above, will also pump into this gravity storm drain. There is approximately 5.2 acre-feet leaving the banks of Morrison creek that is stored over sub watershed WJG201 and the adjacent open space in existing conditions. A portion of this area will be raised to bring development out of the floodplain resulting in a loss of floodplain storage. It is assumed that mitigation of this floodplain storage would occur through excavation in the adjacent open space in the future, however, storage capacity may be added to basin WJG201 as an alternative. Floodplain effects and proposed grading in this area should be revisited during the tentative map stage.

The drainage pipe in Bradshaw Road is an existing public facility. A previous 2011 analysis for the SMUD facility provided allowable discharge rates for watersheds draining to the pipe based on pre-existing watersheds using a peak discharge ratio based on contributing area. This ratio was 0.5 cfs/acre for gravity

drained watersheds and 0.1 cfs/acre for pumped watersheds. The proposed watershed area of 469 acres draining to the pipe in Bradshaw Road in this master plan is considerably higher than the 375 acres shown in the 2011 analysis. The additional watershed area is possible because detention basins have been designed to be larger than the 2011 study and result in a lower peak discharge ratio.

A Nolte analysis of the existing drainage pipe in Bradshaw Road is required before any future development is permitted to drain to this pipe consistent with current SCDWR standards. This analysis has not been performed in this study. Further, it is anticipated that the trunkline in Bradshaw Road has enough capacity to drain WJG201. If future detailed analysis of the Bradshaw Road trunkline system indicates that there is not capacity, this basin may be altered to drain directly to the creek.

Figure 6.10 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG3

Watershed WJG3 is approximately 55 acres and is located immediately east of Bradshaw Road and north of Jackson Road. Under existing conditions, this area drains directly to the creek and does not access capacity along Bradshaw Road; therefore, it is being planned with a dedicated detention basin and gravity discharge to Morrison Creek to address any impacts created by planned development.

Figure 6.11 depicts the planned / estimated local storm drainage facilities draining into the planned detention area

Watershed WJG4

Watershed WJG4 is approximately 233 acres and is located both east and west of Bradshaw Road, south of Morrison Creek and north of Elder Creek Road. The lands within WJG4 are primarily within the FPA B area and are located on higher ground. Planned development runoff is intended to flow to a planned detention basin and gravity drain along Bradshaw Road to Morrison Creek without pumping.

Figure 6.12 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG5

Watershed WJG5 is approximately 202 acres and is located in the western portion of the Plan Area. The majority of the WJG5 watershed is located around the intersection of Fruitridge Road and Hedge Avenue and is within Future Planning Area A. 7These lands currently drain to Morrison Creek by a series of roadside ditches and culverts, and will be configured to drain by gravity under future development conditions.

Figure 6.13 depicts the planned / estimated local storm drainage facilities draining into the planned detention area

Watershed WJG6

Watershed WJG6 is approximately 33 acres and is located immediately west of Excelsior Road and north of Jackson Road. This land will continue to drain by gravity to Elder Creek, via a planned detention basin.

Figure 6.14 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG7

Watershed WJG7 is approximately 67 acres and is located west of Excelsior Road and immediately south of the main Elder Creek channel. The WJG7 watershed receives runoff from upstream lands east of Excelsior Road, outside of the WJHMP boundary. The watershed proposes a detention basin that will drain by gravity to Elder Creek.

Figure 6.15 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG8

Watershed WJG8 is approximately 201 acres and is located just west of Excelsior Road, south of Elder Creek Road. This watershed conveys runoff through it from an unnamed tributary of Elder Creek located east of Excelsior Road outside of the Plan Area boundary. This watershed is entirely within the FPA C

portion of the WJHMP. The watershed plan proposes a detention basin that will drain by gravity to Elder Creek.

Figure 6.16 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG9

Watershed WJG9 is approximately 428 acres and is located south of the Elder Creek main channel to the west of Excelsior Road and north of Florin Road. The northern portion of this watershed drains naturally to Elder Creek and will not be developed. The southern portion of the watershed is land within the FPA C area. This portion of the watershed drains to an existing channel south of Florin Road via a naturally drainage gravity detention basin.

Figure 6.17 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG10

Watershed WJG10 is approximately 67 acres and is located north of Florin Road in the southeast boundary of the Plan Area south of Elder Creek. The watershed is comprised of Very Low Density Residential land uses and drains by gravity to Elder Creek.

Figure 6.18 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG11

Watershed WJG11 is approximately 156 acres and is located south of Jackson Road immediately west of Excelsior Road draining by gravity to Elder Creek.

Figure 6.19 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Watershed WJG12

Watershed WJG10 is approximately 76 acres and is located immediately north of Florin Road in the southeast boundary of the Plan Area south of Elder Creek. The watershed is comprised of land within the FPA C portion of the Plan Area. The watershed drains to the west through an existing channel tributary to Elder Creek.

Figure 6.18 depicts the planned / estimated local storm drainage facilities draining into the planned detention area.

Interior Watershed Summary

The final assumed pumping capacities and rates for each pumped basin shown in **Figure 6.3** through **Figure 6.8** and are summarized in **Table 6.2: Pump Station Summary**. As pumped discharges can potentially increase creek conditions, the discharges from pumped basins will only occur while creek flows are below peak flow rates. This is achieved by setting creek flow monitoring stations at the discharge points of the pumps and throttling pumps off if at the creek flow threshold. Initial creek shutoff thresholds were estimated by subtracting the pumping rates from the peak flow in the creek. Thresholds were then reduced until no downstream impacts occurred. This approach is necessary as the pumped areas do not currently discharge any runoff to the creek and any additional flow during the peak of flow in the creek will create an adverse impact downstream. Additional pumps in the detention basin will turn on as the stage of the basin increases so that max pumping capacity will only be fully used during less frequent storm events. Setting the pump on/off points was determined utilizing an iterative process and was dependent on the stage and flow within Morrison Creek. The designed gravity outfall structures for gravity detention basins are shown in **Figure 6.9** through **Figure 6.19** and are summarized in **Table 6.3: Gravity Outfall Summary**. The dimensions of the detention basins are summarized in **Table 6.4: Detention Basin Summary**. Detention Basins meet all freeboard requirements[14] for the 100-year and 500-year events and minimum adjacent pad elevations are equal to the top elevation as shown in **Table 6.4**.

[14] Freeboard requirements identified in Section 5.0 Design Standards to be Achieved.

Table 6.2: Pump Station Summary

Basin	Pump Number[15]	Pump Start Water Surface Elevation (feet)	Design Flow (cfs)	Pump Shutoff at Morrison Creek Flow (cfs)
WJP1[16]	1[17]	27.5	65	300
	2	32.2	65	500
	3	35	65	565
WJP2	1	31	4	-
	2	34	4	-
WJP3[18]	1[19]	5.5	15	345
	2	8.5	15	635
	3	15	15	650
WJP4	1	2	7.5	350
	2	10	7.5	550
WJP5	1	11	10	-
WJP6	1	51	4	-
	2	54	4	-
WJG106[20]	1	60	1	-

[15] Table shows duty pumps required for design flows. All pumped basins to have redundancy for the largest required pump.

[16] Full pumping capacity is used when the basin water surface elevation is above 50 feet

[17] Pump turns back on if basin water surface elevation hits 35 feet and Morrison Creek Flow is below 565 cfs in order to accommodate large storm events

[18] Full pumping capacity is used when the basin water surface elevation is above 20 feet

[19] Pump turns back on if basin water surface elevation hits 15 feet and Morrison Creek Flow is below 620 cfs in order to accommodate large storm events

[20] While a pump station will be required for part of the drainage shed, the pump is intended to discharge into a gravity conveyance system and gravity basin prior to discharging to Morrison Creek. Therefore, it is annotated with a gravity designation.

Table 6.3: Gravity Outfall Summary

Basin	Outlet 1		Outlet 2		Weir		Outfall Pipe			
	Diameter	Elev.	Diameter	Elev.	Length	Elev.	Diameter	Elev.	Length	Outlet Elevation
	(inches)	(feet)	(inches)	(feet)	(feet)	(feet)	(inches)	(feet)	(feet)	(feet)

WJG207	29.1	0.9	0.8	46.0	59.5

The resulting changes in water surface elevation and flow are included in a spreadsheet in **Appendix F**.

6.3 Description of Morrison Creek and Elder Creek Flood Control Improvements

Planned Levees and Flood Control Facilities

All planned levee and flood control facilities (detention and pumping) behind levees will need to be submitted to FEMA to ensure that structures are designed, constructed, certified, and accredited in accordance with the Code of Federal Regulations 44 CFR 65.10, before FEMA will modify their Flood Insurance Rate Maps (FIRMs). It is anticipated that all flood control facilities must be designed to meet more stringent state ULDC (200-year) requirements. While the specific flood control facilities to meet FEMA

and state ULDC requirements will be analyzed dveuring final design, the planned facilities are described below. Implementation of these flood control improvements will protect the Plan Area from the 100-year and 200-year flood events as shown on **Figure 6.22: Preliminary Levee Locations**. With the phasing of flood control improvements, other improvements are anticipated. These additional improvements are discussed as part of the Flood Improvement Areas later in this section.

Granite 1 / Aspen 6 Detention Basin and Weir

With mining of the Granite 1 / Aspen 6 area, Morrison Creek was channelized and an overflow weir constructed. The purpose of the weir was to mitigate for floodplain losses with the channelizing of Morrison Creek to allow for mining. The weir allows Morrison Creek to overflow into the Granite 1 / Aspen 6 basin. The construction of the weir likely results in over mitigation of the originally intended impacts of the Morrison Creek channelizing. As a result, during large storm events, excess volume spills over the weir and into the Granite 1 / Aspen 6 detention basin. The excess volume flowing into the basin has a direct impact on the developable area within Aspen 6. In addition to the weir allowing Morrison Creek flows to detain in the Granite 1 / Aspen 6 basin, onsite flows and flow from adjacent property that naturally flow to the basin and contribute to the detained storm water volume.

Table 6.5 below shows the volume of storm water entering the Granite 1 / Aspen 6 detention basin for both existing and ultimate conditions from onsite and offsite sources. Additionally, the table shows the increase of volume between existing and ultimate conditions.

The setback levee adjacent to Aspen 6 allows for significant storage capacity within the Granite 1 / Aspen 6 detention basin should the need arise. The water surface elevation within the basin would need to rise to an elevation of 63.9 feet before cresting Jackson Road. At a stage of 63.9 feet, the detention basin has a capacity of 9,250 acre-feet. **Figure 6.20: Granite 1 / Aspen 6 Storage by Source** shows the stage and storage of the Granite 1 / Aspen 6 basin for the 500-year, 10-day duration storm event and includes the source of where the drainage originates.

Table 6.5: Volume Entering Granite 1 / Aspen 6 Detention Basin

Event	Existing Conditions (acre-feet)		Ultimate Conditions (acre-feet)		Increase (acre-feet)	
	Offsite Inflow	Onsite Runoff	Offsite Inflow	Onsite Runoff	Offsite Inflow	Onsite Runoff
100-year	1,497	205	2,312	318	815	113
24 hour	Total = 1,702		Total = 2,630		Total = 928	
200-year	2,096	232	2,709	345	613	113
24 hour	Total = 2,328		Total = 3,054		Total = 726	
500-year	2,528	280	3,301	386	773	106
24 hour	Total = 2,808		Total = 3,687		Total = 879	
100-year	3,318	479	5,220	889	1,902	410
10 day	Total = 3,797		Total = 6,109		Total = 2,312	
200-year	4,011	544	6,105	938	2,094	394
10 day	Total = 4,555		Total = 7,043		Total = 2,488	
500-year	5,196	650	7,620	1,019	2,424	369
10 day	Total = 5,846		Total = 8,639		Total = 2,793	

The Granite 1 / Aspen 6 weir plays an important role in regulating peak flow downstream. As part of this planning effort, modeling has been performed to quantify the additional volume entering Granite 1 / Aspen 6 basin from upstream runoff from future build-out conditions. As shown in **Figure 6.20** and **Table 6.5**, the majority of the current volume and anticipated increase in volume entering the Granite 1 / Aspen 6 basin is sourced from upstream watershed spilling over the weir. The weir consists of an earthen berm and rip-rap that slopes towards a paved access road. The earthen berm was last surveyed in 2016 and was the basis of the weir represented in the modeling for this study. The berm may need to be improved to create a permanent weir structure that is consistent with this study.

Sensitivity Analysis (Channel Capacity-Frequency Estimates)

Within all hydrologic and hydraulic analyses, there is some degree of uncertainty in characterizing peak conditions through frequency analysis and numerical modeling. In an attempt to address these uncertainties, SCDWR has requested a sensitivity analysis to better understand the capacity of the designed facilities. Specifically, the capacity of the Morrison Creek channel, with planned levees, is the focus of the requested analysis.

The Plan Area detains runoff originating from the watershed upstream by spilling large volumes of drainage runoff into the Granite 1 / Aspen 6 detention basin, rather than forcing the additional flow downstream via conveyance. The creek flow spills over a weir structure (approximately 800 feet long), acting as a flow-control device and limiting downstream creek flow. The amount (magnitude and timing) of assumed storm volume reaching the weir, and the available storage with the Granite 1 / Aspen 6 detention basin, are a key focal point for sensitivity analysis within the Plan Area.

In addition to storm frequency, the duration of the storm can affect peak flow and volume accumulation. To satisfy SCDWR requests, the system was tested under the 36-hour and 5-day duration storm events. Analysis of the 500-year storm event indicated that the 24-hour duration results in the highest peak stage and peak flow in Morrison Creek.

The peak 100-year, 200-year and 500-year existing flows in Morrison Creek downstream of the existing weir and immediately upstream are shown in **Table 6.6: Granite 1 / Aspen 6 Weir Sensitivity** below.

Table 6.6: Granite 1 / Aspen 6 Weir Sensitivity

Event	Flow Upstream of Weir (cfs)	Flow Downstream of Weir (cfs)
100-year	2,109	626
200-year	2,287	640
500-year	2,496	655

Variation in flow upstream of the existing weir will have an insignificant impact downstream above a flow threshold of approximately 700 cfs. Therefore, increases in Morrison Creek flow above 700 cfs, are directed to the Granite 1 / Aspen 6 basin under the existing configuration of the weir constructed as part of the mining operations. Future upstream development projects must demonstrate that they do not create adverse impacts to the operation of these detention facilities by increasing peak flows in Morrison Creek.

Mather Dam Failure

The upstream watershed contains a non-jurisdictional dam facility (Mather Dam) which holds approximately 850 acre-feet of storage at a depth of less than six feet. In the event of a catastrophic dam failure, it is

assumed that the Morrison Creek channel has the capacity to convey the flow to the Granite 1 / Aspen 6 weir.

As part of this analysis, a dam failure evaluation was performed using HEC-RAS. This was done to ensure that the Plan Area would not be inundated from high flows in Morrison Creek downstream of Excelsior Road during a 100-year 24-hour storm event. The parameters for failure were determined in collaboration with SCDWR and are listed below:

- Hydrology: 100-year 24-hour storm accounting for watershed infiltration
- Breach Formation Time: 4 hours
- Breach Bottom Width: 20 feet
- Breach Side Slopes: 0.5H:1V
- Breach Bottom Elevation: 131.59 feet (channel invert downstream of dam)
- Breach Trigger Elevation: Mather Lake water surface elevation 4 hours prior to peak
- Breach Location: Earth dam embankment adjacent to new reinforced concrete spillway

The results from this simulation show that the peak water surface elevation at Excelsior Road increases by 0.6 feet to elevation 91.46 feet. It is important to note that Excelsior Road is already overtopped without dam failure during the 100-year flood event. The proposed levee along the south side of Morrison Creek downstream of Excelsior Road provides protection from this modeled condition. The dam failure results in a water surface elevation with a minimum of 2.4-feet of freeboard to the proposed levee. Within the plan area, this condition produces higher water surface elevations compared to the 200-year storm with climate change factors design event for a 500-ft portion of Morrison Creek. This occurs just downstream of Excelsior Road. The design is considered adequate since there is freeboard under a dam break scenario. Elsewhere in the plan area, the effects of the Mather Dam failure breach flows are negligible due to the Granite 1 / Aspen 6 weir. Downstream of the weir, peak water surface rises less than one tenth of a foot and the design heights of the levees maintain at least three feet of freeboard.

As previously discussed, flow above approximately 700 cfs in the Morrison Creek channel would enter the Granite 1 / Aspen 6 basin via the weir. As shown in **Figure 6.20: Granite 1 / Aspen 6 Storage by Source** the Granite 1 / Aspen 6 basin, has the capacity to accommodate the inflow from a catastrophic Mather Dam failure.

Planned Flood Improvement Areas (FIAs)

The implementation of development within the Plan Area will not all occur at once. Due to its large size, the WJHMP area will likely develop over several decades. While the actual phasing of development is unknown at this time, the Plan Area has been divided into two Land Use Districts largely representing the two major participating property owners, as well as three Future Planning Areas (described again later in this section). For areas requiring flood control improvements, the two districts are further divided into Flood Improvement Areas (FIA) as shown on **Figure 6.21: FIA Exhibit**. These FIA's establish the required flood control improvements for sub-areas of the project and assist in future phasing considerations as well as supporting the development of the PFFP. The levee flood control improvements required to support the entire Plan Area are shown in **Figure 6.22: Preliminary Levee Locations.** The post-project flooded areas and residual flooding within the creeks is shown in **Figure 6.23: Post Project Residual Flooding**.

For an illustration of each of the planned flood control improvements within each of the FIA's, refer to **Figure 6.24** through **Figure 6.28**. Anticipated improvements are indicated below by district and flood improvement area. These improvements are anticipated to occur within each individual flood improvement area and were included in the modeling of planned conditions for Morrison Creek.

District #1 – Flood Improvement Area #1

- Planned high ground area to connect into existing high ground
- Tunnel closure structure at Fruitridge Road
- New levees to achieve required flood protection
- Spur levee to tie into existing high ground.

District #1 – Flood Improvement Area #2

A levee is required along Mayhew Road if the southern levee of Morrison Creek within District 2 FIA #1 cannot or is not certified. Where high ground is constructed along the east side of Mayhew Road the levee road can be omitted. If District 2 FIA #1 is constructed, then Mayhew Road would need to be raised. Anticipated improvements are shown below:

- Raise existing ground to above the 200-year water surface elevation of Morrison Creek and the adjacent detention basin.
- Tunnel closure structures at Jackson Road and Bradshaw Road
- Raise existing roads or build levees on land side of existing roads

District #1 – Flood Improvement Area #3

A levee geotechnical analysis must determine whether the portion of Jackson Road between Morrison Creek and the setback levee should be evaluated as a levee. Ultimately, it is anticipated that FEMA will determine whether these potential levees are classified as levees.

- New levees to achieve required flood protection
- Tunnel closure structures at Jackson Road

District #2 – Flood Improvement Area #1

- Raise areas to above floodplain or construct levees / flood wall for protection.

District #2 – Flood Improvement Area #2

- Raise areas to above floodplain or construct levees / flood wall for protection.
- Tunnel closure structure at Bradshaw Road

6.4 Morrison Creek Model Results

For both the planned project and ultimate conditions the 200-year 24-hour storm event and 200-year 10-day storm event were analyzed. Results of these storm events in the planned project and ultimate project

are shown in **Table 6.7** and **Table 6.8** below. These results assume that the improvements planned with this study are constructed and in place.

Table 6.7: Morrison Creek Flow and Stage for 200-year 24-hour Storm Event

6.5 Future Planning Areas

Prior to additional entitlement processing or development of this area, a master plan amendment or specific plan is required which will require floodplain studies. Future Planning Areas A and B are within the Morrison Creek floodplain and subject to shallow flooding. Future Planning Area C is within the Elder Creek floodplain. For purposes of this study, future planning areas have been evaluated as part of both the interior and where applicable the Morrison Creek analysis. As the FPA C basins discharge at or below existing conditions, adverse impacts to Elder Creek are not anticipated. Impacts to Elder Creek, using up-to-date modeling of Elder Creek will have to be evaluated prior to development for each watershed.

6.6 Drainage Infrastructure Phasing

Phasing of drainage infrastructure is anticipated to progress in an orderly fashion. While phasing will largely be subject to specific proposals at time of subsequent entitlements, this study analyzes three independent phases for development. The three phases are consistent with the phases anticipated to be evaluated as part of the Master Plan's Finance Plan. While the portion of watershed WJP3 within Phase B and Phase C can be developed independently, any development within WJP3 requires construction of the detention basin and associated pump station. The master plan proposes that each phase encompass each of the three Flood Improvement Areas as previously discussed in this section. Refer to **Figure 6.29: Phasing Plan** that depicts the three phases of development. Flood control improvements for the Flood improvements Areas are shown on **Figure 6.24** through **Figure 6.28**. Development of each interior basin can occur independently, subject to any flood control improvements required to facilitate development.

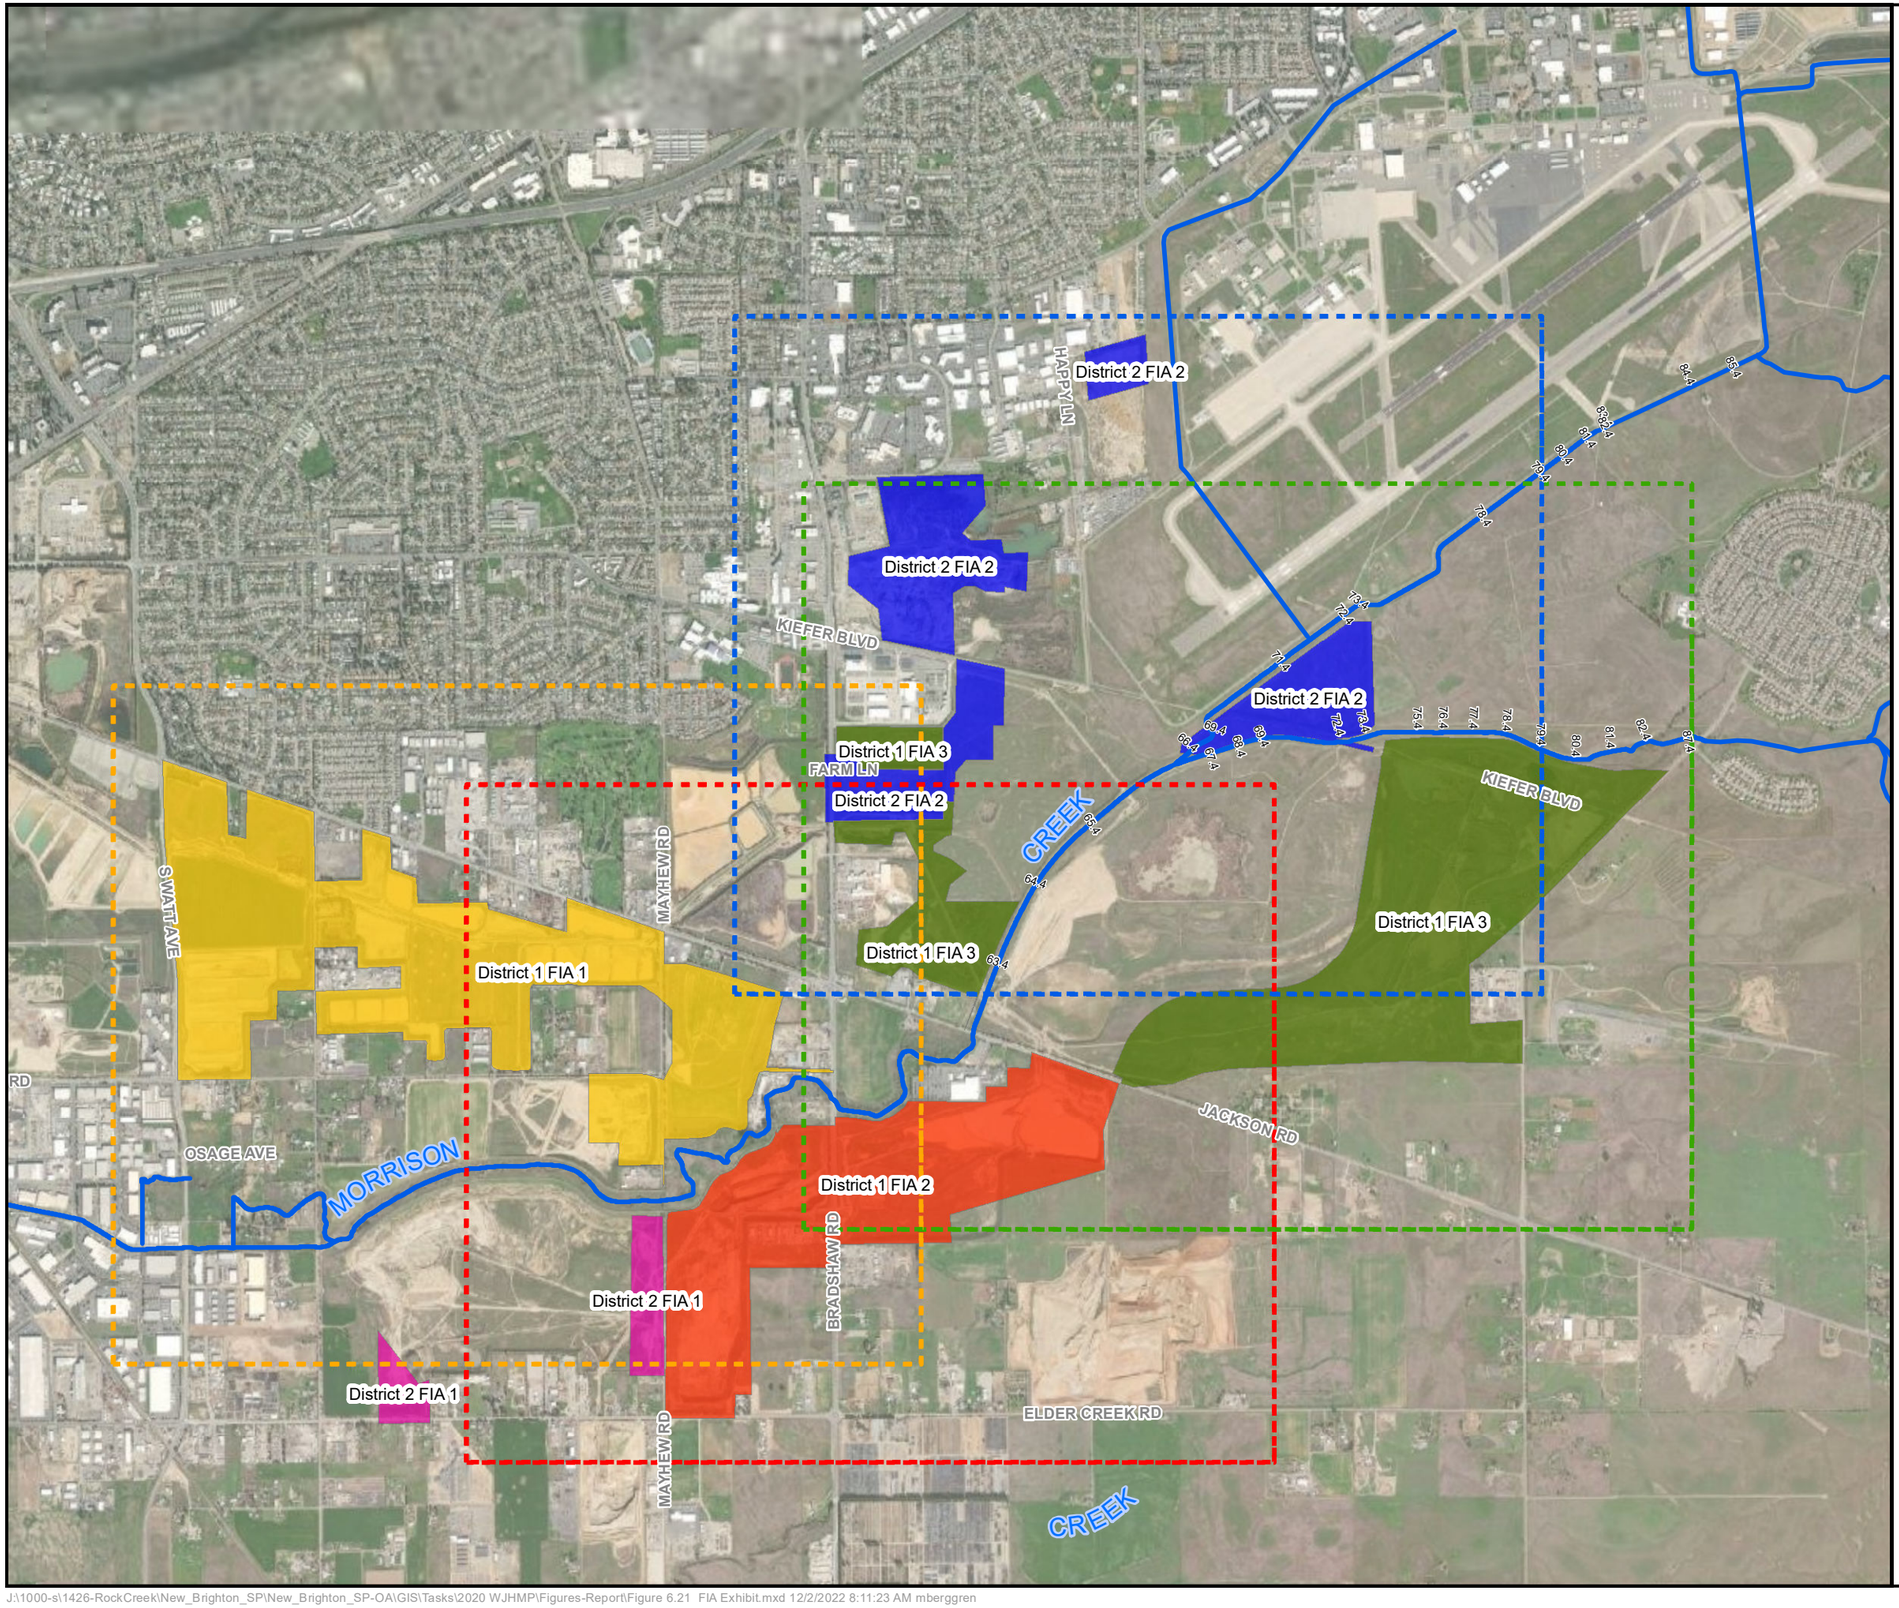
Granite 1 / Aspen 6 Storage by Source for 500-yr 10-day Event, Ultimate Conditions



*Notes:

1. The stage storage curve assumes an expanded environmental corridor which deepens the basin to elevation 27 ft and adds approximately 1,450 acre-ft of storage.
2. Peak storages assume an overall pumping capacity of 195 cfs. Without pumping, peak volume will be higher.
3. Graph value (storage volume) indicates a reduction to 74.6% of volume flowing into basin due to continuous pumping.
4. Mather South storage / inflow is approximate
5. Mather dam volume is the total volume of 850 acre-ft stored in Mather Lake up to the dam crest. It represents a catastrophic failure event.

FIGURE 6.29

7.0 Consistency with Allowed Discharge and Design Standards

Consistency with the allowed discharge and design standards is essential to allow the project to move forward. This section articulates the results of the modeling as it relates to the allowed discharge and design standards as defined in **Section 5.0**

Figure 7.1: Interior Drainage Summary illustrates the planned drainage facilities necessary for each shed to mitigate for the effects of planned development of the Plan Area. **Appendix F** contains a summary table of these same facilities.

7.1 Interior Design Standard (pumped detention basins)

2-year 24-hour volume discharged to creek in less than 48 hours

This standard is achieved by sizing of basins and pumps to evacuate the 2-year 24-hour design storm in 48-hours or less.

100-year 10-day flood containment with three feet of freeboard

This standard is achieved by maintaining a maximum water surface elevation in the planned detention basins that provide a minimum of three feet of freeboard. The minimum pad elevations were determined for each of the planned basins, relative to the determined peak water surface elevations. The planned pad elevations are defined by the preliminary grading study shown in **Appendix G**. Detailed design as required for subsequent entitlements (tentative mapping and/or design review) and improvement plans will validate adequate freeboard to meet this requirement.

500-year 10-day flood containment with no freeboard

This standard is achieved by maintaining a 500-year 10-day maximum water surface elevation in the planned detention basins such that adjacent pads do not flood. Detailed design as required for subsequent entitlements (tentative mapping) and improvement plans will validate this requirement.

Pump Station design and pump redundancy and backup power

This standard will be achieved with future design efforts at improvement plan stage. These efforts will provide for pump redundancy and backup power. Detailed design as required for subsequent entitlements (tentative mapping and / or design review) and improvement plans will validate pumping criteria as outlined

in **Table 5.1: Pump Station Design Criteria**[21]. Required pump redundancy will be provided over and above reliable design capacities that are modeled herein. Modifications, to the satisfaction of SCDWR, to redundancy may be requested that consider the number of pumps being provided versus percent capacity. An adequate creek monitoring station design and operation will also be required for subsequent entitlements. This may include provisions for emergency pumping of detention storage while the peak stage in the creek is still above the 100-year design event thresholds as well additional storage capacity in the detention basins to provide a factor of safety.

7.2 Interior Design Standards (gravity detention basins)

Mitigation of 2-year, 10-year, and 100-year outflows to creek

For this level of analysis each planned gravity detention basin sub-watershed was analyzed for discharge of the 2-year, 10-year, and 100-year storm events. Providing design for these storm events, at this level of analysis, is assumed to accommodate for hydromodification. Increases to basin sizes due to hydromodification for subsequent analysis is not anticipated. In order to confirm this approach, a hydromodification analysis ushing SAHM was performed on two of the proposed gravity detention basins. For the analysis, one basin, WJG3, represented more commercial land use within the watershed and another basin, WJG5, represented predominantly low-density residential land use within the watershed. The analysis indicated that the detention basins would be large enough to meet hydromodification objectives with the addition of required LID measures in the watershed. Bioretention was used as the anticipated LID measure and the mitigated basins passed flow duration tests by a considerable margin. The results of the SAHM analysis are shown in Appendix H.

For a direct comparison, the existing storm event assumes a shed boundary that is consistent with the planned shed boundary. Existing elevated watershed areas that currently gravity discharge to mined areas were excluded for the purposes of determining the target flow rates and reduction factors, as described

[21] SCDWR has agreed that this Master Plan does not need to evaluate all underlying pump scenarios. The 100-year 24-hour, 100-year 10-day, 500-year 24-hour, and 500-year 10-day events with full pumping capacity were analyzed in this study. However, all pump scenarios shown in **Table 5.1** will need to be evaluated and approved as part of final design.

under **Section 6.2**. This standard is achieved as shown in **Table 7.1: Existing and Planned Flow at Gravity Basin Discharge**.

Each gravity detention basin discharges at a rate to the adjacent creek less than the pre-development condition and compensates for additional drainage area flowing to the creek. In some cases, the water quality footprint (area) and the backwater from the creek influence the final mitigation effectiveness, producing peak flows significantly lower than target (allowed) values.

Table 7.1: Existing and Planned Flow at Gravity Basin Discharge

WJG12	15.0	13.7	35.0	24.8	60.0	35.2

100-year flood containment with 1.2-feet of freeboard:

This standard is achieved by designing the detention basins to allow 1.2-feet of freeboard. Future efforts at subsequent entitlement and improvement plan stages will provide for detailed design. This future design will ensure that freeboard standards are achieved.

Overflow release to creek for larger storms

This standard will be achieved with future efforts. Subsequent entitlement and improvement plan stages will provide for detailed design to ensure that freeboard standards are achieved.

7.3 Levee Design Standards

Meet all California Urban Levee Design Criteria (ULDC) and Urban Level of Protection (ULOP)

This standard is achieved with limited / controlled flows entering the creek, and top-of-levee (design) elevations set to a minimum of 3 feet above the maximum 200-year storm with climate change. For the Morrison Creek watershed, sub-watersheds that discharge by gravity do so at or below existing runoff levels. For areas that pump to Morrison Creek, the combined planned pumping rate is equivalent to 271 cfs for all pumped sheds using the County's current standards. The system was also evaluated under estimated climate change conditions, to determine pumping increases and detention offsets, compared to creek conditions under existing development with climate change. Climate change is evaluated in detail in **Section 8.0** . Morrison Creek's maximum 200-year water surface profile and the existing levee elevations are provided in **Figure 7.2** and **Figure 7.3**. The figures show that levee improvements will be required within the plan area in order to achieve 3-feet of freeboard above the maximum 200-year water surface elevation. The project does not adversely impact the Morrison Creek channel outside of the plan area. Morrison Creek water surface elevations are unchanged or lower than the existing condition water surface elevations throughout the channel after the project is implemented. These levees were previously identified in **Figure 6.21: FIA Exhibit** and will be constructed according to 44 CFR 65.10.

Existing bridges crossing Morrison Creek do not require full compliance with ULDC with respect to freeboard, as the State only requires freeboard compliance for new bridge design. While existing Morrison Creek bridges can be relied upon to convey floodwaters, according to SCDWR the ULDC debris and blockage requirements for bridges are still a design consideration. The ULDC allows for the option of quantifying debris loading, presumably to reduce blockage considerations within streams with low debris. In the same manner, if debris can be managed upstream of existing bridges, then blockage considerations can justifiably be adjusted. This master plan recommends the development of a debris management plan during design to capture and/or redirect debris from the upstream Morrison Creek watershed in the vicinity of the Granite1 / Aspen 6 weir and prevent the introduction of new debris throughout the Plan Area. Therefore, the blockage of existing bridges during flood events is assumed to be prevented upstream of the bridges, and therefore full flow capacity has been modeled. Proposed road crossings along Morrison

Creek at Rock Creek Parkway, Kiefer Boulevard, Mayhew Road, Vineyard Road, and Hedge Avenue will be designed to applicable standards and with adequate freeboard to design water surface elevations in the creek in order to avoid hydraulic interaction and prevent debris blockage. Morrison Creek modeling contained within this study will need to be revised if any proposed bridge crossings are deemed to influence the hydraulics of the creek.

An analysis to determine the potential impacts of blockage at Jackson Road at 50% if debris management becomes infeasible was performed in accordance with ULDC requirements. The results show that water surfaces increase a maximum of 0.36 feet during the 200-year design event under ultimate developed conditions. This is due to low velocities and minimal head losses. The blockage analysis is provided in the HEC-RAS model as part of this submittal as part of **Appendix E**. The impact to the ultimate conditions 200-year design event water surface elevation in Morrison Creek is shown on Figures 7.2 and 7.3.

Elder Creek crossings do not trigger ULDC requirements because a ULOP finding is not required for the Elder Creek Corridor. This is because the Elder Creek watershed upstream of the Plan Area is less than 10-square miles. However, SCDWR has requested that a blockage analysis also be performed on Elder Creek to comply with ULDC requirements. Both ultimate developed conditions throughout the watershed and post-mining conditions were analyzed for determining levee heights. The maximum water surface elevation of either buildout condition with debris loading were used to set preliminary levee heights. Within the plan area, the crossing at Elder Creek Road and a driveway crossing approximately 325 feet upstream of Elder Creek Road were analyzed for 50% blockage. Additionally, 50% blockage was applied to the culvert crossing at Bradshaw Road downstream of the project. In order to stabilize the post-mining conditions Elder Creek model with climate change factors, the model was truncated to a driveway bridge approximately 7,000 feet downstream of Bradshaw Road. The rating curve at the bridge from the 200-year event was extrapolated to climate change flows and used as the downstream boundary of the model. The impact to the 200-year design event water surface elevation in Elder Creek is shown on **Figure 7.4: Elder Creek Debris Loading Blockage Analysis.**

Other ULDC and ULOP criteria will be achieved with future design efforts.

Meet the requirements of 44 CFR 65.10, for mapping of areas protected by levee systems

This standard will be achieved as levees and flood control facilities as shown in **Figure 6.22: Preliminary Levee Locations** are to be designed and constructed to meet the requirements of 44 CFR 65.10. This will occur with subsequent design efforts.

7.4 Allowed discharges

Maintain all design flow capacities and freeboard requirements for the 200-year flood event through all downstream County / City flood containment (levee) facilities

This standard is achieved as shown in **Table 7.2: Morrison Creek Flow for 200-year Event**. The table identifies the comparison of flow and stage for existing, project, and ultimate conditions for the higher of the 200-year 24-hour and 200-year 10-day storm events. The results show decreases in peak flows within Morrison Creek during planned project conditions.

7.5 Hydromodification and Storm Water Quality

As part of addressing hydromodification, the Plan Area proposes detention basins, as previously identified. Each gravity basin has been modeled with a stepped outlet to mitigate the peak flows for the 2-year, 10-year, and 100-year storm events. The pumped detention basins utilize a single duty pump to evacuate the 2-year design storm in 48 hours. As a result, the basins have been designed for a wide range of flow conditions. For this level of analysis hydromodification is anticipated to be achieved using this approach. This approach has been deemed appropriate by evaluating a conceptual hydromodification model for two example detention basins.

Water quality treatment can be achieved through a combination of low impact development design elements, such as rain gardens, onsite water reuse, interceptor trees, and bioretention basins. As a

preliminary approach, basins were sized to treat water quality in dry extended basins[22] and assume that no low impact development treatment measures would be implemented. The basins have a bottom area sufficient to store the water quality volume of the tributary watershed with one-foot of depth. Water quality volume was calculated based on SCDWR Low Impact Development (LID) Credits and Treatment BMP Sizing Calculations for Residential and Commercial Sites. Calculations of water quality volume for each basin are shown in **Appendix H.** Subsequent entitlement design efforts are intended to refine the detention basin hydraulics and water quality approach. This will achieve the standards as required by the Sacramento Region's Stormwater Quality Design Manual.

A conceptual analysis in the Sacramento Area Hydromodification Model (SAHM) was used to demonstrate that the preliminary basin sizing approach to water quality would also be sufficient for addressing hydromodification. Detention basins WJG3 and WJG5 were chosen to reflect watersheds that varied from primarily commercial to primarily residential. For each detention basin, a portion of the basin was represented as bioretention to reflect LID measures that assist with hydromodification. As SCDWR does not currently allow LID features within county-maintained detention basins, several alternative LID measures could be implemented outside of the detention basin that produce similar results. The analysis shows that the basins are sized sufficiently to achieve hydromodification objectives. The SAHM model and results are shown in **Appendix H.**

[22] A dry extended water quality detention basin is designed to hold storm water runoff from small storms and the initial runoff ("first flush") from larger storms for a regulated downstream release. These basins are intended to be fully drained (dry) during non-storm periods and operate to remove pollutants through settlement capture and flow-through vegetation, with additional features providing approved filtration for summertime (low/nuisance) flows.

8.0 Climate Change

The State of California and SCDWR began the implementation of climate science considerations relating to flood control. The State of California Senate Bill 5 and subsequent adoption of ULDC requires that climate change be addressed as stated in section 6.3 of ULDC. The section in part states, "Urban and urbanizing area levees and floodwall designs should consider the potential for sea level rise and climate change to increase runoff and peak stages over those calculated using previous hydrology and hydraulics studies, considering the physical limitations of the regional system." SCDWR is carrying this effort forward and planning to update its hydrology standards in the near future to address climate change considerations. It is uncertain at this time how climate change will be addressed, but SCDWR has stated that climate change must be evaluated to provide sufficient information for land use decisions moving forward.

All projections into the future are inherently speculative and carry a degree of uncertainty, beyond the uncertainty associated with purely historical frequency analysis. Nonetheless, the project proponents hired David Ford Consulting Inc. to evaluate the current climate scientific positions and documentation available that might correlate with the Morrison Creek and Elder Creek watersheds affecting the Plan Area. This effort identified four watersheds that could relate to the Morrison Creek watershed from a hydrologic perspective. The analysis identified applicable flow-based scaling factors that when applied to calculated flow, in the traditional sense, translate to climate change flow. Scaling factors are provided for four watersheds, each with several storm events. In general, the recommendations from David Ford Consulting align with the State of California analysis under the State Plan of Flood Control. The complete findings from David Ford Consulting are provided in **Appendix I**. It is anticipated that SCDWR's hydrology standards update will include design considerations for climate change. Once those standards are adopted by the Board of Supervisors, subsequent entitlements will utilize those design standards to the extent those standards differ from the methodology described in this section.

8.1 Watershed Comparison

Watershed comparison findings from David Ford's analysis provide a range of possible scaling factors to be applied to watersheds nearby, but not directly over the Morrison Creek watershed. For purposes of

assessing the potential impacts of climate change, this report evaluates increased runoff within the watershed according to scaling factors derived from the report by David Ford Consulting.

The following four watersheds that were evaluated under the State's efforts were selected by David Ford Consulting as being potentially similar to the Morrison Creek watershed: Arcade Creek, Pleasant Grove Creek Canal, Ulatis Creek, and Putah Creek. All the watersheds selected were identified as similar under similar precipitation influences draining into the central portion of the Central Valley, with elevations low enough that snow or snow melt are not a major influence. For a more detailed comparison, this report evaluates the standard hydrologic and physical parameters for each watershed, based on the USGS Stream Stats online application and orographic conditions.

A hydrologic parameter comparison for the Stream Stats data is provided in **Table 8.1: Watershed Summary / Comparison**.

Table 8.1: Watershed Summary / Comparison
Source: USGS Storm Stats

Hydrologic Parameters	Morrison Creek[1]	Most Similar ↔ Least Similar			
		Arcade Creek	Pleasant Grove Creek Canal	Ulatis Creek	Putah Creek
Drainage Area (mi^2)	28.6	39.5	337.5	32.2	652.3
Mean Elevation (ft)	140	137	344	419	1249
Maximum Elevation (ft)	340	283	2,155	2815	4717
Percentage Developed	23.2	100	6.4	33.2	7.2
Mean Annual Precipitation (in)	21.2	23.4	24.9	25.6	33.7
[1] Upstream of Watt Avenue					

Arcade Creek

Of the four watersheds evaluated, the Arcade Creek watershed appears to be the most similar in hydrologic terms to Morrison Creek. It is the most horizontally proximate watershed, but it also shares similar elevation conditions, drainage area, urban development levels (in Morrison Creek watershed's planned state) and orographic conditions.

Pleasant Grove Creek

The Pleasant Grove Creek Canal watershed is also located on the western slopes of the Sierras. The watershed is centered approximately 20 miles north, is approximately ten times larger in area, and has different locations and densities of urbanization relative to the outflow point of the watershed.

Ulatis Creek

The Ulatis Creek watershed shares some similarities in watershed size, slope and urbanization; however, it is located on the eastern slope of the Coastal Range and is subject to different orographic and precipitation conditions as storms generally move from west to east.

Putah Creek

The Putah Creek watershed is least similar to Morrison Creek as it is almost 20 times larger in area, has very little urbanization, and is located on the eastern slopes of the Coastal Range. Most of the watershed is upstream of Lake Berryessa and Monticello Dam, with elevations reaching over 4,000 feet. While rainfall and volume may change, the peak flow effects downstream of the dam are significantly reduced by storage and attenuation.

8.2 Scaling Factors

Scaling factors for each watershed are summarized in Table 8.2: 200-year Climate Change Flow Based Scaling Factors as shown below. The scaling factors represent a change in the runoff expected with climate change. For the purposes of this analysis, runoff based on the current County standards would represent a factor of 1.0. Based on consultation with SCDWR, scaling factors for Arcade Creek and Pleasant Grove Creek Canal were evaluated as part of the sensitively analysis for assessing potential climate change impacts and resiliency of project design.

Table 8.2: 200-year Climate Change Flow Based Scaling Factors
Source: California Department of Water Resources via David Ford Consulting

Watershed	Storm Duration					
	1-day	3-day	7-day	10-day[23]	15-day	30-day
Arcade Creek	0.99	1.06	1.13	1.18	1.26	1.32
Pleasant Grove Creek Canal	1.60	1.53	1.38	1.34	1.28	1.25
Ulatis Creek	1.21	1.27	1.28	---	1.23	1.23
Putah Creek	1.62	1.6	1.46	---	1.41	1.39

8.3 Climate Change Results

Morrison Creek

Climate change factors applied to ultimate build out conditions are compared with climate change factors applied to existing conditions. For the 200-year 24-hour storm event only the Pleasant Grove Creek Canal Factor was analyzed, as the climate change factor for Arcade Creek is less than 1.0. These results are shown in **Table 8.3**. For the 10-day event only the Pleasant Grove Creek Canal scaling factors were evaluated since those factors are more conservative than Arcade Creek. These results are presented in **Table 8.4**. The results show that climate change increases the stage and flow within Morrison Creek. However, the analysis shows minimal change in stage and flow between existing and ultimate climate change conditions downstream of the Granite 1 / Aspen 6 weir.

Interior Basins

Planned interior detention basins were also analyzed using climate change scaling factors. Detention basins that drain by gravity were designed such that freeboard requirements for the 100-year storm event are met when applying the Pleasant Grove Creek Canal scaling factor. Additionally, the 200-year storm event will be contained below adjacent pad elevations. Pumped detention basins that do not meet freeboard requirements with the pumping capacities outlined previously in **Table 6.2** will have to design and construct additional storage capacity to accommodate increased flows from climate change. Detention basins WJP2, WJP3, WJP5, and WJP6 will require additional storage capacity to accommodate climate change flows.

WJP1 Basin Considerations

WJP1 is designed with a setback levee along Rock Creek Parkway with a levee crown elevation of approximately 65.9-feet. The 200-year, 10-day climate change water surface elevation for the WJP1 basin is approximately 58.1-feet which is below the maximum storage capacity of the basin. This amount of storage is shown graphically on **Figure 8.1: Granite 1 / Aspen 6 Stage Storage Curve**. During potential climate storm events more severe than the 100-year 10-day event, runoff from the Aspen 6 development area east of the setback levee and offsite (Jackson Township) will not discharge to the Granite 1 / Aspen 6 basin. This scenario can be mitigated one of three ways:

- Increase WJP1 Pumping: Provide two additional 50 cfs pumps and discharge any excess climate change volume within the Granite 1 / Aspen 6 basin back to Morrison Creek.

- Provide Pumping for Onsite Development: Provide development pump station (or interconnected with WJP1 pump station) to evacuate flows from the subdivision and discharge into the Granite 1 / Aspen 6 basin. Pumping is anticipated to occur when the water surface elevation exceeds 56-feet. Flows would be directed overland in Rock Creek Parkway to a drainage pipe on the western side of the WJP1 basin that drains to the pump station as shown on Figure 6.1. The pump station will be required to have a separate bay with automated trash racks. A schematic of the bay is shown on **Figure 8.2**.

- Provide in-tract Street Ponding: Provide sufficient volume within the Aspen 6 street sections to store onsite and offsite flows when the Granite 1 / Aspen 6 basin water surface elevation exceeds the water surface elevation for the 500-year, 10-day duration storm event.

WJP4 and WJP5 Basin Considerations

The WJP4 and WJP5 watersheds are also unique in that all climate change increases can easily be accommodated by storage, with no change in outlet capacity. The areas adjacent to these detention basins after mining is complete will be reclaimed to open space at an elevation lower than the development within the watershed. This open space area can be flooded to provide climate change resilience. The assumptions for post-mining open space elevations are included in the stage-storage rating curve in the modeling. These areas will require a floodplain easement. The landscaping and any amenities provided in the floodplain easement will require approval from SCDWR.

Levee Considerations

Preliminary levee design presented in this report takes climate change into consideration. ULDC requirements for Levee design were discussed previously in 7.3. Preliminary levee design elevations were determined using a 50 percent debris loading blockage for the 200-year 24-hour storm event with climate change factors applied.

Overall Considerations

For purposes of assessing the impacts of climate change to storm drainage design, the increases associated with climate change were evaluated relative to current land uses as well as ultimate land uses within the watershed. It is important to note that as future entitlements efforts progress it is anticipated that County climate change standards will be in place and will be utilized in the design and construction of facilities.

Detention storage for both gravity and pumped basins were adjusted. Pumping rates and gravity outlet configurations were not adjusted from what was previously defined in this report. It may be determined in the future that increasing outlet capacity and pumping rates are more practical than expanding the basin footprints. Storage was increased by expanding the footprints of basins previously defined earlier in this report. A summary of the results to pumped basins is provided in **Table 8.5**. A summary of the results for gravity basins is provided in **Table 8.6**.

Table 8.5: Climate Change Detention Basin Containment Verification for Pumped Detention Basins

Basin	Basin Top Elevation	Ultimate Conditions		Ultimate Conditions with Climate Change		Increase in capacity
		100yr WSE + 3' Freeboard	500yr WSE	100yr WSE + 3' Freeboard	500yr WSE	
	(ft)	(ft)	(ft)	(ft)	(ft)	(acre-ft)

WJG11	90.5	89.9	89.6	90.4	90.3	17.5
WJG12	75	74.6	74.2	74.9	74.6	9.4

Under final design the additional storm volume required can be stored by adjustments to the horizontal footprint, the horizontal containment and/or the depth of each basin. Model results of the climate change analysis are provided in **Appendix J**.

Figure 8.1
Granite 1 / Aspen 6 Stage Storage Curve

*Notes:
1. The stage storage curve assumes an environmental corridor which deepens the basin to elevation 27 ft and other excavation that adds approximately 1,450 acre-ft of storage.
2. Peak storages assume an overall pumping capacity of 195 cfs. Without pumping, peak volumes will be higher.
3. Pumps will be used to drain the interior watershed when basin stage is above approximately 56 ft.

Overflow Pump Station Bay Schematic

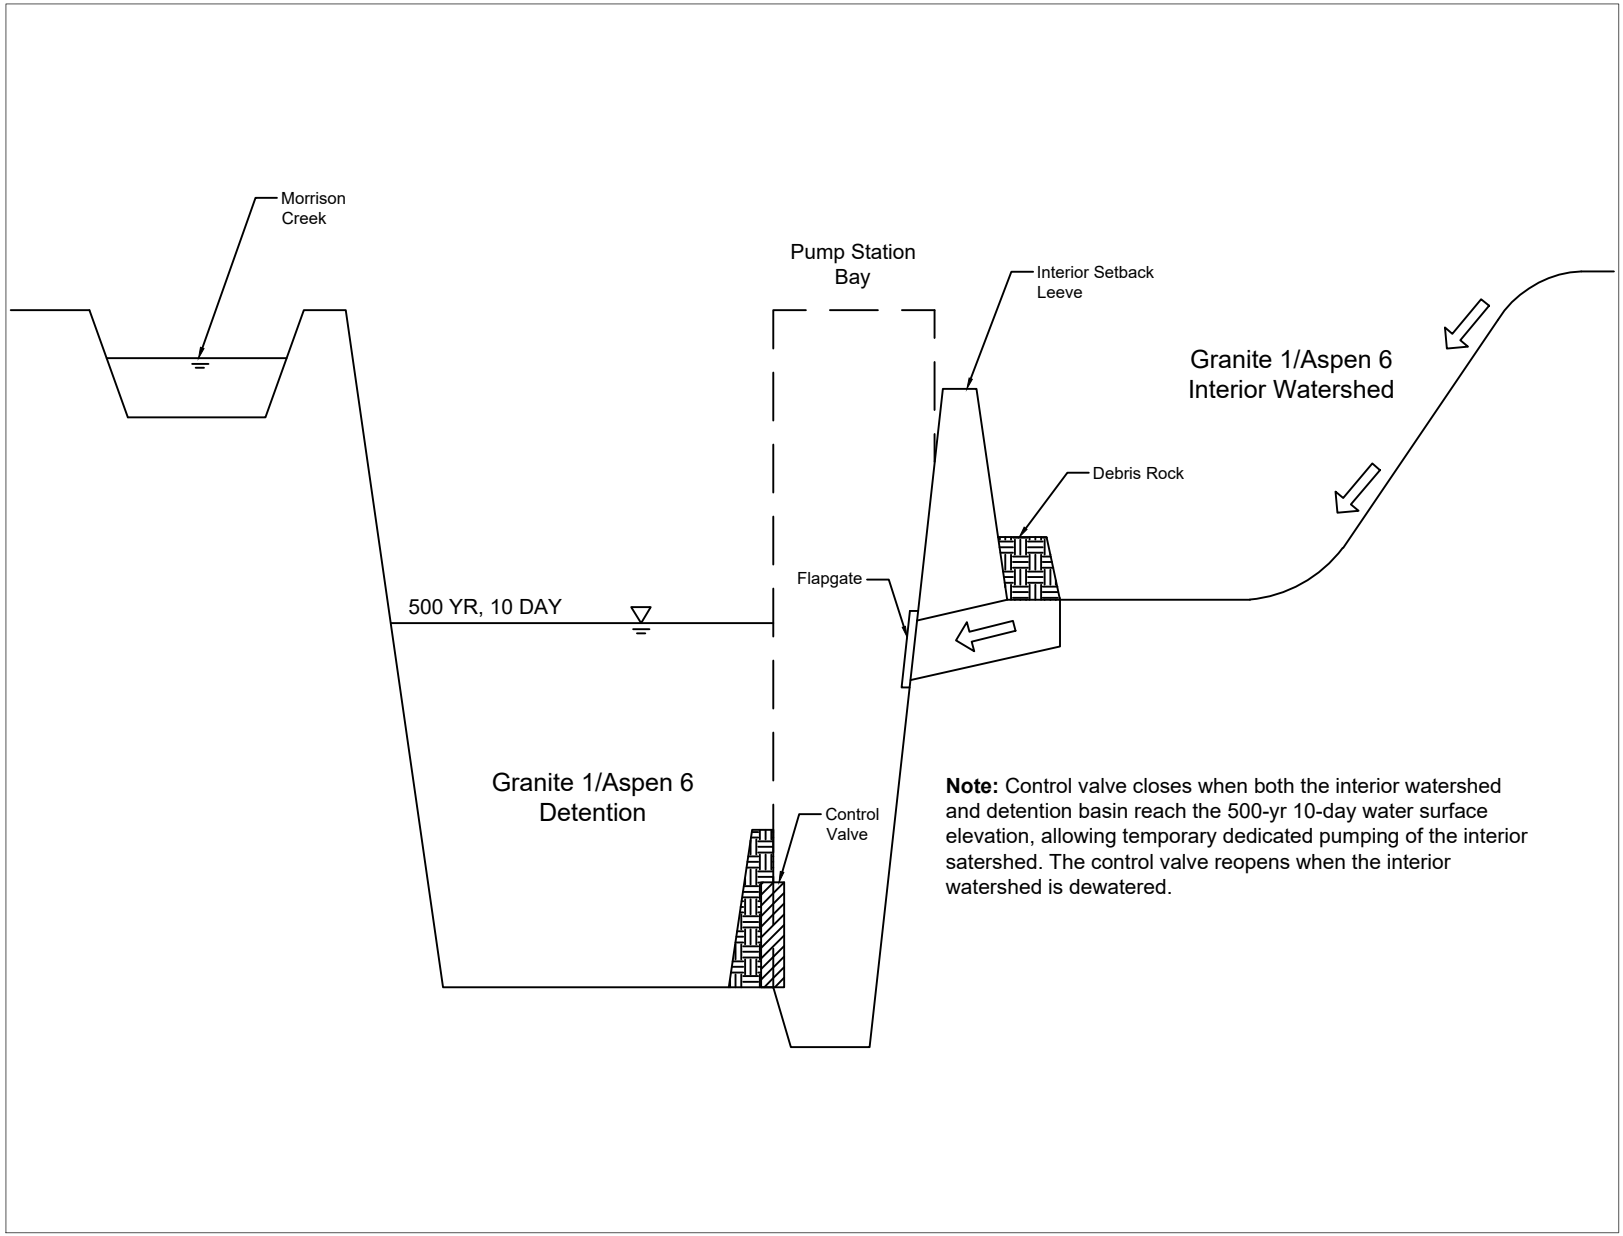

Figure 8.2

9.0 Future Considerations

9.1 Procedural Memorandum

As previously discussed in Section 2.6, the project's procedural memorandum will provide guidance as it relates to complying with FEMA 100-year flood protection, ULOP 200-year flood protection, and the County Floodplain Management Ordinance regulations. Compliance with FEMA, ULOP, and County Floodplain Management Ordinance, where applicable, will necessitate project conditions that require satisfaction prior to building within areas that are subject to these regulations. It is anticipated that the Procedural Memoranda will be approved prior to or concurrent with the Master Plan. A technical memorandum for preliminary levee design demonstrating compliance with ULOP is required prior to entitlements for the Master Plan.

9.2 Operation & Maintenance of Facilities

It is anticipated that ownership and maintenance of Plan Area drainage facilities will be the primary responsibility of Sacramento County once these facilities are designed and constructed by development. Funding for maintenance will be accomplished through the use of various funding mechanisms available to the County including, but not limited to traditional fee districts. The precise method of funding will be established by the financing and urban service plans adopted in conjunction with the Master Plan. Project land owners in conjunction with forming a funding mechanism, will secure or form a levee district to maintain the project's proposed FEMA accredited and CVFPB levees.

9.3 FEMA Compliance

Before development (Building Permit issuance) can take place within current FEMA floodplains, it is anticipated that an existing conditions Letter of Map Revision (LOMR) or a Physical Map Revisions (PMR) will be provided to map the existing conditions of the Morrison Creek watershed through the Plan Area. It is not intended to be a requirement of the applicant to submit an existing conditions LOMR prior to submittal of a CLOMR or LOMR-F, however the purpose of mapping existing conditions is to more easily facilitate future development. Proposed development, where in the existing floodplain, will need to submit a future conditions analysis to FEMA for review under a Conditional Letter of Map Revision (CLOMR) application(s).

SCDWR staff will have the opportunity to review all applications to FEMA and provide adjustments to modeling as necessary to satisfy their responsibilities as a National Flood Insurance Program (NFIP) community. Future CLOMR submittals are anticipated to require Endangered Species Act (ESA) compliance before approval from FEMA. After grading and/or drainage improvements are constructed consistent with a CLOMR, a LOMR will be submitted to reflect the revised floodplain mapping.

9.4 American River Flood Control Plan

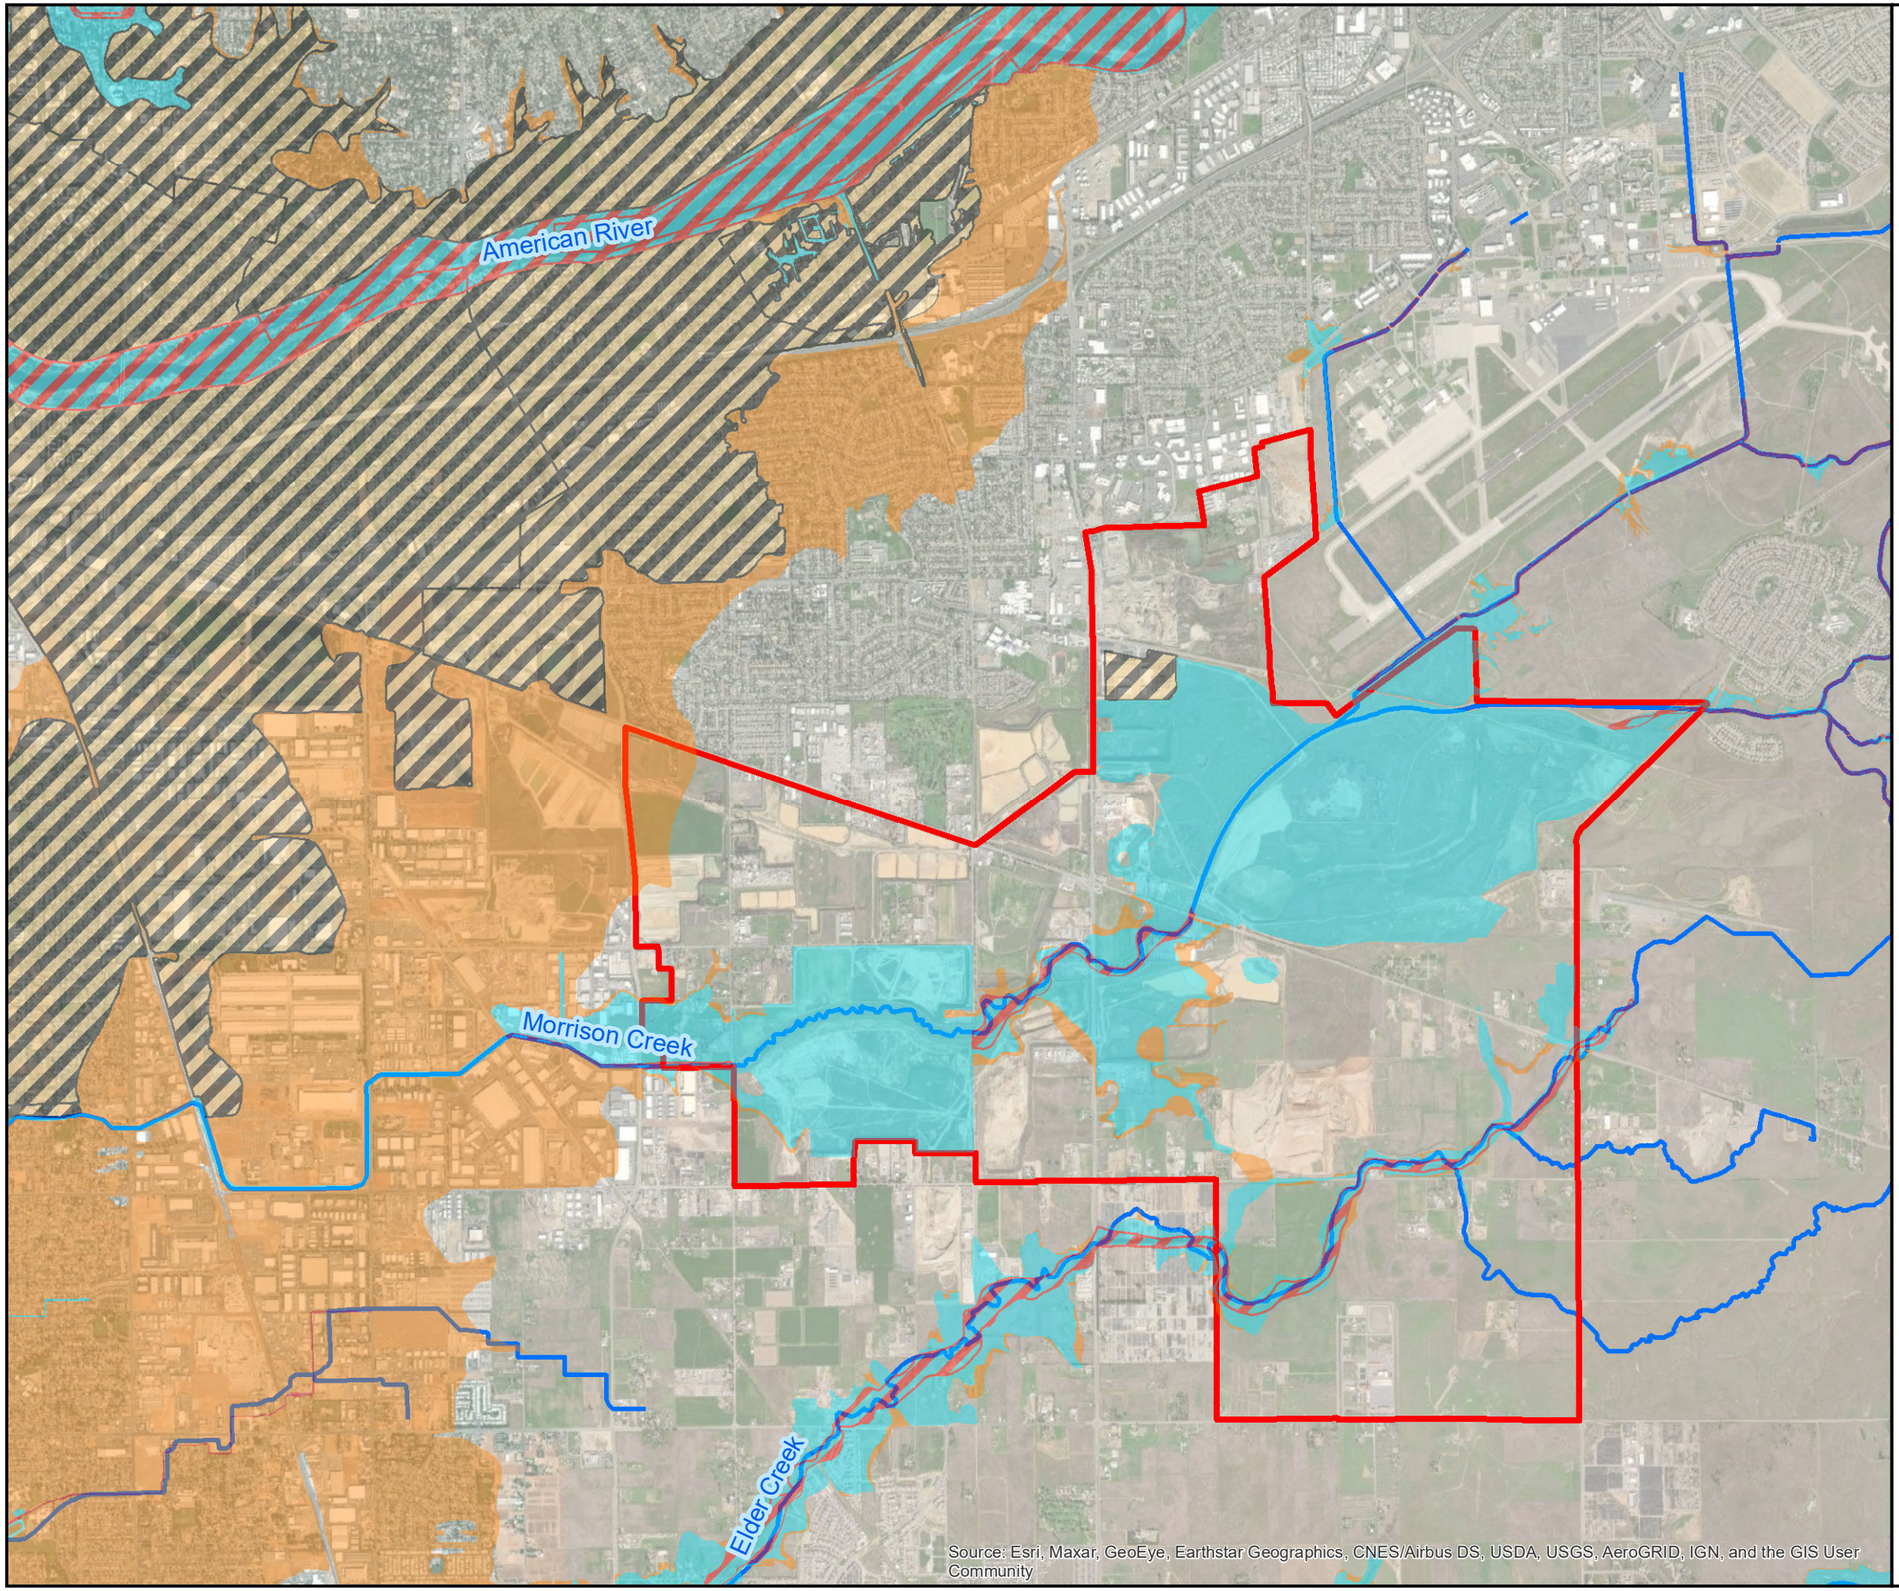
The Sacramento Area Flood Control Agency (SAFCA) and the Bureau of Reclamation have worked together in securing the reoperation of the Folsom Dam and Reservoir to enhance flood protection along the American River. The most recent work involved levee gap closure efforts, and additional spillway gates at Folsom Dam. The intent of their efforts is to reduce the design peak flow in the American River to 115,000 cfs, but for potentially longer periods of time, and discharge that flow to the Sacramento River through a certified and accredited levee system. The certification of the levee system along the south side of the American River, coupled with the reduction in peak flow, allows the lands south of the American River to be considered protected from the 100-year and 200-year flooding conditions.

Revised mapping of the American River Channel to reflect modification of American River flood hazard is now complete. The levee failure floodplain has been recently modified. This revised mapping shows the flood hazard, described as areas protected by levees, is downstream of the Plan Area, as shown on **Figure 9.1: FEMA Floodplain Map**.

9.5 Subsequent Land Use Entitlements

Future design level analysis is anticipated at the tentative map stage to size onsite storm drain systems to convey runoff to downstream detention and pumping facilities. Approximate estimates of trunk storm drain facilities (trunk facilities are defined as draining 30 or more acres) were developed as part of this master plan effort, but are subject to change once parcel and street layouts are defined at subsequent Tentative Map stages.

If future development planning upstream of the Plan Area or within the Plan Area is modified by others, it is assumed that SCDWR staff will be responsible to ensure the integrity of the Plan Area is maintained and



additional impacts are not created by revised hydrologic and hydraulic analysis developed by the proponents of future changes.

FIGURE 9.1

10.0 Summary and Conclusions

The Plan Area can be safely developed using the drainage design concepts presented within this drainage study. Interior storm drainage improvements, including trunk drainage facilities and detention basins, demonstrate that the resultant maximum water surfaces for the evaluated 100-year, 200-year and 500-year storms provide sufficient freeboard to protect the planned development while mitigating the project's peak flows.

Planned flood control improvements to the Morrison Creek and Elder Creek systems, which include the certification of levees to 44 CFR 65.10 standards and state ULDC requirements (200-year), are demonstrated to contain the 100-year and 200-year flood events and meet all State and Federal flood protection requirements for the Plan Area. The flood protection improvements planned are anticipated to improve the level of flood safety for the Plan Area and downstream properties by providing a reliable levee and weir system to reduce peak flows in Morrison and Elder Creeks. Additionally, the project is designed for resiliency in its ability to accommodate climate change.

In conclusion, this study demonstrates that the Plan Area can safely develop with urban land uses without adversely impacting predevelopment conditions in the Morrison Creek and Elder Creek systems and the project will meet all flood safety requirements.

Introduction

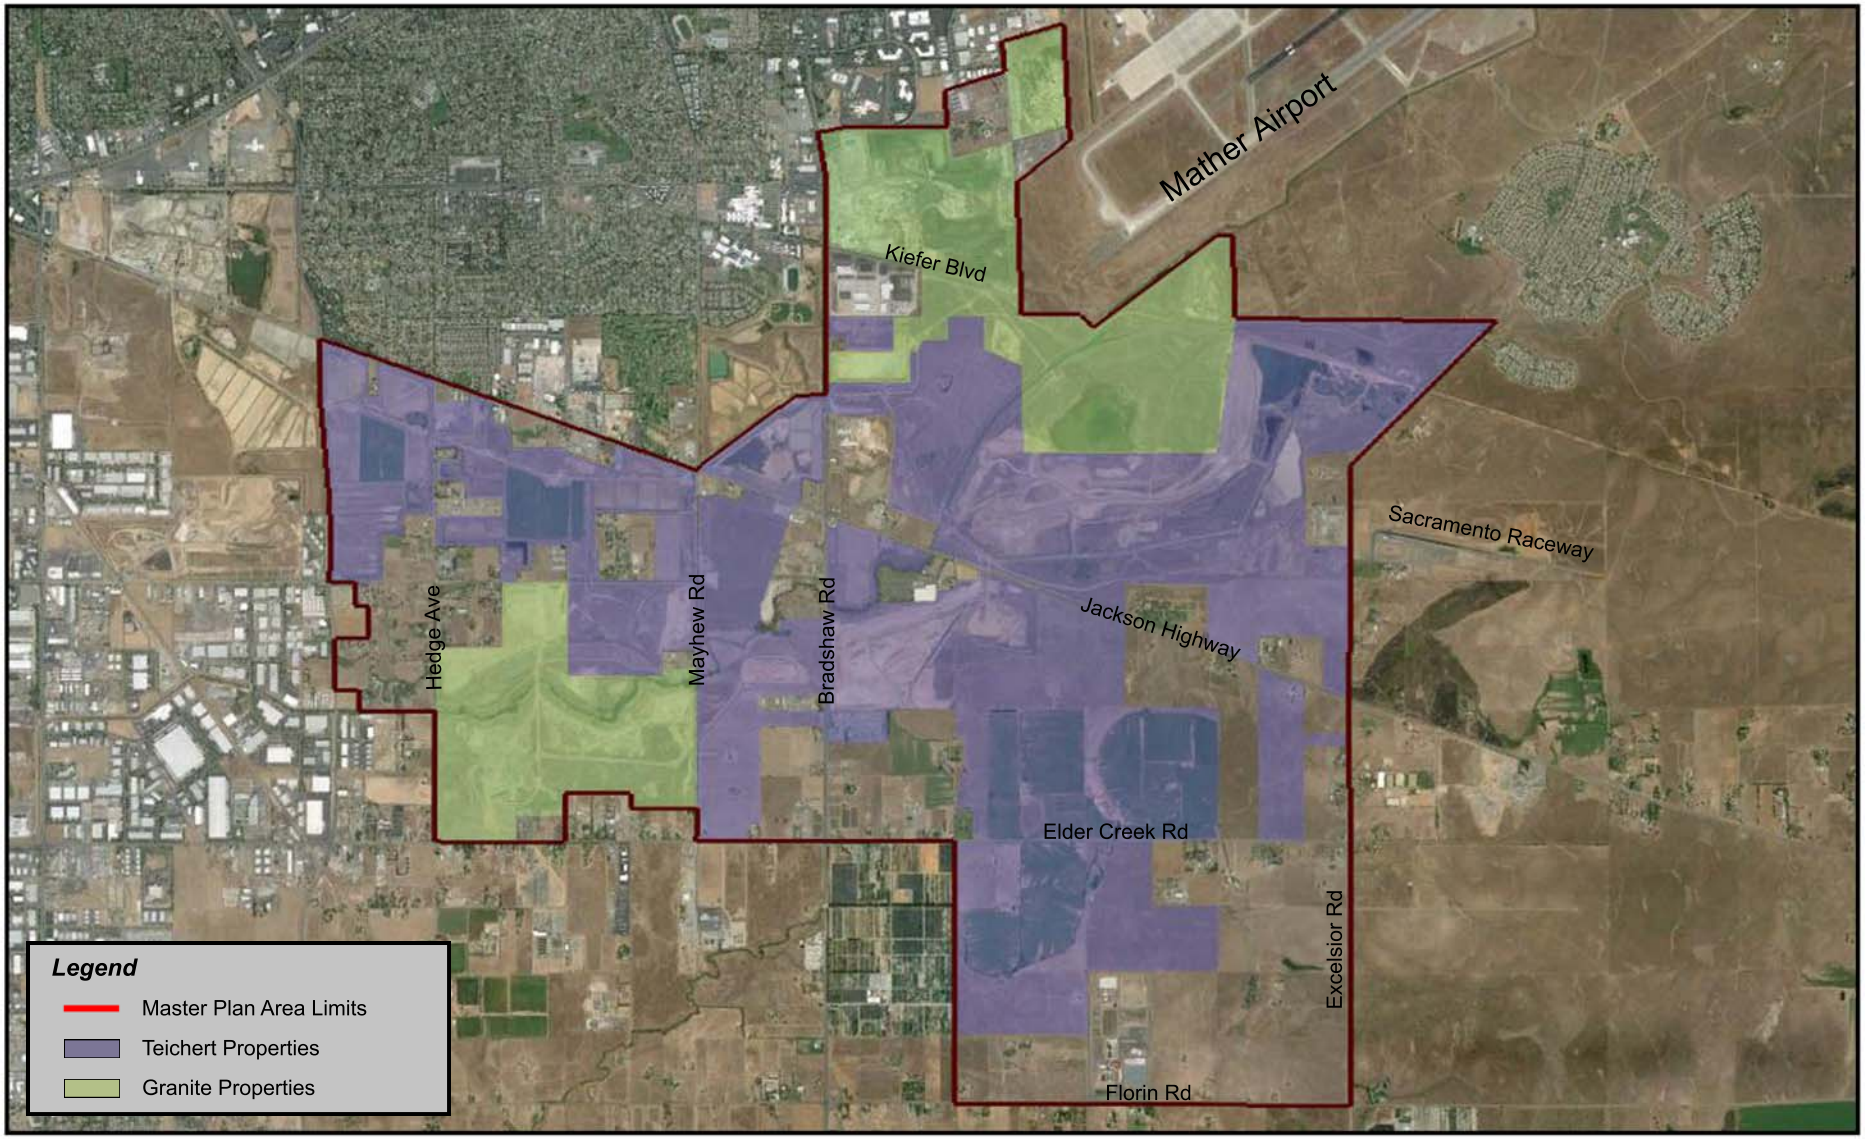
The West Jackson Highway Master Plan was initiated by the Sacramento County Board of Supervisors on April 17, 2012. In accordance with the requirements of General Plan Land Use Element Policy LU-119, Stonebridge Properties, LLC (Stonebridge Properties), a subsidiary of Teichert Land Co., and Granite Construction Company (Granite), a California corporation (Participating Properties) have initiated the Master Plan process for all land encompassed within the proposed Master Plan Area (referred to herein as the "Plan Area"). Stonebridge Properties and Granite have retained Bollard Acoustical Consultants, Inc. (BAC) to prepare this noise study report identifying existing noise sources within or affecting the Plan Area, quantifying baseline ambient noise and vibration conditions within the Plan Area, and identifying noise impacts and mitigation measures associated with development within the Plan Area. It is intended that information contained in this report will be utilized in the development of the Noise Section of the Environmental Impact Report (EIR) to be prepared for the Master Plan.

Of the entire 5,913± acres of the Plan Area, the Participating Properties collectively own 4,079± acres – Teichert owns 3,016± acres and Granite owns 1,063± acres (See Figure 1). Thus, Participating Properties represent 69% of the total Plan Area acreage. These properties primarily include aggregate mining sites used for sand and gravel extraction, many of which have already been mined and reclaimed. Although most of the mining is complete, some of the Participating Properties continue to support various mining related activities.

In addition to mining areas, the Plan Area is comprised of a mixture of rural residential, institutional, agricultural and industrial properties located along State Route 16 (Jackson Highway) in the geographic center of Sacramento County. The Plan Area boundaries are generally Jackson Highway, Kiefer Boulevard and Goethe Road to the north, portions of Elder Creek Road and Florin Road to the south, the City of Sacramento to the west and Excelsior Road to the east. As a result of the mining activities across the landscape since the 1930's, the Plan Area has largely been bypassed by development. Just over 80% of the Plan Area boundary abuts the existing Sacramento County Urban Policy Area and the Sacramento City Limits.

The Master Plan has been designed to provide a mixture of residential, commercial, recreational, farming, and employment nodes intended to reduce vehicle miles traveled (VMT) within the Plan Area and support the provision and use of transit alternatives. Some of the proposed land uses designations have components which could be noise-generating (industrial, active recreation areas parks and school playgrounds, commercial uses, etc.), whereas other uses have noise-sensitive components (residences, school classrooms and office interiors, etc.).

The project environmental document will consider the effects of noise generated by the project as well as noise impacting the project from sources unrelated to the Master Plan development. The Master Plan establishes a framework and strategy for all future land use within the Plan Area, including general land use and development standards, policies, land use allocations, infrastructure, and public service planning. Within the Master Plan, two District Area Plans (labeled as District 1 and District 2), are established, in addition to three Future Planning Areas (FPA's) (labeled as FPA A, B and C) (See Figure 2). District Area Plans primarily consist of



Participating Properties, while Future Planning Areas are comprised of non-participating property owners. Teichert's acreage is fully within District 1. Granite's acreage is fully within District 2.

The District Plans establish specific land uses, policies, design guidelines and development standards for the properties within the District Areas. Although future land uses for the FPAs will be established in gross by the Master Plan, specific land uses, policies, design guidelines and development standards for these areas are not provided by the Master Plan. It is anticipated that the landowners within the FPAs will initiate District Plans or Specific Plans in the future. Should the landowners in those areas contemplate changing existing land uses within the FPA, such future use must be consistent with the provisions of the Master Plan and undergo further analysis, including environmental review, when an entitlement application is submitted to the County.

Fundamentals and Terminology

Noise

Noise is simply described as unwanted sound. Sound is defined as any pressure variation in air that the human ear can detect. If the pressure variations occur frequently enough (at least 20 times per second), they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second, called Hertz (Hz).

Discussing sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel (dB) scale was devised. The decibel scale uses the hearing threshold (20 Micropascals of pressure), as a point of reference, defined as 0 dB. Other sound pressures are compared to the reference pressure and the logarithm is taken to keep the numbers in a practical range. The dB scale allows a million-fold increase in pressure to be expressed as 120 dB. To better relate overall sound levels and loudness to human perception, frequency-dependent weighting networks were developed. There is a strong correlation between the way humans perceive sound and A-weighted sound levels. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment for community exposures. All sound levels expressed in this section are A-weighted sound levels, unless noted otherwise. Definitions of acoustical terminology are provided in Appendix A.

Community noise is commonly described in terms of the “ambient” noise level, which is defined as the all-encompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level (L_{eq}), over a given time period (usually one hour). The L_{eq} is the foundation of the day-night average noise descriptor, and shows very good correlation with community response to noise for the average person.

The L_{dn} is based upon the average noise level over a 24-hour day, with a +10 dB weighting applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average, it tends to disguise short-term variations in the noise environment. Where short-term noise sources are an issue, noise impacts may be assessed in terms of maximum noise levels, hourly averages, or other statistical descriptors.

The perceived loudness of sounds and corresponding reactions to noise are dependent upon many factors, including sound pressure level, duration of intrusive sound, frequency of occurrence, time of occurrence, and frequency content. As mentioned above; however, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by weighing the frequency response of a sound level meter by means of the standardized A-weighing network. Table 1 shows examples of noise levels for several common noise sources and environments.

Table 1
Typical A-Weighted Sound Levels of Common Noise Sources

Loudness Ratio*	dBA	Description
128	130	Threshold of pain
64	120	Jet aircraft take-off at 100 feet
32	110	Riveting machine at operators' position
16	100	Shotgun at 200 feet
8	90	Bulldozer at 50 feet
4	80	Diesel locomotive at 300 feet
2	70	Commercial jet aircraft interior during flight
1	60	Normal conversation speech at 5-10 feet
1/2	50	Open office background level
1/4	40	Background level within a residence
1/8	30	Soft whisper at 2 feet
1/16	20	Interior of recording studio

* Each 10 dBA increase in sound pressure level equates to a doubling of loudness. For example, 70 dBA is twice as loud as 60 dB and 80 dBA is four times as loud as 60 dBA, etc.

Perception of Changes in Noise Levels

Table 2 is based upon recommendations made in August 1992 by the Federal Interagency Committee on Noise (FICON) to provide guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, these criteria have been applied to other sources of noise similarly described in terms of cumulative noise exposure metrics such as the L_{dn}.

Table 2
Significance of Changes in Cumulative Noise Exposure

Ambient Noise Level Without Project, Ldn	Increase Required for Significant Impact
<60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65 dB	+1.5 dB or more

Source: Federal Interagency Committee on Noise (FICON)

According to Table 2, an increase in noise from similar sources of 5 dB or more would be noticeable where the ambient level is less than 60 dB. Where the ambient level is between 60 and 65 dB, an increase in noise of 3 dB or more would be noticeable, and an increase of 1.5 dB or more would be noticeable where the ambient noise level exceeds 65 dB L_{dn}. The rationale for the Table 2 criteria is that, as ambient noise levels increase, a smaller increase in noise resulting from a project is sufficient to cause annoyance.

Single-Event Noise & Sleep Disturbance

A single event is an individual distinct loud activity, such as an aircraft overflight, a train or truck passage, or any other brief and discrete noise-generating activity. Because most noise policies applicable to transportation noise sources are typically specified in terms of 24-hour-averaged descriptors, such as Ldn or Community Noise Equivalent Level (CNEL), the potential for annoyance or sleep disturbance associated with individual loud events can be masked by representing the data as an average. A discussion of Single-Event noise effects relative to Sacramento County Noise Policy is included in the Criteria section of the report.

Berkeley Keep Jets Over the Bay

The analysis of single event noise effects under CEQA can be traced to a 2001 court case (*Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners of the City of Oakland* (2001) 91 Cal.App.4th 1344), which concerned a challenge to the proposed expansion of the Oakland Airport. The court required, in that context (i.e. an airport expansion), that the EIR address single-event noise and sleep disturbance effects on existing residents in the City of Berkeley. However, the court did not recommend an appropriate single event noise level standard to be employed.

Extensive studies have been conducted regarding the effects of single-event noise on sleep disturbance, with the Sound Exposure Level (SEL) metric being a common metric used for such assessments. SEL represents the entire sound energy of a given single event normalized into a one-second period regardless of event duration. As a result, the single-number SEL metric contains information pertaining to both event duration and intensity. Another descriptor utilized to assess single-event noise is the maximum, or Lmax, noise level associated with the event. A problem with utilizing Lmax to assess single events is that the duration of the event is not considered.

There are currently on-going discussions regarding the appropriateness of using the SEL metric as a supplement or replacement for cumulative noise level metrics such as Ldn and CNEL, 24-hour noise descriptors. Nonetheless, because SEL describes a receiver's total noise exposure from a single impulsive event, SEL is often used to characterize noise from individual brief loud events.

Industry Guidance on Single Event Noise and Sleep Disturbance

The Federal Interagency Committee on Aviation Noise (FICAN) has provided estimates of the percentage of people expected to be awakened when exposed to specific SELs inside a home (FICAN 1997). However, FICAN did not recommend a threshold of significance based on the percent of people awakened. According to the FICAN study, 10% of the population is estimated to be awakened when the SEL interior noise level reaches 81 dBA. An estimated 5 to 10 percent of the population is affected when the SEL interior noise level is between 65 and 81 dBA, and few sleep awakenings (less than 5 percent) are predicted if the interior SEL is less than 65 dBA. The FICAN results focused on individual single-event sound levels but did not take into consideration how exposure to multiple single events affected sleep disturbance.

ANSI and the Acoustical Society of America (ASA) released a voluntary methodology to predict sleep disturbance in terms of the probability of awakening. ANSI's *Quantities and Procedures for Description and Measurement of Environmental Sound -Part 6: Methods for Estimation of Awakenings Associated with Outdoor Noise Events Heard in Homes*, July 2008, provides a method to predict sleep disturbance associated with noise levels in terms of indoor A-weighted sound exposure level (ASEL). The methodology was developed from about 10,000 subject-nights of observations primarily in homes near areas of routine jet aircraft takeoff and landings, railroads, roads, and highways. The methodology assumes that the individuals have no sleep disorders, normal hearing, and only applies to individuals over 18 years of age. The methodology also defines "disturbance" as being restricted to a behaviorally confirmed awakening.

While the FICAN has a recommended means of predicting awakenings from a single aircraft event, the new ANSI methodology further refines this approach by taking into account the time since the person fell asleep and the ability to identify the probability of being awakened from multiple aircraft events over the course of the entire night. However, research performed by BAC questions the accuracy of the ANSI methodology.

Although the FICAN and ANSI methodologies provide a means by which the potential for awakenings due to single events can be predicted, neither methodology provides a recommended target level for acceptable single-event noise or percentage of awakening. Further, there is no industry consensus establishing recommended target levels for acceptable single-event noise or percentage of awakening.

Sound Propagation

It is commonly understood that sound decreases with distance. But the propagation of sound is dependent on considerably more variables than distance alone. Those variables include the type of noise source (point, moving point, or line sources), the directionality of the noise source, the frequency content of the source (low frequency sound is absorbed in the atmosphere at a slower

rate than high-frequency sound and therefore "carries" farther), atmospheric conditions (wind, temperature, humidity, gradients), ground type (dirt, grass fields, concrete, etc.), shielding (structures, noise barriers, topography), and vegetation.

In the generally urban setting of the Plan Area, noise-sensitive receptors are located within fairly close proximity to noise sources. At short distances between the source and receptor, the effects of the atmosphere on sound propagation are diminished, as those effects become more pronounced at distances in excess of 300 feet.

For the purposes of assessing noise sources within the project area, traffic on public roadways are considered "moving point" sources. The sound level decay rate for this type of source is 4.5 dB per doubling of distance from the source. Stationary noise sources, such as the Granite Bradshaw aggregate plant, are treated as "point" sources. The sound level decay rate for point sources is 6 dB per each doubling of distance from the source.

Several of the Teichert and Granite parcels located within the Plan Area are former aggregate excavation sites, and are therefore depressed relative to surrounding ground elevation in many cases. This is important in that the nearby noise sources, such as adjacent roadways, are typically not visible from the depressed positions within these parcels. Because the former excavation embankments provide topographic shielding of adjacent traffic noise sources from the depressed positions, ambient noise levels within the depressed areas are considerably lower than locations at or near even grade with adjacent roadways.

Noise Mitigation Fundamentals

Any noise problem may be considered as being composed of three basic elements: the noise source, a transmission path, and a receiver. The appropriate acoustical treatment for a given project should consider the nature of the noise source and the sensitivity of the receiver. The problem should be defined in terms of appropriate criteria (Ldn, L_{50}, or Lmax), the location of the sensitive receiver (inside or outside), and when the problem occurs (daytime, nighttime, or 24-hour average). Noise control techniques should then be selected to provide an acceptable noise environment for the receiving property while remaining consistent with local aesthetic standards and practical structural and economic limits. Fundamental noise control techniques include the following:

Use of Setbacks

Noise exposure may be reduced by increasing the distance between the noise source and receiving use. The available noise attenuation from this technique is limited by the characteristics of the noise source, but is generally about 4 to 6 dB per doubling of distance from the source.

Use of Barriers

Shielding by barriers can be obtained by placing walls, berms or other structures, such as buildings, between the noise source and the receiver. The effectiveness of a barrier depends upon blocking line-of-sight between the source and receiver, and is improved with increasing the distance the sound must travel to pass over the barrier as compared

to a straight line from source to receiver. The difference between the distance over a barrier and a straight line between source and receiver is called the "path length difference," and is the basis for calculating barrier noise reduction.

Barrier effectiveness depends upon the relative heights of the source, barrier and receiver. In general, barriers are most effective when placed close to either the receiver or the source. An intermediate barrier location yields a smaller path-length-difference for a given increase in barrier height than does a location closer to either source or receiver.

For maximum effectiveness, barriers must be continuous and relatively airtight along their length and height. To ensure that sound transmission through the barrier is insignificant, barrier mass should be about 3-4 lbs. /square foot, although a lesser mass may be acceptable if the barrier material provides sufficient transmission loss. Satisfaction of the above criteria requires substantial and well-fitted barrier materials, placed to intercept line of sight to all significant noise sources.

Earth, in the form of berms, or the face of a depressed area, is also an effective barrier material. This project design makes extensive use of topography and site grading to serve as both visual and acoustic barriers to nearby traffic and some on-site noise sources associated with the Teichert Perkins facility.

There are practical limits to the noise reduction provided by barriers. For traffic noise, a 5 to 10 dB noise reduction may often be reasonably attained. A 15 dB noise reduction is usually difficult but sometimes possible to attain, but a 20 dB noise reduction is extremely difficult to achieve. Barriers usually are provided in the form of walls, berms, or berm/wall combinations. The use of an earth berm in lieu of a solid wall may provide additional attenuation over that attained by a solid wall alone due to the absorption provided by the earth. Berm/wall combinations offer slightly better acoustical performance than solid walls, and are often preferred for aesthetic reasons over solid barrier walls alone.

Site Design

Buildings can be placed on a project site to shield other structures or areas, to remove them from noise-impacted areas, and to prevent an increase in noise level caused by reflections. The use of one building to shield another can significantly reduce overall project noise control costs, particularly if the shielding structure is insensitive to noise. As an example, carports or garages can be used to form or complement a barrier shielding adjacent dwellings or an outdoor activity area. Similarly, one residential unit can be placed to shield another so that noise reduction measures are needed for only the building closest to the noise source. Placement of outdoor activity areas within the shielded portion of a building complex, such as a central courtyard, can be an effective method of providing a quiet retreat in an otherwise noisy environment. Patios or balconies should be placed on the side of a building opposite the noise source, and "wing walls" can be added to buildings or patios to help shield sensitive uses.

Another useful option in site design is the placement of relatively insensitive land uses, such as commercial uses, between the noise source and a more sensitive portion of the

project. Examples include development of a commercial strip along a busy arterial to block noise affecting a residential area. If existing topography or development adjacent to the project site provides some shielding, as in the case of an existing berm, knoll or building, sensitive structures or activity areas may be placed behind those features to reduce noise control requirements.

Building Design

When structures have been located to provide maximum noise reduction by site design or shielding, noise reduction measures may still be required to achieve an acceptable interior noise environment. The cost of such measures may be reduced by placement of interior dwelling unit features. For example, bedrooms, living rooms, family rooms and other noise-sensitive portions of a dwelling can be located on the side of the unit farthest from the noise source.

Bathrooms, closets, stairwells and food preparation areas are relatively insensitive to exterior noise sources, and can be placed on the noisy side of a unit. When such techniques are employed, noise reduction requirements for the building facade can be significantly reduced, although the architect must take care to isolate the noise impacted areas by the use of partitions or doors.

Noise Reduction by Building Facades

When interior noise levels are of concern in a noisy environment, noise reduction may be obtained through acoustical design of building facades. Standard residential construction practices provide 10 to 15 dB noise reduction for building facades with open windows, and approximately 25-30 dB noise reduction when windows are closed. Thus a 25 dB exterior-to-interior noise reduction can be obtained by the requirement that building design include adequate ventilation systems, allowing windows on a noise-impacted facade to remain closed under any weather condition.

Where greater noise reduction is required, acoustical treatment of the building facade is necessary. The greatest improvement in building façade noise reduction can typically be realized through specification of upgraded windows with higher Sound Transmission Class (STC) ratings.

Noise transmitted through walls can be reduced by increasing wall mass (using stucco or brick in lieu of wood siding), isolating wall members by the use of double- or staggered-stud walls, or mounting interior walls on resilient channels. Noise control for exterior doorways is provided by reducing door area, using solid-core doors, and by acoustically sealing door perimeters with suitable gaskets. Roof treatments may include the use of plywood sheathing under roofing materials.

Whichever noise control techniques are employed, it is essential that attention be given to installation of weather-stripping and caulking of joints. Openings for attic or subfloor ventilation may also require acoustical treatment; tight-fitting fireplace dampers and glass doors may be needed in aircraft noise-impacted areas.

Use of Vegetation

Trees and other vegetation are often thought to provide significant noise attenuation. However, approximately 100 feet of dense foliage (so that no visual path extends through the foliage) is required to achieve a 5 dB attenuation of traffic noise. Thus, the use of vegetation as a noise barrier should not be considered a practical method of noise control unless large tracts of dense foliage are part of the existing landscape.

Vegetation can be used to acoustically "soften" intervening ground between a noise source and receiver, increasing ground absorption of sound and thus increasing the attenuation of sound with distance. Planting of trees and shrubs is also of aesthetic and psychological value, and may reduce adverse public reaction to a noise source by removing the source from view, even though noise levels will be largely unaffected.

In summary, the effects of vegetation upon noise transmission are minor, and are primarily limited to increased absorption of high frequency sounds and to reducing adverse public reaction to the noise by providing aesthetic benefits.

Noise-Reducing Paving Materials (Rubberized Asphalt)

Studies conducted for the Sacramento County Planning and Environmental Review Department and Transportation Department to determine the noise reduction provided by rubberized asphalt have been completed in recent years. Those studies indicate that the use of rubberized asphalt on two County roadways appears to have resulted in an average traffic noise level reduction of approximately 4 dB over that provided by conventional asphalt.

Vibration

Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that noise is generally considered to be pressure waves transmitted through air, while vibration is usually associated with transmission through the ground or structures. As with noise, vibration consists of an amplitude and frequency. A person's response to vibration will depend on their individual sensitivity as well as the amplitude and frequency of the source.

Vibration can be described in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration measures in terms of peak particle velocities (inches/second). Standards pertaining to perception as well as damage to structures have been developed for vibration in terms of peak particle velocity.

As vibrations travel outward from the source, they excite the particles of rock and soil through which they pass and cause them to oscillate. Differences in subsurface geologic conditions and distance from the source of vibration will result in different vibration levels characterized by different frequencies and intensities. In all cases, vibration amplitudes will decrease with increasing distance. The maximum rate, or velocity of particle movement, is the commonly accepted descriptor of the vibration "strength".

Human response to vibration is difficult to quantify. Vibration can be felt or heard well below the levels that produce any damage to structures. The duration of the event has an effect on human response, as does frequency. Generally, as the duration and vibration frequency increase, the potential for adverse human response increases.

According to the Transportation and Construction-Induced Vibration Guidance Manual (Caltrans, June 2004), operation of construction equipment and construction techniques generate ground vibration. Traffic traveling on roadways can also be a source of such vibration. At high enough amplitudes, ground vibration has the potential to damage structures and/or cause cosmetic damage (e.g., crack plaster). Ground vibration can also be a source of annoyance to individuals who live or work close to vibration-generating activities. However, traffic, including heavy trucks traveling on a highway, rarely generates vibration amplitudes high enough to cause structural or cosmetic damage.

Criteria for Acceptable Noise and Vibration Levels

Sacramento County

Sacramento County General Plan

The Noise Element of the Sacramento County General Plan contains policies pertaining to acceptable noise generation and exposure levels within the County. The policies contained within the County Noise Element which are pertinent to the evaluation of noise impacts due to and upon development within the Plan Area are reproduced below.

Traffic and Railroad Noise Sources

NO-1 The noise level standards for noise-sensitive areas of new uses affected by traffic or railroad noise sources in Sacramento County are shown in Table 3. Where the noise level standards of Table 3 are predicted to be exceeded at new uses proposed within Sacramento County which are affected by traffic or railroad noise, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 3 standards.

Aircraft Noise Sources

NO-2 Proposals for new development within Sacramento County which may be affected by aircraft noise shall be evaluated relative to the Land Use Compatibility for Aircraft Noise table contained in the County General Plan Noise Element. Development proposals which may be affected by aircraft noise from Mather Airport shall be evaluated relative to the Land Use Compatibility Plan prepared for Mather Airport dated February 2021, adopted herein by reference, as well as applicable footnotes in Table 4 of the General Plan Noise Element.

NO-3 New residential development within the 60 CNEL noise contours adopted by the County for planning purposes at any airport or Helipad within Sacramento County shall be prohibited unless exceptions set forth in General Plan Noise Element

Table 4 are found to be applicable. This policy is not applicable to Executive Airport.

Footnotes 2, 6 and 7 of General Plan Noise Element Table 4 state the following with respect to development of noise-sensitive uses within the Mather Airport noise contours:

2. Single family detached residential units within the 60-65 dB CNEL noise contours of the Mather Airport Policy Area may be considered a compatible use if: (a) approved by the Board of Supervisors upon completion of Sacramento County's master plan process, including demonstration of compliance with LU-119 and LU-120; (b) an evaluation of potential noise and safety impacts pursuant to CEQA has occurred and appropriate noise mitigation measures to reduce interior noise levels to 45 dB have been included in the environmental document and adopted as conditions of approval; and (c) all of the requirements in Footnote 8 below are met. Second residential units are a compatible use within all CNEL ranges, subject to the condition that the proposed second unit be consistent with the provisions of Section 65852.1 and 65852.2 of the California Government Code.

6. Compatible at Sacramento International Airport and Franklin Field only if the residential use is directly related to agricultural uses, such as dwelling units for the landowner, the owner's immediate family, or for employees. May be compatible at Mather Airport if approved by the Board of Supervisors as a component of a master plan and all criteria set forth in Footnote 2 above are satisfied. All residential units shall be designed to limit intruding noise such that interior noise levels do not exceed 45 CNEL, with windows closed, in any habitable room.

7. New residential uses within 60 CNEL are not compatible, with the exception of accessory residential dwellings on parcels zoned Agricultural, Agricultural-Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural or single-family dwellings as set forth in Footnote 2 above. Except as provided in Footnotes 2 and 6 above, new residential development within the Mather Airport Policy Area boundaries but outside the 60 CNEL shall be subject to the following conditions:

    A. Provide minimum noise insulation to provide 45dB within new residential dwellings, including detached single-family dwellings, with windows closed, in any habitable room.

    B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within the Mather Airport Policy Area.

    C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento and recorded with the Sacramento County Recorder and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within the Mather Airport Policy

Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of Mather Airport.

New residential development within the Mather Airport Policy Area outside the 65 dB CNEL but inside the 60 dB CNEL shall be subject to Conditions A through C above and a County-approved noise analysis and mitigation to reduce interior noise impacts to 45 dB with windows closed, in any habitable room.

NO-4 New residential development within adopted Airport Policy Area boundaries*, but outside the 60 CNEL**, shall be subject to the following conditions:

A. Provide minimum noise insulation to 45 dB CNEL within new residential dwellings, including detached single-family dwellings, with windows closed in any habitable room.

B. Notification in the Public Report prepared by the California Department of Real Estate disclosing the fact to prospective buyers that the parcel is located within an Airport Policy Area.

C. An Avigation Easement prepared by the Sacramento County Counsel's Office granted to the County of Sacramento, recorded with the Sacramento County Recorder, and filed with Department of Airports. Such Avigation Easement shall acknowledge the property location within an Airport Planning Policy Area and shall grant the right of flight and unobstructed passage of all aircraft into and out of the subject Airport.

Exceptions: New accessory residential dwellings on parcels zoned Agricultural, Agricultural-Residential, Interim Agricultural, Interim General Agricultural, or Interim Limited Agricultural and between the 60 and 65 CNEL contours, shall be permitted within adopted Airport Policy Area boundaries, but would be subject to the conditions listed above.

** The relationship of the Mather Airport Policy Area to the West Jackson Highway Master Plan Area is illustrated on Figure 3. That figure indicates that the majority of the master plan area is located within the Mather Airport Policy Area. As a result, all new residential development within the WJHMP area east of Hedge Avenue would be subject to this General Plan Policy.*

*** The 60 CNEL contour adopted by the County for planning purposes are the "theoretical capacity" contours shown on Figure 4A. Figure 4B shows the portion of the WJMP area which is located within the 60 CNEL contours.*

Sacramento County Guidance on Single Event Noise Methodology

The Sacramento County General Plan Noise Element policies do not provide a noise standard specific to single-events. However, the County has determined that single-event aircraft noise exposure and associated sleep disturbance impacts are to be assessed in accordance with the Sacramento County General Plan Noise Element Policies NO-2 through NO-4 on aircraft noise. Those policies restrict new residential development to areas outside the 60 dB CNEL airport noise contours,

require noise insulation to ensure interior noise levels do not exceed 45 dB CNEL within residences, require notification that prospective buyers are located within an Airport Policy Area, and require that an avigation easement be recorded acknowledging the property is located within an Airport Planning Policy Area.

Non-Transportation Noise Sources

NO-5 The interior and exterior noise level standards for noise-sensitive areas of new uses affected by existing non-transportation noise sources in Sacramento County are shown by Table 4. Where the noise level standards of Table 4 are predicted to be exceeded at a proposed noise-sensitive area due to existing non-transportation noise sources, appropriate noise mitigation measures shall be included in the project design to reduce projected noise levels to a state of compliance with the Table 4 standards within sensitive areas.

NO-6 Where a project would consist of or include non-transportation noise sources, the noise generation of those sources shall be mitigated so as not to exceed the interior and exterior noise level standards of Table 4 at existing noise-sensitive areas in the project vicinity.

NO-7 The "last use there" shall be responsible for noise mitigation. However, if a noise-generating use is proposed adjacent to lands zoned for uses which may have sensitivity to noise, then the noise generating use shall be responsible for mitigating its noise generation to a state of compliance with the Table 4 standards at the property line of the generating use in anticipation of the future neighboring development.

Construction Noise

NO-8 Noise associated with construction activities shall adhere to the County Code requirements. Specifically, Section 6.68.090(e) addresses construction noise within the County.

Transportation Projects

NO-9 For capacity enhancing roadway or rail projects, or the construction of new Roadways or railways, a noise analysis shall be prepared in accordance with the Table 3 requirements. If projected post-project traffic noise levels at existing uses exceed the noise standards of Table 3, then feasible methods of reducing noise to levels consistent with the Table 3 standards shall be analyzed as part of the noise analysis. In the case of existing residential uses, sensitive outdoor areas shall be mitigated to 60 dB, when possible, through the application of feasible methods to reduce noise. If 60 dB cannot be achieved after the application of all feasible methods of reducing noise, then noise levels up to 65 dB are allowed.

If pre-project traffic noise levels for existing uses already exceed the noise standards of Table 3 and the increase is significant as defined below, feasible methods of reducing noise to levels consistent with the Table 3 standards should

be applied. In no case shall the long-term noise exposure for non-industrial users be greater than 75 dB; long-term noise exposure above this level has the potential to result in hearing loss. A significant increase is defined as follows:

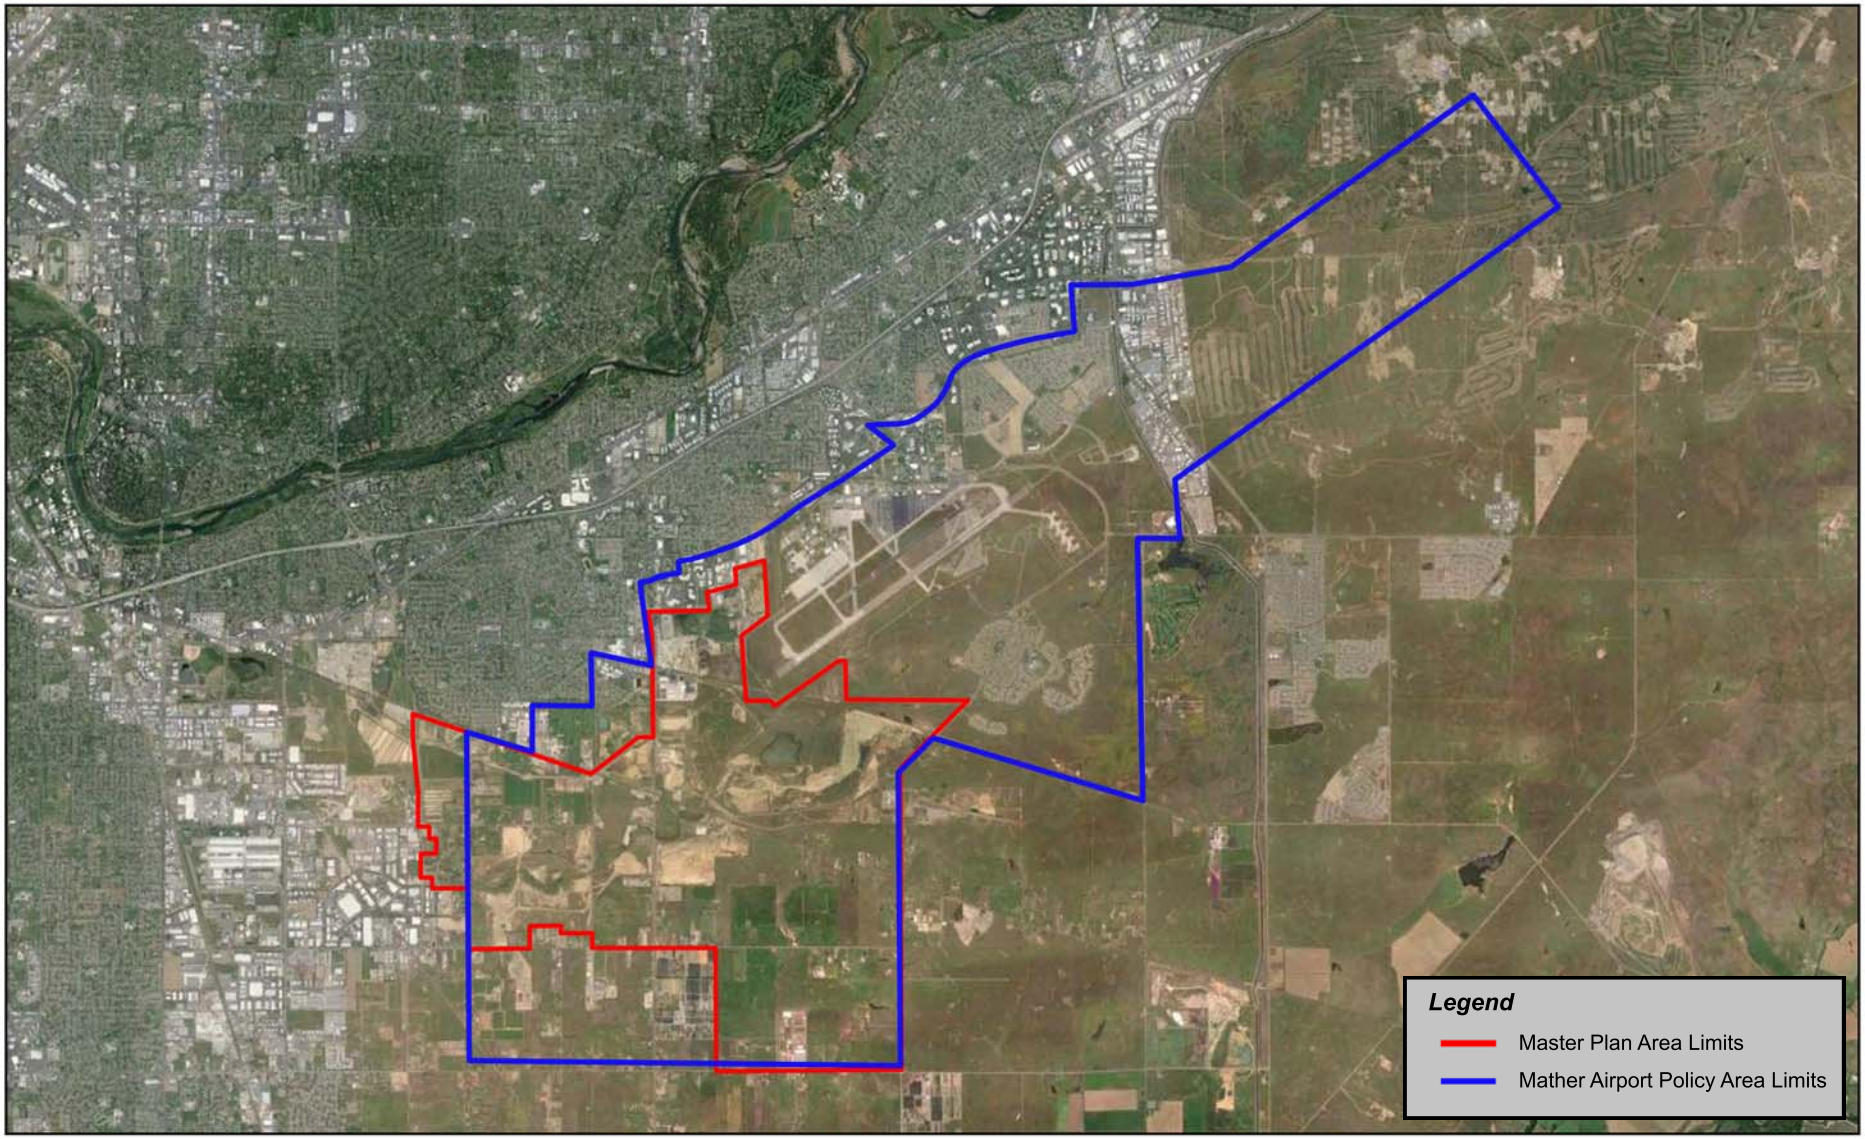
Pre-Project Noise Environment (Ldn)	Significant Increase
Less than 60 dB	5+ dB
60 - 65 dB	3+ dB
Greater than 65 dB	1.5+ dB

NO-10 For interim capacity enhancing roadway or rail projects, or the construction of new interim roadways or railways, it may not be practical or feasible to provide mitigation if the ultimate roadway or railway design would render the interim improvements ineffective or obsolete. An example would be a noise barrier constructed for an interim project which would need to be removed to accommodate the ultimate project. The following factors should be considered in determining whether or not noise mitigation will be implemented for interim projects, but in general, noise mitigation for interim projects would not be provided:

a. The severity of the impact

b. The cost and effectiveness of the mitigation.

c. The number of properties which would benefit from the mitigation.



d. The foreseeable duration between interim and ultimate improvements.

e. Aesthetic, safety and engineering considerations.

NO-11 If noise-reducing pavement is to be utilized in conjunction with a roadway improvement project, or if such paving existing adjacent to a proposed new noise-sensitive land use, the acoustical benefits of such pavement shall be included in the noise analysis prepared for the project.

Figure 3

West Jackson Highway Master Plan - Sacramento County, California
Mather Airport Policy Area and Master Plan Area

BOLLARD
Acoustical Consultants

General Noise Policy

NO-12 All noise analyses prepared to determine compliance with the noise level standards contained within this Noise Element shall be prepared in accordance with Table 3.

NO-13 Where noise mitigation measures are required to satisfy the noise level standards of this Noise Element, emphasis shall be placed on the use of setbacks and site design to the extent feasible, prior to consideration of the use of noise barriers.

NO-14 Noise analyses prepared for multi-family residential projects, town homes, mixed-use, condominiums, or other residential projects where floor ceiling assemblies or party-walls shall be common to different owners/occupants shall be consistent with the State of California Noise Insulation standards.

NO-15 The County shall have the flexibility to consider the application of 5 dB less restrictive exterior noise standards than those prescribed in Tables 3 and 4 in cases where it is impractical or infeasible to reduce exterior noise levels within infill projects to a state of compliance with the Table 3 or 4 standards. In such cases, the rational for such consideration shall be clearly presented and disclosure statements and noise easements should be included as conditions of project approval. The interior noise level standards of Tables 3 and 4 would still apply. The maximum allowable long-term noise exposure permissible for non-industrial uses is 75 dB.

Exemptions

NO-16 The following sources of noise shall be exempt from the provisions of this Noise Element:

a. Emergency warning devices and equipment operated in conjunction with emergency situations, such as sirens and generators which are activated during power outages. The routine testing of such warning devices and equipment shall also be exempt provided such testing occurs during daytime hours.

b. Activities associated with events for which a permit has been obtained from the County.

Table 3
Noise Standards for New Uses Affected by Traffic and Railroad Noise
Sacramento County Noise Element

Land Use	Sensitive Outdoor Areas[a] dBA, L_{dn}/CNEL	Sensitive Interior Areas[b] dBA, L_{dn}/CNEL
Residential	65[e]	45
Transient lodging	65[c,e]	45
Hospitals, nursing homes	65[c,d,e]	45
Theaters, auditoriums, music halls	--	35[c]
Churches, meeting halls	65[c]	40
Office buildings	65[c]	45
School, libraries, museums	65[c]	40
Commercial Buildings	--	50[c]
Playgrounds, neighborhood parks	70	--
Industry	65[c]	50

Source: Sacramento County General Plan (2011)

Notes:

[a] Sensitive areas are defined in acoustic terminology section of the Noise Element.

[b] Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.

[c] Where there are no sensitive exterior spaces proposed for these uses, only the interior noise level standard shall apply.

[d] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.

[e] If this use is affected by railroad noise, a maximum (Lmax) noise level standard of 70 dB shall be applied to all sleeping rooms to reduce the potential for sleep disturbance during nighttime train passages.

Table 4
Non-Transportation Noise Standards
Median (L50) / Maximum (Lmax)[a]
Sacramento County Noise Element

	Outdoor Area[b]		Interior[c]
Land Use	**Daytime**	**Nighttime**	**Day & Night**
All Residential	55 / 75	50 / 70	35 / 55
Transient lodging[d]	55 / 75	--	35 / 55

Industry[f]	60 / 80	--	50 / 70

Source: Sacramento County General Plan (2011)

Notes:

[a] The Table 4 standards shall be reduced by 5 dB for sounds consisting primarily of speech or music, and for recurring impulsive sounds. If the existing ambient noise level exceeds the standards of Table 4, then the noise level standards shall be increased at 5 dB increments to encompass the ambient.

[b] Sensitive areas are defined in the acoustic terminology section of the Noise Element.

[c] Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.

[d] Outdoor activity areas of transient lodging facilities are not commonly used during nighttime hours.

[e] Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.

[f] The outdoor activity areas of these uses (if any), are not typically utilized during nighttime hours.

[g] Where median (L50) noise level data is not available for a particular noise source, average (Leq) values may be substituted for the standards of this table provided the noise source in question operates for at least 30 minutes of an hour. If the source in question operates less than 30 minutes per hour, then the maximum noise level standards shown would apply.

Sacramento County Code

Chapter 6.68 of the Sacramento County Code pertains to Noise Control and is referred to in this study as the Noise Ordinance. The purpose of the Noise Ordinance is to assess complaints of noises alleged to exceed the ambient noise levels. Further, it is declared to be the policy of the County of Sacramento to contain sound levels at their present levels with the ultimate goal of reducing such levels, when and where feasible and without causing undue burdens, to meet the noise standards set forth below. The following section provides the pertinent sections of the County Noise Ordinance.

6.68.070 Exterior Noise Standards

a. The following noise standards, unless otherwise specifically indicated in this chapter, shall apply to all properties within a designated noise area.

Noise Area	County Zoning Districts	Time Period	Exterior Noise Standard
1	RE-1, RD-1, RE-2, RD-2, RE-3, RD-3, RD-4, R-1-A, RD-5, R-2, RD-10, R-2A, RD-20, R-3, R-D-30, RD-40, RM-1, RM-2, A-1-B, AR-1, A-2, AR-2, A-5, AR-5	7 a.m.--10 p.m. 10 p.m.--7 a.m.	55 dBA 50 dBA

b. It is unlawful for any person at any location within the County of Sacramento to create any noise which causes the noise levels on an affected property, when measured in the designated noise area, to exceed for the duration of time set forth following, the specified exterior noise standards in any one hour by:

Cumulative Duration of the Intrusive Sound	Allowance Decibels
1. Cumulative period of 30 minutes per hour	0
2. Cumulative period of 15 minutes per hour	+ 5
3. Cumulative period of 5 minutes per hour	+10
4. Cumulative period of 1 minute per hour	+15
5. Level not to be exceeded for any time per hour	+20

c. Each of the noise limits specified in subdivision (b) of this section shall be reduced by five dBA for impulsive* or simple tone** noises, or for noises consisting of speech or music.

* “Impulsive noise” means a noise characterized by brief excursions of sound pressures whose peak levels are very much greater than the ambient noise level, such as might be produced by the impact of a pile driver, punch press or a drop hammer, typically with one second or less duration.

** “Simple tone noise” or “pure tone noise” means a noise characterized by the presence of a predominant frequency or frequencies such as might be produced by whistle or hum.

d. If the ambient noise level exceeds that permitted by any of the first four noise-limit categories specified in subdivision (b), the allowable noise limit shall be increased in five dBA increments in each category to encompass the ambient noise level. If the ambient noise level exceeds the fifth noise level category, the maximum ambient noise level shall be the noise limit for that category.

6.68.080 Interior Noise Standards

a. In any apartment, condominium, townhouse, duplex or multiple dwelling unit it is unlawful for any person to create any noise from inside his unit that causes the noise level when measured in a neighboring unit during the periods ten p.m. to seven a.m. to exceed:

1. Forty-five dBA for a cumulative period of more than 5 minutes in any hour;
2. Fifty dBA for a cumulative period of more than 1 minute in any hour;
3. Fifty-five dBA for any period of time.

b. If the ambient noise level exceeds that permitted by any of the noise level categories specified in subdivision (a) of this section, the allowable noise limit shall be increased in five-dBA increments in each category to encompass the ambient noise level.

6.68.090 Exemptions

The following activities shall be exempted from the provisions of this chapter:

a. School bands, school athletic and school entertainment events;

b. Outdoor gatherings, public dances, shows and sporting and entertainment events, provided said events are conducted pursuant to a license or permit by the County;

c. Activities conducted on parks, public playgrounds and school grounds, provided such parks, playgrounds and school grounds are owned and operated by a public entity or private school;

d. Any mechanical device, apparatus or equipment related to or connected with emergency activities or emergency work;

e. Noise sources associated with construction, repair, remodeling, demolition, paving or grading of any real property, provided said activities do not take place between the hours of eight p.m. and six a.m. on weekdays and Friday commencing at eight p.m. through and including seven a.m. on Saturday; Saturdays commencing at eight p.m. through and including seven a.m. on the next following Sunday and on each Sunday after the hour of eight p.m. Provided, however, when an unforeseen or unavoidable condition occurs during a construction project and the nature of the project necessitates that work in process be continued until a specific phase is completed, the contractor or owner shall be allowed to continue work after eight

p.m. and to operate machinery and equipment necessary until completion of the specific work in progress can be brought to conclusion under conditions which will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner;

f. Noise sources associated with agricultural operations, provided such operations do not take place between the hours of eight p.m. and six a.m.;

g. All mechanical devices, apparatus or equipment which are utilized for the protection or salvage of agricultural crops during periods of adverse weather conditions or when the use of mobile noise sources is necessary for pest control;

h. Noise sources associated with maintenance of residential area property, provided said activities take place between the hours of six a.m. and eight p.m. on any day except Saturday or Sunday, or between the hours of seven a.m. and eight p.m. on Saturday or Sunday;

i. Any activity, to the extent provisions of Chapter 65 of Title 42 of the United States Code, and Articles 3 and 3.5 of Chapter 4 of Division 9 of the Public Utilities Code of the State of California preempt local control of noise regulations and land use regulations related to noise control of airports and their surrounding geographical areas, any noise source associated with the construction, development, manufacture, maintenance, testing or operation of any aircraft engine, or of any weapons system or subsystems which are owned, operated or under the jurisdiction of the United States, or any other activity to the extent regulation thereof has been preempted by state or federal law or regulation;

j. Any noise sources associated with the maintenance and operation of aircraft or airports which are owned or operated by the United States.

6.68.100 Pre-Existing Industrial or Commercial Facilities – Transition Period

a. Any industrial or commercial facility in existence prior to July 1, 1976, shall be allowed a one-year period commencing on said date within which to comply with this chapter.

b. During said one-year period, all such facilities shall make reasonable efforts to be in compliance and to reduce noise which exceeds the standards specified in this chapter. Commencing at the end of one year after July 1, 1976, any such facility shall be subject to all applicable requirements of this chapter.

c. If any facility which is not in compliance by the end of said one-year period applies for a variance pursuant to Section 6.68.200, in deciding whether to grant a variance the hearing board shall take into account the extent to which the applicant has endeavored to reduce noise during said one-year period to meet the standards specified in this chapter.

d. This section applies only to a commercial or industrial facility already in existence or for which the work of improvement has commenced prior to July 1, 1976.

e. As used in this section “industrial facility” means any building, structure, factory, plant, premises or portion thereof used for manufacturing or industrial purposes, and “commercial facility” means any building, structure, premise or portion thereof used for wholesale or retail commercial purposes.

6.68.110 Schools, Hospitals and Churches

It is unlawful for any person to create any noise which causes the noise level at any school, hospital or church, while the same is in use, to exceed the noise standards specified in Section 6.68.070 or to create any noise which unreasonably interferes with the use of such institution or unreasonably disturbs or annoys patients in the hospital. In any disputed case, interfering noise which is ten dBA or more, greater than the ambient noise level at the building, shall be deemed excessive and unlawful.

6.68.120 Machinery, Equipment, Fans and Air Conditioning

a. It is unlawful for any person to operate any mechanical equipment, pump, fan, air conditioning apparatus, stationary pumps, stationary cooling towers, stationary compressors, similar mechanical devices, or any combination thereof installed after July 1, 1976, in any manner so as to create any noise which would cause the maximum noise level to exceed:

   1. Sixty dBA at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level;

   2. Fifty-five dBA in the center of a neighboring patio three to five feet above ground level;

   3. Fifty-five dBA outside of the neighboring living area window nearest the equipment location. Measurements shall be taken with the microphone not more than three feet from the window opening but at least three feet from any other surface.

b. Equipment installed five years after July 1, 1976 must comply with a maximum limit of fifty-five dBA at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level.

c. Equipment installed before December 17, 1970, must comply with a limit of sixty-five dBA maximum in sound level at any point at least one foot inside the affected property line and three to five feet above ground level by January 1, 1977. Equipment installed between December 16, 1970, and July 1, 1976, must comply with a limit of sixty-five dBA maximum sound level at any point at least one foot inside the property line of the affected residential property and three to five feet above ground level.

6.68.130 Off-Road Vehicles

It is unlawful for any person to operate any motorcycle or recreational off-road vehicle within the County in such a manner that the noise level exceeds the exterior noise standards specified in Section 6.68.070.

6.68.140 Waste Disposal Vehicles

It is unlawful for any person authorized to engage in waste disposal service or garbage collection to operate any truck-mounted waste or garbage loading and/or composting equipment or similar mechanical device in any manner so as to create any noise exceeding the following level, when measured at a distance of fifty feet from the equipment in an open area.

a. New equipment purchased or leased on or after a date six months from July 1, 1976, shall not exceed a noise level of eighty dBA.
b. New equipment purchased or leased on or after forty-two months from July 1, 1976, shall not exceed a noise level of seventy-five dBA.
c. Present equipment shall not exceed a noise level of eighty dBA on or after five years from July 1, 1976.

The provisions of this section shall not abridge or conflict with the powers of the state over motor vehicle control.

A6.68.150 General Noise Regulations

Notwithstanding any other provisions of this chapter and in addition thereto, it is unlawful for any person to willfully make or continue or cause to be made or continued any loud, unnecessary or unusual noise which disturbs the peace and quiet of any neighborhood or which causes discomfort or annoyance to any reasonable person of normal sensitiveness residing in the area. The standards which shall be considered in determining whether a violation of the provisions of this section exists shall include, but not be limited to, the following:

a. The sound level of the objectionable noise;
b. The sound level of the ambient noise;
c. The proximity of the noise to residential sleeping facilities;
d. The nature and zoning of the area within which the noise emanates;
e. The density of the inhabitation of the area within which the noise emanates;
f. The time of day or night the noise occurs;
g. The duration of the noise and its tonal informational or musical content;
h. Whether the noise is continuous, recurrent or intermittent;
i. Whether the noise is produced by a commercial or noncommercial activity.

Noise Standards of Neighboring Jurisdictions

The West Jackson Highway Master Plan area is located entirely within Sacramento County. As a result, noise impacts upon development within the Plan Area are evaluated relative to the Sacramento County noise standards cited above. However, development within the Plan Area would result in increases in off-site traffic noise along roadways located in the Cities of Rancho Cordova, Folsom, Sacramento and Elk Grove. As a result, the transportation noise standards of those jurisdictions are included in this section for use in evaluating off-site traffic noise impacts associated with the project.

It should be noted that the standards of the neighboring jurisdictions are very similar, both in terms of absolute noise standards for residential land uses (60 dB Ldn) and criteria for assessing impacts relative to traffic noise increases. Each neighboring jurisdiction, with the exception of the City of Rancho Cordova utilizes the FICON criteria for assessing significance of project-related noise level increases. The pertinent noise standards of the neighboring jurisdictions are provided below.

City of Rancho Cordova General Plan

Policy N.1.5 - Mitigate noise created by the construction of new transportation noise sources (such as new roadways or new light rail service) to the maximum extent feasible to comply with the City's standards. The City's standards are found in Table N-2 of the Noise Element and are reproduced below as Table 5.

Policy N.2.2 Ensure that operational noise levels of new roadway projects will not result in significant noise impacts.

Action N.2.2.1 Assess the significance of the noise increase of all roadway improvement projects in existing areas according to the following criteria:

A. Where existing traffic noise levels are less than 60 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

B. Where existing traffic noise levels range between 60 and 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +3 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

C. Where existing traffic noise levels are greater than 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +1.5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant.

Table 5
Maximum Transportation Noise Exposure
City of Rancho Cordova Noise Element of the General Plan

	Outdoor Activity Areas[1]	Interior Spaces	
Land Use	**L_{dn}/CNEL, dB**	**L_{dn}/CNEL, dB**	**L_{eq}, dB[2]**
Residential	60[3]	45	_
Residential subject to noise from railroad tracks, aircraft overflights, or similar noise sources which produce clearly identifiable, discrete noise events (e.g., the passing of a single train)	60[3]	40[5]	_
Transient Lodging	60[4]	45	_
Hospitals, Nursing Homes	60[3]	45	_
Theaters, Auditoriums, Music Halls	_	_	35
Churches, Meeting Halls	60[3]	_	40
Office Buildings	_	_	45
Schools, Libraries, Museums	_	_	45
Playgrounds, Neighborhood Parks	70	_	_

1. Where the location of outdoor activity areas is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use. Where it is not practical to mitigate exterior noise levels at patio or balconies of apartment complexes, a common area such as a pool or recreation area may be designated as the outdoor activity area.
2. As determined for a typical worst-case hour during periods of use.
3. Where it is not possible to reduce noise in outdoor activity areas to 60 dB L_{dn}/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB L_{dn}/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.
4. In the case of hotel/motel facilities or other transient lodging, outdoor activity areas such as pool areas may not be included in the project design. In these cases, only the interior noise level criterion will apply.
5. The intent of this noise standard is to provide increased protection against sleep disturbance for residences located near railroad tracks.

City of Folsom General Plan

The City of Folsom General Plan Noise Element establishes an exterior noise level standard of 60 dB L_{dn} at outdoor activity areas of residential land uses exposed to transportation noise sources (i.e., traffic). The intent of this standard is to provide an acceptable exterior noise environment for outdoor activities. The City of Folsom also utilizes an interior noise level standard of 45 dB L_{dn} or less within the interior spaces of habitable residential spaces. The intent of this interior noise limit is to provide a suitable environment for indoor communication and sleep.

City of Sacramento General Plan

The City of Sacramento General Plan Noise Standards are provided in Table 6 (Table EC 1 of the General Plan).

EC 3.1.1 Exterior Noise Standards

The City shall require noise mitigation for all development where the projected exterior noise levels exceed those shown in Table 6 (Table EC 1 of the General Plan), to the extent feasible.

Table 6

Exterior Noise Compatibility Standards for Various Land Uses

Land Use Type	Highest Level of Noise Exposure that is Regarded as "Normally Acceptable"[a] (L_{dn}[b] or CNEL[c])
Residential–Low Density Single Family, Duplex, Mobile Homes	60 dBA[d,e]
Residential–Multi-family	65 dBA
Urban Residential Infill[f] and Mixed-Use Projects[g]	70 dBA
Transient Lodging–Motels, Hotels	65 dBA
Schools, Libraries, Churches, Hospitals, Nursing Homes	70 dBA
Auditoriums, Concert Halls, Amphitheaters	Mitigation based on site–specific study
Sports Arena, Outdoor Spectator Sports	Mitigation based on site–specific study
Playgrounds, Neighborhood Parks	70 dBA
Golf Courses, Riding Stables, Water Recreation, Cemeteries	75 dBA
Office Buildings–Business, Commercial, and Professional	70 dBA
Industrial, Manufacturing, Utilities, Agriculture	75 dBA

Source: Governor's Office of Planning and Research, State of California General Plan Guidelines 2003, October 2003

a. As defined in the Guidelines, "Normally Acceptable" means that the "specified land use is satisfactory, based upon the assumption that any building involved is of normal conventional construction, without any special noise insulation requirements."

b. L_{dn} or Day Night Average Level is an average 24-hour noise measurement that factors in day and night noise levels.

c. CNEL or Community Noise Equivalent Level measurements are a weighted average of sound levels gathered throughout a 24-hour period.

d. dBA or A-weighted decibel scale is a measurement of noise levels.

e. The exterior noise standard for the residential area west of McClellan Airport known as McClellan Heights/Parker Homes is 65 dBA

f. With land use designations of Central Business District, Urban Neighborhood (Low, Medium, or High) Urban Center (Low or High), Urban Corridor (Low or High).

g. All mixed-use projects located anywhere in the City of Sacramento.

EC 3.1.2 Exterior Incremental Noise Standards. The City shall require noise mitigation for all development that increases existing noise levels by more than the allowable increment shown in Table 7 (Table EC 2), to the extent feasible.

Table 7
Exterior Incremental Noise Impact Standards for Noise-Sensitive Uses (dBA)
(Table EC 2 of City of Sacramento General Plan)

Residences and buildings where people normally sleep [a]		Institutional land uses with primarily daytime and evening uses [b]	
Existing L_{dn}	Allowable Noise Increment	Existing Peak Hour L_{eq}	Allowable Noise Increment
45	8	45	12
50	5	50	9
55	3	55	6
60	2	60	5
65	1	65	3
70	1	70	3
75	0	75	1
80	0	80	0

SOURCE: Federal Transit Administration, *Transit Noise Impact and Vibration Assessment*, May 2006

a. This category includes homes, hospitals, and hotels where a nighttime sensitivity to noise is assumed to be of utmost importance.

b. This category includes schools, libraries, theaters, and churches where it is important to avoid interference with such activities as speech, meditation, and concentration on reading material.

EC 3.1.3 Interior Noise Standards

The City shall require new development to include noise mitigation to assure acceptable interior noise levels appropriate to the land use type: 45 dBA L_{dn} for residential, transient lodgings, hospitals, nursing homes and other uses where people normally sleep; and 45 dBA L_{eq} (peak hour) for office buildings and similar uses.

City of Elk Grove General Plan

The City of Elk Grove General Plan (adopted October 2022) establishes maximum allowable noise exposure for residential uses affected by transportation noise sources of 60 dB Ldn exterior and 45 dB Ldn interior. For non-transportation noise sources, the City's General Plan establishes hourly average performance standards of 55 dBA during daytime hours and 45 dBA during nighttime hours for typical noise sources not containing tonal, impulsive, repetitive, speech or music components. The City's standards for sources containing those components are 5 dB lower.

In addition, the City's General Plan Policy N-2-2 establishes the following CEQA thresholds for evaluating the significance of project-related noise level increases:

- Where existing ambient noise levels are less than 60 dB Ldn at the outdoor activity areas of noise sensitive uses, a +5 dB Ldn increase in noise levels shall be considered significant; and

- Where existing ambient noise levels range between 60 and 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +3 dB Ldn increase in noise levels shall be considered significant; and

- Where existing ambient noise levels are greater than 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +1.5 dB Ldn increase in noise levels shall be considered significant.

  Public roadway improvements to alleviate traffic congestion and safety hazards shall utilize FHWA noise standards to allow a reasonable dollar threshold per dwelling to be used in the evaluation and abatement of impacts.

Vibration Criteria

Sacramento County has no adopted vibration standards. As a result, Caltrans-recommended criteria are applied for this project, as described below. Human and structural response to different vibration levels is influenced by a number of factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. The Caltrans publication, *Transportation-and Construction-Induced Vibration Guidance Manual*, written for Caltrans by Jones & Stokes in June 2004, provides guidelines for acceptable vibration limits for transportation and construction projects in terms of the induced peak particle velocity (PPV). Those standards are reproduced below in Table 8.

Table 8
Vibration Criteria

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources[1]	Continuous or Frequent Intermittent Sources[2]
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.20	0.10
Historic and some old building	0.50	0.25
Older residential structures	0.50	0.30
New residential structures	1.00	0.50
Modern industrial/commercial building	2.00	0.50

Notes:
1. Transient sources create a single isolated vibration event.
2. Continuous/frequent intermittent sources include repetitive single events.

Current Caltrans research illustrates that there are different thresholds of perception for different types of vibration sources. Section XI(b) of Appendix G of the CEQA guidelines requires that a project results in exposure of persons to, or generation of, *excessive* groundborne vibration levels or groundborne noise levels, for the finding of a significant impact. The CEQA guidelines specifically mention “excessive” vibration, rather than just perceptible vibration. The general

range at which vibration from continuous or frequent intermittent sources exceeds acceptable levels for older structures is noted in Table 8 as being 0.3 – 0.5 in/sec ppv.

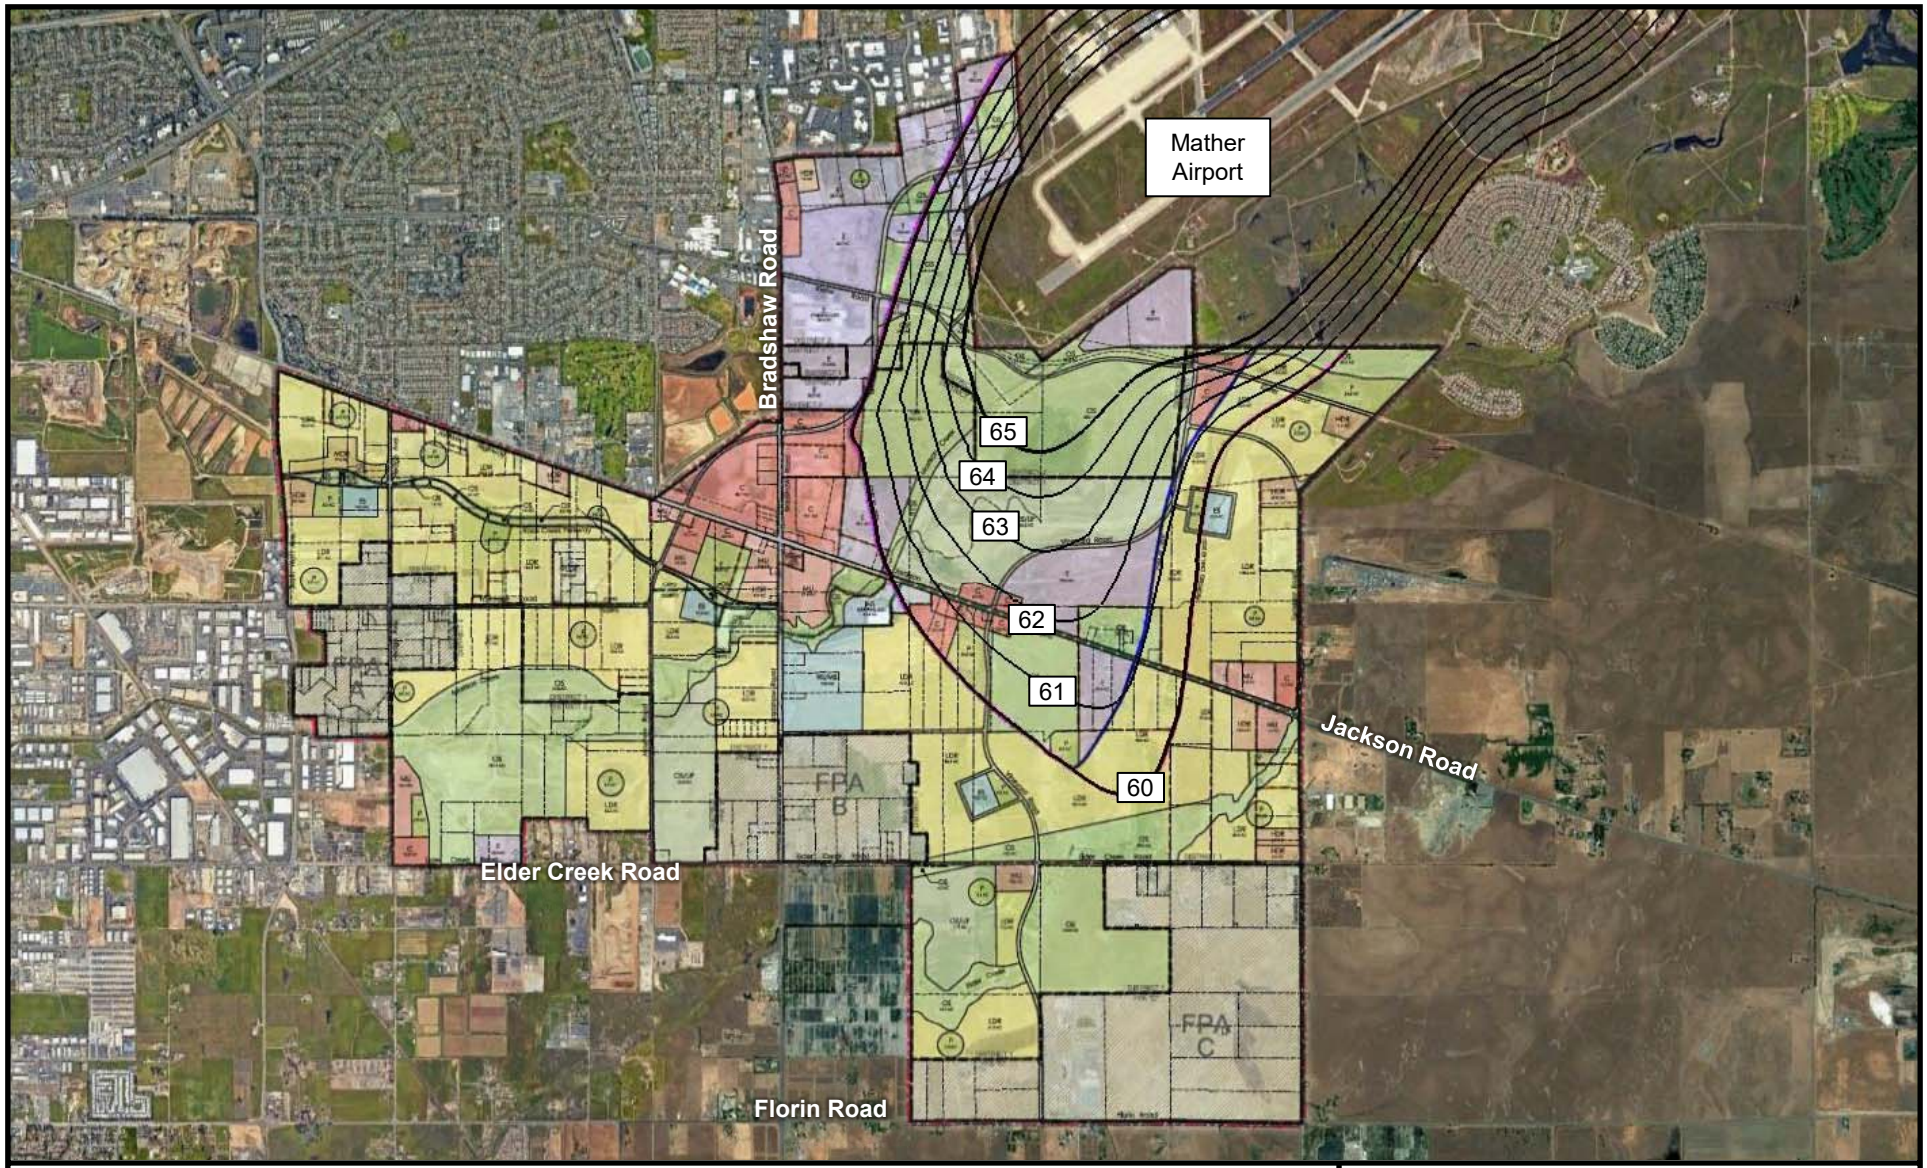
Existing (Baseline) Noise Environment

Master Plan Area

Overview of Existing Noise and Vibration Environment within the Master Plan Area

The existing noise environment within the overall Plan Area varies by location and is defined by a combination of noise sources. The most pervasive noise source affecting the Plan Area is surface traffic on Jackson Highway and major arterial roadways. The Plan Area is also affected by aircraft operations associated with Mather Airport and, to a lesser extent, activities at the Sacramento Raceway on Excelsior Road and construction materials facilities on Bradshaw Road. Aggregate excavation and reclamation activities on the Teichert and Granite properties also contribute to the ambient noise environment within the Plan Area, but in a considerably more localized fashion.

The existing vibration environment in the Plan Area is generally below the threshold of perception with the exception of locations very close (within 100 feet) to existing aggregate excavation and processing equipment and activities.



Methodology for Assessing Baseline Noise Environment within the Master Plan Area

At the Master Plan Level, aircraft noise exposure was quantified using published noise contour maps and traffic noise was modeled using the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA-RD-77-108).

Because noise generated by the Sacramento Raceway, Granite Bradshaw aggregates facility, and both Teichert and Granite excavation and reclamation activities primarily affects the District Area Plans within the larger Plan Area, those sources are evaluated later in this report at a more detailed District Plan Level.

Aircraft Noise Environment within the Master Plan Area

Mather Airport is located immediately adjacent to the northeastern boundary of the Plan Area, as indicated in Figure 1. To quantify the noise generation of the airport in terms of CNEL, the noise contours contained within the Airport Master Plan (Approved August 2022) were utilized, as well as the theoretical capacity noise contours developed for the Airport. The Mather Airport theoretical capacity noise contours are reproduced below in Figure 4A. Figure 4B shows the portion of the West Jackson Highway Master Plan area which is proposed for noise-sensitive (residential) development within the 60 CNEL Mather Airport contours.

Single Event Environment within the Master Plan Area

Although the County has determined that single event noise exposure and associated sleep disturbance effects are appropriately addressed through application of General Plan Noise Element policies NO-2 through NO-4 regarding aircraft noise, the following information pertaining to aircraft single event noise is provided for disclosure purposes. Aircraft single events associated with individual aircraft arrivals or departures at Mather Airport currently occur over the Master Plan Area. The noise generation of such events is a function of several variables, including aircraft type, aircraft weight, and flight track. Consideration of aircraft single event noise is most relevant to the assessment of sleep disturbance impacts at residential areas proposed within the Master Plan Area.

In recognition of the fact that aircraft single events do occur in the area, a Mather Airport Nighttime Awakening Analysis was prepared by ESA in December 2013 (revised April 2014) as part of the Mather Airport Master Plan Update. This analysis utilized the ANSI methodology for prediction of sleep disturbance using the Integrated Noise Model (INM) files used to develop CNEL contours for the Mather Airport Master Plan. The awakenings analysis utilized an assumed 26 nighttime aircraft operations for the year 2035 proposed master plan project condition. Figures 5 and 6 show the predicted percent of population potentially awakened by nighttime single-event aircraft operations.

Existing General Traffic Noise Environment within the Master Plan Area

To describe noise levels because of traffic, the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The FHWA model is based upon the Calveno reference noise factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site.

Baseline FHWA Model inputs and results were provided by Sacramento County. Table 9 shows the predicted existing traffic noise levels at a reference distance of 100 feet from the roadway centerlines, as well as the distances to the unshielded L_{dn} contours. It should be noted that the Table 9 data are provided at the Master Plan level without adjustment for shielding by intervening topography or structures. As such, the Table 9 data should be considered conservative. The FHWA Model Inputs for baseline conditions are provided in Appendix D.

It should be noted that many portions of the Plan Area are former aggregate mining sites. As a result, these sites are substantially depressed relative to the local roadway network. That depression results in screening of roadway traffic at the future development sites, resulting in a substantial decrease in traffic noise exposure at the depressed locations. Figure 7 shows the depressed areas of the Plan Area based on preliminary site grading plans. Figure 7 is based on an overall site grading plan prepared by Wood Rodgers in January 2014 indicating mined areas which are below grade. It should be noted that Figure 7 is intended to generally identify locations within the Plan Area which were identified as being “below grade”, but that there may be considerable differences in the degree of depression of these areas relative to local roadways and Figure 7 does not account for future grading of specific project site within the Master Plan Area. In general, noise-sensitive land uses developed within substantially depressed areas can expect traffic noise levels on the order of 10-15 dB lower than the levels shown in Table 9.

District Area Plans

Overview of Existing Noise and Vibration Environment within the District Area Plans

Like the overall Master Plan Area, the existing noise environment within the two District Area Plans (District 1: mostly Teichert and District 2: mostly Granite) also varies by location and is defined by a combination of noise sources. In addition to the traffic and aircraft noise environment previously described in the Master Plan section of this report, the District Area Plans are also affected by a variety of localized noise sources. Such sources include the Sacramento Raceway, the Granite Bradshaw Aggregates facility, aggregate excavation and reclamation equipment, and small commercial/industrial activities on adjacent non-participating properties within the Plan Area.

As with the Plan Area, the existing vibration environment in the District Area Plans is also generally below the threshold of perception with the exception of locations very close (within 100 feet) to existing aggregate excavation and processing equipment and activities.

Methodology for Assessing Baseline Noise and Vibration Environments within the District Plan Areas

At the District Plan Levels, aircraft noise exposure was quantified using published noise contour maps and traffic noise was modeled using the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA-RD-77-108).

Noise generated by the Sacramento Raceway, Granite Bradshaw Aggregates facility, and both Teichert and Granite excavation and reclamation activities was quantified through a combination of noise level measurements and application of accepted noise prediction models. In addition, an extensive ambient noise survey, consisting of both long-term and short-term noise level measurements, was conducted within the District Area Plans to more specifically characterize the existing baseline noise environment in those areas.

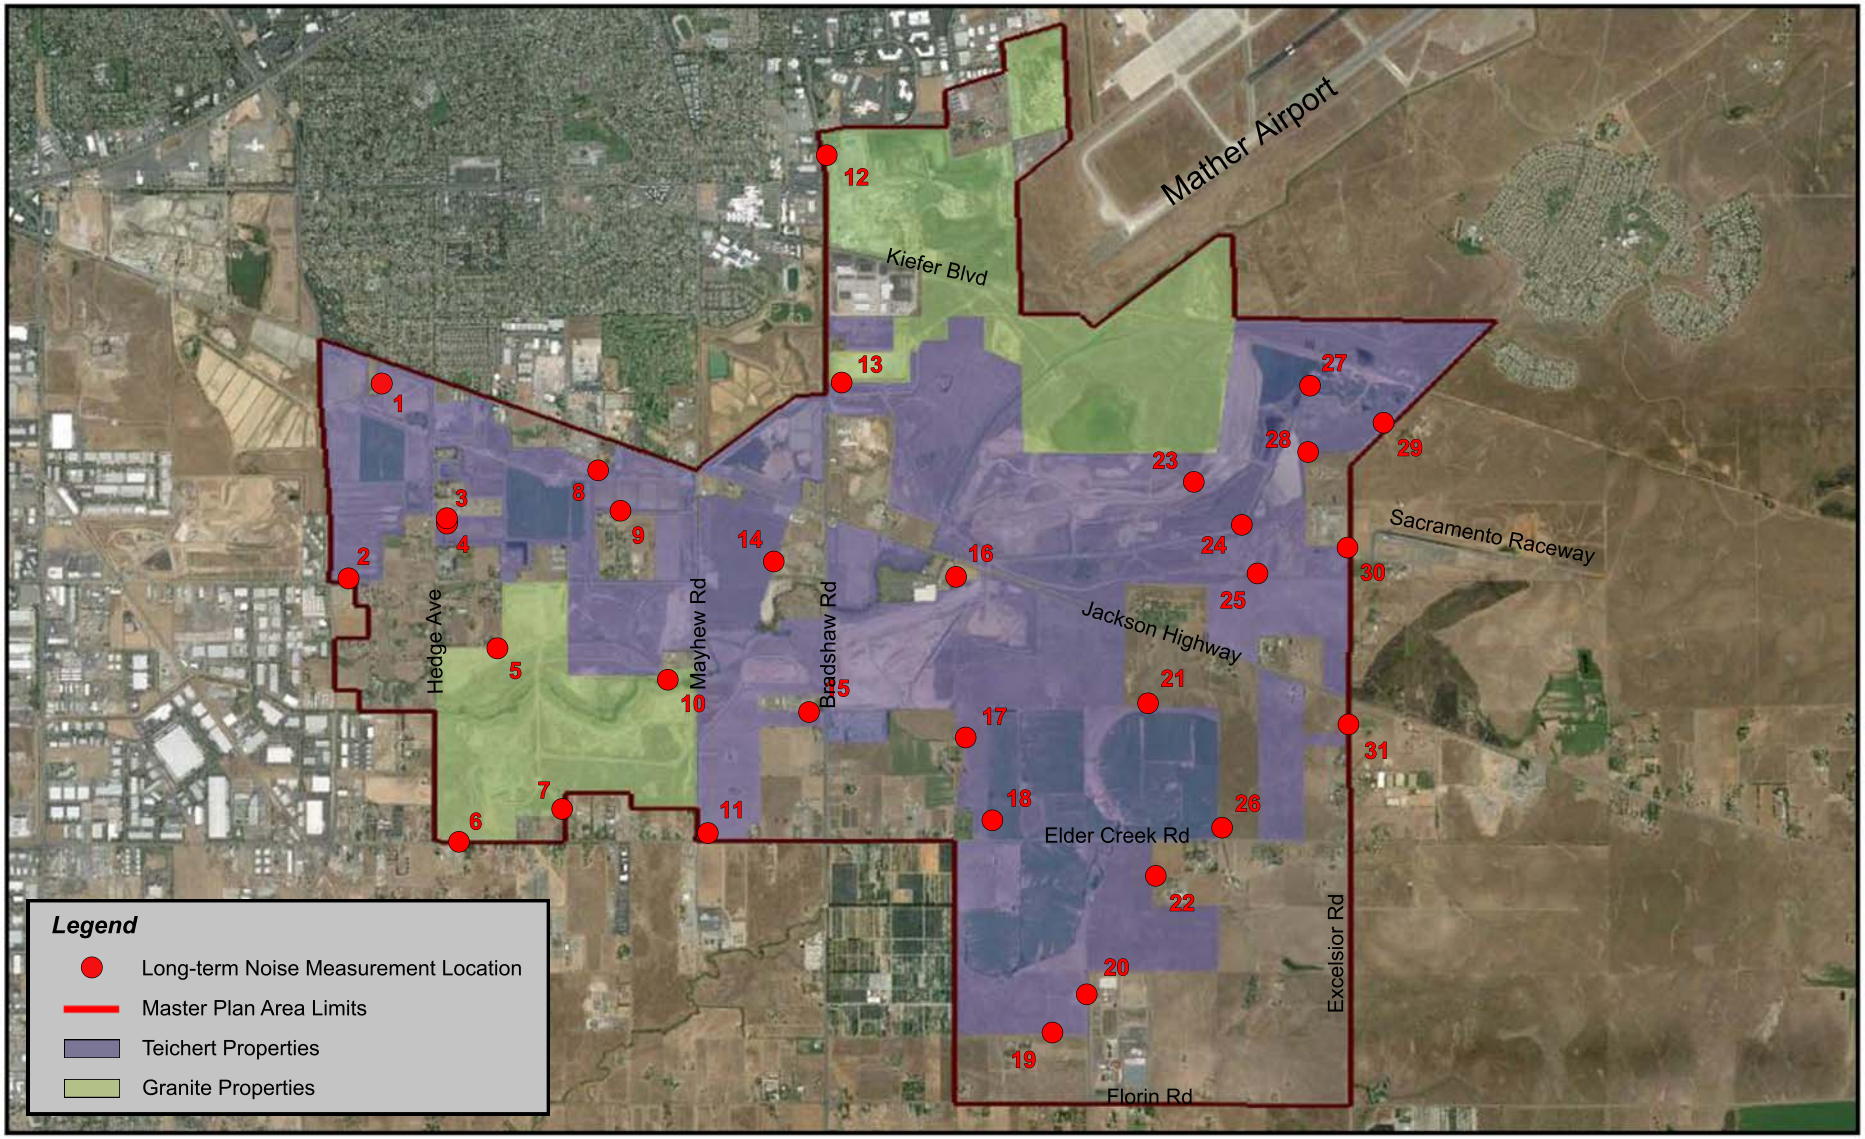
In addition to the extensive ambient noise measurement surveys, baseline vibration measurements were also conducted at several locations within the District Area Plans to quantify baseline vibration environments.

Existing General Ambient Noise Environment within the District Area Plans

To quantify the existing ambient noise environment with the District Area Plans, long-term (continuous) ambient noise level measurements were conducted at 31 locations within the District Area Plan Boundaries in 2013. Supplemental ambient noise monitoring was conducted at 6 of the long-term noise monitoring locations in 2017 and again in 2022 to verify that the 2013 data is still reasonably representative of current baseline ambient noise conditions within the District Areas.

The locations of the continuous noise monitoring sites are shown on Figure 8. In addition to the long-term noise monitoring program, short-term ambient noise level measurements were also conducted at several locations within the District Area Plan. The short-term monitoring sites were

selected to either supplement the long-term sites or because long-term monitoring was not possible at some locations. The short-term noise monitoring sites are identified on Figure 9.



Larson Davis Laboratories (LDL) Model 820, LXT and 831 precision integrating sound level meters were used for the long and short-term ambient noise level measurement surveys. The meters were calibrated before use with LDL Model CAL200 acoustical calibrators prior to use to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute.

The results of the long-term ambient noise measurement surveys are summarized in Table 10, with the short-term monitoring results provided in Table 11. Appendix B provides a graphical representation of the measured average and maximum noise levels measured at each long-term site for the 2013 surveys, Appendix C shows the ambient noise survey results for the 2017 surveys, and Appendix D shows the ambient noise survey results for the 2022 surveys.

The Table 10 and 11 data indicate that existing noise levels within the Plan Area vary, depending on location of the noise monitoring site relative to the major project area noise sources, and whether or not the monitoring sites are depressed in former aggregate mining areas. Inspection of the data for the depressed and non-depressed locations indicates that topographic shielding provided by the existing elevation differences results in traffic noise level reductions generally ranging from 10-15 dBA. This level of shielding is significant because it will greatly reduce the degree of traffic noise attenuation required at future noise-sensitive land uses proposed within the District Area Plan, or eliminate the need for additional noise mitigation measures altogether.

Aircraft Noise Environment within the District Area Plans

Mather Airport is located immediately adjacent to the northeastern boundary of the Plan Area, as indicated in Figure 4. To quantify the noise generation of the airport in terms of CNEL, the noise contours contained within the previous and recently adopted Airport Master Plans were utilized, as well as the theoretical capacity noise contours developed for the Airport. The Mather Airport noise contours are shown in Figures 4A and 4B.

The Mather Airport noise contours shown in Figures 4A and 4B indicate that the 60 dB CNEL contours extend well into both the Teichert and Granite District Area Plans.

Single Event Environment within the District Plan Areas

Although the County has determined that single event noise exposure and associated sleep disturbance effects are appropriately addressed through application of General Plan Noise Element policies NO-2 through NO-4 regarding aircraft noise, the following information pertaining to aircraft single event noise is provided for disclosure purposes. In addition to the 24-hour average aircraft noise contours shown on Figures 4A and 4B, which are presented in terms of Community Noise Equivalent Level (CNEL), noise from individual aircraft arrivals and departures will be audible within the District Plan Areas. Figure 6 illustrates the potential for awakenings based on a study prepared by ESA using the ANSI methodology.

Existing Traffic Noise Environment within the District Area Plans

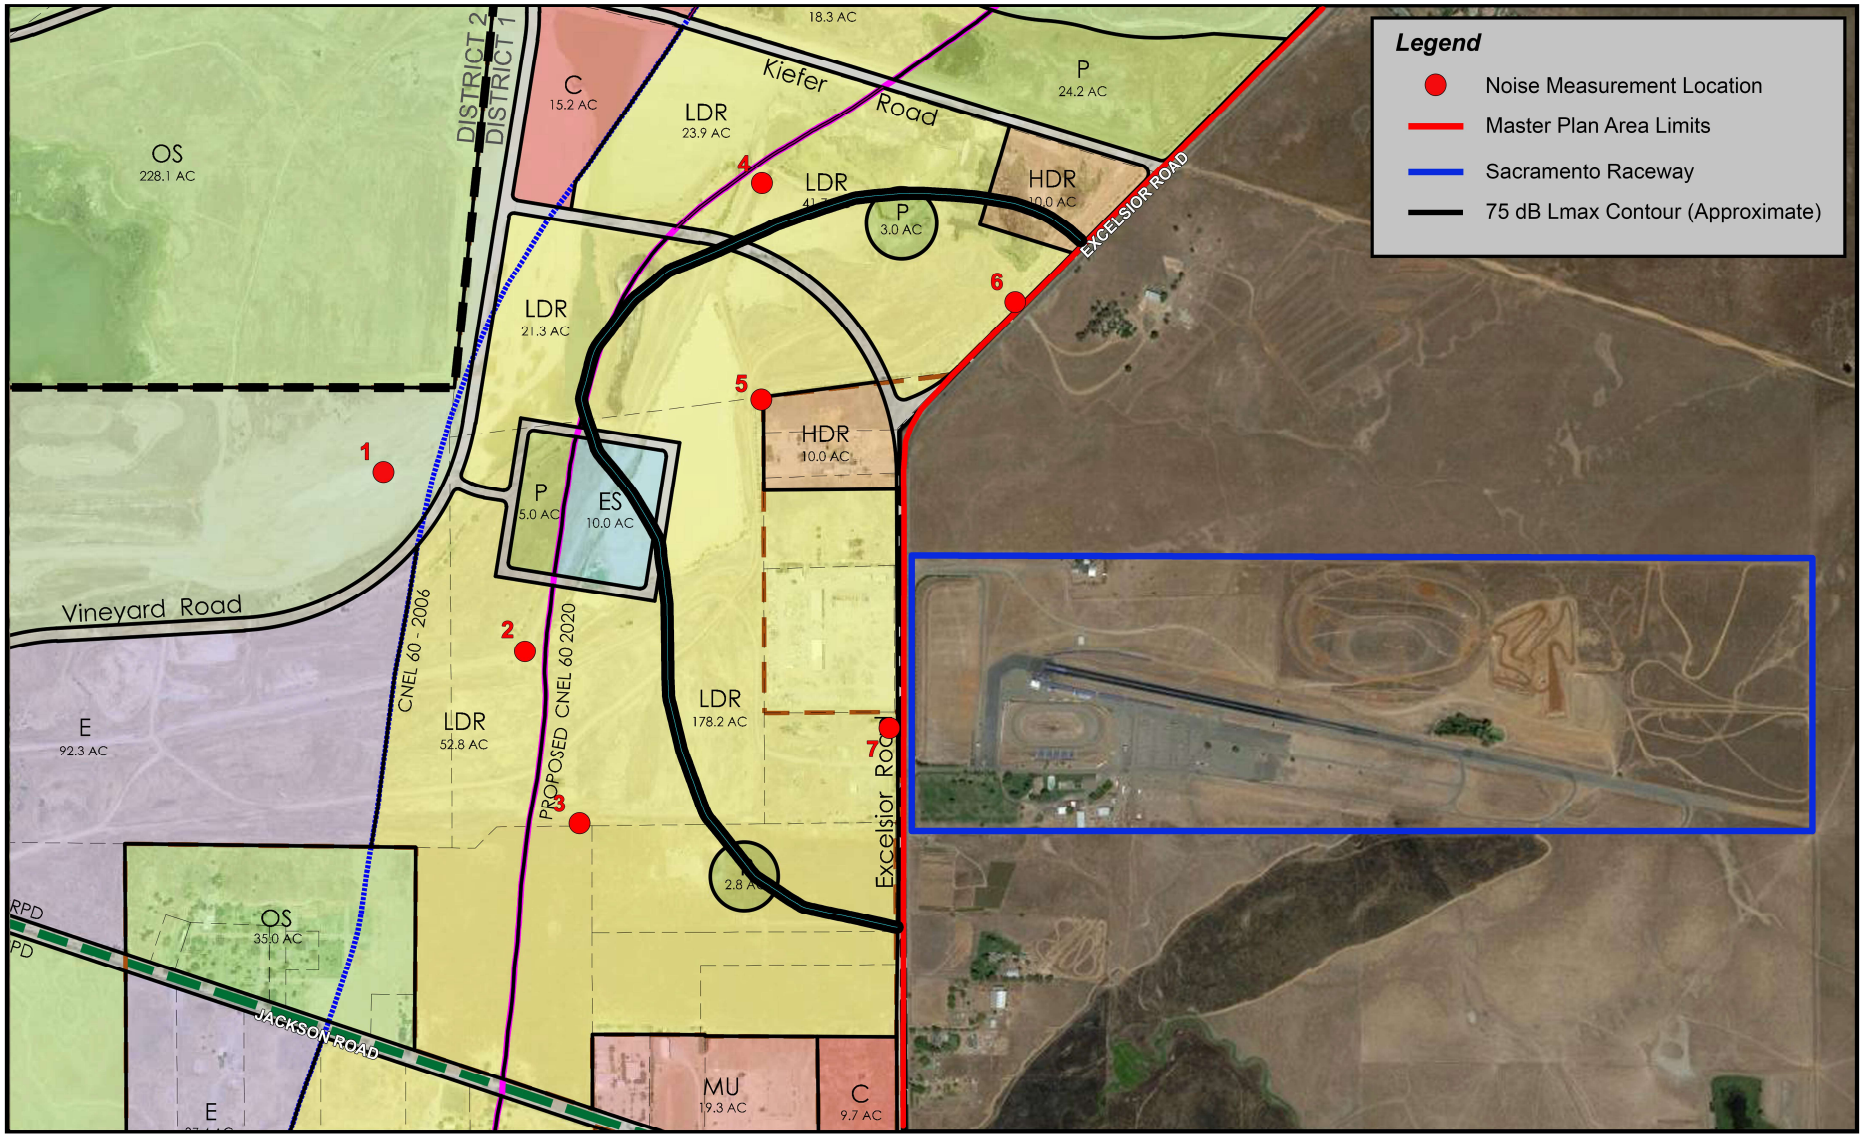
To describe noise levels caused by traffic, the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The FHWA model is based upon the Calveno reference noise factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site.

Baseline FHWA Model inputs and results were provided by Sacramento County. Table 9 shows the predicted existing traffic noise levels at a reference distance of 100 feet from the roadway centerlines, as well as the distances to the unshielded L_{dn} contours. It should be noted that the Table 9 data are provided at the Plan Area level without adjustment for shielding by intervening topography or structures. As such, the Table 9 data should be considered worst-case.

As noted previously in this analysis, many locations within the District Area Plans are former aggregate excavation areas and are, therefore, depressed relative to the surrounding roadways. Those areas subject to substantial depressions result in topographic shielding which was found to reduce traffic noise levels by approximately 10-15 dB.

Existing Sacramento Raceway Noise Environment within the District Area Plans

Sacramento Raceway is located on Excelsior Road, immediately east of the Plan Area as indicated in Figure 1. The Raceway facilities include a quarter mile drag strip, and a midget car and motocross dirt oval track. Racing typically takes place on Wednesday and Friday nights with occasional large events on weekends. It should be noted that the raceway is a non-conforming use which may not continue to operate through the buildout horizon of the Plan Area. In fact, raceway representatives have indicated that the raceway will likely be permanently closing in 2023.



During Governor's Cup races, maximum noise levels of 130 dBA were measured at a distance of 100 feet from the drag strip during Top Fuel Funny Car races. Maximum noise levels measured during Pro- Gas, Door-Slammer and Alcohol Dragster races registered between 100 and 120 dBA at the same location.

To quantify race-related noise levels during a typical race event, noise level measurements were conducted during the night of April 25, 2009 at the seven (7) locations shown on Figure 10. Measured noise levels varied depending on the class of vehicles being raced and by location. The results of the raceway noise monitoring were used to identify the approximate location of the 75 dB Lmax noise contour for the louder classes of vehicles raced that evening. That noise contour is provided on Figure 10.

The Figure 10 noise contour indicates that, if racing activities are to continue to occur in the future, a portion of the Teichert District Area Plan would be adversely affected by maximum raceway noise levels and development of noise mitigation measures would be required.

Existing Granite Bradshaw Aggregates Facility Noise Environment within the District Area Plans

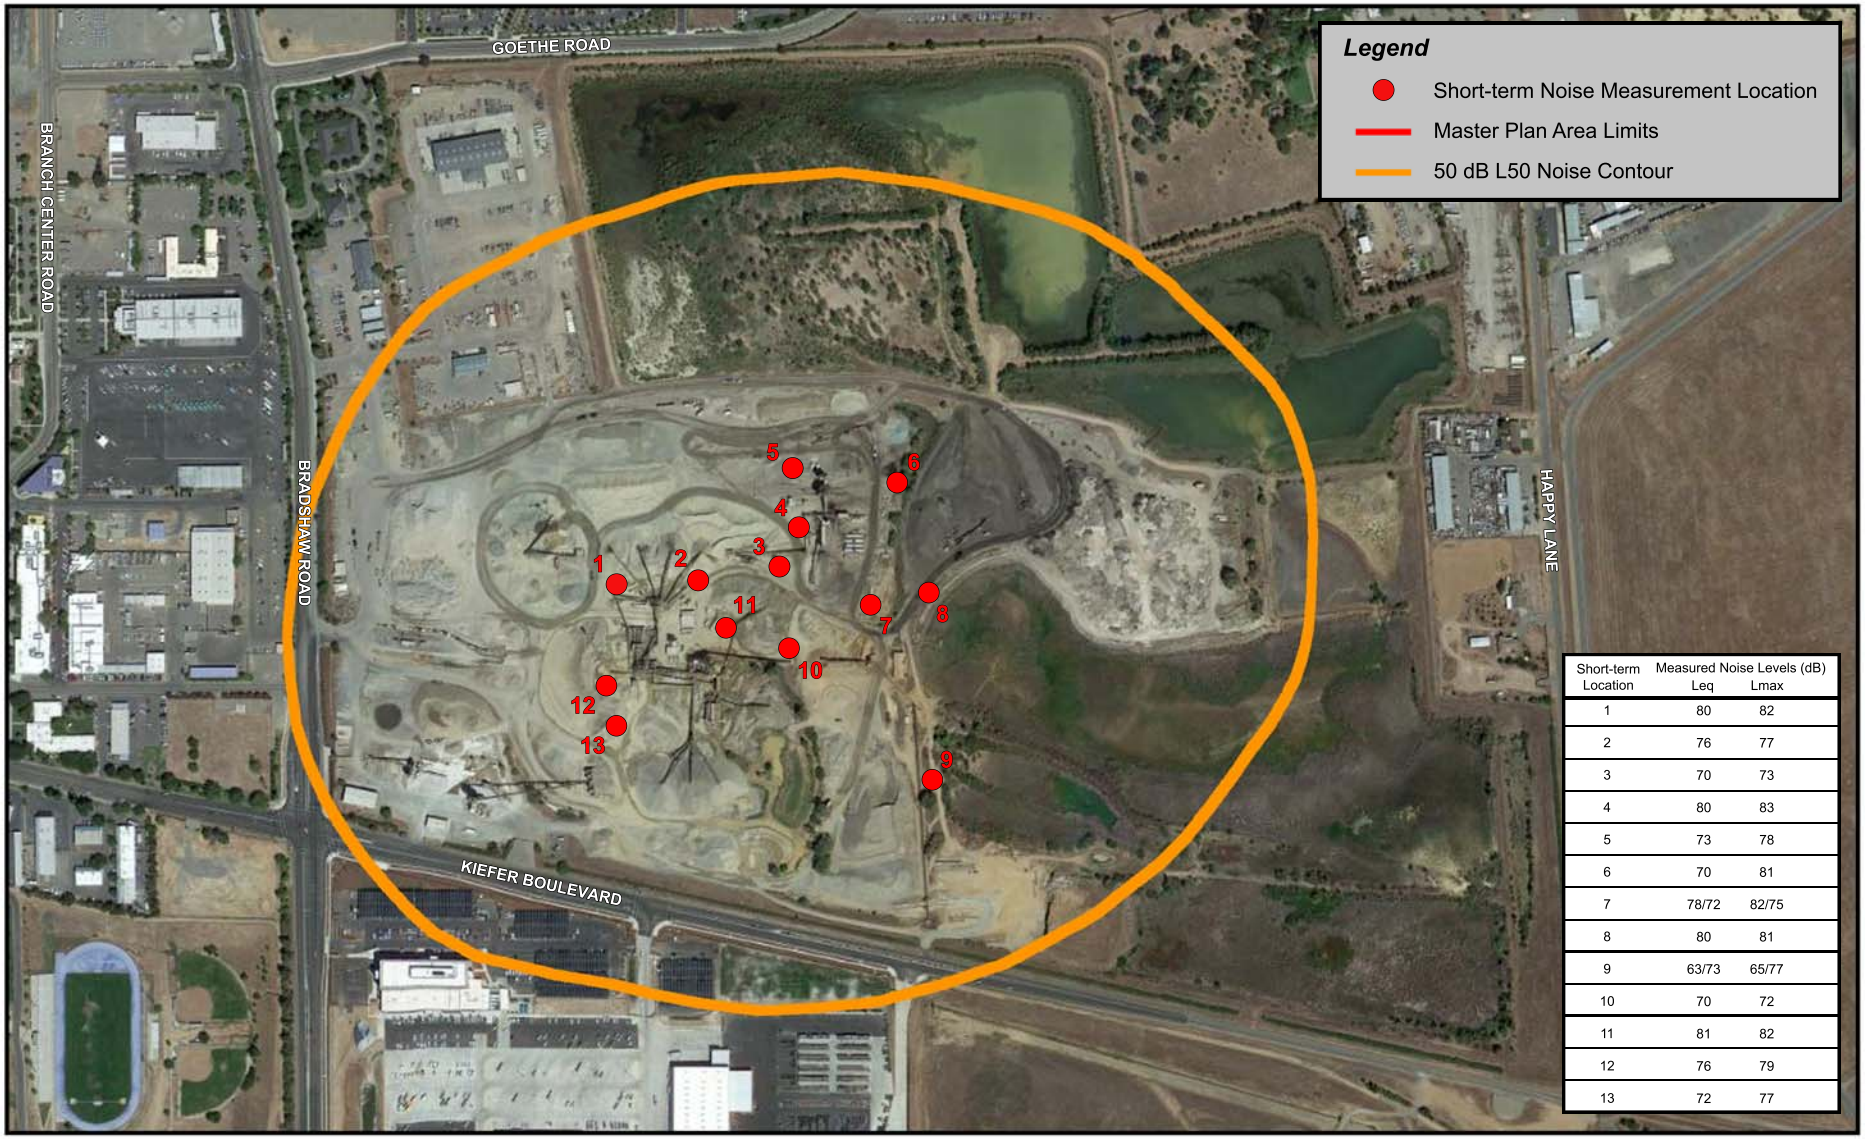
Granite operates an aggregate processing facility at the northeast quadrant of the intersection of Bradshaw Road and Kiefer Boulevard. The permitted facility consists of an aggregate processing plant (crushing, screening, washing, etc.), a smaller recycle plant, and an asphalt plant. A ready-mix plant previously operated at this location but has since been decommissioned. It may, however, be replaced in the future with another ready-mix plant.

To quantify the noise emissions of the Granite facilities, short-term noise level measurements were conducted at 13 locations on the Granite site on the morning of August 15, 2013. The noise measurement locations are identified on Figure 11A.

The noise measurement results were used to quantify reference noise levels in relatively close proximity to the various components of the facility for use in the subsequent evaluation of overall facility noise contour locations. Because the facility is substantially shielded in all directions by intervening topography (primarily tall aggregate stockpiles) and landscaping, the critical noise contour for the facility (50 dB median noise contour) is generally contained within the facility boundaries, as indicated on Figure 11B. The 50 dB median noise contour is considered the critical contour as it relates to the most restrictive nighttime noise level standard contained within the Sacramento County Noise Ordinance (6.68.070 Exterior Noise Standards).

The effects of the Granite facility on future development within the District Area Plan will be discussed in the impacts and mitigation measures section of this report.

Noise Generated by Ongoing Operation of Aggregate Conveyor Belt Operations within the District Area Plans



Ongoing aggregate excavation and conveyance of materials to the Teichert and Granite processing plants may continue to occur during development within the District Area Plans. The conveyors typically operate at the same times as the Teichert and Granite plants.

To quantify the noise emissions of the conveyor belt, BAC conducted noise level measurements at locations near the operating Teichert conveyor on April 29, 2009. The conveyor measurement results were used to identify the approximate locations of the 50 and 55 dB L50 noise contours for that equipment. The 55 and 50 dB L50 values represent the County of Sacramento Noise Ordinance daytime and nighttime noise level standards applicable to noise-sensitive receptors, respectively. Because the same conveyors are in operation as those tested in 2009, the above-described data remains applicable to the evaluation of conveyor noise levels for this project.

The noise measurements indicate that the 55 dB L50 noise contour is located approximately 350 feet from the operating conveyor, with slightly higher noise levels near conveyor transfer locations. The 50 dB L50 conveyor noise contour was calculated to be approximately 700 feet from the belt. Given these distances to the critical noise contours, consideration of noise mitigation measures for these sources will be necessary at such a time as project development encroaches within the 55 and 50 dB L50 noise contours. A discussion of noise mitigation recommendations will be provided in the Impacts and Mitigation measures section of this report.

Existing (Baseline) Vibration Environment

No appreciable sources of vibration were identified during BAC field surveys of the Plan Area and existing ambient vibration levels were subjectively evaluated as being below the threshold of perception. Nonetheless, to quantify baseline vibration levels in the Plan Area, a series of baseline vibration measurements were conducted at various locations within the Plan Area in 2013 as shown on Figure 12. Supplemental vibration surveys were conducted in 2017 to verify that the 2013 vibration data remain representative of current baseline vibration conditions within the Plan Area. The vibration measurement sites were selected to be generally representative of a variety of locations within the Plan Area. Due to the very low measured vibration levels at the 15 monitoring locations, it was determined that baseline vibration monitoring at additional sites was not warranted.

The vibration measurements were conducted using a Larson-Davis Laboratories Model HVM-100 Vibration Analyzer with a PCB Electronics Model 353B51 ICP Vibration Transducer. The test system is a Type I instrument designed for use in assessing vibration as perceived by humans, and meets the full requirements of ISO 8041:1990(E). Atmospheric conditions present during the tests were within the operating parameters of the instrument. A summary of the baseline vibration measurement results is provided in Table 12. Table 12 data indicates that all measured existing vibration levels within the District Area Plans were well below the threshold of perception.

Acoustical Consultants

Standards of Significance Applied to this Project

The following standards of significance, which are based on the California Environmental Quality Act Guidelines (State CEQA Guidelines) in conjunction with adopted local noise policy and appropriate noise standards as described above, are applied to this project:

a) Exposure of persons to generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

For transportation noise affecting existing or proposed noise-sensitive land uses within the Plan Area, the noise standards of Table 3 are applied. For aircraft noise affecting proposed noise-sensitive development within the Plan Area the General Plan policies NO-2, NO-3 and NO-4, with recently amended footnotes to General Plan Noise Element Table 4 (provided above in criteria section of this report).

For non-transportation noise sources affecting existing or proposed noise-sensitive land uses within the Plan Area, the noise standards of Table 4 are applied.

For the evaluation of speech interference and sleep disturbance impacts at future schools and residences proposed within the Plan Area, respectively, compliance with Sacramento County General Plan aircraft noise policies NO-2 through NO-4 is required.

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels.

For this assessment, a vibration level of 1 in/sec ppv is considered a criterion that would protect against significant architectural or structural damage. The general range at which vibration becomes distinct to strongly perceptible is approximately 0.1 in/sec ppv.

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project.

Criteria for assessing the significance of project-related noise level increases in Sacramento County and neighboring jurisdictions (with the exception of the City of Sacramento) are as follows:

1. Where existing traffic noise levels are less than 60 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

2. Where existing traffic noise levels range between 60 and 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +3 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant; and

3. Where existing traffic noise levels are greater than 65 dB Ldn at the outdoor activity areas of noise-sensitive uses, a +1.5 dB Ldn increase in noise levels due to roadway improvement projects will be considered significant.

Criteria for assessing the significance of project-related noise level increases in the City of Sacramento are shown in Table 6.

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above level existing without the project.

A substantial temporary increase in noise levels is defined using the criteria shown above in threshold C. Because temporary increases in noise are commonly limited to construction activities, and because all Master Plan development activities would occur within Sacramento County, the different thresholds used in the City of Sacramento would not be germane to this threshold.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project to excessive noise levels.

The standards of the Sacramento County General Plan which are applicable to Mather Airport are used as the criteria for assessing aircraft noise impacts for this project. In addition, an interior SEL value of 65 dB is applied to the noise-sensitive interior areas of schools and residences proposed within the plan area.

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels.

No private airstrips were identified in the project vicinity so an evaluation of aircraft noise impacts associated with such facilities is not warranted for this project.

Impacts and Mitigation Measures: Existing Plus Project and Future (Cumulative) Noise Environments

Aircraft

Master Plan Area & District Area Plans

Existing Plus Project and Cumulative Aircraft Noise Levels

The locations of the Mather Airport noise contours would not be affected by development within the Master Plan Area as a whole, or specific development within the District Area Plans. As a result, the aircraft noise contours shown on Figure 4 reflect the theoretical capacity aircraft noise within the project area.

Impact 1: 24-hour Average Aircraft Noise Exposure at Proposed Residential Uses within the WJHMP Area.

Most residential development proposed within the WJHMP area is located outside of the Mather Airport 60 dB Ldn theoretical capacity (worst case) exterior noise contour. However, some residential development is proposed within the Mather Airport 60-65 CNEL noise contours. As a result, **this impact is considered significant**.

Mitigation for Impact 1:

A. All residential development proposed within the Mather Airport 60 CNEL noise contours shall include sufficient noise mitigation to satisfy the requirements of Sacramento County General Plan Policies NO-2, NO-3, and NO-4, including the footnotes to General Plan Noise Element Table 4.

B. Appendix J contains the Acoustical Testing Plan for Mather Airport for residences proposed within the 60-65 dB CNEL Mather Airport noise contours. This testing plan shall be followed to ensure satisfaction with the County General Plan policies pertaining to Mather Airport noise exposure within new residential developments.

Significance after mitigation: *Less than significant*.

Impact 2: 24-hour Average Aircraft Noise Exposure at Proposed School within the WJHMP Area.

According to the County General Plan Noise Element school uses are considered acceptable in aircraft noise environments up to 65 dB CNEL. Because no school uses are proposed within Mather Airport noise environments exceeding 65 dB CNEL, **this impact is considered less than significant**.

Mitigation for Impact 2: None Required.

Impact 3: Single-Event Aircraft Noise Exposure and Sleep Disturbance at Proposed Residences within the WJHMP Area.

As discussed earlier, the County has determined that single-event aircraft noise exposure and associated sleep disturbance impacts are to be assessed in accordance with the Sacramento County General Plan Noise Element Policies NO-2 through NO-4 on aircraft noise. Those policies, which are provided above in the criteria section, restrict new residential development to areas outside the 60 dB CNEL airport noise contours (unless specific policy conditions are met), require noise insulation to ensure interior noise levels do not exceed 45 dB CNEL within residences, require notification that prospective buyers are located within an Airport Policy Area, and require that an avigation easement be recorded acknowledging the property is located within an Airport Planning Policy Area.

Because prospective owners of residences constructed within the Airport Policy Area would be choosing to live in an environment where aircraft overflights occur, and because they would be properly notified of the presence of Mather Airport and, therefore, able to make an informed decision regarding purchasing a residence near an airport, and because interior noise levels must not exceed 45 dB CNEL within residences, Sacramento County has concluded that the satisfaction of the County's General Plan policies related to aircraft noise would ensure that no significant impacts occur with respect to aircraft single-event noise exposure and associated sleep disturbance. Therefore, **this impact is considered less than significant**.

Mitigation for Impact 3: None Required.

Traffic Noise

Master Plan Area & District Area Plans

Existing Plus Project Traffic Noise Levels

With development within the Master Plan Area as a whole, and specific development within the District Area Plans, traffic volumes on the local roadway network will increase. Those increases in daily traffic volumes will result in a corresponding increase in traffic noise levels. The FHWA Model was used with traffic input data provided by Sacramento County to predict existing and existing plus project traffic noise levels, and the project-related noise level increases. Table 13 shows existing versus existing plus project traffic noise levels on the regional roadway network. Appendix E contains the FHWA Model inputs for this scenario. The traffic noise levels shown in Table 13 were predicted at a normalized reference distance of 100 feet from the centerlines of the various project-area roadways. It is recognized that the actual distances from project area

roadways to existing and proposed future noise-sensitive land uses varies but the normalization of the traffic noise levels to a standard distance allows a more uniform comparison of traffic noise levels between existing and existing plus project conditions.

Impact 4: Project-Generated Traffic Noise Increases on Existing Receptors: Existing Plus Project

Impact 4 specifically relates to traffic noise impacts of development of the Project on existing sensitive receptors. See Impact 7 for specific discussion related to traffic noise impacts at sensitive receptors proposed as part of the WJHMP.

Development within the District Area Plans would cause increases in existing traffic noise levels on the local roadway network. A total of 171 existing roadway segments were evaluated (See Table 13), and it was determined that the project-related traffic noise level increase relative to existing traffic noise levels without the Project would range from -3.5 dB to +13.1 dB, with an average noise level increase of 1.6 dB Ldn. Of the 171 segments evaluated, the increase was considered to be substantial on 45 roadway segments. The criteria for determination of a substantial project-related increase in traffic noise levels is as follows:

- 5 dB increase where baseline levels are below 60 dB Ldn.
- 3 dB increase where baseline levels are between 60 – 65 dB Ldn.
- 1.5 dB increase where baseline levels exceed 65 dB Ldn.

A finding of a substantial traffic noise increase may or may not trigger a finding of significant noise impact. For example, if a roadway segment where a substantial increase has been identified has no existing noise-sensitive land uses developed adjacent to that roadway, then no impact would be identified. Similarly, if sensitive development is substantially shielded by either topography, structures, or soundwalls, it may reduce the baseline noise conditions at that receptor such that the threshold for a finding of significance increases from 1.5 dB to 3 dB or 5 dB. For example, where an increase of 1.5 dB would be considered significant for an unshielded residence with a baseline exposure exceeding 65 dB Ldn, the same 1.5 dB increase would not be considered significant if the baseline exposure at that same residence was reduced to less than 65 dB Ldn through shielding.

After identification of the roadway segment for which a substantial increase in traffic noise levels was determined to result from the project, additional analysis of those roadway segments was conducted to identify those segments containing residential or other noise-sensitive development, as well as segments containing existing sound walls. Table 14 contains the results of that additional analysis.

While it is recognized that the noise attenuation provided by existing noise barriers within the Plan Area will vary depending on many factors, for purposes of this assessment it was assumed that the barriers would

intercept line of sight between the traffic noise source and the sensitive receptor. The resulting noise attenuation provided by such a barrier is 5 dB or more. Although the attenuation by barriers would not affect the increase in traffic noise experienced at existing residences resulting from the project, it would lower the baseline noise condition of the receptor. In some cases, the application of a 5 dB decrease to the baseline noise exposure results in a decrease in the threshold for a finding of significant noise impacts.

As noted in Table 14, not all of the roadway segments identified as having a substantial project-related traffic noise increase contain impacted noise-sensitive receptors. In addition, not all segments with sensitive receptors are shielded by existing barriers. Table 14 indicates that development within the Master Plan Area would result in significant noise impacts along 21 roadway segments, and potentially significant noise impacts along an additional 5 segments. The reason some impacts are identified as "potentially significant" is because it is not clear if the sensitive receptors would benefit sufficiently from the presence of existing noise barriers to reduce the impact to a less than significant level. As a result, ***this impact is considered significant***.

Mitigation for Impact 4

The mitigation of impacts at existing sensitive receptors resulting from significant project-related traffic noise increases is frequently challenging because of a combination of limited mitigation options, constraints upon implementation of certain options, cost of implementation, and limited effectiveness of some options. Nonetheless, the following specific options for mitigation of off-site traffic noise impacts at existing noise sensitive receptors should be considered to the extent reasonable and feasible:

A. **Reduction in Traffic Volumes:** Because one of the most important factors in traffic noise generation is daily vehicle volume, a reduction in traffic noise levels can be achieved by reducing the overall volume of traffic which would be generated by the project. It should be noted, however, that a 3 dB reduction in traffic noise levels would require a 50% reduction in projected traffic volumes. So, this measure would require a substantial decrease in traffic volume to achieve an appreciable decrease in traffic noise levels. As a result, it is unlikely that this measure would be a feasible means of fully mitigating this noise impact.

B. **Reduction in Vehicle Speeds:** Another factor in the generation of traffic noise is vehicle speed. Higher speeds translate to higher traffic noise levels. However, vehicle speed limits are set based on speed surveys, safety considerations, and other factors, and cannot be arbitrarily reduced to achieve lower traffic noise levels. As a result, this measure would not likely be a feasible means of mitigating this noise impact.

C. **Construction of Noise Barriers:** As noted in the discussion of noise mitigation fundamentals in the beginning of this report, appreciable reductions in traffic noise levels can be achieved through the construction of traffic noise barriers. However, at locations where openings or gaps in the barriers would be required for driveway openings or to maintain safe sight distances, the effectiveness of noise barriers is severely compromised. In addition, this measure would typically require construction of noise barriers on the property of the impacted receptor, rather than within a public right-of-way, so there is no guarantee the impacted receptor would agree to the construction of such barriers or that adequate space is available to construct a barrier. Furthermore, the construction of off-site traffic noise barriers could be extremely costly per benefitted receptor, potentially rendering this measure infeasible.

D. **Use of Setbacks:** A 4.5 dB decrease in traffic noise levels can be achieved for each doubling of distance between the roadway centerline

and affected residences. However, because the locations of existing residences which would be impacted by project-generated increases in traffic noise are fixed, as are the roadways of concern, this measure is not viable for existing residences.

E. **Noise-Reducing Pavement:** Noise-reducing pavement types, such as rubberized asphalt, have been shown to provide an appreciable noise level reduction relative to other pavement types (approximately 3-4 dB over conventional asphalt overlays). However, because the project-related increase in existing traffic noise levels exceeds 4 dB along many of the roadway segments analyzed in Table 13, the benefits of noise-reducing paving materials, even if feasible, would be insufficient to fully mitigate this impact. Nonetheless, at roadway segments where a 3-4 dB decrease in traffic noise levels would be sufficient to reduce this impact to a less than significant level, this mitigation alternative would be effective.

F. **Building Insulation:** As noted in the fundamentals section of this report, when interior noise levels are of concern, noise reduction may be obtained through acoustical improvement of building facades. The greatest improvement in building façade noise reduction can typically be realized through specification of upgraded windows with higher Sound Transmission Class (STC) ratings. Additional noise control for exterior doorways can be provided by replacing hollow doors with solid core doors and by acoustically sealing door perimeters with suitable gaskets.

Some of the aforementioned noise mitigation measures may be utilized to provide appreciable traffic noise level decreases. However, because such measures may be infeasible from a cost, engineering or safety standpoint, may not fully mitigate noise impacts, or could require the consent of the impacted receptor, the successful implementation of these measures cannot be guaranteed. As a result, this impact is considered significant and unavoidable.

Significance after Mitigation: ***Significant and Unavoidable.***

Cumulative Traffic Noise Levels

With cumulative development of the region, including this proposed project and the three other Master Plan developments being considered concurrently with the West Jackson Highway Master Plan, traffic volumes on the local roadway network will increase. Those increases in daily traffic volumes will result in a corresponding increase in cumulative traffic noise levels. The FHWA Model was used with traffic input data provided by Sacramento County to predict future (cumulative) vs. Cumulative-No-Project traffic noise levels, and the project-related noise level increases. Table 15 shows the results of that analysis on the existing and future regional roadway network. Appendices G, H & I contain the FHWA Model inputs for the cumulative scenarios.

The traffic noise levels shown in Table 15 were predicted at a normalized reference distance of 100 feet from the centerlines of the various project-area roadways. It is recognized that the actual distances from project area roadways to existing and proposed future noise-sensitive land uses varies but the normalization of the traffic noise levels to a standard distance allows a more uniform comparison of traffic noise levels between cumulative and cumulative plus project conditions.

It should be noted that several of the roadways evaluated in Table 15 would not exist without the construction of the project. As a result, the predicted noise levels for cumulative plus project conditions are provided for those segments but there are no cumulative no project noise levels for those same roadways. In such cases the change and substantial increase indicators are identified as not applicable (N/A).

Impact 5: Project-Generated Traffic Noise Increase on Existing Receptors - Cumulative Plus Project

Development within the District Area Plans would cause increases in future (cumulative) traffic noise levels on the local roadway network. A total of 234 future roadway segments were evaluated (See Table 15), and it was determined that the project-related traffic noise level increase relative to future (cumulative) traffic noise levels without the project would range from -2.9 dB to +11.4 dB, with an average noise level increase of 0.8 dB Ldn. Of the 234 segments evaluated, the increase was considered to be substantial on 35 roadway segments.

As noted in Impact 1, a finding of a substantial traffic noise increase may or may not trigger a finding of significant noise impact. However, while not all of the 35 roadway segments identified in Table 15 as having a substantial project-related traffic noise increase contain impacted noise-sensitive receptors, several segments do contain unshielded residences. As a result, ***this impact is considered significant***.

Mitigation for Impact 5

The mitigation of cumulative traffic noise impacts at sensitive receptors resulting from significant project-related traffic noise increases is frequently challenging because of a combination of limited mitigation options, constraints upon implementation of certain options, cost of implementation, and limited effectiveness of some options. Nonetheless, the specific options identified in Mitigation Measure 4 should be considered to the extent reasonable and feasible. However, because such measures may be infeasible from a cost, engineering or safety standpoint, may not fully mitigate noise impacts, or could require the consent of the impacted receptor, the successful implementation of these measures cannot be guaranteed. As a result, this impact is considered significant and unavoidable.

Significance after Mitigation: *Significant and Unavoidable.*

Cumulative Plus-Project Traffic Noise Levels at Proposed Noise-Sensitive Uses

Land uses proposed within the District Area Plans have varying degrees of noise sensitivity. The most sensitive of the proposed land uses include residential (of all densities), and school uses (interior spaces only). To predict future traffic noise exposure at the proposed sensitive land uses within the District Area Plans, the information contained in Table 15 was utilized. Specifically, the roadways within the West Jackson Highway Master Plan Area were extracted from the Table 15 data in order to identify exposure at the land uses proposed adjacent to those roadways. Table 16 shows the future traffic noise levels and distances to the critical 65 dB Ldn traffic noise contours for the roadways adjacent to which noise-sensitive development is proposed.

Source: FHWA-RD-77-108 with inputs from Sacramento County
Note: Ldn values presented in red indicate roadway segments where the County's 65 dB Ldn exterior noise standard would be exceeded at a distance of 100 feet from the roadway centerline. If, however, the property adjacent to the roadway is depressed relative to the roadway, the shielding provided by the depression would reduce traffic noise levels by approximately 10-15 dB Ldn relative to those shown in this table. The precise degree of shielding will depend on the ultimate elevation of the ground containing noise-sensitive land uses relative to the roadway elevation.

Impact 6: Traffic Noise Levels at Sensitive Receptors Proposed Within the District Area Plans – Cumulative-Plus-Project

Development within the District Area Plans will have varying degrees of noise sensitivity. The most sensitive of the proposed land uses include residential (of all densities), and school uses. Where future traffic noise levels at proposed sensitive land uses within the District Areas Plans would exceed the Sacramento County General Plan noise standards applicable to sensitive land uses (Table 3), a finding of significant noise impact is made, and mitigation measures must be considered.

The Table 16 data, which represent predicted future (cumulative plus project) traffic noise levels within the WJHMP Area, indicate that traffic noise levels are predicted to exceed the County's 65 dB Ldn exterior noise standard at a distance of 100 feet along 46 of the 92 roadway segments analyzed within the Plan Area. It should be noted, however, that several of the areas proposed for development within the District Area Plans are former aggregate excavation sites which are substantially depressed relative to the Master Plan areas roadways. This depression provides substantial shielding of traffic noise levels. Noise surveys conducted at such depressed locations within the District Plan Areas indicate that this shielding results in a traffic noise level reduction of approximately 10-15 dB

Ldn, depending on the relative elevations of the roadway and adjacent property.

Because none of the predicted future traffic noise levels shown in Table 16 exceed 75 dB Ldn at a reference distance of 100 feet from the roadway centerlines, it can be concluded that development occurring within the areas which are depressed relative to existing roadways would be shielded to levels below the County's 65 dB Ldn exterior noise level standard.

At proposed sensitive developments adjacent to new roadways or adjacent to roadways which are at the same relative elevation as the development site, such shielding would not necessarily be present. Because final site design and grading has not been completed, it is not possible to determine at this time whether noise impacts would actually occur along each of the roadway segments identified in Table 16 as exceeding 65 dB Ldn. However, because it is possible that noise-sensitive development could occur within the 65 dB Ldn noise contours adjacent to portions of these roadways, ***this impact is considered significant***.

Mitigation for Impact 6

When tentative maps and grading plans are available for specific residential and other noise-sensitive developments proposed within the District Area Plans, a project specific acoustical review should be conducted to ensure that appropriate noise mitigation measures are incorporated into the project design to achieve satisfaction with Sacramento County noise standards. The following general noise mitigation measures should be considered as potential noise mitigation options:

A. Building façade (window & glass door) improvements to ensure compliance with County Interior noise level standard within schools and residences.

B. Mechanical ventilation for all schools and residences to allow occupants of those structures to close doors and windows as desired for additional acoustical isolation.

C. Site design for school and residential uses to maximize the setback between roadways and proposed outdoor activity areas.

D. Shielding of outdoor activity areas of proposed multi-family residential uses from view of impacted roadway segments by intervening structures or topography.

E. Where possible, locate noise-sensitive land uses in areas which would be depressed relative to the impacted roadway segments.

F. Provide statements to prospective residences located adjacent to impacted roadway segments disclosing that the roadways are substantial noise sources and that variation in traffic conditions or atmospheric conditions can result in variations in perceived noise levels.

G. Consider construction of noise barriers to achieve compliance with County exterior noise standards only after all other feasible options have been considered.

Significance after Mitigation: ***Less than Significant.***

Non-Transportation Noise Sources

Master Plan Area & District Area Plans

Granite Aggregates Processing Facility

The existing Granite Aggregates processing facility located northeast of the intersection of Bradshaw Road and Kiefer Boulevard is located within Granite's District 2 Area Plan. The proposed use of the site currently containing the aggregate processing facility is identified in Figure 2 as being industrial uses. Until such time as the Granite facility ceases operations the noise generation of that facility is expected to generally remain at the current levels identified in Figure 11.

Impact 7: Impacts to Proposed Land Uses due to Ongoing Granite Aggregate Plant Operations

As noted previously, Granite operates an aggregates processing facility at the northeast corner of Kiefer Boulevard and Bradshaw Road. Granite's operations are expected to continue for the foreseeable future. Figure 11B shows the processing equipment locations and approximate location of the 50 dB L50 noise contour. The 50 dB contour is important in that it represents the most restrictive nighttime noise level standard contained within the Sacramento County Noise Ordinance. Existing Employment and open space uses to the south, and light-industrial (county corporation yard) and professional uses to the west of the Granite facility are not currently impacted by Granite operations. Changes in land use resulting from development of the Granite District Plan Area would consist of converting a portion of the frontage along Bradshaw Road into commercial uses, with additional employment uses generated to the immediate east, and 7 acres of high-density residential uses to the north. The 50 dB L50 noise contour shown on Figure 11B extends into the future commercial and high-density residential use areas to the north of the existing facility. As a result, if the Granite aggregate processing facility were to remain in operation after construction of those high-density residential uses, those residences could be adversely affected by noise if Granite's operations occur at night. As a result, **this impact is considered significant.**

Mitigation for Impact 7

Operations at the Granite aggregate processing facility may cease prior to the development of noise-sensitive land uses to the immediate north of that facility. However, if Granite operations continue when construction of high-density residential land uses to the north is complete and occupancy begins, then a detailed analysis of noise mitigation options would be required at the time specific development site and grading plans have been developed. That analysis would determine the most appropriate and feasible noise mitigation measures required to achieve compliance with the

County's noise standards at the proposed residential uses. Specific options for mitigation of the aggregate facility are as follows:

A. Agreement by Granite that no building permit may be pulled for residential units within 2,000 feet of the aggregate processing facility until plant operations have ceased, or otherwise reduced to levels in compliance with local noise standards.

B. Use of localized noise barriers, partial enclosures, or suspended acoustic curtain/barriers (to be funded and constructed by the developer of the future noise sensitive land use) to reduce noise at residential units to a state of compliance with County noise standards.

C. Lining of metal hoppers with urethane sheets (if consented to by the plant operator; to be funded and constructed by the developer of the future noise sensitive use).

D. Other actions at the aggregate processing facility, to be consented to by the operator and funded by the developer of the future noise sensitive use, that will reduce noise generated by the aggregate processing facility, as measured at residential sites within 2,000 feet of the facility, to levels in compliance with local noise standards.

E. Upgraded construction of the proposed residential structures. Typically, windows are the greatest source of sound transmission into a residence and a substantial improvement in acoustical isolation can be achieved from upgrading window assemblies alone.

Significance after Mitigation: ***Less than Significant.***

Sacramento Raceway

As noted previously, the Sacramento Raceway, which is located immediately east of the eastern WJHMP boundary, is an existing non-conforming use. It is also located within a separate Master Plan area where additional residential development is envisioned. Because of these factors, it is possible that the Raceway will not be in existence throughout the buildout of the WJHMP area. For the duration of time the raceway remains in operation at its current location, it is reasonable to conclude that the noise generation of that facility will continue at, or near, current levels.

Impact 8: Impacts on Proposed Land Uses due to Ongoing Sacramento Raceway Operations.

As noted previously, the Sacramento Raceway, located east of the WJHMP Area on Excelsior Road, is an existing non-conforming use. As such, and given the proposed development of the area upon which the raceway is

located in a parallel Master Plan Study currently being prepared, the future of the raceway is unclear. Nonetheless, should the raceway continue to be in operation at the time noise sensitive land uses are developed in the Teichert District Plan Area 1, racetrack operations would exceed the Sacramento County noise standards shown in Table 4. No impacts due to ongoing Sacramento Raceway operations are anticipated in Granite District Plan Area 2. Specifically, residences constructed within the 75 dB Lmax noise contour shown on Figure 10 would be exposed to maximum noise levels during certain raceway events which exceed the County's noise standard. As a result, **this impact is considered Significant**.

Mitigation for Impact 8

Given the non-conforming status of the raceway, it is unclear if the raceway would be required to implement mitigation to reduce raceway noise exposure at new residential uses proposed in the WJHMP Area. If it is determined that the Raceway must mitigate potential noise impacts upon the WJHMP development, a study would need to be commissioned by the Raceway to identify feasible options for such mitigation. If, on the other hand, the Raceway is to remain in operation and mitigation must be implemented by the WJHMP developers, additional analysis of site and grading plans would be required to develop such mitigation. The following general noise mitigation measures could be implemented to reduce Raceway noise levels at future residences within the WJHMP Area to a state of compliance with the Sacramento County daytime and nighttime Noise Ordinance standards of 55 and 50 dB, respectively:

A. Building façade (windows & glass doors) improvements to ensure compliance with County Interior noise level standards within residences.

B. Mechanical ventilation included in residential construction to allow residents to close doors and windows as desired for additional acoustical isolation.

C. Use of setbacks to maximize the distance between the raceway and proposed residential land uses.

D. Shielding of outdoor activity areas of proposed residential uses from view of the raceway by intervening structures or topography.

E. Design site grading so as to maximize the degree of natural shielding of raceway noise generation by intervening topography.

F. Provide statements to all prospective residences located in the Raceway vicinity disclosing that the raceway is a substantial noise source and that raceway events will result in substantial short-term variations in ambient noise levels.

G. Consider construction of noise barriers to achieve compliance with County exterior noise standards only after all other feasible options have been considered.

Significance after Mitigation: ***Less than Significant.***

Aggregate Excavation and Reclamation Activities

Many of the District Area Plan properties have already been excavated, others are engaged in excavation currently, while still others may be excavated in the future prior to buildout of the District Areas. Because excavated materials are transported to the Teichert and Granite aggregate plants via conveyor, the noise generation of these operations is highly localized to the areas near the excavation activities and locations adjacent to the conveyors. Until such time as aggregate excavation and reclamation is completed within the District Area Plans, the noise generation of those activities will likely remain at current levels, although the location of the noise generation will change as excavation and reclamation activities progress. Due to the lack of specificity regarding details of future noise-sensitive development near aggregate-related equipment and operations, this impact must be evaluated in greater detail at the tentative map stage.

Impact 9: Impacts on Proposed Land Uses due to Ongoing Conveyor Belt Operations

Ongoing aggregate excavation and conveyance of materials to the Teichert and Granite processing plants may continue to occur during development within the District Area Plans. The conveyors typically operate at the same times as the Teichert and Granite plants.

Conveyor noise level measurements indicate that the 55 dB L50 noise contour is located approximately 350 feet from the operating conveyor, with slightly higher noise levels near conveyor transfer locations. As a result, residential uses constructed within 350 feet of ongoing conveyor operations could be exposed to conveyor noise generation in excess of the County's 55 dB L50 exterior noise standard. If such construction were to occur within that distance, **this impact would be considered significant**.

Mitigation for Impact 9

Because it is possible that either Granite or Teichert conveyor belts could operate concurrently with residential construction within either District Plan Area, consideration of noise mitigation would be required for such development. Specific options for mitigation of conveyor noise to

acceptable levels at future residences constructed within the WJHMP Area are as follows:

A. Disclosure Statements.

All prospective residents of residences located within 350 feet of unshielded conveyors should be provided statements disclosing that operations of aggregate conveyors can and do occur during both daytime and nighttime hours, and that variations in those operations or atmospheric conditions can result in variations in perceived noise levels.

B. Relocation of Conveyor System.

At such a time as development of noise-sensitive land uses within the WJHMP Area is projected to encroach within 350 feet of operating conveyors, the conveyor system could be relocated, at the expense of the developer of the noise sensitive use, to a position further from the residences. While this measure would shift the noise impact zone of the conveyors further away from residences, it would not by itself decrease the actual noise generation of the conveyor system. As a result, eventually additional noise mitigation measures could be required as development moves closer to the relocated conveyor system.

C. Construction of Earth Berms and / or Noise Barriers Adjacent to the Conveyor System.

At such a time as residential development is projected to encroach within 350 feet of operating conveyors, an earth berm or solid noise barrier could be constructed adjacent to the conveyor system to further reduce conveyor noise levels, at the expense of the developer of the noise sensitive use. Such a barrier could take the form of an earthen berm, solid wall, or combination of berms and walls. The noise reduction provided by such a barrier would depend on the relative heights of the conveyor, top of barrier, and nearby residences, as well as the relative distances between the conveyor and noise barrier, and distance from noise barrier to receiver.

Significance after Mitigation: ***Less than Significant.***

Vibration Impacts

Master Plan Area & District Area Plans

Impact 10: Impacts associated with Project-Generated Vibration

Extensive field inspections and monitoring of baseline vibration within the District Plan Areas revealed no discernable sources of vibration which would adversely affect future sensitive land uses located within the project area. In addition, the project does not propose any appreciable sources of ongoing vibration, and short-term vibration generated by project construction activities would be at or below vibration levels currently generated by heavy Teichert and Granite excavation equipment. As a result, vibration impacts either due to the project, or upon the project, are not anticipated, and this **impact is considered less than significant.**

Construction Noise Impacts

Master Plan Area & District Area Plans

Impact 11: Impacts associated with Project Construction

During the construction phases of the project, noise from on-site construction activities, including infrastructure construction, grading, and development of a variety of land use types, would add to the noise environment in the project vicinity.

Activities involved in construction would typically generate maximum noise levels ranging from 85 to 90 dB at a distance of 50 feet (*Federal Transit Administration Noise and Vibration Impact Assessment Manual*, 2018, Table 7-1). Noise would also be generated during the construction phase by increased truck traffic on area roadways. A significant project-generated noise source would be truck traffic associated with transport of heavy materials and equipment to and from construction sites.

Provided construction activities occur between the hours of 6 am – 8 pm during weekdays, and 7 am – 8 pm on weekends, construction activities would be exempt from the provisions of the Sacramento County Noise Ordinance (6.68.090). Because on-site construction activities are proposed to adhere to the County's requirements, no adverse on-site or off-site construction noise effects are identified for this project and **this impact is considered less than significant.**

Appendix A
Acoustical Terminology

Acoustics The science of sound.

Ambient Noise The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.

Attenuation The reduction of an acoustic signal.

A-Weighting A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.

Decibel or dB Fundamental unit of sound. A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.

CNEL Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.

Frequency The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz.

IIC Impact Insulation Class (IIC): A single-number representation of a floor/ceiling partition's impact generated noise insulation performance. The field-measured version of this number is the FIIC.

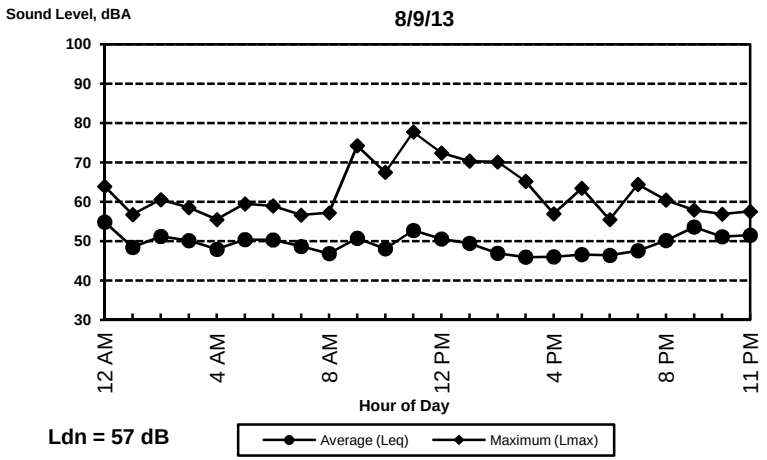
L_{dn} Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.

L_{eq} Equivalent or energy-averaged sound level.

L_{max} The highest root-mean-square (RMS) sound level measured over a given period of time.

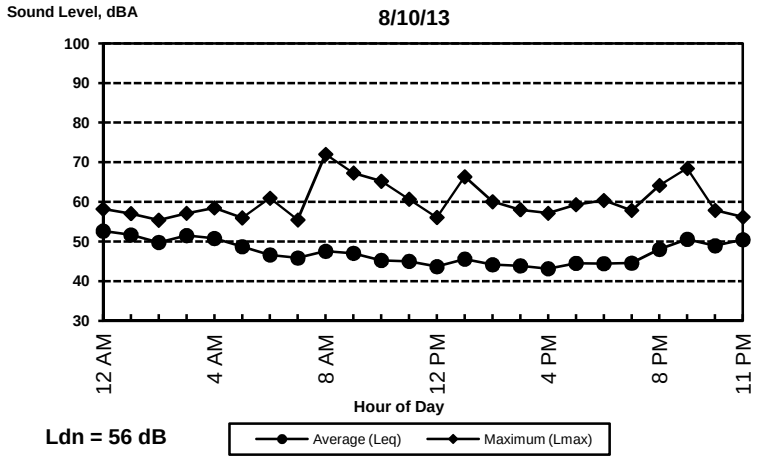
Loudness A subjective term for the sensation of the magnitude of sound.

Masking The amount (or the process) by which the threshold of audibility is for one sound is raised by the presence of another (masking) sound.



Noise Unwanted sound.

Peak Noise The level corresponding to the highest (not RMS) sound pressure measured over a given period of time. This term is often confused with the "Maximum" level, which is the highest RMS level.



RT_{60} The time it takes reverberant sound to decay by 60 dB once the source has been removed.

STC Sound Transmission Class (STC): A single-number representation of a partition's noise insulation performance. This number is based on laboratory-measured, 16-band (1/3-octave) transmission loss (TL) data of the subject partition. The field-measured version of this number is the FSTC.

1 Introduction

The Sacramento County's Airport Land Use Compatibility Plan and General Plan (Noise Element, NO-3) prohibits residential development inside the Community Noise Equivalent Level (CNEL) 60 dB contour as determined through a theoretical capacity analysis, which the Sacramento County Department of Airports (SCDA) updates periodically. With the recent update to the Mather Airport theoretical capacity analysis, the proposed West Jackson Master Plan Alternative 1C development would include residential properties within the CNEL 60 to 65 dB contour.

For federally funded airport residential sound insulation programs, the Federal Aviation Administration (FAA) guidelines suggest assigning an exterior level of CNEL 65 dB to all parcels within the CNEL 60 to 65 dB contour. To ensure that the interior CNEL is below 45 dB, with an appropriate margin of error, we would specify a design goal of 25 dB noise level reduction (NLR), which can be achieved with all structural façade elements having a minimum rating of Outdoor-Indoor Transmission Class (OITC) 25.

In accordance with Appendix R "Noise Compatibility Planning/Projects" of FAA Order 5100.38D Airport Improvement Program Handbook[1] (AIP Handbook), SCDA requires an Acoustical Testing Plan (ATP) and testing in accordance with the ATP to ensure the residential properties constructed within the CNEL 60 to 65 dB contour have a minimum average NLR of 25 dB.

The ATP conforms to "best-practices" utilized by industry professionals for over thirty years in sound insulation programs across the nation and includes acoustical testing methods for determining interior noise levels that are outlined in the FAA's adopted guidance[2] per Advisory Circular 150/5000-9A, *Announcement of Availability – Report No. DOT/FAA/PP/92-5, Guidelines for the Sound Insulation of Residents Exposed to Aircraft Noise*, issued in 1992[3]. The various steps outlined in the ATP also comply with requirements set forth in Table R-4 "Pre- and Post-Testing Criteria for Noise Insulation Projects" of Appendix R in the AIP Handbook.

The following sections provide detailed descriptions of the key components in implementing the ATP.

[1] FAA Order 5100.38D "Airport Improvement Program Handbook", Appendix R "Noise Compatibility Planning/Projects", effective date September 30, 2014.

[2] "Guidelines for the Sound Insulation of Residences Exposed to Aircraft Operations", which is attached to FAA Advisory Circular AC150/5000-9a

[3] FAA released an update in June 2022 for which there are modified testing requirements not included in this ATP.

2 Acoustical Testing

The acoustical testing program is to validate that the residential units constructed within the 60 to 65 dB CNEL contour achieves a minimum of 25 dB NLR to provide for appropriate interior habitable spaces from aircraft noise levels.

2.1 Measurement Methodology

Sound insulation measurements have historically been conducted using either an artificial noise source or actual aircraft noise events. An artificial noise source allows measurements to be made at the properties during a brief measurement period, independent from the reliance on aircraft over flights and without the need for multiple sound level meters to simultaneously measure aircraft noise in all habitable rooms.[4] The testing procedure described herein has been developed to accurately measure outdoor-to-indoor noise level reduction (NLR) of rooms.

The equipment required to complete the sound insulation measurements includes:

- Integrating sound level meter (with spectrum logging capability)[5]
- Loudspeaker (active or passive)
- Power amplifier (may be integrated with speaker)
- Signal generator (pink noise or simulated via graphic equalizer)
- Monopod for microphone
- Speaker tripod
- Power cables
- Digital camera
- Measuring tape

The testing procedures generally follow those outlined in the American Society for Testing and Materials (ASTM) Standard E966[6]. The methodology also conforms to good practice in sound insulation programs and the efficiency and flexibility of the testing procedures are enhanced using methods and theories from other sources such as Leo Beranek's "Noise and Vibration Control", which are applied in supplement to the ASTM standard to achieve the same level of overall accuracy in the testing process.

2.2 Measurement Procedures

The acoustical consultant shall use a field kit that includes a signal generator and public announcement (PA) type loudspeaker to produce a noise source of equal energy in each octave band or one-third octave band (referred to in the acoustics field as "pink noise") at an approximate overall sound level of 90 to 100 dB as measured at the exterior building façade under test.

---

[4] Defined in the AIP Handbook as living, sleeping, eating or cooking areas. Additional discussion is provided in Section **Error! Reference source not found.**

[5] Either octave band or one-third octave band capability is acceptable. This ATP provides methodology for either instrumentation.

[6] ASTM E966-10$^{\varepsilon 1}$ "Standard Guide for Field Measurements of Airborne Sound Attenuation of Building Facades and Façade Elements", with editorial changes in April 2011.

The loudspeaker will be positioned either on a tripod or placed on the ground unless there is compelling evidence that the roof/ceiling element of the room under test has the potential to contribute significantly to the interior sound level from aircraft operations. Examples of compelling reasons include: existence of weak elements within the roof/ceiling structure, such as sky lights; relatively light weight materials to make up the roof structure; limited airspace between the roof and ceiling; and limited or no use of insulation in the space between the roof and ceiling. In these instances, the speaker will be lifted above the roofline of the home to obtain both exterior façade and roof exposure through the use of an industrial grade hoisting device, such as a bucket truck, scissors lift or mobile crane.

The loudspeaker is directed at the room under test as required in the ASTM Standard E966, typically at a 45-degree incidence angle to minimize the application of adjustments to the data. The goal is to obtain a uniform sound field exposure of the entire exterior surface (façade) of interest, whether a single room or multiple rooms along the same facade. To obtain a uniform sound field along a wider area (testing of multiple rooms along the same façade) requires the speaker to be a greater distance from the façade at an increased volume as compared to the measurement of a single room.

The loudspeaker must be positioned such that the sound field at the façade of the room under test is as uniform as possible (± 2 dB along the façade of measurement) at a 45-degree angle of incidence. Corner rooms with two exterior facades should have both facades exposed simultaneously, with the direction of the speaker aimed at the center of only one of the facades. If only one façade is tested, it must be the least performing façade in terms of potential noise reduction. From the center of the façade, the perpendicular and the parallel distance to the speaker must be roughly equal.

At times the consultant may request that the roof/ceiling structure be tested to determine whether it is a major sound transmission path into a particular room. When measuring the acoustical performance of the roof/ceiling structure, the loudspeaker is placed over the roof such that the other structural elements (i.e., doors, windows, walls, etc.) are shielded from the sound field as much as possible. This often requires the use of a longer hoisting device than is necessary when the loudspeaker is placed over the yard.

With the loudspeaker placed to provide sufficiently uniform sound across the primary façade, octave band or one-third octave band sound level measurements are made both on the exterior and in the interior of the structure using both time and spatial averaging of sound levels. Additional measurements are conducted without the loudspeaker in operation to provide background or ambient sound levels.

2.2.1 Interior measurement method

Interior measurements occur to calculate the NLR for each room tested.

For interior room measurements, the microphone is swept in an elliptical or figure-8 pattern throughout the room volume for a minimum period of 20 seconds to measure the spatial average sound level (Leq) of the room. The microphone should, at all times, be at least 12 inches from sound transmitting elements (window, door, wall, vent, etc.) and from any hard reflective surfaces (e.g., walls, floor, and ceiling).

The interior room Leq is measured by sweeping the microphone as described above with the loudspeaker system turned on. The interior background Leq is measured by repeating the interior room Leq process, but with the loudspeaker system turned off. To ensure no contamination of the interior measurements conducted with the loudspeaker on, the background Leq measured with the speaker off must be at least 10 dB below the noise levels measured in each octave band or one-third octave band with the speaker turned on. To obtain this environment, household noise sources may need to be reduced or eliminated including pet noise, talking, and/or movements within the home and specific appliances or electronic devices may also need to be turned down, turned off or muted such as televisions, radios, phones,

ventilation (fan) systems, refrigerators and fish tanks. All household noise sources will be returned to their original conditions once the measurements are completed.

2.2.2 Exterior measurements methods

For exterior building façade measurements, the microphone is swept in a repeated "S" pattern for a minimum period of 20 seconds to measure the average exterior sound level (Leq) for the room or element of interest.

The exterior room façade Leq is measured by sweeping the microphone as described above with the loudspeaker system turned on. The exterior background Leq is measured by repeating the exterior facade Leq process, but with the loudspeaker system turned off. To ensure no contamination of the exterior measurements conducted with the loudspeaker on, the background Leq measured with the speaker off must be at least 10 dB below the noise levels measured in each octave band or one-third octave band with the speaker on.

There are three measurement methods which may be utilized to determine exterior sound levels. Any of the three methods may be used to determine the sound pressure level at the exterior building façade and these methods, when conducted as prescribed in the ASTM standard, will provide the same outdoor sound pressure level at the exterior facade of the structure under ideal conditions. The variety of methods for determining the outdoor sound pressure levels exist to provide flexibility since no one method can be used in all situations encountered in the field.

Each of the three methods are outlined below, in the preferred order of use.

(1) Flush method:

The flush outdoor measurement procedure[7] is outlined in the ASTM E966 standard. This method requires the microphone to be "very close" to the façade surface, but not so close that it is likely to touch the surface. The ASTM standard indicates that this measurement position requires a subtraction of 5 dB to account for the approximate doubling of the sound pressure (+6 dB) at the façade surface. The flush method is the most common and ideal method because of the ease to accomplish, applicability in most circumstances, assurance of the ability to measure similarly for pre- and post-construction conditions and repeatability of the measurement technique in the field.

(2) Nearby method:

ASTM E966 provides a second method for determining the outdoor sound pressure level: the nearby microphone method[8] with a 2 dB subtraction to the measured level to account for the reflection of sound energy from the façade and back to the microphone. This method requires the microphone to be 4 to 8 feet from the surface. This method also requires that the loudspeaker be positioned far away from the building façade (at least 40 feet) to minimize the increase in sound level associated with the measurement position being 4 to 8 feet closer to the speaker than is the façade. An additional adjustment factor of 1 dB should be subtracted from the measured exterior level to account for this effect.

[7] ASTM E966 Section 8.3.3 describes how to conduct the measurements and Section 8.5.3 provides required adjustments.

[8] ASTM E966 Section 8.3.2 describes how to conduct the measurement and Section 8.5.2 provides required adjustments.

(3) Free-field method:

The third technique, known as the free-field or calibration method[9], requires no adjustment as the measurement is conducted in an environment relatively free of reflective surfaces. The free-field method usually requires a separate speaker set up and measurement. To use the free field method, first measure the distance from the speaker to the façade during the interior room measurement. Then position the loudspeaker in a free-field environment over soft ground and measure the sound level at that same distance from the speaker by sweeping the microphone at the distance determined."

2.2.3 Measurement documentation

Digital photographs must be taken of the following:

- Exterior of each home to aid in identifying the property
- Loudspeaker positions and associated exterior façade areas under test
- Exterior elements that have noticeable product and/or installation defects
- Room interiors to document conditions in case noise modeling is undertaken or retesting is required

The digital camera must be set to the same date and time as the integrating sound level meter and all photographs must have a date and time stamp for reference. Data log sheets must also be completed (digital format is acceptable) that include, at a minimum, the following information:

- Airport code/identifier
- Address of property tested
- Resident last name or site name
- Site or parcel number (if known and applicable)
- Building number and unit number (multi-family only)
- Building floor number and unit type (multi-family only)
- Date and time of the measurements
- Initials of person(s) conducting the testing
- Description of rooms and elements tested
- Speaker set up (ground, tripod, or elevated)
- Noise-exposed room surfaces (façade, roof, or both)
- Exterior measurement method (flush, nearby, or free-field)
- A-weighted Leq noise levels, in dB, and corresponding SLM data file numbers (for interior background, interior test, exterior background, and exterior test)
- Sketch of floorplan, including all eligible rooms and noting all exterior elements
- Documentation on sketch of all loudspeaker positions, including reference distances

2.3 Calculation of Outdoor/Indoor Noise Reduction (OINR)

The Outdoor/Indoor Noise Reduction (OINR) of tested rooms and building elements are calculated from the measured exterior and interior sound levels in each octave band or one-third octave band, as outlined in ASTM E966. The OINR values are used to compute the outdoor-to-indoor Noise Level Reduction (NLR) of aircraft noise as measured in A-weighted decibels, denoted dB.

[9] ASTM E966 Section 8.3.1 describes how to conduct the measurement and Section 8.5.1 provides required adjustments.

The OINR values are computed for each tested eligible room by subtracting the interior noise level measured in each octave band or one-third octave band from the corresponding exterior sound level measurement. The exterior sound level data are first adjusted to account for the acoustic energy reflected from the building façade under evaluation, as outlined previously in report Section 2.2.2. The exterior and interior sound level data collected with the artificial noise source operating are likewise adjusted to account for the ambient acoustical energy measured with the noise source turned off. These are shown in the following equations.

The adjusted exterior level in each octave band or one-third octave band is:

$$L_{Ext\ Adj} = 10\log\left(10^{\frac{L_{Ext\ Measured}}{10}} - 10^{\frac{L_{Ext\ Background}}{10}}\right) - Adj_{Ref\ Energy}$$

The adjusted interior level in each octave band or one-third octave band is:

$$L_{Int\ Adj} = 10\log\left(10^{\frac{L_{Int\ Measured}}{10}} - 10^{\frac{L_{Int\ Background}}{10}}\right)$$

The OINR level in each octave band or one-third octave band is then determined by:

$$OINR = L_{Ext\ Adj} - L_{Int\ Adj}$$

The measurements may also be adjusted per ASTM E966 based on the angle of incidence of the noise source. The acoustical consultant typically attempts to position the loudspeaker to obtain an incident angle of 45 degrees for consistency, repeatability and efficiency as it requires no correction in the calculations. If a different angle-of-incidence is required, the consultant must apply the appropriate correction to the calculations as provided in ASTM E966.

2.4 Calculation of Noise Level Reduction (NLR)

NLR is a single number rating used for the comparison of the difference in outdoor-to-indoor noise levels. This number is typically used to judge the overall effectiveness of airport sound insulation programs.

The NLR of a room is dependent on the frequency (sound spectrum) content of the exterior noise source. For aviation sound insulation programs, the computed NLR values are determined using an appropriate aircraft noise source. The exterior aircraft source spectrum is also A-weighted to resemble human perception and to be consistent with FAA guidelines for assessing aircraft noise in communities.

The exterior aircraft noise spectrum was determined using the theoretical capacity analysis. The T-38A was estimated to be the greatest overall contributor to CNEL sound levels for departures from runways 22 L/R. Figure 1 and Table 1 present the octave band aircraft noise spectrum, normalized to an overall A-weighted sound level of 65 dB. Table 2 provides the corresponding one-third octave band sound levels.

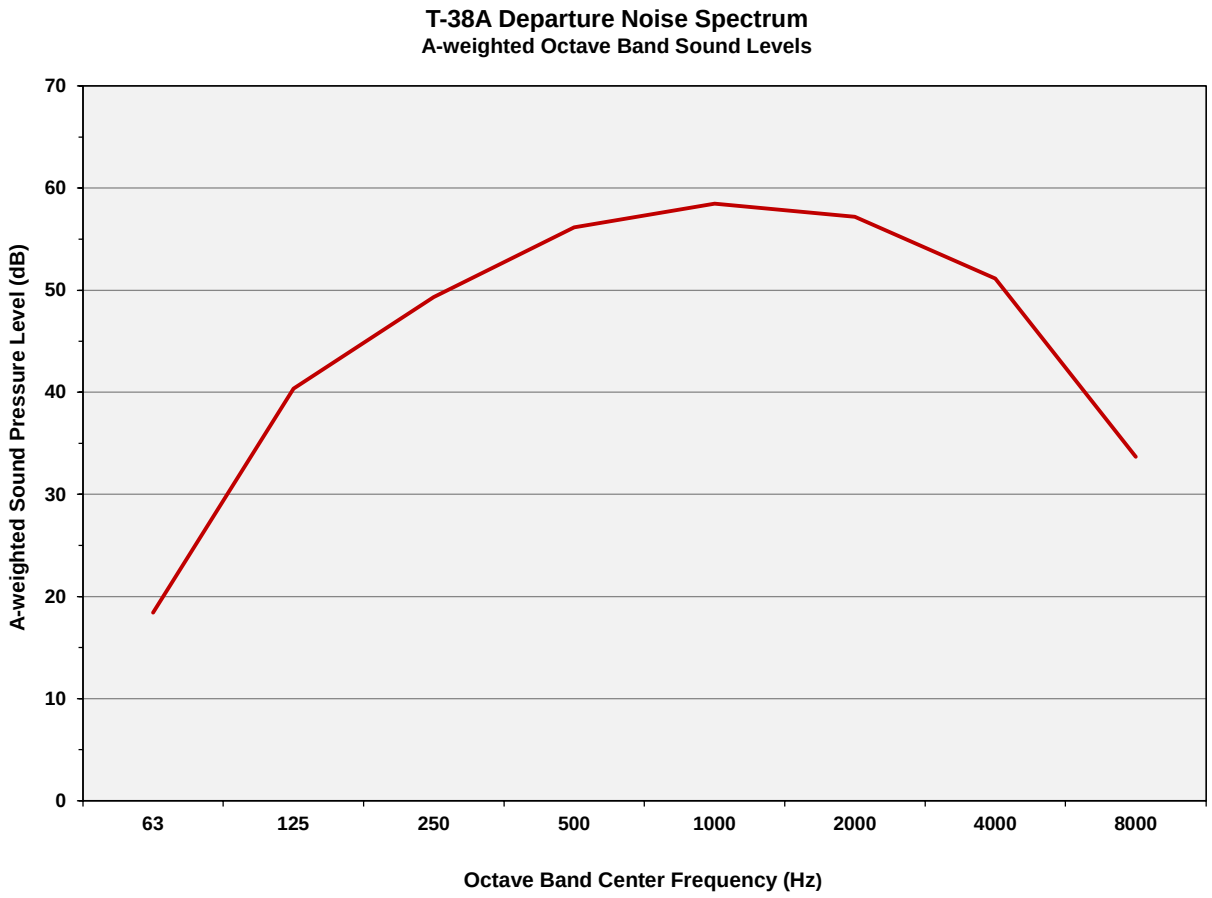

Figure 1. A-weighted Octave Band Aircraft Noise Spectrum

Table 1. A-weighted Octave Band Aircraft Noise Spectrum

Hz	63	125	250	500	1000	2000	4000	8000
dB	20.7	42.6	51.6	58.4	60.8	59.5	53.4	36.0

Table 2. A-weighted One-third Octave Band Aircraft Noise Spectrum

Hz	50	63	80	100	125	160	200	250	315	400	500	630	Hz
dB	11.4	14.7	21.0	30.9	38.2	42.4	42.3	47.3	49.9	52.4	52.4	54.9	dB
Hz	800	1000	1250	1500	2000	2500	3150	4000	5000	6300	8000	10000	Hz
dB	55.8	56.1	55.8	55.3	54.7	53.8	51.6	47.8	42.5	35.2	29.4	24.9	dB

The indoor A-weighted noise source spectrum for each tested eligible room in a structure is obtained by subtracting the measured OINR values from each corresponding octave band or one-third octave band of the exterior A-weighted aircraft source spectrum.

The overall A-weighted interior noise level is then obtained by summing the individual energies calculated for each octave band. The A-weighted NLR value for each tested room, based on the exterior aircraft spectrum, is computed from the difference between the overall outdoor and indoor A-weighted aircraft noise levels. This is shown in the following equations.

The exterior A-weighted total level is:

$$L_{Ext\ Total} = 10log \sum_{i=1}^{k} 10^{\frac{L_{Ext\ Noise\ Source\ Spectrum,i}}{10}}$$

The interior A-weighted total level is:

$$L_{Int\ Total} = 10log \sum_{i=1}^{k} 10^{\frac{L_{Ext\ Noise\ Source\ Spectrum,i} - OINR_i}{10}}$$

where "k" is the total number of octave or one-third octave bands used.

The NLR is then determined by:

$$NLR = L_{Ext\ Total} - L_{Int\ Total}$$

Table 3 presents an example of an octave band measurement calculation.

Table 3. Example Octave Band Measurement Calculation

	Octave Band Center Frequency								A-weighted Total
	63 Hz	125 Hz	250 Hz	500 Hz	1000 Hz	2000 Hz	4000 Hz	8000 Hz

Interior Noise Level	3.0	24.3	29.7	37.3	37.6	34.5	28.1	5.6	**42.0**
								Noise Level Reduction (NLR):	***23.0 dB***

Under the "Unweighted Measured Data" section, the *Interior Background* shows the measured interior background octave band levels with the loudspeaker turned off and the A-weighted total. The *Interior Measurement* presents the measured interior octave band levels with the loudspeaker turned on and the A-weighted total. The *Interior Adjusted* provides the interior octave band levels with the measured background sound level contribution removed and the A-weighted total. The *Exterior Background* shows the measured exterior background octave band levels with the loudspeaker off and the A-weighted total. The *Exterior Measurement* shows the measured exterior façade octave band levels with the loudspeaker on and the A-weighted total. The *Exterior Adjusted* provides the exterior octave band levels with the measured background sound level and the façade reflected energy contributions removed and the A-weighted total. In this example, note that the octave band levels and the A-weighted totals both show the measurements with the speaker turned on being more than 10 dB louder than the background levels with the speaker turned off.

The OINR is then developed by subtracting the *Interior Adjusted* level from the *Exterior Adjusted* level for each octave band, as outlined in Section 2.3. Under "A-Weighted Aircraft Noise Source Spectrum" the OINR is subtracted from the *Exterior Spectrum* to obtain the *Interior Spectrum*. The A-weighted acoustical

energy totals of the *Exterior Spectrum* and the *Interior Spectrum* are subtracted to obtain the NLR value, shown on the last line of the example table.

2.5 Extent of Acoustical Testing

According to Appendix R of the AIP Handbook, FAA recommends testing between 10% and 30% of the potentially eligible parcels[10]. In order to verify that homes are constructed in substantial conformance to a particular master permit plan set for a floorplan type and satisfy the design goal of achieving 25 dB Noise Level Reduction (NLR), post-construction acoustical testing of the first home conforming to the master permit plan set for a floorplan type (typically the model home) and at least one additional home for each floorplan type randomly selected during each construction phase to ensure the homes all meet the acoustical goal.

[10] FAA Order 5100.38D Appendix R, Table R-4 "Pre- and Post-Testing Criteria for Noise Insulation Projects", c. "First Step – Initial Testing" Paragraph (3): "Once the sponsor has characterized the diversity of the residences in the noise contour, it will select a representative sample of each type of similarly-constructed residences for testing, which based on industry review is typically 10% to 30%."

3 Compliance Determination

SCDA will determine compliance based on the testing reports provided during each phase of construction. Residential structures with an average NLR of 25 dB or greater will be considered to have met the SCDA requirements for those within the 60 to 65 dB CNEL contour.

APPENDIX J

NOISE MODELING CALCULATIONS

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)
HVAC - 55 dB threshold	70.0	@	3	hard	8	5	0.00	54.9	@	17
HVAC - 60 dB Threshold	70.0	@	3	hard	8	5	0.00	59.5	@	10
Loading Dock Activity	59.0	@	100	hard	8	5	0.00	54.9	@	160
Loading Dock Activity	60.0	@	101	hard	8	5	0.00	49.8	@	325

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 176 and 177 of FTA 2018.

Computation of the ground factor is based on the equation presentd in Table 4-26 on pg. 86 of FTA 2018, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

U.S. Department of Transportation
CA/T Construction Spec. 721.560

Distance Propagation Calculations for Stationary Sources of Ground Vibration

KEY: Orange cells are for input.

Grey cells are intermediate calculations performed by the model.

Green cells are data to present in a written analysis (output).

STEP 1: Determine units in which to perform calculation.

— If vibration decibels (VdB), then use Table A and proceed to Steps 2A and 3A.

— If peak particle velocity (PPV), then use Table B and proceed to Steps 2B and 3B.

STEP 2A: Identify the vibration source and enter the reference vibration level (VdB) and distance.

STEP 3A: Select the distance to the receiver.

Table A. Propagation of vibration decibels (VdB) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (VdB)	@	distance (ft)	vibration level (VdB)	@	distance (ft)
Impact pile driver	112	@	25	72.0	@	537
Vibratory Roller	94	@	25	74.9	@	108

The Lv metric (VdB) is used to assess the likelihood for vibration to result in human annoyance.

STEP 2B: Identify the vibration source and enter the reference peak particle velocity (PPV) and distance.

STEP 3B: Select the distance to the receiver.

Table B. Propagation of peak particle velocity (PPV) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (PPV)	@	distance (ft)	vibration level (PPV)	@	distance (ft)
Impact pile driver	1.518	@	25	0.199	@	97
Vibratory roller	0.210	@	25	0.198	@	26

The PPV metric (in/sec) is used for assessing the likelihood for the potential of structural damage.

Notes:

Computation of propagated vibration levels is based on the equations presented on pg. 185 of FTA 2018. Estimates of attenuated vibration levels do not account for reductions from intervening underground barriers or other underground structures of any type, or changes in soil type.

APPENDIX K

VMT ANALYSIS AND MEMORANDA

DKS 428 J STREET, SUITE 340 • SACRAMENTO, CA 95814 • 916.368.2000 • DKSASSOCIATES.COM

MEMORANDUM

DATE: September 25, 2023

TO: Todd Smith and Cameron Shew | County of Sacramento

FROM: David Tokarski and Jim Damkowitch | DKS Associates

SUBJECT: SB 743/ VMT Analysis – West Jackson Highway Master Plan Project #13049

Pursuant to Senate Bill (SB) 743, transportation impacts under CEQA may no longer be measured with automobile delay and level of service (LOS) post July 1, 2020. CEQA guidelines (Section 15064.3) state that vehicle miles traveled (VMT) is generally the most appropriate metric for determining transportation related impacts under CEQA. While VMT was previously calculated for the proposed West Jackson development traffic impact analysis, the applied methodologies were not consistent with recently adopted guidance from Sacramento County. The purpose of this technical memorandum is to document revised VMT calculations that are consistent with the County's Transportation Analysis Guidelines published July 1, 2020. Additionally, the proposed project has been re-analyzed using the updated travel demand model based on SACOG's SACSIM19 Activity Based Travel Demand Model.

VMT metrics associated with the residential components (VMT per Capita) and commercial (office and industrial) components (VMT per Employee) of the project are summarized herein. Retail components are not subject to efficiency metrics (VMT per Employee), but rather net change in VMT. This memorandum also summarizes the County's thresholds, which are based on regional averages calculated from the SACSIM19 Activity Based Travel Demand Model.

VMT ANALYSIS

Following the County's Transportation Analysis Guidelines (TAG), the applicable metrics are VMT per Capita for residential land uses and VMT per Employee for commercial (office) and industrial uses. Local retail is screened from further VMT analysis, while for regional retail the OPR recommended efficiency metric is total net change in VMT. Based on the square footage of each of the retail parcels within the West Jackson plan area, it was determined that while some of the proposed retail uses in West Jackson can be considered to be local serving and therefore screened from further VMT analysis, much of the proposed commercial is large enough to be considered regional serving and therefore must be analyzed.

For land uses that cannot be screened and are subject to further VMT analysis, the project's VMT per Capita and/or VMT per employee are compared to a threshold of 85 or 100 percent of the regional average for each metric as applicable. Regional averages are calculated in this memorandum to be consistent with SACOG's SACSIM19 travel demand model. For commercial/retail uses that are not considered locally serving, the established VMT threshold is no net change in VMT.

County guidelines require that each land use be analyzed separately when identifying impacts. The residential, employment, and retail land uses of the project are discussed below.

SIGNIFICANCE THRESHOLDS

Table 3-3 of the County's Transportation Analysis Guidelines lists significance thresholds for various types of development, as follows:

- Project VMT per Capita exceeds 85 percent of the regional average VMT per Capita.
- Project VMT per Employee for office employment exceeds 85 percent of the regional average VMT per Employee.
- Project VMT per Employee for industrial employment exceeds 100 percent of the regional average VMT per Employee.
- The project's regional retail land uses cause a net increase in regional VMT.
- The project's proposed widening of "regional roadways" cause a net increase in regional VMT. If the project entails widening a state highway facility, the Caltrans Traffic Analysis Framework (TAF) recommends that an Induced VMT increment also be determined.

While each of these project components must be analyzed and documented individually based on their respective threshold of significance, it is important to also consider the project's overall VMT efficiency. Thus, if a project only slightly exceeds the threshold of significance for one project component but falls substantially below the threshold for another, or vice versa, total project impacts can be presented by way of a holistic "VMT Budget" that accounts for the various components of the project.

RESIDENTIAL COMPONENTS (VMT PER CAPITA)

For residential land uses, VMT per Capita is the operative metric for CEQA impact analysis. It includes all vehicle tours (both work/commute vehicle tours and non-work vehicle tours) that start and end at a residence. Home-based tours reflect travel for work, school, recreation, and shopping, but exclude travel that begins and ends away from the home location.

An example of a work/commute vehicle tour that is captured in the VMT per Capita calculation may start at a residence, include a stop to drop a child off at school before proceeding to the work site, and a return to the residence with a stop to pick up dinner. A midday sub-tour beginning and ending at the work site to eat lunch at a restaurant would not be included. A non-work vehicle tour starts

that begins and ends at home may also include intermediate stops. VMT from these tours must include full mileage of the entire tour, including all stops.

VMT per Capita is calculated by first combining VMT from home-based tours generated throughout the day at a residential unit. The home-based VMT for all residential units in the project area is summed and divided by the total resident population of the project, resulting in the project's VMT per Capita.

Table 3-3 of the County's Transportation Analysis Guidelines identifies the threshold of significance as 85 percent of the baseline (no project) regional average VMT per Capita. If the regional VMT per Capita from the residential component of the "with-project" model runs exceeds this threshold, the project is determined to require VMT reduction.

To calculate the appropriate VMT per Capita metric for the proposed project, all project residential units (and their associated households and population) were incorporated into a modified Existing Plus Project version of the SASIM19 model. Additionally, the residential units were isolated into their own traffic analysis zones (TAZs) so their daily travel "tours" per person could be isolated from other land uses. Consistent with the methodology described above for what does or does not count in the calculated VMT per Capita, the results of the project's share of the Existing Plus Project model were compared to the results regionwide for the Existing No Project model. The results are as follows:

- Residential Component
    - Existing (No Project) Regional VMT per Capita: 20.20
        - County Threshold of Significance (85%): 17.17
    - Project Specific VMT per Capita: 14.29
        - As Percentage of Regional Average: 70.7%
        - **Exceeds 85% Threshold: No**

OFFICE AND INDUSTRIAL COMPONENTS (VMT PER EMPLOYEE)

For non-residential land uses, VMT per Employee is used to evaluate commercial (office) and industrial VMT. It includes all commute vehicle tours that begin and end at an employment location. A commute tour may include intermediate stops. An example commute tour begins at a residence, includes a stop to drop a child off at school, includes a stop for breakfast, and ends at a place of work.

VMT for commute tours are summed to the employment location of each tour. The commute VMT for all employment locations in the project area is summed and divided by the total employment of the plan area.

Office VMT per Employee is calculated based on results from TAZs that contain predominantly office land uses. Industrial VMT per Employee is calculated based on results from TAZs that contain predominantly industrial land uses.

Results from the "with-project" model runs were compared to the baseline (no project) results to determine if the project's office component exceeds 85 percent or the project's industrial component exceeds 100% of the regional average VMT per Employee, per Table 3-3 of the County's Transportation Analysis Guidelines.

- Office Component
  - Existing (No Project) Regional VMT per Employee: 16.04
    - County Threshold of Significance (85%): 13.64
  - Project Specific VMT per Employee: 16.23
    - As Percentage of Regional Average: 101.1%
    - **Exceeds 85% Threshold: Yes**
- Industrial Component
  - Existing (No Project) Regional VMT per Employee: 16.04
    - County Threshold of Significance (100%): 16.04
  - Project Specific VMT per Employee: 14.63
    - As Percentage of Regional Average: 91.2%
    - **Exceeds 100% Threshold: No**

WIDENING OF "REGIONAL ROADWAYS" VMT ASSESSMENT

The proposed project would widen existing roadways and construct new roadways. These roadway capacity enhancements could induce more VMT due to changes in background travel demand and/or route or mode choice. Per the TAG, all transportation projects that are regionally significant for potential air quality impacts must also be included in the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS). The MTP/SCS is the regional plan that demonstrates compliance with air quality conformity requirements and greenhouse gas reduction targets. As such, roadway projects that are consistent with this plan are part of the regional solution for meeting air pollution and greenhouse gas goals. Roadway projects that are deemed to be consistent with the MTP/SCS would have a less than significant cumulative impact on VMT. Conversely, roadway projects that are not included in the MTP/SCS must be evaluated to determine potential transportation impacts.

Consistent with the guidance in the TAG, to determine the net VMT impact of capacity enhancing improvements, existing or future roadways roadway widenings not already identified in SACOG's MTP/SCS were modeled, with and without project added roadway capacity, to yield the net change in regional VMT. Roadways within and adjacent to West Jackson that are not reflected in the MTP/SCS are as follows:

- Jackson Highway (from Watt Avenue to Excelsior Road): 4.2 Miles
  - MTP/SCS: 2 Lanes
  - With West Jackson: 6 Lanes
- Kiefer Boulevard (from Happy Lane to Excelsior Road): 2.0 Miles

- MTP/SCS: 0-2 Lanes
- With West Jackson: 4-6 Lanes

The above widenings represent an addition of 24.2 lane-miles of roadway to the County's regional roadway system in excess of the roadway widenings identified in the MTP/SCS. According to the TAG, secondary roadways within the project are normally not expected to induce more travel due to their local-serving nature and are therefore not considered in the induced VMT analysis.

The SACSIM model was run without and with the regional roadway widenings listed above (but with all other components of the West Jackson project included). Regional VMT was calculated both without and with the roadway widenings and are summarized as follows:

- Region wide VMT: Existing Conditions Plus West Jackson
  - Without Roadway Widenings: 59,150,613
  - With Roadway Widenings: 59,172,494
  - Difference: +21,880
  - **Increases Total Regionwide VMT: Yes**

RETAIL VMT ASSESSMENT

The County distinguishes between local and regional serving retail land uses. Local serving retail is defined as generally having up to 200,000 square feet of total gross floor area in growth areas, or with a market area of 3 miles or less. Some retail land use designations within West Jackson were determined to fit within the local serving retail definition and could be screened from further VMT analysis. However a majority of the commercial parcels within the project are on sites large enough to be considered regional in nature (i.e., over 200,000 square feet based on floor-area-ratios).

To enumerate the change in net region wide VMT that could be associated with the regional retail portions of the project, the travel demand model was run twice, once with the full project and once with the full project minus the regional retail components. Regionwide VMT was calculated for both scenarios and compared to determine the net impact of the regional serving retail component of the project. This net difference is summarized below.

- Regionwide VMT: Existing Conditions Plus West Jackson
  - Without Regional Retail: 59,127,684
  - With Regional Retail: 59,172,494
  - Difference: +44,810
  - **Increases Total Regionwide VMT: Yes**

PROJECT ROADWAY NETWORK VMT ASSESSMENT

As documented in the LTA, degradation of operations on several project area roadways resulting from the proposed project required additional lanes to be added at affected intersections. To quantify the VMT implications associated with these needed design elements, the model roadway network was modified to include additional lanes on specific segments and the model was re-run to determine changes in VMT. Based on discussions with County staff, the following roadways were widened in the model:

- Widen Mayhew Road from 4 to 6 lanes from Fruitridge to Elder Creek
- Widen Routier Road extension from 4 to 6 lanes from the Mayhew curve to Kiefer

The SACSIM model was run without and with the roadway widenings listed above. Regional VMT was calculated both without and with the roadway widenings and are summarized as follows:

- Region wide VMT: Existing Conditions Plus West Jackson
    - Without Roadway Widenings: 59,172,494
    - With Roadway Widenings: 59,188,647
    - Difference: +16,153
    - **Increases Total Regionwide VMT: Yes**

PROJECT OVERALL EFFECT ON VMT

The prior sections quantified individual impacts on VMT based on project housing, project employment, project roadway widenings, and project retail. To allow for the project's overall impact on VMT to be evaluated, each of the separate VMT metrics were translated into absolute VMT over or under that allowed by County thresholds and guidelines. To translate VMT per Capita and VMT per Employee into absolute VMT, the number of anticipated residents and the number of anticipated employees were multiplied by the amount the VMT exceeds or falls below the appropriate threshold. Per the TAG, it is important to consider that VMT mitigation measures include not only physical improvements (e.g., bike lanes) or travel demand management (TDM) actions (e.g., ridesharing programs), but also changes to the built environment (e.g., density/diversity of land uses, enhanced transit facilities). Built environment factors are often the most effective at achieving VMT reductions and are often assumed as part of the project definition and built into the modeling, rather than analyzed as a separate mitigation. Given that addressing potential impacts on-site is nearly always preferable and more effective than off-site, a "VMT budgeting" approach may be used to reconcile the VMT "savings" and "exceedances." **Table 1** shows the absolute VMT in excess of thresholds for population and employment within the project. For residential uses, the project's VMT per Capita falls below the 85% threshold by 2.89 percentage points, for a total of -112,863 VMT based on a population of 39,110. For office uses, the project's VMT per Employee exceeds the 85% threshold by 2.59 percentage points, for a total of 40,937 excess VMT based on 15,823 office employees. For industrial uses, the project's VMT per Employee falls below the 100% threshold by 1.42 percentage points, for a total of -4,804 VMT based on 3,386 industrial employees. These, combined with an additional 21,880 VMT due to widened roadways, 16,153 VMT due to roadway widenings needed to

address operational deficiencies caused by the project, and 44,810 VMT based on regional retail based on the qualitative analysis above, results in a total of 6,113 VMT above County thresholds.

TABLE 1: PROJECT OVERALL EFFECT ON VMT (VMT BUDGET)

MEASURE	NO PROJECT	PLUS WEST JACKSON	POPULATION	EMPLOYMENT	VMT OVER OR UNDER THRESHOLD
VMT PER CAPITA	20.20	14.29	39,110		-112,863
% OF REGIONAL AVERAGE		70.7%			
VMT PER OFFICE EMPLOYEE	16.04	16.23		15,823	+40,937
% OF REGIONAL AVERAGE		101.1%			
VMT PER INDUSTRIAL EMPLOYEE	16.04	14.63		3,386	-4,804
% OF REGIONAL AVERAGE		91.2%			
PROJECT ROADWAYS BEYOND MTP/SCS					+21,880
PROJECT ROADWAY WIDENINGS TO ADDRESS DEFICIENCIES					+16,153
REGIONAL SERVING RETAIL					+44,810
TOTAL PROJECT VMT OVER/UNDER THRESHOLDS					**+6,113**

Source: DKS Associates, 2023.

Therefore, the sum of specific components of the project exceeds County VMT thresholds and total VMT increases, representing a **significant** impact.

Re: ***West Jackson Highway Master Plan***
Vehicle Miles Traveled Analysis

Date: November 20, 2023

As requested, we have completed a Vehicle Miles Traveled (VMT) analysis for the West Jackson development based on a VMT analysis provided by others on July 24, 2023. The following is a summary of our findings.

Legislative Context

SB 743 is part of a long-standing policy effort by the California legislature to improve California's sustainability and reduce greenhouse gas emissions through denser infill development, a reduction in single occupancy vehicles, improved mass transit, and other actions. Recognizing that the current environmental analysis techniques are, at times, encouraging development that is inconsistent with this vision, the legislature has taken the extraordinary step to change the basis of environmental analysis for transportation impacts from Level of Service (LOS) to Vehicle Miles Travelled (VMT). VMT is understood to be a good proxy for evaluating Greenhouse Gas (GHG) and other transportation related impacts that the State is actively trying to address. While the use of VMT to determine significant transportation impacts has only been considered recently, it is by no means a new performance metric and has long been used as a basis for transportation system evaluations and as an important metric for evaluating the performance of Travel Demand Models.

In January 2019, the Natural Resources Agency finalized updates to the California Environmental Quality Act (CEQA) Guidelines including the incorporation of SB 743 modifications. The Guidelines' changes were approved by the Office of Administrative Law and are now in effect. Specific to SB 743, Section 15064.3(c) states, "A lead agency may elect to be governed by the provisions of this section immediately. The provisions apply statewide as of July 1, 2020."

To aid lead agencies with SB 743 implementation, the Governor's Office of Planning and Research (OPR) produced the Technical Advisory on Evaluating Transportation Impacts in CEQA (December 2018) that provides guidance about the variety of implementation questions they face with respect to shifting to a VMT metric. Key guidance from this document includes:

- VMT is the most appropriate metric to evaluate a project's transportation impact.
- OPR recommends tour- and trip-based travel models to estimate VMT, but ultimately defers to local agencies to determine the appropriate tools.
- OPR recommends measuring VMT for residential and office projects on a "per rate" basis.
- OPR recommends that a per capita or per employee VMT that is fifteen percent below that of existing development average may be a reasonable threshold. In other words, an office project that generates VMT per employee that is more than 15-percent less than the regional average VMT per employee could result in a significant impact. OPR notes that this threshold is supported by evidence that connects this level of reduction to the State's GHG reduction goals.
- Lead agencies have the discretion to set or apply their own significance thresholds.

Sacramento County released their updated Transportation Analysis Guidelines on September 10, 2020[1]. These updated guidelines include analysis methodology for both VMT and LOS. The VMT methodology outlines both the manner in which practitioners should conduct VMT studies, as well as examples of VMT mitigations and how to analyze their associated VMT reductions. This analysis described in this memorandum is consistent with Sacramento County guidance. Specifically, the thresholds against which the Project is evaluated were calculated as 15-percent below the regional average for residential and office uses and at the regional average for industrial uses.

Analysis

A summary of the VMT performance for the Project's residential, office, and industrial uses, as well as the associated regional thresholds were provided. In addition, West Jackson's VMT per capita and VMT per employee metrics for both Existing plus Project and Super Cumulative plus Project Conditions were provided. **Table 1** provides a summary of the region and Project's performance, as well as the thresholds and the percentage by which the project would have to reduce its relative VMT per capita or VMT per employee to equal the regional threshold.

Table 1 – West Jackson Vehicle Miles Traveled (VMT) Summary

Scenario	Existing No Project	Existing Plus Project	Super Cumulative No Project	Super Cumulative Plus Project
Average VMT/Capita	20.20	14.29	18.40	12.98
Average VMT/Employee(Office)	16.04	16.23	13.31	13.02
Average VMT/Employee (Industrial)	16.04	14.63	13.31	11.81
VMT/Capita Threshold(15% Below Regional Average)	17.17		17.17	
VMT/Employee Threshold(15% Below Regional Average, Office)	13.64		13.64	
VMT/Employee Threshold(Regional Average, Industrial)	16.04		16.04	
% to Reduce to Achieve VMT/Capita Threshold		-20.2%		-32.3%
% to Reduce to Achieve VMT/Office Employee Threshold		15.9%		-4.8%
% to Reduce to Achieve VMT/Industrial Employee Threshold		-9.7%		-35.8%

As shown in **Table 1**, West Jackson would need to reduce its VMT per office employee by 15.9-percent to achieve the regional threshold for office uses for Existing plus Project Conditions. However, West Jackson's residential and industrial land uses are both below the calculated regional threshold and thus do not need to be mitigated.

The regional VMT per capita average is 18.40 and the regional VMT per employee (office and industrial) is 13.31 for Super Cumulative No Project Conditions. Consistent with Sacramento County and CEQA guidance, thresholds for Super Cumulative Conditions were set equal to those for Existing Conditions. As shown in **Table 1**, for Super Cumulative plus Project Conditions, West Jackson's VMT per capita is 32.3-percent below the regional threshold for residential uses. In addition, West Jackson's VMT per industrial employee is 35.8-percent below the regional threshold for industrial uses. However, West Jackson's VMT per office employee would need to be reduced by 4.8-percent to achieve the regional threshold for office land uses.

Prior to making a determination as to whether the addition of West Jackson results in a VMT impact, the VMT reductions related to project features that are not able to be integrated into SACOG's travel demand model, SACSIM, were calculated. SACSIM is the travel demand model used to determine the VMT per capita and VMT per employee for the Project's land uses but is limited in its ability to represent all Project

[1] *Transportation Analysis Guidelines*. County of Sacramento. September 10, 2020.

features such as the implementation of Transportation Management Association (TMA) to reduce vehicle trips. Therefore, an "off-model" analysis is performed to calculate the VMT reductions for each land use type before making an impact determination based on the reduced VMT per capita and VMT per employee values for each land use type. **Table 2** below summarizes the effectiveness of implementing a TMA for the West Jackson Project.

Table 2 – West Jackson's Project Feature VMT Reduction Summary

Mitigation	VMT/Office Employee Reduction (%)
Mandatory Communitywide TMA	12.3%
Total	12.3%

As shown in **Table 2**, when implemented, the TMA will result in reducing the Project's VMT per office employee by 12.3-percent. Application of the TMA would not exceed the 15.9-percent reduction required under Existing Conditions, but would exceed the 4.8-percent reduction required under Super Cumulative Conditions (compared to the threshold set under Existing No Project Conditions) to reduce the Project's impact to less than significant for the office uses. Therefore, because the VMT/employee could not be reduced beyond the required percent reduction, the impact for the office uses would be significant and unavoidable for Existing plus Project Conditions. However, the impact for the office uses would be **less than significant for Super Cumulative plus Project Conditions**.

The calculations to determine the effectiveness of reducing VMT for each component of the TMA are based on two separate methodologies: Sacramento County TMA participation and calculations provided in CAPCOA's most recent version of its VMT Reduction Handbook, *Handbook for analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity*[2]. The methodology and calculations for each component of the TMA are outlined below.

It is understood that CAPCOA's VMT Reduction Handbook states that measures used to reduce VMT should only be quantified at either the Project/Site scale or the Plan/Community scale. In addition, the VMT Reduction Handbook states that measure T-6, Implement Commute Trip Reduction Program (Mandatory Implementation and Monitoring), which is similar to the design of the West Jackson TMA, is listed as a measure at the Project/Site scale while other mitigation measures listed below occur at the Plan/Community scale. However, the West Jackson TMA program will be a communitywide TMA program that requires mandatory participation from all residents and employers within the West Jackson community. Both residential and non-residential property will be subject to an annual County Service Area (CSA) fee, which will be used for the TMA services and programs and adding reductions for carpooling and rideshare would result in a total VMT reduction of 12.3-percent.

TMA Participation

TMA Selection

As shown in **Table 3**, there are 13 Sacramento area TMAs, of which nine have formal MOUs established with SACOG[3] and 7.2-percent of eligible employees participate. However, all TMAs are not equal in relevance and with concurrence from Sacramento County[4], a subset of TMAs were taken that are more

representative of the one to be set up for West Jackson. The five TMAs chosen to better represent the West Jackson TMA include the 50 Corridor TMA, the Placer County Transportation Planning Agency (PCTPA) TMA, the Power Inn Alliance TMA, the Sacramento TMA, and the South Natomas TMA.

1 - McClellan park has grown significantly in number of employers and employees between 2012 and 2016.

VMT per Employee Reduction Calculations

Using the five TMAs chosen to better represent the West Jackson plan, the calculated percent of participants in participating employers is 8.3-percent. Thus, one can infer that if all employees of the employers are within the West Jackson TMA, an 8.3-percent VMT per employee reduction can be taken. However, only two of these five TMAs provide a regional rideshare program, the 50 Corridor TMA and the South Natomas TMA, and the ridesharing program will be provided throughout the entire West Jackson employment community. Rather than providing this program on an employer-by-employer basis, the ridesharing program will be implemented as a single program for all employers and so the benefits will be observed at the Plan/Community scale. Therefore, the total VMT per employee reduction should be the calculated 8.3-percent reduction plus the 4-percent reduction related to the ridesharing program for a total reduction for the TMA program of 12.3-percent.

Programs/Projects within TMA and Associated Reductions[5]

To determine which types of programs and projects could be considered for inclusion within the West Jackson TMA, a review was taken of the programs and projects included within the five existing TMAs chosen to be representative of the Jackson Township TMA. SACOG's *Congestion Management Process* report contains a table on page 87 that summarizes the programs and projects within each TMA. After review of the five representative TMAs, four programs and projects were chosen for inclusion that combined, would equal or exceed the calculated 12.3-percent reduction. These programs are outlined below:

- **Commute Trip Reduction Marketing**: CAPCOA's VMT Reduction Handbook's measure T-7 indicates that implementing a commute trip reduction marketing program at eligible employers can reduce VMT by up to 4-percent. As stated in the Handbook, "Information sharing and marketing promote and educate employees about their travel choices to the employment location beyond driving such as carpooling, taking transit, walking, and biking, thereby reducing

[5] Instead of using mitigation measure T-6, which is a project/site scale application, mitigation measure M-3 (Implement an Innovative Strategy for GHG Mitigation) was used instead. Mitigation measure M-3 is a countywide application but requires mandatory participation.

VMT and GHG emissions." The reduction calculation is based on the percentage of employees that are eligible to get involved with the program. As it is assumed that 100-percent of employees will be eligible to be involved with a ridesharing program, the full 4-percent reduction can be taken. The requirements associated with this mitigation measure include onsite or online commuter information services, employee transportation coordinators, and a guaranteed ride home service as described below. These features of the trip reduction marketing program are generally consistent with how other TMAs operate in the County. For example, the 50 Corridor TMA has an employer-based marketing where staff time and materials are spent on promoting alternative modes of travel, promoting regional trip reduction programs, encouraging employers to offer incentives to reducing trips, and promoting local trip reduction programs. In addition, training and education is provided for employee transportation coordinators as part of the 50 Corridor TMA.

- **Guaranteed Ride Home**: While not a standalone measure, the guaranteed ride home program is an essential component of several of the VMT reduction measures included both within the TMA and additional measures implemented in addition to the TMA. To ensure that employees have the flexibility to adapt to the challenges and circumstances they are presented with day-to-day, they must be sure that if they are without a personal vehicle, they are always able to return home. For example, if an employee is required to work later than when the last available carpool leaves or transit options are no longer available, the only remaining option would be the guaranteed ride home program. If this is not provided, employees may think they need their personal vehicle for flexibility purposes, even if the situation is rare where no other options exist. Thus, to bolster the effectiveness of the mitigations implemented, a guaranteed ride home program must be included.
- **Provide Employer-Sponsored Vanpool**: CAPCOA's VMT Reduction Handbook's measure T-11 indicates that implementing an employer-sponsored vanpool service can reduce VMT by up to 20.4-percent. This is based on a calculation that uses the percent of employees that participate in the vanpool program, the average length of a one-way vehicle commute trip, and various constants to calculate the VMT reduction. Based on data from the CAPCOA Handbook, the average one-way vehicle commute trip length for the Sacramento-Roseville-Arden Arcade region is 14.23 miles. In addition, CAPCOA indicates that the average percentage of employees that participate in a vanpool program is 2.7-percent. This results in a VMT reduction of 4.6-percent. As the CAPCOA Handbook states that this mitigation measure is more appropriately implemented by the employer rather than the developer, each employer will be required to participate in the West Jackson TMA and as such, will be required to have an individual monitoring program. This Transportation System Monitoring (TSM) plan that is developed and implemented with each employer will enable the vanpool mitigation measure to be implemented with each employer.
- **Provide Ridesharing and Carpooling Program**: According to Table T-8.1, the 8-percent maximum attributed to this VMT reduction measure is only applicable in urban contexts while a 4-percent maximum is applicable to suburban contexts. Therefore, the 4-percent maximum rather than the 8-percent maximum was used for this VMT reduction measure. The maximum VMT reduction is based on the percentage of employees that are eligible to get involved with the program. As it is assumed that 100-percent of employees will be eligible to be involved with a ridesharing program, the full 4-percent reduction can be taken.

When adding the 4-percent reduction for the commute trip reduction marketing program with the 4.6-percent reduction for the employer-sponsored vanpool and the 4-percent reduction for providing a rideshare program, a total TMA reduction of 12.6-percent is obtained. However, the previously calculated 12.3-percent total reduction based on existing TMAs in the Sacramento region representative of the West

Jackson TMA was used for this analysis as it is based on local data. Note that this is a conservative estimate because CAPCOA's VMT Reduction Handbook's measure T-6 indicates that up to a 26-percent reduction can be applied to a mandatory project trip reduction program (mandatory TMA participation).

TMA VMT per Capita Reduction

While the residential land uses already fall below the regional threshold and thus do not require mitigation, it is important to note that the ridesharing and carpooling program implemented as part of the West Jackson TMA would also reduce residential VMT per capita. As noted above, the ridesharing and carpooling program would result in up to a 4-percent VMT reduction. However, consistent with the calculations performed for the neighboring Jackson Township development[6], a maximum of 2.1-percent reduction is assumed. This results in West Jackson's VMT per capita being reduced from 14.29 and 12.98 VMT per capita for Existing plus Project and Super Cumulative plus Project conditions, respectively, to 13.99 and 12.71 VMT per capita for Existing plus Project and Super Cumulative plus Project conditions, respectively.

Overall Effect on VMT

To allow for the Project's overall impact on VMT to be evaluated, each of the separate VMT metrics were translated into absolute VMT over or under that allowed by County thresholds and guidelines. To translate VMT per Capita and VMT per Employee into absolute VMT, the number of anticipated residents and the number of anticipated employees were multiplied by the amount the VMT exceeds or falls below the appropriate threshold, as summarized in **Table 4**. Per the County's guidelines, it is important to consider that VMT mitigation measures include not only physical improvements or travel demand management (TDM) actions, but also changes to the built environment (i.e., density/diversity of land uses, enhanced transit facilities). Such built environment factors are often the most effective at achieving VMT reductions and are often assumed as part of the project definition and built into the modeling, rather than analyzed as a separate mitigation. Since mitigating impacts on-site is nearly always preferable and more effective than off-site, a "VMT budgeting" approach may be used to reconcile the VMT "savings" and "exceedances."

As shown in **Table 4**, the Project's VMT per capita falls below the 85-percent threshold by 2.89 percentage points, for a total net of -112,637 VMT below the regional threshold for residential uses based on a Project population of 39,110. For office employment, the Project's VMT per employee exceeds the 85-percent threshold by 2.59 percentage points, for a total of 40,937 excess VMT above the regional threshold based on 15,823 office employees. For industrial employment, the Project's VMT per employee falls below the 100-percent threshold by 1.42 percentage points, for a total net of -4,804 VMT below the regional threshold based on 3,386 industrial employees. The results in a total net change in VMT compared to regional thresholds of -76,429 daily VMT (Net VMT Compared to Threshold (1)).

As shown in **Table 4**, the Project also proposes to construct retail uses and widen roadways both on-site and off-site related to addressing deficiencies and to accommodate Project traffic on-site. The increases in VMT were calculated and discussed in an analysis completed by others[7]. The increases in VMT include an additional 21,880 VMT due to widened roadways beyond the MTP/SCS, an additional 16,153 VMT due to roadway widenings to address deficiencies, and an additional 44,810 VMT associated with regional serving retail. As shown in **Table 4**, when added to the Project's net VMT compared to regional thresholds of -76,429 VMT, the Project now results in a net total of +6,414 VMT (Net VMT Compared to Threshold (2)).

[6] *Jackson Township VMT Mitigation Analysis*. Kimley-Horn. August 4, 2022.
[7] *SB 743/VMT analysis – West Jackson Highway Master Plan*. DKS Associates. August 3, 2022.

However, when incorporating the 12.3-percent reduction achieved by implementing the West Jackson TMA for non-residential uses and 2.1-percent reduction for residential uses, the Project's VMT would be further reduced by -11,737 VMT for residential uses, -31,587 VMT for office uses, and -6,093 VMT for industrial uses. This results in a total VMT reduction of -49,417 VMT from implementing the West Jackson TMA, which results in a final total of -43,003 VMT below County thresholds (Net VMT Compared to Threshold (3)). Therefore, while specific components of the Project exceed County VMT thresholds, VMT savings achieved through VMT reducing features (West Jackson TMA) result in **a less than significant impact for VMT**.

Table 4 – TMA Participation in the SACOG Region

Metric	Residential	Office	Industrial	Total
Regional Average	20.2	16.04	16.04	-

VMT Analysis Peer Review Summary

The following comments are provided as part of a peer review conducted on the analysis of the VMT related to regional serving retail and roadway widenings:

- When reviewing the analysis conducted for regional retail, it should be noted that SACOG's travel demand model, SACSIM, is insensitive to the size of the retail. Simply put, whether the retail is 5,000 square-feet or 250,000 square-feet does not affect the distribution/attraction of trips. In addition, when adding retail uses to a travel demand model, an increase in VMT always occurs, regardless of the size and location due to how travel demand models treat retail uses. Therefore, using SACSIM to evaluate regional retail is not recommended and alternative, off-model methodologies should be used. The removal and/or reduction in VMT associated with an alternate analysis approach would further reduce the West Jackson development's net change in VMT.
- It is also recommended that the way regional retail was defined be reconsidered. The memo states that regional retail was defined by calculating total square-feet using Floor-to-Area-Ratio (FAR) and parcel size. However, unless the West Jackson development identifies individual retail

stores that are going to be greater than 200,000 square-feet (the threshold for regional retail as defined by Sacramento County), no component of the retail should be evaluated as being regional serving. Thus, the addition of VMT associated with regional retail should be removed and result in a net reduction in VMT associated with the West Jackson development.

- The induced VMT associated with Project roadway widenings beyond the MTP/SCS for Jackson Road and Kiefer Boulevard is being overstated. This overstatement is due to the short-term induced demand not being reduced from the overall VMT calculation. Due to the elasticity for roadways in the model, the SACSIM documentation[8] states that induced VMT should be reduced by approximately 20-percent. Therefore, this reduction would reduce the net change in VMT for the West Jackson development and when combined with the reductions associated with the TMA mitigation, would result in a negative overall change in VMT.

Findings

Based on the results of this analysis, the following findings are made:

- As shown in **Table 1**, West Jackson's VMT per capita is 20.2-percent below the regional threshold for residential uses, the VMT per office employee will need to be reduced by 15.9-percent to achieve the regional threshold for office uses, and the VMT per industrial employee is 9.7-percent below the regional threshold for industrial land uses for Existing plus Project conditions. These results indicate that West Jackson has a finding of a **less than significant impact** for residential and industrial land uses, but a finding of a **significant impact** for office land uses for Existing plus Project conditions.
- As shown in **Table 1**, for Super Cumulative plus Project Conditions, and when using regional thresholds consistent with Existing Conditions, West Jackson's VMT per capita is 32.3-percent below the regional threshold for residential uses, the VMT per office employee will need to be reduced by 4.8-percent to achieve the regional threshold for office uses, and the VMT per industrial employee is 35.8-percent below the regional threshold. These results indicate that West Jackson has a finding of a **less than significant impact** for residential and industrial land uses, but a finding of a **significant impact** for office land uses for Super Cumulative plus Project Conditions.
    - It is assumed that a 2.1-percent reduction on West Jackson's VMT per capita for residential land uses would also result when implementing the West Jackson TMA ridesharing and carpooling program. Incorporating the 2.1-percent reduction would reduce West Jackson's VMT per capita from 14.29 and 12.98 VMT per capita for Existing plus Project and Super Cumulative plus Project conditions, respectively, to 13.99 and 12.71 VMT per capita for Existing plus Project and Super Cumulative plus Project conditions, respectively.
- As shown in **Table 2**, when implemented, the VMT reducing project features outlined herein will result in reducing the Project's VMT per employee for office land uses by 12.3-percent. These results do not exceed the required 15.9-percent reduction required to meet the regional threshold for office uses for Existing plus Project Conditions but do exceed the 4.8-percent required to meet the regional threshold for office uses for Super Cumulative plus Project Conditions. Therefore, implementing the West Jackson TMA results in the impact for the office uses being reduced to **less than significant for Super Cumulative plus Project Conditions.**
- To allow for the Project's overall impact on VMT to be evaluated for Existing plus Project Conditions, each of the separate VMT metrics were translated into absolute VMT over or under that allowed by County thresholds and guidelines, as summarized in **Table 4**. After converting the VMT per capita and VMT per employee metrics for the residential, office, and industrial land uses

[8] *User Guide and Model Documentation for SACSIM19*. Sacramento Area Council of Governments (SACOG). May 29, 2020.

into total VMT above or below County thresholds, and when combined with an additional 38,033 VMT due to widened roadways and 44,810 VMT based on regional retail, a total of 6,414 VMT above County thresholds is achieved by the Project.

- However, when incorporating the VMT reductions achieved by implementing the West Jackson TMA to the total change in VMT as a Project feature that cannot be modeled using SACSIM, the Project's VMT produced by the office uses would be reduced by 31,587 VMT, the Project's VMT produced by the industrial uses would be reduced by 6,093 VMT, and the Project's VMT produced by the residential uses would be reduced by 11,737 VMT. This results in a total Project VMT reduction of -49,417 VMT from implementing the West Jackson TMA and results in a total of -43,003 VMT below County thresholds for the Project. Therefore, while specific components of the Project exceed County VMT efficiency thresholds, VMT reductions achieved through incorporating Project VMT reducing features that cannot be modeled using SACSIM, **results in a less than significant impact for VMT**.
- Using SACSIM to evaluate regional retail is not recommended and alternative, off-model methodologies should be used. The removal and/or reduction in VMT associated with an alternate analysis approach would further reduce the West Jackson development's net change in VMT.
- It is recommended that the way regional retail is defined be reconsidered. Unless the West Jackson development identifies individual retail stores that are going to be greater than 200,000 square-feet (the threshold for regional retail as defined by Sacramento County), no component of the retail should be evaluated as being regional serving. Thus, the addition of VMT associated with regional retail should be removed and result in a net reduction in VMT associated with the West Jackson development.
- The induced VMT associated with project roadway widenings beyond the MTP/SCS for Jackson Road and Kiefer Boulevard is being overstated. Reducing this VMT, consistent with SACOG guidance for the SACSIM model, and when combined with the reductions associated with the TMA mitigation, would result in a negative overall change in VMT.

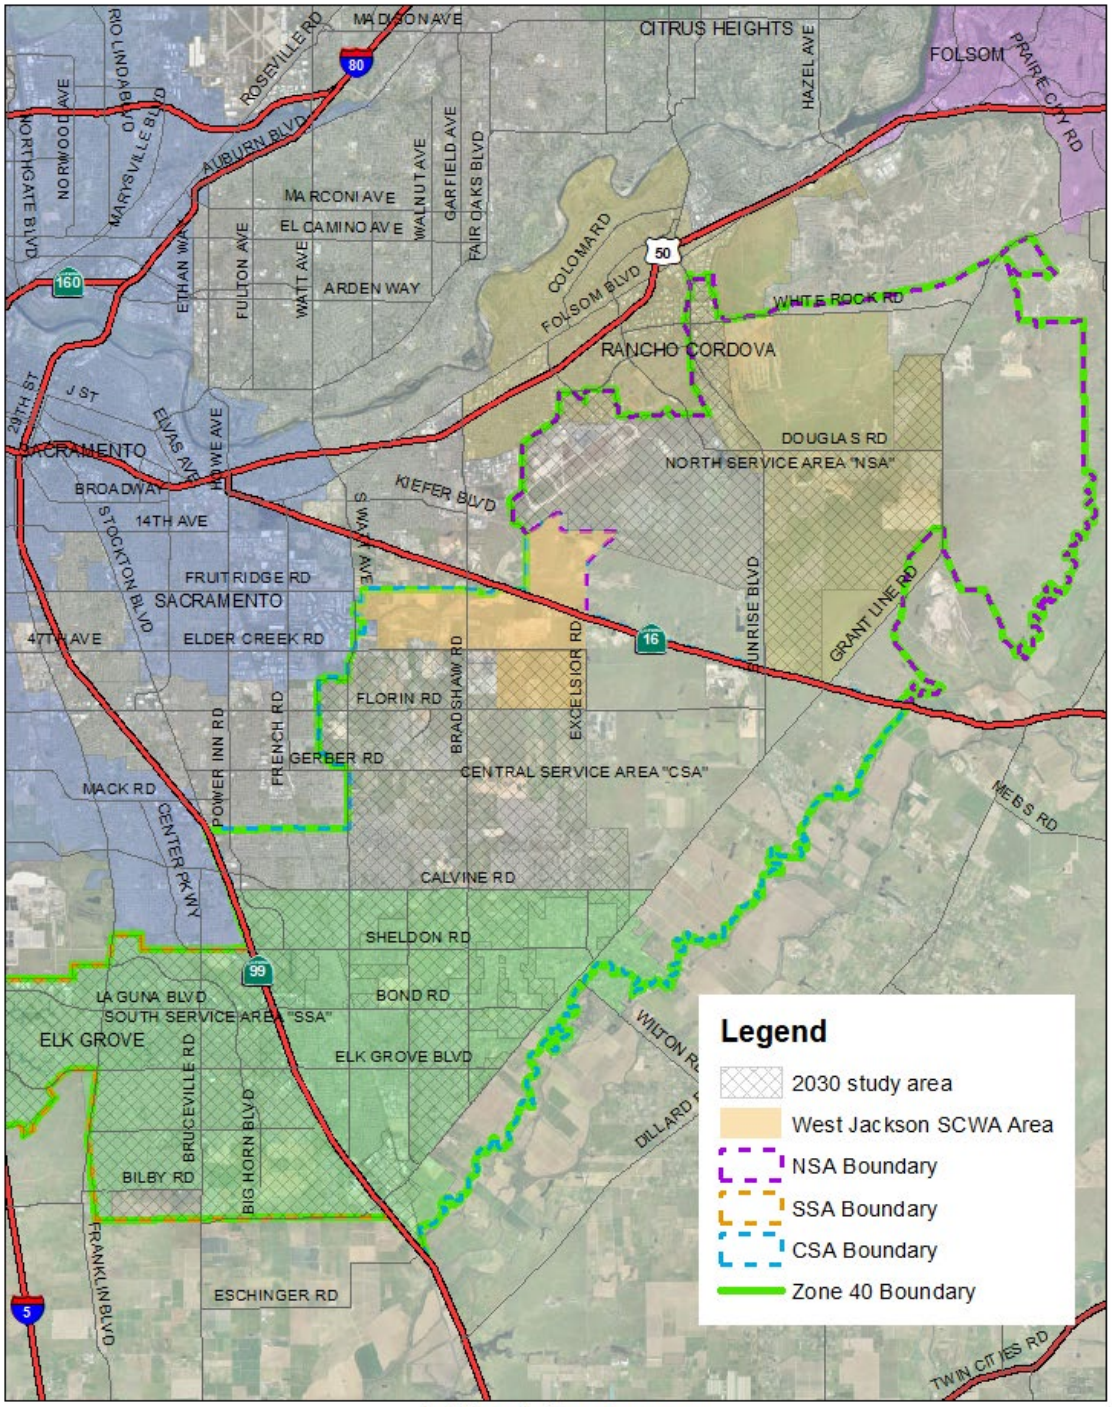
INTRODUCTION

BACKGROUND

The California Water Code (Water Code) requires coordination between land use lead agencies and public water purveyors. The purpose of this coordination is to ensure that prudent water supply planning has been conducted, and that planned water supplies are adequate to meet both existing demands and demands of planned development.

Water Code Sections 10910 – 10915 (inclusive) require land use lead agencies: 1) to identify the responsible public water purveyor for a proposed development project, and 2) to request a "Water Supply Assessment" (WSA) from the responsible purveyor. The objective of a WSA is to demonstrate the sufficiency of a purveyor's water supplies to satisfy the water demands of a proposed development project while still meeting the current and projected water demands of existing customers. Water Code Sections 10910 – 10915 delineate specific information that must be included in a WSA.



THE PROPOSED DEVELOPMENT PROJECT

The County of Sacramento Department of Planning and Environmental Review (PER) is actively processing the proposed project known as West Jackson Highway Master Plan (Project). The Project encompasses approximately 5,913 acres, of which 4,021 acres are within SCWA's service area, and is located in the central portion of Sacramento County (see **Figures 1 and 2**). The project area is located southeast of the South Watt Avenue/Jackson Highway intersection east to Bradshaw Road, and northeast of South Watt Avenue/Elder Creek Road east to Bradshaw Road. East of Bradshaw Road the project area extends north to Goethe Road, then easterly south of the Mather Airport to Excelsior Road which is the easterly boundary of the project area. The project area extends south along Excelsior Road to Florin Road, which is the southern boundary of the project. The project boundary follows Florin Road westerly to Excelsior Road for approximately 8,000 feet, then north to Elder Creek Road, which becomes the southerly boundary west to Hedge Avenue. The Project is one of the three Master Plan Areas along the Jackson Corridor Planning Area. Additionally, a portion of the Project falls within the Sacramento County Water Agency's (SCWA) benefit zones.

The County of Sacramento Department of Planning and Environmental Review has identified the Sacramento County Water Agency as the responsible water purveyor for the portion of the West Jackson Highway Master Plan that falls within its benefit zones and has requested that SCWA prepare this WSA in accordance with Water Code Sections 10910 – 10915 for that area.

WATER SUPPLY ASSESSMENT OBJECTIVE

The objective of this West Jackson Highway Masterplan WSA is to demonstrate that the planned water supplies for SCWA's Zone 40 are sufficient to meet the demands of the Project in addition to the existing and projected water supply obligations over the next 20 years. The findings of this WSA will be included in the Project's CEQA review by PER.

West Jackson

SACRAMENTO COUNTY WATER AGENCY
DEPARTMENT OF WATER RESOURCES

Figure 1 West Jackson Highway Master Plan SCWA Area Location Map

OVERVIEW OF THE WEST JAKSON HIGHWAY MASTER PLAN WSA

The comprehensive area of the Project overlays the purveyor jurisdictions of both the SCWA and the Californian American Water Company (CalAm) (**see Figure 2**). In general, the boundary between the two water purveyors runs along Fruitridge Road in the east-west direction and Happy Lane in the north-south direction. The SCWA portion of the project site encompasses approximately two thirds of the acreage of the Project and is primarily located in the south and east of the project area. CalAm services the northwest portion of the site and encompasses approximately one third of the acreage of the Project. While some streets will have both CalAm and SCWA owned mains, there are no interconnections between the SCWA system and the CalAm system anticipated at this time. The portion of the Project that overlays SCWA falls within the boundaries of SCWA's Zone 40/41 service area. All references to the Project's land-use area and associated water demands in this WSA will constitute solely the portion within SCWA's jurisdictional boundary.

The SCWA portion of the Project lies entirely within the boundaries of SCWA's Zone 40/41 service area but outside of the 2030 Study Area of the Water Supply Master Plan (WSMP), (SCWA, 2005). In 2016, an amendment to the WSMP (WSMPA) was prepared to include the Project and is pending SCWA's Board of Directors (SCWA Board) approval. In 2016, SCWA also developed the Water System Infrastructure Plan (WSIP) (SCWA, 2016). The WSIP is a staff-level document that describes the projected water supply infrastructure needs to meet the projected built-out water demands in Zone 40, including the Project demands. The infrastructure needs of the project are included in the 2016 WSIP. The water demands associated with the Project have also been included and addressed in the latest Urban Water Management Plan (UWMP) (SCWA, 2020) approved by the SCWA Board on June 15, 2021.

In addition to the above referenced documents, the following documents may be used in whole or in part for the water assessment for Project:

- The Central Sacramento County Groundwater Management Plan (SCGA, February 2006)
- The South American Subbasin Groundwater Sustainability Plan (South American Subbasin Groundwater Sustainability Agencies, October 2021)
- The Final Environmental Impact Report (FEIR) for 2002 Zone 40 Water Supply Master Plan (EDAW, December 2004)
- The Water Forum Agreement (WFA), Sacramento City-County Office of Metropolitan Water Planning, January 2000
- Feasibility Report for Sacramento County Water Financing Authority Series 2007 Revenue Bonds (Sacramento County Water Agency Freeport Project) (MWH, April 2007)
- Sacramento County Water Agency Zone 40 Water Development Fee Study (HDR, August 2023)

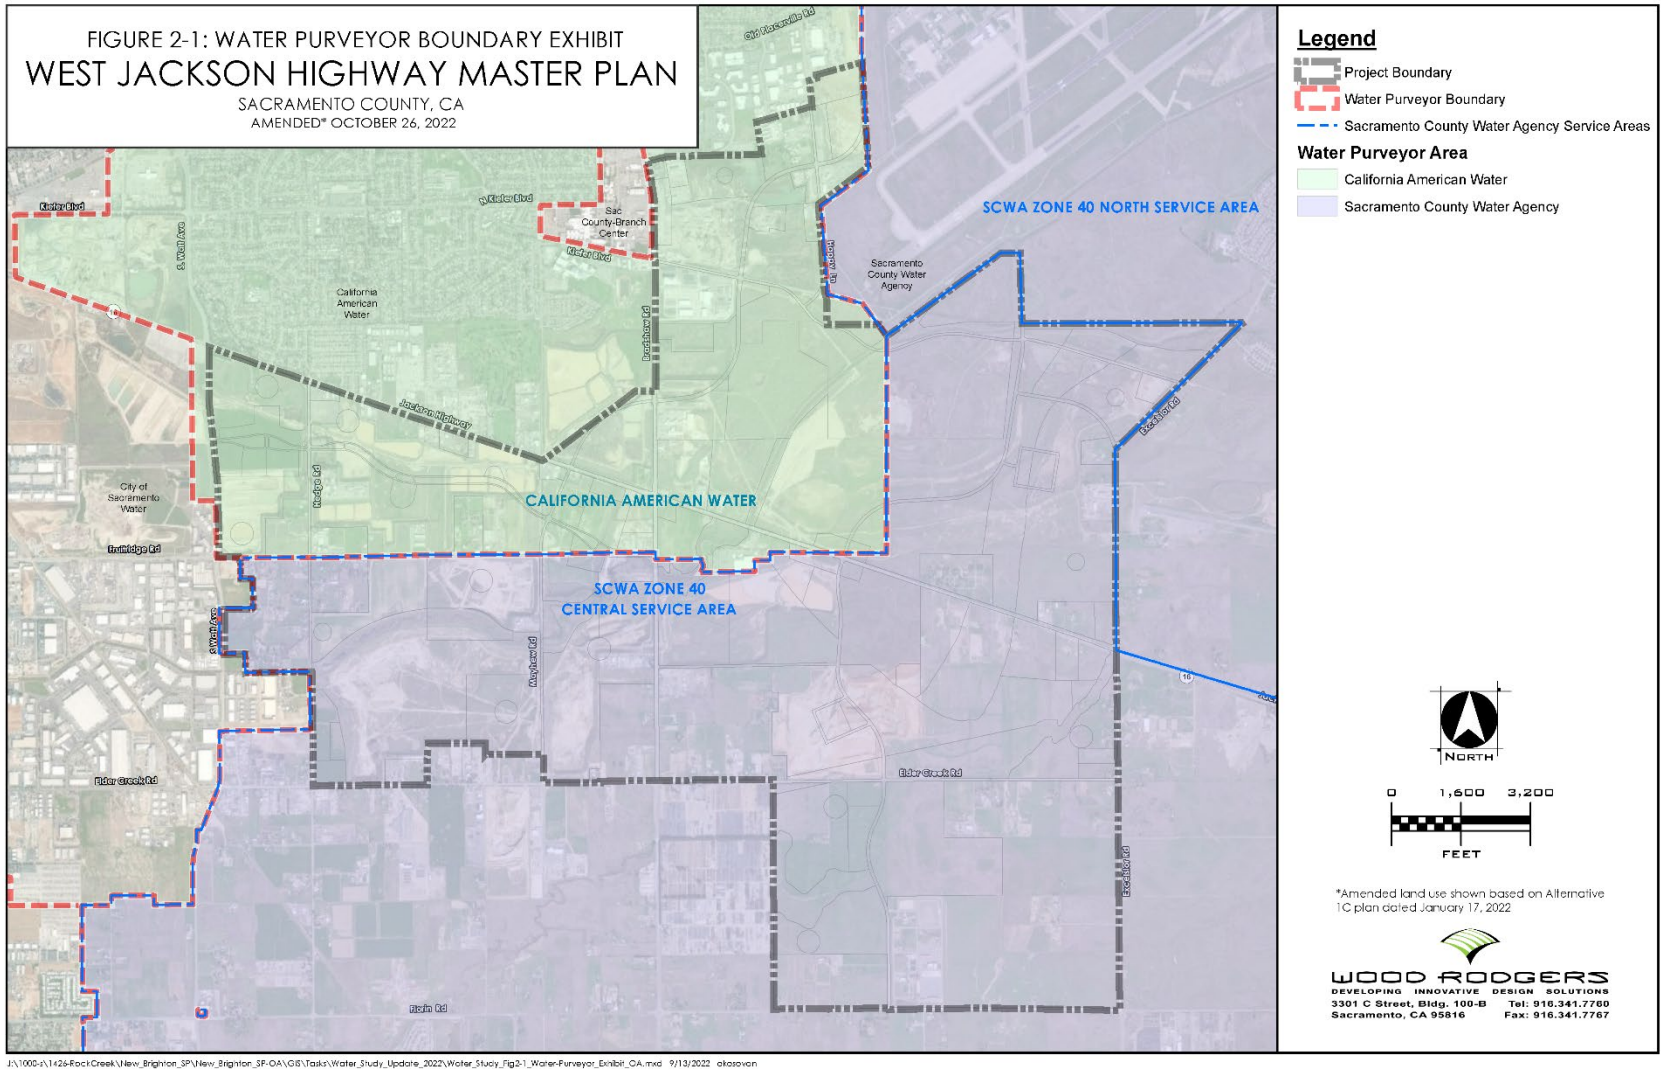


Figure 2 Water Purveyor Boundary Map From West Jackson Highway Master Plan Level 1 Domestic Water Study*

*Note: Water purveyor map sourced from page 6 of *West Jackson Highway Master Plan Level 1 Domestic Water Study, Amended 10/26/2022, Wood Rodgers*.

WSA FOR THE WEST JACKSON HIGHWAY MASTER PLAN PROJECT

Water Code Sections 10910 – 10915 delineate the specific requirements of a WSA. The WSA for the Project is structured according to these requirements.

DETERMINE IF PROJECT IS SUBJECT TO CEQA [Section 10910 (a)]

PER has made the determination that Project is subject to CEQA.

IDENTIFY RESPONSIBLE PUBLIC WATER SYSTEM [Section 10910(b)]

PER has identified SCWA as the responsible public water provider for the Project.

DETERMINE IF UWMP INCLUDES WATER DEMANDS [Section 10910(c)]

The total area for the Project that is within the SCWA benefit zone is estimated to be 4,021 acres. The projected annual water demand for the Project is 6,008 acre-feet per year (AF/year), including system losses. The proposed land use and projected water demand for the Study Area is provided in **Table 1**. See **Figure 3** for a land-use diagram of the entire project area.

Table 1 Proposed Land Use and Water Demand Estimate for the Project

Land Uses	Unit Water Demand Factor (AF/Year/Acre)	Gross Acreage	Water Demand (AF/Year)
Residential Designations			
Multi-family Residential (low density)	2.44	41	100.0
Multi-family Residential (high density)	3.33	149	496.2
Single Family	2.13	1,511	3,218.4
Rural Estate	1.37	95	130.2
Subtotal - Residential		**1,796**	**3,944.8**
Light Industrial	2.02	79	159.6
Commercial	2.02	303	612.1
Public Recreation	2.80	281	786.8
Public	0.81	76	61.6
ROW	0.818	131	23.6
Vacant	-	1,355	-
Subtotal – Non-Residential		**2,225**	**1,643.6**
Total w/o System Loss			**5,588.4**
System Loss (7.5%)			419.2
GRAND TOTAL		**4,021**	**6,007.5**

Note: Information was provided by *West Jackson Highway Master Plan Level 1 Domestic Water Study (Amended October 26, 2022, Wood Rodgers)*. Minor rounding discrepancies account for the difference in total calculated demands identified in the table above and the information provided by Wood Rodgers.

The Project is included in the WSMPA and the estimated demands are accounted for in the current 2020 UWMP, which describes SCWA's existing and projected water demands through

2045. Therefore, the UWMP will serve as the base document for preparing the WSA for the Project.

The projected population growth for Zone 40 was based on the estimated annual number of new connections. First, the buildout population was estimated based on the projected number of dwelling unit connections at buildout. The annual number of new connections was then estimated. The details of population projection for Zone 40 are documented in the WSIP. The WSIP developed buildout land use acreage by type of land use, which was used to quantify the buildout number of dwelling units and water system connections. That assessment included those in the 2030 Study Area and the new growth areas such as the Project. The UWMP adopts the findings and results of the WSIP and presents the population growth projection in 5-year intervals from 2020 to 2045. Note that buildout is projected to occur after 2045 in Zone 40. The 5-year interval population projection is shown in **Table 2** below. The UWMP estimates the water demands for SCWA's service areas in 5-year increments for the 20-year projection (2020 to 2045), as shown in Table 4-10 of the UWMP. A summary of the pertinent data from these tables is presented in **Table 3** below.

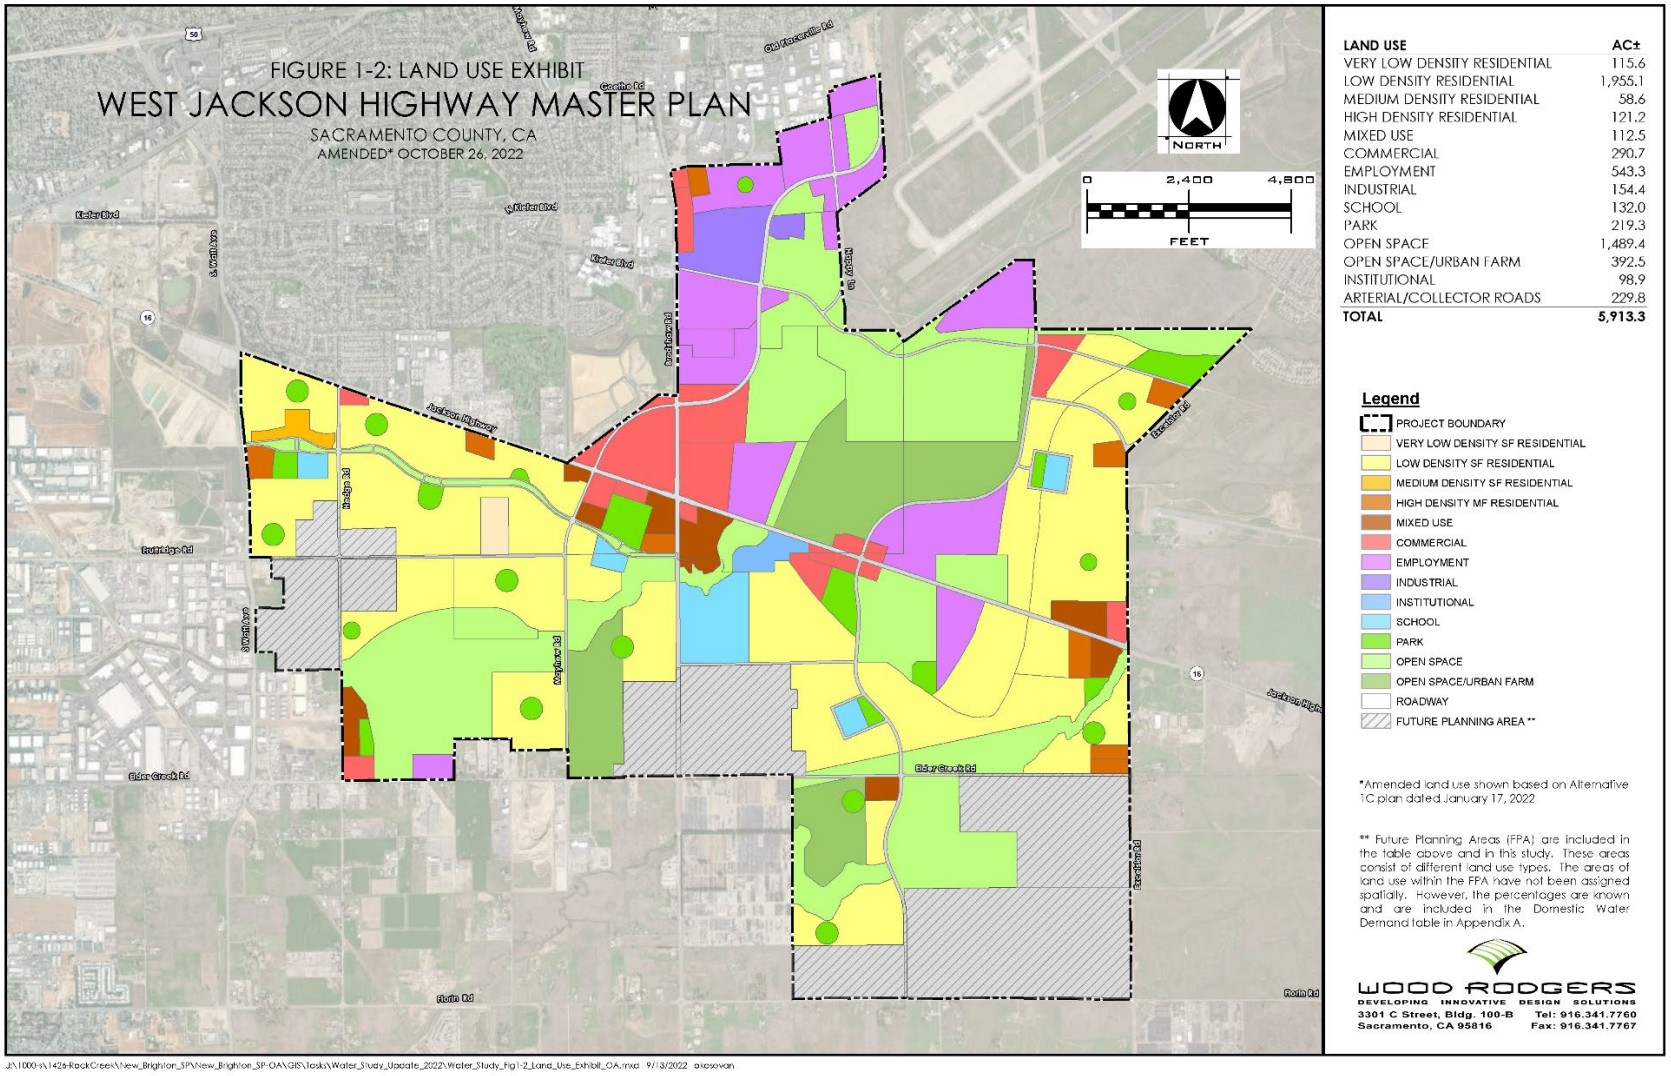

Figure 3 Land Use Diagram From West Jackson Highway Master Plan Level 1 Domestic Water Study*

*Note: Land use diagram sourced from Page 4 of *West Jackson Highway Master Plan Level 1 Domestic Water Study (Amended 10/26/2022, Wood Rodgers)*

Table 2 Population Projection for SCWA Zone 40

SCWA Service Areas	2020	2025	2030	2035	2040	2045
Zone 40 - North Service Area, Central Service Area, South Service Area[1]	169,000	197,027	225,054	253,081	275,698	298,314

[1] Population developed in the 2020 UWMP – see Table 2-7: Zone 40 Population Forecast tied to UWMP connection Projections.

Table 3 Water Demands for SCWA Zone 40 – Normal Year (AF/Year)

SCWA Service Areas	2025	2030	2035	2040	2045
Zone 40 - North Service Area, Central Service Area, South Service Area[1]	46,235	54,494	62,006	68,143	74,388

[1] Water demands developed in the 2020 UWMP – see Table 4-10(a): Zone 40 Forecast Potable Water Use

The water demands for all other dry year scenarios can be found in the 2020 UWMP Chapter 4.

The water demands associated with the Project are substantially included in all tables above and in the UWMP. **Table 4** shows the estimated water demand growth for the Project.

Table 4 Projected Water Demand Growth in Five-Year Increments for the Project (AF/Year)

	2025	2030	2035	2040	2045
Projected Water Demand(1)	1,201	2,401	3,602	4,802	6,008(2)

Notes
1. Information was provided by Wood Rodgers, Inc. 10/18/23.
2. Minor discrepancies in totals provide by applicant and calculated by SCWA due to rounding differences.

IDENTIFY EXISTING WATER SUPPLIES FOR THE PROJECT [Section 10910(d)]

SECTION 10910(d)(1)

Section 10910(d)(1) requires identification of existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the Project and a description of the quantities of water obtained by SCWA pursuant to these water supply entitlements, water rights, or water service contracts in previous years.

Chapter 3 of the 2020 UWMP details all SCWA water supplies. Specifically, 3.1 details Surface Water Rights and Contracts and 3.2 details Groundwater. The Project water demands, as part of the Zone 40 water demand, will ultimately be met by conjunctive use of groundwater and surface water and a small portion of recycled water as described in the 2020 UWMP.

SECTION 10910(d)(2)

Section 10910(d)(2) requires SCWA to demonstrate that water supplies required to serve the Project exist. Section 10910(d)(2) defines what constitutes "proof."

Section 10910(d)(2)(A)

This subsection requires written contracts or other proof of entitlement to the water supplies identified for the Project. The contracts and agreements for the surface water supplies are available for review at the offices of the County of Sacramento, Department of Water Resources.

Initial water demands of the Project could be met with groundwater. SCWA will exercise its right as a groundwater appropriator to extract groundwater from the basin for delivery to the Project; surface water will be from existing entitlements diverted from the Sacramento River and treated at the VSWTP. In the long-term, the water demands for the Project will be met in accordance with the conjunctive use program described in the WSMP.

Section 10910(d)(2)(B)

This subsection requires a copy of the capital outlay program for financing the delivery of the identified water supply to the Project. The documents described below are available for review at the offices of the County of Sacramento, Department of Water Resources.

A financing plan for the construction of groundwater and surface water facilities needed to realize the conjunctive use program identified in the WSMP was approved by SCWA Board. The financing plan, as outlined in Chapter 7 of the WSMP, identifies the necessary water facility projects and estimated costs associated with implementation of said conjunctive use program (Capital Improvement Program or CIP). Section 8.3 of the WSMPA identifies additional infrastructure and a Capital Improvement Plan necessary to serve the Project area.

In addition to the WSMP, the Feasibility Report for Sacramento County Water Financing Authority Series 2007 Revenue Bonds (Sacramento County Water Agency Freeport Project) (MWH, April 2007), and the Sacramento County Water Agency Zone 40 Water Development Fee Study (HDR, August 2023) evaluated and updated the total cost and fee requirements of the Zone 40 conjunctive use program incorporating all future Zone 40 expenditures for major capital facilities (i.e., surface water treatment plants, groundwater treatment plants, major transmission mains, etc.). Funding to meet SCWA's capital and annual funding requirements was then implemented by the SCWA Board through the issuance of revenue bonds for certain projects and the adoption of user fee and development fee increases over time.

SCWA's capital outlay program includes the means for financing facilities to deliver the identified water supply to the Project. Specifically, all facilities needed to serve the Project are included in the CIP that was financed through the above-described revenue bonds, user fee, and development fee. The development fee and user fee, as described in Titles 3 and 4 of the

Sacramento County Water Agency Code, will continue to provide revenue to finance all aspects of the Zone 40 conjunctive use program, including repayment of debt financing. Both fee programs are evaluated periodically and adjusted, if necessary, to accommodate changes in the service area, water demands, needed capital projects, and required debt financing. Based on the CIP, a 10-year CIP is annually updated by the SCWA Board.

Section 10910(d)(2)(C)

This subsection requires identification of any federal, state, and local permits required for construction of the facilities identified for delivering the water supply to the Project.

Water deliveries to the Project will be made through connecting to the existing T-mains surrounding the Project and additional infrastructure internal to the Project as detailed in the WSIP. The 2016 WSIP accounts for the infrastructure needs of this Project. Federal, state, and local permits for the construction of the facilities for delivering water supply to the project will undergo site-specific environmental review and approval. Required permits identified pursuant to the review will have to be obtained prior to acceptance of bids for construction of any project. SCWA does not foresee any regulatory or legal impediments to completing any necessary further environmental review and obtaining those permits when the need arises.

Section 10910(d)(2)(D)

This subsection requires identification of any regulatory approvals required for delivery of the water supply to the Project.

Water production, treatment, and storage facilities will be added to SCWA's public water system permit issued by the California Department of Public Health (DPH) and the design of these facilities will require review and approval by DPH. No other regulatory approvals are anticipated.

New water service and discretionary approval of any project may be withheld until compliance with the Endangered Species Act (ESA) is demonstrated. Depending upon the source of water, compliance may be demonstrated by one of the following: participation in the South Sacramento Habitat Conservation Plan (SSHCP); a letter from the US Fish and Wildlife Service (USFWS) to the project proponent and/or federal agency indicating the Project is not likely to adversely affect or result in a take of listed species; incidental take coverage through a biological opinion for the project; or, incidental take coverage through an ESA section 10(a)(1)(B) permit for the project. This requirement may be a condition of approval for any discretionary action taken by the local land use authority.

IDENTIFY PARTIES DEPENDENT UPON PROPOSED SUPPLY [Section 10910(e)]

SECTION 10910(e)

Section 10910(e) states:

"If no water has been received in prior years by the public water system…, under the existing water supply entitlements, water rights, or water service contracts [identified to serve the proposed project], the public water system,…shall also include in its water supply assessment pursuant to subdivision (c), an identification of the other public water systems or water service contract holders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts to the same source of water as the public water system,…, has identified as a source of water supply within its water supply assessments."

The intent of this section is to identify any potential conflicts that may arise from the exercise of a water supply entitlement, water right, or water service contract to serve a proposed project if such water supply entitlement, water right, or water service contract has not been previously exercised.

Use of Groundwater

The water demands of Zone 40 (including the Project) will be met with groundwater and surface water. SCWA has previously exercised its rights as a groundwater appropriator to meet the water demands of its customers and will continue to exercise those rights to provide treated groundwater supplies to the Project.

Use of Surface Water

The surface water supplies associated with SCWA's conjunctive use program fall into the following categories:

1) Purchased water supplies available through a current USBR CVP contract.
2) Purchased water available through the City of Sacramento for use within the American River Place of Use (POU).
3) Water supplies available through SWRCB Permit 21209.
4) SWRCB Appropriative Water Right License 1062
5) SWRCB Appropriative Water Right License 4060
6) Agreement Between Sacramento County, SCWA and Aerojet with respect to Transfer of GET Water
7) Contract Between State of California Department of Water Resources and North Delta Water Agency
8) 2002 Wholesale Agreement Between SRCSD and SCWA
9) 2004 Agreement with the City of Sacramento for Wholesaling and/or Wheeling Water Service for Sacramento International Airport and Metro Air Park
10) 2000 Agreement Between City of Sacramento and the Sacramento County Water Agency to Treat and Deliver (Wheel) Surface Water
11) 2000 Memorandum of Understanding Regarding the Operation of A Water System Interconnection at 2750 Mercantile Drive
12) Fruitridge Vista Water Company Contract now held by Cal American Water Company

For USBR CVP purchased water and SWRCB Permit 21209 surface water, the parties that could most directly be affected are other CVP contractors, State Water Project (SWP) contractors, water rights holders subject to Term 91 conditions, and riparian diverters downstream of SCWA's point of diversion. The point of diversion is at a site near the community of Freeport on the Sacramento River.

The source of POU water supply is wholesale water from the City of Sacramento to serve the area that lies within the POU. Delivery of this water to SCWA has been included in the City of Sacramento's long-range plan for perfecting their American River water rights. The diversion location, timing, and volume of delivery are currently under negotiation.

DOES SUPPLY FOR PROJECT INCLUDE GROUNDWATER? [Section 10190(f)]

SECTION 10910(f)

As stated earlier, the water supply for Zone 40 (including the Project) include groundwater. Section 10910(f) requires additional information about groundwater to be presented in this WSA.

Section 10910(f)(1)

Section 10910(f)(1) requires a review of groundwater information contained in the UWMP relevant to the identified water supply for the Project. Section 3.2 of the 2020 UWMP provides a description of the applicable groundwater basins, the status of groundwater management, overdraft conditions, historical groundwater pumping, and the remediated groundwater supply.

Section 10910(f)(2)

Section 10910(f)(2) requires a description of the groundwater basin and the efforts being taken to prevent long-term overdraft.
Section 3.2.2 of the 2020 UWMP describes groundwater management in the South American Subbasin. Below is information for historical context.

- **South American Subbasin (5-21.65)**

For the Project, SCWA would pump groundwater from the South American Subbasin as defined by the California Department of Water Resources (DWR) Bulletin 118. According to Bulletin 118, the South American Subbasin is defined as the area bounded on the west by Interstate 5 and the Sacramento River, on the north by the American River, on the south by the Cosumnes and Mokelumne rivers and on the east by the Sierra Nevada.

Groundwater in the South American Subbasin is generally classified as occurring in a shallow aquifer (Laguna or Modesto Formation) and in a deep aquifer (Mehrten Formation). The Laguna or Modesto Formation consists of older alluvial deposits of loosely to moderately compacted sand, silt, and gravel deposited in alluvial fans. These deposits are moderately permeable and have a thickness of about 100 to 650 feet. The deeper Mehrten Formation is a sequence of fragmented volcanic rocks which crops out in a discontinuous band along the eastern margin of the basin. It is composed of black volcanic sands, stream gravels, silt, and clay inter-bedded with

intervals of dense tuff breccia. The sand and gravel intervals are highly permeable and the tuff breccia intervals act as confining layers. The thickness of the Mehrten Formation is between 200 and 1,200 feet. Groundwater is located from 20 to 100 feet below the ground surface depending on when and where the measurement is taken. The base of the potable water portion of the deep aquifer is located approximately 1,400 feet below the ground surface.

Intensive use of groundwater over the past 60 years has resulted in a general lowering of groundwater elevations. Over time, isolated groundwater depressions have grown and coalesced into a single cone of depression that is centered in the southwestern portion of the basin. Groundwater level trends through much of the basin have generally declined consistently from the 1950s and 1960s to about 1980 by 20 to 30 feet. From 1980 through 1983, water levels recovered by about 10 feet and remained stable until the beginning of the 1987-1992 drought; however, wells in the vicinity of Rancho Cordova appear to have recovered less than other wells in the basin since 1995 (generally less than 10 feet). From 1995 to 2003 most groundwater levels recovered to levels that were generally higher than levels prior to the 1987 through 1992 drought. Much of this recovery can be attributed to the increased use of surface water in the South American Subbasin, and the fallowing of previously irrigated agricultural lands transitioning into new urban development areas. In the central portion of the South American Subbasin groundwater level trends observed in California Department of Water Resources monitoring wells generally vary between 40 feet above to 40 feet below mean sea level over the period of the 1950's through the 2000's.

Recharge of the aquifer system occurs along active river and stream channels where extensive sand and gravel deposits exist, particularly along the American, Cosumnes, and Sacramento rivers. Additional recharge occurs along the eastern boundary of Sacramento County at the transition point from the consolidated rocks of the Sierra Nevada to the alluvial-deposited basin sediments. This recharge is classified as subsurface recharge along with underground flow into and out of the basin with adjacent groundwater basins. Other sources of recharge include deep percolation from applied surface water and precipitation.

The sustainable yield for the South American Subbasin was estimated as a part of the Groundwater Sustainability Plan development process, under the mandate of the 2014 Sustainable Groundwater Management Act (SGMA), using analysis of data and information from a number of groundwater modeling scenarios from the *Integrated Water Resources Model of the Cosumnes, South American, and North American* (CoSANA model) for historical, baseline and project conditions reflecting various hydrologic and operational conditions in the Subbasin. The scenarios used a 50-year hydrologic period, which represented reasonably long-term conditions in the Subbasin. The goal of the analysis was to establish a sustainable yield to avoid causing undesirable results as defined and established as part of the GSP Sustainable Management Criteria (SMC). The estimated long term annual sustainable yield of groundwater from the South American Subbasin is 235,000 AF/year. Supply and demand inputs into the CoSANA model for both current baseline conditions (water years 1970-2019) and projected baseline conditions (water year 2040) included SCWA Zone 40 operations and inclusive of those potentially associated with the LEACP. The full CoSANA model report may be viewed as *Appendix 2 –B CoSANA Model Report* of the South American Subbasin Groundwater Sustainability Plan and may be accessed at http://sasbgroundwater.org/resources.html

- **Sustainable Groundwater Management Act (SGMA)**

The Sustainable Groundwater Management Act (SGMA), passed by the California legislature in 2014, requires local entities to jointly assess groundwater conditions in their local areas and to develop a Groundwater Sustainability Plan (GSP) by a specified deadline to ensure that sustainable conditions are achieved within 20 years of GSP adoption. An effective and efficient groundwater management plan is critical to the health and welfare of the people, the environment and all other uses and users of groundwater in a local area.

Six local entities responded to the mandate of SGMA and formed Groundwater Sustainability Agencies (GSAs) within the South American Subbasin (SASb). Sacramento Central Groundwater Authority (SCGA), Omochumne-Hartnell Water District (OHWD), Sloughhouse Resource Conservation District (SRCD), North Delta GSAs (NDGSA), Reclamation District 551 (RD 551), and Sacramento County, agreed to work together to develop and implement a GSP for the SASb. The South American Subbasin Groundwater Sustainability Plan (October 2021) was approved by the California Department of Water Resources on July 27, 2023. A copy of the GSP as submitted, may be viewed at http://sasbgroundwater.org/.

The local entities represented by the six GSAs in the SASb included the City of Sacramento, Sacramento County Water Agency, City of Elk Grove, City of Rancho Cordova, City of Folsom, Rancho Murieta, Sacramento Regional County Sanitation District, Elk Grove Water District, OHWD, SRCD and Reclamation Districts. A variety of local interests are also represented by these GSAs, including agricultural-residential water users, agricultural water users, public water systems, local land use planning agencies, environmental interests, surface water users, the federal government, tribal governments, disadvantaged communities, groundwater monitoring and reporting entities, holders of overlying groundwater rights, adjacent Subbasins, industrial users, commercial users, remediation pumpers, natural ecosystems, and the general public. Many of these local entities have a long history with groundwater and surface water management in the SASb and are well equipped to perform SGMA-required planning functions.

The six GSAs in the SASb have undertaken a thorough and timely review of past, current and projected future water resources needs and groundwater conditions to meet SGMA requirements for GSP development. Throughout the development of the SASb GSP, regular communication and engagement activities were conducted to inform and receive input from local stakeholders and the general public. The SASb GSP includes a comprehensive groundwater subbasin description, which was used in the development of a regional surface and ground water model that quantifies current water budgets and projects future conditions associated with population growth, land use changes, water conservation, climate change, and consideration of beneficial projects that are planned to occur over the next five to ten years. The SASb GSP also includes a thorough assessment of the impacts of predicted future groundwater levels on beneficial users, including groundwater-dependent ecosystems, shallow wells, and interconnected surface water. Importantly, these assessments are used to develop measurable sustainable management criteria

that avoid significant and unreasonable impacts to these beneficial users, and that can be monitored and adjusted throughout plan implementation.

The key finding of the SASb GSP, based on thorough analysis of the best available information, is that the basin will be sustainable over the next twenty years as long as planned recycled water, recharge and other projects are implemented. These projects will raise groundwater levels above current levels, maintain storage volumes, and protect ecosystems, interconnected surface water, and shallow well users. Although projected climate change conditions will increase groundwater use, these effects are not expected to cause the SASb to become unsustainable or to cause significant decreasing trends in groundwater conditions. A groundwater monitoring network comprised of more than 50 wells will be used to track groundwater levels and groundwater quality. Management criteria set at each well in the network will be implemented to assess these conditions over time and ensure that levels and quality remain within a range that avoids significant and unreasonable impacts to beneficial uses and users of groundwater. Once approved by the GSAs, the activities identified and developed through the SASb GSP development process will be implemented, including:

- Ongoing monitoring and annual reporting on conditions in the SASb;
- Ongoing public engagement and outreach;
- Coordination among the GSAs and with neighboring subbasins;
- Development and implementation of a shallow well protection and monitoring program;
- Coordination with regional entities to develop a regional water bank;
- Coordination with land use agencies and water supply agencies to promote consistency with the GSP;
- Coordination with regional agencies in the development of updated climate change projections; and,
- Preparation of a five-year update to the GSP to be submitted in 2027

- **SCWA Conjunctive Use Program**

Section 3.2 and Appendix E of the WSMP provide detailed descriptions of the Zone 40 conjunctive use program. SCWA's operational approach for preventing overdraft of the groundwater basin underlying Zone 40 and optimizing the use of both groundwater and surface water is discussed in detail in these sections. The FEIR for 2002 Zone 40 Water Supply Master Plan includes an extensive analysis of the effects of the Zone 40 conjunctive use program on the groundwater basin and on various recharge sources. A summary of the conjunctive use program is as follows:

SCWA's conjunctive use program is a coordinated approach to manage surface water and groundwater supplies to maximize the yield of available water resources. The conjunctive use program for SCWA includes the use of groundwater, surface water, remediated water, and recycled water supplies. The program also includes the construction of a surface water diversion structure, a surface-water treatment plant, and water conveyance pipelines, as well as groundwater extraction, treatment, and distribution facilities.

This conjunctive use program relies on an abundance of surface water in wet years when as much surface water as possible will be diverted, within entitlement limitations, minimizing the use of groundwater. During these years the groundwater aquifer will be allowed to naturally replenish. In dry years, when surface water availability is reduced, SCWA will pump more groundwater from the replenished aquifer. Using surface water and groundwater conjunctively makes it easier for SCWA to meet demands in a single dry year or in multiple dry years. The goal of the conjunctive use program is to meet all demands during wet and dry years.

SCWA has adopted policies to ensure systematic, incremental implementation of its conjunctive use program. These policies are also consistent with the terms of the WFA, which is intended to maintain a long-term sustainable groundwater supply. The policies are included in the SCWA's UWMP and WSMP, which include specific action items to ensure implementation. Action items include development of additional surface water supply and treatment facilities to provide water during wet years, development of groundwater facilities to provide groundwater during dry years, in-lieu "banking" of groundwater during wet years, development and implementation of demand management and water conservation strategies, development of water reclamation facilities to meet non-potable demands, and development of a financing plan to implement these action items.

The conjunctive use program was included in the development of the SASb GSP's water budget and sustainable yield.

Section 10910(f)(3)

Section 10910(f)(3) requires a description of the volume and geographic distribution of groundwater extractions from the basin for the last five years.

Table 5 identifies past volumes of groundwater extracted by SCWA in Zone 40 between 2000 – 2022. The 2020 UWMP contains 2016-2020 in Table 3-29.

Table 5 Historical Groundwater Pumping in Zone 40, 2000 – 2022

Year	(Acre-Feet/Year)
2000	20,022
2001	22,306
2002	22,949
2003	22,745
2004	25,790
2005	29,184
2006	31,162
2007	31,249
2008	34,225
2009	34,249
2010	32,171
2011	29,809
2012	26,363
2013	23,274
2014	19,683
2015	20,675
2016	18,856
2017	17,157
2018	16,748
2019	14,654
2020	22,475
2021	22,057
2022	25,604

Through the water supply master planning process, SCWA identified a system of sixteen separate well fields throughout Zone 40. A distributed groundwater extraction strategy was selected because it would minimize drawdown effects of pumping by spreading extraction over a wide geographic area. The approximate locations of the SCWA's current and future well fields is shown in **Figure 3**.

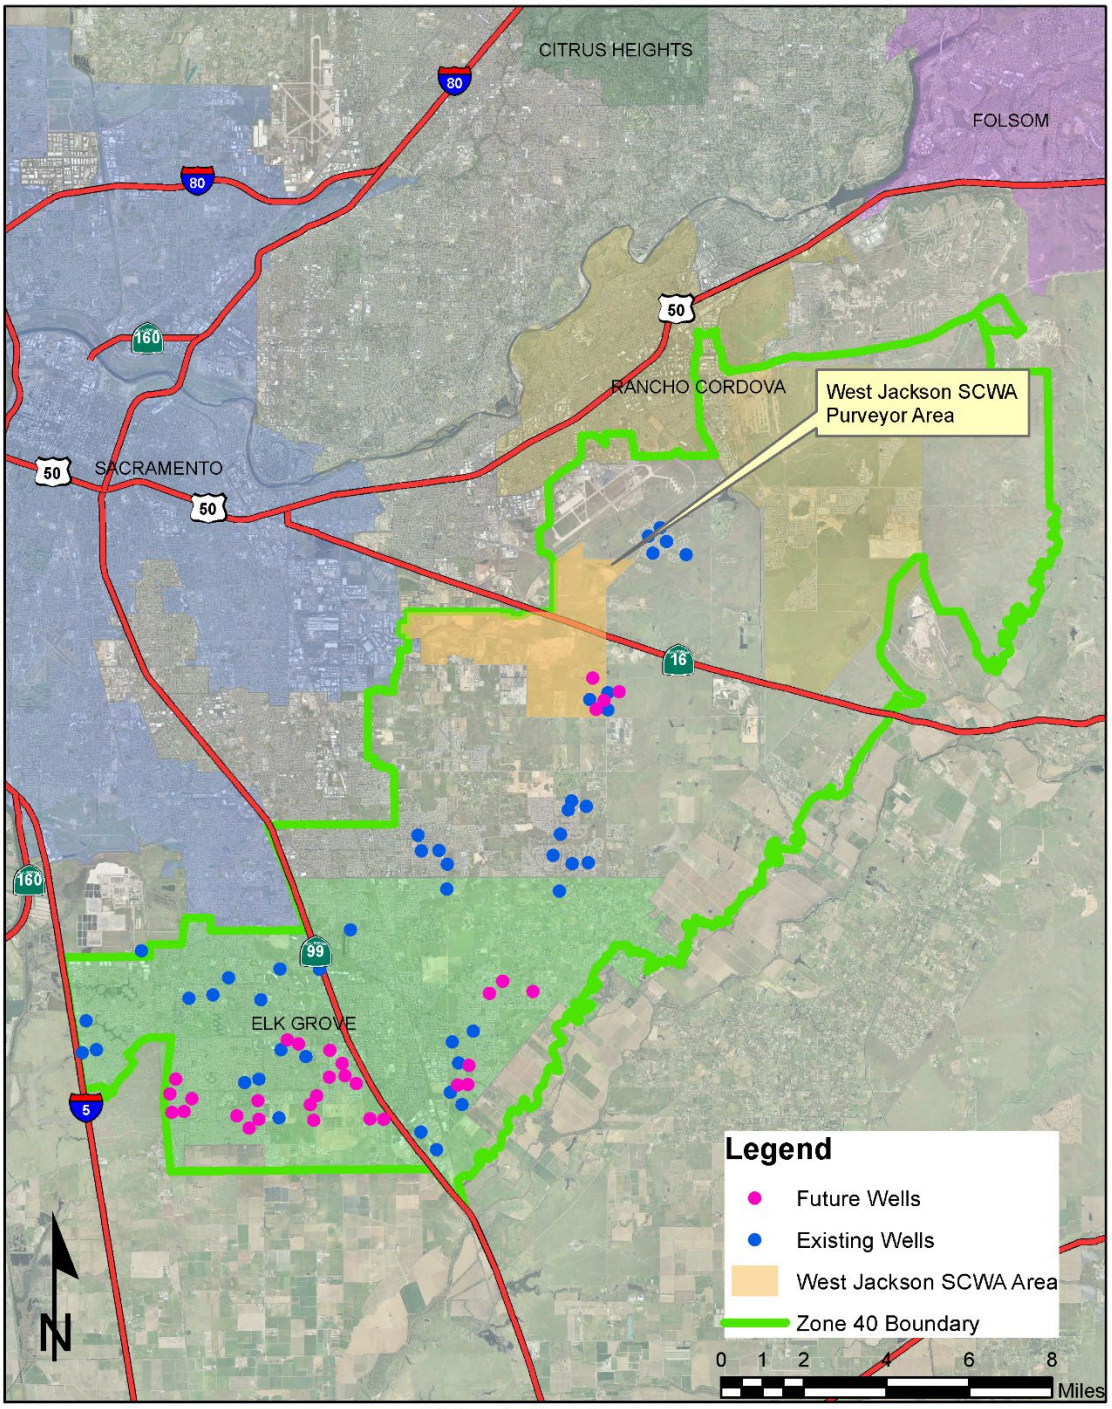

Figure 4 Existing and Future Well Fields in SCWA Zone 40

Section 10910(f)(4)

Section 10910(f)(4) requires a description of the projected volume and geographic distribution of groundwater extractions from the basin.

Groundwater use has declined since the VSWTP has come online, but it will increase over time as water demand continues to grow in Zone 40. In wet and normal years, groundwater pumping will be minimized because surface water becomes the major water supply source. In dry years, groundwater pumping will increase significantly as surface water availability is considerably reduced. Section 3.2.2 Zone 40 Groundwater in the 2020 UWMP describes groundwater use through 2045.

Section 10910(f)(5)

Section 10910(f)(5) requires an analysis of the sufficiency of the groundwater basin to meet the demands associated with the Project.

The Groundwater Sustainability Plan development process for the South American Subbasin estimated a long-term sustainable average annual yield of 235,000 AF/year and provided for SCWA's groundwater needs as identified in the WSMP. The WSMP describes a conjunctive use program that identifies and projects a long-term average use of groundwater to meet identified water demands, including the demand associated with the Project. The South American Sub-basin GSP also accounts for growth in the Project area.

SCWA's conjunctive use program has been extensively analyzed and documented in the WSMP, the FEIR for 2002 WSMP (certified in February 2006), the FEIR – WFA (certified in 1999), and the WFA.

DETERMINATION OF SUFFICIENCY

SCWA determines that it has identified sufficient water supplies to meet the water demands of the Project over the next 20 years during normal, single dry, and multiple dry years.

SCWA makes this determination based on the information provided in this WSA and on the following specific facts:

- SCWA's conjunctive use program is a sustainable water supply program that provides a 100-percent reliable water supply while protecting environmental values and stabilizing the groundwater basin underlying Zone 40.
- SCWA's conjunctive use program has been extensively analyzed and documented in the WSMP, the FEIR for 2002 WSMP (certified in February 2006), the FEIR – WFA (certified in 1999), and the WFA. All referenced documents have been subjected to thorough technical peer review and public scrutiny.
- The Project will be served by water supplies made available through SCWA's conjunctive use program.
- A financing plan for SCWA's conjunctive use program for constructing facilities required for delivering groundwater and surface water to the Project has been approved by the SCWA Board through its adoption of the WSMP, Bond Feasibility Reports, and the Sacramento County Water Agency Code.

The 2020 UWMP demonstrates that SCWA's total projected water supplies during normal, single dry, and multiple dry water years meet the proposed water demands over the next 20 years.

CONCLUSION

This WSA documents all required information specifically delineated by Water Code Sections 10910 – 10915. It demonstrates that SCWA's water supplies are sufficient to satisfy the water demands of the currently proposed Project while still meeting the current and projected water demands of existing customers in the next 20 years. If there are significant changes to land uses for the proposed Project in the future, this WSA may need to be revisited and updated accordingly.

California American Water

Water Supply Assessment for
West Jackson Highway Master Plan

February 2024

I. Introduction

On August 14, 2023, the County of Sacrmento submitted a letter to California American Water requesting a Water Supply Assessment (WSA) for the proposed West Jackson Highway Project (Project). This WSA was prepared pursuant to the **California Water Code [Section 10910]**. California American Water's 2020 Urban Water Management Plan (2020 UWMP) for the Suburban-Rosemont service area did not include water demands for the Project; therefore, this assessment addresses the ability of California American Water to serve water to this Project.

II. Project Overview

The Project encompasses approximately 5,913 acres and is in the central part of Sacramento County. The Project area is located southeast of the South Watt Avenue/Jackson Highway intersection east to Bradshaw Road, and northeast of South Watt Avenue/Elder Creek Road east to Bradshaw Road. East of Bradshaw Road, the Project area extends north to Goethe Road, then easterly south of the Mather Airport to Excelsior Road, which is the easterly boundary of the Project area. The Project area extends south along Excelsior Road to Florin Road, which is the southern boundary of the Project. The Project boundary follows Florin Road westerly to Excelsior Road for approximately 8,000 feet, then north to Elder Creek Road, which becomes the southerly boundary west to Hedge Avenue. The Project is partially located within California American Water's Suburban-Rosemont service area. This includes 1,892 acres in the northwest portion of the Project area bound roughly by Fruitridge Road to the south and Happy Lane to the east. The remaining portion of the Project area will be served by Sacramento County Water Agency.

Wood Rogers, Inc. submitted a Level 1 Domestic Water Study in 2018. In 2022, a revision to this study was submitted that updated projected demands. Changes to the demands generally included an increase in Low Density Residential, Mixed Use, and Park zoning and a decrease in High Density Residential, Commercial, and School zoning. The total acreage of the Project site remains the same, but the annual water demand increased from 973 million gallons (MG) to 996 MG, for a difference of 23 MG. The original and revised demands attached at the end of this document.

III. Water Demands [Section 10910(c)]

California American Water's 2020 UWMP for Suburban-Rosemont did not include the proposed demands for the Project. There have been no significant changes or updates to demand projections for California American Water's Suburban-Rosemont service area since the 2020 UWMP. Historical demands from the past five years are presented in **Table 1**.

Table 1: Historical Demands

Year	2018	2019	2020	2021	2022
Demand (MG)	2,691	2,629	2,872	2,622	2,699

Future demands were estimated by applying historical growth rates as well as the projected demands for the Project. While it is probable that Project will take longer than 20 years to complete, for the purpose of this WSA the Project was conservatively projected to be built-out and in service by 2045. The Project is assumed to begin in 2025, with 25% of the Project completed by 2030, 50% completed by 2035, 75% completed by 2040, and 100% completed by 2045. Projected demands are shown in **Table 2**.

Table 2: Projected Demands

Year	2023	2024	2025	2030	2035	2040	2045
Demand (MG)	2,709	2,718	2,727	3,024	3,322	3,620	3,920

IV. Water Supply [Section 10910(d)]

A. Identification of Water Supply Entitlements [Section 10910(d)(1)]

California American Water's Suburban-Rosemont service area is served primarily by groundwater wells. These wells draw water from the South American Subbasin (SASb). This basin is not adjudicated, therefore rights to the groundwater are based on the water rights of the property owner. As is the case with most municipal water providers, California American Water delivers water to parcels that it does not own. This is considered an appropriative use of groundwater. There is no permitting required for the use of groundwater in this case; however, the use of groundwater is limited to what is used by the overlying property owners.

California American Water has an agreement with the City of Sacramento to purchase water. In 2010, CAW revised an existing wholesale supply agreement with the City to receive a maximum of 3.46 million gallons per day (MGD) of non-firm supply during off-peak periods (October 15th through May 14th), plus an additional 2.3 MGD of firm capacity, for a total of 5.76 MGD. Because the non-firm capacity of 3.46 MGD can only be used during seven months of the year, the total yearly amount available is calculated to be 1,576 MG. However, in a dry year or multiple dry years, it is assumed that only the firm supply would be available. Additionally, this agreement includes three of California American Water's service areas, so it is assumed that this firm supply would be available to each of these service areas proportional to their respective demands. For the Suburban-Rosemont service area, this equates to 403 MG.

Total firm supply availability is summarized in **Table 3** for a normal year, a dry year, and multiple dry years.

Table 3: Supply by Year Type

Year Type	Source	Capacity (MG)
Normal Years	Groundwater Wells	9,279
	Purchased Water	1,576
	Total	10,855
Single Dry Year	Groundwater Wells	9,279
	Purchased Water	403
	Total	9,682
Multiple Dry Years	Groundwater Wells	9,279
	Purchased Water	403
	Total	9,682

B. Demonstration of Water Supply [Section 10910(d)(2)]

Section 10910(d)(2)(A), contracts or proof of entitlements: The agreement between California American Water and the City of Sacramento for purchased water is documented in both California American Water's and City of Sacramento's 2020 UWMPs, which can be found on the Department of Water Resources website at wuedata.water.ca.gov.

California American Water has appropriative rights to the groundwater extracted from groundwater wells.

Section 10910(d)(2)(B), capital outlay program: California American Water's Capital Improvement Program (CIP) must be approved by the California Public Utilities Commission (CPUC). The current approved CIP from the 2019 General Rate Case (GRC) can be found on the CPUC website at cpuc.ca.gov, Decision D.21-11-018, Appendix B, Attachment C-4. California American Water is currently awaiting a CPUC decision for its latest GRC filed in 2022, which contains an updated CIP.

Section 10910(d)(2)(C), permits for construction of infrastructure: The Project will connect to existing California American Water infrastructure. The Project owners will be responsible for providing the infrastructure to convey water to the development, including obtaining any permits for construction.

Section 10910(d)(2)(D), regulatory approvals: The Project is located within California American Water's existing service area, therefore no regulatory approvals are required in order to convey water to the Project.

V. Supply and Demand Assessment [Section 10910(c)(3)]

California American Water has sufficient supply to meet projected demands in normal, dry, and multiple dry years through 2045, as shown in **Table 4**. However, it should be noted that the groundwater wells are aging, and as they age, they tend to lose production capacity and are at risk of failure. California American Water has a well replacement plan in place that prioritizes replacement of wells that are at high risk of failure, whether it be due to age or other factors. This analysis assumes that these wells are replaced when needed to replace diminished capacity or avoid failure and that replacement wells are of similar production capacity.

Table 4: Supply and Demand

Year Type	Source	2022	2025	2030	2035	2040	2045
Normal Years	Supply (MG)	10,855	10,855	10,855	10,855	10,855	10,855
	Demand (MG)	2,699	2,727	3,024	3,322	3,620	3,920
	Surplus/Deficit (MG)	8,156	8,128	7,831	7,533	7,234	6,935
Single Dry Year	Supply (MG)	9,682	9,682	9,682	9,682	9,682	9,682
	Demand (MG)	2,699	2,727	3,024	3,322	3,620	3,920
	Surplus/Deficit (MG)	6,983	6,955	6,658	6,360	6,061	5,762
Multiple Dry Years	Supply (MG)	9,682	9,682	9,682	9,682	9,682	9,682
	Demand (MG)	2,699	2,727	3,024	3,322	3,620	3,920
	Surplus/Deficit (MG)	6,983	6,955	6,658	6,360	6,061	5,762

VI. Maximum Day Demand Analysis

According to California Code of Regulations, Title 22 Section 64554, a public water system's water source(s) shall have the capacity to meet the system's maximum day demand. **Table 5** presents a comparison of maximum day demand versus supply.

Table 5: Maximum Day Demand and Supply

Year	2023	2024	2025	2030	2035	2040	2045
Supply (MGD)	27.7	27.7	27.7	27.7	27.7	27.7	27.7
Maximum Day Demand (MGD)	14.1	14.2	14.2	15.9	17.5	19.1	20.7
Surplus/Deficit (MGD)	13.6	13.5	13.5	11.9	10.3	8.6	7.0

VII. Groundwater Withdrawals [Section 10910(f)]

Section 10910(f)(1), groundwater information in the UWMP: California American Water's 2020 UWMP identified the SASb as the source of groundwater for its Suburban-Rosemont service area. The Suburban-Rosemont service area currently has 25 operational groundwater wells with a total capacity of approximately 19,319 gallons per minute (gpm), which equates to 10,154 MG per year. The firm capacity of these wells, or the capacity with the largest well out of service, is 17,654 gpm, or 9,279 MG. These well capacities were updated from the 2020 UWMP with current well pump efficiency tests.

Section 10910(f)(2)(A), description of groundwater basin: The SASb is a high priority subbasin surrounded by the American, Cosumnes, Mokelumne, and Sacramento Rivers to the north, south and west, and the foothills of the Sierra Nevada to the east. The SASb is comprised of two aquifers; the upper and lower aquifers are described as follows in the SCGA Alternative Submittal:

"The upper fresh-water aquifer is wedge-shaped along the eastern side of the basin (dipping and thickening westward) but is relatively flat-lying on the western side. The thickness can vary up to approximately 300 feet, but is typically 200 feet, and the bottom can extend to an elevation of approximately 200 feet below mean sea level. The upper aquifer is generally correlative to the Laguna Formation and other similar/younger sediments.

The lower fresh-water aquifer is similar in shape to the upper aquifer, but considerably larger. The wedge portion of the lower aquifer, on the eastern side of the basin, rests on bedrock (relatively impermeable) and can extend to depths between 800 and 1,200 feet below mean sea level. Within the center and western portions of the basin, the base of the lower aquifer extends to depths between 1,200 and 2,000 feet below mean sea level, to the top of the unusable water. This unusable water may occur at depths of 800 feet below mean sea level beneath the Delta area of the South American Subbasin. The lower aquifer is generally correlative to the Mehrten Formation and pre-Mehrten sediments.

The Laguna and Mehrten Formations were deposited during the Pliocene and Miocene Epochs, respectively, (Gutierrez, 2011) of the Tertiary or Neogene Period (2.6 to 23.0 million years ago) in a fluvial environment (DWR, 1974). These formations are comprised of interbedded layers of gravel, sand, silt, and clay with numerous channel deposits within the South American Subbasin. The deposits are wedge-shaped and dip gently and thicken in a westerly direction. The Laguna Formation is derived from granitic and

metamorphic rocks while the Mehrten Formation is derived from andesitic rock. The Mehrten Formation also includes dense, hard layers of tuff-breccia."

"The cones-of-depressions…were developed during the middle of the last century as groundwater was pumped extensively for agricultural land uses, and were known to not be in a state of equilibrium (i.e., groundwater levels still falling) in the mid 1980's. The majority of the subbasin's recharge occurs from the percolation of rainfall and irrigation water and from the rivers that bound three sides of the subbasin, including the Delta."

Section 10910(f)(2)(C), Groundwater Sustainability Plan (GSP): California enacted the Sustainable Groundwater Management Act in 2014 and this requires that the state's high and medium priority groundwater basins develop a GSP to balance pumping and recharge to the basin. To accomplish this, six Groundwater Sustainability Agencies (GSAs) were formed to develop one GSP for the SASb. The GSP was finalized in 2022 and can be found on the SASb website at sasbgroundwater.org. The key finding of the GSP is that the basin will be sustainable over the next twenty years as long as planned recycled water, recharge, and other projects are implemented.

Section 10910(f)(3), description and analysis of the amount of groundwater pumped: Actual groundwater withdrawals for the past five years are shown in **Table 6**.

Table 6: Historical Groundwater Withdrawals

Year	2018	2019	2020	2021	2022
Groundwater Withdrawals (MG)	2,570	2,466	2,531	2,622	2,590

VIII. Infrastructure Requirements

The Project owners will be responsible for providing the necessary infrastructure to convey water to the development. This will include water mains and peaking facilities, including a tank (or tanks) and booster pump station, capable of meeting peak hour demand requirements pursuant to Title 22 Section 64554. Preliminary hydraulic modeling results show that the existing Suburban-Rosemont system has adequate pressures and flow to serve the development. Further modeling will be performed as the development plans progress.

IX. Conclusion of Sufficiency

In conclusion California American Water has sufficient supply for future demands, including the West Jackson Highway Project, through 2045. This includes normal years, dry years, and multiple dry years.

Proposed Project Demands, Original (2018) and Revised (2022)

Land Use	Area (acres)		Average Annual Demand (MG)		Average Day Demand (gpm)		Maximum Day Demand (gpm)		Peak Hour Demand (gpm)	
	2018	**2022**	**2018**	**2022**	**2018**	**2022**	**2018**	**2022**	**2018**	**2022**
