CHAPTER 1
Introduction

This technical report has been prepared to assess the potential human health risks associated with implementation of the Baylands Specific Plan ("Specific Plan"). The 641.8-acre Specific Plan site lies within the nine-county San Francisco Bay Area region in the northeastern corner of San Mateo County, in the City of Brisbane, immediately south of the City and County of San Francisco. Under the Specific Plan, the site is proposed to accommodate residential, office, retail, hotel, and open space and recreational uses.

This report discusses the existing background information on toxic air contaminants (TACs) in the project area and analyzes the potential for the proposed project to affect local community health risks from TAC emissions generated by the proposed project. Supplemental information supporting the analysis in this section is provided in Appendix A.

The analysis in this section is based on a review of existing air quality conditions in the bay area region and air quality regulations administered by the U.S. Environmental Protection Agency (U.S. EPA), the California Air Resources Board (CARB), and the Bay Area Air Quality Management District ("BAAQMD" or "air district"). This analysis includes methodologies identified in the air district's California Environmental Quality Act (CEQA) Air Quality Guidelines[1] and its companion documentation.

1.1 Specific Plan Area

The Specific Plan area is currently split between the Baylands and Beatty General Plan Subareas. **Figure 1** shows the project site generally bounded on the east by US Highway 101 (US 101, also called the Bayshore Freeway); on the west and south by Bayshore Boulevard; and on the north by the San Francisco County line and existing Recology waste management facilities within the City of Brisbane.

CHAPTER 2
Environmental Setting

2.1 Toxic Air Contaminants and Local Health Risks and Hazards

Individual projects may emit TACs, which are a diverse group of air pollutants that may cause chronic (i.e., of long duration) and acute (i.e., severe but short-term) adverse effects on human health, including carcinogenic effects. Human health effects of TACs include birth defects, neurological damage, cancer, and death. The California Health and Safety Code defines a TAC as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from diesel-fueled engines. According to the California Air Resources Board (CARB), diesel engine emissions are believed to be responsible for about 70 percent of California's estimated known cancer risk attributable to toxic air contaminants and comprise about eight percent of outdoor $PM_{2.5}$.

Unlike criteria air pollutants, TACs are not subject to ambient air quality standards but are regulated by the air district using a risk-based approach to determine which sources and which pollutants to control as well as the degree of control. A *health risk assessment* is an analysis that estimates human health exposure to toxic substances, and when considered together with information regarding the toxic potency of the substances, a health risk assessment provides quantitative estimates of health risks.[2]

Exposure assessment guidance published by BAAQMD in January 2016 assumes that air pollution exposure frequence for residences would occur 24 hours per day, 350 days per year, for 30 years.[3] BAAQMD assumes exposure frequency occurs 150 days per year for 25 years for worker receptors and a default frequency of 180 days per year for 9 years for children at school sites. Therefore, assessments of air pollutant exposure to residents typically result in the greatest adverse health outcomes of all population groups.

---

[2] In general, a health risk assessment is required if the air district concludes that projected emissions of a specific air toxic compound from a proposed new or modified source suggest a potential public health risk. The applicant is then subject to a health risk assessment for the source in question. Such an assessment generally evaluates chronic, long-term effects, estimating the increased risk of cancer as a result of exposure to one or more TACs.

[3] Bay Area Air Quality Management District, *Air Toxics NSR Program Health Risk Assessment (HRA) Guidelines*, January 2016, accessed January 20, 2023, https://www.baaqmd.gov/~/media/files/planning-and-research/permit-modeling/hra_guidelines_12_7_2016_clean-pdf.pdf?la=en.

Exposures to fine particulate matter ($PM_{2.5}$) are strongly associated with mortality, respiratory diseases, and poor lung development in children, and other health effects, such as hospitalization for cardiopulmonary disease.[4] Therefore, fine particulate matter is included in this discussion and analyzed in the health risk assessment as a pollutant that poses a risk to human health. Diesel particulate matter (DPM), a byproduct of diesel fuel combustion, is also of concern. CARB identified DPM as a TAC in 1998, primarily based on evidence demonstrating cancer effects in humans.[5] The estimated cancer risk from exposure to diesel exhaust is much higher than the risk associated with any other TAC routinely measured in the region.

Both the air district and CARB operate monitoring networks to evaluate background TAC levels in the air basin, in addition to the monitoring stations for criteria pollutants. These TAC monitoring stations measure 10 to 15 TACs, depending on the specific station. The TACs selected for monitoring are those that traditionally have been found in the highest concentrations in ambient air and therefore tend to produce the most significant risk. The nearest air district ambient TAC monitoring station to the proposed Specific Plan area is the station at 10 Arkansas Street in San Francisco, with the most recent year of available data from 2019. This station is considered representative of background TAC levels within the Specific Plan area. The ambient concentrations of carcinogenic TACs measured at the Arkansas Street station, approximately 4 miles north of the project site, are presented in **Table 1**. The estimated cancer risk from a lifetime exposure (70 years) to these substances is also reported in the table. When TAC measurements at this station are compared to ambient concentrations of various TACs for the bay area as a whole, the cancer risks associated with mean TAC concentrations in San Francisco are similar to those for the bay area as a whole. Therefore, the estimated average lifetime cancer risk resulting from exposure to TAC concentrations monitored at the San Francisco station do not appear to be any greater than for the bay area as a region.

2.1.1 Roadway-Related Pollutants

Motor vehicles are responsible for a large share of air pollution, especially in California. Vehicle tailpipe emissions contain diverse forms of particles and gases, and vehicles also contribute to particulates by generating road dust and tire wear. Epidemiologic studies have demonstrated that people living close to freeways or busy roadways have poorer health outcomes, including increased asthma symptoms and respiratory infections, and decreased pulmonary function and poor lung development in children. Air pollution monitoring conducted in conjunction with epidemiologic studies has confirmed that roadway-related health effects vary with modeled exposure to PM and nitrogen dioxide (NO_2). In traffic-related studies, the additional non-cancer health risk attributable to roadway proximity was seen within 1,000 feet of the roadway and was

[4] San Francisco Department of Public Health, *Assessment and Mitigation of Air Pollutant Health Effects from Intra-Urban Roadways: Guidance for Land Use Planning and Environmental Review*, May 2008, accessed January 20, 2023, https://www.gsweventcenter.com/Draft_SEIR_References/2008_0501_SFDPH.pdf.

[5] CARB, *Fact Sheet: The Toxic Air Contaminant Identification Process: Toxic Air Contaminant Emissions from Diesel-Fueled Engines*, October 1998, accessed January 20, 2023, https://ww2.arb.ca.gov/sites/default/files/classic/toxics/dieseltac/factsht1.pdf.

strongest within 300 feet.[6] As a result, CARB recommends that new sensitive land uses, such as residences, schools, daycare centers, playground, or medical facilities, not be located within 500 feet of a freeway or urban roads carrying 100,000 vehicles per day.

TABLE 1
ANNUAL AVERAGE AMBIENT CONCENTRATIONS OF CARCINOGENIC TOXIC AIR CONTAMINANTS MEASURED AT AIR DISTRICT MONITORING STATION IN 2022, 10 ARKANSAS STREET, SAN FRANCISCO

Substance	Concentration (ppb)	Cancer Risk Probability per One Million
Gaseous TACs		
Acetaldehyde	0.41	6
Benzene	0.10	26
1,3-Butadiene	0.022	24
Carbon Tetrachloride	0.062	48
Formaldehyde	1.15	24
Perchloroethylene	0.008	0.9

ABBREVIATIONS: TACs = toxic air contaminants; ppb = part per billion; ng/m^3 = nanograms per cubic meter.

a. PM_{10} is used as a surrogate for DPM.
b. These pollutants are monitored separately from the gaseous TACs and chromium (hexavalent); no cancer risk data are measured for them, as $PM_{2.5}$ is not a carcinogen and PM_{10} monitored data include sources other than just DPM.

2.1.2 Diesel Particulate Matter

The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Mobile sources such as trucks and buses are among the primary sources of diesel emissions, and concentrations of DPM are higher near heavily traveled highways. CARB estimated average bay area cancer risk from exposure to diesel particulate, based on a population-weighted average ambient diesel particulate concentration, at about 520 in 1 million as of the year 2012[7], which is much higher than the risk associated with any other toxic air pollutant routinely measured in the region. Based on guidance from the Office of

[6] CARB, *Air Quality and Land Use Handbook: A Community Health Perspective*, April 2005, accessed January 20, 2023, http://www.aqmd.gov/docs/default-source/ceqa/handbook/california-air-resources-board-air-quality-and-land-use-handbook-a-community-health-perspective.pdf.

[7] California Air Resources Board, Summary: Diesel Particulate Matter Health Impacts, available at https://ww2.arb.ca.gov/resources/summary-diesel-particulate-matter-health-impacts. Accessed September 13, 2023.

Environmental Health Hazard Assessment (OEHHA), PM_{10} is the surrogate for whole diesel exhaust, or DPM.[8]

Despite notable emission reductions from regulations (discussed below), CARB recommends that proximity to sources of DPM emissions be considered in the siting of new sensitive land uses (or sensitive receptors).[9] CARB notes that these recommendations are advisory and should not be interpreted as defined "buffer zones," and that local agencies must balance other considerations, including transportation needs, the benefits of urban infill, community economic development priorities, and other quality of life issues. With careful evaluation of exposure, health risks, and affirmative steps to reduce risk where necessary, CARB's position is that infill development, mixed use, higher density, transit-oriented development, and other concepts that benefit regional air quality can be compatible with protecting the health of individuals at the neighborhood level.[10]

2.2 Sensitive Receptors

Air quality does not affect every individual in the population in the same way, and some groups are more sensitive to adverse health effects than others. More sensitive population groups include: the elderly and the young; those with higher rates of respiratory disease, such as asthma and chronic obstructive pulmonary disease; and those with other environmental or occupational health exposures (e.g., indoor air quality) that affect cardiovascular or respiratory diseases. The air district defines sensitive receptors as individuals more susceptible to poor air quality such as children and those with preexisting serious health problems affected by air quality occupying or residing in residential dwellings, schools, childcare centers, hospitals, and senior-care facilities. Workers are generally not considered sensitive receptors because all employers must follow regulations set forth by the Occupation Safety and Health Administration to ensure the health and well-being of their employees.[11] However, the air district advises that lead agencies consider worker receptors in their HRAs to align with the air district's permitting requirements.

The proximity of sensitive receptors to motor vehicles is an air pollution concern, especially in urban areas where building setbacks are limited and roadway volumes are higher than suburban locations of the bay area. Existing sensitive receptors evaluated in this analysis include a representative sample of known residents (child and adult) in the surrounding area, and other sensitive receptors (school children, childcare facilities, etc.) located in the surrounding

9 The BAAQMD CEQA Guidelines (2023) recommends the consideration of siting a new source near existing source of TACs if the project would include sources (e.g., generators or mobile sources) that would exacerbate the existing risk (Chapter 3.5).

10 CARB, *Air Quality and Land Use Handbook: A Community Health Perspective*, April 2005, accessed January 20, 2023, http://www.aqmd.gov/docs/default-source/ceqa/handbook/california-air-resources-board-air-quality-and-land-use-handbook-a-community-health-perspective.pdf.

11 Bay Area Air Quality Management District CEQA Guidelines, 2022, *Appendix E: Recommended Methods for Screening and Modeling Local Risks and Hazards*, accessed July 12, 2023, https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa-guidelines-2022/appendix-e-recommended-methods-for-screening-and-modeling-local-risks-and-hazards_final-pdf.pdf?la=en.

community and along the expected travel routes of the on-road delivery and haul trucks within the project vicinity. The health risk impact analysis in this document also includes sensitive receptors located within a distance of 1,000 feet from the project site, consistent with the BAAQMD Modeling Guidance.[12] There are numerous residential receptors located within 1,000 feet of the project site, all of which are located west of U.S. 101. In addition to the residential sensitive receptors, eight schools and seven childcare facilities are located within 1,000 feet of the project site. See **Figure 2** for the location of non-residential sensitive receptors. Note that, although CARB includes playgrounds, and medical facilities as sensitive receptors, this analysis did not include locations where sensitive receptors would be present only for a short period, as the analysis focuses on TACs with long-term effects.

Receptors include more than just sensitive receptors; the air district defines receptors as children, adults, and seniors occupying or residing in residential dwellings, places of business, schools, daycare centers, hospitals, temporary housing, detention centers or correctional facilities, and senior-care facilities. The air district recommends that lead agencies analyze health risks for all receptor types potentially affected by the proposed project, and as discussed above, those include locations where sensitive receptors could be present for a long-term period of one year or more.

2.3 Existing Stationary Sources of TACs

The air district's inventory of permitted stationary sources of emissions shows 23 permitted stationary emission facilities present within or near 1,000 feet of the project site. The majority of these permitted facilities include stationary diesel engines for power generators, fuel stations, and automotive repair, including auto body shops, but these also include the Recology facility and the Kinder Morgan terminal. See **Figure 3** for locations of existing TAC sources in the area. Those sources now located on Industrial Way would be demolished once construction of the proposed project begins.

2.4 Mobile Sources of Air Pollution

U.S. 101, Bayshore Boulevard, Geneva Avenue, and Tunnel Avenue are the freeways and arterial roadways within 1,000 feet of the project site that carry the highest volumes of traffic in the project area. This traffic contributes to concentrations of $PM_{2.5}$, DPM, and other TACs emitted from motor vehicles near the street level. The Caltrain rail line is the other "non-permitted" mobile source of air pollution bisecting the project area. Caltrain locomotive engines have been replaced with electric locomotives; however, Amtrak trains also use this rail line, and they would still be diesel-powered.

CHAPTER 3
Regulatory Framework

3.1 Regional

3.1.1 Bay Area Air Quality Management District

The air district is the regional agency with jurisdiction over the nine-county air basin, which includes San Francisco, Alameda, Contra Costa, Marin, San Mateo, Santa Clara, and Napa counties and portions of Sonoma and Solano counties. It is responsible for regulating stationary sources of TACs in the region. The air district has permit authority over most types of stationary emission sources and can require stationary sources to obtain permits, and can impose emission limits, set fuel or material specifications, or establish operational limits to reduce air emissions. The air district regulates new or expanding stationary sources of TACs and requires air toxic control measures for many sources emitting TACs. It also establishes and enforces local air quality rules and regulations for these purposes. A list of the air district rules applicable to construction and operation of the proposed project is provided below:[13]

- **Regulation 6, Rules 1 and 6 (Fugitive Dust Control):** This regulation sets standards and requirements for controlling and reducing fugitive dust emissions at dust generating facilities. Recently adopted in 2018, Rule 6-6 was developed along with a new umbrella regulation, Regulation 6, and amendments to Rule 6-1, to address particulate matter emissions from a variety of activities and operations.
- **Regulation 8, Rule 3 (Architectural Coatings):** This regulation limits the quantity of volatile organic compounds in architectural coatings applied.
- **Regulation 8, Rule 5 (Storage of Organic Liquids):** The purpose of this rule is to limit emissions of organic compounds from storage tanks.
- **Regulation 9, Rule 8 (Stationary Internal-Combustion Engines):** This regulation limits emissions of NO_X and CO from stationary internal-combustion engines of more than 50 hp.
- **Regulation 11, Rule 2 (Hazardous Pollutants):** This regulation limits emissions of asbestos during demolition, renovation, milling, and manufacturing and establishes appropriate waste disposal procedures.

CHAPTER 4
Health Risk Assessment

4.1 Approach to Analysis

The study area for localized health risks is within 1,000 feet of the boundary of the Specific Plan.

The purpose of the health risk assessment (HRA) is to evaluate the adverse human health risks from TAC emissions that would result from the construction and operation of the proposed project, consistent with guidelines and methods from the air district, CARB, the Office of Environmental Health Hazard Assessment (OEHHA), and U.S. EPA.

Pollutants of Concern Analyzed

Pollutants of concern that could pose a risk to human health include DPM and $PM_{2.5}$ from diesel fuel combustion, $PM_{2.5}$ from fugitive dust, and speciated compounds found in total organic gases (TOG) from gasoline fuel combustion. $PM_{2.5}$ is fine particulate matter measuring 2.5 microns in diameter or less, including ultrafine particles (0.1 microns or less in diameter). These TOG compounds include benzene, acrolein, formaldehyde, toluene, and xylenes. The full list of speciated TOG compounds is included in Appendix A. Consistent with the recommendations and requirements of these agencies, the HRA evaluated the estimated incremental increase in lifetime cancer risk and acute and chronic HI from exposure to DPM and speciated TOG compounds, and the annual average $PM_{2.5}$ concentrations.

The construction and operational emission sources analyzed in the HRA include diesel-powered construction equipment exhaust, fugitive $PM_{2.5}$ from construction vehicle traffic (brake wear, tire wear, and road dust), on-road haul truck exhaust, fugitive construction dust, proposed project-related traffic exhaust including diesel trucks and passenger vehicles, fugitive $PM_{2.5}$ from operational vehicle traffic (brake wear, tire wear, and road dust), speciated TOG emissions from on-road, gasoline-powered vehicles, and emergency backup diesel generator exhaust.

The numeric thresholds of significance established by the BAAQMD for human health risks are presented in the risk results tables below. These thresholds are presented in the 2022 BAAQMD CEQA Air Quality Guidelines.[14]

[14] Bay Area Air Quality Management District, 2022, CEQA Guidelines, Table 5-4, accessed July 21, 2023, https://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa-guidelines-2022/ceqa-guidelines-chapter-5-project-air-quality-impacts_final-pdf.pdf?la=en.

Construction Activities and Emissions

Construction of the proposed project has the potential to DPM and $PM_{2.5}$ from the use of heavy-duty off-road construction equipment, construction workers' vehicle trips, and vendor truck trips. Construction TAC emissions were estimated using the CalEEMod (version 2022.1) emissions model. CalEEMod was developed in collaboration with California's air districts and is recommended by the air district for evaluating projects' pollutant emissions.[15] Additional information on the CalEEMod model, including User Guide, documentation, and default assumptions are provided online at: https://www.caleemod.com/user-guide.

Demolition, grading, trenching, hauling, and other ground-disturbing activities also result in on-site fugitive dust emissions. Vehicle travel by on-road vehicles would result in off-site fugitive dust emissions from brake wear, tire wear, and road dust. CalEEMod outputs and detailed calculation spreadsheets are included in Appendix A of the ***Brisbane Baylands Specific Plan Project Air Quality Technical Report***.

Off-Road Equipment

Construction of the proposed project would emit TACs from:

- Demolition of existing industrial structures
- Excavation of soil on the eastern portion of the Baylands and hauling to the area west of the Caltrain right-of-way
- Grading of the west side area
- Construction of new buildings, utilities, roads, and bridges

These activities involve the use of on-site construction equipment, construction workers' vehicle trips, hauling truck trips, and vendor truck trips. Use of diesel equipment and vehicles would emit DPM and $PM_{2.5}$.[16] $PM_{2.5}$ is emitted in exhaust from diesel fuel combustion and in fugitive dust from earthmoving activities, entrained road dust, brake, and tire wear. The assessment of health risks from construction considers each of these sources. Construction TAC emissions were based on project-specific data provided by the project applicant, including a construction equipment list, a construction schedule, and site map. The list of construction equipment and schedule are included in Appendix A.

For diesel-powered off-road construction equipment, emissions were calculated by CalEEMod assuming statewide fleet average equipment and engines, and emission factors from the OFFROAD2017-ORION v1.0.1 model, which is the embedded model used within CalEEMod for

[15] Bay Area Air Quality Management District, *Air Quality Models and Data*, 2022, accessed July 3, 2023, https://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/ceqa-tools/air-quality-models-and-data.

[16] PM_{10} is used as the surrogate for DPM in the emissions calculations, per Office of Environmental Health Hazard Assessment, *For the "Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant" Part B: Health Risk Assessment for Diesel Exhaust*, May 1998, accessed July 20, 2023, https://www.arb.ca.gov/toxics/dieseltac/part_b.pdf.

offroad equipment. This model is approved by CARB for use in estimating emissions for off-road diesel construction equipment.

For diesel-powered off-road construction equipment, emissions were calculated by CalEEMod assuming statewide fleet average equipment and engines, and emission factors from the OFFROAD2017-ORION v1.0.1 model, which is the embedded model used within CalEEMod for offroad equipment. This model is approved by CARB for use in estimating emissions for off-road diesel construction equipment.

On-Road Mobile Sources

Diesel-fueled construction equipment, transport trucks hauling soils from the eastern portion of the site to the western portion of the site, delivery trucks bringing construction materials to the project site, dump trucks, and concrete trucks emit DPM and $PM_{2.5}$ in their exhaust. Emissions would vary in location and schedule depending on which of the phases is undergoing construction. On-road mobile sources include vehicle trips associated with construction workers, vendors, haul trucks, and concrete trucks. CalEEMod, which incorporates the EMFAC2021 on-road emissions model, was used to quantify on-road construction DPM and $PM_{2.5}$ exhaust emissions from these activities, including those from haul trucks used to transport the 2,500,000 cubic yards of excavated material from the eastern portion of the Baylands to the west side, west of the Caltrain right-of-way.

$PM_{2.5}$ emissions include resuspended road dust that is entrained by vehicular travel on paved roads as well as brake wear and tire wear generated by on-road vehicle travel. These $PM_{2.5}$ emissions were included in the total construction emissions from the proposed project. The entrained roadway dust emission factor and emissions from entrained roadway dust construction-related vehicles associated with the proposed project were calculated with CalEEMod, using default trip lengths for construction worker and vendor trips, and for a 3.8 mile distance for hauling soil from the eastern portion of the Baylands to west side. Emissions from brake wear and tire wear for the proposed project were also calculated using CalEEMod.

Operational Activities and Emissions

Land uses that would generate operational TAC emissions include residences and commercial development in the Bayshore, Roundhouse, and Icehouse Hill districts, plus the commercial uses in the East Campus. In addition, the proposed project's sustainable infrastructure would be a source of operational TAC emissions from emergency backup generators and from employee trips, and these sustainable infrastructure facilities include the water recycling facility, the water tank, the electrical substation, the battery storage facility, and the solar farm.

Sources of operational TAC and $PM_{2.5}$ emissions from the proposed project include:[17]

- On-road vehicles
- Emergency diesel generators

Operational On-Road Mobile Sources

On-road mobile sources include vehicle trips associated with residents, retail customers, employees, and vendor deliveries. Diesel and gasoline-powered vehicles on the roadway emit TACs in their exhaust (from organic gases), and through fuel evaporation. Diesel-powered vehicles emit DPM in their exhaust, as discussed above. In addition, fugitive $PM_{2.5}$ would be generated from entrained road dust, brake wear, and tire wear.

Operational vehicle emissions for the proposed project were estimated based on vehicle miles traveled (VMT) from the transportation analysis. Emissions were calculated with CARB's on-road model EMFAC2021, and EMFAC2021 defaults were used for vehicle fleet mix for San Mateo County. Emission factors were conservatively assumed based on the first year of operation as each block's construction is completed. This is a conservative assumption because emissions tend to decrease over time, with advancements in fuel economy and new regulations.

Vehicle trips were modeled in the HRA on the following project-affected roadways:

- Bayshore Boulevard
- Geneva Avenue
- Tunnel Avenue

Vehicle volumes on these roadways were modeled in the HRA, as they would have the potential for the highest daily trips associated with the proposed project. The HRA analyzed DPM, speciated TOG compounds that are considered TACs, and $PM_{2.5}$ from exhaust, tire and brake wear, and resuspended road dust.

Emergency Generators

Operational TAC emissions for emergency diesel generators at all buildings with occupiable space greater than 75 feet in height, as well as at the relocated fire station, the new fire station, the water recycling facility, the battery storage facility, and the solar farm were calculated assuming 50 hours per year of non-emergency testing operation, consistent with the Airborne Toxic Control Measure for Stationary Compression Ignition Engines (17 CCR section 93115), and an additional 100 hours for emergency use.[18]

---

[17] Note that transport refrigeration units are another source of DPM that are associated with developments that include loading docks and/or grocery stores. Neither are assumed for this project. ***[[Not consistent with the air quality technical report. See, for example Mitigation Measure M-AQ-2h.]]***

[18] California Air Resources Board, *Final Regulation Order: Amendments to the Airborne Toxic Control Measure for Stationary Compression Ignition Engines*, 2011, accessed July 3, 2023, https://ww3.arb.ca.gov/diesel/documents/finalreg2011.pdf.

- The generators and associated buildings are listed below:
- Mid- and high-density residential in the Bayshore District
- High-density commercial and hotel in the Bayshore District
- High-density residential in the Roundhouse District
- Mid-density commercial in the Icehouse Hill District
- Low-density commercial in the Campus East District
- Substation
- Battery Storage
- Fire Station
- Relocated Fire Station
- Solar Farm
- Water Recycling Facility
- Water Tank

All generators are assumed to be 939 horsepower, except for the two fire stations, which would be 168 horsepower, the solar farm at 80 horsepower, the water recycling facility at 2,012 horsepower, and the water tank at 670 horsepower. These generator sizes were obtained from the environmental documents for other, similar facilities (described further, below).

The generator at the water recycling facility, which is greater than 1,000 hp, was assumed to meet the air district best available control technology (BACT) requirement of a Tier 4 Final-compliant engine, while generators smaller than 1,000 hp were assumed to meet the BACT requirement for a Tier 2-compliant engine.[19]

4.1.1 Combined Construction and Operational Emissions

The proposed project is estimated to be constructed over a period of 17 years, with some building occupancy and operational emissions occurring as construction proceeds. In years when construction is scheduled to coincide with proposed project operation, construction emissions are combined with operational emissions. This is expected to begin once Roundhouse District construction is completed and those blocks are occupied, estimated to occur starting in 2029. This overlap of construction and operational emissions would continue as the residential and commercial blocks are constructed and subsequently occupied, until 2042, when construction of the east campus low-density commercial blocks is estimated to be completed.

[19] Bay Area Air Quality Management District, BACT/TBACT Workbook, 2021, accessed July 3, 2023, https://www.baaqmd.gov/permits/permitting-manuals/bact-tbact-workbook.

Site Development

Phase 1 development includes:

- Commercial uses in the Icehouse Hill district
- Residential uses in the Roundhouse and Bayshore districts
- Hotel and retail uses in the Bayshore district
- A grade 6–8 middle school in the Bayshore district
- The fire station at 3445 Bayshore Boulevard relocated to 140 Valley Drive
- A new fire station east of the sustainable infrastructure area
- Open space areas (community greens and ecological open space)
- Sustainable infrastructure, including the water recycling facility, water tank, electrical substation, and battery storage facility, and solar farm.
- Geneva bridge construction

Phase 2 development includes:

- East campus low-density commercial
- Ecological open space areas

The Baylands development phase schedule is shown below. The development schedule in **Table 2** shows the assumed sequencing of each construction activity that was used to determine annualized emissions, including the potential for construction and operational emissions to overlap in time. Occupation of that block is assumed to start at the beginning of the year following construction completion.

Sustainable Infrastructure, Middle School, and Fire Stations

Sustainable infrastructure land uses include the following:

- Solar farm
- Water recycling facility
- Water tank
- Electrical substation
- Battery storage facility

Reasonable emergency generator assumptions were developed for these uses based on other, recent environmental documents for projects involving similar facility types and scaled for this Project based on a size comparison. The generator sizes described above represent the operational information used from these similar facilities.

TABLE 2
ASSUMED DEVELOPMENT SEQUENCING

Year Construction Begins	Residential Building Permits	Year of Residential Construction Completion	Commercial Office Building Permits	Year of Commercial Construction Completion
Phase 1	**2,200 dwelling units**		**4,500,000 square feet**	
2027	166 dwelling units	2028	1,424,325 square feet	Dec. 2029
2028	686 dwelling units	2029		
2029	337 dwelling units	2030		
2030	281 dwelling units	2031		
2031	333 dwelling units	2032	1,975,675 square feet	Dec. 2033
2032	108 dwelling units	2033		
2033	124 dwelling units	2034		
2034	165 dwelling units	2035		
2035			1,100,000 square feet (includes 500,000-square-foot hotel)	Dec. 2037
Phase 2			**2,500,000 square feet**	
2038			1,120,000 square feet	Dec. 2040
2039				
2040			1,380,000 square feet	Dec. 2042
Total	***2,200 dwelling units***		***7,000,000 square feet***	

Information from these similar facilities was also used to estimate construction characteristics for the above land uses associated with the proposed project's sustainable infrastructure. Based on the size of these example projects compared to the sustainable land uses for the proposed project, construction equipment use hours were either reduced or increased. For example, construction equipment use for the solar farm was estimated using the Little Bear Solar DEIR.[20] That solar farm is larger (76 percent larger area) than the proposed project's. This analysis assumed that the same types of construction equipment would be used for the propped project's solar facility, but 76 percent fewer equipment use hours would be involved in its construction. This same approach was used for the following, other sustainable infrastructure land uses listed above, as follows:

- Water recycling facility – 81 percent reduction based on the Morro Bay Water Reclamation Facility Project;[21]
- Water tank/storage facility – 47 percent reduction based on the California-American Water Company Monterey Peninsula Water Supply Project;[22] and

[21] Morro Bay Water Reclamation Facility DEIR, Prepared by ESA, March 2018, accessed June 20, 2024, https://morrobaywrf.com/wp-content/uploads/Draft-Environmental-Impact-Report-EIR-March-2018.pdf.

[22] California-American Water Company Monterey Peninsula Water Supply Project DEIR, Prepared by ESA, April 2018, accessed June 20, 2024, https://ia.cpuc.ca.gov/environment/info/esa/mpwsp/deir-eis_toc.html.

- Electrical substation – 18 percent increase based on the Martin Substation Extension Project.[23]

No other example was found for a battery storage facility only. Most of the publicly-available examples are associated with construction of a substation. Therefore, CalEEMod defaults were used for an industrial land use.

The relocated fire station was modeled after the FS-8 Relocation Project[24] and the new fire station was modeled after the FS-32 Project,[25] both in Santa Clara County. For land uses that did not have a comparative facility, CalEEMod default values were used when modeling emissions. The proposed middle school and the battery storage facility are the two land uses that were modeled using CalEEMod default values.

4.1.2 Local Health Risks and Hazards

Local Community Risk

The HRA was conducted to estimate health risks from exposure to TACs emitted by construction and operation of the proposed project.

Health risks were evaluated at the maximally-exposed individual residence (MEIR), school receptor, and maximally exposed individual worker (MEIW).

The health risk assessment was prepared using technical information and health risk assessment guidance and protocol from the BAAQMD,[26] CARB,[27] and OEHHA.[28] For construction, the health risk assessment evaluated the estimated incremental increase in (1) lifetime cancer risk from exposure to emissions of DPM; and (2) the annual average $PM_{2.5}$ concentrations associated with fuel combustion, construction site fugitive dust from earthmoving and ground-disturbing activities, and on-road fugitive sources (including tire wear, brake wear, and road dust) that would be emitted by proposed project-related construction activities. For operations, the HRA included DPM from emergency backup generators, speciated TACs in total organic gas emissions from gasoline-fueled passenger vehicles, and $PM_{2.5}$ from entrained road dust. The health risk assessment

focuses on the TACs of concern from construction activities ($PM_{2.5}$ and DPM) because these pollutants pose substantial health impacts at the local level more so than other types of TACs.

Pollutant concentrations were estimated using the American Meteorological Society/ Environmental Protection Agency Regulatory Model Improvement Committee regulatory air dispersion model (AERMOD version 22112).[29] Consistent with air district HRA guidance, health risks (cancer risk and acute and chronic HI from construction and operational DPM and operational TOG, and annual average $PM_{2.5}$ concentrations associated with construction and operational activities, were estimated at all sensitive receptors and worker receptors located within 1,000 feet of the project site boundary.

Receptor Exposure Assessment

The following receptor types were included in the HRA:

Existing off-site receptors:

1. **Residents** to the west of Bayshore Boulevard from Geneva Avenue north to Wilde Avenue, and between Tunnel Avenue and U.S. 101, including two blocks of residential streets just south of Lathrop Avenue, between Wheeler and Tocoloma avenues (near Little Hollywood park).
2. **Workers** (employees) at commercial and industrial sites east of Tunnel Avenue, on both north and south sides of Beatty Avenue. These include (but are not limited to) Recology, P&F Distributors, Transdev, and Golden State Building Materials. In addition, workers (employees) at the commercial and retail businesses west of Bayshore Boulevard, north of Geneva Avenue. The San Francisco Municipal Transportation Agency office is adjacent to Bayshore Boulevard to the west. Additional workers modeled were employees at commercial and retail businesses west of Bayshore between Guadalupe Canyon Parkway and Valley Drive.

Figure 4 shows the existing residential (sensitive receptors) and commercial/retail blocks (worker receptors) that were modeled in the HRA. As shown above in Figure 2, there are no existing childcare or school receptors within 1,000 feet of the project boundary.

New on-site receptors (in the Baylands development) include:

1. **Residents** in the Roundhouse and Bayshore districts;
2. **Workers** (employees) in the low-density commercial areas east of the Caltrain right-of-way, the mid-density commercial areas of the Icehouse Hill district, and in the high-density commercial areas in the Bayshore district, just west of the Caltrain right-of-way; and
3. **School students** at the new middle school in the northwest corner of the Icehouse Hill district.

Brisbane Baylands Projects

Figure 4
Residential and Commercial/Retail Land Uses
within 1,000 Feet of the Specific Plan Boundary

ESA

Although day care facilities are identified as a permitted use within large portions of the Specific plan area, there are no definitive plans for development of such facilities at any specific locations within the Baylands.

TAC emissions and exposure to sensitive receptors would vary across the estimated 17-year construction period. Initially, existing sensitive receptors west of Bayshore Boulevard would be exposed only to construction emissions from construction activities on the west side. As construction of each block of the Icehouse Hill, Roundhouse, and Bayshore districts is completed and occupied, new, on-site sensitive receptors would be exposed to ongoing construction of the remaining blocks, in addition to operational emissions (mobile sources and generators) from newly built blocks. Although these residences would not be exposed to grading within the western portion of the site, which is generally the period of most intensive use of diesel-powered construction equipment, they would be exposed to diesel vendor trucks plus any other diesel-powered equipment (such as compressors) during the construction of the buildings.

In addition, existing and new sensitive receptors would be exposed to construction emissions from Phase 2 development of low-density commercial uses in the Campus East District. Construction of the solar farm would take place at a distance greater than 1,000 feet from the closest Phase 1 residents, so there would not be substantial exposure to those residents from solar farm construction-related TACs. Nevertheless, its construction was included in the analysis.

Minimum Efficiency Reporting Value 13 Air Filtration

To comply with the California Energy Code, Title 24, Part 6[30], the proposed project must install a mechanical ventilation system at all on-site residential and school buildings at the project site capable of achieving protection from particulate matter ($PM_{2.5}$) equivalent to that associated with a MERV 13 filtration (as defined by American Society of Heating, Refrigerating and Air-Conditioning Engineers Standard 52.2). As part of this action, an ongoing maintenance plan for the building's heating, ventilation, and air conditioning (HVAC) air filtration system is required. Health risks for residential and school receptors evaluated in the project's HRA were estimated assuming the implementation of MERV 13 filters in all residential and school receptor locations.

MERV 13 filters have a removal efficiency of 90 percent for particles ranging from 1 to 3 microns and less than 75 percent for particles ranging from 0.3 to 1 microns.[31,32] The air district's Planning Healthy Places guidance indicates that MERV 13 air filtration devices installed on an HVAC air intake system can remove 80 to 90 percent of indoor particulate matter (greater

than 0.3 microns in diameter).[33] MERV 13 filters are required to be installed in new homes built on the project site per the 2019 California Energy Code. Consequently, it was conservatively assumed that MERV 13 filters would reduce the total exposure of new on-site receptors to DPM and $PM_{2.5}$ concentrations by 60 percent.

For assessing health risks to existing off-site receptors and new onsite sensitive receptors from construction and operational TAC emissions, exposure is assumed to begin to a fetus at the beginning of the third trimester at the start of construction until age 30. Sensitive receptors analyzed include residents, daycare, and students. Off-site worker receptors were also analyzed in the HRA. TAC emissions and sensitive receptor exposures would vary across the 17-year-long construction period. Therefore, multiple exposure scenarios were evaluated to capture the period of maximum risk to on each existing off-site receptor and each new on-site sensitive receptor.

Exposure assessment guidance from the BAAQMD assumes that people in residences would be exposed to air pollution 24 hours per day, 350 days per year, for 30 years as the basis for calculating cancer risk in HRAs. Children at childcare locations are assumed to be exposed for eight hours per day, five days per week, for a total of six years. The schoolchild is assumed to be exposed for eight hours per day, five days per week, for a total of 9 years. Off-site workers were assumed to be exposed for eight hours per day, 260 days per year, for a total of 25 years.

The exposure rate for the residential receptors is generally more conservative than those for other sensitive receptor types (i.e., schoolchildren, children in childcare, and patients) because residents have the highest exposure frequency, exposure time, and exposure duration.[34] Thus, the air pollutant exposure to residents typically results in the greatest adverse health outcome for all population groups and receptor types. This HRA represents a highly conservative assessment because the typical resident spends more than 15 days away from the residence during the year, which was not factored into the exposure estimates.

TAC exposure and resulting health risks were quantified for existing off-site and new on-site (Baylands) residents and schools, along with existing off-site and new, on-site (Baylands) worker, or employee, locations, using three exposure scenarios to determine the MEIR location for residences and MEIW for workers. Three scenarios are needed to identify the sensitive receptor location(s) where maximum health risk values would occur, because TAC emissions vary substantially with each year of construction and operation.

The analysis was conducted assuming a worst-case exposure start date of 2025, which is the assumed construction start date. A worst-case exposure start date represents the highest risks from construction emissions on the more sensitive age groups of the third trimester fetus to age two. Therefore, a receptor that starts its exposure in a different year would experience different health

[33] Bay Area Air Quality Management District, *Planning Healthy Places A Guidebook for addressing local sources of air pollutants in community planning*, May 2016, accessed August 1, 2023, http://www.baaqmd.gov/~/media/files/planning-and-research/planning-healthy-places/php_may20_2016-pdf.pdf?la=en.

[34] For example, residents are assumed to be exposed for 30 years, as compared to the child in childcare who is assumed to be exposed for 6 years; resident children are assumed to be exposed 24 hours a day, 7 days a week, as compared to the childcare child, who is assumed to be exposed 8 hours a day, 5 days a week.

risks, based on the amount of construction equipment in use, haul truck trips nearby, etc. during each year. The three exposure scenarios are as follows:

- **Scenario 1: Off-Site Receptors—Construction-only Followed by Construction and Onsite Operations.** The analysis of Scenario 1 evaluates risks to off-site receptors (residents and workers) within 1,000 feet of the Specific Plan boundary. There are no existing schools or childcare facilities within 1,000 feet of the boundary (Figure 2). Consistent with OEHHA guidance, the residential cancer risk analysis for off-site receptors starts by assuming that a fetus in its third trimester could be present when construction begins for Phase 1.[35] For residential cancer risk, a total exposure of 30 years was evaluated, beginning at the "worst-case" start date,[36] and continuing through the remainder of the construction phases, plus the initial Phase 1 occupancy while Phase 1 construction is ongoing, into the full operational conditions at full buildout. For workers, a total exposure of 25 years was assumed, beginning at the worst-case start date (2025). For acute HI, chronic HI, and annual average $PM_{2.5}$ concentrations, the maximum annual values for each off-site receptor location were identified.
- **Scenario 2: New On-Site Receptors—Construction and Onsite Operations.** As phased development of the Baylands continues, receptors will begin living and working within the Baylands while construction is still underway. The analysis of Scenario 2 thus evaluates impacts to new, Baylands on-site receptors (residents, employees in the new commercial buildings, and middle school students) that would be present at the project site after construction of the first residential and commercial or retail blocks is completed and the buildings are occupied. Scenario 2 also evaluates impacts to the new middle school based on the assumption that other buildings within the Baylands would be under construction after the school is completed and operational. For on-site receptors, the analysis assumes that a fetus in its third trimester would be present at a newly constructed residence within the Baylands when construction of remaining project blocks is ongoing. This would occur throughout the construction duration as each block is constructed, which is assumed to start occurring in 2029. Thus, on-site receptors could be exposed to these ongoing construction emissions plus operational emissions for a total exposure of 30 years beginning as early as 2029; for an on-site worker (employee at a new commercial building) this exposure duration is 25 years. For the new middle school, the exposure duration was conservatively assumed to be 9 years. For acute HI, chronic HI, and annual average $PM_{2.5}$ concentrations, the maximum annual values for each Scenario 2 on-site receptor location were identified.
- **Scenario 3: Off-Site and On-Site Receptors—Operations at Full Specific Plan Buildout.** The analysis of Scenario 3 evaluates operational impacts starting at full buildout of the project, which is assumed to occur in 2043. The risks are evaluated at all receptors described in Scenarios 1 and 2: off-site residents and workers; new, on-site Baylands residents and

[35] Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments*, February 2015, accessed July 3, 2023, http://oehha.ca.gov/air/hot_spots/hotspots2015.html.

[36] The "worst-case" start date was determined by calculating the maximum incremental increase in lifetime cancer risks for all receptors starting each year from the start of construction in 2025 through the end of construction. The exposure start year that produces the highest risk is presented in this EIR.

workers in the commercial and retail buildings; and the new middle school. The residential cancer risk analysis assumes exposure starts in 2043 to a fetus in its third trimester and would continue for 30 years (2043-2072). Scenario 3 represents a full 30-year operational exposure to document lifetime exposure of residents to full project buildout emissions once construction is complete. For the new middle school, exposure is conservatively assumed for nine years, consistent with the schoolchild exposure duration. Worker receptor exposure duration is assumed to be 25 years. For acute HI, chronic HI, and annual average $PM_{2.5}$ concentrations, the maximum annual values for each Scenario 3 off-site and on-site receptor location were identified.

Health Risk Calculations

The health risk calculations used in the HRA for the project are summarized below. Refer to Appendix A for additional supporting technical information regarding the HRA.

Cancer Risk

The HRA evaluated the incremental increase in lifetime cancer risk from exposure to both construction and operational TAC emissions. These lifetime "excess" cancer risks were estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens.

The estimated risk is expressed as a probability. The cancer risk of a specific chemical was calculated by multiplying the chemical intake or dose from human inhalation by the chemical's cancer potency factor. The incremental increase in lifetime cancer risk is based on DPM and $PM_{2.5}$ emissions from construction sources (off-road diesel construction equipment and on-road diesel hauling trucks) and DPM, $PM_{2.5}$, and speciated TOG from operational sources (diesel emergency generators and diesel and gasoline passenger vehicles).[37] For operational traffic, speciated TOG emissions were included for gasoline vehicles, including from running exhaust; fugitive fuel vapor sources, including running loss processes; and fugitive $PM_{2.5}$, including tire wear, brake wear, and entrained road dust. Under California regulatory guidelines, DPM is used as a surrogate measure of exposure for the mixture of chemicals that make up diesel exhaust as a whole. This analysis was based on the surrogate approach for DPM emissions, as recommended by OEHHA.

Lifetime excess cancer risk from exposure to DPM occurs exclusively through inhalation, so only the inhalation pathway was considered in the HRA. Speciated TOG emissions from gasoline combustion were also assessed through the inhalation pathway. Estimated lifetime excess cancer risks were calculated using the sensitivity factors and breathing rates recommended by OEHHA.

For the purposes of this analysis, all off-site and on-site residents, including both adults and children, were assumed to be present at one location for 30 years, consistent with OEHHA guidance. Exposure assessment for schools followed OEHHA and BAAQMD guidance and

[37] Refer to Appendix B for a list of TACs.

methods.[38] The duration of exposure for schools is dependent on the age range of the students; for example, for a kindergarten to sixth grade school, exposure duration could be up to eight years. This analysis conservatively assumed 9 years.

Chronic and Acute Health Risks

The non-cancer effects of chronic (i.e., long-term) and acute, short-term exposure to DPM and speciated TOG emissions were evaluated using the HI approach, consistent with OEHHA guidance. The chronic HI is calculated by dividing the modeled annual average concentration at a receptor by the reference exposure level (REL). The acute HI is calculated by dividing the modeled hourly average concentration at a receptor by the REL. The REL is the concentration at or below which no adverse health effects are anticipated.

RELs for DPM and speciated TOGs were obtained from OEHHA and the air district. For example, OEHHA has recommended an ambient concentration of 5 $\mu g/m^3$ as the chronic inhalation REL for DPM exhaust. Acute and chronic inhalation RELs for TACs from tailpipe and evaporative TOG emissions were based on the air district's weighted toxicity calculation methods and the latest data in CARB's Hotspots Analysis and Reporting Program database.[39]

Annual Average $PM_{2.5}$ Concentrations

The HRA also analyzed annual average $PM_{2.5}$ concentrations resulting from both construction and operational emissions. $PM_{2.5}$ concentrations include both fugitive and exhaust $PM_{2.5}$ emissions. The modeling evaluated the annual average concentration from all sources for each year of project construction and operation at each receptor location. The $PM_{2.5}$ annual concentration presented is the highest annual year for the MEIR and MEIW locations.

Cumulative Health Risk Assessment

A cumulative analysis was completed for the MEIRs and MEIWs under all three scenarios. The cumulative analysis evaluates the combined modeled risk from the proposed project with that from existing, nearby sources of TAC emissions. Sources evaluated included all BAAQMD-permitted stationary sources, roadways with more than 10,000 vehicles per day, the Caltrain rail line, and any other major source of emissions within 1,000 feet of the Specific Plan area.[40] The cumulative health risk assessment tabulated the impact of Specific Plan-generated health risks plus off-site sources (stationary and mobile) near off-site and on-site MEIRs. As such, this evaluation identifies all sources within 1,000 feet of the project boundary. The results of this analysis are discussed in Chapter 8 of the Draft Environmental Impact Report, *Cumulative Environmental Effects*.

Model output and calculation spreadsheets showing all assumptions and methods used in the health risk assessment are included in Appendix A.

4.2 Analysis Results

4.2.1 Community Risk and Hazard Impacts

Impact AQ-3: The BAAQMD significance thresholds for health risks are as follows:

- An excess cancer risk level of more than 10 in 1 million, or a non-cancer (i.e., chronic or acute) HI greater than 1.0; or
- An incremental increase of greater than 0.3 micrograms per cubic meter ($\mu g/m^3$) annual average $PM_{2.5}$.

Health Risk Results

Table 3 through Table 6 present the results of the HRA for all receptor types under Scenario 1, Scenario 2, and Scenario 3, as described above under Section 4.2, *Approach to Analysis*. Tables 3, 4, and 5 present the increased lifetime excess cancer risk probability, and Table 6 presents the acute and chronic HI, and annual average $PM_{2.5}$ concentrations, for all three scenarios. The results are presented for the MEIR, MEIW, and middle school receptor (Scenarios 2 and 3) for each of these health risk impacts (see **Figure 5** and **Figure 6**). As discussed above, there are no existing school or childcare receptors within 1,000 feet of the Specific Plan boundary.

Table 3, Scenario 1, shows the breakdown of contributions to total cancer risk at existing off-site residents over a 30-year period and off-site and on-site workers over a 25-year period that comprises:

- The assumed Baylands construction period from 2025 to 2042 = 17 years
- The assumed period of time when construction of residential and commercial blocks overlaps occupancy of onsite residential and commercial buildings a (for the years 2038 to 2042) = 5 years
- The full buildout operational period during the remaining 13 years for a total of 30 years of exposure to residential receptors. For workers, this exposure period is assumed to last 8 years after full buildout, for a total of 25 years.

The cancer risk MEIR under Scenario 1 is a residence located west of Bayshore Boulevard, north of MacDonald Avenue. The cancer risk MEIW is located east of Tunnel Avenue, south of Esta Avenue. The primary contributor to the total cancer risk at these receptor locations is construction activities resulting in DPM emissions (which are highly carcinogenic) from diesel fuel combustion. In addition, the age range during which exposure of residential sensitive receptors to project emissions begins is the third trimester fetus to 2 years old, which is the age when humans are most sensitive to TACs. The early phases of construction, i.e., the earthwork portions of the project, produce high DPM emissions from the use of heavy duty off-road equipment and therefore impact those most sensitive age bins and drive the risk at the Scenario 1 MEIR.

TABLE 3
SCENARIO 1—CANCER RISK

Receptor Type/Emissions Source	Assumed Exposure Period	Cancer Risk (in 1 million) [a]

a. **Bold values** = threshold exceedance.
b. The resident child MEIR is located west of Bayshore Blvd., north of MacDonald Ave.
c. The worker cancer risk MEIW is located east of Tunnel Ave. and south of Esta Ave.

Table 4, Scenario 2, shows the same breakdown of contributions to total cancer risk over a 30-year period but for new residential receptors at the Baylands and new worker receptors at Baylands commercial and retail development.

For Scenario 2, the MEIR is located in the Roundhouse district in the low-density residential area, and the MEIW is located at the water recycling facility. Again, the major contributor to the total cancer risk for the resident and school receptors is construction and the age at which exposure begins.

For the on-site worker, the majority of the cancer risk is associated with the emergency backup generators near the receptor. The closest generator to the worker receptor is the generator at the water recycling facility.

Table 5, Scenario 3, shows the cancer risks at both existing off-site residential and worker receptors along with new Baylands residential, school, and worker receptors. The exposure period for residents is the 30-year period beginning at full buildout of Phases 1 and 2, starting in 2043 and continuing to 2073, and the exposure period for workers is 25 years, starting in 2043 and continuing to 2068. The exposure period for the school is 9 years.

TABLE 4
SCENARIO 2—CANCER RISK

Receptor Type/Emissions Source	Assumed Exposure Period	Cancer Risk (in 1 million) [a]
MEIR – Baylands Resident Child Receptor [b]		
Project Construction	2028–2042	5.1
Project Operational, interim	2038–2042	0.6
Project Operational, full	2043–2058	0.3
Project Construction + Operations	2028–2058	5.8
Significance Threshold		10
School - Baylands Middle School Receptor [c]		
Project Construction [d]	2029–2038	4.9
Project Operational, interim [d]	2038–2038	0.1
Project Operational, full [d]	NA	NA
Project Construction + Operations [d]	2029–2038	5.0
Significance Threshold		10
MEIW - Baylands Worker Receptor [e]		
Project Construction	2028–2042	0.5
Project Operational, interim	2038–2042	0.6
Project Operational, full	2043–2053	1.3
Project Construction + Operations	2034–2053	2.4
Significance Threshold		10

ABBREVIATIONS: $\mu g/m^3$ = micrograms per cubic meter; HI = Hazard Index; MEIR = Maximally Exposed Individual Resident; MEIW = Maximally Exposed Individual Worker; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter; NA = not applicable

NOTES:

Scenario 2: Construction + operational impacts to new, on-site Baylands receptors.

a. **Bold values** = threshold exceedance.
b. The resident child MEIR is located on site along the north side of Main Street, approximately half way between Bayshore Boulevard and the Caltrain right-of-way.
c. The school receptor is located on site at the southeast corner of Bayshore Boulevard and Main Street.
d. The exposure duration of the school receptor is 9 years. Exposure starting in 2029 would end in 2038, prior to full buildout operations in 2043.
e. The MEIW for cancer risk is located on site at the water recycling facility.

TABLE 5
SCENARIO 3—CANCER RISK

Receptor Type/Emissions Source	Assumed Exposure Period/ HI Max Year/ $PM_{2.5}$ Max Year	Cancer Risk (in 1 million) [a]
MEIR – Off-Site Resident Child Receptor [b]		
Project Operational, full buildout	2043–2073	7.3
Significance Threshold		10
MEIW – Off-Site Worker Receptor [c]		
Project Operational, full buildout	2043–2068	8.8
Significance Threshold		10
MEIR – Baylands Resident Child Receptor [d]		
Project Operational, full buildout	2043–2073	**13.0**
Significance Threshold		10
School – Baylands Middle School Receptor [e]		
Project Operational, full buildout	2043–2052	**13.0**
Significance Threshold		10
MEIW – Baylands Worker Receptor [f]		
Project Operational, full buildout	2043–2068	9.2
Significance Threshold		10

ABBREVIATIONS: $\mu g/m^3$ = micrograms per cubic meter; HI = Hazard Index; MEIR = Maximally Exposed Individual Resident; MEIW = Maximally Exposed Individual Worker; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter

NOTES:

Scenario 3: Operational impacts at full buildout to existing off-site receptors and new, on-site Baylands receptors.

a. **Bold values** = threshold exceedance.
b. The off-site resident child cancer risk MEIR is located west of Bayshore Blvd., along Macdonald Ave.
c. The off-site worker cancer risk MEIW is located east of Tunnel Ave. and south of Beatty Ave.
d. The on-site resident child MEIR for cancer risk is located high-density residential area north of Geneva Avenue, west of the Caltrain right-of-way.
e. The on-site school MEIR is located at the southeast corner of Bayshore Boulevard and Main Street.
f. The on-site worker cancer risk MEIW is located south of Geneva Avenue west of Sierra Point Parkway.

TABLE 6
ACUTE HI, CHRONIC HI, AND ANNUAL AVERAGE $PM_{2.5}$ CONCENTRATION

Receptor Type	Acute HI	Chronic HI	Annual Average $PM_{2.5}$ Concentration ($\mu g/m^3$) [a]
MEIR – Resident Child Receptor [b,c]			
Scenario 1 Impact – Existing Off-Site Receptor	NA	0.01	0.22
Scenario 2 Impact – New Baylands Receptor	NA	0.01	0.05
Scenario 3 Impact - Existing Off-Site Receptor	0.01	<0.01	0.22
Scenario 3 Impact - New Baylands Receptor	0.01	0.01	0.26
Significance Threshold	1.0	1.0	0.3
School Receptor [d,c]			
Scenario 1 Impact	NA	NA	NA
Scenario 2 Impact – New Baylands Middle School	NA	<0.01	0.01
Scenario 3 Impact – New Baylands Middle School	<0.01	<0.01	0.11
Significance Threshold	1.0	1.0	0.3
MEIW— Worker Receptor [e,c]			
Scenario 1 Impact – Existing Off-Site Receptor	NA	0.06	**0.69**
Scenario 2 Impact – New Baylands Receptor	NA	<0.01	0.06
Scenario 3 Impact – Existing Off-Site Receptor	0.02	0.01	0.27
Scenario 3 Impact – New Baylands Receptor	0.01	0.01	0.26
Significance Threshold	1.0	1.0	0.3

ABBREVIATIONS: $\mu g/m^3$ = micrograms per cubic meter; HI = Hazard Index; MEIR = Maximally Exposed Individual Resident; MEIW = Maximally Exposed Individual Worker; NA = not applicable; $PM_{2.5}$ = particulate matter 2.5 microns or less in diameter

NOTES:

Scenario 1: Construction + operational impacts to existing, off-site receptors; Scenario 2: Construction + operational impacts to new, on-site Baylands receptors; Scenario 3: Operational impacts at full buildout to existing off-site receptors and new, on-site Baylands receptors.

a. **Bold value** = threshold exceedance.
b. The resident MEIRs are located at:
   - Scenario 1 Impact – Existing Off-Site Receptor: MEIR is located west of Bayshore Blvd., north of MacDonald Ave.
   - Scenario 2 Impact – New Baylands Receptor: Chronic MEIR is located at the north end of the high-density residential area in the Roundhouse district, and the $PM_{2.5}$ MEIR is located at the high-density residential area on the east side of the Roundhouse district.
   - Scenario 3 Impact – Existing Off-Site Receptor: acute MEIR is located at west of Bayshore Blvd., north of Geneva Ave and the chronic/$PM_{2.5}$ is located at west of Bayshore Blvd., south of MacDonald Ave.
   - Scenario 3 Impact – New Baylands Receptor: acute MEIR is located at the low-density residential area in the northwest corner of the Roundhouse district, chronic MEIR is located at the north end of the high-density residential area in the Roundhouse district, and the $PM_{2.5}$ is located at the low-density commercial to the north, in Campus East.
c. Hazard index values and annual average $PM_{2.5}$ concentrations represent the worst year of exposure, not a summation. Overlapping years of construction and operation have combined impacts.
d. There are no existing, off-site schools located within 1,000 feet of the project boundary. The New Baylands Middle school is located in the northwest corner of the Icehouse Hill district.
e. The worker MEIWs are located at:
   - Scenario 1 Impact – Existing Off-Site Receptor: chronic MEIW is located at West of Tunnel Ave., south of Esta Ave. and the $PM_{2.5}$ is located at West of Tunnel Ave., south of Beatty Ave.
   - Scenario 2 Impact – New Baylands Receptor: chronic MEIW is located at the Water Recycling Facility and the $PM_{2.5}$ is located at the Water Recycling Facility
   - Scenario 3 Impact – Existing Off-Site Receptor: acute MEIW is located west of Bayshore Blvd., south of Geneva Ave. and the chronic/$PM_{2.5}$ is located at west of Tunnel Ave., south of Beatty Ave.
   - Scenario 3 Impact – New Baylands Receptor: acute/chronic/$PM_{2.5}$ MEIW is located at Block the low-density commercial to the north, in Campus East.

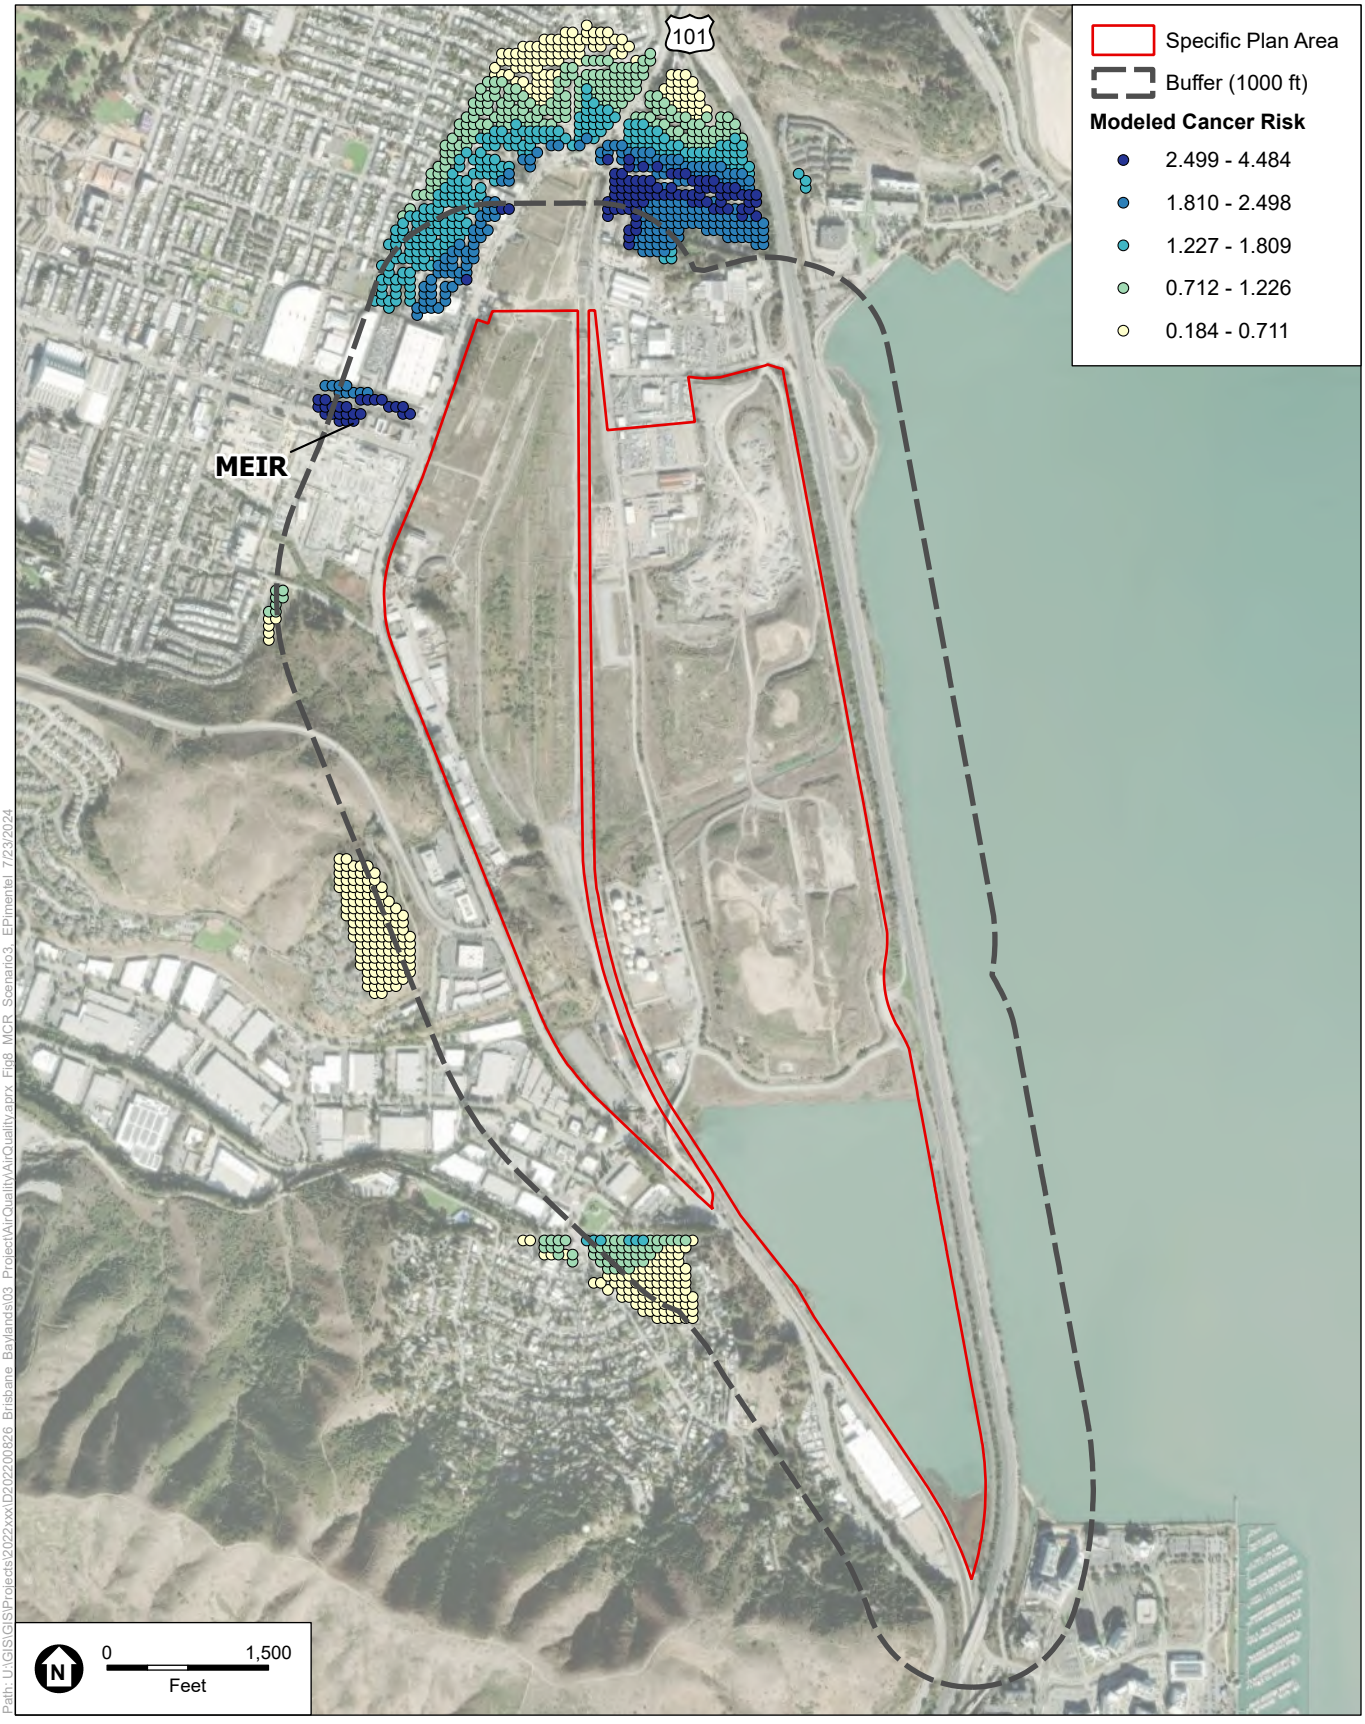
Figure 7
Modeled Cancer Risk at Each Receptor
Scenario 1

ESA



SOURCE: Esri, 2024; ESA, 2024

Brisbane Baylands Projects

Figure 8
Modeled Cancer Risk at Each Receptor
Scenario 3

ESA

Under Scenario 3, the cancer at the new, Baylands on-site MEIR and school receptor is mainly due to emergency backup generator DPM emissions. For the middle school receptor, the closest generator is located at the commercial buildings in the Icehouse Hill district. The generators nearest to the resident are located at high-density residential areas in the Bayshore and Roundhouse districts. The MEIR is in the Bayshore District at high-density residential in the southeast corner, and the on-site school receptor is at the middle school.

The Scenario 1 MEIW is located west of Tunnel Avenue, south of Esta Avenue. The main contributing cause of the annual average $PM_{2.5}$ concentrations at the Scenario 1 MEIW is from fugitive dust emissions that occur during construction in the earthwork phases.
