The USEPA also has established requirements for a new monitoring network to measure NO_2 concentrations near major roadways in urban areas with a population of 500,000 or more. Sixteen new near-roadway monitoring sites are required in California, three of which are in the Bay Area. These monitors are located in Berkeley, Oakland, and San Jose. The new monitoring data has not resulted in a need to change area attainment designations (BAAQMD 2014).

Sulfur Dioxide

SO_2 is a colorless acidic gas with a strong odor. It is produced by the combustion of sulfur-containing fuels such as oil, coal, and diesel. SO_2 has the potential to damage materials and can cause health effects at high concentrations. It can irritate lung tissue and increase the risk of acute and chronic respiratory disease (BAAQMD 2017: B-2, C-16). SO_2 monitoring was terminated at the San Francisco station in 2009 because the state standard for SO_2 is being met in the Bay Area, and pollutant trends suggest that the air basin will continue to meet this standard for the foreseeable future.

In 2010, the USEPA implemented a new 1-hour SO_2 standard presented in **Table 4.9-5**. The USEPA has initially designated the air basin as an attainment area for SO_2. Similar to the new federal standard for NO_2, the USEPA has established requirements for a new monitoring network to measure SO_2 concentrations (USEPA 2016a). No additional SO_2 monitors are required for the Bay Area because the air basin has never been designated as non-attainment for SO_2 and no State Implementation Plan or maintenance plans have been prepared for SO_2 (BAAQMD 2012).

Lead

Leaded gasoline (phased out in the United States beginning in 1973), paint (on older houses and cars), smelters (metal refineries), and manufacture of lead storage batteries have been the primary sources of lead released into the atmosphere. Lead has a range of adverse neurotoxic health effects, which put children at special risk. Some lead-containing chemicals cause cancer

in animals. Lead levels in the air have decreased substantially since leaded gasoline was eliminated. Ambient lead concentrations are only monitored on an as-warranted, site-specific basis in California. On October 15, 2008, the USEPA strengthened the national ambient air quality standard for lead by lowering it from 1.5 $\mu g/m^3$ to 0.15 $\mu g/m^3$. The USEPA revised the monitoring requirements for lead in December 2010. These requirements focus on airports and large urban areas resulting in an increase in 76 monitors nationally (USEPA 2016a). The USEPA operates a lead monitoring station at the Reid-Hillview Airport (San Jose). Non-airport lead monitoring locations in the Bay Area are in San Jose (Jackson Street) and San Francisco (Arkansas Street) (USEPA 2023).

e. Air Quality Index

The USEPA developed the Air Quality Index scale to make the public health impacts of air pollution concentrations easily understandable. The index, much like an air quality "thermometer," translates daily air pollution concentrations into a number on a scale between 0 and 500. The numbers in the scale are divided into six color-coded ranges, with numbers 0 through 500 as outlined below:

- **Green (0–50)** indicates "good" air quality. No health impacts are expected when air quality is in the green range.
- **Yellow (51–100)** indicates air quality is "moderate." Unusually sensitive people should consider limiting prolonged outdoor exertion.
- **Orange (101–150)** indicates air quality is "unhealthy for sensitive groups." Active children and adults, and people with respiratory disease, such as asthma, should limit outdoor exertion.
- **Red (151–200)** indicates air quality is "unhealthy." Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children, should limit prolonged outdoor exertion.
- **Purple (201–300)** indicates air quality is "very unhealthy." Active children and adults, and people with respiratory disease, such as asthma, should avoid prolonged outdoor exertion; everyone else, especially children, should limit outdoor exertion.
- **Maroon (301–500)** indicates air quality is "hazardous." This would trigger health warnings of emergency conditions, and the entire population is more likely to be affected.

The Air Quality Index numbers refer to specific amounts of pollution in the air. They are based on the federal air quality standards for ozone, CO, NO_2, SO_2, PM_{10}, and $PM_{2.5}$. In most cases, the federal standard for these air pollutants corresponds to the number 100 on the index chart. Thus, if the concentration of any of these pollutants rises above its respective standard, the air quality can be unhealthy for the public. In determining the air quality forecast, local air districts

use the anticipated concentration measurements for each of the major pollutants, convert them into index numbers, and determine the highest index for each zone in a district.

Readings below 100 on the Air Quality Index scale would not typically affect the health of the general public (although readings in the moderate range of 51 to 100 may affect unusually sensitive people). Levels above 200 have only occurred six times in the Bay Area in the past five years, in November 2018 and August/September 2020, due to wildfires north of San Francisco and the complex wildfires that occurred throughout the Bay Area (BAAQMD 2025). Wildfires appear to be occurring with increasing frequency in California and the Bay Area as the climate changes (since 2000, 18 of the state's 20 largest wildfires and 18 of the state's 20 most destructive fires on record have occurred) (CAL FIRE 2021a, 2021b). As a result, the Air Quality Index in several neighboring counties reached the "very unhealthy" and "hazardous" designations, ranging from values of 201 to above 350. During those periods, the BAAQMD issued "Spare the Air" alerts and recommended that individuals stay inside with windows closed and refrain from significant outdoor activity.

Air Quality Index statistics over recent years indicate that air quality in the Bay Area is predominantly in the "Good" or "Moderate" categories and healthy on most days for most people. As shown in **Table 4.9-3**, the air basin had a total of 101 days with levels in the "unhealthy for sensitive groups" to "very unhealthy ranges," between 2019 and 2023. A number of these days are attributable to the increasing frequency of wildfires.

Table 4.9-3: Air Quality Index Statistics for the Air Basin

AQI Statistics for Air Basin	Number of Days by Year				
	2019	2020	2021	2022	2023
Unhealthy for Sensitive Groups (Orange) AQI: 101–150	10	34	9	8	7
Unhealthy (Red) AQI: 151–200	0	17	1	0	0
Very Unhealthy (Purple) AQI: 201–300	0	1	0	0	0

SOURCE: Bay Area Air Quality Management District, 2025.

f. Sensitive Receptors

Air quality does not affect every individual in the same way, and some groups are more sensitive to adverse health effects than others. More sensitive population groups include: the elderly and the young; those with higher rates of respiratory disease, such as asthma and chronic obstructive pulmonary disease; and those with other environmental or occupational health exposures (e.g., indoor air quality) that affect cardiovascular or respiratory diseases. The BAAQMD defines sensitive receptors as individuals more susceptible to poor air quality such as children and those with preexisting serious health problems affected by air quality occupying or residing in residential dwellings, schools, childcare centers, hospitals, and senior-care facilities. Workers are generally not considered sensitive receptors because all employers must follow regulations set forth by the Occupation Safety and Health Administration to ensure the health

and well-being of their employees (BAAQMD 2022a). However, the BAAQMD advises that lead agencies consider worker receptors in their health risk assessments to align with the BAAQMD's permitting requirements.

The proximity of sensitive receptors to motor vehicles is an air pollution concern, especially in urban areas where building setbacks are limited, and roadway volumes are higher than suburban locations of the Bay Area. Existing sensitive receptors evaluated for the Baylands include a representative sample of known residents (child and adult) in the surrounding area, and other sensitive receptors (school children, childcare facilities, etc.) located in the surrounding community and along the expected travel routes of the on-road delivery and haul trucks within the Specific Plan vicinity.

The health risk impact analysis for the Baylands also includes sensitive receptors located within a distance of 1,000 feet of the Specific Plan area, consistent with the BAAQMD Modeling Guidance (BAAQMD 2022a) to ensure the maximum health risk impact was captured by the analysis. There are numerous residential receptors located within 1,000 feet of the Baylands. However, the closest eight schools and seven childcare facilities are located beyond the 1,000-foot boundary of the Baylands. See **Figure 4.9-1** for the location of non-residential sensitive receptors. These locations are considered representative of other sensitive receptors in their vicinity. Although CARB includes playgrounds and medical facilities as sensitive receptors, because it focuses on TACs with long-term effects, it does not address locations where sensitive receptors would be present only for a short period of time.

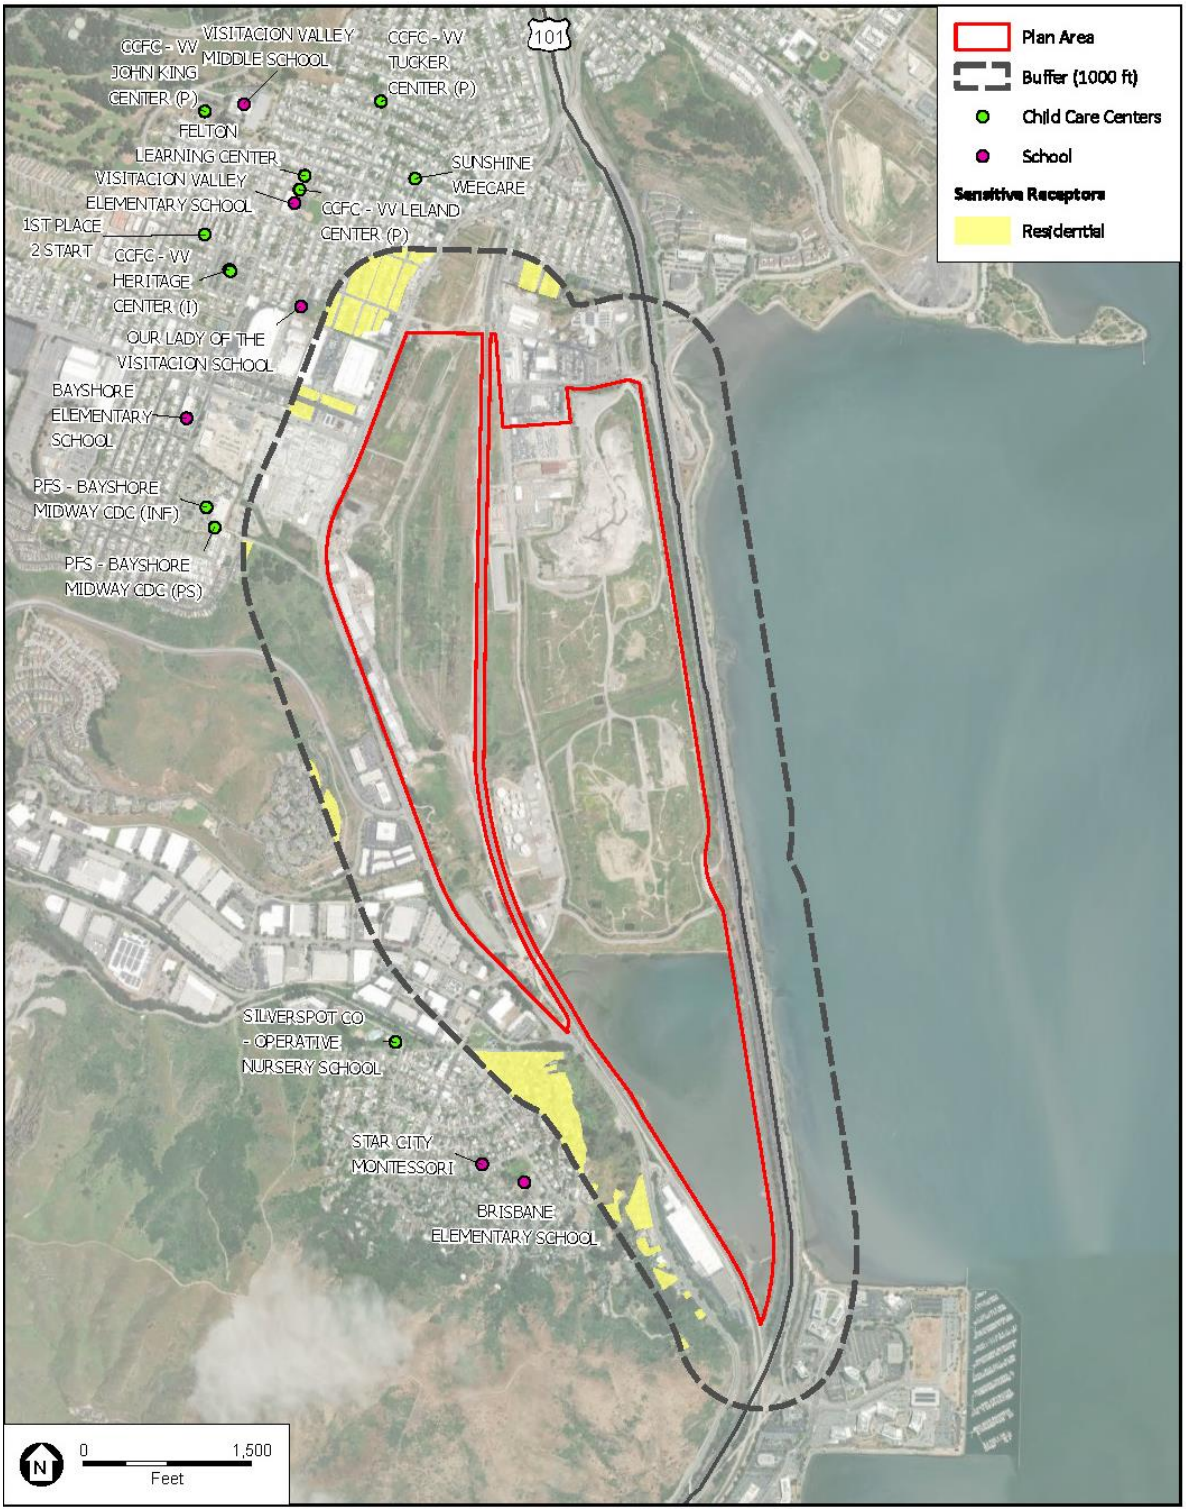
g. Existing Stationary Sources of Air Pollutant Emissions

The BAAQMD's inventory of permitted stationary sources of emissions shows 20 permitted stationary emission facilities present inside of or within 1,000 feet of the Specific Plan area. The majority of these permitted facilities include stationary diesel engines for power generators, fuel stations, and automotive repair, including auto body shops. In addition, these sources are present within and adjacent to the Baylands: Brisbane Recycling, Recology Sunset Scavenger, Brisbane Landfill, Kinder Morgan Brisbane Tank Farm.

h. Existing Mobile Sources of Air Pollutant Emissions

US 101, Bayshore Boulevard, Geneva Avenue, and Tunnel Avenue are the freeways and arterial roadways within 3,280 feet (1,000 meters) of the Specific Plan area that carry the highest volumes of traffic. This traffic contributes to concentrations of $PM_{2.5}$, DPM, and other air contaminants emitted from motor vehicles near the roadway level. The Caltrain rail line is the other "non-permitted" mobile source of air pollution bisecting the Specific Plan area. Caltrain locomotive engines are in the process of being converted to electric; however, diesel-powered freight trains may continue to use this rail line.

Figure 4.9-1: Existing Non-Residential Sensitive Receptor Locations



SOURCES: Microsoft, 2021; ESA, 2024

i. Toxic Air Contaminants

Individual projects may emit toxic air contaminants (TACs), which are a diverse group of air pollutants that may cause chronic (i.e., of long duration) and acute (i.e., severe but short-term) adverse effects on human health, including carcinogenic effects. Human health effects of TACs include birth defects, neurological damage, cancer, and death. There are hundreds of different types of TACs with varying degrees of toxicity. Thus, individual TACs vary greatly in the health risk they present; at a given level of exposure, one TAC may pose a hazard that is many times greater than another.

Unlike criteria air pollutants, TACs are not subject to ambient air quality standards but are regulated by the air district using a risk-based approach based on a health risk assessment to determine which sources and which pollutants to control as well as the degree of control. A health risk assessment is an analysis that estimates human health exposure to toxic substances, and when considered together with information regarding the toxic potency of the substances, a provides quantitative estimates of health risks.[184]

Exposure assessment guidance published by the BAAQMD in January 2016 adopts the assumption that residences would be exposed to air pollution 24 hours per day, 350 days per year, for 30 years (BAAQMD 2016). Therefore, assessments of air pollutant exposure to residents typically result in the greatest adverse health outcomes of all population groups.

Exposures to fine particulate matter ($PM_{2.5}$) are strongly associated with mortality, respiratory diseases, and poor lung development in children, and other health effects, such as hospitalization for cardiopulmonary disease (SFDPH 2008). Therefore, it is included in this discussion and analyzed in the health risk assessment as a pollutant that poses a risk to human health. Diesel particulate matter (DPM), a byproduct of diesel fuel combustion, is also of concern. CARB identified DPM as a TAC in 1998, primarily based on evidence demonstrating cancer effects in humans (CARB 1998). The estimated cancer risk from exposure to diesel exhaust is much higher than the risk associated with any other TAC routinely measured in the region. Based on guidance from the Office of Environmental Health Hazard Assessment (OEHHA), PM_{10} is used as the surrogate for whole diesel exhaust, or DPM (OEHHA 2015).

Both the air district and CARB operate TAC monitoring networks in the air basin. These stations measure 10 to 15 TACs, depending on the specific station. The TACs selected for monitoring are those that traditionally have been found in the highest concentrations in ambient air and therefore tend to produce the most significant risk. The nearest air district ambient TAC monitoring station to the proposed Specific Plan area is the station at 10 Arkansas

[184] In general, a health risk assessment is required if the air district concludes that projected emissions of a specific air toxic compound from a proposed new or modified source suggest a potential public health risk. The applicant is then subject to a health risk assessment for the source in question. Such an assessment generally evaluates chronic, long-term effects, estimating the increased risk of cancer as a result of exposure to one or more TAC's.

Street in San Francisco, with the most recent year of available data being 2022. The ambient concentrations of carcinogenic TACs measured at the Arkansas Street station, approximately 4 miles north of the Baylands, are presented in **Table 4.9-4**. The estimated cancer risk from a lifetime exposure (70 years) to these substances is also reported in the table. When TAC measurements at this station are compared to ambient concentrations of various TACs for the Bay Area as a whole, the cancer risks associated with mean TAC concentrations in San Francisco are similar to those for the Bay Area as a whole. Therefore, the estimated average lifetime cancer risk resulting from exposure to TAC concentrations monitored at the San Francisco station do not appear to be any greater than for the Bay Area as a region.

Table 4.9-4: Annual Average Ambient Concentrations of Carcinogenic Toxic Air Contaminants Measured in 2022 at Air District Monitoring Station at 10 Arkansas Street, San Francisco

Substance	Concentration (ppb)	Cancer Risk Probability per Million
Gaseous TACs		
Acetaldehyde	0.38	6
Benzene	0.10	26
1,3-Butadiene	0.022	24
Carbon Tetrachloride	0.062	48
Formaldehyde	1.15	24
Perchloroethylene	0.008	0.9
Methylene Chloride	0.071	0.7
Chloroform	0.014	1
Trichloroethylene	0.01	0.3
Chromium (Hexavalent) (ng/m^3)	0.083	18
Total Risk		***148.9***
Particulate TACs		
Annual Average, Fine particulate matter, $PM_{2.5}$ ($\mu g/m^3$)	6.8	— [b]
Annual Average, Inhalable particulate matter, PM_{10} ($\mu g/m^3$) [a]	7.7	— [b]

SOURCE: California Air Resources Board, *Ambient Air Toxics Summary*, 2-22, http://www.arb.ca.gov/adam/toxics/sitesubstance.html, and Top 4 Summary for the San Francisco – Arkansas Street monitoring site, accessed July 2024

ABBREVIATIONS: TAC's = toxic air contaminants; ppb = part per billion; ng/m^3 = nanograms per cubic meter.

NOTES:

a. PM_{10} is used as a surrogate for DPM.
b. These pollutants are monitored separately from the gaseous TACs and chromium (hexavalent); no cancer risk data are measured for them, as $PM_{2.5}$ is not a carcinogen and PM_{10} monitored data include sources other than just DPM.

Roadway-Related Toxic Air Contaminants

Motor vehicles are responsible for a large share of air pollution, especially in California. Vehicle tailpipe emissions contain diverse forms of particles and gases, and vehicles also contribute to particulates by generating road dust and tire wear. Epidemiologic studies have demonstrated that people living close to freeways or busy roadways have poorer health outcomes, including

increased asthma symptoms and respiratory infections, and decreased pulmonary function and poor lung development in children. Air pollution monitoring conducted in conjunction with epidemiologic studies has confirmed that roadway-related health effects vary with modeled exposure to PM and NO_2. In traffic-related studies, the additional non-cancer health risk attributable to roadway proximity was seen within 1,000 feet of the roadway and was strongest within 300 feet (CARB 2005). As a result, CARB recommends that new sensitive land uses not be located within 500 feet of a freeway or urban roads carrying 100,000 vehicles per day.

Existing Stationary Sources of TACs

The air district's inventory of permitted stationary sources of emissions shows 20 permitted stationary emission facilities present within or near 1,000 feet of the Baylands. The majority of these permitted facilities include stationary diesel engines for power generators, fuel stations, and automotive repair, including auto body shops, but these also include the Recology facility and the Kinder Morgan terminal, which lies within the Baylands. See **Figure 4.9-2** for locations of existing TAC sources in the area. Those sources now located on Industrial Way would be demolished once construction of the proposed project begins.

Existing Mobile Sources of TACs

US 101, Bayshore Boulevard, Geneva Avenue, and Tunnel Avenue are the freeways and arterial roadways within 1,000 feet of the Baylands that carry the highest volumes of traffic. This traffic contributes to concentrations of $PM_{2.5}$, DPM, and other TACs emitted from motor vehicles near the street level. The Caltrain rail line is a "non-permitted" mobile source of air pollution bisecting the Specific Plan area. Existing Caltrain diesel engines have been replaced with electric locomotives; however, diesel-powered freight may continue to use this rail line.

j. Odors

The ability to detect odors varies considerably among the population and can be subjective. People may have different reactions to the same odor. For example, an odor such as coffee roasting may be offensive to one person but perfectly acceptable to another. Reactions to odors can range from psychological to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache). An unfamiliar odor is also more easily detected and is more likely to cause complaints than a familiar one.

Sources that may generate odors include wastewater treatment and pumping facilities; landfills, transfer stations, and composting facilities; petroleum refineries, asphalt batch plants, chemical (including fiberglass) manufacturing, and metal smelters; painting and coating operations; rendering plants; coffee roasters and food processing facilities; and animal feed lots and dairies.

Figure 4.9-2: Existing Sources of Toxic Air Contaminants

SOURCES: ESRI, 2022; ESA, 2024

Current potential sources of odorous emissions at or near the Baylands include Recology waste management facilities and the Kinder Morgan Tank Farm. However, the BAAQMD has not received any odor complaints from these facilities, or for the former landfill since 2022.

4.9.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

Clean Air Act

The 1970 Clean Air Act (most recently amended in 1990) requires that regional planning and air pollution control agencies prepare a regional air quality plan to outline the measures by which both stationary and mobile sources of pollutants would be controlled in order to achieve all standards by the deadlines specified in the act.

These ambient air quality standards are intended to protect the public health and welfare, and they specify the concentration of pollutants (with an adequate margin of safety) to which the public can be exposed without adverse health effects. They are designed to protect those segments of the public most susceptible to respiratory distress, including asthmatics, the very young, the elderly, people weakened from other illness or disease, or persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollution levels that are somewhat above ambient air quality standards before adverse health effects are observed.

The Clean Air Act establishes two types of national air quality standards. Primary standards set limits to protect public health, including the health of "sensitive" populations. Secondary standards set limits to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings.

The current attainment status for the air basin, with respect to federal standards, is summarized in **Table 4.9-5**. In general, the basin experiences low concentrations of most pollutants when compared to federal standards, except for ozone and PM (PM_{10} and $PM_{2.5}$), for which standards are exceeded periodically (see **Table 4.9-5**).

The air basin is in attainment for other criteria air pollutants, with the exception of the 24-hour standards for PM_{10} and $PM_{2.5}$, for which the Bay Area is designated as "Unclassified" and in non-attainment, respectively. "Unclassified" is defined by the Clean Air Act as any area that cannot be classified, on the basis of available information, as meeting or not meeting the national primary or secondary ambient air quality standard for the pollutant. The air basin is designated as an attainment area with respect to the federal annual average $PM_{2.5}$ standard.

Table 4.9-5: Federal and State Ambient Air Quality Standards for Criteria Pollutants

Pollutant	Averaging Time	State Standard	National Standard	Pollutant Health and Atmospheric Effects	Major Pollutant Sources
Ozone (O_3)	1 hour	0.09 ppm	—	High concentrations can directly affect lungs, causing irritation. Long-term exposure may cause damage to lung tissue.	Formed when ROG and NO_X react in sunlight. Major sources include on-road motor vehicles, solvent evaporation, and commercial/ industrial equipment.
	8 hours	0.070 ppm	0.075 ppm		
Carbon Monoxide (CO)	1 hour	20 ppm	35 ppm	Classified as a chemical asphyxiant, CO interferes with transfer of fresh oxygen to the blood and deprives sensitive tissues of oxygen.	Internal combustion engines, primarily gasoline-powered motor vehicles.
	8 hours	9.0 ppm	9 ppm		
Nitrogen Dioxide (NO_2)	1 hour	0.18 ppm	0.100 ppm	Irritating to eyes and respiratory tract. Colors atmosphere reddish-brown.	Motor vehicles, petroleum refining operations, industrial sources, aircraft, ships, and railroads.
	annual arithmetic mean	0.030 ppm	0.053 ppm		
Sulfur Dioxide (SO_2)	1 hour	0.25 ppm	75 ppb	Irritates upper respiratory tract; injurious to lung tissue. Destructive to marble, iron, and steel. Limits visibility and reduces sunlight.	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
	3 hours	—	0.5 ppm		
	24 hours	0.04 ppm	0.14 ppm		
	annual arithmetic mean	—	0.030 ppm		
Respirable Particulate Matter (PM_{10})	24 hours	50 µg/m^3	150 µg/m^3	May irritate eyes and respiratory tract, and cause decreases in lung capacity, cancer, and increased mortality. Produces haze and limits visibility.	Dust-producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, natural sources (e.g., wind-raised dust).
	annual arithmetic mean	20 µg/m^3	—		
Fine Particulate Matter ($PM_{2.5}$)	24 hours	—	35 µg/m^3	Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and results in surface soiling.	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning; formed from photochemical reactions of other pollutants (NO_X, sulfur oxides, and organics).
	annual arithmetic mean	12 µg/m^3	12.0 µg/m^3		
Lead	30-day average	1.5 µg/m^3	—	Disturbs gastrointestinal system, and causes anemia, kidney disease, and neuromuscular and neurological dysfunction (in severe cases).	Present source: lead smelters, battery manufacturing and recycling facilities. Past source: combustion of leaded gasoline.
	calendar quarter	—	1.5 µg/m^3		
	rolling 3-month average	—	0.15 µg/m^3		
Hydrogen Sulfide	1 hour	0.03 ppm	No national standard	Can cause nuisance odor (rotten egg smell), headache, and breathing difficulties (higher concentrations).	Geothermal power plants, petroleum production and refining.

Pollutant	Averaging Time	State Standard	National Standard	Pollutant Health and Atmospheric Effects	Major Pollutant Sources
Sulfates (SO_4)	24 hour	25 µg/m^3	No national standard	Decreases ventilatory functions; aggravates asthma symptoms and cardio-pulmonary disease; causes vegetation damage; degrades visibility; causes property damage.	Industrial processes.
Visibility-Reducing Particles	8 hour	Reduces visibility to 10 miles or less	No national standard	Reduces visibility, reduces airport safety, lowers real estate value, and discourages tourism.	See $PM_{2.5}$.
Vinyl Chloride	24 hour	0.01 ppm	No national standard	Short-term exposure to high levels can cause dizziness, drowsiness, and headaches. Long-term oral exposure or inhalation can cause liver damage, including angiosarcoma, a rare form of liver cancer.	Polyvinyl chloride (PVC) plastic and vinyl products.

SOURCE: ESA, *Brisbane Baylands Air Quality Technical Report*, February 2025.

ABBREVIATIONS: ppm = parts per million; µg/m^3 = micrograms per cubic meter

The Clean Air Act also requires each state to prepare a State Implementation Plan. The Clean Air Act Amendments of 1990 added requirements for states with non-attainment areas to revise their SIPs to incorporate additional control measures to reduce air pollution. The State Implementation Plan is modified periodically to reflect current emissions inventories, planning documents, and rules and regulations of the air basins, as reported by their jurisdictional agencies. The USEPA is responsible for reviewing all State Implementation Plans to determine whether they conform to the mandates of the Clean Air Act, and to determine whether implementing the State Implementation Plans would achieve air quality goals. In addition, the USEPA sets federal vehicle and stationary source emissions standards and provides research and guidance in air pollution programs.

Vehicle Emissions Standards (Corporate Average Fuel Economy)

Established by the U.S. Congress in 1975, the Corporate Average Fuel Economy (CAFÉ) standards reduce energy consumption by increasing the fuel economy of cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and USEPA jointly administer the CAFÉ standards. Congress has specified that CAFÉ standards must be set at the "maximum feasible level" with consideration given to (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) the need for the nation to conserve energy.

The key federal vehicle efficiency regulations related to national fuel economy and GHG emissions are as follows:

- In 2010, NHTSA and USEPA finalized updated CAFE and GHG emissions standards for passenger cars and light trucks/light-duty vehicles for model years 2012 to 2016.
- In 2012, NHTSA and USEPA extended the CAFE and GHG emissions standards for light-duty vehicles for model years 2017 to 2025. Combined with the 2012 to 2016 standards, the aim is to achieve vehicles emitting 50 percent less than 2010 levels in 2025.
- In 2016, NHTSA and USEPA finalized national fuel economy and GHG emission standards for medium and heavy-duty vehicles that would cover model years 2018 to 2027 for certain trailers and model years 2021 to 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks.
- In 2020, NHTSA and USEPA finalized updated CAFE and GHG emissions standards for passenger cars and light trucks and established new standards covering model years 2021 through 2026.
- In 2021, USEPA revised the GHG emissions standards for passenger cars and light trucks for model years 2023 through 2026, to leverage advances in clean car technology.

In 2022, NHSTA revised the CAFE standards for passenger cars and light trucks for model years 2024 to 2026, which are expected to result in average fuel economy label values of 49 miles per gallon.

Fuel-efficiency standards for medium- and heavy-duty trucks have been jointly developed by USEPA and NHTSA. The Phase 1 heavy-duty truck standards applied to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014–2018, and required a reduction in fuel consumption by 6 to 23 percent over the 2010 baseline, depending on the vehicle type (USEPA 2011). USEPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021–2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline, depending on the compliance year and vehicle type (USEPA 2016).

However, it is legally infeasible for individual municipalities to adopt more stringent fuel efficiency standards (see California Vehicle Efficiency Regulations, below). The Federal Clean Air Act (42 United States Code [USC] Section 7543[a]) states that "no state or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part."

Clean Trucks Plan

On August 5, 2021, USEPA announced plans to reduce GHG emissions and other harmful air pollutants from heavy-duty trucks through a series of three rulemakings that would collectively

be called the Clean Trucks Plan. The first rulemaking, Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, was signed by USEPA on December 20, 2022 (EPA–HQ–OAR–2019–0055) and sets stronger emissions standards for heavy-duty vehicles and engines starting in model year 2027.

Under the Clean Trucks Plan, USEPA has proposed two additional rulemakings in 2023. One of the proposed rulemakings, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles, would revise its regulations to reduce GHG emissions for model year 2027 and later heavy-duty vehicles by improving fuel efficiency standards. This rulemaking would build on the success of previous rulemakings to reduce GHG emissions from model year 2014 and newer heavy-duty vehicles. The second proposed rulemaking would address multi-pollutant emissions, including GHG emissions and emissions that form smog and soot, for model year 2027 and later commercial pickup trucks and vans.

Construction Equipment Regulations

Construction equipment fuel efficiency requirements are generally referenced as "Tier 4" as regulated under 40 Code of Federal Regulations Parts 1039, 1065, and 1068, with similar provisions under the California Air Resources Board regulations such as Cal. Code Regs., tit. 13, §§ 1956.8, 2025. The CARB also regulates construction equipment emissions ensuring that they include "every feasible control measure" (Health & Safety Code, §§ 39602.5, 39667, 43013). "Every feasible measure" under the Clean Air Act (Health & Safety Code § 40612(c)(1)(A)) has been interpreted by CARB to be consistent with the definition of feasibility under CEQA Guidelines § 15364. Under California state law "Tier 4" is generally used interchangeably with "2010 model year engines or equivalent" (Cal. Code Regs., tit. 13, § 2025(d) (3)(F)).

b. State Laws, Plans, Programs, and Regulations

California Clean Air Act

Although the federal Clean Air Act established national ambient air quality standards, individual states retained the option to adopt more stringent standards and to include other pollution sources. California had already established its own air quality standards when federal standards were established, and because of the unique meteorological conditions in California, there is considerable diversity between the state and national ambient air quality standards, as shown in **Table 4.9-5**. California ambient standards are at least as protective as national ambient standards and are often more stringent.

In 1988, California passed the California Clean Air Act (California Health and Safety Code sections 39600 et seq.) to provide the state with a comprehensive framework for air quality planning regulation and to set state air quality standards. The California Clean Air Act, like its federal counterpart, requires the designation of areas as being either in attainment or

nonattainment. The California act requires designation of areas as in attainment or nonattainment to be based on state ambient air quality standards rather than the federal standards. The air basin is designated as in "nonattainment" for state ozone, PM_{10}, and $PM_{2.5}$ standards, and is designated as in "attainment" for the other pollutants.

The basic goal of the California Clean Air Act is to achieve health-based state ambient air quality standards by the earliest practicable date. The Act requires regions that violate the state ozone standard to prepare attainment plans to attain the standard. The BAAQMD is subject to California Clean Air Act requirements for "serious" areas [Secs. 40921.5(a)(2), 40919].

Regional air quality plans are required to achieve a reduction in district-wide emissions of 5 percent per year for ozone precursors (California Health & Safety Code Section 40914). However, if an air district is unable to achieve a 5 percent annual reduction, then the air district is required to adopt a control strategy to implement "all feasible measures" on an expeditious basis [Sec. 40914(b)(2)].

No non-attainment area in the state has been able to demonstrate a 5 percent reduction in ozone precursor pollutants each year. Consequently, air districts throughout the state, including the Bay Area, have opted to adopt "all feasible measures" as expeditiously as possible to meet the requirements of the Act.

State Implementation Plan

The 1977 Clean Air Act Amendments require that regional planning and air pollution control agencies prepare a regional Air Quality Plan to outline the measures by which both stationary and mobile sources of pollutants can be controlled to achieve all standards specified in the Clean Air Act. For areas that are designated "non-attainment" with respect to a standard, the Clean Air Act specifies future dates for achieving compliance with the NAAQS and mandates that states submit and implement a State Implementation Plan for local areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met. Similarly, the 1988 California Clean Air Act also requires development of air quality plans and strategies to meet state air quality standards in areas designated as in non-attainment (except for areas designated as non-attainment for the state PM standards). Maintenance plans are required for attainment areas that had previously been designated in non-attainment to ensure continued attainment of the standards.

Toxic Air Contaminant Regulation

Toxic air contaminants (TACs) have been regulated under federal air quality law since the 1977 federal Clean Air Act Amendments. The most recent federal Clean Air Act Amendments (1990) reflect a technology-based approach for reducing TACs. The first phase involves requiring facilities to install Maximum Achievable Control Technology (MACT). The MACT standards vary depending on the type of emitting source. The USEPA has established MACT standards

for over 20 facilities or activities, such as perchloroethylene dry cleaning and petroleum refineries. The second phase of control involves determining the residual health risk represented by air toxics emissions sources after implementation of MACT standards.

Two principal laws provide the foundation for state regulation of TACs from stationary sources. In 1983, the state legislature adopted Assembly Bill 1807, which established a process for identifying TACs and provided the authority for developing retrofit air toxics control measures on a state-wide basis. Air toxics from stationary sources in California are also regulated under Assembly Bill 2588, the Air Toxics "Hot Spots" Information and Assessment Act of 1987. Regulation of TACs from mobile sources has traditionally been implemented through emissions standards for on-road motor vehicles (imposed on vehicle manufacturers) and through specifications for gasoline and diesel fuel sold in California (imposed on fuel refineries and retailers), rather than through land use decisions, air quality permits, or regulations addressing how motor vehicles are used by the general public.

In 2005, CARB approved a regulatory measure to reduce emissions of toxic and criteria air pollutants by limiting the idling of new heavy-duty diesel vehicles (Tit. 13, Cal. Code Regs. §§ 1956.8, 2485). The regulations generally limit idling of commercial motor vehicles (including buses and trucks) within 100 feet of a school or residential area for more than 5 consecutive minutes or periods aggregating more than 5 minutes in any 1 hour. Buses or vehicles also must turn off their engines upon stopping at a school and must not turn their engines on more than 30 seconds before beginning to depart from a school. Also, Senate Bill 352 was adopted in 2003 and limits locating public schools within 500 feet of a freeway or busy traffic corridor.

Diesel Particulate Matter

The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Mobile sources such as trucks and buses are among the primary sources of diesel emissions, and concentrations of DPM are higher near heavily traveled highways. CARB estimated average Bay Area cancer risk from exposure to diesel particulate, based on a population-weighted average ambient diesel particulate concentration, at about 520 in 1 million as of the year 2012 (CARB 2023a), which is much higher than the risk associated with any other toxic air pollutant routinely measured in the region. Based on guidance from the Office of Environmental Health Hazard Assessment (OEHHA), PM_{10} is used as the surrogate for whole diesel exhaust, or DPM (OEHHA 2015).

Despite notable emission reductions, CARB recommends that proximity to sources of DPM emissions be considered in the siting of new sensitive land uses (or sensitive receptors).[185] CARB notes that these recommendations are advisory and should not be interpreted as defined

[185] BAAQMD CEQA Guidelines (2023) recommends the consideration of siting a new source near existing source of TACs if the project would include sources (e.g., generators or mobile sources) that would exacerbate the existing risk (Chapter 3.5).

"buffer zones," and that local agencies must balance other considerations, including transportation needs, the benefits of urban infill, community economic development priorities, and other quality of life issues. With careful evaluation of exposure, health risks, and affirmative steps to reduce risk where necessary, CARB's position is that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality can be compatible with protecting the health of individuals at the neighborhood level (CARB 2005).

On-Road Diesel Trucks and Off-Road Diesel Equipment

To reduce emissions from non-road diesel equipment and other criteria pollutants, the USEPA established a series of increasingly strict emission standards for new off-road diesel engines (40 Code of Federal Regulations Parts 1039, 1065, and 1068; Cal. Code Regs., tit. 13, § 2025). CARB regulates construction equipment emissions ensuring that they include "every feasible control measure" (Health & Safety Code, §§ 39602.5, 39667, 43013). "Every feasible measure" under the Clean Air Act (Health & Safety Code § 40612(c)(1)(A)) has been interpreted by CARB to be consistent with the definition of feasibility under CEQA Guidelines § 15364.

Tier 1 standards were phased in on newly manufactured equipment from 1996 through 2000 (year of manufacture), depending on the engine horsepower category. Tier 2 standards were phased in on newly manufactured equipment from 2001 through 2006. Tier 3 standards were phased in on newly manufactured equipment from 2006 through 2008. Tier 4 standards, which require advanced emission control technology to attain them, were phased in between 2008 and 2015. Under California state law, "Tier 4" is generally used interchangeably with "2010 model year engines or equivalent" (Cal. Code Regs., tit. 13, § 2025(d) (3)(F)).

CARB also has adopted rules for new diesel trucks and for off-road diesel equipment. Along with rules adopted by the USEPA, these regulations have resulted in substantially more stringent emissions standards for new diesel trucks and new off-road diesel equipment, such as construction vehicles. Haul truck regulations also mandate fleet turnover to ensure that by January 1, 2023, nearly all on-road diesel trucks will have 2010 model year engines or equivalent [i.e., Tier 4] (Cal. Code Regs., tit. 13, § 1956.8).

CARB has also approved the Off-Road Diesel Regulation (13 Cal. Code Regs. § 2449), which imposes limits on idling; requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits); requires the phase-out of the oldest and dirtiest engines starting on January 1, 2024; and requires procurement and use of renewable diesel (R99 or R100) starting January 1, 2024, with limited exceptions.

California Air Resources Board Advanced Clean Fleets Program

On April 28, 2023, CARB adopted the Advanced Clean Fleets rule (Title 13, California Code of Regulations §§ 2013 et seq.) which generally requires the shift to 100 percent zero-emissions trucking by 2035. This regulation is part of CARB's broader strategy to accelerate the transition to zero-emissions medium- and heavy-duty vehicles. It complements the Advanced Clean Trucks regulation, focusing on reducing emissions and promoting zero-emissions vehicle adoption. The Advanced Clean Fleets regulation covers various fleet types, including drayage operations, government-owned fleets, and high-priority fleets, mandating zero-emissions vehicle (ZEV) adoption in phases. Key provisions include manufacturer sales mandates, requirements for drayage fleets to transition to ZEVs, and specific ZEV targets for high-priority and government fleets. The regulation is expected to significantly reduce emissions, benefit public health, and contribute to achieving climate goals (CARB 2023).

To support the transition, CARB provides incentives, grants, and funding programs, with an emphasis on equity for disproportionately impacted communities. These programs aim to reduce the financial burden on fleet owners, promote early adoption, and expand charging and hydrogen fueling infrastructure. CARB estimates that the Advanced Clean Fleets regulation, in conjunction with the Advanced Clean Trucks regulation, will result in a substantial increase in ZEVs on California roads, contributing to emissions reduction and public health improvement. The regulation reflects California's commitment to achieving a fully zero-emissions fleet by 2045, with specific targets for various vehicle categories.

Automobile Fuel Efficiency Standards

The Corporate Average Fuel Economy Standards (CAFÉ) were first enacted in 1975 to improve the average fuel economy of cars and light duty trucks. The current CAFÉ standards for model years 2024–2026 require new passenger and light duty vehicles sold in the US to average at least 40 miles per gallon (mpg). This is a nearly 43 percent increase from the previous standard of approximately 28 mpg. Current proposals seek to increase this to 49 mpg after 2026. Furthermore, the rate of electric vehicle adoption rate is occurring faster than anticipated. California has reached 1.5 million electric vehicle sales 2 years ahead of its planned 2025 target for the sales milestone. At this time, approximately 25 percent of new car sales in California are electric vehicles.

Newest Vehicle Regulations in 2021 and 2022

Heavy Duty Inspection and Maintenance (2021)

Approved in December 2021 with implementation to start in January 2023, this regulation directed CARB to develop and implement a comprehensive heavy-duty vehicle inspection and maintenance (HD I/M) regulation to ensure that vehicles' emissions control systems are

properly functioning when traveling on California's roadways. The Board approved the regulation on December 9, 2021, with implementation to be phased in starting January 2023. Dubbed the "Clean Truck Check," the program combines periodic vehicle testing requirements with other emissions monitoring techniques and expanded enforcement strategies to identify vehicles in need of emissions related repairs and ensure any needed repairs are performed. When fully implemented, the program will provide significant reductions in smog-forming (NO_x) and carcinogenic toxic air pollution (DPM) necessary to achieve federal air quality mandates and healthy air in California's communities.

Advanced Clean Cars II (2022)

Advanced Clean Cars II combines several regulations into one package including the Low-Emission Vehicle (LEV) criteria and greenhouse gas regulations and the zero-emission vehicle (ZEV) regulation. Advanced Clean Cars I was adopted in 2012 and Advanced Clean Cars II was adopted in 2022. These regulations rapidly scale down emissions of light-duty passenger cars, pickup trucks and SUVs and require an increased number of ZEVs to meet air quality and climate change emissions goals. In October 2023, staff launched a new effort to consider potential amendments to the Advanced Clean Cars II regulations, including updates to the tailpipe greenhouse gas emission standard and limited revisions to the Low-Emission Vehicle and Zero-Emission Vehicle regulations.

Advanced Clean Fleets (2022)

The Advanced Clean Fleets (ACF) Regulation is the latest development in CARB's decades long history of setting increasingly stringent emission standards for mobile sources that are needed to protect the public health and welfare of Californians. The ACF Regulation requires fleets that are well suited for electrification to reduce emissions through requirements to both phase-in the use of ZEVs for targeted fleets and requirements that manufacturers only manufacture ZEV trucks starting in the 2036 model year.

Legislation

California Renewables Portfolio Standard

The Renewable Portfolio Standard Program, as updated in 2018 (SB 100), requires the State to procure 60 percent of its electricity from renewable sources by 2030 and that CARB should plan for 100 percent eligible renewable energy resources and carbon-free sources by 2045. SB 1020, signed on September 16, 2022, revises SB 100, and instead requires that renewable energy resources and zero-carbon resources supply 90 percent of all retail electricity sales to end-use customers by December 31, 2035, 95 percent by December 31, 2040, and 100 percent of by December 31, 2045, and supply 100 percent of electricity procured to serve all state agencies by December 31, 2035 (Pub. Utilities Code §§ 399.11, 399.30, and 454.33). Peninsula Clean Energy

(PCE) is the primary electricity provider for residences and businesses in Brisbane. PCE is known as a Community Choice Aggregator (CCA) that supplies electricity principally from wind, solar, and hydro resources, and offers up to 100 percent renewable electricity to residential and commercial customers.

Assembly Bill 341

AB 341, which became law in 2011, established a new state-wide goal of 75 percent recycling through source reduction, recycling, and composting by 2020. The new law changed the way that the state measures progress toward the 75 percent diversion goal, focusing on source reduction, recycling, and composting. AB 341 also requires all businesses and public entities that generate 4 cubic yards or more of waste per week and multifamily residential dwellings with five units or more to have a recycling program in place. The purpose of the law is to reduce GHG emissions by diverting commercial solid waste to recycling efforts and to expand the opportunity for additional recycling services and recycling manufacturing facilities in California.

Assembly Bill 1826

AB 1826, known as the Commercial Organic Waste Recycling Law, became effective on January 1, 2016. This law requires businesses and multifamily complexes (with five units or more) that generate specified amounts of organic waste (compost) to arrange for organics collection services. The law phased in the requirements for businesses, with full implementation realized in 2019:

- **First Tier:** Beginning in April 2016, the first tier of affected businesses was required to comply with AB 1826. This tier consisted of businesses generating 8 cubic yards or more of organic materials per week.
- **Second Tier:** In January 2017, affected businesses expanded to include those generating 4 cubic yards or more of organic materials per week.
- **Third Tier:** In January 2019, affected businesses expanded further to include those generating 4 cubic yards or more of commercial solid waste per week.

Vehicular Emissions Regulations and Requirements

Advanced Clean Cars Program

In January 2012, pursuant to Scoping Plan Recommended Measures T-1 and T-4, CARB approved the Advanced Clean Cars Program, a new emissions-control program for model years 2017 through 2025. In response to a midterm review of the standards in March 2017, CARB directed staff to begin working on post-2025-model-year vehicle regulations (Advanced Clean Cars II) to research additional measures to reduce air pollution from light-duty and medium-

duty vehicles. Additionally, as described previously, in September 2020, Governor Newsom signed EO N-79-20, which established a goal for 100 percent of new passenger cars and trucks sold in California by 2035 to be zero-emissions and directed CARB to develop and propose regulations toward this goal. The primary mechanism for achieving these targets for passenger cars and light trucks is the Advanced Clean Cars II Program. CARB adopted the Advanced Clean Cars II regulations on August 25, 2022.

Advanced Clean Trucks Program

On June 25, 2020, CARB adopted the Advanced Clean Trucks rule, which requires truck manufacturers to transition from diesel vehicles to electric zero-emissions vehicles beginning in 2024, with the goal of reaching 100 percent zero-emissions vehicles by 2045. The goal of this rule is to help California meet its climate targets of a 40 percent reduction in GHG emissions and a 50 percent reduction in petroleum use by 2030, along with an 80 percent reduction in GHG emissions by 2050. Zero-emissions vehicles are two to five times more energy efficient than diesel vehicles, and the Advanced Clean Trucks rule will reduce GHG emissions with the co-benefit of reducing dependence on petroleum fuels and reducing energy consumption.

Truck manufacturers will be required to sell zero-emissions vehicles as an increasing percentage of their annual sales from 2024 through 2035. Companies with large distribution fleets (50 or more trucks) will be required to report information about their existing fleet operations in an effort to identify future strategies for increasing zero-emissions fleets state-wide.

Zero-emissions vehicles are two to five times more energy efficient than diesel vehicles, and the Advanced Clean Trucks rule will reduce GHG emissions with the co-benefit of reducing dependence on petroleum fuels and reducing energy consumption. See also discussion of the Clean Trucks Program under Federal Regulations above.

Advanced Clean Fleets Program

In September 2023, the Office of Administrative Law approved CARB's Advanced Clean Fleets rule, which became state law on October 1, 2023 (Title 13, California Code of Regulations §§ 2013 et seq.). This program requires the shift to 100 percent zero-emissions trucking by 2035. This regulation is part of CARB's broader strategy to accelerate the transition to zero-emissions medium- and heavy-duty vehicles. It complements the Advanced Clean Trucks regulation, which covers various fleet types, including drayage operations, government-owned fleets, and high-priority fleets, mandating zero-emissions vehicle adoption in phases. Key provisions of the Advanced Clean Fleets rule include manufacturer sales mandates, requirements for drayage fleets to transition to zero-emissions vehicles, and specific zero-emissions vehicle targets for high-priority and government fleets. The Advanced Clean Fleets regulation requires that manufacturers sell only zero-emissions medium- and heavy-duty vehicles (ZEV) in California starting in 2036 and that high-priority fleets must purchase only zero-emissions vehicles beginning 2024 and, starting January 1, 2025, must remove internal combustion engine vehicles

at the end of their useful life, or that high-priority fleets must achieve 100 percent zero-emissions vehicles by 2042 (CARB 2023). The regulation is expected to significantly reduce emissions, benefit public health, and contribute to achieving climate goals.

To support this transition, CARB provides incentives, grants, and funding programs, with an emphasis on equity for disproportionately impacted communities. These programs aim to reduce the financial burden on fleet owners, promote early adoption, and expand charging and hydrogen fueling infrastructure.

Advanced Clean Cars Program

The Advanced Clean Cars emissions-control program, approved by CARB in 2012, is closely associated with the Pavley regulations (CARB 2017). The program requires a greater number of zero-emissions vehicle models for the years 2015 through 2025, to control smog, soot, and GHG emissions. This program includes the Low-Emissions Vehicle regulations to reduce emissions of criteria air pollutants and GHGs from light- and medium-duty vehicles; and the Zero-Emissions Vehicle regulations, which require manufacturers to produce an increasing number of pure zero-emissions vehicles (battery and fuel cell electric vehicles) and includes the provision to produce plug-in hybrid electric vehicles between 2018 and 2025. The increase in low- and zero-emissions vehicles will result in a decrease in the consumption of non-renewable fuels such as gasoline and diesel and a concomitant reduction in energy use.

The rate of electric vehicle adoption rate is occurring faster than what was anticipated in 2018. California has reached 1.5 million electric vehicle sales 2 years ahead of its planned 2025 target for the sales milestone (CEC 2023). In the second quarter of 2024, approximately 24.9 percent of new light-duty vehicle sales in California were electric.[186]

California Air Resources Board Mobile Source Strategy

In October 2021, CARB released the updated Mobile Source Strategy, which demonstrates the levels of cleaner technologies necessary to meet state goals for reducing criteria pollutant, GHG, and toxic air contaminant emissions from cars, trucks, tractors, and other on-road vehicles and off-road equipment which are major contributors to emissions of nitrogen oxides (NO_X), GHGs, and toxic air contaminants.

The key focus of the Mobile Source Strategy is on advancing the use of zero-emissions technologies. The Mobile Source Strategy also identifies increased accessibility to clean transportation as a critical strategy to meet air quality goals. Overall, the Mobile Source Strategy calls for 1.4 million medium- and heavy-duty ZEVs in California by 2045. State-wide implementation of the Mobile Source Strategy would reduce mobile-source fuel consumption

[186] https://www.energy.ca.gov/data-reports/energy-almanac/zero-emission-vehicle-and-infrastructure-statistics-collection/new-zev.

by 9.5 billion gallons of gasoline and 3.0 billion gallons of diesel equivalent in 2045, which equates to a GHG emissions reduction of approximately 94 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) in 2045.

Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling

In 2004, CARB adopted the Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling to reduce public exposure to diesel particulate matter emissions (13 CCR Section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure prohibits diesel-fueled commercial vehicles from idling for more than 5 minutes at any given location. The primary goal of this measure is to reduce public health impacts from diesel emissions, compliance with which also reduces GHG emissions and energy consumption by reducing fuel consumption from unnecessary idling.

Airborne Toxic Control Measure for Stationary Compression Ignition Engines

In 2004, CARB adopted an airborne toxic control measure to reduce public exposure to emissions of diesel particulate matter and criteria pollutants from stationary diesel-fueled compression ignition engines (17 CCR Section 93115). The measure applies to all owners and operators of a stationary compression ignition engine in California with a rated brake horsepower greater than 50. The measure also applies to anyone who sells, offers for sale, leases, or purchases a stationary compression ignition engine. This measure outlines fuel and fuel additive requirements; emissions standards; recordkeeping, reporting, and monitoring requirements; and compliance schedules for compression ignition engines.

Truck and Bus Regulation

In addition to limiting exhaust from idling trucks, CARB approved the Truck and Bus Regulation in 2008 to reduce NO_X and particulate matter emissions from existing diesel vehicles operating in California (13 CCR Section 2025). The phased regulation aims to reduce emissions by requiring the installation of diesel soot filters and encouraging the retirement, replacement, or retrofitting of older engines with newer emission-controlled models. This regulation has been implemented in phases, with full implementation in 2023.

CARB also promulgated emissions standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles. The In-Use Off-Road Diesel-Fueled Fleets regulation adopted by CARB on July 26, 2007, aims to reduce emissions by requiring the installation of diesel soot filters and encouraging the retirement, replacement, or repowering of older, dirtier engines with newer emissions-controlled models (13 CCR Section 2449). The compliance schedule requires full implementation by 2023 of all equipment for large and medium fleets and by 2028 for small fleets.

State of California Building Codes

Title 24 of the California Code of Regulations requires California homes and businesses to meet strong energy efficiency measures, thereby lowering their energy use. Title 24 contains numerous subparts, including Part 1 (Administrative Code), Part 2 (Building Code), Part 3 (Electrical Code), Part 4 (Mechanical Code), Part 5 (Plumbing Code), Part 6 (Energy Code), Part 8 (Historical Building Code), Part 9 (Fire Code), Part 10 (Existing Building Code), Part 11 (Green Building Standards Code), and Part 12 (Referenced Standards Code).

Starting in 1978, the California Building Standards Commission and the California Energy Commission adopted the California Energy Code. These energy efficiency standards are reviewed every few years by the Building Standards Commission and the California Energy Commission and revised if necessary (Pub. Res. Code § 25402(b)(1)). These regulations are carefully scrutinized and analyzed for technological and economic feasibility, and cost effectiveness (Pub. Res. Code § 25402(b) and (d)). The regulations are adopted with the goal of "[r]educing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (Pub. Res. Code § 25402; *Building Code Action v. Energy Resources Conservation & Dev. Com.* (1979) 88 Cal.App.3d 913).

Energy Code (Part 6)

The CEC first adopted the Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR Title 24, Part 6) in 1978 in response to a legislative mandate to reduce energy consumption in California. The standards were not originally intended to reduce GHG emissions, but increased energy efficiency and reduced consumption of electricity, natural gas, and other fuels would result in fewer GHG emissions from residential and nonresidential buildings subject to the standard. The standards are typically updated every 3 years to allow for the consideration and inclusion of new energy efficiency technologies and methods. The current Title 24, Part 6 standards (2022 standards) became effective on January 1, 2023.

The 2022 Energy Code provides crucial steps in the state's progress toward 100 percent clean electricity by midcentury and builds on California's technology innovations, encouraging energy-efficient approaches to encourage building decarbonization, particularly emphasizing heat pumps for space heating and water heating. The 2022 Energy Code also strengthens ventilation standards to improve indoor air quality and extends the benefits of photovoltaic and battery storage systems and other demand-flexible technology to work in combination with heat pumps to enable California buildings to be responsive to climate change.

More specifically, the 2022 Energy Code now requires "All single-family residential buildings shall have a newly installed photovoltaic (PV) system or newly installed PV modules meeting the minimum qualification requirements specified in Joint Appendix JA11" (Cal. Code Regs., tit. 24, Part 6, § 150.1(c)(14)). The California Energy Code was further updated in 2022 to require solar for multi-family buildings, and energy storage for structures greater than three habitable

stories (Cal. Code Regs., tit. 24, Part 6, § 170.2(f), (g), (h)). Similarly, solar photovoltaics and energy storage are now required for grocery stores, offices, financial institutions, unleased tenant space, retail, schools, warehouses, auditoriums, convention centers, hotels/motels, libraries, medical office buildings/clinics, restaurants, theaters, and mixed-use buildings where one or more of these building types constitute at least 80 percent of the floor area (Cal. Code Regs., tit. 24, Part 6, § 140.10(a)).

Buildings for which permit applications are submitted on or after January 1, 2023, must comply with the 2022 Energy Code. The Energy Code includes measures that will reduce energy use in single-family, multifamily, and nonresidential buildings. These measures will:

- Affect newly constructed buildings by adding new prescriptive and performance standards for electric heat pumps for space conditioning and water heating, as appropriate for the various climate zones in California.
- Require photovoltaic and battery storage systems for newly constructed multifamily and selected nonresidential buildings.
- Update efficiency measures for lighting, building envelope, and heating, ventilation, and air conditioning (HVAC) systems.
- Make improvements to reduce the energy loads of certain equipment subject to Energy Code requirements that perform a commercial process not related to the building occupant's needs (such as refrigeration equipment in refrigerated warehouses, or air conditioning for computer equipment in data processing centers).

California Green Buildings Standards Code (Part 11)

In 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as CALGreen and establishes minimum mandatory standards as well as voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings and schools and hospitals. The CALGreen 2022 standards became effective on January 1, 2023 (International Code Council [ICC] 2023). The nonresidential mandatory standards require the following measures that relate to utilities and service systems (24 CCR Part 11):

- Mandatory reduction in indoor water usage through installation of separate submeters or metering devices, and compliance with specified flow rates for plumbing fixtures and fittings and faucets and fountains.

- Mandatory reduction in outdoor water usage through compliance with a local water efficient landscaping ordinance or the California Department of Water Resources' Model Water Efficient Landscape Ordinance and installation for recycled water supply systems where available/applicable.
- 65 percent of construction and demolition waste must be diverted from landfills and 100 percent of trees, stumps, rocks, and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled.
- Provide readily accessible areas for recycling that serve the entire building.
- Mandatory inspections of energy systems to ensure optimal working efficiency.
- Inclusion of electric vehicle charging stations or designated spaces capable of supporting future charging stations.

c. Regional Plans, Programs, and Regulations

Bay Area Air Quality Management District

The Bay Area Air Quality Management District is the regional agency responsible for air quality regulation within the San Francisco Bay Area Basin. The BAAQMD regulates air quality through its planning and review activities. The BAAQMD has permit authority over most types of stationary emission sources and can require stationary sources to obtain permits, and can impose emission limits, set fuel or material specifications, or establish operational limits to reduce air emissions. The BAAQMD regulates new or expanding stationary sources of toxic air contaminants.

BAAQMD CEQA Air Quality Guidelines

The 2022 BAAQMD CEQA Guidelines include recommended thresholds of significance to assist lead agencies in evaluating and mitigating air quality impacts under CEQA (BAAQMD 2022b). The BAAQMD's thresholds establish levels at which emissions of ozone precursors (ROG and NO_X), PM_{10}, $PM_{2.5}$, CO, TACs, and odors could cause significant air quality impacts.

The BAAQMD CEQA Guidelines provide project-level thresholds of significance for criteria air pollutants for which the air basin is in non-attainment. The criteria air pollutant NAAQS and CAAQS set by EPA and CARB, respectively, are intended to incorporate an adequate margin of safety to protect the public health and welfare. As described Section 3.7.1, Environmental Setting, the air basin is designated as in non-attainment for ozone, $PM_{2.5}$, and PM_{10}. By definition, regional air pollution is largely a cumulative impact in that no single project is sufficient in size to, by itself, result in non-attainment of air quality standards. Instead, a project's individual emissions are considered to contribute to the existing, cumulative air quality conditions. Regional air pollutants, such as ozone, PM_{10}, and $PM_{2.5}$, can be formed

and/or transported over long distances and affect ambient air quality far from the emissions source. The magnitude and location of specific health effects from exposure to increased ozone, PM_{10}, and $PM_{2.5}$ concentrations are the result of emissions generated by numerous sources throughout the air basin, as opposed to a single project. The BAAQMD project-level thresholds represent the levels above which a project's individual emissions would result in a cumulatively considerable contribution to the air basin's existing non-attainment conditions for criteria air pollutants.

2017 Clean Air Plan: Spare the Air – Cool the Climate

For state air quality planning purposes, the Bay Area Basin is classified as a serious non-attainment area for ozone. The "serious" classification triggers various plan submittal requirements and transportation performance standards. One such requirement is that the Bay Area Basin update the *Clean Air Plan* every 3 years to reflect progress in meeting the air quality standards and to incorporate new information regarding the feasibility of control measures and new emission inventory data. The Bay Area Basin's record of progress in implementing previous measures must also be reviewed. The BAAQMD Clean Air Plan, entitled, "Spare the Air – Cool the Climate," which is incorporated herein by reference, is available at https://www.baaqmd.gov/plans-and-climate/air-quality-plans/current-plans.

The 2017 Clean Air Plan updates the Bay Area's ozone plan, which is based on the "all feasible measures" approach to meet the requirements of the California Clean Air Act. The 2017 Clean Air Plan also lays the groundwork for reducing GHG emissions in the Bay Area to meet the state's 2030 and 2050 GHG reduction targets. The Plan also includes a vision for the Bay Area in a post-carbon year 2050 that encompasses the following:

- Construct buildings that are energy efficient and powered by renewable energy.
- Walk, bicycle, and use public transit for the majority of trips and use electric-powered autonomous public transit fleets.
- Incubate and produce clean energy technologies.
- Live a low-carbon lifestyle by purchasing low-carbon foods and goods in addition to recycling and putting organic waste to productive use.

The 2017 Plan focuses on two goals:

- Protect Air Quality and Health at the Regional and Local Scale:
    - Attain all state and national air quality standards.
    - Eliminate disparities among Bay Area communities in cancer health risk from toxic air contaminants.

- Protect the Climate:
    - Reduce Bay Area GHG emissions 40 percent below 1990 levels by 2030, and 80 percent below 1990 levels by 2050.

In pursuit of these goals, the 2017 Plan has several complementary objectives:

- Update the Bay Area ozone plan (i.e., the Bay Area 2010 Clean Air Plan) pursuant to the requirements of the California Health and Safety Code;
- Reduce population exposure to harmful air pollutants, especially in vulnerable communities and populations; and
- Protect the climate through a comprehensive regional climate protection strategy.

To comply with California Health and Safety Code ozone planning requirements, the 2017 Plan states that it includes "all feasible measures." It defines an integrated, multi-pollutant control strategy to reduce emissions of particulate matter, toxic air contaminants, ozone precursors and greenhouse gases. The control strategy describes specific actions to reduce emissions of air and climate pollutants from the full range of emission sources and is based on four key priorities:

- Reduce emissions of criteria air pollutants and toxic air contaminants from all key sources.
- Reduce emissions of super-GHG pollutants such as methane.
- Decrease demand for fossil fuels by:
    - Increasing efficiency of industrial processes, energy, buildings, and transportation sectors.
    - Reducing demand for vehicle travel, and high-carbon goods and services.
- Decarbonize the region's energy system by:
    - Making the electricity supply carbon-free.
    - Electrifying the transportation and building sectors.

The Clean Air Plan addresses four categories of pollutants: ground-level ozone and its key precursors, ROG and NO_X; PM, primarily $PM_{2.5}$, and precursors to secondary $PM_{2.5}$; air toxics; and GHG emissions. The control measures are categorized based on the economic sector framework including stationary sources, transportation, energy, buildings, agriculture, natural and working lands, waste management, and water measures.

The Clean Air Plan also includes cumulative emission trends, which generally explains that air quality has improved over the last several decades despite substantial increases in economic and population growth. The number of days per year when the region exceeds the state 1-hour ozone standard has been decreasing steadily over the past 30 years. However, the data show

large fluctuations in the number of exceedance days from year to year. For example, from 1996 to 1997 the number of exceedances dropped from 45 to 10, and then rose to 29 in 1998. Most of this short-term fluctuation from one year to the next is due to variation in weather patterns and wildfires. Averaging the data across several years reduces the weather-related short-term variation. The 3-year rolling average in Figure 2-11 of the Clean Air Plan shows a relatively steady downward trend in exceedances, from an average of 20 or more exceedance days in most years prior to 2000 to fewer than 10 days in the past decade.

The Bay Area has also achieved significant reductions in ambient concentrations of both $PM_{2.5}$ and PM_{10} in recent years through efforts to decrease emissions from key emissions sources, such as motor vehicles and wood burning. Figure 2-13 of the Clean Air Plan shows trends relative to the national and state PM standards. PM_{10} levels have been greatly reduced since 1990. Peak concentrations have declined by 60 percent, and annual average values have declined by 50 percent. $PM_{2.5}$ has only been measured since 1999, so long-term quantitative trend analysis is currently limited. However, concentrations of $PM_{2.5}$ have been reduced since 1999 in relation to both the annual standard and the 24-hour standard. Bay Area 24-hour $PM_{2.5}$ levels have been cut in half since 1999.

The Bay Area has also benefited from dramatic reductions in public exposure to toxic air contaminants. Based on ambient air quality monitoring, and using OEHHA cancer risk factors, the estimated lifetime cancer risk for Bay Area residents, over a 70-year lifespan from all TACs combined, declined from 4,100 cases per million in 1990 to 690 cases per million people in 2014, as shown in Figure 2-14 of the Clean Air Plan. This represents an 83 percent decrease between 1990 and 2014.

Future cumulative projections are described in Chapter 5 of the Clean Air Plan. In aggregate, the proposed control measures are expected to reduce emissions of ROG by 11 tons per day, NO_X by 9.3 tons per day, and $PM_{2.5}$ by 3.1 tons per day in 2030.

The estimated health benefits of the reductions in emissions of ozone precursors, particulate matter, and TACs from the proposed control strategy of the Clean Air Plan as a whole are shown below in the cases avoided (from Clean Air Plan Table 5-11):

- Premature mortality – 76 cases avoided;
- Non-fatal heart attacks – 44 cases avoided;
- Hospital admissions – 16 cases avoided;
- Asthma emergency room visits – 29 cases avoided;
- Chronic bronchitis – 47 cases avoided;
- Acute bronchitis – 249 cases avoided;
- Respiratory symptoms – 10,189 cases avoided;

- Lost workdays – 9,128 cases avoided; and
- Minor restricted activity days – 51,403 cases avoided.

The GHG reduction measures in the proposed control strategy are estimated to reduce approximately 4.4 $MMTCO_2e$ per year by 2030, based on 100-year Global Warming Potential (GWP) factors. The emissions reductions are estimated to be 5.6 MMT of CO_2e per year by 2030 if the emissions reductions are calculated based on 20-year GWP factors.

Control strategy actions relevant to development projects, such as the Baylands Specific Plan, are identified in **Table 4.9-6**.

Table 4.9-6: Relevant 2017 Clean Air Plan Air Quality Strategy Actions

Strategy No.	Name	Pollutant	Description
Stationary Source Control Measures			
SS 20	Air Toxics Risk Cap and Reduction from Existing Facilities	TAC	Reducing public exposure to toxic air contaminants (TACs) from existing facilities through Draft Rule 11-18.
SS 21	New Source Review for Toxics	TAC	Propose revisions to Air District Rule 2-5, New Source Review of Toxic Air Contaminants, based on OEHHA's 2015 Health Risk Assessment Guidelines and CARB/California Air Pollution Control Officers Association's 2015 Risk Management Guidance. Revise the Air District's health risk assessment trigger levels for each toxic air contaminant using the 2015 Guidelines and most recent health effects values.
SS 26	Surface Prep and Cleaning Solvent	ROG	Lower the ROG limits for surface preparation, cleanup, and equipment cleaning in Air District Rules 8-24, 8-29, 8-30, 8-35, and 8-38.
SS 27	Digital Printing	ROG	Reduce emissions of ROG from digital printers.
SS 29	Asphaltic Concrete	ROG	Evaluate the cost effectiveness, and feasibility of limiting solvent content of emulsified asphalt and the availability of substitutes for diesel to clean asphalt-related equipment.
SS 35	PM from Bulk Material Storage, Handling and Transport, Including Coke and Coal	PM	Develop Air District rule limits to prevent and control wind-blown fugitive dust from bulk material handling operations. Establish enforceable visible emission limits to support preventive measures such as water sprays, enclosures, and wind barriers.
SS 36	PM from Trackout	PM	Develop new Air District rule to prevent mud/dirt and other solid trackout from construction, landfills, quarries, and other bulk material sites.
SS 37	PM from Asphalt Operations	PM	Develop an Air District rule to require abatement/control of blue smoke emissions related to asphalt delivery to roadway paving projects.
SS 40	Odors	Odors	Propose amendments to Regulation 7 to strengthen odor standards and enhance enforceability. An evaluation of newer air monitoring technologies will be aimed at increasing enforceability of the rule with respect to a wider range of odorous compounds and sources.
Transportation Source Control Measures			
TR 1	Clean Air Teleworking Initiative	All Pollutants	Develop teleworking best practices for employers and develop additional strategies to promote telecommuting. Promote teleworking on Spare the Air Days.

Strategy No.	Name	Pollutant	Description
TR 2	Trip Reduction Programs	All Pollutants	Implement the regional Commuter Benefits Program (Rule 14-1) that requires employers with 50 or more Bay Area employees to provide commuter benefits. Encourage trip reduction policies and programs in local plans, e.g., general and specific plans while providing grants to support trip reduction efforts. Encourage local governments to require mitigation of vehicle travel as part of new development approval, to adopt transit benefits ordinances in order to reduce transit costs to employees, and to develop innovative ways to encourage rideshare, transit, cycling, and walking for work trips. Fund various employer-based trip reduction programs.
TR 5	Transit Efficiency and Use	All Pollutants	Improve transit efficiency and make transit more convenient for riders through continued operation of 511 Transit, full implementation of Clipper® fare payment system and the Transit Hub Signage Program.
TR 6	Freeway and Arterial Operations	All Pollutants	Improve the performance and efficiency of freeway and arterial systems through operational improvements, such as implementing the Freeway Performance Initiative, the Freeway Service Patrol, and the Arterial Management Program.
TR 7	Safe Routes to School and Safe Routes to Transit	All Pollutants	Provide funds for the regional Safe Routes to School and Safe Routes to Transit Programs.
TR 8	Ridesharing, Last Mile Connection	All Pollutants	Promote carpooling and vanpooling by providing funding to continue regional and local ridesharing programs and support the expansion of carsharing programs. Provide incentive funding for pilot projects to evaluate the feasibility and cost-effectiveness of innovative ridesharing and other last-mile solution trip reduction strategies. Encourage employers to promote ridesharing and carsharing to their employees.
TR 9	Bicycle and Pedestrian Access and Facilities	All Pollutants	Encourage planning for bicycle and pedestrian facilities in local plans, e.g., general and specific plans; fund bike lanes, routes, paths, and bicycle parking facilities.
TR 10	Land Use Strategies	All Pollutants	Support implementation of Plan Bay Area, maintain and disseminate information on current climate action plans and other local best practices, and collaborate with regional partners to identify innovative funding mechanisms to help local governments address air quality and climate change in their general plans.
TR11	Value Pricing	All Pollutants	Implement and/or consider various value pricing strategies.
TR12	Smart Driving	All Pollutants	Implement smart driving programs with businesses, public agencies, and possibly schools, and fund smart driving projects.
TR13	Parking Policies	All Pollutants	Encourage parking policies and programs in local plans, e.g., reduce minimum parking requirements; limit the supply of off-street parking in transit-oriented areas; unbundle the price of parking spaces; support implementation of demand-based pricing (such as “SF Park”) in high-traffic areas.
TR14	Cars and Light Trucks	All Pollutants	Commit regional clean air funds toward qualifying vehicle purchases and infrastructure development. Partner with private, local, state, and federal programs to promote the purchase and lease of battery-electric and plug-in hybrid electric vehicles.
TR16	Indirect Source Review	All Pollutants	Consider a rule that sets air quality performance standards for new and modified development projects.

Strategy No.	Name	Pollutant	Description
TR22	Construction, Freight and Farming Equipment	All Pollutants	Provide incentives for the early deployment of electric, Tier 3 and 4 off-road engines used in construction, freight, and farming equipment. Support field demonstrations of advanced technology for off-road engines and hybrid drive trains.
Energy Control Measures			
EN1	Decarbonize Electricity Production	All Pollutants	Engage with PG&E, municipal electric utilities, and Community Choice Energy to maximize the amount of renewable energy contributing to the production of electricity within the Bay Area as well as electricity imported into the region. Work with local governments to implement local renewable energy programs. Engage with stakeholders including dairy farms, forest managers, water treatment facilities, food processors, public works agencies, and waste management to increase use of biomass in electricity production.
EN2	Decrease Electricity Demand	All Pollutants	Work with local governments to adopt additional energy efficiency policies and programs. Support local government energy efficiency program via best practices, model ordinances, and technical support. Work with partners to develop messaging to decrease electricity demand during peak times.
Building Control Measures			
BL1	Green Buildings	All Pollutants	Collaborate with partners such as KyotoUSA to identify energy-related improvements and opportunities for on-site renewable energy systems in school districts; investigate Fundi g strategies to implement upgrades. Identify barriers to effective local implementation of the CALGreen (Title 24) state-wide building energy code; develop solutions to improve implementation/ enforcement. Work with the Association of Bay Area Government's (ABAG) BayREN program to make additional funding available for energy-related projects in the buildings sector. Engage with additional partners to target reducing emissions from specific types of buildings.
BL2	Decarbonize Buildings	All Pollutants	This measure was implemented in March 2023, when amendments to Regulation 9, Rule 4 and Rule 6 were adopted to include first-of-their-kind zero NO_X requirements for furnaces and water heaters installed in buildings.
BL3	Market-Based Solutions	All Pollutants	Implement a call for innovation to support market-based approaches that bring new, viable solutions to significantly reduce emissions associated with existing buildings.
BL4	Urban Heat Island Mitigation	All Pollutants	Develop and urge adoption of a model ordinance for "cool parking" to promote use of cool surface treatments for new parking facilities and existing surface lots being resurfaced. Develop and promote adoption of model building code requirements for new construction or re-roofing/roofing upgrades for commercial and residential multi-family housing. Collaborate with expert partners to perform outreach to cities and counties to make them aware of cool roofing and cool paving techniques, and of new tools available.
Natural and Working Lands Control Measures			
NW2	Urban Tree Planting	Criteria pollutants, GHG	Develop or identify an existing model municipal tree planting ordinance and encourage local governments to adopt such an ordinance. Include tree planting recommendations the Air District's technical guidance, best practices for local plans and CEQA review.

Strategy No.	Name	Pollutant	Description
NW3	Carbon Sequestration in Wetlands	GHG	Identify federal, state, and regional agencies, and collaborative working groups that the Air District can assist with technical expertise, research, or incentive funds to enhance carbon sequestration in wetlands around the Bay Area. Assist agencies and organizations that are working to secure the protection and restoration of wetlands in San Francisco Bay.
Waste Management Control Measures			
WA3	Green Waste Diversion	All Pollutants	Develop model policies to facilitate local adoption of ordinances and programs to reduce the amount of green waste going to landfills.
WA4	Recycling and Waste Reduction	GHG	Develop or identify and promote model ordinances on community-wide zero waste goals and recycling of construction and demolition materials in commercial and public construction projects.
Water Control Measures			
WR1	Limit GHGs from Publicly Owned Treatment Works	GHG, ROG, TACs	Initiate a process to better understand and quantify GHG emissions at publicly owned treatment works. Explore rulemaking to reduce GHGs emitted directly within POTWs. Promote the use of biogas recovery systems at POTWs.
WR2	Support Water Conservation	GHG	Develop a list of best practices that reduce water consumption and increase on-site water recycling in new and existing buildings; incorporate into local planning guidance.
Super-GHG Control Measures			
SL1	Short-Lived Climate Pollutants	GHG, including black carbon	Reduce methane from landfills and farming activities through various control measures listed under waste and agriculture sectors. Develop a rule to reduce methane emissions from natural gas pipelines and processing operations and amend regulations to reduce emissions of methane and other organic gases from equipment leaks at oil refineries. Enforce applicable regulations on the servicing of existing air conditioning units in motor vehicles, support the adoption of more stringent regulations by CARB and/or the USEPA, and encourage better hydrofluorocarbon (HFC) disposal practices.
SL2	Guidance for Local Planners	GHG	Track progress in adoption and implementation of super-GHG reduction measures in local plans and programs.

SOURCE: Bay Area Air Quality Management District, 2017.

Bay Area Air Quality Management District Regulations

The BAAQMD adopts rules and regulations. All projects are subject to the BAAQMD's rules and regulations in effect at the time of construction. Specific rules applicable to project construction and operation may include, but are not limited to, the following rules:

- **Regulation 2, Rule 1, General Permit Requirements.** This rule includes criteria for issuance or denial of permits, exemptions, appeals against decisions of the air pollution control officer, and BAAQMD actions on applications.
- **Regulation 2, Rule 2, New Source Review.** This rule applies to new or modified sources and contains requirements for best available control technology (BACT) and emission offsets. Rule 2 implements federal New Source Review and Prevention of Significant Deterioration requirements.

- **Regulation 6, Rule 1, General Requirements.** Regulation 6 limits the quantity of PM in the atmosphere by controlling emission rates, concentration, visible emissions, and opacity.
- **Regulation 6, Rules 1 and 6 (Fugitive Dust Control).** This regulation sets standards and requirements for controlling and reducing fugitive dust emissions at dust-generating facilities. Recently adopted in 2018, Rule 6-6 was developed along with a new umbrella regulation, Regulation 6, and amendments to Rule 6-1, to address particulate matter emissions from a variety of activities and operations.
- **Regulation 7, Odorous Substances.** Regulation 7 places general limitations on odorous substances and specific emission limitations on certain odorous compounds. A person (or facility) must meet all limitations of this regulation but meeting such limitations would not exempt such person from any other requirements of the BAAQMD, state law, or national law. The limitations of this regulation are not applicable until the BAAQMD receives odor complaints from 10 or more complainants within a 90-day period, alleging that a person has caused odors perceived at or beyond the property line of such person and deemed to be objectionable by the complainants in the normal course of their work, travel, or residence. When the limits of this regulation become effective, as a result of the citizen complaints described above, the limits remain effective until such time as no citizen complaints have been received by the BAAQMD for 1 year. The limits of this regulation become applicable again if the BAAQMD receives odor complaints from five or more complainants within a 90-day period. The BAAQMD staff investigate and track all odor complaints it receives and make attempts to visit the site and identify the source of the objectionable odor and assist the owner or facility in finding a way to reduce the odor.
- **Regulation 8, Rule 3 (Architectural Coatings).** This regulation limits the quantity of volatile organic compounds in architectural coatings supplied, sold, offered for sale, applied, solicited for application, or manufactured for use within the BAAQMD's jurisdiction.
- **Regulation 8, Rule 5 (Storage of Organic Liquids).** The purpose of this rule is to limit emissions of organic compounds from storage tanks.
- **Regulation 9, Rule 4 and Rule 6 (Building Appliance Rules)** March 2023, amendments to Regulation 9, Rule 4 and Rule 6 include zero NO_X requirements for furnaces and water heaters installed in buildings.
- **Regulation 9, Rule 8 (Stationary Internal-Combustion Engines).** This regulation limits emissions of NO_X and CO from stationary internal-combustion engines of more than 50 horsepower.
- **Regulation 11, Rule 2 (Hazardous Pollutants).** This regulation limits emissions of asbestos during demolition, renovation, milling, and manufacturing and establishes appropriate waste disposal procedures.

d. City of Brisbane Plans, Policies, Ordinances, and Regulations

General Plan

Community Health and Safety Element

The Community Health and Safety Element of the City of Brisbane General Plan contains policies related to air quality. Policies and associated programs relating to the City's consideration of local development projects.

Chapter VI: Conservation

Policy 139: Promote the conservation of non-renewable energy resources.

Policy 140: Encourage energy-efficient building design and site planning.

Policy 141: Encourage the installation of energy-efficient appliances.

Program 141a: Cooperate with PG&E in promoting energy conservation by providing information and referral on energy-efficient appliances and heating and cooling systems.

Policy 142: Continue to support vehicle trip-reduction programs to conserve non-renewable fuels. [See Chapters VI and X of the City's general plan for additional trip reduction policies.]

Policy 193: As a part of land use development analysis, consider the impacts on air resources that will be generated by a project through mobile sources.

Program 193a: Consider the design of roadways, transit facilities, bikeways and pedestrian access in all subdivisions, specific plans, and other land use proposals to evaluate whether and to what extent the design addresses air quality issues.

Program 193b: In conjunction with land use development applications and CEQA review, evaluate whether a proposal may have a significant effect on air quality because of mobile emissions. Require environmental impact analysis and mitigation plans and monitoring, as appropriate.

Program 193c: Discourage drive-up service windows and similar uses that generally result in vehicle idling.

Policy 194: Attempt to minimize dependence on automobile travel by encouraging transit, bicycle and pedestrian alternatives and incorporating alternatives to the automobile in land use planning and project design.

Program 194a: Provide park-and-ride facilities to facilitate use of transit.

Program 194b: Provide bicycle and pedestrian access to all areas of the City to provide alternatives to automobile use.

Program 194c: Require all new development to include design principles that are transit oriented and otherwise reduce dependence on the automobile.

Policy 195: Express support for federal and state programs to improve emissions control devices, reformulate gasoline, develop fuel efficient vehicles, and other technological advances that could serve to reduce mobile emissions.

Policy 196: Support efforts to control fuel emissions and excessive idling of airplanes at San Francisco International Airport.

Policy 197: Continue to improve existing roadways to reduce congestion in order to reduce emissions generated by "stop-and-go" driving.

Program 197a: Use traffic management systems, such as signage and timed signals, to facilitate traffic flow and reduce congestion.

Policy 198: Actively participate in and support the development and implementation of transportation system management plans (TSMs) and transportation demand management measures (TDMs).

Program 198a: Support the implementation of transportation demand management measures by private businesses, such as transit and carpool subsidies, preferential carpool/vanpool parking, flexible work schedules and ride matching services.

Program 198b: Encourage the installation of bicycle lockers, changing rooms and showers, guaranteed ride home, the provision of on-site support services in private businesses and other measures to reduce vehicular trips by employees.

Program 198c: Consider providing incentives as a part of land use development permit approvals for the use of TSM and TDM measures.

Policy 199: Encourage County and regional transportation agencies to improve transit and transportation systems in ways that reduce mobile source emissions.

Policy 200: Express support for State and Federal programs to develop filter control devices, vapor recovery systems, leakless valves, reformulated surface coatings and solvents and other technological advances that could serve to reduce stationary emissions.

Policy 201: Encourage households and businesses to properly manage materials that affect air quality and replace these materials with safer alternatives whenever possible.

Policy 202: Incorporate emissions control practices into City ordinances as appropriate.

Program 202a: Strictly enforce the City's Grading Ordinance provisions for dust control.

Program 202b: Require that demolition and construction projects conform to the BAAQMD recommended dust control measures.

Program 202c: On a periodic basis, review the City's ordinance requirements to assure conformance with BAAQMD standards.

Policy 203: Consider issues of stationary emissions in land use planning and project review.

Program 203a: As part of land use planning, establish buffer zones between sensitive receptors and significant emissions sources, including uses that cause offensive odors or dust.

Program 203b: In conjunction with any surface mining, oil and gas operation or industrial development land use permit, place strict conditions for compliance with best management practices for control of dust, odors and other emissions that have air quality impacts.

Chapter XII: Policies and Programs by Subareas

Policy BL.1: Development within the Baylands Subarea shall be subject to the City's approval of a single specific plan for the entirety of the Baylands Subarea and a development agreement that is consistent with General Plan policies, incorporates all applicable EIR [environmental impact report] mitigation measures, and is consistent with the following standards:

G. The required specific plan for the Baylands shall include a sustainability program for new development consistent with the principles of the Sustainability Framework for the Brisbane Baylands, Final Report accepted by the City Council on November 5, 2015. Baylands development shall be designed so as to be energy neutral on an ongoing basis.

Sustainability Framework for the Brisbane Baylands

Chapter 4, "Sustainability Framework," of the Baylands Specific Plan describes strategies and standards for creating a zero-carbon, zero-waste development that conserves energy and water, increases transit accessibility and the use of nonmotorized transportation modes, enhances habitats and the site's natural environment, establishes resiliency in light of projected sea-level-rise adaptation, provides for sustainable infrastructure development, and addresses other sustainability factors.

On November 5, 2015, the City of Brisbane accepted the final draft for the *Sustainability Framework for the Baylands* (Brisbane Baylands Sustainability Framework). The Brisbane Baylands Sustainability Framework is designed to identify key sustainability elements to be addressed in future Baylands development and creates an approach to implement these principles (City of Brisbane 2015).

The Baylands Specific Plan proposes measures to address the requirements set forth in the Brisbane General Plan and Measure JJ that Baylands development be energy-neutral and consistent with the principles of the Brisbane Baylands Sustainability Framework. The sustainability framework in Chapter 4 of the Baylands Specific Plan is organized to reflect the 10 "One Planet Living" principles defined in 2003 by Bioregional, a United Kingdom–based nonprofit, as a framework for sustainable living. The sustainability framework proposes goals and performance standards intended to define how consistency with each One Planet Living principle should be measured. The One Planet Living principles are a set of 10 principles designed to achieve an ecological footprint consistent with the resources available on one planet; they include the social and economic aspects of sustainability as essential elements to achieving and sustaining the environmental outcomes (City of Brisbane 2015). Principles include Zero Carbon Buildings, Zero Waste, Sustainable Transportation, Local and Sustainable Materials, Local and Sustainable Food, Sustainable Water, Open Space and Habitat, Culture and Heritage, Economic Vitality with Equity and Ecology, and Recreation, Health and Happiness.

Brisbane Climate Action Plan

In September 2015, the City of Brisbane adopted its first climate action plan (CAP), which established a GHG emission reduction goal of 15 percent below 2005 levels by the year 2020. This plan was a comprehensive and strategic approach to sustainability, recommending actions to engage all members of Brisbane's community in a journey to protect the environment. The CAP identified key forces that contribute substantially to GHG emissions and provided strategies for reducing emissions in these areas.

The City's most recent GHG inventory report for the 2021 calendar year, published in 2024, showed an estimated 13.66 percent reduction of emissions, falling short of the initial goal from 2015. In July 2021, via Resolution No. 2021-62 "Climate Emergency Declaration," the City established new emissions reduction targets of 66 percent reduction from the 2005 baseline by 2030 and carbon neutrality by 2040.

Brisbane Municipal Code

Brisbane Municipal Code Section 15.80 specifies green building standards for new developments, including meeting a minimum Leadership in Energy and Environmental Design (LEED) "Silver" rating on the Green Building Project Checklist for all new commercial projects over 10,000 square feet and achieving a "green home" rating on the Multi-Family GreenPoint

Checklist[187] for any residential developments with 20 or more units. To meet these requirements, a variety of energy, stormwater, and water efficiency measures can be implemented that are integrated in green building design, siting, construction, and operations.

Building Code

The latest update to the California Building Code (CBC) was adopted by the City of Brisbane and is effective as of January 1, 2023. The CBC requires that new construction be more energy efficient and includes solar requirements for new residential construction. In addition, through Ordinance 675,[188] the City of Brisbane has chosen to exceed the state's standards including installation of electric vehicle charging infrastructure.

Additionally, on October 19, 2023, the Brisbane City Council adopted an updated Transportation Demand Management (TDM) ordinance amending Brisbane Municipal Code Section 10.52. The TDM ordinance's purpose is to "promote more efficient utilization of existing transportation facilities."

Chapter 15.84, Electric Vehicle Infrastructure

Chapter 15.84 of the City's Municipal Code, the Electric Vehicle Infrastructure Ordinance, sets forth requirements for the installation of electric vehicle (EV) charging equipment in new construction. For new single-family residences, duplexes, and townhouses (and new garages at existing such buildings), the Code requires, where two or more parking spaces per unit are required, the installation of one Level 1 EV Ready Circuit and one Level 2 EV Ready Circuit.[189] For new multifamily residential buildings, the Code requires a minimum of one EV-ready parking space per unit, with a minimum 10 percent of these spaces equipped with Level 2 EV chargers. Additionally, at least 50 percent of guest parking spaces must have EV chargers. Finally, a minimum of 40 percent of the total number of parking spaces must be EV-ready or have chargers installed.[190]

For non-residential new construction, where nine or fewer parking spaces are required, at least one space must be either EV-ready or have an EV charger installed. Where 10 or more parking

[187] Build It Green, a non-profit organization, has developed New Home Construction Green Building Guidelines and a Multi-Family GreenPoint Checklist, based upon the Multi-Family Green Building Guidelines established by the Alameda County Waste Management Authority. See Section 15.80.020 of the Brisbane Municipal Code for more information.

[188] Brisbane Ordinance No. 675 can be found at https://library.municode.com/ca/brisbane/ordinances/municipal_code?nodeId=1185187. Ordinance No. 675 amended CALGreen, as it applies in Brisbane (Municipal Code Section 15.04.043), such that new construction and qualifying alterations "do not use combustion equipment or are ready to accommodate installation of electric heating appliances," with certain exceptions.

[189] Level 1 chargers operate using a standard 120-volt, 20-amp household electrical circuit. Level 2 chargers use higher-output 240-volt power sources (generally with a 40-amp capacity) so that recharge times for EVs are much faster than with Level 1 systems.

[190] Certain exceptions are permitted, including, in the case of multi-family residential buildings, a reduction in the number of EV-ready spaces to fewer than one per unit if fewer than one parking space per unit is required.

spaces are required, at least 15 percent of the required spaces must have EV chargers, with an additional 10 percent or 35 percent more low-power (20-amp) EV ready spaces also required, depending on whether the non-residential use is defined in the Municipal Code as having higher or lower parking turnover.[191]

4.9.4 RELEVANT SPECIFIC PLAN PROVISIONS

a. Active Transportation Facilities

An active transportation network would be developed consisting of an internal network of shared use paths, bicycle facilities, and sidewalks in compliance with the Americans with Disabilities Act (ADA) that would connect to existing local and regional routes. Pedestrian facility types are described in **Table 3-3**. The Baylands pedestrian network is illustrated in **Figure 3-30**. Baylands bicycle and micro-mobility facility types are identified in **Table 3-4** and illustrated in **Figure 3-31**. Furthermore, most of the Specific Plan's residential development is contained within a Transit Priority Area, including Bayshore, Main Street West, Main Street East, and portions of Icehouse Hill Southwest and Icehouse Hill Southeast.

A fare-free shuttle network would be provided to transport Baylands residents and workers throughout the site and connect the Baylands to downtown Brisbane and existing transit routes. Shuttle service is proposed to be established in two phases, initially providing an internal Baylands route and weekday connections to downtown Brisbane as illustrated in **Table 3-5** and **Figure 3-32**.

b. Energy Generation and Conservation

The 2025 Specific Plan requires a minimum of 85,000 megawatt hours (MWh) of electricity to be generated annually. To that end, a 55-acre solar farm will be developed east of the Caltrain right-of-way and south of Visitacion Creek along with building- and other ground-mounted solar installations. Based on the reasonably foreseeable mix of building types anticipated within the Baylands, actual renewable energy generation was estimated to be 92,445 MWh in the Baylands Energy Plan prepared by Thornton Tomasetti Inc. in May 2021. Battery storage facilities and equipment installed in buildings and within sustainable infrastructure areas are proposed to extend the reliability of renewable electricity produced on- and off-site. Electrical demand not met by on-site energy generation is required to be met with 100 percent renewable energy "to the maximum extent allowed by law." The Baylands would feature all-electric

[191] Higher parking turnover uses are those such as retail, restaurants, professional offices, gyms, recreational uses, meeting halls. Lower parking turnover uses are those such as office, Research and Development, industrial, hotels, and schools.

residential and commercial buildings; natural gas facilities would not be provided to Specific Plan development.

c. Transportation Demand Management

In addition to providing a roadway network, pedestrian and bicycle facilities, and transit services described above, the Specific Plan proposes preparation of Transportation Demand Management (TDM) Plans for each applicable site-specific development project as it undergoes site-specific development review. The purpose of these TDM plans is to encourage and incentivize travel other than via use of single-occupant vehicle trips in accordance with the City of Brisbane's TDM requirements contained in Brisbane Municipal Code 10.52.010 et seq. The Specific Plan sets a project-wide trip reduction target of a minimum 25 percent below baseline Average Daily Traffic (ADT).

4.9.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of air quality impacts.

Threshold AQ-1: **The Baylands Specific Plan would cause a significant impact if the net increase of any non-attainment criteria pollutant would exceed the following BAAQMD Regional Criteria Pollutant Significance Thresholds.**

Pollutant	Construction	Operations	
	Average Daily Emissions (lbs/day)	Average Daily Emissions (lbs/day)	Max. Annual Emissions (tons/yr)
ROG	54	54	10
NO_X	54	54	10
PM_{10}	82 (Exhaust)	82	15
$PM_{2.5}$	54 (Exhaust)	54	10
PM_{10}, $PM_{2.5}$, Fugitive Dust	Implement Best Management Practices	None	None

Threshold AQ-2: **The Baylands Specific Plan would cause a significant impact by exposing sensitive receptors to substantial pollutant concentrations if it would:**

- **Result in an excess cancer risk level of more than 10 in one million, or a non-cancer (i.e., chronic or acute) hazard index greater than 1.0;**
- **Result in an incremental increase of greater than 0.3 micrograms per cubic meter ($\mu g/m^3$) annual average fine particulate matter ($PM_{2.5}$); or**
- **Add daily traffic volumes at any project-affected intersection with more than 44,000 daily vehicles, thus creating a new or exacerbating an existing carbon monoxide (CO) hot spot (9.0 ppm [8-hour average], 20.0 ppm [1-hour average]).**

Threshold AQ-3: The Baylands Specific Plan would cause a significant impact if it would generate odors adversely affecting a substantial number of people.

Threshold AQ-4: The Baylands Specific Plan would cause a significant impact if it would be inconsistent with the San Francisco Bay Area Clean Air Plan.

4.9.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Threshold AQ-1: Emissions of Criteria Air Pollutants for which the Basin is in Nonattainment

Methodology for Determining Significance in Relation to Threshold AQ-1

The criteria air pollutant thresholds presented under Threshold AQ-1 are those presented within the 2022 BAAQMD CEQA Air Quality Guidelines. Projects that would result in criteria pollutant emissions above these significance thresholds would result in a cumulatively considerable net increase in non-attainment criteria air pollutants within the air basin. As discussed above, the criteria air pollutant NAAQS and CAAQS are intended to incorporate an adequate margin of safety to protect the public health and welfare. Therefore, attainment with the ambient air quality standards can be considered protective of public health.

Construction Activities and Emissions

Construction criteria air pollutant and TAC emissions were estimated using CalEEMod. Demolition, grading, trenching, hauling, and other ground-disturbing activities would also result in fugitive dust emissions.

CalEEMod outputs and detailed calculation spreadsheets are included in Appendix A of the Air Quality Technical Report (EIR Appendix G.1).

Off-Road Equipment

Construction of the proposed project would emit criteria air pollutant emissions from:

- Demolition of existing industrial structures
- Excavation of soil on the eastern portion of the Baylands to be hauled to the area west of the Caltrain right-of-way, including establishment of final grades for Specific Plan development
- Grading of the west side of the Specific Plan area
- Construction of new buildings, utilities, roads, and bridges
- Architectural coating of interior and exterior surfaces
- Paving

For diesel-powered off-road construction equipment, emissions were calculated by CalEEMod assuming fleet average equipment and factors from the OFFROAD2017-ORION v1.0.1 model, which is incorporated in CalEEMod.

On-Road Mobile Sources

CalEEMod, which incorporates the EMFAC2021 on-road emissions model, was used to quantify on-road construction criteria air pollutant and TAC emissions from these sources, including haul trucks used to transport the 2,500,000 cubic yards of excavated material from the eastern portion of the Baylands to the west side, west of the Caltrain right-of-way.

PM emissions can occur from resuspended road dust that is entrained by vehicular travel on paved and unpaved roads and from tire and brake wear. The calculation of the entrained roadway dust emission factor and the calculation of emissions from entrained roadway dust from construction-related vehicle trips were calculated with CalEEMod for trips associated with Baylands development, using default trip lengths, and outside of CalEEMod using CARB entrained road dust emission factors for the above haul truck trips.

Demolition of Existing Buildings

The construction emissions analysis assumed that 272,400 square feet (18 structures) along Industrial Way would be demolished. Thus, the analysis calculated emissions associated with their demolition, using CalEEMod.[192]

Architectural Coatings and Paving

Architectural coating and paving are the predominant sources of ROG emissions during construction. These emissions result from the volatile organic compound (VOC, or ROG) content of the coatings and off-gassing of VOC during paving. The terms VOC and ROG are used interchangeably, both representing volatile, or reactive, organic gases. Emissions from architectural coatings were based on CalEEMod default values of architectural coatings per square footage, default VOC content, which is 100 grams per liter of coating for indoors and 150 grams per liter for outdoors and using the total building square footage provided by the project applicant. Emissions from architectural coating would be compliant with BAAQMD paint VOC regulations. Paving emissions were also based on the CalEEMod default emission rate, which is 2.62 pounds per acre paved, and using the square footage of roadways and parking lots that need to be paved.

[192] While the calculation of mobile source emissions from demolition of structures along Industrial Way uses CalEEMod defaults for the heavy equipment involved in demolition activities, trip-related mobile source emissions for analysis of operations was undertaken based on the VMT analysis undertaken for Impact TRA-1 using EMFAC2021.

Infrastructure, Middle School, and Fire Stations

Infrastructure uses that are analyzed include the following:

- Solar farm
- Water recycling facility (WRF)
- Off-site recycled water supply lines
- Water tank
- Substation
- Battery storage facility

Air pollutant emissions estimates from construction of these uses were based on other, recent environmental documents involving similar facility types and scaled based on their size. Factors that were scaled to best represent the proposed project components included square footage of facility, duration of construction phases, hours of use per equipment, and number of on-site workers. Values for amount of construction equipment, equipment horsepower, and load factors were also used from the example projects for the proposed project modeling inputs as described below.

- The 55-acre solar farm was modeled after the solar photovoltaic power generation facility for the 180-megawatt Little Bear Solar Draft EIR (ESA 2018a) with a reduction scaling factor of 76 percent. This means that the analysis of the Baylands solar farm assumed that the same types of construction equipment would be used as were used for the Little Bear facility, but 76 percent fewer equipment use hours would be required to construct the Baylands facility.
- The 0.95 million gallon per day Baylands water recycling facility was modeled after the 2.75 million gallons per day Morro Bay Water Reclamation Facility Project (ESA 2018b) with a reduction scaling factor of 81 percent.
- A recycled water conveyance pipeline to serve off-site users in the Sierra Point area and Oyster Point portion of South San Francisco would also be constructed using the "cut and cover" open trenching method and would progress at a rate of 100 feet per day from the water recycling facility south along Bayshore Boulevard and Airport Boulevard into South San Francisco.
- The 3.16-million-gallon Baylands water tank/storage facility was modeled after a 6-million-gallon storage facility that was a part of the California-American Water Company Monterey Peninsula Water Supply Project (ESA 2018c) with a reduction scaling factor of 47 percent.
- The 2-acre electrical switching substation within the Baylands was modeled after the 1.7-acre Martin Substation Extension Project (Dudek 2019) with an increased scaling factor

of 18 percent. The battery storage facility was modeled using CalEEMod defaults for an industrial land use.

- The relocated fire station was modeled after the FS-8 Relocation Project (ESA 2022) and the new fire station was modeled after the FS-32 Project (ESA 2023), both in Santa Clara County. The relocated fire station would not introduce new, operational sources of emissions; it would result in new construction emissions only. Therefore, the FS-8 Relocation Project was used as a representative surrogate project. For the new fire station, the new FS-32 Project was used as it would result in new operational emissions sources, in particular from on-road vehicles.
- For land uses that did not have a readily available comparative facility (the middle school and battery storage facility), CalEEMod defaults were used when modeling impacts. The proposed middle school and the battery storage facility were the two land uses that were modeled using CalEEMod defaults.

Operational Activities and Emissions

Land uses that would generate operational emissions include residences and commercial development in the Bayshore, Roundhouse, and Icehouse Hill districts, plus the commercial uses in the East Campus. In addition, the Specific Plan's infrastructure and new fire station would be sources of operational emissions from emergency backup generators and from employee trips. Specific Plan infrastructure includes the water recycling facility, the water tank, the electrical substation, the battery storage facility, and the solar farm.

Sources of operational emissions from the Specific Plan include:

- On-road vehicles
- Landscaping and maintenance of open space areas
- Consumer use of products containing VOCs (paints, solvents, personal care products)
- Architectural coating (interior and exterior)
- Emergency diesel generators
- Energy use (note that the proposed project would be all-electric and not use natural gas)

Operational On-Road Mobile Sources

On-road mobile sources include vehicle trips associated with residents, retail customers, employees, and vendor deliveries and would emit criteria pollutants and TACs in their exhaust, resuspended road dust, tire wear, and brake wear. In addition, gasoline vehicles emit criteria air pollutants and TACs through fuel evaporation. Operational vehicle emissions for the proposed project were estimated based on VMT provided by the Baylands transportation analysis. Emissions were calculated with the CARB EMFAC2021 on-road emissions model and vehicle

fleet mix for San Mateo County. Emission factors were conservatively assumed for the first year of operation as each block's construction is completed. This is a conservative assumption because emissions tend to decrease over time with advancements in fuel economy and new regulations.

Emergency Generators

Operational emissions for emergency generators at all buildings with occupiable space greater than 75 feet in height, and at the relocated fire station, the new fire station, and water recycling facility were calculated assuming a maximum of 50 hours per year of non-emergency testing operation, consistent with the Airborne Toxic Control Measure for Stationary Compression Ignition Engines (17 CCR section 93115) (CARB 2011) plus an additional 100 hours for assumed emergency use. Criteria pollutant and TAC emissions were calculated assuming the generators would be compliant with BAAQMD's BACT, which requires the use of Tier 4 engines for generators 1,000 horsepower and larger (BAAQMD 2021).

Architectural Coatings

Operational architectural coatings account for the reapplication of paint and coatings on interior and exterior surfaces, which would result in ROG emissions. Architectural coating emissions were estimated using a factor from CalEEMod that is based on the VOC content of the coatings and total building square footage, independent of the type of building.

Consumer Products

Consumer product use would be the predominant source of ROG emissions during proposed project operation. Consumer product emissions come from various non-industrial solvents, including cleaning supplies, kitchen aerosols, cosmetics, and toiletries, which emit VOCs during their use. Emissions from consumer products were calculated using the total building square footage of the proposed project. Factors from CalEEMod were used to estimate these emissions. These factors, which are independent of the building type, are based on VOC content per square foot and total building square footage.

Energy Use

The consumption of fossil fuels to generate electricity and to provide central heating, cooling, and hot water generates criteria pollutant emissions. The Specific Plan would not extend natural gas service to Baylands buildings. Therefore, no criteria pollutant emissions associated with Baylands development would be generated from natural gas combustion.

Solar-powered infrastructure systems are proposed to be installed on buildings, ground mounted, and where feasible, over parking lots that would total 92,445 MWh of annual generation. An approximately 55-acre solar farm would be installed within the eastern portion

of the Baylands between Visitacion Creek and the relocated Lagoon Road on a phased basis as portions of the landfill closure process are completed.

The Specific Plan proposes battery storage for each building with an estimated total of 30 megawatts (MW) of distributed battery storage. Additionally, a front-of-the-meter, 250 MW utility-scale battery storage facility is proposed to serve as a regional resource. As discussed in Section 4.11, *Energy Resources*, the Specific Plan does not guarantee development of the 250 MW utility-scale battery storage facility, since its construction is dependent on a number of market and regulatory factors beyond the control of the applicant or the City of Brisbane. Thus, the air quality benefits of the utility-scale battery storage facility were not factored into air quality impact analysis.

Landscaping Equipment

Emissions from landscaping and maintenance of the open space areas designated as community greens were calculated using CalEEMod and based on information regarding the size of the open space area. As a conservative measure, the recent law (Assembly Bill 1346) banning the sale of gasoline-powered landscaping equipment by 2024 was not accounted for, since there is no prohibition on use of non-electric equipment purchased prior to 2024 and such non-electric equipment already in operation could continue.

Net Increase in Emissions of Criteria Pollutants

Existing industrial uses along Industrial Way are anticipated to move elsewhere within the air basin once their operations cease within the Specific Plan area. Thus, existing emissions from these uses would not be retired by Specific Plan development. In addition, other existing uses within the Specific Plan area would continue during and following Baylands development, including Recology uses along Tunnel Avenue, Golden State Lumber, the Kinder Morgan Tank Farm, Bayshore Sanitary District pump station, and Machinery & Equipment, Inc. The existing Mission Blue Nursery would also continue operations, albeit at a new location on Icehouse Hill. Thus, the "net increase" in emissions of criteria pollutants that would result from Specific Plan development is equivalent to the emissions of new uses proposed by the Specific Plan.

Infrastructure, Middle School, and Fire Stations

Air pollutant emissions from operation of the infrastructure, middle school, and fire station uses (listed above) would result from employee vehicle trips, emergency backup generators, consumer product use, and architectural coatings. Emissions from emergency backup generators, consumer product use, and architectural coatings were calculated as described above for each of these categories. For employee vehicle trips, emissions were calculated using the EMFAC2021 model and projected number of employees provided by the applicant.

Emergency Fuel Tanks at the Corporation Yard

As part of the City's ongoing emergency preparedness planning, one aboveground, 2,000-gallon diesel or ethanol storage tank and two, 1,000-gallon mobile propane tanks are proposed to provide enough fuel for 72 hours of emergency fuel demands for City and emergency response use. These tanks would not be a source of substantial TACs from volatile emissions, because no acute, chronic, or carcinogenic TACs are emitted from uncombusted, stored diesel or propane fuel.[193] In addition, tanks would require permits from BAAQMD and be subject to its Rule 8-5. BAAQMD permit conditions for these tanks would include measures to limit leaking, fugitive organic compounds, such as being equipped with liquid mounted primary seals and a zero-gap secondary seals, and no ungasketed roof fittings.[194]

Combined Construction and Operational Emissions

The Specific Plan is estimated to be constructed over a period of 17 years, with some building occupancy and operational emissions occurring while construction of other portions of the site proceeds. In years when construction would coincide with proposed project operation, construction emissions are combined with operational emissions.

As shown in **Table 3-8**, grading operations are anticipated to commence in 2025, with building construction starting in 2027. As a result, construction activities could occur concurrent with occupancy of buildings within the western portion of the Baylands as early as 2029 once construction of several blocks within the Roundhouse District is completed and those blocks are occupied. Thus, project emissions are assumed to include both construction and operational emissions starting in 2029 and continuing through 2042.

The anticipated sequencing of Baylands development is shown below. This sequencing was used for the purpose of developing the analysis of construction and operational emissions. The development schedule in **Table 3-8** shows the assumed sequencing of each construction activity that was used to determine annualized emissions, including the potential for construction and operational emissions to overlap in time. Occupation of dwelling units and commercial buildings is assumed to start at the beginning of the year following completion of construction.

Impact Assessment

Baylands construction activities would emit criteria air pollutant emissions in the form of fugitive dust during earthmoving and ground-disturbing activities; fugitive dust from travel on

[193] The CARB Hot Spots Reporting and Analysis tool, used for health risk assessments of TACs, does not have health risk values for organic compounds in uncombusted diesel or propane fuel (https://ww2.arb.ca.gov/resources/documents/harp-air-dispersion-modeling-and-risk-tool?keywords=2025).

[194] BAAQMD Permit Handbook, accessed March 25, 2025, https://www.baaqmd.gov/~/media/files/engineering/permit-handbook/baaqmd-permit-handbook.pdf?rev=fd6da37a0862483f899488a1f2b7f2fb&sc_lang=en.

paved roads; and exhaust from heavy construction equipment, construction material delivery trucks (including concrete and dump trucks), and construction worker vehicles. Each of these activities is discussed below.

Fugitive Dust Generated by Construction Activities

Specific Plan related demolition, soil transport, remediation, grading, and other construction activities would cause wind-blown dust that would contribute particulate matter to the local atmosphere.

Fugitive dust includes not only PM_{10} and $PM_{2.5}$, but also larger particles. Dust can be an irritant and cause watering eyes or irritation to the lungs, nose, and throat. Demolition, excavation, and other construction activities can cause wind-blown dust to add to particulate matter in the local atmosphere. Although there are federal standards for air pollutants and state and regional air quality control plans, air pollutants continue to have impacts on human health throughout the country. CalEPA has found that particulate matter exposure can cause health effects at levels lower than national standards. Thus, the BAAQMD does not maintain thresholds for fugitive dust emissions but recommends implementation of best management practices in its CEQA Guidelines to reduce fugitive dust emissions. Adherence to BAAQMD's best management dust minimization practices, which are mandated by the State Water Board Construction Stormwater General Permit, Order 2022-0057-DWQ, would reduce potential dust-related criteria air pollutant impacts during project construction to below the applicable threshold. The best management dust minimization practices listed in this regulation are equivalent to those in the BAAQMD 2022 CEQA Guidelines Table 5-2.

Construction-Related Criteria Air Pollutant Emissions

Specific Plan construction activities have the potential to create temporary air quality impacts through emissions of criteria air pollutants associated with the use of heavy-duty construction equipment, construction workers' vehicle trips, and truck hauling trips. Fugitive ROG emissions would result from the application of architectural coatings and paving. Demolition and construction activities would require the use of heavy trucks, excavators, material loaders, cranes, and other mobile and stationary construction equipment. The assessment of construction criteria air pollutant impacts considers each of these potential sources.

As shown in **Table 3-8**, grading operations are anticipated to commence in 2025, with building construction starting in 2027. As a result, construction activities could occur concurrent with occupancy of buildings within the western portion of the Baylands as early as 2029. Thus, project emissions are assumed to include both construction and operational emissions starting in 2029 and continuing through 2042. Operational emissions sources would include architectural coating from tenant improvements, consumer products, exhaust from on-road vehicles (mobile emissions), area sources such as landscaping equipment for open space areas,

and emergency generator testing and use. There would be no natural gas combustion emissions because the proposed project would use only electricity.

Emissions were analyzed for each year of construction. Emissions of NO_X tend to be higher in years with site grading and excavation activities that require heavy diesel equipment and haul trucks. Emissions of ROG are higher during the building construction phases due to architectural coating and paving. Pollutants that would be generated during construction are presented in **Table 4.9-7** for:

- First year of construction, which is when demolition would be undertaken, and grading operations would start (assumed to be 2025);
- The years of maximum emissions for each pollutant; and
- Phase 1 buildout, at which time construction activities west of the Caltrain right-of-way would cease (assumed to be 2038).

The emissions for the first year of grading (assumed to be 2025) would only be from construction. The second year of grading represents the highest year for NO_X emissions. NO_X is the predominant pollutant of concern from diesel-fueled heavy equipment and trucks.

As shown in **Table 4.9-7**, construction emissions of NO_X would exceed significance thresholds. At buildout of Phase 1 (assumed to be in 2038), net new Phase 1 buildout operational emissions would exceed significance thresholds for all pollutants, as would combined construction and net new Phase 1 buildout emissions. Most NO_X emissions would be generated from heavy construction equipment and on-road heavy-duty truck exhaust. Additional NO_X emissions from operation would be generated mostly by on-road passenger vehicles and diesel-fueled emergency backup generators.

Most ROG emissions during construction would be generated from architectural coatings (assuming compliance with BAAQMD Rule 8-3 on VOC content) and during operations from on-road mobile sources and from consumer product use. Construction PM_{10} and $PM_{2.5}$ emissions are mainly from diesel equipment and truck exhaust. These emissions do not exceed significance thresholds during construction. Operational emissions of PM_{10} and $PM_{2.5}$ exceed the thresholds at Phase 1 and full buildout, mainly due to resuspended road dust from on-road vehicles. Refer to Appendix A of the Air Quality Technical Report, *Emissions Calculations*, (EIR Appendix G.1) for detailed construction emissions by source.

Table 4.9-7: Increase in Criteria Air Pollutant Emissions During Construction and Operation

Milestone	Average Daily Construction Criteria Pollutant Emissions (pounds/day) [a]				Net Increase Operational Criteria Pollutant Emissions (pounds/day) [a]				Average Daily Construction and Operational Criteria Pollutant Emissions (pounds/day) [a]

ABBREVIATIONS: PM = particulate matter; $PM_{2.5}$ = PM less than 2.5 microns in diameter; PM_{10} = PM less than 10 microns in diameter; ROG = reactive organic gases; NO_X = nitrogen oxides

NOTES: **Bold values** = threshold exceedance

a. Emissions estimated using CalEEMod® version 2022.1 and EMFAC2021. Due to rounding, numbers in columns may not add to totals.

Net Increase in Operational Criteria Air Pollutant Emissions

Operations at the completion of Phase 1 and at full buildout would generate increased emissions of criteria pollutants for which the basin is in non-attainment. In addition, ROG emissions would be generated from consumer product use involving paints, solvents, sprays, and other products containing VOCs. Finally, for buildings that are 75 feet or more in height, diesel emergency backup generators would be an additional minor source of criteria pollutant emissions during weekly testing and maintenance.

At Specific Plan buildout, the majority of criteria pollutant emissions would have the following sources:

- ROG emissions – consumer product use (56 percent), with the remaining ROG emissions from architectural coatings and landscaping equipment.
- NO_X emissions – mobile source exhaust emissions (95 percent), with the remaining NO_X emissions from landscaping equipment.
- PM_{10} and $PM_{2.5}$ emissions – resuspended road dust (99 percent), with the remaining emissions from landscaping equipment.

Table 4.9-7 and **Table 4.9-8** present the increase[195] in operational emissions through construction and buildout of Phase 1 to full buildout of the Specific Plan. Emissions include those from mobile sources, consumer product use, architectural coating, landscaping of open space community greens areas, and emergency generator use. Emissions of PM_{10} and $PM_{2.5}$ in these tables include vehicle exhaust and fugitive sources including re-suspended road dust, brake wear, and tire wear.

[195] The existing emissions of the Specific Plan's Existing Use areas (e.g., Recology uses along Tunnel Avenue, Golden State Lumber, Bayshore Sanitation District pump station, and Machinery & Equipment, Inc.) would not change over time and have not therefore been calculated as part of Baylands development. Existing uses within buildings along Industrial Way that would be demolished to make way for Specific Plan development are assumed to relocate elsewhere within the Bay Area and were therefore not subtracted from the Specific Plan buildout emissions to reflect the Specific Plan's net increase in emissions.

Regional Mobile Source Emissions Based on VMT

The transportation study analyzed the effect on cumulative VMT for the nine-county Bay Area region that would occur if the development proposed by the Specific Plan were instead spread out between San Francisco and the rest of San Mateo County. As shown in **Table 4.9-9**, by providing mixed-use development that places housing in proximity to entertainment, retail, visitor lodging, and employment opportunities, the Specific Plan could enable residents to live, work, and shop without the use of motor vehicles. Many of the Specific Plan area's 2,200 dwelling units and employment-generating uses are located within a ½-mile walk of the Caltrain Bayshore Station or a SamTrans bus, Muni bus, or Muni light rail transit stop, or within a ¼-mile walk of a Baylands Shuttle stop.

Table 4.9-9: Total Vehicle Miles Traveled

Significance Conclusion for Impact AQ-1

During site grading, average daily emissions of NO_X would exceed applicable thresholds. Once grading activities are completed, construction emissions would be minimal but would add to operational emissions of residential and commercial uses as buildings are completed and occupied. Thus, a significant impact would occur during site grading.

Operational emissions of ROG, NO_X, and PM_{10} from Phase 1 development would exceed annual and daily thresholds, resulting in a significant impact. The addition of Phase 2 development would increase operational emissions of these criteria pollutants and also contribute sufficient emissions such that the Specific Plan would also exceed annual and daily thresholds for $PM_{2.5}$, resulting in a significant impact.

Recent Regulations Not Quantified in the Analysis

The CalEEMod and EMFAC2021 emissions modeling programs that were used to estimate project emissions provide for future emission reductions that would be achieved by many but not all existing regulations, because there are newer regulations that have been adopted but are not yet included within CalEEMod and EMFAC2021 emission factors and/or algorithms. These are presented in Chapter 2, Section 2.5 Regulatory Context for Baylands Development. The regulations presented under *Newest Vehicle Regulations in 2021 and 2022* include the full description of the most recently adopted regulations that would serve to reduce on-road vehicle emissions and include the following:

- Heavy-Duty Inspection and Maintenance (2021)
- Advanced Clean Cars II (2022)
- Advanced Clean Fleets (2022)

The effect of these regulations is not included in CalEEMod or EMFAC2021 and thus not quantified in the analysis. However, these regulations would reduce emissions of NO_X and DPM from heavy diesel trucks, and they would reduce criteria pollutant emissions associated with gasoline-powered light duty passenger vehicles. Since the reductions from these regulations is not quantified, this impact would be significant.

Program EIR Mitigation Measures

MM AQ-1a: Clean Off-Road Construction Equipment (Program EIR Mitigation Measure 4.B-2a). To reduce construction vehicle emissions, the following provisions shall be incorporated into construction specifications for all site-specific development and on- and off-site infrastructure projects:

i. Idling times shall be minimized either by shutting diesel-powered or gasoline-powered equipment off when not in use or reducing the maximum idling time of diesel-powered equipment to five minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.

ii. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. It shall be the contractor's responsibility to ensure that all equipment has been checked by a certified mechanic and determined to be running in proper condition prior to operation.

iii. All construction contract specifications shall include a requirement that on-road diesel trucks used to transport spoils consist of 2020 or newer model-year trucks with factory-built engines. All on-road diesel trucks shall be required to have emission control labels as specified in 13 CCR 2183(c) or any subsequent updates to this CARB regulation, whichever is more stringent. The construction contract specifications shall require that the contractor submit to the City a comprehensive inventory of all on-road trucks used to haul spoils. The inventory shall include each vehicle's license plate number, the engine production year, and a notation of whether the truck is in possession of an emission control label as defined in 13 CCR. The contractor shall update the inventory and submit it monthly to the City throughout the duration of the project.

MM AQ-1b: Tier 3 Off-Road Construction Equipment (Program EIR Mitigation Measure 4.B-2b). All construction contract specifications shall include a requirement that off-road construction equipment used for site improvements shall be equipped with Tier 3 (Tier 2 if greater than 750 hp) diesel engines or better. All diesel generators used for project construction must meet Tier 4 emissions standards. If new emissions standards are adopted by U.S. EPA during project construction, construction contract specifications shall incorporate whichever standard is more stringent.

Significance Conclusion for Impact AQ-1 with Implementation of Program EIR Mitigation Measures

The Storm Water Pollution Prevention Plans (SWPPPs), mandated by the State Water Board Construction Stormwater General Permit, Order 2022-0057-DWQ, require that the Specific Plan implement all the best management practices required by the BAAQMD to reduce construction fugitive dust to less-than-significant levels (BAAQMD 2022 CEQA Guidelines Table 5-2). This includes all the elements in Program EIR Mitigation Measure 4.B-1. Consequently, dust-related criteria air pollutant impacts during project construction would be less than significant.

With adherence to existing regulations, new regulations, and implementation of mitigation measures from the Program EIR, construction exhaust emissions would remain above significance thresholds.

Additional Construction Mitigation Measures

MM AQ-1c: Zero-Emissions and Tier 4 Off-Road Construction Equipment. The following measures shall be required for construction equipment, which would reduce ROG, NO_X, PM_{10} (including DPM), and $PM_{2.5}$ from equipment exhaust:

1. *Engine Requirements.* All off-road equipment greater than 25 horsepower shall meet the following requirements:
    a. All portable engines, such as generators, shall be electric. No propane or natural gas generators shall be used.
    b. Zero-emissions (ZE) construction equipment models, which currently include electric and hydrogen fuel cell technologies, shall be used for all equipment that is commercially available as plug-in or battery-electric equipment. Portable equipment shall be powered by grid electricity. Electric equipment shall include, but is not limited to, concrete/industrial saws, sweepers/scrubbers, aerial lifts, welders, air compressors, fixed cranes, forklifts, and cement and mortar mixers, pressure washers, and pumps. To qualify for an exception, the applicant shall provide the City with evidence supporting its conclusion that electric equipment is not commercially available.
    c. Engines that cannot meet zero-emissions standards must meet or exceed either USEPA or CARB Tier 4 Final off-road emission standards.
    d. Engines shall be fueled with alternative fuels, including natural gas, propane, hydrogen fuel cell, and electricity, as commercially available and to the maximum extent feasible during each construction phase and activity.

e. The Brisbane Community Development Director may permit other best technology that becomes commercially available in the future as substitution(s) for the above items a–d, provided that the project sponsor documents to the satisfaction of the Brisbane Community Development Director that (1) the technology would result in ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions reductions equivalent or greater than the measure(s) it would substitute for and (2) it would not increase other pollutant emissions or exacerbate other impacts, such as noise. This may include new alternative fuels or engine technology for off-road equipment (such as electric or hydrogen fuel cell equipment) that is not available as of 2025.

f. Idling time for off-road equipment not in use shall be limited to 2 minutes, except as provided in exceptions to the applicable state regulations regarding idling for off-road equipment. Documentation shall be provided to equipment operators in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit.

g. Construction contractors shall be required to properly maintain and tune equipment in accordance with manufacturer specifications.

2. All portable construction tools and equipment less than 25 horsepower shall be electric powered.

3. For purposes of this mitigation measure, zero-emissions off-road equipment shall ordinarily be considered "commercially available" if the vehicle is capable of serving the intended purpose and is included in the California Air Resources Board's Advanced Clean Equipment (ACE) List, https://ww2.arb.ca.gov/our-work/programs/msei/off-road-advance-clean-equipment, included in California Air Resources Board's Clean Off-Road Equipment Voucher Incentive Project (CORE) catalog, https://californiacore.org/equipmentcatalog/, or listed as available in the US on the Global Commercial Vehicle Drive to Zero Off-Road Zero-Emissions Technology Inventory (ZETI) inventory, https://globaldrivetozero.org/tools/zeti-offroad/. The City shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. For the City to determine that such vehicles are commercially unavailable, the operator must submit documentation from a minimum of three ZE off-road equipment dealers identified on the ACE or CORE websites demonstrating the inability to obtain the required ZE off-road equipment needed within 6 months.

4. *Exceptions to Requirement 1c, above.* The City of Brisbane Community Development Director may permit exceptions to the requirements of 1.a, 1.b, 1.c, 1.d, and 2 subject to the provisions of requirements in **Tables 4.9-10 and 4.9-11**, below.

Sufficient documentation shall be provided by the construction contractor with a request for any exception described above to demonstrate the need for the requested exception. Any exception granted by the Brisbane Community Development Director shall be based on substantial evidence provided by the construction contractor that one or more of the above exception conditions exists.

Table 4.9-10: Exceptions to Mitigation Measure MM AQ-1d, Items 1.a, 1.b, 1.c, 1d, and 2

Requirement	Condition(s) for Exceptions
1.a. Electric engines for portable equipment 2. Electric equipment less than 25 horsepower	If electric power from the grid becomes unavailable within the Baylands with the outage anticipated to last more than two (2) working days, non-electric equipment may be used.
1.b Zero-Emissions (ZE) engines for construction equipment	The Brisbane Community Development Director may permit use of non-electric equipment should the construction contractor demonstrate to the Director's satisfaction that such zero-emissions equipment is not commercially available as defined above. Any non-zero-emissions equipment permitted for use by the Brisbane Community Development Director shall be the next cleanest piece of commercially available equipment that would reduce exhaust emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$.
1.c. Tier 4 Final emission standards	The Brisbane Community Development Director may permit use of equipment that does not meet Tier 4 Final standards such as but not limited to bore/drill rigs required for grading/shoring/excavation and for mobile cranes required for building construction should the construction contractor demonstrate to the Director's satisfaction that: (1) The contractor does not have the required type of equipment within its current available inventory, has ordered such equipment at least 60 days in advance, and has made a good faith effort to lease or rent such equipment but it is not available; (2) A particular piece of Tier 4 Final off-road equipment is technically or financially infeasible; (3) The equipment would not produce desired emissions reduction due to required operating modes; or (4) There is a compelling emergency need to use off-road equipment that is not Tier 4 Final compliant.
1.d. Alternative fuel engines for construction equipment	The Brisbane Community Development Director may permit use of non-alternative fueled equipment should the construction contractor demonstrate to the Director's satisfaction that: (1) The use of alternative fuels for internal combustion engines would negatively affect construction performance or void equipment warranties; or (2) If the use of alternative fuels would result in additional ROG, NO_X, PM_{10}, and/or $PM_{2.5}$ emissions compared to the proposed equipment.

NOTES: Equipment subject to any of the above criteria shall be the next cleanest piece of equipment that is commercially available, or another alternative that results in equivalent or greater reductions of ROG, NO_X, PM_{10},

Requirement	Condition(s) for Exceptions
and $PM_{2.5}$ emissions, according to **Table 4.9-11** below. Emerging technologies with verifiable emissions reductions supported by substantial evidence may also be employed in lieu of the step-down schedule below, if those technologies meet the requirements of 1.e, above.	

Table 4.9-11: Engine Compliance Alternatives

Compliance Alternative	Minimum Engine Technology / Emissions Standard / Emissions Control
1	Alternative fuels that reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions compared to the equivalent Tier 4 Final diesel engine.
2	Tier 4 Final
3	Tier 4 Interim

HOW TO USE THE TABLE: If zero-emissions engines are not available, then the Project sponsor shall meet Compliance Alternative 1. If off-road equipment meeting Compliance Alternative 1 is not available, then the Project sponsor shall meet Compliance Alternative 2. If engines that comply with Tier 4 Final off-road emission standards are not available, then the Project sponsor shall meet Compliance Alternative 3.

MM AQ-1d: Super-Compliant VOC Architectural Coatings during Construction. "Super-compliant" volatile organic compound (VOC) (i.e., ROG) architectural coatings that meet the regulatory limits in South Coast Air Quality Management District rule 1113 (SCAQMD 2024),[196] which currently requires a limit of 10 grams VOC per liter shall be used during construction for all interior and exterior spaces and shall include this requirement on plans submitted for review to the planning department. The project sponsor shall submit a signed certification statement that this requirement has been incorporated into contract specifications.

MM AQ-1e: Clean On-Road Construction Trucks. Heavy-duty on-road construction trucks shall comply with the following, which would reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions:

1. *Engine Requirements.*
    a. Use alternative-fueled or zero-emissions vehicles (ZEVs) that would reduce emissions below a diesel-fueled vehicle such as electricity, hydrogen fuel cell, natural gas, or propane. If alternative fuels are not commercially available, all on-road heavy-duty diesel trucks with a gross vehicle weight rating of 19,500 pounds or greater used within the Specific Plan area (such as haul trucks, water trucks, dump trucks, concrete trucks, and vendor trucks) shall be model year 2020 or newer.

[196] South Coast AQMD Rule 1113 is required for the Baylands since it is more stringent than comparable BAAQMD requirements.

b. Any other best technology commercially available in the future (i.e., not available as of 2025) may be used in lieu of or in addition to the above item 1.a, provided that (1) the technology would result in equivalent or greater ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions reductions; and (2) such measures would not increase other pollutant emissions or result in other impacts, such as noise.

c. Require the idling time for on-road vehicles be limited to 2 minutes, except as provided in exceptions to the applicable state regulations regarding idling for on-road vehicles. Documentation shall be provided to truck drivers in multiple languages (e.g., English, Spanish, Chinese) to remind operators of the 2-minute idling limit.

d. For purposes of this mitigation measure, an alternative-fueled and ZEV truck shall ordinarily be considered commercially available if the vehicle is capable of serving the intended purpose and is included in California's Hybrid and Zero-Emissions Truck and Bus Voucher Incentive Project, https://californiahvip.org/ or listed as available in the US on the Global Commercial Vehicle Drive to Zero inventory, https://globaldrivetozero.org/. The City shall be responsible for the final determination of commercial availability, based on all the facts and circumstances at the time the determination is made. In order for the City to make a determination that such vehicles are commercially unavailable, the operator must submit documentation from a minimum of three (3) ZEV dealers identified on the californiahvip.org website demonstrating the inability to obtain the required ZEVs or equipment needed within 6 months.

2. *Exceptions.* The lead agency grants an exception to the alternative fuel requirements of item 1.a if alternative fuels are not commercially available or the use of alternative fuels for internal combustion engines is not technologically feasible, would void truck warranties, or would result in additional ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions compared to traditional fuels. The waiver may be granted by the Brisbane Community Development Director based on substantial evidence provided by the project sponsor that one or more of the above waiver conditions exists.

3. The documentation, as described in Mitigation Measure MM AQ-2b item 3 above, shall include a description of each general category of on-road trucks required to comply with item 1, *Engine Requirements*. The description shall also specify the engine model years and fuel type being used (e.g., diesel, electricity, natural gas).

4. The Certification Statement, as described in Mitigation Measure MM AQ-2b item 4 above, shall apply to all applicable requirements for on-road trucks.

MM AQ-1f: Conveyor System for Transport of Excavated Material. An overland conveyor system shall be constructed to transport excavated soil material from the eastern portion of the site to the western portion in lieu of transport by trucks. The conveyor system shall be electric and shall include water sprays for dust reduction during transport. Movement of soil from the eastern to the western portion of the Specific Plan area by truck shall be permitted only if the California Public Utilities Commission does not approve a conveyor system crossing over the Caltrain right-of-way.

Additional Operations Mitigation Measures

MM AQ-1g: Super-Compliant VOC Architectural Coatings during Operation. Future tenant improvements provided by building owners shall use super-compliant VOC architectural coatings for all interior and exterior painting. "Super-compliant" coatings refer to paints that meet the more stringent regulatory limits in the current version of South Coast Air Quality Management District rule 1113,[197] which requires a standard of 10 grams VOC per liter or less (http://www.aqmd.gov/home/regulations/compliance/architectural-coatings/super-compliant-coatings).

MM AQ-1h: Best Available Emissions Controls for Stationary Emergency Generators. To reduce emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ associated with operation of the proposed project's emergency generators, the project applicant shall implement the following measures.

1. Permanent stationary emergency generators installed on-site shall have engines that meet or exceed CARB Tier 4 Off-Road Compression Ignition Engine Standards (California Code of Regulations Title 13, Section 2423). If CARB adopts future emissions standards that exceed the Tier 4 requirement, the emissions standards resulting in the lowest ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions shall apply.
2. As non-diesel-fueled emergency generator technology becomes commercially available, and subject to the review and approval of the North County Fire Authority for safety purposes, non-diesel-fueled generators shall be installed in new buildings, provided that alternative fuels used in generators, such as electricity, hydrogen fuel cell, biodiesel,

[197] South Coast AQMD Rule 1113 is required for the Baylands since it is more stringent than current BAAQMD requirements.

renewable diesel, natural gas, or other biofuels or other non-diesel emergency power systems, are demonstrated to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions compared to diesel fuel.

3. For each new diesel backup generator permit submitted to air district for the proposed project, the backup generator applicant shall submit the anticipated location and engine specifications to the Brisbane Community Development Director for review and approval prior to issuance of a permit for the generator. Once operational, all diesel backup generators shall be maintained in good working order for the life of the equipment, and any future replacement of the diesel backup generators must be consistent with the original generator's engine emissions specifications. The operator of the facility at which the generator is located shall maintain records of the testing schedule and emergency operations for each diesel backup generator for the life of that diesel backup generator and shall provide this information for review to the Brisbane Community Development Director within three months of requesting such information.

These features shall be submitted to the Brisbane Community Development Director for review and approval and shall be included on the project drawings submitted for the construction-related permit(s) or on other documentation submitted to the Brisbane Community Development Director prior to the issuance of any building permits.

MM AQ-1i: **Promote Use of Low-VOC Consumer Products.** To reduce ROG emissions associated with the project, the project sponsor shall provide education for residential and commercial tenants concerning low-VOC consumer products. Prior to receipt of any certificate of occupancy, the project sponsor shall develop electronic correspondence to be distributed by email annually and upon any new lease signing to residential and/or commercial tenants of each building within the Specific Plan area that encourages the purchase of consumer products that generate lower than typical VOC emissions.

MM AQ-1j: **Operational Truck Emissions Reduction.** The following measures shall be incorporated into the building design and construction contracts (as applicable) to reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with operational on-road trucks, along with the potential health risk caused by exposure to toxic air contaminants from operational on-road trucks.

1. Equip all truck delivery bays with electrical hook-ups for diesel trucks at loading docks to accommodate plug-in electric truck transport refrigeration units (TRUs) or auxiliary power units during project operations.

2. Provide a notice on each commercial or office lease or building sale within the Baylands requesting businesses operating their own fleet of truck transport refrigeration units to exclusively use TRUs and auxiliary power units that are electric plug-in capable and trucks that use advanced exhaust technology (e.g., hybrid) or alternative fuels within the Baylands.
3. Prohibit diesel-powered TRUs from operating at loading docks for more than thirty minutes, and post signs at each loading dock presenting this TRU time limit.
4. All loading docks that are on a commercial property and can accommodate trucks with TRUs shall be equipped with electric vehicle (EV) charging equipment for heavy-duty trucks. This measure does not apply to temporary street parking for loading or unloading.
5. Prohibit trucks from idling for more than 2 minutes, and post "no idling" signs at the site entry point, at all loading locations, and throughout the Specific Plan area.

These features shall be submitted to the Brisbane Community Development Director for review and approval prior to the issuance of building permits and shall be included on the project drawings submitted for the construction-related permit or on other documentation submitted to the lead agency. ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions from project-related operational diesel trucks shall be reduced by implementing the following measures.

MM AQ-1k: **Electric Vehicle Charging Infrastructure.** Prior to building permit issuance for any site-specific development project that includes off-street parking, the applicant for such development shall demonstrate compliance with the most current California Green Building Standards (CALGreen Code) Tier 2 voluntary electric vehicle (EV) charging requirements or the mandatory requirements of the most recently adopted version of the City of Brisbane building code, whichever is more stringent. The installation of all EV charging equipment shall be included on the project drawings submitted for the construction-related permit(s) or on other documentation submitted to the City.

MM AQ-1l: **Electric Landscaping Equipment.** To reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions associated with the project, only electric landscaping equipment shall be used within the Specific Plan area. No landscaping equipment powered by gasoline, diesel, propane, or other fossil fuels shall be used. The project applicant shall incorporate this requirement into the project design and tenant contracts (as applicable).

Significance Conclusion for Impact AQ-1 with Implementation of All Mitigation Measures

With implementation of Mitigation Measures MM AQ-1a through MM AQ-1c, MM AQ-1e, and MM AQ-1f, construction NO_X emissions would be reduced, but not below the significance thresholds, as shown in **Table 4.9-12** and **Table 4.9-13**. See Appendix G3 for detailed mitigated emissions calculations.

Mitigation Measures MM AQ-1a through MM AQ-1c and MM AQ-1e would reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions due to cleaner engine technology, and MM AQ-1d would reduce ROG emissions from architectural coating during construction by using lower VOC paints. Mitigation Measure MM AQ-1f would reduce ROG, NO_X, PM_{10}, and $PM_{2.5}$ emissions due to reduction of heavy truck trips for transport of excavated soil. Mitigation measures MM AQ-1g through MM AQ-1l would reduce operational emissions of ROG, NO_X, PM_{10}, and $PM_{2.5}$ for Phase 1 development and full Specific Plan buildout; however, emissions of all criteria pollutants would still exceed significance thresholds after mitigation. Impacts for construction, operations, and combined construction and operational would, therefore, be significant and unavoidable.

Health Implications of Significant Impacts Related to Emissions of Ozone Precursors

Federal and state air quality standards have been set at levels considered safe to protect public health, including the health of sensitive populations such as asthmatics, children, and the elderly with a margin of safety, and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. As explained by CARB, "An air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment" (CARB 2023b). That is, if a region is compliant with the ambient air quality standards, its regional air quality can be considered protective of public health. The national air quality standards are statutorily required to be set by the USEPA at levels that are "requisite to protect the public health."[198]

Modeling for a health impact assessment of Baylands criteria pollutant emissions impacts ("Friant Ranch" type of analysis) would have limitations linking ozone precursor emissions to specific health outcomes. Because of the relatively small amount of emissions that would be generated by Baylands development, existing modeling tools would not link predicted changes in ozone and $PM_{2.5}$ concentrations associated with project operations to any specific *individual* health impact. Consequently, modeling in an attempt to determine how the project's ROG and NO_X emissions, and their contribution to ozone concentrations would affect health outcomes, would not yield meaningful or conclusive results, especially given the quantity of the ROG and NO_X emissions generated by the proposed project.

[198] 42 *U.S. Code* Chapter 7409, National primary and secondary ambient air quality standards, accessed July 3, 2023, https://www.law.cornell.edu/uscode/text/42/7409.

Table 4.9-12: Mitigated Net Increase in Criteria Air Pollutant Emissions During Construction and Operation

Year	Average Daily Construction Criteria Pollutant Emissions (pounds/day) [a]				Net New Operational Criteria Pollutant Emissions (pounds/day) [a]				Average Daily Construction and Net New Interim Operational Criteria Pollutant Emissions (pounds/day) [a]

b Operational emissions shown represent activity and emissions across 365 days per year.

Instead, such an assessment would use studies that report *correlations* between health effects and exposure to ozone and $PM_{2.5}$ to estimate potential effects on the population in the modeling domain. While model outputs would provide seemingly precise values, it would be inappropriate to assume that these values give an exact understanding of the project's actual impacts. The uncertainty in such analyses is inherent and unavoidable, given all of the assumptions about meteorology, photochemical reactions, and other air basin characteristics described further below.

The modeling that would be needed to estimate the Baylands' contribution to ambient concentrations of pollutants would require assumptions for many variables related to the Specific Plan and its future development and the meteorological and other characteristics of the air basin into which pollutants would be emitted. All simulations of physical processes, whether ambient air concentrations or health effects from air pollution, have an associated level of uncertainty because of many simplifying assumptions. Each step in the modeling process, and each assumption incorporated into the model, adds a degree of uncertainty into the reported results, resulting from the usage of air pollutant emission estimates, ambient air concentration modeling, and health impact calculations using various health impact functions. The combination and compounding of the uncertainties from each step of the modeling analysis, in the context of the very small increments of change that are predicted, could result in large uncertainties (ESA 2020).

Nevertheless, the Specific Plan's ROG and NO_X emissions that exceed thresholds could contribute to new or exacerbated air quality violations in the air basin by contributing to more days of ozone exceedance or result in air quality index values that are unhealthy for sensitive groups and other populations. Ozone precursors from consumer products and mobile sources would occur within the Specific Plan area and on local roadways close to residential populations.

Per the *Sierra Club v. County of Fresno (Friant Ranch, L.P.)* (2018) California Supreme Court decision, it is not scientifically feasible at the time of drafting of this report to substantively connect this individual project's criteria pollutant impacts to likely health consequences. In its amicus brief in the case, the South Coast Air Quality Management District (SCAQMD) stated that "EIRs must generally quantify a project's pollutant emissions, but in some cases, it is not feasible to correlate these emissions to specific, quantifiable health impacts (e.g., premature mortality; hospital admissions)." In such cases, a general description of the adverse health impacts resulting from the pollutants at issue may be sufficient.

Human health impacts associated with criteria pollutants are analyzed and taken into consideration when the USEPA sets the NAAQS for each criteria pollutant (42 U.S.C. Section 7409(b)(1)). The health impact of a particular criteria pollutant is analyzed on a regional, not a facility level, based on how close the area is to complying with (attaining) the NAAQS.

In proposing a health risk type analysis for criteria air pollutants, it is important to understand how the relevant criteria pollutants (O_3 and PM) are formed, dispersed, and regulated. Ground level O_3 (smog) is not directly emitted into the air but is instead formed when precursor pollutants such as NO_X and ROG are emitted into the atmosphere and undergo complex chemical reactions in the process of sunlight. Once formed, O_3 can be transported long distances by wind. Because of the complexity of O_3 formation, a specific tonnage amount of NO_X or ROGs emitted in a particular area does not equate to a particular concentration of O_3 in that area. Even rural areas that have relatively low tonnages of emissions of NO_X or ROG can have high levels of O_3 concentrations simply due to wind transport. Conversely, areas that have substantially more NO_X and ROG emissions could experience lower concentrations of O_3 simply because sea breezes disperse the emissions (SJVAPCD 2007).

The disconnect between the tonnage of precursor pollutants and the concentration of O_3 formed is important, because it is not necessarily the tonnage of precursor pollutants that causes human health effects; rather, it is the concentration of resulting O_3 that causes these effects. The NAAQS, which are statutorily required to be set by USEPA at levels that are requisite to protect the public health, are established as concentrations of O_3 and not as tonnages of their precursor pollutants.

Health Consequences of O_3 and PM

Air pollution is a major public health concern, and the adverse health effects associated with air pollution are diverse. O_3 is a pungent, colorless, toxic gas with direct health effects on humans, including respiratory and eye irritation and possible changes in lung functions. Groups most sensitive to O_3 include children, the elderly, persons with respiratory disorders, and people who exercise strenuously outdoors. PM_{10} and $PM_{2.5}$ can damage health by interfering with the body's mechanisms for clearing the respiratory tract or by acting as carriers of an absorbed toxic substance.

The adverse effects reported with short-term O_3 exposure are greater with increased activity because activity increases the breathing rate and the volume of air reaching the lungs, resulting in an increased amount of O_3 reaching the lungs. Children may be a particularly vulnerable population to air pollution effects because they spend more time outdoors, are generally more active, and have a higher ventilation rate than adults. A number of adverse health effects associated with ambient O_3 levels and PM levels have been identified from laboratory and epidemiological studies. These include increased respiratory symptoms, damage to cells of the respiratory tract, decreases in lung function, increased susceptibility to respiratory infection, and increased risk of hospitalization.

The Children's Health Study, conducted by researchers at the University of Southern California, followed a cohort of children who lived in 12 communities in southern California with differing levels of air pollution for several years. A publication from this study found that school absences in fourth graders for respiratory illnesses were associated with ambient O_3 levels and 24-hour PM_{10} values. An increase of 20 parts per billion of O_3 was associated with an 83 percent increase in illness-related absence rates, and a change of 10 micrograms per meter in PM was associated with a 5.7 percent increase in illness-related absences (Gilliland et al. 2004). In addition, long-term exposure to elevated levels of PM can affect acute response to O_3. The number of hospital admissions and emergency room visits for all respiratory causes (infections, respiratory failure, chronic bronchitis, etc.), including asthma, show a consistent increase as ambient O_3 levels increase in a community. These excess hospital admissions and emergency room visits are observed when hourly O_3 concentrations are as low as 0.08 to 0.10 ppm.

Numerous recent studies have found positive associations between increases in O_3 levels and excess risk of mortality. These associations persist even when other variables including season and levels of PM are accounted for. This indicates that O_3 mortality effects are independent of other pollutants (Bell et al. 2004). Several population-based studies suggest that asthmatics are more adversely affected by ambient O_3 levels, as evidenced by increased hospitalizations and emergency room visits. Laboratory studies have attempted to compare the degree of lung function change seen in age and gender-matched healthy individuals versus asthmatics and those with chronic obstructive pulmonary disease. While the degree of change evidenced did not differ significantly, that finding may not accurately reflect the true impact of exposure on

these respiration-compromised individuals. Since the respiration-compromised group may have lower lung function to begin with, the same degree of change may represent a substantially greater adverse effect overall.

A publication from the Children's Health Study focused on children and outdoor exercise. In communities with high O_3 concentrations, the relative risk of developing asthma in children playing three or more sports was found to be over three times higher than in children playing no sports (McConnell et al. 2002). These findings indicate that new cases of asthma in children are associated with heavy exercise in communities with high levels of O_3. The susceptibility to O_3 observed under ambient conditions could be due to the combination of pollutants that coexist in the atmosphere or O_3 may actually sensitize these subgroups to the effects of other pollutants. A study of birth outcomes in southern California found an increased risk for birth defects in the aortic and pulmonary arteries associated with O_3 and PM exposure in the second month of pregnancy (Ritz et al. 2008). In summary, acute adverse effects associated with O_3 exposures have been well documented, although the specific causal mechanism is still somewhat unclear. Additional research efforts are required to evaluate the long-term effects of air pollution and to determine the role of O_3 in influencing chronic effects.

The evidence linking these effects to air pollutants is derived from population based observational and field studies (epidemiological) as well as controlled laboratory studies involving human subjects and animals. There have been an increasing number of studies focusing on the mechanisms (that is, on learning how specific organs, cell types, and biochemicals are involved in the human body's response to air pollution) and specific pollutants responsible for individual effects. Yet the underlying biological pathways for these effects are not always clearly understood. Although individuals inhale pollutants as a mixture under ambient conditions, the regulatory framework and the control measures developed are mostly pollutant-specific. This is appropriate, in that different pollutants usually differ in their sources, their times and places of occurrence, the kinds of health effects they may cause, and their overall levels of health risk. Different pollutants, when acting together, may sometimes harm health more than they would when they are acting separately. Nevertheless, as a practical matter, health scientists, as well as regulatory officials, usually must deal with one pollutant at a time in determining health effects and in adopting air quality standards. To meet the air quality standards, comprehensive plans are developed such as the BAAQMD's 2017 Clean Air Plan.

Conclusions

Consistent with the California Supreme Court's Friant Ranch decision, the above information provides additional details regarding the potential health effects from the project's significant and unavoidable criteria pollutant emissions. It also explains why it is not scientifically feasible at the time of drafting of this report to substantively connect this individual project's criteria pollutant impacts to likely health consequences so that the public may make informed decisions regarding the costs and benefits of the proposed project.

b. Threshold AQ-2: Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Methodology for Determining Significance

Health Risk – Excess Cancer Risk, Fine Particulate Matter ($PM_{2.5}$)

A health risk assessment (HRA) was conducted to estimate health risks from exposure to TACs emitted by Specific Plan construction and operations. The health risk assessment focused on the TACs of concern from construction activities ($PM_{2.5}$ and DPM) because these pollutants pose substantial health impacts at the local level more so than other types of TACs.

If the Specific Plan would contribute TAC emissions resulting in increased health risk values or annual average $PM_{2.5}$ concentration contributions exceeding identified thresholds at the maximally exposed individual residence (MEIR), school receptor, or maximally exposed individual worker (MEIW), the Specific Plan would have a significant impact.

The HRA was prepared using technical information and health risk assessment guidance and protocols from the BAAQMD (BAAQMD 2016), CARB (CARB 2020), and the Office of Environmental Health Hazard Assessment (OEHHA) (OEHHA 2015). For construction, the health risk assessment evaluated the estimated incremental increase in:

- Lifetime cancer risk from exposure to emissions of DPM; and
- The annual average $PM_{2.5}$ concentrations associated with fuel combustion, construction site fugitive dust from earthmoving and ground-disturbing activities, and on-road fugitive sources (including tire wear, brake wear, and road dust) that would be emitted by Specific Plan-related construction activities.

For operations, the Health Risk Assessment included diesel particulate emissions from emergency backup generators, speciated toxic air contaminants in total organic gas emissions from gasoline-fueled passenger vehicles, and $PM_{2.5}$ from entrained road dust.

Pollutant concentrations were estimated using the American Meteorological Society/ Environmental Protection Agency Regulatory Model Improvement Committee regulatory air dispersion model (AERMOD version 22112) (USEPA 2016b). Consistent with air district HRA guidance, health risks (cancer risk and acute and chronic hazard index [HI]) from construction and operational DPM and operational total organic gases (TOGs), and annual average $PM_{2.5}$ concentrations associated with construction and operational activities, were estimated at all sensitive receptors and worker receptors located within 1,000 feet of the Baylands boundary. See Appendix A of the *Health Risk Assessment Technical Report* (EIR Appendix G2) for detailed calculations.

Receptor Exposure Assessment

Figure 4.9-3 shows the existing residential (sensitive receptors) and commercial/retail land uses (worker receptors) that were modeled in the HRA. There are no existing childcare or school receptors within 1,000 feet of the project boundary. The following receptor types were included in the HRA:

A. **Existing off-site receptors**

1. **Residents** to the west of Bayshore Boulevard from Geneva Avenue north to Wilde Avenue, and between Tunnel Avenue and US 101, including two blocks of residential streets just south of Lathrop Avenue, between Wheeler and Tocoloma avenues (near Little Hollywood park).
2. **Workers** (employees) at the commercial and retail businesses west of Bayshore Boulevard, north of Geneva Avenue. The San Francisco Municipal Transportation Agency office is adjacent to Bayshore Boulevard to the west.

   Additional workers modeled were employees at:

   - Commercial and retail businesses west of Bayshore between Guadalupe Canyon Parkway and Valley Drive.
   - Commercial and industrial sites east of Tunnel Avenue and both sides of Beatty Avenue. These include (but are not limited to) Recology, P&F Distributors, Transdev, and Golden State Building Materials.

B. New on-site receptors (within the Baylands)

1. **Residents** in the Roundhouse and Bayshore districts;
2. **Workers** (employees) in the low-density commercial areas east of the Caltrain right-of-way, the mid-density commercial areas of the Icehouse Hill district, and in the high-density commercial areas in the Bayshore district, just west of the Caltrain right-of-way; and
3. **School students** at the new middle school in the northwest corner of the Icehouse Hill district.[199]

TAC emissions and exposure to sensitive receptors would vary across the estimated 17-year construction period. Initially, existing sensitive receptors west of Bayshore Boulevard would be exposed only to construction emissions from construction activities on the west side. As construction of each block of the Icehouse Hill, Roundhouse, and Bayshore districts is

[199] Day care facilities are identified as a permitted use within large portions of the Specific Plan area. Because the specific locations of such uses within the Baylands cannot be known at this time, they are not addressed specifically as day care facilities. However, to ensure the maximum impact was captured, the analysis modeled potential future day care receptor locations as residential receptors. This is conservative because children are assumed to be present at residences and for more of the year than what is assumed for a day care.

completed and occupied, new on-site sensitive receptors would be exposed to ongoing construction of the remaining blocks, in addition to operational emissions (mobile sources and generators) from newly built blocks.

In addition, existing and new sensitive receptors would be exposed to construction emissions from Phase 2 development of low-density commercial uses in the Campus East District. Construction of the solar farm would take place at a distance greater than 1,000 feet from the closest Phase 1 residents, so there would not be substantial exposure to those residents from solar farm construction-related TACs. Nevertheless, its construction was included in the analysis.

Minimum Efficiency Reporting Value 13 Air Filtration

To comply with the California Energy Code, Title 24, Part 6 (CEC 2022) Baylands development must install a mechanical ventilation system at all residential and school buildings capable of achieving protection from particulate matter ($PM_{2.5}$) equivalent to that associated with a MERV 13 filtration (as defined by American Society of Heating, Refrigerating, and Air-Conditioning Engineers [ASHRAE] Standard 52.2). In addition, an ongoing maintenance plan for the building's heating, ventilation, and air conditioning (HVAC) air filtration system is required. Health risks for residential and school receptors evaluated in the project's HRA were estimated assuming the implementation of MERV 13 filters[200] in all residential and school receptor locations.

MERV 13 filters are required to be installed in new homes built on the Baylands per the 2022 California Energy Code. Consequently, it was conservatively assumed that MERV 13 filters would reduce the total exposure of new on-site receptors to DPM and $PM_{2.5}$ concentrations by 60 percent.

For assessing impacts to existing off-site receptors and new on-site sensitive receptors from construction and operational TAC emissions, exposure is assumed to begin to a fetus at the beginning of the third trimester at the start of construction until age 30. Sensitive receptors analyzed include residents and students. Off-site worker receptors were also analyzed in the HRA. TAC emissions and sensitive receptor exposures would vary across the 17-year-long construction period. Therefore, multiple exposure scenarios were evaluated to capture the period of maximum impact on each existing off-site receptor and each new on-site sensitive receptor.

Exposure assessment guidance from the BAAQMD assumes that people in residences would be exposed to air pollution 24 hours per day, 350 days per year, for 30 years as the basis for calculating cancer risk in HRAs. Students assumed to be exposed for 8 hours per day, 5 days

[200] MERV 13 filters have a removal efficiency of 90 percent for particles ranging from 1 to 3 microns and less than 75 percent for particles ranging from 0.3 to 1 micron.

per week, for a total of 9 years. Off-site workers were assumed to be exposed for 8 hours per day, 260 days per year, for a total of 25 years.

The exposure rate for the residential receptors is generally more conservative than those for other sensitive receptor types (i.e., schoolchildren, children in childcare, and patients) because residents have the highest exposure frequency, exposure time, and exposure duration.[201] Thus, the air pollutant exposure to residents typically results in the greatest adverse health outcome for all population groups and receptor types. The HRA also presents a highly conservative assessment because the typical resident spends more than 15 days away from the residence during the year, which was not factored into the exposure estimates.

TAC exposure and resulting health risks were quantified for existing off-site and new on-site (Baylands) residents and schools, along with existing off-site and new, on-site (Baylands) worker, or employee, locations, using three exposure scenarios to determine the MEIR location for residences and MEIW for workers. Three scenarios are needed to identify the sensitive receptor location(s) where maximum health risk values would occur, because TAC emissions vary substantially with each year of construction and operation.

The analysis was conducted assuming a worst-case exposure start date of 2025, which represents the assumed start of site grading and construction. A worst-case exposure start date represents the highest impact of construction emissions on the more sensitive age groups of the third trimester fetus to age two. Therefore, a receptor that starts their exposure in a different year would experience different health risks, based on the amount of construction equipment in use, haul truck trips nearby, etc., during each year. Three exposure analysis scenarios were analyzed in the HRA, including:

- **Exposure Analysis for Off-Site Receptors—Construction and On-Site Operations.** This analysis evaluates impacts to off-site receptors (residents and workers) within 1,000 feet of the Specific Plan boundary for the 30-year period following the start of construction. Consistent with OEHHA guidance, the residential cancer risk analysis for off-site receptors starts by assuming that a fetus in their third trimester could be present when construction begins for Phase 1 (OEHHA 2015). For residential cancer risk, the exposure to Baylands construction and operations emissions over the 30-year period starting with the start of construction was analyzed (assumed to be 2025–2055).
- **Exposure Analysis for On-Site Receptors—Construction and On-Site Operations.** As phased development of the Baylands continues, receptors would begin living and working within the Baylands while construction is still underway. This analysis scenario thus evaluates impacts to new on-site Baylands receptors (residents, employees, and middle school students) who would be present after construction of the initial increments

[201] For example, residents are assumed to be exposed for 30 years, as compared to a child in childcare who is assumed to be exposed for 6 years; resident children are assumed to be exposed 24 hours a day, 7 days a week, as compared to a childcare child, who is assumed to be exposed 8 hours a day, 5 days a week.

of development when buildings are occupied. For on-site receptors, the analysis assumes that a fetus in their third trimester would be present at a newly constructed residence within the Baylands when construction of remaining project blocks is ongoing. This would occur throughout the construction duration as each block is constructed. Thus, on-site receptors could be exposed to these ongoing construction emissions plus operational emissions for a total exposure of 30 years beginning as early as 2029. For Baylands workers at new commercial development, this exposure duration is 25 years. For the new middle school, the exposure duration was conservatively assumed to be 9 years. For acute HI, chronic HI, and annual average $PM_{2.5}$ concentrations, the maximum annual values for each Scenario 2 on-site receptor location were identified.

- **Exposure Analysis: Off-Site and On-Site Receptors—Operations at Full Specific Plan Buildout.** Analysis of operational impacts starting at full Specific Plan buildout, which is assumed to occur starting in 2043 includes all existing off-site receptors within 1,000 of the Baylands, all residents and workers within the Baylands, and students at the middle school within the site. The residential cancer risk analysis assumes exposure starts in 2043 to a fetus in their third trimester and would continue for 30 years (assumed to be 2043–2072). This analysis represents a full 30-year operational exposure to document lifetime exposure of residents to full Specific Plan buildout emissions once construction is complete. For the new middle school, exposure is conservatively assumed for nine years, consistent with the schoolchild exposure duration. Worker receptor exposure duration is assumed to be 25 years. For acute HI, chronic HI, and annual average $PM_{2.5}$ concentrations, the maximum annual values for each Scenario 3 off-site and on-site receptor location were identified.

Health Risk Calculations

Cancer Risk

The Baylands HRA evaluated the incremental increase in lifetime cancer risk from exposure to both construction and operational TAC emissions. These lifetime "excess" cancer risks were estimated as the upper-bound incremental probability that an individual would develop cancer over a lifetime as a direct result of exposure to potential carcinogens.

The estimated risk is expressed as a probability. The cancer risk of a specific chemical was calculated by multiplying the chemical intake or dose from human inhalation by the chemical's cancer potency factor. The incremental increase in lifetime cancer risk is based on DPM and $PM_{2.5}$ emissions from construction sources (off-road diesel construction equipment and on-road diesel hauling trucks) and DPM, $PM_{2.5}$, and speciated TOG from operational sources (diesel emergency generators and diesel and gasoline passenger vehicles). For operational traffic, speciated TOG emissions were included for gasoline vehicles, including from running exhaust; fugitive fuel vapor sources, including running loss processes; and fugitive $PM_{2.5}$, including tire wear, brake wear, and entrained road dust. Under California regulatory guidelines, DPM is

used as a surrogate measure of exposure for the mixture of chemicals that make up diesel exhaust as a whole. This analysis was based on the surrogate approach for DPM emissions, as recommended by OEHHA.

Lifetime excess cancer risk from exposure to DPM occurs exclusively through inhalation, so only the inhalation pathway was considered in the HRA. Speciated TOG emissions from gasoline combustion were also assessed through the inhalation pathway. Estimated lifetime excess cancer risks were calculated using the sensitivity factors and breathing rates recommended by OEHHA.

For the purposes of the HRA, all off-site and on-site residents, including both adults and children, were assumed to be present at one location for 30 years, consistent with OEHHA guidance. Exposure assessment for schools followed OEHHA and BAAQMD guidance and methods (BAAQMD 2016). The duration of exposure for schools is dependent on the age range of the students; for example, for a kindergarten to sixth grade school, exposure duration could be up to 8 years. This analysis conservatively assumed 9 years.

Chronic and Acute Health Impacts

The non-cancer effects of chronic (i.e., long-term) and acute, short-term exposure to DPM and speciated TOG emissions were evaluated using the hazard index (HI) approach, consistent with OEHHA guidance. The chronic HI is calculated by dividing the modeled annual average concentration at a receptor by the reference exposure level. The acute HI is calculated by dividing the modeled hourly average concentration at a receptor by the REL. The REL is the concentration at or below which no adverse health effects are anticipated.

RELs for DPM and speciated TOGs were obtained from OEHHA and the BAAQMD. For example, OEHHA has recommended an ambient concentration of 5 $\mu g/m^3$ as the chronic inhalation REL for DPM exhaust. Acute and chronic inhalation RELs for TACs from tailpipe and evaporative TOG emissions were based on the air district's weighted toxicity calculation methods and the latest data in CARB's Hotspots Analysis and Reporting Program database (CARB 2019).

Annual Average $PM_{2.5}$ Concentrations

The HRA also analyzed annual average $PM_{2.5}$ concentrations resulting from both construction and operational emissions. $PM_{2.5}$ concentrations include both fugitive and exhaust $PM_{2.5}$ emissions. The modeling evaluated the annual average concentration from all sources for each year of project construction and operation at each receptor location. The $PM_{2.5}$ annual concentration presented is the highest annual year for the MEIR and MEIW locations.

Cumulative Health Risk Assessment Impacts

A cumulative analysis was completed for the MEIRs and MEIWs under all three scenarios and is presented in Chapter 7, *Cumulative Environmental Effects*. The cumulative analysis evaluates modeled Specific Plan-generated health risks with that from existing, nearby sources of TAC emissions, including all BAAQMD-permitted stationary sources, roadways with more than 10,000 vehicles per day, the Caltrain rail line, and any other major source of emissions within 1,000 feet of the Specific Plan area (BAAQMD 2024b).

Carbon Monoxide Concentrations

Unlike other criteria air pollutants, whose effects are regional, CO impacts are evaluated locally. The BAAQMD recommends intersection-specific modeling of CO concentrations only for intersections where traffic volumes would exceed 44,000 vehicles per hour (24,000 vehicles per hour where vertical and/or horizontal air mixing is limited), based on modeling of vehicle emissions demonstrating that CO concentrations at intersections with traffic below this screening threshold would not exceed the state's 1-hour or 8-hour CO air quality standards.

Impact Assessment

Health Risk – Excess Cancer Risk, Acute and Chronic HI, and Fine Particulate Matter ($PM_{2.5}$)

Table 4.9-14 through **Table 4.9-16** present the increased lifetime excess cancer risk probability that would result from Baylands development, while **Table 4.9-17** presents the acute and chronic HI and annual average $PM_{2.5}$ concentrations. **Table 4.9-14** shows the Specific Plan's contribution to total cancer risk at existing off-site residents and workers over a 30-year period (25-year period for workers) that includes:

- Construction impacts of Baylands construction (assumed to be 2025–2042).
- Operations impacts following buildout of western portion of the Baylands (Phase 1) through completion of the eastern portion of the Baylands (assumed to be 2038–2042).
- Operations impacts following full Specific Plan buildout though the end of the 30-year exposure period for residential receptors (assumed to be 2043–2055).[202]
- Construction and operational impacts of the full 30-year residential exposure period starting at the beginning of site construction (assumed to be 2025–2055).[203]

The cancer risk for existing off-site receptors would exceed the significance threshold at the MEIR, which is a residence located west of Bayshore Boulevard, north of MacDonald Avenue. The cancer

[202] For workers, the exposure period of 25 years would extend 7 years following full Specific Plan buildout (assumed to be 2043–2050).

[203] For workers, the 25-year exposure period is assumed to be 2025–2050.

risk at the MEIW, located east of Tunnel Avenue, south of Esta Avenue, would not exceed significance thresholds. The primary contributor to the total cancer risk at these receptor locations is construction activities resulting in DPM emissions (which are highly carcinogenic) from diesel fuel combustion. In addition, the age range during which exposure of residential sensitive receptors to project emissions begins is the third trimester fetus to 2-year-old, which is the age when humans are most sensitive to TACs. The early phases of construction, i.e., the earthwork portions of the project, would produce high DPM emissions from the use of heavy-duty off-road equipment and therefore impact those most sensitive age categories and drive the risk at the off-site MEIR.

Table 4.9-15 shows the same breakdown of contributions to total cancer risk over a 30-year period for new residential and worker receptors within the Baylands. Significance thresholds for cancer risk for on-site receptors would not be exceeded at Baylands MEIR or MEIW. The MEIR is located in the Roundhouse, and the MEIW is located at the water recycling facility. The major contributor to the total cancer risk for resident and school receptors is construction and the age at which exposure begins. For Baylands workers, the majority of the health risk is from nearby emergency backup generators. The closest generator to a worker receptor would occur at the water recycling facility.

Table 4.9-16 shows the cancer risks at both existing off-site residential and worker receptors along with new Baylands residential, school, and worker receptors. The exposure period presented in Table 4.9-14 for residents is the 30-year period beginning at full Specific Plan buildout, assumed to start in 2043 and continue through 2073, while the exposure period for workers is 25 years, assumed to start in 2043 and continue through 2068. The exposure period for the middle school is 9 years.

For the buildout analysis in **Table 4.9-16**, the cancer risk threshold would not be exceeded at any off-site receptors. The cancer risk would be exceeded at the on-site MEIR and school receptor due to emergency backup generator DPM emissions. For the middle school receptor, the closest generator would be located at the commercial buildings within the Icehouse Hill District. The generators nearest to residents would be located within high density residential buildings along both sides of Geneva Avenue west of the Caltrain right-of-way. The MEIR would be in the high density residential area along the north side of Geneva Avenue west of the Caltrain right-of-way, and the on-site school receptor would be at the middle school.

Table 4.9-17 presents the acute, chronic, and annual average $PM_{2.5}$ concentrations at both existing off-site residential and worker receptors along with new Baylands residential, school, and worker receptors. The acute, chronic, and annual average $PM_{2.5}$ thresholds would not be exceeded at any resident or school for either the existing or new Baylands receptor types. The worker receptors would have no exceedances of acute or chronic risk. However, the existing off-site MEIW is located west of Tunnel Avenue, south of Esta Avenue, and would experience an annual average $PM_{2.5}$ concentration above the applicable threshold during construction, primarily due to fugitive dust emissions that occur during site grading.

Carbon Monoxide Concentrations

The maximum peak-hour traffic volume at the intersections analyzed in the Baylands transportation study (Appendix F.1) would be 3,580 vehicles per hour at the Geneva Avenue extension and Harney Way under 2040 cumulative conditions (Fehr & Peers 2023). Because the Specific Plan would not contribute traffic to an intersection exceeding applicable CO concentration screening criteria, Baylands development would not cause or contribute to an exceedance of the state's 1-hour or 8-hour CO standards.

Table 4.9-14: Cancer Risk to Existing Off-Site Receptors from Baylands Construction and On-Site Operations

Receptor Type/Emissions Source	Assumed Exposure Period	Cancer Risk (in 1 million)
Maximally Exposed Individual Residence – Off-Site Resident Child Receptor – west of Bayshore Blvd., north of MacDonald Ave.

ABBREVIATIONS: $\mu g/m^3$ = micrograms per cubic meter; HI = Hazard Index; MEIR = Maximally Exposed Individual Resident; MEIW = Maximally Exposed Individual Worker; NA = not applicable; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter

NOTES:

a. **Bold values** = threshold exceedance.
b. Hazard index values and annual average $PM_{2.5}$ concentrations represent the worst year of exposure, not a summation. Overlapping years of construction and operation have combined impacts.

Significance Conclusion for Impact AQ-2

DPM emitted during construction activities would result in an excess cancer risk level of up to 16.0 in one million during site grading (16.9 over a 30-year exposure period starting with initiation of construction activities), as shown in **Table 4.9-14**. DPM from operational activities would result in an excess cancer risk level of up to 13.0 in one million for on-site Baylands residents and the new middle school in the northwest corner of the Icehouse Hill district during the 30-year exposure period following Specific Plan buildout (**Table 4.9-16**). These values exceed applicable thresholds and represent significant impacts. Acute and chronic, non-cancer HI, and annual average $PM_{2.5}$ concentrations would not exceed significance thresholds (**Table 4.9-17**).

Recent Regulations Not Quantified in the Analysis

New regulations not quantified in the analysis (such as CARB's Advanced Clean Fleets regulation, as described above under Impact AQ-1) would reduce DPM from heavy diesel trucks. However, the effect of this reduction, although not quantified as part of the current modeling tools, is assumed not to be sufficient to reduce impacts to less than significant. Therefore, with adherence to existing regulations and new regulations, excess cancer risk probability would remain significant.

Program EIR Mitigation Measures

Impact AQ-1 mitigation measures MM AQ-1a Clean Off-Road Construction Equipment (Program EIR Mitigation Measure 4.B-2a), and MM AQ-1b Tier 3 Off-Road Construction Equipment (Program EIR Mitigation Measure 4.B-2b) would reduce DPM and exhaust $PM_{2.5}$ emissions along with fugitive $PM_{2.5}$ emissions thereby reducing health risks from construction and operation of the Specific Plan.

Significance Conclusion for Impact AQ-2 with Implementation of Program EIR Mitigation Measures

MM AQ-1c would reduce impacts from exposure to DPM, but the effect of this reduction was not quantified in the analysis, and the reduction may not be sufficient to reduce impacts to below significance thresholds. Therefore, with adherence to Mitigation Measures carried forward from the Program EIR and implementation of best management practices in required SWPPPs, excess cancer risk would be significant.

Additional Mitigation Measures

Mitigation Measures for Impact AQ-1, MM AQ-1c, Zero-Emission and Tier 4 Off-Road Construction Equipment; MM AQ-1e, Clean On-Road Construction Trucks; MM AQ-1f Conveyor System for Transport of Excavated Material; MM AQ-1h, Best Available Emissions Controls for Stationary Emergency Generators; MM AQ-1j, Operational Truck Emissions Reduction; MM AQ-1k, Electric Vehicle Charging Infrastructure; and MM AQ-1l, Electric Landscaping Equipment, would reduce DPM and exhaust $PM_{2.5}$ emissions along with fugitive $PM_{2.5}$ emissions thereby reducing health risks from construction and operation of the Specific Plan.

Significance Conclusion for Impact AQ-2 with Implementation of All Mitigation Measures

As discussed below, Impact AQ-2 would be less than significant with mitigation incorporated. The effectiveness of Mitigation Measure MM AQ-1c, Zero-Emission and Tier 4 Off-Road Construction Equipment, was quantified in the analysis and the results presented in **Table 4.9-18** through **Table 4.9-21**. Although Mitigation Measures MM AQ-1e, MM AQ-1f, MM AQ-1h, MM AQ-1j, and MM AQ-1l would further reduce the health risks, as described above, they were not used to calculate the mitigated emissions, because MM AQ-1c was sufficient to show a reduction to below the significance threshold. MM AQ-1k would reduce emissions mainly from gasoline-powered passenger vehicles, and MM AQ-1l would reduce emissions mainly from gasoline-powered landscaping equipment. These sources would contribute a negligible amount to health risks compared to the substantial contribution to health risk from DPM.

As shown in **Table 4.9-18** through **Table 4.9-21**, after implementation of mitigation measures, cancer risk thresholds are not exceeded at any off-site receptors.

As shown in **Table 4.9-18**, the MEIR cancer risk threshold exceedance for construction and concurrent Specific Plan operations was reduced to below the significance threshold with implementation of Mitigation Measure MM AQ-1c. See Appendix G3 for detailed mitigated health risk calculations. Implementation of this mitigation measure would reduce the DPM emissions for all construction phases. After mitigation, the Scenario 1 MEIR would be located east of Tunnel Avenue, north of Lathrop Avenue.

Table 4.9-18: Mitigated Cancer Risk to Existing Off-Site Receptors During Baylands Construction and On-Site Operations

Receptor Type/Emissions Source	Exposure Period	Excess Cancer Risk (in 1 million) [a,b]
Maximally Exposed Individual Residence – Off-Site Resident Child Receptor: east of Tunnel Ave., north of Lathrop Ave.		
Specific Plan Construction	2025–2042	4.8
Specific Plan Operations, Phase 1	2038–2042	0.1
Project Operations, full Specific Plan buildout	2043–2055	0.2
Project Construction + Operations	2025–2055	5.1
Significance Threshold		**10.0**
Threshold Exceeded?		**No**
Maximally Exposed Individual Worker – Off-Site Worker Receptor: east of Tunnel Ave., south of Beatty Ave.		
Specific Plan Construction	2025–2042	1.1
Specific Plan Operations, Phase 1	2038–2042	0.3
Project Operations, full Specific Plan buildout	2043–2050	0.6
Project Construction + Operations	2025–2050	2.0
Significance Threshold		**10.0**
Threshold Exceeded?		No

SOURCE: ESA, *Brisbane Baylands Air Quality Technical Report*, February 2025.

ABBREVIATIONS: $\mu g/m^3$ = micrograms per cubic meter; HI = Hazard Index; MEIR = Maximally Exposed Individual Resident; MEIW = Maximally Exposed Individual Worker; NA = not applicable; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

NOTES:

a. **Bold values** = threshold or exceedance.
b. Health risk values presented in this table include Tier 4 Final engines on all off-road equipment including emergency standby generators required for operations.

With implementation of previously identified mitigation measures, cancer risk values for on-site receptors while construction operations are underway in other portions of the Baylands would remain below the significance threshold for the on-site Baylands MEIR, which would be in the Bayshore District, and the MEIW which would still be at the water recycling facility.

With implementation of Mitigation Measure MM AQ-1c, the off-road construction equipment DPM emissions and the on-site fugitive dust would reduce the cancer risk and annual average

$PM_{2.5}$ concentration for off-site receptors below the respective significance thresholds at the MEIR and MEIW.

Mitigation Measure MM AQ-1h, which applies to all new Baylands stationary emergency diesel generators, would reduce operational DPM emissions below the cancer risk significance threshold for the Baylands MEIR and school receptor, as shown in **Table 4.9-19**.

Table 4.9-19: Mitigated Cancer Risk to Future On-Site Baylands Receptors from Baylands Construction and On-Site Operations

Receptor Type/Emissions Source	Exposure Period	Excess Cancer Risk (in 1 million) [a,b]
Maximally Exposed Individual Residence – Baylands Resident Child Receptor – low-density residential along north side of Geneva Avenue on both sides of Baylands Park		
Specific Plan Construction	2033–2042	1.7
Specific Plan Operations, Phase 1	2038–2042	0.4
Project Operations, full Specific Plan buildout	2043–2063	1.0
Project Construction + Operations	2033–2063	3.0
Significance Threshold		**10.0**
Threshold Exceeded?		No
School – Baylands Middle School Receptor [c] – east of Bayshore Blvd., south of Main Street		
Specific Plan Construction	2034–2038	1.4
Specific Plan Operations, Phase 1	2038–2038	<0.1

Specific Plan Operations, Phase 1	2038–2042	0.1
Project Operations, full Specific Plan buildout	2043–2053	0.3
Project Construction + Operations	2028–2053	0.7
Significance Threshold		**10.0**
Threshold Exceeded?		No

SOURCE: ESA, *Brisbane Baylands Air Quality Technical Report*, February 2025.

ABBREVIATIONS: $\mu g/m^3$ = micrograms per cubic meter; HI = Hazard Index; MEIR = Maximally Exposed Individual Resident; MEIW = Maximally Exposed Individual Worker; NA = not applicable; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

NOTES:

a. **Bold values** = threshold or exceedance.
b. Health risk values presented in this table include Tier 4 Final engines on all off-road equipment including emergency standby generators required for operations.
c. The exposure duration of the school receptor is 9 years. Exposure starting in 2029 would end in 2038, prior to full buildout operations of the project in 2043.

After completion of construction, unmitigated project operations produced cancer risk impacts above the threshold for the Scenario 3 Baylands MEIR and school receptors. After the Specific

Plan is constructed and operations commence, implementation of Mitigation Measure MM AQ-1h would reduce the DPM emissions from on-site emergency generators. Health risk assessment modeling showed that the DPM emissions from the emergency generators would be the main contributors to the cancer risk impacts, at project full buildout, at the Bayshore MEIR and the school receptor. Mitigation Measure MM AQ-1h would reduce the modeled cancer risk at these receptors to below a level of significance. The mitigated cancer risk at the Bayshore MEIR and the school receptor would also be reduced to less than significant (**Table 4.9-20**).

Table 4.9-20: Mitigated Cancer Risk to Existing Off-site and Future On-Site Receptors from Operation of the Baylands Specific Plan at Full Buildout

Receptor Type/Emissions Source	Exposure Period	Excess Cancer Risk (in 1 million) [a,b]

SOURCE: ESA, *Brisbane Baylands Air Quality Technical Report*, February 2025.

ABBREVIATIONS: $\mu g/m^3$ = micrograms per cubic meter; HI = Hazard Index; MEIR = Maximally Exposed Individual Resident; MEIW = Maximally Exposed Individual Worker; NA = not applicable; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter.

NOTES:

a. **Bold values** = threshold or exceedance.
b. Hazard index values and annual average $PM_{2.5}$ concentrations represent the worst year of exposure, not a summation. Overlapping years of construction and operation have combined impacts.

After mitigation, the significance thresholds for cancer risk, annual average $PM_{2.5}$ concentrations, chronic, and acute HI would not be exceeded and therefore, the impact would be less than significant with mitigation incorporated.

c. Threshold AQ-3: Odors

Methodology for Determining Significance

The approach to analyzing potential odor impacts is qualitative. Generally, construction of a project would involve temporary odors from diesel combustion in equipment and vehicles. For operational odor impacts, if the proposed project would include one of the types of facilities that typically involve odorous emissions, there would be the potential for an odor impact, especially if near sensitive receptors.

Sources that typically generate odors include wastewater treatment and pumping facilities; landfills, transfer stations, and composting facilities; petroleum refineries, asphalt batch plants, chemical (including fiberglass) manufacturing, and metal smelters; painting and coating operations; rendering plants; coffee roasters and food processing facilities; and animal feed lots and dairies (BAAQMD 2022b). The analysis addresses the potential for the Specific Plan to introduce or expand of any of these odor-generating uses.

Impact Assessment

Construction

The use of construction equipment within the Specific Plan area could create objectionable odors to nearby properties or residents/employees within the Specific Plan area. Construction-related odors would be localized and temporary, and the use of low-VOC surface coating materials in accordance with BAAQMD Rules would reduce potentially objectionable odors from painting operations.

Operations – Water Recycling Facility

Construction of the Baylands water recycling facility (WRF), including a wastewater recycling facility designed to treat raw sewage and produce disinfected tertiary recycled water conforming to the State of California Administrative Code of Regulations Title 22, is anticipated to occur at the initiation of Phase 1 development and would thus be operational as residential uses are being developed and occupied. The WRF is described in detail in Section 3.3.2 g, *On- and Off-Site Infrastructure*.

Daily operations of the water recycling facility could generate objectionable odors to nearby sensitive receptors. The water recycling facility would be located east of the Icehouse Hill commercial development district, across the Caltrain right-of-way, approximately 500 feet downwind from the closest residential receptor in the Roundhouse District. The closest off-site residents would be located approximately 2,000 feet west of the facility. Nevertheless, the facility could generate odors that would adversely affect residents and workers within and adjacent to the Baylands.

Operations – Other Sources

In addition, food preparation at restaurants and hotels, as well as small-scale coffee roasting within the Baylands, both of which are permitted by the Specific Plan, could result in odor generation. Such odors would be small scale. BAAQMD regulation 7 places general limitations on odorous substances and specific emission limitations on certain odorous compounds.

Significance Conclusion for Impact AQ-3

Because construction-related odors from diesel equipment and vehicles would be localized and temporary, and low-VOC surface coating materials in accordance with BAAQMD rules would reduce potentially objectionable odors from painting operations, construction activities (including the use of diesel and surface coating materials) would be less than significant.

The large majority of uses that would be permitted by the Specific Plan would not generate objectionable odors. While food preparation at restaurants and hotels, as well as coffee roasting

within the Baylands, both of which are permitted by the Specific Plan, could result in odor generation, such odors would be generated on a small scale and not have a substantial adverse effect on a substantial number of people, as would be demonstrated by the required monitoring of BAAQMD regulation 7 for any odor complaints.

Daily operations of the water recycling facility could result in objectionable odors to nearby sensitive receptors. The water recycling facility, which is proposed on the east side of the Caltrain right-of-way, would be located approximately 500 feet from the closest residential receptor in the Roundhouse District. The closest off-site residents would be located approximately 2,000 feet west of the facility. The odor impact of water recycling facility operations would therefore be significant.

Program EIR Mitigation Measures

MM AQ-3a: Recycled Water Plant Odor Management Plan (Program EIR Measure 4.B-8). Prior to the start of operation pursuant to issuance of a permit to operate from the RWQCB, the recycled water plant shall formulate and implement a progressive Odor Management Plan for review and comment by the BAAQMD prior to review and approval by the City. The Odor Management Plan shall select a sufficient number of control measures from the following menu of options identified by the BAAQMD to attain a performance standard which meets the odor detection thresholds of BAAQMD Regulation 7 as achieved and verified by the BAAQMD inspector.

i. Activated carbon filter/carbon absorption
ii. Biofiltration/bio trickling filters
iii. Fine bubble aerator
iv. Hooded enclosures
v. Wet and dry scrubbers
vi. Caustic and hypochlorite chemical scrubbers
vii. Ammonia scrubber
viii. Energy efficient blower system
ix. Thermal oxidizer
x. Capping/covering storage basins and anaerobic ponds
xi. Mixed flow exhaust
xii. Wastewater circulation technology
xiii. Exhaust stack and vent location with respect to receptors

Significance Conclusion for Impact AQ-3 with Implementation of Program EIR Mitigation Measures

With implementation of MM AQ-3a, impacts would remain significant because the water recycling facility would be twice the size of the facility analyzed in the Program EIR.

Additional Mitigation Measures

MM AQ-3b: **Odor Control System.** The water recycling facility shall install sufficient odor controls to manage objectionable odors in compliance with BAAQMD Regulation 7 and meet the performance standard set forth in Section 7-302 of that regulation, which reads:

> "**7-302 Limit on Odorous Substances at or Beyond Property Line:** A person shall not discharge any odorous substance which causes the ambient air at or beyond the property line of such person to be odorous and to remain odorous after dilution with four parts of odor-free air."

To control odors, wastewater processing tanks/structures shall be enclosed and/or covered, and under negative pressure, and provided with positive ventilation through an odor control system such as a two-stage process that involves a biological trickling filter followed by granular activated carbon.

MM AQ-3c: **Hydrogen Sulfide and Odor Management Program for the WRF.** Prior to construction of the WRF, the project applicant shall develop a Hydrogen Sulfide and Odor Management program (HSOM Program) at the WRF for review and approval by the Community Development Director. The HSOM Program shall address hydrogen sulfide and odor management using a performance-based approach designed to meet the regulatory ambient air concentrations established in BAAQMD Regulation 9, Rule 2, (i.e., 0.06 ppm averaged over three consecutive minutes, or 0.03 ppm averaged over any 60 consecutive minutes) and to limit public complaints. The HSOM Program shall include best management practices and emissions controls as follows:

1. For grit and screenings, refuse containers shall be odor proof and contained within an area draining to the sanitary sewer.
2. Primary screenings shall be housed in a ventilated enclosure at the WRF(s).
3. Carbon absorption, biofiltration, or ammonia scrubbers shall be installed at the WRF(s).
4. Ferrous chloride injection for hydrogen sulfide removal may also be installed and implemented if necessary.

The project applicant shall implement the HSOM Program on an ongoing basis and provide the Directors or the Directors' designees with an annual report to describe implementation of the program and any adjustments needed to improve performance.

The HSOM Program shall address odor complaints that occur over time and shall designate WRF staff to receive and respond to complaints. The name and contact information of the responsible WRF staff shall be posted in a noticeable location on each WRF facility. The performance standard for odors shall be based on a three-tier threshold based on 30-day, 90-day, and three-year averaging times for complaints. The performance standards that must be met shall be as follows:

1. Three or more violation notices for public nuisance related to odors issued by the BAAQMD within a 30-day period;
2. Odor complaints from ten or more complainants within a 90-day period; or
3. Five or more confirmed odor complaints per year averaged over three years as an indication of a significant odor impact from a facility.

If one or more of these standards are not met, the project applicant shall revise the program and make any necessary improvement to the WRF odor controls to achieve all performance standards in subsequent reporting years.

MM AQ-3d: **Future Recordkeeping.** The new odor control units proposed as part of the WRF would also be subject to recordkeeping requirements and conditions in the BAAQMD's Permit to Operate for the purpose of abating any public nuisance from odors. The recordkeeping shall log all citizen complaints received by the BAAQMD. If citizen complaints exceed 10 or more within a 90-day period (per BAAQMD Regulation 7), additional odor controls would be required.

Significant Conclusion for Impact AQ-3 with Implementation of All Mitigation Measures

Implementation of mitigation measures would establish performance standards for water recycling facility operations, require installation of an odor control system, and mandate adherence to best management practices. Because of the odor controls required by Mitigation Measure MM AQ-3a through MM AQ-3d, the water recycling facility would not emit odors detectable at or beyond the property line of the facility. Because of the odor controls required by Mitigation Measure MM AQ-3a through MM AQ-3d, the water recycling facility would not emit odors detectable at or beyond the property line of the facility. Impacts would be reduced such that Impact AQ-3 would be less than significant with mitigation incorporated.

d. Threshold AQ-4: Consistency with the San Francisco Bay Area Clean Air Plan

Methodology for Determining Significance

The methodology for determining consistency with the Bay Area Clean Air Plan follows the recommendation of the BAAQMD to address the following three questions.

1. **Does the project support the primary goals of the Clean Air Plan?** In determining consistency with the 2017 Clean Air Plan, this analysis considers whether the proposed project would support the primary goals of the 2017 Clean Air Plan, include applicable control measures from the 2017 Clean Air Plan, and avoid disrupting or hindering implementation of control measures identified in the 2017 Clean Air Plan. In addition, a qualitative assessment is undertaken as to whether the Specific Plan would support achieving equity among Bay Area communities in cancer health risk from toxic air contaminants.
2. **Does the project include applicable control measures from the Clean Air Plan?** Next, an evaluation is undertaken to determine whether each applicable air quality plan control measure has been incorporated into the Specific Plan or can feasibly be incorporated into the mitigation measures. The BAAQMD recommends that projects incorporate all feasible air quality plan control measures that are applicable to the project.
3. **Does the project disrupt or hinder implementation of any Clean Air Plan control measures?** An evaluation is undertaken to determine whether the Specific Plan would cause disruption, delay, or otherwise hinder the implementation of any air quality plan control measure, such as precluding or hindering extension of transit services or a bicycle path or proposing excessive parking beyond parking requirements (BAAQMD 2017).

Impact Assessment

The legislature explained in SB 743 that, "there is a need to balance the need for level of service standards for traffic with the need to build infill housing and mixed-use commercial developments within walking distance to mass transit facilities, downtowns, and town centers and to provide greater flexibility to local governments to balance these sometimes-competing interests." Similarly, the State has adopted findings, "California has a housing supply and affordability crisis of historic proportions. The consequences of failing to effectively and aggressively confront this crisis are hurting millions of Californians, robbing future generations of the chance to call California home, stifling economic opportunities for workers and businesses, worsening poverty and homelessness, and undermining the state's environmental and climate objectives" (Gov. Code § 65589.5(a)(2)). "Among the consequences of those actions are discrimination against low-income and minority households, lack of housing to support

employment growth, imbalance in jobs and housing, reduced mobility, urban sprawl, excessive commuting, *and air quality deterioration*" (Gov. Code § 65589.5(a)(1)(C)).

The proposed project would include the development of residential and commercial development in transit priority areas. The Baylands site has also been expressly called out for development in the City's Housing Element and Land Use Element. Population growth is anticipated throughout the Bay Area, and development of project sites with access to transit and a mix of uses furthers the goals of the 2017 Clean Air Plan. The proposed project would be consistent with the primary goals of the 2017 Clean Air Plan.

The 2017 Clean Air Plan recognizes that to a great extent, community design dictates individual travel mode, and that a key long-term control strategy to reduce emissions of criteria pollutants, air toxics, and greenhouse gases from motor vehicles is to channel future Bay Area growth into urban communities where goods and services are close at hand, and people have a range of viable transportation options.

Transportation control measures that are identified in the 2017 Clean Air Plan are also implemented by the Baylands Specific Plan. The infill nature of the proposed project and high availability of viable transportation options ensure that residents and employees of the commercial and office uses could bicycle, walk, and ride transit to and from the Specific Plan area instead of taking trips via private automobile. Additionally, the Specific Plan would implement Transportation Demand Management (TDM) measures, as described in the Traffic Impact Analysis, to reduce vehicle trips.

As discussed under Impact AQ-1, buildout of the Specific Plan would result in a net increase in operational emissions of criteria air pollutants that would exceed significance thresholds, even after implementation of mitigation. This would result in a significant and unavoidable impact regarding regional criteria air pollutant emissions. However, these emissions do not in and of themselves indicate a conflict with the 2017 Clean Air Plan given the Specific Plan's emphasis on reducing VMT, reducing energy demand, encouraging smart land use and building design, and achieving other objectives.

For the reasons described above, implementation of the Specific Plan would not interfere with, disrupt, or hinder implementation of the Clean Air Plan. Therefore, this impact would be less than significant, and no mitigation is required. Nevertheless, mitigation measures that are required for Impact AQ-1 would further assist the goals of consistency with the Clean Air Plan.

The 2017 Clean Air Plan recommends 85 specific control measures and actions. Other measures in the plan but outside of the BAAQMD's regulatory authority may be advisory or are otherwise not specifically applicable to land use projects. These control strategies are grouped into the following categories:

- Stationary source measures
- Transportation control measures
- Energy control measures
- Building control measures
- Agricultural control measures
- Natural and working lands control measures
- Waste management control measures
- Water control measures
- Super GHG control measures

Many of these control measures address stationary sources and would be implemented by the BAAQMD using its permit authority and therefore are not suited for implementation through local planning efforts or project approval actions. The control measures most applicable to the Specific Plan are transportation control measures and energy and climate control measures. The proposed project's impact with respect to GHGs is discussed in the Greenhouse Gas Emissions technical report.

The following control measures from the 2017 Clean Air Plan (**Table 4.9-22**) would be implemented by the Specific Plan.

Significance Conclusion for Impact AQ-4

The Specific Plan would support the primary goals of the 2017 Clean Air Plan because it is a mixed-use, transit-oriented development generating and using sustainable energy for residential, commercial, and other uses. In addition, the Specific Plan includes many of the control measures from the 2017 Clean Air Plan, as shown in **Table 4.9-22**. This impact would be less than significant.

Table 4.9-22: Project Consistency with Applicable Control Measures of the 2017 Clean Air Plan

Control Measure	Measure Description	Existing or Proposed Implementation Mechanism
SS25 – Coatings, Solvents, Lubricants, Sealants and Adhesives	SS25 would reduce emissions of ROG from architectural coatings and other materials by proposing more stringent ROG limits as appropriate.	The proposed project would comply with the BAAQMD regulatory limits for architectural coatings.
SS32 – Emergency Backup Generators	S32 would reduce emissions of DPM, TACs, and criteria pollutants from emergency backup generators by enforcing Rule 11-18, resulting in reduced health risks to impacted individuals. This measure would also have climate protection benefits through reduced GHG emissions.	The proposed project would comply with BAAQMD BACT requirements, which state that all new diesel backup generators shall meet Tier 4 Final standards.
TR7 – Safe Routes to Schools and Safe Routes to Transit	TR7 would facilitate safe routes to schools and transit by providing funds and working with transportation agencies, local governments, schools, and communities to implement safe access for pedestrians and cyclists. Likely projects would include implementation of youth outreach and educational programs to encourage walking and cycling, the construction of bicycle facilities and improvements to pedestrian facilities.	The proposed project would prioritize pedestrian and bicycle access and implement measures to encourage alternative modes of transportation by building a dense, walkable, mixed-use, transit-oriented development, and prioritizing safety, especially for bicyclists and pedestrians. In addition, a fare-free shuttle network would be provided to transport Baylands residents and workers throughout the site and connect the Baylands to downtown Brisbane and existing transit routes.
TR9 – Bicycle and Pedestrian Access and Facilities	The bicycle component of TR9 strives to expand bicycle facilities serving employment sites, educational and cultural facilities, residential areas, shopping districts, and other activity centers. Typical improvements include bike lanes, routes, paths, and bicycle parking facilities. The bicycle component also includes a bike share pilot project that was developed to assess the feasibility of bicycle sharing as a first- and last-mile transit option. The pedestrian component of this measure is intended to improve pedestrian facilities and encourage walking by funding projects that improve pedestrian access to transit, employment sites, and major activity centers. Improvements may include sidewalks/paths, benches, reduced street width and intersection turning radii, crosswalks with activated signals, curb extensions/bulbs, buffers between sidewalks and traffic lanes, and street trees.	The proposed project would be consistent with this measure by its pedestrian network improvements and separated bicycle paths in the roadway network.

Control Measure	Measure Description	Existing or Proposed Implementation Mechanism
TR10 – Land Use Strategies	This measure supports land use patterns that reduce vehicle miles traveled (VMT) and associated emissions and exposure to TACs, especially within infill locations and impacted communities.	The Baylands Specific Plan proposes a mix of commercial, residential, retail, and recreational uses in a transit-served location. A network of pedestrian and bicycle routes are proposed that connect to regional systems. The Specific Plan proposes electric vehicle (EV) charging infrastructure, a fare-free shuttle system, secure bike parking, and other features to reduce automobile use and fossil fuel consumption. Transportation demand management programs with a target of reducing automobile travel by 16.4 percent are proposed as part of the project (Fehr & Peers 2023).
TR13 – Parking Policies	This control measure outlines how the MTC and the BAAQMD, in cooperation with regional agency partners, would (1) take actions at the regional level to implement parking policies that would benefit air quality, and (2) encourage and support local agency parking policies to reduce motor vehicle travel and promote focused growth.	The Baylands Specific Plan establishes a maximum number of permitted parking spaces to encourage use of transit and non-motorized travel, as well as to reduce the presence of automobiles within the Baylands.
TR22 – Construction, Freight and Farming Equipment	TR22 directs the BAAQMD to work to reduce emissions from off-road equipment used in the construction, freight handling and farming industries by pursuing the following strategies: (1) offering financial incentives between 2017 and 2030 to retrofit engines with diesel particulate filters or upgrade to equipment with electric or Tier 4 off-road engines; (2) work with the air board, the California Energy Commission, and others to develop more fuel-efficient off-road engines and drive trains; and (3) work with local communities to encourage use of renewable electricity and fuels.	Most Bay Area construction equipment currently meets Tier 4 Final standards for all construction equipment greater than 25 hp.[204]
TR23 – Lawn Care Equipment	TR23 directs the BAAQMD to seek funding to expand the Commercial Lawn and Garden Equipment Replacement Program into all nine Bay Area counties.	The proposed project would comply with CARB and BAAQMD requirements.

[204] Construction industry experts in the Bay Area indicate that 75 to 90 percent of construction equipment used in the region consist of Tier 4 engines, and large construction companies like those to be contracted for the Specific Plan have construction fleets with 90 to 95 percent Tier 4 engines (Guadalupe Quarry Redevelopment Project Draft Environmental Impact Report, AQ and GHG technical report, August 2024, available at *https://ceqanet.opr.ca.gov/2022060358/2*. Accessed January 9, 2025.

Control Measure	Measure Description	Existing or Proposed Implementation Mechanism
EN1 – Decarbonize Electricity Production	EN1 focuses on lowering carbon emissions by switching the fuel sources used in electricity generation. The measure would promote and expedite a transition away from fossil fuels used in electricity generation (i.e., natural gas) to a greater reliance on renewable energy sources (e.g., wind, solar). In addition, this measure would promote an increase in cogeneration, which results in useful heat in addition to electricity generation from a single fuel source.	A minimum of 85,000 megawatt-hours (MWh) of electricity annually are proposed to be generated by on-site solar panels installed on buildings and in parking areas, and in a solar farm developed east of the Caltrain right-of-way south of Visitacion Creek. The Specific Plan provides for five additional sustainable infrastructure subareas (along with rooftops and parking lot areas) to accommodate additional electricity generation and storage technologies.
BL1 – Green Buildings	BL1 seeks to increase energy efficiency and the use of on-site renewable energy—as well as decarbonize existing end uses—for all types of existing and future buildings. The measure includes policy assistance, incentives, diffusion of public information, and targeted engagement and facilitation of partnerships in order to increase energy efficiency and on-site renewable energy in the buildings sector.	Carbon emissions reductions would be achieved through energy conservation and building efficiency measures and a combination of landscaping and lighting designs that reduce energy and water use and building design standards to reduce energy and water usage. In addition, the proposed project would install a solar farm and rooftop solar on many of the buildings.
BL4 – Urban Heat Island	This control measure aims to reduce the "urban heat island" phenomenon by increasing the application of "cool roofing" and "cool paving" technologies, as well as increasing the prevalence of urban forests and vegetation through voluntary approaches and educational outreach.	Approximately 29.5 percent of the Year 2100 land area within the Baylands would be retained in open space, park, trails, wetlands and habitat, and similar uses.[205] The Specific Plan also preserves the Brisbane Lagoon as open space and restores critical butterfly habitat. Although removal of wetlands would occur as part of site grading activities, the Specific Plan proposes establishment and maintenance in perpetuity of new wetlands within the Baylands. Further, new public parks and other amenities would be provided and maintained at no cost to existing city residents and businesses. Provision of cool roofs is permitted as a potential means of complying with CALGreen Tier 1 requirements. The Specific Plan requires reflective roof materials; however, such materials would generate substantial glare within Brisbane's hillside residential areas. Thus, EIR Mitigation Measure MM AES-5a (Program EIR Mitigation Measure 4.A-4b) prohibits placement of such reflective materials on building roofs.
NW2 – Urban Tree Planting	NW2 promotes the planting of trees in urbanized settings to take advantage of the myriad benefits provided by these trees, including shading to reduce both the "urban heat island" phenomenon and the need for space cooling, and the absorption of ambient criteria air pollutants as well as carbon dioxide.	The proposed project would include habitat restoration and tree planting. Habitat restoration and enhancement within the Ecological Park (Roundhouse District) include woodland areas that would have the highest canopy and include plantings of live oak, bay, buckeye, and hazelnut trees with an understory sharing many coastal scrub species.

[205] As shown in Table 3-1, 157 acres of the Baylands 494 acres of Year 2100 land area are proposed for open space uses.

Control Measure	Measure Description	Existing or Proposed Implementation Mechanism
WA3 – Green Waste Diversion; and WA4 – Recycling and Waste Reduction	WA3 seeks to reduce the total amount of green waste being disposed in landfills by supporting the diversion of green waste to other uses, while WA4 seeks to reduce greenhouse gas emissions by diverting recyclables and other materials from the landfill.	Baylands construction projects are proposed to recycle and/or salvage for re-use a minimum of sixty-five percent (65%) of nonhazardous construction and/or demolition waste and would reuse 100 percent of non-hazardous soils excavated during grading operations on-site. Operational solid waste reduction is proposed to consist of informational and technical assistance programs, installation, and use of pet waste collection systems, and zero waste programs implemented by Recology for the City and County of San Francisco.
WR2 – Support Water Conservation	WR2 seeks to promote water conservation, including reduced water consumption and increased on-site water recycling, in residential, commercial, and industrial buildings for the purpose of reducing greenhouse gas emissions.	Water conservation is required for indoor building use, and for outdoor landscaping. A dual water system providing for recycled water to be used for outdoor irrigation and designated indoor uses within commercial buildings would be constructed. Once the Project generates a wastewater flow of 0.22 million gallons per day (approximately 20% built out), a water recycling facility would be constructed and operational, at which time potable water would not be used for non-potable purposes.

4.10 GREENHOUSE GAS EMISSIONS

4.10.1 INTRODUCTION

a. Overview

This section evaluates the physical environmental effects of the 2025 Specific Plan project in relation to greenhouse gas (GHG) emissions and whether the Specific Plan would conflict with applicable plans, policies, or regulations adopted for the purpose of reducing GHG emissions. The evaluation includes the technical analyses prepared by Environmental Science Associates (ESA) provided in Appendix H.

GHG emissions and resulting global climate change represent cumulative impacts from human activities and development projects locally, regionally, state-wide, nationally, and worldwide. No single project can generate enough GHG emissions to noticeably change the global average temperature; instead, the combination of GHG emissions from past, present, and future projects around the world have contributed and will continue to contribute to global climate change and its associated environmental impacts. This EIR's GHG emissions analysis thus addresses the Specific Plan's contribution to cumulative significant adverse environmental impacts of global climate change resulting from GHG emissions.

b. Definitions

Atmospheric lifetime describes how long it takes to restore the system to equilibrium after an increase in the concentration of a GHG in the atmosphere. Atmospheric lifetimes of GHGs range from tens to thousands of years.

Carbon dioxide equivalent is a metric measure used to compare the emissions from various GHGs based upon their global warming potential (GWP). Carbon dioxide equivalents are commonly expressed as "million metric tons of carbon dioxide equivalents ($MMTCO_2e$)." The carbon dioxide equivalent for a gas is derived by multiplying the tons of the gas by the associated GWP, as follows:

- $MTCO_2e$ = (metric tons of a gas) x (GWP of the gas)
- $MMTCO_2e$ = (million metric tons of a gas) x (GWP of the gas)

Carbon footprint refers to the total amount of GHG that is emitted into the atmosphere each year by a person, family, building, organization, or company. A person's carbon footprint includes GHG emissions from fuel that an individual burns directly, such as by heating a home or riding in a car. It also includes GHGs that come from producing the goods or services that

the individual uses, including emissions from power plants that make electricity, factories that make products, and landfills where trash is sent.

Carbon neutral means having or resulting in no net addition of carbon dioxide to the atmosphere.

Carbon sequestration is the process by which trees and plants absorb carbon dioxide, release the oxygen, and store the carbon.

Emissions inventory is an estimate of the amount of pollutants emitted into the atmosphere from major mobile, stationary, area-wide, and natural source categories over a specific period of time, such as a day or a year.

Global climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans, along with other significant changes in climate (such as precipitation or wind) that last for an extended period of time. The term *global climate change* is often used interchangeably with the term *global warming*, but *global climate change* is preferred over *global warming* because it helps convey that GHG emissions may result in other changes in addition to rising temperatures.

Global warming potential (GWP) is a measure of how much heat a greenhouse gas traps in the atmosphere relative to the effects of carbon dioxide (CO_2) over a specific time period, allowing for comparisons of the warming potential of different gases. GWP allows for the conversion of different GHG emissions into the same emissions unit, carbon dioxide equivalence. (CO_2e).

Greenhouse gas (GHG) refers to gases that absorb and emit radiation within the thermal infrared range, which is the fundamental cause of human contribution to the greenhouse effect. The most prevalent GHG is carbon dioxide (CO_2), along with methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6).

Greenhouse effect is the warming effect of the Earth's atmosphere. Light energy from the sun that passes through the Earth's atmosphere is absorbed by the Earth's surface and is radiated into the atmosphere as heat energy. The heat energy is then trapped by the atmosphere, creating a situation similar to that which occurs in a car with its windows rolled up. The emission of CO_2 and other gases into the atmosphere increases the greenhouse effect and contributes to global warming.

Intergovernmental Panel on Climate Change (IPCC) is a scientific intergovernmental body set up by the World Meteorological Organization and the United Nations Environment Programme to provide decision-makers and others interested in climate change with an objective source of information about climate change.

Net zero GHG emissions refers to the emissions of GHGs such as carbon dioxide, methane, or nitrous oxide by a particular development or human activity being equal to or less than the

amount of GHGs that are removed from the atmosphere by that development or human activity (i.e., GHG emissions ≤ GHG reductions).

Troposphere is the zone of the atmosphere characterized by water vapor, weather, winds, and decreasing temperature with increasing altitude.

4.10.2 PHYSICAL ENVIRONMENTAL SETTING

Greenhouse gases trap heat in the atmosphere in a manner similar to the effect greenhouses have in raising the internal temperature. GHGs allow sunlight to enter the atmosphere while containing a portion of the outward-bound infrared radiation, which warms the air. Both natural processes and human activities emit GHGs. The natural accumulation of GHGs in the atmosphere regulates the earth's temperature; however, emissions from human activities such as fossil fuel–based electricity production and operation of internal combustion engines in motor vehicles have elevated the concentration of GHGs in the atmosphere. The resulting accumulation of GHGs has contributed to an increase in the temperature of the earth's atmosphere, commonly referred to as global climate change.

a. Climate Change Effects of Greenhouse Gases

The California Legislature and agencies charged with implementing state climate policy have determined that EIRs should focus on GHG emissions rather than attempt to catalogue all the potential global effects that may ultimately result from cumulative GHG emissions (14 Cal. Code Regs., §§ 15064.4, 15126.4, subd.[c], 15183.5). The Natural Resources Agency's statement of reasons for adopting the CEQA Guidelines amendments pursuant to SB 97 states: "[S]ome comments submitted to OPR during its public workshops indicated that the Guidelines should be addressed to 'Climate Change' rather than just the effects of GHG emissions. The focus in the Guidelines on GHG emissions is appropriate."]. Nevertheless, the discussion below provides an overview of the consequences of GHG emissions.

GHGs trap heat that enters Earth's atmosphere. As a result, radiation that otherwise would have escaped back into space is retained, resulting in a warming of the atmosphere. Scientists generally believe that emissions from human activities—such as electricity generation, vehicle emissions, and farming and forestry practices—have elevated the concentration of GHGs in the atmosphere beyond naturally occurring concentrations, contributing to the larger process of global climate change.

Although there are many GHGs, the following six are explicitly identified in California legislation as being of primary concern:

- **Carbon dioxide (CO_2)**, emitted as a result of fossil fuel combustion, with contributions from cement manufacturers and other sources.

- **Methane**, produced through the anaerobic decomposition of waste in landfills, production and distribution of natural gas and petroleum, animal digestion and decomposition of animal wastes,[206] coal production, and incomplete fossil fuel combustion.
- **Nitrous oxide**, typically generated as a result of soil cultivation practices, particularly the use of commercial and organic fertilizers, fossil fuel combustion, nitric acid production, and biomass burning.
- **Hydrofluorocarbons**, used primarily as refrigerants.
- **Perfluorocarbons**, originally introduced as alternatives to ozone-depleting substances and typically emitted as byproducts of industrial and manufacturing processes.
- **Sulfur hexafluoride**, used primarily in electrical transmission and distribution systems.

The primary GHGs anticipated from the 2025 Specific Plan project are CO_2 and methane as the result of combustion of fossil fuels from mobile sources.

Not all GHGs equally affect global climate change. As a result, GHG emissions are commonly quantified in units of their equivalent mass of carbon dioxide (CO_2e). CO_2e emissions are calculated by applying the appropriate global warming potential (GWP) value to pollutant-specific emissions.[207] GWP ranges from 1 (carbon dioxide) to 22,800 (sulfur hexafluoride). GHGs with a higher GWP have a greater global warming effect on an equivalent mass basis over a specified time frame. For example, over a 100-year time frame, one metric ton (MT) of methane has the same contribution to the greenhouse effect as approximately 25 MT of CO_2 and therefore has a GWP of 25.

b. Effects of Adding GHGs to the Atmosphere: Global Climate Change

Temperature Increase

The primary effect of adding GHGs to the atmosphere has been a rise in the average global temperature. In 2021, the average temperature in the contiguous United States was 54.5 degrees Fahrenheit (°F), which was 2.5°F above the 20th-century average and ranked as the fourth-warmest year in the preceding 127-year period of record. The six warmest years on record have all occurred since 2012, while the 10 warmest years have occurred over the past 12-year period.

[206] The State Scoping Plan indicates methane emissions from livestock, both from animals and their waste, to be a primarily component of agricultural greenhouse emissions.

[207] GWPs and associated CO_2e values were developed by the Intergovernmental Panel on Climate Change (IPCC) and initially published in its Second Assessment Report in 1996. The IPCC updated GWP values based on the latest science in its Fourth Assessment Report (AR4). CARB reports GHG emissions inventories for California using the GWP values from the IPCC AR4.

The Intergovernmental Panel on Climate Change's Fourth Assessment Report indicates that average temperatures in California could rise 5.6°F to 8.8°F by the end of the 21st century, depending on the global trajectory of GHG emissions. According to the Cal-Adapt website, the portion of the city of Brisbane in which the Baylands is located could experience an average temperature increase of about 3.6°F to 4.3°F by 2070–2090, compared to the 1961–1990 period.

With climate change, extreme heat conditions and heat waves are predicted to affect larger areas, to last longer, and to have higher temperatures. Heat waves, defined as three or more days with temperatures above 90°F, are projected to occur more frequently by the end of the century. Heat-related illness includes a spectrum of illnesses ranging from heat cramps to severe heat exhaustion and life-threatening heat stroke.

Wildfires

Wildfires in California over the past two decades have been increasing in size, severity, and adverse impacts. Warming temperatures that result from climate change influence the length of both the fire and growing seasons and consequently affect the amount of time and intensity at which fires burn and the amount of available fuels. Higher temperatures lead to drought, which decreases the fuel moisture and increases the likelihood of ignition. Increased wildfire activity leads to more GHG emissions from sources that otherwise would be carbon sinks. Between 2000 and 2019, GHG emissions from California wildfires ranged from a low of 1.2 $MMTCO_2e$ in 2010 to a high of 39 $MMTCO_2e$ in 2018, with an annual average of 14 $MMTCO_2e$. CARB estimates that wildfire emissions increased dramatically in 2020, totaling 112 $MMTCO_2e$.

Air Quality

Higher temperatures, conducive to air pollution formation, worsen air quality in California and make it more difficult for the state to achieve both national and state ambient air quality standards. Climate change may increase the concentration of ground-level ozone in particular, which can cause breathing problems; aggravate lung diseases such as asthma, emphysema, and chronic bronchitis; and cause chronic obstructive pulmonary disease. Emissions from wildfires can lead to excessive levels of particulate matter, ozone, and volatile organic compounds. The resulting increase in fine particulate matter from wildfires is a direct threat to human health even during relatively short exposures, particularly for children, the elderly, and people with existing respiratory problems (Kenward et al. 2013). Additionally, severe health effects accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state.

Water Supply and Water Quality

There is a high degree of uncertainty regarding the overall impact of global climate change on future water supplies in California. Studies indicate considerable variability in predicting

precise impacts of climate change on California hydrology and water resources. Increasing uncertainty in the timing and intensity of precipitation will challenge the operational flexibility of California's water management systems. Warmer, wetter winters would increase the amount of runoff available for groundwater recharge; however, this additional runoff could occur at a time when some basins either are being recharged at their maximum capacity or are already full. Conversely, reductions in spring runoff and higher evapotranspiration levels because of higher temperatures could reduce the amount of water available for recharge.

Climate change could alter water quality in a variety of ways, including through increases in winter flows that reduce pollutant concentrations (through dilution) or increase erosion of land surfaces and stream channels, leading to higher sediment, chemical, and nutrient loads in rivers. Water temperature increases and decreased water flows can result in increasing concentrations of pollutants and salinity. Increases in water temperature alone can lead to adverse changes in water quality, even in the absence of changes in precipitation.

Hydrology and Sea Level Rise

Climate change has the potential to affect the amount of snowfall, rainfall, and snowpack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, and coincidental high-tide and high-runoff events); sea level rise and coastal flooding; coastal erosion; and the potential for saltwater intrusion (CNRA 2014). Refer to Section 4.14, *Hydrology and Water Quality*, for a discussion of impacts related to sea level rise.

Agriculture

Many of California's important crops, including fruit and nut trees, are particularly vulnerable to changing temperature regimes and water-induced stress. California agriculture is projected to experience lower crop yields as a result of extreme heat waves, heat stress and increased water needs of crops and livestock (particularly during dry and warm years), and new and changing pest and disease threats. Higher CO_2 levels can stimulate plant production and increase plants' water use efficiency. However, if temperatures rise and drier conditions prevail, water demand could increase; crop yield could be threatened by a less reliable water supply; and greater ozone pollution could render plants more susceptible to pest and disease outbreaks and interfere with plant growth.

Historically, California has experienced multi-year droughts and has been able to support agricultural water demands through groundwater reserves, winter snowpack, reservoir storage, and conveyance of water throughout the state in canals. However, the higher temperatures that come with climate change will likely decrease snow storage, will cause more frequent and severe droughts, and will require additional preparedness for more frequent surface water shortages and reliance on sustainable groundwater management.

Ecosystems and Wildlife

Changes in temperature, precipitation, food sources, competition for prey, and other physical or biological features of the habitat may force changes in the timing of key life-cycle events for plants and animals and shift the ranges where these plants and animals live. Range shifts have been observed in approximately 75 percent of small animal species and more than 80 percent of bird species in the Sierra Nevada. High-elevation mammals have moved upslope, while birds and low-elevation mammals have moved downslope as frequently as upslope. The varied responses reflect the species' intrinsic sensitivity to temperature, precipitation, or other physical factors, such as changes in food sources, vegetation, and interactions with competitors.

Additionally, range shifts have been noted in wintering bird species and time shifts of arriving species have been noted in butterflies and migratory birds. Furthermore, ocean acidification has affected marine organisms and their food chain. Chinook salmon, for example, have been affected by climate change in terms of both the number of adults returning to spawn and the increased mortality rate among juvenile salmon, while California sea lions have had lower birth rates, higher pup mortality, and increased numbers of pups having poor conditions during years of warmer sea temperatures.

Public Health

Global climate change is also anticipated to result in more extreme-heat events. These extreme-heat events increase the risk of death from dehydration, heart attack, stroke, and respiratory distress, especially for people who are ill, children, the elderly, and the poor, who may lack access to air conditioning and medical assistance. A warming planet is expected to bring more severe-weather events, worsening wildfires and droughts, a decline in air quality, rising sea levels, and increases in allergens and vector-borne diseases, all of which present significant risks to the health and well-being of California populations.

c. Emissions Inventories

Global Greenhouse Gas Emissions

Worldwide human-caused emissions of GHGs were approximately 37,900 $MMTCO_2e$ in 2021, including ongoing emissions from industrial and agricultural sources and emissions from land use changes (e.g., deforestation). Emissions of CO_2 from fossil fuel use and industrial processes account for 65 percent of the total, while CO_2 emissions from all sources account for 76 percent of the total GHG emissions.

United States Greenhouse Gas Emissions

In 2021, the United States was the world's second largest emitter at 4,800 $MMTCO_2e$.[208] Of the major sectors nationwide, transportation accounts for the highest volume of GHG emissions (approximately 27 percent), followed by electricity (25 percent), industry (24 percent), agriculture (11 percent), commercial buildings (7 percent), and residential buildings (6 percent). Between 1990 and 2020, total U.S. GHG emissions decreased by 7.3 percent from a high of 15.7 percent above 1990 levels in 2007.

California Greenhouse Gas Emissions

CARB compiles GHG inventories for the State of California. Based on the 2020 GHG inventory data (i.e., the latest year for which data are available from CARB), emissions from GHG-emitting activities state-wide were 371.1 $MMTCO_2e$, including emissions resulting from imported electrical power. In 2022, California's total GHG emissions were approximately 9.3 $MMTCO_2e$ less than in 2021 and have been declining since 2007. Between 1990 and 2022, California's population grew by approximately 10 million, from 29.8 million to 39.1 million, representing an increase in population of approximately 31 percent from 1990 population levels. Thus, per capita GHG has been declining.

Despite population and economic growth, CARB's 2022 state-wide GHG inventory indicated that California's net GHG emissions in 2022 were below the 2020 GHG emissions limit of 431 $MMTCO_2e$, as codified in California Health and Safety Code Division 25.2 (AB 32). **Table 4.10-1** identifies and quantifies state-wide anthropogenic GHG emissions and sinks (e.g., carbon sequestration caused by forest growth) in 1990 and 2022.

Although the transportation sector remains the largest contributor to state-wide GHG emissions at approximately 38 percent in 2020, the electric vehicle adoption rate is occurring faster than anticipated. California has reached 1.5 million electric vehicle sales 2 years ahead of its planned 2025 target for the sales milestone. The rate of electric vehicle adoption rate is occurring faster than anticipated in 2018. California has reached 1.8 million electric vehicle sales 2 years ahead of its planned 2025 target for the sales milestone (CEC 2023). In the second quarter of 2024, approximately 24.9 percent of new light-duty vehicle sales in California were electric.

[208] China was the largest emitter of CO_2, at 12,500 MMT.

Table 4.10-1: California Greenhouse Gas Emissions Inventory for Years 1990 and 2022

Category	Total 1990 Emissions Using GWP from IPCC's SAR ($MMTCO_2e$)	Percent of Total 1990 Emissions	Total 2022 Emissions Using GWP from IPCC's AR4 ($MMTCO_2e$)	Percent of Total 2020 Emissions
Transportation	150.7	35%	139.9	39%
Electric Power	110.6	26%	59.8	16%
Commercial & Residential Fuel Use	44.1	10%	39.5	14%
Industrial	103.0	24%	72.7	23%
Non-specified	1.3	<1%	—[a]	—
Agriculture/Forestry	23.6	6%	29.8	8%
Forestry Sinks	-6.7	-2%	—[b]	—
NET TOTAL (IPCC SAR)	**426.6**	**100%**[c]	**—**	**—**
NET TOTAL (IPCC AR4)[d]	**431**	**100%**[c]	**371.1**	**100%**[d]

SOURCE: CARB 2024.

ABBREVIATIONS: AR4 = Fourth Assessment Report; GWP = global warming potential; IPCC = Intergovernmental Panel on Climate Change; $MMTCO_2e$ = million metric tons of carbon dioxide equivalent; SAR = Second Assessment Report

NOTES:

a. The "Non-specified" category is not specifically called out in the 2022 emissions inventory.
b. Revised methods under development (not reported for 2022).
c. Total of individual percentages may not add up to 100% due to rounding.
d. The California Air Resources Board revised the state's 1990-level GHG emissions using GWPs from the IPCC AR4.

San Francisco Bay Area Greenhouse Gas Emissions

As stated in the *2017 Clean Air Plan*, in 2015, GHG emissions in the Bay Area were approximately 85 $MMTCO_2e$ per year. Based on the 2015 data, Bay Area emissions from the transportation sector represented the largest source of GHG emissions at 41 percent, followed by stationary industrial sources at 26 percent, electricity generation and co-generation at 14 percent, and fuel use (primarily natural gas) by buildings at 10 percent. The remaining emissions are composed of fluorinated gas emissions and emissions from solid waste and agriculture. Of the total transportation emissions in 2015, on-road sources accounted for approximately 87 percent, while off-road sources accounted for the remainder (BAAQMD 2017a).

City of Brisbane Greenhouse Gas Emissions

The City of Brisbane published its 2021 Community Greenhouse Gas Inventory Report (Inventory Report) in 2024. According to the Inventory Report, local emissions generated within the city limits equaled 72,969 $MTCO_2e$. In Brisbane, the largest source of GHG emissions was the transportation sector (59 percent, which includes total vehicle miles traveled [VMT] and off-road residential equipment), followed by the energy sector (26 percent, which includes electricity and natural gas use in homes, commercial and industrial businesses, other buildings, and stationary sources). In addition, the solid waste sector generated 15 percent, and the wastewater and water sector generated less than 1 percent of emissions.

Specific Plan Area GHG Emissions

Existing Baylands development would largely be displaced by Specific Plan development, including industrial buildings along Bayshore Boulevard and Industrial Way; buildings along Tunnel Avenue, except for structures within the Golden State Lumber site, which would remain; and industrial buildings along the south side of Beatty Avenue. The buildings along Industrial Way that would be removed total 261,400 square feet. GHG emissions from these uses were estimated using California Emissions Estimator Model (CalEEMod) version 2022.1, a state-wide land use emissions computer model to quantify potential emissions of criteria pollutants and GHGs from a variety of land use projects.[209] **Table 4.10-2** presents an estimate of existing emissions from these existing operations.

Table 4.10-2: Existing Greenhouse Gas Emissions Inventory for the Specific Plan Area

Source	Annual $MTCO_2e$
Area	12
Natural Gas	662
Electricity [a]	290
Mobile—on road	102
Waste	7
Water	8
Former Brisbane Landfill Emissions [b]	7,564
TOTAL, OPERATIONAL	**9,365**

SOURCE: Data compiled by Environmental Science Associates in 2023 using CalEEMod (see Appendix G.1 and H.1). Landfill gas emissions from the City of Brisbane.

ABBREVIATIONS: CO_2e = carbon dioxide equivalent; MT = metric tons

a. Indirect electrical emissions are calculated using CalEEMod and conservatively do not assume participation in local Community Choice Aggregation Program. Therefore, the emission calculation methodology for indirect electricity differs from that of the City's inventory.
b. The former Brisbane landfill has an existing landfill gas collection system.

4.10.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

Greenhouse Gas Emissions Regulations

Although the federal Clean Air Act does not specifically regulate GHG emissions, the U.S. Supreme Court ruled on April 2, 2007, in *Massachusetts v. U.S. Environmental Protection Agency*

[209] Additional information on the CalEEMod model, including user guide and documentation are provided online at: https://www.caleemod.com/user-guide.

that GHGs are pollutants that can be regulated under the Clean Air Act. Currently, there are no federal regulations that establish ambient air quality standards for GHGs.

The USEPA Administrator determined that atmospheric concentrations of GHGs endanger the public health and welfare within the meaning of Section 202(a) of the Clean Air Act, and on December 7, 2009, the USEPA Administrator signed the following two findings regarding GHGs under Section 202(a) of the Clean Air Act:

- **Endangerment Finding:** The current and projected concentrations of the six key well-mixed GHGs—carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride—in the atmosphere threaten the public health and welfare of current and future generations. USEPA also found that the combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that endangers public health and welfare under Clean Air Act Section 202(a). Subsequently, federal agencies have adopted specific GHG-related regulations and initiatives, including the following:
    - **USEPA and National Highway Traffic Safety Administration Standards to Cut Greenhouse Gas Emissions and Fuel Use for New Motor Vehicles:** These are coordinated steps to enable the production of a new generation of clean vehicles.
    - **Renewable Fuel Standard Program:** Transportation fuel sold in the United States is required to contain a minimum volume of renewable fuel.
    - **Stationary Sources:** On May 13, 2010, USEPA set GHG emissions thresholds to define when permits under the New Source Review Prevention of Significant Deterioration (PSD) and Title V Operating Permit programs are required for new and existing industrial facilities. This final rule "tailors" the requirements of these Clean Air Act permitting programs to limit covered facilities to the nation's largest GHG emitters: power plants, refineries, and cement production facilities.
    - **Timing of Applicability of the Prevention of Significant Deterioration Permitting Program to GHGs:** In June 2014, the U.S. Supreme Court ruled that USEPA cannot classify facilities as major Prevention of Significant Deterioration or Title V sources based solely on their GHG emissions meeting the major source threshold. However, the Supreme Court said that USEPA could continue to require Prevention of Significant Deterioration permits if triggered by criteria pollutant emissions and these permits contain Best Available Control Techniques limits for GHG emissions.
- **Cause or Contribute Finding:** The combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to greenhouse gas pollution, which threatens public health and welfare.

These findings were a prerequisite for implementing emissions standards for vehicles and do not directly impose requirements on developments or agencies.

b. State Laws, Plans, Programs, and Regulations

Legislation

Assembly Bill 32

California's major initiative for reducing GHG emissions is outlined in Assembly Bill (AB) 32, the "California Global Warming Solutions Act of 2006." AB 32 codified the state-wide goal of reducing GHG emissions to 1990 levels by 2020 and required CARB to prepare a Scoping Plan to outline the main state strategies to meet the 2020 deadline for reducing GHGs. In addition, AB 32 requires CARB to adopt regulations that require reporting and verification of state-wide GHG emissions. The initial Scoping Plan was approved by CARB on December 11, 2008, and included GHG emission reduction strategies related to energy efficiency, water use, and recycling and solid waste. Many of the GHG reduction measures included in the Scoping Plan (e.g., Low Carbon Fuel Standard, Advanced Clean Car standards, and Cap-and-Trade) have been adopted since approval of the Scoping Plan. In 2016, the State of California achieved its 2020 GHG emission reduction targets as annual emissions fell below 431 $MMTCO_2e$ (CARB 2018).

Senate Bill 32

Senate Bill (SB) 32, which became effective on January 1, 2017, requires CARB to develop technologically feasible and cost-effective regulations to achieve the targeted 40 percent GHG emission reduction by 2030 set in EO B-30-15.

Senate Bill 375

Adopted on September 30, 2008, SB 375 established mechanisms to develop regional targets for reducing GHG emissions from passenger vehicles. On September 23, 2010, CARB adopted the vehicular GHG emissions reduction targets that were developed in consultation with metropolitan planning organizations across the state. SB 375 recognizes the importance of achieving significant GHG reductions by working with cities and counties to change land use patterns and improve transportation alternatives. SB 375 directives include:

1. Creation of regional targets for GHG emissions reduction tied to land use;
2. A requirement that regional planning agencies, including the Association of Bay Area Governments (ABAG) and Metropolitan Transportation Commission (MTC), work with local jurisdictions to develop a Sustainable Communities Strategy (SCS) to meet GHG emissions reduction targets (or an Alternative Planning Strategy if the SCS would not reach the target set by CARB);

3. A requirement that regional transportation funding decisions be consistent with the SCS;
4. A requirement that the Regional Housing Needs Allocation numbers for municipal general plan housing element updates must conform to the sustainable communities strategy; and
5. CEQA exemptions and streamlining for projects that conform to the sustainable communities strategy.

The San Francisco Bay Area's reduction target for per capita vehicular GHG emissions is a 10 percent per capita reduction by 2020 and a 19 percent per capita reduction by 2035 relative to 2005 levels.

Senate Bill 1383

Adopted in September 2016, SB 1383 requires CARB to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants. The bill requires the strategy to achieve the following reduction targets by 2030:

- Methane: 40 percent below 2013 levels
- Hydrofluorocarbons: 40 percent below 2013 levels
- Anthropogenic black carbon: 50 percent below 2013 levels

Assembly Bill 1279 (California Climate Crisis Act)

AB 1279 includes a package of significant climate legislation that includes a codification of the state's goal to reach net zero increases in GHG emissions by 2045. With the passage of AB 1279, California has locked in a pathway to reach net zero emissions by no later than 2045. This goal requires California to cut GHG emissions by 85 percent compared to 1990 levels, ensuring that the state uses all available solutions to sharply cut pollution from sources such as industrial facilities, vehicles, and power plants.

Scoping Plans

Climate Change Scoping Plan

CARB developed and approved the initial Scoping Plan in 2008, implementing a specific requirement of AB 32. The Scoping Plan outlined the regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs that would be needed to meet the 2020 state-wide GHG emission limit and initiate the transformations necessary to achieve the state's long-range climate objectives (CARB 2008).

CARB approved the 2017 Climate Change Scoping Plan Update (2017 Scoping Plan Update) in December 2017. The 2017 Scoping Plan Update outlined an action framework to achieve a

40 percent reduction in GHG emissions relative to 1990 levels by 2030. Through a combination of data synthesis and modeling, CARB determined the target state-wide 2030 emissions limit to be 260 $MMTCO_2e$, and that further commitments would be needed to achieve an additional reduction of 50 $MMTCO_2e$ beyond then-current policies and programs. The cornerstone of the 2017 Scoping Plan Update was an expansion of the cap-and-trade program to meet the aggressive 2030 GHG emissions goal and ensure that the state achieves the 2030 limit set forth by EO B-30-15.

In the 2017 Scoping Plan Update, CARB recommended state-wide targets of no more than 6 $MTCO_2e$ per capita by 2030 and no more than 2 $MTCO_2e$ per capita by 2050. CARB acknowledged that because these targets were based on the state-wide GHG emissions inventory that includes all emissions sectors, it would be appropriate for local jurisdictions to derive evidence-based, local per-capita goals based on local emissions and growth projections.

To demonstrate how a local jurisdiction can achieve its long-term GHG goals at the community plan level, CARB recommends developing a geographically specific GHG reduction plan (climate action plan) consistent with the requirements of CEQA Section 15183.5(b). Once adopted, a so-called "CEQA-qualified" GHG reduction plan can provide local governments with a tool for streamlining project-level environmental review of GHG emissions, provided that there are adequate performance metrics for determining project consistency with the plan. Absent conformity with such a plan, CARB (2017) recommends "that projects incorporate design features and GHG reduction measures, to the degree feasible, to minimize GHG emissions. Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development." While acknowledging that recent land use development projects in California have demonstrated the feasibility to achieve net-zero additional GHG emissions (e.g., Newhall Ranch Resource Management and Development Plan), the 2017 Scoping Plan Update states the following:

> *Achieving net zero increases in GHG emissions, resulting in no contribution to GHG impacts, may not be feasible or appropriate for every project, however, and the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA. Lead agencies have the discretion to develop evidence-based numeric thresholds (mass emissions, per capita, or per service population) consistent with this Scoping Plan, the State's long-term GHG goals, and climate change science…To the degree a project relies on GHG mitigation measures, CARB recommends that lead agencies prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project's region that contribute potential air quality, health, and economic co-benefits locally.*

2022 Scoping Plan for Achieving Carbon Neutrality

The 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) assesses progress toward the statutory 2030 GHG reduction target, while laying out a path to achieving carbon neutrality no later than 2045. The 2022 Scoping Plan focuses on outcomes needed to achieve carbon neutrality by assessing paths for clean technology, energy deployment, natural and working lands, and others, and is designed to meet the state's long-term climate objectives and support a range of economic, environmental, energy security, environmental justice, and public health priorities. With respect to the transportation sector in particular, the update strives to achieve a per-capita VMT reduction of at least 25 percent below 2019 levels by 2030 and 30 percent below 2019 levels by 2045.

The 2022 Scoping Plan, adopted by CARB in December 2022, expands on prior versions of the Scoping Plan, and responds to more recent legislation. The plan outlines a technologically feasible, cost-effective, and equity-focused path to achieve the state's climate target of reducing anthropogenic emissions to 85 percent below 1990 levels and achieving carbon neutrality by 2045 or earlier. The 2022 Scoping Plan outlines the strategies the state will implement to achieve carbon neutrality, which include reducing GHG emissions to meet the anthropogenic target, expanding actions to capture and store carbon through the state's natural and working lands, and using mechanical approaches.

The major element of the 2022 Scoping Plan is the decarbonization of every sector of the economy. Successful implementation of this element will require all of the following efforts:

- Rapidly moving to zero-emission transportation for cars, buses, trains, and trucks.
- Phasing out the use of fossil gas for heating.
- Reducing the use of chemicals and refrigerants.
- Enabling communities to provide sustainable options such as walking, biking, and public transit to reduce reliance on cars.
- Continuing to build out solar arrays, wind turbine capacity, and other resources to provide clean, renewable energy to displace fossil fuel–fired electrical generation.
- Scaling up new options such as renewable hydrogen for hard-to-electrify end uses and biomethane where needed.

The 2022 Scoping Plan approaches decarbonization from two perspectives: (1) managing a phasedown of existing energy sources and technology and (2) ramping up, developing, and deploying alternative clean energy sources and technology over time. Key actions to support the success of the 2022 Scoping Plan are addressed for the transportation sector, the clean-electricity grid, sustainable manufacturing and buildings, CO_2 removal and capture, short-lived climate pollutants, and natural and working lands.

Cap-and-Trade Program

Initially authorized by AB 32 and extended through 2030 with the passage of AB 398 in 2017, the California Cap-and-Trade Program is a core strategy that the state is using to meet its GHG reduction targets through 2030, and ultimately to achieve an 80 percent reduction from 1990 levels by 2050. CARB designed and adopted the California Cap-and-Trade Program to reduce GHG emissions from "covered entities"[210] (e.g., electricity generation, petroleum refining, cement production, and large industrial facilities that emit more than 25,000 $MTCO_2e$ per year), setting a firm cap on state-wide GHG emissions and employing market mechanisms to achieve reductions.[211] Under the Cap-and-Trade Program, an overall limit is established for GHG emissions from capped sectors. The state-wide cap for GHG emissions from the capped sectors commenced in 2013 and declines over time. Facilities subject to the cap can trade permits to emit GHGs.[212]

Automobile Fuel Efficiency Standards

The National Highway Transportation Safety Administration's (NHTSA) Corporate Average Fuel Economy Standards (CAFÉ) regulate the average fuel economy of cars and light-duty trucks (collectively, light-duty vehicles). NHTSA also separately sets fuel consumption standards for medium- and heavy-duty trucks and engines

The current CAFÉ standards for model years 2024–2026 require new passenger and light-duty vehicles sold in the US to average at least 40 miles per gallon (mpg). This is a nearly 43 percent increase from the previous standard of approximately 28 mpg.

In June 2024, NHTSA issued new vehicles fuel economy standards, increasing fuel economy by 2 percent per year for passenger cars (model years 2027-2031) and light trucks (model years 2029–2031). These increases will bring the average light-duty vehicle fuel economy up to approximately 50.4 miles per gallon by model year 2031 (NHTSA 2024). Furthermore, the rate of electric vehicle adoption rate is occurring faster than anticipated. California has reached 1.5 million electric vehicle sales 2 years ahead of its planned 2025 target for the sales milestone. At this time, approximately 25 percent of new car sales in California are electric vehicles.

[210] "Covered entity" means an entity in California that has one or more of the processes or operations and has a compliance obligation as specified in Subarticle 7 of the Cap-and-Trade Regulation; and that has emitted, produced, imported, manufactured, or delivered in 2008 or any subsequent year more than the applicable threshold level specified in section 95812(a) of the Regulation.

[212] See, generally, 17 CCR Sections 95811 and 95812.

c. Regional Plans, Programs, and Regulations

BAAQMD CEQA Thresholds for Evaluating Significance of Climate Impacts

The BAAQMD CEQA Air Quality Guidelines were prepared to assist in the evaluation of air quality, toxic air contaminants, and GHG impacts of projects and plans proposed in the Bay Area. The BAAQMD's CEQA Guidelines includes significance thresholds for GHG emissions.

In April 2022, in response to SB 32 and Draft 2022 Scoping Plan Update targets for 2030 and the EO B-88-18 target for carbon neutrality no later than 2045, BAAQMD adopted updated CEQA Thresholds For Evaluating Significance Of Climate Impacts. The suggested thresholds identify what new land use development projects would need to do to achieve California's long-term climate goal of carbon neutrality by 2045. Pursuant to the BAAQMD CEQA Climate Thresholds, a project designed to incorporate these elements would contribute its fair share of what is necessary to achieve California's long-term climate goals, and an agency reviewing the project under CEQA can conclude that the project would not make a cumulatively considerable contribution to global climate change. Additional information is provided in Section 4.10.5 below.

d. City of Brisbane Plans, Ordinances, and Regulations

General Plan

General Plan policies directly related to climate change and reduction of GHG emissions are presented below.

Chapter VI: Conservation

Policy 139: Promote the conservation of non-renewable energy resources.

Policy 140: Encourage energy-efficient building design and site planning.

Program 140a: Continue to administer building codes that contain State requirements for energy conservation.

Program 140b: As a part of the review of land use applications for subdivisions, specific plans and new non-residential and multi-family projects, encourage the design and siting of structures and the use of landscape materials in terms of utilizing natural resources for heating and cooling.

Policy 141: Encourage the installation of energy-efficient appliances.

Program 141a: Cooperate with PG&E in promoting energy conservation by providing information and referral on energy-efficient appliances and heating and cooling systems.

Policy 142: Continue to support vehicle trip-reduction programs to conserve non-renewable fuels. [See Chapters VI and X of the City's general plan for additional trip reduction policies.]

Chapter XII: Policies and Programs by Subareas

Policy BL.1: Development within the Baylands Subarea shall be subject to the City's approval of a single specific plan for the entirety of the Baylands Subarea and a development agreement that is consistent with General Plan policies, incorporates all applicable EIR [environmental impact report] mitigation measures, and is consistent with the following standards: …

G. The required specific plan for the Baylands shall include a sustainability program for new development consistent with the principles of the Sustainability Framework for the Brisbane Baylands, Final Report accepted by the City Council on November 5, 2015. Baylands development shall be designed so as to be energy neutral on an ongoing basis.

Brisbane Climate Action Plan

In September 2015, the City of Brisbane adopted its first climate action plan (CAP), which established a GHG emission reduction goal of 15 percent below 2005 levels by the year 2020. This plan was a comprehensive and strategic approach to sustainability, recommending actions to engage all members of Brisbane's community in a journey to protect the environment. The CAP identified key forces that contribute substantially to GHG emissions and provided strategies for reducing emissions in these areas.

The City's most recent GHG inventory report for the 2021 calendar year, published in 2024, showed an estimated 13.66 percent reduction of emissions, falling short of their initial goal from 2015. In July 2021, via Resolution No. 2021-62 "Climate Emergency Declaration," the City established new emissions reduction targets of 66 percent reduction from the 2005 baseline by 2030 and carbon neutrality by 2040.

Brisbane Municipal Code

Brisbane Municipal Code Section 15.77 implements the goals of the city's climate action plan and related California legislation by lowering the environmental impact of existing buildings through reductions in GHG emissions, energy, and water consumption. Owners and/or tenants of identified public and private properties are initially required to complete annual building energy and water benchmarking. Subsequently, these owners/tenants will be required to demonstrate compliance with contemporary best energy and water performance standards by following either a performance pathway that allows the submittal of documentation confirming the building is already highly efficient, or a prescriptive pathway that requires an energy audit and retro-commissioning or retrofit of base building systems. It is the intent of this chapter that

the provisions align with California Assembly Bill 802 (2015), codified in California Public Resources Code Section 25402.10 and California Code of Regulations Title 20, Division 2, Chapter 4, Article 9.

Brisbane Municipal Code Section 15.80 specifies green building standards for new developments, including meeting a minimum Leadership in Energy and Environmental Design (LEED) "Silver" rating on the Green Building Project Checklist for all new commercial projects over 10,000 square feet and achieving a "green home" rating on the Multi-Family GreenPoint Checklist[213] for any residential developments with 20 or more units. To meet these requirements, a variety of energy, stormwater, and water efficiency measures can be implemented that are integrated in green building design, siting, construction, and operations.

Building Code: Ordinance No. 691, Energy Performance Reach Code

The latest update to the California Building Code (CBC) was adopted by the City of Brisbane and is effective as of January 1, 2023. Subsequently, on July 18, 2024, the Brisbane City Council adopted further Municipal Code amendments in the form of an Energy Performance Reach Code (Ordinance No. 691). At the same time, the Council adopted further amendments to the City's EV charging requirements (see discussion below under "Chapter 15.84, Electric Vehicle Infrastructure").

The CBC requires that new construction be more energy efficient and includes solar requirements for new residential construction. In addition, through Ordinance 675,[214] the City of Brisbane has chosen to exceed the state's standards including installation of electric vehicle charging infrastructure, discussed below.

Ordinance No. 691, the City's Energy Performance Reach Code, both amended EV charging infrastructure requirements, discussed below, and added Energy Performance requirements for new buildings; the latter replaced all-electric requirements previously adopted under Ordinance No. 675. The 2022 CBC requires that new construction be more energy efficient and includes solar energy and battery storage system requirements for new residential and nonresidential construction. Through the Reach Code, the City of Brisbane has chosen to exceed the state's standards by requiring new residential and non-residential development to meet increased energy performance standards, resulting in an anticipated decrease in energy use and emissions from newly constructed buildings, compared to compliances with the 2022 CBC. The enhanced

[213] Build It Green, a non-profit organization, has developed New Home Construction Green Building Guidelines and a Multi-Family GreenPoint Checklist, based upon the Multi-Family Green Building Guidelines established by the Alameda County Waste Management Authority. See Section 15.80.020 of the Brisbane Municipal Code for more information.

[214] Brisbane Ordinance No. 675 can be found at https://library.municode.com/ca/brisbane/ordinances/municipal_code?nodeId=1185187. Ordinance No. 675 amended CALGreen, as it applies in Brisbane (Municipal Code Section 15.04.043), such that new construction and qualifying alterations "do not use combustion equipment or are ready to accommodate installation of electric heating appliances," with certain exceptions.

performance requirements apply to all new construction and are intended to be attainable through compliance with performance standards, rather than through a prescriptive approach that would mandate appliances that exceed federal efficiency standards. Thus, the Reach Code does not prohibit the use of natural gas or propane appliances, although such use must be within an overall building energy use scheme that complies with the new City performance requirements. Additionally, construction that does employ natural gas or propane must also include electrical circuitry to allow for potential future conversion to electric appliances.

The new Reach Code sets forth compliance metrics for single-family residential new construction and for multi-family residential and non-residential new construction, each of which is based on definitions in the California Energy Code (24 CCR Part 6). For single-family homes, the Reach Code requires the achievement of a performance standard (Energy Budget) based on the building's Energy Design Rating. The Energy Design Rating factors in both overall energy efficiency and "time-dependent valuation" (TDV) Energy. TDV Energy considers the varying costs and impacts of energy use at different times of the day and year, including, among other things, greenhouse gas emission rates and actual cost of electricity from "peaker" power plants, which are typically less efficient facilities that operate only during periods of highest energy demand (e.g., on the hottest days of the year, when air conditioning use is highest). TDV Energy is intended to reflect the fact that energy use during periods of peak demand has greater environmental and economic costs than off-peak energy use. Both Source Energy and TDV Energy for a particular building are determined based on calculation methodologies set forth by the California Energy Commission in manuals and appendices to the state Energy Code.

Similarly, for new multifamily residential buildings, the Reach Code requires achievement of TDV Energy Budget as set forth in the Code. Different standards apply to low-rise (four stories or fewer) and high-rise (more than four stories) buildings. Exceptions are available for both single- and multi-family buildings in cases of documented infeasibility and other limited circumstances.

In addition, the Brisbane City Council adopted an updated Transportation Demand Management (TDM) ordinance amending Brisbane Municipal Code Section 10.52 on October 19, 2023. The TDM ordinance's purpose is to "promote more efficient utilization of existing transportation facilities."

Chapter 15.84, Electric Vehicle Infrastructure

Chapter 15.84 of the City's Municipal Code, the Electric Vehicle Infrastructure Ordinance, sets forth requirements for the installation of electric vehicle (EV) charging equipment in new construction.

- For new single-family residences, duplexes, and townhouses (and new garages at existing such buildings) where two or more parking spaces per unit are required, the Code

requires installation of one Level 1 EV Ready Circuit and one Level 2 EV Ready Circuit.[215]

- For new multifamily residential buildings, the Code requires a minimum of one EV-ready parking space per unit, with a minimum 10 percent of these spaces equipped with Level 2 EV chargers. Additionally, at least 50 percent of guest parking spaces must have EV chargers. Finally, a minimum of 40 percent of the total number of parking spaces must be EV-ready or have chargers installed.[216] For non-residential new construction:
    - Where nine or fewer parking spaces are required, at least one space must be either EV-ready or have an EV charger installed.
    - Where 10 or more parking spaces are required, at least 15 percent of the required spaces must have EV chargers, with an additional 10 percent or 35 percent more low-power (20-amp) EV ready spaces also required, depending on whether the non-residential use is defined in the Municipal Code as having higher or lower parking turnover.[217]

Resolution No. 2021-62, "Declaring a Climate Emergency and Initiating Immediate and Accelerated Action to Address the Climate Crisis and Limit Global Warming to 1.5 Degrees Celsius"

On July 15, 2021, the Brisbane City Council unanimously passed a Climate Emergency Declaration, Resolution No. 2021-62, which established aspirational goals of a 66 percent reduction in GHG emissions below the 2005 baseline by 2030 and carbon neutrality by 2040. Current state targets include a 40 percent GHG emissions reduction below 1990 levels by 2030, which is roughly equivalent to 50 percent reduction below 2005 levels (the City's baseline inventory) by 2030, and carbon neutrality by 2045.

4.10.4 RELEVANT SPECIFIC PLAN PROVISIONS

a. Active Transportation Facilities

An active transportation network consisting of an internal network of shared use paths, bicycle facilities, and sidewalks that comply with the Americans with Disabilities Act (ADA) will be developed to connect uses within the Baylands to each other and to existing local and regional

[215] Level 1 chargers operate using a standard 120-volt, 20-amp household electrical circuit. Level 2 chargers use higher-output 240-volt power sources (generally with a 40-amp capacity) so that recharge times for EVs are much faster than with Level 1 systems.

[216] Certain exceptions are permitted, including, in the application to multi-family residential buildings, a reduction in the number of EV-ready spaces to fewer than one per unit if fewer than one parking space per unit is required.

[217] Higher parking turnover uses are those such as retail, restaurants, professional offices, gyms, recreational uses, and meeting halls. Lower parking turnover uses are those such as office, R&D, industrial, hotels and schools.

routes. Pedestrian facility types are described in **Table 3-4**. The Baylands pedestrian network is illustrated in **Figure 3-44**. Baylands bicycle and micro-mobility facility types are identified in **Table 3-5** and illustrated in **Figure 3-45**.

A fare-free shuttle network will be provided to transport Baylands residents and workers throughout the site and connect the Baylands to downtown Brisbane and existing transit routes. Shuttle service is proposed to be established in two phases, initially providing an internal Baylands route and weekday connections to downtown Brisbane as illustrated in **Table 3-6** and **Figure 3-46**.

b. Energy Generation and Conservation

Renewable energy generation will include a 55-acre solar field along with building- and ground-mounted installations totaling 92,445 MWh of renewable energy generation.[218] In addition, the Specific Plan proposes 30 MW of battery-based, building-mounted stationary energy storage capacity that would be distributed across the Baylands within sustainable infrastructure, residential, and commercial land use areas, as permitted, to provide for establishment of a distributed energy resource management system. A 250 MW front-of-the-meter, utility-scale battery storage facility is also proposed to serve as a regional grid resource.

Consistent with the Baylands Sustainability Framework, the 2025 Specific Plan proposes not to provide natural gas service to new Baylands development. Existing natural gas service to surrounding off-site uses, including the Kinder Morgan Tank Farm, Recology facilities along Tunnel Avenue, and Golden State Lumber, would be maintained. Research and development uses within the Baylands would use on-site propane tanks on an as-required basis.

c. Transportation Demand Management

In addition to providing a roadway network, pedestrian and bicycle facilities, and transit services described above, the Specific Plan proposes preparation of Transportation Demand Management (TDM) Plans for each applicable site-specific development project as it undergoes site-specific development review. The purpose of these TDM plans is to encourage and incentivize travel other than via use of single-occupant vehicle trips in accordance with San Mateo County's Congestion Management Program requirements. The Specific Plan sets a project-wide trip reduction target of a minimum 25 percent below baseline Average Daily Traffic (ADT).

[218] The Specific Plan requires a minimum of 85,000 MWh of renewable electricity be generated within the Baylands. Based on the reasonably foreseeable mix of building types anticipated within the Baylands, actual renewable energy generation was estimated to be 92,445 MWh annually in the Baylands Energy Plan prepared by Thornton Tomasetti Inc. in May 2021.

4.10.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of greenhouse gas emissions impacts.

Threshold GHG-1: The Baylands Specific Plan would cause a significant impact if it would result in a net increase in average annual greenhouse gas (GHG) emissions generated by Specific Plan land uses.

Threshold GHG-2: The Baylands Specific Plan would cause a significant impact if it would result in a net increase in average annual regional greenhouse gas (GHG) emissions.

Threshold GHG-3: The Baylands Specific Plan would cause a significant impact if it would conflict with:

- **The BAAQMD's 2022 *CEQA Thresholds for Evaluating the Significance of Climate Impacts* by:**
  - **Providing natural gas appliances or natural gas plumbing in either residential or nonresidential development;**
  - **Resulting in wasteful, inefficient, or unnecessary energy usage as determined by the analysis required under CEQA Section 21100(b)(3) and CEQA Guidelines Section 15126.2(b);**
  - **Achieving less than the reduction in project-generated vehicle miles traveled below the regional average specified in the current version of the California Climate Change Scoping Plan[219] or a locally adopted vehicle miles traveled reduction target; or**
  - **Not meeting CALGreen Tier 2 electric vehicle EV requirements;**
- **The CARB 2022 Climate Change Scoping Plan by obstructing implementation of relevant Scoping Plan actions to reduce GHG emissions related to VMT reduction and building decarbonization.**

[219] The 2022 Scoping Plan identifies a target per capita VMT reduction of "at least 25 percent below 2019 levels by 2030 and 30 percent below 2019 levels by 2045."

4.10.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact GHG-1: Specific Plan Area Greenhouse Gas Emissions

Methodology for Determining Significance

Quantification of greenhouse gas emissions followed the calculation guidance from state and regional agencies with scientific expertise in quantifying GHG emissions, such as CARB and the BAAQMD. Detailed assumptions are provided in the *Brisbane Baylands Specific Plan Project Greenhouse Gas Technical Report* in Appendix H.1. GHG emissions from construction and operation of the Baylands Specific Plan were estimated using California Emissions Estimator Model (CalEEMod) version 2022.1, a state-wide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential emissions of criteria pollutants and GHGs from a variety of land use projects.[220] The methodology for the evaluation of Specific Plan GHG impacts includes a quantitative evaluation of the net increase in Baylands emissions compared to the net-zero threshold.

Construction Emissions

The emissions of GHGs associated with Specific Plan construction were calculated using CalEEMod version 2022.1 for each year of construction activity based on the anticipated sequencing of Baylands construction described in **Table 3-8**. Construction emissions were then forecasted by assuming a conservative estimate of construction activities (i.e., assuming all construction occurs at the earliest feasible date during the year). This methodology is conservative since construction impacts would be similar to or less than those analyzed should construction activities occur later than assumed in **Table 3-8** because the energy-efficiency of construction equipment and vehicle fleet mix is expected to increase over time, while emissions from construction equipment and vehicles is expected to decrease. This occurs due to state and federal fuel economy regulations that require construction equipment fleet operators to phase in less polluting heavy-duty construction equipment and trucks over time.

Specific Plan construction activities would generate GHG emissions through the use of heavy-duty construction equipment and vehicle trips generated by construction workers, vendor trucks, and haul trucks traveling to and from the site. Construction GHG emissions were based on Baylands-specific data provided by the project applicant, including a construction equipment list and site map. For diesel-powered off-road construction equipment, emissions were calculated by CalEEMod assuming fleet average equipment and factors from the OFFROAD2017-ORION v1.0.1 model, which is incorporated in CalEEMod. Construction

[220] Additional information on the CalEEMod model, including user guide and documentation are provided online at: https://www.caleemod.com/user-guide

emissions typically vary from day to day, depending on the level of activity, the specific type of operation, and weather and wind conditions. To address this variability, CalEEMod analyzes annual average emissions.

Direct inputs to the model include project-specific information such as the size of development, construction schedule, and the type and amount of materials to be imported and exported, where such information is available. Where project-specific data was not available, CalEEMod default values were used. The output values used in this analysis were adjusted to be Baylands-specific based on equipment types and the construction schedule. Detailed assumptions are provided in the *Brisbane Baylands Specific Plan Project Air Quality Technical Report*. These values were then applied to the construction sequencing assumptions described in Draft EIR **Table 3-8**, which are the same as those used in the criteria air pollutant construction emissions. Construction-generated GHGs were amortized over a 30-year period and were then added to average annual operational emissions.[221]

Operational Emissions

Operational GHG emissions associated with mobile sources, area sources, energy use, water use, waste generation, and stationary sources (such as emergency backup generators) were estimated either using CalEEMod or using off-model calculations with methodologies consistent with CalEEMod. Detailed operational emissions calculations are included in Appendix H.1 and G.1, and the primary assumptions used to model operational GHG emissions are presented below.

Area Sources

Area sources of Baylands GHG emissions consist primarily of landscaping equipment use and refrigerant emissions. Hearths and woodstoves are not proposed for any of the residential land uses. Landscape equipment generates emissions of CO_2 and smaller amounts of methane and nitrous oxide. While landscape emissions will be reduced in the future through implementation of state regulations that require most newly manufactured small off-road engines such as those found in landscape equipment to be zero emission starting in 2024, the benefit of this regulation is not currently embedded in the CalEEMod model and is conservatively reported consistent with the modeled approach. Emissions resulting from landscape equipment use depend on the size of land uses, GHG emissions factors associated with each activity, and the GWP values for the GHGs that would be emitted. Refrigerant emissions are based on Specific Plan land use types since different types of refrigeration equipment are used by different uses. CalEEMod

[221] A 30-year amortization period is typically sed to represent the estimated useful life of the proposed project, consistent with preliminary guidance developed by the South Coast Air Quality Management District and widely used as an industry standard. The Baylands GHG operational analysis is consistent with OPR's *CEQA and Climate Change Advisory Discussion Draft*. As stated therein, "when possible, lead agencies should quantify the project's construction and operational greenhouse gas emissions, using available data and tools, to determine the amount, types, and sources of greenhouse gas emissions resulting from the project."

quantifies refrigerant emissions from leaks that are assumed to occur during regular operation and routine servicing of the refrigeration equipment's lifetime and then derives average annual emissions from the lifetime estimate.

Energy Use

GHG emissions from energy use result from the consumption of fossil fuels to generate electricity and to provide central heating, cooling, and hot water. The Specific Plan proposes to not extend natural gas service to Baylands buildings. Therefore, no GHG emissions would be generated from natural gas combustion.

Solar-powered infrastructure systems totaling 92,445 megawatt-hours (MWh) of annual generation are proposed to be installed on buildings, ground-mounted, and, where feasible, over parking lots. An approximately 55-acre solar farm would be installed within the eastern portion of the Baylands between Visitacion Creek and the relocated Lagoon Road on a phased basis as portions of the landfill closure process are completed.

The Specific Plan proposes 30 megawatts (MW) of distributed battery storage. Additionally, a front-of-the-meter, 250 MW utility-scale battery storage facility is proposed to serve as a regional resource. As discussed in Section 4.11, *Energy Resources*, the EIR does not assume development of the 250 MW utility-scale battery storage facility, since its construction is dependent on a number of market and regulatory factors beyond the control of the applicant or City of Brisbane. Because its development within the Baylands is not certain, the GHG benefits of the utility-scale battery storage facility are not assumed in emissions calculations.

As proposed, distributed battery storage facilities would be constructed with sufficient capacity to store solar energy generated on-site with the goal of storing energy in excess of that consumed by Baylands development during daylight hours for use during nighttime hours when solar energy is not being produced.

The net electricity energy above that generated within the Baylands that would be drawn from the grid on an average annual basis is documented in **Table 4.11-7,** Baylands Net Energy Consumption Analysis. The remainder of power would be supplied by Peninsula Clean Energy, which opts all users into a 100 percent renewable energy plan that is discretionary. However, given the existing opt-out rate of 2.5 percent for Peninsula Clean Energy (EQ Research 2019), some GHGs would likely be generated by a portion of overall electrical demand in the Specific Plan area. Therefore, a similar opt-out rate was assumed for the Baylands and net electrical-based GHG emissions from the energy sector are assumed to be generated by 2.5 percent of the overall demand in the Specific Plan area. However, that remaining electrical demand will ultimately become 100 percent renewable by 2045 at the latest (Pub. Utilities Code §§ 399.11, 399.30 and 454.33).

Mobile Sources

On-road mobile sources would include vehicle trips by residents, visitors, retail customers, employees, and vendor deliveries. On-road mobile emissions were estimated based on emission factors from EMFAC2021 using VMT figures generated by the Specific Plan's Transportation Impact Analysis, including implementation of a transportation demand management plan required to achieve with a 16.4 percent trip reduction target (Fehr & Peers 2023). Since all vehicle types could visit the Baylands, assessment of GHG emissions uses San Mateo County's motor vehicle fleet mix and the fleet average calendar year emissions factors from EMFAC2021 to estimate mobile source emissions. Countywide fleet-aggregated emission factors for 2038 (the first full year following the assumed completion date of Phase 1 development) were applied for operations of Phase 1, while countywide fleet-aggregated emission factors for 2043 (the first full year following the assumed full buildout of the Baylands) were applied for operations at full buildout.

The Specific Plan proposes electric vehicle (EV) charging infrastructure that would reduce operational vehicle GHG emissions. Mobile emissions reduction associated with EV charging infrastructure were calculated based on the number of EV-ready stalls proposed, the electricity demand required for EV charging, and the number of vehicle miles travelled that would otherwise be carbon-fuel based.

In addition to the conservative assumption that all 2025 Specific Plan project-related trips are new trips, the analysis below of Impact GHG-2 also evaluates the project's future cumulative regional VMT reduction in relation to greenhouse gas emissions occurring in 2040.

Water and Wastewater

Water and wastewater generated by Specific Plan land uses would require energy to supply, distribute, and treat potable and recycled water, as well as convey and treat wastewater.

Water supply for the Baylands would use a combination of (1) potable water purchased from the San Francisco Public Utilities Commission (SFPUC) supplemented by five existing off-site groundwater wells and (2) recycled water from a water recycling facility (WRF) to be constructed within the Baylands. GHG emissions from water treatment and conveyance were calculated using estimated water demand in the Baylands Water Balance Technical Memorandum (Brown & Caldwell 2022) and state-wide electricity intensity factors (CAPCOA 2020).

Based on an estimated average water demand of 1,408 acre-feet per year, and assuming that 198 acre-feet per year of water demand would be for outdoor irrigation and not discharged to the sanitary sewer, an adjustment was made to account for a conservatively estimated 25 percent of the remaining demand discharging to the SFPUC system. GHG emissions associated with wastewater treatment process at the SFPUC plant were calculated using emission factors from CalEEMod. The emissions are based on the type of treatment (e.g., aerobic). The emissions are

based on the water demand factors, the electrical intensity factors for wastewater treatment and conveyance, the GHG emission factors for the electricity utility provider, and the GWP values for the GHGs emitted. The future year CO_2 intensity factors of 85 pounds CO_2/MWh for year 2038 and 26 pounds of CO_2/MWh for year 2043 were scaled proportionately based on the future year renewable energy targets of 60 percent by 2030 and 100 percent by year 2045 consistent with Pub. Utilities Code §§ 399.11, 399.30 and 454.33 (NewGen Strategies & Solutions 2022).

The water recycling facility would be powered by on-site carbon-free electricity and no GHG emissions from electrical consumption were assumed to be generated by wastewater treatment associated with the facility. However, GHG emissions would be generated by non-electrical processes of the water recycling facility. Anaerobic digesters produce methane-rich biogas, which is typically combusted on site. The methane emissions from incomplete combustion of digester gas was quantified using methods detailed in CalEEMod Appendix C.

Solid Waste

Specific Plan development would generate solid waste from day-to-day operational activities. A portion of waste would be diverted to waste recycling and reclamation facilities, while waste that is not diverted would be sent to landfills for disposal. Waste that is disposed of in landfills would result in GHG emissions of CO_2 and methane during decomposition that would occur over the span of many years.

Solid waste generated by Specific Plan land uses is estimated to be 1,703.37 cubic yards of solid waste per day, 374 cubic yards of which would be hauled to a landfill based on Recology's projected 78 percent diversion rate, including compliance with the City's Municipal Code and applicable state and federal regulations (see Impact UTL-3, Section 4.16.6c). GHG emissions have been calculated based on emission factors for solid waste decomposition and the GWP values for the CH_4 emitted.

Stationary Sources

The Specific Plan would generate operational emissions from testing and maintenance of emergency generators. Buildings and facilities proposed or required to have backup emergency generators include all buildings with occupied space above 75 feet in height, the relocated fire station, the new fire station, and the water recycling facility. Emissions were calculated assuming 50 hours per year of non-emergency testing operation per CARB guidance and 100 hours per year of emergency use (non-testing and non-maintenance) per BAAQMD guidance.

Consistent with the Baylands Health Risk Assessment, generators were conservatively assumed to be 939 horsepower, except for the two fire stations (168 horsepower each), the solar farm (80 horsepower), the water recycling facility (2,012 horsepower), and the water tank (670 horsepower). These generator sizes were obtained from the environmental documents for other, similar facilities (described further, below). The generator at the water recycling facility, which

is greater than 1,000 hp, was assumed to meet BAAQMD's best available control technology (BACT) requirement of a Tier 4 Final-compliant engine, while generators smaller than 1,000 hp were assumed to meet the BACT requirement for a Tier 2-compliant engine. There are currently two backup diesel generators that are permitted by the BAAQMD at existing facilities along Industrial Way. Because no details are available regarding their size, the GHG emissions from these two diesel generators were not quantified.

Existing Baylands Tenants

The analysis of operational emissions assumed that 272,400 square feet (18 structures) of existing industrial buildings along Industrial Way would be demolished. Under existing conditions, GHG emissions from these existing uses are generated by vehicle trips to and from the business; on-site combustion of natural gas for heating; off-site combustion of fossil fuels for electricity; and off-site emissions from solid waste decomposition, water conveyance, and wastewater treatment.

As indicated in **Table 4.4-6**, there is adequate vacant building area in the region to accommodate existing Specific Plan uses that would be removed by Baylands development. For the quantitative analysis of GHG emissions associated with Specific Plan development, it was conservatively assumed that these industrial uses would locate elsewhere within the Bay Area region and would continue to operate with the same GHG-generating characteristics. Consequently, the existing GHG emissions from uses were assumed to continue elsewhere and not be eliminated with implementation of the project. This is a conservative assumption, as newer structures in the region are substantially more energy efficient than the older facilities located along Industrial Way, which were developed during the 1960s and 1970s.

Impact Assessment

Baylands development would generate GHG emissions from direct and indirect sources during construction and operation. Development phasing and anticipated construction sequencing for the Baylands are described in Draft EIR Section 3.3.4.

GHG emissions during construction would be generated from worker trips, vendor trips, and haul trips and from the site, along with use of heavy-duty construction equipment. Construction activities are anticipated to run through 2042, with the first full year of operations following Specific Plan buildout occurring in 2043, at which time the Specific Plan would generate only operational emissions, primarily from mobile sources (residents, employees and guests traveling to and from the site), area sources (use of landscape equipment), and stationary sources (testing and maintenance of emergency diesel generators).

Construction Emissions

Construction emissions for Specific Plan construction activities were calculated using CalEEMod. Total Baylands construction emissions were estimated on an annual basis based on the anticipated construction sequencing is summarized in **Table 3-8**. Total emissions were then amortized over a 30-year operational life of site development. Overall, as shown in **Table 4.10-3**, amortized over a 30-year period, construction emissions would be 2,425 $MTCO_2e$.

Table 4.10-3: Anticipated Annual Construction Emissions

Year	Residential Permits Issued	Commercial/Office Permits Issued	Total GHG Emissions ($MTCO_2e$ [a])
Site Grading			***20,031***
2025			11,879
2026			8,152
Phase 1	***2,200 units***	***4,500,000 s.f.***	***44,976***
2027	166 units	1,424,325 s.f.	8,866
2028	686 units		10,300
2029	337 units		8,807
2030	281 units		1,199
2031	333 units		4,363
2032	108 units	1,975,675 s.f.	3,681
2033	124 units		3,060
2034	165 units		658
2035		1,100,000 s.f.	1,423
2036			1,404

Phase 2		***2,500,000 s.f.***	***7,756***
2038		1,120,000 s.f.	957
2039			1,897
2040		1,380,000 s.f.	2,357
2041			2,241
2042			304
BAYLANDS TOTAL	**2,200 units**	**7,000,000 s.f.**	**72,763**
GHG Emissions Amortized over 30 Years [a]			**2,425**

SOURCE: ESA, 2024.

NOTES:

a. Total construction emissions were amortized over 30 years to estimate average annual emissions when combined with operational GHG emissions in Table 4.10-5.

Operational Emissions

Annual GHG emissions resulting from area sources, energy use, mobile sources, waste generation, and water use for operation of the 2025 Specific Plan project were estimated for Phase 1 and full Specific Plan buildout. Annual GHG operations emissions after completion of Phase 1 (including amortized construction emissions) are estimated to be 38,473 $MTCO_2e$ (see **Table 4.10-4**). As shown in **Table 4.10-5**, Specific Plan buildout would result in a 51,260 $MTCO_2e$ annual increase in GHG emissions.

Table 4.10-4: Operational Emissions by Source at the Completion of Phase 1

Source	$MTCO_2e$/year
Area [a]	147
Energy	30
Emergency Generator	877
Mobile	33,397 [b]
Solid Waste	1,479
Water	144
Water Recycling Facility	103
Refrigeration	130
SUBTOTAL OPERATIONAL EMISSIONS	*36,307*
Amortized Construction Emissions	2,167
TOTAL OPERATIONAL EMISSIONS	**38,473**

SOURCE: Data compiled by Environmental Science Associates in 2024 (see Appendix H.1).

NOTES: CO_2e = carbon dioxide equivalent; MT = metric tons

a. Area sources of Baylands GHG emissions consist primarily of landscaping equipment use.
b. Includes a reduction of 1,745 $MTCO_2e$ for proposed EV charging.

The 2025 Specific Plan project would generate GHG emissions from direct and indirect sources during construction and operation. Construction activities would generate GHG emissions from worker trips, vendor trips, and haul trips, as well as from the use of heavy-duty construction equipment. A total of 72,763 $MTCO_2e$ would be generated by construction activities through Specific Plan buildout. When amortized over the anticipated 30-year life of Specific Plan improvements, annualized construction emissions would total 2,425 $MTCO_2e$ and, when these annualized construction emissions are added to operational GHG emissions at buildout, the Baylands Specific Plan would generate 51,260 $MTCO_2e$ of GHGs annually. Operational emissions are conservative, as it assumes all project-related vehicle trips are new to the Bay Area.

Table 4.10-5: Operational Emissions by Source at Full Specific Plan Buildout

Source	$MTCO_2e$/year
Area	228
Energy	15

NOTES: CO_2e = carbon dioxide equivalent; MT = metric tons

a. Includes a reduction of 1,745 $MTCO_2e$ for EV charging proposed.

Regulations That Would Serve to Reduce GHG Emissions

The CalEEMod and EMFAC2021 emissions modeling programs that were used to estimate project GHG emissions provide for future emission reductions that would be realized by many existing regulations. However, there are newer regulations that have been adopted that are not currently considered within the emission factors and/or algorithms of the model. These are presented in Chapter 2, Section 2.5, Regulatory Context for Baylands Development. The regulations presented under *Newest Vehicle Regulations in 2021 and 2022* include the full description of the most recently adopted regulations that would serve to reduce on-road vehicle emissions and include the following:

- Heavy-Duty Inspection and Maintenance (2021)
- Advance Clean Cars II (2022)
- Advance Clean Fleets (2022)

The effect of these regulations is not included in CalEEMod or EMFAC2021 and thus not quantified in the analysis. However, qualitatively, these regulations would reduce emissions of GHG from medium- and heavy-duty trucks and emissions from light duty passenger vehicles. Although the reductions from these regulations are not quantified, this impact would still be significant because the reductions would not be sufficient to reduce emissions to a net zero increase.

Significance Conclusion for Impact GHG-1

Baylands development would add 51,260 $MTCO_2e$ to annual GHG emissions generated within the Specific Plan area. The effect of regulations that are not included in the CalEEMod or EMFAC2021 models and thus not quantified in this EIR would be to reduce GHG emissions from medium- and heavy-duty trucks and emissions from light duty passenger vehicles. However, such reductions would not be sufficient to offset the Specific Plan's net annual increase. A significant impact would therefore result.

Program EIR Mitigation Measures

No GHG emissions mitigation measures are being carried forward from the Program EIR.

Additional Mitigation Measures

MM GHG-1a: Low Global Warming Potential Refrigerants. Refrigerants with a global warming potential of 1,400 or less[222] shall be used in all heat pumps installed in residential and nonresidential buildings, including all HVAC systems, water heaters, and refrigeration appliances. Examples of such low global warming potential include, but are not limited to, natural refrigerants such as CO_2, ammonia (NH_3), and hydrocarbons, or next generation low-GWP synthetic refrigerants like hydrofluoroolefin-1234yf.

MM GHG-1b: Preferred Parking for Alternative-Fueled Vehicles and Carsharing Vehicles. Preferential parking for ZEVs (designated and proximate to the building entry) shall be provided for commercial, office, and hotel uses, as well as guest parking at a rate 10 percent above regulatory provision requirements. In addition, preferential parking shall be provided for ridesharing vehicles (designated and proximate to the building entry) site at a rate 10 percent above City requirements for a transportation demand management plan.

MM GHG-1c: Renewable Fuel Shuttles. The Baylands shuttle system described in Specific Plan Section 6.3.4 shall utilize zero-emission vehicles or run entirely on 100 percent renewable fuels.

MM GHG-1d: Renewable Fuels for On-Site Water Recycling Facilities. The Baylands water recycling facility shall be designed and operated using 100 percent renewable fuels, including carbon-free electricity provided by Pacific Gas & Electric or Peninsula Clean Energy or by on-site renewable energy generation.

[222] The U.S. EPA guidance for transitioning to low-GWP alternatives in commercial refrigeration provides available refrigerants with a GWP of 1,400 or less, https://www.epa.gov/sites/default/files/2016-12/documents/international_transitioning_to_low-gwp_alternatives_in_commercial_refrigeration.pdf.

MM GHG-1e: GHG Offset Credits. In addition to implementing all feasible construction- and operation-related land use design practices and related mitigation measures for the reduction of construction and operational greenhouse gas (GHG) emissions, the Specific Plan applicant shall retire GHG offset credits in a quantity sufficient to offset 100 percent of the Project's construction emissions and 100 percent of the Project's operational emissions, for a 30-year period, consistent with the performance standards and requirements set forth below. GHG offset credits within the City of Brisbane and regionally within the County shall be prioritized (see *Locational Performance Standards* below).

The Applicant may opt to prepare a Project-wide GHG Emissions Reduction Plan (Plan) to "true-up" re-modeled Project emissions with the amount of GHG offset credits needed to be retired to offset 100 percent of the Project's operational emissions, as stipulated in the section *Emissions Inventory "True Up" Procedures and Standards* below.

Purchase and Retire GHG Offset Credits: The Specific Plan applicant shall purchase and retire GHG offset credits sufficient to offset the project's post-mitigation GHG emissions for the life of the project (assumed to be 30 years) as shown in **Table 4.10-6**.

Table 4.10-6: Required GHG Emissions Offsets ($MTCO_2e$)

	Construction Emissions [a]		Operational Emissions [b]		Combined Emissions	
	Unmitigated	Mitigated [c]	Unmitigated	Mitigated [c]	Unmitigated	Mitigated [c]
Phase 1 [d]	65,007	61,227	1,089,199	1,088,840	1,154,206	1,150,067
Phase 2	7,756	7,756	375,855	375,855	383,641	383,611
TOTAL	**72,763**	**68,983**	**1,465,055**	**1,464,696**	**1,537,818**	**1,533,679**

NOTES: CO_2e = carbon dioxide equivalent; MT = metric tons

a. Construction emissions are total estimated emissions over the entirety of the construction period.
b. All operational values are calculated based on unrounded annual emissions multiplied by 30 years.
c. Mitigated emissions include implementation of the quantifiable air quality and GHG mitigation measures.
d. Phase 1 construction emissions are inclusive of grading.

For construction, the project applicant shall purchase and retire GHG offset credits necessary to offset construction-generated emissions before obtaining the first building permit in each phase of construction, for a total of two offset payments over both construction phases. Alternatively, payments may occur gradually as long as enough offsets are retired in time to offset total construction emissions for each phase.

The project applicant shall also purchase and retire GHG offset credits necessary to offset the cumulative residual increase in operational emissions over the life of the project before the City issues the final certificate of occupancy for the first

building in each phase of construction, for a total of two offset payments over two construction phases.

GHG Offset Credit Phasing: The project applicant shall purchase and retire GHG offset credits for each of the two construction phases and two operational phases as follows.

- ***Construction—Phase 1:*** Before obtaining the first grading or other construction-related permit for construction, the project applicant shall purchase and retire the first installment of GHG offset credits for construction emissions as presented in **Table 4.10-6**, above.
- ***Construction—Phase 2:*** Before obtaining the first grading or other construction-related permit in Phase 2 of construction, the project applicant shall purchase and retire GHG offset credits for construction emissions as presented in the table above.
- ***Operations—Phase 1:*** Before the City issues the final certificate of occupancy for the first building in Phase 1, the project applicant shall purchase the first installment of GHG offset credits for operational emissions as presented in the table above.
- ***Operations—Phase 2:*** Before the City issues the final certificate of occupancy for the first building in Phase 2, the project applicant shall purchase the second installment of GHG offset credits for operational emissions as presented in the table above.

GHG Offset Credit Standards – Eligible Registries, Acceptable Protocols and Defined Terms: "GHG offset credit" shall mean an instrument, credit or other certification verifying the reduction GHG emissions issued by one of the following CARB-approved carbon registries: the American Climate Registry, the Climate Action Reserve, and Verra (formerly Verified Carbon Standard). The GHG offset credits shall be third-party verified and enforceable in accordance with the registry's applicable standards, practices, or protocols. The Specific Plan applicant shall provide funding for the City to retain the services of a third-party expert who meets the qualifications described below.

GHG offset credits shall include, but are not limited to, an instrument, credit or other certification issued by these registries for GHG reduction activities within California. Further, no GHG offset credits shall originate from international areas, as discussed in the "Locational Performance Standards" section below. The Project shall neither purchase GHG offset credits from the Clean Development Mechanism (CDM) registry nor purchase offsets generated under CDM protocols. Qualifying GHG offset credits presented for compliance with

this mitigation measure may be used provided that the evidence required by the "Reporting and Enforcement Standards" below is submitted to the City demonstrating that each registry shall continue its existing practice of requiring the following for the development and approval of protocols or methodologies:

i) Adherence to established GHG accounting principles set forth in the International Organization for Standardization (ISO) 14064, Part 2 or the World Resources Institute/World Business Council for Sustainable Development (WRI/WBCSD) Greenhouse Gas Protocol for Project Accounting; and

ii) Oversight of the implementation of protocols and methodologies that define the eligibility of GHG offset credit projects and set forth standards for the estimation, monitoring, and verification of GHG reductions achieved from such projects. The protocols and methodologies shall:

   a. Be developed by the registries through a transparent public and expert stakeholder review process that affords an opportunity for comment and is informed by science;

   b. Incorporate standardized offset crediting parameters that define whether and how much emissions reduction credit a GHG offset project should receive, having identified conservative project baselines and the length of the crediting period, and considered potential leakage and quantification uncertainties;

   c. Establish data collection and monitoring procedures, mechanisms to ensure permanency in reductions, and additionality and geographic boundary provisions; and,

   d. Adhere to the principles set forth in the program manuals of each of the aforementioned registries, as such manuals are updated from time to time.

Further, any GHG offset credit used to reduce the project's GHG emissions shall be a GHG offset credit that represents the past or forecasted reduction or sequestration of one metric ton of carbon dioxide equivalent that is "not otherwise required" (CEQA Guidelines Section 15126.4(c)(3)). Each GHG offset credit used to reduce GHG emissions shall achieve additional, real, permanent, quantifiable, verifiable, and enforceable reductions, which are defined for purposes of this mitigation measure as follows:

i) "Additional" means that the GHG offset credit is not otherwise required by law or regulation, and not any other GHG emissions reduction that otherwise would occur.

ii) "Real" means that the GHG reduction underlying the GHG offset credit results from a demonstrable action or set of actions and is quantified under the protocol or methodology using appropriate, accurate, and conservative methodologies that account for all GHG emissions sources and sinks within the boundary of the applicable carbon offset project, uncertainty, and the potential for activity-shifting leakage and market-shifting leakage.

iii) "Verifiable" means that the GHG reduction underlying the GHG offset credit is well documented, transparent, and set forth in a document prepared by an independent verification body that is accredited through the American National Standards Institute (ANSI).

iv) "Permanent" means that the GHG reduction underlying the GHG offset credit is not reversible; or, when GHG reduction may be reversible, that a mechanism is in place to replace any reversed GHG emission reduction.

v) "Quantifiable" means the ability to accurately measure and calculate the GHG reduction relative to a project baseline in a reliable and replicable manner for all GHG emission sources and sinks included within the boundary of the GHG offset credit project, while accounting for uncertainty and leakage.

vi) "Enforceable" means that the implementation of the GHG reduction activity must represent the legally binding commitment of the offset project developer to undertake and carry it out.

The above definitions are provided as criteria and performance standards associated with the use of GHG offset credits. The City hereby clarifies that such criteria and performance standards are intended only to further construe the standards under CEQA for mitigation related to GHG emissions (see, e.g., State CEQA Guidelines Section 15126.4(a), (c)), and are not intended to apply or incorporate the requirements of any other statutory or regulatory scheme not applicable to the project (e.g., the Cap-and-Trade Program).

To be eligible to be used to meet this mitigation measure, GHG offset credits must be generated and verified in accordance with published protocols and other applicable standards that can demonstrate to the satisfaction of the City's third-party expert and reviewer that all six of these environmental integrity requirements are substantively satisfied. All GHG offset credits purchased and retired from the registries shall have been verified by an independent verifier who meets stringent levels of professional qualification (i.e., ANSI National Accreditation Board Accreditation Program for Greenhouse Gas Validation/Verification Bodies or a Greenhouse Gas Emissions Lead Verifier

accredited by CARB), or an expert with equivalent qualifications to the extent necessary to assist with the verification.

Without limiting the generality of the foregoing, in the event that an approved registry becomes no longer accredited by CARB and the GHG offset credits cannot be transferred to another accredited registry, the project applicant shall comply with the rules and procedures for retiring and/or replacing offset credits in the manner specified by the applicable protocol or other applicable standards, including (to the extent required) by purchasing an equivalent number of credits to recoup the loss.

Locational Performance Standards: All GHG offset credits required to reduce the project's GHG emissions shall originate from the following geographic locations (in order of priority): (1) On-site GHG reduction measures or credits over and above which is already required or proposed as part of the 2025 Specific Plan project; (2) within the City of Brisbane outside of the Baylands Specific Plan area; (3) off-site, incorporated areas of San Mateo County; (4) off-site, unincorporated areas of San Mateo County; (5) off-site areas within nine-county Bay Area Region; and (6) off-site areas within the State of California. No GHG offset credits shall originate from off-site, out-of-state or international areas. As listed, geographic priorities would focus first on local reduction options to ensure that reduction efforts achieved locally would provide cross-over, co-benefits to other environmental resource areas.

For purposes of implementing this mitigation measure, the City shall require the GHG offset credits to adhere to the following locational performance standards in order to reduce the project's construction and operational GHG emissions:

i) The project shall use all available GHG offset credits within the City of Brisbane or San Mateo County (the first priority is within incorporated areas of the County and the second priority is within unincorporated areas of the County). "Available," for purposes of this subdivision, means that the project applicant provide objective, verifiable evidence to the City documenting that such GHG offset credits are available for retirement from GHG offset credit projects within the subject geography no later than at the time of application for grading permit issuance. The objective, verifiable evidence to be provided includes a market survey report that shall comply with the following content requirements:

   a. Preparation by a GHG offset credit broker with a minimum of 10 years of experience assisting with transactions in emissions markets;

   b. Identification of the carbon registry listings reviewed for GHG offset credit availability, including the related date of inquiry; and,

c. Identification of the geographic attributes of GHG offset credits that are offered for sale and available for retirement.

ii) In the event that a sufficient quantity of GHG offset credits are not "available" in San Mateo County, the project applicant shall obtain the remaining GHG offset credits needed from within the nine-county Bay Area region (third priority). For the definition of "available," see subdivision "i)" immediately above.

iii) In the event that a sufficient quantity of GHG offset credits are not "available" in the nine-county Bay Area region, the project applicant shall obtain the remaining GHG offset credits needed from within the State of California (third priority). For the definition of "available," see subdivision "i)" immediately above.

iv) In the event that a sufficient quantity of GHG offset credits are not "available" in San Mateo County or the State of California, the project applicant shall obtain the remaining GHG offset credits needed from within the United States (fifth priority). For the definition of "available," see subdivision i) immediately above.

In the unlikely event that an approved registry becomes no longer approved by CARB and the GHG offset credits cannot be transferred to another CARB-approved registry, the project applicant shall comply with the rules and procedures for retiring and/or replacing offset credits in the manner specified by the applicable protocol, standard, or methodology, including (to the extent required) by purchasing an equivalent number of credits to recoup the loss.

Emissions Inventory "True Up" Procedures and Standards: As new federal, state and local regulations are adopted or technological advancements occur, the quantity of GHG emission reductions needed to demonstrate achievement of the no net increase in GHG emissions may decrease. Therefore, the amount of GHG offset credits needed may be reduced if the Applicant can demonstrate, with substantial evidence, that changes in regulation or law, or other increased technological efficiencies have reduced the total CO_2e emitted by the Project. As described further in the following paragraph, any modification to the emissions reduction value stated herein shall require approval from the City of Brisbane Community Development Director or the Director's designee, as considered pursuant to a noticed public hearing process that complies with applicable legal requirements, including those set forth in CEQA for the post-approval modification of mitigation implementation parameters.

Specifically, if the Applicant elects to process a "true-up" exercise subsequent to the City's certification of the Final EIR and approval of the Project, the Applicant

shall provide an updated operational GHG emissions inventory for the Project that includes emissions from mobile sources, energy, area sources, water consumption, and solid waste. Mobile sources must include off-road equipment, on-road vehicles (on-site and off-site), and rail. Subject to the satisfaction of the City of Brisbane Community Development Director or the Director's designee, these calculations shall be conducted using a City-approved model and/or methodology and must validate the continuing adequacy of modeling inputs used in the EIR that are not proposed to be altered as part of the "true-up" exercise. The inclusion of the validation requirement ensures that any updated operational GHG emissions inventories for the Project fully account for then-existing information that is relevant to the emissions modeling. For additional detail and requirements on the "true-up" exercise, see subsection 4.c Emissions Inventory "True Up" Compliance below.

The "true up" operational GHG emissions inventory, if conducted, will be provided in the form of a Project-wide GHG Emissions Reduction Plan (GHG Plan) to the City of Brisbane Community Development Director or the Director's designee prior to the issuance of building permits for the next build-out phase. The subject technical documentation shall be prepared by a City-approved, qualified air quality and greenhouse gas technical specialist.

In all instances, substantial evidence must confirm that any reduction to the total GHG offset credits value as identified in the certified EIR for the Project is consistent with the commitment to achieve a no net increase in GHG emissions for the 30-year life of the Project.

Reporting and Enforcement: On an annual basis, by March 1 of each year, the project applicant shall submit a letter to the City of Brisbane Sustainability Manager or the Manager's designee confirming implementation of the emission reduction strategies listed in the GHG reduction plan and this EIR.

In addition, before the City issues the final certificate of occupancy for the first building constructed in each phase, the applicant shall provide copies of GHG offset credit contracts demonstrating required purchases, along with records of their retirement, to the Community Development Director or the Director's designee.

For purposes of demonstrating that each GHG offset credit is additional, real, permanent, quantifiable, verifiable and enforceable, the reports shall include (i) the applicable protocol(s) and methodologies associated with the GHG offset credits; (ii) the third-party verification report(s) and statement(s) affiliated with the GHG offset credit projects; (iii) the unique serial numbers assigned by the registry(ies) to the GHG offset credits to be retired, which serves as evidence that the registry has determined the GHG offset credit project to have been

implemented in accordance with the applicable protocol or methodology and ensures that the GHG offset credits cannot be further used in any manner; and (iv) the locational attributes of the GHG offset credits. The reports also shall append the market survey report described in the "Locational Performance Standards" provision above.

If the City determines that the project's GHG offset credits do meet the requirements of this mitigation measure, the GHG offset credits can be used to reduce project GHG emissions and project permits shall be issued. Upon an affirmative finding from the City that the project's GHG offset credits are eligible for use under this measure, and prior to permit issuance, the City shall confirm that the project applicant has included, in their GHG offset credit agreement(s), a requirement that the GHG offset credit seller(s) provide the City with reasonable notice of any emissions reversal from the GHG offset credits that are the subject of the transaction(s). The City also shall confirm that the project applicant's purchase agreement(s) requires the seller(s) to provide the City with information and evidence regarding the steps taken by the applicable registry(ies) and GHG offset credit project developer(s) to rectify any reversal in accordance with applicable program manuals, protocols, and methodologies, and provide supporting documentation from the registry(ies) to substantiate the correction of the reversal. In the event that the City concludes a GHG offset credit reversal has not been sufficiently corrected within a reasonable period of time based on the nature of the reversal and the standards set forth in the applicable program manuals, protocols and methodologies, the City shall require that an equivalent quantity of substitute GHG reductions are achieved. Methods to achieve the reductions could include requiring the project applicant to secure and retire substitute GHG offset credits meeting the requirements of this mitigation measure in a quantity equivalent to those reversed.

If the City determines that the project's GHG offset credits do not meet the requirements of this mitigation measure, the offsets cannot be used to reduce project GHG emissions and project permits shall not be issued. Additionally, the City may issue a notice of non-consistency and cease permitting activities in the event that the City determines the GHG offset credits provided to reduce project GHG emissions are not compliant with the aforementioned standards. In the event of such an occurrence, project permitting activities shall not resume until the project applicant has demonstrated that the previously provided GHG offset credits are compliant with the standards herein *or* have provided substitute GHG offset credits achieving the standards of this mitigation measure in the quantity needed to achieve the required emission reduction.

This will serve as documentation to fully enforce the provision that the project will result in net-zero GHG emissions for the Specific Plan's 30-year project life.

Emissions Inventory "True Up" Compliance Reporting

(i) ***General Requirements.*** If the Applicant chooses to prepare a Project-wide GHG Emissions Reduction Plan (GHG Plan), pursuant to section 3) *Emissions Inventory "True Up" Procedures and Standards* above, the Project sponsor shall retain a qualified air quality consultant to develop the GHG Plan for implementation over the life of the Project in accordance with the requirements of this mitigation measure.

The GHG Plan shall quantify, using the most current information available, operational GHG emissions for the life of the Project (defined as 30 years of operation). The Plan shall specify anticipated GHG emission reduction measures sufficient to reduce or offset these emissions in accordance with the standards set forth above, such that the resulting GHG emissions are below the City's "no net increase" threshold of significance pursuant to CEQA.

For each phase or sub-phase of development, the Plan shall be updated as set forth in greater detail below. At all times throughout the life of the Project, the GHG Plan shall demonstrate that all operational activities are below the City's "no net increase" threshold of significance pursuant to CEQA for (1) operational activities already completed, permitted, and being proposed for permitting; and (2) anticipated future operational activities.

The City shall retain the services of a third-party expert to assist with the City's review and approval of the GHG Plan. The third-party expert shall also assist the City with its review and approval of updates to the GHG Plan and Progress Reports, as described below. All costs relating to the third-party expert, including City review of its services, shall be paid by the Applicant.

The GHG Plan shall identify GHG Emission Reduction Measures that shall be implemented to achieve the "no net increase" CEQA significance threshold. Measures shall be verifiable and feasible to implement, and the Plan shall identify the person/entity responsible for each measure, each measure's reduction amount, and the person/entity responsible for monitoring that reduction, all subject to review and approval by the City. The GHG Plan shall also identify the required number of GHG offset credits to achieve the "no net additional" threshold.

(ii) ***Additional Emission Reduction Measures.*** The following types of measures may be included in the GHG Plan, as necessary, to meet the

requirements of this mitigation measure and the "no net increase" GHG emissions requirement for the Project:

(1) *Additional or substitute measures and technology to reduce GHG emissions from Project construction or operations that are not currently known or available:* this may include new energy systems (such as battery storage), new transportation systems (such as autonomous vehicle networks), or other technology (such as carbon capture and storage) that is not currently available at the project-level, provided that the GHG Plan demonstrates to the City's satisfaction that such measures are equally or more effective as existing available measures, including those described above and listed in Mitigation Measures MM GHG-1a through MM GHG-1d.

Significance Conclusion for Impact GHG-1 with Implementation of all Mitigation Measures

As discussed below, even with implementation of identified GHG and Air Quality mitigation measures, Baylands development would result in a net increase in GHG emissions compared to existing Specific Plan area land uses.

Implementation of Air Quality Mitigation Measures MM AQ-1e through MM AQ-1l, along with Greenhouse Gas Mitigation Measure MM GHG-1d, would result in a quantifiable reduction of GHG emissions by approximately 4,138 $MTCO_2e$ per year (refer to Appendix H.1) After subtracting this estimated reduction from the emissions shown in **Table 4.10-5**, Baylands development would still exceed the net-zero threshold for Specific Plan area land uses. Other mitigation measures (Air Quality Mitigation Measures MM AQ-1a, MM AQ-1b, MM AQ-1c, MM AQ-1f, MM AQ-1j, and MM AQ-1k, along with Greenhouse Gas Mitigation Measures MM GHG-1a, MM GHG-1b, MM GHG-1c, and MM GHG-1e) for which an estimated reduction is not readily quantifiable along with the regional VMT reduction identified in Section 4.8, *Transportation*, would only achieve marginally more reductions, and Baylands GHG emissions would remain above the GHG-1 net-zero increase threshold for Specific Plan area land uses.

Thus, the only remaining feasible measure to achieve the "net-zero" GHG emissions threshold[223] would be implementation of the GHG emissions offset program set forth in Mitigation Measure MM GHG-1e. MM GHG-1e, GHG Offset Credits, requires monitoring, including submittal of an annual report to the City along with copies of GHG offset credit contracts and records documenting their retirement. This documentation must include proof that each GHG offset credit is additional, real, permanent, quantifiable, verifiable, and enforceable. If the City determined that any proposed GHG offset credits would not meet the

[223] "Net zero" GHG emissions as no increase in Baylands GHG emissions, including the Specific Plan's 30-year amortized construction plus its new operational GHG emissions.

requirements of Mitigation Measure GHG-1e, the GHG offset credits could not be used to reduce GHG emissions and permits for such development would not be issued.

Also, if total lifetime project emissions from operations and construction were to exceed the total estimated in **Table 4.10-6**, additional emission reductions would be required before the City would issue a certificate of occupancy. The modeling conducted for the Specific Plan uses conservative assumptions about the project's construction and operational activities that would generate emissions and did not incorporate the effects of some regulations, laws, and technology improvements that are either already adopted or approved, are proposed for adoption, or are likely to occur in the future.[224]

However, implementation of a large-scale GHG offset credit program such as required by Mitigation Measure GHG-1e would be difficult given the large number of GHG offset credits required, their locational parameters, the timing of their purchase and retirement, and their future availability. For example:

- Based on the modeling conducted in this EIR, over 1.5 million GHG offset credits would be needed for the Specific Plan to achieve the GHG-1 net zero GHG emissions threshold for Specific Plan area land uses. These GHG offset credits are required to be purchased and retired between the first phase of construction permits and the last phase of operational permits. The specific timing of the purchasing and retirement of these GHG offset credits cannot be known at this time, nor can the availability of GHG offset credits in the required amount be guaranteed.
- All GHG offset credits must be purchased from projects within California, with a priority placed on GHG offset credits close to the project site. The future availability of GHG offset credits within California in the quantity required to achieve net zero GHG emissions for the Specific Plan cannot be guaranteed.

Because the availability of GHG offset credits at the time they need to be purchased is uncertain, achieving a net zero increase in Baylands emissions cannot be guaranteed.

Impact GHG-1 would therefore be significant and unavoidable.

[224] Among the specific approved regulatory requirements not accounted for in the modeling are CARB's Zero-Emission Vehicle Program (EO B-16-2012), CARB's Advanced Clean Trucks regulation, the California Department of Transportation/CARB California Sustainable Freight Action Plan, California's carbon-neutral goal by 2045 (EO B-55-18), and AB 630/CARB's Clean Cars 4 All program. Among the regulations and legislation proposed but not accounted for in the modeling are CARB's 2020 Mobile Source Strategy, CARB's Zero Emission TRU rule, future updates to Title 24 energy efficiency standards, and CARB's Heavy-Duty Omnibus Regulation.

b. Impact GHG-2: Effect on Regional GHG Emissions

Methodology for Determining Significance

The analysis of Impact GHG-1 quantified the net increase in mobile source emissions that proposed Specific Plan area land uses would generate. The analysis of Impact GHG-2 differs from GHG-1 in that the following analysis focuses on the Specific Plan's effect on regional GHG emissions based on the regional vehicle miles traveled (VMT) analysis prepared for Section 4.8, *Transportation*, and qualitatively evaluates this effect on regional GHG emissions from mobile sources.[225]

As discussed in relation to Impact POP-1, the 2,200 dwelling units, 6.5 million square feet of commercial, and 500,000 square feet of hotel use proposed in the Specific Plan are consistent with the General Plan and represent planned growth. Consistent with the VMT analysis undertaken in Section 4.8, the anticipated future 4,905 Baylands residents and 19,480 employees are already accounted for in Plan Bay Area 2050 regional growth projections and therefore would not represent GHG emissions sources in addition to those projected for the nine-county Bay Area region. As discussed in Plan Bay Area 2050, "Between now and 2050, best estimates suggest the Bay Area's population will rise from nearly 8 million to over 10 million residents and that the number of jobs withing the nine counties will climb from 4 million to more than 5 million" (ABAG and MTC 2021). Plan Bay Area 2050 further recognizes that new housing must be provided to achieve the state's climate goals.

There is also evidence that the existing housing shortage within the Bay Area region is contributing to longer commutes and higher VMT. Plan Bay Area 2050 explains that "planning for enough new housing to ensure that strong job growth is not met with an increase in the number of long-distance commuters … Transportation and environmental strategies that support active and shared modes, combined with a transit-supportive land use pattern, are forecasted to lower the share of Bay Area residents that drive to work alone … [and] Greenhouse gas emissions from transportation would decrease significantly as a result of these transportation and land use changes" (ABAG and MTC 2021). This concept is recognized by the legislature itself, which has explained that "the lack of housing … is a critical problem that threatens the economic, environmental, and social quality of life in California … Among the consequences of those actions are … urban sprawl, excessive commuting, and air quality deterioration … and undermining the state's environmental and climate objectives" (Gov. Code § 65589.5). The Housing Crisis Act of 2019 ("SB 330") notes that the lack of housing is

[225] The regional VMT analysis undertaken in Section 4.8 quantified regional VMT with Baylands development to regional VMT without Baylands development assuming that the Specific Plan's proposed residential and commercial development would be spread between San Francisco and San Mateo County using the same total regional growth forecast as Plan Bay Area 2050 for the nine-county Bay Area region. See Section 4.8 and the Baylands Transportation Impact Analysis (Appendix F.1) for additional information.

"[i]ncreasing greenhouse gas emissions from longer commutes to affordable homes far from growing job centers" (SB 330 Finding 12(B)).

A 2021 analysis by the San Francisco Bay Area Planning and Urban Research Association (SPUR) revealed a shortfall of nearly 700,000 housing units between 2000 and 2018 (San Francisco Bay Area Planning and Urban Research Association. 2021). This shortage has been exacerbated by a focus on market-rate and luxury developments rather than affordable housing and has resulted in longer commutes for many residents and commuters. As people move further away from urban centers to find affordable housing, they often face longer travel times to get to work (UCITS 2019). Longer commutes contribute to higher VMT, as more people rely on cars for their daily travel. Studies have shown that high housing costs and the resulting longer commutes are significant factors in increasing VMT (Islam and Saphores 2024).

Further, the 2022 Scoping Plan and Plan Bay Area 2050 support infill housing as the type of development that will reduce VMT and support the state's and region's climate goals. As stated in the Scoping Plan:

> "Accelerating housing production to meet the extraordinary need for more homes can help reduce vehicle miles traveled (VMT) and GHG emissions… Increasing housing opportunities in transportation-efficient locations is a necessary paradigm shift and is part of the State's GHG emission reduction strategy" (CARB 2022, Appendix D, Local Actions).

The 2022 Scoping Plan also describes how transit-oriented and transportation-efficient development reduces VMT and GHG emissions:

> "Climate-smart locations include neighborhoods, commercial corridors, town centers, downtowns, and other areas where residents have access to a broad range of mobility options in addition to private automobiles (such as transit, walking, and biking), as well as where residents have access to housing, jobs, and other key destinations. Such communities make it possible for residents to live, work, and recreate without dependence on a personal car. For trips where driving is required, car trips can be relatively short and public infrastructure should support the use of zero-emission vehicles… the State has long been clear that urban infill projects, particularly in high-resource and low-VMT areas, would be generally supportive of the State's climate and regional air quality goals" (CARB 2022, Appendix D, Local Actions).

Impact Assessment

The Specific Plan's VMT characteristics were analyzed in Impact TRA-1. As shown in **Table 4.8-11**, the Specific Plan's location in relation to transit, its mix of land uses, and implementation of TDM programs result in substantially lower per capita VMT than the regional average for Specific Plan area employees and workers. The Specific Plan's per capita

VMT was also analyzed on a regional basis, comparing cumulative future 2040 regional VMT with and without the Specific Plan development.[226] As indicated in **Table 4.8-12**, the Baylands Specific Plan would reduce future cumulative 2040 daily regional VMT by 80,000 miles at buildout (105,000 miles with construction of Candlestick interchange improvements).

Because Baylands residential and employment growth is consistent with Plan Bay Area 2050 growth projections, the vehicle miles travelled and GHG emissions associated with Baylands residents and employees would not be in addition to projected regional GHG mobile emissions within the state or region. In addition, because per capita vehicle miles traveled for Baylands residents and employees would be more than 35 percent less than the regional average with implementation of required TDM measures for the Baylands as indicated in **Table 4.8-11** and future cumulative 2040 regional VMT would be reduced by 80,000 to 105,000 miles as indicated in **Table 4.8-12**, it is reasonable to conclude that Specific Plan development would also result in a decrease in mobile GHG emissions.

A reduction in average daily regional light-duty VMT of 80,000 miles throughout the Bay Area region in 2040, assuming regional average mobile emission rates for light-duty vehicles based on CARB's EMFAC2021 model, could result in over 7,000 $MTCO_2e$ reduced per year as a result of the project. Further, the Baylands building-related emissions are likely to also be lower than average existing and future buildings within the region because the project would achieve zero-carbon buildings, be all-electric, rely on 100 percent carbon-free electricity, meet CALGreen Tier 1 voluntary energy efficiency standards, and supply over 50 percent of on-site electricity demand with on-site solar energy production. This could result in a regional average decrease in building-related emissions if Baylands buildings were displacing existing and future building operations. Consequently, when considering the reduction in future regional mobile source GHG emissions and the potential reduction in future regional building GHG emissions, the project would result in a net reduction in regional GHG emissions overall.

Significance Conclusion for Impact GHG-2

Because the 2025 Specific Plan project would not increase and would likely reduce regional GHG mobile source emissions, Impact GHG-2 would be less than significant.

[226] The cumulative future 2040 without Specific Plan scenario assumes that the 2,200 dwelling units, 6.5 million square feet of commercial development, and 500,000 square feet of hotel use proposed for the Specific Plan would occur outside of the Baylands within San Francisco and San Mateo County.

c. Impact GHG-3: Consistency with Applicable Greenhouse Gas Emissions Reduction Plans, Policies, Performance Standards, and Regulations

Methodology for Determining Significance

BAAQMD 2022 CEQA Thresholds Consistency Analysis Methodology

To evaluate potential conflicts with the BAAQMD's 2022 *CEQA Thresholds for Evaluating the Significance of Climate Impacts*, the EIR generally follows the BAAQMD recommendation for land use projects endorsed by the California Supreme Court in *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) (62 Cal.4th 204). As the California Supreme Court held if a project would contribute its "fair share"[227] to achieve the long-term climate goals, then the lead agency can find that the impact would not be significant because the project would help solve the problem of global climate change (62 Cal.4th 220–223). Applying this approach, the BAAQMD has found that a new land use development project being built today that incorporates the design elements identified below would contribute its fair share toward achieving California's long-term climate goals and it would not result in a cumulatively considerable contribution to global climate change. Thus, in relation to the BAAQMD's 2022 *CEQA Thresholds*, the EIR analyzes whether the Specific Plan includes the following design elements:

- Buildings
    - The project will not include natural gas appliances or natural gas plumbing (in both residential and nonresidential development).
- The project will not result in any wasteful, inefficient, or unnecessary electrical usage as determined by analysis required under CEQA Section 21100(b)(3) and Section 15126.2(b) of the CEQA Guidelines.
- Transportation
    - Achieve compliance with electric-vehicle requirements in the most recently adopted version of CALGreen Tier 2 or the mandatory requirements of the most recently adopted version of the City of Brisbane building code, whichever is more stringent.
    - Achieve a reduction in project-generated vehicle miles traveled (VMT) below the regional average consistent with the current version of the California Climate

[227] The BAAQMD defines "fair share" as the design elements that need to be incorporated into a project to lay the foundation for achieving carbon neutrality by 2045. These design elements are elements over which the project has influence or control. For example, becoming carbon neutral by 2045 will require California's electrical power generators to shift to 100 percent carbon-free energy resources, which is not something that can be controlled through the design of new land use projects and would not be a part of a project's fair share. Other sources that would not be part of the "fair share" are vehicle fleet mix or indirect off-site emissions (e.g., methane emissions from wastewater or solid waste).

Change Scoping Plan or meet a locally adopted Senate Bill 743 VMT target, reflecting the recommendations provided in the Governor's Office of Planning and Research's Technical Advisory on Evaluating Transportation Impacts in CEQA.

If the Specific Plan would not incorporate these design elements, the project would obstruct the state's efforts to address climate change, and a significant impact would result.

Impact Assessment

Consistency with Bay Area Air Quality Management District CEQA Thresholds for Evaluating the Significance of Climate Impacts

The BAAQMD's *CEQA Thresholds for Evaluating the Significance of Climate Impacts* were published in April 2022 and identify building design and transportation elements that would be required of new land use development projects to achieve California's long-term climate goals.

Building Design Elements

Baylands Specific Plan development would not include natural gas infrastructure, plumbing, or appliances. In addition, laboratory and other research and development uses within the Baylands would be permitted to use on-site propane tanks only on an as-required basis.[228] With respect to electrical energy and building design, because residential and nonresidential buildings would comply with CALGreen Tier 1 voluntary standards and because the vast majority of electrical demand would be supplied from on- and off-site carbon free sources, building design would not result in a wasteful, inefficient, or unnecessary consumption of energy.

The Specific Plan proposes to comply with the CALGreen Code Tier 1 voluntary standards, which would ensure that buildings use energy and other resources efficiently. The Building Code and energy efficiency standards are reviewed every few years by the Building Standards Commission and the California Energy Commission and revised if necessary (Pub. Res. Code § 25402(b)(1)). The regulations are adopted with the goal of "[r]educing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (Pub. Res. Code § 25402). Part 6 of Title 24 contains the 2022 Building Energy Efficiency Standards for new residential and non-residential buildings, which went into effect on January 1, 2023 (CEC 2022a). The 2022 Standards focus on efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, and strengthens ventilation standards. The Specific Plan requires a minimum of 85,000 MWh of electricity to be generated annually. To that end, a 55-acre solar farm will be developed east of the Caltrain right-of-way and south of Visitacion Creek along with building- and other ground-mounted solar

[228] Such gases are used for research purposes in scientific labs. For example, Bunsen burners offer unique heating characteristics which cannot be replicated by electric heating devices. Open flames are typically required to produce pipettes and related glassware and are required for certain types of chemical reactions and procedures.

installations. Based on the reasonably foreseeable mix of building types anticipated within the Baylands, actual renewable energy generation was estimated to be 92,445 MWh in the Baylands Energy Plan prepared by Thornton Tomasetti Inc. in May 2021.

Transportation Elements

As shown in **Table 4.10-7**, per-capita vehicle miles traveled by Baylands residents and workers would achieve reductions below the nine-county Bay Area average in excess of 35 percent. This reduction would be below the VMT reduction of at least 25 percent below 2019 levels by 2030 and 30 percent below 2019 levels by 2045 identified in the *Final 2022 Scoping Plan Update*.

Table 4.10-7: Per Capita Vehicle Miles Traveled, Existing and at Specific Plan Buildout

Land Use	Existing		Specific Plan Buildout		
	Baylands	San Francisco Bay Area Average	Baylands	Percent Below Baylands Existing	Percent Below Bay Area Average
Residential	N/Aa	12.8	8.0	N/A	37.5%
Employment	12.9	15.0	9.2	28.7%	38.7%

SOURCE: C/CAG Travel Demand Model; Fehr & Peers, 2023.

NOTES:

a. There is currently no residential land within the Baylands.

In addition, Baylands development would reduce regional vehicle miles traveled compared to the Regional Baseline Emissions wherein residential and commercial/office development that would otherwise have occurred within the Baylands is spread around the San Francisco Bay Area. As indicated in **Table 4.10-8**, development under the Specific Plan would reduce regional VMT within the nine-county Bay Area region, as determined in Section 4.8, *Transportation*.

Table 4.10-8: Effect of Baylands Development on Regional Vehicle Miles Traveled

	Regional Vehicle Miles Traveled Nine-County Bay Area Region	Would Baylands Development Increase VMT?
Cumulative 2040 VMT Without Baylands	197,771,000	
Cumulative 2040 VMT With Baylands		
• **No Candlestick Interchange**	197,691,000	No
• **With Candlestick Interchange**	197,666,000	No

SOURCE: C/CAG Travel Demand Model; Fehr & Peers, 2023.

NOTES: VMT results from C/CAG Travel Demand Model are presented in this table because the effect of the required TDM measures would further reduce VMT generated by the region but would be imperceptible for the results presented in this table at the scale of the 9-County Bay Area region.

The BAAQMD CEQA threshold also indicates compliance with CALGreen Tier 2 off-street EV requirements. The applicant provided an estimate of proposed off-street EV charging spaces, both with and without all necessary charging equipment to qualify as an electrical vehicle charging station (EVCS). A comparison of these estimates with the CALGreen Tier 2 voluntary

EV charging requirements indicates that, while the project would meet Tier 2 requirements with respect to single family housing, it would be below the requirements for multifamily residential and non-residential uses. Thus, Specific Plan development would not be consistent with BAAQMD CEQA thresholds in relation to EV charging spaces.

Consistency with AB 1279 and the 2022 Scoping Plan

AB 1279 and the CARB *2022 Scoping Plan for Achieving Carbon Neutrality* provide for reducing anthropogenic GHG emissions to 85 percent below 1990 levels and achieving carbon neutrality by 2045 or sooner. **Table 4.10-9** shows relevant actions of the 2022 Scoping Plan Update and correlates each action with elements of the Baylands Specific Plan that serve to address the action.

Table 4.10-9: Consistency of the Baylands Specific Plan with the 2022 Scoping Plan

2022 Scoping Plan Action	Specific Plan Elements
Increase in Renewable Energy and Decrease in Oil and Gas Use Actions	The Specific Plan would generate 92,445 MWh of solar energy from on-site solar panels, and the remaining energy demand would be sourced from PCE, which includes 100% renewable sources. While PCE customers can opt out of this program, only 2.5% of current customers elect to opt out. Furthermore, under state Renewable Portfolio Standard (RPS) requirements, all electricity generated after 2045 would be carbon free. Furthermore, the project would lower regional VMT and per capita VMT for the Bay Area. Therefore, the project would not obstruct the Scoping Plans efforts to increase renewables and decrease oil and gas use. Additionally, distributed battery storage within the Baylands would enable all of the energy generated within the Baylands to be used within the site regardless of the time of day it is generated.
Low Carbon Fuels Actions	The 2022 Scoping Plan identifies this action measure to be implemented through AB 197 as it directs emissions reductions for sources covered by the AB 32 Inventory. Therefore, it is not an action to be directly implemented through local development. However, the Specific Plan would be required to support this measure through required compliance with the City of Brisbane's Building Code as it pertains to electric vehicle charging infrastructure and, accordingly, would not impede the realization of this Action.
Expansion of Electrical Infrastructure Actions	Electricity to power the Baylands Specific Plan area would be generated by on-site solar panels installed on buildings, in parking areas, and in a solar farm required within the southeastern portion of the site. Distributed battery storage would extend the reliability and resiliency of on-site renewable electricity generation and a proposed 250 MW utility scale battery storage, if it is ultimately developed within the Baylands, would enhance extend the reliability and resiliency of off-site renewable energy at times when generation exceeds demand.
Climate Ready and Climate-Friendly Buildings	The Sustainability Framework of the Specific Plan describes strategies and standards for creating "zero carbon buildings" that conserve energy and water, establishing resiliency in light of projected sea level rise adaptation and providing for sustainable infrastructure development, as well as addressing other sustainability factors.
Expanded Use of Zero-Emission Mobile-Source Technology Actions	The Specific Plan would support this Action through required compliance with the City of Brisbane's recently adopted Building Code as it pertains to electric vehicle charging infrastructure and, accordingly, would serve to implement this Action.

2022 Scoping Plan Action	Specific Plan Elements
Mechanical Carbon Dioxide Removal and Carbon Capture and Sequestration Actions	Carbon capture and mechanical carbon dioxide removal technology is still in development and not yet commercially available. The Specific Plan provides for 64.4 acres of landscape parkland and 78.4 acres of habitat conservation and restoration, including wetlands, grasslands, coastal scrub, and woodland. Additionally, large evergreen shrubs and trees would be planted along Baylands roadways. All of these plantings would serve to sequester carbon. The Specific Plan would not hinder further development of carbon capture technology and would provide for restoration of habitats that promote carbon sequestration.
Forest, Shrubland, and Grassland Management Actions	A total of 78.4 acres of land within the Specific Plan would be devoted to habitat conservation and restoration, including wetlands, grasslands, coastal scrub, and woodland. Overall, a total of 156.8 acres of the site's (27.8 percent) 563.5-acre land area remaining after a projected 6.9 feet of sea level rise through 2100 would be preserved as open space.
Agricultural Actions	The Baylands Specific Plan permits development of a small urban farm or community garden adjacent to Icehouse Hill to grow organic produce for use in the Baylands or other Brisbane neighborhoods. Furthermore, operation of the specific plan could include a local farmers' market that would encourage tenancies by and permits for food retailers, restaurants, and food trucks, with preferential participation by local food producers.
Organic Waste Diversion and Composting Actions	Recology provides solid waste collection, recycling, and disposal services for residential and commercial customers in San Francisco and the Baylands through a three-cart collection program that requires, under San Francisco's Mandatory Recycling and Composting Ordinance, customers to sort solid waste into recyclables; compostable items, such as food scraps and yard trimmings; and garbage. Recology's 78 percent diversion rate is slightly greater than that achieved in other parts of Brisbane (76 percent) and the State's goal of 75 percent waste diversion by 2020 (City of Brisbane 2024). Chapter 15.75 of the Brisbane Municipal Code requires that a minimum of sixty-five percent (65 percent) of the nonhazardous construction and/or demolition waste and one hundred percent (100 percent) of inert solid material associated with excavations and land clearing operations, including trees, stumps and rocks be recycled and/or salvaged for re-use. Recology is also committed to implementing a zero-waste program for the Baylands. In addition, information regarding waste segregation requirements, including at minimum segregation of recyclable and compostable waste (green waste), would be provided to new owners, lessees, and renters
Afforestation, Urban Forestry Expansion, Urban Greening, Avoided Natural and Working Land Use Conversion, and Wetland Restoration Actions	A total of 78.4 acres of land within the Specific Plan would be devoted to habitat conservation and restoration, including wetlands, grasslands, coastal scrub, and woodland. Overall, a total of 156.8 acres of the site's (27.8 percent) 563.5-acre land area remaining after a projected 6.9 feet of sea level rise through 2100 would be preserved as open space. Habitat conservation and enhancement on Icehouse Hill would be specifically designed to increase the extent and quality of habitat for sensitive butterfly species.
Reduced VMT Actions	The Specific would implement a transportation demand management (TDM) plan consistent with the City's TDM ordinance. Potential TDM measures include transit accessibility, proximity of amenities, proximity of employment opportunities, an extensive bicycle network, a bikeshare program, provision of minimal automobile parking, preferential EV and carpool parking, provision of bicycle parking, and implementation of transit accessibility. The TDM measures would reduce vehicle trip generation by 16.4 percent. Resulting per capita VMT for Baylands residents' and workers' home to work trips would be more than 30 percent below the existing average for the nine-county Bay Area region.

2022 Scoping Plan Action	Specific Plan Elements
Provides EV charging infrastructure that, at minimum, meets the most ambitious voluntary standard in the California Green Building Standards Code at the time of project approval	The applicant provided an estimate of proposed off-street EV charging spaces, both with and without all necessary charging equipment to qualify as an electrical vehicle charging station (EVCS). A comparison of these estimates with the CALGreen Tier 2 voluntary EV charging requirements indicates that, while the project would meet Tier 2 requirements with respect to single family housing, it would be below the requirements for multifamily residential and non-residential uses. Thus, Specific Plan development would not be consistent.
Is located on infill sites that are surrounded by existing urban uses and reuses or redevelops previously undeveloped or underutilized land that is presently served by existing utilities and essential public services (e.g., transit, streets, water, sewer)	The Baylands Specific Plan area is one of the largest underdeveloped locations in the central Bay Area and is surrounded by existing urban development to the north, west, and south (San Francisco Bay is located east of the Baylands). The Baylands comprises the San Mateo County portion of the Bi-County Priority Development Area designated by Plan Bay Area 2050 along with large-scale redevelopment aeras to the north in San Francisco. The Specific Plan is served by two interchanges along the US 101 freeway along with a network of existing highways and roadways. The Specific Plan area is also served by existing water and sewer infrastructure that would need to be upgraded to serve future development.
Does not result in the loss or conversion of natural and working lands	The Scoping Plan defines natural and working lands as forests, shrublands/chaparral, croplands, and wetlands. The Specific Plan site primarily consists of a former Southern Pacific railroad maintenance yard and the former Brisbane landfill. A total of 78.4 acres of land within the Specific Plan would be devoted to habitat conservation and restoration, including wetlands, grasslands, coastal scrub, and woodland. There are no agricultural or forestry resources within the Baylands or City of Brisbane. The existing Mission Blue Nursery, which propagates natural plant materials for habitat restoration and enhancement projects in the San Bruno Mountain area would be relocated to Icehouse Hill as part of Specific Plan development.
Consists of transit-supportive densities (minimum of 20 dwelling units per acre), or is in proximity to existing transit stops (within a half mile), or satisfies more detailed and stringent criteria specified in the region's SCS	The Baylands Specific Plan area has been designed as a Priority Development Area (PDA) in Plan Bay Area 2050. PDAs are defined as "areas generally near existing job centers or frequent transit that are locally identified (i.e., identified by towns, cities, or counties) for housing and job growth." The Specific Plan establishes a maximum permitted number of dwelling units for each residential block that, on average, exceeds an allowable 35 dwelling units per acre maximum and/or a minimum density of 25 dwelling units per acre within ½ mile of the Caltrain Bayshore Station.
Reduces parking requirements by: Eliminating parking requirements or including maximum allowable parking ratios (i.e., the ratio of parking spaces to residential units or square feet); or providing residential parking supply at a ratio of less than one parking space per dwelling unit; or for multifamily residential development, requiring parking costs to be unbundled from costs to rent or own a residential unit	Mandatory TDM Measures to be implemented by the Specific Plan (Per Tier 3 of Brisbane TDM Ordinance, §10.52.070) include: • Measure J: Right-Size Parking Supply • Measure M: Paid Parking or Parking Cash-out.
At least 20 percent of units included are affordable to lower-income residents	Existing City ordinance would require Baylands development to provide a minimum of 15% of its housing production at rates affordable to lower income households unless a higher percentage is negotiated as part of a Development Agreement.
Results in no net loss of existing affordable units	There are no existing residential units within the Specific Plan area.

2022 Scoping Plan Action	Specific Plan Elements
Uses all-electric appliances without any natural gas connections and does not use propane or other fossil fuels for space heating, water heating, or indoor cooking	The Specific Plan requires new development to be all electric. Existing uses adjacent to the Specific plan area would continue having access to natural gas infrastructure.

SOURCES: CARB 2022; Baylands Specific Plan, 2053.

NOTES: 2022 Scoping Plan = *2022 Scoping Plan for Achieving Carbon Neutrality*; CALGreen Code = California Green Building Standards Code; City = City of Brisbane; EV = electric vehicle; GWP = global warming potential; MPOA = Master Property Owners' Association; MWh = megawatt-hours; TDM = transportation demand management; VMT = vehicle miles traveled

As shown in the table above, the Specific Plan would not obstruct implementation of relevant Scoping Plan actions to reduce GHG emissions related to VMT reduction and building decarbonization per the CARB 2022 Climate Change Scoping Plan, except related to EV charging spaces.

Significance Conclusion for Impact GHG-3

The Baylands Specific Plan is consistent with many but not all applicable greenhouse gas emissions reduction plans, policies, performance standards, and regulations.

- Baylands development would be consistent with most performance metrics contained in the BAAQMD's CEQA Guidelines.
    - Natural gas service would not be extended to any new residential or nonresidential development.[229] The Specific Plan commits to operating with 100 percent renewable energy along with all electric buildings, a minimum of 85,000 MWh of on-site renewable energy generation, and 30 MW of distributed battery storage.
    - As documented in Section 4.11, *Energy Resources*, Impact EN-1, Baylands development would not result in wasteful, inefficient, or unnecessary energy usage.
    - As documented in Section 4.8, *Transportation*, the Specific Plan would, with implementation of required transportation demand management programs result in per capita VMT for Baylands residents and employees more than 35 percent below the nine-county regional average for the Bay Area and reduce regional vehicle miles traveled consistent with achieving state-wide GHG reduction goals.
    - While not meeting all voluntary CALGreen Tier 2 electric vehicle EV requirements, the Specific Plan would provide a total of 6,924 parking spaces of the total maximum 11,000 parking spaces permitted by the Specific Plan with EV charging infrastructure.

[229] Existing uses that currently use natural gas and would remain at their current locations would be permitted to retain natural gas service.

- As demonstrated in **Table 4.10-9**, Baylands development would not obstruct implementation of relevant Scoping Plan actions to reduce GHG emissions related to VMT reduction and building decarbonization CARB 2022 Climate Change Scoping Plan, except related to EV charging spaces.
- As demonstrated in **Table 4.3-2**, the Baylands Specific Plan would be inconsistent with MTC's Transit-Oriented Communities Policy (Resolution No. 4530), which would increase the severity of the Specific Plan's significant GHG emissions impact.
- The Specific Plan is designated as a Priority Development Area in Plan Bay Area 2050 and is consistent with GHG reduction measures of its Sustainable Communities Strategy.

While the project is consistent with the majority of policies described above, it would not provide sufficient EV charging spaces necessary to achieve CAL Green Tier 2 voluntary standards. Therefore, this impact is significant.

Program EIR Mitigation Measures

No mitigation measures are being carried forward from the Program EIR.

Additional Mitigation Measures

Significance Conclusion for Impact GHG-3 with Implementation of All Mitigation Measures

The 2025 Specific Plan Project is consistent with many but not all applicable greenhouse gas emissions reduction plans, policies, performance standards, and regulations. It would not, however, obstruct implementation of relevant Scoping Plan actions to reduce GHG emissions related to VMT reduction and building decarbonization CARB 2022 Climate Change Scoping Plan. Revisions to the Specific Plan required by Mitigation Measure MM LUP-2 would ensure consistency with MTC's Resolution No. 4530 by requiring:

- Residential development within ½ mile of the Caltrain Bayshore Station to have a minimum average of 25 dwelling units per acre as measured on a block-by-block basis;
- Decreasing the maximum per unit parking ratio for Multi-Family Low, Townhome, and Duplex/Single Family housing types from 1.25 to 1.0 spaces per unit; and
- Requiring commercial office development within ½ mile of the Caltrain Bayshore Station to have an average minimum FAR of 2.0 as measured on a block-by-block basis.

Mitigation Measure MM AQ-1k requires that the applicant for development shall demonstrate compliance with the most current California Green Building Standards (CALGreen Code) Tier 2 voluntary electric vehicle (EV) charging requirements.

Implementation of Mitigation Measures MM LUP-2 and MM AQ-1k would achieve consistency with applicable Greenhouse Gas Emissions reduction plans, policies, performance standards, and regulations.

Mitigation Measure MM AQ-1k requires on-site development to comply with CALGreen Code Tier 2 vehicle charging standards within the Baylands. These energy-saving project elements would substantially reduce energy consumption compared to existing mixed land use developments throughout the region. Many of these energy benefits are not accounted for in the quantitative analysis provided with respect to Impact GHG-1.

Impact GHG-2 would be less than significant with mitigation incorporated.

4.11 ENERGY RESOURCES

4.11.1 INTRODUCTION

a. Overview

This section assesses the generation, storage, and use of energy resources, including the change in energy consumption that would result from the Baylands Specific Plan. This section also examines whether the 2025 Specific Plan project includes "mitigation measures proposed to minimize significant effects on the environment, including, but not limited to, measures to reduce the wasteful, inefficient, and unnecessary consumption of energy." Refer to Section 4.9, *Air Quality*, for discussion of the relationship between energy consumption and air pollutant emissions; Section 4.10, *Greenhouse Gas Emissions*, for discussion of the relationship between energy consumption and greenhouse gas (GHG) emissions; and Section 4.16, *Utilities, Service Systems, and Water Supply*, for discussion of the relationship between energy consumption and (1) waste generation and (2) water consumption.

b. Definitions

British thermal unit (Btu) is a commonly used measure of the heat content of fuel and other energy sources. It is the amount of heat needed to raise the temperature of one pound of water by 1 degree Fahrenheit. Measured in terms of electricity, 1 kilowatt-hour equals approximately 3,400 Btu, while 1 cubic foot of natural gas equals just over 1,000 Btu and 1 therm of natural gas equals 100,000 Btu. One gallon of gasoline equals about 120,000 Btu.

Energy neutral means generating sufficient energy[230] on-site to meet the Specific Plan's demand for energy on an annual basis for:

- Buildings, outdoor lighting, streetlights, traffic signals, landscape irrigation, non-commercial on-site electric vehicle charging whose energy is metered as part of on-site buildings; and
- All on-site infrastructure such as operation of the on-site water storage tank and the water recycling facility.[231]

[230] Because the Baylands Specific Plan proposes new development to be all electric, on-site natural gas combustion would be limited to existing uses. Therefore, for purposes of this analysis, energy neutrality is equivalent to electricity neutrality. Energy neutrality does not include off-site energy consumption such as vehicle fuel use or embodied energy associated with water and wastewater.

[231] In relation to on-site water storage and water recycling facilities, "the Specific Plan's demand for energy" does not include energy used to provide potable or recycled water to uses outside of the Specific Plan area.

Watt, kilowatt, megawatt are measurements of energy capacity, or electrical power. In comparison, energy use is measured in watt-hours. For example, if a light bulb has a capacity rating of 100 watts (W), the energy required to keep the bulb on for 1 hour would be 100 watt-hours. If ten 100 W bulbs were on for 1 hour, the energy required would be 1,000 watt-hours or 1 kilowatt-hour. On a utility scale, the capacity of a generator is typically rated in megawatts (MW), which is 1 million watts, while energy usage is measured in megawatt-hours (MWh) or gigawatt-hours, which is 1 billion watt-hours.

Zero Net Energy, Building refers to an energy-efficient building where, on a source energy basis,[232] the actual annual consumed energy is less than or equal to the on-site renewable generated energy.

Zero Net Energy, Campus refers to an energy-efficient campus (e.g., site-specific development project) where, on a source energy basis, the actual annual consumed energy is less than or equal to the on-site renewable generated energy.

Zero Net Energy, Community refers to an energy-efficient community (e.g., Specific Plan area) where, on a source energy basis, the actual annual consumed energy is less than or equal to the on-site renewable generated energy.

4.11.2 PHYSICAL ENVIRONMENTAL SETTING

a. Baseline

The recirculated Notice of Preparation review period (spring 2023) is used to describe existing conditions and to analyze direct and indirect impacts of the Baylands Specific Plan.

b. State-Wide Energy Profile

Total energy usage in California was 6,822 trillion Btu in 2022 (the most recent year for which specific data are available), which equates to an average of 200 million Btu per capita per year. These figures place California second among the 50 states in total energy use and 48th in per-capita consumption. Of California's total energy usage, the breakdown by sector is roughly 42.6 percent transportation, 22.5 percent industrial, 17.4 percent commercial, and 17.6 percent residential. Electricity and natural gas in California are generally consumed by stationary users such as residences and commercial and industrial facilities, whereas petroleum-based fuel

[232] According to the U.S. Environmental Protection Agency's EnergyStar website, source energy "represents the total amount of raw fuel that is required to operate the building. It incorporates all transmission, delivery, and production losses." https://www.energystar.gov/buildings/benchmark/understand-metrics/source-site-difference. Accessed November 4, 2024.

consumption is generally accounted for by transportation-related energy use. **Table 4.11-1** summarizes state, PG&E, and San Mateo County energy use.

Table 4.11-1: Existing Annual State and Regional Energy Consumption, 2022

Source	State of California	PG&E	San Mateo County
Electricity[a]	287,826,110 MWh	104,694,979 MWh	
Natural Gas[b]	2,122,002,896 MMBtu	444,919,589MMBtu	
Gasoline[c]	13,640,000,000 gallons		265,000,000 gallons
Diesel[c]	2,290,000,000 gallons		15,000,000 gallons

b. California Gas and Electric Utilities, 2023 California Gas Report (Table 5), https://www.socalgas.com/sites/default/files/Joint_Biennial_California_Gas_Report_2023_Supplement.pdf; California Energy Commission, Gas Consumption by Planning Area, 2023e, https://ecdms.energy.ca.gov/gasbyplan.aspx.

c. California Energy Commission, 2023f California Retail Fuel Outlet Annual Reporting (CEC-A15) Results, 2022, accessed June 2024, https://www.energy.ca.gov/data-reports/energy-almanac/transportation-energy/california-retail-fuel-outlet-annual-reporting.

ABBREVIATIONS: MMBtu = million British thermal units; MWh = megawatt-hours; PG&E = Pacific Gas and Electric Company

California relies on a regional power system composed of a diverse mix of natural gas, renewable, hydroelectric, coal, and nuclear generation resources. In 2023, total electricity generation in California comprised 57.9 percent of non-GHG and renewable energy resources, with the remaining 42.1 percent generated by thermal and unspecified sources, including 36.6 percent natural gas, 1.7 percent coal, 0.01 percent oil, 0.07 percent waste heat/petroleum coke, and 3.7 percent unspecified (CEC 2024).

c. Electricity

Electricity, as a consumptive utility, is a man-made resource. The production of electricity for use in California currently requires the consumption or conversion of resources—including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources—into usable energy. The delivery of electricity involves a number of system components for distribution to users through a network of transmission and distribution lines commonly called a power grid.

PG&E provides electrical and natural gas services to approximately 16 million people throughout its 70,000-square-mile service area across central, coastal, and Northern California, an area stretching from Humboldt County to the north to Kern County to the south (PG&E 2024). PG&E produces and purchases energy from a mix of conventional and renewable generating sources.

Approximately 38 percent of PG&E's 2022 electricity purchases were from renewable sources; for comparison the state-wide percentage of electricity purchases from renewable sources was approximately 36 percent (PG&E 2023). In 2022, PG&E delivered approximately 77,887,000 MWh to customers (CEC 2023d).

In Brisbane, electricity is procured by Peninsula Clean Energy (PCE), a Community Choice Aggregation program of San Mateo County and all of its cities and towns, as well as the City of Los Banos. PCE purchases electricity directly from generators, which is then delivered by PG&E over its existing utility lines within San Mateo County and the City of Brisbane. Residents and businesses of Brisbane have a choice of two electricity plans:

- ECOPlus, which offers nearly double the percentage of renewable energy as that of PG&E; and
- ECO100, which offers 100 percent renewable energy.

d. Natural Gas

Natural gas consumed in California is obtained from naturally occurring reservoirs and delivered through high-pressure transmission pipelines. Natural gas provides almost one-third of California's total energy requirements. Natural gas is measured in terms of both cubic feet and Btu.

PG&E provides natural gas transportation services to "core" customers and to "non-core" customers (industrial, large commercial, and natural gas–fired electric generation facilities) that are connected to its gas system in its service territory. Core customers can purchase natural gas procurement service (natural gas supply) from either PG&E or non-utility third-party gas procurement service providers (referred to as "core transport agents"). When core customers purchase gas supply from a core transport agent, PG&E still provides gas delivery, metering, and billing services to those customers. When PG&E provides both transportation and procurement services, PG&E refers to the combined service as "bundled" natural gas service. Currently, more than 95 percent of core customers, representing nearly 80 percent of the annual core market demand, receive bundled natural gas service from PG&E.

PG&E does not provide procurement service to non-core customers, who must purchase their gas supplies from third-party suppliers. PG&E offers backbone gas transmission, gas delivery (local transmission and distribution), and gas storage services as separate and distinct services to its non-core customers. Access to PG&E's backbone gas transmission system is available for all natural gas marketers and shippers, as well as non-core customers. PG&E also delivers gas to off-system customers (i.e., outside of PG&E's service territory) and to third-party natural gas storage customers.

e. Transportation Energy

Transportation accounted for nearly 37 percent of total energy consumption in California during 2020 (CARB 2022). In 2022, 13.6 billion gallons of gasoline and 2.2 billion gallons of diesel fuel were consumed in California (CEC 2022b). Petroleum-based fuels currently account for 89 percent of transportation fuel use in California (CEC 2018).

The state is developing flexible strategies to reduce petroleum use. Over the last decade, California has implemented several policies, rules, and regulations to improve vehicle efficiency, increase the development and use of alternative fuels, reduce air pollutants and GHG emissions from the transportation sector, and reduce VMT. Accordingly, total gasoline consumption in California has declined. The CEC predicts that the demand for gasoline will continue to decline over the next 10 years, and there will be an increase in the use of alternative fuels. According to fuel sales data from the CEC, fuel consumption in San Mateo County was approximately 265 million gallons of gasoline and 15 million gallons of diesel fuel in 2022 (CEC 2022b). Refer to **Table 4.11-1** for a summary of state-wide fossil fuel consumption in 2022.

f. Local Setting

Electricity is currently provided to the Specific Plan area through a mix of underground cables and overhead lines. Existing electrical infrastructure serving existing properties is primarily located within Tunnel Avenue. Along the eastern side of Tunnel Road in the former landfill area, PG&E overhead electrical lines serve the existing Golden State Lumber and Recology properties. Overhead electrical lines extend from the area between Brisbane's existing fire station and Icehouse Hill to Bayshore Boulevard. An existing 230-kV underground electrical transmission line runs beneath Bayshore Boulevard.

Current energy consumption within the Baylands is minimal and primarily related to small industrial uses within 18 buildings totaling 272,400 square feet along Industrial Way in the northwestern portion of the Specific Plan area. Some of these existing on-site uses would be removed and replaced by Specific Plan development; uses within "Existing Use Areas" and the Mission Blue Nursery, which would be relocated to Icehouse Hill, would remain and continue to consume energy.

4.11.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

National Energy Conservation Policy Act

The National Energy Conservation Policy Act serves as the underlying authority for federal energy management goals and requirements. Signed into law in 1978, the Act has been regularly updated and amended by subsequent laws and regulations. This law is the foundation of most federal energy requirements. The Act established energy-efficiency standards for consumer products and includes a residential program for low-income weatherization assistance, grants and loan guarantees for energy conservation in schools and hospitals, and energy-efficiency standards for new construction. Initiatives in these areas continue today.

Energy Policy Act of 1992

The Energy Policy Act of 1992 was enacted to reduce U.S. dependence on foreign petroleum and improve air quality. This law includes several provisions intended to build an inventory of alternative-fuel vehicles in large, centrally fueled fleets in metropolitan areas. The Energy Policy Act of 1992 requires certain federal, state, and local government and private fleets to purchase a percentage of light-duty alternative fuel vehicles capable of running on alternative fuels each year. Financial incentives are also included. Federal tax deductions are allowed for businesses and individuals to cover the incremental cost of alternative fuel vehicles. The Energy Policy Act of 1992 also requires states to consider a variety of incentive programs to help promote alternative-fuel vehicles.

Energy Policy Act of 2005

The Energy Policy Act of 2005 includes provisions for renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

Executive Order 13423 (Strengthening Federal Environmental, Energy, and Transportation Management), signed in 2007, strengthens the key energy management goals for the federal government and sets more challenging goals than the Energy Policy Act of 2005. The energy reduction and environmental performance requirements of Executive Order 13423 were expanded upon in Executive Order 13514 (Federal Leadership in Environmental, Energy, and Economic Performance), which was signed in 2009.

Corporate Average Fuel Economy Standards

Established by the U.S. Congress in 1975, the Corporate Average Fuel Economy (CAFÉ) standards reduce energy consumption by increasing the fuel economy of cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and U.S. Environmental Protection Agency (USEPA) jointly administer the CAFÉ standards. Congress has specified that CAFÉ standards must be set at the "maximum feasible level" with consideration given to (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) the need for the nation to conserve energy.[233]

[233] For more information on the CAFÉ standards, refer to https://www.nhtsa.gov/laws-regulations/corporate-average-fuel-economy.

The key federal vehicle efficiency regulations related to national fuel economy and GHG emissions are as follows:

- In 2016, NHTSA and EPA finalized national fuel economy and GHG emission standards for medium- and heavy-duty vehicles that would cover model years 2018 to 2027 for certain trailers and model years 2021 to 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks.
- In 2020, NHTSA and EPA finalized updated CAFÉ and GHG emissions standards for passenger cars and light trucks and established new standards, covering model years 2021 through 2026.
- In 2021, EPA revised the GHG emissions standards for passenger cars and light trucks for model years 2023 through 2026 to leverage advances in clean car technology.
- In 2022, NHSTA revised the CAFÉ standards for passenger cars and light trucks for model years 2024 to 2026, which are expected to result in average fuel economy label values of 49 miles per gallon.

Fuel-efficiency standards for medium- and heavy-duty trucks have been jointly developed by USEPA and NHTSA. USEPA and NHTSA have also adopted heavy-duty truck standards, which cover model years 2021–2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline, depending on the compliance year and vehicle type (USEPA 2016).

However, it is legally infeasible for individual municipalities to adopt more stringent fuel efficiency standards (see California Vehicle Efficiency Regulations, below). The Federal Clean Air Act (42 United States Code [USC] Section 7543[a]) states that "no state or any political subdivision thereof shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part."

Clean Trucks Plan

On August 5, 2021, EPA announced plans to reduce GHG emissions and other harmful air pollutants from heavy-duty trucks through a series of three rulemakings that would collectively be called the Clean Trucks Plan. The first rulemaking, Control of Air Pollution from New Motor Vehicles: Heavy-Duty Engine and Vehicle Standards, was signed by EPA on December 20, 2022 (EPA–HQ–OAR–2019–0055), and sets stronger emissions standards for heavy-duty vehicles and engines starting in model year 2027.

Under the Clean Trucks Plan, EPA has proposed two additional rulemakings in 2023. One of the proposed rulemakings, Greenhouse Gas Emissions Standards for Heavy-Duty Vehicles, would revise its regulations to reduce GHG emissions for model year 2027 and later heavy-duty vehicles by improving fuel efficiency standards. This rulemaking would build on the success of

previous rulemakings to reduce GHG emissions from model year 2014 and newer heavy-duty vehicles. The second proposed rulemaking would address multi-pollutant emissions, including GHG emissions and emissions that form smog and soot, for model year 2027 and later commercial pickup trucks and vans.

Construction Equipment Regulations

Construction equipment fuel efficiency requirements are generally referenced as "Tier 4" as regulated under 40 Code of Federal Regulations Parts 1039, 1065, and 1068, with similar provisions under the California Air Resources Board regulations such as California Code of Regulations (CCR), Title 13, Sections 1956.8, 2025. The CARB also regulates construction equipment emissions ensuring that they include "every feasible control measure" (Health & Safety Code, Sections 39602.5, 39667, 43013). "Every feasible measure" under the Clean Air Act (Health & Safety Code Section 40612(c)(1)(A)) has been interpreted by CARB to be consistent with the definition of feasibility under CEQA Guidelines Section 15364. Under California law, "Tier 4" is generally used interchangeably with "2010 model year engines or equivalent" (13 CCR Section 2025(d) (3)(F)). To provide for a worst-case analysis, quantitative modeling conservatively assumed the default rate in CalEEMod.

b. State Laws, Plans, Programs, and Regulations

California Public Utilities Commission Plans and Programs

The California Public Utilities Commission (CPUC) regulates privately owned utilities providing telecommunications, electric, natural gas, water, railroad, rail transit, passenger transportation services, and in-state moving companies. The CPUC is responsible for assuring that California utility customers have safe, reliable utility services at reasonable rates, while protecting utility customers from fraud. The CPUC regulates the physical construction of electric generation, transmission, and distribution facilities, and the local distribution pipelines for natural gas.[234]

Renewable Portfolio Standard

The Renewable Portfolio Standard Program, as updated in 2018 (SB 100), requires the state to procure 60 percent of its electricity from renewable sources by 2030 and that CARB should plan for 100 percent eligible renewable energy resources and carbon-free sources by 2045. SB 1020, signed on September 16, 2022, revises SB 100, and instead requires that renewable energy resources and zero-carbon resources supply 90 percent of all retail electricity sales to end-use customers by December 31, 2035, 95 percent by December 31, 2040, and 100 percent by December 31, 2045; and supply 100 percent of electricity procured to serve all state agencies by

[234] California Public Utilities Commission, California Public Utilities Commission website, accessed June 2024, http://www.cpuc.ca.gov/.

December 31, 2035 (Public Utilities Code Sections 399.11, 399.30, and 454.33). Peninsula Clean Energy (PCE) is the primary electricity provider for residences and businesses in Brisbane. PCE is a Community Choice Aggregator (CCA) that supplies electricity principally from wind, solar, and hydro resources, and offers up to 100 percent renewable electricity to residential and commercial customers.

Long-Term Energy Efficiency Strategic Plan

The CPUC adopted the 2011 updated Long-Term Energy Efficiency Strategic Plan, which is a road map to achieving maximum energy savings in California through 2020. The Energy Efficiency Strategic Plan indicates that energy efficiency is the highest priority resource in meeting California's energy needs.

The CPUC also adopted zero net energy (ZNE) goals. In order to achieve ZNE standards, new buildings must use a combination of improved efficiency and distributed renewable energy generation to meet 100 percent of their annual energy need. The 2019 Title 24 standards were adopted on May 9, 2018, and went into effect on January 1, 2020. The 2019 Title 24 standard required photovoltaic (PV) installations on new homes for the first time. The following goals are set forth in the Long-Term Energy Efficiency Strategic Plan:

- All new residential construction will be zero net energy by 2020.
- All new commercial construction will be zero net energy by 2030.
- 50 percent of commercial buildings will be retrofit to zero net energy by 2030.
- 50 percent of new major renovations of state buildings will be zero net energy by 2025.

However, outstanding issues remain, including how ZNE should be defined, the need to identify compliance pathways when on-site renewable generation is not feasible, and the appropriate role for natural gas in ZNE buildings. The primary challenge is to build a technical and regulatory foundation for orchestration of energy efficiency and all other feasible distributed and customer-sited clean energy resources.

California Energy Action Plan

California's *2008 Energy Action Plan Update* updates the *2005 Energy Action Plan II*, which is the state's principal energy planning and policy document. The plan maintains the goals of the original *Energy Action Plan*, describes a coordinated implementation plan for state energy policies, and identifies specific action areas to ensure that California's energy is adequate, affordable, technologically advanced, and environmentally sound. First-priority actions to address California's increasing energy demands are to promote energy efficiency, demand response (i.e., reducing customer energy usage during peak periods to address power system reliability and support the best use of energy infrastructure), and use of renewable power

sources. To the extent that these strategies are unable to satisfy increasing energy and capacity needs, the plan supports clean and efficient fossil-fuel fired generation.

California Energy Commission

The California Energy commission (CEC) is the primary energy policy and planning agency in California. Created by the California Legislature in 1974, the CEC has five major responsibilities: (1) forecast future energy needs and keep historical energy data; (2) license thermal power plants 50 MW or larger; (3) promote energy efficiency through appliance and building standards; (4) develop energy technologies and support renewable energy; and (5) plan for and direct the state response to energy emergencies.

In 2017, as called for in Senate Bill 350, the CEC established ambitious annual targets to achieve a state-wide doubling of cumulative energy efficiency savings in electricity and natural gas end uses by 2030. The CEC developed the doubling targets in collaboration with the CPUC, investor-owned utilities (IOUs), publicly owned utilities (POUs), and other stakeholders through a public process. Achieving these efficiency targets is one of the primary ways the energy sector can help achieve the state's climate goal of reducing GHG emissions to 40 percent below 1990 levels by 2030. However, the state will need additional efforts to decarbonize homes and businesses to meet California's goals for 2030 and 2050.

Electrification of space and water heating is one of the state's key strategies to reduce or eliminate GHG emissions from buildings, including the methane emissions associated with natural gas use. GHG reductions will accelerate as the electricity system becomes cleaner with large increases in renewable resources.

Senate Bill 1389

Senate Bill (SB) 1389 (Public Resources Code [PRC] Sections 25300–25323) requires the CEC to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the electricity, natural gas, and transportation fuel sectors in California, and to provide policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the state economy; and protect public health and safety (PRC Section 25301(a)).

The 2022 Integrated Energy Policy Report Update (CEC 2023a) provides the results of CEC assessments on a variety of energy issues facing California, including:

- Embedding Equity and Environmental Justice at the CEC
- California Energy Demand Forecast
- Energy Reliability
- Western Electricity Integration

- Gasoline Cost Factors and Price Spikes
- Role of Hydrogen in California's Clean Energy Future
- Fossil Gas Transition
- Distributed Energy Resources

California Air Resources Board

Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling

In 2004, the California Air Resources Board (CARB) adopted the Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling to reduce public exposure to diesel particulate matter emissions (13 CCR Section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure prohibits diesel-fueled commercial vehicles from idling for more than 5 minutes at any given location. While the goal of this measure is primarily to reduce public health impacts from diesel emissions, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from unnecessary idling.

Low Carbon Fuel Standard

The Low Carbon Fuel Standard administered by CARB required producers of petroleum-based fuels to reduce the carbon intensity of their products to 10 percent total reduction by 2020. Petroleum importers, refiners, and wholesalers can either develop their own low-carbon fuel products or buy Low Carbon Fuel Standard credits from other companies that develop and sell low-carbon alternative fuels, such as biofuels, electricity, natural gas, and hydrogen.

Truck and Bus Regulation

In addition to limiting exhaust from idling trucks, CARB approved the Truck and Bus Regulation in 2008 to reduce the emissions of oxides of nitrogen and particulate matter from existing diesel vehicles operating in California (13 CCR Section 2025). The phased regulation aimed to reduce emissions by requiring the installation of diesel soot filters and encouraging the retirement, replacement, or retrofit of older engines with newer emission-controlled models. This regulation was fully implemented in 2023.

CARB has also promulgated emissions standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes, and forklifts, as well as many other self-propelled off-road diesel vehicles. The In-Use Off-Road Diesel-Fueled Fleets regulation adopted by CARB on July 26, 2007, aims to reduce emissions by installing diesel soot filters and encouraging the retirement, replacement, or repowering of older, dirtier engines with newer

emissions-controlled models (13 CCR Section 2449). The compliance schedule required the full implementation by 2023 of all equipment for large and medium fleets and requires full implementation for small fleets by 2028.

While the goals of these measures are primarily to reduce public health impacts from diesel emissions, compliance with the regulation has shown an increase in energy savings in the form of reduced fuel consumption from more fuel-efficient engines (Cummins Inc. 2024).

CARB also approved the Off-Road Diesel Regulation (13 CCR Section 2449), which imposes limits on idling; requires fleets to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies (i.e., exhaust retrofits). The requirements and compliance dates of the Off-Road Diesel Regulation vary by fleet size, and large fleets (fleets with more than 5,000 horsepower) were required to meet average targets or comply with Best Available Control Technology (BACT) requirements beginning in 2014. In 2022, CARB approved amendments that required the use of renewable diesel fuel starting January 1, 2024. Fleets comprising Tier 4 Final equipment or zero-emission equipment are exempt from this requirement.

California Air Resources Board Advanced Clean Trucks Program

On June 25, 2020, CARB adopted the Advanced Clean Trucks rule, which requires truck manufacturers to transition from diesel vehicles to electric zero-emissions vehicles beginning in 2024, with the goal of reaching 100 percent zero-emissions vehicles by 2045. The goal of the legislation is to help California meet its climate targets of a 40 percent reduction in GHG emissions and a 50 percent reduction in petroleum use by 2030, and an 80 percent reduction in GHG emissions by 2050.

Truck manufacturers will be required to sell zero-emissions vehicles as an increasing percentage of their annual sales from 2024 through 2035. Companies with large distribution fleets (50 or more trucks) will be required to report information about their existing fleet operations in an effort to identify future strategies for increasing zero-emissions fleets state-wide (CARB 2020).

Zero-emissions vehicles are two to five times more energy efficient than diesel vehicles, and the Advanced Clean Trucks rule will reduce GHG emissions with the co-benefit of reducing dependence on petroleum fuels and reducing energy consumption.

California Air Resources Board Advanced Clean Fleets Program

On April 28, 2023, CARB adopted the Advanced Clean Fleets rule (13 CCR Sections 2013 et seq.), which generally requires the shift to 100% zero-emissions trucking by 2035. This regulation is part of CARB's broader strategy to accelerate the transition to zero-emissions medium- and heavy-duty vehicles. It complements the Advanced Clean Trucks regulation, focusing on reducing emissions and promoting zero-emissions vehicle adoption. The Advanced

Clean Fleets regulation covers various fleet types, including drayage operations, government-owned fleets, and high-priority fleets, mandating Zero Emission Vehicle (ZEV) adoption in phases. Key provisions include manufacturer sales mandates, requirements for drayage fleets to transition to ZEVs, and specific ZEV targets for high-priority and government fleets. The regulation is expected to significantly reduce emissions, benefit public health, and contribute to achieving climate goals (CARB 2023).

To support the transition, CARB provides incentives, grants, and funding programs, with an emphasis on equity for disproportionately impacted communities. These programs aim to reduce the financial burden on fleet owners, promote early adoption, and expand charging and hydrogen fueling infrastructure. CARB estimates that the Advanced Clean Fleets regulation, in conjunction with the ACT regulation, will result in a substantial increase in ZEVs on California roads, contributing to emissions reduction and public health improvement. The regulation reflects California's commitment to achieving a fully zero-emissions fleet by 2045, with specific targets for various vehicle categories.

In January 2025, California withdrew requests for Clean Air Act waivers from the EPA needed to support four recently adopted vehicle emissions regulations, including the Advanced Clean Fleets Regulations. CARB withdrew the waiver requests due to the uncertainty caused by the impending change in federal administration. Until CARB repeals the regulations, or they are invalidated by a court, some legal requirements still apply. While certain aspects of ACF are likely unenforceable absent a Clean Air Act waiver, other portions may not be subject to the Clean Air Act and the waiver requirement, such as the part of the Advanced Clean Fleet regulation that applies to state and local government fleets.

Advanced Clean Cars II Program

In January 2012, pursuant to Recommended Measures T-1 and T-4 of the Scoping Plan, CARB approved the Advanced Clean Cars Program, a new emissions-control program for model years 2017 through 2025. In response to a midterm review of the standards in March 2017, CARB directed staff to begin working on post-2025-model-year vehicle regulations (Advanced Clean Cars II) to research additional measures to reduce air pollution from light-duty and medium-duty vehicles. Additionally, as described previously, in September 2020, Governor Newsom signed Executive Order (EO) N-79-20, which established a goal for 100 percent of new passenger cars and trucks sold in California by 2035 to be zero-emissions and directed CARB to develop and propose regulations toward this goal. The primary mechanism for achieving these targets for passenger cars and light trucks is the Advanced Clean Cars II Program. CARB adopted the Advanced Clean Cars II regulations on August 25, 2022.

Title 24, California Code of Regulations

Title 24 of the California Code of Regulations (24 CCR) requires, among other things, that California homes and businesses meet strong energy efficiency measures, thereby lowering their energy use. Title 24 contains numerous subparts, including Part 1 (Administrative Code), Part 2 (Building Code), Part 2.5 (Residential Code), Part 3 (Electrical Code), Part 4 (Mechanical Code), Part 5 (Plumbing Code), Part 6 (Energy Code), Part 8 (Historical Building Code), Part 9 (Fire Code), Part 10 (Existing Building Code), Part 11 (Green Building Standards Code), and Part 12 (Referenced Standards Code).

Starting in 1978, the California Building Standards Commission and the California Energy Commission adopted the California Energy Code (24 CCR Part 6). These energy efficiency standards are reviewed every few years by the Building Standards Commission and the California Energy Commission and revised if necessary (PRC Section 25402(b)(1)). The regulations are adopted with the goal of "[r]educing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (PRC Section 25402; *Building Code Action v. Energy Resources Conservation & Dev. Com.* (1979) 88 Cal.App.3d 913). These regulations are carefully scrutinized and analyzed for technological and economic feasibility, and cost effectiveness (PRC Section 25402(b), and (d)).

Part 6 (Building Energy Efficiency Standards)

Part 6 of Title 24 contains the 2022 Building Energy Efficiency Standards for new residential and non-residential buildings, which went into effect on January 1, 2023 (CEC 2022a). The 2022 Standards focus on efficient electric heat pumps, establishes electric-ready requirements for new homes, expands solar photovoltaic and battery storage standards, and strengthens ventilation standards.

Under the 2022 Standards, state-wide CO_2 emissions will be reduced by about 330,000 metric tons per year, or about 0.4 percent, per year, compared to the previous 2019 Standards (CEC 2021).

Part 11 (CALGreen)

In 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as CALGreen and establishes minimum mandatory standards as well as voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential, state-owned buildings, and schools and hospitals. The CALGreen 2022 standards became effective on January 1, 2023 (International

Code Council [ICC] 2023). The nonresidential mandatory standards require the following measures that relate to utilities and service systems (24 CCR Part 11):

- Mandatory reduction in indoor water usage through installation of separate submeters or metering devices, and compliance with specified flow rates for plumbing fixtures and fittings and faucets and fountains.
- Mandatory reduction in outdoor water usage through compliance with a local water efficient landscaping ordinance or the California Department of Water Resources' Model Water Efficient Landscape Ordinance and installation for recycled water supply systems where available/applicable.
- 65 percent of construction and demolition waste must be diverted from landfills and 100 percent of trees, stumps, rocks, and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled.
- Provide readily accessible areas for recycling that serve the entire building.
- Mandatory inspections of energy systems to ensure optimal working efficiency.
- Inclusion of electric vehicle charging stations or designated spaces capable of supporting future charging stations.

Clean Energy and Pollution Reduction Act of 2015

The Clean Energy and Pollution Reduction Act of 2015 (SB 350) requires that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased from 33 percent to 50 percent by December 31, 2030, thereby doubling energy efficiency within the state. SB 350 revises the California Renewable Portfolio Standard program and certain other requirements for public utilities and publicly owned electric utilities. SB 350 also requires local publicly owned electric utilities to establish annual targets for energy efficiency savings and demand reduction consistent with a state-wide goal established by the CPUC and provides incentives for electrification of rail facilities. Local utilities would be required to develop more detailed strategies and incentives for use of renewable energy sources, resulting in an increased demand for renewable energy generation.

SB 350 emphasizes the important role of electric vehicles in California's overall scheme to combat climate change, declaring that "[d]eploying electric vehicles should assist in grid management, integrating generation from eligible renewable energy resources, and reducing fuel costs for vehicle drivers …" The bill promotes the development of additional electric vehicle charging infrastructure to encourage greater use of electric cars and requires electrical utilities to include expansion of electrical vehicle charging facilities as part of their strategies and incentives for reducing overall energy consumption.

c. Regional Plans, Programs, and Regulations

Descriptions of energy-related regional plans, programs, and regulations, including Plan Bay Area 2050 and Transit-Oriented Communities Policy (MTC Resolution No. 4530) are provided in Section 4.3, Land Use and Planning Policies.

d. City of Brisbane Plans, Ordinances, and Regulations

General Plan

Chapter IX: Conservation

Policy 139: Promote the conservation of non-renewable energy resources.

Policy 140: Encourage energy-efficient building design and site planning.

Program 140a: Continue to administer building codes that contain State requirements for energy conservation.

Program 140b: As a part of the review of land use applications for subdivisions, specific plans and new non-residential and multi-family projects, encourage the design and siting of structures and the use of landscape materials in terms of utilizing natural resources for heating and cooling.

Policy 141: Encourage the installation of energy-efficient appliances.

Policy 142: Continue to support vehicle trip-reduction programs to conserve non-renewable fuels. (See Chapters VI and X of the City's General Plan for additional trip reduction policies.)

Chapter XII: Policies and Programs by Subarea

Policy BL.1 G: The required specific plan for the Baylands shall include a sustainability program for new development consistent with the principles of the Sustainability Framework for the Brisbane Baylands, Final Report accepted by the City Council on November 5, 2015. Baylands development shall be designed so as to be energy neutral on an ongoing basis.

Brisbane Municipal Code

Brisbane Municipal Code Section 15.80 specifies green building standards for new developments, including meeting a minimum Leadership in Energy and Environmental Design (LEED) "Silver" rating on the Green Building Project Checklist for all new commercial projects over 10,000 square feet and achieving a "green home" rating on the Multi-Family GreenPoint

Checklist[235] for any residential developments with 20 or more units. To meet these requirements, a variety of energy, stormwater, and water efficiency measures can be implemented that are integrated in green building design, siting, construction, and operations.

Building Code[236]

The latest update to the California Building Code (CBC) was adopted by the City of Brisbane and is effective as of January 1, 2023. Subsequently, on July 18, 2024, the Brisbane City Council adopted further Municipal Code amendments in the form of an Energy Performance Reach Code (Ordinance No. 691). At the same time, the Council adopted further amendments to the City's EV charging requirements (see discussion below under "Chapter 15.84, Electric Vehicle Infrastructure").

The CBC requires that new construction be more energy efficient and includes solar requirements for new residential construction. In addition, through Ordinance 675,[237] the City of Brisbane has chosen to exceed the state's standards including installation of electric vehicle charging infrastructure, discussed below.[238]

Ordinance No. 691, the City's Energy Performance Reach Code, both amended EV charging infrastructure requirements, discussed below, and added Energy Performance requirements for new buildings; the latter replaced all-electric requirements previously adopted under Ordinance No. 675. The 2022 CBC requires new construction be more energy efficient and includes solar energy and battery storage system requirements for new residential and nonresidential construction. Through the Reach Code, the City of Brisbane has chosen to exceed the state's standards by requiring new residential and non-residential development to meet increased energy performance standards, resulting in an anticipated decrease in energy use and emissions from newly constructed buildings, compared to the 2022 CBC. The City's Reach Code applies to all new construction and is intended to achieve cost-effective energy efficiency and reduce emission through performance standards, rather than a set of detailed prescriptive requirements. For example, the Reach Code does not prohibit the use of natural gas or propane appliances, but requires that such use be within an overall building energy use scheme that

[235] Build It Green, a non-profit organization, has developed New Home Construction Green Building Guidelines and a Multi-Family GreenPoint Checklist, based upon the Multi-Family Green Building Guidelines established by the Alameda County Waste Management Authority. See Section 15.80.020 of the Brisbane Municipal Code for more information.

[236] The California Building Standards Code, often referred to as the state's "Building Code," comprises all parts of Title 24 of the California Code of Regulations (24 CCR), as set forth above on page 4.11-13.

[237] Brisbane Ordinance No. 675 can be found at: https://library.municode.com/ca/brisbane/ordinances/municipal_code?nodeId=1185187. Ordinance No. 675 amended CALGreen, as it applies in Brisbane (Municipal Code Section 15.04.043), such that new construction and qualifying alterations "do not use combustion equipment or are ready to accommodate installation of electric heating appliances," with certain exceptions.

[238] Ordinance No. 675 also generally precluded use of natural gas in new construction; however, those provisions were repealed in July 2024 as part of adoption of the Energy Performance Reach Code through Ordinance No. 691.

meets the City's performance standards. Additionally, the Reach Code requires construction that employs natural gas or propane to also include electrical circuitry to allow for potential future conversion to electric appliances.

The Reach Code sets forth compliance metrics for new single-family residential construction and for new multi-family residential and non-residential construction, each of which is based on definitions in the California Energy Code (24 CCR Part 6). For single-family homes, the Reach Code requires achievement of a performance standard (Energy Budget) based on the building's Energy Design Rating. The Energy Design Rating factors in both overall energy efficiency and "time-dependent valuation" (TDV) Energy. TDV Energy considers the varying costs and impacts of energy use at different times of the day and year, including, among other things, greenhouse gas emission rates and actual cost of electricity from "peaker" power plants, which are typically less efficient facilities that operate only during periods of highest energy demand (e.g., on the hottest days of the year, when air conditioning use is highest). TDV Energy is intended to reflect the fact that energy use during periods of peak demand have greater environmental and economic costs than off-peak energy use. Both Source Energy and TDV Energy for a particular building are determined based on calculation methodologies set forth by the California Energy Commission in manuals and appendices to the state Energy Code.

Similarly, for new multifamily residential buildings, the Reach Code requires achievement of TDV Energy Budget as set forth in the Code. Different standards apply to low-rise (four stories or fewer) and high-rise (more than four stories) buildings. Exceptions are available for both single- and multi-family buildings in cases of documented infeasibility and other limited circumstances.

In addition, the Brisbane City Council adopted an updated Transportation Demand Management (TDM) ordinance amending Brisbane Municipal Code Section 10.52 on October 19, 2023. The TDM ordinance's purpose is to "promote more efficient utilization of existing transportation facilities."

Chapter 15.84, Electric Vehicle Infrastructure

Chapter 15.84 of the City's Municipal Code, Electric Vehicle Infrastructure, sets forth requirements for the installation of electric vehicle (EV) charging equipment in new construction.

- For new single-family residences, duplexes, and townhouses (and new garages at existing such buildings) where two or more parking spaces per unit are required, the Code requires installation of one Level 1 EV Ready Circuit and one Level 2 EV Ready Circuit.[239]

[239] Level 1 chargers operate using a standard 120-volt, 20-amp household electrical circuit. Level 2 chargers use higher-output 240-volt power sources (generally with a 40-amp capacity) so that recharge times for EVs are much faster than with Level 1 systems.

- For new multifamily residential buildings, the Code requires a minimum of one EV charging ready parking space per unit, with a minimum of 10 percent of these spaces equipped with Level 2 EV chargers. Additionally, at least 50 percent of guest parking spaces must have EV chargers. Finally, a minimum of 40 percent of the total number of parking spaces must be EV charging-ready or have chargers installed.[240]
- For non-residential new construction:
    - Where nine or fewer parking spaces are required, at least one space must be either EV-ready (equipped with a Level 2 EV Ready Circuit) or have an EV charger installed.
    - Where 10 or more parking spaces are required, at least 15 percent of the required spaces must have Level 2 EV chargers, with additional 10 percent or 35 percent being required to provide low-power (20-amp) EV charging-ready spaces, depending on whether the non-residential use is defined in the Municipal Code as having higher or lower parking turnover.[241]

4.11.4 RELEVANT SPECIFIC PLAN PROVISIONS

The Specific Plan includes the following energy-related features that would either reduce energy consumption or reduce the Specific Plan's demand for energy from the regional electricity grid and other regional energy supply infrastructure:

- Higher-intensity development within walking distance of the Caltrain Bayshore station, along with construction of an entry plaza to the station.
- Solar-powered infrastructure systems totaling 59.8 MW of capacity and 92,445 MWh of annual generation[242] would be installed within the Specific Plan area, including a 55-acre solar field[243] (40 MW) in addition to 30 MW of distributed solar installed on buildings, ground-mounted, and over parking lots where feasible.
- 30 MW of battery-based stationary energy storage systems, equivalent to 44,056 MWh of annual electricity storage,[244] would be installed as part of site-specific development projects within the Specific Plan area. In addition, a 250 MW front-of-the-meter, utility-

[240] Certain exceptions are permitted, including, in the case of multi-family residential buildings, a reduction in the number of EV-ready spaces to fewer than one per unit if fewer than one parking space per unit are required.

[241] Higher parking turnover uses are those such as retail, restaurants, professional offices, gyms, recreational uses, and meeting halls. Lower parking turnover uses are those such as office, R&D, industrial, hotels, and schools.

[242] The Specific Plan requires a minimum of 85,000 MWh of electricity to be generated annually. Based on the reasonably foreseeable mix of building types anticipated within the Baylands, actual renewable energy generation was estimated to be 92,445 MWh in the Baylands Energy Plan prepared by Thornton Tomasetti Inc. in May 2021.

[243] The 55-acre solar farm would be constructed in the eastern portion of the Baylands, between Visitacion Creek and the relocated Lagoon Road, in increments as portions of the landfill closure process are completed.

[244] The annual energy storage figure is based on 30 MW of total battery capacity operating 4 hours per day for 365 days per year, based on the Baylands Energy Plan prepared by Thornton Tomasetti Inc. in June 2023.

scale battery storage facility, equivalent to 365,000 MWh of annual electricity storage,[245] is proposed that would serve as a regional grid resource.

- On-site bicycle and pedestrian trails that connect to off-site trails.
- An on-site shuttle system connecting Baylands residential and office uses to the Caltrain Bayshore Station.

a. LEED Rating Requirements

The Specific Plan requires that all new buildings constructed as part of the Specific Plan be LEED Gold or GreenPoint Rated (based on 2022 rating criteria for LEED and GreenPoint). The Specific Plan incorporates the current (as of 2022) LEED for Neighborhood Development (ND) strategies, as well as the current LEED v4 Gold minimum rating for new commercial buildings, and the current Greenpoint Rated Checklist for single-family and multi-family new homes in California. The Specific Plan also requires residential and nonresidential buildings to comply with CALGreen Tier 1 voluntary standards. In the event of a conflict between the private and GreenPoint rating systems and applicable laws, regulations, or ordinances (inclusive of CALGreen Tier 1), the Specific Plan states the more stringent requirement shall apply.[246]

b. Building Electrification

The Specific Plan applicant has committed to construct all buildings to be all-electric (i.e., no use of natural gas) and proposes not extending natural gas service to new development outside of Existing Use Areas within the Baylands.[247] Additionally, the Specific Plan proposes to deliver all energy from renewable resources to the Baylands.

c. Building Energy Efficiency Strategies

The Baylands Energy Plan prepared for the applicant identifies specific building efficiency project design features that development teams should incorporate to meet the Specific Plan's energy efficiency targets (Thornton Tomasetti Inc. 2023).[248] This document was included in the energy modeling conducted for the project.

[245] The annual energy storage figure is based on 250 MW of total battery capacity operating 4 hours per day for 365 days per year, based on the Baylands Energy Plan prepared by Thornton Tomasetti Inc. in June 2023.

[246] The Specific Plan does not define "conflict," nor does it require compliance with the most stringent applicable standard. Thus, the EIR assumes that Specific Plan development would comply with CALGreen Tier 1 voluntary standards, unless an adopted legal requirement would mandate more stringent requirements.

[247] Research and development uses would use on-site propane tanks on an as-needed basis.

[248] Because the Specific Plan does not explicitly require implementation of these measures, the EIR assumes that Specific Plan development would comply with CALGreen Tier 1 voluntary standards, unless an adopted legal requirement would mandate more stringent requirements.

Title 24, Part 6 code requirements include efficient envelopes, lighting, mechanical systems, and simple and inexpensive energy-saving methods such as air-side economizers. Automated daylight controls are also required for most perimeter non-residential/hotel space types by Title 24, Part 6. Building strategies that will be explored in the design process for all on-site buildings to benefit the Baylands and improve upon the code standards include:

- **Passive Building Strategies:** To reduce lighting energy, orienting buildings on an east-west axis where possible will minimize solar heat gain and maximize daylight. Incorporating natural ventilation into all building types except high-density office and lab sections and using shading devices to reduce unwanted solar heat gain.
- **Energy Star Products and Equipment:** Using Energy Star rated appliances, lighting, data center equipment, electronics, office equipment, building envelope products, heating and cooling systems, water heaters, and commercial food service equipment.
- **Efficient Building Envelopes:** Incorporating improvements to Title 24 code requirements for insulation R-values and infiltration. Minimizing thermal bridging across the facade with thermal breaks at connecting areas like overhangs and balconies. Using high-performance window wall systems with shading to block excessive solar heat gain and glazing with low u-values, low solar-heat gain coefficient (SHGC), and high visible light transmittance (VLT), apart from Lab buildings – due to the high volume of air movement, additional heating must be needed in which a higher SHGC is beneficial.
- **Air Sealing:** Designing a "tight" envelope using an exterior liquid applied air barrier, envelope taping and sealing all connection points and transitions, installing air locks at entrances, windows with low air-leakage ratings, and latching mechanisms, for all buildings will significantly reduce air leakage. Incorporating vestibules at main entrances in all multi-family and commercial buildings to reduce air infiltration.
- **High-Efficiency Fans, Pumps, & Motors with Variable Speed Drives:** Installing only fans, pumps, and motors with variable speed drives (increase/decrease speed) to reduce energy use.
- **Heat Pumps:** Using heat pump systems that move heat or cool air by using a compressor and a circulating liquid of refrigerant from one area to another for space heating and hot water systems. Heat pumps use less energy to make heat and can achieve more than 300 percent efficiency, versus traditional gas furnaces, which achieve around 98 percent efficiency. Air-to-water heat pumps will extract low temperature heat from outside air and deliver heat into a stream of water passing through a condenser. This system pairs well with the use of hydronic heating systems such as radiant floors and radiant ceiling panels, fan-coil convectors, and chilled beams. The heat pump system will also be configured to provide energy needed for most domestic water heating.

- **HVAC Controls:** Optimize energy saving by adjusting setpoints (e.g., lowering daytime temperature for heating, increasing for cooling, and lowering nighttime heating), reducing minimum air flow rates through variable-air volume boxes, and limiting heating and cooling to when the building is most likely occupied.
- **Heat Recovery Ventilators:** The appropriateness of using heat recovery ventilators will be evaluated on a building-by-building basis. Buildings with a Variable Refrigerant Flow (VRF) type heat pump system will also utilize a Dedicated Outdoor Air system (DOAS) with heat recovery to optimize energy savings.
- **Lighting Technology:** The 2022 California Green Building Code, Title 24, Part 6 requires using lighting controls to reduce energy use in building lighting systems. These requirements can be done by sizing and orientating windows for optimal daylight and providing shade as needed to prevent glare. Reducing lighting power densities (LPDs) can be achieved through selection of LED fixtures and the careful layout of lighting.
- **Water Efficiency:** The building developments will use WaterSense labeled plumbing products per code, which will also reduce water use below code, targeting a combined 40 percent or greater reduction from code in fixture flush and flow rates. This will reduce consumption and water heating, especially for residential buildings where hot water consumption is the greatest.
- **Equipment Sizing:** Operating oversized equipment may be less efficient compared to properly sized equipment as it can decrease indoor thermal comfort due to unnecessary cycling and excessive airflow.
- **Duct Insulation:** Improving insulation of ducts that are not in enclosed, conditioned spaces above the code minimum will decrease efficiency losses.
- **Thermostats:** Using "smart thermostats" that minimize the use of supplementary electric resistance heating during startup and recovery from setback and optimize thermal comfort and energy savings by learning behavioral patterns of the occupants.
- **Zonal Control:** Zoning heating and air-conditioning systems into smaller zones to enable energy savings by maintaining a certain temperature setpoint only in a smaller square footage that is occupied. Fine grained controls can allow for adaptation in different occupied spaces in office buildings.
- **Lab-Specific Measures:** Providing supply and exhaust air to fume hoods with VAV (Variable Air Volume) capabilities to reduce energy.
- **Building Energy Metering:** Requiring meters for all loads in all buildings to monitor energy use. Implementing an ongoing operations and maintenance program to monitor building energy performance in line with best practices in retro-commissioning.

d. Electric Vehicle Charging

The Specific Plan requires provision of EV charging facilities in compliance with 2022 CALGreen Code Tier 1 voluntary requirements. Tier 1 requires one- and two-dwelling unit residential buildings to be Level 2 EV Ready. For multifamily, hotel, and motel buildings, the Brisbane Municipal Code Chapter 15.84 requires 40 percent of parking spaces to be EV Ready and 10 percent of parking spaces to be Level 2 EV Ready (a total of 50 percent of the parking spaces would include EV charging infrastructure). For non-residential buildings, Table 5.106.5.6.1 of the CALGreen Code is to be used to determine the number of EV-capable spaces required.

e. Transportation Demand Management Plan

As discussed in Chapter 3, *Project Description*, the Specific Plan proposes preparation of Transportation Demand Management (TDM) Plans for each applicable site-specific development project as it undergoes site-specific development review. The purpose of these TDM Plans is to encourage and incentivize travel other than via use of single-occupant vehicle trips in accordance with the City of Brisbane's TDM ordinance (Municipal Code Chapter 10.52), which would reduce vehicle trip generation by an additional 16.4 percent compared to the Specific Plan without the TDM measures (see analysis of Impact TRA-1). Mobile energy use associated with the Specific Plan was calculated based on total annual VMT assuming implementation of the TDM Plan.

4.11.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of energy impacts.

Threshold EN-1: **The Baylands Specific Plan would cause a significant impact by consuming energy resources in a wasteful, inefficient, or unnecessary way.**

Threshold EN-2: **The Baylands Specific Plan would cause a significant impact if it would conflict with applicable programs, plans, ordinances, or policies for renewable energy and energy efficiency.**

4.11.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact EN-1: Consumption of Energy Resources in a Wasteful, Inefficient, or Unnecessary Way

Methodology for Determining Significance in Relation to Threshold EN-1

The significance of Impact EN-1 relies on quantifying, where possible, Baylands energy consumption during construction and operations and undertaking qualitative analysis where quantification is not possible to consider whether Baylands development would:

- Increase per capita energy consumption;
- Increase reliance on fossil fuels such as gasoline or diesel, natural gas, or coal; or
- Decrease reliance on renewable energy sources.

Project Construction

Construction activities could vary substantially from day to day, depending on the phase, specific types and number of construction activities being undertaken on any given day, and the number of workers and vendors who would travel to and from the Baylands for each such activity. This analysis considers these factors and provides the estimated maximum daily construction energy consumption for purposes of evaluating the associated impacts on energy resources.

Construction fuel use was forecasted by estimating CO_2 emissions from CalEEMod version 2022 for on-road and off-road equipment and converting CO_2 to gallons of gasoline and diesel fuel use using Climate Registry emission factors for the construction equipment expected to be used for each phase of project development (The Climate Registry 2023). Construction equipment and hours are consistent with the emissions modeling described in the *Air Quality Technical Report* and the *Greenhouse Gas Emissions Technical Report*.

Construction activities associated with the 2025 Specific Plan project are proposed to take place in two general phases, with Phase 1 (inclusive of the solar farm and infrastructure in the Phase 2 area) assumed to occur from 2027 through 2035, and Phase 2 assumed to occur from 2036 through 2040 (see Section 3.3.4 and **Table 3-8**). The development schedule would also be affected by market forces. The specific type of construction work would also vary by the buildout of the Baylands Specific Plan, but would generally consist of the following sequence:

1. Site preparation, including demolition of existing buildings and removal of existing vegetation and infrastructure in areas to be graded over the entirety of the Baylands;

2. Grading, which generally consists of moving approximately 2.5 million cubic yards of soil from the eastern portion of the Baylands to the western portion to achieve final grades and provide pads for building construction; and
3. Construction of infrastructure, buildings, and on-site amenities generally within the Phase 1 area west of the Caltrain right-of-way, followed by construction of these features within the eastern portion of the site.[249]

Phase 1 would be the more intensive of the two construction phases because the majority of site grading, which includes moving 2.5 million cubic yards of soil from the east side of the site (Phase 2 area) to the west side (Phase 1 area) would occur.

If the onset of construction were to be delayed to a later date than assumed in the analysis, construction impacts would be similar to or less than those analyzed. This is because a more energy-efficient construction equipment and vehicle fleet mix would be expected in the future, because the In-Use Off-Road Diesel-Fueled Fleets Regulation and Advanced Clean Trucks Program implemented by CARB require construction equipment fleet operators to phase in less-polluting, more fuel-efficient heavy-duty equipment and trucks over time (CARB 2016).

Electricity Consumption during Construction

A qualitative assessment of energy use during project construction was undertaken to determine whether Baylands construction would be expected to result in demand for fuel greater on a per-unit-of-development basis than other development projects in the region. In addition, the CalEEMod emissions model, described further in the *Greenhouse Gas Emissions Technical Report*, was used to estimate project emissions of criteria air pollutants and GHGs, as well as electricity, natural gas, and water use. The same model used for the air quality and GHG analyses in this Technical Report was also used for estimating energy use.

Transportation and Construction Equipment Fuels

Transportation fuels would be consumed for transportation of construction workers and materials to and from the Specific Plan and off-site construction areas, and operation of construction equipment within those areas throughout the two construction phases.

Fuel consumption by on-site heavy-duty construction equipment was calculated based on the equipment mix estimated by the Specific Plan applicant and usage factors provided in the CalEEMod construction output files included in Appendix C1 of the Brisbane Baylands Energy

[249] As discussed in Section 3.3.2, certain Baylands infrastructure features and project amenities located within the eastern portion of the site are proposed to be constructed concurrent with residential development within the western portion of the site. Such infrastructure features include the water recycling and water detention facilities, water storage tank, Lagoon Park, and Visitacion Creek.

Technical Report (EIR Appendix I). The total CO_2 was then divided by emission factors from The Climate Registry to estimate fuel use (The Climate Registry 2023).

Fuel consumption by construction on-road workers, vendors, and delivery/haul trucks was calculated using the trip rates and trip distances consistent with the air quality and GHG emissions modeling worksheets and CalEEMod construction output files. The total CO_2 was then divided by emission factors from The Climate Registry to estimate fuel use (The Climate Registry 2023).

A combination of CalEEMod defaults and project-specific information was used for construction vehicle trip lengths, worker commutes, vendor and concrete truck trips, and haul truck trips. Consistent with CalEEMod defaults, construction worker trips were assumed to include a mix of light-duty gasoline automobiles and light-duty gasoline trucks. Construction vendor trucks were assumed to be a mix of medium-heavy-duty and heavy-duty diesel trucks, and concrete and haul trucks were assumed to be heavy-duty diesel trucks. Fuel consumption under baseline conditions was then subtracted from construction fuel consumption to determine the net fuel consumption during construction of the Specific Plan, including off-site infrastructure improvements. Refer to Appendix F1 of the Brisbane Baylands Energy Technical Report (EIR Appendix I) for detailed energy calculations.

The energy usage required for construction of the Specific Plan and off-site infrastructure was estimated based on the number and types of equipment that would be used during both construction phases by assuming a conservative estimate of construction activities (i.e., maximum daily equipment usage levels). Energy for construction worker commuting trips was estimated based on the predicted number of workers for the various phases of construction and the estimated VMT based on the conservative values in the CalEEMod and EMFAC2021 models. The assessment also includes a discussion of the Specific Plan and off-site infrastructure compliance with relevant energy-related regulatory requirements and incorporation of design features discussed in the *Greenhouse Gas Emissions Technical Report* (EIR Appendix H.1), that would minimize the amount of energy usage during construction. These measures are also discussed in Chapter 3, *Project Description*, and the *Air Quality Technical Report* (EIR Appendix G.1).

The estimated fuel economy for heavy-duty construction equipment was based on fuel consumption factors from the CARB OFFROAD emissions model, a state-approved model for estimating emissions from off-road heavy-duty equipment. The estimated fuel economy for haul trucks, vendor trucks, concrete trucks, and worker commute vehicles was calculated using the trip rates and distances consistent with the air quality and GHG emissions modeling worksheets and CalEEMod construction output files. The total CO_2 was then divided by emission factors from The Climate Registry to estimate fuel use.

Specific Plan Operations

Existing uses within the Specific Plan area currently consume energy; some of these uses would be demolished and replaced with Specific Plan components, and some would remain. However, because the existing uses along Industrial Way that are planned to be demolished are anticipated to move elsewhere within San Francisco and San Mateo counties and continue to consume energy, such energy consumption would not be "retired" by the Specific Plan. Therefore, to provide a conservative analysis of the Specific Plan's impacts, energy usage for existing conditions was not subtracted from the Specific Plan's total estimated energy use. The assumptions used here are the same as those used in the *Greenhouse Gas Emissions Technical Report* (EIR Appendix H.1).

Operational Energy Demand Scenarios

Operational energy impacts are evaluated based on three modeling scenarios as described below:

- **Scenario 1:** Completion of the First Increment of the Proposed On-Site Solar Energy Generation Field. This represents operations of the Specific Plan at the completion of construction of the first increment of the on-site solar field in 2037, and includes 2,200 dwelling units of low-density residential, mid-rise residential, and high-rise residential, and 3,400,000 square feet of mid-density commercial with lab and retail, the water treatment plant, and the new fire station.
- **Scenario 2:** Phase 1 Operations. This represents operations of the Specific Plan at the completion of Phase 1 construction, which is anticipated to occur in 2038, and includes all of Scenario 1 plus 1,100,000 square feet of high-density commercial with hotel and retail.
- **Scenario 3:** Phase 2 Operations. This represents full buildout operations of the Specific Plan at the completion of Phase 2 construction, which is anticipated to occur in 2042, and includes 2,500,000 square feet of low-density commercial tech campus.

Operational energy use is estimated for each of these three scenarios.

Electrical Power and Consumption

Electrical power for the Specific Plan would be provided by PCE through PG&E's transmission lines at transmission voltage (115 kV) from the off-site PG&E Martin Substation on Geneva Avenue and a substation to be located on approximately 2 acres of the Specific Plan area. The 115 kV electricity would be stepped down to 12 kV and distributed to the various buildings within the Specific Plan area through new on-site underground distribution lines. Modifications to the PG&E Martin Substation to connect the 250 MW battery storage facility and Baylands development would include a line disconnect switch and line coupling capacitor voltage transformers for the generation tie line, and fiber termination at the Martin Substation.

The Specific Plan's estimated electricity demand was analyzed relative to the state's existing and planned energy supplies in 2035 (the closest projected year to the Specific Plan buildout

year) (CEC 2018). Annual consumption of electricity usage associated with the supply and conveyance of water from operation of the Specific Plan was calculated using demand factors provided in CalEEMod. In addition, the Specific Plan's energy demand was analyzed relative to PG&E's maximum peak demand of 20,118 MW (CISO 2022).

Up to 2,723 EV charging stations would be installed within the Baylands, assuming compliance with CALGreen and Energy Performance Reach Code (Ordinance No. 691) EV charging requirements (24.75 percent of the maximum permitted 11,000 parking spaces). An additional 4,201 EV ready parking spaces would be installed, for a total of 6,924 parking spaces with EV charging infrastructure (approximately 63 percent of the maximum permitted 11,000 parking spaces). Electrical demand from these charging stations was estimated by multiplying the number of charging stations by their d kilowatt capacity and their average estimated annual usage (Thornton Tomasetti Inc. 2023).

Off-site electricity demand from water use associated with operation of the Specific Plan was calculated using CalEEMod and the electrical intensity factors for water supply, treatment, distribution, and wastewater treatment.

Electrical demand for Specific Plan buildings and for project infrastructure (water pump and lift stations, street lighting and traffic signals, parking lot lighting, and the on-site water reclamation facility) was derived from the Specific Plan applicant's energy plan document (Thorton Tomasetti Inc. 2023).

Natural Gas

The Baylands Specific Plan would not extend natural gas service to new development within the Specific Plan area but would retain existing natural gas service to Existing Use Areas. Therefore, the project would not cause changes to natural gas use, and there would be no impact.

Mobile Energy

Energy demand from employees, vendors and suppliers, and visitors traveling to and from the Specific Plan area was estimated based on the predicted number of trips to and from the Specific Plan area taken from the analysis in the Baylands Transportation Impact Analysis (EIR Appendix F.1). Energy use associated with firefighting apparatus that would operate from the Baylands' new on-site firehouse was derived in the same manner.

Based on the Specific Plan's annual mobile-source GHG emissions, gasoline, diesel, and natural gas consumption rates were calculated using the county-specific vehicle fleet mixes in EMFAC2021 and a standard conversion factor from GHG emissions to gallons of fossil fuels (i.e., gasoline, diesel, and natural gas). Electricity use for battery electric vehicles and plug-in hybrid electric vehicles was also based on county-specific vehicle fleet mixes and electricity consumption rates for these vehicles from EMFAC2021. Supporting calculations are provided in Appendix F2 of the Baylands Energy Technical Report (EIR Appendix I).

Emergency Generator Energy Consumption

Emergency generators would be located at all buildings with occupied space greater than 75 feet in height, the relocated fire station, the new fire station, the water recycling facility, the battery storage facility, and the solar farm. The emergency generators would use diesel fuel for testing and maintenance and for emergency generation of electricity in the event of a power outage. Routine proposed maintenance and testing for each of the emergency generators is conservatively assumed to consist of 50 hours run time per year, consistent with the maximum allowed testing time pursuant to the Airborne Toxics Control Measure (ATCM) for Stationary Compression Ignition Engines (17 CCR 93115), plus an additional 100 hours for assumed emergency use.

Emergency generator fuel usage was estimated based on the fuel consumption rate and anticipated size of the generators (i.e., 1,000 horsepower for Tier 4 generators). Additional details on fuel consumption rates and hours of operation for the emergency generators can be found in the Air Quality Technical Report; a separate run of CalEEMod was employed for this purpose.

Landscaping Energy Consumption

Energy use associated with Baylands landscaping maintenance was similarly taken from the *Air Quality Technical Report* and the estimated GHG emissions for the Specific Plan; a separate run of CalEEMod was also undertaken for this purpose. The analysis assumes that only the approximately 18 acres of active recreation areas (Community Fields) and community greens (Sunnydale Park, Baylands Park, and Roundhouse Park) would be actively landscaped, while the remainder of the Specific Plan's open space area would be natural space.

Impact Assessment

Construction

Construction of the Specific Plan would include, among other things:

- Demolition of existing buildings and streets;
- Construction of new buildings, streets, open space;
- Construction of on-site and off-site wet infrastructure, including water, sewer, and stormwater pipelines, pumps, and related facilities;
- Construction of on-site and off-site dry infrastructure, including electricity and telecommunication and internet facilities.[250]

In addition, the Specific Plan would construct on-site renewable energy generation, distributed and utility-scale battery storage, and electrical line undergrounding and construction of new

[250] Consistent with the Specific Plan, natural gas service would not be extended to buildings in the Specific Plan area.

distribution facilities; an on-site switching substation; and connections to as well as improvements and equipment upgrades at PG&E's Martin Substation. New underground transmission lines would connect the Martin Substation to the Specific Plan area and its on-site switching station and battery storage facility. Energy use for construction of these infrastructure improvements is included in this analysis. Specifically, construction-related energy expenditures for the Martin Substation improvements and associated infrastructure such as transmission lines would be primarily in the form of diesel and gasoline fuel for construction equipment and worker trips. The amount of electricity used during construction would be minimal; typical demand would stem from the use of electrically powered hand tools and any construction trailers needed during construction activity. The proposed Martin Substation improvements, including connection of the substation to the Baylands site via a new power line, is estimated to consume approximately 3,400 gallons of gasoline and 13,200 gallons of diesel fuel. These totals are included in the overall Specific Plan construction energy tabulation below.

Table 4.11-2 presents an estimate of the amount of petroleum-based transportation energy that would be consumed annually during Specific Plan construction, including the Martin Substation improvements and connection of the substation to the Baylands site. During Phase 1 construction, which includes the movement of approximately 2.5 million cubic yards of soil from the eastern to the western portion of the site, on- and off-road vehicles would consume an estimated annual average of approximately 90,153 gallons of gasoline and 410,345 gallons of diesel. During Phase 2 project construction, on- and off-road vehicles would consume an estimated annual average of approximately 85,948 gallons of gasoline and 111,895 gallons of diesel.

Table 4.11-2: Average Annual Petroleum-Based Energy Usage during Project Construction

Energy Type	Average Annual Gallons of Fuel Used during Construction	
	Phase 1 (assumed 2025–2037)	Phase 2 (assumed 2038–2042)
Gasoline		
On-Road Construction Vehicles	90,153	85,948
Off-Road Construction Equipment	—	—
TOTAL AVERAGE ANNUAL GASOLINE CONSUMPTION[a]	**90,153**	**85,948**
Diesel		
On-Road Construction Vehicles	188,148	84,109
Off-Road Construction Equipment	222,197	27,786
TOTAL AVERAGE ANNUAL DIESEL CONSUMPTION[a]	**410,345**	**111,895**

SOURCES: Data compiled by Environmental Science Associates in 2024; CalEEMod 2022

NOTES:

Detailed calculations are provided in Appendix F1 of the Baylands Energy Technical Report (EIR Appendix I).

a. Totals may not add up due to rounding.

Because Baylands construction will occur over a nearly 20-year period, electrical consumption for Baylands construction was analyzed qualitatively since the extent to which electric powered equipment might be commercially available during future construction activities to replace non-

electric powered vehicles and equipment could vary substantially and cannot be accurately estimated.

Transportation fuels (gasoline and diesel) are produced from crude oil, which can be domestic or imported from various regions around the world. Based on current proven reserves, crude oil production would be sufficient to meet more than 50 years of worldwide consumption (BP Global 2021). Construction on-road vehicles would comply with CAFÉ fuel economy standards, CARB's Advanced Clean Cars I and II standards, CARB's Advanced Clean Trucks standards, and CARB's Advanced Clean Fleets standards, all of which would result in more efficient use of transportation fuels (lower consumption). Vehicles used for project-related trips would also comply with AB 1493 and the Low Carbon Fuel Standard, which are designed to reduce vehicular GHG emissions, but would also result in additional fuel savings.

Specific Plan construction activities would be required to use fuel-efficient off-road equipment consistent with federal and state regulations, such as the anti-idling regulation in accordance with CCR Title 13, Section 2485; and fuel requirements for stationary equipment in accordance with CCR Title 17, Section 93115 (concerning Airborne Toxic Control Measures). Compliance with the anti-idling and emissions regulations discussed above would result in fuel savings from the use of more fuel-efficient engines. Construction equipment would also be required to comply with federal and state fuel efficiency standards for on-road and off-road construction equipment. As discussed in the Regulatory Context for Baylands Development discussion, stringent emission standards were adopted for off-road construction equipment (i.e., "Tier 4" standards) (40 CFR Parts 1039, 1065, and 1068; 13 CCR, Section 2025; AR 2854). CARB also adopted emission standards for on-road heavy duty diesel vehicles (i.e., haul trucks). (13 CCR, Section 1956.8.) These haul truck regulations mandated fleet turn-over to ensure that nearly all on-road diesel trucks would have 2010 model year engines or equivalent [i.e., Tier 4] by January 1, 2023. CARB regularly evaluates and updates these regulations to implement the best available control measures and implementing every feasible control measure.

In addition, the Specific Plan proposes to meet the minimum diversion requirements identified in the City's Recycling and Diversion of Debris from Construction and Demolition (Chapter 15.75, of the Brisbane Municipal Code) of 65 percent of the nonhazardous construction and/or demolition waste and 100 percent of inert solid material associated with excavations and land clearing operations. This would be accomplished by diverting mixed construction and demolition debris to City-certified construction and demolition waste processors, using City-certified waste haulers, to recycle and/or salvage for re-use.

Diverting mixed construction and demolition debris would reduce truck trips to landfills, which are typically located some distance away from city centers and would increase the amount of waste recovered (e.g., recycled, reused) at material recovery facilities.

Construction activities would use energy for construction worker travel and to transport construction materials and demolition debris to and from the Baylands. Idling restrictions and

the use of cleaner, energy-efficient equipment and vehicles would result in relatively less fuel combustion and energy consumption.

Although there would be a temporary increase in electricity consumption within the Baylands during construction, electrical demand would vary at any given time based on the specific construction activities being performed and would cease upon completion of construction. Electricity use from construction would be short-term, limited to the working hours, used for necessary construction-related activities, and would represent a small fraction of the Specific Plan's net annual operational electricity. Furthermore, the electricity used for off-road construction equipment would have the effect of reducing construction-related emissions of air pollutants and GHGs compared to traditional diesel-powered equipment.

Overall, Baylands construction would not be expected to result in demand for energy greater on a per-unit-of-development basis than other development projects in the region, with the exception that substantial site grading is needed to move 2.5 million cubic yards of soil from atop the former landfill within the eastern portion of the site to the western portion to create final grades and provide adequate protection from flooding and projected sea level rise. Because such grading is required to return the Baylands to a safe and healthy condition, the resulting energy consumption would not result in a wasteful, inefficient, or unnecessary consumption of energy. Although the extent Baylands development is large, construction and development would occur over an anticipated 17-year period, and demand for construction-related electricity and fuels would be spread out over that time frame.

Operations

Operation of residential, commercial, and other uses within the Baylands would consume energy for multiple purposes, including building operations such as HVAC systems, building lighting, and cooking; landscaping equipment; traffic signals; on-site infrastructure including the water recycling facility and water storage tank; irrigation pumps; EV charging stations; the new fire station; and emergency generators. Energy would also be consumed during operations for water supply/conveyance, treatment, distribution, and wastewater treatment; and on-road vehicle trips. Total annual energy consumption at various points during Specific Plan buildout are summarized in **Table 4.11-3** and provided in greater detail in **Table 4.11-4**, **Table 4.11-5**, and **Table 4.11-6**. These tables present the total consumption for electricity, natural gas, gasoline, and diesel for project operation during completion of the first increment of the Baylands solar energy generating field (assumed to be in 2037), completion of Phase 1 development (assumed to be in 2038), and completion of the full Specific Plan (assumed to be in 2042).

Table 4.11-3: Total Annual Specific Plan Area Annual Energy Use

Source	Electricity (MWh/yr)	Natural Gas (MMBtu/yr)[a,b]	Gasoline (gal/yr.)	Diesel (gal/yr.)
Project Operation at Completion of the First Increment of the Proposed On-Site Solar Energy Generation Field (assumed to be in 2037)	145,010	20,723	3,595,123	446,558
Project Operation at Completion of Phase 1 Development (assumed to be in 2038)	155,709	20,392	3,569,797	475,867
Project Operation at full Specific Plan (assumed to be in 2042)	184,592	21,570	4,834,331	585,109

SOURCES: Data compiled by Environmental Science Associates in 2024; Thornton Tomasetti Inc., 2023 (energy use values); CalEEMod, 2022; EMFAC, 2021; California Energy Commission, California Energy Consumption Database, 2023, https://ecdms.energy.ca.gov/; California Energy Commission, California Annual Retail Fuel Outlet Report Results, 2022, https://ww2.energy.ca.gov/almanac/transportation_data/gasoline/piira_retail_survey.html.

ABBREVIATIONS: EV = electric vehicle; gal = gallons; MMBtu/yr = million British thermal units; MWh/yr = megawatts per year

NOTES:

All mobile-source fuel consumption calculated using fleet mixes, vehicle types, fuel efficiencies, and fuel types from EMFAC2021.

a. Natural gas consumption includes consumption of natural gas by vehicles that would travel to or from the Specific Plan area. Values estimated using EMFAC2021.
b. Electricity use includes EV energy consumption not accounted for by on-site EV charging. Natural gas consumption includes non-electric shuttle and transit vehicles.
c. Energy use values from Thornton Tomasetti Inc., 2023.
d. Energy consumption assumes compliance with Tier 1 CALGreen Code requirements.

Table 4.11-4 summarizes the Specific Plan's on- and off-site annual operational energy use at completion of the first increment of the Baylands solar energy generating field (assumed to be in 2037), at which time a portion of Phase 1 development[251] west of the Caltrain right-of-way would be completed and occupied. On-site energy use includes total annual building energy, EV charging, pump and lift stations, parking lot lighting, street lighting, traffic signals, emergency generators, wastewater reclamation facility, landscaping equipment, and fire stations. Off-site energy use includes water use and mobile sources. As shown in **Table 4.11-4**, the Specific Plan's annual energy demand at completion of the first increment of the Baylands solar energy generating field would be approximately 145,010 MWh of electricity,[252] 20,723 million British thermal units (MMBtu) of natural gas, 3,595,123 gallons of gasoline, and 446,558 gallons of diesel.

[251] Completion of the first increment of the proposed on-site solar energy generation field (assumed to be in 2037), would include 13,170,850 square feet of total gross building area. This includes 2,200 dwelling units.

[252] Because the first increment of the Baylands solar energy generating field would become operational at this time, and buildings constructed within Phase 1 would include roof-mounted solar energy generation, a portion of this electrical consumption would be satisfied with renewable energy generated within the Baylands. See discussion of "Energy Neutrality," below for discussion of the extent to which Baylands electrical demands would be met by on-site energy generation and storage systems.

Table 4.11-4: Total Annual On-Site and Off-Site Energy Use during Project Operation at Completion of the First Increment of the Proposed On-Site Solar Energy Generation Field (assumed to be in 2037)

NOTES:

All mobile-source fuel consumption calculated using fleet mixes, vehicle types, fuel efficiencies, and fuel types from EMFAC2021.

a. Natural gas consumption includes consumption of natural gas by vehicles that would travel to or from the Specific Plan area. Values estimated using EMFAC2021.

b. Electricity use includes EV energy consumption not accounted for by on-site EV charging. Natural gas consumption includes non-electric shuttle and transit vehicles.

c. Energy use values from Thornton Tomasetti Inc., 2023.

d. Energy consumption assumes compliance with Tier 1 CALGreen Code requirements.

e. On-site energy use includes total annual building energy, EV charging, pump and lift stations, parking lot lighting, street lighting, traffic signals, emergency generators, wastewater reclamation facility, landscaping equipment, and fire stations.

f. Off-site energy use includes water use and mobile sources.

Table 4.11-5 summarizes the Specific Plan's on- and off-site annual operational energy use for buildout of Phase 1[253] (assumed to be in 2038). On-site energy use includes total annual building energy, EV charging, pump and lift stations, parking lot lighting, street lighting, traffic signals, emergency generators, wastewater reclamation facility, landscaping equipment, and fire stations. Off-site energy use includes water use and mobile sources. As shown in **Table 4.11-5**, the Specific Plan's annual energy demand at the completion of Phase 1 encompassing the entirety of development west of the Caltrain right-of-way would be approximately 155,709 MWh of electricity,[12] 20,392 MMBtu of natural gas, 3,569,797 gallons of gasoline, and 475,867 gallons of diesel.

[253] Buildout of Phase 1 (assumed to be 2038) includes 14,420,850 square feet of total gross building area.

NOTES:

All mobile-source fuel consumption calculated using fleet mixes, vehicle types, fuel efficiencies, and fuel types from EMFAC2021.

a. Natural gas consumption includes consumption of natural gas by vehicles that would travel to or from the Specific Plan area. Values estimated using EMFAC2021.

b. Electricity use includes EV energy consumption not accounted for by on-site EV charging. Natural gas consumption includes non-electric shuttle and transit vehicles.

c. Energy use values from Thornton Tomasetti Inc., 2023.

d. Energy consumption assumes compliance with Tier 1 CALGreen Code requirements.

e. On-site energy use includes total annual building energy, EV charging, pump and lift stations, parking lot lighting, street lighting, traffic signals, emergency generators, wastewater reclamation facility, landscaping equipment, and fire stations.

f. Off-site energy use includes water use and mobile sources.

Table 4.11-6 summarizes the Specific Plan's on- and off-site annual operational energy use at full buildout[254] (completion of Phase 2 assumed to be in 2042). On-site energy use includes total annual building energy, EV charging, pump and lift stations, parking lot lighting, street lighting, traffic signals, emergency generators, wastewater reclamation facility, landscaping equipment, and fire stations. Off-site energy use includes water use and mobile sources. As shown in **Table 4.11-6**, the Specific Plan's annual net increased energy demand at full buildout (completion of Phase 2 assumed to be in 2042) would be approximately 184,592 MWh of electricity, 21,570 MMBtu of natural gas, 4,834,331 gallons of gasoline, and 585,109 gallons of diesel.

[254] Full Specific Plan buildout (assumed to be 2042) includes 16,920,850 square feet of total gross building area.

Table 4.11-6: Total Annual On-Site and Off-Site Energy Use at Full Specific Plan Buildout (assumed to be 2042)

Source	Electricity (MWh/yr)	Natural Gas (MMBtu/yr)[a,b]	Gasoline (gal/yr.)	Diesel (gal/yr.)
Total Annual Building Energy[c,d]	162,765	—	—	—
EV Charging[c,d]	4,160	—	—	—

NOTES:

All mobile-source fuel consumption calculated using fleet mixes, vehicle types, fuel efficiencies, and fuel types from EMFAC2021.

a. Natural gas consumption includes consumption of natural gas by vehicles that would travel to or from the Specific Plan area.

b. Electricity use includes EV energy consumption not accounted for by on-site EV charging. Natural gas consumption includes non-electric shuttle and transit vehicles.

c. Energy use values from Thornton Tomasetti Inc., 2023.

d. Energy consumption assumes compliance with Tier 1 CALGreen Code requirements.

e. On-site energy use includes total annual building energy, EV charging, pump and lift stations, parking lot lighting, street lighting, traffic signals, emergency generators, wastewater reclamation facility, landscaping equipment, and fire stations.

f. Off-site energy use includes water use and mobile sources.

Building and Infrastructure Energy

ELECTRICITY

The project will be required to comply with the 2022 Title 24 standards and applicable 2022 CALGreen Code requirements. Therefore, the Specific Plan's buildings and infrastructure would result in a projected annual demand for electricity of approximately 145,010 MWh during Phase 1 when the first increment of the Baylands solar energy generating field comes online (assumed to be 2037), 155,709 MWh for Phase 1 operations (assumed to be 2038), and 184,592 MWh for full Specific Plan buildout (assumed to be 2042), as shown in **Table 4.11-3** through **Table 4.11-6**. The Specific Plan would also provide on-site solar powered infrastructure systems, which are anticipated to generate a total of 92,445 MWh of electricity annually at full buildout.

In addition to complying with the CALGreen Code, the Specific Plan would incorporate project design features necessary to achieve LEED Gold for all buildings or GreenPoint Rated.

NATURAL GAS

The Specific Plan would not extend natural gas service to new uses within the Specific Plan area. Existing natural gas service will be maintained for existing natural gas users outside of the Specific Plan area, including the Kinder Morgan Tank Farm and Golden State Lumber. Research and development use within the Baylands would consume electricity or use on-site propane tanks on an as-required basis.[255]

DIESEL FUEL

In addition to electricity, Specific Plan uses would consume diesel fuel to power emergency backup generators. As shown in **Table 4.11-3** through **Table 4.11-6**, annual diesel consumption for backup generators would total 69,835 gallons during Phase 1 when the first increment of the Baylands solar energy generating field comes online (assumed to be 2037), 85,587 gallons for Phase 1 operations (assumed to be 2038), and 96,089 gallons at full Specific Plan buildout (assumed to be 2042).

Transportation Fuel Energy

GASOLINE, DIESEL, AND NATURAL GAS

During operations, Specific Plan-related vehicle travel would consume petroleum-based fuels (gasoline, diesel, and natural gas) and electricity for vehicular travel to and from the Baylands. Electricity consumed by electric and hybrid electric vehicles is discussed below.

The vehicle fleet that would be used by Baylands employees and visitors would consist primarily of light-duty automobiles and light-duty trucks that are subject to fuel-efficiency standards. Other trips to the Baylands would include trips associated with residential uses, the hotel, conferences, and delivery of goods. Most of these trips would also be subject to fuel-efficiency standards and/or compliance with anti-idling regulations for medium- and heavy-duty vehicles.

As shown in **Table 4.11-3**, the Specific Plan's mobile source petroleum-based fuel consumption would be approximately 5,595,123 gallons of gasoline and 466,558 gallons of diesel fuel annually during Phase 1 when the first increment of the Baylands solar energy generating field comes online (assumed to be 2037). Phase 1 (assumed to be 2038) annual mobile source fuel consumption would be 3,569,797 gallons of gasoline and 475,867 gallons of diesel. At full Specific

[255] Because the extent to which specific future research and development companies within the Baylands might require propane use cannot be determined, the amount of propane use was not estimated.

Plan buildout (assumed to be 2042), annual mobile source petroleum-based fuel consumption would be approximately 4,834,331 gallons of gasoline and 585,109 gallons of diesel.[256]

MOBILE SOURCE ELECTRICAL CONSUMPTION

As shown in **Table 4.11-3** through **Table 4.11-6**, annual electrical consumption by EVs is estimated to be 5,599 MWh when the first increment of the Baylands solar energy generating field comes online (assumed to be 2037), 5,811 MWh for Phase 1 operations (assumed to be 2038), and 9,434 MWh for full Specific Plan buildout (assumed to be 2042). These estimates of electric consumption by EV and plug-in electric vehicles are conservative because they comprise the sum of total vehicle electricity use calculated based on Specific Plan VMT by electric and hybrid vehicles in addition to the anticipated annual electricity use from on-site electric vehicle charging stations (4,160 MWh based on Tier 1 CALGreen requirements).

LOCAL TRANSIT

A fare-free shuttle network would be provided to transport Baylands residents and workers throughout the site and connect the Baylands to downtown Brisbane and existing transit routes. While the *Sustainability Framework for the Baylands* sets a target for use of electric (renewable energy) shuttles, the Specific does not include a requirement for its proposed shuttle system to use zero-emission vehicles.

VEHICLE MILES TRAVELED

As indicated in *Brisbane Baylands Transportation Impact Assessment*, VMT by Baylands residents and employees would be more than 30 percent below the existing regional baseline VMT for both Baylands residents and employees. In addition, Baylands development would result in an 80,000-mile daily decrease in regional (nine-county Bay Area) VMT under cumulative Year 2040 conditions (105,000-mile reduction with construction of Candlestick interchange improvements).

Total Baylands Electricity Use

As shown in **Table 4.11-3** through **Table 4.11-6**, total annual electricity consumption would be approximately 144,010 MWh when the first increment of the Baylands solar energy generating field comes online (assumed to be 2037), 155,709 MWh for Phase 1 operations (assumed to be 2038), and 184,592 MWh for full Specific Plan buildout (assumed to be 2042).

This estimate conservatively excludes the benefits of LEED Gold building design and improvements in demand response attributable to the Title 24 energy standards, which would further reduce peak demand. The Title 24 Building Energy Efficiency Standards include measures that encourage load shifting and demand response. Title 24 energy use performance standards are based on the time-dependent valuation of energy, which uses the value of the

[256] At buildout, Baylands mobile sources would also use a small amount of natural gas—21,570,000 Btu/yr, the energy equivalent of fewer than 200 gallons of gasoline.

electricity or natural gas used at every hour of the year to incentivize load shifting off of the peak use periods.

Total Specific Plan Fossil Fuel Use

As shown in **Table 4.11-3** through **Table 4.11-6**, petroleum-based fuel usage by the Specific Plan's mobile sources would be approximately 3,595,123 gallons of gasoline and 466,558 gallons of diesel fuel during Phase 1 when the first increment of the Baylands solar energy generating field comes online (assumed to be 2037). Phase 1 operations (assumed to be 2038), would consume 3,569,797 gallons of gasoline and 475,867 gallons of diesel. At full Specific Plan buildout (assumed to be 2042), annual consumption would be 4,834,331 gallons of gasoline and 585,109 gallons of diesel.

Vehicles and fuels used for vehicle trips resulting from the Specific Plan would be required to comply with federal CAFÉ fuel economy standards, CARB's Advanced Clean Cars I and II standards, and CARB's Advanced Clean Trucks and Advanced Clean Fleets standards, which would result in more efficient use of transportation fuels (lower consumption). Vehicles used for project-related vehicle trips would also comply as applicable with AB 1493 and the Low Carbon Fuel Standard, which are designed to reduce vehicular GHG emissions, but would also result in additional fuel savings.

The Specific Plan would support state-wide efforts to improve transportation energy efficiency and reduce transportation energy consumption with respect to private automobiles. The Specific Plan's design and characteristics would be consistent with and would not conflict with the goals of Plan Bay Area 2050. As discussed in Impact EN-2, the mixed-use design of the proposed Specific Plan would increase the density of an infill site served by a variety of transit options.

In addition, Specific Plan development would be required to implement several mitigation measures in response to significant air quality and greenhouse gas impacts that would have the benefit of reducing operational fuel use.

Net Energy Consumption

Table 4.11-7 analyzes the 2025 Specific Plan project's net on-site energy demand, which includes all sources of electricity consumed and generated on-site, including total annual building energy, EV charging, pump and lift stations, parking lot lighting, street lighting, traffic signals, emergency generators, landscaping equipment, and fire stations **Table 4.11-7** also includes the proportion of energy use from the water recycling facility that would be required to serve the Specific Plan area (i.e., not total energy consumption generated by this source, since it is a regional facility, and the Specific Plan would only be associated with part of its operation). This table does not include water use and mobile sources because its off-site energy use is electricity generated from outside the Baylands. Energy associated with energy consumed by the proposed recycling facility to generate recycled water for landscape irrigation and other

non-potable uses within the Baylands is, however, included in **Table 4.11-7**. On-site generation includes solar infrastructure systems (building solar, community solar, and utility-scale solar).

Table 4.11-7: Baylands Net On-Site Energy Consumption Analysis

Scenario	Estimated On-Site Electricity Consumption[a] (MWh/yr)	Estimated On-Site Electricity Generation[b] (MWh/yr)	Net Electricity Consumption[c] (MWh/yr)	Percent of Baylands Electrical Demand met by On-Site Generation
Specific Plan with First Increment of On-Site Solar Energy Generation Field and Partial Development of Phase 1 (assumed to be 2037)	138,360	47,317	91,043	34.2%
Phase 1 and Solar Energy Generation Field Buildout (assumed to be 2038)	148,701	74,691	74,010	50.2%
Full Specific Plan Buildout (assumed to be 2042)	172,882	92,445	80,437	53.5%

SOURCE: ESA Associates, 2024; Thornton Tomasetti Inc., 2023.

NOTES: Net energy is estimated by subtracting the energy produced by on-site electricity generation from the on-site energy consumed. On-site electricity includes all sources of electricity consumed and generated on-site.

a. Electricity consumption includes all on-site building and infrastructure electricity use, including buildings, lighting, traffic signals, irrigation, EV charging, and the water storage tank. The electricity consumption associated with the water recycling facility is based on the quantity of electricity consumed by land uses proposed by the Specific Plan. For Phase 1, this rate was developed by dividing on-site Phase 1 and Phase 2 non-potable water consumption (approximately 82,602,481 and 93,193,386 gallons, respectively) by the total capacity of the water reclamation facility (approximately 128,000,000 gallons) (Thornton Tomasetti Inc. 2023). Electricity consumption assumes compliance with 2022 CALGreen Tier 1 standards. This table does not include water use and mobile sources because its off-site energy use is electricity generated from outside the Baylands.

b. Electricity generation includes on-site building solar, community solar, and utility-scale solar (the solar fields). These estimates are based on compliance with 2022 CALGreen Tier 1 standards, but the final actual generation amount could change. This analysis considers estimated PV panel efficiency for 2028 based on Fraunhofer IBP's Photovoltaic Report, 2021 which predicts future PV panel efficiency based on historical trends. The community solar is a 40 MWdc system anticipated to generate approximately 60,967 MWh annually at full build out and includes two phases. Phase 1 is the development of the 55-acre solar field and Phase 2 is the parking lot area adjacent to the Campus East District. Building solar refers to solar located on buildings. At full build out the aggregated solar system is projected to be equivalent to 20 MWdc and generate approximately 31,478 MWh annually (Thornton Tomasetti Inc. 2023).

c. Value is the total electricity generation minus the total on-site electricity consumption.

As shown in **Table 4.11-7**, the Baylands Specific Plan would consume more electricity than it generates on an annual basis during partial development of Phase 1, when the first increment of the Baylands solar energy generating field comes online (assumed to be 2037); during full development of Phase 1, when the solar energy generating field is fully operational (assumed to be 2038); and at full Specific Plan buildout(assumed to be 2042). However, the Baylands would produce over half (53.5 percent or 92,445 MWh) of its total annual on-site electricity consumption via on-site solar powered infrastructure systems. Given the high percentage of the Baylands electricity demand being generated on-site, the Baylands would not result in the wasteful, inefficient, or unnecessary use of electricity.

The Specific Plan's net electricity consumption ranges from 74,010 MWh (with buildout of Phase 1 and the 55-acre solar field, assumed to occur in 2038) to 91,043 MWh (with partial

Specific Plan buildout and the first increment of the 55-acre solar field, assumed to be 2042) that must be generated outside of the Baylands and supplied by the grid.

The analysis provided in **Table 4.11-7** is conservative in that it assumes sufficient distributed battery storage will be provided such that all energy generated by the Baylands' solar energy generation field and building-mounted solar panels would be available for consumption within the Baylands.

Significance Conclusion for Impact EN-1

Construction

Compliance with existing state regulations to minimize fuel use would ensure that project construction activities requiring the use of fossil fuels would not be wasteful, inefficient, or unnecessary. Moreover, Baylands construction would not be expected to result in demand for energy greater on a per-unit-of-development basis than other development projects in the region, with the exception of the necessary grading that is required to return the Baylands to a safe and healthy condition and provide adequate protection from flooding and projected sea level rise.

Therefore, Baylands construction would not result in the wasteful, inefficient, or unnecessary consumption of energy, and impacts would be less than significant.

While mitigation for energy construction impacts is not required, air quality mitigation measures MM AQ-1a, MM AQ-1c, and MM AQ-1i would further reduce energy consumption during Baylands construction.

Operations

The Specific Plan is designed to be an energy efficient development by including a suite of sustainability features including LEED Gold buildings, all-electric buildings, electric vehicle charging, on-site solar powered infrastructure systems, distributed and utility-scale battery storage systems, on-site bicycle and pedestrian trails connecting to off-site trails, and TDM Plans to reduce mobile fuel use. In addition, TDM programs would be implemented to reduce per capita vehicle miles traveled by Baylands residents and employees by more than 30 percent below the existing regional baseline VMT.

The Specific Plan provides for buildings to be designed to be LEED Gold or GreenPoint Rated (based on 2022 rating criteria for LEED and GreenPoint), and residential and non-residential buildings within the Specific Plan area would comply with CALGreen Tier 1 voluntary standards.

Ultimately, Baylands development would have lower per capita energy consumption compared to the Bay Area region due to:

- The combination of the Specific Plan's mixed-use character, location adjacent to transit, provision of a comprehensive on-site trails system with connections to areawide and regional trails, and TDM programs would reduce per capita vehicle miles traveled (VMT) for Baylands residents and employees below the regional average and reduce regional VMT.
- With respect to EV charging, Baylands residential and commercial buildings would be constructed to meet the 2022 CALGreen Tier 1 Voluntary Building Energy Standards and the City's recently adopted Reach Code.
- On-site renewable generation and distributed battery storage would be far greater than is typical of development throughout the Bay Area region.

Therefore, the project would not increase per-capita energy consumption in comparison to the regional baseline.

Baylands development would not increase reliance on fossil fuels or decrease reliance on renewable energy sources because:

- The relatively lower per capita VMT identified above would result in less per-capita fossil fuel consumption than is typical for the Bay Area.
- The project would include substantial on-site solar energy generation and on-site battery storage, thereby reducing the need for fossil-fuel-generated energy and actually increasing reliance on renewable energy.

Therefore, Specific Plan operations would not result in the wasteful, inefficient, or unnecessary consumption of energy, and impacts would be less than significant.

b. Impact EN-2: Consistency with Applicable Programs, Plans, Ordinances, and Policies for Renewable Energy and Energy Efficiency

Methodology for Determining Significance in Relation to Threshold EN-2

Baylands development would be required to comply with CALGreen Code Voluntary Tier 1 standards and Title 24 requirements as adopted by the City of Brisbane to reduce energy consumption by implementing energy-efficient building designs, reducing indoor and outdoor water demands, providing EV charging spaces, and installing energy-efficient appliances and equipment. In addition, Specific Plan development would be required to implement transportation demand measures to meet C/CAG and City of Brisbane requirements to reduce vehicle trip generation. The Specific Plan therefore incorporates all mandatory energy efficiency

requirements. In addition to these mandatory requirements, the Specific Plan requires all buildings to be designed to be LEED Gold or GreenPoint Rated.

To determine whether a significant impact would occur, relevant provisions of the Brisbane General Plan and Plan Bay Area 2050. The consistency of the Baylands Specific Plan with these provisions was then analyzed and is documented in Section 4.3, *Land Use and Planning Policies*, **Table 4.3-2**.

Impact Assessment

Consistency with Plan Bay Area 2050 Energy Related Policies

Evaluation of the Specific Plan's consistency with energy-related Plan Bay Area 2050 Provisions is presented in Section 4.3, *Land Use and Planning Policies*, **Table 4.3-2**.

Consistency with Brisbane General Plan Energy-Related Policies

Evaluation of the Specific Plan's consistency with energy-related General Plan policies is presented in Section 4.3, *Land Use and Planning Policies*, **Table 4.3-2,** along with a detailed evaluation of the Specific Plan's consistency with all relevant Brisbane General Plan policies.

Significance Conclusion for Impact EN-2

The Baylands Specific Plan provides for transit-oriented mixed-use development within an area designated by *Plan Bay Area 2050* as a Priority Development Area and a Transit Priority Area and would provide substantial on-site energy generation; it would not conflict with *Plan Bay Area 2050*.

Impact EN-2 would therefore be less than significant.

4.12 NOISE AND VIBRATION

4.12.1 INTRODUCTION

a. Overview

This section of the environmental impact report (EIR) evaluates the noise impacts that would result from the 2025 Baylands Specific Plan project. It discusses the existing noise environment within and around the Baylands, as well as the regulatory framework for regulation of noise and vibration. It also analyzes the on- and off-site effects that Specific Plan development would have on the existing ambient noise environment during construction, demolition, and operational activities, and evaluates the Specific Plan's noise effects for consistency with relevant noise policies and regulations.

The analysis in this section also addresses groundborne vibration impacts and is based on a comprehensive review of existing documentation for the Specific Plan area and the Baylands Noise and Vibration Technical Report prepared by Environmental Science Associates (ESA), for which modeling results are provided in Appendix J.

Specific Plan-related noise effects on biological resources are discussed in Section 4.6, *Biological Resources*.

b. Fundamentals of Noise

"Sound" is mechanical energy transmitted by pressure waves through a medium such as air. "Noise" is defined as unwanted sound. Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) that is measured in decibels (dB), which is the standard unit of sound amplitude measurement. The dB scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound, with 0 dB corresponding roughly to the threshold of human hearing and 120 to 140 dB corresponding to the threshold of pain. Pressure waves traveling through air exert a force registered by the human ear as sound.

Sound

Sound always has a source (e.g., construction activities, automobile and rail traffic, jets flying overhead, people talking). The loudness of a sound source is dependent on how rapidly the object converts energy into sound energy. In contrast, an individual's perception of the loudness of a sound depends on his or her distance from the sound source.

Sound pressure fluctuations can be measured in units of hertz (Hz), which correspond to the frequency of a particular sound. Typically, sound does not consist of a single frequency, but

rather a broad band of frequencies varying in levels of magnitude (sound power). When all the audible frequencies of a sound are measured, a sound spectrum is plotted consisting of a range of frequencies spanning 20 to 20,000 Hz. The sound pressure level therefore constitutes the additive force exerted by a sound corresponding to the sound frequency/sound power level spectrum.

The human ear does not hear all frequencies equally and de-emphasizes low and very high frequencies. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 Hz and above 5,000 Hz, corresponding to the human ear's decreased sensitivity to low and very high frequencies. This method of frequency weighting follows an international standard methodology, is expressed in units of A-weighted decibels (dBA), and is typically applied to community noise measurements. Some representative noise sources and their corresponding A-weighted noise levels are shown in **Table 4.12-1**. Unless specifically stated, all noise levels discussed below are A-weighted.

Noise Exposure and Community Noise

A *noise level* is a measure of noise at a given instant in time, whereas an individual's or community's *noise exposure* is a measure of noise experienced over a period of time. The noise levels presented above in **Table 4.12-1** thus represent noise levels generated by various sources at a given instant in time. However, community noise is primarily the product of many noise sources generated at various locations and times, which combine to form a relatively stable background noise exposure, with the individual sources being unidentifiable. The background noise level changes throughout a typical day but does so gradually with the addition and subtraction of noise sources at various distances, as well as increases and decreases in noise levels generated by individual noise sources such as traffic. What makes community noise variable throughout a day, besides the slowly changing background noise, is the addition of short-duration, single-event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual.

Definition of Noise Descriptors

Because community noise levels change from instant to instant, the measurement of noise exposure is averaged over a period of time, such as an hour or day, to characterize the community noise environment and evaluate noise impacts. This time-varying characteristic of environmental noise is described using the statistical noise descriptors described below.

Ambient noise level is the background noise level associated with a given environment at a specified time and is usually a composite of sound from many sources from many directions, near and far, with no particular dominant sound.

Table 4.12-1: Typical Sound Levels Measured in the Environment

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	110	Rock band
Jet flyover at 1,000 feet		
	100	
Gas lawnmower at 3 feet		
	90	
Diesel truck at 50 feet at 50 mph		Food blender at 3 feet
	80	Garbage disposal at 3 feet
Noisy urban area, daytime		
Gas lawnmower at 100 feet	**70**	Vacuum cleaner at 10 feet
Commercial area		Normal speech at 3 feet
Heavy traffic at 300 feet	**60**	
		Large business office
Quiet urban daytime	**50**	Dishwasher in next room
Quiet urban nighttime	**40**	Theater, large conference room (background)
Quiet suburban nighttime		
	30	Library
Quiet rural nighttime		Bedroom at night, concert hall (background)
	20	
		Broadcast/recording studio
	10	
	0	

SOURCE: Caltrans, 2013. *Technical Noise Supplement to the Traffic Noise Analysis Protocol.* September 2013.
NOTE: Continuous exposure above 85 dBA is likely to degrade the hearing of most people. Range of speech is 50 to 70 dBA.

CNEL, or Community Noise Equivalent Level, which is similar to L_{dn} (see below), is the average A-weighted noise level during a 24-hour day that is obtained after an addition of 5 dBA to measured noise levels between the hours of 7:00 p.m. and 10:00 p.m. and after an addition of 10 dBA to noise levels between the hours of 10:00 p.m. and 7:00 a.m. to account for noise sensitivity in the evening and nighttime, respectively. The CNEL is the metric generally used for assessment of aircraft noise. The result is normally about 0.5 dBA higher than L_{dn} using the same 24-hour data (Caltrans 2013).

L_{dn}, also termed "day-night" average noise level (**DNL**), is a measure of the average of A-weighted sound levels occurring during a 24-hour period, accounting for the greater sensitivity of most people to nighttime noise by weighting noise levels at night ("penalizing" nighttime noises). Noise between 10:00 p.m. and 7:00 a.m. is weighted by adding 10 dBA to account for the greater annoyance of nighttime noises.

L_{eq}, or equivalent-continuous sound level, is used to describe noise over a specified period of time in terms of a single numerical value. The L_{eq} of a time-varying signal and that of a steady signal are the same if they deliver the same acoustic energy over a given time. L_{eq} may also be referred to as the "average sound level."

L_{max} is the maximum instantaneous noise level experienced during a given period of time.

L_{min} is the minimum instantaneous noise level experienced during a given period of time.

L_x is the sound level that is equaled or exceeded by "x" percent of a specified time period. The "x" thus represents the percentage of time a noise level is exceeded. For instance, L_{50} and L_{90} represent the noise levels that are exceeded 50 percent and 90 percent of the time, respectively.

Noise-Sensitive Uses

Noise-sensitive uses are generally defined to include places where people sleep, such as residences, hospitals, and hotels; institutional land uses where it is important to avoid interference with speech or reading, such as schools, libraries, and churches; and outdoor areas where quiet is fundamental to its specific use, such as an amphitheater. Noise may be perceived at a sensitive use as "intrusive" when noise levels exceed ambient noise levels. The relative intrusiveness of a sound depends on the sound's amplitude, duration, frequency, and time of occurrence and tonal or informational content, as well as the prevailing ambient noise level.

Effects of Noise on People

Noise can have four different types of effects on people:

- Subjective effects (e.g., dissatisfaction, annoyance)
- Interference effects (e.g., interference with communication, sleep, and learning)
- Physiological effects (e.g., startle response)
- Physical effects (e.g., hearing loss)

Although exposure to high noise levels can cause physical and physiological effects, the principal human responses to typical environmental noise exposure are subjective and related to interference with activities. Interference effects of environmental noise refer to those effects that interrupt daily activities, including interference with human communication such as normal conversations, television watching, and telephone conversations.

Sleep interference effects can include both awakening and a lesser state of sleep. Nighttime noise can potentially affect sleep. Noise can make it difficult to fall asleep, can create momentary disturbances of natural sleep patterns by causing shifts from deep to lighter stages, and can cause awakening. Although nighttime awakenings occur independent of noise, Fidell, et al.

(2010) provided the following summary of night awakenings: "Depending on the definition adopted for 'awakening,' people may awaken for reasons having nothing to do with noise many times per night, at moments which may or may not closely coincide in time with the occurrence of noise events." According to Basner et al. (2014), "people exhibit an average of 21 electro physiologically detectable arousals per hour of sleep, or about 144 spontaneous arousals per night." Counting both shifts from deeper to lighter sleep states and momentary awakenings, Ollerhead et al. (1992), reported about 45 "awakenings or arousals" per night, of which only 40 percent were thought to represent even momentary awakenings. People commonly attain full waking consciousness two or three times per night for reasons having nothing to do with noise exposure.

The responses of individuals to similar noise events are diverse and are influenced by many factors, including individuals' thresholds of annoyance and tolerances to noise based on past experiences with noise, the type of noise, the perceived importance of the noise, the appropriateness of the noise to the setting, the duration of the noise, the time of day and the type of activity during which the noise occurs, and individual noise sensitivity. Thus, an important way of predicting a person's reaction to a new noise environment is to analyze the difference between the new environment and the existing environment to which that person has adapted (i.e., comparison to the ambient noise environment).

In general, the more a new noise level exceeds the previously existing ambient noise level, the less acceptable the new noise level will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships generally occur:

- Except in carefully controlled laboratory experiments, a change of 1 dB cannot be perceived.
- Outside of the laboratory environment, a 3 dB change in noise levels is considered to be a barely perceivable difference.
- A change in noise levels of 5 dB is considered to be a readily perceivable difference.
- A change in noise levels of 10 dB is subjectively heard as doubling of the perceived loudness.

These relationships occur in part because of the logarithmic nature of sound and the decibel system. Since the decibel scale is based on logarithms, two noise sources do not combine in a simple additive fashion, but rather logarithmically. For example, if two identical noise sources produce noise levels of 50 dB, the combined sound level would be 53 dB, not 100 dB.

Health effects from noise have been studied around the world for nearly 30 years. Scientists have attempted to determine if high noise levels can adversely affect human health apart from auditory damage. In a review of 30 studies conducted worldwide between 1993 and 1998, a team of international researchers concluded that, while some findings suggest that noise can affect health, improved research concepts and methods are needed to verify or discredit such a

relationship. The team of international researchers called for more study of the numerous environmental and behavioral factors than can confound, mediate, or moderate survey findings. Until science refines the research process, a direct link between a single source noise exposure and non-auditory health effects remains to be demonstrated (LAWA 2012).

The Occupational Safety and Health Administration has an established noise exposure limit of 90 dBA for 8 hours per day (or higher for shorter duration exposures) to protect an individual from hearing loss (29 Code of Federal Regulations [CFR] 1910.95). Noise levels in neighborhoods, even near a major airport or a major freeway, are not sufficiently loud to cause hearing loss.

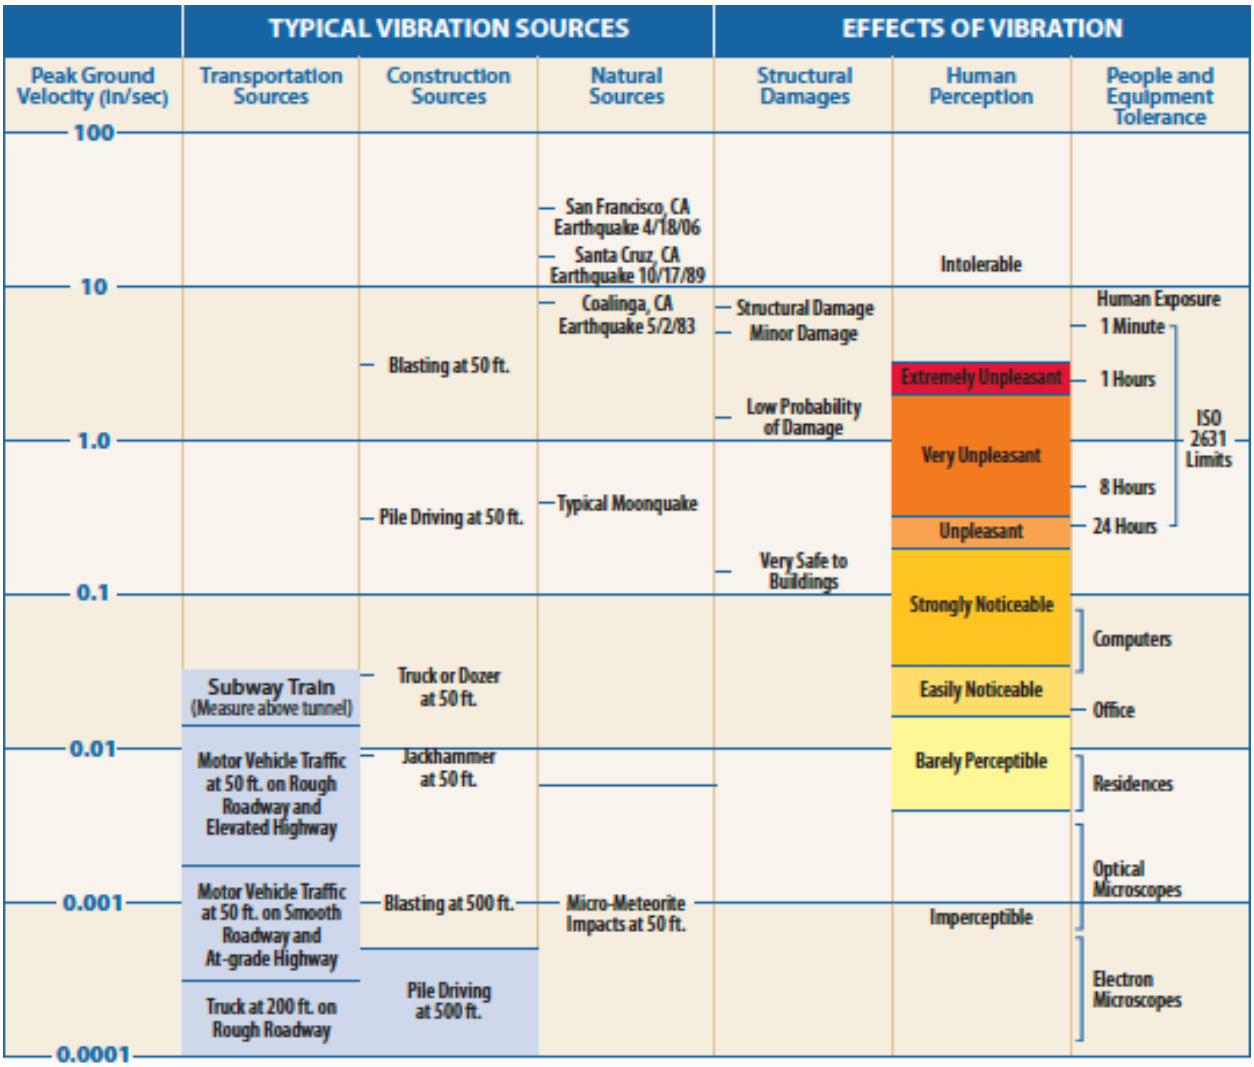
Noise Attenuation

Stationary "point" sources of noise, including stationary mobile sources such as idling vehicles, attenuate (lessen) at a rate between 6 dB for hard sites and 7.5 dB for soft sites for each doubling of distance from the reference measurement, depending on the topography of the area and environmental conditions (e.g., atmospheric conditions, noise barriers [either vegetative or manufactured]). Hard sites are those with a reflective surface between the source and the receiver, such as asphalt or concrete surfaces or smooth bodies of water. No excess ground attenuation is assumed for hard site attenuation (6 dBA per doubling of distance), and the change in noise levels with distance (drop-off rate) is simply the geometric spreading of the noise from the source. Soft sites have an absorptive ground surface such as soft dirt, grass, or scattered bushes and trees. In addition to geometric spreading, an excess ground attenuation value of 1.5 dB (per doubling distance) is normally assumed for soft site attenuation, resulting in the 7.5 dBA reduction per doubling of distance cited above. "Line" sources (such as traffic noise from vehicles) attenuate at a rate between 3 dB for hard sites and 4.5 dB for soft sites for each doubling of distance from the reference measurement.

c. Fundamentals of Vibration

Groundborne vibration can be a serious concern for nearby neighbors of a transit system route or maintenance facility because the vibration can cause buildings to shake and rumbling sounds to be heard. In contrast to airborne noise, groundborne vibration is not a common environmental problem. It is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. Some common sources of groundborne vibration are trains, buses on rough roads, and construction activities such as pile driving and operation of heavy earth-moving equipment. Typical vibration sources and their physical effects are illustrated in **Figure 4.12-1**.

Figure 4.12-1: Typical Vibration Sources and Their Effects



SOURCE: Nugent, R.E. & H. Amick, "Vibration Considerations in Land Use Planning," AEP Environmental Monitor, pp. 5-8 (Summer 1992).

Quantifying Vibration

There are several different methods used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal. The PPV is most frequently used to describe vibration impacts on buildings. The root mean square amplitude is most frequently used to describe the effect of vibration on the human body. The root mean square amplitude is defined as the average of the squared amplitude of the signal. Decibel notation (VdB) is commonly used to measure root mean square. The relationship of PPV to root mean square velocity is expressed in terms of the "crest factor," defined as the ratio of the PPV amplitude to the root mean square amplitude. Peak particle velocity is typically a factor of 1.7 to 6 times greater than root mean square vibration velocity. The decibel notation acts to compress the range of numbers required to describe vibration. Typically, groundborne vibration generated by human activities attenuates rapidly with distance from the source of the vibration.

Effects of Vibration

Sensitive receptors for vibration include structures (especially older masonry structures), people (especially residents, the elderly, and sick), and vibration-sensitive equipment.[257]

The effects of groundborne vibration include movement of building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. In extreme cases, vibration can damage buildings. Building damage does not typically occur, with the occasional exception of pile driving and blasting during construction. Annoyance from vibration often occurs when vibration levels exceed the threshold of perception by only a small margin. A vibration level that causes annoyance will be well below the damage threshold for normal buildings. The Federal Transit Administration (FTA) measure of the threshold of architectural damage for conventional sensitive structures is 0.2 inch/second (in/sec) PPV (FTA 2018).

In residential areas, the background vibration velocity level is usually around 50 VdB (approximately 0.0013 in/sec PPV). This level is well below the vibration velocity level threshold of perception for humans, which is approximately 65 VdB. A vibration velocity level of 75 VdB is considered to be the approximate dividing line between barely perceptible and distinctly perceptible levels for many people.

4.12.2 ENVIRONMENTAL SETTING

a. Baseline

The baseline used for analysis of the Specific Plan's noise and vibration impacts is the time the Notice of Preparation was issued in April 2023.

b. Existing Noise Environment

Noise Generators within and adjacent to the Baylands

The Specific Plan area adjoins a network of regional transportation facilities that are the predominant noise generators in the area and influence the local noise environment. Major transportation noise generators affecting the Baylands include:

- Rail operations along the Caltrain right-of-way through the Specific Plan area

[257] While there are no specific vibration criteria for vibration effects on animals, the sensitivity of active bird nesting is addressed in Section *4.6 Biological Resources*. The analysis in Section 4.6 discusses designated buffer distances for project activities near active nesting birds consistent with guidance from the California Department of Fish and Wildlife. Buffer distances are related to intensity and duration of activity, and varying bird sensitivity to disturbance.

- The San Francisco Municipal Railway (Muni) Light Rail K/T Line that terminates on Bayshore Boulevard near the western boundary of the Specific Plan area
- The US 101 freeway along the eastern edge of the Specific Plan area
- Vehicular traffic combined with Muni and SamTrans bus service along Bayshore Boulevard

The ambient noise environment within the Baylands is dominated by vehicular traffic on US 101 and Tunnel Avenue, along with intermittent noise from Caltrain commuter trains. Existing industrial uses along Industrial Way and within the adjacent Recology solid waste facility generate intermittent noise from off-road equipment operations and machine shop activities.

Noise Measurements and Modeling

Long-term noise level measurements were conducted within and near the Baylands in February 2023 to establish existing ambient noise conditions. Six short-term (20-minute) measurements were collected within the Baylands. A comparison of the 2013 measurements conducted for the Brisbane Baylands Program EIR to the 2023 measurements demonstrates that there has been relatively little change in the existing noise environment over the 10-year period. For off-site receptor locations, new long-term (48-hour) measurements were collected in February 2023.[258] Additional noise measurements were taken in proximity to the closest residential uses located west, northwest, north, and southwest of the Baylands.

The measured average noise levels (L_{eq}) during different averaging periods are shown in **Table 4.12-2** (long-term) and **Table 4.12-3** (short-term). Noise measurement locations are identified in **Figure 4.12-2**. Additional long-term noise measurements collected as part of the Draft EIR/environmental impact statement (EIS) for the California High-Speed Rail San Francisco to San Jose Segment are included in **Table 4.12-2** and **Table 4.12-13.**

In addition, existing roadside noise levels along roadway segments near the Specific Plan area were modeled to provide estimates of existing weekday noise levels for the roadway segments near the Specific Plan area. The existing roadside noise levels during the weekday peak commute hour are presented in **Table 4.12-4**.[259] These modeled noise levels reflect only the noise generated by traffic on the identified roadway segments; they do not include other sources in the area, such as rail and highway noise where these other sources are nearby. These sources are included in the noise monitoring results in **Table 4.12-2** and **Table 4.12-3**, below.

[258] The noise measurements were conducted using a Larson Davis Model LxT2 sound level meter that was calibrated before use and operated according to the manufacturer's written specifications.

[259] Existing and future traffic volumes provided by the transportation analysis were in the average daily trip metric for weekdays. These values were adjusted to reflect a peak-traffic-hour volume percentage of 5 percent.

Table 4.12-2: Existing Noise Environment in and Adjacent to the Baylands – Long-Term Monitoring

Long-Term (LT) Noise Monitoring Location	Noise Levels (dBA)				Primary Noise Sources
	Day-Night Noise Level (DNL)	24-Hour L_{eq}	Daytime[a] Hourly Average L_{eq}	Nighttime[b] Hourly Average L_{eq}	
On-Site Long-Term Noise Data					
LT-1: Northeast Portion of Baylands[c]	75	69	69	69	Traffic on US 101

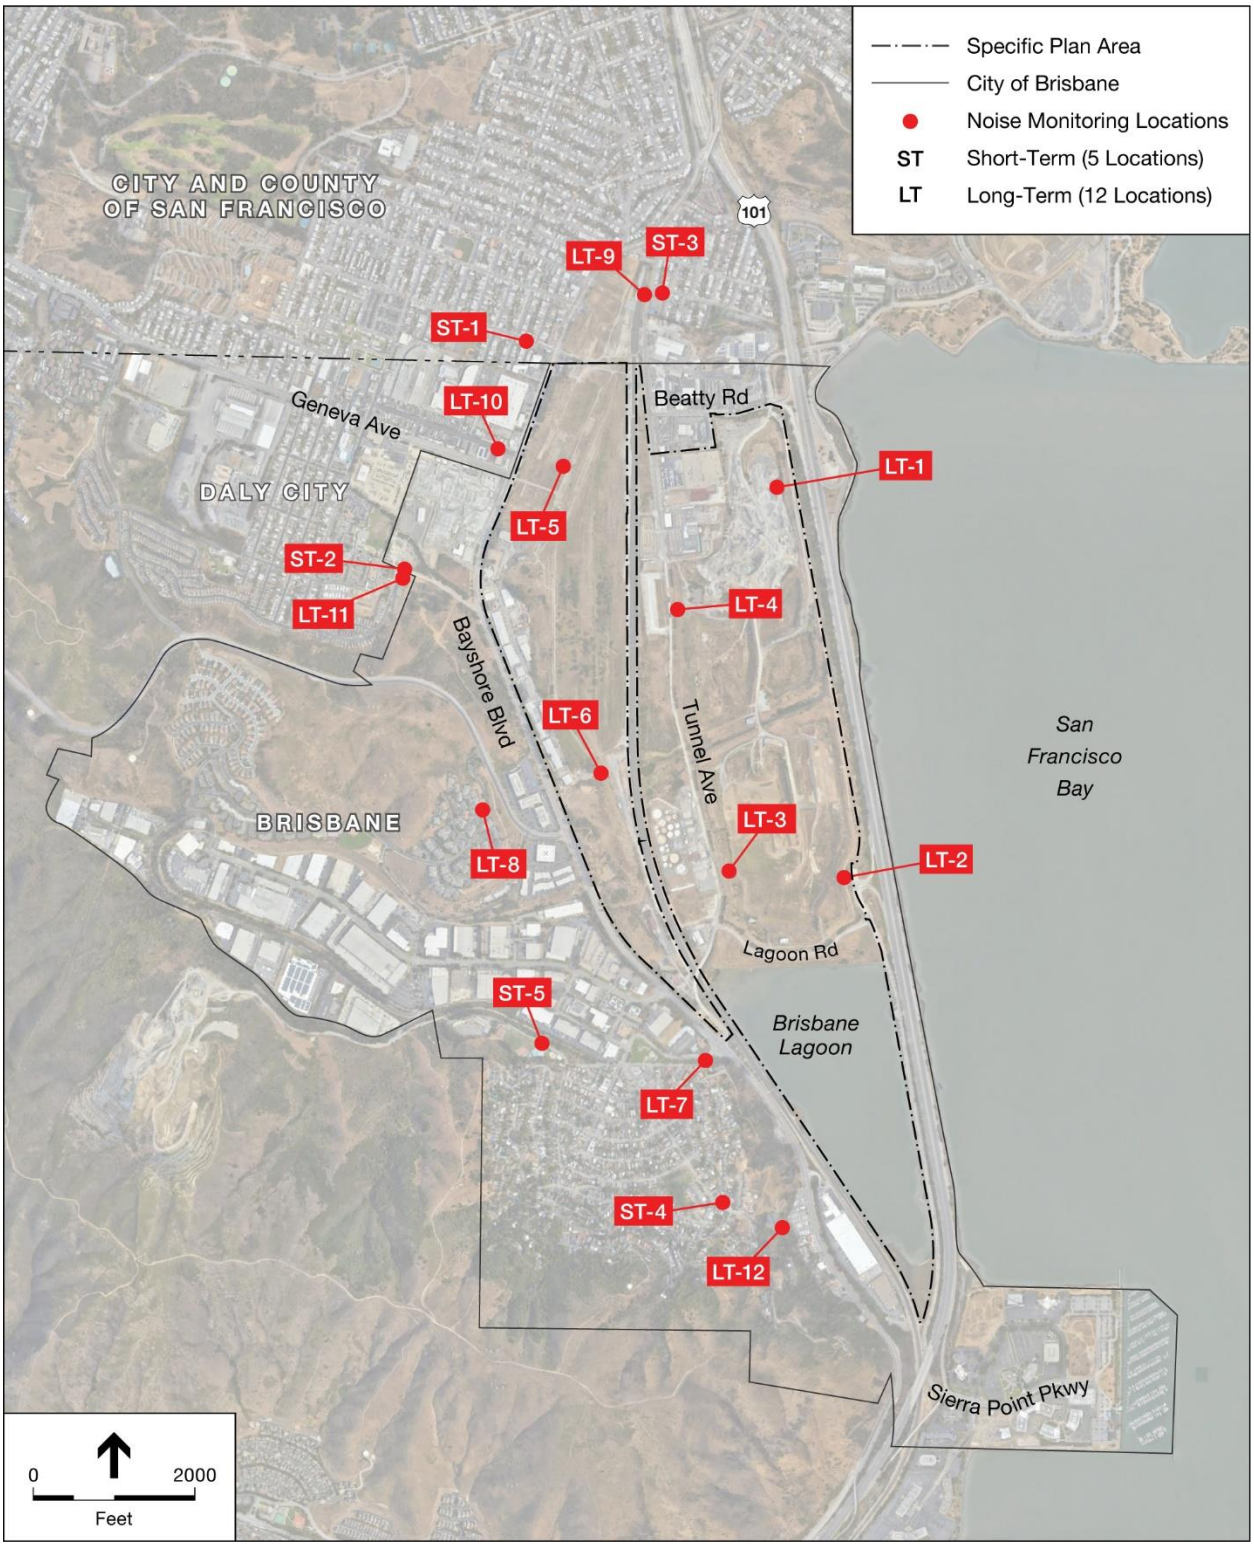
Figure 4.12-2: Noise Monitoring Locations



Airport Noise

San Francisco International Airport (SFO) is located approximately 3 miles south of the Baylands. Aircraft flights from SFO also contribute to the ambient noise environment. A 1992 survey conducted by the City of Brisbane for its General Plan Noise Element, public comments received on the Brisbane Baylands Program EIR, and noise complaints received by SFO reveal that Brisbane citizens consider the city to be affected by single-event noise levels generated by flights from SFO, especially in the early morning and evening hours. A review of the most recent complaint summary in the 4th Quarter 2023 Brisbane Noise Monitoring Report for SFO indicates that 87 complaints were received from Brisbane residents during the October 2023 monitoring period (SFO 2024).

The City of Brisbane participates in the SFO Community Roundtable, which provides a forum for the public to address local elected officials, airport management, FAA staff, and airline representatives regarding aircraft noise issues. The committee monitors a performance-based aircraft noise mitigation program, as implemented by airport staff; interprets community concerns; and attempts to achieve additional noise mitigation through a cooperative sharing of authority brought forth by the airline industry, the FAA, airport management, and local government officials.

Topography and Noise Perception

Topography plays a role in how noise is perceived within Brisbane. Brisbane's local terrain tends to act as a noise barrier for ground-based noise sources in all directions except toward the mouth of the valley to the east. For example, the hillsides around Brisbane act as noise barriers, blocking noise generated north of the city. This tends to reduce the background sound level, which makes other sounds more noticeable. In addition, the hillside slopes within much of Brisbane mean that homes, like seats in an amphitheater, have a "good view" of noise sources, and noise attenuates less than it would in a typical flat community because buildings are less likely to intercept the line of sight to a noise source.

c. Existing Groundborne Vibration

Sources of vibration in the Baylands vicinity include Caltrain, which bisects the Specific Plan area from north to south. FTA has published generalized ground-surface vibration curves for locomotive-powered passenger and freight trains. These generalized vibration levels are presented in **Table 4.12-5**. Because all local Caltrain operations (44 percent of weekday trains and 100 percent of weekend trains) currently stop at the Bayshore station, speeds for these trains are generally in the range of 5 to 20 miles per hour (mph). The 58 daily express trains do not stop at the Bayshore station during the weekdays and travel through the Specific Plan area at speeds of up to 50 mph.

Table 4.12-5: Generalized Vibration Levels from Locomotive-Powered Passenger or Freight Trains (Vibration Decibels)

Train Speed	Distance from Tracks				
	30 Feet	50 Feet	100 Feet	150 Feet	200 Feet
10 mph	74 VdB	71 VdB	62 VdB	60 VdB	58 VdB
20 mph	80 VdB	77 VdB	68 VdB	66 VdB	64 VdB
30 mph	84 VdB	81 VdB	72 VdB	70 VdB	68 VdB
50 mph	88 VdB	85 VdB	76 VdB	74 VdB	72 VdB

SOURCE: FTA, 2018.

ABBREVIATIONS: mph = miles per hour; VdB = vibration decibels.

NOTE: These levels reflect generalized diesel locomotive activity and do not reflect potential future reductions from electrification of Caltrain or potential future increases from high-speed rail operations.

The only other sources of groundborne vibration in the Baylands vicinity are heavy-duty vehicular travel (e.g., refuse trucks, haul trucks) on local roadways. Trucks traveling at a distance of 50 feet typically generate groundborne vibration velocity levels of around 63 VdB (approximately 0.006 in/sec PPV), and these levels could reach 72 VdB (approximately 0.016 in/sec PPV) where trucks pass over discontinuities in the roadway (FTA 2018).

Vibration measurements in the vicinity of the Baylands were collected for the California High-Speed Rail EIR/EIS in 2016 (see **Table 4.12-6**). The results include the range of maximum overall groundborne vibration levels for each type of train pass-by event based on the distance from the track. The dominant existing vibration sources are train traffic. Traffic on roadways can cause some vibration, but due to the rubber tires on the vehicles, those vibration levels are typically low and isolated to locations close to roadways.

Table 4.12-6: Existing Vibration Levels Monitored in the Baylands Vicinity

Roadway Segment	Distance from Track (feet)	Vibration Level (VdB)
Bayshore Boulevard and Old County Road, Brisbane	25–118	60–73
29 San Francisco Avenue, Brisbane	314–414	36–41

SOURCE: California High-Speed Rail Authority, 2019.

ABBREVIATION: VdB = Vibration decibels.

d. Sensitive Receptors

Some land use types are more sensitive to elevated noise levels than others due to the amount of noise exposure (in terms of both exposure duration and insulation from noise) and the types of activities typically involved. Residences, motels and hotels, schools, libraries, churches, hospitals, nursing homes, and auditoriums generally are more sensitive to noise than commercial and industrial land uses. Sensitive receptors in the Specific Plan area are described below and presented in **Table 4.12-7**, along with their approximate distance to the Specific Plan area boundary.

Table 4.12-7: Existing Noise-Sensitive Receptors within 1,000 Feet of the Specific Plan Area

Type of Sensitive Receptor	Location	Minimum Distance from Specific Plan Area	Representative Monitoring Location[a]
North of the Specific Plan Area			
Single-family residences	221–257 block of Desmond Street, San Francisco	330 feet	LT-10; ST-1
Single-family residences	Sunnydale Avenue, San Francisco	350 feet	LT-10; ST-1
Single-family residences	426–625 block of Wheeler Avenue, San Francisco	900 feet	LT-9; ST-3
Symphony Church of San Francisco	333 Tunnel Avenue, San Francisco	900 feet	LT-9
West of the Specific Plan Area			
Single-family residences	MacDonald Avenue, Daly City	250 feet	LT-10
Single-family residences	100–104 block of Main Street, Daly City	900 feet	LT-11
Southwest of the Specific Plan Area			
Multi-family residential complex	111–163 block of Cliff Swallow Court, Brisbane	900 feet	LT-8
Multi-family residential complex	San Francisco Avenue/Santa Clara Street, Brisbane	500 feet	LT-7

SOURCES: Data compiled by Environmental Science Associates in 2023; Google Earth (imagery date May 2022) for parcel data (address and distance to the Specific Plan area).

NOTES:

a. See **Figure 4.12-2** for long-term (LT) and short-term (ST) monitoring locations.

Receptors sensitive to vibration include:

- Structures (especially older masonry structures). High levels of vibration can damage buildings. Depending on the age of the structure and type of vibration (transient, continuous, or frequent intermittent sources), vibration levels as low as 0.5 to 2.0 in/sec PPV can damage structures.
- Special buildings as defined by FTA (concert halls, TV and recording studios, and theaters), are not present within 1,000 feet of the Specific Plan area.
- Residents, the elderly, and the sick.
- Equipment such as magnetic resonance imaging equipment and high-resolution lithographic, optical, and electron microscopes.

The vibration criteria in Caltrans' Transportation and Construction Vibration Guidance Manual (2020) rely on the FTA Guidance Manual.

4.12.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Programs, and Regulations

Noise

U.S. Occupational Safety and Health Administration Noise Regulations

The primary federal noise standards that would regulate Specific Plan-related noise address noise exposure and workers. The U.S. Occupational Safety and Health Administration (OSHA) enforces regulations to safeguard the hearing of workers exposed to occupational noise. OSHA has established worker noise exposure limits that vary with the duration of the exposure and requires implementation of a hearing conservation program if employees are exposed to noise levels in excess of 85 dBA.

Federal Noise Standards for Trucks

Federal regulations also establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under Title 40, Part 205, Subpart B of the Code of Federal Regulations (CFR). The federal truck pass-by noise standard is 80 dB at 15 meters from the vehicle pathway centerline. These controls are implemented through regulatory controls on truck manufacturers.

U.S. Department of Housing and Urban Development Noise Abatement and Control

The U.S. Department of Housing and Urban Development (HUD) environmental noise regulations are set forth in CFR Title 24, Part 51, Subpart B, Noise Abatement and Control. According to the regulations, "It is HUD's general policy to provide minimum national standards applicable to HUD programs to protect citizens against excessive noise in their communities and places of residence." These regulations include criteria for assessing whether a HUD project is suitable for a particular site, given the background noise levels. HUD has defined the suitability of a site for new housing construction based on existing noise levels as follows:

- Acceptable—65 dB day-night average sound level (DNL) or less;
- Normally Unacceptable—Exceeding 65 dB DNL but not exceeding 75 dB DNL; and
- Unacceptable—Exceeding 75 dB DNL.

The HUD regulations also include a goal (rather than a standard) that interior noise levels not exceed 45 dB DNL. Sound-attenuating features such as barriers or sound-attenuating building materials must be used to achieve the interior noise goal where feasible. Standard building construction generally provides 20 dB DNL of sound attenuation; therefore, if the exterior noise environment is classified as "acceptable," according to HUD standards, the interior noise

environment should not exceed 45 dB DNL. The HUD regulations also encourage the use of quieter construction equipment and methods.

Federal Highway Administration Noise Abatement Criteria

CFR Title 23, Part 772 is the federal regulation governing traffic noise impacts. A federal or federally funded project is considered to have a traffic noise impact if it involves the construction of a new highway, or includes substantial modification of an existing highway, where the project would result in a substantial operational noise increase or where the predicted operational noise level approaches or exceeds the Federal Highway Administration (FHWA) Noise Abatement Criteria. In this case, a "substantial increase" is not defined by the FHWA but is generally defined by the state and/or local governing agencies. The noise level is defined as "approaching" the Noise Abatement Criteria if it is within 1 dB of the applicable criterion. **Table 4.12-8** summarizes the FHWA Noise Abatement Criteria as presented in the U.S. Department of Transportation/FHWA Highway Traffic Noise Analysis and Abatement Policy and Guidance document.

Table 4.12-8: Summary of Federal Highway Administration (FHWA) Noise Abatement Criteria

Activity Category	Hourly Average Noise Level (L_{eq}, dBA)	Description of Activities
A	57 Exterior	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B	67 Exterior	Picnic areas, recreation areas, playgrounds, active sport areas, parks, residences, motels, hotels, schools, churches, libraries, and hospitals.
C	72 Exterior	Developed lands, properties, or activities not included in categories A or B above.
D	—	Undeveloped lands.
E	52 Interior	Residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals, and auditoriums.

SOURCE: U.S. Department of Transportation, 2011, cited in *Plan Bay Area 2050 Draft EIR*, 2021.

Federal Transit Administration Construction Noise Guidelines

In addition to addressing transit operations noise, the Federal Transit Administration (FTA) offers guidance with respect to the evaluation of transit construction noise exposure. Like the operational noise criteria, construction noise criteria are intended to consider the existing (ambient) noise environment. Additionally, construction noise exposure should consider the duration of construction activities and the receiving land use (i.e., sensitivity of receiver). FTA construction noise guidelines are summarized in **Table 4.12-9**.

Table 4.12-9: Federal Transit Administration (FTA) Construction Noise Criteria

Affected Land Use	Hourly L_{eq} dBA		8-Hour L_{eq} dBA	
	Daytime (7:00 a.m.–10:00 p.m.)	Nighttime (10:00 p.m.–7:00 a.m.)	Daytime (7:00 a.m.–10:00 p.m.)	Nighttime (10:00 p.m.–7:00 a.m.)
Residential	90	80	80	70
Commercial	100	100	85	85
Industrial	100	100	90	90

SOURCE: FTA, 2008, cited in *Plan Bay Area 2050 Draft EIR*, 2021.

NOTES: In urban areas with very high noise levels, construction noise should not exceed ambient noise levels plus 10 dB.

Federal Aviation Regulations Part 150, Noise

Federal Aviation Administration (FAA) Order 1050.1E, FAA Order 5050.4B, and Title 14 - Aeronautics and Space Chapter I - Federal Aviation Administration, Department of Transportation Subchapter I - Airports Part 150 - Airport Noise Compatibility Planning (FAR Part 150) provide the regulatory framework for noise related to aircraft operations. Appendix A of FAR Part 150 states that "for the purpose of compliance with this part, all land uses are considered to be compatible with noise levels less than DNL (or CNEL in California) 65 dB. Local needs or values may dictate further delineation based on local requirements or determinations."

Vibration

Federal Transit Administration Standards Evaluating for Building Damage from Construction Vibration

FTA has adopted vibration standards that are used to evaluate potential building damage impacts related to construction activities. The vibration damage criteria adopted by FTA are shown in **Table 4.12-10**.

Table 4.12-10: Construction Vibration Damage Criteria

Building Category	Vibration Level at Which Damage May Occur PPV (in/sec)
I. Reinforced concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

SOURCE: FTA, 2018.

ABBREVIATIONS: in/sec = inches per second; PPV = peak particle velocity.

Federal Transit Administration Standards for Evaluating Human Annoyance from Vibration

In addition, FTA has adopted standards for evaluating human annoyance for groundborne vibration impacts for the following three land use categories:

- **Category 1—High Sensitivity:** Buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes.
- **Category 2—Residential:** All residential land uses and any buildings where people sleep, such as hotels and hospitals.
- **Category 3—Institutional:** Land uses such as schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment but still have the potential for activity interference.

Under conditions where there are an infrequent number of events per day, FTA has established thresholds of 65 VdB for Category 1 buildings, 80 VdB for Category 2 buildings, and 83 VdB for Category 3 buildings.[260] Under conditions where there are an occasional number of events per day, FTA has established thresholds of 65 VdB for Category 1 buildings, 75 VdB for Category 2 buildings, and 78 VdB for Category 3 buildings.[261] No thresholds have been adopted or recommended for commercial and office uses.

b. State Laws, Plans, Programs, and Regulations

Noise

Title 24, California Building Code

State regulations related to noise include requirements for the construction of new hotels, motels, apartment houses, and dwellings other than detached single-family dwellings that are intended to limit the extent of noise transmitted into habitable spaces. These requirements, collectively known as the California Noise Insulation Standards are found in the California Code of Regulations, Title 24, Part 2 (known as the California Building Code), Appendix Chapters 12 and 12A. For limiting noise transmitted between adjacent dwelling units, the noise insulation standards specify the extent to which walls, doors, and floor ceiling assemblies must block or absorb sound.

[260] "Infrequent events" is defined by FTA as being fewer than 30 vibration events of the same kind per day.
[261] "Occasional events" is defined by FTA as between 30 and 70 vibration events of the same source per day.

For limiting noise from exterior sources, the noise insulation standards set forth an interior standard of DNL 45 dBA in any habitable room and, where such units are proposed in areas subject to noise levels greater than DNL 60 dBA, require an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard. If the interior noise level depends upon windows being closed, the design for the structure must also specify a ventilation or air conditioning system to provide a habitable interior environment. Title 24 standards are enforced in the City of Brisbane through the building permit application process.

Guidelines for Land Use and Noise Exposure

The California Department of Public Health has established guidelines for evaluating the compatibility of various land uses as a function of community noise exposure. These guidelines for land use and noise exposure compatibility are shown in **Table 4.12-11**. In addition, Section 65302(f) of the California Government Code requires each county and city in the state to prepare and adopt a comprehensive long-range general plan for its physical development, with Section 65302(g) requiring a noise element to be included in the general plan. The noise element must (1) identify and appraise noise problems in the community, (2) recognize Office of Noise Control guidelines, and (3) analyze and quantify current and projected noise levels.

Noise Limits for Vehicles

The State of California also establishes noise limits for vehicles licensed to operate on public roads. For heavy trucks, the state pass-by standard is consistent with the federal limit of 80 dB. The state pass-by standard for light trucks and passenger cars (less than 4.5 tons, gross vehicle rating) is also 80 dB at 15 meters from the centerline. These standards are implemented through controls on vehicle manufacturers and by legal sanction of vehicle operators by state and local law enforcement officials.

Caltrans Construction Noise Standards

California Department of Transportation (Caltrans) Standard Specifications, Section 14-8.02, Noise Control, establishes a construction noise exposure/production limit of 86 dB (L_{max}) at a distance of 50 feet. Additionally, this specification establishes that all internal combustion engines should be equipped with manufacturer-recommended mufflers and that no internal combustion engines may be operated without mufflers.

Table 4.12-11: State of California Community Noise Compatibility Guidelines (DNL or CNEL)

Land Use	Normally Acceptable[a]	Conditionally Acceptable[b]	Normally Unacceptable[c]	Clearly Unacceptable[d]
Single-Family Homes, Duplexes, Mobile Homes	50–60	55–70	70–75	above 75
Multi-Family Homes	50–65	60–70	70–75	above 75
Schools, Libraries, Churches, Hospitals, Nursing Homes	50–70	60–70	70–80	above 80
Transient Lodging—Motels, Hotels	50–65	60–70	70–80	above 75
Auditoriums, Concert Halls, Amphitheaters	—	50–70	—	above 70
Sports Arenas, Outdoor Spectator Sports	—	50–75	—	above 75
Playgrounds, Neighborhood Parks	50–70	—	67–75	above 75
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50–75	—	70–80	above 80
Office Buildings, Business and Professional, Commercial	50–70	67–77	above 75	—
Industrial, Manufacturing, Utilities, Agriculture	50–75	70–80	above 75	—

SOURCE: Governor's Office of Planning and Research, 2017.

ABBREVIATIONS: CNEL = community noise equivalent level; DNL = day-night average noise level.

NOTES:

a. Normally Acceptable: Specified land use is satisfactory, based on the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
b. Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning, will normally suffice.
c. Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
d. Clearly Unacceptable: New construction or development should generally not be undertaken.

Vibration

There are no state vibration standards directly applicable to the 2025 Baylands Specific Plan project. While the Caltrans *Transportation and Construction Vibration Guidance Manual* (2020) does not provide official Caltrans standards for vibration, it provides guidelines for assessing vibration damage potential in various types of buildings. The manual is meant to provide guidance related to vibration issues associated with the construction, operation, and maintenance of Caltrans projects. Caltrans vibration criteria for assessing structural damage and human perception are shown in **Table 4.12-12** and **Table 4.12-13**, respectively.

Table 4.12-12: Caltrans Criteria for Vibration Damage Potential

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources[a]	Continuous/ Frequent Sources[b]
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

SOURCE: Caltrans, 2020.

NOTES:

a. Transient sources create a single isolated vibration event, such as blasting or drop balls.
b. Continuous/frequent intermittent sources include impact pile drivers, "pogo-stick" compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

Table 4.12-13 Caltrans Criteria for Vibration Annoyance Potential

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources[a]	Continuous/ Frequent Sources[b]
Barely Perceptible	0.04	0.01
Distinctly Perceptible	0.25	0.04
Strongly Perceptible	0.9	0.10
Severe	2.0	0.4

SOURCE: Caltrans, 2020.

NOTES:

a. Transient sources create a single isolated vibration event, such as blasting or drop balls.
b. Continuous/frequent intermittent sources include impact pile drivers, "pogo-stick" compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

c. Regional Plans and Programs

San Francisco International Airport (SFO) Land Use Comprehensive Use Plan

The Specific Plan area is approximately 3.5 miles northwest of SFO and approximately 4 miles from the nearest SFO runway. The City/County Association of Governments of San Mateo (C/CAG), which is the designated Airports Land Use Commission for San Mateo County, has developed and is implementing the *San Mateo County Comprehensive Airport Land Use Plan for the Environs of San Francisco International Airport*. The SFO Airport Land Use Plan applies to areas that are located within the designated Airport Influence Area boundary established and defined by the Airport Land Use Plan. Airport Influence Area boundaries define areas where height, noise, overflight, and safety standards, policies, and criteria are applied to certain proposed land use policy actions. The Specific Plan area is located within the Airport Influence Area "A," which encompasses the entirety of San Mateo County.

Within Area A, Section 11010 of the Business and Professions Code requires people offering subdivided property for sale or lease to disclose the presence of all existing and planned airports within 2 miles of the property. The law requires that, if the property is within an Airport Influence Area designated by the airport land use commission, a notification must be included in the notice of intention to offer the property for sale. The notification must indicate that the property may be subject to some of the annoyances or inconveniences associated with proximity to airport operations (e.g., noise, vibration, odors).

Airport Influence Area B is based on a combination of the outer boundaries of the noise compatibility and safety zones. In accordance with guidance provided in Federal Aviation Regulation (FAR) Part 150, the Airport Land Use Plan includes Noise Exposure Maps that depict CNEL noise contours of CNEL 65 dBA, 70 dBA, and 75 dBA. As shown in **Figure 4.12-3**, the Specific Plan area is located outside the 65 dBA CNEL contour.

City and County of San Francisco Plans, Ordinances, and Regulations

The northern portion of the Specific Plan area lies along the border with the City and County of San Francisco and many of the closest receptors to the northern portion of the Specific Plan area are located within San Francisco.

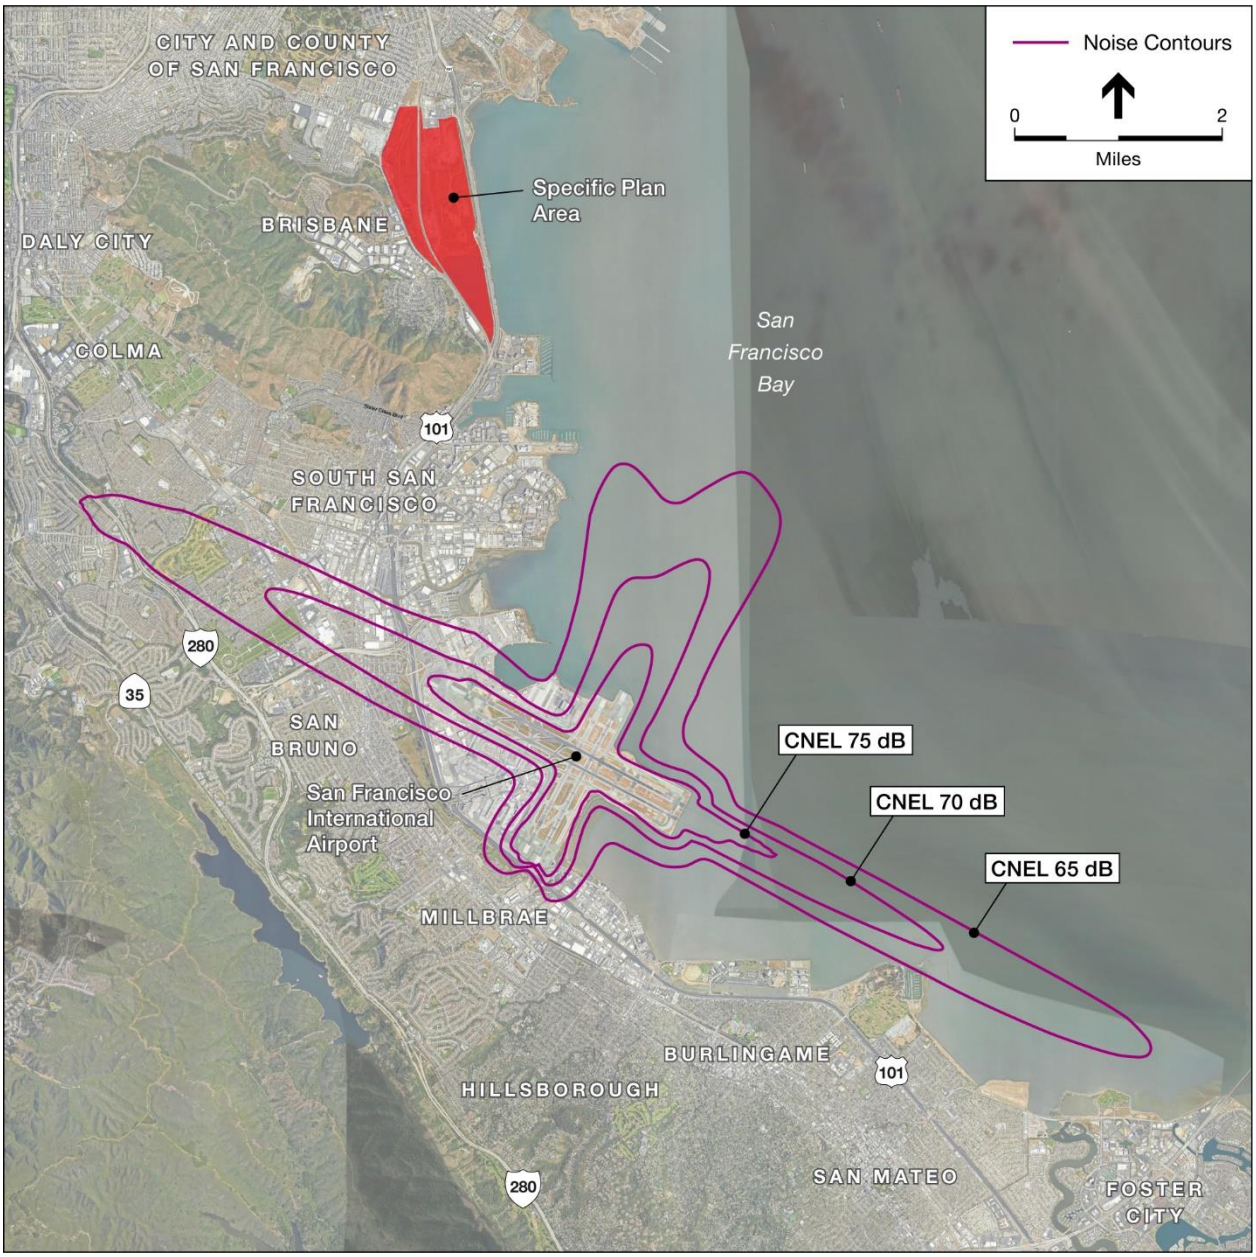
San Francisco General Plan

Land Use Compatibility Guidelines

The Environmental Protection Element of the San Francisco General Plan contains Land Use Compatibility Guidelines for Community Noise for determining the compatibility of various land uses with different noise levels (see **Table 4.12-14**). These guidelines, which are similar to the State of California's guidelines (see **Table 4.12-11**), indicate maximum acceptable noise levels for various land uses.

Although this table presents a range of noise levels that the City and County of San Francisco considers compatible or incompatible with various land uses, as shown in **Table 4.12-8**, the maximum satisfactory noise level (the upper limit where a noise exposure level is still considered "satisfactory") is 60 dBA (L_{dn}) for residential and hotel uses; 65 dBA (L_{dn}) for school classrooms, libraries, churches, and hospitals; 70 dBA (L_{dn}) for playgrounds, parks, office uses, retail commercial uses, and noise-sensitive manufacturing/communications uses; and 77 dBA (L_{dn}) for other commercial uses such as wholesale, some retail, industrial/manufacturing, transportation, communications, and utilities.

Figure 4.12-3: San Francisco International Airport Existing Noise Contours



SOURCE: ESA, 2023.

Table 4.12-14: San Francisco Land Use Compatibility Guidelines for Community Noise

Land Use Category	Sound Levels and Land Use Consequences (L_{dn} Values in dBA)
	55 60 65 70 75 80 85
Residential – All Dwellings, Group Quarters	Transient Lodging – Motels, Hotels	School Classrooms, Libraries, Churches, Hospitals, Nursing Homes, etc.	Auditoriums, Concert Halls, Amphitheaters, Music Shells	Sports Arenas, Outdoor Spectator Sports	Playgrounds, Parks	
Golf Courses, Riding Stables, Water-Based Recreation Areas, Cemeteries	Office Buildings – Personal, Business, and Professional Services	Commercial – Wholesale and Some Retail, Industrial/Manufacturing, Transportation, Communication, and Utilities	Manufacturing – Noise-Sensitive Communications – Noise-Sensitive	
SOURCE: City and County of San Francisco, 1996.

ABBREVIATIONS: L_{dn} = day-night noise level; dBA = a-weighted decibel.

NOTES:

Satisfactory, with no special noise insulation requirements. Noise levels in this range are considered "Acceptable."

New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Noise levels in this range are considered "Conditionally Acceptable."

New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design. Noise levels in this range are considered "Conditionally Unacceptable."

New construction or development should generally not be undertaken. Noise levels in this range are considered "Unacceptable."

Objectives and Policies

The Environmental Protection Element of the General Plan includes the following objectives and policies that pertain to noise:

- **Objective 9:** Reduce Transportation-related Noise
    - *Policy 9.2:* Impose traffic restrictions to reduce transportation noise;
    - *Policy 9.6:* Discourage changes in streets that will result in greater traffic noise in noise-sensitive areas;
- **Objective 10:** Minimize the impact of noise on affected areas;
    - *Policy 10.1:* Promote site planning, building orientation and design, and interior layout that lessen noise intrusion;
    - *Policy 10.2:* Promote the incorporation of noise insulation materials in new construction;
    - *Policy 10.3:* Construct physical barriers to reduce noise transmission from heavy traffic carriers; and
- **Objective 11:** Promote land uses that are compatible with various transportation noise levels.

San Francisco Municipal Code

Construction Noise Ordinance Article 29, Sections 2907 and 2908 regulate construction equipment and construction work at night, while Section 2909 provides for limits on any machine, device, music or entertainment, or any combination of such sources. Sections 2907 and 2908 are enforced by San Francisco Public Works (Public Works), and Section 2909 is enforced by the San Francisco Department of Public Health. Summaries of these and other relevant sections are presented below.

Construction Noise Regulations

San Francisco Noise Ordinance Section 2907(a) limits noise from construction equipment to 80 dBA when measured at a distance of 100 feet from such equipment, or an equivalent sound level at some other convenient distance. Exemptions to this requirement include impact tools with approved mufflers, pavement breakers, and jackhammers with approved acoustic shields, and construction equipment used in connection with emergency work. However, Section 2907(b) requires that all such equipment be used with manufacturer-approved acoustic shields. Noise Ordinance Section 2908 prohibits nighttime construction (between 8:00 p.m. and 7:00 a.m.) that generates noise exceeding the ambient noise level by 5 dBA at the nearest property line unless the City and County of San Francisco has issued a special permit.

Regulations for Mechanical Equipment and Other Noise

San Francisco Noise Ordinance Section 2909 generally prohibits fixed mechanical equipment noise and music in excess of 5 dBA above the ambient noise level from residential sources, 8 dBA more than the ambient noise level from commercial sources, and 10 dBA more than the ambient noise level on public property at a distance of 25 feet or more. Specifically, on public property, Section 2909(c) generally prohibits noise produced by any machine or device, or any combination of the two, that exceeds the local ambient noise level more than 10 dBA at a distance of 25 feet or more unless the machine or device is being operated to serve or maintain the property.

The standards in Section 2909(d)—45 dBA between 10:00 p.m. and 7:00 a.m. and 55 dBA between 7:00 a.m. and 10:00 p.m.—are the absolute maximum allowable level of interior noise produced from any combination of mechanical device(s) and audio systems(s) under one ownership/use originating from outside the dwelling unit. The standards in this section may not apply to areas in which the ambient noise level exceeds the limits.

City of Daly City Plans, Ordinances, and Programs

The northwestern portion of the Specific Plan area is located adjacent to the City of Daly City and many of the closest receptors to that portion of the Specific Plan area are located within the City of Daly City.

Daly City General Plan

The Daly City General Plan Noise Element contains the following noise and vibration policies and actions:

Policy NE-2: Use the State Office of Noise Control Guidelines as a guide to assess development that will need additional noise study and mitigations.

Task NE-2.1: Use the Noise Control Guidelines to assess the suitability of a site for new development in combination with the noise contours to accurately identify areas that may need additional noise study and mitigation. Noise mitigations include additional insulation, double glazing of windows and increasing building setbacks from the noise source. Mitigations should also be creative and attractive whenever possible and appropriate. Creative noise mitigation measures can include incorporation of fountains using water to mask freeway noise and noise walls of an appropriate scale painted with decorative murals.

Policy NE-3: Maintain a CNEL level of not more than 70 dBA L_{eq} in residential areas.

Task NE-3.1: Continue to enforce the environmental noise requirements of the State Building Code (Title 24).

Task NE-3.2: Encourage noise insulation programs in areas that do not meet the current noise standard and ensure that future development is mitigated appropriately or avoided in areas where the noise levels exceed or are projected to exceed 70 dBA, L_{eq}.

Daly City Municipal Code

Daly Municipal Code Section 9.22.030 prohibits "any noise, music, sound or other disturbance… which may be heard by, or which noise disturbs or harasses, any other person beyond the confines of the property, quarters or apartment from which the noise, music, sound or disturbance emanates" between the hours of 10:00 p.m. and 6:00 a.m. of the following day.

Municipal Code Section 17.39.100 limits normal maintenance of wireless telecommunications facilities to between the hours of 7:00 a.m. and 5:00 p.m., Monday through Saturday, "excluding emergency repairs, unless the carrier requests and receives approval through a use permit or an administrative use permit for a different maintenance period." Backup generators for wireless telecommunications facilities may only be operated during power outages or for testing and maintenance between the hours of 7:00 a.m. and 5:00 p.m., Monday through Saturday.

City of South San Francisco Plans, Ordinances, and Regulations

South San Francisco General Plan

The South San Francisco General Plan provides the following noise and vibration policy direction:

GOAL NOI-1: Residents and employees of South San Francisco are exposed to acceptable noise levels.

Policy NOI-1-1: Ensure new development complies with Noise Compatibility guidelines. Ensure that all new development within the city complies with the Land Use/Noise Compatibility guidelines shown in Table 11.

Policy NOI-1.2: Enforce Noise Performance Standards. The City enforces the Noise Ordinance noise performance standards.

Table 11: Land Use/Noise Compatibility Matrix to Guide New Development

Land Use Categories		CNEL	
Categories	**Compatible Uses**	**Interior[a]**	**Exterior[b]**
Residential	Single Family, Duplex, Multiple Family, Mobile Homes, Residential Care	45[c]	65[d]
Commercial	Hotel, Motel, Transient Lodging	45[c]	65[d]
	Office Buildings, Research and Development, Professional Offices	55	—
	Amphitheater, Concert Hall, Auditorium, Meeting Hall, Movie Theater	50	—
	Manufacturing, Warehousing, Wholesale, Utilities	65	—
Open Space	Parks, Neighborhood Parks, Playgrounds	—	65[d]
Institutional/Public Facility	Hospitals, Schools, Classrooms	45[c]	65[d]
	Churches, Libraries	45[c]	—

INTERPRETATION:

a. Interior environment excludes bathrooms, toilets, closets, and corridors.
b. Outdoor environment limited to private yard of single family residential, multifamily residential, and mobile home park outdoor common space area; hospital patio; park picnic area; and hotel and motel recreation area.
c. Noise level requirement with closed windows. Mechanical ventilation or other measures of natural ventilation shall be provided pursuant to UBC requirements.
d. Multifamily developments with private balconies that would not meet the 65 CNEL standard are required to provide occupancy notices to future tenants regarding potential noise impacts.

GOAL NOI-2: Prevent the exposure of residents and employees of South San Francisco unacceptable vibration levels.

Policy NOI-2.1: Require vibration analysis for sensitive receptors. A vibration analysis shall be prepared by a qualified acoustical consultant for any construction-related activities, located within 100-feet of residential or other sensitive receptors, that require the use of pile driving or other construction method that has the potential to produce high vibration levels.

Policy NOI-2.2: Require vibration analysis for rail lines. A vibration analysis shall be prepared by a qualified acoustical consultant for new land use development located within 200-feet of existing rail lines.

GOAL NOI-3: Historic structures are not exposed to unacceptable vibration levels.

Policy NOI-3.1: Require vibration analysis for historic structure protection. Prior to issuance of grading permits for any development project that is located within 150 feet of a historic structure and, if construction activities will require either: (1) pile driving within 150 feet; or (2) utilization of mobile construction equipment within 50 feet of the historic structure, the property owner/developer shall retain an acoustical engineer to conduct a vibration analysis for potential impacts from construction-related vibration impacts onto the historic structure. The vibration analysis shall determine the vibration levels created by construction activities at the historic structure, and if necessary, develop mitigation to reduce the vibration levels to within Caltrans threshold of 0.12 inches per second PPV for historic buildings.

South San Francisco Municipal Code

Section 8.32.030 of the South San Francisco Municipal Code sets standards for maximum allowable noise generation as follows:

(a) It is unlawful for any person to operate or cause to be operated any source of sound at any location within the city or allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which causes the noise level when measured on any other property to exceed:

(1) The noise level standard for that land use as specified in Table 8.32.030 for a cumulative period of more than thirty minutes in any hour.

(2) The noise level standard plus five dB for a cumulative period of more than fifteen minutes in any hour;

(3) The noise level standard plus ten dB for a cumulative period of more than five minutes in any hour;

(4) The noise level standard plus fifteen dB for a cumulative period of more than one minute in any hour; or

(5) The noise level standard or the maximum measured ambient level, plus twenty dB for any period of time.

(b) If the measured ambient level for any area is higher than the standard set in Table 8.32.030, then the ambient level shall be the base noise level standard for purposes of subsection (a)(1) of this section. In such cases, the noise levels for purposes of subsections (a)(2) through (a)(5) of this section shall be increased in five dB increments above the ambient level.

Table 8.32.030 Noise Level Standards

Land Use Category	Time Period	Noise Level (dB)
R-E, R-1 and R-2 zones or any single-family or duplex residential in a specific plan district	10 p.m.—7 a.m. 7 a.m.—10 p.m.	50 60
R-3 and D-C zones or any multiple-family residential or mixed residential/commercial in any specific plan district	10 p.m.—7 a.m. 7 a.m.—10 p.m.	55 60
C-1, P-C, Gateway and Oyster Point Marina specific plan districts or any commercial use in any specific plan district	10 p.m.—7 a.m. 7 a.m.—10 p.m.	60 65
M-1, P-1	Anytime	70

SOURCE: Adapted from "The Model Community Noise Control Ordinance," Office of Noise Control, California Department of Health.

(c) If the measurement location is on a boundary between two different zones, the noise level standard shall be that applicable to the lower noise zone plus five dB.

(d) Notwithstanding any other provisions of this chapter, no person shall willfully make or continue, or cause to be made or continued, any loud, unnecessary or unusual noise which disturbs the peace or quiet of any neighborhood.

Section 8.32.030 of the South San Francisco Municipal Code states:

It is unlawful for any person to operate or cause to be operated any source of sound, on multifamily residential property or multitenant commercial or industrial property, a noise level more than ten dB above the level allowed by Section 8.32.030 three feet from any wall, floor or ceiling inside any unit on the same property when the windows and doors of the unit are closed, except within the unit in which the noise source or sources is located.

Section 8.32.050 of the South San Francisco Municipal Code sets noise standards for construction noise as follows:

(d) **Construction.** Construction, alteration, repair or landscape maintenance activities which are authorized by a valid city permit shall be allowed on weekdays between the hours of eight a.m. and eight p.m., on Saturdays between the hours of nine a.m. and eight p.m., and on Sundays and holidays between the hours of ten a.m. and six p.m., or at such other hours as may be authorized by the permit, if they meet at least one of the following noise limitations:

(1) No individual piece of equipment shall produce a noise level exceeding ninety dB at a distance of twenty-five feet. If the device is housed within a structure or trailer on the property, the measurement shall be made outside the structure at a distance as close to twenty-five feet from the equipment as possible.

(2) The noise level at any point outside of the property plane of the project shall not exceed ninety dB.

d. City of Brisbane Plans, Ordinances, and Regulations

Brisbane General Plan

The following Community Health and Safety Element policies and programs regarding noise are relevant to Specific Plan development:

Policy 176: Minimize the intrusion of unwarranted and intrusive noise on community life.

Program 176a: Discourage new sources that generate excessive noise.

Policy 179: Require the incorporation, when feasible, of new road or landscaping features that buffer noise impacts on adjacent areas.

Policy 180: Establish and enforce truck routes and times of operation for haul routes to minimize impacts on residential areas.

Policy 182: Support efforts to reduce vehicle trips and keep smooth traffic flow to the extent that the number of trips and stop-and-start traffic contribute to traffic noise.

Policy 183: Coordinate land uses and construction conditions to minimize noise impacts of the Caltrain corridor and major highway arterials on adjacent land uses.

Policy 184: In conjunction with development applications and other land use decisions, consider the potential for noise generation from, as well as noise impacts on, the project or area.

Program 184a: Use the State Guidelines for land use compatibility to determine noise impacted uses.

Program 184b: Require acoustical studies for development applications in areas identified as noise impacted and potential noise generators.

Program 184c: For such projects, noise attenuation or a mitigation program to be submitted as part of the project design.

Program 184a requires using the State of California's Land Use Compatibility Guidelines to determine noise-affected uses. The acceptable noise exposures for land use compatibility published by the State of California were presented in **Table 4.12-11**.

The State of California's Land Use Compatibility Guidelines are used for determining the compatibility of various land uses with different noise environments. Noise levels in **Table 4.12-11** are expressed in terms of DNL, which applies a correction or "penalty" to noise generated during the more sensitive nighttime hours. CNEL measurements are a weighted average of sound levels gathered throughout a 24-hour period, providing a measure of ambient noise. Different weighting factors apply to day, evening, and nighttime periods. This recognizes that community members are most sensitive to noise in late night hours and are more sensitive during evening hours than in daytime hours.

Policy 189: In the Municipal Code, continue to restrict noise-producing construction activities to daytime hours of operation.

Under the State of California guidelines identified in **Table 4.12-11**, the acceptable noise level for residential, hotel, and motel uses is generally 60 to 65 dBA or less, while conditionally acceptable noise levels range from 60 dBA to 70 dBA (may require insulation, etc.). Noise levels over 70 dBA are, in general, unacceptable for these sensitive land uses.

Noise environments of up to 70 dBA are generally considered acceptable for office, professional, and business commercial land uses, while conditionally acceptable noise levels[262] range from 67.5 dBA to 77.5 dBA. Noise levels over 75 dBA are, in general, normally unacceptable for these land uses.

Policy 189: In the Municipal Code, continue to restrict noise-producing construction activities to daytime hours of operation.

Brisbane Noise Ordinance

The City of Brisbane also regulates community noise levels through enforcement of Chapter 8.28 of the Brisbane Municipal Code. Noise standards are established by land use and are presented in **Table 4.12-15**.

Table 4.12-15: Brisbane Municipal Code Chapter 8.28 Noise Standards

Land Use Type	Duration of Noise in Minutes within an Hour	Noise Standard as Maximum Allowable dBA above Ambient
Single Family Residential	At any time	30
	3 minutes	20
	10 minutes	10
Multi-Family Residential	Any time	30
	3 minutes	20
	10 minutes	10
Commercial / Industrial	Any time	30
	3 minutes	20
	10 minutes	10

SOURCE: City of Brisbane, 2023.

Noise from construction activities is restricted by Section 8.28.060 of the Brisbane Municipal Code. This section limits construction hours to between 7:00 a.m. and 7:00 p.m. on weekdays and 9:00 a.m. and 7:00 p.m. on weekends and holidays. Further, this section requires construction activities to meet at least one of the following standards:

A. No individual piece of equipment shall produce a noise level exceeding 83 dBA at a distance 25 feet from the source thereof. If the device or other source is housed within a structure on the property, the measurement shall be made outside the structure, but at a distance as close to the equipment or source as possible.

B. The noise level at any point outside of the property plane of the project shall not exceed 86 dBA.

[262] "Conditionally acceptable" noise levels are those where noise insulation or building design features can be included in the design to reach acceptable levels. In many cases, conventional construction, but with closed windows and fresh air supply systems or air conditioning, will suffice.

Approval of an exception permit pursuant to Brisbane Municipal Code Section 8.280.080 would be required for construction noise levels greater than 83 dBA at 25 feet from the source.

4.12.4 SIGNIFICANCE CRITERIA

As discussed in Section 4.1.3, the following criteria were used to determine the significance of noise and vibration impacts:

Threshold NOI-1: The Baylands Specific Plan would cause a significant impact if any of the following would occur:

- **Construction Hours**
  - **Baylands-related construction activities within the City of Brisbane would occur outside of the construction hours specified in Brisbane Municipal Code Section 8.28.060; or**
  - **Baylands-related construction activities conducted in a jurisdiction other than the City of Brisbane would occur either (1) outside of the construction hours adopted by the jurisdiction within which construction takes place or (2) outside of the construction hours set forth in Brisbane Municipal Code Chapter 8.28, whichever standards are more stringent.**
- **Construction Noise**
  - **Baylands-related construction activities would exceed the noise standards set forth in Brisbane Municipal Code Chapter 8.28.060 within the City of Brisbane; or**
  - **Baylands-related construction activities generating noise outside of the City of Brisbane would exceed either (1) any construction noise standard adopted by the jurisdiction within which such noise would occur or (2) the noise standards set forth in Brisbane Municipal Code Chapter 8.28, whichever is more stringent.**
  - **Baylands-related construction activities would increase ambient noise levels by 10 dBA or more at the nearest sensitive receptor averaged over the construction hours specified in Brisbane Municipal Code Section 8.28.060.**

Threshold NOI-2: **The Baylands Specific Plan would cause a significant impact during operations if a stationary source would generate noise in excess of 5 dBA[263] L_{eq} above the ambient at any sensitive receptor or in excess of any of the standards of Brisbane Municipal Code Section 8.28.030.**

Threshold NOI-3: **The Baylands Specific Plan would cause a significant impact during operations following construction if Specific Plan-generated traffic would cause ambient noise increases at one or more sensitive receptors in excess of the increases indicated in the table below.**

Ambient Noise Level without Project (DNL)	Project Increases Ambient Noise Levels by:
<60 dBA	+ 5.0 dBA or more
60–65 dBA	+ 3.0 dBA or more
>65 dBA	+ 1.5 dBA or more

Threshold NOI-4: **The Baylands Specific Plan would cause a significant impact if it would exacerbate land use / noise incompatibilities by exposing people living or staying at a hotel within the Baylands to noise levels in excess of:**

- **65 DNL generated by railroad or freeway operations; or**
- **A 65 CNEL noise contour generated by aircraft activity.**
- **An interior noise level in excess of Title 24 standard of 45 DNL.**

Threshold NOI-5: **The Baylands Specific Plan would cause a significant impact if any of the following would occur:**

- **Human Annoyance (Construction or Operation)**
  - **A vibration level of 72 VdB (vibration decibels) would be generated for more than 70 vibration events on a daily basis by construction or operational activities at an occupied residential use; or**
  - **A vibration level of 80 VdB (vibration decibels) would be generated by construction activities at an occupied non-residential use.**

[263] As stated in the Physical Environmental Setting section, a change in noise levels of 5 dB is considered to be a readily perceivable difference.

- **Damage to Historic Structures**
  - **Construction or operational activities would generate in excess of 0.25 inches per second [in/sec] peak particle velocity [PPV] at a historic structure.**
- **Damage to Modern Structures**
  - **Construction or operational activities would generate in excess of 0.5 inches per second [in/sec] peak particle velocity [PPV] at a modern structure.**
- **Damage to Underground Utilities**
  - **Construction activities would generate in excess of the Association of State Highway and Transportation Officials (AASHTO) guidelines for underground utility criteria, including 4.0 in/sec for utility lines and 10.0 in/sec for cables and underground structures.**

Threshold NOI-6: The Baylands Specific Plan would cause a significant impact if it would exacerbate human annoyance due to vibration levels by placing residential buildings or hotels in areas experiencing either:

- **A vibration level of 80 vibration decibels (VdB) or more on a daily basis if fewer than 30 events per day; or**
- **A vibration level of 72 VdB from activities that generate more than 70 vibration events on a daily basis.**

4.12.5 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact NOI-1: Temporary Increase in Ambient Noise Levels during Construction

Methodology for Determining Significance

Threshold NOI-1 addresses whether Baylands construction would generate noise in excess of established construction and mobile source noise standards. The Impact NOI-1 analysis focuses on specific Baylands construction activities that would exceed these standards.

Construction noise levels were estimated for standard construction equipment and for high-impact construction equipment with consideration of the duration and intensity of construction activities. The FHWA Roadway Construction Noise Model (RCNM) was used to calculate construction noise (FHWA 2006). The RCNM is used as the FHWA's national standard for predicting construction noise. RCNM analysis includes the calculation of noise levels (L_{max} and L_{eq}) at incremental distances for a variety of construction equipment. Inputs for the model

include acoustical use factors and L_{max} reference noise levels and estimated distances to the receptor location analyzed.

FTA methodology for general assessment of construction noise was used to determine noise levels that would result from Baylands construction activities. The FTA methodology entails a process for calculating the hourly dBA L_{eq} and determining resulting noise levels for the two noisiest pieces of equipment expected to be used in each stage of construction considering:

- The reference noise emissions level at 50 feet for equipment to be used for each stage of construction;
- The usage factor for each piece of equipment; and
- The distance between the construction centerline and receptors.

Brisbane Municipal Code Section 8.28.060, Construction Activities, sets forth specific standards for construction hours, noise levels from individual pieces of equipment, and allowable noise levels at the property lines of a construction project. Because these standards were designed to prevent substantial nuisance noise during construction activities, exceedances of these standards indicate a significant impact, and therefore, the standards are used to determine whether Baylands construction activities would have significant impacts within the City of Brisbane.

Where Baylands-related construction activities generate noise in jurisdictions other than the City of Brisbane, such jurisdictions may also have adopted noise standards designed to prevent substantial nuisance noise during construction activities, and exceedances of these standards would indicate a significant impact within those jurisdictions. The standards set forth in Section 2907(a) of the San Francisco Noise Ordinance were used to determine the significance of Baylands construction noise on receptors in San Francisco. Similarly, the noise standards set forth in Daly City Municipal Code Section 17.39.100 were used to determine the significance of Baylands construction noise on receptors in Daly City.

In addition to the assessment of construction noise relative to noise standards adopted by Brisbane, San Francisco, Daly City, and South San Francisco, Impact NOI-1 also examines whether an increase of 10 dBA or more over existing noise levels at sensitive-receptor locations, which would be perceived as a doubling of loudness, would occur.

Local jurisdictions do not have the authority to regulate transportation noise through their County or municipal codes.[264] Therefore, transportation noise increases are assessed in Impact NOI-3 separate from construction or operational noise which are generally assessed relative to standards in the local municipal code. The measures of a substantial increase in transportation noise exposure as recommended by the Federal Interagency Committee on Noise are used in

[264] Local jurisdictions can establish noise exposure standards for proposed new uses relative to transportation in their General Plans. Additionally, some local jurisdictions can adopt General Plan Policies that establish CEQA criteria for transportation noise. However, this later condition is not the case for Brisbane or San Francisco.

the analysis and are presented in Table 12 of Appendix J, *Baylands Noise and Vibration Technical Report*. A significant noise impact would occur if Baylands development and traffic would cause ambient noise levels greater than 3 dBA above levels existing without the project for areas already impacted by noise and a 5 dBA increase at receptors where the noise compatibility standard is being met along the portions of roadways in the jurisdiction of either Brisbane or San Francisco. These are the criteria applied in the assessment of roadway vehicle noise on local roadways as identified for operational noise in Threshold NOI-3, above.

Impact Assessment

As detailed in Section 3.3.4, *Phasing of Baylands Development*, grading and construction of the buildings, street network, and infrastructure in the Specific Plan area would be sequenced over two primary phases.

Table 4.12-16 presents the noise levels generated by common pieces of construction equipment and by pile driving and compaction activities that would be required for Specific Plan development.

Table 4.12-16: Typical Maximum Noise Levels from Construction Equipment (Reference Levels)

Construction Equipment	Reference Noise Level (dBA, L_{max} at 50 feet)	Noise Level (dBA, L_{max} at 25 feet)
Backhoe	78	84
Excavator	81	87
Compactor	83	89
Scraper	84	90
Air Compressor	78	84
Dozer	82	88
Crane	81	87
Grader	85	91
Paver	77	83
Roller	80	86
Front End Loader	79	85
Trucks	76	82
Concrete Crusher	79	85
Impact and Vibratory Pile Driver	101	107

SOURCE: FHWA, 2006.

NOTE: These are maximum field measured values at 50 feet as reported from multiple samples. Concrete crusher processing noise level based on data from H.M. Pitt Labs, 2006.

As can be seen from **Table 4.12-16**, many pieces of standard construction equipment generate a noise level exceeding 83 dBA at a distance of 25 feet. Therefore, compliance of Baylands development with Brisbane Municipal Code Section 8.28.060 (A) is incumbent upon ensuring that construction noise does not exceed 86 dBA outside the property plane. The following

analysis assesses potential construction noise impacts relative to the 86 dBA property plane limitation and also addresses whether construction activities would result in an increase in ambient noise levels greater than 10 dBA.

Nighttime Construction

All grading and construction permitted by the Specific Plan would be required to comply with General Plan Policy 189 and the Brisbane Municipal Code, including the following standards:

- Hours of construction activities will be limited to the hours of:
    - Monday through Friday – 7:00 a.m. to 7:00 p.m.
    - Weekends and Holidays – 9:00 a.m. to 7:00 p.m.

However, some construction activities, such as concrete pours or other work to maintain safety or avoid traffic impacts, may require nighttime activity that could conflict with the City of Brisbane's ordinance limiting the hours and days allowed for construction work. Such nighttime activities could result in temporary noise level increases exceeding the quieter nighttime ambient noise levels by more than 10 dBA, particularly for proposed on-site receptors occupied while construction of later phases is still ongoing.

Brisbane Municipal Code Section 8.28.080 provides for limited exceptions to the standards of Section 8.28, in general. Specifically, if an applicant can demonstrate to the satisfaction of the community development director immediate compliance with the requirements of this chapter would be impractical or unreasonable, the community development director may issue a permit to allow exception from any or all of the provisions contained in Chapter 28, with appropriate conditions to minimize the public detriment caused by such exceptions.

Such construction activities would be subject to review, permitting, and approval by the Director of the Community Development Department or the Director's designee for review and approval before the issuance of any building permit.

Initial Demolition Activities within the Western Portion of the Baylands

Initial preparation of the Baylands for development would include the demolition and deconstruction of non-historic buildings, site structures (retaining walls, utility structures), streets and pavement, existing utilities, and landscape elements that are incompatible with the proposed land development program and design within the western portion of the Baylands. The historic Roundhouse structure would be dismantled for future restoration following site grading. Non-historic buildings and structures to be removed are primarily of wood, masonry, and concrete construction and were formerly used for administration, railyard maintenance, and industrial operations. Within the western portion of the Baylands, these primarily consist of the industrial buildings along Bayshore Boulevard and Industrial Way. The nearest noise-sensitive receptors to buildings that would be demolished include residences on Linda Vista

Drive in Daly City, approximately 950 feet away, and residences on Cliff Swallow Court in Brisbane, approximately 1,000 feet away.

Equipment involved with demolition of the existing structures within the western portion of the Baylands would include excavators, backhoes, loaders, tractors, and haul trucks. Noise levels from demolition activities at the nearest sensitive receptors are presented in **Table 4.12-17**. Noise levels from demolition activities would be less than 86 dBA, would increase by 4.4 dBA at the nearest receptor, and would therefore be below this level at other receptors.

Table 4.12-17: Daytime Noise from Demolition Activities within the Western Portion of the Baylands

Representative Sensitive Receptor	Existing Daytime Noise Level (dBA, L_{eq})[a]	Loudest Two Noise Sources	Reference Noise Level (dBA)[b]	Distance to Receptor (feet)	Usage Factor	Adjusted L_{eq} Level (dBA, L_{eq})[c]	Resultant Noise Level (dBA, L_{eq})[d]	Increase over Existing Noise Level (dBA)
Linda Vista Drive, Daly City	—	Dozer	81.7	950	40%	52.1	—	NA
		Tractor	84.0	950	40%	54.4	—	NA
	54	Combined Total	84.0	950	40%	56.4	58.4	+4.4
Cliff Swallow Court in Brisbane	—	Dozer	81.7	1,000	40%	51.7	—	NA
		Tractor	84.0	1,000	40%	54.0	—	NA
	60	Combined Total	84.0	1,000	40%	56.0	61.5	+1.5

NOTES:

NA = not applicable

a. Existing noise level based on long- or short-term noise monitoring.
b. Reference value for equipment at 50 feet is an L_{max} as published by the FHWA.
c. Noise level is adjusted for number of equipment, distance to receptors, and usage factor.
d. Resultant noise level is the logarithmic sum of the existing noise level and the adjusted noise level.

Site Grading

Loading and Transport of Soils from the Former Landfill for Grading and Compaction to Create Building Pads within the Western Portion of the Baylands

Once initial demolition activities within the western portion of the Baylands are complete, construction activities would, for the approximately 2.5 million cubic yards of soil within the former landfill, consist of simultaneously loading the soil onto trucks; transporting these soils to the western portion of the site; and then unloading, grading, and compacting soils to create building pads within the western portion of the Baylands. Once the southernmost portion of the former landfill area is cleared of overlying soils and the underlying landfill area has undergone Title 27 final landfill closure subject to the regulatory authority and oversight of the Regional Water Quality Control Board, construction of the 55-acre solar farm would commence while the remaining soils to the north are moved, transported, graded, and compacted within the western portion of the Baylands. Each of the activities subject to City of Brisbane regulatory authority is

assessed individually below, followed by an assessment of the aggregate construction noise from these activities occurring simultaneously.[265]

SOIL LOADING

The movement of 2.5 million cubic yards of soil from atop the former landfill area in the eastern portion of the Baylands to be placed as engineered fill within the area west of the Caltrain right-of-way would involve the use of loaders to fill haul trucks. Approximately 10 loaders would work on a daily basis to fill haul trucks with soil stockpiled within the former landfill footprint area for transport to the western portion of the Baylands to establish building pads, starting from south to north.

Although loaders filling haul trucks in the eastern portion of the Baylands would generate noise, loading activities in the northern portion of the former landfill area would occur approximately 1,500 feet from the nearest receptors (ST-1) in the Little Hollywood neighborhood of San Francisco, while loading activities in the southern portion of the former landfill area would occur 1,800 feet from the nearest receptors on San Francisco Avenue in Brisbane (LT-7).

Construction noise levels were calculated for the loading of haul trucks in the eastern portion of the Baylands. The general assessment methodology for assessing construction noise impacts developed by FTA assumes simultaneous operation of the two noisiest pieces of equipment, and this assumption is applied for subsequent construction phases. However, for this analysis of soil loading activities, it is assumed that 10 loaders would be simultaneously engaged in loading trucks, as this effort to transport soil within the construction schedule would require such a scenario. The resulting noise levels at the nearest sensitive receptors are presented in **Table 4.12-18**.

As each truck is loaded within the eastern portion of the Baylands, soil would be transported to the western portion of the site where truckloads of soil would be unloaded, graded, and compacted to create building pads.

SOIL MOVEMENT AND PLACEMENT

As soil is transported to and unloaded within the western portion of the Baylands, rough grading would be undertaken. Equipment used for this rough grading would likely include loaders, graders, and compaction rollers. Noise levels from grading activities would increase by 7.0 dBA at the nearest noise-sensitive receptor and would be below this level at other receptors.

[265] Because Title 27 landfill closure is not subject to the regulatory authority of the City of Brisbane and was approved by the Regional Water Quality Control Board prior to release of this Draft EIR, noise impacts associated with placement of the required landfill cap are not analyzed as part of the Baylands Specific Plan project.

Table 4.12-18: Daytime Noise from Soil Loading within the Former Landfill Area by 10 Loaders

Representative Sensitive Receptor	Existing Daytime Noise Level (dBA, L_{eq})[a]	Equipment: 10 Loaders	Reference Noise Level (dBA)[b]	Distance to Receptor (feet)	Usage Factor	Adjusted L_{eq} Level (dBA, L_{eq})[c]	Resultant Noise Level[d]	Increase over Existing Noise Level (dBA)
Lathrop Avenue, San Francisco	54	Combined Total	79.1	1,500	40%	55.6	57.9	+3.9
San Francisco Avenue, Brisbane	61	Combined Total	79.1	1,800	40%	54.0	61.8	+ 0.8

SOURCE: Environmental Science Associates, 2025.

NOTES:

a. Existing noise level based on long- or short-term noise monitoring.
b. Reference value is an L_{max} for a single loader.
c. Noise level is adjusted for number of equipment, distance to receptors, and usage factor.
d. Resultant noise level is the logarithmic sum of the existing noise level and the adjusted noise level.

The noise impacts identified above assume that placement of soil and grading for the approach to the Geneva Avenue bridge over the Caltrain right-of-way would be undertaken concurrent with grading of adjacent lands north and south of the Geneva Avenue extension. Should residential structures adjacent to the bridge approach west of the Caltrain right-of-way be completed and occupied prior to placement and grading of the bridge approach, noise levels during that activity would approach the reference noise levels in **Table 4.12-16**. Should grading of the bridge approach on the east side of the Caltrain right-of-way occur after completion and occupancy of residential structures adjacent to Geneva Avenue west of the Caltrain right-of-way, noise levels during that activity would be similar to those identified in **Table 4.12-19** for Desmond Street in San Francisco.

Table 4.12-19: Daytime Noise from Grading Activities Associated with Grading Activities for Phase 1 Development

Representative Receptor	Existing Daytime Noise Level (dBA, L_{eq})[a]	Loudest Two Noise Sources	Reference Noise Level (dBA)[b]	Distance to Receptor (feet)	Usage Factor	Adjusted L_{eq} Level (dBA, L_{eq})[c]	Resultant Noise Level (dBA, L_{eq})[d]	Increase over Existing Noise Level (dBA)
Desmond Street, San Francisco	—	Compactor	83.2	470	20%	56.8	—	NA
	—	Excavator	80.7	470	40%	57.3	—	NA
	54	Combined Total	83.2	470	20/40%	60.0	61.0	+7
Cliff Swallow Court in Brisbane	—	Compactor	83.2	1,000	20%	50.2	—	NA
	—	Excavator	80.7	1,000	40%	50.7	—	NA
	60	Combined Total	83.2	1,000	20/40%	53.5	60.9	+0.9

SOURCE: Environmental Science Associates, 2025.

NOTES:

a. Existing noise level based on long- or short-term noise monitoring.
b. Reference value for equipment at 50 feet is an L_{max} as published by FHWA.
c. Noise level is adjusted for number of equipment, distance to receptors, and usage factor.
d. Resultant noise level is the logarithmic sum of the existing noise level and the adjusted noise level.

Soil materials to be moved from the eastern portion of the Baylands to the western portion would be hauled by trucks following a 3.8-mile route using a combination of off-road haul routes and public streets indicated in **Figure 3-54** over an approximately 34-month period. During peak times for site grading, approximately 640 daily round trip truck hauls would occur, including approximately 160 round trip truck hauls in the AM peak hour and 160 round trip truck hauls in the PM peak hour.

Transport of soil to the southwesterly portion of the Baylands would use Tunnel Avenue south to the Old County Road intersection where trucks would briefly proceed north on Bayshore Boulevard before accessing an internal roadway within the Baylands for unloading. This southerly route would be approximately 500 feet from existing residences on San Francisco Avenue in Brisbane and 1,200 feet from existing residences on Cliff Swallow Court in Brisbane.

Transport of soil to the northwesterly portion of the Baylands would use Tunnel Avenue north to Blanken Avenue and then proceed south on Bayshore Boulevard before accessing an internal roadway within the Baylands for unloading. This northerly route would be within 20 feet of existing residences on Blanken Avenue between Tunnel Avenue and Bayshore Boulevard and within 50 feet of residences on the 2400 block of Bayshore Boulevard.

Table 4.12-20 presents the results of the roadway hourly average noise modeling for construction haul trucks.

As shown in this table, roadway noise levels would increase by more than 3 dBA along the following roadway segments:

- Tunnel Avenue between Beatty Avenue and Blanken Avenue;
- Blanken Avenue between Tunnel Avenue and Bayshore Boulevard;
- Bayshore Boulevard between Tunnel Avenue and Southern Access Road; and
- Bayshore Boulevard between Blanken Avenue and Northern Access Road.

SOIL STABILIZATION

Soil stabilization within the Baylands would involve consecutive weeks of deep dynamic compaction. Deep dynamic compaction involves repeatedly dropping a large weight onto the soil using a crane. The weight is repeatedly dropped in a specific grid pattern at a defined drop height. At impact with the ground, the energy is transmitted at depth to densify loose material.

Table 4.12-20: Hourly average Daytime Noise Levels from Haul Truck Noise Increases along Soil Haul Routes (dBA, L_{eq})

Roadway Segment	Nearest Sensitive Receptor Location	Distance from Roadway Centerline to nearest Receptor (feet)	(A) Existing Modeled or Monitored[a] Noise level	Applicable Significance Threshold[b]	(B) Existing plus Haul Trucks	(B-A) Difference between Existing plus Haul Trucks and Existing	Significant Increase?
Bayshore Boulevard between Tunnel Avenue and Southern Access Road	**San Francisco Avenue, Brisbane**	**375**	**64.7**	**>3 dBA increase in an area >60 dBA L_{dn}**	**70.1**	**5.4**	**Yes**
Southern Access Road between Bayshore Boulevard and Icehouse District Deposition Area	Cliff Swallow Court in Brisbane	1,200	62[a]	>3 dBA increase in an area >60 dBA L_{dn}	62	<1	No
Tunnel Avenue between Beatty Avenue and Blanken Avenue	**Tunnel Avenue Residences, San Francisco**	**22**	**65.9**	**>3 dBA increase in an area >60 dBA L_{dn}**	**78.0**	**12.2**	**Yes**
Blanken Avenue between Tunnel Avenue and Bayshore Boulevard	**Blanken Avenue Residences, San Francisco**	**22**	**67.6**	**>3 dBA increase in an area >60 dBA L_{dn}**	**78.2**	**10.5**	**Yes**
Bayshore Boulevard between Blanken Avenue and Northern Access Road	**Bayshore Boulevard Residences, San Francisco**	**50**	**68.5**	**>3 dBA increase in an area >60 dBA L_{dn}**	**75.4**	**6.9**	**Yes**
Northern Access Road between Bayshore Boulevard and Bayshore District Deposition Area	Desmond Street Residences, San Francisco	1,100	59.7[a]	>3 dBA increase in an area >60 dBA L_{dn}	62.2	2.5	No

SOURCE: Environmental Science Associates noise survey, 2019

NOTES:

a. Monitored noise values are used for the nearest sensitive receptors that are not located along haul routes. All other existing values are modeled values for the roadway.
b. See Section 4.12-4 for the full text of Threshold NOI-3. Further detail is provided in Appendix J of this EIR, *Baylands Noise and Vibration Technical Report*.

While deep dynamic compaction is considered an impact-type activity, the impact from weight drops results in noticeable levels of vibration but a much lesser degree of noise. The weights used in deep dynamic compaction generally land on soils that absorb the impact and sound of the weight drop (i.e., impact noise from dropping of a weight is a low-level "thud" sound). Steady noise from deep dynamic compaction is emitted at relatively low levels from mobile cranes that move and drop weights. Noise levels generated by deep dynamic compaction are identified in **Table 4.12-21**.[266] For deep dynamic compaction activities, the closest off-site receptors on Desmond Street in San Francisco would be approximately 450 feet away. Noise levels from deep dynamic compaction activities would increase daytime noise levels by 4.2 dBA at the nearest off-site sensitive receptor. On-site sensitive receptors would not be present while deep dynamic compaction is occurring.

Solar Farm Construction

A solar farm would be constructed within the Baylands on a 55-acre site south of Visitacion Creek between Tunnel Avenue and US 101, approximately 1,800 feet from the nearest off-site receptor on San Francisco Avenue in Brisbane. Solar energy generation facilities would generally require standard construction methods generally organized into three broad work stages:

1. Mobilization, site preparation, fencing, laydown, and trenching.
2. Cable install, trench backfill, pile driving and racking install, inverter install, and module install.
3. Inverter, pile driving and racking installation, module installation, commissioning, and testing.

Installing solar panels with single axis tracking systems typically requires driving steel piers about 6 to 10 feet into the ground. Because of the limited depth, pile driving intensity for solar panels would be far less than that associated with building foundations. Noise levels from solar panel pile driving activities at the nearest sensitive receptors are presented in **Table 4.12-22**. Noise levels from solar panel pier installation activities would increase daytime noise by 4.2 dBA at the nearest sensitive receptor and would be below this level at other receptors.

[266] Vibration emissions from deep dynamic compaction are evaluated in Impact NOI-3, below (see **Table 4.12-39**).

Table 4.12-21: Daytime Noise from Deep Dynamic Compaction

Representative Sensitive Receptor	Existing Daytime Noise Level (dBA, L_{eq})[a]	Loudest Two Noise Sources	Reference Noise Level (dBA)[b]	Distance to Receptor (feet)	Usage Factor	Adjusted L_{eq} Level (dBA, L_{eq})[c]	Resultant Noise Level (dBA, L_{eq})[d]	Increase over Existing Noise Level (dBA)
Desmond Street, San Francisco	—	Crane	61.1	470	16%	53.1	—	NA
	—	Crane	61.1	470	16%	53.1	—	NA
	54	Combined Total	61.1	470	16%	56.1	58.2	+4.2

b. Combined noise level is the logarithmic sum of the existing noise level and the contributions from each simultaneous soil work activity.

Installation of Pile Foundations within the Western Portion of the Baylands

After grading and compaction of the western portion of the Baylands, excavation and foundation work for individual structures would begin. In general, the Geneva Avenue bridge and buildings greater than 50 feet in height (typically 5 stories or more) would not likely be able to use flat slab foundations and would therefore require pile foundations. Installation of pile foundations at one or more construction sites could thus occur intermittently throughout the projected 8 years of building construction following grading.

Pile Foundations

Where soil conditions preclude resting the weight of a building on a flat concrete slab constructed on the ground surface, piles consisting of columns of reinforced concrete, timber, or steel-concrete composite materials are used. With a pile foundation, the base of a building rests on a cap attached to the top of piles such that the weight of the building is transferred through the piles to a hard bedrock or a compact soil stratum below the ground surface.

Numerous types of pile foundation installation techniques are available, the most common of which are:

- Drop hammer (impact) pile driving in which a massive weight (typically 1,200 to 3,000 pounds) is raised to a suitable height and dropped onto a pile, driving it into the ground until the tip of the pile rests on a hard layer of bedrock or soil.
- Vibratory pile driving using a spinning counterweight attached to a pile that creates a vibration causing the pile to cut into the soil below.
- Boring by mechanical auger of holes into which piles are cast in place.

Impact pile driving would be the loudest construction activity occurring within the Baylands. The reference noise level for impact pile driving is 101 dBA, L_{max} at a distance of 50 feet, which equates to a noise level of 107 dBA L_{max} at a distance of 25 feet. The resulting noise levels at the nearest existing sensitive receptors are presented in **Table 4.12-24**.

Table 4.12-24: Daytime Noise from Pile Driving Activities within the Western Portion of the Baylands

Representative Sensitive Receptor	Existing Daytime Noise Level (dBA, L_{eq})[a]	Loudest Two Noise Sources	Reference Noise Level (dBA)[b]	Distance to Receptor (feet)	Usage Factor	Adjusted L_{eq} Level (dBA, L_{eq})[c]	Resultant Noise Level (dBA, L_{eq})[d]	Increase over Existing Noise Level (dBA)

NOTES:

a. Existing noise level based on long- or short-term noise monitoring.
b. Reference value is for equipment at 50 feet as published by the FHWA.
c. Noise level is adjusted for number of equipment, distance to receptors, and usage factor.
d. Resultant noise level is the logarithmic sum of the existing noise level and the adjusted noise level.

Noise from pile driving activities would substantially increase existing noise levels at both off-site receptors and future on-site receptors. Off-site receptors as far as 1,500 feet or more away could experience significant noise increases of 10 dBA or more over existing daytime noise levels, potentially affecting dozens of receptors in Brisbane, Daly City, and San Francisco during activities for the westernmost portion of the Icehouse District and northern portions of the Bayshore District. Additionally, if pile driving is conducted while new housing is occupied, uses within 120 feet would experience noise levels exceeding the 86 dBA criterion of the Brisbane Municipal Code, and uses within 1,500 feet may experience noise levels exceeding 10 dBA over existing daytime ambient levels.

Installing cast-in-place concrete piles would reduce noise (as noise from auger drilling is 17 dBA less than an impact pile driver), but only where geologic conditions can support this option. Other "quiet" pile-installation technology such as pre-drilling of piles and the use of more than one pile driver to shorten the total pile installation duration are other techniques to reduce noise. More recently, newer technologies such as micro pile installation for foundations or use of the Giken Silent Pile Driver are becoming common. It has been demonstrated that using such equipment can generate reduced noise levels of approximately 64 dBA at 16 meters.

Building Construction within the Western Portion of the Baylands

Once the foundation is in place for each given structure, vertical construction would begin, which would involve a standard set of construction equipment. Noise levels from building construction activities at the nearest sensitive receptors are presented in **Table 4.12-25**. Noise levels from building construction would increase by 9.8 dBA at the nearest off-site receptor; at adjacent on-site receptors, however, noise from building construction activities would be more than 30 dBA over existing levels.[267]

Noise Levels Associated with Development of the Eastern Portion of the Baylands

Soil Stabilization – Deep Dynamic Compaction

Soil stabilization of individual development sites east of the Caltrain right-of-way would involve consecutive weeks of deep dynamic compaction. Steady noise from deep dynamic compaction is emitted at relatively low levels from mobile cranes that move and drop weights during deep dynamic compaction activities. Noise levels from this activity within the eastern portion of the Baylands are presented in **Table 4.12-26**, which indicates that the closest off-site sensitive receptors would be on Lathrop Avenue in San Francisco, approximately 1,100 feet away. The closest on-site receptors could be Baylands housing within the Roundhouse and Bayshore districts, which could be as close as 500 feet to deep dynamic compaction activities.

[267] As early increments of construction are completed and buildings are occupied, ambient noise levels would likely increase as traffic is added to the roadway network. **Table 4.12-24** therefore represents a worst-case analysis.

Deep dynamic compaction activities within the eastern portion of the Baylands would increase noise levels by 0.5 dBA at the nearest off-site receptor and by 2.4 dBA at the nearest potential on-site sensitive receptors.

Table 4.12-26: Daytime Noise from Deep Dynamic Compaction within the Eastern Portion of the Baylands

Installation of Pile Foundations within the Eastern Portion of the Baylands

After compaction, foundation work for individual structures would commence within the eastern portion of the Baylands. Because of the presence of the landfill below the landfill cap, it is conservatively assumed that all structures within the former landfill area would require installation of pile foundations. Pile installation may also be required for the Geneva Avenue bridge over the Caltrain right-of-way.

Pile driving would be the loudest construction activity and would occur intermittently over the projected two-year building construction period east of the Caltrain right-of-way as well as during a portion of the Geneva Avenue bridge construction. Intermittent noise from pile driving during these construction activities would affect not only existing off-site sensitive receptors but also Baylands residents who move to the site during earlier development increments.

The reference noise level for pile driving is 101 dBA, L_{max} at a distance of 50 feet, which equates to a noise level of 107 dBA L_{max} at a distance of 25 feet. Should pile driving be required for the Geneva Avenue bridge, it could occur as close as 100 feet to residential structures in the western portion of the Baylands, provided they are constructed and occupied prior to the bridge. Noise levels from pile driving activities at the nearest existing sensitive receptors are presented in **Table 4.12-27**. Off-site receptors as far as 1,100 feet or more away from pile driving activities

could experience significant noise increases of 10 dBA or more over existing daytime noise levels, potentially affecting dozens of existing receptors in Brisbane and San Francisco.

Table 4.12-27: Daytime Noise from Pile Driving Activities within the Eastern Portion of the Baylands

Building Construction within the Eastern Portion of the Baylands

Once foundations are in place for a given structure, vertical construction would begin, which would involve a standard set of construction equipment. Vertical construction would also be required for the Geneva Avenue bridge over the Caltrain right-of-way. Noise levels from building construction activities at the nearest sensitive receptors are presented in **Table 4.12-28**. Noise from building construction would increase daytime noise levels by 2.2 dBA at the nearest off-site receptor. At adjacent on-site receptors, noise from building construction would increase daytime noise levels by 7.0 dBA over existing levels.

Road Construction within the Eastern Portion of the Baylands

Noise levels from roadway construction and paving activities[268] at the nearest sensitive receptors are presented in **Table 4.12-29**. Noise from road construction activities would increase noise levels by 2.1 dBA at the nearest sensitive receptor and have lesser increases at other, more distant sensitive receptors.

[268] The Specific Plan proposes Geneva Avenue bridge construction as part of development east of the Caltrain right-of-way.

Noise from On- and Off-Site Public Facilities Construction

Relocated Fire Station No. 81

Under the Specific Plan, the existing Brisbane Fire Station No. 81 at 3445 Bayshore Boulevard would be relocated to 140 Valley Drive. The new location would be approximately 1,000 feet from the nearest sensitive receptor on San Francisco Avenue in Brisbane. Noise levels from building construction activities at the nearest sensitive receptor are presented in **Table 4.12-30**. Noise levels from building construction activities would increase by 1.4 dBA at the nearest receptor and would be below this level at other receptors.

Table 4.12-30: Daytime Noise from Construction of the Relocated Fire Station

New Fire Station within the Baylands

A new fire station that would primarily serve the Baylands and Sierra Point would be located adjacent to US 101, between Beatty Avenue and the Geneva Avenue extension. The new station would be approximately 1,080 feet from the nearest sensitive receptor on Lathrop Avenue in San Francisco. Construction noise levels at the nearest sensitive receptors are presented in **Table 4.12-31**. Noise from fire station construction activities would increase existing noise levels by 2.2 dBA at the nearest sensitive receptor, with lesser increases at other receptors.

Table 4.12-31: Daytime Noise from Construction of a New Fire Station within the Baylands

NOTES:

a. Existing noise level based on long- or short-term noise monitoring.
b. Reference value is for equipment at 50 feet as published by the FHWA.
c. Noise level is adjusted for number of equipment, distance to receptors, and usage factor.
d. Resultant noise level is the logarithmic sum of the existing noise level and the adjusted noise level.

On-Site Switching Substation Construction

A new 2-acre on-site switching substation would be constructed within the Baylands along the north side of Geneva Avenue east of the Caltrain right-of-way (see **Figure 3-52**). The substation would be approximately 1,200 feet from the nearest off-site noise-sensitive receptor in the Little Hollywood neighborhood in San Francisco. Construction activities for the substation would involve equipment similar to that considered above for construction of the fire station and at a further distance from receptors.

Construction of Water Recycling Facility, Off-Site Recycled Water Lines, Water Storage Tank, and Battery Storage Facilities

An on-site water recycling facility, 3.16-million-gallon water storage tank with interconnecting water mains, and battery storage facilities would be constructed between the Caltrain right-of-way and Tunnel Avenue, north of the Kinder Morgan Tank Farm. This area is approximately 2,000 feet from the nearest off-site sensitive receptor on Cliff Swallow Court in Brisbane. Activities for construction of the water recycling facility and water storage tank would involve equipment similar to that analyzed above for construction of the relocated fire station and would be located farther from sensitive receptors. Battery storage facility construction would be modest with construction of foundation slabs, placement of battery units on those slabs, and electrical work to connect the facility to the grid. Consequently, noise impacts from construction of the battery storage facility would be less than impacts for fire station construction.

The water recycling facility would also serve off-site users in the Sierra Point and Oyster Point portions of South San Francisco in the future and would, therefore, require construction of pipelines for conveyance of recycled water along Tunnel Avenue and Bayshore Boulevard. Trenching work for pipeline installations would generally consist of cut-and-cover methods except where crossing of Caltrain tracks and US 101 may require use of trenchless methods,

such as jack-and-bore techniques. The total length of pipeline to be constructed would depend on the number and location of end users but is conservatively estimated to be up to 5.5 miles (including 0.5 mile of pipeline within the project site to connect to the off-site recycled water pipeline). The receptors nearest to the pipeline trenching activity would be the Sierra Point Trailer Park, approximately 90 feet west of the eastern right-of-way of Bayshore Boulevard.

Noise levels from pipeline trenching activity at the nearest sensitive receptor are presented in **Table 4.12-32**. Noise levels from pipeline trenching activity would increase by 14.7 dBA at the nearest receptor and would be below the level of significance at receptors located further than 160 feet. Pipeline construction would progress at a rate of approximately 100 feet per day. Although the total duration of noise increases in excess of 10 dBA above ambient levels would be less than 2 weeks, individual receptors would experience construction noise for approximately 3 days as construction approaches then recedes.

Table 4.12-32: Daytime Noise from WRF Pipeline Trenching Activity

Representative Sensitive Receptor	Existing Daytime Noise Level (dBA, L_{eq})[a]	Loudest Two Noise Sources	Reference Noise Level (dBA)[b]	Distance to Receptor (feet)	Usage Factor	Adjusted L_{eq} Level (dBA, L_{eq})[c]	Resultant Noise Level (dBA, L_{eq})[d]	Increase over Existing Noise Level (dBA)

b. Reference value is for equipment at 50 feet as published by the FHWA.
c. Noise level is adjusted for number of equipment, distance to receptors, and usage factor.
d. Resultant noise level is the logarithmic sum of the existing noise level and the adjusted noise level.

Trenchless construction methods require pits at both the launching and receiving ends of the bore. These pits would have to be shored with interlocking sheet piles that would likely require use of a vibratory pile driver. The exact locations of pits are currently unknown but the initial crossing from Tunnel Avenue toward Bayshore Boulevard would likely be the location closest to receptors (residences on San Francisco Avenue). At a conservatively estimated distance of 400 feet, vibratory pile driving would generate a noise level of 76 dBA, which would be 15 dBA over the existing ambient level at these receptors. The duration of pile driving activity would be approximately 2 weeks.

ROAD CONSTRUCTION

Development within the western portion of the Baylands would involve construction of internal roadways, including the extension of Geneva Avenue from Bayshore Boulevard to the Caltrain right-of-way. Noise levels from road building and paving activities at the nearest sensitive receptors are presented in **Table 4.12-33**. Noise levels from road building activities would increase by 6.3 dBA at the nearest receptor and would be below this level at other receptors.

Table 4.12-33: Daytime Noise from Roadway Construction in the Western Portion of the Baylands

Underground Utility Installation

Underground utility installation for the western portion of the Baylands would require cut and fill trenching activities within the Baylands and along Bayshore Boulevard Geneva Avenue and Airport Boulevard. In-ground utility installation would occur throughout the western portion of the Baylands and would be closest to off-site sensitive receptors where it occurs within the Bayshore Boulevard right-of-way. Additionally, trenching would be required to provide connection to and improvements at the existing PG&E Martin Substation across Bayshore Boulevard from the Baylands. Noise levels from trenching activities, which would be the noisiest activity during underground utility installation, are presented in **Table 4.12-34**, which indicates that trenching activities would increase existing daytime noise levels by 9.7 dBA at the nearest sensitive receptor (MacDonald Avenue in San Francisco), with lesser increases at other sensitive receptors.

Table 4.12-34: Daytime Noise from Trenching for Underground Utility Construction

SOURCE: Environmental Science Associates, 2025.

ABBREVIATION: NA = not applicable

NOTES:

a. Existing noise level based on long- or short-term noise monitoring.
b. Reference value is for equipment at 50 feet as published by the FHWA.
c. Noise level is adjusted for number of equipment, distance to receptors, and usage factor.
d. Resultant noise level is the logarithmic sum of the existing noise level and the adjusted noise level.

Significance Conclusion for Impact NOI-1

Impact NOI-1 would be significant for the following reasons.

- Some construction activities, such as concrete pours or other work to maintain safety or avoid traffic impacts, may require nighttime activity. While such construction outside of the hours and days allowed for construction work could be permitted, subject to approval of an exception permit, such nighttime activities would result in temporary noise level increases exceeding the quieter nighttime ambient noise levels by more than 10 dBA at any Baylands housing that might be occupied at the time such construction activities are being undertaken.
- Noise generated by trucks hauling soil from the eastern to the western portion of the Baylands would cause an increase in noise greater than 3 dBA in the following areas that have a current L_{dn} of less than 60 dBA:
    - Bayshore Boulevard between Tunnel Avenue and Southern Access Road (+5.4 dBA);
    - Tunnel Avenue between Beatty Avenue and Blanken Avenue (+12.2 dBA);
    - Blanken Avenue between Tunnel Avenue and Bayshore Boulevard (+10.5 dBA); and
    - Bayshore Boulevard between Blanken Avenue and Northern Access Road (+6.9 dBA).

- Pile driving activities would increase daytime noise levels by more than 10 dBA in the following locations:
  - Pile driving within the western portion of the Baylands:
    - Desmond Street, San Francisco (+21 dBA);
    - Wheeler Avenue, San Francisco (+15 dBA); and
    - Baylands residential areas once they are constructed and occupied (up to +43 dBA).
  - Pile driving within the eastern portion of the Baylands:
    - Lathrop Avenue, San Francisco (+10 dBA); and
    - Baylands residential areas once they are constructed and occupied (up to +17.4 dBA).
- Building construction adjacent to an occupied dwelling unit within the Baylands would increase daytime noise levels by more than 10 dBA (+32 dBA).

Program EIR Mitigation Measures

MM NOI-1a: Construction Noise Control (Program EIR Mitigation Measure 4.J-4a). All applicants for site-specific development within the Baylands shall implement site-specific noise attenuation measures during all construction- related activities under the supervision of a qualified acoustical consultant as a pre-requisite to issuance of site grading(s). These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by the City of Brisbane Building Department to ensure that construction noise does not exceed the standards set forth in the City's Noise Ordinance. These attenuation measures shall include all or any combination of the following control strategies:

- Limit construction activities to between 7:00 a.m. and 7:00 p.m. Monday through Friday and between 9:00 a.m. and 7:00 p.m. on weekends and holidays;
- Pile driving and/or other extreme noise- generating activities (L_{max} greater than 90 dBA) would be limited to between 8:00 a.m. and 4:00 p.m. Monday through Friday, with no extreme noise-generating activity permitted between 12:30 p.m. and 1:30 p.m. No extreme noise-generating activities would be allowed on weekends and holidays;
- Equipment and trucks used for construction shall use the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds);

- Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible; this could achieve a reduction of 5 dBA. Quieter procedures, such as use of drills rather than impact tools, shall be used;
- Stationary noise sources shall be located as far as possible from adjacent receptors, and they shall be muffled and enclosed within temporary sheds, incorporate insulation barriers, or include other measures;
- Erect temporary plywood noise barriers around the construction site when adjacent occupied sensitive land uses are present within 75 feet;
- Implement "quiet" pile-driving technology (such as pre-drilling of piles and the use of more than one pile driver to shorten the total pile driving duration), where feasible, in consideration of geotechnical and structural requirements and conditions;
- Use noise control blankets on building structures as buildings are erected to reduce noise emission from the site; and
- Use cushion blocks to dampen impact noise.

MM NOI-1b: Noise complaint response and monitoring (Program EIR Mitigation Measure 4.J-4b). Prior to City issuance of grading permits, applicants for site-specific development projects shall submit to the Brisbane Community Development Department a list of measures that will be undertaken to respond to and track complaints pertaining to construction noise, including:

- A procedure for notifying the City staff of complaints;
- A plan for posting on-site signs pertaining to permitted construction days and hours, complaint procedures, and the contact person who should be notified in the event of a problem;
- A listing of telephone numbers (during regular construction hours and off-hours);
- Designation of an on-site construction complaint manager;
- Notification of neighbors within 300 feet of the construction area about the estimated duration of pile driving activity at least 30 days in advance of the activity; and

- A preconstruction meeting with the job inspectors and the general contractor/on-site project manager to confirm that noise mitigation and practices (including construction hours, neighborhood notification, posted signs, etc.) are completed.

Significance Conclusion for Impact NOI-1 with Implementation of Program EIR Mitigation Measures

Implementation of Mitigation Measure MM NOI-1a and MM NOI-1b would reduce construction noise to less than significant, with the exception of localized noise increases of more than 10 dBA at new residences within the Specific Plan area from both vertical building construction and installation of pile foundations. Site-specific geotechnical conditions may require impact pile driving as close as 50 feet to occupied residential uses within the Baylands, which could generate noise as great as 21 dBA above ambient levels in proximate off-site locations. Therefore, construction noise impacts on occupied residential uses would be significant and would require additional mitigation.

Additional Mitigation Measures

MM NOI-1c: Construction Hours along existing Roadways and for Concrete Pours. Approval of an exception permit pursuant to the provisions of Brisbane Municipal Code Section 8.28.080 shall be required for any activities where daytime construction activities would cause substantial traffic congestion or safety hazards such as construction along existing roadways and for required nighttime concrete pours. Exception permits for these nighttime construction activities shall be conditioned to provide for a minimal duration of nighttime construction and identify detailed methods to be employed to minimize noise during any such required nighttime construction.

MM NOI-1d: Document measures to achieve noise performance standards. Prior to issuance of (1) a demolition permit, (2) a grading permit for the mass movement of soil from the eastern to the western portion of the Baylands, (3) a grading or building permit for a site-specific development project, or (4) a permit for infrastructure construction, the applicant shall have a Construction Noise Control Plan prepared by a qualified acoustical consultant to identify the specific measures to be implemented to ensure at least one of the following performance standards set forth in Brisbane Municipal Code Chapter 18.28 are achieved:

- No individual piece of equipment shall produce a noise level exceeding 83 dBA at a distance of 25 feet from the source thereof, unless an exception permit pursuant to Brisbane Municipal Code Section 8.280.080 is acquired from the City of Brisbane.

- The noise level at any point outside of the property plane of the project shall not exceed 86 dBA.

The Construction Noise Control Plan shall be submitted to the City of Brisbane Community Development Department for review and approval prior to permit issuance.

Where applicable to the permit being requested, each of the following measures shall be implemented as requirements of the requested permit to achieve the above performance standards:

1. **Construction Site Perimeter Barrier.** To reduce noise levels for work adjacent to residences, schools, or other noise-sensitive land uses, a noise barrier(s) shall be constructed along the edge of the work site facing the receptor(s). Barriers shall be constructed either with two layers of 0.5-inch-thick plywood (joints staggered) and K-rail or other support, or with a limp mass barrier material weighing 2 pounds per square foot. If commercial barriers are employed, such barriers shall be constructed of materials with a Sound Transmission Class (STC) rating of 25 or greater.
2. **Stationary-Source Equipment Placement.** Stationary noise sources, such as generators and air compressors, shall be located as far from adjacent properties as possible. These noise sources shall be muffled and enclosed within temporary sheds, shall incorporate insulation barriers, or shall use other measures as determined by the Community Development Director to provide equivalent noise reduction.
3. **Stationary-Source Equipment Local Barriers.** For stationary equipment, such as generators and air compressors that will operate for more than one week within 500 feet of a noise-sensitive land use, the construction contractor shall provide additional localized barriers around such stationary equipment that block the line of sight[269] to neighboring properties.
4. **Temporary Power.** Temporary power poles instead of on-site generators shall be used wherever feasible.
5. **Construction Equipment and Haul Trucks.** Equipment and trucks used for soil loading, transport, unloading, grading, and deep dynamic compaction shall use the best commercially available noise control features (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or

[269] If a noise barrier does not block the line of sight between the noise source and the receptor, the barrier will provide little or no attenuation.

shrouds). Exhaust mufflers shall be provided on pneumatic tools when in operation for more than one week within 500 feet of noise-sensitive land use. All equipment shall be properly maintained.

6. **Impact Tool Use.** The Construction Noise Control Plan shall incorporate measures to reduce the use of heavy impact tools and locate use of such tools away from the property line to the extent feasible. Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for demolition and construction shall be hydraulically or electrically powered wherever possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. Where use of pneumatic tools is unavoidable, an exhaust muffler on the compressed air exhaust shall be used.[270] External jackets on the tools themselves shall be used where feasible.[271] Quieter procedures, such as use of drills rather than impact tools, shall be used.
7. **Truck Traffic Restrictions.** Truck idling shall be restricted to no more than two consecutive minutes per trip end. Trucks shall load and unload materials within approved construction or staging areas, rather than idling or loading/unloading on local streets. If truck staging is required, the staging area shall be located along major roadways with higher traffic noise levels or away from the noise-sensitive receptors, where such locations are available.
8. **Noise Control Blankets.** Where feasible, noise control blankets shall be used on building structures to reduce noise emission from the construction site.

MM NOI-1e: Installation of Pile Foundations. Impact pile driving shall be prohibited for any building within the Baylands unless a site-specific geotechnical study along with any test borings recommended by that study demonstrate that geologic or other unique conditions exist that preclude the use of quieter, alternative pile installation techniques, such as but not limited to:

- "Press-in" method of pile driving such as the Giken Silent Pile Driver[272]
- Piles that could be pre-drilled for auger-cast or micro pile foundation installation

[270] This type of muffler can lower noise levels from the exhaust by up to about 10 dBA.

[271] External jackets on tools could achieve a reduction of 5 dBA.

[272] The Giken Silent Pile Driver is capable of generating reduced noise levels of approximately 64 dBA at 16 meters (Giken Ltd. 2024).

- Vibratory pile driving where press-in or pre-drilled pile installation is infeasible

Where no alternative to impact pile driving is available, noise mitigation at the site of the pile driving, such as, but not limited to, baffles, echo barriers, cushion blocks, or other methods shall be implemented to ensure that noise from the impact of the pile driving hammer is minimized to achieve compliance with the performance standards set forth in Brisbane Municipal Code Chapter 18.28.[273]

Significance Conclusion for Impact NOI-1 with Implementation of all Mitigation Measures

Implementation of Mitigation Measures MM NOI-1a through MM NOI-1e would reduce construction noise to both off-site receptors and to occupied on-site receptors within the Baylands. However, building construction adjacent to occupied dwelling units within the Baylands and roadway noise increases along four roadway segments would still remain significant and unavoidable because of the proximity of receptors and unavailability of feasible mitigation strategies. Additionally, construction noise impacts from the installation of pile foundations would remain significant since site-specific geotechnical conditions may require impact pile driving as close as 50 feet to occupied residential uses within the Baylands and generate noise as great as 21 dBA above ambient levels in proximate off-site locations, exceeding the 10 dBA over existing ambient level standard. Construction noise impacts therefore would be significant and unavoidable with implementation of all feasible mitigation.

The geotechnical reports prepared for the western and eastern portions of the Baylands (ENGEO 2022) acknowledge that quieter methods of pile foundation installation are dependent on building design and site-specific geotechnical conditions, requiring recommendations for specific pile types and installation techniques to be provided based on design-level geotechnical reports for individual building sites. Thus, the potential for traditional impact pile driving and its associated noise levels over a large portion of the site, including the potential for simultaneous impact pile driving to occur at different locations, remain. Consequently, even with implementation of noise reduction measures such as cushion blocks,[274] the potential for achieving the 16 dBA reduction necessary for construction noise to be below 10 dBA over existing ambient levels is unlikely, as barriers would need to be of substantial height to block the line of sight from proposed residential buildings that could be up to 50 feet in height. Therefore, given that foundation construction for Phase 1 development would occur over a 10-year period and could likely involve some degree of impact pile driving, including

[273] Such barriers can be installed immediately adjacent to the pile lead itself and reduce noise by as much as 30 dBA.

[274] To reduce noise from impact pile driving, a "cushion," typically made of wood, is placed between the hammer and the pile.

simultaneous pile driving at different locations, even with identified mitigation measures, this impact would be significant and unavoidable.

b. Impact NOI-2: Permanent Increase in Ambient Noise Levels from Stationary Sources

Methodology for Determining Significance

The Baylands Specific Plan proposes the development of office, commercial, retail, event, and conference space; on-site utility plants; and other noise-generating sources, such as back-up generators and mechanical equipment for residential towers. These uses and sources could substantially increase noise levels at noise-sensitive land uses or could expose sensitive receptors to noise levels exceeding applicable noise standards.

Analysis of Impact NOI-2 considers noise from sources such as mechanical equipment, water recycling facility, battery storage facilities, solar farm, electrical substation, school yard, truck loading docks and delivery activities, public address systems and amplified sound, fire stations, and parking lots by describing documented reference noise levels associated with these sources and determining noise levels at sensitive receptors based on their distance from Baylands-related noise sources. The resulting noise levels were compared to the applicable threshold to determine significance.

Impact Assessment

Mechanical Equipment Noise

Following construction, operation of new land uses within the Baylands would increase ambient noise levels in the immediate vicinity of the Specific Plan area through the on-site use of stationary equipment such as heating, ventilation, and air conditioning (HVAC) systems and emergency generators that would be required by building code for emergency egress of high-rise buildings more than 75 feet in height or for utility facilities such as the water recycling facility. Because mechanical equipment is commonly available with noise-attenuating enclosures designed to meet local noise ordinances (Soundfighter 2024), the equipment's noise generation for individual buildings would not exceed applicable noise thresholds. However, depending on the height of buildings and their proximity, as well as the location of HVAC equipment, the noise generated by HVAC equipment installed on different buildings would combine to increase noise depending on their distance from each other and whether there is a clear line of site between them. For example, this could occur when people using rooftop recreation areas for residential tower buildings in the Bayshore and Roundhouse districts have direct line-of-sight to HVAC units on rooftops of two adjacent buildings.

Emergency back-up generators for fire stations and for buildings with occupied space above 75 feet would be tested regularly and operated occasionally. The Bay Area Air Quality Management District permits emergency back-up generators to operate for up to 50 hours per year, or on average of about 1 hour per week (BAAQMD 2024). The noise generated by generator testing would be akin to that of a diesel-powered truck engine, and while this occasional testing would result in a temporary increase in noise levels over ambient conditions, such maintenance operations would be infrequent and of limited duration.

The northern portion of the Specific Plan area lies directly adjacent to the City and County of San Francisco boundary. Sensitive receptors within San Francisco would be adversely affected should noise sources within the Baylands exceed the City and County of San Francisco's noise ordinance. Sections 2909(a) and (b) of the San Francisco Municipal Code limit noise produced at residential properties to no more than 5 dBA above the local ambient condition at any point outside the property plane, and at commercial properties to no more than 8 dBA above the local ambient condition at any point outside the property plane.

Section 2909(d) states that in order to prevent sleep disturbance, no fixed noise source may cause the noise level measured inside any sleeping or living room in a dwelling unit on residential property to exceed 45 dBA between 10:00 p.m. and 7:00 a.m. or 55 dBA between 7:00 a.m. and 10:00 p.m. with windows open, except where building ventilation is achieved through mechanical systems that allow windows to remain closed.

The Baylands Specific Plan does not depict specific building designs for buildings within the Baylands and does not set exact locations or specifications for mechanical equipment. Therefore, it is speculative to precisely estimate noise levels at specific individual receptor locations that would result from operations of such stationary noise sources. It is reasonably foreseeable that mechanical equipment of Baylands buildings may be as close as 250 feet to existing sensitive receptors and as close as 50 feet to future sensitive receptors within the Baylands. **Table 4.12-35** presents reference noise levels for these sources for informational purposes. Given the data in **Table 4.12-35** and the possibility that sensitive receptors could be as close as 50 feet away, the potential exists for unobstructed noise levels to be 70 dBA or higher at the nearest sensitive receptor locations, which would exceed 5 dB over ambient noise at sensitive receptors as well as City of Brisbane exterior noise standards where existing ambient levels are below 60 dBA.

Table 4.12-35: Reference Noise Levels for Stationary Noise Sources

Stationary Noise Source	Documented Sound Levels (dBA)	Source
HVAC Equipment	72–78 dBA at 30 feet without acoustical treatments	Trane, *Engineering Bulletin, Sound Data and Application Guide for New and Quieter Air-Cooled Series R Chiller*, 2002.
Standby Diesel Generator	75–90 dBA at 23 feet (size dependent) without acoustical enclosure	Cummins Power Generation, *Sound Attenuation and Weather-Protective Enclosures for Generators Sets from 10 to 1,000 kW*, 2008.
Parking Structure (4 stories)	53–58 dBA, L_{max} at 75 feet	Illingworth and Rodkin, *Santana Row Parking Structure Project Noise Assessment, San José, California*, 2014.
Loading Dock	77 dBA, L_{eq} at 20 feet	Urban Crossroads, *Moreno Valley Walmart Noise Impact Analysis, City of Moreno Valley*, 2015.
Battery Storage Facility (3 GW with substation)	37 dBA at 3,300 feet	Rincon, *Key Energy Storage Project Noise and Vibration Study*, October 2022.
Solar Farm (200 MW)	40 dBA at 1,500 feet	ESA, *Luna Valley Solar Project Draft Environmental Impact Report*, May 2021.
Electrical Substation (2.9 acres w/ HVAC)	61 dBA at 40 feet	ESA, *Denny Substation Project, Noise Discipline Report, Seattle, WA*, March 2014.
School Yard	55 L_{eq} and 75 L_{max} at 50 feet	Bollard Acoustical Consultants, *Environmental Noise and Vibration Assessment for the Upper Westside Specific Plan*, December 2022.

SOURCE: Data compiled by Environmental Science Associates in 2023.

ABBREVIATIONS: dBA = A-weighted decibels; ESA = Environmental Science Associates; GW = gigawatt; HVAC = heating, ventilation, and air conditioning; kW = kilowatt; MW = megawatt.

It is reasonably foreseeable that, for tower buildings and commercial buildings, mechanical equipment would be roof-mounted and shielded by screens or parapets, which would generally reduce noise levels for sensitive receptors, except those in taller adjacent buildings. For example, residential tower buildings in the Bayshore and Roundhouse districts could have rooftop recreation areas that have direct line-of-sight to HVAC units on rooftops of two adjacent buildings. Low-density buildings, such as residential structures, would have setbacks as small as 5 feet. While the Specific Plan requires screening for all building types,[275] it cannot be assured that unspecified shielding, alone, would be sufficient to reduce noise below applicable thresholds.

Noise from Parking Lots and Structures

Commercial mixed-use parking noise activities of multiple vehicle types arriving and departing a parking area (of 300 vehicle stalls), including engines starting and stopping, car doors opening and closing, and persons conversing as they enter and exit vehicles,[276] have been documented to result in an exposure of 58 dB L_{max} at a reference distance of 75 feet inclusive of car horns

[275] Baylands Specific Plan, page 109.

[276] Assembly Bill No. 1307 added sections to the Public Resources Code stating that the effects of noise generated by project occupants and their guests on human beings is not a significant effect on the environment for residential projects for purposes of CEQA.

(Illingworth and Rodkin 2014). Given that monitored values within and around the Baylands are over 48 dBA, the predicted noise levels from the proposed parking areas would be less than 5 dBA L_{eq} and comply with the Brisbane Municipal Code.

Noise from Loading Docks

Commercial heavy/medium-duty truck delivery truck noise activities generate an unshielded noise level of 77 dBA at a distance of 20 feet or about 69 dBA at 50 feet. Assuming loading movements of one semi-trailer delivery during any given hour, the predicted noise increase would be more than 5 dBA where the existing noise level is 59 dB L_{eq} or less at 50 feet away, which is a condition that could occur during early morning deliveries (before 7:00 a.m.). The Specific Plan does not provide standards to ensure that noise generated at loading docks would fall below applicable thresholds.

Water Recycling Facility Noise Impacts on Existing and Future Receptors

The Specific Plan proposes a water recycling facility that would be located on the west side of Tunnel Avenue north of Visitacion Creek Park. As such, this facility could be located as close as 150 feet to high-density residential uses within the Roundhouse District.

The following types of operational noise are associated with treatment facilities and/or pump stations at the water recycling facility:

- Noise from the operation of mechanical equipment, including pumps, blowers, fans, centrifuges, and cogeneration engine or turbine generators
- Noise from standby electrical generation equipment (e.g., back-up generators for treatment facilities or pump stations during a power outage)
- Noise from water flowing over weirs

The technical memorandum (Brown and Caldwell 2022) for the Baylands water recycling facility states that, to control noise, buildings with interior acoustical treatment and noise-trapping louvers would house all mechanical equipment that generates noise (e.g., blowers) but did not provide specifications for the extent to which these louvers would reduce noise. While the operations of the water recycling facility would be required to comply with Brisbane Municipal Code Section 8.28.030, without noise-generating specifications for mechanical equipment, it cannot be reasonably assumed that the water recycling facility would generate noise below the 5 dBA increase over ambient threshold at the nearest noise sensitive receptor.

Battery Storage Facility Noise Impacts on Existing and Future Receptors

The proposed battery storage facility would occupy an approximately 10-acre parcel along the west side of Tunnel Avenue north of Visitacion Creek Park. This facility could be located as close as 150 feet to Baylands high-density residential uses within the Roundhouse District.

High-voltage electrical equipment at a battery storage facility generates tonal humming and buzzing that can be annoying to a listener. A recent acoustical study for a 3-gigawatt (GW) storage facility in Fresno County modeled noise from such a facility including an on-site substation to be 37 dBA at 3,300 feet. At a distance of 150 feet, this noise level could be as high as 64 dBA. This is a conservative estimate given that the proxy battery facility is much larger than that proposed for the Baylands. Additionally, noise impacts are typically greater when a battery storage facility has a consolidated rather than a distributed inverter design (Ecology 2024).

The Caltrain right-of-way would separate the facility from proposed residential uses, and the existing ambient noise levels in this location was recorded to be 58 dBA. Given the unknown design for the proposed battery storage facility and specifics with regard to locations of battery storage liquid cooling units as well as inverters, the potential exists for operational noise to exceed the 5 dBA increase over ambient threshold.

Solar Farm Noise Impacts on Existing and Proposed Receptors

The proposed solar farm would occupy an approximately 55-acre parcel east of Tunnel Avenue south of Visitacion Creek. This facility would be located more than 1,500 feet from the nearest off-site sensitive receptor and 1,500 feet from the nearest Baylands sensitive receptor within the Roundhouse District.

A recent acoustical study for a 200-megawatt (MW)[277] solar farm in Fresno County modeled noise from such a facility, including an on-site substation, to be 40 dBA at 1,500 feet. This is a conservative estimate given that the proxy solar farm is much larger than that proposed for the Baylands. Based on (1) the analysis for this proxy project and (2) the existing ambient noise level at the nearest receptor location was recorded to be 58 dBA, noise from the solar farm would not result in an increase of 5 dBA over the existing ambient noise levels in the on-site or off-site locations and would not, therefore, exceed applicable significance thresholds.

Noise from New Electrical Substation

The Specific Plan provides for a new electrical substation on a 2-acre site located north of Geneva Avenue east of the Caltrain right-of-way. This substation could be located as close as 400 feet to Baylands high-density residential uses within the Roundhouse District and approximately 1,700 feet from the nearest existing off-site noise-sensitive receptor.

An acoustical study for a regional substation serving a plan area (Environmental Science Associates 2014) modeled noise from a 3-acre facility, including on-site HVAC equipment, to be 61 dBA at 40 feet. At the 400-foot distance to the nearest on-site receptor, the resultant noise

[277] This is a conservative comparison. Based on the proposed projects with 85,000 MWh per year of solar generation, the PVWatts calculator of the National Renewable Energy Laboratory estimates that the proposed project within the City of Brisbane would have a system size of 53 megawatts.

level would be expected to be 41 dBA. Based on (1) the analysis for this proxy project and (2) the existing nighttime ambient noise levels at the on-site receptor location was recorded to be 52 dBA, such noise would not be 5 dBA over the existing ambient nighttime noise levels in this location (52 dBA). The substantial distance of the substation from off-site receptors would preclude operational noise impacts on off-site receptors.

School Yard Noise

The Specific Plan provides for a middle school on a 5-acre parcel in the northwest corner of the Icehouse District. School playgrounds, playing fields, and outdoor play areas (of 50 children) generate noise levels of approximately 55 dB L_{eq} at a reference distance of 50 feet (Bollard 2022).

The nearest existing noise-sensitive uses to the middle school site are residences located approximately 1,100 feet distant. At this distance, the exposure of noise generated by school yard use at these residences would be approximately 36 dB L_{eq}. The nearest proposed noise-sensitive uses within the Baylands would be housing adjacent to the school in the southern end of the Roundhouse District.

Section 8.28.050 (C) of the Brisbane Municipal Code specifically exempts activities conducted on parks, public playgrounds, and school grounds from otherwise applicable noise standards, provided such parks, playgrounds, and school grounds are owned and operated by a public entity or private school. The noise levels from the middle school would nevertheless be below the ambient noise level conditions at the nearest existing residential uses.

Relocated Fire Station Noise

Under the Specific Plan, the existing Brisbane Fire Station No. 81 at 3445 Bayshore Boulevard would be relocated to 140 Valley Drive. In addition to the existing engine company at the relocated Station No. 81, a ladder company would operate from Station No. 81 until the new fire station within the Baylands is operational, at which time the ladder company would be relocated to the new station. The relocated station would be the same distance to the nearest existing noise-sensitive receptor (1,000 feet) as the existing location, so this relocation would not result in a noise increase at sensitive receptors. While the Specific Plan would increase the level of demand of the fire station with a commensurate increase in the number of emergency calls using lights and sirens, this demand would be split between the relocated and new fire station to be constructed and operated within the Baylands. Consequently, the number of emergency calls using lights and sirens from each station would remain equivalent to the baseline, and the relocated fire station would not generate noise in excess of the 5 dBA increase over ambient threshold.

New Fire Station Noise

A new fire station would be constructed primarily to serve the Baylands and Sierra Point. This station would be located in the northeastern corner of the Baylands adjacent to the US 101 freeway between Beatty Avenue and Geneva Avenue.

The typical practice for emergency siren use is to use sirens to break traffic at intersections or warn drivers of the emergency vehicle approach when traffic is congested, or at intersections where sound is the only way the oncoming driver can be alerted to the emergency vehicle's presence. While the use of sirens in connection with emergency responses would generate a high level of sound along the response routes, Section 8.28.050 of the Brisbane municipal code specifically exempts emergencies from the noise level restrictions set out in Sections 8.28,030 and 8.26.040. Additionally, a siren on an ambulance would not constitute a stationary noise source. Therefore, the new fire station would not cause a significant impact during operations because it would not represent a stationary source that would generate noise in excess of 5 dBA[278] L_{eq} above the ambient level at any sensitive receptor nor would it generate noise in excess of any of the standards of Brisbane Municipal Code Section 8.28.030, as it would be exempt.

Noise Impacts of Public Gathering Spaces

The Baylands development would provide the following public gathering spaces:

- Community Fields (7.4 acres)
- Sunnydale Park (0.8 acre)
- Baylands Park (5.8 acres)
- Roundhouse Park (3.7 acres)
- Bayshore Caltrain Station Plaza (1.4 acres)

The proposed multi-purpose community gathering space at Sunnydale Park and Baylands Park, in the community event area, could be as close as 50 feet to the low-density residential units in the Bayshore District Development Plan. Brisbane Municipal Code Section 8.28.070 establishes restrictions on amplified sound and would apply to events at the outdoor performance space.

Operators of events at the outdoor performance space would be required to obtain a special event permit from the City of Brisbane to operate any loudspeaker or sound amplifier, as required by Municipal Code Section 8.28.070. Such a permit would require additional operational conditions, such as hours of operation, direction of speakers, or sound level restrictions. Such events would not be regular occurrences and would be restricted by permit

[278] As stated in the Physical Environmental Setting section, a change in noise levels of 5 dB is considered to be a readily perceivable difference.

conditions to certain hours. This would limit the noticeable increase in noise generated by occasional events at the outdoor performance space. However, such events may indeed result in a temporary noise increase in excess of 5 dBA[279] L_{eq} above the ambient level at a sensitive receptor.

Aggregate Noise Level Increases from Multiple Stationary Sources throughout the Baylands

The preceding analyses address single or multiple noise sources within a single site, operated by a single operator controlling those sources, and assesses the potential for different source types within the Baylands to comply with the Brisbane noise ordinance and applicable significance thresholds. However, the aggregate operation of all these sources together would increase noise levels generated within the Specific Plan area as a whole. Because the exact future location and configuration for all of these sources cannot be currently known, it is not possible to provide a quantitative estimate of the aggregate increase in noise levels at specific off-site receptor locations.

There are 39 identified blocks that would be developed within the Baylands, and many of these blocks would accommodate multiple buildings. While individual HVAC systems alone will comply with the City's noise ordinance, it is reasonable to acknowledge that the aggregate operation of dozens of HVAC systems across the Specific Plan area would result in an increase in ambient noise levels at existing off-site receptors. When combined with other stationary noise sources such as the water recycling facility, parking lots, and loading docks, operational increase over ambient noise levels that would exceed applicable significance thresholds is possible. The City of Brisbane enforces its noise ordinance standards based on the operation of sources within a single site operated by a single operator controlling those sources. While multiple sources may individually operate consistent with the restrictions of Municipal Code Section 8.28.030, the potential exists for an aggregate increase that would result in stationary sources to result in a permanent noise increase in excess of 5 dBA L_{eq}. Therefore, aggregate stationary source noise impacts would be significant.

Significance Conclusion for Impact NOI-2

Impact NOI-2 would be significant for the following reasons.

- Stationary Source Impacts
    - Specific Plan requirements for screening of HVAC units do not provide specific provisions that would ensure compliance with applicable thresholds for sensitive receptors in Brisbane (Section 8.26.030 of the Municipal Code) and San Francisco (Section 2909 of the Police Code). Thus, HVAC units could exceed applicable

[279] As stated in Section 4.12.3, Environmental Setting, a change in noise levels of 5 dB is considered to be a readily perceivable difference.

noise ordinance requirements. Even if each HVAC unit within the Specific Plan area would meet applicable noise standards and depending on the location and screening provided for individual units, the aggregate noise from multiple HVAC units operating simultaneously could be more than 10 dB over ambient noise levels.

- Noise increases from commercial heavy/medium-duty truck deliveries would be more than 5 dBA where the existing noise level is 59 dB L_{eq} or less at 50 feet away, which is a condition that could occur during early morning deliveries in nighttime hours (before 7:00 a.m.). The Specific Plan does not contain requirements that would ensure loading docks are sited such that the building acts as a barrier from noise for adjacent noise-sensitive land uses or by provision of noise barriers or limits on delivery times and access routes, potentially allowing noise from loading activities to exceed applicable noise standards.
- The technical memorandum (Brown and Caldwell 2022) prepared for the Baylands water recycling facility states that, to control noise, buildings with interior acoustical treatment and noise-trapping louvers would house all mechanical equipment that generates noise (e.g., blowers). However, because only a conceptual design was available for the facility, the technical memorandum could not provide specifications that would permit analysis of the extent to which these louvers would reduce noise. In the absence of such design specifications, a quantitative demonstration that the facility would meet applicable noise standards is not possible and it must be assumed that noise levels from operations would exceed applicable thresholds.
- Noise increases from battery storage systems which could be located as close as 150 feet to Baylands high-density residential uses within the Roundhouse District, would generate noise that could increase ambient noise levels in excess of 5 dBA.
- Temporary events employing amplified sound within the multi-purpose community gathering spaces at Sunnydale Park and Baylands Park, in the community event area, could be as close as 50 feet to the low-density residential units in the Bayshore District Development Plan and result in an increase in ambient noise levels in excess of 5 dBA.
- Aggregate operation of all stationary noise sources together would increase noise levels generated within the Specific Plan that could result in an increase in ambient noise levels in excess of 5 dBA.

Program EIR Mitigation Measures

MM NOI-2a: Project Design Features (Program EIR Mitigation Measure 4.J-3a). All development within the Baylands shall incorporate the following design features into the final site plans prior to issuance of a building permit:

- Building equipment (e.g., heating, ventilation, and air conditioning units) shall be located away from nearby residences, on building rooftops, or adequately shielded within an enclosure that effectively blocks the line of sight of the source from receivers in order to meet a performance standard of 5 dBA over existing ambient noise levels (generally perceptible increase to most persons) for this source which would potentially operate more than 20 minutes in a given hour.
- Designated truck delivery areas (e.g., loading bays) shall be located at least 100 feet from residences to maintain noise levels of less than 5 dBA over existing monitored levels, except within mixed-use buildings containing both residential and commercial uses. Truck delivery bays and waste collection areas shall be located so that they are blocked by Project buildings or designed with noise reduction barriers to reduce noise impacts on residences or other sensitive receptors.
- Where truck delivery bays are provided within mixed-use buildings containing both residential and commercial uses, they shall be located and designed so as to minimize the effects of noise from loading activities on residential uses within the building.

Significance Conclusion for Impact NOI-2 with Implementation of Program EIR Mitigation Measures

Implementation of Mitigation Measure MM NOI-2a would reduce noise impacts associated with stationary building equipment and truck delivery areas and loading docks. Mitigation Measure NOI-2a would be sufficient to ensure that these sources would meet Significance Threshold NOI-2 with respect to Municipal Code Section 8.28.030 and a noise increase in excess of 5 dBA L_{eq} above ambient levels.

However, significant impacts from other stationary noise sources would remain. Specifically, significant noise impacts associated with the battery storage systems, water recycling facility, amplified sound, and an overall aggregate noise increase from stationary sources not envisioned in the Program EIR would remain significant.

Additional Mitigation Measures

MM NOI-2b: Compliance with Brisbane Municipal Code. Prior to the issuance of any building permit, the applicant shall demonstrate to the satisfaction of the Brisbane Community Development Director that all mechanical equipment is selected and designed to meet the performance standards of Sections 8.28.030 and 8.28.040 of the Brisbane Municipal Code and that the noise from the building's mechanical equipment would limit increasing noise levels more than 5 dBA L_{eq} above ambient at any sensitive receptor.

If projected noise levels from mechanical equipment would exceed 5 dBA L_{eq} above ambient at any sensitive use or City standards, appropriate noise reduction measures shall be provided. Methods of achieving these standards include using low-noise-emitting HVAC equipment, locating HVAC and other mechanical equipment within a rooftop mechanical penthouse, and using shields and parapets to reduce noise levels sufficiently to meet the performance standards of Sections 8.28.030 and 8.28.040 of the Brisbane Municipal Code at adjacent land uses.

For example, emergency generators would be required to include industrial-grade silencers that can reduce exhaust noise by 12 to 18 dBA or residential-grade silencers that can reduce such noise by 18 to 25 dBA as necessary. (ASHRAE 2006). Acoustical screening can also be applied to exterior noise sources of the proposed central utility plants and can achieve up to 15 dBA of noise reduction (ENC 2014).

An acoustical study shall be prepared by a qualified acoustical engineer during final building design to evaluate the noise generated by building mechanical equipment and to identify the necessary design measures (e.g., equipment selection, acoustical housing, or screening) to be incorporated to limit increased noise levels to no more than 5 dBA L_{eq} above ambient at any sensitive receptor and meet the City's Municipal Code noise standards. The study shall be submitted to the Brisbane Community Development Director for review and approval before the issuance of any building permit.

MM NOI-2c: Loading Dock Noise. Loading docks shall be located and designed so as to not increase noise levels more than 5 dBA L_{eq} above ambient at any sensitive receptor and meet the City's Municipal Code noise standards.

An acoustical study shall be prepared by a qualified acoustical engineer during final building design to identify the necessary design measures (e.g., loading dock location, acoustical barriers) to be incorporated and demonstrate that loading docks will meet the City's Municipal Code noise standards and not

increase noise levels more than 5 dBA L_{eq} above ambient at any sensitive receptor. The study shall be submitted to the Brisbane Community Development Director for review and approval before the issuance of any building permit.

Potential design measures that could be implemented to achieve this performance standard (the City's Municipal Code noise standards) may include, but are not limited to, shielding from features integrated into site design, and/or restrictions on hours for commercial deliveries within the commercial mixed-use areas. Such measures shall be determined by the site-specific noise impact study that addresses commercial mixed-use truck delivery activities, completed by a qualified noise consultant once site-specific development plans are completed, but must be designed to achieve the performance standards in Brisbane Municipal Code Sections 8.28.030 and 8.28.040.

MM NOI-2d: Water Recycling Facility Noise. The Baylands water recycling facility shall be designed to limit noise to no more than 5 dBA above the ambient level at any sensitive receptor and meet the performance standards of Brisbane Municipal Code Sections 8.28.030 and 8.28.040. Available measures shall be incorporated into the facility's design to meet applicable noise standards, such as locating mechanical equipment within a mechanical penthouse, using shields and parapets to reduce noise levels at nearby land uses, and additional measures, such as those provided below in **Table 4.12-36** as required, to limit noise to no more than 5 dBA above ambient at any sensitive receptor and meet the performance standards of Brisbane Municipal Code Sections 8.28.030 and 8.28.040.

An acoustical study shall be prepared by a qualified acoustical engineer during final building design to evaluate the noise generated by building mechanical equipment and to identify the necessary design measures to be incorporated to meet the City's standards of Brisbane Municipal Code Sections 8.28.030 and 8.28.040. The study shall be submitted to the Brisbane Community Development Director or the Director's designee for review and approval before the issuance of any building permit.

Table 4.12-36: Major Water Recycling Facility Treatment Process Equipment and Available Noise Mitigation Methods

Noise Source	Potential Noise Reduction Methods
Effluent Pumps	Motor room absorptive surface treatments Acoustic louvers Ventilation duct silencers
Aeration Blowers	Acoustic louvers Ventilation duct silencers Blower inlet silencers Blower vent silencers
Influent and Bypass Pumps Stations	Pump room absorptive surface treatments Acoustic louvers Ventilation duct silencers
Back-Up Generator	Industrial-grade silencers
Odor Control Exhaust Fans	Fan room absorptive surface treatments Acoustic louvers Ventilation duct silencers Sound-rated fan selection and specification Fan duct silencers

SOURCE: Environmental Science Associates, 2025.

MM NOI-2e: Utility-Scale Battery Storage Facility. Battery storage facilities shall be designed to limit noise to no more than 5 dBA above ambient at any sensitive receptor and meet the performance standards of Brisbane Municipal Code Sections 8.28.030 and 8.28.040. Potential design measures that could be implemented to achieve this performance standard (the City's Municipal Code noise standards) may include, but are not limited to, using distributed inverter system design, selection of quiet cooling systems, and acoustical shielding for inverters and cooling equipment. Such measures shall be determined by the site-specific noise impact study completed by a qualified noise consultant once site-specific development plans are completed but must be designed to achieve the performance standards in Brisbane Municipal Code Sections 8.28.030 and 8.28.040.

MM NOI-2f: Amplified Sound. The applicant or operator of all amplified music events within public parks shall prepare and implement a Noise Control Plan for operations at the proposed entertainment venues to reduce the potential for noise impacts from public address and/or amplified music. This Noise Control Plan shall contain the following elements:

- All activities held at the community event area consisting of amplified speech or music shall be limited to daytime hours of 7 am to 10 pm.

- Amplified speech or music levels shall be maintained at or below the performance standard of fifteen (15) dBA above the local ambient to any receiver (Brisbane Municipal Code Sections 8.28.070).

Significance Conclusion for Impact NOI-2 with Implementation of all Mitigation Measures

Mitigation Measures NOI-2a through NOI-2f would be sufficient to achieve operation of individual stationary sources to be consistent with the noise standards of Brisbane Municipal Code Sections 8.28.030, 8.28.040, and 8.28.050.[280] However, ensuring that resultant noise levels could be maintained less than 5 dBA above ambient levels is not reasonably feasible given that (1) each given receptor would need a baseline measurement in a noise environment with multiple sources; (2) the noise environment would be constantly changing due to other noise sources as the Specific Plan develops; and (3) construction activities discussed under Impact NOI-1 would hinder the establishment of baseline noise levels within the Specific Plan area for many years.

Therefore, the residual impact of each of these stationary noise source types would be significant and unavoidable with mitigation. Additionally, the aggregate operation of all these sources would increase noise levels generated within the Specific Plan area as a whole. Because the exact future location and configuration for all of these sources cannot be known at this time, it is not possible to ensure that the aggregate increase in noise levels at specific off-site receptor locations from stationary sources would not result in a permanent noise increase in excess of 5 dBA L_{eq}. Therefore, aggregate stationary source noise impacts would also be significant and unavoidable with mitigation.

c. Impact NOI-3: Permanent Increase in Ambient Noise Levels along Roadways

Methodology for Determining Significance

Traffic noise levels were determined for weekday peak commute hours based on the transportation analysis (Fehr & Peers 2023) and assessed for the following scenarios:

1. Existing conditions.
2. Existing plus buildout of Specific Plan Phase 1 (assumed to be 2035).
3. Existing plus full buildout of the Specific Plan (assumed to be 2040).

[280] All stationary sources constructed by the Specific Plan would be within the City of Brisbane and subject to the enforcement of the standards of the City of Brisbane. While some receptors immediately north of the Baylands district would be adjacent to future development within the City of San Francisco, they would still be subject to the standards of the City of Brisbane.

For roadway segments where modeling of traffic noise increases indicated that these roadways could experience noise increases in excess of applicable thresholds, existing and future land uses were evaluated to determine whether the presence of other noise sources, such as rail activity, would render these increases from traffic alone unnoticeable, and whether sensitive receptors would or would not be present to be affected roadway noise increases.

All traffic volumes provided in the project's transportation analysis and used in these roadway noise analyses were provided by Fehr & Peers Transportation Consultants and reflect the proximity of Bayshore Caltrain Station and internal trip reduction resulting from the proposed mix of uses. The modeled with-project scenarios also account for implementation of required Transportation Demand Management (TDM) measures developed by Fehr & Peers Transportation Consultants. These TDM measures represent all feasible available measures for reducing vehicle miles traveled (Fehr & Peers 2023).

Impact Assessment

Vehicle trips resulting from Specific Plan development would generate roadway noise within the Baylands and surrounding environment. Modeling of traffic noise increases along area roadway segments is presented in **Table 4.12-37** for mid-term, Year 2035 conditions projected at the completion of Phase 1 development in the western portion of the Baylands. **Table 4.12-38** presents projected conditions at full buildout of the Baylands in 2040. As shown in these tables, three of the 15 segments that were analyzed would experience roadside noise increases exceeding applicable thresholds:

- Geneva Avenue from Carter Street to Bayshore Boulevard (2040)
- Tunnel Avenue from Blanken Avenue to north of Beatty Road (2040)
- Guadalupe Canyon Parkway west of North Hill Drive (2035 and 2040)

These segments were then assessed to determine whether the presence of other noise sources, such as rail activity, would render these increases from traffic alone unnoticeable, or whether sensitive receptors are not present along these roadways to be affected by these increases.

All three of the above roadway segments have sensitive land uses along them that would be adversely affected by roadway noise increases caused by Baylands traffic. None of these segments are located near US 101 or near any other source of consistent noise generation that would render the increase unnoticeable.

As demonstrated in **Table 4.12-37**, Phase 1 Baylands-generated traffic (2035) would exceed applicable thresholds along one of the 15 roadways segments that were analyzed. At full Specific Plan buildout (2040), Baylands-generated traffic would exceed applicable thresholds along three of the 15 roadways segments that were analyzed as shown in **Table 4.12-38**.

Table 4.12-37: Weekday Peak Hour Traffic Noise Increases along Baylands Area Roadways at the Completion of Specific Plan Phase 1 (assumed to be 2035)

Roadway Segment	Existing	Applicable Increase Threshold (dB)	Existing plus Project (2035)	dBA Difference	Significant Increase?
Bayshore Boulevard from Blanken Road to Geneva Road	69.2	1.5	68.7	-0.5	No
Bayshore Boulevard from Geneva Avenue to Old County Road/Tunnel Avenue	72.9	1.5	74.1	1.2	No
Bayshore Boulevard from Old County Road/Tunnel Avenue to southern city limits	73.9	1.5	74.6	0.5	**No**
Geneva Avenue from Carter Street to Bayshore Boulevard	68.1	1.5	68.7	0.6	No
Geneva Avenue extension from Bayshore Boulevard to US 101 ramps	NA	NA	61.7	NA	No[a]
Tunnel Avenue from Old County Road/Tunnel Avenue to south of Lagoon Road	65.1	1.5	67.9	2.8	No[b]
Tunnel Avenue from Blanken Avenue to north of Beatty Road	64.7	3	66.2	1.5	No
Blanken Avenue from Executive Park Boulevard to Gillette Avenue	56.5	5	59.2	2.7	No
Blanken Avenue from Bayshore Boulevard to Tunnel Avenue	60.2	3	62.0	1.8	No
Visitacion Avenue from Bayshore Boulevard to Mansell Street	56.6	5	58.3	1.7	No
Sunnydale Avenue from Bayshore Boulevard to Santos Street	58.4	5	57.6	-0.8	No
Main Street from Bayshore Boulevard to Linda Vista Drive	55.8	5	57.1	1.3	No
Guadalupe Canyon Parkway west of North Hill Drive	**68.7**	**1.5**	**70.9**	**2.2**	**Yes**
Old County Road from Bayshore Boulevard to San Francisco Avenue	62.2	3	62.3	0.1	No
San Bruno Avenue from Bayshore Boulevard to Glen Park Way	56.2	5	56.7	0.5	No

SOURCE: Traffic data compiled by Fehr & Peers in 2022. Noise modeling performed by Environmental Science Associates in 2023.

ABBREVIATIONS: dB = decibels; dBA = A-weighted decibels; NA = not applicable as road does not currently exist.

NOTES:

a. This roadway does not currently exist nor are there any existing noise-sensitive land uses along it.
b. There are no noise-sensitive uses along this roadway segment.
c. This impact along this segment would be less than significant because existing noise from the adjacent US 101 would reduce the realized increase to less than 1.0 Dba.

Table 4.12-38: Weekday Peak Hour Traffic Noise Increases along Baylands Area Roadways at Specific Plan Buildout (assumed to be 2040)

Roadway Segment	Existing	Applicable Increase Threshold (dB)	Existing plus Project (2040) with TDM	dBA Difference	Significant Increase?
Bayshore Boulevard from Blanken Road to Geneva Road	69.2	1.5	67.1	-2.1	No
Bayshore Boulevard from Geneva Avenue to Old County Road/Tunnel Avenue	72.9	1.5	73.8	0.9	No
Bayshore Boulevard from Old County Road/Tunnel Avenue to southern city limits	73.9	1.5	74.7	0.8	No
Geneva Avenue from Carter Street to Bayshore Boulevard	**68.1**	**1.5**	**70.4**	**2.3**	**Yes**
Geneva Avenue extension from Bayshore Boulevard to US 101 ramps	NA	NA	70.1	NA	No[a]

Tunnel Avenue from Blanken Avenue to north of Beatty Road	**64.7**	**3**	**67.7**	**3.0**	**Yes**
Blanken Avenue from Executive Park Boulevard to Gillette Avenue	56.5	5	57.6	1.1	No
Blanken Avenue from Bayshore Boulevard to Tunnel Avenue	60.2	3	59.5	-0.7	No
Visitacion Avenue from Bayshore Boulevard to Mansell Street	56.6	5	57.0	0.4	No
Sunnydale Avenue from Bayshore Boulevard to Santos Street	58.4	5	57.8	-0.6	No
Main Street from Bayshore Boulevard to Linda Vista Drive	55.8	5	56.5	0.7	No
Guadalupe Canyon Parkway west of North Hill Drive	**68.7**	**1.5**	**70.9**	**2.2**	**Yes**
Old County Road from Bayshore Boulevard to San Francisco Avenue	62.2	3	62.4	0.2	No
San Bruno Avenue from Bayshore Boulevard to Glen Park Way	56.2	5	56.3	0.1	No

SOURCE: Traffic data compiled by Fehr & Peers in 2022. Noise modeling performed by Environmental Science Associates in 2023.

ABBREVIATIONS: dB = decibels; dBA = A-weighted decibels; NA = not applicable since the road does not currently exist; TDM = Transportation Demand Management.

NOTES:

a. This roadway does not currently exist nor are there any existing noise-sensitive land uses along it.

Significance Conclusion for Impact NOI-3

As described above, one of the 15 roadways segments would exceed applicable thresholds in 2035, and three of the 15 roadway segments would exceed applicable thresholds in 2040. Thus, a significant impact would result.

Program EIR Mitigation Measures

No mitigation measures are being carried forward from the Program EIR.

Additional Mitigation Measures

MM NOI-3: Traffic Noise Reduction Measures. Each of the following traffic noise reduction measures that are determined by the Brisbane City Engineer or the Daly City or San Francisco City Engineer to be feasible for physical improvements along roadway segments in those cities shall be implemented to reduce the projected roadway noise increases along (1) Geneva Avenue from Carter Street to Bayshore Boulevard, (2) Tunnel Avenue from Blanken Avenue to north of Beatty Road, and (3) Guadalupe Canyon Parkway west of North Hill Drive by an estimated 0.1 to 0.8 dBA for each measure.

- **Reduction in Traffic Volumes:** Because one of the primary components of traffic noise generation is daily vehicle volume, a reduction in traffic noise levels would result from reducing the overall volume of Baylands-generated traffic. However, achieving a 3 dB reduction in traffic noise levels would require a 50 percent reduction in projected traffic volumes. As the increase in noise along Guadalupe Canyon Parkway is predicted to be 3.2 dBA over the applicable significance criterion of a 1.5 dBA increase (4.7 dBA total increase), an almost 50 percent reduction in the Baylands traffic volume contribution would be necessary to achieve a less than significant roadway noise increase.

  Specific Plan development already includes implementation of a Transportation Demand Management (TDM) program to encourage and create incentives for travel other than via use of single-occupant vehicle trips, in accordance with Brisbane ordinance and San Mateo County's Congestion Management Program requirements. The trip reductions attributable to required implementation of TDM measures are already reflected in the traffic volumes in the transportation analysis that was used to estimate roadway noise increases in Table 4.12-37 and Table 4.12-38.

- **Reduction in Vehicle Speeds:** Another factor in the generation of traffic noise is vehicle speed. Higher speeds translate to higher traffic noise levels. Each 5-mph reduction in average speed provides approximately 1.4 dBA of noise reduction on an average basis (L_{eq}/DNL). Speed reductions may be achieved by posting new speed limits or through installation of traffic calming infrastructure such as roundabouts. However, vehicle speed limits are set based on speed surveys, safety considerations, and other factors, rather than achieving lower traffic noise levels. In addition, the City and County of San Francisco has jurisdiction over portions of affected roadways within San Francisco (the northern portions of Bayshore Boulevard and Tunnel Avenue). As a result,

implementation of this measure could only be assured if speed surveys and safety studies demonstrated the feasibility of reducing speed limits.

- **Construction of Noise Barriers:** Reductions in traffic noise levels can be achieved through the construction of traffic noise barriers. However, at locations where openings or gaps in the barriers would be required for driveway openings or to maintain safe sight distances, the effectiveness of noise barriers would be severely compromised. In addition, this measure would typically require construction of noise barriers on the property of the impacted receptor, rather than within a public right-of-way, so there is no guarantee the impacted receptor would agree to the construction of such barriers. Therefore, barriers are generally not an available means of mitigation.
- **Acoustical Treatments for Existing Impacted Residences:** Sound insulation treatments, such as replacing existing windows and doors with sound-rated windows and doors and providing a suitable form of forced-air mechanical ventilation, can reduce indoor noise levels sufficient to achieve an interior noise level of 45 dBA DNL, as recommended for interior residential spaces. This measure would typically require construction of replacement doors and windows on the property of the impacted receptor, rather than within a public right-of-way, so there is no guarantee the impacted receptor would agree to the construction of such improvements. Therefore, implementation of the measure cannot be assured.
- **Use of Setbacks:** A 4.5 dBA decrease in traffic noise levels can be achieved for each doubling of distance between the roadway centerline and affected residences. However, because the locations of existing residences that would be impacted by Baylands-generated increases in traffic noise are fixed, as are the roadways of concern, this measure is not viable for the existing impacted residences.
- **Engineered Asphalt:** Noise-reducing pavement types, such as rubberized asphalt, have been shown to provide an appreciable noise level reduction relative to other pavement types. Studies have demonstrated these measures reduce traffic noise levels along local roadways by 3 to 5 dBA DNL. Engineered asphalt intended to reduce tire-pavement noise could potentially reduce noise levels along impacted roadways. This approach would consist of the replacement of dense grade asphalt with open-grade or rubberized asphalt. However, this approach is likely infeasible. The FHWA currently does not endorse the use of quiet asphalt as a noise abatement measure because the effectiveness of quiet paving declines as the pavement ages and will cease to serve its noise abatement function if

not properly maintained.[281] To be a permanent mitigation, subsequent repaving would also have to use "quieter" pavements. The working assumption for maintenance assumes replacement of the asphalt overlay to occur every 7 years as opposed to a 20-year cycle for ridged pavement (Caltrans 2018). The cost per mile is approximately 26 percent more than for Portland cement with standard asphalt (Institute of Noise Control Engineering 2014).

Significance Conclusion for Impact NOI-3 with Implementation of All Mitigation Measures

The above discussed potential mitigation strategies are limited and not feasible for all roadways, or in the case of Geneva Avenue and Tunnel Avenue, would be in the purview of other jurisdictions. However, these measures are identified as a menu of available measures to mitigate traffic noise impacts to the extent feasible. As such, it cannot be assured that these measures could be implemented to the degree sufficient to reduce impacts to a less-than-significant level.

Mitigation Measure MM NOI-3 is proposed; however, the degree to which it could feasibly be implemented to reduce traffic noise to a less than significant level cannot be assured. Therefore, Impact NOI-3 would be significant and unavoidable.

d. Impact NOI-4: Exposure of People to Railroad, Freeway, and Airport Noise

Methodology for Determining Significance

CEQA requires the analysis of potential adverse effects of a project on the environment, and the California Supreme Court ruled in *BIA v. BAAQMD* that CEQA does not apply to the potential effects of the environment on a project, except where the project's impacts would exacerbate adverse existing conditions. The *BIA v. BAAQMD* court provided several exceptions to the general principle that CEQA does not require an evaluation of the impacts of the environment on a project. Among these exceptions is when a project is exposed to potential noise and safety impacts on the site's occupants because of the site's proximity to an airport (Public Resources Code Section 21096).

[281] The FHWA does not recognize special wearing surfaces as a noise abatement measure under 23 CFR 772 Procedures for Abatement of Highway Traffic Noise and Construction Noise. The noise reduction properties degrade as traffic loads wear these surfaces out over time, resulting in the abatement measure no longer fulfilling its intended abatement commitment and the surface requiring replacement. Replacement with standard pavement would in turn be a potentially substantial adverse environmental effect. Ensuring similar continuing performance for a quiet pavement abatement technique would require regular testing because the acoustical benefits may deteriorate; also required is the agency's commitment, backed by funding, to maintain the acoustical properties of the pavement in perpetuity.

Therefore, this analysis uses the future noise exposure estimates for railroad operations within the Caltrain right-of-way and the US 101 freeway. Additionally, the analysis uses the future noise exposure estimates provided in the Airport Land Use Compatibility Plan for SFO to assess the potential for Baylands development to exacerbate aircraft noise impacts. A significant impact would result if Specific Plan were to locate noise-sensitive uses within the 65 dBA CNEL noise contour of a public or public use airport and thereby expose residents within the Specific Plan area to excessive noise levels.

Because DNL (and CNEL) measurements apply a penalty to noise during the sensitive nighttime hours, the interior noise standard of 45 dBA DNL is used to address sleep disturbance impacts.[282]

Impact Assessment

Freeway and Railroad Noise

As shown in **Table 4.12-10**, noise monitoring within the Baylands indicates that the US 101 freeway currently generates a Day Night Noise Level "DNL" of 75 dBA in the northeastern portion of the Baylands and 69 dBA in the southeastern portion of the Baylands. Both long-term monitoring locations in the western Baylands (LT-5 and LT-6) where residences and the hotel are proposed have existing noise levels below 65 DNL. Because of their distance from the freeway and intervening structures that would be developed within the Baylands, residential and hotel uses proposed within the western portion of the Specific Plan area would experience freeway noise levels below 65 DNL.

Table 4.12-10 also indicates that both long-term monitoring locations in the western Baylands (LT-5 and LT-6 where residences and the hotel are proposed) have existing noise levels below 65 DNL. However, proposed high density residential towers along the frontage road would be located immediately adjacent to the Caltrain tracks and Bayshore Station with no intervening structures. FTA guidance indicates that noise from rapid rail transit station would require an acoustical analysis if the station is located within 200 feet of a receptor (FTA, 2018). Therefore, because high density residential towers along the frontage road would be located within this distance, specific windows and building materials would be required to ensure that interior noise exposure are consistent with the requirements of Title 24 interior noise standard of 45 dBA, DNL. Exposure to rail noise levels would exceed FTA exposure criteria at the closest locations.

[282] Sleep disturbance metrics have sometimes been applied to evaluate new sources of aircraft noise. There is, however, debate within the scientific community and a lack of concurrence regarding the relationship between aircraft noise and sleep disturbance, especially as related to determining a definitive noise dose and the response relationship for sleep disturbance. Thus, even if noise events are measured using supplemental metrics (e.g., SEL, L_{max}, TA, etc.), there is no scientific concurrence on the appropriate "threshold" to compare such measurements against, when it comes to sleep disturbance (LAWA 2020).

Airport Noise

The Baylands site is approximately 3.5 miles northwest of the SFO boundary and approximately 4 miles from the nearest SFO runway. The Specific Plan area is outside of the SFO 65 CNEL noise contour (see **Figure 4.12-2**), but is within Airport Influence Area A, which is defined as an area where aircraft are flown at an altitude of 10,000 feet or less above mean sea level a minimum of once weekly. The SFO Airport Land Use Compatibility Plan considers the types of uses proposed for the Baylands to be to be compatible with Airport Influence Area A.

Significance Conclusion for Impact NOI-4

Residential and hotel development adjacent to the west side of the Caltrain right-of-way would exacerbate the noise impacts of rail operations by exposing residents and hotel guests to DNL noise levels in excess of 65 dBA. This represents a significant impact for which mitigation is required.

The Baylands is located outside the 65 dB CNEL noise contour of SFO airport operations. In addition, proposed residential and hotel uses are proposed to be located a sufficient distance from the freeway that residents and hotel guests would not be subject to DNL noise levels in excess of 65 dBA.

Program EIR Mitigation Measures

MM NOI-4a: Residential Exposure to Railroad Noise (Program EIR Mitigation Measure 4.J-1a). All residential development within the Specific Plan area shall minimize the exposure of people within the Specific Plan area to noise from Caltrain and High-Speed Rail operations through construction of noise barriers or maintenance of buffer distances, and shall adhere to the following noise performance standards:

- Exterior noise level of below 65 dBA, DNL for outdoor common areas within any approved residential use; and
- Interior noise standard of 45 dBA, DNL.

These noise levels shall be attained through use of appropriate building materials as required by state of California Title 24 standards. Compliance with these performance standards shall be verified by an acoustical professional prior to issuance of a building permit. Specific measures to achieve these performance standards shall include all or any combination of the following options:

- Site design measures, including use of building orientation to minimize window exposure toward noise sources, avoid placing balcony areas in high noise areas, and use of buildings as noise barriers.

- Use of acoustically rated building materials (insulation and windows);
- Construction of architectural noise barriers between sources and receptors; and
- Provision of landscaping or other non-noise-sensitive buffer zones between sources and receptors.

MM NOI-4b: Hotel Exposure to Railroad Noise (Program EIR Mitigation Measure 4.J-1b). All hotel projects within the Specific Plan area shall minimize the exposure of people within the Specific Plan area to noise from Caltrain and High-Speed Rail operations through construction of noise barriers or maintenance of buffer distances, and shall adhere to the following noise performance standards:

- Exterior noise level of below 65 dBA, DNL for outdoor common areas within any approved residential use or hotel; and
- Interior noise standard of 45 dBA, DNL.

These noise levels shall be attained through use of appropriate building materials as required by State of California Title 24 standards. Compliance with these performance standards shall be verified by an acoustical professional prior to issuance of a building permit. Specific measures to achieve these performance standards shall include all or any combination of the following options:

- Site design measures, including use of building orientation to minimize window exposure toward noise sources, avoid placing balcony areas in high noise areas, and use of buildings as noise barriers;
- Use of acoustically rated building materials (insulation and windows);
- Construction of architectural noise barriers between sources and receptors; and
- Provision of landscaping or other non-noise-sensitive buffer zones between sources and receptors.

Significance Conclusion for Impact NOI-4 with Implementation of Program EIR Mitigation Measures

Implementation of Mitigation Measures MM NOI-4a and NOI-4b would require residential, hotel, and other uses where people normally sleep to be designed to maintain an interior Day Night Noise Level (DNL) no greater than 45 dBA and outdoor common areas to a 65 dBA DNL., Baylands residents would be adequately protected from noise generated by rail operations within the Caltrain right-of-way. As a result, Baylands development would not exacerbate the

noise impacts of railroad-generated noise by placing noise-sensitive uses close to the Caltrain right-of-way. Impacts would therefore be less than significant with mitigation incorporated.

e. Impact NOI-5: Temporary or Permanent Increase in Vibration

Methodology for Determining Significance

Impacts from groundborne vibration during Baylands construction and operations are assessed using vibration damage threshold criteria expressed in PPV for architectural damage and human annoyance. Equipment or activities that typically generate continuous vibration include, but are not limited to, excavation equipment, static compaction equipment, vibratory pile drivers, pile-extraction equipment, and vibratory compaction equipment.

The Baylands Specific Plan would cause a significant impact on structures if vibration levels caused by Baylands construction or operations would exceed applicable vibration criteria for potential damage to structures presented in **Table 4.12-6** or human annoyance from project-generated vibration sources. For annoyance from construction vibration, a threshold of 72 VdB (0.02 in/sec PPV) is applied for residential uses, consistent with FTA criteria for conditions where there are a frequent (70 or more) number of events per day for Category 2 (residential) land uses.

Vibration impacts were estimated using reference vibration levels for construction equipment in concert with vibration propagation equations published by FTA and estimating the potential for resultant vibration levels that could cause building damage or human annoyance.

Vibration may also affect underground structures and pipelines. The 2004 American Association of State Highway and Transportation Officials (AASHTO) guidelines include references for underground utility criteria, citing studies that indicate vibration under the ground surface is lower than that measured at the ground surface. One major utility has adopted a criterion of 4.0 in/sec (AASHTO 2004). Underground or restrained concrete structures can withstand vibration of 10.0 in/sec before the appearance of threshold cracks. Thus, the former threshold is applied to pipelines (e.g., Kinder Morgan tank farm), while the latter threshold is applied to cables and underground structures.

Impact Assessment

Construction Vibration

This analysis addresses vibration impacts generated by construction activities at existing off-site buildings as well as vibration impacts caused by construction activities at Baylands buildings that would be constructed and occupied while Baylands construction activities remain ongoing.

Icehouse Hill District

While the Specific Plan would establish zoning and development standards for Baylands development and describes the construction phasing, the precise location, design, and timing for construction of individual buildings are not yet known. Based on the geotechnical reports prepared for the western and eastern portions of the Specific Plan area, it is likely that buildings that are 4 stories or more in height could require pile driving. A matrix of vibration from construction activities with distance to vibration-sensitive receptors was, therefore, used to conduct the analysis. This matrix, presented in **Table 4.12-39**, uses dark-shaded areas to indicate the distances at which vibration levels would exceed the significance criterion for conventional structures. The lighter shaded areas indicate the distances at which the criterion for historic structures or buildings that are documented to be structurally weakened would be exceeded. As shown in **Table 4.12-39**, cosmetic damage to a conventionally constructed building could result from pile driving at a distance of 30 feet or closer, and cosmetic damage to a historic building could result from pile driving at a distance of 75 feet or closer as illustrated in **Table 4.12-39**.

Table 4.12-39: Vibration Levels for Construction Activity

Equipment	Estimated Peak Particle Velocity (inches per second)							
	At 25 Feet (reference)	At 30 Feet	At 40 Feet	At 75 Feet	At 135 Feet	At 145 Feet	At 170 Feet	At 340 Feet
Loader	0.0263	0.020	0.013	0.005	0.002	0.002	0.001	0.001
Backhoe	0.028	0.021	0.014	0.005	0.002	0.002	0.002	0.001
Jackhammer	0.035	0.027	0.017	0.007	0.003	0.003	0.002	0.001
Loaded Trucks	0.076	0.058	0.038	0.015	0.006	0.005	0.004	0.002
Large Bulldozer	**0.089**	0.068	0.044	0.017	0.007	0.006	0.005	0.002
Excavators	**0.175**	**0.133**	**0.086**	0.034	0.014	0.013	0.010	0.003
Impact Pile Driver	**0.65**	**0.494**	**0.321**	**0.125**	0.052	0.047	0.037	0.013
Vibratory Pile Driver	**0.65**	**0.494**	**0.321**	**0.125**	0.052	0.047	0.037	0.013

SOURCES: Caltrans, 2020; FTA, 2018; New Hampshire Department of Transportation, 2012.

NOTES:

Dark-shaded bold text indicates distances where vibration levels would exceed the criterion for conventional structures.

Lighter shaded bold text indicates the distances at which the criterion for historic structures or buildings that are documented to be structurally weakened would be exceeded.

There are no historic structures within 200 feet of the Icehouse Hill District. The nearest off-site structure, 3240 Bayshore Boulevard, is approximately 340 feet from the nearest construction area within the Icehouse Hill District. The use of an impact pile driver during construction within this district would generate the highest vibration levels. The 3240 Bayshore Boulevard off-site structure would be exposed to a vibration level of 0.013 in/sec PPV, below the human annoyance (72 VdB or 0.016 in/sec PPV) and building damage threshold (0.5 in/sec PPV).

However, once construction of the first buildings within the Icehouse Hill District is completed, these buildings would be subject to vibration from construction of adjacent buildings and pile

driving, which could be as close as approximately 40 feet to completed buildings. The structures would be exposed to a vibration level of 0.321 in/sec PPV, above the applied human annoyance criterion of 72 VdB (0.016 in/sec PPV) but below the building damage threshold for modern structures of 0.5 in/sec PPV. Therefore, within the Icehouse Hill District, construction-related vibration impacts with respect to building damage would not exceed the applicable threshold but construction-related vibration impacts with respect to human annoyance would.

Roundhouse District

Specific locations where pile driving would be required is speculative; therefore, the matrix of vibration from construction activities with distance to receptors provided in **Table 4.12-39** was used to analyze impacts associated with Roundhouse District construction activities. Based on the existing geotechnical study for the western portion of the Baylands, low-density residential uses with a maximum building height of 50 feet would likely not require pile installation for foundations. High-density residential towers in the Roundhouse District with a maximum height of between 110 feet and 270 feet would, however, likely require pile driving.

Because the historic Roundhouse structure is proposed to be dismantled for future restoration following site grading and then reassembled, it would not be affected by vibration from grading activities. The nearest potential for pile driving to the roundhouse location is 300 feet to the south at the northern boundary of the Icehouse Hill District. Use of the reference vibration level for pile driving of 0.65 in/sec PPV at 25 feet results in a vibration level of 0.02 PPV at the roundhouse location. This predicted vibration level would be below the threshold for historic buildings,[283] which is a maximum of 0.25 PPV.

The nearest off-site structure, 2850 Bayshore Boulevard, is approximately 145 feet from the nearest construction area for the Roundhouse District. An excavator typically generates vibration levels of 0.013 in/sec PPV at a distance of 145 feet (see **Table 4.12-39** above). At this distance, vibration levels are below the applied building damage threshold for the site structure on 2850 Bayshore Boulevard. The structure at 2850 Bayshore Boulevard is an industrial use and would not be considered vibration-sensitive for the purposes of determining human annoyance. The nearest off-site residential use to the Roundhouse District would be residences on McDonald Avenue approximately 530 feet to the northwest. At this distance, vibrations from earth-moving equipment would be reduced to 47 VdB (0.0009 in/sec PPV), which is below the annoyance threshold of 72 VdB (0.016 in/sec PPV).

However, residential buildings within the Roundhouse District would be approximately 30 feet south of the construction of the proposed high-density residential tower, where pile driving could occur. These on-site structures would be exposed to a vibration level of 102 VdB (0.494 in/sec PPV), above the applied human annoyance threshold for residential uses of 72 VdB

[283] Once it is reassembled within Roundhouse Park, the historic Roundhouse building would no longer be extremely fragile.

(0.016 inch/sec PPV) but just below the building damage threshold for modern construction. Therefore, within the Roundhouse District, construction-related vibration impacts with respect to building damage would be less than significant, but construction-related vibration impacts with respect to human annoyance would be significant.

Bayshore District

There are no historic structures within 200 feet of the proposed Bayshore District. The nearest off-site structure, 2650 Bayshore Boulevard, is approximately 135 feet from the nearest construction area for the Bayshore District in an area that would not require pile driving. An excavator typically generates vibration levels of 0.014 in/sec PPV at a distance of 135 feet (see **Table 4.12-39**). At this distance, vibration levels are well below the applied human annoyance threshold for residential uses of 72 VdB (0.016 in/sec PPV) and building damage threshold (0.50 in/sec PPV) for the structure on 2650 Bayshore Boulevard.

Low-density residential uses with a maximum building height of 50 feet within the Bayshore District would not likely require pile installation for foundations. However, pile driving would be required for residential and commercial towers with a maximum height of between 110 feet and 270 feet. Construction of these taller buildings within the Bayshore District, once adjacent residential buildings have been completed and are occupied, is likely to occur. Occupied low-density residential buildings could be as close as approximately 30 feet to tower construction, where pile driving could occur. Such structures would be exposed to a vibration level of 0.494 in/sec PPV, well above the applied human annoyance threshold for residential uses 72 VdB (0.006 in/sec PPV) but just below the building damage threshold for modern construction of 0.5 in/sec PPV. Therefore, within the Bayshore District, project-generated construction-related vibration would not exceed criteria specific to building damage but could exceed the human annoyance criterion.

Underground Utility Installations

Underground utility installation would require cut and fill trenching activities and would occur throughout the western portion of the Baylands and along Bayshore Boulevard. In-ground utility installation would be closest to off-site receptors where it occurs within the right-of-way of Bayshore Boulevard where trenching would be 150 feet from the nearest off-site structures on the other side of this roadway. This distance would be sufficient to ensure that vibration levels from excavation equipment would be reduced to well below building damage thresholds (refer to **Table 4.12-39**).

Additionally, there are a number of underground utilities that currently exist beneath the Baylands, including subsurface pipelines for the Kinder Morgan Tank Farm. Vibrations from construction equipment, including pile driving, could adversely affect existing utility installation within the western portion of the Baylands if they were to occur in very close proximity. Pile driving within 8 feet of an optical fiber cable could exceed the 4.0 in/sec criterion, which would

be a potentially significant impact. Pile driving within 5 feet of underground pipelines or other underground structures could exceed the 10.0 in/sec threshold criterion.

Campus East District

No historic structures are within 200 feet of the Campus East District. The nearest off-site structures would be the Recology and Golden State Lumber buildings, approximately 100 feet from developable areas of the Campus East District. Because of the presence of the capped landfill, it is conservatively assumed that all building development in the Campus East District would require pile driving. The Recology and Golden State Lumber buildings would be exposed to a vibration level of less than 0.013 in/sec PPV, well below the building damage threshold of 0.5 in/sec PPV. These business uses are not considered vibration-sensitive for the purposes of annoyance.

However, on-site construction of the proposed low-density commercial buildings would be less than approximately 25 feet south of the construction of adjacent low-density commercial buildings, where pile driving would occur. Structures could be exposed to vibration levels of more than 0.65 in/sec PPV, above both the applied human annoyance threshold of 72 VdB (0.016 in/sec PPV) and building damage thresholds of 0.5 in/sec PPV. Therefore, within the Campus East District, construction-related vibration would exceed the criteria with respect to building damage as well as to human annoyance.

Operational Vibration

Land uses permitted by the Baylands Specific Plan would not be expected to result in new sources of operational vibration. Operational sources of vibration are generally associated with projects that would implement new rail transit operations, mining, or blasting, and these types of operations are not included in the Specific Plan.

Brisbane Municipal Code 17.30.030 (B)(1) states that all permanent mechanical equipment, such as motors, compressors, pumps, and compactors that could be a source of structural vibration or structure-borne noise, shall be shock-mounted with inertia blocks or bases and/or vibration isolators for newly constructed residential condominiums and residential condominium conversions (including residential units in mixed-use developments).

Significance Conclusion for Impact NOI-5

Temporary, construction-related increases in vibration identified by Impact NOI-5 would be significant and require mitigation. Although existing off-site structures would not experience Baylands-generated vibration exceeding applicable thresholds, building construction in the early increments of Baylands development would be subject to vibration levels above the

applied human annoyance criterion of 72 VdB (0.016 in/sec PPV) or the building damage threshold for modern structures of 0.5 in/sec PPV in the following locations:

- Icehouse Hill District, where pile driving for buildings would expose previously constructed Baylands buildings as close as 40 feet to a vibration level of 0.321 in/sec PPV, above the applied human annoyance criterion of 72 VdB (0.016 in/sec PPV) but below the building damage threshold for modern structures of 0.5 in/sec PPV.
- Roundhouse District, where pile driving would expose previously constructed Baylands buildings as close as 30 feet to a vibration level of 0.494 in/sec PPV, well above the applied human annoyance threshold for residential uses 72 VdB (0.016 in/sec PPV) but just below the building damage threshold for modern construction. Pile driving could occur as close as 300 feet to the reconstructed Roundhouse, which would experience a resultant vibration level of 0.02 PPV. This predicted vibration level would be below the 0.25 in/sec PPV criteria for historic structures.
- Bayshore District, where pile driving would expose previously constructed Baylands buildings as close as 30 feet to a vibration level of 0.494 in/sec PPV, well above the applied human annoyance threshold for residential uses 72 VdB (0.016 in/sec PPV) but just below the building damage threshold for modern construction of 0.50 in/sec PPV.
- Campus East District, where pile driving would expose previously constructed Baylands buildings as close as 25 feet south of the construction of low-density commercial buildings to a vibration level of more than 0.65 in/sec PPV, well above both the applied human annoyance threshold of 72 VdB (0.016 in/sec PPV) and the building damage threshold of 0.50 in/sec PPV.
- Pile driving activities within 8 feet of Kinder Morgan pipelines would generate sufficient vibration to damage the pipeline. Pile driving within 5 feet of underground pipelines or other underground structures could exceed the 10.0 in/sec PPV criterion.

Program EIR Mitigation Measures

MM NOI-5a: Pre-Construction Assessment to Minimize Structural Pile-Driving Vibration Impacts on Adjacent Historic Buildings and Structures and Vibration Monitoring (Program EIR Mitigation Measure 4.J-2b). Any development within 85 feet of the Roundhouse and the Machinery & Equipment Building that would require pile driving or other construction techniques that could result in vibrations of 0.25 in/sec shall engage a qualified geotechnical engineer subject to City approval to conduct a pre-construction assessment of existing subsurface conditions and the structural integrity of the nearby historic structures subject to piledriving or other vibration-inducing activity before a building permit is issued to demonstrate that the proposed construction activities would not result in

vibration-induced damage to the Roundhouse or the Machinery & Equipment building.

If recommended by the pre-construction assessment, groundborne vibration monitoring of nearby historic structures shall be required. Such methods and technologies shall be based on the specific conditions at the construction site such as, but not limited to, the pre-construction surveying of potentially affected historic structures and underpinning of foundations of potentially affected structures, as necessary. The pre-construction assessment shall include a monitoring program to detect ground settlement or lateral movement of structures in the vicinity of pile-driving activities. Monitoring shall be maintained while construction occurs within 85 feet of historic structures, and results shall be submitted to the City Engineer. In the event of unacceptable ground with the potential to cause structural damage movement (in excess of 0.25 in/sec PPV at historic structures), as determined by the City Engineer, all impact work shall cease until corrective measures (e.g., installation of vibration wave barriers) are implemented to reduce ground movement to below 0.25 inches PPV.

In addition, the following measure shall be implemented:

- Evaluate and implement feasible measures for reducing vibration, such as alternative pile driving methods (e.g., cast-in-drilled-hole piles versus driven piles), alternative foundation types for the new construction (e.g., spread footings versus driven piles), alternative compaction methods, and physical measures (intervening trench, increased distance).
- Require monitoring to be conducted at the building during construction. This monitoring can include crack gages on existing cracks and vibration amplitude monitoring. Establish warning and stop work thresholds for monitoring. Implement visual and audible signals that are triggered by a vibration monitor when exceedances of warning and stop work thresholds occur. If warning thresholds are exceeded routinely, consider alternative construction approaches.
- If the stop work threshold is exceeded, evaluate the condition of the building for damage. If no damage is indicated, consult with structural engineer and/or architectural historian to assess whether higher thresholds are possible and adjust as appropriate.
- If damage occurs, determine if any other construction approaches are feasible to reduce vibration. If none is available, examine the severity of the damage to determine if damage is minor and repair is feasible. If repair is feasible, continue with construction but monitor vibration and

damage closely to ensure that damage remains repairable. Consider whether a lower stop work threshold is feasible.

- Repair any damage that has occurred.

MM NOI-5b: Protection of Underground Utilities (Program EIR Mitigation Measure 4.J-2c). All development sites requiring pile driving shall have underground utility[284] surveys completed before an application for a building permit is submitted to demonstrate that pile driving will be located a minimum of 15 feet from buried utilities. All pile driving shall be designed so as to result in peak particle velocity of less than 4.0 in/sec (100 mm/s) at the location of underground utilities.

Within one week following completion of pile driving activities, a post-construction assessment of all underground utilities within 30 feet of the pile driving activity shall be submitted to the City by the contractor, confirming that no damage to any underground utilities occurred as a result of the pile driving activity. Should the post-construction assessment determine that underground utilities were damaged by pile driving activities, such damage shall be repaired by the contractor to the satisfaction of the City and affected utility.

Significance Conclusion for Impact NOI-5 with Implementation of Program EIR Mitigation Measures

Implementation of Mitigation Measures MM NOI-5a and MM NOI-5b would reduce impacts related to building damage to the Roundhouse or the Machinery & Equipment building and historic structures to a less-than-significant level by requiring preconstruction surveys, monitoring, and provisions for repairing damage.

Residual impacts with respect to human annoyance would remain significant even with implementation of Mitigation Measures MM NOI-5a and MM NOI-5b and would require additional mitigation measures.

Additional Mitigation Measure

MM NOI-5c: Vibration Control. Any impact pile driving that is permitted per Mitigation Measure MM NOI-1f after having demonstrated via a site-specific geotechnical study along with any test borings that geologic or other unique conditions preclude the use of quieter, alternative pile installation techniques shall be subject to the following requirements.

[284] Underground utilities include electrical lines, irrigation lines, reclaimed water lines, municipal water lines, sewer lines, gravity flow facilities (storm, sanitary, and laterals), cable/ communication lines, and gas lines.

Each site-specific development and infrastructure project that would occur within 75 feet of a conventionally constructed building shall implement sufficient measures so as to ensure vibration from impact or vibratory pile driving would not exceed 0.5 in/sec PPV at the nearest structure or 72 VdB (0.016 in/sec PPV) at the nearest occupied residential structure.

Prior to the issuance of a building permit or construction permit, the applicant shall prepare a Construction Vibration Avoidance and Reduction Plan to identify the specific measures to be implemented to achieve the above performance standard. The plan shall be submitted to the Community Development Director for review and approval, and include, at a minimum, the following vibration avoidance and reduction measures:

- Neighbors within 500 feet of the construction site shall be notified of the construction schedule and that noticeable vibration levels could result from pile driving.
- Vibration levels and/or impacts from pile driving shall be minimized by instituting as many of the following measures as necessary to reduce the potential impacts from pile driving to meet the performance standards identified above:
    - Tower buildings requiring pile driving shall be constructed during the initial phases of construction for a given neighborhood to avoid annoyance vibration impacts on other occupied residential buildings within the neighborhood.
    - Foundation pile holes shall be pre-drilled to minimize the number of impacts required to seat the pile.
    - Piles shall be jetted or partially jetted into place to minimize the number of impacts required to seat the piles.
- The pre-construction survey of underground utility lines required by Mitigation Measure MM NOI-5b shall be conducted within a radius of 100 feet of the construction site. All pile installation locations shall be located no closer than 8 feet to existing utility easements containing underground cables, pipelines, or fuel lines associated with the Kinder Morgan Tank Farm.

Additionally, construction vibration monitoring shall be implemented to document conditions before, during, and after pile driving within 30 feet of a modern structure, within 50 feet of a historic structure, or within 8 feet of a utility line right-of-way or easement. All monitoring tasks shall be undertaken under the direction of a licensed Professional Structural Engineer in the State of

California (and a Historic Architect if the affected structures are historic resources) and shall be in accordance with industry-accepted standard methods. Construction vibration monitoring shall include the following tasks:

- Identify the sensitivity of nearby structures to groundborne vibration. Perform a pre-construction photo survey, elevation survey, and crack monitoring survey for each of these structures. Surveys shall be performed before any pile driving activity, at regular intervals during pile driving, and after completion. The surveys shall include internal and external crack monitoring in structures, settlement, and distress, and shall document the condition of foundations, walls, and other structural elements in the interior and exterior of the structures.
- Develop a Contingency Plan. The plan shall identify structures where monitoring will be conducted, establish a vibration monitoring schedule, define structure-specific vibration limits, and address the need to conduct photo, elevation, and crack surveys to document conditions before and after pile driving.
- Should monitored vibration levels reach 0.47[285] in/sec PPV at buildings of conventional construction or 0.22 in/sec PPV at historic buildings, alternative construction techniques shall be used to minimize vibration levels during repaving activities where needed to meet vibration criteria. Such alternative construction techniques include, but are not limited to, use of non-vibratory, excavator-mounted compaction wheels and small smooth drum rollers for final compaction of asphalt base and asphalt concrete, if within 50 feet of a historic structure or 25 feet of a conventionally constructed structure. If needed to meet compaction requirements, smaller vibratory rollers may also be used.
- If vibration levels reach 0.47 in/sec PPV at buildings of conventional construction or 0.22 in/sec PPV at historic buildings, suspend construction and implement alternative construction methods to either lower vibration levels or secure the affected structures.
- Conduct a post-construction survey on structures where either monitoring has indicated high levels or complaints have been received regarding damage. Where damage has resulted from construction activities, make appropriate repairs or provide compensation.
- Within one month after substantial completion of any building constructed with impact pile driving, summarize the results of all

[285] Identified trigger levels for cease-work reflect a vibration level 0.03 in/sec below the damage criteria.

vibration monitoring in a report and submit the report for review by the Community Development Director or the Director's designee. The report shall describe measurement methods and equipment used, present calibration certificates, and include graphics as required to clearly identify the locations of vibration monitoring. An explanation of all events that exceeded vibration limits shall be included together with proper documentation supporting any such claims.

- Designate a person responsible for registering and investigating claims of excessive vibration. The contact information for such a person shall be clearly posted on the construction site.

Significance Conclusion for Impact NOI-5 with Implementation of All Mitigation Measures

Mitigation Measure MM NOI-5a would reduce significant impacts related to building damage to the Roundhouse or the Machinery & Equipment building and historic structures to a less-than-significant level by requiring preconstruction surveys, monitoring, and provisions for repairing damage. Mitigation Measure MM NOI-5b would reduce significant impacts related to underground utilities by requiring underground utility[286] surveys and a post-pile driving assessment.

Mitigation Measure NOI-5c addresses residual impacts associated with potential damage to non-historic structures and human annoyance impacts. This measure would require the preparation and implementation of a Master Construction Vibration Avoidance and Reduction Plan that would ensure vibration levels from impact or vibratory pile driving within the Baylands would not exceed the following standards:

- 72 VdB (0.02 in/sec PPV) at the nearest occupied housing, which is the applied human annoyance threshold for residential uses; or
- 0.5 in/sec PPV) at the nearest occupied structure, which represents the building damage threshold for modern construction.

Thus, impacts would be less than significant with mitigation incorporated.

[286] Underground utilities include electrical lines, irrigation lines, reclaimed water lines, municipal water lines, sewer lines, gravity flow facilities (storm, sanitary and laterals), cable/communication lines, and gas lines.

f. Impact NOI-6: Exposure of People to High Vibration Levels

Methodology for Determining Significance

Consistent with CEQA Guidelines Section 15126.2(a), in addition to addressing changes in the physical environmental that a project would cause, Impact NOI-6 analyzes the potential for causing "significant environmental effects the project might cause or risk exacerbating by bringing development and people into the area affected." Thus, the analysis undertaken for Threshold NOI-6 reflects the example provided in CEQA Guidelines Section 15126.2(a) and evaluates whether Baylands development would exacerbate the impacts of rail operations by exposing residents and hotel guests to vibration levels in excess of 72 VdB, as defined in federal standards established by the U.S. Department of Transportation, Federal Transit Administration, and Caltrans.

Impact Assessment

Because the Specific Plan area is bisected by the Caltrain commuter rail tracks, Baylands development would result in the exposure of people to vibrations from Caltrain rail operations. As of September 2024, Caltrain operates as many as 101 trains each weekday. Because Caltrain pass-by events occur more than 70 times daily, the more stringent threshold of 72 VdB rather than the 80 VdB threshold is applied. The FTA identifies screening buffer distances in its document, *Transit Noise and Vibration Impact Assessment*. Specifically, for commuter rail lines, buffer distances of 200 feet from the right-of-way are recommended for residences or any land uses where people sleep, such as hotels and hospitals, to avoid vibration impacts. For institutional land uses, such as schools and churches, the recommended buffer distance to avoid vibration impacts is 120 feet from the right-of-way.

The Final EIR/EIS for the High-Speed Rail San Francisco to San Jose Project Section states that typical existing vibration levels from train pass-by events between San Francisco and South San Francisco varies from 74 VdB (at 25 feet) to 48 VdB (at 240 feet), depending on the location of the measurement and distance to the rail alignment (CHSRA, 2019). Based on these vibration values, the potential would exist for high density residential towers within the Bayshore and Roundhouse Districts and hotel uses within the high-density commercial building in the Bayshore District to be exposed to vibration levels in excess of 72 VdB.

Significance Conclusion for Impact NOI-6

Development of housing and hotel uses proposed for the tower buildings in the Bayshore and Roundhouse Districts within 50 feet of the Caltrain rail line would exacerbate the vibration impacts of Caltrain and other rail operations by exposing on-site residents and hotel guests to more than 70 rail operations generating 72 VdB or more. This would constitute a significant impact.

Program EIR Mitigation Measures

MM NOI-6: Exposure to Vibration from Rail Operations (Program EIR Mitigation Measure 4.J-2a). All development in the Baylands shall be designed to avoid vibration from Caltrain and other rail operations in excess of 72 VdB. Prior to issuance of any building permit for residential or hotel structures intended for human occupancy within 200 feet of the mainline track, a detailed vibration design study shall be completed by a qualified acoustical engineer to confirm ground vibration levels and frequency of operations along the Caltrain rail line and determine appropriate design that would limit interior vibration levels to less than 72 VdB within residences and hotel rooms. Implementation of the recommended measures of the acoustical study into project design elements shall be verified by the Brisbane Building Department as part of the plan-check process.

Specific measures to achieve the performance standard set forth above shall include all or any combination of the following methods:

- Use of vibration isolation techniques, such as supporting the new building foundations on elastomer pads similar to bridge bearing pads;
- Installation of vibration wave barriers. Wave barriers would consist of control trenches or sheet piles, which are analogous to controlling noise with a sound barrier. The applicability of this technique depends on the characteristics of the vibration waves.

Significance Conclusion for Impact NOI-6 with Implementation of Program EIR Mitigation Measures

Implementation of Mitigation Measure MM NOI-6 would ensure that groundborne vibration from rail operations would be less than the applicable threshold and thereby avoid exacerbating vibration impacts from rail operations on Baylands residential and hotel uses. Impact NOI-6 would therefore be less than significant with mitigation incorporated.

4.13 HAZARDS AND HAZARDOUS MATERIALS

4.13.1 INTRODUCTION

a. Overview

This section addresses the routine use, handling, processing, transportation, and disposal of hazardous materials associated with the 2025 Specific Plan project. It also addresses the potential for upset and accidents in which hazardous materials could be released into the environment, both during site and infrastructure construction, as well as subsequent long-term operational use of the Baylands. The potential for aviation-related hazards and emergency response/access issues associated with Specific Plan development are also addressed.

The two primary historic industrial uses of the Baylands—the former railyard and the former Brisbane Landfill—left contaminants classified as hazardous waste in the site's soil and groundwater. This contamination has been the subject of longstanding remediation and final landfill closure planning efforts, culminating in State of California regulatory agency approvals of Feasibility Studies/Remedial Action Plans (FS/RAPs) for the western portion of the Baylands in 2022 and approval of a Closure and Post-Closure Maintenance Plan (landfill closure plan or Title 27 landfill closure plan) for the former Brisbane Landfill within the eastern portion of the Baylands by the Regional Water Quality Control Board (RWQCB) and San Mateo County Environmental Health Services. Because these FS/RAPs and the landfill closure plan have undergone environmental review and been approved by the appropriate State and regional regulatory agencies, site remediation and landfill closure activities are not part of the Specific Plan project and are not analyzed in this EIR.

Regulatory Authority for Baylands Site Remediation and Final Landfill Closure

Site remediation and Title 27 final landfill closure will be undertaken pursuant to the regulatory oversight of the Department of Toxic Substance Control (DTSC), San Francisco Regional Water Quality Control Board (RWQCB), and San Mateo County Environmental Health Services as the local enforcement agency for landfill closure.

As a result, site remediation and landfill closure activities undertaken pursuant to the regulatory oversight of state and regional agencies that are prerequisites to Baylands development are not part of the 2025 Specific Plan project and are not analyzed in this EIR.

However, site grading activities subject to a City grading permit that would result in building pads for Specific Plan development are part of the Specific Plan project and are analyzed in this EIR.

In addition, Brisbane General Plan policy requires site remediation and landfill closure to be undertaken pursuant to the regulatory oversight of state and regional agencies prior to development permitted by the Specific Plan. Finally, remediation of the existing chlorinated volatile organic compounds (CVOC) groundwater plume within the Baylands is being addressed as part of the Schlage Operating Unit in San Francisco, which has undergone environmental review and been approved by the RWQCB.

While this EIR does not evaluate the impacts of site remediation and landfill closure activities that are subject to the oversite of state and regional regulatory authority, it does evaluate the physical environmental effects of site grading conducted pursuant to City of Brisbane grading permits that create building pads for Baylands development.

Impacts related to hazardous or toxic air emissions such as vehicle use (diesel particulate emissions from exhaust) and proximity to existing or relocated sources of diesel or other toxic air emissions are addressed in Section 4.9, *Air Quality*. Flood hazards are addressed in Section 4.14, *Hydrology and Water Quality*. Seismic and geologic hazards, such as earthquakes and liquefaction, are addressed in Section 4.15, *Geology, Soils, and Seismicity*. Fire hazards are addressed in Section 4.19, *Wildland Fire Hazards*.

b. Definitions

Airport Influence Area encompasses the area that is flown by an aircraft to or from an airport at an altitude of 10,000 feet or less above mean sea level a minimum of once each week. Unless otherwise specified, "Airport Influence Area" refers to the Airport Influence Area of San Francisco International Airport (SFO).

Airport Land Use Commission, unless specified otherwise, refers to the City/County Association of Governments of San Mateo County (C/CAG) Board of Directors, acting in its capacity as the Airport Land Use Commission for San Mateo County.

Airspace protection surfaces refer to the imaginary surfaces in the airspace surrounding airports that define maximum building heights needed to provide safety from physical interference for aircraft taking off or landing at an airport. Airport Protection Surfaces are defined for an airport in accordance with criteria set forth in 14 Code of Federal Regulations Part 77, Subpart C, and FAA Order 8260.3B, U.S. Standard for Terminal Instrument Procedures (TERPS). They also include imaginary surfaces reflecting the one-engine-inoperative climb procedures of commercial aircraft operators at the Airport, developed in accordance with the requirements of 14 Code of Federal Regulations Part 121 and other applicable federal regulations.

Constituent of concern, chemical of concern, or **contaminant of concern** is a hazardous material that has the potential to cause damage to human health or the environment and create a "risk" to human health and the environment.

Exposure pathway is the course a chemical or pollutant takes from the source to the organism exposed. A "complete" exposure pathway consists of four elements: chemical sources, migration routes (i.e., transport in the environment), an exposure point for contact (i.e., soil, air, or water), and exposure routes.

Exposure route is the way a chemical or pollutant enters the organism after contact. Four exposure routes are recognized in risk evaluation methods: ingestion, inhalation, dermal (skin and eye), and injection.

Extremely hazardous substance, in the context of Public Resources Code Section 21151.4 pertaining to hazardous materials emissions near schools, refers to a material included on lists compiled pursuant to Section 25532 of the California Health and Safety Code, which incorporates regulated toxic and flammable substances under Section 112(r) of the federal Clean Air Act. Table 3 of Section 112(r) lists those regulated substances pursuant to Section 25532(g)(2) of the California Health and Safety Code.

Hazard includes any condition, practice, or procedure that is or may be dangerous, harmful, or perilous to employees, property, neighbors, or the general public.

Hazardous material refers to any material that, because of its quantity, concentration, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, and any material that a handler or an administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment (California Health and Safety Code, Section 25501).

Hazardous materials release site refers to any area, location, or facility where a hazardous material has been released or threatens to be released to the environment.

Hazardous waste refers to any waste substance that, because of its quantity, concentration, or physical, chemical, or infectious characteristics, may either cause or significantly contribute to an increase in mortality or an increase in serious illness, or pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed (California Health and Safety Code, Section 25117).

Real estate disclosure refers to a written statement that notifies a prospective purchaser of real estate, prior to completion of the purchase, of the potential annoyances or inconveniences associated with airport operations. Typically, a real estate disclosure is provided at the real estate sales or leasing offices. Real estate disclosure is required by state law as a condition of the sale of most residential property if the property is located in the vicinity of an airport and is within its Airport Influence Area (see Bus. & Prof. Code, §11010; Civ. Code, §§1102.6, 1103.4, 1353). State law does not require the real estate disclosure to be recorded in the chain of title for the affected property.

Recognized environmental concerns are defined as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property (1) due to any release to the

environment, (2) under conditions indicative of a release to the environment, or (3) under conditions that pose a material threat of a future release to the environment.[287]

Remedial action or **remediation** refers to actions required by federal, state, or local laws, ordinances, or regulations necessary to prevent, minimize, or mitigate damage that may result from the release or threatened release of a hazardous material. These actions include site cleanup; monitoring, testing, and analysis of site conditions; site operation and maintenance; and placement of conditions or restrictions on the land use of a site upon completion of remedial actions.

Risk is determined by the probability of exposure to a hazardous material or a hazardous condition and the severity of harm such exposure would pose. Accordingly, the likelihood and means of exposure, in addition to the inherent toxicity of a material or damage that could be caused by a hazardous condition, are used to determine the degree of risk to human health or the environment.

Title 27 Landfill Closure, Final Landfill Closure refers to the performance standards set forth in Title 27 of the Code of California Regulations, Sections 20950 through 21200 for the formal closure of landfills within California once waste disposal activities cease. These performance standards address final cover requirements, grading and drainage, post-closure maintenance duties, and related requirements.

4.13.2 PHYSICAL ENVIRONMENTAL SETTING

a. Baseline

Although spring 2023 is generally used in this EIR to describe existing conditions, completion of site remediation and landfill closure activities subject to the regulatory oversight of state and regional regulatory agencies that have received environmental review and been approved by those regulatory agencies are included in the baseline for analysis of hazards and hazardous materials. However, because site grading is subject to a City grading permit to move soil from the eastern to the western portion of the Baylands to create building pads for Baylands development, it is not included in the baseline for hazards and hazardous materials and analyzed as part of the 2025 Specific Plan project.

[287] As per American Society for Testing and Materials (ASTM) Standard Practice E 1527-13.

b. Hazards and Hazardous Materials Conditions

Whether a person exposed to a hazardous substance would suffer adverse health effects depends upon a complex interaction of factors, including:

- The exposure pathway (the route by which a hazardous material enters the body);
- The amount of material to which the person is exposed;
- The physical form (e.g., liquid, vapor) and characteristics (e.g., toxicity) of the material;
- The frequency and duration of exposure; and
- The individual's unique biological characteristics such as age, weight, and general health.

Adverse health effects from exposure to hazardous materials may be short-term (acute) or long-term (chronic). Acute effects can include damage to organs or systems in the body and possibly death. Chronic effects, which may result from long-term exposure to a hazardous material, can also include organ or systemic damage, but chronic effects of particular concern include birth defects, genetic damage, and cancer.

Types of Hazardous Materials Found within Baylands Specific Plan Area

The potential for exposure to hazardous materials within the Baylands from existing conditions includes:

- Underlying contamination of the soil, air, and groundwater from historic railyard and landfill uses; and
- Existing off-site hazardous sites.

The primary types of contaminants found within the Specific Plan area include the following:

- **Leachate:** Leachate is defined as liquid that has come into contact with solid waste, carrying dissolved or suspended materials. Leachate can be either liquid that is generated as part of the decomposition of the waste or liquid that has percolated into the waste from external sources (e.g., surface drainage, rainfall, or groundwater). The quantity of leachate generated at a landfill is a direct function of the amount of water entering the landfill from external sources.
- **Landfill Gas (LFG)**: Decomposition of organic waste under anaerobic conditions (without the presence of oxygen) results in landfill gas (LFG) generation.
- **Volatile Organic Compounds:** Volatile organic compounds (VOCs) are organic chemicals that have a high vapor pressure under ordinary, room temperature conditions. VOCs are numerous, varied, and ubiquitous. They include both human-

made and naturally occurring chemical compounds. Some VOCs are dangerous to human health or cause harm to the environment. Harmful VOCs are typically not acutely toxic but instead have compounding long-term health effects. Concentrations of VOCs are usually low, and symptoms are slow to develop.

- **Metals:** As the result of past industrial operations, various metals can be found in on-site soils, including primarily arsenic, lead, and chromium.
    - **Arsenic** is common in semiconductor electronic devices. The main use of metallic arsenic is for strengthening alloys of copper and especially lead (as in car batteries). Arsenic and its compounds are also used in the production of pesticides, treated wood products, herbicides, and insecticides, although these applications are declining. Arsenic is highly poisonous.
    - **Lead** is a soft and malleable metal, used in building construction; lead-acid batteries; bullets and shot; weights; as part of solders, pewters, and fusible alloys; and as a radiation shield. Lead is a poisonous substance that damages the nervous system and causes brain and nervous system disorders. Excessive lead also causes blood disorders in mammals. Lead is a neurotoxin that accumulates both in soft tissues and the bones.
    - **Chromium** is a steely-gray, lustrous, hard, and brittle metal, which is odorless and tasteless. Metallic chromium is used in the steelmaking process to form stainless steel, adding high resistance to corrosion and discoloration, along with chrome plating. Because chromium compounds were also used in dyes and paints and the tanning of leather, these compounds are often found in soil and groundwater at abandoned industrial sites. Primer paint containing hexavalent chromium is still widely used for aerospace and automobile refinishing applications.
- **Bunker C Fuel:** Bunker fuel is technically any type of fuel oil used aboard ships or trains. It gets its name from the containers in which it is stored on ships and in ports. Bunker C fuel oil is a high-viscosity residual oil that requires pre-heating before the oil can be pumped from a bunker tank. “Residual” refers to the material remaining after the more valuable cuts of crude oil have boiled off. The residue used for Bunker C fuel may contain various undesirable impurities including 2 percent water and one-half percent mineral soil.
- **Polychlorinated Biphenyls (PCBs):** PCBs are petroleum-based oils that were formerly used primarily as insulators in many types of electrical equipment, including transformers and capacitors. After PCBs were determined to be carcinogenic in the mid to late 1970s, the USEPA banned PCB use in most new equipment and began a program to phase out certain existing PCB-containing equipment. Fluorescent lighting ballasts manufactured after January 1, 1978, for example, do not contain PCBs and are required to have a label clearly stating that PCBs are not present in the unit.

c. Existing Contamination and Assessments within the Specific Plan Area

The Baylands contains two primary areas where past hazardous materials releases have occurred: the former Brisbane Landfill and the former Brisbane Railyard, which was used as a railroad switching and maintenance yard from 1911 to 1982. For regulatory purposes, the former railyard was divided into two "operable units" (see **Figure 4.13-1**), recognizing differences in the type of contamination present and the different regulatory agencies responsible for overseeing site remediation.

- The 35-acre northern portion of the Baylands west of the Caltrain right-of-way is within the San Mateo County portion of the Universal Paragon Corporation Operable Unit (OU-SM).[288] OU-SM is subject to the regulatory authority of the California Department of Toxic Substances Control (DTSC).
- The 130-acre southerly portion of the Baylands west of the Caltrain right-of-way is within Operable Unit OU-2 (OU-2). OU-2 is subject to the regulatory authority of the San Francisco Bay RWQCB.

Final landfill closure for the former Brisbane Landfill is subject to the regulatory authority of the RWQCB and San Mateo County Health as the former landfill's Local Enforcement Agency (LEA).

General Plan Policy BL.1 A requires activities related to site remediation within OU-SM and OU-2, as well as Title 27 landfill closure, to be undertaken pursuant to the regulatory authority of the RWQCB and DTSC as a prerequisite to Baylands development.

San Mateo County Portion of the Universal Paragon Corporation Operable Unit (OU-SM)

The 35-acre OU-SM site is currently vacant with various foundations and building slabs remaining. It lies at the base of the Visitacion Valley between Candlestick Point to the north and Visitacion Point to the south. OU-SM is situated on a low-lying flatland that was formed by filling of the area and railroad construction in the early 1900s. The site is nearly flat with a gentle slope to the east, toward San Francisco Bay (Geosyntec 2021a).

Historical Use Summary

The OU-SM site was acquired by the Southern Pacific Railroad (SPRR) in 1896. Prior to SPRR acquiring the property, fill had been added to the San Francisco tidal flats to extend the buildable land surface. Landfilling operations continued following SPRR acquisition and are thought to have consisted of general soil material, refuse, and rock blasted from a nearby roadcut through Visitacion Point as well as rubble and wreckage from the 1906 San Francisco earthquake and fire.

[288] This operable unit was formerly designated as "Operable Unit – 1 (OU-1)."

Figure 4.13-1: Agency Regulatory Responsibilities for Baylands Site Remediation and Landfill Closure

By 1914, sufficient material was imported to the site to lay the foundation for SPRR railroad operations, which began that year. By 1935, fill was placed on most of the area between what is now Bayshore Boulevard and Tunnel Avenue (Geosyntec 2021a). SPRR operated the former Brisbane Railyard from approximately 1911 through 1982 and its major railroad operations resulted in the construction of numerous railroad facilities, including the railroad switching yard.

Several historical facilities with operations that could have affected soil and groundwater quality were located within the UPC OU-SM site, including:

- A passenger coach car repair shop in the southwest portion of the site;
- A freight car repair shop plus nearby paint shop, forge, and blacksmith shop in the western portion of the site;
- A paint storage house in the southern portion of the site;
- A former lumber shed in the center of the site;
- A wheel press;
- A planing mill;
- The former Unit #1 Oil Trap located on the western boundary of the site; and
- The former Unit #2 Sludge Traps located in the northwest portion of the site (Geosyntec 2021a).

Chemicals that may have been used or generated as waste at these facilities include metals, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and petroleum hydrocarbons, including gasoline-range hydrocarbons (TPH-g), diesel-range hydrocarbons (TPH-d), and polynuclear aromatic hydrocarbons (PAHs). Site-wide, organochlorine pesticides (OCPs) may have been used. Radionuclides are not suspected of being present in site soil at concentrations exceeding regional background concentrations based on the site history detailed above (Geosyntec 2021a).

In 1985, DTSC (formerly the California Department of Health Services, Toxic Substances Control Division), determined that "There has been a release of hazardous substances on, or into the land on the Southern Pacific Bayshore Yard site located east of the intersection of Bayshore Boulevard and Geneva Road, Brisbane." Therefore, DTSC issued the "Order to Post and Fence" that required SPTC "… to post the site with signs and enclose portions of the site with fences …" (DTSC 1985).

Groundwater Quality and Use

Groundwater at the OU-SM site is not used for domestic or industrial purposes. In 2019, the State Water Resources Control Board issued a determination acknowledging that groundwater in the fill, to a depth of approximately 15 feet below ground surface, meets exceptions (a) and

(c) of State Water Resources Control Board Resolution No. 88-63 (i.e., total dissolved solids concentrations and well yield, respectively) and is not likely to be used as a source of drinking water (SFBRWQCB 2019b, as cited in Geosyntec 2021a). Groundwater in the Colma and Merced formations beneath the site is not considered a potential municipal supply under the San Francisco Bay Basin (Region 2) Water Quality Control Plan (Basin Plan).

The groundwater quality of the fill at OU-SM is affected by already impacted groundwater flowing onto the site from the Schlage OU and Zone A groundwater at the landfill (located east of OU-SM). Fill zone groundwater is characterized as having high total dissolved solids (TDS) because the original land surface at the site was submerged under the saline waters of San Francisco Bay. In the early to mid-1900s (ending in 1935), fill was placed in the Bay to create the current land surface. The placement of fill entrapped the saline bay water, which strongly influences the quality of the groundwater in the fill zone. Specifically, the quality of groundwater considered for potential use as municipal or domestic water supply must not exceed a TDS concentration of 3,000 milligrams per liter (mg/L) or an electrical conductivity of 5,000 microsiemens per centimeter (µS/cm) pursuant to the Basin Plan. Historically, several monitoring wells screened in the fill have exhibited electrical conductivity values exceeding those requirements (Geosyntec 2021a).

Wells screened in the deeper water-bearing units, the Colma and Merced formations, do not exhibit high electrical conductivity values and are likely capable of producing 200 gallons per day. These water-bearing units, which are recharged from below and from upgradient sediments to the west, are protected from the poor water quality in the fill by the Young Bay Mud aquitard and upward potentiometric gradients between the Colma Formation and the fill (Geosyntec 2021a).

Previous Environmental Investigations and Site Remediation

Numerous environmental investigations have been conducted at the OU-SM site since 1984 to characterize the distribution of contaminants resulting from historical railroad operations and a contaminant plume from the adjacent Schlage Lock site (Schlage OU). As described above, investigations have identified the presence of metals (primarily arsenic, lead, and mercury), polynuclear aromatic hydrocarbons (PAHs), organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), chlorinated volatile organic compounds (CVOCs), and petroleum hydrocarbons, including gasoline-range hydrocarbons (TPH-g) and diesel-range hydrocarbons (TPH-d) (Geosyntec 2021a). Most recently, a data gap investigation was completed in 2018. The data generated by remedial investigations were deemed sufficient by DTSC for updating the Human Health Risk Assessment (HHRA) and completing a FS/RAP for UPC OU-SM. Both documents have been reviewed and approved by DTSC (BKF 2023). The FS/RAP is discussed in detail above in Section 2.7.2.

Site remediation completed to date includes the safe removal of hydrocarbon-impacted soil from the northwest portion of the OU-SM site. In addition, a groundwater extraction and

treatment system operated in the northern portion of the site from 1995 to 2008 to address CVOC contaminants that had migrated from the Schlage OU. Currently, the contaminated groundwater is being addressed as documented in the Schlage OU FS/RAP (Geosyntec 2021a)

Contaminants of Concern

In the absence of any additional remediation or mitigation efforts, the primary risk-driving contaminants of concern identified in the HRA are as follows:

- Soil: arsenic, lead, mercury, carcinogenic PAHs, naphthalene, TPH-d, and Aroclor-1260;
- Soil vapor: CVOCs (1,1-dichloroethene; cis-1,2-dichloroethene; trans-1,2-dichloroethene; tetrachloroethene; trichloroethene; and vinyl chloride); and
- Groundwater: CVOCs (1,1-dichloroethene; cis-1,2-dichloroethene; trans-1,2-dichloroethane; tetrachloroethene; trichloroethene; and vinyl chloride) (Geosyntec 2021a).

The potential exposure pathways to these risk-driving COCs are direct exposures (incidental ingestion, dermal contact, and inhalation of particulates in ambient air) with COCs in soil, and potential inhalation of VOCs in indoor air migrating from soil and shallow groundwater (Geosyntec 2021a).

Contaminant Distribution

SOIL

Historical environmental investigations, including the 2018 Data Gap Investigation, indicated the presence of metals and PAHs in shallow fill soil at elevated concentrations in some areas of the OU-SM site. Arsenic and lead were detected most frequently at relatively elevated concentrations in shallow fill soil, likely resulting from the historical application of lead arsenate pesticide as part of railyard activities (BKF 2023).

OCPs and PCBs were detected at only a few locations, indicating that impacts on soil are localized at the site. CVOCs were detected at only a few locations at low concentrations in soil samples and their distribution in groundwater is indicative of impacts from the adjacent Schlage OU rather than point sources within UPC OU-SM. TPH-g was detected only at low concentrations, and concentrations of TPH-d were elevated only at a few locations, again indicating that impacts on the subsurface are localized at the site. Asbestos was not detected in any soil samples (BKF 2023).

GROUNDWATER

Historical environmental investigations, including the 2018 Data Gap Investigation, indicated that groundwater and soil vapor are impacted by residual levels of CVOCs emanating from the off-site Schlage OU. CVOC concentrations in groundwater and soil are highest in the northern portion of UPC OU-SM. Dissolved metals concentrations in groundwater were generally low with localized elevated concentrations (BKF 2023).

Baseline Health Risk Assessment

A Baseline Health Risk Assessment (HRA) for OU-SM was prepared under the assumption that no remediation or mitigation would be implemented. Using this assumption, the HRA evaluated potential risks to current and future populations that could be exposed to chemicals at the site so that measures could be implemented to address risks appropriately. The results of the HRA found that present site conditions are protective for current populations (i.e., site visitors, commercial/industrial workers at neighboring facilities, and residents of adjacent neighborhoods) but future action to remediate or mitigate potential exposure to contaminants of concern (COCs) in soil and soil vapor are warranted to protect future commercial/industrial workers, construction workers, and residents at the site under a high-intensity, mixed-use redevelopment scenario (Geosyntec 2021a).

Feasibility Study/Remedial Action Plan

The FS/RAP has been reviewed and was approved by DTSC in October 2021 and is discussed in detail above in Section 2.7.2, *Site Remediation*. General Plan Policy BL.1 A requires activities related to site remediation within OU-SM to be undertaken pursuant to the regulatory authority of DTSC as a prerequisite to Baylands development.

Operable Unit OU-2 (OU-2)

A 1990 Imminent and/or Substantial Endangerment (I&SE) Order and Remedial Action Order was issued by DTSC in 1990 for the entire Brisbane Railyard property. In 1995, an amendment to the order divided the railyard into the OU-1 (portion north of Geneva Avenue, which is now designated OU-SM) and OU-2 (portion south of Geneva Avenue) operable units. The OU-2 site is approximately 130 acres and occupies the southern portion of the former SPTC Brisbane Railyard. The OU-2 site is bounded to the north by OU-SM site, to the west by Bayshore Boulevard, to the southwest by Industrial Way, to the east by the Caltrain railroad tracks, and to the south by Icehouse Hill (see **Figure 4.13-1**). The former railyard portion of the OU-2 site is currently owned by Sunquest Properties, Inc. The Industrial Way properties are located to the southwest of the former railyard and are bound by the railyard to the north and east, by Bayshore Boulevard to the west, and by Icehouse Hill to the south.

The Industrial Way properties include sites identified on GeoTracker as Kessler and Kessler #1 (250 Industrial Way) and Kessler and Kessler #2 (350 Industrial Way). This portion of the OU-2 site is currently owned by Brisbane Bayshore Properties. The properties along Industrial Way have been occupied by various commercial/industrial tenants over the last approximately 150 years. The former hide and glue plant located at 200 Industrial Way from approximately 1878 to 1962 was evaluated in 1987 by the USEPA. Based on this evaluation, the USEPA concluded that the property did not meet the criteria for inclusion on the CERCLA National Priorities List. According to the evaluation, there were no documented releases, the quantities of waste

generated and discharged were unknown, and there was not a target population that would have been affected by historical releases at the site. To date, none of the Industrial Way properties have been included on the CERCLA National Priorities List (Geosyntec 2021b). Aerial photographs of the OU-2 site taken between 1935 and 1991 are provided in Appendix A of the FS/RAP (Geosyntec 2021b).

The OU-2 site lies at the base of the Visitacion Valley between Candlestick Point to the north and Visitacion Point to the south. The OU-2 site is situated on a low-lying flatland that was formed by filling a former embayment located along the western margin of San Francisco Bay. The current land surface has been largely formed by filling of the area in the early 1900s. The site is relatively flat, excluding drainage ditches and delineated wetlands (Geosyntec 2021b).

Historical Use Summary

Former Railyard

Historical use of the former railyard is proved above in the discussion of OU-SM. The major railyard facilities located within OU-2 consisted of the following:

- Machine and Erecting Shop – constructed in 1920, this facility was a machine shop and mechanical construction shop.[289]
- Turntable – constructed in 1908 and retired in 1942, the turntable was used to transfer locomotives to the individual servicing stalls within the roundhouse.
- Roundhouse – constructed in 1908 and now a vacant structure, this was a service area for the locomotives.
- Oil Tank – constructed in 1920, this 3-million-gallon above-ground tank stored fuel oil, commonly called Bunker C, for boilers used in the steam locomotives. The tank was dismantled in 1988, and 550,000 gallons of residual oil were recovered and removed for disposal.
- Tank and Boiler Shop – constructed in 1922 and retired in 1963, this shop repaired water tanks and boilers for steam locomotives. The building was used by Lazzari Fuel Company until it was destroyed by fire in April 2024.
- Switching Yard – constructed in the early 1900s, the switching yard consisted of a series of tracks used for organizing and building freight trains. It was the largest part of the railyard. Caltrain operates a commuter line including four active tracks with two siding tracks along the eastern edge of the site.

[289] Also identified as the "Machine and Electric Shop" in historical figures and demolished after 1969 but before 1993 (Geosyntec 2021b).

- South Disposal Area – this area is a solid waste dump site containing waste imported to and generated at the railyard, and a railcar cleaning area (Geosyntec 2021b).

Chemicals that may have been used or generated as waste at these facilities include metals, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and petroleum hydrocarbons, including gasoline-range hydrocarbons (TPH-g), diesel-range hydrocarbons (TPH-d), and polynuclear aromatic hydrocarbons (PAHs). Organochlorine pesticides (OCPs) may have also been used. In contrast, radionuclides are not suspected of being present in site soil at concentrations exceeding regional background concentrations based on the site history.

In 1985, DTSC (formerly California Department of Health Services, Toxic Substances Control Division) determined that "There has been a release of hazardous substances on, or into the land on the Southern Pacific Bayshore Yard site located east of the intersection of Bayshore Boulevard and Geneva Road, Brisbane." Therefore, DTSC issued an "Order to Post and Fence," which required SPTC "[T]o post the site with signs and enclose portions of the site with fences …" (DTSC 1985, as cited in Geosyntec 2021b).

Industrial Way Properties

The Industrial Way properties, which are located outside of the former railyard, include three former underground storage tank (UST) sites located at 250, 285, and 350 Industrial Way, in addition to other properties as discussed below that are not known to be impacted. The USTs located at 250, 285, and 350 Industrial Way were thought to have once been used in support of the former railyard operations and were adjacent to buildings historically related to railyard activities (Geosyntec 2021b).

Historical activity at Industrial Way also included the manufacture of glue and fertilizer by Consolidated Chemical/Stauffer Chemical and previous tenants between approximately 1878 and 1963. Historical industrial operations prior to 1990 were reportedly conducted at the following approximate locations (Geosyntec 2021b):

- 21 to 27 Industrial Way – automobile refinishing;
- 55 and 55A Industrial Way – Moore Manufacturing Company;
- 60 to 130 Industrial Way – fertilizer plant;
- 250 Industrial Way – glue works;
- 285 Industrial Way – hide and glue plant;
- 290 to 295 Industrial Way – Consolidated Chemical Industries; and
- 300 to 312 Industrial Way – bone storage.

A summary of historical uses of Industrial Way properties from 1977 through 1993 is provided in Appendix A of the FS/RAP (Geosyntec 2021b). Briefly, the properties at 21 through 27 and 55 through 400 Industrial Way comprise the Industrial Way properties included in the Brisbane Baylands Specific Plan. The properties at 10, 36, and 40 Industrial Way are excluded from the OU-2 FS/RAP (Geosyntec 2021b). The longest-tenured operation appears to be a hide and glue plant, which occupied the northern portion of the Industrial Way properties between approximately 1878 and 1962 and was owned successively by Pacific Bone, Coal, and Fertilizing Company; Consolidated Chemical Industries, Inc.; and Stauffer Chemical Company. Historical chemical use at the Industrial Way properties from 1977 through 1993 is provided in Table 7 of Appendix A of the OU-2 FS/RAP (Geosyntec 2021b). In addition to chemicals potentially used in the railyard, historical activities at Industrial Way properties may have included the use of the following hazardous materials (Geosyntec 2021b):

- Acids and bases;
- Gasoline and oils used in vehicle maintenance;
- Santobrite™, a product containing pentachlorophenol used as a preservative for wood and glue products; and
- Solvents used in printing, painting, dyeing textiles, and cleaning.

It was noted that chemicals in use at the time of site inspection in 1993 involved small quantities that appeared to be properly used, stored, and disposed of or recycled (T&R 1993, as cited in Geosyntec 2021b). The former railyard buildings have since been replaced by more modern buildings. Land uses at these properties currently include automobile garages, storage warehouses, and a boxing ring. Aside from the UST cases at 250, 285, and 350 Industrial Way, no chemical releases to the environment requiring regulatory response are documented in the RWQCB's and DTSC's electronic document repositories, GeoTracker and EnviroStor, respectively (Geosyntec 2021b).

Previous Environmental Investigations and Site Remediation

Numerous environmental investigations have been conducted at the OU-2 site since 1982 to characterize the presence, nature, and extent of contaminants resulting from historical operations. Investigations have identified metals (primarily arsenic, lead, and mercury); polynuclear aromatic hydrocarbons (PAHs); organochlorine pesticides (OCPs); polychlorinated biphenyls (PCBs); chlorinated volatile organic compounds (CVOCs); and petroleum hydrocarbons, including Bunker C oil, gasoline-range hydrocarbons (TPH-g), diesel-range hydrocarbons (TPH-d), and motor oil range hydrocarbons (TPH-mo) as chemicals of potential concern (COPCs).

Site remediation completed to date includes the removal of underground storage tanks (USTs) and the safe removal of hydrocarbon-impacted soil associated with the USTs adjacent to Industrial Way (Geosyntec 2021b).

Contaminants of Concern

In the absence of any additional remediation or mitigation efforts, the primary risk-driving contaminants of concern identified in the HRA are as follows:

- Soil: arsenic, lead, TPH-d, PCE, TCE, cis-1,2-DCE, and vinyl chloride
- Soil vapor (based on groundwater evaluation): benzene and vinyl chloride, PCE, TCE, and cis-1,2-DCE
- Groundwater (vapor intrusion pathway only): benzene and vinyl chloride PCE, TCE, and cis-1,2-DCE (Geosyntec 2021b)

The potential exposure pathways to these risk-driving contaminants of concern in soil are direct exposures (incidental ingestion, dermal contact, and inhalation of particulates in ambient air) and potential inhalation of VOCs in indoor air migrating from soil and shallow groundwater. Due to the presence of VOCs in soil and shallow groundwater, it is appropriate that soil vapor and groundwater cleanup levels for vapor intrusion be developed for implementation of the remedy and assessment of the need for vapor mitigation engineering controls during development (Geosyntec 2021b).

Contaminant Distribution

SOIL

Metals and PAHs are present in shallow fill soil at elevated concentrations across certain areas of OU-2. Specifically, arsenic and lead were detected in nearly every sampling location during the 2018 Data Gap Investigation at relatively elevated concentrations in shallow fill soil, likely resulting from the historical application of lead arsenate pesticide to the ground surface during railyard operations. VOCs, OCPs, and PCBs exceeded screening criteria at only a few locations, indicating that impacts on soil from these COCs are localized. The distribution of Bunker C oil has been delineated and appears to be contained to the fill layer and above the Young Bay Mud layer (BKF 2023).

GROUNDWATER

Dissolved metals concentrations in groundwater were generally low with localized elevated concentrations. VOC detections in groundwater were similarly limited. Benzene, ethylbenzene, naphthalene, and xylene exceedances were observed primarily in the former Bunker C oil tank area, and chlorinated solvents were in a localized area in the western-central portion of the site (BKF 2023).

Baseline Health Risk Assessment

A Baseline Health Risk Assessment (HRA) for OU-2 was prepared under the assumption that no remediation or mitigation would be implemented. Using this assumption, the HRA evaluated potential risks to current and future populations that could be exposed to compounds of potential concern (COPCs) at the site under different land use scenarios. The results of the HRA found that present site conditions are protective for site users, but future action to remediate or mitigate potential exposure to COPCs in soil and soil vapor is warranted to protect future users under a high-intensity, mixed-use redevelopment scenario (Geosyntec 2021b).

Feasibility Study/Remedial Action Plan

The FS/RAP has been reviewed and approved by the RWQCB (BKF 2023). The FS/RAP is discussed in detail above in Section 2.7.2, Site Remediation. Activities related to site remediation within OU-2 are required to be undertaken pursuant to the regulatory authority of the RWQCB as a prerequisite to Baylands development.

Former Brisbane Landfill

Landfill Site History

The former Brisbane Landfill is bounded to the east by US Highway 101, to the west by the railroad tracks, and to the south by the Brisbane Lagoon. The highway provides a physical barrier along the eastern boundary of the landfill that separates San Francisco Bay from the Brisbane Landfill. The northern edge of the Brisbane Landfill contains a row of industrial properties located north of Beatty Avenue, while the railroad and Tunnel Avenue represent the approximate western boundary of the Brisbane Landfill. Approximate boundaries of the Brisbane Landfill are shown in **Figure 4.13-2** (BKF 2023).

Prior to 1932, the area now occupied by the Brisbane Landfill site was part of San Francisco Bay. In 1896, the landfill site was purchased by the Southern Pacific Transportation Company (Southern Pacific Railroad or SPRR) and, by 1914, a railroad had been constructed to the west of the landfill site. In 1932, the landfill site was leased by the Sanitary Fill Company, which had subcontracted day-to-day filling operations to the Easly and Brassy Company. US Highway 101 was constructed in the mid-1950s, adjacent to the eastern landfill boundary. Records indicate that the highway was constructed on fill material sourced from the nearby Candlestick Point area and San Bruno Mountain. The highway acted to isolate the landfill site from direct wave action generated in San Francisco Bay (ENGEO 2022).

Generally, the landfill was filled in three main areas (see **Figure 4.13-2**)

- Fill Area I (northwestern portion) – Waste was placed here from 1932 through 1952. This fill area extended approximately 1,000 feet into San Francisco Bay from SPRR's railroad track area.
- Fill Area II (northeastern portion) – Waste was disposed here from 1953 through 1956. This area extended approximately 600 feet farther eastward into San Francisco Bay, and filling extended to the current eastern property boundary. An access road and Visitacion Creek divide Fill Areas I and II from Fill Area III to the south.
- Fill Area III (southern portion) – Waste was placed here from 1956 until 1967, when the landfill stopped receiving waste. The construction of an earthen dike was completed to facilitate the expansion of the landfill to the south.

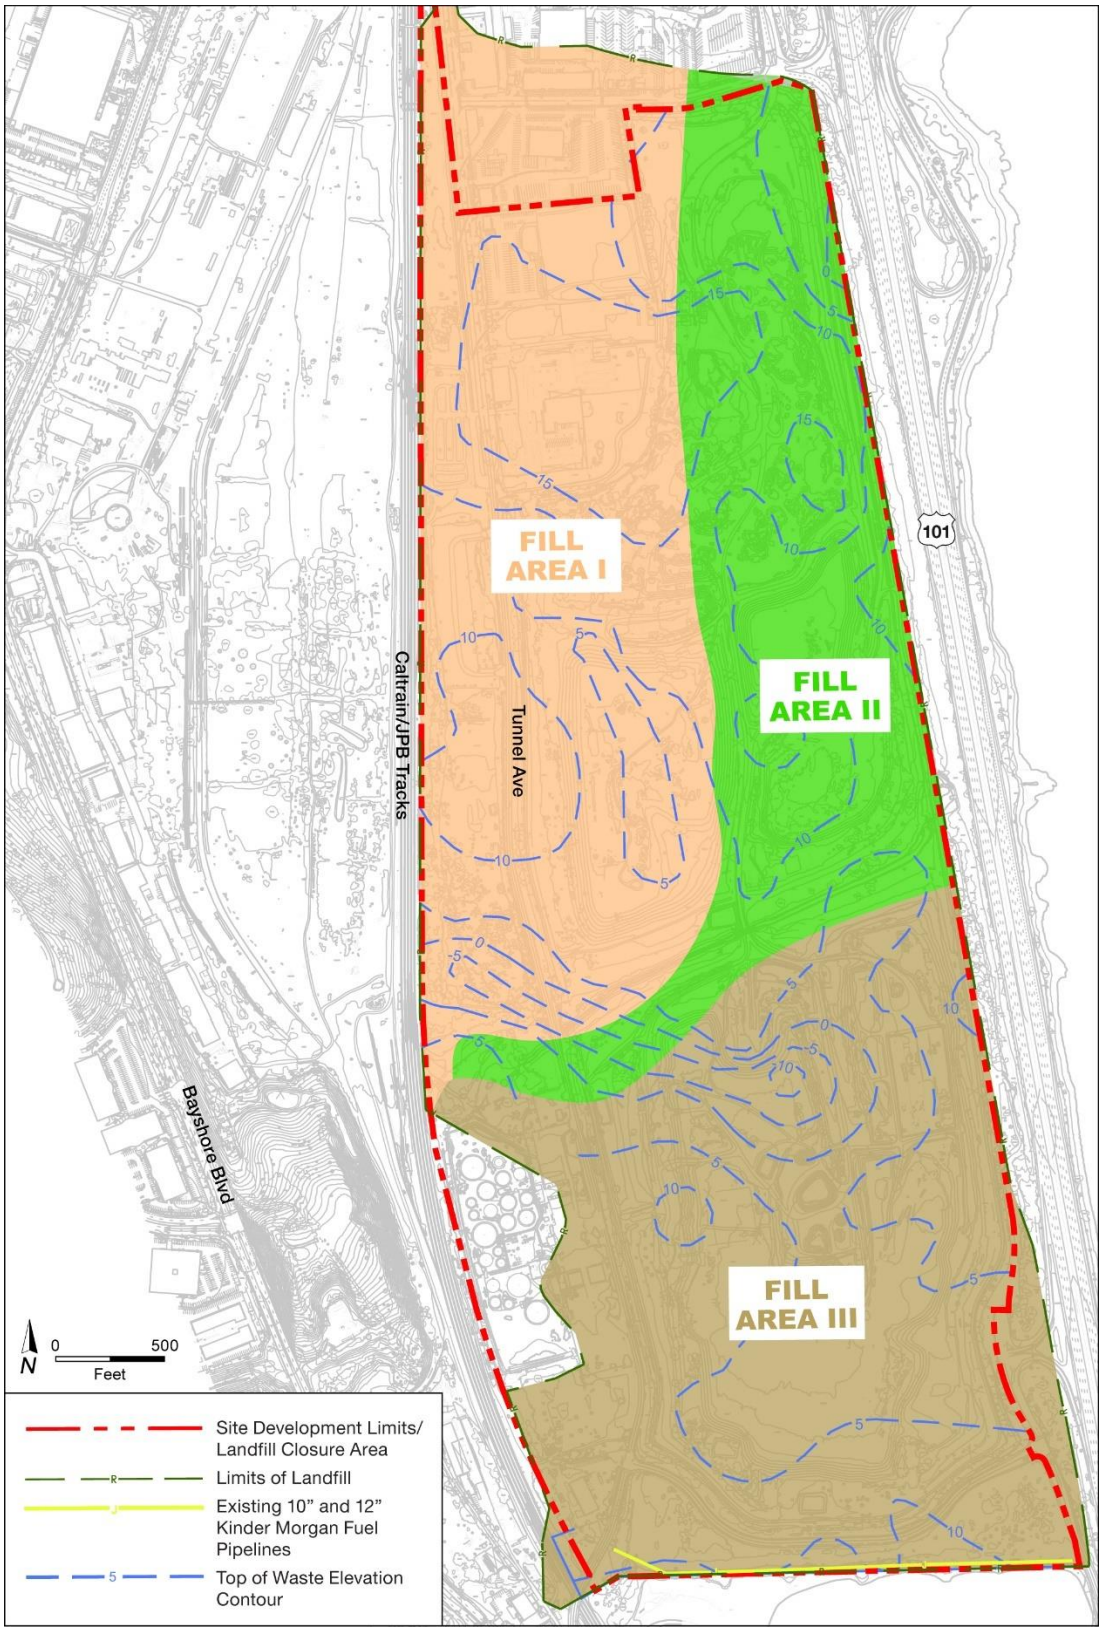
In 1967, the Easly and Brassy Company ceased to operate at the landfill, and the landfill has not accepted waste since then. The waste has since been covered with fill and inert debris. No records of the hydraulic properties or thickness of the fill were identified. A total estimated volume of 12½ million cubic yards of waste was disposed at the landfill. An estimated 73 percent of this waste was produced by residential and commercial activities. Inert fill accounts for approximately 25 percent, and the remaining 2 percent was assumed to be liquid waste (RWQCB 2001, as cited in ENGEO 2022).

At the time of the Brisbane Landfill operation and closure, modern waste disposal practices were not yet developed, and formal regulatory closure plans were not yet required. Typical of the standard practice at the time, waste was placed into the Bay water directly on the underlying native soil. The landfill does not have a liner, waste was not segregated into disposal cells, and there was no leachate collection system.

Various commercial and industrial structures, including petroleum storage tanks, have been constructed on the landfill since the 1950s. Portions of the landfill have been paved, but the surface cover of the majority of the landfill consists of permeable soil. Cover materials were added from the late 1960s until September 2017 on a large portion of the landfill.

In 1958, the RWQCB adopted Resolution 58-278 for the Brisbane Landfill, which prohibited waste discharge directly to surface water and required that a monitoring program be established. Between 1988 and 1992, a groundwater monitoring well network was installed on the portion of the landfill owned by Sunquest. A landfill gas extraction system consisting of vertical and horizontal extraction wells was installed from 1990 to 1991.

Figure 4.13-2: Existing Waste Conditions



In 1992, as required by Section 13273 of the California Water Code, a Solid Wastewater Quality Assessment Test was prepared for the Brisbane Landfill (Kleinfelder 1992, as cited in ENGEO 2022). The report identified contaminants of potential concern with the potential for off-site migration, particularly along the eastern and southern landfill boundaries. Hazardous materials were not identified.

Cleanup and Abatement Order No. 94-134 issued by the RWQCB in 1994 required maintenance of 2 feet of clean soil cover, a positive drainage gradient, and compliance with State Water Resources Control Board Order 92-08, which required an SWPPP for the landfill site. Waste Discharge Requirements were adopted in 2001 for the Brisbane Landfill. A Closure and Post-Closure Maintenance Plan was prepared for the site in March 2022. The plan was conditionally approved by the RWQCB.

Sections 4.15, *Geology, Soils, and Seismicity*, and Section 4.14, *Hydrology and Water Quality*, include discussion of existing geology and hydrology of the landfill portion of the Baylands.

Surface Conditions

Much of the landfill site has until recently been used as a soil recycling facility. Commercial and industrial facilities are also located in this portion, including Brisbane Recycling Company, Golden State Lumber, Transdev bus storage yard, and Avis Car Rental storage yard. A landfill gas extraction system is in place and has been maintained to provide continuous operation. A flare system for the landfill gas extraction system and compressor for the leachate management system are located on the northwest corner of the landfill. The Kinder Morgan tank farm is adjacent to the southwest corner of the former landfill. The rest of the site is covered with stockpiles that are covered with seasonal grasses. Ground surface elevations range from approximately 15 to 30 feet in the northern portion and around the stockpiles to 60 to 70 feet at the top of the stockpiles. Based on review of a Landfill Cover Thickness Investigation Report for the Brisbane Landfill prepared by Burns & McDonnell (B&MD) (B&MD 2001, as cited in ENGEO 2022), the existing soil stockpile material that is overlying the waste ranges in thickness from 1 to 37 feet. **Figure 4.13-2** provides a contour map of the estimated top of waste based on the data from the 2001 study; however, it is anticipated that significant settlement has occurred at the site since the study was performed, and the top of waste is likely lower than shown (ENGEO 2022).

Summary of Remedial Investigations Conducted to Date

Remedial investigations at the Brisbane Landfill have been conducted since 1987. Groundwater monitoring and landfill gas monitoring continue on an annual basis as required by the WDRs.

Groundwater

A groundwater monitoring well network was installed within portions of the Brisbane Landfill between 1987 and 2003 in accordance with the WDRs. There are 20 monitoring wells and two leachate monitoring wells located on the landfill. The Brisbane Landfill requires semi-annual groundwater monitoring (Order No. 01-041 and Title 27). The most recent Summer-Fall (August) 2021 Monitoring Report (Geosyntec 2021, as cited in ENGEO 2022) has reported groundwater and leachate monitoring well data to be consistent with historical data and indicated that the groundwater gradient is generally toward the south and east with a local component of flow toward Visitacion Creek (see **Figure 4.13-3**). No significant exceedances of clean up levels were reported (ENGEO 2022).

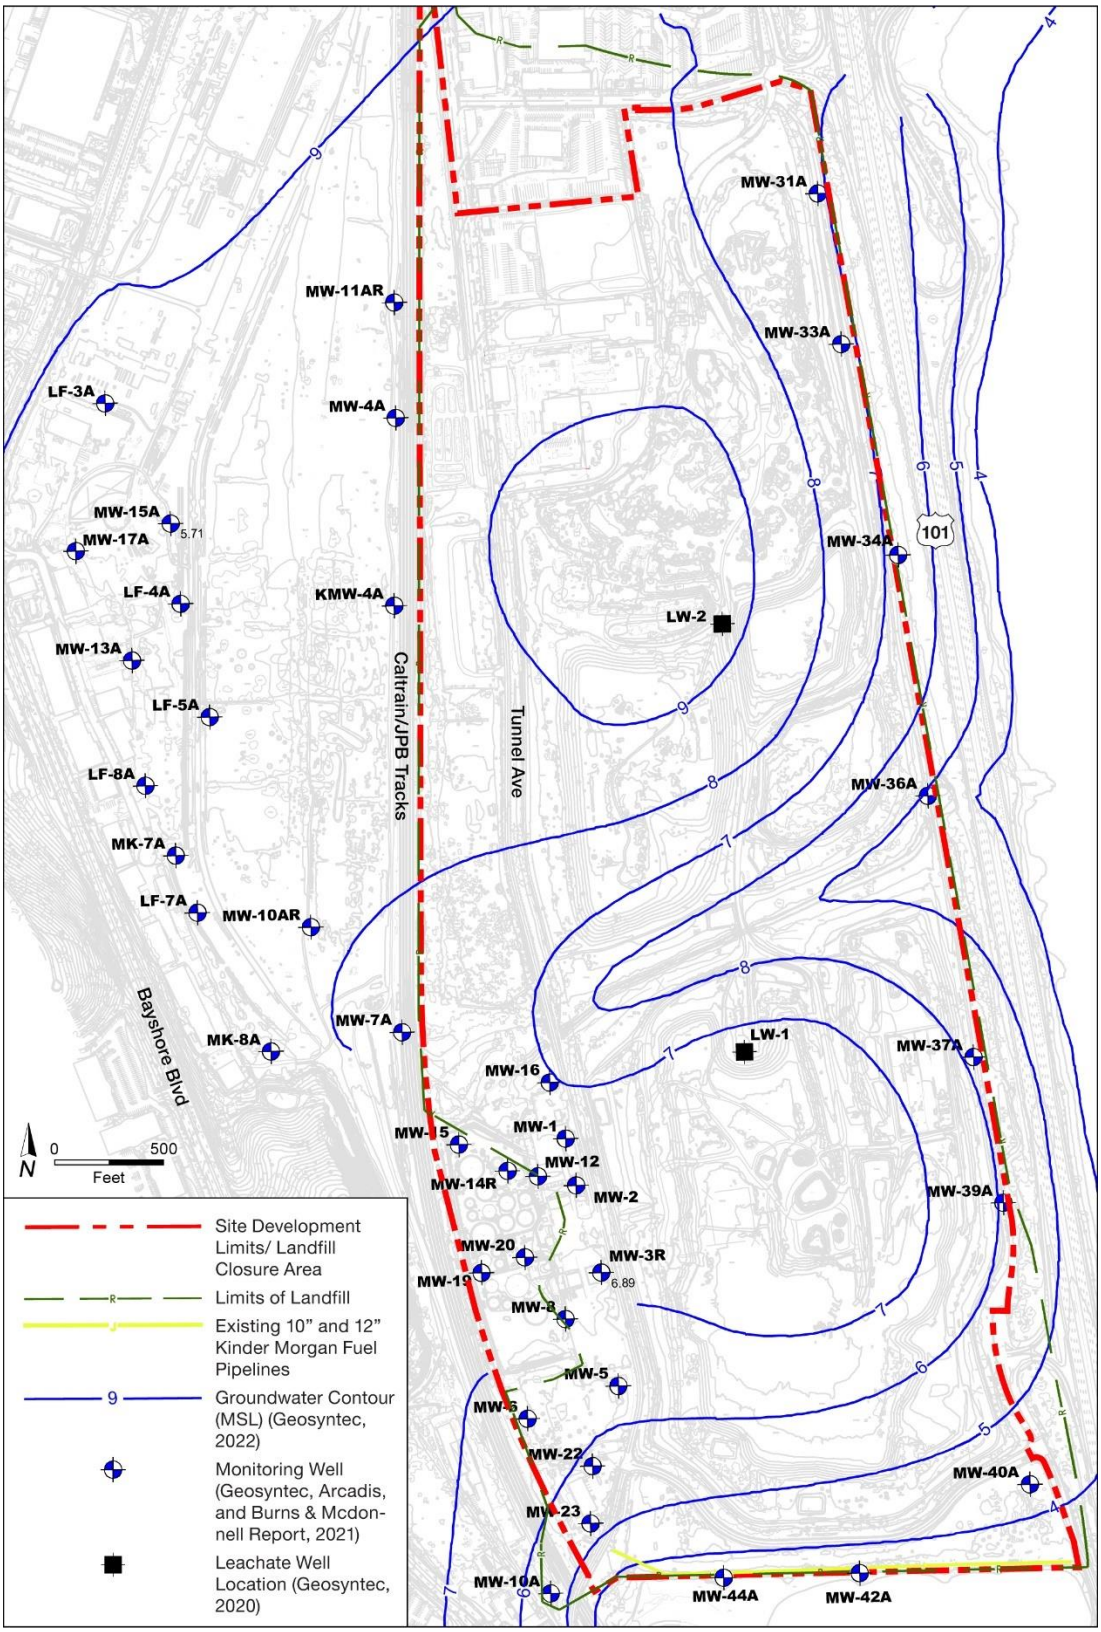
Leachate

The three sources of leachate at the landfill are surface infiltration, upward flow of pore water from Young Bay Mud consolidation, and upward flow from settlement and decomposition of waste. As described in the WDRs, leachate contains dissolved metals, elevated ammonia, VOCs, and SVOCs within the shallow and deep aquifer within the Brisbane Landfill. Landfill leachate is brackish to saline. The Brisbane Landfill is following a Leachate Monitoring Plan (LMP) that is in accordance with the WDRs (ENGEO 2022).

The existing leachate seep collection and transmission system at the Brisbane Landfill began operation on August 7, 2009, following its RWQCB approval in 2008. The system is designed to eliminate surface seepage of leachate from the landfill into the Brisbane Lagoon. Leachate is discharged to a Bayshore Sanitary District (BSD) sewer line for treatment and disposal. The San Francisco Public Utilities Commission (SFPUC) requires that the leachate seep collection and transmission system discharge be sampled semi-annually for chemicals required by the permit. Leachate sampling results are reported to the SFPUC and BSD. From August 10, 2009, to August 27, 2021, approximately 36.1 million gallons of leachate were discharged to the BSD sewer line (Sunquest 2021, as cited by ENGEO 2022).

The system receives regular maintenance and repair. Semi-annual sampling events are performed for the Brisbane Lagoon seeps, Visitacion Creek seeps, and leachate wells within the landfill footprint. Perimeter seep inspections occur on a quarterly basis. Water levels in interior leachate wells indicate that approximately 3 feet of leachate have accumulated within the landfill over the past 15 years. Infiltration of precipitation and consolidation of waste and Young Bay Mud under the weight of stockpiled soil are the likely source of the apparent leachate buildup (Geosyntec 2008a, as cited in ENGEO 2022).

Figure 4.13-3: Existing Groundwater Conditions at Former Brisbane Landfill



In the Summer–Fall 2021 Semiannual Discharge Monitoring Report (Geosyntec 2021, as cited in ENGEO 2022), the groundwater quality data collected at the landfill were statistically evaluated in order to identify trends or possible releases from the landfill. No significant exceedances were reported (ENGEO 2022). As discussed above in Section 2.6.2, *Landfill Closure*, the Closure and Post-Closure Maintenance Plan includes plans for a new leachate management system.

Surface Water and Seeps

There are two surface water stations located along Visitacion Creek, five seeps along the southern border of the landfill (near the Brisbane Lagoon), and three seeps along the eastern border of the landfill (along US Highway 101). The two surface water stations along Visitacion Creek and the five seeps along the Brisbane Lagoon are included in semi-annual sampling and quarterly perimeter observations, in accordance with the WDRs (RWQCB 2001, as cited in ENGEO 2022).

Based on the Summer-Fall 2021 Monitoring Report (Geosyntec 2021, as cited in ENGEO 2022), two surface water samples and two seep samples were collected, and the following results were reported:

- No VOCs, SVOCs, PCBs, or OCPs were detected in the surface water samples.
- Metals detected, including arsenic, barium, lead, nickel, and selenium, were within the range of historic concentrations.
- TDS was 31,000 mg/L, sulfate was 2,400 mg/L, and nitrate was not detected.
- The maximum concentration criterion for un-ionized ammonia was not exceeded in the 2021 monitoring event.
- The seeps tests along the Brisbane Lagoon indicated a presence of only chlorobenzene and 1,4-dichlorobenzene at maximum concentrations, below the California maximum contaminant level (MCL). One SVOC, 1,4-dichlorobenzene, was detected.
- No PCBs and OCPs were detected in the seep samples. The un-ionized portion of ammonia (as nitrogen) was calculated to be 2.68 mg/L (SG-3) and 0.53 mg/L (SG-4) (ENGEO 2022).

In 2021, Geosyntec observed interior stations that were dry, with no odors, no ponded water, and no evidence of cover erosion or daylighted waste. The perimeter stations also were observed to be generally dry, without odors, and no liquid was seen entering or leaving the landfill at the 16 perimeter stations. No significant exceedances were reported (ENGEO 2022).

Landfill Gas Management System

An existing gas collection and control system, installed in 1991, operates within the Brisbane Landfill on a less-than-continuous permit due to decreasing methane production. The landfill gas extraction system has received various maintenance during its operation. Due to low

landfill gas production, the flare currently operates a couple of hours per week. There are 57 landfill gas extraction monitoring wells, and landfill gas is monitored on a quarterly basis. The main header of the landfill gas extraction system surrounds the approximately 240-acre plot located east of Tunnel Avenue, north of Lagoon Way and west of US Highway 101. Monitoring reports indicate the landfill gas extraction system has been in compliance with the BAAQMD's operational criteria (ENGEO 2022).

Contaminants of Concern and Distribution

The following contaminants of concern have been identified at the former landfill (BKF 2022):

- Soil: No COCs have been identified for soil. Waste primarily consists of non-hazardous materials, consistent with Class III landfills.
- Groundwater: Shallow (Zone A) groundwater at the Brisbane Landfill is naturally brackish to saline. COCs for the shallow and deep groundwater zones at the landfill include the following:
    - Inorganics (ammonia/un-ionized ammonia, nitrate, sulfate, total dissolved solids [TDS], and total organic carbon [TOC]);
    - Metals (arsenic, barium, lead, nickel, and selenium);
    - Volatile organic compounds (VOCs);
    - Semi-volatile organic compounds (SVOCs); and
    - Organochlorine pesticides (OCPs) and PCBs.
- Landfill Gas: Low concentrations of methane.

Groundwater monitoring data from August 2020 indicate that COC concentrations are generally low and are highest in the southern (downgradient) portion of the Brisbane Landfill. Of the inorganic COCs, TDS, TOC, and sulfate are highest in shallow wells, and nitrate is highest in deep groundwater. Of the dissolved metals, concentrations of arsenic, barium, lead, nickel, and selenium are uniformly low in shallow and deep wells. The VOCs methyl tert-butyl ether (MTBE), chlorobenzene, 1,4-dichlorobenzene, and cis-1,2-dichlorobenzene are present at low levels in shallow groundwater, whereas acetone was the only organic chemical detected above the reporting limit in deep groundwater. The SVOCs acenaphthene and n-nitroso diphenyl were detected above reporting limits in shallow groundwater, but none were detected in deep groundwater. Neither organochlorine pesticides (OCPs) nor PCBs were detected above the reporting limit in shallow or deep groundwater (BKF 2023).

Former Police Shooting Range

The southerly slope of Icehouse Hill was previously used as a police shooting range. The site has not undergone remediation and has lead remaining from the leftover shells. Spent lead shot

or bullets left in the environment are subject to the broader definition of solid waste used in Sections 7002 and 7003 of the RCRA statute.

d. Existing Contamination and Assessments in the Vicinity of the Specific Plan Area

Schlage Lock Site (San Francisco Portion of OU-1)

The Schlage Lock Company manufactured door hardware and lock parts from 1926 to 1999 at a facility located at Bayshore and Sunnydale boulevards immediately north of the Baylands Specific Plan area in San Francisco. Operations started in a building known as Plant 1. The size of the facility was expanded in 1942 and 1950. The manufacturing process included stamping and machining metal alloys; deburring brass, bronze, nickel, silver, and steel parts; and cleaning brass and bronze parts with a product known as Safety Kleen 150, a petroleum naphtha solvent. Other solvents that contained trichloroethane were also commonly used at the facility, which closed operations in December 1999.

Soil removal and cleanup actions have been conducted by the landowner at this site since 1994 when a groundwater extraction and treatment system was installed. Groundwater was sampled quarterly to monitor the movement and levels of chemicals. The groundwater extraction and treatment system ceased operation in 2009. In 1996, an interim removal action was conducted by the landowner at the strip and degreasing rooms in Building 3 to remove soil contaminated with volatile organic compounds (VOCs). Also, in 1999, a soil vapor and extraction treatment system was installed by the landowner to remove soil vapor underneath the strip and degreasing area. The soil vapor and extraction treatment system was decommissioned in September 2008. This site is now part of the Visitacion Valley redevelopment project area.

As discussed above, the contaminated groundwater affecting OU-SM resulting from the Schlage Lock property is being addressed as documented in the Schlage OU FS/RAP (MACTEC 2009, as cited in Geosyntec 2021a). Remedial action for groundwater and soil contamination at the Schlage OU site was certified by DTSC in 2014 and operation and maintenance are ongoing (DTSC 2014, as cited in Geosyntec 2021a). Impacts on soil vapor on the UPC OU-SM site that result from the residual CVOCs in groundwater from the Schlage OU will be addressed in the remedial design phase and mitigated at the time occupied buildings are constructed, if necessary (Geosyntec 2021a).

Recology Solid Waste Transfer Facility

The existing 44-acre Recology Solid Waste Transfer Facility (Recology) site is located north of the Baylands Specific Plan area and is situated partially within the City of Brisbane and partially within the City and County of San Francisco. Operational activities include waste transfer, materials recovery, public disposal and recycling, vehicle weighing and maintenance, organics transfer, fueling, temporary hazardous materials storage, fleet parking, cart and container

maintenance, and storage. The facility included seven underground storage tanks (USTs) within a small area in the center of the facility that were removed in the mid to late 1990s. The Recology site is partly located over the former landfill.

Data indicate that multiple investigations and removal actions occurred between 1986 and 1999. Since February 1988, the site has been in the verification monitoring stage of the regulatory process. Groundwater at the site is impacted by total petroleum hydrocarbons in the form of diesel fuel. Data from the most recent remedial investigation report indicate that groundwater flow direction at the site is to the south toward the Specific Plan Area and that concentrations of total petroleum hydrocarbons in the form of gasoline, diesel, and motor oil at the site exceed the groundwater environmental screening levels (Fugro 2011).

Petroleum hydrocarbons were released to soil and groundwater at the Recology site from underground storage tanks (USTs) and dispensers. Site investigation and remediation activities commenced at the Recology site in August 2000. Two extraction wells were installed to remove free-floating petroleum products. On March 22, 2011, one extraction well had a sheen, and the other extraction well had no observable floating petroleum product. Groundwater in selected wells was sampled and analyzed in September 2010 for the following compounds (but not all of the listed compounds were analyzed in all wells): TPHd, TPHmo, TPHg, BTEX (benzene, toluene, ethylbenzene, and xylene), MTBE, and inorganic parameters (pH, electrical conductivity, dissolved oxygen). Results of analyses indicate that groundwater in the former underground storage tank (UST) area is affected primarily by petroleum hydrocarbons (Fugro West, Inc. 2011).

Kinder Morgan Tank Farm

Petroleum hydrocarbons were released to soil and groundwater at the Kinder Morgan tank farm and have been under investigation since the early 1990s (LFR 2008). This Spills, Leaks Investigation and Cleanup site, which is designated by the Baylands Specific Plan as an Existing Use Area, is a bulk petroleum storage facility and distribution terminal. The facility has 21 above-ground storage tanks, which are constructed on a bedrock outcrop to the west of the former Brisbane Landfill. Five loading rack facilities, where transport trucks are filled with petroleum products, are also located at the site. The Kinder Morgan Terminal is an important nexus in the fuel distribution system for Northern California and the Bay Area. In addition to supplying fuel to retail service stations in the Bay Area, the terminal provides aviation fuel to San Francisco International Airport. Since the early 1990s, Kinder Morgan has conducted subsurface assessments, including the installation of 33 groundwater monitoring wells, to evaluate impacted soil and groundwater quality conditions in the vicinity of the site.

Previous remedial actions have occurred between 1998 and 2006 and consisted of dual-phase extraction, non-aqueous phase hydrocarbons (NAPH) recovery, and soil excavations. The current approved remedial activities being implemented are monitored natural attenuation

(MNA) for the dissolved phase petroleum hydrocarbon plume in shallow groundwater and NAPH recovery using absorbent socks and hand bailing in wells exhibiting NAPH near the manifold and loading rack areas of the site (Arcadis 2011).

Conclusions in the Semiannual Groundwater Monitoring Report, July 1 to December 31, 2010, prepared for Kinder Morgan, have been reviewed and are summarized as follows (Arcadis 2011):

- Soil impacts are limited to the Kinder Morgan property.
    - Based on the total dissolved solids (TDS) concentrations, which are greater than 1,000 milligrams per liter (mg/L) (upper limit for drinking water supplies established in CCR Title 22, Section 64449), groundwater beneath the [Kinder Morgan] Specific Plan area is not considered to be a drinking water supply. Though water samples were found to be above estuary habitat environmental screening levels in surface waters adjacent to the Kinder Morgan facility, it was determined that the Kinder Morgan facility was not the source (Arcadis 2011).
    - Groundwater contaminants of concern include non-aqueous phase hydrocarbons, total petroleum hydrocarbons, benzene, and methyl tert-butyl ether (MTBE). The total petroleum hydrocarbons groundwater plume extends off the Kinder Morgan site underneath the footprint of the Brisbane Landfill. However, concentrations of contaminants of concern extending underneath the Brisbane Landfill are below environmental screening levels.
    - Groundwater was first encountered at a depth of 2 to 13 feet below the top of casing in the monitoring wells. Impacted groundwater beneath the Kinder Morgan site generally flows in a radial pattern outward from the center of the northern tank farm to the northeast and east toward the Brisbane Landfill. Recent groundwater measurements indicate that there is also a localized area of groundwater flow, westward from the Brisbane Landfill into the Kinder Morgan site.
    - During the fourth quarter of 2010, the concentration trends for total petroleum hydrocarbons, BTEX compounds, and MTBE were generally stable or decreasing in the majority of monitored site wells, but a few of the wells showed increasing concentrations. Plume extent for the majority of the contaminants has been shown to be stable or decreasing.
    - The presence of contaminants attributable to the Brisbane Landfill (e.g., chlorobenzene) supports the theory that groundwater flow beneath the landfill is a contributing source of groundwater contamination in the northeastern portion of the Kinder Morgan facility (Arcadis 2011). This theory has also been documented and confirmed by the RWQCB. Therefore, the combined groundwater flow directions and distribution of contaminants of concern in groundwater suggest that groundwater from the Brisbane Landfill is affecting groundwater beneath the Kinder Morgan site (Arcadis 2011).

> A report prepared for the site that evaluated various remediation alternatives, known as a Remedial Action Effectiveness Evaluation, concluded that the recent trends showing decreasing total petroleum hydrocarbons and volatile organic compounds (VOC) concentrations and the overall decreasing contamination plume size are largely the result of natural processes where the contaminants degrade into harmless elements (Arcadis 2011). A screening level risk evaluation conducted as part of the Remedial Action Effectiveness Evaluation found that concentrations of contaminants of concern in the Kinder Morgan groundwater plume, on the site, and below the landfill remain below the environmental screening levels (ESLs) for Indoor Air for Commercial/Industrial Land Use as established by the RWQCB. Concentrations of contaminants of concern in soil are above environmental screening levels for protection of a construction worker; however, protective measures are in place for construction workers at the Kinder Morgan facility.

In addition, as part of the 2011 Remedial Action Effectiveness Evaluation (Arcadis 2011) for the Kinder Morgan site, the possibility of volatilization of contaminants of concern from groundwater to indoor air was evaluated assuming potential commercial use. Maximum detected concentrations of volatile constituents were found to be below environmental screening levels for the protection of indoor air in a commercial or industrial setting (Arcadis 2011). This evaluation was performed for the well with the highest detected levels of contaminants of concern, located in the center of the Kinder Morgan property. Volatile constituents in wells bordering the Specific Plan area have most recently been below laboratory detection levels except in one well in the northeastern corner of the site that is impacted by contaminants of concern from the Brisbane Landfill (Arcadis 2011).

PG&E Martin Substation and Service Center

As shown in **Table 4.13-2**, the existing Martin Substation is listed twice as a hazardous materials site pursuant to Government Code Section 65962.5. This site is certified with land use controls and ongoing operation and maintenance of remedial measures.

e. Database Records Search

Environmental Risk Information Services (ERIS) performed a computerized public records search of government hazardous materials databases in December 2022. The database search was conducted for all sites located within 1 mile from the center of the Specific Plan area, depending on the database. **Table 4.13-1** lists, for each database, the number of hazardous sites located within the Specific Plan area vicinity. Although the agency lists are updated regularly, there may be contaminated sites that have not yet been identified and, therefore, are absent from the databases.

Table 4.13-1: Environmental Records Database Results in Vicinity of the Specific Plan Area

4.13.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

Resource Conservation and Recovery Act

Federal hazardous waste regulations are generally promulgated under the Resource Conservation and Recovery Act (RCRA). Pursuant to RCRA, the United States Environmental Protection Agency (USEPA) regulates the generation, transportation, treatment, storage, and disposal of hazardous waste in a "cradle to grave" manner. RCRA was designed to protect human health and the environment, reduce or eliminate the generation of hazardous waste, and conserve energy and natural resources. The USEPA has largely delegated responsibility for implementing the RCRA program to the State of California, which implements this program through the California Hazardous Waste Control Act.

RCRA regulates landfill siting, design, operation, closure (including identifying liner and capping requirements), and post-closure for licensed landfills. In California, RCRA landfill requirements are delegated to the California Department of Resources Recycling and Recovery (CalRecycle), which is discussed in detail below. RCRA also allows the USEPA to control risk to human health at contaminated sites. Vapor intrusion presents a significant risk to human populations overlying contaminated soil and groundwater and was addressed in the human health risk assessments and remedial action objectives prepared for contaminated sites within the Baylands, discussed below.

Safe Drinking Water Act

The federal Safe Drinking Water Act, 40 Code of Federal Regulations (CFR) Part 141, gives the USEPA the power to establish water quality standards and beneficial uses for waters from below- or above-ground sources of contamination. For the Specific Plan area, water quality standards are administered by the San Francisco Bay RWQCB.

USEPA Superfund and Contingency Planning Regulations

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)

The 1980 Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as "Superfund," established prohibitions and requirements concerning closed and abandoned hazardous waste sites, provided for liability of persons responsible for releases of hazardous waste at these sites, and established a trust fund to provide for cleanup when no responsible party for cleanup of a contaminated site could be identified. The law authorizes two kinds of response actions: (1) short-term removals, where actions may be taken to address releases or threatened releases requiring prompt response; and (2) long-term remedial response actions that permanently and significantly reduce the dangers associated with releases or threats of releases of hazardous substances that are serious, but not immediately life threatening. These actions can only be conducted at sites listed on the USEPA's National Priorities List, established by the National Contingency Plan.

Superfund Amendments and Reauthorization Act (SARA)

The Superfund Amendments and Reauthorization Act (SARA) amended CERCLA in 1986 and stressed the importance of permanent remedies and innovative treatment technologies in cleaning up hazardous waste sites. It also required Superfund actions to consider the standards and requirements found in other state and federal environmental laws and regulations, provided expanded enforcement authorities and settlement tools, increased state involvement in the Superfund program, increased the focus on human health problems posed by hazardous waste sites, encouraged greater citizen participation in making decisions on how sites should be cleaned up, and increased the size of the trust fund to $8.5 billion. SARA also required the USEPA to revise the Hazard Ranking System to ensure that it accurately assessed the relative degree of risk to human health and the environment posed by uncontrolled hazardous waste sites that may be placed on the National Priorities List.

As shown in **Table 4.13-1**, the environmental database records search conducted for the Specific Plan area include the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database and the CERCLIS No Further Remedial Action Planned (NFRAP) database. The Baylands was once considered for inclusion but was not ultimately designated a Superfund site.

National Priorities List and Hazard Ranking System

The National Priorities List is the list of sites of known or threatened releases of hazardous substances, pollutants, or contaminants throughout the United States and its territories. The National Priorities List is intended primarily to guide the USEPA in determining which sites warrant further investigation. The Hazard Ranking System is the principal mechanism that the USEPA uses to place uncontrolled waste sites on the National Priorities List. It is a numerically

based scoring system that uses information from initial, limited investigations—the preliminary assessment, the site inspection, and the expanded site inspection if necessary—to assess the relative potential of sites to pose a threat to human health or the environment.

There are no sites within or in the vicinity of the Baylands included on the National Priorities List (USEPA 2022).

Emergency Planning and Community Right-to-Know Act of 1986 and America's Water Infrastructure Act of 2018

The Emergency Planning and Community Right-to-Know Act was passed to address concerns regarding the environmental and safety hazards posed by the storage and handling of toxic chemicals. The USEPA imposed requirements related to emergency planning and "Community Right-to-Know" reporting on hazardous and toxic chemicals. Community Right-to-Know provisions are intended to increase the public's knowledge and access to information on chemicals at individual facilities, their uses, and releases into the environment. States and communities, working with facilities, can use the information to improve chemical safety and protect public health and the environment.

Section 2018 of the America's Water Infrastructure Act requires state and tribal emergency response commissions to notify the applicable state agency (i.e., California State Water Resources Control Board, Division of Drinking Water) of any reportable releases and provide community water systems with hazardous chemical inventory data.

To implement the Emergency Planning and Community Right-to-Know Act, each state is required to appoint a State Emergency Response Commission, which is required to divide each state into Emergency Planning Districts and to name a Local Emergency Planning Committee for each district. The federal Emergency Planning and Community Right-to-Know Act program is administered in California by the California Governor's Office of Emergency Services (Cal OES), a State Emergency Response Commission, six Local Emergency Planning Committees, and 83 Certified Unified Program Agencies (CUPAs). The California Emergency Response Commission (also known as the Chemical Emergency Planning and Response Commission) oversees implementation of Emergency Planning and Community Right-to-Know Act in California. San Mateo County is a member of the Local Emergency Planning Committee Region II (Coastal Region).

Hazardous Materials Transportation Act

The transportation of hazardous materials is regulated by the Hazardous Materials Transportation Act, which is administered by the Research and Special Programs Administration of the United States Department of Transportation (USDOT). The Act provides USDOT with a broad mandate to regulate the safe transport of hazardous materials with the purpose of adequately protecting the nation against risk to life and property, which is inherent

in the commercial transportation of hazardous materials. These USDOT regulations are applicable to any person who transports, ships, causes to be transported or shipped, or is involved in any way with the manufacture or testing of hazardous materials packaging or containers. USDOT regulations pertain to the actual movement of hazardous materials and govern every aspect of the movement, including packaging, handling, labeling, marking, placarding, operational standards, and highway routing. Additionally, USDOT is responsible for developing curricula to train for emergency response and administers grants to states and Native American tribes for ensuring the proper training of emergency responders.

Occupational Safety and Health Act of 1970

Federal and state occupational health and safety regulations contain provisions regarding hazardous waste management through the Occupational Safety and Health Act of 1970 (amended), which is implemented by the Occupational Safety and Health Administration (OSHA). OSHA regulates the administration of Title 29 of the Code of Federal Regulations (29 CFR), which requires special training of handlers of hazardous materials; notification to employees who work in the vicinity of hazardous materials; acquisition from the manufacturer of material safety data sheets, which describe the proper use of hazardous materials; and training of employees to remediate any hazardous material accidental releases.

OSHA also establishes standards regarding safe exposure limits for chemicals to which construction workers may be exposed. Safety and Health Regulations for Construction (29 CFR 1926.65 Appendix C) contains requirements for construction activities, which include occupational health and environmental controls to protect worker health and safety. The guidelines describe the health and safety plan(s) that must be developed and implemented during construction, including associated training, protective equipment, evacuation plans, chains of command, and emergency response procedures.

Due to the existence of hazardous materials in the vicinity of the Specific Plan area, adherence to applicable hazard-specific OSHA standards would be required to maintain worker safety. For example, methane is regulated by OSHA under 29 CFR Part 1910.146 relative to worker exposure to a "hazardous atmosphere" within confined spaces where the presence of flammable gas vapor or mist is in excess of 10 percent of the lower explosive limit. Additionally, Title 49 of the CFR governs the manufacture of packaging and transport containers, packing and repacking, labeling, and the marking of hazardous material transport, and Title 42, Chapter 82 governs solid waste disposal and resource recovery.

Pipeline and Hazardous Materials Safety Administration

The Pipeline and Hazardous Materials Safety Administration is the primary federal regulatory agency responsible for ensuring that pipelines are safe, reliable, and environmentally sound. The federal pipeline integrity management regulations for hazardous liquid pipelines (Section

195.452) and natural gas pipelines (Sections 192.901–192.951) require operators to perform risk assessments of their pipelines to:

- Ensure that integrity assessment methods (internal inspection, pressure testing, direct assessment, etc.) are employed to address significant threats on pipeline segments.
- Ensure that integrity assessments of the highest risk segments are scheduled with priority over lower risk segments.
- Ensure that assessments of threats and potential consequences are conducted to define, evaluate, and implement additional measures that address significant threats to the pipeline (e.g., conducting depth-of-cover surveys and correcting any deficiencies), or reduce potential consequences of failures (e.g., installing additional valves on the pipeline to reduce the amount of liquid or gas that might be released should a failure occur).

b. State Laws, Plans, Programs, and Regulations

Hazardous Materials Management

In the regulation of hazardous waste management, California law often mirrors or is more stringent than federal law. The California Environmental Protection Agency (CalEPA) and California Occupational Safety and Health Administration (Cal/OSHA) are the primary state agencies responsible for hazardous materials management. Additionally, the California Emergency Management Agency (CalEMA) administers the California Accidental Release Prevention (CalARP) program. The California Department of Toxic Substances Control (DTSC), which is a branch of CalEPA, regulates the generation, transportation, treatment, storage, and disposal of hazardous waste, as well as the investigation and remediation of hazardous waste sites. The DTSC program incorporates the provisions of both federal (RCRA) and state hazardous waste laws.

California Unified Program Administration

In 1996, CalEPA adopted the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program). The Unified Program consolidates and makes consistent the administrative requirements, permits, inspections, and enforcement activities of the following six state programs that regulate business and industry use, storage, handling, and disposal of hazardous materials and wastes:

- Hazardous Materials Release Response Plans and Inventories (Business Plans)
- California Accidental Release Program (CalARP)
- Underground Storage Tank Program

- Above-Ground Petroleum Storage Act Program
- Hazardous Waste Generator and On-Site Hazardous Waste Treatment (tiered permitting) Programs
- California Uniform Fire Code: Hazardous Material Management Plans and Hazardous Material Inventory Statements

State agency partners involved in the Unified Program have the responsibility of setting program element standards, working with CalEPA on program consistency, and providing technical assistance to the Certified Uniform Program Agencies (CUPAs). The following state agencies are involved with the Unified Program:

- **California Environmental Protection Agency (CalEPA).** The Secretary of CalEPA is responsible for coordinating the administration of the Unified Program. The Secretary certifies Unified Program agencies.
- **California Department of Toxic Substances Control (DTSC).** DTSC provides technical assistance and evaluation for the hazardous waste generator program, including on-site treatment (tiered permitting). Under California Code of Regulations (CCR) Title 22 and the California Hazardous Waste Control Law, Chapter 6.5, DTSC regulates the generation, transportation, treatment, storage, and disposal of hazardous waste.
- **California Governor's Office of Emergency Services (Cal OES).** Cal OES is responsible for providing technical assistance and evaluation of the Hazardous Material Release Response Plan (Business Plan) Program and the CalARP programs.
- **Office of the State Fire Marshal.** The Office of the State Fire Marshal is responsible for ensuring the implementation of the Hazardous Material Management Plans and the Hazardous Material Inventory Statement Programs. These programs tie in closely with the Business Plan Program.
- **State Water Resources Control Board (SWRCB).** SWRCB provides technical assistance and evaluation for the underground storage tank program in addition to handling the oversight and enforcement for the above-ground storage tank program.

Both RCRA and the Hazardous Waste Control Law impose "cradle to grave" regulatory systems for handling hazardous waste in a manner that protects human health and the environment. CalEPA has delegated some of its authority under the Hazardous Waste Control Law to county health departments and other CUPAs.

The San Mateo County Environmental Health Services Division is the Certified Uniform Program Agency and thus provides regulatory oversight for federal, state, and local hazardous materials use and disposal laws and regulations throughout the County. County Environmental Health Services protects the public health and the environment from accidental releases and improper handling, storage, transportation, and disposal of hazardous materials and wastes

through coordinated efforts of inspections, emergency response, enforcement, and site mitigation oversight. In addition, County Environmental Health Services implements the following programs:

- Hazardous Materials Reporting and Response Planning (Hazardous Materials Disclosure)
- Uniform Fire Code Business Plan
- Hazardous Waste Generation and On-Site Treatment
- Accidental Release Prevention Program
- Above-Ground Storage Tank Regulations
- Underground Storage Tank Regulations

Hazardous Waste Control Act

The Hazardous Waste Control Act established the California Hazardous Waste Control Program within the Department of Health Services, which was more comprehensive than the federal RCRA system. Emergency regulations enacted in 1973 clarified and defined the hazardous waste program as follows:

- The regulations included definitions of what was a waste and what was hazardous, as well as what was necessary for appropriate handling, processing, and disposal of hazardous and extremely hazardous waste in a manner that would protect the public, livestock, and wildlife from hazards to health and safety.
- The early regulations also established a tracking system for the handling and transportation of hazardous waste from the point of waste generation to the point of ultimate disposition, as well as a system of fees to cover the costs of operating the hazardous waste management program.
- The program established a technical reference center for public and private use dealing with all aspects of hazardous waste management.

Hazardous Waste and Substance Sites (Cortese) List

The Cortese List is used by the state, local agencies, and developers to comply with California Environmental Quality Act (CEQA) requirements for providing information about the location of hazardous materials release sites. Government Code Section 65962.5 requires CalEPA to develop an updated Cortese List at least annually. DTSC and other state and local government agencies provide additional hazardous material release information for the Cortese List. While Government Code Section 65962.5 refers to preparation of a "list," this information is now largely available through on-line databases, including EnviroStor and GeoTracker. The

Environmental Database Records Search conducted for the Specific Plan included these two databases and more (see **Table 4.13-1**).

Hazardous Materials Business Plans

Article 1 of Chapter 6.95 of the California Health and Safety Code (Sections 25500–25520) requires that any business that handles, stores, or disposes of a hazardous substance at a given threshold quantity must prepare a Hazardous Materials Business Plan (Business Plan). Business Plans are intended to minimize hazards to human health and the environment from fires, explosions, or an unplanned release of hazardous substances into air, soil, or surface water. The Business Plan must be carried out immediately whenever a fire, explosion, or unplanned chemical release occurs. Business Plans include three sections: (1) an inventory of hazardous materials, including a site map that details their locations; (2) an emergency response plan; and (3) an employee-training program. Business Plans serve as an aid to employers and employees in managing emergencies at a given facility. They also help better prepare emergency response personnel for handling a wide range of emergencies that might occur at the facility.

Hazardous Materials Business Plans are submitted to the Environmental Health Services Hazardous Materials Division and must be resubmitted, reviewed, revised, or amended on a regular basis. Business Plans must also be amended within 30 days whenever there are changes in the amount or location of stored hazardous chemicals on a site. The Hazardous Materials Division conducts routine inspections at businesses required to submit Hazardous Materials Business Plans. The purpose of these inspections is to (1) ensure compliance with existing laws and regulations concerning Hazardous Materials Business Plan requirements, (2) identify existing safety hazards that could cause or contribute to an accidental spill or release, and (3) suggest preventative measures designed to minimize the risk of a spill or release of hazardous materials. After initial submission of a Business Plan, the business must review and recertify the Plan on a regular basis.

California Accidental Release Prevention (CalARP) Program

The purpose of the California Accidental Release Prevention (CalARP) program is to prevent accidental releases of substances that can cause serious harm to the public and the environment, to minimize the damage if releases do occur, and to satisfy community right-to-know laws.

This is accomplished by requiring businesses that produce, handle, process, distribute, or store certain chemicals over a threshold quantity to develop a Risk Management Program, prepare a Risk Management Plan, and submit the plan to the local Certified Unified Program Agency (in San Mateo County, the Environmental Health Services Division).

The CalARP program requires that a risk management plan include a hazard assessment program, an accidental release prevention program, and an emergency response plan. The risk management plan must be revised every 5 years or as necessary. The risk management plan

must consider proximity to sensitive populations located in schools, residential areas, general acute care hospitals, long-term health care facilities, and child day care facilities. The risk management plan must also consider external events such as seismic activity. Typical facilities or businesses that are required to prepare risk management plans include ammonia refrigeration facilities, water treatment and wastewater treatment plants that handle chlorine gas, and facilities that store flammable chemicals such as methane and propane.

Occupational Safety (Title 8 – Cal/OSHA)

Cal/OSHA administers federal occupational safety requirements and additional state requirements in accordance with CCR Title 8. Cal/OSHA requires preparation of an Injury and Illness Prevention Program (IIPP), which is an employee safety program of inspections, procedures to correct unsafe conditions, employee training, and occupational safety communication. This program is administered via inspections by the local Cal/OSHA enforcement unit.

Cal/OSHA also regulates lead and asbestos exposure during construction activities under CCR Title 8, Section 1532.1, Lead, and Section 1529, Asbestos. These sections establish the rules and procedures for conducting demolition and construction activities such that worker exposure to lead and asbestos contamination is minimized or avoided. Compliance with Cal/OSHA regulations and associated programs would be required for the Baylands Specific Plan due to the potential hazards posed by on-site construction activities and contamination from former uses.

Emergency Response to Hazardous Materials Incidents

The California Governor's Office of Emergency Services (Cal OES) develops and maintains state-level emergency plans and planning guidance for state and local agencies.

California Emergency Services Act

The California Emergency Services Act was adopted to establish the state's roles and responsibilities during human-made or natural emergencies that result in conditions of disaster and/or extreme peril to life, property, or the resources of the state. The California Emergency Services Act requires development of the State of California Emergency Plan that describes how response to natural or human-caused emergencies occur in California. The State Emergency Plan describes how emergency operations are conducted, how mutual aid is rendered, what emergency services are offered by government agencies, how resources are mobilized, how the public is informed, and how continuity of government is maintained during emergency. The SEP further describes hazards mitigation, as well as preparedness and recovery from disasters.

California Disaster Assistance Act

The California Disaster Assistance Act authorizes the Director of Cal OES to administer a disaster assistance program that provides financial assistance from the state for costs incurred

by local governments as a result of a disaster event. Funding for the repair, restoration, or replacement of public real property damaged or destroyed by a disaster is made available when the Director concurs with a local emergency proclamation requesting state disaster assistance. The program also provides for the reimbursement of local government costs associated with certain emergency activities undertaken in response to a state of emergency proclaimed by the Governor. In addition, the program may provide matching fund assistance for cost sharing required under federal public assistance programs in response to a Presidential Major Disaster or Emergency Declaration.

Remediation Requirements for the Baylands

Remedial Action Plan for Operable Unit-SM (OU-SM)

The California Department of Toxic Substances Control (DTSC) approved a Feasibility Study/Remedial Action Plan (FS/RAP) and accompanying Human Health Risk Assessment (HHRA) for the portion of the Baylands known as Operable Unit-SM (OU-SM) in October 2021.[290] The OU-SM site is approximately 35 acres and occupies the northern portion of the former railyard within the Baylands (see **Figure 4.13-1**).

The FS/RAP establishes remedial action objectives consisting of site-specific, quantitative goals that define the extent of cleanup required to achieve the appropriate level of protectiveness for human health and the environment along with media-specific cleanup levels for:

- **Soil:** arsenic, lead, mercury, carcinogenic PAHs, naphthalene, TPH-d, and Aroclor-1260
    - *Remedial Action Objective:* Prevent exposure to soil with constituents of concern exceeding clean up levels by eliminating the exposure pathway for future receptors, which include incidental ingestion, inhalation of windblown dust particles, and dermal contact.
- **Soil vapor:** Chlorinated Volatile Organic Compounds (CVOCs) (1,1-dichloroethene; cis-1,2-dichloroethene; trans-1,2-dichloroethene; tetrachloroethene; trichloroethene; and vinyl chloride)
    - *Remedial Action Objective:* Prevent exposure to CVOCs in soil vapor at concentrations that exceed the cleanup levels for soil vapor by either demonstrating through a site-specific risk assessment that no significant risk is present, or by blocking or minimizing the vapor intrusion pathway from CVOCs in soil vapor that originate from the Schlage OU groundwater plume.

[290] The approved Feasibility Study/Remedial Action Plan and DTSC approval letter can be found at https://www.envirostor.dtsc.ca.gov/public/final_documents2?global_id=41490037&doc_id=60410165.

- **Groundwater:** CVOCs (1,1-dichloroethene; cis-1,2-dichloroethene; trans-1,2-dichloroethene; tetrachloroethene; trichloroethene; and vinyl chloride)
    - *Remedial Action Objective:* Prevent exposure to CVOCs in groundwater associated with the Schlage OU CVOC plume by eliminating inhalation risks through the vapor intrusion pathway where significant risk exists, preventing ingestion and dermal contact through the use of groundwater for potable and agricultural purposes, and minimizing dermal exposure of CVOCs and metals in groundwater to construction workers. Treatment of CVOCs in groundwater that migrated beneath the site from the Schlage OU will continue, as directed in the Schlage OU RAP, until the cleanup levels established for the Schlage OU cleanup have been met.

Required remedial actions included in the FS/RAP include:

- **Placement of a Soil Cap to Cover and Prevent Exposure to Existing Soils Containing Constituents of Concern.** Prior to constructing the clean soil cap, a demarcation layer consisting of a bright-colored geotextile fabric will be placed atop the existing soil to indicate the contact between the clean soil cap and the underlying material.

  All earthwork is required to be conducted in accordance with a dust control plan to be approved by DTSC that will define methods to be used for dust monitoring and procedures for minimizing dust emission. All earthwork will also be required to be conducted in accordance with a stormwater pollution prevention plan (SWPPP) to minimize impacts to the local stormwater conveyance system and receiving waters. The SWPPP will identify best management practices for controlling stormwater and preventing sediment transport in run-off during construction.

  In areas where impacted soil cannot be capped in-place with hardscape or a minimum of 5 feet of clean fill, such as along Bayshore Boulevard, the impacted soil will be excavated and either relocated on-site beneath a cap (e.g., roadways, building foundations, concrete areas, asphalt parking lots, or 5 feet of clean soil) or transported off-site to an appropriate disposal facility. All soil excavation, stockpiling, relocation, and/or off-site hauling will be conducted in accordance with the Dust Control Plan and SWPPP to be approved by DTSC.
- **Soil Vapor Mitigation.** Soil vapor sampling will be conducted at proposed building locations to assess, at a screening level, the potential need for vapor mitigation systems in buildings planned for construction. In order for this sampling data to be useful, it cannot be conducted until after the site has been capped and re-graded to the new development elevation, and after soil vapor concentrations have reached steady state at the target sample depth(s). The soil vapor sampling plan will be prepared in accordance with applicable DTSC guidance documents on evaluating vapor intrusion and will be submitted to DTSC for approval in advance of performing field work.

- **Land Use Restrictions.** One or more land use covenants will be recorded on the title to the properties within OU-SM with restrictions to limit human exposure to contaminants. The Land Use Covenant(s) will include the following restrictions:
    - No occupied buildings, including sensitive uses, where CVOC concentrations in soil vapor exceed cleanup levels without DTSC approval based on either (1) a risk assessment demonstrating site conditions pose no significant risk to human health, or (2) engineering controls, such as building design or gas intrusion mitigation systems, that will reduce the risk to an acceptable level;
    - No growing produce or vegetables for human consumption in native soil. Plants for human consumption may be grown if they are planted in raised beds (above the approved cover) containing non-native soil. Trees producing edible fruit (including trees producing edible nuts) may also be planted provided they are grown in containers with a bottom that prevents the roots from penetrating the native soil;
    - No extraction or use of underlying groundwater is allowed without a Groundwater Management Plan pre-approved by DTSC;
    - No drilling for any water, oil, or gas, or extraction or removal of groundwater may occur without a DTSC-approved Groundwater Management Plan and prior written approval by DTSC;
    - No interference with, or modification of, a vapor mitigation system shall be permitted without prior written approval by DTSC, and future tenants must provide reasonable access for O&M of vapor mitigation systems;
    - All excavation into the cap shall comply with the DTSC-approved Soil Management Plan;
    - Contaminated soils brought to the surface by grading, excavation, trenching, or backfilling shall be managed in accordance with all applicable provisions of state and federal law and a DTSC-approved Soil Management Plan; and
    - All uses and development of the site shall preserve the integrity and effectiveness of the cap.
- **Operations and Maintenance (O&M).** Site inspections are to be conducted on an annual basis to evaluate the effectiveness of the cap and ensure compliance with the Land Use Covenant(s). The O&M program will be detailed in an O&M Plan to be approved by DTSC and will generally consist of annual inspections to verify that the soil cap is not eroding, that engineered cap materials are in good condition, that unauthorized wells providing access to restricted groundwater or unauthorized excavations into impacted soil have not been constructed, and that vapor intrusion mitigation systems are operating as designed.

Remedial Design and Implementation Plan

Prior to physical site remediation, preparation of one or more Remedial Design and Implementation Plans (RDIP) for DTSC review and approval is required. The RDIP(s) will contain a detailed description of the remedial work to be performed as well as the plan for implementation. The RDIP(s) will include design drawings, a health and safety plan, procedures for minimizing fugitive dust emission, the program for monitoring air and dust during remedial construction, procedures for managing stormwater during remedial construction, an adaptive management strategy for sea level rise that provides technical justification for year 2100 protective strategies, a traffic plan for the import and off-haul of soil, and a plan for restricting OU-2 site access to authorized personnel only.

Remedial Action Plan for Operable Unit-2 (OU-2)

The San Francisco Bay RWQCB approved a Feasibility Study/Remedial Action Plan (FS/RAP) and accompanying Human Health Risk Assessment (HHRA) for the portion of the Baylands known as Operable Unit-2 (OU-2) in December 2021.[291] The OU-2 site is approximately 130 acres and occupies the southern portion of the former railyard within the Baylands (see **Figure 4.13-1**).

The FS/RAP establishes remedial action objectives for OU-2 that consist of site-specific, quantitative goals defining the extent of cleanup required to achieve the appropriate level of protectiveness for human health and the environment along with media-specific cleanup levels for:

- **Soil:** arsenic, lead, TPH-d in Zones 1, 2, 3, 5, and 6; lead and TPH-d in Zone 4; and PCE, TCE, cis-1.2-DCE, and vinyl chloride in soil in CVOC area.
    - *Remedial Action Objective:* Prevent exposure to soil with COPCs at concentrations exceeding cleanup levels by eliminating the exposure pathway for future receptors, which include incidental ingestion, inhalation of windblown dust particles, and dermal contact.
- **Soil vapor (based on groundwater evaluation):** benzene and vinyl chloride sitewide, and PCE, TCE, cis-1.2-DCE, and vinyl chloride in CVOC area, CVOCs (1,1-dichloroethene; cis-1,2-dichloroethene; trans-1,2-dichloroethene; tetrachloroethene; trichloroethene; and vinyl chloride)
    - *Remedial Action Objective:* Prevent exposure to volatile organic compounds (VOCs) in soil vapor at concentrations that exceed the cleanup levels for soil vapor by blocking or minimizing the vapor intrusion pathway.

[291] The approved Feasibility Study/Remedial Action Plan can be found at https://www.baylandsou2.com/.

- **Groundwater (vapor intrusion pathway only):** benzene and vinyl chloride sitewide, and PCE, TCE, cis-1.2-DCE, and vinyl chloride in CVOC area groundwater.
    - *Remedial Action Objective:* Prevent exposure to VOCs in groundwater by eliminating inhalation risks through the vapor intrusion pathway and preventing ingestion and dermal contact through the use of groundwater for potable and agricultural purposes.

Fire Safety Requirements

State Fire Regulations

State fire regulations set forth in Section 13000 et seq. of the California Health and Safety Code include regulations concerning building standards (as also set forth in the California Building Code), fire protection and notification systems, fire protection devices such as extinguishers and smoke alarms, high-rise building and childcare facility standards, and fire suppression training. The state fire marshal enforces these regulations and building standards in all state-owned buildings, state-occupied buildings, and state institutions throughout California.

California Fire Code (Chapter 33, Fire Safety during Construction and Demolition)

California Fire Code Chapter 33 related to fire safety during construction and demolition prescribes safeguards to provide reasonable safety to life and property from fire during such operations. Specific safeguards relate to oil-fired heaters, gas heaters, refueling, smoking, waste disposal, welding, electrical, flammable, and combustible odors; water supply for fire protection; and fire extinguishers. Implementation of these safeguards is designed to reduce the potential for fire-related hazards during construction and demolition activities.

School Site Safety Requirements

California Code of Regulations (CCR) Title 5, Section 14010 sets forth California Department of Education safety criteria[292] for school site locations, including:

c. The property line of the site even if it is a joint use agreement as described in subsection (o) of this section shall be at least the following distance from the edge of respective power line easements:
    1. 100 feet for 50–133 kV line.
    2. 150 feet for 220–230 kV line.
    3. 350 feet for 500–550 kV line.

[292] The full listing of the Department of Education's school location, design, and safety criteria can be found in Draft EIR Section 4.17.2.

d. If the proposed site is within 1,500 feet of a railroad track easement, a safety study shall be done by a competent professional trained in assessing cargo manifests; frequency, speed, and schedule of railroad traffic; grade; curves; type and condition of track need for sound or safety barriers; need for pedestrian and vehicle safeguards at railroad crossings; presence of high-pressure gas lines near the tracks that could rupture in the event of a derailment; and preparation of an evacuation plan. In addition to the analysis, possible and reasonable mitigation measures must be identified.

e. The site shall not be adjacent to a road or freeway that any site-related traffic and sound level studies have determined will have safety problems or sound levels which adversely affect the educational program.

f. Pursuant to Education Code sections 17212 and 17212.5, the site shall not contain an active earthquake fault or fault trace.

g. Pursuant to Education Code sections 17212 and 17212.5, the site is not within an area of flood or dam inundation unless the cost of mitigating the flood or inundation impact is reasonable.

h. The site shall not be located near an above-ground water or fuel storage tank or within 1500 feet of the easement of an above-ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission.

i. The site is not subject to moderate to high liquefaction or landslides.

k. The site shall be easily accessible from arterial roads and shall allow minimum peripheral visibility from the planned driveways in accordance with the Sight Distance Standards established in the "Highway Design Manual," Table 201.1, published by the Department of Transportation, July 1, 1990, edition, and incorporated into this section by reference, in toto.

l. The site shall not be on major arterial streets with a heavy traffic pattern as determined by site-related traffic studies including those that require student crossings unless mitigation of traffic hazards and a plan for the safe arrival and departure of students appropriate to the grade level has been provided by city, county or other public agency in accordance with the "School Area Pedestrian Safety" manual published by the California Department of Transportation, 1987 edition, incorporated into this section by reference, in toto.

m. Existing or proposed zoning of the surrounding properties shall be compatible with schools in that it would not pose a potential health or safety risk to students or staff in accordance with Education Code Section 17123 and Government Code Section 65402 and available studies of traffic surrounding the site.

u. If the proposed site is on or within 2,000 feet of a significant disposal of hazardous waste, the school district shall contact the Department of Toxic Substance Control for a determination of whether the property should be considered a Hazardous Waste Property or Border Zone Property.

v. At the request of the governing board of a school district, the State Superintendent of Public Instruction may grant exemptions to any of the standards in this section if the district can demonstrate that mitigation of specific circumstances overrides a standard without compromising a safe and supportive school environment.

c. Regional Plans Programs, and Regulations

San Mateo County Hazardous Materials Business Plan Program

Businesses must complete a Hazardous Materials Business Plan for the safe storage and use of chemicals. Firefighters, health officials, planners, public safety officers, health care providers, and others rely on the Business Plan in an emergency. The intent of the Business Plan is to prevent or lessen damage to the health and safety of people and the environment when a hazardous material is released.

The Business Plan must include:

- Owner/operator information, including emergency contacts;
- The type and quantity of reportable hazardous materials;
- A site map;
- Spill prevention procedures;
- Emergency response procedures;
- An employee training program; and
- Record-keeping procedures.

In general, a business must submit a Business Plan to the County if it handles and/or stores a hazardous material equal to or greater than the minimum reportable quantities. These quantities are 55 gallons for liquids, 500 pounds for solids, and 200 cubic feet (at standard temperature and pressure) for compressed gases. Radioactive materials and extremely hazardous substances are reportable in any amount.

Bay Area Air Quality Management District Asbestos Regulations

Because asbestos has been proven to cause serious and fatal diseases, it is strictly regulated in its use as a building material and where it occurs naturally.

Asbestos Demolition and Renovation Program

The Bay Area Air Quality Management District (BAAQMD) regulates the demolition and renovation of buildings and structures that may contain asbestos, and the manufacture of materials known to contain asbestos. The BAAQMD must be notified at least 10 business days before any demolition project or any renovation involving the removal of 100 square feet or more, 100 linear feet or more, or 35 cubic feet or more of asbestos.

Naturally Occurring Asbestos Program

To reduce public exposure to naturally occurring asbestos, the BAAQMD regulates all construction and mining activities that produce dust potentially containing naturally occurring asbestos. The Airborne Toxic Control Measure places requirements on the following activities in areas where naturally occurring asbestos is likely to be found:

- Road construction and maintenance;
- Construction and grading; and
- Quarrying and surface mining.

Comprehensive Airport Land Use Compatibility Plan for the Environs of San Francisco International Airport

Airport Land Use Commissions are required by state law in counties where there is an airport operated for the benefit of the general public. The purpose of such commissions is to protect public health, safety, and welfare by ensuring the orderly development of airports and the adoption of land use measures that minimize the public's exposure to excessive noise and safety hazards to the extent that areas around public airports are not already devoted to incompatible uses. The City/County Association of Governments of San Mateo County (C/CAG) Board of Directors, which is the designated Airport Land Use Commission for San Mateo County, adopted a Comprehensive Airport Land Use Compatibility Plan for the Environs of San Francisco International Airport in November 2012.

As indicated in the Airport Land Use Compatibility Plan, the Baylands Specific Plan area is located more than 2 miles from the nearest public airport (San Francisco International Airport [SFO]) or airstrip and is not located within the SFO Airport Safety Compatibility Zone, FAA Notification Area, Airport Imaginary Surface area per 14 CFR Part 77, or the 65 decibel (dB) noise contour. The Airport Land Use Compatibility Plan does not identify any land use restrictions within the Baylands due to its location in relation to SFO.

The Specific Plan area is, however, identified in the Airport Land Use Compatibility Plan as being within that airport's Airport Influence Area A – Real Estate Disclosure Area. Anyone

offering real property for lease or sale is thus required to provide the following disclosure statement.

> ***NOTICE OF AIRPORT IN VICINITY***
>
> *This property is presently located in the vicinity of an airport, within what is known as an airport influence area. For that reason, the property may be subject to some of the annoyances or inconveniences associated with proximity to airport operations (for example: noise, vibration, or odors). Individual sensitivities to those annoyances can vary from person to person. You may wish to consider what airport annoyances, if any, are associated with the property before you complete your purchase and determine whether they are acceptable to you.*

San Francisco Bay Area Regional Emergency Coordination Plan

The Bay Area Regional Emergency Coordination Plan was prepared by the California Office of Emergency Services, the nine Bay Area counties (as well as Santa Cruz County), and the cities of Oakland and San Jose to provide a framework for collaboration and coordination during regional emergencies. The Regional Emergency Coordination Plan defines procedures for regional coordination, collaboration, decision making, and resource sharing among emergency response agencies in the Bay Area. The Regional Emergency Coordination Plan also provides critical linkages to ensure that existing Bay Area emergency response systems work together effectively during the response to an event.

d. City of Brisbane Plans, Ordinances, and Regulations

Brisbane General Plan

General Plan policies and programs relevant to hazards and hazardous materials issues raised by the Baylands development are identified below.

Chapter X: Community Health and Safety Element

This General Plan chapter contains the following relevant policies and programs:

> **Policy 166:** Protect the community's health, safety, welfare, natural resources and property through regulation of the handling and storage of hazardous materials, with specific focus on prevention of accidents.
>
> *Program 1661a:* In connection with any application for a proposed specific plan or land use development project involving biotechnical research activities, determine the nature and extent of any regulations that should be adopted to protect the public health and safety before any such specific plan or land use development application is approved.

Policy 168: Encourage the County of San Mateo to establish a safe collection station for hazardous wastes from households and small businesses that is convenient and accessible to Brisbane citizens, as addressed in the Household Hazardous Waste Element of the Integrated Waste Management Plan.

Policy 172: Establish that it is of the highest priority that contaminated lands in Brisbane be remediated.

Program 172c: Require private property owners to remediate contaminated lands consistent with state and federal requirements.

Program 172d: Continue to maintain good communications and working relationships with the CalEPA DTSC, the RWQCB and other agencies regulating remedial actions.

Policy 173: The City shall not grant approval of a development project on a contaminated site unless a plan for remediation of the site has first been approved and adopted by all Federal, State and local agencies having jurisdiction over the remediation plan.

Policy 174: Include the remediation requirements of Federal, State and local agencies in the process of making determinations on land use designations and development applications.

Program 174a: Take into account risk assessments and other technical studies prepared by governmental agencies when making land use determinations for contaminated lands.

Program 174b: Condition all final approval of development projects on full compliance with all orders, remediation programs and mitigation measures imposed by regulatory agencies.

Program 174c: Require applicants to provide for analysis by environmental engineers, toxicologists or other technical specialists deemed necessary by the City to process development applications and complete environmental review for projects on contaminated lands.

Policy 175: Assure that any development otherwise permitted on lands filled with municipal waste is safe by implementing the following programs.

Program 175b: Require evidence that scientific testing and verification has taken place to the satisfaction of regulatory agencies.

Program 175c: Encourage property owners of filled lands to complete all testing and related requirements of the federal, state and local agencies well in advance of requesting land use permits from the City.

Chapter XII: Policies and Programs by Subarea

This General Plan chapter contains the following relevant policies:

Policy BL.1: Development within the Baylands Subarea shall be subject to the City's approval of a single specific plan for the entirety of the Baylands Subarea and a development agreement that is consistent with General Plan policies, incorporates all applicable EIR mitigation measures, and is consistent with the following standards:

A. The single specific plan and development agreement subject to City review and approval referenced above shall include:

- Detailed plans for Title 27 compliant closure of the landfill and Remedial Action Plans for OU-1 and OU-2 that have been approved by all appropriate regulatory agencies, which include, but shall not be limited to, CalRecycle, the San Mateo County Environmental Health Department, the California Department of Toxic Substances Control, the California Regional Water Quality Control Board;
- A specific schedule establishing the time frames by which (i) the landfill must be closed in full compliance with Title 27 and (ii) the remediation of OU-1 and OU-2 must be completed; and
- Specific means by which the City may enforce the applicant's adherence to the schedule for closure and remediation and specific consequences, e.g., monetary penalties, suspension of building permits, etc., that the City may impose on the applicant for failing to adhere to the schedule.

C. All residential development shall be designed and remediated to accommodate ground level residential uses and ground level residential-supportive uses such as daycare, parks, schools, playgrounds, and medical facilities.

F. Sufficient assurances for the satisfactory ongoing performance of site remediation and site development (e.g., site monitoring, performance bonds, environmental insurance) shall be provided as determined by the City.

K. Prior to the issuance of a grading permit to export soil or move soil from the existing landfill area for incorporation in a remediation or grading plan, the soil shall be tested in a manner approved by the City.

Policy BL.6: Establish a safety buffer around and provide for visual screening of the Tank Farm.

Policy BL.29: Disclose, in a risk analysis, all hazardous materials to be utilized in research and development and biotechnical research, the assumptions that were used, and methods of safe handling and disposal. The City has a concern with and may exclude research and

development and biotechnical research uses which involve high use or generation of hazardous materials and/or do not address public safety in handling and disposal to the City's satisfaction.

Municipal Code Section 13.06.142, Clean-Up of Spilled or Accidentally Discharged Wastes

Brisbane Municipal Section 13.06.142 requires any person "delivering, hauling, disposing, storing, discharging or otherwise handling hazardous materials or potentially polluting substances, solid or liquid, such as, but not limited to the following: fuel oil, gasoline, solvents, industrial liquids or fluids, milk, grease trap and catch-basin wastes, oil or petroleum wastes, shall immediately clean up any such spilled materials or substances to prevent such materials or substances becoming a hazard to health or safety or, directly or indirectly, permitting such materials or substances to enter the city's storm sewer system."

Emergency Operations Plan

The Brisbane Emergency Operations Plan (EOP) outlines the authorities, organizational structures, and procedures that the City will use to coordinate planning, response, recovery, and prevention activities related to local emergencies and disasters. Because Brisbane and the surrounding region are susceptible to a number of hazards such as natural disasters and human-caused events, as well as technological failures and public health threats, the City's EOP uses an "all-hazards" approach to prepare for, respond to, recover from, and mitigate (to the extent possible) all potential hazards and critical incidents.

The primary purpose of the EOP is to:

1) Provide the framework, concepts, and policies that will ensure the effective management and coordination of the City's response to major emergencies and disasters.
2) Identify roles and responsibilities for City departments as they pertain to preparedness, response, recovery, and mitigation activities.
3) Codify the City's understanding and adoption of state and federal policies and guidance through which operational coordination, mutual aid, and other requests for support will be integrated.
4) Serve as a foundational document for supporting City plans, as well as support emergency plans of other governments, CBOs, and others (e.g., private businesses, etc.).
5) Comply with state and federal laws and regulations such as the California Emergency Services Act.[293]

[293] California Emergency Services Act (Chapter 7 of Division 1 of Title 2 of the Government Code).

The EOP serves as the foundational document for the City's emergency management activities. While all City resources may be called upon as needed, specific departmental responsibilities are outlined in the EOP. To ensure the City is adequately prepared, all City departments are required to actively participate in preparedness and planning activities including preparation and review of departmental plans, policies, procedures, resource information, and contact information as necessary to fulfill their assigned roles and obligations.

The EOP is based on the Federal Emergency Management Agency's (FEMA's) "Whole Community" approach to emergency management and therefore recognizes the roles of special districts, non-government organizations, faith-based organizations, private-sector businesses, educational organizations, and other stakeholders in addition to City resources. Additionally, the EOP is intended to reflect the wide variety of support that may be required by residents, visitors, and businesses, including people with disabilities and others with access or functional needs.

The EOP addresses the four phases of emergency management:

- Preparedness for an emergency (activities undertaken prior to an emergency in order to improve the City's ability to coordinate, respond, and recover from a critical incident);
- Response to an emergency (actions taken immediately before, during, or directly after a critical incident in order to minimize the potential or existing impacts of the incident);
- Recovery from an emergency (damage assessment, short-term and long-term recovery activities, and administration of recovery assistance programs); or
- Mitigation of the potential for emergencies (actions and measures taken to reduce or eliminate the degree of long-term risk from natural and technological hazards).

The EOP is organized as follows:

- Part I: Basic Plan (also referred to as the "EOP") presents the planning assumptions, policies, and concept of operations that guide the responsibilities for emergency preparedness, response, recovery, and mitigation for the City of Brisbane.
- Part II: Hazard Annexes: There are a number of City plans, procedures and other documents that support or relate to this Basic Plan. These plans provide additional detail and guidance for specific hazards, functions, or operations.
    - Earthquake
    - Storm/Flood
    - Wildfire

- Supporting Plans
    - Emergency Operations Center Manual (includes Emergency Operations Center Position Checklists)
    - San Mateo Countywide Local Hazard Mitigation Plan

4.13.4 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of hazards and hazardous materials impacts:

Threshold HAZ-1: The Baylands Specific Plan would cause a significant impact if it would create a substantial hazard to the public or the environment due to the release of hazardous materials into the environment as the result of:

- **Inherent risks involved in the routine transport, use, disposal, or management of hazardous or potentially hazardous materials by Baylands-related construction activities or by uses permitted by the Specific Plan;**
- **Failure to comply with approved regulatory requirements for (1) remediation of Operable Unit OU-SM or Operable Unit OU-2; or (2) the Title 27 landfill closure plan for the former Brisbane Landfill; or**
- **Reasonably foreseeable upset or accident conditions.**

Threshold HAZ-2: The Baylands Specific Plan would cause a significant impact if it would create a public health hazard due to location of a school:

- **Within one-quarter mile of hazardous emissions or handling of hazardous or acutely hazardous materials, substances, or waste;**
- **Closer to powerline easements than:**
    - **100 feet of a 50-133 kV line;**
    - **150 feet of a 220-230 kV line; or**
    - **350 feet of a 500-550 kV line;** [294]
- **Within 1,500 feet of a railroad track easement;**[9]
- **Located adjacent to a roadway or freeway where traffic or noise studies have identified safety problems**[9]**;**

[294] CCR Title 5, Section 14010

- **Having an earth fault or fault trace within the site[9];**
- **Located on a site subject to flood or dam inundation hazards[9];**
- **Nearby an above-ground water or fuel storage tank, or within 1,500 feet of an easement for an underground pipeline that could cause a safety hazard[9];**
- **Within 2,000 feet of a significant hazardous waste disposal site[9];**
- **For which existing or proposed zoning of surrounding properties inconsistent with the school's location[9];**
- **That would require students to cross one or more heavily traveled roadways without implementation of a safe routes to school plan; or**
- **That would expose students to:**
  - **Health risk greater than 10 in 1,000,000;**
  - **An Acute Hazard or Chronic Hazard Index greater than 1.0; or**
  - **An Annual Average $PM_{2.5}$ Concentration greater than 0.3 μg/m³.[295]**

Threshold HAZ-3: **The Baylands Specific Plan would cause a significant impact if it would create a substantial hazard to the public or the environment as the result of locating site-specific development or Baylands-related off-site infrastructure on a site that is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5.**

Threshold HAZ-4: **The Baylands Specific Plan would cause a significant impact if it would permit development inconsistent with the adopted *Comprehensive Airport Land Use Compatibility Plan for the Environs of San Francisco International Airport* and thereby result in a safety hazard or excessive noise for people residing or working in the Specific Plan area due to aircraft operations.**

Threshold HAZ-5: **The Baylands Specific Plan would cause a significant impact if it would impair:**

- **Preparedness for an emergency (activities undertaken prior to an emergency in order to improve the City's ability to coordinate, respond, and recover from a critical incident);**

[295] These health risk exposures are analyzed in Section 4.9, *Air Quality*.

- **Response to an emergency (actions taken immediately before, during, or directly after a critical incident in order to minimize the loss of life, injury, and property damage from the incident);**
- **Recovery from an emergency (damage assessment, short-term and long-term recovery activities, and administration of recovery assistance programs); or**
- **Mitigation of the potential for emergencies (actions and measures taken to reduce or eliminate the degree of long-term risk from natural and technological hazards).**

4.13.5 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact HAZ-1: Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Methodology for Determining Significance

The assessment of risks involved in the routine transport, use, disposal, and management of hazardous materials associated with Baylands development focuses on hazards that would be encountered during construction and operation of Specific Plan-related structures and land uses.

Routine Transport, Use, Storage, or Disposal of Hazardous Materials

Impact HAZ-1 addresses day-to-day (routine) transport, use, storage, and disposal of hazardous or potentially hazardous materials that would occur as the result of construction (including demolition of existing structures) and operation of Specific Plan-related residential, commercial, and other uses, as well as infrastructure. While Chapter 3, *Project Description*, identifies the types of land uses proposed within the Baylands, the individual businesses and specific activities that will ultimately locate and operate within the Baylands cannot be known at this time. The extent to which individual Baylands activities and future uses would use hazardous materials, nor can the specific hazardous materials, amounts, and locations that would be used and stored, or how specifically they would be used, also cannot be known at this time.

Because the precise amounts and types of hazardous materials transport, storage, use, and disposal by future Baylands uses cannot be precisely known, qualitative analysis is undertaken based on the following reasonable assumptions:

- All Baylands demolition, grading, and construction activities, as well as future uses would involve the routine transportation, storage, use, and disposal of hazardous materials to some degree with the potential for release of hazardous materials into the environment.

- General commercial, retail, hotel, and household hazardous materials are typically handled and transported in small quantities, although some uses such as a hardware store would store materials such as paints and solvents in larger quantities. In addition, the health effects associated with materials common to office and retail uses are generally not as serious as industrial or laboratory uses.
- Laboratory and medical-related establishments such as biotechnical firms, medical laboratories, doctor/dentist offices, or pharmacies would receive, store, and use medical- or laboratory-type chemicals, compressed gases, pharmaceuticals, and radiological materials. Medical, biohazardous, and low-level radioactive wastes would also be produced from these activities.
- Baylands development would comply with federal, state, and local regulations that are designed to ensure the safety of routine transport, use, storage, and disposal of hazardous materials.

Regulatory Requirements for (1) Remediation of Operable Unit OU-SM or Operable Unit OU-2; or (2) the Title 27 Landfill Closure Plan

Analysis of Impact HAZ-1 also recognizes that development would be required to comply with the approved regulatory requirements for site remediation and final landfill closure within the Baylands during demolition, site grading, and construction activities, as well as during post-construction operation of Baylands land uses and infrastructure. Regulatory approvals for site remediation of Operable Units OU-SM and OU-2, as well as Title 27 final landfill closure include measures determined to be necessary for the protection of future use of the Baylands based on existing hazards, applicable standards for environmental and public health, and requirements for site remediation and landfill closure. Baylands development was therefore analyzed in relation to site remediation and landfill closure plan requirements for future development and land uses within the Baylands. Compliance by future development with those requirements would be indicative of a less-than-significant impact.

Upset or Accident Conditions

While federal, state, and local regulations designed to ensure the safety of routine transport, use, storage, and disposal of hazardous materials minimize the potential for risk of upset, the analysis of Impact HAZ-1 recognizes that the risk of upset exists and that accidents can and do happen.

In determining the level of significance related to reasonably foreseeable upset or accident conditions, the analysis recognizes that demolition, site grading, and construction activities as well as future Baylands uses would be required to comply with relevant federal, state, and local laws and regulations that are designed to minimize the potential for upset or accident conditions, and to protect public health and safety from release of hazardous materials.

Impact Assessment

Routine Transport, Use, Disposal, and Management of Hazardous Materials during Demolition and Construction Activities

Construction activities would include demolition and removal of existing buildings within the Specific Plan area and use of hazardous materials during site grading and construction of new buildings, structures, infrastructure, and other features of Baylands development. The potential for exposure of the public or the environment to hazardous materials due to the routine transport, use, management, storage, and disposal of hazardous materials during these construction activities is addressed below.

Exposure to Hazardous Materials in Existing Buildings during Demolition

Baylands development would include demolition of approximately 272,400 square feet of existing on-site industrial buildings of varying ages, including structures built prior to 1978 that could contain hazardous building materials. Exposure to hazardous building materials, including asbestos-containing materials, lead-based paint, polychlorinated biphenyls (PCBs), mercury, and other hazardous materials, would occur during demolition and disposal activities, potentially resulting in adverse health effects. Once structures containing such materials have been removed, there would be no further exposure to these materials during operation of Baylands development. Hazardous materials generated from demolition of existing on-site industrial buildings would also require disposal in one of the three Class I landfills in California.[296]

Existing federal, state, and local regulations require structures subject to demolition or renovation that may disturb or require the removal of materials that consist of, contain, or are coated with asbestos-containing materials, lead-based paint, PCBs, mercury, or other hazardous materials to be inspected and/or tested for the presence of such materials. Further, all hazardous materials must be managed, hauled, and disposed of in accordance with applicable laws and regulations designed to protect the public and the environment from exposure to hazardous materials.

The identification, removal, hauling, and disposal of asbestos-containing materials is regulated by 8 CCR sections 1529 and 5208. The identification, removal, and disposal of lead-based paint is regulated by CFR Title 29, Section 1926.62 and 8 CCR section 1532.1. For both asbestos-containing materials and lead-based paint, all work must be conducted by a state-certified professional. If asbestos-containing materials and/or lead-based paint are determined to exist on-site, a site-specific hazard control plan must be prepared and submitted to the appropriate

[296] https://www.waterboards.ca.gov/water_issues/programs/land_disposal/walist.html identifies the only Class I landfills in California as Clean Harbors-Buttonwillow (Kern County), Chem Waste Management-Kettleman (Kings County), and Safety Kleen (Laidlaw) (Imperial County).

agency detailing removal methods and specific instructions for providing protective clothing and equipment for abatement personnel (BAAQMD for asbestos and Cal/OSHA for lead). If necessary, a state-certified lead-based paint and/or an asbestos removal contractor would be required to be retained to conduct the appropriate abatement measures. Waste from abatement and demolition activities would be disposed of at a landfill(s) licensed to accept such waste. Once all abatement measures have been implemented, the contractor would conduct a clearance examination and provide written documentation to the City that testing and abatement have been completed in accordance with all federal, state, and local laws and regulations.

The identification, removal, and disposal of PCBs is regulated under the Toxic Substances Control Act (Title 40, Chapter 1, Subchapter R, Part 761) and State of California regulations (22 CCR 66263.44). Electrical transformers and older fluorescent light ballasts that have not previously been tested and verified to be free of PCBs must be tested. If PCBs are detected above action levels, the materials must be disposed of at a licensed facility permitted to accept the materials. Upon completion of abatement measures, if applicable, the contractor would be required to provide written documentation to the City that testing and abatement have been completed in accordance with all federal, state, and local laws and regulations.

In the case of mercury in fluorescent light tubes and switches, identification, removal, and disposal are regulated under 22 CCR sections 67426.1–67428.1 and 66261.50. Under these regulations, the light tubes must be removed without breakage and disposed of at a licensed facility permitted to accept the materials. Upon completion of abatement measures, if applicable, the contractor is required to provide written documentation that testing and abatement have been completed in accordance with all federal, state, and local laws and regulations.

Existing abatement laws and regulations, combined with enforcement mechanisms by agencies including the BAAQMD and Cal/OSHA, require compliance with applicable federal, state, and local laws and regulations that would prevent the exposure of individuals and the environment to hazards during demolition of structures built before newer regulatory requirements were enacted (1978 for lead-based paint and PCBs, 1981 for asbestos-containing materials, and 2004 for mercury in fluorescent lighting).

Exposure to Hazardous Materials during Site Grading and Construction

Baylands grading and on- and off-site construction activities would also require the use of hazardous materials such as fuels, oils, and lubricants for construction equipment and electrical cable pulling; paints and thinners; and solvents and cleaners. These hazardous materials are typically packaged in consumer quantities, used, and stored in accordance with manufacturer recommendations, and would be transported to and from the Baylands. When not in use, hazardous materials needed for construction would be stored in designated construction staging areas in compliance with federal, state, and local requirements. The volume of stored materials in any one place would be small (i.e., generally less than 25 gallons) and would be the

minimum necessary to carry out construction activities. Maintenance, fueling, and servicing of construction vehicles would occur off-site, such as at a pre-existing gas station or service center.

Hazardous materials needed for construction would be stored and used in accordance with the product specifications and applicable regulations that are described in detail on Material Safety Data Sheets (MSDS) that accompany every batch of materials considered hazardous. Information in the MSDS includes instructions on proper use and application of the material, accidental release measures, and handling and storage requirements. Applicable regulations specify storage and handling requirements, such as proper container types and usage methods.

Transportation of hazardous materials is regulated by the United States Department of Transportation (USDOT) and the California Department of Transportation (Caltrans). Together, federal and state agencies determine driver-training requirements, load labeling procedures, and container specifications designed to minimize the exposure of hazardous materials. In addition, businesses that use hazardous materials, including construction companies, are required to prepare and implement Hazardous Materials Business Plans describing procedures for the handling, transportation, generation, and disposal of hazardous materials. As the Certified Uniform Program Agency (CUPA), the San Mateo County Environmental Health Services Division[297] would be responsible for ensuring compliance with these regulations including, but not limited to, the Hazardous Waste Control Act, the Hazardous Waste Generator Program, the Hazardous Materials Release Response Plans and Inventory Program, the California Accidental Release Prevention Program, and the Above-Ground Storage Tank Program.

Lead within the Former Police Shooting Range on Icehouse Hill

The United States Environmental Protection Agency (USEPA) reports that lead can be introduced into the environment at shooting ranges in one or more of the following three pathways, each of which is site-specific and may or may not occur at any given range:

- Lead oxidizes when exposed to air and dissolves when exposed to acidic water or soil.
- Lead bullets, bullet particles, or dissolved lead can be moved by stormwater runoff.
- Dissolved lead can migrate through soils to groundwater.

Birds are also in danger of lead poisoning from soil contaminated with spent lead shot. Large waterfowl and birds of prey routinely swallow beakfuls of dirt or grit. Lead pellets that are swallowed can build up and lead to lead poisoning.

Since site-specific clean-up of the former police shooting range on the southerly slope of Icehouse Hill has not been undertaken, nor is it explicitly planned by the landowner, lead and

[297] The San Mateo County Environmental Health Services Division was designated by the State Secretary for Environmental Protection as the Certified Unified Program Agency (CUPA) for San Mateo County in 1996.

other contaminants[298] could be encountered on ground surfaces as well as within soils during construction of trails and the relocation of the Mission Blue Nursery to Icehouse Hill, exposing the public to health hazards.

While there are no specific requirements for remediation of shooting ranges, the USEPA has developed guidelines for the reclamation of firing ranges:

1. Sift munitions fragments from the soil and recycle them.
2. Analyze samples of the remaining soil to determine how much contamination has leached away. If leachable levels of lead are below the approved EPA limit, no further action is needed. Proper testing methods must be used.
3. Analyze the soil in layers to assess the extent of downward contamination.
4. Treat or dispose of contaminated soil in a hazardous waste landfill or use on-site stabilization, solidification, and soil washing techniques to the extent permitted by state and local regulation.

Routine Transport, Use, Disposal, or Management of Hazardous Materials by Baylands Land Uses and Infrastructure Operations

Baylands development is proposed as a mixed-use community with residential, commercial/ retail, habitat restoration and recreational uses, public facilities, and infrastructure, all of which would involve the presence of hazardous materials (or products containing hazardous materials) at varying levels. Baylands commercial, retail, and hotel activities would use hazardous chemicals that are common in commercial, retail, and hotel settings, including familiar materials such as toners; paints; lubricants; kitchen and restroom cleaners; refrigerants associated with building mechanical and heating, ventilation, and air conditioning (HVAC) systems; and other maintenance materials. The relocated fire station would include an above-ground 1,000-gallon fuel storage tank.

General commercial, retail, hotel, and household hazardous materials are typically handled and transported in small quantities that would not require preparation of a business plan, although some uses such as a hardware store would store materials such as paints and solvents in sufficient quantities to require preparation of a business plan.[299] In addition, the health effects associated with materials common to office/commercial uses are generally not as serious as

[298] Some types of ammunition can also release toxic metals, such as mercury, into the environment. Corrosive mercury-based primers are found in many types of old ammunition as well as vintage military surplus ammunition.

[299] A business would be required to submit a Hazardous Materials Business Plan if it would handle and/or store a hazardous material (e.g., flammable liquids and solids, petroleum-based products, such as motor oil, gasoline and diesel fuel; acids and bases, such as pool chemicals and drain cleaners; paints; inks; fertilizers) in an amount equal to or greater than the minimum reportable quantities. These quantities are 55 gallons for liquids, 500 pounds for solids, and 200 cubic feet (at standard temperature and pressure) for compressed gases.

industrial or laboratory uses. For commercial, retail, and hotel uses, additional regulatory requirements include adherence to instruction on manufacturers' labels, and appropriate training of employees in the use, storage, and disposal of the hazardous materials and wastes they are expected to encounter in the workplace.

In addition to typical office-based businesses, future Baylands commercial development could include businesses and facilities engaging in medical and laboratory-based activities. These could include doctor/dentist offices and "dry" laboratories (or operations), where relatively small or negligible quantities of hazardous materials would be used. "Wet" lab functions, on the other hand, could involve a broad spectrum of activities involving use of hazardous materials in controlled indoor environments. The types and volumes of hazardous materials that would be used in wet laboratories are difficult to predict and speculative because the specific businesses that might move to the Baylands cannot be known at this time, and because hazardous materials use is subject to continuous change as technologies evolve and as businesses change.

Research, laboratory, and biotechnical operations would be subject to more intense federal, state, and local regulation and oversight than typical households and commercial, retail, and hotel businesses that handle smaller quantities of more common materials. Employees performing wet laboratory work would be required by law to receive specific training in the use and handling of hazardous materials, which is intended to protect the workplace and also to minimize the potential for spills or inadvertent releases.

Laboratory and medical-related establishments operating within the Baylands such as biotechnical firms, medical laboratories, doctor/dentist offices, or pharmacies would involve medical- or laboratory-type chemicals, compressed gases, pharmaceuticals, and radiological materials. Medical, biohazardous, and low-level radioactive wastes would also be produced from these activities. Such uses are required to comply with federal and state regulations and standards, including measures such as preparation of a spill prevention, control, and countermeasure plans. Laboratory and medical-related establishments would be more likely to handle and/or store a hazardous material equal to or greater than minimum reportable quantities than office/commercial, residential, or other Baylands uses and would be required to prepare Hazardous Materials Business Plans tailored to their specific operations. These measures would reduce the potential for hazardous materials release during the routine transport, use, or disposal of such materials.

Disposal of biohazardous materials (e.g., medical waste,[300] cell plates, and absorbents) that might be generated by future businesses within the Baylands would be required to comply with applicable federal, state, and local regulations to ensure their safe handling and disposal. These materials, along with pharmaceutical and chemotherapy wastes and surgery specimens, would be required to be transported off-site for treatment and disposal by a licensed medical waste

[300] Medical wastes generated could include blood and blood products, tissues and specimens, needles, and infectious items.

treatment vendor. The Environmental Management Branch of the California Department of Public Health regulates the generation, handling, storage, treatment, and disposal of medical waste by providing oversight for the implementation of the Medical Waste Management Act.[301]

The relocated fire station would have a 1,000-gallon fuel storage tank and may store other hazardous materials in amounts equal to or greater than the minimum reportable quantities. It is also possible that future laboratory uses within the Bayland would handle and/or store hazardous materials in amounts equal to or greater than the minimum reportable quantities. Such uses would be required to prepare a Hazardous Materials Business Plan.

Grounds and landscape maintenance within the Baylands would also use a wide variety of commercial products formulated with hazardous materials, including fuels, cleaners and degreasers, solvents, paints, lubricants, adhesives, sealers, and pesticides/herbicides. These common consumer products would be used for the same purposes as in any landscape maintenance setting. Small quantities of household hazardous materials including cleaning products, fuels, oils, pesticides, and lubricants would also be associated with Baylands residential development.

Consistency with Remedial Action Plans for Operable Unit OU-SM and Operable Unit OU-2; Consistency with the Title 27 Landfill Closure Plan

The Remedial Action Plans for OU-SM and OU-2 outline a series of land use restrictions governing future construction to which Baylands development will comply. Key among these provisions in relation to site construction are the following:

- Baylands grading operations will move sufficient soil from the eastern portion of the Baylands to raise final pad elevations for development within the western portion to cap existing soil containing constituents of concern. Any future excavation into the cap would require compliance with a regulatory agency-approved Soil Management Plan;
- Any contaminated soil brought to the surface by grading, excavation, trenching, or backfilling would require compliance with all applicable provisions of state and federal law and a regulatory agency-approved Soil Management Plan;
- Baylands development would be subject to and required to comply with land use covenants that will be established by regulatory agencies and recorded on the title to properties within OU-SM and OU-2 as part of the remediation process. These covenants would limit human exposures to contaminants left in place in soil, soil vapor, and groundwater above levels considered protective of unrestricted use of the site.
    - No occupied buildings, including sensitive uses, would be permitted, where CVOC concentrations in soil vapor exceed cleanup levels without regulatory

[301] https://www.cdph.ca.gov/Programs/CEH/DRSEM/Pages/EMB/MedicalWaste/MedicalWaste.aspx.

agency approval based on either (1) a risk assessment demonstrating site conditions pose no significant risk to human health, or (2) engineering controls, such as building design or gas intrusion mitigation systems, that will reduce the risk to an acceptable level;

- No growing produce or vegetables for human consumption in native soil would be permitted. Plants for human consumption would be permitted to be grown in raised beds (above Baylands soils) containing non-native soil. Trees producing edible fruit (including trees producing edible nuts) would be only if they are grown in containers with a bottom that prevents the roots from penetrating into native soil;
- No extraction or use of underlying groundwater would be permitted without a Groundwater Management Plan pre-approved by the appropriate regulatory agency;
- No drilling for any water, oil, or gas, or extraction or removal of groundwater would be permitted without a regulatory agency-approved Groundwater Management Plan and prior written approval by the appropriate regulatory agency;
- No interference with, or modification of, a vapor mitigation system would be permitted without prior written approval by the appropriate regulatory agency, and future tenants must provide reasonable access for O&M of vapor mitigation systems;
- All excavation into the cap would be required to comply with the regulatory agency-approved Soil Management Plan;
- Any contaminated soils that may be brought to the surface by grading, excavation, trenching, or backfilling would be required to be managed in accordance with all applicable provisions of state and federal law and a regulatory agency-approved Soil Management Plan; and
- All uses and development of the site would be required to preserve the integrity and effectiveness of the cap provided over contaminated soils.

The landfill closure plan includes the following measures over which Baylands development within the eastern portion of the site will be constructed:

- A landfill cover is to be constructed as specified in the approved Closure and Post-Closure Maintenance Plan consisting of the following layers from the bottom up:
  - Foundation layer that is a minimum of 2 feet over the last lift of waste with appropriate engineering properties to provide low permeability;
  - Low-hydraulic-conductivity layer with a minimum 2 percent slope.

    - Drainage layer to facilitate drainage of water infiltrating from above the final cover and convey it to wetland areas or drainage facilities.
    - Erosion-resistant engineered fill layer to accommodate appropriate root depths, utilities, and shallow foundations. All irrigated areas would contain a subdrain beneath the vegetative layer of the final cover.
- A landfill gas intrusion mitigation system consisting of a vapor barrier and a gas venting system layer will underlay commercial building footprints.

Baylands development will be required to be constructed such that roots of vegetation, utilities, and shallow foundations are accommodated within the erosion-resistant layer.

In addition, continuous methane monitoring systems will be maintained within the buildings as required by Title 27 to ensure that there is no hazard due to the accumulation of levels of landfill methane gas above 5,000 parts per million by volume (ppmv).

Exposure to Hazardous Materials Due to Accident or Risk of Upset Conditions

Improper transportation, use, storage, or disposal of hazardous materials during construction or post-construction operations could result in accidental spills or releases, posing health risks to workers, the public, and the environment.

Baylands Construction and Post-Construction Activities

Construction and post-construction activities associated with Baylands development include:

- Site grading, trenching for underground utilities, building pad construction, or landscape installation, which could expose contaminated soils within the western portion of the site or the waste matrix within the former Brisbane Landfill.
- Accidental damage to existing utility lines and disruption of service when undergrounding existing above-ground electrical lines within the Baylands; tunneling under Bayshore Boulevard, along Geneva Avenue, and within the Martin Substation while extending electrical lines; and when trenching for installation of on-site utilities within the Baylands and for off-site water improvements.

- Realignment of Lagoon Road and demolition/removal of the existing roadway along with site grading and construction of lagoon shoreline improvements in the vicinity of existing underground Kinder Morgan fuel lines.[302]
    - Future improvements at the lagoon waterfront may require additional material to be placed on top of the existing fuel lines to accommodate Baylands site grading and provide waterfront protection.
    - Baylands development could generate settlement that could encroach into the Kinder Morgan fuel pipeline easement.[303]
- Temporary dewatering in areas of shallow groundwater would be undertaken prior to completion of required groundwater remediation activities, which would expose workers, the public, and the environment to contaminated groundwater.
- Short-term use and storage of materials within construction sites during the construction day, which could result in spills of various hazardous materials and expose workers, the public, and the environment to those materials.
- Storage and handling of hazardous materials in commercial areas (general commercial, retail, hotel), research and other laboratory settings, and medical facilities, which could result in spills of various hazardous materials and expose workers, the public, and the environment to those materials.
- Vehicular accidents during delivery to or disposal from Baylands construction sites and ongoing post-construction activities, which could result in hazardous materials spills and expose workers, the public, and the environment to those materials.
- Accidents during unloading of fuels, solvents, and other hazardous materials needed for construction and ongoing post-construction activities, along with loading of waste materials that could result in spills of various hazardous materials and expose workers, the public, and the environment to those materials.

[302] Pipeline operators are required by law to post brightly colored markers along their right-of-way to indicate the presence of their underground pipelines. Markers contain information about the nearby pipeline as well as emergency contact information. To ensure safety and avoid damage, anyone planning to dig or excavate is also required by law to contact the Underground Service Alert center at least 48 hours in advance so that utility operators, including Kinder Morgan, can coordinate with the contractor to avoid any close contact with the pipeline. To minimize damage and facilitate closing down a line in the event of an accident, pipelines are monitored 24 hours per day, 7 days per week both at Brisbane Terminal and at Kinder Morgan's regional headquarters in Orange, California, as well as by a "Supervisory Control and Data Acquisition" computer system, which gathers real-time current operating conditions data, including pipeline pressures, volume, flow rates, status of pumping equipment and valves, and temperatures, and can react to any sudden changes should they occur.

[303] Buried pipelines, being constrained by the bedding material and soil surrounding them, can withstand high-vibration intensities (Oriard 1994; Siskind and Stagg 1993); cited in Caltrans *Transportation and Construction Vibration Guidance Manual*, April 2020). Caltrans did not therefore include vibration criteria for protection of pipelines in its manual.

In addition, the transportation, use, storage, and disposal of hazardous materials following site construction by Baylands land uses and infrastructure is subject to numerous federal, state, and local regulations designed to minimize exposure to hazardous materials and protect public health and the environment.

However, as noted above, accidental release of hazardous materials is addressed by federal, state, and local regulations, including the following:

- Title 29 of the Code of Federal Regulations (29 CFR), which requires special training of handlers of hazardous materials; notification to employees who work in the vicinity of hazardous materials; acquisition from the manufacturer of material safety data sheets, which describe the proper use of hazardous materials; and training of employees to remediate any hazardous material accidental releases.
- Safety and Health Regulations for Construction (29 CFR 1926.65 Appendix C), which contains requirements for construction activities, including occupational health and environmental controls to protect worker health and safety. The guidelines describe the health and safety plan(s) that must be developed and implemented during construction, including associated training, protective equipment, evacuation plans, chains of command, and emergency response procedures.
- Article 1 of Chapter 6.95 of the California Health and Safety Code (Sections 25500–25520), which requires that any business that handles, stores, or disposes of a hazardous substance at a given threshold quantity prepare a Hazardous Materials Business Plan to minimize hazards to human health and the environment from fires, explosions, or an unplanned release of hazardous substances into air, soil, or surface water.[304] The Hazardous Materials Business Plan must be carried out immediately whenever a fire, explosion, or unplanned chemical release occurs. Hazardous Materials Business Plans serve as an aid to employers and employees in managing emergencies and help better prepare emergency response personnel for handling a wide range of emergencies that might occur at any specific location. The San Mateo County Environmental Health Services Division, acting as the Certified Unified Program Agency, oversees implementation of this program in San Mateo County.

Kinder Morgan Tank Farm and Pipeline

The Kinder Morgan Bulk Terminal facility stores large quantities of hazardous materials that are delivered by pressurized liquid pipelines that traverse the Baylands to the facility. Upset and accident conditions could result in the release of large quantities of gasoline, diesel, or jet

[304] In general, a business must submit a Hazardous Materials Business Plan to the County if it handles and/or stores a hazardous material equal to or greater than the minimum reportable quantities. These quantities are 55 gallons for liquids, 500 pounds for solids, and 200 cubic feet (at standard temperature and pressure) for compressed gases. Radioactive materials and extremely hazardous substances are reportable in any amount.

fuel that might potentially adversely affect residents, workers, visitors, or the environment. However, the storage tanks are constructed, monitored, inspected, and upgraded as necessary in accordance with American Petroleum Institute recommendations (API Standard 620 Design and Construction of Large, Welded, Low-Pressure Storage Tanks and API Standard 650 Welded Tanks for Oil Storage). The tanks are kept at atmospheric pressure and any damage would result in leakage rather than an explosion. Secondary containment improvements incorporated into the facility design would ensure that, in the unlikely event of leakage, including substantial damage from an earthquake, any released fuels would remain at the terminal within the containment areas. The tanks are on a regular inspection schedule, including major inspections in which the tanks are emptied, and all components inspected and upgraded as necessary to limit the potential for any releases.

As noted above, the pipelines are pressurized and continuously monitored by trained operators and a computerized system that can react to any sudden changes. The Pipeline and Hazardous Materials Safety Administration (PHMSA) is the primary federal regulatory agency responsible for ensuring that pipelines are safe, reliable, and environmentally sound. The federal pipeline integrity management regulations for hazardous liquid pipelines (Section 195.452) and natural gas pipelines (Sections 192.901-192.951) require operators to perform risk assessments of their pipelines to:

- Ensure that integrity assessment methods (internal inspection, pressure testing, direct assessment, etc.) are employed to address significant threats on pipeline segments.
- Ensure that integrity assessments of the highest risk segments are scheduled with priority over lower risk segments.
- Ensure that assessments of threats and potential consequences are conducted to define, evaluate, and implement additional measures that address significant threats to the pipeline (e.g., conducting depth-of-cover surveys and correcting any deficiencies), or reduce potential consequences of failures (e.g., installing additional valves on the pipeline to reduce the amount of liquid or gas that might be released should a failure occur).

Significance Conclusion for Impact HAZ-1

Routine Transport, Use, Disposal, or Management of Hazardous Materials During Demolition and Construction Activities

As discussed above, a comprehensive set of federal, state, and local laws and regulations regulate the transportation, use, management, and disposal of hazardous materials and wastes to minimize potential risks of human and environmental exposure during site grading and construction of buildings, infrastructure, and site amenities, avoiding exposure of people and the environment. These programs also provide for training of workers to react to and contain

accidental hazardous materials spills and other exposures to hazardous materials. In addition, the design and construction activities involved with undergrounding of electrical lines, installation of renewable energy generation and battery storage facilities, and installation of service connections and connections to the Martin Substation would comply with applicable codes, California Public Utilities Commission and Independent System Operator Rules and Regulations, and PG&E requirements. Thus, with the exception of lead within the former shooting range on Icehouse Hill, impacts would be less than significant. However, because clean-up of the former shooting range is addressed by EPA guidelines rather than mandatory requirements, exposure to lead within the former firing range would be significant and require mitigation.

Routine Transport, Use, Disposal, or Management of Hazardous Materials by Operation of Baylands Land Uses and Infrastructure

Proposed Baylands development would primarily consist of residential, commercial/office, public, and open space uses that would not transport, use, store, or dispose of large quantities of hazardous materials that could present a substantial risk to people. Uses such as hardware stores, laboratories, and the relocated fire station that would store hazardous materials in amounts greater than minimum reportable quantities would be required to prepare Hazardous Materials Business Plans tailored to their specific operations. Implementation of the Hazardous Materials Business Plans would reduce the potential for hazardous materials release during the routine transport, use, or disposal of such materials would therefore not present a substantial risk. Impacts would be less than significant.

Consistency with Remedial Action Plans for Operable Unit OU-SM and Operable Unit OU-2; Consistency with the Title 27 Landfill Closure Plan

Baylands development would be required to comply with the requirements of Remedial Action Plans for Operable Unit for OU-SM and Operable Unit OU-2, restricting human interaction with contaminated soils or groundwater. Construction of buildings and infrastructure within the eastern portion of the Baylands will also comply with applicable Title 27 Closure and Post-Closure Maintenance Plan requirements. Thus, Baylands development would have a less-than-significant impact.

Upset or Accident Conditions

Grading and construction activities in the vicinity of the Kinder Morgan pipelines include the potential of accidental loading or undermining of soils covering and underlying the pipeline, causing damage to the pipeline. Because current grading and development plans do not include specific provisions for protecting the structural integrity of the pipeline, a significant impact would result from Baylands development.

Program EIR Mitigation Measures

MM HAZ-1a: Confirm Achievement of Remediation Goals (Program EIR 4.G-2a). Prior to issuance of a building or grading permit for any parcel within OU-SM, OU-2, and the former landfill, the applicant shall provide the City with evidence that the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency in relation to the landfill have approved Remedial Design and Implementation Plan(s) or final closure and post-closure maintenance plans for the area subject to the requested permit.

Prior to issuance of a building permit for any parcel within the Baylands, the project applicant shall obtain regulatory approval from the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency in relation to the landfill for the proposed land use, in the form of a Remediation Action Completion Report or equivalent closure letter stating that remediation goals have been achieved for proposed land uses.

MM HAZ-1b: Soil and Groundwater Management Plan (Program EIR Mitigation Measure 4.G-2b). Prior to issuance of a building or grading permit for any parcel within the Baylands, a Soil and Groundwater Management Plan shall be prepared by a qualified environmental consulting firm, reviewed, and approved by DTSC and the RWQCB, and implemented by the applicant.

The Soil and Groundwater Management Plan shall also include a requirement for development and implementation of site-specific safety plans to be prepared prior to commencement of construction consistent with Occupational Safety and Health Administration (OSHA) Safety and Health Standards 29 Code of Federal Regulation (CFR) 1910.120, as well as management of groundwater produced through temporary dewatering activities.

Such site-specific safety plans shall include necessary training, operating and emergency response procedures, and reporting requirements to regulate all activities that bring workers in contact with potentially contaminated soil or groundwater, landfill gas, or leachate to ensure worker safety and avoid impacts on the environment. Further, the Soil and Groundwater Management Plan shall include protocols for any areas of the site that require excavation and relocation of refuse material (e.g., building foundations and utility infrastructure) in accordance with Title 27 of the California Code of Regulations to ensure that the integrity of the low-hydraulic-conductivity layer requirements is maintained.

MM HAZ-1c: Master Deconstruction and Demolition Plan (Program EIR Mitigation Measure 4.G-2c). City review and approval of a specific plan per the requirements of the Brisbane General Plan shall be completed prior to submittal of any application for a demolition permit within the Project Site. Prior to issuance of a demolition permit for any parcel within the Baylands, the applicable property owner shall submit a Master Deconstruction and Demolition Plan prepared by a licensed professional to the City Building Official. The plan shall be reviewed and approved by the Building Official prior to issuance of the requested demolition permit. The demolition plan shall include documentation of hazardous materials determinations (surveys) and demolition or deconstruction recommendations in accordance with local and state requirements. If the surveys conducted by licensed professionals prior to issuance of a demolition permit per the requirements above hazardous building materials, demolition or deconstruction shall proceed in accordance with applicable Bay Area Air Quality Management District (BAAQMD), OSHA, and California Occupational Safety and Health Administration (Cal/OSHA) requirements, which may include air permits or agency notifications, worker awareness training, exposure monitoring, medical examinations, and a written respiratory protection program.

MM HAZ-1d: Former Police Shooting Range Cleanup (Program EIR Mitigation Measure 4.G-2i). Prior to any construction of trails on the southerly slope of Icehouse Hill, best management practices for lead removal consistent with United States Environmental Protection Agency Circular EPA-902-B-01-001, *Best Management Practices for Lead at Outdoor Shooting Ranges*, Revised June 2005, shall be implemented.

Significance Conclusion for Impact HAZ-1 with Implementation of Program EIR Mitigation Measures

Mitigation Measures MM HAZ-1a, MM HAZ-1b, MM HAZ-1c, and MM HAZ-1d would ensure implementation of General Plan policy and address impacts not addressed through compliance with applicable federal, state, and regional hazardous materials regulatory requirements.

However, a significant impact could occur because Mitigation Measure MM HAZ-1d only addresses remediation for construction of trails on the southerly slope of Icehouse Hill and does not address additional remediation for other construction on Icehouse Hill, including relocation of the Mission Blue Nursery to the site of the former police shooting range. In addition, the Kinder Morgan fuel pipelines could be damaged during construction. Both of these impacts would be significant and require additional mitigation.

Additional Mitigation Measures

MM HAZ-1e: Shooting Range Remediation. Prior to any construction activities on Icehouse Hill where lead fragments from the former police shooting range may be found, the following shall be implemented consistent with United States Environmental Protection Agency Circular EPA-902-B-01-001, *Best Management Practices for Lead at Outdoor Shooting Ranges*, Revised June 2005:

1. Prepare an exhibit along with supporting technical information for review and approval by the Brisbane Police Department identifying all areas where lead fragments from the former police shooting range on Icehouse Hill may be found.
2. Within those areas identified where lead fragments from the former police shooting range might be found, sift munitions fragments from the soil for recycling.[305]
3. Sample and analyze the remaining soil in layers to assess the extent of downward contamination to determine if the leachable level is at or above the United States Environmental Protection Agency (USEPA) limit of 5 milligrams per liter (mg/L). If it does not exceed the limits, the soil can be left in place with no further action required. If the USEPA limit is exceeded, remediation subject to oversight by the appropriate regulatory agency—San Mateo County Environmental Health Services Division or DTSC—shall be required prior to relocation of the Mission Blue Nursery to the site.

MM HAZ-1f: Kinder Morgan Fuel Pipeline. Existing infrastructure for the Kinder Morgan Tank Farm shall be protected in place during Baylands grading and construction consistent with the following requirements and specifications.

A Construction Workplan shall be developed with Kinder Morgan to document construction means and methods, including provisions for appropriate construction techniques, settlement monitoring, and setbacks to protect the structural integrity of existing pipeline facilities in accordance with the following performance standards.

- Any fill materials placed within 100 feet of any Kinder Morgan pipeline easement shall avoid additional loading on existing Kinder Morgan fuel lines and avoid settlement of soils supporting pipelines unless required

[305] Recycling the fragments makes them exempt from hazardous waste reporting and management requirements.

by a state or regional regulatory authority in an approved site remediation or landfill closure plan.[306]

- Excavation activities within 25 feet of a Kinder Morgan fuel pipeline easement shall be designed to ensure the integrity of manufactured slopes within the excavation at all times.
- Temporary construction dewatering for excavations below groundwater levels shall be performed in a controlled manner and avoid prolonged drawdown of the groundwater table (exceeding one month).

Prior to issuance of a grading or construction permit for activities within 100 feet of a Kinder Morgan fuel pipeline easement, the applicant for such permit shall demonstrate to the satisfaction of the City Engineer that adequate measures will be implemented to ensure the structural integrity of existing pipeline facilities is protected, including measures such as, but not limited to, physical separation of construction activities, fill, and buildings from pipeline easements along with implementation of Mitigation Measure MM NOI-5b, Protection of Underground Utilities.

The Construction Workplan shall be subject to review and approval by the City of Brisbane prior to commencement of grading within 100 feet of any Kinder Morgan pipeline easement.

Significance Conclusion for Impact HAZ-1 with Implementation of All Mitigation Measures

Mitigation Measure MM HAZ-1a ensures implementation of General Plan policy requiring completion of site remediation and landfill closure prior to development within the Baylands. Mitigation Measures MM HAZ-1b and MM HAZ-1c address impacts not addressed through compliance with applicable federal, state, and regional hazardous materials regulatory requirements. MM HAZ-1c provides for clean-up of the former police shooting range consistent with USEPA guidelines not included in mandatory hazardous materials requirements for the construction of trails on the southerly slope of Icehouse Hill. Mitigation Measure MM HAZ-1d provides for remediation of the former police shooting range, which would require identifying all areas where lead fragments from the former police shooting range on Icehouse Hill may be found. MM HAZ-1e would protect Kinder Morgan fuel pipelines from risk of upset during site construction. Thus, the combination of compliance with applicable federal, state, and regional

[306] As noted in Footnote 11, Caltrans' *Transportation and Construction Vibration Guidance Manual*, April 2020, does not recommend vibration criteria for protection of pipelines since buried pipelines, being constrained by the bedding material and soil surrounding them, can withstand high-vibration intensities.

hazardous materials regulatory requirements and Mitigation Measures MM HAZ-1a through MM HAZ-1e- would reduce impacts to less than significant with mitigation incorporated.

b. Impact HAZ-2: Emissions or Handling of Hazardous or Acutely Hazardous Materials or Waste within One-Quarter Mile of a School

Methodology for Determining Significance

Analysis of this impact focuses on the potential for Baylands development, including a proposed middle school, to result in hazardous emissions or handling of hazardous or acutely hazardous materials within 0.25 mile of an existing or proposed school. The potential severity of consequences to people or property at school facilities in the event of a release of hazardous materials into the environment from operation of proposed residential and commercial uses is analyzed.

In determining the level of significance, the analysis recognizes that Specific Plan development, including establishment of a school within the Specific Plan area, would be required to comply with relevant federal, state, and local laws and regulations that are designed to minimize emission or release of hazardous or acutely hazardous materials into the environment, particularly within 0.25 mile of an existing or proposed school.

Threshold HAZ-2 supplements the CEQA Guidelines Appendix G screening threshold, recognizing that the location of a facility that emits hazardous emissions or handles hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school indicates the *potential* for a significant environmental effect but is not necessarily indicative of a significant physical environmental effect. Thus, Threshold HAZ-2 therefore first examines whether a potential health hazard might exist due to the location of a facility emitting or handling hazardous materials within one-quarter mile of an existing or proposed school. If such a condition would occur, analysis is undertaken to determine whether a public health hazard would result. Threshold HAZ-2 also recognizes that such a public health hazard would be created in one of two ways:

1. Creating a change in the physical environment by placing a facility that emits hazardous emissions or handles hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school; or
2. Creating a health hazard for students by placing a school within one-quarter mile of an existing facility that emits hazardous emissions or handles hazardous or acutely hazardous materials, substances, or waste.

Threshold HAZ-2 also recognizes the school safety standards set forth in CCR Title 5, Section 14010, Standards for School Site Construction, which sets performance standards for the protection of schools within the state from environmental hazards and risks of upset. As such,

exceeding the performance standards of CCR Title 5, Section 14010 without mitigation would be indicative of a significant impact.

Impact Assessment

Location of a School within One-Quater Mile of a Site That Would Handle or Emit Hazardous or Acutely Hazardous Materials, Substances, or Waste

The Baylands Specific Plan includes development of a middle school to be constructed on an approximately 5- to 7-acre site along Main Street east of Bayshore Boulevard (see **Figure 3-9** and **Figure 3-10**). The area within which the school might be constructed is more than 0.25 mile from the Kinder Morgan Tank Farm, and there are no other existing facilities within 0.25 mile of the school site that would handle or emit hazardous or acutely hazardous materials, substances, or waste within 0.25 mile of the site.

In addition to mandatory adherence to federal, state, and local requirements, compliance with the requirements of CCR Title 5, Section 14010, Standards for School Site Construction and California Department of Education School Facilities Planning Division as overseen by DTSC, would further ensure that hazardous materials impacts on any school within 0.25 mile of Baylands development would be minimized by ensuring selection of a school site that provides safety and supports learning, per the regulations.

Proposed School Locations in Relation to California Department of Education Title 5 Distance Criteria for Environmental Hazards

Table 4.13-3 evaluates the location of the proposed middle school in relation to the safety criteria for school site locations provided in CCR Title 5, Section 14010.

Table 4.13-3: Evaluation of Proposed Baylands Middle School Location in Relation to CCR Title 5, Section 14010 Environmental Safety Criteria

Criterion	Evaluation of Proposed Middle School Location
c. Location of powerline easements within: 1. 100 feet of a 50–133 kV line; 2. 150 feet of a 220–230 kV line; or 3. 350 feet of a 500–550 kV line.	PG&E owns a 230 kilovolt (kV) underground electrical transmission line along Bayshore Boulevard, which would be within 150 feet of the proposed school site. The proposed school's location is more than 1,000 feet from PG&E's Martin Substation. Overhead electrical powerlines connecting Baylands development to the substation would be located more than 1,500 feet north of the school site.
d. Location within 1,500 feet of a railroad track easement.	The school site could be as close as 900 feet from the Caltrain rail line. Existing daily passenger rail operations are projected to increase from 92 diesel trains operating at 79 miles per hour to 248–258 electric trains operating at 110 miles per hour past the Baylands by 2040. In addition, the existing 2–4 freight operations through the Baylands are projected to increase to 7-10 trains per day. As a result, the Department of Education requires a safety evaluation of potential endangerment to school occupants from an incident (derailment or other accident) that could occur along the rail lines per Education Code Section 17521.

Criterion	Evaluation of Proposed Middle School Location
e. Location adjacent to a road or freeway that would cause noise or safety hazards.	The US 101 freeway is located more than 3,600 feet to the east of the school site. Bayshore Boulevard lies immediately adjacent to the west side of the proposed school site. Bayshore Boulevard is projected to carry 3,250 vehicles during the weekday a.m. peak hour and 3,320 vehicles day during the p.m. peak hour. Roadway noise along Bayshore Boulevard is projected to be 76.3 dBA.
f. Location on an active earthquake fault or fault trace.	No active earthquake fault or fault trace is located within the proposed school site or Baylands Specific Plan area.
g. Areas subject to flood or dam flood inundation.	The proposed school site is not subject to flood or dam inundation.
h. Location near an above-ground water or fuel storage tank within 1500 feet of the easement of an above-ground or underground pipeline that can pose a safety hazard.	The proposed school site would be located more than 2,000 feet from the nearest fuel storage tank at the Kinder Morgan tank farm and more than 1,000 feet from the water storage tank to be constructed east of the Caltrain right-of-way within the Baylands. A Pacific Gas & Electric Company (PG&E) 24-inch high-pressure natural gas transmission pipeline is located within 1,500 feet west of the proposed school site along Bayshore Boulevard.[307] The San Francisco Public Utilities Commission (SFPUC) Hetch Hetchy water pipeline system was also identified west of Bayshore Boulevard, which contains multiple large diameter water pipelines (44-inch to 60-inch) within 300 feet of the site. An existing 14-inch water pipeline appears to bisect the existing school site along Industrial Way.
i. Areas subject to moderate to high liquefaction or landslides.	Geotechnical studies prepared for the Baylands indicate that material within the artificial fill and the sandy deposits below the Young Bay Mud underlying the Baylands and the proposed middle school site would be subject to liquefaction and cyclic densification during a design seismic event.
k. Easily accessible from arterial roads and shall allow minimum peripheral visibility from the planned driveways. l. Not on a major arterial street with a heavy traffic pattern.	The proposed school site along proposed Main Street east of Bayshore Boulevard would be easily accessible from residential areas within the Baylands. Implementation of the proposed Bayshore Mobility Plan and Safe Routes Program would improve access from residential areas within Daly City west of Bayshore Boulevard since Daly City middle school students would be required to cross Bayshore Boulevard on a daily basis.
m. Compatible with surrounding zoning.	The proposed school site would be located adjacent to lower density residential and office uses, which would be compatible with the proposed middle school.
u. Within 2,000 feet of a significant disposal of hazardous waste.	The proposed school site is located more than 2,000 feet from the former Brisbane Landfill.

At the request of the governing board of a school district, the State Superintendent of Public Instruction may grant exemptions to any of the standards in this section if the district can demonstrate that mitigation of specific circumstances overrides a standard without compromising a safe and supportive school environment (5 CCR, § 14010(u)).

In relation to the PG&E underground 230 kV powerline within Bayshore Boulevard, the Department of Education has an interim policy that allows schools within the vicinity of underground lines to apply for variances to this regulation as described in the *Power Line*

[307] National Pipeline Mapping System (NPMS), 2022. Hazardous liquids pipeline map produced by the NPMS Public Viewer. Accessed October 30, 2023. https://pvnpms.phmsa.dot.gov/PublicViewer/.

Setback Exemption Guidance Policy.[308] However, the setback exemption request is only applicable for new schools that are planning to have *limited activity uses* within the setback zone.

Limited activity uses are defined as staff/visitor/joint-use parking, bus and parent drop-off parking, driveways, access roads, sidewalks, fire lanes, and landscaping. Finally, to address the safety of students crossing Bayshore Boulevard on a daily basis, the proposed Bayshore Mobility Plan provide protected crossings at Main Street and Geneva Avenue, while the Safe Routes to School program address traffic speeds, queueing and drop-off/pick-up zones, and bicycle/pedestrian routes to and from the middle school.

Significance Conclusion for Impact HAZ-2

A comprehensive set of federal, state, and local laws and requirements regulate the transportation, use, storage, and disposal of hazardous materials and wastes to reduce the potential risks of human and environmental exposure during post-construction operations of the land use types permitted within the Baylands, particularly those operations occurring within 0.25 mile of a school facility. These programs also provide for training of workers to react to and contain accidental hazardous materials spills and other exposures to hazardous materials. No significant impact would thus result in relation to proximity of facilities that handle or emit hazardous or acutely hazardous materials, substances, or waste.

However, as shown in **Table 4.13-3**, proposed middle school locations do not meet all provisions of CCR Title 5, Section 14010 because they are:

- Within 150 feet of PG&E's 230 kV underground electrical transmission line along Bayshore Boulevard.
- Within 1,500 feet of the Caltrain railroad right-of-way.
- Within 1,500 feet of a PG&E 24-inch high-pressure natural gas transmission pipeline.
- Subject to liquefaction and cyclic densification during a design seismic event.

A significant impact would therefore result.

Program EIR Mitigation Measures

MM HAZ-2: Protection of School Facilities (Program EIR Mitigation Measure 4.G-3). Grade K–12 school facilities constructed within the Baylands shall not be located within 0.25 miles of a facility with hazardous emissions or that handles hazardous or acutely hazardous materials, substances or waste, unless approved by School Facilities Planning Division of the California Department of Education in conformance with California Code of Regulations (CCR) Title 5, Section 14010,

[308] California Department of Education, *Power Line Setback Exemption Guidance*, May 2006.

which sets forth California Department of Education criteria for school site locations:

- "If the proposed [school] site is within 1,500 feet of a railroad track easement, a safety study shall be done by a competent professional trained in assessing cargo manifests, frequency, speed, and schedule of railroad traffic, grade, curves, type and condition of track need for sound or safety barriers, need for pedestrian and vehicle safeguards at railroad crossings, presence of high pressure gas lines near the tracks that could rupture in the event of a derailment, preparation of an evacuation plan. In addition to the analysis, possible and reasonable mitigation measures must be identified in accordance the referenced code." California Code of Regulations (CCR) Title 5, Section 14010 (d)
- "The [school] site shall not be located near an above-ground water or fuel storage tank or within 1,500 feet of the easement of an above ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission." CCR Title 5, Section 14010 (h)

Grade K–12 school facilities shall also comply with California Education Code Sections 17210 through 17224 and related statutory provisions related to risk to human health or the environment at proposed school properties as overseen by the Department of Toxic Substances Control (DTSC). In accordance with California Education Code Sections 17210 through 17224 and related statutory provisions, the school district must prepare a Phase I Environmental Site Assessment and/or a Preliminary Endangerment Assessment (PEA) to identify potential contamination and evaluate whether it presents a risk to human health or the environment at proposed school properties as overseen by the Department of Toxic Substances Control (DTSC). The environmental investigation and any required remediation of properties to be developed for use as schools shall be overseen by DTSC in coordination with the California Department of Education and the School Facilities Planning Division.

Final design plans shall be approved by the School Facilities Planning Division of the California Department of Education prior to commencement of construction.

All required remediation within 0.25 mile of a proposed K–12 school site within the Specific Plan area shall be completed prior to occupancy of the school.

Significance Conclusion for Impact HAZ-2 Following Implementation of Program EIR Mitigation Measures

Mitigation Measure MM HAZ-2 requires the proposed middle school to meet the standards set for in CCR Title 5, Section 14010 or to prepare the required studies for review by the Department of Education and to secure approval of the proposed school site pursuant to the provisions of CCR Title 5, Section 14010(u).

Existing state and federal programs provide for protection of school sites and also provide for training of workers to react to and contain accidental hazardous materials spills and other exposures to hazardous materials. MM HAZ-2 would ensure that the proposed school site would meet the design and safety standards set forth in CCR Title 5, Section 14010 or demonstrate safety and provide mitigation for any hazards prior to approval pursuant to CCR Title 5, Section 14010(u).

The impact would therefore be less than significant with mitigation incorporated.

c. Impact HAZ-3: Development on a Hazardous Materials Site Identified Pursuant to Government Code Section 65962.5

Methodology for Determining Significance

The methodology used in this assessment includes review of database information to assess the potential presence of hazards and hazardous materials sites within and adjacent to the Baylands. The Specific Plan area was evaluated for the presence of hazardous materials based on a review of the DTSC EnviroStor database and the RWQCB GeoTracker database.

To identify the level of significance in relation to this threshold, the first step is to determine whether the Baylands or adjacent areas encompass any sites that are included on a list of hazardous materials sites or that contain unidentified/unknown contaminants. Next, the analysis recognizes that all development would be required to comply with relevant federal, state, and local laws and regulations that are designed to remediate such sites so as to protect the public health.

A significant impact would result if development would occur on a hazardous materials site that would endanger public health or the environment.

Impact Assessment

Various portions of the Baylands and adjacent areas, including the former Brisbane Landfill, OU-SM, and OU-2, are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. The Schlage Lock site (also known as “Baylands North”), immediately north of the Baylands, is also listed as a hazardous materials site. These sites have

a long history of environmental investigation and cleanup efforts with additional remediation activities approved by state regulatory agencies (DTSC and the RWQCB) to ensure that all remediation is completed to levels that protect human health and the environment.

Pursuant to applicable state and local requirements, remediation and landfill closure activities must be completed to the satisfaction of state regulatory agencies prior to development of affected aeras within the Baylands. As outlined in approved Remedial Action Plans for OU-SM and OU-2, as well as the final closure plan for the former Brisbane Landfill, site remediation and landfill closure will be completed in phases, allowing for phased development of the Baylands. As discussed in Impact HAZ-1, Baylands development would be consistent with approved site remediation and landfill closure plans and would occur only after remediation or landfill closure activities for the site-specific development area have been completed.

The only location within which off-site infrastructure would be constructed on a listed hazardous materials site compiled pursuant to Government Code Section 65962.5 is the PG&E Martin Substation, which is subject to regulatory oversight related to past cleanup activities. As described in Section 3.3.2 g, improvements associated with this substation would be minor, such as installing line disconnect switch and line coupling capacitor voltage transformers along with a fiber termination, compliant with PG&E specifications. See Impact HAZ-1 for discussion of the potential for construction activities within and adjacent to the Martin Substation to expose workers and the environment to contaminated soils and other risks of upset.

Significance Conclusion for Impact HAZ-3

Various portions of the Specific Plan area, including the former Brisbane Landfill, OU-SM, and OU-2, are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Baylands development would be consistent with approved site remediation and remediation and landfill closure would occur prior to Baylands development. In addition, the only off-site location where Baylands-related off-site infrastructure is proposed is the PG&E Martin Substation, which is subject to regulatory oversight related to past cleanup activities. Thus, the potential for exposure of workers, the public, and the environment to hazardous materials within sites included on databases listing hazardous materials pursuant to Government Code Section 65962.5 would be less than significant.

d. Impact HAZ-4: Safety or Noise Hazards Due to Aircraft Operations

Methodology for Determining Significance

The first test in evaluating whether a significant impact would occur is to determine whether any portion of the Specific Plan area is within an airport land use plan or within 2 miles of a public airport for which an airport land use plan has not been adopted. Within these areas, a significant impact would result if the Specific Plan would place new development within an

airport safety zone, permit building heights that would pierce an "imaginary surface" of an airport, include a concentration of development inconsistent with an Airport Land Use Compatibility Plan, or propose new residential development within a 65 decibel (dB) Community Noise Equivalent Level (CNEL) noise contour. As stated in the San Mateo Airport Land Use Commission's Resolution 12-67 adopting the SFO airport land use compatibility plan, the plan sets forth "land use compatibility policies that are consistent with the state's noise standards" and would "prevent the creation of new noise and safety problems." Thus, consistency of proposed development with Airport Land Use Compatibility Plan policies would be indicative of less-than-significant impacts.

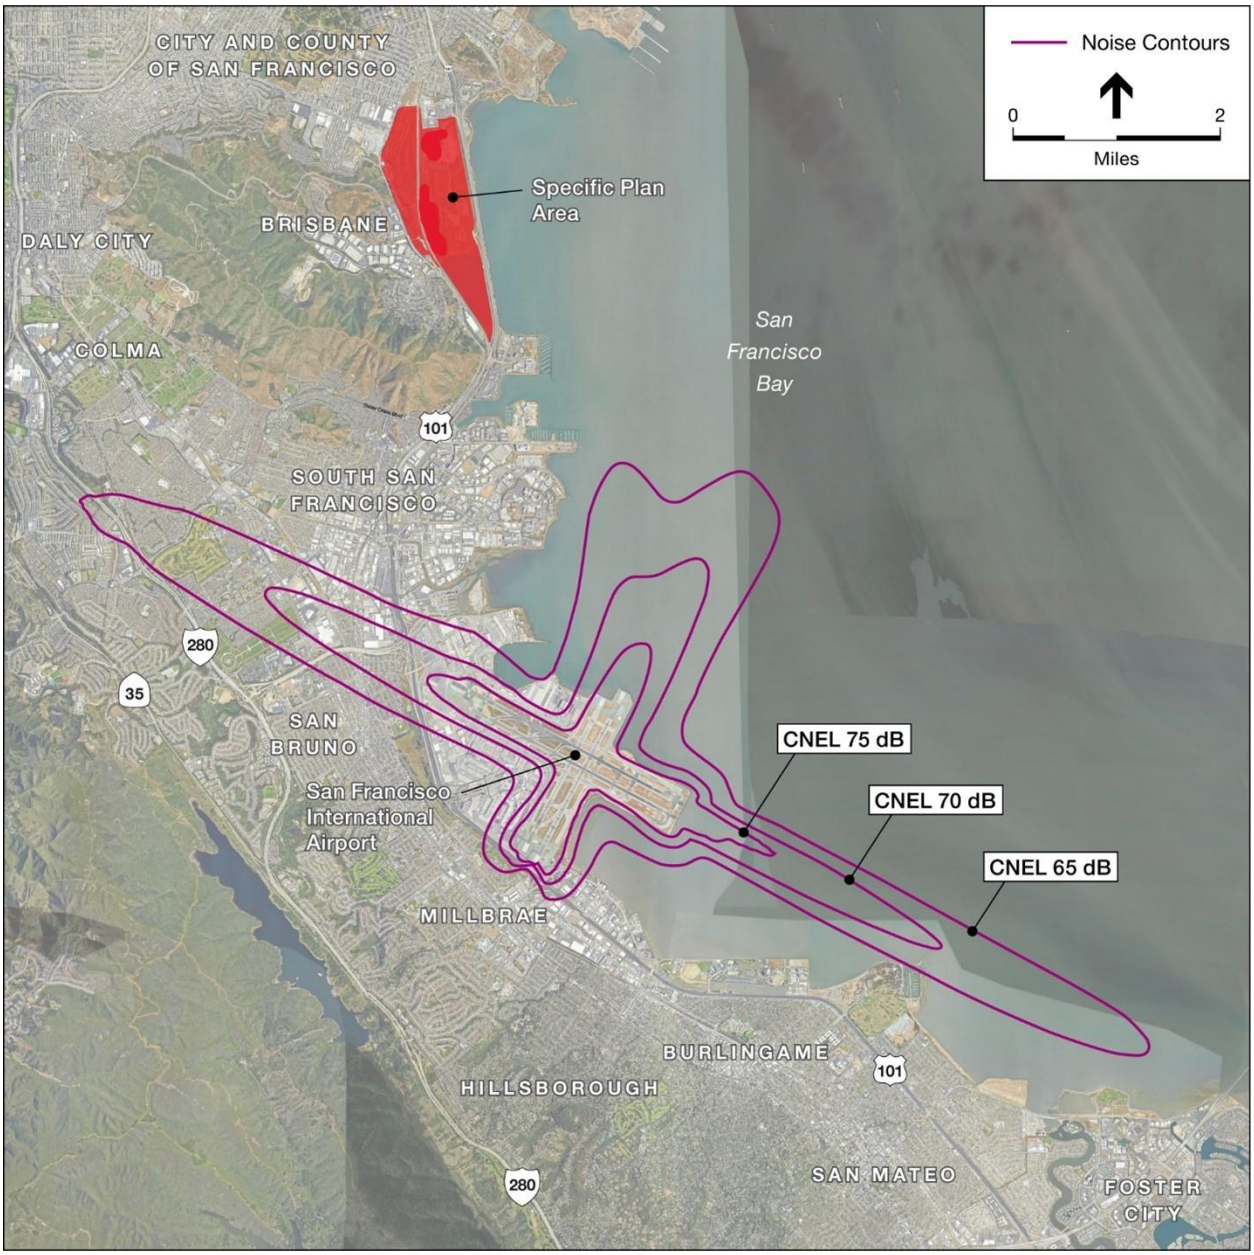
Impact Assessment

As indicated in the Airport Land Use Compatibility Plan for the Environs of San Francisco International Airport (SFO), the Baylands Specific Plan area is located 4 miles north of SFO and is not located within the 65 dB noise contour of the airport (see **Figure 4.13-4**). The Specific Plan area is not within 2 miles of any other airport or airstrip.

As indicated in the Airport Land Use Compatibility Plan, the Baylands Specific Plan area is not located within an Airport Safety Compatibility Zone (see **Figure 4.13-5**), FAA Notification Area (see **Figure 4.13-6**), or Airport Imaginary Surface area (see **Figure 4.13-7**). The Airport Land Use Compatibility Plan does not therefore identify any land use restrictions due to the location of the Baylands in relation to SFO. The Baylands site is, however, within SFO's Airport Influence Area A – Real Estate Disclosure Area, which requires any person or entity offering real property for lease or sale to provide an airport disclosure statement. Anyone offering real property for lease or sale is thus required to provide the following disclosure statement:

> ***NOTICE OF AIRPORT IN VICINITY***
>
> *This property is presently located in the vicinity of an airport, within what is known as an airport influence area. For that reason, the property may be subject to some of the annoyances or inconveniences associated with proximity to airport operations (for example: noise, vibration, or odors). Individual sensitivities to those annoyances can vary from person to person. You may wish to consider what airport annoyances, if any, are associated with the property before you complete your purchase and determine whether they are acceptable to you.*

Figure 4.13-4: San Francisco International Airport Existing Noise Contours



SOURCE: ESA, 2023.

Figure 4.13-5: Airport Safety Compatibility Zones

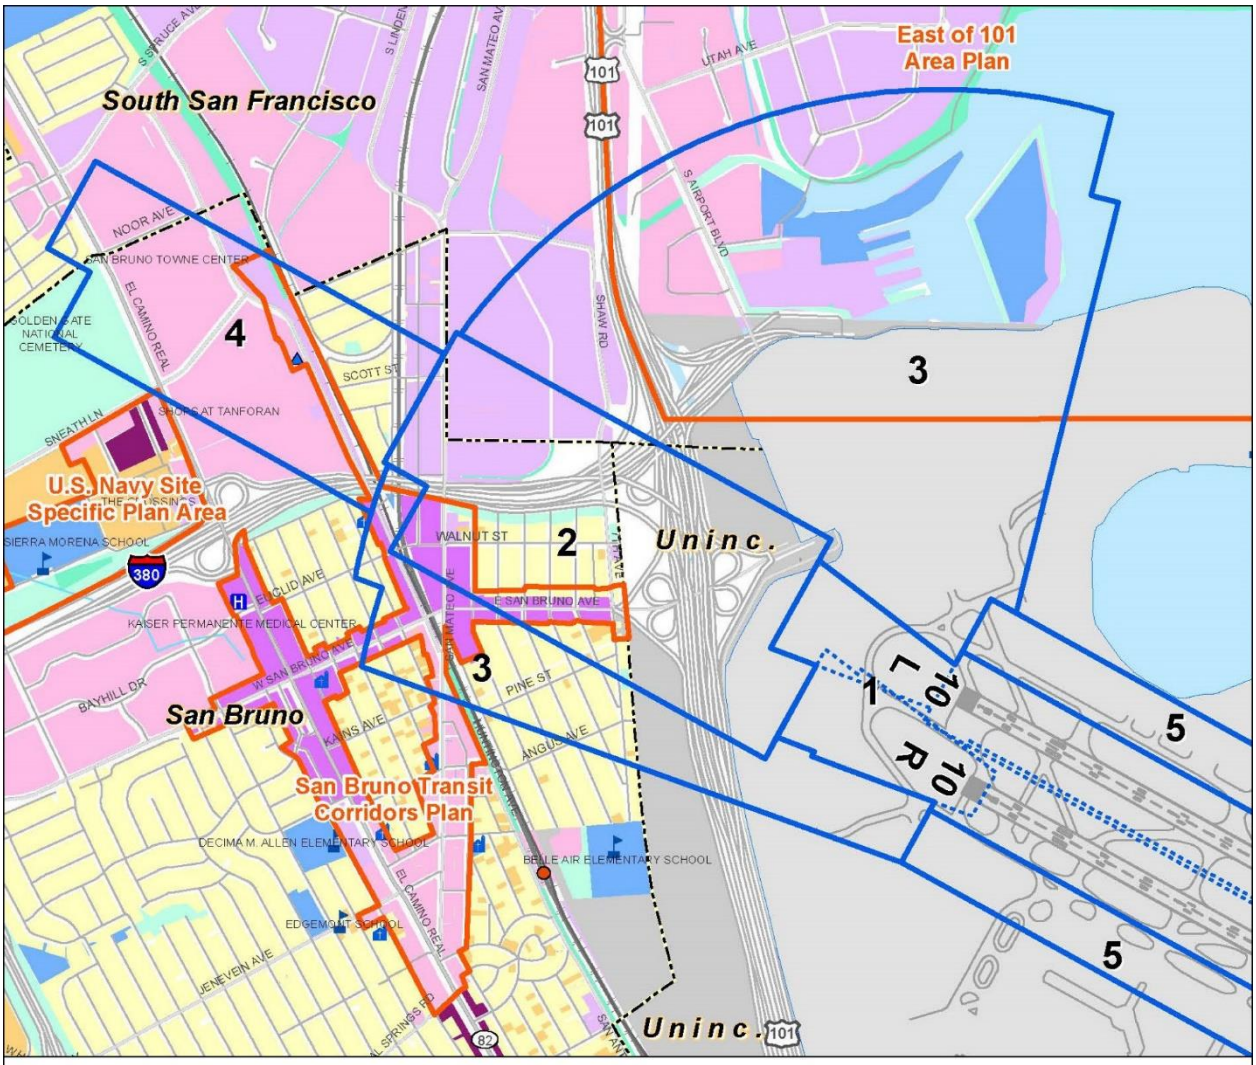


Figure 4.13-6: FAA Notification Area

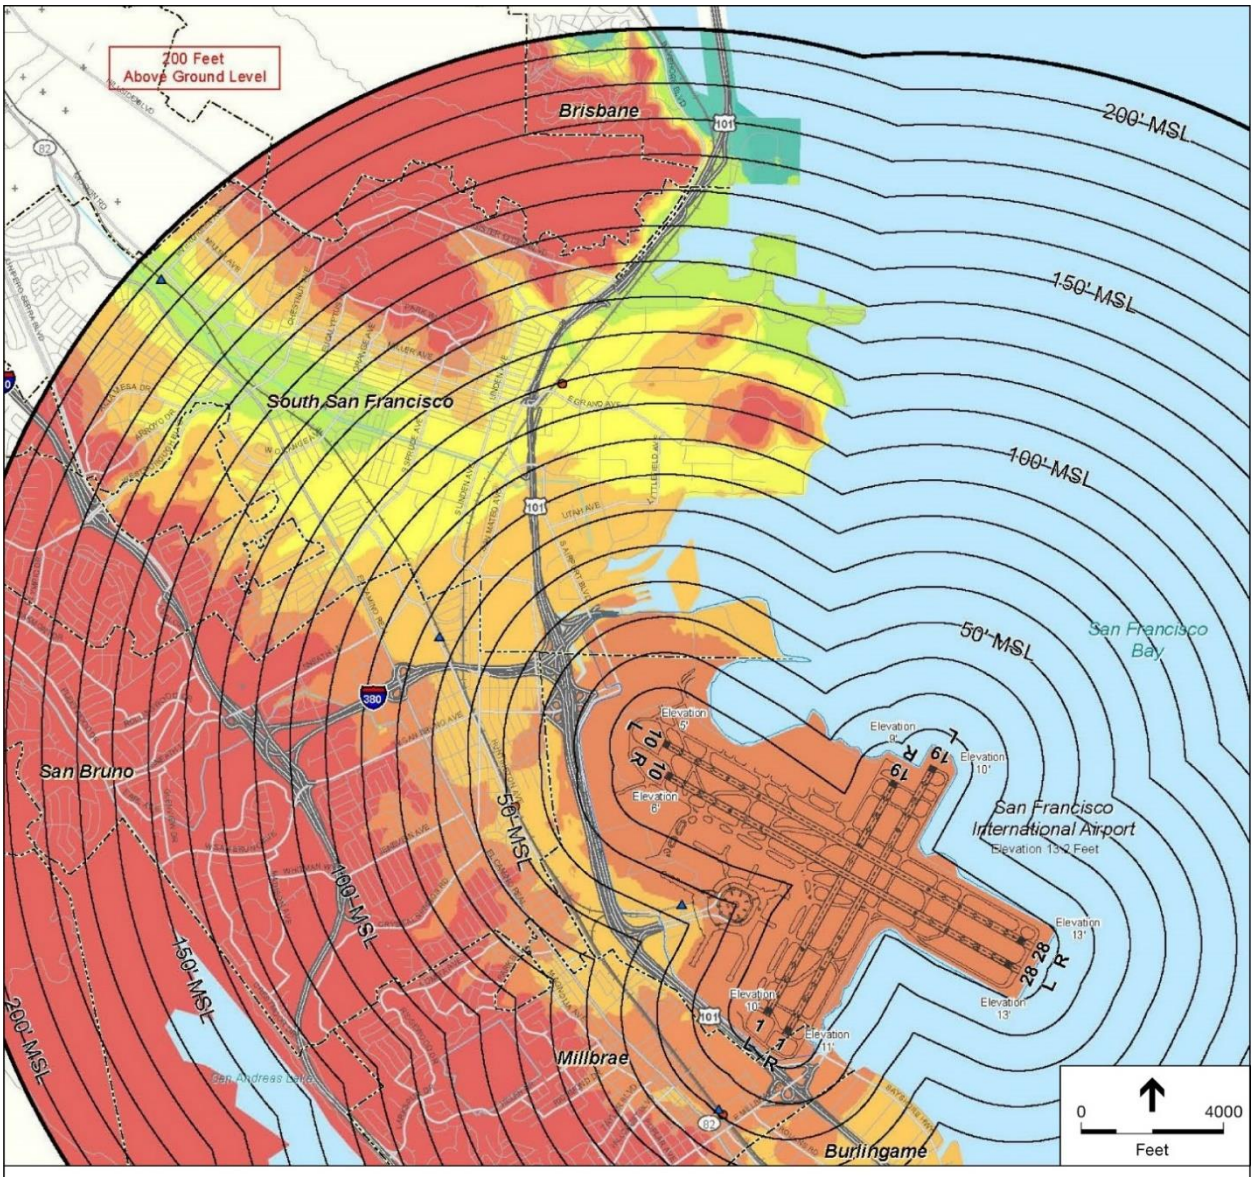


FAA NOTIFICATION REQUIREMENTS

A structure proponent must file FAA Form 7460-1, Notice of Proposed Construction or Alteration, for any proposed construction or alteration that meets any of the following Notification Criteria described in 14 CFR Part 77.9: §77.9(a): A height more than 200' above ground level (AGL) at its site; §77.9(b): Within 20,000' of a runway more than 3,200' in length, and exceeding a 100:1 slope imaginary surface (i.e., a surface rising 1' vertically for every 100' horizontally) from the nearest point of the nearest runway.

The 100:1 surface is shown as follows: 20,000' Limit from Nearest Runway; 100' MSL Elevation Above Mean Sea Level

Heights of 100:1 Surface Above Ground (AGL)

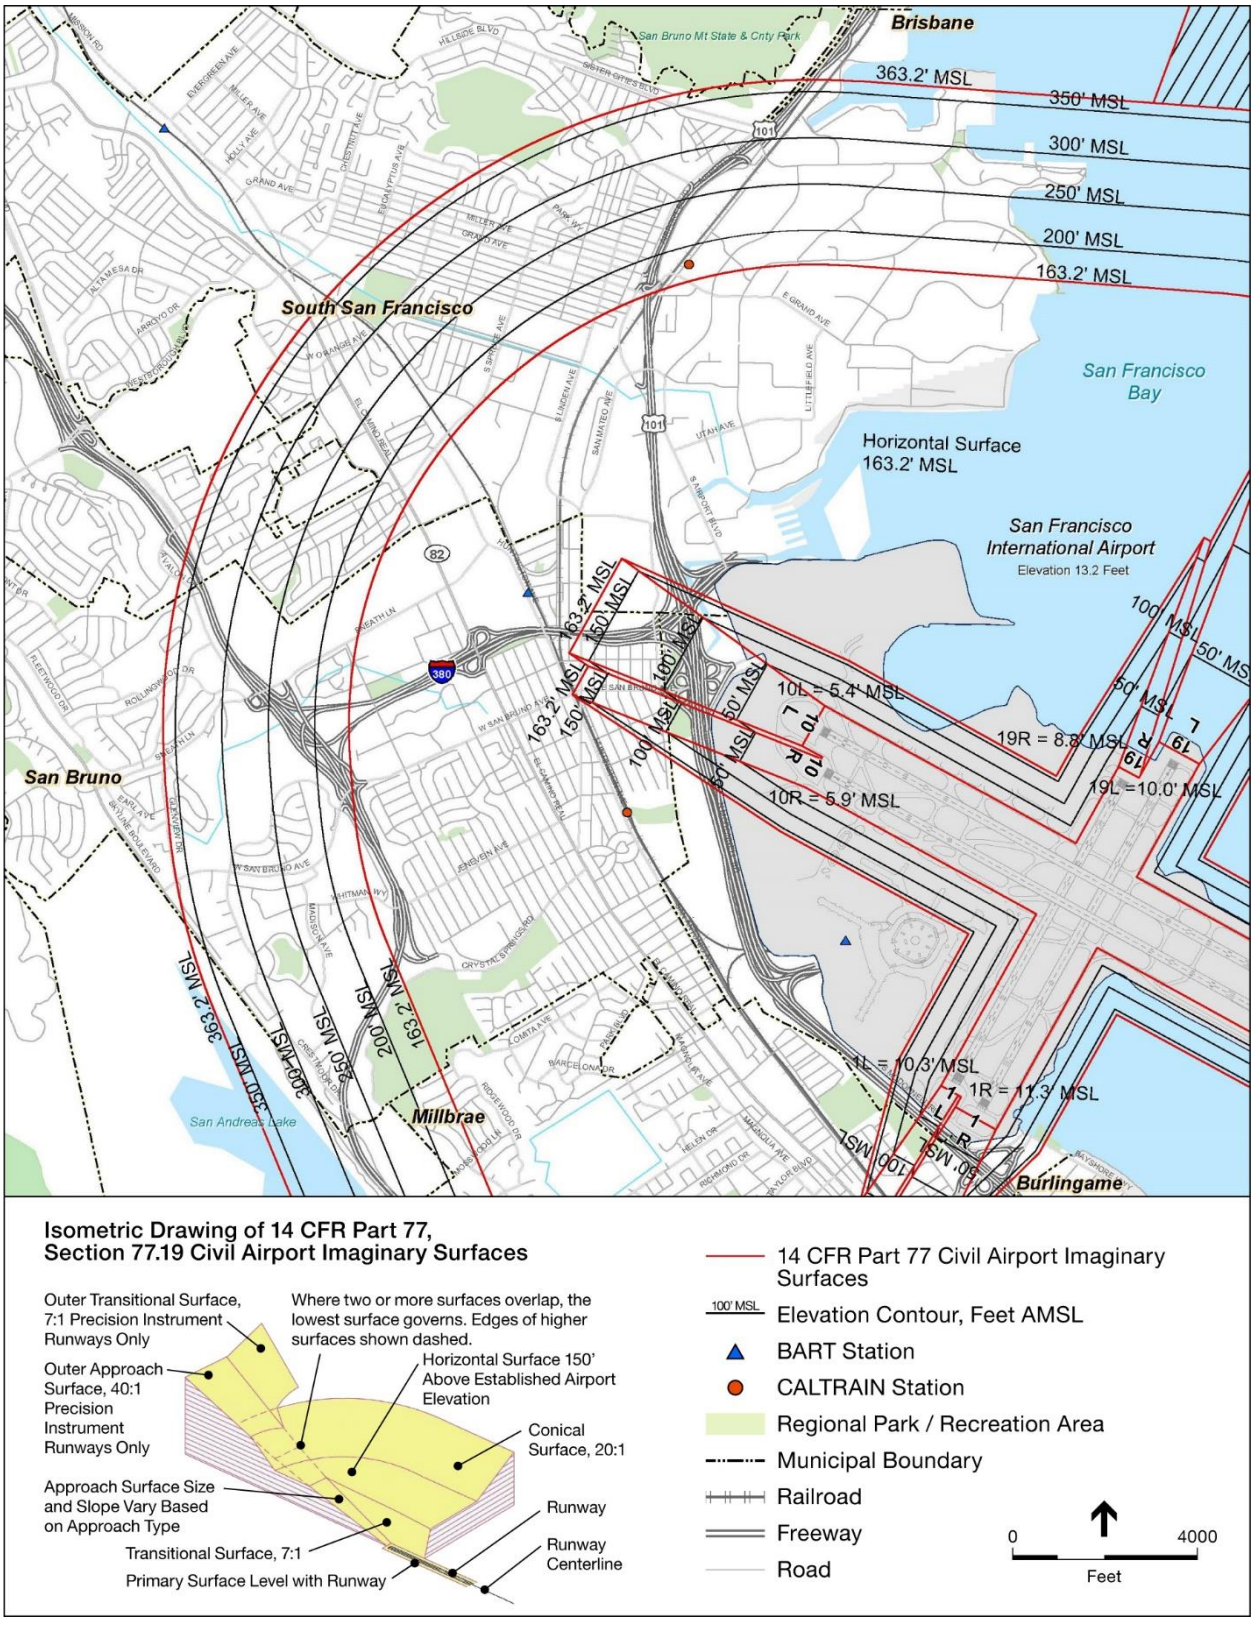
- Terrain Penetrations of Airspace Surface
- Less than 30
- 30-65
- 65-100
- 100-150
- 150-200
- 200 and more

§77.9(c): Roadways, railroads, and waterways are evaluated based on heights above surface providing for vehicles: by specified amounts or by the height of the highest mobile object normally traversing the transportation corridor; §77.9(d): Any construction or alteration on any public use or military airport (or heliport).

Structure proponents or their representatives may file via traditional paper forms via US mail or online at the FAA's OE/MA website, http://oeaaa.faa.gov

- BART Station
- CALTRAIN Station
- Municipal Boundary
- Railroad
- Freeway
- Road

Figure 4.13-7: Airport Imaginary Surface Areas



Significance Conclusion for Impact HAZ-4

Because the Specific Plan area is not within SFO's 65 dB CNEL, an Airport Safety Compatibility Zone, FAA Notification Area, or Airport Imaginary Surface area, the SFO Airport Land Use Compatibility Plan does not identify any land use restrictions due to the location of the Baylands in relation to SFO. Thus, development of the Specific Plan is consistent with the adopted Comprehensive Airport Land Use Compatibility Plan for the Environs of San Francisco International Airport and would not result in a safety hazard or excessive noise for people residing or working in the Specific Plan area due to aircraft operations.

Impacts of Baylands development in relation to SFO airport operations would be less than significant.

e. Impact HAZ-5: Emergency Preparedness

Methodology for Determining Significance

Threshold HAZ-5 addresses the four phases of emergency response outlined in the City of Brisbane's November 2018 *Emergency Operations Plan* and provide clear performance standards and an analytical framework for determining whether Baylands development would impair implementation or physically interfere with of the City's adopted emergency response plan. Impairing any of the identified phases of emergency response would therefore be indicative of a significant impact.

Impact Assessment

Emergency Preparedness

Emergency preparedness includes actions taken in advance of an emergency to plan for and establish resources to respond to and recover from an emergency. This includes a formal emergency operations plan for responding to and recovering from emergencies and maintaining adequate emergency response personnel, supplies, equipment, and infrastructure to respond to and recover from an emergency. It also includes the establishment and maintenance of police and fire emergency personnel and facilities along with standards and requirements for development of residential and non-residential uses and infrastructure.

Development of the 2,200 dwelling units, along with up to 6.5 million square feet of commercial office development and an additional 500,000 square feet of hotel use permitted by the Specific Plan would increase Brisbane's 2022 population of 4,661 by approximately 4,905 residents and increase the City's estimated 2022 employment base of 13,000 by up to 19,480 jobs. To accommodate this doubling of the City's population and employment base would require a major update to the City's Emergency Operations Plan to address both the substantial new

demand that Baylands development would place on emergency services along with the new police and fire facilities and capabilities that would be provided by Specific Plan development. While the Specific Plan would necessitate updating the City's Emergency Operations Plan, it would not interfere with the City's ability to prepare and maintain an updated Emergency Operations Plan or perform other emergency preparedness activities.

Emergency Access

NUMBER OF ACCESS POINTS

As shown in **Figure 3-8** through **Figure 3-11**, each block designated for development of residential, commercial, and amenities within the Specific Plan area would have at least two points of access that would allow residents and/or workers on that block to evacuate without impeding access by emergency vehicles arriving on-site, including frontage on two or more roadways. As shown in **Figure 3-12**, Sustainable Infrastructure Block E4 has roadway access only along Tunnel Avenue. The elongated shape of Block E4 provides the ability to provide multiple points of access from Tunnel Avenue to each infrastructure use within the Block. The Specific Plan provides two points of access such that development would allow workers on that block to evacuate without impeding access by emergency vehicles arriving on-site.

EMERGENCY ACCESS DURING FLOOD EVENTS

The Specific Plan provides for adequate emergency access that would allow residents and/or workers to evacuate without impeding access by arriving emergency vehicles. As shown in **Figure 3-5**, except for the Amenity area that would front on two streets, each block within the Specific Plan area would front on at least three and in many cases four streets.

The Baylands primary roadway system would remain open for emergency access and evacuation in the event of flooding based on the following standards set forth in Specific Plan:

- On-site storm drainage collection facilities would be sized to convey the peak flow rate from a 25-year storm event entirely within the piping system such that Baylands roadways and recreational facilities are not flooded.
- Drainage improvements would accommodate the 100-year peak storm event within the piping system and within streets such that building finished floor elevations provide a minimum of 1 foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and 100 years of estimated sea level rise.
- Key Baylands roadways including Sierra Point Parkway, Lagoon Road, and Tunnel Avenue would remain available as evacuation routes in the event of a 100-year storm event with tidal flow and 100 years of estimated sea level rise.

Provision of Adequate Fire Flow and Fire Hydrants

As part of Baylands development, an on-site water storage tank would be constructed to provide adequate fire flow per the requirements of the North County Fire Authority, City of Brisbane, and the California Water Company (Cal Water). In addition, Cal Water and the North County Fire Authority would review water facility engineering plans to ensure that each increment of development is provided with adequate water pressure.

Site-Specific Development On-Site Safety Measures

Standard City practice is to have site-specific development projects reviewed by the North County Fire Authority in addition to the City to ensure adequate access for fire apparatus to hydrants, including adequate room for turning movements. It would also standard City practice to have the Brisbane Police Department and North County Figure Authority review site-specific development projects within the Baylands to ensure easy identification of building addresses and adequate access for emergency responders to building entries.

The City's Public Works Department and the North County Fire Authority would additionally review site-specific development plans as well as roadway and water facilities engineering plans to ensure that the placement of fire hydrants meets applicable requirements, including proper spacing, access, and identification. California Water Company would review site-specific development and water facilities engineering plans to ensure adequate water pressure and fire flows in addition to the Public Works Department and North County Fire Authority.

Site-specific multi-family residential, commercial, retail, and hotel development would also be reviewed by the City and North County Fire Authority to ensure that each building site is provided with a safe outdoor space for people to gather in the event of an emergency requiring a building to be evacuated.

Emergency Response

Emergency response activities are actions taken during, or in the immediate aftermath, of a critical incident to reduce actual impacts. Emergency response actions could include public warnings, evacuations, resource mobilization and staging, and responses from agencies including law enforcement, fire protection, emergency medical services, utilities, and public works.

As discussed in Section 4.8, *Transportation*, Baylands construction (e.g., for utility and roadwork) would require temporary closure of traffic lanes on roadways within and adjacent to the site. This could impede emergency response and evacuation activities; however, any construction activities that would result in temporary roadway closures would be required to obtain traffic permits from the City and prepare a Traffic Control Plan, which would maintain emergency response and evacuation access through appropriate traffic control measures and detours.

Police and Fire Emergency Response during Peak Travel Hours

During the weekday p.m. peak hour, traffic along Geneva Avenue will range from 2,300 to 3,200 vehicles per hour. As discussed in Section 4.8, *Transportation*, the Specific Plan proposes a four-lane road section on the Geneva Avenue bridge over Caltrain, modifying the six-lane road section that will be constructed to either side bridge by merging bus rapid transit lanes into "mixed flow" travel lanes. This reduction in width would require emergency responders to maneuver through congested traffic on the bridge without any room to maneuver around traffic. As a result, emergency response from the new fire station to be located within the northeastern portion of the Baylands to lands west of the Caltrain right-of-way would be delayed by more than 1 minute during the weekday p.m. peak hour. Police response from the western to the eastern portion of the Baylands would be similarly delayed.

Recovery from an Emergency

Recovery from an emergency is highly dependent on the nature, type, extent, and severity of the short- and long-term damage caused by the emergency, and can include post-emergency safety/damage assessments, short-term and long-term cleanup and construction activities, and administration of recovery assistance programs. In combination with available resources, the same physical features that facilitate emergency response – access, emergency water supply availability, and others -- facilitate response and recovery.

The City, in combination with other agencies, would undertake review of specific development plans, addressing issues that would assist with recovery from an emergency. Such reviews include:

- Review by the City's Public Works Department and the North County Fire Authority would ensure that Specific Plan development provides adequate access and maneuvering room for fire apparatus to facilitate recovery efforts.
- Review by the City's Public Works Department and the North County Fire Authority would ensure the placement of fire hydrants meets applicable requirements, including proper spacing, access, and identification, that adequate water pressure will be maintained, and that the site is provided with a safe outdoor space for people to gather in the event of an emergency requiring evacuation of one or more buildings.
- Relocating the Brisbane Fire Station includes expanding training facilities and provides additional space for emergency operations management that could facilitate recovery from an emergency.

Thus, Baylands development would be designed and constructed so as to facilitate emergency response, and the Specific Plan would not impair emergency recovery.

Reduce the Potential for Emergencies

As discussed in Chapter 3, *Project Description*, and throughout this chapter, the Baylands Specific Plan and EIR mitigation measures to reduce or eliminate short- and long-term risks from natural and manmade hazards, include, but are not limited to:

- Baylands development would follow the recommendations of site-specific geotechnical recommendations and be required to comply with applicable building codes and requirements of site remediation and landfill closure plans.
- Baylands roadways, utilities, and other infrastructure would be constructed in compliance with applicable design standards. Operations would comply with applicable federal, state, regional, and local laws, requirements, and standards.
- The Bayshore Mobility Plan will reduce travel speeds and increase the safety of travel.

Significance Conclusion for Impact HAZ-5

The Specific Plan development would not interfere with implementation of an adopted emergency plan, impede evacuation routes, or restrict access for emergency response or recovery. Development review by the City of Brisbane, in combination with review by the North County Fire Authority, would ensure availability of needed evacuation routes and access for emergency response personnel, provision of adequate fire flow and on-site safety measures, implementation of measures to reduce the potential for emergencies, and expand facilities needed to respond to emergencies. Impact HAZ-5 would be less than significant.

4.14 HYDROLOGY AND WATER QUALITY

4.14.1 INTRODUCTION

a. Overview

This section describes existing environmental conditions in relation to water quality, flooding, and groundwater management; evaluates the physical environmental changes that would result from the 2025 Specific Plan project; and identifies needed mitigation measures to address significant impacts. The discussion of flooding considers projected sea level rise (SLR) through the end of the century.

Groundwater conditions and impacts in relation to existing contamination and remediation are addressed in Draft EIR Section 4.13, *Hazards and Hazardous Materials*. Issues related to the capacity and construction of stormwater drainage facilities are addressed in Section 4.16, *Utilities, Service Systems, and Water Supply*.

b. Definitions

100-year flood, base flood refers to a flood that has a 1 percent statistical chance of occurring in any given year. The 100-year flood can, however, occur in consecutive years or multiple times within any given year.

100-year storm is a storm event that has a 1 percent statistical chance of occurring in any given year. The 100-year storm can, however, occur in consecutive years or multiple times within any given year.

Aquifer refers to a body of rock or sediment that is sufficiently porous and permeable to store, transmit, and yield significant or economic quantities of groundwater to wells and springs.

Basin plan refers to a water quality control plan developed pursuant to the federal Clean Water Act[309] Section 13240. The Basin Plan is a master policy document that contains descriptions of the legal, technical, and programmatic bases of water quality regulation in the region. The Basin Plan must include (1) a statement of beneficial water uses that the Regional Water Quality Control Water Board (RWQCB) will protect, (2) the water quality objectives needed to protect the designated beneficial water uses, and (3) the strategies and time schedules for achieving the water quality objectives. Factors to be considered by an RWQCB in establishing water quality objectives must include, but are not necessarily limited to, all of the following: (1) past, present,

[309] The Clean Water Act was originally known as the Federal Water Pollution Control Act of 1948, which was the first major U.S. law to address water pollution. Concern for controlling water pollution led to sweeping amendments in 1972. As amended in 1972, the law became commonly known as the Clean Water Act.

and probable future beneficial uses of water; (2) environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto; (3) water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area; (4) economic considerations; (5) the need for developing housing within the region; and (6) the need to develop and use recycled water.

Best management practices (BMPs), in relation to stormwater management, are control measures taken to mitigate changes to both quantity and quality of urban runoff caused through changes to land use. BMPs are designed to reduce stormwater volume, peak flows, and/or nonpoint source pollution through evapotranspiration, infiltration, detention, and filtration or biological and chemical actions. Stormwater BMPs are often classified as "structural" (i.e., devices installed or constructed on a site) or "non-structural" (procedures, such as modified landscaping practices). The U.S. Environmental Protection Agency (USEPA), California Stormwater Association, and Caltrans publish lists of stormwater BMPs for use by local governments, builders, and property owners.

Bioretention is a type of stormwater management practice that uses shallow, landscaped depressions or vegetated areas to capture, store, and treat runoff, utilizing soil and vegetation to filter pollutants and promote infiltration with the remaining design flow or volume of runoff released back into the storm drain system. A bioretention area may be lined or unlined.

C.3 refers to the provision of the Municipal Regional Stormwater NPDES Permit (MRP) that requires each Permittee to control the flow of stormwater and stormwater pollutants from land development projects (i.e., C.3 Regulated Projects or Regulated Projects). Provision C.3 also requires municipalities to implement Green Infrastructure (GI) Plans and various other GI-related actions/projects.

C.3 Regulated Projects refers to development projects subject to stormwater control requirements as defined by Provision C.3.b.ii of the MRP. This includes public and private projects that create and/or replace quantities of impervious surface above specific thresholds defined in the MRP.

Detention means the temporary storage of stormwater runoff in ponds, vaults, within berms, or in depressed areas to allow treatment by sedimentation and metered discharge of runoff at reduced peak flow rates. See also "Infiltration" and "Retention."

Discharge refers to a release or flow of stormwater or other substance from a conveyance system or storage container.

Emergent groundwater refers to the process of groundwater rising upward so that it emerges on the land surface and floods low-lying areas.

Green Infrastructure refers to stormwater infrastructure that uses vegetation, soils, and natural processes to manage water for healthier urban environments. At the scale of a development the

size of the Baylands, Green Infrastructure refers to stormwater management systems that mimic nature by soaking up, storing, and/or improving the quality of water.

GreenSuite Guidance Materials refers to the guidance materials prepared as part of the San Mateo Countywide Water Pollution Prevention Program (Countywide Program). GreenSuite guidance materials consist of the C.3 Regulated Projects Guide and the Green Infrastructure Design Guide.

FEMA refers to the Federal Emergency Management Agency.

Flood Insurance Rate Map (FIRM) refers to the official map on which the Federal Emergency Management Administration has delineated both the Areas of Special Flood Hazards and the risk premium zones applicable to the community.

Flooding refers to any condition in which the soil surface is temporarily covered with flowing water from any source, such as streams overflowing their banks, runoff from adjacent or surrounding slopes, inflow from high tides, or any combination of sources. It is distinguished from **ponding,** in which the soil surface is temporarily covered by standing water at a low point. Ponded water is typically removed by percolation, transpiration, stormwater management, or evaporation or by a combination of these processes.

Frequency (inundation) refers to the average frequency of flooding by surface water or soil saturation. It is usually expressed as the number of years (e.g., 50 years) that the soil is inundated or saturated at least once during a year.

Groundwater includes water that occurs beneath the land surface and fills the pore spaces of the alluvium, soil, or rock formation in which it is situated. It excludes soil moisture, which refers to water held by capillary action in the upper unsaturated zones of soil or rock.

Groundwater basin refers to any basin identified in the California Department of Water Resources (DWR) "California's Groundwater: Bulletin No. 118" (September 1975, updated 2003), and any amendments to that bulletin, but does not include a basin in which the average well yield, excluding domestic wells that supply water to a single-unit dwelling, is less than 100 gallons per minute.

Groundwater table refers to the upper surface of the zone of saturation in an unconfined aquifer.

Impervious Surface means a constructed surface covering or pavement that prevents the land's natural ability to absorb and infiltrate rainfall/stormwater. Typical impervious surfaces include, but are not limited to, roof tops; walkways; patios; driveways; parking lots; storage areas; impervious concrete and asphalt; gravel areas not built as pervious pavement systems; and any other continuous watertight pavement or covering. Landscaped soil and pervious pavement systems, including pavers with pervious openings and seams, underlain with pervious soil or

pervious storage material, such as an aggregate layer sufficient to hold at least the Provision C.3.d volume of rainfall runoff, are not impervious surfaces as long as infiltration into native soil can occur. Open, uncovered retention/detention facilities are not considered impervious surfaces for purposes of determining whether a project is a Regulated Project under Provisions C.3.b and C.3.g. Open, uncovered retention/detention facilities are considered impervious surfaces for purposes of runoff modeling and meeting the Hydromodification standard.

Infiltration means the downward entry of runoff from the surface into the soil.

Integrated pest management refers to an approach to weed and pest control that aims to avoid/reduce the use of chemicals (i.e., pesticides and herbicides). Integrated pest management uses regular monitoring to determine if and when treatments are needed and employs physical, mechanical, cultural, biological, and educational tactics to keep pest numbers low enough to prevent unacceptable damage or annoyance.

Inundation is the condition in which water from any source temporarily or permanently covers a land surface.

Low-impact development (LID) is an approach to land development that uses various land planning and design practices and technologies to simultaneously conserve and protect natural resource systems and reduce infrastructure costs. Typically, emphasis is on employing natural and constructed features that reduce the rate of stormwater runoff, filter out pollutants, facilitate stormwater storage on-site, infiltrate stormwater into the ground to replenish groundwater supplies, or improve the quality of receiving groundwater and surface water.

Municipal Stormwater Permit is the Phase I municipal stormwater NPDES permit under which discharges are permitted from municipal separate storm sewer systems throughout San Mateo County and other NPDES Phase I jurisdictions within the San Francisco Bay Region. The current Municipal Stormwater Permit (Order No. R2-2022-0018) was adopted on May 22, 2022.

National Flood Insurance Program (NFIP) refers to the federal program that authorizes the sale of federally subsidized flood insurance in communities where such flood insurance is not available privately.

National Pollutant Discharge Elimination System (NPDES) refers to the provision of the federal Clean Water Act that prohibits discharge of pollutants into waters of the United States unless a special permit is issued by USEPA, a state, or another delegated agency.

NAVD88 (North American Vertical Datum of 1988) refers to the vertical datum for orthometric heights established for vertical control surveying in the United States based upon the General Adjustment of the North American Datum of 1988, which serves as the standard for determining all vertical elevations, such as that of building floors and sea level.

Nonpoint source pollution refers to pollution that enters water from dispersed and uncontrolled sources, such as surface runoff, rather than through pipes. Nonpoint sources (e.g., landscape practices, on-site sewage disposal, and automobiles) may contribute pathogens, suspended solids, and toxicants to water bodies. While individual sources may seem insignificant, the cumulative effects of nonpoint source pollution can be significant.

Non-stormwater discharge includes any discharge that is not entirely composed of stormwater except those noted within an NPDES permit.

NPDES Permit is an authorization, license, or equivalent control document issued in California by Regional Water Quality Control Boards to implement the requirements of the National **Pollutant Discharge Elimination System (NPDES)** program for the discharge of pollutants from municipal sanitary sewers and industries as well as stormwater discharges.

Pervious Surface includes, but is not limited to, any of the following types of properly designed pavement systems: permeable interlocking concrete pavement (permeable pavers); pervious or permeable concrete unit pavers; reinforced grid paving containing either gravel or turf; modular pre-cast and poured-in-place pervious concrete; porous asphalt; turf block; grasscrete; suspended decking and boardwalks; porous rubber; and clay/concrete bricks and stones set on an aggregate base with aggregate in the joint spaces (not sand). Pervious pavement systems are designed to store and infiltrate rainfall at a rate equal to or greater than the immediately surrounding unpaved, landscaped areas, or store and infiltrate the rainfall runoff volume described in Provision C.3.d of the MRP. Pervious pavement must be able to infiltrate water into the ground (native soil) in order to be considered a pervious surface and qualify as LID.

Pollutant refers to a substance introduced into the environment that adversely affects or potentially affects the beneficial use of the receiving water.

Pollutant of concern refers to a contaminant that would contribute to impairments in downstream receiving waters.

Receiving waters refers to water bodies (including streams or rivers, existing lakes, or the ocean) that receive treated or untreated runoff from upland areas.

Rip rap means a layer of unconsolidated boulders, stone, rubble, concrete without protruding rebar, or similar materials placed on or near a shoreline to mitigate wave impacts and prevent erosion.

Retention means the capture and storage of stormwater to prevent it from leaving the site.

Sedimentation refers to the process of depositing soil particles, clays, sands, minerals, or other sediments being washed from land, roofing, and pavements into storm drains and drainage channels usually after rain, which accumulate in receiving waters.

Seiche is a surface wave created when a body of water is shaken, usually by earthquake activity.

Siltation refers to the accumulation of fine sediment particles, particularly silt, in runoff, streams, and water bodies. While both siltation and sedimentation are related to the accumulation and settling of soils, "siltation" specifically refers to the accumulation and settling of fine sediments (e.g., silt).

Stormwater refers to discharges generated by runoff from land and impervious areas, such as paved streets, parking lots, and building rooftops, due to rainfall and snow events that often contain pollutants in quantities that could adversely affect water quality. Most stormwater discharges are considered point sources and require coverage by a NPDES permit.

Stormwater Pollution Prevention Plan (SWPPP) is a plan describing the temporary BMPs used to prevent erosion and control sediment and other pollutants during construction of a project.

Stormwater Treatment Measures are engineered systems designed to remove pollutants by gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process. Sometimes called a treatment control, treatment control measure, or treatment control BMP.

Surface water refers to water present above the substrate or soil surface.

Tidally influenced refers to that portion of a waterway or body of water subject to inundation or changes in water level in response to the daily ebb and flow of tides.

Total maximum daily load (TMDL) is a regulatory term in the U.S. Clean Water Act, describing a plan for restoring impaired waters that identifies the maximum amount of a pollutant that a body of water can receive while still meeting water quality standards.

Tsunami refers to the ocean waves caused by a sudden displacement of the ocean floor, most often due to earthquakes. Tsunamis are sometimes referred to as "tidal waves" due to their common appearance as that of an extraordinarily high, rapidly rising, and forceful tide. The use of this term to describe tsunamis is discouraged by the scientific community, however.

4.14.2 PHYSICAL ENVIRONMENTAL SETTING

a. Baseline

As permitted by CEQA Guidelines Section 15125 (a)(1), in addition to existing drainage and water quality conditions (as of spring 2023) comprising the baseline for analysis of hydrology and water quality impacts, this section includes projected sea level rise through the Year 2100 in the baseline for analysis of flooding. Projected sea level rise as used in the baseline for flooding analysis is based on the 2024 State of California Sea Level Rise Guidance (Sea Level Rise Guidance), developed by the Ocean Protection Council (OPC), which provides a framework for

State agencies and local governments to factor climate change and associated impacts into planning and development decisions.

b. Topography and Existing Drainage Patterns

The Specific Plan area is located on the eastern flanks of the San Francisco Peninsula, which is characterized by a northwest-trending coastal mountain range with drainages that flow either to the Pacific Ocean or toward San Francisco Bay. The Baylands has a varying topography across the site, with grades at Visitacion Creek being the lowest and Icehouse Hill being the highest.

Within the western portion of the Baylands, grades are generally flat with ground slopes projecting from the edge conditions toward a dirt drainage channel running parallel to and east of the Industrial Way buildings. Portions of the Baylands near the Roundhouse and Industrial Way areas drain toward an existing low point elevation of approximately 9 feet near the intersection of Bayshore Boulevard and Industrial Way. The highest elevations are found on top of Icehouse Hill.

Topography within the eastern portion of the Baylands is dominated by the former Brisbane Landfill. After the landfill stopped receiving waste in 1967, the site was used for soil recycling, both receiving and selling fill soil. Soil recycling operations caused the landfill's height to frequently increase and decrease over the years as soil materials were imported and exported. Because of the soil recycling operation, the site has many dirt mounds with adjacent flat areas that provided access for trucks moving dirt. Visitation Creek divides the site perpendicular to Highway 101 into two areas and collects runoff from the majority of the area east of Caltrain. The northernmost areas east of Caltrain slope gently toward Beatty Avenue, while the southernmost areas slope gently toward the Brisbane Lagoon. Elevations east of Caltrain range from approximately elevation -3 feet at the existing drainage channel bottom adjacent to the Highway 101 box culvert, to approximately 80 feet atop the highest dirt mound within the former landfill (BKF 2023).

The Baylands site is located within three drainage areas (see **Figure 3-47**):

- Bayshore: 422 acres
- Brisbane Lagoon: 52 acres
- Beatty Avenue: 46 acres

Bayshore Drainage Area

The Bayshore drainage area is relatively steep and well-defined, bounded on the west and south by the slopes of San Bruno Mountain. The Bayshore drainage area is divided into an "Upper Reach" and a "Lower Reach." Encircling the upstream portion of the Bayshore drainage area west of Bayshore Boulevard, the Upper Reach carries stormwater runoff from portions of Daly

City, Brisbane, and San Francisco. Located entirely within the City of Brisbane, the Lower Reach drainage area conveys stormwater runoff from approximately 422 acres of the Baylands east of Bayshore Boulevard along with flows from the Upper Reach of the drainage area.

Flows from both reaches are discharged to the San Francisco Bay through an existing 10-foot by 10-foot box culvert under US 101 (BKF 2023), which experiences friction losses due to buildup of sediment and refuse. With sufficient precipitation and tidal action, the San Francisco Bay outfall will be submerged; however, water will not overtop the upstream drainage channel due to excess channel capacity.

Upper Reach Drainage Facilities

Drainage facilities within the Upper Reach of the Bayshore Drainage Area are described in the Baylands Infrastructure Study (BKF 2023) and include the following.

- **Daly City Storm Drain Network:** The Daly City storm drain network encompasses the western, upstream portion of the Upper Reach, where the highest elevations are located. Much of the runoff from the steeper areas travels along surface routes through natural channels and street gutters before entering the pipe network. The Daly City storm drain network terminates in a 60-inch-diameter inverted siphon that discharges to the upper open channel on PG&E's Martin Substation on Geneva Avenue.
- **Upper Open Channel:** The Daly City storm drain system discharges from the 60-inch-diameter inverted siphon at the eastern end of Midway Village into a 1,300-foot-long open channel. The channel winds its way across the southern portion of the Martin Substation and the Levinson Property in Brisbane to Bayshore Boulevard. There it discharges to a 90-foot-long, 8-foot by 5-foot box culvert connected to a 54-inch storm drain culvert under Bayshore Boulevard. In the 1990s, the existing headwall and inoperable weir at the discharge point of the open channel was replaced by the City of Brisbane to improve system efficiency by allowing unrestricted flow to the box culvert and subsequent 54-inch storm drain line under Bayshore Boulevard.
- **Levinson Overflow Area:** This 3.8-acre parcel, also referred to as the Levinson Detention Basin, is located on the west side of Bayshore Boulevard across from the Baylands at the northwest corner of Main Street and Bayshore Boulevard. The parcel is currently undeveloped and occasionally ponds due to direct precipitation, overflow runoff from the adjacent Martin Substation, and overtopping of the contiguous upper open channel. Fed by a sideways weir in the upper open channel, an approximately 6.5-foot-deep, 2.5-acre detention basin acts to alleviate downstream and Bayshore Boulevard flooding. During a 100-year design storm event, the water level of the detention basin exceeds the height of the berm and overflows onto Bayshore Boulevard.
- **Bayshore Boulevard Drainage Facilities:** Bayshore Boulevard has a low point of approximately 9 feet NAVD88 located 450 feet north of the Bayshore box culvert.

Bayshore Boulevard is currently drained by a 4-foot by 3-foot box culvert located on the west side of the street and two 24-inch-diameter parallel storm drain lines on the east side of the street. The box culvert and two parallel storm drain lines discharge into the 54-inch storm drain under Bayshore Boulevard.

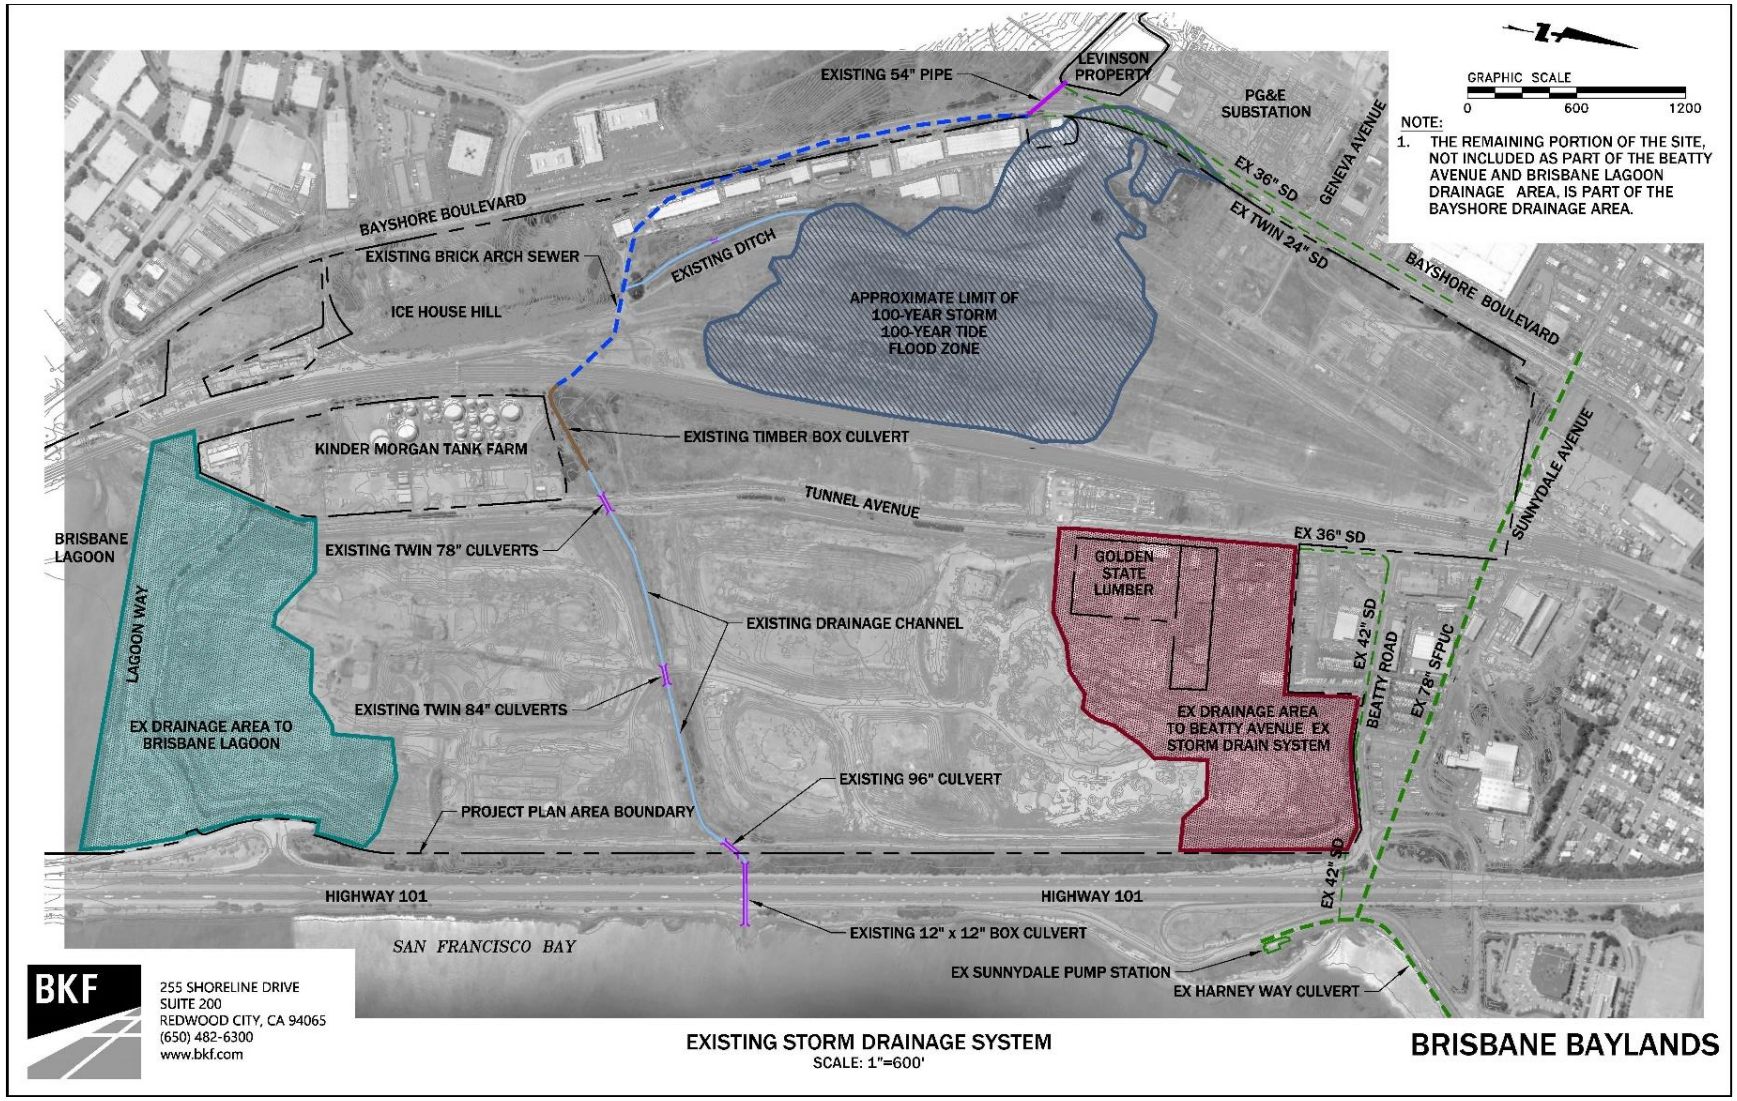
- **Brick Arch Sewer:** Stormwater from both the 8-foot by 5-foot box culvert and Bayshore Boulevard drainage facilities discharges through the 54-inch storm drain line under Bayshore Boulevard into a 3,500-foot-long, 7.5-foot-high by 8-foot-wide brick arch sewer. The brick arch sewer conveys flows from the outlet of the Bayshore Boulevard 54-inch storm drain line along Bayshore Boulevard, through the western portion of the Baylands, under the Caltrain right-of-way, and to the final discharge point on the east side of the site.

Lower Reach Drainage Facilities

Drainage facilities within the Lower Reach of the Bayshore Drainage Area are described in the Baylands Infrastructure Study (BKF 2023) and include the following.

- **Railyard Drainage Channel:** An earthen drainage channel parallels the existing Industrial Way for about 2,400 feet. The average channel bottom width is about 6 feet, and the average top width is about 18 feet. The railyard channel discharges to the brick arch sewer about 500 feet upstream of the Caltrain right-of-way.
- **Timber Box Culvert:** The brick arch sewer discharges to a 440-foot long, 5.3-foot-wide by 10-foot-high timber box culvert located in the western portion of the Baylands. The timber box culvert conveys flow from the Caltrain right-of-way to the lower open channel (see below) approximately 150 feet west of Tunnel Avenue. Due to its limited capacity and disrepair, the timber box culvert is recommended for removal.
- **Lower Drainage Channel:** The lower drainage channel is a 2,400-foot-long section of open earthen channel located within the eastern portion of the Baylands. The average channel bottom width is approximately 17 feet, with an average top width of approximately 60 feet, and the channel is segmented by three road crossings. The western crossing at Tunnel Avenue and the central crossing consist of double 78-inch-diameter culverts. The eastern crossing consists of a single 96-inch-diameter culvert.
- **US Highway 101 Box Culvert:** The lower drainage channel discharges to San Francisco Bay through a 300-foot-long, 12-foot by 12-foot box culvert under US Highway 101.

Figure 4.14-1: Existing Storm Drainage System



Beatty Avenue Drainage Area

Within the northeastern portion of the Baylands, approximately 46 acres east of the Caltrain right-of-way drain into the Beatty Avenue storm drain system. Stormwater runoff is captured by a series of inlets in the local streets and conveyed northerly through a succession of 36-inch and 42-inch-diameter reinforced concrete pipes. This system connects to a 42-inch-diameter storm drain line on Beatty Avenue between Tunnel Avenue and Alana Way before discharging to a 42-inch-diameter storm drain line that crosses under Highway 101. The 42-inch-diameter storm drain line connects to a San Francisco 78-inch-diameter combined sewer main, which ultimately discharges to the Harney Way box culvert and into the Sunnydale pump station, located east of Highway 101 on Harney Way in Brisbane.

Brisbane Lagoon Drainage Area

Approximately 57 acres of the Baylands east of the Caltrain right-of-way drain to the 121.8-acre Brisbane Lagoon. Flows from the existing surface are conveyed through a series of shallow swales adjacent to Lagoon Way, and discharge through small culverts running under Lagoon Way. Upon exiting the Lagoon Way culverts, the flow continues overland southerly to the Brisbane Lagoon.

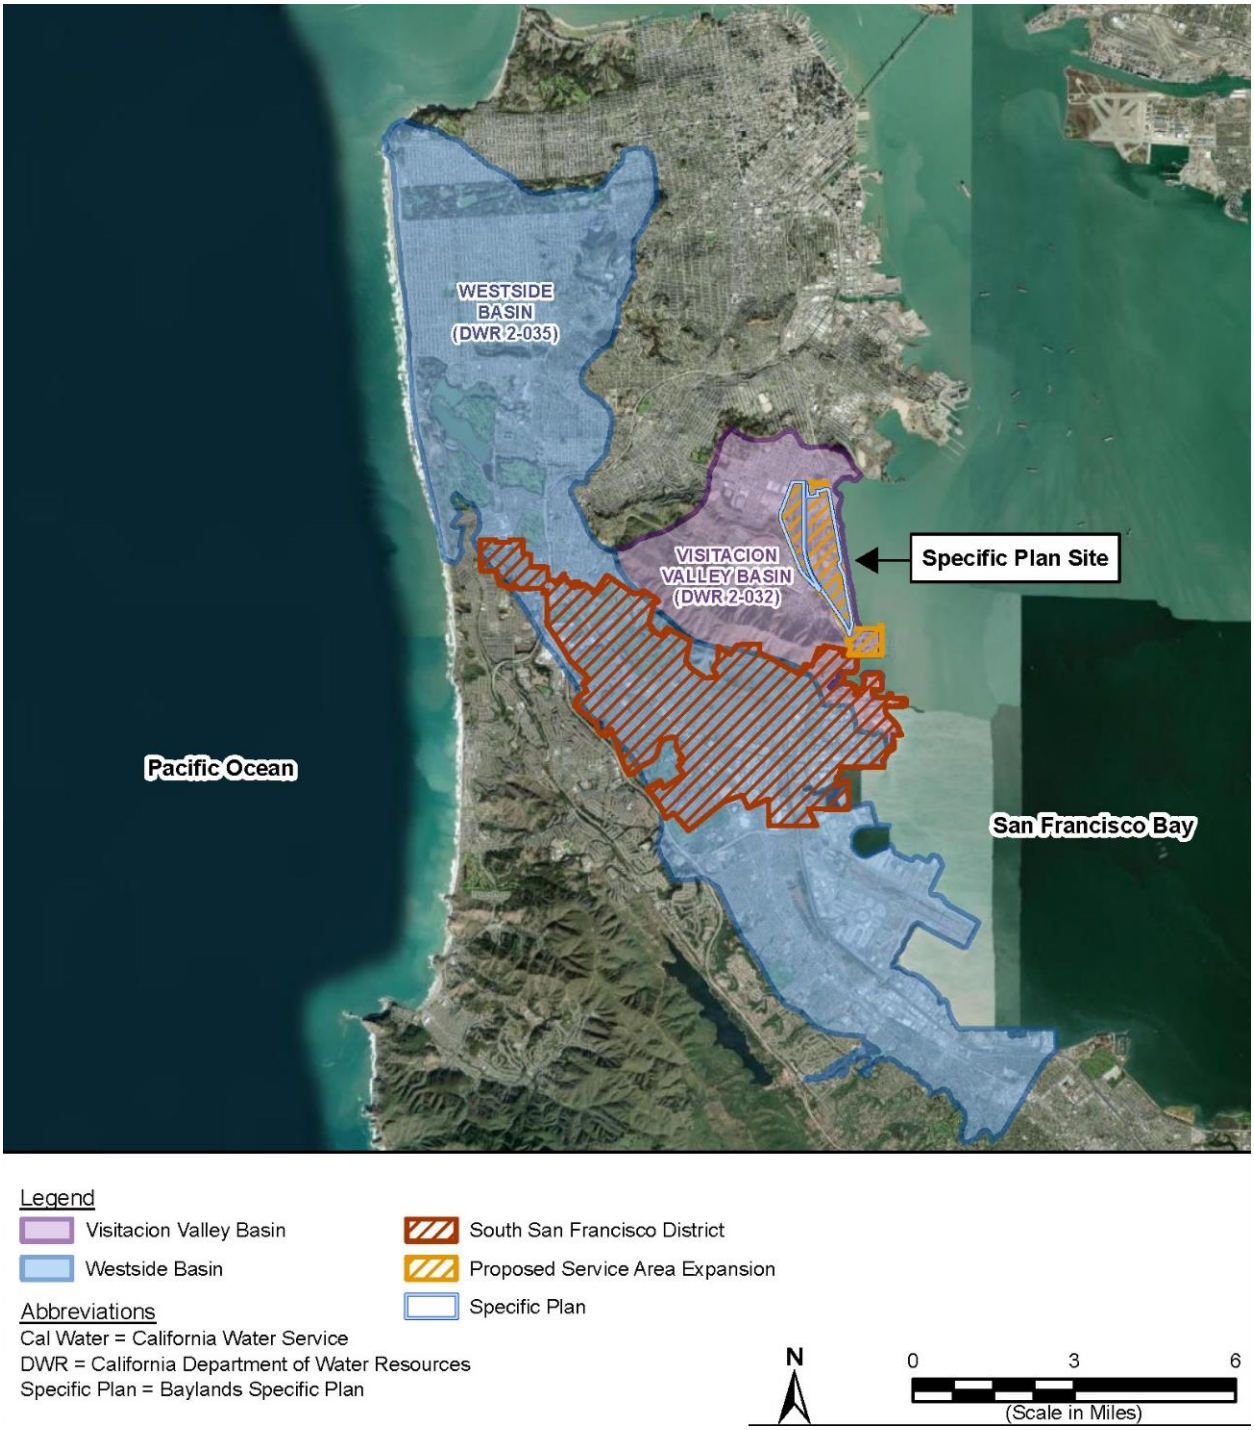
c. Existing Groundwater Conditions

The Visitacion Valley Groundwater Basin, within which the Baylands is located, encompasses a 5,830-acre area within San Francisco and northern San Mateo County (see **Figure 4.14-2**). The basin is roughly triangular in shape and is bounded by San Bruno Mountain on the southwest, the Islais Valley Groundwater Basin to the northwest, and the South San Francisco Groundwater Basin to the east. Geologically, the primary water-bearing formations consist of unconsolidated sediments, including dune sand, the Colma Formation (fine-grained sand, silty sand, and discontinuous beds of clay to 5 feet thick), bay mud and clay, and artificial fill that is largely composed of dune sand with lesser amounts of silt and clay, and some man-made debris. The unconsolidated material has a maximum thickness of 200 feet, indicating a relatively low storage capacity for groundwater and minimal protection from potential surface contamination.

A 2022 analysis of shallow groundwater conditions prepared by Geosyntec (see Appendix L.2) indicates that existing groundwater conditions vary throughout the site. Within the western portion of the Baylands, the groundwater table was observed in monitoring wells between approximately 4 to 6.5 feet NAVD88 during 2019 and 2022. Groundwater monitoring within the eastern portion of the Baylands identified groundwater elevations to be approximately 9 feet and 11 feet NAVD88 in the northern and southern portions, respectively. Groundwater near the Visitacion Creek channel and the edge of Brisbane Lagoon was found to be at approximately 3

to 4 feet NAVD88 and is generally 4 to 10.5 feet NAVD88 around the exterior of the landfill boundary. Fluctuations in the level of groundwater may occur due to variations in tidal fluctuations from the San Francisco Bay, earthwork activities, rainfall, irrigation practices, and other factors (Geosyntec 2022).

Figure 4.14-2: Visitacion Valley Groundwater Basin



As discussed in Section 4.16, *Utilities, Service Systems, and Water Supply*, Brisbane does not use groundwater from the Visitacion Groundwater Basin and purchases potable water from the San Francisco Public Utilities Commission (SFPUC). The California Water Service Company (Cal Water), which will provide water to the Baylands, Sierra Point, and Beatty areas, operates five groundwater production wells within the unadjudicated Westside Basin to supply its South San Francisco District. In its recent evaluation of California groundwater basins, DWR determined that the Basin was not in a condition of critical overdraft and designated the Basin as low priority (Cal Water 2024). From 2005 through 2024, Cal Water's South San Francisco District met up to 19 percent of its water demand from groundwater, excluding purchased in-lieu groundwater credits such as those purchased from SFPUC.

The Visitacion Valley Basin within which the Baylands, Siera Point, and Beatty areas are located is approximately 9.1 square miles and is physically bordered by a combination of surface water hydrologic boundaries, jurisdictional boundaries, and the extent of the San Francisco Bay shoreline. The Visitacion Valley Basin is categorized as a very-low priority basin according to the DWR Bulletin 118 basin priority classification (Cal Water 2024).

Like the Westside Basin, the Visitacion Valley Basin is not adjudicated, is not designated as high- or medium-priority, and is not critically over-drafted (Cal Water 2024). San Francisco overlies the northern portion of the Visitacion Valley Basin, and SFPUC applied to become the "Groundwater Sustainability Agency" for the portion of the Visitacion Valley Basin within San Francisco City/County limits. No entity has been designated as a Groundwater Sustainability Agency for the San Mateo County portion of the Visitacion Valley Basin. No groundwater sustainability plans have been developed for the Basin. As a very low-priority basin, compliance with Sustainable Groundwater Management Act within the Visitacion Valley Basin is "encouraged" but not required.

Groundwater beneath various portions of the Baylands contains pollutants at concentrations above regulatory action levels as the result of the former railyard and the former Brisbane Landfill.[310] Groundwater contamination has been the subject of longstanding remediation and final landfill closure planning efforts, culminating in State regulatory agency approvals of Feasibility Studies/Remedial Action Plans (FS/RAPs) for the western portion of the Baylands in 2022. Approved remedial action plans prohibit use of underlying groundwater without a Groundwater Management Plan pre-approved by the appropriate state regulatory agency. A similar prohibition is included in the Final Landfill Closure Plan for the former Brisbane Landfill, which has been conditionally approved by the Regional Water Quality Control Board.

[310] See Section 2.7, *Site Remediation and Title 27 Landfill Closure*, and Section 4.13, *Hazards and Hazardous Materials*, for more detail regarding groundwater contamination within the Baylands.

d. Flooding

Flood Insurance Rate Maps (FIRMs) prepared by FEMA (Community-Panel Number 06081C0035F) indicate portions of the Specific Plan area within 100-year special flood hazard zones (see **Figure 4.14-3**) (FEMA 2019). As shown, special flood hazard areas are identified north of Brisbane Lagoon and south of Lagoon Road, north of the Kinder Morgan Facility, between the railroad tracks and Tunnel Avenue, along Visitacion Creek, along US 101, and in the industrial areas along Bayshore Boulevard (FEMA 2019). A large portion of the area west of the railroad tracks is identified as being within the 500-year flood (0.2 percent Annual Chance Flood Hazard) area. The FIRMs show the remaining portions of the Specific Plan area as being outside the 100-year flood hazard area.

Existing Flooding Conditions within the Bayshore Drainage Area

Flooding conditions within the Bayshore Drainage Area are described in the Baylands Infrastructure Study (BKF 2023) and are summarized below.

Bayshore Boulevard

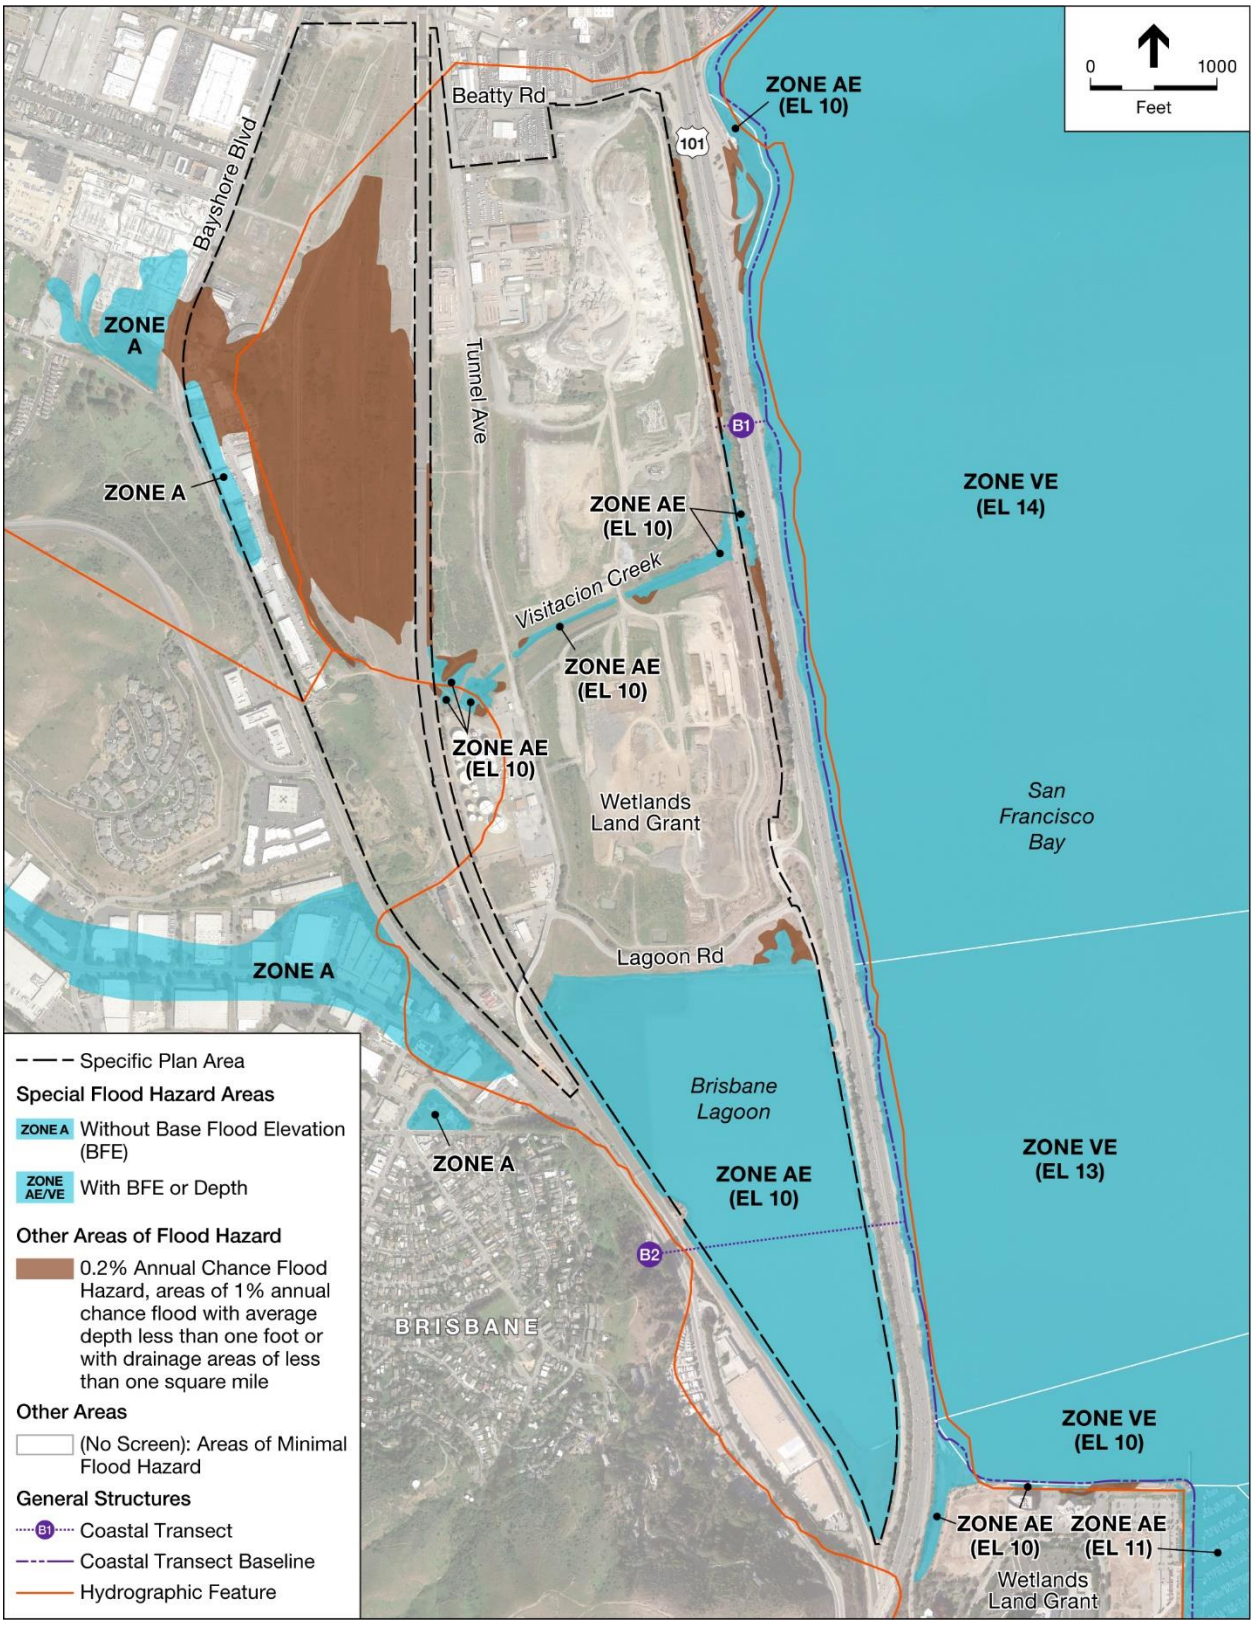
The top, or crown, elevation of the brick arch sewer is approximately 12.3 feet NAVD88 (approximately 3 feet above the low point on Bayshore Boulevard at Industrial Way). During a large storm event, stormwater from the brick arch sewer backflows into the Levinson Detention Basin.[311] When the stormwater runoff exceeds the capacity of the Levinson Detention Basin, water overtops its eastern berm and discharges to Bayshore Boulevard. In addition, runoff from the PG&E Martin Substation discharges overland to Bayshore Boulevard, increasing flood conditions during large storm events.

Former Rail Yard

As a result of stormwater runoff from Bayshore Boulevard and the railroad right-of-way, ponding occurs within the western portion of the Baylands at the outfall of the railyard drainage channel adjacent to Icehouse Hill. Overflow from the railyard drainage channel, east of and parallel to Industrial Way, further exacerbates flooding conditions during large storm events.

[311] As noted above, an approximately 6.5-foot-deep, 2.5-acre detention basin at the northwest corner of Main Street and Bayshore Boulevard acts to alleviate downstream and Bayshore Boulevard flooding. During a 100-year design storm event, the water level of the detention basin exceeds the height of the berm and overflows onto Bayshore Boulevard.

Figure 4.14-3: Special Flood Hazard Areas



SOURCE: FEMA, 2019

Timber Box Culvert

The existing timber box culvert is unable to convey the flow entering the eastern portion of the Baylands from the brick arch sewer. Due to disrepair and capacity deficiencies, ponding occurs during large storm events on a triangular portion of the site north of the timber box culvert and between the Caltrain right-of-way and Tunnel Avenue.

Existing Flooding in the Bayshore Boulevard/Industrial Way Area

The intersection of Industrial Way and Bayshore Boulevard is located at an existing low point along Bayshore Boulevard and is subject to inundation in a 100-year storm.

Existing Flooding in the Vicinity of the Kinder Morgan Tank Farm, City of Brisbane Corporation Yard, and Caltrain Right-of-Way

Existing grades within the eastern portion of the Baylands adjacent to the Kinder Morgan tank farm, Brisbane corporation yard, and the Caltrain right-of-way are subject to inundation in a 100-year flood.

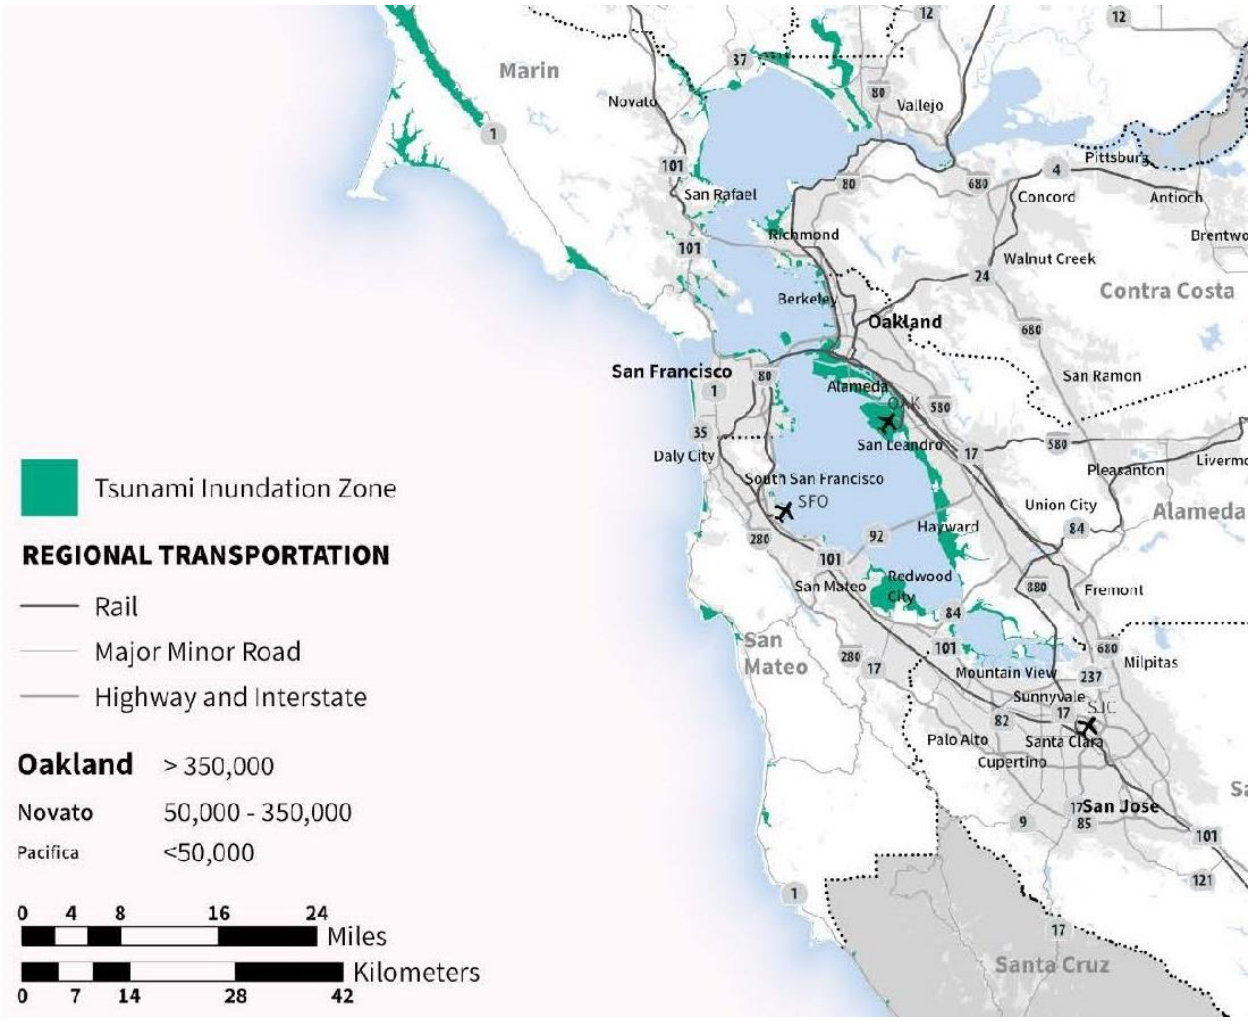
e. Tsunamis and Seiches

A tsunami is a series of waves generated in a body of water by a rapid disturbance (e.g., submarine seismic, volcanic, or landslide event) that vertically displaces water. Tsunamis affecting San Francisco Bay can result from offshore earthquakes within the Bay Area or from distant events. While it is most common for tsunamis to be generated by subduction faults, such as those in Washington and Alaska, local tsunamis can be generated from strike-slip faults (such as the small one that was triggered by the 1906 San Andreas earthquake). In general, a tsunami can move hundreds of miles per hour in the open ocean and reach land with waves as high as 100 feet or more.

According to the Plan Bay 2050 EIR, 51 tsunamis have been recorded or observed within the San Francisco Bay since 1850. Of these, the 1964 Alaska earthquake triggered by a 9.2 magnitude earthquake caused the most damage in San Francisco Bay. With a wave that was just under 4 feet in height, damage was limited to marinas and private boats in Marin County.

The geography of the bay reduces the risk of a large tsunami event (ABAG/MTC 2021). A seismic event on the Cascadia subduction zone, which runs roughly from Mendocino County to Vancouver Island and is considered a worst-case scenario for tsunami in the bay, is estimated to take several hours to reach the City and County of San Francisco, providing time to mobilize a response. ABAG has mapped portions of tsunami inundation areas within the Bay Area for emergency planning. As shown in **Figure 4.14-4**, no portions of the Baylands are within a tsunami inundation zone.

Figure 4.14-4: Tsunami Inundation Areas



SOURCE: ABAG, MTC, Plan Bay Area 2050 EIR, 2023

Seiches are oscillations of enclosed and semi-enclosed bodies of water, such as bays, lakes, or reservoirs, caused by strong ground motion from seismic events, wind stress, volcanic eruptions, large landslides, and local basin reflection of tsunamis. Seiches can create long-period waves that can cause water to overtop or damage containment features or run up on adjacent land masses. No facilities are currently present that could be subject to seiche in an earthquake.

4.14.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

Clean Water Act (33 USC 1251 et seq.)

The federal Clean Water Act serves as the primary federal law protecting the quality of the nation's surface waters, including lakes, rivers, wetlands, and aquatic resources. The Clean Water Act empowers the USEPA to set national water quality standards and effluent limitations and includes programs addressing both point source and nonpoint-source pollution. Point-source pollution is pollution that originates or enters surface waters at a single, discrete location, such as an outfall structure, an excavation site, or construction site. Nonpoint-source pollution originates over a broader area and includes urban contaminants in stormwater runoff and sediment loading from upstream areas. The Act made it unlawful to discharge any pollutant from a point source into navigable waters unless a permit is obtained. The USEPA's National Pollutant Discharge Elimination System (NPDES) permit program controls discharges.

Relevant sections include:

- Section 303(d) requires each state to identify water bodies or segments of water bodies that are "impaired" (i.e., not meeting one or more of the water quality standards established by the state). Once the water body or segment is listed, the state is required to establish a TMDL for the pollutant causing the conditions of impairment. The TMDL is the quantity of a pollutant that can be safely assimilated by a water body without violating water quality standards. The TMDL can also act as a plan to reduce loading of a specific pollutant from various sources to achieve compliance with water quality objectives. Listing a water body as impaired does not necessarily suggest that the pollutants are at levels considered hazardous to humans or aquatic life or that the water body segment cannot support the beneficial uses. The intent of the 303(d) list is to identify the water body as requiring future development of a TMDL to maintain water quality and reduce the potential for continued water quality degradation.

  In accordance with Clean Water Act Section 303(d), the Regional Water Quality Control Board (RWQCB)-San Francisco Bay Region has identified impaired water bodies within its jurisdiction, the pollutant or stressor impairing water quality, and set priorities for developing a TMDL. San Francisco Bay is included on the Section 303(d) list. Pollutants or stressors identified on the Section 303(d) list for Central San Francisco Bay include pesticides such as chlordane, dichlorodiphenyltrichloroethane (DDT), and dieldrin; toxic organics such as dioxin compounds, furan compounds, polybrominated diphenyl ethers (PBDEs), and polychlorinated biphenyls (PCBs); metals such as mercury and selenium; and invasive species and trash.

TMDLs have been established for San Francisco Bay for chlordane, DDT, dieldrin, mercury, PCBs (non-dioxin-like), and the RWQCB is working on TMDLs for the Bay for dioxin compounds, exotic species, furan compounds, PCBs, and selenium, as well as a revision to the mercury TMDL. The RWQCB has also adopted a TMDL for pesticide toxicity in urban creeks such as Visitacion Creek.

- Under Section 401 as it is implemented in California, projects that propose activities that would result in the discharge of a fill material into waters of the United States are required to obtain certification from the RWQCB. Discharge of fill into non-federal waters of the state are addressed through notification in accordance with the Waste Discharge Requirements of the Porter-Cologne Water Quality Act.
- Section 402 regulates point- and non-point source discharges to surface waters through the NPDES permit program. In California, the State Water Resources Control Board (SWRCB) oversees the NPDES program, and the RWQCBs administer the permits. The NPDES program regulates point and non-point-source discharges to surface waters and provides for both general permits (those that cover a number of similar or related activities) and individual permits. Non-point sources are diffuse and originate from a wide area rather than from a definable point. Non-point pollution often enters receiving waters in the form of surface runoff but is not conveyed by way of pipelines or discrete conveyances. As defined in the federal regulations, such non-point sources are generally exempt from federal NPDES permit program requirements. However, three types of non-point source discharges are controlled by the NPDES program: discharges associated with industrial operations, non-point source discharge caused by general construction activities, and the general quality of stormwater in municipal separate stormwater systems (MS4s).

  The NPDES industrial stormwater permitting component covers ten categories of industrial activity that require authorization for stormwater discharges. California's NPDES Permit for General Construction Activity is discussed below in Section 4.14.3, *State Plans, Policies, and Regulations*. MS4 permits include requirements for construction and post-construction control of stormwater runoff.
- Section 404 establishes a program to regulate the discharge of dredged or fill material into "waters of the United States," including wetlands. Activities in waters of the United States regulated under this program include fill for development, water resource projects (such as dams and levees), infrastructure development (such as highways and airports) and mining projects. Section 404 requires a permit before dredged or fill material may be discharged into waters of the United States, unless the activity is exempt from Section 404 regulation (e.g., certain farming and forestry activities).

  The basic premise of the 404 program is that no discharge of dredged or fill material may be permitted if (1) a practicable alternative exists that is less damaging to the aquatic environment, or (2) the nation's waters would be significantly degraded. Thus,

permit applicants must show that steps have been taken to avoid impacts on wetlands, streams, and other aquatic resources; that potential impacts have been minimized; and that compensation will be provided for all remaining unavoidable impacts.

Proposed activities are regulated through a permit review process. For most discharges that will have only minimal adverse effects, a "general permit" may be suitable. General permits are issued on a nationwide, regional, or state basis for particular categories of activities. The general permit process eliminates individual review and allows certain activities such as minor road improvements to proceed with little or no delay, provided that the applicable conditions for the general permit are met. States also have a role in Section 404 decisions through state program general permits, water quality certification, or program assumption.

- An individual permit is required for potentially significant impacts. Individual permits are reviewed by the U.S. Army Corps of Engineers, which evaluates applications under a public interest review, as well as the environmental criteria set forth in the Clean Water Act Section 404(b)(1) Guidelines, regulations promulgated by USEPA.

National Flood Insurance Program

The National Flood Insurance Program, administered by FEMA under the National Flood Insurance Act, enables property owners in participating communities to purchase insurance as a protection against flood losses in exchange for state and community floodplain management regulations that reduce flood damage. Participation in the Program is based on an agreement between communities and the federal government. If a community adopts and enforces a floodplain management ordinance to reduce flood risk to new construction in floodplains, the federal government will make flood insurance available within the community as a financial protection against flood losses. This insurance is designed to provide an affordable insurance alternative to disaster assistance to reduce the escalating costs of repairing damage to buildings and their contents caused by floods. Communities are occasionally audited by the California Department of Water Resources to ensure the proper implementation of FEMA floodplain management regulations.

The City of Brisbane is a participant in the Program, and must therefore satisfy certain mandated floodplain management criteria, including adopting an ordinance that complies with regulatory standards issued by FEMA and monitoring construction and building permits and the status of the City ordinance to ensure compliance with federal laws and regulations (See Brisbane Municipal Code Chapter 15.56, Floodplain Management).

b. State Laws, Plans, Programs, and Regulations

Porter-Cologne Water Quality Control Act (California Water Code Sections 13000 et seq.)

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act) established nine RWQCBs to oversee water quality on a day-to-day basis at the local and/or regional level. The nine regional boards have the primary responsibility for protection and enhancement of water quality within their respective jurisdictional boundaries. Their duties include preparing and updating water quality control plans and issuing Section 401 water quality certifications.

The State Water Resources Control Board provides state-level coordination of the water quality control program by establishing state-wide policies and plans for the implementation of state and federal laws and regulations. The RWQCBs adopt and implement water quality control plans that recognize the unique characteristics of each region with regard to natural water quality, actual and potential beneficial uses, and water quality problems. The Porter-Cologne Act grants ultimate authority to the State Water Resources Control Board over state water rights and water quality policy. The Act provides a broad definition of waters under State jurisdiction that includes any surface water or groundwater, including saline waters within the boundaries of the state. Isolated waters that may not be subject to regulations under federal law are considered to be "waters of the state" and regulated accordingly by the RWQCB. If the USACE determines wetlands or other non-wetland waters are isolated waters and not subject to regulation under the federal Clean Water Act, the RWQCB has authority to exert jurisdiction over these waters under the Porter-Cologne Act as waters of the state.

Under the Porter-Cologne Act, "water quality objectives" establish limits on levels of water quality constituents or characteristics to protect identified beneficial uses. The Act requires RWQCBs to establish water quality objectives while acknowledging that water quality may be changed to some degree without unreasonably affecting beneficial uses. Designated beneficial uses, together with the corresponding water quality objectives, also constitute water quality standards under the federal Clean Water Act. Therefore, the water quality objectives form the regulatory references for meeting State and federal requirements for water quality control.

Anti-Degradation Policy

California's anti-degradation policy, formally known as the Statement of Policy with Respect to Maintaining High Quality Waters in California (SWRCB Resolution No. 68-16), applies to the disposal of waste to high-quality surface water and groundwater.

The Policy, which protects water bodies where existing quality is higher than necessary for the protection of beneficial uses, requires any actions that can adversely affect water quality in surface and groundwaters: (1) to be consistent with maximum benefit to the people of the state, (2) not unreasonably affect present and anticipated beneficial use of the water, and (3) not result in water quality less than that prescribed in water quality plans and policies, (i.e., not result in

exceedances of water quality objectives). Any actions that could adversely affect surface waters are also subject to the federal anti-degradation policy (40 CFR Section 131.12) developed as part of the Clean Water Act.

NPDES Construction General Permit

SWRCB adopted a state-wide NPDES Permit for General Construction Activity (Construction General Permit). The San Francisco Bay RWQCB monitors and enforces the NPDES stormwater permitting for the region. Additional information on the Construction General Permit is provided below in Section 4.14.3c, *Regional Plans, Programs, and Regulations*.

California Stormwater Quality Association Best Management Practices Handbooks

The California Stormwater Quality Association is a professional member association dedicated to the advancement of stormwater quality management through collaboration, education, implementation guidance, regulatory review, and scientific assessment. It has developed and published four handbooks (Construction, Industrial & Commercial, Development, and Municipal) providing information for BMP selection throughout the life of a project—from planning and design, through construction—and into operation and maintenance. These handbooks are available for purchase from CASQA at their website: https://www.casqa.org/.

Recycled Water Use Requirements

The State Water Board adopted Water Reclamation Requirements for Recycled Water Use (Order WQ 2016-0068-DDW) on June 7, 2016 (General Order). The General Order establishes standard conditions for recycled water use and conditionally delegates authority to an Administrator to manage a Water Recycling Program and issue Water Recycling Permits to recycled water users. Only treated municipal wastewater for non-potable uses can be permitted, such as landscape irrigation, crop irrigation, dust control, industrial/commercial cooling, and decorative fountains. Potable reuse activities are not authorized under this General Order (SWRCB 2016).

RWQCB-San Francisco Amendment to Waste Discharge Requirements for Long-Term Flood Protection Considerations

The RWQCB–San Francisco Bay Region adopted Order No. R2-2022-0031, Amendment to Waste Discharge Requirements for Long-Term Flood Protection Considerations at Closed and Operating Municipal Solid Waste Bayfront Landfills in October 2022.[312] The Order requires submission of a Long-Term Flood Protection Plan for listed Bayfront Landfills, including Brisbane Landfill, within 270 days from the adoption of the Order (October 12, 2022), and is to be

[312] The full text of the Order can be found at ORDER NO. R2-2022-0031, Amending Waste Discharge Requirements for Bayfront Landfills (ca.gov).

updated every 5 years thereafter. Specifically, the order states that: The Discharger shall submit a climate change vulnerability assessment and adaptation plan acceptable to the Executive Officer. The plan shall identify strategies for the long-term protection of the landfill from flooding and inundation due to SLR, groundwater rise, and extreme climate/weather events. The plan shall:

a. Be prepared by qualified experts and consider and reference the most current official State of California climate change guidance documents.

b. Be based on providing protection from the estimated 100-year storm event, on top of the 2050 "medium-high" (0.5 percent probability of exceedance) or "extreme" risk aversion SLR scenarios as described in the most recent official state of California SLR guidance (e.g., the 2018 OPC Sea Level Rise Guidance). The 100-year storm event shall take into account astronomical tides and storm surge as well as wave run-up, seasonal effects (e.g., El Niño conditions), and discharge from local tributaries (e.g., as modeled by the USGS Coastal Storm Modeling System [CoSMoS] tool).

c. Describe how vulnerable features and infrastructure will be protected (such as landfill caps, monitoring wells, landfill gas wells, flares, levees, etc.), and how building uses, and public access will be protected prior to the projected timing of SLR, groundwater rise, and extreme storm event impacts (e.g., prior to projected flooding).

d. Propose a phased adaptation strategy that briefly describes the potential future projects that may be necessary to provide for protection from the 2100 "medium high" or "extreme" risk aversion SLR scenarios as described in the most recent official state of California SLR guidance, as well as potential accompanying changes in groundwater rise and extreme storm events. The strategy shall allow for a range of future actions at different climate change thresholds to address uncertainty and allow for flexibility over the long term.

e. Provide technical justification for the selection of both the 2050 and 2100 SLR risk aversion scenarios.

f. Identify baseline conditions for the landfill and show at a minimum the following on a map(s): sitewide elevations, vulnerable infrastructure (i.e., waste containment features, wetlands, roads, buildings, remediation systems, piping, wells), existing groundwater levels, the degree of SLR, groundwater rise, and/or extreme storm event exposure already noted at the landfill (if any), sea level elevations at which flooding will impact the landfill, areas potentially vulnerable to groundwater rise.

g. Be updated and submitted every five years with the most recently available and credible information and climate change adaptation guidance at the time of the update, including observed changes in sea levels, groundwater levels, and flooding measured at or as near as possible to the landfill (e.g., from local tide gauges and monitoring wells), and any observed or potential changes in the adaptive capacity and risk tolerance of vulnerable

infrastructure, including an implementation schedule with key milestones that have been or will be met in the future.

h. When preparing and implementing adaptive management plans, the Discharger shall take into consideration how rising shallow groundwater and any associated flooding may affect long-term cap stability, increase in leachate amounts, leachate and landfill gas migration, and post-closure monitoring and maintenance goals at the site. Groundwater monitoring data from the site should be used for the most accurate water level on-site; however, if groundwater wells are not present at the landfill, databases such as GeoTracker can be used to access water table elevations nearby, using USGS, California DWR, or other nearby cleanup site well observations. Additionally, shallow groundwater response to SLR across four Bay Area counties is currently under development." (RWQCB-SF 2022b).

State of California Sea Level Rise Guidance

At the time the Specific Plan was being developed, the 2018 State of California Sea Level Rise Guidance[313] (Sea Level Rise Guidance), developed by the Ocean Protection Council (OPC), provided a framework for State agencies and local governments to factor sea level rise impacts into planning decisions. The Sea Level Rise Guidance summarizes the best available science on SLR and encourages agencies to select a SLR projection for planning purposes based on multiple factors, such as the location of a facility, its expected lifespan, SLR exposure and associated impacts, adaptive capacity, and risk tolerance/aversion, as defined in this 2018 document. California updated its SLR planning guidance[314] in 2024 (OPC 2024). Therefore, as discussed below, the SLR analysis of the Plan for the EIR was conducted according to the 2024 updated guidance. The Sea Level Rise Guidance is expected to be revised every five years.

Because future GHG emissions depend on future actions that are not yet known, and because the climate response to these emissions are not precisely known, the sea level rise scenario that will occur cannot be precisely known at this time. To accommodate this uncertainty, the OPC (OPC 2018; OPC, 2024) recommends considering a range of scenarios for climate change adaptation planning. OPC (2018) recommends using the low risk aversion scenario for open space, such as along Visitacion Creek and Brisbane Lagoon. They also recommend using the medium-high risk aversion scenario for occupied residential and commercial buildings, such as are proposed for much of the Plan area. For OPC (2024), the derivation and terminology of the SLR scenarios was modified to be consistent with those in the nationwide update (Sweet et al.,

[313] Ocean Protection Council. 2018. State of California Sea-Level Guidance.

[314] Ocean Protection Council. 2024. State of California Sea-Level Guidance: 2024 Science & Policy Update.

2022[315]). The 2024 scenario recommended for open space, corresponding to low risk aversion, is the Intermediate Scenario. The 2024 scenario recommended for residential and commercial buildings with lifespans to 2075 and beyond is the Intermediate-High Scenario. The 2024 scenario recommended for critical infrastructure (such as roads and landfills) and for lifespans beyond 2100 is the High Scenario. **Table 4.14-1** compares the sea level rise projections from OPC (2018) and OPC (2024) for Year 2050 and Year 2100. All of these projections are relative to sea level in Year 2000. For this report, the bracketing OPC (2024) Intermediate Scenario of 3.1 feet and the High Scenario of 6.5 feet are used to assess the Plan.

Table 4.14-1: Sea Level Rise Projections, in Feet

	OPC 2018 Guidance		OPC 2024 Guidance Scenarios		
	Low Risk Aversion	**Medium-High Risk Aversion**	**Intermediate**	**Intermediate-High**	**High**
	Likely Range 66% probability sea level rise is …	*1-in-200 Chance 0.5% probability sea level rise meets or exceeds …*	*5% exceedance probability for 3°C warming*	*0.1% exceedance probability for 3°C warming*	*<0.1% exceedance probability for 3°C warming*

2100	3.4	6.9	3.1	4.8	6.5

SOURCE: OPC 2018 (high emissions scenario), OPC 2024 (for San Francisco)

SB 272

SB 272 (Laird), adopted in October 2023, requires local governments within the State's coastal zone to prepare adaptation plans to address sea level rise to protect their residents, communities, infrastructure, and habitat from rising sea levels. SB 272 also authorizes the Bay Conservation and Development Commission (BCDC) to review and approve or deny these plans along the shore of San Francisco Bay, based upon Guidelines that BCDC develops. On December 5, 2024, BCDC adopted *Regional Shoreline Adaption Plan: One Bay Vision, Strategic Regional Priorities, and Subregional Adaptation Plan Guidelines* to provide the guidelines required by SB 272.

Sustainable Groundwater Management Act

The passage of the Sustainable Groundwater Management Act set forth a statewide framework to help protect groundwater resources over the long-term. The Department of Water Resources provides regulatory oversight and has classified California's 515 groundwater basins into one of four categories high-, medium-, low-, or very low-priority. Each basin's priority determines which provisions of the Act apply.

The latest basin prioritization project, Sustainable Groundwater Management Act 2019 Basin Prioritization, was completed in December 2019. Ninety-four basins and/or sub-basins were identified as medium- or high-priority and will be required to form Groundwater Sustainability Agencies and develop Groundwater Sustainability Plans. These 94 basins, in combination with adjudicated areas which have existing governance and oversight in place, account for 98 percent of the pumping (20 million acre-feet), 83 percent of the population (25 million Californians), and 88 percent of all irrigated acres (6.7 million acres) within the state's groundwater basins.

There are no groundwater sustainability plans applicable to the Specific Plan Area. The groundwater basin underlying Brisbane is Groundwater Basin 2-032, the Visitacion Valley groundwater basin is considered a very low-priority basin (DWR 2024).

c. Regional Plans, Programs, and Regulations

Regional Water Quality Control Board – San Francisco Bay Region

The Baylands lies within the jurisdiction of the San Francisco Bay RWQCB, which has adopted the Water Quality Control Plan for the San Francisco Bay Region (Basin Plan) to implement plans, policies, and provisions for water quality management. Beneficial uses of surface waters within the San Francisco Bay Region are described in the Basin Plan and are designated for major surface waters and their tributaries. Beneficial uses of Central San Francisco Bay include ocean, commercial, and sport fishing; estuarine habitat; industrial service supply; fish migration; fish spawning; navigation; rare and endangered species preservation; recreation; shellfish harvesting; and wildlife habitat. The California Water Resources Control Board identifies estuarine habitat, wildlife habitat, water contact recreation, and non-contact recreation as existing beneficial uses of the lagoon.[316]

Construction Activity Permitting – National Pollutant Discharge Elimination System

CONSTRUCTION GENERAL PERMIT

As discussed above, the NPDES permit program was established by the Clean Water Act to regulate municipal and industrial discharge to surface waters of the United States from their

[316] https://www.waterboards.ca.gov/rwqcb2/water_issues/programs/planningtmdls/basinplan/web/tab/tab_2-01.pdf.

municipal stormwater systems. The SWRCB adopted a state-wide NPDES Permit for General Construction Activity (Construction General Permit) on September 2, 2009 (Order No. 2009-0009-DWQ, as amended by 2010-0014-DWQ and 2012-0006-DWQ). The SWRCB adopted a General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities in September 2022 (Order WQ 2022-0057-DWQ). The order became effective on September 1, 2023.

The San Francisco Bay RWQCB monitors and enforces the NPDES stormwater permitting for the region.

The Construction General Permit regulates construction site stormwater management. Dischargers whose projects disturb 1 or more acres of soil, or whose projects disturb less than 1 acre but are part of a larger common plan of development that in total disturbs 1 or more acres, are required to obtain coverage under the general permit for discharges of stormwater associated with construction activity. Construction activity subject to this permit includes clearing, grading, grubbing, excavation, or any other activity that results in a land disturbance of equal to or greater than 1 acre. The permit does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility.

The Construction General Permit requires that developers of land where construction activities will occur over more than 1 acre do the following (SWRCB 2022):

- Complete a risk assessment to determine pollution prevention requirements pursuant to the three risk levels established in the General Permit;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation;
- Develop and implement a stormwater pollution prevention plan (SWPPP) that identifies the sources of sediment and other sources that affect the quality of stormwater discharges and specifies BMPs that will reduce pollution in stormwater discharges to the Best Available Technology Economically Achievable/Best Conventional Pollutant Control Technology standards; and
- Perform inspections and maintenance of all BMPs.

To obtain coverage under this permit, project operators must electronically file permit registration documents with SWRCB before the start of construction. Permit registration documents must include the following.

- Notice of Intent;
- SWPPP, including:
    - Risk assessment for construction sites;

    - Active stormwater effluent monitoring and reporting program during construction;
    - Rain event action plans;
    - Numeric action levels for pH and turbidity;
    - Requirements for qualified professionals to prepare and implement the plan;
    - Specifications for BMPs to be implemented during and after project construction; and
    - Plan for inspection and maintenance of project BMPs and facilities at end of construction.
- Site Drawings and Maps;
- Applicable plans, calculations, and other supporting documentation for compliance with existing permitted Phase I or Phase II municipal separate storm sewer system post-construction requirements or the post-construction standards of the General Permit;
- Permit fee; and
- Signed certification statement.

The Construction General Permit requires the SWPPP to identify BMPs that will be implemented to reduce potential chemical contaminants that would affect water quality. There are two categories of BMPs: structural and non-structural. Structural BMPs involve the specific construction, modification, operation, maintenance, or monitoring of facilities to minimize the introduction of pollutants from the drainage system. Non-structural BMPs are activities, programs, and other non-physical measures that would contribute to the reduction of pollutants from nonpoint source pollutants to the drainage system. BMPs include treatment requirements, operation procedures, and practices to control site runoff, spillage, leaks, waste disposal, and drainage from raw materials storage.

Types of BMPs include erosion control (e.g., preservation of vegetation), sediment control (e.g., fiber rolls), non-stormwater management (e.g., water conservation), and waste management. The SWPPP also includes descriptions of BMPs to reduce pollutants in stormwater discharges after all construction phases have been completed at the site (post-construction BMPs).

BMP implementation must consider changing weather conditions and construction activities, and various combinations of BMPs may be used over the life of a project to maintain compliance with the Clean Water Act. The NPDES General Permit gives the owner the discretion to determine the most economical, effective, and innovative BMPs to achieve the performance-based goals of the NPDES General Permit.

MUNICIPAL REGIONAL STORMWATER PERMIT

Municipalities in San Mateo County, including the City of Brisbane, are listed as co-permittees in a Municipal Regional Stormwater NPDES Permit (MRP) Order No. R2-2022-018, NPDES Permit No. CAS612008 adopted by the San Francisco Bay RWQCB in May 2022 (RWQCB-SF 2022). The Municipal Regional Permit outlines the State's requirements for municipal agencies in San Mateo County to address the water quality and flow-related impacts of stormwater runoff (RWQCB-SF 2022a). The MRP is a comprehensive permit that regulates activities related to construction sites, industrial sites, illegal discharges and illicit connections, new development, and municipal operations. The permit also requires a public education program, implementing targeted pollutant reduction strategies, and a monitoring program to help characterize local water quality conditions and begin evaluating the overall effectiveness of the permit's implementation (C/CAG 2024).

The Municipal Regional Permit includes requirements for incorporating appropriate source control, site design, and stormwater treatment measures through LID measures into new development and redevelopment projects. These requirements are known as Provision C.3 requirements. In particular, development and redevelopment projects are required to capture, control, treat, and/or promote the infiltration of stormwater such that the rate and volume of stormwater exiting the property to the municipal stormwater system is equal to or less than existing conditions.

Subsequent to Specific Plan approval, Baylands development will require preparation of a Stormwater Management Plan that identifies specific measures to meet Provision C.3 of the NPDES permit (RWQCB-SF 2022a).

San Mateo Countywide Water Pollution Prevention Program

The San Mateo Countywide Water Pollution Prevention Program (SMCWPPP) was established in 1990 to reduce the pollution carried by stormwater into local creeks, San Francisco Bay, and the Pacific Ocean. The program is a partnership of the City/County Association of Governments (C/CAG), each incorporated city and town in the county, and the County of San Mateo, which share a common regional urban stormwater NPDES permit. Some of the requirements of the MRP are implemented directly by municipalities while others are addressed by the San Mateo Countywide Water Pollution Prevention Program on behalf of all the municipalities.

Due to the complex and varied nature of the MRP and efforts related to stormwater management in San Mateo County, the Countywide Water Pollution Prevention Program maintains its own program website, which can be found at www.flowstobay.org, and provides

project guides to aide project applicants with including post-construction stormwater controls in development project designs. These guides include:

- C.3 Regulated Project Guide (Guidebook) describes stormwater treatment options, techniques, design, and maintenance requirements. These treatment options vary from "local" improvements at individual building sites to "area wide" concepts such as stormwater treatment ponds and bio-retention areas with large open space areas (SMCWPPP 2020b). The Guide is intended to provide technical information primarily for parcel-based projects that are required to implement stormwater control measures to comply with the MRP.
- The Green Infrastructure Design Guide (GI Design Guide) is a comprehensive design guide to help agencies, developers, design professionals and construction firms design, build and integrate green infrastructure facilities into street, site, and parking lot projects that may or may not be required to implement stormwater control measures in San Mateo County (SMCWPPP 2020a). This Design Guide integrates complete street and green street goals (sustainable streets) and is intended to assist local jurisdictions in the gradual transition of stormwater infrastructure from "gray" to "green" over time.

Both the C.3 Regulated Project Guide and the Green Infrastructure Design Guide contain design guidance and typical details for green infrastructure and low impact development (LID) implementation in public and private projects.

San Mateo County Flood and Sea Level Rise Resiliency District (One Shoreline)

The San Mateo County Flood and Sea Level Rise Resiliency District, also known as "OneShoreline," was established by State legislation in January 2020 as the first countywide government agency in California to build regional resilience to the water-related impacts of climate change. The countywide District focuses on planning and constructing solutions to the climate change impacts of SLR, flooding, and coastal erosion. OneShoreline is governed by a seven-member Board consisting of two members of the San Mateo County Board of Supervisors, and five members from city and town councils within the county.

In June 2023, OneShoreline adopted Planning Policy Guidance to function as a "standardized yet evolving resource for cities and the County to account for climate-driven flooding, stormwater, shallow groundwater rise, and sea level rise in planning documents (general plan, specific plan, zoning ordinance) and approvals of projects in areas near the Bay subject to foreseeable climate impacts."

The document contains recommendations for new development rather than guidance for existing development, consistent with OneShoreline's current focus on ensuring private development is appropriately sited and designed with respect to projected sea level rise. Also, while the document includes template policies that pertain to public facilities and

infrastructure, it does not provide detailed guidance on how to implement those policies. OneShoreline anticipates issuing a complementary guidance document to address integrating climate risks into capital improvements planning.

OneShoreline's Bay Protection Standard is the Base Flood Elevation of San Francisco Bay plus 6 feet. In coastal areas impacted by waves, the Base Flood Elevation incorporates tides, storm surge, and wave runup on the existing coastal structure. Based on the current FIRMs published for San Mateo County in 2019, the Base Flood Elevation Bay water level along the shoreline ranges from 10 feet to 16 feet NAVD88. Therefore, the Bay Protection Standard ranges from 16 feet to 22 feet NAVD88.

Policies suggested for General Plans contained in the OneShoreline Planning Policy Guidance document include the following:

- **Buffer Zone.** Develop a Buffer Zone of 100 feet—at a minimum—from the San Francisco Bay Shoreline and 35 feet—at a minimum—from Top of Creek Bank to provide space to accommodate and maintain built and Natural Infrastructure for flood protection, habitat restoration, and Public Access. A wider Buffer Zone to accommodate habitat migration shall be included where feasible.
- **Future Conditions Protection for the Built Environment.** Ensure that new and/or substantial construction is planned and designed to accommodate Future Conditions for the life of the project.
- **Siting and Designing New Critical Facilities and Public Infrastructure.** Site new Critical Facilities and public infrastructure in areas that are not vulnerable to Future Conditions. If new Critical Facilities and public infrastructure cannot be located outside of areas prone to flooding, sea level rise, and shallow groundwater rise, ensure that facilities are constructed to appropriate standards to maintain operations under these Future Conditions over the life of the project.
- **Private Development Vulnerability Assessment and Mitigation.** Based on the geotechnical data collected on-site, new and/or substantial construction shall assess the project's vulnerability to shallow groundwater rise and incorporate project measures that will monitor and mitigate seasonal and permanent impacts, including buoyancy, seepage, infiltration, liquefaction, corrosion, and contaminant mobilization hazards.
- **Natural Infrastructure in Shoreline Protection.** Prioritize the use of Natural Infrastructure, including the protection, restoration, and expansion of existing coastal habitats, consistent with the Open Space and Conservation element habitat conservation policies. Shoreline infrastructure projects should evaluate the use or restoration of natural features and ecosystem processes—such as tidal marshes, eelgrass, mudflats, beaches, and oyster reefs—and incorporate these features to the greatest extent feasible to conserve ecosystem values and functions, which benefit people and wildlife

- **Shoreline Barrier Location.** Require that shoreline barriers are sited as landward as possible within the Buffer Zone to provide as much space as possible for rising Bay water levels, incorporation of natural elements, sensitive habitats, and future Bayland-upland transition zone habitat migration.
- **Future Conditions Protection for Ecological Assets.** Protect critical existing ecological assets from Future Conditions brought on by climate change by accounting for these assets in land use planning and shoreline infrastructure project development. This includes protecting sensitive habitats within Buffer Zones adjacent to planned shoreline infrastructure projects, as well as planning for and accommodate upland migration of habitats vulnerable to sea level rise.
- **Intertidal and Subtidal Habitat Conservation and Restoration.** Promote the conservation, restoration, and enhancement of intertidal and subtidal habitats, which can help reduce impacts on shoreline infrastructure.
- **Habitat Buffers.** By requiring a Buffer Zone wider than the minimum where feasible, encourage shoreline development projects and associated infrastructure to be sited such that they do not encroach upon Bayland-upland transition zone habitats and provide adequate space to accommodate upland migration of habitats vulnerable to sea level rise.
- **Native Plants.** Require that shoreline development projects and other projects including habitat restoration include native plantings consistent with BCDC Policies and Design Guidelines.
- **Removal of Hard Infrastructure.** To allow opportunities to restore ecological value to shorelines and creek banks and restore natural floodplain processes for increased flood protection, existing hard protection should be removed when the structure(s) no longer requires a hard protective structure (e.g., redeveloped or demolished).
- **Public Access in Buffer Zones.** Require that new development in higher density residential or commercial areas adjacent to the San Francisco Bay shoreline or creeks provide and maintain Public Access within the Bay and Creek Buffer Zones based on the locally adopted guidelines and BCDC Policies and Design Guidelines. Public Access along these water bodies shall be provided in perpetuity, including dedicating appropriate access easements to the local agency at no cost to the public in the same manner that streets, park sites, and school sites are dedicated to the public as part of the subdivision process in cities and counties.
- **Future Conditions for Public Access.** Require Public Access to remain viable in the event of future flooding, sea level rise, and shallow groundwater rise, or provide equivalent access consistent with the project as existing access is impacted by Future Conditions over the life of the project in accordance with BCDC Policies and Design Guidelines.

- **Gaps in the Bay Trail.** Eliminate gaps in the Bay Trail where applicable coordination with the Metropolitan Transportation Commission/Association of Bay Area Governments Bay Trail Program by requiring new shoreline development and redevelopment to construct missing Bay Trail segments.
- **Regional Shoreline Infrastructure.** Require new and/or substantial construction on properties within 100 feet of the San Francisco Bay to contribute to regional shoreline infrastructure that incorporates natural features to the greatest extent feasible.
- **Stormwater Infrastructure Capacity.** Require any new stormwater infrastructure to be designed to function under Future Conditions for the life of the project.
- **Local Floodplain Ordinances.** Update local floodplain ordinances to align with State and OneShoreline sea level rise guidance.
- **Natural Infrastructure in Shoreline Protection.** Prioritize the use of natural infrastructure, including the protection, restoration, and expansion of existing coastal habitats, consistent with habitat conservation policies. Shoreline infrastructure projects should evaluate the use or restoration of natural features and ecosystem processes—such as tidal marshes, eelgrass, mudflats, beaches, and oyster reefs—and incorporate these features to the greatest extent feasible to conserve ecosystem values and functions, which benefit people and wildlife.
- **Habitat Buffers.** By requiring a buffer zone wider than the minimum where feasible, encourage shoreline development projects and associated infrastructure to be sited such that they do not encroach upon shoreline-upland transition zone habitats and provide adequate space to accommodate upland migration of habitats vulnerable to sea level rise.

BCDC Regional Shoreline Adaptation Plan

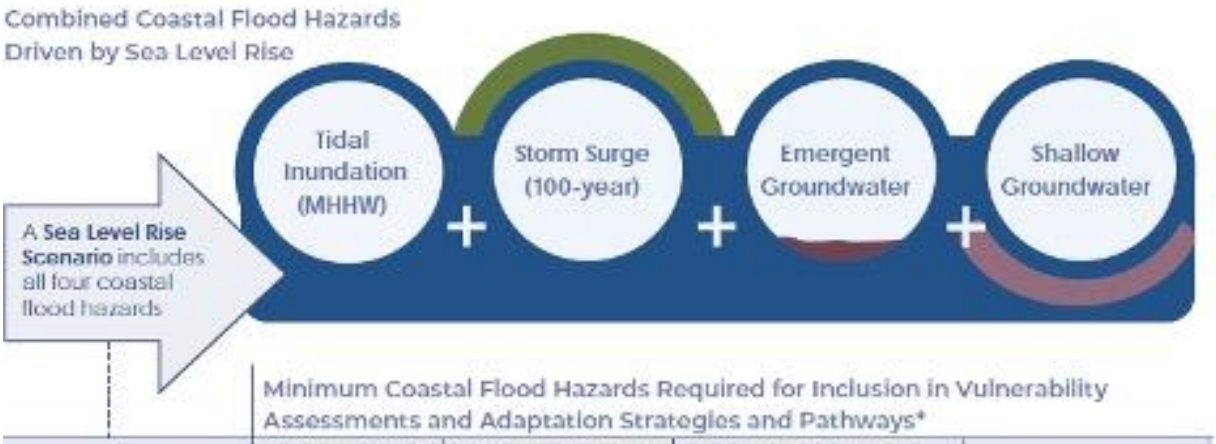
The BCDC Commission adopted *Regional Shoreline Adaption Plan: One Bay Vision, Strategic Regional Priorities, and Subregional Adaptation Plan Guidelines* as part of its San Francisco Bay Plan on December 5, 2024. A key requirement of this plan is for cities with land subject to BCDC jurisdiction to prepare Subregional Shoreline Adaptation Plans. As outlined in SB 272, all plans must be approved by January 1, 2034; however, BCDC strongly encourages local agencies to submit their subregional plans before the legislative deadline.[317]

[317] As required by SB 272, Subregional Plans are based on best available science, contain a vulnerability assessment that include efforts to ensure equity for at-risk communities, include sea level rise adaptation strategies and recommended projects, identify planning and implementation responsibilities, and include a timeline for updates, among other requirements.

The Regional Shoreline Adaption Plan contains three major components:

1. **One Bay Vision** provides big-picture goals to guide the priorities and requirements of the Regional Shoreline Adaption Plan and addresses the following issues:
    - Community Health and Well-being
    - Ecosystem Health and Resilience
    - Development, Housing and Land Use
    - Critical Infrastructure and Services
    - Public Access and Recreation
    - Transportation and Transit
    - Shoreline Contamination
    - Collaborative Governance, Flood Management, and Funding
2. **Strategic Regional Priorities** identify the key issues that impact the entire region and can only be resolved through coordinated local adaptation, including:
    - Reduced Involuntary Displacement Risk
    - Complete and Connected Ecosystems
    - Reliable Critical and Emergency Services
    - Connected Regional Shoreline Access
    - Regional Movement of People and Goods
    - Clean Communities and Environmental Justice
    - Cross-Jurisdictional Flood Risk Reduction
3. **Subregional Shoreline Adaptation Plan Guidelines** describe how cities and counties are to develop Subregional Shoreline Adaptation Plans, including:
    - **Coastal Flood Hazards and Sea Level Rise Scenarios** that identify the hazards that plans are to address -- sea level rise, tidal inundation, storm surge, groundwater emergence flooding, and shallow groundwater (see **Figure 4.14-5**).

Figure 4.14-5: Minimum Coastal Hazards Requirements for Subregional Shoreline Adaption Plan Vulnerability Assessments and Adaptation Strategies and Pathways



Minimum Coastal Flood Hazards Required for Inclusion in Vulnerability Assessments and Adaptation Strategies and Pathways*

Sea Level Rise Scenarios	Tidal Inundation (MHHW)	Storm Surge (100-year)	Groundwater Emergence/ Flooding	Shallow Groundwater (<9ft)
0.8 ft (2050)	MHHW + 0.8 ft	MHHW + 3.5 ft + 0.8 ft	Groundwater that has reached the surface for 0.8 ft of sea level rise	Depth to groundwater for 0.8 ft of sea level rise
3.1 ft (2100 Intermediate)	MHHW + 3.1 ft	MHHW + 3.5 ft + 3.1 ft	Groundwater that has reached the surface for 3.1 ft of sea level rise	Depth to groundwater for 3.1 ft of sea level rise
4.9 ft (2100 Intermediate -High)	MHHW + 4.9 ft	MHHW + 3.5 ft + 4.9 ft	Groundwater that has reached the surface for 4.9 ft of sea level rise	Depth to groundwater for 4.9 ft of sea level rise
6.6 ft (2100 High)	MHHW + 6.6 ft	MHHW + 3.5 ft + 6.6 ft	Groundwater that has reached the surface for 6.6 ft of sea level rise	Depth to groundwater for 6.6 ft of sea level rise

- The **Minimum Categories and Assets** standard identifies essential assets to be evaluated, including:
  - Plan Requirements
  - Vulnerability Assessment
  - Adaptation Strategies and Pathways
  - Land Use and Policy Plan
  - Implementation Plan and Funding Strategy, including prioritized listing of adaptation projects to be undertaken

Regional Groundwater Storage and Recovery Project

In a joint effort between SFPUC, Cal Water, the City of Daly City, and the City of San Bruno, the Regional Groundwater Storage and Recovery Project was developed to support groundwater and surface water management in the South Westside Basin[318] and improve the reliability of the SFPUC regional water system. The Storage and Recovery Project agreement, which was signed in December 2014 included an agreement by the four municipal pumpers within the South Westside Basin to self-limit pumping to no more than 6.9 mgd, of which Cal Water's designated quantity is an annual average rate of 1.37 mgd or 1,534 afy.

Under the Storage and Recovery Project, SFPUC provides supplemental regional water system water to Cal Water and the other "Partner Agencies" (i.e., Cal Water, Daly City, and San Bruno) during normal and wet years and in turn the Partner Agencies reduce their groundwater pumping in their own wells to allow the South Westside Basin to recharge. During dry years, the Partner Agencies may pump from Storage and Recovery Project wells in addition to resuming use of their own wells up to designated quantities. The in-lieu recharge (i.e., "put") and additional groundwater pumping from Storage and Recovery Project wells (i.e., "take") are tracked under the Westside Basin Storage Account. Production wells in the South Westside Basin are considered to be either a Storage and Recovery Project Well Facility or a Partner Agency Facility, where only production from Storage and Recovery Project Well facilities is tracked as part of the Storage and Recovery Project.

The Storage and Recovery Project provides additional dry-year water supply to increase regional water supply reliability. Phase 1 of the Storage and Recovery Project consisted of the construction of 13 well stations to produce approximately 6.2 MGD and associated facilities, such as pumping systems, pipelines, and chemical treatment equipment. Phase 2 consisted of the installation of test wells that will not be converted to production wells at this time but will allow for determination as to whether the identified sites could be viable future production wells and will provide information related to water quality and potential pumping capacities that can be used for future planning and decision making.

[318] **Figure 4.14-2** indicates the boundaries of the Westside Basin in relation to the Baylands Specific Plan area and the Visitacion Valley Groundwater Basin.

d. City of Brisbane Plans, Ordinances, and Regulations

General Plan

Chapter IX: Conservation Element

Policy 130: Conserve water resources in the natural environment.

Program 130a: As an ongoing part of land use planning and CEQA analysis, determine whether proposals could affect water resources.

Program 130b: Require, as appropriate, project analysis of drainage, siltation, and impacts on vegetation and on water quality.

Policy 130.1: The City requires restoration of wetland losses. The determination of which land areas are wetlands will be done by those federal and state agencies having jurisdiction. The City, however, is especially concerned with those wetlands surrounding the perimeter of the Brisbane Lagoon, the Bay shoreline, the Levinson Marsh, and the Quarry sediment ponds. The ratios of restoration may exceed the regulatory agencies' mitigation minimums.

Policy 130.4: Wetland and mitigation areas that are mitigations for project impacts must be protected by recorded deed restrictions.

Policy 130.5: It is Brisbane's desire that mitigation for Brisbane's wetland losses occur somewhere within the jurisdictional boundaries or sphere of influence of the City of Brisbane, if feasible.

Policy 131: Emphasize the conservation of water quality and of riparian and other water-related vegetation, especially that which provides habitat for native species, in planning and maintenance efforts.

Policy 132: Recognize the importance of the Brisbane Lagoon and the Levinson Marsh as wildlife habitats, valuable community resources and drainage basins, and cooperate with responsible agencies in their conservation.

Policy 133: Reduce the amount of sediment entering waterways.

Program 133a: Participate in programs to improve water quality in the Lagoon and the Bay.

Program 133b: Require all development, especially that involving grading, to exercise strict controls over sediment.

Policy 134: Reduce the amount of pollutants entering waterways.

Program 134a: Cooperate with the Water Quality Control Board and County Department of Environmental Health and participate in the NPDES Program to monitor and regulate point and non-point discharges.

Program 134c: Encourage wetlands restoration projects to remove or fix toxicants and reduce siltation.

Program 134d: Utilize wetlands restoration projects to remove or fix toxicants and reduce siltation where appropriate.

Chapter X: Community Health and Safety Element

Policy 153: Require the construction of new improvements and the upgrade of existing stormwater infrastructure to mitigate flood hazard (see *Policy 130.2*).

Program 153b: Work with Daly City and affected property owners to design improvements to alleviate flooding on the section of Bayshore Boulevard between Geneva Avenue and Main Streets.

Program 153c: In conjunction with design of infrastructure to serve the Baylands, require that the property owner address the issue of flooding around the open drainage channel that flows west to east across the property.

Policy 155: Pay special attention to the condition and maintenance of storm drain facilities to avoid flooding.

Program 155a: Schedule regular maintenance to remove silt and debris from storm drain facilities.

Program 155b: As a part of Capital Improvements Planning, replace and repair, as economically feasible, storm drain facilities as needed to prevent flooding.

Policy 221: If new development occurs, require storm drain systems to be installed to City standards.

Program 221a: In conjunction with land use development applications for vacant lands, require studies to determine design requirements to collect and remove stormwater from the property or reuse stormwater to benefit the public. Require facilities to be designed and installed to City standards, at developer's expense.

Policy 222: Require that all storm drain lines be installed within dedicated public streets.

Policy 223: Storm drains in undeveloped areas where facilities do not currently exist shall be installed at the property owner or developer's expense.

Policy 226: Undertake drainage studies to determine responsibility for siltation of the system and seek opportunities to assess the responsible parties for maintenance costs.

Program 226a: Consider environmental sensitivities in conjunction with drainage studies.

Policy 227: Cooperate with Daly City, responsible property owners, and responsible agencies to develop plans to improve the storm facilities on Bayshore Boulevard to relieve flooding.

Policy 228: Establish requirements in the Municipal Code for the installation of stormwater collection systems on private properties.

Program 228a: Require new construction and substantial renovation projects to provide roof gutters and leaders that direct stormwater through the curb to the City street so that the water can be collected in City facilities.

Program 228b: Require drainage plans to be submitted in conjunction with land use development applications, including those for building permits, as applicable to the project.

Program 228c: Provide public information on the safety aspects of dealing with stormwater and encourage homeowners and businesses to make necessary improvements and repairs.

Program 228d: Comply with National Pollutant Discharge Elimination System, as required.

Chapter XI: Policies and Programs by Subarea

Policy BL.1 J: Development shall be designed to protect uses from the 100-year flood, including 100 years of projected sea level rise as determined based on regulatory standards or guidelines in effect at the time of project construction, with the reference to guidelines and sea level rise projections approved by the Director of Public Works/City Engineer based on context-specific considerations of risk tolerance and adaptive capacity.

Policy BL.26: Support County and regional efforts to maintain and improve water quality in San Francisco Bay. Work closely with responsible agencies to assure monitoring of the landfill so as to avoid toxic leaking into the Bay and to have property owners repair any leaks.

Policy BL.27: Improve water circulation and water quality in the Lagoon by control of sedimentation and by careful monitoring and maintenance of underground pipelines by responsible agencies.

Municipal Code Chapter 15.56, Floodplain Management

Municipal Code Chapter 15.56, Floodplain Management, implements local requirements for the National Flood Insurance Program and provides the following provisions relevant to Baylands development.

A. Restricting or prohibiting uses which are dangerous to health, safety and property due to water or erosion hazards, or which result in damaging increases in erosion or flood heights or velocities;

B. Requiring that uses vulnerable to floods, including facilities which serve such uses, be protected from flood damage at the time of initial construction;

C. Controlling the alteration of natural floodplains, stream channels and natural protective barriers, which help accommodate or channel floodwaters;

D. Controlling filling, grading, dredging, and other development which may increase flood damage; and

E. Preventing or regulating the construction of flood barriers which will unnaturally divert floodwaters or which may increase flood hazards in other areas.

Within areas subject to special flood hazards, Chapter 15.56 sets standards for the following:

A. Anchoring to prevent flotation, collapse or lateral movement of the structure resulting from hydrodynamic and hydrostatic loads, including the effects of buoyancy.

B. Construction Materials and Methods to provide resistance minimize flood damage to buildings and utilities and to prevent water from entering or accumulating within electrical, heating, ventilation, plumbing and air conditioning equipment and other facilities.

C. Elevation and Floodproofing to place the lowest floor (including basements) of residential structures at or above the base flood elevation and to require that any portion of a non-residential structure, including attendant utility and sanitary facilities, below the base flood elevation is watertight with walls substantially impermeable to the passage of water and have structural components capable of resisting hydrostatic and hydrodynamic loads and effects of buoyancy as certified by a registered civil engineer or architect. In addition, all new construction and substantial improvements of structures with fully enclosed areas below the lowest floor (excluding basements) that are usable solely for vehicle parking, building access, or storage, and which are subject to flooding, shall be designed to automatically equalize hydrostatic flood forces on exterior walls by allowing for the entry and exit of floodwater.

   Chapter 15.56 also contains requirements for garages and low-cost accessory structures.

D. Standards for Utilities that require all new and replacement utilities to minimize or eliminate infiltration of floodwaters into water supply and sanitary sewage systems and discharge from systems into floodwaters.

4.14.4 RELEVANT BAYLANDS SPECIFIC PLAN PROVISIONS

The Specific Plan proposes removing existing drainage infrastructure within the eastern portion of the Baylands and installing a new drainage system following completion of landfill closure. Existing drainage infrastructure within the western portion of the site will be removed as needed during site grading and remediation, and Baylands development. The Baylands drainage and stormwater treatment system is described in greater detail in Section 3.3.2 g.

a. Drainage and Flooding

The Specific Plan requires the Baylands storm drainage system to implement solutions to address the following (see Appendix A.1 for City of Brisbane Baylands Specific Plan, Chapter 7.4, Stormwater):

- Storm drainage collection facilities shall have capacity to convey the peak flow rate from a 25-year storm event entirely within the piping system such that Baylands roadways and recreational facilities are not flooded.
- The stormwater system shall accommodate the 100-year peak storm event within the piping system and within streets such that building finished floor elevations have a minimum of 1-foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and 2100 Medium-High Risk SLR.
- Stormwater conveyance and storage capacity shall be sufficient to keep key roadways, including Sierra Point Parkway, Lagoon Road and Tunnel Avenue, available as evacuation routes in the event of a 100-year storm event with tidal flows.
- Existing drainage inlets fronting Levinson Overflow Area and the PG&E substation shall be hydraulically isolated from the existing Brick Arch Sewer system.
- Underground stormwater installations shall be designed to minimize impacts to the underlying Low Hydraulic Conductivity Layer for landfill closure.
- Storm drain materials and design shall include materials and installation techniques that address anticipated settlement due to compression/decomposition of the waste material.
- Existing Use Areas: Properties adjacent to the applicant's ownership (e.g., Kinder Morgan Tank Farm and Brisbane Public Works Yard, Bayshore Sanitary Pump Station, and Golden State Lumber) are proposed in the Specific Plan to remain at their current elevations with property access provided at the existing grades of these sites. As stated in the Specific plan, "these properties will require measures by others to adapt to future conditions.

b. Stormwater Treatment and Quality

New stormwater infrastructure for Baylands roadways, building sites, and recreational areas will be installed to provide for collection and conveyance of runoff through a network of inlets and storm drains to connect to the main open channel/underground backbone line and to Visitacion Creek (see **Figure 3-50**). The Specific Plan requires stormwater runoff to be treated prior to discharge to wetlands, Visitacion Creek, Brisbane Lagoon, and San Francisco Bay in compliance with Provision C.3 of the NPDES Municipal Regional Stormwater Permit. In addition, the Specific Plan requires stormwater treatment to include pre-treatment of development runoff before flow is directed to created wetlands. Stormwater entering the Baylands from upstream along Bayshore Avenue will not receive treatment within the site except for incidental filtration or settlement associated with flows through open channels, the in-line stormwater detention area, and Visitacion Creek.

Required stormwater treatment also includes low impact development (LID) strategies that promote landscape, habitat focused, and infiltration solutions where permitted. The final detailed selection, design, and approval of stormwater treatment measures is proposed to occur as part of the construction permitting process "to inform the development of the Stormwater Management Plan (SMP)." (See Appendix A.1 for City of Brisbane Baylands Specific Plan, Chapter 7.4 Stormwater).

4.14.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of hydrology and water quality impacts.

Threshold HWQ-1: The Baylands Specific Plan would cause a significant impact if it would degrade water quality by:

- **Causing erosion or siltation at a rate greater than would occur naturally under baseline conditions at any of the following times; or**
- **Discharging chemicals of concern in stormwater to the Brisbane Lagoon or San Francisco Bay in a manner inconsistent with the Water Quality Control Plan (Basin Plan) for the San Francisco Bay Basin.**

Threshold HWQ-2: The Baylands Specific Plan would result in a significant impact if it would:

- **Permit conversion of a sufficient amount of pervious surface area to impervious surfaces so as to substantially reduce groundwater recharge and thereby contribute to subsidence; or**

- **Divert water supply to the Baylands that would otherwise be used for groundwater recharge in sufficient quantities to impede sustainable management of a groundwater basin.**

Threshold HWQ-3: The Baylands Specific Plan would cause a significant impact if it would result in injury or loss of life, or damage to a building or infrastructure, either on-site or off-site due to flooding.

Threshold HWQ-4: The Baylands Specific Plan would cause a significant impact if on-site pollutants could be released into the environment as the result of flood hazard, sea level rise and emergent groundwater, tsunami, or seiche.

4.14.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact HWQ-1: Water Quality Protection

Methodology for Determining Significance

Threshold HWQ-1 focuses on siltation and sedimentation, as well as chemical and other pollutants in runoff occurring in three distinct time periods:

(1) During the demolition and grading, when the potential for erosion, siltation, and sedimentation is the greatest;

(2) Following demolition and grading, during construction of site-specific development projects prior to the establishment of ground cover and infrastructure construction when open trenches or bare ground is present, when the potential for erosion, siltation, and sedimentation decreases and the potential for chemicals of concern to enter stormwater runoff increases; and

(3) Following completion of site-specific development, when impacts related to erosion decrease markedly, but those associated with urban runoff and waste discharges to enter stormwater runoff increase.[319]

Impacts related to siltation and sedimentation as well as chemical and other pollutants in runoff were evaluated by considering the general type of pollutants that Baylands development would generate during grading, construction, and subsequent operations and the likelihood of pollutants entering receiving waters such as Visitacion Creek, Brisbane Lagoon, and San Francisco Bay. In determining the level of significance, the analysis assumes that Baylands

[319] Because site remediation and final landfill closure are not part of the Specific Plan project, their potential to transport pollutants into the environment is not addressed in this EIR. Site remediation and landfill closure are required to prevent human contact with contaminated soils or the waste matrix within the former landfill. Landfill closure is also required to be designed to prevent infiltration of stormwater through the waste matrix into groundwater, the Bay, or the lagoon.

development would comply with relevant federal, state, regional, and local laws and regulations that are designed to reduce the potential for pollutants in receiving waters and thereby meet applicable water quality standards. Whether substantial soil erosion, siltation, or sedimentation would occur is defined as an increase in on- or off-site soil erosion, siltation, or sedimentation compared to that which would naturally under baseline conditions. Such an increase caused by Baylands development would be indicative of a significant impact.

In accordance with Section 303(d) of the federal Clean Water Act, the San Francisco Bay RWQCB has identified San Francisco Bay as an impaired water body and has established total maximum daily loads (TMDLs) for the pollutant causing the impairment.[320] The TMDL is the quantity of a pollutant that can be safely assimilated by a water body without violating water quality standards. Thus, an inconsistency with existing regulatory requirements designed to protect water quality would result in a significant impact because Baylands development would lead to exceedance of established total maximum daily loads for pollutants and cause impairment within the Brisbane Lagoon or San Francisco Bay.

The determination of whether Baylands development would or would not be consistent with existing regulatory requirements designed to protect water quality or discharge chemicals of concern in stormwater to the Brisbane Lagoon or San Francisco Bay exceeding San Francisco Bay Regional Water Quality Control Board (RWQCB) thresholds was based on compliance with C.3 requirements and GreenSuite guidance materials prepared as part of the San Mateo Countywide Water Pollution Prevention Program (Countywide Program), which include the *C.3 Regulated Projects Guide* and the *Green Infrastructure Design Guide*.

This analysis reasonably assumes that Specific Plan development would comply with relevant federal, state, regional, and local laws and regulations designed to minimize erosion and siltation, sedimentation, and chemical pollutants in stormwater runoff, including but not limited to:

- The California State Water Resources Control Board's General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit) Order WQ 2022-0057-DWQ NPDES No. CAS000002[321]; and
- Implementation of each specific BMP identified in the required Stormwater Pollution Prevention Plan (SWPPP).

[320] The intent of the 303(d) listing and TMDLs is to maintain water quality and reduce continued water quality degradation.

[321] California Water Resources Control Board. *National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (General Permit). Order WQ 2022-0057-DWQ, NPDES No. CAS000002*. September 8, 2022. https://www.waterboards.ca.gov/water_issues/programs/stormwater/construction/docs/2022-0057-dwq-with-attachments/cgp2022_order.pdf.

Impact Assessment

Demolition and Site Grading

From the initial demolition of existing buildings along Industrial Way and removal of pavement, vegetation, and other improvements within the Baylands and at the fire station relocation site (140 Valley Drive) until site grading is completed and ground cover (landscaping, hardscape, paving, buildings) is established, surface soils would be subject to disturbance over large portions of the Baylands and offsite construction sites, causing erosion and entrainment of silt and sediment in stormwater runoff.

While grading of the Specific Plan area would be balanced, an estimated 2.5 million cubic yards of soil would be moved from atop the former landfill in the eastern portion of the Baylands and hauled by truck to be placed as engineered fill within the area west of the Caltrain right-of-way over an approximate 2-year period. The approximately 1.8 million cubic yards of soil remaining on top of the former landfill would be temporarily moved around within the eastern portion of the site to enable construction of an impermeable landfill cap and then placed over the landfill cap as engineered fill to facilitate development and building construction within the Campus East District.

Grading activities, including excavation, backfilling, loading, and unloading soil haul trucks and placement of fill material, would expose large areas of loose soil and generate temporary stockpiles of soils, paving materials, and building materials. These stockpiles would be subject to soil loss; erosion; and transport of silts, sediments, and chemical contaminants in stormwater runoff to San Francisco Bay and the Brisbane Lagoon. In addition, accumulation of sufficient amounts of sediment would risk blockage of flows that could cause localized ponding or flooding.

Removal of vegetation prior to installation of habitat improvements within Visitacion Creek and along the north side of Brisbane Lagoon would have a higher potential for erosion than other portions of the Baylands due to tidal action and concentrated stormwater drainage over exposed soils. While proposed Specific Plan phasing indicates that soils will be disturbed and vegetation removed within Visitacion Creek relatively early to accommodate construction of the required landfill cap, it also proposes that open space and habitat restoration along Visitacion Creek and Lagoon Park would be completed as follows:

- Visitacion Creek restoration is required to be completed before the approval of any building permit (within the Campus East District) exceeding 1.25 million square feet (50 percent of the maximum allowing development east of Caltrain).
- Lagoon Park restoration must be completed before the approval of any building permit (within the Campus East District) exceeding 2.0 million square feet (75 percent of the maximum allowing development east of Caltrain).

The result of this phasing program is that temporary erosion control measures would need to be required by regulatory agencies and the City for landfill closure and grading permits, respectively. In addition, following landfill closure and placement of initial erosion control measures (which could be undertaken in multiple phases), soils would again be disturbed along Visitacion Creek and the north shore of the lagoon for habitat restoration activities, thus increasing the potential for erosion compared to undertaking landfill closure along Visitacion Creek at a single time with habitat restoration activities occurring immediately following completion of landfill closure along the creek. Based on the anticipated construction sequence indicated in **Table 3-8**, initial erosion control measures would be in place as long as 10 to 12 years.

Demolition and soil disturbance would also result in the potential for chemical releases into runoff and receiving waters. Construction equipment used on-site would operate, park, and be maintained within unpaved areas with the potential for spillage of fuels, oils, and solvents entering stormwater runoff during the approximately 2-year site grading period and from construction sites following site grading. Grading activities would also contribute to short-term siltation and pollutant loading in urban runoff from on-road vehicular travel, including hauling of soils from the eastern to the western portions of the Baylands, delivery of construction materials and removal of waste, and worker travel to and from construction sites as well as from on-site watering activities to reduce airborne dust.

Because of contaminants within existing surface soils in the western portion of the site,[322] excavations within these existing soils would have the potential to expose and risk release of those contaminants into stormwater runoff.

Baylands demolition and construction activities would generate debris in the form of building materials, as well as asphalt and concrete materials from demolition of roadways and parking areas. Demolition, grading, and construction activities would also generate contaminants associated with construction materials, construction waste, vehicles, and equipment. Due to their age, demolition of buildings along Industrial Way would expose hazardous materials such as PCBs, asbestos, and lead-based paint, risking their release into the environment.

Once released, soils and other substances exposed or generated during demolition and grading would be transported to the Brisbane Lagoon, Visitacion Creek, and San Francisco Bay in stormwater runoff, wash water, and dust control water in the absence of specific measures to contain such substances onsite. The proximity of the Baylands to Brisbane Lagoon and San Francisco Bay reduces the chance that the pollutants in stormwater runoff (e.g., sediment, construction debris, petroleum hydrocarbons, and lubricants) would be naturally attenuated prior to discharge to the Bay.

[322] See Section 4.13, *Hazards and Hazardous Materials*.

Post-Grading, Construction of Site-Specific Development Projects

Once grading is completed and construction of site-specific development projects is initiated, compacted soils within constructed building pads would be disturbed, site-by-site. An increased potential for erosion and siltation would be present at site specific and infrastructure development sites until construction of impervious surfaces is completed and landscape or habitat restoration plantings are established due to:

- All construction areas:
    - Unpaved staging areas.
    - Presence of temporary stockpiles.
- Site-specific residential and commercial development:
    - Excavations for on-site utilities, building foundations, and parking garages.
    - "Fine grading" to create on-site drainage to streets and storm drains.
    - Installation of ornamental landscaping.
- Infrastructure:
    - Excavations for underground utilities and storm drains within roadway rights-of-way.
    - Grading for roadways not completed during initial site grading.
    - Pavement removal and construction of the realigned Lagoon Road.
- Open space / Open areas:
    - Construction of park improvements within open space areas.
    - Construction of manufactured slopes to create trails and recreational amenities at Icehouse Hill.
    - Habitat restoration and trail construction activities along Visitacion Creek, including construction of the proposed detention basin.
    - Habitat restoration and construction of Lagoon Park, including placement of soils on existing rip rap to facilitate habitat restoration (see **Figure 3-20**, **Figure 3-21a**, and **Figure 3-21b**).
- Manufactured slopes, including those:
    - That would be constructed along Geneva Avenue leading to the bridge over the Caltrain right-of-way.
- Along the Caltrain right-of-way that will sit lower than the flat building pads created within the western and eastern portions of the Specific Plan for residential and commercial development, along with the flat development pads themselves.

- Slopes along the sides of the former landfill that are constructed above the required landfill cap.

Post-Construction Operations

Once construction is completed, soils within limited areas of the Baylands would continue to be exposed to forces that cause erosion, including:

- Tidal action and stormwater runoff within Visitacion Creek;
- Wave action and stormwater runoff within Lagoon Park; and
- Runoff from manufactured slopes along the Geneva Avenue extension, slopes containing the former Brisbane Landfill, and trails on Icehouse Hill.

Nonpoint source pollutants washed by rainwater from rooftops and paved areas as well as pollutants washed from landscaped areas into on-site and local drainage networks would be the primary contributors to water quality degradation following construction during the life of Baylands development.

Specific Plan development would increase vehicular use of on- and off-site roadways and parking areas, the result of which would be increased accumulation and release of petroleum hydrocarbons, lubricants, sediments, and metals (generated by the wear of automobile parts) in stormwater runoff. Runoff from landscaped areas, whether as the result of irrigation or a storm, would cause common urban pollutants to be transported to Brisbane Lagoon, Visitacion Creek, and San Francisco Bay, adversely affecting water quality, unless specific containment and treatment measures were to be implemented.

Runoff from Baylands roadways, as well as parking and loading areas, would carry urban runoff pollutants such as:

- Particulates from pavement wear and vehicles
- Metals, such as zinc, lead, iron, copper, cadmium, chromium, nickel, and manganese
- Gasoline, diesel fuel, greases, and lubricating oils from automobiles and trucks
- Tire and brake lining wear
- Polycyclic aromatic hydrocarbons (PAHs), which are created as combustion by-products of gasoline and other fossil fuels
- Trash discarded from vehicles and along the roadside

Throughout the life of Specific Plan development, nonpoint source pollutants would have the potential to be washed by rainwater from rooftops, landscaped areas, and roadways into receiving waters via on-site drainage facilities. Potential nonpoint source pollutants include products used in landscaping (e.g., pesticides, herbicides, and fertilizers); oil, grease, gasoline,

and heavy metals (nickel, copper, zinc, cadmium, and lead)[323]; trash from roads and parking areas; and petroleum hydrocarbons from fuels. Roof runoff can contribute zinc if galvanized rain gutters are installed. In addition, urban runoff can mobilize pathogens, including bacteria and viruses. Trash (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic debris (such as leaves, grass cuttings, and food waste) have the potential to be entrained in urban runoff and adversely affect aquatic habitats.

Table 4.14-2 identifies the sources of urban pollutants that would be generated by operation of Specific Plan development.

Table 4.14-2: Sources of Specific Plan Pollutants in Urban Runoff

Pollutant	Potential Sources
Suspended-Solid/Sediments	Landscaping areas and disturbed earth surfaces.
Nutrients	Fertilizers from landscaped areas, sediment, and trash/debris.
Heavy Metals	Streets, as well as commercial and multi-family parking areas.
Pathogens (Bacteria/Virus)	Pet and food wastes, landscaped areas.
Pesticides	Landscaping and open space/areas.
Oil and Grease	Streets and parked vehicles.
Trash and Debris	Common litter and trash from developed and open space/areas.

Operations and maintenance activities would also include the use of pesticides, fuels to power equipment and vehicles, fertilizers, paints, and cleaners. In addition, urban runoff commonly contains a variety of water pollutants, including elevated levels of pathogens, sediment, trash, fertilizers, pesticides, heavy metals, and petroleum products. Stormwater can carry these pollutants through storm drain systems and ultimately to receiving waters such as Visitacion Creek, San Francisco Bay, and Brisbane Lagoon.

As noted above, the RWQCB has also adopted a TMDL for pesticide toxicity in urban creeks such as Visitacion Creek.

Together, the substantial amount of Baylands demolition, grading, and construction needed for development of 2,200 dwelling units, 6.5 million square feet of commercial office use, 500,000 square feet of hotel use, habitat and recreational improvements, and related on- and off-site infrastructure would risk release of pollutants and debris from demolition, grading, and construction activities into stormwater runoff. Following site construction, urban pollutants would be released in

[323] The primary sources of trace metals in stormwater are typically commercially available metals used in transportation (e.g., automobiles), buildings, and infrastructure. Metals are also found in fuels, adhesives, paints, and other coatings. Copper, lead, and zinc are the most prevalent metals typically found in urban runoff. Other trace metals, such as cadmium, chromium, and mercury, are typically not detected in urban runoff or are detected at very low levels. Metals are of concern because of the potential for toxic effects on aquatic life in receiving waters.

stormwater runoff from the site with the potential for releases of pollutants from the Baylands that would reach the Brisbane Lagoon or be carried by Visitacion Creek into San Francisco Bay.

Significance Conclusion for Impact HWQ-1

Soils within the Baylands would be exposed and susceptible to erosion during and after grading until groundcover is established and again during construction of site-specific projects, as well as immediately after construction before groundcover is established. In particular, grading and habitat restoration activities along Visitacion Creek and the north shore of the lagoon that are subject to tidal action would be particularly susceptible to erosion.

Grading and construction contractors for Baylands development would be required to comply with the General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order WQ 2022-0057-DWQ NPDES No. CAS000002) (Construction General Permit).

The Construction General Permit would require each onsite and offsite Baylands construction activity to minimize or prevent pollutants in stormwater discharges and authorized non-stormwater discharges through use of controls, structures, and management practices as set forth in the General Permit that achieve best available technology (BAT) for toxic and non-conventional pollutants and best conventional technology (BCT) for conventional pollutants. The General Permit also requires that each site-specific construction development be designed to ensure that stormwater discharges and authorized non-stormwater discharges will not:

- Adversely affect human health or the environment;
- Contain pollutants in quantities that threaten to cause pollution or a public nuisance; or
- Contain pollutants that cause or contribute to an exceedance of any applicable water quality objectives or water quality standards contained in an applicable water quality control plan.

The Construction General Permit requires that site grading and site-specific development projects encompassing more than 1 acre:

- Complete a risk assessment to determine pollution prevention requirements pursuant to the three risk levels established in the General Permit;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation; and
- Develop and implement an SWPPP that identifies the sources of sediment and other sources that affect the quality of stormwater discharges and specifies BMPs that will reduce pollution in stormwater discharges to the Best Available Technology Economically Achievable/Best Conventional Pollutant Control Technology standards; and Perform inspections and maintenance of all BMPs.

A SWPPP includes specific construction-related BMPs to prevent soil erosion and loss of topsoil. BMPs implemented could include, but would not be limited to, physical barriers to prevent erosion and sedimentation, construction of sedimentation basins, limitations on work periods during storm events, use of swales, protection of stockpiled materials, and a variety of other measures that would substantially reduce or prevent erosion from occurring during construction.

Because (1) the BMPs to be implemented will be specific to each on- and off-site demolition, grading, and construction activity and location and (2) BMPs evolve with advancing technology, it is not possible to identify the precise BMPs that would be required by SWPPPs for each Baylands construction activity over its 20-year buildout period and subsequent operations. The process of selecting the specific BMPs for individual Baylands construction activities would typically follow the general protocol outlined below:

- **Step 1 – Identify Activities, Pollutants and Issues of Concern:** The typical first step in BMP selection is to identify:
    - Specific construction activities to be undertaken (e.g., grading, trenching, excavation, stockpiling of soil, demolition of buildings or pavement, or other activities with the potential to impact storm water and non-storm water discharges). Different types of construction activities may require different or more extensive BMPs than others. For example, Baylands site grading will occur over a much longer time frame and expose a far greater amount of soil at any given time than would construction of offsite water and electrical lines.
    - Potential pollutants of concern (e.g., sediment, known soil contaminants; petroleum products such as fuel, oil, and grease from vehicle and equipment operation; demolition debris, including debris from structures of an age where lead based paint and asbestos may be present; paving materials such as concrete and asphalt components; other materials used or stored on site, such as pesticides, herbicides, fertilizer, detergents, paint adhesives, and solvents; and project wastes such as litter, debris, hazardous wastes, and liquid wastes; and
    - Site-specific issues of concern, such as proximity to Visitacion Creek and the Brisbane Lagoon.
- **Step 2 – Evaluate Site Conditions and Select BMPs:** To assist in BMP selection, the Water Resources Control Board,[324] US EPA,[325] and Caltrans[326] have prepared manuals outlining BMPs applicable to site grading, as well as building and utility construction projects. The BMPs contained in these manuals will be used to identify the potential BMPs to be selected for each Baylands construction activity with the specific BMPs to be

[324] https://www.waterboards.ca.gov/water_issues/programs/stormwater/.

[325] https://www.epa.gov/npdes/npdes-stormwater-program.

[326] https://dot.ca.gov/programs/environmental-analysis/stormwater-management-program.

implemented for each construction activity reflecting project-specific requirements and other factors such as BMP effectiveness, cost, availability, feasibility, and suitability for the proposed construction activity and site. **Table 4.14-3** presents typical guidelines for BMP selection and implementation at a construction site.

- **Step 3 – Implement, Monitor, and Maintain the BMPs:** Selected BMPs will also need to be implemented in a sequence that maximizes protection of water quality, be monitored regularly for effectiveness and be maintained as necessary throughout the project. Most BMPs will only be implemented when needed, and/or when a storm event is forecasted or occurs.

The Construction General Permit requires compliance with specified performance standards designed to achieve and maintain applicable water quality objectives and water quality standards contained in an applicable water quality control plan.

Also, landscape management within the Baylands would be required to comply with California Department of Pesticide Regulation requirements for pesticide use (CCR Title 3, Division 6, Pesticides and Pest Control Operations). To minimize adverse effects from Baylands land use operation and maintenance activities, implementation of BMPs, such as secondary containment for storage of hazardous materials, proper disposal techniques for associated wastes, and good housekeeping measures to minimize trash and other contaminants from being collected in runoff and transported to waterways, would be required. Stormwater control/LID[327] measures would be required by the City of Brisbane as standard conditions of approval for Tentative Subdivision Map and building permits, along with compliance with RWQCB Municipal Regional Stormwater Permit Order No. 2011-0083 Provision C.3 (Provision C.3). As required by the permit, the site-specific development project applicants would incorporate LID strategies, such as stormwater reuse, on-site infiltration, and evapotranspiration as initial stormwater management strategies. Secondary methods would include the use of natural, landscape-based stormwater treatment measures, as identified by Provision C.3.

Stormwater treatment measures would also be required in the final design plans. in accordance with the San Mateo Countywide Water Pollution Prevention Program C.3 Regulated Projects Guide.[328]

[327] The goal of LID is to reduce runoff and mimic a site's predevelopment hydrology by minimizing disturbed areas and impervious cover and then infiltrating, storing, detaining, evapotranspiring, and/or biotreating stormwater runoff close to its source. LID employs principles such as preserving and recreating natural landscape features and minimizing imperviousness to create functional and appealing site drainage that treats stormwater as a resource, rather than a waste product. Practices used to adhere to these LID principles include measures such as rain barrels and cisterns, green roofs, permeable pavement, preserving undeveloped open space, and biotreatment through rain gardens, bioretention units, bioswales, and planter/tree boxes.

[328] https://www.flowstobay.org/wp-content/uploads/2024/01/C3-Regulated-Projects-Guide-2023_010524.pdf.

Table 4.14-3: Typical Best Management Practices Sequencing and Options

Description	Actions	BMP Options
1. Before Construction	Evaluate, mark, and protect areas to be protected (e.g., biological and cultural resources, underground utilities to remain).	**Scheduling.** Develop a schedule for construction sequencing that is correlated with implementation of construction site BMPs to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking at any given time. • Schedule major soil disturbing activities and activities near water bodies during the non-rainy season. • Monitor weather forecasts for seasonal and non-seasonal storms. • Contingency plans to deploy erosion, sediment control, and soil stabilization BMPs when needed on short notice.
2. Site Access Areas (construction site entrances; parking, staging, and storage areas)	Stabilize site access areas prior to earthwork.	**Tracking Controls.** Controls to reduce offsite tracking of sediment and other pollutants at defined construction site entrances and exits along with clean-up methods to prevent sediment or other materials from entering storm drains. • Minimize points of entrance/exit and require their use. • Limit vehicle speeds. • Grade construction entrances/exits to prevent runoff from the site. • Route runoff from entrances/exits through a sediment-trapping device before discharge. • Design entrances/exits to support the heaviest vehicles and equipment using them. • Select construction access stabilization (aggregate, asphaltic concrete, concrete) based on longevity, required performance, and site conditions. • Use steel plates with ribs for entrance/exit access if needed and permitted. • Use aggregate only as recommended by a geotechnical engineer. • Inspect potential sediment tracking locations routinely and sweep or vacuum sediment as needed. • If not mixed with debris or trash, incorporate removed sediment back into the project. • Avoid sweeping up any unknown potentially hazardous substance or object. • Properly dispose of sweeper wastes. • Routinely inspect for damage and assess effectiveness of BMPs; repair if access is clogged. • Where tracking has occurred on roadways, sweeping should be conducted the same day. • Keep temporary roadway ditches clear.
3. Storm Drain Inlet Protection	Install inlet protection at down-gradient inlets that project runoff/tracking might impact.	**Storm Drain Inlet Protection.** Install devices at storm drain inlets to protect against the discharge of sediment-laden storm water and non-storm water runoff from construction activities. Because such devices cause ponding to allow sediment to settle out before discharge to the storm drain, construct such devices to avoid ponding into road traffic or onto erodible surfaces, as well as to avoid overflow onto sidewalks. • Inspect inlet protection devices prior and after storm events, as well as routinely throughout the rainy season. • Remove inlet protection devices at the end of the construction, or when the inlet can no longer be impacted.
4. Perimeter Sediment Control	Install perimeter sediment controls (silt fence, fiber	**Silt Fences.** Use silt fences to intercept and slow the flow of sediment-laden sheet flow runoff before water leaves the construction site. Silt fences are typically placed:

Description	Actions	BMP Options
	rolls, etc.) as applicable prior to land disturbing activities. Install additional runoff control measures during construction as needed.	• Below the toe of exposed and erodible slopes. • Down-slope of exposed soil areas. • Around temporary stockpiles. • Along streams and channels. • Along the perimeter of a construction site. **Fiber Rolls, Gravel Bags, Sandbags.** Use fiber rolls consisting of straw, flax or other similar materials that are rolled and bound into a tight roll or a single row berm of sand or gravel bags to intercept runoff, reduce flow velocity, release the runoff as sheet flow, remove sediment.
5. Materials and Waste Storage Areas	Prepare staging areas, material storage, and disposal areas as applicable. Grade to reduce run-on and runoff, install perimeter controls, obtain clean-up materials, plastic covers for stockpiles, etc. prior to storing materials on site.	**Stockpile management.** One or more of the following options may be used to manage stockpiles and prevent stockpile erosion and sediment discharges for storm water and non-storm water runoff/run-on: • Stockpiled materials may be returned to the excavation if precipitation is forecast. • Protect stockpiles from storm water run-on using temporary perimeter sediment barriers such as berms, silt fences, fiber rolls, covers, sand/gravel bags, or straw bale barriers, as appropriate. • Keep stockpiles organized and surrounding areas clean. • Protect storm drain inlets, watercourses, and water bodies from stockpiles, as appropriate. • Implement dust control practices as appropriate on all stockpile material. • Cover, stabilize, or otherwise protect stockpiles with a perimeter sediment barrier prior to onset of precipitation. **Onsite Material Delivery and Storage** • Only store the minimum amount of material that is needed for the job. • Locate storage areas away from storm drain inlets, drainage systems, and watercourses to prevent storm water run-off from reaching the materials. • If practical, store materials in enclosed storage containers such as cargo containers. • Store materials on impervious surfaces or use plastic groundcovers to prevent any spill or leakage from contaminating the ground. • For known hazardous materials, keep materials covered using plastic or other waterproof materials. • If necessary, provide secondary containment systems around materials storage areas to prevent contaminated run-off/run-on from leaving storage area(s). • Keep an adequate supply of spill kit materials nearby. • Ensure that qualified personnel are available when hazardous materials are delivered to ensure proper delivery and storage in designated area. • When a storage area is no longer needed, promptly return it to the original condition. • Place bagged materials such as cold patch, concrete mix, and other materials with the potential to pollute runoff on pallets and under cover. **Materials Use**

Description	Actions	BMP Options
		• Reduce or eliminate use of hazardous materials onsite when practical. • Do not dispose of empty latex paint and paint cans, used brushes, paint rags, absorbent materials, and drop cloths with other construction debris until they are thoroughly dry and are no longer hazardous. • Do not remove original product labels containing safety and disposal information. • Use the entire product before disposing of the container. • When possible, mix paint indoors; otherwise, use secondary containment structures. • Do not clean paintbrushes or rinse paint containers in a street, gutter, storm drain, sanitary sewer, or watercourse. • Dispose of any paint thinners, residue, and sludge(s), that cannot be recycled, as hazardous waste. • For water-based paints, clean brushes to the extent practicable, and rinse into a concrete washout pit or temporary sediment trap. For oil-based paints, clean brushes to the extent practicable and filter and reuse thinners and solvents. • If possible, recycle residual paints, solvents, non-treated lumber, and other materials. • Do not over-apply fertilizers, pesticides, and soil amendments. Prepare only the amount needed. Strictly follow the recommended usage instructions. • Keep an ample supply of spill cleanup material near use areas. Train employees in spill cleanup procedures. • Avoid exposing applied materials to rainfall unless sufficient time has been allowed for them to dry or cure. • Hazardous materials use shall also be managed in accordance with the BMP on "Hazardous Materials/Waste Management." **Spillage Control.** Stop spillage of material if it can be done safely. Clean the contaminated area, and properly dispose of contaminated materials. For all spills, notify the project foreman and appropriate authorities. Use the following spill prevention and controls when applicable: • To the extent that it would not compromise clean-up activities, cover and protect spills from storm water run-off during rainfall. • Do not bury or dilute spills with wash water. • Store and dispose of all used clean-up materials, contaminated materials, and recovered spill material in accordance with federal, state, and local regulations (Refer to BMP on "Hazardous Materials/Waste Management"). • Use absorbent materials on spill rather than using water to hose down a spill. • When water is used for cleaning and decontamination of a spill, collect and dispose of it properly. Do not allow the water to enter storm drain inlets or watercourses. • Keep spill cleanup kits in areas where any materials are used and stored. **Solid Waste Management.** These BMPs are typically applied to construction projects that generate solid waste such as concrete, cement, asphalt rubble, masonry brick/block, vegetation debris, steel and scrap metals, pipe and electrical cuttings, non-hazardous equipment parts, Styrofoam, general trash, and other materials used to transport and package construction materials.

Description	Actions	BMP Options
		• Practice good housekeeping and keep site clean. • Use "dry" methods for site cleanup such as sweeping, vacuuming, and hand pick-up. • Designate a waste storage area onsite. If a designated onsite waste storage area is not feasible, remove wastes from the site regularly. • Prohibit littering by employees, contractors, and visitors. • Provide sufficient trash receptacles on site and/or in construction vehicles. • Protect wastes from being washed away by rainfall, storm water run-off, or other waters (irrigation, water line breaks, etc.). • For materials with the potential for spills or leaks, stockpile on impervious surfaces or use plastic groundcovers to prevent spills or leaks from infiltrating the ground. • Do not hose out or clean out dumpsters or containers at the construction site. • Prevent solid waste and trash from entering and clogging storm drain inlets. • As practicable, incorporate any removed clean sediment and soil back into the project. • Reference BMP on Stockpile Management. **Hazardous Materials/Hazardous Waste Management.** This BMP is typically used when projects involve the storage and use of hazardous materials, and the generation of waste byproducts, from petroleum products; glues, adhesives, and solvents; herbicides, pesticides, and fertilizers; paints, stains, and curing compounds; and other hazardous and toxic substances. • Comply with all federal, state and local laws regarding storage, handling, transportation, and disposal of hazardous waste. • Minimize the amount of hazardous materials stored at the construction site. Minimize the production and generation of hazardous waste at the construction site. • Cover or containerize and protect any hazardous materials and wastes from vandalism. • Clearly mark all hazardous materials and wastes. Place hazardous waste containers in secondary containment systems if stored at the construction site. • Place stockpiled cold mix on plastic and cover it with plastic. • Do not mix waste materials. Doing so complicates or inhibits disposal and recycling options and can result in dangerous chemical reactions. • Stormwater that collects within secondary containment structures must be inspected prior to being discharged to ensure no pollutants are present. Contaminated storm water must be managed per Utility Environmental Practices. • Do not allow spills to be discharged from a secondary containment system. See BMP on Spill Control. • Segregate hazardous waste from other solid waste and dispose of properly. **Contaminated Soil Management.** This contaminated soil management BMP is typically used when soil contamination is suspected or contaminated soil is encountered. Construction crews need to be particularly vigilant on construction sites where soil contamination has or may have occurred in the past from spills, illicit discharges, or leaks from

Description	Actions	BMP Options

		underground storage tanks. Contaminated soils may also be encountered during digging and trenching activities on highways and roadways. Contaminated soil wastes should be managed in accordance with the following procedures:
		• Identify contaminated soil; look for the following:
		  ○ Soil that is discolored, black, gray, or white.
		  ○ Soil that has an unusual odor, such as petroleum, acid, alkaline, sewage, solvent, or any other chemical smell.
		• If any potentially contaminated soil is detected, discontinue the activity and contact appropriate authorities.
		• Contaminated soils must be managed properly per appropriate requirements and protocols.
		• Perform routine inspection of digging and trenching operations looking for contaminated soils.
		• Manage all soils with unknown contaminants as hazardous substances, in accordance with federal, state, and local laws.
		Sanitary Waste Management. This BMP is typically used on construction sites with temporary or portable sanitary/septic waste systems.
		• Locate temporary sanitary facilities away from drainage facilities, watercourses, and traffic circulation. When subjected to high winds or risk of high winds, secure temporary sanitary facilities to prevent overturning.
		• Do not bury or discharge sanitary wastewater, except to a properly permitted sanitary sewer discharge facility.
		• Use only reputable, licensed sanitary/septic waste haulers.
		• Empty temporary sanitary facility's holding tanks prior to transport.

6. Earthwork (trenching, excavation, grading, surface roughening, grubbing)	Begin excavation, trenching, or grading after installing applicable sediment and runoff control measures. Install additional control measures as work progresses as needed.	Each of the above BMPs could be appropriate, depending on the specific location and activity being undertaken.
7. Surface Stabilization (temporary and permanent seeding, mulching)	Apply temporary or permanent soil stabilization measures as applicable on all disturbed areas where work is delayed or completed.	**Preserve Existing Vegetation** • Preserve existing vegetation whenever possible. • Locate construction material, equipment storage, and parking areas outside the drip line of any tree to be retained. • Remove any markings, barriers, or fencing after project is completed. **Temporary Soil Stabilization** • Use one or more temporary soil stabilization practices, such as hydraulic mulch, hydro seeding, soil binders, straw mulch, geotextiles, plastic covers, erosion control blankets/mats, fiber rolls, or gravel bags or sandbags.

Description	Actions	BMP Options

		Hydraulic Mulch. Hydraulic mulch is typically applied to disturbed areas requiring temporary protection until permanent vegetation is established. Avoid use in areas where the mulch would be incompatible with immediate earthwork activities and would have to be removed.
		• Avoid mulch over-spray onto the traveled way, sidewalks, lined drainage channels, or existing vegetation.
		• Maintain an unbroken, temporary mulched ground cover throughout the period of construction when the soils are not being reworked. Inspect before expected rainstorms and repair any damaged ground cover and re-mulch exposed areas of bare soil.
		• Hydraulic Mulches:
		  ○ Apply as a liquid slurry using a hydraulic application machine (i.e., hydroseeder) at rates of mulch and stabilizing emulsion recommended by the manufacturer.
		• Hydraulic Matrices:
		  ○ Apply a combination of wood fiber and/or paper fiber mixed with acrylic polymers as binders. Apply as a liquid slurry using a hydraulic application machine (i.e., hydroseeder) at rates recommended by the manufacturer.
		• Bonded Fiber Matrix (BFM)
		  ○ Apply BFM using a hydraulic application machine (mulch and tackifier are premixed in a single bag) in accordance with manufacturers instruction. Do not apply immediately before, during, or after a rainfall.
		Hydroseeding. Hydroseeding typically consists of applying a mixture of fiber, seed, fertilizer, and stabilizing emulsion with hydro-mulch equipment, which temporarily protects disturbed soil areas from erosion.
		• Avoid use of hydroseeding in areas where it would be incompatible with future earthwork activities and would have to be removed such as:
		  ○ Steep slopes that are difficult to protect with temporary seeding.
		  ○ Temporary seeding that may not be appropriate in dry periods without supplemental irrigation.
		  ○ Temporary vegetation that may have to be removed before permanent vegetation is applied.
		  ○ Temporary vegetation that is not appropriate for short-term inactivity.
		• Hydroseeding can be accomplished using a multiple-step (with straw mulch) or a one-step process (mixed with hydraulic mulch, hydraulic matrix, or bonded fiber matrix). When the one-step process is used to apply the mixture of fiber, seed, etc., increase the seed rate to compensate for all seed not having direct contact with the soil.
		• Prior to application, roughen the slope, fill area, or area to be seeded with the furrows trending along the contours.
		• Apply a straw mulch as necessary to keep seeds in place and to moderate soil moisture and temperature until the seeds germinate and grow.
		• Avoid over-spray onto the travel way, sidewalks, drainage channels, and existing vegetation.

Description	Actions	BMP Options
		• Inspect seeded areas for failures and re-seed, fertilize, and mulch within the planting season, using not less than half the original application rates. Any temporary revegetation efforts that do not provide adequate cover are to be revegetated. • After any rainfall event, maintain all slopes to prevent erosion. **Soil Binders.** Soil binders are typically applied to disturbed areas requiring short-term temporary protection. Because soil binders can often be incorporated into the work, they may be a good choice for areas where grading activities will soon resume. • Binders have the following limitations: o Soil binders generally experience spot failures during heavy rainfall and may need reapplication after storm and do not hold up to pedestrian or vehicular traffic. o Soil binders may not penetrate soil surfaces made up primarily of silt and clay, particularly when compacted. o Some soil binders may not perform well with low relative humidity. Under rainy conditions, some agents may become slippery or leach out of the soil. • Follow manufacturer's recommendations for application procedures and cleaning of equipment after use. Any onsite cleaning must use appropriate BMPs for pollution prevention plans. • Do not apply soil binders during or immediately before rainfall, as they require a minimum curing time of 24 hours before they are fully effective. • Avoid over-spray onto traveled way, sidewalks, lined drainage channels, sound walls, and existing vegetation. **Straw Mulch.** Straw mulch is typically used when temporary soil stabilization surface cover is needed on disturbed areas until soils can be prepared for re-vegetation and permanent vegetation is established. It is often used in combination with temporary and/or permanent seeding strategies to enhance plant establishment. • A tackifier is the preferred method for anchoring straw mulch to soil on slopes. Tackifiers act to glue the straw fibers together and to the soil surface, and the tackifier shall be selected based on longevity and ability to hold fibers in place. Soil binders (tackifier) will generally experience spot failures during heavy rainfall events. • Avoid placing straw onto the traveled way, sidewalks, lined drainage channels, sound walls, and existing vegetation. • Straw mulch with tackifier shall not be applied during or immediately before rainfall. • Apply loose straw at a minimum rate of 4,000 pounds per acre, either by machine using a straw blower or by hand distribution. • Distribute the straw mulch evenly on the soil surface. • Anchor the mulch in place by using a tackifier or by "punching" it into the soil mechanically. "Punching" of straw does not work in sandy soils. • Methods for holding the straw mulch in place depend on slope steepness, accessibility, soil conditions, and longevity. If selected method is incorporation of straw mulch into the soil, then do as follows: o On small areas, a spade or shovel can be used.

Description	Actions	BMP Options
		○ On slopes with soils that are stable enough and of sufficient gradient to safely support construction equipment without contributing to compaction and instability problems, straw can be "punched" into the ground using a knife-blade roller or a straight bladed coulter, known commercially as a "crimper." ○ On small areas and/or steep slopes, straw can also be held in place using plastic netting or jute. The netting shall be held in place using 11-gauge wire staples, geotextile pins, or wooden stakes (as described BMP on "Geotextiles, Plastic Covers Erosion Control Blankets/Mats"). **Geotextiles, Plastic Covers Erosion Control Blankets/Mats.** These methods are typically used when disturbed soils may be particularly difficult to stabilize or access, including steep slopes or channels to be revegetated. Because plastic covers result in 100 percent runoff, their use is typically limited to covering stockpiles or covering small graded areas for short periods, such as through an imminent storm event, until alternative measures can be installed.
8. Construction and Paving (install utilities, buildings, paving)	Implement applicable control practices as work takes place.	**Dewatering Operations.** This BMP is applicable to trench or excavation dewatering. Discharges of non-storm water from a trench or excavation that contain sediments or other pollutants to the sanitary sewer, storm drain systems, creek bed (even if dry), or receiving waters is typically prohibited. Water from dewatering activities is generally allowed to be discharged if the water does not contain any sediment or other pollutants. Generally, non-contaminated discharges of non-storm water to lands (such as infiltration) are allowed. This BMP is not applicable to utility vault or sub structure dewatering. For these applications, refer to the BMP for Dewatering Utility Substructures and Vaults. This BMP is also not applicable if the water is known, or suspected to be, contaminated. • Use water where possible for construction activities such as compaction and dust control. If used for these applications, ensure that the water will infiltrate and not run-off from the land to storm drain systems, creek beds (even if dry), or receiving waters. • If water is to be discharged to land for infiltration: ○ The water may contain sediments but must not be contaminated with other pollutants. ○ The water must not run-off to storm drain systems, creek beds (even if dry), or other surface waters. • Water from dewatering that contains only sediment may be discharged if the sediment is allowed to settle out or the sediment is filtered out first. Alternatively, a vacuum truck may be used to remove the water and haul it to an authorized discharge location. • If a permit is required, provide temporary onsite storage of water removed from trenches, excavations, etc., until a permit to discharge is obtained. • If a permit is obtained for discharge to a storm water or sanitary sewer system, conduct all dewatering discharge activities in accordance with permit requirements. **Paving Operations.** This BMP is typically used for pavement surfacing, resurfacing, removal, or patching applications of: cold mix, asphalt, chip seal, seal coat, tack coat slurry seal, fog seal, or Portland cement concrete. For pavement grinding, saw cutting, coring or drilling, refer to BMP Concrete/Coring/Saw Cutting and Drilling Waste Management. • Protect storm drain inlets near work and down gradient of the area to be paved.

Description	Actions	BMP Options

		• If onsite mixing is planned then an area must be designed for conducting the mixing. This area should be paved or made impervious (e.g., plastic or wood sheeting) and be located away from storm drain inlets or watercourses.
		• Minimize overspray of tackifying emulsions or placement of other paving materials beyond the limits of the area to be paved.
		• Use dry methods to clean equipment and conduct cleaning in accordance with the BMP on Vehicle and Equipment Washing.
		• Material use and stockpiles to be managed in accordance with BMPs on Material Use and Stockpile Management.
		• Collect and remove all broken asphalt and concrete, recycle when feasible, and dispose of materials in accordance with local, state, and federal requirements.
		• Do not apply asphalt, concrete paving, seal coat, tack coat, slurry seal, or fog seal if rain is expected during the application or curing period.
		  ○ Avoid, if possible, transferring, loading, or unloading paving materials near storm drain inlets or watercourses. If not possible, use BMP on Storm Drain Inlet Protection.
		Vehicle and Equipment Washing. Use these procedures on all construction sites where vehicle and equipment cleaning is performed. Note that onsite vehicle and equipment washing is not typically performed on utility construction projects.
		• Use "dry" cleaning methods such as wiping down, rather than water washing vehicles or equipment.
		• Whenever possible, washing should not be conducted at the construction site.
		• If onsite vehicle washing is authorized by the Environmental Representative, use the following methods:
		  ○ Locate vehicle and equipment washing away from storm drain inlets, drainage systems, or watercourses.
		  ○ Place sandbags or another type of berm around storm drain inlets and drainage systems to prevent wash water from entering a storm inlet, drainage system, or watercourse.
		  ○ Never discharge wash water to the storm drain system.
		  ○ Use as little water as possible, such as by using high-pressure sprayers instead of a hose.
		  ○ Use a positive shutoff valve to minimize water usage.
		Vehicle and Equipment Fueling. This BMP is typically used for projects where onsite fueling of vehicles and equipment, including handheld equipment, is planned. Onsite fueling of vehicles and equipment is not typical unless it is impractical to send vehicles and equipment off site for fueling. Handheld equipment is treated separately from other equipment. Handheld equipment includes those smaller, manually operated pieces of equipment such as trenchers, mowers, chainsaws, generators, and other equipment that needs fueling during regular daily operation.
		• If practical, fuel vehicles and equipment off site.
		• Mobile fueling equipment is the preferred equipment used for onsite fueling.
		• Locate fuel storage and fueling areas away from storm drain inlets, drainage systems, and watercourses.

Description	Actions	BMP Options
		• Conduct fueling with the fueling operator always in attendance regardless of whether fuel nozzles are equipped with automatic shutoff features. • Fuel tanks are not to be "topped off." • Have spill containment and cleanup equipment and materials readily available. • Clean up any spills immediately and properly dispose of contaminated materials. • Properly store and dispose of rags and absorbent material used to clean up any spilled fuel. • Ensure that mobile fueling trucks and operators have all necessary permits, licenses, and training. • Ensure that an adequate supply of spill cleanup materials and trained personnel are available. **Concrete/Coring/Saw Cutting and Drilling Waste Management.** Typically used in projects where concrete and asphalt are used or where slurry or pavement/concrete wastes are generated by construction activities, including saw cutting; coring/drilling; grinding, repaving, or patching; encasing conduit in concrete; and footings. • Install storm drain protection at any down-gradient inlets that may be impacted by the activity. See the BMP on Storm Drain Inlet Protection. • Minimize the amount of water used during coring/drilling or saw cutting. During wet coring or saw cutting, use shovel or wet vacuum to lift the slurry from the pavement. Additionally, if wet vacuuming is not adequate to capture wastewater from the activity, used sandbag barriers or other containment. • If concrete residue remains after drying, sweep up the area and remove residue to avoid contact with storm water entering a storm drain or water body via the wind. • Do not wash residue or particulate matter into a storm drain inlet or watercourse. • Use the following options for concrete truck chute and/or pump and hose washout: o If available, arrange to use an existing concrete washout station. Upon entering site, instruct concrete truck drivers about practices being used on site. o Concrete Washouts: Washout Stations can be a plastic lined, temporary pit or bermed area designed with sufficient volume to completely contain all liquid and waste concrete materials plus enough capacity for rainwater. Locate the designated area away from storm drain inlets or watercourses. o Washout in Trench: Manually rinse the concrete truck chute into the trench itself. o Bucket Washout: Manually rinse the chute into a wheelbarrow, plastic bucket or pail, and then empty the bucket into the concrete truck barrel or on top of the placed concrete. **Dewatering Utility Substructures and Vaults.** The discharge of water from dewatering of vaults and substructures to the storm drain is allowed under an existing NPDES permit (General Permit CAG990002, Order No. 2001-1-DWQ). General requirements for discharge under this permit are listed below. • Discharges to land require prior approval from the landowner. • If the water to be discharged conforms to the practices within the EP, the discharge is allowed. • During discharge, do not allow pollutants (e.g., sediment) to come in contact with the discharge. For example, if there is pre-existing soil in the path of the discharge (i.e., gutter), it must be swept up or avoided before discharging the substructure water.

Description	Actions	BMP Options

		Vegetation Management Including Mechanical and Chemical Weed Control. Vegetation control may consist of manual or mechanical removal of vegetation and/or chemical treatment.
		• General Vegetation Management Procedures:
		  ○ Do not allow vegetation debris to enter storm drain inlets and watercourses.
		  ○ Identify drain inlets and watercourses, both upstream and downstream of the work site(s).
		  ○ Pre-plan the work to protect storm water drainage systems and watercourses from discharge of potential pollutants, and maintain equipment in good operating condition.
		  ○ Set up the work area to minimize tracking of material by vehicles and equipment in or out of the work area.
		• Good Housekeeping Practices:
		  ○ Properly collect and dispose of litter and debris.
		  ○ Secure containers of liquids with lids until needed.
		  ○ Transport collected non-hazardous materials for proper disposal. If the material is a hazardous waste, follow the BMP on Hazardous Materials & Hazardous Waste Management.
		  ○ If a leak or spill occurs, protect drainage systems and watercourses from spilled material; follow the BMP on Storm Drain Inlet Protection.
		• Mechanical Weed Control. "Mechanical" is the physical removal of weeds or unwanted vegetation growing around electric utility poles and electric distribution or transmission structures for fire control:
		  ○ Do not stack or leave removed weeds or vegetation or other debris on or near drain inlets or in the storm water drainage system or watercourses.
		  ○ Do not fuel equipment next to drain inlets or place fuel or oilcans near or in watercourses, the storm drainage system or next to a drain inlet.
		  ○ Because of fire control requirements, do not leave cut vegetation around structures.
		• Chemical Weed Control. This method of weed and vegetation control uses herbicides to eliminate weed growth and control vegetation growth year-round for fire control. To achieve effective vegetation control through chemical means and protect the environment:
		  ○ Use the correct herbicides for the application.
		  ○ Do not use chemical vegetation control prior to a forecasted rain event.
		  ○ Apply pesticides only as specified on the "Pesticide Use Recommendation" on the label. The pesticide label is considered the law, and use of an herbicide inconsistent with the label is considered a violation. Follow safety and application methods as specified in the Annual Pesticide Safety Training.
		  ○ Follow the Herbicide/Pesticide application protocol when near storm water drainage systems or watercourses.
		  ○ Calibrate the spray rig as needed to ensure accurate application of herbicides.
		  ○ Record the use of all herbicides.

Description	Actions	BMP Options
		○ Avoid using overhead irrigation for as long as recommended by the chemical manufacturer of pesticides or post-emergents. ○ Avoid applying post-emergents prior to a predicted rain event. **Over-Water Protection.** Applies to projects where construction, maintenance, or repair activities such as chipping, grinding, scraping, welding/burning, painting, wrapping, and coating of pipes and conduits will be conducted above surface waters. • Prior to conducting over-water activities, confirm the need for permits with appropriate local and state agencies. • Properly design and install containment systems prior to the beginning of any operation that may impact a water body to prevent discharge of pollutants to surface waters. • Keep work areas clean of all trash and potential pollutants. • Place containment booms around the work area as necessary to contain discharge of contaminants such as oil and hydraulic fluid. • Give special attention to existing and forecasted wind and weather conditions to prevent pollutant discharges to surface waters. • Use shrouds to prevent paint overspray, welding slag, and other pollutants from entering surface waters and being dispersed into the air. Note that shrouding may not be effective during periods of high wind. • Ensure that shrouds are large enough to adequately enclose or segregate the working area from surface waters. This may include plywood barrier, visqueen, and scaffolding to help prevent fugitive material from entering surface waters. • Use support structures such as scaffolding in conjunction with shrouding to withstand potential wind stress. • Thoroughly clean or properly dispose of contaminated shrouding material and equipment. **Removal of Underground Utility Location/Mark-Out Paint.** This BMP is typically used when utility projects involve mark-out by painting surfaces where underground utilities are located and where paint is required to be removed by local jurisdictions or another authority. • Use non-toxic, light degradable mark-out paint when possible. • Hydro Pressure wash. • Dry abrasive blast/grinding. • Wet abrasive blast/grinding. • Wet/Dry Vacuum. • Dry Sweep. • Install storm drain inlet protection at adjacent down gradient inlets during wet hydro pressure washing and wet abrasive blasting and grinding. • Minimize the amount of water used during hydro washing. • Use shovel or wet vacuum to lift the paint slurry from the pavement or surface.

Description	Actions	BMP Options
		• If wet vacuuming is not adequate to capture all wastewater from these activities, use additional containment (sandbags, booms, or other containment devices) methods near the work area to prevent the discharge to a storm drain inlet or watercourse. • If paint residue remains after drying, sweep up the area and remove residue to avoid contact with storm water. • If paint residue remains after sweeping, the area can be water washed, provided that water containing the paint residue is not allowed to enter storm drain inlets or watercourses. • Dispose of all waste using the BMPs for Liquid Waste Disposal.
9. Final Stabilization and Landscaping	Stabilize open areas. Remove temporary control measures and install final stabilization controls (topsoil, trees and shrubs, permanent seeding, mulching, sodding, and riprap).	Vegetation Management Including Mechanical and Chemical Weed Control (see above) Hydraulic Mulch (see above) Hydroseeding (see above)

The treatment measures would vary from "local" improvements at individual construction sites to "areawide" concepts. The treatment BMPs would be required to include one or more of the following: bioretention areas (including bioretention swales), flow-through planters, tree well filters, vegetated buffer strips, infiltration trenches, extended detention basins, pervious paving, green roofs, and media filter. Features within the footprint of the former landfill that would encourage infiltration would require use of subdrains due to the low permeability cap and the need to avoid creation of leachate within the waste materials. Use of green roofs, planter boxes, and other treatment measures such as mechanical filters, retention basins, and other similar methods would also be appropriate.

Grading and construction activities, including landfill closure and subsequent habitat and recreational improvements along Visitacion Creek and the north shore of the lagoon, would be required to comply with General Construction Activity (Construction General Permit, Order No. 2009-0009-DWQ, as amended by 2010-0014-DWQ and 2012-0006-DWQ) and the General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order WQ 2022-0057-DWQ). Such compliance would reduce construction impacts to less than significant. As noted in **Table 4.14-3**, above, operational BMPs generally call for applying pesticides only as specified on the "Pesticide Use Recommendation" on the label. Regardless, because of the large area within the Baylands being landscaped and subject to pesticide use, a significant water quality impact would nevertheless result.

Program EIR Mitigation Measures

MM HWQ-1: Integrated Pest Management (Program EIR Mitigation Measure 4.H-5). Prior to issuance of an occupancy permit for site-specific development within the Baylands, an integrated pest management plan shall be prepared and implemented, subject to City review and approval, to set forth a preventative, long-term, low toxicity program to control pests. The plan shall provide guidelines for landscape and building maintenance with the emphasis on minimizing the use of pesticides while controlling pests. At a minimum, the integrated pest management plan shall include:

- ***Identification of acceptable pest levels*** (action thresholds) with an emphasis on *control*, not *eradication*, identifying site and pest specific action thresholds, and the controls to be used if those thresholds are exceeded.
- ***Preventive practices:*** Design, construction, and maintenance of landscape facilities, and buildings, as well as operation of uses that prevent or minimize pest problems would include integrated pest management strategies, sanitation practices, and proactive maintenance to minimize pest infestations.

- ***Monitoring:*** Regular observation, including inspection and identification.
- ***Mechanical controls:*** Should a pest reach an unacceptable level, provide for mechanical methods as the first options, including include simple hand-picking, erecting insect barriers, using traps, vacuuming, and tillage to disrupt breeding.
- ***Biological Controls:*** Provide for use of natural biological processes and materials for control, including promoting beneficial insects that prey on target pests and biological insecticides derived from naturally occurring microorganisms.
- ***Responsible Pesticide Use:*** Provide for use of synthetic pesticides generally only as required when preferred methods are infeasible or ineffective, including use of the least toxic pesticide that will do the job and is the safest for other organisms and for air, soil, and water quality; use of pesticides in bait stations rather than sprays; or spot-spraying rather than general application.

Significance Conclusion for Impact HWQ-1 with Implementation of Program EIR Mitigation Measures

Implementation of Mitigation Measures MM GEO-4a (Program EIR Mitigation Measure 4.E-4a) and MM HWQ-1 (Program EIR Mitigation Measure 4.H-5) would minimize use of chemical pesticides and herbicides within the Baylands and, in combination with NPDES permit requirements and compliance with SWPPPs and Provision C.3, would reduce impacts to less than significant.

b. Impact HWQ-2: Groundwater Recharge and Sustainable Management

Methodology for Determining Significance

The analysis of impacts on groundwater considers changes in groundwater recharge due to increases in impervious surfaces, increase in water demand, and the condition of the local groundwater basin.

Impacts are considered significant if the Specific Plan would result in a depletion of groundwater supplies or interfere with groundwater recharge such that the 2025 Specific Plan project would impede implementing sustainable management of a groundwater basin or there would be a lowering of the groundwater levels causing subsidence.

Impact Assessment

Depletion of Groundwater Supplies for Potable or Non-Potable Water Use

Baylands development would increase demands for water supplies. Groundwater is not currently used within the Baylands for potable or non-potable purposes and no groundwater use is proposed by the Specific Plan. Brisbane purchases potable water from the SFPUC, which obtains its water supplies primarily from the Hetch Hetchy Reservoir in Yosemite National Park; however, occasionally the water may be supplemented or come directly from SFPUC's reservoirs in the East Bay or San Mateo Peninsula.

The Visitacion Valley Basin within which the Baylands, Sierra Point, and Beatty areas are located, is categorized as a very-low priority basin according to the DWR Bulletin 118 basin priority classification (Cal Water 2024). Remedial Action Plans approved by regulatory agencies for the western portion of the Baylands and the final landfill closure plan conditionally approved by the Regional Water Quality Control Board prohibit extraction or use of groundwater underlying the Baylands without a Groundwater Management Plan pre-approved by the appropriate state regulatory agency.

As discussed in Section 4.16, *Utilities, Service Systems, and Water Supply*, of this EIR, water supply for Baylands development would come from the California Water Service Company (Cal Water), which operates five groundwater production wells within the Westside Basin to supply its South San Francisco District. The Westside Basin is not adjudicated, not in a condition of critical overdraft, and is designated by DWR as low priority (Cal Water 2024). Pursuant to the Regional Groundwater Storage and Recovery Project, Cal Water and the other municipal pumpers within the South Westside Basin self-limit pumping to no more than 6.9 mgd, of which Cal Water's designated quantity is an annual average rate of 1.37 mgd or 1,534 afy. As indicated in the Baylands Water Supply Assessment, Cal Water does not project any extractions from the South Westside Basin in excess of its agreed upon 1,534 afy limit.

Interference with Groundwater Recharge

Prior to Baylands development within the eastern portion of the site, the required construction of a landfill cap within the former landfill area would prevent infiltration of water through the waste matrix into the underlying groundwater basin.[329] Proposed Specific Plan development would retain approximately 29.5 percent of its Year 2100 land area (532.3 acres) in open space/open area. Thus, approximately 375.3 acres of impervious surface area would be constructed within the Baylands for residential, commercial, public facilities, and infrastructure

[329] According to the Final Closure and Post-closure Maintenance Plan for the former landfill required under Title 27 of the California Code of Regulations and the RWQCB Waste Discharge Order 01-041 (described in Section 4.G, *Hazards and Hazardous Materials*), the design of the soil cap requires that infiltration is minimized to the maximum extent possible in order to prevent accumulation of leachate within the underlying waste material.

uses, encompassing approximately 70.5 percent of the site's Year 2100 land area. This calculation is conservative given that some of the BMPs described above require bioswales and other permeable surfaces to be included as part of the developed areas of the project.

Significance Conclusion for Impact HWQ-2

Baylands development would not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence for the following reasons:

- Visitacion Valley Groundwater Basin
    - Local groundwater is not proposed to be used for potable or non-potable purposes as part of Baylands development.
    - Provision C.3 of the NPDES Municipal Regional Stormwater Permit requires runoff during a storm event be retained or detained onsite such that post-development peak flows do not exceed pre-development conditions. Release of stormwater flows to unlined drainages in the Ecological Park and Visitacion Creek will reduce loss of groundwater recharge due to increased impervious surface area within the Specific Plan.
    - Title 27 requirements for final closure of the former Brisbane Landfill requires installation of a landfill cap to prevent infiltration from the ground surface through the waste matrix in the former landfill. Thus, loss of pervious surface area within the landfill footprint is the result of final landfill closure, which is required to precede Baylands development, rather than to Baylands development itself.
    - As shown in **Figure 4.14-2**, the Visitacion Valley groundwater basin overlies the Brisbane Lagoon, which will continue to recharge the basin.
    - Approximately 26 acres of the Baylands will become subject to daily inundation as the result of projected sea level rise, providing continuous recharge to the basin and thereby preventing subsidence.
    - As a very low priority basin, compliance with the Sustainable Groundwater Management Act within the Visitacion Valley Basin is not required.
- Westside Groundwater Basin
    - The Westside Basin is not in a condition of critical overdraft and is designated by DWR as low priority.

- As indicated in the Baylands Water Supply Assessment, Cal Water does not project any extractions from the South Westside Basin in excess of its agreed upon 1,534 afy limit for groundwater extractions.

Impacts associated with groundwater recharge and sustainable management would therefore be less than significant.

c. Impact HWQ-3: Flood Hazards

Methodology for Determining Significance

Threshold HWQ-3 focuses on the physical environmental effects (flooding on- or off-site). In relation to increases in the rate or amount of runoff and flooding, on- or off-site, a significant impact would result if increased runoff generated by Baylands development would increase stormwater flow rates so as to overload an area's storm drain system or otherwise cause or exacerbate flooding of properties within or adjacent to on and offsite Baylands development. To determine whether such an impact would occur, the capacity of the Specific Plan's proposed storm drainage system to convey post-development storm flows was evaluated based on clear and measurable performance standards based on Program EIR Mitigation Measure 4.H-4a, compliance with which the Brisbane City Council previously determined would reduce flooding impacts to less than significant. Thus, exceedance of the following criteria would be indicative of a significant environmental effect:

- The peak flow rate from a 25-year storm event would not be accommodated entirely within open drainage courses and an underground piping system such that Baylands roadways or recreational facilities would be flooded;
- The peak flow rate from a 100-year storm event would not be accommodated within open drainage courses, an underground piping system, and within streets such that the finished floor elevation of any building within the Baylands would be lower than a minimum of 1 foot above the 100-year storm event hydraulic grade line water elevation with tidal flow and Year 2100 projected sea level rise; or
- Key roadways including Sierra Point Parkway, Lagoon Road, Geneva Avenue, and Tunnel Avenue not being available as evacuation routes in the event of a 100-year storm-surge event in the Bay and Year 2100 projected sea level rise.
- Increased hazard from emergent groundwater with Year 2100 projected sea level rise.

In addition, a significant impact would result if Specific Plan development would increase flooding frequency, duration, or depth at any existing on-site use or off-site location.

Impact Assessment

The Baylands Specific Plan proposes moving approximately 2.5 million cubic yards of soil from the eastern (former landfill) portion of the Baylands to the western (former railyard) portion, providing for finished floor elevations within the western portion of the Baylands at a minimum 19 feet NAVD88.

The proposed drainage system for the Baylands would accommodate:

- The 25-year design storm event within designated drainage courses and underground pipes; and
- The 100-year design storm event carried within designated drainage courses, underground pipes, and Specific Plan streets.

Thus, the peak flow from a 25-year storm event would not cause flooding along Baylands roadways or within recreational open areas.

In addition, the peak flow from a 100-year storm event would not generally cause flooding within Baylands development areas, including roadways and recreational facilities, since the finished floor elevations of Baylands buildings would have a minimum of 1 foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and Year 2100 projected sea level rise. Flows to San Francisco Bay through the existing 10-foot by 10-foot box culvert under US 101 experience increased friction losses as sediment and refuse continue to build up. With sufficient precipitation and tidal action, the San Francisco Bay outfall will be submerged; however, water will not overtop the upstream drainage channel due to excess capacity along Visitacion Creek.

The unfinished basement floors of Baylands buildings along the west side of the Caltrain right-of-way are proposed in an area subject to a 100-year flood to accommodate parking garages. Such unfinished basement parking garages would not be subject to the finished floor requirement of being at or above the base flood elevation (100-year flood with 6.5 feet of SLR). Thus, basement areas along Frontage Road, as well as the roadway itself, would not be accessible in a 100-year flood with 6.5 feet of sea level rise. Although the lowest finished floor elevations of these buildings would be a minimum of 1 foot above the base flood elevation in compliance with applicable flood protection requirements, subterranean parking areas would be subject to inundation in a 100-year flood and 6.5 feet of sea level rise.

Properties at the intersection of Industrial Way and Bayshore Boulevard, including the Bayshore Sanitary Pump Station and adjacent buildings, are located at an existing low point along Bayshore Boulevard and are either fully, or partially below future 100-year storm elevation with tidal flow and estimated Year 2100 High Scenario SLR. These properties are not owned by the applicant and the Specific Plan would not change the elevation of these properties

and their street access.[330] Because Provision C.3 requirements mandate site-specific development projects to capture, control, treat, and/or infiltrate stormwater falling on their site such that the rate and volume of stormwater exiting their site is equal to or less than existing conditions, the Specific Plan would not subject these existing use areas to increased flooding risk.

In addition, existing grades within the eastern portion of the Baylands adjacent to the Kinder Morgan Tank Farm and the Brisbane corporation yard, as well as the Caltrain right-of-way are lower than 100-year flood elevations with the addition of Year 2100 projected sea level rise. The Baylands Specific Plan proposes leaving these properties and their street access at current elevations.[331] The combination of (1) leaving roadways in front of these properties at their existing grade and (2) concentrating stormwater runoff within Baylands streets would increase flood hazards and damage to existing structures would preclude the use adjacent streets for emergency response and as evacuation routes during a 100-year flood event.

Along the shoreline, groundwater levels and the water table will rise as a consequence of sea level rise elevating San Francisco Bay water levels. Rising groundwater can infiltrate storm drains, destabilize and corrode buried infrastructure, spread soil or groundwater contamination, undermine building foundations, and increase liquefaction hazards.[332] In some cases, sea level rise can cause groundwater levels to raise high enough that groundwater can emerge on the land surface in low-lying areas and cause flooding, an effect known as "emergent groundwater." As shown on **Figure 4.14-6**, regional studies of existing conditions have indicated that emergent groundwater could cause flooding within the large portions of the Baylands based on existing ground levels. However, this mapping takes a simplistic approach to predicting inland groundwater levels, does not account for proposed landfill remediation, and does not account for the Specific Plan adding fill on the western Plan area.

Site-specific groundwater modeling was undertaken as part of site remediation and landfill closure planning, including evaluation of the effects of sea level rise of 6.9 feet by Year 2100.[333] **Figure 4.14-7** indicates that the site-specific modeled change in water table elevations due to 6.9

[330] The Baylands Infrastructure Report states that these properties "may need to be raised, have pump stations installed, or employ another strategy to protect … (them) from the impacts of anticipated SLR (sea level rise). As these buildings are not controlled by the developer, they will require measures by others to adapt to future conditions (BKF 2023).

[331] The Baylands Infrastructure Report states, "Raising grades in these areas is constrained by existing improvements that are to remain and the need to avoid causing settlement of the railroad tracks. These properties, if they remain at existing grades, will require measures by others to adapt to future conditions. If required in the future, in response to SLR, drainage systems in these areas can be installed with pump stations and back flow devices in order to protect existing streets and buildings during large storm events, subject to approval of the City of Brisbane and property owners" (BKF 2023).

[332] Ocean Protection Council. 2024. State of California Sea Level Rise Guidance. https://opc.ca.gov/wp-content/uploads/2024/05/California-Sea-Level-Rise-Guidance-2024-508.pdf.

[333] Geosyntec Consultants, Inc. Groundwater Modeling to Evaluate Potential Influence of Sea Level Rise on Groundwater Levels, The Baylands, Brisbane, California. March 23, 2022.

feet of sea level rise would be a decrease in the water table elevation across the majority of the Specific Plan area. The decrease in the calculated water table elevations for Year 2100 are due to the leachate collection and recovery system trenches that are to be installed along the south and east side of the landfill as part of the final landfill closure. As is also shown in **Figure 4.14-7**, modeling with 6.9 feet of sea level rise shows increases in water table elevations of approximately 2 feet in the central portions of OU-2 and OU-SM west of the landfill and increases in the water table elevation of up to a few feet in the Baylands and Guadalupe Creek valley west of the Brisbane Lagoon, and in the Visitacion Valley north and west of the northern portion of the Specific Plan area. Because the western portion of the Baylands would be raised by proposed site grading, Specific Plan development would not be subject to flooding due to emergent groundwater.

Significance Conclusion for Impact HWQ-3

Baylands development would provide adequate flood protection for new residential, commercial, and other uses within the Baylands because:

- The peak flow rate from a 25-year storm event would be accommodated within designated drainage areas and an underground piping system;
- The peak flow rate from a 100-year storm event would be accommodated within an underground piping system, designated drainage areas, and within streets such that the finished floor elevations of buildings would have more than 1 foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and Year 2100 projected sea level rise; and
- To provide this level of protection, the final design for Baylands drainage features, including Visitacion Creek, will be required to use the capacity of the existing culvert under the US 101 freeway based on the culvert's actual and projected capacity rather than the theoretical capacity of the culvert.

A significant impact would nevertheless result because the Specific Plan's drainage system does not fully implement Program EIR Mitigation Measures 4.H-4a (requires compliance with NPDES Construction General Permit and City of Brisbane Municipal Regional Stormwater Permit) or 4.H-4b (requires compliance with RWQCB dewatering permit or Bayshore Sanitary District sanitary sewer discharge requirements).

Figure 4.14-6: Areas Susceptible to Groundwater with 6.6 Feet of Sea Level Rise

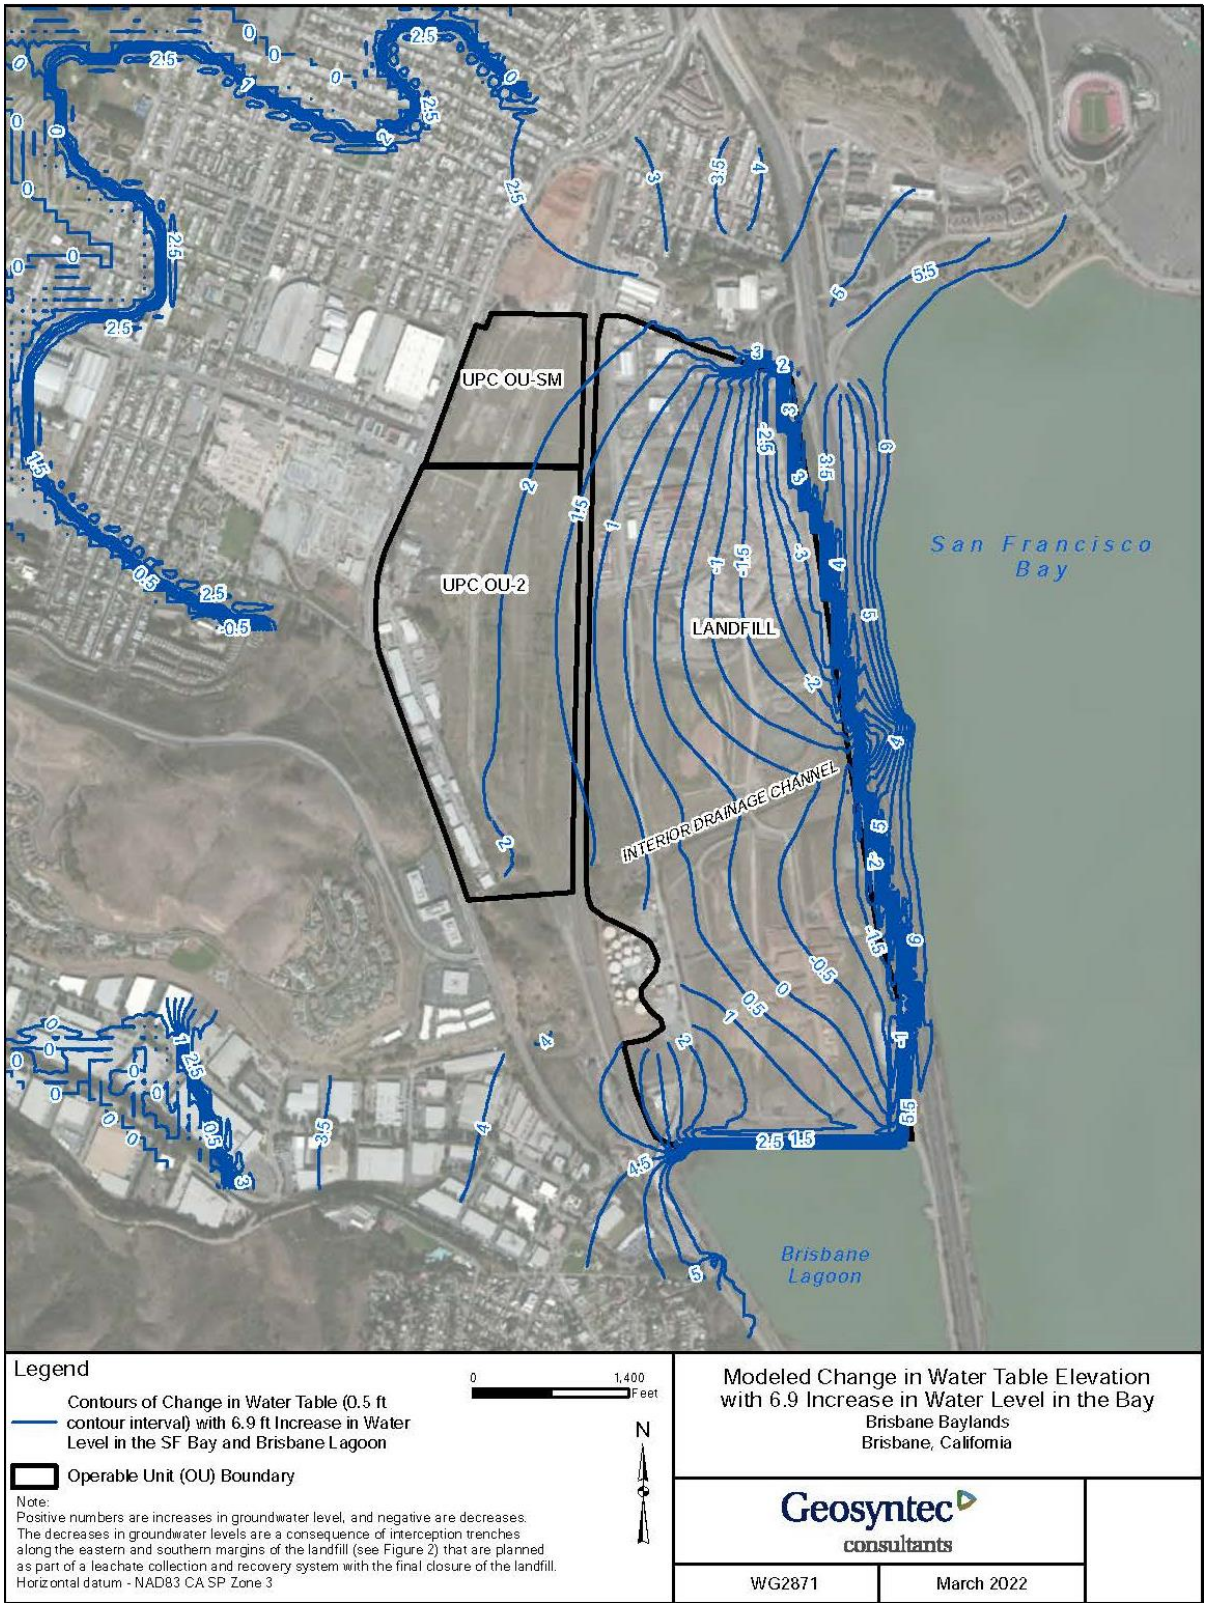
Figure 4.14-7: Site-Specific Modeling of Groundwater Level Changes



Program EIR Mitigation Measures

MM HWQ-3a: Known Drainage Deficiencies (Program EIR Mitigation Measure 4.H-4a). Prior to issuance of a building permit, all site-specific development plans within the Baylands shall include systemwide drainage improvements that shall accommodate all increased runoff and correct the Project's incremental, additional impact to flood risks to areas with existing deficiencies (e.g., Levinson Overflow Area and the PG&E property):

- On-site storm drainage collection facilities shall be sized to convey the peak flow rate from a 25-year storm event entirely within the piping system such that Baylands roadways and recreational facilities are not flooded.
- Drainage improvements shall accommodate the 100-year peak storm event within the piping system and within streets such that building finished floor elevations provide a minimum of 1 foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and Year 2100 projected sea level rise.
- Key roadways including Sierra Point Parkway, Lagoon Road, and Tunnel Avenue shall be designed such that these roadways are available as evacuation routes in the event of a 100-year storm event.

The proposed system design shall be submitted to the City Engineer for approval and shall hydraulically isolate existing drainage inlets fronting the Levinson Overflow Area and the PG&E property from the existing Brick Arch Sewer system.

MM HWQ-3b: Bayshore Boulevard Drainage (Program EIR Mitigation Measure 4.H-4b). Prior to issuance of a building permit, all site-specific development plans within the Baylands shall include additional conveyance capacity by incorporating new storm drain facilities along Bayshore Boulevard north of Industrial Avenue. Development plans shall also require addition of a new inlet near the Bayshore Boulevard and Industrial Way intersection that is large enough to intercept surface flows from Levinson Overflow Area and the PG&E property in accordance with and as approved by the City. Review and approval by the City Engineer shall be required to confirm that conveyance capacity is sufficient to accommodate the 100-year peak storm event within the piping system and streets such that building finished floor elevations provide a minimum of 1 foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and Year 2100 projected sea level rise.

Significance Conclusion for HWQ-3 with Implementation of Program EIR Mitigation Measures

Mitigation Measures MM HWQ-3a and HWQ-3b would require all areas within the Baylands, including streets adjacent to existing use areas, to accommodate the increased runoff caused by Baylands development such that:

- Baylands roadways and recreational facilities are not flooded in a 25-year storm event;
- Lowest finished floors of buildings for human occupancy are not flooded in a 100-year storm event; and
- Sierra Point Parkway, Lagoon Road, Geneva Avenue, and Tunnel Avenue would be able to provide access for emergency response and serve as evacuation routes during a 100-year storm event.

However, the new unfinished basement parking areas proposed by the Project along Frontage Road would still be subject to flooding, which would cause damage to vehicles within such garages and preclude emergency response access to all portions of development sites along Frontage Road.

Thus, a significant impact would remain with implementation of Program EIR mitigation measures.

Additional Mitigation Measures

MM HWQ-3c: Drainage and Flood Protection along Frontage Road. Drainage along Frontage Road shall be designed to:

- Avoid flooding of parked vehicles consistent with National Flood Insurance Program Technical Bulletin 6, *Requirements for Dry Flood-Proofed Below-Grade Parking Areas under Non-Residential and Mixed-Use Buildings* (FEMA 2021).
- Provide emergency response access to all portions of development sites along Frontage Road.

Significance Conclusion for Impact HWQ-3 with Implementation of All Mitigation Measures

Mitigation Measures MM HWQ-3a through MM HWQ-3c would ensure adequate response access to all portions of development sites along Frontage Road, including basement parking areas, and would also ensure that Baylands development would not increase flooding frequency, duration, or depth of a 100-year storm on adjacent lands even with anticipated SLR

of 6.5 feet through the Year 2100. Thus, impacts are less than significant with all mitigation incorporated.

d. Impact HWQ-4: Release of Pollutants Due to Flood and Tidal Action, Sea Level Rise-Induced Changes to Groundwater, Tsunami, or Seiche

Methodology for Determining Significance

Stormwater flows would come into contact with common urban pollutants such as petroleum hydrocarbons (i.e., fuel and motor oil), lubricants (i.e., grease and oil), sediment, and metals (generated by the wear of automobile parts), as well as herbicides and pesticides used within landscaped areas, and flows could transport sediment and other pollutants into the Bay and lagoon. Analysis was undertaken for Impact HWQ-1 to determine the extent to which stormwater flows, landscape irrigation, and other activities would transport urban pollutants into receiving waters. The analysis below focuses on the extent to which flood events, sea level-rise induced changes to groundwater levels, tsunamis, and seiches could increase the transport pollutants into the Bay and lagoon.

While sea level rise is generally addressed in relation to tidal or permanent inundation, sea level rise is also associated with rising groundwater elevations raising the water table. In some cases, sea level rise can result in raising groundwater high enough that it can emerge on the surface in low-lying areas and cause flooding, an effect known as "emergent groundwater." This slow but chronic threat can flood communities from below, damaging buried infrastructure, flooding below-grade structures, mobilizing pollutants, compromising foundations, and emerging above ground as an urban flood hazard.

Although Baylands development would not cause emergent groundwater, analysis has been undertaken to determine whether the Specific Plan would place new development in locations where emergent groundwater would result in the release of pollutants into the environment. Such analysis included review of various sources, including vulnerability mapping prepared by San Mateo County based on USGS, California of Environmental Health Hazard Assessment, and BCDC.

As stated above, the Specific Plan area does not include any areas that are at risk of flooding from a tsunami. Thus, there would be no potential for a tsunami to cause the release of pollutants as a result of Specific Plan development.

Inundation from a seiche can occur if the wave containment walls, such as the wall of a reservoir, water storage tank, dam, or other artificial body of water are overtopped or damaged. The Specific Plan proposes construction of a water storage tank and fuel storage tanks that

could be subject to seiche as the result of an earthquake. A significant impact would occur if above-ground water storage tanks were constructed in a manner that:

- A storage tank wall would be damaged from a seiche created within the storage tank by an earthquake; and
- Water or fuel released from a storage tank would cause the release of pollutants into the environment.

Impact Assessment

Release of On-Site Pollutants into the Environment Due to Flooding

As stated above in the analysis of Impact HWQ-1, nonpoint source pollutants would be washed by rainwater from rooftops, landscaped areas, and roadways into receiving waters via on-site drainage facilities. The volume of rain falling on new impervious surfaces would result in an increase in volume and velocity of flows and would wash additional urban pollutants from rooftops, roadways, parking lots, and landscaped areas into receiving waters relative to existing conditions.

Sea Level Rise and Groundwater

As previously discussed, groundwater levels and the water table will rise as a consequence of sea level rise, with the rise limited to 2 feet or less in the Specific Plan area due to the leachate collection system that will be installed as part of final landfill closure prior to site development. Because most of the western portion of the Baylands would be raised by proposed site grading by 8 to 12 feet, Specific Plan development would not be subject to flooding due to emergent groundwater. Without the occurrence of emergent groundwater, this mechanism would not release pollutants.

In addition, the direction of groundwater flow across the Baylands area is toward the leachate collection and recovery system to be installed for the landfill (see Section 4.13, *Hazards and Hazardous Materials*, for further discussion). The Remedial Action Plans for Baylands area (i.e., Operable Units OU-SM and OU-2) will require the construction of a cap over buried contaminated materials to prevent exposure of people and the environment to those contaminated materials. Contaminated groundwater in the area of the Baylands will flow to the leachate collection and recovery system for treatment, thus preventing the exposure of people and the environment to pollutants in groundwater.

Tsunami

Because the Specific Plan area is not located within a tsunami hazard zone, there would be no impact related to release of pollutants into the environment as the result of damage caused to the on-site water storage tank by a tsunami.

Seiche

Above-Ground Tanks

Water storage tanks would comply with California Code of Regulations, Title 16, Section 64585, which sets design standards for above ground water distribution reservoirs and incorporates American Waterworks Association design standards. Thus, Baylands water storage tanks would be constructed to withstand seiches. In addition, above-ground fuel tanks at fire stations would comply with the design standards of California Health and Safety Code Sections 24000–26275. Thus, it is not likely that a water storage or above-ground fuel storage tank or containment wall would be damaged in an earthquake such that its contents would spill into the environment.

San Francisco Bay

San Francisco Bay is partially enclosed, with outlets to San Pablo Bay, as well as to the Pacific Ocean via the Golden Gate, and is relatively shallow, with a mean depth of approximately 27.6 feet.[334] While small-scale seiches are commonly observed in California lakes, ponds, swimming pools, and bathtubs during earthquakes, the California Geological Survey reported in April 2006 that "a strong earthquake in northern California could trigger a large seiche in San Francisco Bay or Lake Tahoe with considerable damaging effects."[335] However, geologic-induced seiche events have not been documented in San Francisco Bay, and meteorologic effects are quickly dissipated due to the connection with the Pacific Ocean.[336]

Significance Conclusion for Impact HWQ-4

The Specific Plan requires stormwater runoff to be treated prior to discharge to wetlands, Visitacion Creek, Brisbane Lagoon or San Francisco Bay in compliance with Municipal Regional Stormwater NPDES Permit (MRP) Order No. R2-2022-018, NPDES Permit No. CAS612008 adopted by the RWQCB-San Francisco Bay Region in May 2022. Appropriate source control, site design, and stormwater treatment measures that would be implemented are identified in:

- The San Mateo Countywide Water Pollution Prevention Program C.3 Regulated Project Guide, which describes stormwater treatment options, techniques, design, and maintenance requirements.

[334] U.S. Geological Survey. *San Francisco Bay Bathymetry 2007.* https://www.usgs.gov/centers/pcmsc/science/san-francisco-bay-bathymetry. Accessed November 19, 2024.

[335] California Geological Survey, *California Geology April 2006, Earthquakes of the San Francisco Bay Are and Northern California*, https://www.conservation.ca.gov/cgs/Documents/Publications/Special-Publications/SP_125.pdf. Accessed November 19, 2024.

[336] City and County of San Francisco. *Treasure Island and Yerba Buena Island Redevelopment Project Draft EIR*. July 12, 2010.

- The Green Infrastructure Design Guide, which is a comprehensive design guide for the design, construction, and maintenance of green infrastructure, including sustainable stormwater design (SMCWPP 2020a).[337]

In addition:

- The operation of the leachate collection and recovery system to be installed as part of final landfill closure prior to Specific Plan development would maintain groundwater flow toward San Francisco Bay and would capture and treat contaminated groundwater, if any.
- Project water storage and above-ground fuel storage tank facilities would be constructed to withstand an earthquake and not rupture. Above-ground fuel tanks to be constructed at fire stations would be provided with containment such that a leak would not be carried into streets, storm drain systems, Visitacion Creek, or the Brisbane Lagoon.
- The Specific Plan area is not located within a tsunami hazard zone.
- Geologic-induced seiche events have not been documented in San Francisco Bay, and meteorologic effects are quickly dissipated due to the connection with the Pacific Ocean.

Impact HWQ-4 would therefore be less than significant.

4.15 GEOLOGY, SOILS, AND SEISMICITY

4.15.1 INTRODUCTION

a. Overview

This section describes environmental conditions and regulatory setting; evaluates the physical environmental effects of the 2025 Specific Plan project related to geology, soils, and seismicity, including hazards such as fault rupture and earthquakes, seismic-related ground failure (e.g., liquefaction), landslides and slope stability, lateral spreading, subsidence, expansive soils, and soil corrosivity; and identifies mitigation measures needed to address significant impacts. This section also addresses the existing conditions and potential for impacts associated with vertebrate and invertebrate fossils and unique geologic units.

The effects of erosion on water quality are addressed in Section 4.14, *Hydrology and Water Quality*.

b. Definitions

Corrosive soils contain chemical constituents that can react with construction materials, such as concrete and ferrous metals, to damage foundations and buried pipelines, potentially leading to metals in pipes to leach into ground and surface waters and cause leaks in plumbing.

Design Earthquake, Design Ground Motion is used as the basis for the structural design of buildings to meet to provide an acceptable level of risk in terms of both public safety and economic impact during the operating life of the structure and its intended use. Determination of design earthquake and resulting design ground motions to ensure earthquake safety are estimated on a site-specific basis per California Building Code Chapter 16A, *Structural Design*.[338] Thus, the design earthquake, design ground motion, and resulting structural design standards for structures that must remain operational following a major earthquake (e.g., fire and police stations, hospitals) would be more stringent than other uses (e.g., warehouses) and more stringent for high as compared to low occupancy uses (e.g., multi-story v. single story structures).

Earthquake is the result of a sudden release of energy in the earth's crust that creates seismic waves. Earthquakes are classified by their magnitude, which is a measure of the amount of energy released during an event. The seismicity or seismic activity of an area refers to the frequency, type, and size of earthquakes experienced over time.

[338] California Building Code (CBC), Chapter 16A, *Structural Design* contains California amendments based on the American Society of Civil Engineers (ASCE) Minimum Design Standard ASCE/SEI 7-16, *Minimum Design Loads for Buildings and Other Structures*. Chapter 16A provides requirements for general structural design and includes means for determining earthquake loads as well as other loads (such as wind loads).

Erosion refers to the loosening and transportation of rock and soil debris by wind, rain, or running water.

Expansive soils are soils containing water-absorbing minerals that expand or contract when they absorb or lose water. Expansive soils can damage buildings due to the force they exert on foundations as they expand.

Factor of safety is a geotechnical criterion that refers to the ratio of forces resisting movement of a slope to those causing movement. It is used in quantitative slope stability modeling to determine the stability of manufactured slopes. Expressed as a numeric figure, the factor of safety represents a comparison of shearing forces (e.g., gravitational forces and internal pressures causing movement) versus resisting forces of the soil or bedrock. Therefore, the higher the factor of safety, the more stable the slope because the factor of safety represents a determination of greater resisting forces present. When a calculated factor of safety is less than 1.0, forces that make a slope susceptible to failure exceed those that tend to hold it in place Generally accepted geotechnical practices for the San Francisco Bay Area regard a slope safety factor of 1.5 as suitable for development under static or non-earthquake conditions. For pseudo-static or earthquake conditions, a lower safety factor is typically used because a higher factor cannot be practically achieved. Therefore, a safety factor of 1.2 for pseudo-static conditions is a generally accepted practice.

Fault refers to a fracture in the earth's crust forming a boundary between rock masses that have shifted.

Fault, active is defined by the California Geologic Survey as one that has had surface displacement within Holocene time (about the last 11,700 years).

Fault, inactive is defined by the California Geologic Survey as one that has not had surface displacement since before the Quaternary period (more than 1,800,000 years ago).

Fault, potentially active is defined by the California Geologic Survey as one that has had surface displacement within Quaternary time (the last 1,800,000 years).

Fill refers to earth or any other substance or material, including pilings placed for the purposes of erecting structures thereon.

Fill material refers to any material placed in an area to increase surface elevation.

Ground failure includes mudslides, landslides, liquefaction, or the compaction of soils due to ground shaking from an earthquake.

Ground lurching is a consequence of earthquakes involving the horizontal movement of deposits, soil, sediments, or fills found on vertical embankments that create irregular ground cracks.

Landslide denotes the down-slope movement of soil and rock under the direct influence of gravity. The term "landslide" encompasses five modes of slope movement: falls, topples, slides, spreads, and flows. These are further subdivided by the type of geologic material (bedrock, debris, or earth). Debris flows (commonly referred to as mudflows or mudslides) and rock falls are examples of common landslide types.

Lateral spreading is a ground failure condition induced by liquefaction that causes soil to move toward a free face (e.g., a slope along a creek) or down a gentle slope, due to the pore-pressure build-up during liquefaction of an underlying saturated material. Lateral spreading often occurs along riverbanks and shorelines where loose, saturated sandy soil is commonly encountered at shallow depths.

Liquefaction is the phenomenon in which saturated granular soils temporarily lose their shear strength during periods of earthquake-induced strong ground shaking. The susceptibility of a site to liquefaction is a function of depth to density, water content of granular sediments, and the magnitude and frequency of earthquakes in the surrounding region. Saturated, unconsolidated silt, sand, and silty sand within 50 feet of the ground surface are most susceptible to liquefaction. Liquefaction-related phenomena may include lateral spreading,[339] ground oscillation, loss of load bearing strength, subsidence, and buoyancy effects.

Moment magnitude scale is based on the total energy release of the earthquake. Moment magnitude (M_W) is a product of the distance a fault moved and the force required to move it and is derived from modeling recordings of the earthquake at multiple stations. Moment magnitude has become the standard scale used by seismological authorities such as the United States Geological Survey (USGS) for reporting large earthquakes (typically M > 4.0), replacing the local magnitude (Richter, M_L) scale, which continues to be used for smaller earthquakes (typically M <4.0).

Paleontological resources refer to any fossilized remains, traces, or imprints of organisms older than recorded history and/or more than 5,000 years old that are preserved in or on the Earth's crust and provide information about the history of life on Earth.

Seismic Design Category refers to broad classes of common soil conditions used by the California Building Code to assign ground motion attenuation and amplification effects. Seismic Design Categories are determined based on the average properties of the soil within 100 feet (30 meters) of the ground surface of a proposed structure. Seismic Design Categories are an indicator of how much attention must be paid to the seismic design and construction of a building. Ranging from "A" to "F," buildings within Category "A" must be designed for seismic forces, but do not require any special seismic attention. Buildings in Category "F" require substantial seismic care and attention. Three parameters determine Seismic Design Categories:

[339] Lateral spreading occurs when liquefaction on gentle slopes causes subsurface soil layers to move downslope.

- The geographic location parameter addresses relative seismicity.
- The second parameter, underlying soils, addresses the extent to which soils underlying a building site dampen or amplify seismic forces.
- The third parameter in determining seismic design is the intended use of a specific building. Seismic Design Categories define two types of buildings:
    - Typical structures (e.g., offices, residential buildings), and
    - Those that must be functional after a seismic event (e.g., hospitals, fire stations).

Soil Class refers to the six Seismic Design Categories rating the extent to which soils underlying a building site dampen or amplify seismic forces per California Building Code Section 1613.2.2 and 1613A.2. An "A" soil is one which consists of hard rock, which is advantageous to seismic design. "E" and "F" class soils are soft and tend to amplify seismic forces.

Site Classification	General Description
A	Hard Rock
B	Rock
C	Very Dense Soil and Soft Rock
D	Stiff Soil
E	Soft Clay Soil
F	Unstable Soils

Unique geologic feature refers to a feature that:

- Is the best example of its kind locally or regionally;
- Embodies the distinctive characteristics of a geologic principle that is exclusive locally or regionally;
- Provides a key piece of geologic information important in the area's geology or geologic history;
- Is a geologic formation that exclusively occurs locally or regionally;
- Contains a mineral that is not known to occur elsewhere in the Bay Area; or
- Is used repeatedly as a teaching tool.

4.15.2 ENVIRONMENTAL SETTING

a. Baseline

Although spring 2023 is generally the period used to describe existing conditions in relation to other resource chapters, completion of site remediation and final landfill closure is used as the baseline for analysis of geology, soils, and seismicity impacts for the following reasons:

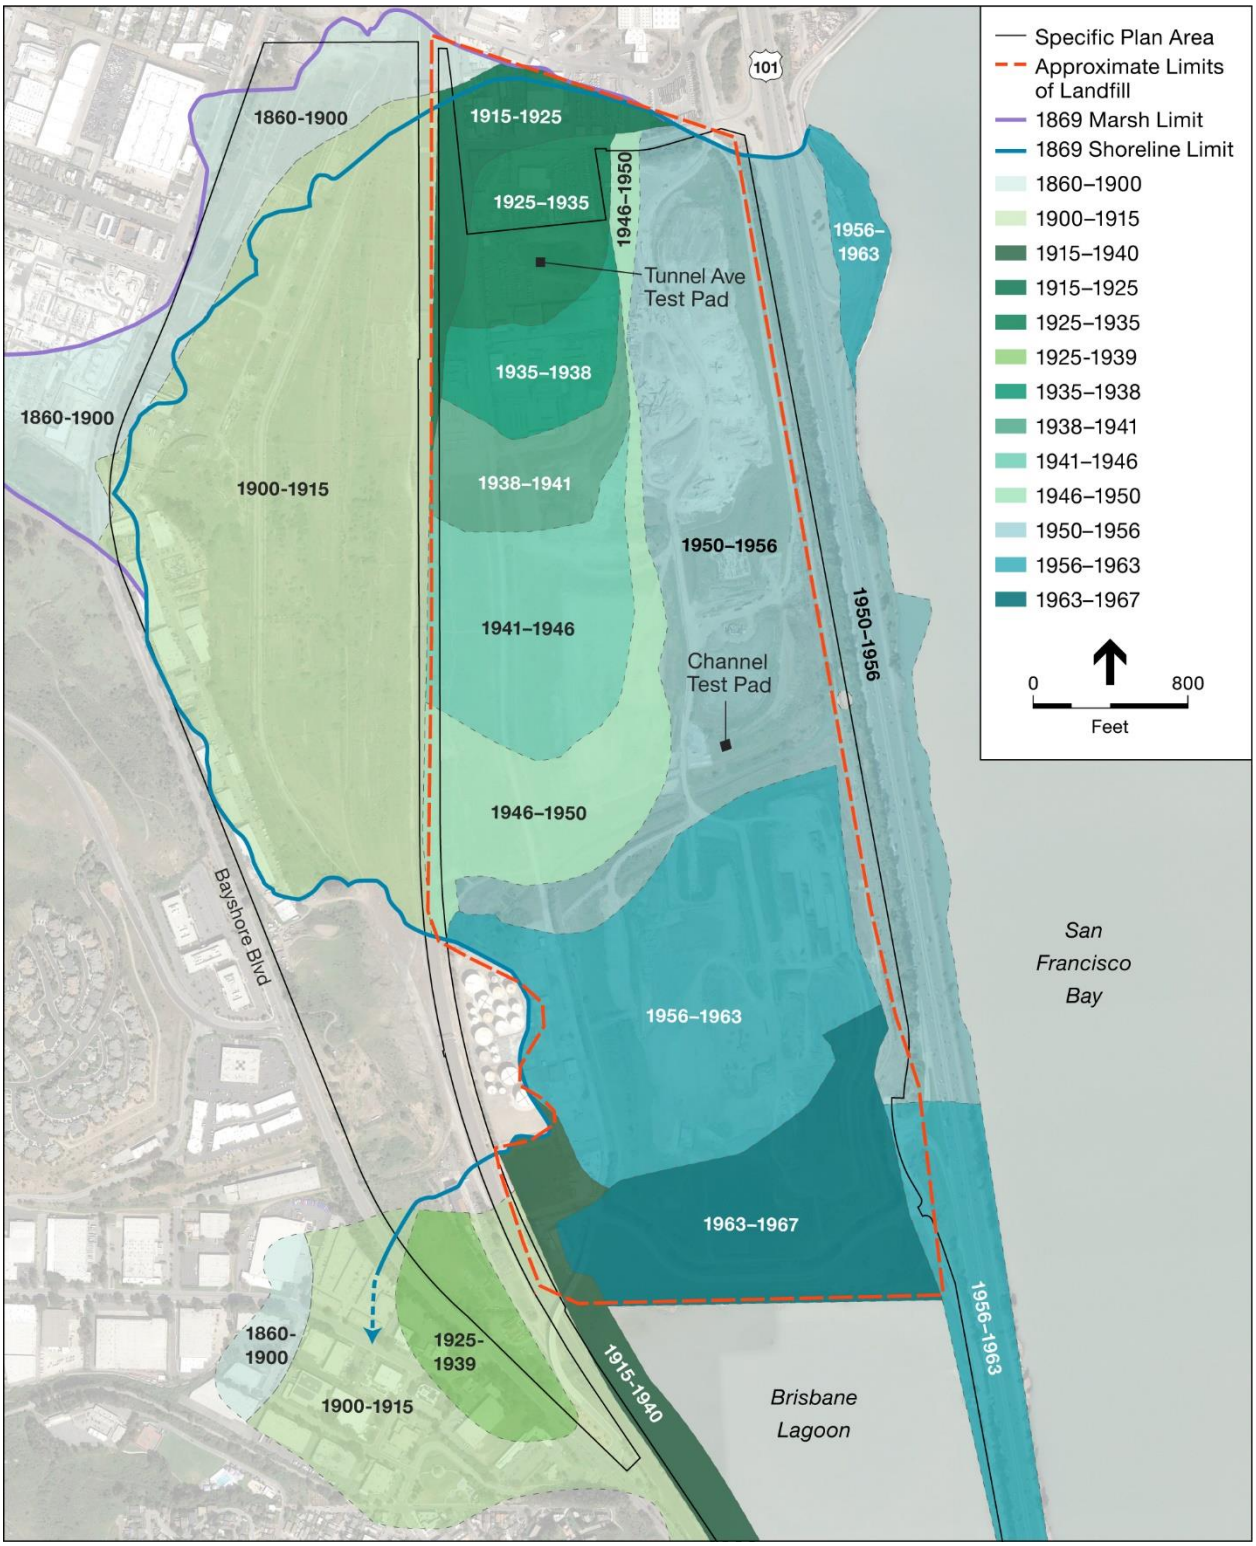
- Feasibility Studies/Remedial Action Plans (Geosyntec Consultants 2021a, 2021b) have undergone environmental review and been approved by the appropriate state regulatory agencies (Department of Toxic Substances Control: Regional Water Quality Control Board) for the western portion of the Baylands.
- A Final Landfill Closure Plan (Engeo 2023) has undergone environmental review and been approved by the Regional Water Quality Control Board and San Mateo County Environmental Health Services.
- Brisbane General Plan policy requires site remediation and landfill closure to be undertaken pursuant to the regulatory oversight of state and regional agencies prior to development permitted by the Specific Plan (see Section 4.15.3, Regulatory Context for Baylands Development, City of Brisbane General Plan, Policy 175, and Baylands Specific Plan, Infrastructure).

Site remediation and landfill closure activities subject to the regulatory oversight of state and county regulatory agencies that have received environmental review and been approved by those agencies are not part of the Specific Plan project and are not analyzed in this EIR. However, because site grading that would be subject to issuance of a City grading permit to move soil from the eastern to the western portion of the Baylands would create building pads for Specific Plan development, the physical environmental effects of such grading, as well as soils, geology, and seismicity impacts associated with Specific Plan development following site remediation and landfill closure, are addressed in this EIR.

b. Landform History of the Baylands

Figure 4.15-1 shows the historical San Francisco Bay shoreline, as well as the evolution of fill within the Baylands, forming both the former Southern Pacific Railroad railyard in the western portion of the site and the former Brisbane Landfill in the eastern portion of the Baylands.

Figure 4.15-1: Baylands Historic Fill



Source: City of Brisbane, Final Brisbane Baylands Program EIR, August 2018. ENGEO, Final Landfill Closure Geotechnical Report, May 19, 2022.

As shown in **Figure 4.15-1**, except for Icehouse Hill, the terrestrial portions of the Baylands are located on fill that was placed over Bay Mud in the past. Filling of the Bay leading to creation of the Baylands began in the late 1800s. In 1904, the Southern Pacific Railroad began construction of a new level route south from San Francisco that more closely followed the Bay's shoreline. By 1914, the Southern Pacific Railroad railyard was installed, and by 1935, the entire portion of the Baylands west of the railroad tracks had been filled with rubble from the 1906 earthquake, debris, soil, and local bedrock rubble excavated during construction of tunnels and roads in the area.

Starting the early 1930s, San Francisco began the gradually filling in San Francisco Bay east of the railroad tracks by placing solid waste into the Bay, creating the "Brisbane Landfill" and forming the eastern portion of the Baylands. The former Brisbane Landfill was filled in three areas:

- A portion that extended eastward about 1,000 feet into San Francisco Bay from near the Southern Pacific Railroad tracks was used for waste placement from 1932 until 1952. In 1948, construction of US Highway 101 east of the landfill set the eastern boundary for the landfill, which was then isolated from the direct wave action of San Francisco Bay.
- From 1953 to 1958, the landfill was extended eastward into San Francisco Bay and southward into what became the Brisbane Lagoon following freeway construction.

An additional landfill area was created in 1959 when the landfill was extended farther south and used for waste placement until the landfill stopped receiving waste in 1967.

c. Regional and Site Geology

The Baylands lies along the western margin of San Francisco Bay. The northwesterly trend of ridges and valleys characteristic of California's Coast Ranges is apparent in San Bruno Mountain and the hills west of the Specific Plan area. San Francisco Bay lies within a dropped-down crustal block bounded by the East Bay Hills and the Santa Cruz Mountains. The San Francisco Bay depression resulted from interaction between the major faults of the San Andreas Fault zone, particularly the Hayward and San Andreas faults located east and west of the Bay, respectively (see Appendices M.1, M.2).

Below its human-made fill, the majority of the Specific Plan area is underlain at depth by Jurassic- to Cretaceous-aged bedrock of the Franciscan complex, consisting of highly deformed and fractured sedimentary rocks. Quaternary sediments deposited on eroded Franciscan bedrock underlie the low-lying areas in the Baylands vicinity. Sediment deposition within the pre-historic Bay margin has been influenced by oscillating late-Quaternary sea levels that resulted from the advance and retreat of glaciers worldwide. The resulting sequence of alternating estuarine and terrestrial sediments correspond to high and low sea-level stands, respectively. Quaternary sediments in the plains landward of the Bay are predominantly terrestrial (see Appendices M.1, M.2).

By late Pleistocene time (approximately 125,000 years ago), the high sea level resulted in deposition of "Yerba Buena Mud," also known locally as "Old Bay Clay." Yerba Buena Mud was deposited in an estuarine environment similar in character and extent to the present Bay. Sea-level lowering associated with the onset of glaciation exposed the Bay floor and resulted in terrestrial sedimentation, such as the Colma Formation, on top of the Old Bay Clay. Sea levels rose again starting roughly 20,000 years ago, fed by the melting of glaciers. The sea re-entered the Golden Gate about 10,000 years ago (Atwater 1979, as cited in Appendix M.1). Inundation of the present Bay resulted in deposition of estuarine sediments, called Young Bay Mud, which continues to accumulate regionally.

Historical development of the San Francisco Bay shoreline within the Baylands and elsewhere resulted in placement of artificial fill material over substantial portions of modern estuaries, marshlands, tributaries, and creek beds in an effort to reclaim land (Nichols and Wright 1971, as cited in Appendix M.1).

d. Topography

Topography varies across the Specific Plan area, with Icehouse Hill the highest point on the site (approximately 190 feet above mean sea level [AMSL]) and Visitacion Creek the lowest. West of the Caltrain right-of-way, grades are generally flat, with most of the area draining toward a central drainage channel running parallel to and east of the Industrial Way. Areas near the Roundhouse and Industrial Way drain toward an existing low point elevation of approximately 9 feet AMSL near the intersection of Bayshore Boulevard and Industrial Way (BKF 2022).

Topography within the eastern portion of the Baylands is largely formed by the former Brisbane Landfill and subsequent use of the area as a soil recycling operation, both receiving and selling fill soil. The soil recycling operation created many piles of soil for which topography frequently changed as quantities of soil materials were imported and exported. Separating the piles of earthen materials were flat areas serving as access for trucks moving dirt to and from the site. Visitation Creek, which overlies waste materials from the former landfill, divides the Specific Plan area perpendicular to US Highway 101 into north and south areas and collects runoff from the majority of the Baylands. The northeastern-most portions of the Baylands drain toward Beatty Avenue, while the southern-most areas grade toward the Brisbane Lagoon. Elevations within the eastern portion of the Baylands range from approximately -3 feet AMSL at the existing drainage channel bottom adjacent to the US Highway 101 box culvert to approximately 80 feet AMSL atop the highest dirt mound (BKF 2022).

e. Subsurface Conditions

Soils

Figure 4.15-2 shows the extent of artificial fill within and adjacent to the Baylands. Within the western portion of the Baylands, the upper layer of soil is artificial fill placed to create the Southern Pacific Railroad rail line and maintenance yard between 1904 and 1914. The upper soil layers within the eastern portion of the Baylands consist of soil stockpiled during soil recycling operations atop municipal wastes within the former Brisbane Landfill. Below the artificial fill west of the Caltrain right-of-way and below waste layers to the east, subsurface layers are, from youngest to oldest (shallowest to deepest) (see Appendices M.1, M.2):

- Holocene Bay Deposits consisting of Young Bay Mud and marine sand;
- Pleistocene aeolian, alluvial, and marine deposits; and
- Franciscan bedrock.

Area West of Caltrain Right-of-Way

Within the western portion of the Baylands, artificial fill placed for construction of the Southern Pacific Railroad rail line and maintenance yard is highly variable, with different portions consisting of brown or olive gray gravel, sand, clay, and silt that varies from loose to dense or medium stiff to stiff. Rock fragments, organic matter, and human-made debris were encountered in many of the borings within this portion of the Baylands. Records regarding the placement and compaction of this material are not available; however, the variable density of soil sampled from borings indicates that the fill is likely non-engineered. The artificial fill generally ranges from 6 to 12 feet in thickness, with some localized areas having deeper fill extending up to 22 feet deep (see Appendix M.2).

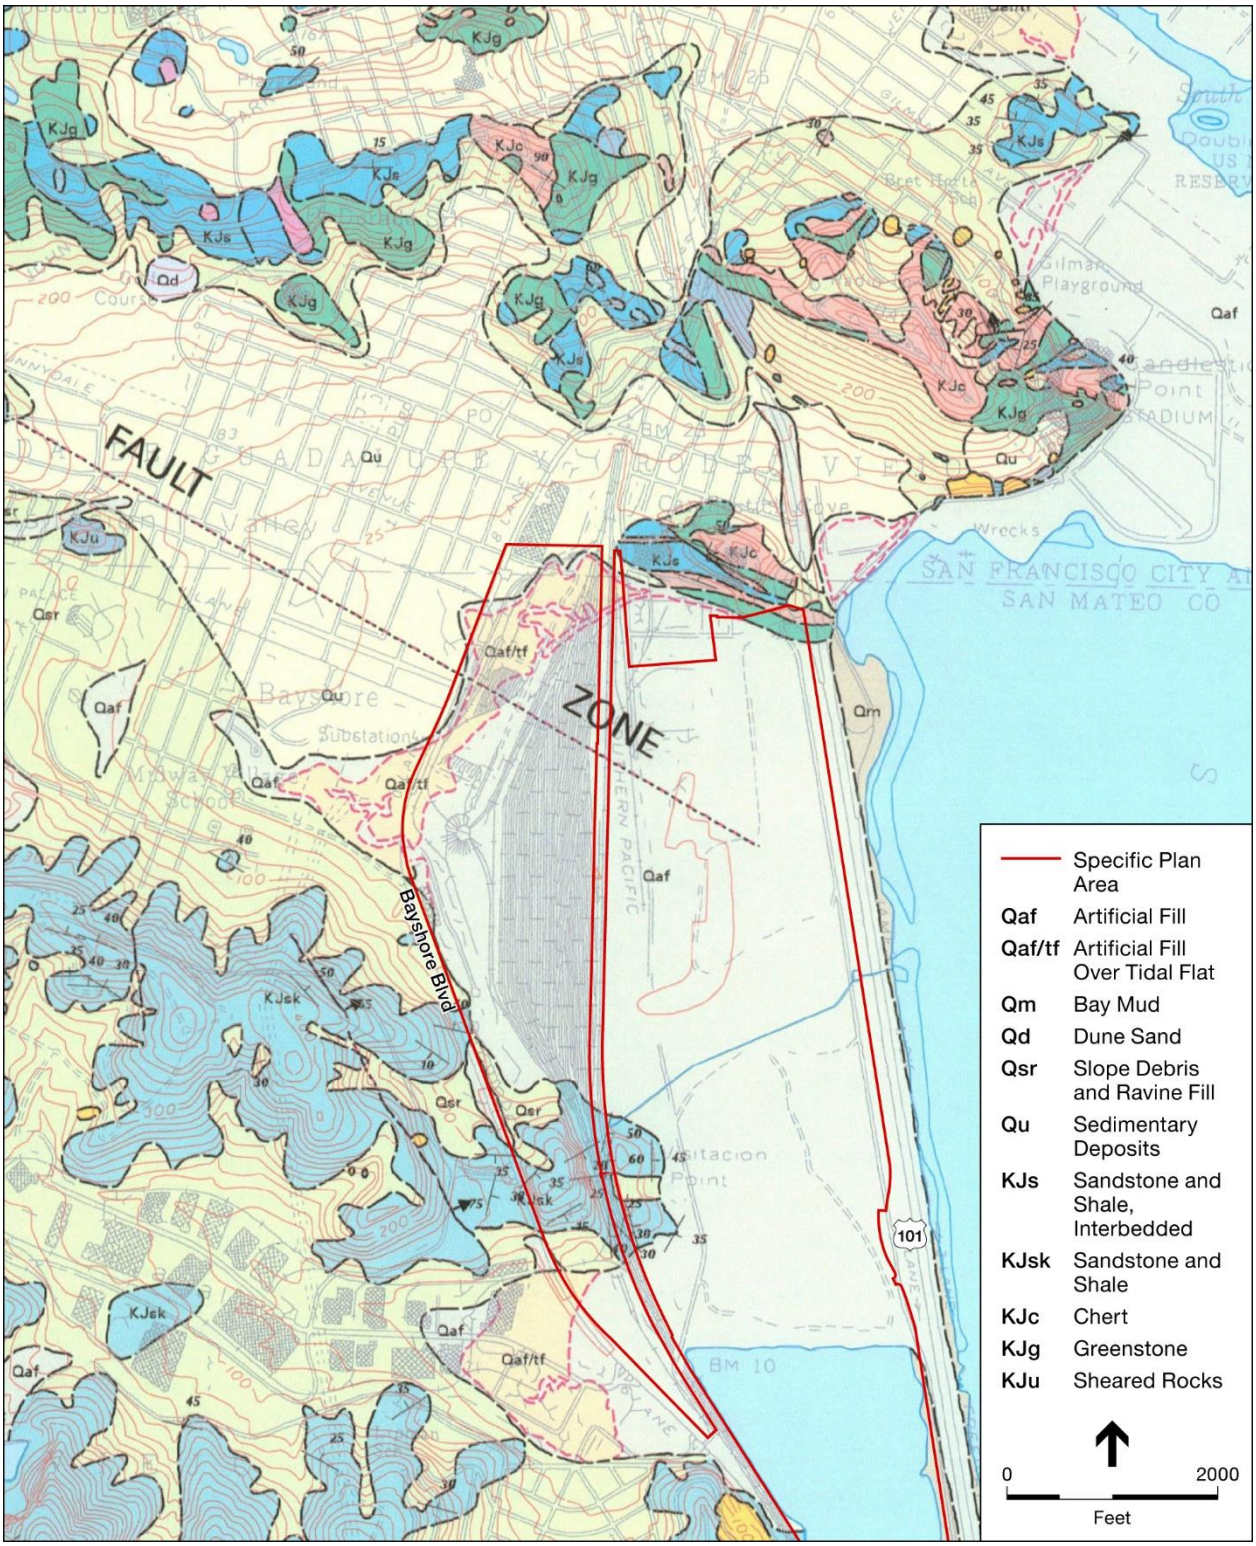
Artificial Fill and Soil Stockpile (Non-Engineered Fill)

Area East of Caltrain Right-of-Way

Within the eastern portion of the Baylands, the upper soil layer consists of soil stockpiled from the soil recycling operation. This layer is highly variable and ranges from sandy clay to gravel with sand, with the majority of fill consisting of silty clayey sand. These materials range from loose to very dense with variable amounts of debris consisting of concrete, bricks, tires, steel, and wood. Because soils imported to the site were intended for sale, they were placed as non-engineered fill.

The thickness of the fill is highly variable across the former landfill site, with elevations ranging from 15 to 70 feet AMSL primarily due to differing fill thickness. In general, the fill on the northern portion of the former landfill, where the site elevation is lower, is relatively thin, ranging in thickness from 3 to 5 feet. Fill within the southern portion of the former landfill ranges up to 40 feet thick or more (see Appendix M.2).

Figure 4.15-2: Regional Geologic Map



Waste within the Former Brisbane Landfill

The former Brisbane Landfill operated prior to current requirements for providing landfill liners, daily cover, and other measures to protect groundwater quality and adjacent soils. Over time, approximately 12.5 million cubic yards of waste were disposed of at the former landfill. Of this volume, an estimated 73 percent was produced by residential and commercial activities, with inert fill accounting for approximately 25 percent and the remaining 2 percent assumed to be liquid waste (ENGEO 2023).

Based on the Waste Discharge Requirements from the California Regional Water Quality Control Board (RWQCB) in effect at the time, the landfill was used for the disposal of primarily non-hazardous solid wastes composed of domestic, industrial, and shipyard waste, sewage, and rubble. Waste materials include wood, paper, plastic, glass, wires, tires, metals, and gravelly soil. The thickness of waste deposits ranges from 15 to 35 feet, with the majority ranging between 25 and 30 feet (ENGEO 2023).

Holocene Bay Deposits

The Holocene Bay Deposits underlying artificial fill and waste deposits within the Baylands include intermixed soft to medium stiff clay, silt, loose to medium dense sand, and organic material deposited by intertidal activity. These deposits occur between 2 feet AMSL and 48 feet below mean sea level and include zones of highly compressible clay, locally known as Young Bay Mud. The thickness of the Young Bay Mud generally increases moving west to east, with thicknesses ranging from less than 5 feet along Bayshore Boulevard to up to 60 feet near US Highway 101. There are two troughs of deeper Young Bay Mud leading to the former drainage outlets of Visitacion Valley and Guadalupe Valley. In some areas of the Baylands, the Bay Deposits include a loose to medium dense sandy soil strata up to 10 feet thick underlying the Young Bay Mud.

When subjected to new loads from fill or structures greater than the material has previously experienced, the Young Bay Mud will undergo long-term settlement. Additionally, the sandy layers within the Bay Deposits may be susceptible to liquefaction during cyclic loading (see Appendix M.2).

Pleistocene Aeolian, Alluvial, and Marine Deposits

Below the Holocene Bay Deposits, Pleistocene sand and clay were deposited in aeolian, alluvial, and marine environments. The sand deposits range from greenish gray to orangish brown and are medium dense to dense. Clay deposits, locally known as Old Bay Clay, range from greenish gray to olive brown and generally increase in strength with depth from approximately 1,100 to 3,500 per square foot. Old Bay Clay generally has similar consolidation properties as Young Bay Mud; however, it is only susceptible to settlement from higher loading conditions since it is over-consolidated (BKF 2022).

Jurassic- and Cretaceous-Age Franciscan Bedrock

The Pleistocene deposits are underlain by Jurassic- and Cretaceous-age Franciscan bedrock that is generally composed of interbedded mélange matrix and siltstone/sandstone. Published bedrock maps show that bedrock elevation ranges from mean sea level to -250 feet below mean sea level across the Baylands, with the shallower bedrock located at the northern and southwestern extents of the site and the deepest bedrock in the middle. The Franciscan bedrock typical of the area is friable to strong and severely weathered, consisting of greenstone, serpentinite, siltstone, and greywacke sandstone (see Appendices M.1, M.2).

Existing Groundwater Conditions

Existing groundwater conditions vary throughout the Baylands, and shallow and deep aquifers are present. Within the western portion of the Baylands, a shallow groundwater table of between approximately 6 and 15.5 feet AMSL was observed in monitoring wells during monitoring in 2019 and 2020. For construction purposes, Baylands geotechnical analyses indicate that groundwater should be expected to be encountered as shallow as 1 foot below the existing ground surface. (see Appendix M.1)

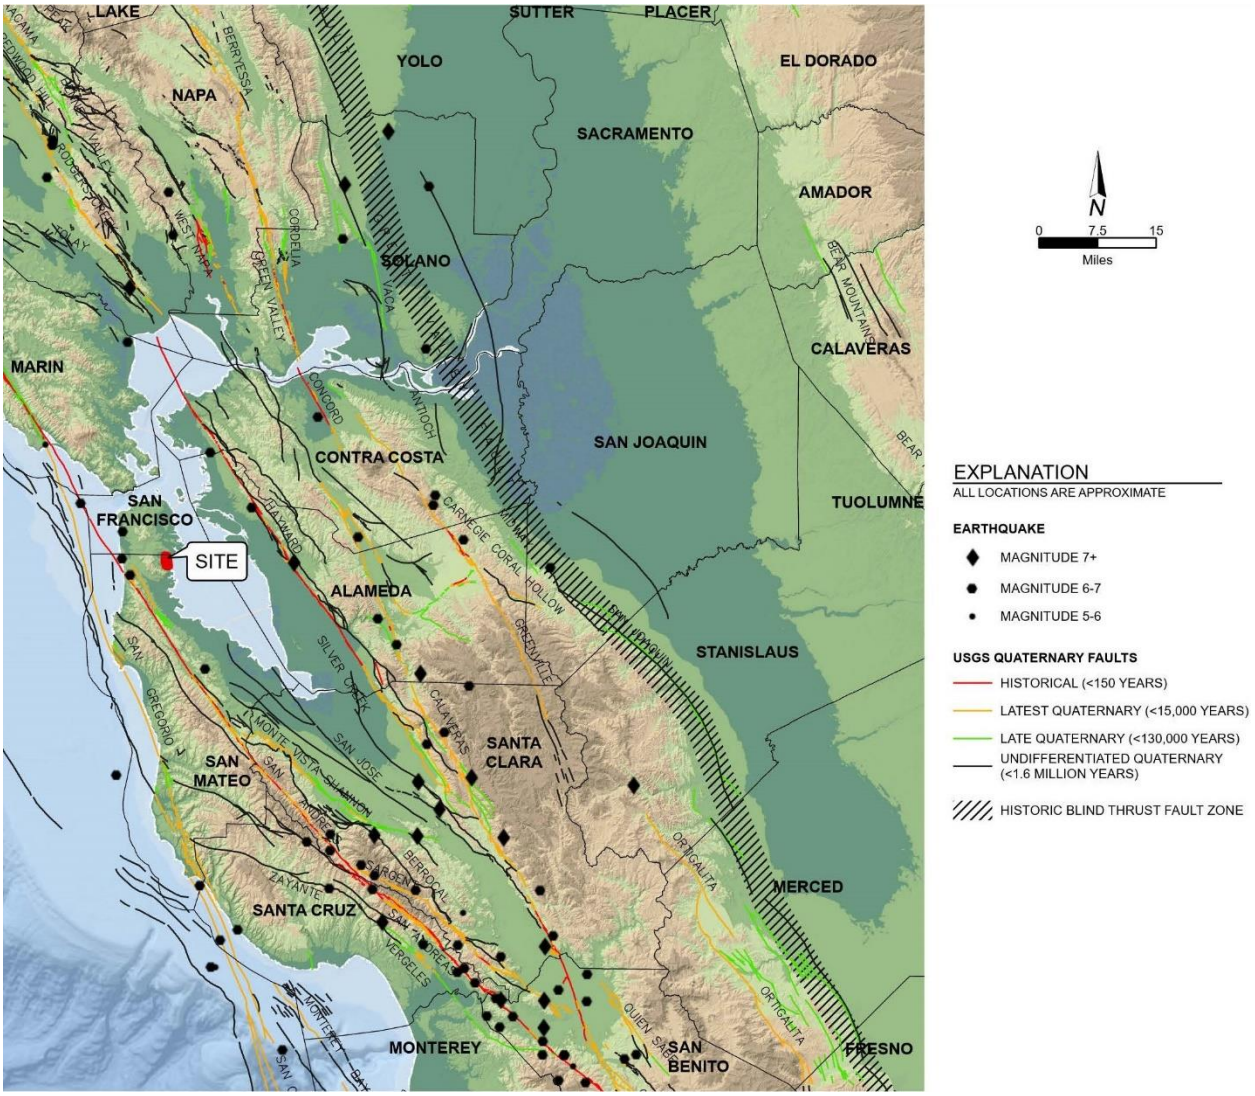
During monitoring east of the Caltrain rail line, groundwater elevations were approximately 10 and 12.5 feet AMSL in the northern and southern portions, respectively. Groundwater near the existing internal drainage channel and the edge of the Brisbane Lagoon is at approximately 3 to 4 feet AMSL and generally between 4 and 10.5 feet AMSL around the exterior of the former landfill. Fluctuations in the level of groundwater may occur due to variations in tidal fluctuations from San Francisco Bay, earthwork activities, rainfall, irrigation practice, and other factors (BKF 2022). For design and geotechnical evaluation, the geotechnical analysis prepared for the eastern portion of the Baylands recommends using a groundwater table of 10 feet AMSL.

f. Seismicity

The San Francisco Bay Area region is seismically active, as evidenced by the presence of multiple active faults. Numerous small earthquakes occur every year in the region, and large (greater than moment magnitude [M_W] 7.0) earthquakes have been recorded and can be expected to occur in the future. **Figure 4.15-3** shows the approximate location of active and potentially active faults and significant historic earthquake epicenters mapped within the Bay Area region.

To determine nearby active faults that are capable of generating strong seismic ground shaking within the Specific Plan area, geotechnical studies prepared for the Baylands used the United States Geological Survey (USGS) Unified Hazard Tool, with the resulting faults listed below in **Table 4.15-1**. The locations of the faults are also presented in **Figure 4.15-3** (see Appendices M.1, M.2).

Figure 4.15-3: Regional Faulting And Seismicity



SOURCE: ENGEO, 2022.

Table 4.15-1: Nearby Active Faults

Fault Name	Distance from Specific Plan Area (Miles)	Maximum Moment Magnitude
San Andreas (Peninsula)	8.3	7.9
San Gregorio (North)	15.4	7.7
Hayward (North)	22.0	7.5

SOURCE: ENGEO, 2022a and 2022b. Based on USGS Unified Hazard Tool: Dynamic Conterminous U.S. 2014 (update) (v 4.2.0).

The 2015 Working Group on California Earthquake Probabilities, as cited in the Baylands geotechnical reports (see Appendices M.1, M.2), evaluated the 30-year probability of a Moment Magnitude 6.7 or greater earthquake occurring along known active fault systems in the Bay Area in the Third Uniform California Earthquake Rupture Forecast (UCERF3). UCERF3

estimated an overall probability of 72 percent for the Bay Area as a whole, and a probability of 6.4 percent for the Northern San Andreas Fault, which is the closest active fault to the site.

Based on the historical seismicity, the proximity of known active faults, and the estimated earthquake probabilities for the Bay Area as a whole, it is anticipated that the Baylands will experience strong seismic ground shaking during the lifetime of Specific Plan improvements.

g. Geologic and Geotechnical Hazards

Seismic Hazards

Potential seismic hazards resulting from a design earthquake include ground rupture (surface faulting), ground shaking, soil liquefaction, dynamic densification, earthquake-induced landslides, regional subsidence or uplift, and tsunamis and seiches. The potential effects of liquefaction include lateral spreading, settlement, loss of bearing capacity, down-drag on deep foundations, ground loss due to sand boil formation, and floatation of buried structures (see Appendices M.1, M.2). The 2022 California Building Code uses design criteria set forth in ASCE 7-16. Geotechnical studies prepared for the Baylands classified the area east of the Caltrain right-of-way as Seismic Design Category B. The area east of the right-of-way was identified as being Seismic Design Category F in accordance with ASCE 7-16, based on the area's liquefaction hazard. ASCE 7-16 requires that site response analysis be performed for Seismic Design Category F sites for design of structures and buildings (see Appendix M.1).

Ground Rupture

Ground surface displacement, or surface rupture, caused by an earthquake is a major consideration in the siting of buildings in areas that are traversed by active faults. Surface rupture occurs when movement on a fault deep within the earth breaks through to the surface.

Most surface faulting follows pre-existing faults, which are zones of weakness, and is confined to a relatively narrow zone several feet to tens of feet wide. Avoidance through implementation of building setbacks is the common method for avoiding fault rupture impacts.

A trace of the City College Fault Zone crosses the Baylands. This fault zone is considered not to have been active in the late Quaternary era and there is no seismicity associated with it; therefore, it is not considered active. The Specific Plan area is not located within a designated Alquist-Priolo Earthquake Fault Zone and there are no known surface expressions of active faults within the area; therefore, fault rupture through the Specific Plan area is not anticipated (see Appendices M.1, M.2).

Ground Shaking

An earthquake produces seismic waves that emanate in all directions from the fault rupture surface. The seismic waves cause ground shaking, which is typically strongest near the fault and attenuates as the waves move through the earth away from the fault. Based on the historic seismicity, the proximity of known active faults, and the estimated earthquake probabilities for the Bay Area as a whole, it should be expected that the Baylands will experience strong seismic ground shaking, as would most of the Bay Area, during the lifetime of buildings within the Specific Plan area (see Appendices M.1, M.2).

Liquefaction and Seismic-Related Ground Failure

Liquefaction

Soil liquefaction results from loss of strength during cyclic loading, such as that imposed by earthquakes. The soil considered the most susceptible to liquefaction is clean, loose, saturated, uniformly graded fine sand below the groundwater table. Empirical evidence indicates that loose fine-grained soil, including low plasticity silt and clay, is also potentially liquefiable. When seismic ground shaking occurs, the soil is subjected to cyclic shear stresses that can cause excess hydrostatic pressures to develop and liquefaction of susceptible soil to occur. If liquefaction occurs, and if the soil consolidates or vents to the surface during and following liquefaction, ground settlement and surface deformation may occur (see Appendix M.2).

Based on California Geologic Survey Seismic Hazard Zone Maps, the Specific Plan area is mapped as being in a seismic hazard zone with potential permanent ground displacements due to liquefaction. This liquefaction susceptibility mapping is based on regional geologic mapping of soil and rock deposits rather than on site-specific exploration or analyses (ENGEO 2022b). As part of the geotechnical studies for the Baylands, ENGEO assessed the seismic susceptibility and deformation potential based on material properties from laboratory testing and in-situ cone penetration test data. The results indicate that material within the artificial fill and the sandy deposits below the Young Bay Mud would be subject to liquefaction and cyclic densification during a design seismic event (see Appendices M.1, M.2).

Liquefaction-Induced Ground Settlement

Seismic-induced settlement may be generally subdivided into two categories: (1) settlement resulting from liquefaction of saturated soil, and (2) settlement resulting from dynamic densification of non-saturated soil. Based on cone penetration test data, Baylands geotechnical studies determined that liquefaction-induced settlement of generally between 2 to 3 inches may occur during a design seismic event. Some areas closest to the historic shoreline could, however, have settlement up to 4½ inches (see Appendices M.1, M.2).

Lateral Spreading

As discussed above, a likely continuous potentially liquefiable sand layer exists beneath the Young Bay Mud in the Specific Plan area. However, this layer varies from 40 to 90 feet deep, well below the bottom of the adjacent San Francisco Bay at the shoreline along the eastern border of the landfill. As such, the risk of liquefaction-induced lateral spreading was determined to be negligible (see Appendix M.1).

Ground Lurching

Ground lurching is a result of the rolling motion imparted to the ground surface during an earthquake. Such rolling motion can cause ground cracks to form in weaker soils. The potential for the formation of these cracks is considered greater at contacts between deep alluvium and bedrock. While such an occurrence is possible within the Specific Plan area, geotechnical studies for the Baylands conclude that the offset will be minor due to the site's location and underlying geology (see Appendices M.1, M.2).

Soils-Related Hazards

Compressible Soils

Young Bay Mud deposits are highly compressible and may be susceptible to significant settlement when subjected to additional loading. The approximate thickness of the Young Bay Mud deposits in the Specific Plan area is depicted on **Figure 4.15-4**.

Published maps and site explorations indicate that most of the western portion of the Baylands is underlain by soft, highly compressible Young Bay Mud deposits up to 50 feet thick, while Young Bay Mud within the eastern portion of the Baylands is 20 to 65 feet thick. Since the existing artificial fill within the western portion of the site was placed more than 50 years ago, the geotechnical study for that area assumes that settlement from previous infilling is essentially complete. However, future settlement of the compressible Young Bay Mud is anticipated when it is subjected to added loading, such as from placement of new fill to raise grades and/or planned structural loads of buildings and site improvements (see Appendix M.1). Placement of the waste within the eastern portion of the Baylands from 1932 to 1967 and the subsequent soil recycling operation subjected the Young Bay Mud to loading and settlement from primary consolidation. Future additional loading will induce continued settlement of this deposit.

Figure 4.15-4: Young Bay Mud Thickness

Expansive Soils

Expansive soils exhibit "shrink-swell" behavior, also called "linear extensibility." Shrink-swell is the cyclic change in soil volume (expansion and contraction) that occurs in fine-grained sediments from the process of wetting and drying. Typically, expansiveness is directly correlated to the amount of clay in the soil, with a high clay percentage resulting in a high expansion index (Edwards et al. 1970). The Young Bay Mud underlying the Baylands has a highly expansive nature (see Appendix M.1).

Soil Corrosivity

Corrosivity of soils is dependent on soil texture, soil pH, moisture content, and geochemical composition of fluids within the soil. These factors, in turn, are influenced by the physical and mineralogical composition of soils. Soil composition often is directly derived from the characteristics of the underlying geologic deposits on which it develops. Silty, loamy, and clayey soils tend to be among the more potentially corrosive soils, in contrast to granular soils (sands and gravels). In addition, the topography of the land, depth to groundwater, and native vegetation all influence the soil corrosivity potential.

As part of the geotechnical studies prepared for the Baylands, representative soil samples of artificial fill soils and Young Bay Mud were tested by a qualified analytical lab to determine soil pH, resistivity, and sulfate and chloride content. The Young Bay Mud underlying the Baylands was determined to be highly corrosive to metals due to high clay content and brackish bay water. Corrosive subsurface soils are especially likely along Bayshore Boulevard, where Bay Mud is present beneath the fill (see Appendix M.1).

Corrosive soils could have a detrimental effect on concrete and metals. Depending on the degree of corrosivity of subsurface soils at a specific location, concrete and reinforcing steel in concrete structures and bare-metal structures exposed to these soils could deteriorate, eventually leading to structural failures.

Landslide Hazards and Slope Stability

Slope failure can occur in the form of creep, slumps, large progressive translational or rotational failures, rockfall, or debris flow. These processes are defined as follows:

- Soil creep is the slow continuous deformation of soil or rock.
- Slumps refer to a mass movement of materials that slide on a curved plane and are generally smaller than what would be considered to be a large translational or rotational failure, which would also occur along a curved plane of motion.
- Rockfalls and debris flows are more general references to the downward movement of rock or soil materials.

Landslides can occur during earthquakes, triggered by the strain induced in soil and rock by the ground shaking vibrations. During non-earthquake (static) conditions, slope failures occur most frequently during the rainy season when high groundwater conditions persist. Landslides typically occur most frequently during or following large storms and in years with significant precipitation. Slides may occur slowly or suddenly, at times without apparent provocation. Possible landslide causes include gradual disintegration of the structure of the soil, an increase in pore water pressure, liquefaction of underlying soil, or horizontal acceleration due to earthquake ground shaking.

Geotechnical studies for the Baylands confirm that no landslides have been mapped within the Specific Plan area. The associated landslide hazard for the former landfill area is nil to very low because surface gradients are very gentle. Along the southwestern boundary of the former railyard area, moderate to locally steep relief is associated with bedrock outcrops in the vicinity of Icehouse Hill, near the Kinder Morgan Tank Farm; however, no landslides are documented for this area. The road cut on the west side of Icehouse Hill has experienced some rockfall, which the City has addressed through placement of concrete k-rail barriers to prevent falling rocks and soil from reaching Bayshore Boulevard travel lanes.

h. Paleontological Resources

The Baylands lies mostly on artificial fill (Qaf) overlying bay muds (Qm), including historical fill deposits. Thus, lands within the Specific Plan area other than Icehouse Hill are not natural features of the San Francisco Bay region. The Baylands geotechnical reports prepared by Geosyntec in 2021 (Appendices M.1, M.2) show that no bedrock was encountered in any borehole to depths of approximately 30 feet below ground surface (bgs) and that artificial fill overlies bay mud to a depth of approximately 3 to 13 feet bgs. Geotechnical bores did not extend below these deposits, but the geotechnical reports stated that the Pleistocene-aged Colma Formation sand (with some silt and clay) underlies the Young Bay Mud and is approximately 30 feet thick. The Pliocene-Pleistocene aged Merced Formation sandstone and secondary siltstone potentially underlies the Baylands, with Franciscan bedrock at a depth of 50 to 60 feet bgs underneath these layers.

The Colma and Merced formations have a well-established record of hosting significant marine and terrestrial vertebrates. In addition, a search of the online holdings of the University of California Museum of Paleontology (UCMP; accessed March 2023) yielded a number of terrestrial Pleistocene vertebrates associated with the Colma and Merced formations, including sloths, horses, mammoths, mastodons, and camelids. Marine units of unlisted formation status that are likely to be the Merced formation based on age have yielded over 280 invertebrate fossils. An additional search of the Paleobiological Database (paleodb.org; accessed March 2023) provided a number of critical invertebrate and vertebrate fossils from the Merced Formation in San Mateo County.

4.15.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

National Earthquake Hazards Reduction Program

The National Earthquake Hazards Reduction Program was established by the Earthquake Hazards Reduction Act of 1977, Public Law (PL) 95–124. In establishing the Program, Congress recognized that earthquake-related losses could be reduced through improved designs, including improved construction methods and practices; land use controls, including redevelopment; prediction techniques and early-warning systems; coordinated emergency preparedness plans; and public education and involvement programs. The four basic goals of the National Earthquake Hazards Reduction Program are to:

- Develop effective practices and policies for reducing earthquake-related losses and accelerate their implementation.
- Improve techniques for reducing the earthquake vulnerabilities of facilities and systems.
- Improve earthquake-related hazards identification and risk assessment methods and their use.
- Improve the understanding of earthquakes and their effects.

Implementation of Earthquake Hazards Reduction Program priorities is accomplished primarily through original research, publications, and recommendations to assist and guide state, regional, and local agencies in development of plans and policies that promote safety and emergency planning. For example, the Program's *Recommended Seismic Provisions for New Buildings and Other Structures* presents a set of recommended improvements to the ASCE/SEI 7-16 Standard: Minimum Design Loads and Associated Criteria for Buildings and Other Structures, intended for use by national standards and code organizations and earthquake engineering professionals.

b. State Laws, Plans, Programs, and Regulations

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act was passed in 1972 to mitigate surface fault rupture hazards to structures used for human occupancy by preventing the construction of such structures on top of the traces of active faults. Although the Act addresses the hazards associated with surface fault rupture, it does not address other earthquake-related hazards, such as seismically induced ground shaking, liquefaction, or landslides.

The Act has led to the establishment of regulatory zones, referred to as Earthquake Fault Zones, around the mapped surface traces of active faults, including mapping of these zones. Before a development project can be permitted within an Earthquake Fault Zone, local agencies must require preparation of a site-specific geologic investigation and written report by a licensed geologist demonstrating that proposed buildings would not be constructed across active faults. If an active fault is found, structures for human occupancy cannot be placed over the trace of the fault and must be set back a minimum of 50 feet from the fault.

The Baylands Specific Plan area is not located within a designated Alquist-Priolo Earthquake Fault Zone.

Seismic Hazards Mapping Act

The State of California requires analysis of the seismic stability of slopes for certain projects. Pursuant to the Seismic Hazards Mapping Act of 1990 (Chapter 7.8, Sections 2690 et. seq., California Public Resources Code). The purpose of the Act is to protect public safety from the effects of strong ground shaking, liquefaction, landslides, or other ground failure; or other hazards caused by earthquakes. The Seismic Hazards Mapping Act is a companion and complement to the Alquist-Priolo Earthquake Fault Zoning Act, which addresses only surface fault-rupture hazards.

Pursuant to the Act, the State Geologist has mapped seismic hazard zones to assist local governments in addressing seismic hazards. Public Resources Code Section 2697(a) states that "cities and counties shall require, prior to the approval of a project located in a seismic hazard zone, a geotechnical report defining and delineating any seismic hazard." The City-required geotechnical reports delineating seismic hazards that were prepared for the Baylands Specific Plan are provided as Draft EIR Appendix M.1 (area west of the Caltrain right-of-way) and M.2 (area east of the Caltrain right-of-way).

California Geological Survey Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California

Special Publication 117A provides, among other things, definitions, caveats, and general considerations for earthquake hazard mitigation, including seismic slope stability along with tools for screening and evaluation of slope stability and liquefaction hazards. The Guidelines provide a summary overview of analysis and mitigation of earthquake-induced landslide hazards. Special Publication 117A also provides guidelines for the review of site-investigation reports by regulatory agencies who have been designated to enforce the Seismic Hazards Mapping Act.

California Building Code

The California Building Code (CBC) has been codified in the California Code of Regulations (CCR) as Title 24. Title 24 is administered by the California Building Standards Commission, which, by law, is responsible for coordinating all building standards. The 2022 California Building Standards Code (CCR Title 24) was published on July 1, 2022, with an effective date of January 1, 2023. The current CBC (2022) was adopted by the City of Brisbane ("City") in Title 15, Buildings & Construction, of the City's Municipal Code.

Purpose and Application

The purpose of the CBC is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability by regulating and controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of all buildings and structures within its jurisdiction. The 2022 edition of the CBC became effective on January 1, 2023. The provisions of the CBC apply to the construction, alteration, movement, replacement, and demolition of every building or structure, or any appurtenances connected or attached to such buildings or structures throughout California.

Chapter 16, Structural Design

The CBC includes earthquake design requirements in Chapter 16, Structural Design. Specifically, Chapter 16, Section 1613 provides earthquake loading specifications for design and construction to resist the effects of earthquake motion in accordance with the American Society of Civil Engineers (ASCE) 7-05 document, Minimum Design Loads for Buildings and Other Structures.

Chapter 18, Soils and Foundations

Chapter 18, *Soils and Foundations*, of the California Building Code provides criteria for geotechnical and structural considerations in the selection, design, and installation of foundation systems to support various loads imposed by structures. This chapter covers the requirements of geotechnical investigations (Section 1803); excavation, grading, and fills (Section 1804); load bearing of soils (Section 1806); foundations (Section 1808); shallow foundations (Section 1809); and deep foundations (Section 1810). Chapter 18 also describes analysis of expansive soils and the determination of the depth to groundwater table. For Seismic Design Categories C, D, E, and F, Chapter 18 requires analysis of slope instability, liquefaction, total and differential settlement, and surface displacement due to faulting or seismically induced lateral spreading or lateral flow.

Section 1803 includes requirements for geotechnical investigations. Section 1803 requires that the geotechnical investigation be prepared by a geotechnical engineer registered in the State of

California with the advice of a certified engineering geologist and other technical experts, as necessary. The approved engineering geologic report is required to be submitted with, or as part of, the geotechnical report. The geotechnical investigation must cover soil classification, questionable soils, expansive soils, groundwater table, deep foundations, rock strata, excavation near foundations, compacted fill material, and controlled low-strength material. Additional studies must be made as necessary to evaluate slope stability, soil strength, position and adequacy of load-bearing soils, the effect of moisture variation on soil-bearing capacity, compressibility, liquefaction, and expansiveness.

Section 1803.7 of the CBC requires geohazard reports for all proposed construction to identify geologic and seismic conditions that may require mitigation. The reports must assess the nature of the site and potential for earthquake damage based on appropriate investigations of the regional and site geology, project foundation conditions, and potential seismic shaking at the site. These reports must consider the most recent:

- California Geologic Survey Note 48 (Checklist for the Review of Engineering Geology and Seismology Reports for California Public Schools, Hospitals, and Essential Services Buildings);
- California Geologic Survey Special Publication 42: Fault Rupture Hazard Zones in California (for project sites proposed within an Alquist-Priolo Earthquake Fault Zone); and
- California Geologic Survey Special Publication 117: Guidelines for Evaluating and Mitigating Seismic Hazard in California (for project sites proposed within a Seismic Hazard Zone).

All conclusions of required geologic and earthquake engineering reports must be fully supported by satisfactory data and analysis. The City of Brisbane regulates construction activities through a process that requires the preparation of a site-specific geotechnical investigation, consistent with Title 24, Part 2, Chapter 18 of the CBC. Site-specific geotechnical investigations have been performed by ENGEO and are included in Appendix M.

California Residential Code and California Green Building Standards Code

CCR Title 24 also includes the California Residential Code and the California Green Building Standards Code, commonly referred to as "CALGreen." The California Residential Code includes structural design standards for one- and two-family dwellings and covers all structural requirements for conventional construction. All other structures, including multi-family residential projects, are found in the other parts of the CBC, as discussed above.

CALGreen establishes minimum mandatory standards as well as voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency, water conservation, material conservation, and interior air quality. The CALGreen standards took

effect in January 2011 and instituted mandatory minimum environmental performance standards for all new construction of commercial buildings, low- and high-rise residential buildings, state-owned buildings, schools, and hospitals.

California Code of Regulations, Title 27, Section 21190

CCR, Title 27, Section 21190 pertains to development in or within 1,000 feet of active, inactive, and abandoned solid waste landfills. It requires that all proposed post-closure land uses be designed and maintained to:

(1) Protect public health and safety and prevent damage to structures, roads, utilities, and gas monitoring and control systems;

(2) Prevent public contact with waste, landfill gas, and leachate; and

(3) Prevent landfill gas explosions.

This regulation dictates various construction requirements for buildings, including measures to mitigate the effect of differential settlement through use of flexible connections and utility collars for the placement of utilities.

Public Resources Code Sections 5097.5 and 30244

State requirements for paleontological resource management are included in Public Resources Code Sections 5097.5 and 30244. These statutes prohibit the removal of any paleontological site or feature from public lands without permission of the jurisdictional agency, define the removal of paleontological sites or features as a misdemeanor, and require reasonable mitigation of adverse impacts to paleontological resources from developments on public (state, county, city, district) lands.

c. City of Brisbane Plans, Ordinances, and Regulations

General Plan

General Plan policies and programs relevant to geology, soils, and seismicity issues raised by the Baylands development are identified below.

Chapter X: Community Health and Safety Element

This General Plan chapter contains the following relevant policies and programs:

Policy 149: Construct new buildings and retrofit existing ones to withstand seismic forces.

Program 149a: Require that all new construction meet current codes for seismic stability.

Program 149b: Consider a requirement, in conjunction with both residential and non-residential rehabilitation or reconstruction, that some portion of the improvements be devoted to improving seismic safety.

Program 149e: Require soils reports and engineering recommendations for structural stability in conjunction with building permit applications in areas which have been identified as prone to seismically induced landslides or subsidence in seismic events.

Policy 152: Consider issues of slope stability in conjunction with development applications.

Program 152a: Require soil and geologic investigations in areas identified as prone to slope instability. Consider both on-site and off-site impacts.

Program 152b: Unless adequate mitigating measures are undertaken, prohibit land alteration, including any grading and structural development, in identified areas of slope instability.

Program 152c: Require topographical and soils information for all projects on slopes identified over 20 percent.

Program 152e: Encourage placement of structures away from areas identified as prone to slope failure or erosion unless effective mitigation measures are proposed as a part of the project design.

Program 152g: Strictly enforce the provisions of the City's Grading Ordinance.

Policy 175: Assure that any development otherwise permitted on lands filled with municipal waste is safe by implementing the following programs.

Program 175a: Exchange information with the California Integrated Waste Management Board, San Mateo County Environmental Health Division and other responsible agencies regarding the requirements for safe and successful landfill development, utilizing the experience of Sierra Point.

Program 175b: Require evidence that scientific testing and verification has taken place to the satisfaction of regulatory agencies.

Program 175c: Encourage property owners of filled lands to complete all testing and related requirements of the Federal, State and local agencies well in advance of requesting land use permits from the City.

Chapter XII: Policies and Programs by Subarea

This General Plan chapter contains the following relevant policies:

Policy BL.28: Meet applicable seismic requirements in all construction, with special attention to non-engineered fill.

Policy BL.31: Require improvement of drainage and correction of hillside erosion and flooding on Bayshore Boulevard.

Municipal Code

Title 15 of the Brisbane Municipal Code, Buildings and Construction, incorporates the CBC, 2022 Edition, as the building code of the City along with the following construction-related codes.

- Chapter 15.01, Grading
- Chapter 15.04, adopting Title 24 of the California Code of Regulations, 2022 Edition of the California Building Standards Code including:
    - 2022 California Administrative Code, Title 24, Part 1.
    - 2022 California Building Code, Volumes 1 and 2, based on the 2021 International Building Code (ICC), Title 24, Part 2, including Appendix G Flood Resistant Construction, Appendix I Patio Covers, and Appendix J Grading.
    - 2022 California Residential Code, based on the 2021 Edition International Residential Code (ICC), Title 24, Part 2.5, including Appendix H Patio Covers, Appendix J Existing Building and Structures, Appendix K Sound Transmission, and Appendix V Swimming Pool Safety Act.
    - 2022 California Electrical Code, based on the 2020 Edition National Electric Code as published by the National Fire Protection Association (NFPA), Title 24, Part 3.
    - 2022 California Mechanical Code, based on the 2021 Uniform Mechanical Code as published by the International Association of Plumbing and Mechanical Officials (IAPMO), including all appendix chapters, Title 24, Part 4.
    - 2022 California Plumbing Code, based upon the 2021 Uniform Plumbing Code as published by the International Association of Plumbing and Mechanical Officials (IAPMO), including all appendix chapters, Title 24, Part 5.
    - 2022 California Energy Code, Title 24, Part 6.
    - 2022 California Historical Building Code, Title 24, Part 8.
    - 2022 California Fire Code, Title 24, Part 9, and modifications thereof, contained in Chapter 15.44.

- 2022 California Existing Building Code based on the 2021 International Existing Building Code Edition, published by the International Code Council, together with those omissions, amendments, exceptions, and additions thereto as amended in Part 10 of the California Building Standards Code, California Code of Regulations Title 24.
- 2022 California Green Building Standards Code, Title 24, Part 11.
- 2022 California Referenced Standards Code, Title 24, Part 12.
- The 2021 International Property Maintenance Code.

4.15.4 RELEVANT SPECIFIC PLAN PROVISIONS

Specific Plan goals relevant to geology, soils, and seismicity issues raised by the Baylands development are identified below.

Goal 7.2.2: Promote Creation of a Safe Site Through Earthwork and Soils Remediation.

Program 149a: This goal addresses the following General Plan requirements:

"The single specific plan and development agreement subject to City review and approval referenced above shall include:

(i) detailed plans for Title 27 compliant closure of the landfill and Remedial Action Plans (RAPs) for OU-1 and OU-2 that have been approved by all appropriate regulatory agencies, which include, but shall not be limited to, CalRecycle, the San Mateo County Environmental Health Department, the California Department of Toxic Substances Control, the California Regional Water Quality Control Board

(ii) a specific schedule establishing time frames by which (i) the landfill must be closed in full compliance with Titles 27 and (ii) the remediation of OU-1 and OU-2 must be completed; and

(iii) specific means by which the City may enforce the applicant's adherence to the schedule for closure and remediation and specific consequences, e.g., monetary penalties, suspension of building permits, etc., that the City may impose on the applicant for failing to adhere to the schedule." (GP1-18, 3(A))

and:

- "All residential development shall be designed and remediated to accommodate ground level residential uses and ground level residential-supportive uses such as daycare, parks, schools, playgrounds, and medical facilities." (GP-1-18, (3C))

and:

- "Sufficient assurances for the satisfactory ongoing performance of site remediation and site development (e.g., site monitoring, performance bonds, environmental insurance) shall be provided as determined by the City." (GP-1-18, 3(F))

and:

- "Prior to issuance of a grading permit to export soil or move soil from the existing landfill area for incorporation in a remediation or grading plan, the soil shall be tested in a manner approved by the City." (GP-1-18, 3(K))

OU-SM was previously known as OU-1 and is subsequently named by California Department of Toxic Substances Control (DTSC) as "OU-SM" and is indicated as such herein.

To promote a safe site for all planned uses, Feasibility Study/Remedial Action Plans (RAPs)[340,341] and the Title 27 Landfill Closure Plan[342] have been developed and approved by the applicable regulatory agencies. Adherence to the remediation efforts is overseen by the applicable regulatory agencies in conformance with Chapter 6.8 of the California Health and Safety Code. The landfill closure and post-closure maintenance plans are overseen by the applicable agencies pursuant to Title 27 of the California Code of Regulations. The phasing schedule of remediation activities is described in Section 9.2, Phasing.

4.15.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of geology, soils, and seismicity impacts:

Threshold GEO-1: **The Baylands Specific Plan would cause a significant impact if it would directly or indirectly cause a substantial risk of loss, injury, or death involving rupture of a known earthquake fault, including but not limited to those delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area as well as those identified based on other substantial evidence of a known potentially active fault.**

340 Geosyntec, *Feasibility Study/Remedial Action Plan (FS/RAP) for the San Mateo County Portion of Universal Paragon Operable Unit (UPC OU-SM)*, October 11, 2021.

341 Geosyntec, *Feasibility Study/Remedial Action Plan (FS/RAP) for the Brisbane Baylands Operable Unit 2 (OU-2)*, December 22, 2021.

342 ENGEO, *Baylands Closure and Post Closure Maintenance Plan Volume 1*, January 25, 2023, revised January 8, 2025.

Threshold GEO-2: The Baylands Specific Plan would cause a significant impact if it would directly or indirectly cause a substantial risk of loss, injury, or death by exposing people or structures to strong seismic ground shaking.

Threshold GEO-3: The Baylands Specific Plan would cause a significant impact if it would directly or indirectly cause a substantial risk of loss, injury, or death by exposing people or structures to secondary effects of seismic shaking, including liquefaction or seismic-related ground failure (e.g., ground lurching, lateral spreading).

Threshold GEO-4: The Baylands Specific Plan would cause a significant impact if it would directly or indirectly cause a substantial risk of loss, injury, or death due to slope instability, subsidence, or soil collapse.

Threshold GEO-5: The Baylands Specific Plan would cause a significant impact if it would directly or indirectly cause a substantial risk of loss, injury, or death by exposing structures for human occupancy to expansive soils or soil corrosivity.

Threshold GEO-6: The Baylands Specific Plan would cause a significant impact if it would directly or indirectly destroy a unique paleontological resource or site, or a unique geologic feature.

Threshold GEO-7: The Baylands Specific Plan would cause a significant impact if it would include use of septic tanks or alternative wastewater disposal systems on soils that are incapable of supporting such use.

Erosion, siltation, and sedimentation are addressed in Section 4.14, *Hydrology and Water Quality*.

4.15.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact GEO-1: Fault Rupture

Methodology for Determining Significance

The analysis of impacts related to fault rupture is based on the geotechnical reports prepared for the Baylands in 2022 (Appendix M.1 and M.2). In determining whether a significant impact would result from the Baylands Specific Plan, the analysis reasonably assumes compliance with independently enforceable federal, state, and local laws and requirements, including the Alquist-Priolo Earthquake Fault Zoning Act. If any structure for human occupancy would be proposed within an Alquist-Priolo Earthquake Fault Zone or astride any other known potentially active fault, a significant impact related to fault rupture would occur if the setbacks established by a site-specific geotechnical analysis providing precise mapping of the fault were not met.

Impact Assessment

As discussed above, there are no known active or potentially active fault traces across the Baylands, and the site is not located within an Alquist-Priolo Earthquake Fault Zone.

Significance Conclusion for Impact GEO-1

Because there are no known active or potentially active fault traces across the Baylands, and the site is not located in an Alquist-Priolo Earthquake Fault Zone, no impact related to rupture of a known earthquake fault would result.

b. Impact GEO-2: Seismic Ground Shaking

Methodology for Determining Significance

In determining whether a significant impact would result from the 2025 Specific Plan project, the analysis reasonably assumes new buildings and restoration of historic structures comply with federal, state, and local laws and requirements, including the California Building Code (CBC), which sets standards for buildings to withstand seismic events as well as with recommendations of geotechnical studies designed to achieve building code compliance (e.g., Appendices M.1, M.2). Existing state law and building codes provide for an adequate level of safety such that buildings constructed to code would withstand ground shaking forces of a minor earthquake without damage, of a moderate earthquake without structural damage, and of a major earthquake without collapse of the structure. In addition, critical facilities and structures (e.g., fire stations) built to code would remain functional following a major earthquake. Any building designed for human occupancy meeting applicable seismic design standards would be considered to have a less than significant impact.

The geologic hazards present within the Baylands have been studied and documented in numerous geotechnical investigations that were performed within various portions of the Baylands by several different reputable geotechnical firms, and were presented in geotechnical evaluations completed in 1990, 2006, and 2008 (Kleinfelder 1990; Geosyntec 2006; Treadwell & Rollo, Inc. 2008; Geosyntec 2008 as cited in the Brisbane Baylands Program Environmental Impact Report) prior to preparation of the previous Brisbane Baylands Program EIR, in addition to the 2022 ENGEO geotechnical studies for the western and eastern portions of the Baylands as part of the site remediation and landfill closure plans, as well as for this EIR (Appendices M.1, M.2). The 2022 geotechnical studies provide a sound understanding of soil geotechnical conditions within the Baylands, along with their associated hazards, and present sufficient information to analyze the geotechnical feasibility of the Specific Plan development.

The CBC sets forth specific performance standards for improvements to foundation soils, such as compaction or densification, combined with building foundation design criteria based on

underlying soil properties necessary to provide adequate protection to the public during and following an earthquake event. The 2022 Baylands geotechnical studies provide specific recommendations to ensure compliance of future site-specific development projects with CBC standards.

As site-specific development and infrastructure projects are designed and proposed specifying the precise location, dimensions, height, and design of each individual building within the Baylands, geotechnical studies completed to date would be supplemented to provide requirements for individual foundation designs. This is because (1) the precise location, height, and bulk of each future building within the Baylands cannot be known at this time; and (2) the foundation system for each building site must be designed in accordance with the site-specific engineering properties of the materials beneath the structure, combined with the intended loading (weight) of the structure itself. It is common practice to prepare a more detailed design-level study later in the design process, after the specific design has been determined.[343]

Thus, while existing geotechnical analyses include mapping the depth of fill materials and Bay Mud within the Baylands, as the precise location, height, seismic design, and loading of each building within the Baylands becomes known as part of site-specific development proposals, site-specific investigations would:

- Determine the specific depth of the fill materials and Bay Mud at each building site; and
- Provide requirements, in compliance with the CBC, for individual foundation designs, including determining whether shallow foundations or deep foundation pilings are appropriate, along with the number and dimensions of each deep foundation.

Per CBC requirements, design specifications are determined according to the seismic design category, including earthquake loading specifications for every structure, and portions thereof that are permanently attached to structures and their supports and attachments. These features must be designed and constructed to resist the effects of earthquake motions anticipated within the applicable seismic design category. Thus, compliance with CBC performance standards as specified in a site-specific geotechnical study would be indicative of a less than significant impact in relation to seismic ground shaking.

Impact Assessment

The 2025 Specific Plan project would add residents, employees, and new structures for human occupancy within a seismically active region that would likely experience at least one major

[343] See *California Oak Foundation v. Regents of University of California* [2010] 188 Cal.App.4th 227 [rejecting claims that a detailed geotechnical study then underway was required to be prepared before EIR certification]; *Oakland Heritage Alliance v. City of Oakland* [2011] 195 Cal.App.4th 884 [upholding EIR's analysis based on a preliminary geotechnical analysis of the site, with a detailed design-level geotechnical study to be prepared as part of the building design].

earthquake (M_W 6.7 or greater) within the next 20 years, producing considerable ground accelerations. The specific intensity of such an event and resulting ground shaking within the Baylands would depend on the specific characteristics of the earthquake, including the causative fault, distance to the epicenter, depth of the rupture below ground surface, the moment magnitude, and the duration of shaking. Peak ground accelerations of 0.76g for the western portion of the site and 0.60g in the eastern portion of the site were used in conjunction with the mapped maximum considered earthquake.

Structures for human occupancy constructed pursuant to the Specific Plan would be required to comply with applicable seismic design regulations at the time of construction. The CBC, as adopted in the Brisbane Municipal Code, includes provisions to reduce impacts caused by potential major structural failures or loss of life resulting from earthquakes and other geologic hazards. For example, the CBC requires that a California Certified Engineering Geologist or California-licensed civil engineer prepare a site-specific engineering analysis that demonstrates the satisfactory performance of each proposed structure, including requirements for design and construction of structures to resist loads and peak ground accelerations that could result from earthquakes. In addition, Municipal Code section 15.01.210 (implementing the CBC) requires that a site-specific soil engineering report be prepared to include appropriate subsurface exploration, laboratory testing, and engineering analysis necessary to provide specific foundation, floor slab, and grading recommendations that include considerations for type of occupancy, building structural system, and height and that are required to be incorporated into grading plans and specifications as a condition of approval for each building site. Deep foundation systems would be required for most structures over 3 stories in height to ensure they are founded on dense competent materials that occur at depth.

In addition, the landfill owner is required to comply with California Code of Regulations (CCR), Title 27, Section 21130(c), which requires the operator to amend emergency response plans should post-closure land use and/or structures on the site change and these changes are not addressed in existing plans.

Significance Conclusion for Impact GEO-2

Because the Specific Plan area is located in a seismically active region, buildings and other structures developed within the Baylands would be at risk of damage related to seismic ground shaking and could directly or indirectly expose people to a risk of loss, injury, or death compared to baseline.

New structures for human occupancy would conform to the seismic design parameters of the CBC, while restoration of the Roundhouse would be subject to California Building Code seismic standards for historic structures. Compliance with these requirements would be reviewed by the City of Brisbane for appropriate inclusion in the building plan check and development review process prior to issuance of grading and building permits. Baylands geotechnical studies

prepared for this EIR (Appendices M.1, M.2) provide recommendations for compliance with CBC standards, state law and building codes, final geotechnical studies for each site-specific development project will define precise requirements for the foundation system for each building site needed for compliance with the CBC based on the site-specific engineering properties of the materials beneath the structure, combined with the intended loading (weight) of the structure itself.

Thus, because each building within the Baylands would comply with CBC requirements as specified in site-specific geotechnical studies, a less than significant impact would result.

c. Impact GEO-3: Liquefaction and Seismic-Related Ground Failure

Methodology for Determining Significance

The analysis of impacts related to risk of loss, injury, or death as the result of liquefaction or seismic-related ground failure (liquefaction-induced ground settlement, lateral spreading, ground lurching) is based on the geotechnical reports prepared for the Baylands in 2022 (see Appendices M.1, M.2). The analysis considers the risk of loss, injury, or death due to liquefaction or seismic-related ground failure that would occur as the result of the Specific Plan increasing the number of people and buildings in locations subject to these conditions. In determining whether a significant impact would result, the analysis reasonably assumes compliance with federal, state, and local laws and requirements, including CBC requirements for new construction and restoration of historic structures, as well as geotechnical report recommendations aimed at minimizing the risks to life and property from liquefaction and seismic-related ground failure.

The CBC covers the requirements of geotechnical investigations; excavation, grading, and fills; and load bearing of soils (Section 1805), as well as foundations (Section 1808), shallow foundations (Section 1809), and deep foundations. The CBC also describes analysis of expansive soils and the determination of the depth to groundwater table. The CBC specifies risk-related screening standards and requirements for analyses of slope instability, liquefaction, and surface rupture attributable to faulting or lateral spreading, plus an evaluation of lateral pressures on basement and retaining walls, liquefaction and soil strength loss, and lateral movement or reduction in foundation soil-bearing capacity. It also addresses specific measures to be considered in structural design, which may include ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements, or any combination of these measures. The potential for liquefaction and soil strength loss must be evaluated for site-specific peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions. Thus, compliance with CBC performance standards as specified in a site-specific geotechnical study would be indicative of a less than significant impact in relation to ground failure and liquefaction.

Impact Assessment

Liquefaction

The Specific Plan area is underlain by Bay Mud that contains saturated sand lenses susceptible to liquefaction. The landfill portion of the site contains buried municipal waste materials that may also be prone to liquefaction during strong ground shaking. Analysis of Baylands soils data determined that liquefaction susceptibility is present throughout the site, within both the former railyard area and the former landfill area (see Appendices M.1, M.2). Liquefaction within the Baylands following a major earthquake could result in loss of bearing pressure, lateral spreading, sand boils (liquefied soil exiting at the ground surface), and other potentially damaging effects if not addressed in the geotechnical engineering design of buildings and infrastructure.

The final design-level geotechnical reports required under the California Building Code would be prepared by a licensed professional and submitted to the City for review and approval. As is standard for the geotechnical industry, the final design-level geotechnical reports for each site-specific development would address the site-specific potential for liquefaction and lateral spreading and provide recommendations for each building and for infrastructure improvements to reduce potential damage in accordance with CBC requirements.

Seismic-Related Ground Failure

Secondary effects of seismic shaking resulting from large earthquakes along the major faults in the Bay Area include lateral spreading and ground lurching.

Lateral Spreading

Lateral spreading is a ground failure condition induced by liquefaction that causes soil to move toward a free face (e.g., a slope along a creek) or down a gentle slope and can cause ground cracking and settlement that may gradually propagate away from the face as blocks continue to break free. Geotechnical studies prepared for the Baylands identified a likely continuous potentially liquefiable sand layer beneath the Young Bay Mud. Because this layer varies from 40 to 90 feet deep, well below the bottom of the adjacent San Francisco Bay at the shoreline along the eastern border of the landfill, the geotechnical study (Appendix M.1) states "the risk of liquefaction-induced lateral spreading is negligible."

Ground Lurching

Lurching is the movement of the ground surface toward an open face (e.g., graded slope, stream bank, or other similar feature) when the soil liquefies. Ground lurching can cause surface cracks to form, with the potential for such cracks being greater at contacts between deep alluvium and bedrock. The geotechnical studies prepared for the Baylands (Appendices M.1, M.2) state that ground lurching, while possible based on the Baylands location within the Bay Area, would be minor.

Significance Conclusion for Impact GEO-3

Because of the presence of high groundwater and loose, unconsolidated soils underlying the Specific Plan area, which is located in a seismically active region, liquefaction could occur within the Baylands, adversely affecting structures. As documented in the geotechnical studies prepared for the Baylands in 2022 (Appendices M.1, M.2), a substantial risk of loss, injury, or death by exposing people or structures to secondary effects of seismic shaking (e.g., ground lurching, lateral spreading) would not result from Baylands development. Nevertheless, due to the presence of high groundwater and loose, unconsolidated soils underlying the project site, liquefaction within the Baylands following a major earthquake could result in loss of bearing pressure, lateral spreading, sand boils (liquefied soil exiting at the ground surface), and other potentially damaging effects if not addressed in geotechnical engineering design of buildings and infrastructure.

Baylands development would be required to conform to site-specific foundation design parameters required for compliance with the CBC (Municipal Code Sections 15.01.210, Soils Engineering Report and 15.01.220, Engineering Geology Report), which are reviewed by the City of Brisbane for appropriate inclusion in the building plan check and development review process prior to issuance of grading and building permits.

Site-specific geotechnical analyses building upon the information provided in the geotechnical studies prepared for the Baylands in 2022 would identify the specific seismic and foundation design parameters and monitoring to be required by the City for Baylands development to comply with the CBC based on site-specific geotechnical conditions and the precise location, height, massing, and bulk of each future building within the Baylands.

Thus, impacts would be less than significant.

d. Impact GEO-4: Slope Stability

Methodology for Determining Significance

The analysis of impacts related to risk of loss, injury, or death as the result of on-site or off-site landslides is based on the geotechnical reports prepared for the Baylands in 2022 (Appendix M.1 and M.2), as well as 2008 studies by Geosyntec and Treadwell & Rollo, Inc. that were cited in the Program EIR. The analysis considers the risk of loss, injury, or death due to on- or off-site landslide that would result from the proposed Specific Plan increasing the number of people and buildings that may be subject to such hazards. In determining whether a significant impact would result from the Specific Plan, the analysis reasonably assumes grading and new construction would comply with CBC requirements, which are aimed at minimizing slope-stability hazards to life and property.

Impact Assessment

Baylands development would require substantial grading that would create manufactured slopes of fill materials along the Geneva Avenue extension and in other locations such as along Icehouse Hill trails where cut slopes will also be constructed. These constructed slopes have the potential for slope failure, which could damage proposed improvements or cause physical injury to Baylands residents, workers, or visitors.

Geotechnical analyses prepared for the Baylands in 2008 concluded that the placement of engineered fill could cause underlying Bay Mud to fail as the result of substantial additional loading. Geosyntec (2008) conducted slope-stability analysis for the former landfill area on a cross-section extending from the edge of the Brisbane Lagoon approximately 1,000 feet toward the north. The analysis showed that the extent of possible slope instability is estimated to extend from the edge of the Brisbane Lagoon north approximately 600 feet, increasing from 480 feet for existing conditions. Geosyntec (2006, 2008) recommended that fill not be placed within 600 feet of the edge of the Brisbane Lagoon[344] and that the stability of the area be re-evaluated once final designs are available. The Baylands Specific Plan proposes placement of fill on existing rip rap along the north shore of the lagoon to facilitate habitat restoration, along with grading to construct Lagoon Park and its habitat enhancements and recreational features. The placement of such fill within 600 feet of the edge of the lagoon would be less than 10 feet deep.

Although not specifically analyzed in current Baylands geotechnical analyses, given that soils would be potentially unstable under static conditions, they would also likely be unstable under dynamic conditions.

Significance Conclusion for Impact GEO-4

Site-specific development projects would comply with Brisbane General Plan policy requirements and the most recent California Building Code requirements for slope stability of manufactured slopes. All final design and engineering plans submitted for Baylands development would be subject to review and approval by the City of Brisbane Building Official prior to issuance of a grading or building permit.

Although manufactured slopes constructed as part of Baylands development would be required to comply with the most recent California Building Code requirements at the time of construction to ensure the stability of existing and manufactured slopes under static and pseudo-static conditions, placement of fill within 600 feet of the north shore of the lagoon would be inconsistent with recommendations of the 2008 geotechnical study prepared for the Baylands and Program EIR Mitigation Measure 4.E-4a and would therefore risk causing instability in the Bay Mud that underlies this area.

[344] The recommendation was included in Program EIR Mitigation Measure 4.E-4a.

Impact GEO-4 would therefore be significant.

Program EIR Mitigation Measures

MM GEO-4a: Manufactured Slopes (Program EIR Mitigation Measure 4.E-4a). Site-specific development projects within the Baylands shall not place new fill materials within 600 feet of Brisbane Lagoon, except when required for roadway improvements, habitat enhancement, recreational facilities, or other site improvements permitted by the Specific Plan. Placement of new fill materials within 600 feet of the Brisbane Lagoon shall be designed to prevent erosion of soils into the lagoon during and subsequent to construction. All manufactured slopes shall require certification by a licensed geotechnical engineer to the satisfaction of the City Engineer that a factor of safety of at least 1.5 for static conditions and 1.2 under dynamic conditions will be achieved.

Significance Conclusion with Implementation of Program EIR Mitigation Measures

Implementation of Mitigation Measure MM GEO-4a (Program EIR Mitigation Measure 4.E-4a) would ensure the stability of manufactured slopes throughout the Baylands. While Mitigation Measure MM GEO-4a exempts roadway improvements, habitat enhancement, recreational facilities, or other approved site improvements from the prohibition on placement of fills within 600 feet of the lagoon because such fills were anticipated to be relative shallow, such fills may still adversely affect the stability of underlying Bay Mud. A significant impact would remain.

Additional Mitigation Measures

MM GEO-4b: Placement of Fill Materials within 600 Feet of the Brisbane Lagoon. Placement of fill materials within 600 feet of the Brisbane Lagoon for roadway improvements, habitat enhancement, recreational facilities, or other approved site improvements shall require certification by a licensed geotechnical engineer to the satisfaction of the City Engineer that the stability of underlying Bay Mud would not be adversely affected.

Significance Conclusion with Implementation of All Mitigation Measures

The addition of Mitigation Measure MM GEO-4b ensures that placement of fill materials within 600 feet of Brisbane Lagoon for roadway improvements, habitat enhancement, recreational facilities, or other approved site improvements such as construction of Lagoon Park would not adversely affect the stability of underlying Bay Mud. Impact GEO-4 would therefore be reduced to less than significant with implementation of Mitigation Measures MM GEO-4a and MM GEO-4b.

e. Impact GEO-5: Expansive Soils and Soil Corrosivity

Methodology for Determining Significance

Because the Specific Plan area is known to contain corrosive soils, this section analyzes the proposed placement of underground utilities, concrete pilings, and concrete foundations to determine whether concrete or steel elements, including pile foundations, could be damaged by corrosive soils. In addition, because the Young Bay Mud underlying the Baylands has a highly expansive nature, this section analyzes whether a substantial risk of loss, injury, or death would result by exposing structures for human occupancy to expansive soil hazards.

In determining the level of significance, the analysis below reasonably assumes that Specific Plan development would comply with relevant federal, state, and regional laws and regulations, which are designed to reduce soils impacts related to corrosivity and expansiveness as well as with recommendations of geotechnical studies designed to achieve building code compliance (e.g., Appendices M.1, M.2).

Impact Assessment

The Young Bay Mud underlying the site is likely corrosive to metals and concrete due to high clay content and brackish Bay water. Thus, excavations into Bay Mud, such as those along Bayshore Boulevard and during construction of deep foundations, would encounter corrosive and expansive subsurface soils.

Due to its expansive nature and high natural moisture content, Baylands geotechnical studies recommend that Young Bay Mud excavated from the site not be incorporated into soils placed beneath Baylands structures to prevent damage to foundations (Appendix M.1. M.2). Instead, Young Bay Mud would either be removed or used in landscaping areas of the site. In addition, building foundations could be damaged by expansive soils if water is permitted to pond near building foundations or pavement.

Significance Conclusion for Impact GEO-5

Young Bay Mud underlying the Baylands is both expansive and corrosive. Existing state law and building codes provide for an adequate level of safety and the Baylands geotechnical studies prepared for this EIR provide recommendations for compliance with CBC standards, state law, and building codes that will be incorporated into site grading, as well as Baylands building and infrastructure construction. As noted above, the foundation system for each building within the Baylands must be designed in accordance with the site-specific engineering

properties of the soil characteristics beneath the structure and the specific loading characteristics of the building itself. Thus, to comply with the CBC:

- All concrete and metals in contact with corrosive soil would be designed and constructed based on the results of the site-specific soil corrosivity testing and subsequent recommendations of a qualified geotechnical engineer as reviewed and approved by the City. Treatment methods include coating, using galvanized metals, or cathodic protection.
- Building foundations and infrastructure in contact with expansive soils would be designed and constructed based on the results of the site-specific soil corrosivity testing and subsequent recommendations of a qualified geotechnical engineer as reviewed and approved by the City. Treatment methods include removal of expansive soils or chemical treatment such the addition of lime.

Impact GEO-5 is therefore less than significant.

f. Impact GEO-6: Paleontological Resources

Methodology for Determining Significance

A formation or rock unit is determined to have paleontological sensitivity based on previous studies of sediment types in the region that contain vertebrate, invertebrate, or plant fossils. Hence, a determination of the potential of paleontological resources to exist is based on the types of soils and rock that underlie a site and the potential for fossils suspected to occur in that unit, because generally the actual existence of fossils cannot be known until excavation for a development project is underway.

The geologic units that could be encountered by Specific Plan development range in their paleontological sensitivity. Most of the surface of the Specific Plan and off-site improvements consist of artificial fill which, by definition, has no potential for paleontological resources as any fossils found in the fill would be out of geological context. According to available geotechnical reports, both fine and coarse fill extend from the surface down to approximately 10 feet below ground surface. Bay Mud exposed at the surface is too young to host significant fossils. Surface exposures of Franciscan Formation sandstone and shale is unlikely to produce significant paleontological resources due to the paucity of known fossils, the lack of significant vertebrate fossils, and the low grade of metamorphism. The Specific Plan crosses exposures of Pleistocene slope and ravine alluvium (Qsr) that range from silt and clay through gravel. Although they are of an age that has a potential for significant Pleistocene vertebrates and contain fine-grained sediments that typically preserve fossils well, the lack of a published record of fossils means the paleontological potential of these deposits is unknown. The Colma and Merced formations have a well-established record of hosting significant marine and terrestrial vertebrates. Based on the

evidence presented in Section 4.15.2h, above, both the Colma and Merced formations are considered of high significance for paleontological resources.

Numerous paleontological studies have developed criteria for the assessment of significance for fossil discoveries. In general, these studies assess fossils as significant if one or more of the following criteria apply:

1. The fossils provide information on the evolutionary relationships and developmental trends among organisms, living or extinct;
2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;
3. The fossils provide data regarding the development of biological communities or interaction between paleobotanical and paleozoological biotas;
4. The fossils demonstrate unusual or spectacular circumstances in the history of life; or
5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

In summary, significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important. Significant fossils can include remains of large to very small aquatic and terrestrial vertebrates or remains of plants and animals previously not represented in certain portions of the stratigraphy. Assemblages of fossils that might aid stratigraphic correlation, particularly those offering data for the interpretation of tectonic events, geomorphologic evolution, and paleoclimatology, are also critically important.

The potential of the Baylands Specific Plan to result in impacts on paleontological resources is based on identification of the rock and soils within areas where ground disturbance and excavations would occur for the Specific Plan. A database search of the holdings of the University of California Museum of Paleontology was undertaken to determine the geologic formations underlying the Baylands and their sensitivity in relation to paleontological resources. Baylands grading, infrastructure, and development plans were reviewed to determine the likelihood of construction activities encountering sensitive geologic formations.

The paleontological assessment undertaken for the Baylands addresses both the Specific Plan area and the maximum extent, both horizontally and vertically, of both direct and indirect potential impacts resulting from Baylands development within the Specific Plan and off-site improvements, including areas of new construction and related activities (e.g., construction staging areas). The vertical extent of this Project Area consists of the maximum depth of ground disturbance anticipated to occur due to Specific Plan development.

Impact Assessment

Potential for Disturbing Paleontological Resources

Surficial and shallow excavations within the Project Area are anticipated to only encounter artificial fill and Holocene Bay muds and silts and would, therefore, not disturb paleontological resources. Similarly, excavations into the Franciscan Formation would not disturb significant paleontological resources as that formation has not demonstrated a sensitivity for significant fossil finds in this area. However, deep excavations for foundational support (greater than approximately 25 to 30 feet bgs) may reach the Pleistocene Colma or Pliocene-Pleistocene Merced formations, which have a high potential to host significant paleontological resources.

Significance Conclusion for Impact GEO-6

Disturbance of paleontological resources within the Colma or Merced formations would result in a significant impact due to their potential for paleontological resources. These formations are more than 25-30 feet below ground surface and the only deep excavations that would be undertaken for Baylands development within these formations would be pile foundation installation. Surficial and shallow excavations, which will make up the majority of ground-disturbing activity, have no potential to encounter or impact paleontological resources. Therefore, it is not likely that paleontological resources would be identified during ground disturbing within the Pleistocene Colma or Pliocene-Pleistocene Merced formations. If an inadvertently identified paleontological resource is damaged during construction, the impact would be significant.

Program EIR Mitigation Measures

No mitigation measures are carried forward from the Program EIR.

Additional Mitigation Measures

MM GEO-6a: Paleontological Resources Awareness Training. Prior to the start of any ground disturbing activities anticipated to exceed 25 feet in depth, the Qualified Paleontologist, or a paleontological specialist under the supervision of the Qualified Paleontologist, shall conduct pre-construction worker paleontological resources sensitivity training. The Qualified Paleontologist, or a paleontological monitor under the supervision of the Qualified Paleontologist, shall contribute to any construction worker paleontological resources sensitivity training either in person or via a training module. The training shall include information on what types of paleontological resources could be encountered during excavations, what to do in case an unanticipated discovery is made by a worker, and laws protecting paleontological resources. All construction personnel shall be

informed of the possibility of encountering fossils and instructed to immediately inform the construction foreman or supervisor if any bones or other potential fossils are unexpectedly unearthed in an area where a paleontological monitor is not present. The Applicant shall ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.

MM GEO-6b: Inadvertent Discovery of Paleontological Resources. If a paleontological resource is discovered during construction, the paleontological monitor shall be empowered to temporarily divert or redirect grading and excavation activities in the area of the exposed resource to facilitate evaluation of the discovery. An appropriate buffer area shall be established by the Qualified Paleontologist around the find where construction activities shall not be allowed to continue. Work shall be allowed to continue outside of the buffer area. At the Qualified Paleontologist's discretion and to reduce any construction delay, the grading and excavation contractor shall assist the Qualified Paleontologist or paleontological monitor in removing rock samples for initial processing and evaluation of the find. All significant fossils shall be collected by the paleontological monitor and/or the Qualified Paleontologist. Collected fossils shall be prepared to the point of identification and catalogued before they are submitted to their final repository. Any fossils collected shall be curated at a public, non-profit institution with a research interest in the materials, such as the UCMP, if such an institution agrees to accept the fossils. If no institution accepts the fossil collection, they shall be donated to a local school in the area for educational purposes. Accompanying notes, maps, photographs, and a technical report shall also be filed at the repository and/or school.

Significance Conclusion for Impact GEO-6 with Implementation of Mitigation Measures

Implementation of Mitigation Measures MM GEO-6a and MM GEO-6b would reduce impacts to paleontological resources to a less-than-significant level by requiring training of construction personnel in paleontological resource identification and requiring a qualified paleontologist to be retained in the event that paleontological resources are identified in order to address any inadvertent discoveries. Mitigation Measure MM GEO-6b requires inadvertent discoveries of fossils to be collected by the paleontological monitor and/or Qualified Paleontologist, who would prepare, identify, and catalogue such discoveries prior to placing such discovered fossils at a public, non-profit institution, or public school for their preservation. While it is highly unlikely that paleontological resources would be found in the landfill or disturbed portions of the Project Area, required awareness training for construction personnel who are involved in ground disturbance in undisturbed areas of the Project Area would facilitate identification of any fossils inadvertently exposed during grading and excavation activities. Impact MM GEO-6 would be less than significant with mitigation incorporated.

g. Impact GEO-7: Use of Septic Tanks or Alternative Wastewater Systems

Methodology for Determining Significance

If use of septic tanks or alternative wastewater disposal systems were to be proposed by the Specific Plan, analysis would be undertaken to determine the suitability of soils for such systems. A significant impact would result should soils be incapable of supporting use of any proposed septic tanks or alternative wastewater disposal systems.

Impact Assessment

The Baylands Specific Plan requires construction of an integrated municipal sewer system to serve all proposed uses. Neither septic tanks nor alternative wastewater disposal systems would be used for Baylands development.

Significance Conclusion for Impact GEO-7

Because the Baylands Specific Plan requires construction of an integrated municipal sewer system to serve all proposed uses, septic systems or other alternative wastewater disposal systems would not be used and no impacts related to the capability of soils to support such wastewater treatment would result.

4.16 UTILITIES, SERVICE SYSTEMS, AND WATER SUPPLY

4.16.1 INTRODUCTION

a. Overview

This section addresses the physical environmental effects associated with construction and operation of Baylands water, wastewater, energy, and telecommunications utilities, as well as solid waste management facilities. This section also addresses water demand, supply, and reliability for the 2025 Specific Plan project.

Because CEQA focuses on physical environmental effects, increased demand for such facilities and services is not considered to be a physical change in the environment. Instead, increased demand for utilities and service systems resulting from Baylands development are analyzed as potential precursors to construction of new or expanded facilities, the physical environmental effects of which are analyzed to determine significance.

Energy consumption and use of renewable energy resources are addressed in Section 4.11, *Energy Resources*. Flood management and drainage facilities are addressed in Section 4.14, *Hydrology and Water Quality*. Seismic safety issues related to Baylands utility facilities are addressed in Section 4.15, *Geology, Soils, and Seismicity*.

b. Definitions

Acre-foot is the volume of water required to cover 1 acre of land (43,560 square feet) to a depth of 1 foot. It is equal to 43,560 cubic feet or 325,851 gallons.

Biofiltration refers to the use of plants and landscaping to capture and biologically degrade pollutants. Capturing harmful chemicals or silt from surface runoff is a common form of biofiltration.

Recycled water is former wastewater (sewage) that is treated to remove solids and impurities to a level that is safe for beneficial uses, such as landscape irrigation.

Zero waste refers to maximizing diversion from landfills and reducing waste at the source, with the ultimate goal of not sending any waste to landfills. Given current technology and waste management practices, achieving at least 90 percent diversion of non-hazardous solid waste from landfill disposal is considered "zero waste."

4.16.2 ENVIRONMENTAL SETTING

a. Potable Water

Existing Water Service Agencies

City of Brisbane

Existing uses within the Baylands and City of Brisbane are served by one of the two water districts operated by the City to provide water to local residents and businesses. The Brisbane Water District serves Central Brisbane, Sierra Point, and the Baylands. The Guadalupe Valley Municipal Improvement District (GVMID) serves Crocker Park and the Northeast Ridge residential development. The City's two water districts are interconnected and are operated together, which allows the City to move water freely across the districts to supplement higher than normal demands in any portion of the City at any given time.

California Water Service Company

California Water Service Company (Cal Water), which is proposed to be the water supply agency for the Baylands, Sierra Point, and Beatty portions of Brisbane, is an investor-owned public utility supplying water service to approximately 1.8 million Californians through over 481,000 connections. Cal Water incorporated in 1926 and has provided potable water service to communities served by the South San Francisco District since 1931, when it purchased the South San Francisco Water Company. The South San Francisco District (District) operates the South San Francisco Public Water System (PWS). The District currently serves the communities of South San Francisco, Colma, a small portion of Daly City and an unincorporated area of San Mateo County known as Broadmoor, which lies between Colma and Daly City.

Cal Water, the City of Brisbane, Bayshore Sanitary District, and Baylands Development, Inc. have signed a non-binding letter of understanding that provides a framework to supply water to the Baylands, Beatty, and Sierra Point areas of Brisbane by expanding its service area into Brisbane. In addition, as discussed in Chapter 3, *Project Description*, expansion of Cal Water's service area is subject to discretionary actions by the San Mateo County Local Agency Formation Commission, California Public Utilities Commission, and San Francisco Public Utilities Commission.

Existing Wholesale Water Supply – San Francisco Public Utilities Commission

The City of Brisbane does not currently have its own groundwater or surface water supplies and purchases all of its potable water from the San Francisco Public Utilities Commission

(SFPUC). The City receives water from SFPUC through five turnouts[345] along SFPUC's Crystal Springs pipeline, under a Water Supply Agreement with SFPUC (EKI 2024).

San Francisco Regional Water System and Supply

SFPUC owns and operates the San Francisco Regional Water System ("Regional Water System") that serves more than 2.7 million residents and businesses in the San Francisco Bay Area (SFPUC 2021). Through its Regional Water System, SFPUC delivers approximately two thirds of its total water supply to wholesale customers,[346] with the remaining one third delivered to retail customers within and outside of San Francisco.

The SFPUC regional water system supply originates predominantly from Sierra Nevada snowmelt, with approximately 85 percent of the regional water supply sourced from the Tuolumne River via Hetch Hetchy Reservoir and aqueducts. The remaining 15 percent consists of treated water that is derived from local watersheds and the San Antonio, Calaveras, Crystal Springs, Pilarcitos, and San Andreas reservoirs (EKI 2024). Treated water from local sources is typically blended with Hetch Hetchy water before it is distributed to customers.

Bay Area Water Supply and Conservation Agency

The Bay Area Water Supply and Conservation Agency (BAWSCA) provides regional water supply planning, resource development, and conservation program services. BAWSCA members include 16 cities, 8 water districts, and 2 private water providers, including Cal Water, that provide water to over 1.8 million people and over 40,000 commercial, industrial and institutional accounts in Alameda, San Mateo, and Santa Clara counties. The City of Brisbane (and its two water districts) is a member of BAWSCA.

The SFPUC sells water to BAWSCA members and other wholesale customers under the terms of a Water Supply Agreement and individual water sales contracts that each of the wholesale customers have with the SFPUC. Since 1970, the SFPUC has supplied approximately 65 percent of the total wholesale customers' demand. Some of the wholesale customers, including Brisbane, are entirely reliant on the SFPUC for their supply (SFPUC 2021).

2018 Water Supply Agreement and Individual Water Sales Contracts

In July 2009, the SFPUC entered into a Water Supply Agreement (2009 Agreement), replacing its expiring predecessor agreement, the 1984 Settlement Agreement and Master Water Sales Contract between the SFPUC and the Wholesale Customers (1984 Agreement). The 2009

[345] Turnouts are structures usually constructed in a water conveyance facility for the purposes of diverting part of the water to a smaller conveyance system.

[346] SFPUC's wholesale customers are located in Alameda, Santa Clara, and San Mateo Counties, and also include the Groveland Community Services District (Groveland CSD) in Tuolumne County and Cordilleras Mutual Water Company in Redwood City.

Agreement, as amended and restated in December 2018, describes the current contractual relationship between the SFPUC and the Wholesale Customers (SFPUC 2021).

The 2009 Agreement carries forward the SFPUC's "Supply Assurance" of 184 million gallons per day (mgd) to the Wholesale Customers from the 1984 Agreement in which the SFPUC has agreed to deliver water to the Wholesale Customers up to the amount of the Supply Assurance. This agreement is perpetual and survives the expiration of the 2009 Agreement. The Supply Assurance is, however, subject to reduction due to water shortage, drought, scheduled regional water supply maintenance activities, and emergencies (SFPUC 2021).

Twenty-three of these 24 Wholesale Customers have an "Individual Supply Guarantee," which represents their dedicated individual share of the overall 184 mgd Supply Assurance.[347] The Individual Supply Guarantees are also perpetual and survive the expiration of the 2009 Agreement. Cal Water's Individual Supply Guarantee is 35.68 mgd, while the City of Brisbane's is 0.98 MGD (SFPUC 2021).

Each of SFPUC's 26 Wholesale Customers also has an individual water sales contract with the SFPUC that describes the wholesale customer's service area, location, and size of service connections between the regional water system and the customer's distribution systems, and in some instances additional specific provisions unique to the particular customer. The individual water sales contracts may be amended from time to time by the SFPUC and the applicable Wholesale Customers pursuant to the terms of the Water Supply Agreement (SFPUC 2021).

Water System Improvement Program

In October 2008, the SFPUC adopted Resolution No. 08-200, an extensive $4.8 billion Water System Improvement Program to upgrade the regional water system facilities. SFPUC's 2020 Urban Water Management Plan indicates that this multi-year capital infrastructure program is approximately 96 percent complete (SFPUC 2021). The Water System Improvement Program is intended to ensure the regional water system's ability to meet specified goals and objectives for water quality, seismic reliability, delivery reliability, and water supply. SFPUC's stated goals are to meet customer water needs in non-drought and drought periods (SFPUC 2021). The SFPUC adopted an alternative analyzed in the Program EIR for the WSIP, referred to as the Phased Water System Improvement Program Variant (SFPUC 2021).

[347] The Supply Assurance is shared among 24 of SFPUC's Wholesale Customers, representing all wholesale customers except the cities of San Jose and Santa Clara. The City of Hayward is the 24th Wholesale Customer, and does not have an Individual Supply Guarantee due to the terms of its 1962 individual water supply contract with the SFPUC that did not contain a fixed allocation of water. Hayward's unspecified water supply allocation is included as the difference between overall 184 mgd Supply Assurance and the sum of the other 23 Wholesale Customers' Individual Supply Guarantees. In the event that Hayward's water use exceeds its unspecified water supply allocation, the 23 Wholesale Customers with Individual Supply Guarantees would be required to reduce their Individual Supply Guarantees to accommodate Hayward's water demand.

The Phased Water System Improvement Program Variant includes the following water supply elements:

- Cap on regional water system deliveries at 265 mgd annual average, referred to as the "Interim Supply Limitation." This includes 184 mgd for the Wholesale Customers and 81 mgd for retail customers.
- Water supply sources include 265 mgd average annual from the regional water system and 20 mgd of water conservation, recycled water, and local groundwater developed within the SFPUC's service area (10 mgd in the retail service area and 10 mgd in the wholesale service area).
- Water supply projects to meet dry-year demands with no greater than 20 percent system-wide rationing in any one year.
- Reevaluation of 2030 demand projections, potential regional water system purchase requests, and water supply options by December 31, 2018, and a separate SFPUC decision no later than 2018 regarding regional water system future water deliveries after 2018. Per the SFPUC 2020 Urban Water Management Plan, this process has been postponed to 2028 to allow for the necessary supply assessments and environmental review (SFPUC 2021).

Existing and Projected Water Demand

Existing Regional Water Demand

In 2020, the SFPUC delivered approximately 198 mgd of regional water system supplies to its entire water service area, with an additional 2.3 mgd in local groundwater and recycled water provided to retail customers. Of the 198 mgd, 132 mgd was delivered to wholesale customers, 65 mgd to in-city retail customers, and 4 mgd to suburban retail customers (SFPUC 2021).

Existing Brisbane Water Demand

Historical annual water demand in Brisbane between 2000 and 2021 was approximately 232.6 million gallons (mg), reaching a peak of 264 mg in 2018, and declining to 220 mg in 2021, which reflects conservation efforts during the most recent drought.

The total existing annual water use provided by the City to the Baylands and proposed Cal Water Brisbane water service area is summarized in **Table 4.16-1**, based on actual water use from 2019 to 2023.

Table 4.16-1: Water Use Supplied by the City of Brisbane to the Area Proposed to Be Served by Cal Water (acre-feet per year)

Location	2019	2020	2021	2022	2023	Average
Baylands	1.49	1.68	1.80	1.50	1.52	1.60
Sierra Point	101.09	113.45	102.22	105.93	123.38	108.58
TOTAL WATER DEMAND	**102.58**	**115.13**	**104.02**	**107.43**	**124.90**	**110.17**

SOURCE: Brisbane Public Works, 2025

Water supply provided by Cal Water to its expanded service area within Brisbane would use a combination of potable water purchased from the SFPUC supplemented by five existing off-site groundwater wells and recycled water from the water recycling facility to be constructed within the Baylands. Cal Water potable supplies would be delivered via existing turnouts from the SFPUC Regional Water System. **Table 4.16-2** summarizes existing and projected future water demand within the Baylands, Beatty, and Sierra Point areas that are proposed to be served by Cal Water.

Table 4.16-2: Existing and Projected Potable Water Demand for the Portions of Brisbane Proposed to Be Served by Cal Water

	Existing		Projected Year 2045 (Baylands Specific Plan Buildout)		Change	
	MGD	AFY	MGD	AFY	MGD	AFY
Baylands Specific Plan Area:	0.018	21.0	1.03	1,149.0	+1.012	+1,128.0

MGD = million gallons per day; AFY = acre-feet per year

BAWSCA's Long-Term Reliable Water Supply Strategy

BAWSCA's Long-Term Reliable Water Supply Strategy Phase II Final Report (BAWSCA Strategy), completed in 2015, does not project a regional need for additional water supplies to meet normal year demands through 2040 (not including full Baylands buildout). However, the BAWSCA Strategy identifies reliability shortfalls on the regional water system of up to 43 mgd in dry years during the same planning period, resulting in system-wide regional water system supply cutbacks of up to 20 percent. The BAWSCA Strategy identifies nine specific projects, which, if all were successfully implemented, would effectively meet the 43 mgd dry year supply need (BAWSCA 2015, 2022).

The BAWSCA Strategy identifies recommended actions to maximize the likelihood that its member agencies could provide water when and where it is needed, including leading water

transfer development and implementation and identifying and evaluating water storage options (BAWSCA 2022).

b. Water Facilities

Regional Facilities

The SFPUC regional water system supplies drinking water from the Tuolumne River watershed and from local reservoirs in the Alameda and Peninsula watersheds. The regional water system draws an average of 85 percent of its supply from the Tuolumne River watershed, which is collected in Hetch Hetchy Reservoir in Yosemite National Park.

This water feeds into an aqueduct system delivering water 167 miles by gravity to Bay Area reservoirs and customers. SFPUC draws the remaining 15 percent of its regional water system supply from local surface waters in the Alameda and Peninsula watersheds. The split between these resources varies from year to year depending on the water year hydrology and operational circumstances. During dry years, the water received from the Hetch Hetchy System can amount to over 90 percent of the total water delivered (SFPUC 2021).

The Hetch Hetchy Project, also referred to as the Hetch Hetchy Regional Water System, is generally composed of the reservoirs, hydroelectric generation and transmission facilities, and water transmission facilities from the Hetch Hetchy Valley west to the Alameda East Portal of the Coast Range Tunnel in Sunol Valley. In the Hetch Hetchy System, water is diverted from Hetch Hetchy Reservoir into a series of tunnels and aqueducts from the Sierra Nevada to the San Joaquin Pipelines that cross the San Joaquin Valley to the Coast Range Tunnel, which connects to the Alameda System at the Alameda East Portal (SFPUC 2021). Local watershed facilities are operated to conserve local runoff for delivery and to maintain enough stored water to meet demands in the event of an emergency that affects the supply of water.

Regional Water Treatment

The Hetch Hetchy Reservoir is the largest unfiltered water supply on the west coast, and one of only a few large unfiltered municipal water supplies in the nation. The water originates from well-protected wilderness areas in Yosemite National Park, which flows down the Tuolumne River to Hetch Hetchy Reservoir. This water meets or exceeds all federal and state criteria for watershed protection. Water from Hetch Hetchy Reservoir is protected in pipes and tunnels as it is conveyed to the Bay Area and requires pH adjustment to control pipeline corrosion and disinfection for bacteria control. Based on the SFPUC's disinfection treatment practice, extensive bacteriological quality monitoring, and high operational standards, the U.S. Environmental Protection Agency (USEPA) and the SWRCB Division of Drinking Water determined that the Hetch Hetchy water source meets federal and state drinking water quality requirements without the need for filtration (SFPUC 2021).

A USEPA regulation that took effect in 2012 requires secondary disinfection for all unfiltered drinking water systems to control the waterborne parasite cryptosporidium. To comply with this regulation, the SFPUC completed construction of a new ultraviolet (UV) treatment facility. The Tesla Treatment Facility is a key component of SFPUC's Water System Improvement Program and enhances the high-quality water from the regional water system. The facility has a capacity of 315 mgd, making it the third largest UV drinking water disinfection facility in the nation (SFPUC 2021).

Regional Water Storage

The amount of water available to the SFPUC at any given time is determined by hydrology, physical facilities, and the institutional parameters that allocate the water supply of the Tuolumne River. During dry years, only a small share of the Tuolumne River supply may be available to the SFPUC, and the local watersheds produce very little water. Reservoir storage is critical during drought cycles because it enables the SFPUC to carry over water supply from wet years to dry years (SFPUC 2021).

Three major reservoirs collect runoff: Hetch Hetchy Reservoir, Lake Lloyd (a.k.a. Cherry Lake), and Lake Eleanor. A "water bank" in New Don Pedro Reservoir is also integrated into regional water system operations. New Don Pedro Reservoir, which is jointly owned and operated by Modesto Irrigation District and Turlock Irrigation District, is located on the Tuolumne River downstream of the Hetch Hetchy System. Normally, only Hetch Hetchy Reservoir water supplies are exported to the Bay Area (SFPUC 2021).

Downstream of the Hetch Hetchy System, the SFPUC uses local watersheds in the Bay Area. Crystal Springs, San Andreas, and Pilarcitos Reservoirs, which are all located in San Mateo County, capture local runoff in the Peninsula watershed, and Calaveras and San Antonio Reservoirs, which are located in Alameda Country, capture local runoff in the Alameda watershed. In addition to capturing local runoff, San Andreas, San Antonio, and Crystal Springs Reservoirs also provide storage for water from the Hetch Hetchy System and, along with Calaveras Reservoir, are an important water supply in the event of an interruption to Hetch Hetchy System deliveries (SFPUC 2021).

Existing City of Brisbane Water System

The citywide water distribution system includes about 25 miles of water mains ranging in diameter from 6 to 16 inches. The system is designed to have the capacity to deliver water at a residual pressure of 50 pounds per square inch gage (psig) during peak-hour demand where technically and economically feasible and at least 35 psig. The system is also designed to maintain at least 20 psig during maximum-day demand coincident with a fire flow. The distribution system is in good condition.

Existing Cal Water System

Cal Water's South San Francisco District, which delivers potable water to residential, commercial, industrial, and governmental customers, operates five groundwater wells, 12 storage tanks, 21 booster pumps, and 144 miles of pipeline to deliver roughly six million gallons of water per day to more than 16,000 service connections.

c. Wastewater System

The City of Brisbane provides sanitary sewer collection services to approximately 3,600 residents, several commercial areas, and some light industrial development in the Bayshore, Central Brisbane, Crocker Industrial Park, Guadalupe Canyon, and Sierra Point areas of Brisbane. Wastewater collection services within the Baylands are provided by the Bayshore Sanitary District (BSD). BSD's service area also includes Daly City and parts of Brisbane outside of the Baylands. Both the City and BSD contract with the SFPUC for wastewater treatment.

Existing Collection System

Bayshore Sanitary District Wastewater Collection System

The oldest BSD lines in service date back to 1925, are located along Geneva Avenue and Tunnel Avenue, and are still serviceable. The majority of BSD sewer lines are much newer, with only 24 percent of the sewer lines over 50 years old. The older lines are predominately vitrified clay pipe (VCP), and the newer lines are poly-vinyl chloride (PVC) pipe. Current District standards specify PVC AWWA C900 for both the mainline and laterals (BSD 2021).

Flows from Daly City and the Baylands are collected through a system of gravity pipes and force mains at the BSD Industrial Way lift station, which is located near the intersection of Bayshore Boulevard and Industrial Way. From the Industrial Way lift station, wastewater is pumped to the SFPUC's 78-inch combined storm and wastewater main in Sunnydale Avenue and then flows by gravity under US Highway 101 to the Harney Way 20'x30' Box Storage Culvert and Sunnydale lift station. Flow is then conveyed through a series of conduits, tunnels, and lift stations, eventually arriving at SFPUC's Southeast Treatment Plant for treatment (BKF 2022).

City of Brisbane Wastewater Collection System

The City of Brisbane wastewater collection system serves approximately 3,600 residents, several commercial areas, and some light industrial development in the Bayshore, Central Brisbane, Crocker Industrial Park, Guadalupe Canyon, and Sierra Point areas of Brisbane. A series of gravity collection system mains and smaller pumping stations convey most of the wastewater flow to the Valley Drive Pump Station, located near the corner of Bayshore Boulevard and Valley Drive. At the Valley Drive pump station, flow is conveyed north along Bayshore Boulevard through a series of 12-inch and 16-inch force mains to the same 78-inch combined

storm and wastewater main in Sunnydale Avenue as BSD sewage flows. City of Brisbane sewage is also treated at SFPUC's Southeast Treatment Plant.

Existing Baylands Specific Plan Area Sewer Facilities

There are existing sanitary sewer lines serving the Industrial Way buildings and other buildings within the Baylands west of the Caltrain right-of-way. The location of these existing facilities are outside of the Specific Plan's planned roadway system and do not have adequate capacity to handle projected Baylands sewage generation (BKF 2022). Existing sewer lines will, therefore, be removed to make way and provide service for future development.

Sewage from the existing Kinder Morgan Tank Farm is pumped from a small lift station within the property through a 4-inch force main to an existing 21-inch BSD line within Tunnel Avenue. From the sewer main in Tunnel Avenue, sanitary sewer flow is conveyed to the 78-inch SFPUC combined storm and wastewater main in Sunnydale Avenue and then to the Southeast Treatment Plant for treatment (BKF 2022).

Wastewater Treatment by SFPUC

Southeast Treatment Plant

Located in the Bayview District of southeastern San Francisco, the Southeast Treatment Plant is a 250-mgd pure-oxygen activated-sludge treatment facility that provides secondary treatment and serves municipal and industrial customers on the east side of San Francisco, as well as Brisbane and the BSD. The treatment plant was originally constructed in 1952 and subsequently upgraded several times. The Southeast Treatment Plant is part of San Francisco's combined sewer system, which allows the collection and treatment of both wastewater and stormwater (SFPUC 2010) in a single system. The wastewater treated at the Southeast Treatment Plant is discharged to San Francisco Bay through two outfalls (SFPUC 2010).

The Southeast Treatment Plant treats 57 mgd of wastewater, handling 160 wet tons of biosolids each day. During rainstorms, the plant can treat up to 250 mgd (100 mgd of primary treatment and 150 mgd of secondary treatment) of wastewater (Tuser 2020). The Plant has a daily dry weather flow average design capacity of 85 mgd, a peak hour design capacity of 142 mgd, and can treat up to 250 mgd (100 mgd of primary treatment and 150 mgd of secondary treatment) of wet weather flows (SFPUC 2010). The current average daily dry weather flow is approximately 60 mgd, which accounts for approximately 70 percent of its available dry weather flow capacity (BKF 2022).

In response to the need to modernize aging wastewater infrastructure, the SFPUC launched a multi-billion-dollar Sewer System Improvement Program. The SFPUC is upgrading its Southeast Treatment Plant to address earthquake preparedness, sea-level rise, and operational efficiency, as well as to reduce odors and improve the quality of life for nearby residents and

employees. Two of the largest projects, the Biosolids Digester Facilities Project and New Headworks Facility Project, are currently under construction. The Biosolids Digester Facilities Project will replace and relocate the existing (and outdated) solids treatment facilities with more reliable, efficient, and modern technologies and facilities (SFPUC 2024a). The existing 35-year old Headworks facility is at the end of its useful life and is being replaced with a new Headworks facility, upgrades to the Bruce Flynn Pump Station, and an odor control structure (SFPUC 2024b).

North Point Wet Weather Facility

The North Point Wet Weather Facility was commissioned in 1951. In the early 1980's it was connected to the Southeast Treatment Plant through a force main. The North Point Facility is now used as a primary treatment plant for wet weather flows from the northeast portion of the Bayside Watershed (SFPUC 2010a).

The North Point Facility only operates during, and shortly after, significant rainfall events. Its peak hourly treatment capacity is 150 mgd. On average, it operates 30 times per year (450 hours), treating an annual average total flow of 700 million gallons (4 percent of the annual average total citywide wastewater flow) (SFPUC 2010a). The North Point Facility operates when the Southeast Treatment Plant approaches capacity (BKF 2022).

Parallel Combined Sewer Facility

To further reduce the frequency of combined sewer overflows into the Bay and increase system capacity, San Francisco recently constructed a parallel 169-inch combined sewer facility along the San Francisco - San Mateo County line directly north of the Baylands (BKF 2022).

City of Brisbane Dry Weather Sewer Discharges

Under its current contract with SFPUC, the City of Brisbane is allowed to convey up to 6.0 mgd of dry weather sewer discharges to the Southeast Treatment Plant. As identified in the 2017 City of Brisbane Sanitary Sewer System Master Plan (2017 SSMP) by Erler and Kalinowski, Inc. (EKI), current discharges for dry weather and wet weather conditions are approximately 0.72 mgd and 3.6 mgd, respectively (BKF 2022).

The BSD's contract with the SFPUC does not have a set treatment capacity allocation at the Southeast Treatment Plant based on its current contract. The established BSD protocol has been for BSD to notify Southeast Treatment Plant staff and confirm that capacity is available for projects generating a demand greater than 200,000 gallons per day (gpd) (BKF 2022).

d. Non-Hazardous Solid Waste

Solid Waste Service Agencies

Recology San Francisco provides solid waste collection and recycling services for the Specific Plan area. The South San Francisco Scavenger Company serves other portions of Brisbane.

Recology San Francisco

Recology provides solid waste collection, recycling, and disposal services for residential and commercial customers in San Francisco and the Baylands through a three-cart collection program that requires, under San Francisco's Mandatory Recycling and Composting Ordinance, customers to sort solid waste into recyclables; compostable items, such as food scraps and yard trimmings; and garbage.

Materials are collected and hauled to the Recology transfer station/recycling center on Tunnel Avenue, adjacent to the Baylands' northerly boundary. The 60-acre transfer facility sorts and consolidates waste streams for diversion programs and subsequent transport to other facilities. The facility currently achieves a 75 percent diversion rate for construction and demolition waste.

The 126-acre Blossom Valley Organics facility processes in excess of 700,000 tons of food scraps, plant trimmings, food-soiled fiber products, and other organic materials annually for compost.

Recycle Central at Pier 96 processes up to 700 tons of waste daily, achieving an estimated 80 percent recovery rate with less than 2 percent contamination. Recyclable materials are sent to the Recycling Center at Pier 96 in San Francisco, where they are separated and sold to manufacturers that turn the materials into new products.

Solid waste generated in San Francisco that is not recycled is hauled to Recology's Hay Road Landfill in Solano County. The Hay Road Landfill is permitted by Solano County and the California Department of Resources Recycling and Recovery (CalRecycle) to accept up to 2,400 tons per day of municipal solid waste for disposal. The Hay Road Landfill has an anticipated closing date of January 1, 2077.

South San Francisco Scavenger Company

Waste collected by South San Francisco Scavenger Company is transported to the Blue Line Transfer Incorporated Public Disposal and Recycling Facility for sorting and processing. The Blue Line Facility, which is located in South San Francisco, has a permitted capacity of 2,400 tons of waste per day and an average daily throughput of 1,200 tons a day (CalRecycle 2022d).

Existing Waste Diversion

Recology San Francisco

Recology San Francisco collects and processes all residential and commercial waste, along with recycling and composting through its subsidiaries: San Francisco Recycling and Disposal, Golden Gate Disposal and Recycling, and Sunset Scavenger. All materials are taken to the San Francisco Solid Waste Transfer and Recycling Center where they are sorted for transport to composting and recycling facilities and the Hay Road Landfill in Solano County.

In 2018, the City and County of San Francisco updated its waste reduction targets, which included reducing the amount of municipal solid waste by 15 percent by 2030 and reducing landfill disposal and incineration by 50 percent by 2030. In 2023, Recology disposed of 520,749 tons of solid waste generated in San Francisco, a 20.6 percent reduction from the 656,267 tons of solid waste generated in San Francisco disposed of at landfills in 2018 (CalRecycle 2024b).

City of Brisbane

Brisbane, in cooperation with waste haulers, provides services and programs that have resulted in 76 percent of the waste generated by residents and businesses being diverted from landfills, exceeding the state's goal of 75 percent waste diversion by 2020 (City of Brisbane 2024c). In 2020, Brisbane had approximately 49 different waste diversion programs in effect to reduce waste generation, including composting, recycling, and public education programs (CalRecycle 2022b).

As discussed above in Section 4.16.3 *State Plans, Policies, and Regulations*, since the implementation of the revised diversion measurement system under SB 1016, the City of Brisbane has achieved compliance by remaining below the calculated per capita disposal target set by the state. According to CalRecycle, the City of Brisbane has a per resident disposal rate target of 16.9 pounds/person/day and a per employee disposal rate target of 7.9 pounds/person/day. The most recent approved data (2023) from CalRecycle for the City of Brisbane identified the annual per capita disposal rate per resident as 12.6 pounds/person/day. The annual per capita disposal rate per employee was 6.9 (CalRecycle 2024).

Landfill Capacity

Brisbane's overall landfill waste stream disposal was 6,719 tons in 2020, 8,245 tons in 2019, and 6,896 tons in 2018 (CalRecycle 2024a). In 2019, solid waste from Brisbane was sent to the Altamont Landfill & Resource Recovery, Corinda Los Trancos Landfill (Ox Mountain), Potrero Hills Landfill, Recology Hay Road, Recology Ostrom Road LF Inco, Vasco Road Sanitary Landfill, and Zanker Material Processing Facility (CalRecycle 2024a.) Total capacity of those landfills is shown in **Table 4.16-3**.

e. Communications Infrastructure

Existing telecommunications facilities within and adjacent to the Baylands serve the few existing facilities within the Baylands. Removal and replacement of existing telecommunications facilities is anticipated as part of Baylands development based on the large-scale demands of Specific Plan development compared to existing Baylands development (BKF 2023).

f. Kinder Morgan Tank Farm Jet Fuel Infrastructure

An existing high-pressure liquid gas line conveys jet fuel from the Kinder Morgan Tank Farm to the San Francisco Airport. This fuel line runs from the tank farm along an alignment parallel to the north side of the Brisbane Lagoon to US Highway 101.

Table 4.16-3: Landfills and Processing Facilities Receiving Solid Waste from the City of Brisbane

Name	Location (County)	Total Permitted Capacity (million cubic yards)	Total Estimated Capacity Used (million cu. yards) (% of total)	Remaining Estimated Capacity (million cubic yards) (% of total)	Estimated Closure Date	Permitted Maximum Disposal (tons/day)
LANDFILLS						
Recology						
Hay Road	Solano	37.0	6.6 (18%)	30,433,000	1/1/2077	2,400
Ostrom Road	Yuba	43.5	4.2 (10%)	39,223,000	12/31/2066	3,000
Other						
Altamont Landfill & Resource Recovery	Alameda	124.4	59.0 (47%)	65,400,000	12/1/2070	11,150
Corinda Los Trancos (Ox Mountain)	San Mateo	60.5	38.3 (63%)	22,180,000	1/1/2034	3,598
Potrero Hills	Solano	83.1	69.2 (83%)	13,872,000	2/14/2048	4,330
Vasco Road	Alameda	40.2	35.2 (88%)	5,010,000	12/31/2051	2,518
PROCESSING FACILITIES						
Zanker Material Processing Facility	Santa Clara	0.64	N/A	N/A	11/1/2025	350
TOTAL		**382,077,231**		**179,127,000**		**27,346**

NOTES: Landfills identified in **bold type** received the majority of solid waste from City of Brisbane in 2019.

4.16.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

Safe Drinking Water Act

The Safe Drinking Water Act gives the United States Environmental Protection Agency (USEPA) the authority to set drinking water standards for public water systems that provide water for human consumption through at least 15 service connections or regularly serve at least 25 individuals. There are two categories of drinking water standards: the National Primary Drinking Water Regulations (Primary Standards) and the National Secondary Drinking Water Regulations (Secondary Standards). Primary Standards protect drinking water quality by limiting the levels of specific contaminants that can adversely affect public health and are known or anticipated to occur in water. The Act protects against both naturally occurring and human-made contaminants in drinking water and requires that information on the quality of drinking water be made available to the public.

Within California, the Department of Health Services (DHS) implements the requirements of the Act and oversees public water system quality state-wide in accordance with federal and state standards.

Resource Conservation and Recovery Act

At the federal level, the USEPA regulates the management of non-hazardous solid waste according to the Resource Conservation and Recovery Act (RCRA), Subtitle D. Subtitle D establishes state and local governments as the primary planning, regulating, and implementing agencies for management of non-hazardous solid waste. The USEPA provides these governments with information, guidance, and policies to promote recycling, waste reduction, and safe handling of solid waste. As required by RCRA, the USEPA has developed federal criteria for the design and operation of municipal solid waste landfills and other disposal facilities, which have since been adopted by most states, including California.

b. State Laws, Plans, Programs, and Regulations

Municipal and Special District Service Area Boundaries

Cortese–Knox–Hertzberg Local Government Reorganization Act

The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000 establishes procedures for local government changes of organization, including city incorporations, annexations to a city or special district, city and special district consolidations, and special district service areas. Local Agency Formation Commissions (LAFCOs) have been established in

all 58 counties pursuant to this act with the authority to approve boundary changes and to adopt spheres of influence for local cities and special districts.

LAFCOs' regulatory powers are outlined in California Government Code Sections 56375 and 56133, and include approving, establishing, expanding, reorganizing, and, in limited circumstances, dissolving cities and special districts. LAFCOs are also responsible for approving service extensions outside a city's or special district's service area by contract or agreement.

LAFCOs' planning responsibilities are explicit to informing their regulatory powers and highlighted by establishing spheres of influence for all cities and special districts. Spheres of influence indicate the territory that the LAFCO independently believes represents the appropriate and probable future jurisdictional boundary and service area of each city and special district. All jurisdictional boundary changes and outside service extensions, notably, must be consistent with the agency's spheres of influence, with limited exceptions.

Potable Water Supply and Facilities

California Urban Water Management Planning Act (Water Code Section 10610)

Section 10610 of the California Water Code requires urban water suppliers to initiate planning strategies to ensure an appropriate level of water service reliability. Every urban water supplier that provides water to 3,000 or more customers, or that annually provides more than 3,000 acre-feet (AF) of water service, should make every effort to ensure the appropriate level of reliability in its water service to meet the needs of its various categories of customers during normal, dry, and multiple-dry years. The Act describes the contents of Urban Water Management Plans as well as methods for urban water suppliers to adopt and implement the plans.

Because the City of Brisbane has only approximately 2,040 service connections and supplies less than 3,000 acre-feet of water annually, it does not meet the definition of "Urban Water Supplier" and it is not required to complete an Urban Water Management Plan.

Cal Water adopted its 2020 Urban Water Management Plan for the South San Francisco District in June 2021. Because it did not anticipate expanding its service area into Brisbane at the time it was written, Cal Water's 2020 Urban Water Management Plan did not anticipate future water demand within the City of Brisbane.

SFPUC adopted its 2020 Urban Water Management Plan in June 2021. SFPUC's 2020 Urban Water Management Plan extrapolated data to estimate future water demand for the City of Brisbane through 2045.

Water Shortage Contingency Plans

California Water Code Section 10632 requires that every urban water supplier prepare and adopt a water shortage contingency plan as part of its Urban Water Management Plan. Section 10632.2 provides that, "An urban water supplier shall follow, where feasible and appropriate, the prescribed procedures and implement determined shortage response actions in its water shortage contingency plan … or reasonable alternative actions, provided that descriptions of the alternative actions are submitted with the annual water shortage assessment report pursuant to Section 10632.1." Notwithstanding, the California Water Code does not prohibit an urban water supplier from taking actions not specified in its water shortage contingency plan, if needed, without having to formally amend its urban water management plan or water shortage contingency plan. The City of Brisbane adopted a Water Shortage Contingency plan in September 2014. Cal Water's adopted Water Shortage Contingency Plan is presented as Appendix L of its 2020 Urban Water Management Plan. SFPUC adopted its 2020 Water Shortage Contingency along with its 2020 Urban Water Management Plan in June 2021.

Water Supply Assessment and Water Supply Verification

Senate Bill 610

Senate Bill (SB) 610 requires public urban water suppliers with 3,000 or more service connections to identify existing and planned sources of water for planned developments of a certain size. It further requires the public water system to prepare a specified Water Supply Assessment for the following types of projects:

- A proposed residential development of more than 500 dwelling units;
- A proposed shopping center employing more than 1,000 persons or having more than 500,000 square feet of floor space;
- A commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- A hotel or motel, or both, with more than 500 rooms;
- An industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 sf of floor area; or
- A mixed-use project that includes one or more of the projects above.

A Water Supply Assessment must address existing water demand and future water demand by the project and must ensure that water is available for the project during normal years, a single dry year, and multiple dry years during a 20-year future projection period. The Water Supply Assessment must also describe whether the project's water demand is accounted for in the water supplier's Urban Water Management Plan. Supplies of water for future use must be

documented in the Water Supply Assessment. Because the Specific Plan area meets several of these criteria, a water supply assessment was completed for the EIR in 2024, according to the requirements of SB 610. Water supply for the Baylands is proposed to be provided by Cal Water. The water supply assessment was completed Cal Water and is included as **Appendix P** to this EIR.

Senate Bill 221

SB 221 requires the local water provider to provide "written verification" of "sufficient water supplies" to serve proposed development projects. SB 221 applies to residential projects of 500 units or more (infill or low-income or very-low-income housing subdivisions are exempt) and requires the land use planning agency to include as a condition of approval of a tentative map, parcel map, or development agreement a requirement that "sufficient water supply" be available. In most cases, the Water Supply Assessment required by SB 610 meets the SB 221 requirement for proof of water supply.

SB 221 differs from SB 610 in that "sufficiency" is determined by also considering the availability of water over the past 20 years, the applicability of any urban water shortage contingency analysis prepared pursuant to Water Code Section 10632, the reduction in water supply allocated to a specific use by an adopted ordinance, and the amount of water that can be reasonably relied upon from other water supply projects, such as conjunctive use, reclaimed water, water conservation, and water transfer.

"Making Water Conservation a California Way of Life" Regulation

In July 2024, the Water Resources Control Board adopted the "Making Water Conservation a California Way of Life" regulation to implement SB 606/AB 1668 annual water use objective requirements. As part of this regulation, urban water suppliers are required to calculate and report their Urban Water Use Objective beginning in January 2024 and every year thereafter. The Urban Water Use Objective is an estimate of efficient urban water use based on the adopted urban water use efficiency standards and local service area characteristics. By January 2027, compliance with the Urban Water Use Objective will be enforced.

The Making Conservation a California Way of Life regulation establishes agency-specific conservation goals for each urban retail water supplier. As part of the regulation, urban retail water suppliers – not individual households or businesses – will be held to "urban water use objectives." The regulation, which can be found at California Code of Regulations, title 23, section 965 et seq., requires urban retail water suppliers to annually calculate and comply with an urban water use objective; carry out commercial, industrial, and institutional performance measures; and provide progress reports.

California Green Building Standards Code

The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as "CALGreen" and establishes minimum mandatory standards as well as voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency, water conservation, material conservation, and interior air quality. The CALGreen standards took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low- and high-rise residential and state-owned buildings and schools and hospitals. The CALGreen 2022 standards became effective on January 1, 2023.

The residential and nonresidential mandatory standards require the following measures that relate to utilities and service systems (24 CCR Part 11):

- Mandatory reduction in indoor water usage through installation of separate submeters or metering devices (for nonresidential uses) and compliance with specified flow rates for water conserving plumbing fixtures and fittings and faucets and fountains.
- Mandatory reduction in outdoor water usage through compliance with a local water efficient landscaping ordinance or the California Department of Water Resources' Model Water Efficient Landscape Ordinance, which ever is more stringent, and installation for recycled water supply systems where available/applicable (for nonresidential uses).
- 65 percent of construction and demolition waste must be diverted from landfills and 100 percent of trees, stumps, rocks, and associated vegetation and soils resulting primarily from land clearing shall be reused or recycled.
- Provide readily accessible areas for recycling that serve the entire building.

CALGreen standards that have been adopted by the City of Brisbane also include voluntary efficiency measures that are provided at two separate tiers and implemented at the discretion of local agencies and applicants. These voluntary measures call for indoor and outdoor water use reduction, higher diversion of construction and demolition waste, further improvement in energy requirements, stricter water conservation, increased percentage of recycled content in building materials, increase in permeable paving, cement reduction, and cool/solar-reflective roofs.

Recycled Water

In California, the Department of Public Health and the State Water Resources Control Board are the primary agencies responsible for regulating the treatment, distribution, and use of recycled water. The main state laws and regulations governing the use of recycled water are described below:

- **California Health and Safety Code (Division 104; Part 12)** requires recycled water pipes installed above or below ground to be colored purple.

- **California Water Code (Division 7; Chapters 2,6, 7, and 22)** establishes recycled water permits to streamline the permitting process for recycled water, prohibits unauthorized discharges of recycled water, and requires the use of recycled water for non-potable purposes whenever suitable recycled water is available. Proposed recycled water projects require submission of an engineering report to the Department of Public Health and State Water Board to describe compliance with California Code of Regulations Title 22 requirements.
- **Title 17 of California Code of Regulations (Division 1; Chapter 5)** sets specific infrastructure standards to prevent contamination of potable water with recycled water.
- **Water Recycling Act of 1991 (Sections 13575–13583)** established a state-wide goal of recycling 1.0 million acre-feet of water annually by the year 2010 and encouraged retail water suppliers to increase the use of recycled water. This was meant to encourage state and local agencies to implement recycled water projects whenever feasible.
- **Recycled Water Policy** includes numeric goals for the use of recycled water, two narrative goals to encourage recycled water use in groundwater-overdrafted and coastal areas, and annual reporting requirements state-wide for the volume of recycled water produced and used as well as the volume of wastewater treated and discharged. The goals include:
    - Increase the use of recycled water from 714,000 acre-feet per year (afy) in 2015 to 1.5 million afy by 2020 and to 2.5 million afy by 2030.
    - Reuse all dry weather direct discharges of treated wastewater to enclosed bays, estuaries, coastal lagoons, and ocean waters that can be viably put to a beneficial use. For the purpose of this goal, treated wastewater does not include discharges necessary to maintain beneficial uses and brine discharges from recycled water facilities or desalination facilities.
    - Maximize the use of recycled water in areas where groundwater supplies are in a state of overdraft, to the extent that downstream water rights, instream flow requirements, and public trust resources are protected.
- **SBDDW-22-001 Regulations for On-Site Treatment and Reuse of Non-Potable Water.** California Water Code section 13558 requires the State Water Board to adopt regulations for on-site treatment and reuse of non-potable water in multifamily residential, commercial, and mixed-use buildings on or before December 1, 2022. Water Code section 13558 also requires that on or before December 1, 2023, the Department of Housing and Community Development, in consultation with the State Water Board, is required to develop and propose for adoption any necessary corresponding building standards to support the risk-based water quality standards established by the State Water Board. The risk-based water quality standards will not address untreated graywater systems that are used exclusively for subsurface irrigation and untreated rainwater systems that are used exclusively for surface, subsurface, or drip irrigation.

As of this date, the Water Boards' staff is working on the rulemaking package while coordinating with stakeholders and partner state agencies. Staff plan to submit the Notice of Proposed Rulemaking to the Office of Administrative Law to start the rulemaking process in late 2024 with a projected board adoption in 2025. Draft regulations can be found at: Regulations for On-Site Treatment and Reuse of Nonpotable Water (SBDDW-22-001) | California State Water Resources Control Board

- **Uniform Statewide Recycling Criteria, Title 22 of California Code of Regulations (Division 4; Chapters 1, 2, and 3)** establishes water quality standards, level of treatment, and use areas for recycled water. Last updated in 2014, the Uniform Statewide Recycling Criteria define limitations for application of recycled water based on level of treatment and specified use, such as landscape and agricultural irrigation, landscape impoundments, industrial or commercial cooling, and golf course irrigation. The level of treatment required in the Uniform Statewide Recycling criteria for approved uses of recycled water depends on the potential for human contact with recycled water. The Uniform Statewide Recycling Criteria classify non-potable recycled water uses based on treatment levels into four categories:
    - Undisinfected secondary recycled water, as defined in California Code of Regulations, Title 22, § 60301.900.
    - Disinfected secondary-23 recycled water, as defined in California Code of Regulations, Title 22, § 60301.225.
    - Disinfected secondary-2.2 recycled water, as defined in California Code of Regulations, Title 22, § 60301.220.
    - Disinfected tertiary recycled water, as defined in California Code of Regulations, Title 22, § 60301.230.

Water Quality Control Plan for the San Francisco/Sacramento-San Joaquin Delta Estuary (Bay-Delta Plan Amendment)

On December 12, 2018, the State Water Board adopted amendments to the Water Quality Control Plan for the San Francisco Bay/Sacramento–San Joaquin Delta Estuary (Bay-Delta Plan) pursuant to Resolution No. 2018-0059, establishing Lower San Joaquin River flow objectives and revised southern Delta salinity objectives. Whether and how these amendments will be implemented and their effect on supply reliability of SFPUC's regional water system has been the subject of litigation and negotiations. Following its adoption by the State Water Resources Control Board, there were over a dozen active lawsuits challenging the Bay-Delta Plan Amendment, including claims that the Bay-Delta Plan Amendment could significantly reduce water available from the Tuolumne River, which is the source of 85 percent of the water for SFPUC's regional water system. In March 2024, the Sacramento County Superior Court ruled in

the State Water Board's favor on all claims by the petitioners. In May 2024, the City and County of San Francisco and other water suppliers filed an appeal on this decision (EKI 2024).

Since 2019, SFPUC has participated in negotiations with the state and other stakeholders to reach a compromise wherein a voluntary agreement could be adopted as an alternative or substitute for the Bay-Delta Plan Amendment that would minimize the impacts to the regional water system. In March 2019, SFPUC submitted a proposed voluntary agreement (Proposed Voluntary Agreement) to the state. On November 9, 2022, SFPUC signed a non-binding MOU with state representatives outlining conceptual deal points for a Tuolumne River Voluntary Agreement. As of this date, the MOU remains in effect, while the Proposed Voluntary Agreement is currently undergoing review and evaluation by the State Water Board (EKI 2024).

Given the ongoing negotiations, litigation, and regulatory proceedings surrounding the Bay-Delta Plan Amendment, the SFPUC uses three scenarios to analyze water supply and demand in its Water Supply Assessments (EKI 2024). These scenarios, which account for the uncertainty regarding the extent and timing of the Bay-Delta Plan Amendment's implementation, were used in the Baylands Water Supply Assessment as recommended by SFPUC:

- Scenario 1 (Implementation of the Bay-Delta Plan Amendment)
- Scenario 2 (Without Implementation of the Bay-Delta Plan Amendment or the Proposed Voluntary Agreement
- Scenario 3 (Implementation of the Proposed Voluntary Agreement

Wastewater and Stormwater

State Water Resources Control Board Statewide General Waste Discharge Requirements for Sanitary Sewer Systems

The Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (State Water Resources Control Board Order No 2006-0003-DWQ) applies to sanitary sewer systems that are greater than one mile long and collect or convey untreated or partially treated wastewater to a publicly owned treatment facility. The goal of Order No. 2006-0003 is to provide a consistent state-wide approach for reducing sanitary sewer overflows and accidental releases of untreated or partially treated wastewater from sanitary sewer systems by requiring that:

- In the event of a sanitary sewer overflow, all feasible steps must be taken to control the released volume and prevent untreated wastewater from entering storm drains, creeks, etc.
- If a sanitary sewer overflow occurs, it must be reported to the State Water Resources Control Board using an online reporting system developed by the State Water Board.
- All publicly owned collection system agencies with more than 1 mile of sewer pipe in the state must develop a Sewer System Management Plan, which must be updated every 5 years.

The State Water Resources Control Board adopted the Statewide Sanitary Sewer Systems General Order on June 5, 2023. The new includes new requirements related to spill prevention and reporting and would increase the regulatory scope such as discretionary regulation of privately owned sanitary sewer systems or sewer laterals and prohibition of any sanitary sewer overflows from a system, as opposed to only those that reach Waters of the United States and those that create a nuisance.

Water Reclamation Requirements for Recycled Water Use General Order

The State Water Board adopted Water Reclamation Requirements for Recycled Water Use (Order WQ 2016-0068-DDW) on June 7, 2016 (General Order). The General Order replaces 2014-0090-DWQ General Waste Discharge Requirements for Recycled Water Use. The General Order establishes standard conditions for recycled water use and conditionally delegates authority to an Administrator to manage a Water Recycling Program and issue Water Recycling Permits to recycled water users. Only treated municipal wastewater for non-potable uses can be permitted, such as landscape irrigation, crop irrigation, dust control, industrial/commercial cooling, decorative fountains, etc. Potable reuse activities are not authorized under this General Order.

Solid Waste Management

California Integrated Waste Management Act of 1989 (Assembly Bill [AB] 939)

AB 939 redefined solid waste management in terms of both objectives and planning responsibilities for local jurisdictions and the state. The Act was adopted to reduce the volume and toxicity of solid waste that is landfilled and incinerated by requiring local governments to prepare and implement plans to improve the management of waste resources. AB 939 required each of the cities and unincorporated portions of the counties to divert a minimum of 25 percent of the solid waste sent to landfills by 1995, and 50 percent by the year 2000 through source reduction, recycling and composting, and environmentally safe landfill disposal and transformation. This law established the California Integrated Waste Management Board, later the California Department of Resources Recycling and Recovery (CalRecycle).

SB 1016 Solid Waste Disposal Measurement Act (2008)

CalRecycle introduced a new diversion measurement system pursuant to SB 1016 based on a City's population and disposal tons to calculate a per capita disposal rate expressed in pounds per person per day. SB 1016 builds on AB 939 compliance requirements by implementing a simplified measure of the City's recycling performance. Under this measurement system, a city needs to annually dispose of an amount equal to or less than its "50 percent equivalent per capita disposal target" calculated by CalRecycle.

Since the implementation of the revised diversion measurement system under SB 1016, the City of Brisbane has achieved compliance by remaining below the calculated per capita disposal

target set by the state. According to CalRecycle, the City of Brisbane has a per resident disposal rate target of 16.9 pounds/person/day (PPD) and a per employee disposal rate target of 7.9 PPD. The most recent approved data (2015) from CalRecycle for the City of Brisbane identified the annual per capita disposal rate per resident as 6.7 PPD. The annual per capita disposal rate per employee was 4.2 (CalRecycle 2022c).

Other State Solid Waste Management Statutes

Other solid waste management statutes include the following:

- **AB 1327 California Solid Waste Reuse and Recycling Act (1991)** requires adequate areas for collecting and loading recyclable materials within a project site.
- **AB 1826 Mandatory Commercial Organics Recycling (2014)** requires local governments to establish organic waste recycling programs. In addition, it requires businesses and multifamily residences of at least five units that generate four cubic yards or more of solid waste per week to arrange for organic waste recycling services.
- **AB 1594 Green Material Disposal (2014)** established that effective January 1, 2020, jurisdictions can no longer count green material used as alternative daily cover (ADC) at landfills toward their recycling goals. They are required to develop plans to divert green material from landfills.
- **Senate Bill 1383 Short-Lived Climate Pollutants: Organic (2016)** is a state-wide effort to reduce emissions of short-lived climate pollutants. Specifically, the law sets the following targets: (1) reduce state-wide disposal of organic waste by 50 percent by January 1, 2020, and by 75 percent by January 1, 2025 (based on 2014 levels), and (2) rescue at least 20 percent of currently disposed of edible food for human consumption by 2025.

California Occupational Safety and Health Requirements for Excavation

The California Occupational Safety and Health Regulations outline specific requirements for any person planning to conduct excavation. The excavator is required to notify the Underground Service Alert at least 2 days prior to excavation and to delineate the area to be excavated. Any operator of a subsurface utility in the area who receives notification must locate and field mark the approximate location of any utilities that could be affected by the excavation. Utilities in conflict with the excavation must be exposed by digging with hand tools prior to the use of any power equipment (Underground Service Alert, undated).

California Public Utilities Commission

The California Public Utilities Commission (CPUC) has constitutional authority to regulate privately owned public utilities, including electric, natural gas, telecommunications, water, railroad, rail transit, and passenger transportation companies. As part of its mission, the CPUC

"… ensures the provision of safe, reliable utility service and infrastructure at reasonable rates" to its consumers including a commitment to enhancement of the environment and a "healthy California economy." The CPUC regulates utility services and promotes innovation as well as a competitive marketplace for services (CPUC 2007).

c. Regional Plans, Policies, and Regulations

SFPUC Alternative Water Supply Planning Program

SFPUC's Alternative Water Supply Planning Program is designed to address future long-term water supply reliability challenges and vulnerabilities and identify water supply projects that increase the dry-year reliability of regional water system supplies to avoid a long-term water supply gap. The alternative water supply plan identifies a diverse suite of non-traditional water sources and means of leveraging regional partnerships to meet retail and wholesale customer needs through 2045.

Wholesale Water Supply Agreement

The Amended and Restated Water Supply Agreement Between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo County, and Santa Clara County (Water Supply Agreement)[348] is an agreement between the City and County of San Francisco and its wholesale customers (including the City of Brisbane and GVMID) that defines the water supply availability for the regional water system. The Water Supply Agreement introductory statement acknowledges that both San Francisco and its wholesale customers share a commitment to the regional water system by providing a reliable supply of high-quality water at a fair price in an environmentally sustainable manner. The Water Supply Agreement's term was established July 1, 2009, for a 25-year period that is set to expire on June 30, 2034, unless an extension is granted. The text of the Water Supply Agreement is included as an appendix to the Baylands Water Supply Assessment (Draft EIR Appendix P).

The Bay Area Water Supply and Conservation Agency coordinates water conservation, supply, and recycling activities for its agencies; and acquires water to make available to other agencies on a wholesale basis. The Water Supply Agreement provides a 184-mgd supply assurance to the SFPUC's wholesale customers collectively. The supply is broken down further into contractual allocations to the various wholesale customers. The contractual allocation of the SFPUC supply (referred to as an "Individual Supply Guarantee") for Cal Water is 35.68 mgd (39,993 acre-feet per year), which is shared among its South San Francisco, Mid-Peninsula, and Bear Gulch

[348] SFPUC, *Amended and Restated Water Supply Agreement between the City and County of San Francisco and Wholesale Customers in Alameda County, San Mateo and Santa Clara County*. November 2018.

districts. Brisbane's Individual Supply Guarantee of 0.98 mgd (1,098.5 acre-feet per year) is shared by the GVMID and Brisbane Water District.

California Water Company

Water Shortage Contingency Plan

California Water Company's Water Shortage Contingency Plan applies to its regulated ratemaking areas throughout California. The plan, which has been approved by the California Public Utilities Commission, establishes four stages of mandatory restrictions of water use, which may be implemented if:

a. Water supplies are projected to be insufficient to meet normal customer demand by Cal Water; or

b. A water supply shortage or threatened shortage exists; or

c. Water supplies are curtailed by a wholesale water supplier; or

d. Directed to do so under a duly adopted emergency regulation by the Public Utilities Commission or other authorized government agency.

Wasteful Uses of Water Prohibited. Except where necessary to address an immediate health or safety need or to comply with a term or condition in a permit issued by a state or federal agency, customers are prohibited, at all times, from using potable water for specified non-essential, wasteful uses.

Stage 1 Water Shortage. A Stage 1 Water Shortage occurs when Cal Water, the Public Utilities Commission, a wholesale water supplier (e.g., SFPUC), or other authorized government agency determines that measures are needed to reduce water consumption by customers served by public water suppliers. Stage 1 includes restrictions that limit use of potable water for irrigation to 3 days per week and only between the hours of 6:00 p.m. and 8:00 a.m.

Stage 2 Water Shortage. A Stage 2 Water Shortage occurs when the Stage 1 Water Shortage restrictions are deemed insufficient to achieve identified water use goals established by Cal Water, the Public Utilities Commission, a wholesale water supplier (e.g., SFPUC), or other authorized government agency. In addition to requirements for a Stage 1 water shortage, customers are prohibited from the following:

- Application of potable water to driveways and sidewalks
- Use of potable water in a water feature, except where the water is part of a recirculating system
- Application of potable water to outdoor landscapes during and within forty-eight (48) hours after measurable rainfall

- Serving of drinking water other than upon request in eating or drinking establishments, including but not limited to restaurants, hotels, cafes, cafeterias, bars, or other public places where food or drink are served and/or purchased
- Irrigation of ornamental landscapes within public street medians
- Irrigation outside of newly constructed homes and buildings with potable water in a manner inconsistent with regulations or other requirements established by the California Building Standards Commission and the Department of Housing and Community Development
- Filling or re-filling ornamental lakes or ponds with potable water is prohibited, except to the extent needed to sustain aquatic life, provided that such animals are of significant value and have been actively managed within the water feature prior to the implementation of any staged mandatory restrictions of water use as described in this Rule
- Other duly adopted restrictions on the use of potable water as prescribed from time to time by the Commission or other authorized government agencies

In addition, operators of hotels and motels are required to provide guests with the option of choosing not to have towels and linens laundered daily. Hotel and motels are also required to prominently display notice of this option in each guest room using clear and easily understood language.

Stage 3 Water Shortage. A Stage 3 Water Shortage occurs when Stage 2 Water Shortage restrictions are deemed insufficient to achieve identified water use goals established by Cal Water, the Public Utilities Commission, a wholesale water supplier (e.g., SFPUC), or other authorized government agency. In addition to Stage 2 restriction, the following additional restrictions would apply.

- Use of potable water for irrigation would be reduced to 2 days per week and only between the hours of 6:00 p.m. and 8:00 a.m.
- Use of potable water for street cleaning with trucks, except for initial wash-down for construction purposes (if street sweeping is not feasible).
- Use of potable water for construction purposes, such as consolidation of backfill, dust control, or other uses unless no other source of water or other method can be used.

Stage 4 Water Shortage. A Stage 4 Water Shortage occurs when the Stage 3 Water Shortage restrictions are deemed insufficient to achieve identified water use goals established by Cal Water, the Public Utilities Commission, a wholesale water supplier (e.g., SFPUC), or other authorized government agency. In addition to Stage 2 restriction, the following additional restrictions would apply.

- Irrigating ornamental landscape with potable water is prohibited, except when a hand-held bucket or a similar container, or a continuously monitored hose which is fitted with an automatic shut-off nozzle or device attached to it that causes it to cease dispensing water immediately when not in use or monitored is used to maintain vegetation, including trees and shrubs.
- Stage 3 exceptions to potable water use in eating and drinking establishments, for street cleaning with trucks, and for construction purposes would be eliminated.

Bay Area Regional Water Supply Reliability Study

Cal Water recently completed the "Bay Area Regional Water Supply Reliability Study," which employs integrated resource planning practices to create a long-term supply reliability strategy through 2050 for the three Peninsula Districts (Cal Water 2022). The study creates long-term strategies to address a wide range of water supply challenges including climate change, new regulatory requirements (e.g., the Bay-Delta Plan Amendment), and potential growth in demands due to new development. The Water Supply Reliability Study explores potential recycled water developments to augment supply in the three Peninsula Districts.

Development Offset Program

In July 2021, Cal Water began developing a Development Offset Program for its three Peninsula Districts to ensure that overall customer demand for water does not exceed available current or future supply under a range of hydrologic conditions, and to ensure the availability of water for residential, commercial, and other purposes for future water use in the three Peninsula Districts.[349]

As described and approved in the June 7, 2022 Advice Letter No. 2453 to the California Public Utilities Commission, the Development Offset Program requires any new residential, commercial, or industrial development within any of the three Peninsula Districts that would increase net demand by more than 50 acre-feet per year to pay a special facilities fee, referred to as a "developer offset fee," of $15,400 per acre-foot of net demand increase.[350] The developer offset fee was calculated based on representative alternative water projects in the Bay Area region, and the anticipated yield of those projects, and will be used to fund accelerated water supply projects and expanded customer conservation programs. The alternative water projects included in the Developer Offset Fee include projects where Cal Water is partnering with the SFPUC as described in SFPUC's Alternative Water Supply Plan.

[349] Cal Water's three Peninsula District share the same SFPUC supply allocation

[350] "Net demand increase" is defined as the expected total potable water use for the development once it is completed, minus the average annual existing potable water use on the property over the previous five years.

The result of this program is that new residential, commercial, and industrial development projects that pay offset fees are considered by Cal Water to result in a net zero increase in potable water demand.

San Mateo County Local Agency Formation Commission Municipal Service Reviews

Under the Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000, a Local Agency Formation Commission (LAFCo) evaluates establishment, amendment, or updates of a local agency's spheres of influence (SOIs), in accordance with the following Government Code section:

> **56430. (a)** In order to prepare and to update spheres of influence in accordance with Section 56425, the commission shall conduct a service review of the municipal services provided in the county or other appropriate area designated by the commission. The commission shall include in the area designated for service review the county, the region, the subregion, or any other geographic area as is appropriate for an analysis of the service or services to be reviewed and shall prepare a written statement of its determinations.

The San Mateo Local Agency Formation Commission (LAFCo) is required to conduct periodic reviews of each service provider, and to adopt determinations addressing current service levels and the ability of each agency to continue to provide adequate services into the future. LAFCo completed Municipal Service reviews for the City of Brisbane and Bayshore Sanitary District in September 2015 as part of the North County Cities and Special Districts Municipal Service Review-Sphere of Influence Study.[351]

While LAFCo has approval authority to detach the Baylands, Sierra Point, and Beatty areas from the City's service area for water because Cal Water is a private company, approval authority to extend its service area into Brisbane rests with the California Public Utilities Commission rather than LAFCo.

Countywide Integrated Waste Management Plan

The San Mateo County Office of Sustainability is responsible for preparing and maintaining the Countywide Integrated Waste Management Plan (CIWMP). This plan consists of Source Reduction and Recycling Elements, Household Hazardous Waste Elements, and Non-Disposal Facility Elements of each jurisdiction within the County; the Countywide Siting Element, and the Countywide Integrated Waste Management Summary Plan. The CIWMP addresses waste management conditions and provides an overview of the actions that will be taken to achieve applicable solid waste diversion requirements and to maintain 15 years of landfill disposal capacity.

[351] https://www.smcgov.org/media/71721/download?inline=.

California statute requires the County of San Mateo to review its CIWMP every five years and then report on its adequacy to CalRecycle.

San Francisco Zero Waste Policy

In 2018, San Francisco updated its zero-waste policy to set waste reduction targets of reducing the amount of municipal waste by 15 percent by 2030 and reducing landfill disposal and incineration by 50 percent by 2030.

In addition, San Francisco Ordinance No. 1009, Mandatory Recycling and Composting Ordinance, requires all of San Francisco to separate recyclables, compostables, and trash to be landfilled. Under this ordinance, it is unlawful to mix recyclables, compostables, or trash, or to deposit refuse of one type in a collection container designated for another type of waste.

d. City of Brisbane Plans, Ordinances, and Regulations

General Plan

Chapter IX: Conservation Element

Policy 130: Conserve water resources in the natural environment.

Program 130a: As an ongoing part of land use planning and CEQA analysis, determine whether proposals could affect water resources.

Policy 133: Encourage conservation of domestic water.

Program 138a: Require the use of water conserving fixtures in new construction and remodeling projects.

Program 138b: Encourage the use of water conserving landscape and irrigation systems.

Program 138c: Utilize, if safe and appropriate, recycled water for landscape irrigation and dust control.

Policy 143: Maximize opportunities to recycle solid waste.

Program 143e: In the review of land use development applications, consider design factors pertaining to the storage and disposal of recycling materials.

Program 143f: Consult with refuse disposal contractors or other recycling services on applicable land use development applications regarding the adequacy of the proposed measures.

Policy 146: Require that developers and property owners in undeveloped areas who wish to build on their land provide infrastructure at their own expense, including water, sewer, storm drains and paved streets to City standards.

Chapter X: Community Health and Safety

Policy 213: If new development occurs, require trunk and lateral lines to be installed to City standards.

Program 213a: In conjunction with land use development applications for vacant lands, require studies to determine capacity and design requirements for sanitary sewer services and require infrastructure design and installation to the satisfaction of the City at developer's expense.

Policy 214: Require, as feasible, that all sanitary sewer lines be installed within dedicated public streets.

Policy 215: Sanitary sewer service to undeveloped areas where facilities do not currently exist shall be installed and connected to the City's system at the property owner or developer's expense.

Policy 216: If development occurs, extend City sanitary sewer service to currently undeveloped areas so that all new users within the City Limits are served by the City as legally permissible.

Policy 217: If new development occurs, require storm drain systems to be installed to City standards.

Program 221a: In conjunction with land use development applications for vacant lands, require studies to determine design requirements to collect and remove stormwater from the property or reuse stormwater to benefit the public. Require facilities to be designed and installed to City standards, at developer's expense.

Policy 222: Require that all storm drain lines be installed within dedicated public streets.

Policy 223: Storm drains in undeveloped areas where facilities do not currently exist shall be installed at the property owner or developer's expense.

Policy 224: In conjunction with development applications that place substantial increased demands upon the existing system, require that the system be upgraded or replaced to the satisfaction of the City. Contributions from responsible parties should be proportional to the impact of their projects.

Policy 227: Cooperate with Daly City, responsible property owners, and responsible agencies to develop plans to improve the storm facilities on Bayshore Boulevard to relieve flooding.

Chapter XII: Policies and Programs by Subarea

Policy BL.1: Development within the Baylands Subarea shall be subject to the City's approval of a single specific plan for the entirety of the Baylands Subarea and a development agreement that is consistent with General Plan policies, incorporates all applicable EIR mitigation measures, and is consistent with the following standards:

- A reliable water supply approved by the City of Brisbane to support proposed uses within the Baylands shall be secured prior to site development.
- Each increment of development shall be provided with appropriate transportation related and other infrastructure, facilities, and site amenities as determined by the City. Such transportation related and other infrastructure, facilities, and site amenities (e.g., parks, open space preservation, habitat enhancement) shall be provided at the developer's cost.

Municipal Code

Chapter 15.75, Recycling and Diversion of Debris from Construction and Demolition

Chapter 15.75 of the Brisbane Municipal Code requires that a minimum of sixty-five percent (65 percent) of the nonhazardous construction and/or demolition waste and one hundred percent (100 percent) of inert solid material associated with excavations and land clearing operations, including trees, stumps, and rocks be recycled and/or salvaged for re-use. This standard is to be achieved in accordance with either a waste management plan or by an approved waste management company, as outlined below:

A. Waste Management Plan. Submit a waste management plan in conformance with items 1 through 5. The construction waste management plan shall be updated as necessary and shall be available during construction for examination by the city.
    1. Identify the construction and demolition waste materials to be diverted from disposal by efficient usage, recycling, reuse on the project or salvage for future use or sale. Priority is to be given to salvage over recycling in the plan.
    2. Specify if construction and demolition waste materials will be sorted on-site (source-separated) or bulk mixed (single stream).
    3. Identify diversion facilities where construction and demolition waste materials collected will be taken.
    4. Identify construction methods employed to reduce the amount of construction and demolition waste generated.
    5. Specify the amount of construction and demolition waste materials diverted shall be calculated by weight or volume, but not by both.

B. Waste Management Company. Utilize a waste management company, approved by the city, which can provide verifiable documentation that the percentage of construction and demolition waste material diverted from the landfill complies with the minimum recycling and/or salvage for re-use percentages listed above in this section.

Chapter 8.41, Water Conservation

Municipal Code Chapter 8.41 establishes standards and procedures for water conservation to ensure the maximum beneficial use of city water supplies; enable implementation of the city's responsive actions to drought conditions and/or water supply shortages; facilitate compliance with requirements for voluntary or mandatory reductions during water shortages; ensure sufficient water supplies to meet the basic needs of human consumption, sanitation, and fire protection; and protect the health, safety, welfare, and economic vitality of the City's customers.

City of Brisbane Water Shortage Contingency Plan

The City's Water Shortage Contingency Plan (WSCP) is a plan in response to anticipated future dry-year shortfalls that systematically identifies ways in which the City can respond effectively and efficiently in the event of a water shortage emergency. The City/GVMID collectively serves approximately 2,100 accounts and delivers 0.59 mgd of water. The guiding principle of the WSCP aims to eliminate water waste and prioritize reducing non-essential water uses, such as landscape irrigation and other discretionary outdoor water use. The overall reduction goals in the WSCP are established for six drought stages and address water demand reductions of up to 40 percent (City of Brisbane/Guadalupe Valley Municipal Improvement District 2023, EKI Environment & Water 2024). The WSCP identifies Shortage Response Actions associated with each drought stage. In the event of a water shortage, the Project would be required to comply with all applicable Shortage Response Actions. Specific actions that are relevant to the analysis of Project utilities include:

- Stage 1
    - Shortage Response Action 13. Use recycled water for construction purposes, if available.
    - Shortage Response Action 14. No new, non-residential water meters may be issued unless the Director determines that such issuance will not impede the City's compliance with the required water use reductions.
- Stage 2
    - Shortage Response Action 4. Prohibit use of potable water for construction and dust control.

4.16.4 RELEVANT SPECIFIC PLAN PROVISIONS

a. Potable and Recycled Water

Potable and recycled water supply for the Baylands site is proposed to be provided by Cal Water through its "Bayshore District" using a combination of (1) potable water purchased from the SFPUC supplemented by five existing off-site groundwater wells and (2) recycled water provided by a water recycling facility (WRF) to be constructed within the Baylands. Cal Water potable supplies would be delivered to the Brisbane site via existing turnouts from the SFPUC regional water system.

The Baylands WRF would reduce total potable water demand by providing recycled water for landscape irrigation and non-potable uses within non-residential buildings. Recycled water generated by the WRF would be distributed to uses by way of a separate piping system from the potable water network to prevent unintended use of recycled water and to avoid contamination of the potable water system. Activated sludge from the WRF and sewage that does not go through the WRF would be routed into the SFPUC sewer system at the north end of the Baylands.

b. Wastewater

The Baylands WRF would treat approximately 1.73 mgd of sewage from the Baylands site to generate a maximum of 1.0 mgd of recycled water. The approximately 0.73 mgd would be discharged to the SFPUC sewer system for treatment at the Southeast Treatment Plant. Sewage collection services within the Baylands not associated with the Baylands WRF would be provided by the Bayshore Sanitary District (BSD), which owns and operates wastewater collection facilities within the Brisbane city limits. Proposed Baylands sewer system improvements are illustrated in **Figure 3-46**. To accommodate differential settlement at the interface between proposed structures and sanitary sewer lateral service connection lines, flexible connections with settlement vaults are proposed to be provided to avoid shearing of utility infrastructure.

Sanitary sewage generated on-site would be routed to a proposed WRF for extraction and treatment of non-potable water to reduce demands for potable water on-site.

c. Electrical Facilities

The Specific Plan proposes that electric power for construction and future uses continue to be provided by Pacific Gas and Electric Company (PG&E) with energy resource purchased

through Peninsula Clean Energy.[352] Proposed Baylands energy improvements are illustrated in **Figure 3-49** and **Figure 3-50**, and include:

- Undergrounding of existing overhead lines and construction of new on-site electrical supply lines underground in joint trenches with communications infrastructure;
- 92,445 MWh (megawatt-hours) of on-site solar energy generation within a 55-acre solar farm as well as building-mounted and parking lot solar panels;
- A 250-megawatt (MW) battery storage facility, including connection to and improvements at the existing PG&E Martin Substation across Bayshore Boulevard from the Baylands;
- 44,055 MW of battery storage capacity distributed across the site within sustainable infrastructure, residential, and commercial areas; and
- A 2-acre on-site switching substation.

d. Solid Waste

The Specific Plan sets the following standards for construction waste generation and diversion:

1. Total construction waste generated from new construction activities shall not exceed 7.5 pounds of waste/square feet of new development.
2. For both residential and non-residential covered projects, recycle and/or salvage for re-use shall include a minimum of 65 percent of the nonhazardous construction and/or demolition waste.
3. Source 100 percent of recycled soils on-site.

The Specific Plan also sets the following standards for ongoing post-construction waste generation and diversion:

1. Information regarding recycling, reuse, minimization, management, container storage, and pickup operations shall be provided to new owners, lessees and renters by the Master Property Owners' Association (MPOA) or a designated residential or commercial property owners' association designated by the MPOA (collectively, HOA). HOAs shall also include with this information regarding waste segregation requirements including at minimum segregation of recyclable and composting (green waste).
2. The HOAs shall also provide on such websites and in designated public areas information regarding the management of wastes requiring special handling, such as household hazardous waste, universal wastes, paints, compact fluorescent bulbs, and electronics.

[352] Peninsula Clean Energy is a community-controlled, not-for-profit, joint powers agency formed as a Community Choice Aggregation program by San Mateo County and all 20 of its cities and towns in 2016 and joined by the City of Los Banos in 2020.

3. The MPOA shall encourage food retailers to use low-waste food packaging by requiring website training and review of online educational materials for new food vendors, including but not limited to retail grocery stores and restaurants, farmers' markets and food trucks, and in conjunction with events and gatherings.
4. The MPOA or its designees shall meet no less than annually with the refuse and recycling collection companies to identify items that cannot be recycled under current conditions and update educational information on websites to encourage alternatives to landfilling such as encouraging customers to recycle and reuse their own plastic bags.

The MPOA shall require the installation and use of pet waste collection systems, including bags and waste containers, in designated outdoor pet areas and on trail segments allowing pets. Pet wastes shall be segregated for pickup, and to the extent feasible diverted from landfills if feasible alternatives exist, such as disposal at a methane recovery or other treatment facility.

4.16.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of utilities, service systems, and water supply impacts.

Threshold UTL-1: **The Baylands Specific Plan would cause a significant impact if water supplies available to California Water Service Company's South San Francisco District would be insufficient to serve buildout of the Baylands Specific Plan in addition to existing and planned future development within California Water Service Company's South San Francisco District as it is proposed to be expanded into Brisbane during normal, dry, and multiple dry years throughout Baylands development and at projected buildout.**

Threshold UTL-2: **The Baylands Specific Plan would cause a significant impact if the physical environmental effects associated with construction, relocation, or improvement of new or expanded water, wastewater, energy, or telecommunications facilities would cause or contribute to one or more significant impacts not identified elsewhere in this EIR.[353]**

[353] Analysis of the physical environmental effects associated with construction, relocation, or improvement of new or expanded stormwater drainage facilities is provided in Section 4.14, *Hydrology and Water Quality*, Impact HWQ-1. Analysis of physical environmental effects associated with construction, relocation, or improvement of new or expanded energy generation, storage, and distribution is provided in Section 4.11, *Energy Resources*, Impact EN-1.

Threshold UTL-3: The Baylands Specific Plan would cause a significant impact if it would not minimize solid waste generation and maximize diversion of solid wastes from landfills and incinerators set forth in applicable solid waste management and reduction statutes, regulations, plans, policies, and strategies.

Threshold UTL-4: The Baylands Specific Plan would cause a significant impact if substantial adverse physical environment effects would be associated with new or expanded solid waste facilities due to:

- **Generating solid waste in excess of the daily capacity of local infrastructure and area landfills to manage; or**
- **Substantially reducing the life expectancy of the landfill(s) to which Specific Plan-generated solid waste would be delivered.**

4.16.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Threshold UTL-1: Water Supply

Methodology for Determining Significance

The analysis of the Specific Plan's impact related to water supply identifies the increased demand of water supply that would be generated by buildout of the Specific Plan and the capacity of Cal Water to meet the current and planned water demands within its expanded service area, including the demands associated with the Baylands, Beatty, and Sierra Point areas.

Water supply was evaluated through a water supply assessment (Appendix P) addressing whether Cal Water would have sufficient water supply to meet the current and projected water demands within its expanded service area to ensure that water is available for the Baylands, Beatty, and Sierra Point areas during normal years, a single dry year, and multiple dry years over a 20-year future projection.

If water supplies available to Cal Water's South San Francisco District would be insufficient to serve projected demands of the Baylands, Beatty, and Sierra Point areas, including buildout of the Specific Plan in addition to existing and planned future development within Cal Water's South San Francisco District during normal, dry, and multiple dry years throughout Baylands development and at projected buildout, a significant impact would result.

Impact Assessment

As stated in the Baylands Water Supply Assessment, the increased potable water demand for the Baylands Specific Plan and future projects within Sierra Point would be offset by Cal

Water's Development Offset Program and are therefore considered by Cal Water to have a zero net increase. The Development Offset Fee Program provides funds to accelerate water supply projects and expand customer conservation programs. Water projects included in the offset fee program include projects Cal Water is partnering with the SFPUC as described in SFPUC's Alternative Water Supply Plan (SFPUC 2024c), as well as other projects that would increase local water supply. SFPUC alternative water supply projects include supply projects (surface water, purified water, groundwater, or recycled water), storage projects, and conveyance projects.

- **Supply Projects**
    - Surface water supply projects include supplies that are outside of the SFPUC's existing supplies and may also include brackish water. Surface water supply projects would rely on a combination of transfers, storage, and conveyance to make the supply available within the SFPUC service area.
    - Purified water projects are those that generate potable water through the advanced treatment of wastewater either through indirect potable or direct potable reuse. Indirect potable reuse projects are those where purified water is blended in surface water reservoirs (referred to as reservoir augmentation) or injected into groundwater basins (groundwater recharge) before being added to distribution facilities. Direct potable reuse projects are those where purified water is added directly to the distribution system. This may be done through raw water augmentation, which is the planned placement of purified water into a system of pipelines that deliver raw water to a drinking water treatment plant, or treated water augmentation, which is the planned placement of purified water into the water distribution system.
    - Groundwater supply programs focus on management of storage and recovery in dry years by offsetting groundwater use in normal or wet years with available surface water supplies or, in the case of non-potable use of groundwater, with alternative supplies such as recycled water. The groundwater that is offset accumulates, or is stored, in the basin and then recovered for use as a potable supply in future dry years when surface water supplies are limited.
    - Recycled water that has been treated to be safe for a variety of non-potable uses are aimed at (1) increasing potable water supplies by increasing potable water supplies to replace potable water use for non-potable water demand (e.g., landscape irrigation) or (2) being blended in groundwater basins as part of an indirect potable use project.

- **Storage Projects**

  Due to extreme changes from severe weather patterns and their effect on the timing of water availability, the Alternative Water Supply Plan recognizes the importance of having sufficient storage for use in dry years. Storage options include:

  - Surface water storage by expanding existing facilities or building new reservoirs.
  - Groundwater storage, including sustainably managing groundwater aquifers as storage for future dry-year reliability through storage and recovery projects, as described above, and by percolation or injection of water supply into the aquifer for future recovery.

- **Conveyance Projects** would connect existing or new facilities and enable deliveries of water. In addition to evaluating options for building new infrastructure, the alternative water supply program considers how existing facilities that are part of the SFPUC regional water system and facilities that are owned by other agencies could provide efficient and cost-effective connections and deliveries.

As indicated in **Table 4.16-2**, the estimated offset amount for the Specific Plan is 1,146.3 acre-feet per year. Cal Water will verify compliance with the Development Offset Program (i.e., ensure that all payments for offsets are completed) prior to establishing a water service connection.

Table 4.16-4 shows the projected water demands for the South San Francisco District inclusive of estimated Specific Plan water demands, as well as other known developments and existing SFPUC or City customers within the Cal Water service area expansion that are exempt from the Development Offset Program. As indicated in the Baylands Water Supply Assessment, with the implementation of Cal Water's Development Offset Program, the Specific Plan and other proposed development projects within Sierra Point would not increase the demand on the South San Francisco District's water supplies.

The projected water supply and demands for Cal Water's three Peninsula Districts for normal year, single dry-year, and multiple dry-year hydrologic conditions are shown in **Table 4.16-5**, **Table 4.16-6**, and **Table 4.16-7**, respectively. The water supply conditions presented in these tables address a worst-case scenario wherein the Bay-Delta Plan is implemented as written. Anticipated dry-year supply estimates presented are based on the delivery estimates provided by Cal Water as part of its 2020 Urban Water Management Plan (UWMP).

As indicated in **Table 4.16-5**, under normal year conditions, no shortfalls relative to total demands would occur.

Table 4.16-4: Projected Future Potable Water Demand for the Cal Water/South San Francisco District and Proposed Service Area Expansion

	Projected Annual Water Demand (in acre-feet)				
	2025	**2030**	**2035**	**2040**	**2045**

ABBREVIATIONS: SSF = South San Francisco; UWMP = Urban Water Management Plan

NOTES:

a. Water demand projections for the SSF District were updated in 2021. Projected demands have decreased by 527 AFY relative to those reported in the 2020 UWMP because the Southline Specific Plan Project is now expected to comply with Cal Water's Development Offset Program and will not result in a net increase in demands.
b. Demands for other known developments that are not subject to Cal Water's Development Offset Program within the SSF District can be found in Appendix C of the Water Supply Assessment.
c. This includes existing water users currently served by the City of Brisbane and SFPUC that are located within the Specific Plan area and will either be replaced by the Specific Plan or remain active within the Specific Plan area upon full buildout.
d. This includes existing water users currently served by the City and SFPUC that are located outside of the Specific Plan area and will therefore not be replaced by the 2025 Specific Plan project.

SOURCE: EKI Environment & Water, *Water Supply Assessment for the Baylands Specific Plan*, January 2025.

NOTES:

a. Projected supply is assumed equal to the supplies available for all three districts during normal hydrologic years, which includes 840 afy from the Bear Gulch Reservoir, 1,534 afy from South San Francisco wells, and Cal Water's Individual Supply Guarantee of 39,993 AFY from SFPUC, which is shared among Cal Water's three Peninsula Districts.
b. Water demand projections for the SSF District were updated in 2021. Projected demands have decreased by 527 afy relative to those reported in the 2020 UWMP because the Southline Specific Plan Project is now expected to comply with Cal Water's Development Offset Program and will not result in a net increase in demands.
c. Demands for other known developments that are not subject to Cal Water's Development Offset Program within the SSF District can be found in Appendix C of the Water Supply Assessment.
d. This includes existing water users currently served by the City of Brisbane and SFPUC that are located within the Specific Plan area and will either be replaced by the Specific Plan or remain active within the Specific Plan area upon full buildout.
e. This includes existing water users currently served by the City and SFPUC that are located outside of the Specific Plan area and will therefore not be replaced by the 2025 Specific Plan project.

During single dry years, assuming implementation of the Bay-Delta Plan Amendment, the annual supply for the three Peninsula Districts' service areas will be reduced to 21,039 acre-feet per year by 2045. Supply shortfalls relative to total demands during single dry years are estimated to range between 35 percent in 2025 and 44 percent in 2045 (see **Table 4.16-6**).

Table 4.16-6: Projected Single Dry Year Water Supply and Demand with Implementation of the Bay-Delta Plan Amendment

c. Demands for other known developments that are not subject to Cal Water's Development Offset Program within the SSF District can be found in Appendix C of the Water Supply Assessment.
d. In accordance with Cal Water's Development Offset Program, the Specific Plan will not result in a net increase in demands.
e. This includes existing water users currently served by the City of Brisbane and SFPUC that are located within the Specific Plan area and will either be replaced by the Specific Plan or remain active within the Specific Plan area upon full buildout.
f. This includes existing water users currently served by the City and SFPUC that are located outside of the Specific Plan area and will therefore not be replaced by the 2025 Specific Plan project.
g. In accordance with Cal Water's Development Offset Program, planned developments within Sierra Point will not result in a net increase in demands.

During multiple dry years, Cal Water estimates that annual supply for its three Peninsula Districts will be reduced to 23,615 acre-feet in 2025 during the first year of a drought, and 20,492 acre-feet in 2025 in the second, third, fourth, and fifth years of drought, assuming implementation of the Bay-Delta Plan Amendment. Cal Water further estimates that in 2045, annual supply will be reduced to 20,954 acre-feet during the first three years of a drought, and 18,061 afy in the fourth and fifth years of drought. Supply shortfalls relative to total demands are estimated to range between 36 percent during the first year of a drought in 2025 to 53 percent during the fifth year of a drought in 2045 (see **Table 4.16-7**).

Table 4.16-7: Projected Multiple Dry Years Water Supply and Demand with Implementation of the Bay-Delta Plan Amendment

SOURCE: EKI Environment & Water, *Water Supply Assessment for the Baylands Specific Plan*, January 2025.

a. While Water Supply Assessment regulations require an analysis of a three-year drought scenario, Urban Water Management Plan regulations require a five-year drought scenario (California Water Code §10635).
b. Projected supply is assumed equal to the supplies available for all three districts during normal hydrologic years, which includes 840 afy from the Bear Gulch Reservoir, 1,534 afy from South San Francisco wells, and Cal Water's Individual Supply Guarantee of 39,993 afy from SFPUC, which is shared among Cal Water's three Peninsula Districts. Although local surface water diversions in the Bear Gulch District (and subsequent treatment and use of local surface water) have occurred historically during dry years, the Bear Gulch District conservatively assumes that local surface water supplies will be zero during single dry and multiple dry years over the planning horizon. Projected SFPUC supply is based on dry year allocation projections included in the 2020 UWMPs for each Peninsula District based on the methodology, assumptions, and information used and provided by SFPUC and BAWSCA; however, actual future supply allocations may vary based on actual shortage levels and then-applicable allocation methodology being applied.
c. Cal Water updated its water demand projections for the South San Francisco, Mid-Peninsula, and Bear Gulch Districts in 2021. Projected demands for the South San Francisco District have decreased by 527 afy because the Southline Specific Plan Project is now expected to comply with the Development Offset Program and will not result in a net increase in demands.
d. Demands for other developments that are not subject to the Development Offset Program within the three Peninsula Districts can be found in Appendix C of the Water Supply Assessment.
e. Baylands Specific Plan development will be subject to Cal Water's Development Offset Program and will not result in a net increase in demands.
f. This includes existing water users currently served by the City and SFPUC that are located within the Specific Plan area and will either be replaced by the Specific Plan or will remain active upon full boundary buildout. It is assumed that these customers will be served by Cal Water.
g. This includes existing water users currently served by the City and SFPUC that are located outside of the Specific Plan area and will therefore not be replaced by Specific Plan development. It is assumed that these customers will be served by Cal Water.
h. Proposed development projects within Sierra Point will be subject to Cal Water's Development Offset Program and will not result in a net increase in demands.

The Baylands Water Supply Assessment concludes that available water supplies will be sufficient to meet the demands under normal year hydrologic conditions through 2045, including existing and planned development within Cal Water's three Peninsula Districts and the proposed expansion area in Brisbane encompassing the Baylands, Beatty, and Sierra Point areas for all three Bay-Delta Amendment scenarios.

Under Scenario 1, shortfalls of up to 53 percent are possible in drought periods representing the "worst-case" supply scenario in which the Bay-Delta Plan Amendment is implemented as written, the implementation of actions identified as part of the Settlement Agreement, SFPUC's Alternative Water Supply Program, BAWSCA's 2015 Strategy, or Cal Water's Water Supply Reliability Study. As discussed in the Baylands Water Supply Assessment, Cal Water is working independently and with the other BAWSCA agencies to identify regional measures to improve reliability for regional and local water supplies and meet its customers' water needs.

Under Scenario 2, in which the Bay-Delta Plan Amendment or the Proposed Voluntary Agreement are not implemented, the Baylands Water Supply Assessment concluded that the three Peninsula Districts would have sufficient supply to meet demands in normal, single dry, and multiple dry years through 2040 and would only anticipate a supply shortfall of 15 percent during the fourth and fifth years of a multi-year drought by 2045 as shown in **Table 4.16-7**.

Under Scenario 3, Cal Water anticipates that the degree of water use reduction during dry years would also more closely align with the SFPUC's regional water system goal of limiting water use reduction to no more than 20 percent on a system-wide basis in drought years.

As described in the Baylands Water Supply Assessment, in response to anticipated future dry-year shortfalls, Cal Water has developed a Water Supply Contingency Plan that systematically identifies ways in which the South San Francisco District can reduce water demands during dry years. The overall reduction goals in the Contingency Plan are established for six drought stages ranging from 10 percent to more than 50 percent shortfalls.

The Baylands Water Supply Assessment notes that the SFPUC regional water system has historically met demand in its service area in all year types, and prior to 2021, only called for voluntary 10 percent rationing during 2007 to 2009 and 2014 to 2015. Although the South San Francisco District has not experienced any shortage of SFPUC regional water system deliveries, during the 2015/2016 drought it was subject to the Water Resource Control Board's mandatory water reduction target at 8 percent between June 2015 and May 2016. During this period, the South San Francisco District surpassed its reduction targets in each month and achieved an average water demand reduction of 20 percent compared to its water use in 2013. The Mid-Peninsula and Bear Gulch Districts were required to reduce water use by 16 percent and 36 percent, respectively, and through May 2016 exceeded their targets with cumulative reductions of 24.1 percent and 36.7 percent, respectively. In response to Governor Newsom's Executive Order N-7-22 and calls for water conservation from the Water Resources Control Board, the SFPUC entered into Level 2 of its Water Supply Contingency Plan, resulting in a voluntary

water use reduction goal of 11 percent. However, as of June 5, 2023, the Water Resources Control Board no longer requires water agencies to remain in Level 2 of their Contingency Plans.

In July 2024, the Water Resources Control Board adopted the "Making Water Conservation a California Way of Life" regulation to implement SB 606/AB 1668 annual water use objective requirements. As part of this regulation, urban water suppliers are required to calculate and report their Urban Water Use Objective beginning in January 2024 and every year thereafter. The Urban Water Use Objective is an estimate of efficient urban water use based on the adopted urban water use efficiency standards and local service area characteristics. By January 2027, compliance with the Urban Water Use Objective will be enforced.

Based on the three Peninsula Districts' most recent Urban Water Use Objective Report submitted to DWR in 2023 pursuant to SB 606/AB 1668 annual water use objective requirements, the South San Francisco District's actual water use was approximately 41 percent below its estimated objective, the Mid-Peninsula District's actual water use was approximately 28 percent below its estimated objective, and the Bear Gulch District's actual water use was approximately 20 percent above its estimated objective. It is expected that Urban Water Use Objectives will become incrementally more stringent over time, and achieving these objectives in the future could potentially require an increase in the three Peninsula Districts' conservation programming.

As customers within the District, existing and future development within the proposed expansion area would be obligated to comply with the demand reduction efforts imposed by Cal Water through implementation of Cal Water's Water Supply Contingency Plan in any future water shortage condition.

While the SFPUC's regional water system reliability is constrained by hydrology, physical facilities, and institutional parameters including state and federal regulations, the SFPUC is implementing both capital improvement and planning processes to enhance regional water system reliability and meet its contractual commitment to Wholesale Customers through 2045 (see SFPUC memorandum included as Appendix D). Within and outside the regional water system reliability, BAWSCA is also leading multiple efforts to develop additional water supply for its member agencies through implementation of its 2015 Strategy and development of its Strategy 2050 update.

Cal Water is also striving to increase the water supply portfolio for the South San Francisco, Mid-Peninsula, and Bear Gulch Districts through: (1) investment in water conservation, (2) participation in the Regional Groundwater Storage Project and the regional water recycling project (i.e., Potable Reuse Exploratory Plan [PREP]), and (3) development of integrated resource planning practices to create a long-term supply reliability strategy through 2050 for Cal Water districts in the Bay Area, among other things as described in the 2020 UWMPs for each District. As previously described, the Specific Plan will also implement the Baylands Water

Recycling Facility to meet the non-potable demands for the Specific Plan, other known developments, and existing customers in the SSF District. The three Peninsula Districts share access to Cal Water's SFPUC supply and, as such, any supply added to one of these Districts will benefit the others.

Significance Conclusion for Impact UTL-1

The water supply assessment projected that available water supplies will be sufficient to meet the demands under normal year hydrologic conditions through 2045, inclusive of existing and future development within Cal Water's three Peninsula Districts and the proposed water service expansion area under all Bay-Delta Plan Amendment scenarios. Under dry year hydrologic scenarios, projected shortfalls would be addressed through implementation of the District's Water Supply Contingency Plan. In addition, BAWSCA, Cal Water, and SFPUC are pursuing the development of additional water supplies to improve SFPUC's Regional Water System and South San Francisco District supply reliability. As stated in the Baylands Water Supply Assessment, participation in Cal Waters' Development Offset Program would not result in net increase in water demands for Specific Plan development or anticipated future development within Sierra Point. In addition, the Baylands water recycling facility would eliminate the use of potable water for non-potable purposes within the Specific Plan area and would provide 0.41 mgd of recycled water to the Cal Water South San Francisco District, which does not currently have access to recycled water, for non-potable uses.

Impacts would therefore be less than significant.

b. Threshold UTL-2: Construction and Improvement of Utility and Service System Facilities

Methodology for Determining Significance

The analysis of impacts associated with the development of water, wastewater, and energy utility facilities involves identifying whether physical environmental effects associated with construction, relocation, or improvement of new or expanded water, wastewater, energy, or telecommunications facilities would cause or contribute to one or more significant impacts not identified elsewhere in this EIR. The analysis of the adverse physical effects has been included as part of the overall project and in other impact analyses addressed in this EIR, such as biological resources; cultural resources; transportation; air quality; greenhouse gas emissions; noise; hazards and hazardous materials; geology and soils; hydrology and water quality; and public services and facilities.

Physical environmental effects associated with demolition and removal of existing utility facilities along with grading for site drainage, excavation/filling of trenches for underground utility systems throughout the Baylands, and for construction of new and expanded utility

facilities are largely indistinguishable from those of other Specific Plan grading and construction activities within the Baylands and are not parsed out separate from the other Specific Plan construction impacts, including those leading to significant unavoidable net increases in NO_X emissions (Impact AQ-2) and greenhouse gas emissions (Impact GHG-1) during grading and construction. Demolition, removal, and construction of utility facilities within the Baylands are included as part of the grading quantities used to analyze transportation, air quality, greenhouse gas and energy construction impacts (Sections 4.8, 4.9, 4.10, and 4.11, respectively). Analysis of construction noise impacts for Baylands development incorporates noise generated by grading, excavations, demolition, and construction for utility facilities in its analyses and conclusions (see Section 4.12).

Impacts of site grading and construction on biological, cultural, tribal cultural, and paleontological resources include the contribution of utility facilities to the overall impacts of site grading for Baylands development. Hazards and hazardous materials impact analyses include the contribution of utility facilities as well as potential impacts of vibration generated by construction activities adversely affecting existing utilities within the Specific Plan area.[354] Geological impact analyses address not only the site's suitability for construction of above-ground buildings and utility structures, but also the site's suitability for installation of underground utilities, including, for example, the potential for encountering expansive or corrosive soils.[355] Ongoing energy generation and consumption by Baylands water and other utility facilities are included in the analysis of the site's energy generation and demand.[356]

The analysis of the Specific Plan's impact related to wastewater treatment facilities addresses the on-site water treatment facility and identifies the increased amount of wastewater that would be generated by buildout of the Specific Plan, addition of waste activated sludge to sewage flows, and the capacity of the wastewater treatment facilities to which sewage from the Baylands would be discharged. If Baylands development would exceed Bayshore Sanitary District's treatment capacity allocation or otherwise require modifications to SFPUC treatment facilities that would have a substantial adverse environmental effect, a significant impact would result.

Table 4.16-8 identifies the utility improvements addressed as part of overall Baylands development in other EIR sections and those analyzed in Impact UTL-2.

[354] Analysis addressing hazards and hazardous materials can be found in Section 4.13.

[355] Geological impact analyses related to suitable of soils for underground utility lines can be found in Section 4.15.

[356] See Section 4.11 for analysis of the energy consumption characteristics of the on-site water recycling facility.

Table 4.16-8: Summary of Baylands Water, Wastewater, Energy, and Telecommunications Utility Facilities Addressed in Impact UTL-2 and as Part of Overall Baylands Development

Physical Improvements	Description
Potable Water: see Draft EIR Section 3.3.2h	Included in analyses of overall Baylands construction and operation impacts are: • Removal of existing Baylands water system. • Construction of on-site potable water system improvements as illustrated in Draft EIR **Figure 3-43**. • Construction of on-site water storage reservoir.
Recycled Water: see Draft EIR Section 3.3.2h	Included in analyses of overall Baylands construction and operation impacts are: • Construction of on-site water recycling facility. • Construction of on-site recycled water system improvements as illustrated in Draft EIR **Figure 3-45**. • Construction of off-site recycled water system improvements as illustrated in Draft EIR **Figure 3-42**.
Wastewater: see Draft EIR Section 3.3.2i	Included in analyses of overall Baylands construction and operation impacts are: • Removal of existing Baylands wastewater system. • Construction of on-site wastewater system improvements as illustrated in Draft EIR **Figure 3-46**. Analyzed in Impact UTL-2 is: • Increased wastewater flows, including waste activated sludge discharged to the SFPUC wastewater treatment system.

Energy Facilities: see Draft EIR Section 3.3.2k	Included in analyses of overall Baylands construction and operation impacts are:
	• Underground existing on-site electrical lines.
	• Construct on-site electrical system, including:
	  ○ New underground electrical lines;
	  ○ Switching substation;
	  ○ Distributed battery storage;
	  ○ 250 utility-scale battery storage facility;
	  ○ 55-acre solar farm; and
	  ○ Building- and parking lot-mounted renewable energy generation.
	Analyzed in Impact UTL-2 is:
	• Connections to and improvements at the PG&E Martin Substation as described in Draft EIR Section 3.3.2g.

Telecommunications Facilities: see Draft EIR Section 3.3.2l	Construction and operation of Baylands telecommunications facilities is analyzed as part of the overall impacts of Baylands development.

Impact Assessment

Construction of Off-Site Connections to and Improvements at the Martin Substation

As described in the Energy Facilities section of Chapter 3, *Project Description*, the Specific Plan proposes an on-site electrical switching substation and battery storage facility that will include connections to and improvements at the existing PG&E Martin Substation, which is located across Bayshore Boulevard from the Baylands. Improvements needed at the Martin Substation to connect the 250 MW battery storage facility and Baylands development include:

1. Install line disconnect switch and line coupling capacitor voltage transformers for the generation tie line with the following protection:
    a. Install line current differential (LCD) relay scheme on the Martin Substation — Baylands Battery 115kV line. Relays compliant with PG&E specifications and requirements at the installation will be used.
2. Install fiber termination at the Martin Substation

a. Each LCD scheme will be provided with redundant fiber circuits with no common point of failure.
    b. Install, terminate, and test new fiber cable from station property line to control building.

All electrical utility improvements would be designed and installed by PG&E in accordance with CPUC and PG&E design standards.

Discharge of Wastewater and Waste Activated Sludge

The SFPUC indicates that its Southeast Treatment Plant (SEP) currently receives an average dry weather flow of 60 mgd, which accounts for approximately 70 percent of its available dry weather flow capacity of 85.4 mgd. The SFPUC upgraded the SEP wet weather flow capacity to 250 mgd in 1994 to comply with federal regulations requiring a reduction in Combined Sewer Overflow discharges to the Bay. In addition, the North Point Wet Weather Facility operates when the SEP approaches capacity. To further reduce the frequency of combined sewer overflows into the Bay and increase system capacity, the San Francisco recently constructed a parallel 169-inch combined sewer facility along the County of San Francisco and County of San Mateo jurisdictional limits directly north of the Baylands.

Under the current contract, the City of Brisbane is allowed to convey dry weather sewer discharges to the SEP of up to 6.0 mgd. As identified in the 2017 City of Brisbane Sanitary Sewer System Master Plan (2017 SSMP), the current discharges for dry weather and wet weather conditions are approximately 0.72 mgd and 3.6 mgd, respectively.[357] As indicated in **Table 4.16-6**, the addition of Baylands average daily sewage generation (1.09 mgd) to City dry weather wastewater flows would not exceed Brisbane's 6.0 mgd capacity. Thus, no new or improved facilities would be required to treat Baylands-generated wastewater at the SEP.

Operation of the water recycling facility would generate flow to the SFPUC Southeast Treatment Plant that would consist of 0.74 mgd of excess wastewater not used by the WRF and 0.05 mgd of waste activated sludge, a byproduct of the membrane bioreactor system (MBR). The

[357] As stated in the Baylands Infrastructure Report, the BSD has no set capacity allocation at the SEP based on its current contract. The established BSD protocol has been that if a proposed project requires service for a demand greater than 200,000 gpd, then the district would request confirmation from the staff at the SEP that capacity is available.

Southeast Treatment Plant has a 250-mgd capacity and currently treats 57 mgd of wastewater with the City of Brisbane allowed to convey up to 6.0 mgd of dry weather sewer discharges. The 0.05 mgd of waste activated sludge would constitute 0.09 percent of the 57 mgd total currently treated at the Southeast Treatment Plant. Given this small percentage of treated sewage, waste activated sludge discharged from the Baylands WRF to the Southeast Treatment Plant would be sufficiently diluted so as to (1) not require any modifications to the plant or result in changes to water quality from treated wastewater and (2) not result in changes to water quality from treated wastewater discharged to San Francisco Bay.

Significance Conclusion for Impact UTL-2

Impact UTL-2 would be less than significant for the following reasons.

- Electrical utility improvements would be designed and installed by PG&E in accordance with CPUC and PG&E design standards. Conformance with applicable CPUC, PG&E, and City requirements would sustain efficiency of the utility grid and reduce life-cycle costs.
- No improvements to the SFPUC wastewater treatment facilities would be needed to treat Baylands-generated wastewater.
    - Baylands development would not exceed Brisbane's 6.0 mgd wastewater treatment capacity.
    - The raw sewage, treated sewage, and waste activated sludge discharged to SFPUC's Southeast Treatment Plant would be sufficiently diluted so as to (1) not require any modifications to the plant or result in changes to water quality from treated wastewater and (2) not result in changes to water quality from treated wastewater discharged to San Francisco Bay.

c. Threshold UTL-3: Waste Diversion

Methodology for Determining Significance

Analysis of the 2025 Specific Plan project's impacts identifies the amount of solid waste that would be generated during on- and off-site construction and operation of Specific Plan land uses. The analysis identifies the anticipated amount of construction debris and operational solid waste that would be generated and the amount that would be disposed of in landfills after implementation of applicable recycling/diversion programs.

Threshold UTL-3 analyzes the extent to which Baylands development would minimize solid waste generation and maximize diversion of solid wastes from landfills and incinerators set forth in applicable solid waste management and reduction statutes, regulations, plans, policies,

and strategies. Compliance with these statutes, regulations, plans, policies, and requirements would be indicative of a less than significant impact.

Impact Assessment

Construction Impacts

Baylands demolition and construction activities would generate a substantial amount of solid waste such as wood, metal, concrete, bricks, drywall/gypsum/sheetrock, carpet, and dirt/fill. Demolition of existing industrial buildings within the Baylands would generate the greatest amount of solid waste (1,828.06 tons on a peak demolition day) during site development compared to 920 tons on a peak construction day as shown in **Table 4.16-9**.

Table 4.16-9: Daily Construction Waste Generation Estimates

	Residential and Non-Residential (square feet)[a]	Construction Waste Generated[b]		
		Pounds	Tons[c]	Cubic Yards[c]
Demolition				
Total	231,400	36,561,200	18,280.60	26,115.14
Maximum Day[d]		3,656,120	1,828.06	2,611.51
Construction				
Phase 1	4,500,000	19,530,000	9,765.00	19,530.00
Maximum Day[e]		1,953,000	920.00	1,840.00
Phase 2	2,500,000	10,850,000	5,425.00	10,850.00
Maximum Day[e]		1,085,000	542.50	1,085.00

SOURCE: Metis Environmental Group, 2024.

NOTES:

a. Residential development is assumed to have an average of 1,300 square feet per dwelling unit.
b. Demolition was assumed to generate approximately 158 pounds of solid waste per square foot of building area. Construction was assumed to generate 4.34 pounds of waste per square foot of building area. Construction solid waste generation based on USEPA, 2009.
c. Weight of solid waste was converted to cubic yards based on WasteCap Resource Solutions, Inc., 2011.
d. Maximum day is assumed to represent 10 percent of the total square footage undergoing demolition.
e. Maximum day is assumed to represent 10 percent of the total square footage undergoing construction.

Operations

As shown in **Table 4.16-10**, an estimated 1,703.37 cubic yards of solid waste would be generated weekly within the Baylands, 374.12 cubic yards of which would be hauled to a landfill based on Recology's projected 78 percent diversion rate including compliance with the City's Municipal Code and applicable state and federal regulations.

Table 4.16-10: Baylands Projected Weekly Solid Waste Generation

Source	Size	Trash To Landfill (cubic yards)	Recycling (cubic yards)	Composting (cubic yards)	TOTAL (cubic yards)
Residential	2,200 dwelling units	185.1	479.30	174.30	838.70
Commercial	6,500,000 sf building area	150.0	375.00	150.00	675.00
Hotel	500,000 sf building area	30.0	75.00	30.00	135.00
Park	64.4 acres	5.60	20.30	13.30	39.20
Community Center	3,000 sf building	0.95	1.90	1.30	4.15
School	350 students	2.47	7.29	1.56	11.32
TOTAL		**374.12**	**958.79**	**370.46**	**1,703.37**

NOTES: Source for waste generation and diversion rates: Recology San Francisco, 2024.

Significance Conclusion for Impact UTL-3

Baylands development would minimize solid waste generation and maximize diversion of solid wastes from landfills and incinerators consistent with applicable solid waste management and reduction statutes, regulations, plans, policies, and strategies, resulting in a less than significant impact for the following reasons.

- Baylands development would meet the requirements of Brisbane Municipal Code Chapter 15.75 that a minimum of 65 percent of nonhazardous construction and/or demolition waste and 100 percent of inert solid material associated with excavations and land clearing operations, including trees, stumps, and rocks be recycled and/or salvaged for re-use.
- Baylands development would, at a minimum, participate in the same waste diversion programs provided by Recology operations to residential and commercial customers within the City and County of San Francisco, which exceed the requirements of applicable solid waste management and reduction statutes, regulations, plans, policies, and strategies and are more extensive than those currently available within Brisbane.[358]

[358] CalRecycle, *Disposal Rate Calculator*, access on June 21, 2024, Disposal Rate Calculator. For 2023, San Francisco reported a disposal rate of 3.4 pounds per resident and 3.9 pounds per employee, which are below the target rates of 6.6 pounds per resident and 10.6 pounds per employee set for San Francisco by CalRecycle. By comparison, South San Francisco Scavenger achieved a disposal rate of 12.6 pounds per resident and 6.9 pounds per employee, which are also below the target rates of 16.9 pounds per resident and 7.9 pounds per employee set for Brisbane by CalRecycle.

San Francisco has long been recognized for its zero waste programs. In 2012, San Francisco succeeded in diverting close to 80% of its waste, the highest rate achieved by any major city in the US. San Francisco also reported a 11.7% reduction in total disposal volumes from 2015-20. San Francisco and Recology are highlighted as a case study for zero on the US EPA website (https://www.epa.gov/transforming-waste-tool/zero-waste-case-study-san-francisco).

d. Threshold UTL-4: Landfill Capacity

Methodology for Determining Significance

The analysis of the Specific Plan's impact on solid waste and landfill facilities identifies changes in the amount of solid waste that would be generated during Specific Plan construction and operation. The analysis identifies the anticipated amount of non-hazardous construction debris and operational solid waste that would be generated from implementation of the Specific Plan and the amount that would be processed at Recology's San Francisco transfer facility and disposed of in landfills after compliance with applicable recycling/diversion programs.

Specific Plan solid waste generation was compared to the daily capacity of Recology's San Francisco transfer facility and the amount of solid waste to be disposed of in landfills after recycling/diversion was compared with the available capacity of the landfills serving the site to assess the significance of the Specific Plan's solid waste generation during construction and at build-out. Impacts were considered significant if development within the Specific Plan area would result in a substantial increase in solid waste that would exceed available landfill capacity.

Impact Assessment

As noted in the analysis of Impact UTL-3, Baylands development would generate:

- 2,611.51 cubic yards of demolition waste during the peak day of demolition operations;
- 1,840.00 cubic yards of construction waste during the peak construction day; and
- 374.12 cubic yards of waste to be disposed of at a landfill on a weekly basis at buildout (72.82 cubic yards based on five pickup days per week).

During the maximum construction day, 75 percent of the 1,840.00 cubic yards of construction waste generated within the Baylands would be diverted from landfill disposal. Thus, a maximum of 460 cubic yards of construction waste would need to be disposed of at a landfill. Because a maximum construction day could occur after site occupancy begins, a peak day for waste generation to be sent to a landfill is estimated to be 535 cubic yards (460 cubic yards of construction waste plus 55 cubic yards of operations waste (374.12 cubic yards of waste weekly divided by 5 days of trash pickup).

Landfill waste generated within the Specific Plan area would be hauled to Recology's Hay Road Facility for disposal. The Hay Road landfill has approximately 27,569,000 cubic yards of capacity with an estimated remaining site life of 38 years. The Hay Road facility is permitted to receive 3,200 tons of waste daily, and, according to Recology, has sufficient daily capacity to accommodate the Specific Plan's needs.

Significance Conclusion for Impact UTL-4

Because Recology's Hay Road Landfill currently has daily capacity to accept solid waste from the Baylands and approximately 27,569,000 cubic yards of long term capacity with an estimated remaining site life of 38 years, the addition of 535 cubic yards of solid waste per day from the Specific Plan area on a peak construction day (3,054 tons) and 427 tons per day following construction would not exceed the permitted daily capacity of the Hay Road landfill or substantially reduce its life expectancy. Thus, Specific Plan development would not exceed the capacity of area landfills, and no new or expanded facilities would be needed.

Impacts would therefore be less than significant.

4.17 PUBLIC SERVICES AND FACILITIES

4.17.1 INTRODUCTION

a. Overview

This section addresses the physical environmental effects of new or expanded governmental facilities that are necessary to maintain acceptable service levels for police, fire protection, schools, libraries, and other essential services. Because CEQA focuses on physical environmental effects, this section analyzes projected increased service demands that would be generated by the 2025 Specific Plan project as a means for determining whether new or expanded public facilities might be needed that could cause significant physical environmental effects. Thus, increased demand for public services, the need to expand staffing associated with public services, and increased numbers of students at area schools are not considered physical changes in the environment. However, construction of new facilities or expansion of existing facilities to accommodate increased demand, staffing, or students are considered to be physical changes to the environment that could result in a significant impact.

b. Definitions

Fire confinement refers to holding structure fires to the floor of origin (i.e., preventing the fire from spreading to additional floors after first arrival on the scene).

Index crimes are the eight crimes the Federal Bureau of Investigation combines to produce its annual crime index. The Federal Bureau of Investigation created a common definition for crime comparison to compare statistical information on a national basis. The index seeks to overcome differences in individual state statutes and create a standardized definition of crime classification. The City-Data.com index weighs serious crimes and violent crimes more heavily. A higher index means more crime. The crime index adjusts for the number of visitors and daily workers commuting into cities.

Response time refers to the time between when a police or fire call for service is received, and the time first responders arrive at the scene.

Running distance refers to the distance a fire company must travel on roadways and highways between the station and the scene to which the company is responding.

Squad refers to a specialized fire protection company whose primary focus may be suppression but carry specialized equipment and are trained to perform hazmat, rescue, and other special functions.

Total reflex time is measured from the time a call is received at the county communications center to the arrival of the first apparatus at the scene. Typically, for the public, the response time clock begins when an individual becomes aware there is an emergency incident occurring. While the difference between the two may vary by only a minute or two, the distinction is significant in that fire service response time goals are set to measure fire service performance from the moment the emergency enters the system.

4.17.2 PHYSICAL ENVIRONMENTAL SETTING

a. Baseline

The baseline for analysis of public services effects consists of conditions that existed at the release of the second Notice of Preparation during spring 2023. When existing conditions and analyses address a full year of data, the most recent year for which data is available is used and specific citations are provided indicating the year used to describe existing conditions and for analysis purposes.

b. Police Services

The Brisbane Police Department provides police services to residents and businesses within the City of Brisbane. The Department currently operates from its headquarters located in City Hall at 50 Park Place, less than 0.5 miles from the Baylands.

Police Staffing

The Department is staffed with 16 sworn officers and 4 support staff members. The staff is composed of one chief, one commander, four patrol sergeants, one corporal, and nine patrol officers. Officers are assigned specialty positions; for example, there is one K9 officer, two traffic officers, and one SWAT officer. Current patrol staffing consists of a single beat with a minimum of one sergeant or shift supervisor and two other officers per shift.

The current ratio of sworn police officers per 1,000 residents is approximately 3.42, based on the city's 2022 population of 4,672. Based on a total resident and worker population of almost 13,000 in 2022, a citywide ratio of 1.23 officers per 1,000 residents and workers is currently provided.

Per Department practice, five sworn officers are required to staff a patrol beat with a single officer 24 hours per day, seven days per week. Currently, Brisbane Police officers work four 12-hour shifts with four days off. This results in two shifts (dayshift and nightshift) and two teams, one of which is working the four days the other team is off. Considering there may be one officer on vacation, sick, or away at training at any given time, the result is that a minimum of

five officers is required to cover each 24/7 shift. Exceptions include staffing for daytime positions such as Community Service Officers, Detectives, and School Resource Officers.

The Brisbane Police Department maintains thirteen vehicles, including six patrol cars, two motorcycles, one pick-up truck, three unmarked detective vehicles, two unmarked administration vehicles and one unmarked Code Enforcement vehicle.

Service Demand

Table 4.17-1 summarizes the number of service calls to the Brisbane Police Department and average response time for calendar year 2022.

Table 4.17-1: Brisbane Police Department Calls for Service and Average Response Times, 2022

Service Call Type	Number of Service Calls	Average Response Time (minutes: seconds)
Priority 1 Emergency life threatening	107	3:09
Priority 2 Emergency response (other)	1,566	3:57
Priority 3 Non-emergency	1,186	5:20
TOTAL CALLS FOR SERVICE	**2,859**	

SOURCE: Brisbane Police Department, 2023

Based on City-Data's crime index, Brisbane's 2020 crime rate was 228.6, which is less than, but comparable to, the U.S. average of 254.8 (City-Data.com 2023). Rates in neighboring cities include 182.6 in South San Francisco, 129.4 in Daly City, 387.4 in San Francisco, and 1,234.8 in Colma. As a City with a small resident population and a large daytime worker population, Brisbane's per capita crime rate was higher than in 79.6 percent of U.S. cities. The 2020 Brisbane crime rate fell by 5 percent compared to 2019. In the last five years, Brisbane has seen a rise in violent crime and a decline in property crime (City-Data.com 2023).

c. Fire Services

Formed in 2003, the North County Fire Authority (NCFA) is a Joint Powers Authority that provides fire protection, emergency medical, and hazardous materials assistance services to the cities of Brisbane, Daly City, and Pacifica. NCFA will be responsible for providing fire protection services to the Baylands.

NCFA's Fire Prevention Division seeks to ensure that all new buildings comply with state and local building and fire code requirements. Members of the Fire Prevention Division attend meetings during the design and development stage with architects, fire protection engineers,

and contractors to assure code compliance, accelerate the review and approval process, and minimize construction delays. One of the most important local requirements is that every new building constructed is equipped with an automatic fire sprinkler system.

In addition to its firefighting and emergency medical response capabilities, the NCFA, through its Training and Special Operations Divisions, train for and respond to emergencies involving hazardous materials, as well as incidents involving cliff/high angle, urban search and rescue, structural collapse, water rescue, confined space, trench rescue, terrorism/weapons of mass destruction, major transportation incidents - BART/Caltrain, and mass casualty incidents.

Facilities and Staffing

The NCFA currently operates eight engine companies and one ladder truck company in eight fire stations within its 60-square-mile service area. NCFA fire stations include:

- City of Brisbane
    - Fire Station No. 81 at 3445 Bayshore Boulevard (engine company)
- City of Daly City
    - Fire Station No. 91 at 151 Lake Merced Boulevard (engine company)
    - Fire Station No. 92 at 18 Bepler Street (engine company)
    - Fire Station No. 93 at 464 Martin Street (engine company)
    - Fire Station No. 94 at 444 Gellert Boulevard (engine company)
    - Fire Station No. 95 at 191 Edgemont Drive (engine and ladder truck companies)
- City of Pacifica
    - Fire Station No. 71 at 616 Edgemar Avenue (engine company)
    - Fire Station No. 72 at 1100 Linda Mar Boulevard (engine company)

There are at least three firefighters, including at least one paramedic, assigned to each engine, while the ladder truck is staffed with four personnel. In addition, a minimum of two battalion chiefs and one deputy fire chief are on duty 24/7. Currently, the NCFA maintains 30 personnel on duty daily.

Fire Station No. 81 (Brisbane)

The City of Brisbane and the Baylands are served by NCFA Fire Station No. 81 (Brisbane), which is located on an approximately 94,000 s.f. site (3445 Bayshore Boulevard) at the intersection of Bayshore Boulevard and Valley Drive in Brisbane. The 1-story, 7,700 s.f. station has two apparatus bays housing four vehicles, with 18 turnout gear lockers, a clean-up sink, washer and dryer for house laundry, and a hose storage rack to accommodate one complement

of synthetic hose along the sides of the bays. The station is staffed 24/7 by one three-person engine company. Thirteen personnel are assigned to Station No. 81, including one Assistant Fire Marshal, three captains, and nine firefighters.

Based on a review of current operations at the existing station, the City of Brisbane and NCFA determined that an 8,600 to 9,000 s.f. facility would be needed to meet current building codes, the California Essential Services Act, the American with Disabilities Act, National Fire Protection Association (NFPA), and Occupational Safety and Health Administration (OSHA) design standards.

NCFA Fire Stations No. 93 and No. 95 (Daly City)

Fire Station No. 93, located at 464 Martin Street in Daly City, located approximately one mile from the Baylands, is the next closest NCFA station. This station is staffed by a three-person engine company.

NCFA's existing aerial ladder company is located at Station No. 95, located at 191 Edgemont in Daly City. This station is more than 6.5 miles running distance and more than 15 minutes running time from the closest portion of the Baylands.

Service Demand

The NCFA responded to approximately 9,774 incidents throughout its service area in 2020. Most of these calls were for medical emergencies, followed by rescue, alarm, assist, vehicle accidents, other/unknown, fires, and hazmat/hazardous conditions. NCFA achieved getting a first due fire company on scene in 5 minutes and 28 seconds to all fire and medical emergencies from time of dispatch to arrival, which more than achieved its goals (NCFA 2022).

In 2022, Station No. 81 responded to a total of 822 service calls; 626 of which originated from within the City of Brisbane as follows:

- Emergency Medical Services – 181
- Alarm – 149
- Traffic Collision – 62
- Public Assist – 49
- Fire – 31
- Other – 154

The average response time to calls that originated from within the City was 5 minutes and 50 seconds (NCFA 2023).

d. Schools

The Bayshore Elementary School District (Bayshore ESD), Brisbane School District (Brisbane SD), and the Jefferson Union High School District (JUHSD) provide PK/TK–12 public education

to Brisbane residents (see **Figure 4.17-1**). The Baylands Specific Plan area is almost entirely located within the Bayshore ESD for grades PK–8. The area along the existing Industrial Way is within the Brisbane SD for grades TK–8. The entirety of the Baylands is within the JUHSD for grades 9–12. As in many Bay Area school districts, enrollment in the school districts serving Brisbane has been declining (see **Table 4.17-2**).

Table 4.17-2: Enrollment Data for Schools Serving Brisbane

School	Capacity	7-Year Peak Enrollment[a]	2022–2023 Enrollment	2018–2019 (Pre-Pandemic Enrollment)	7-Year Average Enrollment
Bayshore Elementary School District[b]					
Bayshore School (PK–8)	568	409 (2019–20)	347	409 (2019–2020)[c]	367
DISTRICTWIDE TOTALS	**568**	**409 (2019–20)**	**347**	**409**	**367**

Oceana High School (Pacifica)	997	619 (2017–18)	535	599	589
Westmoor High School (Daly City)	1,677	1,598 (2016–17)	1,302	1,526	1,447
Jefferson High School (Daly City)	1,264	1,325 (2020–21)	1,159	1,217	1,213
Thornton High School (Alt. Education)	198	140 (2019–20)	77	124	113
DISTRICTWIDE TOTALS	**5,691**	**4,869 (2017–18)**	**3,812**	**4,278**	**4,182**

SOURCES: California Department of Education (CDE) Data Quest, 2023, Bayshore Elementary School District Letter to Metis Environmental Group, September 29, 2023, and Jefferson Union High School District Letter to Metis Environmental Group, September 28, 2023

NOTES:

a. The numbers shown in this column identify the highest enrollment in a certain year for each school and district during the 7-year period of 2016-2023. The numbers are not meant to be added together.
b. The Bayshore School consolidated into one school in 2017. Therefore, peak enrollment and average enrollment numbers are for the 6-year time period between 2017-2023.
c. The Bayshore School District provided 2019–2020 for its pre-pandemic enrollment as enrollment was higher this year than in 2018-2019.
d. N/A= Not Available.

Bayshore Elementary School District

The Bayshore ESD serves residents in the eastern portions of Daly City and Brisbane. In 2017, the Bayshore ESD consolidated Bayshore Elementary School and Robertson Intermediate School (grades 5–8) into the Bayshore School, which currently serves Pre-Kindergarten (PK) through grade 8. The PK–8 school is designed to accommodate 568 students, with 47,000 s.f. on two floors and an indoor/outdoor theater/gym. The Bayshore School is located 0.5 miles west of the Baylands at 155 Oriente Street in Daly City. Bayshore School enrollment was 347 students in 2022–2023, down from its seven-year peak of 409 in the 2019–2020 school year. The school's six-year average enrollment is 367 students (CDE 2023).

Figure 4.17-1: Bayshore and Brisbane School District Boundaries

Brisbane School District

The Brisbane SD encompasses most of Brisbane and parts of Daly City and South San Francisco. The Brisbane SD is a Transitional Kindergarten (TK)–8 school district composed of two elementary schools and one middle school. The district had a combined enrollment of 454 students in the 2022–2023 school year, down from the seven-year peak of 475 students in the 2019–2020 school year. The Brisbane SD's seven-year average enrollment is 464 students (CDE 2023).

The elementary school closest to the Baylands is Brisbane Elementary School, located less than 1 mile west at 500 San Bruno Avenue. Panorama Elementary School, located at 25 Bellevue Avenue in Daly City, is less than 2 miles west of the Baylands. Lipman Middle School, located at 1 Solano Street, is also less than 1 mile from the Baylands.

Jefferson Union High School District

Residents of the Bayshore ESD and Brisbane SD are also residents of the Jefferson Union High School District. In 2022–23, the JUHSD served approximately 3,800 students in grades 9 through 12, as well as adults, in the cities of Pacifica, Brisbane, Daly City, Colma, South San Francisco, San Bruno and a portion of unincorporated San Mateo County.

The JUHSD operates four high schools—Jefferson (Daly City), Westmoor (Daly City), Terra Nova (Pacifica), and Oceana (Pacifica)—in addition to the Thornton continuation high school (Daly City). Enrollment in the JUHSD has shown a relatively steady decline over the last several years. District enrollment was 3,812 in the 2022–23 school year, down from the peak of 4,278 in pre-pandemic year 2018-2019. Each of the high schools' 2022–2023 enrollments were below their respective 7-year average and below pre-pandemic enrollment (CDE 2023).

The two JUHSD schools closest to the Baylands are Jefferson High School, approximately 3 miles west of the Baylands at 6996 Mission Street in Daly City; and Westmoor High School, approximately 4 miles west of the Baylands at 131 Westmoor Avenue in Daly City.

e. Library Services

San Mateo County operates 13 community libraries in 12 cities and towns within the incorporated and unincorporated areas of San Mateo County. Brisbane is served by the Brisbane Branch Library, located 0.5 miles west of the Baylands. The 7,700 square foot Brisbane Library opened at its new location at 163 Visitacion Avenue in April 2021. Features include the Library's children's area, teen space, quiet room, history room and makerspace complete with 3D printers, a Glowforg laser cutter, sewing machines, virtual reality, GoPro kits, and more. The exterior portions of the site include a courtyard, patio area, vegetated areas, and a water garden. Parking is accommodated on-street; no off-street parking is available.

A library card issued at the Brisbane Library entitles patrons to online resources as well as to use the resources and services available at all the libraries in the Peninsula Library System, which is a consortium of 35 public and community college libraries working together to provide innovative and cost-effective service. Additionally, 13 branch libraries of the Daly City, San Francisco, and South San Francisco public library systems are located within 3.5 miles of the Baylands.

f. City of Brisbane Corporation Yard

The City of Brisbane corporation yard is located at 1020 Tunnel Avenue on a site leased from the company that operates the Kinder Morgan tank farm. The corporation yard consists of a single building along with outside storage and parking areas for equipment used for infrastructure maintenance throughout the City.

4.17.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

There are no federal laws, plans, programs, or regulations relevant to physical environmental effects associated with public services or facilities.

b. State Laws, Plans, Programs, and Regulations

Fire Protection

California Fire (Building) Code

The California Building Code establishes building requirements for construction and renovation. The 2022 edition, which was published July 1, 2022, took effect on January 1, 2023. Included in the California Building Code is the California Fire Code, which establishes minimum requirements that would provide a reasonable degree of safety from fire, panic, and explosion. The Fire Prevention Code mandates certain requirements, including, among other things, that plans submitted in support of an application for a building permit must first be reviewed by the fire department. The City of Brisbane enforces the Building Code through its building permit review process. The City of Brisbane has adopted the 2022 edition of the California Fire Code as its Fire Prevention Code within the Buildings and Construction Chapter of the City's Municipal Code.

Health and Safety Code

The California Health and Safety Code, Section 13000, et seq., includes regulations concerning building standards (as also set forth in the California Building Code), fire protection systems, fire protection devices (such as extinguishers and smoke alarms, and high-rise building

standards), and standards for building inspection and certification. The City of Brisbane enforces these standards through its building permit review process.

School Facilities

Local Control Funding Formula

Enacted in 2013, Local Control Funding Formula legislation fundamentally changed how local educational agencies throughout the state were funded. The law aims to improve outcomes by providing more resources to meet the education needs of low-income students, English language learners, and foster youth. The law also expanded the autonomy of local districts by giving them greater flexibility over how they choose to spend state funding. In exchange for greater flexibility, school districts are now required to provide greater transparency to local communities on how district funds will be spent by producing a 3-year spending and academic plan called a Local Control and Accountability Plan.

School Districts are funded through a combination of local property taxes and state funding from the State School Fund and Education Protection Account. For school districts and charter schools, local control funding is allocated through the "principal apportionment," which is a series of apportionment calculations that adjust the flow of state funds throughout the fiscal year as information becomes known.

With the exception of a few categorical funds, money goes directly to districts based on student attendance. Each district receives the same base grant for each student based on grade level. Then the district receives additional "supplemental" and "concentration" grants based on the numbers and concentration of high-need students (defined as low-income, English language learner, or foster youth). Thus, a district that serves more high-need students will receive more state funding overall than a district of the same size that serves fewer high-need students. A district must explain in its local spending plan how its use of supplemental and concentration funds will increase or improve services for high-need students in proportion to the increase in supplemental and concentration funds it receives.

Financing Act and Education Code

California Government Code Sections 53080, 65995, and 66001 authorize school districts to collect fees for construction of school facilities from new residential and commercial development. Additionally, California Education Code Sections 17620 through 17626 state that the governing board of any school district is authorized to levy a fee, charge, dedication, or other requirement against any construction within the boundaries of the district, for the purpose of funding the construction or reconstruction of school facilities, subject to any limitations set forth in Chapter 4.9 (commencing with Section 65995) of Division 1 of Title 7 of the Government Code. Current school fees for local school districts are $5.17/square foot (s.f.)

for residential development and $0.84/s.f. for commercial/industrial development (City of Brisbane 2024).

Senate Bill 50 – Leroy F. Greene Schools Facilities Act of 1998

Senate Bill (SB) 50, or the Leroy F. Greene School Facilities Act of 1998, restricts the ability of local agencies to deny project approvals on the basis that public school facilities (classrooms, auditoriums, etc.) are inadequate. Payment of school fees required by SB 50 for all new residential development projects[359] is considered "full and complete mitigation" for any impacts a project may have on school capacity. School impact fees are paid at the time of building permits to offset capital cost impacts associated with new developments, which result primarily from costs of additional facilities, related furnishings and equipment, and projected capital maintenance requirements. As such, cities and counties cannot require additional mitigation for any school impacts other than those required by law. While school fees are the sole mitigation available for the need to construct school facilities, the physical environmental changes caused by school construction are subject to CEQA analysis and mitigation if significant impacts would occur.

Assembly Bill 130 – Education Trailer Bill of 2021

In 2021, as part of the expansion to universal Pre-Kindergarten (PK), Governor Newsom signed AB 130 to phase in Transitional Kindergarten (TK) access for all of California's 4-year-olds. TK has been provided beginning in the 2022–23 school year for children turning 5 between September 2 and February 2 of that school year and reach full implementation for all students turning 4 years old by September 1 by 2025–26.

State Standards for School Site Selection: California Code of Regulations (CCR) Title 5, Section 14010

CCR Title 5, Section 14010 sets forth the California Department of Education's location, design, and safety criteria for school site location, including:

a. The net usable acreage and enrollment for a new school site shall be consistent with the numbers of acres and enrollment established in Tables 1–6 of the 2000 Edition, "School Site Analysis and Development" published by the California Department of Education and incorporated into this section by reference, in toto, unless sufficient land is not available, or circumstances exist due to any of the following:

    1. Urban or suburban development results in insufficient available land even after considering the option of eminent domain.

[359] School fees are also collected for commercial and industrial development on a square footage basis since parents are now permitted to register children for school by either their place of residence or place of employment.

2. Sufficient acreage is available, but it would not be economically feasible to mitigate geological or environmental hazards or other site complications which pose a threat to the health and/or safety of students and staff.
3. Sufficient acreage is available but not within the attendance area of the unhoused students or there is an extreme density of population within a given attendance area requiring a school to serve more students on a single site. Choosing an alternate site would result in extensive long-term bussing of students that would cause extreme financial hardship for the district to transport students to the proposed school site.
4. Geographic barriers, traffic congestion, or other constraints would cause extreme financial hardship for the district to transport students to the proposed school site.

b. If a school site is less than the recommended acreage required in subsection (a) of this section, the district shall demonstrate how the students will be provided an adequate educational program including physical education as described in the district's adopted course of study.

c. The property line of the site even if it is a joint use agreement as described in subsection (o) of this section shall be at least the following distance from the edge of respective power line easements:
    1. 100 feet for 50-133 kilovolt (kV) line.
    2. 150 feet for 220-230 kV line.
    3. 350 feet for 500-550 kV line.

d. If the proposed site is within 1,500 feet of a railroad track easement, a safety study shall be done by a competent professional trained in assessing cargo manifests, frequency, speed, and schedule of railroad traffic, grade, curves, type and condition of track need for sound or safety barriers, need for pedestrian and vehicle safeguards at railroad crossings, presence of high pressure gas lines near the tracks that could rupture in the event of a derailment, preparation of an evacuation plan. In addition to the analysis, possible and reasonable mitigation measures must be identified.

e. The site shall not be adjacent to a road or freeway that any site-related traffic and sound level studies have determined will have safety problems or sound levels which adversely affect the educational program.

f. Pursuant to Education Code sections 17212 and 17212.5, the site shall not contain an active earthquake fault or fault trace.

g. Pursuant to Education Code sections 17212 and 17212.5, the site is not within an area of flood or dam flood inundation unless the cost of mitigating the flood or inundation impact is reasonable.

h. The site shall not be located near an above-ground water or fuel storage tank or within 1500 feet of the easement of an above-ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission.

i. The site is not subject to moderate to high liquefaction or landslides.

j. The shape of the site shall have a proportionate length to width ratio to accommodate the building layout, parking and playfields that can be safely supervised and does not exceed the allowed passing time to classes for the district.

k. The site shall be easily accessible from arterial roads and shall allow minimum peripheral visibility from the planned driveways in accordance with the Sight Distance Standards established in the "Highway Design Manual," Table 201.1, published by the Department of Transportation, July 1, 1990, edition, and incorporated into this section by reference, in toto.

l. The site shall not be on major arterial streets with a heavy traffic pattern as determined by site-related traffic studies including those that require student crossings unless mitigation of traffic hazards and a plan for the safe arrival and departure of students appropriate to the grade level has been provided by city, county or other public agency in accordance with the "School Area Pedestrian Safety" manual published by the California Department of Transportation, 1987 edition, incorporated into this section by reference, in toto.

m. Existing or proposed zoning of the surrounding properties shall be compatible with schools in that it would not pose a potential health or safety risk to students or staff in accordance with Education Code Section 17123 and Government Code Section 65402 and available studies of traffic surrounding the site.

n. The site shall be located within the proposed attendance area to encourage student walking and avoid extensive bussing unless bussing is used to promote ethnic diversity.

o. The site shall be selected to promote joint use of parks, libraries, museums and other public services, the acreage of which may be included as part of the recommended acreage as stated in subsection (a) of this section.

p. The site shall be conveniently located for public services including but not limited to fire protection, police protection, public transit, and trash disposal whenever feasible.

q. The district shall consider environmental factors of light, wind, noise, aesthetics, and air pollution in its site selection process.

r. Easements on or adjacent to the site shall not restrict access or building placement.

s. The cost and complications of the following shall be considered in the site selection process and should not result in undue delays or unreasonable costs consistent with State Allocation Board standards.

    1. Distance of utilities to the site, availability and affordability of bringing utilities to the site.
    2. Site preparation including grading, drainage, demolition, hazardous cleanup, including cleanup of indigenous material such as serpentine rock, and off-site development of streets, curbs, gutters, and lights.
    3. Eminent domain, relocation costs, severance damage, title clearance and legal fees.
    4. Long-term high landscaping or maintenance costs.
    5. Existence of any wildlife habitat that is on a protected or endangered species list maintained by any state or federal agency, existence of any wetlands, natural waterways, or areas that may support migratory species, or evidence of any environmentally sensitive vegetation.

t. If the proposed site is on or within 2,000 feet of a significant disposal of hazardous waste, the school district shall contact the Department of Toxic Substance Control for a determination of whether the property should be considered a Hazardous Waste Property or Border Zone Property.

u. At the request of the governing board of a school district, the State Superintendent of Public Instruction may grant exemptions to any of the standards in this section if the district can demonstrate that mitigation of specific circumstances overrides a standard without compromising a safe and supportive school environment.

c. Regional Plans Programs, and Regulations

North County Fire Authority

Formed in 2003, the North County Fire Authority (NCFA) is a Joint Powers Authority that provides fire protection, emergency medical, and other hazardous assistance services to the communities of Brisbane, Daly City, and Pacifica.

As part of the environmental review for the Program EIR, the NCFA and City of Brisbane set the following performance standards for emergency response to the Baylands:

- Total Reflex Time
    - Seven-minute Total Reflex Time (four-minute travel time) for the first responding fire company for 90 percent of incidents.

  - Eleven-minute Total Reflex Time (eight-minute travel time) for multiple fire companies for 90 percent of all structure fires.

- Fire Station Location and Reliability
  - All Baylands development to be within 1.5 miles of a fire station.
  - All Baylands development to be within 2.0 miles of a ladder truck.
  - Fire Confinement Success Rate – holding structure fires to floor or origin (i.e., preventing the fire from spreading to additional floors after first arrival on the scene) for 90 percent of structure fires.

d. City of Brisbane Plans, Ordinances, and Regulations

General Plan

Chapter V: Land Use

Policy LU.19: Provide centrally located public facilities for public services and community events so as to maximize use by Brisbane residents and businesses.

Program LU.19.d: In coordination with the School District, continue shared community use of District facilities.

Chapter X: Community Health and Safety

Policy 156: Take advantage of technology to require built-in fire safety systems using appropriate materials and technology.

Policy 158: Provide a level of fire protection proportional to the size, risks and service demands of the community within budgetary constraints.

Program 158a: 1n conjunction with development applications, evaluate fire service requirements, response times and levels of risk. Require impact fees and exactions to maintain the level of service and to provide for any special equipment needs.

Policy 160: Provide a level of police protection of persons and property proportional to the size and law enforcement needs of the community within budgetary constraints.

Program 160a: In conjunction with land use development applications, evaluate police service requirements and response times. Require impact fees and exactions to maintain the level of service.

Policy 163: Continue to ensure a three-minute emergency response average and a ten-minute average response to other calls for service.

Chapter XII: Policies and Programs by Subarea

Policy BL.1: Development within the Baylands Subarea shall be subject to the City's approval of a single specific plan for the entirety of the Baylands Subarea and a development agreement that is consistent with General Plan policies, incorporates all applicable EIR mitigation measures, and is consistent with the following standards:

D. Each increment of development shall be provided with appropriate transportation related and other infrastructure, facilities, and site amenities as determined by the City. Such transportation related and other infrastructure, facilities, and site amenities (e.g., parks, open space preservation, habitat enhancement) shall be provided at the developer's cost.

Municipal Code

The City of Brisbane adopted the 2022 edition of the California Fire Code as its Fire Prevention Code within the Buildings and Construction Chapter of the City's Municipal Code. The Fire Prevention Code mandates certain requirements, including, among other things, that plans submitted in support of an application for a building permit must first be reviewed by the fire department.

City of Brisbane Emergency Operations Plan

The City, through its Emergency Services Department, has developed an Emergency Operations Plan that provides procedures and establishes responsibilities for coordinating response to major emergencies and disasters. The City's Emergency Operations Center is at 50 Park Place (City Hall) and provides a centralized location where emergency management coordination and decision making can be supported. When activated, the Emergency Operations Center provides support for several critical tasks related to communications, coordination, resource management, and executive leadership (City of Brisbane 2018).

4.17.4 RELEVANT SPECIFIC PLAN PROVISIONS

An approximately 5-acre middle school (grades 6–8) site is proposed in the vicinity of Main Street within the Bayshore School District portion of either Block 6, 9, or 10, or to the south of Main Street within Block C2 of the Icehouse Hill District. The Specific Plan is silent in relation to police, fire, library, and other public facilities.

4.17.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of public services and facilities impacts.

Threshold PUB-1: **The Baylands Specific Plan would cause a significant impact if adverse physical environment effects associated with construction of new or physically altered on-site or off-site fire protection, police, school, or other public facilities would cause or contribute to one or more of the significant impacts not disclosed elsewhere in this EIR.**

4.17.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact PUB-1: New and Expanded Public Facilities

Methodology for Determining Significance

Determining the significance of public services and facilities impacts is based on evaluating:

- The extent to which the Specific Plan would increase demand for services;
- Whether an increased demand for services would require construction of new facilities or expansion of existing facilities to maintain adequate response times; and
- Whether such construction of new facilities or expansion of existing facilities would have an adverse physical effect on the environment.

A significant impact would occur if (1) the Specific Plan−generated demand for service could not be accommodated within existing facilities and therefore require the construction of new or expansion of existing facilities that (2) would have an adverse physical effect on the environment. Because the physical environmental effects of project-wide activities such as site grading and building construction cannot be parsed out and assigned to individual public facilities within the Baylands. Thus, the significance determination for Impact PUB-1 focuses on whether construction of a new or expansion of an existing public facility necessitated by Baylands development would cause a significant impact in addition to those analyzed for overall Baylands development in the other sections of this chapter.

Physical environmental effects associated with demolition and removal of existing on-site buildings, along with grading for site drainage, excavation/filling of trenches for underground utility systems throughout the Baylands, and for construction of new and expanded public facilities within the Baylands are largely indistinguishable from those of other Specific Plan grading and construction activities and are not parsed out separate from the other Specific Plan construction impacts, including those leading to significant unavoidable net increases in NO_X emissions (Impact AQ-2) and greenhouse gas emissions (Impact GHG-1) during grading and

construction. Demolition, removal, and construction activities within the Baylands are included as part of the grading quantities used to analyze transportation, air quality, greenhouse gas, and energy construction impacts (Sections 4.8, 4.9, 4.10, and 4.11, respectively). Analysis of construction noise impacts for Baylands development incorporates noise generated by grading, excavations, demolition, and construction of public facilities in its analyses and conclusions (see Section 4.12).

Impacts of site grading and construction on biological, cultural, tribal cultural, and paleontological resources include the contribution of new and expanded public facilities to the overall impacts of site grading for Baylands development. Hazards and hazardous materials impact analyses include the contribution of utility facilities as well as potential impacts of vibration generated by construction activities that may adversely affect existing utilities within the Specific Plan area.[360] Geological impact analyses address the site's suitability for construction of above-ground buildings, including those used to provide public services.[361] Ongoing energy generation and consumption by new and expanded public facilities are included in the analysis of the site's energy generation and demand.[362]

Impact Assessment

Police Facilities

Table 4.17-1 summarizes the number of service calls to the Brisbane Police Department and average response time for calendar year 2022. These calls for police service were generated by a resident population of 4,721 and a daytime worker population of approximately 13,000. The Baylands Specific Plan is expected to generate a maximum resident population of 4,905 and a maximum daytime worker population of approximately 19,480 at buildout. Thus, the number of calls for police service received by the Brisbane Police Department as a result of Baylands development is expected to approximately double.

To accommodate the anticipated doubling of service calls that Baylands development would cause and maintain adequate response times, the City developed a Police Facilities and Staffing Plan (BPD 2023, Appendix N.1). The Plan proposes the following changes in police service, staffing, and facilities:

- Prior to the start of Baylands grading operations:
    - Initiate a two-beat patrol system by adding a new 24/7 officer shift and one civilian daytime shift along with the equipment needed to support the additional shift.

[360] Analysis addressing hazards and hazardous materials can be found in Section 4.13.

[361] Geological impact analyses related to suitable of soils for underground utility lines can be found in Section 4.15.

[362] See Section 4.11 for analysis of the energy consumption characteristics of the on-site water recycling facility.

- Prior to issuance of the first Certificate of Occupancy for new residential or commercial buildings within the Baylands:
    - Construct and initiate operation of a police substation within the Baylands to accommodate additional required staff.

      The facility would be sized to accommodate a waiting area, interview room, office space to allow officers assigned to the Baylands-designated patrol beat to take reports while remaining within the beat area, temporary holding facilities, restroom, storage area, and emergency generator.

      The Baylands substation would be located within a ground-floor location that is easily visible and accessible to the general public.

The Police Facilities and Staffing Plan (Appendix N.1) determined that the existing police station has adequate space to accommodate the projected two-beat patrol system. However, given the Baylands' location in relation to downtown Brisbane and the existing police station, the BPD also determined that maintaining adequate response times would require a substation within the Baylands.

The physical environmental effects associated with construction and operation of a new police substation within the Baylands, including increases in the demand for utilities, are addressed in the overall analysis of Baylands development set forth in relevant sections throughout this EIR, including mitigation of impacts as necessary.

Fire Protection Facilities

As discussed in Section 4.17.3 (b), in 2022, NCFA Station No. 81 responded to a total of 822 calls, of which 626 originated from within the City of Brisbane. These calls for service were generated by a resident population of 4,721 and a daytime worker population of approximately 13,000. At buildout, the Baylands Specific Plan is expected to generate a resident population of 4,905 and a daytime worker population of approximately 19,480. Thus, the Baylands Specific Plan would approximately double Brisbane's resident and daytime worker population. As a result, the number of calls for fire protection service received by the Brisbane Fire Station is expected to approximately double with buildout of the Specific Plan. Service calls for specialized services, including but not limited to rescue and hazmat, are also expected to increase with buildout of the Specific Plan.

Because many Baylands residential dwellings and nearly all commercial office square footage is anticipated to occur within buildings that are 75 feet or more in height, including six towers proposed to be more than 250 feet (20+ stories) in height planned along the west side of the Caltrain rail line, emergency response by a ladder company would be needed. NCFA's existing aerial ladder company at 191 Edgemont in Daly City is more than 6.5 miles running distance and more than 15 minutes running time from the closest portion of the Baylands, which does

not meet NCFA's performance standards of the mitigation measure established for the Baylands in the Final Program EIR (MM 4-L-3, all Baylands development to be within 2.0 miles of a ladder truck). Because of the small size of existing Fire Station No. 81 and the shape of its site, expanding Station No. 81 to add a ladder company would not be feasible (NCFA 2023, Appendix N.2).

To accommodate the anticipated doubling of service calls that would result from Baylands development and maintain adequate response times throughout the city, including adequate response times for buildings over 75 feet in height and specialized response to calls for medical assistance, rescue, hazmat, and other special functions within Brisbane, the NCFA and City of Brisbane prepared a Fire Protection and Facilities Plan (NCFA 2023, Appendix N.2). This plan, which would establish a new ladder truck company and a squad[363] in addition to the existing Engine Company No. 81, proposes the following:

- Prior to the start of construction of any building within the Baylands that is 75 feet or more in height:
    - Relocate the existing NCFA Fire Station No. 81 to 140 Valley Drive to house the existing Engine Company No. 81. **Figure 3-55** illustrates a conceptual site plan for the relocated fire station and its location in relation to the existing Station No. 81.
    - Establish a new ladder truck company to be temporarily housed at the relocated Station No. 81 until such time as a new fire station is constructed and operational within the Baylands.
- Prior to certificates of occupancy for 50 percent of <u>either</u> (1) Mid- and High-Density Residential <u>or</u> (2) Mid- and High-Density Commercial areas identified on Specific Plan Figure 2.1, Land Use Plan, a new fire station shall be constructed and operational at a location within the Baylands acceptable to the North County Fire Authority and the City of Brisbane. The new fire station within the Baylands would house the ladder truck company that was temporarily housed at the relocated Figure Station No. 81 and a squad would be established for the new station.
    - Unless otherwise approved by the North County Fire Authority and the City of Brisbane, the specific location, site plan, and building plans for the new station shall:
        - Have ready access to the US 101 freeway and the Geneva Avenue extension, be in a functional location based on the Baylands Specific Plan Figure 2.1, Land Use Plan, and able to remain operational with minimal or no interference from future improvement of the Candlestick

[363] "Squad" refers to a specialized company whose primary focus may be suppression but carry specialized equipment and are trained to perform hazmat, rescue, and other special functions.

Interchange based on the most recent plans identified and maintained by the Brisbane City Engineer for such improvements.

- Be capable of permanently housing the ladder truck company temporarily housed at the relocated Station No. 81 along with a new squad as detailed in the Fire Protection Plan (NCFA 2023, Appendix N.2).

- To ensure the ability of the ladder truck company and squad housed at the new Baylands fire station to achieve acceptable ladder company response times within the Baylands and Sierra Point and acceptable squad response times throughout the City of Brisbane, the following roadway improvements would need to be constructed and functional when the new Baylands fire station becomes operational:
  - Geneva Avenue extension from Bayshore Boulevard to Alana Way, including the bridge over the Caltrain right-of-way.
  - The northern extension of Sierra Point Parkway from its current terminus at the US 101 southbound freeway ramps to Geneva Avenue.

The physical environmental effects associated with construction and operation of a new fire station within the Baylands are addressed in the overall analysis of Baylands development set forth in relevant sections of this EIR, including feasible mitigation of impacts as necessary.

Relocation of the existing fire station would include demolition of the existing building at 140 Valley Drive along with construction of the new station. Where the physical environmental effects associated with relocating the existing Fire Station No. 81 were not included in the overall assessment of the Specific Plan, relocation-specific impacts are explicitly addressed in the following EIR sections:

- Land Use (Section 4.3)
  - Relocating Fire Station No. 81 would be consistent with General Plan Policy 158, which calls for providing a level of fire protection proportional to the size, risks, and service demands of the community within budgetary constraints.
- Biological Resources (Section 4.6)
  - Trees subject to the provisions of Brisbane Municipal Code Chapter 12.12 would be removed. However, because the provisions of that Chapter are for private projects requiring permits from the City, relocation of the City's existing fire station would not require a City permit to remove trees within the relocation site.

    The North County Fire Authority and City are, however, committed to achieving a 1:1 replacement of trees removed within the relocation site to the extent compatible with the fire station's emergency services function.

- Cultural and Paleontological Resources (Section 4.7)
    - Demolition of the existing building and construction of a fire station at 140 Valley Drive would not have cultural or paleontological resources impacts unless excavations extended down into native, previously undisturbed ground, which is not anticipated.
    - Mitigation Measures MM CUL-2a, MM CUL-2b, and MM CUL-2d would address the potential for discovery of previously unknown cultural resources. MM GEO-7a and MM GEO-7b would address the potential for discovery of previously unknown paleontological resources
- Air Quality (Section 4.9)
    - Demolition of the existing building at 140 Valley Drive and construction of the relocated fire station was incorporated into the analysis of construction impacts in Section 4.9, which concluded that construction NO_X emissions from Baylands construction activities would be reduced, but not below the significance thresholds, while fugitive PM_{10} and $PM_{2.5}$ impacts from construction would be reduced to less than significant through Mitigation Measure MM AQ-2a. Although the relative contribution of constructing the relocated fire station would be small in relation to overall Baylands construction impacts, construction of the relocated fire station would contribute to the significant construction impact and be subject to applicable mitigation requirements.
    - Because the relocated fire station would generate no more air pollutant emissions at its new location than it does at its current location, it would not contribute to significant and unavoidable operational air quality impacts.
- Greenhouse Gas Emissions (Section 4.10)
    - Demolition of the existing building at 140 Valley Drive and construction of the relocated fire station was incorporated into the analysis of construction impacts in Section 4.10, which concluded that greenhouse gas emissions during construction, while temporary, would be significant and unavoidable. Although the relative contribution of constructing the relocated fire station would be small in relation to overall Baylands construction impacts, construction of the relocated fire station would contribute to the significant construction impact and be subject to applicable mitigation requirements.
    - Because the relocated fire station would be expected to generate no more greenhouse gas emissions at its new location as it does as its current location, it would not contribute to significant and unavoidable operational greenhouse gas emissions impacts identified in Section 4.10.

- Noise and Vibration (Section 4.12)
    - Demolition of the existing building at 140 Valley Drive and construction activities for the relocated fire station would increase noise levels at the nearest sensitive receptor which is located approximately 1,000 feet from the relocated fire station on San Francisco Avenue in Brisbane, by 1.4 dBA. Construction impacts would thus be less than significant.
    - The operational noise impacts of the relocated fire station would be similar to those of the City's existing fire station.
- Hazards and Hazardous Materials (Section 4.13)
    - The relocated fire station would include an above-ground 1,000-gallon fuel storage tank and engage in fueling of vehicles housed at the station. The storage tank would be required to meet applicable design standards to minimize the risk of leaks and ensure public health and safety are protected.

Schools

Because Baylands development is anticipated to approximately double Brisbane's resident and daytime worker population, the Bayshore ESD and JUHSD superintendents suggested that the number of students that would be generated by Baylands development would conservatively approximate the peak enrollment of the TK–8 grade students in the Brisbane SD and the peak number of JUHSD high school students residing within the City of Brisbane[364] (Personal Communication, Superintendents Presta and Veal, 2023).

Based on current enrollment at Brisbane SD, Brisbane's 2022 resident population of 4,672 and daytime employment population of 13,000 generated a total of 454 students in the 2022/2023 school year. Brisbane SD's seven-year peak enrollment as a district occurred in the 2019/2020 school year with 475 grade TK–8 students, composed of 344 grade TK–5 students and 131 grade 6–8 students (CDE 2023). Therefore, it is anticipated that the Baylands Specific Plan would generate approximately 475 grade TK–8 students, as shown in **Table 4.17-3**. Based on the peak number of students from Brisbane enrolled in JUHSD high schools, Superintendent Presta estimated that Baylands Specific Plan development would generate approximately 60 high school students (Personal Communication, Superintendent Presta, 2023).

[364] The Brisbane School District serves Brisbane's entire resident population and all employment-generating uses within the City except for the Recology solid waste transfer station, Golden State Lumber, and other commercial uses along Tunnel Avenue.

Elementary School Student Generation and Capacity

BAYSHORE ELEMENTARY SCHOOL DISTRICT

Table 4.17-3 projects that Baylands development would generate approximately 337 elementary school students in the Bayshore ESD. To accommodate additional students, the Bayshore ESD intends to convert the existing Bayshore School, which now serves grades TK–8 and has a capacity for 568 students, back to an elementary school serving grade TK–5 students. According to California Department of Education data (CDE 2023), approximately 62 percent of the students at the existing Bayshore School are in grades TK–5, which equals 217 elementary school students in the 2022/2023 school year. Thus, after adding 337 Baylands students to the existing 217 grade TK–5 students enrolled at the Bayshore School, approximately 554 grade TK–5 students would be anticipated to attend Bayshore Elementary School after buildout of the Baylands. Therefore, the newly converted elementary school would have adequate capacity to accommodate additional elementary school students generated by the Baylands.

BRISBANE SCHOOL DISTRICT

As shown in **Figure 4.17-1**, the portion of the Specific Plan area along Industrial Way is located within the Brisbane SD. The Brisbane SD elementary school closest to the Baylands is Brisbane Elementary School, located less than 1 mile west at 500 San Bruno Avenue. **Table 4.17-3** projects that approximately seven elementary school students would be generated by the portion of the Specific Plan within the Brisbane SD. Adding seven new students to the school's 2022/2023 enrollment of 205 (for a total of 212) would be less than the 7-year peak enrollment of Brisbane Elementary School, which was 230 students. Therefore, there would be adequate capacity with the addition of Baylands students.

Middle and High School Student Generation and Capacity

BAYSHORE ELEMENTARY SCHOOL DISTRICT

Table 4.17-3 estimates that up to 128 middle school students in the Bayshore ESD could be generated by Specific Plan development. According to CDE data (CDE 2023), approximately 38 percent of the students at the existing Bayshore School are in grades 6–8, which equals 132 middle school students in the 2022/2023 school year. Using peak enrollment, there were approximately 155 middle school students in the Bayshore ESD. Bayshore ESD plans to convert the Bayshore School, which currently serves grades TK–8, back to an elementary school serving students TK–5 and construct a new middle school on the Baylands to accommodate students from the Baylands. Thus, enrollment at the proposed Baylands middle school is anticipated to be 283 students, including 155 existing grade 6–8 students currently attending the Bayshore School from the Daly City portion of the district and the 128 additional Baylands students.

Table 4.17-3: Baylands Specific Plan Student Generation

School District	Specific Plan Development[a]	Grade Level	Peak # of Brisbane ESD Students[b]	Projected Number of Baylands Students[c]
Bayshore Elementary School District	2,158 dwelling units	Elementary (Grades TK–5)	344	337
	6.1 million s.f. non-residential	Middle (Grades 6–8)	131	128
		TOTAL	**475**	**465**
Brisbane School District	42 dwelling units	Elementary (Grades TK–5)	344	7
	900,000 s.f. non-residential	Middle (Grades 6–8)	131	3
		TOTAL	**475**	**10**
Jefferson Union High School District	2,200 dwelling units	High School (Grades 9–12)	60	60
	7.0 million s.f. non-residential			

NOTES:

a. The number of dwelling units and square footage of non-residential are estimates based on maximum density allowed within the small area along Industrial Way that is included within the Brisbane School District service area. Of the 2,200 dwelling units proposed within the Baylands, it is estimated that approximately 98% of those units would be built within the Bayshore Elementary School district service area and 2% within the Brisbane School District service area. Of the 7.0 million square feet of proposed non-residential uses, it is estimated that approximately 87% of those uses would be built within the Bayshore Elementary School District service area and 13% within the Brisbane School District.

b. To estimate the number of students to be generated by the Baylands Specific Plan's doubling of Brisbane's resident and daytime population, the 7-year peak enrollment of Brisbane School District was used, including Brisbane Elementary, Panorama Elementary, and Lipman Middle School. Superintendent Presta estimated that the peak number of students within the Jefferson Union High School District residing in Brisbane is 60.

c. While non-residential uses do generate students based on parent's place of employment, the majority of student generation comes from residential uses. Therefore, it was assumed that 98% of students generated by the Baylands would attend Bayshore Elementary School District schools and 2% of students would attend Brisbane School District schools. All Baylands high school students would attend high schools within the Jefferson Union High School District.

BRISBANE SCHOOL DISTRICT

Lipman Middle School, located at 1 Solano Street, is located less than 1 mile from the Baylands. **Table 4.17-3** estimates that approximately three middle school students would be generated by Specific Plan development in the area along Industrial Way that is within the Brisbane School District (see **Figure 4.17-1**). Adding three new students to the 2022/2023 enrollment of 132 students would result in 135 students. Since the 7-year peak enrollment of Lipman Middle School was 160 students, it is reasonable to conclude that there would be adequate capacity with the addition of Baylands students.

JEFFERSON UNION HIGH SCHOOL DISTRICT

All students from Brisbane ESD and Bayshore ESD attend JUHSD high schools. Based on the peak number of students from Brisbane enrolled in JUHSD schools, Superintendent Presta estimated approximately 60 high school students would be generated by Specific Plan development (Personal Communication, Superintendent Presta, 2023). **Table 4.17-2** indicates that the JUHSD as a whole could accommodate an additional 1,879 students based on 2022–2023 enrollment. Current capacity at Westmoor and Jefferson High Schools (the high schools closest

to the Baylands) is 2,941 students, with a 2022–2023 enrollment of 2,461 students, resulting in capacity for an additional 480 students. Superintendent Presta has confirmed that there would be sufficient capacity within existing JUHSD schools to accommodate additional students generated by the Baylands (Personal Communication, Superintendent Presta, 2023).

Physical Impacts Associated with School Facilities Improvements

PROPOSED ON-SITE MIDDLE SCHOOL

To meet the increased demand for schools generated by Baylands development, the Specific Plan provides for a grade 6–8 middle school to be located within the Baylands. State and District approval of that proposed school is required, and a school site suitability assessment report would be undertaken by the school district pursuant to the state school site approval process.

The Bayshore Mobility Plan proposed as part of Baylands development would provide safe bicycle and pedestrian crossings of Bayshore Boulevard at Geneva Avenue and Main Street (see Section 3.3., *Bayshore Mobility Plan*). Section 4.8, *Transportation*, analyzes pedestrian and bicycle connections between residential areas within the Baylands and the Bayshore School, as well as between Daly City residential areas within the Bayshore ESD and the proposed middle school within the Baylands. The analysis provided in Section 4.8 also addresses vehicular, bicycle, and pedestrian travel to and from the proposed school and provides appropriate mitigation measures.

Section 4.13, *Hazards and Hazardous Materials*, evaluates the proposed middle school in relation to safety criteria for school site locations provided in CCR Title 5, Section 14010, which set performance standards for the protection of schools within the state from environmental hazards and risks of upset. As required by state law, the proposed middle school would meet the standards set forth in CCR Title 5, Section 14010 or prepare the required studies for review by the Department of Education and to secure approval of the proposed school site pursuant to the provisions of CCR Title 5, Section 14010(u).

The middle school, which would be designed to accommodate 300 to 325 students, would be located along the south side of Main Street west of the Specific Plan's amenities area. This location would provide for separation from the Caltrain rail line and Kinder Morgan tank farm without a loss of land for residential development.

CONVERSION OF THE EXISTING BAYSHORE SCHOOL FROM A PK–8 SCHOOL TO A PK–5 ELEMENTARY SCHOOL

Following approval by the state and construction of a middle school (grades 6–8) within the Baylands, the existing Bayshore School would be converted back to an elementary school for PK to grade 5 students. Since the Bayshore School was just remodeled and upgraded in 2017, only minimal improvements, such as conversion of sports fields to playgrounds and adjustments to

classrooms, would be needed to convert the school from a PK–8 school back to a PK–5 elementary school.

Library Facilities

The Specific Plan would slightly more than double Brisbane's existing resident and daytime worker population without providing for expanded library facilities. According to San Mateo County Libraries, adding the projected population of Baylands development to the City of Brisbane "would likely impact library hours, parking/public transportation, staffing and usage of library space" (San Mateo County Libraries 2023). As a result, overuse and deterioration of the existing Brisbane Library could occur, necessitating construction of a new library.

Brisbane Corporation Yard

Baylands development would generate a resident population of 4,905 and a daytime worker population of approximately 19,480, approximately doubling the City's current daytime resident (4,721) and worker (13,000) populations. Because of its higher development intensity compared to the balance of Brisbane, Baylands development would substantially increase but not double the amount of roadway and other infrastructure to be maintained by the city. The existing Brisbane Corporation Yard, which is triangular in shape, has limited usable area, and was not designed to accommodate demands resulting from proposed Baylands development. Accordingly, the Project would require expansion of the City's corporation yard.

Significance Conclusions for Impact PUB-1

Impacts associated with construction of public facilities within the Specific Plan area would be indistinguishable from those of other grading and construction activities within the Baylands, which include significant unavoidable net increases in emissions of non-attainment criteria pollutants (ROG, NOx, PM_{10}, $PM_{2.5}$), and greenhouse gas. Operation of Baylands-related public facilities would also contribute to significant and unavoidable air quality and greenhouse gas impacts.

The contribution of Baylands-related public facilities impacts is addressed in the air quality and greenhouse gas emissions sections of this chapter. In addition, physical environmental impacts associated with construction and operation of a new police substation, relocation of Fire Station No. 81, and construction and operation of a second fire station are addressed in the overall analysis of Baylands development set forth in relevant sections of this EIR, along with necessary mitigation measures. The physical environmental impacts associated with construction and operation of the proposed middle school within the Baylands, including consistency with the design and safety standards set forth in CCR Title 5, Section 14010 and the requirement to demonstrate safety and provide mitigation for any hazards prior to approval pursuant to CCR Title 5, Section 14010(u), are addressed in the overall analysis of Baylands development set forth in relevant sections of this EIR, along with necessary mitigation measures.

Impact PUB-1 would be less than significant in relation to police, fire protection, and schools for the following reasons:

- Where the physical environmental effects associated with relocating the existing Fire Station No. 81 can be distinguished from the overall assessment of the Specific Plan, they are explicitly addressed and would be less than significant.[365]
- Since the existing Bayshore School was just remodeled and upgraded in 2017, only minimal exterior and interior improvement would be needed to convert the Bayshore School from a PK–8 school to a PK–5 elementary school.

Impact PUB-1 would, however, be significant in relation to libraries and the City's corporation yard for the following reasons:

- The Specific Plan would more than double Brisbane's existing resident and daytime worker population without expanding library facilities, resulting in overuse and deterioration of the existing Brisbane Library and requiring the construction of a new library.
- The existing corporation yard is not capable of storing sufficient equipment to maintain existing service levels for the City of Brisbane with the addition of Baylands service demands. The result could be inadequate maintenance capability and deterioration of municipal infrastructure. Accordingly, expansion of the City's corporation yard would be required.

Program EIR Mitigation Measures

MM PUB-1a: On-Site Library (Program EIR Mitigation Measure 4.L-4). To avoid overuse of existing and proposed library facilities, a library facility shall be developed within the Baylands that is of sufficient size to serve the Specific Plan's population. The on-site library shall be constructed and operational prior to issuance of the occupancy permits for more than 50 percent of the residential dwelling units permitted by the Specific Plan, thereby ensuring an on-site resident population at the time of its opening.

Significance Conclusion for Impact PUB-1 with Implementation of Program EIR Mitigation Measures

Mitigation Measure MM PUB-1a would ensure adequate library facilities to serve Baylands development without causing deterioration of existing facilities. The physical environmental

[365] Impacts associated with relocation of the existing Figure Station No. 81 are explicitly analyzed in the following EIR sections: Land Use, Biological Resources, Cultural Resources, Air Quality, Greenhouse Gas Emissions, Noise and Vibration, and Hazards and Hazardous Materials.

effects of establishing a Baylands library facility cannot be parsed out from the overall impacts of Baylands development and have been addressed throughout the impact analyses provided in this EIR.

Mitigation Measure MM-PUB-1a, however, does not address the City's corporation yard.

Additional Mitigation Measures

MM PUB-1b: Corporation Yard. The Specific Plan shall reserve a site for a new corporation yard acceptable to the Brisbane Public Works Director that meets the following criteria:

- Approximately 2.5 usable acres;
- Generally square in shape;
- Level;
- Fully remediated; and
- Has a direct connection to a minimum roadway classification of collector.

Significance Conclusion for Impact PUB-1 with Implementation of All Mitigation Measures

Mitigation Measures MM PUB-1a and MM PUB-1b provide for adequate library facilities and land for a new corporation yard that would maintain existing service levels with the addition of Baylands service demands and would reduce impacts to less than significant. The physical environmental effects of expanding the City's corporation yard cannot be parsed out from the overall impacts of Baylands development and have been addressed throughout the impact analyses provided in this EIR.

4.18 PARKS, OPEN SPACE/OPEN AREAS, AND RECREATIONAL RESOURCES

4.18.1 INTRODUCTION

a. Overview

This section analyzes whether the 2025 Specific Plan project would either (1) increase the use of existing parks, open space/open areas, or recreational facilities such that substantial physical deterioration or degradation of the facilities would occur or be accelerated; or (2) result in adverse physical effects on the environment associated with the provision of new or expanded parks, open space/open areas, or recreational facilities. It also evaluates the impacts of Baylands development on windsurfing resources in San Francisco Bay adjacent to the Candlestick Point State Recreation Area and Baylands site.

b. Definitions

Bikeway, Class I, often referred to as a **bike path** or **shared use path**, is a hiking/biking trail with an improved surface that is physically separated from the street, often consisting of a concrete or asphalt surface for bicycle travel and an unpaved surface for hiking and jogging.

Bikeway, Class II, often referred to as a **bike lane**. It often consists of a striped on-street lane between the curb or parking lane and auto travel lanes.

Bikeway, Class III, often referred to as a **bike route**, consists of shared use of automobile travel lanes and is marked with street signs.

Bikeway, Class IV consists of a raised bike lane that is separated from moving traffic both vertically and horizontally with a distinct buffer that is a minimum of 1 foot wide (3 feet adjacent to parking).

Community recreational facilities include community centers; dedicated sports fields; tennis, paddleball, basketball, volleyball, and other types of sports courts; gymnasiums; skateboard facilities; community swimming pools; and other similar developed recreational facilities that may or may not be located within a formal "park."

Open area, as described in the Brisbane General Plan Land Use Element, consists of land, primarily in private ownership, which serves to soften the impacts of urban development by providing primarily green areas and a feeling of "openness" to the overall development pattern. Open areas include, but are not limited to, setbacks and easements that are landscaped or characterized by native vegetation, gardens, and landscaped vegetation. Open areas might also include golf courses and private parks and recreation areas within private developments. An

open area may consist of a combination of hardscape and landscape, typical of plazas, sculpture gardens, and gathering places. Streets, sidewalks, parking lots, and similar improvements, although not covered by structures, are not included in the definition of an "open area."

Open space, as used in this EIR, refers to lands the Specific Plan designates for parks and recreation facilities that would be available to the public along with lands designated for the preservation or enhancement of biological resources.

Parks and recreational facilities, for purposes of this EIR, include (1) active recreational use areas such as a children's play apparatus area, paved game concrete area, turf playfield, picnic area, community garden, dog park, running or walking trails, swimming pool, or recreation center building; (2) passive recreational use areas such as a landscaped park; (3) special facilities open to the public such as lakes or golf courses; and (4) cultural/educational attractions within open space areas otherwise devoted to the preservation of natural resources.

Sailable day refers to a day on which there exists a minimum two-hour window between the hours of 12:00 p.m. and 7:00 p.m. local time at the Candlestick Point State Recreation Area wind sensor such that 75 percent of the observations during that two-hour window are Sailable Observations (a minimum lull wind speed of 10 miles per hour [mph], a minimum mean wind speed of 16 mph, and a minimum gust wind speed of 20 mph and a wind direction either west, west-northwest, or northwest).

Government Code Section 65560 Types of "Open Space"

California planning law identifies five types of open space:

- **Open space for public health and safety**, including, but not limited to, areas that require special management or regulation because of hazardous or special conditions;
- **Open space for the preservation of natural resources**, including, but not limited to, natural vegetation, fish and wildlife, and water resources;
- **Open space for resource management and production**, including, but not limited to, agricultural and mineral resources, forests, rangeland, and areas required for the recharge of groundwater basins;
- **Open space for outdoor recreation**, including, but not limited to, parks and recreational facilities, areas that serve as links between major recreation and open space reservations (such as trails, easements, and scenic roadways), and areas of outstanding scenic and cultural value; and
- **Open space for the protection of Native American sites**, including, but not limited to, places, features, and objects of historical, cultural, or sacred significance, such as Native American sanctified cemeteries, places of worship, religious or ceremonial sites, or sacred shrines located on public property (further defined in Public Resources Code [PRC] Sections 5097.9 and 5097.993).

Substantial deterioration refers to a decline in the quality of a park or facility beyond normal wear and tear.

4.18.2 PHYSICAL ENVIRONMENTAL SETTING

a. Baseline

The baseline for analysis of recreational resources is Spring 2023, which encompasses the recirculated Notice of Preparation public review period.

b. City of Brisbane Recreational Resources

The Brisbane Parks and Recreation Department manages the City's system of parks, trails, and recreational facilities within the city limits. The Brisbane Public Works Department helps to maintain the parks.

Public Parks, Recreational Facilities, and Open Space Areas

The City currently owns 23.45 acres of public parks (including linear parks), recreational lands, and open space and trails within the City, exclusive of the school portions of joint school/park sites, as well as a number of parks and open space areas (see **Table 4.18-1**). Based on an existing population of 4,661 (DOF 2024), Brisbane currently has 5.03 acres of parkland per 1,000 residential population.

The Brisbane Parks and Recreation Department coordinates the use of recreational facilities for Brisbane residents, including a senior center, community pool, ball field, community pool, and several activity/community rooms. The Mission Blue Complex includes a 250-person capacity community center, softball field, tennis court, and sand volleyball court.

Brisbane residents are allowed use of Brisbane Elementary School District (Brisbane ESD) baseball and multi-purpose playing fields, the junior high gymnasium, and other properties owned by the Brisbane ESD through a joint use agreement with the City. The Parks and Recreation Department also provides an extensive collection of classes and workshops geared toward all ages in the community.

Brisbane Marina

The Brisbane Marina, completed in 1983, has a 270-foot guest dock and can house 580 boats ranging in size from 10 feet to 120 feet. The Brisbane Marina is the closest marina to San Francisco and is 7 nautical miles from the Bay Bridge. The marina is home to the Sierra Point Yacht Club, a portion of the San Francisco Bay Trail, and a public 300-foot fishing pier.

Table 4.18-1: Existing Public Parks and Recreational Facilities Serving Brisbane

Name	Location	City-Owned Acres	Improved Acres
Parks		***12.68***	***11.92***
Community Center Park	250 Visitacion Avenue	0.12	0.12
Community Park	5 Old County Road	2.82	2.82
Brisbane Dog Park	50 Park Place	0.54	0.54
Firth Canyon and Park	201 Glen Park Way	0.27	0.27
Fisherman's Park	Brisbane Lagoon	0.25	0.25
Mission Blue Complex	475 Mission Blue Drive	4.95	3.85
Quarry Road Park	399 San Francisco Avenue	0.20	0.20
Tot Lot Playground/Park	4 Solano Street	0.25	0.25
Marina Park	Sierra Point Parkway	3.00	3.00
Skatepark	Old County Road & Park Lane	0.12	0.12
Basketball Courts (2)	Old County Road & Park Lane	0.16	0.16
Tennis Courts (2)	1 Solano Street	School Land	0.34
Recreational Facilities		***1.44***	***1.44***
Brisbane Community Pool	2 Solano Street	0.62	0.62
Childcare Modular	500 San Bruno Avenue	School Land	School Land
Community Center/Library	200 Visitacion Avenue	0.11	0.11

c. Regional and State Recreation Areas

San Francisco Bay Trail

Portions of the San Francisco Bay Trail serve Brisbane residents. The San Francisco Bay Trail is a planned recreational corridor that, when complete, will encircle San Francisco and San Pablo bays with a continuous 500-mile network of bicycling and hiking trails. Currently, a paved portion of the trail extends most of the distance around Sierra Point south of the Baylands. The trail extends farther north along the bay side of the Brisbane Lagoon, providing pedestrian and bicycle access. To the north of the Baylands, a paved portion of the trail runs along the southern edge of Candlestick Point State Recreation Area. A portion of the trail is planned to extend

through the Baylands, connecting Sierra Point with the trail segment at Candlestick Point State Recreation Area.

San Bruno Mountain State and County Park

San Bruno Mountain State and County Park lies roughly three miles west of the Baylands. The rugged 2,326-acre San Bruno Mountain State and County Park was jointly purchased by San Mateo County and the State of California and is managed by the San Mateo County Department of Parks. Additionally, two areas on the north side of the park, Owl Canyon and Buckeye Canyon, are owned by the California Department of Fish and Wildlife. These canyons are approximately 81 acres in combined size and comprise the San Bruno Mountain Ecological Reserve. Both areas are within the San Bruno Mountain Habitat Conservation Plan boundary and consist of permanently protected habitat.

Candlestick Point State Recreation Area

Less than one mile northeast of the Baylands is the Candlestick Point State Recreation Area (Candlestick Point), a 252-acre regional open space. Recreational opportunities include gardening, hiking, jogging, bicycling, birding, fishing, picnicking and a bike path and fitness course. Candlestick Point is a popular entry point for windsurfing on the Bay and is considered by windsurfers to be one of the premier sites in the San Francisco Bay Area. The windsurfing launch site is located on the shoreline of Candlestick Cove near the southern end of the Candlestick Point parking lot, a turnaround known as "Windsurf Circle." According to the San Francisco Boardsailing Association (2014), Candlestick Point is an ideal location for beginning- and intermediate-level windsurfers, because there is very little swell (wave action). These flat-water conditions allow windsurfers to develop skills that are more difficult to master in choppy water. The primary windsurfing area within the Candlestick Point State Recreation Area (identified as the "Area of Interest") is illustrated in **Figure 4.18-1**.

Long-term wind statistics recorded at San Francisco International Airport between 1992 and 2022 indicate that winds from the west-southwest through the northwest are most frequent in the area.

The San Francisco Boardsailing Association considers westerly wind conditions to be generally good for windsurfing at Candlestick Point, with the best conditions during west-northwest winds. The Candlestick Point launch area and windsurfing area are not dependent on tidal conditions and have adequate water depth for safe sailing at low tides. According to the Candlestick Preservation Association (2013), Candlestick Point has an average of 85 "Sailable Days" per year (from April through September), and is frequented, on average, by 20 sailors per Sailable Day.

Figure 4.18-1: Candlestick Point State Recreation Area Primary Windsurfing Area (Area of Interest)

4.18.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

There are no federal laws, plans, programs, or regulations relevant to the physical environmental effects of open space or recreational facilities.

b. State of California Laws, Plans, Programs, and Regulations

Mitigation Fee Act

The California Mitigation Fee Act, Government Code Sections 66000, et seq., allows cities to establish fees to be imposed upon development projects for the purpose of mitigating impacts that development projects have upon the city's ability to provide specified public facilities.

Quimby Act

The Quimby Act is part of the Subdivision Map Act and authorizes cities to adopt ordinances to require new residential development to dedicate parkland and/or pay in-lieu fees for the purpose of providing parklands and recreational facilities. The Quimby Act establishes a standard for jurisdictions of dedicating 3 acres of parkland per 1,000 residents.

The Quimby Act provides cities and counties with opportunities to improve parks and create new parks using developer-paid Quimby Act fees in areas other than the one in which the developer's subdivision is located if certain requirements are met. These requirements include the following:

- The neighborhood where the city or county is proposing to use the fees to provide parks must have fewer than 3 acres of park area per 1,000 population;
- The neighborhood where the proposed subdivision is located must have at least 3 acres of park area or more per 1,000 population;
- The city or county must hold a public hearing before using the fees in another neighborhood;
- The city or county must find it reasonably foreseeable that the new subdivision's residents will use the park facilities in the other neighborhood; and
- The city or county must use the fees in areas consistent with the city or county's local Quimby Act ordinance and General Plan.

A city or county may also enter into a joint or shared use agreement with one or more public districts to provide additional park and recreational access.

c. Regional Plans and Programs

San Francisco Bay Trail

Senate Bill 100 (1987) states that "The Association of Bay Area Governments (ABAG) shall develop and adopt a plan and implementation program, including a financing plan, for a continuous recreational corridor which will extend around the perimeter of San Francisco and San Pablo Bays. The plan shall include a specific route of a bicycling and hiking trail, the relationship of the route to existing park and recreational facilities, and links to existing and proposed public transportation facilities."

The San Francisco Bay Trail Plan was adopted by ABAG in 1989 and provides for the development of approximately 500 miles of regional hiking and bicycling trails around the perimeter of San Francisco and San Pablo bays, to form a "ring around the Bay." Implementation of roughly half of the total planned length of the Bay Trail has been

coordinated by the Bay Trail Project, a non-profit organization. The bicycle lanes within the existing Sierra Point Parkway are part of the Bay Trail, leaving a gap from the current terminus of Sierra Point Parkway through the Baylands to Brisbane's boundary with San Francisco. Bay Trail Project plans show a future extension through the east side of the Baylands between the current north and south termini of the trail, connecting the bicycle lanes along Sierra Point Parkway with the trail segment at Candlestick Point State Recreation Area.

San Francisco Bay Plan

The Bay Conservation and Development Commission (BCDC) San Francisco Bay Plan recognizes that San Francisco Bay "is the most important open space in the Bay region. The Bay and its shoreline provide unique recreational opportunities. Participating in recreation activities on the Bay and along its shoreline can inspire an appreciation of the Bay and can motivate people to participate in the responsible management and protection of the Bay."

Policies for Recreational Resources

Compliance with the San Francisco Bay Plan requires adherence to the following relevant policies for recreational resources:

1. Diverse and accessible water-oriented recreational facilities, such as marinas, launch ramps, beaches, and fishing piers, should be provided to meet the needs of a growing and diversifying population, and should be well distributed around the Bay and improved to accommodate a broad range of water-oriented recreational activities for people of all races, cultures, ages, and income levels. Periodic assessments of water-oriented recreational needs that forecast demand into the future and reflect changing recreational preferences should be made to ensure that sufficient, appropriate water-oriented recreational facilities are provided around the Bay. Because there is no practical estimate of the acreage needed on the shoreline of the Bay, waterfront parks should be provided wherever possible.
3. Recreational facilities, such as waterfront parks, trails, marinas, live-aboard boats, non-motorized small boat access, fishing piers, launching lanes, and beaches, should be encouraged and allowed by the Commission, provided they are located, improved, and managed consistent with the following standards:
    a. **General Recreational facilities** should:
        (1) Be well distributed around the shores of the Bay to the extent consistent with the more specific criteria below. Any concentrations of facilities should be as close to major population centers as is feasible;
        (2) Not pre-empt land or water area needed for other priority uses, but efforts should be made to integrate recreation into such facilities to the extent that they are compatible;

(3) Be feasible from an engineering viewpoint; and

(4) Be consistent with the public access policies that address wildlife compatibility and disturbance.

In addition:

(5) Different types of compatible public and commercial recreation facilities should be clustered to the extent feasible to permit joint use of ancillary facilities and provide a greater range of choices for users.

(6) Sites, features, or facilities within designated waterfront parks that provide optimal conditions for specific water-oriented recreational uses should be preserved and, where appropriate, enhanced for those uses, consistent with natural and cultural resource preservation.

(7) Access to marinas, launch ramps, beaches, fishing piers, and other recreational facilities should be clearly posted with signs and easily available from parking reserved for the public or from public streets or trails.

(8) To reduce the human health risk posed by consumption of contaminated fish, projects that create or improve fishing access to the Bay at water-oriented recreational facilities, such as fishing piers, beaches, and marinas, should include signage that informs the public of consumption advisories for the species of Bay fish that have been identified as having potentially unsafe levels of contaminants.

(9) Complete segments of the Bay and Ridge Trails where appropriate, consistent with Policy 4-a-6 (see below).

e. **Non-Motorized Small Boats**.

(1) Where practicable, access facilities for non-motorized small boats should be incorporated into waterfront parks, marinas, launching ramps and beaches, especially near popular waterfront destinations.

(2) Access points should be located, improved and managed to avoid significant adverse effects on wildlife and their habitats, should not interfere with commercial navigation, or security and exclusion zones or pose a danger to recreational boaters from commercial shipping operations, and should provide for diverse, water-accessible overnight accommodations, including camping, where acceptable to park operators.

(3) Sufficient, convenient parking that accommodates expected use should be provided at sites improved for launching non-motorized small boats. Where feasible, overnight parking should be provided.

(4) Site improvements, such as landing and launching facilities, restrooms, rigging areas, equipment storage and concessions, and educational programs that address navigational safety, security, and wildlife compatibility and disturbance should be provided, consistent with use of the site.

(5) Facilities for boating organizations that provide training and stewardship, operate concessions, provide storage or boathouses should be allowed in recreational facilities where appropriate.

(6) Design standards for non-motorized small boat launching access should be developed to guide the improvement of these facilities. Launch facilities should be accessible and designed to ensure that boaters can easily launch their watercraft. Facilities should be durable to minimize maintenance and replacement costs.

f. Fishing Piers. Fishing piers should not block navigation channels, nor interfere with normal tidal flow.

4. To assure optimum use of the Bay for recreation, the following facilities should be encouraged in waterfront parks and wildlife refuges.

a. **In waterfront parks**.

(1) Where possible, parks should provide some camping facilities accessible only by boat and docking and picnic facilities for boaters.

(2) To capitalize on the attractiveness of their bayfront location, parks should emphasize hiking, bicycling, riding trails, picnic facilities, swimming, environmental, historical and cultural education and interpretation, viewpoints, beaches, and fishing facilities. Recreational facilities that do not need a waterfront location, e.g., golf courses and playing fields, should generally be placed inland, but may be permitted in shoreline areas if they are part of a park complex that is primarily devoted to water-oriented uses, or are designed to provide for passive use and enjoyment of the Bay when not being used for sports.

(3) Where shoreline open space includes areas used for hunting waterbirds, public areas for launching non-motorized small boats should be provided so long as they do not result in overuse of the hunting area.

(4) Public launching facilities for a variety of boats and other water-oriented recreational craft, such as kayaks, canoes, and sailboards, should be provided in waterfront parks where feasible.

(5) Except as may be approved pursuant to recreation policy 4-b,[366] limited commercial recreation facilities, such as small restaurants, should be permitted within waterfront parks provided they are clearly incidental to the park use, are in keeping with the basic character of the park, and do not obstruct public access to and enjoyment of the Bay. Limited commercial development may be appropriate (at the option of the park agency responsible) in all parks shown on the Plan maps except where there is a specific note to the contrary.

(6) Trails that can be used as components of the San Francisco Bay Trail, the Bay Area Ridge Trail, or links between them should be developed in waterfront parks. San Francisco Bay Trail segments should be located near the shoreline unless that alignment would have significant adverse effects on Bay resources; in this case, an alignment as near to the shore as possible, consistent with Bay resource protection, should be provided. Bay Area Ridge Trail segments should be developed in waterfront parks where the ridgeline is close to the Bay shoreline.

(7) Bus stops, kiosks, and other facilities to accommodate public transit should be provided in waterfront parks to the maximum extent feasible. Public parking should be provided in a manner that does not diminish the park-like character of the site. Traffic demand management strategies and alternative transportation systems should be developed where appropriate to minimize the need for large parking lots and to ensure parking for recreation uses is sufficient.

(8) Interpretive information describing natural, historical, and cultural resources should be provided in waterfront parks where feasible.

(9) In waterfront parks that serve as gateways to wildlife refuges, interpretive materials and programs that inform visitors about the wildlife and habitat values present in the park and wildlife refuges should be provided. Instructional materials should include information about the potential for adverse impacts on wildlife, plant and habitat resources from certain activities.

(10) The Commission may permit the placement of public utilities and services, such as underground sewer lines and power cables, in recreational facilities provided they would be unobtrusive, would not permanently disrupt use of the site for recreation, and would not detract from the visual character of the site.

[366] Recreation Policy 4-b addresses waterfront parks and wildlife refuges with historic buildings and would not apply to Baylands development.

5. Bay resources in waterfront parks and, where appropriate, wildlife refuges should be described with interpretive signs. Where feasible and appropriate, waterfront parks and wildlife refuges should provide diverse environmental education programs, facilities and community service opportunities, such as classrooms and interpretive and volunteer programs.

7. Because of the need to increase the recreational opportunities available to Bay Area residents, small amounts of Bay fill may be allowed for waterfront parks and recreational areas that provide substantial public benefits and that cannot be developed without some filling.

Policies for Public Access

Relevant public access policies include the following:

A proposed fill project should increase public access to the Bay to the maximum extent feasible, in accordance with the policies for Public Access to the Bay.

In addition to the public access to the Bay provided by waterfront parks, beaches, marinas, and fishing piers, maximum feasible access to and along the waterfront and on any permitted fills should be provided in and through every new development in the Bay or on the shoreline, whether it be for housing, industry, port, airport, public facility, wildlife area, or other use, except in cases where public access would be clearly inconsistent with the project because of public safety considerations or significant use conflicts, including unavoidable, significant adverse effects on Bay natural resources. In these cases, in lieu access at another location, preferably near the project, should be provided. If in lieu public access is required and cannot be provided near the project site, the required access should be located preferably near identified vulnerable or disadvantaged communities lacking well-maintained and convenient public access in order to foster more equitable public access around the Bay Area.

Public access to some natural areas should be provided to permit study and enjoyment of these areas. However, some wildlife are sensitive to human intrusion. For this reason, projects in such areas should be carefully evaluated in consultation with appropriate agencies to determine the appropriate location and type of access to be provided.

Public access should be sited, designed and managed to prevent significant adverse effects on wildlife. To the extent necessary to understand the potential effects of public access on wildlife, information on the species and habitats of a proposed project site should be provided, and the likely human use of the access area analyzed. In determining the potential for significant adverse effects (such as impacts on endangered species, impacts on breeding and foraging areas, or fragmentation of wildlife corridors), site specific information provided by the project applicant, the best available scientific evidence, and expert advice

should be used. In addition, the determination of significant adverse effects may also be considered within a regional context. Siting, design and management strategies should be employed to avoid or minimize adverse effects on wildlife, informed by the advisory principles in the Public Access Design Guidelines. If significant adverse effects cannot be avoided or reduced to a level below significance through siting, design and management strategies, then in lieu public access should be provided, consistent with the project and providing public access benefits equivalent to those that would have been achieved from on-site access. Where appropriate, effects of public access on wildlife should be monitored over time to determine whether revisions of management strategies are needed.

Public access that substantially changes the use or character of the site should be sited, designed, and managed based on meaningful community involvement to create public access that is inclusive and welcoming to all and embraces local multicultural and indigenous history and presence. In particular, vulnerable, disadvantaged, and/or underrepresented communities should be involved. If such previous outreach and engagement did not occur, further outreach and engagement should be conducted prior to Commission action.

Public access should be sited, designed, managed, and maintained to avoid significant adverse impacts from sea level rise and shoreline flooding.

Whenever public access to the Bay is provided as a condition of development, on fill or along the shoreline, access should be permanently guaranteed. This should be done wherever appropriate by requiring dedication of fee title or easements at no cost to the public, in the same manner that streets, park sites, and school sites are dedicated to the public as part of the subdivision process in cities and counties. Any public access provided as a condition of development should either be required to remain viable in the event of future sea level rise or flooding, or equivalent access consistent with the project should be provided nearby.

Public access improvements provided as a condition of any approval should be consistent with the project, the culture(s) of the local community, and the physical environment, including protection of Bay natural resources, such as aquatic life, wildlife and plant communities, and provide for the public's safety and convenience. The improvements should be designed and built to encourage diverse Bay-related activities and movement to and along the shoreline, should provide barrier free access for persons with disabilities, for people of all income levels, and for people of all cultures to the maximum feasible extent, should include an ongoing maintenance program, and should be identified with appropriate signs, including using appropriate languages or culturally relevant icon-based signage.

In some areas, a small amount of fill may be allowed if the fill is necessary and is the minimum absolutely required to develop the project in accordance with the Commission's public access requirements.

Roads near the edge of the water should be designed as scenic parkways for slow-moving, principally recreational traffic. The roadway and right-of-way design should maintain and enhance visual access for the traveler, discourage through traffic, and provide for safe, separated, and improved physical access to and along the shore. Public transit use and connections to the shoreline should be encouraged where appropriate.

San Mateo County Trails Plan

The San Mateo County Trails Plan provides guidelines for trail planning, design, and trail management in cities and parks within San Mateo County. The trail design and management guidelines primarily pertain to the construction of new trails and address long-term management activities for existing trails. Policies relevant to protection of biological resources are as follows:

6.4.1 – Locate, design, and develop trail routes with sensitivity to their potential environmental, recreational and other impacts on adjacent lands, private property, and utilities.

6.4.2 – Levels-of-use and types-of-use on trails shall be controlled to avoid unsafe use conditions or risk severe environmental degradation.

6.4.7 – Locate trails to recognize the resources and hazards of the areas they traverse, and to be protective of sensitive habitat areas such as estuaries, wetlands, riparian corridors, erodible soils, and other areas where sensitive species may be adversely affected.

6.4.8 – Develop design guidelines to ensure that sensitive species and the habitats they rely on shall be protected, and where possible, enhanced by trail development and trail use.

6.29.4 – Develop a monitoring program for use by the lead agency in evaluating current conditions and determining whether or not new trails or trail management programs (including maintenance, reconstruction, education, and use regulations) are effective in addressing user conflicts, safety issues, and environmental impacts.

d. City of Brisbane Plans, Ordinances, and Regulations

General Plan

Land Use Element

A minimum of 25 percent of the Specific Plan's land area[367] of the Baylands is required to be provided in open space and/or open area.

Open Space Element

Park Definitions and Standards

The Open Space Element defines the following types of parks.

- **Mini Park —** small-scale outdoor areas for limited public or private park and recreation uses.
- **Neighborhood Park —** public areas of at least 0.5 acres for a range of recreational activities, such as field games, court and playground games, crafts, or picnicking, including school/park facilities.
- **Linear Park —** long, narrow areas used for one or more varying modes of recreational travel, such as hiking, biking, or horseback riding, including built or natural corridors, such as utility rights of way fire roads and canyons.
- **Combined Standard for Mini Parks, Neighborhood Parks, and Linear Parks:**
    - Minimum of 10.5 acres per 1,000 residential population, representing continuation of the 1994 existing level of service.
- **Community Park —** a public area of at least 2 acres in size serving the residential and business communities, such as outdoor community gathering places or multi-use recreational complexes.
    - Standard for Community Parks: Minimum of 8 acres per 1,000 residential population, representing the top of the range of the National Recreation and Park Association (NRPA) standard.

[367] For purposes of this EIR, the "land area" used to determine the portion of the Specific Plan devoted to open space use excludes those areas subject to daily inundation due to tidal action based on anticipated sea level rise through the Year 2100 (approximately 83 inches). Privately owned facilities that would be open only to Baylands residents, workers, and their guests are considered to be "open areas" and are not included in determining the amount of open space provided by the Specific Plan.

- **Special Recreational Use —** A structure for specialized or single purpose recreational activities.
    - Standard for Special Recreational Use: To be determined by City facilities study.
- **Conservancy —** An area of protected and managed natural /cultural resources.
    - Standard for Conservancy: 66 acres per 1,000 residential population, representing existing, Northeast Ridge dedication, and 40 percent conservation of the "Brisbane Acres" per the HCP.

Relevant Policies and Programs

The Open Space Element contains the following relevant policies and programs:

Policy 81: The City shall conduct an ongoing effort to identify sites or portions of sites having particular value as open space, wildlife habitat, wetlands, or other environmental qualities that should be preserved and protected. In such cases, the City shall explore the feasibility of acquisition of these areas by the City or by other public or private agencies that are engaged in the ownership and preservation of open space, and, when legally possible, imposing a requirement that such areas be dedicated by the owner to the public for open space purposes.

Policy 81.1: Work to preserve open space lands to protect the natural environment and to provide outdoor educational and recreational opportunities consistent with the sensitivity of the resource.

Policy 82: Encourage the preservation, conservation and restoration of open space to retain existing biotic communities, including rare and endangered species habitat, wetlands, watercourses and woodlands.

Policy 85: Encourage the preservation and conservation of aquatic resources in Brisbane: the Lagoon, the Bayfront and the Marsh.

Program 85a: Seek opportunities to utilize aquatic areas for recreational and educational activities consistent with the sensitivity of the resource.

Program 85b: Develop provisions in the Zoning Ordinance, including setback requirements, to protect the natural ecology of aquatic resources.

Program 85d: Work with responsible agencies, property owners and environmental and conservation groups to ensure preservation of aquatic ecosystems.

Policy 86: Provide access to natural areas consistent with the nature of the resource.

Program 86a: Develop and maintain a network of trails and pathways throughout the City to provide appropriate access to open space and to link City trails with County and regional trail systems.

Program 86b: Extend the trail system to include aquatic areas and provide access to public transportation systems.

Program 86c: Examine the potential to extend a pedestrian and bicycle trail between Sierra Point and the Candlestick Recreation Area along the Bay to the east of US 101 in cooperation with regional efforts to obtain the same objective.

Policy 87: Maintain parks and open space to serve the community equivalent to or greater than the acreage/population standards set by the National Recreation and Parks Association.

Program 87a: Use the standards in Table 6 as guidelines for the provision of parks and open space for the community.

Policy 88: Develop parks to maximize passive recreational opportunities.

Program 88c: Require impact fees or exactions as contributions to the acquisition, development and maintenance of passive open space, park and recreation facilities in conjunction with the mitigation requirements for development projects.

Policy 89: Work with local employers to preserve open space and to develop outdoor open areas that would benefit employees as well as residents during and after the work day.

Policy 91: Explore the widest range of options for preserving open space lands, including acquisition, dedication, and exactions on development projects.

Program 91b: In conjunction with all new development and the redevelopment of existing uses, where appropriate, require dedication of lands with habitat or other natural resource value to remain as open space and/or in-lieu fees for open space acquisition.

Recreation and Community Services Element

The Recreation and Community Services Element contains the following relevant policies and programs:

Policy 95: Provide recreational facilities that accommodate community activities, meet national standards, are accessible in accordance with State and National standards, and contain the necessary components for multiple uses and community enjoyment.

Policy 96: Condition, as appropriate, new developments to construct, maintain or provide for new recreational facilities, amenities and opportunities.

Policy 97: Encourage the development of private sector recreational facilities, such as commercial playing fields, bowling alleys, health clubs, performing arts facilities and theaters.

Policy 98: Maximize the extended use of existing public facilities for year-round and evening activities.

Policy 99: For all recreational facilities, consider the inclusion of restrooms, drinking fountains, pay phones, security lighting, adequate parking, storage, facilities for trash recycling and, where appropriate, food preparation and/or vending/concession facilities.

Policy 100: Investigate opportunities for joint public-private development of commercial recreational facilities.

Program 100c: Encourage new commercial development and renovation to include shower and locker room facilities in order to promote employees' physical fitness, encourage use of public and private recreational opportunities in the community, and reduce dependence on the automobile for transportation.

Policy 132: Recognize the importance of the Brisbane Lagoon and the Levison Marsh as wildlife habitats, valuable community resources and drainage basins, and cooperate with responsible agencies in their conservation.

Policies and Programs by Subarea – Baylands

Policy BL.1 D: Each increment of development shall be provided with appropriate transportation related and other infrastructure, facilities, and site amenities as determined by the City. Such transportation related and other infrastructure, facilities, and site amenities (e.g., parks, open space preservation, habitat enhancement) shall be provided at the developer's cost.

Policy BL.4: Maximize opportunities for open space and recreational uses in any land use planning for this subarea [Brisbane Baylands].

Policy BL.15: Cooperate with other agencies to develop the Bay Trail between Sierra Point and the Candlestick Recreation Area.

Policy BL.17: After the water environment is determined to be safe for public access, develop public water-related passive recreation at the Brisbane Lagoon, with due concern for the preservation and enhancement of the wetlands.

Policy BL.18: Develop a public pathway and access facilities immediately adjacent to the Lagoon.

Policy BL.20: Dedicate land area for open space, recreational uses and wetlands restoration, especially around the Lagoon.

City of Brisbane Open Space Plan

The *Brisbane Open Space Plan* is intended to function as a working tool to guide implementation of the policies and programs of the City of Brisbane General Plan. One of the purposes of the Open Space Plan is to provide a comprehensive map of vacant lands and identify open space potential through the possibility of land acquisition by evaluating natural resources, amenities, and the open space value of parcels. The Open Space Plan presents an analysis of open space resources in six subareas of the city, including the Baylands and Beatty subareas that encompass the majority of the Specific Plan area.

The Open Space Plan recommends that areas south of the drainage channel and north of Lagoon Way "be maintained in a way that maximizes open area." It also recommends that Icehouse Hill be kept largely as open area or dedicated open space. The Beatty Subarea is completely developed except for a triangular, 0.51-acre parcel near US Highway 101. The Open Space Plan recommends that this parcel remain an open space/open area.

Brisbane Municipal Code

Brisbane Municipal Code Sections 16.24.010-16.24.070 authorize the City to require Quimby Act dedications to "provide for adequate and appropriate recreational facilities," defining the amount of land needed by setting a standard of 3.0 acres per 1,000 residents, assuming 2.35 persons per dwelling unit.

4.18.4 RELEVANT SPECIFIC PLAN PROVISIONS

The Specific Plan provides for development of a 157-acre open space/area system, including 64.8 acres of parks (see **Figure 4.18-2** and **Table 4.18-2**). See Section 3.3.2d for a detailed description of the Specific Plan's proposed open space/area system. The Specific Plan's proposed phasing for improvement of this open space/area system is summarized in **Table 4.18-2**.

4.18.5 SIGNIFICANCE CRITERIA

The following criteria were used to determine the significance of recreational resources impacts.

Threshold REC-1: The Baylands Specific Plan would cause a significant impact if the increased population resulting from Baylands development would increase the use of existing public parks or community recreational facilities such that substantial physical deterioration would occur or be accelerated.

Threshold REC-2: The Baylands Specific Plan would cause a significant impact if it would either:

- **Reduce wind speeds or increase turbulence within the Candlestick Point State Recreational Area that would adversely affect windsurfing in prime windsurfing areas; or**
- **Substantially impair access to existing launch sites or access from existing launch sites to prime windsurfing areas.**

4.18.6 PROJECT IMPACTS AND MITIGATION MEASURES

a. Impact REC-1: Physical Deterioration of a Park or Recreational Facility

Methodology for Determining Significance

The analysis considers the extent to which the approximate doubling of Brisbane's population resulting from the Specific Plan project would increase the use of existing Brisbane parks and recreation facilities as well as the physical effects of such increased use. To determine the significance of Impact REC-1, three factors are considered:

1. Acreage of publicly accessible parkland;
2. Availability of community recreational facilities within and outside of publicly accessible park lands; and
3. Availability of parkland acreage and community recreational facilities provided within the Baylands to serve Baylands residents.

The acreage of publicly accessible parkland to be provided in the Specific Plan is compared to the ratio of publicly accessible parkland per 1,000 residents currently available within Brisbane. If the Specific Plan provides as much or more publicly accessible parkland per 1,000 residents as is currently available within Brisbane (5.03 acres per 1,000 population), Baylands development would not increase per capita use of existing parkland within Brisbane and deterioration of parklands would not occur.

Conversely, if the Specific Plan would provide less parkland per 1,000 residents than is currently available in Brisbane, Baylands development would increase per capita use of existing parkland, resulting in overuse and deterioration of existing facilities, which were not designed to serve a population twice the City's existing size. Substantial physical deterioration is recognized as a decline in the quality of current conditions of a park or facility beyond regular wear and tear.

Because the Specific Plan's phasing program does not tie the provision of Baylands park facilities to its residential development, the analysis examines parkland availability within the Baylands at various stages of development, including buildout of Baylands housing, completion of Phase 1 (area west of Caltrain), and Specific Plan buildout.

The analysis also recognizes that Brisbane's existing inventory of park and recreational facilities consists not only of park acreage but also includes community recreational facilities such as a community center and meeting rooms, active sports fields, tennis courts, basketball courts, volleyball courts, skateboard facilities, and a pool. Depending on the types and extent of recreational facilities that would be provided by the Specific Plan to accommodate its projected 4,905 residents, overuse of existing community recreational facilities could occur that would result in substantial deterioration.

Impact Assessment

As indicated in Chapter 3, *Project Description*, the Baylands Specific Plan provides for 157 acres of open space/open area, including active recreation areas, community greens, urban plazas, community greens, and ecological greenspaces and green edges (see **Figure 3-13**). As indicated in **Table 4.18-2**, approximately 43.6 percent of this open space/open area would be devoted to parks and recreational uses (64.8 acres). The other 56.4 percent would be devoted to resource conservation (78.0 acres of habitat conservation), public safety (13.8 acres of stormwater detention), and managed production of resources (0.4-acre Mission Blue native plant nursery).

The 2,200 dwelling units proposed by the Baylands Specific Plan would generate a resident population of approximately 4,905 and be served by 64.8 acres of park facilities (13.2 acres per 1,000 population). In 2023, 4,661 Brisbane residents were served by 23.45 acres of parkland (5.03 acres per 1,000 population).

The Specific Plan's 64.8-acres of parks and trails per 1,000 population (13.2) is substantially more than is currently available to Brisbane residents and would increase the City's existing 5.03 acres per 1,000 population of parkland available to Brisbane residents to 9.2 acres per 1,000 residents throughout the City and the Baylands at Specific Plan buildout. However, as indicated in **Table 4.18-3** and **Table 4.18-4**, the Specific Plan ties only 26.6 of its 64.8 acres of parkland to the buildout of housing within the Baylands (41.0 percent). At Phase 1 Specific Plan buildout (area west of Caltrain), a total of 5.9 acres of parkland per 1,000 population would be completed. With issuance of building permits for 50 percent of the permitted commercial development east

of Caltrain an additional 23.1 acres of parkland would be completed. The final 13.0 acres of parkland would be completed when building permits are issued for 75 percent of permitted commercial development east of Caltrain. The timing for completion of park and trail improvements is dependent on the phased completion of final landfill closure.

Table 4.18-3: Proposed Timing of Baylands Open Space/Area and Park Improvements

Open Space/Area Facility	Acreage		Proposed Timing for Completion
	Total	Park	
Sunnydale Park	0.8	0.8	Concurrent with development of surrounding land uses in the Bayshore District.
Baylands Park (north of Geneva Avenue)	2.9	2.9	
Bayshore Station Plaza	1.4	1.4	
Baylands Park (south of Geneva Avenue)	2.9	2.9	Concurrent with development of surrounding land uses in the Roundhouse District.
Roundhouse Park	3.9	3.9	
Ecological Park (north of Main Street)	3.7	3.7	
Ecological Park (south of Main Street)	3.6	3.6	Concurrent with development of surrounding land uses in the Icehouse Hill District.
Community Fields	7.4	7.4	Prior to issuance of an occupancy permit for the 1,001st dwelling unit.
West Rail Trail and connection to the adjacent Crocker Park Recreational Trail	8.5	—	
Icehouse Hill Habitat Enhancement and Restoration; Recreational Facilities	24.3	2.1	Prior to issuance of an occupancy permit for commercial development exceeding 4.0 million square feet west of Caltrain.
Stormwater Detention Area	13.8	—	Concurrent with start of building construction.
Visitacion Creek	30.8	3.1	Must be completed prior to approval of any building permit exceeding 1.25 million square feet within the Campus East District.
Bay Trail	20.0	20.0	
Lagoon Park	15.4	5.3	Must be completed prior to approval of any building permit exceeding 2.0 million square feet within the Campus East District.
Baylands Preserve	14.1	7.7	
East Rail Trail Green Edge	3.5	—	No timing requirement specified.
TOTAL	**157.0**	**64.8**

Significance Conclusion for Impact REC-1

The 13.2 acres per 1,000 population (64.8 acres) of parks and trail facilities provided by the Baylands Specific Plan exceeds the current 5.03 acres per 1,000 population available to Brisbane residents. While new Baylands residents would be able to use existing City parks, existing Brisbane residents would also be able to use the Baylands parks identified in **Table 4.18-2**. By providing substantially more parkland per 1,000 population than is currently available to Brisbane residents, Baylands development would not result in overuse of existing neighborhood and community park acreage such that substantial physical deterioration of existing facilities in Brisbane would occur or be accelerated.

A less than significant impact would therefore result.

Table 4.18-4: Phasing of Park Acreage per 1,000 Population

Park/Trail	Acres	Baylands Park Acreage at:			
		Residential Buildout	4.0 million s.f. of Commercial west of Caltrain	1.25 million s.f. of Commercial east of Caltrain	2.0 million s.f. of Commercial east of Caltrain

Program EIR Mitigation Measures

The Program EIR did not propose any mitigation measures addressing the impacts on existing recreational facilities.

b. Threshold REC-2: Physical Deterioration of Candlestick Point Windsurfing Resources

Methodology for Determining Significance

Because windsurfing and related recreational activities rely on wind for lift/drag force for propulsion, generally strong and consistent (low fluctuations/turbulence) winds are generally preferred for wind- and kite-surfing enthusiasts since they allow for greater exhilaration and better maneuverability. While a definition of a "Sailable Day" is available, there are no generally accepted significance criteria for changes in wind conditions that might be caused by a proposed development project. Thus, impacts on windsurfing activities within the Candlestick Point State Recreation Area are analyzed in terms of changes in average wind speeds and turbulence levels that would result from Baylands development, compared to the existing conditions.

Wind Assessment Approach

The Wind Assessment undertaken for the Baylands Specific Plan (RWDI 2023) (see Appendix O) provides a quantitative assessment of existing wind speeds and turbulence, wind speeds and turbulence with Baylands development, and wind speeds and turbulence with Baylands and cumulative project development. The assessment is based on Computational Fluid Dynamics (CFD) simulations of wind flows in a virtual model of the Baylands and adjacent lands to the north.

Of the 16 major wind directions, three directions—west, west by northwest, and northwest—were simulated in order to understand the range of possible flow conditions that would result from Baylands development and are the three wind directions considered in determining a "Sailable Day." West-southwest winds, although more prevalent than northwest winds, were not simulated because the Baylands and cumulative development sites are not generally upwind from the primary windsurfing area for winds from this direction.

Wind conditions were analyzed using a Large Eddy Simulation[368] approach that allows for the prediction of mean wind flows as well as the effect of transient phenomena such as wind gusts. Simulations were run to acquire statistically significant predictions of an equivalent mean value which was normalized by the reference speed (a wind speed measured at a high elevation that is not affected by ground level structures).

Average wind speeds from the long-term meteorological data were applied to the velocity ratios generated from the flow simulations to generate a map of average wind speeds over the primary windsurfing area east of the Baylands.

Three-dimensional computer models were constructed to include the terrain and building features present in an area spanning approximately 3.5 miles from north to south and 3 miles from west to east. The level of details in the model reflects the expected influence that the terrain and built environment may have on wind conditions east of the Baylands. The effects of terrain were also considered in the model by applying appropriate input conditions (wind profile and turbulence conditions) for each wind direction being analyzed.

Simulations were completed for three development scenarios:

- **Existing** site and surroundings
- **Baylands** development with the existing surrounding conditions
- **Cumulative** development, including the Baylands and cumulative projects identified in **Table 7-2**[369]

[368] Large Eddy Simulation is a mathematical model for turbulence used in computational fluid dynamics and to simulate atmospheric air currents. It is used in a wide variety of engineering applications, including combustion, acoustics, and simulations of air flow.

[369] Cumulative windsurfing impact analysis can be found in EIR Section 7.3.16.

Each of these development scenarios was analyzed for:

- **Predominant wind directions**,[370] including Westerly (W, 270°), Westerly-Northwesterly (WNW, 292.5°), and Northwesterly (NW, 315°) winds; and
- **Vertical distance above the water surface**,[371] including 5 feet, 10 feet, 16 feet, 32 feet, and 82 feet above the surface of the Bay.

Effects of Wind Speed on Water-Related Recreation

Wind speed effects on water-related recreational uses of Candlestick Point State Recreation Area shoreline and the Bay vary with the specific use. While there appear to be no specific criteria for minimum wind speeds to support "good" sailing, windsurfing, and the like, wind speeds of 13 mph or more are usually considered desirable for wind-powered activities, such as paragliding and hang-gliding, and apply to windsurfing as well; for highly skilled windsurfers, the more wind in the sailing area, the better. Wind is necessary to launch and land, but if winds at the launch site are too strong, beginning- and intermediate-level windsurfers could find it difficult to do either. Wind direction is also important to windsurfing, in that an adverse wind direction can make it more difficult to launch the board, to reach a desirable sailing area, or to return safely to the launch site.

California Environmental Quality Act (CEQA) Guidelines provide no specific criteria to assess necessary or optimal wind conditions to support windsurfing, and preferences for wind conditions may vary according to the skill level and objectives of the individual windsurfer. For the purposes of this analysis, however, the criteria listed in Threshold REC-2 above are applied to the Candlestick Point State Recreation Area windsurfing resource. Thus, a significant impact would occur if Baylands development would substantially degrade the windsurfing resource by reducing wind speeds or increasing turbulence to an extent that would adversely affect windsurfing in the primary windsurfing area east of the Baylands, south of Candlestick Point.

Effects on Existing Candlestick Point Launch Sites

In addition to effects on wind speed and turbulence within the primary windsurfing area, Baylands development would adversely affect Candlestick Point recreational resources if it would substantially impair access to existing launch sites or access from those sites to the primary windsurfing area. Analysis is therefore undertaken to determine whether Baylands

[370] Given the area's dominant prevailing wind patterns and the location of the Baylands and future cumulative projects in relation to San Francisco Bay, Westerly (W, 270°), Westerly-Northwesterly (WNW, 292.5°) and Northwesterly (NW, 315°) winds were determined to have the highest potential for wind impact and were therefore analyzed for potential impacts on water-related recreational activities.

[371] Five feet above the Bay's water surface was used for impact analysis since it is generally representative of the elevation of a windsurfer's sail. In addition, because existing winds are stronger at distances greater than 5 feet above the Bay's water surface, areas affected by Baylands and cumulative development would generally be smaller in comparison to impacts experienced at 5 feet above the Bay's water surface.

development would impair access to existing Candlestick Point windsurfing launch sites. In addition, changes in wind speed and turbulence adjacent to launch sites to determine whether Baylands development would impact access from launch sites to the primary windsurfing area.

Impact Assessment

Wind Speed

With the addition of the Specific Plan development, overall wind conditions within the Candlestick Point windsurfing area east of the Baylands would remain comparable to existing conditions, with average wind speeds slightly reduced in the vicinity of the shorelines downwind of Baylands. Changes in wind speed with the most prevalent west (W) winds can be seen in **Figure 4.18-3a** and **Figure 4.18-3b**. As can be seen, Baylands development would reduce the average wind speeds by 1 to 2 mph about 300 yards downwind of the site within the Candlestick Point windsurfing area. The effect of Baylands development on wind speed would dissipate farther from shore.

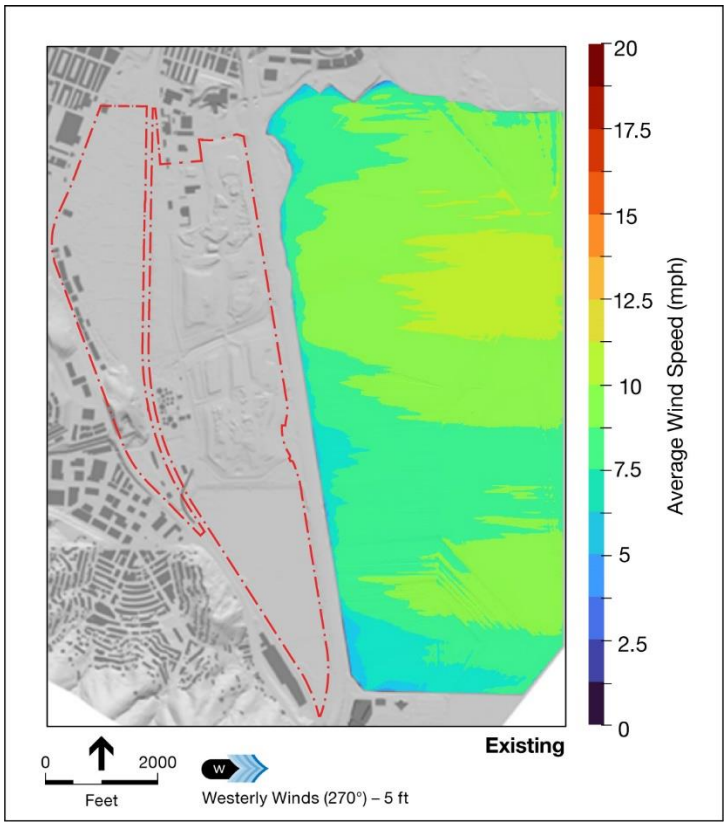
Similarly, in the case of west-northwest (WNW) winds (see **Figure 4.18-4a** and **Figure 4.18-4b**), Baylands development would reduce the average wind speeds by 1 to 1.5 mph about 300 yards downwind of the site within the Candlestick Point windsurfing area.

During northwest (NW) winds (see **Figure 4.18-5a** and **Figure 4.18-5b**), Baylands development would result in some moderate decrease in wind speeds farther from shore, particularly in the southern part of the windsurfing area. However, this decrease in wind speed would be small, on the order of 1 to 1.5 mph. This decrease in wind speed would likely not be perceptible to recreational users, particularly since northwesterly winds occur only about 5 percent of the time and are generally not as strong as the other two wind directions that were simulated.

Turbulence

Wind fluctuations (turbulence) would increase to a small degree, with the greatest effect anticipated downwind of the tallest Baylands buildings and those closest to the shoreline, similar to influenced areas presented for average wind speeds (about 300 yards from the shoreline). In case of W winds (see **Figure 4.18-6a** and **Figure 4.18-6b**), average wind fluctuations would increase by about 0.5 to 1 mph close to the shoreline. For both WNW and NW winds (see **Figure 4.18-7a**, **Figure 4.18-7b**, **Figure 4.18-8a**, and **Figure 4.18-8b**), the Specific Plan's effect on turbulence would be comparable to W winds but would occur closer to the shoreline and extend farther south.

Figure 4.18-3a: Existing and With-Project Wind Speed, Westerly Winds



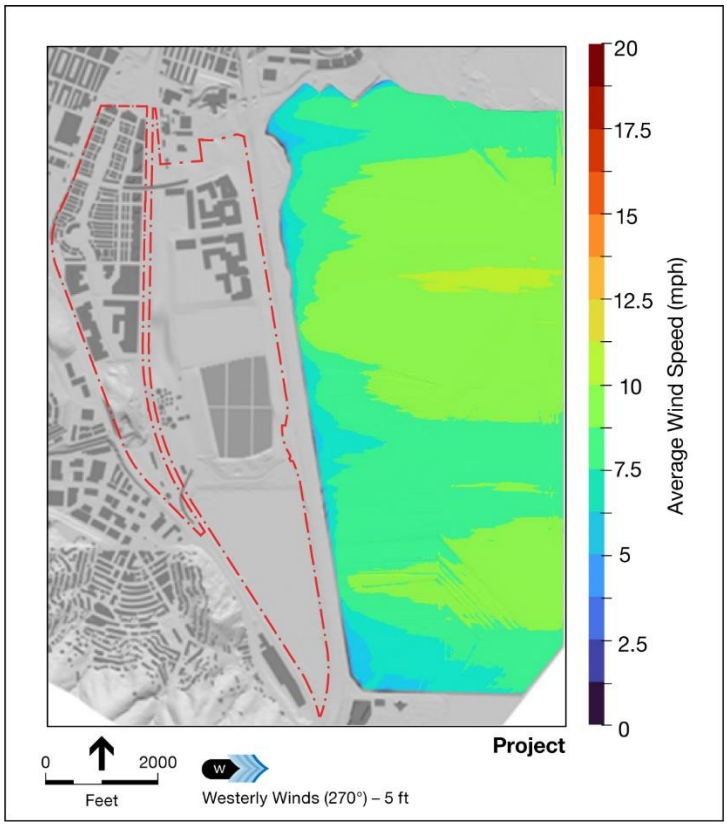


Figure 4.18-3b: Changes in Wind Speed With Project, Westerly Winds

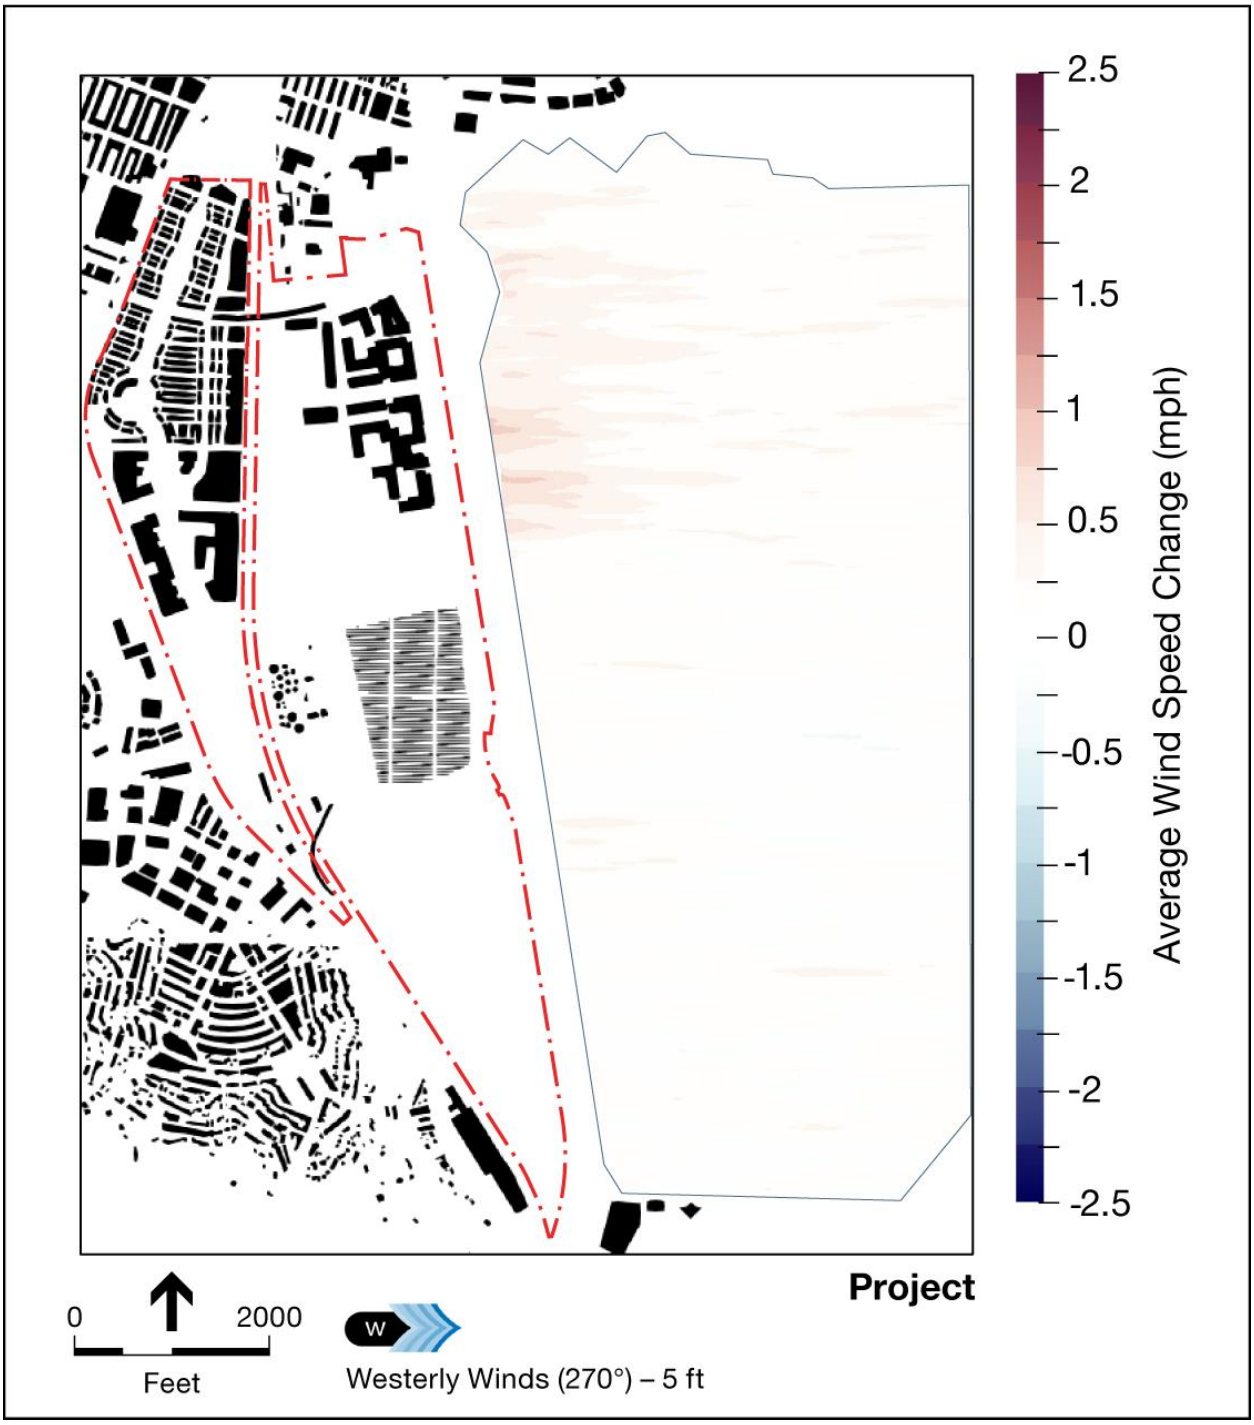

Figure 4.18-7a: Existing and With-Project Wind Fluctuations, Westerly-Northwesterly Winds

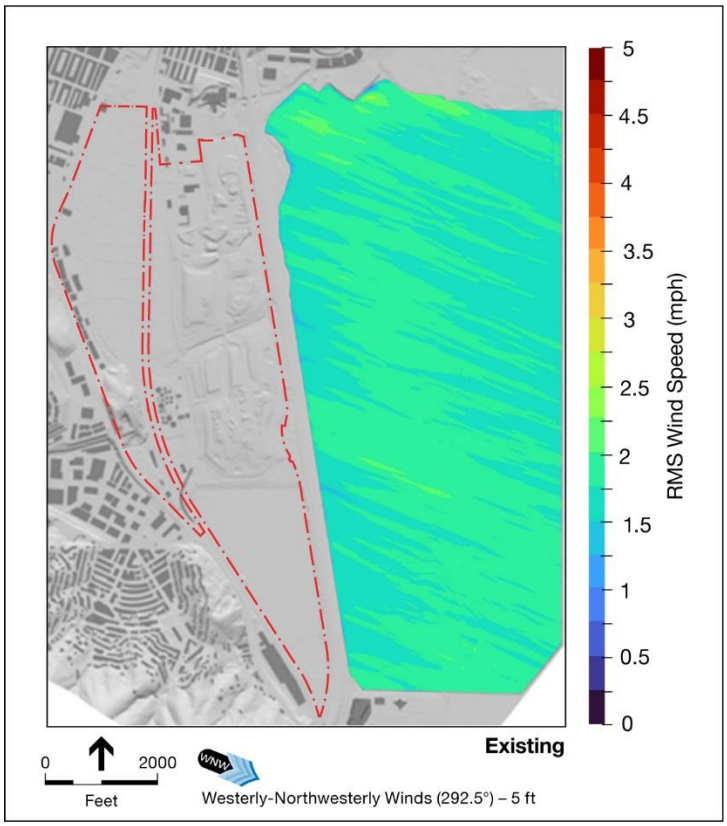

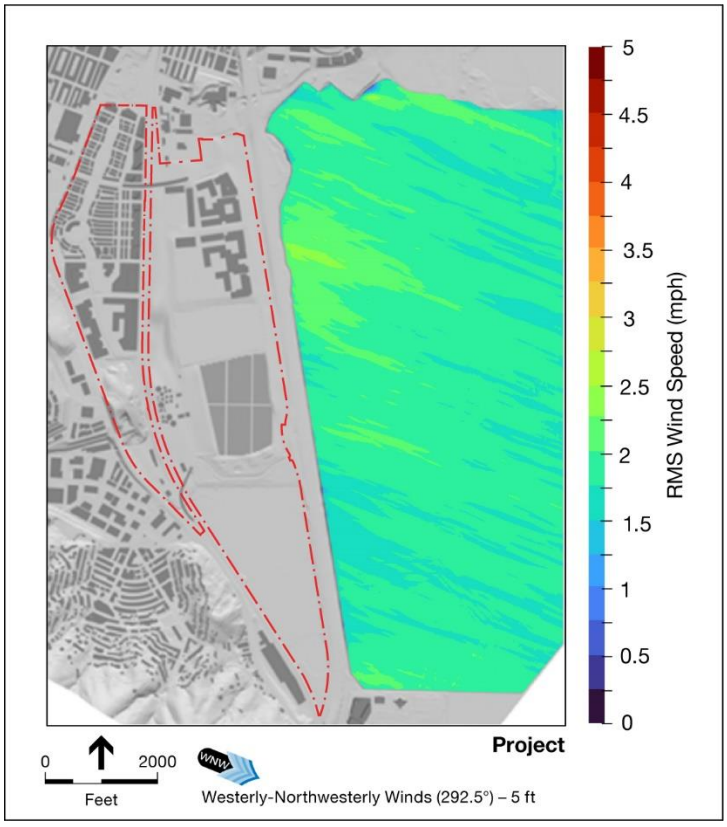

Figure 4.18-7b: Changes in Average Wind Fluctuation With Project, Westerly-Northwesterly Winds

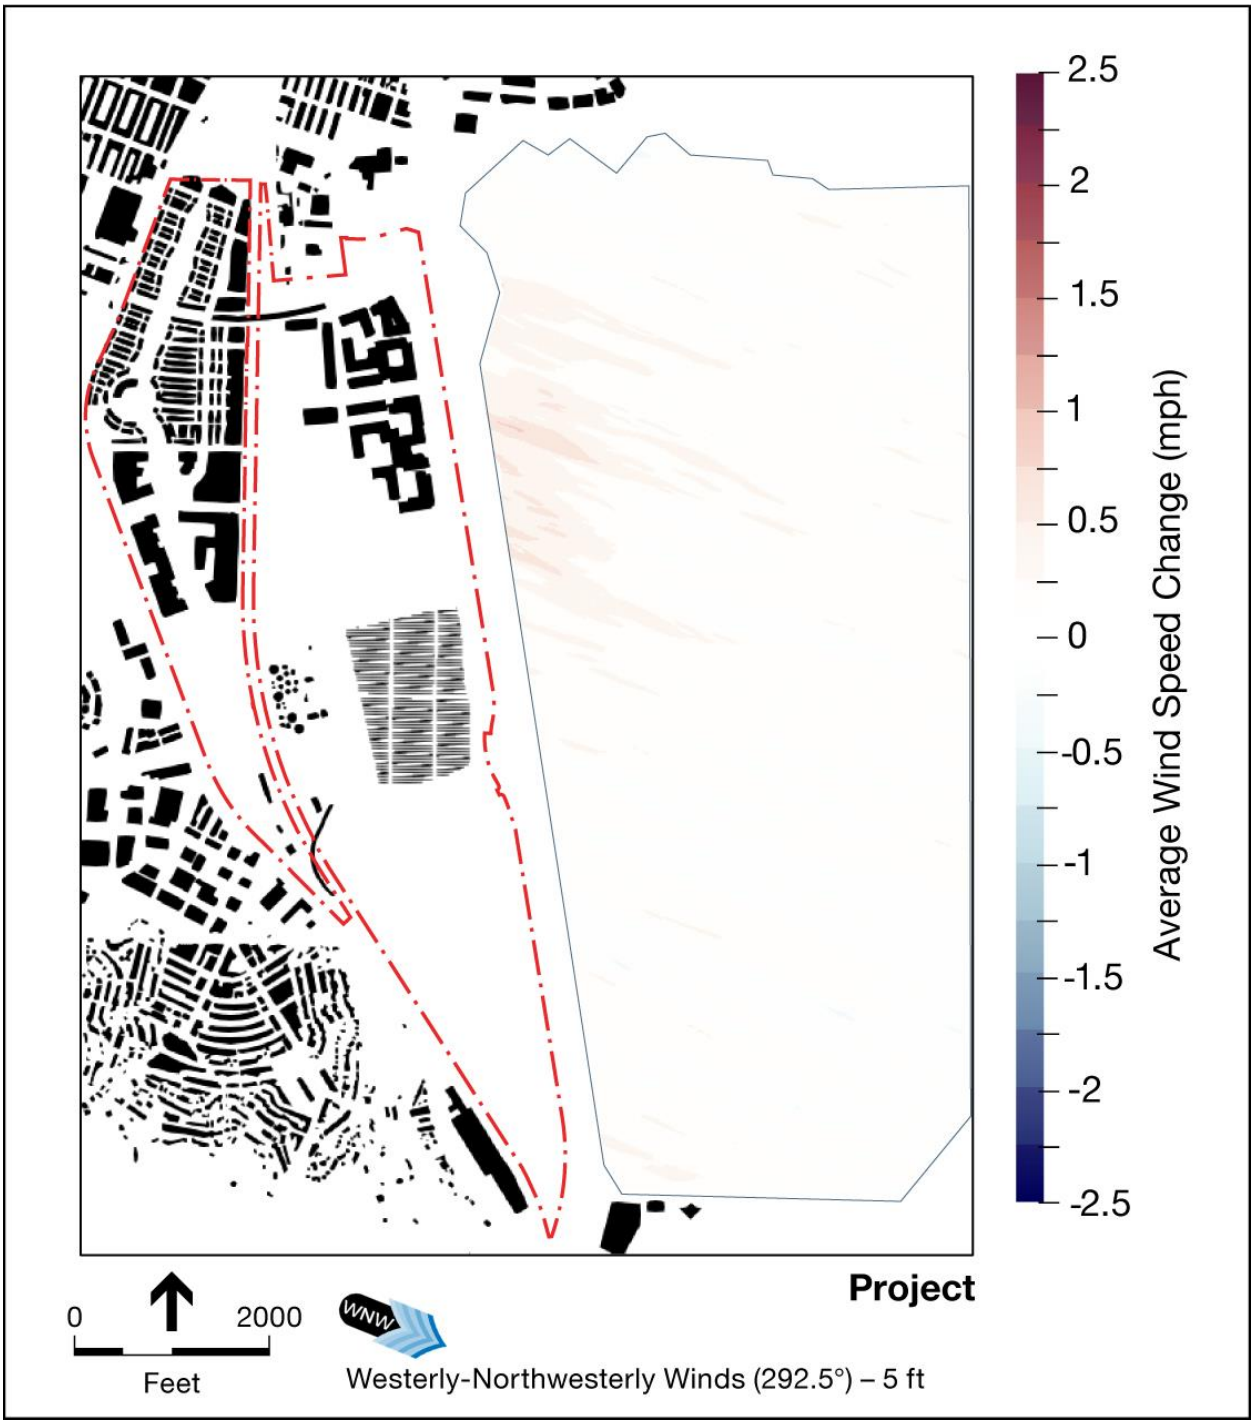

Figure 4.18-8a: Existing and With-Project Wind Fluctuations, Northwesterly Winds

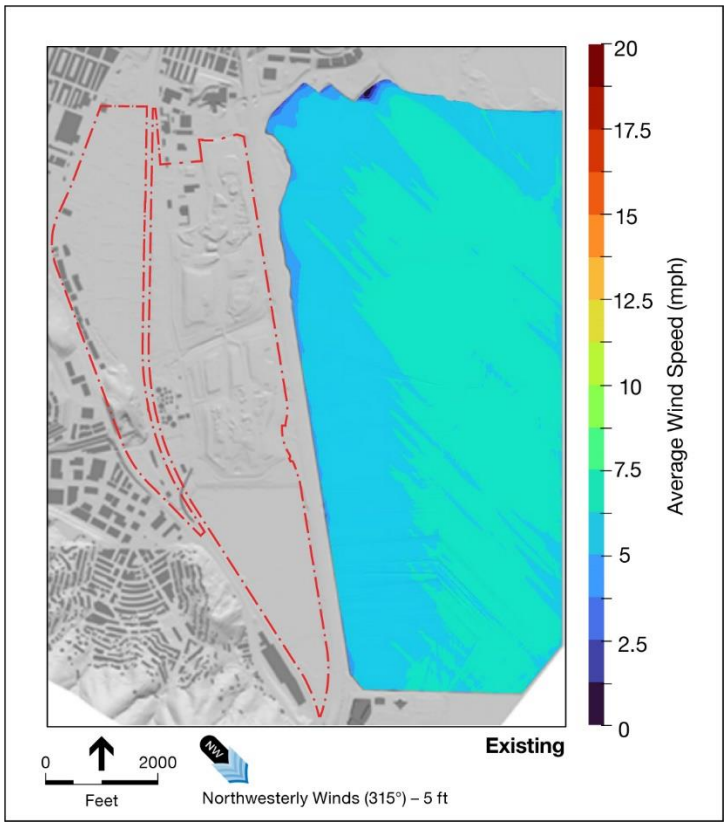

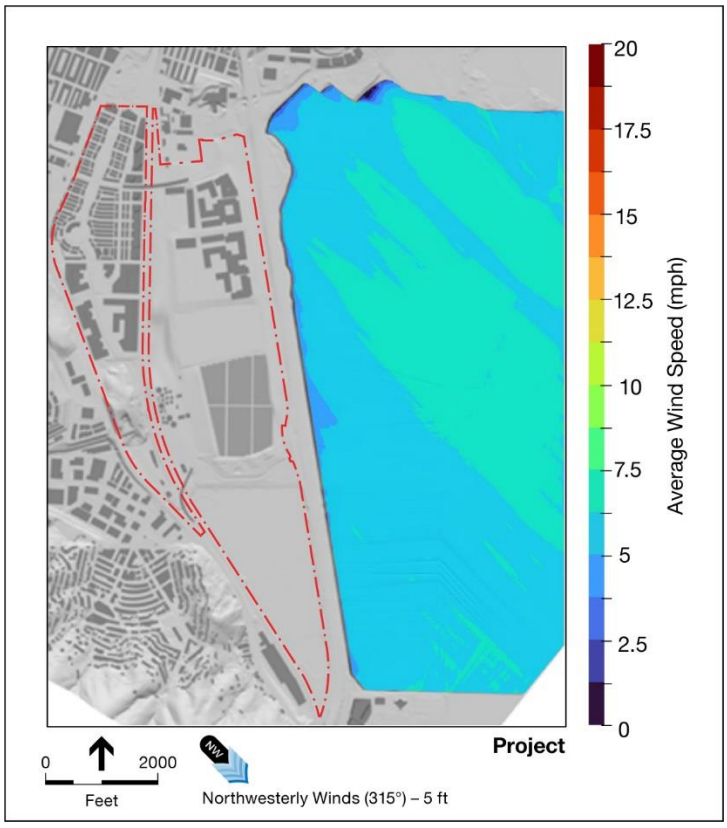

Figure 4.18-8b: Changes in Average Wind Fluctuation With Project, Northwesterly Winds

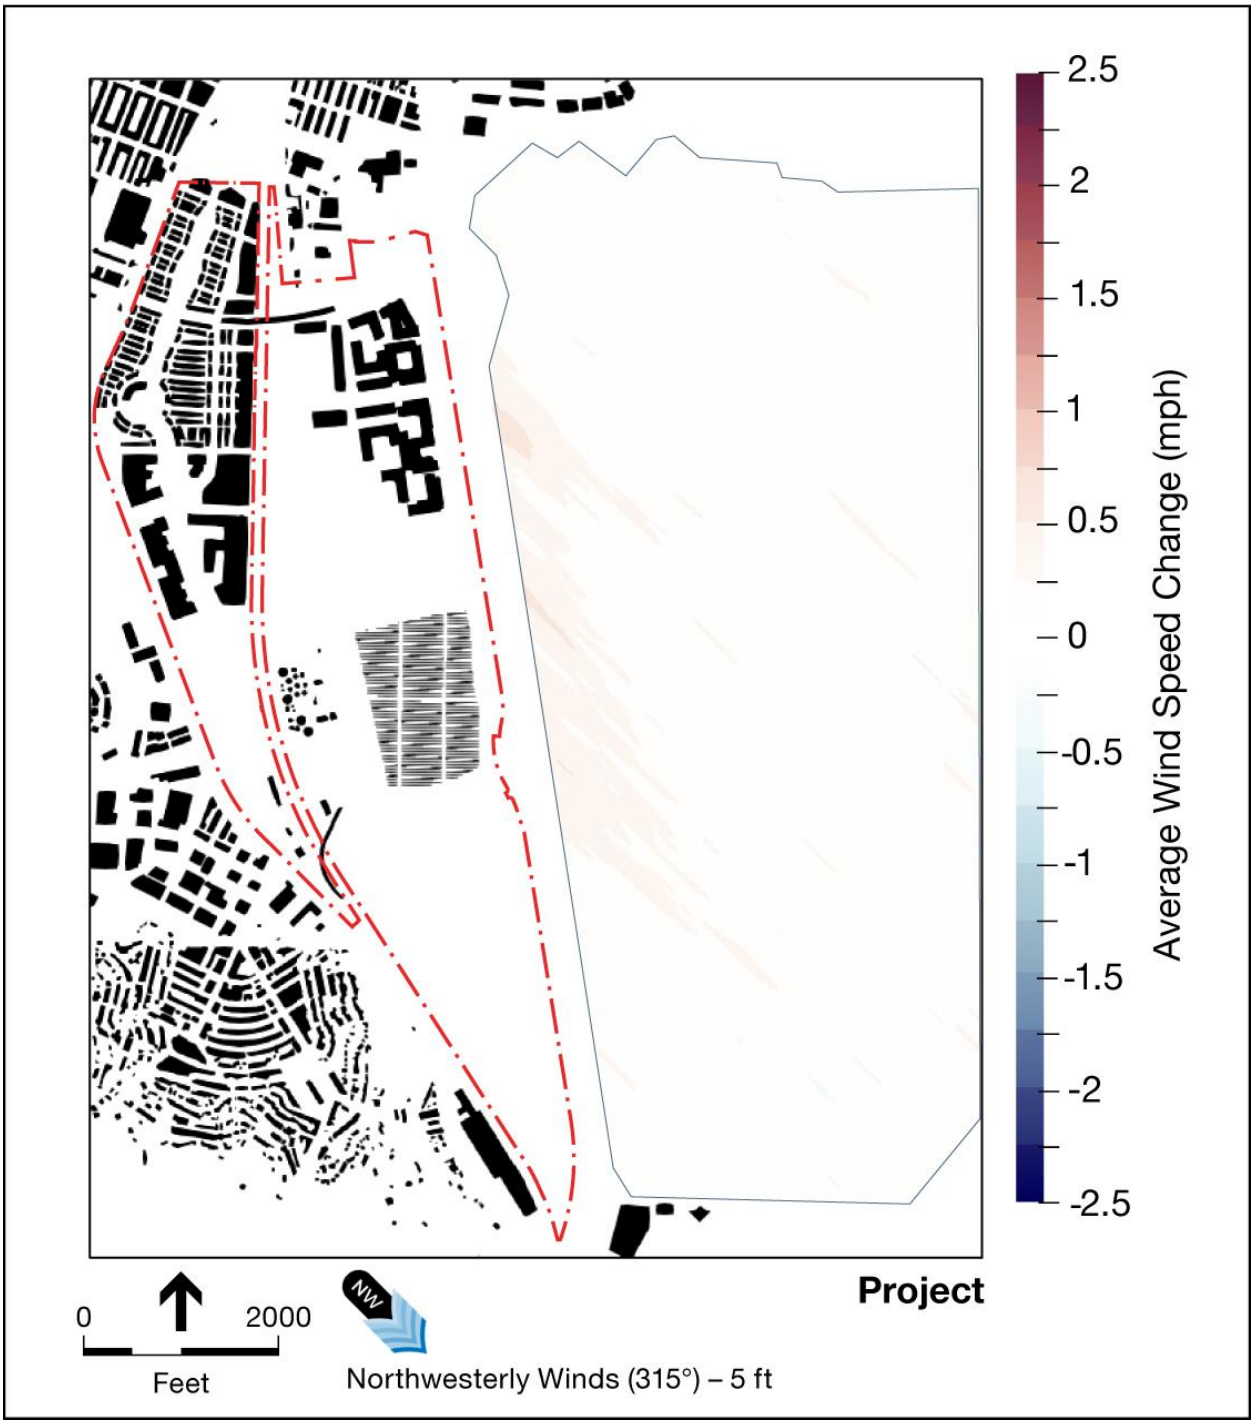

Effects on Existing Candlestick Point Launch Sites

Figure 4.18-9 illustrates the location of proposed Baylands development in relation to the north shore of the primary sailing area (Area of Interest). Baylands development would occur more than ¾ miles west of the launch point and would not cause any changes in vehicular access to parking areas serving the launch area. With westerly winds, Baylands would cause less than a ½ mph reduction in wind speed with no change in average wind fluctuation adjacent to the launch site.[372]

Figure 4.18-9: Baylands Development in Relation to the Candlestick Point State Recreation Area Primary Windsurfing Area (Area of Interest)

Significance Conclusion for Impact REC-2

As shown in **Figure 4.18-3a** through **Figure 4.18-8b**, although Baylands development would cause some decrease in average wind speeds and increase in turbulence, wind conditions within the majority of the Candlestick Point windsurfing area, including the launch area, would not be affected by the Specific Plan. Areas that would be affected are generally limited to 300-yard area along the shoreline, encompassing about 20 percent of the primary windsurfing area (Area of Interest) within which the average change in wind speed would generally be 1 to 2

[372] Because the Specific Plan area is located generally southwest of the Candlestick Point launch area, westerly winds would be indicative of the Specific Plan development's greatest effects at that location.

mph, with changes in turbulence generally limited to 1 to 1.5 mph. Thus, Baylands development would not substantially degrade the primary windsurfing area offshore from the Baylands within the Candlestick Point State Recreation Area. The impact is less than significant.

4.19 WILDLAND FIRE

4.19.1 INTRODUCTION

a. Overview

This section addresses the physical environmental effects of Baylands development in relation to wildfire hazards, including the potential to exacerbate wildland fire risks as well as secondary effects such as exposure of people to pollutant concentrations from a wildland fire, and the potential for downstream flooding or landslides following a wildland fire.

b. Definitions

Fire hazard is the potential fire behavior or fire intensity in an area, based on the type(s) of fuel present (including both the natural and built environment) and their combustibility.

Fire hazard severity zones are defined based on vegetation, topography, and weather (i.e., temperature, humidity, and wind) and represent the likelihood of an area burning over a 30- to 50-year period without considering modifications such as fuel reduction efforts. CAL FIRE, which maintains fire hazard severity data for the entire state, designates three classes of fire hazard severity ratings: Moderate, High, and Very High.

"**Risk**" considers the intensity and likelihood of a fire event to occur as well as the chance, whether high or low, that a hazard such as wildfire will cause harm. Fire risk can be determined by identifying the susceptibility of a value or asset to the potential direct or indirect impacts of wildfire hazard events.

Local Responsibility Areas include incorporated cities, cultivated agricultural lands, and portions of the desert. Within these areas, fire protection is typically provided by city fire departments, fire protection districts, counties, and by CAL FIRE under contract to local governments. The Baylands is within a Local Responsibility Area.

State Responsibility Areas include those areas where the state has fiscal responsibility for wildland fire protection and exclude incorporated cities and lands under federal ownership.

Wildland Fire refers to an unplanned and uncontrolled fire in a natural area with combustible vegetation. A wildfire differs from other fires in that it is typically extensive in size and takes place outdoors in areas of grasslands, woodlands, bushlands, scrublands, peatlands, and other wooded areas that act as a source of fuel or combustible material.

Wildland-Urban Interface is broadly defined as any developed area where conditions affecting the combustibility of natural and cultivated vegetation (wildland fuels) and structures or

infrastructure (built fuels) allow for the ignition and spread of fire through these combined fuels. Such interface areas may have a "hard edge" between developed and undeveloped areas or may have an "intermix" area in which structures or semi-developed areas are mixed with wildland areas and vegetation.

4.19.2 ENVIRONMENTAL SETTING

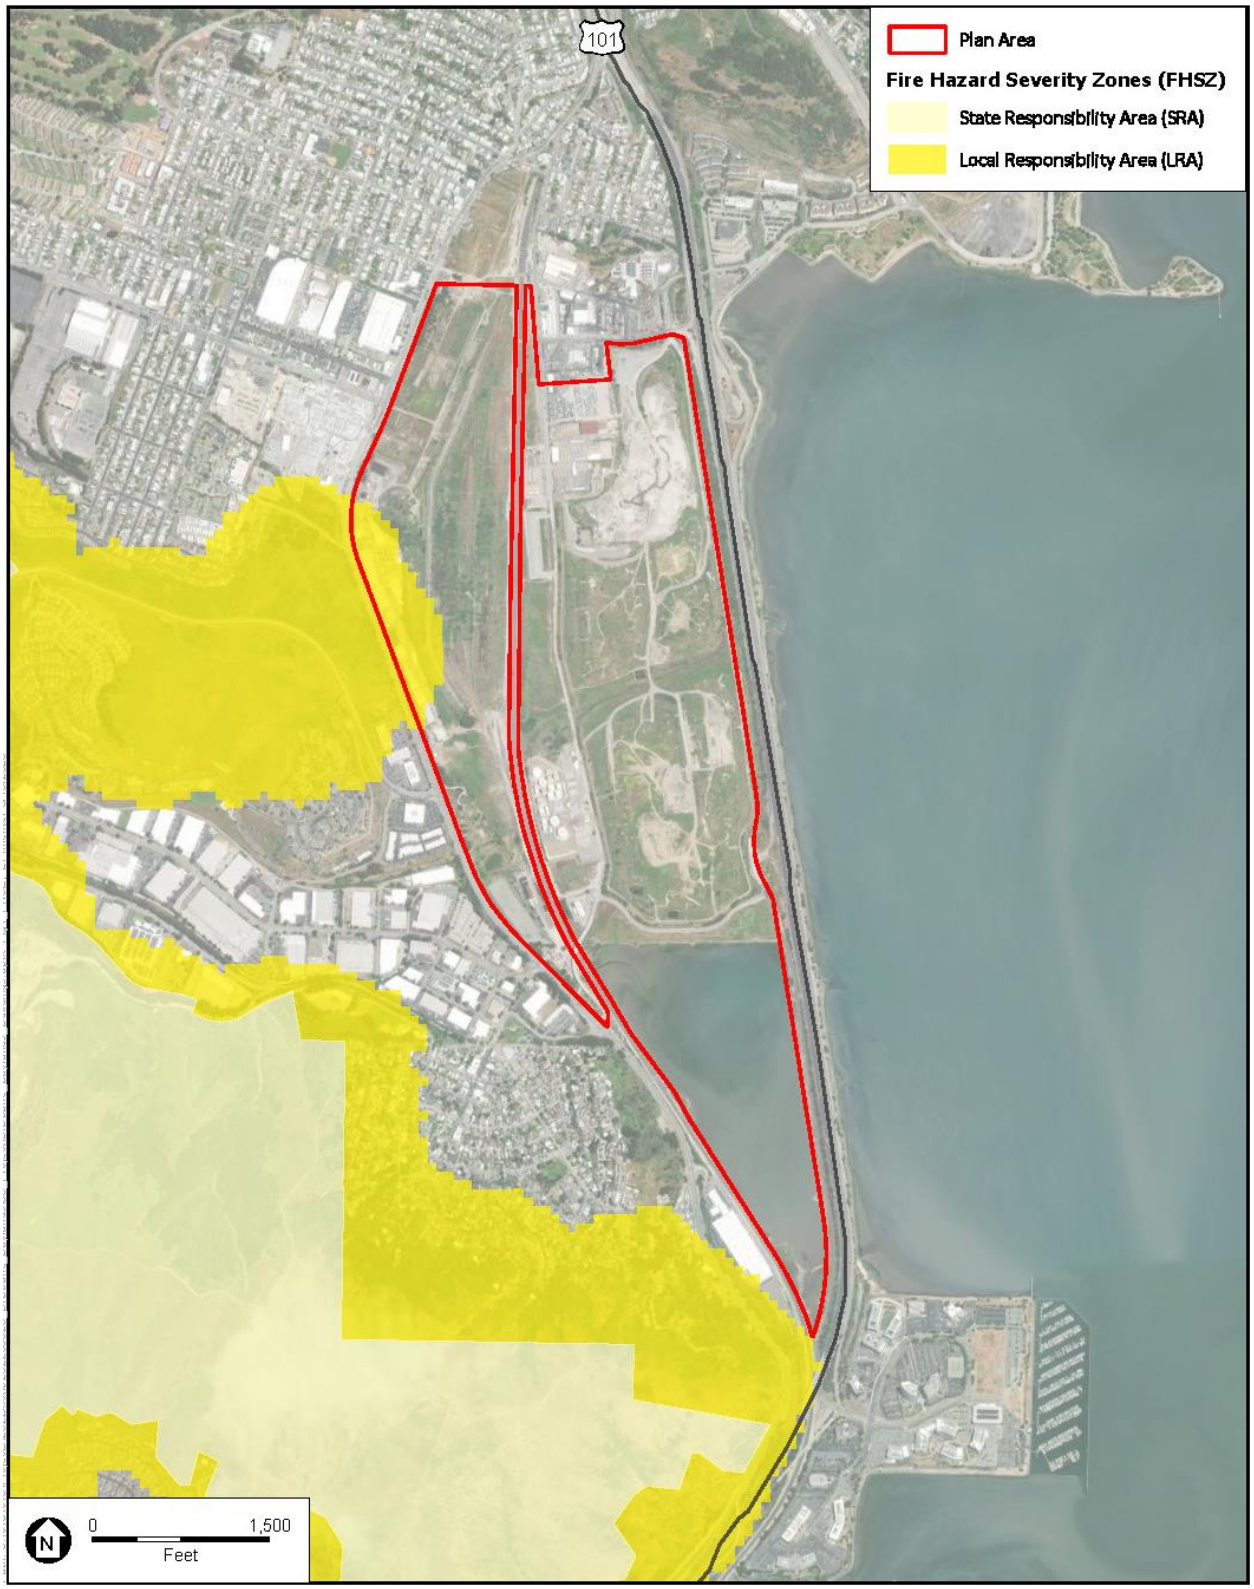
The Baylands Specific Plan area is located in an urban setting, with annual grasslands and coastal scrub habitats on Icehouse Hill constituting the largest area containing combustible vegetation. Other areas of combustible vegetation exist along Visitacion Creek and existing roadways, as well as smaller patches of vegetation throughout the site.

The Baylands site is within a "local responsibility area," which includes incorporated cities, urban regions, agriculture lands, and potions of the desert where the local government rather than the state is responsible for wildfire protection. Fire protection services within the City of Brisbane are provided by the North County Fire Authority, which delivers emergency and non-emergency fire response services. Brisbane is currently served from Fire Station No. 81, located at 3445 Bayshore Boulevard, within the southwestern portion of the Baylands.

The Baylands site is not within or adjacent to a High or Very High Fire Hazard Severity Zone (CAL FIRE 2025b). The closest Very High Fire Hazard Severity Zone to the Baylands is located adjacent to the San Andreas Reservoir and State Route 35, east of the City of Pacifica, approximately 5.75 miles to the southwest. The portion of the Specific Plan area that is designated as a Moderate Fire Hazard Area is located along the existing Industrial Way and consists of small-scale industrial and commercial uses (see **Figure 4.19-1**).[373] California Building Code Chapter 7A, which aims to reduce the risk of embers fanned by wind-blown wildfires from igniting buildings, as well as codes for roofing, siding, decking, windows, and vents currently applies only to the design and construction of new buildings located in High and Very High fire hazard zones within Local Responsibility Areas and throughout all State Responsibility Area regardless of the fire hazard severity ranking.

[373] The fire hazard severity model used by CAL FIRE to classify wildland fire hazards has two key elements: probability of an area burning and expected fire behavior under extreme fuel and weather conditions. Moderate, High, and Very High fire severity zones reflect areas that have similar burn probabilities and fire behavior characteristics. The factors considered in determining fire hazard within wildland areas are fire history, flame length, terrain, local weather, and potential fuel over a 50-year period. Within areas outside of wildlands such as the Baylands, the model considers factors that might lead to buildings being threatened, including terrain, weather, urban vegetation cover, blowing embers, proximity to wildland, fire history, and fire hazard in nearby wildlands. Designation of a portion of the Baylands that is an urban area without combustible vegetation as within a moderate fire hazard area recognizes that embers can spread wildfire because they can travel long distances in the wind and ignite roofs and attics (by getting in through vents). Fire hazard severity zones are not a structure loss model, as key information regarding structure ignition (such as roof type, etc.) is not included (CAL FIRE 2025a).

Figure 4.19-1: Fire Hazard Severity Zones



Source: ESRI, 2022; CAL FIRE, 2025a; ESA, 2025.

As shown in **Figure 4.19-2**, the Baylands is not within a wildland-urban interface, where conditions affecting the combustibility of natural and cultivated vegetation (wildland fuels) and structures or infrastructure (built fuels) would allow for the ignition and spread of fire through these combined fuels. Wildland-urban interface areas are designated along the west side of Bayshore Boulevard within Brisbane and Daly City and to the north in San Francisco (US Forest Service 2020).

4.19.3 REGULATORY CONTEXT FOR BAYLANDS DEVELOPMENT

a. Federal Laws, Plans, Programs, and Regulations

National Incident Management System

The National Incident Management System is a standardized approach to incident management and response, developed by the Department of Homeland Security. The system guides all levels of government, nongovernmental organizations, and the private sector to work together to prevent, protect against, mitigate, respond, and recover from incidents. The system defines operational systems that guide how personnel work together during incidents (FEMA 2022).

Disaster Mitigation Act of 2000

The Code of Federal Regulations Title 44, CFR, Chapter 1, Part 201 provides requirements and procedures for state, local, tribal, and territorial governments to engage in hazard mitigation planning to receive certain types of non-emergency disaster assistance.

National Fire Plan

Managing the Impacts of Wildfire on Communities and the Environment: A Report to the President in Response to the Wildfires of 2000 (National Fire Plan) was prepared by the Department of Agriculture and the Department of the Interior to develop a response to severe wildland fires, reduce fire impacts on rural communities, and assure sufficient firefighting capacity in the future. The National Fire Plan is organized into the following major topic areas: firefighting preparedness and capacity, rehabilitation, and restoration, to restore landscapes and protect communities from post-fire damage, hazardous fuel reduction, forest health management, rural and community assistance, accountability, and research and development.

Figure 4.19-2: Wildland-Urban Interface

Source: Microsoft, 2021; SILVIS Lab, 2019; ESA, 2025.

b. State Laws, Plans, Programs, and Regulations

California Fire Code

The California Fire Code is contained within California Code of Regulations Title 24, Chapter 9 and is also referred to as the California Building Standards Code. The California Fire Code establishes minimum requirements consistent with nationally recognized good practices to safeguard the public health, safety, and general welfare from the hazards of fire, explosions, or dangerous conditions in new and existing buildings, structures, and premises and provides safety and assistance to firefighters and emergency responders during emergency operations. This code establishes regulations affecting or relating to buildings, structures, processes, premises, and a reasonable degree of life and property safeguards regarding fire hazards, fire suppression, or alarm systems, and conditions affecting the safety of emergency responders.

Chapter 7A of the Fire Code establishes minimum standards for protection of life and property by increasing the ability of buildings in a State Responsibility Area fire hazard zone or any Wildland-Urban Interface area to resist the intrusion of flames or embers penetrating buildings. Minimum standards are required for all components of a building, including ignition-resistant walls, floors, roofing, and other exterior coverings, vents, doors, windows, skylights, and decking.

Title 8, California Code of Regulations

California Code of Regulations Section 6773, Fire Protection and Fire Equipment, establishes minimum fire suppression and emergency medical services. The standards include guidelines on the handling of highly combustible materials, firehose sizing requirements, restrictions on the use of compressed air, access routes, and testing, maintenance, and use of all firefighting and emergency medical equipment.

California Health and Safety Code

California Health and Safety Code Section 13000 et seq. provides fire regulations concerning building standards, fire protection and notification systems, fire protection devices, and fire suppression training.

Strategic Fire Plan for California

The 2018 Strategic Fire Plan for California (California Fire Plan) is the state's roadmap for reducing the risk of wildfire. The California Fire Plan focuses on fire prevention and suppression activities to protect lives, property, ecosystem services, and natural resource management. The California Fire Plan's vision is for a natural environment that is more fire resilient; buildings and infrastructure that are more fire resistant; and a society that is more

aware of and responsive to the benefits and threats of wildland fire; all achieved through local, state, federal, tribal, and private partnerships.

California State Hazard Mitigation Plan

The 2023 California Hazard Mitigation Plan (State Hazard Mitigation Plan) represents the state's primary hazard mitigation guidance document. The State Hazard Mitigation Plan details California's historical and current hazards, identifies mitigation strategies and actions to address those hazards, and provides guidance to local jurisdictions developing their own hazard mitigation plans.

California Emergency Response Plan

Pursuant to the Emergency Services Act (Government Code Section 8550 et seq.), California has developed an Emergency Response Plan to coordinate emergency services that are provided by federal, state, and local government agencies and private persons. The Emergency Response Plan is administered by the State's Office of Emergency Services (OES). The OES coordinates the response of state agencies, such as Cal EPA, California Highway Patrol, California Department of Fish and Wildlife, Regional Water Quality Control Boards, regional air districts, and local agencies. The Emergency Response Plan defines the policies, concepts, and general protocols for proper implementation of the California Standardized Emergency Management System. The California Standardized Emergency Management System provides an emergency management protocol that agencies in California are required to follow during multi-agency response efforts, whenever state agencies are involved.

California Fire Service and Rescue Emergency Mutual Aid Plan

The purpose of the California Fire Service and Rescue Emergency Mutual Aid Plan is to provide for systematic mobilization, organization, and operation of necessary fire and rescue resources of the state and its political subdivisions in mitigating the effects of disasters, whether natural or human-caused. The plan provides plans for the expedient mobilization and response of available fire and rescue resources on a local, area, regional, and statewide basis. The plan also provides instructions for communication facilities for the exchange and dissemination of fire and rescue-related data, directives, and information between fire and rescue officials of local, state, and federal agencies.

Attorney General's Best Practices for Analyzing and Mitigating Wildfire Impacts of Development Projects under the California Environmental Quality Act

The Office of the Attorney General released the guidance document *Best Practices for Analyzing and Mitigating Wildfire Impacts of Development Projects Under the California Environmental Quality Act* in October 2022. While it does not have the force of law or a mandatory regulation, this

document provides guidance to assist lead agencies in complying with CEQA as they consider the effects of wildfire on development projects.

Among other things, this document suggests that lead agencies consider the contexts within which wildfire risk can be reduced through planning and design. These include such factors as project density (higher density developments tend to be less vulnerable to wildfire and present lessened risk associated with wildfire ignitions); project location within the landscape (project placement in the landscape relative to fire history, topography, and wind patterns influences wildfire risk); and the availability of adequate water supplies and infrastructure.

California Public Utilities Commission

General Order 165

General Order 165 establishes requirements for the inspection of electric distribution and transmission facilities that are not contained within a substation. Utilities must perform "Patrol" inspections, defined as a simple visual inspection of utility equipment and structures that is designed to identify obvious structural problems and hazards, at least once per year for each piece of equipment and structure. "Detailed" inspections, where individual pieces of equipment and structures are carefully examined, are required every five years for all overhead conductor and cables, transformers, switching/protective devices, and regulators/capacitors. By July 1st of each year, each utility subject to this General Order must submit an annual report of its inspections for the previous year under penalty of perjury.

General Order 166

General Order 166 Standard 1.E requires that investor-owned utilities develop a Fire Prevention Plan, which describes measures that the electric utility will implement to mitigate the threat of power-line fires generally. Additionally, this standard requires that investor-owned utilities outline a plan to mitigate power-line fires when wind conditions exceed the structural design standards of the line during a Red Flag Warning in a high fire threat area. Fire Prevention Plans created by investor-owned utilities are required to identify specific parts of the utility's service territory where the conditions described above may occur simultaneously. Standard 11 requires that utilities report annually to the CPUC regarding compliance with General Order 166. In compliance with Standard 1.E of this General Order, PG&E adopted a Fire Prevention Plan in October 2017 that was updated in October 2018.

Cal/OSHA

The Occupational Safety and Health Act of 1970 (Title 8 CCR) requires development and enforcement of workplace safety regulations concerning the use of hazardous materials in the workplace, including requirements for employee safety training, availability of safety equipment, accident and illness prevention programs, hazardous substance exposure warnings,

and emergency action and fire prevention plan preparation. For example, under Title 8 CCR 5194 (Hazard Communication Standard), construction workers must be informed about hazardous substances that may be encountered. Compliance with Injury Illness Prevention Program (IIPP) requirements (Title 8 CCR 3203) would ensure that workers are properly trained to recognize workplace hazards and to take appropriate steps to reduce potential risks due to such hazards.

c. Regional Plans, Policies, and Regulations

CAL FIRE 2022 Strategic Fire Plan

The CAL FIRE 2022 Strategic Fire Plan for the San Mateo to Santa Cruz Unit (2022 Strategic Fire Plan) serves as a planning and assessment tool that identifies and prioritizes pre-fire and post-fire management strategies and tactics to reduce loss. The 2022 Strategic Fire Plan identifies values, goals and objectives, ignition analysis, priority landscapes, unit preparedness and firefighting capabilities, fire prevention, and vegetation management.

San Francisco Bay Area Regional Emergency Coordination Plan

The San Francisco Bay Area Regional Emergency Coordination Plan (Regional Emergency Coordination Plan) provides an all-hazards framework for collaboration among responsible entities and coordination during emergencies in the San Francisco Bay Area. The Regional Emergency Coordination Plan defines procedures for regional coordination, collaboration, decision-making, and resource-sharing among emergency response agencies in the Bay Area.

San Mateo County Greater Alarm and Mutual Aid Plans

The San Mateo County Greater Alarm and Mutual Aid Plans is a collaborative effort of the San Mateo County Fire Chiefs Association to provide an efficient and effective response to all risk incidents that occur in San Mateo County. The plans include wildland alarm plans, wildland procedures, dispatch levels, wildland resources, and contact information for the responsible fire response entities in the County. San Mateo fire agencies have accepted the terms of the mutual aid plans and agree to follow the plans and procedures for providing mutual aid.

d. City of Brisbane Plans, Ordinances, and Regulations

General Plan

The following General Plan policies are applicable to wildfire:

Circulation Element

Policy C.46: Consider potential effects on mobility and emergency evacuation in making land use decisions.

Community Health and Safety Element

Policy 163: Continue to ensure a 3-minute emergency

Municipal Code

Fire Prevention Code

Municipal Code Chapter 15.44, Fire Prevention Code (Fire Code), combines the 2021 Edition of the International Fire Code and the 2022 Edition of the California Fire Code, including Appendices B, C, D, F, and L, with some modifications. Municipal Code Chapter 15.44 thus establishes fire safety requirements for new and existing buildings, facilities, storage, and processes, and addresses fire prevention, fire protection, life safety, safe storage, and use of hazardous materials. The City's modifications in the Fire Code establish additional building permit requirements regarding dead-end fire apparatus roads and fire turnarounds, fire lanes, fire hydrants, roof coverings, storage of explosive and blasting agents, fire sprinkler systems, and design requirements for exterior doors, as well as setbacks and vertical clearance on fire access routes.

Weed and Flammable Waste Abatement Ordinance

Municipal Code Chapter 8.50, Weed and Flammable Waste Abatement, requires private landowners to monitor and control weeds and flammable waste materials to which the owner or occupant has right of access. The purpose of this chapter is to reduce the threat of fire created by weeds and flammable wastes on private property, which the fire chief determines to constitute a fire hazard and a public nuisance. Implementation and enforcement of Chapter 8.50 is delegated to the North County Fire Authority.

City of Brisbane Emergency Operations Plan

Brisbane's Emergency Operations Plan outlines how the City will coordinate responses to major emergencies and disasters, including operational strategies and plans for managing inherently complex and potentially catastrophic events. The Plan addresses four phases of emergency management: (1) preparedness, (2) response, (3) recovery, and (4) mitigation. The Emergency Operations Plan organizes various departments and agencies into 21 emergency functions to facilitate planning and coordination. The Emergency Operations Plan addresses multiple potential hazards and threats (e.g., earthquakes, storms, flooding, and wildfires).

2021 Multijurisdictional Local Hazard Mitigation Plan

The 2021 Multijurisdictional Local Hazard Mitigation Plan defines measures to reduce risks from natural disasters in San Mateo County, including incorporated cities and unincorporated areas. The Local Hazard Mitigation Plan assesses hazard vulnerabilities, including wildfires, and identifies mitigation actions that jurisdictions will pursue in order to reduce the level of injury, property damage, and community disruption that might otherwise result from such events. The Local Hazard Mitigation Plan is included as an appendix to the City's General Plan.

4.19.4 SIGNIFICANCE CRITERIA

The following criterion was used to determine the significance of utilities, service systems, and water supply impacts.

Threshold WLF-1: The Baylands Specific Plan would cause a significant impact if construction or operational activities would exacerbate fire risk, thereby exposing people to pollutant concentrations from a wildfire or causing a substantial risk of loss, injury, or death due to downslope or downstream flooding or landslides as the result of runoff, post-fire instability, or drainage changes.

Analysis of the extent to which the Baylands Specific Plan would substantially impair an adopted emergency response plan or emergency evacuation plan is provided in Section 4.13, Impact HAZ-5, Emergency Preparedness.

4.19.5 PROJECT IMPACTS AND MITIGATION MEASURES

a. Threshold WLF-1: Exacerbate Fire Risk

Methodology for Determining Significance

In determining whether a significant impact would result from the 2025 Specific Plan project, the analysis considers the types of activities that would occur within areas of combustible vegetation during construction and operations. The analysis reasonably assumes compliance with federal, state, and local laws and requirements, recognizing that the Specific Plan and off-site infrastructure areas are within local responsibility areas and not designated as High or Very High Fire Hazard Zones. Thus, Specific Plan development would be subject to the provisions of Brisbane Municipal Code Chapter 8.60 (Weed and Flammable Waste Abatement) and Chapter 15.88 (Fire Prevention Code) but would not be subject to requirements for development within state responsibility or High or Very High Fire Hazard Zones.

Impact Assessment

Construction

Construction activities within areas containing combustible vegetation include clearing and grubbing prior to site grading and construction of trails, recreational improvements, and relocation of the Mission Blue Nursery on Icehouse Hill. These activities would occur within areas of light to medium fuels (mainly scrubs and grasses).

These activities would involve the use of typical construction equipment (i.e., scraper/blade, backhoes, and rollers) powered by gasoline or diesel fuel, as well as smaller, handheld equipment, such as weed trimmers. Use of construction equipment has the potential to cause sparks. The large rocks on Icehouse Hill would also have the potential for causing a fire if struck by a metal blade.

Sparks originating from construction activities have the potential to ignite vegetation or other materials within construction sites area, or to spread to the surrounding vegetated land. Site grading, including clearing and grubbing activities, have the highest potential to generate sparks that may ignite a fire.

Operations

Post-construction activities would be concentrated within residential, commercial, institutional, and infrastructure use that would be separated from wildland portions of the site. However, the use of trails and recreational improvements on Icehouse Hill and within restored habitat areas would generate the potential for ignition of dry vegetation.

Significance Conclusion for Impact WLF-1

Construction

Because sparks originating from construction activities have the potential to ignite vegetation or other materials within or adjacent to the construction sites, a significant impact would occur.

Operations

Baylands development would be required to comply with the California Building Code, California Fire Code, and Municipal Code fire prevention and weed and flammable waste abatement requirements, which will ensure that required safety measures are incorporated into all building designs. However, human use of trails constructed through or adjacent to habitat areas as well as recreational improvements on Icehouse Hill have the potential for ignition of dry vegetation.

Program EIR Mitigation Measures

The Program EIR did not propose any wildland fire mitigation measures.

Additional Mitigation Measures

MM WLF-1: Wildfire Risk Reduction. To prevent sparking a wildland fire, construction activities within or adjacent to non-irrigated vegetated areas shall be subject to the following requirements:

- Construction activities shall not occur during red flag warning days.
- Internal combustion engines used in construction shall be equipped with spark arrestors that are in good working order.
- Equipment staging and storage areas shall be cleared of extraneous flammable materials and provided with a non-flammable surface.
- Fires ignited on site shall be immediately reported to the North County Fire Authority.
- No driving (cars, trucks, all-terrain vehicles, or similar) shall be permitted over unmaintained dry vegetation.
- Equipment engines shall be kept free of oil and dust, and mowers shall be kept free of flammable materials.
- Weed trimmers shall be used to cut down any dry weeds and grass before commencing any construction activities.
- Because a rock hidden in vegetation can start a fire if struck by a metal blade, large rocks in the area of grading or blading shall be removed before clearing and grubbing.
- Smoking shall be restricted to designated smoking areas that are void of vegetation and have appropriate cigarette butt receptables.
- Construction crew vehicles within or adjacent to areas of non-irrigated vegetation shall be equipped with a water-type fire extinguisher and crew shall be trained in the use of the fire extinguisher in the event that equipment sparks a fire.

Significance Conclusion for Impact WLF-1 Following Implementation of All Mitigation Measures

Mitigation Measure MM WLF-1 identifies specific precautions to be taken prior to and during construction activities that occur within or adjacent to non-irrigated vegetated areas and ensures that crew have been trained in the use of the equipment to extinguish small fires.

By minimizing the risk of construction-related fire ignition, implementation of MM WLF-1 would also minimize the potential for a wildfire to spread and expose people to pollutant concentrations from a wildfire or cause a substantial risk of loss, injury, or death due to downslope or downstream flooding or landslides as the result of runoff, post-fire instability, or drainage changes.

This impact would be less than significant with mitigation incorporated.

4.20 SIGNIFICANT UNAVOIDABLE ENVIRONMENTAL EFFECTS

CEQA Guidelines Section 15126.2(b) requires EIRs to describe "any significant impacts, including those which can be mitigated but not reduced to a level of insignificance." Once an impact is determined to be significant, it is the Lead Agency's responsibility to identify and implement all feasible[374] mitigation measures to avoid the significant impact or to reduce its severity to below the identified threshold of significance.

CEQA does not preclude a Lead Agency from approving a project with one or more significant unavoidable impacts. To approve a project with one or more significant unavoidable impacts, the Lead Agency must, on the basis of substantial evidence, (1) conclude that the unavoidable environmental damage from the project is acceptable when balanced against the project's benefits and (2) adopt a statement of overriding considerations detailing why the agency believes that specific economic, legal, social, technological, or other stated benefits, including regionwide or state-wide environmental benefits, are sufficient to warrant project approval (CEQA Guidelines Section 15093). The statement of overriding considerations is required to explain in writing the specific reasons supporting the City's action to approve a project with one or more significant unavoidable impacts based on the Final EIR and/or other information in the record.

Draft EIR Sections 4.3 through 4.19 have identified the physical environmental impacts effects that would result from the Baylands Specific Plan, including those impacts that were determined to be less than significant, less than significant with implementation of required mitigation measures,

Relationship of Significant Unavoidable Impacts and Project Approval (CEQA Guidelines Section 15093)

(a) CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or state-wide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or state-wide environmental benefits, of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable."

(b) When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.

(c) If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the notice of determination. This statement does not substitute for, and shall be in addition to, findings required pursuant to Section 15091.

[374] For each identified significant effect, CEQA Guidelines Section 15126.4(a)(1) requires an EIR to "describe feasible measures which could minimize significant adverse impacts, including where relevant, inefficient and unnecessary consumption of energy." CEQA Guidelines Section 15364 defines "feasible" as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors."

and those for which implementation of all feasible mitigation measures would not be capable of reducing the impact to less than significant. Each of the significant unavoidable environmental impacts that would result from the Baylands Specific Plan are identified below.

Impact AQ-1: The Baylands Specific Plan would cause a net increase in emissions of non-attainment criteria pollutants (ROG, NO_X, $PM_{2.5}$, PM_{10}) exceeding BAAQMD Regional Criteria Pollutant Significance Thresholds during construction and for operations at the completion of Phase 1 development, as well as at full Specific Plan buildout.

Impact GHG-1: The Baylands Specific Plan would cause an increase in total greenhouse gas (GHG) emissions generated within the Baylands.

Impact NOI-1: Building construction adjacent to occupied dwelling units within the Baylands and roadway noise increases along four roadway segments would be significant and unavoidable because of the proximity of receptors and unavailability of feasible mitigation strategies sufficient to reduce impacts to less than significant. Additionally, construction noise impacts from installation of pile foundations would remain significant since site-specific geotechnical conditions may require impact pile driving as close as 50 feet to occupied residential uses within the Baylands and generate noise as great as 21 dBA above ambient in proximate off-site locations, exceeding the 10 dBA over existing ambient level standard. Construction noise impacts therefore would be significant and unavoidable with implementation of all feasible mitigation. Additionally, given that construction of foundations for Phase 1 development would occur over a 10-year period and could likely involve some degree of impact pile driving, including simultaneous pile driving at different locations, even with identified mitigation measures, this impact would be significant and unavoidable.

Impact NOI-2: The aggregate operation of all stationary noise sources would increase noise levels generated within the Specific Plan area as a whole. Because the exact future location and configuration for all of these sources cannot be known at this time, it is not possible to ensure that the aggregate increase in noise levels at specific off-site receptor locations from stationary sources would not result in a permanent noise increase in excess of 5 dBA L_{eq}.

Impact NOI-3: Increased noise levels from Baylands-generated traffic would exceed applicable standards along one roadway segment at the conclusion of Phase 1 development (assumed to occur in 2035), increasing to three roadway segments at full Specific Plan buildout (assumed to be 2040).

4.21 PROGRAM EIR MITIGATION MEASURES

4.21.1 INTRODUCTION

Because an EIR was certified for development of the Baylands in August 2018 (Brisbane Baylands Program EIR, State Clearinghouse #2006022136), the preceding impact analyses include applicable mitigation measures from the certified Final Program EIR. This section identifies each Program EIR mitigation measures and indicates the reasons each measure was or was not carried forward from the Program EIR.

Any modifications to Program EIR mitigation measures carried forward into the Specific Plan EIR are presented below in underline/~~strikeout~~ format. Such modifications include:

- Renumbering and providing names for Program EIR mitigation measures consistent with other mitigation measures in this EIR;
- Deleting portions of Program Mitigation Measures that have been implemented in the proposed Specific Plan;
- Modifying outdated references and clarifying the area to which the mitigation measure applies; and
- Revising portions of mitigation measures as required to comply with current legal requirements and standards.

The reasons for any such modifications are presented, where applicable, for each Program EIR mitigation measure.

4.21.2 STATUS OF PROGRAM EIR MITIGATION MEASURES

a. Land Use and Planning Policy

Table 4.21-1: Program EIR Land Use and Planning Policy Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward into Chapter 4 Mitigation Measures?	Revisions to Program EIR Mitigation Measure as Presented in Section 4.3
General Plan Consistency	**4.I-1:** "Each of the inconsistencies identified in Table 4.I-1 shall be resolved prior to selection of a Concept Plan or approval of a Specific Plan for development within the Baylands through either modification(s) to the Concept Plan or Specific Plan or amendments to the Brisbane General Plan …"	No. The General Plan inconsistencies identified in Section 4.3, Impact LUP-1, (inconsistency with MTC's Transit-Oriented Communities Policy) were not addressed by Program EIR Mitigation Measure 4.I-1.	

b. Population and Housing

No mitigation measures related to population and housing were proposed in the Program EIR.

c. Aesthetic and Visual Resources

Table 4.21-2: Program EIR Aesthetic and Visual Resources Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward into Chapter 4 Impact Mitigation Measures?**	**Revisions to Program EIR Mitigation Measure as Presented in Section 4.5**
Loss of scenic views of Bay shoreline	**4.A-1a:** Development within 350 feet of the eastern boundary of the Baylands Project Site (US Highway 101) shall be designed to avoid blockage of views of the Bay shoreline from Viewpoints 1, 2, 3, 7, 8, and 11 by limiting the height of buildings within 350 feet of US Highway 101 to a maximum height of 80 feet based on the grading plan included in the proposed Brisbane Baylands Infrastructure Plan. Each specific plan approved for development within the Baylands Project Site shall include development standards setting forth this requirement.	**Yes.** This measure's height limitations within 350 feet of the eastern boundary of the Baylands are needed to mitigate impacts of the current Baylands development project.	**MM AES-1a: Maintain Views of Scenic Resources (Program EIR Mitigation Measure 4.A-1a).** Development within 350 feet of the eastern boundary of the Baylands ~~Project Site~~ Specific Plan area (US Highway 101) shall be designed to avoid blockage of views of the Bay shoreline ~~from Viewpoints 1, 2, 3, 7, 8, and 11 by~~ limiting the height of buildings within 350 feet of US Highway 101 to a maximum height of 80 feet based on the grading plan included in the proposed Brisbane Baylands Infrastructure Plan (January 2023). ~~Each specific plan approved for development within the Baylands Project Site shall include development standards setting forth this requirement.~~ *Reason for revisions to this Program EIR Mitigation Measure:* *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" encompasses an area larger than the Baylands, revisions were needed to focus implementation of this measure on the physical area affected by the impact that requires mitigation consistent with the original intent of Program EIR Mitigation Measure 4.A-1a.* • *The listing of viewpoints in the Program EIR is outdated.* • *The requirement for adoption of a single specific plan for the entirety of the Baylands would be implemented by the Baylands Specific Plan currently being considered by the City.*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward into Chapter 4 Impact Mitigation Measures?**	**Revisions to Program EIR Mitigation Measure as Presented in Section 4.5**
			• *The reference to the Baylands Infrastructure Specific was modified to reflect the specific date of that document.*
Loss of scenic views of Bay shoreline	**4.A-1b:** Development within 350 feet of the eastern boundary of the Project Site (US Highway 101) shall be designed to avoid blockage of views of the Bay shoreline from Viewpoints 1, 2, 8, and 11. Each specific plan approved for development within the Project Site shall include development standards setting forth this requirement. These standards shall include a requirement that buildings within 350 feet of US Highway 101 be no greater than 80 feet in height.	**No.** This measure addresses impacts of concept plan scenarios that were rejected when General Plan Amendment GP-1-18 was adopted and is not relevant to the current Baylands development project.	
Differences in the intensity of Baylands development compared to existing surrounding development	**4.A-3:** All site-specific development projects within the Project Site shall be subject to the following minimum standards, which shall be set forth in required specific plan(s) prepared for development of the Project Site: • ***Landscaping/Open Space:*** Landscaping and open space areas shall be designed to provide usable outdoor spaces; to provide a pedestrian orientation within residential (DSP and DSP-V scenarios) and non-residential development areas; and to avoid the appearance of a solid mass of buildings as viewed from within the Project Site, from US Highway 101, from Bayshore Boulevard, and from the representative viewpoints shown in Figure 4.A-1. • ***Development Intensity, Setbacks, Stepbacks, and Building Heights:*** Variations, including reductions in the development intensity of site-specific development sites within the Project Site from the maximum allowable development intensity, shall be provided to	**No.** Program EIR Mitigation Measure 4.A-3 was implemented by the current Specific Plan.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward into Chapter 4 Impact Mitigation Measures?**	**Revisions to Program EIR Mitigation Measure as Presented in Section 4.5**
	maintain compatibility with the development intensity of surrounding neighborhoods and community areas. Variations in building heights (reductions from maximum allowable heights), along with appropriate building setbacks and provision of buildings stepbacks in height, shall be employed to maintain a feeling of openness within Project Site open space areas; to maintain compatibility with the scale of historic structures being preserved onsite; to reduce the perceived intensity of development as viewed from the Geneva Avenue extension, Bayshore Boulevard, US 101 freeway, and Viewpoints 1, 2, 3, 7, 8, and 11; and to provide view corridors through the Baylands so that development is not perceived as a solid mass of buildings when viewed from downtown Brisbane or the US 101 freeway. • ***Roofs:*** Roof design shall be compatible with the building design and articulation, emphasizing color, form, and materials. Rooftop mechanical equipment shall be screened from visibility from the representative viewpoints shown in Figure 4.A-1. Roofs shall incorporate opportunities for solar panels, which when installed need not be screened from view. • ***Fenestration:*** Window patterns shall be well proportioned to the building, shall be varied to achieve diversity in architecture, and shall provide adequate light and air to interiors. • ***Building Articulation:*** Facade articulation of a minimum of five feet shall be required at minimum intervals of 80 feet.		

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward into Chapter 4 Impact Mitigation Measures?	Revisions to Program EIR Mitigation Measure as Presented in Section 4.5
	• ***Building Materials:*** Materials shall be high quality with textures and colors that further accentuate building design. Changes in building materials along a building face shall relate to building massing. • ***Signage:*** Signage shall complement building design in material, scale, lettering, and lighting and enhance the public realm. • ***Transparency:*** In retail buildings along publicly accessible frontages, 40 to 60 percent of ground-floor wall areas shall be transparent. • ***Building Facades:*** Building design shall avoid large flat wall areas unbroken by protections, recesses, or other architectural features. Entrances shall be appropriately scaled and easy to find. • ***Outdoor Storage and Mechanical Equipment:*** Any permitted outdoor storage or mechanical equipment shall be fully screened from view from areas accessible to the general public, as well as from the representative viewpoints shown in Figure 4.A-1. • ***Parking:*** Podium or structured parking shall be wrapped with active uses at ground level and not exposed to the street. As part of the approval of specific plan(s) for development within the Project Site, the City shall first make the finding that the design standards and guidelines contained in the specific plan set forth, at a minimum, these standards. As part of the approval of all subsequent site-specific development within the Project Site, the approving body for such development shall first make the finding that the site-specific

Table 4.21-3: Program EIR Biological Resources Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
Adverse effect on candidate, sensitive, or special-status plant and wildlife species	**4.C-1a:** Prior to construction or any other Project Site development-related ground disturbance activities on Icehouse Hill, the applicant shall conduct pre-construction presence/absence surveys for special-status plants. Initial surveys at Icehouse Hill shall be carried out in conjunction with surveys for endangered butterfly host plants as described in **Mitigation Measure 4.C-1c**. Surveys would be implemented to determine if a special-status plant species has colonized the site in the interim between the determination of baseline conditions for this EIR, and project initiation, as well as to provide site-specific direction for final trail routing and design to avoid sensitive plant species (see **Mitigation Measures 4.C-1b** and **4.C-1c**). Surveys shall be conducted in accordance with CNPS and CDFW rare plant survey guidelines and shall be conducted during the flowering period when each species is most readily identifiable. In order to capture variability of special-status plant species distribution, three special-status plant surveys shall be conducted at two-week intervals during the appropriate flowering period (April to June), before commencement of any development activities on Icehouse Hill. Any special-status plant populations shall be mapped in the field (see **Mitigation Measure 4.C-1b**). If the presence of any special-status plant species is confirmed, a copy of the survey results shall be forwarded to CDFW, and **Mitigation Measure 4.C-1b** shall be implemented.	**Yes.** Because of the potential for a special-status plant species to colonize the site in the interim between baseline conditions for this EIR and ground disturbance for habitat and trail improvements, retention of this measure for the Specific Plan is needed.	**MM BIO-1a: Special Status Plant Surveys at Icehouse Hill (Program EIR Mitigation Measure 4.C-1a).** Prior to construction, or any other ~~Project Site~~ Baylands development-related ground disturbance activities on Icehouse Hill, the applicant shall conduct pre-construction presence/absence surveys for special-status plants. Initial surveys at Icehouse Hill shall be carried out in conjunction with surveys for endangered butterfly host plants described in ~~**Mitigation Measure 4.C-1c**~~ EIR Appendix D, *Biological Resources Technical Report*. Surveys would be implemented to determine if a special-status plant species has colonized the site in the interim between the determination of baseline conditions for this EIR, and project initiation, as well as to provide site-specific direction for final trail routing and design to avoid sensitive plant species (see ~~**Mitigation Measures 4.C-1b**~~ MM BIO-1b, Special-Status Plant Avoidance at Icehouse Hill, and ~~**4.C-1c**~~ MM BIO-1c, Rare Butterfly Surveys and Habitat Protection at Icehouse Hill. Surveys shall be conducted in accordance with CNPS and CDFW rare plant survey guidelines and shall be conducted during the flowering period when each species is most readily identifiable. In order to capture variability of special-status plant species distribution, three special-status plant surveys shall be conducted at two-week intervals during the appropriate flowering period (April to June), before commencement of any development activities on Icehouse Hill.

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
	In the event that special-status plants are not identified within development areas, including areas used for construction, the additional mitigation identified in **Mitigation Measure 4.C-1b** is not required.		Any special-status plant populations shall be mapped in the field ~~(see **Mitigation Measure 4.C-1b**)~~. If the presence of any special-status plant species is confirmed, a copy of the survey results shall be forwarded to the CDFW, and **Mitigation Measure ~~4.C-1b~~ MM BIO-1b** shall be implemented. Whether or not special-status plants are identified during surveys, the additional mitigation identified in MM BIO-1c, Rare Butterfly Surveys and Habitat Protection at Icehouse Hill, shall be implemented to avoid special-status plants and butterfly host plants. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" encompasses an area larger than the Baylands, revisions were needed to focus implementation of this measure on the physical area affected by the impact that requires mitigation consistent with the original intent of Program EIR Mitigation Measure 4.C-1a.* • *Since protocol surveys for host and nectar plants for sensitive butterfly species were undertaken for this EIR, references to Program EIR Mitigation Measure 4.C-1b needed to be updated to reference Appendix D, Biological Resources Technical Report, of this EIR.* • *To clarify the intent of the Program EIR mitigation measure, text is provided to ensure MM BIO-1c (Program EIR mitigation measure 4.C-1c) is implemented regardless of survey findings.*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
Adverse effect on candidate, sensitive, or special-status plant and wildlife species	**4.C-1b:** Documented plant occurrences on Icehouse Hill shall be avoided by establishing a buffer zone of no less than 25 feet prior to Project trail construction, or other ground-disturbing activities having the potential to disturb or result in mortality of special-status plant populations. This buffer zone, whose specific width shall be determined based on site-specific analysis of proposed construction techniques and their potential for dust creation, shall be demarcated using flagging, orange fencing, or any other visual barrier between plant populations and the active disturbance footprint. Buffer distances may be increased if hydrology features would be altered as a result of trail construction. Trail configurations shall be sited to avoid special-status plants and *Viola pedunculata*. In the event the City determines that trail construction cannot be accomplished without disturbance or mortality then trail construction would be abandoned and Icehouse Hill would remain closed for public uses. To reduce impacts from off-trail use, and increased horse use in association with trail riding, trail head signage shall be required to educate the public regarding sensitive resources and restoration that would be affected by off-trail use. Protected areas shall be marked in perpetuity. Trail use rules shall be developed prior to trail construction, and in addition to limiting use to identified trails, may include other requirements to limit the possibility that sensitive species would be impacted. As part of trail construction, native grasses, and host plant species for special status butterflies shall be planted to enhance the existing habitat and assist in soil stabilization on Icehouse Hill. A planting palette shall be designed by a qualified botanist in coordination with the San Bruno Mountain Habitat	**Yes.** Program EIR Mitigation Measure 4.C-1b, which addresses impacts of trail construction on Icehouse Hill, is relevant to the current Specific Plan project and is carried forward into the Specific Plan EIR.	**MM BIO-1b: Special-Status Plant Avoidance at Icehouse Hill (Program EIR Mitigation Measure 4.C-1b).** Documented plant occurrences on Icehouse Hill shall be avoided by establishing a buffer zone of no less than 25 feet prior to Specific Plan trail construction, or other ground-disturbing activities having the potential to disturb or result in mortality of special-status plant populations. This buffer zone, whose specific width shall be determined based on site-specific analysis of proposed construction techniques and their potential for dust creation, shall be demarcated using flagging, orange fencing, or any other visual barrier between plant populations and the active disturbance footprint. Buffer distances may be increased if hydrology features would be altered as a result of trail construction. ~~Trail configurations shall be sited to avoid special-status plants and *Viola pedunculata*. In the event the City determines that trail construction cannot be accomplished without disturbance or mortality then trail construction would be abandoned and Icehouse Hill would remain closed for public uses.~~ If the City determines that disturbance or mortality is unavoidable, special-status plants shall be restored onsite in either the annual grassland or coastal scrub habitat located on Icehouse Hill. Restoration would be at a 1:1 ratio consistent with typical CDFW requirements in areas that are to remain as post-development open space, as is Icehouse Hill. The 1:1 replacement ratio shall be met at the end of five years and may therefore require initial plantings at a greater than 1:1 ratio, as determined by a qualified botanist. If feasible, special-status plants and/or seeds shall be salvaged from on-site plants and used for any replacement plantings.

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Development EIR
	Conservation Plan using plant species that are known to have high survival rates and are compatible with the flora and fauna of the region, as proven by successful restoration efforts on San Bruno Mountain.		To reduce impacts from off-trail use, and increased horse use, trail head signage shall be required to educate the public regarding sensitive resources and restoration that would be affected by off-trail use. ~~Protected areas shall be marked in perpetuity~~ Mitigation areas shall be fenced or marked for three years. Trail use rules shall be developed prior to construction, and in addition to limiting use to identified trails, may include other requirements to limit the possibility that sensitive species would be impacted. ~~As part of trail construction, native grasses, and host plant species for special status butterflies shall be planted to enhance the existing habitat and assist in soil stabilization on Icehouse Hill. A planting palette shall be designed by a qualified botanist in coordination with the San Bruno Mountain Habitat Conservation Plan using plant species that are known to have high survival rates and are compatible with the flora and fauna of the region, as proven by successful restoration efforts on San Bruno Mountain.~~ To avoid indirect impacts to special status plant species that could occur if slope drainage or surface hydrology is modified as a result of trail construction Mitigation Measure 4.C1-g shall also be applied. Prior to issuance of project approvals, and in coordination with state and federal permitting requirements, a five-year restoration mitigation and monitoring program shall be developed and implemented for any planting areas established to mitigate impacts to special-status species plants. Restoration success criteria shall include: 1) Establishment of mitigation site(s) at or near the location of impacts where plant restoration will occur.

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Development EIR
			2) A qualified botanist shall identify an appropriate plant palette and restoration methodology compatible with the specific impacted special status species. Mitigation sites could include existing annual grassland or coastal scrub habitat areas on Icehouse Hill, depending on site conditions and locations of special status plants found. 3) No loss in total number of individual plants in a special status plant population found on Project Site shall be verified at the end of the five-year monitoring period established in coordination with state and federal agencies with jurisdiction over these resources. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Edits de-emphasized the avoidance of butterfly host plants, which are not special-status plants, and put emphasis on restoration of special-status plants.* • *Greater definition added to performance standards for rare plant mitigation plantings.* • *Providing signage in perpetuity unneeded for mitigation areas and was removed. New language was added to fence such areas from the public.* • *Butterfly habitat enhancement actions (e.g., planting native grasses and host plants) were moved to the butterfly habitat protection mitigation measure (Mitigation Measure MM BIO-1c).*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
Adverse effect on candidate, sensitive, or special-status plant and wildlife species	**4.C-1c:** Prior to any trail-related construction, vegetation management, development, or any other ground disturbing activities taking place on Icehouse Hill, pre-construction surveys for butterfly larval host plants (*Viola pedunculata*, *Lupinus albifrons*, *L. formosus*, and *L. versicolor*) shall be conducted by a qualified invertebrate biologist with demonstrated experience working with the species to ensure avoidance of such host plants. Required surveys may be conducted in conjunction with the rare plant surveys required under **Mitigation Measure 4.C-1a**. The timing for these preconstruction surveys is further specified, below. All populations of butterfly host plants located on Icehouse Hill shall be mapped and trails shall be designed to avoid them, whether or not they are being used by butterflies at the time of the initial surveys. All populations of butterfly host plants located on Icehouse Hill shall be inspected by a qualified invertebrate biologist, at an appropriate time of year, to determine whether or not they are being used by endangered butterflies for reproduction. If it is determined that they are being used for reproductive purposes by endangered butterflies, the specific project applicant shall contact USFWS to identify the appropriate consultation process prior to proceeding further with any activities on Icehouse Hill. Consultation may indicate that an Incidental Take Permit is required pursuant to the FESA. If populations of callippe silverspot or Mission blue butterflies are determined to be reproducing on Icehouse Hill, the property owner shall prepare and implement a Butterfly Protection Plan in coordination with the USFWS and the habitat managers for the SBMHCP prior to any ground-disturbing activities on or adjacent to Icehouse Hill.	**Yes.** Program EIR Mitigation Measure 4.C-1c, which addresses protection of butterfly larval host plants on Icehouse Hill, is relevant to the current Specific Plan project and is carried forward into the Specific Plan EIR.	**MM BIO-1c: Rare Butterfly Surveys and Habitat Protection at Icehouse Hill (Program EIR Mitigation Measure 4.C-1c).** Prior to any trail-related construction, vegetation management, development, or any other ground disturbing activities taking place on Icehouse Hill, pre-construction surveys for butterfly larval host plants (*Viola pedunculata*, *Lupinus albifrons*, *L. formosus*, and *L. versicolor*) shall be conducted by a qualified invertebrate biologist with demonstrated experience working with the species to ensure avoidance of such host plants. Required surveys may be conducted in conjunction with the rare plant surveys required under ~~**Mitigation Measure 4.C-1a**~~ MM BIO-1a, Special Status Plant Surveys at Icehouse Hill. 	silverspot and Mission blue butterfly species, particularly lupine host species and Veolia species. These efforts shall be planned in coordination with similar SBMHCP efforts and according to the butterfly habitat restoration and vegetation management guidelines that have been established for the SBMHCP (San Mateo County, 2007). The criteria for successful implementation of habitat restoration shall be no loss of butterfly habitat and at least 50 percent cover (includes at least two of the lupine species used by butterflies) in restored areas after five years.		populations of butterfly host plants <u>according to the following performance standards:</u> • <u>No net loss of existing butterfly host plants or damage to existing butterfly habitat or host plants from the trail and other recreational improvements, with habitat monitoring provided in years 1, 3, and 5.</u> • <u>Reintroduced nectar and host plants for the Callippe silverspot, Bay checkerspot, and Mission blue butterflies achieve 50 percent cover in designated Habitat Management Areas within five years.</u> • <u>Non-native invasive species such as French broom and fennel shall kept to a minimum within management areas.</u> ~~This shall include regular and ongoing management of non-native invasive species, such as French broom and fennel, as well as revegetation with native grassland species and establishment of new populations of butterfly host plants for callippe silverspot and Mission blue butterfly species, particularly lupine host species and Veolia species. These efforts shall be planned in coordination with similar SBMHCP efforts and according to the butterfly habitat restoration and vegetation management guidelines that have been established for the SBMHCP (San Mateo County, 2007). The criteria for successful implementation of habitat restoration shall be no loss of butterfly habitat and at least 50 percent cover (includes at least two of the lupine species used by butterflies) in restored areas after five years.~~ *Reasons for revisions to this Program EIR Mitigation Measure:*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
			• *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *The acronym SBMHCP is spelled out for clarity.* • *Reference to "larval host plants" is revised to "larval butterfly host plants" for clarity.* • *With the addition of fencing, horses would not have access to sensitive butterfly habitat. Hence, seasonal use restrictions for horses were unnecessary.* • *Greater definition was added to performance standards for butterfly habitat restoration and enhancements, including standards for retaining host plants, goals for butterfly nectar plant densities, and clarification on the management of non-native vegetation within these areas.*
Adverse effect on candidate, sensitive, or special-status plant and wildlife species	**4.C-1d:** The following steps shall be taken to avoid direct losses of nests, eggs, and nestlings and indirect impacts to special status avian species. Vegetation removal, including removal of trees and shrubs as part of site development, shall be confined to the non-breeding season, except as provided for below. Grading or ground disturbance activities associated with site development including site remediation activities shall occur after pre-construction protocol burrowing owl surveys are conducted as described below and in the 2012 CDFW Staff Report on Burrowing Owls. • If removal of trees and shrubs or disturbance to trees and shrubs (i.e., tree removal, tree trimming) is proposed to occur between January 1 and September 15, a qualified avian biologist shall survey any trees proposed to be removed or trimmed during the nesting season (i.e., January 1 through September 15) to determine if active nests are present. Surveys shall occur not	**Yes.** Although surveys conducted for this EIR concluded that there is no burrowing owl habitat on-site, there is now an unconfirmed iNaturalist sighting of this species from 2016. Due to the recent change in listing status for this species, this mitigation measure, which includes actions to survey for and protect burrowing owl, is to be carried forward from the Program EIR.	**MM BIO-1d: Nesting Bird Protection (Program EIR Mitigation Measure 4.C-1d).** The following steps shall be taken to avoid direct losses of nests, eggs, and nestlings and indirect impacts to common and special-status avian species. Vegetation removal including removal of trees and shrubs as part of site development shall be confined to the nonbreeding season, except as provided for below. Grading or ground disturbance activities associated with site development including site remediation activities shall occur after pre-construction protocol burrowing owl surveys are conducted as described below and in the 2012 CDFW Staff Report on Burrowing Owls. • If removal of trees and shrubs or disturbance to trees and shrubs (i.e., tree removal, tree trimming) or grading is proposed to occur between January 1 and September 15, a qualified avian biologist shall survey any ~~trees~~ habitat proposed to be ~~removed or trimmed~~

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
	more than 14 days prior to tree removal or trimming. If active nests are found, tree removal and/or tree trimming shall be conducted only after the young have left the nest and the nest is no longer in use. Confirmation that the nest is no longer in use shall be provided by a qualified biologist familiar with the species. If the qualified avian biologist identifies active nests, a no disturbance buffer of 150 feet shall be established and monitored by a qualified avian biologist, with authority to stop work in the event construction activities encroach within the disturbance buffer thus ensuring that impacts to nesting birds would not occur. Survey and monitoring reports shall be submitted to City staff for review: preconstruction survey reports shall be submitted prior to initiating construction activities; monitoring reports shall be submitted weekly until activities associated with nest habitat removal or disturbance activities are completed. • Prior to initiating ***grading or ground disturbance activities*** associated with remediation activities required prior to site development, the following shall occur: o Not less than 45 days prior to site grading, a qualified biologist shall survey the site to determine the presence of active burrowing owl nests. If active nests are found passive relocation of the individuals would be accomplished according to the CDFW standards in effect at the time of the survey, including the 2012 CDFW Staff Report on Burrowing Owls. o Results of the burrowing owl survey will be forwarded to CDFW.		modified during the nesting season (i.e., January 1 through September 15) to determine if active bird nests are present. Surveys shall occur not more than 14 days prior to tree removal or trimming. Surveys shall include all trees in line-of-sight and within 500 feet of construction for raptors, and all vegetation (including bare ground within 250 feet) for all other species. If active nests are found, tree removal and/or tree trimming shall be conducted only after the young have left the nest and the nest is no longer in use. Confirmation that the nest is no longer in use shall be provided by a qualified biologist familiar with the species. If the qualified avian biologist identifies active nests, a no disturbance buffer of 150 feet shall be established and monitored by a qualified avian biologist, with authority to stop work in the event construction activities encroach within the disturbance buffer thus ensuring that impacts to nesting birds would not occur. Survey and monitoring reports shall be submitted to City staff for review: preconstruction survey reports shall be submitted prior to initiating construction activities; monitoring reports shall be submitted weekly until activities associated with nest habitat removal or disturbance activities are completed. • At all times of year, prior to initiating grading or ground disturbance activities associated with remediation activities required prior to site development, the following shall occur: o Not less than 45 days prior to site grading, a qualified biologist shall survey the site to determine the presence of active burrowing owl nests. If active nests are found passive

	Should the results of the survey include positive finding for occupied burrows, the location and condition of the burrows shall be reported to the CDFW, and an on-site mitigation plan shall be prepared for review and approval by the CDFW. Onsite mitigation shall include construction of artificial burrows at a ratio of not less than 1:1 with the burrows located away from areas permitted for use by dogs and hikers. Following construction of the artificial burrows, the existing owls shall be passively removed from their burrows using one-way trap doors. The artificial burrows shall be monitored for a period of five years to confirm occupation by the species. Monitoring reports shall be forwarded to the CDFW to document compliance with this mitigation measure.		relocation of the individuals would be accomplished according to the CDFW standards in effect at the time of the survey including the 2012 CDFW Staff Report on Burrowing Owls. o Results of the burrowing owl survey will be forwarded to CDFW. Should the results of the survey include positive findings for occupied burrows, the location and condition of the burrows shall be reported to the CDFW and an on-site mitigation plan shall be prepared for review and approval by the CDFW. Onsite mitigation shall include construction of artificial burrows at a ratio of not less than 1:1 with the burrows located away from areas permitted for use by dogs and hikers. Following construction of the artificial burrows, the existing owls shall be passively removed from their burrows using one-way trap doors. The artificial burrows shall be monitored for a period of five years to confirm occupation by the species. Monitoring reports shall be forwarded to the CDFW to document compliance with this mitigation measure. *Reason for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *To clarify and streamline survey requirements relative to nesting birds, PEIR Mitigation Measure 4.C-4f has been combined with this measure. Several elements of that measure were added here to clarify that nesting bird survey areas should consider areas within 500 feet of disturbance areas, and to explain that avian surveys are needed for all habitat modifications, not just for removal of trees and shrubs.*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
			• *The burrowing owl bullet was updated to reflect that owl surveys should occur in advance of grading at all times of year, owing to the possible presence of overwintering burrowing owls that may be within burrows on the site.*
Adverse effect on candidate, sensitive, or special-status plant and wildlife species	**4.C-1e:** Prior to construction of any wind turbines within the Project Site, the applicant for such wind turbines shall prepare a site-specific micrositing report in designing the proposed turbine layout that incorporates modeling of raptor species' flight patterns, hovering or kiting patterns, bat roosting habitat areas and foraging areas. The report shall provide micrositing recommendations to reduce avian collision and impacts to bat species that shall be implemented in the final design and placement of wind turbines. Utilization data; digital elevation modeling; slope attributes; techniques to identify saddles, notches, and benches; and associations between bird utilization and topography may be included, for example. The report shall include adaptive management during and after Project Site construction using information gathered in the pre-construction assessment to guide possible Project modifications, mitigation, or the need for and design of post-construction studies; post-construction studies can test design modifications and operational activities to determine their effectiveness in avoiding or minimizing significant adverse impacts (USFWS, 2010b). The design of wind turbines shall minimize the use of above ground electrical cabling; be designed with solid surfaces that are not conducive to perching; not run when visibility is poor, such as at night and during periods of heavy fog; and be designed with low rotor speeds (20 rpm maximum).	**No.** Because wind turbines are not proposed in the 2025 Specific Plan, Mitigation Measure 4.C-1e is not carried forward into the Specific Plan EIR.

Adverse effect on candidate, sensitive, or special-status plant and wildlife species	**4.C-1f:** Prior to construction or operation of wind turbines within the Project Site, the applicant shall implement the following mitigation measure, which is based upon the California Bat Working Group *Guidelines for Assessing and Minimizing Impacts to Bats at Wind Energy Development Sites in California* (CBWG, 2006). These measures will help to mitigate the Project's effects on bats by addressing the data gaps that prevent adequate assessment of the Project's effects on bats, such as what bat species are using the site and how they are using the Project area. The applicant shall contribute to the body of knowledge on bat/turbine interactions by performing pre-construction and post-construction surveys, and post-construction monitoring within the Project area at each discrete location of a wind turbine or solar facility.	**No.** Because wind turbines are not proposed in the 2025 Specific Plan, Mitigation Measure 4.C-1f is not carried forward into the Specific Plan EIR.	
Adverse effect on candidate, sensitive, or special-status plant and wildlife species	**4.C-1g:** Construction and operation of proposed uses and open space areas along Visitacion Creek or adjacent to the northern lagoon edge shall include implementation of erosion control and water pollution control measures consistent with Storm Water Pollution Prevention Program (SWPPP) requirements, and implementation of an on-going maintenance plan to ensure no reduction in water and environmental quality within the Creek and lagoon. Project applicants shall provide the City with proof that appropriate stormwater permits have been obtained pursuant to the City of Brisbane's NPDES stormwater discharge permit, the San Francisco Regional MS4 Permit. This shall include construction site inspection and control programs at all construction sites, with follow-up and enforcement consistent with each Permittee's respective Enforcement Response Plan, to prevent construction	**Yes.** Because compliance with the statewide General Permit for Discharges of Storm Water Associated with Construction Activities, as well as preparation and implementation of site-specific SWPPPs for Baylands construction activities is required by law, Program EIR Mitigation Measure 4.H-1a was not carried forward into the Specific Plan EIR. Because it specifies requirements for such SWPPPs, Program EIR Mitigation Measure 4.C-1g is carried forward from the Program EIR.	**MM BIO-2c: Water Quality Protection Measures near Aquatic Sites (Program EIR Mitigation Measure 4.C-1g).** Construction and operation of proposed uses and open space areas along Visitacion Creek or adjacent to the northern lagoon edge shall include implementation of erosion control and water pollution control measures consistent with Stormwater Pollution Prevention Program (SWPPP) requirements, and implementation of an ongoing maintenance plan to ensure no reduction in water and environmental quality within the Creek and lagoon. Project applicants shall provide the City with proof that appropriate stormwater permits have been obtained pursuant to the City of Brisbane's NPDES stormwater discharge permit, the San Francisco Regional MS4 Permit. This shall include construction site inspection and control programs at all construction sites, with follow-up and enforcement

	more nesting and roosting habitat for native birds and bats. • Landscape plans shall incorporate both east-west and north-south open space areas, to promote both linkages between upland habitats and San Francisco Bay and linkages between upland habitats along the Bay shoreline. • Removed trees shall be replaced at a minimum ratio of 1:1 (native trees shall be substituted for non-native trees whenever possible). The minimum ratio of 1:1 shall be met five years after planting; initial plantings may require greater than 1:1 ratio to achieve this standard. • Nest boxes for bats and cavity-nesting bird species shall be installed in passive recreational areas.		
Restrictions on the movement of wildlife species	**4.C-4b:** Development in the Baylands shall be subject to a requirement for a Marsh Wildlife and Habitat Protection Plan for the Project to be prepared as part of the specific plan process prior to approval of any site-specific development projects. The Habitat Protection Plan shall be prepared by a qualified biologist and subject to approval by the Brisbane Community Development Department and must be implemented prior to or concurrently with construction of development projects in the Baylands. The Plan shall provide for accommodating the hydrologic effects of 100 years of projected sea level rise, recognize potential negative effects of rodent population management programs, and include (but not be limited to), the following components: • To minimize the effect of night lighting on wetland habitats adjacent to Project Site development, the following shall apply in the vicinity of wetlands located north of the lagoon, development north and south of the Visitacion	**No.** The Specific Plan implements this mitigation measure.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
	Creek channel, and any development adjacent to freshwater wetlands in the western portion of the Project Site: o Street lighting shall be provided only at intersections. o Low-intensity streetlamps and low elevation lighting poles shall be provided. o Internal silvering of the globe or external opaque reflectors shall be provided to direct light away from preserved wetland or open water habitats. o In addition, private sources of illumination around homes (**for DSP and DSP-V only**) shall also be directed and/or shaded to minimize glare into these habitats. • Residential and commercial leases within the Project Site shall prohibit building occupants from creating outdoor feeding stations for feral cats to prevent feral cat colonies from establishing and to prevent the attraction of other predatory wildlife such as red fox, raccoon, or opossums. Such restrictions shall be monitored by a property owners association which shall have the right to impose fines for violation of this requirement. • If a buffer cannot be accommodated between development and habitat areas, cyclone fencing with vinyl slats (or an equivalent screening barrier) at a minimum height of three feet for screening shall be installed outside of wetland habitat and between any preserved wetland or open water habitat and all residential or commercial development. Appropriate native vegetation shall be planted both inside and outside of the fence to provide further screening. This fencing would provide a barrier		

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
	to exclude cats, dogs, and other household pets, which are not effectively deterred by buffers. • If control of rodent populations in open space areas becomes necessary, trapping and use of non-poisonous methods will be utilized. Any rodent control actions would be coordinated and documented with the County Health department. • An education program for residents shall be developed, including posted interpretive signs and informational materials regarding the sensitivity of preserved habitats and the dangers of unleashed domestic animals in this area. Such restrictions shall be monitored by a property owners association which shall have the right to impose fines for violation of the pet policy. Such information shall be provided in the vicinity of onsite marshes where public access is provided.		
Restrictions on the movement of wildlife species DSP, DSP-V, CPP, & CPP-V scenarios	**4.C-4c:** All development on the Baylands shall be required to have a no-pets policy for construction workers. All development within the Baylands that includes a residential component shall also include a pet policy that requires residents to adhere to the measures of this policy to prevent impacts on wildlife from domestic animals. The policy shall become a part of the Covenants, Conditions, and Restrictions (CC&Rs) attached to each property deed for for-sale residential properties and enforced through the homeowners' association or other entity specified in the CC&Rs and made part of leases for residential rental properties and commercial leases within the Project Site. The pet policy shall limit the number of animals per residence and require adult cats, dogs, and rabbits to be spayed or neutered. Cats and dogs shall be required to be kept inside the residences and allowed outside residences only if on a leash and	**Yes.** Program EIR Mitigation Measure 4.C-4c, which protects natural habitats from domestic pets, is relevant to the Specific Plan, and is to be carried from the Program EIR.	**MM BIO-3a: Wildlife-Safe Pet Policy during Construction and Operations (Program EIR Mitigation Measure 4.C-4a).** All development on the Baylands shall be required to have a no-pets policy for construction workers. All development within the Baylands that includes a residential component shall also include a pet policy that requires residents to adhere to the measures of this policy to prevent impacts on wildlife from domestic animals. The policy shall become a part of the Covenants, Conditions, and Restrictions (CC&Rs) attached to each property deed for for-sale residential properties and enforced through the homeowner's association or other entity specified in the CC&Rs and made part of leases for residential rental properties and commercial leases within the ~~Project Site~~ Baylands. The pet policy shall limit the number of animals per residence and require adult cats, dogs, and rabbits to be spayed or neutered. Cats and

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
Restrictions on the movement of wildlife species	**4.C-4f:** Prior to tree removal, trimming of trees or shrubs or soil disturbance for site grading, a survey of suitable nesting habitat shall be conducted by an avian biologist familiar with Bay Area species and habitats to map the location of vegetation that could support avian species. If ground-disturbing activities or vegetation removal are proposed during the breeding bird season (January 1 through September 15), to avoid direct losses of nests, eggs, and nestlings and indirect impacts on avian breeding success, a qualified avian biologist shall survey active sites for nesting raptors and passerine birds not more than 14 days prior to the ground-disturbing activity or vegetation removal. Surveys shall include all trees in line-of-sight and within 500 feet of construction for raptors, and all vegetation (including bare ground within 250 feet) for all other species. If active nests are found, tree removal or tree trimming and construction activities, including soil disturbance, construction noise, increased human presence, would be halted and the nest would be monitored by a qualified biologist who shall verify when the nestlings have fledged and left the nest.	**Yes.** To streamline the EIR and clarify nesting bird requirements, this measure was combined with PEIR Mitigation Measure 4.C-1d, which included similar survey requirements, buffer distances, and biological monitoring protocols.	
Restrictions on the movement of wildlife species	**4.C-4g:** Applicants for site specific development projects pursuant to an approved specific plan within the Project Site shall take the following measures to avoid direct mortality of roosting special-status bats and disturbance of maternity roosts or winter hibernacula: • A bat biologist familiar with Bay Area species shall conduct surveys of all potential bat habitat, including areas suitable for maternity roosts and/or winter hibernacula within a site proposed for development prior to initiation of construction activities, including initial grading. Surveys shall be conducted within one year prior	**Yes.** Program EIR Mitigation Measure 4.C-4g, which protects against direct mortality of roosting special-status bats and disturbance of maternity roosts or winter hibernacula, is relevant to the 2025 Specific Plan, and is to be carried from the Program EIR.	**MM BIO-1e: Special-Status Bat Roost Protection (Program EIR Mitigation Measure 4.C-4g).** Applicants for demolition, grading or site-specific development projects pursuant to an approved specific plan within the Baylands shall take the following measures to avoid direct mortality of roosting special-status bats and disturbance of maternity roosts or winter hibernacula: • A bat biologist familiar with Bay Area species shall conduct surveys of all potential bat habitat, including areas suitable for maternity roosts and/or winter hibernacula within a site proposed for development prior to initiation of

	to construction to capture current bat habitats at the site, as presence of bats could vary yearly, and survey results several years before impacts occur could be inaccurate. Potentially suitable habitat shall be located visually. Bat emergence counts shall be made at dusk as the bats depart from any suitable habitat. In addition, an acoustic detector shall be used to determine any areas of bat activity. At least four nighttime emergence counts shall be undertaken on nights that are warm enough for bats to be active. The bat biologist shall determine the type of each active roost (i.e., maternity, winter hibernacula, day or night). • Removal or trimming of trees or demolition of buildings showing evidence of bat activity shall occur during the period least likely to affect the bats as determined by a qualified bat biologist (generally between February 15 and October 15 for winter hibernacula and between August 15 and April 15 for maternity roosts). If active day or night (non-maternity) roosts are found, the bat biologist shall take action to allow individual bats to depart prior to tree removal or building demolition. During construction, a no-disturbance buffer shall be created around active bat roosts being used for maternity or hibernation purposes at a distance to be determined in consultation with CDFW. Bat roosts initiated during construction are presumed to be unaffected, and no buffer is necessary.		construction activities, including initial grading. Surveys shall be conducted within one year prior to construction to capture current bat habitats at the site, as presence of bats could vary yearly, and survey results several years before impacts occur could be inaccurate. Potentially suitable habitat shall be located visually. Bat emergence counts shall be made at dusk as the bats depart from any suitable habitat. In addition, an acoustic detector shall be used to determine any areas of bat activity. At least four nighttime emergence counts shall be undertaken on nights that are warm enough for bats to be active, or as otherwise deemed adequate by a qualified bat biologist to determine species absence. The bat biologist shall determine the type of each active roost (i.e., maternity, winter hibernacula, day or night). • Removal or trimming of trees or demolition of buildings showing evidence of bat activity shall occur during the period least likely to affect the bats as determined by a qualified bat biologist (generally between February 15 and October 15 for maternity roosts ~~winter hibernacula~~ and between August 15 and April 15 for ~~maternity roosts~~ winter hibernacula). If active day or night (non-maternity) roosts are found, the bat biologist shall take action to allow individual bats to depart prior to tree removal or building demolition. • The following steps shall be taken during the removal of active or suspected bat roosts: 1. The qualified biologist shall be present during tree and structure disturbance or removal if active non-maternity or hibernation bat roosts or potential roosting habitat are present. Trees and structures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Development EIR
			with active non-maternity or hibernation roosts or potential habitat shall be disturbed or removed only under clear weather conditions when precipitation is not forecast for three days and when nighttime temperatures are at least 50°F, and when wind speeds are less than 15 mph. 2. Trimming or removal of trees with active (non-maternity or hibernation) or potentially active roost sites shall follow a two-step removal process: 3. On the first day of tree removal and under supervision of the qualified biologist, branches and limbs not containing cavities or fissures in which bats could roost, shall be cut only using hand tools (e.g., chainsaws). 4. On the following day and under the supervision of a qualified biologist, the remainder of the tree may be removed, either using hand tools or other equipment (e.g., excavator or backhoe). 5. All felled trees shall remain on the ground for at least 24 hours prior to chipping, off-site removal, or other processing to allow any bats to escape, or be inspected once felled by the qualified biologist to ensure no bats remain within the tree and/or branches. 6. Disturbance to or removal of structures containing or suspected to contain active bat roosts (non-maternity or hibernation) or potentially active bat roosts shall be done in the evening and after bats have emerged from the roost to forage. Structures shall be partially dismantled to significantly change the roost conditions, causing bats to abandon and not return to the roost.

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Development EIR
			Removal will be completed the subsequent day. 7. During construction, a no-disturbance buffer shall be created around active bat roosts being used for maternity or hibernation purposes at a distance to be determined in coordination with the CDFW. *Reasons for revising this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in because update analyses of hydrology this EIR.* • *The measure corrects an error in the timing of bat maternity roosting and winter hibernacula.*

e. Cultural Resources and Tribal Cultural Resources

Table 4.21-4: Program EIR Cultural Resources and Tribal Cultural Resources Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Development EIR
Roundhouse Building	**Mitigation Measure 4.D-1a:** Within 90 days of Specific Plan adoption or prior to the issuance of the first grading or building permit within the Project Site (whichever occurs first), the property owner shall prepare and implement a stabilization plan subject to review and approval by the Brisbane Planning Department to protect and stabilize the Roundhouse from further deterioration and future vandalism. Such a plan may include, but is not limited to, additional protective fencing, signage, installation of temporary roof coverings to protect the interior from rainwater intrusion and covering of all window and door openings with plywood. In preparation of the stabilization plan, the property owner shall use the National Park Service's *Preservation Brief #31, Mothballing Historic Buildings*. Within 90 days of the issuance of any planning or development approval (e.g., site remediation, grading, site development plan, building permit) encompassing the area of the historic Roundhouse, the property owner shall also submit a rehabilitation plan for the historic Roundhouse to the City for review and approval by the Brisbane Planning Commission. Implementation of the rehabilitation plan shall be completed prior to the first occupancy permit for the area subject to the planning or development permit approved encompassing the area of the historic Roundhouse. The rehabilitation plan shall be consistent with the performance standards contained in the following documents:	**No.** Prepared along with the draft Specific Plan in 2025 was a detailed plan for restoration and adaptive reuse of the historic Roundhouse, which implements Program EIR Mitigation Measure 4.D-1a. As a result, Program EIR Mitigation Measure 4.D-1a no longer applies.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
	i. The Secretary of the Interior's Standards for Rehabilitation. Such standards call for the retention of significant, character-defining features of the building while finding a new use for the structure that is compatible with its historic character; ii. The National Park Service's *Preservation Brief #17, Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving Their Architectural Character*; and iii. The National Park Service's *Preservation Brief #18, Rehabilitating Interiors in Historic Buildings – Identifying and Preserving Character-Defining Elements*. To ensure compliance with the Secretary of the Interior's Standards for Rehabilitation, rehabilitation plans shall also be reviewed by a qualified consulting architectural historian who meets the Secretary of the Interior's Standards for Architectural History prior to action by the Planning Commission. The rehabilitation plans shall meet a minimum of 7 out of 10 of the Standards.		
Roundhouse, Machinery and Equipment Buildings	**Mitigation Measure 4.D-1b:** All Project Site development within 50 feet of the Roundhouse or the Machinery & Equipment building be designed to ensure their architectural compatibility with the historic Roundhouse, and to ensure that new buildings do not overwhelm or unnecessarily contrast with these historic buildings. To this end, all development projects shall incorporate a minimum 50-foot structural setback and appropriate heights, volumes, and materials for any proposed new buildings in the immediate vicinity to ensure compatibility with the Roundhouse and the Machinery & Equipment building. Appropriate heights of new construction adjacent to the Roundhouse would be the same as (about 25 feet),	**Yes.** This measure's design requirements are needed to address impacts of the 2025 Specific Plan in relation to the Roundhouse but require the modifications described to the right.	**MM CUL-1a Design Guidelines (Program EIR Mitigation Measure 4.D-1b).** All ~~Project Site~~ Baylands development within 50 feet of the Roundhouse or the Machinery & Equipment building shall be designed to ensure their architectural compatibility with the historic Roundhouse, and to ensure that new buildings do not overwhelm or unnecessarily contrast with these historic buildings. To this end, the reconstructed Roundhouse shall be located no closer than 30 feet from the park boundary, and all development projects shall incorporate a minimum 50-foot structural setback and appropriate heights, volumes, and materials for any proposed new buildings in the immediate

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Development EIR**
	or slightly greater than (i.e., up to 15 feet greater than), the existing height of the building. Appropriate heights of new construction adjacent to the Machinery & Equipment building would be the same as (about 40 feet) or slightly greater than (up to 10 feet greater than), the existing height of the building. Appropriate materials for new construction in the immediate vicinity of either building would be brick cladding and/or cementitious materials painted a similar dark red color, as well as Spanish tile roof cladding. Appropriate volumes for new development that would face the Roundhouse should mirror the curve of the existing structure. Appropriate volumes for new development in the vicinity of the Machinery & Equipment building would be rectilinear in massing. All development projects within 50 feet of the Roundhouse or the Machinery & Equipment building shall be subject to City design permit review and approval prior to development.		vicinity to ensure compatibility with the Roundhouse ~~and the Machinery & Equipment~~ building. Appropriate heights of new construction adjacent to the Roundhouse would be the same as (about 25 feet), or slightly greater than (i.e., up to 15 feet greater than), the existing height of the building. ~~Appropriate heights of new construction adjacent to the Machinery & Equipment building would be the same as (about 40 feet) or slightly greater than (up to 10 feet greater than), the existing height of the building.~~ Appropriate materials for new construction in the immediate vicinity of either building would be brick ~~and/or cementitious materials painted a similar dark red color, as well as Spanish tile roof~~ cladding. Appropriate volumes for new development that would face the Roundhouse should mirror the curve of the existing structure. ~~Appropriate volumes for new development in the vicinity of the Machinery & Equipment building would be rectilinear in massing.~~ All <u>non-residential</u> development projects within 50 feet of the Roundhouse ~~or the Machinery & Equipment building~~ shall be subject to City design permit review and approval prior to development <u>to ensure consistency with the guidelines</u>. *Reason for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *The term "Project site" encompasses an area larger than the Baylands. Deletion of this term focuses mitigation requirements on the physical area affected by the impact consistent with the original intent of Program EIR Mitigation Measure 4.A-1b.*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Development EIR
			• *Since the project has been changed to propose dismantling and reconstruction of the Roundhouse, placement of the reconstructed building no closer than 30 feet from the park boundary would accomplish the objective of this measure.* • *Because of changes in state law, residential development cannot be subject to discretionary design review permits.* • *The Specific Plan implements this Program EIR mitigation measure in relation to the Machinery & Equipment building, reducing impacts on that building to less than significant.*
Previously Unidentified Archaeological Resources	**Mitigation Measure 4.D-2:** If any previously unidentified archaeological resources are discovered during ground-disturbing activities associated with development on the Baylands, all work within 100 feet of the resources shall be halted. The City, in consultation with a City-approved qualified consulting archaeologist, shall assess the significance of the find according to CEQA Guidelines Section 15064.5. Prehistoric materials subject to this measure might include obsidian and chert flaked-stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; stone milling equipment (e.g., mortars, pestles, handstones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-era materials subject to this measure might include in-situ (in place) stone, concrete, or adobe footings and walls; filled wells or privies; and in-situ deposits of metal, glass, and/or ceramic refuse. If any find is determined to be a historical resource or a unique archaeological resource, the City and the	**Yes.** Program EIR Mitigation Measure 4.D-2 is relevant to proposed Baylands development and is to be carried forward into the Baylands Specific Plan EIR.	**MM CUL-2a: Inadvertent Discovery of Cultural Resources (Program EIR Mitigation Measure 4.D-2).** If any previously unidentified archaeological resources are discovered during ground-disturbing activities associated with development on the Baylands, all work within 100 feet of the resources shall be halted. The City, in consultation with a City-approved qualified consulting archaeologist, shall assess the significance of the find according to CEQA Guidelines Section 15064.5. 			• *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.*
Disturbance of Human Remains	**Mitigation Measure 4.D-4:** If human skeletal remains are uncovered during Project construction, work shall immediately be halted within 100 feet of the find and the San Mateo County Coroner shall be contacted to evaluate the remains as required by the protocols set forth in Section 15064.5(e)(1) of the CEQA Guidelines. If the County Coroner determines that the remains are Native American, the coroner has 24 hours to contact the Native American Heritage Commission (NAHC), in accordance with Health and Safety Code Section 7050.5, Subdivision (c), and Public Resources Code Section 5097.98 (as amended by Assembly Bill 2641). The NAHC will then identify the person(s) thought to be the Most Likely Descendent (MLD) of the deceased Native American, who will then help determine what course of action should be taken in dealing with the remains. In accordance with Public Resources Code Section 5097.98, the specific project applicant/landowner shall ensure that, according to generally accepted cultural or archaeological standards or practices, the immediate vicinity where the Native American human remains are located is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in Public Resources Code Section 5097.98, with the MLD regarding their recommendations, if applicable, taking into account the possibility of multiple human remains.	**No.** Compliance with Health and Safety Code Sections 7050.5 and 7052.5, as well as Public Resources Code Section 5097.98 would protect any previously unidentified human remains, including those interred outside of formal cemeteries. Compliance with applicable legal requirements would result in a less than significant impact. Thus, Program EIR Mitigation Measure 4.D-4, which requires compliance with those requirements, is no longer necessary.	

f. Transportation

Table 4.21-5: Program EIR Transportation Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR**
Increased traffic and resulting level of service at intersections	**4.N-1a, 4.N-3a:** Outlines specific physical improvements to be constructed to improve levels of service at the intersection of Bayshore Boulevard and Geneva Avenue. **4.N-1b., 4.N-3b:** Outlines specific physical improvements to be constructed to improve level of service at the intersection of Bayshore Boulevard and Old County Road. **4.N-1c:** Outlines specific physical improvements to be constructed to improve level of service at the Alana Way/Beatty Avenue/US 101 Southbound Ramps intersection. **4.N-1d:** Outlines specific physical improvements to be constructed to improve level of service at the Alana Way/Harney Way/Thomas Mellon Drive intersection. **4.N-1e:** Outlines specific physical improvements to be constructed to improve level of service at the intersection of Tunnel Avenue and Bayshore Boulevard. **4.N-3c:** Outlines specific physical improvements to be constructed to improve level of service at the intersection of Sierra Point Parkway and the US 101 freeway ramps. **4.N-3d:** Outlines specific physical improvements to be constructed to improve level of service at the intersection of Lagoon Way and Tunnel Avenue. **4.N-3e:** Outlines specific physical improvements to be constructed to improve level of service at	**No.** Subsequent to certification of the Program EIR, the adoption of SB 743 eliminated traffic delay as a significant impact from CEQA. While SB 743 permits implementation of level of service and other types of traffic delay standards as part of a City's General Plan, level of service standards for Bayshore Boulevard and Geneva Avenue were removed from the Brisbane General Plan in 2020 with the adoption of General Plan Amendment GP-1-19, which called for preparation of a mobility plan for Bayshore Boulevard. The proposed Bayshore Boulevard Mobility Plan implements GP-1-19 and replaces the requirements for physical improvements to Bayshore Boulevard incorporated into Program EIR Mitigation Measures.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR**
	the Lagoon Way/Sierra Point Parkway intersection. **4.N-3f:** Provides for coordination with the San Francisco County Transportation Authority, San Francisco Municipal Transportation Authority, and Caltrans in the design of future US 101 SB Ramp improvements as part of the Geneva Avenue extension project. Also specifies timing for completion of the extension of Geneva Avenue from Bayshore Boulevard to the US 101 freeway and reconfiguration of the US 101 Candlestick interchange in relation to an LOS standard. **4.N-3g:** Outlines specific physical improvements to be constructed to improve level of service at the Carter Street/Geneva Avenue intersection in San Francisco. **4.N-3h:** Outlines specific physical improvements to be constructed to improve level of service at the E. Market Street/Orange Street intersection.		
Increased traffic and resulting level of service due to special events at an onsite arena	**4.N-1f, 4.N-5:** Requires preparation and implementation of a Transportation Management Plan to address traffic from an arena within the Project Site.	**No.** Development of an arena within the Baylands is no longer proposed. In addition, increased traffic and resulting level of service at intersections is no longer considered to be a significant environmental effect.	
Increased traffic and resulting level of service; Emergency response	**4.N-1g:** Outlines requirements for spacing of intersections along the Geneva Avenue extension through the Baylands.	**Yes. In addition to increased traffic congestion, this measure also addresses adverse emergency response impacts that would result from traffic at an intersection backing up into another intersection along the Geneva Avenue extension.**	**MM TRA-3b: Closely Spaced Intersections on Geneva Avenue (Program EIR Mitigation Measure 4.N-1g).** Approval of any tentative map providing for spacing of less than 1,200 feet between full-access intersections along the Geneva Avenue extension shall require that the interactions of green and red signal timing at any one intersection along the Geneva Avenue extension shall not affect operations at any other intersection along the extension, by

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR
			backing traffic waiting for a green signal at one intersection along the Geneva Avenue extension into another intersection along the extension. Should full-access intersections along the Geneva Avenue extension with spacing of less than 1,200 feet be proposed, a microsimulation of all proposed intersections along the extension (e.g., Synchro, VISSUM) shall be undertaken to analyze interactions of green and red signal timing and demonstrate that operations at any one intersection along the Geneva Avenue extension would not affect operations at any other intersection along the extension. *Reason for revisions to this Program EIR Mitigation Measure:* *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.*
Increased traffic and resulting access to non-Recology lands east of the Caltrain	**4.N-1h:** Requires access to be provided via public street(s) to existing uses east of Caltrain at all times prior to the completion of the proposed Geneva Avenue extension.	**No.** The current grading plan indicates that access is to be provided via public street(s) to existing uses east of Caltrain, implementing this mitigation measure.	
Increased traffic on the regional roadways and the US 101 freeway mainline	**4.N-4:** Provides for fair share funding from Baylands development for cumulative regional roadway system impacts, including freeway segment impacts	**No.** Because increased traffic and resulting level of service are no longer considered to be significant environmental effects, Program EIR Mitigation Measure 4.N-4 was not carried forward from the Program EIR.	
Increased transit ridership and impacts on Muni operations	**4.N-7:** Prior to issuance of the first building occupancy permit for new development other than improvement of relocation of an existing use within the Project Site, the developer(s) of Project Site land uses shall provide a fair-share contribution to the San Francisco Municipal Transportation Agency (SFMTA) to cover Baylands development's share of the capital	**No.** Because increased traffic and resulting level of service are no longer considered to be significant environmental effects, Program EIR Mitigation Measure 4.N-4 was not carried forward from the Program EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR**
	costs for providing additional transit service needed to achieve San Francisco Muni's capacity threshold of 85 percent along the Northeast and Southeast screenlines. In addition, provision shall be made for implementation of shuttle service between the Project Site and the Balboa Park BART Station in the Geneva Avenue corridor.		
Adequacy of transit service (areas of site more than 1/3 miles from Caltrain and Muni T-line stations)	**4.N-9:** Prior to issuance of the first building occupancy permit for any new development other than improvement or relocation of an existing use within the Project Site, a shuttle bus service plan shall be developed and approved by the City that provides convenient transit service (maximum 15 minute headways in the peak hour) between Project Site land uses within the Baylands located more than one-third mile from the Bayshore Caltrain Station or Sunnydale Muni Station to those stations. Shuttle service shall be implemented as described in the plan prior to occupancy of any qualifying Project Site land use other than improvement or relocation of an existing use within the Project Site. This requirement shall also be included in any specific plan approved for development within the Project Site.	**No.** Because Program EIR Mitigation Measure 4.N-9 has been implemented by the Specific Plan, it is not carried forward from the Program EIR.	
Pedestrian circulation	**4.N-10:** Prior to issuance of the first building occupancy permit for new development other than improvement or relocation of an existing use within the Project Site, at a minimum, the following measures shall be implemented to improve pedestrian accessibility: • The Bay Trail in the northern portion of the Project Site shall be realigned to provide a more direct route to the east side of US 101,	**No.** The Specific Plan implements this mitigation measure within the Specific Plan area but does not provide adequate connections to pedestrian systems adjacent to the Specific Plan area. Since Program EIR Mitigation Measure 4.N-10 would not address these off-site connections, it is not carried forward from the Program EIR and new mitigation measures are provided in the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR**
	following Geneva Avenue through the US 101 interchange. • Sidewalks or equivalent pedestrian paths shall be provided to safely permit pedestrian access to all uses within the Project Site intended for human occupancy and use, including provision of through pedestrian routes to minimize pedestrian travel distances between uses. • Specific provisions shall be made for safe pedestrian movement within and through parking areas to access buildings • Sidewalks shall be provided along the Project Site frontage on Bayshore Boulevard between Sunnydale Avenue and Tunnel Avenue. These minimum requirements, along with the equivalent of the facilities shown in Table 4.N-8, shall also be included within each specific plan approved within the Project Site.		

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR**
Bicycle circulation	**4.N-11:** Prior to issuance of the first building occupancy permit for new development other than improvement or relocation of an existing use within the Project Site, roadways and trails shall provide for safe accessibility for bicycles to buildings and recreational areas throughout the Project Site, including connections to offsite bicycle routes and trails. In addition, Project Site land uses shall provide bicycle parking in appropriate areas (i.e., where they will get the most use, where security is maximized, and where pedestrian circulation is minimally affected by their presence). The minimum standards contained in this mitigation measure, along with the equivalent bicycle access as that shown in Table 4.N-7, shall be included in any specific plan approved for development within the Project Site. In addition, details of Project Site development-provided bicycle parking spaces (number and location) shall be determined at the time when site-specific development projects are proposed pursuant to the adopted Specific Plan, and shall adhere to the following guidelines which shall also be included in any specific plan adopted for development within the Project Site: • Bicycle parking shall be placed within 50 feet of building and facility entrances, where it can be well-lit, clearly visible, and out of the primary travel path of pedestrians. Retail shopping centers and supermarkets shall include one Class I rack (covered bicycle locker for long-term parking) per 30 employees, and one Class II rack (able to secure both the frame and at least one	**No.** The Specific Plan implements this mitigation measure on-site but does not address adequate connections to bicycle systems adjacent to the Specific Plan area. It is therefore not carried forward from the Program EIR and new mitigation measures are provided in the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR**
	wheel of a bicycle for short-term parking) per 6,000 square feet of retail space. • Parks and recreational fields normally shall include one Class I rack per 30 employees and one Class II rack per 9 users (during peak daylight times of peak season). Transit centers normally shall include individual parking spaces equal to 2 percent of daily boardings (75 percent Class I and 25 percent Class II).		
Temporary traffic impacts during construction	**4.N-12:** In conjunction with all construction permits, site-specific development projects shall develop, submit for City review and approval, and implement Construction Management Plans that specify measures that would reduce impacts on motor vehicle, bicycle, pedestrian, and transit circulation. The Construction Management Plans shall include, but not necessarily be limited to, the following: • Location of construction staging areas for materials, equipment, and vehicles. • Notification procedures for adjacent property owners and public safety personnel regarding when major deliveries, detours, and lane closures will occur. • Identification of haul routes for movement of construction vehicles that would minimize impacts on vehicular and pedestrian traffic, circulation and safety; and provision for monitoring surface streets used for haul routes so that any damage and debris attributable to the haul trucks can be identified and corrected by the project applicant.	**Yes.** Mitigation Measure 4.N-12 is relevant to the 2025 Specific Plan and is to be carried forward from the Program EIR.	**MM TRA-3a: Construction Management Plans (Program EIR Mitigation Measure 4.N-12).** In conjunction with all construction permits, site-specific development and infrastructure projects subject to City of Brisbane approval shall develop, submit for City review and approval, and implement Construction Management Plans that specify measures that would reduce impacts on motor vehicle, bicycle, pedestrian, and transit circulation. The Construction Management Plans shall include, but not necessarily be limited to, the following: • Location of construction staging areas for materials, equipment, and vehicles. • Notification procedures for adjacent property owners and public safety personnel regarding when major deliveries, detours, and lane closures will occur. • Identification of haul routes for movement of construction vehicles that would minimize impacts on vehicular and pedestrian traffic, circulation, and safety; and provision for monitoring surface streets used for haul routes so that any damage and debris attributable to the haul trucks can be

Implementation of C/CAG trip generation reduction requirements	**4.N-13:** Prior to issuance of the first building occupancy permit for new development other than improvement or relocation of an existing use within the Project Site, the developer(s) and/or tenants of Project Site land uses shall prepare, submit to the City/County Association of Governments of San Mateo County (C/CAG) for approval, and establish a Transportation Demand Management (TDM) program to mitigate the C/CAG project impact of generating more than 100 net new vehicle trips during the peak traffic hours. Implementation of TDM programs shall be made a condition of approval for all new development within the Project Site that generates 100 or more net new trips during the AM or PM peak hour. A summary of	**No.** Increased traffic and resulting level of service at intersections is no longer considered to be a significant environmental effect. TDM programs remain an important tool for addressing energy, air quality, and GHG impacts. To that end, the City of Brisbane adopted a TDM consistent with the C/CAG program subsequent to certification of the Program EIR. Analyses conducted for this EIR reflect compliance with the City's TDM requirements. Program EIR Mitigation Measure 4.N-13 was not therefore carried forward from the Program EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward or Modified into the Baylands Specific Plan EIR**
	recommended TDM strategies can be found in Table 4.N-45.		
Demand for loading areas	**4.N-17:** Each site-specific development projects shall provide sufficient loading areas in appropriate locations such that loading activities, including loading vehicle queuing, will not block roadway or onsite parking area travel lanes, or bicycle or pedestrian facilities.	**Yes.** This measure is relevant to the 2025 Specific Plan.	**MM TRA-3b: Loading Areas (Program EIR Mitigation Measure 4.N-17).** Each site-specific development and infrastructure projects shall provide sufficient loading and unloading areas in appropriate locations such that loading and unloading activities, including ~~loading~~ vehicle queuing, will not block roadway or onsite parking area travel lanes, or bicycle or pedestrian facilities. *Reason for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Consistent with its original intent, this measure has been clarified to include infrastructure projects and both loading and unloading activities.*

g. Air Quality

Table 4.21-6: Program EIR Air Quality Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Dust generation during construction	**Mitigation Measure 4.B-1:** To reduce fugitive dust emissions, the following provisions shall be incorporated into construction specifications for all site-specific development projects within the Project Site. These measures would reduce fugitive dust emissions primarily during soil movement, grading and demolition activities but also during vehicle and equipment movement on unpaved project sites. ***Basic Controls that Apply to All Construction Sites*** 1. All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered as needed, but no less than two times per day on days with no precipitation. 2. All haul trucks transporting soil, sand, or other loose material off-site shall be covered. 3. All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited. 4. All vehicle speeds on unpaved roads shall be limited to 15 mph. 5. All roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads shall be laid as soon as possible after grading unless seeding or soil binders are used. 6. Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California	**No.** Required preparation of SWPPPs would mandate all the best management practices identified in Program EIR Mitigation Measure 4.B-1, which is therefore not carried forward into the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	airborne toxics control measure Title 13, Section 2485 of California Code of Regulations). Clear signage shall be provided for construction workers at all access points. 7. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified mechanic and determined to be running in proper condition prior to operation. 8. A publicly visible sign shall be posted with the telephone number and person to contact at the Lead Agency regarding dust complaints. This person shall respond and take corrective action within 48 hours. BAAQMD's phone number shall also be visible to ensure compliance with applicable regulations. 9. Construction foreman and crew shall receive training from contractors on implementation of the above emission reduction techniques prior to each development phase.		
Generate cumulatively considerable construction emissions of criteria pollutants	**4.B-2a:** To reduce construction vehicle emissions, the following provisions shall be incorporated into construction specifications for all projects on the Baylands: i. Idling times shall be minimized either by shutting diesel-powered or gasoline-powered equipment off when not in use or reducing the maximum idling time of diesel-powered equipment to five minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Clear signage shall be provided for construction workers at all access points.	**Yes.** Program EIR Mitigation Measure 4.B-2a, which sets requirements to reduce emissions of criteria pollutants during construction, is relevant to the Specific Plan EIR and is to be carried forward from the Program EIR.	**MM AQ-1a: Clean Off-Road Construction Equipment (Program EIR Mitigation Measure 4.B-2a).** To reduce construction vehicle emissions, the following provisions shall be incorporated into construction specifications for all site-specific development and on- and off-site infrastructure projects ~~on the Baylands~~: i. Idling times shall be minimized either by shutting diesel-powered or gasoline-powered equipment off when not in use or reducing the maximum idling time of diesel-powered equipment to five minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations [CCR]). Clear

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	ii. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. It shall be the contractor's responsibility to ensure that all equipment has been checked by a certified mechanic and determined to be running in proper condition prior to operation. iii. All construction contract specifications shall include a requirement that on-road diesel trucks used to transport spoils consist of 2007 or newer model-year trucks with factory-built engines. All on-road diesel trucks shall be required to have emission control labels as specified in 13 CCR 2183(c) or any subsequent updates to this CARB regulation, whichever is more stringent. The construction contract specifications shall require that the contractor submit to the City a comprehensive inventory of all on-road trucks used to haul spoils. The inventory shall include each vehicle's license plate number, the engine production year, and a notation of whether the truck is in possession of an emission control label as defined in 13 CCR. The contractor shall update the inventory and submit it monthly to the City throughout the duration of the project.		signage shall be provided for construction workers at all access points. ii. All construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. It shall be the contractor's responsibility to ensure that all equipment has been checked by a certified mechanic and determined to be running in proper condition prior to operation. iii. All construction contract specifications shall include a requirement that on-road diesel trucks used to transport spoils consist of ~~2007~~ 2020 or newer model-year trucks with factory-built engines. All on-road diesel trucks shall be required to have emission control labels as specified in 13 CCR 2183(c) or any subsequent updates to this CARB regulation, whichever is more stringent. The construction contract specifications shall require that the contractor submit to the City a comprehensive inventory of all on-road trucks used to haul spoils. The inventory shall include each vehicle's license plate number, the engine production year, and a notation of whether the truck is in possession of an emission control label as defined in 13 CCR. The contractor shall update the inventory and submit it monthly to the City throughout the duration of the project. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the 2025 Baylands Specific Plan would require offsite infrastructure improvements, this mitigation measure has been revised to include*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Specific Plan EIR
			all development associated with the Specific Plan, not just development within the Baylands. • *The requirement that on-road diesel trucks used to transport spoils consist of 2007 or newer model-year trucks with factory-built engines has been replaced with a more stringent and feasible requirement that 2020 newer model-year trucks with factory-built engines be used.*
Generate cumulatively considerable construction emissions of criteria pollutants	**4.B-2b:** All construction contract specifications shall include a requirement that off-road construction equipment used for site improvements shall be equipped with Tier 3 (Tier 2 if greater than 750 hp) diesel engines or better. All diesel generators used for project construction must meet Tier 4 emissions standards. If new emissions standards are adopted by U.S. EPA during project construction, construction contract specifications shall incorporate whichever standard is more stringent.	**Yes.** Program EIR Mitigation Measure 4.B-2b, which sets requirements for off-road construction equipment used for site improvements to reduce emissions of criteria pollutants during construction, is relevant to the Specific Plan EIR and is to be carried forward from the Program EIR.	**MM AQ-1b: Tier 3 Off-Road Construction Equipment (Program EIR Mitigation Measure 4.B-2b).** All construction contract specifications shall include a requirement that off-road construction equipment used for site improvements shall be equipped with Tier 3 (Tier 2 if greater than 750 hp) diesel engines or better. All diesel generators used for project construction must meet Tier 4 emissions standards. If new emissions standards are adopted by U.S.EPA during project construction, construction contract specifications shall incorporate whichever standard is more stringent. *Reason for revising this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.*
Considerable net increase of criteria pollutants during operations	**4.B-4:** The following measures identified in the 2012 BAAQMD *CEQA Guidelines* shall be implemented for site-specific development projects within the Project Site and shall be included, as applicable, into commercial leases, as well as Covenants, Codes, and Restrictions (CC&Rs) within the Project Site: (i) Provide free transit passes (e.g., Clipper Card for use on Caltrain, San Francisco Municipal Railway [Muni], and SamTrans) to employees (for employers of 100 or more employees);	**No.** The 2012 BAAQMD *CEQA Guidelines* were superseded by updated Guidelines in 2022. Measures to reduce emissions of criteria pollutants that are called for in the 2022 Guidelines have been incorporated into new Specific Plan mitigation measures.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	(ii) Provide and maintain secure bike parking for commercial and industrial uses (at least one space per 20 vehicle spaces) as a condition of occupancy permit/tenancy contract; (iii) Provide and maintain showers and changing facilities for employees in buildings having a gross leasable area of 25,000 square feet or more; (iv) Provide information on transportation alternatives to employees as a condition of occupancy permit/tenancy contract; (v) Establish a dedicated employee transportation coordinator for each site-specific development as a condition of occupancy permit/tenancy contract; (vi) Provide and maintain preferential carpool and vanpool parking for non-residential uses; (vii) Increase building energy efficiency by 20 percent beyond Title 24 (reduces NOx related to natural gas combustion); (viii) Require use of electrically powered landscape equipment through CC&Rs; (ix) Require only natural gas hearths in residential units as a condition of final building permit; (x) Use low VOC architectural coatings in maintaining buildings through CC&Rs; (xi) Require smart meters and programmable thermostats; (xii) Meet Green Building Code standards in all new construction (reduces NOx related to natural gas combustion); and (xiii) Install solar water heaters for all uses as feasible. A majority of these measures could be included in the TDM plan that would be required of all project		

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	scenarios. Refer to **Mitigation Measure 4.N-13** of the Section 4.N, *Traffic and Circulation*, of this EIR.		
Generation of objectionable odors by the proposed onsite recycled water plant	**4.B-8: Recycled Water Plant Odor Management Plan.** Prior to the start of operation pursuant to issuance of a permit to operate from RWQCB, the recycled water plant shall formulate and implement a progressive Odor Management Plan for review and comment by BAAQMD prior to review and approval by the City. The Odor Management Plan shall select a sufficient number of control measures from the following menu of options identified by BAAQMD to attain a performance standard which meets the odor detection thresholds of BAAQMD Regulation 7 as achieved and verified by the BAAQMD inspector. • Activated carbon filter/carbon adsorption • Biofiltration/bio trickling filters • Fine bubble aerator • Hooded enclosures • Wet and dry scrubbers • Caustic and hypochlorite chemical scrubbers • Ammonia scrubber • Energy efficient blower system • Thermal oxidizer • Capping/covering storage basins and anaerobic ponds • Mixed flow exhaust • Wastewater circulation technology • Exhaust stack and vent location with respect to receptors	**Yes.** Because the 2025 Specific Plan project continues to include a recycled water facility, the odor control measures included in Program EIR Mitigation Measure 4.B-8 are needed.	**MM AQ-3a: Recycled Water Plant Odor Management Plan (Program EIR Measure 4.B-8).** Prior to the start of operation pursuant to issuance of a permit to operate from the RWQCB, the recycled water plant shall formulate and implement a progressive Odor Management Plan for review and comment by the BAAQMD prior to review and approval by the City. The Odor Management Plan shall select a sufficient number of control measures from the following menu of options identified by the BAAQMD to attain a performance standard which meets the odor detection thresholds of BAAQMD Regulation 7 as achieved and verified by the BAAQMD inspector. i. Activated carbon filter/carbon absorption ii. Biofiltration/bio trickling filters iii. Fine bubble aerator iv. Hooded enclosures v. Wet and dry scrubbers vi. Caustic and hypochlorite chemical scrubbers vii. Ammonia scrubber viii. Energy efficient blower system ix. Thermal oxidizer x. Capping/covering storage basins and anaerobic ponds xi. Mixed flow exhaust xii. Wastewater circulation technology xiii. Exhaust stack and vent location with respect to receptors *Reason for revising this Program EIR Mitigation Measure:*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
			• *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.*
Conflict with or obstruct implementation of the applicable air quality plan	**4.B-9:** The following TDM measures shall be implemented: i. Promote use of clean fuel-efficient vehicles through preferential parking and/or installation of charging stations. ii. As a potential element of a required TDM program, promote zero-emission vehicles such as through a neighborhood electric vehicle program or other programs or policies to reduce the need to have a car or second car vehicles. See also Table 4.B-21.	**No.** TDM programs remain an important tool for addressing energy, air quality, and GHG impacts. To that end, the City of Brisbane adopted a TDM consistent with the C/CAG program subsequent to certification of the Program EIR. Analyses conducted for this EIR reflect compliance with the City's TDM requirements. Program EIR Mitigation Measure 4.B-9 was therefore not carried forward from the Program EIR.	

h. Greenhouse Gas Emissions

No Greenhouse Gas Emissions mitigation measures were proposed in the Program EIR.

i. Energy Resources

Table 4.21-7: Program EIR Energy Resources Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Specific Plan EIR
Energy consumption.	**4.P-1:** During all Project Site construction activities, construction contractors shall implement the following measures to prevent the wasteful or inefficient use of energy during construction: • Implement work schedules and procedures that minimize equipment idle time and double handling of material; • Minimize equipment idling time either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes (as required by the California Airborne Toxic Control Measure Title 13, Section 2485 of California Code of Regulations [CCR]); • Switch off office equipment and lights when not in use; • Use solar power sources for road signs and other applicable equipment that will be required at the construction site; • Design all temporary roads to minimize travel distances; and • Maintain and properly tune all construction equipment in accordance with manufacturer's specifications. It shall be the contractor's responsibility to ensure that all equipment has been checked by a certified mechanic and determined to be running in proper condition prior to operation.	**No.** Analysis of energy consumption during Baylands construction concluded that a less than significant impact would result. Thus, this mitigation measure has not been carried forward from the Program EIR.	
Energy consumption.	**4.P-2a:** All new buildings within the Project Site subject to the provisions of Brisbane Municipal Code Section 15.80 shall be required to achieve a LEED Gold rating, rather than the LEED Silver rating now required by the Municipal Code. In addition, all appliances installed within the Project Site as part of original building construction shall be ENERGY STAR rated or equivalent.	**No.** This measure has been implemented by the Specific Plan and is therefore not carried forward from the Program EIR.	
Energy consumption.	**Mitigation Measure 4.P-2b:** All street and parking lot lighting within the Project Site shall be energy efficient light emitting diode (LED) based lighting, until a more efficient technology for street and parking lot lighting acceptable to the City of Brisbane becomes commercially available, at which time all street and parking lot lighting shall be the most energy efficient technology that is commercially available for street and parking lot lighting and that is also acceptable to the City of Brisbane.	**No.** Analysis of energy consumption during Baylands construction concluded that a less than significant impact would result. Thus, this mitigation measure has not been carried forward from the Program EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Energy consumption.	**4.P-2c:** Should the CPP scenario be selected, Project Site development shall provide for an equivalent amount of onsite renewable energy generation as is proposed in the DSP scenario (currently estimated to be 42,000 to 45,000 megawatt hours annually). Should the CPP-V scenario be selected, Project Site development shall provide for an equivalent amount of onsite renewable energy generation as is proposed in the DSP scenario (currently estimated to be 42,000 to 45,000 megawatt hours annually) in addition to the renewable energy generation proposed as part of the Recology expansion.	**No.** Because the scenario to which this mitigation measure refers was not approved, Program EIR Mitigation Measure 4.P-2c was not carried forward from the Program EIR.	

j. Noise and Vibration

Table 4.21-8: Program EIR Noise and Vibration Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Exposure of onsite residential to noise levels in excess of City standards.	**4.J-1a:** All residential development within the Project Site shall minimize the exposure of people within the Project Site to noise from Caltrain operations through construction of noise barriers or maintenance of buffer distances, and shall adhere to the following noise performance standards: • Exterior noise level of below 65 dBA, DNL for outdoor common areas within any approved residential use; and • Interior noise standard of 45 dBA, DNL. These noise levels shall be attained through use of appropriate building materials as required by state of California Title 24 standards. Compliance with these performance standards shall be verified by an acoustical professional prior to issuance of a building permit. Specific measures to achieve these performance standards shall include all or any combination of the following options: • Site design measures, including use of building orientation to minimize window exposure toward noise sources, avoid placing balcony areas in high noise areas, and use of buildings as noise barriers. • Use of acoustically rated building materials (insulation and windows); • Construction of architectural noise barriers between sources and receptors; and • Provision of landscaping or other non-noise-sensitive buffer zones between sources and receptors.	**Yes.** Program EIR Mitigation Measure 4.J-1a, which protects Baylands residents from noise generated by railroad operations, is relevant to the Specific Plan EIR and therefore carried forward from the Program EIR.	**MM NOI-4a: Residential Exposure to Railroad Noise (Program EIR Mitigation Measure 4.J-1a).** All residential development ~~within the Project Site~~ shall minimize the exposure of people within the ~~Project Site~~ Specific Plan area to noise from Caltrain and High-Speed Rail operations through construction of noise barriers or maintenance of buffer distances, and shall adhere to the following noise performance standards: • Exterior noise level of below 65 dBA, DNL for outdoor common areas within any approved residential use; and • Interior noise standard of 45 dBA, DNL. These noise levels shall be attained through use of appropriate building materials as required by state of California Title 24 standards. Compliance with these performance standards shall be verified by an acoustical professional prior to issuance of a building permit. Specific measures to achieve these performance standards shall include all or any combination of the following options: • Site design measures, including use of building orientation to minimize window exposure toward noise sources, avoid placing balcony areas in high noise areas, and use of buildings as noise barriers. • Use of acoustically rated building materials (insulation and windows); • Construction of architectural noise barriers between sources and receptors; and • Provision of landscaping or other non-noise-sensitive buffer zones between sources and receptors.

	• Construction of architectural noise barriers between sources and receptors; and • Provision of landscaping or other non-noise-sensitive buffer zones between sources and receptors.		• Use of acoustically rated building materials (insulation and windows); • Construction of architectural noise barriers between sources and receptors; and • Provision of landscaping or other non-noise-sensitive buffer zones between sources and receptors. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" now includes offsite lands not analyzed in the Program EIR, references have been revised to "Specific plan area," consistent with the original intent of this measure.* • *In addition to Caltrain, rail operations to which this measure would apply will include High-Speed Rail operations.*
Exposure of onsite residents to vibration from rail operations.	**Measure 4.J-2a:** All development in the Baylands shall be designed to avoid vibration from Caltrain operations in excess of 72 VdB for residences. Prior to issuance of any building permit for structures intended for human occupancy within 200 feet of the mainline track, a detailed vibration design study shall be completed by a qualified acoustical engineer to confirm the ground vibration levels and frequency content along the Caltrain tracks and to determine appropriate design to limit interior vibration levels to 72 VdB for residences. Implementation of the recommended measures of the acoustical study into project design elements shall be verified by the Brisbane Building Department as part of the plan-check process. Specific measures to achieve the performance standards set forth above shall include all or any combination of the following methods:	**Yes.** Program EIR Mitigation Measure 4.J-2a, which protects Baylands residents from vibration generated by railroad operations, is relevant to the Specific Plan EIR and therefore carried forward from the Program EIR.	**MM NOI-6: Exposure to Vibration from Rail Operations (Program EIR Mitigation Measure 4.J-2a).** All development in the Baylands development shall be designed to avoid vibration from Caltrain and other rail operations in excess of 72 VdB. Prior to issuance of any building permit for residential or hotel structures intended for human occupancy within 200 feet of the mainline track, a detailed vibration design study shall be completed by a qualified acoustical engineer to confirm ground vibration levels and frequency of operations along the Caltrain rail line and determine appropriate design that would limit interior vibration levels to less than 72 VdB within residences and hotel rooms. Implementation of the recommended measures of the acoustical study into project design elements shall be verified by the Brisbane Building Department as part of the plan-check process.

	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	• Use of vibration isolation techniques such as supporting the new building foundations on elastomer pads similar to bridge bearing pads; • Installation of vibration wave barriers. Wave barriers would consist of control trenches or sheet piles, which are analogous to controlling noise with sound barrier. The applicability of this technique depends on the characteristics of the vibration waves.		Specific measures to achieve the performance standard set forth above shall include all or any combination of the following methods: • Use of vibration isolation techniques such as supporting the new building foundations on elastomer pads similar to bridge bearing pads; • Installation of vibration wave barriers. Wave barriers would consist of control trenches or sheet piles, which are analogous to controlling noise with sound barrier. The applicability of this technique depends on the characteristics of the vibration waves. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because this mitigation is intended to address impacts related to residential and hotel uses, it has been revised to apply to those two uses rather than to "all" Baylands development.*
Exposure of onsite historic structures to vibration from pile driving operations.	**4.J-2b: Pre-Construction Assessment to Minimize Structural Pile-Driving Vibration Impacts on Adjacent Historic Buildings and Structures and Vibration Monitoring.** Any development within 85 feet of the Roundhouse and the Machinery & Equipment Building that would require pile driving or other construction techniques that could result in vibrations of 0.25 in/sec shall engage a qualified geotechnical engineer subject to City approval to conduct a pre-construction assessment of existing subsurface conditions and the structural integrity of the nearby historic structures subject to pile-driving or other vibration-inducing activity before a building permit is issued to demonstrate that the proposed construction activities would not result in vibration-induced damage to the Roundhouse or the Machinery & Equipment building.	**Yes.** Program EIR Mitigation Measure 4.J-2b, which protects Baylands historic structures from vibration generated by impact pile driving, is relevant to the Specific Plan EIR and therefore carried forward from the Program EIR.	**MM NOI-5a: Pre-Construction Assessment to Minimize Structural Pile-Driving Vibration Impacts on Adjacent Historic Buildings and Structures and Vibration Monitoring (Program EIR Mitigation Measure 4.J-2b).** Any development within 85 feet of the Roundhouse and the Machinery & Equipment Building that would require pile driving or other construction techniques that could result in vibrations of 0.25 in/sec shall engage a qualified geotechnical engineer subject to City approval to conduct a pre-construction assessment of existing subsurface conditions and the structural integrity of the nearby historic structures subject to piledriving or other vibration-inducing activity before a building permit is issued to demonstrate that the proposed construction activities would not result in vibration-induced damage

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Specific Plan EIR
	If recommended by the pre-construction assessment, groundborne vibration monitoring of nearby historic structures shall be required. Such methods and technologies shall be based on the specific conditions at the construction site, such as, but not limited to, the pre-construction surveying of potentially affected historic structures and underpinning of foundations of potentially affected structures, as necessary. The pre-construction assessment shall include a monitoring program to detect ground settlement or lateral movement of structures in the vicinity of pile-driving activities. Monitoring shall be maintained while construction occurs within 85 feet of historic structures, and results shall be submitted to the City Engineer. In the event of unacceptable ground with the potential to cause structural damage movement (in excess of 0.25 in/sec PPV at historic structures), as determined by the City Engineer, all impact work shall cease until corrective measures (e.g., installation of vibration wave barriers) are implemented to reduce ground movement to below 0.25 inches PPV. In addition, the following measure shall be implemented: • Evaluate and implement feasible measures for reducing vibration, such as alternative pile driving methods (e.g., cast- in-drilled-hole piles versus driven piles), alternative foundation types for the new construction (e.g., spread footings versus driven piles), alternative compaction methods, and physical measures (intervening trench, increased distance). • Require monitoring to be conducted at the building during construction. This monitoring can include crack gages on existing cracks and vibration amplitude monitoring. Establish warning and stop work thresholds for monitoring. Implement visual and audible signals that are triggered by a vibration monitor when exceedances of warning and stop work thresholds occur. If warning thresholds are		to the Roundhouse or the Machinery & Equipment building. If recommended by the pre-construction assessment, groundborne vibration monitoring of nearby historic structures shall be required. Such methods and technologies shall be based on the specific conditions at the construction site such as, but not limited to, the pre-construction surveying of potentially affected historic structures and underpinning of foundations of potentially affected structures, as necessary. The pre-construction assessment shall include a monitoring program to detect ground settlement or lateral movement of structures in the vicinity of pile-driving activities. Monitoring shall be maintained while construction occurs within 85 feet of historic structures, and results shall be submitted to the City Engineer. In the event of unacceptable ground with the potential to cause structural damage movement (in excess of 0.25 in/sec PPV at historic structures), as determined by the City Engineer, all impact work shall cease until corrective measures (e.g., installation of vibration wave barriers) are implemented to reduce ground movement to below 0.25 inches PPV. In addition, the following measure shall be implemented: • Evaluate and implement feasible measures for reducing vibration, such as alternative pile driving methods (e.g., cast-in-drilled-hole piles versus driven piles), alternative foundation types for the new construction (e.g., spread footings versus driven piles), alternative compaction methods, and physical measures (intervening trench, increased distance). • Require monitoring to be conducted at the building during construction. 	exceeded routinely, consider alternative construction approaches. • If the stop work threshold is exceeded, evaluate the condition of the building for damage. If no damage is indicated consult with structural engineer and/or architectural historian to assess whether higher thresholds are possible and adjust as appropriate. • If damage occurs, determine if any other construction approaches are feasible to reduce vibration. If none is available examine the severity of the damage to determine if damage is minor and repair is feasible. If repair is feasible continue with construction but monitor vibration and damage closely to ensure that damage remains repairable. Consider whether a lower stop work threshold is feasible. • If damage approaches becoming unrepairable and vibration levels have approached or exceeded the stop work threshold repeatedly, reconsider construction of the project. • Repair any damage that has occurred.		monitor when exceedances of warning and stop work thresholds occur. If warning thresholds are exceeded routinely, consider alternative construction approaches. • If the stop work threshold is exceeded, evaluate the condition of the building for damage. If no damage is indicated consult with structural engineer and/or architectural historian to assess whether higher thresholds are possible and adjust as appropriate. • If damage occurs determine if any other construction approaches are feasible to reduce vibration. If none is available examine the severity of the damage to determine if damage is minor and repair is feasible. If repair is feasible continue with construction but monitor vibration and damage closely to ensure that damage remains repairable. Consider whether a lower stop work threshold is feasible. • ~~If damage approaches becoming unrepairable and vibration levels have approached or exceeded the stop work threshold repeatedly, reconsider construction of the project.~~ • Repair any damage that has occurred. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Should repeated violation of this mitigation measure occur, the building permit could be revoked. In addition, vibration levels from Baylands development, including impact pile driving, would not be sufficient to cause irreparable damage to a structure.*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Exposure of underground utilities to vibration from pile driving operations.	**4.J-2c:** All development sites requiring pile driving shall have underground utility[375] surveys completed before a building permit is issued to demonstrate that pile driving will be located a minimum 15 feet from buried utilities. Underground utilities surveys shall be submitted to the City for review and consultation with affected utilities a minimum of two weeks prior to commencement of construction activities. If underground utilities are identified within 15 feet of proposed pile driving activities, alternative pile installation methods shall be required. Alternative methods may include use of sonic drivers or drilled and cast-in-place piles. All pile driving shall be designed so as to result in peak particle velocity of less than 4.0 in/sec (100 mm/s) at the location of underground utilities. Within one week following completion of pile driving activities, a post-construction assessment of all underground utilities within 30 feet of the pile driving activity shall be submitted to the City by the contractor, confirming that no damage to any underground utilities occurred as the result of the pile driving activity. Should the post-construction assessment determine that underground utilities were damaged by pile driving activities, such damage shall be repaired by the contractor to the satisfaction of the City and affected utility.	**Yes.** Program EIR Mitigation Measure 4.J-2c, which protects Baylands underground utility lines from vibration generated by impact pile driving, is relevant to the Specific Plan EIR and therefore carried forward from the Program EIR.	**MM NOI-5b: Protection of Underground Utilities (Program EIR Mitigation Measure 4.J-2c).** All development sites requiring pile driving shall have underground utility[7] surveys completed before a building permit is issued to demonstrate that pile driving will be located a minimum 15 feet from buried utilities. Alternative methods may include use of sonic drivers or drilled and cast-in-place piles. ~~Underground utilities surveys shall be submitted to the City for review and consultation with affected utilities a minimum of two weeks prior to commencement of construction activities. If underground utilities are identified within 15 feet of proposed pile driving activities, alternative pile installation methods shall be required.~~ All pile driving shall be designed so as to result in peak particle velocity of less than 4.0 in/sec (100 mm/s) at the location of underground utilities. Within one week following completion of pile driving activities, a post-construction assessment of all underground utilities within 30 feet of the pile driving activity shall be submitted to the City by the contractor, confirming that no damage to any underground utilities occurred as the result of the pile driving activity. Should the post-construction assessment determine that underground utilities were damaged by pile driving activities, such damage shall be repaired by the contractor to the satisfaction of the City and affected utility. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.*

[375] Underground utilities include electrical lines, irrigation lines, reclaimed water lines, municipal water lines, sewer lines, gravity flow facilities (storm, sanitary and laterals), cable/communication lines and gas lines.

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
			• *Revisions to the timing for preparation of utility surveys resolve a potential conflict in requirements.* • *The revised text acknowledges that the vibration performance standard in this mitigation measure along with Specific Plan EIR Mitigation Measure MM NOI-1e would supersede the provision in Program EIR MM 4.J-2c addressing alternatives to pile driving.*
Increases in ambient noise levels from stationary and mobile operational sources.	**4.J-3a:** All development within the Project Site shall incorporate the following design features into the final site plans prior to issuance of a building permit: • Building equipment (e.g., heating, ventilation, and air conditioning units) shall be located away from nearby residences, on building rooftops, or adequately shielded within an enclosure that effectively blocks the line of sight of the source from receivers in order to meet a performance standard of 5 dBA over existing ambient noise levels (generally perceptible increase to most persons) for this source which would potentially operate more than 20 minutes in a given hour. • Formal truck delivery areas (e.g., loading bays) shall be located at least 100 feet from residences to maintain noise levels of less than 5 dBA over existing monitored levels, except within mixed-use buildings containing both residential and commercial uses. Truck delivery bays and waste collection areas shall be located so that they are blocked by Project buildings or designed with noise reduction barriers to reduce noise impacts on residences or other sensitive receptors. • Where truck delivery bays are provided within mixed-use buildings containing both residential and commercial uses, they shall be located and designed so as to minimize the effects of noise from loading activities on residential uses within the building.	**Yes.** Program EIR Mitigation Measure 4.J-3a, which minimizes operational noise increases, is relevant to the Specific Plan EIR and therefore carried forward from the Program EIR.	**MM NOI-2a: Project Design Features (Program EIR Mitigation Measure 4.J-3a).** All development within the ~~Project Site~~ Baylands shall incorporate the following design features into the final site plans prior to issuance of a building permit: • Building equipment (e.g., heating, ventilation, and air conditioning units) shall be located away from nearby residences, on building rooftops, or adequately shielded within an enclosure that effectively blocks the line of sight of the source from receivers in order to meet a performance standard of 5 dBA over existing ambient noise levels (generally perceptible increase to most persons) for this source which would potentially operate more than 20 minutes in a given hour. • ~~Formal~~Designated truck delivery areas (e.g., loading bays) shall be located at least 100 feet from residences to maintain noise levels of less than 5 dBA over existing monitored levels, except within mixed-use buildings containing both residential and commercial uses. Truck delivery bays and waste collection areas shall be located so that they are blocked by Project buildings or designed with noise reduction barriers to reduce noise impacts on residences or other sensitive receptors. • Where truck delivery bays are provided within mixed-use buildings containing both residential and commercial uses, they shall be located and designed

			so as to minimize the effects of noise from loading activities on residential uses within the building. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" now includes offsite lands not analyzed in the Program EIR, references have been revised to "Specific plan area," consistent with the original intent of this measure.* • *The term "Formal" in the second bullet point could be misinterpreted and is being revised consistent with its original intent to apply to truck routes designated as such by local agencies.*
Increases in ambient noise levels from onsite wind energy generation. **DSP, DSP-V, CPP, & CPP-V scenarios**	**4.J-3b:** Small wind turbines shall be sited a minimum of 50 feet from the property line of noise sensitive land uses (e.g., residential, schools, religious institutions). Utility scale wind turbines shall be sited a minimum of 100 feet from the property line of noise sensitive land uses and separated from one another by a distance no less than a minimum of two times the rotor diameter of the larger turbine.	**No.** Because wind turbines are no longer proposed, Program EIR Mitigation Measure 4.J-3b is not carried forward into the Specific Plan EIR.	
Construction noise.	**4.J-4a:** All applicants for site-specific development within the Project Site shall implement site-specific noise attenuation measures during all construction-related activities under the supervision of a qualified acoustical consultant as a pre-requisite to issuance of site grading(s). These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by the City of Brisbane Building Department to ensure that construction noise does not exceed the standards set forth in the City's Noise Ordinance. These attenuation measures shall include all or any combination of the following control strategies:	**Yes.** Program EIR Mitigation Measure 4.J-4a, which minimizes construction noise, is relevant to the Specific Plan EIR and therefore carried forward from the Program EIR.	**MM NOI-1a: Construction Noise Control (Program EIR Mitigation Measure 4.J-4a).** All applicants for site-specific development within the ~~Project Site~~ Baylands shall implement site-specific noise attenuation measures during all construction-related activities under the supervision of a qualified acoustical consultant as a pre-requisite to issuance of site grading(s). These measures shall be included in a Noise Control Plan that shall be submitted for review and approval by the City of Brisbane Building Department to ensure that construction noise does not exceed the standards set forth in the City's Noise Ordinance. These attenuation

	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	• A procedure for notifying the Building Department staff of complaints; • A plan for posting onsite signs pertaining to permitted construction days and hours, complaint procedures, and the contact person who should be notified in the event of a problem; • A listing of telephone numbers (during regular construction hours and off-hours); • Designation of an onsite construction complaint manager for Project site development; • Notification of neighbors within 300 feet of the Project site development construction area about the estimated duration of the pile-driving activity at least 30 days in advance of the activity; and • A preconstruction meeting with the job inspectors and the general contractor/onsite project manager to confirm that noise mitigation and practices (including construction hours, neighborhood notification, posted signs, etc.) are completed.		• A procedure for notifying the City staff of complaints; • A plan for posting on-site signs pertaining to permitted construction days and hours, complaint procedures, and the contact person who should be notified in the event of a problem; • A listing of telephone numbers (during regular construction hours and off-hours); • Designation of an on-site construction complaint manager; • Notification of neighbors within 300 feet of the construction area about the estimated duration of pile driving activity at least 30 days in advance of the activity; and • A preconstruction meeting with the job inspectors and the general contractor/on-site project manager to confirm that noise mitigation and practices (including construction hours, neighborhood notification, posted signs, etc.) are completed. *Reason for revising this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.*

k. Hazards and Hazardous Materials

Table 4.21-9: Comparison of Program EIR and Baylands Development EIR Hazards and Hazardous Materials Significance Conclusions

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2a (Confirm Achievement of Remediation Goals):** Prior to approval of a specific plan for any parcel within the Project Site, the project applicant shall provide confirmation to the City that the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency, as applicable, have completed their review and accepted the Remedial Action Plan or final closure and post-closure maintenance plans. Prior to issuance of a building or grading permit (other than for grading needed for remediation activities) for any parcel within OU-1, OU-2, or the former landfill, the applicant shall provide the City with evidence that the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency in relation to the landfill have approved applicable Remedial Action Plan(s) or final closure and post-closure maintenance plans. Prior to commencement of building construction or site grading for any parcel within OU-1, OU-2, or the former landfill, the project applicant shall obtain regulatory approval from the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency in relation to the landfill for the proposed land use, in the form of a Remediation Action Completion Report or equivalent closure	**Yes.** Program EIR Mitigation Measure 4.G-2a, which requires confirmation of the completion of site remediation or final landfill closure prior to Baylands development, is relevant to the Baylands Development Project and is carried forward from the Program EIR.	**MM HAZ-1a: Confirm Achievement of Remediation Goals (Program EIR Mitigation Measure 4.G-2a).** ~~Prior to approval of a specific plan for any parcel within the Project Site, the project applicant shall provide confirmation to the City that the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency, as applicable, have completed their review and accepted the Remedial Action Plan or final closure and post-closure maintenance plans.~~ Prior to issuance of a building or grading permit (other than for grading needed for remediation activities) for any parcel within OU-SM~~1~~, OU-2, or the former landfill, the applicant shall provide the City with evidence that the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency in relation to the landfill have approved Remedial Design and Implementation Plan(s) (RDIP) ~~applicable Remedial Action Plan(s)~~ or final closure and post-closure maintenance plans for the area subject to the requested permit. Prior to ~~commencement~~ issuance of a of building permit ~~construction or site grading~~ for any parcel within the ~~Project Site~~ Baylands, the project applicant shall obtain regulatory approval from the Department of Toxic Substances Control (DTSC), Regional Water Quality Control Board (RWQCB), and/or the San Mateo County Environmental Health Division as the Local Enforcement Agency in relation to the landfill

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	letter stating that remediation goals have been achieved for proposed land uses.		for the proposed land use, in the form of a Remediation Action Completion Report or equivalent closure letter stating that remediation goals have been achieved for proposed land uses. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" now includes offsite lands not analyzed in the Program EIR, references have been revised to "Baylands," consistent with the original intent of this measure.* • *Because remedial action plans for OU-SM (formerly OU-1) and OU-1 have been approved by state regulatory agencies, the requirements in the first paragraph of this measure have been fulfilled and are no longer needed.* • *The requirement for issuance of a grading permit has been modified to be approval of a Remedial Design and Implementation Plan for the area subject to the requested permit to reflect the regulatory approval that would provide sufficient information to ensure consistency of requested site grading with regulatory requirements and provide for phased grading to support any phasing of site remediation or landfill closure approved by regulatory agencies.* • *Because of the change in requirement for a grading permit described above, the requirement related to building construction has been modified to issuance of a building permit.*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2b (Soil and Groundwater Management Plan):** Prior to issuance of a building or grading permit for any parcel within the Project Site, a Soil and Groundwater Management Plan (SGMP) shall be prepared by a qualified environmental consulting firm, reviewed and approved by DTSC and the RWQCB and implemented by the project applicant. The Soil and Groundwater Management Plan shall also include a requirement for development and implementation of site-specific safety plans to be prepared prior to commencement of construction consistent with Occupational Safety and Health Administration (OSHA) Safety and Health Standards 29 CFR 1910.120 as well as management of groundwater produced through temporary dewatering activities. Such site-specific safety plans shall include necessary training, operating and emergency response procedures, and reporting requirements to regulate all activities that bring workers in contact with potentially contaminated soil or groundwater, landfill gas, or leachate to ensure worker safety and avoid impacts to the environment. Further, the Soil and Groundwater Management Plan shall include protocols for any areas of the site that require excavation and relocation of refuse material (e.g., building foundations and utility infrastructure) in accordance with the Title 27 of the California Code of Regulations to ensure that the integrity of the low-hydraulic-conductivity layer (LHCL) requirements are maintained.	**Yes.** Program EIR Mitigation Measure 4.G-2b, which requires preparation of a soil and groundwater management plan, is relevant to the Baylands Development Project and is carried forward from the Program EIR.	**MM HAZ-1b: Soil and Groundwater Management Plan (Program EIR Mitigation Measure 4.G-2b).** Prior to issuance of a building or grading permit for any parcel within the Baylands, a Soil and Groundwater Management Plan shall be prepared by a qualified environmental consulting firm, reviewed, and approved by DTSC and the RWQCB, and implemented by the applicant. The Soil and Groundwater Management Plan shall also include a requirement for development and implementation of site-specific safety plans to be prepared prior to commencement of construction consistent with Occupational Safety and Health Administration (OSHA) Safety and Health Standards 29 Code of Federal Regulation (CFR) 1910.120, as well as management of groundwater produced through temporary dewatering activities. Such site-specific safety plans shall include necessary training, operating and emergency response procedures, and reporting requirements to regulate all activities that bring workers in contact with potentially contaminated soil or groundwater, landfill gas, or leachate to ensure worker safety and avoid impacts on the environment. Further, the Soil and Groundwater Management Plan shall include protocols for any areas of the site that require excavation and relocation of refuse material (e.g., building foundations and utility infrastructure) in accordance with Title 27 of the California Code of Regulations to ensure that the integrity of the low-hydraulic-conductivity layer requirements is maintained. *Reason for revisions to this Program EIR Mitigation Measure:* • *Renumbering this measure is needed for consistency with all mitigation measures contained in this EIR.*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2c (Master Deconstruction and Demolition Plan):** City review and approval of a specific plan per the requirements of the Brisbane General Plan shall be completed prior to submittal of any application for a demolition permit within the Project Site. Prior to issuance of a demolition permit for any parcel within the Project Site, the applicable property owner shall submit a Master Deconstruction and Demolition Plan to the City Community Development Director and Building Official. The plan shall be reviewed and approved by the Community Development Director and Building Official prior to issuance of the requested demolition permit to ensure that the proposed demolition is consistent with applicable provisions of the Brisbane General Plan and the specific plan adopted pursuant to the General Plan. The demolition plan shall include documentation of hazardous materials determinations (surveys) and demolition or deconstruction recommendations in accordance with local and state requirements. If the surveys conducted by licensed professionals prior to issuance of a demolition permit per the requirements above hazardous building materials,[376] demolition or deconstruction shall proceed in accordance with applicable BAAQMD, OSHA, and Cal/OSHA requirements, which may include air permits or agency notifications, worker awareness training, exposure monitoring, medical examinations and a written respiratory protection program.	**Yes.** Program EIR Mitigation Measure 4.G-2b, which requires preparation of a master deconstruction and demolition plan, is relevant to the Baylands Development Project and is carried forward from the Program EIR.	**MM HAZ-1c: (Master Deconstruction and Demolition Plan (Program EIR Mitigation Measure 4.G-2c).** City review and approval of a specific plan per the requirements of the Brisbane General Plan shall be completed prior to submittal of any application for a demolition permit within the Project Site. Prior to issuance of a demolition permit for any parcel within the Baylands, the applicable property owner shall submit a Master Deconstruction and Demolition Plan prepared by a licensed professional to the City Building Official. The plan shall be reviewed and approved by the Building Official prior to issuance of the requested demolition permit. The demolition plan shall include documentation of hazardous materials determinations (surveys) and demolition or deconstruction recommendations in accordance with local and state requirements. If the surveys conducted by licensed professionals prior to issuance of a demolition permit per the requirements above hazardous building materials, demolition or deconstruction shall proceed in accordance with applicable Bay Area Air Quality Management District (BAAQMD), OSHA, and California Occupational Safety and Health Administration (Cal/OSHA) requirements, which may include air permits or agency notifications, worker awareness training, exposure monitoring, medical examinations, and a written respiratory protection program. *Reasons for revisions to this Program EIR Mitigation Measure:*

[376] Typical hazardous building materials include lead-based paint; asbestos-containing materials, such as insulation, paint, or fiberboards; PCBs in lighting ballasts or wiring; and mercury in thermostat switches. BAAQMD oversees the public health and environmental aspects of removal and disposal of asbestos-containing materials and other hazardous building materials. Cal/OSHA oversees worker protection and contractor licensing with respect to hazardous building materials.

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
			• *Renumbering this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Preparation of the deconstruction and demolition plans by a licensed professional is a standard City requirement and has been made explicit to avoid confusion.*
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2d (NPDES Permit):** Prior to issuance of a building or grading permit for any parcel within the Project Site, preparation and implementation of an industry standard spill prevention and protection procedure plan shall be conducted by a licensed professional selected or approved by the City in accordance with NPDES General Construction Permit requirements and reviewed and approved by the City Building Official. The plan shall include implementation of Best Management Practices for the storage and use of hazardous materials in accordance with California Stormwater Quality Association Construction guidelines, including emergency procedures for hazardous materials releases for materials that shall be brought onto the site as part of site development and construction activities. The plan shall include standard emergency procedures for hazardous materials releases that would be implemented during Project construction activities, identification of required personal protective equipment, proper housekeeping, spill containment procedures, training of workers to respond to accidental spills/releases, most direct route to a hospital, and requirements for a site safety officer. These measures shall be included within a construction management plan required to be reviewed by all workers.	**No.** Because preparation, regulatory agency review and approval, and implementation of an NPDES permit is required by law, Program EIR Mitigation Measure 4.G-2d is not carried forward into the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Specific Plan EIR
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2e (Hazardous Materials Business Plan).** Prior to receipt of a Certificate of Occupancy, any business that would handle, store, transport, or dispose of hazardous materials or wastes shall prepare and implement a Hazardous Materials Business Plan (HMBP) that shall include at a minimum, the following components: • Details, including floor plans, of the facility and business conducted at the site; • An inventory of the type and quantity of hazardous materials that are handled or stored onsite; • Spill prevention procedures; • An emergency response plan that provides emergency notification procedures; and • A safety and emergency response training program for new employees with annual refresher courses. The HMBP shall be submitted to and approved by the San Mateo Department of Environmental Health prior to site occupancy.	**No.** Because preparation, regulatory agency review and approval, and implementation of hazardous materials business plans is required by law, Program EIR Mitigation Measure 4.G-2e is not carried forward into the Specific Plan EIR.	
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2f:** Prior to issuance of a building permit for any development within the Project Site, proposed underground utilities and utility vaults located on or within 500 feet of the landfill footprint shall be constructed with soil vapor barriers and constructed of intrinsically safe and/or explosion-proof equipment in accordance with City Building Division requirements and overseeing agency (DTSC or RWQCB) as well as the San Mateo County Environmental Health Division as necessary.	**No.** The provisions of Program EIR Mitigation Measure 4.G-2g have been superseded by legal requirements, including Title 27, which is therefore not carried forward into the Specific Plan EIR.	
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2g:** Prior to issuance of a grading permit, all grading specifications for OU-1 and OU-2 shall be developed in accordance with RWQCB and DTSC requirements regarding soil vapor barriers and incorporated into the final grading plan. Any	**No.** The provisions of Program EIR Mitigation Measure 4.G-2g have been superseded by legal requirements associated with approvals of site remediation plans for OU-SM and OU-2,	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	installation of utilities in areas that have adopted soil capping remediation strategies shall be located above the contaminated soil and groundwater areas in accordance with RWQCB and DTSC requirements. Where gravity and utility force mains require encroachment into contaminated areas, special construction details and mitigation measures shall be developed during the preparation of the final RAPs for OU-1 and OU-2 as approved by the RWQCB and DTSC and in accordance with Soil and Groundwater Management Plans. Final RAPs shall include overseeing agency (DTSC or RWQCB) approved Human Health Risk Assessments which include inhalation risks and are based on proposed land uses.	as well as conditional approval of a final landfill closure plan. This measure is therefore not carried forward into the Specific Plan EIR.	
Routine use, storage, transport, and disposal of hazardous materials	**4.G-2h.** Construction of all new structures within the former landfill footprint and within OU-1 and OU-2, as well as on site areas within 1,000 feet of the waste material footprint, shall incorporate sub-slab vapor barriers to minimize potential vapor intrusion into buildings. Further, all structures built within 1,000 feet of the landfill footprint shall be equipped with automatic combustible gas sensors in sub-floor areas and on the first floor of occupied interior spaces of buildings. A centralized sensor monitoring and recording system shall also be provided. Gas monitoring for trace gases shall be conducted in accordance with the requirements of Title 27, for 30 years or until the operator receives authorization from the local enforcement agency (LEA) and CalRecycle to discontinue monitoring upon demonstration by the operator that there is no potential for trace gas migration into onsite structures.	**No.** The provisions of Program EIR Mitigation Measure 4.G-2g have been superseded by legal requirements associated with approvals of site remediation plans for OU-SM and OU-2, as well as conditional approval of a final landfill closure plan. This measure is therefore not carried forward into the Specific Plan EIR.	
Potential lead contamination on Icehouse Hill from the former shooting range	**4.G-2i:** Prior to any construction of trails on the southerly slope of Icehouse Hill, best management practices for lead removal consistent with United States Environmental Protection Agency Circular EPA-902-B-01-001, *Best Management Practices for*	**Yes.** Program EIR Mitigation Measure 4.G-2i, which sets requirements for remediation of the former police shooting range on Icehouse Hill, is relevant to the Baylands Development	**MM HAZ-1i: Former Police Shooting Range Cleanup (Program EIR Mitigation Measure 4.G-2i).** Prior to any construction of trails on the southerly slope of Icehouse Hill, best management practices for lead removal consistent with United States Environmental

	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	Lead at Outdoor Shooting Ranges, Revised June 2005, shall be implemented.	Project and is carried forward from the Program EIR.	Protection Agency Circular EPA-902-B-01-001, *Best Management Practices for Lead at Outdoor Shooting Ranges*, Revised June 2005, shall be implemented. *Reason for revisions to this Program EIR Mitigation Measure:* • *Naming and renumbering this measure are needed for consistency with all mitigation measures contained in this EIR.*
Potential contamination within the Bayshore Industrial Park	**4.G-2j:** Prior to approval of any demolition plan within the Bayshore Industrial Park, any building(s) proposed for demolition shall be tested for asbestos and lead-based paint. Should asbestos or lead-based paint be identified, the affected building(s) shall be remediated to the satisfaction of the RWQCB pursuant to the most current regulatory standards in effect at the time of remediation. Prior to site development within the Bayshore Industrial Park, soils shall be tested for likely constituents of concern based on the site's use pursuant to the requirements of the RWQCB. Human health risk assessment(s) for sites proposed for demolition shall be prepared based on the future uses of the area approved by the City of Brisbane. Should risks to human health be identified, remediation to the risk-based remediation standards set by the RWQCB shall be completed prior to initiating grading or other onsite development.	**No.** The provisions of Program EIR Mitigation Measure 4.G-2g have been superseded by legal requirements and is therefore not carried forward into the Specific Plan EIR.	
Locating a school site within 0.25 mile of the Kinder Morgan site	**4.G-3:** Grade K–12 school facilities constructed on the Project Site shall not be located within 0.25 miles of a facility with hazardous emissions or that handles hazardous or acutely hazardous materials, substances or waste, unless approved by School Facilities Planning Division of the California Department of Education in conformance with California Code of Regulations (CCR) Title 5, Section	**Yes.** Because a middle school is proposed within the Baylands, Program EIR Mitigation Measure 4.G-3 is relevant to proposed Baylands development and is carried forward into the Specific Plan EIR.	**MM HAZ-2: Protection of School Facilities (Program EIR Mitigation Measure 4.G-3).** Grade K–12 school facilities constructed ~~on the Project Site~~ within the Baylands shall not be located within 0.25 miles of a facility with hazardous emissions or that handles hazardous or acutely hazardous materials, substances or waste, unless approved by School Facilities Planning Division of the California Department of Education in conformance with California Code of Regulations (CCR) Title 5, Section 14010, which sets

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Specific Plan EIR
	14010, which sets forth California Department of Education criteria for school site locations: • "If the proposed [school] site is within 1,500 feet of a railroad track easement, a safety study shall be done by a competent professional trained in assessing cargo manifests, frequency, speed, and schedule of railroad traffic, grade, curves, type and condition of track need for sound or safety barriers, need for pedestrian and vehicle safeguards at railroad crossings, presence of high pressure gas lines near the tracks that could rupture in the event of a derailment, preparation of an evacuation plan. In addition to the analysis, possible and reasonable mitigation measures must be identified in accordance the referenced code." California Code of Regulations (CCR) Title 5, Section 14010 (d) • "The [school] site shall not be located near an above-ground water or fuel storage tank or within 1,500 feet of the easement of an above ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission." CCR Title 5, Section 14010 (h): Grade K–12 school facilities shall also comply with California Education Code Sections 17210 through 17224 and related statutory provisions related to risk to human health or the environment at proposed school properties as overseen by the Department of Toxic Substances Control (DTSC). In accordance with California Education Code Sections 17210 through 17224 and related statutory provisions, the school district must prepare a Phase I Environmental Site Assessment and/or a Preliminary Endangerment Assessment (PEA) to		forth California Department of Education criteria for school site locations: • "If the proposed [school] site is within 1,500 feet of a railroad track easement, a safety study shall be done by a competent professional trained in assessing cargo manifests, frequency, speed, and schedule of railroad traffic, grade, curves, type and condition of track need for sound or safety barriers, need for pedestrian and vehicle safeguards at railroad crossings, presence of high pressure gas lines near the tracks that could rupture in the event of a derailment, preparation of an evacuation plan. In addition to the analysis, possible and reasonable mitigation measures must be identified in accordance the referenced code." California Code of Regulations (CCR) Title 5, Section 14010 (d) • "The [school] site shall not be located near an above-ground water or fuel storage tank or within 1,500 feet of the easement of an above ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission." CCR Title 5, Section 14010 (h) Grade K–12 school facilities shall also comply with California Education Code Sections 17210 through 17224 and related statutory provisions related to risk to human health or the environment at proposed school properties as overseen by the Department of Toxic Substances Control (DTSC). In accordance with California Education Code Sections 17210 through 17224 and related statutory provisions, the school district must prepare a Phase I Environmental Site Assessment and/or a Preliminary Endangerment Assessment (PEA) to identify potential contamination and evaluate whether it presents a risk to human

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	identify potential contamination and evaluate whether it presents a risk to human health or the environment at proposed school properties as overseen by the Department of Toxic Substances Control (DTSC). The environmental investigation and any required remediation of properties to be developed for use as schools shall be overseen by DTSC in coordination with the California Department of Education and the School Facilities Planning Division. Final design plans shall be approved by the School Facilities Planning Division of the California Department of Education prior to commencement of construction. All required remediation within 0.25 miles of a proposed K–12 school site within the Project Site shall be completed prior to occupancy of the school.		health or the environment at proposed school properties as overseen by the Department of Toxic Substances Control (DTSC). The environmental investigation and any required remediation of properties to be developed for use as schools shall be overseen by DTSC in coordination with the California Department of Education and the School Facilities Planning Division. Final design plans shall be approved by the School Facilities Planning Division of the California Department of Education prior to commencement of construction. All required remediation within 0.25 miles of a proposed K–12 school site within the ~~Project Site~~ Specific Plan area shall be completed prior to occupancy of the school. *Reasons for revisions to this Program EIR Mitigation Measure:* • *Renumbering this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "on the Project Site" now encompasses more area than was addressed in the Program EIR, the reference has been modified to "within the Baylands" to reflect the original intent of the mitigation measure.*

1. Hydrology and Water Quality

Table 4.21-10: Program EIR Hydrology and Water Quality Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Compliance with water quality standards during construction	**4.H-1a:** Prior to issuance of a grading permit, an applicant for any site specific development project to be constructed within the Project Site shall (1) file a Notice of Intent to the RWQCB to comply with the statewide General Permit for Discharges of Storm Water Associated with Construction Activities and shall prepare and implement a site-specific SWPPP for construction activities on the Project Site in accordance with the NPDES General Construction Permit and (2) demonstrate compliance with the City of Brisbane's Municipal Regional Stormwater Permit Order No. 2011-0083 Provision C.3. The site-specific SWPPP shall include all provisions of the Erosion and Sediment Control Plan submitted as part of grading and construction permits. In addition to meeting the regulatory requirements for the SWPPP, the site-specific SWPPP shall include provisions for the minimization of sediment disturbance (i.e., production of turbidity) and release of chemicals to the Bay.	**No.** Compliance with the statewide General Permit for Discharges of Storm Water Associated with Construction Activities, as well as preparation and implementation of site-specific SWPPPs for Baylands construction activities is required by law. Program EIR Mitigation Measure 4.H-1a is therefore not carried forward into the Specific Plan EIR.	
Compliance with water quality standards during construction	**4.H-1b:** Prior to issuance of a grading permit, an applicant for any site-specific development project to be constructed within the Project Site shall comply with any site-specific NPDES permit requirements for dewatering activities, as administered by the RWQCB. The RWQCB could require compliance with certain provisions in the permit, such as treatment of the flows prior to discharge, depending on the particular site conditions. Discharge of the groundwater generated during dewatering to the sanitary sewer or storm drain system shall only occur with authorization of and required permits from the applicable regulatory agencies, including the Bayshore Sanitary District or the RWQCB. Site	**No.** Because compliance with legal requirements would result in less than significant impacts, and the Program EIR Mitigation Measure 4.H-1b reflects those requirements, it is not carried forward into the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	dewatering activities shall also be monitored by a state licensed geotechnical engineer in such a manner as to avoid the potential for damaging buildings or infrastructure due to potential subsidence of the ground surface in accordance with any requirements from the City Engineer.		
Compliance with water quality standards during construction	**4.H-1c.** Applicants for site-specific development projects to be constructed within the Project Site shall prepare and implement a Final Stormwater Management Plan (SMP) in accordance with the most recent NPDES C.3 requirements to be reviewed and approved by the City Engineer prior to approval of final design plans. The SMP shall be prepared by licensed professionals and act as the guiding document detailing best management practices for mitigating water quality impacts in the post-construction phase. Industrial uses shall prepare a SMP in accordance with NPDES permit requirements for Industrial Activity. Industrial applicants shall include management measures that will achieve the performance standard of best available technology economically achievable and best conventional pollutant control technology in accordance with the General Industrial Permit as approved by the RWQCB and shall demonstrate compliance within an annual report be submitted each July 1. The SMP shall provide operations and maintenance guidelines for all of the BMPs identified in the SMP, including LID measures and other BMPs designed to mitigate potential water quality degradation of runoff from all portions of the completed development, and shall clearly identify the entity responsible for the required ongoing maintenance. The SMP shall be developed in conjunction with the Storm Drain Master Plan to ensure that the treatment designs support the hydraulics and hydrology of the proposed storm drainage system.	**No.** Because compliance with legal requirements, including preparation and implementation of a Final Stormwater Management Plan (SMP) in accordance with the most recent NPDES C.3 requirements would result in a less than significant impact, Program EIR Mitigation Measure 4.H-1c is not carried forward into the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Increase in the amount of runoff and potential flooding.	**4.H-4a:** Prior to issuance of a building permit, all site-specific development plans within the Project Site shall include systemwide drainage improvements that shall accommodate all increased runoff in accordance with City requirements and correct known existing deficiencies (e.g., Levinson Overflow Area and the PG&E property). On-site storm drainage collection facilities shall be sized to convey the peak flow rate from a 25-year storm event entirely within the piping system such that Baylands roadways and recreational facilities are not flooded. Drainage improvements shall accommodate the 100-year peak storm event within the piping system and within streets such that building finished floor elevations provide a minimum of 1-foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and 100 years of estimated sea level rise. Key roadways including Sierra Point Parkway, Lagoon Road, and Tunnel Avenue shall be designed such that these roadways are available as evacuation routes in the event of a 100-year storm event. The proposed system design shall be submitted to the City Engineer for approval and shall hydraulically isolate existing drainage inlets fronting Levinson Overflow Area and the PG&E property from existing Brick Arch Sewer system.	**Yes.** Program EIR Mitigation Measure 4.H-4a, which sets performance standards for flood protection, is relevant to the proposed Specific Plan and is therefore carried forward into the Specific Plan EIR.	**MM HWQ-3a: Known Drainage Deficiencies (Program EIR Mitigation Measure 4.H-4a).** Prior to issuance of a building permit, all site-specific development plans within the ~~Project Site~~ Baylands shall include systemwide drainage improvements that shall accommodate all increased runoff and correct the Project's incremental additional impact to flood risks to areas with ~~known~~ existing deficiencies (e.g., Levinson Overflow Area and the PG&E property): • On-site storm drainage collection facilities shall be sized to convey the peak flow rate from a 25-year storm event entirely within the piping system such that Baylands roadways and recreational facilities are not flooded. • Drainage improvements shall accommodate the 100-year peak storm event within the piping system and within streets such that building finished floor elevations provide a minimum of 1 foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and ~~100 years of estimated~~ Year 2100 projected sea level rise. • Key roadways including Sierra Point Parkway, Lagoon Road, and Tunnel Avenue shall be designed such that these roadways are available as evacuation routes in the event of a 100-year storm event. The proposed system design shall be submitted to the City Engineer for approval and shall hydraulically isolate existing drainage inlets fronting the Levinson Overflow Area and the PG&E property from the existing Brick Arch Sewer system. *Reasons for revisions to this Program EIR Mitigation Measure:*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
			• *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" now includes offsite lands not analyzed in the Program EIR, references have been revised to "Baylands," consistent with the original intent of this measure.* • *The measure has been revised to require mitigation of existing known drainage deficiencies to be proportional to the project's impacts.* • *Sea level rise terminology has been updated to reflect the states most recent guidance (2024).*
Increase in the amount of runoff and potential flooding.	**4.H-4b:** Prior to issuance of a building permit, all site-specific development plans within the Project Site shall include additional conveyance capacity by incorporating new storm drain facilities along Bayshore Boulevard north of Industrial Avenue. Development plans shall also require the addition of a new inlet near the Bayshore Boulevard and Industrial Way intersection that is large enough to intercept surface flows from Levinson Overflow Area and the PG&E property in accordance with and as approved by the City. Review and approval by the City engineer shall be required to confirm that conveyance capacity is sufficient to accommodate the 100-year peak storm event within the piping system and streets such that building finished floor elevations provide a minimum of 1-foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and 100 years of estimated sea level rise.	**Yes.** Program EIR Mitigation Measure 4.H-4b, which requires flood protection improvements, is relevant to the proposed Specific Plan and is therefore carried forward into the Specific Plan EIR.	**MM HWQ-3b: Bayshore Boulevard Drainage (Program EIR Mitigation Measure 4.H-4b).** Prior to issuance of a building permit, all site-specific development plans within the ~~Project Site~~ Baylands shall include additional conveyance capacity by incorporating new storm drain facilities along Bayshore Boulevard north of Industrial Avenue. Development plans shall also require addition of a new inlet near the Bayshore Boulevard and Industrial Way intersection that is large enough to intercept surface flows from Levinson Overflow Area and the PG&E property in accordance with and as approved by the City. Review and approval by the City Engineer shall be required to confirm that conveyance capacity is sufficient to accommodate the 100-year peak storm event within the piping system and streets such that building finished floor elevations provide a minimum of 1-foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and ~~100 years of estimated~~ Year 2100 projected sea level rise.

	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
			Reasons for revisions to this Program EIR Mitigation Measure: • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" now includes offsite lands not analyzed in the Program EIR, references have been revised to "Baylands," consistent with the original intent of this measure.* • *Sea level rise terminology has been updated to reflect the states most recent guidance (2024).*
Increase in the amount of runoff and potential flooding	**4.H-4c:** Prior to issuance of a building permit, all development plans in the Baylands shall include conveyance improvements to existing Visitacion Creek in the final drainage plan design and extend it further west of Tunnel Road to the Roundhouse area as approved by the City and in accordance with Army Corps of Engineers and California Department of Fish and Wildlife requirements. Improvements to tidal portions of Visitacion Creek will be made in accordance with requirements stipulated in permits from the BCDC. Project Site development and infrastructure design shall also incorporate a detention zone within the newly extended channel. Project Site development shall remove the existing Timber Box Culvert between Tunnel Road and the Caltrain mainline tracks and replace it with an open channel system prior to Project site development completion. The design shall accommodate increases in peak runoff during 100-year design storm event with tidal flow, and with consideration of estimated sea level rise over the next century and provide protection of new structures for human occupancy from the 100-year design storm event throughout and after Project Site development.	**No.** Due to changes in proposed Baylands development, Program EIR Mitigation Measure is no longer relevant and is therefore not carried forward into the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Urban pollutants in stormwater runoff	**4.H-5:** Prior to issuance of an occupancy permit for site-specific development within the Project Site, an integrated pest management plan shall be prepared and implemented, subject to City review and approval, to set forth a preventative, long-term, low toxicity program to control pests. The plan shall provide guidelines for landscape and building maintenance with the emphasis on minimizing the use of pesticides while controlling pests. At a minimum, the integrated pest management plan shall include: • ***Identification of acceptable pest levels*** (action thresholds) with an emphasis on *control*, not *eradication*, identifying site and pest specific action thresholds, and the controls to be used if those thresholds are exceeded. • ***Preventive practices:*** Design, construction, and maintenance of landscape facilities, and buildings, as well as operation of uses that prevent or minimize pest problems. • ***Monitoring:*** Regular observation, including inspection and identification. • ***Mechanical controls:*** Should a pest reach an unacceptable level, provide for mechanical methods as the first options, including simple hand-picking, erecting insect barriers, using traps, vacuuming, and tillage to disrupt breeding. • ***Biological Controls:*** Provide for use of natural biological processes and materials for control, including promoting beneficial insects that prey on target pests and biological insecticides derived from naturally occurring microorganisms. • ***Responsible Pesticide Use:*** Provide for use of synthetic pesticides generally only as required when preferred methods are infeasible or ineffective, including use of the least toxic	**Yes.** Program EIR Mitigation Measure 4.H-5, which establishes integrated pest management requirements, is relevant to the proposed Specific Plan and is therefore carried forward into the Specific Plan EIR.	**MM HWQ-1: Integrated Pest Management (Program EIR Mitigation Measure 4.H-5).** Prior to issuance of an occupancy permit for site-specific development within the ~~Project Site~~ Baylands, an integrated pest management plan shall be prepared and implemented, subject to City review and approval, to set forth a preventative, long-term, low toxicity program to control pests. The plan shall provide guidelines for landscape and building maintenance with the emphasis on minimizing the use of pesticides while controlling pests. At a minimum, the integrated pest management plan shall include: • ***Identification of acceptable pest levels*** (action thresholds) with an emphasis on *control*, not *eradication*, identifying site and pest specific action thresholds, and the controls to be used if those thresholds are exceeded. • ***Preventive practices:*** Design, construction, and maintenance of landscape facilities, and buildings, as well as operation of uses that prevent or minimize pest problems would include integrated pest management strategies, sanitation practices, and proactive maintenance to minimize pest infestations. • ***Monitoring:*** Regular observation, including inspection and identification. • ***Mechanical controls:*** Should a pest reach an unacceptable level, provide for mechanical methods as the first options, including include simple hand-picking, erecting insect barriers, using traps, vacuuming, and tillage to disrupt breeding. • ***Biological Controls:*** Provide for use of natural biological processes and materials for control, including promoting beneficial insects that prey

	accordance with the San Francisco Bay Plan. Any BCDC requirements after review of the Sea Level Rise Risk Assessment report shall also be incorporated into Project design prior to issuance of a building permit. Sea level rise analyses shall be based on the California Climate Action Team's sea level rise projections for the West Coast, unless otherwise substantiated to the satisfaction of BCDC. For site-specific development projects within the area subject to BCDC jurisdiction, discretionary permits from the City such as grading or building permits shall be obtained prior to final approval of the BCDC permit.		

m. Geology, Soils, and Seismicity

Table 4.21-11: Program EIR Geology, Soils, and Seismicity Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Exposure of people and structures to strong seismic groundshaking	**4.E-2a:** Prior to the issuance of a grading permit, applicants for all site-specific development and infrastructure projects within the Project Site, including structures, utilities, and roadways shall submit to the City Engineer a final design-level geotechnical report prepared by a licensed geotechnical or soil engineer experienced in construction methods on fill materials in an active seismic area. The report shall provide site-specific construction methods and recommendations regarding grading activities, fill placement, soil corrosivity/expansion/erosion potential, compaction, foundation construction, drainage control (both surface and subsurface), and avoidance of settlement, liquefaction, differential settlement, spread of leachate outside of the former landfill, and seismic hazards in accordance with current California Building Code requirements including Chapter 16, Section 1613. The report shall also require that all subsurface improvements such as utilities that include any materials susceptible to corrosive effects would be engineered in conformance with the most recently adopted California Building Code requirements including the use of engineered backfill. The report shall also include stability analyses of final design cut and fill slopes, including recommendations for avoidance of slope failure(s). The final grading plan and associated development elements including the landfill cap layer shall be designed and constructed in accordance with requirements of the final design-level geotechnical investigation as approved by the City Engineer prior to the issuance of any building permits. Designers and contractors shall comply with recommendations of the design-level geotechnical investigation during project construction including any modifications required by the City Engineer. A licensed geotechnical or soil engineer shall monitor earthwork and construction activities to ensure that	**No.** Because the requirements set forth in Program EIR Mitigation Measure 4.E-2a are required by law, impacts related to seismic groundshaking would be less than significant, and this measure need not be carried forward into the Specific Plan EIR.	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	recommended site-specific construction methods are followed during Project construction. These recommendations shall be incorporated into all development plans submitted and approved for the Project Site development as conditions of approval.		
Exposure of people and structures to strong seismic groundshaking	**4.E-2b:** To address recovery from damage to future structures and to the landfill itself that may be caused by future earthquakes, a Post-Earthquake Inspection and Corrective Action Plan (Plan) for the site-specific development projects within the former landfill portion of the Project Site shall be prepared and implemented by all Project applicants in accordance with Title 27 landfill closure requirements as approved by the RWQCB and the San Mateo County Department of Environmental Health prior to issuance of a building permit. The plan shall be implemented in the event of a magnitude 7.0 or greater earthquake centered within 30 miles of the former Brisbane Landfill. Results of the inspection of containment features and groundwater and leachate control facilities potentially affected by any static or seismic deformations of the landfill shall be reported to the RWQCB within 72 hours of the event. Immediately following an earthquake event causing damage to the landfill structures, the Plan shall be implemented and the RWQCB notified of any damage. Plan activities following a triggering event shall include assessing perimeter dikes and shoreline erosion protection measures, the surface locations of underground utilities, landfill cover including roads and parking areas, groundwater monitoring systems, leachate monitoring systems, and surface-water drainage and outlet facilities. Any restorative measures as required under Order 01-041 shall be implemented in accordance with RWQCB requirements.	**No.** Because the requirements set forth in Program EIR Mitigation Measure 4.E-2b are required by law, impacts related to seismic groundshaking would be less than significant, and this measure need not be carried forward into the Specific Plan EIR.	
Seismic related ground failure	**4.E-3:** The final design-level geotechnical investigation recommended in Mitigation Measure 4.E-2a above, to be prepared by a licensed professional and submitted to the City for review and approval, shall address liquefaction potential. The geotechnical investigation shall include	**No.** Because the requirements set forth in Program EIR Mitigation Measure 4.E-3 are required by law, impacts related to seismic-related ground failure	

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
	recommendations for foundation design to address site-specific potential liquefaction issues. The recommendations of the investigation shall be in accordance with the most recent California Building Code requirements for building design and incorporated into all development plans submitted for the Project Site development. All final design and engineering plans submitted by the applicant shall be subject to review and approval by the City of Brisbane Building Official.	would be less than significant, and this measure need not be carried forward into the Specific Plan EIR.	
Slope stability	**4.E-4a:** Site-specific development projects within the Project Site shall not place new fill materials within 600 feet of Brisbane Lagoon, except when required for roadway improvements, habitat enhancement, or other approved site improvements. Placement of new fill materials within 600 feet of the Brisbane Lagoon shall be designed to prevent erosion of soils into the lagoon during and subsequent to construction. All manufactured slopes shall require certification by a licensed geotechnical engineer to the satisfaction of the City Engineer that a factor of safety of at least 1.5 for static conditions and 1.2 under dynamic conditions will be achieved.	**Yes.** Program EIR Mitigation Measure 4.E-4a, which addresses stability of Bay Mud soils within 600 feet of the lagoon's north shore, is relevant to the current Specific Plan project and is carried forward into the Specific Plan EIR.	**MM GEO-4a: Manufactured Slopes (Program EIR Mitigation Measure 4.E-4a).** Site-specific development projects within the ~~Project Site~~ Baylands shall not place new fill materials within 600 feet of Brisbane Lagoon, except when required for roadway improvements, habitat enhancement, recreational facilities, or other ~~approved~~ site improvements permitted by the Specific Plan. Placement of new fill materials within 600 feet of the Brisbane Lagoon shall be designed to prevent erosion of soils into the lagoon during and subsequent to construction. All manufactured slopes shall require certification by a licensed geotechnical engineer to the satisfaction of the City Engineer that a factor of safety of at least 1.5 for static conditions and 1.2 under dynamic conditions will be achieved. *Reason for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.* • *Because the term "Project site" encompasses an area larger than the Baylands, revisions were needed to focus implementation of this measure on the physical area affected by the impact that requires mitigation consistent with the original*

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
			intent of Program EIR Mitigation Measure 4.E-4a. • *Addition of the term "recreational facilities" confirms that the recreational components of Lagoon Park are, in fact, "approved site improvements."* • *Replacement of "other approved site improvements" with "other site improvements permitted by the Specific Plan" clarifies the original intent of the mitigation measure and ties "other improvements" to the Specific Plan as approved by the City.*
Slope stability	**4.E-4b:** Site-specific development projects within the Project Site shall comply with Brisbane General Plan policy requirements and the most recent California Building Code requirements for slope stability, including Chapters 16 and 18 that require geotechnical investigations. The recommendations of the investigation shall be in accordance with the most recent California Building Code requirements for building design and incorporated into all development plans submitted for Project Site development. All final design and engineering plans submitted by the Project applicant shall be subject to review and approval by the City of Brisbane Building Official prior to issuance of a building permit.	**No.** Because the requirements set forth in Program EIR Mitigation Measure 4.E-3 are required by law, impacts related to slope stability would be less than significant, and this measure need not be carried forward into the Specific Plan EIR.	

n. Utilities, Service Systems, and Water Supply

Table 4.21-12: Program EIR Utilities, Service Systems, and Water Supply Mitigation Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	Carry Forward or Modify into Specific Plan EIR?	Mitigation Measures Carried Forward into the Baylands Specific Plan EIR
Adequate local water storage	**4.O-1a:** The City shall issue building permits for habitable structures only after it determines that sufficient water storage is available and connected to the Project Site's water delivery system. Water storage facilities shall be constructed either by the Brisbane Baylands developer or by the City, as mutually agreed. Should the City construct facilities, site-specific development projects shall reimburse the City for their fair share of costs, as determined by the City of Brisbane Public Works Department, for the development of water storage to provide fire flows and peak daily water demands to serve Project Site development. Prior to issuance of the first permit of occupancy, site-specific development projects shall verify the availability of adequate water storage capacity to provide fire flows and meet peak daily water demands to serve Project Site development. Each required specific plan for development within the Project Site shall include this mitigation measure as a requirement for future development.	**No.** The 2025 Specific Plan project includes on-site water storage facilities that would be constructed and maintained by the California Water Company.	
Biological resources impacts of water diversions along the Tuolumne River	**4.O-1b: Controlled Releases to Recharge Groundwater in Streamside Meadows and Other Alluvial Deposits.** In any year during which the SFPUC determines that controlled releases of water from Hetch Hetchy Reservoir are required to sustain existing meadow vegetation within the Poopenaut Valley, Brisbane shall contribute a percentage of the water it purchases from OID to the SFPUC to augment the controlled releases from Hetch Hetchy Reservoir. The City's contribution shall be in proportion to the amount of water required for controlled releases by the SFPUC in any given year that such releases are needed and shall be in an amount sufficient to ensure that impacts to meadows resulting from the proposed OID-Brisbane water transfer are reduced to less than significant. Prior to the City's approval of a water supply agreement with OID, the formula for determining Brisbane's required contribution to the SFPUC shall be determined in consultation with the SFPUC. That formula shall be included in the City's agreement with the SFPUC to transport and store the water purchased from OID.	**No.** Program EIR Mitigation Measure 4.O-1b is specific to the acquisition of water supply from the Oakdale Irrigation District, which is no longer proposed.	

o. Public Services and Facilities

Table 4.21-13: Program EIR Public Services and Facilities Measures

Significant Impact Being Mitigated	PROGRAM EIR		SPECIFIC PLAN EIR
	Mitigation Measures Adopted in the Program EIR Mitigation Monitoring and Reporting Program	**Carry Forward or Modify into Specific Plan EIR?**	**Mitigation Measures Carried Forward into the Baylands Specific Plan EIR**
Increased demand for police services	**4.L-1:** A site for a storefront substation that is easily visible and accessible to the general public and sized large enough to accommodate operations described in the Police Services and Facilities Plan shall be provided as required by the Brisbane Police Department.	**No.** The Police Services and Facilities Plan required by this mitigation measure has been prepared and will be implemented as part of the Baylands planning review process.	
Increased demand for school facilities	**4.L-3:** A site for an elementary/middle school of sufficient size to accommodate development-related enrollment shall be reserved as part of the specific plan required by the Brisbane General Plan for development within the Project Site.	**No.** The proposed on-site middle school and conversion to the existing Bayshore school to an elementary school implements this mitigation measure.	
Increased demand for library facilities	**4.L-4:** To avoid existing and proposed library facilities in surrounding communities, a library facility shall be developed within the Project Site that is of sufficient size to serve Project Site population. The onsite library shall be constructed and operational prior to issuance of the occupancy permits for more than 50 percent of the residential dwelling units permitted under the DSP and DSP-V scenarios, thereby ensuring an onsite resident population to use onsite library facilities at the time of its opening. This requirement shall be reflected in the specific plan(s) required to be prepared and approved prior to Project Site development.	**Yes.** Because the Specific Plan did not make provision for library facilities, Program EIR Mitigation Measure 4.L-4 remains relevant to the proposed project and will be carried forward into the Specific Plan EIR.	**MM PUB-1a: On-Site Library (Program EIR Mitigation Measure 4.L-4).** To avoid overuse of existing and proposed library facilities ~~in surrounding communities~~, a library facility shall be developed within the ~~Project Site~~ Baylands that is of sufficient size to serve ~~Project Site~~ the Specific Plan's population. The on-site library shall be constructed and operational prior to issuance of the occupancy permits for more than 50 percent of the residential dwelling units permitted ~~under the DSP and DSP-V scenarios~~ by the Specific Plan, thereby ensuring an on-site resident population at the time of its opening. ~~This requirement shall be reflected in the specific plan(s) required to be prepared and approved prior to Project Site development.~~ *Reason for revisions to this Program EIR Mitigation Measure:* • *Renumbering and adding a title to this measure is needed for consistency with all mitigation measures contained in this EIR.*

No Recreational Resources mitigation measures were proposed in the Program EIR.

q. Wildland Fire

No Wildland Fire mitigation measures were proposed in the Program EIR.

Intentionally Blank

CHAPTER 5 IRREVERSIBLE ENVIRONMENTAL EFFECTS

5.1 INTRODUCTION

Section 15126.2(d) of the California Environmental Quality Act (CEQA) Guidelines requires environmental impact reports (EIRs) to evaluate the potential for significant irreversible environmental changes to result from proposed projects as follows:

> *Significant Irreversible Environmental Changes Which Would be Caused by the Proposed Project Should it be Implemented. Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.*

Determining whether a project could result in significant and irreversible effects thus requires a determination of whether key resources would be degraded or destroyed in such a way that there would be little possibility of restoring them.

5.2 CHANGES IN LAND USE THAT WOULD COMMIT FUTURE GENERATIONS

The Brisbane General Plan, as amended by General Plan Amendments GP-1-18 and GP-1-19, serves as the City of Brisbane's principal land use planning and policy document, providing guidance for Baylands development. General Plan Amendment GP-1-18, confirmed by Brisbane voters as Measure JJ in 2018, and General Plan Amendment GP-1-19 provide for development of the Baylands with 1,800 to 2,200 dwelling units, 6.5 million square feet of commercial/office development, and an additional 500,000 square feet of hotel use. A minimum of 25 percent of the Baylands' upland area is required to be preserved in open space use uses accessible to the public.

Development permitted by the Baylands Specific Plan would constitute a permanent commitment of the land within the Baylands that would be physically altered to support residential, commercial, office, hotel, habitat restoration, and open space and recreational uses. Given the existing marginal uses within the Baylands, presence of contaminated groundwater and soils in the western portion of the site requiring remediation, and the former Brisbane landfill in the eastern portion of the site requiring final closure in compliance with state law, it is unreasonable to anticipate that circumstances could arise that would justify the return of the land to its current condition following development permitted by the Specific Plan.

5.3 CONSUMPTION OF NON-RENEWABLE RESOURCES

5.3.1 CONSTRUCTION MATERIALS

Nonrenewable resources, such as natural gas, petroleum products and fossil fuels, asphalt, petrochemical-based construction materials, steel, copper, other metals, and sand and gravel, are commodities with a finite supply that are used in development projects such as those that would be allowed by the Baylands Specific Plan. To varying degrees, these materials are readily available and some, such as asphalt, sand, and gravel, are abundant. During construction of buildings and infrastructure, a variety of natural resources would be consumed, including water,[377] sand and gravel, asphalt, petrochemical-based construction materials, steel, copper, and other metals as well as other slowly renewable resources such as lumber and other forest products.

With regard to building materials, future site-specific residential and non-residential developments would be constructed with durable materials having a substantial lifespan, such as cast-in-place concrete, precast concrete, and structural steel, which would improve building longevity. As such, even though construction would result in the commitment of building materials, the materials would not be expected to require replacement during the operational lifespan of Baylands buildings. Once used, these materials would be "lost" for subsequent or alternative use and/or committed to the Baylands site on a long-term basis.

Construction and demolition waste would be generated during site clearance and demolition activities, grading, street and utilities construction, building construction, and installation of landscaping and irrigation systems. Construction and demolition wastes would include vegetation, non-hazardous earth materials, concrete, wood, metals, and other miscellaneous debris (e.g., cardboard, paper, plastic, trash from existing businesses, food wastes). Compliance with City of Brisbane source reduction and recycling requirements for construction projects would minimize the amount of renewable and non-renewable construction and demolition wastes that would be generated and require transport to landfills during site construction. EIR Mitigation Measure PUB-1 requires site development to implement zero waste programs that are, at a minimum, equivalent to San Francisco's zero waste program provided by Recology.

Furthermore, if future buildings constructed within the Baylands were to be demolished after the end of their lifespan, City of Brisbane Municipal Code requirements would ensure that building materials are recycled.

[377] Water will also be consumed during site grading activities. Construction-related water consumption estimates are provided in Section 4.16, *Utilities, Service Systems, and Water Supply*.

5.3.2 FOSSIL FUELS

During construction, fossil fuels would be used both on-site and off-site by workers traveling to and from the site, construction equipment, and delivery vehicles. Once consumed, those fossil fuels will be unavailable for subsequent or alternative uses. Following construction, fossil fuels would be consumed by Baylands residents, workers, and visitors traveling to and from the site, as well as by delivery vehicles.

The vehicles that would travel to and from future Baylands development would include an increasing proportion of electric vehicles. Fossil fuel-based internal combustion vehicles would also be subject to increasingly stringent emissions standards over time, which would reduce the amount of fossil fuel consumed per vehicle (see Section 4.11, *Energy Resources*, for details). Furthermore, the Baylands Specific Plan includes provisions that support decreased use of personal vehicles and increased use of transit, walking, and bicycling. As documented in Section 4.8, *Transportation*, per service population vehicle miles traveled is projected to be substantially less for Baylands development than the San Francisco Bay Area average.

Even though on-site Baylands development will be energy neutral, long-term energy consumption of fossil fuels related to transportation, water delivery, and the production of consumable goods will continue. The amount of fossil fuel that would be consumed during and after Baylands construction has been estimated and can be found in Section 4.11, *Energy Resources*.

5.3.3 WATER

Ongoing operation of Baylands development would also consume water and consumer products manufactured from nonrenewable materials and sources.[378] As discussed in Section 4.16, *Utilities, Service Systems, and Water Supply*, Baylands development would include construction and operation of a water recycling facility as part of Baylands development to minimize consumption of potable water supplies.

5.4 POTENTIAL IRREVERSIBLE ENVIRONMENTAL DAMAGE FROM ACCIDENTS

Baylands development has the potential to expose the public and the environment to hazards. As discussed in Section 4.13, *Hazards and Hazardous Materials*, the Baylands Specific Plan would result in land uses within the Baylands that typically involve the use, storage, disposal, and transportation of hazardous materials, such as fuels, lubricants, solvents, degreasers, and paints.

[378] As discussed in Section 4.3, *Land Use and Planning Policies*, and Section 4.11, *Energy Resources*, Baylands development would be all-electric and use 100 percent renewable energy, much of which would be generated onsite. Thus, Baylands development would not be a consumer of non-renewable energy supplies.

Hazardous materials in various forms can cause death, severe injury, long-lasting health effects, and damage to buildings and other property. Additionally, the transportation of hazardous materials and wastes may increase because of increased use of hazardous materials and wastes within the Baylands.

Compliance with numerous federal, state, and local regulations that are designed to reduce and/or eliminate exposure of hazardous materials to the public and the environment would be required of those transporting, using, or disposing of hazardous materials. Overall, compliance with permitting and associated regulations would protect future residents and others within the Baylands from exposure to hazardous materials.

5.5 IRREVERSIBLE ENVIRONMENTAL CHANGES

The irreversible commitment of land within the Baylands for development of additional housing and commercial space along with recreational facilities within the City of Brisbane would result in the following irreversible environmental changes:

- Changes to existing views and the visual character of the site, as discussed in Section 4.5, *Aesthetic and Visual Resources*, including a significant loss of scenic vistas that would be reduced to less than significant with mitigation incorporated.
- The increased resident and employee population that would result from Baylands development analyzed in Section 4.4, *Population and Housing*. The Specific Plan would permit development of 2,200 dwelling units and up to 6.5 million square feet of commercial space with an additional 500,000 square of hotel space, resulting in a resident population of 4,905 and an employee population of 19,480. These increases in resident and employee population are precursors to the increased air pollutant and greenhouse gas emissions documented in Section 4.9, *Air Quality*, and Section 4.10, *Greenhouse Gas Emissions*, respectively.
- Increased noise resulting from implementation of the Specific Plan as documented in Section 4.12, *Noise and Vibration*.
- Increased demands for:
    - Public utilities (e.g., water and sewer systems, as well as water supply) as discussed in Section 4.16, *Utilities, Service Systems, and Water Supply*.
    - Public services (e.g., police, fire, schools, libraries) as discussed in Section 4.16, *Public Services and Facilities*.
- These increased demands contribute to and are indistinguishable from the increased air pollutant and greenhouse gas emissions documented in Section 4.9, *Air Quality*, and Section 4.10, *Greenhouse Gas Emissions*, respectively.

While Baylands development would increase resource consumption during construction and operation, it would also result in some benefits related to long-term resource consumption in the region. As discussed in Section 4.3, *Land Use and Planning Policies*, the Baylands site is within a Priority Development Area identified in Plan Bay Area 2050, the Regional Transportation Plan/Sustainable Communities Strategy for the nine-county Bay Area region, and Baylands development would be consistent with that plan. The Baylands Specific Plan would provide the City of Brisbane with adequate sites for housing development to meet the City's share of regional housing needs, including housing very low and low-income households in proximity to transit and employment.

Intentionally Blank

CHAPTER 6 GROWTH-INDUCING EFFECTS

6.1 INTRODUCTION

This chapter analyzes the growth-inducing potential of the 2025 Specific Plan project and the associated secondary effects of growth that the Specific Plan might facilitate. As required by the California Environmental Quality Act (CEQA), an Environmental Impact Report (EIR) must discuss the growth-inducing impacts of the proposed project. (Public Resources Code Section 21100(b)(5)). Specifically, CEQA Guidelines Section 15126.2(e) states an EIR must:

> *Discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth (a major expansion of a recycled water plant might, for example, allow for more construction in service areas). Increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. Also discuss the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.*

Pursuant to CEQA Guidelines Section 15126.2(e), the analyses and conclusions set forth in this chapter do not address or imply whether any growth that may be induced by the Baylands Specific Plan would be planned or unplanned or would be beneficial or detrimental.

CEQA Guidelines Section 15126.2(e) requires an EIR to "discuss the ways" in which a project could foster growth, and to discuss project characteristics that may "encourage … activities that could significantly affect the environment," Given the large number of variables involved (e.g., income ranges of Baylands employment; types, cost, and location of available housing at the time on-site jobs are created; individual preferences of Baylands employees), determining where, when, or in what form induced growth might occur can be difficult to predict.

6.2 POTENTIAL FOR GROWTH INDUCEMENT

This analysis examines the potential for implementation of the 2025 Specific Plan project to:

- Directly generate substantial new population or employment growth as the result of permitting new housing and/or employment-generating uses.
- Stimulate economic activity within the area such that additional housing, businesses, or services would be needed to support the new economic activity;

- Remove a physical obstacle to additional growth and development beyond the Specific Plan area, such as by removing a constraint to or increasing the capacity of infrastructure or public services. For example, an increase in the capacity of a utility or roadway could allow either new or additional development in the surrounding area; or
- Remove a regulatory obstacle, such as by increasing allowable development intensity and thereby establishing a precedent for additional increases in allowable development intensity outside of the project site.

6.2.1 DIRECT GENERATION OF POPULATION AND EMPLOYMENT GROWTH

Direct growth inducement results when a project, for example, involves construction of new housing or employment-generating development, or other uses that would result in additional residents and jobs. Section 4.4, *Population and Housing*, presents a detailed analysis of the potential for the Baylands development to induce substantial increases in population not previously contemplated by regional growth projections. Association of Bay Area Governments (ABAG) growth forecasts for Brisbane, as well as growth forecasts for the San Francisco/San Mateo Bi-County and Bayview/Hunters Point/Candlestick Point Priority Development Areas (PDAs) provide the context for evaluating the projected population, housing, and employment impacts of Baylands development. As noted in Section 4.4, *Population and Housing*, the projections used in analyzing the extent to which Baylands development would induce population growth are based on growth forecasts prepared for the Bay Area Sustainable Communities Strategy, Plan Bay Area 2050. This same regional approach is used to assess the potential for Baylands development to induce substantial, unanticipated growth.

The Baylands Specific Plan would permit a substantial number of new housing units and jobs (through the provision of new employment-generating land uses), including 2,200 dwelling units, 6.5 million square feet of office and commercial development, and 500,000 square feet of hotel use, which is consistent with long-term socioeconomic projections. Thus, the Baylands Specific Plan would directly induce substantial household and employment growth.

6.2.2 STIMULATION OF ECONOMIC ACTIVITY THAT CREATES A NEED FOR ADDITIONAL HOUSING, BUSINESSES, OR SERVICES

Induced growth can occur outside of a project site as the result of direct and indirect investment and spending by residents, employees, and businesses. Such growth stems from the "induced" employment and retail demand generated by a project's economic activity. Indirect employment growth generated by a direct increase in economic activity can be due to the increases in spending that would occur on the part of the businesses, employees, and employee households. It could also be due to the additional spending that would occur on the part of suppliers of goods and services demanded by a project's direct economic activity (households, businesses, and employees).

The Baylands Specific Plan would encourage and facilitate economic growth. During construction, a number of temporary design and engineering jobs, as well as temporary employment for a wide variety of construction specialties, would be generated. These jobs would be available to varying degrees from the time site-specific engineering and architectural design begins through construction to buildout of the Specific Plan. This would be a direct but temporary growth-inducing effect of the Specific Plan. As discussed in Section 4.4, *Population and Housing*, due to the availability of construction workers and the phasing of Baylands development, it is unlikely that construction workers would relocate their households because of the construction job opportunities presented by Baylands development. Because of the large number of engineering and architectural design firms located within the nine-county San Francisco Bay Area and the ability of design firms to provide their services far from their physical locations, it is also unlikely that design professionals would relocate their households because of the job opportunities presented by Baylands development.

The estimated 19,480 jobs that would be created within the Baylands as the result of Specific Plan buildout would be associated with approximately 14,537 worker households, based on the projected average number of workers per household (1.34) for the nine-county San Francisco Bay Area in 2050 (MTC/ABAG 2021).

As indicated in the 2020 Census, 59.8 percent of Brisbane residents were employed within San Mateo County. Although the 2020 Census (U.S. Census 2021) does not report the number of Brisbane residents employed within Brisbane, past demographic reports indicate that about 15 percent of employed Brisbane residents held jobs in the City, while Brisbane residents working in the City held about 5 percent of the jobs in Brisbane and residents of other San Mateo County cities and San Francisco held most of Brisbane's jobs (ESA 2018). Thus, it is reasonable to project that the work force for increased Baylands employment would primarily be drawn from residents of San Francisco and San Mateo counties. In addition, it is reasonable to assume the work force would be primarily drawn from these counties given that the population and employment growth that would be generated by Baylands development would be consistent with Plan Bay Area 2050 (see **Table 4.3-1** and **Table 4.3-2**).

The degree to which Baylands housing would meet the needs of Baylands employees depends on a variety of factors including types of employment, price of housing, and where specifically new employees at Baylands would be drawn from, for which little information is available at this point in the planning process. However, as discussed in the analysis of Threshold POP-3, compliance with Brisbane inclusionary housing requirements provide an array of dwelling units in the Baylands that would be affordable to households of different income levels, thereby increasing the opportunity for on-site workers to also live on-site.

Specific Plan residential and office development would result in a demand for new retail and service commercial uses. According to the urban study prepared for the Baylands, the Baylands' residents and employees would generate retail sales capable of supporting 801,175 square feet

of retail floor space as indicated in **Table 6-1** (ALH Urban and Regional Economics 2023). Much of this demand would consist of community- and regional-oriented retail outlets.

Table 6-1: Baylands Specific Plan Supportable Retail Square Footage by Type

Retail Category	Baylands			
	Households	Employees	Hotel Guests	Total Demand
Home Furnishings and Appliance Stores	14,490			14,490
Building Materials and Garden Equipment	25,959			25,959
Food and Beverage Stores	34,085	56,291		90,354
Clothing and Accessories	18,078			18,078
General Merchandise	47,491			47,491
Food Services and Drinking Places	27,756	78,016	39,041	144,787
Other Retail	47,257	374,798		422,055
Services	37,962			37,962
TOTAL	**253,078**	**509,083**	**39,014**	**801,175**

SOURCE: ALH Urban and Regional Economics, *The Baylands Urban Decay Analysis*, July 2023.

As indicated in the Baylands Urban Decay Study, there are currently 22 development projects providing retail space under construction (147,050 s.f.), approved (793,000 s.f.), or undergoing review (3,700 s.f.) in the Baylands retail market area, which consists of the City of Brisbane, the southern portion of San Francisco near the Brisbane city limits, the eastern portion of Daly City, and the northern portion of South San Francisco. Thus, retail demand generated by Baylands development would be met by the large amount of commercial development that is under construction, approved, proposed, or planned within the Baylands retail market area in Brisbane, the southern portion of San Francisco, the eastern portion of Daly City, and the northern portion of South San Francisco. Thus, Baylands development would not induce retail growth beyond that already under construction, approved, proposed, or planned.

6.2.3 REMOVE PHYSICAL OBSTACLES TO GROWTH

The elimination of a physical obstacle to growth such as a lack of access, water supply, or public service infrastructure would be considered to be a growth-inducing impact.

a. Water Supply

The acquisition of a water supply from the California Water Service Company (Cal Water) by establishing Cal Water as the water service agency for the Baylands, Sierra Point, and Beatty subareas for the 2025 Specific Plan project would replace use of the City's water supply for these areas and become available for use elsewhere within Brisbane. **Table 6-2** identifies the water demands currently being met by City water supply within the proposed Cal Water service area expansion. Once Cal Water assumes service for these areas, the City of Brisbane

would no longer be responsible for meeting annual water demands of approximately 35.9 million gallons per year.

Table 6-2: Water Use Currently Supplied by the City of Brisbane to the Area Proposed to Be Served by Cal Water (million gallons per year)

Location	2019	2020	2021	2022	2023	Average
Baylands	0.58	0.54	0.59	0.49	0.50	0.54
Sierra Point	32.85	37.04	33.31	34.51	40.20	35.58
TOTAL WATER DEMAND	**33.43**	**37.58**	**33.90**	**35.00**	**40.70**	**36.12**

SOURCE: Brisbane Public Works, 2025

Table 6-3, **Table 6-4**, and **Table 6-5** identify how the proposed expansion of Cal Water's service area would affect the City's ability to provide water to its customers in normal dry and multiple dry years, respectively.

Table 6-3: Projected Normal Year Water Supply and Demand with and without the Proposed Cal Water Service Area Expansion (million gallons per year)

City of Brisbane Projected Water Supply and Demand							
Year	City of Brisbane Water Supply[a]	Without Proposed Cal Water Service Area Expansion (Existing City Service Area)		With Proposed Cal Water Service Area Expansion (see Figure 3-45)			
		Demand with Future Proposed Projects[b]	Supply Shortfall with Future Proposed Projects	City Water Demand to Be Assumed by California Water Company		Net City Water Demand and Shortfall	
				Existing Water Demand[c]	Future Proposed Projects Water Demand[d]	Water Demand[e]	Supply Shortfall
2025	358	293	None	36	—	—	None
2030	358	408	50	36	100	272	None
2035	358	564	206	36	250	278	None
2040	358	819	461	36	500	283	None
2045	358	850	492	36	525	289	None

NOTES:

a. City water supply taken from Water Supply Assessment for the Guadalupe Quarry Redevelopment Project (Guadalupe Quarry WSA).
b. Project water demand based on Guadalupe Quarry Redevelopment WSA projections of water demand for the Quarry Project. Projections for Sierra Point Towers, Sierra Point Hotel and Life Sciences, and High-Speed Rail Light Maintenance Facility based on Guadalupe Quarry Water Supply Assessment estimate of total water demand and projected buildout of these projects. Baylands buildout based on Baylands Water Supply Assessment.
c. Based on Table 6-2.
d. Projections for Sierra Point Towers, Sierra Point Hotel and Life Sciences, and High-Speed Rail Light Maintenance Facility based on Guadalupe Quarry Water Supply Assessment estimate of total water demand and projected buildout of these projects. Baylands water demand based on Baylands Water Supply Assessment.
e. Water demand for City water service area after Cal Water assumes responsibility for providing water to the Baylands and Sierra Point areas was determined based on the following formula: City of Brisbane Water Supply – (Existing + Future Projects Water Demand).

As indicated in **Table 6-3**, the proposed Cal Water service area expansion would eliminate projected water supply shortfalls for the City of Brisbane. In a single dry year, **Table 6-4** indicates that the proposed service area expansion would eliminate a supply shortfall in 2025, and the City would experience water supply shortfalls starting in 2030 that would be far less severe than without the expansion. As shown in **Table 6-5**, the proposed Cal Water service area expansion would substantially reduce but not eliminate projected water supply shortfalls for the City of Brisbane in multiple dry years. Because the proposed Cal Water service area expansion would provide adequate water supply for the Baylands Specific Plan and future development projects within the Baylands and Sierra Point areas, the 2025 Specific Plan project would remove a critical obstacle to Specific Plan development and development of future projects within the Baylands and Sierra Point areas and would thus be considered to be growth inducing.

Table 6-4: Projected Single Dry Year Water Supply and Demand with and without the Proposed Cal Water Service Area Expansion

are based on the Guadalupe Quarry Redevelopment Water Supply Assessment estimate of total water demand. The projected buildout of these projects are based on projected Baylands Water Supply Assessment.

c. Based on Table 6-2.

d. Projections for Sierra Point Towers, Sierra Point Hotel and Life Sciences, and High-Speed Rail Light Maintenance Facility based on Guadalupe Quarry Redevelopment Water Supply Assessment estimate of total water demand and projected buildout of these projects. Baylands water demand based on Baylands Water Supply Assessment.

e. Water demand for City water service area after Cal Water assumes responsibility for providing water to the Baylands and Sierra Point areas based on the following formula: City of Brisbane Water Supply – (Existing + Future Projects Water Demand).

b. Provision of Infrastructure

Nearly all water, wastewater, water recycling, storm drain, energy facilities, communications, and other utilities improvements that would be constructed to support Baylands development would be designed and sized for use solely by Baylands development. While the need for additional water storage has been generated by the Specific Plan, the proposed water storage tank would be designed and operated as part of California Water Company's water system and would store water for the South San Francisco District rather than Baylands-only use.

However, because the additional water storage capacity to be provided within the Baylands would not increase water supply for future development, the on-site water storage tank would not be growth inducing. The 250 MW utility-scale battery storage facility proposed for the Baylands would operate as a regional PG&E facility while also functioning to balance Baylands renewable energy generation and its energy consumption. Because availability of energy supplies is not a constraining factor in local or regional population or employment growth[379], development of the utility-scale battery storage facility would not remove a constraint to development and would therefore not be growth inducing.

In addition, while the parks, trails, and habitat enhancements included as part of Baylands development would be available to the general public, these improvements would not remove constraints to development of any property other than the Baylands itself.

Except for major roadway improvements designed to serve regional development in the Bi-County San Francisco/Daly City/Brisbane area (Geneva Avenue extension and access

[379] PG&E, *2018 Integrated Resource Plan*. August 1, 2018. https://www.pge.com/assets/pge/docs/about/doing-business-with-pge/2018-PGE-Integrated-Resource-Plan.pdf.

improvements for the Candlestick Point interchange), infrastructure improvements associated with Baylands development are designed to only serve Baylands development and would not result in a growth-inducing impact. However, by improving access to US Highway 101, the major roadway improvements designed to serve regional development in the Bi-County San Francisco/Daly City/Brisbane area would remove a major obstacle to development and would facilitate growth in Daly City, as well as development of the San Francisco/San Mateo Bi-County and Bayview/Hunters Point/Candlestick Point PDAs described in Plan Bay Area 2050, including cumulative projects addressed in Chapter 7, *Cumulative Environmental Effects*. While these major roadway improvements are not part of the Baylands Specific Plan components described in EIR Chapter 3, *Project Description*, they are nonetheless required to support Baylands development. Because major roadway improvements would remove obstacles to development of the Specific Plan area and surrounding lands, they would result in a growth-inducing impact.

6.2.4 REMOVE A REGULATORY OBSTACLE TO GROWTH

The Baylands Specific Plan and associated actions described in Draft EIR Chapter 3 do not remove any regulatory obstacles for development outside of the Specific Plan area.

6.3 ENVIRONMENTAL IMPACTS OF INDUCED GROWTH

The Baylands Specific Plan would directly foster population and employment growth within the Baylands as the result of constructing 2,200 dwelling units, 6.5 million square feet of commercial and office development, and an additional 500,000 square feet of hotel use. The direct and indirect physical environmental effects that would result from this development are analyzed throughout Chapter 4, *Environmental Setting, Impacts, and Mitigation Measures*.

In addition to development within the Baylands, the Specific Plan will generate the potential for inducing growth outside of the Baylands as the result of:

- Providing an adequate water supply for Baylands development as well as future development project within the Baylands and Sierra Point areas.
- Fostering population growth and construction of housing;
- Eliminating obstacles to population growth;
- Fostering economic growth; and
- Affecting service levels, facility capacity, or infrastructure demand leading to construction of new and expanded facilities.

The physical environmental effects of Baylands-induced growth are addressed in Draft EIR Chapter 7, *Cumulative Environmental Effects*.

CHAPTER 7 CUMULATIVE ENVIRONMENTAL EFFECTS

As required by California Environmental Quality Act (CEQA) Guidelines Section 15130, this chapter analyzes the ways in which impacts of the 2025 Specific Plan project would combine with the impacts of other past, present, and reasonably foreseeable probable future projects to create "cumulatively significant" effects (i.e., result in significant cumulative impacts). For each identified significant cumulative impact, this chapter also determines whether the Specific Plan's incremental contribution to the significant cumulative impact is "cumulatively considerable."

Understanding the nature and extent of cumulative impacts and the Specific Plan's contribution to them is critical to understanding the full extent of the Specific Plan's environmental effects. Even in cases where the individual impacts of Baylands development are less than significant, environmental impacts can occur incrementally from a variety of small sources, including the Baylands. These sources may individually appear insignificant but assume "threatening dimensions only when considered in light of the other sources with which they interact."[380] As such, cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time (CEQA Guidelines Section 15355).[381]

CEQA Guidelines Section 15130 Discussion of Cumulative Impacts

CEQA Guidelines Section 15355 defines a cumulative impact as an impact that is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts within a given geographic area.

CEQA Guidelines Section 15130 requires an EIR to discuss cumulative impacts of a project when the project contributes to some degree to an impact that, when viewed in combination with the effects of past, present, and reasonably foreseeable probable future projects would be "cumulatively significant," regardless of whether the project itself was determined to have a significant or less than significant impact.

Because cumulative impact analysis addresses the ways in which impacts of individual impacts combine, a series of less than significant project impacts can combine to generate a significant cumulative impact. In addition, a project's contribution to a significant cumulative impact may be cumulatively considerable, even if the project's individual impact was determined to be less than significant.

Only those cumulative impacts to which the project contributes are addressed in an environmental impact report.

7.1 DEFINITIONS

Cumulative Impact: A cumulative impact is the change in the physical environment that results from the incremental effects of a project when evaluated together with the impacts of other past,

[380] *Los Angeles Unified School Dist. v. City of Los Angeles* (1997) 58 Cal. App. 4th 1019, 1025; *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal. App. 3d 693, 720; Selmi, *Judicial Development of CEQA* (1984) 18 U.C. Davis L. Rev. 197, 244.

[381] *Los Angeles* Unified *School Dist.* v. *City of Los Angeles* (1997) 58 Cal. App. 4th 1019, 1025; *Kings County Farm Bureau* v. *City of Hanford* (1990) 221 Cal. App. 3d 693, 720; Selmi, *Judicial Development of CEQA* (1984) 18 U.C. Davis L. Rev. 197, 244.

present, and reasonably foreseeable probable future projects causing related impacts. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time. CEQA Guidelines state that if a project does not make some contribution to a cumulative environmental effect, the cumulative effect cannot be characterized as a cumulative impact of that project (CEQA Guidelines Section 15130; see *Sierra Club v. West Side Irrig. Dist.* [2005] 128 Cal.App.4th 690, 700).

Cumulatively Considerable Contribution: The incremental effects of an individual project would be cumulatively considerable if they would contribute substantially to an identified significant cumulative impact. However, the "mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable" (CEQA Guidelines Section 15064(h)(4)).

Less than Cumulatively Considerable Contribution: The project's incremental contribution to a significant cumulative impact would not contribute substantially to an identified significant cumulative impact and thus is not significant. The project's contribution to a significant cumulative impact could also be rendered less than cumulatively considerable if the project would implement or fund its fair share of a mitigation measure or measures that would alleviate a significant cumulative impact.

7.2 APPROACH TO CUMULATIVE IMPACT ANALYSIS

In accordance with CEQA Guidelines Section 15130(b), the discussion of cumulative impacts provided in this chapter is intended to "reflect the severity of the impacts and their likelihood of occurrence." CEQA Guidelines Section 15130(b) states that the discussion of cumulative impacts "need not provide as great [of a level of] detail as is provided for the effects attributable to the project alone." CEQA Guidelines state that the cumulative impact discussion should be guided by practicality and reasonableness and focus on the cumulative impacts that would result from the combination of the proposed project and other projects, rather than the attributes of the project or other projects that do not contribute to cumulative impacts.

Pursuant to CEQA Guidelines Section 15130(a)(1), this EIR discusses only those cumulative impacts to which the 2025 Specific Plan project would contribute. Thus, cumulative impact analysis is not provided for any environmental resource area for which the Baylands Specific Plan would have no environmental impact. Analysis of cumulative impacts is, however, provided for all Baylands impacts determined to be less than significant, less than significant with mitigation incorporated, and significant and unavoidable.

The developed portions of ongoing phased projects as they existed in the Spring 2023 baseline are addressed as part of the environmental setting/baseline for cumulative effects. The portions of ongoing, phased development projects that were yet to be built as of the Spring 2023 baseline

are considered in relation to existing and reasonably foreseeable probable future projects and are included as part of the analysis of cumulative impacts.

When the combined cumulative impact associated with the Specific Plan's incremental effect and the effects of other projects is not significant, the EIR indicates why the cumulative impact is not significant, consistent with CEQA Guidelines Section 15130(a). If the combined effects of the 2025 Specific Plan project and those of other past, present, and reasonably foreseeable probable future projects would be significant, the Specific Plan's contribution to the significant cumulative impact is analyzed as required by CEQA to determine whether the Baylands *contribution* to the significant cumulative impact would be "cumulatively considerable."

Because the Baylands Specific Plan would not contribute to cumulative impacts related to certain issues,[382] cumulative impacts associated with those issues are not addressed per the requirements of CEQA Guidelines Section 15130(a)(1). The following cumulative impacts are therefore addressed in this chapter:

- Land Use and Planning Policy
- Population and Housing
- Aesthetic and Visual Resources
- Biological Resources
- Cultural and Tribal Cultural Resources
- Transportation
- Air Quality
- Greenhouse Gas Emissions
- Energy Resources
- Noise and Vibration
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Geology, Soils, and Seismicity
- Utilities, Service Systems, and Water Supply
- Public Services and Facilities
- Recreational Resources
- Wildland Fire

7.2.1 GEOGRAPHIC SCOPE OF CUMULATIVE IMPACT ANALYSES

Section 7.3, below, examines the cumulative environmental effects of Baylands development as described in EIR Chapter 3, *Project Description*, in combination with past, present, and reasonably foreseeable probable future projects that could combine with the Specific Plan's impacts to generate cumulative impacts.

CEQA requires an EIR to "define the geographic scope of the area affected by the cumulative effect and provide a reasonable explanation for the geographic area" (CEQA Guidelines

[382] Cumulative environmental effects to which the Baylands Specific Plan would not contribute include Agricultural and Forestry Resources; Mineral Resources; and Geology, Soils, and Seismicity: Use of Septic Tanks or other Alternative Waste Disposal Systems.

Section 15130(b)(3)). The geographic scope is determined based on the resource under review such that analysis of each cumulative impact is undertaken within a specific geographic area within which the impacts of individual projects, taken together, could generate a cumulative impact. For example, because most air quality impacts of individual projects combine to create impacts within a specific air basin, cumulative air quality impacts are analyzed regionally for the Bay Area Air Basin. In contrast, most Baylands Specific Plan aesthetic resource impacts would combine with those of other closely related projects to create cumulative impacts only within the specific viewshed of the Specific Plan area. Such impacts are, therefore, analyzed within a specific viewshed area.

Because the manner in which impacts of Baylands development would combine with the impacts of past, present, and reasonably foreseeable probable future projects differs for each impact being analyzed, the geographic scope of individual cumulative impact analyses varies based on the impact analyzed and the area over which Baylands impacts might combine with those of other past, present, and reasonably foreseeable probable future projects. Section 7.3 identifies the geographic scope used for each cumulative impact analysis to address the cumulative impacts of Baylands development in combination with buildout of the Brisbane General Plan and other past, present, and reasonably foreseeable probable future projects.

7.2.2 PROJECTIONS- AND LIST-BASED APPROACHES TO CUMULATIVE IMPACT ANALYSIS

CEQA Guidelines Section 15130(b)(1) describes two approaches to analyzing the cumulative impacts of a project, either or both of which may be used in an EIR:

- The first approach relies upon a summary of projections contained in an adopted local, regional, or state-wide plan, or related planning or environmental documents that describes or evaluates conditions contributing to the cumulative effect. In some cases, such as transportation analysis, models generated by agencies during preparation of adopted plans are used in the EIR's cumulative impact analysis.
- The second is a "list approach," which requires a listing of past, present, and reasonably foreseeable probable future projects producing related or cumulative impacts, including, if necessary, projects outside the control of the lead agency.

The cumulative impact analyses in this EIR use both projections- and list-based approaches, as well as a combination of these two approaches, depending upon the resource area analyzed. Where projections are available from an adopted local, regional, or state-wide plan, the projections approach is typically used. Where such projections are not available or the geographic analysis area does not lend itself to a projections approach, a list-based approach is typically used.

For each cumulative impact evaluated in this chapter, the specific geographic area of analysis and the method of analysis, whether projections-based, list-based, or a combination of the two, are described in the relevant resource sections below.

a. Use of the Nine-County San Francisco Bay Area Region for Projections-Based Cumulative Impact Analysis

The nine-county San Francisco Bay Area region is an appropriate geographic area for analysis of many different cumulative impacts because the entire Bay Area falls within the jurisdiction of a single Metropolitan Planning Organization (the Metropolitan Transportation Commission [MTC] and a single Council of Governments (Association of Bay Area Governments [ABAG]), which together are responsible for regional land use and transportation planning. The nine-county Bay Area region is also the geographic boundary for *Plan Bay Area 2050*, which serves as the sustainable communities strategy and basis for transportation planning for the nine-county Bay Area region. In addition, the nine-county Bay Area region is close in size and shape to the San Francisco Bay Area Air Basin and the watershed that drains into San Francisco Bay. While the Bay Area is not a fully self-contained community, more than 95 percent of Bay Area employees who commute to work do so from within one of the nine Bay Area counties (MTC 2024).

b. Regional and Citywide Growth Projections

Projections-based analyses rely on projections and impact analyses contained in adopted local, regional, or state-wide plans, or related planning documents, including:

- The regional growth forecast approved by the Metropolitan Transportation Commission (MTC) and the Association of Bay Area Governments (ABAG) in September 2021;
- *Plan Bay Area 2050*, which serves as the Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) for the nine-county San Francisco Bay Area region, including the Plan Bay Area 2050 EIR;
- *Spare the Air · Cool the Climate*, which is the San Francisco Air Basin's Clean Air Plan, prepared and adopted by the Bay Area Air Quality Management District;
- Socioeconomic projections prepared by the City/County Association of Governments of San Mateo County (C/CAG);
- The projected buildout of the Brisbane, San Francisco, Daly City, and South San Francisco General Plans;
- The San Francisco Urban Water Management Plan; and
- The South San Francisco District Urban Water Management Plan (California Water Company).

Projections used for projections-based cumulative analyses are identified in **Table 7-1**.

Table 7-1: Household and Employment Projections used in Cumulative Impact Analyses

	Households			Employment		
	2015	2050	Change: 2015–2050	2015	2050	Change: 2015–2050
Brisbane [a]	1,910	2,713	803	10,465	14,865	+4,400
San Mateo County	265,000	394,000	+129,000	393,000	507,000	+114,000
Bay Area Region	2,667,000	4,043,000	+1,367,000	4,005,000	5,408,000	+1,403,000

SOURCE: City of Brisbane, 2022; Metropolitan Transportation Commission/Association of Bay Area Governments, 2021.

NOTE:

a. Does not include development of the Baylands or other cumulative projects within Brisbane (**Table 7-2** Cumulative Projects 2–4: Sierra Point Towers, Guadalupe Quarry Project, Sierra Point Hotel and Life Sciences Project).

In cases where one or more of the cumulative projects identified below in **Table 7-2**, *Cumulative Projects List*, are not included in the projections identified in **Table 7-1**, they are added to such projections when analyzing cumulative impacts.

c. Cumulative Projects List

In this Draft EIR, list-based cumulative impact analyses rely on a list of past, present, and reasonably foreseeable probable future projects provided by the cities of San Francisco, Daly City, and South San Francisco in addition to projects within Brisbane. Large-scale regional projects, such as the Caltrain Modernization Program, High-Speed Rail Program San Jose to San Francisco Segment, improvement programs at San Francisco International Airport, and habitat restoration projects along the San Francisco Bay shoreline, are included in the cumulative projects list.

A total of 73 projects (16 infrastructure projects, 2 planning projects, and 55 development projects) were identified whose physical environmental effects might combine with those of the Baylands Specific Plan to create one or more cumulative impacts. These cumulative projects are identified in **Table 7-2** with locations illustrated in **Figure 7-1**. Specific Plan development represents 10.7 percent of the 20,629 cumulative units and 22.6 percent of the cumulative 28,722,643 square feet (s.f.) of commercial/office space.

Figure 7-1: Cumulative Projects Locations

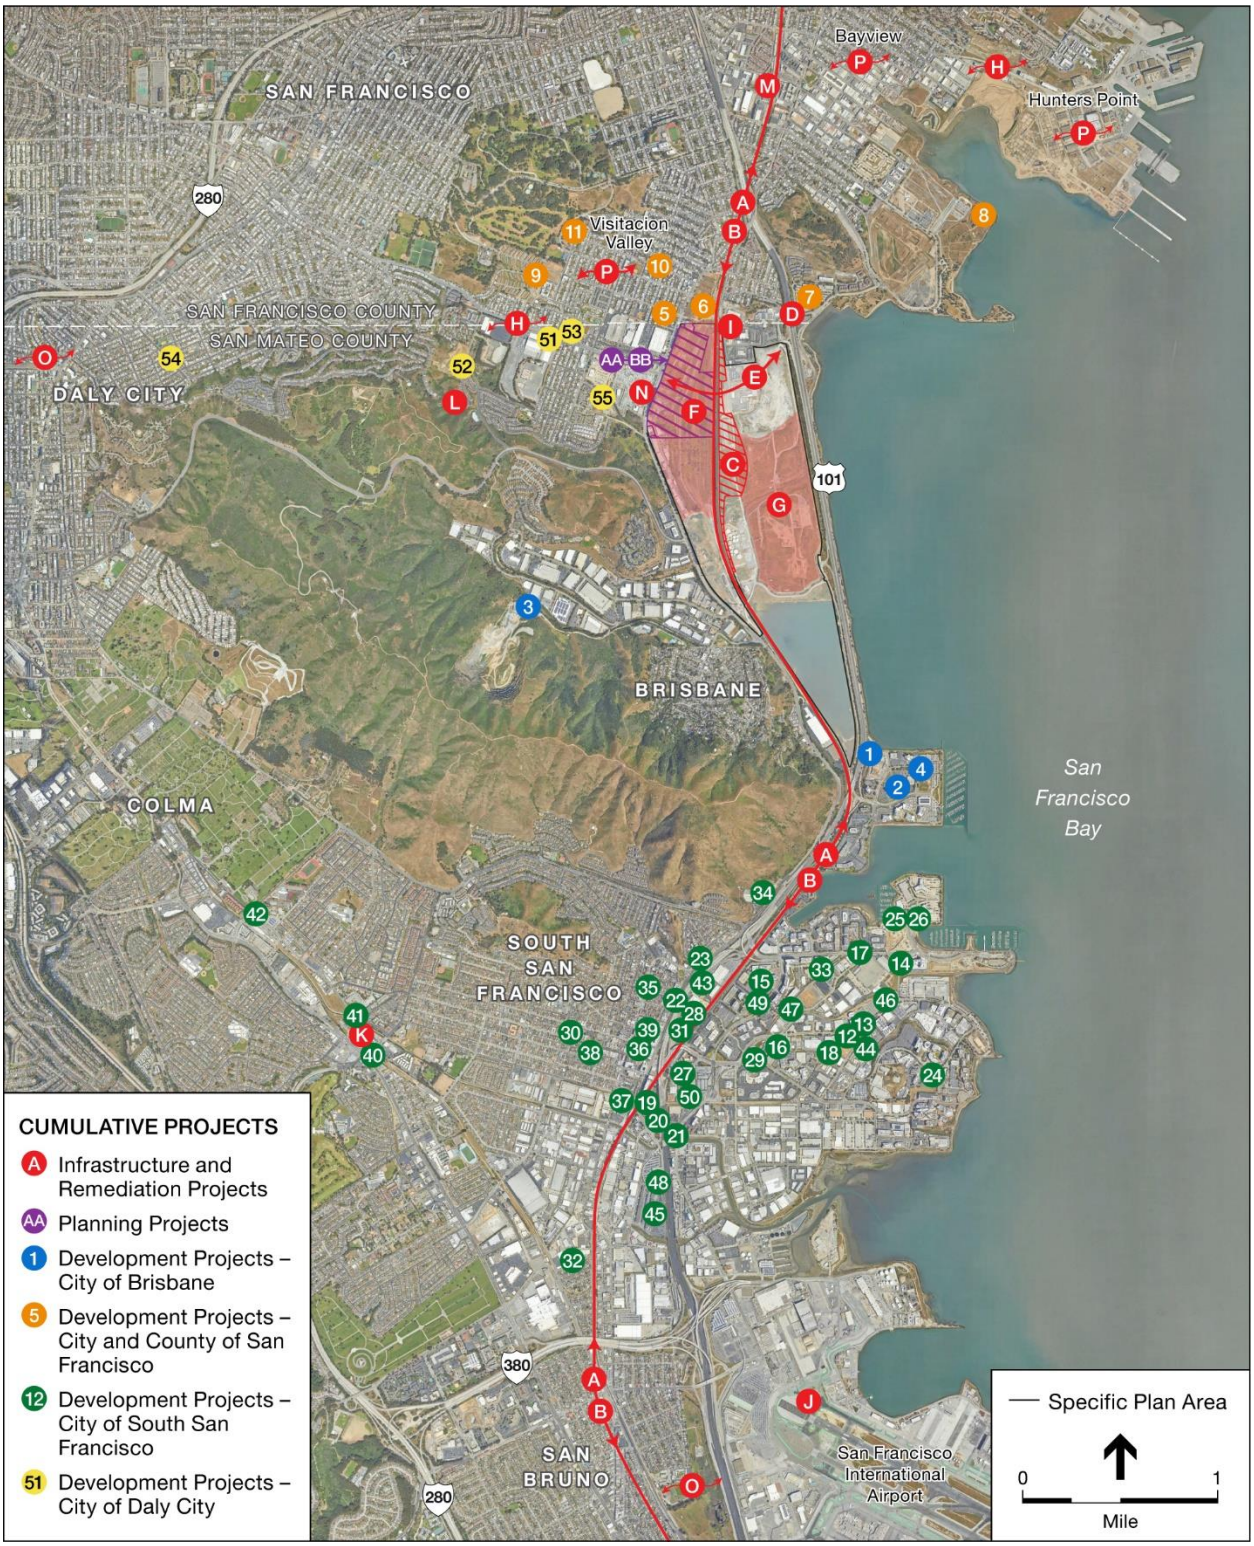

Table 7-2: Cumulative Projects List

No.	Project Name	Jurisdiction	Location in Relation to Baylands	Residential Units	Commercial/ Office Square Footage	Other	Description
Infrastructure, Remediation, and Water Supply Projects							
A	Caltrain Modernization Program	Peninsula Joint Powers Authority	Caltrain rail corridor from San Francisco through the Baylands to San Jose	NA	NA	NA	Electrification of the existing Caltrain corridor between San Francisco and San Jose; installation of a Communications Based Overlay Signal System Positive Train Control, which is an advanced signal system that includes federally mandated safety improvements; and the replacement of Caltrain's diesel trains with high-performance electric trains called Electric Multiple Units.
B	California High Speed Rail, San Francisco to San Jose Segment	California High Speed Rail Authority	Caltrain rail corridor from San Francisco through the Baylands to San Jose	NA	NA	NA	Planned 50-mile segment from San Francisco to San Jose passing through the Baylands would require four tracks in the Caltrain corridor and provide track improvements and grade separations that would allow for 22 trains to operate daily at speeds up to 110 mph. High speed rail stops, including station improvements are proposed in San Francisco, Millbrae, and San Jose. The existing Caltrain Bayshore Station will not be a stop for high-speed rail service along the corridor.
C	California High Speed Rail Brisbane Light Maintenance Facility	California High Speed Rail Authority	Area east of the Caltrain line within Baylands	NA	NA	NA	Approximately 45 acres of the Baylands east of the Caltrain right-of-way would be developed by the High-Speed Rail Authority as a light maintenance and storage facility.

No.	Project Name	Jurisdiction	Location in Relation to Baylands	Residential Units	Commercial/ Office Square Footage	Other	Description
D	US 101/Candlestick Interchange Reconstruction	Caltrans, San Francisco Transportation Agency, San Mateo Transportation Agency, City and County of San Francisco, City of Brisbane	Immediately northeast of the Specific Plan area	NA	NA	NA	Reconstruction of the US 101/Candlestick Interchange to a full all-directional interchange with a single-point cross-street connection, join an improved Harney Way to the east, and join the Geneva Avenue Extension to the west. The project includes two general purpose lanes and one transit-only lane in each direction between the Geneva Avenue Extension and Alana Way, and three general purpose travel lanes in each direction between Alana Way and Harney Way. Alana Way would become transit-only between Harney and Geneva.
E	Geneva Avenue Extension	San Francisco Transportation Agency, San Mateo Transportation Agency, City and County of San Francisco, City of Brisbane	Project is within the Baylands	NA	NA	NA	Extension of the existing Geneva Avenue east from its current terminus at Bayshore Boulevard, including a bridge over the Caltrain rail right-of-way. Geneva Avenue is planned as a 6-lane facility with two lanes for vehicles and one lane for bus rapid transit in each direction, sidewalks, and Class II bicycle facilities.
F	Site Remediation for Baylands Operable Units OU-SM, OU-2	California DTSC, San Francisco Bay RWQCB	Projects are within the Baylands	NA	NA	NA	Remediation of existing soil and groundwater contamination within the former Southern Pacific Railyard in the western portion of the Baylands.
G	Title 27 Landfill Closure	San Francisco Bay RWQCB, San Mateo County Environmental Health	Project is within the Baylands				Final landfill closure pursuant to the requirements of Title 27 within the former Brisbane Landfill in the eastern portion of the Baylands.
H	Geneva-Harney Bus Rapid Transit	San Francisco, Brisbane	Would traverse Geneva Avenue through the Baylands	NA	NA	NA	Provision of exclusive bus lanes, transit signal priority, and stations along Geneva Avenue (from Santos Street to Executive Park Boulevard), Harney Way, and Crisp Avenue, and terminating at the Hunters Point Shipyard Center.

No.	Project Name	Jurisdiction	Location in Relation to Baylands	Residential Units	Commercial/ Office Square Footage	Other	Description
I	Recology 501 Tunnel Avenue Facility Modernization Project	San Francisco, Brisbane	Immediately adjacent to the northern boundary of the Specific Plan area	NA	NA	NA	Physical and operational modifications to Recology's 501 facility to consolidate operations, increase efficiency, and support the San Francisco's Zero Waste program. The project would demolish or repurpose some existing structures, construct new buildings and parking areas, and reconfigure the campus layout. Recology's regional office, fleet maintenance, and fleet storage operations, currently at 250 Executive Park Boulevard and 900 7th Street, would be relocated to the 501 Tunnel site, which is within both San Francisco and Brisbane.
J	SFO Tomorrow Airport Development Plan	Unincorporated San Mateo County	5.5 miles to the south	NA	NA	NA	Taxiway and runway improvements; expansion and renovation of Terminal 3; internal improvements to other terminals; upgraded baggage handling system; roadway and parking improvements; new rental car center; air train expansion; and infrastructure improvements including new fuel tanks, substation improvements, and sea level rise protection.
K	Community Civic Campus	South San Francisco	3.1 miles to the southwest	NA	NA	NA	Design and construction of a new police station, a new fire station, and a shared library and parks and recreation facility.
L	San Bruno Mountain State and County Park Fuel Reduction Project	San Mateo County	2.0 miles to the west	NA	NA	NA	Ongoing fuel reduction/habitat improvement.

No.	Project Name	Jurisdiction	Location in Relation to Baylands	Residential Units	Commercial/ Office Square Footage	Other	Description
M	Egbert Switching Station (Martin Substation Extension)	San Francisco, Daly City, Brisbane	1.4 miles to the north (Egbert Switching Station) 0.3 miles to the west (Martin Substation	NA	NA	NA	Construction of a new 230 kV switching station (Egbert Switching Station). The project would reroute two existing underground 230 kV transmission lines currently connected to the existing Martin Substation and connect them to the proposed Egbert Switching Station. The existing Martin-Embarcadero line would be looped into the proposed Egbert Switching Station, creating a Martin-Egbert line and an Egbert-Embarcadero line, and the existing Jefferson-Martin line would be rerouted and extended to the proposed Egbert Switching Station, creating a Jefferson-Egbert line.
N	San Francisco Public Utilities Commission (SFPUC)–Pacific Gas and Electric Company (PG&E) Acquisition Project	Regional	NA	NA	NA	NA	Acquisition by SFPUC of a portion of the PG&E transmission system within the San Francisco city limits, including substations, interconnections, transformers, transmission and distribution lines, supporting equipment, operational facilities, relevant records, and other facilities (e.g., streetlights). The project would include physical separation of some assets from the remainder of PG&E's electricity grid, modification of existing infrastructure, and construction of new infrastructure. The portion of the project requiring new construction or modifications to existing facilities would primarily be in the southern portion of San Francisco and along the county border in the northern portions of Brisbane and Daly City. New equipment would be installed within the Martin, Potrero, Randolph, and Plymouth substations. Additional work would be performed in small, discontinuous areas generally located near the county border.

No.	Project Name	Jurisdiction	Location in Relation to Baylands	Residential Units	Commercial/ Office Square Footage	Other	Description
O	SFPUC Local Alternative Water Supply Projects	SFPUC	NA	NA	NA	NA	Planning program to increase long-term supply or reduce demand beyond existing infrastructure and surface water supplies of SFPUC's Regional Water System and local groundwater sources. The program is studying new and diverse or "alternative" water supply options such as groundwater banking, surface water storage expansion with a potential for diverse water supply sources, water transfers, purified water (potable reuse), desalination as well as technological innovations.
P	Southeast Muni Expansion	San Francisco Municipal. Railway	NA	NA	NA	NA	New Muni bus routes, bus route extensions and reroutes, and more frequent service on existing Muni bus routes in San Francisco's southeastern neighborhoods (Bayview, Hunters Point, and Visitacion Valley). Includes new service along Harney Way through to the existing Bayshore Caltrain station. Implementation of the initial bus service options is anticipated to begin along with the next major phases of the development projects, primarily at Candlestick Point-Hunters Point Shipyard.

7.3 CUMULATIVE IMPACTS OF THE 2025 SPECIFIC PLAN PROJECT IN COMBINATION WITH RELATED PAST, PRESENT, AND REASONABLY FORESEEABLE PROBABLE FUTURE PROJECTS

7.3.1 LAND USE AND PLANNING POLICY

a. Geographic Context and Method of Analysis

The geographic context and method of analysis for cumulative land use and planning policy impacts are identified in **Table 7-3**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**. The geographic analysis area used to address the potential for cumulative projects to divide a community encompasses a cluster of development along the US 101 freeway and Bayshore Boulevard stretching from the southern portion of San Francisco through Brisbane and Daly City to the northern portion of South San Francisco.

Table 7-3: Geographic Context and Methodology for Analysis of Cumulative Land Use and Planning Policy Impacts

Impact	Geographic Context	List- or Projections-Based Analysis
Threshold LUP-1 Physically Separate a Neighborhood or Community	Buildout of the Brisbane General Plan and cumulative projects within the City of Brisbane, the San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area, and the Oyster Point portion of the City of South San Francisco.	Land development and infrastructure projects, including: • Brisbane (Cumulative Projects 1, 2, 4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)
Threshold LUP-2 Significant Impacts Resulting from a Conflict with an Applicable Adopted Planning Document	Same as above.	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)

Because land use policies are local in nature and specific to the agency adopting such policies, the City of Brisbane is a logical geographic area for analysis of cumulative impacts related to consistency with applicable planning documents since projects within the City would be subject to the same set of planning policies. However, addition of the cluster of development to the north and south of the Baylands within adjacent portions of San Francisco and South San Francisco represents the areas outside of Brisbane where environmental impacts resulting from inconsistencies with local planning policies could combine with related impacts of Baylands

development such that the cluster of development to the north and south of the Baylands are included in the geographic scope for this cumulative impact analysis.

Existing land use in the geographic area for cumulative analysis is described in Section 4.3, *Land Use and Planning Policy*, and represents baseline conditions for evaluation of cumulative impacts.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative land use and planning policy impacts?

Past, present, and probable future development would result in substantial changes to existing land use patterns and intensities through conversion of vacant land to residential, office, commercial, and industrial uses, as well as through the conversion of existing developed land to substantially higher intensity residential, office, and mixed-use development. Transportation projects undertaken by local, regional, and state agencies would also facilitate access and mobility for past, present, and probable future land development within the cumulative impact analysis area.

Impact LUP-1: Physically Separate a Neighborhood or Community

Physical barriers within the City of Brisbane and the cumulative analysis geographic area outside of the City include the US 101 freeway, Bayshore Boulevard, the Caltrain right-of-way, Visitacion Creek and the Brisbane Lagoon, large industrial uses such as the Recology San Francisco solid waste management facility, and PG&E's Martin substation. To the west of Bayshore Boulevard, Brisbane lies within a "cove" formed by the hillsides and ridges extending from San Bruno Mountain that separate the community from more highly urbanized areas to the north, west, and south in San Francisco, Daly City, and South San Francisco.[383] Together, these features physically separate the Specific Plan area from adjacent communities in Brisbane and Daly City to the west, in San Francisco to the north, and in South San Francisco to the south of the Baylands. In addition:

- Central Brisbane, the Northeast Ridge, and the existing Brisbane community are physically separated from the Baylands by Bayshore Boulevard;
- Recology and the Martin substation physical separate the existing Brisbane community and the Baylands from existing neighborhoods and large-scale redevelopment project areas to the north in San Francisco;

[383] Guadalupe Canyon Road west from Bayshore Boulevard into Daly City is the only roadway traversing across the hillsides and ridges extending outward from San Bruno Mountain.

- US 101 physically divides the existing Brisbane community and the Baylands west of the freeway from the Sierra Point area east of the freeway; and
- Bayshore Boulevard, the US 101 freeway, and the Brisbane Lagoon physically divide Brisbane from the Oyster Point area to the south in South San Francisco.

Baylands Specific Plan development in combination with the cumulative projects identified in **Table 7-3** would greatly intensify land use within the cumulative analysis area as the result of substantial residential, office, commercial, and industrial development. Future communities would experience decreased connectivity as the result of temporary roadway lane closures and detours during construction of approximately 15,000 new housing units and over 14 million s.f. of new employment-generating uses currently approved and proposed within the Baylands, the San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area, and the Oyster Point portion of South San Francisco.

To plan for the transportation facilities needed to support this level of development, the "Bi-County Transportation Study" was undertaken jointly by the San Francisco County Transportation Authority (SFCTA), City/County Association of Governments of San Mateo County, City of Brisbane, City and County of San Francisco, Peninsula Corridor Joint Powers Board (Caltrain), and others. Transportation projects planned as part of the Bi-County Transportation Study, such as the Geneva Avenue extension, Candlestick interchange, bus rapid transit service, and others would maintain connectivity as these areas develop.

Habitat restoration and enhancement projects would occur along existing drainage courses, existing wetland and shoreline areas, and upland habitat areas such as Visitacion Creek, the Levinson Marsh, Brisbane Lagoon, and Icehouse Hills. These activities would occur within existing habitat areas and not create any new physical barriers that would separate communities.

Construction activities associated with land development and infrastructure projects routinely involve temporary disruptions and physical barriers within established communities such as lane or road closures and service delays or detours for bus routes.

Cumulative Impact Conclusion

The Specific Plan's and cumulative development's construction activities would create temporary roadway disruptions and physical barriers that would adversely affect connectivity between communities. Although individual Baylands and cumulative construction projects would each be required to prepare and implement a traffic control plan and related measures to accommodate access during construction, such as designating and maintaining alternate routes, the proximity of cumulative projects to the Baylands could result in multiple temporary disruptions to transportation systems occurring simultaneously. While no single temporary disruption would likely affect connectivity to the extent that communities would be separated

during construction, multiple concurrent disruptions along transportation routes could generate a significant cumulative impact.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

As demonstrated in Impact LUP-1, Baylands Specific Plan development would maintain access along area roadways at all times during construction, including during peak travel hours. Access to transit and access to bicycle and pedestrian facilities would also be maintained during Baylands development. In addition, by constructing the Geneva Avenue extension and participating in the other improvements outlined in the Bi-County Transportation Study, Baylands Specific Plan development as proposed by the applicant would improve future connectivity in the area.

The 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative impact related to physical separation of neighborhoods or communities.

Impact LUP-2: Significant Impacts Due to a Conflict with an Applicable Adopted Planning Document

Development projects within Brisbane would be subject to the provisions of the Brisbane General Plan, while cumulative development projects within San Francisco, South San Francisco, and Daly City would be subject to the provisions of those communities' General Plans. Because development projects would be required to be consistent with local General Plan policies, development of the Baylands and other cumulative development projects would not combine to generate significant cumulative impacts resulting from conflicts with the applicable local General Plan or adopted planning policies.

Transportation, infrastructure, and habitat restoration projects would be subject to the requirements of the agency undertaking such projects including any mitigation measures in applicable CEQA documents. Development within areas subject to BCDC jurisdiction would be subject to BCDC permitting authority and would therefore be required to be consistent with the provisions of San Francisco Bay Plan. Such projects would also typically be subject to environmental and planning review.

Transportation projects undertaken by regional and state agencies would not, however, be subject to requirements for consistency with local General Plans. While project-specific environmental documentation for such transportation projects is required to identify significant impacts in relation to conflicts with adopted local plans and policies, if any, and identify mitigation measures, it cannot be concluded that all conflicts between transportation projects and adopted local planning policies would be avoided or that significant cumulative impacts resulting from conflicts with local General Plans and planning policies would be avoided or reduced to less than significant.

Cumulative Impact Conclusion

Because Baylands and cumulative development projects within Brisbane would be subject to the provisions of the Brisbane General Plan, while cumulative development projects within San Francisco, South San Francisco, and Daly City would be subject to the provisions of those communities' General Plans, development of the Baylands and other cumulative development projects would not combine to generate significant cumulative impacts resulting from conflicts with the applicable local General Plan or adopted planning policies.

Transportation, infrastructure, and habitat restoration projects would be subject to the requirements of the agency undertaking such projects including any mitigation measures in applicable CEQA documents. Development within areas subject to BCDC jurisdiction would be subject to BCDC permitting authority and would therefore be required to be consistent with the provisions of San Francisco Bay Plan. Such projects would also typically be subject to environmental and planning review.

Thus, cumulative development projects would be consistent with the provisions of applicable local and regional plans, and a less than significant cumulative impact would result.

7.3.2 POPULATION AND HOUSING

The analysis of cumulative population and housing effects focuses on whether the population and housing effects of the Baylands development in combination with those of past, present, and probable future projects would result in related physical environmental effects.

a. Geographic Context and Method of Analysis

The geographic context and method of analysis for cumulative population and housing impacts is identified in **Table 7-4**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Population and housing issues are generally experienced over a broad area, which is reflected in using the nine-county San Francisco Bay region as the geographic area of analysis for most cumulative population and housing impacts. In contrast, cumulative urban decay effects[384] are

[384] "Urban decay" refers to the extensive and widespread physical deterioration of properties or structures in an area caused by a downward spiral of business closures and multiple long-term vacancies. This physical deterioration to properties or structures is so prevalent, substantial, and lasting for a significant period of time that it impairs the proper utilization of the properties or structures, along with the health, safety, and welfare of the surrounding community. The manifestations of urban decay include such visible conditions as plywood-boarded doors and windows, uncontrolled truck parking, long-term unauthorized use of the properties and parking lots, graffiti, dumping of refuse on-site, overturned dumpsters, broken parking barriers, broken glass, dead trees and shrubbery together with weeds, lack of building maintenance, abandonment of multiple buildings, and unsightly and dilapidated fencing.

more limited to smaller market areas for specific types of uses (e.g., retail, life science/office development).

Table 7-4: Geographic Context and Methodology for Analysis of Cumulative Population and Housing Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact POP-1 **Unplanned Growth**	Nine-county San Francisco Bay Area region.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Impact POP-2 **Displace Existing Housing or Businesses**	Nine-county San Francisco Bay Area region.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Impact POP-3 **Housing for all Economic Segments of the Community**	City of Brisbane.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane General Plan and Housing Element (Cumulative Projects AA, BB)
Impact POP-4 **Urban Decay** New development attracting business from older areas	Lands within and adjacent to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane General Plan and Housing Element (Cumulative Projects AA, BB, 1, 2, 4) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)
Lack of investment and maintenance in anticipation of redevelopment	Nine-county San Francisco Bay Area region.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative population and housing effects?

Impact POP-1: Significant Physical Environmental Impacts Resulting from Unplanned Growth

The approved regional housing and employment growth forecast used for Plan Bay Area 2050 indicates that the San Francisco Bay Area will grow by 2.7 million people to a population of 10.3 million in 2050. The regional growth forecast also projects that employment will grow by 1.4 million to just over 5.4 million total jobs by 2050.

Government Code Section 65080(b)(2)(B)(ii) requires the regional growth forecast used for the Bay Area's Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) to accommodate expected population growth, household formation, and employment growth of the region. The regional growth forecast also accounts for all economic segments (i.e., very low, low, moderate, and above moderate income households) and net migration into the region. Thus, population and employment growth within the nine-county Bay Area region as a whole

would not be expected to exceed projections through 2050. However, because neither of the two agencies that prepared and approved regional socioeconomic projections – the Metropolitan Transportation Commission (MTC) and Association of Bay Area Governments (ABAG) – have land use authority, the resulting pattern of future housing, commercial, and industrial development could vary widely on a localized basis from the assumptions contained in the Regional Transportation Plan/Sustainable Communities Strategy. Shifts in land use patterns and development intensities away from the assumptions contained in Plan Bay Area 2050 could encompass numerous individual development projects that would exceed existing local General Plan buildout, even though the Bay Area's total population, housing, and employment growth would not exceed regional projections.

Cumulative Impact Conclusion

Individual future development projects could include amendments to existing local General Plans that may modify land use patterns or increase a community's buildout. However, Plan Bay Area 2050's regional population and employment growth projections are based on socioeconomic and market modeling that are not likely to be exceeded regionwide even if local shifts in land use patterns occur compared to the exact land use inputs that were used to project population and employment growth over the next 15-25 years. Thus, unplanned growth exceeding regional projections would not occur and a less than significant cumulative impact would result.

Impact POP-2: Displace Existing Housing or Businesses

As noted above, the most recent approved regional growth forecast indicates that the Bay Area will grow by 2.7 million people (1.5 million new housing units) and 1.4 million jobs between 2015 and 2050. While some of this growth would be accommodated by conversion of existing open space and agricultural lands within the nine-county Bay Area to urban development, Plan Bay Area 2050 sets forth strategies to concentrate future development and focus future growth within 216 locally nominated "Priority Development Areas (PDAs) and 36 locally nominated Priority Production Areas (PPAs) as well as other existing urban areas.[385] These Priority Development Areas typically consist of existing low- to moderate-intensity urbanized development in proximity to transit with the capability of supporting substantially higher intensity development.

Regional growth projections for 1.5 million new housing units along with 1.4 million new jobs thus anticipate growth to occur primarily within existing built-up urban areas. Substantial redevelopment of sites with existing housing and employment-generating uses is expected to occur through 2050, resulting in localized displacement of households and businesses and

[385] Approximately 69 percent of the region's land use growth footprint is projected to occur within existing urban and built-up lands, including 46 percent of the region's land use growth footprint occurring within PDAs.

requiring construction of replacement housing and buildings for commercial, office, and industrial businesses.

Cumulative Impact Conclusion

The majority of the region's land use growth footprint is projected to occur within existing urban and built-up lands, including 46 percent of the region's land use growth footprint occurring within identified areas of existing low- to moderate-intensity development in proximity to transit designated as PDAs due to their capability of supporting substantially higher intensity development. To accommodate 1.5 million new housing units and 1.4 million jobs between 2015 and 2050, 46 percent of which is projected to occur within areas of existing low- to moderate-intensity development, substantial displacement will occur, necessitating substantial replacement housing and employment-generating development. Thus, a significant cumulative physical environmental impact would result and are addressed throughout this chapter.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

The 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative environmental impact related to displacement of existing housing or businesses for the following reasons:

- Development of the proposed 2,200 dwelling units, 6.5 million square feet of commercial development, and 500,000 square feet of hotel use within the Baylands rather than elsewhere within San Francisco and San Mateo counties would substantially reduce regional vehicle miles traveled, which would reduce regional air pollutant and GHG emissions.
- No existing housing would be displaced from the Baylands.
- Although approximately 231,400 s.f. of existing industrial businesses within the Baylands would be displaced, as indicated in the Baylands urban decay study (Appendix C), as of November 2022, there was more than 2.6 million s.f. of vacant industrial space within Brisbane and adjacent communities and more than 6.3 million s.f. of vacant industrial space within San Francisco and San Mateo counties. As a result, displacement of industrial businesses from the Specific Plan area would not necessitate new construction for which significant physical environmental impacts would occur.
- All off-site infrastructure associated with Baylands development would be located within existing roadway rights-of-way.
- Existing grades and roadway access to business within or adjacent to the Specific Plan area would be maintained at all times through Baylands development.

- While Baylands development would displace Golden State Lumber's laydown area and its ability to receive and ship lumber by rail, adversely affecting its business operations, the resulting economic effects would not constitute a physical environmental effect as defined by CEQA. The Specific Plan would not therefore contribute to a cumulative physical environmental effect.

Impact POP-3: Housing for all Economic Segments of the Community

Baylands development, in combination with development of the housing sites identified in the City's General Plan, including the Housing Element, would provide adequate opportunities for the production of housing for all economic segments of the community as defined in the Regional Housing Needs Assessment for 2023-2031. No significant cumulative impact would therefore result.

Impact POP-4: Urban Decay

As noted in Draft EIR Section 4.4, urban decay is characterized by visible symptoms of physical deterioration caused by a downward spiral of business closures and long-term vacancies. In a region such as the Bay Area that will experience substantial growth, urban decay could occur as the result of:

- Buildings in older areas reaching the end of their useful lives.
- Development of new commercial and employment-generating uses designed to meet current market demands attracting business movement from areas with older buildings and development not as well suited to current needs; or
- Lack of investment and maintenance within areas of low- to moderate-intensity development in anticipation of opportunities for redevelopment at higher intensities.

Buildings in Older Areas Reaching the End of Their Useful Lives

Deterioration of older buildings and areas containing such buildings is possible simply because buildings reach the end of their useful lives. This represents a "natural" cycle of development, activity, and decay that can ultimately lead to improvements or replacement of older buildings with similar or different uses and development intensities. Urban decay of this type is not "caused" by redevelopment activities. Instead, in such cases, redevelopment is "caused" by the decay of older areas. Thus, this type of urban decay would not be caused by Baylands or cumulative development.

Development of New Commercial and Employment-Generating Uses Attracting Business Movement from Areas with Older Buildings and Development Not Well Suited to Current Needs

New development can cause decay of older urban areas by introducing new buildings, commercial and office centers, and neighborhoods better suited to contemporary lifestyles, retail demand, or offices, leading to abandonment of older buildings and areas or driving rents down such that maintenance may be deferred and decay occurs. In such cases, new development can be said to cause urban decay.

Cumulative Retail Development

A cumulative retail supply and demand analysis (including the Specific Plan) was conducted as part of the urban decay study undertaken for the Baylands (Appendix C). **Table 7-5** and **Table 7-6** summarize occupied retail supply and demand for the Baylands and cumulative retail projects in the Baylands' retail market area.

Table 7-5: Summary of Cumulative Project Retail Space and Retail Demand Generators within the Baylands Retail Market Area

Development Status	Retail s.f.	Residential Units	Hotel Rooms	Office/Life Science s.f.
Under Construction	147,050	5,708	0	720,000
Approved	793,000	13,606	225	0
Under Review	3,700	820	958	657,620
Cumulative Projects Total	942,750	20,134	1,183	1,377,620
Cumulative Projects Total in Retail Market Area	50,400	2,234	608	657,620
Baylands	102,200	2,200	800	6,500,000
Baylands Plus Cumulative Projects Total in Retail Market Area	152,600	4,434	1,408	7,157,620

SOURCE: ALH Urban and Regional Economics, *The Baylands Urban Decay Analysis*, July 2023.

Table 7-6: Baylands and Cumulative Retail Market Area Demand Capture Rate

Retail Supply and Demand Characteristic	
Baylands Proposed Retail Space (Occupied)	91,980
Retail Market Area Cumulative Retail Supply (Occupied)	50,400
Vacancy Rate	10%
Total New Market Area Cumulative Retail Supply (Occupied)	137,340
Total New Market Area Supportable Square Feet	1,067,057
Baylands and Cumulative Retail Demand Capture Rate	12.9%
Demand Remaining for Other Retail Venues (s.f.)	929,717

SOURCE: ALH Urban and Regional Economics, *The Baylands Urban Decay Analysis*, July 2023.

The cumulative retail analysis results indicate that assuming all cumulative retail projects are developed within the same time horizon as the Baylands, they will require a 12.9 percent capture rate[386] of new brick and mortar retail demand to achieve a 90 percent occupancy rate. This is a relatively low capture rate, leaving almost an additional 1.0 million s.f. of demand available for other local and regional retail venues. This suggests that not only will existing retail outlets not experience any negative sales impacts due to development of the Baylands in combination with cumulative retail projects, but that additional demand will be generated to support a range of existing retail and service providers.

Cumulative Office/Life Science Development

Projected demand in San Mateo County totals approximately 17.4 million s.f. through 2050. The planned supply among all the projects identified in the office/life science market area, including the Baylands, totals approximately 28.96 million s.f. Thus, potential supply in just Brisbane and South San Francisco (plus Hunters Point in San Francisco) exceeds projected countywide demand by 66 percent. This assumes all planned projects materialize, which may not be the case given the potential for a significant oversupply of space.

With this potential surplus of supply, it is reasonable to conclude that some projects that are not currently under construction (i.e., approved or under review) would not move forward until such time as demand supports their construction and project sponsors had a major tenant commitment for space. The Baylands urban decay technical analysis (EIR Appendix C) concluded this is a reasonable scenario since most of the future supply projects are sponsored by well-established corporate developer-investors. These developers would likely keep a close watch on economic and market conditions and time their projects such that the completed office/life science buildings would not sit empty for an extended period of time following construction.

Another possible scenario is that demand exceeds the study projection and is generated in sufficient volume to absorb the planned supply. The urban decay analysis for the Baylands conservatively assumed that San Mateo County would retain its current capture rate of Bay Area life science employment. A more aggressive assumption of a 34 percent capture rate as previously noted, which is the midpoint of the 28–40 percent capture rate range analyzed in the Baylands urban decay study, would support an additional 4.1 million s.f. of space in San Mateo County. However, other considerations, such as the cost of real estate in San Mateo County, limited housing production, and regional traffic congestion, suggest that this scenario is less likely.

While the potential cumulative supply of space is extensive, much of the future development would only take place when there is sufficient demand. Existing under-construction buildings would serve as indicators over time for developers to determine whether future development

[386] "Capture rate," as a real estate market term, refers to the percentage of individuals who take a desired action out of the total number of people who had the opportunity to do so. In the context of retail market sales and **Table 7-7**, a 12/9% capture rate means the percentage of total retail sales by Baylands and cumulative project residents, employees, and businesses within the Baylands' retail market area who make a purchase within the Baylands.

would proceed or be delayed until demand catches up with supply. Thus, urban deterioration or decay would not result from the combination of Baylands and cumulative office/life science development.

Lack of Investment and Maintenance within Low- to Moderate-Intensity Development in Anticipation of Opportunities for Redevelopment at Higher Intensities

A third type of urban decay results from planning rather than actual development and construction of new buildings. For example, Plan Bay Area 2050 and local General Plans throughout the nine-county Bay Area emphasize infill development, and in particular, intensifying development within existing urban areas in proximity to transit. While guiding approximately 69 percent of the region's planned land use growth footprint to existing urban and built-up lands, including 46 percent of the region's land use growth footprint to identified Priority Development Areas,[387] is critical to reducing greenhouse gas emissions and traffic from new development, such policies could also act as a disincentive for investment in some older, low- to moderate-intensity areas in advance of actual development of the substantially higher intensity transit-oriented infill uses planned for such areas.

Cumulative Impact Conclusion

Cumulative development would result in a less than significant cumulative urban decay impact for the following reasons:

- Deterioration of older buildings and areas containing such buildings occurs as buildings reach the end of their useful lives as part of a "natural" cycle of development, activity, and decay that can ultimately lead to improvements or replacement of older buildings. Urban decay of this type is not "caused" by redevelopment activities. In such cases, redevelopment is "caused" by the natural decay of older areas.
- Although a surplus of supply compared to demand would result if all proposed office/life science projects were to be developed, the most likely scenario is that projects that are not currently under construction (i.e., approved or under review) would be delayed until such time as demand supports their construction and project sponsors had a major tenant commitment for space. This is a reasonable scenario as most of the future supply projects are sponsored by well-established corporate developer-investors.
- Baylands and cumulative development would generate more demand for retail space than such projects propose to provide.
- While regional growth strategies could act as a disincentive for investment in some older, low- to moderate-intensity areas in advance of actual development of the

[387] Priority Development Areas typically consist of existing low- to moderate-intensity development in proximity to transit and are designated as PDAs due to their capability of supporting substantially higher intensity development.

substantially higher intensity transit-oriented infill uses planned for such areas, the Baylands Specific Plan proposes redevelopment of a largely undeveloped site and would not contribute to this potential cause of urban decay.

7.3.3 AESTHETICS AND VISUAL RESOURCES

a. Geographic Context and Method of Analysis

The geographic context and methodology of analysis for cumulative aesthetics and scenic resources impacts are identified in **Table 7-7**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative aesthetics and visual resources effects?

Impact AES-1: Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon), Including Those within a State Scenic Highway

Effects on scenic vistas relate to development having sufficient building intensity and height that could obscure scenic vistas available to the public. Cumulative effects on scenic vistas result when multiple projects combine to either (1) increase the amount of scenic vista that is obscured from view at a single vantage point available to the public, or (2) substantially reduce the number or area of publicly accessible locations with views of an unobstructed scenic vista.

Construction activities associated with the Baylands in combination with cumulative projects would introduce elements that may be considered visually intrusive (e.g., cranes, backhoes, staging areas, and stockpiling of soil and construction materials) within scenic vistas. However, construction equipment and stockpiles would not generally be sufficiently large or bulky to block views of scenic vistas. The presence of construction equipment for specific land development, transportation, and other projects would generally be temporary in nature, dispersed at any given time, and unlikely to occur in concentrations sufficient to substantially increase blockage of scenic views.

The cumulative effect of proposed and anticipated building heights of the Baylands Specific Plan and adjacent cumulative projects to the north would be to partially block existing views of natural hillside areas from the US 101 freeway and adjacent portions of San Francisco Bay by placing a substantial amount of urban development in the foreground of these scenic vistas. In addition, Baylands development, as well as cumulative projects, would be placed in the

Table 7-7: Geographic Context and Methodology for Analysis of Cumulative Aesthetics and Visual Resource Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact AES-1 Scenic Vistas	Areas with scenic vistas that have the Baylands site and at least one other cumulative project in the foreground or middle ground.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (Cumulative Projects 1, 2, 4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, C, D, E, I, L) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8)
Impact AES-2 Impacts to Scenic Resources	Areas containing scenic resources that are either visible from the Baylands or within scenic vistas that have the Baylands site in the foreground or middle ground.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects C, L)
Impact AES-3 Consistency with Visual Quality-Related Policies and Programs	Nine-county San Francisco Bay Area region.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Threshold AES-4 Nighttime Lighting		
Light Trespass	Lands within and adjacent to the Baylands with the potential for light trespass onto common properties, roadways, or highways.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects C, D, E, I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 6, 7)
Dark Night Sky	Nine-county San Francisco Bay Area region.	• Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Impact AES-5 Glare	Lands within and adjacent to the Baylands with the potential for causing glare on common properties, roadways, or highways	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (Cumulative Projects 1, 2, 4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, C, D, E, H, I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–7)

foreground of blue water views of San Francisco Bay and views of the Oakland Hills beyond from locations along public roadways within Brisbane's hillside residential areas, Visitacion Valley, and John McLaren Park.

Cumulative Impact Conclusion

As documented in **Table 4.5-2o**, Baylands development would be within the middle ground of views from the northern portion of the Sierra Point area. However, Cumulative Projects 1, 2, and 4 within the Sierra Point area would not combine with Baylands development to block scenic vistas of San Bruno Mountain or the San Francisco Bay to a greater degree than would

Baylands development alone. The only vista points that would have both Baylands and Cumulative Projects 1, 2, or 4 in the same view would be from within Sierra Point, in which case Sierra Point development would be predominant and obscure project-level impacts of Baylands development.

In addition, development to the north in the San Francisco portion of the Bi-County Priority Development Area and to the south in the Oyster Point area of South San Francisco either would not be of a sufficient height and scale to combine with Baylands development to block identified scenic vistas or would be in a location where there would be no public viewpoint from which both the Baylands and a cumulative project would combine to block views of a scenic vista.

Thus, the 2025 Specific Plan project would not combine with other past, present, and reasonably foreseeable probable future development to generate a significant cumulative impact.

Impact AES-2: Impacts to Scenic Resources, Including Those within Scenic Highways

Construction Equipment and Activities

Although construction activities associated with the Baylands and cumulative projects would not block scenic vistas, they can be expected to introduce elements that may be considered to be visually intrusive (e.g., cranes, backhoes, staging areas, and stockpiling of soil and construction materials) in the foreground of views of scenic resources such as San Francisco Bay and San Bruno Mountain and its adjacent ridgelines, thereby temporarily reducing the visual quality of those resources. However, the only views of Baylands construction equipment and activities that could occur simultaneously with those of a cumulative project would be Cumulative Projects 1, 2, and 4 within the Sierra Point area. Although Baylands construction would occur over a 20- to 30-year period, construction activities associated with Cumulative Projects 1, 2, and 4 would be located approximately 1.5 miles from the Baylands and occur on sites far smaller than construction sites within the Baylands. As a result, Baylands and Sierra Point construction activities would not combine to substantially degrade the visual quality of views of scenic resources.

Long-Term Impacts to Scenic Resources

In addition to the potential for partially blocking scenic vistas, the cumulative effect of Baylands development in combination with cumulative projects would be to place a substantial amount of urban development and transportation infrastructure in the foreground of public views of San Francisco Bay and the Oakland Hills beyond. In addition, Baylands development in combination with cumulative projects would place urban development in the foreground of long-distance views of San Bruno Mountain and San Francisco from the US 101 freeway.

Cumulative Impact Conclusion

The Baylands site is not within or visible from any existing eligible or official scenic highway and would therefore not contribute to any impacts to scenic resources within a scenic highway.[388] Cumulative projects would not involve any substantial alteration to a scenic resource that would also be altered by Baylands development, nor would Baylands and cumulative project construction activities substantially degrade the visual quality of scenic resources.

As a result, the 2025 Specific Plan project would not combine with past, present, and reasonably foreseeable probable future cumulative development to cumulatively cause substantial damage to a scenic resource.

Impact AES-3: Consistency with Visual Quality-Related Policies and Programs

The General Plans of the cities and counties within the nine-county San Francisco Bay Area are designed to accommodate the people, households, and jobs each agency proposes be developed through the community's buildout. The cumulative effect of such development could create new or exacerbate existing adverse effects on the visual character of existing communities. Overall, the greatest adverse effects would result from the conversion of open space resources and suburban style development with high intensity residential, mixed use, and non-residential development projects. Development outside of existing urban areas could introduce dense compact development that would be visually incompatible with the existing character of adjacent lands and individual communities.

Each jurisdiction within the Bay Area maintains policies (e.g., general plan), regulations (e.g., zoning), and other guidance (e.g., design guidelines) that control the size and scale of new development and directly or indirectly address visual compatibility with the natural and built environments. General Plan, zoning, and other development standards are applied to development projects as part of their planning review processes. However, the effectiveness of these policies, regulations, and guidance can vary widely. Depending on the extent to which the intensity, densities, and building heights of new development are greater than those within the surrounding community, substantial short-term disruptions of the local character of existing communities can occur as planned growth expands onto open lands and areas transition from lower to higher intensity use.

Cumulative Impact Conclusion

Because the Plan Bay Area 2050 EIR sustainable communities strategy proposes increasing the density and intensity of growth within designated growth geographies to a level greater than currently planned by local agencies, particularly in less urbanized areas, a significant

[388] The nearest designated Scenic Highway is the Interstate 280 freeway (I-280), approximately four miles to the west. San Bruno Mountain and the adjacent ridgeline block views between the Baylands and the I-280 scenic corridor.

cumulative impact in relation to visual character and quality impacts would occur. In addition, transportation projects undertaken by regional and state agencies would not be subject to requirements for consistency with local visual quality-related standards.

Required planning reviews for land development projects ensure compliance with applicable visual quality-related local plans and policies. However, while environmental documentation for transportation projects would identify significant impacts in relation to conflicts with adopted visual quality-related local plans and policies, transportation agencies would not necessarily require compliance with the visual quality plans and policies of local cities and counties. As a result, visual conflicts between transportation projects and adopted local visual quality standards could occur, and significant environmental cumulative impacts would not necessarily be avoided or reduced to less than significant. Thus, a significant cumulative impact in relation to transportation projects would result.

The 2025 Specific Plan project, which would be required to comply with applicable visual quality-related plans and policies, would not contribute to this significant cumulative impact.

Impact AES-4: Nighttime Lighting

Development of Baylands and cumulative residential, office, commercial, and industrial projects to accommodate nearly 1.4 million new households and 1.4 million new jobs would create substantial new sources of indoor and outdoor lighting, including street lighting, building illumination, security lighting, parking lot lighting, and landscape, park, and trail lighting, as well as light emanating from building interiors passing through windows in new or redeveloped residential and non-residential buildings.

Light Trespass

As discussed in Section 4.5, *Aesthetic and Visual Resources*, Baylands development is subject to light trespass mitigation requirements that would eliminate light trespass from the Baylands onto adjacent properties. As such, Baylands development would not contribute to any cumulative light trespass impacts.

Dark Night Sky

Baylands development, in combination with past, present, and reasonably foreseeable probable future cumulative development would generate nighttime lighting over a broad area. To address dark night sky preservation, the City of Brisbane adopted Municipal Code Chapter 15.88 to establish quantitative standards to reduce nighttime lighting impacts while providing the lighting necessary to ensure community safety and security. While development and transportation projects not subject to the City's nighttime lighting standards may include strategies to direct night lighting downward instead of up to the sky, such standards are also not typically explicit enough to prevent incremental contributions to brightening of the night

sky. As a result, cumulative development within the nine-county Bay Area would include projects generating lighting in excess of the guidelines set forth by DarkSky International, formerly the International Dark Sky Association, thereby brightening the night sky.

Cumulative Impact Conclusion

Nighttime lighting from cumulative development throughout the Bay Area would be of a sufficient scale so as to combine with Baylands development to brighten the night sky and a significant cumulative impact would result.

Cumulative impacts related to light trespass would occur where Baylands development, as well as one or more past, present, or future projects, would result in light trespass onto a common receptor. Because of the location of the Baylands in relation to such other projects, a cumulative light trespass impact would only occur through the combination of the Baylands and Sierra Point projects spilling nighttime lighting onto the US 101 freeway. However, EIR mitigation measures are being applied to each of these projects that would prevent the three projects' nighttime lighting from spilling onto the freeway, and a less than significant cumulative impact would result in relation to light trespass.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

Because Baylands mitigation measures for nighttime lighting would apply the standards from the City's Municipal Code to the Baylands along with other recommendation of DarkSky International, the 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative impact related to sky glow.

Impact AES-5: Glare

The large amount of development represented by Baylands development in combination with cumulative projects would create a substantial amount of building and structural surfaces that could generate glare. While mitigation consisting of non-glare building surfaces is available for each project, such mitigation measures cannot be assumed to be uniformly applied to all projects; therefore, some reflective surfaces generating glare would be constructed.

Cumulative Impact Conclusion

Cumulative impacts related to glare would occur where Baylands development, as well as one or more past, present, or future projects, would simultaneously cast glare onto a common receptor. Because of the location of the Baylands in relation to such other projects, a cumulative glare impact would only occur through the combination of the Baylands and Sierra Point projects projecting glare onto the US 101 freeway or onto Brisbane housing overlooking these sites. However, EIR mitigation measures are being applied to the Baylands Specific Plan that

would require implementation of non-reflective surfaces and prevent glare impacts.[389] Baylands development would therefore not combine with Sierra Point projects to reflect glare onto the US 101 freeway or onto Brisbane housing overlooking these sites. Thus, a less than significant cumulative impact would result.

7.3.4 BIOLOGICAL RESOURCES

a. Geographic Context and Method of Analysis

The geographic context and methodology of analysis for cumulative biological resources impacts are identified in **Table 7-8**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-8: Geographic Context and Methodology for Analysis of Cumulative Biological Resources Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact BIO-1 Special-Status Species and Habitats	Brisbane city limits, lands adjacent to the Baylands, habitat areas that are biologically linked to the Baylands, and ecologically similar areas throughout the San Francisco Peninsula that are within a five-mile radius of the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D, E, I, L) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 6–8) • Oyster Point (Cumulative Projects 25, 26)
Impact BIO-2 Freshwater Habitats and Jurisdictional Waters	Habitat areas that are biologically linked to the Baylands and ecologically similar areas throughout the San Francisco Peninsula.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Impact BIO-3 Wildlife Movement	Habitat areas that are biologically linked to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects C, F, G, I, L)
Impact BIO-4 Loss of Protected Trees	Brisbane city limits.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A-I)
Impact BIO-5	Brisbane city limits and lands biologically linked to the San Bruno Mountain Park.	List-based analysis, including the following projects in addition to the Baylands Specific Plan:

[389] Cumulative Projects 2 and 3 within the Sierra Point area will both have an EIR prepared to analyze environmental impacts. While it is reasonable to expect that any glare impacts identified for either of these projects would be mitigated, such mitigation cannot be assumed at this time.

	Geographic Context	List- or Projections-Based Analysis
Consistency with Conservation Plans and Ordinances		• Guadalupe Quarry Redevelopment Project (Brisbane Cumulative Project 3)

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative biological resources impacts?

Impact BIO-1: Special-Status Species and Habitats

Development of the Baylands and cumulative projects would involve removal and/or modification of areas that have the potential to contain special-status species and sensitive natural communities (wetlands and non-wetland waters are discussed in a separate impact statement below). As development continues in and around the Baylands, habitats connected to the Baylands, and biologically similar areas throughout the San Francisco Peninsula that are within five miles of the Baylands would have localized effects on special-status species including the temporary and permanent removal or conversion of vegetation and habitat, direct mortality of special-status plants and wildlife, entrapment of wildlife in open trenches, and general disturbance due to noise or vibration during pile driving, earthmoving, and other construction activities for species present in disturbance areas. Construction-generated fugitive dust accumulation on surrounding vegetation and construction-related erosion, runoff, and sedimentation could degrade the quality of adjacent vegetation communities, affecting their ability to support special-status plants and wildlife. Habitat fragmentation and disruption of migratory corridors could also occur on a local level, potentially affecting local populations by making them more vulnerable to extirpation.

Cumulative Impact Conclusion

Although more mobile species might be able to survive continuing habitat loss by relocating to new areas, wildlife movement corridors are limited, and less mobile species would more likely be lost since remaining habitats would be largely limited to existing preservation areas. As a result, the availability and accessibility of remaining natural habitats can be expected to dwindle over time with smaller disjunct habitat areas being preserved within individual development sites. Such disjunct preservation areas might not be able to support plant or animal populations at their pre-development carrying capacities. Thus, the 2025 Specific Plan project and cumulative development would cause loss of sensitive plant and wildlife habitat areas, and a significant cumulative impact on special-status species and their habitats would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

The 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative impact on related to special-status species. As described in Section 4.6, *Biological Resources*, the Specific Plan and EIR mitigation measures provide for extensive habitat restoration and enhancement along Visitacion Creek and the north shore of the lagoon that would result in higher quality habitat than now exists. In addition, the Specific Plan would preserve and enhance habitat for sensitive butterfly host and nectar plants on Icehouse Hill.

Impact BIO-2: Freshwater Habitats (e.g., Seasonal Wetlands, Riparian Habitat); Tidally Influenced Habitats, Waters of the U.S., Waters of the State, or Any Area Subject to the Jurisdiction of the State lands Commission or Bay Conservation and Development Commission

Wetland and jurisdictional waters restoration projects within the Bay Area are extensive. Although these restoration projects are attempting to reduce the cumulative loss of wetland and waters habitats, the large historical loss of these areas due to past projects, including construction of US Highway 101, has resulted in a loss of more than 90 percent of historic tidal wetlands in the San Francisco Bay Area along with substantial loss of other wetlands and jurisdictional waters. The Plan Bay Area 2050 EIR indicates that development within San Francisco and San Mateo counties would result in loss of state- or federally protected jurisdictional waters, including wetlands, "other waters" (e.g., streams, rivers, lakes, San Francisco Bay), and riparian habitat (see **Table 7-9**).

Cumulative Impact Conclusion

Cumulative development within the San Francisco Peninsula would result in a substantial loss; however, both the U.S. Department of Fish and Wildlife and the California Department of Fish and Wildlife maintain a zero net loss policy for wetlands and jurisdictional waters. Thus, because impacts to wetlands and jurisdictional waters are subject to federal and/or state permits, mitigation measures would be required such that no net loss of wetlands and jurisdictional waters would ultimately result from future development and transportation projects.

Although existing habitat areas along Visitacion Creek and the north shore of Brisbane Lagoon would be removed by grading necessary for required site remediation, final landfill closure, creation of development pads that are protected from flooding and sea level rise, and proposed recreational trail and facilities, the Specific Plan in combination with EIR mitigation measures would result in equivalent or greater wetland and non-wetland waters in relation to acreage and habitat values and functions.

Thus, no significant cumulative impact would result to which the Baylands Specific Plan might contribute.

Table 7-9: Projected Land Use Growth within San Francisco and San Mateo County Wetland Areas (in acres)

SOURCE: ABAG/MTC, Plan Bay Area 2050 EIR, June 2021.

NOTE: "Cumulative projects" include land development and transportation projects along the San Francisco Bay shoreline that would affect protected wetlands or jurisdictional waters, either adversely (i.e., development projects) or beneficially (i.e., restoration as part of development).

Impact BIO-3: Wildlife Movement

Baylands development would not contribute to a significant cumulative wildlife movement impact in relation to terrestrial species due to the presence of existing barriers such as railroads and major roads, as well as industrial uses to the north that limit the current use of the Baylands site as a corridor for aquatic or terrestrial wildlife movement to other properties. Open space areas in the vicinity of the Baylands that support wildlife populations and attract wildlife movement include the San Bruno Mountain area to the west, and wetland and aquatic habitats in San Francisco Bay to the east of the site. Currently, suitable wildlife habitat within the Baylands that could support wildlife movement is limited to Icehouse Hill, which could attract butterfly species present in the San Bruno Mountain area, and aquatic habitat in the lagoon which may attract fish species present in San Francisco Bay. In addition, Baylands development would enhance habitat for sensitive butterfly host and nectar plants and thus have a beneficial impact on potential butterfly movement between San Bruno Mountain and Icehouse Hill.

Baylands development, in combination with cumulative projects, would, however, adversely affect special-status avian species migrating through the cumulative analysis area as the result of an increased number of mid-rise and taller buildings along with increased nighttime lighting along the Pacific Flyway. Migrating birds such as songbirds can be affected by human-built structures because of their propensity to migrate at night, their low flight altitudes, and their tendency to be disoriented by artificial light, making them vulnerable to collision with obstructions. A majority of bird strikes occur when birds do not recognize windows on buildings. Thus, tall residential and non-residential buildings would pose collision hazards to migratory birds since effects associated with the lighting of the towers can alter the flight patterns of migratory birds and substantially increase bird strike collisions with the structures.

Cumulative Impact Conclusion

The substantial amount of high intensity development proposed within and adjacent to the Baylands would greatly increase the amount of building surface area subject to bird strikes. Because it cannot be assumed that all new development within the Bay Area portion of the Pacific Flyway would be designed and constructed with effective measures to avoid or minimize bird strikes, a significant cumulative impact would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

As demonstrated in Section 4.6, *Biological Resources*, Baylands development would implement specific and effective measures to design Baylands buildings to avoid or minimize bird strikes. The 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative impact related to bird strikes.

Impact BIO-4: Severely Trim or Remove Trees Protected by Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Development projects within the City of Brisbane would be required to comply with the City's tree ordinance, acquire necessary permits from the City, and adhere to the provisions of the ordinance and permit for tree replacement. Baylands development would not, therefore, contribute to a significant impact related to severely trimming or removing trees protected by Brisbane Municipal Code Chapter 12.12.

Impact BIO-5: Remove or Harm Butterfly Host or Nectar Plant Species or Inhibit Butterfly Movement Between Host and Nectar Plants within the Baylands and the San Bruno Mountain Habitat Conservation Area

Of the cumulative projects identified in **Table 7-1**, only the Guadalupe Quarry Project is biologically linked to San Bruno Mountain or its Habitat Conservation Plan area. The quarry property is identified as an unplanned parcel within the Habitat Conservation Plan area and, therefore, does not have Section 10(a) coverage under the Habitat Conservation Plan.

The presence of host plants for sensitive butterflies has been documented within the Quarry Project site, including Johnny-jump up (*Viola pedunculata*), a host plant for Callippe Silverspot butterfly, and perennial lupine species (*Lupinus albifrons* ssp. *collinus* and *L. variicolor*), host plants for the Mission Blue butterfly. The EIR for the Guadalupe Quarry Project includes mitigation measures that minimize impacts to listed butterfly species by avoiding or reducing impacts to host plant species during construction and requiring design features to reduce the potential for impacts to butterflies during project operation.

Baylands development would (as mitigated) conserve and restore habitat for listed butterfly species and promote the recovery of these species through establishment of suitable habitat with host and nectar plants within dispersal range of these species from San Bruno Mountain Park.

Cumulative Impact Conclusion

Impact of Baylands Specific Plan development would not combine with impacts of the Guadalupe Quarry Project to generate a cumulative impact in relation to the San Bruno Mountain or its Habitat Conservation Plan.

7.3.5 CULTURAL RESOURCES AND TRIBAL CULTURAL RESOURCES

Cumulative impacts involving cultural or tribal cultural resources occur as the result of multiple projects affecting resources that have a common resource type or theme, such as a prehistoric ethnic site, an industry (e.g., railyard), or a historic theme (e.g., early settlement of a community) that occurs within a larger geographic context than a single project site.

a. Geographic Context and Method of Analysis

Cumulative effects involving cultural resources occur as the result of multiple projects affecting cultural resources with a common resource type or theme, such as historic ethnic sites or an industry (e.g., railroads), that occur within a larger geographic context than a single project site. Thus, the following analysis considers cumulative projects that are located immediately adjacent to the Baylands and elsewhere in Brisbane, as well as major regional projects, particularly those along and within the Bay.

The geographic context and method of analysis for cumulative land use and planning policy impacts are identified in **Table 7-10**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-10: Geographic Context and Methodology for Analysis of Cumulative Cultural Resources and Tribal Cultural Resources Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact CUL-1 Historic Architectural Resources	Buildout of the Brisbane General Plan and cumulative projects within the City of Brisbane and the San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area.	Land development and infrastructure projects having common potential effects on the Roundhouse, 7 Mile House Sports Bar and Grill, the former Schlage Lock Building A (Old Office Building), or the Bayshore/Crocker Tunnel, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8)
Impact CUL-2 Archaeological Resources	Same as Historic Architectural Resources.	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects A, B, D–I, AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D, E, I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8)
Impact CUL-3 Tribal Cultural Resources	Same as Historic Architectural Resources.	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects A, B, D–I, AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D, E, I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8)
Impact CUL-4 Disturbance of Human Remains	Same as Historic Architectural Resources.	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects A, B, D–I, AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D, E–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative cultural or tribal cultural resources impacts?

Impact CUL-1: Historic Architectural Resources

In addition to the historic Roundhouse and Machinery & Equipment building within the Baylands, other historic resources in the surrounding area include the 7 Mile House Sports Bar and Grill, the former Schlage Lock Building A (Old Office Building), and the Bayshore/Crocker Tunnel. The significance of each of these resources is site-specific; only the Roundhouse and Machinery & Equipment building involve a common resource type or theme (SPRR rail yard),

and no thematic historical resources are recognized to exist among the cumulative projects identified in **Table 7-2**.

Past developments have involved demolition of industrial buildings at the Schlage Lock site immediately north of the Baylands for which significant and unavoidable impacts were identified, even with adaptive reuse of the Old Office Building (which has been completed), along with photo-documentation and public interpretation. However, these past impacts at the Schlage Lock site would not combine with impacts of the Baylands to form a significant cumulative impact to historic resources for the following reasons:

- There are no shared building types or historical themes between the historic industrial buildings at the Schlage Lock site and the former SPRR maintenance yard, including the remaining Roundhouse and Machinery and Equipment Building within the Baylands.
- There are substantial differences between the type and severity of impacts within the Baylands (potential incompatible adaptive reuse and potential incompatible new construction adjacent to historic resources within the Baylands) and Schlage Lock site (demolition of historic resources on the Schlage Lock site).

Cumulative Impact Conclusion

The lack of a common resource type or theme between the Baylands and cumulative projects, combined with the distances between historic resources and cumulative project sites, precludes the occurrence of cumulative impacts on historic architectural resources.

Impact CUL-2: Archaeological Resources

Archaeological resources are by nature specific to their local context. Baylands development, in combination with past, present, and probable future projects involving excavation, grading, or soil removal in previously undisturbed areas or at depths below those that have been previously disturbed, could encounter previously identified or unidentified archaeological resources.

Development projects within urbanized settings along the historic margins of San Francisco Bay typically occur within previously disturbed areas and are likely to encounter archaeological resources when excavations and construction activities involve disturbance at depths greater than those of previous development projects.

Cumulative Impact Conclusion

Because Baylands and cumulative projects would involve excavations along the historic margins of San Francisco Bay, a significant cumulative impact would result.

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact

The 2025 Specific Plan project would not have a cumulatively considerable contribution a significant cumulative impact related to cultural resources since the potential for excavations to reach native soils is low. In addition, EIR mitigation measures have been developed to address the potential for encountering previously unknown resources.

Impact CUL-3: Tribal Cultural Resources

As documented in Section 4.7, *Cultural and Tribal Cultural Resources*, no Tribal cultural resources have been identified within the Baylands.

Cumulative Impact Conclusion

Because no Tribal cultural resources have been identified within the Baylands, the Specific Plan would not contribute to any cumulative Tribal cultural resource impact.

Impact CUL-4: Disturbing Known or Unknown Human Remains

Impacts associated with encountering and disturbing human remains are specific to their local context. Thus, it is unlikely that multiple projects would each involve excavations into native soils that would disturb a common set of human remains.

In addition, California law recognizes the need to protect Native American human burials, Native American skeletal remains, and items associated with Native American burials from vandalism and inadvertent destruction. The procedures for the treatment of Native American human remains are contained in California Health and Safety Code Section 7050.5 and PRC Section 5097 et seq.

Cumulative Impact Conclusion

In the unlikely event that Baylands development would, in combination with one or more cumulative projects, encounter a common set of previously unknown human remains, each such project would be required to comply with California Health and Safety Code Section 7050.5 and PRC Section 5097, thereby providing for avoiding or minimizing disturbance of human remains and appropriately treating any remains that are discovered. A less than significant cumulative impact would result.

7.3.6 TRANSPORTATION

a. Geographic Context and Methods of Analysis

The geographic context and methodology of analysis for cumulative transportation impacts are identified in **Table 7-11**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-11: Geographic Context and Methodology for Analysis of Cumulative Transportation Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact TRA-1 Vehicle Miles Traveled	Nine-county San Francisco Bay Area region	Projections-based analysis of projected vehicle miles traveled.
Impact TRA-2 Use of Bicycle, Pedestrian, and Transit Modes of Transportation	Buildout of the Brisbane General Plan and cumulative projects within the City of Brisbane, the San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area, and the Oyster Point portion of the City of South San Francisco	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)
Impact TRA-3 Hazards to Vehicles, Bicyclists, or Pedestrians	Buildout of the Brisbane General Plan and cumulative projects within the City of Brisbane, the San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area, and the Oyster Point portion of the City of South San Francisco	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)
Impact TRA-4 Emergency Response	City of Brisbane	Projections-based analysis of Brisbane General Plan buildout, along with projects affecting emergency access to/from Brisbane, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative transportation impacts?

Impact TRA-1: Vehicle Miles Traveled (VMT)

Through 2050, Plan Bay Area 2050 forecasts that the Bay Area will experience:

- Growth of 1.4 million jobs between 2015 and 2050, 25 percent of which will occur within San Francisco and San Mateo counties.
- An increase of over nearly 1.4 million households between 2015 and 2050, 25 percent of which will occur within San Francisco and San Mateo counties.

Regional traffic modeling undertaken for the Baylands EIR indicates that miles traveled within the nine-county San Francisco Bay area would increase from 155,006,000 in 2015 to 197,771,000 in 2040, assuming projected regional growth through 2040 in a cumulative no project scenario wherein development of the 2,200 dwelling units, 6.5 million s.f. of commercial use, and 500,000 s.f. of development that would have occurred within the Baylands is distributed throughout the Bay Area region (Fehr & Peers 2023).

Two separate VMT methodologies are used, including (1) an efficiency-based metric (i.e., VMT per capita), and (2) Total VMT Traveled. For both approaches, OPR's Technical Advisory (OPR 2018) allows reliance upon a comparison to baseline conditions for project level and cumulative analysis. As discussed under OPR's Technical Advisory, "A project that falls below an efficiency-based threshold that is aligned with long-term environmental goals and relevant plans would have no cumulative impact distinct from the project impact. Accordingly, a finding of a less-than-significant project impact would imply a less than significant cumulative impact, and vice versa." Consequently, while the analysis below provides future year cumulative scenarios, these are not required for the purposes of CEQA. Nevertheless, cumulative scenarios were run for the following scenarios:

1. Mid-Term Without Project represents projected background conditions that would exist in 2035.
2. Mid-Term Without Project Conditions were used to evaluate impacts of Phase 1 Baylands development taking into account land use, roadway, and traffic conditions surrounding the Baylands through 2035 when site preparation and construction of the western portion of the Baylands (Phase 1) is projected to be complete.
3. Mid-Term plus Phase 1 adds buildout of Phase 1 Baylands development (area west of the Caltrain right-of-way) to the projected year 2035 background conditions that were analyzed in the above Mid-Term Without Project scenario.

4. Mid-Term plus Phase 1 with Recommended Improvements represents mid-term conditions for the year 2035 consistent with local and regional growth, as well as buildout of the west side of the Specific Plan area (Phase 1), plus implementation of the year 2035 mid-term improvements recommended in TIA, including the Candlestick interchange improvements (Appendix F.1).
5. Cumulative without Project represents cumulative conditions for the year 2040 consistent with the Brisbane General Plan, regional growth associated with Plan Bay Area 2050, and C/CAG's current future year model horizon year of 2040. Existing conditions within the Baylands would continue through 2040 in this analysis scenario. Cumulative without Project conditions serve as the basis for analyzing full buildout of the Specific Plan.
6. Cumulative plus Project represents cumulative year conditions for the Year 2040 consistent with local and regional growth, including full buildout of the Baylands Specific Plan.
7. Cumulative plus Project and Candlestick Interchange represents cumulative year conditions for the Year 2040 consistent with the buildout of the Brisbane General Plan. As shown in Table 4.8-5, this scenario includes the Candlestick Interchange as envisioned within the Bi-County Transportation Study and the 2013 Project Study Report.
8. Cumulative plus Project with Candlestick Interchange and Recommended Improvements represents cumulative conditions for the year 2040 consistent with the buildout of the Brisbane General Plan and regional growth associated with Plan Bay Area, full buildout of the Specific Plan, improvement of the Candlestick Interchange, and implementation of improvements recommended in TIA (Appendix F.1).

Cumulative Impact Conclusion

The Plan Bay Area 2050 EIR identifies projected VMT for the San Francisco Bay Area in the year 2050 to be between 175,497,000 and 181,917,000, which theoretically includes development of the Baylands as adopted in Brisbane's General Plan Amendment GP-1-18. However, model runs prepared for the Baylands transportation analysis indicate VMT for the nine-county Bay Area region will be 197,771,000 in the Year 2040. A significant cumulative impact would therefore result from total regional development.

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact

As indicated in **Table 7-12**, the Baylands Specific Plan would reduce regional VMT, with or without the Candlestick Interchange. The 2025 Baylands Specific Plan project would not have a cumulatively considerable contribution to a significant VMT impact.

Table 7-12: Effect of the Baylands Specific Plan on Regional Vehicle Miles Traveled

Cumulative Analysis Scenario	Nine-County Regional VMT (miles)	Change from Cumulative No Project (miles)
Year 2040 Cumulative VMT with Baylands development distributed around the nine-county Bay Area region	197,771,000	NA
Year 2040 Cumulative VMT with Baylands development but no Candlestick Interchange improvements	197,691,000	-80,000
Year 2040 Cumulative VMT with Baylands development and improvement of the Candlestick Interchange	197,666,000	-105,000

SOURCE: Fehr & Peers, 2025

Impact TRA-2: Use of Bicycle, Pedestrian, and Transit Modes of Transportation

To achieve regional GHG emissions reduction targets, Plan Bay Area 2050 forecasts a 300-percent projected increase in bicycle trips from baseline (2015) to future conditions (2050), resulting in bicycle trips growing from two percent of all trips in 2015 to seven percent of all trips by 2050. Each of the cities and counties within the cumulative impact analysis area maintain General Plan circulation elements intended to facilitate use of bicycle, pedestrian, and transit modes of travel. Development projects within these cities and counties would be required to be consistent with the applicable General Plan circulation element and to provide such facilities as necessary to achieve that consistency.

Cumulative Impact Conclusion

While the General Plan circulation elements for Brisbane, South San Francisco, Daly City, San Mateo County, and San Francisco each contain policies and programs to facilitate use of bicycle, pedestrian, and transit modes of travel, plans for bicycle and pedestrian facilities tend to focus on local facilities and connections to existing or already planned regional facilities. By comparison, local General Plan policies to facilitate the use of transit tend to focus on a more regional or subregional basis due to the regional focus of transit providers and transit planning agencies. None of the General Plan circulation elements in the cumulative analysis were developed with the express intent of achieving a 300-percent projected increase in bicycle trips from baseline (2015) to future conditions (2050) or to grow bicycle trips from two percent of all trips in 2015 to seven percent of all trips by 2050. Thus, cumulative development projects would exceed the capacity of planned bicycle and pedestrian systems, and a significant cumulative impact would result.

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact

As noted in the significance conclusion for Impact TRA-2, the Specific Plan includes several inadequate bicycle and pedestrian connections. In addition, the proposed 4-lane roadway cross-section for the Geneva Avenue bridge would be inconsistent with planned bus rapid transit improvements and would hinder rather than facilitate transit use. Mitigation measures are

proposed including widening the Geneva Avenue bridge and requirements to provide adequate bicycle and pedestrian connections. The 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative impact related to use of bicycle, pedestrian, and transit modes of transportation.

Impact TRA-3: Hazards to Vehicles, Bicyclists, or Pedestrians

The cities and counties within the cumulative impact analysis area each maintain design standards for roadways, as well as for pedestrian and bicycle facilities. Development projects within these cities and counties would be required to comply with such development standards.

Cumulative Impact Conclusion

Cumulative development would be required to comply with design standards maintained by cities, counties, and transportation agencies for roadways, as well as for pedestrian and bicycle facilities based on commonly accepted engineering safety standards such as those developed by Caltrans. Thus, a less than significant cumulative impact would result.

Impact TRA-4: Emergency Access

Although construction activities could temporarily impair roadways used for emergency response and evacuation, projects requiring encroachment permits for temporary construction activities within public roadways that could be used for emergency response or evacuation are required to implement traffic mitigation plans that address traffic control during the period when project construction is occurring within public right-of-way. To address any temporary road closures that would be required during construction, standard construction procedures include notification of emergency responders and development of alternative routes for emergency access.

Although design details of future cumulative projects cannot be known, Brisbane and adjacent cities maintain design standards for new and existing development and roadways to ensure passage of emergency vehicles. In addition, emergency access for cumulative projects would be subject to review by jurisdictions with authority over the projects as well as responsible emergency service agencies, thereby ensuring projects would be designed to meet applicable emergency access and design standards.

Cumulative Impact Conclusion

Although individual projects would be subject to standard design and construction requirements, cumulative development projects can be expected to occur simultaneously at multiple locations. Thus, police, fire, and emergency medical responders could experience multiple delays and inconveniences during any given emergency response trip. A less than significant cumulative impact would result.

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact.

The Baylands Specific Plan and other cumulative projects would meet standard design and construction requirements, minimizing adverse effects on emergency response, and result in a significant cumulative impact only because of the potential for emergency responders to encounter lane closures and minor delays from multiple projects during a single emergency trip. The 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative impact related to emergency access.

7.3.7 AIR QUALITY

a. Geographic Context and Method of Analysis

The geographic context and methodology of analysis for cumulative air quality impacts are identified in **Table 7-13**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-13: Geographic Context and Methodology for Analysis of Cumulative Air Quality Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact AQ-1 Emissions of Criteria Pollutants	San Francisco Bay Area Air Basin	Projections-based analysis of criteria air pollutant emissions.
Impact AQ-2 Consistency with Applicable Air Quality Plan	San Francisco Bay Area Air Basin	Projections-based analysis of criteria air pollutant emissions.
Threshold AQ-3 Health Risk	Lands within 1,000 feet of the exterior boundaries of the Baylands Specific Plan	Land development and infrastructure projects, including the Baylands Specific Plan and: • Brisbane (Cumulative Projects AA, BB) [a] • Infrastructure and Remediation Projects (Cumulative Projects A, B, C, E, F, G, I, M, N) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Project 6)
Impact AQ-4 Odors	Lands within 1,000 feet of the exterior boundaries of the Baylands Specific Plan	Land development and infrastructure projects, including the Baylands Specific Plan and: • Brisbane (Cumulative Project AA) • Infrastructure and Remediation Projects (Cumulative Projects A, B, C, E, I, N) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Project 6)

NOTE:

a. Although Cumulative Projects 1, 2, and 4 within the Sierra Point area are within 1,000 feet of the lagoon portion of the Specific Plan, they are not within 1,000 feet of any Baylands housing, commercial/office development, or existing sensitive receptors and are therefore not analyzed as cumulative projects in relation to health risks.

b. Cumulative Impacts: Would the proposed Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative air quality impacts?

Impact AQ-1: Emissions of Criteria Pollutants for which the Air Basin is in Non-Attainment

Construction Emissions

Construction activity for cumulative development within the air basin, although temporary in nature at individual sites, would be expected to occur throughout the Specific Plan's construction period. Cumulative construction emissions are dependent on the extent of construction activities being undertaken for the 2025 Specific Plan project in combination with past, present, and reasonably foreseeable probable future projects under construction concurrently within any given year.

As individual projects are developed, construction activity would result in emissions of criteria air pollutants (e.g., $PM_{2.5}$ and PM_{10}) and precursors (e.g., reactive organic gases [ROGs] and NO_X) from site preparation (e.g., excavation, grading, and clearing); exhaust from off-road equipment, material delivery vehicles, and worker commute vehicles; vehicle travel on paved and unpaved roads; and other miscellaneous activities (e.g., building construction, asphalt paving, application of architectural coatings, and trenching for utility installation). Typically, the site preparation phase typically generates the greatest emission levels from activities associated with grading, compacting, and excavation.

The USEPA and CARB have adopted rules and regulations establishing criteria pollutant and hazardous emissions limits for diesel-powered on-road vehicles and off-road equipment. Implementation of USEPA and CARB rules and emission standards is therefore reasonably foreseeable. In addition, CARB's clean fuel standards would reduce emissions from all internal combustion engines and their stationary and portable equipment regulations would reduce emissions from the smaller equipment used at construction sites, such as portable generators and tub grinders.

Although the USEPA and CARB have adopted stringent air diesel PM emission regulations for construction equipment, these regulations alone do not ensure that each cumulative project would use only the lowest emissions-generating construction equipment due primarily to the fleet averaging component of the compliance requirements. It can be anticipated that construction impacts from some of the larger individual cumulative land development and infrastructure projects may individually exceed the thresholds for short-term construction criteria air pollutant emissions, particularly if best management practices (BMPs) are not implemented.

Operational Emissions

The Plan Bay Area 2050 EIR projects that area-source emissions of criteria pollutants and precursors would increase from 2015 through 2050. Area-source ROG emissions would increase by 22.8 tons per day, NO_X emissions by 5.3 tons per day, PM_{10} emissions by 1.5 tons per day, and $PM_{2.5}$ emissions by 1.5 tons per day due to increased population, households, and employment in the region. In addition, because the Bay Area is in nonattainment for state and federal ozone standards, the federal 24-hour $PM_{2.5}$ standard and state PM_{10} standard, and emissions of ozone precursors (ROG and summertime NO_X), $PM_{2.5}$ and PM_{10}, the Plan Bay Area 2050 EIR evaluated projected increased pollutant emissions to determine whether a cumulatively considerable net increase would result.

Although VMT in the Bay Area region will increase through 2050, the Plan Bay Area 2050 EIR concluded that mobile source emissions of criteria pollutants ROG, NO_X (summertime and wintertime), and $PM_{2.5}$ in the region would decrease between 2015 and 2050. When compared to existing conditions (2015), emissions associated with regional development consistent with Plan Bay Area 2050 projections would be reduced: ROG emissions by 70 percent (41.1 tons per day), summertime NO_X emissions by 81 percent (89.9 tons per day), and wintertime NO_X emissions by 81 percent (102.2 tons per day). The primary reason for these reductions is the increasingly stringent emission controls adopted by CARB for new vehicle engines and fuels, enhanced smog check programs, and fleet turnover wherein older polluting cars are retired and replaced with newer and substantially less polluting cars. In addition, the Bay Area's higher density transit-oriented development future land use pattern combined with transit investment and investment would reduce per capita driving and motor vehicle emissions.

Table 7-14 shows the 2015-2050 daily emissions change that is projected within the region.

Table 7-14: Net Projected Change in Regional Mobile and Area Source Emissions (Tons per Year)

Source	ROG	NO_X	PM_{10}	$PM_{2.5}$
Mobile	-41.1	-89.9	-0.7	3.0
Area	22.8	5.3	1.5	1.5
TOTAL	**-18.3**	**-84.6**	**0.8**	**4.5**
Increase from Existing?	**No**	**No**	**Yes**	**Yes**

SOURCE: Plan Bay Area 2050 EIR

Cumulative Impact Conclusion

As shown in **Table 7-14**, a net decrease in ROG and NO_X emissions is projected along with an increase in PM_{10} and $PM_{2.5}$ emissions within the Bay Area Air Basin. Increased PM_{10} and $PM_{2.5}$ emissions would contribute to the existing nonattainment condition for state and federal PM standards, thereby increasing the potential for adverse health impacts from exposure to PM.

Recognizing this regional air quality impact, the Plan Bay Area 2050 EIR proposed Mitigation Measures AQ-3(a) through AQ-3(d). Mitigation Measures AQ-3(a) through AQ-3(d) would reduce significant impacts from forecasted increases in $PM_{2.5}$ and PM_{10} because they would lead to reductions in vehicle trips and VMT. Further, Plan Bay Area 2050 EIR Mitigation Measure AQ-3(e) would reduce area-source emissions from natural gas combustion and landscaping equipment in new developments. Projects taking advantage of CEQA streamlining provisions of SB 375 (PRC Sections 21155.1, 21155.2, and 21159.28) would be required to apply these mitigation measures to address site-specific conditions. However, because reductions cannot be estimated, the Plan Bay Area 2050 EIR determined that it could not be concluded with certainty all significant impacts would be avoided. Thus, a significant and unavoidable cumulative impact would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

With implementation of Mitigation Measures MM AQ-2b through M-AQ-2d, construction NO_X emissions would be reduced, but not below the significance thresholds, as shown in **Table 4.9-12** and **Table 4.9-13**. Fugitive PM_{10} from construction would be reduced to less than significant through Mitigation Measure MM AQ-2a, which requires implementation of best management practices to minimize dust and would ensure impacts would not exceed the threshold fugitive PM_{10} and $PM_{2.5}$ from construction. Mitigation Measures MM AQ-2e through MM AQ-2j would reduce operational emissions for Phase 1 development and full Specific Plan buildout; however, emissions of all criteria pollutants would still exceed significance thresholds after mitigation.

Due to these significant unavoidable impacts, Baylands development would have a cumulatively considerable contribution to significant cumulative impact related to emissions of criteria pollutants.

Impact AQ-2: Consistency with the San Francisco Bay Area Clean Air Plan

Development projects within Brisbane would be subject to the provisions of the Brisbane General Plan, while cumulative development projects within San Francisco, South San Francisco, and Daly City would be subject to the provisions of those communities' General Plans. Even though each cumulative development project would be consistent with the local General Plan, General Plan consistency would not necessarily equate to consistency with the San Francisco Bay Area Clean Air Plan.

Transportation and infrastructure projects would be subject to the requirements of the agency undertaking such projects and would be required to be consistent with the San Francisco Bay Area Clean Air Plan and Plan Bay Area 2050 if state or federal funding was proposed. However, because state or federal funding might not be sought for all such projects, it is possible that some transportation or infrastructure projects would not be consistent with the San Francisco Bay Area Clean Air Plan.

Cumulative Impact Conclusion

To fulfill state ozone planning requirements, BAAQMD's 2017 Clean Air Plan, Spare the Air Cool the Climate (2017 Plan), includes all feasible measures to reduce emissions of ozone precursors—ROG and NO_X—and reduce transport of ozone and its precursors to neighboring air basins. In addition, the 2017 Plan builds upon and enhances BAAQMD's efforts to reduce emissions of $PM_{2.5}$ and TACs. The Plan Bay Area 2050 EIR concluded that the Plan Bay Area 2050's core objectives and strategies align with and would support the implementation of the 2017 Clean Air Plan. Thus, cumulative development consistent with Plan Bay Area 2050 growth projections projects "would not conflict with or obstruct implementation of the primary goals, applicable control measures, or implementation of any control measures of BAAQMD's 2017 Clean Air Plan" (MTC/ABAG, 2021), and a less than significant cumulative impact would result.

Impact AQ-3: Health Risk

Based on guidance from the BAAQMD, a significant cumulative health risk impact would occur if a project plus background and future cumulative stationary and mobile sources within a "zone of influence" of 1,000 feet consistent with the BAAQMD Modeling Guidance (BAAQMD 2022a) would combine with a project's health risks to expose sensitive receptors to substantial levels of toxic air contaminants (TACs) resulting in:

- A cancer risk level greater than 100 in 1 million;
- A non-cancer risk (chronic or acute) HI greater than 10.0; or
- Annual average $PM_{2.5}$ concentration of greater than 0.8 $\mu g/m^3$.

Existing (Background) Sources of Toxic Air Contaminants

The combined health risks from all existing background TAC and $PM_{2.5}$ sources were evaluated at the Baylands on-site and off-site maximally exposed individual residences (MEIRs) and at the on-site school receptor. Sources evaluated included all BAAQMD-permitted stationary sources, roadways with more than 44,000 vehicles per day,[390] the Caltrain rail line, and any other major source of emissions within 1,000 feet of the Specific Plan area. The cumulative health risk assessment tabulated the impact of Specific Plan-generated health risks plus off-site sources (stationary and mobile) near off-site and on-site MEIRs. As such, this evaluation identifies all sources within 1,000 feet of the project boundary.

[390] The BAAQMD recommends intersection-specific modeling of CO concentrations only for intersections where traffic volumes would exceed 44,000 vehicles per hour (24,000 vehicles per hour where vertical and/or horizontal mixing is limited), based on modeling of vehicle emissions demonstrating that below this volume of traffic CO concentrations would not exceed the applicable state air quality standards.

Cumulative Projects and Baylands Contribution to Cumulative Health Risk

The cumulative projects identified in **Table 7-13** were evaluated for their potential to contribute to cumulative health risks at a common maximally exposed individual resident (MEIR) within the Baylands. The TACs of concern from cumulative projects would include DPM from construction equipment and vehicles and from emergency backup generators, speciated TOGs from gasoline-fueled passenger vehicles, and entrained road dust ($PM_{2.5}$) from project-related travel on paved roads.

The **Caltrain Modernization Program** is nearing completion of electrification of Caltrain locomotives. These locomotives will be fully electric by the time the first phase of construction begins in the Baylands (PCJPB 2014). As a result, construction activities would not overlap with those of the Baylands. In addition, since Caltrain operations would be electrified prior to Baylands development, Modernization Program operations would not be a source of health risks.

The **California High Speed Rail** Final EIR/EIS determined that construction of high-speed rail facilities would contribute a maximum excess cancer risk of 1.1 per million and an annual average $PM_{2.5}$ concentration of less than 0.1 $\mu g/m^3$ along the subsection between San Francisco and South San Francisco. Because the state legislature has not provided funds for construction of high-speed rail between San Francisco and San Jose, the timing of construction in relation to Baylands construction cannot be known.

The Baylands Specific Plan would construct the **Geneva Avenue extension**, including the bridge over the Caltrain right-of-way, the impacts of which are included in Baylands' impacts.

While construction of **US 101 freeway interchange improvements** would generate TACs, construction of those impacts would not occur simultaneously with Baylands construction. Once constructed, the only operational TAC emissions associated with interchange improvements would be associated with the location of ramps that may be closer to existing or proposed receptors, thereby creating an increase in traffic emissions. However, such an increase in TACs from the US 101 interchange would be minor as would operational TACs from Baylands development and would be insufficient to combine to adversely affect a common MEIR. Thus, cumulative effects would be less than significant.

Baylands site remediation and **Title 27 Final Landfill Closure** cumulative projects would overlap in time with Baylands grading operations and are required to be completed prior to construction of buildings within Phase 1 and Phase 2 of the Specific Plan, respectively. Within the western portion of the Baylands, grading pursuant to a City of Brisbane grading permit would be the primary construction activity generating TACs. No information is available regarding quantified emissions of TACs for site remediation or resulting health risks. Because remediation activities are required by law to not increase health risks, it can be reasonably concluded that remediation actions undertaken subject to the regulatory authority of the Regional Water Quality Control Board and the Department of Toxic Substances Control would,

at most, add only minor TACs to those emitted by site grading. Within the eastern portion of the Baylands, construction of a landfill cap would overlap in time with grading pursuant to a City of Brisbane grading permit as soil materials within portions of the former landfill area are moved to the eastern portion of the Baylands. No information on the staging of landfill cap construction is available, making it impossible to quantify TAC emissions that might result from landfill cap construction that would overlap in time with Baylands site grading within the eastern portion of the Baylands. The environmental clearance for Title 27 Final Landfill Closure does not identify a significant cumulative TAC emissions impact and it is therefore reasonable to conclude that construction of the landfill cap would be coordinated with Baylands grading activities such that cumulative health risk impacts would be less than significant. Once operational, Baylands site remediation and final landfill closure would require infrequent trips for maintenance purposes and would not result in new sources of operational TACs.

The **Recology Modernization** project would have the potential to create construction and operational TAC emissions within its existing footprint. Such activities may include renovation of the construction and demolition debris sorting line, installation of new mechanical separation equipment, and construction of a fleet maintenance yard. Activities associated with these changes could increase TAC emissions levels. The nearest receptors to the Recology site are located in the Little Hollywood neighborhood of San Francisco, which is directly north of the Recology facility. Other future receptors include housing within the Bayshore District of the Baylands and within the Baylands North development in San Francisco. Activities associated with the Recology Modernization project could expose future proposed project receptors to an increase in risk levels from diesel combustion equipment used by Recology and from any fugitive $PM_{2.5}$ that could be generated from movement over paved and unpaved surfaces. While a wide variety of improvements to modernize existing Recology facilities and increase diversion of wastes to varying degrees have been proposed in the past, the Recology Modernization project has long been dormant, and sufficient information is not available to estimate changes in TAC emissions from modernization of Recology facilities.

The **Egbert Substation and SFPUC PG&E Acquisition** projects, as well as the Baylands Specific Plan, each include improvements to the Martin Substation. New PG&E equipment for the Baylands is expected to be consistent with the overall scale and type as existing equipment already located at the Martin Substation, such as transformers and HVAC equipment. This is also true for the Egbert and SFPUC projects. The closest sensitive receptors to the Martin Substation are across Geneva Avenue, but they would not be exposed to increased TAC emissions since future activities would be similar to existing activities.

The **Brisbane Housing Element** identifies housing opportunity sites. Housing opportunity sites other than Phase 1 of the Baylands are located well beyond the 1,000-foot geographic scope for cumulative risk impacts.

The **Baylands North** project would be constructed immediately adjacent to the residential and commercial towers in the Specific Plan's Bayshore District, across the extended Sunnydale Avenue. Potential cumulative risk impacts would mainly be associated with construction DPM and $PM_{2.5}$ emissions, plus operational mobile source TOG and $PM_{2.5}$ emissions after buildout, plus DPM emissions from any emergency backup generators. Much of Baylands North construction could overlap with Baylands grading and construction. However, quantified TAC emissions from Baylands North are not available.

Because of the significant project-level impacts identified for Baylands development in Impact AQ-3, the following mitigation measures were identified and are required to reduce the project-level impacts to less than significant.:

- **MM AQ-2a: Construction Best Management Practices**
- **MM AQ-2b: Clean Off-Road Construction Equipment**
- **MM AQ-2d: Clean On-Road Construction Trucks**
- **MM AQ-2f: Best Available Emissions Controls for Stationary Emergency Generators**
- **MM AQ-2h: Operational Truck Emissions Reduction**
- **MM AQ-2i: Electric Vehicle Charging Infrastructure**
- **MM AQ-2j: Electric Landscaping Equipment**

Because implementation of these measures is required of Baylands development, cumulative health risk impacts were evaluated including mitigated Baylands construction and operations.

Cumulative Health Risk Analysis

Table 7-15 and **Table 7-16** identify the cumulative incremental increase in lifetime cancer risk, non-cancer chronic hazard index, acute hazard index, and maximum annual-average $PM_{2.5}$ concentrations, including unmitigated Baylands emissions. The sensitive receptor locations shown in these tables are the same ones included in **Table 4.9-14** and **Table 4.9-15** for project-level health risks.

Table 7-15 and **Table 7-16** indicate that cumulative cancer risk, chronic hazard index, acute hazard index, and annual-average $PM_{2.5}$ concentration would all be below the cumulative significance threshold at the MEIRs and Baylands Middle School.

Thus, a less than significant cumulative health risk impact would result.

Table 7-15: Cumulative Incremental Increase in Lifetime Cancer Risk, Chronic Hazard Index, and Annual-Average $PM_{2.5}$ Concentration for Construction and Operations throughout Baylands Development

Receptor Type/Emissions Source[a]	Incremental Increase in Lifetime Cancer Risk (in 1 million)[b]	Chronic Hazard Index[b]	Acute Hazard Index[b]	Annual-Average $PM_{2.5}$ Concentration ($\mu g/m^3$)[b]

Impact AQ-4: Generate Odors Adversely Affecting a Substantial Number of People

Typical sources of odorous emissions include landfills, transfer stations, and composting facilities; petroleum refineries, asphalt batch plants, chemical (including fiberglass) manufacturing, and metal smelters; painting and coating operations; rendering plants; coffee roasters; and food processing facilities.

Of the cumulative projects cited in **Table 7-2**, only the Recology 501 Tunnel Avenue Facility Modernization Project (Cumulative Project I) has the potential to combine with the Baylands Specific Plan to generate a significant cumulative odor impact. Other cumulative projects listed above would not construct the type of facility associated with odors. The odors associated with these cumulative projects would be those from diesel-powered vehicles and equipment during construction and would cease once construction is complete.

While modernization of the existing Recology solid waste management facility would be required to provide odor control measures, the effectiveness of those measures to eliminate objectionable odors cannot be known in the absence of a specific design for the modernization project and specific odor control measures. As documented in Impact AQ-4, with odor control measures required by Mitigation Measure MM AQ-4, the Baylands water recycling facility would not emit odors detectable at or beyond the property line of the facility. Thus, the Baylands Specific Plan would not combine with the Recology 501 Tunnel Avenue Facility Modernization Project to generate a significant odor impact, and no cumulative impacts would occur.

The Specific Plan could result in objectionable odors from the water recycling facility. As described in Impact AQ-4, to control odors, wastewater processing tanks and structures would be enclosed and/or covered and provided with positive ventilation through an odor control system, which would likely include a two-stage process that involves a biological trickling filter followed by granular activated carbon. With these controls, the Specific Plan would not contribute to a cumulative impact in combination with the Recology facility.

7.3.8 GREENHOUSE GAS EMISSIONS

a. Geographic Context and Method of Analysis

Greenhouse gas (GHG) emissions impacts throughout the state are assessed in terms of a project's contribution to a cumulative effect since no single project can cause a discernible change to climate. Climate change impacts are the result of incremental contributions from natural processes, as well as past and present human activities. Therefore, the area in which a proposed project in combination with other past, present, or probable future projects could contribute to a significant cumulative climate change impact due to GHG emissions cannot be defined by a geographical boundary such as a combination of sites, a city, a county, a metropolitan region, or an air basin. Because GHG emissions do not recognize political

boundaries, past, present, and future development projects contribute to global GHG emissions. BAAQMD CEQA Guidelines state that global climate change represents a significant cumulative impact to which the GHG emissions of individual projects contribute to the significant adverse environmental impacts of global climate change. The Specific Plan's GHG emissions would contribute to cumulative climate change effects, as described in Section 4.10.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative greenhouse gas emissions impacts?

Impact GHG-1: Emissions of Greenhouse Gases

The Plan Bay Area 2050 EIR notes that the Intergovernmental Panel on Climate Change (IPCC) has reached consensus that human-caused emissions of GHGs in excess of natural ambient concentrations are responsible for intensifying the greenhouse effect and leading to a trend of unnatural warming of the earth's climate, known as global climate change. It is "extremely likely" that more than half of the observed increases in global average surface temperature from 1951 to 2010 were caused by the anthropogenic increase in GHG concentrations and other anthropogenic forces together.

IPCC predicts that the global mean surface temperature will increase by the end of the 21st century (2081–2100), relative to 1986–2005, could range from 0.5 to 8.7 degrees Fahrenheit and that global mean sea level rise will continue during the 21st century, very likely at a faster rate than observed from 1971 to 2010.

The Plan Bay Area 2050 EIR also notes that accelerating global climate change has the potential to cause adverse impacts in the Bay Area, including but not limited to the following:

- Water Supply: Changes in local rainfall, saltwater intrusion, seawater flooding the Sacramento–San Joaquin Delta (Delta), and a reduced Sierra Nevada snowpack can all threaten the Bay Area's water supply. The potential for larger storms may also threaten current water management systems and infrastructure.
- Infrastructure: Increased risks of flooding because of sea level rise, coastal erosion, more frequent and extreme storms, and stronger precipitation events may lead to damage, inoperability, or impairment of critical infrastructure, such as wastewater treatment plants, sewage, power plants, and transportation. This would affect not only daily commutes and activities but also emergency response. Increased wildfires also threaten much of the inland infrastructure and can have cascading effects with rainfall on areas that were recently burned. Increased temperatures may complicate this adaptation, as they are expected to increase roadway construction costs.

- Agriculture: Changes in temperatures, more extreme heat days, and the earlier onset of spring may lead to suboptimal growing conditions for grapes and other agricultural products that significantly contribute to the Bay Area economy and tourism.
- Ecosystems and Biodiversity: Increased temperatures and wind changes are expected to increase the size and severity of wildfires, damaging habitat resilience and connectivity. With sea level rise, the Bay Area's coastal wetlands are threatened and cannot naturally move inland because of existing developments, thus destroying this important ecosystem. This threatens the region's freshwater fish species and may allow nonnative species to thrive. Increased temperatures also result in increased fire risk.
- Energy Demand, Supply, and Transmission: Increasing wildfires attributable to climate change threaten the transmission and distribution of electricity. Coastal flooding may affect other energy infrastructure, including oil and gas refineries or terminals. These challenges may be exacerbated by more common temperature extremes, which could lead to increased demand. This could lead to rolling blackouts or other issues with the Bay Area's aging energy infrastructure.
- Public Health: Many Bay Area residences and businesses were not built with air conditioning to control temperatures on extreme heat days, which may lead to illness and mortality. Higher temperatures also lead to worsened air quality and potentially the spread of diseases and pests. Increased incidence and severity of wildfires may also contribute to worsening air quality. These changes will disproportionately burden vulnerable populations.
- Tribal and Indigenous Communities: Tribal relationships with the environment have been limited because of historic U.S. policy. For many tribes, modern land status and geographic allotments create challenges for them to adapt to a changing climate.

Cumulative Impact Conclusion

A significant cumulative impact related to greenhouse gas emissions would result from Baylands development in combination with past, present, and probable future projects. As explained in BAAQMD CEQA Guidelines:

> *Similar to regulated air pollutants, GHG emissions and global climate change also represent cumulative impacts. GHG emissions contribute, on a cumulative basis, to the significant adverse environmental impacts of global climate change. Climate change impacts may include an increase in extreme heat days, higher concentrations of air pollutants, sea level rise, impacts to water supply and water quality, public health impacts, impacts to ecosystems, impacts to agriculture, and other environmental impacts. No single project could generate enough GHG emissions to noticeably change the global average temperature. The combination of GHG emissions from past, present, and future projects contribute substantially to the phenomenon of global climate change and its associated environmental impacts.*

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact

BAAQMD CEQA Guidelines indicate, if a project is determined to have a significant GHG emissions impact, the impact is cumulatively considerable. As discussed in Impact GHG-1, even with mitigation, Baylands development would generate a net increase in GHG emissions and therefore have a significant impact. Thus, the 2025 Specific Plan project Baylands development would have a cumulatively considerable contribution to a significant cumulative impact in relation to increased emissions of GHG.

Impact GHG-2: Regional Greenhouse Gas Emissions

The Plan Bay Area 2050 EIR estimated that annual regional GHG emissions in the nine-county Bay Area would increase by 589,400 $MTCO_2e$ from 2015 to 2050, and that San Mateo and San Francisco counties would account for 42.0 percent of that increase. In comparison, Alameda County would account for 55.5 percent of the regional increase. Thus, a significant cumulative impact would result.

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact

The Specific Plan's location in relation to transit, its mix of land uses, and implementation of TDM programs result in substantially lower per capita VMT than the regional average for Specific Plan area employees and workers. The Baylands lower per capita VM T would reduce future cumulative 2040 daily regional VMT by 80,000 miles at buildout (105,000 miles with construction of Candlestick interchange improvements) when comparing cumulative future 2040 regional VMT with and without the Specific Plan development.[391] The 2025 Specific plan project would not have a cumulatively considerable contribution to a significant cumulative impact related to regional GHG emissions.

Impact GHG-3: Consistency with Applicable Greenhouse Gas Emissions Reductions Plans, Policies, and Regulations

GHG reduction plans are adopted by national, state, and local jurisdictions. Within California, local climate action plans and GHG reduction plans are adopted locally to achieve the goals set in CARB's Scoping Plan and are therefore designed to support the same state-mandated goals and targets for GHG reduction. It is the responsibility of a myriad of local jurisdictions and transportation agencies to determine the specific greenhouse emissions measures to be implemented and whether such projects would be consistent with applicable emissions reductions plans, policies, and regulations.

[391] The cumulative future 2040 without Specific Plan scenario assumes that the 2,200 dwelling units, 6.5 million square feet of commercial development, and 500,000 square feet of hotel use proposed for the Specific Plan would occur outside of the Baylands within San Francisco and San Mateo County.

As a result, there is no assurance that cumulative development would be consistent with applicable emissions reductions plans, policies, and regulations or that the regional and state-wide reductions needed to attain 2030 and 2050 targets would be achieved. Nor is there assurance that global GHG reductions needed to avoid the adverse effects of climate change can be achieved.

Cumulative Impact Conclusion

The potential adverse effects of greenhouse gas emissions are well documented. Because there can be no assurance that individual projects would be consistent with applicable emissions reduction plans, policies, and regulations to the extent that the adverse effects of greenhouse gas emissions can be avoided, a significant cumulative impact would result.

Incremental Contribution of the Baylands Specific Plan to Significant Cumulative Greenhouse Gas Emissions Impacts

As documented in Section 4.10, Baylands development would be consistent with applicable greenhouse gas emissions reduction plans, policies, and regulations. Thus, the Specific Plan's contribution to the significant cumulative greenhouse gas emission impact would be less than cumulatively considerable.

7.3.9 ENERGY RESOURCES

a. Geographic Context and Method of Analysis

The geographic context for analysis of cumulative energy resources impacts is the nine-county San Francisco Bay Area and relies on the household and employment projections approved by MTC and ABAG for use in the regional sustainable communities strategy (see **Table 7-17**). The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-17: Geographic Context and Methodology for Analysis of Cumulative Energy Impacts

	Geographic Context	List- or Projections-Based Analysis
Threshold EN-1 Energy Consumption	Nine-county San Francisco Bay Area region.	Projections-based analysis of regional energy use.
Threshold EN-2 Consistency with Plans for Energy Efficiency	Nine-county San Francisco Bay Area region.	Projections-based analysis of consistency with plans for energy efficiency.

The Specific Plan would begin contributing incremental impacts to cumulative environmental conditions starting upon initiation of development on the Specific Plan site and would continue to do so through the *Plan Bay Area* horizon year of 2050 and beyond for the lifetime of the Specific Plan.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative energy resources impacts?

Impact EN-1: Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources

Existing and projected energy consumption of projected population and employment growth in the region, measured in gigawatt-hours of electricity, BTU of natural gas, gallons of gasoline, and gallons of diesel fuel, was estimated for the year 2050 and compared to the regional projections' 2015 baseline year (MTC/ABAG 2021, **Table 3.6-5** and **Table 3.6-8**). MTC and ABAG estimated that annual electrical consumption within the nine-county Bay Area region would increase by 7.809 million megawatt hours, or about 14 percent, between 2015 and 2050. They also estimated that annual natural gas consumption would increase by 12,432,000 million British thermal units, or about 4 percent, during the same period. Each of these increases is well below the estimated increase in population (35 percent) and employment (also 35 percent) during the 2015-2050 planning horizon (MTC/ABAG 2021, Table 2-16). This means that the use of energy per capita is expected to decline substantially over time, resulting in a more efficient energy system which supports a larger economy.

For electricity, overall supply during most conditions is adequate; therefore, there is no existing significant adverse condition that would be worsened or intensified to which Baylands development might contribute. However, as demand continues to increase in PG&E's service area, temporary shortfalls could occur in PG&E's system (and other portions of the state-wide grid) during temporary periods of high peak demand. Peak demands occur in the region during the summer's hot weather conditions when people run their air conditioners. In the future, electrification of buildings and increased use of electricity as a transportation fuel would add to PG&E's peak demand.

With an increasing number of hot-weather days and the move toward electrification of buildings, meeting demand during peak periods is a key planning consideration for the utility. PG&E is actively planning to offset growth in peak demands by encouraging and deploying energy efficiency and conservation measures within its service area. Through a combination of increases in efficiency and deployment of power management strategies, including power imports during peak periods, PG&E expects to maintain sufficient capacity to provide power to its service area, including development allowed under the proposed project, at least through 2035 (PG&E 2022). More importantly, with the addition of on-site PV generation to satisfy EV charging demand, the project would generate more renewable solar energy than the total energy consumed. The renewable solar energy would be stored in the on-site battery storage facility. Therefore, on an annualized basis, the contribution of the proposed project to a potential cumulative impact with respect to electrical supply and capacity would not be cumulatively considerable.

Projected gasoline and diesel fuel consumption in the region was estimated based on the analysis of VMT estimates developed by MTC, fleet-average CO_2 emission rates for the region, and the carbon content of both fuel types. Fleet-average CO_2 emission rates for the region for both 2015 and 2050 were developed using CARB's emission factor model, EMFAC2021. MTC and ABAG estimated that gasoline consumption in the nine-county Bay Area would decrease by 2.4 million gallons (36 percent) daily, diesel consumption would decrease by 100,000 gallons (8 percent) daily, and natural gas consumption for transportation uses would double, to 20,000 gallons daily, from 2015 to 2050 (PG&E 2022, Table 3.6-9). The combined change would represent an approximately 31 percent decrease in transportation fossil-fuel fuel energy from gasoline, diesel, and natural gas combined.[392] This decrease in fossil-fuel fuel energy consumption would be partially offset by increases in electricity consumption as vehicles transition to EVs, but this increase in electricity demand is accounted for in the MTC and ABAG projections (MTC/ABAG 2021, **Table 3.6-5** and **Table 3.6-8**).

Site-specific development projects throughout the Bay Area would be required to comply with the energy efficiency standards in the California Green Building Standards Code (CALGreen Code)/Title 24 requirements, and some of the developments would provide for additional reductions in energy consumption by use of Leadership in Energy and Environmental Design (LEED©)-type energy efficiency infrastructure. This would reduce energy consumption for new buildings compared to existing regional averages; as stated above, population and employment growth would exceed the increase in overall energy use, resulting in less per-capita energy consumption.

Because *Plan Bay Area 2050* would promote compact development in established communities with high-quality transportation access, transportation-related fossil fuel consumption associated with new development in the Bay Area is projected to decrease through 2050 due to a number of factors, including development patterns that provide for greater use of transit and higher density mixed use development that allows residents to work, shop, and live within a small area, reducing average trip lengths, as well as increased use of transit and electric vehicles being recharged with 100 percent renewable energy (MTC/ABAG 2021, Table 2-16).

In addition, recent modifications to the CEQA Guidelines pursuant to Senate Bill (SB) 743 have introduced vehicle miles traveled (VMT) as the operative CEQA transportation significance threshold, replacing level of service (LOS) and other traffic delay metrics. The intent of this threshold is to reduce VMT within the region to align with CARB's goals of reducing state-wide VMT to achieve California's GHG reduction targets codified in SB 32 and AB 1279, including increasing transit usage and decreasing per capita energy consumption for vehicular travel. Other existing regulations are likely to result in more efficient use of all types of energy, and reduction in reliance on non-renewable sources of energy over the next 20+ years. These include

[392] It is noted that electricity use would increase with the increase in electric vehicles. This change is accounted for above in the discussion of energy use associated with population and employment growth.

the federal Energy Independence and Security Act and the state Long Term Energy Efficiency Strategic Plan (described in Section 4.11, *Energy Resources*), which are designed to reduce reliance on non-renewable energy resources and reduce energy demand by providing federal tax credits for purchasing fuel-efficient appliances and equipment. For these reasons, cumulative impacts associated with energy use would be less than significant.

Cumulative Impact Conclusion

Because projected population and employment growth would result in more efficient land use patterns, increased use of transit, and more energy-efficient buildings than "business-as-usual" conditions, projected cumulative energy use of the Specific Plan, in combination with other cumulative projects, would not be considered to be wasteful or inefficient, or to reflect significant unnecessary consumption. Thus, a less than significant cumulative impact would result.

Impact EN-2: Conflict with or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency

Consistency of cumulative development with energy-related provisions of the local General Plan and Plan Bay Area 2050 is included in the evaluation of significant impacts due to a conflict with an applicable adopted planning document in Section 7.3.1, Impact LUP-2, above.

7.3.10 NOISE AND VIBRATION

a. Geographic Context and Method of Analysis

The geographic context and methodology of analysis for cumulative noise and vibration impacts are identified in **Table 7-18**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-18: Geographic Context and Methodology for Analysis of Cumulative Noise and Vibration Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact NOI-1 Increase Ambient Noise Levels during Construction	Lands within 3,000 feet of the Baylands.[a]	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1, 2, and 4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D, E, F, G, I, M, and N) • San Francisco (Cumulative Projects 6, 7, and 10)

	Geographic Context	List- or Projections-Based Analysis
Impact NOI-2 **Increase Ambient Noise Levels from Traffic during Operations due to Traffic**	Lands adjacent to roadways in the vicinity of the Specific Plan area.	Projections-based analysis of noise increases that would be generated by traffic generated within the nine-county Bay Area along the following roadways: • Bayshore Boulevard from Blanken Avenue to the southerly Brisbane City limits • Geneva Avenue from Carter Street to US 101 freeway ramps • Tunnel Avenue from Old County Road/Tunnel Avenue to Beatty Road • Blanken Avenue from Executive Park Boulevard to Tunnel Avenue • Visitacion Avenue from Bayshore Boulevard to Mansell Street • Sunnydale Avenue from Bayshore Boulevard to Santos Street • Main Street from Bayshore Boulevard to Linda Vista Drive • Guadalupe Canyon Parkway west of North Hill Drive • Old County Road from Bayshore Boulevard to San Francisco Avenue • San Bruno Avenue from Bayshore Boulevard to Glen Park Way
Impact NOI-3 **Increase Ambient Noise Levels during Operations due to Stationary Noise Sources**	Lands within 1,000 feet of the Baylands.[b]	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects D–I, AA, BB, 1, 2, and 4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)
Impact NOI-4 **Expose People to Excessive Noise Levels**	Lands within and adjacent to the Baylands.	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects D–I, AA, BB, 1, 2, and 4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8)
Impact NOI-5 **Project-Induced Vibration**	Lands within 300 feet of the Baylands.[c]	Land development and infrastructure projects, including: • Infrastructure and Remediation Projects (Cumulative Projects A, B, D–I) • San Francisco (Cumulative Projects 5–7)
Impact NOI-6 **Exacerbate Human Annoyance or Hazards to Buildings due to Vibration Levels**	Lands within and adjacent to the Baylands.	Land development and infrastructure projects, including: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects D–I, AA, BB, 1, 2, and 4) • Infrastructure and Remediation Projects (Cumulative Projects A, B, D–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8)

NOTES:

a. This screening threshold distance was developed based on equations for stationary-source noise attenuation (California Department of Transportation, *Technical Noise Supplement to the Traffic Noise Analysis Protocol*, September 2013). The development analysis also used the combined noise levels generated by pile driving equipment. Using the attenuation equations, the maximum noise level of 101 dBA for a pile driver would diminish to 65 dBA at 3,000 feet. Hence, 3,000 feet is used as the geographic scope, since 65 dBA is a common daytime background noise exposure for an urban area and commensurate with monitored noise levels around the project site.

b. This screening threshold distance was also developed based on equations for stationary-source noise attenuation and an assumed operational stationary source at 80 dBA. Noise from such a source would diminish to below 55 dBA at 1,000 feet. Monitored nighttime average noise levels at the closest noise-sensitive receptors were above 55 dBA.

	Geographic Context	List- or Projections-Based Analysis

c. This screening threshold distance was developed based on equations for vibration attenuation (Federal Transit Administration [FTA], *Transit Noise and Vibration Impact Assessment Manual*, 2018) and reference vibration levels for pile drivers. Using the attenuation equations, the typical vibration level of 0.644 inches per second PPV for a pile driver would diminish to 0.016 inches per second PPV at 300 feet. Hence, 300 feet is used as the geographic scope, since 0.02 inches per second PPV is the applicable threshold for building damage to historic structures.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative noise and vibration impacts?

Cumulative construction noise impacts would occur if construction activities associated with the 2025 Specific Plan project and one or more cumulative projects in close physical proximity would overlap in time, whereas operation impacts would be assumed to routinely occur concurrently. Due to attenuation of sound over distance, only those cumulative projects immediately adjacent to the Baylands could combine to generate cumulative construction or stationary source noise impacts. Cumulative traffic noise impacts could be generated by traffic increases from cumulative projects throughout the Bay Area and are analyzed on roadways in the vicinity of the Baylands where the Specific Plan could generate measurable noise increases in combination with cumulative traffic.

Similarly, because vibration impacts dissipate quickly with distance, given the physical separation of cumulative projects from the Baylands and the low likelihood that vibration-generating activities (e.g., site grading) would occur simultaneously, cumulative vibration impacts would be less than significant.

Impact NOI-1: Substantial Temporary or Permanent Increase in Ambient Noise Levels from Construction

Cumulative construction noise impacts would occur when Baylands construction activities occur simultaneously with construction of one or more cumulative projects within 3,000 feet of the Baylands. In addition to Baylands construction noise impacts that would be significant and unavoidable, the High-Speed Rail EIR/EIS reported that construction of the Brisbane LMF could be exceed the 8-hour Leq criterion of 70 dBA as far as 354 feet from the building structure and as far away as 706 feet from pile-driving activity during the foundation work and 446 feet from non-pile-driving activity during foundation work. Given that the precise timing for construction of cumulative projects is generally unknown in relation to the various increments of Baylands construction, it is conservatively assumed that Baylands construction activities would occur simultaneously with cumulative projects.

Cumulative Impact Conclusion

Given that the Baylands construction noise impacts would be significant and unavoidable, simultaneous construction within the Baylands and the LMF or one or more other cumulative projects within 3,000 feet of the Baylands would further increase ambient noise levels and a significant cumulative impact would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

Since Baylands construction activities would generate a significant and unavoidable noise impact, Baylands construction activities would have a cumulatively considerable contribution to a significant cumulative impact related to construction noise.

Impact NOI-2: Cumulative Traffic Noise Impacts

Cumulative Year 2040 traffic data was analyzed to estimate cumulative roadway noise increases. The roadway segments analyzed and resulting noise increases from increased traffic on area roadways are shown in **Table 7-19** for 2040 cumulative plus Baylands Specific Plan buildout conditions during the weekday p.m. peak hour.[393] The cumulative noise level was then compared to the existing noise level to determine if a cumulative roadway noise impact would occur.

Cumulative Impact Conclusion

As shown in **Table 7-19**, significant cumulative traffic noise increases would exceed thresholds along six of the fifteen roadway segments that were analyzed, and a significant cumulative impact would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

The six roadway segments experiencing significant cumulative noise impacts were examined to determine if the Specific Plan's contribution would be cumulatively considerable. **Table 7-20** compares Year 2040 roadway cumulative traffic noise with and without Specific Plan buildout. As show in in that table, the 2025 Specific Plan project would have a cumulatively considerable along two roadway segments:

- Tunnel Avenue from Blanken Avenue to north of Beatty Road
- Guadalupe Canyon Parkway west of North Hill Drive

[393] The peak hour was used to represent the maximum period of traffic generation and associated noise generated by the project.

Table 7-19: Weekday Peak-Hour Traffic Noise Increases along Roadways in the Baylands Vicinity for Cumulative 2040 Plus Specific Plan Buildout

Roadway Segment	Existing	Applicable Increase Threshold (dB)	Cumulative 2040 plus Specific Plan Buildout	dBA Difference	Significant Increase?
Bayshore Boulevard from Blanken Road to Geneva Road	69.2	1.5	71.7	2.5	**Yes**
Bayshore Boulevard from Geneva Avenue to Old County Road/Tunnel Avenue	72.9	1.5	76.3	3.4	**Yes**
Bayshore Boulevard from Old County Road/Tunnel Avenue to Southern City Limits	73.9	1.5	76.3	2.4	**Yes**
Geneva Avenue from Carter Street to Bayshore Boulevard	68.1	1.5	71.0	**2.9**	**Yes**
Geneva Avenue Extension from Bayshore Boulevard to US 101 ramps	NA	NA	71.6	NA	No[a]
Tunnel Avenue from Old County Road/Tunnel Avenue to South of Lagoon Road	65.1	1.5	71.6	6.5	No[b]
Tunnel Avenue from Blanken Avenue to North of Beatty Road	64.7	3	70.7	6.0	**Yes**
Blanken Avenue from Executive Park Boulevard to Gillette Avenue	56.5	5	62.7	6.2	No[c]
Blanken Avenue from Bayshore Boulevard to Tunnel Avenue	60.2	3	61.5	1.3	No
Visitacion Avenue from Bayshore Boulevard to Mansell Street	56.6	5	57.7	1.1	No
Sunnydale Avenue from Bayshore Boulevard to Santos Street	58.4	5	60.8	2.4	No
Main Street from Bayshore Boulevard to Linda Vista Drive	55.8	5	56.8	1.0	No
Guadalupe Canyon Parkway west of North Hill Drive	68.7	1.5	73.4	4.7	**Yes**
Old County Road from Bayshore Boulevard to San Francisco Avenue	62.2	3	65.0	2.8	No
San Bruno Avenue from Bayshore Boulevard to Glen Park Way	56.2	5	57.9	1.7	No

SOURCES: Traffic data compiled by Fehr & Peers in 2023, and modeling performed by Environmental Science Associates in 2023.

ABBREVIATIONS: dB = decibels; dBA = A-weighted decibels; NA = not applicable as road does not currently exist.

NOTES:

a. This roadway does not currently exist nor are there any existing noise-sensitive land uses along it.
b. There are no existing noise-sensitive land uses along this roadway segment; thus, the impact would be less than significant.
c. This impact along this segment would be less than significant because, as explained below, existing noise from the adjacent US 101 would reduce the realized increase to less than 1.0 dBA.

Table 7-20: Weekday Peak-Hour Traffic Noise Contribution of the Baylands Specific Plan to Cumulative Traffic Impacts

Roadway Segment	Cumulative 2040 without Specific Plan Buildout	Cumulative 2040 plus Specific Plan Buildout	dBA Difference	Cumulatively Considerable Contribution Threshold (dB) [a]	Is the Specific Plan's Contribution Cumulatively Considerable?
Bayshore Boulevard from Blanken Road to Geneva Road	72.5	71.7	-0.8[a]	>1.0	No
Bayshore Boulevard from Geneva Avenue to Old County Road/Tunnel Avenue	75.7	76.3	0.6	>1.0	No
Bayshore Boulevard from Old County Road/Tunnel Avenue to Southern City Limits	75.8	76.3	0.5	>1.0	No
Geneva Avenue from Carter Street to Bayshore Boulevard	69.1	71.0	0.9	>1.0	No
Tunnel Avenue from Blanken Avenue to North of Beatty Road	69.4	70.7	1.3	>1.0	**Yes**
Guadalupe Canyon Parkway west of North Hill Drive	72.3	73.4	1.1	>1.0	**Yes**

SOURCES: Traffic data compiled by Fehr & Peers in 2023, and modeling performed by Environmental Science Associates in 2023.

ABBREVIATIONS: dB = decibels; dBA = A-weighted decibels

NOTES:

Under 2040 conditions, the Geneva Avenue extension draws some traffic away from Bayshore Boulevard north of Geneva Avenue as people continue straight on Geneva Avenue rather than turn left onto northbound Bayshore Boulevard to reach Candlestick-Hunters Point or US 101.

a. Except in carefully controlled laboratory experiments, a change of 1 dB cannot be perceived. Consequently, a cumulatively considerable contribution would reasonably be greater than 1.0 dBA.

Impact NOI-3: Cumulative Stationary Source Operational Noise Impacts

The Noise and Vibration Study for the Caltrain electrification project (Wilson Ihrig 2014) conservatively estimated a 1.1 to 3.4 dBA, Ldn cumulative increase in noise levels along Tunnel Avenue and in Brisbane, resulting in a moderate cumulative noise impact. The Noise and Vibration Study for the High-Speed Rail project (CHSRA 2019) estimated this project would more than double the total number of train operations per day and would produce noise that exceeds standards for high-speed ground transportation. Therefore, there would be a significant and unavoidable cumulative operational noise impact attributable to the High-Speed Rail project alone. Noise analysis undertaken in the High-Speed Rail EIR/EIS did not quantify noise from LMF operations in dBA or the effects of LMF operational noise on Baylands housing, reporting that the closest identified receptors to the LMF were approximately 1,900 feet away (residences on Cliff Swallow Court). The combination of Baylands development and LMF operations would place high density residential development immediately across the Caltrain right-of-way from the LMF.

The Baylands Specific Plan would also contribute additional stationary source noise and transportation noise, as discussed below. Cumulative traffic noise impacts considered region-wide development projects that were included in the cumulative transportation analysis.

The Recology Modernization Project would have the potential to construct or move noise-generating activities within its existing footprint, outside of the Baylands Phase 2 area, east of Tunnel Avenue. Activities associated with Recology Modernization may be operational 24 hours a day and combine with noise generated within the Baylands and the Baylands North project in San Francisco. The nearest common receptors for these three projects are located in the Little Hollywood neighborhood of San Francisco, which is directly behind the Recology facility and future receptors within the Baylands District of the Specific Plan and the future Baylands North development, both of which would be at least 300 feet from the Recology site, depending on the location of the Recology improvements.

The SFPUC PG&E Acquisition Project includes improvements to the Martin Substation, as does the Baylands Specific Plan. New PG&E equipment is reasonably expected to be consistent with the overall scale and type of equipment already located at the Martin Substation, such as transformers and HVAC equipment. Receptors across Geneva Avenue from the substation may experience an increase in operational noise from these combined improvements, especially during nighttime hours. The PG&E Martin Substation is located in the City of Brisbane, but the nearest sensitive receptors are residences in Daly City, across Geneva Avenue, approximately 200 feet north of the substation boundary. Each transformer could generate up to 55 dBA at 6 feet (NEMA 2019). When combined, two transformers would generate noise levels of 58 dBA. The Daly City General Plan (City of Daly City 2013) reports ambient noise levels along Geneva Avenue to be 65–70 dBA. Because the transformer noise levels would be unlikely to exceed the ambient noise levels in the vicinity of receptors, operational noise would not be expected to exceed the Brisbane Noise Ordinance standards.[394] The transformer noise levels at these receptors would also likely be below the 60 dBA noise level considered acceptable by the City of Daly City General Plan noise compatibility guidelines. Therefore, cumulative equipment noise at the Martin Substation would not exceed the local noise ordinance or result in a substantial, permanent increase in ambient noise levels at sensitive receptors.

The Baylands North project will be constructed immediately adjacent to the residential and commercial towers in the Baylands District of the Specific Plan, across the extended Sunnydale Avenue. While specifications are not available to quantify noise from mechanical equipment, Specific Plan Mitigation Measure NO-1a provides a performance standard, consistent with Brisbane Municipal Code Section 8.28.030, for the selection and shielding of HVAC equipment associated with the Baylands. Similarly, mechanical equipment noise for the Baylands North

[394] Pursuant to the Brisbane Noise Ordinance, mechanical noise shall not exceed the local ambient noise level to any receiver by more than 10 dBA for a cumulative period of more than 10 minutes per hour, more than 20 dBA for more than 3 minutes per hour, or a noise level more than 30 dBA. Available at https://library.municode.com/ca/brisbane/codes/code_of_ordinances?nodeId=TIT8HESA_CH8.28NOCO.

project would also be restricted by San Francisco Noise Ordinance Section 2909, which generally prohibits fixed mechanical equipment noise and music in excess of 5 dBA above the ambient noise level from residential sources.

Cumulative Impact Conclusion

The High-Speed Rail project would have a significant and unavoidable operational impact for which it, along with Recology modernization and Baylands development, have common noise receptors in the Little Hollywood neighborhood of San Francisco directly behind the Recology facility and future receptors within the Specific Plan area. In addition, the combination of Baylands and high-speed rail projects would place high density residential development immediately across from the LMF, which would operate on a 24-hour-per-day schedule. Thus, a significant cumulative impact would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

The 2025 Specific Plan project would exceed applicable thresholds on one roadway segment with Phase 1 development and on two additional roadway segments (three total) at buildout. The Specific Plan would also place high density residential development along the west side of the Caltrain right-of-way across from the high-speed rail LMF and would have a cumulatively considerable contribution to a significant cumulative impact related to operational noise.

Impact NOI-4: Exacerbate Land Use/Noise Incompatibilities by Placing People in Areas with Excessive Noise Levels Due to Railroad, Freeway, or Aircraft Operations

Railroad

As stated in the Final EIR/EIS for the High-Speed Rail Project, Caltrain electrification and the high-speed rail project would increase existing passenger rail operations from 92 diesel trains operating at 79 miles per hour to 248-258 electric trains operating at 110 miles per hour past the Baylands and Baylands North project in San Francisco by 2040. In addition, the existing 2–4 freight operations through the Baylands are projected to increase to 7-10 trains per day. In addition, 24/7 operations at the light maintenance facility within the eastern portion of the Baylands would also generate noise that would adversely affect Baylands residential development. While the Final High-Speed Rail EIR/EIS does not report future rail noise in terms of decibels, it does disclose that existing rail noise at 50 Joy Avenue, Brisbane, Final EIR/EIS Figure 5-5 indicates that in the year 2040, "severe" noise impacts[395] would extend as far as 550 feet from the rail line.

[395] As indicated in the *Plan Bay Area 2050* EIR, there are an estimated 17,898 documented sites of contamination in some stage of DTSC or SWRCB oversight in the nine-county San Francisco Bay Area.

Thus, the cumulative effect of the Baylands Specific Plan, Baylands North, Caltrain Electrification, and High-Speed Rail projects would be to exacerbate existing noise impacts as the result of:

- Caltrain and the High-Speed Rail projects increasing noise by more than doubling the number, increasing the speed of passenger rail operations along the Caltrain rail line, and adding LMF operations within the Baylands and adjacent to the Baylands North project in San Francisco; and.
- The Baylands and Baylands North projects placing noise-sensitive residential and hotel uses within 750 feet and immediately adjacent to the Caltrain rail line (see **Figure 7-2**).

Freeway

Because Baylands housing would not be located within 2,000 feet of the US 101 freeway, the Baylands Specific Plan and the Baylands North project in San Francisco would not combine to exacerbate noise impacts by exposing people to excessive noise levels from the freeway.

Aircraft Operations

The proposed SFO Tomorrow Airport Development Plan would be the only cumulative project that would involve operations at San Francisco International Airport, approximately 3.5 miles to the southeast of the Baylands. The Notice of Preparation for this project states that proposed landside improvements are not expected to induce passenger demand but would rather serve as a roadmap to modernize SFO, increase the efficiency of airport operations, enhance the passengers, and cargo while on the ground. Therefore, no increase in aircraft operations is envisioned or induced by this cumulative project at SFO. As stated in the Baylands project-level passenger experience and balance the capacity of the existing runway system with the capacity of terminal and landside facilities needed for the handling of aircraft, general aviation analysis, the Specific Plan site is located outside the 65 dB CNEL noise contour of airport operations. Consequently, there is no potential for Baylands development to combine with other cumulative projects to exacerbate noise impacts by exposing people to excessive noise levels generated by aircraft operations.

Cumulative Impact Conclusion

Baylands development in combination with the Baylands North Project in San Francisco, Caltrain Electrification, and High-Speed Rail operations between San Francisco and San Jose would exacerbate noise impacts by:

- Placing residential development within 446–706 feet of the LMF rail flyover where the Final EIR/EIS states that an 8-hour L_{eq} criterion of 70 dBA could be exceeded; and

Figure 7-2: Residential Lands within the Specific Plan Area Subject to Severe Noise Impacts from Rail Operations

- Placing noise-sensitive residential and hotel uses within 750 feet of the Caltrain rail line where they would be subject to severe noise impacts from railroad operations, including more than doubling the number and increasing the speed of passenger train operations along the Caltrain rail line along with nighttime train operation to, from, and within the LMF.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

As shown in **Figure 3-5**, the Specific Plan places high density residential uses immediately adjacent to the Caltrain right-of-way from the future Main Street to the north side of the Geneva Avenue extension, as well as a substantial area of low-density residential to the west of the high density area. Thus, Baylands development would have a cumulatively considerable contribution to a significant cumulative impact related to exacerbating noise impacts by placing people in areas with excessive noise levels.

Impact NOI-5: Substantial Temporary or Permanent Increase in Vibration

Construction

Cumulative construction vibration impacts would occur if construction activities associated with the Baylands and one or more cumulative projects within 3,000 feet of the Baylands would overlap in time. Various construction activities for the Specific Plan would be undertaken starting with grading, which is assumed to start in 2025, through completion of the final buildings within the eastern portion of the site, which is assumed to occur in 2040.

Baylands site grading would overlap in time with both site remediation within the western portion of the site and the early increments of Title 27 landfill closure with building construction within first the western and later the eastern portion of the Baylands overlapping later increments of landfill closure. Baylands site grading could also overlap with some grading, as well as much of the building construction within the Baylands North project is San Francisco.

Construction of Candlestick interchange improvements on the US 101 freeway would likely not occur until relatively late in the Baylands development process but could overlap with construction of the last increments of building construction within the western portion of the Baylands and building construction within the eastern portion of the site, including the potential for concurrent construction of interchange improvements, construction of the northerly extension of Sierra Point Parkway, and Baylands buildings adjacent to the interchange. Construction of the high-speed rail LMF and related pile driving activities could overlap with pile driving for construction of Baylands buildings and construction of the Geneva Avenue bridge. Although it has long been dormant, it is possible that construction activities for the Recology Modernization project might overlap with Phase 1 or Phase 2 Baylands development.

Vibration-generating Baylands and cumulative project construction activities that could occur simultaneously include:

- Impact pile driving for Baylands buildings and piers for the Geneva Avenue bridge crossing over the Caltrain right-of-way.
- Grading for the Geneva Avenue extension and bridge, as well as earth movement and landfill cap construction associated with Title 27 landfill closure.
- Renovation of the Recology construction and demolition debris sorting line, installation of new mechanical separation equipment, and construction of a fleet maintenance yard; construction of roadways and parking areas within the Baylands and Baylands North projects; and Candlestick interchange improvements, each of which could include use of a vibratory roller.

The Egbert Switching Station (Martin Substation Extension), SFPUC PG&E Acquisition project, and Baylands electrical system all include improvements to the Martin Substation. These construction activities may involve paving that could require the use of a vibratory roller. While it is likely that each of these projects could occur simultaneously with the construction activities cited above occurring on the east side of Bayshore Boulevard, distances between the Martin Substation and these other construction sites make it unlikely that vibration generation during construction on either side of Bayshore Boulevard would combine with construction vibration on the other side to generate a cumulative impact. It is possible, however, that the Baylands and one of the two cumulative projects might require a common improvement at the Martin Substation, in which case a single construction project would be undertaken. In the unlikely event that improvements were to be needed for two or all three of the Baylands and cumulative projects, the most probable scenario would be for PG&E to merge improvements into a single coordinated construction effort.

The analysis of vibration impacts is based on instantaneous PPV levels, and worst-case ground-borne vibration levels from construction are generally determined by whichever individual piece of equipment generates the highest vibration levels. Unlike the analysis for average noise levels, in which noise levels of multiple pieces of equipment are logarithmically summed to generate a maximum combined noise level, instantaneous PPV levels do not combine in this way. Vibration from construction of Baylands and cumulative projects, even if those projects are located in close proximity, would not combine to raise the maximum PPV because there would be sufficient distance as well as a substantial unlikelihood of vibration peaks from separate construction sites occurring simultaneously. For these reasons, vibration impacts from construction activities within and near the Baylands would be highly localized and would not be expected to combine to further increase vibration levels from those predicted for pile driving associated with the Baylands alone.

Operations

Caltrain electrification and High-Speed Rail operations would combine along the Caltrain rail line running through the Baylands. The Noise and Vibration Study for the Caltrain electrification project conservatively estimated a 2 VdB increase in vibration levels along Tunnel Avenue at a distance of 125 feet from the nearest track centerline. However, this estimate does not account for differences in vibrations between electric trainsets and locomotives, and thus likely overestimates impacts of electrification, which could actually result in reducing vibrations along the rail line due to Caltrain operations compared to existing conditions. The Noise and Vibration Study for the High-Speed Rail project estimated a ground-borne vibration impact within the City of Brisbane and identified these impacts as significant and unavoidable because High-Speed Rail operations would more than double the number of train pass-by events each day and exceed the annoyance criterion of 72 VdB.

Cumulative Impact Conclusion

Due to the variability of timing for vibration-generating construction activities and distances between the Baylands and cumulative project construction activities, the extent to which vibration generation between Baylands and cumulative projects might overlap cannot be precisely known. However, should vibration-generating construction activities occur simultaneously, a significant cumulative construction impact would result.

The Baylands Specific Plan would not, however, result in any operational vibration-generating sources that could combine with operation vibrations of cumulative projects to generate adverse effects on existing or future uses. Thus, a less than significant cumulative operational vibration impact would result.

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact

Because the 2025 Specific Plan project includes pile driving activities, it would have a cumulatively considerable contribution to a significant cumulative impact related to vibration during construction.

Impact NOI-6: Exacerbate Human Annoyance or Hazards to Buildings Due to Vibration Levels

As noted above, the Noise and Vibration Study for the High-Speed Rail project estimated a ground-borne vibration impact from increased Caltrain and High-Speed Rail operations within the City of Brisbane and identified these impacts as significant and unavoidable because the number of train pass-by events each day would more than double and exceed the annoyance criterion of 72 VdB. In addition, as noted above, both the Specific Plan and the Baylands North project in San Francisco would place residential and hotel uses immediately adjacent to the Caltrain right-of-way where residents and hotel guests would be exposed to that significant

cumulative vibration impact. In addition, LMF construction within 55 feet would expose buildings to excessive vibration.

Cumulative Impact Conclusion

Should pile driving activities for construction of the high-speed rail LMF and Baylands buildings occur simultaneously, a significant cumulative impact would result. A significant cumulative impact would also result from the combination of (1) Caltrain and High-Speed Rail operations more than doubling rail operations along the Caltrain right-of-way, exceeding the number of train pass-by events each day would more than double and exceed the annoyance criterion of 72 VdB; and (2) the Specific Plan and the Baylands North project in San Francisco placing residential and hotel uses immediately adjacent to the Caltrain right-of-way where residents and hotel guests would be exposed to that significant cumulative vibration impact.

Incremental Contribution of the Baylands Specific Plan to the Significant Cumulative Impact

As shown in **Figure 3-5**, the Specific Plan places high density residential uses immediately adjacent to the Caltrain right-of-way from the future Main Street to the north side of the Geneva Avenue extension, as well as a substantial area of low density residential to the west of the high density area. Thus, the Baylands Specific Plan would have a cumulatively considerable contribution to the significant cumulative impact. High speed rail operations would further exacerbate noise impacts by increasing rail operations along the Caltrain line. The 2025 Specific Plan project would have a cumulatively considerable contribution to a significant cumulative impact related to vibration both during construction and ongoing operations.

7.3.11 HAZARDS AND HAZARDOUS MATERIALS

a. Geographic Context and Method of Analysis

Hazards and hazardous materials impacts are generally localized and site-specific, except for those resulting from transportation of hazardous materials, upset conditions, or contamination of groundwater. As a result, the cumulative context for this analysis varies, depending on the threshold being analyzed, as described in **Table 7-21**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-21: Geographic Context for Analysis of Cumulative Hazards and Hazardous Materials Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact HAZ-1 **Routine Use, Handling, and Storage of Hazardous Materials**	Lands within and adjacent to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 6–8)
Routine Transportation and Disposal of Hazardous Materials	Lands along roadways and highways providing access to the Baylands, as well as the Caltrain right-of-way within and adjacent to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (Cumulative Projects 1, 2, 4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–7) • Oyster Point (Cumulative Projects 12–21, 24–26, 29, 33)
Accidental Release of Hazardous Materials into the Environment	Lands within and adjacent to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 6–8)
Impact HAZ-2 **Emit Hazardous Emissions or Handle Acutely Hazardous Materials, Substances, or Waste within ¼ Mile of an Existing or Proposed School**	Lands that are within ¼ mile of any existing or proposed school that is within ¼ mile of the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 6–8)
Impact HAZ-3 **Projects Located on Sites Included on a List of Hazardous Materials Sites**	Lands within and adjacent to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 6–8)
Impact HAZ-4 **Consistency with the Adopted "Comprehensive Airport Land Use Compatibility Plan for the Environs of San Francisco International Airport"**	Lands within and adjacent to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 6–8)
Impact HAZ-5 **Emergency Response**	Lands along roadways and highways providing access to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (Cumulative Projects 1, 2, 4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–7) • Oyster Point (Cumulative Projects 12–21, 24–26, 29, 33)

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative hazards and hazardous materials impacts?

Impact HAZ-1: Use, Handling, and Storage of Hazardous Materials

Routine Use, Handling, and Storage of Hazardous Materials

Several development projects within the vicinity of the Baylands (see **Table 7-21**) would involve the routine need for use, handling, and storage of hazardous materials, which, in combination with Baylands development, could result in a substantial cumulative increase in the use, handling, and storage of hazardous materials.

Baylands and cumulative development projects would use consumer products containing hazardous chemicals that are common in residential, medical, office, retail, commercial services, and warehouse settings. Small quantities of hazardous materials are also associated with residential land uses, including cleaning products, fuels, oils, pesticides, and lubricants. Because general office, commercial services, retail, and household hazardous materials are typically handled and transported in small quantities, and because the health effects associated with them are generally not as serious as for many industrial uses, adverse cumulative effects on the environment with respect to the routine transport, use, or disposal of general office and household hazardous materials would not result.

R&D and life sciences/biotech uses permitted within the Baylands by the Specific Plan, in combination with the R&D uses proposed for the Genesis Marina, Sierra Point Towers, Sierra Point Hotel and Life Sciences Project, Sierra Point towers, and the former Schlage Lock site, as well as the Brisbane LMF (Cumulative Projects 1, 2, 4, 6, and C, respectively), could include the storage, handling, transport, and disposal of relatively larger quantities of hazardous materials that would be subject to regulatory requirements that are designed to minimize the potential for adverse effects due to exposure. Laboratory-based activities are reasonably expected to include both "dry" laboratories (or operations), where relatively small or negligible quantities of hazardous materials would be used and the types of hazardous materials would be limited to such items as cleaning and maintenance materials and office products, as well as "wet" lab functions that could involve a broad spectrum of activities involving hazardous materials used in controlled indoor environments.

These R&D and life sciences/biotech uses would be subject to more intense regulation and oversight than typical commercial/office businesses. Employees performing wet laboratory work would be required (by law) to receive specific training in the use and handling of hazardous materials, which is intended to protect the workplace and also to minimize the potential for spills or inadvertent releases that could adversely affect the environment through air emissions or releases to sewers, storm drains, or land. Medical-related establishments would

involve use, transport, and storage of small amounts of laboratory-type chemicals, compressed gases, and pharmaceuticals, and radiological materials would be used and stored. Medical, biohazardous, and low-level radioactive wastes would also be produced from these activities. The LMF would be expected to maintain a relatively large inventory of cleaning solvents and oils, and other chemicals for trainset maintenance.

Cumulative Impact Conclusion

The health and safety procedures required for the routine use, handling, and storage of hazardous materials protect workers and other individuals in the immediate vicinity of those materials and also protect the adjacent community and environment. Because the use, handling, and storage of hazardous materials is highly regulated, a less than significant cumulative impact would result in relation to the routine use, handling, and storage of hazardous materials.

Routine Transportation and Disposal of Hazardous Materials

Because general commercial/retail, household, and medical hazardous materials used by the types of uses planned for the Baylands and cumulative projects are typically handled and transported in small quantities, and because the health effects associated with them are generally not as serious as large-scale industrial processing uses, adverse cumulative effects on the environment with respect to the routine transport, use, or disposal of general office and household hazardous materials would not result.

Hazardous materials would be routinely transported to, from, and within the Baylands and cumulative project sites, as well as along area roadways, including small amounts of hazardous waste transported to licensed disposal facilities. Because the specific types and amounts of hazardous materials transported to or from cumulative project sites are dependent on the specific businesses that would locate within the Baylands and cumulative project sites, specific types and amount of hazardous materials transport cannot be definitively known. It can be anticipated, however, that biotechnology facilities, as well as medical laboratories and medical-related uses, would be developed within the Baylands and cumulative project sites, serving as a source for hazardous medical wastes.

Baylands and cumulative developments would simultaneously use the same roadways in the vicinity of the Baylands (e.g., Bayshore Boulevard, Geneva Avenue, Tunnel Road, US Highway 101) for transportation of hazardous materials. Baylands development would, when combined with the cumulative projects enumerated above, result in a substantial cumulative increase in the amount of hazardous material transported in the area.

Cumulative Impact Conclusion

The transport and disposal of hazardous materials would be provided by vendors licensed for such transport, and appropriate documentation for all hazardous materials and wastes would

be required for compliance with existing hazardous materials regulations. Adherence to existing state and federal regulations related to hazardous materials transport and disposal at facilities specifically designed for hazardous materials disposal would thus minimize the possibility of hazardous materials releases due to the routine transport and disposal of hazardous materials. In addition, the potential for multiple projects to combine to generate a cumulative impact would be remote. Thus, although there would be a substantial cumulative increase in the amount of hazardous materials transported in the area as a result of cumulative development, a less than significant cumulative impact from transportation of those materials would result.

Accidental Release of Hazardous Materials into the Environment

There are several reasonably foreseeable situations that could result in the accidental release of hazardous materials into the environment, such as vehicular accidents during transport of hazardous materials and accidental spills occurring during otherwise routine use of hazardous substances in construction or operation of land uses. Other reasonably foreseeable accident risks that could expose the public and environment to potentially hazardous materials include disturbance of hazardous wastes in soil or groundwater, hazards associated with demolition of structures and grading, and construction in areas with naturally occurring asbestos. Cumulative effects would be more likely to occur as the results of increased risk due to increased transport and use of potentially hazardous materials from cumulative projects rather than from multiple accidents at multiple sites occurring simultaneously.

Transportation Accidents

Traffic accidents can occur during the transport of gasoline or other hazardous materials being transported along area roadways as well as their transport to, from, and within the Baylands and cumulative project sites. Typically, traffic accidents would result in small spills that would have a negligible impact on public health and the environment because they would be discrete, localized releases. Spills would be resolved in accordance with applicable regulations so that there would not be long-term exposure or potential for contaminant migration. Hazardous materials spills or releases, including petroleum products, such as gasoline, diesel, and hydraulic fluid, regardless of quantity spilled, must be immediately reported if the spill has entered or threatens to enter a water of the state, including a stream, lake, wetland, or storm drain.

Less likely, but still possible, would be the release of hazardous materials into the environment as the result of a freight train accident. Such accidents would have the potential for larger releases of materials that are more toxic than those that might occur in a traffic accident on area roadways. Baylands development would not, however, contribute to cumulative risk of accidental release of hazardous materials into the environment as the result of a train accident.

In addition, Baylands development in combination with past, present, and probable future projects would increase the number of people exposed to hazards associated with

transportation of hazardous materials and potential risks of upset both temporarily during construction as well as in the long term following construction and development activities.

As noted above, the transport of hazardous materials would be provided by vendors licensed for such transport. Appropriate documentation for all hazardous materials and wastes being transported would also be required to comply with existing hazardous materials regulations. Adherence to existing state and federal regulations related to hazardous materials in combination with roadway improvements provided by Baylands development and other past, present, and probable future cumulative projects in compliance with applicable roadway design standards would minimize the possibility of hazardous materials releases.

Construction Accidents

Demolition of existing structures and infrastructure within the Baylands and cumulative projects could result in exposure of construction workers and nearby residents and employees to airborne contaminants during demolition activities or improper handling and disposal of debris containing hazardous materials. However, federal, state, and local regulations are in place to minimize potential impacts through adherence to regulatory standards that prescribe specific methods of material characterization, handling, and disposal, including training of construction workers regarding actions to be taken in the event of an accidental release of hazardous materials.

Long-Term Operational Impacts

In the longer term, development of the Baylands in combination with past, present, and probable future projects would be generally associated with sustained, expanded use of household hazardous materials (e.g., paints, cleaning supplies, solvents, and petroleum products). Many specific land uses (e.g., dry cleaners, gas stations, and certain industrial uses) could also involve routine transport, use, and disposal of certain hazardous materials and wastes unique to the land use (e.g., medical waste). These activities are subject to a suite of established regulations that address the potential for impacts from the routine transport, use, and disposal use of hazardous materials.

Cumulative Impact Conclusion

Baylands development, combined with past, present, and reasonably foreseeable probable future development, would increase the potential for accidents and risk of upset releasing hazardous materials into the environment, although the potential for multiple projects to simultaneously experience accident conditions that release hazardous materials into the environment would be remote. Cities and counties typically expand emergency services capabilities over time commensurate with the increased demands generated by population and employment growth resulting from approvals of cumulative projects. Thus, a less than significant cumulative impact would result.

Impact HAZ-2: Emit Hazardous Emissions or Handle Acutely Hazardous Materials, Substances, or Waste within ¼ Mile of an Existing or Proposed School

A comprehensive set of federal, state, and local laws and requirements regulate the transportation, use, storage, and disposal of hazardous materials and wastes to reduce the potential risks of human and environmental exposure during post-construction operations of the land use types permitted within the Baylands. Baylands Specific Plan uses would not handle acutely hazardous materials, substances, or waste within ¼ mile of an existing or proposed school.

However, as shown in **Table 4.13-3**, proposed middle school locations do not meet all provisions of CCR Title 5, Section 14010. Mitigation Measure MM HAZ-2 requires the proposed middle school to meet the standards set for in CCR Title 5, Section 14010, or to prepare the required studies for review by the Department of Education and to secure approval of the proposed school site pursuant to the provisions of CCR Title 5, Section 14010(u).

Cumulative Impact Conclusion

Development of the proposed middle school within the Baylands would be required to meet the standards set for in CCR Title 5, Section 14010, or to prepare the required studies for review by the Department of Education and to secure approval of the proposed school site pursuant to the provisions of CCR Title 5, Section 14010(u).

Baylands development would not contribute to cumulative impacts related to emissions of such substances within ¼ mile of an existing or proposed school. The four provisions of CCR Title 5, Section 14010 that the proposed middle school locations do not meet—proximity to a PG&E 230 kV underground electrical transmission line along Bayshore Boulevard and a PG&E 24-inch high-pressure natural gas transmission pipeline, as well as proximity to the Caltrain railroad right-of-way and the sites being subject to liquefaction and cyclic densification during a design seismic event—occur regardless of any cumulative project. Thus, the 2025 Specific Plan would not combine with any cumulative project, and a less than significant cumulative impact would result.

Impact HAZ-3: Projects Located on Sites Included on a List of Hazardous Materials Sites

As identified in **Table 4.13-8**, two properties (former Southern Pacific railyard, former Brisbane Landfill) that are included on a list of hazardous materials sites pursuant to Government Code Section 65962.5 are located within and adjacent to the Baylands, while three others (PG&E Martin Substation, South Levinson parcel, Schlage Lock) are located in close proximity to the Baylands.[396] Baylands site grading operations could overlap in time with remediation of the former railyard and final closure of the former landfill.

[396] As indicated in the Plan Bay Area 2050 EIR, there are an estimated 17,898 documented sites of contamination in some stage of DTSC or SWRCB oversight in the nine-county San Francisco Bay Area.

Site grading for Specific Plan development as well as excavation of wastes within the former landfill area for the LMF could inadvertently disperse contaminated material into the environment and expose construction personnel to potentially hazardous conditions. For example, dewatering activities could accelerate the migration of contaminated groundwater or could discharge contaminated groundwater to surface waters. Potential hazards to human health include ignition of flammable liquids or vapors; inhalation of toxic vapors in confined spaces, such as trenches; and skin contact with contaminated soil or water. These risks would be greatest for construction workers; however, it is possible that the nearby public could be affected if the contaminated materials are of a sufficient volume.

Unless construction activities are coordinated with site remediation activities, there would be a temporary increased risk of damaging or interfering with remediation site controls, such as soil containment areas. Temporary effects could include potential localized spread of contamination; exposure of construction workers or the public to chemical compounds in soils, soil gases, and groundwater; exposure of workers, the public, and the environment to airborne chemical compounds migrating from the demolition or construction areas; potential accidents during remediation as a result of operational failure of treatment systems; and potential interference with ongoing remediation activities.

Cumulative Impact Conclusion

Site grading activities subject to a City grading permit have been addressed by state regulatory agencies as part of their site remediation and final landfill closure approvals. In addition, site grading activities subject to City of Brisbane permits will implement protocols to ensure that contaminated soils are not exposed or moved during site grading. Development of the LMF would be required to secure approval of a modified Title 27 final landfill closure plan that would establish safety protocols to minimize the potential for localized spread of contamination; exposure of construction workers or the public to chemical compounds in excavated waste from the former landfill, soils, soil gases, and groundwater; exposure of workers, the public, and the environment to airborne chemical compounds migrating from excavation and construction areas; and potential damage to landfill gas and leachate control systems as well as the landfill cap within portions of the former landfill outside of the LMF footprint.

Development on properties included on a list of hazardous materials sites pursuant to Government Code Section 65962.5 would be required to comply with applicable regulations that prevent risks associated with existing hazardous materials sites, such as CERCLA, PRGs, Cortese List, and CHHSLs. Development adjacent to such sites within Brisbane and San Francisco would be required to comply with federal, state, and local regulations and policies to ensure the safety of development or redevelopment activities, and a less than significant cumulative impact would result.

Impact HAZ-4: Create an Airport Safety Hazard or Expose People to Excessive Noise from Aircraft Operations

The Specific Plan area is not within SFO's 65 dB CNEL, an Airport Safety Compatibility Zone, FAA Notification Area, or Airport Imaginary Surface area, and the SFO Airport Land Use Compatibility Plan does not identify any land use restrictions due to the location of the Baylands in relation to SFO. Thus, Specific Plan development would not combine with cumulative projects to generate any significant cumulative impact in relation to SFO or other airport operations.

Impact HAZ-5: Impair Emergency Response

The City of Brisbane has an emergency response plan that was developed to ensure allocation and coordination of resources in the event of an emergency. The City and County of San Francisco also maintains an emergency response plan for the same purpose. Caltrans uses emergency contracts when services or goods are needed to immediately respond to "a sudden, unexpected occurrence that poses a clear and imminent danger requiring immediate action to prevent or mitigate the loss or impairment of life, health, property, or essential public services" as provided by Public Contract Code Section 1102.

Baylands development in combination with future development in Brisbane and adjacent areas in San Francisco would result in a cumulative increase in demand for emergency response capabilities along area roadways and highways, including the US 101 freeway, Bayshore Boulevard, Geneva Avenue, Lagoon Road, and Tunnel Avenue.

Cumulative Impact Conclusion

Because the combination of Baylands and cumulative development within the City of Brisbane would more than double Brisbane's population and commercial/industrial development inventory, current first response capabilities and hazardous materials emergency response capabilities would not be sufficient for buildout of the cumulative projects. Furthermore, while substantive hazardous materials accidents are rare based on the implementation of existing regulatory requirements, when such incidents occur, they typically require substantial response.

However, neither the Specific Plan nor cumulative projects within Brisbane would be expected to handle or store substantial amounts of hazardous materials. In addition, it is reasonable to expect that existing emergency service capabilities within Brisbane would be expanded commensurate with the emergency response needs of future Baylands and cumulative projects development. Additional hazardous materials response services would be available from NCFA stations outside of Brisbane and through mutual aid agreements with other jurisdictions, and private hazardous materials emergency response agencies. Thus, a less than significant cumulative impact would result.

7.3.12 HYDROLOGY AND WATER QUALITY

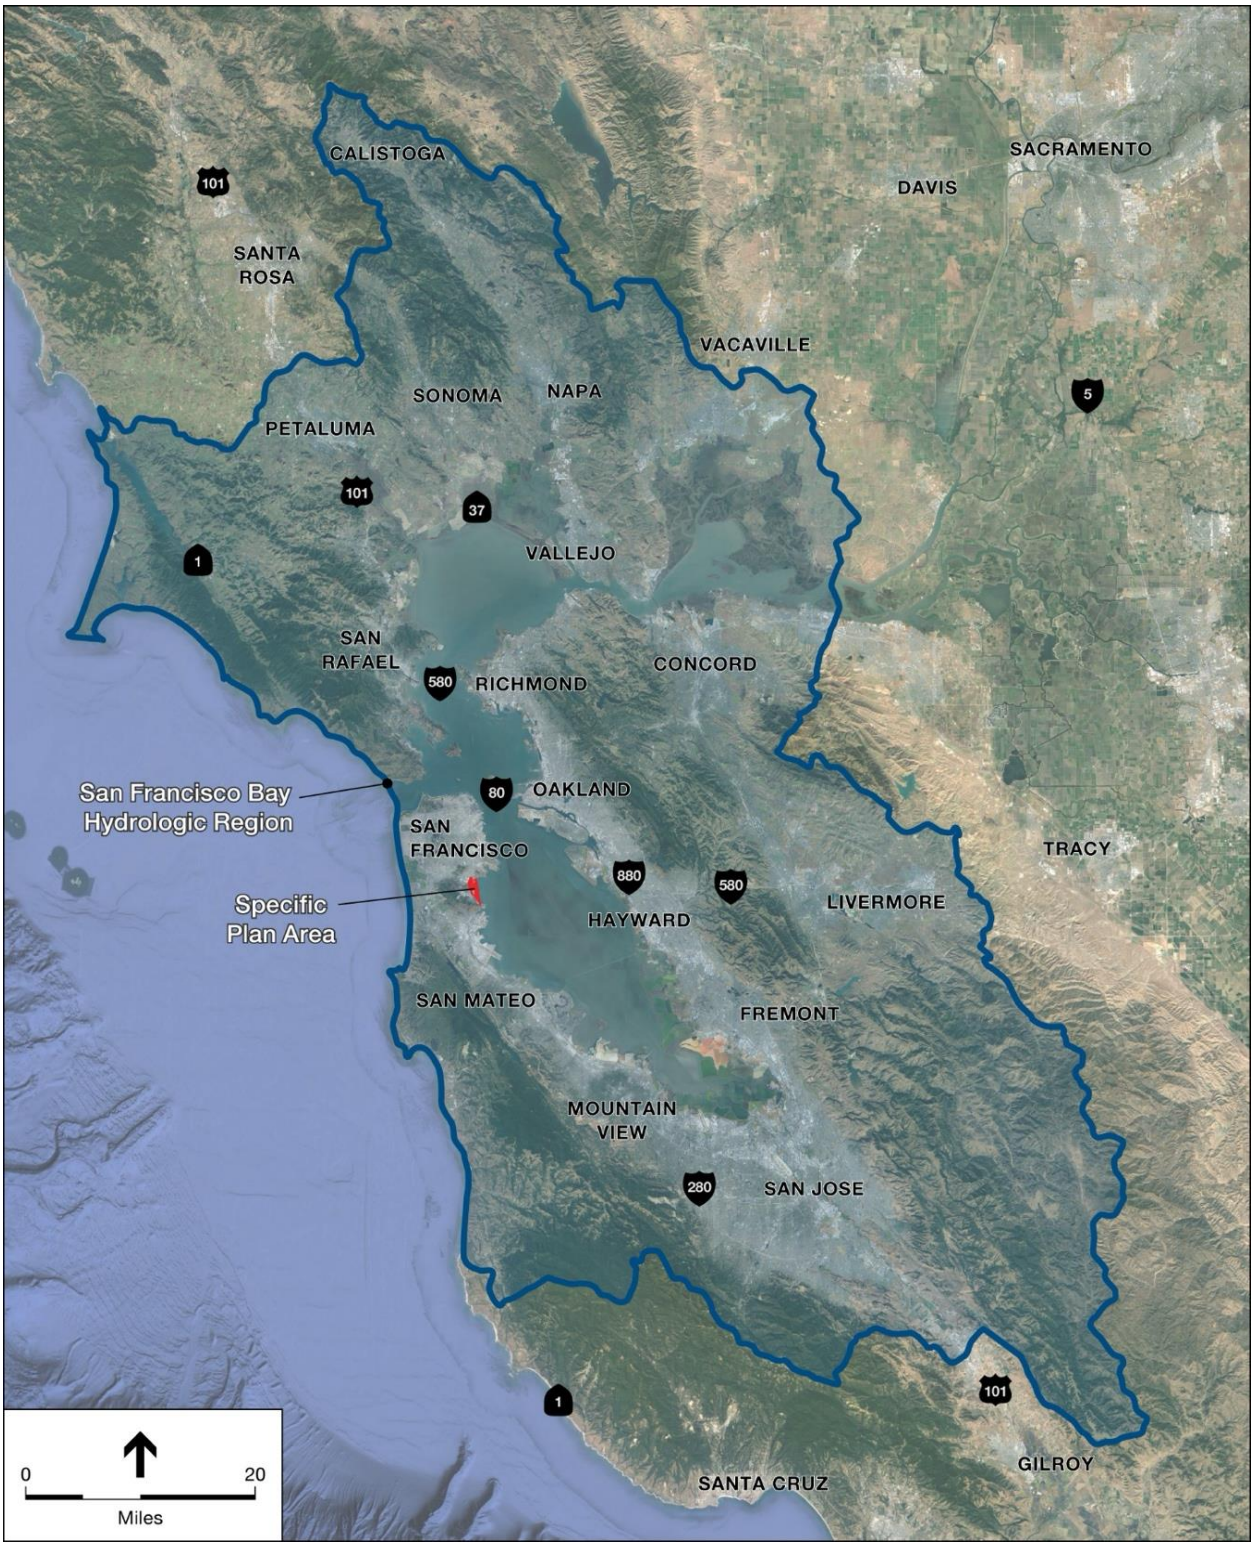
a. Geographic Context and Method of Analysis

The geographic context and methodology of analysis for cumulative hydrology and water quality impacts are identified in **Table 7-22**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-22: Geographic Context and Methodology for Analysis of Cumulative Hydrology and Water Quality Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact HWQ-1 Surface and Groundwater Quality	Lands subject to the Water Quality Control Plan for the San Francisco Bay Region (Basin Plan) as illustrated in **Figure 7-3**.	Projections-based analysis of water quality within San Francisco Bay, Brisbane Lagoon, and drainage through the Baylands.
Impact HWQ-2 Groundwater Resources and Sustainable Groundwater Management	The groundwater basin underlying the Baylands, as well as groundwater basins underlying associated with California Water Company's potable water supply being acquired for the Baylands.	Projections-based analysis of groundwater resources available to California Water Service's existing South San Francisco and proposed Brisbane service areas.
Impact HWQ-3 Erosion and Siltation	Lands subject to the Water Quality Control Plan for the San Francisco Bay Region (Basin Plan).	Projections-based analysis of water quality within San Francisco Bay, Brisbane Lagoon, and drainage through the Baylands.
Impact HWQ-4 Flood Hazards	Lands within the Baylands as well as lands: • Within upstream watersheds draining into the Baylands; • Draining into Brisbane Lagoon; and • Downstream of the Baylands draining into San Francisco Bay.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–7)
Impact HWQ-5 Release of On-Site Pollutants into the Environment as the Result of Flood Hazard, Emergent Groundwater, Tsunami, or Seiche	Lands subject to the Water Quality Control Plan for the San Francisco Bay Region (Basin Plan).	Projections-based analysis of water quality within San Francisco Bay, Brisbane Lagoon, and drainage through the Baylands.

Figure 7-3: San Francisco Bay Hydrologic Region (Area Subject to the Basin Plan)



b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative hydrology and water quality impacts?

Impact HWQ-1: Water Quality Protection

Construction Impacts

Projected growth of new residential units and employment centers within the San Francisco Bay Area Hydrologic Region would require substantial construction and ground disturbance that could result in erosion and sedimentation with the potential to adversely affect water quality. Following construction, common urban pollutants associated with sustained, expanded use of household hazardous materials, herbicides and pesticides, and erosion from soil disturbance could be transported in runoff and potentially adversely affect the quality of receiving surface waters or groundwater.

The Section 402 National Pollutant Discharge Elimination System (NPDES) Municipal Separate Storm Sewer System (MS4) Phase I and Phase II permits required under the Clean Water Act, which cover all jurisdictions, as well as large institutional users within the San Francisco Bay Area Hydrologic Region, require agencies and developments to implement Stormwater Management Plans (SWMPs), which in turn require the implementation of source and treatment control measures. Section 402 NPDES Construction General permits require project proponents to incorporate general site design control measures into project design. These control measures may include conserving natural areas, protecting slopes and channels, and minimizing impervious areas. Treatment control measures may include use of vegetated swales and buffers, grass median strips, detention basins, wet ponds, or constructed wetlands, infiltration basins, and other measures. Filtration systems may be either mechanical (e.g., oil/water separators) or natural (e.g., bioswales and settlement ponds). Selection and implementation of these measures would occur on a project-by-project basis depending on project size and stormwater treatment needs of the site-specific project. NPDES MS4 permittees are also required to develop and enforce ordinances and regulations to reduce the discharge of sediments and other pollutants in runoff and must verify compliance. For each site, NPDES Construction General permittees are also required to develop a Stormwater Pollution Prevention Plan (SWPPP) that identifies best management practices (BMPs) to reduce potential construction impacts.

Each construction contractor's Qualified SWPPP Developer would prepare the SWPPP, which would identify stormwater BMPs that minimize erosion and sedimentation that may result from temporary changes in drainage patterns, including BMPs for temporary drainage systems and temporary stream diversion and dewatering. All Qualified SWPPP Developers must be trained to ensure that SWPPPs are prepared according to the requirements of the permit. The construction contractor's Qualified SWPPP Practitioner would be responsible for implementing

the SWPPP. As part of that responsibility, the effectiveness of construction BMPs would be monitored before, during, and after storm events. Records of these inspections and monitoring results would be submitted to the RWQCBs as part of the annual report required by the permit.

In addition, all projects, including those that would disturb less than 1 acre, would be subject to CALGreen requirements related to stormwater drainage that have been designed to prevent or reduce discharges of sediments, chemicals, and wastes through BMPs that include on-site retention and filtration. Smaller projects may also be subject to additional requirements, which vary by local jurisdiction. In many cases, stormwater drainage measures and compliance with RWQCB Municipal Regional Stormwater Permit Order No. 2011-0083 Provision C.3 may be required by local jurisdictions as standard conditions of approval for building permit applications.

BMPs are used to protect surface water and groundwater quality and meet regulatory standards by removing or substantially lessening the volume of pollutants that flow off-site and into surface water or groundwater. Typical BMPs include:

- Water all exposed surfaces 2–3 times per day, maintaining soil moisture at a minimum of 12 percent.
- Cover haul trucks transporting soil, sand, or other loose material.
- Cover on-site dirt piles or other stockpiled particulate matter, install wind breaks, and employ water and/or soil stabilizers to reduce wind-blown dust emissions.
- Limit vehicle speeds on unpaved roads and surfaces to 15 mph.
- Complete roadway, driveway, and sidewalk paving as soon as possible. Pave building pads as soon as possible after grading.
- Phase excavation, grading, and ground-disturbing construction activities to reduce the extent of disturbed surfaces at any given time.
- Operate transfer processes involving a free fall of soil or other particulate matter in such a manner as to minimize the free fall distance and fugitive dust emissions.
- Wash off trucks and equipment, including their tires, before they leave the site.
- Plant vegetative ground cover in disturbed areas as soon as possible and irrigate it appropriately until vegetation is established.
- Store hazardous materials used on the construction sites, such as fuels and solvents, in covered containers that are protected from rainfall, runoff, and vandalism.

Operations Impacts

Following construction, common urban pollutants associated with sustained, expanded use of household hazardous materials, herbicides and pesticides, and erosion from soil disturbance

could be transported in runoff and potentially adversely affect the quality of receiving surface waters or groundwater.

Common urban pollutants (e.g., petroleum hydrocarbons, lubricants, herbicides and pesticides, sediments, and metals generated by the wear of automobile parts) could be transported in runoff and washed by rainwater from rooftops and landscaped areas into local drainage networks, potentially adversely affecting the quality of receiving surface waters or groundwater. Managed landscaped areas could provide a source of nutrients, weed abatement herbicides, and irrigation runoff. Contributions of these contaminants and other common urban pollutants to stormwater and non-stormwater runoff could degrade the quality of receiving waters if not properly managed. During the dry season, vehicle travel and other urban activities release contaminants on impervious surfaces and in landscaped areas, where they can accumulate until the first storm event. During this "first flush," concentrated pollutants can be transported via runoff to stormwater drainage systems. Contaminants can also be released during the dry season as a result of overirrigation and other urban water uses (e.g., car washing, hosing down paved surfaces). Runoff during storm events and non-stormwater flows (e.g., overirrigation) can transport contaminants into stormwater drainage systems that discharge into rivers, agricultural ditches, sloughs, and channels and ultimately could degrade the water quality of any of these water bodies. Contaminated runoff can also infiltrate into groundwater basins and negatively affect groundwater quality.

State and local agencies require developments to implement BMPs and control measures, adhere to NPDES permit requirements, and comply with local drainage standards. Drainage plans would be consistent with the San Francisco Bay RWQCB MS4 NPDES permit as well as any applicable local drainage control requirements that exceed or reasonably replace regional measures to protect receiving waters from pollutants. In addition, NPDES Provision C.3 requirements include post-construction drainage control requirements that address the volume of off-site flows, which can be effective in reducing sedimentation effects on downstream receiving waters. Baylands and cumulative projects would be required to be planned, designed, and developed to (1) protect areas that provide important water quality benefits necessary to maintain riparian and aquatic biota and/or are particularly susceptible to erosion and sediment loss; (2) limit increases in the extent of impervious areas; (3) limit land disturbance activities, such as clearing and grading, and cut-and-fill to reduce erosion and sediment loss; (4) limit disturbance of natural drainage features and vegetation; and (5) reduce erosion and, to the extent practicable, retain sediment on-site during and after construction.

The following BMPs typically are used during post-construction operation of land uses:

- Provide for oil filtration of stormwater before discharge.
- Use integrated pest management methods to minimize the use of potentially hazardous chemicals in landscaped areas.

- Handle, store, and apply potentially hazardous chemicals in accordance with applicable laws and regulations.
- Implement erosion control and revegetation programs for reestablishing native vegetation on slopes in undeveloped areas.
- Use constructed wetland, infiltration basin, or bioretention in areas where habitat for fish and other wildlife could be threatened by pollutants in stormwater discharge.

Implementation of Water Quality Protection Requirements

Clean Water Act Section 303(d) requires states to evaluate water quality-related data and information, develop a list of waters that do not meet established water quality standards (referred to as "impaired"), and develop a TMDL for every pollutant/water body combination on the list. This includes the development of a loading capacity that is allocated among various point sources and nonpoint sources. The San Francisco Bay RWQCB has identified nearly 350 listings for approximately 130 water bodies, including the Bay itself, that are classified as impaired under Clean Water Act Section 303(d). Standards have been developed for approximately 120 of these listings, including San Francisco Bay. Water quality constituents addressed through existing TMDLs include mercury and sediment loading.

Permits for discharge from point sources are issued through the NPDES program. In addition, several jurisdictions in the San Francisco Bay area have adopted BMPs and ordinances that address runoff resulting from new development. Where TMDLs have been established, compliance with the standards (which are required through the NPDES permitting process) would substantially address the potential to contribute to existing pollution.

Cumulative Impact Conclusion

Construction Impacts

Less than significant cumulative construction impacts on surface and groundwater quality would result for the following reasons:

- Baylands development, in combination with past, present, and probable future projects, would each be required to adhere to the most current NPDES permits, which are designed to minimize water quality impacts, taking into account the requirements needed to be placed on individual projects to protect the quality of receiving waters from the cumulative impacts of these individual projects on a regional basis.
- Water quality standards incorporated into permit requirements are periodically updated and guided by regional water quality issues such that future development must adhere to standards that would minimize potential impacts through ensuring that stormwater runoff is given appropriate treatment, if necessary, prior to off-site discharge as a means of protecting the quality of receiving waters.

- Treatment controls are generally designed to treat stormwater runoff to the maximum extent practical and have made vast improvements over practices that were in effect for older past projects.

Operations Impacts

State and local agencies require developments, including the Baylands and each cumulative project, to implement BMPs and control measures, adhere to NPDES permit requirements, and comply with local drainage standards. Drainage plans for these projects would be consistent with the San Francisco Bay RWQCB MS4 NPDES permit as well as any applicable local drainage control requirements that exceed or reasonably replace regional measures to protect receiving waters from pollutants. In addition, NPDES Provision C.3 requirements include post-construction drainage control requirements that address the volume of off-site flows, which can be effective in reducing sedimentation effects on downstream receiving waters.

Baylands and cumulative projects would be required to be planned, designed, and developed to (1) protect areas that provide important water quality benefits necessary to maintain riparian and aquatic biota and/or are particularly susceptible to erosion and sediment loss; (2) limit increases in the extent of impervious areas; (3) limit land disturbance activities, such as clearing and grading, and cut-and-fill to reduce erosion and sediment loss; (4) limit disturbance of natural drainage features and vegetation; and (5) reduce erosion and, to the extent practicable, retain sediment on-site during and after construction.

Thus, a less than significant cumulative impact would result.

Impact HWQ-2: Groundwater Recharge and Sustainable Groundwater Management

As described in Section 4.16, *Utilities, Services Systems, and Water Supply*, Baylands development would not use local groundwater resources from the Visitacion Valley Basin (DWR Basin No. 2-32) over which the proposed water service expansion area is located. The majority of the Cal Water South San Francisco District overlies the Westside Basin (DWR Basin No. 2-35), from which Cal Water only pumps groundwater to supply the South San Francisco District. No groundwater from the Visitacion Valley Basin would be used for potable or non-potable purposes.

The Westside Basin is not adjudicated and, in its recent evaluation of California groundwater basins, DWR determined that the Westside Basin was not in a condition of critical overdraft and was a low priority basin.

Cal Water operates five groundwater production wells within its South San Francisco District service area. From 2005 to 2023, the Cal Water South San Francisco District met up to 19 percent of its water demand from groundwater, excluding purchased in-lieu groundwater credits, and up to 23 percent including in-lieu groundwater credits purchased from the SFPUC.

Historical groundwater pumping in the Westside Basin by four municipal groundwater users (Cal Water, San Francisco, Daly City, San Bruno) from 2010 through 2020 averaged 5,090 AFY, of which 505 AFY was by Cal Water. The Baylands Water Supply Assessment conservatively assumed total projected groundwater pumping by the SFPUC, Cal Water, Daly City, and San Bruno would be equal to each agency's agreed-upon pumping limitation from 2020 through 2045, of which Cal Water is projecting to pump up to 1,534 AFY.

Cumulative Impact Conclusion

As described in Section 4.16, *Utilities, Services Systems, and Water Supply*, Baylands development would not use local groundwater resources. In addition, the Specific Plan and future development projects within Sierra Point would be required to participate in Cal Water's Development Offset Program. The Baylands Water Assessment concludes that the result of such participation is no net increase in water demand from the Specific Plan or future development projects within the proposed water service expansion area (see discussion of Impact UTL-1 in Section 4.16 for more detail). Because groundwater pumping within the Westside Basin would be consistent with the amounts agreed by the SFPUC, Cal Water, Daly City, and San Bruno as part of the Regional Groundwater Storage and Recovery Project, no significant cumulative impact on groundwater resources or sustainable groundwater management would result.

Impact HWQ-3: Flood Hazards

Projected development within the San Francisco Bay Hydrologic Region would substantially increase the extent of impervious surface through the addition of new paved areas and building rooftops. This increase in impervious surface area would increase the amount of stormwater runoff and cause runoff to discharge at a greater rate, leading to higher peak flows during storm events. The net result of such development would be to increase the potential for stormwater to cause flood conditions either as the result of (1) increased stormwater flow and flow rates, or (2) the potential for storm drains and small channels in urban areas to become blocked or surcharged during intense short-duration storms.

Drainage plans for development of the Baylands and cumulative projects would each be required to comply with the San Francisco Bay RWQCB MS4 NPDES permit and any applicable local drainage control requirements that exceed or reasonably replace measures to control the rate of stormwater runoff. NPDES Provision C.3 includes postconstruction drainage control requirements that address the volume of off-site flows. As described above, the Baylands and cumulative project development are required to plan, design, and develop sites to limit both increases in the extent of impervious areas and disturbance of natural drainage features. Under Provision C.3, the San Francisco Bay RWQCB requires designs that prevent increases in runoff flows from new development and redevelopment projects. In some cases, adherence to NPDES Provision C.3 requirements may result in improved detention of stormwater, compared to existing conditions, through implementation of low impact development (LID) drainage control

measures, which typically include bioretention facilities, rain gardens, vegetated rooftops, rain barrels, and permeable pavements. Projects that would disturb less than 1 acre would be subject to CALGreen requirements related to stormwater drainage. Projects would also generally comply with the design guidelines established in the Stormwater Best Management Practice Handbook: New Development and Redevelopment (CASQA 2003) to minimize increases in both the volume and rate of stormwater runoff.

Baylands development would, and cumulative projects could, require the expansion or construction of new stormwater drainage facilities consistent with state water quality standards and applicable local ordinances and design standards. These may include on-site detention ponds and upgrades to off-site stormwater transmission (e.g., storm drain improvements, culvert upgrades, or enhanced flood protection along natural drainageways used for stormwater conveyance) that attenuate flow from sites and facilitate conveyance. Local development review processes would typically require preparation of hydrologic engineering reports to demonstrate projects would not substantially increase the rate or amount of off-site flow, as well as to demonstrate the capacity of off-site infrastructure to accommodate flows. Based on local conditions and applicable local requirements, on-site LID measures to reduce flow would be incorporated into projects.

Projected land development within the San Francisco Bay Hydrologic Region would be required to maintain pre-project hydrology in accordance with federal, state, and local stormwater management regulations. In addition, local ordinances generally provide prescriptive requirements related to infrastructure capacity and design and limit the potential for development to increase off-site flows so as to cause or exacerbate flood conditions. All projects that would disturb 1 acre or more would be subject to San Francisco Bay RWQCB requirements that prevent increases in runoff flows from new development and redevelopment projects. The required LID drainage control measures would, in some cases, improve stormwater rates and volumes compared to existing conditions.

Cumulative Impact Conclusion

Because Baylands development, as well as development of each cumulative project, would be required to comply with applicable drainage and flood protection standards that are designed to minimize flood hazards, significant cumulative impacts would not result.

Impact HWQ-4: Release of Pollutants Due to Flood and Tidal Action, Sea Level Rise-Induced Changes to Groundwater, Tsunami, or Seiche

As discussed above, Baylands systems are in place to address and minimize impacts related to flooding and release of pollutants during storm events. As discussed in Draft EIR Section 4.14, *Hydrology and Water Quality*, the water table rise that would occur as a consequence of sea level rise would be limited to two feet or less within the Specific Plan area due to the leachate

collection system that will be installed as part of final landfill closure prior to site development. Because most of the western portion of the Baylands would be raised by proposed site grading by 8 to 12 feet, Specific Plan development would not be subject to flooding due to emergent groundwater. Without the occurrence of emergent groundwater, this mechanism would not release pollutants. In addition, Baylands development is not subject to tsunami hazards. While the proposed on-site water storage facility within the Baylands has the potential for seiche impacts, the facility would be designed to withstand expected shaking in an earthquake without rupture. Finally, there are no upstream or downstream facilities within which the Baylands water storage facility could combine to result in a cumulative seiche hazard impact.

Cumulative Impact Conclusion

Baylands development would not combine with past, present, or reasonably foreseeable probable future projects to generate a significant cumulative impact in relation to release of on-site pollutants into the environment as the result of flood or tidal action, sea level rise-induced changes to groundwater, tsunami, or seiche.

7.3.13 GEOLOGY, SOILS, AND SEISMICITY

a. Geographic Context and Method of Analysis

The geographic context and methodology of analysis for cumulative geology, soils, and seismicity impacts are identified in **Table 7-23**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative geology, soils, and seismicity impacts?

Baylands development, combined with the above-referenced cumulative projects, would increase resident and temporary population in an area subject to substantial seismic risks and hazards. However, each cumulative project, including Baylands development, would be required to meet building code and related safety design requirements that address the various seismic and geologic hazards present in the Bay Area, thereby minimizing cumulative geology and soils impacts. Development and infrastructure projects are required to meet the most recent geologic and seismic design standards, which are more stringent than older codes and practices, making new structures likely to perform better than older structures in the event of a significant seismic event. Compliance with applicable building and other codes and design requirements, as would be implemented for all present and future cumulative projects, would provide adequate protection for life and property.

Table 7-23: Geographic Context and Methodology for Analysis of Cumulative Biological Resources Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact GEO-1 Rupture along a Known Fault	Lands through which an active fault passes that also passes through the Baylands.	There are no known faults crossing through the Baylands; therefore, no cumulative impact to which Baylands development might contribute would occur.
Impact GEO-2 Strong Seismic Ground Shaking	Nine-county San Francisco Bay Area region.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Impact GEO-3 Seismic-Related Ground Failure	Nine-county San Francisco Bay Area region.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Impact GEO-4 Landslide, Mudslide, or Debris Flow	Lands within the Baylands as well as lands: • Within upstream watersheds draining into the Baylands; • Draining into Brisbane Lagoon; and • Downstream of the Baylands draining into San Francisco Bay.	There are no cumulative projects that could combine with Baylands development to form cumulative impacts.
Impact GEO-5 Expansive Soils and Soil Corrosivity	Lands within and adjacent to the Baylands.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane General Plan (Cumulative Projects AA, BB, 1, 2, 4) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–8) • Oyster Point (Cumulative Projects 12–18, 24–26, 29, 33)
Impact GEO-6 Paleontological Resources	Nine-county San Francisco Bay Area region.	Projections-based analysis of land development and infrastructure identified in Plan Bay Area 2050.
Impact GEO-7 Use of Septic Tanks and Alternative Wastewater Disposal systems	Nine-county San Francisco Bay Area region.	Since Baylands development would be served by a municipal sewer system, it would not combine with past, present, or probable future projects to form cumulative impacts.

Impact GEO-1: Loss, Injury, or Death as the Result of Rupture along a Known Earthquake Fault

There are no known faults crossing through the Baylands. Thus, Baylands development would not contribute to a related cumulative impact.

Impact GEO-2: Strong Seismic Ground Shaking

The San Francisco Bay Area has a nearly three in four chance of experiencing a magnitude 6.7 or greater earthquake over the next 30 years (MTC/ABAG 2021). The shaking intensity of the next significant earthquake at any given location depends on the causative fault and the distance to

the epicenter, the earthquake's magnitude and duration of shaking, and the characteristics of underlying geologic materials. The potential for damage or loss during a magnitude 6.7 or greater earthquake could be substantial.

In general, ground shaking is more severe in softer sediments where surface waves can be amplified, causing a longer duration of ground shaking compared to bedrock materials. Areas where bedrock is exposed or located at relatively shallow depth tend to experience surface waves from an earthquake as more of a sharp jolt, compared to other areas. Areas located within or near the San Francisco Bay shoreline where alluvial sediments tend to be thicker, especially in areas where non-engineered fill or loose alluvial materials are present, could experience considerable ground shaking.

To reduce impacts related to ground shaking, Baylands and cumulative projects development would be required to comply with the current version of the California Building Code (CBC) at the time of building permits. Compliance with the CBC's regulatory requirements and applicable local ordinances would be ensured during the building permit review process for buildings and construction plan review for infrastructure.

Baylands and cumulative development must comply with CBC Chapter 16, Section 1613, which provides earthquake loading specifications for structures and associated attachments that must also meet the seismic criteria of ASCE Standard 07-05. To determine seismic criteria for proposed improvements, geotechnical investigations would be prepared by state-licensed engineers and engineering geologists to provide recommendations for site preparation and foundation design, as required by CBC Chapter 18, Section 1803. Geotechnical investigations would also evaluate hazards such as liquefaction, lateral spreading, landslides, and expansive soils in accordance with CBC requirements and the California Geological Survey's *Guidelines for Evaluating and Mitigation Seismic Hazards in California* (Special Publication 117A 2008), where applicable.

Required geotechnical studies for Baylands and cumulative development would document underlying soils and bedrock on project sites and determine the response of those underlying materials to ground shaking generated during an earthquake. Site-specific geotechnical investigations would also provide recommendations for methods and materials for all aspects of site development, including site preparation, building foundations, structural design, utilities, and sidewalks and roadways, to remedy any geotechnical conditions related to seismic impacts. In connection with grading, foundation, building, and other site development permits, the local city or county or, in the case of infrastructure project, the responsible agency would review geotechnical investigations and recommendations, imposing needed permit requirements based on the geotechnical recommendations and CBC provisions.

Cumulative Impact Conclusion

While Baylands and cumulative projects development would increase population in an area subject to substantial seismic risks and hazards, each of these projects would be required to meet applicable building code and engineering design requirements to protect public health and safety from the various seismic and geologic hazards present in the Bay Area, thereby reducing cumulative impacts. Development projects would be required to meet the most recent geologic and seismic standards, which are more stringent that older codes and practices, making new structures likely to perform better than older structures in the event of a significant seismic event.

Reliable mechanisms are in place to enforce applicable federal, state, and local regulations and engineering design standards to address site-specific seismic hazards identified in required geotechnical investigations. Required implementation of the recommendations contained in these geotechnical investigations as part of local development review processes would protect public health and safety from substantial risks. In addition, the physical separation between cumulative project sites and differences in the timing of construction of cumulative projects would substantially reduce the potential for site-specific impacts to combine to generate cumulative impacts. Thus, a less than significant cumulative impact would result.

Impact GEO-3: Seismic-Related Ground Failure or Collapse, Liquefaction, or Expansive Soils

Ground failure, including liquefaction, lateral spreading, and subsidence, as a result of an earthquake could occur throughout the nine-county Bay Area depending on site-specific conditions including groundwater level, relative size of soil particles, and density of subsurface materials within 50 feet of ground surface. Damage from earthquake-induced ground failure associated with liquefaction, lateral spreading, and subsidence could be high in buildings with foundations not properly constructed for such hazards. The impacts from ground failure, including liquefaction, lateral spreading, and subsidence, from development of Baylands and cumulative projects development would be addressed through site-specific geotechnical studies prepared in accordance with CBC requirements, the Seismic Hazards Mapping Act, and standard construction design practices. The state provides guidance in CGS Special Publication 117A, which includes uniform guidelines for evaluating seismic hazards other than surface fault rupture, as well as mitigation measure recommendations as required by PRC Section 2695(a). Chapters 6 and 7 of California Geological Survey Special Publication 117A provide standards for site evaluation and provide strategies to address liquefaction. These chapters recommend that geotechnical evaluations determine the amount of liquefiable soil, which may provide an indication of the magnitude of subsidence and/or the presence of a gentle slope and open face, such as a shoreline, where lateral spreading can occur. The Seismic Hazards Mapping Act requires a geotechnical site-specific investigation before any parcel subdivisions or structure permits may be issued, to determine the strength of underlying soils or rock. Subsequent development (excavations,

foundations, building frames, retaining walls, and other building elements) would be required to conform to the current seismic design provisions of the CBC to reduce potential losses from ground failure as a result of an earthquake. CBC Section 1613 requires projects within liquefaction zones to incorporate seismic design features into both grading and construction plans. CBC Chapter 18 includes requirements for geotechnical investigations (Section 1803), as well as foundations (Section 1808). Chapter 18 requires analysis of slope instability, liquefaction, and surface rupture attributable to faulting or lateral spreading, plus an evaluation of lateral pressures on basement and retaining walls, liquefaction and soil strength loss, and lateral movement or reduction in foundation soil-bearing capacity. It also addresses measures to be considered in structural design, which may include ground stabilization, selecting appropriate foundation type and depths, selecting appropriate structural systems to accommodate anticipated displacements, or any combination of these measures. Baylands and cumulative projects would also be required to adhere to local general plan and building code requirements for new development to resist ground failure through modern construction techniques.

Cumulative Impact Conclusion

While Baylands and cumulative projects development would increase population in an area subject to substantial geologic and soils risks and hazards, each of these projects would be required to meet applicable building code and engineering design requirements to protect public health and safety from the various geologic and soils hazards present in the Bay Area, thereby reducing cumulative impacts. Development projects would be required to meet the most recent geologic and soils standards, which are more stringent that older codes and practices, making new structures likely to perform better than older structures in the event of a significant geologic event, as well as better capable of safely accommodating adverse soils conditions.

Reliable mechanisms are in place to enforce applicable federal, state, and local regulations and engineering design standards to address site-specific geologic and soils hazards identified in required geotechnical and soils investigations. Required implementation of the recommendations contained in these investigations as part of local development review processes would protect public health and safety from substantial risks. In addition, the physical separation between cumulative project sites and differences in the timing of construction of cumulative projects would substantially reduce the potential for site-specific impacts to combine to generate cumulative impacts. Thus, a less than significant cumulative impact would result.

Impact GEO-4: Landslide, Mudslide, or Debris Flow

Sloping areas within the Baylands including Icehouse Hill, the slopes of the former Brisbane landfill, and (in the future) embankments for the Geneva Avenue bridge over the Caltrain right-of-way would be constructed to applicable CBC design requirements and would therefore not be prone to rain-induced landslide, mudslide, or debris flow hazards.

Cumulative Impact Conclusion

Baylands development would not combine with past, present, or reasonably foreseeable probable future projects to form cumulative impacts.

Impact GEO-5: Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard, and during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. Baylands and cumulative projects would be required to meet applicable building code and engineering design requirements that address expansive soils and soil corrosivity and reliable mechanisms are in place to enforce applicable federal, state, and local regulations and engineering design standards to address site-specific hazards, thereby reducing cumulative impacts. In addition, the physical separation between cumulative project sites and differences in the timing of construction of cumulative projects would substantially reduce the potential for site-specific impacts to combine to generate cumulative impacts.

Cumulative Impact Conclusion

Because (1) Baylands and cumulative development would be required to comply with applicable building code and engineering design requirements, and (2) the physical separation between cumulative project sites and differences in the timing of construction of cumulative projects would substantially reduce the potential for site-specific impacts to combine to generate cumulative impacts, a less than significant cumulative impact in relation to expansive soils and soil corrosivity would result.

Impact GEO-6: Paleontological Resources and Unique Geologic Features

The likelihood that previously unknown or unrecorded paleontological resources would be encountered within the Baylands is remote, since it is unlikely that grading and construction activities would encounter older bay mud deposits that may be old enough to have fossilized the remains of ancient organisms. In addition, there are no unique geologic features within the Baylands that could be adversely affected. Baylands development would not, therefore, contribute to any cumulative paleontological resource impact.

Impact GEO-7: Use of Septic Tanks and Alternative Wastewater Systems

All Baylands development would be connected to a municipal sewer system and neither septic tanks nor alternative wastewater systems would be used.

Cumulative Impact Conclusion

Baylands development would not contribute to any cumulative impact in relation to septic tanks or alternative wastewater disposal systems.

7.3.14 UTILITIES, SERVICE SYSTEMS, AND WATER SUPPLY

a. Geographic Context and Method of Analysis

The geographic context for analysis of cumulative utilities, service systems, and water supply impacts encompasses the service areas for each of the agencies providing services to the Baylands, as identified in **Table 7-24**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-24: Geographic Context and Methodology for Analysis of Cumulative Utilities, Service Systems, and Water Supply Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact UTL-1 **Water Supply**	California Water Service Company South San Francisco District.	Projections-based analysis.
Impact UTL-2 **New or Expanded Utilities**		
Water Facilities	California Water Service Company South San Francisco District.	Projections-based analysis.
Wastewater Facilities	Bayshore Sanitary District Service Area.	Projections-based analysis.
Drainage Facilities	Lands within the Baylands as well as lands: • Within upstream watersheds draining into the Baylands; • Draining into Brisbane Lagoon; and • Downstream of the Baylands draining into San Francisco Bay.	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 1–4) • Infrastructure and Remediation Projects (Cumulative Projects A–I) • San Francisco portion of the San Francisco/San Mateo Bi-County Priority Development Area (Cumulative Projects 5–7)
Impact UTL-3; Impact UTL-4 **Solid Waste Diversion; Landfill Capacity**	Recology San Francisco service area.	Projections-based analysis.

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative utilities, service systems, or water supply impacts?

As discussed above, Baylands development, in combination with Cumulative Projects 1–4 would increase Brisbane's population by approximately 110 percent and nearly triple its employment base between 2015 and 2050. The result of this growth would be a substantial increase in the demand placed on local utilities, service systems, and water supply.

Impact UTL-1: Water Supply

A Water Supply Assessment was prepared and approved by the California Water Company to analyze the adequacy of its water supply for the 2025 Specific Plan project, existing customers, and cumulative development within its three Peninsula districts in normal, dry, and multiple dry years through 2045. The Baylands Water Supply Assessment, which can be found in Appendix P, shows estimated cumulative water supply and demand (see also **Table 7-25**).

Cumulative Impact Conclusion

The Baylands Water Supply Assessment concluded that available water supplies will be sufficient to meet the demands under normal year hydrologic conditions through 2045, inclusive of existing and future development within Cal Water's three Peninsula districts and the proposed water service expansion area under all Bay-Delta Plan Amendment scenarios. Under dry year hydrologic scenarios, projected shortfalls would be addressed through implementation of the District's Water Supply Contingency Plan. In addition, BAWSCA, Cal Water, and the SFPUC are pursuing the development of additional water supplies to improve the SFPUC's Regional Water System and South San Francisco District supply reliability. Thus, a less than significant cumulative impact would result.

Table 7-25: Cumulative Water Supply and Demand (in million gallons per year)

	2025	2030	2035	2040	2045
Normal Year					
Cal Water's Three Peninsula Districts					
Supply	13,800	13,800	13,800	13,800	13,800
Demand	11,371	11,382	11,525	11,683	11,925
Shortfall	None	None	None	None	None

SOURCE: EKI, 2025.

NOTE: Specific Plan and other planned developments within the service area are included in District demands after implementation of development offset program. The net annual demands associated with the Specific Plan as presented in Table 7-25 are expected to be met by development offset with and through implementation of Cal Water's Development Offset Program and therefore would not result in a net increase in demands for the SSF District. As such, these demands are not included in Tables 7-25 as additive demands.

Impact UTL-2: Construction and Improvement of Utility and Service System Facilities

Water Facilities

Development of Baylands would result in an increase in potable water demand; however, this demand would be offset by Cal Water's Development Offset Program. The Development Offset Program requires any new residential, commercial, or industrial development within any of the

three Peninsula districts that is projected to increase net demand by more than 50 acre-feet per year (AFY) to pay a special facilities fee, referred to as a "developer offset fee," of $15,400 per acre-feet of net demand increase. The developer offset fee was calculated based on representative alternative water projects in the Bay Area region, and the anticipated yield of those projects, and will be used to fund accelerated water supply projects and expanded Baylands development, in normal hydrologic years.

Under dry year hydrologic scenarios, shortfalls are projected for the City inclusive of the Specific Plan if the Bay-Delta Plan Amendment is implemented as adopted and additional regional supplies are not developed. It is anticipated that dry year shortfalls would be addressed through implementation of the District's Water Shortage Contingency Plan (WSCP), as discussed in the Water Supply Assessment (Appendix P). In addition, as described in Appendix P and in Cal Water's 2020 UWMP, the Bay Area Water Supply & Conservation Agency (BAWSCA), Cal Water, and the SFPUC are pursuing the development of additional water supplies to improve the regional water system (RWS) and District supply reliability.

Cumulative Impact Conclusion

Water supply would be available to serve the future cumulative demands of the existing Cal Water District service area (as well as the Mid-Peninsula and Bear Gulch Districts), Baylands development, and cumulative projects in normal hydrologic years. Under dry year hydrologic scenarios, shortfalls are projected for the City inclusive of the Specific Plan if the Bay-Delta Plan Amendment is implemented as adopted and additional regional supplies are not developed. However, it is anticipated that dry year shortfalls would be addressed through implementation of the District's WSCP. In addition, the development of additional water supplies is being pursued to improve the RWS and District supply reliability.

Wastewater Facilities

Wastewater Collection

Wastewater generated within the Baylands is proposed to be delivered to an on-site water recycling facility that would generate flow comprised of 0.74 mgd of excess wastewater not used by the WRF and 0.05 mgd of waste activated sludge, a byproduct of the membrane bioreactor system delivered directly to the SFPUC for treatment. Since the wastewater collection facilities constructed for the Baylands and all facilities needed to deliver excess wastewater and activated sludge to the SFPUC for treatment would be exclusive to Baylands development, no significant cumulative impact would result.

Wastewater Treatment Facilities

SFPUC's Southeast Water Pollution Control Plant (SEWPCP) currently receives an average dry weather flow of 60 mgd, which accounts for approximately 70 percent of its available dry

weather flow capacity of 85.4 mgd. San Francisco upgraded the SEWPCP wet weather flow capacity to 250 mgd in 1994 to comply with federal regulations requiring a reduction in Combined Sewer Overflow discharges to the Bay. In addition, the North Point Wet Weather Facility operates when the SEWPCP approaches capacity. To further reduce the frequency of combined sewer overflows into the Bay and increase system capacity, the City and County of San Francisco recently constructed a parallel 169-inch combined sewer facility along the San Francisco-San Mateo Countyline directly north of the Baylands.

The City of Brisbane is allowed to convey dry weather sewer discharges of up to 6.0 mgd to the SEWPCP. As identified in the 2017 City of Brisbane Sanitary Sewer System Master Plan (2017 SSMP), current discharges for dry weather and wet weather conditions are approximately 0.72 mgd and 3.6 mgd, respectively.

Cumulative Impact Conclusion

Given that (1) Brisbane's current dry weather discharges to the SEWPCP are approximately 12 percent of the permitted 6.0 mgd discharge to the SEWPCP, and (2) Baylands development, which makes up the bulk of Brisbane's growth, will not discharge stormwater flows to the SEWPCP, Baylands development in combination with past, present, and reasonably foreseeable future projects would not exceed Brisbane's capacity at the SEWPCP.

Since expanded facilities needed to treat Baylands wastewater would be exclusive to the Baylands, no significant cumulative impact would result.

Stormwater Drainage Facilities

The Baylands Specific Plan area is located at the downstream end of the watersheds within which it is located and drains directly to San Francisco Bay and the Brisbane Lagoon. Thus, runoff from the Baylands would not combine with any downstream flows to generate a cumulative impact. As demonstrated in Section 4.14, *Hydrology and Water Quality*, the Specific Plan drainage system has been designed to accommodate stormwater flows from upstream areas.

Development of the LMF would result in approximately 980 linear feet of Visitacion Creek being filled and placed in an underground channel beneath the LMF. The LMF would also displace the Specific Plan's proposed detention basin, which would need to be constructed at another location. The cumulative effect of the LMF and Baylands development outside of the LMF footprint would thus combine to generate a significant cumulative impact in relation to construction of drainage facilities.

Cumulative Impact Conclusion

Baylands development would combine with LMF construction to generate a significant cumulative impact.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

Baylands development would contribute to the significant cumulative impact by relocating construction of the proposed detention basin outside of the LMF footprint. However, such relocation would not be needed but for the LMF. Thus, the 2025 Specific Plan project would not have a cumulatively considerable contribution to a significant cumulative impact related to impacts of stormwater drainage facilities construction or operation.

Impact UTL-3: Solid Waste Generation; Impact UTL-4, Consistency with Solid Waste Diversion Policies

As documented in the analysis of Impact UTL-3, the Baylands Specific Plan would be consistent with and achieve a diversion rate in excess of applicable solid waste management and reduction statutes, regulations, plans, and policies. However, development of the 121-acre LMF would require excavation of more than 2.1 million cubic yards of waste material from the former Brisbane landfill for reburial of non-hazardous and hazardous wastes at landfills in San Mateo and Kern counties, respectively. LMF construction would therefore be inconsistent with applicable solid waste management and reduction policies.

As presented in **Table 4.16-7**, the Recology Hay Road landfill to which solid waste from the Baylands that could not be reused or recycled would be delivered is projected to reach full capacity in 2077 based on projected development within Recology San Francisco's service area. The addition of Baylands development along with future growth within Recology's service area would have minimal, if any, effect on the projected lifespan of the Hay Road landfill due to the Baylands high projected waste diversion rate (90 percent to be achieved by 2035 with a 95 percent diversion rate to be achieved by 2040) and San Francisco's zero waste goal (SFEnvironment 2021).

Cumulative Impact Conclusion

While LMF construction would be inconsistent with applicable solid waste management and reduction policies, other projects, including Baylands development outside of the LMF footprint, would be consistent with these policies. Thus, no significant cumulative impact would result.

Landfill capacity would be available through 2077 to accommodate development of Baylands residential, commercial, open space, and other uses combined with the projected waste stream generated within the Recology San Francisco service area that would go to the Hay Road landfill, and a less than significant cumulative impact would result.

7.3.15 PUBLIC SERVICES AND FACILITIES

a. Geographic Context and Method of Analysis

The geographic context for analysis of cumulative public services and facilities impacts encompasses the service areas for each of the agencies providing police, fire protection, school, library, and other public services to be Baylands (see **Table 7-26**). The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-26: Geographic Context and Methodology for Analysis of Cumulative Public Services and Facilities Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact PUB-1 **New or Altered Public Facilities**		
Police Facilities	City of Brisbane.	Projections-based qualitative analysis for Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 2–4).
Fire Protection Facilities	City of Brisbane.	Projections-based qualitative analysis for Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 2–4).
School Facilities	Service area of the Bayshore Elementary School District (Grades PK–8), Brisbane School District (PK–8), and Jefferson Union High School District (Grades 9–12).	List-based qualitative analysis for Bayshore Elementary, Brisbane, and Jefferson Union school districts, including the following projects in addition to the Baylands Specific Plan: • Brisbane (General Plan buildout and Cumulative Projects AA, BB, 2–4) • Daly City (Cumulative Projects 43–47)
Public Library Facilities	City of Brisbane.	Projections-based qualitative analysis for housing and population within Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA and BB).
Other Public Facilities	City of Brisbane.	Projections-based qualitative analysis for Brisbane (**Table 7-1** projections for General Plan buildout and Cumulative Projects AA, BB, 2–4).

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in substantial adverse physical impacts associated with the provision of new or physically altered public service facilities, or the need for new or physically altered public facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives?

Impact PUB-1: New or Altered Public Facilities

Socioeconomic Projections Driving Future City of Brisbane Public Services and Facilities Needs

As shown in **Table 7-27**, the City of Brisbane is projected to grow by 803 residents and 4,400 employees through 2050, excluding residents and employees from the Baylands and Cumulative Projects 2–4.

Table 7-27: Household and Employment Projections for City of Brisbane Buildout, Including Cumulative Projects 2–4

	Households			Employment		
	2015	2050	Change: 2015–2050	2015	2050	Change: 2015–2050
Brisbane General Plan [a]	1,910	2,713	803	10,465	14,865	+4,400
Baylands Specific Plan	—	2,200	2,200	—	19,480	+19,480

Sierra Point Hotel and Life Sciences	—	—	—	—	2,078	+2,078
CITY OF BRISBANE TOTAL	**1,910**	**4,913**	**+3,003**	**11,685**	**41,083**	**+29,398**

SOURCE: City of Brisbane, 2023.

NOTE:

a. Includes Genesis Marina (Cumulative Project 1) but excludes the Baylands Specific Plan and Sierra Point Towers, Guadalupe Quarry Redevelopment, and Sierra Point Hotel and Life Sciences projects (Cumulative Projects 2–4).

As shown in **Table 7-27**, the cumulative projection for Brisbane is to more than double the City's housing and employment base through 2050. The Brisbane Specific Plan would account for 73 percent of the City's population growth and 66 percent of its employment growth.

Police Facilities

The doubling of Brisbane's resident and employee population by the Baylands and Cumulative Projects AA, BB, and 2–4 development would more than double the number of calls for service to the Brisbane Police Department. To accommodate this increased service demand, one or more additional patrol beats will need to be established, including additional personnel, equipment, and a new police substation.

The addition of a 24/7 patrol beat for the area east of Bayshore Boulevard and a police substation within the Baylands would also be necessary and would be established as part of Baylands development, which would generate the majority of future citywide growth in calls for police service. Increases in traffic on US Highway 101 would also increase the number of calls for service to the Brisbane Police Department, as would cumulative development within Brisbane west of Bayshore Boulevard.

Cumulative Impact Conclusion

Baylands development would create the need for an additional police beat and the establishment of a police substation within the Baylands. Brisbane General Plan buildout and development of Cumulative Projects 2–4 would not require police facilities in addition to those required for the Baylands alone. Therefore, no significant cumulative impact would result.

Fire Protection Facilities

The doubling of Brisbane's resident and employee population by development of the Baylands and Cumulative Projects 2–4 would approximately double the number of calls for service to the North County Fire Authority originating from within Brisbane. To accommodate this increased service demand, the North County Fire Authority and City of Brisbane have determined that relocating the City's existing Fire Station No. 81 to a site west of Bayshore Boulevard adjacent to City Hall and then constructing and equipping a new fire station within the Baylands would provide adequate service for projected growth. The relocated fire station would temporarily house a ladder truck company as well as the existing Engine Company No. 81. Once it is constructed and operational, the Baylands fire station would house the aerial ladder company and a new squad.[397]

Cumulative Impact Conclusion

Baylands development would create the need for relocating the City's existing fire station and establishment of a new fire station within the Baylands. Brisbane General Plan buildout and development of Cumulative Projects 2–4 would not require fire protection facilities in addition to those required for the Baylands alone. Therefore, no significant cumulative impact would result.

School Facilities

Although student generation is primarily the result of residential development, current state law permits parents to register their children for school based on their place of employment, as well as their place of residence. Thus, commercial and industrial cumulative projects, even though they do not all contain residential development, would generate new students. These

[397] "Squad" refers to a specialized company whose primary focus may be suppression but that carries specialized equipment and is trained to perform hazmat, rescue, and other special functions.

projects, together with Baylands development, would combine to create the need for new or expanded school facilities.

New residential and non-residential development within the Bayshore Elementary School District, Brisbane School District, and Jefferson Union High School District would generate new students, increasing enrollment within the three districts, each of which has experienced reduced enrollment over the past several years. To accommodate Specific Plan development, a new middle school would be constructed within the Baylands, and the Bayshore School within Daly City would be converted to serve pre-kindergarten through grade 5. New residential and non-residential development within the Bayshore Elementary School District, Brisbane School District, and Jefferson Union High School District would also be required to pay school impact fees. Payment of school facilities impact fees mandated under SB 50 is the exclusive method of considering and mitigating the direct impacts on school facilities.

In addition, Baylands development in combination with development projects within the Bayshore, Brisbane and Jefferson Union school districts could indirectly cause environmental impacts as the result of new school construction and improvements to existing schools.

Because the buildout of cumulative projects within Brisbane and Daly City has not been fully defined, a precise determination of commercial/industrial square footage cannot be determined. Based on the available information presented in **Table 7-2**, development of cumulative projects in Brisbane and Daly City would include approximately 3,270 dwelling units, 3.55 million s.f. of commercial and industrial use along with an unknown amount of square footage in Cumulative Projects AA, BB, and 43-47, and 608 hotel rooms. Given that enrollment in the Bayshore, Brisbane, and Jefferson Union school districts is below the districts' historic highs and enrollments have been dropping, it cannot be known at this time how each district would accommodate incoming students from cumulative projects.

During the CEQA review process for individual development projects, as well as for any new or improved school facilities, environmental impacts associated with such projects would be analyzed and would be avoided or reduced through the imposition of conditions of approval and mitigation measures imposed on those directly involved in the development, construction, or expansion activities.

Cumulative Impact Conclusion

Because payment of school facilities impact fees mandated under SB 50 is the exclusive method of mitigating direct impacts on school facilities, no significant direct cumulative impact would result. However, since the extent to which cumulative projects within the Bayshore, Brisbane, and Jefferson Union school districts would require new or improved school facilities cannot be known at this time, construction of new or improved school facilities could result in significant cumulative impacts.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

Construction of the middle school within the Baylands would contribute to significant impacts of Specific Plan development and have a cumulatively considerable contribution to a significant cumulative impact related to construction of schools.

Public Libraries

The City's new library on Visitacion Avenue was designed to accommodate population growth associated with residential buildout of the Brisbane General Plan, not including Baylands housing. The population increase generated by Baylands development would approximately double the City's population, exceed the library's capacity, and cause deterioration of the existing facility. A significant cumulative impact in relation to library expansion would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

Because the City's existing library was designed to accommodate Brisbane's population growth outside of the Baylands, impacts to the library and the need for new or expanded library facilities would not occur but for the 2025 Specific Plan project. The Specific Plan would have a cumulatively considerable contribution to a significant cumulative impact related to library facilities.

Other Public Facilities

The 3,003 new households projected for Brisbane through 2050 will increase the City's population from 4,344 to approximately 11,135. Through 2050, the number of jobs within Brisbane would increase by 29,398 to 41,083. The approximate doubling of Brisbane's population and employment base through 2050 would require expansion of the City's current corporation yard at the intersection of Tunnel Avenue and Lagoon Road to an approximately 2.5-acre site with the following characteristics:

- Generally square in shape;
- Level;
- Fully remediated; and
- With direct connection to a minimum roadway classification of collector.

Because the existing corporation yard is of adequate size to serve Brisbane General Plan buildout along with Cumulative Projects 2–4, it would not need to be relocated and expanded in the absence of Baylands development. Thus, no significant cumulative impact would result.

7.3.16 RECREATIONAL RESOURCES

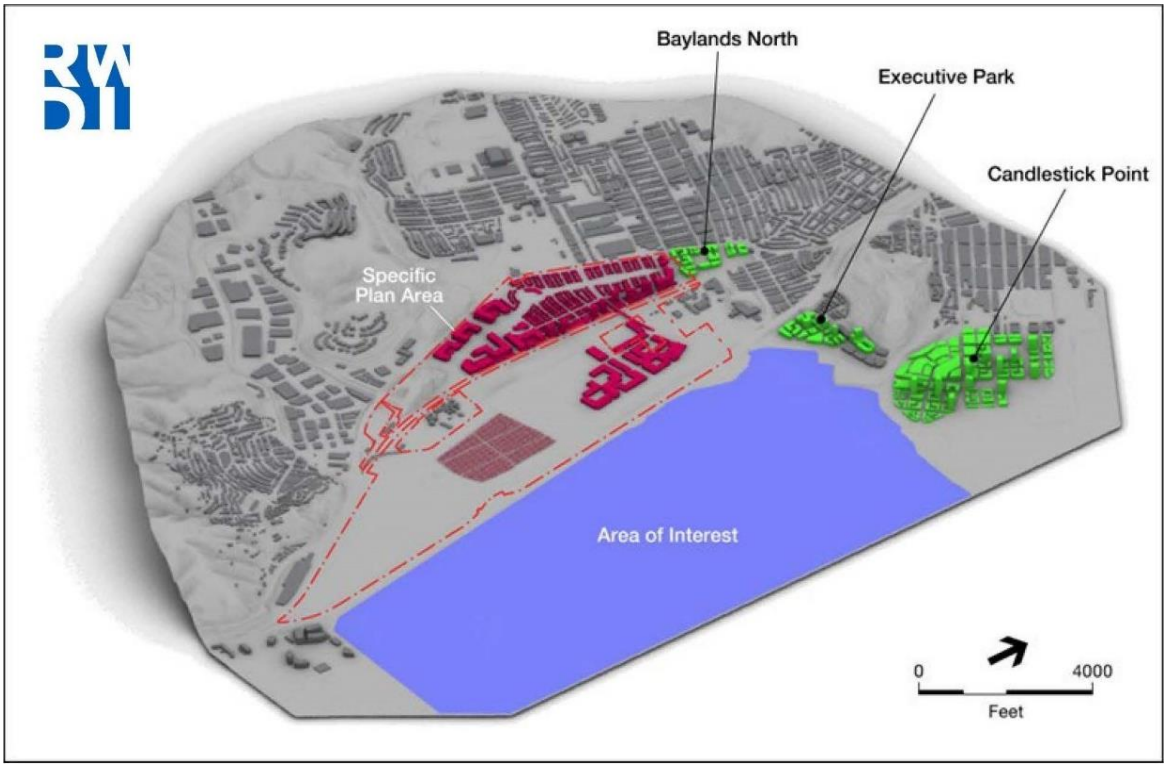
a. Geographic Context and Method of Analysis

The geographic context and methodology of analysis for cumulative recreational resources impacts are identified in **Table 7-28**. The full list of cumulative projects used in list-based analyses is provided in **Table 7-2**.

Table 7-28: Geographic Context and Methodology for Analysis of Cumulative Recreational Resources Impacts

	Geographic Context	List- or Projections-Based Analysis
Impact REC-1 Physical Deterioration of Existing Recreational Facilities	City of Brisbane.	Projections-based analysis.
Impact REC-2 Physical Effects on the Candlestick Point State Recreation Area	Lands adjacent to the offshore portions of the Candlestick Point State Recreation Area due east of the Baylands and south of Candlestick Point (see **Figure 7-4**).	List-based analysis, including the following projects in addition to the Baylands Specific Plan: • Baylands North (Cumulative Project 6) • Executive Park Baylands North (Cumulative Project 7) • Candlestick Point Baylands North (Cumulative Project 8)

Figure 7-4: Geographic Context for Analysis of Cumulative Impacts on Windsurfing Resources within the Candlestick Point State Recreation Area



SOURCE: RWDI, 2023

b. Cumulative Impacts: Would the Baylands Specific Plan, in conjunction with past, present, and probable future projects, result in significant cumulative recreation impacts?

Impact REC-1: Substantial Physical Deterioration of Existing Recreational Facilities Due to Increased Use

As noted above, the cumulative buildout for the City of Brisbane, including the Baylands, is an increase of 3,003 dwelling units, 2,200 (73.3 percent) of which would be constructed within the Baylands. Assuming 2.35 persons per dwelling unit for residential development outside of the Baylands, Brisbane's population would grow by 1,887. Pursuant to the provisions of Municipal Code Sections 16.24.010–16.24.070, which authorize the City to require Quimby Act dedications to "provide for adequate and appropriate recreational facilities" at a standard of 4.50 acres per 1,000 residents, cumulative development would be required to provide for approximately 8.5 acres of new park facilities. The Baylands Specific Plan would provide 64.4 acres of improved parkland, resulting in 11.12 acres of improved parkland per 1,000 population, even if residential growth outside of the Baylands is not accompanied by any parkland expansion. This ratio exceeds the 5.05 acres per 1,000 population of parkland currently available to Brisbane residents.

Cumulative Impact Conclusion

By providing substantially more parkland per 1,000 population than is currently available to Brisbane residents, Baylands development would help ensure that Baylands and cumulative development would not increase the use of existing neighborhood and community parks such that substantial physical deterioration of these existing facilities would occur or be accelerated. Thus, no significant cumulative impact would result.

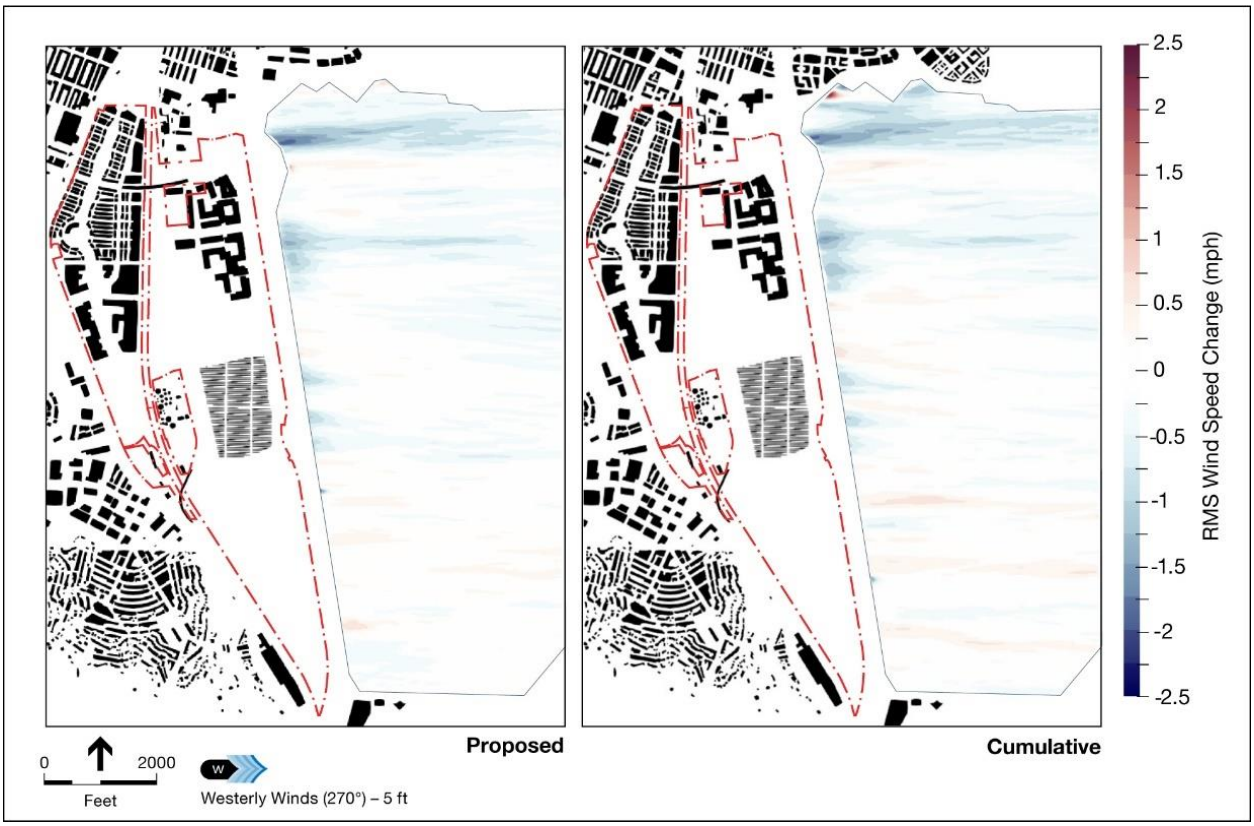
Impact REC-2: Physical Effects on Windsurfing Resources within the Candlestick Point State Recreation Area

As illustrated below, cumulative development projects would cause some additional decrease in wind speeds compared to Specific Plan impacts and increase in turbulence in the case of westerly-northwesterly and northwesterly winds. However, the area affected by cumulative development is generally limited to the northern one-tenth of the primary windsurfing area, closest to the Candlestick Point State Recreational Area launch area.

Wind Speed

With westerly winds, the primary effects of cumulative projects would occur close to the northern shoreline of the primary windsurfing area in an area largely not affected by Baylands development. As illustrated in **Figure 7-5**, cumulative projects would reduce wind speeds by about 1.0 mile per hour along the shoreline.

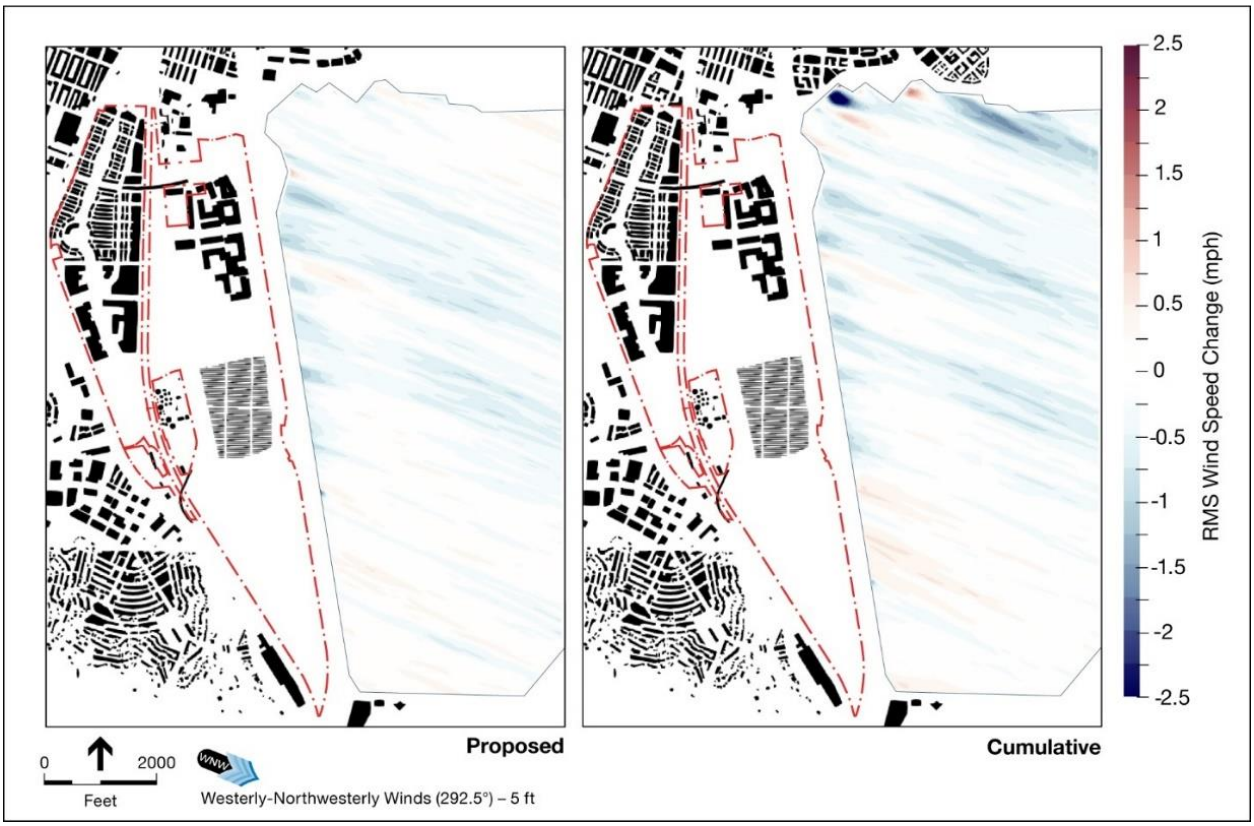
Figure 7-5: Cumulative Changes in Wind Speeds: Westerly Winds



SOURCE: RWDI, 2023.

With westerly-northwesterly winds, the effects of cumulative projects would occur over a larger area close to the shoreline where cumulative projects add wind speed reductions of 1.0 to 2.5 miles per hour (see **Figure 7-6**). Farther south of the shoreline, the effects of cumulative projects would mix with those of Baylands development to expand the offshore area subject to wind speed reduction of 1.0 mile per hour and less.

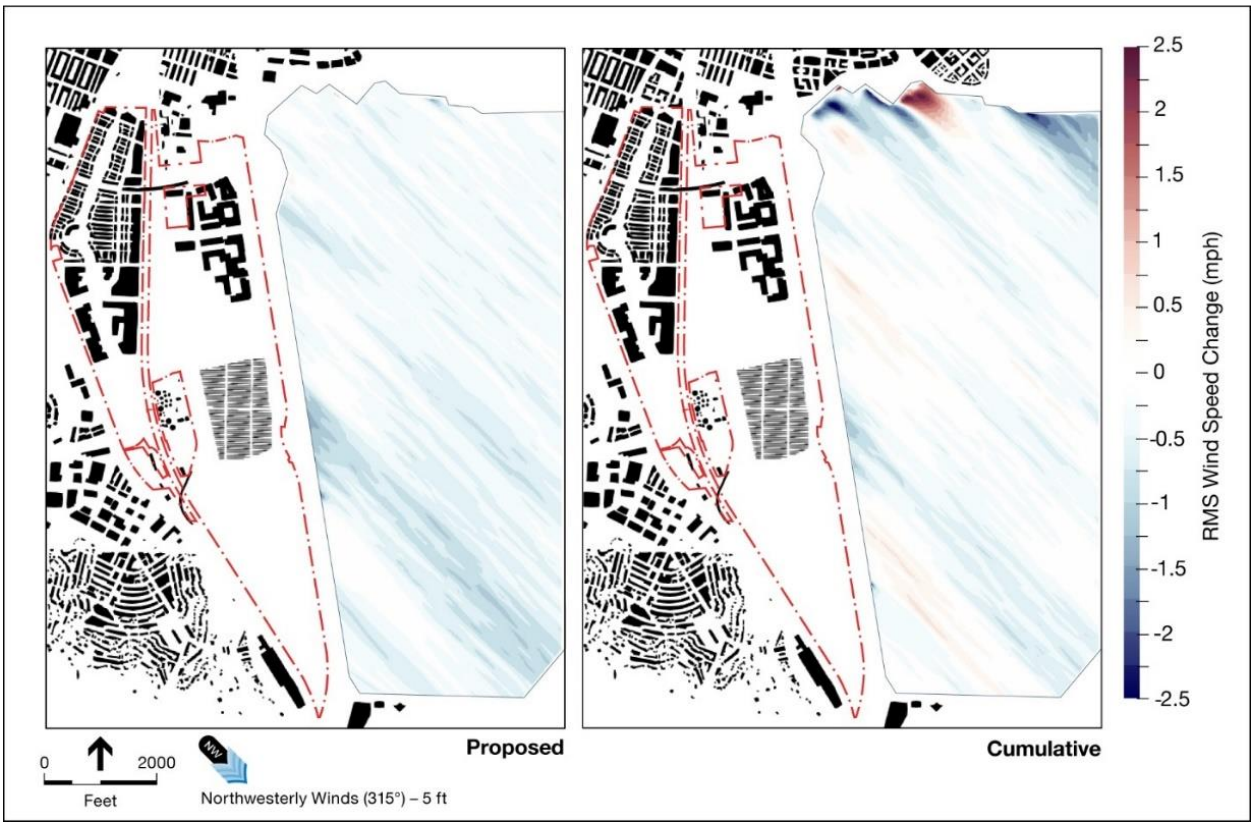
Figure 7-6: Cumulative Changes in Wind Speeds: West-Northwesterly Winds



SOURCE: RWDI, 2023.

With northwesterly winds, the effects of cumulative projects on wind speeds along the north shore of the primary windsurfing area would be more pronounced than would occur with other wind directions (see **Figure 7-7**). Close to the northern shore of the primary windsurfing area, cumulative projects would reduce wind speeds by 1.0 to 2.5 miles per hour. Farther south within the primary windsurfing area, the combined effects of Baylands and cumulative development would tend to result in smaller reductions in wind speed than would occur with Baylands development alone and would result in some areas where minor increases in wind speed would occur.

Figure 7-7: Cumulative Changes in Wind Speeds: Northwesterly Winds

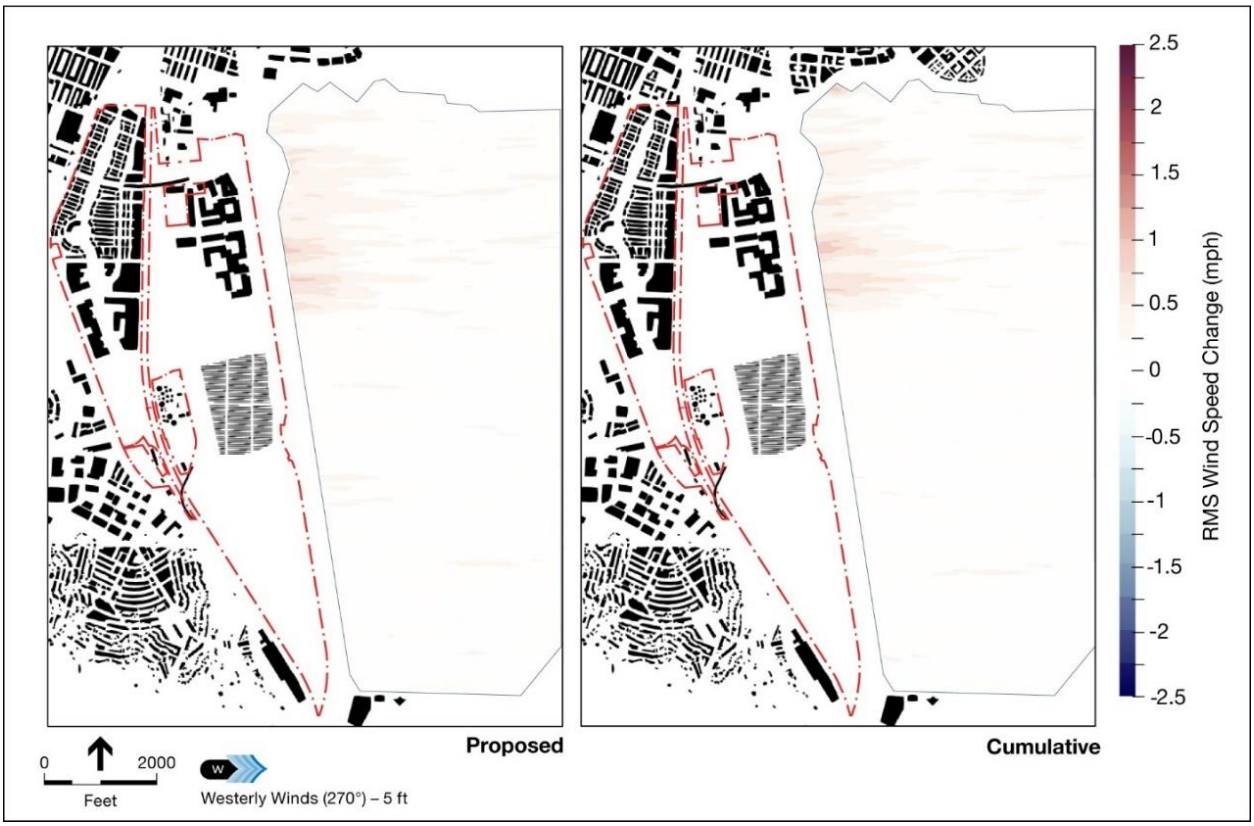


SOURCE: RWDI, 2023.

Turbulence

As shown in **Figure 7-8**, the combined effect of Baylands development and Cumulative Projects 6–8 would be to expand the area where wind speed fluctuations would occur along the northerly shoreline of the primary windsurfing area. Overall, increases in wind speed fluctuations would be minor, and would approach 1.0 mile per hour in a limited area south of the Executive Park project. In addition, a larger area east of the Baylands would experience an increase in wind speed fluctuations of up to 1.0 mile per hour.

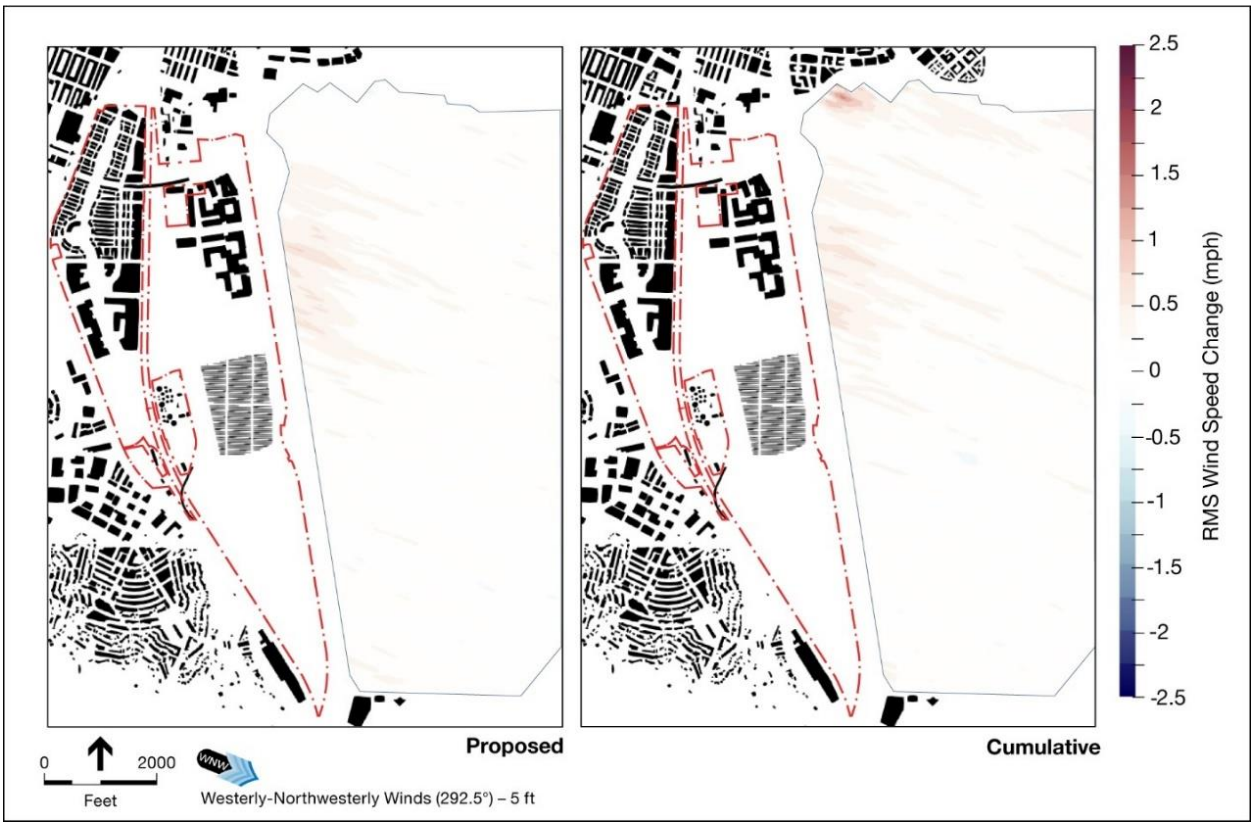
Figure 7-8: Cumulative Changes in Wind Fluctuations: Westerly Winds



SOURCE: RWDI, 2023.

As illustrated in **Figure 7-9**, below, the effects of Cumulative Projects 6–8 on wind speed fluctuations with westerly-northwesterly winds would be more pronounced along the northerly shoreline of the primary windsurfing area where Baylands development would have little or no effect. As illustrated below, cumulative development would increase wind speed fluctuation generally by no more than 0.75 mile per hour with wind speed fluctuation increasing by up to 1.5 miles per hour in a small area south of Executive Park. Cumulative Projects 6–8 would also combine to increase the area subject to wind fluctuation increases of 0.75 mile per hour or less to the south within the primary windsurfing area.

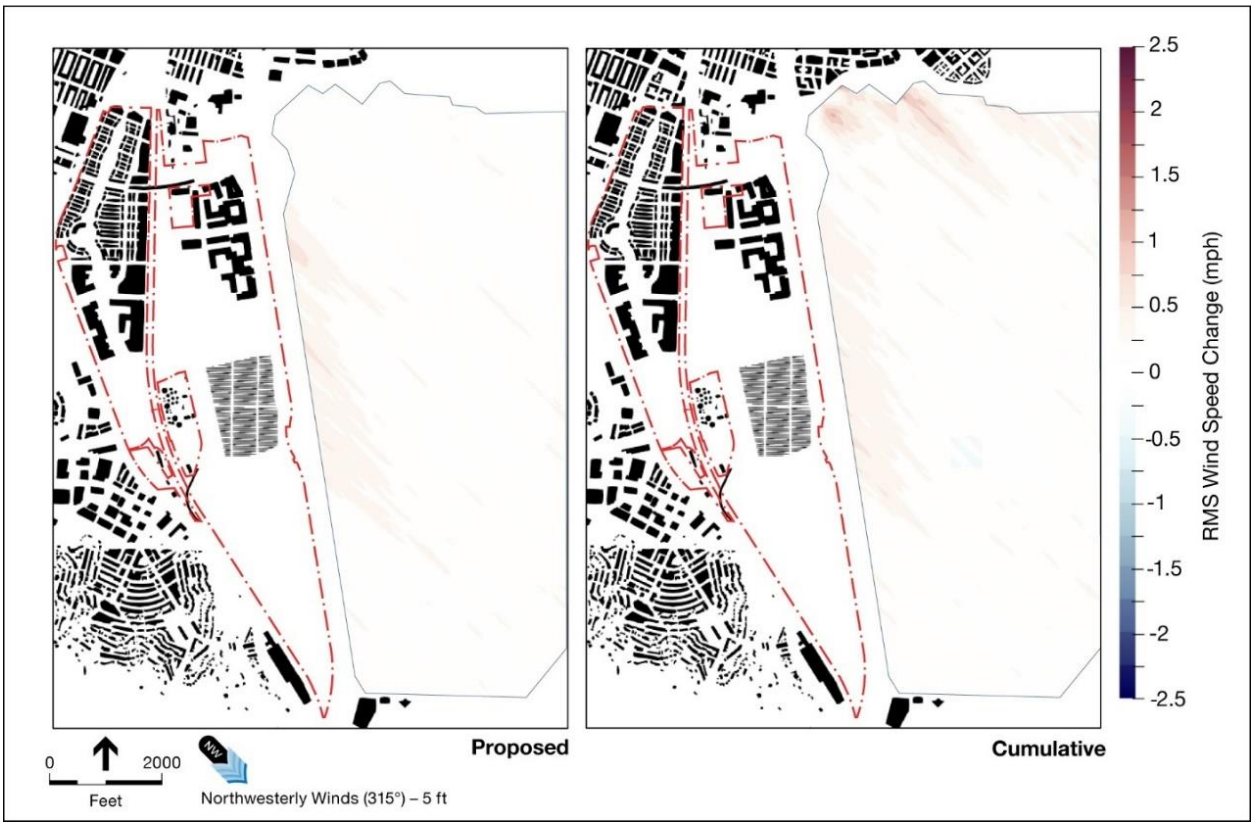
Figure 7-9: Cumulative Changes in Wind Fluctuations: Westerly-Northwesterly Winds



SOURCE: RWDI, 2023.

As illustrated in **Figure 7-10**, wind speed fluctuations caused by Cumulative Projects 6–8 with northwesterly winds would be more pronounced than for other wine speed directions along the northerly shoreline of the primary windsurfing area where Baylands development would have little or no effect. Farther south within the primary windsurfing area, the combination of Baylands and cumulative project development would result in wind speed fluctuation increases of less than 0.5 mile per hour.

Figure 7-10: Cumulative Changes in Wind Fluctuations: Northwesterly Winds



SOURCE: RWDI, 2023.

Cumulative Impact Conclusion

As shown in **Figure 7-5** through **Figure 7-10**, although the combination of Baylands and Cumulative Projects 6–8 would cause some decrease in average wind speeds and increase in turbulence, wind conditions within the majority of the Candlestick Point windsurfing area would not be affected. Areas that would be affected are largely limited to a 300-yard area along the shoreline, and the average changes in wind speed would generally be 1 to 2 mph, with changes in turbulence generally limited to 1 to 1.5 mph.

Thus, Baylands and cumulative development would not substantially degrade the offshore wind-related recreational resource within the Candlestick Point State Recreation Area and a less than significant cumulative impact would result.

7.3.17 WILDLAND FIRE

a. Geographic Context

The geographic context for analysis of cumulative wildland fire impacts encompasses the City of Brisbane and its sphere of influence, as well as the San Bruno Mountain Habitat Conservation

Plan area and areas adjacent to the Baylands designated as a moderate wildland fire hazard area (see **Figure 4.19-1**)as well as lands adjacent to the Baylands that are within a wildland-urban interface (see **Figure 4.19-2**).

b. Impact WLF-1: Exacerbate Fire Risk

As illustrated in **Figure 4.19-1**, a portion of the Specific Plan area is within a moderate wildland fire hazard area, as are large areas to the west of the site. In addition, wildland-urban interface areas, where conditions affecting the combustibility of natural and cultivated vegetation (wildland fuels) and structures or infrastructure (built fuels) would allow for the ignition and spread of fire through these combined fuels are designated along the west side of Bayshore Boulevard within Brisbane and Daly City as well as to the north in San Francisco.

San Bruno Mountain is designated as a high fire hazard zone. The Mountain's slopes are varied, which could contribute to the uncontrolled spread of a wildfire, dependent upon where fire might start, and other important conditions such as wind speed and direction, fuel, and moisture. Due to the location of the mountain on the Bay peninsula between the Pacific Ocean and San Francisco Bay, protection from the Diablo winds, and the high humidity conditions from the fog and overcast conditions common to the area, vegetation is able to absorb and maintain a high fuel moisture level, which could decrease a wildfire's rate of spread.

Development of areas susceptible to wildfire could exacerbate fire risk by introducing human activities into fire-prone open space. Human-caused wildfires tend to be generated by activities such as debris and brush-clearing fires, electrical equipment malfunctions, campfire escapes, smoking, fire play (e.g., fireworks), vehicles, and arson. Development within wildland-urban interface areas between San Bruno Mountain and the Baylands could exacerbate the potential for a wildland fire to spread and cause structural fires within nearby urban areas, as well as to expose more receptors to pollutant concentrations from a wildfire. A significant cumulative impact would result.

Incremental Contribution of Baylands Development to the Significant Cumulative Impact

Baylands development would contribute to the significant cumulative impact by increasing population in the vicinity of San Bruno Mountain and increasing human activity within the San Bruno Mountain State and Regional Park, as well as the number of receptors that could be adversely affected by pollution from a wildland fire. However, the 2025 Specific Plan project would increase North County's firefighting capability commensurate with the size of Baylands development. Baylands development would not have a cumulatively considerable contribution to a significant cumulative impact related to wildland fire.

CHAPTER 8 ALTERNATIVES

8.1 INTRODUCTION

The identification and analysis of alternatives to a proposed project is fundamental to the environmental documentation and review process. The California Environmental Quality Act (Public Resources Code Section 21002.1(a)) establishes the need to address alternatives in an EIR by stating that, in addition to determining a project's significant environmental impacts and indicating potential means of mitigating or avoiding those impacts, "the purpose of an environmental impact report is … to identify alternatives to the project" that would avoid or lessen the project's significant effects.

Pursuant to the provisions of CEQA Guidelines Section 15126.6(d), this chapter describes and evaluates alternatives to the Baylands Specific Plan, in comparison to the impacts that would result from buildout of the Specific Plan as it has been proposed by the applicant. Included in the identification and evaluation of project alternatives is discussion of the "no project alternative" and identification of the "environmentally superior alternative" as required by CEQA Guidelines Section 15126.6(e).

CEQA Guidelines Section 15126.6 Consideration and Discussion of Alternatives in an EIR

CEQA Guidelines Section 15126.6(a) requires that an EIR describe a reasonable range of alternatives to the proposed project or to the project's location that would avoid or substantially lessen its significant environmental impacts while attaining most, but not necessarily all, of the project's objectives. An EIR need not consider every conceivable alternative to a project but must consider a reasonable range of potentially feasible alternatives that will foster informed decision-making and public participation (CEQA Guidelines Section 15126.6[a]).

Because an EIR must identify ways to mitigate or avoid a project's significant effects on the environment, CEQA Guidelines Section 15126.6(b) emphasizes that the selection of project alternatives must be based primarily on the ability to reduce impacts relative to the proposed project, "even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly."

CEQA Guidelines Section 15126.6(c) requires the EIR to address a "range of reasonable alternatives," including "those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects."

CEQA Guidelines Section 15126.6(d) requires the EIR to "include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project." The environmental effects of alternatives are, however, permitted to be addressed in less detail than those of the proposed project. Additionally, an EIR is not required to analyze alternatives when the effects of the alternative "cannot be reasonably ascertained and whose implementation is remote and speculative" (CEQA Guidelines Section 15126.6[f][3]).

8.2 RATIONALE FOR SELECTION OF ALTERNATIVES

The specific reasons for selection of each alternative addressed in this EIR or rejection of an alternative from further analysis are discussed below. The following general factors were used to define the development, location, and water supply alternatives that are analyzed in this chapter and meet the requirements of CEQA Guidelines Section 15126.6:

- Contributing to a "reasonable range" of alternatives necessary to permit a reasoned choice between the proposed project and alternatives.
- Avoiding or substantially lessening one or more of the Specific Plan's significant environmental effects[398] while achieving the underlying purpose of the Specific Plan along with some but not necessarily all other project objectives.
- Being potentially feasible,[399] considering site suitability, economic viability, availability of infrastructure, property control (ownership), and consistency with applicable plans and regulatory limitations.
- Meeting the requirement to consider a "no project" alternative, including an alternative that provides for the likely outcome should the Specific Plan not be approved.

Neither the CEQA statute, California CEQA Guidelines, nor recent court cases indicate a specific number of alternatives to be evaluated in an EIR. Rather, "the range of alternatives required in an EIR is governed by the rule of reason that sets forth only those alternatives necessary to permit a reasoned choice" (CEQA Guidelines Section 15126[f]). Based on the preceding guidance, alternatives were selected for review that would achieve the underlying purpose of the Specific Plan; meet most of the other project objectives; reduce one or more of the significant impacts of the Specific Plan; and be reasonable, potentially feasible, and not speculative.

8.2.1 SIGNIFICANT UNAVOIDABLE ENVIRONMENTAL EFFECTS OF THE BAYLANDS SPECIFIC PLAN

CEQA requires the alternatives selected for comparison in an EIR to avoid or substantially lessen one or more significant effects of the project being evaluated. To identify alternatives that would avoid or substantially lessen any of the identified significant environmental effects of the Baylands Specific Plan, significant unavoidable impacts must be considered. It is recognized

[398] See Section 8.2.1 for a listing of significant unavoidable impacts.

[399] CEQA Guidelines Section 15364 defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors." CEQA Guidelines Section 15126.6(f)(1) states that "Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries … and whether the proponent can reasonably acquire, control or otherwise have access to the alternative site …"

that alternatives aimed at reducing the significant unavoidable impacts of the Specific Plan would also avoid or reduce significant impacts that could be reduced to a less than significant level. The analysis in Chapter 4 (Sections 4.3 through 4.19) of this EIR determined that development associated with the Baylands Specific Plan would result in the following significant unavoidable impacts.

- **Impact AQ-1:** The Baylands Specific Plan would cause a net increase in emissions of non-attainment criteria pollutants (ROG, NO_X, PM_{10}, $PM_{2.5}$) exceeding BAAQMD Regional Criteria Pollutant Significance Thresholds during construction and for operations at the completion of Phase 1 development, as well as at full Specific Plan buildout.
- **Impact GHG-1:** The Baylands Specific Plan would cause a net increase in total greenhouse gas (GHG) emissions generated within the Baylands.
- **Impact NOI-1:** The use of impact pile driving for construction of buildings over 5 stories in height or for the Geneva Avenue bridge in proximity to occupied residential and office buildings would cause unavoidable adverse effects, particularly if multiple pile driving activities were undertaken at the same time, until construction of such buildings is completed.
- **Impact NOI-2:** The aggregate operation of all stationary noise sources would increase noise levels generated within the Specific Plan area as a whole. Because the exact future location and configuration for all of these sources cannot be known at this time, it is not possible to ensure that the aggregate increase in noise levels at specific off-site receptor locations from stationary sources would not result in a permanent noise increase in excess of 5 dBA L_{eq}.
- **Impact NOI-3:** Increased noise levels from Baylands-generated traffic would exceed applicable standards along one roadway segment at the conclusion of Phase 1 development (assumed to occur in 2035), increasing to 3 roadway segments at full Specific Plan buildout (assumed to be 2040).

8.2.2 PROJECT OBJECTIVES

The following identifies the objectives of the Baylands Specific Plan project pursuant to CEQA Guidelines Section 15124(b), which requires an EIR to include a "statement of objectives sought by the proposed project" and "should include the underlying purpose of the project." The **underlying purpose of the Baylands Specific Plan** and the development it permits is to provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.

Project objectives for the Baylands are to:

- Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.
- Implement the Brisbane General Plan, including General Plan Amendments GP-1-18 (Measure JJ) and GP-1-19.
- Preserve and enhance the site's natural resources and historic features within a system of permanent open space that:
    - Restores and enhances wetlands and natural habitats within the Baylands;
    - Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay;
    - Adapts to climate change and sea level rise; and
    - Provides a range of recreational opportunities and open space experiences for Baylands residents and workers, as well as for the larger Brisbane community.
- Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive for the City.
- Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).
- Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.
- Enable residents, workers, and visitors to be less dependent on cars.

8.3 BAYLANDS ALTERNATIVES CONSIDERED BUT REJECTED

As required by CEQA Guidelines Section 15126.6 (c), the following identifies alternatives that were considered, but were not evaluated in detail because they would not achieve the underlying purpose of the project, are infeasible, and/or they would not reduce any of the project's significant impacts. As further required by CEQA Guidelines Section 15126.6 (c), a brief explanation of the reasons why each alternative was rejected is also provided.

The alternatives that were considered but rejected are identified in two groups that are summarized in Section 8.3.1 along with the reasons they have been eliminated from further consideration:

3. Alternatives that were analyzed in the Brisbane Baylands Program EIR and were considered during the public hearing process leading to adoption of General Plan Amendment GP-1-18.
4. Additional alternatives that were considered but rejected during the scoping process for the current Specific Plan EIR.

8.3.1 LAND DEVELOPMENT ALTERNATIVES CONSIDERED BUT REJECTED

As part of the previous environmental and planning review of Baylands development leading to certification of the Brisbane Baylands Program EIR and adoption of GP-1-18 and Measure JJ, the 2011 Specific Plan and its variant, as well as two additional concept plan scenarios were evaluated as the "Project," along with alternatives to that project, all of which were considered and ultimately rejected by the Brisbane City Council in favor of adopting General Plan Amendment GP-1-18 and submitting Measure JJ to a public vote. The City Council resolutions and findings rejecting the project and alternatives addressed in the Program EIR can be found at:

- Draft Program EIR – https://archive.brisbaneca.org/baylands-deir
- Final Program EIR – https://archive.brisbaneca.org/feir-documents
- Full Text of Comments on the Draft Program EIR – https://archive.brisbaneca.org/deir-comments

Table 8-1 identifies the concept plans and alternatives analyzed in the Program EIR that were rejected in favor of General Plan Amendment GP-1-18 (Measure JJ). **Table 8-1** also identifies the additional alternatives that were considered during scoping for the current Specific Plan EIR.

Table 8-1: Alternatives Considered but Rejected

Alternative	Description	Reasons for Rejection
Concept Plan Scenarios Analyzed in the Program EIR at an Equal Level of Detail as the "Project"		
2011 Baylands Specific Plan (Developer Proposed Plan)	4,434 residential units 6.9 million square feet (s.f.) of office/retail/industrial/institutional uses Approximately 169.7 acres of "open space/open area," and approximately 135.6 acres of "lagoon" area	Substantial significant unavoidable environmental impacts were identified in relation to: • Aesthetics and Visual Resources • Air Quality

Alternative	Description	Reasons for Rejection
Developer Proposed Plan – Entertainment Variant	Same as the 2011 Specific Plan with retail and office/R&D uses in the northeast portion of the Baylands replaced with entertainment-oriented uses, including a 17,000- to 20,000-seat sports arena, a 5,500-seat concert theater, a multiple-screen cinema, and additional conference/exhibition space and hotel rooms.	• Noise and Vibration • Population and Housing • Traffic and Circulation • Utilities, Service Systems, and Water Supply Overall development intensity was out of character and incompatible with the Brisbane community and adjacent neighborhoods in San Francisco.
Community Prepared Plan	Approximately 7.7 million s.f. of office, industrial, commercial, and institutional uses with no residential development. 330 acres of open space/open area and a 135.6-acre lagoon area.	Substantial significant unavoidable environmental impacts were identified in relation to: • Aesthetics and Visual Resources • Air Quality • Biological Resources • Noise and Vibration • Population and Housing • Traffic and Circulation • Utilities, Service Systems, and Water Supply No housing provided to meet critical regional and local needs.
Community Prepared Plan – Recology Variant	Added expansion of the existing Recology facility within the City of Brisbane to the Community Prepared Plan, replacing hotel and R&D uses north of Geneva Avenue and east of Tunnel Road. Expanded Recology facilities within Brisbane from 44.2 acres and 260,000 s.f. of building area to 65 acres and 1,011,000 s.f. as part of a proposed zero waste program. Total new development under this variant would be approximately 8.1 million s.f. with no residential development.	
Alternatives Analyzed in the Program EIR		
Renewable Energy Generation	170 acres of alternative energy uses, including solar farm, wind turbines, and rooftop PV solar panels 654,900 s.f. R&D on 59 acres 173,800 s.f. of retail/entertainment uses on 26 acres Open space/public uses	Although identified as the environmentally superior alternative, this alternative failed to meet most of the project's objectives and was determined to be infeasible due to specific economic viability, legal, social, technological, and other reasons (City of Brisbane 2018b).
Reduced Intensity Non-Residential	• General Retail: 500,000 s.f. • General Office: 800,000 s.f. • R&D: 2,000,000 s.f. • Industrial/Warehouse: 224,000 s.f. • Public/Civic (community center/community theater): 180,000 s.f. • Recology Expansion (total): 1,011,000 s.f. • Hotel: 520,000 s.f. (650 rooms) • Institutional (office): 80,000 s.f. • Renewable Energy Generation: 25 acres	Would not have avoided significant traffic, air quality, or GHG emissions impacts. No housing provided to meet critical regional and local needs. Additionally, GP-1-18, which had similar or lesser environmental impacts, provided Baylands-specific development and environmental protection General Plan policies and also assisted the City address regional and local housing needs.
Reduced Intensity Mixed-Use	2,400 dwelling units 3,750,780 s.f. of non-residential development 25-acre solar farm, small-scale wind and rooftop solar energy generation	Although having a similar overall development intensity, this alternative was rejected in favor of GP-1-18, which provided Baylands-specific development and environmental protection General Plan policies. In addition, this alternative would likely have resulted in a net annual fiscal deficit to the City's General Fund.

Alternative	Description	Reasons for Rejection
Alternatives Considered but Rejected during Scoping for the Current Specific Plan EIR		
Public Park or Commercial Recreation Use	Acquisition of the majority of the Baylands by the City or another public agency for public open space and park use. Bayshore Industrial Park, Golden State Lumber, Recology facilities along Tunnel Avenue, Kinder Morgan tank farm, Machinery & Equipment, Inc., and Mission Blue Nursery would remain.	Rejected from further consideration since no funding exists or would likely become available for acquisition, site remediation and final landfill closure, habitat restoration, infrastructure, recreational improvements, and ongoing operations and maintenance. Alternative would be inconsistent with the General Plan, not meet the overarching purpose of the project, and would not provide housing opportunities, requiring increased residential development outside of the Baylands to implement the City's adopted Housing Element.
Site Remediation in the Absence of Further Baylands Development	Site remediation within Operable Units OU-SM and OU-2, as well as final Title 27 landfill closure would be implemented, but no subsequent development within the Baylands would occur.	Unrealistic to assume that a landowner would undertake and bear the costs of site remediation and final landfill closure absent the ability to develop the Baylands to pay for those activities. Alternative would be inconsistent with the General Plan, not meet the overarching purpose of the project, and would not provide housing, requiring increased residential development outside of the Baylands to implement the City's adopted Housing Element.
Baylands Development Around an Operating 121-Acre High Speed Rail Light Maintenance Facility (LMF)	2,200 dwelling units, 6.5 million s.f. of commercial development, 500,000 s.f. of hotel use, and infrastructure and open space/open area developed around an operating 121-acre high-speed rail LMF as described as the preferred project in the High-Speed Rail Final EIR/EIS for the San Francisco to San Jose segment.[400]	Alternative would not reduce significant unavoidable impacts and would result in new and substantially more severe significant impacts than would the 2025 Specific Plan project, along with substantial incompatibilities between Baylands development and High-Speed Rail LMF construction and operations.[401] As the result of a September 2024 agreement between the City of Brisbane and the California High-Speed Rail Authority, development of a 121-acre LMF within the eastern portion of the Baylands is no longer reasonably foreseeable.[402] Baylands development around an operating 45-acre LMF as described in the City-Authority agreement is instead evaluated as an alternative to the proposed Specific Plan.

[401] The City of Brisbane's comments on the High-Speed Rail EIR/EIS can be found at https://www.brisbaneca.org/citycouncil/page/high-speed-rail-authority-publishes-final-eireis.

[402] The September 2024 agreement can be found at https://www.brisbaneca.org/city-attorney/page/california-high-speed-rail-authority-and-city-brisbane-reach-settlement.

8.3.2 ALTERNATIVE LOCATION FOR THE BAYLANDS SPECIFIC PLAN

CEQA encourages the evaluation of an alternative project site when a different location has the potential to reduce significant environmental impacts associated with a project's setting. CEQA Guidelines do not, however, require analysis of off-site alternatives in every EIR. Only feasible locations that would avoid or substantially lessen any of the significant effects of the project and meet most of the project objectives need to be considered in an EIR's alternatives analysis. In determining whether potential alternative sites are feasible, factors to be considered include whether the project proponent could reasonably acquire, control, or otherwise have access to the alternative site (CEQA Guidelines Section 15126.6(f)(1)).

Relevant criteria for an alternative site include supporting overarching project objectives (productive reuse of this brownfield site that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands) and implementing GP-1-18, meeting key geographic metrics for size and location in relation to transit, suitability for development (access to roads and utilities, available water supply), availability of property, and ability to reduce impacts of the Baylands Specific Plan. To be considered feasible, properties must meet necessary requirements and criteria, including the following:

- Comparable size to the Baylands' land area (450-550 acres);
- Have the ability to produce an equivalent amount of housing within the City of Brisbane to that which was approved in GP-1-18 (1,800 to 2,200 dwelling units) and thereby meet the City's share of regional housing need required for its 6th cycle Housing Element, including access to:
    - Regional transportation systems (freeway and roadway; rail and bus transit)
    - Needed utilities
- Potentially available for purchase; and
- Suitable for development with impacts no greater than those of proposed Baylands development.

Based on the above criteria, there are no suitable alternative sites for the Baylands that would meet the underlying purpose of the project, which is to provide for the productive reuse of a brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the site. In addition, there are no sites within Brisbane that have sufficient area size and physical capability of achieving consistency with key General Plan provisions (1,800 to 2,200 dwelling units, up to 6.5 million s.f. of commercial development, and 500,000 s.f. of hotel use that would be revenue positive to the City and provide sufficient opportunities for development of housing for all economic segments of the community to meet the City's share of regional housing need required for implementation of the City's Housing Element. Accordingly, no off-site alternative has been carried forward for detailed analysis.

8.3.3 WATER SUPPLY ALTERNATIVES CONSIDERED BUT REJECTED

a. Oakdale Irrigation District Water Transfer

The potable water supply proposed for Baylands development and analyzed in the Program EIR was to be acquired from the Oakdale Irrigation District (OID) and delivered to the site via a water transfer agreement between the City and OID. Under the previous proposal, the City would acquire a supplemental water supply of up to 2,400 acre-feet per year (AFY) via a water transfer agreement with OID. The water would be transferred from OID to the City of Brisbane pursuant to water supply and conveyance agreements to be executed among OID, Modesto Irrigation District (MID), San Francisco Public Utilities Commission (SFPUC), and the City of Brisbane. Only existing diversion rights and existing facilities would be used, and no new facilities would be built.

The transfer of OID water supply was found to be problematic and was ultimately rejected for the following reasons:

- Uncertain timing for improvements to SFPUC's regional water system that would be required to move water supply to Brisbane and the Baylands;
- Environmental impacts associated with extraction of water from the Tuolumne River; and
- Opposition by MID to the proposed transfer agreement.

b. Contra Costa Water District

In December 2021, the applicant entered into a Memorandum of Understanding with the Contra Costa Water District (CCWD) to acquire water supply and reserve storage capacity at CCWD's Los Vaqueros Reservoir along with conveyance to the Specific Plan area. The CCWD-Baylands Development Inc. Memorandum of Understanding provided a framework for acquisition of up to 2,500 AFY and 10,000 acre-feet of storage in Los Vaqueros Reservoir, plus or minus 20 percent depending on final determination of need.[403]

Delivery of water from Los Vaqueros Reservoir to the SFPUC regional water system and the Baylands was proposed via the Transfer-Bethany Pipeline, Bethany Reservoir, South Bay Aqueduct, and San Antonio Reservoir. SFPUC would then deliver water from the San Antonio Reservoir to the Baylands via the same facilities now used to supply water to Brisbane.

[403] This proposed supply exceeded the 1,122 AFY of estimated potable annual water demand for the Baylands. The applicant stated that it would retain ownership of the excess water supply and the ability to sell that excess water supply to the City of Brisbane or to other entities outside of the City.

Water would be conveyed from Los Vaqueros Reservoir via an upgraded Transfer Facility pump station through the proposed Transfer-Bethany Pipeline to the existing California Aqueduct, which connects to the existing Bethany Reservoir. Bethany Reservoir is interconnected to the South Bay Aqueduct, an existing 49-mile aqueduct that is owned by the California Department of Water Resources (DWR). Existing turnout infrastructure connects the South Bay Aqueduct to San Antonio Reservoir and consists of a 30-inch-diameter valve and pipe, a meter, and an energy dissipater all contained in separate concrete vaults (the "Turnout"). This Turnout currently discharges water from the South Bay Aqueduct into an existing streambed that drains into the SFPUC's San Antonio Reservoir and the Sunol Valley Water Treatment Plant, both of which are part of the SFPUC's regional water system.

Comments regarding the potential impacts of this water supply provided by CCWD, the SFPUC, and the Zone 7 Water Agency (Zone 7 of the Alameda County Flood Control and Water Conservation District) in response to the revised Notice of Preparation distributed by the City of Brisbane in April 2023 raised substantial questions regarding the availability of this water supply and the feasibility of delivering it to the Baylands. In addition, on September 23, 2024, CCWD Board President Ernesto A. Avila issued a statement that CCWD would end its participation in the Los Vaqueros Reservoir Phase 2 Expansion Project, stating that "the facts show that this well-intended project is not viable." This alternative is therefore rejected from further consideration.

c. San Francisco Public Utilities Commission Retail Water Supply

In this alternative, proposed agreements with California Water Company (Cal Water) to transfer the Baylands, Sierra Point, and Beatty subareas from Brisbane's water service area to Cal Water's service area would not be approved, and Brisbane would remain the water service agency for the Baylands. Potable water supply to meet Baylands water demand would instead be acquired from the SFPUC from its retail portfolio in addition to Brisbane's Individual Supply Guarantee.

This alternative would rely on the same physical source of water as the proposed project since Cal Water purchases its supply based on an Individual Supply Guarantee from the SFPUC as does the City of Brisbane. This alternative would use existing turnouts from the SFPUC regional water system and require similar internal improvements as the Specific Plan. In this alternative, the Baylands recycled water facility would be downsized to provide recycled water for irrigation and other non-potable uses exclusively for Baylands development. No recycled water would be delivered to developments within South San Francisco.

This alternative was rejected from further consideration since this would not be a feasible long-term water solution. SFPUC's December 31, 2024, Water Supply Assessment for the 447 Battery and 530 Sansome Street Project indicated the following:

- With no implementation of the Bay-Delta Plan Amendment, system-wide shortages of regional water system supplies available to San Francisco would be adequate to meet demands in normal and single dry years. However, even though shortages would occur in the 4th and 5th years of a multi-year drought in 2045 projected levels of demand, adequate water would be available because "retail customers would reduce their demands by 5 percent as required by the Water Supply Agreement between SFPUC and its Wholesale Customers.
- Should the Healthy Rivers and Landscapes Agreement be accepted by the State Water Resources Control Board, systemwide shortage would occur although not to as great a degree as would occur under the Bay-Delta Plan Amendment. The Healthy Rivers and Landscapes Agreement would more closely align with SFPUC's goal of limiting water use reduction to no more than 20 percent on a system-wide basis in drought years.
- Implementation of the Bay-Delta Plan Amendment would cause significant shortfalls in single dry and multiple dry years through 2045, corresponding to water use reduction of approximately 15–36 percent over the next 20 years.

Giver this uncertainty, it is unlikely that the SFPUC would agree to sell water from its retail supply to supplement Brisbane's Individual Supply guarantee to serve Baylands development. This water supply alternative was therefore rejected from further consideration.

8.4 IDENTIFICATION AND EVALUATION OF BAYLANDS SPECIFIC PLAN ALTERNATIVES

Pursuant to CEQA Guidelines Section 15126.6(d), an EIR must evaluate the comparative merits of the alternatives identified in an EIR and contain sufficient information about each alternative to permit that evaluation. The significant effects of each alternative must be discussed, but in less detail than is required for the project's effects. However, the analysis must be conducted at a sufficient level of detail to provide the public, other public agencies, and City decision-makers with adequate information to allow an informed comparison of the impacts of the site development with those of the alternatives.

Implementation of the Remedial Action Plans for OU-SM and OU-2, described in Chapter 3, *Project Description*, of this EIR, is required prior to any future Baylands development, including

development of any of the alternatives (except the No Project-No Build Alternative) identified in this chapter. Alternatives evaluated in this chapter include:

- No Project Alternatives, which are analyzed in Section 8.4.1
    a. No Project-No Build
    b. No Project-General Plan Buildout
- Land Development Alternatives, which are summarized in **Table 8-5** and analyzed in Sections 8.4.3 and 8.4.4.
    - Proposed Density Alternatives (analyzed in Section 8.4.3)
        1. Proposed Density Development Around an Operating 45-Acre Light Maintenance Facility
        2. Proposed Density, Balanced Commercial Development
        3. Proposed Density, Lower Maximum Building Heights
    - Reduced Density Alternatives (analyzed in Section 8.4.4)
        4. Reduced Commercial Development
        5. Reduced Density Development Around an Operating 45-Acre Light Maintenance Facility
        6. Reduced Density, Balanced Commercial Development
        7. Reduced Density, Lower Maximum Building Heights

The following are provided for each of these alternatives:

- A description of the alternative's purpose;
- Analysis of the alternative's physical environmental effects including comparison to the impacts of the Baylands Specific Plan;
- Evaluation of the extent to the alternative would reduce of avoid the significant unavoidable impacts of the 2025 Specific Plan project and support the project's objectives; and
- Evaluation of the alternative's reasonableness and feasibility.

Section 8.5 provides a comparison of alternatives and identifies the environmentally superior alternative.

8.4.1 NO PROJECT ALTERNATIVES

a. No Project-No Build Alternative

Description and Purpose

The No Project-No Build Alternative assumes that the Baylands Specific Plan would not be approved and there would be no further development within the Baylands. No infrastructure improvements would be made, existing uses would continue but not expand, and any new uses within the Baylands would either occupy existing buildings or operate as interim or temporary uses. Since no future development would occur:

- Neither site remediation nor final Title 27 landfill closure would be undertaken;
- No site grading or new construction would be undertaken; and
- An expanded water supply for the Baylands would not be acquired.

The Geneva Avenue extension would not be part of Baylands development but could nevertheless be constructed by others as one of the regional transportation improvements identified in the Bi-County Transportation Study independent of any action taken by the City in relation to the Baylands Specific Plan. Since it would not be part of Baylands development under this alternative, the Geneva Avenue extension is not analyzed as part of the No Project-No Build Alternative.

The purpose of this alternative is to comply with CEQA Guidelines Section 15126.6(e) requirements for evaluation of a "no project" alternative.

CEQA Guidelines Section 15126.6(e) "No Project" Alternative

CEQA Guidelines Section 15126.6(e) requires evaluation of a no project alternative "to allow decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project."

For a land use or regulatory plan or policy, the "no project" alternative typically evaluates impacts associated with the existing plan or policy compared to the proposed project, commonly referred to as a "No Project-General Plan Buildout Alternative."

For a site-specific development project, the "no project" alternative typically compares the environmental effects of the property remaining in its existing state against environmental effects that would occur if the project were approved and constructed, commonly referred to as a "No Project-No Build Alternative."

Because the Baylands Specific Plan contains elements of both a land use/regulatory plan and a site-specific development, both a "No Project-No Build" and a "No Project-General Plan Buildout Alternative" are analyzed in this EIR.

Environmental Evaluation

Land Use and Planning Policies

The No Project-No Build Alternative does not provide for any future development within the Baylands. Existing industrial uses along Industrial Way and other existing uses within the Baylands would continue. As such, this alternative would fail to implement the City's General Plan, including GP-1-18 and Measure JJ. In the absence of an approved specific plan, it is unlikely that the Baylands landowner would

undertake physical site remediation and final Title 27 landfill closure since these actions are not required to maintain the site's land use status quo. The No Project-No Build Alternative would therefore be inconsistent with General Plan policies calling for site remediation, rehabilitation of historic buildings, and restoration and enhancement of habitats within the Baylands, as well as policies aimed at providing for the Geneva Avenue extension as part of revitalizing the site through development of a mixed-use community.

The No Project-No Build Alternative would be inconsistent with the City's adopted General Plan Land Use and Housing elements and fail to achieve the project's overarching purpose of providing opportunity for development of housing for all economic segments of the community.

The No Project-No Build Alternative would also be inconsistent with the General Plan by not providing for development of 6.5 million s.f. of commercial and 500,000 s.f. of hotel use. While existing habitat areas would be left in place, no habitat restoration or enhancement would be undertaken. By eliminating development of residential and commercial uses from the Baylands, this alternative would be inconsistent with the regional sustainable communities strategy, Plan Bay Area 2050, by preventing transit-oriented development adjacent to transit within a Priority Development Area, resulting increasing regional vehicle miles traveled (VMT), as well as mobile source GHG and air pollutant emissions.

Population and Housing

Because no new development would occur, no new housing development or employment opportunities would be provided within the Baylands, nor would any urban decay effects occur. In the absence of any land zoned for housing or residential development within the Baylands, the City of Brisbane would be required to identify and undertake General Plan and zoning amendments to permit development of sufficient new housing outside of the Baylands to meet its fair share of regional housing needs as described in the Regional Housing Needs Allocation (RHNA) and the City's adopted General Plan Housing Element, which would generate environmental impacts outside of the Baylands equal to or greater than those of the Specific Plan.

As shown in **Table 8-2**, in the absence of a Specific Plan providing for development of 1,800 to 2,200 dwelling units, Brisbane's adopted 6th Cycle Housing Element would need to be amended to identify opportunities for the development 1,189 additional dwelling units outside of the Specific Plan area for the 2023-2031 Housing Element Cycle.

Table 8-2: Effect of the No Project-No Build Alternative on Brisbane's Ability to Provide Housing for All Economic Segments of the Community

Household Income Group	RHNA Objective for Brisbane	Baylands Housing Capacity	Housing Capacity Outside of the Baylands	Capacity Shortfall without Baylands Housing
Very Low	317	145	172	(145)
Low	183	82	101	(82)
Moderate	303	287	16	(287)
Above Moderate	785	1,286	131	(654)
TOTAL	**1,588**	**1,800**	**420**	**(1,168)**

SOURCE: City of Brisbane, 2023.

Thus, the No Project-No Build Alternative would necessitate construction of housing in locations that are not now planned for such development, thereby causing unplanned growth. Because such housing within Brisbane outside of the Baylands would not have direct access to the Bayshore Caltrain station equivalent to that of the Baylands, transit use would be reduced and impacts resulting from vehicular travel, including VMT, air quality, GHG emissions, and energy, would be increased.

Aesthetic and Visual Resources

Because there would be no new development, no visual impacts would occur within the Baylands. This alternative would not affect scenic vistas and resources, the visual character of the Baylands, or ambient light and glare. As such, Specific Plan impacts would be substantially greater than those of this alternative.

Biological Resources

Because no development would occur, the No Project-No Build Alternative would not result in the removal of any biological resources within the Baylands. However, none of the habitat restoration or enhancement proposed as part of the Baylands Specific Plan would occur.

Cultural and Tribal Cultural Resources

Because the historic Roundhouse building would not be rehabilitated or adaptively reused, in the absence of public funding, it would continue to deteriorate until it could no longer be restored. The resulting loss of the historic Roundhouse would be a significant and unavoidable impact.

Because the No Project-No Build Alternative includes no development-related ground disturbance, there would be no potential for impacts on archaeological resources. No Tribal cultural resources are present within the Baylands, and no impacts would occur.

Transportation

Because no new development would occur within the Baylands, the total amount of VMT generated within the Baylands would remain unchanged. Although no new traffic would be generated within the Baylands, new development occurring in surrounding jurisdictions would cause traffic conditions within and surrounding the Baylands to continue to deteriorate due to regional through traffic as commuters seek alternatives, including Bayshore Boulevard, to an increasingly congested US Highway 101 (US 101) freeway. In addition, in the absence of Baylands development, VMT would increase within the nine-county Bay Area region to a greater degree than it would with development of the Baylands Specific Plan due to the site's transit orientation, resulting in a greater (although still less than significant) impact compared to the Specific Plan.

Air Quality and Greenhouse Gas Emissions

Because no new development would occur within the Baylands, the No Project-No Build Alternative would not generate any increase in air pollutant or GHG emissions and the impacts described in Section 4.9, *Air Quality*, and Section 4.10, *Greenhouse Gas Emissions*, would not occur. However, as demonstrated in Section 4.8, *Transportation*, regional VMT would be greater without Baylands development than with its development due to the site's transit orientation. Thus, the No Project-No Build Alternative would increase the Specific Plan's regional mobile source GHG and air pollutant emissions impact.

Energy Resources

Because no new development would occur within the Baylands, no new energy-consuming use would be introduced to the Baylands. However, because the Specific Plan proposes 100 percent use of renewable energy, on-site consumption of fossil fuels would be greater for the No Project-No Build Alternative than it would be for the Specific Plan, although mobile source energy consumption for Baylands use would be substantially less for the No Project-No Build Alternative than it would be for the Specific Plan.

However, because regional VMT would be greater without Baylands development than with development of the Specific Plan, regional mobile source fuel consumption would be greater for the No Project-No Build Alternative than it would be for the Specific Plan.

Noise and Vibration

Because the No Project-No Build Alternative does not provide for new Baylands development, it would eliminate the noise and vibration impacts described in Section 4.12, *Noise and Vibration*, that would result from Specific Plan development. Thus, the No Project-No Build Alternative would have less noise impact than the proposed project.

Hazards and Hazardous Materials

Because no development would occur within the Baylands, it is likely that none of the remedial actions or Title 27 final landfill closure required for future development would be undertaken. Maintenance of existing methane and leachate control systems for the former landfill within the Baylands would, however, continue. None of the Specific Plan's impacts described in Section 4.13, *Hazards and Hazardous Materials*, would occur.

Hydrology and Water Quality

Because no development would occur, existing drainage patterns, impervious surface area, and peak runoff volumes would remain unchanged. Thus, Specific Plan impacts related to water quality degradation, alteration of drainage patterns, stormwater runoff, and flooding addressed in Section 4.14, *Hydrology and Water Quality*, would not occur. However, in the absence of sea level rise adaptation measures that would be undertaken by Specific Plan development, the existing Lagoon Road would become subject to flooding from tidal action and eventually become permanently inundated. Flooding along portions of the existing Sierra Point Parkway could also become a regular occurrence. Thus, significant impacts would result from the No Project-No Build Alternative that would otherwise be mitigated by the proposed Specific Plan.

Geology, Soils, and Seismicity

Because no ground disturbance or construction of new structures subject to geological, soils, or seismic hazards would occur as the result of new development within the Baylands, none of the Specific Plan's impacts would result. However, because the No Project-No Build Alternative would not require seismic retrofit of the seismically unsound historic Roundhouse, the structure would become increasingly vulnerable to seismic damage over time.

Utilities, Service Systems, and Water Supply

Because no future development would occur, the No Project-No Build Alternative would not generate any new or increased demands for utilities and services systems, nor any increase in water consumption for which expanded water supply would be necessary. As a result, none of the Specific Plan's impacts addressed in Section 4.16, *Utilities, Service Systems, and Water Supply*, would occur.

Public Services and Facilities

Because future Baylands development would not occur, the No Project-No Build Alternative would not generate any new or increased demands for public services. As a result, none of the Specific Plan's impacts addressed in Section 4.17, *Public Services and Facilities*, would occur.

Recreation Resources

The No Project-No Build Alternative would not result in any Baylands population growth that would generate a demand for recreational facilities. Neither would any ground disturbance or construction be undertaken for any new or expanded recreational facilities within the Baylands. Thus, none of the Specific Plan's impacts addressed in Section 4.18, *Parks, Open Space/Open Areas, and Recreational Resources*, would occur.

Wildland Fire

The No Project-No Build Alternative would not result in any development or population/ employment growth that could increase wildland fire hazards. No impact would result.

Evaluation of the No Project-No Build Alternative in Relation to Project Objectives

The environmental impacts that would result from the Baylands Specific Plan would largely be avoided by eliminating proposed future development and leaving the Baylands in its existing condition. However, the No Project-No Build Alternative would not achieve the underlying purpose of the project, namely, to provide for the productive reuse of a brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands site, nor would this alternative achieve project objectives. In addition, this alternative would prevent implementation of the Brisbane General Plan and result in new significant impacts in relation to:

- Not remediating contaminated soils or groundwater within Baylands Operable Units OU-SM and OU-2, as well as not providing required Title 27 final landfill closure of the former Brisbane Landfill.
- Preventing implementation of the adopted Housing Element, which would require the City to identify and rezone locations outside of the Baylands to accommodate an additional 1,164 dwelling units outside of the Baylands through 2031 as defined in the City's RHNA (see **Table 4.4-1**), thereby creating additional environmental impacts west of Bayshore Boulevard.
- Ongoing deterioration and ultimate loss of the historic Roundhouse building.
- By leaving Lagoon Road in its current location, projected sea level rise over time would cause daily and ultimately permanent inundation of the roadway, limiting access to the Sierra Point Subarea and requiring public expenditure for roadway realignment.

Table 8-3: Evaluation of the No Project-No Build Alternative in Relation to Project Objectives

Project Objectives	Extent to which the No Project-No Build Alternative Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	This alternative does not provide for reuse of the former railyard or former landfill. In the absence of any development within the Baylands, future site remediation or Title 27 Final Landfill Closure would be doubtful.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores, and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers, as well as for the larger Brisbane community.	While existing Baylands habitat areas would be preserved, they would not be restored or enhanced, nor would recreational opportunities be provided within the Baylands. Deterioration of the historic Roundhouse would continue until its restoration and adaptive reuse would no longer be possible.
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	No land would be zoned for housing within the Baylands, and the City would be required to identify and rezone locations outside of the Baylands to meet local and regional housing needs for all economic segments of the community.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	The existing balance of minimal Baylands costs and revenue would continue.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	This alternative would not provide any new sustainability features or address any of the Sustainability Framework principles.
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	This alternative would provide for the continuation of existing uses within the Baylands but would not attract new office-based employment that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.
• Enable residents, workers, and visitors to be less dependent on cars.	By eliminating future development within the Baylands, there would be no on-site residents, workers, or visitors.

b. No Project-General Plan Buildout Alternative

Description

The No Project-General Plan Buildout Alternative assumes that the Baylands Specific Plan as it is currently proposed would not be approved and that future development of the Baylands would occur without any amendments to the Brisbane General Plan. Thus, development of the

No Project-General Plan Buildout Alternative would differ from the proposed Specific Plan in the following ways:

- The No Project-General Plan Buildout Alternative would encompass only the area that is currently within the Baylands Subarea (see existing General Plan in **Figure 3-3**).
- Sierra Point Parkway would not be extended north from its current terminus at the US 101 freeway southbound off-ramps.
- Lagoon Road would remain in its current alignment and not be realigned to the north to terminate at the US 101 freeway southbound off-ramps.
- Green Shared Streets would not be added to the roadway types identified in the General Plan Circulation Element and would therefore be replaced by standard local streets.

The purpose of this alternative is to comply with CEQA Guidelines Section 15126.6(e) requirements for evaluation of a "no project" alternative.

Environmental Evaluation

Land Use and Planning Policies

The No Project-General Plan Buildout Alternative provides for development of the Specific Plan land use program (1,800-2,200 dwelling units, up to 6.5 million s.f. of commercial development, and 500,000 s.f. of hotel use) based on the existing General Plan boundaries and roadway plan for the Baylands. As such, this alternative would implement and be consistent with the City's General Plan.

The No Project-General Plan Buildout Alternative would also be consistent with the regional sustainable communities strategy, Plan Bay Area 2050, by providing for transit-oriented development within a Priority Development Area. Impacts would therefore be the same (less than significant) as for the Specific Plan.

Population and Housing

The No Project-General Plan Buildout Alternative would provide for development of the same types and intensity of residential, commercial, and hotel development within the existing Baylands Subarea as the Specific Plan, as well as the same amount of commercial development within the existing Beatty Subarea as is currently permitted by the General Plan. While this would result in a greater total amount of development than is proposed in the Specific Plan, this alternative would have similar impacts related to new housing development and employment opportunities, as well as urban decay effects as the Specific Plan.

Aesthetic and Visual Resources

This alternative would build out the same amount of residential, commercial, and hotel development as the Specific Plan within the existing Baylands Subarea, resulting in roughly equivalent visual impacts to those of the Specific Plan, while differing in the following ways:

- Sustainable infrastructure proposed in the Specific Plan for the area east of the Caltrain right-of-way would be shifted from the north side of Geneva Avenue to other locations. As a result, the office uses within the Campus District would be slightly taller and have a slightly greater development intensity than for the Specific Plan.
- Because Sierra Point Parkway would not be extended north from its current terminus at the US 101 southbound freeway ramps, office uses within the Campus District would take primary access from Geneva Avenue and Tunnel Avenue. As a result, office buildings would have a greater setback from the freeway than would occur with Specific Plan development, offsetting the marginal increase in scenic vista impacts that would result from taller buildings within the Campus District east of the Caltrain.

Biological Resources

The No Project-General Plan Buildout Alternative would require removal of the same sensitive biological resources for site grading and development within the Baylands as the Specific Plan. This alternative would also provide the same habitat restoration and enhancement along Visitacion Creek and on Icehouse Hill as would the Baylands Specific Plan. Because Lagoon Road would not be realigned to the north, the habitat restoration and enhancement proposed in the Specific Plan for Lagoon Park would not be provided. As a result, biological resources impacts would be greater than those of the Specific Plan.

Cultural Resources and Tribal Cultural Resources

The historic Roundhouse building would be rehabilitated and adaptively reused as provided for in the Specific Plan. Because the No Project-General Plan Buildout Alternative would include development-related ground disturbance to the same depths as the Specific Plan, the potential for impacts on archaeological resources would be the same. No Tribal cultural resources are present within the Baylands.

Transportation

The No Project-General Plan Buildout Alternative includes the same 2,200 dwelling units, 6.5 million s.f. of commercial, 500,000 s.f. of hotel use, and open space/open area program as the Specific Plan. However, not extending Sierra Point Parkway to Geneva Avenue and leaving Lagoon Road in its current location would increase VMT compared to the Specific Plan. As sea level rises over time, the existing Lagoon Road would become inundated and impassable on a daily and eventually a permanent basis, forcing traffic to divert onto longer routes to and from

the US 101 freeway. Emergency response to the Sierra Point area would also be adversely affected as access to and from that area would be limited to the US 101 freeway when Lagoon Road was inundated. Thus, transportation impacts would be substantially greater than those of the Specific Plan.

Since Baylands development would not make any contribution to the need or funding for the Geneva Avenue extension and related Candlestick freeway interchange improvements at US Highway 101, a funding gap would result. Thus, construction of the Geneva Avenue extension and freeway interchange improvements would be dependent on other agencies and development projects to increase their funding.[404]

Air Quality and Greenhouse Gas Emissions

Because VMT would be greater than for the Specific Plan, the No Project-General Plan Buildout Alternative would have greater mobile source air pollutant and GHG emissions, which would exacerbate the significant unavoidable impacts of the Specific Plan. Stationary source emissions associated with Baylands on-site non-vehicular activities would have similar air pollutant and GHG emissions as the Specific Plan.

Energy Resources

No Project-General Plan Buildout Alternative buildings would consume and generate similar amounts of electricity as the Specific Plan. However, due to increased VMT, vehicular energy consumption would be greater than for the Specific Plan.

Noise and Vibration

Because the No Project-General Plan Buildout Alternative would concentrate traffic due to the lack of the Sierra Point Parkway extension and limited availability of Lagoon Road, vehicular noise along alternative travel routes would be greater (although not noticeably so) than for the Specific Plan, resulting in similar significant unavoidable impacts. Vibration impacts would be the same as those of the Specific Plan.

Hazards and Hazardous Materials

The No Project-General Plan Buildout Alternative would have similar on-site impacts because it would have same general development program as the Specific Plan.

[404] Geneva Avenue extension and interchange improvements are indicated in the San Francisco Bay Area Regional Transportation Plan, and Bi-County Transportation Study. These improvements are also assumed in the Candlestick Point-Hunters Point Shipyard Phase II Development Plan Project EIR.

Hydrology and Water Quality

As previously noted, the present alignment of Lagoon Road would be subject to daily inundation and eventually become permanently inundated due to projected sea level rise through 2100. Other portions of the Baylands would be provided with similar protection from flooding and the effects of sea level rise as would be provided by the Specific Plan. In addition, the same measures to be implemented by Specific Plan development to minimize water quality impacts and to prevent sedimentation and erosion would be implemented with this alternative.

Geology, Soils, and Seismicity

Construction of new structures would be subject to the same geological, soils, and seismic hazards as would Specific Plan development. The seismically unsound historic Roundhouse structure would undergo the same seismic retrofit as the Specific Plan. Thus, impacts of the No Project-General Plan Buildout Alternative would be the same as for the Specific Plan.

Utilities, Service Systems, and Water Supply

The No Project-General Plan Buildout Alternative would generate the same demands for utilities and services systems and increased water consumption as the Specific Plan. As a result, impacts would be the same as for the Specific Plan.

Public Services and Facilities

The No Project-General Plan Buildout Alternative would generate the same demands for new or increased public services as the Specific Plan, requiring the same public facilities improvements, and resulting in the same impacts as the Specific Plan.

Recreation Resources

The No Project-General Plan Buildout Alternative would generate the same Baylands population growth and demand for recreational facilities as the Specific Plan. As a result, the same public facilities improvements would be required and the same impacts as the Specific Plan would result.

Wildland Fire

The No Project-General Plan Buildout Alternative would result in similar development and population/employment growth as the Specific Plan and would result in similar wildland fire hazard impacts.

Evaluation of the No Project-General Plan Buildout Alternative in Relation to Project Objectives

The No Project-General Plan Buildout Alternative would generally achieve the underlying purpose of the project objectives, although to a lesser degree than would the Specific Plan without substantially reducing the Specific Plan's significant impacts (**Table 8-4**). In addition, by not requiring Baylands development to realign Lagoon Road, projected sea level rise over time would cause daily and ultimately permanent inundation of the roadway, limiting access to the Sierra Point Subarea and requiring public expenditure for roadway realignment.

8.4.2 DESCRIPTION AND SUMMARY COMPARISON OF PROPOSED AND REDUCED DENSITY LAND DEVELOPMENT ALTERNATIVES

The land development alternatives described and analyzed in this section are each based on the assumption that the Specific Plan described in Chapter 3 and analyzed in Chapter 4 would be modified. As shown in **Table 8-5**, each of the seven land development alternatives to the Specific Plan were developed based on different ways of distributing development around the Baylands. Alternatives 1–3 analyze the effects of redistributing Specific Plan development (2,200 dwelling units, 6.5 million s.f. of commercial, 500,000 s.f. of hotel use) around the Baylands, while Alternatives 4–7 analyze the effects of both redistributing and reducing the amount of residential and commercial development that would be permitted within the Baylands.

Table 8-6 provides a summary comparison of the impacts of each of the alternatives analyzed above to those of the Baylands Specific Plan.

Table 8-4: Evaluation of the No Project-General Plan Buildout in Relation to Project Objectives

Project Objectives	Extent to Which the No Project-General Plan Buildout Alternative Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	The No Project-General Plan Buildout Alternative would provide the same development program as the Specific Plan and generally meet the Specific Plan's underlying purpose, although to a lesser degree than would the Specific Plan.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores, and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers, as well as for the larger Brisbane community.	By not requiring Baylands development to realign Lagoon Road, projected sea level rise would cause daily, and eventually permanent, inundation of the roadway and eliminate Lagoon Park. As a consequence of not requiring Baylands development to realign Lagoon Road to the north, public expenditure would ultimately be required to realign the roadway. Baylands housing within the northwestern portion of the Baylands would implement the City's adopted Housing Element to the same degree as the Specific Plan. The No Project-General Plan Buildout Alternative would provide all of the sustainability features of the Specific Plan, albeit with a small habitat conservation area. This alternative would also provide for the same type and extent of employment-generating development as the Specific Plan.
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	Because the same residential development program would be developed, the same opportunities for development of housing for all economic segments of the community would be provided within the adopted Housing Element's planning period (2023-2031) as would the Specific Plan.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	This alternative would provide the same development program as would the Specific Plan and generate a similar positive revenue stream to the City as would the Specific Plan.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	This alternative would provide the same sustainability features as the Specific Plan except that Lagoon Road would not be designed for resiliency to sea level rise and a smaller habitat area would be restored and enhanced due to the loss of Lagoon Park.
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	This alternative would provide the same employment-generating commercial development as the Specific Plan and generate a similar range of employment opportunities.
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would provide the same features designed to encourage use of transit, bicycle, and pedestrian travel as the Specific Plan.

Table 8-5: Alternatives Analyzed in Addition to No Project Alternatives

	Proposed Density Alternatives			Reduced Density Alternatives			
	1. Development around an Operating 45-Acre Light Maintenance Facility (LMF)	**2. Balanced Commercial**	**3. Reduced Maximum Building Heights**	**4. Reduced Commercial Development**	**5. Development around an Operating 45-Acre Light Maintenance Facility (LMF)**	**6. Balanced Commercial**	**7. Reduced Maximum Building Heights**
Housing	2,200 dwelling units west of Caltrain, north of Main Street. (same as Specific Plan)	2,200 dwelling units west of Caltrain, north of Main Street. (same as Specific Plan)	2,200 dwelling units west of Caltrain, north of Main Street. (same as Specific Plan)	2,200 dwelling units west of Caltrain, north of Main Street. (same as Specific Plan)	1,800 dwelling units west of Caltrain, north of Main Street. (same as Specific Plan)	1,800 dwelling units west of Caltrain, north of Main Street. (same as Specific Plan)	1,800 dwelling units west of Caltrain, north of Main Street. (same as Specific Plan)
Commercial Development (west of Caltrain)	4.0 million s.f. commercial office 500,000 s.f. hotel (same as Specific Plan)	3.6 million s.f. commercial office 500,000 s.f. hotel (same locations as Specific Plan)	4.0 million s.f. commercial office 500,000 s.f. hotel (same as Specific Plan)	2.8 million s.f. commercial office 350,000 s.f. hotel (same locations as Specific Plan)	2.8 million s.f. commercial office 350,000 s.f. hotel. (concentrated along Geneva Ave. and Sierra Point Pkwy.)	2.6 million s.f. commercial office 350,000 s.f. hotel (same locations as Specific Plan)	2.8 million s.f. commercial office 350,000 s.f. hotel (concentrated along Geneva Ave. and Sierra Point Pkwy.)
Commercial Development (east of Caltrain)	2.5 million s.f. commercial office (same as Specific Plan)	2.9 million s.f. commercial office (same locations as Specific Plan)	2.5 million s.f. commercial office (same as Specific Plan)	1.7 million s.f. commercial office (concentrated on Geneva Ave and Sierra Point Pkwy)	1.7 million s.f. commercial office (concentrated on Geneva Ave and Sierra Point Pkwy)	1.9 million s.f. commercial office (same locations as Specific Plan)	1.7 million s.f. of commercial office (same as Specific Plan)
Maximum Building Heights	Same as Specific Plan (permits 20+ story buildings)	12-story max. for commercial office 8-story max. for housing	12-story max. for commercial office 8-story max. for housing	12-story max. for commercial office 8-story max. for housing	Same as Specific Plan (permits 20+ story buildings)	12-story max. for commercial office 8-story max. for housing	12-story max. for commercial office 8-story max. for housing
High-Speed Rail Light Maintenance Facility (LMF)	Relocates development outside of an operating 45-acre LMF footprint.	Could relocate development outside of an operating 45-acre LMF footprint.	Does not include high-speed rail LMF.	Could relocate development outside of an operating 45-acre LMF footprint.	Relocates development outside of an operating 45-acre LMF footprint.	Could relocate development outside of an operating 45-acre LMF footprint.	Does not include high-speed rail LMF.

	Proposed Density Alternatives			Reduced Density Alternatives			
	1. Development around an Operating 45-Acre Light Maintenance Facility (LMF)	**2. Balanced Commercial**	**3. Reduced Maximum Building Heights**	**4. Reduced Commercial Development**	**5. Development around an Operating 45-Acre Light Maintenance Facility (LMF)**	**6. Balanced Commercial**	**7. Reduced Maximum Building Heights**
Roadways west of Caltrain	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.
Roadways east of Caltrain	Realigns Tunnel Ave. to the east. Otherwise, same as Specific Plan.	Same as Specific Plan. Could include realignment of Tunnel Ave. to the east to allow for a 45-acre high speed rail LMF.	Same as Specific Plan.	Same as Specific Plan. Could include realignment of Tunnel Ave. to the east to allow for a 45-acre high speed rail LMF.	Realigns Tunnel Ave. to the east. Otherwise, same as Specific Plan.	Same as Specific Plan. Could include realignment of Tunnel Avenue to the east to allow for a 45-acre high speed rail LMF.	Same as Specific Plan.
Infrastructure west of Caltrain	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.	Same as Specific Plan.
Infrastructure east of Caltrain	Shifts water recycling and water storage tank to the east of Tunnel Ave.	Same as Specific Plan unless water recycling and water storage tank are shifted east for LMF.	Same as Specific Plan.	Same as Specific Plan unless water recycling and water storage tank are shifted east for LMF.	Shifts water recycling and water storage tank to the east of Tunnel Ave.	Same as Specific Plan unless water recycling and water storage tank are shifted east for LMF.	Same as Specific Plan.

8.4.3 EVALUATION OF PROPOSED DENSITY LAND DEVELOPMENT ALTERNATIVES

Alternatives 1–3 each propose the same 2,200 dwelling units, 6.5 million s.f. of commercial, 500,000 s.f. of hotel use, and open space/open area program as the Specific Plan, while redistributing Specific Plan land uses by:

(1) Relocating development around and outside of an operating 45-acre California High-Speed Rail Light Maintenance Facility (LMF);

(2) Achieving a more balanced distribution of commercial development on either side of the Caltrain right-of-way; and

(3) Reducing the maximum allowing building heights for residential and commercial development within the Baylands.

a. Alternative 1: Proposed Density Development Around an Operating 45-Acre LMF

The purpose of this alternative is to address the impacts of developing Specific Plan land uses around and outside of a 45-acre operating LMF footprint should the California High-Speed Rail Authority construct and operate such a facility within the Baylands consistent with the provisions of the September 2024 agreement between the City and High-Speed Rail Authority.[405] The analyses below do not address impacts of constructing and operating the LMF facility itself.

Land Use and Planning Policies

Physical Division of an Existing Community

Because the southbound rail flyover to the LMF described in the High-Speed Rail EIR/EIS would not be required for a 45-acre LMF,[406] the Geneva Avenue bridge would be constructed with the same profile as was analyzed for Specific Plan development. This alternative would thus provide the same configuration of development, recreational and habitat areas, and the same roadway and non-motorized transportation system as the Specific Plan within the western portion of the site. Within the eastern portion of the site, Tunnel Avenue would be realigned slightly to the east, incorporating approximately 15 acres from Low Density Commercial,

[405] The September 2024 agreement can be found at https://www.brisbaneca.org/city-attorney/page/california-high-speed-rail-authority-and-city-brisbane-reach-settlement.

[406] The preferred alternative analyzed by the California High Speed Rail Authority in its *Final EIR/EIS for the California High-Speed Rail System, San Francisco to San Jose Section* (June 2022) included a flyover to provide access for southbound trains to a then-proposed 121-acre LMF along the east of the Caltrain right-of-way within the Baylands. This flyover would have required raising the proposed profile of the Geneva Avenue bridge by approximately 30 feet and providing a 1,000- to 1,200-foot-long bridge.

Visitacion Creek, and Sustainable Infrastructure (solar field) areas within a 45-acre LMF between the Caltrain rail line and Tunnel Avenue.

Proposed Density development around an operating 45-acre LMF would include the same construction projects affecting area roadways as the Specific Plan, be subject to the same requirements and mitigation measures, and would therefore result in the same construction impacts as the Specific Plan. This alternative would provide the same connectivity within the Specific Plan, to the Caltrain Bayshore station, and the US 101 freeway as the Specific Plan. Proposed Density development around an operating 45-acre LMF would therefore have the same (less than significant) impacts in relation to dividing an existing community as would the proposed Specific Plan.

Consistency with Local and Regional Plans

Proposed Density development around an operating 45-acre LMF would be consistent with the General Plan's development intensity standards for the Baylands. Development of 2,200 dwelling units is at the top end of the range for housing specified in the General Plan and the same as that of the Baylands Specific Plan. Development of the same 6.5 million s.f. of commercial office space and an additional 500,000 s.f. of hotel use as the Specific Plan would also be consistent with the General Plan. Consistency with General Plan policies as well as with other local and regional plans would be the same as for the Specific Plan.

Population and Housing

Induce Substantial Unplanned Growth

Proposed Density development around an operating 45-acre LMF provides for the same number of dwelling units (2,200) and would result in the same resident population as the Baylands Specific Plan (4,095) at buildout, which represents planned growth. In addition, this alternative provides for the same amount of commercial office space (6.5 million s.f.) and hotel use (500,000 s.f.) within the Baylands as the Specific Plan. Baylands employment would therefore be the same as for the Specific Plan and also represent planned growth, not substantial unplanned growth. Impacts would be the same as the Specific Plan (less than significant).

Displacement of Existing Housing or Businesses

Because this alternative would have the same footprint as the Specific Plan within the western portion of the Baylands, Proposed Density development around an operating 45-acre LMF would displace the same 231,400 s.f. of existing industrial businesses along Industrial Way, resulting in the same less than significant impact.

Because this alternative would maintain the Specific Plan's development footprint within the western portion of the site and nearly the same footprint within the eastern portion of the

Baylands, there would be room for locating the sustainable infrastructure features proposed in the Specific Plan between the Caltrain right-of-way and Tunnel Avenue to another suitable location east of Tunnel Avenue, either to the east side of Tunnel Avenue (water recycling facility) or to the north of Geneva Avenue (utility-scale battery facility). This alternative would place the Golden State Lumber laydown yard within the 45-acre LMF, which would result in the same less than significant physical environmental impact and the same economic impact as the Specific Plan.

Housing for all Economic Segments of the Community

The zoning to implement this alternative would provide for the same opportunity for development of housing as the Specific Plan (2,200 units) and would be capable of meeting the City's quantified housing objectives for all segments of the community for the 2023-2031 housing element cycle. Impacts would therefore be the same as for the 2025 Specific Plan.

Urban Decay

Because Proposed Density development around an operating 45-acre LMF would provide the same amount of residential, retail, and office development as the Specific Plan, it would generate the same demand for retail uses and have the same less than significant physical urban decay impacts as the Specific Plan.

Aesthetic and Visual Resources

Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon)

Proposed Density development around an operating 45-acre LMF includes the full 2.5 million s.f. of commercial office space proposed by the Specific Plan east of the Caltrain line within an approximately 15-acre smaller area. This would be achieved by increasing the footprint or height of buildings, or both. Because approximately 67 acres of development area (over 80 percent) would remain within the Campus East District, it is unlikely the maximum building heights proposed in the Specific Plan would need to be increased to such a degree that public views of San Francisco Bay would be adversely affected to a greater degree than for the 2025 Specific Plan project. Thus, impacts on scenic resources resulting from development around a 45-acre LMF would be similar to those of the Specific Plan.

Impacts to Scenic Resources

Proposed Density development around an operating 45-acre LMF would provide for the same preservation and improvements of existing scenic resources within the Baylands as the Specific Plan. Icehouse Hill and the edges of Brisbane Lagoon would be improved in the same manner as would the Specific Plan, including restoration of wetland and habitat areas; however,

because a slightly smaller portion of Visitacion Creek corridor would be affected by the 2025 Specific Plan project, a smaller area would be restored and enhanced. This alternative would also extend the San Francisco Bay Trail through the site. Proposed Density development around an operating 45-acre LMF would have a similar less than significant impact as the Specific Plan.

Consistency with Visual Quality-Related Policies and Programs

By relocating the water recycling facility to the east of the realigned Tunnel Avenue, Proposed Density development around an operating 45-acre LMF would require construction of an estimated 3,800 linear feet of retaining wall ranging in height from 9 to 15 feet along the commercial parcel boundaries east of the LMF feet along with 500 feet of 8-foot-high retaining wall along Geneva Avenue. This retaining wall would be subject to the same design guidelines and be required to comply with the design principles reflected in the findings that are required to be made by the Planning Commission for approval of a design permit. Impacts would thus be similar to those of the Specific Plan.

Nighttime Lighting

Because approximately 67 acres of development area (over 80 percent) would remain within the Campus East District, this alternative would generate nighttime lighting over smaller, though still broad area that is currently largely dark at night compared to the Specific Plan. Nighttime lighting of outdoor open space and park areas would remain the same as that for the Specific Plan. Proposed Density development around an operating 45-acre LMF would be subject to the same nighttime lighting standards and EIR mitigation measures as the Specific Plan and would result in similar less than significant impacts as the Specific Plan.

Glare

Proposed Density development around an operating 45-acre LMF would generate a similar amount of glare-producing reflective building materials on building roofs and thematic elements, while retaining a similar façade area and amount of above-ground infrastructure as the Specific Plan. Shifting above-ground infrastructure (e.g., utility-scale battery storage that may include highly reflective stainless-steel surfaces from Tunnel Avenue to the more heavily traveled Geneva Avenue corridor could increase impacts on motorists.

This alternative would result in a similar significant glare impact and be required to comply with the same mitigation and performance standards as the Specific Plan. A similar less than significant impact with mitigation incorporated as the Specific Plan would result.

Biological Resources

Candidate, Sensitive, and Special-Status Plants, Animals, and Habitats

Proposed Density development around an operating 45-acre LMF would have a similar development footprint and require the same movement of soil from the eastern to the western portion of the Baylands to achieve final grades as would the Specific Plan. Thus, the same impacts to existing species and habitats would occur as the Specific Plan. This alternative would provide the same habitat restoration and enhancement on Icehouse Hill and the north shore of the Lagoon, with a smaller restoration and enhancement area along Visitacion Creek as the Specific Plan. This alternative would be subject to the same mitigation measures and result in similar less than significant impacts with mitigation incorporated as the Specific Plan.

Wetlands and Non-Wetland Waters Acreage, Functions, and Values

Proposed Density development around an operating 45-acre LMF would have a similar development footprint and cause a similar loss of wetlands and non-wetland waters during site grading and construction as the Specific Plan.

Site grading pursuant to a City grading permit to achieve final grades within the western portion of the site would cause a similar, through slightly smaller, loss of wetland and non-wetland waters within Visitacion Creek as the Specific Plan since a small portion of the creek would be located within the 45-acre LMF and would not be disturbed as part of Baylands development.[407] In addition, construction of Lagoon Park and realignment of Lagoon Road would result in the loss of existing wetlands and non-wetland waters along the north shore of the lagoon. Proposed Density development around an operating 45-acre LMF would, however, restore and enhance the portion of Visitacion Creek outside of the 45-acre LMF and the entirety of Lagoon Park as outlined in the Specific Plan. This alternative would be subject to the same mitigation requirements as the Specific Plan and would therefore result in similar less than significant with mitigation incorporated impacts.

Movement of Fish and Wildlife Species

Trails, recreational improvements, and habitat restoration and enhancement on Icehouse Hill would be the same as with the Specific Plan. Because a similar amount of building glass area would result as the Specific Plan, bird strike impacts would be similar, and implementation of the same mitigation measures would be required. Thus, impacts would be similar to those of the Specific Plan.

[407] The small portion of Visitacion Creek that would not be disturbed by Baylands development would be removed and placed in an underground channel beneath the 45-acre LMF as part of its construction. The cumulative effect of Baylands and LMF development on loss of habitat would be the same as for the Specific Plan. LMF construction would, however, require off-site mitigation of biological resources impacts.

Consistency with Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Proposed Density development around an operating 45-acre LMF would be required to comply with the requirements of Brisbane Municipal Code Chapter 12.12 in relation to tree replacement. As a result, impacts would be the same as those of the Specific Plan.

Consistency with the San Bruno Mountain Habitat Conservation Plan

Because this alternative would provide the same improvements within Icehouse Hill as the Specific Plan, impacts would be the same.

Cultural Resources and Tribal Cultural Resources

Roundhouse and Machinery & Equipment Buildings

Because the development footprint and areas subject to site grading and other ground-disturbing activities would be unchanged from the Specific Plan within the western portion of the site, the Roundhouse would be restored for adaptive reuse as is proposed in the Specific Plan and subject to the same EIR mitigation measures. In addition, development surrounding the Roundhouse and Machinery & Equipment building would be consistent with their historic character. Thus, impacts would be the same as those for the Specific Plan.

Archaeological Resources

Because site grading and other ground-disturbing activities would remain the same and development would be subject to the same mitigation measures, impacts would be the same as those of the Specific Plan.

Tribal Cultural Resources

Because no Tribal cultural resources have been identified within the Baylands, no impacts would result.

Disturbance of Known or Unknown Human Remains

Because site grading and other ground-disturbing activities would remain the same and development would be subject to the same mitigation measures, impacts would be the same as those of the Specific Plan.

Transportation

Vehicle Miles Traveled

Proposed Density development around an operating 45-acre LMF would retain a similar number of Baylands residents and employees within walking distance of the Caltrain Bayshore station. This alternative would provide a similar comprehensive system of bicycle and pedestrian facilities, including completion of the Bay Trail through the eastern portion of the Baylands and provision bicycle and pedestrian connections to the Bay Trail, Visitacion Creek, and Lagoon Park. The result would be no change in the use of transit, bicycle, and pedestrian modes of transportation or change in per capita employee VMT compared to the Specific Plan.

Transit, Bicycle, and Pedestrian Travel Modes

Proposed Density development around an operating 45-acre LMF would provide a similar comprehensive system of bicycle and pedestrian facilities, including completion of the Bay Trail through the eastern portion of the Baylands and provision bicycle and pedestrian connections to the Bay Trail, Visitacion Creek, and Lagoon Park. The result would be no change in the use of transit, bicycle, and pedestrian modes of transportation.

Hazards to Vehicles, Bicyclists, and Pedestrians

All roadways, as well as bicycle and pedestrian facilities, and trails within the Baylands would be constructed to City standards. Thus, impacts would be similar to those of the Specific Plan.

Emergency Access

Proposed Density development around an operating 45-acre LMF would be provided with more than one point of access, facilitating emergency response, similar to the Specific Plan. Because the extension of Geneva Avenue over the Caltrain right-of-way to the US 101 freeway and extension of Sierra Point Parkway would be the same as for the Specific Plan, emergency response from the proposed new fire station within the northeastern portion of the Baylands would be similar to the Specific Plan. In addition, because all roadways would be constructed to City standards and this alternative would provide emergency access during flooding events consistent with EIR mitigation requirements, impacts would be similar to the Specific Plan.

Air Quality

Consistency with the 2017 Regional Clean Air Plan

Proposed Density development around an operating 45-acre LMF would retain the same amount and intensity of residential and commercial development in proximity to transit and Baylands shuttle stops while making little difference, if any, east of Caltrain. In addition, this

alternative would include all of the same sustainability features, be subject to the same mitigation measures, and be equally consistent with the 2017 Clean Air Plan as the 2025 Specific Plan project.

Increased Emissions of Non-Attainment Criteria Air Pollutants

Proposed Density development around an operating 45-acre LMF would retain the same amount and intensity of residential and commercial development in proximity to transit and Baylands shuttle stops while making little difference, if any, east of Caltrain. In addition, the amount of grading required for this alternative would be similar to that required for the Specific Plan. Thus, the significant unavoidable construction impact associated with site grading for Proposed Density development around an operating 45-acre LMF would be similar to the Specific Plan.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Because site grading would be similar for Proposed Density development around an operating 45-acre LMF as for the Specific Plan, exposure of off-site receptors to pollutant concentrations resulting from grading activities would be similar to the Specific Plan. Development would be subject to the same mitigation measures and result in a similar less than significant impact with mitigation incorporated as the Specific Plan.

Odors

The potential for odor generation during site grading would be the same as that of the Specific Plan. However, because Proposed Density development around an operating 45-acre LMF would relocate the water recycling facility to the east of the realigned Tunnel Avenue, it would be further downwind from residential receptors. While the water recycling facility would be closer upwind from campus office uses than for Specific Plan development, the facility would be subject to the same mitigation measures to reduce odor emissions and would therefore have a similar impact as would Specific Plan development.

Greenhouse Gas Emissions

Specific Plan Area Greenhouse Gas (GHG) Emissions

Proposed Density development around an operating 45-acre LMF would result in the same amount of development with similar proximity to transit as the Specific Plan, provide a comprehensive system of bicycle and pedestrian facilities throughout the site, and complete the Bay Trail through the Baylands. The result would be similar use of transit, bicycle, and pedestrian modes of transportation, per capita VMT, and GHG emissions as the Specific Plan.

Effect on Regional GHG Emissions

Because Proposed Density Development around an operating 45-acre LMF would have the same amount of development with similar use of transit, bicycle, and pedestrian modes of transportation, per capita VMT, and GHG emissions as the Specific Plan, similar reductions in regional VMT and mobile source GHG emissions as the Specific Plan would result.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

This alternative would implement the same GHG reduction features and mitigation measures as the Specific Plan and would therefore be equally consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Energy Resources

Wasteful, Inefficient, or Unnecessary Use of Energy

Proposed Density development around an operating 45-acre LMF would result in the same amount of development with similar proximity to transit, provide a comprehensive system of bicycle and pedestrian facilities throughout the site, and result in similar transportation-related energy use as the Specific Plan. This alternative would generate and store a similar amount of renewable energy as the Specific Plan. On-site buildings would meet Tier 2 CALGreen Standards. Thus, impacts would be similar to the less than significant impacts of the Specific Plan.

Consistency with Applicable Energy Reduction Programs, Plans, Ordinances, and Policies

Because Proposed Density development around an operating 45-acre LMF would generate, store, and consume a similar amount of renewable energy on-site, as well as consume a similar amount of transportation-related energy, the impacts would be consistent with applicable energy reduction programs, plans, ordinances, and policies to a similar degree as the Specific Plan.

Noise and Vibration

Temporary Increase in Ambient Noise

The extent of site grading required for Proposed Density development around an operating 45-acre LMF would be similar to the significant unavoidable impacts of the Specific Plan, resulting in a similar need for pile foundations and pile driving. Similar construction noise impacts would therefore result.

Traffic Noise Increase

Proposed Density development around an operating 45-acre LMF would generate a similar amount of traffic as the Specific Plan. Traffic noise impacts would thus be similar to those of the Specific Plan (significant and unavoidable).

Permanent Increase in Ambient Noise

Proposed Density development around an operating 45-acre LMF would generate noise from the same stationary sources and be subject to the same mitigation measures as the Specific Plan. All development within the Baylands would be required to meet the same performance standards and comply with City noise ordinance requirements. Impacts of this alternative would, therefore, be the same as for the Specific Plan (significant and unavoidable).

Exacerbate Land Use/Noise Incompatibilities by Placing People in High Noise Areas

This alternative would place a similar type and amount of development along the west side of the Caltrain rail line and would thus experience similar land use/noise incompatibilities. Office development within the Campus East District would be separated from the Caltrain rail line by the 45-acre LMF, which would operate primarily at night when office workers would not be present. As a result, impacts would be less than those of the Specific Plan.

Vibration

The extent of site grading required for Proposed Density development around an operating 45-acre LMF would be similar to that of the Specific Plan, resulting in a similar need for pile foundations and pile driving. Similar construction vibration impacts would therefore result. Development of this alternative would generate operational vibration from the same stationary sources as the Specific Plan and result in the same impacts as the Specific Plan.

Exacerbation of Human Annoyance or Hazards by Placing Buildings in High Groundborne Vibration Areas

This alternative would place a similar type and amount of development along the west side of the Caltrain rail line and would thus experience similar human annoyance from railroad-generated vibration. Office development within the Campus East District would be separated from the Caltrain rail line by the 45-acre LMF, which would operate primarily at night when office workers would not be present. As a result, impacts would be less than those of the Specific Plan.

Hazards and Hazardous Materials

Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Demolition of older buildings potentially containing asbestos or lead-based paints would be the same for Proposed Density development around an operating 45-acre LMF as for the Specific Plan. In addition, because the types and intensity of uses for this alternative would be unchanged from the Specific Plan, the potential for a release of hazardous materials due to the transport, use, disposal, or management of hazardous materials, whether resulting from routine activities or an accident, would be similar to the Specific Plan. Development of this alternative would be subject to the same extensive set of regulations designed to protect the public and environment from such a release of hazardous materials. Thus, impacts would be similar to those of the Specific Plan.

Create a Health Hazard for an Existing or Planned School Site Due to Release of Hazardous Materials or Proximity of Hazardous Conditions

The location of a school site within the Baylands in relation to locations of hazardous materials sites and emitters would be no different than for the Specific Plan. Thus, the impacts of this alternative would be the same as for the Specific Plan.

Development on a Property That Is Included on a List of Hazardous Materials Sites

The majority of the Baylands site, including the former Brisbane Landfill, OU-SM, and OU-2, is included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Within the western portion of the Baylands, development would occur within operating units OU-SM and OU-2 following site remediation pursuant to the regulatory authority of the San Francisco Bay Regional Water Quality Control Board (RWQCB) and Department of Toxic Substances Control (DTSC).

Proposed Density development around an operating 45-acre LMF would occur within the same footprint within OU-SM and OU-2, and a nearly identical footprint within the former Brisbane Landfill, all of which are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Development of this alternative would be subject to the same General Plan policies and EIR mitigation measures as the Specific Plan and would thus have a similar less than significant impact as the Specific Plan.

Create an Airport Safety Hazard or Expose People to Excessive Noise of Aircraft Operations

Since none of the Specific Plan area is subject to safety hazards or excessive noise from aircraft operations, this alternative would have the same impacts as the Specific Plan.

Emergency Preparedness and Response

The same amount of development proposed for the Specific Plan would occur in the same locations within the western portion of the site and nearly the same footprint east of the Caltrain right-of-way. Development would provide the same regional roadway connections and meet the same access requirements for police and fire service response as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Hydrology and Water Quality

Protection of Water Quality

The amount of grading and construction needed for Proposed Density development around an operating 45-acre LMF would be the same as for the Specific Plan, including the high potential for erosion and siltation and release of pollutants. Because this alternative would have the same development footprint and roadway systems as the Specific Plan, the potential for release of urban pollutants to the Brisbane Lagoon and to San Francisco Bay via Visitacion Creek following construction would be the same as the Specific Plan. This alternative would implement Best Management Practices outlined in required National Pollution Discharge Elimination System (NPDES) permits, stormwater pollution prevention plans (SWPPPs), and the requirements of NPDES Provision C.3 in combination with the same mitigation measures as the Specific Plan. Impacts would therefore be the same as those of the Specific Plan.

Groundwater Recharge and Sustainable Management

Proposed Density development around an operating 45-acre LMF would result in a similar amount of impervious surface area as the Specific Plan. Because the local groundwater basin is not used as a potable or non-potable water supply and is hydraulically connected to the Bay and lagoon, this alternative would not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence for the same reasons as the Specific Plan. In addition, as demonstrated in the Water Supply Assessment prepared by Cal Water, Baylands development would have no effect on groundwater pumping within South San Francisco. Thus, impacts would be similar to those of the Specific Plan.

Flood Hazards

Proposed Density development around an operating 45-acre LMF would construct a similar impermeable surface area and generate a similar increase in stormwater runoff as the Specific Plan. This alternative would comply with the same flood protection standards and mitigation measures as the Specific Plan. Impacts would be similar to the Specific Plan.

Release of Pollutants Due to Flood, Emergent Groundwater, Tsunami, or Seiche

The Specific Plan area is not located within a tsunami hazard zone, and on-site water storage tank facilities would be designed and constructed to withstand anticipated oscillations in water surface caused by an earthquake. Further, the risk of release of pollutants attributable to inundation would be negligible since potential pollutants would not be present at the ground surface and no facilities storing hazardous materials would be located downstream of Baylands water storage facilities. In addition, this alternative would be subject to the same less than significant potential for emergent groundwater as the Specific Plan. Thus, impacts would be the same as for the Specific Plan.

Geology, Soils, and Seismicity

Fault Rupture

Because there are no known active or potentially active fault traces across the Baylands, and the site is not located within an Alquist-Priolo Earthquake Fault Zone, no impact would occur.

Seismic Ground Shaking

Development of this alternative would be subject to a similar risk of damage related to seismic ground shaking as the Specific Plan. Development would also be required to conform to the same California Building Code (CBC) seismic design parameters and mitigation measures as the Specific Plan, which would provide an appropriate level of safety and reduce hazards from strong seismic ground shaking to a similar less than significant level as the Specific Plan.

Liquefaction and Seismic-Related Ground Failure

Because of the presence of high groundwater and loose, unconsolidated soils underlying both the western and eastern portions of the Specific Plan area, this alternative would be subject to similar liquefaction hazards as the Specific Plan. Proposed Density development around an operating 45-acre LMF would be required to conform to the same site-specific foundation design parameters and EIR mitigation measures as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Slope Stability

Site grading would be similar to the Specific Plan. Site-specific development projects would be required to comply with the same CBC requirements for slope stability as the Specific Plan. Impacts would therefore be similar to the less than significant impacts of the Specific Plan.

Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard, and during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. Site-specific development projects for this alternative would be designed and constructed to comply with the requirements of final site-specific design geotechnical reports, which would ensure appropriate design and construction to mitigate soil corrosivity and expansive soils hazards for each building and infrastructure project. Compliance with the CBC and EIR mitigation measures would result in hazards from soil corrosivity and expansive soils similar to the less than significant impacts of the Specific Plan.

Paleontological Resources

The only proposed deep excavations that could disturb significant paleontological resources within the Colma or Merced Formations would be pile foundation installation. Because installation of pile foundations would render any potentially valuable specimens irretrievable, such installation is not typically considered to cause significant impacts. This alternative would also have the same unlikely potential that excavations for other construction activities would be deep enough to encounter paleontological resources as the Specific Plan. Because this alternative would have the same potential for such excavations and would be subject to the same mitigation measures, impacts would be the same as for the Specific Plan.

Use of Septic Tanks or Alternative Wastewater Disposal Systems

All Baylands development would be connected to a municipal wastewater system and neither septic tanks nor alternative wastewater disposal systems would be used.

Utilities, Service Systems, and Water Supply

Water Supply

Proposed Density development around an operating 45-acre LMF would consume the same amount of potable water, generate the same amount of recycled water, and have the same impact as the Specific Plan.

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and would result in the same less than significant impacts.

Consistency with Solid Waste Management Policies

Because this alternative would generate the same amount of solid waste on a per-unit basis and achieve the same waste diversion rate as the Specific Plan, impacts would be the same as for the Specific Plan.

Landfill Capacity

Proposed Density development around an operating 45-acre LMF would generate the same total amount of solid waste, be subject to the same diversion programs, and achieve the same waste diversion rate as the Specific Plan. Thus, impacts would be the same as for the Specific Plan.

Public Services and Facilities

Adverse Physical Environment Effects Associated with Construction or Improvements of Fire Protection, Police, School, and Other Public Facilities

Demolition, grading, and construction of fire protection, police, school, and other facilities to serve Baylands development would be the same as for the Specific Plan and would result in the same less than significant impacts in relation to police, fire protection, and schools. This alternative would also generate similar demands, result in similar impacts, and be subject to the same mitigation measures as the Specific Plan in relation to libraries and the City's corporation yard.

Recreation Resources

Physical Deterioration of a Park or Recreational Facility

Proposed Density development around an operating 45-acre LMF would generate the same population increase and nearly the same amount of parkland as the Specific Plan. Thus, parkland provided by this alternative would exceed the 5.03 acres per 1,000 population of parkland currently available to Brisbane residents and therefore not cause any physical deterioration of existing parks and recreational facilities within the City. Because population growth would be the same as for the Specific Plan, this alternative would have the same impact on existing community facilities and be subject to the same mitigation requirements, resulting in a similar less than significant with mitigation incorporated impact as the Specific Plan.

Physical Deterioration of Candlestick Point Windsurfing Resources

Proposed Density development around an operating 45-acre LMF would not necessitate increasing the height of buildings close to the eastern boundary of the site. As a result, impacts would be similar to the Specific Plan.

Wildland Fire

Exacerbate Fire Hazards

Proposed Density Development around an operating 45-acre LMF would result in similar development and population/employment growth as the Specific Plan. Wildland fire hazard impacts would be similar to the Specific Plan.

Evaluation of Proposed Density Development around an Operating 45-Acre LMF in Relation to Project Objectives

By developing the same land uses as the Specific Plan within the area outside of the 45-acre LMF, this alternative would implement the Brisbane General Plan, including GP-1-18 and Measure JJ. In addition, this alternative would achieve each of the overarching and other objectives (see **Table 8-7**). Proposed Density development around an operating 45-acre LMF provides for productive reuse of the Baylands along with restoration and enhancement of on-site resources. Housing opportunities for all economic segments of the community would be provided to meet the City's RHNA and adopted Housing Element obligations (see **Table 4.4-1**), along with providing economic development opportunities and fiscal benefits for the community.

Feasibility of Alternative 1, Proposed Density Development around an Operating 45-Acre LMF, and Overall Conclusion

Proposed Density development around an operating 45-acre LMF would be consistent with the Brisbane General Plan. Developing the same overall land use program as the Specific Plan outside of an operating 45-acre LMF would have minimal effect on the intensity of development compared to the Specific Plan. As such, Proposed Density development around an operating 45-acre LMF would be both reasonable and potentially feasible per the requirements of CEQA Guidelines Section 15126.6(a).

Overall, Project Density development around an operating 45-acre LMF would result in similar environmental impacts as the Baylands Specific Plan. Alternative 1, Proposed Density development around an operating 45-acre LMF, would neither avoid nor reduce significant unavoidable impacts resulting from the 2025 Specific Plan project.

Table 8-7: Evaluation of Alternative 1, Proposed Density Development Around an Operating 45-Acre LMF in Relation to Project Objectives

Project Objectives	Extent to Which Alternative 1, Proposed Density Development Around an Operating 45-Acre LMF Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	Proposed Density development around an operating 45-acre LMF would require site remediation and Title 27 landfill closure prior to development. This alternative would eliminate ongoing ecological damage, provide for productive reuse of the Baylands, and ensure the safety of all who will use the site to the same degree as the 2025 Specific Plan project.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers, as well as for the larger Brisbane community.	This alternative would provide for restoration and enhancement of on-site habitat areas and restoration/adaptive reuse of the historic Roundhouse. Proposed Density development around an operating 45-acre LMF would also restore and enhance habitats within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill. Relocating commercial development within the eastern portion of the site outside of an operating 45-acre LMF would not require increasing office building heights to an extent that would increase obstructions to views of San Bruno Mountain and the San Francisco Bay compared to the Specific Plan. Proposed Density development around an operating 45-acre LMF would protect development from adverse effects of climate change and sea level rise through an adaptation strategy that would provide for wetlands and non-wetland waters within Visitacion Creek and along the north shore of the lagoon to adapt naturally to sea level rise and increasing tidal influence.
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	Proposed Density development around an operating 45-acre LMF would provide a sufficient mix and intensity of residential building types to provide opportunities for production of housing for all economic segments of the community in accordance with the City's Housing Element.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	Proposed Density development around an operating 45-acre LMF provides the same mix of housing and income-generating commercial office and hotel uses as the Specific Plan. This alternative would therefore also generate similar revenue-positive municipal revenues and costs as the 2025 Specific Plan project.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	Proposed Density development around an operating 45-acre LMF would include all of the sustainability features set forth in the Specific Plan and EIR mitigation measures and achieve consistency with the principles of the Sustainability Framework and this objective to the same degree as the Specific Plan.
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	Proposed Density development around an operating 45-acre LMF would generate the same mix of on-site employment as to the Specific Plan and achieve this objective to the same degree as the Specific Plan.
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would provide similar features as the Specific Plan to reduce dependency on motor vehicle travel and achieve this objective to the same degree as the Specific Plan.

b. Alternative 2: Proposed Density, Balanced Commercial

The purpose of this alternative is to provide a more balanced distribution of commercial development than proposed in the Specific Plan consistent with General Plan policy that "non-residential development shall be distributed both to the west and to the east of the rail line" and to determine whether the significant impacts of Specific Plan development could be reduced with a more balanced distribution of commercial development[408] while retaining the same amount of housing as the Specific Plan.

Land Use and Planning Policies

Physical Division of an Existing Community

Proposed Density, Balanced Commercial development would provide the same configuration of residential and commercial development, recreational and habitat areas, and the same roadway and non-motorized transportation system as the Specific Plan throughout the site. Proposed Density, Balanced Commercial development would include the same construction projects affecting area roadways as the Specific Plan, would be subject to the same requirements and mitigation measures, and would therefore result in the same construction impacts as the Specific Plan. This alternative would provide the same connectivity within the Specific Plan, to the Caltrain Bayshore station, and to the US 101 freeway as the Specific Plan. Proposed Density, Balanced Commercial development would therefore have the same (less than significant) impacts in relation to dividing an existing community as would the proposed Specific Plan.

Consistency with Local and Regional Plans

Proposed Density, Balanced Commercial development would be consistent with the General Plan's development intensity standards for the Baylands. Development of 2,200 dwelling units is at the top end of the range for housing specified in the General Plan and the same as that of the Specific Plan. Development of the same 6.5 million s.f. of commercial office space and an additional 500,000 s.f. of hotel use as the Specific Plan would also be consistent with the General Plan. Consistency with local and regional plans would be the same as for the Specific Plan.

Population and Housing

Induce Substantial Unplanned Growth

Proposed Density, Balanced Commercial development provides for the same number of dwelling units (2,200) and would result in the same resident population as the Specific Plan

[408] The proportional distribution of commercial development between the western and eastern portions of the Baylands in this alternative is similar to the proportional distribution of commercial, retail, and R&D uses in the previously proposed 2011 Specific Plan.

(4,095) at buildout, which represents planned growth. In addition, this alternative provides for the same amount of commercial office space (6.5 million s.f.) and hotel use (500,000 s.f.) within the Baylands as the Specific Plan, which represents planned growth. Impacts would be the same as the Specific Plan (less than significant).

Displacement of Existing Housing or Businesses

Because Proposed Density, Balanced Commercial development would have the same footprint as the Specific Plan within the Baylands, it would displace the same 231,400 s.f. of existing industrial businesses along Industrial Way, resulting in the same less than significant impact. It would also affect the Golden State Lumber laydown yard in the same manner as the Specific Plan, which would result in the same less than significant physical environmental impact and the same economic impact as the Specific Plan.

Housing for All Economic Segments of the Community

The zoning to implement this alternative would provide for the same number of dwelling units as the Specific Plan (2,200) and would be capable of meeting the City's quantified housing objectives for all segments of the community for the 2023-2031 housing element cycle to the same degree as the Specific Plan.

Urban Decay

Because Proposed Density, Balanced Commercial development would provide the same amount of residential, retail, and office development as the Specific Plan, it would generate the same demand for retail uses and have the same less than significant urban decay impacts.

Aesthetic and Visual Resources

Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon)

By shifting 400,000 s.f. of commercial development from the western to the eastern portion of the Baylands, Proposed Density, Balanced Commercial development would provide for reducing the heights of the tallest office buildings west of Caltrain, provide greater opportunities for view corridors, and thereby reduce impacts to public views of identified scenic resources. However, such reduced impacts would be limited since:

- There would be no reduction in the 2,200 dwelling units west of Caltrain;
- The addition of 400,000 s.f. of commercial development within the area east of Caltrain could be accommodated by either (1) increasing the height of buildings to take advantage of views, which could increase visual impacts or (2) by spreading out

increased square footage across the area which would not increase building heights or impacts on scenic vistas; and

- Proposed Density, Balanced Commercial development would be subject to the same mitigation measures protecting scenic vistas as would the Specific Plan.

Thus, impacts on scenic resources resulting from Proposed Density, Balanced Commercial would likely be similar to the Specific Plan.

Impacts to Scenic Resources

Proposed Density, Balanced Commercial development would provide for the same preservation and improvements of existing scenic resources within the Baylands as the Specific Plan. Icehouse Hill and the edges of Brisbane Lagoon would be improved in the same manner as would the Specific Plan, including restoration of wetland and habitat areas. This alternative would also extend the San Francisco Bay Trail through the site. Proposed Density, Balanced Commercial development would thus have a similar less than significant impact as the Specific Plan.

Consistency with Visual Quality-Related Policies and Programs

Proposed Density, Balanced Commercial development would be subject to the same design guidelines and be required to comply with the design principles reflected in the findings that are required to be made by the Planning Commission for approval of a design permit as the Specific Plan. Impacts would thus be similar to those of the Specific Plan.

Nighttime Lighting

Proposed Density, Balanced Commercial development would generate nighttime lighting over the same broad area that is currently largely dark at night and provide similar nighttime lighting of outdoor open space and park areas as the Specific Plan. This alternative would also be subject to the same nighttime lighting standards and EIR mitigation measures as the Specific Plan and result in similar less than significant impacts.

Glare

Proposed Density, Balanced Commercial development would generate a similar amount of glare-producing reflective building materials on building roofs and façades, thematic elements, and above-ground infrastructure as the Specific Plan. This alternative would result in a similar significant glare impact and be required to comply with the same mitigation and performance standards as the Specific Plan. A similar less than significant impact as the Specific Plan would result.

Biological Resources

Candidate, Sensitive, and Special-Status Plants, Animals, and Habitats

Proposed Density, Balanced Commercial development would have the same development footprint and require the same movement of soil from the eastern to the western portion of the Baylands to achieve final grades as would the Specific Plan. Thus, the same impacts to existing species and habitats would occur as the Specific Plan. This alternative would provide the same habitat restoration and enhancement on Icehouse Hill, Visitacion Creek, and the north shore of the Lagoon as the Specific Plan. This alternative would be subject to the same mitigation measures and result in similar less than significant impacts as the Specific Plan.

Wetlands and Non-Wetland Waters Acreage, Functions, and Values

Proposed Density, Balanced Commercial development would have the same development footprint and cause the same loss of wetlands and non-wetland waters during site grading and construction as the Specific Plan. This alternative would also be subject to the same requirements and mitigation measures as the 2025 Specific Plan project and would result in similar impacts.

Movement of Fish and Wildlife Species

Trails, recreational improvements, and habitat restoration and enhancement on Icehouse Hill would be the same as the Specific Plan. Because a similar amount of building glass area would result as the Specific Plan, bird strike impacts would be similar, and implementation of the same mitigation measures would be required. Thus, impacts would be similar to those of the Specific Plan.

Consistency with Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Proposed Density, Balanced Commercial development would be required to comply with the requirements of Brisbane Municipal Code Chapter 12.12 in relation to tree replacement. As a result, impacts would be the same as those of the Specific Plan.

Consistency with the San Bruno Mountain Habitat Conservation Plan

Because this alternative would provide the same improvements within Icehouse Hill as the Specific Plan, impacts would be the same.

Cultural Resources and Tribal Cultural Resources

Roundhouse and Machinery & Equipment Buildings

Because the development footprint and areas subject to site grading and other ground-disturbing activities would be the same as the Specific Plan, the Roundhouse would be restored for adaptive reuse as is proposed in the Specific Plan and subject to the same EIR mitigation measures. In addition, development surrounding the Roundhouse and Machinery & Equipment building would be the similar to the Specific Plan and would therefore be consistent with their historic character. Thus, impacts would be similar to the Specific Plan.

Archaeological Resources

Because site grading and other ground-disturbing activities would remain the same and development would be subject to the same mitigation measures, impacts would be the same as those of the Specific Plan.

Tribal Cultural Resources

Because no tribal cultural resources have been identified within the Baylands, no impacts would result.

Disturbance of Known or Unknown Human Remains

Because site grading and other ground-disturbing activities would remain the same and development would be subject to the same mitigation measures, impacts would be the same as those of the Specific Plan.

Transportation

Vehicle Miles Traveled

Although this alternative would provide similar access to the Bayshore Caltrain station and comprehensive system of bicycle and pedestrian facilities as the Specific Plan, shifting 400,000 s.f. of commercial office space from the western to the eastern portion of the Specific Plan area would reduce the number of Baylands employees within walking distance of the Caltrain Bayshore station. Thus, Proposed Density, Balanced Commercial development would result in a slight reduction in the use of transit along with a slight increase in per capita employee VMT compared to the Specific Plan. Impacts would, however, remain less than significant.

Transit, Bicycle, and Pedestrian Travel Modes

Proposed Density, Balanced Commercial development would provide a similar comprehensive system of bicycle and pedestrian facilities, including completion of the Bay Trail through the eastern portion of the Baylands and providing bicycle and pedestrian connections to the Bay Trail, Visitacion Creek, and Lagoon Park. However, by shifting some office development from the western to the eastern portion of the Specific Plan area, a slight reduction in use of transit by Baylands employees would occur.

Hazards to Vehicles, Bicyclists, and Pedestrians

All roadways as well as bicycle and pedestrian facilities and trails within the Baylands would be constructed to City standards. Thus, impacts would be similar to those of the Specific Plan.

Emergency Access

The Specific Plan area, each development district, and each block within the Baylands would be provided with more than one point of access, facilitating emergency response. Because the extension of Geneva Avenue over the Caltrain right-of-way to the US 101 freeway and extension of Sierra Point Parkway would be the same as for the Specific Plan, emergency response from the proposed new fire station within the northeastern portion of the Baylands would be similar to the Specific Plan. In addition, because all roadways would be constructed to City standards and this alternative would provide emergency access during flooding events consistent with EIR mitigation requirements, impacts would be similar to the Specific Plan.

Air Quality

Consistency with the 2017 Regional Clean Air Plan

Although this alternative would provide similar access to the Bayshore Caltrain station and comprehensive system of bicycle and pedestrian facilities as the Specific Plan, shifting 400,000 s.f. of commercial office space from the western to the eastern portion of the Specific Plan area would reduce the number of Baylands employees within walking distance of the Caltrain Bayshore station. Thus, Proposed Density, Balanced Commercial development would result in a slight reduction in the use of transit along with a slight increase in VMT, which would increase mobile source emissions. This alternative would, however, include all of the same sustainability features and be subject to the same mitigation measures as the Specific Plan. Proposed Density, Balanced Commercial development would therefore be consistent with the 2017 Clean Air Plan.

Increased Emissions of Non-Attainment Criteria Air Pollutants

Proposed Density, Balanced Commercial development would retain the same overall amount and intensity of residential and commercial development as the Specific Plan but would shift

some office development to the eastern portion of the Baylands, which would slightly reduce transit use and increase mobile source emissions. Because the amount of grading required for this alternative would be similar to that required for the Specific Plan, the significant unavoidable construction impact associated with site grading would be similar to the Specific Plan, while the significant unavoidable operations impact would be slightly increased by Proposed Density, Balanced Commercial development.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Because site grading would be similar for Proposed Density, Balanced Commercial development as for the Specific Plan, exposure of off-site receptors to pollutant concentrations resulting from grading activities would be similar to the Specific Plan. Development would be subject to the same mitigation measures and result in a similar less than significant impact with mitigation incorporated as the Specific Plan.

Odors

The potential for odor generation during site grading, construction, and operations would be similar to that of the Specific Plan and would be subject to the same mitigation measures to reduce odor emissions. This alternative would therefore have a similar impact as Specific Plan development.

Greenhouse Gas Emissions

Specific Plan Area Greenhouse Gas (GHG) Emissions

Proposed Density, Balanced Commercial development would result in the same overall amount of development with slightly reduced proximity to transit from office uses compared to the Specific Plan. This alternative would provide a comprehensive system of bicycle and pedestrian facilities throughout the site and complete the Bay Trail through the Baylands. The result would be similar use of transit, bicycle, and pedestrian modes of transportation as well as GHG emissions as the Specific Plan. Residential per capita VMT would remain the same as the Specific Plan while per capita employee VMT and resulting GHG emissions would increase slightly, increasing the Specific Plan's significant unavoidable impact.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

This alternative would implement the same GHG reduction features and mitigation measures as the Specific Plan and would therefore be equally consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

This alternative would implement the same GHG reduction features and mitigation measures as the Specific Plan and would therefore be consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Effect on Regional GHG Emissions

Because Proposed Density, Balanced Commercial development would have the same amount of development with similar use of transit, bicycle, and pedestrian modes of transportation, per capita VMT, and GHG emissions as the Specific Plan, similar reductions in regional VMT and mobile source GHG emissions as the Specific Plan would result.

Energy Resources

Wasteful, Inefficient, or Unnecessary Use of Energy

Proposed Density, Balanced Commercial development would result in the same overall amount of development with similar proximity to transit for Baylands residents and slightly reduced proximity for employees. This alternative would provide a similar comprehensive system of bicycle and pedestrian facilities throughout the site. The result would be slightly increased transportation-related energy use as the Specific Plan. This alternative would generate and store a similar amount of renewable energy as the Specific Plan. On-site buildings would meet Tier 2 CALGreen Standards. Thus, impacts would be similar to the less than significant impacts of the Specific Plan.

Consistency with Applicable Energy Reduction Programs, Plans, Ordinances, and Policies

Proposed Density, Balanced Commercial development would generate, store, and consume a similar amount of renewable energy on-site, as well as consume only a slightly increased amount of transportation-related energy. This alternative would be consistent with applicable energy reduction programs, plans, ordinances, and policies to a similar degree as the Specific Plan.

Noise and Vibration

Temporary Increase in Ambient Noise

The extent of site grading required for Proposed Density, Balanced Commercial development would be similar to that of the Specific Plan, resulting in a similar need for pile foundations and pile driving. Similar significant unavoidable construction noise impacts would therefore result.

Traffic Noise Increase

Proposed Density, Balanced Commercial development would generate a slightly greater amount of traffic as the Specific Plan, although not sufficiently greater so as to increase traffic noise compared to the Specific Plan. Traffic noise impacts would thus be similar to the Specific Plan (significant and unavoidable).

Permanent Increase in Ambient Noise

Proposed Density, Balanced Commercial development would generate noise from the same stationary sources and be subject to the same mitigation measures as the Specific Plan. All development within the Baylands would be required to meet the same performance standards and comply with City noise ordinance requirements. Impacts of this alternative would, therefore, be similar to the Specific Plan (significant and unavoidable).

Exacerbate Land Use/Noise Incompatibilities by Placing People in High Noise Areas

This alternative would retain the Specific Plan's placement of residential uses west of the Caltrain rail line, which would thus experience similar land use/noise incompatibilities. By spreading office development more evenly to the east and west of the Caltrain rail line, a greater amount of office development would be subject to rail noise impacts. Because all development subject to railroad noise levels would be required to implement the same mitigation measures, impacts would be similar to those of the Specific Plan.

Vibration

The extent of site grading required for Proposed Density, Balanced Commercial development would be similar to that of the Specific Plan, resulting in a similar need for pile foundations and pile driving. Similar construction vibration impacts would therefore result. Development of this alternative would generate operational vibration from the same stationary sources as the Specific Plan and result in the same impacts as the Specific Plan.

Exacerbate Human Annoyance or Hazards by Placing Buildings in High Groundborne Vibration Areas

This alternative would retain the Specific Plan's placement of residential uses west of the Caltrain rail line, which would thus experience similar vibration impacts. By spreading office development more evenly to the east and west of the Caltrain rail line, a greater amount of office development would be subject to rail noise impacts. Because all development subject to railroad vibration levels would be required to implement the same mitigation measures, impacts would be similar to those of the Specific Plan.

Hazards and Hazardous Materials

Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Demolition of older buildings potentially containing asbestos or lead-based paints would be the same for Proposed Density, Balanced Commercial development as for the Specific Plan. In addition, because the overall types and intensity of uses for this alternative would be similar to the Specific Plan, the potential for a release of hazardous materials due to the transport, use, disposal, or management of hazardous materials, whether resulting from routine activities or an accident, would also be similar to the Specific Plan. This alternative would be subject to the same extensive set of regulations designed to protect the public and environment from such a release of hazardous materials. Thus, impacts would be similar to those of the Specific Plan.

Create a Health Hazard for an Existing or Planned School Site Due to Release of Hazardous Materials or Proximity of Hazardous Conditions

The location of a school site within the Baylands in relation to locations of hazardous materials sites and emitters would be no different than for the Specific Plan. Thus, the impacts of this alternative would be the same as for the Specific Plan.

Development on a Property That Is Included on a List of Hazardous Materials Sites

The majority of the Baylands site, including the former Brisbane Landfill, OU-SM, and OU-2, is included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Within the western portion of the Baylands, development would occur within operating units OU-SM and OU-2 following site remediation pursuant to the regulatory authority of the San Francisco Bay RWQCB and DTSC.

Proposed Density, Balanced Commercial development would occur within the same footprint within OU-SM, OU-2, and the former Brisbane Landfill, all of which are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Development of this alternative would be subject to the same policies, requirements, and EIR mitigation measures as the Specific Plan and would thus have a similar less than significant impact as the Specific Plan.

Create an Airport Safety Hazard or Expose People to Excessive Noise of Aircraft Operations

Since none of the Specific Plan area is subject to safety hazards or excessive noise from aircraft operations, this alternative would have the same impacts as the Specific Plan.

Emergency Preparedness and Response

The same amount of residential development proposed for the Specific Plan would occur in the same locations within the western portion of the site, while approximately 400,000 s.f. of commercial use would be shifted from the western to the eastern portion of the Specific Plan

area. Development would provide the same regional roadway connections and meet the same access requirements for police and fire service response as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Hydrology and Water Quality

Protection of Water Quality

The amount of grading and construction needed for Proposed Density, Balanced Commercial development would be the same as for the Specific Plan, including the high potential for erosion and siltation and release of pollutants. Because this alternative would have the same development footprint and roadway systems as the Specific Plan, the potential for release of urban pollutants to Brisbane Lagoon and to San Francisco Bay via Visitacion Creek following construction would be the same as the Specific Plan. This alternative would implement Best Management Practices outlined in required NPDES permits, SWPPPs and the requirements of NPDES Provision C.3 in combination with the same mitigation measures as the Specific Plan. Impacts would therefore be the same as those of the Specific Plan.

Groundwater Recharge and Sustainable Management

Proposed Density, Balanced Commercial development would result in a similar amount of impervious surface area as the Specific Plan and would therefore not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence. In addition, as demonstrated in the Water Supply Assessment prepared by Cal Water, Baylands development would have no effect on groundwater pumping within South San Francisco. Thus, impacts would be similar to those of the Specific Plan.

Flood Hazards

Proposed Density, Balanced Commercial development would construct a similar impermeable surface area and generate a similar increase in stormwater runoff as the Specific Plan. This alternative would comply with the same flood protection standards and mitigation measures as the Specific Plan. Impacts would be similar to the Specific Plan.

Release of Pollutants Due to Flood, Emergent Groundwater, Tsunami, or Seiche

The Specific Plan area is not located within a tsunami hazard zone and on-site water storage tank facilities would be designed and constructed to withstand anticipated oscillations in water surface caused by an earthquake. Further, the risk of release of pollutants attributable to inundation would be negligible since potential pollutants would not be present at the ground surface and no facilities storing hazardous materials would be located downstream of Baylands

water storage facilities. In addition, this alternative would be subject to the same less than significant potential for emergent groundwater as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Geology, Soils, and Seismicity

Fault Rupture

Because there are no known active or potentially active fault traces across the Baylands, and the site is not located within an Alquist-Priolo Earthquake Fault Zone, no impact would occur.

Seismic Ground Shaking

Development of this alternative would be subject to a similar risk of damage related to seismic ground shaking as the Specific Plan. Development would also be required to conform to the same CBC seismic design parameters and mitigation measures as the Specific Plan, which would provide an appropriate level of safety and reduce hazards from strong seismic ground shaking to a similar less than significant level as the Specific Plan.

Liquefaction and Seismic-Related Ground Failure

Because of the presence of high groundwater and loose, unconsolidated soils underlying both the western and eastern portions of the Specific Plan area, this alternative would be subject to similar liquefaction hazards as the Specific Plan. Proposed Density, Balanced Commercial development would be required to conform to the same site-specific foundation design parameters and EIR mitigation measures as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Slope Stability

Site grading would be similar to the Specific Plan. Site-specific development projects would be required to comply with the same California Building Code requirements for slope stability as the Specific Plan. Impacts would therefore be similar to the less than significant impacts of the Specific Plan.

Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard and during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. Site-specific development projects for this alternative would be designed and constructed to comply with the requirements of final site-specific design-level geotechnical reports, which would ensure appropriate design and construction to mitigate soil corrosivity and expansive soils hazards for each building and infrastructure project. Compliance with the CBC and EIR

mitigation measures would result in hazards from soil corrosivity and expansive soils similar to the less than significant impacts of the Specific Plan.

Paleontological Resources

The only deep excavations that could disturb significant paleontological resources within the Colma or Merced Formations would be pile foundation installation. Because installation of pile foundations would render any potentially valuable specimens irretrievable, such installation is not typically considered to cause significant impacts. The potential in this alternative that excavations for construction activities would be deep enough to encounter paleontological resources would be similar to the Specific Plan (unlikely). Because this alternative would have the same potential for such excavations and would be subject to the same mitigation measures, impacts would be the same as the Specific Plan.

Use of Septic Tanks or Alternative Wastewater Disposal Systems

All Baylands development would be connected to a municipal wastewater system and neither septic tanks nor alternative wastewater disposal systems would be used.

Utilities, Service Systems, and Water Supply

Water Supply

Proposed Density, Balanced Commercial development would consume the same amount of potable water, generate the same amount of recycled water, and result in the same impact as the Specific Plan.

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and result in the same less than significant impacts.

Consistency with Solid Waste Management Policies

Because this alternative would generate the same amount of solid waste on a per unit basis and achieve the same waste diversion rate as the Specific Plan, impacts would be the same as for the Specific Plan.

Landfill Capacity

Proposed Density, Balanced Commercial development would generate the same amount of solid waste, be subject to the same diversion programs, and achieve the same waste diversion rate as the Specific Plan. Thus, impacts on landfill capacity would be the same as for the Specific Plan.

Public Services and Facilities

Adverse Physical Environment Effects Associated with Construction or Improvements of Fire Protection, Police, School, and Other Public Facilities

Demolition, grading, and construction of fire protection, police, school, and other facilities to serve Baylands development would be the same as for the Specific Plan and result in the same less than significant impacts in relation to police, fire protection, and schools. This alternative would also generate similar demands, result in similar impacts, and be subject to the same mitigation measures as the Specific Plan in relation to libraries and the City's corporation yard.

Recreation Resources

Physical Deterioration of a Park or Recreational Facility

Proposed Density, Balanced Commercial development would generate the same population increase and nearly the same amount of parkland as the Specific Plan. Thus, parkland provided by this alternative would exceed the 5.03 acres per 1,000 population of parkland currently available to Brisbane residents and therefore not cause any physical deterioration of existing parks and recreational facilities within the City. Because population growth would be the same as for the Specific Plan, this alternative would have the same impact on existing community facilities and be subject to the same mitigation requirements, resulting in a similar less than significant impact as the Specific Plan.

Physical Deterioration of Candlestick Point Windsurfing Resources

Proposed Density, Balanced Commercial development would not necessitate increasing the height of buildings close to the eastern boundary of the site. As a result, impacts would be similar to the Specific Plan.

Wildland Fire

Exacerbate Fire Hazards

Proposed Density, Balanced Commercial development would result in similar development and population/employment growth as the Specific Plan. Wildland fire hazard impacts would be similar to the Specific Plan.

Evaluation of Proposed Density, Balanced Commercial Development in Relation to Project Objectives

Proposed Density, Balanced Commercial development would implement the Brisbane General Plan, including GP-1-18 and Measure JJ. In addition, this alternative would achieve each of the

overarching and other objectives (see **Table 8-8**). Proposed Density, Balanced Commercial development provides for productive reuse of the Baylands along with restoration and enhancement of on-site resources. Housing opportunities for all economic segments of the community would be provided to meet the City's RHNA and adopted Housing Element obligations (see **Table 4.4-1**), along with providing economic development opportunities and fiscal benefits for the community.

Feasibility of Alternative 2, Proposed Density, Balanced Commercial Development, and Overall Conclusion

Proposed Density, Balanced Commercial development would be consistent with the Brisbane General Plan and retain the overall development program of the Specific Plan. Relocating 400,000 s.f. of commercial use to the eastern portion of the Baylands would have no effect on the intensity of development. As such, Proposed Density, Balanced Commercial development would be both reasonable and potentially feasible per the requirements of CEQA Guidelines Section 15126.6(a).

Overall, Proposed Density, Balanced Commercial development would result in similar environmental impacts as the Baylands Specific Plan.

Table 8-8: Evaluation of Alternative 2, Proposed Density, Balanced Commercial Development in Relation to Project Objectives

Project Objectives	Extent to Which Alternative 2, Proposed Density, Balanced Commercial Development Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	Proposed Density, Balanced Commercial development would require site remediation and Title 27 landfill closure prior to development. This alternative would eliminate ongoing ecological damage, provide for productive reuse of the Baylands, and ensure the safety of all who will use the site.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers as well as for the larger Brisbane community.	This alternative would provide for restoration and enhancement of on-site habitat areas and restoration/adaptive reuse of the historic Roundhouse. Proposed Density, Balanced Commercial development would also restore and enhance habitats within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill. Relocating 400,000 s.f. of commercial development from the western to the eastern portion of the site would not require increasing office building heights to an extent that would increase obstructions to views of San Bruno Mountain and the San Francisco Bay compared to the Specific Plan. Proposed Density, Balanced Commercial development would protect development from adverse effects of climate change and sea level rise through an adaptation strategy that would provide for wetlands and non-wetland waters within Visitacion Creek and along the north shore of the lagoon to adapt naturally to sea level rise and increasing tidal influence.

Project Objectives	Extent to Which Alternative 2, Proposed Density, Balanced Commercial Development Would Achieve Objectives
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	Proposed Density, Balanced Commercial development would provide a sufficient mix and intensity of residential building types to provide opportunities for production of housing for all economic segments of the community in accordance with the City's Housing Element.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	Proposed Density, Balanced Commercial development provides the same mix of housing and income-generating commercial office and hotel uses as the Specific Plan. This alternative would therefore also generate similar revenue-positive municipal revenues and costs.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	Proposed Density, Balanced Commercial development would include all of the sustainability features set forth in the Specific Plan and EIR mitigation measures, achieve consistency with the principles of the Sustainability Framework, and achieve this objective to the same degree as the Specific Plan.
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	Proposed Density, Balanced Commercial development would generate the same mix of on-site employment as to the Specific Plan and achieve this objective to the same degree as the Specific Plan.
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would provide similar features as the Specific Plan to reduce dependency on motor vehicle travel and achieve this objective to a similar degree as the Specific Plan.

c. Alternative 3: Proposed Density, Lower Maximum Building Heights

The purpose of this alternative is to evaluate the extent to which reducing maximum building heights within the Baylands would reduce the significant impacts of Specific Plan development.

Land Use and Planning Policies

Physical Division of an Existing Community

Proposed Density, Lower Maximum Building Height development would include the same construction projects affecting area roadways as the 2025 Specific Plan project and be subject to the same requirements and mitigation measures. Because this alternative's configuration of development and open space areas as well as its roadway and non-motorized transportation system would be the same as for the Specific Plan, the Proposed Density, Lower Maximum Height Alternative would have similar (less than significant) impacts in relation to dividing an existing community as would the proposed Specific Plan.

Plan Consistency

Proposed Density, Lower Maximum Height development is consistent with the General Plan's development intensity standards for the Baylands. Development of 2,200 dwelling units is at the top end of the range for housing specified in the General Plan, and the same as that of the

Baylands Specific Plan. Development of the same 6.5 million s.f. of commercial office space and an additional 500,000 s.f. of hotel use as the Specific Plan would also be consistent with the General Plan. Consistency with local and regional plans would be the same as for the Specific Plan.

Population and Housing

Induce Substantial Unplanned Growth

Proposed Density, Lower Maximum Height development provides for the same number of dwelling units (2,200) and would result in the same resident population as the Baylands Specific Plan (4,095) at buildout. This represents the upper end of development permitted by the Brisbane General Plan and is therefore consistent. In addition, this alternative provides for the same amount of commercial office space (6.5 million s.f.) and hotel use (500,000 s.f.) within the Baylands as in the Specific Plan. Baylands employment would therefore be the same as for the Specific Plan. Thus, population and employment growth associated with Proposed Density, Lower Maximum Height development would be considered to be planned growth and impacts would be similar to the Specific Plan's (less than significant).

Displacement of Existing Housing or Businesses

Because the Proposed Density, Lower Maximum Height Alternative involves development of the same footprint as the Specific Plan, the same 231,400 s.f. of existing industrial businesses along Industrial Way would be displaced, resulting in the same less than significant impact. This alternative would also displace Golden State Lumber's laydown area and its ability to receive and ship lumber by rail, resulting in the same less than significant physical environmental impact and the same economic impact as the Specific Plan.

Housing for all Economic Segments of the Community

Proposed Density, Lower Maximum Height development proposes the same 2,200 dwelling units as the Specific Plan and would, therefore, meet City housing objectives for the development of opportunities to provide housing for all segments of the community for the 2023-2031 housing period. By retaining the 2,200 dwelling units proposed in the Specific Plan, an equivalent level of housing opportunities would be available for the development of housing in subsequent Housing Element cycles beyond 2031.

Urban Decay

Because the Proposed Density, Lower Maximum Height Alternative would provide the same amount of residential, retail, and office development as the Specific Plan, it would generate the same demand for retail uses and have the same less than significant urban decay impacts as the Specific Plan.

Aesthetic and Visual Resources

Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon)

Reducing development intensity within the western portion of the Baylands by reducing the heights of taller buildings within that area while maintaining the Specific Plan's overall development intensity would most likely be achieved by raising building heights for low and moderate density office buildings, which would reduce obstructions by the tower buildings along the Caltrain right-of-way, while increasing the extent of lower-level obstructions to views of San Francisco Bay and appearance of development as a solid mass compared to the Specific Plan. As shown in **Table 4.5-2a** through **Table 4.5-2r**, while development within the eastern portion of the Baylands has little effect on Bay views, it does block views of San Bruno Mountain from the east, particularly along the US 101 freeway. Lowering building heights east of the Caltrain right-of-way would have little or no effect on views from the US 101 freeway due to the closeness of buildings to the freeway but would reduce blockage of San Bruno Mountain views from more distant vantage points.

Impacts to Scenic Resources

Proposed Density, Lower Maximum Height development would provide for the same preservation and improvements of existing scenic resources within the Baylands as the Specific Plan. The Visitacion Creek corridor, Icehouse Hill, and the edges of Brisbane Lagoon all would be improved in the same manner as would the Specific Plan, including restoration of wetland and habitat areas, which would retain their natural character. This alternative would also extend the San Francisco Bay Trail through Baylands. Thus, this alternative would have the same beneficial effects as would the Specific Plan by preserving 100-foot shoreline band areas around the Visitacion Creek corridor and Brisbane Lagoon and providing public access to the Bay.

Consistency with Visual Quality-Related Policies and Programs

Regardless of the specific density and distribution of land use within the Baylands, development would be required to be consistent with applicable visual-quality-related policies and programs. Specifically, Proposed Density, Lower Maximum Height development would be required to comply with the design principles reflected in the findings that are required to be made by the Planning Commission for approval of a design permit.

Nighttime Lighting

Because total building area and development footprint within the Baylands would be the same as the Specific Plan, this alternative would generate nighttime lighting over the same broad area that is currently largely dark at night.

Proposed Density, Lower Maximum Height development would have the same potential to permit light sources that would result in light trespass and sky glow impacts as the Specific Plan. Because this alternative would be required to comply with the same performance standards and implement the same mitigation measures as the Specific Plan, similar less than significant with mitigation incorporated impacts would result compared to the Specific Plan.

Glare

Proposed Density, Lower Maximum Height development would result in a similar amount of glare-producing reflective materials as the Specific Plan. This alternative would be subject to the same mitigation measures and result in similar less than significant with mitigation incorporated impacts as the Specific Plan.

Biological Resources

Candidate, Sensitive, and Special-Status Plants, Animals, and Habitats

Because the Proposed Density, Lower Maximum Height Alternative would have the same development footprint throughout the Baylands, it would require the same movement of soil from the eastern to the western portion of the Baylands to achieve final grades. Thus, similar impacts to existing species and habitats would occur. This alternative would be subject to the same mitigation requirements as the Specific Plan and would result in similar less than significant with mitigation incorporated impacts.

Wetlands and Non-Wetland Waters Acreage, Functions, and Values

Lowering building heights within the Baylands would not reduce the loss of wetlands and non-wetland waters that would occur during site grading and construction compared to the Specific Plan. Proposed Density, Lower Maximum Height development would result in similar impacts to wetlands and non-wetland waters, be subject to the same mitigation requirements, and result in a similar less than significant with mitigation incorporated impact as the Specific Plan.

Movement of Fish and Wildlife Species

Trails and recreational improvements on Icehouse Hill would be the same as the Specific Plan and result in the same impacts. Because a similar amount of building glass area as the Specific Plan would result, bird strike impacts would be similar. This alternative would be subject to the same mitigation requirements and would result in a similar less than significant with mitigation incorporated impact as the Specific Plan.

Consistency with Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Proposed Density, Lower Maximum Height development would be required to comply with the requirements of Brisbane Municipal Code Chapter 12.12. As a result, impacts would be the same as the Specific Plan.

Consistency with the San Bruno Mountain Habitat Conservation Plan

Because this alternative would provide the same improvements within Icehouse Hill as would the Specific Plan, impacts would be the same.

Cultural Resources and Tribal Cultural Resources

Roundhouse and Machinery & Equipment Buildings

Because lowering building heights would not change the development footprint or areas subject to site grading and other ground-disturbing activities, the Roundhouse would be restored for adaptive reuse in the same manner as proposed for the Specific Plan. In addition, surrounding development would be compatible with the character of these historic buildings. Thus, this alternative would be subject to the same mitigation measures and the same less than significant with mitigation incorporated impacts as the Specific Plan would result.

Archaeological Resources

Because lowering building heights would not change site grading and other ground-disturbing activities, impacts and required mitigation measures would be the same as for the Specific Plan.

Tribal Cultural Resources

Because no tribal cultural resources have been identified within the Baylands, no impacts would result.

Disturbance of Known or Unknown Human Remains

Because lowering building heights would not change site grading and other ground-disturbing activities, impacts and required mitigation measures would be the same as for the Specific Plan.

Transportation

Vehicle Miles Traveled

Reducing building heights while retaining the same overall intensity of development within the western portion of the Baylands would not substantially change the number Baylands residents or employees within walking distance of the Caltrain Bayshore Station and not affect per capita

VMT. However, lowering building heights within the western portion of the site and the same overall intensity of Specific Plan development by shifting some office development to the eastern portion of the site would decrease the number of employees within walking distance of transit and result in a slight increase in per capita VMT for Baylands employees, although the impact would remain less than significant.

Transit, Bicycle, and Pedestrian Travel Modes

The Proposed Density, Lower Maximum Height Alternative would provide the same comprehensive system of bicycle and pedestrian facilities within the Baylands as the Specific Plan. This alternative would also have similar effects in relation to transit, bicycle, and pedestrian modes of travel. However, shifting some commercial office space from the western to the eastern portion of the site would increase the number of employees working beyond walking distance to the Bayshore Caltrain station. This increased distance would result in a slight reduction in use of transit, as well as reduced use of pedestrian and pedestrian travel.

Hazards to Vehicles, Bicyclists, and Pedestrians

All roadways throughout the Baylands would be constructed to City standards, implementing identified mitigation requirements. Impacts in relation to transportation hazards would thus be similar to the Specific Plan.

Emergency Access

The Specific Plan area, each development district, and each block within the Baylands would continue to have more than one point of access, facilitating emergency response. Extending Geneva Avenue from Bayshore Boulevard over the Caltrain right-of-way to the US 101 freeway and extending Sierra Point Parkway would occur as proposed in the Specific Plan, including implementation of the mitigation requirement to construct the Geneva Avenue bridge section with a six-lane cross section. This alternative would also be subject to requirements for compliance with Brisbane roadway design standards. Thus, this alternative would have similar impacts to the less than significant with mitigation incorporated impact as the Specific Plan.

Air Quality

Consistency with the 2017 Regional Clean Air Plan

Reducing building heights within the western portion of the Baylands while retaining the same amount of residential and commercial development as the Specific Plan would slightly reduce the amount of office development in proximity to transit should some office development be shifted to the eastern portion of the site in comparison to the Specific Plan. The Proposed Density, Lower Maximum Height Alternative would include all of the same features and mitigation measures as the Specific Plan and would be consistent with the 2017 Clean Air Plan.

Increased Emissions of Non-Attainment Criteria Air Pollutants

Reducing building heights within the western portion of the Baylands while retaining the same amount of residential and commercial development as the Specific Plan would slightly reduce the amount of office development in proximity to transit should some office development be shifted to the eastern portion of the site in comparison to the Specific Plan. In addition, the amount of grading required for the Proposed Density, Lower Maximum Height Alternative would be similar to the significant unavoidable impacts of the Specific Plan. Thus, construction and operational emissions would be similar to the Specific Plan.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Because site grading would be similar to the Specific Plan, exposure of off-site receptors to pollutant concentrations resulting from grading activities would be similar. Because the amount of building construction activity would be similar to that of the Specific Plan, impacts to on- and off-site sensitive receptors would be similar to Specific Plan development.

Odors

The potential for odor generation during site grading would be the same as the Specific Plan. The Proposed Density, Lower Maximum Height Alternative would result in a more uniform distribution of development intensity within the western portion of the site but would not substantially change the amount of development either upwind or downwind of the water recycling facility. Thus, odor impacts would be similar to Specific Plan development.

Greenhouse Gas Emissions

Specific Plan Area Greenhouse Gas (GHG) Emissions

Lowering building heights while retaining the same amount of development within the western portion of the Baylands would not change per capita resident of resident VMT, nor would GHG emissions be reduced. Should some commercial office use be shifted east of Caltrain, mobile source emissions would increase slightly. This alternative would provide all of the same features and mitigation measures to reduce GHG emissions as the Specific Plan and would result in a similar significant unavoidable impact as the Specific Plan.

Effect on Regional GHG Emissions

Because Proposed Density, Lower Maximum Height development would have the same amount of development with similar use of transit, bicycle, and pedestrian modes of transportation, per capita VMT, and GHG emissions as the Specific Plan, similar reductions in regional VMT and mobile source GHG emissions as the Specific Plan would result.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

The Proposed Density, Lower Maximum Height Alternative would include all of the GHG reduction features and mitigation measures as the Specific Plan and would therefore be similarly consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Energy Resources

Wasteful, Inefficient, or Unnecessary Use of Energy

Lowering the maximum permitted building heights to 12 stories for commercial development and 8 stories for residential development while retaining the same development intensity as the Specific Plan would decrease the amount of roof area per dwelling unit and square foot of commercial space. Because the Specific Plan's land use plan does not include room for additional buildings, lowering the height of the tallest proposed buildings requires increasing the height of the shortest buildings within the Baylands. Because a substantial portion of the Specific Plan's residential development is anticipated to consist of single family, duplex, and townhouse building types, the Proposed Density, Lower Maximum Height Alternative would require converting a large number of these building types to Multi-Family Low stacked flats within Low Density Residential areas. In addition, a large number of Campus Low-Rise buildings within Mid-Density Commercial areas would be converted to taller Campus Mid-Rise buildings. The net effect would be to reduce the area available for solar energy generation in relation to the number of dwelling units and commercial office square footage compared to the Specific Plan. Thus, this alternative would consume an equal amount of energy as would the Specific Plan while generating less renewable energy. This alternative would, however, include the 55-acre solar field and distributed battery storage proposed for the Specific Plan, while also improving energy conservation by meeting Tier 2 CALGreen standards. As a result, the Proposed Density, Lower Maximum Height Alternative would have a similar less than significant impact as the Specific Plan.

Consistency with Applicable Energy Reduction Programs, Plans, Ordinances, and Policies

This alternative would meet Tier 2 CALGreen standards and provide the same energy conservation features as the Specific Plan, and would be consistent with applicable energy reduction programs, plans, ordinances, and policies.

Noise and Vibration

Temporary Increase in Ambient Noise

The extent of site grading required for the Proposed Density, Lower Maximum Height Alternative would be similar to the Specific Plan, resulting in similar noise impacts. Lowering

the heights of taller buildings while retaining the Specific Plan's overall development intensity would require increasing the heights of lower density buildings, which would likely necessitate pile foundations for more buildings than the Specific Plan. As a result, the Proposed Density, Lower Maximum Height Alternative would likely increase the amount of pile driving needed for Baylands buildings, increasing the severity of the Specific Plan's significant unavoidable impact, even though this alternative would be subject to the same mitigation measures.

Traffic Noise Increase

The Proposed Density, Lower Maximum Height Alternative would generate a similar amount of traffic as the Specific Plan. The net result would be similar traffic noise impacts to those of the Specific Plan.

Permanent Increase in Ambient Noise

The Proposed Density, Lower Maximum Height Alternative would generate noise from the same stationary sources and be subject to the same mitigation measures as the Specific Plan. All development within the Baylands would be required to meet the same performance standards and comply with City noise ordinance requirements. Impacts would therefore be similar to the Specific Plan (significant and unavoidable).

Exacerbate Land Use / Noise Incompatibilities by Placing People in High Noise Areas

Since the tallest buildings proposed by the Specific Plan are located along the west side of the Caltrain line, the Proposed Density, Lower Maximum Height Alternative would reduce the number of dwelling units and amount of commercial office development occurring in high noise areas adjacent to the Caltrain right-of-way. Thus, impacts would be decreased in comparison to the Specific Plan.

Increase in Groundborne Vibration

Because the same grading would be required for the Proposed Density, Lower Maximum Height Alternative, vibration generated during site grading would be unchanged from the Specific Plan, resulting in similar noise impacts. However, lowering the heights of taller buildings while retaining the Specific Plan's overall development intensity would require increasing the heights of lower density buildings, which would likely necessitate pile foundations for more buildings than the Specific Plan. Development of this alternative would be subject to the same mitigation measures as the Specific Plan, resulting in similar impacts.

Exacerbate Human Annoyance or Hazards by Placing Buildings in High Groundborne Vibration Areas

The Proposed Density, Lower Maximum Height Alternative would reduce the heights of the tallest buildings within the Baylands, which the Specific Plan proposes placing along the west side of the Caltrain right-of-way. The result would be to shift some residential and commercial office development further to the west reducing the amount of Baylands subject to existing groundborne vibration. Development that would be subject to existing groundborne vibration would be required to implement the same performance standards and mitigation measures as the Specific Plan.

Hazards and Hazardous Materials

Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Demolition of older buildings potentially containing asbestos or lead-based paints would be the same for the Proposed Density, Lower Maximum Height Alternative as for the Specific Plan. In addition, the types and intensity of uses for this alternative would be similar to the Specific Plan. Because the development footprint of this alternative would be the same as for the Specific Plan, a release of hazardous materials due to the transport, use, disposal, or management of hazardous materials, whether resulting from routine activities or an accident, would adversely affect a similar number of people as would Specific Plan development. Baylands development in this alternative would be subject to the same extensive set of regulations designed to protect the public and environment from such a release of hazardous materials. Thus, impacts would be similar to those of the Specific Plan.

Create a Health Hazard for an Existing or Planned School Site Due to Release of Hazardous Materials or Proximity of Hazardous Conditions

The location of a school site within the Baylands in relation to locations of hazardous materials sites and emitters would be no different than for the Specific Plan. Thus, impacts of this alternative would be similar to the Specific Plan.

Development on a Property that is Included on a List of Hazardous Materials Sites

Proposed Density, Lower Maximum Height development would have the same footprint as the Specific Plan, including the former railyard and former Brisbane Landfill, which are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. The same site remediation and final landfill closure pursuant to Title 27 requirements would be implemented for this alternative as for Specific Plan development. Development within the Baylands would be subject to the same General Plan policies and EIR mitigation measures as the Specific Plan. Thus, this alternative would have a similar impact as the Specific Plan.

Create an Airport Safety Hazard or Expose People to Excessive Noise of Aircraft Operations

Since none of the Specific Plan area is subject to safety hazards of excessive noise due to aircraft operations, the Proposed Density, Lower Maximum Height Alternative would have the same impacts as the Specific Plan.

Emergency Preparedness and Response

Because this alternative would have the same amount of development within the same footprint as the Specific Plan, impacts would be the same.

Hydrology and Water Quality

Protection of Water Quality

The amount of grading and construction needed for the Proposed Density, Lower Maximum Height Alternative would be the same as for the Specific Plan, including the high potential for erosion and siltation and release of pollutants. Because this alternative would have the same development footprint and roadway systems as the Specific Plan, the potential for release of urban pollutants to the Brisbane Lagoon and to San Francisco Bay via Visitacion Creek following construction would be the same as the Specific Plan. This alternative would implement Best Management Practices outlined in required NPDES permits, SWPPPs and the requirements of NPDES Provision C.3 in combination with the same mitigation measures as the Specific Plan. Impacts would therefore be the same as those of the Specific Plan.

Groundwater Recharge and Sustainable Management

Proposed Density, Lower Maximum Height development would not reduce the site's impervious surface area compared to the Specific Plan due to the requirement for construction of an impermeable cap on the landfill. Because the local groundwater basin is not used as a potable or non-potable water supply and is hydraulically connected to the Bay and Lagoon, this alternative would not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence. In addition, as demonstrated in the Water Supply Assessment prepared by Cal Water, Baylands development would have no effect on groundwater pumping within South San Francisco. Impacts would be similar to the Specific Plan (less than significant).

Flood Hazards

This alternative would retain the same development footprint and roadway system as the Specific Plan and would generate the same increase in stormwater runoff as the Specific Plan. The Proposed Density, Lower Maximum Height Alternative would comply with the same flood

protection standards and mitigation measures as the Specific Plan. Impacts would therefore be similar to the Specific Plan.

Release of Pollutants Due to Flood, Emergent Groundwater, Tsunami, or Seiche

The Specific Plan area is not located within a tsunami hazard zone and the required on-site water storage tank facilities would be designed and constructed to withstand anticipated oscillations in water surface caused by an earthquake. Further, the risk of release of pollutants attributable to inundation would be negligible since potential pollutants would not be present at the ground surface and no facilities storing hazardous materials would be located downstream of Baylands water storage facilities. In addition, this alternative would be subject to the same less than significant potential for emergent groundwater as the Specific Plan. Thus, impacts would be the same as for the Specific Plan.

Geology, Soils, and Seismicity

Fault Rupture

Because there are no known active or potentially active fault traces across the Baylands, and the site is not located within an Alquist-Priolo Earthquake Fault Zone, no impact would occur.

Seismic Groundshaking

Development of this alternative would be subject to a similar risk of damage related to seismic groundshaking as the Specific Plan. Development would also be required to conform to the same CBC seismic design parameters and geotechnical design requirements as the Specific Plan, which would provide an appropriate level of safety and reduce hazards from strong seismic groundshaking to the same less than significant level as the Specific Plan.

Liquefaction and Seismic-Related Ground Failure

Because of the presence of high groundwater and loose, unconsolidated soils underlying both the western and eastern portions of the Specific Plan area, this alternative would be subject to similar liquefaction hazards as the Specific Plan. Proposed Density, Lower Maximum Height development would be required to conform to the same site-specific foundation design parameters and EIR mitigation measures as the Specific Plan. Thus, impacts would be similar.

Slope Stability

The Proposed Density, Lower Maximum Height Alternative would include the same grading and manufactured slopes as the Specific Plan. Site-specific development projects would be required to comply with the most recent City and California Building Code requirements for

slope stability. Compliance with Building Code requirements and EIR Mitigation Measures would result in similar less than significant impacts as the Specific Plan.

Siltation and Erosion

As would be required for the Specific Plan, site-specific development projects for this alternative would be required to obtain a NPDES Permit for Discharges of Stormwater Associated with Construction Activities from the San Francisco Bay RWQCB for all proposed construction activities. Implementation of specific construction-related best management practices (BMPs) to prevent soil erosion and loss of topsoil would also be required. Implementation of required NPDES permits and SWPPPs would result in similar less than significant impacts as the Specific Plan.

Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard and during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. The Proposed Density, Lower Maximum Height Alternative's site-specific development projects would be designed and constructed to comply with the requirements of final site-specific design-level geotechnical reports, which would ensure appropriate design and construction to mitigate soil corrosivity and expansive soils hazards for each building and infrastructure project. The combination of compliance with CBC and City requirements would reduce hazards from soil corrosivity and expansive soils to a similar less than significant level as the Specific Plan.

Paleontological Resources

The only deep excavations that would disturb significant paleontological resources within the Colma Formation or Merced Formation would be pile foundation installation. Because installation of pile foundations would render any potentially valuable specimens irretrievable, such installation is not typically considered to cause significant impacts. This alternative would also have the same unlikely potential that excavations for other construction activities would be deep enough to encounter paleontological resources. Because this alternative would have the same potential for such excavations as the Specific Plan and would be subject to the same mitigation measures, impacts would be similar to the Specific Plan.

Use of Septic Tanks or Alternative Wastewater Disposal Systems

All Baylands development would be connected to a municipal wastewater system and neither septic tanks nor alternative wastewater disposal systems would be used.

Utilities, Service Systems, and Water Supply

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and result in the same less than significant impacts.

Water Supply

Because Proposed Density, Lower Maximum Height development would consume the same amount of potable water and generate the same amount of wastewater, impacts would be the same as the Specific Plan.

Consistency with Solid Waste Management Policies

Because this alternative would generate the same amount of solid waste on a per unit basis, be subject to the same requirements, and achieve the same waste diversion rate as the Specific Plan, impacts would be unchanged from the Specific Plan.

Landfill Capacity

The Proposed Density, Lower Maximum Height Alternative would generate the same amount of solid waste, be subject to the same diversion programs, and achieve the same waste diversion rate as the Specific Plan. Thus, impacts on landfill capacity would be unchanged from the Specific Plan.

Public Services and Facilities

Adverse Physical Environment Effects Associated with Construction or Improvements of Fire Protection, Police, School, and Other Public Facilities

Demolition, grading, and construction of fire protection, police, school, and other facilities to serve Baylands development would be the same as for the Specific Plan and result in similar less than significant impacts in relation to police, fire protection, and schools. This alternative would also generate similar demands, result in similar impacts, and be subject to the same mitigation measures as the Specific Plan in relation to libraries and the City's corporation yard.

Recreation Resources

Physical Deterioration of a Park or Recreational Facility

The Proposed Density, Lower Maximum Height Alternative would retain the same amount of parkland and generate the same population increase as the Specific Plan. Thus, parkland provided by this alternative would substantially exceed the 5.03 acres per 1,000 population of

parkland currently available to Brisbane residents and not cause any physical deterioration of existing parks and recreational facilities within the City. Because population growth would be the same as for the Specific Plan, this alternative would have the same impact on existing community facilities as the Specific Plan. The Proposed Density, Lower Maximum Height Alternative would be subject to the same mitigation measures, resulting in the same less than significant with mitigation incorporated impact as the Specific Plan.

Physical Deterioration of Candlestick Point Windsurfing Resources

The Proposed Density, Lower Maximum Height Alternative would necessitate increasing the height of some buildings within the western portion of the Baylands to reduce the height of the tallest buildings while retaining the same amount of development as the Specific Plan. The location and height of commercial office buildings east of the Caltrain right-of-way would remain unchanged. As a result, this alternative would result in a similar less than significant impact as the Specific Plan.

Wildland Fire

Exacerbate Fire Hazards

The Proposed Density, Lower Maximum Building Height Alternative would result in similar development and population/employment growth as the Specific Plan. Wildland fire hazard impacts would be similar to the Specific Plan.

Evaluation of Alternative 3, Proposed Density, Lower Maximum Height Alternative, in Relation to Project Objectives

Lowering the maximum building heights of the tallest proposed buildings within the Baylands would implement the Brisbane General Plan, including GP-1-18 and Measure JJ. In addition, this alternative would achieve each of the project's overarching and other objectives (see **Table 8-9**). The Proposed Density, Lower Maximum Height Alternative provides for productive reuse of the Baylands along with restoration and enhancement of on-site resources. Housing opportunities for all economic segments of the community would be provided to meet the City's RHNA and adopted Housing Element obligations (see **Table 4.4-1**), along with providing economic development opportunities and fiscal benefits for the community. Environmental impacts of the Baylands Specific Plan would be marginally reduced.

Feasibility of Alternative 3, Proposed Density, Lower Maximum Building Height, and Overall Conclusion

The Proposed Density, Lower Maximum Building Height Alternative would be consistent with the Brisbane General Plan and retain the overall development program and land use map of the Specific Plan. Lowering maximum building heights within the western portion of the site would

redistribute development intensity and increase the intensity of lower density development but would not introduce any additional building types or development densities to the Specific Plan area. As such, Proposed Density, Lower Maximum Building Height development would be both reasonable and potentially feasible per the requirements of CEQA Guidelines Section 15126.6(a).

Overall, the Proposed Density, Lower Maximum Building Height would slightly reduce the environmental impacts of the Baylands Specific Plan.

Table 8-9: Evaluation of Alternative 3, Proposed Density, Lower Maximum Building Height Alternative in Relation to Project Objectives

Project Objectives	Extent to Which Alternative 3, Proposed Density, Lower Maximum Building Height Development, Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	The Proposed Density, Lower Maximum Building Height Alternative would require site remediation and Title 27 landfill closure prior to development and thereby provide for reuse of the Baylands, eliminate ongoing ecological damage, and ensure the safety of all who will use the site.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers as well as for the larger Brisbane community.	This alternative provides for restoration and enhancement of on-site habitat areas and restoration/ adaptive reuse of the historic Roundhouse. Habitats within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill would be restored and enhanced. By lowering building heights, this alternative would reduce obstructions to views of San Bruno Mountain and the San Francisco Bay compared to the Specific Plan. Development would be protected from adverse effects of climate change and sea level rise through an adaptation strategy that would provide for wetlands and non-wetland waters within Visitacion Creek and along the north shore of the lagoon to adapt naturally to sea level rise and increasing tidal influence.
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	This alternative provides a sufficient amount, mix, and intensity of residential building types to provide housing for all economic segments of the community and zone in accordance with the City's adopted Housing Element.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	The Proposed Density, Lower Maximum Building Height Alternative provides an appropriate mix and amount of housing and income-generating commercial office and hotel uses similar to that of the Specific Plan and would be expected to be revenue positive to the City.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	The Proposed Density, Lower Maximum Building Height Alternative would include all of the sustainability features set forth in the Specific Plan and EIR mitigation measures.

Project Objectives	Extent to Which Alternative 3, Proposed Density, Lower Maximum Building Height Development, Would Achieve Objectives
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	This alternative would also generate the same types of employment opportunities as the Specific Plan although to a lesser degree.
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would improve access to the Bayshore Caltrain Station and place all residents within walking distance of the station.

8.4.4 EVALUATION OF REDUCED DENSITY LAND DEVELOPMENT ALTERNATIVES

The following four alternatives each propose the reducing the number of dwelling units and commercial square footage in addition to redistributing development by:

- Reducing the amount of commercial development while retaining the same 2,200 dwelling units proposed by the Specific Plan (Alternative 4);
- Relocating development around and outside of an operating 45-acre LMF (Alternative 5);
- Achieving a more balanced distribution of commercial development on either side of the Caltrain right-of-way (Alternative 6); and
- Reducing the maximum allowed building heights for residential and commercial development within the Baylands (Alternative 7).

a. Alternative 4: Reduced Commercial Development

The purpose of this alternative is to reduce the significant impacts of the Specific Plan land by reducing Baylands commercial development, while retaining the same amount of housing as the Specific Plan.

Land Use and Planning Policies

Physical Division of an Existing Community

The Reduced Commercial Development Alternative would provide the same configuration of development, recreational, and habitat areas, and the same roadway and non-motorized transportation system as the Specific Plan within the western portion of the site. Within the eastern portion of the site, development would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors.

Reduced Commercial Development would include the same construction projects affecting area roadways as the Specific Plan, be subject to the same requirements and mitigation measures, and therefore result in the same construction impacts as the Specific Plan. This alternative would provide the same connectivity to the Caltrain Bayshore station and the US 101 freeway as the Specific Plan. Reduced Commercial Development would therefore have similar (less than significant) impacts in relation to dividing an existing community as the proposed Specific Plan.

Consistency with Local and Regional Plans

Reduced Commercial Development would be consistent with the General Plan's development intensity standards for the Baylands. Development of 2,200 dwelling units is at the top end of the range for housing specified in the General Plan and the same as that of the Baylands Specific Plan. Development of 4.5 million s.f. of commercial office space and an additional 350,000 s.f. of hotel use as the Specific Plan would be less than the maximum allowed but still consistent with the General Plan. Consistency with local and regional plans would be the same as for the Specific Plan.

Population and Housing

Induce Substantial Unplanned Growth

Reduced Commercial Development provides for the same number of dwelling units (2,200) and would result in the same resident population as the Baylands Specific Plan (4,095) at buildout, which represents planned growth. Reducing commercial office space within the Baylands to 4.5 million s.f. with an additional 350,000 s.f. of hotel use would reduce Baylands employment from 19,480 to 16,365 jobs, which would also be consistent with the Brisbane General Plan. Thus, population and employment growth associated with the Reduced Commercial Development Alternative would be considered to be planned growth, not substantial unplanned growth and impacts would be similar to the Specific Plan (less than significant).

Displacement of Existing Housing or Businesses

The Reduced Commercial Development Alternative would maintain the Specific Plan's development footprint within the western portion of the site and would thus displace the same 231,400 s.f. of existing industrial businesses along Industrial Way.

Commercial development east of the Caltrain right-of-way would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors. As would be the case for the Specific Plan, existing uses within this area would be retained, with the exception of the Golden State Lumber laydown yard along the west side of Tunnel Avenue and interim and temporary uses east of Tunnel Avenue. Displacement of the laydown yard would result in the same less than significant physical environmental impact and the same economic impact as the Specific Plan.

Housing for all Economic Segments of the Community

The zoning to implement this alternative would provide for the same number of dwelling units as the Specific Plan (2,200) and would be capable of meeting the City's quantified housing objectives for all segments of the community for the 2023-2031 housing element cycle.

Urban Decay

Reduced Commercial Development would provide the same number of dwelling units as the Specific Plan while reducing the amount of retail and office development. While this alternative would generate less demand for retail space than the Specific Plan due to reduced spending by on-site businesses and employees, sufficient off-site retail development is under construction and proposed such that physical urban decay impacts would remain less than significant.

Aesthetic and Visual Resources

Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon)

This alternative would reduce commercial office development west of Caltrain from 4.0 million s.f. proposed by the Specific Plan to 2.8 million s.f. and from 2.5 million s.f. to 1.7 million s.f. east of the Caltrain line that would be clustered along the Geneva Avenue and Sierra Point Parkway corridors. By reducing maximum building heights and implementing EIR mitigation measures, public views of San Francisco Bay would be retained. Thus, impacts on scenic resources resulting from Reduced Commercial Development would be similar to those of the Specific Plan with mitigation incorporated.

Impacts to Scenic Resources

Reduced Commercial Development would provide for the same preservation and improvements to existing scenic resources within the Baylands as the Specific Plan. Icehouse Hill and the edges of Brisbane Lagoon would be improved in the same manner as would the Specific Plan, including restoration of wetland and habitat areas. This alternative would also extend the San Francisco Bay Trail through the site. Reduced Commercial Development would have a similar less than significant impact as the Specific Plan.

Consistency with Visual Quality-Related Policies and Programs

By reducing maximum building heights and commercial office square footage, as well as by implementing EIR mitigation measures, the Reduced Commercial Development Alternative would retain views of the Bay and San Bruno Mountain, as well as provide view corridors through the site. Impacts would thus be reduced from the less than significant impact of the Specific Plan.

Nighttime Lighting

Reduced Commercial Development would generate nighttime lighting over the same footprint and be subject to the same mitigation requirements as the Specific Plan. This alternative would therefore result in similar less than significant impacts as the Specific Plan.

Glare

Reduced Commercial Development would generate a reduced amount of façade area, while retaining a similar amount of above-ground infrastructure as the Specific Plan.

This alternative would be required to comply with the same mitigation and performance standards as the Specific Plan. Due to a reduced amount of façade area, impacts would be reduced compared to the Specific Plan.

Biological Resources

Candidate, Sensitive, and Special-Status Plants, Animals, and Habitats

Reduced Commercial Development would have a similar development footprint within the western portion of the Baylands and require similar movement of soil from the eastern to the western portion of the Baylands to achieve final grades as the Specific Plan. Thus, similar impacts to existing species and habitats would occur. This alternative would provide the same habitat restoration and enhancement as the Specific Plan and would be subject to the same mitigation measures. A similar less than significant with mitigation incorporated impact as the Specific Plan would result.

Wetlands and Non-Wetland Waters Acreage, Functions, and Values

Reduced Commercial Development would have a similar development footprint within the western portion of the Baylands and require similar movement of soil from the eastern to the western portion as the Specific Plan, which would cause the same loss of wetlands and non-wetland waters during site grading and construction as the Specific Plan.

Site grading pursuant to a City grading permit to achieve final grades within the western portion of the site would cause the same loss of wetland and non-wetland waters within Visitacion Creek as the Specific Plan along with the same restoration. In addition, construction of Lagoon Park and realignment of Lagoon Road would result in the same loss of existing wetlands and non-wetland waters along the north shore of the lagoon along with the same restoration. This alternative would be subject to the same mitigation requirements as the Specific Plan and would therefore result in the same less than significant with mitigation incorporated impacts.

Movement of Fish and Wildlife Species

Trails, recreational improvements, and habitat restoration and enhancement on Icehouse Hill would be the same as the Specific Plan. Because a reduced amount of building glass area would result than the Specific Plan, bird strike impacts would be reduced but still require implementation of the same mitigation measures. Thus, impacts would be reduced from the Specific Plan.

Consistency with Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Reduced Commercial Development would be required to comply with the requirements of Brisbane Municipal Code Chapter 12.12 in relation to tree replacement. As a result, impacts would be the same as those of the Specific Plan.

Consistency with the San Bruno Mountain Habitat Conservation Plan

Because this alternative would provide the same habitat improvements on Icehouse Hill and be subject to the same mitigation requirements as the Specific Plan, impacts would be the same.

Cultural and Tribal Cultural Resources

Roundhouse and Machinery & Equipment Buildings

Because the development footprint and areas subject to site grading and other ground-disturbing activities would be unchanged from the Specific Plan within the western portion of the site, the Roundhouse would be restored for adaptive reuse as is proposed in the Specific Plan and subject to the same EIR mitigation measures. In addition, development surrounding the Roundhouse and Machinery & Equipment building would be consistent with their historic character. Thus, impacts would be the same as for the Specific Plan.

Archaeological Resources

Because site grading and other ground-disturbing activities would remain the same and development would be subject to the same mitigation measures, impacts would be the same as those of the Specific Plan.

Tribal Cultural Resources

Because no tribal cultural resources have been identified within the Baylands, no impacts would result.

Disturbance of Known or Unknown Human Remains

Because site grading and other ground-disturbing activities would remain the same and development would be subject to the same mitigation measures, impacts would be the same as those of the Specific Plan.

Transportation

Vehicle Miles Traveled

Reduced Commercial Development would retain a similar number of Baylands residents but a reduced number of employees within walking distance of the Caltrain Bayshore station as the Specific Plan. This alternative would provide a similar comprehensive system of bicycle and pedestrian facilities, including completion of the Bay Trail through the eastern portion of the Baylands and providing bicycle and pedestrian connections to the Bay Trail, Visitacion Creek, and Lagoon Park. Because commercial development east of Caltrain would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors further from the Bayshore Caltrain station, there would be decreased use of transit, bicycle, and pedestrian modes of transportation with a slight (though still less than significant) increase in per capita employee VMT compared to the Specific Plan.

Transit, Bicycle, and Pedestrian Travel Modes

Reduced Commercial Development would provide a similar comprehensive system of bicycle and pedestrian facilities, including completion of the Bay Trail through the eastern portion of the Baylands and providing bicycle and pedestrian connections to the Bay Trail, Visitacion Creek, and Lagoon Park. Because commercial development east of Caltrain would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors further from the Bayshore Caltrain station, there would be decreased use of transit, bicycle, and pedestrian modes of transportation compared to the Specific Plan. Because use of trails and transit by Baylands residents would remain unchanged and the decreased use of trails and transit by Baylands employees would be limited to the eastern portion of the site, impacts would remain less than significant.

Hazards to Vehicles, Bicyclists, and Pedestrians

All roadways as well as bicycle and pedestrian facilities and trails within the Baylands would be constructed to City standards. Thus, impacts would be similar to those of the Specific Plan with mitigation incorporated.

Emergency Access

All site-specific developments within the Baylands would be provided with more than one point of access facilitating emergency response, similar to the Specific Plan. Because the extension of Geneva Avenue over the Caltrain right-of-way to the US 101 freeway and extension of Sierra Point Parkway would be the same as for the Specific Plan, emergency response from the proposed new fire station within the northeastern portion of the site would be similar to the Specific Plan. In addition, because all roadways would be constructed to City standards and this alternative would provide emergency access during flooding events consistent with EIR mitigation requirements, impacts would be similar to the Specific Plan.

Air Quality

Consistency with the 2017 Regional Clean Air Plan

Reduced Commercial Development would retain the same amount and intensity of residential development in proximity to transit within the western portion of the site. Commercial development within the eastern portion of the site would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors and would be dependent on Baylands shuttle service for connection to the Bayshore Caltrain station. In addition, this alternative would include the same sustainability features and be subject to the same air-quality-related mitigation measures as the Specific Plan. While there would be a slight per capita increase in employee use of vehicular travel to and from work, development of this alternative would be consistent with MTC's transit-oriented development policy and would also be consistent with the 2017 Clean Air Plan.

Increased Emissions of Non-Attainment Criteria Air Pollutants

Because the amount of grading required for Baylands development is dictated by the need to raise the western portion of the Baylands using soil from the eastern portion of the site, grading for this alternative would be similar to that required for the Specific Plan. Reduced Commercial Development would retain the same amount and intensity of residential development in proximity to transit, while commercial development within the eastern portion of the site would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors and would be dependent on Baylands shuttle service for connection to the Bayshore Caltrain station. Thus, the significant unavoidable construction impact associated with site grading for Reduced Commercial Development would be similar to the Specific Plan. Because the ratio of on-site employment to housing would be reduced in this alternative compared to the Specific Plan, per capita employee vehicular travel would increase, resulting in a more severe significant and unavoidable operations impact than the Specific Plan.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Because site grading would be similar for Reduced Commercial Development as for the Specific Plan, exposure of off-site receptors to pollutant concentrations resulting from grading activities would be similar to the Specific Plan. Development would be subject to the same mitigation measures and result in a similar less than significant impact with mitigation incorporated as the Specific Plan.

Odors

The potential for odor generation during site grading would be the same as that of the Specific Plan. The Baylands water recycling facility would be subject to the same mitigation measures to reduce odor emissions and would therefore have a similar impact as Specific Plan development.

Greenhouse Gas Emissions

Specific Plan Area Greenhouse Gas (GHG) Emissions

Because the amount of grading required for Baylands development is dictated by the need to raise the western portion of the Baylands using soil from the eastern portion of the site, grading for this alternative would be similar to that required for the Specific Plan. Reduced Commercial Development would retain the same amount and intensity of residential development in proximity to transit, while commercial development within the eastern portion of the site would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors and would be dependent on Baylands shuttle service for connection to the Bayshore Caltrain station. Because the ratio of on-site employment to housing would be reduced in this alternative compared to the Specific Plan, per capita employee vehicular travel would increase, resulting in a more severe significant and unavoidable impact than the Specific Plan.

Effect on Regional GHG Emissions

Because Reduced Commercial Development would reduce the ratio of on-site employment to housing compared to the Specific Plan, per capita employee vehicular travel would increase, resulting in smaller reductions in regional VMT and mobile source GHG emissions as the Specific Plan.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

This alternative would implement the same GHG reduction features and mitigation measures as the Specific Plan and would therefore be consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Energy Resources

Wasteful, Inefficient, or Unnecessary Use of Energy

By reducing the amount of commercial development in relation to on-site housing and concentrating commercial uses east of Caltrain along the Geneva Avenue and Sierra Point Parkway corridors, Reduced Commercial Development would:

- Reduce total energy consumption;
- Expand the 55-acre solar field, producing a greater portion of the Baylands' energy demand within the Specific Plan area; and
- Slightly increase higher per capita energy consumption for Baylands employees commuting to and from work.

This alternative would provide a comprehensive system of bicycle and pedestrian facilities as well as a shuttle system throughout the site and would meet Tier 2 CALGreen Standards. Thus, impacts would be similar to the less than significant impacts of the Specific Plan.

Consistency with Applicable Energy Reduction Programs, Plans, Ordinances, and Policies

Reduced Commercial development would include all energy conservation measures as the Specific Plan. Compared to the Specific Plan, this alternative would expand the 55-acre solar field and generate more on-site renewable energy while storing a similar amount and consuming less renewable energy on-site. Reduced Commercial Development would consume more transportation-related energy than the Specific Plan on a per capita basis due to concentrating commercial uses east of Caltrain along the Geneva Avenue and Sierra Point Parkway corridors. Overall, Reduced Commercial Development would be consistent with applicable energy reduction programs, plans, ordinances, and policies to a similar degree as the Specific Plan.

Noise and Vibration

Temporary Increase in Ambient Noise

The extent of site grading required for Reduced Commercial Development would be similar to that of the Specific Plan. Reducing the overall amount of commercial development while concentrating commercial uses east of Caltrain along the Geneva Avenue and Sierra Point Parkway corridors would likely yield fewer buildings requiring pile foundations and pile driving. Reduced Commercial Development would reduce but not avoid the significant unavoidable impacts of the 2025 Specific Plan project.

Traffic Noise Increase

Reduced Commercial Development would reduce the number of on-site employees; however, as discussed above, per capita employee transit use would be less for this alternative than for the Specific Plan. Because the overall number of Baylands development-related trips would not change dramatically compared to the Specific Plan, traffic noise impacts would be similar to those of the Specific Plan (significant and unavoidable).

Permanent Increase in Ambient Noise zzz

Reduced Commercial Development would generate noise from the same stationary sources as the Specific Plan. Due to the logarithmic scale used to measure noise, reducing commercial development would not likely be sufficient to substantially reduce permanent increases in ambient noise compared to the Specific Plan. All development within the Baylands would be subject to the same performance standards and mitigation measures and would be required to comply with the City noise ordinance. Impacts would be similar to the Specific Plan (significant and unavoidable).

Exacerbate Land Use/Noise Incompatibilities by Placing People in High Noise Areas

This alternative would place a similar type and amount of development along the west side of the Caltrain rail line and would thus experience similar land use/noise incompatibilities. Office development within the Campus East District would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors away from the Caltrain rail line. As a result, impacts would be less than those of the Specific Plan.

Vibration

The extent of site grading required for Reduced Commercial Development would be similar to that of the Specific Plan. Reducing the amount of commercial development overall while concentrating commercial uses east of Caltrain along the Geneva Avenue and Sierra Point Parkway corridors would likely yield fewer buildings requiring pile foundations and pile driving, reducing but not avoiding the project's significant unavoidable impact.

Exacerbation of Human Annoyance or Hazards by Placing Buildings in High Groundborne Vibration Areas

This alternative would place a similar type and amount of development along the west side of the Caltrain rail line and would thus experience similar human annoyance from railroad-generated vibration. Office development within the Campus East District would be concentrated along the Geneva Avenue and Sierra Point Parkway corridors away from the Caltrain rail line. As a result, impacts would be less than those of the Specific Plan.

Hazards and Hazardous Materials

Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Demolition of older buildings potentially containing asbestos or lead-based paints would be the same for Reduced Commercial Development as for the Specific Plan. In addition, because the commercial development would be reduced, the potential for a release of hazardous materials due to the transport, use, disposal, or management of hazardous materials, whether resulting from routine activities or an accident, would be less than the Specific Plan. Development of this alternative would be subject to the same extensive set of regulations designed to protect the public and environment from such a release of hazardous materials. Thus, impacts would be reduced from the less than significant impacts of the Specific Plan.

Create a Health Hazard for an Existing or Planned School Site Due to Release of Hazardous Materials or Proximity of Hazardous Conditions

The location of a school site within the Baylands in relation to locations of hazardous materials sites and emitters would be no different than for the Specific Plan. Thus, the impacts of this alternative would be the same as for the Specific Plan.

Development on a Property that is Included on a List of Hazardous Materials Sites

The majority of the Baylands site, including the former Brisbane Landfill, OU-SM, and OU-2, is included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Within the western portion of the Baylands, development would occur within operating units OU-SM and OU-2 following site remediation pursuant to the regulatory authority of the San Francisco Bay RWQCB and DTSC.

Reduced Commercial Development would occur within the same footprint within OU-SM and OU-2, and a smaller portion of the former Brisbane Landfill footprint, all of which are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Development of this alternative would be subject to the same requirements and EIR mitigation measures as the Specific Plan and would thus have a similar less than significant impact as the Specific Plan.

Create an Airport Safety Hazard or Expose People to Excessive Noise of Aircraft Operations

Since none of the Specific Plan area is subject to safety hazards or excessive noise from aircraft operations, this alternative would have the same impacts as the Specific Plan.

Emergency Preparedness and Response

While the amount of commercial development would be reduced, the same amount of housing would be developed as for the Specific Plan. This development proposed for the Specific Plan

would occur in the same locations within the western portion of the site and be concentrated along the Geneva Avenue and Sierra Point Parkway corridors east of the Caltrain right-of-way. Reduced Commercial Development would provide the same regional roadway connections and meet the same access requirements for police and fire service response as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Hydrology and Water Quality

Protection of Water Quality

The amount of grading and construction required for Reduced Commercial Development would be similar to the Specific Plan, including the high potential for erosion and siltation and release of pollutants during grading and construction. Because this alternative would encompass a smaller development footprint and fewer streets east of Caltrain, the potential for release of urban pollutants to the Brisbane Lagoon and to San Francisco Bay via Visitacion Creek would be less than the Specific Plan. This alternative would implement Best Management Practices outlined in required NPDES permits, SWPPPs and the requirements of NPDES Provision C.3 in combination with the same mitigation measures as the Specific Plan. Impacts would therefore be similar to those of the Specific Plan.

Groundwater Recharge and Sustainable Management

Reduced Commercial Development would result in a similar amount of impervious surface area as the Specific Plan due to the requirement for construction of an impermeable cap on the landfill. Because the local groundwater basin is not used as a potable or non-potable water supply and is hydraulically connected to the Bay and Lagoon, this alternative would not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence for the same reasons as the Specific Plan. In addition, as demonstrated in the Water Supply Assessment prepared by Cal Water, Baylands development would have no effect on groundwater pumping within South San Francisco. Thus, impacts would be similar to those of the Specific Plan.

Flood Hazards

Reduced Commercial Development would result in a similar impermeable surface area and generate a similar increase in stormwater runoff as the Specific Plan due to the requirement for construction of an impermeable cap on the landfill. This alternative would comply with the same flood protection standards and mitigation measures as the Specific Plan. Impacts would be similar to the Specific Plan.

Release of Pollutants Due to Flood, Emergent Groundwater, Tsunami, or Seiche

The Specific Plan area is not located within a tsunami hazard zone and on-site water storage tank facilities would be designed and constructed to withstand anticipated oscillations in water surface caused by an earthquake. Further, the risk of release of pollutants attributable to inundation would be negligible since potential pollutants would not be present at the ground surface and no facilities storing hazardous materials would be located downstream of Baylands water storage facilities. In addition, this alternative would be subject to the same less than significant potential for emergent groundwater as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Geology, Soils, and Seismicity

Fault Rupture

Because there are no known active or potentially active fault traces across the Baylands, and the site is not located within an Alquist-Priolo Earthquake Fault Zone, no impact would occur.

Seismic Ground Shaking

All buildings within the site would be required to conform to the same CBC seismic design parameters and mitigation measures as the Specific Plan, which would provide an appropriate level of safety and reduce hazards from strong seismic ground shaking. Development of this alternative would be subject to a lesser risk of damage related to seismic ground shaking than the Specific Plan due to reduced commercial development, resulting in reduced impacts.

Liquefaction and Seismic-Related Ground Failure

Because of the presence of high groundwater and loose, unconsolidated soils underlying both the western and eastern portions of the Specific Plan area, this alternative would be subject to similar liquefaction hazards as the Specific Plan. Reduced Commercial Development would be required to conform to the same site-specific foundation design parameters and EIR mitigation measures as the Specific Plan. Thus, impacts would be slightly less than the Specific Plan due to fewer commercial buildings.

Slope Stability

Site grading would be similar to the Specific Plan. Site-specific development projects would be required to comply with the same California Building Code requirements for slope stability as the Specific Plan. Impacts would therefore be similar to the less than significant impacts of the Specific Plan.

Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard, and during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. Site-specific development projects for this alternative would be designed and constructed to comply with the requirements of final site-specific design-level geotechnical reports, which would ensure appropriate design and construction to mitigate soil corrosivity and expansive soils hazards for each building and infrastructure project. Compliance with the CBC and EIR mitigation measures would result in reduced hazards from soil corrosivity and expansive soils compared to the less than significant impacts of the Specific Plan due to reduced building area.

Paleontological Resources

The only deep excavations that could disturb significant paleontological resources within the Colma Formation or Merced Formation would be pile foundation installation. Because installation of pile foundations would render any potentially valuable specimens irretrievable, such installation is not typically considered to cause significant impacts. This alternative would also have the same unlikely potential that excavations for other construction activities would be deep enough to encounter paleontological resources as the Specific Plan. Because this alternative would have the same potential for such excavations and would be subject to the same mitigation measures, impacts would be the similar to the Specific Plan.

Use of Septic Tanks or Alternative Wastewater Disposal Systems

All Baylands development would be connected to a municipal wastewater system and neither septic tanks nor alternative wastewater disposal systems would be used.

Utilities, Service Systems, and Water Supply

Water Supply

Reduced Commercial Development would consume less water than the Specific Plan. Because it would generate less wastewater, this alternative would also generate less recycled water than the Specific Plan, unless sewage generated by the City and Bayshore Sanitary District were to be recycled on-site. As a result, water supply impacts of this alternative would be similar to the Specific Plan.

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and result in the same less than significant impacts.

Consistency with Solid Waste Management Policies

Because this alternative would generate solid waste on a similar per unit basis and achieve the same waste diversion rate as the Specific Plan, impacts would be similar to the Specific Plan.

Landfill Capacity

Because of less commercial square footage, Reduced Commercial Development would generate less total solid waste, but be subject to the same diversion programs and achieve the same waste diversion rate as the Specific Plan. Reduced Commercial Development would therefore reduce the Specific Plan's less than significant impact on landfill capacity.

Public Services and Facilities

Adverse Physical Environment Effects Associated with Construction or Improvements of Fire Protection, Police, School, and Other Public Facilities

Demolition, grading, and construction of fire protection, police, school, and other facilities to serve Baylands development would be similar to the Specific Plan. Reduced commercial development would reduce demand for police, fire protection, and schools, reducing the Specific Plan's less than significant impact. This alternative would also reduce demands and be subject to the same mitigation measures as the Specific Plan in relation to libraries and the City's corporation yard thereby reducing the Specific Plan's less than significant with mitigation incorporated impact.

Recreation Resources

Physical Deterioration of a Park or Recreational Facility

Reduced Commercial Development would generate the same population increase and nearly the same amount of parkland as the Specific Plan. Thus, parkland provided by this alternative would exceed the 5.03 acres per 1,000 population of parkland currently available to Brisbane residents and therefore not cause any physical deterioration of existing parks and recreational facilities within the City. Because population growth would be the same as for the Specific Plan, this alternative would have the same impact on existing community facilities and be subject to the same mitigation requirements, resulting in a similar less than significant impact as the Specific Plan.

Physical Deterioration of Candlestick Point Windsurfing Resources

Reduced Commercial Development would not increase the height of buildings close to the eastern boundary of the site. As a result, impacts would be similar to the Specific Plan.

Wildland Fire

Exacerbate Fire Hazards

Reduced Commercial Development would result in similar construction activities within and adjacent to combustible vegetation and would reduce population/employment growth compared to the Specific Plan. Wildland fire hazard impacts would be less than the Specific Plan.

Evaluation of Alternative 4, Reduced Commercial Development, in Relation to Project Objectives

Reduced Commercial Development would implement the Brisbane General Plan, including GP-1-18 and Measure JJ. In addition, this alternative would achieve each of the project's overarching and other objectives (see **Table 8-10**). Reduced Commercial Development provides for productive reuse of the Baylands along with restoration and enhancement of on-site resources. Housing opportunities for all economic segments of the community would be provided to meet the City's RHNA and adopted Housing Element obligations (see **Table 4.4-1**), along with providing economic development opportunities and fiscal benefits for the community.

Table 8-10: Evaluation of Alternative 4, Reduced Commercial Development in Relation to Project Objectives

Project Objectives	Extent to Which Alternative 3, Reduced Commercial Development, Would Achieve Project Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	Reduced Commercial Development would require site remediation and Title 27 landfill closure prior to development. This alternative would eliminate ongoing ecological damage, provide for productive reuse of the Baylands, and ensure the safety of all who will use the site.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers as well as for the larger Brisbane community.	This alternative would restore and enhance habitats within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill. This alternative would also restore and provide for adaptive reuse of the historic Roundhouse. By reducing the amount of commercial development compared to the Specific Plan, this alternative would maintain a lower vertical profile of commercial development than the Specific Plan, although the vertical profile of residential development would be unchanged. This alternative would protect development from adverse effects of climate change and sea level rise through an adaptation strategy that would provide for restoration of wetlands and non-wetland waters within Visitacion Creek and along the north shore of the lagoon to adapt naturally to sea level rise and increasing tidal influence.

Project Objectives	Extent to Which Alternative 3, Reduced Commercial Development, Would Achieve Project Objectives
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	Reduced Commercial Development would provide a sufficient mix and intensity of residential building types to provide opportunities for the development of housing for all economic segments of the community in accordance with the City's Housing Element.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	Compared to the Specific Plan, commercial office development would be reduced by 30.8 percent while retaining the same amount of hotel development as the Specific Plan. This alternative would be revenue positive for the City although to a lesser degree than the Specific Plan.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	Reduced Commercial Development would include all of the sustainability features set forth in the Specific Plan and EIR mitigation measures.
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	While this alternative would produce a lower jobs-to-housing ratio than the Specific Plan, Reduced Commercial Development would generate a mix of on-site employment at a sufficient scale to achieve this objective, although not to the same extent as the Specific Plan.
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would improve access to the Bayshore Caltrain Station. This alternative would place employee-generating development east of Caltrain along Sierra Point Parkway to take advantage of Bay views, reducing ease of access for employees in the Campus East District to the Caltrain station compared to the Specific Plan.

Feasibility of Alternative 4, Reduced Commercial Development, and Overall Conclusion

Reduced Commercial Development would be consistent with the Brisbane General Plan. The resulting 2,200 dwelling units, 4.5 million s.f. of commercial, and 350,000 s.f. of hotel use would not introduce any additional building types or development densities to the Specific Plan area. As such, Alternative 3, Reduced Commercial Development, would be both reasonable and potentially feasible per the requirements of CEQA Guidelines Section 15126.6 (a).

Overall, Reduced Commercial Development would reduce but would not avoid significant unavoidable impacts resulting from the 2025 Specific Plan project.

b. Alternative 5: Reduced Density Development Around an Operating 45-Acre LMF

The purpose of this alternative is to reduce the significant impacts of Specific Plan by reducing the intensity of development around and outside of an operating 45-acre LMF within the Baylands should the California High-Speed Rail Authority construct and operate such a facility. The analyses below do not address impacts of constructing and operating the LMF facility itself.

Land Use and Planning Policies

Physical Division of an Existing Community

Reduced Density development around an operating 45-acre LMF would include the same construction projects affecting area roadways as the Specific Plan would be subject to the same requirements and mitigation measures, and would therefore result in the same construction impacts as the Specific Plan. Because this alternative would (1) increase renewable energy generation within the eastern portion of the Baylands, (2) reduce the intensity of residential and commercial development, and (3) maintain similar open space areas and roadway and non-motorized transportation system as the Specific Plan, Reduced Density Development around an operating 45-acre LMF would have similar less than significant impacts in relation to dividing an existing community as the proposed Specific Plan.

Consistency with Local and Regional Plans

Reduced Density Development around an operating 45-acre LMF would be consistent with the General Plan's development intensity standards for the Baylands. Development of 1,800 dwelling units is at the low end of the range for housing specified in the General Plan, and approximately 18 percent below that of the Baylands Specific Plan, which represents the General Plan's maximum permitted number of dwelling units. Development of 4.5 million s.f. of commercial/office space would be consistent with the General Plan and would be approximately 30.7 percent less than the 6.5 million s.f. proposed in the Baylands Specific Plan. The same additional 500,000 s.f. of hotel development as the Specific Plan would also be consistent with the General Plan's maximum permitted development. Consistency with General Plan policies as well as with other local and regional plans would be the same as for the Specific Plan.

Population and Housing

Induce Substantial Unplanned Growth

Reduced Density Development around an operating 45-acre LMF provides for the development of 1,800 dwelling units, which would result in approximately 4,015 residents within the Baylands compared to the 4,905 Baylands residents resulting from Specific Plan buildout. This reduced housing and population is consistent with the Brisbane General Plan, which provides for 1,800 to 2,200 dwelling units within the Baylands. Reducing commercial office space within the Baylands to 4.5 million s.f. with an additional 500,000 s.f. of hotel use would reduce Baylands employment from 19,480 to 16,365 jobs, which would also be consistent with the Brisbane General Plan. Thus, population and employment growth associated with this alternative would be considered to be *planned* growth, not substantial unplanned growth and impacts would be the same as the Specific Plan (less than significant).

Displacement of Existing Housing or Businesses

Because Reduced Density Development around an operating 45-acre LMF involves development of the same footprint within the western portion of the Baylands as the Specific Plan, the same 231,400 s.f. of existing industrial businesses along Industrial Way would be displaced, resulting in the same less than significant impact.

Housing for All Economic Segments of the Community

Reduced Density Development around an operating 45-acre LMF proposes 1,800 dwelling units, consistent with the Baylands residential development assumption set forth in the City's adopted Housing Element. This alternative would, therefore, meet City objectives to provide opportunities for the development of housing for all segments of the community within the 2023-2031 Housing Element. By reducing Baylands housing by 400 units compared to the Specific Plan, this alternative would reduce opportunities for the development of housing for subsequent Housing Element updates, which are required on an 8-year basis.[409]

Urban Decay

Because housing would provide less residential, retail, and office development than the Specific Plan, it would generate less demand for retail uses and reduce the less than significant physical urban decay impacts of the Specific Plan.

Aesthetic and Visual Resources

Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon)

Within the area east of the Caltrain right-of-way, Reduced Density Development around an operating 45-acre LMF would place approximately 1.0 million s.f. of office development along the south side of Geneva Avenue and west side of Sierra Point Parkway. This development would be subject to EIR mitigation measures that reduce the maximum height of buildings along the west side of the Caltrain rail line and MM AES-1a, which limit the height of buildings within 350 feet of US Highway 101. Compliance with these measures would reduce the impacts of this alternative to less than those of the Specific Plan (less than significant with mitigation incorporated).

Impacts to Scenic Resources

Reduced Density Development around an operating 45-acre LMF would provide the same preservation and improvements of existing scenic resources within the Baylands as the Specific

[409] The City of Brisbane would next be required to approve an updated Housing Element in 2031 for the 2031–2039 period.

Plan. The Visitacion Creek corridor, Icehouse Hill, and the north shore of Brisbane Lagoon would each be improved in the same manner as the Specific Plan, including restoration of wetland and habitat areas, thereby retaining their natural character. This alternative would also extend the San Francisco Bay Trail through Baylands, preserve 100-foot shoreline band areas around the Visitacion Creek corridor and Brisbane Lagoon and provide public access to the Bay. Thus, impacts would be the same as for the Specific Plan (less than significant).

Consistency with Visual Quality-Related Policies and Programs

Reduced Density Development around an operating 45-acre LMF would shift the water recycling facility to the east side of the realigned Tunnel Avenue and require construction of the same retaining wall as for Alternative 1. Reduced Density Development around an operating 45-acre LMF would also be required to be consistent with the same visual-quality-related policies and programs as Specific Plan development, including the findings that are required to be made by the Planning Commission for approval of a design permit. Impacts would thus be similar to the Specific Plan.

Nighttime Lighting

Reduced Density Development around an operating 45-acre LMF would generate nighttime lighting over a smaller, though still broad area that is currently largely dark at night compared to the Specific Plan. This alternative would reduce total building area and reduce some sources of outdoor lighting (e.g., street lighting, surface parking lots). Nighttime lighting of outdoor open space and park areas would remain the same as for the Specific Plan.

This alternative would be required to comply with the same performance standards and EIR mitigation measures as the Specific Plan. Because it would generate nighttime lighting over a slightly smaller area than the Specific Plan while also complying with the same mitigation measures and achieving the same performance standards, this alternative would slightly reduce the less than significant impacts of the Specific Plan.

Glare

While development of 1,800 dwelling units, 4.5 million s.f. of commercial office and 500,000 s.f. of hotel use would reduce the amount of glare-producing reflective building materials on building roofs and façades compared to the Specific Plan, it would nevertheless substantially increase daytime glare, particularly in the early morning and late afternoon hours.

Glare resulting from this alternative could produce nuisance effects within residential areas, classrooms, parks, trails, and playgrounds, as well as adversely affect motorists along US Highway 101, Geneva Avenue, and Bayshore Boulevard by impairing vision, although to a lesser degree than the Specific Plan due to reduced development density. While this alternative would have less glare-producing surface area than the Specific Plan, it would nevertheless

result in a significant glare impact and be required to implement the same mitigation measures. Reduced Density Development around an operating 45-acre LMF would reduce the less than significant with mitigation incorporated impact of the Specific Plan.

Biological Resources

Candidate, Sensitive, and Special-Status Plants, Animals, and Habitats

Reduced Density Development around an operating 45-acre LMF would have the same development footprint within the western portion of the Baylands and require similar movement of soil from the eastern to the western portion of the Baylands to achieve final grades. Thus, similar impacts to existing species and habitats would occur. Because this alternative would provide similar habitat restoration and enhancement improvements as the Specific Plan along Visitacion Creek outside of the 45-acre LMF, along the north shore of the lagoon, and on Icehouse Hill, a similar less than significant with mitigation incorporated impact as the Specific Plan would result.

Wetlands and Non-Wetland Waters Acreage, Functions, and Values

Reduced Density Development around an operating 45-acre LMF would have the same development footprint within the western portion of the Baylands and require similar movement of soil from the eastern to the western portion of the Baylands to achieve final grades. Because this alternative would have similar impacts to wetlands and non-wetland waters and provide similar habitat restoration and enhancement improvements along Visitacion Creek outside of the 45-acre LMF as well as along the north shore of the lagoon, a similar less than significant with mitigation incorporated impact as the Specific Plan would result.

Movement of Fish and Wildlife Species

Trails and recreational improvements on Icehouse Hill would remain unchanged from the Specific Plan. Because a reduced amount of building glass area would result than the Specific Plan, bird strike impacts would be reduced but still require implementation of the same mitigation measures. Thus, impacts and required mitigation would be reduced for this alternative compared to the Specific Plan.

Consistency with Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Reduced Density Development around an operating 45-acre LMF would be required to comply with the requirements of Brisbane Municipal Code Chapter 12.12. As a result, impacts would be unchanged from those of the Specific Plan.

Consistency with the San Bruno Mountain Habitat Conservation Plan

Because this alternative would provide the same improvements within Icehouse Hill as would the Specific Plan, impacts would be unchanged.

Cultural Resources and Tribal Cultural Resources

Roundhouse and Machinery & Equipment Buildings

Because the development footprint and site grading requirements for the western portion of the site would be unchanged, Reduced Density Development around an operating 45-acre LMF would restore the Roundhouse for adaptive reuse in the same manner as the Specific Plan and be subject to the same mitigation requirements. Development surrounding the Roundhouse and Machinery & Equipment building would be compatible with the historic character of these buildings. Thus, impacts would be similar to the Specific Plan.

Archaeological Resources

Because site grading would not be changed, impacts and resulting mitigation measures would be the same as for the Specific Plan.

Tribal Cultural Resources

Because no tribal cultural resources have been identified within the Baylands, no impacts would result.

Disturbance of Known or Unknown Human Remains

This alternative would cause ground disturbance within the same areas as would Specific Plan development. Should development within the western portion of the Baylands result in fewer buildings to be constructed due to its lower density, less excavation would be required than for the Specific Plan while implementing the same mitigation requirements. Thus, this alternative would reduce the less than significant with mitigation incorporated impact of the Specific Plan.

Transportation

Vehicle Miles Traveled

Reduced Density Development around an operating 45-acre LMF would result in a slight increase in per capita employee VMT by concentrating development within the eastern portion of the Baylands along the Geneva Avenue and Sierra Point Parkway corridors further from transit, even if shuttle services similar to the Specific Plan were to be provided. While the reduced development intensity of this alternative would not likely support the same level of shuttle service as would be provided for Specific Plan development, the availability of transit

service within the western portion of the Baylands combined with the mixed-use character of the alternative and requirements for a transportation demand management plan, VMT generated by Baylands uses would remain less than significant. In addition, this alternative would result in a lesser reduction in regional miles traveled than the Specific Plan but still result in a less than significant impact.

Transit, Bicycle, and Pedestrian Travel Modes

Reduced Density Development around an operating 45-acre LMF would provide a comprehensive system of bicycle and pedestrian facilities within the site and complete the Bay Trail through the eastern portion of the Baylands. Impacts would be similar to those of the Specific Plan.

Hazards to Vehicles, Bicyclists, and Pedestrians

All roadways within the Baylands would be constructed to City standards. Impacts would therefore be similar to the Specific Plan as it is proposed to be mitigated.

Emergency Access

The Specific Plan area, each development district, and each block within the Baylands would be provided with more than one point of access facilitating emergency response. Because the extension of Geneva Avenue over the Caltrain right-of-way to the US 101 freeway and extension of Sierra Point Parkway would be the same as for the Specific Plan, emergency response from the proposed new fire station within the northeastern portion of the site would be similar to the Specific Plan. In addition, because all roadways would be constructed to City standards and this alternative would provide emergency access during flooding events consistent with EIR mitigation requirements, impacts would be similar to the Specific Plan.

Air Quality

Consistency with the 2017 Regional Clean Air Plan

Site grading for Reduced Density Development around an operating 45-acre LMF would be similar to the Specific Plan, would be subject to the same mitigation measures, and therefore would result in similar impacts. This alternative would also have slightly higher per employee VMT but would generate more renewable energy than the Specific Plan. As a result, this alternative would result in similar impacts in relation to consistency with the 2017 Clean Air Plan as the Specific Plan.

Increased Emissions of Non-Attainment Criteria Air Pollutants

Reduced Density Development around an operating 45-acre LMF would require a similar amount of grading as the Specific Plan. This alternative would be subject to the same mitigation measures as the Specific Plan and result in a similar significant unavoidable construction impact.

Reduced Density Development around an operating 45-acre LMF would reduce ease of access to transit east of Caltrain by concentrating office development along the Geneva Avenue and Sierra Point Parkway corridors further from the Caltrain Bayshore station than the Specific Plan. A slight increase in per capita emissions would result. Even though total mobile and area source operational emissions would be reduced compared to the Specific Plan, emissions for this alternative would exceed thresholds and remain significant and unavoidable.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Because Reduced Density Development around an operating 45-acre LMF would require a similar amount of grading, exposure of off-site receptors to pollutant concentrations during site grading activities would be similar to the Specific Plan. This alternative would be subject to the same mitigation measures as the Specific Plan, and result in a similar less than significant with mitigation incorporated impact.

Odors

The potential for odor generation during site grading would be the same as that of the Specific Plan. Reduced Density Development around an operating 45-acre LMF would also move employment-generating uses along Geneva Avenue closer to the on-site water recycling facility than would occur for Specific Plan development. Because the water recycling facility in this alternative would be subject to the same mitigation requirements as the Specific Plan, a similar less than significant with mitigation incorporated impact would occur.

Greenhouse Gas Emissions

Specific Plan Area Greenhouse Gas (GHG) Emissions

Reduced Density Development around an operating 45-acre LMF would generate slightly higher VMT per employee than the Specific Plan by locating development east of Caltrain further from the Bayshore Caltrain station. Reducing Baylands development by 400 dwelling units and 2.5 million s.f. of commercial office use would result in a smaller amount of Baylands-generated GHG emissions than the Specific Plan, thereby reducing the severity of, but not eliminating, its significant unavoidable impact. However, should development of these 400 dwelling units and 2.5 million s.f. of commercial office use occur outside of the Baylands in

other, less transit-oriented locations within the Bay Area, resulting regional GHG emissions could be greater for this alternative than for Specific Plan development.

Effect on Regional GHG Emissions

Because Reduced Density Development around an operating 45-acre LMF development would generate slightly higher VMT per employee than the Specific Plan, per capita employee vehicular travel would increase, resulting in smaller reductions in regional VMT and mobile source GHG emissions as the Specific Plan.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

Reduced Density Development around an operating 45-acre LMF would include the same GHG reduction features and mitigation measures as the Specific Plan and would therefore be equally consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Energy Resources

Wasteful, Inefficient, or Unnecessary Use of Energy

By reducing the total number of dwelling units and commercial square footage within the Baylands and expanding the Specific Plan's 55-acre solar field, this alternative would generate more renewable energy while reducing Specific Plan area consumption. On-site buildings would meet Tier 2 CALGreen Standards. As a result, Reduced Density Development around an operating 45-acre LMF would reduce the Specific Plan's less than significant impact.

Consistency with Applicable Energy Reduction Programs, Plans, Ordinances, and Policies

In addition to implementing all of the energy efficiency features of the Specific Plan, this alternative would generate more renewable energy while reducing Specific Plan area consumption. Reduced Density Development around an operating 45-acre LMF would, therefore, be consistent with applicable energy reduction programs, plans, ordinances, and policies.

Noise and Vibration

Temporary Increase in Ambient Noise

The extent of site grading required for Reduced Density Development around an operating 45-acre LMF would be similar to the Specific Plan, generating similar construction noise. This alternative would likely result in fewer buildings requiring pile driving and move construction of some buildings east of Caltrain and further from sensitive receptors. Development in this

alternative would be subject to the same mitigation measures as the Specific Plan and would reduce but not avoid its significant impacts.

Traffic Noise Increase

Reduced Density Development around an operating 45-acre LMF would generate less traffic than the Specific Plan. As a result, the amount of traffic along area roadways would increase to a lesser degree and reduce the Specific Plan's impacts. Such impacts, although reduced, would remain significant and unavoidable.

Permanent Increase in Ambient Noise

Reduced Density Development around an operating 45-acre LMF would generate noise from the same stationary sources as the Specific Plan. Due to the logarithmic scale used to measure noise, the reduced development intensity of this alternative would not likely be sufficient to substantially reduce permanent increases in ambient noise compared to the Specific Plan. Reduced Density Development around an operating 45-acre LMF would be subject to the same performance standards and mitigation measures as the Specific Plan and would be required to meet the same comply with City noise ordinance requirements. Impacts would therefore be similar to the Specific Plan (significant and unavoidable).

Exacerbate Land Use / Noise Incompatibilities by Placing People in High Noise Areas

Because the tallest buildings within the western portion of the Baylands are those closest to the Caltrain rail line, the number of dwelling units and square footage of commercial office development adjacent to the Caltrain right-of-way would decrease while commercial office development proximity to the US 101 freeway would increase. Overall, there would be fewer sensitive receptors, particularly residents, within high noise areas in the alternative than in the Specific Plan. Thus, impacts for this alternative would be less than for the Specific Plan.

Groundborne Vibration

The extent of site grading required for Reduced Density Development around an operating 45-acre LMF would be similar to the Specific Plan, generating similar vibration impacts. This alternative would likely result in fewer buildings requiring pile driving and move construction of some buildings east of Caltrain and further from sensitive receptors. Development of this alternative would be subject to the same mitigation measures as the Specific Plan, resulting in reduced impacts.

Exacerbate Human Annoyance or Hazards by Placing Buildings in High Groundborne Vibration Areas

Because the tallest buildings within the western portion of the Baylands are those closest to the Caltrain rail line, the number of dwelling units and square footage of commercial office development adjacent to the Caltrain right-of-way would decrease while commercial office development proximity to the US 101 freeway would increase. Thus, impacts for this alternative would be similar to the Specific Plan.

Hazards and Hazardous Materials

Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Demolition of older buildings along Industrial Way that potentially contain asbestos or lead-based paints would be the same for this alternative as for the Specific Plan. In addition, the types of uses proposed for this alternative would be the same as the Specific Plan, albeit with a reduced development intensity. The potential for a release of hazardous materials due to the transport, use, disposal, or management of hazardous materials, whether resulting from routine activities or an accident, to adversely affect a substantial number of people would be reduced compared to the Specific Plan due to reduced development intensity. In addition, the Baylands development in this alternative would be subject to the same extensive set of regulations designed to protect the public and environment from such a release of hazardous materials. Thus, impacts would be less than those of the Specific Plan.

Create a Health Hazard for an Existing or Planned School Site Due to Release of Hazardous Materials or Proximity of Hazardous Conditions

The location of a school site within the Baylands in relation to locations of hazardous materials sites and emitters would be the same as for the Specific Plan. Thus, the impacts of this alternative would be the same.

Development on a Property That Is Included on a List of Hazardous Materials Sites

Various portions of the Baylands and adjacent areas, including the former Brisbane Landfill, OU-SM, and OU-2, are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Within the western portion of the Baylands, development would occur within the OU-SM and OU-2 following site remediation pursuant to the regulatory authority of the San Francisco Bay RWQCB and DTSC.

Reduced Density Development around an operating 45-acre LMF would reduce the amount of, but not eliminate, the campus office uses proposed by the Specific Plan within the footprint of the former Brisbane Landfill, which is included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Final closure pursuant to Title 27 requirements

would be required for the development of this alternative as it would be for the Specific Plan. Development throughout the Baylands would be subject to the same requirements as the Specific Plan and would reduce the less than significant impact of the Specific Plan.

Create an Airport Safety Hazard or Expose People to Excessive Noise of Aircraft Operations

Since none of the Specific Plan area is subject to safety hazards of excessive noise due to aircraft operations, Reduced Density Development around an operating 45-acre LMF would have similar impacts as the Specific Plan.

Emergency Preparedness and Response

Development would provide the same regional roadway connections and meet the same access requirements for police and fire service response as the Specific Plan. Thus, impacts would be the same as for the Specific Plan.

Hydrology and Water Quality

Protection of Water Quality

The extent of site grading required for Reduced Density Development around an operating 45-acre LMF would be similar to the Specific Plan, including a similar high potential for erosion and siltation and for release of pollutants during grading and construction. Because this alternative would concentrate development east of Caltrain along Geneva Avenue and Sierra Point Parkway, it would have a more compact roadway system with less potential for release of urban pollutants to the Brisbane Lagoon and to San Francisco Bay via Visitacion Creek than the Specific Plan. Because the potential for urban pollutants to enter the Bay would remain significant, this alternative would implement the same Best Management Practices outlined in required NPDES permits, SWPPPs and the requirements of NPDES Provision C.3 in combination with the same mitigation measures as the Specific Plan. Impacts would therefore be similar to those of the Specific Plan.

Groundwater Recharge and Sustainable Management

Reduced Density Development around an operating 45-acre LMF would reduce the site's impervious surface area compared to the Specific Plan, and would therefore not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence for the same reasons as the Specific Plan. In addition, as demonstrated in the Water Supply Assessment prepared by Cal Water, Baylands development would have no effect on groundwater pumping within South San Francisco.

Thus, impacts would be similar to those of the Specific Plan.

Flood Hazards

By concentrating development east of Caltrain along Geneva Avenue and Sierra Point Parkway, this alternative would not reduce impermeable surface area or generate a smaller increase in stormwater runoff than the Specific Plan due to requirements for construction of an impermeable cap within the landfill. Reduced Density Development around an operating 45-acre LMF would comply with the same flood protection standards and mitigation measures as the Specific Plan. Impacts would be similar to the Specific Plan.

Release of Pollutants Due to Flood, Emergent Groundwater, Tsunami, or Seiche

The Specific Plan area is not located within a tsunami hazard zone and the required on-site water storage tank facilities would be designed and constructed to withstand anticipated oscillations in water surface caused by an earthquake. Further, reduced density of this alternative would have a negligible effect in relation to the risk of release of pollutants attributable to inundation since potential pollutants would not be present at the ground surface and no facilities storing hazardous materials would be located downstream of Baylands water storage facilities. In addition, this alternative would be subject to the same less than significant potential for emergent groundwater as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Geology, Soils, and Seismicity

Fault Rupture

Because there are no known active or potentially active fault traces across the Baylands and the site is not located within an Alquist-Priolo Earthquake Fault Zone, no impact would occur.

Seismic Ground Shaking

This alternative would be subject to the same combination of CBC compliance as the Specific Plan, which would provide an appropriate level of safety and reduce hazards from strong seismic ground shaking. Seismic ground shaking would affect fewer people and less development would be at risk than the Specific Plan, resulting in reduced impacts.

Liquefaction and Seismic-Related Ground Failure

Because of the presence of high groundwater and loose, unconsolidated soils underlying the Specific Plan area, this alternative would be subject to the same liquefaction hazards as the Specific Plan. Reduced Density Development around an operating 45-acre LMF would be

required to conform to the same site-specific foundation design parameters and requirements as the Specific Plan. Thus, impacts would be similar to those of the Specific Plan.

Slope Stability

The amount of grading needed for Reduced Density Development around an operating 45-acre LMF would be similar to the Specific Plan and include the same embankments for the Geneva Avenue bridge over Caltrain as the Specific Plan. Site-specific development projects would be required to comply with the same development requirements, including compliance with the most recent California Building Code requirements for slope stability. The combination of compliance with Building Code requirements and EIR Mitigation Measures would result in a similar less than significant with mitigation incorporated impact as the Specific Plan.

Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard and during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. Site-specific development projects for this alternative would be designed and constructed to comply with the requirements of final site-specific design-level geotechnical reports, which would ensure appropriate design and construction to mitigate soil corrosivity and expansive soils hazards for each building and infrastructure project. Compliance with the CBC in combination with reducing the number of buildings within the eastern portion of the Baylands would reduce hazards from soil corrosivity and expansive soils compared to the less than significant impacts of the Specific Plan.

Paleontological Resources

The only deep excavations that would disturb significant paleontological resources within the Colma or Merced Formations would be pile foundation installation. Because installation of pile foundations would render any potentially valuable specimens irretrievable, such installation is not typically considered to cause significant impacts. This alternative would also have the same unlikely potential that excavations for other construction activities would be deep enough to encounter paleontological resources as the Specific Plan. Because this alternative would have the same potential for such excavations and would be subject to the same mitigation measures, impacts would be unchanged from the Specific Plan.

Use of Septic Tanks or Alternative Wastewater Disposal Systems

All Baylands development would be connected to a municipal wastewater system and neither septic tanks nor alternative wastewater disposal systems would be used.

Utilities, Service Systems, and Water Supply

Water Supply

Reduced Density development around an operating 45-acre LMF would consume less water than the Specific Plan. Because it would generate less wastewater, this alternative would also generate less recycled water than the Specific Plan, unless sewage generated by the City and Bayshore Sanitary District were to be recycled on-site. As a result, water supply impacts of this alternative would be similar to the Specific Plan.

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and result in the same less than significant impacts.

Consistency with Solid Waste Management Policies

Because this alternative would generate the same amount of solid waste on a per unit basis, be subject to the same mitigation measures, and achieve the same waste diversion rate as the Specific Plan, impacts would be the same as the Specific Plan.

Landfill Capacity

Reduced Density Development around an operating 45-acre LMF would generate the same amount of solid waste on a per unit basis, be subject to the same diversion programs, and achieve the same waste diversion rate as the Specific Plan. By reducing the amount of development, this alternative would reduce total solid waste generation and therefore also reduce the Specific Plan's less than significant impact on landfill capacity.

Public Services and Facilities

Adverse Physical Environment Effects Associated with Construction or Improvements of Fire Protection, Police, School, and Other Public Facilities

Demolition, grading, and construction of fire protection, police, school, and other facilities to serve Baylands development would reduce demand for police, fire protection, and schools, reducing the Specific Plan's less than significant impact. This alternative would also reduce demands and be subject to the same mitigation measures as the Specific Plan in relation to libraries and the City's corporation yard, thereby reducing the Specific Plan's less than significant with mitigation incorporated impact.

Recreation Resources

Physical Deterioration of a Park or Recreational Facility

Reduced Density Development around an operating 45-acre LMF would retain the same ratio of improved parkland to population as the Specific Plan. Thus, parkland provided by this alternative would exceed the 5.03 acres per 1,000 population of parkland currently available to Brisbane residents to same degree as the Specific Plan on a phased basis and not cause any physical deterioration of existing parks and recreational facilities within the City. Because population growth would be less than the Specific Plan, this alternative would have a significant although proportionately smaller impact on existing community facilities. Reduced Density Development around an operating 45-acre LMF would be subject to a proportionately smaller mitigation requirement, resulting in a similar impact with mitigation incorporated as the Specific Plan.

Physical Deterioration of Candlestick Point Windsurfing Resources

Although Reduced Density Development around an operating 45-acre LMF would place buildings along Sierra Point Parkway, such buildings would be limited to a maximum 80-foot height within 300 feet of the US 101 freeway as would Specific Plan development. As a result, Reduced Density Development around an operating 45-acre LMF would have a similar less than significant effect on windsurfing resources as would the Specific Plan.

Wildland Fire

Exacerbate Fire Hazards

Reduced Density Development around an operating 45-acre LMF would result in similar construction activities within and adjacent to combustible vegetation and would reduce population/employment growth compared to the Specific Plan. Wildland fire hazard impacts would be less than the Specific Plan.

Evaluation of Alternative 5, Reduced Density Development Around an Operating 45-Acre LMF in Relation to Project Objectives

Reducing the intensity of Baylands development throughout the Baylands, including reducing development east of Caltrain to approximately 1.0 million s.f. along Geneva Avenue and Sierra Point Parkway, would generally implement the Brisbane General Plan, including GP-1-18 and Measure JJ. In addition, this alternative would achieve each of the project's overarching and other objectives (see **Table 8-11**).

Table 8-11: Evaluation of Alternative 5, Reduced Density Development Around an Operating 45-Acre LMF in Relation to Project Objectives

Project Objectives	Extent to Which Alternative 2, Baylands (Reduced Density) Development Around an Operating 45-Acre LMF, Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	Reduced Density Development around an operating 45-acre LMF would require site remediation and Title 27 landfill closure prior to development. This alternative would eliminate ongoing ecological damage, provide for productive reuse of the Baylands, and ensure the safety of all who will use the site.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers as well as for the larger Brisbane community.	This alternative would restore and enhance habitats within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill. This alternative would also restore and provide for adaptive reuse of the historic Roundhouse. By reducing the overall amount of development compared to the Specific Plan, this alternative would maintaining a lower vertical profile than the Specific Plan. Baylands Reduced Density development around an operating 45-acre LMF would protect development from adverse effects of climate change and sea level rise through an adaptation strategy that would provide for restoration of wetlands and non-wetland waters within Visitacion Creek and along the north shore of the lagoon to adapt naturally to sea level rise and increasing tidal influence.
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	Reduced Density Development around an operating 45-acre LMF would provide a sufficient mix and intensity of residential building types to provide opportunities for the development of housing for all economic segments of the community in accordance with the City's Housing Element. By reducing the number of dwelling units permitted within the Baylands, this alternative would make a smaller contribution to meeting future housing needs for the next required update of the City's Housing Element addressing need for the 2031-2039 Housing Element period than would the Specific Plan.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	Compared to the Specific Plan, Reduced Density Development around an operating 45-acre LMF would reduce residential development by 18.2 percent and commercial office development by 30.8 percent, while retaining the same amount of hotel development as the Specific Plan. This alternative would be revenue positive for the City although to a lesser degree than the Specific Plan.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	Reduced Density Development around an operating 45-acre LMF would include all of the sustainability features set forth in the Specific Plan and EIR mitigation measures.
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	While this alternative would produce a lower jobs-to-housing ratio than the Specific Plan, Reduced Density Development around an operating 45-acre LMF would generate a mix of on-site employment at a sufficient scale to achieve this objective, although not to the same extent as the Specific Plan.

Project Objectives	Extent to Which Alternative 2, Baylands (Reduced Density) Development Around an Operating 45-Acre LMF, Would Achieve Objectives
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would improve access to the Bayshore Caltrain Station. This alternative would place employee-generating development east of Caltrain along Sierra Point Parkway to take advantage of Bay views, reducing ease of access for employees in the Campus East District to the Caltrain station compared to the Specific Plan.

Feasibility of Alternative 5, Reduced Density Development Around an Operating 45-Acre LMF, and Overall Conclusion

Reduced Density Development around an operating 45-acre LMF would be consistent with the Brisbane General Plan while reducing the overall development intensity of the Specific Plan. Concentrating development could reduce the cost for on-site infrastructure required to support 1,800 dwelling units, 4.5 million s.f. of commercial, and 500,000 s.f. of hotel use. As such, Alternative 5, Reduced Density Development Around an Operating 45-Acre LMF, would be both reasonable and potentially feasible per the requirements of CEQA Guidelines Section 15126.6(a).

Overall, Reduced Density Development around an operating 45-acre LMF would reduce but not avoid the significant unavoidable impacts of the Baylands 2025 Specific Plan project.

c. Alternative 6: Reduced Density, Balanced Commercial

The purpose of this alternative is to determine whether the significant impacts of Specific Plan development could be reduced through a combination of (1) decreasing the overall amount of residential and commercial development within the Baylands and (2) a more balanced distribution of commercial development within the western and eastern portions of the Baylands.[410]

Land Use and Planning Policies

Physical Division of an Existing Community

Reduced Density, Balanced Commercial development would include the same construction projects affecting area roadways as the Specific Plan would be subject to the same requirements and mitigation measures, and would therefore result in the same construction impacts as the Specific Plan. Because this alternative would retain the same development footprint, same open space areas, and same roadway and non-motorized transportation system as the Specific Plan,

[410] The proportional distribution of commercial development between the western and eastern portions of the Baylands is similar to the distribution of commercial, retail, and R&D uses in the previously proposed 2011 Specific Plan.

the Reduced Density, Balanced Commercial development would have similar less than significant impacts in relation to dividing an existing community as the proposed Specific Plan.

Consistency with Local and Regional Plans

Reduced Density, Balanced Commercial development would be consistent with the General Plan's development intensity standards for the Baylands. Development of 1,800 dwelling units is at the low end of the range for housing specified in the General Plan, and approximately 18 percent below that of the Baylands Specific Plan, which represents the General Plan's maximum permitted number of dwelling units. Development of 4.5 million s.f. of commercial/office space would be consistent with the General Plan and would be approximately 30.7 percent less than the 6.5 million s.f. proposed in the Baylands Specific Plan. The same additional 500,000 s.f. of hotel development as the Specific Plan would also be consistent with the General Plan maximum permitted development. Consistency with specific General Plan policies and resulting environmental effects of inconsistencies would be the same as the Specific Plan.

Population and Housing

Induce Substantial Unplanned Growth

Reduced Density, Balanced Commercial development provides for the development of 1,800 dwelling units, which would result in approximately 4,015 residents within the Baylands compared to the 4,905 Baylands residents resulting from Specific Plan buildout. This reduced housing and population is consistent with the Brisbane General Plan, which provides for 1,800 to 2,200 dwelling units within the Baylands. Reducing commercial office space within the Baylands to 4.5 million s.f. with an additional 500,000 s.f. of hotel use would reduce Baylands employment from 19,480 to 16,365 jobs, which would also be consistent with the Brisbane General Plan. Thus, population and employment growth associated with this alternative would be considered to be *planned* growth and impacts would be the same as the Specific Plan (less than significant).

Displacement of Existing Housing or Businesses

Because Reduced Density, Balanced Commercial development involves development of the same footprint, the same 231,400 s.f. of existing industrial businesses along Industrial Way would be displaced, resulting in the same less than significant impact.

Housing for all Economic Segments of the Community

Reduced Density, Balanced Commercial development proposes 1,800 dwelling units, consistent with the Baylands residential development assumption set forth in the City's adopted Housing Element. This alternative would, therefore, meet City objectives to provide opportunities for the development of housing for all segments of the community within the 2023-2031 Housing

Element. By reducing Baylands housing by 400 units compared to the Specific Plan, this alternative would reduce opportunities for the development of housing for subsequent Housing Element updates, which are required on an 8-year basis.[411]

Urban Decay

Because housing would provide less residential, retail, and office development than the Specific Plan, it would generate less demand for retail uses and reduce the less than significant urban decay impacts of the Specific Plan.

Aesthetic and Visual Resources

Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon)

Within the area east of the Caltrain right-of-way, Reduced Density, Balanced Commercial development would reduce overall development by approximately 600,000 s.f. This development would be subject to EIR mitigation measures that reduce the maximum height of buildings along the west side of the Caltrain rail line and limit the height of buildings within 350 feet of US Highway 101. Compliance with these measures would reduce the impacts of this alternative to less than those of the Specific Plan (less than significant with mitigation incorporated).

Impacts to Scenic Resources

Reduced Density, Balanced Commercial development would provide the same preservation and improvements of existing scenic resources within the Baylands as the Specific Plan. The Visitacion Creek corridor, Icehouse Hill, and the north shore of Brisbane Lagoon would each be improved in the same manner as would the Specific Plan, including restoration of wetland and habitat areas, which would thereby retain their natural character. This alternative would also extend the San Francisco Bay Trail through Baylands, preserve 100-foot shoreline band areas around the Visitacion Creek corridor and Brisbane Lagoon and provide public access to the Bay. Thus, impacts would be the same as for the Specific Plan (less than significant).

Consistency with Visual Quality-Related Policies and Programs

Reduced Density, Balanced Commercial development would have the same development footprint and open space areas as the Specific Plan. This alternative would also be required to be consistent with the same visual quality-related policies and programs as Specific Plan

[411] The City of Brisbane would next be required to approve an updated Housing Element in 2031 for the 2031–2039 period.

development, including the findings that are required to be made by the Planning Commission for approval of a design permit. Impacts would thus be similar to the Specific Plan.

Nighttime Lighting

Reduced Density, Balanced Commercial development would generate nighttime lighting over the same broad area that is currently largely dark at night as the Specific Plan. This alternative would reduce total building area. Nighttime lighting of outdoor open space and park areas would remain the same as for the Specific Plan. This alternative would be required to comply with the same performance standards and EIR mitigation measures as the Specific Plan. Because it would generate nighttime lighting over a similar area as the Specific Plan while also complying with the same mitigation measures and achieving the same performance standards, this alternative would have similar impacts as the Specific Plan.

Glare

Reduced Density, Balanced Commercial development would reduce the amount of glare-producing reflective building materials on building roofs and façades as the Specific Plan. Nevertheless, 1,800 dwelling units, 4.5 million s.f. of commercial office space, and 500,000 s.f. of hotel use would substantially increase daytime glare, particularly in the early morning and late afternoon hours.

Glare resulting from this alternative could produce nuisance effects within residential areas, classrooms, parks, trails, and playgrounds, as well as adversely affect motorists along US Highway 101, Geneva Avenue, and Bayshore Boulevard by impairing vision, although to a lesser degree than the Specific Plan due to reduced development density. While this alternative would have less glare-producing surface area than the Specific Plan, it would nevertheless result in a significant glare impact and be required to implement the same mitigation measures as the Specific Plan. Reduced Density, Balanced Commercial development would reduce the less than significant impacts of the Specific Plan with implementation of mitigation.

Biological Resources

Candidate, Sensitive, and Special-Status Plants, Animals, and Habitats

Reduced Density, Balanced Commercial development would have the same development footprint within the western portion of the Baylands and require the same movement of soil to be transported from the eastern to the western portion of the Baylands to achieve final grades. Thus, the same impacts to existing species and habitats would occur. Because this alternative would provide the same habitat restoration and enhancement improvements as the Specific Plan along Visitacion Creek, the north shore of the lagoon, and on Icehouse Hill, and would be subject to the same mitigation measures, a similar less than significant impact as the Specific Plan would result.

Wetlands and Non-Wetland Waters Acreage, Functions, and Values

Reduced Density, Balanced Commercial development would have the same development footprint and require the same movement of soil to be transported from the eastern to the western portion of the Baylands to achieve final grades. Thus, the same impacts to wetlands and non-wetland waters would occur as the Specific Plan. Because this alternative would provide the same habitat restoration and enhancement improvements as the Specific Plan along Visitacion Creek, the north shore of the lagoon, and on Icehouse Hill, and would be subject to the same mitigation measures, a similar less than significant impact as the Specific Plan would result.

Movement of Fish and Wildlife Species

Trails and recreational improvements on Icehouse Hill would remain unchanged from the Specific Plan. Because a reduced amount of building glass area would result than the Specific Plan, bird strike impacts would be reduced although implementation of the same mitigation measures would be required. Thus, impacts and required mitigation would be reduced for this alternative compared to the Specific Plan.

Consistency with Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Reduced Density, Balanced Commercial development would be required to comply with the requirements of Brisbane Municipal Code Chapter 12.12. As a result, impacts would be the same as the Specific Plan.

Consistency with the San Bruno Mountain Habitat Conservation Plan

Because this alternative would provide the same improvements within Icehouse Hill as would the Specific Plan, impacts would be the same.

Cultural and Tribal Cultural Resources

Roundhouse and Machinery & Equipment Buildings

Because the development footprint and site grading requirements for the western portion of the site would be unchanged, Reduced Density, Balanced Commercial development would restore the Roundhouse for adaptive reuse in the same manner as the Specific Plan and be subject to the same mitigation requirements. Development surrounding the Roundhouse and Machinery & Equipment building would also be compatible with the historic character of these buildings. Thus, impacts would be similar to the Specific Plan.

Archaeological Resources

Because site grading would not be changed, impacts and resulting mitigation measures would be the same as for the Specific Plan.

Tribal Cultural Resources

Because no tribal cultural resources have been identified within the Baylands, no impacts would result.

Disturbance of Known or Unknown Human Remains

This alternative would cause ground disturbance within the same areas as would Specific Plan development. Should fewer buildings be constructed due to this alternative's lower density, less excavation would be required than for the Specific Plan while complying with the same mitigation requirements as the Specific Plan. Thus, impacts would be reduced from the less than significant impacts of the Specific Plan.

Transportation

Vehicle Miles Traveled

Reduced Density, Balanced Commercial development would result in a slight increase in per capita employee VMT by shifting some commercial development from the western to the eastern portion of the Baylands, which would slightly increase average distances to the Bayshore Caltrain station even if shuttle services similar to the Specific Plan were to be provided. While the reduced development intensity of this alternative would not likely support the same level of shuttle service as would the Specific Plan, the availability of transit service within the western portion of the Baylands combined with the mixed-use character of the alternative and requirements for a transportation demand management plan, VMT would remain less than significant. In addition, this alternative would result in a lesser reduction in regional miles traveled than the Specific Plan but still cause a less than significant impact.

Transit, Bicycle, and Pedestrian Travel Modes

Reduced Density, Balanced Commercial development would provide a comprehensive system of bicycle and pedestrian facilities within the site and complete the Bay Trail through the eastern portion of the Baylands. Improving the balance of commercial development between the western and eastern portion of the Baylands would shift some office space further from the Bayshore Caltrain station, resulting in a slight reduction in per capita employee use of transit.

Hazards to Vehicles, Bicyclists, and Pedestrians

All roadways within the Baylands would be constructed to City standards. Impacts would therefore be similar to the Specific Plan.

Emergency Access

The Specific Plan area, each development district, and each block within the Baylands would be provided with more than one point of access, facilitating emergency response. Because the extension of Geneva Avenue over the Caltrain right-of-way to the US 101 freeway and extension of Sierra Point Parkway would remain part of the Specific Plan, emergency response from the proposed new fire station within the northeastern portion of the site would be similar to the Specific Plan. In addition, because all roadways would be constructed to City standards and this alternative would provide emergency access during flooding events consistent with EIR mitigation requirements, impacts would be similar to the Specific Plan.

Air Quality

Consistency with the 2017 Regional Clean Air Plan

Site grading for the Reduced Density, Balanced Commercial development would be similar to the Specific Plan, be subject to the same mitigation measures, and therefore result in similar impacts as the Specific Plan. This alternative would also have slightly higher per employee VMT but would include the same features and be subject to the same mitigation measures as the Specific Plan. This alternative would thus have similar impacts in relation to consistency with the 2017 Clean Air Plan.

Increased Emissions of Non-Attainment Criteria Air Pollutants

Reduced Density, Balanced Commercial development would require a similar amount of grading as the Specific Plan. This alternative would be subject to the same mitigation measures as the Specific Plan and result in a similar significant unavoidable construction impact.

A slight increase in per capita employee emissions would result due to shifting some office development to the eastern portion of the Baylands away from the Bayshore Caltrain station. The significant unavoidable construction impact associated with site grading would remain. Even though total mobile and area source operational emissions would be reduced compared to the Specific Plan, emissions for this alternative would exceed thresholds and remain significant and unavoidable.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Because Reduced Density, Balanced Commercial development would require a similar amount of grading as the Specific Plan, exposure of off-site receptors to pollutant concentrations during

site grading activities would be similar to the Specific Plan. This alternative would be subject to the same mitigation measures as the Specific Plan, and result in a similar impact.

Odors

The potential for odor generation during site grading would be the same as that of the Specific Plan. Reduced Density, Balanced Commercial development would also move some employment-generating uses closer to the on-site water recycling facility than would occur for Specific Plan development. Because the water recycling facility would be subject to the same mitigation requirements as for the Specific Plan, a similar less than significant impact would occur.

Greenhouse Gas Emissions

Specific Plan Area Greenhouse Gas (GHG) Emissions

Reduced Density, Balanced Commercial development would generate slightly higher VMT per employee than the Specific Plan by shifting some office development east of the Caltrain right-of-way further from the Bayshore Caltrain station. Reducing Baylands development by 400 dwelling units and 2.5 million s.f. of commercial office use would reduce Baylands-generated GHG emissions compare to the Specific Plan, thereby reducing but not eliminating the severity of its significant unavoidable impact.

Effect on Regional GHG Emissions

Because Reduced Density, Balanced Commercial development would generate slightly higher VMT per employee than the Specific Plan, per capita employee vehicular travel would increase, resulting in smaller reductions in regional VMT and mobile source GHG emissions as the Specific Plan.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

Reduced Density, Balanced Commercial development would include the same GHG reduction features and mitigation measures as the Specific Plan and would therefore be equally consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Energy Resources

Wasteful, Inefficient, or Unnecessary Use of Energy

By reducing the total amount of development, this alternative would generate a greater proportion of the Baylands' energy demand on-site than would the Specific Plan. On-site

buildings would meet Tier 2 CALGreen Standards. As a result, Reduced Density, Balanced Commercial development would reduce the Specific Plan's less than significant impact.

Consistency with Applicable Energy Reduction Programs, Plans, Ordinances, and Policies

In addition to implementing all of the energy efficiency features of the Specific Plan, this alternative would generate a greater proportion of the Baylands' energy demand on-site than would the Specific Plan. Reduced Density, Balanced Commercial development would, therefore, be consistent with applicable energy reduction programs, plans, ordinances, and policies.

Noise and Vibration

Temporary Increase in Ambient Noise

The extent of site grading required for Reduced Density, Balanced Commercial development would be similar to the Specific Plan, generating similar construction noise. This alternative would move construction of some office buildings east of Caltrain further from sensitive receptors. Development in this alternative would be subject to the same mitigation measures as the Specific Plan and thereby result in less severe significant and unavoidable impacts compared to the Specific Plan.

Traffic Noise Increase

Reduced Density, Balanced Commercial development would generate less traffic than the Specific Plan. As a result, the amount of traffic along area roadways would increase to a lesser degree and reduce the Specific Plan's impacts. Such impacts, although reduced, would remain significant and unavoidable.

Permanent Increase in Ambient Noise

Reduced Density, Balanced Commercial development would generate noise from the same stationary sources. Due to the logarithmic scale used to measure noise, reducing development intensity would not likely be sufficient to substantially reduce permanent increases in ambient noise compared to the Specific Plan. This alternative would be subject to the same performance standards and mitigation measures as the Specific Plan and would be required to comply with City noise ordinance requirements. Impacts would therefore be similar to those of the Specific Plan (significant and unavoidable).

Exacerbate Land Use / Noise Incompatibilities by Placing People in High Noise Areas

Because the tallest buildings proposed within the western portion of the Baylands are those closest to the Caltrain rail line, the number of dwelling units and square footage of commercial

office development adjacent to the Caltrain right-of-way would decrease while commercial office development proximity to the US 101 freeway would increase. Overall, there would be fewer sensitive receptors, particularly residents, within high noise areas in the alternative than in the Specific Plan. Thus, impacts for this alternative would be less than for the Specific Plan.

Groundborne Vibration

The extent of site grading required for Reduced Density, Balanced Commercial development would be similar to the Specific Plan, generating similar vibration impacts. This alternative would likely result in fewer buildings requiring pile driving and move construction of some buildings east of Caltrain further from sensitive receptors. Development in this alternative would be subject to the same mitigation measures as the Specific Plan, resulting in reduced impacts.

Exacerbate Human Annoyance or Hazards by Placing Buildings in High Groundborne Vibration Areas

Because the tallest buildings within the western portion of the Baylands would be those closest to the Caltrain rail line, the number of dwelling units and square footage of commercial office development adjacent to the Caltrain right-of-way would decrease while commercial office development proximity to the US 101 freeway would increase. Thus, impacts for this alternative would be similar to the Specific Plan.

Hazards and Hazardous Materials

Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Demolition of older buildings along Industrial Way that potentially contain asbestos or lead-based paints would be the same for this alternative as for the Specific Plan. In addition, the types of uses proposed for this alternative would be the same as the Specific Plan, albeit with a reduced development intensity. The potential for a release of hazardous materials due to the transport, use, disposal, or management of hazardous materials, whether resulting from routine activities or an accident, to adversely affect a substantial number of people would be reduced compared to the Specific Plan due to reduced development intensity. In addition, the Baylands development in this alternative would be subject to the same extensive set of regulations designed to protect the public and environment from such a release of hazardous materials. Thus, impacts would be less than those of the Specific Plan.

Create a Health Hazard for an Existing or Planned School Site Due to Release of Hazardous Materials or Proximity of Hazardous Conditions

The location of a school site within the Baylands in relation to locations of hazardous materials sites and emitters would be the same as for the Specific Plan. Thus, the impacts of this alternative would be the same as for the Specific Plan.

Development on a Property that is Included on a List of Hazardous Materials Sites

Various portions of the Baylands and adjacent areas, including the former Brisbane Landfill, OU-SM, and OU-2, are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. Within the western portion of the Baylands, a reduced amount of development would occur within the OU-SM and OU-2 following site remediation pursuant to the regulatory authority of the San Francisco Bay RWQCB and DTSC. Within the eastern portion of the Baylands, a reduced amount of development would occur following final landfill closure pursuant to Title 27 requirements.

Development throughout the Baylands would be subject to the same General Plan requirements as the Specific Plan and would reduce the less than significant impact of the Specific Plan.

Create an Airport Safety Hazard or Expose People to Excessive Noise of Aircraft Operations

Since none of the Specific Plan area is subject to safety hazards of excessive noise due to aircraft operations, Reduced Density, Balanced Commercial development would have no impact in relation to airport operations.

Emergency Preparedness and Response

Development would provide the same regional roadway connections and meet the same access requirements for police and fire service response as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Hydrology and Water Quality

Protection of Water Quality

The extent of site grading required for Reduced Density, Balanced Commercial development would be similar to the Specific Plan, including a similar high potential for potential for erosion and siltation and release of pollutants during grading and construction. Because this alternative would have reduced development intensity, smaller development footprint, and fewer streets east of Caltrain, the potential for release of urban pollutants to the Brisbane Lagoon and to San Francisco Bay would be less than the Specific Plan. Because the potential for urban pollutants to enter the Bay would remain significant, this alternative would implement the same Best Management Practices outlined in required NPDES permits, SWPPPs and the requirements of

NPDES Provision C.3 in combination with the same mitigation measures as the Specific Plan. Impacts would therefore be similar to those of the Specific Plan.

Groundwater Recharge and Sustainable Management

Reduced Density, Balanced Commercial development would not reduce the site's impervious surface area compared to the Specific Plan due to the requirement for construction of an impermeable cap on the landfill. Because the local groundwater basin is not used as a potable or non-potable water supply and is hydraulically connected to the Bay and Lagoon, this alternative would not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence. In addition, as demonstrated in the Water Supply Assessment prepared by Cal Water, Baylands development would have no effect on groundwater pumping within South San Francisco. Impacts would be similar to the Specific Plan (less than significant).

Flood Hazards

By reducing the total amount of development while shifting some office development from the area west of Caltrain to the eastern portion of the site, this alternative would reduce impermeable surface area and generate a smaller increase in stormwater runoff than the Specific Plan. Reduced Density, Balanced Commercial development would comply with the same flood protection standards and mitigation measures as the Specific Plan. Impacts would be less than the Specific Plan due to reduced runoff since less impermeable area would be constructed compared to the Specific Plan.

Release of Pollutants Due to Flood, Emergent Groundwater, Tsunami, or Seiche

The Specific Plan area is not located within a tsunami hazard zone and the required on-site water storage tank facilities would be designed and constructed to withstand anticipated oscillations in water surface caused by an earthquake. Further, the risk of release of pollutants attributable to inundation would be negligible since potential pollutants would not be present at the ground surface. In addition, this alternative would be subject to the same less than significant potential for emergent groundwater as the Specific Plan. Thus, impacts would be similar to the Specific Plan.

Geology, Soils, and Seismicity

Fault Rupture

Because there are no known active or potentially active fault traces across the Baylands, and the site is not located within an Alquist-Priolo Earthquake Fault Zone, no impact would occur.

Seismic Ground Shaking

Reduced Density, Balanced Commercial development would be subject to subject to the same combination of building code compliance and mitigation measures as the Specific Plan, which would provide an appropriate level of safety. This alternative would reduce the number of people and structures subject to hazards from strong seismic ground shaking, reducing impacts compared to the Specific Plan.

Liquefaction and Seismic-Related Ground Failure

Because of the presence of high groundwater and loose, unconsolidated soils underlying the Specific Plan area, this alternative would be subject to the same liquefaction hazards as the Specific Plan. Reduced Density, Balanced Commercial development would be required to conform to the same site-specific foundation design parameters and EIR mitigation measures as the Specific Plan, resulting in similar impacts.

Slope Stability

The amount of grading needed for Reduced Density, Balanced Commercial development would be the same as for the Specific Plan, including the same embankments for the Geneva Avenue bridge over Caltrain. Site-specific development projects would be required to comply with the same development requirements, including compliance with the most recent adopted building code requirements for slope stability. The combination of compliance with building code requirements and EIR Mitigation Measures would result in a similar less than significant impact as the Specific Plan.

Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard and during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. Site specific development projects for this alternative would be designed and constructed to comply with the requirements of final site-specific design-level geotechnical reports, which would ensure appropriate design and construction to mitigate soil corrosivity and expansive soils hazards for each building and infrastructure project. Compliance with the building code and EIR mitigation measures in combination with reducing the number of buildings would reduce hazards from soil corrosivity and expansive soils compared to the less than significant impacts of the Specific Plan.

Paleontological Resources

The only deep excavations that would disturb significant paleontological resources within the Colma or Merced Formations would be pile foundation installation. Because installation of pile foundations would render any potentially valuable specimens irretrievable, such installation is

not typically considered to cause significant impacts. This alternative would also have the same unlikely potential that excavations for other construction activities would be deep enough to encounter paleontological resources as the Specific Plan. Because this alternative would have the same potential for such excavations and would be subject to the same mitigation measures, impacts would be similar to the Specific Plan.

Use of Septic Tanks or Alternative Wastewater Disposal Systems

All Baylands development would be connected to a municipal wastewater system and neither septic tanks nor alternative wastewater disposal systems would be used.

Utilities, Service Systems, and Water Supply

Water Supply

Reduced Density, Balanced Commercial development would consume less water than the Specific Plan. Because it would generate less wastewater, this alternative would also generate less recycled water than the Specific Plan, unless sewage generated by the City and Bayshore Sanitary District were to be recycled on-site. As a result, water supply impacts of this alternative would be similar to the Specific Plan.

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and result in the same less than significant impacts.

Consistency with Solid Waste Management Policies

Because this alternative would generate the same amount of solid waste on a per unit basis (although less total solid waste for landfill disposal), be subject to the same mitigation measures, and achieve the same waste diversion rate as the Specific Plan, impacts would be similar to the Specific Plan.

Landfill Capacity

Reduced Density, Balanced Commercial development would generate less total solid waste, be subject to the same diversion programs, and achieve the same waste diversion rate as the Specific Plan. Thus, this alternative would reduce the Specific Plan's less than significant impact on landfill capacity.

Public Services and Facilities

Adverse Physical Environment Effects Associated with Construction or Improvements of Fire Protection, Police, School, and Other Public Facilities

Demolition, grading, and construction of fire protection, police, school, and other facilities to serve Baylands development would be the same as for the Specific Plan and result in similar less than significant impacts in relation to police, fire protection, and schools. This alternative would also generate similar demands, result in similar impacts, and be subject to the same mitigation measures as the Specific Plan in relation to libraries and the City's corporation yard.

Recreation Resources

Physical Deterioration of a Park or Recreational Facility

Reduced Density, Balanced Commercial development would retain the same ratio of improved parkland to population as the Specific Plan. Thus, parkland provided by this alternative would exceed the 5.03 acres per 1,000 population of parkland currently available to Brisbane residents to same degree as the Specific Plan and not cause any physical deterioration of existing parks and recreational facilities within the City. Because population growth would be less than the Specific Plan, this alternative would have a significant although proportionately smaller impact on existing community facilities. Reduced Density, Balanced Commercial development would be subject to a proportionately smaller mitigation requirement, resulting in a similar net impact as the Specific Plan.

Physical Deterioration of Candlestick Point Windsurfing Resources

Although Reduced Density, Balanced Commercial development would place buildings along Sierra Point Parkway, such buildings would be limited to a maximum 80-foot height within 300 feet of the US 101 freeway as would Specific Plan development. As a result, Reduced Density, Balanced Commercial development would have a similar less than significant effect on windsurfing resources as would the Specific Plan.

Wildland Fire

Exacerbate Fire Hazards

Reduced Density, Balanced Commercial development would result in similar construction activities within and adjacent to combustible vegetation and would reduce population/ employment growth compared to the Specific Plan. Wildland fire hazard impacts would be less than the Specific Plan.

Evaluation of Alternative 6, Reduced Density, Balanced Commercial Development in Relation to Project Objectives

Reducing the intensity of Baylands development throughout the Baylands would implement the Brisbane General Plan, including GP-1-18 and Measure JJ. In addition, this alternative would achieve each of the Project's overarching and other objectives (see **Table 8-12**).

Table 8-12: Evaluation of Alternative 6, Reduced Density, Balanced Commercial Development in Relation to Project Objectives

Project Objectives	Extent to Which Alternative 5, Reduced Density, Balanced Commercial Development, Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	Reduced Density, Balanced Commercial development would require site remediation and Title 27 landfill closure prior to development. This alternative would eliminate ongoing ecological damage, provide for productive reuse of the Baylands, and ensure the safety of all who will use the site.
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers as well as for the larger Brisbane community.	This alternative would restore and enhance habitats within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill. This alternative would also restore and provide for adaptive reuse of the historic Roundhouse. By reducing the overall amount of development compared to the Specific Plan, this alternative would maintain a lower vertical profile than the Specific Plan. Reduced Density, Balanced Commercial development would protect development from adverse effects of climate change and sea level rise through an adaptation strategy that would provide for restoration of wetlands and non-wetland waters within Visitacion Creek and along the north shore of the lagoon to adapt naturally to sea level rise and increasing tidal influence.
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contributes to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	Reduced Density, Balanced Commercial development would provide a sufficient mix and intensity of residential building types to provide opportunities for the development of housing for all economic segments of the community in accordance with the City's Housing Element. By reducing the number of dwelling units permitted within the Baylands, this alternative would make a smaller contribution to meeting future housing needs for the next required update of the City's Housing Element addressing need for the 2031-2039 Housing Element period than would the Specific Plan.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	Compared to the Specific Plan, Reduced Density, Balanced Commercial development would reduce residential development by 18.2 percent and commercial office development by 30.8 percent, while retaining the same amount of hotel development as the Specific Plan. This alternative would be revenue positive for the City although to a lesser degree than the Specific Plan.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	Reduced Density, Balanced Commercial development would include all of the sustainability features set forth in the Specific Plan and EIR mitigation measures.

Project Objectives	Extent to Which Alternative 5, Reduced Density, Balanced Commercial Development, Would Achieve Objectives
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	While this alternative would produce a lower jobs-to-housing ratio than the Specific Plan, Reduced Density, Balanced Commercial development would generate a mix of on-site employment at a sufficient scale to achieve this objective, although not to the same extent as the Specific Plan.
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would improve access to the Bayshore Caltrain station. Shifting some commercial development from the western to the eastern portion of the Baylands would place employee-generating development further from the Bayshore Caltrain station, reducing ease of access to transit for some employees compared to the Specific Plan.

Feasibility of Alternative 6, Reduced Density, Balanced Commercial Development, and Overall Conclusion

Reduced Density, Balanced Commercial development would be consistent with the Brisbane General Plan while reducing the overall development intensity of the Specific Plan. Concentrating development could reduce the cost for on-site infrastructure required to support 1,800 dwelling units, 4.5 million s.f. of commercial, and 500,000 s.f. of hotel use. As such, Alternative 5, Reduced Density, Balanced Commercial development, would be both reasonable and potentially feasible per the requirements of CEQA Guidelines Section 15126.6(a).

Overall, Reduced Density, Balanced Commercial development would reduce the environmental impacts of the Baylands Specific Plan.

d. Alternative 7: Reduced Density, Lower Maximum Building Height

The purpose of this alternative is to reduce the Project's significant impacts by both reducing overall Specific Plan development density and maximum building heights within the Baylands.

Land Use and Planning Policies

Physical Division of an Existing Community

Reduced Density, Lower Maximum Building Height development would include the same construction projects affecting area roadways as the Specific Plan, would be subject to the same requirements and mitigation measures, and would therefore result in similar construction impacts as the Specific Plan. Because this alternative's configuration of development and open space areas as well as its roadway and non-motorized transportation system would be the same as for the Specific Plan, the Reduced Density, Lower Maximum Height development would have similar impacts (less than significant) in relation to dividing an existing community as the proposed Specific Plan.

Plan Consistency

Reduced Density, Lower Maximum Height development is consistent with the General Plan's development intensity standards for the Baylands. Development of 1,800 dwelling units is at the low end of the range for housing specified in the General Plan, and approximately 18 percent below that of the Baylands Specific Plan, which represents the General Plan's maximum permitted number of dwelling units. Development of 4.5 million s.f. of commercial/office space would be consistent with the General Plan and would be approximately 30.7 percent less than the 6.5 million s.f. proposed in the Baylands Specific Plan. The same additional 500,000 s.f. of hotel development as the Specific Plan would also be consistent with the General Plan maximum permitted development. Consistency with local and regional policies would be the same as for the Specific Plan.

Population and Housing

Induce Substantial Unplanned Growth

Reduced Density, Lower Maximum Building Height development provides for 1,800 dwelling units, which would result in approximately 4,140 residents within the Baylands as compared to the 4,905 Baylands residents resulting from Specific Plan buildout. This reduced residential density and population is consistent with the Brisbane General Plan, which provides for 1,800 to 2,200 dwelling units within the Baylands. Reducing commercial office space within the Baylands to 4.5 million s.f. with an additional 500,000 s.f. of hotel use would reduce Baylands employment from 19,480 to 16,365 jobs, which would also be consistent with the Brisbane General Plan. Thus, population and employment growth associated with the Reduced Density, Lower Maximum Building Height development would be considered to be planned growth, not substantial unplanned growth, and impacts would be similar to the Specific Plan (less than significant).

Displacement of Existing Housing or Businesses

Because the Reduced Density, Lower Maximum Building Height development involves development of the same footprint as the Specific Plan, the same 231,400 s.f. of existing industrial businesses along Industrial Way would be displaced, resulting in the same less than significant impact. This alternative would also displace Golden State Lumber's laydown area and its ability to receive and ship lumber by rail, resulting in the same less than significant physical environmental impact and the same economic impact effect as the Specific Plan.

Housing for All Economic Segments of the Community

The Reduced Density, Lower Maximum Building Height development proposes 1,800 dwelling units, consistent with the Baylands residential development assumption set forth in the City's adopted Housing Element. This alternative would, therefore, meet City housing objectives for

the development of opportunities for housing for all segments of the community for the 2023-2031 housing period. By reducing Baylands housing by 400 units compared to the Specific Plan, this alternative would reduce opportunities for the development of housing for subsequent Housing Element updates, which are required on an 8-year basis.[412]

Urban Decay

Because Reduced Density, Lower Maximum Building Height development would provide less residential, retail, and office development than the Specific Plan, it would generate less demand for retail uses and reduce the less than significant urban decay impacts of the Specific Plan.

Aesthetic and Visual Resources

Public Views of Identified Scenic Resources (San Bruno Mountain and Adjacent Ridgelines, San Francisco Bay, and the Brisbane Lagoon)

Reducing development intensity by reducing the heights of taller buildings within the Baylands would reduce obstructions to views of the San Francisco Bay caused by the tower buildings along the Caltrain right-of-way. As shown in **Table 4.5-2a** through **Table 4.5-2r**, while development within the eastern portion of the Baylands has little effect on Bay views, it does block views of San Bruno Mountain from the east, particularly along the US 101 freeway. Lowering building heights east of the Caltrain right-of-way would have little or no effect on views from the US 101 freeway due to the closeness of buildings to the freeway but would reduce blockage of San Bruno Mountain views from more distant vantage points.

Impacts to Scenic Resources

Reduced Density, Lower Maximum Building Height development would provide for the same preservation and improvements of existing scenic resources within the Baylands as the Specific Plan. The Visitacion Creek corridor, Icehouse Hill, and the edges of Brisbane Lagoon would be improved in the same manner as the Specific Plan, including restoration of wetland and habitat areas, which would retain their natural character. This alternative would also extend the San Francisco Bay Trail through Baylands. Thus, Reduced Density, Lower Maximum Building Height development would have the same beneficial effects as the Specific Plan by preserving 100-foot shoreline band areas around the Visitacion Creek corridor and Brisbane Lagoon and providing public access to the Bay.

Consistency with Visual-Quality-Related Policies and Programs

Regardless of the specific density and distribution of land use within the Baylands, development would be required to be consistent with applicable visual-quality-related policies

[412] The City of Brisbane would be required to approve an updated Housing Element in 2031 for the 2031–2039 period.

and programs. Specifically, Reduced Density, Lower Maximum Building Height development would comply with the design principles reflected in the findings that are required to be made by the Planning Commission for approval of a design permit. Impacts would be similar to the Specific Plan.

Nighttime Lighting

Reduced Density, Lower Maximum Building Height development would have a similar potential to permit light sources that would result in light trespass and sky glow impacts as the Specific Plan. Because this alternative would be required to comply with the same performance standards and implement the same mitigation measures as the Specific Plan, similar less than significant with mitigation incorporated impacts would result compared to the Specific Plan.

Glare

Reduced Density, Lower Maximum Building Height development would reduce the amount of glare-producing reflective building materials on building roofs and façades within the Baylands compared to the Specific Plan. Nevertheless, 1,800 dwelling units, 4.5 million s.f. of commercial office space, and 500,000 s.f. of hotel use would generate substantial new sources of daytime glare, particularly in the early morning and late afternoon hours. Above-ground infrastructure could also include highly reflective stainless-steel piping and cladding on structures.

Glare resulting from development of this alternative could produce nuisance effects within residential areas, classrooms, parks, trails, and playgrounds, as well as adversely affect air traffic leaving San Francisco International Airport and motorists along US Highway 101, Geneva Avenue, and Bayshore Boulevard by impairing vision, although to a somewhat lesser degree than the Specific Plan due to reduced development density.

While Reduced Density, Lower Maximum Building Height development would have less glare-producing surface area than the Specific Plan and thereby reduce impacts, this alternative would nevertheless result in a significant glare impact and be subject to the same mitigation measures as the Specific Plan. Due to a reduced amount of glare-producing surface area, a reduced less than significant with mitigation incorporated impact would result compared to the Specific Plan.

Biological Resources

Candidate, Sensitive, and Special-Status Plants, Animals, and Habitats

Because Reduced Density, Lower Maximum Building Height development would have the same development footprint throughout the Baylands, it would require the same movement of soil from the eastern to the western portion of the Baylands to achieve final grades. Thus,

similar impacts to existing species and habitats would occur, requiring similar mitigation as would the Specific Plan.

Wetlands and Non-Wetland Waters Acreage, Functions, and Values

Because this alternative would have the same development footprint as the Specific Plan, a similar acreage of wetlands and non-wetland waters would be lost during site grading and construction compared to the Specific Plan, even if overall development density were to be reduced. In addition, the need to realign Lagoon Road, along with General Plan requirements for improved open space and recreational areas, would result in the loss of wetlands and non-wetland waters along the north shore of the lagoon along with construction of Lagoon Park. Thus, Reduced Density, Lower Maximum Building Height development would result in a similar less than significant with mitigation incorporated impact as the Specific Plan.

Movement of Fish and Wildlife Species

Trails and recreational improvements on Icehouse Hill would remain unchanged from the Specific Plan. Because a reduced amount of building glass area would result than the Specific Plan, bird-strike impacts would be reduced although implementation of the same mitigation measures would be required. Due to a reduced amount of building glass area, impacts would be reduced compared to the Specific Plan.

Consistency with Brisbane Municipal Code Chapter 12.12, Private Tree Regulations

Reduced Density, Lower Maximum Building Height development would be required to comply with the requirements of Brisbane Municipal Code Chapter 12.12. As a result, impacts would be unchanged from the Specific Plan.

Consistency with the San Bruno Mountain Habitat Conservation Plan

Because this alternative would provide the same improvements within Icehouse Hill as would the Specific Plan, impacts would be unchanged.

Cultural and Tribal Cultural Resources

Roundhouse and Machinery & Equipment Buildings

Because lowering building heights would not change site grading, the Roundhouse would be restored for adaptive reuse in the same manner as proposed for the Specific Plan and impacts would be the same. In addition, development surrounding the Roundhouse and Machinery & Equipment would be consistent with their historic character. Thus, this alternative would result in a similar less than significant with mitigation incorporated impact as the Specific Plan.

Archaeological Resources

Because lowering building heights would not change site grading and other ground-disturbing activities, impacts and resulting mitigation measures would be the same as for the Specific Plan.

Tribal Cultural Resources

Because no tribal cultural resources have been identified within the Baylands, no impacts would result.

Disturbance of Known or Unknown Human Remains

Because lowering building heights would not change site grading and other ground-disturbing activities, impacts and resulting mitigation measures would be the same as the Specific Plan.

Transportation

Vehicle Miles Traveled

Reducing building heights and reducing the intensity of development within the western portion of the Baylands would slightly decrease the proportion of employees within the eastern portion of the site beyond walking distance of the Caltrain Bayshore Station. Per capita VMT for Baylands employees would be slightly higher than for the Specific Plan as a result.

Transit, Bicycle, and Pedestrian Travel Modes

Reduced Density, Lower Maximum Building Height development would provide a comprehensive system of bicycle and pedestrian facilities within the Baylands similar to the Specific Plan. This alternative would result in slightly reduced use of transit, bicycle, and pedestrian modes of travel since a slightly greater proportion of employees within the eastern portion of the site would be further from the Caltrain Bayshore station compared to the Specific Plan.

Hazards to Vehicles, Bicyclists, and Pedestrians

All roadways throughout the Baylands would be required to be constructed to City standards. Impacts in relation to transportation hazards would thus be similar to the Specific Plan.

Emergency Access

The Specific Plan area, each development district, and each block within the Baylands would continue to have more than one point of access facilitating emergency response. Extending Geneva Avenue from Bayshore Boulevard over the Caltrain right-of-way to the US 101 freeway and extending Sierra Point Parkway would be accomplished in accordance with EIR mitigation

measures. Thus, emergency response impacts would be similar to the Specific Plan's less than significant with mitigation incorporated impact.

Air Quality

Consistency with the 2017 Regional Clean Air Plan

Reducing building heights within the western portion of the Baylands while simultaneously reducing the amount of residential and commercial development as the Specific Plan would slightly reduce the proportion of Baylands office development in proximity to transit. This alternative would include all of the same features and be subject to the same mitigation measures as the Specific Plan and would therefore be consistent with the 2017 Clean Air Plan.

Increased Emissions of Non-Attainment Criteria Air Pollutants

Lowering building heights while simultaneously reducing the amount of residential and commercial development as the Specific Plan would slightly reduce the proportion of Baylands office development in proximity to transit and therefore slightly increase per capita air pollutant emissions. This per capita increase would be offset by the reduced density of Baylands development, resulting in reduced mobile source pollutant emissions for project operations.

The amount of grading required for Reduced Density, Lower Maximum Height development would be similar to the Specific Plan. Thus, construction emissions and the resulting significant unavoidable construction impact would be similar to the Specific Plan.

Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Because site grading would be similar to the Specific Plan, exposure of sensitive receptors to pollutant concentrations resulting from grading activities would be similar to the Specific Plan, resulting in a similar less than significant with mitigation incorporated impact. Because the amount of building construction activity would be similar to the Specific Plan, impacts on on-site sensitive receptors would be similar to Specific Plan development.

Odors

The potential for odor generation during site grading would be similar to the Specific Plan. Reduced Density, Lower Maximum Height development would result in a more uniform distribution of development intensity within the western portion of the site but would not change the amount of development either upwind or downwind of the water recycling facility. Thus, odor impacts would be similar to Specific Plan development.

Greenhouse Gas Emissions

Specific Plan Area Greenhouse Gas (GHG) Emissions

Lowering building heights to reduce Baylands development by 400 dwelling units and 2.5 million s.f. of commercial office use would reduce the Specific Plan's net increase of GHG emissions and reduce the severity of its significant unavoidable impact.

Effect on Regional GHG Emissions

Because per capita VMT for Baylands employees would be slightly higher than for the Specific Plan, the Reduced Density, Lower Maximum Building Height development would result in a smaller reduction in regional VMT and mobile source GHG emissions than the Specific Plan.

Consistency with GHG Reduction Plans, Policies, Performance Standards, and Regulations

Reduced Density, Lower Maximum Building Height development would include the same GHG reduction features and be subject to the same mitigation measures as the Specific Plan and would therefore be consistent with applicable GHG reduction plans, policies, performance standards, and regulations.

Energy Resources

Wasteful, Inefficient, or Unnecessary Use of Energy

By reducing the total number of dwelling units and commercial square footage within the Baylands, the Specific Plan's 55-acre solar field would reduce overall energy use and generate a greater proportion of the Specific Plan's on-site energy demand within the Baylands. On-site buildings would provide the same energy conservation features as the Specific Plan but would also meet Tier 2 CALGreen Standards. As a result, this alternative would reduce the Specific Plan's less than significant impact.

Consistency with Applicable Energy Reduction Programs, Plans, Ordinances, and Policies

In addition to the energy efficiency features of the Specific Plan, this alternative would generate a greater proportion of the energy it consumes as well as meet Tier 2 CALGreen Standards. Reduced Density, Lower Maximum Building Height development would, therefore, be consistent with applicable energy reduction programs, plans, ordinances, and policies.

Noise and Vibration

Temporary Increase in Ambient Noise

The extent of site grading required for Reduced Density, Lower Maximum Building Height development would be no different than that of the Specific Plan, resulting in similar noise impacts. Lowering the heights of taller buildings while simultaneously reducing the Specific Plan's overall development intensity could reduce the number of buildings that would require pile foundations compared to the Specific Plan. In addition, the combination of reduced building heights and development intensity could enhance the feasibility of constructing pile foundations using quieter technologies, which would reduce the amount of pile driving required for Baylands development. As a result, Reduced Density, Lower Maximum Building Height development would reduce the severity of the Specific Plan's significant unavoidable impact if fewer buildings would require pile driving.

Traffic Noise Increase

Reduced Density, Lower Maximum Building Height development would generate less traffic than the Specific Plan, while retaining direct access to the US 101 freeway Candlestick interchange. As a result, the amount of traffic along area roadways would decrease, reducing significant unavoidable impacts of the Specific Plan, although not to a less than significant level.

Permanent Increase in Ambient Noise

Reduced Density, Lower Maximum Building Height development would generate noise from the same stationary sources as the Specific Plan. Due to the logarithmic scale used to measure noise, reducing development intensity would not likely be sufficient to substantially reduce permanent increases in ambient noise compared to the Specific Plan. This alternative would be subject to the same performance standards and mitigation measures would be required to comply with City noise ordinance requirements. Impacts would thus be similar to those of the Specific Plan (significant and unavoidable).

Exacerbate Land Use / Noise Incompatibilities by Placing People in High Noise Areas

Because the tallest buildings within the Baylands are those closest to the Caltrain rail line, Reduced Density, Lower Maximum Building Height development would reduce the number of dwelling units and square footage of commercial office development adjacent to the Caltrain right-of-way and the US 101 freeway. Thus, impacts would be less than the Specific Plan.

Groundborne Vibration

Because the same grading would be required for Reduced Density, Lower Maximum Building Height development, vibration generated during site grading would be similar to the Specific

Plan. Lowering the heights of taller buildings while simultaneously reducing the Specific Plan's overall development intensity would, at a minimum, not increase and could decrease the number of buildings that would require pile foundations compared to the Specific Plan. As a result, Reduced Density, Lower Maximum Building Height development could reduce the severity of the Specific Plan's significant unavoidable impact.

Exacerbate Human Annoyance or Hazards by Placing Buildings in High Groundborne Vibration Areas

Because the tallest buildings within the western portion of the Baylands are those closest to the Caltrain rail line, the number of dwelling units and square footage of commercial office development adjacent to the Caltrain right-of-way would decrease while commercial office development proximity to the US 101 freeway would be eliminated. Thus, impacts for this alternative would be less than for the Specific Plan.

Hazards and Hazardous Materials

Risks Involved in Transport, Use, Disposal, and Management of Hazardous Materials

Demolition of older buildings potentially containing asbestos or lead-based paints would be the same for Reduced Density, Lower Maximum Building Height development as for the Specific Plan. Because the types and intensity of uses would be similar but reduced in intensity, the potential for a release of hazardous materials due to the transport, use, disposal, or management of hazardous materials, whether resulting from routine activities or an accident, would be reduced and likely adversely affect fewer people within the Baylands than would the Specific Plan. Baylands development in this alternative would be subject to the same extensive set of regulations designed to protect the public and environment from such a release of hazardous materials. Thus, impacts would be less than those of the Specific Plan.

Create a Health Hazard for an Existing or Planned School Site due to Release of Hazardous Materials or Proximity of Hazardous Conditions

The location of a school site within the Baylands in relation to locations of hazardous materials sites and emitters would be similar to the Specific Plan. Thus, the impact of this alternative would also be similar.

Development on a Property that is Included on a List of Hazardous Materials Sites

Reduced Density, Lower Maximum Building Height development would have the same footprint as the Specific Plan, including the former railyard and former Brisbane Landfill, which are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. The same site remediation and final landfill closure pursuant to Title 27 requirements would be implemented for this alternative as for the Specific Plan prior to

development. This alternative would be subject to the same requirements as the Specific Plan and would have a similar impact.

Create an Airport Safety Hazard or Expose People to Excessive Noise of Aircraft Operations

Since none of the Specific Plan area is subject to safety hazards of excessive noise due to aircraft operations, this alternative would have the same impact as the Specific Plan.

Emergency Preparedness and Response

Because this alternative would have the same amount of development within the same footprint as the Specific Plan, impacts would be the same.

Hydrology and Water Quality

Protection of Water Quality

The amount of grading and construction needed for Reduced Density, Lower Maximum Building Height development would be similar to the Specific Plan, including the high potential for potential for erosion and siltation and release of pollutants during grading and construction. Because this alternative would have a similar roadway system, the potential for release of urban pollutants to the Brisbane Lagoon and to San Francisco Bay via Visitacion Creek would be similar to the Specific Plan. This alternative would implement a similar set of Best Management Practices outlined in required NPDES permits, SWPPPs and the requirements of NPDES Provision C.3. Impacts would therefore be similar to the Specific Plan.

Groundwater Recharge and Sustainable Management

Reduced Density, Lower Maximum Building Height development would not reduce the site's impervious surface area compared to the Specific Plan due to the requirement for construction of an impermeable cap on the landfill. Because the local groundwater basin is not used as a potable or non-potable water supply and is hydraulically connected to the Bay and lagoon, this alternative would not interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence. In addition, as demonstrated in the Water Supply Assessment prepared by Cal Water, Baylands development would have no effect on groundwater pumping within South San Francisco. Impacts would be similar to the Specific Plan (less than significant).

Flood Hazards

This alternative would have a similar development footprint with a similar impermeable surface area and generate a similar stormwater runoff as the Specific Plan. Reduced Density,

Lower Maximum Building Height development would comply with the same flood protection standards and requirements, resulting in similar impacts as the Specific Plan.

Release of Pollutants Due to Flood, Emergent Groundwater, Tsunami, or Seiche

The Specific Plan area is not located within a tsunami hazard zone and the required on-site water storage tank facilities would be designed and constructed to withstand anticipated oscillations in water surface caused by an earthquake. Further, the risk of release of pollutants attributable to inundation would be negligible since potential pollutants would not be present at the ground surface and no facilities storing hazardous materials would be located downstream of Baylands water storage facilities. In addition, this alternative would be subject to the same less than significant potential for emergent groundwater as the Specific Plan. Thus, impacts would be the same as for the Specific Plan.

Geology, Soils, and Seismicity

Fault Rupture

Because there are no known active or potentially active fault traces across the Baylands, and the site is not located within an Alquist-Priolo Earthquake Fault Zone, no impact would occur.

Seismic Ground Shaking

Development would be required to conform to the same CBC seismic design parameters and mitigation measures as the Specific Plan, which would provide an appropriate level of safety. Due to fewer people and less development within the Baylands, development of this alternative would result in reduced impacts compared to the Specific Plan.

Liquefaction and Seismic-Related Ground Failure

Because of the presence of high groundwater and loose, unconsolidated soils underlying both the western and eastern portions of the Specific Plan area, this alternative would be subject to similar liquefaction hazards as the Specific Plan. Reduced Density, Lower Maximum Building Height development would be required to conform to the same site-specific foundation design parameters and requirements as the Specific Plan. Thus, similar impacts would result.

Slope Stability

Reduced Density, Lower Maximum Building Height development would produce similar grading and manufactured slopes as the Specific Plan. Site-specific development projects would be required to comply with the same California Building Code requirements for slope stability. Compliance with the same California Building Code and City requirements as the Specific Plan would result in similar less than significant impacts.

Expansive Soils and Soil Corrosivity

Wherever Bay Mud is present, such as along Bayshore Boulevard as well as during construction of deep foundations, corrosive and expansive subsurface soils are likely to be encountered. Site-specific development projects would be designed and constructed to comply with the same requirements of final site-specific design-level geotechnical reports as the Specific Plan, which would ensure appropriate design and construction to mitigate soil corrosivity and expansive soil hazards. The combination of compliance with the CBC and City requirements would reduce hazards from soil corrosivity and expansive soils to a similar less than significant level as the Specific Plan.

Paleontological Resources

The only deep excavations that would disturb significant paleontological resources within the Colma or Merced Formations would be pile foundation installation. Because installation of pile foundations would render any potentially valuable specimens irretrievable, such installation is not typically considered to cause significant impacts. This alternative would also have the same unlikely potential that excavations for other construction activities would be deep enough to encounter paleontological resources. Because this alternative would have the same potential for such excavations as the Specific Plan and would be subject to the same mitigation measures, impacts would be similar to the Specific Plan.

Use of Septic Tanks or Alternative Wastewater Disposal Systems

Baylands development would be connected to a municipal wastewater system and neither septic tanks nor alternative wastewater disposal systems would be used.

Utilities, Service Systems, and Water Supply

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and result in the same less than significant impacts.

Water Supply

Reduced Density, Lower Maximum Building Height development would consume less water than the Specific Plan. Because it would generate less wastewater, this alternative would also generate less recycled water than the Specific Plan, unless sewage generated by the City and Bayshore Sanitary District were to be recycled on-site. As a result, water supply impacts of this alternative would be similar to the Specific Plan.

Construction and Improvement of Utility and Service System Facilities

Demolition, grading, and construction of utility facilities would be the same as for the Specific Plan and result in the same less than significant impacts.

Consistency with Solid Waste Management Policies

Because this alternative would generate the same amount of solid waste on a per unit basis, would be subject to the same diversion programs, and would achieve the same waste diversion rate as the Specific Plan, impacts would be similar to the Specific Plan.

Landfill Capacity

Reduced Density, Lower Maximum Building Height development would generate less total solid waste, be subject to the same diversion programs, and achieve the same waste diversion rate as the Specific Plan. By reducing the amount of development, this alternative would reduce the Specific Plan's less than significant impact on landfill capacity.

Public Services and Facilities

Adverse Physical Environment Effects Associated with Construction or Improvements of Fire Protection, Police, School, and Other Public Facilities

Demolition, grading, and construction of fire protection, police, school, and other facilities to serve Baylands development would be the same as for the Specific Plan and result in similar less than significant impacts in relation to police, fire protection, and schools. This alternative would also generate similar demands, result in similar impacts, and be subject to the same mitigation measures as the Specific Plan in relation to libraries and the City's corporation yard.

Recreation Resources

Physical Deterioration of a Park or Recreational Facility

Reduced Density, Lower Maximum Building Height development would provide parkland in excess of the 5.03 acres per 1,000 population of parkland currently available to Brisbane residents and not cause any physical deterioration of existing parks and recreational facilities within the City. Because population growth would be reduced in comparison to the Specific Plan, this alternative would have a proportionately lesser (although still significant) impact on existing community facilities and be subject to the same mitigation as the Specific Plan, resulting in a similar impact.

Physical Deterioration of Candlestick Point Windsurfing Resources

Reduced Density, Lower Maximum Building Height development would reduce the height of the tallest buildings within the western portion of the Baylands. While the location of commercial office buildings east of the Caltrain right-of-way would remain unchanged, some building heights would be reduced. As a result, this alternative would reduce the less than significant impact of the Specific Plan.

Wildland Fire

Exacerbate Fire Hazards

Reduced Density, Lower Maximum Building Height development would result in similar construction activities within and adjacent to combustible vegetation and would reduce population/employment growth compared to the Specific Plan. Wildland fire hazard impacts would be less than the Specific Plan.

Evaluation of Alternative 7, Reduced Density, Lower Maximum Building Height, in Relation to Project Objectives

Lowering the maximum building heights of the tallest proposed buildings within the Baylands and reducing the overall amount of development permitted within the Baylands compared to the Specific Plan would implement the Brisbane General Plan, including GP-1-18 and Measure JJ. In addition, this alternative would achieve each of the project's overarching and other objectives (see **Table 8-13**). Reduced Density, Lower Maximum Building Height development provides for productive reuse of the Baylands along with restoration and enhancement of on-site resources. Housing opportunities for all economic segments of the community would be provided to meet the City's RHNA and adopted Housing Element obligations (see **Table 4.4-1**), along with providing economic development opportunities and fiscal benefits for the community. Environmental impacts of the Baylands Specific Plan would be reduced overall.

Table 8-13: Extent to Which Alternative 7, Reduced Density, Lower Maximum Building Height Development, Would Achieve Project Objectives

Project Objectives	Extent to Which Alternative 7, Lower Maximum Building Height (Reduced Density) Development, Would Achieve Objectives
The underlying purpose of the Baylands Specific Plan and the development it permits is to:	
Provide for the productive reuse of this brownfield site in a manner that eliminates ongoing ecological damage and ensures the safety of all who will use the Baylands.	Reduced Density, Lower Maximum Building Height development would require site remediation and Title 27 landfill closure prior to development. This alternative would also provide for the reuse of the Baylands, eliminate ongoing ecological damage, and ensure the safety of all who will use the site
Project Objectives for the Baylands are to:	
• Preserve and enhance the site's natural resources and historic features within a system of permanent open space that: o Restores and enhances wetlands and natural habitats within the Baylands; o Promotes visual connectivity between the Baylands, San Bruno Mountain, and San Francisco Bay; o Adapts to climate change and sea level rise; and o Provides a range of recreational opportunities and open space experiences for Baylands residents and workers as well as for the larger Brisbane community.	This alternative provides restoration and enhancement of on-site habitat areas within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill. Restoration/adaptive reuse of the historic Roundhouse would occur in the same manner as the Specific Plan. By lowering building heights and reducing development intensity, this alternative would reduce obstructions to views of San Bruno Mountain and the San Francisco Bay compared to the Specific Plan. This alternative would protect development from adverse effects of climate change and sea level rise through an adaptation strategy that would allow wetlands and non-wetland waters along Visitacion Creek and the north shore of the lagoon to adapt naturally to sea level rise and increasing tidal influence.
• Implement the City's Housing Element by providing a mix of housing types, sizes, and densities that contribute to local and regional housing needs for all economic segments of the community, as well as for families and individuals of all ages and physical abilities.	This alternative would provide a sufficient amount, mix, and intensity of residential building types to provide housing for all economic segments of the community in accordance with the City's Housing Element through 2031 but would also make a smaller contribution to meeting future housing needs beyond the 2031 than would the Specific Plan.
• Enhance Brisbane's economic vitality by ensuring that Baylands development will be revenue positive to the City.	Compared to the Specific Plan, this alternative would reduce residential development by 18.2 percent and commercial office development by 30.1 percent, while retaining the same amount of hotel development. As a result, Reduced Density, Lower Maximum Building Height development should be revenue positive for the City.
• Establish the Baylands as a leading model of sustainable development consistent with the principles of the City's Sustainability Framework for the Baylands (Integral Group 2015).	Reduced Density, Lower Maximum Building Height development would include all of the sustainability features set forth in the Specific Plan and EIR mitigation measures.
• Attract office-based employment to the Baylands that provides a broad range of high-paying jobs as well as training and advancement opportunities for the community's young adults.	This alternative would also generate the same types of employment opportunities as the Specific Plan, although to a lesser degree.
• Enable residents, workers, and visitors to be less dependent on cars.	This alternative would improve access to the Bayshore Caltrain station and place all residents within walking distance of the station.

Feasibility of Alternative 7, Reduced Density, Lower Maximum Building Height Development, and Overall Conclusion

The Reduced Density, Lower Maximum Building Height development would be consistent with the Brisbane General Plan while reducing the overall development program of the Specific Plan. The resulting 1,800 dwelling units, 4.5 million s.f. of commercial, and 500,000 s.f. of hotel use would not introduce any additional building types or development densities to the Specific Plan area. As such, Alternative 7, Reduced Density, Lower Maximum Building Height development would be both reasonable and feasible per the requirements of CEQA Guidelines Section 15126.6 (a).

Overall, the Reduced Density, Lower Maximum Building Height alternative would reduce the environmental impacts of the Baylands Specific Plan.

8.5 ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA Guidelines Section 15126.6(e)(2) states, "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives." Typically, the "No Project-No Build" alternative constitutes the environmentally superior alternative since no changes to the physical environment would occur, thereby requiring identification of another alternative to the project to be identified as being "environmentally superior."

8.5.1 SUMMARY COMPARISON OF LAND DEVELOPMENT ALTERNATIVES

The following tables summarize differences between the alternatives considered above in relation to their impacts and relative effectiveness at reducing significant impacts, as well as their advantages and disadvantages.

Table 8-14: Advantages and Disadvantages of EIR Alternatives

Alternative	Summary of Advantages and Disadvantages
No Project-No Build	Eliminating proposed future development and leaving the Baylands in its existing condition would avoid the 2025 Specific Plan project's significant unavoidable environmental impacts and largely avoid the project's other environmental impacts. The No Project-No Build Alternative would, however, prevent implementation of the General Plan and generate new impacts. • Eliminating residential development within the Baylands would require the City to identify and rezone locations outside of the Baylands to accommodate an additional 1,164 dwelling units through 2031 as defined in the City's RHNA. • The historic Roundhouse would continue to deteriorate, leading to its eventual loss in the absence of intervention with public funding. • By leaving Lagoon Road in its current location, projected sea level rise over time would cause daily and ultimately permanent inundation of the roadway, limiting

Alternative	Summary of Advantages and Disadvantages
	access to the Sierra Point Subarea and requiring public expenditure for roadway realignment. • Existing contamination within the western portion of the Baylands would not be remediated, nor would the former Brisbane landfill undergo final closure pursuant to Title 27 requirements.
No Project-General Plan Buildout	The No Project-General Plan Buildout Alternative would be consistent with the General Plan, restore the Roundhouse for adaptive use, and provide zoning to accommodate housing for all economic segments of the community through 2031. However, by eliminating proposed General Plan amendments from the project, this alternative would: • Leave Lagoon Road subject to projected sea level rise that would, over time, cause daily and ultimately permanent inundation of the roadway, limiting access to the Sierra Point Subarea and requiring public expenditure for roadway realignment. • Create confusion for Specific Plan implementation due to differing General Plan policies for the Beatty and Baylands Subarea portions of the Specific Plan area. This alternative would also increase overall development intensity by applying the 6.5 million s.f. maximum commercial development established in GP-1-18 and Measure JJ only to the Baylands Subarea, which would permit additional development within the Beatty portion of the Specific Plan area.
1. Proposed Density Development Around an Operating 45-Acre Light Maintenance Facility	The alternative differs from the Specific Plan by shifting the alignment of Tunnel Avenue slightly to the east and moving infrastructure facilities from the west side of Tunnel Avenue to accommodate construction and operation of a 45-acre light maintenance facilities by the California High-Speed Rail Authority. Impacts of this alternative would be similar to those of the 2025 Specific Plan project, including its significant unavoidable impacts.
2. Proposed Density, Balanced Commercial Development	The alternative differs from the Specific Plan by shifting 400,000 s.f. of office development from the western to the eastern portion of the site. • The resulting balance of commercial development (3.6 million s.f. office west of Caltrain and 2.9 million s.f. to the east) would better implement General Plan policy calling for commercial uses to be distributed to both sides of the Caltrain right-of-way than the Specific Plan but would have little to no effect on most project impacts. • This alternative would have the potential to reduce the visual mass of commercial development west of Caltrain compared to other Project Density alternatives.
3. Proposed Density, Lower Maximum Building Height	This alternative reduces maximum building heights to 12 stories for commercial buildings and 8 stories for residential uses and thereby eliminates the Specific Plan's proposed 20+ story towers. Compared to the Specific Plan and other Project Density alternatives, reducing the maximum permitted height of Baylands residential development while permitting the maximum allowable development proposed in the Specific Plan would: • Result in a more uniform profile across the site with substantially reduced variation in building heights. • Substantially reduce or possibly eliminate the number of lower density residential building types (single family, duplex, townhouse). • Require increasing the heights of lower profile buildings proposed in the Specific Plan, potentially leading to an increased need for pile driving building foundations.
4. Reduced Commercial Development	The Reduced Commercial Development Alternative would reduce Specific Plan commercial development from 6.5 to 4.5 million s.f. • This alternative would reduce the Specific Plan's impacts, including its significant unavoidable impacts although not to the same degree as other reduced density alternatives that were analyzed.

Alternative	Summary of Advantages and Disadvantages
	• While this alternative would not reduce impacts to the same degree as other reduced density alternatives, it would also not reduce housing opportunities that might be needed to meet future Regional Housing Needs Allocations. • By concentrating commercial development east of Caltrain along the Geneva Avenue and Sierra Point Parkway corridors, the 55-acre solar farm would be expanded and the Baylands would generate a greater proportion of its electrical demand on-site.
5. Reduced Density Development Around an Operating 45-Acre Light Maintenance Facility	Alternative 5 would reduce Specific Plan residential development from 2,200 to 1,800 dwelling units, while also reducing commercial development from 6.5 to 4.5 million s.f. • This alternative would reduce the Specific Plan's impacts, including its significant unavoidable impacts. • By concentrating commercial development east of Caltrain along the Geneva Avenue and Sierra Point Parkway corridors, the 55-acre solar farm would be expanded and the Baylands would generate a greater proportion of its electrical demand on-site. • While this alternative would provide adequate residential zoning to meet the current Housing Element's quantified objectives, it would also provide less opportunity for the development of housing to meet the quantified needs for housing development for future Housing Elements.
6. Reduced Density, Balanced Commercial Development	Alternative 6 would reduce Specific Plan residential development from 2,200 to 1,800 dwelling units, while also reducing commercial development from 6.5 to 4.5 million s.f. It would also shift 200,000 s.f. of commercial use from the western to the eastern portion of the Baylands compared to other reduced density alternatives. • This alternative would have the potential to reduce the visual mass of commercial development to a greater degree than other alternatives. • While this alternative would not reduce impacts to the same degree as other reduced density alternatives, it would also not reduce housing opportunities that might be needed to meet future Regional Housing Needs Allocations. • Office development within the eastern portion of the Baylands would be located in the same footprint as the Specific Plan. As a result, buildings could be lower in height compared to other reduced density development, although the solar field would not be increased.
7. Reduced Density, Lower Maximum Building Height	Alternative 7 reduces residential development from 2,200 to 1,800 dwelling units, while also reducing commercial development from 6.5 to 4.5 million s.f. This is accomplished by reducing maximum building heights to 12 stories for commercial buildings and 8 stories for residential uses and thereby eliminates the Specific Plan's proposed 20+ story towers. • Variation in building heights and lower density residential and office building types (single family, duplex, townhouse) would be retained without increasing the number of buildings requiring pile driving for building foundations. • This alternative would reduce the Specific Plan's overall impacts, including its significant unavoidable impacts. • While this alternative would provide adequate residential zoning to meet the current Housing Element's quantified objectives, it would also provide less opportunity for the development of housing to meet the quantified needs for housing development for future Housing Elements. • By concentrating commercial development east of Caltrain along the Geneva Avenue and Sierra Point Parkway corridors, the 55-acre solar farm would be expanded and the Baylands would generate a greater proportion of its electrical demand on-site.

8.5.2 ENVIRONMENTALY SUPERIOR ALTERNATIVE: REDUCED DENSITY, LOWER MAXIMUM BUILDING HEIGHT

The environmentally superior alternative for the Baylands considers both the number of significant impacts each alternative would generate as well as the relative severity of each alternative's adverse environmental effects. The Reduced Density, Lower Maximum Building Height alternative would be the environmentally superior alternative for Baylands land development since it would have the least overall adverse effect on the physical environment in comparison to the Specific Plan and the alternatives evaluated in this Draft EIR. Reduced Density, Lower Maximum Building Height development would have the following effects on the significant unavoidable impacts of the Specific Plan:

Impact AQ-1: The Baylands Specific Plan would cause a net increase in emissions of non-attainment criteria pollutants (ROG, NO_X, $PM_{2.5}$, PM_{10},) exceeding BAAQMD Regional Criteria Pollutant Significance Thresholds during construction and for operations at the completion of Phase 1 development, as well as at full Specific Plan buildout.

Lowering building heights while simultaneously reducing the amount of residential and commercial development as the Specific Plan would reduce overall mobile source pollutant emissions for project operations.

Impact GHG-1: The Baylands Specific Plan would cause an increase in total greenhouse gas (GHG) emissions generated within the Baylands.

Lowering building heights to reduce Baylands development by 400 dwelling units and 2.5 million s.f. of commercial office use would reduce the Specific Plan's net increase of GHG emissions.

Impact NOI-1: The use of impact pile driving for construction of buildings over 5 stories in height or for the Geneva Avenue bridge in proximity to occupied residential and office buildings would cause unavoidable adverse effects, particularly if multiple pile driving activities were undertaken within the Baylands at the same time, until construction of such buildings is completed.

Lowering the heights of taller buildings while simultaneously reducing the Specific Plan's overall development intensity could decrease the number of buildings that would require pile foundations. In addition, reduced building heights could enhance the feasibility of constructing pile foundations using quieter technologies.

Impact NOI-2: The aggregate operation of all stationary noise sources would increase noise levels generated within the Specific Plan area as a whole. Because

the exact future location and configuration for all of these sources cannot be known at this time, it is not possible to ensure that the aggregate increase in noise levels at specific off-site receptor locations from stationary sources would not result in a permanent noise increase in excess of 5 dBA L_{eq}.

Due to the logarithmic scale used to measure noise, reducing development intensity would not likely be sufficient to substantially reduce permanent increases in ambient noise compared to the Specific Plan.

Impact NOI-3: Increased noise levels from Baylands-generated traffic would exceed applicable standards along one roadway segment at the conclusion of Phase 1 development (assumed to occur in 2035), increasing to 3 roadway segments at full Specific Plan buildout (assumed to be 2040).

Lower Maximum Building Height (Reduced Density) development would generate less traffic than the Specific Plan, while retaining direct access to the US 101 freeway Candlestick interchange. As a result, the amount of traffic along area roadways would decrease, reducing significant unavoidable impacts of the Specific Plan, although not to a less than significant level.

Additional effects of the Reduced Density, Lower Maximum Building Height Alternative include:

- Reducing the Specific Plan's overall impacts.
- Eliminating the Specific Plan's proposed 20+ story towers.
- Retaining variation in building heights and lower density residential and office building types (single family, duplex, townhouse) without increasing the number of buildings requiring pile driving for building foundations.
- Expanding the 55-acre solar farm and generating a greater proportion of the Baylands electrical demand on-site compared to the Specific Plan and Project Density alternatives.

CHAPTER 9 SUBSEQUENT EIR ANALYSIS AND FINDINGS

9.1 INTRODUCTION

Because an EIR was certified for development of the Baylands in August 2018 (Brisbane Baylands Program EIR, State Clearinghouse #2006022136), this chapter analyzes the 2025 Specific Plan in relation to CEQA Section 21166 and CEQA Guidelines Section 15162 requirements for preparation of a subsequent or supplemental EIR. Many of the physical environmental effects that would result from the 2025 Specific Plan project represent new significant environmental effects that were not previously identified in the Program EIR or substantial increases in the severity of previously identified significant effects. These new and substantially more severe environmental impacts are described in this chapter, which serves as a Subsequent Draft EIR pursuant to the provisions of CEQA Section 21166 and CEQA Guidelines Section 15162, incorporating by reference the environmental analyses contained in Chapter 4 and the various appendices of this EIR.

CEQA Section 21166, *Subsequent or Supplemental Impact Report; Conditions*, states:

> When an environmental impact report has been prepared for a project pursuant to this division, no subsequent or supplemental environmental impact report shall be required by the lead agency or by any responsible agency, unless one or more of the following events occurs:
>
> (a) Substantial changes are proposed in the project which will require major revisions of the environmental impact report.
>
> (b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report.
>
> (c) New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, becomes available.

CEQA Guidelines Section 15162 expands upon CEQA Section 21166 and states:

> **15162. Subsequent EIRs and Negative Declarations**
>
> (a) When an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:
>
> (1) Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the

involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;

(2) Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or Negative Declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

(3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete, or the Negative Declaration was adopted, shows any of the following:

(A) The project will have one or more significant effects not discussed in the previous EIR or negative declaration;

(B) Significant effects previously examined will be substantially more severe than shown in the previous EIR;

(C) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or

(D) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative.

The tables below provide one of the following conclusions based on substantial evidence for each impact analyzed in the Program EIR and Chapter 4 of this EIR:

1. **Neither a new significant impact that was not disclosed in the Program EIR nor a substantially more severe significant impact than was identified in the Program EIR would result because:**

    a. **The Specific Plan would have no impact.** This conclusion is reached if the 2025 Specific Plan would not have any measurable physical effect on the environment, which was also the conclusion of the Program EIR; or

    b. **The Program EIR Adequately Addresses the Specific Plan's Impact.** This conclusion is reached if the Baylands Program EIR would not be needed because it adequately addressed impacts the 2025 Specific Plan project and none of the

conditions set forth in CEQA Section 21166 or CEQA Guidelines Section 15162 that would require a subsequent or supplemental EIR would therefore occur.

2. **A new significant impact that was not disclosed in the Program EIR or a substantially more severe significant impact than was identified in the Program EIR would result due to:**

    a. **Substantial Changes to the Project.** This conclusion is reached if analysis indicates the presence of substantial changes to the project analyzed in the Program EIR would result in new significant environmental effects or a substantial increase in the severity of previously identified significant effects.

    b. **Substantial Changes to the Circumstances under which the Project is Undertaken.** This conclusion is reached if analysis indicates substantial changes occur with respect to the circumstances under which the project is undertaken that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects.

    c. **Availability of Information not Known when Program EIR was Certified.** This conclusion is reached if analysis indicates the availability of information of substantial importance that was not available at the time of the Program EIR such that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects.

9.2 CHANGES TO THE PROGRAM EIR PROJECT DESCRIPTION MADE BY THE 2025 SPECIFIC PLAN PROJECT

This section identifies changes made by the 2025 Specific Plan project to the project that was analyzed in the Program EIR, including differences between the 2025 Specific Plan project and:

- The 2011 Specific Plan proposed by the applicant (Section 9.2.1);
- Other Concept Plan Scenarios analyzed in the Program EIR (Section 9.2.2); and
- General Plan Amendment GP-1-18 as approved by the City Council and Measure JJ as approved by Brisbane voters in 2018.

9.2.1 COMPARISON OF THE 2011 SPECIFIC PLAN PROPOSED BY THE APPLICANT AND THE 2025 SPECIFIC PLAN PROJECT

As illustrated in **Table 9-1**, **Figures 9-1a and 9-1b**, and **Figures 9-2a and 9-2b**, the 2025 Specific Plan project described in Chapter 3 proposes substantial changes to the 2011 Specific Plan that

was proposed by the applicant and analyzed in the Program EIR. Compared to the 2011 Specific Plan in the Program EIR, the 2025 Specific Plan project includes the following land use changes:

- Reduces the number of dwelling units by 55 percent (from 4,434 to 2,200).
    - Retains approximately the same amount of residential acreage while reducing overall residential density (52.8 acres, 42.7 du/ac) compared to the 2011 Specific Plan (56.0 acres, 79.2 du/ac).
    - Increases the proportion of single-family lower-density housing products, while also increasing maximum residential building height from 125 feet to 270 feet to provide for construction of residential towers.
- Reduces the total amount of commercial development by 213,000 square feet (approximately 3.2 percent), while increasing projected employment within the Baylands by approximately 11 percent.
    - Reduces the amount of retail space by approximately 82 percent, while nearly doubling the amount of hotel use within the Baylands.
    - Reduces commercial office acreage and increases overall development intensity (133.3 acres, 1.21 FAR) compared to the 2011 Specific Plan (150 acres, 1.02 FAR).
    - Increases maximum office building height from 170 feet to 260 feet.
    - Eliminates previously proposed industrial development adjacent to the east side of the Kinder Morgan tank farm.
- Realigns Lagoon Road to serve as a through route from Bayshore Boulevard connecting directly to the US 101 freeway southbound on- and off-ramps within the Baylands.
- Increases the proposed onsite solar field from 19 to 55 acres, eliminates wind energy generation, and doubles the minimum requirement for onsite renewable energy generation from 42,400 MWh to 85,000 MWh.
- Adds development of a 250 MW utility-scale battery storage facility, distributed battery storage, onsite switching substation, and distributed battery storage within the Baylands, along with an underground gen-tie line and improvements at the PG&E Martin Substation to connect the Baylands electrical system.
- Retains the existing lumber yard in its current location rather than moving it to another location within Baylands. The 2025 Specific Plan designates Golden State Lumber's main facility as an "Existing Use Area."

In addition, the following changes are proposed to other project components.

- **Modify the proposed water supply for the Baylands.** The previously proposed water supply agreement under which the City would acquire up to 2,400 acre-feet per year (AFY) via a water transfer agreement with the Oakdale Irrigation District (OID) subject

to conveyance agreements to be executed among OID, Modesto Irrigation District, San Francisco Public Utilities Commission (SFPUC), and the City of Brisbane is no longer proposed.

The 2025 Specific Plan project instead proposes establishing the California Water Service Company (Cal Water) as the water agency for the Baylands, Sierra Point, and Beatty areas, which would make water now being provided by the City to those areas available for buildout of the balance of the City. This plan would use existing water sources available to BAWSCA agencies and would not require new infrastructure to deliver potable water to Brisbane. In exchange for the provision of potable water supply by Cal Water, the proposed Baylands water recycling facility would be doubled in size to provide up to 0.43 million gallons per day of recycled water for irrigation purposes to Cal Water for use within its South San Francisco District, requiring approximately 5.5 miles of offsite recycled water line construction.

- **Eliminate site remediation and landfill closure as part of the project.** Remedial action plans for Operating Units OU-SM and OU-2 have undergone environmental review based on the Program EIR and have been approved by state and county regulatory agencies. Thus, continued inclusion of site remediation and landfill closure as a component of Specific Plan development is no longer necessary.
- **Add a "Bayshore Boulevard Mobility Plan."** General Plan Amendment GP-1-19, which was adopted in January 2020 called for development of a plan to enhance mobility for Brisbane residents and reduce regional through traffic on Bayshore Boulevard. The Bayshore Boulevard Mobility Plan proposed by the City includes a "road diet" along Bayshore Boulevard that would reconfigure the roadway from four lanes (two in each direction) to two lanes (one in each direction), consolidate the closely spaced Main Street and Industrial Way intersections into a single intersection, and provide protected turn lanes, a multi-use trail, and bus turnouts.
- **Add relocation of Brisbane's existing fire station and establish a second fire station within the Baylands.** The Program EIR established performance criteria for emergency response to fires within the Baylands and called for preparation of a fire services and facilities plan, the results of which are reflected in this new project component. Fire station relocation was not previously analyzed in the Program EIR.
- **Provide a grade 6–8 middle school within the Baylands rather than the previously proposed elementary or charter high school.** The 2025 Specific Plan proposes development of a grade 6–8 middle school within the Baylands. Development of a middle school within the Baylands would necessitate conversion of the existing Bayshore School to a grade PK–5 elementary school, which was not previously analyzed in the Program EIR.

Table 9-1: Comparison of Development Proposed by the 2011 Specific Plan, GP-1-18/Measure JJ, and the 2025 Specific Plan

	2011 Specific Plan	Approved General Plan Amendment GP-1-18/ Measure JJ	2025 Specific Plan	Net Change from 2011 Specific Plan	Net Change from GP-1-18/ Measure JJ
Project Acreage	684.0 acres	684.0 acres	680.1 acres	(3.9) acres	(3.9) acres
Proposed Land Use					
Residential	4,434 d.u.	1,800 to 2,200 d.u.	2,200 d.u.	(2,234) d.u.	Maximum allowed
Commercial	6,713,000 s.f.	Up to 6,500,000 s.f.	6,500,000 s.f.	(184,000) s.f.	Maximum allowed
Office/R&D	6,118,500 s.f.		6,397,800 s.f.	+279,300 s.f.	
Retail	566,300 s.f.		102,200 s.f.	(464,100) s.f.	
Entertainment	28,200 s.f.				
Hotel	261,300 s.f. 329 rooms	500,000 s.f.	500,000 s.f. 800 rooms	+238,700 s.f. +481 rooms	None
Industrial	142,200 s.f.	None	None	(142,200) s.f.	None
Maximum Building Height					
Residential	125 feet		270 feet	+145 feet	
Commercial	170 feet		260 feet	+90 feet	
Non-Residential Development					
West of Caltrain	3,962,500 s.f.		4,500,000 s.f.	+537,500 s.f.	
East of Caltrain	3,125,000 s.f.		2,500,000 s.f.	(625,000) s.f.	
Total Square Feet	7,087,500 s.f.		7,000,000 s.f.	(87,500) s.f.	
Population and Employment					
Population	9,888 residents		4,905 residents	(4,983) residents	
Employees	17,540 employees		19,480 employees	+1,940 employees	
Open Space/Area					
Total	169.6 acres		157.0 acres	(12.6) acres	
Park Land	92.0 acres		64.8 acres	(27.2) acres	
Site Grading	Approximately 4,475,000 cubic yards of soil would be cut within the eastern portion of the site, approximately 3,730,000 cubic yards of which would be transported to the western portion of the site and placed as engineered fill.		Approximately 4,300,000 cubic yards of soil would be cut within the eastern portion of the site, approximately 2,500,000 cubic yards of which would be transported to the western portion of the site and placed as engineered fill.	(175,000) cubic yards	

	2011 Specific Plan	Approved General Plan Amendment GP-1-18/ Measure JJ	2025 Specific Plan	Net Change from 2011 Specific Plan	Net Change from GP-1-18/ Measure JJ
	The remaining 745,000 cubic yards of soils would be temporarily moved about within the landfill footprint to enable construction of an impermeable landfill cap, before being placed as engineered fill.		The remaining 1,800,000 cubic yards of soils would be temporarily moved about within the landfill footprint to enable construction of an impermeable landfill cap, before being placed as engineered fill.	+ 1,055,000 cubic yards	
Water Supply	Acquisition of a water supply for the Baylands from the Oakdale Irrigation District via water transfer agreements.	A reliable water supply approved by the City of Brisbane to support proposed uses within the Baylands shall be secured prior to site development.	Acquisition of a water supply for the Baylands, Beatty, and Sierra Point areas by expanding the California Water Service Company's South San Francisco District to serve these areas.		
Proposed Service Providers					
Water Service	City of Brisbane	City of Brisbane	California Water Service		
Sewer	Bayshore Sanitary District	Bayshore Sanitary District	Bayshore Sanitary District		
Police	Brisbane Police Department	Brisbane Police Department	Brisbane Police Department		
Fire Protection	North County Fire Authority	North County Fire Authority	North County Fire Authority		
Schools Districts	Bayshore Elementary (K–8)	Bayshore Elementary (K–8)	Bayshore Elementary (K–8)		
	Brisbane (K–8)	Brisbane (K–8)	Brisbane (K–8)		
	Jefferson Union High School (9–12)	Jefferson Union High School (9–12)	Jefferson Union High School (9–12)

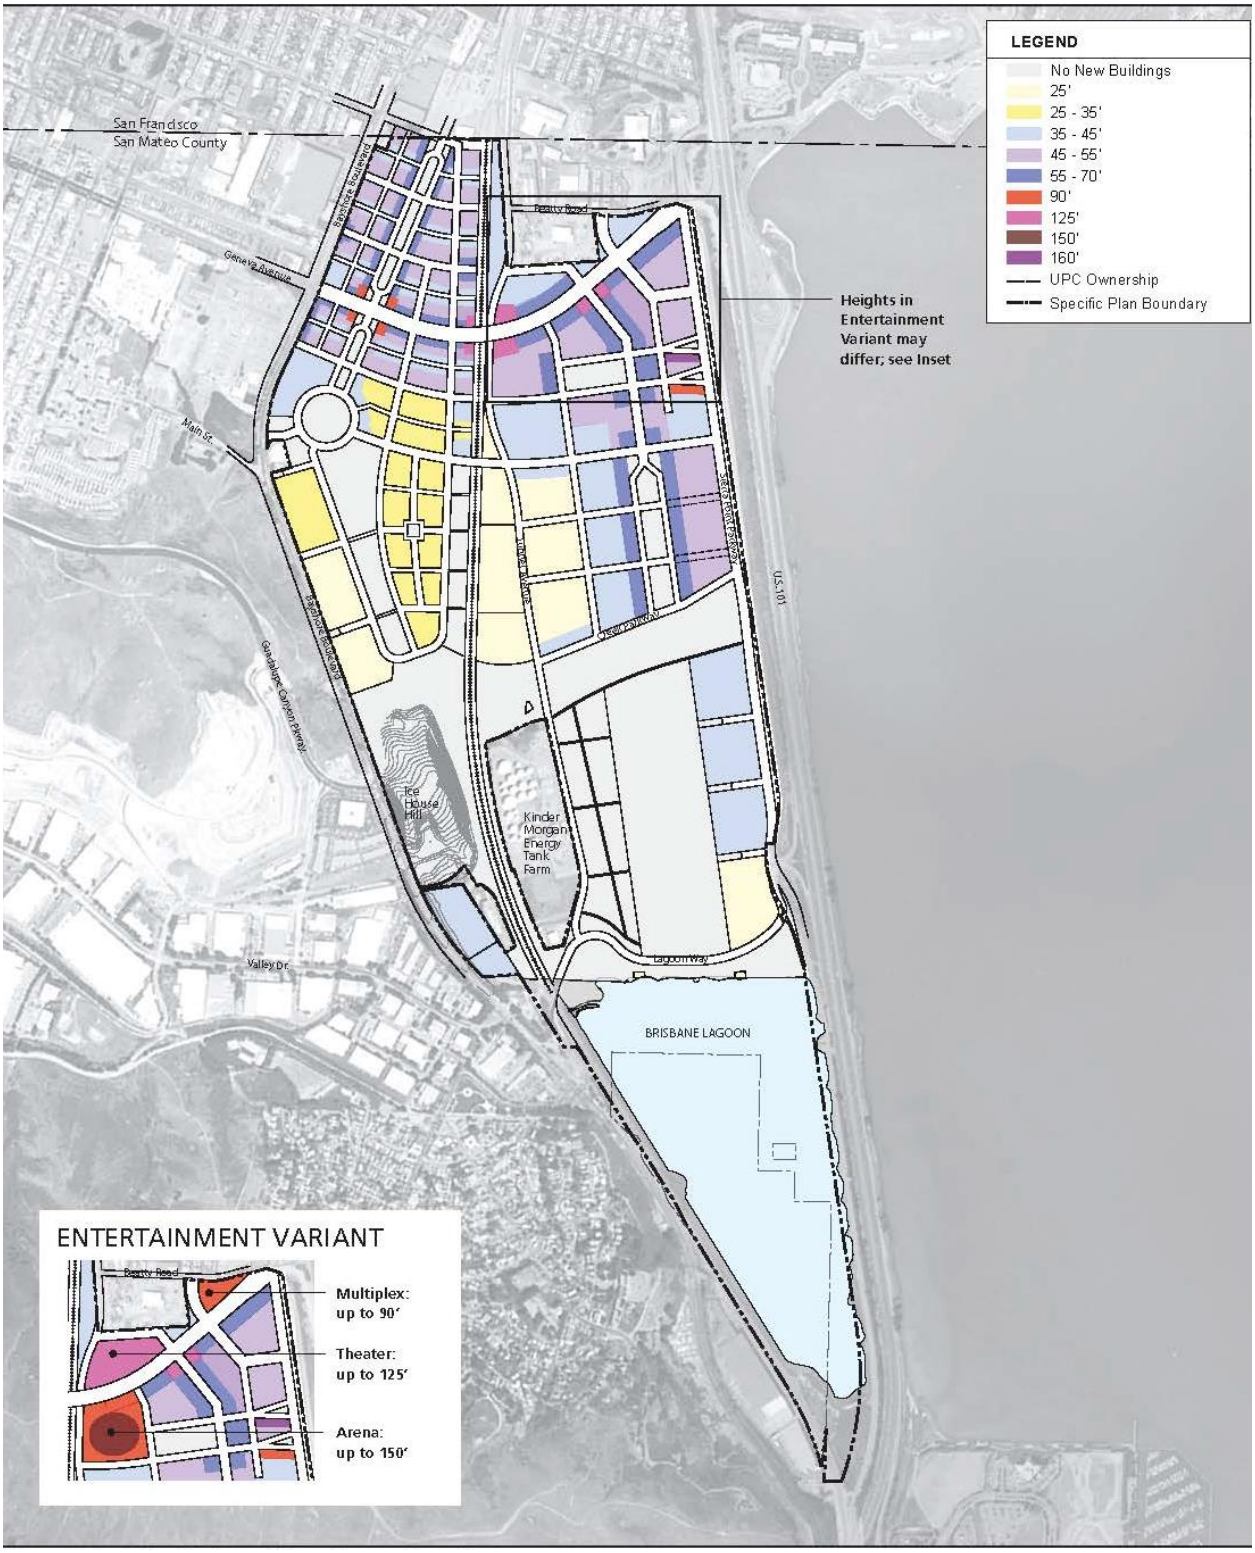

Figure 9-2b: Maximum Building Heights Analyzed in this EIR (2025 Specific Plan)

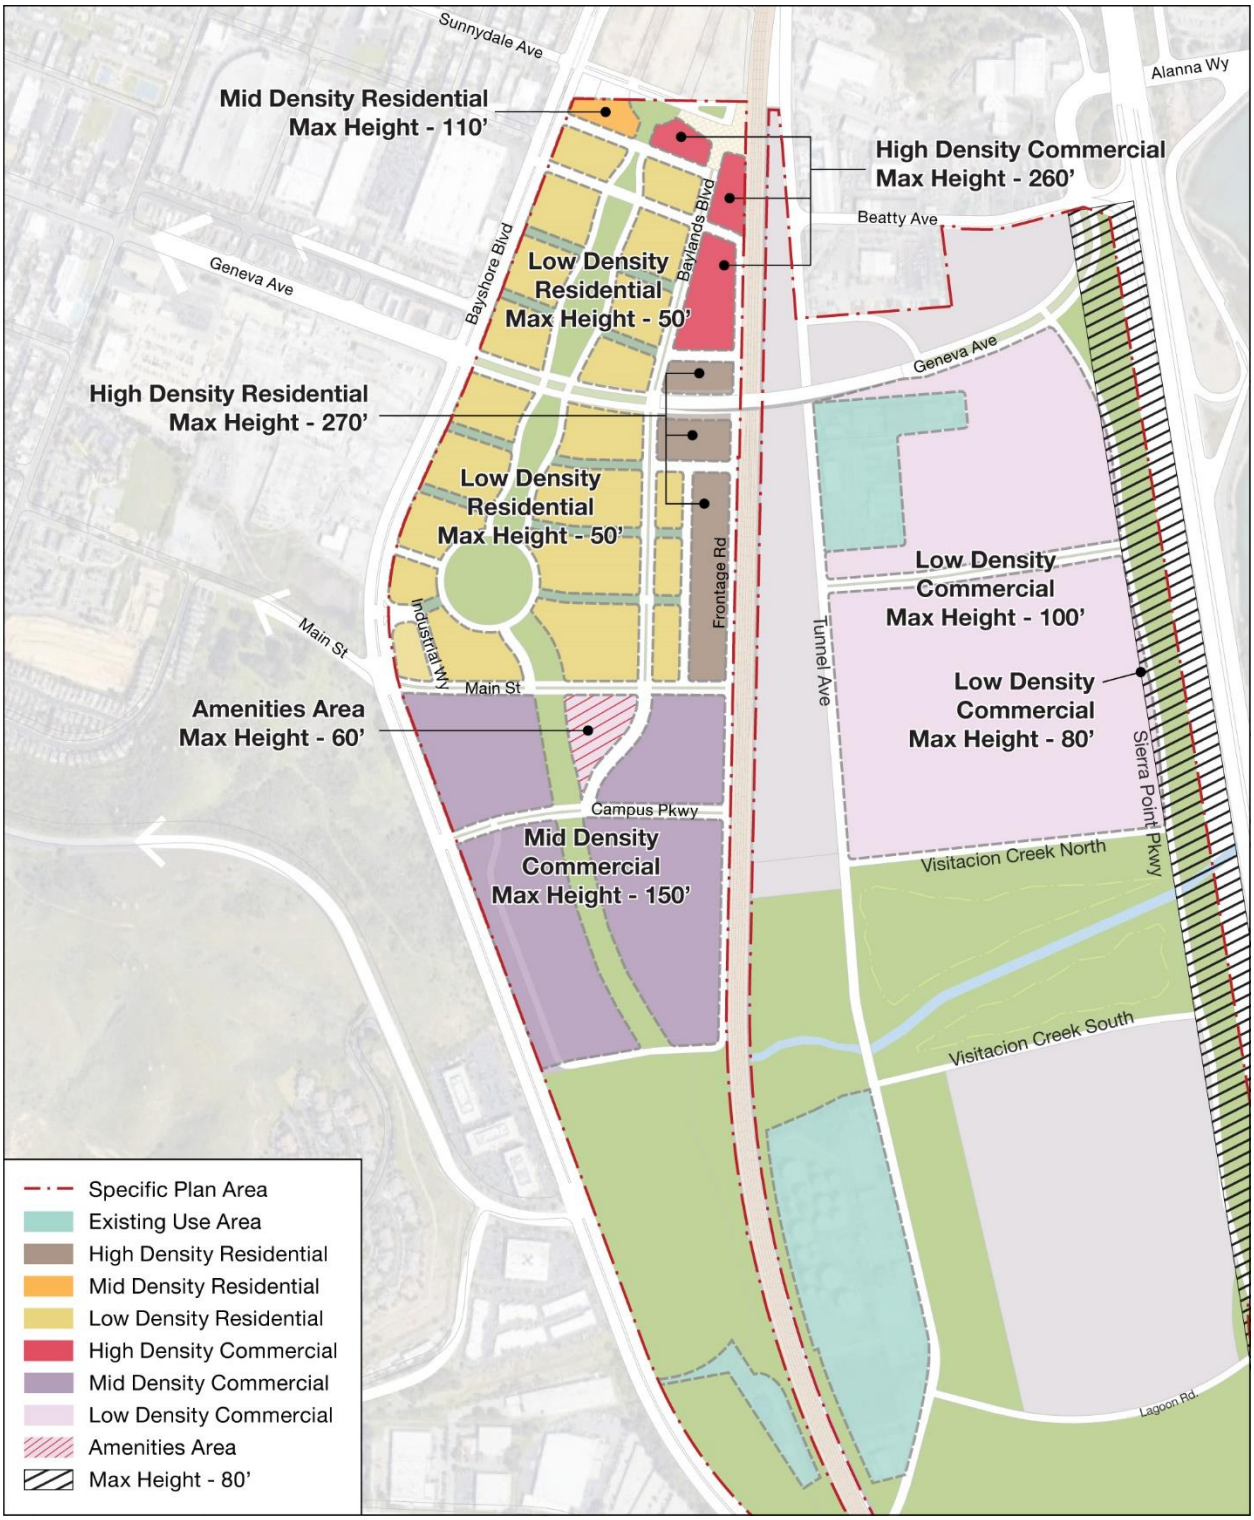

9.2.2 COMPARISON OF THE CONCEPT PLAN SCENARIOS ANALYZED IN THE PROGRAM EIR TO THE 2025 SPECIFIC PLAN

As noted in Chapter 2, the Program EIR analyzed four Concept Plans for the development of the Baylands at an equal level of detail:

- ***Developer-Sponsored Plan (DSP).*** This scenario represented the 2011 *Draft Brisbane Baylands Specific Plan*; encompassed a 684-acre area; and proposed 4,434 residential units, approximately 7 million sf of office/retail/industrial/institutional uses, approximately 169.7 acres of "open space/open area," and approximately 135.6 acres of "lagoon" area.
- ***Developer-Sponsored Plan – Entertainment Variant (DSP-V).*** This scenario emphasized entertainment-oriented uses by proposing a sports arena, concert venue, multiple-screen cinema, and additional conference/exhibition space and hotel rooms rather than the retail and office/R&D uses proposed in the DSP scenario for the northeastern portion of the site. DSP-V development also proposed 4,434 residential units.
- ***Community Proposed Plan (CPP).*** The CPP scenario did not include residential development and proposed approximately 7.7 million s.f. of office, industrial, commercial, and institutional uses, along with approximately 330 acres of open space/open area and the 135.6-acre lagoon. In addition to the 684-acre area included in the DSP scenario, the CPP scenario included the Recology site and adjacent roadway rights-of-way for a total area of 733 acres.
- ***Community Proposed Plan – Recology Expansion Variant (CPP-V).*** The 733-acre CPP-V scenario proposed a substantial expansion of the existing Recology facility within the Baylands from 260,000 s.f. to 1,011,000 s.f., replacing the hotel and R&D uses proposed in the CPP scenario within the area north of Geneva Avenue and east of Tunnel Road.

The land uses proposed for each of these scenarios are summarized and compared to the 2025 Specific Plan project in **Table 9-2**, below.

Table 9-2: Comparison of the Projects Analyzed in the Baylands Program EIR and Specific Plan EIR

	Program EIR Concept Plan Scenarios				2025 Specific Plan Project	GP-1-18/Measure JJ
	DSP	DSP-V	CPP	CPP-V		
Project Acreage	684.0 acres	684.0 acres	733.0 acres	733.0 acres	680.1 acres	684.0 acres
Proposed Land Use						
Residential	4,434 d.u.	4,434 d.u.	None	None	2,200 d.u.	1,800 to 2,200 d.u.
Commercial	6,713,000 s.f.	7,440,200 s.f.	7,676,000 s.f.	5,948,900 s.f.	6,500,000 s.f.	Up to 6,500,000 s.f.
Office/R&D	6,118,500 s.f.	6,090,300 s.f.	5,209,200 s.f.	4,874,000 s.f.	6,397,800 s.f.	
Retail	566,300 s.f.	283,400 s.f.	—[a]	—[a]	102,200 s.f.	
Entertainment	28,200 s.f.	1,066,500 s.f.	1,074,500 s.f.	1,074,500 s.f.		
Hotel	261,300 s.f. 329 rooms	586,800 s.f. 719 rooms	1,392,300 s.f. 1,990 rooms	1,046,100 s.f. 1,500 rooms	500,000 s.f. 800 rooms	500,000
Industrial	142,500 s.f.	142,500 s.f.	469,100 s.f. b	1,074,500 s.f.	None	None
Max. Building Height						
Residential	125 feet	125 feet	—	—	270 feet	Not Specified
Commercial	170 feet	160 feet	160 feet	160 feet	260 feet	
Non-Residential Development						
West of Caltrain	3,962,500 s.f.	3,088,700 s.f.	4,982,150 s.f.	4,982,150 s.f.	4,500,000 s.f.	Not Specified
East of Caltrain	3,125,000 s.f.	4,351,500 s.f.	4,555,250 s.f.	4,555,250 s.f.	2,500,000 s.f.	
Total	7,118,800 s.f.	7,440,200 s.f.	9,537,400 s.f.	8,069,500 s.f.	7,000,000 s.f.	
Socioeconomic Characteristics						
Population	9,888 residents	9,888 residents	—	—	4,905 residents	Not Specified
Employment	17,540 employees	15,466 employees	16,187 employees	16,069 employees	19,480 employees	
Open Space/Area						
Total Land Area	168.0 acres	168.0 acres	330.0 acres	330.0 acres	157.0 acres	25 percent
Park Land	92.0 acres	92.0 acres	—	—	64.8 acres	Not Specified

NOTES:
a. Retail square footage is included in Office/R&D to reflect mixed-use development.
b. Includes 66,600 s.f. of new industrial development, existing industrial along Industrial Way to remain (142,500 s.f.), and existing Recology uses to remain at is main facility (260,000 s.f.).
c. Includes 66,600 s.f. of new industrial development, existing industrial along Industrial Way to remain (142,500 s.f.), and expansion of the Recology main facility to 1,011,000 s.f.

9.2.3 COMPARISON OF THE 2025 SPECIFIC PLAN PROJECT TO GENERAL PLAN AMENDMENT GP-1-18/MEASURE JJ

Compared to the approved GP-1-18/Measure JJ, the 2025 Specific Plan project:

- Proposes the maximum number of dwelling units (2,200), commercial square footage (6.5 million), and hotel square footage (500,000 permitted by GP-1-18/Measure JJ.
- Realigns Lagoon Road to serve as a through route from Bayshore Boulevard connecting directly to the US 101 freeway southbound on- and off-ramps within the Baylands.
- Eliminates wind energy generation and doubles the minimum requirement for onsite renewable energy generation from 42,400 MWh to 85,000 MWh.
- Adds development of a 250 MW utility-scale battery storage facility, distributed battery storage, onsite switching substation, and distributed battery storage within the Baylands, along with an underground gen-tie line and improvements at the PG&E Martin Substation to connect the Baylands electrical system.
- Retains the existing lumber yard in its current location rather than moving it to another location within Baylands. The 2025 Specific Plan designates Golden State Lumber's main facility as an "Existing Use Area."
- Modifies the proposed water supply for the Baylands by establishing the California Water Service Company (Cal Water) as the water agency for the Baylands, Sierra Point, and Beatty areas, which would make water now being provided by the City to those areas available for buildout of the balance of the City.
- In exchange for the provision of potable water supply by Cal Water, the proposed Baylands water recycling facility would be doubled in size to provide up to 0.43 million gallons per day of recycled water for irrigation purposes to Cal Water for use within its South San Francisco District, requiring approximately 5.5 miles of offsite recycled water line construction.
- Eliminates site remediation and landfill closure as part of the project since they have undergone environmental review based been approved by state and county regulatory agencies.
- Adds a "Bayshore Boulevard Mobility Plan" to implement General Plan Amendment GP-1-19, which called for development of a plan to enhance mobility for Brisbane residents and reduce regional through traffic Bayshore Boulevard.
- Adds relocation of Brisbane's existing fire station and establishes a second fire station within the Baylands to implement performance criteria for emergency response to fires established in the Program EIR.

- Provides a grade 6–8 middle school within the Baylands rather than the previously proposed elementary or charter high school.

9.3 SUBSEQUENT EIR ANALYSES

The Subsequent EIR analyses set forth in the tables below compare the significance conclusions of each impact analyzed in the Baylands Program EIR and Specific Plan EIR. The first column of these tables summarizes the impact conclusions of the Program EIR. Based on the analyses presented in Chapter 4, the second column of these tables evaluates whether the 2025 Specific Plan project would result in either (1) a new significant impact that was not previously identified in the Program EIR or a (2) a substantially more-severe significant impact than was identified in the Program EIR.

9.3.1 LAND USE AND PLANNING POLICY[413]

Table 9-3: Program EIR and Subsequent EIR Land Use and Planning Policy Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Physically Divide an Existing Community **No Impact** The Program EIR determined that detailed analysis as to whether Baylands development would physically divide or create a physical barrier to an established community need not be undertaken because (1) the Baylands was already physically divided from the rest of the Brisbane community and surrounding lands by Bayshore Boulevard, the Recology facility, and Brisbane Lagoon; (2) there was no existing community within the Baylands; and (3) the Baylands was already divided into east and west areas by the Caltrain rail line.	**Impact LUP-1: Physically Divide an Existing Community** **Subsequent EIR Finding. A New Significant Impact Would Result from Substantial Changes to the Project:** • **Increased need for temporary lane closures that would reduce connectivity.** No new physical barriers to mobility would be constructed, nor would existing connectivity be substantially diminished as the result of construction traffic. The Specific Plan would enhance mobility by extending Geneva Avenue to the US 101 freeway providing safe turning movements for Brisbane residents and businesses onto and from Bayshore Boulevard along with enhanced pedestrian and bicycle facilities. However, the planned realignment of Lagoon Road, construction of offsite recycled water lines, and the Bayshore Mobility Plan, which were not addressed in the Program EIR, would result in temporary partial or complete lane closures along Lagoon Road, Sierra Point Parkway, Bayshore Boulevard, and/or Airport Boulevard (City of South San Francisco) that would temporarily reduce connectivity. Because the Program EIR concluded that no land use connectivity impacts would occur, roadway lane closures during construction represent a new significant land use and policy impact. Mitigation Measures LUP-1a (Program EIR Transportation Mitigation Measure 4.N-12) and MM LUP-1b reduce this impact to less than significant.
Impact 4.I-1: Conflict with an Applicable Land Use Plan or Policy **Significant but Mitigable** The Program EIR identified inconsistencies of the four scenarios it analyzed with several provisions of the City's General Plan, including prohibitions on residential development and exceeding the permitted development intensity for the Baylands subarea, exceeding roadway level of service standards, and other issues.	**Impact LUP-2: Conflict with an Applicable Land Use Plan or Policy** **Subsequent EIR Finding. A New Significant Impact Would Result from Changed Circumstances:** • **Inconsistency with MTC's Transit-Oriented Communities Policy Resolution No. 4530, which was adopted subsequent to Program EIR analysis.**

[413] The regulatory context for Baylands development in relation to Land Use and Planning Policy is presented in Section 4.3.3. Relevant Specific Plan provisions are presented in Section 4.3.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	Adoption of General Plan Amendments GP-1-18[414] and GP-1-19[415] resolved the General Plan inconsistencies identified in the Program EIR, including both those that would and would not result in physical environmental impacts. The 2025 Specific Plan would be inconsistent with the Metropolitan Transportation Commission's (MTC) Transit-Oriented Communities Policy (Resolution No. 4530) because it would permit (1) residential development types with an average density below 25 units per acre and not require sufficient affordable housing within ½ mile of the Bayshore Caltrain station, and (2) lower density housing to exceed the maximum parking space standards included in Resolution No. 4530, and not requiring a minimum average floor area ration of 2.0 within ½ mile of the Bayshore Caltrain station. Because MTC's Transit-Oriented Communities Policy is intended to reduce mobile source emissions, inconsistency with this policy would exacerbate the Specific Plan's significant air quality and GHG emissions impacts and represent a new significant impact. Implementation of Mitigation Measure MM LUP-2 would achieve consistency with MTC's Transit-Oriented Communities Policy and reduce this impact to less than significant.

9.3.2 POPULATION AND HOUSING[416]

Table 9-4: Program EIR and Subsequent EIR Population and Housing Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.K-1: Induce Substantial Growth **Significant and Unavoidable** The 2011 Specific Plan and its variant proposed 4,434 dwelling units which would generate an onsite population of 9,888 and exceed ABAG's projected citywide population growth (3,418).	**Impact SOC-1: Induce Substantial Unplanned Growth** **Subsequent EIR Finding. Substantial Changes to the Project and Circumstances Indicate a Previously Identified Significant and Unavoidable Impact Would Now Be Less than Significant:** • **Revised land use development program.** • **Adoption of Regional Housing Needs Allocation, Brisbane Housing Element, and General Plan growth housing and commercial projections for the Baylands in GP-1-18/Measure JJ.**

[414] General Plan Amendment GP-1-18 set development standards for any Specific Plan prepared for Baylands development. Inconsistencies with many of the policies established in General Plan Amendment GP-1-18 could constitute significant environmental impacts.

[415] General Plan Amendment GP-1-19 modified roadway performance standards. Included in General Plan Amendment GP-1-19 was a requirement for a mobility plan for Bayshore Boulevard that is being prepared concurrent with the City's planning and environmental review of the Baylands Specific Plan. Also included in General Plan Amendment GP-1-19 are performance standards related to roadway safety and a requirement that any Specific Plan for the Baylands be consistent with the 10 sustainability principles outlined in the City's Sustainability Framework for the Brisbane Baylands.

[416] The regulatory context for Baylands development in relation to Population and Housing is presented in Section 4.4.3.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
In addition, the Baylands development scenarios analyzed in the Program EIR would generate 15,500 to 17,500 onsite jobs, each exceeding ABAG's projected citywide employment growth (9,880). The various scenarios analyzed in the Program EIR were determined to be capable of accommodating a substantial portion of the housing and employment projected by ABAG for Brisbane and surrounding cities although each scenario would greatly exceed ABAG projections for Brisbane. The impact of exceeding housing and employment projections was found to be manifested in the project's significant unavoidable traffic and air quality impacts. Because no feasible mitigation measures to bring project buildout into line with ABAG projections for Brisbane were available other than increasing ABAG projections for the San Francisco/San Mateo Bi-County PDA within Brisbane or substantially reducing buildout rand approving a project alternative, the impact was determined to be significant and unavoidable.	• **Revised CEQA Guidelines focusing on impacts of inducing unplanned growth rather than any growth.** After certification of the Program EIR, CEQA Guidelines were revised to focus the population and housing analysis of growth inducement on unplanned growth. In contrast, the Program EIR evaluated the environmental effects of all growth the project might induce, whether planned or unplanned. Growth associated with the 2025 Specific Plan project would be consistent with the Brisbane General Plan (1,800 to 2,200 dwelling units, 6.5 million square feet of commercial use, and an additional 500,000 square feet of hotel use). Thus, direct population and employment growth associated with the Baylands Specific Plan would constitute planned rather than unplanned growth, which would not constitute a significant impact. Planned Baylands residential development intensities and building types would provide the opportunity to meet RHNA objectives for the production of housing to meet the housing needs of all economic segments of the community. The estimated 19,480 jobs that would result from Specific Plan buildout would be associated with approximately 14,537 households. The 2020 Census, reports that 59.8 percent of Brisbane residents were employed within San Mateo County. Although the 2020 Census does not report the number of Brisbane residents employed within Brisbane, past demographics reports indicate that about 15 percent of employed Brisbane residents held jobs in the City, Brisbane residents working in the City held about five percent of the jobs in Brisbane, and residents of other San Mateo County cities and San Francisco held most of Brisbane's jobs. Thus, it is reasonable to project that the work force for increased Baylands employment would primarily be drawn from residents of San Francisco and San Mateo counties. Baylands roadway, water, sewer, drainage, and utilities infrastructure would serve *planned* rather than *unplanned* growth. Specific Plan infrastructure capacity is designed to (1) serve the Baylands, (2) mitigate the effects of Baylands development on existing infrastructure, and/or (3) provide recycled water to planned land uses within the California Water Company's service area in the City of South San Francisco.[417] In addition, major transportation improvements that are part of bi-county transportation planning efforts would be designed and constructed in accordance with regional growth projections.

[417] See Baylands Water Supply Assessment is provided in EIR Appendix P.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Displace Substantial Numbers of People **No Impact** Because no housing exists within the Baylands, the displacement of housing was not addressed in the Program EIR. The Program EIR also did not address physical environmental effects associated with displacement of Baylands businesses along Industrial Way.	**Impact POP-2: Need for Replacement Housing or Commercial/Industrial Buildings Summary** **Subsequent EIR Finding. No New Significant Impact Would Result** There is no existing housing within the Baylands, and no replacement housing would be needed. Approximately 231,400 square feet of existing Baylands industrial businesses would be displaced by Specific Plan grading and development. However, because over 6.3 million s.f. of industrial building area was vacant within San Francisco and San Mateo counties, over 2.6 million s.f. of which was located within Brisbane and adjacent communities, construction of new buildings to accommodate displaced businesses would not be needed. Off-site Baylands-related infrastructure would be located within existing roadway rights-of-way, thereby avoiding displacement of adjacent offsite residential and non-residential uses.
Not addressed in the Program EIR.	**Impact POP-3: Housing for all Economic Segments of the Community** **Subsequent EIR Finding. No New Significant Impact Would Result** Adoption of the Baylands Specific Plan would provide zoning at appropriate densities to provide housing opportunities and facilitate meeting the City's quantified objectives for the production housing for all economic segments of the community. Site remediation, grading, and installation of infrastructure is projected to be completed on a schedule consistent with the City's Regional Housing Needs Allocation by the end of 2031.
Not addressed in the Program EIR.	**Impact POP-4 Urban Decay** **Subsequent EIR Finding. No New Significant Impact Would Result** Specific Plan development is proposed to occur in phases and be driven by market conditions and tenant demand. The existing inventory of space in Brisbane and South San Francisco has a highly concentrated ownership pattern, with large, experienced companies controlling most of the space, which suggests that these landlords have the wherewithal to successfully maintain, market, and re-tenant vacancies should tenant movement to the Baylands occur. The Specific Plan's 4,905 residents, 19,480 on-site employees, and Baylands businesses would generate approximately $298.9 million in brick-and-mortar spending by Baylands residents and daytime spending by Baylands employees and hotel guests annually. In comparison, $33.1 million in retail sales would be generated annually by 91,980 square feet of Baylands retail space, representing approximately 11.5 percent of the retail sales generated by the Specific Plan's residents, employees, and hotel guests at full buildout. Thus, if Baylands development would divert any sales away from existing retailers, other sales support would be available to backfill those diverted sales. The Specific Plan would not therefore cause a downward spiral of business closures and multiple long-term vacancies of retail spaces.

9.3.3 AESTHETIC AND VISUAL RESOURCES[418]

Table 9-5: Program EIR and Subsequent EIR Aesthetic and Visual Resources Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.A-1: Impacts on Scenic Vistas **Significant but Mitigable** Each development scenario analyzed in the Program was found to block or partially block views of scenic vistas, including San Bruno Mountain and the San Francisco Bay, resulting in substantial adverse effects on a scenic vista. Program EIR Mitigation Measure 4.A-1 required that buildings within 350 feet of US Highway 101 be no taller than 80 feet in height.	**Impact AES-1: Adverse Effects on a Scenic Vista** **Subsequent EIR Finding. A Substantially More Severe Significant Impact Would Result from Substantial Changes to the Project:** • **Increased maximum building heights blocking scenic vistas.** Substantial changes were made to the project, including increasing maximum residential and commercial office building heights in the western portion of the Baylands and placement of 20+ story buildings along the west side of the Caltrain right-of-way. Updated visual simulations and analysis determined that the 2025 Specific Plan project would impede scenic views of San Francisco Bay, Brisbane Lagoon, and San Bruno Mountain from several public viewpoints even with implementation of Program EIR Mitigation Measure 4.A-1, resulting in a substantially more severe impact than was disclosed in the Program EIR. In addition to Program EIR Mitigation Measure 4.A-1 (numbered MM AES-1a in this document), Mitigation Measure MM AES-1b would limit development within the western portion of the Baylands to 12 stories (or 150 feet) for office buildings and 8 stories (or 100 feet) for residential buildings. These two mitigation measures would ensure that public views of San Bruno Mountain and its ridgelines, the San Francisco Bay, and the Brisbane Lagoon would not be substantially blocked.
Impact 4.A-2: Impacts on Scenic Resources **Less than Significant** None of the concept plan scenarios would substantially damage scenic resources, including but not limited to trees, rock outcroppings, hillsides, and historic buildings.	**Impact AES-2: Physical Effects on Scenic Resources** **Subsequent EIR Finding. A New Significant Impact Would Result:** • **Construction of trails on Icehouse Hill would require manufactured slopes typically up to 6 to 10 feet high, with higher, more visually prominent slopes.** Substantial changes were made to the project, including revised plans for Icehouse Hill, Visitacion Creek, and Lagoon Park, along with a substantial increase in acreage devoted to renewable energy production and a realignment of Lagoon Road. The Specific Plan provides for preservation and improvement of existing scenic resources within Visitacion Creek and along the north shore of the Brisbane Lagoon, including restoration of wetland and habitat areas. Habitat areas on Icehouse Hill would be preserved, and the relocated Mission Blue Nursery would be located on an existing flat pad and use an existing access road. A significant impact would nevertheless result since trails on Icehouse Hill would require manufactured slopes, the physical environmental effects of which were not explicitly analyzed in the Program EIR in relation to effects on scenic resources. These trails would typically be up to 6 to 10 feet high, with higher, more visually prominent slopes constructed

[418] The regulatory context for Baylands development in relation to Aesthetic and Visual Resources is presented in Section 4.5.3. Relevant Specific Plan provisions are presented in Section 4.5.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	where trails would traverse along steep hillsides. Newly constructed trails on Icehouse Hill would thus be seen as long "ribbons" of disturbed bare ground. Mitigation Measure MM AES-2 would ensure that Icehouse Hill trails minimize site grading and resulting visual impacts. Biological Resources Mitigation Measures MM BIO-1a through MM BIO-1c would minimize removal of natural vegetation. With implementation of these measures, Icehouse Hill, the Visitacion Creek corridor, and the north shore of Brisbane Lagoon would retain a natural character and therefore not degrade the scenic resource.
Impact 4.A-3: Visual Character[419] **Significant but Mitigable** Each development scenario analyzed in the Program EIR was determined to be substantially greater in intensity than existing surrounding development. While such development would not substantially degrade the existing visual character of the Baylands site (former railyard and landfill), the Program EIR concluded that the substantial difference between the intensity of proposed Project Site development and that of its surroundings would substantially degrade the surrounding area's visual character. Mitigation Measure 4.A-3 established urban design performance standards to be incorporated into Specific Plan design guidelines.	**Impact AES-3: Consistency with Visual Quality Policies and Programs** **Subsequent EIR Finding. A Substantially More Severe Significant Impact Would Result from Substantial Changes to the Project:** • **Increased maximum building heights and solid masses of buildings blocking views.** The 2024 Specific Plan incorporated design guidelines as required by Program EIR Mitigation Measure 4.A-3. Baylands development would urbanize the Baylands with substantially greater development intensity and buildings that are taller, larger, and more abundant and closely spaced than the surrounding area. It also proposes increasing the maximum residential building height from 125 feet to 270 feet to provide for construction of 20+ story residential towers along the Caltrain rail line. These towers would be the tallest buildings within Brisbane and adjacent developed areas in Daly City and San Francisco. The 2025 Specific Plan also proposes reducing commercial acreage and building square footage, which would increase the intensity of commercial development (133.3 acres, 6.5 million s.f., 1.21 FAR) compared to the 2011 Specific Plan (150 acres, 6.7 million s.f., 1.02 FAR). In comparison, the Program EIR also analyzed impacts of two non-residential concept plan scenarios that proposed up to 7.7 million square feet of commercial office use on approximately 135 acres (1.31 FAR). The result, as described above, is that development would impede scenic views of San Francisco Bay, Brisbane Lagoon, and San Bruno Mountain from several public viewpoints even with implementation of Program EIR mitigation measures. Proposed mitigation measures for Impacts AES-1 and AES-2 would reduce impacts related to loss of public views and require screening of infrastructure facilities along the north side of Geneva Avenue, thereby achieving consistency between the Specific Plan and the visual quality related General Plan policies and programs.
Impact 4.A-4 Light and Glare **Significant and Unavoidable** The Program EIR concluded that each development scenario would create substantial new sources of nighttime lighting from streets, buildings, parking lots, and other outdoor activity areas.	**Impact AES-4: New Sources of Substantial Light** **Subsequent EIR Finding. Substantial Changes to Circumstances Indicate a Previously Identified Significant and Unavoidable Impact Can Now Be Reduced to Less than Significant:** • **Adoption of the City's Dark Sky Ordinance provides a new basis for performance standards and mitigation.**

[419] Subsequent to certification of the Program EIR, the CEQA Guidelines Appendix G question related to visual quality was substantially revised. As a result, the Program EIR analyzed the extent to which Baylands development would substantially degrade the existing visual character of the Baylands site and its surroundings. In comparison, this EIR analyzes whether the 2025 Specific Plan project would conflict with applicable plans, regulations, and policies governing scenic quality. As a result, the Program EIR and 2025 Specific Plan EIR only indirectly address the same issues.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
The Program EIR proposed Mitigation Measure 4.A-4a to address nighttime lighting by establishing a series of performance standards that primarily addressed light trespass. The Program EIR concluded that a significant and unavoidable impact would result even with implementation of this measure, "primarily given the level of nighttime lighting levels typical of the proposed uses (especially the entertainment-oriented uses proposed in the DSP-V scenario that would involve prominent, lighted displays), compared to the minimal nighttime lighting that currently exists on the Project Site, and the existence of nearby surrounding nighttime-light-sensitive uses (residences) that would be affected."	Subsequent to the certification of the Program EIR and adoption of Mitigation Measure 4.A-4a to address nighttime lighting impacts, the City adopted Municipal Code Chapter 15.88, Dark Sky Ordinance, to establish quantitative standards that reduce nighttime lighting impacts while providing the lighting necessary to ensure community safety and security. These standards include provisions to limit the amount of lighting within site-specific development projects, which were not required in Program EIR Mitigation Measure 4.A-4a. While Section 3.8 of the 2025 Specific Plan prohibits some but not all sources from having light emitted above 90 degrees, nighttime lighting would be permitted to be projected above the horizontal plane from the bottom of the lamp, which would be inconsistent with Municipal Code Chapter 15.88 and contribute to a significant sky glow impact. Development permitted by the Baylands Specific Plan would generate nighttime lighting over the broad area that is currently largely dark at night as was analyzed in the Program EIR. In relation to the light trespass that such lighting would cause, the 2025 Specific Plan incorporates the performance standards set forth in Program EIR Mitigation Measure 4.A-4a but omits requirements for lighting master plans and photometric analyses of site-specific development projects included in that measure. This EIR therefore proposes Mitigation Measure AES-4a to restore those provisions. Mitigation Measure MM AES-4b ensures compliance with Municipal Code Chapter 15.88, Dark Sky Ordinance, and provides additional requirements to reduce the adverse effects of nighttime lighting on the area's dark night sky to less than significant with mitigation incorporated.
Impact 4.A-4: Daytime Glare **Significant but Mitigable** The Program EIR concluded that each development scenario would create substantial new sources of daytime glare as part of onsite buildings. Program EIR Mitigation Measure 4.A-4b was adopted, setting performance standards for reflective materials on building façades to reduce glare impacts to less than significant.	**Impact AES-5: Daytime Glare** **Subsequent EIR Finding. New and Substantially More Severe Impacts Would Result from Substantial Changes to the Project:** • **Requirement to provide glare-producing roof materials as an energy conservation measure.** • **Glare from above-ground infrastructure, signage, and public art installations.** The 2025 Specific Plan includes new provisions that explicitly require glare-producing reflective roof materials. While proposed as a means of reducing building heat gain, this requirement conflicts with Program EIR Mitigation Measure 4.A-4b and would result in a significant glare impact, particularly in the early morning and late afternoon hours. Updated analysis of glare impacts provided in Chapter 4 also indicates that a significant glare impact would result even with Program EIR Mitigation Measure 4.A-4b due to highly reflective stainless-steel piping and cladding on above-ground infrastructure, as well as from the placement of reflective materials on signage and outdoor public art installations. In addition, updated analysis in Chapter 4 indicates that concave surfaces can concentrate reflective light, and reflective façade materials that slope back from the ground surface at less than a 90-degree angle can reflect high angle sunlight along the ground surface. Thus, Mitigation Measure MM AES-5b is proposed to supplement MM AES-5a (Program EIR Mitigation Measure 4.A-4b) and reduce impacts to less than significant.

9.3.4 BIOLOGICAL RESOURCES[420]

Table 9-6: Program EIR and Subsequent EIR Biological Resources Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.C-1: Impacts to candidate, sensitive, or special-status plants or animals **Significant but Mitigable** The Program EIR concluded that Project Site development would have a substantial adverse effect on candidate, sensitive, or special-status plant and wildlife species, not only from site grading, but also from construction of trails on Icehouse Hill, discouragement of use of habitat areas due to the close presence of human activities and bird and bat strikes on wind turbines and buildings. Impacts to habitat for special status fish species would occur at the lagoon and Visitation Creek as the result of introducing sediment and other materials such as litter or refuse generated during Project Site construction and operation. Mitigation Measures 4.C-1a through 4.C-1d provided requirements for pre-construction surveys and performance standards contained in those measures that would reduce impacts to a less than significant level and were carried forward from the Program EIR. Mitigation measures 4.C-1e and 4.C-1f addressed impacts from wind turbines that are no longer proposed. These measures were, therefore, not carried forward from the Program EIR. Mitigation measures 4.C-1g, 4.H-1a, 4.H-1b, 4.H-4 were proposed requiring compliance with Storm Water Pollution Prevention Program (SWPPP) and Provision C.3 regulatory requirements. In response to Program EIR Mitigation Measure 4.C-4a, which calls for preparation of a project-wide "Open Space Plan," and Mitigation Measure 4.C-4b, which calls for preparation of a "Marsh Wildlife and Habitat Protection Plan," the 2025 Specific Plan provides for extensive habitat restoration and enhancement within Visitacion Creek, along the north shore of the lagoon, and on Icehouse Hill. The Specific Plan also proposes an "Ecological Park" and provides trails and recreational concept plans for each	**Impact BIO-1: Impacts to candidate, sensitive, or special-status plants or animals** **Subsequent EIR Finding. New and Substantially More Severe Significant Impacts Would Result from Substantial Changes to the Project:** • **Icehouse Hill trails plan.** • **Potential listing of large marble butterfly.** *Rare Plants.* The 2025 Specific Plan provided a new plan for construction of trails on Icehouse Hill and proposed increased recreation-related activities that would cause adverse effects on special status plants on Icehouse Hill. In addition, Program EIR Mitigation Measures 4.C-1a and 4.C-1b did not provide explicit performance standards that would apply to plant restoration sites. *Butterflies.* The construction of trails and recreational facilities at Icehouse Hill, and planned management activities in this area have the potential to cause direct or indirect adverse effects on Callippe silverspot butterfly or Bay checkerspot butterfly host plants. Project activities, including general site clearing and grubbing in preparation for construction, have the potential to encounter large marble butterfly adults or larvae on weedy mustard plants that grow sporadically throughout the Specific Plan area, the effects of which were not analyzed in the Program EIR. While the butterfly does not have protected status, should a recent petition to federally list the large marble butterfly be adopted, the species would be recognized as a special-status species and project-related disturbances within its preferred habitat of invasive radish and mustards would be considered to be a significant impact. *Nesting Birds.* Grading or ground disturbance activities associated with site development have the potential to encounter protected nesting birds, particularly between February 1 to August 31. Construction activities within the Specific Plan area have the potential to impact nesting birds. Night lighting would not exceed the performance standards established in Section 4.5, *Aesthetic and Visual Resources*, and therefore would not have a significant direct or indirect impact on wildlife resources. *Mammals.* Sensitive bats may be encountered during the demolition and deconstruction of on-site buildings or during tree and vegetation removal. The injury of sensitive bats or destruction of active maternity roosts constitute a significant impact. Implementation of Mitigation Measures MM BIO-1a through MM BIO-1e would reduce impacts to less than significant.

[420] The regulatory context for Baylands development in relation to Biological Resources is presented in Section 4.6.3. Relevant Specific Plan provisions are presented in Section 4.6.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
of these areas, none of which were previously analyzed in the Program EIR.	Program EIR Mitigation Measures 4.C-1a and 4.C-1b (EIR Mitigation Measures MM BIO-1a, MM BIO-1b) did not provide explicit performance standards that would apply to plant restoration sites. Impacts related to rare plants. The Program EIR identified Mitigation Measure MM BIO-1c (Program EIR Mitigation Measure 4.C-1c) to identify, avoid, and protect rare butterflies and their habitat at Icehouse Hill. The measure required butterfly surveys and preparation of a Butterfly Protection Plan but also did not provide explicit performance standards related to long-term butterfly habitat management. Impacts to rare butterflies at Icehouse Hill would remain significant without additional performance assurances that were not identified in Mitigation Measure BIO-1c. Mitigation Measures MM BIO-1f and MM BIO-1g provide explicit performance standards for special-status plants and rare butterflies and would reduce impacts to a less-than-significant level. Mitigation Measure MM BIO-1h addresses the large marble butterfly and would avoid and mitigate impacts to this species should it become state or federally listed. Together, these mitigation measures ensure that impacts to special-status plants and wildlife species would be reduced to less than significant.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.C-2: Riparian Habitat **Significant but Mitigable** Project Site development would have a substantial adverse effect on riparian habitat resulting from proposed site remediation and grading operations and remove sensitive natural communities within the landfill and rail yard areas. Depending on timing of site-specific development, construction activities in the vicinity of restored sensitive natural areas wetlands constructed as mitigation such as runoff from development construction areas and increased human presence and noise would temporarily disturb adjacent habitat areas. Compliance with regulatory requirements and implementation of required mitigation measures would ensure no overall loss of either total area/amount or functions and values of sensitive natural communities and likely result in a greater quantity and higher overall quality than what exists at the site currently. **Impact 4.C-3: Jurisdictional Waters** **Significant but Mitigable** Project Site development would have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act through direct removal by grading for site remediation and development. Performance standards set forth in Mitigation Measure 4.C-2c ensure that the total area and/or overall functions and values of jurisdictional wetlands or waters of the U.S. would be preserved.	**Impact BIO-2: Freshwater and Tidally Influenced Habitats; Waters of the US and State; Areas Subject to State Lands or BCDC Jurisdiction** **Subsequent EIR Finding. A New Significant Impact Would Result from Substantial Changes to the Project:** • **Temporal loss of wetlands prior to implementation of habitat restoration and enhancement.** In response to Program EIR Mitigation Measure 4.C-4b, which calls for preparation of a "Marsh Wildlife and Habitat Protection Plan," the 2025 Specific Plan provides for extensive habitat restoration and enhancement within Visitacion Creek and along the north shore of the lagoon. Implementation of this plan would provide in-kind replacement of wetlands and non-wetland waters. While the Specific Plan's intention is to enhance Visitacion Creek and along the north shore of the lagoon to replace habitat lost due to site grading and development, resource agencies may not accept enhancement or mitigation actions located within the landfill footprint as mitigation and could require additional off-site mitigation. In addition, the Specific Plan's proposed phasing of habitat restoration improvements in relation sensitive natural community disturbance at Visitacion Creek and the north shore of Brisbane Lagoon could result in a temporal gap as long as 10-12 years between the impacts and site restoration. Even with in-kind replacement, there would be a temporal loss of wetlands between the time the landfill is capped and before wetland features required by the Specific Plan are provided, which was not addressed in the Program EIR. Specific Plan requirements for physical barriers, such as cyclone fencing or equivalent screening, to be maintained along with educational signage for trails within and adjacent to areas of wetlands and non-wetland waters, would reduce impacts associated with human encroachment. Changes to the project's phasing program would lead to a temporal gap between the removal of vegetation along Visitacion Creek and the north shore of the Lagoon and installation of habitat improvements required by the Specific Plan within those areas. Mitigation Measure BIO-2f requires final grading of those areas to be completed within 2 years of initial site disturbance, which would avoid the need to remove wetland species that naturally returned after site grading to be removed when the habitat and park improvements are installed, which could be as long as 10 years after existing vegetation is removed. This would reduce a new significant temporal impact to less than significant. In addition, trails within the wetland portions of Visitacion Creek and Lagoon Park would be provided on raised platforms, resulting in minimal effects on habitat areas.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.C-4: Fish and Wildlife Movement **Significant but Mitigable** The Program EIR concluded that Project Site development would restrict movement of wildlife species (primarily avian species) through the construction and lighting of mid-rise buildings that would directly restrict movement (collision impacts) and hinder nighttime navigation as the result of Project Site lighting. Program EIR Mitigation Measure 4.C-4a required preparation of a Project wide Open Space Plan to be prepared by a landscape architect in coordination with a qualified habitat restoration biologist. In addition, Mitigation Measure 4.C-4b required preparation of an "Open Space Plan." The plans required by these measures were incorporated into the 2025 Specific Plan. The physical environmental impacts of these plans were not evaluated in the Program EIR.	**Impact BIO-3: Fish and Wildlife Movement** **Subsequent EIR Finding. A Substantially More Severe Significant Impact Would Result from Substantial Changes to the Project and Information that was not Known and could not have been Known at the Time of the Program EIR:** • **Advancements in bird strike prevention science indicate Program EIR mitigation would not have been effective.** The implementation of the Specific Plan's habitat conservation and enhancement program will incorporate wildlife movement corridors into the site design and enhance existing high-quality habitat for native plant and wildlife species. Proposed habitat enhancements and mitigation measures for Icehouse Hill will enhance butterfly movement opportunities between Icehouse Hill and San Bruno Mountain and reduce impacts to less than significant. The Program EIR recognized the potential for impacts on migratory birds from night lighting and potential to collide with windows and reflective surfaces on tall buildings associated with development of the site, a potentially significant impact, and proposed mitigation to reduce the magnitude of the impact. However, significant advancements have been made in the understanding of bird hazards, such as the need for protection measures for buildings less than 100 feet in height, and methods to reduce bird collision risks subsequent to Program EIR certification. In addition, the 2025 Specific Plan proposes to substantially increase maximum allowable building heights within the Baylands. The result is that Program EIR Mitigation Measure 4.C-3c would not sufficiently minimize bird strike impacts of the 2025 Specific Plan project to less than significant. The addition of Mitigation Measure BIO-3d would reduce bird strike impacts to less than significant.
Impact 4.C-5: Brisbane Tree Ordinance **Less than Significant** Because Project Site development would be required to comply with the provisions of the Brisbane Tree Ordinance, the Program EIR concluded that compliance with City ordinance would ensure the removal of trees for needed grading activities would be less than significant.	**Impact BIO-4: Brisbane Tree Ordinance** **Subsequent EIR Finding. No New Significant Impact Would Result** Specific Plan development would result in the **removal** of nearly all trees within the Baylands. Consistent with the City's tree ordinance, replacement trees would be provided at a minimum ratio of 1:1. Relocation of the City's existing fire station would also require removal of some existing trees at the relocation site. Such removed trees would be replaced at a 1:1 ratio to the extent possible given operational requirements for the relocated fire station.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact BIO-6: San Bruno Mountain Habitat Conservation Plan **Less than Significant** Because the San Bruno Mountain Habitat Conservation Plan extends from San Bruno Mountain west of the site to Bayshore Boulevard and does not extend east of Bayshore Boulevard into the Baylands, the Program EIR stated that the Project is not required to comply with the Habitat Conservation Plan. In addition, the Program EIR found that Icehouse Hill would remain as open space and Baylands development would not conflict with the Habitat Conservation Plan.	**Impact BIO-5: San Bruno Habitat Conservation Plan** **Subsequent EIR Finding. A New Significant Impact Would Result from Substantial Changes to the Project:** • **Detailed restoration plan for Icehouse Hill.** • **Relocation of Mission Blue Nursery to the former shooting range on Icehouse Hill.** Restoration of Icehouse Hill would promote the goals of the Habitat Conservation Plan to conserve and restore listed butterflies by restoring Icehouse Hill in a manner that supports native plants, and particularly host and nectar plants for listed butterfly species. Adverse physical effects on Icehouse Hill habitat identified in Impact BIO-1, above, that would adversely affect implementation of the Habitat Conservation Plan would be mitigated by a combination of Specific Plan implementation and Mitigation Measure BIO-1c such that the Specific Plan would not conflict with the San Bruno Mountain Habitat Conservation Plan and would likely result in a potentially beneficial impact on achieving Habitat Conservation Plan goals relative to listed butterfly species. Relocation of Mission Blue Nursery to Icehouse Hill has been added to the 2025 Specific Plan project. Should there be a delay between the time the nursery would need to vacate its existing site and the time the new site on Icehouse Hill would be operational, this delay could lead to a temporary disruption in the nursery's ability to continue providing native plants for ecological restoration projects within the Habitat Conservation Plan area, which would hinder the mission of the Habitat Conservation Plan. This would be a new significant impact not disclosed in the Program EIR. Mitigation Measure BIO-5 ensures continuous operation of the facility and reduces the impact to less than significant.

9.3.5 CULTURAL RESOURCES AND TRIBAL CULTURAL RESOURCES[421]

Table 9-7: Program EIR and Subsequent EIR Cultural Resources and Tribal Cultural Resources Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.D-1: Substantial Adverse Change in the Significance of a Historic Building or Structure **Significant but Mitigable** The Program EIR acknowledged that the historically significant Roundhouse would be restored, and the Lazzari Fuel building would be preserved. However, because of its existing condition, short term protection of the Roundhouse was found to be needed prior to its restoration and adaptive reuse. In addition, the substantial new development proposed adjacent these two structures would adversely affect the character of their historic setting. Mitigation Measure 4.D-1 was therefore proposed to require preparation and implementation of a restoration plan for the Roundhouse. Program EIR Mitigation Measure 4.D-1b was proposed to establish performance standards for development adjacent to these historic structures.	**Impact CUL-1: Substantial Adverse Change in the Significance of a Historic Building or Structure** **Subsequent EIR Finding. A New Significant Impact Would Result due to Substantial Changes to the Project:** • **Detailed Roundhouse restoration and adaptive reuse plan and potential for damage.** The Program EIR addressed protecting the Roundhouse in place and required preparation of a restoration plan. The 2025 Specific Plan provides a five-stage plan to deconstruct the existing Roundhouse prior to site grading along with reconstruction and adaptive use of the structure following site grading. Restoration and adaptive reuse of the historic Roundhouse would comply with the Secretary of the Interior's Standards for Rehabilitation. While the Roundhouse restoration plan recommends initial safety measures, including fencing the site, installing security measures to prevent unwanted access, mitigating imminent hazards, and removal of pests and plants, be initiated prior to Specific Plan approval, should these measures not be undertaken, continued deterioration of the historic Roundhouse structure would occur inconsistent with the General Plan and Program EIR mitigation measures. In addition, damage to the Roundhouse that might occur during this process could adversely affect the building's historic integrity. Finally, introduction of visually incompatible construction immediately adjacent to the building could result in a loss of integrity impacting the historic significance of the building. Analysis of the Roundhouse Preservation and Protection Plan indicate inadvertent damage to the roundhouse during its stabilization and restoration would constitute a significant impact that was not analyzed in the Program EIR. Mitigation Measure MM CUL-1b provides a protocol for addressing any damage that may occur to the Roundhouse during restoration activities that reduces the impact to less than significant. Baylands development would not have a direct or indirect impact on the Machinery & Equipment Building or the Bayshore/Crocker Tunnel as historical resources.

[421] The regulatory context for Baylands development in relation to Cultural Resources and Tribal Cultural Resources is presented in Section 4.7.3. Relevant Specific Plan provisions are presented in Section 4.7.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.D-2: Substantial Adverse Change in the Significance of an Archaeological Resource **Significant but Mitigable** The Program EIR concluded there was no surface evidence of a significant archaeological resource, but that site grading could uncover previously unidentified archaeological resources. Such a discovery would result in a substantial adverse change in the significance of an archaeological resource. Program EIR Mitigation Measure 4.D-2 establishes protocols to be followed should a previously unknown resource be encountered.	**Impact CUL-2: Substantial Adverse Change in the Significance of an Archaeological Resource** **Subsequent EIR Finding. A New Significant Impact Would Result as the Result of Information that was not known at the Time of the Program EIR:** • **Coring samples indicate high sensitivity for buried pre-contact cultural materials in native soils.** Coring samples conducted by the applicant after certification of the Program EIR to support Remedial Action Plans identified new areas with cultural materials indicating that portions of the Specific Plan Area have a high sensitivity for buried pre-contact cultural deposits in native soils. Updated analysis determined that the Baylands and adjacent areas also have a high sensitivity for surficial or shallow historic-era cultural deposits. Pre-contact sensitivity at the surface is also high along the northern and eastern edge of the Specific Plan area, which was on the edge of the marshland prior to the placement of artificial fill. Thus, excavations into native soils beneath the artificial fill within the Specific Plan have the potential to disturb buried resources. Should excavations for Baylands development extend into native soils, significant impacts to archaeological historical resources could result. Mitigation Measures MM UL-2a through CUL-2d require that, prior to Baylands construction, an Archaeological Testing Plan be established to clarify the depth of fill and the sensitivity of the construction site for archaeological resources, and to determine if site P-38-005131 has a subsurface component within that site. These measures also require cultural resources awareness training be provided for all construction personnel involved in ground-disturbing work and that archaeological monitoring be conducted in all areas identified as sensitive as a result of the archaeological testing.
Not addressed in the Program EIR.	**Impact CUL-3: Substantial Adverse Change in the Significance of a Tribal Cultural Resource** **Subsequent EIR Finding. No New Significant Impact Would Result** Because the Program EIR preceded adoption of Assembly Bill (AB) 52, no tribal consultation was offered at the time of the Program EIR, which did not address Tribal Cultural Resources. To comply with current legal requirements, six Tribal nations were offered the opportunity for consultation regarding the potential presence of Tribal Cultural Resources within the Baylands and appropriate mitigation for any resources that might be present. No Tribes responded and thus no potential Tribal Cultural Resources were identified.
Impact 4.D-4: Disturb Human Remains **Significant but Mitigable** While there is no surface evidence or historic record of use of the Project Site as a cemetery, site remediation and grading could uncover locations of previously unknown human remains, including those interred outside of formal cemeteries. Mitigation measure 4.D-4 required compliance with California Health and Safety Code Sections 7050.5(b), 7052, and 5097.	**Impact: CUL-4: Disturb Human Remains** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** Although nearly all of the Baylands site consists of historical fill and has been previously disturbed and developed, Specific Plan development could involve excavation in native soils underlying the site. Specific Plan development would comply with California Health and Safety Code Sections 7050.5(b), Section 7052, and Section 5097, which would protect any previously unidentified human remains, including those interred outside of formal cemeteries.

9.3.6 TRANSPORTATION[422]

Table 9-8: Program EIR and Subsequent EIR Transportation Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.N-1, 4.N-3: Increased Traffic at Intersections **Significant and Unavoidable** **Impact 4.N-2, 4.N-4: Increased Traffic on Freeway Mainline Segments** **Significant and Unavoidable** **Impact 4.N-5: Increased Traffic Due to Special Events** **Significant and Unavoidable** **Impact 4.N-13: Consistency with C/CAG Congestion Management Program** **Significant but Mitigable**	**Traffic Delay Metrics: Not Analyzed**[423] Subsequent to certification of the Program EIR, SB 743 and CEQA Guidelines Section 15064.3(b) eliminated traffic delay as a significant impact for land development projects. Analysis of increased traffic in relation to vehicle delay was not, therefore, undertaken and is not addressed in this EIR. No comparison can therefore be made to the analysis of traffic delay metrics in the Program EIR.

[422] The regulatory context for Baylands development in relation to Transportation is presented in Section 4.8.3. Relevant Specific Plan provisions are presented in Section 4.8.4. Additional proposed Transportation improvements are presented in Section 4.8.5.

[423] Senate Bill (SB) 743 and CEQA Guidelines Section 15064.3(b), which require analysis of transportation impacts based on vehicle miles traveled (VMT), went into effect after the Program EIR was certified. Traffic impact analyses and mitigation measures included in Program EIR Impacts 4.N-1 through 4.N-5, 4.N-13, and 4.N-17 are therefore no longer applicable under CEQA. CEQA Guidelines note that "Amendments to the Guidelines apply prospectively only … a project need only comply with the Guidelines in effect when the [CEQA] document is set out for public review …" (see CEQA Guidelines sections 15064.3(c) and 15007). A "project" refers to the underlying activity which may be subject to approval by one or more governmental agencies; it does not refer to each of the several approvals sequentially issued by different agencies (CEQA Guidelines section 15378(c)). OPR also explains "there may be circumstances when public agencies are considering changes to already approved projects that were analyzed using LOS. When determining whether subsequent and supplemental analyses are required under Public Resources Code section 21166, the agency should focus the inquiry on whether there are substantial changes in the project or circumstances that would require major revisions of the document, or if new information, which was not known and could not have been known at the time of becomes available. (Pub. Resources Code, § 21166; CEQA Guidelines, §§ 15162-15163.)" See also *Olen Properties Corp. v. City of Newport Beach* (2023) 93 Cal.App.5th 270, finding that "it is settled law in California that subsequent changes to the guidelines are not "new information" triggering section 21166, subdivision (c), so long as the underlying environmental issue was understood at the time of the initial EIR." At the time of the Program EIR, vehicle miles traveled was understood as part of equations to quantify mobile source air pollutant and GHG emissions, rather than as an environmental issue for transportation analysis.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Vehicle Miles Traveled: Not Analyzed CEQA Guidelines at the time of the Program EIR focused on vehicle delay metrics. While the Program EIR included vehicle miles traveled as an input to analyses of air quality and GHG mobile source emissions, no analysis was undertaken specifically to address the significance of vehicle miles traveled.	**Impact: TRA-1 Vehicle Miles Traveled** **Subsequent EIR Finding. A New Significant Impact Would Result due to Changed Circumstances:** • **CEQA requirement for analysis of vehicle miles travelled indicated VMT impact due to diversions resulting from temporary roadway lane closures during construction.** Although Baylands construction activities would generate vehicle miles traveled, such travel would be temporary and not of a scale that would change regional VMT characteristics. While applicable encroachment permit requirements would provide safe travel, compliance with encroachment permit requirements and California Manual on Uniform Traffic Control Devices regulations during construction would provide safe travel. The 2025 Specific Plan would generate approximately 10 percent more daily trips (46,103) than were analyzed in the Program EIR (42,528 daily trips). While this would tend to increase VMT due to San Mateo County's jobs/housing imbalance, the 2025 Specific Plan concentrates a greater proportion of its housing and employment-generating uses within walking distance of the Bayshore Caltrain station and would implement a more robust transportation demand management program than was analyzed in the Program EIR. As a result, total VMT for the 2025 Specific Plan would be similar to that analyzed in the Program EIR.
Impact 4.N-6, 4.N-9: Increased Transit Demand on BART and Caltrain **Less than Significant** None of the scenarios analyzed in the Program EIR would exceed train transit capacity (BART and Caltrain) or require changes to Caltrain operations at the Bayshore Station. **Impact 4.N-7, 4.N-8: Increased Transit Demand on San Francisco Muni or SamTrans Systems** **Significant and Unavoidable** Baylands transit ridership in combination with cumulative effects would exceed Muni's capacity between San Francisco and San Mateo County and along the Geneva Avenue corridor for each scenario. While impact fees would be paid to Muni, Brisbane would not have the authority to direct the use of those fees. **Impact 4.N-10: Pedestrian Circulation** **Significant but Mitigable** Although Baylands development would not disrupt existing facilities outside the site, pedestrian accessibility would be limited at the periphery of the site due to a lack of existing pedestrian	**TRA-2: Facilitate Transit, Bicycle, and Pedestrian Travel Modes** **Subsequent EIR Finding. New and Substantially More Severe Significant Impacts Would Result due to Substantial Changes to the Project:** • **New Significant Impact. Proposed four-lane Geneva Avenue bridge cross-section would discourage bus rapid transit.** • **Substantially More Severe Significant Impact. Revised pedestrian and bicycle facilities plans result in gaps between Baylands and adjacent facilities.** Senate Bill (SB) 743 and CEQA Guidelines Section 15064.3(b), which eliminate increased transit usage as a physical environmental impact, went into effect after the Program EIR was certified. In addition, the 2025 Specific Plan substantially changes proposed Baylands roadway, bicycle, and pedestrian systems; modifies access to transit; and modifies the phasing of transportation improvements in relation to residential development. While the 2025 Specific Plan proposes a comprehensive internal bicycle and pedestrian system, it also includes several inadequate connections to offsite facilities which would require vehicular travel for trips that might otherwise be made by bicycle or walking. In addition, reduction of the Geneva Avenue bridge cross-section from 6 to 4 lanes would eliminate proposed dedicated bus rapid transit lanes on the bridge. This would require rapid transit buses to merge with vehicular traffic when crossing the bridge, discourage use of transit, slow emergency response across the bridge, and represent a new significant impact not disclosed in the Program EIR. Mitigation Measures MM TRA-2a through MM TRA-2d would reduce impacts to less than significant by eliminating inadequate bicycle and pedestrian connections and requiring a 6-lane bridge section that would accommodate bus rapid transit and minimize the potential for traffic safety conflicts at its western end. Continued availability of a bus stop and crosswalk adjacent to

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
facilities. Proposed mitigation measures would provide adequate pedestrian connections to offsite facilities. **Impact 4.N-11: Bicycle Circulation** **Significant but Mitigable** Bicycle circulation would be improved within the site by each scenario analyzed in the Program EIR. Baylands development would not disrupt existing bicycle facilities adjacent to the site, interfere with planned bicycle facilities, or create inconsistencies with adopted bicycle system plans. However, because the 2011 Specific Plan did not include requirements to enhance the bicycling environment and maximize bicycle accessibility, the Program EIR determined a significant impact would result and proposed mitigation to reduce the impact to less than significant.	the relocated fire station would be maintained during and after construction, along with safe ingress and egress of fire apparatus as well as safe traffic, bus, and pedestrian movement.
Impact 4.N-12: Construction Traffic **Significant but Mitigable** Baylands development would result in temporary traffic increases during the site's 20-year construction period (with periods of no activity). Traffic impacts associated with construction would be temporary and intermittent related to the delivery of materials and equipment, removal of debris, and daily commute trips for construction workers. The Program EIR concluded that construction traffic coinciding with peak hour traffic could exacerbate adverse effects on traffic, transit services, and pedestrian and bicycle circulation and proposed Mitigation Measure 4.N-12 to reduce impacts to less than significant. **Impact 4.N-15: Hazards to Vehicles, Bicyclists, or Pedestrians** **Less than Significant** Baylands development would be required to meet applicable roadway design standards and would therefore not substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses.	**Impact TRA-3: Hazards to Vehicles, Bicyclists, or Pedestrians** **Subsequent EIR Finding. New Significant Impacts Would Result due to Substantial Changes to the Project:** • **Inadequate four-lane Geneva Avenue bridge cross-section with unsafe intersections at its western landing.** • **Closely spaced intersections along Bayshore Boulevard at Industrial Way and Main Street, as well as along Main Street at Industrial Way.** • **Roadway cross-sections for Roundhouse Circle, East Park Boulevard, and West Park Boulevard that would not meet City standards for fire access.** • **The new Baylands middle school and conversion of the existing Bayshore School to an elementary school would result in a substantial number of students walking or bicycling along and crossing Geneva Avenue and Bayshore Boulevard, both of which are identified by San Mateo County as High Injury Network roadways. Students would also travel along a 500-foot section of Main Street without sidewalks or bike lanes.** • **Potential for vehicle queueing at the Baylands middle school picking up and dropping off students to conflict with and create hazards for safe vehicular, bicycle, and pedestrian travel.** • **Increased queueing of vehicles waiting to exit the southbound US 101 freeway routinely backing onto the freeway mainline.** Baylands construction activities would conform to the requirements of the City's encroachment permit process and the California Manual on Uniform Traffic Control Devices regulations, which establish traffic operations and management rules for working safely and causing the least possible interference with people walking, bicycling, driving, or taking transit near construction areas.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	Changes to the project include new intersection configurations, a modified cross-section on the Geneva Avenue bridge, and a roadway type (green shared streets) that would introduce geometric design features that would not meet applicable City design standards, which would result in new transportation safety hazards impacts not analyzed in the Program EIR. In addition, while the Program EIR analyzed the potential for close spacing of intersections to cause traffic queueing at one intersection along Geneva Avenue to back up into another intersection, the analysis addressed traffic delay rather than traffic safety. Mitigation Measures MM TRA-3a through MM TRA-3m would reduce these impacts to less than significant.
Impact 4.N-16: Emergency Access **Less than Significant** Project site development would provide internal circulation systems meeting City and NCFA requirements, and would therefore not result in inadequate emergency access, defined as physical or traffic congestion impediments that would prevent emergency vehicles from traveling to and from an emergency situation.	**TRA-4: Access for Emergency Response and Evacuation** **Subsequent EIR Finding. New Significant Impacts Would Result due to Substantial Changes to the Project:** • **Proposed four-lane Geneva Avenue bridge cross-section would constrain emergency response.** • **Roadway cross-sections for Roundhouse Circle, East Park Boulevard, and West Park Boulevard would not meet City standards for fire access.** • **Flooding along roadways needed for emergency vehicle access.** The 2025 Specific Plan makes substantial changes to the proposed Baylands roadway system, including relocating the existing Baylands fire station and adding a second fire station within the Baylands. Other changes would result in new significant impacts related to emergency access and response due to an inadequate cross-section on the Geneva Avenue bridge, flooding along Tunnel Avenue, and roadway sections that would not meet minimum City standards for emergency vehicle access that were not previously addressed in the Program EIR. The Specific Plan's proposed roadway network would provide multiple routes for emergency response, providing alternatives should any given roadway become inaccessible. In addition, the Bayshore Mobility Plan would maintain the ability for emergency vehicles to bypass traffic on Bayshore Boulevard by providing emergency traffic signal priority, median breaks, and queue jumps. The Geneva Avenue bridge section four-lane roadway section with no shoulders would adversely affect emergency access. In addition, the proposed cross sections for Roundhouse Circle, East Park Boulevard, and West Park Boulevard would not meet minimum City standards for emergency vehicle access. During a 100-year storm event, portions of key roadways such as Tunnel Avenue would not be available, which would hinder emergency access. Emergency access would also not be available to development sites along Frontage Road, including basement parking areas. Implementation of Mitigation Measure MM TRA-2c would require continuous bus rapid transit lanes along the Geneva Avenue extension, including the bridge over the Caltrain rail line, which would facilitate emergency response across the bridge and along the entirety of Geneva Avenue, even during peak travel hours.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	Mitigation Measure MM TRA-3c would require Specific Plan roadways to meet City design standards and Supplemental Roadway Design Guidelines developed for the Baylands. In addition, Mitigation Measures MM HWQ-4a and MM HWQ-4b would ensure adequate emergency response access during a 100-year flood event.
Impact 4.N-14: Impacts to Air Traffic **No Impact** Project site development would not result in a change in air traffic patterns.	**Impacts to Air Traffic: Not Analyzed** **Subsequent EIR Finding. No New Significant Impact Would Result** Impacts to air traffic were adequately addressed in the Program EIR and no new analysis was necessary.
Impact 4.N-17: Loading Facilities **Significant but Mitigable** Project site development would substantially increase loading demand during the peak hour of activities. There were not sufficient details (e.g., number and location of parking spaces) at the time of the Program EIR to assess loading conditions, but as site-specific development projects would be proposed under the selected development scenario and required specific plan, loading (demand and supply) would be reviewed to ensure that demand would be met. Because there are no specific loading requirements in the Brisbane Municipal Code, a significant impact was identified. Program EIR Mitigation Measure 4.N-17 required site-specific development projects to provide sufficient loading areas in appropriate locations such that loading activities, including vehicle queuing, would not block roadway or onsite parking area travel lanes, or bicycle or pedestrian facilities.	**Impact TRA-5: Loading Facilities** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** Impacts related to loading facilities were adequately addressed in the Program EIR its analysis, conclusions, and mitigation measure have been carried forward from the Program EIR.

9.3.7 AIR QUALITY[424]

Table 9-9: Program EIR and Subsequent EIR Air Quality Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.B-2: Criteria Air Pollutants – Construction **Significant and Unavoidable** The Program EIR found that construction of each scenario would generate cumulatively considerable construction emissions of criteria pollutants and precursors for which the air basin is in nonattainment. Implementation of all feasible mitigation measures would not be capable to reducing this significant impact to less than significant. **Impact 4.B-4: Criteria Air Pollutants – Operations** **Significant and Unavoidable** The Program EIR found that operations of each scenario would cause a considerable net increase of criteria pollutants and precursors for which the air basin is in nonattainment under an applicable federal or state ambient air quality standard, primarily from mobile (vehicular) sources. Implementation of all feasible mitigation measures would not be capable of reducing this significant impact to less than significant.	**AQ-1: Criteria Air Pollutants** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impacts Would Result** During site grading, average daily emissions of NO_X would exceed applicable thresholds. Once grading activities are completed, construction emissions would be minimal but would add to operational emissions of residential and commercial uses as buildings are completed and occupied. Grading and construction activities for the 2025 Specific Plan would increase daily average emissions of NO_X during the maximum grading construction year from the 89.9 pounds per day disclosed in the Program EIR to 104.7 pounds per day (16.5%). A comparison of unmitigated emissions indicates that the 2025 Specific Plan would increase daily emissions of ROG from 410.81 to 426.2 (3.7%), while reducing emissions of other criteria pollutants. Adherence to BAAQMD's best management dust minimization practices, which are mandated by the State Water Board Construction Stormwater General Permit, Order 2022-0057-DWQ, would reduce potential dust-related criteria air pollutant impacts during project construction. However, combined construction and operational emissions of ROG, NO_X, $PM_{2.5}$, and PM_{10} would exceed annual and daily thresholds starting with Phase 1 buildout and continue through full buildout operations. As documented in the vehicle miles traveled analysis undertaken for Impact TRA-1, Baylands residents and workers would generate substantially lower per capita vehicle miles traveled than the regional average. It is logical to conclude that reduced per capital VMT from Baylands residents and workers would result in reduced future cumulative regional mobile source air pollutant emissions within the nine-county Bay Area region compared to the same amount of development (2,200 dwelling units, 6.5 million square feet of commercial office, and 500,000 square feet of hotel use) being distributed elsewhere spread throughout San Francisco and San Mateo counties. With implementation of additional construction mitigation measures, construction NO_X emissions would be reduced, but not below the significance thresholds. Construction and operational mitigation measures would reduce ROG, NO_X, $PM_{2.5}$, and PM_{10} emissions due to cleaner engine technology; ROG emissions from architectural coatings by using lower VOC paints; criteria pollutants from operational vehicles through the installation of EV charging infrastructure; and other emissions through additional mitigation measures. Overall, implementation of more stringent TDM programs and mitigation measures than were proposed in the Program EIR would avoid generating a substantially more severe impact compared to the Program EIR.

[424] The regulatory context for Baylands development in relation to Air Quality is presented in Section 4.9.3. Relevant Specific Plan provisions are presented in Section 4.9.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.B-1: Localized Construction Dust Impacts **Significant but Mitigable** Development of each scenario analyzed in the Program EIR would result in substantial localized dust during the anticipated 20-year construction period. Mitigation measures were proposed that would reduce these impacts to less than significant. **Impact 4.B-3: Expose Sensitive Receptors to Substantial Pollutant Concentrations** **Less than Significant** Construction of each of the scenarios that were analyzed would not expose sensitive receptors to substantial concentrations of toxic air contaminants or respirable particulate matter ($PM_{2.5}$). **Impact 4.B-5: Expose Sensitive Receptors to Substantial Pollutant Concentrations** **Less than Significant** Operations associated with each scenario that was analyzed would not expose sensitive receptors to substantial concentrations of toxic air contaminants or respirable particulate matter ($PM_{2.5}$) as the result of Project Site development. **Impact 4.B-6: Expose Sensitive Receptors to Substantial Pollutant Concentrations** **Less than Significant** None of the scenarios analyzed in the Program EIR would expose people (new receptors) to substantial levels of toxic air contaminants (TACs), which may lead to adverse health as the result of Project Site development. **Impact 4.B-7: Expose Sensitive Receptors to Substantial Pollutant Concentrations** **Less than Significant** Sensitive receptors would not be exposed to substantial carbon monoxide concentrations as the result of any of the scenarios analyzed in the Program EIR.	**AQ-2: Expose Sensitive Receptors to Substantial Pollutant Concentrations** **Subsequent EIR Finding. New Significant Impacts Would Result from Substantial Changes to the Project:** • **Emissions of diesel particulate matter in relation to locations of sensitive receptors.** Whereas the Program EIR determined that construction of each of the scenarios that were analyzed would not expose sensitive receptors to substantial concentrations of toxic air contaminants or respirable particulate matter ($PM_{2.5}$), updated analyses undertaken for this EIR found that changes in the project's land use plan and phasing would cause emissions of diesel particulate matter (DPM) to result in an excess cancer risk level of up to 16.0 in one million during site grading (16.9 over a 30-year exposure period starting with initiation of construction activities). In addition, DPM from operational activities would result in an excess cancer risk level of up to 13.0 in one million for on-site Baylands residents and the new middle school in the northwest corner of the Icehouse Hill district during the 30-year exposure period following Specific Plan buildout. These values exceed applicable thresholds and represent significant impacts. Acute and chronic, non-cancer hazard index (HI), and annual average $PM_{2.5}$ concentrations would not exceed significance thresholds. Implementation of Mitigation Measures MM AQ-1c, MM AQ-1e, MM AQ-1g, and MM AQ-1k would reduce: • Excess cancer risk during grading and all construction to a maximum of 5.1 in 1 million, which is well below the significance threshold of 10 in 1 million. • The maximally exposed child receptor during operations to an excess cancer risk level of up to 5.9 in 1 million for a child residing adjacent to the Caltrain rail line north of Geneva Avenue and to 4.9 in 1 million for students at the Baylands middle school, both below the significance threshold of 10 in 1 million. • The maximally exposed individual residence to 4.5 in 1 million for offsite residents and 5.1 in 1 million for onsite residents, both below the significance threshold of 10 in 1 million. • The maximally exposed individual worker during operations would be 2.4 in 1 million for offsite workers and 1.8 in 1 million for onsite workers, both well below the significance threshold of 10 in 1 million. Impact AQ-2 would therefore be less than significant with mitigation incorporated.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.B-8: Odors **Significant but Mitigable** The Program EIR determined that objectionable odors would be generated by the proposed onsite recycled water plant, affecting a substantial number of people under all Project site development scenarios. Mitigation Measure 4.B-8 would reduce this impact to less than significant.	**Impact AQ-3: Odors** **Subsequent EIR Finding. A Substantially More Severe Significant Impact Would Result from Substantial Changes to the Project:** • **Increased odor generation from increasing water treatment facility capacity.** • **Sensitive receptors located approximately 500-600 feet closer than analyzed in the Program EIR.** The 2025 Specific Plan proposes doubling the size of the water recycling facility that was analyzed in the Program EIR. Daily operations of the water recycling facility could result in objectionable odors to nearby sensitive receptors. The water recycling facility, which is proposed on the east side of the Caltrain right-of-way, would be located approximately 500 feet from the closest residential receptor in the Roundhouse District. The closest, off-site residents would be located approximately 2,000 feet west of the facility, approximately 500-600 feet closer than was analyzed in the Program EIR. Because construction-related odors from diesel equipment and vehicles would be localized and temporary, and low-VOC surface coating materials in accordance with BAAQMD Rules would reduce potentially objectionable odors from painting operations, construction activities, including the use of diesel and surface coating materials would be less than significant. The large majority of uses that would be permitted by the Specific Plan would not generate objectionable odors. While food preparation at restaurants and hotels, as well as coffee roasting within the Baylands, both of which are permitted by the Specific Plan, could result in odor generation, such odors would be generated on a small scale and not have a substantial adverse effect on a substantial number of people, as would be demonstrated by the required monitoring of BAAQMD regulation 7 for any odor complaints. Implementation of mitigation measures would establish performance standards for water recycling facility operations, require installation of an odor control system, and mandate adherence to best management practices.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.B-9: Would the Project conflict with or obstruct implementation of the applicable air quality plan? **Significant and Unavoidable** Because each Project Site development scenario was found to exceed applicable thresholds for emissions of criteria pollutants during both construction and operations, the Program EIR concluded that Project Site development would not support the primary goals of the Clean Air Plan and would therefore conflict with its implementation.	**Impact AQ-4: Consistency with the Bay Area Clean Air Plan** **Subsequent EIR Finding. Substantial Changes to the Project and Circumstances Indicate a Previously Identified Significant and Unavoidable Impact would now be Less than Significant** • **Changes to the Project: More stringent energy conservation and TDM programs, increased onsite renewable energy generation, onsite use of 100 percent renewable energy, and reduced housing** • **Changes to Circumstances: Adoption of an Updated Clean Air Plan by the BAAQMD** The Specific Plan would support the primary goals of the 2017 Clean Air Plan because it is a mixed-use, transit-oriented development generating and using sustainable energy for residential, commercial, and other uses. In addition, the Specific Plan includes many of the control measures from the 2017 Clean Air Plan, as shown in Table 4.9-22. Thus, the Specific Plan would not interfere with, disrupt, or hinder implementation of the Plan. Additionally, Mitigation Measure MM LUP-2 would ensure consistency with MTC's Transit-Oriented Communities Policy and ensure the Specific Plan provides appropriate housing and employment-generating development in proximity to transit, reducing vehicle miles traveled and associated mobile source emissions.

9.3.8 GREENHOUSE GAS EMISSIONS[425]

Table 9-10: Program EIR and Subsequent EIR Greenhouse Gas Emissions Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.F-1: Greenhouse Gas Emissions **Less than Significant** Based on a quantitative efficiency threshold of 4.6 metric tons of CO_2e per service population annually that had been proposed by BAAQMD in its 2009 document *Revised Draft Options and Justification Report for California Environmental Quality Act Thresholds of Significance*, the Program EIR determined the GHG impact of Baylands development to be less than significant. Project Site development would generate greenhouse gas emissions primarily as the result of motor vehicle use, but also	**Impact GHG-1: Specific Plan Area Greenhouse Gas Emissions** **Subsequent EIR Finding. A New Significant Impact Would Result from Changed Circumstances:** • **Adoption of an Updated Clean Air Plan by BAAQMD** • **Use of net zero emissions threshold in place of the outdated efficiency metric used in the Program EIR** Program EIR Impact 4.F-1 determined that the then-proposed mix of 4,434 dwelling units; 6,684,000 square feet of commercial, office, retail, and research and development (R&D) uses; and 369 hotel rooms (261,100 square feet) would generate 86,203 $MTCO_2e$ annually at buildout. The Program EIR also determined that eliminating onsite residential development, retaining 6,752,800 square feet of non-residential, and increasing the number of hotel rooms to 1,990 (1,392,300 square feet) would increase GHG emissions from 108,222 $MTCO_2e$ annually at buildout.

[425] The regulatory context for Baylands development in relation to Greenhouse Gas Emissions is presented in Section 4.10.3. Relevant Specific Plan provisions are presented in Section 4.10.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
through stationary sources (e.g., building energy use). The proposed onsite mix of residential and commercial/ office development in the Specific Plan, provides for internal capture of trips within the Baylands, substantially reducing per capita GHG emissions compared to commercial office only development scenarios.	GHG emissions from the 2025 Specific Plan at buildout (including amortized construction emissions) would be 51,260 metric tons of carbon dioxide equivalent ($MTCO_2e$). When taking into account the Baylands effect on future cumulative regional VMT documented by the analysis of Impact TRA-1, Baylands development at buildout would likely reduce future cumulative regional GHG emissions associated with mobile sources within the nine-county Bay Area region as the result of reducing regional VMT. Implementation of Air Quality Mitigation Measures MM AQ-1e, and MM AQ-1k, along with Greenhouse Gas Mitigation Measure MM GHG-1d would result in a quantifiable reduction of GHG emissions by approximately 4,138 MT CO_2e per year. Other mitigation measures (Air Quality Mitigation Measures MM AQ-1a, MM AQ-1b, MM AQ-1c, MM AQ-1i, and MM AQ-1j, along with Greenhouse Gas Mitigation Measures MM GHG-1a, MM GHG-1b, and MM GHG-1c, and MM GHG-1e) for which an estimated reduction is not readily quantifiable along with the regional VMT reduction identified in Section 4.8, *Transportation*, would only achieve marginally more reductions. Implementation of the GHG emissions offset program set forth in Mitigation Measure MM GHG-1e would be difficult given the large number of GHG offset credits required, their locational parameters, the timing of their purchase and retirement, and their future availability and its success could not be guaranteed.
Not addressed in the Program EIR.	**Impact GHG-2: Effect on Regional Greenhouse Gas Emissions** **Subsequent EIR Finding. No New Significant Impact Would Result** As documented in the vehicle miles traveled analysis undertaken for Impact TRA-1, Baylands residents and workers would generate substantially lower per capita vehicle miles traveled than the regional average. While Baylands development would increase GHG emissions from uses within the Specific Plan area, it is logical to conclude that reduced per capital VMT from Baylands residents and workers would result in reduced regional mobile source GHG emissions compared to developing the Specific Plan's proposed 2,200 dwelling units, 6.5 million square feet of commercial office, and 500,000 square feet of hotel use outside of the Baylands spread throughout San Mateo and San Francisco counties.
Impact 4.F-2: Consistency with Applicant GHG Reduction Plans and Programs **Less than Significant** The Program EIR determined that greenhouse gas emissions for each of the scenarios that were analyzed would be less than significant. As a result, Baylands development would not impair attainment of GHG reduction goals established pursuant to AB 32 in the *Climate Change Scoping Plan*.	**Impact GHG-3: Consistency with Applicant GHG Reduction Plans and Programs** **Subsequent EIR Finding. No New Significant Impact Would Result** The Specific Plan would not obstruct implementation of relevant Scoping Plan actions to reduce GHG emissions related to VMT reduction and building decarbonization. The 2025 Baylands Specific Plan provides land use, building design, and transportation features consistent with meeting most of the performance standards contained in the BAAQMD's CEQA Guidelines. Specific Plan development would reduce regional vehicle miles traveled and result in substantial reductions in home to work trips for Baylands residents and workers consistent with achieving state-wide GHG reduction goals. The Specific Plan commits to substantial on-site renewable energy generation, and, all-electric buildings. It would not extend natural gas service to new uses and would provide distributed battery storage facilities and operate with 100 percent renewable energy. The Specific Plan is designated as a Priority Development Area in Plan Bay Area 2050 and is consistent with the GHG reduction measures of the regional Sustainable Communities Strategy. In addition, with implementation of Mitigation Measure LUP-2, the Specific Plan would be consistent with MTC's Transit-Oriented Communities Policy (Resolution No. 4530).

9.3.9 ENERGY RESOURCES[426]

Table 9-11: Program EIR and Subsequent EIR Energy Resources Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
4.P-1: Energy Consumption during Construction **Significant but Mitigable** Energy use during Project Site construction of each alternative analyzed in the Program EIR would result in substantial consumption of energy, which is considered to be a significant impact. To reduce this impact to a less-than-significant level, implementation of Mitigation Measure 4.P-1 would be required as would implementation of Mitigation Measures 4.B-2a and 4.B-2b, as recommended in Section 4.B, *Air Quality*, and Mitigation Measure 4.N-12, as recommended in Section 4.N, *Traffic and Circulation*. In addition, construction energy use would (following completion of site remediation) be similar on a unit basis to other developments throughout the region. Although the extent of Project Site development is large, construction and development would occur over a 20-year period, and demand for construction-related electricity and fuels would be spread out over that time. **4.P-2: Energy Consumption during Operations** **Significant but Mitigable** Each scenario analyzed in the Program EIR would substantially increase consumption of electricity and natural gas within the Project Site. While Project Site development-related electrical consumption would be largely offset by renewable energy generation, the total increase in energy consumption would nevertheless remain substantial. Baylands development would comply with Brisbane Municipal Code Section 15.80, which specifies green building standards for new developments, including meeting a minimum Leadership in Energy and Environmental Design (LEED) "Silver" rating on the Green Building Project Checklist for all new commercial projects	**EN-1: Energy Resources** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** *Construction.* Compliance with existing state regulations to minimize fuel use would ensure that Project construction activities requiring the use of fossil fuels would not be wasteful, inefficient, or unnecessary. Moreover, Baylands construction would not be expected to result in demand for energy greater on a per-unit-of-development basis than other development projects in the region, except for the necessary grading that is required to return the Baylands to a safe and healthy condition and provide adequate protection from flooding and projected sea level rise. While mitigation for construction impacts is not required, Mitigation Measures MM AQ-1a, MM AQ-1c, and MM AQ-1i would further reduce energy consumption during Baylands construction. *Operations.* The Specific Plan proposes a suite of sustainability features including LEED Gold buildings, all-electric buildings, electric vehicle charging, on-site solar powered infrastructure systems, distributed and utility-scale Battery Storage systems, on-site bicycle and pedestrian trails connecting to off-site trails, and TDM Plans to reduce mobile fuel use. In addition, transportation demand management programs would be implemented to reduce per capita vehicle miles traveled by Baylands residents and employees by more than 30 percent below the existing regional baseline VMT. The Specific Plan provides for buildings to be designed to be LEED Gold or GreenPoint Rated (based on 2022 rating criteria for LEED and GreenPoint) Residential and nonresidential buildings within the Specific Plan area would comply with CALGreen Tier 1 voluntary standards. Ultimately, Baylands development would have lower per capita energy consumption compared to the Bay Area region due to the following: • The combination of the Specific Plan's mixed-use character, location adjacent to transit, provision of a comprehensive on-site trails system with connections to areawide and regional trails, and TDM programs would reduce per capita VMT for Baylands residents and employees below the regional average and reduce regional VMT. • With respect to EV charging, Baylands residential and commercial buildings would be constructed to meet the 2022 CALGreen Tier 1 Voluntary Building Energy Standards and the City's recently adopted Reach Code. Mitigation Measure AQ-1j would require the Specific Plan to meet Tier 2 Voluntary Building Energy Standards.

[426] The regulatory context for Baylands development in relation to Energy Resources is presented in Section 4.11.3. Relevant Specific Plan provisions are presented in Section 4.11.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions

over 10,000 square feet and achieving a "green home" rating on the MultiFamily GreenPoint Checklist for any residential developments with 20 or more units.
A number of Project Site development features and EIR mitigation measures would reduce the significant increase in energy consumption to a less-than-significant level, including development of onsite alternative energy-generating technologies and implementation of energy-saving design and building techniques.
On a per-square-foot-of-building basis, development of the Project Site would result in 56.6 to 80.8 percent less electrical consumption than would comparable development projects that comply with the requirements of Title 24 but do not provide for onsite electrical energy generation.
Inefficient, wasteful, and unnecessary consumption of energy would be avoided or reduced with implementation of Mitigation Measure 4.F-1 (see Section 4.F, *Greenhouse Gas Emissions*), which sets energy efficiency performance standards. In addition, Mitigation Measures 4.P-2a through 4.P-2c would further reduce energy use by ongoing operations of Project Site uses.
 	
4.P-3: Mobile Source Energy Consumption
Significant but Mitigable
Project Site development would result in a substantial increase in vehicular fuel use. Inefficient, wasteful, and unnecessary consumption of fuel would be avoided or reduced with implementation of mitigation measures to help minimize fuel use associated with Project Site development-related trips, including Mitigation Measures 4.B-4, which imposes operational emission controls; 4.N-1f and 4.N-13, which require preparation of a Transportation Demand Management program; 4.N-7, which requires provision of bus service to and from proposed land uses; and 4.N-11, which requires provision of bicycle parking onsite.
	• On-site renewable generation and distributed battery storage would be far greater than is typical for development throughout the Bay Area region.
	• Baylands development would not increase reliance on fossil fuels or decrease reliance on renewable energy sources because:
	  ○ The relatively lower per capita VMT identified above would result in less per-capita fossil fuel consumption than is typical for the Bay Area.
	  ○ The project would include substantial on-site solar energy generation and on-site battery storage, thereby reducing the need for fossil-fuel-generated energy and actually increasing reliance on renewable energy.
	Thus, Baylands development would not result in a new or substantially more severe impact.

Not addressed in the Program EIR.	**EN-2: Consistency with Energy Resources Plans** **Subsequent EIR Finding. No New Significant Impact Would Result** The Baylands Specific Plan provides for transit-oriented mixed-use development within an area designated by *Plan Bay Area 2050* as a Priority Development Area, and a Transit Priority Area, and would provide substantial on-site energy generation. The Baylands would not conflict with the *Plan Bay Area 2050* policies related to renewable energy or energy efficiency as concluded in Section 4.3, *Land Use and Planning Policy*.

9.3.10 NOISE AND VIBRATION[427]

Table 9-12: Program EIR and Subsequent EIR Noise and Vibration Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.J-4: Temporary Increase in Noise Levels **Significant and Unavoidable** The noisiest phase of construction would be during pile driving, which would generate noise levels of approximately 90 to 105 L_{eq} at 50 feet. Excavation and exterior finishing would also generate a substantial amount of noise. Mitigation Measures 4.J-4a and 4.J-4b would reduce Project construction noise; however, the substantial noise levels associated with potential pile driving and the proximity to residential receptors would be a significant and unavoidable impact.	**Impact NOI-1: Temporary Increase in Ambient Noise Levels during Construction** **Subsequent EIR Finding. Substantially More Severe Significant Impacts Would Result from Substantial Changes to the Project and Information not Available at the Time of the Program EIR:** • **Revised Specific Plan phasing program** • **Updated geotechnical reports prepared for site remediation and landfill closure submitted to state and county regulatory authorities** Updated geotechnical reports indicate that installation of pile foundations and resulting pile driving within the Baylands would be more extensive than was analyzed in the Program EIR, which also did not explicitly analyze noise effects resulting from multiple pile driving activities that could occur at any given time or the effects of pile driving for the Geneva Avenue bridge and buildings west of Caltrain on adjacent residential uses within the Baylands. In addition, the 2025 Specific Plan's phasing program could create increased potential for sensitive uses to be located immediately adjacent to buildings requiring pile driving compared to what was previously considered in the Program EIR. Pile driving activities within the western portion of the Baylands would increase daytime noise levels by 15 to 43 dBA in 3 locations while pile driving within the eastern portion of the Baylands would increase daytime noise levels by 10 to 17.4 dBA in two locations. Updated noise analyses have determined that some construction activities, such as concrete pours or other work to maintain safety or avoid traffic impacts, may require nighttime activity that could conflict with the City of Brisbane's ordinance limiting the hours and days allowed for construction work. Such nighttime activities would result in temporary noise level increases exceeding the quieter nighttime ambient noise levels by more than 10 dBA at any Baylands housing that might be occupied while construction activities are being undertaken for other Baylands development increments. While implementation of Program EIR Mitigation Measures 4.J-4a and 4.J-4b (now numbered MM NOI-1a and MM NOI-1b) would reduce construction noise, localized noise increases of more than 10 dBA at new residences within the Specific Plan area from both vertical building construction and installation of pile foundations would occur. Site-specific geotechnical conditions may require impact pile driving as close as 50 feet to occupied residential uses within the Baylands, which could generate noise as great as 21 dBA above ambient in proximate offsite locations. While the addition of Mitigation Measures MM NOI-1c through MM NOI-1e would further reduce construction noise, building construction adjacent to occupied dwelling units within the Baylands and roadway noise increases along four roadway segments would remain significant and unavoidable because of the proximity of receptors and unavailability of feasible mitigation strategies. Additionally, construction

[427] The regulatory context for Baylands development in relation to Noise and Vibration is presented in Section 4.12.3.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	noise impacts from installation of pile foundations would still remain significant since site-specific geotechnical conditions may require impact pile driving as close as 50 feet to occupied residential uses.
Impact 4.J-3: Permanent Increase in Noise Levels **Significant but Mitigable** Operation of heating, ventilation, and air conditioning equipment would be subject to City Noise Ordinance standards. Provided that the equipment would be designed and used in a manner that complies with those standards (see Mitigation Measure 4.J-3a), the noise impact on Project residences and adjacent land uses would be less than significant. Operational noise related to the arrival, departure, and loading/unloading of goods from delivery trucks associated with Project site development's proposed warehouse and commercial land uses would generate noise. Retail land uses in all scenarios would be located as close as 350 feet from the nearest existing sensitive receptor (residences) on MacDonald Avenue. With implementation of the Mitigation Measures 4.J-3a and 4.J-3b, the noise impact from stationary operations would be reduced to a less-than-significant level.	**Impact NOI-2: Permanent Increase in Ambient Noise Levels from Stationary Sources** **Subsequent EIR Finding. New and Substantially More Severe Significant Impacts Would Result from Substantial Changes to the Project:** • **Revised land use plan placing stationary noise sources and receptors in different locations relative to each other.** • **Increased size of water recycling facility and addition of battery storage facilities.** Substantial changes to the project would place stationary noise generators and noise sensitive receptors in different locations relative to each other than was analyzed in the Program EIR. Analysis of noise from HVAC units undertaken for the Specific Plan EIR indicated a new significant impact not addressed in the Program EIR would occur. While the 2025 Specific Plan provides requirements for screening of HVAC units, these screening requirements would not ensure compliance with applicable thresholds for sensitive receptors and applicable noise ordinance requirements could thus be exceeded. The Specific Plan EIR also recognizes practical difficulties in establishing baseline ambient noise levels within the Baylands that would be used to determine compliance with Brisbane noise ordinance standards and therefore concluded that mitigation of operational noise impacts could not be guaranteed. In addition, the Program EIR did not analyze the noise impacts of onsite infrastructure. While the Baylands water recycling facility would provide noise control features, the facility's current design is conceptual. In the absence of design specifications, a quantitative demonstration that the facility would meet applicable Brisbane noise standards is not possible and it must be assumed that noise levels from operations would exceed applicable thresholds. In addition, battery storage systems which could be located as close as 150 feet to Baylands high-density residential uses within the Roundhouse District, would generate noise that could increase ambient noise levels in excess of 5 dBA. Noise increases from commercial heavy/medium-duty truck deliveries would be more than 5 dBA where the existing noise level is 59 dB L_{eq} or less at 50 feet away, which could occur during early morning deliveries in nighttime hours (before 7:00 a.m.). The Specific Plan does not contain requirements that would ensure loading docks are sited such that the building acts as a barrier from noise for adjacent noise-sensitive land uses or by provision of noise barriers or limits on delivery times and access routes, potentially allowing noise from loading activities to exceed applicable noise standards. Program EIR Mitigation Measure 4.J-3a (now numbered MM NOI-2a) would reduce noise impacts associated with stationary building equipment and truck delivery areas and loading docks. Mitigation Measure NOI-2a would ensure that these sources would be less reduced to less than significant. However, significant impacts from battery storage systems, water recycling facility, amplified sound, and an overall aggregate noise increase from stationary sources not envisioned in the Program EIR would remain significant.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	The addition of Mitigation Measures NOI-2c through NOI-2f would be sufficient to achieve operation of individual stationary sources to be consistent with the noise standards of Brisbane Municipal Code Sections 8.28.030, 8.28.040, and 8.28.050. However, ensuring that resultant noise levels could be maintained less than 5 dBA above ambient levels is not reasonably feasible given that (1) each receptor would need a baseline measurement in a noise environment with multiple sources; (2) the noise environment would be constantly changing due to other noise sources as the Specific Plan develops; and, (3) construction activities discussed under Impact NOI-1 would hinder the establishment of baseline noise levels within the Specific Plan area for many years. Therefore, the residual impact of each of these stationary noise source types would be significant and unavoidable. Additionally, the aggregate operation of all these sources would increase noise levels generated within the Specific Plan area as a whole to an extent not analyzed in the Program EIR. Because the exact future location and configuration for all of these sources cannot be known at this time, it is not possible to ensure that the aggregate increase in noise levels at specific off-site receptor locations from stationary sources would not result in a permanent noise increase in excess of 5 dBA L_{eq}.
Impact 4.J-3: Permanent Increase in Ambient Noise Levels **Less than Significant** The Baylands development scenarios analyzed in the Program EIR would generate approximately 42,446 to 82,176 net new vehicle trips per day (44,985 for the 2011 Specific Plan), which would be distributed over the local street network and increase roadside noise levels. At a distance of 75 feet from the centerline of roadway segments to account for the presence of multiple lanes, roadway shoulder, sidewalk and building setbacks, all of which contribute to the attenuated sound level at residences or other receptors, the only roadway segment where increases noise would exceed significance criteria (in this case, an increase of 1.5 or greater in an area in excess of 65 DNL), which would only occur during a special event at the arena or concert venue proposed in one of the scenarios analyzed in the Program EIR.	**Impact NOI-3: Permanent Increase in Ambient Noise Levels along Roadways** **Subsequent EIR Finding. A New Significant Impact Would Result from Substantial Changes to the Project:** • **Revised land use program and roadway configuration.** The 2025 Specific Plan project would generate 46,103 daily trips on the surrounding roadway system at buildout, slightly more than the 44,985 daily trips than the 2011 Specific Plan but more than 40 percent less than non-residential scenarios that were analyzed in the Program EIR. the Program EIR determined that a significant traffic noise impact would result only for special event traffic at an arena or concert venue that are not proposed in the 2025 Specific Plan. The Specific Plan EIR, however, identified one roadway segment where Baylands-generated traffic would exceed applicable noise thresholds with Phase 1 traffic and three roadway segments that would at exceed applicable thresholds buildout. Thus, the 2025 Specific Plan project would result in a significant impact that was not identified in the Program EIR. Mitigation Measure MM NOI-3 evaluated available measures to reduce Baylands-generated noise impacts and determined that measures other than TDM programs, which were already included in the traffic projections upon which noise impact analysis was undertaken, would be feasible only in some locations, or would be unenforceable since the impact would occur outside of Brisbane. As such, it cannot be assured that feasible measures could be implemented to the degree sufficient to reduce impacts to less than significant.
Impact 4.J-1: Expose People to Noise Levels in Excess of Applicable Standards **Significant but Mitigable** *Expose Residents and Hotel Guests to Excessive Noise Levels from Railroad Operations*	**Impact NOI-4: Expose People to Railroad, Freeway, and Airport Noise** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** *Expose Residents and Hotel Guests to Excessive Noise Levels from Railroad Operations* Implementation of Program EIR Mitigation Measures 4.J-1a and 4.J-1b (now numbered MM NOI-4a and NOI-4b) would require residential, hotel, and other uses where people normally sleep to be designed to maintain an interior Day Night Noise Level (DNL) no greater than 45 dBA. Outdoor common areas would

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Residents of multi-family housing and hotel guests would be exposed to noise levels that exceed the standards established by the Brisbane General Plan. Exposure of schools within the Project Site to noise would be less than significant under Project Site development. Mitigation Measures 4.J-1a and 4.J-1b would reduce impacts to less than significant. *Expose People to Excessive Noise Levels from Airport Operations* The Noise Exposure Map for SFO indicates that all portions of the City of Brisbane are outside the 65-CNEL noise contour relative to aircraft noise from the airport (i.e., aircraft operations from the airport contribute less than 65 dBA to ambient noise levels within Brisbane) (SFO, 2012) which is the state and federal threshold for noise abatement pursuant to Caltrans and FAA guidelines. As noted in Section 4.I, *Land Use and Planning*, the Project Site is, however, within Airport Influence Area A, which is defined as an area that is flown by an aircraft at an altitude of 10,000 feet or less above mean sea level a minimum of once weekly.	be required to maintain a 65 dBA DNL, which would adequately protect Baylands residents from noise generated by Caltrain rail operations. As a result, Baylands development would not exacerbate the noise impacts of railroad-generated noise by placing noise-sensitive uses close to the Caltrain right-of-way. *Expose People to Excessive Noise Levels from Airport Operations* The Baylands is located outside the 65 dB CNEL noise contour of SFO airport operations. As noted in the Program EIR, the Baylands is within Airport Influence Area A, which is defined as an area that is flown by an aircraft at an altitude of 10,000 feet or less above mean sea level a minimum of once weekly.
Impact 4.J-2: Vibration Effects on Buildings **Significant but Mitigable** Development in the vicinity of the Roundhouse would involve standard construction equipment and would be unlikely to require high-impact equipment such as pile driving. However, if pile driving were necessary for proposed buildings near the Roundhouse, construction-related vibration would be significant if it were to occur within 85 feet of the structure. The upper end of vibration levels generated by standard construction equipment would be 0.089 in/sec which would be generated by large bulldozers, hoe rams or caisson drilling at a distance of 25 feet and would be below the criterion published by Caltrans of 0.25 in/sec for the protection of fragile buildings. Implementation of Mitigation Measure 4.J-2b would ensure that impacts to historic structures resulting from pile driving vibrations would be less than significant.	**Impact NOI-5: Temporary or Permanent Increase in Vibration** **Subsequent EIR Finding. New and Substantially More Severe Significant Impacts Would Result from Substantial Changes to the Project:** • **Substantially More Severe Significant Impact: Changes to phasing program that would result in pile driving in proximity to newly constructed buildings within the Baylands** • **New Significant Impact: Pile driving in proximity to Kinder Morgan underground pipelines.** Although existing off-site structures would not experience Baylands-generated vibration exceeding applicable thresholds, pile driving within the Baylands buildings would expose previously constructed buildings as close as 25-40 feet away within the Icehouse Hil, Roundhouse, and Bayshore districts to vibration levels of 0.321 to in/sec PPV, above the applied human annoyance criterion of 72 VdB (0.016 in/sec PPV) but below the building damage threshold for modern structures of 0.5 in/sec PPV. Within the Campus East District, pile driving would expose previously constructed Baylands buildings as close as 25 feet south of the construction of low-density commercial buildings to a vibration level of more than 0.65 in/sec PPV, which is above both the applied human annoyance threshold of 72 VdB (0.016 in/sec PPV) and the building damage threshold of 0.50 in/sec PPV. Pile driving activities within 8 feet of Kinder Morgan pipelines would generate sufficient vibration to damage the pipeline. Pile driving within 5 feet of underground pipelines or other underground structures could exceed the 10.0 in/sec PPV criterion, which would constitute a new significant impact not disclosed in the Program EIR. Implementation of Program EIR Mitigation Measures 4.J-2b and 4.J-2c (now numbered MM NOI-5a and MM NOI-5b) would reduce impacts related to building damage to the Roundhouse or the Machinery & Equipment building and historic structures to less than significant by requiring preconstruction surveys,

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	monitoring, and provisions for repairing damage. Impacts to the Roundhouse structure would be further minimized because it would be removed and reassembled. However, significant impacts with respect to human annoyance would remain. The addition of Mitigation Measure NOI-5c addresses residual impacts associated with potential damage to non-historic structures and human annoyance impacts. This measure would require the preparation and implementation of a Master Construction Vibration Avoidance and Reduction Plan that would ensure vibration levels from impact or vibratory pile driving within the Baylands would not exceed applicable thresholds.
Impact 4.J-2: Exposure of People to Groundborne Vibration or Noise Levels **Significant but Mitigable** Project Site development would expose onsite residents to vibration from rail operations, representing a significant impact. Mitigation Measure 4.J-2a establishes a vibration performance standard for residential developments within 200 feet of the Caltrain Station and mainline track and requires that detailed project-level vibration analyses be prepared to ensure that the standard will be met. In addition, Mitigation Measure 4.J-2b would ensure that pile driving vibrations impacts to any historic structures (Roundhouse) are minimized. Implementation of Mitigation Measure 4.J-2a would ensure that impacts related to groundborne vibration from rail operations would be less than significant. Implementation of Mitigation Measure 4.J-2b would ensure that impacts to historic structures resulting from pile driving vibrations would be less than significant.	**Impact NOI-6: Exposure of People to High Vibration Levels** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** Development of housing and hotel uses proposed for the tower buildings within the eastern portion of the Bayshore and Roundhouse Districts within 50 feet of the Caltrain rail line would exacerbate the vibration impacts of Caltrain and other rail operations by exposing on-site residents and hotel guests to more than 70 rail operations generating 72 VdB or more. This would constitute a significant impact. Implementation of Mitigation Measure MM NOI-6 would ensure that groundborne vibration from rail operations would be less than the applicable threshold and thereby avoid exacerbating vibration impacts from rail operations on Baylands residential and hotel uses.

9.3.11 HAZARDS AND HAZARDOUS MATERIALS[428]

Table 9-13: Program EIR and Subsequent EIR Hazards and Hazardous Materials Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.G-1: Routine Transport, Use, and Disposal of Hazardous Materials **Significant but Mitigable** *Construction* Compliance with applicable requirements and a Stormwater Pollution Prevention Plan pursuant to Program EIR mitigation measures would ensure that hazards to the public or the environment through the routine transport and use or disposal of hazardous materials during project construction activities would be reduced to a less-than-significant level. *Operations* Baylands development would primarily consist of residential, commercial/office, public, and open space uses that would not transport, use, store, or dispose of large quantities of hazardous materials that could present a substantial risk to people. Uses such as hardware stores, laboratories, and the relocated fire station that would store hazardous materials in amounts greater than minimum reportable quantities would be required to prepare Hazardous Materials Business Plans tailored to their specific operations *to* reduce the potential for hazardous materials release during the routine transport, use, or disposal of such materials. **Impact 4.G-2: Risk of Upset** **Significant but Mitigable** While the routine use, storage, transport, and disposal of hazardous materials in accordance with applicable regulations would not pose health risks, improper use, storage, transportation and disposal of hazardous materials and wastes could result in accidental spills or releases. Encountering contaminated soils or groundwater either during or following remediation could result in significant adverse effects. If temporary dewatering occurs in areas of shallow groundwater and groundwater contamination is	**Impact HAZ-1: Transport, Use, Disposal, and Management of Hazardous Materials** **Subsequent EIR Finding. A Substantially More Severe Significant Impact Would Result from Substantial Changes to the Project:** • **Plans for Icehouse Hill trails and recreational improvements, as well as relocation of Mission Blue Nursery to the police shooting range site, requiring clean up.** Because Remedial Action Plans for OU-SM and OU-2 have been approved as has the Title 27 landfill closure plan, the physical environmental effects of site remediation and landfill closure activities are no longer part of the project. Program EIR Mitigation Measures 4.G-2a through 4.G-2d (now numbered MM HAZ-1a through MM HAZ-1d), and MM HAZ-1d would ensure implementation of General Plan policy and address impacts not addressed through compliance with applicable federal, state, and regional hazardous materials regulatory requirements. However, Program EIR Mitigation Measure 4.G-2d (MM HAZ-1d) only addresses remediation for construction of trails on the southerly slope of Icehouse Hill and does not address additional remediation for other construction on Icehouse Hill, including relocation of the Mission Blue Nursery to the site of the former police shooting range. In addition, the Kinder Morgan fuel pipelines could be damaged during construction. Both of these impacts would constitute new significant impacts. Activities involved with installation of underground electrical lines, renewable energy generation and battery storage facilities, service connections, and connections to the Martin Substation were not part the project at the time of the Program EIR and were therefore not analyzed. Construction of these improvements would comply with applicable codes, California Public Utilities Commission and Independent System Operator Rules and Regulations, and PG&E requirements and therefore have less than significant environmental effects. In addition, cleanup of the former shooting range is addressed in the Program EIR by EPA guidelines. As such, the potential for exposure to lead exists during construction of trails and relocation of Mission Blue Nursery to the site of the former firing range. Construction impacts would therefore be significant even with implementation of Program EIR mitigation measures. Because Remedial Action Plans for Operable Units OU-SM and OU-2 and the Title 27 Landfill Closure Plan were not available at the time of the Program EIR, analysis of the 2025 Specific Plan project's consistency with these plans was undertaken. The analysis of Impact HAZ-1 concludes that Baylands development would be required to comply with the requirements of Remedial Action Plans for OU-SM and OU-2, restricting human interaction with contaminated soils or groundwater and that construction of buildings

[428] The regulatory context for Baylands development in relation to Hazards and Hazardous Materials is presented in Section 4.13.3.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
still present, exposure if dewatering is not handled appropriately. While current regulations and procedures would minimize the potential for accidental damage to existing underground fuel pipelines within the Project Site, the possibility remains that underground excavations would still damage a pipeline, with a resulting release of hazardous materials. Significant impacts would be avoided through compliance with federal, state, and local regulations pertaining to the handling and disposal of hazardous waste; implementation of a Soil and Groundwater Management Plan and a Master Deconstruction and Demolition Plan; and mitigation measures.	and infrastructure within the eastern portion of the Baylands would comply with applicable Title 27 Closure and Post-Closure Maintenance Plan requirements. Grading and construction activities in the vicinity of Kinder Morgan pipelines includes the potential of accidental loading or undermining of soils covering and underlying the pipeline, causing damage to the pipeline. Because current grading and development plans do not include specific provisions for protecting the structural integrity of the pipeline, a significant impact is assumed to result from Baylands development.
Impact 4.G-3: Emissions or Handling of Hazardous or Acutely Hazardous Materials within ¼ Mile of a School **Less than Significant** A charter high school and an elementary school are proposed. R&D, institutional, and commercial uses would entail the storage, handling, transport, and disposal of hazardous materials. If not managed appropriately, schoolchildren may be exposed to accidental spillage or leakage of the common hazardous materials (fuels, oils, lubricants, paints, cleaning chemicals, and other petroleum products) used onsite. A comprehensive set of federal, state, and local laws and requirements regulate the transportation, use, storage, and disposal of hazardous materials and wastes to reduce the potential risks of human and environmental exposure during post-construction operations of the land use types that would be permitted within the Baylands, particularly those operations occurring within 0.25 mile of a school. These programs also provide for training of workers to react to and contain accidental hazardous materials spills and other exposures to hazardous materials. The combination of these programs with Program EIR Mitigation Measure 4.G-3, which is to be incorporated into the Specific Plan EIR, would reduce impacts to less than significant.	**Impact HAZ-2: Emissions or Handling of Hazardous or Acutely Hazardous Materials or Waste Within ¼ Mile of a School** **Subsequent EIR Finding. A New Significant Impact Would Result from Substantial Changes to the Project:** • **Proposed middle school location would not meet all provisions of CCR Title 5, Section 14010.** A comprehensive set of federal, state, and local laws and requirements regulate the transportation, use, storage, and disposal of hazardous materials and wastes to reduce the potential risks of human and environmental exposure during post-construction operations of the land use types permitted within the Baylands, particularly those operations occurring within 0.25 mile of a school facility. These programs also provide for training of workers to react to and contain accidental hazardous materials spills and other exposures to hazardous materials. No significant impact would thus result in relation to proximity of facilities that handle or emit hazardous or acutely hazardous materials, substances, or waste. However, the proposed middle school locations do not meet all provisions of CCR Title 5, Section 14010 because they are: • Within 150 feet of PG&E's 230 kV underground electrical transmission line along Bayshore Boulevard. • Within 1,500 feet of the Caltrain railroad right-of-way. • Within 1,500 feet of a PG&E 24-inch high-pressure natural gas transmission pipeline. • Subject to liquefaction and cyclic densification during a design seismic event. Mitigation Measure MM HAZ-2 requires the proposed middle school to meet the standards set for in CCR Title 5, Section 14010 or to (1) prepare the required studies for review by the Department of Education and (2) secure approval of the proposed school site pursuant to the provisions of CCR Title 5, Section 14010(u). Existing state and federal programs provide for protection of school sites and also provide for training of workers to react to and contain accidental hazardous materials spills and other exposures to hazardous materials. MM HAZ-2 would ensure that the proposed school site would meet the design and safety

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	standards set forth in CCR Title 5, Section 14010 or demonstrate safety and provide mitigation for any hazards prior to approval pursuant to CCR Title 5, Section 14010(u). The impact would therefore be reduced to less than significant.
Impact 4.G-4: Development on a Hazardous Materials Site **Significant but Mitigable** The Project Site and adjacent areas include several sites that are included on databases listing hazardous materials pursuant to Government Code Section 65962.5 including the former Brisbane Landfill, OU-1 (now OU-SM), and OU-2, and the Schlage Lock facility. These sites have a long history of environmental investigation and cleanup efforts with additional remediation activities occurring in the future and are actively overseen by regulatory agencies (DTSC and RWQCB) to ensure that all remediation is completed to levels that protect human health and the environment. Although various portions of the Specific Plan area, including the former Brisbane Landfill, OU-SM, and OU-2, are included on databases listing hazardous materials pursuant to Government Code Section 65962.5, remedial action plans have been approved by state and county regulatory agencies. In addition, remediation and landfill closure will occur prior to Baylands development as required by Program EIR Mitigation Measure 4.G-2a, which is to be incorporated into the Specific Plan EIR. Substantial revisions to the Program EIR are, however, required to reflect state and county regulatory agency approvals, each of which is based on updated information. Changes to the project include offsite infrastructure improvements at the PG&E Martin Substation, which is subject to regulatory oversight related to past cleanup activities and is therefore listed pursuant to Government Code Section 65962.5. New analyses and substantial revisions to the Program EIR are required to determine whether the potential for exposure of workers, the public, and the environment to hazardous materials associated with improvements at the PG&E Martin Substation would have significant effects not previously disclosed in Program EIR.	**Impact HAZ-3: Development on a Hazardous Materials Site** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** Various portions of the Baylands, including the former Brisbane Landfill, OU-SM, and OU-2, are included on databases listing hazardous materials pursuant to Government Code Section 65962.5. site remediation and landfill closure pursuant to plans approved by state regulatory authorities would occur prior to Baylands development. In addition, the only off-site location where Baylands-related off-site infrastructure is proposed is the PG&E Martin Substation, which is subject to regulatory oversight related to past cleanup activities. Thus, the potential for exposure of workers, the public, and the environment to hazardous materials within sites included on databases listing hazardous materials pursuant to Government Code Section 65962.5 would be less than significant.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.G-5: Safety or Noise Hazards Due to Aircraft Operations **No Impact** The Project Site is located more than 2 miles from the nearest public airport (SFO) or airstrip and is not located within an airport land use plan. Development under any of the proposed scenarios would not conflict with an airport land use plan nor present any other impact related to a public airport use or private airstrip.	**Impact HAZ-4: Safety or Noise Hazards Due to Aircraft Operations** **Subsequent EIR Finding. No New Significant Impact Would Result** The Baylands is located more than 2 miles from San Francisco International Airport (SFO) and is not located within an Airport Safety Compatibility Zone, FAA Notification Area, Airport Imaginary Surface area per 14 CFR Part 77, or the 65 decibel (dB) noise contour of the airport. The Airport Land Use Compatibility Plan does not identify any land use restrictions due to the location of the Baylands in relation to SFO. The Specific Plan area is, however, identified in the Airport Land Use Compatibility Plan as being within the SFO Airport Influence Area A – Real Estate Disclosure Area. Anyone offering subdivided property for sale or lease is required to disclose the presence of SFO per Section 11010 of the California Business and Professions Code. Thus, Baylands development is consistent with the adopted Comprehensive Airport Land Use Compatibility Plan for the Environs of San Francisco International Airport and would not result in a safety hazard or excessive noise for people residing or working in the Specific Plan area due to aircraft operations.
Impact 4.G-6: Emergency Preparedness **Less than Significant** Circulation plans are designed to ensure appropriate emergency access to and egress from the Project Site under all four scenarios. The Project reserves a specific site for a centrally located fire facility. Adequate access to and from this facility would be provided by the roadway and circulation improvements proposed for each scenario. Additionally, all site-specific development site designs, including private internal circulation and building site plans, will be subject to review and approval by the City, as well as emergency service providers under each of the four development scenarios.	**Impact HAZ-5: Emergency Preparedness** **Subsequent EIR Finding. No New Significant Impact Would Result** Development review by the City of Brisbane, in combination with review by the North County Fire Authority, would ensure (1) availability of needed evacuation routes and access for emergency response personnel, (2) provision of adequate fire flow, (3) on-site safety measures, (4) implementation of measures to reduce the potential for emergencies, and (5) expansion facilities needed to respond to emergencies. Thus, Specific Plan development would not interfere with implementation of an adopted emergency plan, impede evacuation routes, or restrict access for emergency response or recovery.

9.3.12 HYDROLOGY AND WATER QUALITY[429]

Table 9-14: Program EIR and Subsequent EIR Hydrology and Water Quality Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.E-5: Soil Erosion or Loss of Topsoil **Significant but Mitigable** Construction and remediation activities required for Project Site development, such as excavation, backfilling, grading, and placement of fill material for surcharging purposes can expose areas of loose soil subject to soil loss and erosion by wind and storm water runoff. At the Project Site, areas that are susceptible to erosion are those that would be exposed during the construction phase and along the shoreline where soil is subjected to wave action. However, construction contractors for the Project Site development would be required by law to obtain a National Pollutant Discharge Elimination System (NPDES) Permit for Discharges of Stormwater Associated with Construction Activities from the San Francisco Bay RWQCB- for all proposed construction as part of the proposed Project. Conditions of this permit would include preparation and implementation of a Storm Water Pollution Prevention Plan (SWPPP) as required by EIR mitigation measures. Once construction is completed, the interior areas of the Project Site would be largely developed, with open spaces being landscaped. As a result, few locations would be created that would be exposed to the forces that cause erosion. **Impact 4.H-1: Violate Water Quality Standards or Waste Discharge Requirements** **Significant but Mitigable** With the substantial amount of earthwork, grading, and remediation activities required for construction under any of the four Project Site development scenarios, water quality standards would be violated, resulting in a significant impact. In addition, Project Site development would result in changes to existing	**Impact HWQ-1: Water Quality Protection** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** Stormwater treatment facilities have been substantially changed from those analyzed in the Program EIR. In addition, the Specific Plan's phased approach for improvements along Visitacion Creek and the north shore of the Brisbane Lagoon has the potential for causing erosion and siltation that were not addressed in the Program EIR. Grading and construction activities, including landfill closure and subsequent habitat and recreational improvements along Visitacion Creek and the north shore of the lagoon, would be required to comply with General Construction Activity (Construction General Permit, Order No. 2009-0009-DWQ, as amended by 2010-0014-DWQ and 2012-0006-DWQ) and the General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order WQ 2022-0057-DWQ). Such compliance would reduce construction impacts to less than significant. Soils within the Baylands would be exposed and susceptible to erosion during and after grading until groundcover is established and again during construction of site-specific projects, as well as immediately after construction before groundcover is established. Grading and habitat restoration activities along Visitacion Creek and the north shore of the lagoon that are subject to tidal action would be particularly susceptible to erosion. Grading and construction contractors for Baylands development would be required to comply with General Construction Activity (Construction General Permit, Order No. 2009-0009-DWQ, as amended by 2010-0014-DWQ and 2012-0006-DWQ) and the General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (Order WQ 2022-0057-DWQ NPDES NO. CAS000002). The Construction General Permit would require each onsite and offsite Baylands construction activity to minimize or prevent pollutants in stormwater discharges and authorized non-stormwater discharges through use of controls, structures, and management practices as set forth in the General Permit that achieve best available technology (BAT) for toxic and non-conventional pollutants and best conventional technology (BCT) for conventional pollutants. The General Permit also requires that each site-specific construction activity development be designed to ensure that stormwater discharges and authorized non-stormwater discharges will not: • Adversely affect human health or the environment; • Contain pollutants in quantities that threaten to cause pollution or a public nuisance; or

[429] The regulatory context for Baylands development in relation to Hydrology and Water Quality is presented in Section 3.14.3. Relevant Specific Plan provisions are presented in Section 3.14.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
drainage patterns that could affect water quality of stormwater runoff. **Impact 4.H-3: Alter Drainage Pattern so As to Cause Erosion or Siltation** **Significant but Mitigable** The DSP and DSP-V scenarios retain the existing drainage pattern of the Bayshore and Brisbane Lagoon drainage areas but alter the Beatty Avenue drainage area by redirecting runoff from approximately 47 acres away from Beatty Avenue to a proposed storm drain discharging to the Central Drainage Channel. The CPP and CPP-V scenarios propose similar substantial changes to existing drainage patterns, but preserve a larger amount of open space, reducing the amount of impervious surface area. Project Site development would not alter the actual existing course (location) of Visitacion Creek east of the railroad right of way but would daylight the currently subsurface portion of the creek from the railroad right of way east and extending to the Roundhouse. Development under each development scenario would collect and convey onsite runoff through a modified storm drainage system constructed in accordance with the City's requirements and regional MS4 NPDES permit requirements to accommodate the increase in runoff and changes to existing drainage patterns. **Impact 4.H-5: Exceed Capacity of Stormwater Drainage Systems; Increased Sources of Polluted Runoff** **Significant but Mitigable** Each scenario would substantially increase impervious surfaces and increase stormwater runoff volumes. There is a lack of adequate capacity in the Project Site's existing storm drainage system. While the CPP and CPP-V scenarios would result in a lesser increase in stormwater runoff than the DSP and DSP-V scenarios, they would still exceed the capacity of the existing system. Thus, development under each development scenarios would result in changes to existing drainage patterns that would result in flooding impacts onsite and offsite. Project Site development would introduce new impervious surfaces that would be the source of new stormwater runoff pollutants typical of urban settings, which, if not managed appropriately, would violate water quality standards. The	• Contain pollutants that cause or contribute to an exceedance of any applicable water quality objectives or water quality standards contained in an applicable water quality control plan. The Construction General Permit requires that site grading and site-specific development projects encompassing more than 1 acre: • Complete a risk assessment to determine pollution prevention requirements pursuant to the three risk levels established in the General Permit; • Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the nation; • Develop and implement a SWPPP that identifies the sources of sediment and other sources that affect the quality of stormwater discharges and specifies BMPs that will reduce pollution in stormwater discharges to the Best Available Technology Economically Achievable/Best Conventional Pollutant Control Technology standards; and Perform inspections and maintenance of all BMPs. A SWPPP includes specific construction-related BMPs to prevent soil erosion and loss of topsoil. BMPs implemented could include, but would not be limited to, physical barriers to prevent erosion and sedimentation, construction of sedimentation basins, limitations on work periods during storm events, use of swales, protection of stockpiled materials, and a variety of other measures that would substantially reduce or prevent erosion from occurring during construction. It is not possible to identify the precise BMPs that would be required by SWPPPs for each Baylands construction activity over its 20-year buildout period and subsequent operations because (1) the BMPs to be implemented will be specific to each on- and off-site demolition, grading, and construction activity and location and (2) BMPs evolve with advancing technology over the project's 20-year buildout period as well as throughout subsequent operations. However, operational BMPs generally call for applying pesticides only as specified on the "Pesticide Use Recommendation" on the label. Because of the large area within the Baylands being landscaped, a significant water quality impact would nevertheless result. Implementation of Mitigation Measure HWQ-1 (Program EIR Mitigation Measure 4.H-5) would minimize use of chemical pesticides and herbicides within the Baylands and, in combination with NPDES permit requirements and compliance with SWPPPs and Provision C.3, would reduce impacts to less than significant.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
management of landscaped areas would also present the potential for runoff and/or infiltration of herbicides and pesticides. These common urban pollutants could be transported in runoff, potentially adversely affecting the surface and ground water quality.	
Impact 4.H-2: Deplete Groundwater Supply or Interfere with Groundwater Recharge **Less than Significant** Because no groundwater would be used for Project site development, groundwater supplies would not be substantially depleted, nor would the Project substantially interfere with groundwater recharge such that a net deficit in aquifer volume or a lowering of the local groundwater table level would occur.	**Impact HWQ-2: Groundwater Recharge and Sustainable Management** **Subsequent EIR Finding. No New Significant Impact Would Result** A different water source is proposed for the 2025 Specific Plan than was analyzed in the Program EIR. Provision of water by the California Water Service Company would not interfere substantially with groundwater recharge such that a net deficit in aquifer volume or a lowering of the local groundwater table level that could impede sustainable management of a groundwater basin or cause subsidence would occur for the following reasons: • Local groundwater is not proposed to be used for potable or non-potable purposes as part of Baylands development. • Provision C.3 of the NPDES Municipal Regional Stormwater Permit requires runoff during a storm event be retained or detained onsite such that post-development peak flows do not exceed pre-development conditions. Release of stormwater flows to unlined drainages in the Ecological Park and Visitacion Creek will reduce loss of groundwater recharge due to increased impervious surface area within the Specific Plan. • Title 27 requirements for final closure of the former Brisbane Landfill require installation of a landfill cap to prevent infiltration of from the ground surface through the waste matrix in the former landfill. Thus, loss of pervious surface area within the landfill footprint would be the result of final landfill closure, which is required to precede Baylands development, rather than as a result of Baylands development itself. • The Visitacion Valley groundwater basin that overlies the Baylands also overlies the Brisbane Lagoon, which will continue to recharge the basin. • Approximately 26 acres of the Baylands will become subject to daily inundation as the result of projected sea level rise, providing continuous recharge to the basin. • As a very low priority basin, compliance with Sustainable Groundwater Management Act within the Visitacion Valley Basin is not required.
Impact 4.H-4: Alter Drainage Pattern so As to Cause Flooding **Significant but Mitigable** Each development scenario analyzed in the Program EIR would add a substantial amount of new impervious area that would reduce the rate of infiltration of precipitation and increase the amount of runoff generated during a rain event. The CPP and CPP-V scenarios would add a lesser amount of new impervious area than the DSP and DSP-V scenarios, although the amount would still be substantial and increase runoff generated onsite. Thus, if	**Impact HWQ-3: Flood Hazards** **Subsequent EIR Finding. New and Substantially More Severe Significant Impacts Would Result Due to Substantial Changes to the Project:** • **Substantially more Severe significant impact. Revised drainage plan would allow flooding to occur that would hinder emergency response.** • **New significant impact. Revised drainage plan would cause flooding of basement areas along Frontage Road.**

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
not properly designed, development would exacerbate existing flooding onsite and offsite. **Impact 4.H-6: Housing in a 100-Year Flood Area** **Significant but Mitigable** The DSP and DSP-V scenarios propose housing in areas that have been mapped as 100-year flood hazard areas based on existing topography. These areas are prone to flooding primarily due to insufficient capacities in the existing drainage system. The CPP and CPP-V scenarios do not propose residential use. **Impact 4.H-7: Flooding** **Significant but Mitigable** Development under all four development scenarios would allow development of structures in areas between Bayshore Boulevard and the Caltrain tracks that, as described under Impact 4.H-6 above, could become flooded during a 100-year storm event. As also discussed under Impact 4.H-4 above, Project Site development would be required to improve the existing system conveyance capacity to reduce flooding onsite and offsite. Mitigation Measures 4.H-1c, 4.H-4a, 4.H-4b, and 4.H-4c would require a Final Stormwater Management Plan and improvements to existing system deficiencies as mentioned above. Implementation of these mitigation measures is recommended under all four proposed development scenarios to reduce impacts related to the placement of structures within the flood zone. **Impact 4.H-8: Flooding due to Dam or Levee Failure; Sea Level Rise** **Significant but Mitigable** The Project Site is not located in any inundation area for any dams or reservoirs. Therefore, impact due to failure of a levee or dam would be less than significant for all four scenarios. Increases in sea level, if sustained for 50-100 years or more, could create or exacerbate existing coastal flooding hazards for the Project Site. While it is not possible to project exactly what the future effects of sea level rise will be within the Project site, over time, Project Site development would be subject to impacts related to sea level rise.	Proposed Baylands development would result in substantially more severe impacts by not fully implementing Program EIR Mitigation Measure 4.H-4a or 4.H-4b and new significant impacts by placing basement parking areas along Frontage Road that would be subject to flooding, cause damage to vehicles, and preclude emergency response access to all portions of development sites along Frontage Road. The 2025 Specific Plan project would provide adequate flood protection for new residential, commercial, and other uses within the Baylands as follows: • The peak flow rate from a 25-year storm event would be accommodated within designated drainage areas and an underground piping system; • The peak flow rate from a 100-year storm event would be accommodated within an underground piping system, within designated drainage areas, and within streets such that the finished floor elevations of buildings would have more than 1-foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and 100 years of estimated sea level rise; and • To provide this level of protection, the final design for Baylands drainage features, including Visitacion Creek would be required to utilize the capacity of the existing culvert under the US 101 freeway based on the culvert's actual and projected capacity rather than the theoretical capacity of the culvert. A significant impact would nevertheless result because the 2025 Specific Plan project's drainage system would not fully implement Program EIR Mitigation Measure 4.H-4a or 4.H-4b and ensure that Tunnel Avenue would be available as an evacuation route in a 100-year storm event. Proposed Baylands development would increase the site's impervious surface area and thereby increase flooding frequency, duration, or depth at two locations (Industrial Way – Bayshore Boulevard intersection; adjacent to the Kinder Morgan tank farm, Brisbane corporation yard, Caltrain right-of-way) but only "require measures by others to adapt to future conditions" to address increased flooding. In addition, Tunnel Avenue would not be available for emergency response or evacuation in the event of a 100-year flood even though the substantial increase in Specific Plan development would necessitate such use. With implementation of Program Mitigation Measures 4.H-4a and 4.H-4b (now numbered HWQ-3a and HWQ-3b), Baylands development would provide adequate flood protection for new residential, commercial, and other uses within the Baylands because: • Baylands roadways and recreational facilities would not be flooded since the 25-year storm's peak flow rate would be accommodated within designated drainage areas and underground drainage pipes; and • The peak flow rate from a 100-year storm event would be accommodated within underground drainage pipes, within designated drainage areas, and within streets such that the finished floor elevations of buildings would have more than 1-foot of freeboard above the 100-year storm event hydraulic grade line water elevation with tidal flow and 100 years of estimated sea level rise. However, basement parking areas along Frontage Road would be subject to flooding, which would cause damage to vehicles within such garages and preclude emergency response access to all portions of development sites along Frontage Road.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
	The addition of Mitigation Measure MM HWQ-3c would ensure adequate response access to all portions of development sites along Frontage Road, including basement parking areas, and would also ensure that Baylands development would not increase flooding frequency, duration, or depth of a 100-year storm on adjacent lands even with anticipated sea level rise of 6.5 feet through the Year 2100. Thus, impacts would be reduced to less than significant.
Impact 4.H-9: Seiche, Tsunami, Mudflow **Less than Significant** The Project Site is located in the western part of San Francisco Bay, which is not subject to potential flooding by wind-induced seiches because of the predominant eastward winds. In addition, seismically induced seiche waves have not been documented in the Bay. The Project Site is located in a relatively low-lying area in a developed urbanized region that is not susceptible to mudflows, and therefore Project Site development impacts would be less than significant. In addition, the Project Site is not susceptible to mudflows and therefore impacts would be less than significant.	**Impact HWQ-4: Release of Pollutants Due to Flood, Tsunami, or Seiche** **Subsequent EIR Finding. No New Significant Impact Would Result** The 2025 Specific Plan eliminates the previously proposed elevated offsite water storage tank location in favor of an onsite tank. In addition, an above-ground fuel storage tank is proposed at the relocated fire station. Geologic-induced seiche events were not analyzed in the Program EIR and have not been documented in San Francisco Bay largely since meteorologic effects are quickly dissipated. In addition, the Specific Plan area is not located within a tsunami hazard zone. The proposed water storage and above-ground fuel storage tank facilities would be constructed to applicable state and local requirements and would thus withstand and not rupture during an earthquake. Above-ground fuel tanks to be constructed at fire stations would also be provided with containment such that a leak would not be carried into streets, storm drain systems, Visitacion Creek, or the Brisbane Lagoon. The Specific Plan requires stormwater runoff to be treated prior to discharge to wetlands, Visitacion Creek, Brisbane Lagoon, or San Francisco Bay in compliance with Municipal Regional Stormwater NPDES Permit (MRP) Order No. R2-2022-018, NPDES Permit No. CAS612008 adopted by the San Francisco Bay RWQCB in May 2022. Appropriate source control, site design, and stormwater treatment measures that would be implemented are identified in: • The San Mateo Countywide Water Pollution Prevention Program C.3 Regulated Project Guide, which describes stormwater treatment options, techniques, design, and maintenance requirements. • The Green Infrastructure Design Guide, which is a comprehensive design guide for the design, construction, and maintenance of green infrastructure, including sustainable stormwater design (SMCWPP 2020a). Thus, release of pollutants due to flood, tsunami, or seiche would not occur.

9.3.13 GEOLOGY, SOILS, AND SEISMICITY[430]

Table 9-15: Program EIR and Subsequent EIR Geology, Soils, and Seismicity Significance Conclusions

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
Impact4.E-1: Fault Rupture **Less than Significant** No known active fault traces across the Project Site, and the site is not located in an Alquist-Priolo Earthquake Fault Zone.	**Impact GEO-1: Fault Rupture** **Subsequent EIR Finding. No New Significant Impact Would Result** Because there are no known active or potentially active fault traces across the Baylands, and the site is not located in an Alquist-Priolo Earthquake Fault Zone, no impact related to rupture of a known earthquake fault would result.
Impact 4.E-2: Seismic Groundshaking **Significant but Mitigable** Geotechnical engineering methods for building design, underground utilities, and roadways (including bridge crossings) in accordance with California Building Code (CBC) requirements have been used throughout the Bay Area in areas where similar challenges of development on thick deposits of Bay Mud and imported fills have been encountered. In addition, impacts from a major seismic event would be further reduced by carrying out the site-specific analyses required by the CBC and the City Engineer. Chapter 16, Section 1613 of the CBC provides earthquake loading specifications for every structure and associated attachments that must also meet ASCE 07-05. This approach is required by Chapter 18, Section 1803 of the CBC. Site-specific investigations are used to obtain site-specific data, such as the depths of artificial fill and Bay Mud, to be considered along with the proposed loading (size of building) that would overlie that area for each specific structure within the Project Site. In general, deep foundation systems would be required for most Project Site structures to ensure that the proposed structures are founded on dense competent materials found at depth. The geotechnical report required by Mitigation Measure 4.E-2a would provide site-specific construction methods regarding grading activities, fill placement, soil corrosivity/expansion/ erosion potential, compaction, foundation construction, drainage control (both surface and subsurface), and avoidance of settlement, liquefaction, differential settlement, and seismic hazards. The	**Impact GEO-2: Seismic Groundshaking** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** Updated geotechnical reports prepared for (1) Remedial Action Plans within the western portion of the Baylands approved by the Regional Water Control Board and the California Department of Toxic Substances Control and (2) Title 27 landfill closure in the eastern portion of the Baylands approved by the Regional Water Control Board and San Mateo County Environmental Health Agency provide updated recommendations for Specific Plan development. New structures for human occupancy would be required to conform to the seismic design parameters of the CBC, while restoration of the Roundhouse would be subject to CBC seismic standards for historic structures. Compliance with these requirements would be reviewed by the City of Brisbane for appropriate inclusion in the building plan check and development review process prior to issuance of grading and building permits. Generally, buildings that are constructed to code would withstand ground shaking forces of a minor earthquake without damage, of a moderate earthquake without structural damage, and of a major earthquake without collapse of the structure. In addition, critical facilities and structures (e.g., fire station) built to code would remain standing and functional following an earthquake. Baylands geotechnical studies prepared for this EIR (Appendices M.1, M.2) provide recommendations for compliance with CBC standards, state law, and building codes. Final geotechnical studies for each site-specific development project will define precise requirements for the foundation system for each building site needed for compliance with the CBC based on the site-specific engineering properties of the materials beneath the structure, combined with the intended loading (weight) of the structure itself.

[430] The regulatory context for Baylands development in relation to Geology, Soils, and Seismicity is presented in Section 4.16.3.

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
report would also include stability analyses of final design cut and fill slopes, including recommendations for avoidance of slope failure(s). The final grading plan and associated development elements would be designed and constructed in accordance with requirements of the final design-level geotechnical investigation and would be submitted to the City Engineer prior to the issuance of building permits. Designers and contractors would comply with recommendations of the design-level geotechnical investigation during Project construction. The recommendations would be incorporated into all development plans submitted for site-specific development projects within the Baylands.	
Impact 4.E-3: Seismic-Related Ground Failure, Liquefaction **Significant but Mitigable** Analysis of site-specific soils data by Treadwell & Rollo in 2008 determined that liquefaction susceptibility at the former railyard area was relatively high. In contrast, a 2008 Geosyntec report suggested that the liquefaction risk for the Project site was low because of the depth to the sand and the type of subsurface material (i.e., clayey soils) and that further investigation would be necessary to pinpoint the site-specific liquefaction risk. Additional site-specific investigations would be required to determine the site-specific risk and appropriate foundation system design. The landfill portion of the Project Site may be more susceptible to liquefaction because it contains unknown buried materials that may be prone to liquefaction during strong ground shaking. Because the potential for liquefaction may be present at the site and would require site-specific analysis per California Building Code Chapters 16 and 18, implementation of Mitigation Measure 4.E-3 would be required to reduce liquefaction impacts to less than significant. **Impact 4.E-6: Development on Unstable Geologic Units or Soils, Including Subsidence or Collapse** **Significant but Mitigable** Settlement would occur in the former landfill, as well as in the overlying non-engineered fill and in natural deposits (Young Bay Mud, Old Bay Mud, etc.). Short- and long-term settlement within the Project Site is expected to be differential due to variances in deposit thickness and material properties. Additional fill placed within the Project Site as part of site development would increase	**Impact GEO-3: Liquefaction and Seismic-Related Ground Failure** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impacts Would Result** Updated geotechnical reports prepared for (1) Remedial Action Plans within the western portion of the Baylands approved by the Regional Water Control Board and the California Department of Toxic Substances Control and (2) Title 27 landfill closure in the eastern portion of the Baylands approved by the Regional Water Control Board and San Mateo County Environmental Health Agency provide updated recommendations for Specific Plan development. Because of the presence of high groundwater and loose, unconsolidated soils underlying the Specific Plan area, which is located in a seismically active region, liquefaction could occur within the Baylands, adversely affecting structures. As documented in the updated geotechnical studies (Appendices M.1, M.2), a substantial risk of loss, injury, or death by exposing people or structures to secondary effects of seismic shaking (e.g., ground lurching, lateral spreading) would not result from Baylands development. Nevertheless, due to the presence of high groundwater and loose, unconsolidated soils underlying the project site, liquefaction within the Baylands following a major earthquake could result in loss of bearing pressure, lateral spreading, sand boils (liquefied soil exiting at the ground surface), and other potentially damaging effects if not addressed in geotechnical engineering design of buildings and infrastructure. Baylands development would be required to conform to site-specific foundation design parameters required for compliance with the CBC (Municipal Code Sections 15.01.210, Soils Engineering Report and 15.01.220, Engineering Geology Report), which are reviewed by the City of Brisbane for appropriate inclusion in the building plan check and development review process prior to issuance of grading and building permits. Site-specific geotechnical analyses building upon the information provided in the updated geotechnical studies prepared for the Baylands (Appendices M.1, M.2) would identify the specific seismic and foundation design parameters and monitoring to be required by the City for Baylands development to comply with the CBC based on site-specific geotechnical conditions and the precise location, height, massing, and bulk of each future building within the Baylands.

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
total surface settlement. Consolidation of Bay Mud and tidal flat deposits and non-engineered artificial fill beneath proposed engineered fills may also be associated with differential settlement across the Project Site. Consolidation settlement is anticipated to occur between one and 30 years after fill placement. Based on geotechnical data collected for the Project Site, it is estimated that 6 to 30 inches of settlement may occur in the former landfill area and 12 to 38 inches of settlement may occur in the former railyard area. However, because studies for the western and eastern portions of the Baylands used different assumptions and methods, direct comparisons between settlement of the former landfill and railyard areas cannot be made. The potential for Project Site development to cause or be subject to collapse is very low based on the known characteristics of underlying materials. Collapse is considered to have a greater potential in soils with high porosities or low densities, such as windblown silt deposits known as Loess that are often found in more arid climates. The materials at the Project Site are denser and not considered susceptible to collapse. Because it is known that some degree of ground settlement would occur, implementation of Mitigation Measure 4.E-2a, which requires that all structures be designed and constructed in conformance with the most recently adopted California Building Code requirements, is required to reduce impacts to less than significant.	
Impact 4.E-4: Landslides **Significant but Mitigable** The underlying, or in some areas, exposed weak Bay Mud layer has the potential to fail under the proposed fills, which represent substantial additional. Slope stability analysis undertaken on a cross-section extending from the edge of Brisbane Lagoon approximately 1,000 feet toward the north for the former landfill area in 2008 estimated that possible slope instability extended north from the edge of the Lagoon approximately 600 feet. The geotechnical report recommended that fill not be placed within 600 feet of the north edge of the lagoon and that the stability of the area be re-evaluated once final designs are available. Geotechnical studies have concluded that placement of	**Impact GEO-4: Slope Stability** **Subsequent EIR Finding. A New Significant Impact Would Result from Substantial Changes to the Project:** • **Instability of underlying Bay Mud along the north shore of the lagoon caused by placement of fill for construction of habitat enhancements and Lagoon Park.** Site-specific development projects would comply with Brisbane General Plan policy requirements and the most recent California Building Code requirements for slope stability of manufactured slopes. Such compliance would ensure the stability of existing and manufactured slopes under static and pseudo-static conditions. Although manufactured slopes constructed as part of Baylands development would comply with the most recent California Building Code requirements at the time of construction, placement of fill within 600 feet of the north shore of the lagoon would be inconsistent with Program EIR Mitigation Measure 4.E-4a and could cause instability in the Bay Mud that underlies this area. While this measure, which is incorporated

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
engineered fill may cause underlying Bay Mud to fail and recommended that additional subsurface exploration and static/seismic stability of the proposed slopes be analyzed prior to final design and construction. Generally accepted geotechnical practices for the San Francisco Bay Area regard a slope safety factor of 1.5 as suitable for development under static or non-earthquake conditions. For pseudo-static or non-earthquake conditions a lower safety factor is typically used because a higher factor cannot be practically achieved. Therefore, a safety factor of 1.2 for pseudo-static conditions is generally accepted practice in the Bay Area. Although not specifically addressed, given that the soils are potentially unstable under static conditions, soils beneath the Project Site are also likely unstable under dynamic conditions. Because Mitigation Measures 4.E-4a and 4.E-4b include minimum standards for slope stability to reduce the risk from static and dynamic slope instability, this impact would be reduced to a less-than-significant level.	into this EIR as Mitigation Measure MM GEO-4 exempts roadway improvements, habitat enhancement, recreational facilities, or other approved site improvements from the prohibition on placement of fills within 600 feet of the lagoon because such fills were anticipated to be relative shallow, it does not explicitly address the instability of underlying Bay Mud, which would result in a new significant impact. The addition of Mitigation Measure MM GEO-4b ensures that placement of fill materials within 600 feet of Brisbane Lagoon for habitat restoration and construction of Lagoon Park would not adversely affect the stability of underlying Bay Mud and would thus reduce Impact GEO-4 to less than significant.
Impact 4.E-5: Soil Erosion or Loss of Topsoil **Significant but Mitigable** Construction and remediation activities required for Project Site development, such as excavation, backfilling, grading, and placement of fill material for surcharging purposes can expose areas of loose soil. If not properly stabilized or protected, these soils and fills could be subjected to soil loss and erosion by wind and storm water runoff. Concentrated water erosion, if not managed or controlled, can eventually result in significant soil loss. Excessive soil erosion can also eventually lead to damage of building foundations and roadways. At the Project Site, areas that are susceptible to erosion are those that would be exposed during the construction phase and along the shoreline where soil is subjected to wave action. However, construction contractors for the Project Site development would be required by law to obtain a National Pollutant Discharge Elimination System (NPDES) Permit for Discharges of Stormwater Associated with Construction Activities from the San Francisco Bay RWQCB for all proposed construction as part of the proposed Project. Conditions of this permit would include preparation and implementation of a Storm Water Pollution Prevention Plan (SWPPP).	See Impact HWQ-1, Water Quality Protection, above.

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
Once construction is completed, the interior areas of the Project Site would be largely developed, with the exception of open spaces, which would be landscaped. As a result, few locations would be created that would be exposed to the forces that cause erosion.	
Impact 4.E-7: Corrosive Soils **Significant but Mitigable** Because it is known that some degree of ground settlement would occur, this impact is considered significant. Implementation of Mitigation Measure 4.E-2a, which requires that all structures be designed and constructed in conformance with the most recently adopted California Building Code requirements, which set performance standards for building design in areas undergoing compaction, and that all final design and engineering plans be submitted by the licensed geotechnical engineer and subject to review and approval by the City Engineer to confirm that Project Site development meets those performance standards, is recommended for each of the proposed development scenarios. **Impact 4.E-8: Expansive Soils** **Significant but Mitigable** Soil conditions within the Project Site vary considerably, and expansive soils may exist in certain places, especially along Bayshore Boulevard, where Bay Mud is present beneath the fill. As required by Mitigation Measure 4.E-2a, a final design-level geotechnical report would be required to address the potential for expansive soils on each site-specific development within the Project Site, and to ensure that the performance standards set forth in the CBC are met. Development elements would be designed and constructed in accordance with requirements of the final design-level geotechnical report which include moisture content requirements along with minimum standards for expansion potential and would be submitted to the City for review and approval prior to the issuance of building permits. Characterization of the potential for expansive soil at the Project Site in accordance with standard geotechnical practices and building code requirements is required prior to issuance of building permits. Without final design and engineering plans based on parcel-specific evaluation of the expansion potential and since it is known that expansive soils are present with the Project Site, this impact is considered to be significant. Implementation of Mitigation	**Impact GEO-5: Expansive Soils and Soil Corrosivity** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** Young Bay Mud underlying the Baylands is both expansive and corrosive. Existing state law and building codes provide for an adequate level of safety, and updated geotechnical studies (Appendices M.1 and M.2) provide recommendations for compliance with CBC standards, state law, and building codes that will be incorporated into site grading, as well as Baylands building and infrastructure construction. The foundation system for each building within the Baylands must be designed in accordance with the site-specific engineering properties of the soil characteristics beneath the structure and the specific loading characteristics of the building itself. Thus, to comply with the CBC: • All concrete and metals in contact with corrosive soil would be designed and constructed based on the results of the site-specific soil corrosivity testing and subsequent recommendations of a qualified geotechnical engineer as reviewed and approved by the City; and • Building foundations and infrastructure in contact with expansive soils would be designed and constructed based on the results of the site-specific soil corrosivity testing and subsequent recommendations of a qualified geotechnical engineer as reviewed and approved by the City.

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
Measure 4.E-2a, which requires such site-specific investigations would reduce impacts to less than significant.	
Impact 4.D-3: Paleontological Resources **No Impact** No known paleontological resources or unique geologic features are located on the Project Site, nor is the Project Site geologically sensitive for paleontological resources. Even with the magnitude (substantial depth, extent, and volume) of proposed earthwork and cuts that would occur under Project Site development, including deep-driven piles into older bay muds, it is unlikely that construction crews would encounter paleontological resources or sites or unique geologic features.	**Impact GEO-6: Paleontological Resources** **Subsequent EIR Finding. A New Significant Impact Would Result due to Information not Available at the Time of the Program EIR:** • **Potential for disturbance of paleontological resources by deep excavations in the Colma Formation or Merced Formation.** An updated review of geologic records indicated disturbance of paleontological resources within the Colma Formation or Merced Formation would result in a significant impact due to their potential for paleontological resources. These formations are more than 25-30 feet below ground surface and the only deep excavations that would be undertaken for Baylands development within these formations would be pile foundation installation. Surficial and shallow excavations, which would make up the majority of ground-disturbing activity, have no potential to encounter or impact paleontological resources. Therefore, it is not likely that paleontological resources would be identified during ground disturbing within the Pleistocene Colma Formation or Pliocene-Pleistocene Merced Formation. While pile foundations, whether constructed by drilling or pile driving, would render any specimens irretrievable and construction of pile foundations within fossil-bearing formations is considered to be an environmental impact, paleontological resources could be encountered during other construction activities within the Pleistocene Colma Formation or Pliocene-Pleistocene Merced Formation. Implementation of Mitigation Measure MM GEO-4b would reduce impacts to paleontological resources to less than significant by requiring training of construction personnel in paleontological resource identification and requiring a qualified paleontologist to be retained in the event that paleontological resources are identified in order to address any inadvertent discoveries. Inadvertent discoveries of fossils would be collected by the paleontological monitor and/or qualified paleontologist, who would prepare, identify, and catalogue such discoveries prior to placing such discovered fossils at a public, non-profit institution, or public school for their preservation.
Impact 4.E-9: Use of Septic Tanks, or Alternative Wastewater Systems **No Impact** Wastewater services within the Project Site are currently provided by the Bayshore Sanitary District (BSD) in the area north of the Lagoon. BSD maintains wastewater collection facilities and contracts with the San Francisco Public Utilities Commission for wastewater treatment. None of the development scenarios would include the use of septic tanks or alternative wastewater disposal systems.	**Impact GEO-7: Use of Septic Tanks, or Alternative Wastewater Systems** **Subsequent EIR Finding. No New Significant Impact Would Result** Because the Baylands Specific Plan requires construction of an integrated sewer system connected to the Brisbane municipal sewer system, neither septic tanks nor alternative wastewater disposal systems would be used. Therefore, there would be no change from the Program EIR's conclusion that no impacts related to soils being incapable of supporting septic systems or other alternative wastewater disposal systems would occur.

9.3.14 UTILITIES, SERVICE SYSTEMS, AND WATER SUPPLY[431]

Table 9-16: Program EIR and Subsequent EIR Utilities, Service Systems, and Water Supply Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.O-1: Water Supply **Significant but Mitigable** Because the City of Brisbane does not have adequate existing water supplies to serve proposed Baylands development under any of the four scenarios analyzed in the Program EIR, a surface water transfer of 2,400 AFY from the Oakdale Irrigation District (OID) to Brisbane was proposed along with an extensive water conservation program that included demand management measures and provision of recycled water via an onsite recycled water plant. In addition, existing water storage facilities would not provide adequate peak day / peak hour water flow to the Project in the event of an emergency. Additional storage capacity within the City was proposed to provide adequate fire flows and meet peak daily water demands. As the result of the proposed water transfer agreement, there would be a change in the amount of water released from Hetch Hetchy Reservoir flowing down the segment of the Tuolumne River between Hetch Hetchy Reservoir and New Don Pedro Reservoir. The proposed water transfer agreement would contribute to impacts to streamside meadows and other alluvial deposits along the Tuolumne River due to reduced flow releases in the reach of the river below Hetch Hetchy Reservoir to New Don Pedro Reservoir associated with the 2 mgd (2,400 acre-feet per year) OID-Brisbane water transfer. The SFPUC evaluated the effects of increasing diversions from the Tuolumne River and, in turn, reducing flow releases from Hetch Hetchy Reservoir on the Tuolumne River and its resources in the Program EIR it prepared on its Water System Improvement Program in 2008. By contributing a proportional share of the SFPUC's mitigation costs, Baylands impacts would be reduced to less than significant.	**Impact UTL-1: Water Supply** **Subsequent EIR Finding. No New or Substantially More Severe Significant Impact Would Result** The Specific Plan proposes a different water source (California Water Service Company or Cal Water) from what was analyzed in the Program EIR. The 2025 Specific Plan project proposes expanding Cal Water's South San Francisco water service district to encompass the Baylands, Sierra Point, and Beatty areas of Brisbane, which would make water now being provided by the City of Brisbane to these areas available for use throughout the rest of Brisbane. The proposed Cal Water supply would not require increasing Cal Water's contractual water supply, nor would new offsite facilities other than meters at existing turnouts from the regional water system be needed to provide potable water. A Water Supply Assessment (WSA) was prepared for and approved by Cal Water. The WSA concluded that adequate water was available to serve the portions of Brisbane proposed to be served by Cal Water in addition to existing and projected future demands for potable water within Cal Water's three service districts on the Peninsula. The Baylands Specific Plan and other future development projects would be required to participate in Cal Water's offsite development program and provide funding for expediting water supply expansion projects. Thus, impacts would be less than significant, and no new significant impacts would result.

[431] The regulatory context for Baylands development in relation to Utilities, Service Systems, and Water Supply is presented in Section 4.16.3. Relevant Specific Plan provisions are presented in Section 4.16.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
No adverse effect on SFPUC's regional water system capacity would result from Baylands development.	
Impact 4.O-2: Adequate Wastewater Treatment Capacity **Less than Significant** Wastewater generated by Baylands development would be discharged into the Bayshore Sanitary District system for treatment at the SFPUC Southeast Plant. Midway through Project Site development buildout (about year 15), an onsite recycled water plant would be constructed to produce recycled water to meet Baylands non-potable water needs and reduce potable water demand. The recycled water plant would reduce the liquid wastewater flows requiring conveyance and treatment. Adequate conveyance and treatment capacity are available in the BSD and SFPUC systems under existing contract arrangements to handle wastewater flows from Project Site development. As a result, wastewater flows from Project Site development would be properly treated and disposed of through existing facilities that comply with San Francisco Bay RWQCB wastewater treatment requirements. **Impact 4.O-3: New or Expanded Facilities** **Significant and Unavoidable** In the absence of information regarding location, design, and method of water storage facility construction, it must be assumed that constructing a new storage tank on a hillside could result in significant environmental impacts in areas such as visual resources, slope stability, erosion and water quality, and possibly biological resources. While it is likely that impacts of siting and constructing such a storage facility could be avoided or mitigated to less-than-significant levels through a combination of siting options and mitigation measures, at this time without site-specific information these impacts are considered to be significant and unavoidable. No water treatment facilities would be needed or constructed as part of Project Site development. The proposed new recycled water recycling facility and construction of stormwater facilities would contribute to significant impacts in relation to aesthetic resources, air quality, biological resources, cultural resources, and other areas, some of	**Impact UTL-2: New or Expanded Utility Facilities** **Subsequent EIR Finding. No New Significant Impact Would Result** Baylands development would not exceed Brisbane's 6.0 mgd capacity. In addition, the raw sewage, treated sewage, and waste activated sludge discharged to the SFPUC Southeast Treatment Plant would be sufficiently diluted so as to (1) not require any modifications to the plant or result in changes to water quality from treated wastewater and (2) not result in changes to water quality from treated wastewater discharged to San Francisco Bay. Other impacts related to new or expanded utility facilities have been addressed in other sections of this EIR. The 2025 Specific Plan proposes a different water source (California Water Service Company) and substantially different onsite water facilities along with new offsite recycled water pipelines that were not analyzed in the Program EIR. The 2025 Specific Plan also modifies the project to add utility-scale, building-mounted, and distributed battery storage facilities; an onsite switching substation; utility line connections to the PG&E Martin Substation; and improvements to the PG&E Martin Substation. These facilities could result in various significant impacts not previously analyzed in the Program EIR.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
which would be unavoidable with implementation of all feasible mitigation measures. **Impact 4.O-4: Wastewater Treatment Requirements** **Less than Significant** Construction and operation of an onsite recycled water plant would require detailed engineering design, development, and approval of wastewater treatment requirements by the San Francisco Bay RWQCB, and further project-level environmental evaluation specific to recycled water plant construction and operation. Whether it uses mechanical or natural scalping treatment, the water recycling facility would be designed and engineered to produce tertiary-treated effluent that conforms to the requirements of California Code of Regulations Title 22 for reuse of recycled water and would produce effluent that would be pumped directly to SFPUC for treatment.	
Impact 4.O-5: Landfill Capacity during Construction (Recycling and Diversion) **Less than Significant** Baylands construction would comply with Brisbane Municipal Code Chapter 15.75 requirements for solid waste diversion and recycling. **Impact 4.O-5: Landfill Capacity during Operations Construction (Recycling and Diversion)** **Less than Significant** Solid waste from Project Site development would represent a small portion of remaining landfill capacity with implementation of Brisbane Municipal Code requirements for recycling, recovery, and participation in programs to reduce the quantity of waste sent to landfills.	**Impact UTL-3: Waste Diversion** **Subsequent EIR Finding. No New Significant Impact Would Result** Baylands development would minimize solid waste generation and maximize diversion of solid wastes from landfills consistent with applicable solid waste management and reduction statutes, regulations, plans, policies, and strategies. Baylands development would meet the requirements of Brisbane Municipal Code Chapter 15.75 that a minimum of 65 percent of nonhazardous construction and/or demolition waste and 100 percent of inert solid material associated with excavations and land clearing operations, including trees, stumps and rocks be recycled and/or salvaged for re-use. Subsequent to certification of the Program EIR, Recology San Francisco became the solid waste collection and recycling agency for the Baylands. With Recology providing solid waste collection and recycling services, solid waste generated within the Specific Plan area would be delivered to a different transfer station, be subject to different waste diversion programs, and be delivered to a different landfill than was analyzed in the Program EIR. In addition, General Plan Amendment GP-1-18 requires the Specific Plan to be consistent with Brisbane Baylands Sustainability Framework principles, including zero waste and other issues that were not addressed in Program EIR. As a result, Baylands development would, at a minimum, participate in the same waste diversion programs provided by Recology operations to residential and commercial customers within the City and County of San Francisco, which exceed the requirements of state law and are more extensive than those currently available within Brisbane.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.O-5: Landfill Capacity during Construction **Less than Significant** Considering that (1) solid waste from Project Site construction would comprise a small proportion of remaining landfill capacity and would be generated and disposed of over a period of 30 years, and (2) landfill capacity is available through 2077, there is adequate existing landfill capacity to accept all Project Site construction waste. **Impact 4.O-5: Landfill Capacity during Operations** **Less than Significant** Considering that (1) solid waste from Project Site operations would comprise a small proportion of remaining landfill capacity and would be generated and disposed of over a period of 30 years, and (2) landfill capacity is available through 2077, there is adequate existing landfill capacity to accept all Project Site construction waste.	**Impact UTL-4: Landfill Capacity** **Subsequent EIR Finding. No New Significant Impact Would Result** Because Recology's Hay Road Landfill currently has daily capacity to accept solid waste from the Baylands and approximately 27,569,000 cubic yards of long term capacity with an estimated remaining site life of 38 years, the addition of 535 cubic yards of solid waste per day from the Specific Plan area on a peak construction day (3,054 tons) and 427 tons per day following construction would not exceed the permitted daily capacity of the Hay Road landfill or substantially reduce its life expectancy. Thus, new or expanded facilities would not be needed. As noted above, solid waste generated within the Specific Plan area would be delivered to a different transfer station, be subject to different waste diversion programs, and be delivered to a different landfill from what was analyzed in the Program EIR. New analysis and substantial revisions to the Program EIR are therefore required to determine whether the 2025 Specific Plan would result in new significant utilities impacts not previously disclosed in the Program EIR.

9.3.15 PUBLIC SERVICES AND FACILITIES[432]

Table 9-17: Program EIR and Subsequent EIR Public Services and Facilities Significance Conclusions

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
Impact 4.L-1: Police Facilities **Significant but Mitigable** Implementation of Mitigation Measure 4.L-1 along with preparation and implementation of a Police Services and Facilities Plan would ensure that Project Site development-related increases in the demand for police services are met without overburdening Police Department response. The physical impacts associated with the construction and operation of a new Baylands police substation	**Impact PUB-1: Public Services and Facilities** **Subsequent EIR Finding. New Significant Impacts Would Result from Substantial Changes to the Project:** • **Proposed middle school location would not meet all CCR Title 5, Section 14010 standards.** • **Existing library and corporation yard would not be able to accommodate doubling of Brisbane's population.** • **Expanded library facilities required by Program EIR Mitigation Measure 4.L-4 not provided.** Changes to the project proposed by the 2025 Specific Plan include relocation of the City's existing fire station and construction of a new fire station within the Baylands to accommodate a new ladder truck

[432] The regulatory context for Baylands development in relation to Public Services and Facilities is presented in Section 4.17.3. Relevant Specific Plan provisions are presented in Section 4.17.4.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
were analyzed along with provision of needed mitigation measures throughout the Program EIR. **Impact 4.L-1: Fire Protection** **Significant but Mitigable** Development of the Project Site would more than double current demand for fire service within the City. To accommodate that demand and meet NCFA's emergency service response goals for the Baylands without impacting existing services being provided to the Brisbane community would require additional fire protection personnel and/or equipment. The Program EIR thus required preparation and implementation of a Fire Protection Services Plan that would provide for the timely provision of fire protection facilities, equipment, and staffing to meet NCFA fire protection standards. Site-specific development projects would be required to meet the NCFA standards related to fire hydrant placement, fire flow requirements, installation of fire protection devices, and other fire code requirements. All new structures built within the Project Site, including residential, commercial, and other non-residential uses would be required to comply with applicable building and fire code requirements, which include, for example, the installation of fire protection devices (such as extinguishers, fire alarms, and automatic sprinkler systems). **Impact 4.L-3: School Facilities** **Significant but Mitigable** Implementation of Program EIR Mitigation Measure 4.L-3 and the legally required payment of school fees would mitigate direct impacts on school facilities. Construction and operational related impacts of new school facilities were analyzed along with provision of needed mitigation measures in other sections throughout the Program EIR. **Impact 4.L-4: Public Libraries** **Significant but Mitigable** Project Site development would require expansion of library space to avoid impacting the capacity of existing facilities. The physical impacts associated with the construction and operation of new library facilities as required by Program EIR Mitigation Measure	company and a squad. In addition, relocation of the police firing range from Icehouse Hill to a satellite police facility within the Baylands is now proposed. Impacts associated with construction and operation of public facilities within the Specific Plan area would be indistinguishable from those of other construction, grading, and operations activities within the Baylands, the impacts of which are addressed throughout Chapter 4. For impacts related to police, fire protection, and schools that are distinguishable from the overall project no significant impacts would result for the following reasons: • Where the physical environmental effects associated with relocating the existing Fire Station No. 81 could be distinguished from the overall assessment of the Specific Plan, they are explicitly addressed in the Land Use and Planning Policy, Biological Resources, Cultural Resources and Tribal Cultural Resources, Air Quality, Greenhouse Gas Emissions, Noise and Vibration, and Hazards and Hazardous Materials sections, each of which determined a less than significant impact would result. • Since the existing Bayshore School was just remodeled and upgraded in 2017, only minimal exterior and interior improvement would be needed to convert the Bayshore School from a TK–8 school to a TK–5 elementary school. Impact PUB-1 would, however, be significant in relation to the onsite middle school, libraries, and the City's corporation yard for the following reasons: • Proposed locations for the onsite middle school would not meet all applicable provisions of CCR Title 5, Section 14010. Mitigation Measure MM HAZ-2 requires the proposed middle school to meet the standards set for in CCR Title 5, Section 14010 or to (1) prepare the required studies for review by the Department of Education and (2) secure approval of the proposed school site pursuant to the provisions of CCR Title 5, Section 14010(u). • The 2025 Specific Plan project would more than double Brisbane's existing resident and daytime worker population without expanding library facilities as required by Program EIR Mitigation Measure 4.L-4, which would result in overuse and deterioration of the existing Brisbane Library. • The existing corporation yard is not capable of storing sufficient equipment and maintain existing service levels for the City of Brisbane with the addition of Baylands' service demands. The result could be inadequate maintenance capability and deterioration of municipal infrastructure. Mitigation Measures MM PUB-1a through MM PUB-1c provide for expansion of facilities that would maintain existing service levels with the addition of Baylands service demands and avoid deterioration.

Program EIR Significance Conclusions	Subsequent EIR Significance Conclusions
4.L-4 were analyzed along with provision of needed mitigation measures in other sections throughout the Program EIR.	

9.3.16 RECREATIONAL RESOURCES[433]

Table 9-18: Program EIR and Subsequent EIR Recreational Resources Significance Conclusions

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
Impact 4.M-1: Physical Deterioration of a Park or Recreational Facility **Less than Significant** The 2011 Specific Plan provided for park and recreational land in excess of Brisbane Municipal Code requirements and would therefore not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	**Impact REC-1: Physical Deterioration of a Park or Recreational Facility** **Subsequent EIR Finding. No New Significant Impact Would Result** Although Baylands development would double the City's existing population and demand for park lands and community recreational facilities, Specific Plan development would substantially increase the availability of park land within Brisbane. In addition, Mitigation Measure MM REC-1 requires provision of community recreational facilities at a rate proportional to the community recreational facilities currently available within the City to Brisbane residents. Thus, the Specific Plan would not result in overuse or substantial deterioration of existing parks or recreational facilities within Brisbane.
Impact 4.M-3: Physical Deterioration of Candlestick Point Windsurfing Resources **Less than Significant** Baylands development would not reduce wind speeds enough to substantially impair windsurfing in prime windsurfing areas on San Francisco Bay or substantially impair access to or from those areas from the Candlestick Point State Recreation Area launch site.	**Impact REC-2: Physical Deterioration of Candlestick Point Windsurfing Resources** **Subsequent EIR Finding. No New Significant Impact Would Result** The 2025 Specific Plan substantially changes the project by modifying building heights and the configuration of building types. Updated Computational Fluid Dynamics simulations using a Large Eddy Simulation approach were undertaken to provide for a more accurate prediction of project effects on mean wind flows and transient phenomena such as turbulence than was available at the time of the Program EIR. Although Baylands development would cause some decrease in average wind speeds and increase in turbulence, updated computer simulations indicate that wind conditions within the majority of the Candlestick Point windsurfing area, including the launch area, would not be affected by Baylands development. Areas that would be affected are largely limited to 300-yard area along the shoreline, and the average changes in wind speed would generally be 1 to 2 mph, with changes in turbulence generally limited to 1 to 1.5 mph. Thus, Baylands development would not substantially degrade the existing wind-related recreational resource offshore from the Baylands within the Candlestick Point State Recreation Area.

[433] The regulatory context for Baylands development in relation to Recreational Resources is presented in Section 4.18.3. Relevant Specific Plan provisions are presented in Section 4.18.4.

9.3.17 WILDLAND FIRE

Table 9-19: Program EIR and Subsequent EIR Wildland Fire Significance Conclusions

Program EIR Significance Conclusion	Subsequent EIR Significance Conclusions
No Impact The Program EIR noted that the Specific Plan area was within an urban setting that was not considered wildlands and did not adjoin any wildlands that are at risk for wildfires. Wildland fire hazards were therefore not analyzed.	**Impact WLF-1: Exacerbate Wildfire Hazard** **Subsequent EIR Finding. A New Significant Impact Would Result due to Information that was Not Known and Could Not Have Been Known at the Time the Program EIR was Certified as Complete:** • **Updated statewide mapping of fire hazard zones designated a portion of the Baylands as having a moderate wildland fire hazard.** • **Updated statewide mapping of wildland-urban interface areas placed the Baylands adjacent to an interface area.** Sparks originating from construction activities would have the potential to ignite vegetation or other materials within or adjacent to the construction sites. Baylands development would be required to comply with the California Building Code, California Fire Code, and Municipal Code fire prevention and weed and flammable waste abatement requirements, which will ensure that required safety measures are incorporated into all building designs. However, human use of trails constructed through or adjacent to habitat areas as well as recreational improvements on Icehouse Hill have the potential for ignition of dry vegetation. Mitigation Measure MM WLF-1 identifies specific precautions to be taken prior to and during construction activities that occur within or adjacent to non-irrigated vegetated areas and ensures that crew have been trained in the use of the equipment to extinguish small fires. By minimizing minimize the risk of construction-related fire ignition, implementation of MM WLF-1 would also minimize the potential for a wildfire to spread and expose people to pollutant concentrations from a wildfire or cause a substantial risk of loss, injury, or death due to downslope or downstream flooding or landslides as the result of runoff, post-fire instability, or drainage changes.

CHAPTER 10 EIR PREPARATION STAFF AND RESOURCES

This Draft Environmental Impact Report was prepared by the City of Brisbane with assistance from a consulting team of environmental planners, engineers, and scientists.

10.1 LEAD AGENCY

City of Brisbane
50 Park Place
Brisbane, California 94005

Jeremy Dennis, City Manager (current)
Clay Holstine, City Manager (retired)
John Swiecki, AICP, Community Development Director
Randy Breault, P.E., Public Works Director
