Control Pathway

Dispersion Options

Titles

C:\Lakes\AERMOD View\Alexan_ProjectArea_RCZ\Alexan_ProjectArea_RCZ.i

Dispersion Options

- [x] Regulatory Default
- [ ] Non-Default Options

Dispersion Coefficient

Urban

Population:
Name (Optional):
Roughness Length:

Output Type

- [x] Concentration
- [ ] Total Deposition (Dry & Wet)
- [ ] Dry Deposition
- [ ] Wet Deposition

Plume Depletion

- [ ] Dry Removal
- [ ] Wet Removal

Output Warnings

- [ ] No Output Warnings
- [ ] Non-fatal Warnings for Non-sequential Met Data

Pollutant / Averaging Time / Terrain Options

Pollutant Type

PM10

Averaging Time Options

Hours

- [ ] 1
- [ ] 2
- [ ] 3
- [ ] 4
- [ ] 6
- [ ] 8
- [ ] 12
- [ ] 24

- [ ] Month
- [x] Period
- [ ] Annual

Exponential Decay

Half-life of 4 hours will be used

Terrain Height Options

- [ ] Flat
- [x] Elevated

SO: Meters
RE: Meters
TG: Meters

Flagpole Receptors

- [x] Yes
- [ ] No

Default Height = 0.00 m

Profile Met Data

Filename: T:\CASE\Env\13819_Monrovia_TrammelCrowe\AGN\HRA\SCAQMD_MetData\AZUS_V9_ADJU\AZUS_v9.P
Format Type: Default AERMET format

Wind Speed

☐ Wind Speeds are Vector Mean (Not Scalar Means)

Wind Direction

Rotation Adjustment [deg]:

Potential Temperature Profile

Base Elevation above MSL (for Primary Met Tower): 182.00 [m]

Meteorological Station Data

Stations	Station No.	Year	X Coordinate [m]	Y Coordinate [m]	Station Name
Surface		2012			
Upper Air		2012			
On-Site		2012			

Data Period

Data Period to Process

Start Date: 1/1/2012 Start Hour: 1 End Date: 12/31/2016 End Hour: 24

Wind Speed Categories

Stability Category	Wind Speed [m/s]	Stability Category	Wind Speed [m/s]
A	1.54	D	8.23
B	3.09	E	10.8
C	5.14	F	No Upper Bound

Source Pathway - Source Inputs

Polygon Area Sources

Source Type: AREA POLY

Source: PAREA1 (I-210)

Base Elevation (Optional)	Release Height [m]	Emission Rate [g/ (s-m^2)]	Initial Vertical Dim. [m]	Number of Vertices (or sides)	X Coordinate for Vertices [m]	Y Coordinate for Vertices [m]
142.58	3.28	1.98E-8		8	406639.35	3777858.98

1.0 INTRODUCTION

This report presents the results of MIG's general biological resources assessment (BRA) of the approximately 6.77-acre Alexan Foothills Specific Plan area (referred to as Project Site in this document) located in Monrovia, Los Angeles County, California (APNs 8507-006-016, -022, -024, -035, -041, -042, -043, and -044). The purpose of this report is to verify the type, location, and extent of potential sensitive biological resources within the Project Site and vicinity. MIG conducted a field survey of the Project Site on January 19, 2018. This report provides a thorough description of the biological setting of the site and surrounding area, including the vegetation communities, potential habitat for special status plant and wildlife species, sensitive natural communities, wildlife migration corridors, and potential state- and federal-jurisdictional habitats. An assessment of the project impacts and recommended mitigation measures to avoid, minimize, or compensate for potential adverse impacts to sensitive habitats and species is also included in the report. The evaluation of potential project impacts follows the checklist items from Appendix G of the California Environmental Quality Act (CEQA) guidelines and has been prepared in a format suitable to support CEQA review and to submit with any future regulatory application packages that might be required.

1.1 Project Location

The 6.77-acre Alexan Foothills Specific Plan is located on a single city block at 1625 Magnolia Avenue in the City of Monrovia, Los Angeles County, California (APNs 8507-006-016, -022, -024, -035, -041, -042, -043, and -044). The block is by bounded by West Evergreen Avenue to the north, South Magnolia Avenue to the east, South Mayflower Avenue to the west, and the METRO Light Rail Gold Line to the south (Figure 1, Regional Map and Figure 2, Project Site Map). The Specific Plan area occurs within the United States Geological Survey (USGS) 7.5' series Mt. Wilson Quadrangle, Township 1 North, Range 12 West (no section noted). The Project Site is relatively flat, with elevations ranging between approximately 430-445 feet above mean sea level (AMSL) (see Figure 3, USGS Topographic Map). Residential land uses border the Project Site to the south and west. Mixed commercial and residential land uses lie to the east and Interstate 210 lies to the north.

2.0 REGULATORY SETTING

The following discussion identifies federal, state, and local environmental regulations that serve to protect sensitive biological resources relevant to the proposed Project Site and CEQA review process.

2.1 Federal

2.1.1 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) of 1973, as amended, provides the regulatory framework for the protection of plant and animal species (and their associated critical habitats), which are formally listed, proposed for listing, or candidates for listing as endangered or threatened under the FESA. The FESA has the following four major components: (1) provisions for listing species, (2) requirements for consultation with the United States Fish and Wildlife Service (USFWS) and the National Oceanic and Atmospheric Administration's National Marine Fisheries Service (NOAA Fisheries), (3) prohibitions against "taking" (meaning harassing, harming, hunting, shooting, wounding, killing, trapping, capturing, or collecting, or attempting to engage in any such conduct) of listed species, and (4) provisions for permits that allow incidental "take". The FESA also discusses recovery plans and the designation of critical habitat for listed species. Section 7 requires Federal agencies, in consultation with, and with the assistance of the USFWS or NOAA Fisheries, as appropriate, to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of threatened or endangered species or result in the destruction or adverse modification of critical habitat for these species. Both the USFWS and NOAA Fisheries share the responsibility for administration of the FESA.

2.1.2 The Migratory Bird Treaty Act

The Federal Migratory Bird Treaty Act (MBTA) (16 U.S.C. 703 et seq.), Title 50 Code of Federal Regulations (CFR) Part 10, prohibits taking, killing, possessing, transporting, and importing of migratory birds, parts of migratory birds, and their eggs and nests, except when specifically authorized by the Department of the Interior. As used in the act, the term "take" is defined as meaning, "to pursue, hunt, capture, collect, kill or attempt to pursue, hunt, shoot, capture, collect or kill, unless the context otherwise requires." With a few exceptions, most birds are considered migratory under the MBTA. Disturbances that causes nest abandonment and/or loss of reproductive effort or loss of habitat upon which these birds depend would be in violation of the MBTA.

2.1.3 The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act that was first passed in 1940 regulates take, possession, sale, purchase, barter, transport, import, and export of any bald or golden eagle or their parts (e.g., nests, eggs, young) unless allowed by permit (16 U.S.C. § 668(a); 50 CFR 22). Take was broadly defined to include shoot, wound, kill, capture, collect, molest, or disturb. In the 1972 amendments, penalties for violations were raised to a maximum fine of $250,000 for an individual or a maximum of two years in prison for a felony conviction, with a doubling for organizations instead of individuals.

2.1.4 Clean Water Act Sections 404 and 401

The U.S. Army Corps of Engineers (USACE) and the U.S. Environmental Protection Agency (U.S. EPA) regulate the discharge of dredged or fill material into waters of the United States, including wetlands, under Section 404 of the Clean Water Act (CWA) (33 U.S.C. § 1344). Waters of the United States are defined in Title 33 CFR Part 328.3(a) and include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows,

playa lakes, or natural ponds. The lateral limits of jurisdiction in those waters may be divided into three categories – territorial seas, tidal waters, and non-tidal waters – and is determined depending on which type of waters is present (Title 33 CFR Part 328.4[a], [b], [c]). Activities in waters of the United States regulated under Section 404 include fill for development, water resource projects (e.g., dams and levees), infrastructure developments (e.g., highways, rail lines, and airports) and mining projects. Section 404 of the CWA requires a Federal permit before dredged or fill material may be discharged into waters of the United States, unless the activity is exempt from Section 404 regulation (e.g., certain farming and forestry activities).

Section 401 of the CWA (33 U.S.C. § 1341) requires an applicant for a Federal license or permit to conduct any activity that may result in a discharge of a pollutant into waters of the United States to obtain a water quality certification from the State in which the discharge originates. The discharge is required to comply with the applicable water quality standards. A certification obtained for the construction of any facility must also pertain to the subsequent operation of the facility. The responsibility for the protection of water quality in California rests with the State Water Resources Control Board (State Water Board) and its nine Regional Water Quality Control Boards (Water Boards).

2.2 State

2.2.1 California Endangered Species Act

The State of California enacted similar laws to the FESA, the California Native Plant Protection Act (NPPA) in 1977, and the California Endangered Species Act (CESA) in 1984. The CESA expanded upon the original NPPA and enhanced legal protection for plants, but the NPPA remains part of the California Fish and Game Code. To align with the FESA, CESA created the categories of "threatened" and "endangered" species. It converted all "rare" animals into the CESA as threatened species but did not do so for rare plants. Thus, these laws provide the legal framework for protection of California-listed rare, threatened, and endangered plant and animal species. The California Department of Fish and Wildlife (CDFW) implements NPPA and CESA, and its Wildlife and Habitat Data Analysis Branch maintains the California Natural Diversity Database (CNDDB), a computerized inventory of information on the general location and status of California's rarest plants, animals, and natural communities. During the CEQA review process, the CDFW is given the opportunity to comment on the potential of the proposed Project to affect listed plants and animals.

2.2.2 Native Plant Protection Act

The NPPA of 1977 (California Fish and Game Code, §§ 1900 through 1913) directed the CDFW to carry out the Legislature's intent to "preserve, protect and enhance rare and endangered plants in this State." The NPPA is administered by the CDFW, which has the authority to designate native plants as endangered or rare and to protect them from "take."

2.2.3 California Environmental Quality Act

CEQA was enacted in 1970 to provide for full disclosure of environmental impacts to the public before issuance of a permit by state and local public agencies. CEQA (Public Resources Code Sections 21000 et. seq.) requires public agencies to review activities which may affect the quality of the environment so that consideration is given to preventing damage to the environment. When a lead agency issues a permit for development that could affect the environment, it must disclose the potential environmental effects of the project. This is done with an Initial Study and Negative Declaration (or Mitigated Negative Declaration) or with an Environmental Impact Report. Certain classes of projects are exempt from detailed analysis under

CEQA. CEQA Guidelines Section 15380 defines endangered, threatened, and rare species for purposes of CEQA and clarifies that CEQA review extends to other species that are not formally listed under the state or federal Endangered Species Acts but that meet specified criteria.

2.2.4 Fully Protected Species and Species of Special Concern

The classification of "fully protected" was the CDFW's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibian and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under CESA and/or FESA. The Fish and Game Code sections (fish at §5515, amphibian and reptiles at §5050, birds at §3511, and mammals at §4700) dealing with "fully protected" species states that these species "…may not be taken or possessed at any time and no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to take any fully protected species," (CDFW Fish and Game Commission 1998) although take may be authorized for necessary scientific research. This language makes the "fully protected" designation the strongest and most restrictive regarding the "take" of these species. In 2003, the code sections dealing with fully protected species were amended to allow the CDFW to authorize take resulting from recovery activities for state-listed species.

Species of special concern are broadly defined as animals not listed under the FESA or CESA, but which are nonetheless of concern to the CDFW because they are declining at a rate that could result in listing or historically occurred in low numbers and known threats to their persistence currently exist. This designation is intended to result in special consideration for these animals by the CDFW, land managers, consulting biologist, and others, and is intended to focus attention on the species to help avert the need for costly listing under FESA and CESA and cumbersome recovery efforts that might ultimately be required. This designation also is intended to stimulate collection of additional information on the biology, distribution, and status of poorly known at-risk species, and focus research and management attention on them. Although these species generally have no special legal status, they are given special consideration under the CEQA during project review.

2.2.5 California Fish and Wildlife Code Sections 3503 and 3513

According to Section 3503 of the California Fish and Wildlife Code, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird (except English sparrow (*Passer domesticus*) and European Starling (*Sturnus vulgaris*). Section 3503.5 specifically protects birds in the orders Falconiformes and Strigiformes (birds-of-prey). Section 3513 essentially overlaps with the MBTA, prohibiting the take or possession of any migratory non-game bird. Disturbance that causes nest abandonment and/or loss of reproductive effort is considered "take" by the CDFW.

2.2.6 Porter-Cologne Water Quality Control Act

Waters of the State are defined by the Porter-Cologne Act as "any surface water or groundwater, including saline waters, within the boundaries of the State." The State Water Board protects all waters in its regulatory scope but has special responsibility for isolated wetlands and headwaters. These water bodies have high resource value, are vulnerable to filling, and may not be regulated by other programs, such as Section 404 of the CWA. Waters of the State are regulated by the Water Boards under the State Water Quality Certification Program, which regulates discharges of dredged and fill material under Section 401 of the CWA and the Porter-Cologne Water Quality Control Act. Projects that require a USACE permit, or fall under other Federal jurisdiction, and have the potential to impact Waters of the State are required to comply with the terms of the Water Quality Certification Program. If a proposed project does not require a

Federal license or permit but does involve activities that may result in a discharge of harmful substances to Waters of the State, the Water Boards have the option to regulate such activities under its State authority in the form of Waste Discharge Requirements or Certification of Waste Discharge Requirements.

2.2.7 Other Sensitive Plants – California Native Plant Society

The California Native Plant Society (CNPS), a non-profit plant conservation organization, publishes and maintains an Inventory of Rare and Endangered Vascular Plants of California in both hard copy and electronic version (http://www.cnps.org/cnps/rareplants/inventory/).

The Inventory assigns plants to the following categories:

1A Presumed extinct in California;
1B Rare, threatened, or endangered in California and elsewhere;
2 Rare, threatened, or endangered in California, but more common elsewhere;
3 Plants for which more information is needed – A review list; and
4 Plants of limited distribution – A watch list.

Additional endangerment codes are assigned to each taxon as follows:

1 Seriously endangered in California (over 80% of occurrences threatened/high degree of immediacy of threat).
2 Fairly endangered in California (20-80% occurrences threatened).
3 Not very endangered in California (<20% of occurrences threatened or no current threats known).

Plants on Lists 1A, 1B, and 2 of the CNPS Inventory consist of plants that may qualify for listing, and the CDFW, as well as other state agencies (e.g., California Department of Forestry and Fire Protection). As part of the CEQA process, such species should be fully considered, as they meet the definition of threatened or endangered under the NPPA and Sections 2062 and 2067 of the California Fish and Game Code. California Rare Plant Rank 3 and 4 species are considered to be plants about which more information is needed or are uncommon enough that their status should be regularly monitored. Such plants may be eligible or may become eligible for state listing, and CNPS and CDFW recommend that these species be evaluated for consideration during the preparation of CEQA documents (CNPS 2018, CDFW 2018b).

2.2.8 California Fish and Game Code Section 1600-1603

Streams, lakes, and riparian vegetation, as habitat for fish and other wildlife species, are subject to jurisdiction by the CDFW under Sections 1600-1616 of the California Fish and Game Code. Any activity that will do one or more of the following: (1) substantially obstruct or divert the natural flow of a river, stream, or lake; (2) substantially change or use any material from the bed, channel, or bank of a river, stream, or lake; or (3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it can pass into a river, stream, or lake generally require a 1602 Lake and Streambed Alteration Agreement. The term “stream”, which includes creeks and rivers, is defined in the California Code of Regulations (“CCR”) as follows: “a body of water that flows at least periodically or intermittently through a bed or channel having banks and supports fish or other aquatic life”. This includes watercourses having a surface or subsurface flow that supports or has supported riparian vegetation” (14

CCR 1.72). In addition, the term stream can include ephemeral streams, dry washes, watercourses with subsurface flows, canals, aqueducts, irrigation ditches, and other means of water conveyance if they support aquatic life, riparian vegetation, or stream-dependent terrestrial wildlife (CDFW 1994). Riparian vegetation is defined as, "vegetation which occurs in and/or adjacent to a stream and is dependent on, and occurs because of, the stream itself" (CDFW 1994). In addition to impacts to jurisdictional streambeds, removal of riparian vegetation also requires a Section 1602 Lake and Streambed Alteration Agreement from the CDFW.

2.2.9 Sensitive Natural Communities

Sensitive vegetation communities are natural communities and habitats that are either unique in constituent components, of relatively limited distribution in the region, or of particularly high wildlife value. These communities may or may not necessarily contain special-status species. Sensitive natural communities are usually identified in local or regional plans, policies or regulations, or by the CDFW (i.e., CNDDB) or the USFWS. The CNDDB identifies a number of natural communities as "rare", which are given the highest inventory priority (Holland 1986; CDFW 2010). Impacts to sensitive natural communities and habitats must be considered and evaluated under the CEQA.

2.2.9 CDFW California Natural Diversity Database

CDFW maintains the California Natural Diversity Database (CNDDB), which is a program that inventories the status and locations of rare plants and animals in California. Each rare species or plant community is assigned an "element ranking" in the CNDDB, which quantifies and qualifies the rarity of each species/community within its global and State range. The CNDDB gives five categories of rarity for each species' global and State range; these are summarized in the General Biological Assessment Report in Appendix D. All Federal and State listed species are assigned a ranking; however, even non-listed species (such as Species of Concern, Special Animals, or plants on the CNPS list) are assigned an element ranking by CDFW for the CNDDB. Impacts to species which are assigned an element ranking in the CNDDB are considered under CEQA.

2.3 Local

2.3.1 City of Monrovia General Plan

According to the City of Monrovia General Plan, "little vacant land suitable for development is available. Therefore, future development, like current development patterns, will involve either the intensification of already existing uses or recycling to similar uses." The over 4.5-mile trail system and surrounding Hillside Wilderness Preserve, discussed at length in the Hillside Wilderness Preserve Resource Management Plan (adopted in 2012), will remain protected and intact. Other areas within City boundaries have been designated or envisioned for future development/improvement, are generally urbanized, and have very little value for biological resources.

2.3.2 City of Monrovia Oak Tree Preservation Ordinance

The City of Monrovia Oak Tree Preservation Ordinance (87-11) adopted in 1987 to preserve Monrovia's native oak trees, contains regulations in §17.20.40 of the Monrovia Municipal Code. Oak trees protected include any trees of the genus Quercus within the city limits of Monrovia with trunks ten inches in diameter or more, measured at two feet above level ground. Oaks are protected within: single-family, multiple-family, commercial, or industrial zones, in addition to vacant lots and/or oak trees indicated in an oak tree preservation plan. Oaks must also be protected from grading, oil/gas/other construction chemicals, or signage or other obstructions during construction via an oak protection plan approved by the City's

Development Review Committee, which includes guidelines for placing fencing around protected oaks. Activities that will cut an oak to the ground, extract an oak, kill/remove an oak by other means, prune and oak so that more than one-third of the crown/existing foliage/root system is removed, or will disturb underground beneath the dripline of an oak require permitting through the City of Monrovia.

3.0 METHODS

This analysis of potential biological resources located on the Project Site includes a review of available background information in and around the vicinity of the Project Site and completion of a field survey.

3.1 Literature Review

Prior to conducting field surveys, MIG biologists reviewed available background information pertaining to the biological resources on and in the vicinity of the project. Available literature and resource mapping reviewed included the occurrence records for special-status species and sensitive natural communities and numerous other information sources listed below:

- CDFW California Natural Communities Database (CNDDB) record search within the Mt Wilson and surrounding eight USGS quadrangles (CDFW 2018a)
- CNPS Rare Plant Program, Inventory of Rare and Endangered Plants of California (CNPS 2018) records search within the Mt Wilson and surrounding eight USGS quadrangles
- Soil Survey Staff, Natural Resource Conservation Service (NRCS), United States Department of Agricultural (USDA NRCS 2018)
- CDFW California Natural Community List (CDFW 2018b)
- CDFW State and Federally Listed Endangered, Threatened, and Rare Plants of California (CDFW 2018c)
- USFWS Information for Planning and Consultation (IPaC; USFWS 2018a)
- USFWS National Wetlands Inventory (USFWS 2018b)

3.2 Field Surveys

A biological field survey was conducted by MIG biologists Jonathan Campbell, PhD and Melinda Mohamed on January 19, 2018. The field survey was conducted on foot to assess the existing conditions of the Project Site, including recording observed plant and wildlife species, characterizing and delineating the vegetation communities and associated wildlife habitats, and evaluating the potential for these habitats to support special-status species and sensitive communities.

3.2.1 Plant Communities

During the field survey, MIG biologists traversed the entire Project Site by foot and evaluated the suitability of onsite vegetation communities to support special status species documented within the Project Site. An attempt was made to classify plant communities according to the Second Edition of the Manual of California Vegetation (Sawyer et al. 2009) classification system, as this method is preferred (but not required) by CDFW. However, for certain vegetation types, this system is too species-specific in its definitions of plant associations and alliances and does not accurately characterize the highly variable species composition of plant communities. For this Project Site, it was necessary to identify variants of plant community types for ornamental plant assemblages and non-vegetated areas that are not described in the literature. The List of California Natural and Terrestrial Communities (CDFW 2018b) was consulted to determine if any rare or

sensitive plant communities are present. In addition, plant communities were evaluated to determine if they are considered sensitive under federal and/or other state regulations and local policies. Plant communities within the Study Area were mapped in the field onto a color aerial photograph and digitized into ArcView Geographic Information System (GIS) shapefiles (refer to Figure 5, Biological Resources Map).

3.2.2 Jurisdictional Habitats and Aquatic Features

Although a formal jurisdiction delineation report has not been conducted, habitats on the project site were assessed to determine if any wetlands and "other waters" or streambeds potentially subject to jurisdiction by the USACE, RWQCB, or CDFW were present. Habitats were evaluated for the presence of wetland indicators including dominance by hydrophytic plant species and presence of wetland hydrology. Estimation of the approximate boundaries of potential USACE and/or RWQCB jurisdictional areas followed standard methodologies as described in the *Interim Regional Supplement to the USACE Wetland Delineation Manual: Arid West Region* (*USACE 2008*). The site was also inspected for the presence of drainages, streams, and other aquatic features, including those that support stream-dependent (riparian) plant species that may be considered jurisdictional by CDFW. During the site assessment, potentially jurisdictional areas were identified by the presence of one or more indicators of hydrophytic vegetation and wetland hydrology for wetlands or the presence of an "ordinary high water mark" for non-wetland other water features. Hydrophytic vegetation communities were identified as areas dominated by plant species with a wetland indicator status of OBL, FACW, or FAC as listed on the *USFWS List of Plant Species that Occur in Wetlands* (Lichvar and Kartesz 2016). Indicators of wetland hydrology include visible inundation or saturation, drift deposits, oxidized root channels, and biotic crusts. The preliminary assessment of other water features was based primarily on the presence of unvegetated, ponded areas or flowing water, or evidence indicating their presence such as an ordinary high water mark or well-defined drainage patterns.

3.2.3 Special-Status Species Habitat Assessment

The potential occurrence of special-status plant and animal species on the Project Site was initially evaluated by developing a list of special-status species that are known to or have the potential to occur in the vicinity of the Project Site based on a review of past studies including species-specific studies; search of current database records (e.g., CNDDB and CNPS Electronic Inventory records); and review of the USFWS list of federal endangered and threatened species (See Appendix C). The potential for occurrence of those species included on the list were then evaluated based on the habitat requirements of each species relative to the conditions observed during the field survey conducted by MIG. Plant species that have been documented to occur well outside of the elevation and geographic range of the Project Site were eliminated from further consideration. Each species was evaluated for its potential to occur on or in the immediate vicinity of the Project Site according to the following criteria.

> **Not Expected.** There is no suitable habitat present on the Project Site (i.e., habitats on the Project Site are clearly unsuitable for the species requirements [e.g., foraging, breeding, cover, substrate, elevation, hydrology, plant community, disturbance regime, etc.]). Additionally, there are no recent known records of occurrence in the vicinity of the Project Site. The species has no potential of being found on the Project Site.
>
> **Low Potential.** Limited suitable habitat is present on the Project Site (i.e., few of the habitat components meeting the species requirements are present and/or the majority of habitat on the Project Site is unsuitable or of very low quality). Additionally, there are no or few recent known

records of occurrence in the vicinity of the Project Site. The species has a low probability of being found on the Project Site.

Moderate Potential. Suitable habitat is present on the Project Site (i.e., some of the habitat components meeting the species requirements are present and/or the majority of the habitat on the Project Site is suitable or of marginal quality). Additionally, there are few or many recent known records of occurrences in the vicinity of the Project Site. The species has a moderate probability of being found on the Project Site.

High Potential. Highly suitable habitat is present on the Project Site (i.e., all habitat components meeting the species requirements are present and/or all of the habitat on the Project Site is highly suitable or of high quality). Additionally, there are few or many recent known records of occurrences in the vicinity of the Project Site. This species has a high probability of being found on the Project Site.

Present. Species was observed on the Project Site (i.e., species was either observed during recent surveys or has a recorded observation in the CNDDB on the Project Site).

Appendices A and B present the list of special-status plants and animals (respectively) that have the potential to occur in the vicinity of the Project Site, their habitat requirements, and a ranking of potential for occurrence on the Project Site. Nomenclature used for plant names follows the *Second Edition of The Jepson Manual* (Baldwin *et al*. 2012). Nomenclature for wildlife follows CDFW's *Complete List of Amphibian, Reptile, Bird, And Mammal Species in California* (CDFW 2016) and any changes made to species nomenclature as published in scientific journals since the publication of CDFW's list.

4.0 EXISTING CONDITIONS

The following provides a description of the soils, vegetation communities, wildlife, and wildlife movement corridors present on the Project Site.

4.1 Physical Characteristics

The Project area is flat with elevations ranging between 430-445 feet above mean sea level (AMSL). The Project area is dominated by a parking lot, several industrial buildings, five residential buildings, and an office. The vast majority of the Project area is paved, with very little, mostly weedy vegetation. Interstate-210 and its associated landscaping is located to the north of the Project area. METRO's Gold Line light rail tracks are located directly to the Project area's south property line. Residences occur west and east of the Project area, and industrial structures occur east of the Project area.

A concrete-lined drainage channel crosses the Project area. It initiates near Interstate-210 and drains to the southeast off the Project site, mapped drainage by the National Wetlands Inventory. This approximately 10-feet wide x 400-feet long open drainage runs along the Alexan Foothills Specific Plan's western boundary and flows into a culvert passing under the METRO Gold Line tracks.

4.2 Soils

The Web Soil Survey reports the following soils within the boundary of the 6.77-acre Alexan Foothills Specific Plan area as shown on Figure 4, Soils Map (USDA NRCS 2018):

- Urban land-Palmview-Tujunga complex, 0 to 5 percent slopes (1002). The Palmview and Tujunga series consist of very deep, somewhat excessively drained soils that formed in alluvium from granitic sources. This soil type occurs on alluvial fans and floodplains, including urban areas. Slopes range from 0 to 15 percent.

4.3 Plant Communities & Associated Wildlife Habitats

As described in Section 3 (Methods), plant communities on-site were mapped in the field onto a color aerial photograph (See Figure 5, Biological Resources Map) and were evaluated to determine if they are considered sensitive under federal, state, or local regulations or policies. Biological communities were classified as sensitive or non-sensitive as defined by CEQA and other applicable laws and regulations.

4.3.1 Vegetation Communities

The majority of the Project area is unvegetated due to development and characterized by weedy species. Vegetation communities that are present are described in more detail below.

Developed (6.03 acres)

The Project Site is dominated car lots and structures (Figure 6, Current Project Site Photographs). These areas are generally unvegetated although weedy species such as wild oats (*Avena fatua*), tree of heaven (*Ailanthus altissima*), castor bean (*Ricinus communis*), Bermuda grass (*Cynodon dactylon*), broad leaf filaree (*Erodium botrys*), and common groundsel (*Senecio vulgaris*) are present.

Ornamental (0.58 acres)
Portions of the Project Site are characterized by ornamental plantings including Siberian elm (*Ulmus pumila*), carob (*Ceratonia siliqua*), ash (*Fraxinus* sp.), crimson bottlebrush (*Callistemon citrinus*), Mexican fan palm (*Washingtonia robusta*), honeysuckle (*Lonicera* sp.), oceanblue morning glory (*Ipomoea indica*), multiflora rose (*Rosa multiflora*), lily of the Nile (*Agapanthus africanus*), and gardenia (*Gardenia* sp.) (Figures 6 and 7, Current Project Site Photographs). Weedy species are common in these communities and include smilo grass (*Stipa miliacea*), Bermuda buttercup (*Oxalis pes-caprae*), and wild oats.

Coast Live Oak (0.16 acres)
Three coast live oak trees (*Quercus agrifolia*) are present along the western boundary of the Alexan Foothills Specific Plan area and grow along the edge of the drainage channel (Figure 6, Current Project Site Photographs). These trees are all over 10" in diameter or more, 2 feet above ground level. Therefore, they are protected by the City of Monrovia Oak Tree Preservation Ordinance and may be regulated as riparian habitat by California Department of Fish and Wildlife (CDFW).

Additional oak trees occur in the remaining GP/ZCA area along and adjacent to the unnamed drainage channel and may also be regulated as riparian habitat by CDFW.

4.4 Wildlife

Wildlife species that were observed on site during the January 19, 2018 biological field survey include Anna's hummingbird (*Calypte anna*), house finch (*Haemorhous mexicanus*), northern mockingbird (*Mimus polyglottus*), American crow (*Corvus brachyrhynchos*), house sparrow (*Passer domesticus*), mourning dove (*Zenaida macroura*), ruby-crowned kinglet (*Regulus calendula*), and yellow-rumped warbler (*Setophaga coronata*).

Other wildlife species that could inhabit the Project area are limited to urban species adapted to high levels of anthropogenic disturbance. Common urban-tolerant birds include: black phoebe (*Sayornis nigricans*), non-native European Starling (*Sturnus vulgaris*), non-native Eurasian collared dove (*Streptopelia decaocto*) and various other migrant songbirds, such as warblers, vireos, and grosbeaks. Common small mammals expected to occur in the urban setting include, but are not limited to, western gray squirrel (*Sciurus griseus*), raccoon (*Procyon lotor*), California mouse (*Peromyscus californicus*), Virginia opossum (*Didelphis virginiana*), and Botta's pocket gopher (*Thomomys bottae*). The unnamed, concrete drainage channel in the Project Area may occasionally provide aquatic habitat to the disturbance-tolerant Sierran treefrog (*Pseudacris sierra*) (formerly Pacific Treefrog [*Pseudacris regilla*] or Pacific Tree Chorus Frog [*Hyla regilla*]), when it contains water.

4.5 Sensitive Plant Communities

CDFW and CNPS have identified several native plant communities that are rare and unique to California. While they have no legal, protective status, impacts to these plant communities may be considered "significant" under CEQA. No sensitive plant communities were observed on the Project Site, as they did not exhibit the characteristic attributes of these communities, such as the known distribution and elevation, landscape position, plant species composition, soil and/or substrate type, water chemistry, and/or hydroperiod.

4.6 Special-Status Plants

Special-status plants are defined here to include: (1) plants that are federal- or state-listed as rare, threatened or endangered, (2) federal and state candidates for listing, (3) plants assigned a Rank of 1 through 4 by the CNPS Inventory, and (4) plants that qualify under the definition of "rare" in CEQA, Section 15380.

The Alexan Foothills Specific Plan was initially determined to provide potentially suitable habitat for a total of 49 special-status plant species based on the Plan area's proximity to previously recorded occurrences in the region, vegetation types and habitat quality, topography, elevation, soil types, other species-specific habitat requirements, and geographic ranges of special-status plant species known to occur in the region (CDFW 2018). Based on the California Natural Diversity Data Base (CNDDB) and the biological field survey and habitat suitability analysis performed by MIG biologists on the Alexan Foothills Specific Plan site, none of the 49 species are expected to occur (i.e. species ranked as "Not Expected"). A table presenting all special-status plant species considered and evaluated for their potential occurrence in the Alexan Foothills Specific Plan area, including plant species' habitat requirements and reported blooming periods, is provided in Appendix A. Due the developed nature of the remaining GP/ZCA area, it is expected to have less potential to support special-status plant species than the Alexan Foothills Specific Plan.

4.7 Special-Status Wildlife

Special-status wildlife species include those species listed as endangered or threatened under the FESA or CESA; candidates for listing by the USFWS or CDFW; and species of special concern to the CDFW; and birds protected by the USFWS under the MTBA and/or by the CDFW under Fish and Game Code Sections 3503 and 3513. It was initially determined that 43 special-status wildlife species have been recorded in the vicinity of the Project Site (CDFW 2018a). Of these animal species, none are expected to occur on the Project Site (i.e., species ranked as "Not Expected"). Reasons include the absence of essential habitat requirements for the species, the distance to known occurrences and/or the species distributional range, the limited availability of foraging and nesting habitat, amount of site disturbance from past and present land uses, and/or the proximity of existing human-related disturbances. In addition, no USFWS-designated critical habitat areas for any federally listed animals are present. A table presenting all special-status animal species considered and evaluated for their potential occurrence on the Project Site, including species' habitat requirements is provided in Appendix B.

Nesting Birds

Migratory birds are also protected under the Federal MBTA, which prohibits killing any migratory bird or disturbing or destroying an active nest of a migratory bird; this list contains hundreds of birds, including many of which are considered common or even nuisance or non-native species. Nesting birds are also protected under California Fish and Game Code 3503, 3503.5, and 3512, which prohibits the take of active bird nests. The existing trees on the Project Site provide potentially suitable nesting habitat for songbirds. Although no active nests were observed during the field surveys, there is potential for ground- and tree-nesting birds to establish nests on the Project Site prior to initiation of project construction. These species are protected under the MBTA and would be protected under the California Fish and Game Code when actively nesting.

4.8 Wildlife Movement Corridors

Providing functional habitat connectivity between natural areas is essential to sustaining healthy wildlife populations and allowing for the continued dispersal of native plant and animal species. The regional movement and migration of wildlife species has been substantially altered due to habitat fragmentation over the past century. This fragmentation is most commonly caused by development of open areas, which can result in large patches of land becoming inaccessible and forming a virtual barrier between undeveloped areas. Additional roads associated with development, although narrow, may result in barriers to smaller or less mobile wildlife species. Habitat fragmentation results in isolated islands of habitat, which affects wildlife behavior, foraging activity, reproductive patterns, immigration and emigration or dispersal capabilities, and survivability. Wildlife corridors can consist of a sequence of discontinuous areas of habitat such as isolated wetlands, or continuous lineal strips of vegetation and habitat (e.g., riparian strips and ridge lines), or they may be parts of larger habitat areas selected for its known or likely importance to local wildlife. The Project area does not act as a wildlife movement corridor due to the current built environment at the site as well as the presence of dense urban development surrounding the site including residential neighborhoods, I-210 freeway to the north, METRO rail line to the south, and other commercial development nearby.

4.9 Jurisdictional Waters/Wetlands

As discussed above, an unnamed concrete-lined drainage (approximately 10 feet wide) occurs through the Project area along the Alexan Foothills Specific Plan's western boundary and flows southeast. The drainage is mapped as a blue-line drainage by the U.S. Geological Survey and is subject to California Department of Fish and Wildlife (CDFW) jurisdiction pursuant to Division 2, Chapter 6, Section 1600 of the Fish and Game Code. The drainage is also subject to U.S. Army Corps of Engineers' (USACE) jurisdiction pursuant to Section 404 of the Clean Water Act (CWA) and the Los Angeles Regional Water Quality Control Board (RWQCB) jurisdiction pursuant to Section 401 of the CWA. No other waters or wetlands were observed in the Project area.

5.0 Environmental Impacts

This section describes potential impacts to sensitive biological resources—including special-status plants and animals, and aquatic resources that may occur in the Project Site. Each impact discussion includes mitigation measures that would be implemented during the project to avoid and/or reduce the potential for and/or level of impacts to each resource. With the implementation of the recommended mitigation measures, all impacts to biological resources are anticipated to be reduced to less than significant pursuant to CEQA.

5.1 Thresholds of Significance

This section describes potential impacts to biological resources that may occur as a result of the construction of the proposed project. CEQA Guidelines provide guidance in evaluating project impacts and determining whether impacts may be significant. CEQA defines "significant effect on the environment" as "a substantial adverse change in the physical conditions which exist in the area affected by the proposed project." In accordance with Appendix G of the CEQA Guidelines, a project could have a significant environmental impact on biological resources if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service;

- Have a substantial adverse effect on State or Federally protected wetlands (including but not limited to marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or Ordinances protecting biological resources, such as a tree preservation policy or Ordinance; or

- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or State habitat conservation plan

5.2 Impacts and Mitigation Measures

Implementation of the proposed Project would involve alteration of an already-developed area that does not support a wide diversity of biological resources. Though the majority of the Project area currently encompasses residential, commercial, industrial, and other urban development, sensitive habitat along an unnamed drainage channel and coast live oak trees still exist that could support plant and wildlife species. Potential impacts to these resources, and where necessary, associated mitigation measures to offset these impacts, are discussed below.

Impact BIO-1: Nesting Birds

Native and ornamental vegetation in the Project area have the potential to provide nesting habitat for bird species protected by the MBTA and California Fish and Game Code Sections 3503 and 3513. There is potential for ground- and tree-nesting birds to establish nests in the Project area prior to construction activities. Intentional destruction of or disturbance to an active nest is prohibited under state and federal law. Construction activities including site mobilization, tree removal, other vegetation clearing, grubbing, grading, and noise and vibration from the operation of heavy equipment have the potential to result in significant direct (i.e., death or physical harm) and/or indirect (i.e., nest abandonment) impacts to nesting birds. Implementation of mitigation measure MM BIO-1 would be required to reduce impacts to nesting birds to a less than significant level.

Mitigation Measures

MM BIO-1: Nesting Bird Protection. If vegetation removal is scheduled during the nesting season (typically February 1 to September 1), then a focused survey for active nests shall be conducted by a qualified

biologist (as determined by a combination of academic training and professional experience in biological sciences and related resource management activities) no more than five (5) days prior to the beginning of excavation, grading and/or vegetation removal. Surveys would be conducted in proposed work areas, staging and storage areas, along equipment transportation routes, and soil, equipment, and material stockpile areas. For passerines and small raptors, surveys should be conducted within a 250-foot radius surrounding the work area (in non-developed areas and where access is feasible). For larger raptors, such as those from the genus Buteo, the survey area should encompass a 500-foot radius. Surveys shall be conducted during weather conditions suited to maximize the observation of possible nests and shall concentrate on areas of suitable habitat. If a lapse in Project-related work of five (5) days or longer occurs, an additional nest survey shall be required before work can be reinitiated.

If active nests are found during any preconstruction survey, a qualified biologist shall establish an appropriate buffer between the nest and active construction. The qualified biologist shall clearly mark the established buffer. The Project proponent shall maintain the buffer until young have fledged and are foraging independently. The qualified biologist shall document pre-construction baseline monitoring of the nest to characterize "normal" bird behavior. The qualified biologist shall monitor the nesting birds daily during construction activities and shall increase the buffer if birds are showing signs of unusual or distressed behavior (e.g., defensive flights and vocalizations, standing up from a brooding position, and flying away from the nest). If this is not possible, work shall cease in the area until young have fledged and the nest is no longer active (e.g. young have fledged, predation, or other non-anthropogenic nest failure). Requirements and Timing: Measure shall be printed on all construction drawings. Monitoring: City Planning staff shall conduct periodic inspections in the field during construction to ensure measure is adhered to.

Impact BIO-2: Potential Adverse Effects on Jurisdictional Waters

A significant impact would occur if a Project has a substantial adverse effect on jurisdictional waters. The USACE and EPA regulate the discharge of dredged or fill material into waters of the United States, including wetlands, under Section 404 of the Clean Water Act. Section 404 of the CWA requires a permit before dredged or fill material may be discharged into waters of the United States. Section 401 of the CWA requires that an applicant for a federal permit obtain a certification from the RWQCB as well. Additionally, Section 1602 of the California Fish and Game Code requires the issuance of a Lake and Streambed Alteration Agreement (LSAA) to authorize work in jurisdictional streambeds.

Although a federal/state jurisdictional delineation was not completed as part of this effort, the onsite USGS blue line, concrete-lined drainage channel represents a potential USACE, CDFW, and RWQCB jurisdictional resource. Overflow stormwater discharge would be routed to this drainage channel during large storm events. However, it is unknown whether disturbance of the jurisdictional resource would be required in order to connect to it. It may be possible to avoid disturbance of the jurisdictional resource or it may be required to install a stormwater pipe into the bank of the drainage. In addition, future proposed development in the remaining GP/ZCA area could propose disturbance to the drainage channel.

No direct impacts to oak trees associated with the drainage is proposed and the channel is completely concrete-lined. However, modification of the bank of the jurisdictional drainage and discharge of stormwater to it, would be considered a potentially significant impact on the drainage and would be subject to permits by the CDFW, RWQCB, and likely the USACE. Impacts would be mitigated to a less than significant level, however, by implementing mitigation measures BIO-2a through BIO-2c.

Mitigation Measures

MM BIO-2a: Obtain USACE 404 Permit. If any alterations of, or discharges into, waters of the United States, including Section 404 wetlands are proposed, these alterations must be in conformance with the Sections 404 and 401 of the CWA via certification and permitting prior to any grading or construction that may impact jurisdictional area(s), as applicable. Activities that usually involve a regulated discharge of dredged or fill materials include (but are not limited to) grading, placing of riprap for erosion control, pouring concrete, laying sod, preparing soil for planting (e.g., turning soil over, adding soil amendments), stockpiling excavated material, mechanized removal of vegetation, and driving of piles for certain types of structures. If avoidance of federally protected wetlands is not feasible, securing 404 and 401 permits under the Clean Water Act and compliance with the federal and state "no net loss of wetlands" policy will be required in accordance with USACE and RWQCB regulations. The terms and conditions of these permits are anticipated to require mitigation consistent with *Compensatory Mitigation for Losses of Aquatic Resources; Final Rule* (USACE, United States Environmental Protection Agency [EPA], *Federal Register*, April 10, 2008).

Prior to initiation of ground disturbance activities within waters of the U.S., the applicant shall submit a jurisdictional delineation of waters of the U.S. to the USACE to request a formal verification of the limits of their jurisdiction and to identify potential impacts to waters of the U.S. If the USACE determines that jurisdictional waters of the U.S. will be impacted, the appropriate CWA Section 404 permit shall be acquired by the applicant for the construction of the proposed project. In addition, the Applicant shall be required to submit a Section 401 Water Quality Certification application to the Los Angeles RWQCB. If the USACE does not assert regulatory jurisdiction, then the applicant may be required to submit a Notice of Intent to the RWQCB for their General Permit R6T-2003-0004 for minor impact projects. If required, all regulatory permits will be obtained, and all conditions will be agreed upon to prior to project implementation. The Applicant shall be responsible for complying with all conditions outlined in the applicable USACE, and/or RWQCB permit. Impact minimization measures associated with permit conditions of approval may include implementation of best management practices (i.e., erosion and sediment control measures) and seasonal work restrictions, as appropriate. Impacts to jurisdictional features shall not occur until the permits are received from the appropriate regulatory agencies, or correspondence is received from the agencies indicating that a permit is not required. Requirements and Timing: Measure shall be printed on all drawings. A Section 404 permit and Section 401 Water Quality Certification or Waiver shall be obtained prior to issuance of building permits for any portion of the project impacting the drainage in the Project area. Monitoring: For projects disturbing the drainage in the Project area, City Planning staff shall confirm that any required Section 404 permit and Section 401 Water Quality Certification or Waiver is obtained prior to issuance of building permits for the portion of the project impacting the jurisdictional drainage.

MM BIO-2b: Consult CDFW on Section 1602 Requirements. If waters of the State cannot be feasibly avoided, the project proponent shall consult with CDFW regarding the need to apply for a Lake and Streambed Alteration Agreement (LSAA) to authorize work in jurisdictional streambeds and removal of coast live oak trees that may be regulated as riparian habitat. If this permit is required, the Applicant shall be responsible for complying with all conditions outlined in the LSAA, which may include wildlife habitat and streambed impact avoidance, minimization, and mitigation measures consistent with CDFW requirements for LSAAs. Impacts to state jurisdictional streambeds or riparian vegetation shall not occur until an LSAA is received from CDFW, or correspondence is received indicating that a permit is not required. Requirements and Timing: Measure shall be printed on all drawings. A LSAA shall be obtained prior to issuance of building permits for any portion of the project impacting the jurisdictional drainage**.** Monitoring: For projects

disturbing the drainage in the Project area, City Planning staff shall confirm that any required LSAA is obtained prior to issuance of building permits for the portion of the project impacting the drainage.

MM BIO-2c: Habitat Mitigation Plan. Preparation of a habitat mitigation plan may be required prior to permit issuance. The mitigation plan would address protection measures for the potential jurisdictional drainage and any protected trees retained onsite, quantify the total acreage of impacts to each sensitive resource, describe creation/replacement ratio for acres impacted (typically at least 1:1), identify potential mitigation sites, provide a planting plan, and outline monitoring and maintenance requirements. The amount of compensatory acreage shall be based on the functions and values of the impacted drainage and riparian habitat. If required, the plan would be prepared by a qualified biologist pursuant to, and through consultation with, CDFW. As an alternative, equivalent mitigation credits may be purchased at a mitigation bank to offset impacts to jurisdictional resources. The mitigation plan would provide detailed information about the bank and how the purchase of credits will result in no net loss of these protected resources. Purchase of mitigation credits would be subject to approval and verification by CDFW. Requirements and Timing: Measure shall be printed on all drawings. If required by the permitting resource agencies (i.e., USACE, RWQCB, or CDFW), a Habitat Mitigation Plan shall be prepared and approved by the City and other responsible natural resource agencies prior to issuance of building permits for the portion of the project impacting the drainage. Monitoring: For projects disturbing the jurisdictional drainage in the Project area, City Planning staff and the City Engineer shall review and approve of the Habitat Mitigation Plan, if one is required by resource agencies, prior to issuance of building permits for the portion of the project impacting the drainage.

Impact BIO-3: Impact on Sensitive Natural Vegetation Communities

No sensitive natural vegetation communities documented in CNDDB (CDFW 2018) are present in the Project area. However, the stand coast live oak trees along the concrete-lined drainage channel may be regulated as riparian habitat by CDFW. As stated under Impact BIO-2 above, buildout of the Alexan Foothills Specific Plan would avoid impacts on oak trees; however, future buildout in the remaining GP/ZCA area could propose disturbance to this drainage. Removal of riparian habitat would be considered a potentially significant impact. This impact would be mitigated to a level of less than significant with implementation of mitigation measures BIO-2a through BIO-2c.

Mitigation Measures

Refer to mitigation measures BIO-2a through BIO-2c.

Impact BIO-4: Impact on Wildlife Corridors

The Project area represents a developed and urbanized area and is not located within an established wildlife movement corridor, movement pathway, or linkage between larger habitat areas for terrestrial or aquatic wildlife. Due to the disturbed, limited, and fragmented condition of habitats on-site, which would preclude most species from using the site for breeding/nesting, the Project area also does not function as a wildlife nursery site that would contribute disproportionately to a population. Thus, wildlife species, migratory corridors and native wildlife nursery sites would not be impacted due to Project implementation.

Mitigation Measures

No mitigation measures are required.

Impact BIO-5: Impact on Other Special-Status Species

No other special status plant or wildlife species are expected to occur within the Project area due to a lack of suitable habitat and due to the high degree of site disturbance from existing development within and surrounding the Project area. Therefore, impacts on other special-status plant and wildlife species would be less than significant.

Mitigation Measures

No mitigation measures are required.

Impact BIO-6: Conflict with Local Policies or Ordinances or Conservation Plans

The Project area contains protected coast live oak trees (>10" in diameter at least 2 feet above the ground), including three along the Alexan Foothills Specific Plan area's western border. Disturbance to these oak trees would be avoided under the Alexan Foothills Specific Plan. However, any planned Project-related alterations to any/all of these oaks under buildout of the remaining GP/ZCA area would be required to comply with the City of Monrovia's Oak Tree Preservation Ordinance, which may require a permit through the City's Development Review Committee. The City's permit procedures require consideration of the condition of the following criteria:

1. The condition of the tree with respect to disease, danger of falling, proximity to existing or proposed structures, and interference with utility service;
2. The necessity to remove the tree for compelling economic necessity to construct proposed structural improvements, or for the purpose of re-landscaping with plant material more suitable to the immediate environment;
3. Good forestry practice, such as in the thinning of growth where necessary or desirable to promote the healthy growth of the tree;
4. The topography of the land and the effect of tree removal on erosion, soil retention or surface water flow shall be taken into account and balanced with all other considerations affecting decision upon the permit; and
5. The number of oak trees or other trees existing in the neighborhood on improved property.
6. The Development Review Committee shall be guided by the standards established in the neighborhood and the effect of tree removal upon property values in the area. Accordingly, due to the City's Oak Tree Preservation Ordinance requirements, impacts on protected oak trees would be less than significant.

The Project area is not located within an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plan. Therefore, no impact would occur.

Standard Conditions

SC BIO-1: Compliance with the City of Monrovia Oak Tree Preservation Ordinance (87-11), Municipal Code Section 17.20.40 is required for disturbance to protected coast live oak trees that are greater than or equal to 10" in diameter at least 2 feet above the ground. Requirements and Timing: Measure shall be printed on all construction drawings. Any planned removal or encroachment upon oak trees shall be shown on proposed site plans and grading plans, including the number and size of each oak tree, as well as the limits of the dripline of each oak tree. Monitoring: City Planning staff shall review and approve of site plans and

grading plans prior to issuance of land use clearance to confirm that the Oak Tree Preservation Ordinance is adhered to.

Mitigation Measures

No mitigation measures are required.

5.2 Impact Conclusions

The Project area is almost entirely hardscaped and provides very little biological resource value. However, the limited amount of native and non-native vegetation as well as the concrete-lined channel in the Project area may provide marginal habitat to some species. Any disturbance of the jurisdictional drainage would result in a significant impact. However, with implementation of standard conditions and mitigation measures MM BIO-1 and MM BIO-2a through MM BIO-2c, impacts would be reduced to less than significant levels.

Appendix A
Special-Status Plant Species with Potential to Occur on the Project Site

This document is formatted for double-sided printing

Appendix A: Special-Status Plant Species with Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
DICOTS						
slender silver moss *Anomobryum julaceum*	--	--	4.2	Occurs in damp rock and soil on rocky outcrops, usually on roadcuts; occurs in broadleafed upland forest, lower montane coniferous forest, and North Coast coniferous forest	100-1000 m; moss	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Braunton's milk-vetch *Astragalus brauntonii*	FE	--	1B.1	Occurs in recently burned or disturbed areas, usually in sandstone with carbonate layers; occurs in chaparral, coastal scrub, valley grassland, or foothill grassland	4-640 m; Perennial herb; Blooms January to August	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
Davidson's saltscale *Atriplex serenana var. davidsonii*	--	--	1B.2	Occurs in alkaline coastal bluff scrub or coastal scrub	10-200 m; Annual herb; Blooms April to October	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Nevin's barberry *Berberis nevinii*	FE	SE	1B.1	Occurs in chaparral, cismontane woodland, coastal scrub, riparian scrun and on steep, north-facing slopes or in low grade sandy washes.	290-1,575 m; Shrub; Blooms March to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.

[1] The potential for occurrence is based on occurrences recorded in the CNDDB, knowledge of species requirements, and site inspections during 2018 field surveys

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
Mt. Gleason paintbrush *Castilleja gleasoni*	--	--	1B.2	Occurs in granitic habitats, including: chaparral, lower montane coniferous forest, pinyon woodland, and juniper woodland	1160-2170 m; Perennial hemiparasitic herb; Blooms May to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
slender mariposa-lily *Calochortus clavatus var. gracilis*	--	--	1B.2	Occurs in chaparral, coastal scrub, valley, and foothill grassland. Found in shaded foothill canyons; often on grassy slopes within other habitat.	310 to 1,620 m; Perennial herb (bulb); Blooms March to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Palmer's mariposa-lily *Calochortus palmeri var. palmeri*	--	--	1B.2	Occurs in chaparral, lower montane coniferous forest, meadows, and seeps	710-2390 m; Perennial bulbiferous herb; Blooms April to July	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Plummer's mariposa-lily *Calochortus plummerae*	--	--	4.2	Occurs in coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, and lower montane coniferous forest. Found on rocky and sandy sites, usually of granitic or alluvial material. Can be very common after fire.	140-1,920 m; Perennial herb (bulb); Blooms May to July	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
alkali mariposa-lily *Calochorus striatus*	--	--	1B.2	Occurs in alkaline and mesic habitats, including: chaparral, chenopod scrub, Mojavean desert scrub, meadows, and seeps	70-1595 m; Perennial bulbiferous herb; Blooms April to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
Intermediate mariposa-lily *Calochortus weedii var. intermedius*	--	--	1B.2	Occurs in coastal scrub, chaparral, valley and foothill grassland. Found in dry, rocky open slopes and rock outcrops.	17-1,260 m; Perennial herb (bulb); Blooms May to July	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
southern tarplant *Centromadia parry ssp. australis*	--	--	1B.1	Found on the margins of marshes and swamps, is vernally mesic in valley and foothill grasslands, and occurs in vernal pools	0-480 m; Annual herb; Blooms May to November	**Not Expected.** There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Smooth tarplant *Centromadia pungens* ssp. *laevis*	--	--	1B.1	Found in valley and foothill grassland, chenopod scrub, meadows, playas, riparian woodland. Occurs in alkali meadows, alkali scrub, and also in disturbed places.	0-640 m; Annual herb; Blooms April to September	**Not Expected.** There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Parry's spineflower *Chorizanthe parryi* var. *parryi*	--	--	1B.1	Occurs in coastal scrub, chaparral, cismontane woodland, valley, and foothill grassland. Found in dry slopes and flats; sometimes at interface of two vegetation types, such as chaparral and oak woodland; dry, sandy soils.	225-1,220 m; Annual herb; Blooms April to June	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
California saw-grass *Cladium californicum*	--	--	2B.2	Occurs in meadows and seeps, marshes and swamps (alkaline or freshwater). Found in freshwater or alkaline moist habitats.	-24 to 1,810 m; Perennial grasslike herb; Blooms June to September	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
Peruvian dodder *Cuscuta obtusiflora var. glandulosa*	--	--	2B.2	Occurs in freshwater marshes and swamps	15-280 m; Annual vine; Blooms July to October	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
Slender-horned spineflower *Dodecahema leptoceras*	FE	SE	1B.1	Occurs in chaparral, cismontane woodland, coastal scrub (alluvial fan sage scrub). Found in flood deposited terraces and washes; associates include *Encelia, Dalea*, and *Lepidospartum*. Sandy soils.	200-760 m; Annual herb; Blooms April to June	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. Not observed during January 2018 field survey; however, focused surveys were not conducted. The species is not expected to be found on the Project Site.
San Gabriel River dudleya *Dudleya cymosa ssp. crebrifolia*	--	--	1B.2	Occurs in granitic chaparral	275-457 m; Perennial herb; Blooms April to July	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
San Gabriel Mountains dudleya *Dudleya densiflora*	--	--	1B.1	Occurs in granitic cliffs and canyon walls, also in chaparral, cismontane woodland, coastal scrub, lower montane coniferous forest, and riparian woodland	244-610 m; Perennial herb; Blooms March to June	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
many-stemmed dudleya *Dudleya multicaulis*	--	--	1B.2	Occurs in chaparral, coastal scrub, valley and foothill grassland. Found in heavy, often clayey soils or grassy slopes.	20-1,000 m; Perennial herb; Blooms April to July	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
San Gabriel bedstraw *Galium grande*	--	--	1B.2	Occurs in broadleafed upland forest, chaparral, cismontane woodland, and lower montane coniferous forests	425-1500 m; Perennial deciduous shrub; Blooms January to July	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
Los Angeles sunflower *Helianthus nuttallii ssp. parishii*	--	--	1A	Occurs in salt or freshwater marshes and swamps	10-1525 m; Perennial rhizomatous herb; Blooms August-October	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Mesa horkelia *Horkelia cuneata* var. *puberula*	--	--	1B.1	Occurs in chaparral, cismontane woodland, coastal scrub. Found on sandy or gravelly sites.	70-810 m; Perennial herb; Blooms February to July	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
California satintail *Imperata brevifolia*	--	--	2B.1	Occurs in chaparral, coastal scrub, Mojavean desert scrub, meadows, seeps (especially alkali), and riparian scrub	0-1215 m; Perennial rhizomatous herb; Blooms September to May	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
Coulter's goldfields *Lasthenia glabrata* ssp. *coulteri*	--	--	1B.1	Occurs in coastal salt marshes, playas, vernal pools. Usually found on alkaline soils in playas, sinks, and grasslands.	1-1,200 m; Annual herb; Blooms February to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
Robinson's pepper-grass *Lepidium virginicum* var. *robinsonii*	--	--	4.3	Occurs in chaparral, coastal scrub. Found on dry soils and shrubland.	1-885 m; Annual herb; Blooms January to July	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
Davidson's bush-mallow *Malacothamnus davidsonii*	--	--	1B.2	Occurs in chaparral, cismontane woodland, coastal scrub, and riparian woodland	185-1140 m; Perennial deciduous shrub; Blooms June through January	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
California muhly *Muhlenbergia californica*	--	--	4.3	Occurs in coastal scrub, chaparral, lower montane coniferous forest, meadows and seeps. Usually found near streams or seeps.	440 to 2,380 m; Perennial grass (rhizomatus); Blooms June to September	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Prostrate vernal pool navarretia *Navarretia prostrata*	--	--	1B.1	Occurs in coastal scrub, valley and foothill grassland, vernal pools, meadows, and seeps. Found on alkaline soils in grasslands, or in vernal pools. Occurs on mesic and alkaline sites.	20-640 m; Annual herb; Blooms April to July	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Robbins' nemacladus *Nemacladus secundiflorus var. robbinsii*	--	--	1B.2	Occurs in openings in chaparral, valley grasslands, and foothill grasslands	350-1700 m; Annual herb; Blooms April to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
Short-joint beavertail *Opuntia basilaris var. brachyclada*	--	--	1B.2	Occurs in chaparral, Joshua tree woodland, Mojavean desert scrub, and pinyon-juniper woodland. Found in sandy soil or coarse, granitic loam.	750-1,900 m; Shrub (stem succulent); Blooms April to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Brand's star phacelia *Phacelia stellaris*	--	--	1B.1	Occurs in coastal scrub and coastal dunes. Found in open areas.	1-400 m; Annual herb, Blooms March to June	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
White rabbit-tobacco *Pseudognaphalium leucocephalum*	--	--	2B.2	Occurs in riparian woodland, cismontane woodland, coastal scrub, and chaparral. Found on sandy and gravelly sites.	14-1,400 m; Perennial herb; Blooms August to November	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
Parish's gooseberry *Ribes divaricatus var. parishii*	--	--	1A	Occurs in riparian woodland	65-300m; Perennial deciduous shrub; Blooms February to April	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
Sanford's arrowhead *Sagittaria sanfordii*	--	--	1B.2	Occurs in marshes and swamps. Found in standing or slow-moving freshwater ponds, marshes, and ditches.	7 to 1,270 m; Perennial herb (rhizomatus); Blooms May to October	**Not Expected.** There are no recent known records of occurrence in the vicinity of the project (within 5 miles). There is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
southern mountains skullcap *Scutellaria bolanderi ssp. austromontana*	--	--	1B.2	Occurs in chaparral, cismontane woodland; and lower montane coniferous forest	425-2000m; Perennial rhizomatous herb; Blooms June to August	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
Salt Spring checkerbloom *Sidalcea neomexicana*	--	--	2B.2	Occurs on playas, chaparral, coastal scrub, lower montane coniferous forest, and Mojavean desert scrub. Found in alkali springs and marshes.	0-1,390; Perennial herb; Blooms March to June	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Prairie wedge grass *Sphenopholis obtusata*	--	--	2B.2	Occurs in cismontane woodland, meadows, and seeps. Found in open moist sites, along rivers and springs, alkaline desert seeps.	240 to 2,870 m; Perennial grass; Blooms August to July	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
San Bernardino aster *Symphyotrichum defoliatum*	--	--	1B.2	Occurs in meadows and seeps, marshes and swamps, coastal scrub, cismontane woodland, lower montane coniferous forest, and grassland. Found in vernally mesic grassland or near ditches, streams and springs; disturbed areas.	2-2,040 m; Perennial herb; Blooms July to November	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). Not observed during January 2018 field survey; however, focused surveys were not conducted. The species is not expected to be found on the Project Site.
Greata's aster *Symphyotrichum greatae*	--	--	1B.3	Occurs in chaparral, cismontane woodland, broadleaved upland forest, lower montane coniferous forest, and riparian woodland. Found in mesic canyons.	310 to 2,040 m; Perennial herb; Blooms June to October	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

Species	Status			Habitat Requirements	Elevation Range; Life Form; Blooming Period	Potential Occurrence in the Project Area[1]
	Federal	State	CNPS			
Sonoran maiden fern *Thelypteris puberula var. sonorensis*	--	--	2B.2	Occurs in meadows, seeps, and along streams	50-610 m; Perennial rhizomatous herb; Blooms January - September	**Not Expected.** There are records of occurrences of this species in the vicinity of the project (within 5 miles), however there is no suitable habitat present on the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
Rigid fringepod *Thysanocarpus rigidus*	--	--	1B.2	Occurs in pinyon and juniper woodland. Found on dry, rocky slopes and ridges of oak and pine woodland in arid mountain ranges.	425-2,165 m; Annual herb; Blooms February to May	**Not Expected.** There is no suitable habitat present on the Project Site. There are no recent known records of occurrence in the vicinity of the project (within 5 miles). The species is not expected to be found on the Project Site.
Plant Communities						
Canyon Live Oak Ravine Forest						This plant community is not present on the Project Site.
California Walnut Woodland						This plant community is not present on the Project Site.
Coastal and Valley Freshwater Marsh						This plant community is not present on the Project Site.
Riversidean Alluvial Fan Sage Scrub						This plant community is not present on the Project Site.
Southern Coast Live Oak Riparian Forest						This plant community is not present on the Project Site.
Southern Cottonwood Willow Riparian Forest						This plant community is not present on the Project Site.
Southern Riparian Forest						This plant community is not present on the Project Site.
Southern Sycamore Alder Riparian Woodland						This plant community is not present on the Project Site.
Southern Willow Scrub						This plant community is not present on the Project Site.

Appendix A: Special Status Plant Species With Potential to Occur

STATUS KEY:

Federal

FE: Federally-listed Endangered
FT: Federally-listed Threatened

State

CE: California-listed Endangered
CT: California-listed Threatened

California Native Plant Society (CNPS)**:**

1B: Plants listed as rare, threatened, or endangered in California and elsewhere
2B: Plants rare, threatened, or endangered in California, but more common elsewhere
3: Plants about which we need more information
4: Plants of Limited Distribution, a watch list

CNPS added a decimal threat rank to the List rank to parallel that used by the CNDDB. This extension replaces the E (Endangerment) value from the R-E-D Code. CNPS ranks therefore read like this: 1B.1, 1B.2, etc. Threat code extensions and their meanings are as follows:

.1 – Seriously endangered in California (over 80% of occurrences threatened / high degree of immediacy of threat)
.2 – Fairly endangered in California (20-80% occurrences threatened)
.3 – Not very endangered in California (<20% of occurrences threatened or no current threats known)

SOURCES:

1 Calflora and the California Native Plant Society Rare and Endangered Plant Inventory was used to identify preferred habitat for each species
2 CNDDB records are from CNDDB 2018

Appendix B
Special-Status Wildlife Species with Potential to Occur on the Project Site

This document is formatted for double-sided printing

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
INVERTEBRATES				
crotch bumble bee *Bombus crotchii*	--	--	Found along coastal California east to the Sierra-Cascade crest and south into Mexico. Food plant genera include *Antirrhinum, Phacelia, Clarkia, Dendromecon, Eschscholzia, and Eriogonum.*	**Not Expected.** There is no suitable food plant or habitat located on the Project Site. There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles). Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
FISHES				
Santa Ana sucker *Catostomus santaanae*	FT	--	Endemic to Los Angeles Basin south coastal streams. Habitat generalists, but prefer sand-rubble-boulder bottoms, cool, clear water, and algae.	**Not Expected.** No water bodies are present on the Project Site; therefore, there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
Arroyo chub *Gila orcuttii*	--	CSC	Native to streams from Malibu Creek to San Luis Rey River basin. Introduced into streams in Santa Clara, Ventura, Santa Ynez, Mohave and San Diego river basins. Inhabits slow water stream sections with mud or sand bottoms. Feeds heavily on aquatic vegetation and associated invertebrates.	**Not Expected.** No water bodies are present on the Project Site. The species is not expected to be found on the Project Site.
Santa Ana speckled dace *Rhinichthys osculus ssp. 3*	--	CSC	Inhabits headwaters of the Santa Ana and San Gabriel rivers. May be extirpated from the Los Angeles River system. Requires permanent flowing streams with summer water temps of 17-20 Celsius. Usually inhabits shallow cobble and gravel riffles.	**Not Expected.** No water bodies are present on the Project Site; therefore, there is no suitable habitat present on the Project Site. The species is not expected to be found on the Project Site.
AMPHIBIANS				
Arroyo toad *Anaxyrus californicus*	FE	CSC	Found in semi-arid regions near washes or intermittent streams, including valley-foothill and desert riparian, and desert washes. Inhabits rivers with sandy banks, willows, cottonwoods, and sycamores; loose, gravelly areas of streams in drier parts of range.	**Not Expected.** There is no suitable habitat located on the Project Site. There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles). Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
southern mountain yellow-legged frog *Rana muscosa*	FE	SE, CSC	Species always encountered within a few feet of water. Tadpoles may require 2 to 4 years to complete their aquatic development.	**Not Expected.** There is no suitable habitat including water bodies located on the Project Site. The only occurrences within 5 miles of the Project Site are listed as extirpated or possibly extirpated on CNDDB due to surrounding urbanization. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
coast range newt *Taricha torosa*	--	CSC	Found in Coastal drainages from Mendocino County to San Diego County. Lives in terrestrial habitats and will migrate over one kilometer to breed in ponds, reservoirs, and slow moving streams.	**Not Expected.** There is no suitable habitat including water bodies located on the Project Site. One occurrence nearly 5 miles to the north is within rural hills and the species has likely been excluded from the region due to urbanization. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
REPTILES				
silvery legless lizard *Anniella pulchra pulchra*	--	CSC	Sandy or loose loamy soils under sparse vegetation. Soil moisture is essential. they prefer soils with a high moisture content.	**Not Expected.** There is no suitable habitat located on the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
Southern California legless lizard *Anniella stebbinsi*	--	CSC	Inhabits coastal sand dunes, sandy washes, alluvial fans—generally in sandy soils with vegetative cover.	**Not Expected.** There is no suitable habitat located on the Project Site. There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles). Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
California glossy snake *Arizona elegans occidentalis*	--	CSC	Inhabits arid scrub, rocky washes, grasslands, chaparral.	**Not Expected.** There is no suitable habitat located on the Project Site. There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles). Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
coastal whiptail *Aspidoscelis tigris stejnegeri*	--	--	Found in deserts and semiarid areas with sparse vegetation and open areas. Also found in woodland and riparian areas. Ground may be firm soil, sandy, or rocky.	**Not Expected.** There is no suitable habitat located on the Project Site. One occurrence within the vicinity (within 5 miles) of the Project Site is located in a flood control basin and is highly unlikely to disperse into an already urbanized site like that of the Project Site. Not observed during April 2016 field survey. The species is not expected to be found on the Project Site.
western pond turtle *Emys marmorata*	--	CSC	Inhabits ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Requires basking sites and sandy banks or open grassy fields up to 0.5 kilometers from the water's edge for egg-laying.	**Not Expected.** There is no suitable habitat located on the Project Site. There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles). Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
coast horned lizard *Phrynosoma blainvillii*	--	CSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes. Requires open areas for sunning, bushes for cover, patches of loose soil for refuge, and abundant supply of insects.	**Not Expected.** There is no suitable habitat located on the Project Site. One occurrence within the vicinity (within 5 miles) of the Project Site is located in a flood control basin and is highly unlikely to disperse into an already urbanized site like that of the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
two-striped garter snake *Thamnophis hammondii*	--	CSC	Found along coastal California from vicinity of Salinas to northwest Baja California. Inhabits areas from the sea to about 7,000 feet in elevation. Highly aquatic, found in or near permanent fresh water. Often found along streams with rocky beds and riparian growth.	**Not Expected.** There is no suitable habitat including water bodies located on the Project Site. One occurrence nearly 5 miles to the north is within rural hills and the species has likely been excluded from the region due to urbanization. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
BIRDS				
tricolored blackbird *Agelaius tricolor*	--	CSC	Inhabits freshwater marsh, marsh and swamp, swamp, and wetland habitats. Highly colonial species, most numerous in Central Valley and vicinity. Largely endemic to California. Requires open water, protected nesting substrate, and foraging area with insect prey within a few kilometers of the colony.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
golden eagle *Aquila chrysaetos*	--	--	Inhabits rolling foothills, mountain areas, sage-juniper flats, and desert. Nesting habitat includes cliff-walled canyons and large trees in open areas.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
burrowing owl *Athene cunicularia*	--	CSC	Inhabits open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel (*Otospermophilius beecheyi*).	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
Swainson's hawk *Buteo swainsoni*	--	ST	Occurs in Great Basin grassland, riparian forest, riparian woodland, valley and foothill grassland habitats. Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
western yellow-billed cuckoo *Coccyzus americanus occidentalis*	FT	SE	Riparian forest nester, along the broad, lower flood-bottoms of larger river systems. Nests in riparian jungles of willow (*Salix* sp.) often mixed with cottonwoods (*Populus* sp.), with lower story of blackberry (*Rubus sp.*), nettles (*Urtica sp.*), or wild grape (*Vitis girdiana*).	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
American swift *Cypseloides niger*	--	CSC	Occurs along the coastal belt of Santa Cruz and Monterey counties; central and southern Sierra Nevada; San Bernardino and San Jacinto Mountains. Breeds in small colonies on cliffs behind or adjacent to waterfalls in deep canyons and sea-bluffs above the surf; forages widely.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
southwestern willow flycatcher *Empidonax traillii extimus*	FE	SE	Inhabits riparian and wetland thickets, generally of willow, tamarisk, or both, sometimes boxelder or Russian olive.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
American peregrine falcon *Falco peregrinus anatum*	--	FP	Prefers extremely high vertical habitat for nesting (i.e. skyscrapers, clifftops, etc.). More likely to occur in habitat with nearby freshwater sources.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
California condor *Gynogyps californianus*	FE	SE	Prefers chaparral scrub and forested mountains for nesting and is an opportunistic forager over open areas, including grasslands.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
yellow-breasted chat *Icteria virens*	--	CSC	Summer resident; inhabits riparian thickets of willow and other brushy tangles near watercourses. Nests in low, dense riparian, consisting of willow, blackberry, wild grape.	**Not Expected.** There is no suitable habitat located on the Project Site. One occurrence within the vicinity (within 5 miles) of the Project Site is located in a flood control basin and is highly unlikely to disperse into an already urbanized site like that of the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
coastal California gnatcatcher *Polioptila californica californica*	FT	CSC	Obligate, permanent resident of coastal sage scrub below 2,500 feet in Southern California. Inhabits low, coastal sage scrub in arid washes, on mesas and slopes. Not all areas classified as coastal sage scrub are occupied.	**Not Expected.** There are recent known records of occurrence in the vicinity of the Project Site (within 5 miles). However, there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
bank swallow *Riparia riparia*	--	ST	Inhabits low areas along waterways (riparian, freshwater reservoirs, or coastal). Nests in colonies on vertical cliff habitat.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
American yellow warbler *Setophaga petechia*	--	CSC	Occurs in riparian plant associations in close proximity to water. Also nests in montane shrubbery in open conifer forests in Cascades and Sierra Nevada. Frequently found nesting and foraging in willow shrubs and thickets, and in other riparian plants including cottonwoods, sycamores, ash, and alders.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
least Bell's vireo *Vireo bellii pusillus*	FE	SE	Summer resident of Southern California in low riparian in vicinity of water or in dry river bottoms below 2,000 feet. Nests placed along margins of bushes or on twigs projecting into pathways (usually *salix*, *baccharis*, *Prosopis*).	**Not Expected.** There are recent known records of occurrence in the vicinity of the Project Site (within 5 miles). However, there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
MAMMALS				
pallid bat *Antrozous pallidus*	--	CSC	Occurs in deserts, grasslands, shrublands, woodlands, and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	**Not Expected.** There are historic records of occurrence in the vicinity of the Project Site (within 5 miles). However, there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
Townsend's big-eared bat *Corynorhinus townsendii*	--	CSC	Occurs through North America in a wide variety of habitats including coniferous forests, mixed wood forests, deserts, prairies, riparian, agricultural, and coastal habitats.	**Not Expected.** There are recent known records of occurrence in the vicinity of the Project Site (within 5 miles). However, there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
western mastiff bat *Eumops perotis californicus*	--	CSC	Inhabits many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, valley and foothill grasslands, and chaparral. Roosts in crevices in cliff faces, high buildings, trees and tunnels.	**Not Expected.** There are historic records of occurrence in the vicinity of the Project Site (within 5 miles). However, there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
silver-haired bat *Lasionycteris noctivagans*	--	--	Occurs throughout most of the United States and into parts of Canada and Mexico, primarily associated with coniferous and mixed coniferous forests, but seasonally in lower elevation habitats.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
hoary bat *Lasiurus cinereus*	--	--	Prefers open habitats or habitat mosaics, with access to trees for cover and open areas or habitat edges for feeding. Roosts in dense foliage of medium to large trees. Feeds primarily on moths. Requires water.	**Not Expected.** There are historic records of occurrence in the vicinity of the Project Site (within 5 miles). However, there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
western yellow bat *Lasiurus xanthinus*	--	CSC	Found in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats. Roosts in trees, particularly palms. Forages over water and among trees.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
San Diego black-tailed jackrabbit *Lepus californicus bennettii*	--	CSC	Found in intermediate canopy stages of shrub habitats and open shrub/herbaceous and tree/herbaceous edges. Inhabits coastal sage scrub habitats in Southern California.	**Not Expected.** There is no suitable habitat located on the Project Site. One occurrence within the vicinity (within 5 miles) of the Project Site is located in a flood control basin and is highly unlikely to disperse into an already urbanized site like that of the Project Site. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
fringed myotis *Myotis thysanodes*	--	--	Occurs throughout western North America. This species is more common in oak/pinyon-juniper/ponderosa pine woodlines but less commonly occurs in desert scrub, coniferous forests, grassland, and sage-grass steppe as well.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
long-legged myotis *Myotis volans*	--	--	Occurs throughout western North America, primarily in coniferous forests, but seasonally within riparian and desert habitats.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
lodgepole chipmunk *Neotamia speciosus speciosus*	--	--	Isolated populations occur in Southern California mountains in mixed wood and chaparral habitat.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
pocketed free-tailed bat *Nyctinomops femorosaccus*	--	CSC	Inhabits a variety of arid areas in Southern California, including pine-juniper woodlands, desert scrub, palm oasis, desert wash, and desert riparian. Prefers rocky areas with high cliffs.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
big free-tailed bat *Nyctinomops macrotis*	--	CSC	Occurs in low-lying arid areas in Southern California. Needs high cliffs or rocky outcrops for roosting sites. Feeds principally on large moths.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
southern grasshopper mouse *Onychomys torridus ramona*	--	CSC	Occurs in arid deserts and desert scrub habitat. Prey is almost exclusively arthropods.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.
desert bighorn sheep *Ovis canadensis nelsoni*	--	--	Widely distributed from the White Mountains in Mono County to the Chocolate Mountains in Imperial County. Occurs in open, rocky, steep areas with available water and herbaceous forage.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

Species	Status		Habitat Requirements	Potential for Occurrence
	Federal	State		
American badger *Taxidea taxus*	--	CSC	Prefers vast, wide-open grassland habitat with abundant sources of burrowing mammal prey.	**Not Expected.** There are no recent known records of occurrence in the vicinity of the Project Site (within 5 miles) and there is no suitable habitat present on the Project Site. The Project Site is completely paved with gravel and asphalt. Not observed during January 2018 field survey. The species is not expected to be found on the Project Site.

Appendix B: Special-Status Wildlife Species with Potential to Occur

KEY:
(nesting and/or wintering) = For most taxa, the CNDDB is interested in information that indicates the presence of a resident population. For some species (primarily birds), the CNDDB only tracks certain parts of the species range or life history (e.g., nesting locations).

STATUS:

Federal
FE: Federally-listed Endangered
FT: Federally-listed Threatened
FD: Federally-delisted

State
SE: State-listed Endangered
ST: State-listed Threatened
CSC: State Species of Special Concern
FP: Fully-Protected

SOURCES:
1 California Natural Diversity Database (CNDDB), BIOS 5 Data Viewer, and NatureServe.org Explorer were used to identify preferred habitat for each species
2 CNDDB records are from CNDDB 2018

Scientific Name	Common Name	Family	Lifeform	Blooming Period	CA Rare Plant Rank	State Rank	Global Rank
Acanthoscyphus parishii var. parishii	Parish's oxytheca	Polygonaceae	annual herb	Jun-Sep	4.2	S3S4	G4?T3T4
Anomobryum julaceum	slender silver moss	Bryaceae	moss		4.2	S2	G5?
Arctostaphylos glandulosa ssp. gabrielensis	San Gabriel manzanita	Ericaceae	perennial evergreen shrub	Mar	1B.2	S3	G5T3
Arctostaphylos parryana ssp. tumescens	interior manzanita	Ericaceae	perennial evergreen shrub	Feb-Apr	4.3	S3S4	G4T3T4
Asplenium vespertinum	western spleenwort	Aspleniaceae	perennial rhizomatous herb	Feb-Jun	4.2	S4	G4
Astragalus brauntonii	Braunton's milk-vetch	Fabaceae	perennial herb	Jan-Aug	1B.1	S2	G2
Astragalus pulsiferae var. coronensis	Modoc Plateau milk-vetch	Fabaceae	perennial herb	May-Jul	4.2	S3	G4T3
Atriplex serenana var. davidsonii	Davidson's saltscale	Chenopodiaceae	annual herb	Apr-Oct	1B.2	S1	G5T1
Berberis nevinii	Nevin's barberry	Berberidaceae	perennial evergreen shrub	(Feb)Mar-Jun	1B.1	S1	G1
Calochortus catalinae	Catalina mariposa lily	Liliaceae	perennial bulbiferous herb	(Feb)Mar-Jun	4.2	S3S4	G3G4
Calochortus clavatus var. gracilis	slender mariposa lily	Liliaceae	perennial bulbiferous herb	Mar-Jun(Nov)	1B.2	S2S3	G4T2T3
Calochortus palmeri var. palmeri	Palmer's mariposa lily	Liliaceae	perennial bulbiferous herb	Apr-Jul	1B.2	S2	G3T2
Calochortus plummerae	Plummer's mariposa lily	Liliaceae	perennial bulbiferous herb	May-Jul	4.2	S4	G4
Calochortus striatus	alkali mariposa lily	Liliaceae	perennial bulbiferous herb	Apr-Jun	1B.2	S3	G3
Calochortus weedii var. intermedius	intermediate mariposa lily	Liliaceae	perennial bulbiferous herb	May-Jul	1B.2	S2	G3G4T2
Castilleja gleasoni	Mt. Gleason paintbrush	Orobanchaceae	perennial herb (hemiparasitic)	May-Jun(Sep)	1B.2	S2	G2
Castilleja plagiotoma	Mojave paintbrush	Orobanchaceae	perennial herb (hemiparasitic)	Apr-Jun	4.3	S4	G4
Centromadia parryi ssp. australis	southern tarplant	Asteraceae	annual herb	May-Nov	1B.1	S2	G3T2
Centromadia pungens ssp. laevis	smooth tarplant	Asteraceae	annual herb	Apr-Sep	1B.1	S2	G3G4T2
Chorizanthe parryi var. fernandina	San Fernando Valley spineflower	Polygonaceae	annual herb	Apr-Jul	1B.1	S1	G2T1
Chorizanthe parryi var. parryi	Parry's spineflower	Polygonaceae	annual herb	Apr-Jun	1B.1	S2	G3T2
Cladium californicum	California sawgrass	Cyperaceae	perennial rhizomatous herb	Jun-Sep	2B.2	S2	G4
Clinopodium mimuloides	monkey-flower savory	Lamiaceae	perennial herb	Jun-Oct	4.2	S3	G3
Cuscuta obtusiflora var. glandulosa	Peruvian dodder	Convolvulaceae	annual vine (parasitic)	Jul-Oct	2B.2	SH	G5T4T5
Diplacus johnstonii	Johnston's monkeyflower	Phrymaceae	annual herb	May-Aug	4.3	S4	G4
Dodecahema leptoceras	slender-horned spineflower	Polygonaceae	annual herb	Apr-Jun	1B.1	S1	G1
Dudleya cymosa ssp. crebrifolia	San Gabriel River dudleya	Crassulaceae	perennial herb	Apr-Jul	1B.2	S2	G5T2
Dudleya densiflora	San Gabriel Mountains dudleya	Crassulaceae	perennial herb	Mar-Jun	1B.1	S2	G2
Dudleya multicaulis	many-stemmed dudleya	Crassulaceae	perennial herb	Apr-Jul	1B.2	S2	G2
Erythranthe diffusa	Palomar monkeyflower	Phrymaceae	annual herb	Apr-Jun	4.3	S3	G4
Frasera neglecta	pine green-gentian	Gentianaceae	perennial herb	May-Jul	4.3	S4	G4
Galium angustifolium ssp. gabrielense	San Antonio Canyon bedstraw	Rubiaceae	perennial herb	Apr-Aug	4.3	S3	G5T3
Galium grande	San Gabriel bedstraw	Rubiaceae	perennial deciduous	Jan-Jul	1B.2	S1	G1

			shrub				
Galium jepsonii	Jepson's bedstraw	Rubiaceae	perennial rhizomatous herb	Jul-Aug	4.3	S3	G3
Galium johnstonii	Johnston's bedstraw	Rubiaceae	perennial herb	Jun-Jul	4.3	S4	G4
Helianthus nuttallii ssp. parishii	Los Angeles sunflower	Asteraceae	perennial rhizomatous herb	Aug-Oct	1A	SH	G5TH
Heuchera caespitosa	urn-flowered alumroot	Saxifragaceae	perennial rhizomatous herb	May-Aug	4.3	S3	G3
Hordeum intercedens	vernal barley	Poaceae	annual herb	Mar-Jun	3.2	S3S4	G3G4
Horkelia cuneata var. puberula	mesa horkelia	Rosaceae	perennial herb	Feb-Jul(Sep)	1B.1	S1	G4T1
Hulsea vestita ssp. gabrielensis	San Gabriel Mountains sunflower	Asteraceae	perennial herb	May-Jul	4.3	S4	G5T3
Imperata brevifolia	California satintail	Poaceae	perennial rhizomatous herb	Sep-May	2B.1	S3	G4
Juglans californica	Southern California black walnut	Juglandaceae	perennial deciduous tree	Mar-Aug	4.2	S3	G3
Juncus duranii	Duran's rush	Juncaceae	perennial rhizomatous herb	Jul-Aug	4.3	S3	G3
Lasthenia glabrata ssp. coulteri	Coulter's goldfields	Asteraceae	annual herb	Feb-Jun	1B.1	S2	G4T2
Lepechinia fragrans	fragrant pitcher sage	Lamiaceae	perennial shrub	Mar-Oct	4.2	S3	G3
Lepidium virginicum var. robinsonii	Robinson's pepper-grass	Brassicaceae	annual herb	Jan-Jul	4.3	S3	G5T3
Lilium humboldtii ssp. ocellatum	ocellated Humboldt lily	Liliaceae	perennial bulbiferous herb	Mar-Jul(Aug)	4.2	S3	G4T3
Lilium parryi	lemon lily	Liliaceae	perennial bulbiferous herb	Jul-Aug	1B.2	S3	G3
Linanthus concinnus	San Gabriel linanthus	Polemoniaceae	annual herb	Apr-Jul	1B.2	S2	G2
Linanthus orcuttii	Orcutt's linanthus	Polemoniaceae	annual herb	May-Jun	1B.3	S2	G3
Lupinus albifrons var. johnstonii	interior bush lupine	Fabaceae	perennial shrub	May-Jul	4.3	S4	G4T4
Lupinus elatus	silky lupine	Fabaceae	perennial herb	Jun-Aug	4.3	S4	G4
Lupinus peirsonii	Peirson's lupine	Fabaceae	perennial herb	Apr-Jun	1B.3	S3	G3
Malacothamnus davidsonii	Davidson's bush-mallow	Malvaceae	perennial deciduous shrub	Jun-Jan	1B.2	S2	G2
Monardella australis ssp. cinerea	gray monardella	Lamiaceae	perennial rhizomatous herb	Jul-Aug	4.3	S3	G4T3
Muhlenbergia californica	California muhly	Poaceae	perennial rhizomatous herb	Jun-Sep	4.3	S4	G4
Navarretia prostrata	prostrate vernal pool navarretia	Polemoniaceae	annual herb	Apr-Jul	1B.1	S2	G2
Opuntia basilaris var. brachyclada	short-joint beavertail	Cactaceae	perennial stem succulent	Apr-Jun(Aug)	1B.2	S3	G5T3
Oreonana vestita	woolly mountain-parsley	Apiaceae	perennial herb	Mar-Sep	1B.3	S3	G3
Orobanche valida ssp. valida	Rock Creek broomrape	Orobanchaceae	perennial herb (parasitic)	May-Sep	1B.2	S2	G4T2
Packera ionophylla	Tehachapi ragwort	Asteraceae	perennial herb	Jun-Jul	4.3	S4	G4
Phacelia hubbyi	Hubby's phacelia	Hydrophyllaceae	annual herb	Apr-Jul	4.2	S4	G4
Phacelia mohavensis	Mojave phacelia	Hydrophyllaceae	annual herb	Apr-Aug	4.3	S4	G4Q
Phacelia stellaris	Brand's star phacelia	Hydrophyllaceae	annual herb	Mar-Jun	1B.1	S1	G1
Pickeringia montana var. tomentosa	woolly chaparral-pea	Fabaceae	evergreen shrub	May-Aug	4.3	S3S4	G5T3T4
Pseudognaphalium leucocephalum	white rabbit-tobacco	Asteraceae	perennial herb	(Jul)Aug-Nov(Dec)	2B.2	S2	G4
Quercus durata var. gabrielensis	San Gabriel oak	Fagaceae	perennial evergreen shrub	Apr-May	4.2	S3	G4T3
Quercus engelmannii	Engelmann oak	Fagaceae	perennial deciduous tree	Mar-Jun	4.2	S3	G3
Ribes divaricatum var. parishii	Parish's gooseberry	Grossulariaceae	perennial deciduous shrub	Feb-Apr	1A	SX	G5TX
Romneya coulteri	Coulter's matilija poppy	Papaveraceae	perennial rhizomatous herb	Mar-Jul(Aug)	4.2	S4	G4
Rupertia rigida	Parish's rupertia	Fabaceae	perennial herb	Jun-Aug	4.3	S4	G4
Scutellaria bolanderi ssp. austromontana	southern mountains skullcap	Lamiaceae	perennial rhizomatous herb	Jun-Aug	1B.2	S3	G4T3
Senecio astephanus	San Gabriel ragwort	Asteraceae	perennial herb	May-Jul	4.3	S3	G3
Sidalcea neomexicana	salt spring checkerbloom	Malvaceae	perennial herb	Mar-Jun	2B.2	S2	G4
Sidotheca caryophylloides	chickweed oxytheca	Polygonaceae	annual herb	Jul-Sep(Oct)	4.3	S4	G4
Symphyotrichum defoliatum	San Bernardino aster	Asteraceae	perennial rhizomatous herb	Jul-Nov	1B.2	S2	G2
Symphyotrichum greatae	Greata's aster	Asteraceae	perennial rhizomatous	Jun-Oct	1B.3	S2	G2

			herb				
Thelypteris puberula var. sonorensis	Sonoran maiden fern	Thelypteridaceae	perennial rhizomatous herb	Jan-Sep	2B.2	S2	G5T3

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

Location

Los Angeles County, California

Local office

Carlsbad Fish And Wildlife Office

(760) 431-9440
(760) 431-5901

2177 Salk Avenue - Suite 250
Carlsbad, CA 92008-7385

http://www.fws.gov/carlsbad/

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information.
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

NOT FOR CONSULTATION

Birds

NAME	STATUS
California Condor *Gymnogyps californianus* There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/8193	Endangered
Coastal California Gnatcatcher *Polioptila californica californica* There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/8178	Threatened

Flowering Plants

NAME	STATUS
Braunton's Milk-vetch *Astragalus brauntonii* There is **final** critical habitat for this species. Your location is outside the critical habitat. https://ecos.fws.gov/ecp/species/5674	Endangered

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php
- Nationwide conservation measures for birds http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see maps of where birders and the general public have sighted birds in and around your project area, visit E-bird tools such as the E-bird data mapping tool (search for the name of a bird on your list to see specific locations where that bird has been reported to occur within your project area over a certain timeframe) and the E-bird Explore Data Tool (perform a query to see a list of all birds sighted in your county or region and within a certain timeframe). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA *SOMETIME WITHIN THE TIMEFRAME* SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Allen's Hummingbird *Selasphorus sasin* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15

Ashy Storm-petrel Oceanodroma homochroa — Breeds May 1 to Jan 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/7237

Bald Eagle Haliaeetus leucocephalus — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1626

Black Oystercatcher Haematopus bachmani — Breeds Apr 15 to Oct 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9591

Black Skimmer Rynchops niger — Breeds May 20 to Sep 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/5234

Black Swift Cypseloides niger — Breeds Jun 15 to Sep 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8878

Black Turnstone Arenaria melanocephala — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Black-chinned Sparrow Spizella atrogularis — Breeds Apr 15 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9447

Burrowing Owl Athene cunicularia — Breeds Mar 15 to Aug 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9737

California Thrasher Toxostoma redivivum — Breeds Jan 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Clark's Grebe Aechmophorus clarkii — Breeds Jan 1 to Dec 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Costa's Hummingbird Calypte costae — Breeds Jan 15 to Jun 10
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9470

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

NOT FOR CONSULTATION

Gull-billed Tern Gelochelidon nilotica — Breeds May 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9501

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Le Conte's Thrasher toxostoma lecontei — Breeds Feb 15 to Jun 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8969

Lewis's Woodpecker Melanerpes lewis — Breeds Apr 20 to Sep 30
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9408

Long-billed Curlew Numenius americanus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/5511

Marbled Godwit Limosa fedoa — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9481

Mountain Plover Charadrius montanus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3638

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

Rufous Hummingbird selasphorus rufus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8002

Short-billed Dowitcher Limnodromus griseus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9480

Tricolored Blackbird Agelaius tricolor — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/3910

NOT FOR CONSULTATION

Whimbrel Numenius phaeopus This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9483	Breeds elsewhere
White Headed Woodpecker Picoides albolarvatus This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA https://ecos.fws.gov/ecp/species/9411	Breeds May 1 to Aug 15
Willet Tringa semipalmata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds elsewhere
Wrentit Chamaea fasciata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 15 to Aug 10

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in your project's counties during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

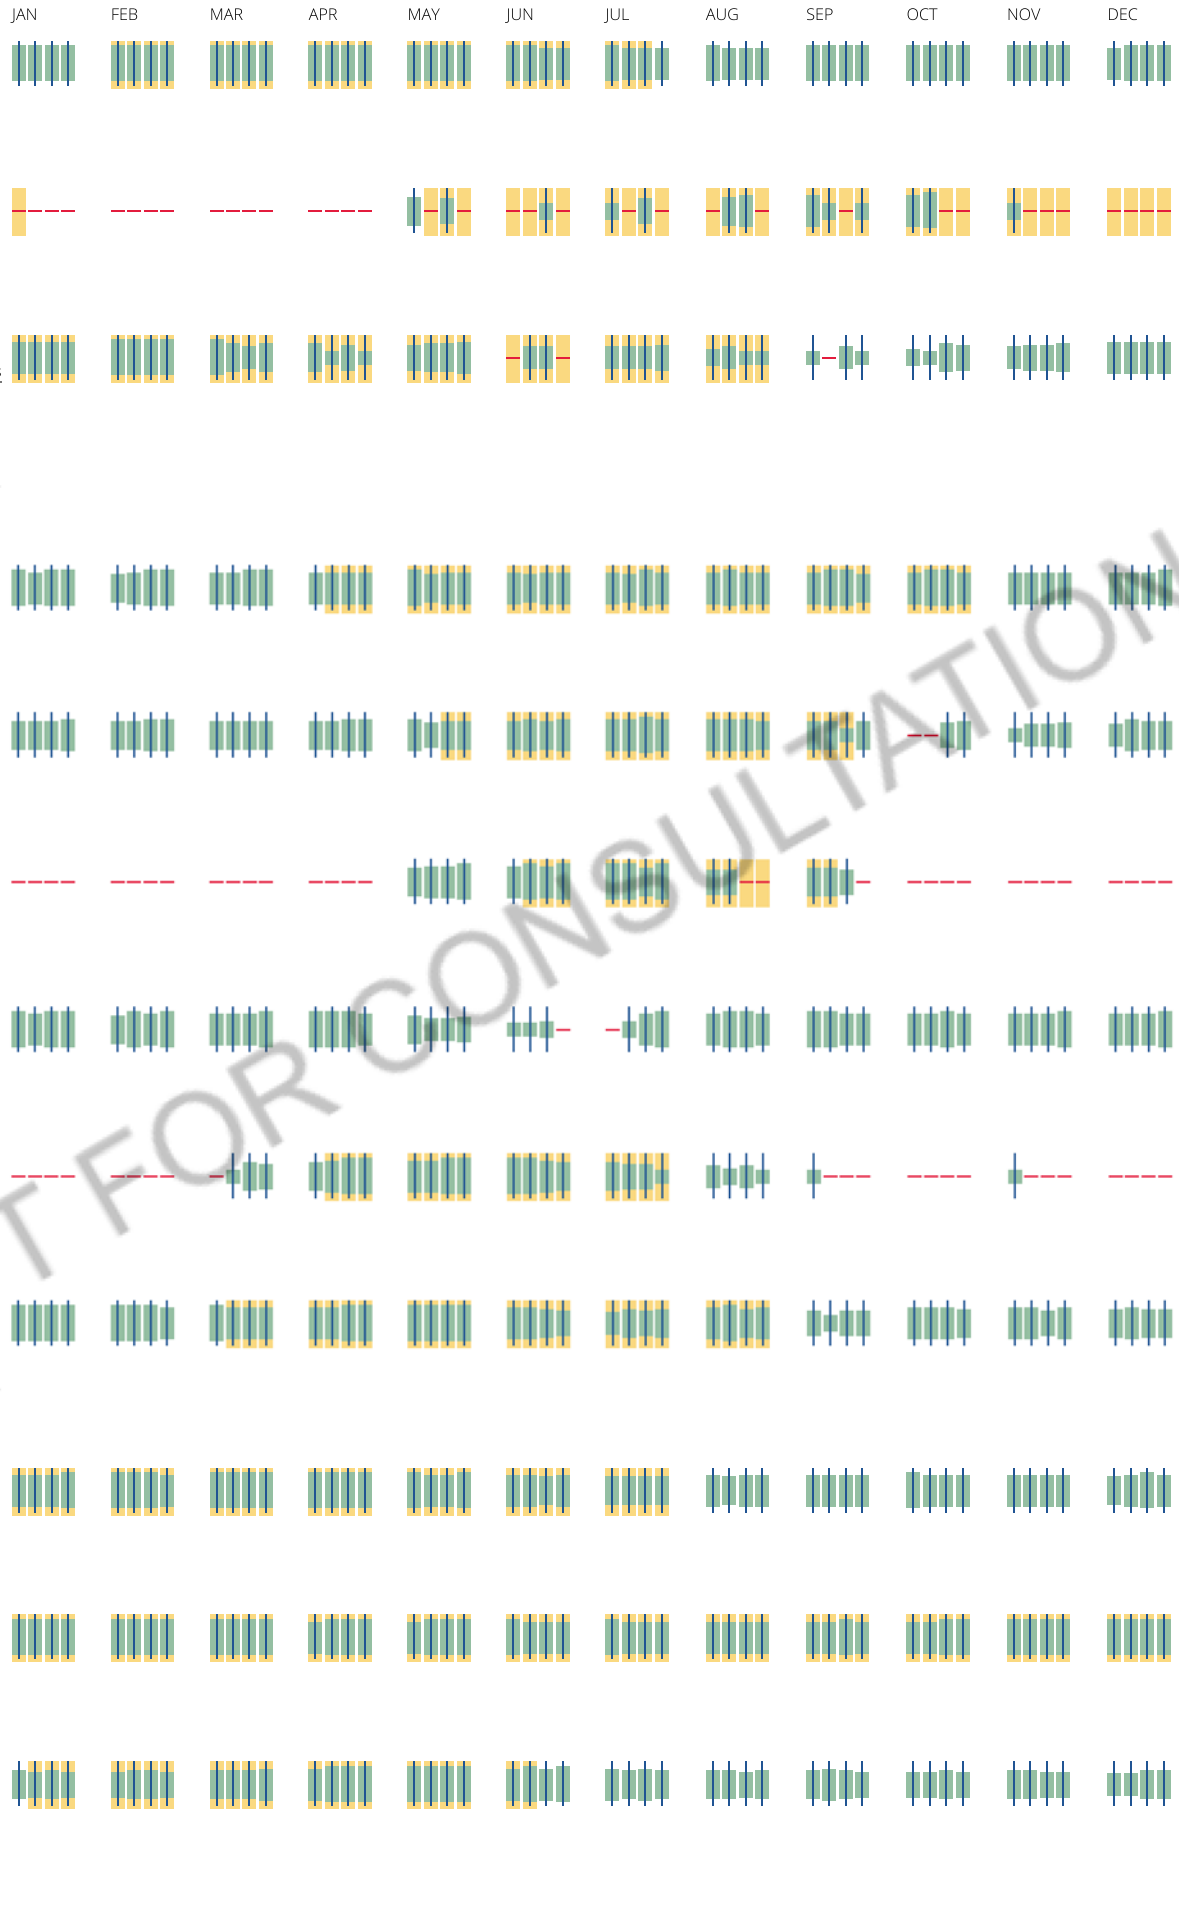
How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

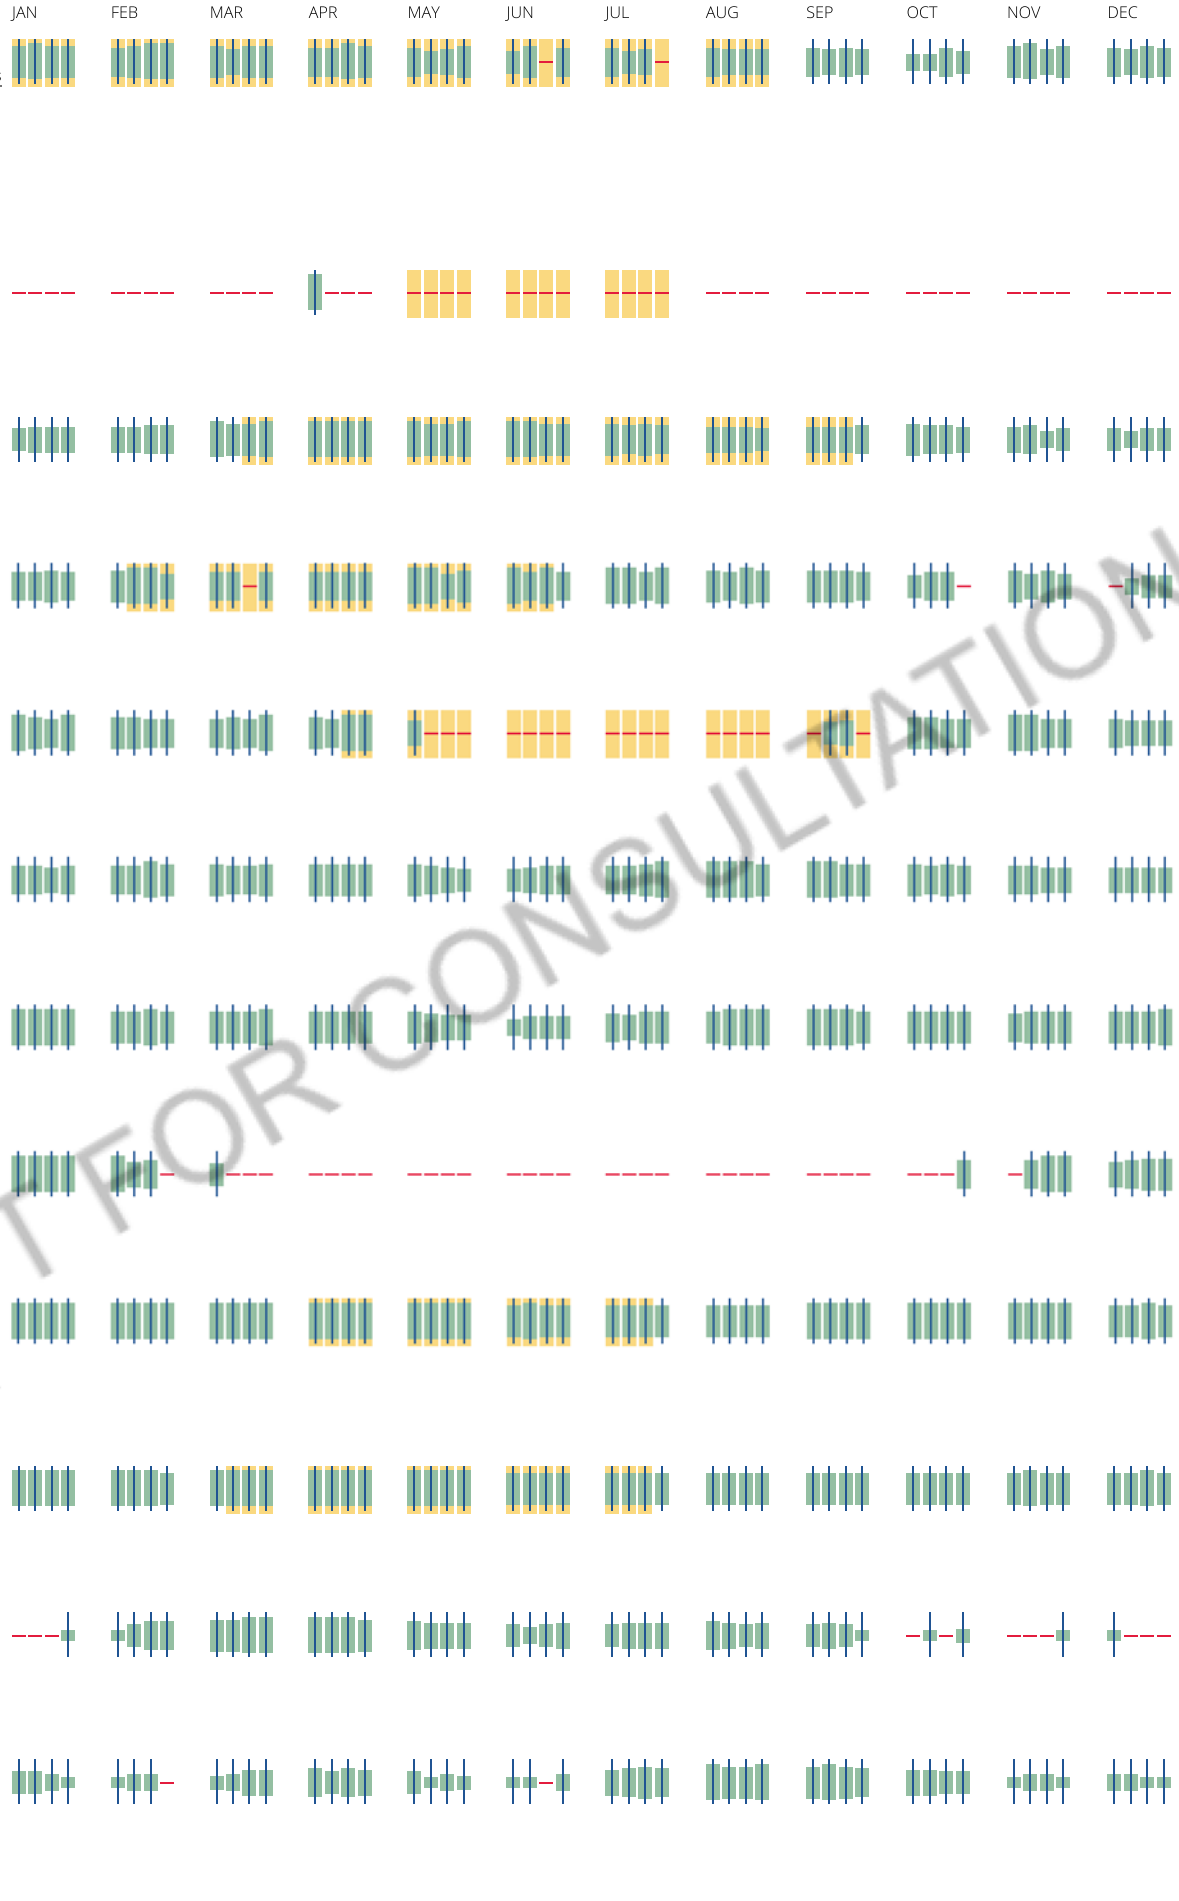
Breeding Season (■)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the counties of your project area. The number of surveys is expressed as a range, for example, 33 to 64 surveys.



To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.



Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information.

■ probability of presence ■ breeding season | survey effort – no data

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures and/or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the counties which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the E-bird Explore Data Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird entry on your migratory bird species list indicates a breeding season, it is probable that the bird breeds in your project's counties at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the BGEPA should such impacts occur.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

THERE ARE NO KNOWN WETLANDS AT THIS LOCATION.

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

NOT FOR CONSULTATION

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Mr. Alec Schiffer
Trammell Crow Residential
5790 Fleet Street, Suite 140
Carlsbad, CA 92008

Subject: Jurisdictional Delineation Results for the South Magnolia Avenue Apartment Project

Dear Mr. Schiffer:

This letter presents the results of a jurisdictional delineation conducted by HELIX Environmental Planning, Inc. (HELIX) for the South Magnolia Avenue Apartment Project (project). The delineation was conducted to identify and map existing areas within the study area that are "waters of the U.S." under U.S. Army Corps of Engineers (USACE) jurisdiction pursuant to Section 404 of the Clean Water Act (CWA); waters of the State under Regional Water Quality Control Board (RWQCB) jurisdiction pursuant to Section 401 of the CWA; and streambed habitats under California Department of Fish and Wildlife (CDFW) jurisdiction pursuant to Section 1600 of the California Fish and Game Code. This report presents HELIX's best efforts to quantify jurisdiction within the study area using the current regulations, written policies, and guidance from the regulatory agencies. The results presented here are subject to confirmation by USACE, RWQCB, and CDFW.

PROJECT LOCATION

The approximately 8-acre study area is in the City of Monrovia, Los Angeles County, California. The study area is generally located to the south of Interstate (I-) 210 and to the west of I-605 (Figure 1, *Regional Location*). The study area is within the U.S. Geological Survey (USGS) 7.5-minute Mount Wilson quadrangle map in Township 1 North, Range 11 West (Figure 2, *USGS Topography*). Specifically, the study area is located to the south of W Evergreen Avenue, west of S Magnolia Avenue, north of an Atchison Topeka and Santa Fe railroad right-of-way (ROW), and east of Mayflower Avenue (Figure 3, *Aerial Photograph*).

PROJECT DESCRIPTION

The proposed project consists of a 436-unit for rent apartment development consisting of a five-story residential building surrounding a seven-story parking structure (Figure 4, *Site Plan*). A rectangular

concrete channel is located adjacent to the southwestern study area boundary. The project will require a 12-inch outflow pipe to properly divert overflow stormwater from the site to the channel.

METHODS

Prior to beginning fieldwork, aerial photographs (1 inch = 150 feet), topographic maps (1 inch = 150 feet), USGS quadrangle maps, and National Wetland Inventory maps (U.S. Fish and Wildlife Service 2019) were reviewed. HELIX biologists Lauren Singleton and Matthew Dimson conducted the jurisdictional delineation field work on April 30, 2019. Data collection was targeted in areas that were deemed to have the potential to support jurisdictional resources, such as the presence of an ordinary high water mark (OHWM) and/or other surface indications of streambed hydrology. Representative photographs were taken of the drainage feature and are included as Attachment A, *Drainage Photographs*. Delineation methods used to determine each agency's jurisdictional limits are discussed below.

U.S. Army Corps of Engineers

The USACE waters of the U.S. were determined using current USACE guidelines (Environmental Laboratory 1987, U.S. Army Corps of Engineers [USACE] 2008a). Areas were determined to be waters of the U.S. if there was evidence of regular surface flow (e.g., bed and bank). Jurisdictional limits for these areas were measured according to the presence of a discernible OHWM, which is defined in 33 Code of Federal Regulations (CFR) Section 329.11 as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank; shelving; changes in the character of the soil; destruction of terrestrial vegetation; the presence of litter or debris; or other appropriate means that consider the characteristics of the surrounding areas." The USACE has issued further guidance on the OHWM (Riley 2005; USACE 2008b), which also was considered in this jurisdictional assessment.

The jurisdictional delineation was conducted in accordance with court decisions (i.e., Rapanos v. United States, Carabell v. United States, and Solid Waste Agency of Northern Cook County v. USACE), as outlined and applied by the USACE (USACE 2007; Grumbles and Woodley 2007); and USACE and U.S. Environmental Protection Agency (EPA; 2007). These publications explain that the EPA and USACE will assert jurisdiction over traditional navigable waters (TNW) and tributaries to TNWs that are a relatively permanent water body (RPW), which has year-round or continuous seasonal flow. For water bodies that are not RPWs, a significant nexus evaluation is used to determine if the non-RPW is jurisdictional. As an alternative to the significant nexus evaluation process, a preliminary jurisdictional delineation may be submitted to the USACE. The preliminary jurisdictional delineation treats all waters and wetlands on a site as if they are jurisdictional waters of the U.S. (USACE 2008a). A significant nexus evaluation or preliminary jurisdictional delineation are typically only required for projects that propose impacts to potentially jurisdictional features and, therefore, require a Section 404 permit from the USACE.

Regional Water Quality Control Board

The RWQCB asserts regulatory jurisdiction over activities affecting wetland and non-wetland waters of the State pursuant to Section 401 of the CWA and the State Porter-Cologne Water Quality Control Act. Potential RWQCB jurisdiction found within the study area follows the boundaries of potential USACE

jurisdiction for waters of the U.S. There are no areas supporting isolated waters of the State subject to exclusive RWQCB jurisdiction pursuant to the State Porter-Cologne Water Quality Control Act.

California Department of Fish and Wildlife

The CDFW jurisdictional boundaries were determined based on the presence of riparian vegetation or regular surface flow, if present. Streambeds within CDFW jurisdiction were delineated based on the definition of streambed as "a body of water that flows at least periodically or intermittently through a bed or channel having banks and supporting fish or other aquatic life. This includes watercourses with surface or subsurface flow that supports riparian vegetation" (Title 14, Section 1.72). This definition for CDFW jurisdictional habitat allows for a wide variety of habitat types to be jurisdictional, including some that do not include wetland species (e.g., oak woodland and alluvial fan sage scrub). Jurisdictional limits for CDFW streambeds were defined by the top of bank. Vegetated CDFW habitats were mapped at the limits of streambed-associated vegetation, if present.

RESULTS

Channel A, which is a USGS-mapped blueline stream, is a concrete rectangular channel that runs northwest to southeast along the southwestern study area boundary. Based on the USGS Mount Wilson quadrangle map, the headwaters of Channel A appear to originate approximately 0.70 mile to the northwest of the study area near the near the terminus of West Olive Avenue. The channel likely collects sheet flow from impervious surfaces in the surrounding area. The channel is underground from its headwaters until it reaches the study area. Channel A surfaces on the study area via a cement culvert near the northwestern study area boundary. The channel flows southeast through the study area for approximately 384 linear feet (LF) and exits the study area near the southern boundary, just north of the railroad ROW. After exiting the study area, the channel extends southeast for approximately 0.80 mile and then continues underground approximately 600 feet to the north of the intersection of Peck Road and W Camino Real Street. Channel A likely connects to Sawpit Wash approximately 0.5 mile to the southeast of Peck Road. Sawpit Wash is a tributary to Rio Hondo, which drains to the Los Angeles River. The Los Angeles River ultimately drains into the Pacific Ocean approximately 28 miles to the southwest of the study area.

USACE/RWQCB jurisdictional waters of the U.S. in the study area is defined by signs of flow as well as water stains as a result of intermittent flows in Channel A. CDFW jurisdiction within the study area consists of nearly vertical concrete walls and concrete bottom within Channel A. Since a number of large cracks were observed in the concrete lining of the channel, coast live oak (*Quercus agrifolia*) trees directly adjacent to the channel were included as CDFW jurisdiction since the trees appear to be supported or partially supported by water in the channel. The channel was mostly unvegetated, with the exception of an area near the center of the channel where sediment had accumulated on the concrete bottom of the channel. The sediment was likely dirt that collapsed from the embankment above the concrete wall of the channel. Vegetation observed in this area included bigleaf periwinkle (*Vinca major*), Himalayan blackberry (*Rubus armeniacus*), smilo grass (*Piptatherum miliaceum*), spiny sowthistle (*Sonchus asper*), and wild radish (*Raphanus sativus*). Soils within Channel A are mapped as Urban land-Palmview-Tujunga complex (0 to 5 percent slopes; NRCS 2019; Figure 5, *Soils*). The majority of the channel does not support soil, except for the areas where the concrete lining is cracked and where the embankment collapsed.

Based on the results of the jurisdictional delineation, Channel A supports approximately 0.08 acre (384 LF) of USACE/RWQCB non-wetland waters of the U.S. and 0.12 acre of CDFW jurisdictional streambed and associated vegetation (Figure 6, *Jurisdictional Features*). Representative photographs of jurisdictional areas delineated on the study area are included as Attachment A.

IMPACTS

The project will require installation of an outflow pipe to properly divert overflow stormwater from the development to Channel A. To install the pipe, an approximately two-foot diameter hole will be bored into the concrete wall to install the outflow pipe. Since the invert of the channel will not be impacted, the project will only temporarily impact a small area of CDFW jurisdiction totaling approximately 1.5 square feet (Figure 7, *Impacts to Jurisdictional Features*). The project would not impact USACE/RWQCB waters of the U.S. or any drainage-associated coast live oak trees.

AVOIDANCE AND MINIMIZATION MEASURES

The project will not require work within USACE/RWQCB jurisdictional waters but may require work within CDFW jurisdiction associated with Channel A in order to install a stormwater overflow pipe within the channel banks. If CDFW jurisdictional waters cannot be feasibly avoided for the overflow pipe installation, the Project Proponent shall submit to CDFW a Section 1602 Notification regarding the potential need for a Lake and Streambed Agreement (LSA) to authorize work in CDFW jurisdictional areas. If an LSA is required, the Applicant shall be responsible for complying with all conditions outlined in the LSA, which may include wildlife habitat and streambed impact avoidance, minimization, and mitigation measures consistent with CDFW requirements for LSAs. Impacts to project areas subject to CDFW's jurisdiction shall not occur unless an LSA is received from CDFW, or correspondence is received indicating that (1) an LSA is not required, or (2) the work is authorized by "operation of law" pursuant to the Fish and Game Code.

The following minimization measures shall also be implemented during construction if work is required within Channel A:

1. Construction-related equipment shall be stored in upland areas, outside of the channel except as required by project design (restoration, trash removal, etc.).

2. Source control and treatment control BMPs shall be implemented to minimize the potential contaminants that are generated during and after construction. Source control BMPs may include landscape planning, roof runoff controls, trash storage areas, use of alternative building materials, and education of future tenants and residents. Treatment control BMPs may include detention basins, vegetated swales (bio-swales), drain inlets, and vegetated buffers. Water quality BMPs shall be implemented throughout the project to capture and treat contaminants.

3. To avoid attracting predators during construction, the project shall be kept clean of debris to the extent possible. All food-related trash items shall be enclosed in sealed containers and regularly removed from site.

4. Employees shall strictly limit their activities, vehicles, equipment, and construction material to the proposed project footprint, staging areas, and designated routes of travel.

5. Construction limits shall be fenced with orange snow screen and exclusion fencing should be maintained until the completion of construction activities.

CONCLUSION

The project may require minor impacts to Channel A to install an outflow pipe, which would result in approximately 1.5 square feet of temporary impacts to CDFW jurisdiction. The project would not impact USACE/RWQCB waters of the U.S. or any drainage-associated coast live oak trees. If CDFW jurisdictional waters cannot be feasibly avoided, the Project Proponent shall submit to CDFW a Section 1602 Notification regarding need for an LSA to authorize work in CDFW jurisdictional areas. In addition, the minimization measures outlined above should be implemented during construction of the project if temporary impacts are required to Channel A.

If you have any questions regarding the information presented in this letter report, please contact me at LaurenS@helixepi.com or (949) 234-8770.

Sincerely,

Lauren Singleton
Biologist

APPENDIX E
CULTURAL RESOURCES DOCUMENTATION

APPENDIX E1
AB 52 and SB18 CONSULTATION DOCUMENTATION

City of MONROVIA 1887

All-America City

November 1, 2018

Gabrieleno Band of Mission Indians - Kizh Nation
Andrew Salas, Chairperson
Post Office Box 393
Covina, CA 91723

Subject: **AB 52 Consultation Request for Alexan Specific Plan and General Plan/Zoning Code Amendment**

Dear: Mr. Salas

Thank you for your letter of October 26, 2018 in which you requested consultation regarding the Alexan Specific Plan and General Plan/Zoning Code Amendment. You may have recently received the project's Notice of Preparation (NOP) which describes the proposed project and a list of environmental issues to be studied in the Environmental Impact Report.

On January 11, 2018, we consulted with you about this particular project. On that day, we received your recommended mitigation measures regarding the Tribal Cultural Resources and human remains and associated funerary objects within the Kizh Gabrieleno Tribal Territory. We also received a screenshot of the project site with the tribal cultural resources identified in the 1938 LA County map. These are attached for your review.

We are more than happy to meet with you again to review these mitigation measures, and any additional consultation as needed. Please notify me within 30 calendar days from receipt of this letter if you wish to consult further on this project.

Sincerely,

John Mayer, AICP
Senior Planner

Kizh Gabrieleno Band of Mission Indians

Re: Cultural Resources Mitigation Measures, regarding Tribal Cultural Resources and Human Remains and associated funerary objects within Kizh Gabrieleño Tribal Territory.

Note: *The Gabrieleño Band of Mission Indians Kizh -Nation ONLY replies to projects within their ANCESTRAL territory, because it's the highest degree of relationship to the land, even over culturally or traditionally affiliated, and our Oral History and documented information pertain to our Tribe's village areas, commerce areas, recreation areas, and burial locations within our tribe's ancestral territory. Therefore, in order to protect these irreplaceable Tribal Cultural Resources within our ancestral tribal territory, Native American Monitors shall be from the Gabrieleño Band of Mission Indians Kizh -Nation.*

Retain a Native American Monitor: The project Applicant will be required to obtain the services of a qualified Native American Monitor(s) during construction-related ground disturbance activities. Ground disturbance is defined by the Tribal Representatives from the Gabrieleño Band of Mission Indians-Kizh Nation as activities that include, but are not limited to, pavement removal, pot-holing or auguring, grubbing, weed abatement, boring, grading, excavation, drilling, and trenching, within the project area. The monitor(s) must be approved by the Tribal Representatives and will be present on-site during the construction phases that involve any ground disturbing activities. The Native American Monitor(s) will complete monitoring logs on a daily basis. The logs will provide descriptions of the daily activities, including construction activities, locations, soil, and any cultural materials identified. The monitor(s) shall possess Hazardous Waste Operations and Emergency Response (HAZWOPER) certification. In addition, the monitor(s) will be required to provide insurance certificates, including liability insurance, for any archaeological resource(s) encountered during grading and excavation activities pertinent to the provisions outlined in the California Environmental Quality Act, California Public Resources Code Division 13, Section 21083.2 (a) through (k). The on-site monitoring shall end when the project site grading and excavation activities are completed, or when the Tribal Representatives and monitor have indicated that the site has a low potential for archeological resources.

***Hazwoper is needed only if the site has hazardous concerns.*

Unanticipated Discovery of Tribal Cultural Resources: All archaeological resources unearthed by project construction activities shall be evaluated by the Qualified Archaeologist and Native Monitor. If the resources are Native American in origin, the Tribe shall coordinate with the landowner regarding treatment and curation of these resources. Typically, the Tribe will request reburial or preservation for educational purposes. If a resource is determined by the Qualified Archaeologist to constitute a "historical resource" pursuant to CEQA Guidelines Section 15064.5(a) or has a "unique archaeological resource" pursuant to Public Resources Code Section 21083.2(g), the Qualified Archaeologist shall coordinate with the applicant and the City to develop a formal treatment plan that would serve to reduce impacts to the resources. The treatment plan established for the resources shall be in accordance with CEQA Guidelines Section 15064.5(f) for historical resources and Public Resources Code Sections 21083.2(b) for unique archaeological resources. Preservation in place (i.e., avoidance) is the preferred manner of treatment. If preservation in place is not feasible, treatment may include implementation of archaeological data recovery excavations to remove the resource along with

If the coroner determines the remains represent a historic non-Native American burial, the burial shall be treated in the same manner of respect with agreement of the coroner. Reburial will be in an appropriate setting. If the coroner determines the remains to be modern, the coroner will take custody of the remains.

Each occurrence of human remains and associated funerary objects will be stored using opaque cloth bags. All human remains, funerary objects, sacred objects and objects of cultural patrimony will be removed to a secure container on site if possible. These items should be retained and reburied within six months of recovery. The site of reburial/repatriation shall be on the project site but at a location mitigated between the Tribe and the landowner at a site to be protected in perpetuity. There shall be no publicity regarding any cultural materials recovered.

Professional Standards: Archaeological and Native American monitoring and excavation during construction projects will be consistent with current professional standards. All feasible care to avoid any unnecessary disturbance, physical modification, or separation of human remains and associated funerary objects shall be taken. Principal personnel must meet the Secretary of Interior standards for archaeology and have a minimum of 10 years of experience as a principal investigator working with Tribal Cultural Resources in southern California. The Qualified Archaeologist shall ensure that all other personnel are appropriately trained and qualified.

Michelle Gibbs
Senior Planner/Biologist
MIG, Inc.
800 Hearst Avenue
Berkeley, CA 94710

Re: Alexan Monrovia and MIG Project #13819

Dear Ms. Gibbs;

Please find attached the completed California Department of Parks and Recreation (DPR) Series 523 Inventory Site forms for the documentation and evaluation of the properties at 340 West Evergreen Avenue and 1607 South Magnolia Avenue in the City of Monrovia, California. The DPR forms were completed per the instructions of the City of Monrovia's "Requirements for Preparing Historic Assessments" in association with the use of the *Final City of Monrovia Historic Context Statement (2018)*, for the evaluation of the built-environment resources situated in the project parcels.

Methodology

The field survey and evaluation of the buildings at 340 West Evergreen Avenue and 1607 South Magnolia Avenue, was conducted by Pamela Daly, M.S.H.P., Principal Architectural Historian. Ms. Daly holds a Master of Science Degree in Historic Preservation from the University of Vermont, and a Bachelor of Science Degree in Business Management (with a minor in History), and exceeds the Secretary of the Interior's Professional Qualifications (36 CFR 61) for Architectural Historians and Historians. Ms. Daly has authored over 150 historical resource assessments and evaluations required for buildings/structures/objects/features/and landscapes under the California Environmental Quality Act (CEQA). (See attachment for additional information.)

In order to identify and evaluate the subject properties as potential historical resources, a multi-step methodology was utilized. An inspection of the sites and the existing structures, combined with a review of data for these parcels, was performed to document existing conditions and assist in assessing and evaluating the properties for significance. Photographs were taken of the subject buildings, surrounding landscape, or other points of interest situated in the proposed project area, during the intensive-level pedestrian survey.

The *Final City of Monrovia Historic Context Statement*, prepared by ASM Affiliates, Inc., for the City of Monrovia (2018), was utilized to provide historical backgrounds for the subject

properties located within the City, and as a framework for understanding the properties place in the history of the City.

The criteria for listing a property in the California Register of Historical Resources, and the City of Monrovia Designation Criteria (MMC § 17.40.060(b)), were employed to evaluate the potential historical significance of the subject properties. In addition, the following tasks were performed for the study:

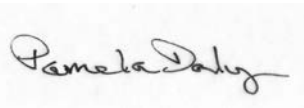
- Ordinances, statutes, regulations, bulletins, and technical materials relating to federal, state, and local historic preservation, designation assessment processes, and related programs were reviewed and analyzed;
- site-specific research was conducted on the subject property utilizing historic United States Geological Survey (USGS) topographic maps;
- historical road maps of the Automobile Club of Southern California were referenced;
- *Los Angeles City Directory Company* books for Monrovia resident and street listings were referenced;
- U.S. Census data was accessed from Ancestry.com;
- U.S. Military draft cards were accessed from Ancestry.com;
- Los Angeles County voting roles were accessed from Ancestry.com;
- building permit records for the properties were provided by the City; and
- historic aerial photographs dating from 1948 were accessed from NETR Historic aerials.

Assessment Results

340 West Evergreen Avenue: The property at 340 West Evergreen Avenue was evaluated for significance by using the theme of "Residential Development 1941-1967", with the sub-theme of "Single-Family Residential Infill", as presented in the *Final City of Monrovia Historic Context Statement* (ASM, 2018).

- The property was found not to be part of, or potential contributor to any historic district in the City.
- The property was not found to be a significant historical resource when evaluated under the criteria for listing in the California Register of Historical Resources.
- The property was not found to meet the criteria to be eligible for being considered a Designated Historical Resource in the City of Monrovia.
- The property was assigned the California Historical Resources Status Code of 6Z.

1607 South Magnolia Avenue: Due to the architectural style of the residence at 1607 South Magnolia Avenue, and the good possibility that the building dates from circa 1910 to 1940, the property was evaluated for significance by using the theme of Residential Development 1903-1940", with the sub-theme of "Single-Family Residential", as presented in the *Final City of Monrovia Historic Context Statement* (ASM, 2018).



- The property was found not to be part of, or potential contributor to any historic district in the City.

- The property was not found to be a significant historical resource when evaluated under the criteria for listing in the California Register of Historical Resources.
- The property was not found to meet the criteria to be eligible for being considered a Designated Historical Resource in the City of Monrovia.
- The property was assigned the California Historical Resources Status Code of 6Z.

Complete set of DPR 523 Series inventory site forms for each property are attached to this memorandum. The DPR forms contain detailed architectural descriptions of each building, histories of each property, and statements of significance for the resources.

Please do not hesitate to contact me with any questions.

Sincerely,

Pamela Daly, M.S.H.P.
Principal

DPR forms for 340 West Evergreen Avenue
DPR forms for 1607 South Magnolia Avenue

Pamela Daly, M.S.H.P., Principal Architectural Historian
Daly & Associates, 2242 El Capitan Drive, Riverside, CA 92506
(951) 369-1366 daly.rvrsde@sbcglobal.net

Ms. Daly is a 36 CFR 61 Qualified Architectural Historian with more than 21 years experience in historic resource management and consulting in California, Vermont, New York, and Nevada. She earned a Master of Science degree in Historic Preservation at University of Vermont, and a Bachelor of Science degree in Business Management from Elmira College in Elmira, New York. Ms. Daly's coursework in Historic Preservation included the study of American Architecture, Historic Landscapes, and Building Conservation Techniques.

Ms. Daly has experience with federal agencies including U.S. Air Force, U.S. Navy, U.S. Army Reserve, U.S. Army Corps of Engineers, Bureau of Land Management, the U.S. Forest Service, the National Park Service, and U.S. Fish & Wildlife. She is accepted as a principal investigator for both Architectural History and History by the California State Office of Historic Preservation, and holds the qualifications to work throughout the United States. Ms. Daly belongs to the National Trust for Historic Preservation, Vernacular Architecture Forum, Society of Industrial Archaeology, and Association of Preservation Technology.

Ms. Daly has expertise not only in assessing and evaluating classic residential architectural styles of the United States dating from the eighteenth to the twenty-first century, but she has a wide range of experience in the survey and evaluation of military sites and structures in both the western and eastern United States. She has performed studies on airplane hangars, military housing, helicopter hangers, ammunition bunkers, flight simulators, and Cold War radar arrays. Industrial archaeological sites include automobile and railroad bridges, irrigation canals and ditches, gravity-fed water supply systems, sewer treatments systems, gold mines, water-pumping systems, privately-owned reservoirs, electric transmission line towers, historic roads, historic signage, airplane hangars, steam-powered belt and pulley systems, and a historic zanja.

Studies of built-environment resources include archival research, field investigation, significance criteria and determinations, assessment of impacts/effects, management plans, and mitigation implementation. Mitigation measures include preparation of Historic American Building Survey (HABS) documentation, Historic American Engineering Record (HAER) documentation, Historic American Landscape (HALS) documentation, interpretive signage, layout and production of brochures, websites, and video displays. Ms. Daly has also worked with clients with historically significant buildings to restore or rehabilitate them in accordance with the *Secretary of the Interior's Standards for the Treatment of Historic Properties*.

From her training at the University of Vermont, Ms. Daly is qualified to prepare Historic Structure Reports (HSR) for built-environment resources. She has the expertise and equipment to perform chromochronology, mortar analysis, historic interior evaluations, and analysis of historic paint finishes. She has prepared reports detailing the existing conditions of the interior and exterior features of a building, and presented the recommended repair and maintenance tasks necessary to protect the historic resource.

The building is located approximately 177 yards west of the intersection of South Magnolia Avenue and West Evergreen Avenue, on the south side of the street.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The building permit for erection of this dwelling was not in the file for this property. According to Permit No. 2468 filed by the owners of the property in 1952, the house at that time was a one-story residence and garage, with the residence measuring 20 feet x 32 feet, for a total of 640 square feet of living space. The house was comprised of only five rooms, and a review of a historical aerial photographs dating from 1948, 1952, 1964, and 1972, provide information as to the original massing of the house, its location, and the reorientation of South Alta Vista Street and West Evergreen Avenue because of the construction of the 210 Freeway through this area in Monrovia.

The original building had a rectangular massing and a low-pitched gable roof set on an east-west axis, with rafter tails extending from under the overhanging eaves. The house sits on a poured-concrete foundation. To this main block, an addition was made to the west elevation, and this addition connected to the original unattached garage. Many of the windows are currently covered over from the outside, but those visible present primarily 1-over-1 wood sash, double-hung windows. On the front façade, a large square window comprised of nine fixed lights, set in wood sash and frame is situated immediately to the west of the exterior chimney. In 1999, David Miller received a permit to remove the existing doors of the house, and replace a sliding door on the rear elevation, and some other windows, with modern composite units.

The addition and garage conversion to living space extended the house approximately 24 feet to the west. A small addition, approximately 8' x 8' was constructed off of the east elevation, and its gable-on-hip roof height is noticeably lower than the main block. A faux birdhouse is set in the east gable end of the main block, and the east façade of the small addition has "ranch style" wood shutters and framing the window. The main front entrance appears to be situated at the east end of the front (north) elevation under a sheet of plywood. A chimney was added to the front elevation in the approximate middle of the main block. This location of the front door and chimney are out of character for the orientation of features on the front façade, and may have resulted from the alteration of 1952. The house is currently vacant and has been boarded up.

BUILDING, STRUCTURE, AND OBJECT RECORD

***NRHP Status Code**: 6Z

***Resource Name or # : 340 West Evergreen Avenue**

B1. Historic Name: 1519 South Alta Vista Ave. (address was changed when streets were reorganized due to construction of the 210 Freeway)

B2. Common Name:

B3. Original Use: single-family dwelling B4. Present Use: vacant

***B5. Architectural Style:** Minimalist

***B6. Construction History:** The original building permit is not available. Based upon review of historic aerial photographs, the subject house appears to have been constructed contemporaneously with other small tract houses in this area, such as the houses on Montana Street that were also constructed between 1948 and 1952. A permit was issued in April 1952 for the house to be substantially enlarged to 1,540 feet, but that does not appear to have been completed. (Permit No. 2468, April 29, 1952.) The L. A. County Assessor notes the building as currently having 1,080 square feet.

B9a. Architect: Unknown b. Builder: Unknown

***B10. Significance:** N/A **Theme:** Residential Development 1941-1960; Minimal Traditional style **Area:** City of Monrovia
Period of Significance: N/A **Property Type:** Single-family residence **Applicable Criteria:** NA

The single-family dwelling at 340 West Evergreen Avenue is purported to have been constructed in 1949 per the Los Angeles County Assessor property tax records. At the time it was built, prior to the construction of the 210 Freeway through Monrovia, the property had the street address of 1519 South Alta Vista. The City was undergoing a housing boom in the 1940s, and what had been agricultural land, between Central Avenue and the Atchison Topeka and Santa Fe Railroad line, and Magnolia Avenue and Mayflower Avenue, was converted to use for residential dwellings. Historic aerial photographs present evidence that light industrial complexes began to move into the area after 1952. After the 210 Freeway was completed through the subject area, it was – for all intents and purposes – cut off from the rest of the main center of the City, and the subject property was given the address of 340 West Evergreen Avenue.

Donald S. and Alta Warren are noted as the owners of the property when a permit was issued in 1952 to substantially alter the original 640 square foot house with additions totally 900 square feet. Donald Warren was a sheet metal worker at Gauf/Gough Brothers, and this may have been a starter home for his family. The house was enlarged by only 440 additional square feet, and most of the enlargement consisted of an addition off the west elevation, to connect to what had been a standalone garage. The Warrens moved to Pasadena in 1955. According to the City Directory, Charles R. Simons, an electrician, and his wife Dorothy were the next residents of the property, and lived there until 1968. Permit records are quiet until 1985, when David Miller files a request for some electrical and plumbing work. Miller would establish his plumbing and sewer business (SGV Plumbing and Sewer) on the property, using the house for his residence and office.

***B14. Evaluator:** Pamela Daly, M.S.H.P.

***Date of Evaluation:** July 30, 2018.

(This space reserved for official comments.)

B10. Statement of Significance, continued:

The property at 340 West Evergreen Avenue was evaluated for significance by using the theme of "Residential Development 1941-1967", with the sub-theme of "Single-Family Residential Infill", as presented in the *Final City of Monrovia Historic Context Statement* (ASM, 2018).

California Register of Historical Resources

California Register Criterion 1: The property at 340 West Evergreen Avenue does not appear to be eligible under Criterion 1 for listing in the California Register of Historical Resources (CRHR) for any association with themes important to the City of Monrovia or California. As required for a property under the theme of "Residential Development 1941-1967", the property does not express the updated functionality and quality of life expectations of housing in the post-World War II era. When first constructed, the house at 340 West Evergreen Avenue was recorded as being 640 square feet. A house of that size would have been one that was built and marketed to returning veterans (World War II or the Korean Conflict) as a "starter home". From a review of historic photographs, many of the tract houses on Montana Street (due north, on the other side of the 210 Freeway), appear to have been built contemporaneously with the subject property. Many of the Montana Street houses have been altered with additions, but they still retain sufficient architectural attributes to show their evolution from a "starter house" into a residence that reflected the growth of a family within. The house at 340 West Evergreen Avenue does not represent an important association with residential development, nor is it a better example of circa 1949/1952 construction than the houses on Montana Street.

CRHR Criterion 2: Under the criterion for evaluating properties for listing in the California Register for their *direct* association with the lives of persons important to the history of Monrovia, the San Gabriel Valley, or California, the property at 340 West Evergreen Avenue does not appear eligible for listing in the CRHR under Criterion 2. We could find no evidence that any individual owners or tenants associated with the property were persons identified as having made an important contribution to the history of the City, region, or state.

CRHR Criterion 3: Evaluating the subject property under Criterion 3 the CRHR for determining the significance of the architecture, design, or construction of the built-environment resource at 340 West Evergreen Avenue, it is apparent that the building was constructed as a modest interpretation of Minimal Traditional architecture. Subsequent alterations and additions to the house since its construction have caused the loss of a majority of its original design. The additions to both the east and west elevations of the house, as well as the rearrangement of windows and doors on the front façade, didn't enhance or improve the buildings original design, massing, balance, and proportions, but rather served to present a disjointed and unpleasant appearance to this house. Compared to many of the houses on Montana Street, which appear to have been built around the same time as the subject house, the house at 340 West Evergreen Avenue has lost its ability to convey its roots in the Minimal Traditional style as a small, single-family, post-World War II residence.

The house at 340 West Evergreen Avenue has lost many of the essential physical aspects of its original, physical integrity that adversely affect its ability to convey any historic significance:

Design: this aspect of integrity was lost with the construction of the badly designed additions, removal of the original windows and doors, and converting the garage to living space.

Materials: although some of the original architectural features remain, they are not part of a larger cohesive plan for the building. The construction of the additions, and the removal and replacement of original windows and doors, has created a disrupted visage.

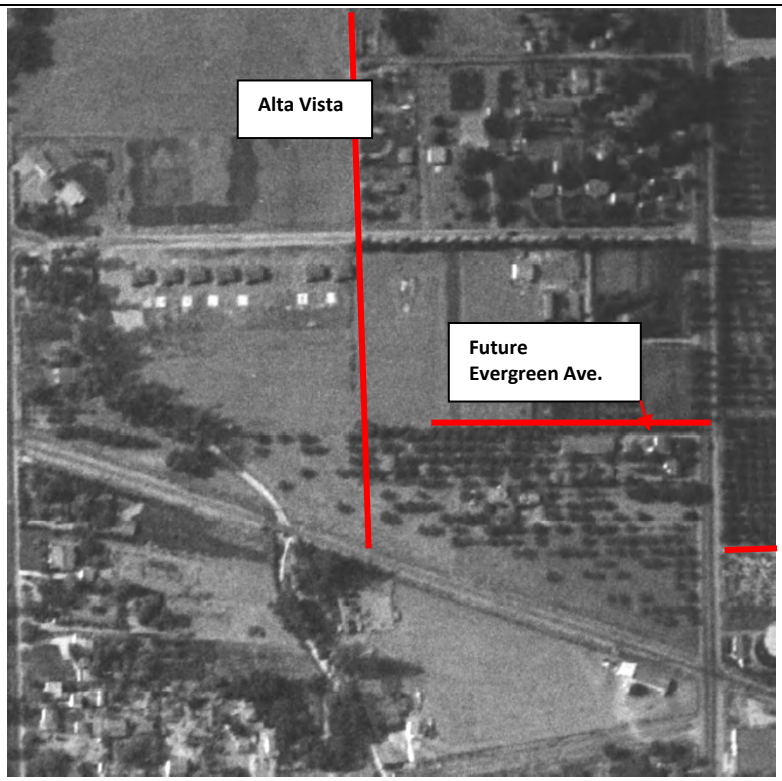
Workmanship: the additions made to the house do not appear to have been made with a concern for high quality outcome of effort and appearance of the building after work was completed.

Setting: the setting of the house has changed from that of a lightly-settled residential neighborhood, with some remaining citrus groves nearby, to that of a major, eight-lane freeway on the other side of the street, and commercial light-industrial business surrounding the property on its other three sides.

Feeling: the property has lost its ability to convey a sense of the late 1940s and/or early 1950s period of residential construction.

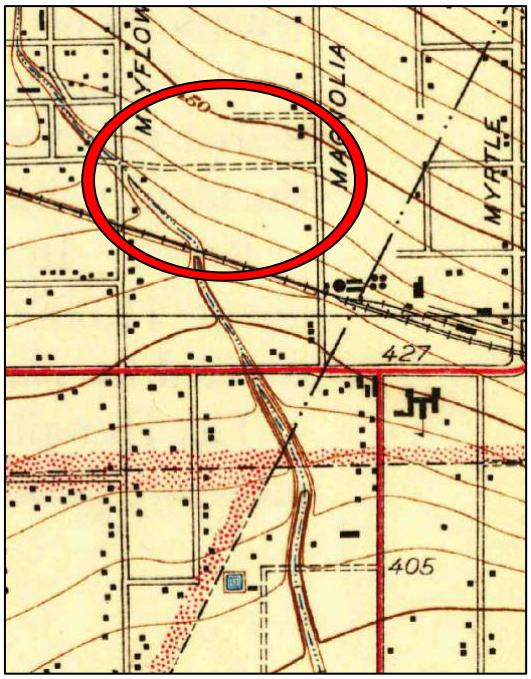
Association: the property has lost its association with the post-World War II era, and the boom period in Southern California actualizing the optimism for a peaceful future.

Location: the house has remained in its original location.



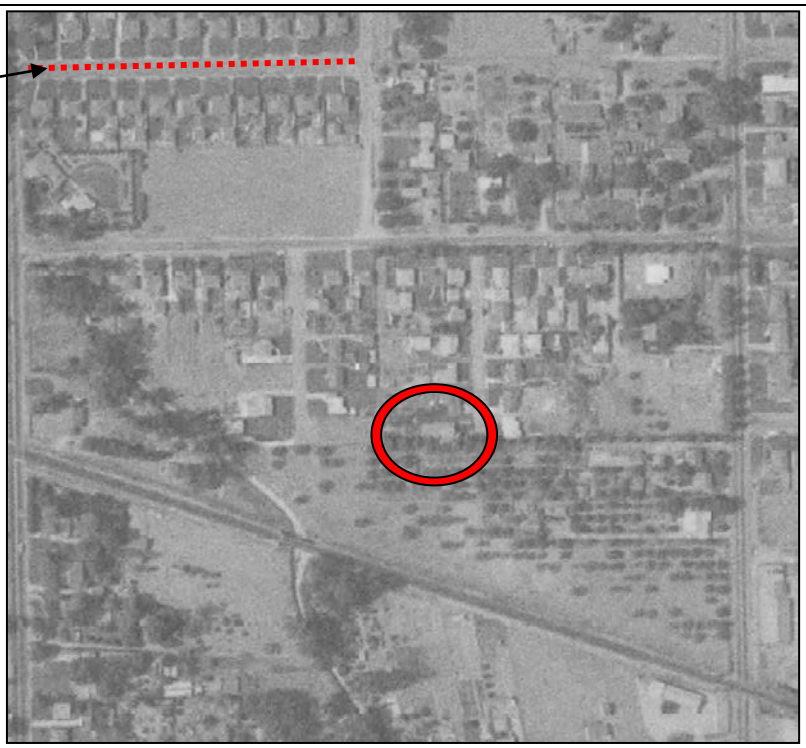
(See Continuation sheet for additional text)

B10. Statement of Significance, continued:



The property at 340 West Evergreen Avenue has not yielded, nor does it appear to have the potential to yield, information important to the history of the local area, California or the nation. The property does not appear eligible for listing in the National Register under Criterion D, or the California Register under Criterion 4.

City of Monrovia criterion

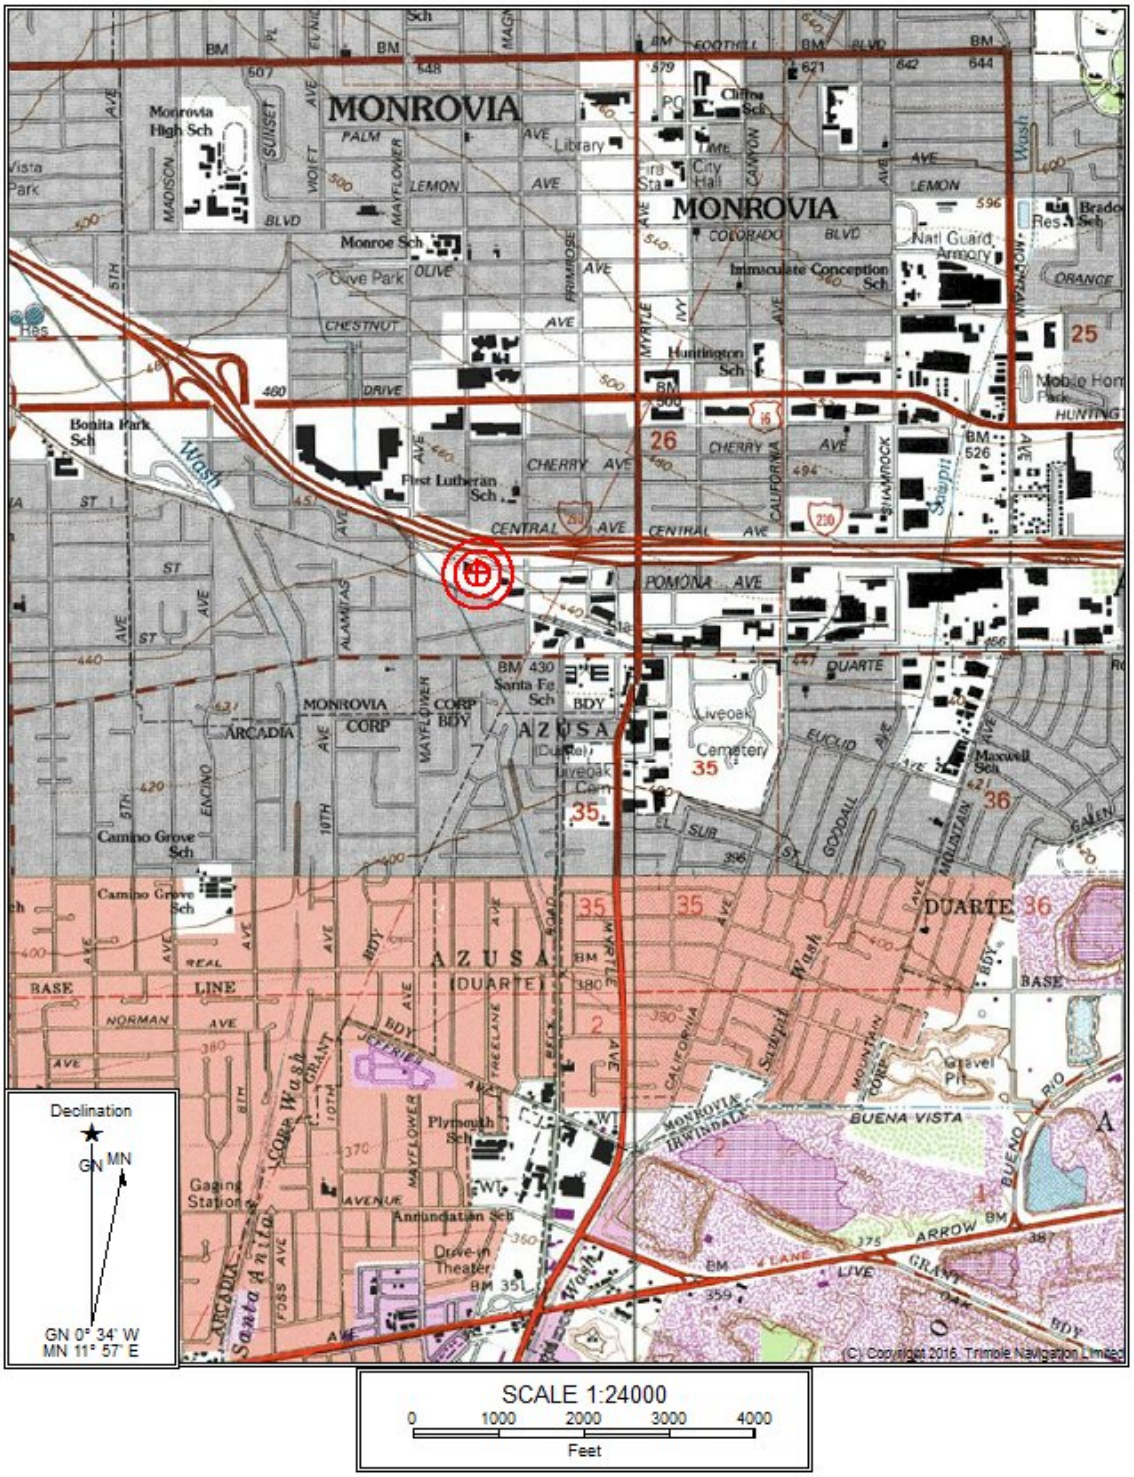


1. It is identified with persons or events significant in local, regional, state or national history.
   The property at 340 West Evergreen Avenue has not been identified with persons or events significant in local, regional, state, or national history.
2. It is representative of work of a notable builder, designer, or architect.
   The original building permit for the property was not available, but based on our experience, the property at 340 West Evergreen Avenue does not appear to be the product of a notable builder, designer, or architect. The building has been substantially altered with the addition of inappropriate modifications, and does not present a professionally designed residence.
3. It contributes to the significance of an historic area, being a geographically definable area possessing a concentration of not less than 50% of historic or architecturally related grouping of properties which contribute to each other and are unified aesthetically by physical layout or development.
   The house at 340 West Evergreen Avenue was literally cut-off from its original neighborhood with the construction of the 210 Freeway through Monrovia. It is not related to any similar buildings in its immediate setting.
4. It embodies one or more distinctive characteristics of style, type, period, design, materials, detail, or craftsmanship.
   To be considered a historic resource in the City of Monrovia, the Sub-Theme for Minimal Traditional buildings states that eligible buildings under this theme should "exemplify tenets of the Modern era and Minimal Traditional style" and "retain all of its character-defining features" to be considered significant. The house at 340 West Evergreen Avenue, has lost by way of inappropriate alterations and ill-designed additions, substantial aspects of the Minimal Traditional style that comprised the original structure.
5. It has a unique location or physical characteristics or represents an established and familiar visual feature of a neighborhood, a community, or the City.
   The residence at 340 West Evergreen Avenue is not situated in a unique location, does not possess unique physical characteristics, or represent an established and familiar visual feature to the light industrial area situated south of the 210 Freeway, west of Magnolia Avenue.
6. It incorporates elements that help preserve and protect a historic place or area of historic interest in the City.
   The residence at 340 West Evergreen Avenue is not located in an area of historic interest in the City.
7. It has yielded, or may be likely to yield information important in prehistory or history.
   The property at 340 West Evergreen Avenue has not yielded, nor does it appear likely to yield, information important to the history of Monrovia.

1948 aerial photograph of the project site, before the subject house was constructed. Magnolia Avenue runs north-south to the east; Central Avenue is the paved road to the north; the Atchison Topeka and Santa Fe Railroad lines run diagonally northwest-southeast; and Mayflower Avenue to the west. South Alta Vista Street does not go below Central Avenue at this time. (NETR Historic Aerials)

Excerpt from historic map of 1941 showing the lightly settled area where the subject house was built in 1949.
U.S.G.S. Topographic Map: 1941 Sierra Madre, 1:24,000

1952 aerial photograph of the project site. Magnolia Avenue runs north-south to the east; Central Avenue is the paved road to the north; the Atchison Topeka and Santa Fe Railroad lines run diagonally northwest-southeast; and Mayflower Avenue to the west. South Alta Vista Street does not go below Central Avenue at this time. Note the rapid development of tract houses along Central Avenue and north on Montana Street. (NETR Historic Aerials)



Aerial view of subject property in 1972 after the construction of the 210 Freeway. Note that the surrounding neighborhood has changed entirely to light industrial use.

e. Other Locational Data: (e.g., parcel #, directions to resource, elevation, etc., as appropriate) Elevation: 441 feet a.s.l.

The building is located approximately 100 feet south of the intersection of South Magnolia Avenue and West Evergreen Avenue, on the west side of the street.

***P3a. Description:**

This building is a one-story vernacular bungalow, with a rectangular massing that measures approximately 28' x 26'. The building has a medium-pitched side-gable roof that has a shed roof extending from the rear (west) gable roof slope. All the original windows and doors have been removed and replaced with modern, vinyl composite units. The original redwood siding and trim boards were removed and replaced with pressboard siding in the late 1990s or 2000s when extensive renovations were made to the house. (Pressboard siding, also called synthetic wood siding, or hardboard siding, is mainly comprised of wood fibers, flakes or chips that are held together by glues and resins and then pressed in forms to look like wood boards.) The house sits on a slightly raised poured-concrete foundation. There is a short extension of the east roof slope over the area of the front door, and a set of three poured-concrete steps, with metal pipe railings, lead up to the front door. The rear of the property is used for vehicle storage, and there is just a small amount of front lawn that still remains from the larger, 1.5 acre parcel on which the building was situated.

Period of Significance: N/A **Property Type:** single-family dwelling **Applicable Criteria:** N/A

David Garett Fields and his wife Margaret lived at the house situated at the corner of South Magnolia Avenue and (future) West Evergreen Avenue in 1939, and David G. Fields was noted as being employed as a printer in the Monrovia City Directory, at that time. The U.S. Census of 1930 noted that he and his wife were living in Stockton, California, at that time, and that he was a printer for a newspaper.

Fields owned a large lot on South Magnolia Avenue in Monrovia that measured 103' along South Magnolia, and 635' to the west (parallel to Huntington Drive), for a total of 65,405 square feet, or 1.5 acres. The building permit file for 1607 South Magnolia Avenue also contains permits issued for projects issued for 1603 South Magnolia Avenue. Unfortunately, it is difficult to read many of the older (1940s) permits issued for work on the entire parcel, but there is a permit for multiple poultry houses to be built, and also a 5-family apartment building. The apartment building was constructed due west of the house at 1603 South Magnolia Avenue, and the flat roof of the linear row of units appears in aerial photographs from 1948 to 1972. The apartment building and the house at 1603 South Magnolia Avenue were demolished sometime after the 210 Freeway and West Evergreen Avenue were constructed, and replaced with light industrial buildings.

Margaret Fields died between 1940 and 1943 (based on information from U.S. Census of 1940 and the 1943 Monrovia City Directory), and David then married (a much younger) Clara M. Lowry in 1943, and they settled in the house at 1603 South Magnolia Avenue. In 1948, Clara and David moved into the small house at 1607 South Magnolia Avenue, and Lyman W. Stuckey and his wife Helen moved into the house at 1603 South Magnolia Avenue. David and Clara Fields (a nurse) lived at 1607 South Magnolia Avenue together until his death in 1963, and then she continued to live there alone until 1996. Landon Lowry (a family relation of Clara's) moved into the house in 1997, and lived there for six years. According to building permit records, the interior and exterior of the house were substantially altered during renovations in the late 1990s and 2000s.

***B14. Evaluator:** Pamela Daly, M.S.H.P.

***Date of Evaluation:** July 30, 2018

(This space reserved for official comments.)

*Recorded by: Pamela Daly, M.S.H.P. *Date: July 30, 2018 ☒Continuation ☐ Update

B10. Statement of Significance, continued:

Due to the architectural style of the residence at 1607 South Magnolia Avenue, and the good possibility that the building dates from circa 1910 to 1940, the property will be evaluated for significance by using the theme of Residential Development 1903-1940", with the sub-theme of "Single-Family Residential", as presented in the *Final City of Monrovia Historic Context Statement* (ASM, 2018)

California Register of Historical Resources

California Register Criterion 1: Evaluating the subject property for its association with the historic themes of the City of Monrovia, the property at 1607 South Magnolia Avenue does not appear to be eligible under Criterion 1 for listing in the California Register of Historical Resources (CRHR). The property does not represent an important association with residential development in a previously established neighborhood, or a residential area developed during the early twentieth century. The house at 1607 South Magnolia Avenue does not reflect the pattern and form of development typical of early suburban development and trends.

CRHR Criterion 2: Under the criterion for evaluating properties for listing in the California Register for their *direct* association with the lives of persons important to the history of Monrovia, the San Gabriel Valley, or Los Angeles County, the property at 1607 South Magnolia Avenue does not appear eligible for listing in the CRHR under Criterion 2. We could find no evidence that individual owners or tenants associated with the property were persons identified as having made an important contribution to the history of the City, region, or state.

CRHR Criterion 3: Evaluating the subject property under Criterion 3 of the CRHR for determining the significance of the architecture, design, or construction of the built-environment resource at 1607 South Magnolia Avenue, it is apparent that the building was constructed as a modest dwelling in a simple vernacular style of architecture. As stated in the *Final City of Monrovia Historic Context Statement*, small vernacular cottages were usually located on the very outer edges of a city, and occupied by families in the lower stratus of society, and finding a building that represents this aspect of early twentieth-century life is very difficult. Unfortunately, even though the subject building appears to have retained its original massing, all the exterior materials including the original wood siding, windows and doors, that are integral features of simple, wood buildings, were removed during renovations. With the loss of its original material, and character-defining features, the building is unable to convey a structure dating from the early twentieth century.

The house at 1607 South Magnolia Avenue has lost many of the essential physical aspects of its original, physical integrity that adversely affect its ability to convey any historic significance:

Design: this aspect of integrity was lost with complete removal of the original wood siding, wood windows and doors, and trim boards.

Materials: this aspect of integrity was lost with complete removal of the original wood siding, wood windows and doors, and trim boards.

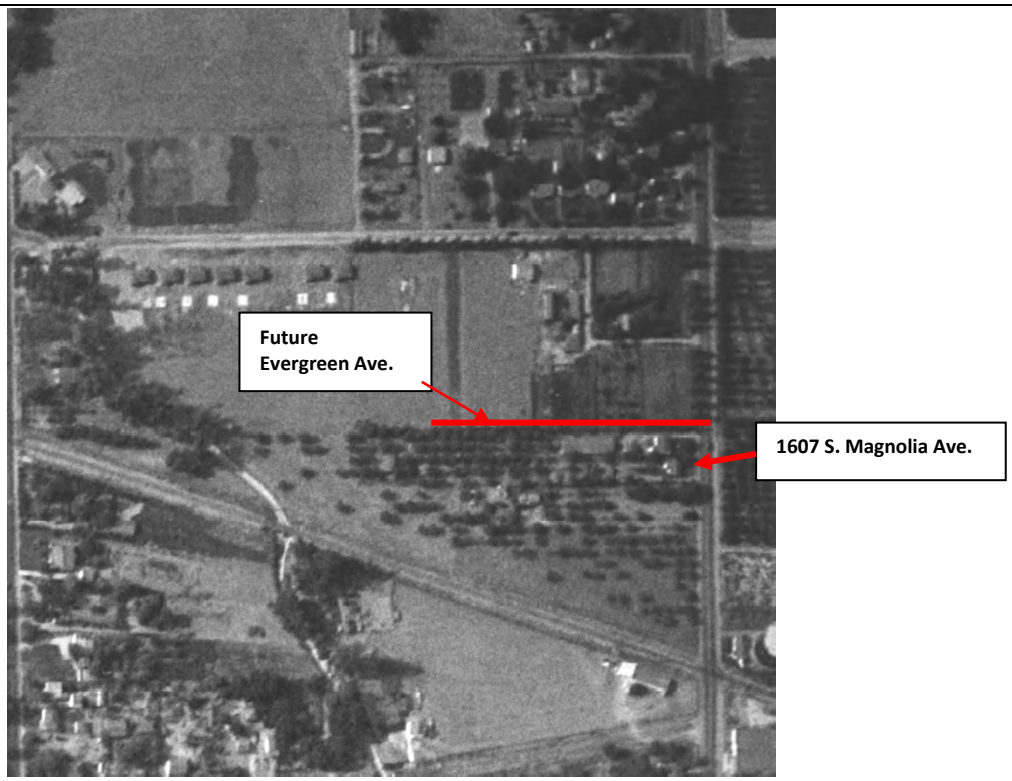
Workmanship: this aspect of integrity was lost with complete removal of the original wood siding, wood windows and doors, and trim boards.

Setting: the setting of the house has changed from that of a lightly-settled residential neighborhood, with some remaining citrus groves nearby, to that of a major, eight-lane freeway on the other side of the street, and commercial light-industrial business surrounding the property on its other three sides.

Feeling: this aspect of integrity was lost with complete removal of the original wood siding, wood windows and doors, and trim boards.

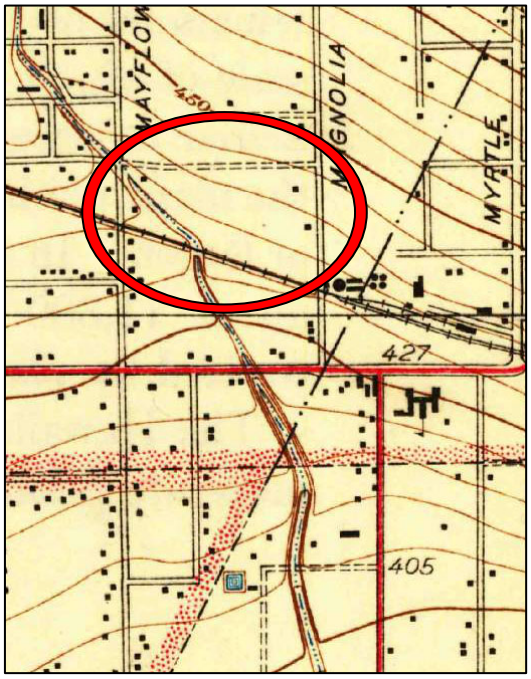
Association: the house was most probably moved from a prior location to its current site in the early 1940s. Not only has it lost association with its true location, but the neighborhood where the building was set in the 1940s has also been substantially altered from light agricultural to light industrial use.

Location: the house has been in its current location since 1942.



The property at 1607 South Magnolia Avenue has not yielded, nor does it appear to have the potential to yield, information important to the history of the local area, California or the nation. The property does not appear eligible for listing in the National Register under Criterion D, or the California Register under Criterion 4.

*Recorded by: Pamela Daly, M.S.H.P. *Date: July 30, 2018 ☒Continuation ☐ Update



B10. Statement of Significance, continued:

City of Monrovia criterion:

1. It is identified with persons or events significant in local, regional, state or national history.
   The property at 1607 South Magnolia Avenue has not been identified with persons or events significant in local, regional, state, or national history.
2. It is representative of work of a notable builder, designer, or architect.
   The original building permit for the property was not available, but based on our experience, the property at 1607 South Magnolia Avenue was not the product of a notable builder, designer, or architect. The building was substantially altered when the original windows, doors, siding, and trim were removed during renovations, and the building is unable to convey its association with the early twentieth century.
3. It contributes to the significance of a historic area, being a geographically definable area possessing a concentration of not less than 50% of historic or architecturally related grouping of properties which contribute to each other and are unified aesthetically by physical layout or development.
   The house at 1607 South Magnolia Avenue was literally cut-off from its original neighborhood and setting with the construction of the 210 Freeway through Monrovia. It is not related to any similar buildings in its immediate setting.
4. It embodies one or more distinctive characteristics of style, type, period, design, materials, detail, or craftsmanship.
   To be considered a historic resource under the theme for Residential Development 1903-1940, eligible buildings should "reflect the pattern and form of development typical of early to mid-twentieth century suburban development and trends" and "retain the essential aspects of integrity" that reflect this theme. Because of the substantial loss of physical integrity suffered by the house at 1607 South Magnolia Avenue, and that the house has completely lost any association with a setting dating from the early 1900s, the property does not appear to be significant.
5. It has a unique location or physical characteristics or represents an established and familiar visual feature of a neighborhood, a community, or the City.
   The residence at 1607 South Magnolia Avenue is not situated in a unique location, does not possess unique physical characteristics, or represent an established and familiar visual feature to the light industrial area situated south of the 210 Freeway, west of Magnolia Avenue.
6. It incorporates elements that help preserve and protect a historic place or area of historic interest in the City.
   The residence at 1607 South Magnolia Avenue is not located in an area of historic interest in the City.
7. It has yielded, or may be likely to yield information important in prehistory or history.
   The property at 1607 South Magnolia Avenue has not yielded, nor does it appear likely to yield, information important to the history of Monrovia.

1948 aerial photograph of the project site. Magnolia Avenue runs north-south to the east; Central Avenue is the paved road to the north; the Atchison Topeka Santa Fe Railroad lines run diagonally northwest-southeast; and Mayflower Avenue to the west. The house at 1603 South Magnolia Avenue is immediately north of the subject building. (NETR Historic Aerials)

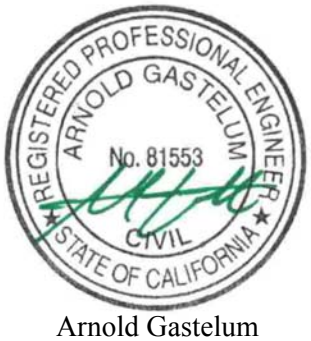
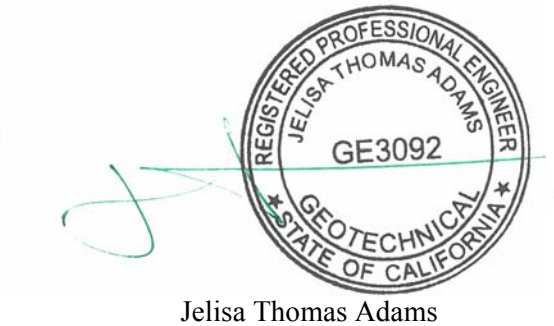
Attention: Mr. Bryce Tabb

Subject: GEOTECHNICAL INVESTIGATION
PROPOSED MULTI-FAMILY RESIDENTIAL DEVELOPMENT
1625 SOUTH MAGNOLIA AVENUE
MONROVIA, CALIFORNIA



Dear Mr. Tabb:

In accordance with your authorization of our proposal dated March 23, 2017, we have performed a geotechnical investigation for the proposed multi-family residential development located at 1625 South Magnolia Avenue in the City of Monrovia, California. The accompanying report presents the findings of our study, and our conclusions and recommendations pertaining to the geotechnical aspects of proposed design and construction. Based on the results of our investigation, it is our opinion that the site can be developed as proposed, provided the recommendations of this report are followed and implemented during design and construction.



If you have any questions regarding this report, or if we may be of further service, please contact the undersigned.

Very truly yours,

GEOCON WEST, INC.

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for the proposed multi-family residential development located at 1625 South Magnolia Avenue in the City of Monrovia, California (see Vicinity Map, Figure 1). The purpose of the investigation was to evaluate subsurface soil and geologic conditions underlying the site and, based on conditions encountered, to provide conclusions and recommendations pertaining to the geotechnical aspects of design and construction.

The scope of this investigation included a site reconnaissance, field exploration, laboratory testing, engineering analysis, and the preparation of this report. The site was explored on June 12, 2017, by excavating six 8-inch diameter borings to depths of approximately 25½ feet below the existing ground surface utilizing a truck-mounted hollow-stem auger drilling machine. The approximate locations of the exploratory borings are depicted on the Site Plan (see Figure 2). A detailed discussion of the field investigation, including boring logs, is presented in Appendix A.

Laboratory tests were performed on selected soil samples obtained during the investigation to determine pertinent physical and chemical soil properties. Appendix B presents a summary of the laboratory test results.

The recommendations presented herein are based on analysis of the data obtained during the investigation and our experience with similar soil and geologic conditions. References reviewed to prepare this report are provided in the *List of References* section.

If project details vary significantly from those described above, Geocon should be contacted to determine the necessity for review and possible revision of this report.

2. SITE AND PROJECT DESCRIPTION

The subject site is located at 1625 South Magnolia Avenue in the City of Monrovia, California. The site consists of a 5.73-acre irregularly shaped parcel which is currently an automobile distribution lot. The site is occupied by four existing commercial/industrial structures, paved surface parking lots, and associated hardscape and landscaping. Two single-story residential structures also occupy a portion of the site adjacent to Evergreen Avenue. The site is bounded by Magnolia Avenue to the east, by a railroad right-of-way to the south, by residential and industrial structures to the west, by Evergreen Avenue to the north and northwest, and by commercial structures and associated surface parking lots to the east. The site is relatively level, with no pronounced highs or lows. The topography at the site and in the general site vicinity slopes downward toward the south and southwest. Surface water drainage at the site appears to be by sheet flow along the existing ground contours to the city streets. Vegetation consists of some isolated trees and sparse grass and shrubbery in isolated planter areas.

Based on the information provided by the Client, it is our understanding that the proposed project will consist of a Type III wrap development including five-story residential buildings and a seven-level parking structure. The development will include approximately 436 residential housing units. It is our further understanding that the proposed structures will be constructed at or near present site grade. The footprints of the proposed structures are shown on Figure 2 (Site Plan).

Due to preliminary nature of the design at this time, wall and column loads were not available. It is anticipated that column loads for the proposed residential buildings will be up to 200 kips, and wall loads will be up to 5 kips per linear foot. It is anticipated that column loads for the proposed parking structure will be up to 800 kips, and wall loads will be up to 10 kips per linear foot.

Once the design phase and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Any changes in the design, location or elevation of any structure, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

3. GEOLOGIC SETTING

The site is located in the northeastern San Gabriel Valley. The San Gabriel Valley is an alluvial filled valley bounded by the Sierra Madre Fault Zone and San Gabriel Mountains on the north, by the Puente Hills on the south, by the Covina and Indian Hills on the east, and by the Raymond Basin on the west. The alluvial deposits are derived from erosion of the San Gabriel Mountains to the north and subsequent deposition by the San Gabriel River and other local drainages. The alluvium is estimated to be approximately 200 feet thick at the base of the mountains, extending to hundreds of feet thick in the central portion of the valley.

Regionally, the site is located within the northern portion of the Peninsular Ranges geomorphic province. This geomorphic province is characterized by northwest-trending physiographic and geologic features such as the Whittier Fault located approximately 7.2 miles to the southwest. The active Raymond Fault, located approximately 1.4 miles to the northwest of the site, forms the boundary between the Peninsular Ranges Geomorphic Province and the Transverse Ranges Geomorphic Province to the north.

4. SOIL AND GEOLOGIC CONDITIONS

Based on our field investigation and published geologic maps of the area, the site is underlain by artificial fill and Holocene are young alluvial fan deposits consisting of varying amounts of sand, silt, clay and gravel (California Geological Survey [CGS], 2010). Detailed stratigraphic profiles are provided on the boring logs in Appendix A.

4.1 Artificial Fill

Artificial fill was encountered in the exploratory borings to a maximum depth of 2½ feet below existing ground surface. The artificial fill generally consists of light yellowish brown, grayish brown and dark brown silty sand with lesser amounts of sandy silt and varying amounts of fine gravel and trace roots. The fill is characterized as moist and loose to medium dense. The fill is likely the result of past grading or construction activities at the site. Deeper fill may exist between excavations and in other portions of the site that were not directly explored.

4.2 Alluvium

Holocene age young alluvial deposits were encountered beneath the artificial fill and consist primarily of light gray, yellowish brown, dark brown, and reddish brown interbedded silty sand, poorly graded and well-graded sand, sandy silt, and silt with varying amounts of fine gravel. The soil is characterized as slightly moist to moist and loose to very dense or firm.

5. GROUNDWATER

Based on a review of the Seismic Hazard Evaluation of the Mount Wilson Quadrangle, Los Angeles County, California (California Division of Mines and Geology [CDMG], 1998), the historically highest groundwater level in the area is approximately 145 feet beneath the ground surface. Groundwater information presented in this document is generated from data collected in the early 1900's to the late 1990s. Based on current groundwater basin management practices, it is unlikely that groundwater levels will ever exceed the historic high levels.

Considering the historic high groundwater level (CDMG, 1998), the lack of groundwater encountered in our borings, and the depth of the proposed construction, it is unlikely that groundwater will be encountered during construction. However, it is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially in impermeable fine-grained soils which are heavily irrigated or after seasonal rainfall. In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the immediate site vicinity. Proper surface drainage of irrigation and precipitation will be critical for future performance of the project. Recommendations for drainage are provided in the S*urface Drainage* section of this report (see Section 7.21).

6. GEOLOGIC HAZARDS

6.1 Surface Fault Rupture

The numerous faults in Southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geological Survey (CGS, formerly known as CDMG) for the Alquist-Priolo Earthquake Fault Zone Program (Bryant and Hart, 2007). By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years), but has had no known Holocene movement. Faults that have not moved in the last 1.6 million years are considered inactive.

The site is not within a currently established State of California Alquist-Priolo Earthquake Fault Zone for surface fault rupture hazards (CGS, 2017). In addition, the site is not located within the Raymond Hill Fault Zone as defined by the City of Monrovia Safety Element of the General Plan (2002). No active or potentially active faults with the potential for surface fault rupture are known to pass directly beneath the site. Therefore, the potential for surface rupture due to faulting occurring beneath the site during the design life of the proposed development is considered low. However, the site is located in the seismically active Southern California region, and could be subjected to moderate to strong ground shaking in the event of an earthquake on one of the many active Southern California faults. The faults in the vicinity of the site are shown in Figure 3, Regional Fault Map.

The closest active fault to the site is the Raymond Fault located approximately 1.4 miles to the northwest (CDMG, 2007). Other nearby active faults are the Duarte Fault, the Sierra Madre Fault, the Verdugo Fault, the Whittier Fault, the Hollywood Fault, and the Cucamonga Fault, located approximately 1.6 miles northeast, 2.1 miles north-northeast, 7.1 miles west, 7.2 miles southwest, 13½ miles west, and 19 miles east of the site, respectively. (Ziony and Jones, 1989). The active San Andreas Fault Zone is located approximately 23 miles north-northeast of the site.

The closest potentially active faults to the site are the San Jose Fault and the Indian Hill Fault located approximately 7.4 miles to the southeast and 7.5 miles to the southeast, respectively. The potentially active San Gabriel Fault located is located approximately 7.7 miles north of the site (Ziony and Jones, 1989).

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3.0 kilometers. The October 1, 1987 M_w 5.9 Whittier Narrows earthquake and the January 17, 1994, M_w 6.7 Northridge earthquake were a result of movement on the Puente Hills Blind Thrust and the Northridge Thrust, respectively. These thrust faults and others in the Los Angeles area do not present a potential surface fault rupture hazard at the site. However, these deep thrust faults are considered active features capable of generating future earthquakes that could result in moderate to significant ground shaking at the site.

6.2 Seismicity

As with all of Southern California, the site has experienced historic earthquakes from various regional faults. The seismicity of the region surrounding the site was formulated based on research of an electronic database of earthquake data. The epicenters of recorded earthquakes with magnitudes equal to or greater than 5.0 in the site vicinity are depicted on Figure 4, Regional Seismicity Map. A partial list of moderate to major magnitude earthquakes that have occurred in the Southern California area within the last 100 years is included in the following table.

LIST OF HISTORIC EARTHQUAKES

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (Miles)	Direction to Epicenter
San Jacinto-Hemet area	April 21, 1918	6.8	63	ESE
Near Redlands	July 23, 1923	6.3	44	ESE
Long Beach	March 10, 1933	6.4	36	S
Tehachapi	July 21, 1952	7.5	83	NW
San Fernando	February 9, 1971	6.6	29	NW
Whittier Narrows	October 1, 1987	5.9	7	SW
Sierra Madre	June 28, 1991	5.8	9	N
Landers	June 28, 1992	7.3	90	E
Big Bear	June 28, 1992	6.4	68	E
Northridge	January 17, 1994	6.7	31	W
Hector Mine	October 16, 1999	7.1	104	ENE

The site could be subjected to strong ground shaking in the event of an earthquake. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated if the proposed structures are designed and constructed in conformance with current building codes and engineering practices.

6.3 Seismic Design Criteria

The following table summarizes summarizes site-specific design criteria obtained from the 2016 California Building Code (CBC; Based on the 2015 International Building Code [IBC] and ASCE 7-10), Chapter 16 Structural Design, Section 1613 Earthquake Loads. The data was calculated using the computer program *U.S. Seismic Design Maps*, provided by the USGS. The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.3.2 of the 2016 CBC and Table 20.3-1 of ASCE 7-10. The values presented below are for the risk-targeted maximum considered earthquake (MCE_R).

2016 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2016 CBC Reference
Site Class	D	Section 1613.3.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	2.157g	Figure 1613.3.1(1)
MCE_R Ground Motion Spectral Response Acceleration – Class B (1 sec), S_1	0.834g	Figure 1613.3.1(2)
Site Coefficient, F_A	1.0	Table 1613.3.3(1)
Site Coefficient, F_V	1.5	Table 1613.3.3(2)
Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	2.157g	Section 1613.3.3 (Eqn 16-37)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	1.251g	Section 1613.3.3 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	1.438g	Section 1613.3.4 (Eqn 16-39)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.834g	Section 1613.3.4 (Eqn 16-40)

The table below presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with ASCE 7-10.

ASCE 7-10 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-10 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.819g	Figure 22-7
Site Coefficient, F_{PGA}	1.0	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.819g	Section 11.8.3 (Eqn 11.8-1)

The Maximum Considered Earthquake Ground Motion (MCE) is the level of ground motion that has a 2 percent chance of exceedance in 50 years, with a statistical return period of 2,475 years. According to the 2016 California Building Code and ASCE 7-10, the MCE is to be utilized for the evaluation of liquefaction, lateral spreading, seismic settlements, and it is our understanding that the intent of the Building code is to maintain "Life Safety" during a MCE event. The Design Earthquake Ground Motion (DE) is the level of ground motion that has a 10 percent chance of exceedance in 50 years, with a statistical return period of 475 years.

Deaggregation of the MCE peak ground acceleration was performed using the USGS online BETA Unified Hazard Tool, 2008 Conterminous U.S. Dynamic edition. The result of the deaggregation analysis indicates that the predominant earthquake contributing to the MCE peak ground acceleration is characterized as a 6.7 magnitude event occurring at a hypocentral distance of 6.87 kilometers from the site.

Deaggregation was also performed for the Design Earthquake (DE) peak ground acceleration, and the result of the analysis indicates that the predominant earthquake contributing to the DE peak ground acceleration is characterized as a 6.7 magnitude occurring at a hypocentral distance of 10.44 kilometers from the site.

Conformance to the criteria in the above tables for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur if a large earthquake occurs. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

6.4 Liquefaction Potential

Liquefaction is a phenomenon in which loose, saturated, relatively cohesionless soil deposits lose shear strength during strong ground motions. Primary factors controlling liquefaction include intensity and duration of ground motion, gradation characteristics of the subsurface soils, in-situ stress conditions, and the depth to groundwater. Liquefaction is typified by a loss of shear strength in the liquefied layers due to rapid increases in pore water pressure generated by earthquake accelerations.

The current standard of practice, as outlined in the "Recommended Procedures for Implementation of DMG Special Publication 117, Guidelines for Analyzing and Mitigating Liquefaction in California" and "Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California" requires liquefaction analysis to a depth of 50 feet below the lowest portion of the proposed structure. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

The Seismic Hazards Zone Map for the Mount Wilson 7.5 Minute Quadrangle (CGS, 2017; CDMG, 1999) indicates that the site is not located within a zone of required investigation for liquefaction. In addition, the County of Los Angeles Safety Element (Leighton, 1990), indicates that the site is not located in a liquefiable area. Groundwater was not encountered in our borings drilled to a maximum depth of 25½ feet beneath the existing ground surface and the historic high groundwater level in the area is reported to be approximately 145 feet beneath the existing ground surface (CDMG, 1998). Based on these considerations, it is our opinion that the potential for liquefaction and associated ground deformations beneath the site is very low.

6.5 Slope Stability

The site is relatively level and the topography in the site vicinity slopes downward toward the south and southwest. The County of Los Angeles Safety Element (Leighton, 1990), indicates that the site is not located in a hillside area. Also, the State of California Seismic Hazard Zone Map for the Mount Wilson Quadrangle (CGS, 2017; CDMG, 1999) indicates that the site is not located within a zone of required investigation for earthquake-induced landslides. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Therefore, the potential for slope stability hazards to adversely impact the site is considered low.

6.6 Earthquake-Induced Flooding

Earthquake-induced flooding is inundation caused by failure of dams or other water-retaining structures due to earthquakes. The City of Monrovia Safety Element (2002) and the Los Angeles County Safety Element (Leighton, 1990) indicates that the site is located within the potential inundation area for Big Santa Anita Dam, Sierra Madre Dam, and Saw Pit Dam. However, these reservoirs, as well as others in California, are continually monitored by various governmental agencies (such as the State of California Division of Safety of Dams and the U.S. Army Corps of Engineers) to guard against the threat of dam failure. Current design, construction practices, and ongoing programs of review, modification, or total reconstruction of existing dams are intended to ensure that all dams are capable of withstanding the maximum considered earthquake (MCE) for the site. Therefore, the potential for inundation at the site as a result of an earthquake-induced dam failure is considered low.

6.7 Tsunamis, Seiches, and Flooding

The site is not located within a coastal area. Therefore, tsunamis, seismic sea waves, are not considered a significant hazard at the site.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. No major water-retaining structures are located immediately up gradient from the project site. Therefore, flooding from a seismically-induced seiche is considered unlikely.

The majority of the site is within an area of minimal flooding (zone X) as defined by the Federal Emergency Management Agency, however the eastern portion of the site (adjacent to Magnolia Avenue) is within a flood zone D for possible but undetermined flood hazards (FEMA, 2017; LACDPW, 2017b).

6.8 Oil Fields & Methane Potential

Information on the California Division of Oil, Gas and Geothermal Resources (DOGGR) Well Finder Website (DOGGR, 2017) indicates the site is not located within the limits of an oilfield and oil or gas wells are not located within a mile of the site vicinity. However, due to the voluntary nature of record reporting by the oil well drilling companies, wells may be improperly located or not shown on the location map and undocumented wells could be encountered during construction. Any wells encountered during construction will need to be properly abandoned in accordance with the current requirements of the DOGGR.

As previously indicated, the site is not located within an oilfield. Therefore, the potential for methane or other volatile gases to occur at the site is considered very low. However, should it be determined that a methane study is required for the proposed development it is recommended that a qualified methane consultant be retained to perform the study and provide mitigation measures as necessary.

6.9 Subsidence

Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils that are particularly subject to subsidence include those with high silt or clay content. The site is not located within an area of known ground subsidence. No large-scale extraction of groundwater, gas, oil, or geothermal energy is occurring or planned at the site or in the general site vicinity. There appears to be little or no potential for ground subsidence due to withdrawal of fluids or gases at the site.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 General

7.1.1 It is our opinion that neither soil nor geologic conditions were encountered during this investigation that would preclude the construction of the proposed development provided the recommendations presented herein are followed and implemented during design and construction.

7.1.2 Up to 2½ feet of existing artificial fill was encountered during site exploration. The existing fill encountered is believed to be the result of past grading and construction activities at the site. Deeper fill may exist in other areas of the site that were not directly explored. It is our opinion that the existing fill, in its present condition, is not suitable for direct support of proposed foundations or slabs. The existing fill and site soils are suitable for re-use as engineered fill provided the recommendations in the Grading section of this report are followed (see Section 7.5).

7.1.3 As a minimum, the upper 5 feet of existing soils within the footprint areas of the proposed residential buildings and parking structure should be excavated and properly compacted for foundation and slab support. The engineered fill blanket should extend at least 5 feet beyond the edge of foundations or for a distance equal to the depth of fill below the foundations, whichever is greater. Where the recommended grading cannot be performed, such as adjacent to property lines, alternate grading and foundation design recommendations may be required. Proposed foundations should be underlain by at least 3 feet of newly compacted engineered fill. Foundations with an embedment greater than 2 feet will require deeper grading in order to maintain the required 3-foot-thick fill blanket beneath foundations. It is recommended that the grading contractor verify the depth of all building foundations prior to commencement of site grading activities in order to correctly determine the required excavation depth. Deeper fill or soft soils encountered during site grading operations should be excavated as necessary at the direction of the Geotechnical Engineer. The limits of existing fill and/or soft soil removal will be verified by the Geocon representative during site grading operations.

7.1.4 Subsequent to the recommended grading, the proposed residential buildings and parking structure may be supported on conventional foundation systems deriving support the newly placed engineered fill. All foundation excavations must be observed and approved in writing by the Geotechnical Engineer prior to placement of steel or concrete. Recommendations for *Conventional Foundation Design* are provided in Sections 7.7 through 7.9 of this report.

7.1.5 It is recommended that a seismic separation or flexible connection be utilized where adjacent structures abut. The design of the connection is at the discretion of the project structural engineer.

7.1.6 It is recommended that flexible utility connections be utilized for all rigid utilities to minimize or prevent damage to utilities from minor differential movements.

7.1.7 It is anticipated that stable excavations for the recommended grading associated with the proposed structures can be achieved with sloping measures. However, if excavations in close proximity to an adjacent property line and/or existing structure are required, special excavation measures such as slot-cutting may be necessary in order to maintain lateral support of offsite improvements. Excavation recommendations for *Temporary Excavations* and *Slot Cutting* are provided in Sections 7.18 and 7.19.

7.1.8 Foundations for small outlying structures, such as block walls up to 6 feet high, planter walls or trash enclosures, which will not be tied to the proposed structure, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and proper compaction cannot be performed or is undesirable, foundations may derive support directly in the undisturbed alluvial soils found at or below a depth of 12 inches, and should be deepened as necessary to maintain a minimum 12-inch embedment into the recommended bearing materials. If the soils exposed in the excavation bottom are soft or loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved in writing by a Geocon representative.

7.1.9 Where new paving is to be placed, it is recommended that all existing fill and soft alluvial soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all existing fill and soft soils in the area of new paving is not required; however, paving constructed over existing uncertified fill or unsuitable alluvium may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of soil should be scarified and properly compacted for paving support. *Preliminary Pavement Recommendations* are provided in Section 7.13.

7.1.10 Based on the results of percolation testing performed at the site, a stormwater infiltration system is considered feasible for this project. Recommendations for *Stormwater Infiltration* are provided in Section 7.20.

7.1.11 Once the design and foundation loading configuration for the proposed structure proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Based on the final foundation loading configurations, the potential for settlement should be re-evaluated by this office.

7.1.12 Any changes in the design, location or elevation, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

7.1.13 The most recent ASTM standards apply to this project and must be utilized, even if older ASTM standards are indicated in this report.

7.2 Soil and Excavation Characteristics

7.2.1 The in-situ soils can be excavated with moderate effort using conventional excavation equipment. Due to the loose and granular nature of the soils, minor caving should be anticipated in unshored excavations. In addition, the contractor should be aware that formwork may be required to prevent caving of shallow spread foundation excavations.

7.2.2 It is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with applicable OSHA rules and regulations to maintain safety and maintain the stability of adjacent existing improvements.

7.2.3 All onsite excavations must be conducted in such a manner that potential surcharges from existing structures, construction equipment, and vehicle loads are resisted. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation or vehicle load. Penetrations below this 1:1 projection will require special excavation measures such as sloping and shoring. Excavation recommendations are provided in the *Temporary Excavations* section of this report (see Section 7.18).

7.2.4 The existing site soils encountered during the field investigation near the ground surface are considered to have a "very low" (EI = 4) expansive potential and are classified as "non-expansive" in accordance with the 2016 California Building Code (CBC) Section 1803.5.3. The recommendations presented herein assume that the building foundations and slabs will derive support in these materials.

7.3 Hydroconsolidation

7.3.1 Hydroconsolidation is the tendency of unsaturated soil structure to collapse upon saturation resulting in the overall settlement of the effected soil and overlying foundations or improvements supported thereon. Potentially compressible soils underlying the site are typically removed and recompacted during remedial site grading. However, if compressible soil is left in-place, a potential for settlement due to hydroconsolidation of the soil exists.

7.3.2 The laboratory test results presented herein, indicate that the potential for hydroconsolidation for the soils located near Borings B1 and B6, between 10 and 14 feet in depth ranges from about 1.7 to 2.2 percent. Therefore, the potential for settlement due to hydroconsolidation is up to 1 inch in those areas, should those soils become saturated.

7.3.3 Minimal infiltration of surface runoff is anticipated in property paved and maintained parking areas. Provided proper drainage measures are designed and implemented, the potential for saturation of the soils and subsequent hydroconsolidation will be minimized. Maintaining proper site drainage is discussed in Section 7.21 of the referenced report.

7.4 Minimum Resistivity, pH, and Water-Soluble Sulfate

7.4.1 Potential of Hydrogen (pH) and resistivity testing, as well as chloride content testing, were performed on representative samples of on-site material to generally evaluate the corrosion potential to surface utilities. The tests were performed in accordance with California Test Method Nos. 643 and 422 and indicate that the soils are considered "moderately corrosive" with respect to corrosion of buried ferrous metals on site. The results are presented in Appendix B (Figure B9) and should be considered for design of underground structures.

7.4.2 Laboratory tests were performed on representative samples of the on-site materials to measure the percentage of water-soluble sulfate content. Results from the laboratory water-soluble sulfate tests are presented in Appendix B (Figure B9) and indicate that the on-site materials possess "not applicable" sulfate exposure to concrete structures as defined by 2016 CBC Section 1904 and ACI 318-11 Sections 4.2 and 4.3.

7.4.3 Geocon West, Inc. does not practice in the field of corrosion engineering and mitigation. If corrosion sensitive improvements are planned, it is recommended that a corrosion engineer be retained to evaluate corrosion test results and incorporate the necessary precautions to avoid premature corrosion of buried metal pipes and concrete structures in direct contact with the soils.

7.5 Grading

7.5.1 Grading is anticipated to include excavation of site soils for the proposed residential buildings, parking structure, foundations, and utility trenches, as well as placement of backfill for foundations, walls, and trenches.

7.5.2 Earthwork should be observed, and compacted fill tested by representatives of Geocon West, Inc. The existing fill encountered during exploration is suitable for re-use as an engineered fill, provided any encountered oversize material (greater than 6 inches) and any encountered deleterious debris are removed.

7.5.3 A preconstruction conference should be held at the site prior to the beginning of grading operations with the owner, contractor, civil engineer and geotechnical engineer in attendance. Special soil handling requirements can be discussed at that time.

7.5.4 Grading should commence with the removal of all existing vegetation and existing improvements from the area to be graded. Deleterious debris such as wood and root structures should be exported from the site and should not be mixed with the fill soils. Asphalt and concrete should not be mixed with the fill soils unless approved by the Geotechnical Engineer. All existing underground improvements planned for removal should be completely excavated and the resulting depressions properly backfilled in accordance with the procedures described herein. Once a clean excavation bottom has been established it must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

7.5.5 As a minimum, the upper 5 feet of existing soils within the footprint areas of the proposed residential buildings and parking structure should be excavated and properly compacted for foundation and slab support. The engineered fill blanket should extend at least 5 feet beyond the edge of foundations or for a distance equal to the depth of fill below the foundations, whichever is greater. Where the recommended grading cannot be performed, such as adjacent to property lines, alternate grading and foundation design recommendations may be required. Proposed foundations at or near existing grade should be underlain by at least 3 feet of newly compacted engineered fill. Foundations with an embedment greater than 2 feet will require deeper grading in order to maintain the required 3-foot-thick fill blanket beneath foundations. It is recommended that the grading contractor verify the depth of all building foundations prior to commencement of site grading activities in order to correctly determine the required excavation depth. Deeper fill or soft soils encountered during site grading operations should be excavated as necessary at the direction of the Geotechnical Engineer. The limits of existing fill and/or soft soil removal will be verified by the Geocon representative during site grading operations.

7.5.6 It is anticipated that stable excavations for the recommended grading associated with the proposed structures can be achieved with sloping measures. However, if excavations in close proximity to an adjacent property line and/or existing structure are required, special excavation measures such as slot-cutting may be necessary in order to maintain lateral support of offsite improvements. Excavation recommendations for *Temporary Excavations* and *Slot Cutting* are provided in Sections 7.18 and 7.19.

7.5.7 Excavated soil generally free of deleterious debris can be placed as fill and compacted in layers to the design finish grade elevations. Fill and backfill soil should be placed in horizontal loose layers approximately 6 to 8 inches thick, moisture conditioned to optimum moisture content, and compacted to a dry density of at least 90 percent of the laboratory maximum dry density as determined by ASTM D 1557 (latest edition).

7.5.8. Where new paving is to be placed, it is recommended that all existing fill and soft alluvium be excavated and properly compacted for paving support. As a minimum, the upper 12 inches of soil should be scarified, moisture conditioned to optimum moisture content, and compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Paving recommendations are provided in *Preliminary Pavement Recommendations* section of this report (see Section 7.13).

7.5.9 Foundations for small outlying structures, such as block walls up to 6 feet high, planter walls or trash enclosures, which will not be tied to the proposed structure, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and proper compaction cannot be performed or is undesirable, foundations may derive support directly in the undisturbed alluvial soils found at or below a depth of 12 inches, and should be deepened as necessary to maintain a minimum 12-inch embedment into the recommended bearing materials. If the soils exposed in the excavation bottom are soft or loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved in writing by a Geocon representative

7.5.10 It is recommended that flexible utility connections be utilized for all rigid utilities to minimize or prevent damage to utilities from minor differential soil movements. Utility trenches should be properly backfilled in accordance with the requirements of the Green Book (latest edition). The pipe should be bedded with clean sands (Sand Equivalent greater than 30) to a depth of at least 1 foot over the pipe, and the bedding material must be inspected and approved in writing by the Geotechnical Engineer (a representative of Geocon). The use of gravel is not acceptable unless used in conjunction with filter fabric to prevent the gravel from having direct contact with soil. The remainder of the trench backfill may be derived from onsite soil or approved import soil, compacted as necessary, until the required compaction is obtained. The use of minimum 2-sack slurry as backfill is also acceptable as backfill. Prior to placing any bedding materials or pipes, the excavation bottom must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon).

7.5.11 Although not anticipated for this project, all imported fill shall be observed, tested, and approved by Geocon West, Inc. prior to bringing soil to the site. Rocks larger than 6 inches in diameter shall not be used in the fill. If necessary, import soils used as structural fill should have an expansion index less than 20 and soil corrosivity properties that are equally or less detrimental to that of the existing onsite soils (see Figure B9).

7.5.12 All trench and foundation excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon), prior to placing bedding materials, fill, steel, gravel or concrete.

7.6 Earthwork Grading Factors

7.6.1 Shrinkage results when a volume of material removed at one density is compacted to a higher density. A shrinkage factor of between 5 and 10 percent should be anticipated when excavating and compacting the existing earth materials on the site to an average relative compaction of 92 percent.

7.6.2 If import soils will be utilized in the building pad, the soils must be placed uniformly and at equal thickness at the direction of the Geotechnical Engineer (a representative of Geocon West, Inc.). Soils can be borrowed from non-building pad areas and later replaced with imported soils.

7.7 Conventional Foundation Design – Residential Buildings

7.7.1 Subsequent to the recommended grading, a conventional foundation system may be utilized for support of the proposed residential buildings provided foundations derive support in newly placed engineered fill. Foundations should be underlain by a minimum of 3 feet of newly placed engineered fill.

7.7.2 Continuous footings may be designed for an allowable bearing capacity of 2,200 pounds per square foot (psf), and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.7.3 Isolated spread foundations may be designed for an allowable bearing capacity of 2,500 psf, and should be a minimum of 24 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.7.4 The allowable soil bearing pressure above may be increased by 500 psf and 800 psf for each additional foot of foundation width and depth, respectively, up to maximum allowable bearing value of 3,300 psf should be utilized.

7.7.5 The allowable bearing pressures may be increased by one-third for transient loads due to wind or seismic forces.

7.7.6 Continuous footings should be reinforced with a minimum of four No. 4 steel reinforcing bars, two placed near the top of the footing and two near the bottom. The reinforcement for isolated spread footings should be designed by the project structural engineer.

7.7.7 If depth increases are utilized for the exterior wall footings, this office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary. Additional grading should be performed as necessary in order to maintain the required 3-foot-thick engineered fill blanket beneath building foundations.

7.7.8 The above foundation dimensions and minimum reinforcement recommendations are based on soil conditions and building code requirements only, and are not intended to be used in lieu of those required for structural purposes.

7.7.9 No special subgrade presaturation is required prior to placement of concrete. However, the foundation subgrade should be sprinkled as necessary to maintain a moist condition at the time of concrete placement.

7.7.10 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

7.7.11 This office should be provided a copy of the final construction plans so that the foundation recommendations presented herein could be properly reviewed and revised if necessary.

7.8 Conventional Foundation Design – Parking Structure

7.8.1 Subsequent to the recommended grading, a conventional foundation system may be utilized for support of the proposed residential structures provided foundations derive support in newly placed engineered fill. Foundations should be underlain by a minimum of 3 feet of newly placed engineered fill.

7.8.2 Continuous footings may be designed for an allowable bearing capacity of 3,000 psf, and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.8.3 Isolated spread foundations may be designed for an allowable bearing capacity of 3,500 psf, and should be a minimum of 24 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.8.4 The allowable soil bearing pressure above may be increased by 500 psf and 800 psf for each additional foot of foundation width and depth, respectively, up to maximum allowable bearing value of 4,500 psf should be utilized.

7.8.5 The allowable bearing pressures may be increased by one-third for transient loads due to wind or seismic forces.

7.8.6 Continuous footings should be reinforced with a minimum of four No. 4 steel reinforcing bars, two placed near the top of the footing and two near the bottom. The reinforcement for isolated spread footings should be designed by the project structural engineer.

7.8.7 If depth increases are utilized for the exterior wall footings, this office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary. Additional grading should be performed as necessary in order to maintain the required 3-foot-thick engineered fill blanket beneath building foundations.

7.8.8 The above foundation dimensions and minimum reinforcement recommendations are based on soil conditions and building code requirements only, and are not intended to be used in lieu of those required for structural purposes.

7.8.9 No special subgrade presaturation is required prior to placement of concrete. However, the foundation subgrade should be sprinkled as necessary to maintain a moist condition at the time of concrete placement.

7.8.10 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

7.8.11 This office should be provided a copy of the final construction plans so that the foundation recommendations presented herein could be properly reviewed and revised if necessary.

7.9 Conventional Foundation Settlement

7.9.1 The maximum expected total settlement for the residential buildings supported on a conventional foundation system with a maximum allowable bearing pressure of 3,300 psf is estimated to be less than 1 inch and occur below the heaviest loaded structural element. Settlement of the foundation system is expected to occur on initial application of loading. Differential settlement is expected to be less than ½ inch over a distance of 20 feet.

7.9.2 The maximum expected total settlement for the parking structure supported on a conventional foundation system with a maximum allowable bearing pressure of 4,500 psf deriving support in the recommended bearing material is estimated to be less than 1½ inches and occur below the heaviest loaded structural element. Settlement of the foundation system is expected to occur on initial application of loading. Differential settlement is expected to be less than ¾ inch over a distance of 20 feet.

7.9.3 It is recommended that a seismic separation or flexible connection be utilized where adjacent structures abut. The design of the connection is at the discretion of the project structural engineer.

7.9.4 If side by side construction is planned for the residential structure and parking structure it is recommended that the parking structure be constructed prior to the adjacent residential structure in order to allow the majority of the static settlement to occur. This will help to minimize differential settlements between the two structures. The utilization of a lesser bearing value would further reduce the anticipated settlements and could be evaluated further once the design becomes more finalized.

7.9.5 Once the design and foundation loading configurations for the proposed structures proceeds to a more finalized plan, the estimated settlements presented in this report should be reviewed and revised, if necessary. If the final foundation loading configurations are greater than the assumed loading conditions, the potential for settlement should be reevaluated by this office.

7.10 Miscellaneous Foundations

7.10.1 Foundations for small outlying structures, such as block walls up to 6 feet in height, planter walls or trash enclosures, which will not be structurally supported by the proposed building, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and compaction cannot be performed, such as adjacent to property lines, foundations may derive support in the undisturbed alluvial soils found at or below a depth of 12 inches, and should be deepened as necessary to maintain a minimum 12-inch embedment into the recommended bearing materials.

7.10.2 If the soils exposed in the excavation bottom are soft, compaction of the soft soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative. Miscellaneous foundations may be designed for a bearing value of 1,500 psf, and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade and 12 inches into the recommended bearing material. The allowable bearing pressure may be increased by up to one-third for transient loads due to wind or seismic forces.

7.10.3 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated.

7.11 Lateral Design

7.11.1 Resistance to lateral loading may be provided by friction acting at the base of foundations, slabs and by passive earth pressure. An allowable coefficient of friction of 0.40 may be used with the dead load forces in the undisturbed alluvial soils or newly placed engineered fill.

7.11.2 Passive earth pressure for the sides of foundations and slabs poured against undisturbed alluvial soils may be computed as an equivalent fluid having a density of 270 pounds per cubic foot (pcf) with a maximum earth pressure of 2,700 psf. When combining passive and friction for lateral resistance, the passive component should be reduced by one-third.

7.12 Concrete Slabs-on-Grade

7.12.1 Concrete slabs-on-grade subject to vehicle loading should be designed in accordance with the recommendations in the *Preliminary Pavement Recommendations* section of this report (Section 7.13).

7.12.2 The project structural engineer may determine and design the necessary slab thickness and reinforcing for this structure. Unless specifically evaluated and designed by a qualified structural engineer, the slab-on-grade in the residential building should be a minimum of 4 inches of concrete reinforced with No. 4 steel reinforcing bars placed 16 inches on center in both horizontal directions and positioned vertically near the slab midpoint. The concrete slab-on-grade may bear directly on the newly placed engineered fill. Any disturbed soils should be properly compacted for slab support.

7.12.3 Slabs-on-grade at the ground surface that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder placed directly beneath the slab. The vapor retarder and acceptable permeance should be specified by the project architect or developer based on the type of floor covering that will be installed. The vapor retarder design should be consistent with the guidelines presented in Section 9.3 of the American Concrete Institute's (ACI) *Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials* (ACI 302.2R-06) and should be installed in general conformance with ASTM E 1643 (latest edition) and the manufacturer's recommendations. A minimum thickness of 15 mils extruded polyolefin plastic is recommended; vapor retarders which contain recycled content or woven materials are not recommended. The vapor retarder should have a permeance of less than 0.01 perms demonstrated by testing before and after mandatory conditioning. The vapor retarder should be installed in direct contact with the concrete slab with proper perimeter seal. If the California Green Building Code requirements apply to this project, the vapor retarder should be underlain by 4 inches of clean aggregate. It is important that the vapor retarder be puncture resistant since it will be in direct contact with angular gravel. As an alternative to the clean aggregate suggested in the California Green Building Code, it is our opinion that the concrete slab-on-grade may be underlain by a vapor retarder over 4 inches of clean sand (sand equivalent greater than 30), since the sand will serve a capillary break and will minimize the potential for punctures and damage to the vapor barrier.

7.12.4 For seismic design purposes, a coefficient of friction of 0.40 may be utilized between concrete slabs and subgrade soils without a moisture barrier, and 0.15 for slabs underlain by a moisture barrier.

7.12.5 Exterior slabs, not subject to traffic loads, should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. Prior to construction of slabs, the upper 12 inches of subgrade should be moistened to optimum moisture content and properly compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Crack control joints should be spaced at intervals not greater than 10 feet and should be constructed using saw-cuts or other methods as soon as practical following concrete placement. Crack control joints should extend a minimum depth of one-fourth the slab thickness. The project structural engineer should design construction joints as necessary.

7.12.6 The recommendations of this report are intended to reduce the potential for cracking of slabs due to settlement. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade may exhibit some cracking due to minor soil movement and/or concrete shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

7.13 Preliminary Pavement Recommendations

7.13.1 Where new paving is to be placed, it is recommended that all existing fill and soft or unsuitable soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all soft or unsuitable soils in the area of new paving is not required, however, paving constructed over existing unsuitable soils may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of soil should be scarified and recompacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

7.13.2 The following pavement sections are based on an assumed R-Value of 35. Once site grading activities are complete, it is recommended that laboratory testing confirm the properties of the soils serving as paving subgrade prior to placing pavement.

7.13.3 The Traffic Indices listed below are estimates. Geocon does not practice in the field of traffic engineering. The actual Traffic Index for each area should be determined by the project civil engineer. If pavement sections for Traffic Indices other than those listed below are required, Geocon should be contacted to provide additional recommendations. Pavement thicknesses were determined following procedures outlined in the *California Highway Design Manual* (Caltrans). It is anticipated that the majority of traffic will consist of automobile and large truck traffic.

PRELIMINARY PAVEMENT DESIGN SECTIONS

Location	Estimated Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Automobile Parking	3.5	3	4
Driveways	5	3	5
Trash Truck & Fire Lanes	7	4	8

7.13.4 Asphalt concrete should conform to Section 203-6 of the "*Standard Specifications for Public Works Construction"* (Green Book). Class 2 aggregate base materials should conform to Section 26-1.02A of the "*Standard Specifications of the State of California, Department of Transportation"* (Caltrans). The use of Crushed Miscellaneous Base (CMB) in place of Class 2 aggregate base is acceptable. Crushed Miscellaneous Base should conform to Section 200-2.4 of the "*Standard Specifications for Public Works Construction"* (Green Book).

7.13.5 Unless specifically designed and evaluated by the project structural engineer, where concrete paving will be utilized for support of vehicles, we recommend that the concrete be a minimum of 6 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions. Concrete paving supporting vehicular traffic should be underlain by a minimum of 4 inches of aggregate base and a properly compacted subgrade. The subgrade and base material should be compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

7.13.6 The performance of pavements is highly dependent upon providing positive surface drainage away from the edge of pavements. Ponding of water on or adjacent to the pavement will likely result in saturation of the subgrade materials and subsequent cracking, subsidence and pavement distress. If planters are planned adjacent to paving, it is recommended that the perimeter curb be extended at least 12 inches below the bottom of the aggregate base to minimize the introduction of water beneath the paving.

7.14 Retaining Wall Design

7.14.1 The recommendations presented below are generally applicable to the design of rigid concrete or masonry retaining walls having a maximum height of 6 feet. In the event that walls significantly higher than 6 feet are planned, Geocon should be contacted for additional recommendations.

7.14.2 Retaining wall foundations may be designed in accordance with the recommendations provided in the *Conventional Foundation Design* sections of this report (see Sections 7.7 through 7.9).

7.14.3 Retaining walls with a level backfill surface that are not restrained at the top should be designed utilizing a triangular distribution of pressure (active pressure). Restrained walls are those that are not allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall in feet) at the top of the wall. Where walls are restrained from movement at the top, walls may be designed utilizing a triangular distribution of pressure (at-rest pressure). The table below presents recommended pressures to be used in retaining wall design, assuming that proper drainage will be maintained. Calculations of the recommended retaining wall pressures are provided as Figure 5.

RETAINING WALL WITH LEVEL BACKFILL SURFACE

HEIGHT OF RETAINING WALL (Feet)	ACTIVE PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)	AT-REST PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)
Up to 6	39	59

7.14.4 The wall pressures provided above assume that the retaining wall will be properly drained preventing the buildup of hydrostatic pressure. If retaining wall drainage is not implemented, the equivalent fluid pressure to be used in design of undrained walls is 90 pcf. The value includes hydrostatic pressures plus buoyant lateral earth pressures.

7.14.5 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures and should be designed for each condition as the project progresses.

7.14.6 It is recommended that line-load surcharges from adjacent wall footings, use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.20\times\left(\frac{z}{H}\right)}{\left[0.16+\left(\frac{z}{H}\right)^2\right]^2}\times\frac{Q_L}{H}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.28\times\left(\frac{x}{H}\right)^2\times\left(\frac{z}{H}\right)}{\left[\left(\frac{x}{H}\right)^2+\left(\frac{z}{H}\right)^2\right]^2}\times\frac{Q_L}{H}$$

where x is the distance from the face of the excavation to the vertical line-load, H is the distance from the bottom of the footing to the bottom of excavation, z is the depth at which the horizontal pressure is desired, QL is the vertical line-load and σH is the horizontal pressure at depth z.

7.14.7 It is recommended that vertical point-loads, from construction equipment outriggers or adjacent building columns use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.28\times\left(\frac{z}{H}\right)^2}{\left[0.16+\left(\frac{z}{H}\right)^2\right]^3}\times\frac{Q_P}{H^2}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.77\times\left(\frac{x}{H}\right)^2\times\left(\frac{z}{H}\right)^2}{\left[\left(\frac{x}{H}\right)^2+\left(\frac{z}{H}\right)^2\right]^3}\times\frac{Q_P}{H^2}$$

then

$$\sigma'_H(z) = \sigma_H(z)cos^2(1.1\theta)$$

where x is the distance from the face of the excavation to the vertical point-load, H is distance from the outrigger/bottom of column footing to the bottom of excavation, z is the depth at which the horizontal pressure is desired, Q_P is the vertical point-load, σ is the vertical pressure at depth z, Θ is the angle between a line perpendicular to the bulkhead and a line from the point-load to half the pile spacing at the bulkhead, and σ_H is the horizontal pressure at depth z.

7.14.8 In addition to the recommended earth pressure, the upper ten feet of the retaining wall adjacent to the street or driveway areas should be designed to resist a uniform lateral pressure of 100 psf, acting as a result of an assumed 300 psf surcharge behind the wall due to normal street traffic. If the traffic is kept back at least ten feet from the wall, the traffic surcharge may be neglected.

7.15 Retaining Wall Drainage

7.15.1 Retaining walls should be provided with a drainage system extended at least two-thirds the height of the wall. At the base of the drain system, a subdrain covered with a minimum of 12 inches of gravel should be installed, and a compacted fill blanket or other seal placed at the surface (see Figure 6). The clean bottom and subdrain pipe, behind a retaining wall, should be observed by the Geotechnical Engineer (a representative of Geocon), prior to placement of gravel or compacting backfill.

7.15.2 As an alternative, a plastic drainage composite such as Miradrain or equivalent may be installed in continuous, 4-foot wide columns along the entire back face of the wall, at 8 feet on center. The top of these drainage composite columns should terminate approximately 18 inches below the ground surface, where either hardscape or a minimum of 18 inches of relatively cohesive material should be placed as a cap (see Figure 7). These vertical columns of drainage material would then be connected at the bottom of the wall to a collection panel or a 1-cubic-foot rock pocket drained by a 4-inch subdrain pipe.

7.15.3 Subdrainage pipes at the base of the retaining wall drainage system should outlet to an acceptable location via controlled drainage structures.

7.15.4 Moisture affecting below grade walls is one of the most common post-construction complaints. Poorly applied or omitted waterproofing can lead to efflorescence or standing water. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

7.16 Elevator Pit Design

7.16.1 The elevator pit slab and retaining wall should be designed by the project structural engineer. As a minimum the slab-on-grade for the elevator pit bottom should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. The elevator slab and retaining wall footings may derive support in either newly placed engineered fill or the alluvial soils found at or below a depth of 5 feet if exposed in the elevator pit excavation bottom. Elevator pit walls may be designed in accordance with the recommendations in the *Conventional Foundation Design* and *Retaining Wall Design* section of this report (see Sections 7.7 through 7.9, and 7.14).

7.16.2 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent foundations and should be designed for each condition as the project progresses.

7.16.3 If retaining wall drainage is to be provided, the drainage system should be designed in accordance with the *Retaining Wall Drainage* section of this report (see Section 7.15).

7.16.4 It is suggested that the exterior walls and slab be waterproofed to prevent excessive moisture inside of the elevator pit. Waterproofing design and installation is not the responsibility of the geotechnical engineer.

7.17 Elevator Piston

7.17.1 If a plunger-type elevator piston is installed for this project, a deep drilled excavation will be required. It is important to verify that the drilled excavation is not situated immediately adjacent to a foundation, or the drilled excavation could compromise the existing foundation support, especially if the drilling is performed subsequent to the foundation construction.

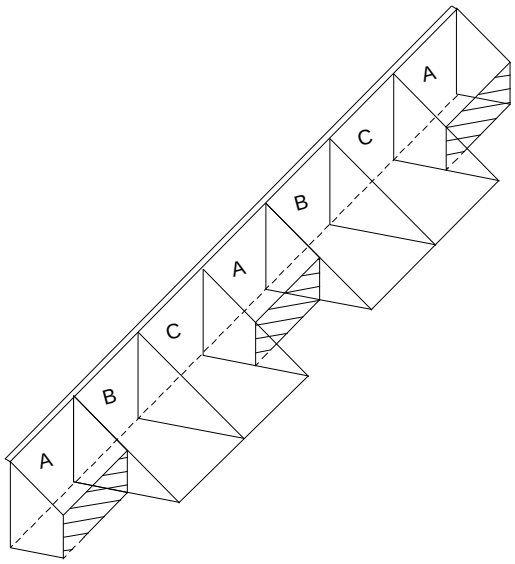
7.17.2 Casing will be required since caving is expected in the drilled excavation and the contractor should be prepared to use casing and should have it readily available at the commencement of drilling activities. Continuous observation of the drilling and installation of the elevator piston by the Geotechnical Engineer (a representative of Geocon West, Inc.) is required.

7.17.3 The annular space between the piston casing and drilled excavation wall should be filled with a minimum of 1½-sack slurry pumped from the bottom up. As an alternative, pea gravel may be utilized. The use of soil to backfill the annular space is not acceptable.

7.18 Temporary Excavations

7.18.1 Excavations on the order of 5 feet in height may be required for excavation and construction of the proposed foundations. The excavations are expected to expose artificial fill and alluvial soils, which may be subject to caving where loose and granular soils are exposed. Vertical excavations up to 5 feet in height may be attempted where not surcharged by adjacent traffic or structures.

7.18.2 Vertical excavations greater than 5 feet or where surcharged by existing structures or traffic loads will require sloping or slot-cutting measures to provide a stable excavation. Where sufficient space is available, temporary unsurcharged embankments could be sloped back at a uniform 1:1 slope gradient or flatter up to a maximum height of 7 feet. A uniform slope does not have a vertical portion.



7.18.3 Performing continuous vertical excavations along property lines or adjacent to an existing structure could remove support from the property and/or structure which is not acceptable. Excavations in close proximity to an adjacent property may require special excavation measures, such as slot-cutting. Recommendations for slot-cutting are provided in the following sections.

7.18.4 Where sloped embankments are utilized, the top of the slope should be barricaded to prevent vehicles and storage loads at the top of the slope within a horizontal distance equal to the height of the slope. If the temporary construction embankments are to be maintained during the rainy season, berms are suggested along the tops of the slopes where necessary to prevent runoff water from entering the excavation and eroding the slope faces. Geocon personnel should inspect the soils exposed in the cut slopes during excavation so that modifications of the slopes can be made if variations in the soil conditions occur. All excavations should be stabilized within 30 days of initial excavation.

7.19 Slot Cutting

7.19.1 The slot-cutting method employs the earth as a buttress and allows the earth excavation to proceed in phases. Where slot-cutting is used for foundation construction, the proposed construction techniques should be discussed with the structural engineer so that appropriate modifications can be made to the foundation design; such as additional reinforcing or details for doweling.

7.19.2 It is recommended that the initial temporary excavation along the property line be sloped back at a uniform 1:1 (H:V) slope gradient or flatter for excavation of the existing soils to the necessary depth. The temporary excavation should not extend below the surcharge area of any adjacent foundations. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation. The temporary slope may then be excavated using the slot-cutting (see illustration below).

7.19.3 Alternate "A" slots of 5½ feet in width may be worked. The remaining earth buttresses ("B" and "C" slots) should also be 5½ feet in width. The wall, foundation, or backfill should be completed in the "A" slots to a point where support of the offsite property and/or any existing structures is restored before the "B" slots are excavated. After completing the wall, foundation, or backfill in the "B" slots, finally the "C" slots may be excavated. Slot-cutting is not recommended for vertical excavations greater than 5 feet in height. The slot-cut calculation should be revised as needed for each surcharge condition as the project progresses. A slot-cut calculation is provided on the following page.

Slot Cut Calculation

Input:

Height of Slots	(H)	5.0	feet
Unit Weight of Soils	(γ)	120.0	pcf
Friction Angle of Soils	(ϕ)	33.0	degrees
Cohesion of Soils	(c)	50.0	psf
Factor of Safety	(FS)	1.50	
Factor of Safety = Resistance Force/Driving Force			
Coefficient of Lateral Earth Pressure At-Rest	K_o	0.46	

Surcharge Pressure:

Line Load	(q_L)	0.0	plf
Distance Away from Edge of Excavation	(X)	0.0	feet

Design Equations

$b = H/(\tan \alpha)$

$A = 0.5*H*b$

$W = 0.5*H*b*\gamma$ *(per lineal foot of slot width)*

$F_1 = d*W*(\sin \alpha)*(\cos \alpha)$

$F_2 = d*L$

$R_1 = d*[W*(\cos^2 \alpha)*(\tan \phi)+(c*b)]$

$R_2 = 2*\Delta F$

$\Delta F = A*[1/3*\gamma*H*K_o*(\tan \phi)+c]$

FS = Resistance Force/Driving Force

*Width of Slots to achieve a minimum of 1.5 Factor of Safety, with a Maximum Allowable Slot Width of 8 feet.

Critical Slot Width with Factor of Safety equal or exceeding 1.5:

d_{allow} = 5.6 feet

7.20 Stormwater Infiltration

7.20.1 During the June 12, 2017 site exploration, boring B6 was excavated and utilized to perform percolation testing. The boring was advanced to the depth listed in the table below. A slotted casing was placed in the boring, and the annular space between the casing and excavation was filled with filter pack. The boring was then filled with water to pre-saturate the soils. On June 13, 2017, the casing was refilled with water and percolation test readings were performed after repeated flooding of the cased excavation. Based on the test results, the average infiltration rate (adjusted percolation rate) for the earth materials encountered is listed in the following table. Additional correction factors may be required and should be applied by the engineer in responsible charge of the design of the stormwater infiltration system and based on applicable guidelines. Percolation test data sheet is included herein as Figure 8.

Boring	Infiltration Depth (ft.)	Average Infiltration Rate (in / hour)
B6	10-25	0.48

7.20.2 Based on the results of the subsequent laboratory testing, the upper 14 feet of existing site soils may be subject to hydroconsolidation when saturated. Therefore, it is recommended that infiltration of storm water occur below a depth of 15 feet to minimize saturation of the soils supporting the proposed structures. In addition, it is suggested that additional infiltration and laboratory testing be performed in stormwater infiltration is proposed at a location other than near where the above test was performed.

7.20.3 Provided that infiltration occurs below a depth of 15 feet, it is our opinion that the soil encountered at the depths and location as listed in the table above are suitable for infiltration of stormwater and will not create a perched groundwater condition, will not affect soil structure interaction of existing or proposed foundations due to expansive soils, will not saturate soils supported by existing or proposed retaining walls, and will not increase the potential for liquefaction. Resulting settlements are anticipated to be less than ¼ inch, if any.

7.20.4 Where infiltration systems will be utilized, it is recommended that a minimum 10-foot horizontal and vertical setback be maintained from existing or proposed foundations. The boundary of the zone of saturation may be assumed to project downward from the discharge of the infiltration facility at a gradient of 1:1. Additional setbacks may be required by the governing jurisdiction and should be incorporated into the stormwater infiltration system design as necessary.

7.20.5 Subsequent to the placement of the infiltration system, it is acceptable to backfill the resulting void space between the excavation sidewalls and the infiltration system with minimum two-sack slurry provided the slurry is not placed in the infiltration zone. It is recommended that gravel, approved by the project civil engineer, be utilized adjacent to the infiltration zone so communication of water to the soil is not hindered.

7.20.6 Due to the preliminary nature of the project at this time, the type of stormwater infiltration system and location of the stormwater infiltration systems has not yet been determined. The design drawings should be reviewed and approved by the Geotechnical Engineer. The installation of the stormwater infiltration system should be observed and approved by the Geotechnical Engineer (a representative of Geocon).

7.21 Surface Drainage

7.21.1 Proper surface drainage is critical to the future performance of the project. Uncontrolled infiltration of irrigation excess and storm runoff into the supporting soils can adversely affect the performance of the planned improvements. Saturation of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the original designed engineering properties. Proper drainage should be maintained at all times.

7.21.2 All site drainage should be collected and controlled in non-erosive drainage devices. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. The site should be graded and maintained such that surface drainage is directed away from structures in accordance with 2016 CBC 1804.4 or other applicable standards. In addition, drainage should not be allowed to flow uncontrolled over any descending slope. Discharge from downspouts, roof drains and scuppers are not recommended onto unprotected soils within 5 feet of the building perimeter. Planters which are located adjacent to foundations should be sealed to prevent moisture intrusion into the soils providing foundation support. Landscape irrigation is not recommended within 5 feet of the building perimeter footings except when enclosed in protected planters.

7.21.3 Positive site drainage should be provided away from structures, pavement, and the tops of slopes to swales or other controlled drainage structures. The building pad and pavement areas should be fine graded such that water is not allowed to pond.

7.21.4 Landscaping planters immediately adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Either a subdrain, which collects excess irrigation water and transmits it to drainage structures, or an impervious above-grade planter boxes should be used. In addition, where landscaping is planned adjacent to the pavement, it is recommended that consideration be given to providing a cutoff wall along the edge of the pavement that extends at least 12 inches below the base material.

7.22 Plan Review

7.22.1 Grading and foundation plans should be reviewed by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to finalization to verify that the plans have been prepared in substantial conformance with the recommendations of this report and to provide additional analyses or recommendations.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon West, Inc. should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon West, Inc.

2. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

3. The findings of this report are valid as of the date of this report. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

4. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project geotechnical engineer of record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

Geologic Time Scale			Years Before Present (Approx.)	Fault Symbol	Frequency of Movement	Description: On Land	Description: Offshore
Quaternary	Late Quaternary	Historic	200			Displacement during histoic time (e.g. San Andreas fault 1906). Includes areas of known fault creep	
		Holocene	11,700			Displacement during Holocene time.	Fault offsets seafloor sediments or strata of Holocene age.
	Early Quaternary	Pleistocene	700,000			Faults showing evidence of displacement during late Quaternary time.	Fault cuts strata of Late Pleistocene age.
			1,600,000			Undivided Quaternary faults - most faults in this category show evidence of displacement during the last 1,600,000 years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age.	Fault cuts strata of Quaternary age.
Pre-Quaternary			4.5 billion (Age of Earth)			Faults without recognized Quaternary displacement or showing evidence of no displacement or showing evidence of no displacement during Quaternary time. Not necessarily inactive.	Fault cuts strata of Pliocene or older age.

*Quaternary now recognized as extending to 2.6 Ma (Walker and Geissman, 2009). Quaternary faults in the map were established using the pervious 1.6 Ma criterion

APPENDIX A

FIELD INVESTIGATION

The site was explored on June 12, 2017, by excavating six 8-inch diameter borings to depths of approximately 25½ feet below the existing ground surface utilizing a truck-mounted hollow-stem auger drilling machine. Representative and relatively undisturbed samples were obtained by driving a 3 inch, O. D., California Modified Sampler into the "undisturbed" soil mass with blows from a 140-pound auto-hammer falling 30 inches. The California Modified Sampler was equipped with 1-inch high by 2 3/8-inch diameter brass sampler rings to facilitate soil removal and testing. Bulk samples were also obtained.

The soil conditions encountered in the borings were visually examined, classified and logged in general accordance with the Unified Soil Classification System (USCS). Logs of the borings are presented on Figures A1 through A6. The logs depict the soil and geologic conditions encountered and the depth at which samples were obtained. The locations of the borings are shown on Figure 2.

APPENDIX B

LABORATORY TESTING

Laboratory tests were performed in accordance with generally accepted test methods of the "American Society for Testing and Materials (ASTM)", or other suggested procedures. Selected samples were tested for direct shear strength, consolidation, compaction, expansion characteristics, corrosivity, and in-place dry density and moisture content. The results of the laboratory tests are summarized in Figures B1 through B9. The in-place dry density and moisture content of the samples tested are presented on the boring logs, Appendix A.

SAMPLE	SOIL TYPE	DRY DENSITY	INITIAL MOISTURE (%)	FINAL MOISTURE (%)
*B2 @ 2-5'	SM	118.0	8.5	14.9
B2 @ 4'	SM	108.3	12.8	16.5

*REMOLDED TO 90% RELATIVE COMPACTION

1.0 INTRODUCTION

This report presents the results of a Phase I Environmental Site Assessment (ESA) conducted by FREY Environmental, Inc. (FREY) for seven parcels located on the southwest block of the intersection of West Evergreen and South Magnolia Avenues, with the following assessor's parcel numbers (APNs): 8507-006-016 (340 W. Evergreen Ave.), 8507-006-022 (418 W. Evergreen Ave.), 8507-006-024 (no current address), 8507-006-041 (1621 & 1625 S. Magnolia Ave.), 8507-006-042 (1641 & 1671 S. Magnolia Ave.), 8507-006-043 (404 & 410 W. Evergreen Ave.), and 8507-006-044 (1541 S. Dale Dr.), in Monrovia, California (hereafter referred to as "the Site"). A Site location map, Site Vicinity sketch, and Site sketch are presented as Figures 1, 2, and 3, respectively.

2.0 OBJECTIVE

The objective of the scope of work described below was to assess past and present land use practices, Site operations and conditions, and identify the potential presence of hazardous substances in the soil vapor, and groundwater beneath the Site to the extent feasible, pursuant to the processes described in the American Society for Testing and Materials (ASTM) guidelines (ASTM, 2013).

3.0 TERMINOLOGY

For the purposes of discussion, the following terms are used in this report:

- Site refers to the property depicted in Figures 1, 2, and 3 and described in Section 6.1;

- Immediate Site Vicinity refers to the properties immediately adjacent to the Site that share a common boundary with the Site;

- Recognized Environmental Conditions (RECs) as defined in ASTM E1527-13 is the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not RECs.

- Controlled Recognized Environmental Condition (CREC) as defined in ASTM E1527-13 is a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- Historical Recognized Environmental Condition (HREC) as defined in ASTM E1527-13 is a past release of any hazardous substance or petroleum product that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls.

- Vapor Encroachment Condition (VEC) as defined in ASTM E2600-10 is the presence or likely presence of vapor phase chemical(s) of concern (COC) in the subsurface of the target property as identified during the vapor encroachment screening process (ASTM, 2010).

- Area of Concern (AOC) as defined in ASTM E2600-10, for potential contaminated facilities with non-petroleum hydrocarbon COCs is equal to 1,760 feet around the Site and 528 feet around the Site for facilities with petroleum hydrocarbon COCs (ASTM, 2010).

- The term "hazardous" is used here in general accordance with its definition in Title 22, Division 4, Chapter 30, California Code of Regulations (CCR). The terms "material" and "waste" are used interchangeably, and no legal distinction is implied between the two terms as used herein.

4.0 SCOPE OF WORK

The scope of work designed to provide the information needed to meet the objectives of the investigation was as follows:

- Inspect the Site;
- Conduct a Site vicinity reconnaissance in order to compile a current list of companies and/or businesses that may utilize potentially hazardous materials in the Immediate Site Vicinity;
- Photograph the Site and the properties which bound the Site;
- Interview personnel familiar with the history of the Site, if available;
- Review files at City of Monrovia Department of Building and Safety (CDBS);
- Review files maintained by the Los Angeles County Department of Public Works (LADPW);
- Review files maintained by the South Coast Air Quality Management District (SCAQMD);
- Review the California State Water Resources Control Board's (SWRCB) GeoTracker and Department of Toxic Substance Control (DTSC) EnviroStor databases for any available files;
- Review Sanborn maps, historical aerial photographs, topographic maps, phone directories, environmental lien and activity use limitation (AUL) reports, and a government agency database report specifically prepared for the Site by Environmental Data Resources Inc. (EDR), and;
- Prepare a report summarizing the findings of the information presented above.

The results of the Site inspection and record review, as described above, were evaluated and interpreted in the context of existing Site conditions and the hydrogeological setting. The scope of work did not include the sampling of soil vapor, groundwater, lead paint, asbestos, or air.

5.0 PHYSICAL SETTING

5.1 REGIONAL GEOLOGY AND HYDROGEOLOGY

The following is taken from a report prepared by Partner Engineering and Science, Inc.(Partner) titled *Phase II Environmental Site Assessment Industrial Complex, 1625/1625B, 1631 South Magnolia Avenue and 410 West Evergreen Avenue, Monrovia, California*, dated July 22, 2011 (Partner, 2011).

Based on a review of the United States Geological Survey (USGS) Mount Wilson Quadrangle topographic map, the subject property is situated approximately 440 feet above mean sea level (amsl), and the local topography slopes gently to the south-southwest.

The Site is located in the eastern San Gabriel Valley within the Main San Gabriel Hydrogeologic-Basin. The basin is bounded by the San Gabriel Mountains to the north, the San Jose Hills and subsurface bedrock high to the east; the Puente, Repetto and Merced hills to the south and west; and the Raymond Fault to the northwest.

Local geology is characterized by Recent alluvium and Pleistocene older alluvium consisting of poorly consolidated continental sediments. These sediments consist of interbedded sand, silt, and clay in variable proportions with lenses of gravel. They were deposited in large part by coalescing alluvial fans emanating from canyons exiting the southern San Gabriel Mountains north of the site. In the site vicinity, older alluvium occurs at grade to a depth of approximately 700 feet, and comprises a more youthful portion of the alluvial fan, which has accumulated at the mouth of Monrovia Canyon.

The dominant structural feature in the vicinity of the site is the Sierra Madre fault zone. Elements of this fault zone occur approximately 1.0 mile northeast of the subject site and include the Duarte and Sierra Madre faults.

Based on borings advanced during previous investigations at the Site, the underlying subsurface consists predominantly of sand with silt from the ground surface to 30 feet bgs (Partner, 2011).

Hydrogeologically, the Site is located in the eastern San Gabriel Valley within the Main San Gabriel Hydrogeologic Basin. The San Gabriel and the Rio Hondo rivers, and their tributaries flow from the San Gabriel Valley. The rivers have their headwaters in the San Gabriel Mountains and have a common exit from the southern portion of the valley at Whittier Narrows between the Merced and Puente hills. The Site is approximately 3 miles west of the San Gabriel River.

Percolation of direct rainfall and run-off water from the mountains is the major source of natural recharge of the San Gabriel Hydrogeologic Basin. Imported water and return flow from applied water also supply recharge water to the basin. The alluvial deposits, which contain the major aquifer in the basin, attain a maximum thickness of greater than 4,000 feet. The average thickness of water-bearing deposits in the center of the basin is 900 to 1,000 feet. The alluvium is underlain by Miocene Puente and Topanga formations that yield limited quantities of water. The elevation of the groundwater ranges from 100 feet to greater than 500 feet amsl.

Regionally, groundwater flows from the perimeter of the basin in a southerly direction toward Whittier Narrows, where it exits the basin. Locally, the groundwater flow is towards the west.

5.2 GROUNDWATER SUPPLY WELLS WITHIN THE SITE VICINITY AND DEPTH TO GROUNDWATER

Based on information from the Hydrogeologic Records Division of the LACDPW, there are eight (8) groundwater monitoring wells in the Site Vicinity. The nearest two are located approximately 1,600 feet southwest of the Site and are labeled #4197 and #4197b. The most recent depth to groundwater data measurements reported for wells #4197 and #4197b are 200 feet (in 2004) and 203 feet (in 2003), respectively (LACDPW, 2017).

Groundwater was not encountered below the Site at the maximum depth explored (30 feet bgs) during the Phase II investigation conducted by Partner (Partner, 2011).

6.0 FIELD INVESTIGATION

6.1 SITE INSPECTION

FREY conducted a Site inspection on June 9, 2017. The inspection included examination of the Site and Site buildings for past or present use, storage, handling, and disposal of potentially hazardous substances, and possible future releases of such substances. Photographs of the Site are included in Appendix A. Figure 3 presents a Site sketch showing the locations of the areas discussed.

Site Buildings

The Site includes five buildings including four commercial buildings and one residential building.

1625 South Magnolia – Vioski, Inc.

The Vioski, Inc. building included offices and work stations for the manufacturing of wood chairs, sofas, and furniture upholstery. The building included storage for furniture padding and fabric. Minor asphalt staining and Underground Service Alert (USA) markings were observed outside the building. No RECs were observed at this address.

1621 South Magnolia Avenue – Sierra Chevrolet Sales and Ram Commercial Truck

The Sierra Chevrolet building includes offices, a lounge area, a maintenance garage, and a parking show/lot used for various Chevrolet car models and Dodge Ram trucks. Several household cleaning supplies were kept in a supply closet .

The Sierra Chevrolet maintenance garage located on the western portion of the building. The maintenance garage contained four service bays included electric lifts for servicing automobiles. Four mobile self-evacuating oil drains were observed throughout the maintenance garage. An area along the west portion of the garage in between the middle two service bays contained various new and used oil storage containers. These containers included:

- Three 55-gallon drums of waste antifreeze (1) and used oil filters (2),
- One 55-gallon "lube cube" of new transmission fluid,
- Two approximately 150-gallon (size not posted) "lube cubes" of new 5W-30 motor oil, and
- One approximately 100-gallon (size not posted) "lube cube" of waste oil.

All drums and "lube cubes" appeared to be properly maintained, labeled, and contained and no leaks were observed. Three additional empty 55-gallon and three empty 30-gallon drums were preset just outside the maintenance garage as well as several car wash fluids and paint buckets. The garage areas were organized and relatively clean. The concrete floors of the service area were in very good condition with no stains or cracks observed (Appendix A).

The historical maintenance operations in the garage and service area at this address are considered a REC.

1641 & 1671 South Magnolia Avenue - Anderson Woodworks Fine Cabinets and Kitchen Remodeling & Sierra Auto Cars

The Anderson Woodworks Fine Cabinets and Kitchen Remodeling business is located in a small section of the building located in between the Sierra Auto Cars photography bay and maintenance bay. No one from the business was present at the time of the Site inspection, therefore a detailed description of this facility was not able to be made.

The Sierra Auto Cars area performs tests and checks on automobiles ready to be sent to dealerships. This address includes one small office building, a small auto maintenance shop with two car bays, a bay for photographing the automobiles, and a car wash station under a portable canopy. Several small jugs of automotive oil, transmission fluid, and antifreeze are kept in a cupboard in the auto maintenance shop. A small floor drain is located at the corner of the car wash area, which appeared free of staining or accumulated liquids.

RECs were observed at these addresses.

404 West Evergreen – California Theaming, Inc.

The California Theaming Inc. business is a two story industrial building included small offices and several areas/workshops used to create and manufacture small to large props, fixtures, and decorations used in various theme parks around Southern California. materials used in the creation of these props include paints, polyester and epoxy resins, fiberglass, glue adhesives, metals, and wood stains. Propane tanks used for forklifts and welding tanks for metal working were properly stored in a specific area.

Due to contracts with clients of California Theaming, Inc., no photographs were allowed inside the California Theaming building.

The chemicals historically used at the California Theaming facility are considered a REC.

340 West Evergreen Avenue - Residence

The one-story residence appeared to be vacant at the time of the Site inspection. No RECs were observed at the residence.

6.2 IMMEDIATE SITE VICINITY RECONNAISSANCE

The Site is bound to the north by West Evergreen Avenue, the 210 Freeway, an Evangelical Church, and commercial buildings; to the east by South Magnolia Avenue, commercial buildings, and a construction site; to the south by railroad tracks, followed by commercial businesses apartment buildings, and residences; and to the west by commercial businesses and Mayflower Street. Additional Site vicinity details are presented in the Site Vicinity Sketch presented as Figure 2.

With the exception of the railroad tracks bordering the southern side of the Site, RECs were not observed in the immediate Site vicinity. The railroad tracks could potentially be considered an REC given the potential for chemicals to have been sprayed on the tracks for weed and pest control, and possibly the use of chemicals to preserve the railroad ties. However, the relatively comprehensive subsurface investigative work conducted by Partner in 2011 demonstrated that no impacts to soil and soil gas were present along the railroad tracks (Partner, 2011).

6.3 PERSONNEL INTERVIEW

Mr. Paul Hoffman representing Sierra Auto Properties LLC, the Site owner, completed a transaction screen questionnaire as part of the Phase I ESA pertaining to potential environmental impairment at the Site from historical site use. A copy of the transaction screen questionnaire is included in Appendix B. The questionnaire responses are summarized below.

PERSONNEL INTERVIEW	
	DETAILS
Name	Peter Hoffmann
Business Title	Representative
Firm	Sierra Auto Properties, LLC
Telephone	N/A
Role/Relationship	Representative
Summary	Mr. Hoffmann noted the past presence of a septic tank and a septic system/leach field at two previous residences on Dale Avenue, which were removed when the residences were demolished. He also noted that several 55 gallon drums were used by California Theaming in 2011 which are no longer present, and a truck maintenance facility may have been located on the property located northwest of the Site (450 W. Evergreen Ave.). He also noted the past and current vehicle maintenance activities and oil storage at the Site.

The past and current vehicle maintenance activities and oil storage at the Site are an REC. If the 55 gallons drums used by California Theaming were for storage of hazardous wastes, they would be considered an REC. The presence of a truck maintenance facility on the property north of the Site is considered an REC.

7.0 REGULATORY AGENCY REVIEW

7.1 CITY OF MONROVIA BUILDING DEPARTMENT

FREY reviewed building permit records for the Site at the City of Monrovia Building Department (MBD) personnel on July 6, 2017.

Building permit record files were located for the following addresses associated with the Site:

- 340 W. Evergreen Avenue (earliest permit dated 2006)
- 410 W. Evergreen Avenue (earliest permit dated 2014)
- 418 W. Evergreen Avenue (earliest permit dated 1991)
- 1625 S. Magnolia Avenue (earliest permit dated 1954)
- 1631 S. Magnolia Avenue (earliest permit dated 1966)
- 1641 S. Magnolia Avenue (earliest permit dated 2000)
- 1671 S. Magnolia Avenue (earliest permit dated 2011)

Permit records were not found at the MBD for the other addresses associated with the Site.

With the exception of a 1967 listing for a business called "STD Research Co" located at 1631 S. Magnolia Avenue that reportedly used and stored acids, mercury and oil wastes, the permits in the files reviewed were primarily for routine building activities (plumbing, electrical, change of address, etc.), and did not indicate property use activities of environmental concern.

The information in the 1967 record discussed above is considered an REC for the 1631 S. Magnolia Avenue address. No other RECs were identified in the building permit records reviewed at the MBD.

7.2 COUNTY OF LOS ANGELES DEPARTMENT OF PUBLIC WORKS

FREY personnel reviewed files at the LACDPW for the Site addresses. No LACDPW files exist for the Site addresses (LACDPW, 2017b).

An LACDPW file existed for the removal of a 10,000-gallon gasoline UST and a 10,000-gallon diesel UST from the property located northwest of the Site, at 450 W. Evergreen Avenue (formerly "Johnson Tree Service" currently "Brkich Robert Construction") on August 3, 1987. The USTs and adjacent dispensers were located in the center of the property. According to a UST removal report prepared by Brown and Caldwell Consulting Engineers, dated August 11, 1987, soil samples collected from beneath the USTs did not contain detectable petroleum hydrocarbon constituents. The LACDPW subsequently issued a case closure letter, dated September 15, 1987. (LACDPW, 2017b).

7.3 SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

FREY searched for the Site on the Facility Information Detail (FIND) website database maintained by the SCAQMD. The FIND database contains information about regulated facilities within the South Coast Air Basin. Information on the Site was included in the database (SCAQMD, 2017).

The Site address of 1625 S. Magnolia Avenue is listed in the FIND database under the company name Calcraft Co. The equipment listed under permit (issued in 1975 and active through 1990) is spray booth paint and solvent. No notices to comply or violations are reported. The company is listed as out of business.

7.4 STATE OF CALIFORNIA

FREY researched environmental cleanup sites and hazardous waste facilities using the DTSC Envirostor website and researched leaking underground storage tank (LUST) cleanup sites, RWQCB cleanup sites, land disposal sites, military sites, and Waste Discharge Requirement Program sites using the SWRCB Geotracker website. FREY reviewed information for the Site and the AOC to assess potential on-Site and off-Site sources of chemicals of concern in soil and groundwater beneath the Site.

7.4.1 DTSC EnviroStor Database

The DTSC EnviroStor database did not list any cases for the Site. According to the database there are three (3) voluntary cleanup sites within the AOC (DTSC, 2017).

Two of the facilities within the AOC, Metric Machining and So Cal Gas/Monrovia MGP, are located at 1622 South Magnolia Avenue (approximately 60 feet east of the Site). The Metric Machining facility case was for the cleanup of the southwest portion of the property for contaminants including TPH, arsenic, lead, and one polycyclic aromatic hydrocarbons (PAH). The So Cal Gas/Monrovia MGP facility case was for the cleanup of the northwest portion of the property for contaminants including TPH, PAHs, arsenic, lead, and VOCs. Contaminated soil was excavated and confirmation soil samples were collected prior to both facilities receiving cleanup certification in November of 2014 (DTSC, 2017).

The third facility within the AOC, The Parks at Monrovia Station Square I LLC, is located at 204 & 200 West Pomona Avenue and 1625 Primrose Avenue (approximately 500 feet east of the Site). This case was for the cleanup of various metals, and following numerous investigations and remedial soil excavation, the case received cleanup certification in December of 2015 (DTSC, 2017).

The two properties (three facility cases) are not considered RECs based on the oversight provided by the DTSC, remedial efforts conducted at each property and cleanup certification received by the DTSC.

7.4.2 SWRCB Geotracker Database

The Site is not listed on the SWRCB Geotracker database, and no facility listings of concern are listed within the AOC of the Site (SWRCB, 2017).

8.0 HISTORICAL INFORMATION REVIEW

EDR provided Sanborn maps, historical aerial photographs, historical topographic maps, historical city directory, an environmental lien search, a property tax map report, and radius map search report for the Site. The EDR information presented below has been attached in Appendices C and D.

8.1 SANBORN MAPS

According to the EDR Certified Sanborn Map Report, the Site is an unmapped property.

8.2 TOPOGRAPHIC MAPS

EDR provided historical topographic maps from 1894, 1896, 1900, 1928, 1933, 1939, 1953, 1966, 1972, 1988, 1994, 1995, and 2012.

No visible structures appeared on the Site in any of the maps except in the 1995 map. On the 1995 map, two large structures that appear similar to those currently existing are shown on parcel 8507-006-041 (1625 S. Magnolia Ave.).

Few to no structures are shown on properties bounding the Site on the topographic maps provided by EDR. Structures of concern are shown on the property just east of the Site across Magnolia Avenue in the 1928 (large circular structure), 1939 (large circular structure, two rectangular structures, and four smaller circular structures), and 1953 (two rectangular structures and four smaller circular structures labeled “oil Tanks”) maps. These structures are likely associated with the So Cal Gas/Monrovia MGP discussed above in Section 7.4.1 above, which received cleanup certification from the DTSC.

No RECs were noted on the topographic maps.

8.3 HISTORICAL AERIAL PHOTOGRAPHS

EDR provided aerial photographs from 1928, 1938, 1952, 1964, 1972, 1977, 1981, 1990, 1994, 2005, 2009, 2010, and 2012. The scale for the aerial photographs was 1inch equals 500 feet. A brief summary of information derived from the photos is as follows:

Site:

- In 1928 and 1938, the Site appears mainly used for agricultural purposes.
- In 1952, a residential structure appears on parcels 8507-006-016, 8507-006-022, and 8507-006-041 (northeast corner), and two or more residential structures appear on parcels 8507-006-043 (northern portion) and 8507-006-044 (one on north side and one located centrally).
- In 1964, the southwest portion of the Site appears vacant, and an additional smaller structure and two large buildings (that appear to be those currently existing) are visible on parcel 8507-006-041.
- In 1972, parcel 8507-006-042 is fully developed with a large rectangular building and parking lot. Parcel 8507-006-043 appears mainly vacant with one residential size structure remaining in north portion. Paved parking appears on the northern portion of parcel 8507-006-044, and a residential sized square structure appears on parcel 8507-006-024.
- In the 1977 photo, the smaller structure seen earlier on parcel 8507-006-043 has been replaced by a large industrial size building and paved parking on the northern half of the parcel.
- No other significant changes were observed in later photos.

Site Vicinity:

- Magnolia Avenue, the railroad (adjacent south), and Mayflower Avenue appear in the 1928 photo. The surrounding properties appear mainly agricultural with exception of the property to the west of the Site across Magnolia Avenue where a large round structure is visible. This is the location of the former So Cal Gas/Maonrovia MGP discussed earlier in Section 7.4.1.
- In 1952, two small, north-south trending, residential streets (Dale Drive and another unknown) appear north of the Site, and the majority of the properties north of the Site appear to be developed residentially. Additional industrial sized buildings appear southeast of the Site.
- In the 1964 photo, round structures loacted earlier at the MGP property are no longer visible, and the majority of surrounding properties appear to me a mix of residential and commercial.
- In the 1972 photo, one of the residential streets north of the Site is no longer present. Evergreen Avenue and the 210 Foothill Freeway are now visible, replacing residential properties north of the Site.

No additional RECs were noted on the historical aerial photos.

8.4 CITY DIRECTORY REVIEW

FREY reviewed an EDR City Directory Abstract for the years spanning 1920 through 2014 for the Site and Site vicinity properties. A summary of the information obtained for the Site is provided in the table below.

CITY DIRECTORY REVIEW: SITE PROPERTIES		
ADDRESS (APN)	**YEAR**	**LISTING**
340 W. Evergreen Ave. (8507-006-016)	1999-2010	Dial One/ Mon Arc/ Cornerstone Plumbing, SVG Underground, Ace Pelizon Electrical
418 W. Evergreen Ave. (8507-006-022)	1999	Private residential listing
1613 S. Magnolia Ave. (8507-006-041)	1985-1988	Sanchez Landscaping, Alvarez and Sons Gardening
1617 S. Magnolia Ave. (8507-006-041)	1950	Monrovia Sash and Door Manufacturing Co.
1625 S. Magnolia Ave. (8507-006-041)	1957-2014 1975-1960 2010-2014	Stone & Phillips Inc. Calcraft Co. Vioski Manufacturing LLC, Aeroenvironment Inc. (also listed at 1610 S. Magnolia Ave.)
1631 S. Magnolia Ave. (8507-006-042)	1965-1970 1980 1999	STD Research Group W B Engineering John's Installations
404 W. Evergreen Ave. (8507-006-043)	1980-1990 2010-2014	United Van Lines Crown Transfer & Storage California Theaming Co.
410 W. Evergreen Ave. (8507-006-043)	1999	(no listings)
1541 Dale Dr. (8507-006-044)	1950	Private residential listing

Several manufacturing companies are listed within the Site Vicinity. Metric Machining Corp. listed at 1622 South Magnolia Avenue is discussed in Section 7.4.1 above. Mesa Industries, a manufacturer of rubber parts, is listed at 1726 South Magnolia Avenue (approximately 150 feet southeast of the Site) from 1975 to 2014.

The listings of several other manufacturing companies included within the Site Vicinity in the EDR City Directory Abstract could potentially have impacted soil, soil vapor or groundwater beneath their facilities, but are not considered RECs with respect to the Site since based on the nature of the facilities and their distance from the Site.

No additional RECs with respect to the Site were identified from the City Directory review.

8.5 ENVIRONMENTAL LIENS

FREY reviewed the environmental lien and other activity and use limitations (AUL) search report for the Site prepared by EDR. No environmental liens or AULs were found in the environmental lien report.

8.6 PREVIOUS PHASE II ENVIRONMENTAL ASSESSMENT REPORT

FREY reviewed the report titled *Phase II Environmental Site Assessment Industrial Complex, 1625/1625B, 1631 South Magnolia Avenue and 410 West Evergreen Avenue, Monrovia, California* [(Partner, 2011) (Appendix E)]. Partner included a summary of a Phase I Environmental Site Assessment conducted by Partner in 2011. The following is the summary of potential RECs noted by Partner in their report. Note that 1625 South Magnolia Avenue as referenced in the Partner reports is currently addressed as 1621 South Magnolia Avenue, and 1631 South Magnolia Avenue as referenced in the Partner reports is currently addressed as 1641 and 1671 South Magnolia Avenue.

- 1625 South Magnolia Avenue was developed for industrial use from 1954 to the present. Historical operations included furniture manufacturing and upholstering, woodworking, structural manufacturing, and the development of scientific machinery (prototypes) from 1966 to 1976, the subject property was occupied by STD/Standard Research Company for the development of scientific machinery (prototypes). Building records indicated that STD Research Company utilized detergents and "common organic solvents" for cleaning purposes and mercury for operations. From 1973 to 1990, the subject property was occupied by Calcraft for structural manufacturing. Calcraft operated a spray booth and utilized solvents during this period of time. Based on the duration of industrial operation, the nature of industrial activities including spray painting operations and solvent usage; and the absence of subsurface investigations to account for these concerns, the historical industrial operations at the subject property was considered to constitute a REC.

- 1631 South Magnolia Avenue was developed for industrial use from 1965 to the present. Historical operations included sheet metal work and manufacturing, electronics operations, wood-working, and structural manufacturing. Calcraft occupied the subject property in 1972. Calcraft operated a spray booth and utilized solvents as part of day-to-day operations. Metric Machining Co. occupied the subject property in 1988 and operated as a metal machining company and fabricated metallic parts, utilizing oils, lubricants, cutting fluids, and solvents as part of day-to-day operations. Based on the duration of industrial operation, the nature of industrial activities including spray painting and metal manufacturing operations and solvent usage, and the absence of subsurface investigations to account for these concerns, the historical industrial use of the subject property was considered to constitute a REC.

- 410 West Evergreen Avenue was developed for industrial use as early as 1968 to present-day. Former operations on the subject property included sheet metal work. The absence of information regarding historical operations and regulatory agency records, and the absence of subsurface investigations to determine whether former operations have impacted the subject property constitute a REC.

- In addition to the environmental concern of the historical industrial operations, the adjacent railroad tracks also pose a concern. Railroad spurs represent environmental concerns due to the historical application of oils containing polychlorinated biphenyls (PCBs), herbicides, and arsenic for pest and weed control, as well as the potential presence of creosote on the rail ties, and the historical common practice of using coal cinders for track fill material.

Partner completed a subsequent Environmental Site Assessment at the subject property to determine the presence or absence of soil and/or soil-vapor contamination from the former and potentially "current" industrial use of the subject property. The scope of the investigation included the installation of 34 soil/soil gas borings.

Soil borings B1 through B15 were drilled at the parcel located at 1625/1625 B South Magnolia Avenue, borings B16 through B20 were drilled at the parcel located at 1631 South Magnolia Avenue, borings B21 through B25 were drilled at the parcel located at 410 West Evergreen Avenue, and borings B26 through B34 were drilled in the vicinity of the railroad track located along the southern Site boundary.

Borings B1, B6, B11, B12, and B16 were advanced to a terminal depth of 5 feet bgs. Borings B2 and B3 were advanced to a terminal depth of 30 feet bgs. Borings B4, B5, B7 through B10, B13 through B15, and B17 through B25 were advanced to a terminal depth of 20 feet bgs. Soil gas probes were screened at 5 feet bgs were constructed within soil borings B1 through B6, B8, B10 through B17, B19 through B22, B24, and B25 upon completion of soil sampling.

Twenty-one soil gas samples were analyzed for VOCs. Twenty-two soil samples were analyzed for VOCs and , total petroleum hydrocarbon chain speciation (TPH-cc). Nine soil samples were analyzed for semi-volatile organic compounds (SVOCs). Three soil samples were analyzed for PCBs. Twenty soil samples were analyzed for California Administrative Manual (CAM) 17 Metals. Three composite soil samples were analyzed for VOCs, TPH-cc, PCBs, organochlorine pesticides (OCPs), and CAM 17 Metals.

- Partner summarized and concluded the following based on the results of the Phase II Investigation. Trichlorofluoromethane was detected in one soil gas sample. No soil gas regulatory guidelines are currently established for the detected refrigerant. The VOC TBA was detected in one soil sample collected at a depth of 5 feet bgs. The 10-foot soil sample collected from the same boring had non-detectable concentrations of all VOCs including TBA, suggesting a very limited localized TBA impact and very limited vertical migration of

this contaminant. No soil regulatory guidelines are currently established for TBA and impacts to the deep groundwater are very unlikely. The OCP Endosulfan I was detected in one composite soil sample at concentrations below available regulatory guidelines.

- Metals were detected in soil samples, however concentrations were below applicable regulatory guidelines. No other elevated concentrations of target contaminants, other than the suspected very localized low concentration of the refrigerant trichlorofluoromethane were detected in soil gas or soil during this investigation.

- Given the findings of this investigation, Partner recommended no further investigation with respect to the industrial complex was warranted.

9.0 GOVERNMENT AGENCY LISTING FINDINGS

9.1 OIL AND GAS

FREY reviewed the EDR Summary Radius Map Report (Appendix F) and the California Division of Oil, Gas and Geothermal (CADOGG) Resources Well Finder Website for oil and gas wells in the vicinity of the Site. There are no oil/gas wells mapped within a 1-mile radius of the Site. (CADOGG, 2017).

Based on information from the LACDPW, the Site is not located in a methane zone or methane buffer zone (LACDPW, 2017b).

9.2 RADON

The EDR Radius Map Report (Appendix E) indicates the Site is located in an average radon exposure zone according to a generalized assessment of radon potential in the zip code area of 91016. Of twenty-two sites tested, none had detections of radon greater than four picocuries per liter (pCi/L). The USEPA lists Los Angeles County as Radon Zone Level 2, for areas where the indoor average radon level is greater than 2 pCi/L but less than 4 pCi/L (EDR, 2017). The USEPA has an action level of 4 pCi/L (EPA, 2002).

9.3 REGULATORY AGENCY DATABASE REVIEW

9.3.1 Site

The Site is listed as three facilities in agency databases summarized in the EDR Radius Map Report (Appendix D).

The Site is listed as the Sierra Auto Properties (1613 S. Magnolia Ave.) in the HAZNET database and is reported to have handled asbestos containing waste and other organic solids in 2015. The Site is also listed as Stone and Phillips (1625 S. Magnolia Ave.) in the HAZNET database and is reported to have handled unspecified oil-containing waste, off-specification, aged or surplus organics, and other organic solids in 2005. Calcraft Co. (additionally listed at 1625 S. Magnolia Ave.) is listed in the EMI database with SCAQMD listings from 1987, 1990, and 1995. No violations are reported.

9.3.2 Immediate Site Vicinity

Five (5) properties, which bound the Site or are located within 100 feet across travel routes, are listed in the EDR Radius Map report as potentially having used, stored, or released petroleum hydrocarbons or other COCs such as solvents (Appendix F).

Live Oak Carpet Cleaning, located at 1518 South Mayflower Avenue and adjacent to the Site on the west-northwest, is listed in the EDR Historic Cleaner database as a carpet and upholstery cleaner in 2006 through 2008. There are no reports of violations or open cases on this property.

Two facilities, located at 450 West Evergreen Avenue and adjacent to the Site on the northwest, are listed in databases searched by EDR. Jim's Auto Repair is listed in the EDR Historic Auto Station database as a general automotive repair shop in 1979. Johnson Tree Service is listed in various UST databases. Two UST tanks used for diesel and regular gasoline are reported to have been located at this property and may have been in use as recent as 1989. There are no reports of violations or open cases on this property.

So Cal Gas/Monrovia MGP, located at 1622 South Magnolia Avenue (approximately 60 feet east of the Site) and listed in the EnviroStor, VCP, EMI, and EDR MGP databases, is discussed in Section 7.4.1 above. There are currently no open cases on this property.

Strand automotive, located at 333 Genoa Street and 60 feet south of the Site across the railroad, is listed in the EDR Historic Auto Station database as general automotive repair shop in 1991, 1996, and 1997.

Two facilities, located at 335 Genoa Street and 60 feet south-southwest of the Site across the railroad, are listed in databases searched by EDR. A F B Engineering is listed in the EDR Historic Auto Station database as a general automotive repair shop in 1987 through 1993. Lieder

Development Inc. is listed in various databases related to hazardous waste handling, and is listed a small quantity generator of waste oil, mixed oil, unspecified aqueous solution, unspecified organic liquid mixtures, and other organic solids in 2005 and 2006. There are no reports of violations or open cases on this property.

9.3.3 Potential Areas of Concern

Three (3) additional addresses are listed in the Radius Map Report within the AOC of 528 feet of the Site as potentially having used or stored petroleum hydrocarbons (Appendix F). These facilities are listed in the following databases: EDR Historic Auto Station, SWEEPS UST, CA FID UST, UST, and Los Angeles Co. HMS. None of the facilities listed at the three addresses are listed as having any violations or open cases and are not considered RECs.

Eight (8) facilities, which may have used other COCs such as chlorinated VOCs or solvents, are listed on the Radius Map database within 1,760 feet of the Site. These facilities were listed in one or more of the following databases: RCRA-SQG, HAZNET, and EDR US Historic Cleaners. None of the eight facilities are listed as having any violations or open cases, and are not considered RECs.

10.0 DATA GAPS

No data gaps were noted during the preparation of this document.

11.0 CONCLUSIONS

FREY has performed a Phase I Environmental Site Assessment in general conformance with the scope and limitations of the ASTM guidelines for the Site. Any exceptions to, or deletions from, this practice are described in Section 4.0.

11.1 SITE HISTORY AND CURRENT STATUS

- The Site was used for agricultural purposes based on the 1928 and 1938 aerial photos, and appeared to be first developed with residential and industrial buildings in the early 1950s.
- Historical and current Site usage includes automotive service and sales, furniture manufacturing, theme park prop/decoration manufacturing and residential.

11.2 ON-SITE RECs

The following items were identified as on-Site RECs in this Phase I ESA:

- Historical auto maintenance operations
- Possible storage of hazardous materials in 55-gallon drums
- Railroad tracks south of the Site (possible use of chemicals for weed/pest control)
- Chemicals used at the California Theaming facility
- Chemicals used / stored at the 1631 S. Magnolia Avenue address

However, as discussed herein, the comprehensive Phase II ESA conducted by Partner in 2011 (Partner, 2011), adequately assessed these on-Site RECs. Since no significant change in the Site usage has occurred since 2011, these on-Site RECs do not appear to have impacted subsurface conditions beneath the Site, and no further assessment is warranted.

11.3 SURROUNDING PROPERTIES

- The property northwest of the Site, at 450 W. Evergreen Avenue, was identified as having former truck maintenance activities on it, which represent a REC. Based on a review of LACDPW files, the 450 W. Evergreen Avenue property previously had a 10,000 gallon gasoline UST and a 10,000 gallon diesel UST which were removed in August 1987. Soil samples collected from beneath the fuel USTs did not contain petroleum hydrocarbon constituents, and a case closure letter was issued by the LACDPW on September 15, 1987. As such, this identified off-Site REC does not appear to have impacted subsurface soils beneath the Site. Further assessment of this off-Site REC is not warranted.

- No other off-Site RECs were identified.

12.0 LIMITATIONS

The judgments described in this report are professional opinions based solely within the limits of the scope of work authorized, and pertain to conditions judged to be present or applicable at the time the work was performed. Future conditions may differ from those described herein, and this report is not intended for future evaluations of this Site unless an update is conducted by a consultant familiar with environmental assessments.

This report was compiled partially of information supplied to FREY Environmental, Inc. from outside sources, other information that is in the public domain and a visual inspection of the Site. FREY Environmental, Inc. makes no warranty as to the accuracy of statements made by others, which may be contained in this report, nor are any other warranties or guarantees, expressed or implied, included or intended by the report, except that it has been prepared in accordance with the current accepted practices and standards consistent with the level of care and skill exercised under similar circumstances by other professional consultants or firms performing similar services.

13.0 PROFESSIONAL STATEMENTS

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental professional as defined in §312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the Site. We have developed and performed all the appropriate inquiries in conformance with ASTM E1527-13 which meets the standards and criteria set forth in 40 CFR 312.

Should you have any questions regarding this report, please contact us.

Sincerely,
FREY Environmental, Inc.

TRANSACTION SCREEN QUESTIONNAIRE

TRANSACTION SCREEN QUESTIONNAIRE
FOR PHASE I ENVIRONMENTAL SITE ASSESSMENT

Site: #698-19
1625 -1641 S. Magnolia Ave.
340, 410 & 418 West Evergreen Ave.
1541 Dale Drive
Monrovia, California

Completed By: _____Peter Hoffman_____ Company: Sierra Auto Properties LLC

General Site Questions:

How is storm water handled? For much of the property it flows into the drainage canal that borders the west end of the property. I'm not sure where the eastern properties drain.

Herbicide/Pesticide use (type, quantity, frequency)?: Don't know of any such use

---

Utilities: Septic or Sewer: both

There was a poorly functioning septic tank at the last house on Dale Ave. There was also another septic system and leach field at the other. Both were removed when the houses were demolished.

Water Supply Well or City Water: City

Electricity: SCE

Gas: Southern California Gas Company

Trash / Non-Haz Waste Disposal: Athens Services

Hazardous Waste: _____

Historical Chemical Use and Storage (type, used for, storage locations:

Don't know for California Theaming, Inc.

For 1621 S. Magnolia, new automobile oil storage. Same for 1631 S. Magnolia

The Phase I for our purchase of the property speculated that there may have been an open truck repair operation in the Northwest edge of the property (along the area where Bkrich Construction borders the property), but there were no details.

1a. Did you observe evidence or do you have any prior knowledge that the subject property is currently or has been previously used for an industrial use?	Yes XX	No	Unknown
1b. Did you observe evidence or do you have any prior knowledge that any adjoining properties is currently or has been previously used for an industrial use?	Yes XX	No	Unknown
2a. Did you observe evidence or do you have any knowledge that the subject property is currently or has previously been used for any of the following (circle all that apply): • gasoline station • motor repair facility Currently new car get ready (see also the note under historical chemical use) • dry cleaners • photo developing laboratory • junkyard or landfill • waste treatment, storage, disposal, processing or recycling facility	Yes XX	No	Unknown
2b. Did you observe evidence or do you have any knowledge that any adjoining property is currently or has previously been used for any of the following (circle all that apply): • gasoline station • motor repair facility – the possible truck repair facility may have been on the Bkrich property) • dry cleaners • photo developing laboratory • junkyard or landfill • waste treatment, storage, disposal, processing or recycling facility (across Magnolia there was a significant clean-up from a gas processing operation)	Yes xx	No	Unknown
3. Did you observe evidence or do you have any knowledge that there are currently or have been previously any damaged or discarded automotive or industrial batteries, pesticides, paints, or other chemicals in individual containers > 5 gallons (19 L) in volume or 50 gallons (190 L) in the aggregate, stored on or used at the subject property? See remarks on #4	YesXX	No	Unknown

below

4. Did you observe evidence or do you have any knowledge that there are currently or have been previously any industrial drums (typically 55 gal) or sacks of chemicals located on the subject property? Yes xx No Unknown

When we acquired the property, California Theaming was storing a number of 55 gal drums on the property adjacent to Brkich and behind the second house to the South. They removed all of that shortly thereafter. Haven't looked at their current storage area immediately south of their building. The Dealership operations currently have oil stored at the facility.

---

5. Did you observe evidence or do you have any prior knowledge that fill dirt has been brought onto the subject property that originated from a contaminated site or is of unknown origin? Yes No xx Unknown

---

6. Did you observe evidence or do you have any prior knowledge that there is currently or has been previously any pits, ponds, or lagoons located on the subject property in connection with waste treatment or waste disposal? Yes No XX Unknown

---

7. Did you observe evidence or do you have any prior knowledge that there is currently or has been previously any stained soil on the subject property? Yes NoXX Unknown

---

8. Did you observe evidence or do you have any prior knowledge that there is currently or has been previously any registered or unregistered storage tanks (above or underground) located on the subject property? Yes No xx Unknown

---

9. Did you observe evidence or do you have any prior knowledge that there is currently or has been previously any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on Yes No xx Unknown

---

the subject property or adjacent to any structure on the subject property?

10. Is there currently evidence of leaks, spill, or staining by substances other than water, or foul odors, associated with flooring, drains, walls, ceilings, or exposed grounds on the subject property? Yes NoXX Unknown

11. If the subject property is served by a private well or non-public water system, is there evidence or do you have any knowledge that contaminants have been identified in the well or system, or that the well has been designated as contaminated by any government environmental / health agency? Yes NoXX Unknown

12. Do you have any knowledge of environmental liens or government notification relating to past or recurrent violations of environmental laws with respect to the subject property? Yes NoXX Unknown

13. Have you been informed of the current or past existence of hazardous substances or petroleum products with respect to the subject property? YesXX No Unknown

In connection with the current automotive operations and with current and past operations of California Theaming.

14. Do you have any knowledge of any environmental site assessment of the property or facility that indicated the presence of hazardous substances or petroleum products on, or contamination of, the subject property, or recommended further assessment of the subject property? YesXX No Unknown

Only to the extent mentioned in the Phase I and Phase II assessments incident to our purchase of the property, which you have a copy of.

15. Do you know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any hazardous

substance or petroleum products involving the subject property by any owner or occupant of the property?	Yes	NoXX	Unknown
16. Does the subject property discharge waste water (not including sanitary waste or storm water) onto or adjacent to the property and/or into a storm water system? Don't know what this question means, but much of the rainwater landing on the westerly portion of the property flows into the drainage canal that makes up part of the western border of the property.	Yes	NoXX	Unknown
17. Do you have any prior knowledge that any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or any other waste materials have been drummed above grade, buried and/or burned on this property?	Yes	NoXX	Unknown
18. Is there a transformer, capacitor, or any hydraulic equipment for which there are any records indicating the presence of PCB's?	Yes	No	UnknownXX

Please provide details relating to any questions answered "yes" in the space provided. Attach additional sheets or informative documents if necessary:

The details have been provided below each question. Essentially all of the "Yes" answers are due to existing automotive operations, which do use oil and transmission fluids and for which we are not aware of any spills, and the operations of California Theaming, Inc. which does fiberglass fabrication, painting and other manufacturing operations in connection with its business of creating backdrops and sets for theme parks, like Disneyland. We don't have much information about their operation and are not aware of any issues (like spills or enforcement actions). None of the "Yes" answers relate to Vioski Manufacturing, which makes upholstered furniture. That is a manufacturing facility, but I have never seen any paint, glue or 55 gallon drums, so I am not aware of any

relevant activity or issues.

The undersigned represents, that to the best of his knowledge, the above statements and facts are true and correct and, to the best of his knowledge, no material facts have been suppressed or misstated.

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Certified Sanborn® Map Report

06/06/17

Site Name:

Alexan Monrovia
1625 S. Magnolia Avenue
Monrovia, CA 91016
EDR Inquiry # 4958658.3

Client Name:

Frey Environmental
2817-A Lafayette Avenue
Newport Beach, CA 92647
Contact: Ed Rands

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Frey Environmental were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # E0F1-488F-A7ED

PO # 698-19

Project Alexan Monrovia

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: E0F1-488F-A7ED

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

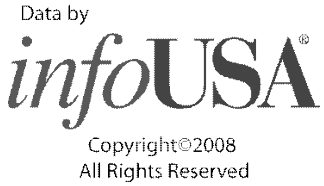
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

RESEARCH SUMMARY

EDR Environmental Lien and AUL Search

The EDR Environmental Lien and AUL Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for

listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 02/07/2017 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

CHEVRON STATION NO 2	*1515 S MYRTLE AVE*	*E 1/8 - 1/4 (0.238 mi.)*	*J49*	*82*

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 7 RCRA-SQG sites within approximately 0.25 miles of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/30/2017 has revealed that there are 7 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, has revealed that there are 5 UST sites within approximately 0.25 miles of the target property.

State and tribal voluntary cleanup sites

VCP: Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

A review of the VCP list, as provided by EDR, and dated 01/30/2017 has revealed that there are 2 VCP sites within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/12/2016 has revealed that there are 3 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2015 has revealed that there is 1 HAZNET site within approximately 0.001 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there are 2 EDR MGP sites within approximately 1 mile of the target property.

SO CAL GAS/MONROVIA	1622 S MAGNOLIA AVE	E 0 - 1/8 (0.011 mi.)	A6	22
SO CAL EDISON CO	W. CHESTNUT AND S. P	NNE 1/2 - 1 (0.567 mi.)	65	111

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 7 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical

Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there are 2 EDR Hist Cleaner sites within approximately 0.125 miles of the target property.

Completed Info:

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Workplan
Completed Date:	03/04/2003
Comments:	DTSC approved RAW on 3/4/03. Proposed remedial activities include the

SO CAL GAS/MONROVIA MGP (Continued) **S106836061**

removal of approximately 3,864 cubic yards of soil. Previously identified chemicals of potential concern include PAHs and BTX. Removal activities are anticipated to last approximately 40 days. DTSC placed the special Initial Study, Negaive Declaration, and De Minimis Impact for public review. There were two written comments received. DTSC provided a response to the two comments. The comments were not substantial and did not result in any changes to the CEQA documents. DTSC approved the CEQA on 3/4/03.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 12/31/2002
Comments: DTSC approved Site Characterization activities in December 2002. Contaminants of concern included PAHs & BTEX.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 02/05/1993
Comments: The Department completed review of the PEA on January 4, 1993. The levels of the contaminants at the site were above the regulatory limit. Therefore, the Department recommended further investigation or assessment of the site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 07/14/1992
Comments: The Dept received a notice of intent to initiate a PEA for the site. The reports indicate that the site appears to be used as part of an industrial operation. The gas production at the site began in 1905 and ended in 1910. The site approximately .06 acres in size.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Other Report
Completed Date: 09/27/2005
Comments: The Department of Toxic Substances Control (DTSC) has reviewed the PROPOSED SUPPLEMENTAL SITE INVESTIGATION, FORMER MONROVIA MANUFACTURED GAS PLANT SITE, 1622 SOUTH MAGNOLIA STREET, MONROVIA, CALIFORNIA, SEPTEMBER 6, 2005. DTSC approves the proposed Supplemental Sampling. However; DTSC may require additional sampling based on visual observations in the field.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Technical Report
Completed Date: 03/15/2007
Comments: Supplemental Site Investigation Report was reviewed by DTSC. Based on the results of Additional off-site step out sampling additional removal action is necessary in the areas as described in DTSCs comments.A Supplemental Removal Action Workplan should be submitted to DTSC for review & comment prior to any removal activities.

Completed Info:

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 03/04/2003
Comments: DTSC approved RAW on 3/4/03. Proposed remedial activities include the removal of approximately 3,864 cubic yards of soil. Previously identified chemicals of potential concern include PAHs and BTX. Removal activities are anticipated to last approximately 40 days. DTSC placed the special Initial Study, Negaive Declaration, and De Minimis Impact for public review. There were two written comments received. DTSC provided a response to the two comments. The comments were not substantial and did not result in any changes to the CEQA documents. DTSC approved the CEQA on 3/4/03.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Characterization Report
Completed Date: 12/31/2002
Comments: DTSC approved Site Characterization activities in December 2002. Contaminants of concern included PAHs & BTEX.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 02/05/1993
Comments: The Department completed review of the PEA on January 4, 1993. The levels of the contaminants at the site were above the regulatory limit. Therefore, the Department recommended further investigation or assessment of the site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Site Screening
Completed Date: 07/14/1992
Comments: The Dept received a notice of intent to initiate a PEA for the site. The reports indicate that the site appears to be used as part of an industrial operation. The gas production at the site began in 1905 and ended in 1910. The site approximately .06 acres in size.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Other Report
Completed Date: 09/27/2005
Comments: The Department of Toxic Substances Control (DTSC) has reviewed the PROPOSED SUPPLEMENTAL SITE INVESTIGATION, FORMER MONROVIA MANUFACTURED GAS PLANT SITE, 1622 SOUTH MAGNOLIA STREET, MONROVIA, CALIFORNIA, SEPTEMBER 6, 2005. DTSC approves the proposed

SO CAL GAS/MONROVIA MGP (Continued) **S106836061**

Supplemental Sampling. However; DTSC may require additional sampling based on visual observations in the field.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Technical Report
Completed Date: 03/15/2007
Comments: Supplemental Site Investigation Report was reviewed by DTSC. Based on the results of Additional off-site step out sampling additional removal action is necessary in the areas as described in DTSCs comments.A Supplemental Removal Action Workplan should be submitted to DTSC for review & comment prior to any removal activities.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

Manufactured Gas Plants:

Site located at 1622 South Magnolia Street in Monrovia, California. The former MGP site occupies approximately 0.6 acres within the property. An oil gas plant operates at the site from 1905 until 1917. Sometime in 1917, the MGP was converted to a reggulating station and storage site. It is believed that

SO CAL GAS/MONROVIA (Continued) **1008407719**

between 1917 to 1921, the gas generating and processing equipment was dismantled. Various businesses have occupied the site since 1965.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002629709

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

FINDS:

Registry ID: 110002643818

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Background Info:	This lead contaminated Site has been a joint project between LA County, US-EPA, and DTSC, with DTSC now as the Lead Agency. The Site originally consisted of five properties; 827, 829, 831 Olive Avenue and 824, 832 Colorado Blvd; but now two properties, 831 Olive and the 824 Colorado are determined clean. Lead contamination exists in sols from 0-2 and the contamination was probably from Barth's Battery Shop which was located on 832 Colorado Blvd. in the 1930s. In the 1930s the Olive Avenue properties were a vacant lot. The battery shop probably disposed their battery waste beind the business as pieces of battery casings have been found in Site soils. In the 1960s the Olive Avenue vacant lot was developed with the current residential buildings which were built on top

TROTTER APARTMENTS (Continued) **S106076586**

of the battery waste. Grading of the lot prior to construction probably spread the lead waste throughout the properties.
Not reported
DTSC sampled in May and October 2001 to define the vertical and lateral extent of the lead contamination. DTSC then conducted an Emergency Removal Action in January 2002 to remove surface soils contaminated with lead that may pose a health risk to residents. After this action the 824 Colorado Blvd address was determined cleaned as only a small area in the southwest corner of the property needed excavation. In May 2003 DTSC conducted a Removal Action to remove the remaining lead contaminated soil that was not covered by structures or paving. After this action the 831 Olive Avenue was determined cleaned as only a small area on the south western lot was excavated.
Not reported
DTSC believes that the health risk has been removed at the Site. Lead contaminated soil still exists there, but the areas where lead contaminated soil exists are either covered by concrete, asphalt, or building structures, and therefore do not pose a risk to human health or the environment.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/05/2017

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/05/2017

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 12/12/2016

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Data Release Frequency: Varies

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

SCRD DRYCLEANERS: State Coalition for Remediation of Drycleaners Listing

The State Coalition for Remediation of Drycleaners was established in 1998, with support from the U.S. EPA Office of Superfund Remediation and Technology Innovation. It is comprised of representatives of states with established drycleaner remediation programs. Currently the member states are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Southwest Map:	5630799 EL MONTE, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

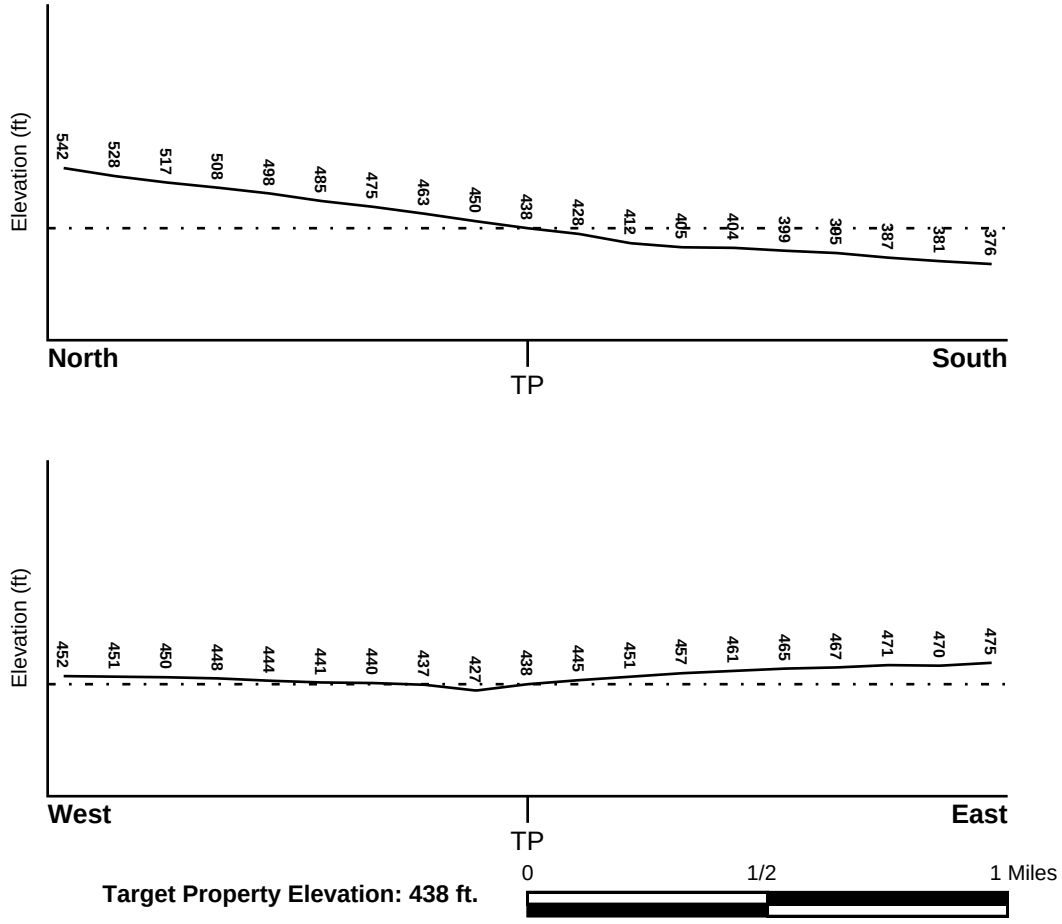
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1400F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1415F	FEMA FIRM Flood data
06037C1675F	FEMA FIRM Flood data
06037C1700F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
MOUNT WILSON	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:
sandy loam
gravelly - sandy loam
silt loam
clay
fine sand
gravelly - sand
sand
fine sandy loam

Surficial Soil Types:
sandy loam
gravelly - sandy loam
silt loam

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Subject: **Phase II Environmental Site Assessment**
Industrial Complex
1625/1625B, 1631 South Magnolia Avenue, and 410 West Evergreen Avenue
Monrovia, California 91016
Partner Project Number 11-76495.9

Dear Mr. Hoffman:

The following letter report details the field activities, methods, and findings of the Phase II Environmental Site Assessment (ESA) conducted by Partner Engineering and Science, Inc. (Partner) at the above-referenced property ("site" or "subject property"). The purpose of the investigation was to determine the presence or absence of soil and/or soil-vapor contamination from the former and potentially current industrial use of the subject property. Sierra Autocars, Inc., provided project authorization through a signed copy of Partner Proposal Number P11-76495.9.

Site Description

The Site is located on the southwest corner of the intersection of West Evergreen Avenue and South Magnolia Avenue. The Site is comprised of three parcels: 1625/1625 B South Magnolia Avenue parcel which consists of 2.09 acres; the 1631 South Magnolia Avenue parcel which consists of 0.79 acre; and the 410 West Evergreen Avenue parcel which consists of 1.3 acres. Adjacent properties consist of a church to the north, vacant land to the east across South Magnolia Avenue, railroad track to the south, and residences to the west across South Dale Drive. Please see Figure 1 for a site vicinity map.

The parcel located at 1625/1625 B South Magnolia Avenue is developed with two industrial buildings (Building A constructed in 1954 and Building B constructed in 1962), a single family residence constructed in 1950, and two metal sheds. Building A is currently occupied by Vioski Manufacturing for the manufacturing of furniture. Building B is currently occupied by an unnamed tenant for the storage of various gym equipment, as well as by AeroVironment for the warehousing of military drone equipment.

The parcel located at 1631 South Magnolia Avenue is developed with two buildings, including a multi-tenant industrial building and a small office building constructed in 1966. The multi-tenant industrial building is occupied by The Classic Garden for pottery warehousing and distribution operations; by Andersen Woodworks for woodworking operations; and an unnamed pottery tenant for garden pot/planter making operations.

The parcel located at 410 West Evergreen Avenue is developed with one industrial building constructed in 1977. The subject property is currently occupied by California Theaming Company for industrial use. Onsite operations consist of the manufacturing of theme-park fixtures and props, including silicone and plaster molding, welding, spray painting, sanding, cutting, and typical office and administrative activities.

The remainder of the Site consists of asphalt-paved parking spaces and associated landscaping. Please see Figure 2 for a site plan.

Site History

According to an April 2011 Partner Phase I Environmental Site Assessment (Phase I) Report, the parcel located at:

- 1625/1625 B South Magnolia Avenue was developed for industrial use from 1954 to the present. Historical operations included furniture manufacturing and upholstering, woodworking, structural manufacturing, and the development of scientific machinery (prototypes). From 1966 to 1976, the subject property was occupied by STD/Standard Research Company for the development of scientific machinery (prototypes). Building records indicated that STD Research Company utilized detergents and "common organic solvents" for cleaning purposes and mercury for operations. From 1973 to 1990, the subject property was occupied by Calcraft for structural manufacturing. Calcraft operated a spray booth and utilized solvents during this period of time. Based on the duration of industrial operation, the nature of industrial activities including spray painting operations and solvent usage; and the absence of subsurface investigations to account for these concerns, the historical industrial operations at the subject property was considered to constitute a recognized environmental condition (REC).

- 1631 South Magnolia Avenue was developed for industrial use from 1965 to the present. Historical operations included sheet metal work and manufacturing, electronics operations, wood-working, and structural manufacturing. Calcraft occupied the subject property in 1972. Calcraft operated a spray booth and utilized solvents as part of day-to-day operations. Metric Machining Co. occupied the subject property in 1988 and operated as a metal machining company and fabricated metallic parts, utilizing oils, lubricants, cutting fluids, and solvents as part of day-to-day operations. Based on the duration of industrial operation, the nature of industrial activities including spray painting and metal manufacturing operations and solvent usage, and the absence of subsurface investigations to account for these concerns, the historical industrial use of the subject property was considered to constitute a REC. In addition, the adjacent railroad tracks also constitute a potential environmental concern. Railroad spurs represent environmental concerns due to the historical application of oils containing polychlorinated biphenyls (PCBs), herbicides, and arsenic for pest and weed control, as well as, the potential presence of creosote on the rail ties, and the historical common practice of using coal cinders for track fill material.

- 410 West Evergreen Avenue has been developed for industrial use as early as 1968 to present-day. Former operations on the subject property included sheet metal work. The absence of information regarding historical operations and regulatory agency records, and the absence of subsurface investigations to determine whether former operations have impacted the subject property constitute a REC. In addition to the environmental concern of the historical industrial operations, the adjacent railroad tracks also pose a concern. Railroad spurs represent environmental concerns due to the historical application of oils containing polychlorinated biphenyls (PCBs), herbicides, and arsenic for pest and weed control, as well as the potential presence of creosote on the rail ties, and the historical common practice of using coal cinders for track fill material.

Field Activities

To provisionally investigate the potential impact of petroleum/chlorinated hydrocarbons, PCBs, pesticides, and metals to soil as a consequence of a release or releases from historical and current industrial activities, Partner conducted a Phase II Environmental Site Assessment. The assessment scope included 34 soil/soil gas borings (B1 through B34).

Utility Clearance

Partner delineated the work area with white spray paint and notified Underground Services Alert (USA) to clear public utility lines as required by law at least 48 hours prior to drilling activities. USA issued ticket number A11720332 for the project.

Geophysical Survey

On June 29, 2011, Ground Penetrating Radar Systems, Inc. (GPRS) conducted a Geophysical Survey under the supervision of Partner. The purpose of the Geophysical Survey was to scan for underground utilities at the proposed boring locations, as well as to try and locate a drywell/cess pool associated with the 410 West Evergreen parcel. The investigation focused on the accessible exterior areas surrounding the Site.

The Geophysical Survey was conducted with a GSSI (model SIR-3000) in conjunction with a 400 megahertz (MHz) antenna ground penetrating radar (GPR) unit, and radio detection equipment (model#RD 7000).

GPRS systematically free-traversed the investigation area with the aforementioned equipment. The equipment readouts were interpreted in real time and compiled as necessary in order to identify subsurface anomalies consistent with piping trenches, utility lines, and/or other subsurface conduits/features.

In addition, GPRS systematically free-traversed each Partner-proposed boring location with the aforementioned equipment and the equipment readouts were interpreted in real time for evidence of utility lines and/or other subsurface features of potential concern. Boring placement was

modified as necessary based on the Geophysical Survey results to avoid conflicts with underground features.

Please see Appendix A for a copy of the Geophysical Survey Report, which provides additional details regarding the Geophysical Survey equipment and methodology.

Health and Safety Plan

Partner reviewed the site-specific Health and Safety Plan with all on-site personnel involved in the project prior to the commencement of drilling activities. Please see Appendix B for a copy of the signed Health and Safety Plan.

Drilling Equipment

On June 30, July 1, and July 6, 2011, Partner subcontracted with Kehoe Testing and Engineering (KTE) (State of California C57 Water Well Drilling Contractor License Number 786163) to provide and operate drilling equipment. KTE, under the direction of Partner, advanced soil borings B1 through B3, B10 through B13, B16 through B18, B21, B22, and B25, with a direct-push truck-mounted Geoprobe Model 5400 drill rig; borings B4, B5 and B23 with a limited-access direct-push Geoprobe drill rig; borings B6 through B9, B14, B15, B19, B20 and B24 with a direct-push, track-mounted Geoprobe drill rig; and borings B26 through B34 with a hand auger. All drilling rods and/or sampling equipment were decontaminated between samples and/or boreholes to prevent cross-contamination.

Boring Locations

Soil borings B1 through B15 were drilled at the parcel located at 1625/1625 B South Magnolia Avenue, borings B16 through B20 were drilled at the parcel located at 1631 South Magnolia Avenue, borings B21 through B25 were drilled at the parcel located at 410 West Evergreen Avenue, and borings B26 through B34 were drilled in the vicinity of the railroad track located along the southern Site boundary. Boring placement was limited due to the subject property boundary and parked cars. Please see Figure 3 for a map indicating boring locations.

Sampling Depths

Borings B1, B6, B11, B12, and B16 were advanced to a terminal depth of 5 feet below ground surface (bgs). Soil samples were collected for lithology purposes only at 5 feet bgs.

Borings B2 and B3 were advanced to a terminal depth of 30 feet bgs. Borings B4, B5, B7 through B10, B13 through B15, and B17 through B25 were advanced to a terminal depth of 20 feet bgs. Soil samples were collected from each boring at 5-foot intervals to terminal depth.

Borings B26 through B34 were advanced to a terminal depth of 4 feet bgs. Soil samples were collected from each boring at 1-foot and 4-foot intervals.

Soil gas samples were collected from borings B1 through B6, B8, B10 through B17, B19 through B22, B24, and B25 at 5 feet bgs.

Soil Sampling Methodology

Borings B1 through B3, B6 through B8, B10 through B13, B16 through B18, and B26 through B33 were overlain by asphalt, which was penetrated using the punch bit attachment advanced by the direct-push drill rig. Borings B4, B5, B14, B15, B19, B20, B23, B24, and B25 were overlain by concrete, which was penetrated using a concrete coring attachment advanced by the direct-push rig. Borings B9, B21, B22, and B34 were overlain by soil.

Soil was manually excavated from the upper 5 feet of each boring with a hand-auger equipped with a 3.5-inch diameter auger bucket to clear for underground utilities. At the desired sampling depth, soil was transferred from the auger bucket into a 1¾-inch diameter by 2-foot long acetate liner/or 4-ounce glass jar.

The remaining soil samples were collected using a 2-foot long by 1¾-inch diameter sampler with a 2-foot long acetate liner and sampling point. The sampler was advanced by the direct-push drill rig using 3-foot long by 1.5-inch diameter hollow rods with the inner rods in place to prevent soil from entering the sampler. At approximately 1 foot above the desired sampling depth, an inner rod was removed and the sampler was advanced to the desired sampling depth to allow undisturbed soil to enter the sampling liner. The sampler was retrieved from the subsurface and the soil-filled liner was removed.

Each acetate liner was cut using a hacksaw. A sample was collected from the lower half of the liner using a disposable plastic syringe in accordance with Environmental Protection Agency (EPA) Method 5035 sampling protocol. The remainder of the lower half of the liner was capped on either end with Teflon tape and plastic caps. The capped liners and syringes were labeled for identification and stored in an iced cooler. The soil in the upper half of the liner was visually inspected for discoloration, monitored for odors, classified in accordance with the Unified Soil Classification System (USCS), placed in a sealable plastic bag, and field-screened with a photoionization detector (PID) calibrated to isobutylene. None of the samples exhibited discoloration or an odor and none of the PID readings suggested the presence of significantly elevated volatile organics concentrations.

Soil Gas Probe Construction

Soil gas probes screened at 5 feet bgs were constructed within soil borings B1 through B6, B8, B10 through B17, B19 through B22, B24, and B25 upon completion of soil sampling. New ¼-inch diameter polyethylene tubing with a ¼-inch diameter polypropylene filter at the terminal end was inserted into a borehole to the desired sampling depth. One-inch diameter polyvinyl chloride (PVC) casing was used as a guide for the tubing to ensure that the desired sampling depth was achieved. Sand was poured into the boring annulus to form an

approximately 1-foot long sand pack around the polypropylene filter, at which time the PVC piping was withdrawn and approximately 1 foot of dry, granular bentonite was placed atop the sand pack. The borehole was backfilled with hydrated bentonite to the ground surface to form a seal. The sampling end of the tubing was fitted with a valve and the probe was labeled for identification.

Soil Gas Sampling Methodology

Soil gas samples were collected in general accordance with the February 1997 Los Angeles Regional Water Quality Control Board (LARWQCB) "Interim Guidance for Active Soil Gas Investigation" and the January 2003 Department of Toxic Substances Control (DTSC) and LARWQCB "Advisory – Active Soil Gas Investigations."

The mobile laboratory was calibrated at the beginning of the day prior to the first analysis. Each probe was allowed to equilibrate for at least 30 minutes after installation prior to sampling with gas-tight glass syringes. A purge test was conducted on the first probe to determine the optimal purge volume. The optimal purge volume based on the purge test was three purge volumes, which was then purged from the remaining probes. Each day, one soil vapor sample was collected as a duplicate to assess the precision (repeatability) of the laboratory analysis.

Tracer gas n-propanol was placed around each probe at the ground surface while sampling to detect ambient air intrusion. The tracer gas was not detected in any sample, indicating that the integrity of the bentonite seal was maintained. In addition, recovery of all surrogate compounds included with each analysis was within acceptable limits, indicating that the sampling containers and analysis equipment did not leak.

The probes were removed from the subsurface and the boreholes were backfilled with hydrated bentonite chips and capped with concrete or asphalt to match existing ground cover upon completion of sampling.

No significant amounts of derived wastes were generated during this investigation.

Soil Gas Sample Laboratory Analyses

Jones Environmental, Inc. (JEI), a state-certified mobile laboratory [California Department of Public Health (CDPH) Environmental Laboratory Accreditation Program (ELAP) certificate number 6C73103] was present on-site and collected 21 soil gas samples (plus three duplicate samples) on June 30, July 1, and July 6, 2011. The soil gas samples were immediately loaded into the gas chromatograph/mass spectrometer (GC/MS) for analysis. Each sample was analyzed for volatile organic compounds (VOCs) via EPA Method 8260B.

Soil Sample Laboratory Analyses

Partner collected 32 soil samples on June 30, 2011, 32 soil samples on July 1, 2011 and 38 soil samples on July 6, 2011, for analysis using the JEI mobile lab. A total of 25 soil samples were analyzed for VOCs via EPA Method 8260B and total petroleum hydrocarbon chain speciation (TPH-cc) via EPA Method 8015M.

Discrete soil samples collected along the southern property boundary in the vicinity of the railroad tracks were composited by the laboratory into a composite sample (three samples total) and analyzed for TPH-cc via EPA Method 8015M, and VOCs via EPA Method 8260B.

Partner collected eight soil samples on June 30, 2011, eight soil samples on July 1, 2011 and 22 soil samples on July 6, 2011, for analysis by SunStar Laboratories, Inc. (SunStar), a state-certified laboratory [California Department of Health Services (DHS) ELAP certificate number 2250] in Lake Forest, California. The samples on the day that they were collected were transported in an iced cooler under proper chain-of-custody protocol to SunStar laboratory for analyisis.

Based on field-screening results, a total of 23 soil samples were analyzed for California Administrative Manual (CAM) 17 Metals via EPA Method 6010B/7471A, nine soil samples were analyzed for semi-volatile organic compounds (SVOCs) via EPA Method 8270C, and six soil samples were analyzed for polychlorinated biphenyls (PCBs) via EPA Method 8081B.

The discrete composite soil samples collected along the southern property boundary in the vicinity of the railroad tracks, discussed above, were analyzed for CAM 17 Metals via EPA Method 6010B/7471A, PCBs via EPA Method 8081B, and for organochlorine pesticides (OCPs) via EPA Method 8081B.

Investigation Scope Summary

Please see Table 1 for a summary of the borings, sampling schedule, and laboratory analyses for this investigation. Please see Table 2 for a summary of the laboratory analyses schedule for the soil samples composited by the laboratory during this investigation.

Table 1: Summary of Investigation Scope

Boring Identification	Location	Terminal Depth (feet bgs)	Matrix Sampled	Sampling Depths* (feet bgs)	Target Contaminants

Geology and Hydrogeology

Based on a review of the United States Geological Survey (USGS) Mount Wilson Quadrangle topographic map, the subject property is situated approximately 440 feet above mean sea level (amsl), and the local topography is sloping gently to the south-southwest.

The Site is located in the eastern San Gabriel Valley within the Main San Gabriel Hydrogeologic-Basin. The basin is bounded by the San Gabriel Mountains to the north, the San Jose Hills and subsurface bedrock high to the east; the Puente, Repetto and Merced hills to the south and west; and the Raymond Fault to the northwest. Local geology is characterized by recent age younger alluvium and Pleistocene age older alluvium consisting of poorly consolidated continental sediments. These sediments consist of interbedded sand, silt, and clay in variable proportions with lenses of gravel. They were deposited in large part by coalescing alluvial fans emanating from canyons exiting the southern San Gabriel Mountains north of the site. In the site vicinity, older alluvium occurs at grade to a depth of approximately 700 feet, and comprises a more youthful portion of the alluvial fan which has accumulated at the mouth of Monrovia Canyon. The dominant structural feature in the vicinity of the site is the Sierra Madre fault zone. Elements of this fault zone occur approximately 1.0 mile northeast of the subject site and include the Duarte and Sierra Madre faults.

Based on borings advanced during this investigation, the underlying subsurface consists predominantly of dark brown, dry to slightly moist sand (SP) with silt from the ground surface to 30 feet bgs. Please see Appendix C for boring logs from this investigation.

Hydrogeologically, the Site is located in the eastern San Gabriel Valley within the Main San Gabriel Hydrogeologic Basin. The San Gabriel and the Rio Hondo rivers, and their tributaries flow from the San Gabriel Valley. The rivers have their headwaters in the San Gabriel Mountains and have a common exit from the southern portion of the valley at Whittier Narrows between the Merced and Puente hills. The site is approximately 3 miles west of the San Gabriel River. Percolation of direct rainfall and run-off water from the mountains is the major source of natural recharge of the San Gabriel Hydrogeologic Basin. Imported water and return flow from applied water also supply recharge water to the basin. The alluvial deposits, which contain the major aquifer in the basin, attain a maximum thickness of greater than 4,000 feet. The average thickness of water-bearing deposits in the center of the basin is 900 to 1,000 feet. The alluvium is underlain by Miocene-age Puente and Topanga formations that yield only limited quantities of water. The elevation of the groundwater ranges from 100 feet to greater than 500 feet amsl.

Regionally, groundwater flows from the perimeter of the basin in a southerly direction toward Whittier Narrows, where it exits the basin. Locally, the groundwater flow is towards the west. Los Angeles County Water District records indicate that groundwater occurs at approximately 280 feet bgs in the area of the subject property; however, shallower, perched groundwater may also occur. According to the Los Angeles County Department of Public Works (LACDPW) Hydrologic Unit, the nearest well is #4197. Well #4197 is located approximately 4,800 feet

southwest of the Site. Depth to groundwater was reported as 191.5 feet bgs on May 5, 2002. Groundwater was not encountered during this investigation.

Laboratory Analysis Results

JEI reported the laboratory results on July 6 and July 11, 2011. SunStar reported the laboratory results on July 8, July 11, and July 13, 2011. Please see Tables 3 through 9 for a summary of the soil gas VOCs, soil VOCs, soil TPH-cc, soil CAM 17 metals, soil SVOCs, soil PCBs, and soil OCPs laboratory analysis results, respectively.

DDT = dichlorodiphenyltrichloroethane
ND = not detected above laboratory Reporting Limits

Please see Appendix D for the full laboratory analysis reports, which include chain-of-custody and laboratory quality assurance/quality control (QA/QC) documentation. All laboratory QA/QC data were within acceptable limits.

Discussion

One soil gas sample (PES-B2-SV5) contained a detectable concentration of trichlorofluoromethane at 0.190 micrograms per liter (µg/L). None of the soil gas samples indicated detectable concentrations of one or more other VOCs.

One soil sample (B14-5) contained a detectable concentration of tertiary-butyl alcohol (TBA) at 33.4 micrograms per kilogram (µg/kg). None of the soil samples indicated detectable concentrations of one or more other VOCs.

One composite soil sample (Composite 3) contained a detectable concentration of the OCP Endosulfan I at 5.5 µg/kg. None of the soil samples indicated detectable concentrations of one or more other OCPs.

None of the analyzed soil samples contained a detectable concentration of SVOCs or PCBs.

Most of the analyzed detected soil sample results did not exceed the background concentrations for typical California soils as based on the Kearney Foundation of Soil Science March 1996 Background Concentrations of Trace and Major Elements in California Soils Report.

Regional Screening Levels

Regional Screening Levels (RSLs) [formerly Preliminary Remediation Goals (PRGs)] are generic, risk-based chemical concentrations developed by the EPA Region 9 for use in initial screening-level evaluations. RSLs combine human health toxicity values with standard exposure factors to estimate contaminant concentrations that are considered to be health protective of human exposures over a lifetime through direct-contact exposure pathways (e.g., via inhalation and/or ingestion of and/or dermal contact with impacted soil). RSLs are not legally enforceable

standards, but rather are considered guidelines to determine if potential risks associated with encountered contamination may warrant further evaluation.

Please see Table 10 for a comparison of detected soil contaminant concentrations and available residential and industrial soil RSLs. Only contaminants detected above laboratory Practical Quantitation Limits (PQLs) are included in the table.

Table 10: RSLs and Detected Soil Contaminant Concentrations (µg/kg)

Detected Contaminants	Number of Samples with Detectable Concentrations*	Sample with Peak Concentration	Peak Concentration	Residential Soil RSL	Industrial Soil RSL	Number of Samples Exceeding RSLs
Endosulfan I	1 of 3	Composite 3	5.5	370,000	3,700,000	0 / 0

Notes:
*Exceeding the laboratory Practical Quantitation Limit (PQL)
RSLs = Regional Screening Levels
µg/kg = micrograms per kilogram

None of the contaminants detected in the analyzed soil samples exceeded the residential or industrial soil RSLs.

Summary and Conclusions

Partner completed an Environmental Site Assessment at the subject property to determine the presence or absence of soil and/or soil-vapor contamination from the former and potentially current industrial use of the subject property. The scope of the investigation included the installation of 34 soil/soil gas borings. Twenty-one soil gas samples were analyzed for VOCs. Twenty-two soil samples were analyzed for VOCs and TPH-cc. Nine soil samples were analyzed for SVOCs. Three soil samples were analyzed for PCBs. Twenty soil samples were analyzed for CAM 17 Metals. Three composite soil samples were analyzed for VOCs, TPH-cc, PCBs, OCPs, and CAM 17 Metals.

Trichlorofluoromethane was detected in one soil gas sample. No soil gas regulatory guidelines are currently established for the detected refrigerant. The VOC TBA was detected in one soil sample collected at a depth of 5 feet bgs. The 10-foot soil sample collected from the same boring had non-detectable concentrations of all VOCs including TBA, suggesting a very limited localized TBA impact and very limited vertical migration of this contaminant. No soil regulatory guidelines are currently established for TBA and impacts to the deep ground water are very unlikely. The OCP Endosulfan I was detected in one composite soil sample at concentrations below available regulatory guidelines.

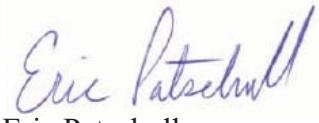
Metal were detected in soil samples, however concentrations were below applicable regulatory guidelines. No other elevated concentrations of target contaminants, other than the suspected very localized low concentration of the refrigerant, were detected in soil gas or soil during this investigation.

Given the findings of this investigation, Partner recommends no further investigation with respect to the industrial complex at this time.

Limitations

This Report presents a summary of work completed by Partner. The completed work includes observations of site conditions encountered and the analytical results provided by an independent third party laboratory of samples collected during the course of the project. The number and location of samples were selected to provide the required information. However, it cannot be assumed that the limited available data are representative of subsurface conditions in areas not sampled.

All conclusions and/or recommendations are based on the observations, laboratory analyses, and the governing regulations. Conclusions and/or recommendations beyond those stated and reported herein should not be inferred from this document.



Partner warrants that the environmental consulting services contained herein were accomplished in accordance with generally accepted practices in the environmental engineering, geology, and hydrogeology fields that existed at the time and location of work. No other warranties are implied or expressed.

All reports, both verbal and written, as they pertain to the property located at 1625/1625 B, 1631 South Magnolia Avenue, and 410 West Evergreen Avenue in the City of Monrovia, California, are for the sole use and benefit of Sierra Autocars, Inc. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of Partner.

Signatures of Participating Professionals

Thank you for the opportunity to be of service. If you have any questions regarding this investigation, please contact the undersigned at (310) 615-4500.

Sincerely,

Eric Patschull
Project Geologist

Joseph P. Derhake, PE
President

Industrial Complex
1625/1625B, 1631 South Magnolia Avenue, and 410 West Evergreen Avenue
Monrovia, California 91016
Partner Project Number 11-76495.9

Dear Mr. Hoffman:

The following letter report details the field activities, methods, and findings of the Phase II Environmental Site Assessment (ESA) conducted by Partner Engineering and Science, Inc. (Partner) at the above-referenced property ("site" or "subject property"). The purpose of the investigation was to determine the presence or absence of soil and/or soil-vapor contamination from the former and potentially current industrial use of the subject property. Sierra Autocars, Inc., provided project authorization through a signed copy of Partner Proposal Number P11-76495.9.

Site Description

The Site is located on the southwest corner of the intersection of West Evergreen Avenue and South Magnolia Avenue. The Site is comprised of three parcels: 1625/1625 B South Magnolia Avenue parcel which consists of 2.09 acres; the 1631 South Magnolia Avenue parcel which consists of 0.79 acre; and the 410 West Evergreen Avenue parcel which consists of 1.3 acres. Adjacent properties consist of a church to the north, vacant land to the east across South Magnolia Avenue, railroad track to the south, and residences to the west across South Dale Drive. Please see Figure 1 for a site vicinity map.

The parcel located at 1625/1625 B South Magnolia Avenue is developed with two industrial buildings (Building A constructed in 1954 and Building B constructed in 1962), a single family residence constructed in 1950, and two metal sheds. Building A is currently occupied by Vioski Manufacturing for the manufacturing of furniture. Building B is currently occupied by an unnamed tenant for the storage of various gym equipment, as well as by AeroVironment for the warehousing of military drone equipment.

The parcel located at 1631 South Magnolia Avenue is developed with two buildings, including a multi-tenant industrial building and a small office building constructed in 1966. The multi-tenant industrial building is occupied by The Classic Garden for pottery warehousing and distribution operations; by Andersen Woodworks for woodworking operations; and an unnamed pottery tenant for garden pot/planter making operations.

The parcel located at 410 West Evergreen Avenue is developed with one industrial building constructed in 1977. The subject property is currently occupied by California Theaming Company for industrial use. Onsite operations consist of the manufacturing of theme-park fixtures and props, including silicone and plaster molding, welding, spray painting, sanding, cutting, and typical office and administrative activities.

The remainder of the Site consists of asphalt-paved parking spaces and associated landscaping. Please see Figure 2 for a site plan.

Site History

According to an April 2011 Partner Phase I Environmental Site Assessment (Phase I) Report, the parcel located at:

- 1625/1625 B South Magnolia Avenue was developed for industrial use from 1954 to the present. Historical operations included furniture manufacturing and upholstering, woodworking, structural manufacturing, and the development of scientific machinery (prototypes). From 1966 to 1976, the subject property was occupied by STD/Standard Research Company for the development of scientific machinery (prototypes). Building records indicated that STD Research Company utilized detergents and "common organic solvents" for cleaning purposes and mercury for operations. From 1973 to 1990, the subject property was occupied by Calcraft for structural manufacturing. Calcraft operated a spray booth and utilized solvents during this period of time. Based on the duration of industrial operation, the nature of industrial activities including spray painting operations and solvent usage; and the absence of subsurface investigations to account for these concerns, the historical industrial operations at the subject property was considered to constitute a recognized environmental condition (REC).

- 1631 South Magnolia Avenue was developed for industrial use from 1965 to the present. Historical operations included sheet metal work and manufacturing, electronics operations, wood-working, and structural manufacturing. Calcraft occupied the subject property in 1972. Calcraft operated a spray booth and utilized solvents as part of day-to-day operations. Metric Machining Co. occupied the subject property in 1988 and operated as a metal machining company and fabricated metallic parts, utilizing oils, lubricants, cutting fluids, and solvents as part of day-to-day operations. Based on the duration of industrial operation, the nature of industrial activities including spray painting and metal manufacturing operations and solvent usage, and the absence of subsurface investigations to account for these concerns, the historical industrial use of the subject property was considered to constitute a REC. In addition, the adjacent railroad tracks also constitute a potential environmental concern. Railroad spurs represent environmental concerns due to the historical application of oils containing polychlorinated biphenyls (PCBs), herbicides, and arsenic for pest and weed control, as well as, the potential presence of creosote on the rail ties, and the historical common practice of using coal cinders for track fill material.

- 410 West Evergreen Avenue has been developed for industrial use as early as 1968 to present-day. Former operations on the subject property included sheet metal work. The absence of information regarding historical operations and regulatory agency records, and the absence of subsurface investigations to determine whether former operations have impacted the subject property constitute a REC. In addition to the environmental concern of the historical industrial operations, the adjacent railroad tracks also pose a concern. Railroad spurs represent environmental concerns due to the historical application of oils containing polychlorinated biphenyls (PCBs), herbicides, and arsenic for pest and weed control, as well as the potential presence of creosote on the rail ties, and the historical common practice of using coal cinders for track fill material.

Field Activities

To provisionally investigate the potential impact of petroleum/chlorinated hydrocarbons, PCBs, pesticides, and metals to soil as a consequence of a release or releases from historical and current industrial activities, Partner conducted a Phase II Environmental Site Assessment. The assessment scope included 34 soil/soil gas borings (B1 through B34).

Utility Clearance

Partner delineated the work area with white spray paint and notified Underground Services Alert (USA) to clear public utility lines as required by law at least 48 hours prior to drilling activities. USA issued ticket number A11720332 for the project.

Geophysical Survey

On June 29, 2011, Ground Penetrating Radar Systems, Inc. (GPRS) conducted a Geophysical Survey under the supervision of Partner. The purpose of the Geophysical Survey was to scan for underground utilities at the proposed boring locations, as well as to try and locate a drywell/cess pool associated with the 410 West Evergreen parcel. The investigation focused on the accessible exterior areas surrounding the Site.

The Geophysical Survey was conducted with a GSSI (model SIR-3000) in conjunction with a 400 megahertz (MHz) antenna ground penetrating radar (GPR) unit, and radio detection equipment (model#RD 7000).

GPRS systematically free-traversed the investigation area with the aforementioned equipment. The equipment readouts were interpreted in real time and compiled as necessary in order to identify subsurface anomalies consistent with piping trenches, utility lines, and/or other subsurface conduits/features.

In addition, GPRS systematically free-traversed each Partner-proposed boring location with the aforementioned equipment and the equipment readouts were interpreted in real time for evidence of utility lines and/or other subsurface features of potential concern. Boring placement was

modified as necessary based on the Geophysical Survey results to avoid conflicts with underground features.

Please see Appendix A for a copy of the Geophysical Survey Report, which provides additional details regarding the Geophysical Survey equipment and methodology.

Health and Safety Plan

Partner reviewed the site-specific Health and Safety Plan with all on-site personnel involved in the project prior to the commencement of drilling activities. Please see Appendix B for a copy of the signed Health and Safety Plan.

Drilling Equipment

On June 30, July 1, and July 6, 2011, Partner subcontracted with Kehoe Testing and Engineering (KTE) (State of California C57 Water Well Drilling Contractor License Number 786163) to provide and operate drilling equipment. KTE, under the direction of Partner, advanced soil borings B1 through B3, B10 through B13, B16 through B18, B21, B22, and B25, with a direct-push truck-mounted Geoprobe Model 5400 drill rig; borings B4, B5 and B23 with a limited-access direct-push Geoprobe drill rig; borings B6 through B9, B14, B15, B19, B20 and B24 with a direct-push, track-mounted Geoprobe drill rig; and borings B26 through B34 with a hand auger. All drilling rods and/or sampling equipment were decontaminated between samples and/or boreholes to prevent cross-contamination.

Boring Locations

Soil borings B1 through B15 were drilled at the parcel located at 1625/1625 B South Magnolia Avenue, borings B16 through B20 were drilled at the parcel located at 1631 South Magnolia Avenue, borings B21 through B25 were drilled at the parcel located at 410 West Evergreen Avenue, and borings B26 through B34 were drilled in the vicinity of the railroad track located along the southern Site boundary. Boring placement was limited due to the subject property boundary and parked cars. Please see Figure 3 for a map indicating boring locations.

Sampling Depths

Borings B1, B6, B11, B12, and B16 were advanced to a terminal depth of 5 feet below ground surface (bgs). Soil samples were collected for lithology purposes only at 5 feet bgs.

Borings B2 and B3 were advanced to a terminal depth of 30 feet bgs. Borings B4, B5, B7 through B10, B13 through B15, and B17 through B25 were advanced to a terminal depth of 20 feet bgs. Soil samples were collected from each boring at 5-foot intervals to terminal depth.

Borings B26 through B34 were advanced to a terminal depth of 4 feet bgs. Soil samples were collected from each boring at 1-foot and 4-foot intervals.

Soil gas samples were collected from borings B1 through B6, B8, B10 through B17, B19 through B22, B24, and B25 at 5 feet bgs.

Soil Sampling Methodology

Borings B1 through B3, B6 through B8, B10 through B13, B16 through B18, and B26 through B33 were overlain by asphalt, which was penetrated using the punch bit attachment advanced by the direct-push drill rig. Borings B4, B5, B14, B15, B19, B20, B23, B24, and B25 were overlain by concrete, which was penetrated using a concrete coring attachment advanced by the direct-push rig. Borings B9, B21, B22, and B34 were overlain by soil.

Soil was manually excavated from the upper 5 feet of each boring with a hand-auger equipped with a 3.5-inch diameter auger bucket to clear for underground utilities. At the desired sampling depth, soil was transferred from the auger bucket into a 1¾-inch diameter by 2-foot long acetate liner/or 4-ounce glass jar.

The remaining soil samples were collected using a 2-foot long by 1¾-inch diameter sampler with a 2-foot long acetate liner and sampling point. The sampler was advanced by the direct-push drill rig using 3-foot long by 1.5-inch diameter hollow rods with the inner rods in place to prevent soil from entering the sampler. At approximately 1 foot above the desired sampling depth, an inner rod was removed and the sampler was advanced to the desired sampling depth to allow undisturbed soil to enter the sampling liner. The sampler was retrieved from the subsurface and the soil-filled liner was removed.

Each acetate liner was cut using a hacksaw. A sample was collected from the lower half of the liner using a disposable plastic syringe in accordance with Environmental Protection Agency (EPA) Method 5035 sampling protocol. The remainder of the lower half of the liner was capped on either end with Teflon tape and plastic caps. The capped liners and syringes were labeled for identification and stored in an iced cooler. The soil in the upper half of the liner was visually inspected for discoloration, monitored for odors, classified in accordance with the Unified Soil Classification System (USCS), placed in a sealable plastic bag, and field-screened with a photoionization detector (PID) calibrated to isobutylene. None of the samples exhibited discoloration or an odor and none of the PID readings suggested the presence of significantly elevated volatile organics concentrations.

Soil Gas Probe Construction

Soil gas probes screened at 5 feet bgs were constructed within soil borings B1 through B6, B8, B10 through B17, B19 through B22, B24, and B25 upon completion of soil sampling. New ¼-inch diameter polyethylene tubing with a ¼-inch diameter polypropylene filter at the terminal end was inserted into a borehole to the desired sampling depth. One-inch diameter polyvinyl chloride (PVC) casing was used as a guide for the tubing to ensure that the desired sampling depth was achieved. Sand was poured into the boring annulus to form an

approximately 1-foot long sand pack around the polypropylene filter, at which time the PVC piping was withdrawn and approximately 1 foot of dry, granular bentonite was placed atop the sand pack. The borehole was backfilled with hydrated bentonite to the ground surface to form a seal. The sampling end of the tubing was fitted with a valve and the probe was labeled for identification.

Soil Gas Sampling Methodology

Soil gas samples were collected in general accordance with the February 1997 Los Angeles Regional Water Quality Control Board (LARWQCB) "Interim Guidance for Active Soil Gas Investigation" and the January 2003 Department of Toxic Substances Control (DTSC) and LARWQCB "Advisory – Active Soil Gas Investigations."

The mobile laboratory was calibrated at the beginning of the day prior to the first analysis. Each probe was allowed to equilibrate for at least 30 minutes after installation prior to sampling with gas-tight glass syringes. A purge test was conducted on the first probe to determine the optimal purge volume. The optimal purge volume based on the purge test was three purge volumes, which was then purged from the remaining probes. Each day, one soil vapor sample was collected as a duplicate to assess the precision (repeatability) of the laboratory analysis.

Tracer gas n-propanol was placed around each probe at the ground surface while sampling to detect ambient air intrusion. The tracer gas was not detected in any sample, indicating that the integrity of the bentonite seal was maintained. In addition, recovery of all surrogate compounds included with each analysis was within acceptable limits, indicating that the sampling containers and analysis equipment did not leak.

The probes were removed from the subsurface and the boreholes were backfilled with hydrated bentonite chips and capped with concrete or asphalt to match existing ground cover upon completion of sampling.

No significant amounts of derived wastes were generated during this investigation.

Soil Gas Sample Laboratory Analyses

Jones Environmental, Inc. (JEI), a state-certified mobile laboratory [California Department of Public Health (CDPH) Environmental Laboratory Accreditation Program (ELAP) certificate number 6C73103] was present on-site and collected 21 soil gas samples (plus three duplicate samples) on June 30, July 1, and July 6, 2011. The soil gas samples were immediately loaded into the gas chromatograph/mass spectrometer (GC/MS) for analysis. Each sample was analyzed for volatile organic compounds (VOCs) via EPA Method 8260B.

Soil Sample Laboratory Analyses

Partner collected 32 soil samples on June 30, 2011, 32 soil samples on July 1, 2011 and 38 soil samples on July 6, 2011, for analysis using the JEI mobile lab. A total of 25 soil samples were analyzed for VOCs via EPA Method 8260B and total petroleum hydrocarbon chain speciation (TPH-cc) via EPA Method 8015M.

Discrete soil samples collected along the southern property boundary in the vicinity of the railroad tracks were composited by the laboratory into a composite sample (three samples total) and analyzed for TPH-cc via EPA Method 8015M, and VOCs via EPA Method 8260B.

Partner collected eight soil samples on June 30, 2011, eight soil samples on July 1, 2011 and 22 soil samples on July 6, 2011, for analysis by SunStar Laboratories, Inc. (SunStar), a state-certified laboratory [California Department of Health Services (DHS) ELAP certificate number 2250] in Lake Forest, California. The samples on the day that they were collected were transported in an iced cooler under proper chain-of-custody protocol to SunStar laboratory for analyisis.

Based on field-screening results, a total of 23 soil samples were analyzed for California Administrative Manual (CAM) 17 Metals via EPA Method 6010B/7471A, nine soil samples were analyzed for semi-volatile organic compounds (SVOCs) via EPA Method 8270C, and six soil samples were analyzed for polychlorinated biphenyls (PCBs) via EPA Method 8081B.

The discrete composite soil samples collected along the southern property boundary in the vicinity of the railroad tracks, discussed above, were analyzed for CAM 17 Metals via EPA Method 6010B/7471A, PCBs via EPA Method 8081B, and for organochlorine pesticides (OCPs) via EPA Method 8081B.

Investigation Scope Summary

Please see Table 1 for a summary of the borings, sampling schedule, and laboratory analyses for this investigation. Please see Table 2 for a summary of the laboratory analyses schedule for the soil samples composited by the laboratory during this investigation.

Table 1: Summary of Investigation Scope

Boring Identification	Location	Terminal Depth (feet bgs)	Matrix Sampled	Sampling Depths* (feet bgs)	Target Contaminants

Geology and Hydrogeology

Based on a review of the United States Geological Survey (USGS) Mount Wilson Quadrangle topographic map, the subject property is situated approximately 440 feet above mean sea level (amsl), and the local topography is sloping gently to the south-southwest.

The Site is located in the eastern San Gabriel Valley within the Main San Gabriel Hydrogeologic-Basin. The basin is bounded by the San Gabriel Mountains to the north, the San Jose Hills and subsurface bedrock high to the east; the Puente, Repetto and Merced hills to the south and west; and the Raymond Fault to the northwest. Local geology is characterized by recent age younger alluvium and Pleistocene age older alluvium consisting of poorly consolidated continental sediments. These sediments consist of interbedded sand, silt, and clay in variable proportions with lenses of gravel. They were deposited in large part by coalescing alluvial fans emanating from canyons exiting the southern San Gabriel Mountains north of the site. In the site vicinity, older alluvium occurs at grade to a depth of approximately 700 feet, and comprises a more youthful portion of the alluvial fan which has accumulated at the mouth of Monrovia Canyon. The dominant structural feature in the vicinity of the site is the Sierra Madre fault zone. Elements of this fault zone occur approximately 1.0 mile northeast of the subject site and include the Duarte and Sierra Madre faults.

Based on borings advanced during this investigation, the underlying subsurface consists predominantly of dark brown, dry to slightly moist sand (SP) with silt from the ground surface to 30 feet bgs. Please see Appendix C for boring logs from this investigation.

Hydrogeologically, the Site is located in the eastern San Gabriel Valley within the Main San Gabriel Hydrogeologic Basin. The San Gabriel and the Rio Hondo rivers, and their tributaries flow from the San Gabriel Valley. The rivers have their headwaters in the San Gabriel Mountains and have a common exit from the southern portion of the valley at Whittier Narrows between the Merced and Puente hills. The site is approximately 3 miles west of the San Gabriel River. Percolation of direct rainfall and run-off water from the mountains is the major source of natural recharge of the San Gabriel Hydrogeologic Basin. Imported water and return flow from applied water also supply recharge water to the basin. The alluvial deposits, which contain the major aquifer in the basin, attain a maximum thickness of greater than 4,000 feet. The average thickness of water-bearing deposits in the center of the basin is 900 to 1,000 feet. The alluvium is underlain by Miocene-age Puente and Topanga formations that yield only limited quantities of water. The elevation of the groundwater ranges from 100 feet to greater than 500 feet amsl.

Regionally, groundwater flows from the perimeter of the basin in a southerly direction toward Whittier Narrows, where it exits the basin. Locally, the groundwater flow is towards the west. Los Angeles County Water District records indicate that groundwater occurs at approximately 280 feet bgs in the area of the subject property; however, shallower, perched groundwater may also occur. According to the Los Angeles County Department of Public Works (LACDPW) Hydrologic Unit, the nearest well is #4197. Well #4197 is located approximately 4,800 feet

southwest of the Site. Depth to groundwater was reported as 191.5 feet bgs on May 5, 2002. Groundwater was not encountered during this investigation.

Laboratory Analysis Results

JEI reported the laboratory results on July 6 and July 11, 2011. SunStar reported the laboratory results on July 8, July 11, and July 13, 2011. Please see Tables 3 through 9 for a summary of the soil gas VOCs, soil VOCs, soil TPH-cc, soil CAM 17 metals, soil SVOCs, soil PCBs, and soil OCPs laboratory analysis results, respectively.

PCBs = polychlorinated biphenyls
µg/kg = micrograms per kilogram
< = not detected above indicated laboratory Reporting Limit (RL)
ND = not detected above laboratory RLs

Table 9: Soil Sample OCPs Laboratory Results (µg/kg)

Sample Identification	alpha-Chlordane	Endosulfan I	4,4'-DDE	4,4'-DDT	All Other OCPs
Composite 1	< 5	< 5	< 5	< 5	ND
Composite 2	< 5	< 5	< 5	< 5	ND
Composite 3	< 5	**5.5**	< 5	< 5	ND

Notes:
OCPs = organochlorine pesticides
µg/kg = micrograms per kilogram
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
ND = not detected above laboratory Reporting Limits

Please see Appendix D for the full laboratory analysis reports, which include chain-of-custody and laboratory quality assurance/quality control (QA/QC) documentation. All laboratory QA/QC data were within acceptable limits.

Discussion

One soil gas sample (PES-B2-SV5) contained a detectable concentration of trichlorofluoromethane at 0.190 micrograms per liter (µg/L). None of the soil gas samples indicated detectable concentrations of one or more other VOCs.

One soil sample (B14-5) contained a detectable concentration of tertiary-butyl alcohol (TBA) at 33.4 micrograms per kilogram (µg/kg). None of the soil samples indicated detectable concentrations of one or more other VOCs.

One composite soil sample (Composite 3) contained a detectable concentration of the OCP Endosulfan I at 5.5 µg/kg. None of the soil samples indicated detectable concentrations of one or more other OCPs.

None of the analyzed soil samples contained a detectable concentration of SVOCs or PCBs.

Most of the analyzed detected soil sample results did not exceed the background concentrations for typical California soils as based on the Kearney Foundation of Soil Science March 1996 Background Concentrations of Trace and Major Elements in California Soils Report.

Regional Screening Levels

Regional Screening Levels (RSLs) [formerly Preliminary Remediation Goals (PRGs)] are generic, risk-based chemical concentrations developed by the EPA Region 9 for use in initial screening-level evaluations. RSLs combine human health toxicity values with standard exposure factors to estimate contaminant concentrations that are considered to be health protective of human exposures over a lifetime through direct-contact exposure pathways (e.g., via inhalation and/or ingestion of and/or dermal contact with impacted soil). RSLs are not legally enforceable

standards, but rather are considered guidelines to determine if potential risks associated with encountered contamination may warrant further evaluation.

Please see Table 10 for a comparison of detected soil contaminant concentrations and available residential and industrial soil RSLs. Only contaminants detected above laboratory Practical Quantitation Limits (PQLs) are included in the table.

Table 10: RSLs and Detected Soil Contaminant Concentrations (µg/kg)

Detected Contaminants	Number of Samples with Detectable Concentrations*	Sample with Peak Concentration	Peak Concentration	Residential Soil RSL	Industrial Soil RSL	Number of Samples Exceeding RSLs
Endosulfan I	1 of 3	Composite 3	5.5	370,000	3,700,000	0 / 0

Notes:
*Exceeding the laboratory Practical Quantitation Limit (PQL)
RSLs = Regional Screening Levels
µg/kg = micrograms per kilogram

None of the contaminants detected in the analyzed soil samples exceeded the residential or industrial soil RSLs.

Summary and Conclusions

Partner completed an Environmental Site Assessment at the subject property to determine the presence or absence of soil and/or soil-vapor contamination from the former and potentially current industrial use of the subject property. The scope of the investigation included the installation of 34 soil/soil gas borings. Twenty-one soil gas samples were analyzed for VOCs. Twenty-two soil samples were analyzed for VOCs and TPH-cc. Nine soil samples were analyzed for SVOCs. Three soil samples were analyzed for PCBs. Twenty soil samples were analyzed for CAM 17 Metals. Three composite soil samples were analyzed for VOCs, TPH-cc, PCBs, OCPs, and CAM 17 Metals.

Trichlorofluoromethane was detected in one soil gas sample. No soil gas regulatory guidelines are currently established for the detected refrigerant. The VOC TBA was detected in one soil sample collected at a depth of 5 feet bgs. The 10-foot soil sample collected from the same boring had non-detectable concentrations of all VOCs including TBA, suggesting a very limited localized TBA impact and very limited vertical migration of this contaminant. No soil regulatory guidelines are currently established for TBA and impacts to the deep ground water are very unlikely. The OCP Endosulfan I was detected in one composite soil sample at concentrations below available regulatory guidelines.

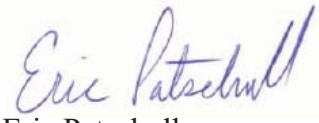
Metal were detected in soil samples, however concentrations were below applicable regulatory guidelines. No other elevated concentrations of target contaminants, other than the suspected very localized low concentration of the refrigerant, were detected in soil gas or soil during this investigation.

Given the findings of this investigation, Partner recommends no further investigation with respect to the industrial complex at this time.

Limitations

This Report presents a summary of work completed by Partner. The completed work includes observations of site conditions encountered and the analytical results provided by an independent third party laboratory of samples collected during the course of the project. The number and location of samples were selected to provide the required information. However, it cannot be assumed that the limited available data are representative of subsurface conditions in areas not sampled.

All conclusions and/or recommendations are based on the observations, laboratory analyses, and the governing regulations. Conclusions and/or recommendations beyond those stated and reported herein should not be inferred from this document.



Partner warrants that the environmental consulting services contained herein were accomplished in accordance with generally accepted practices in the environmental engineering, geology, and hydrogeology fields that existed at the time and location of work. No other warranties are implied or expressed.

All reports, both verbal and written, as they pertain to the property located at 1625/1625 B, 1631 South Magnolia Avenue, and 410 West Evergreen Avenue in the City of Monrovia, California, are for the sole use and benefit of Sierra Autocars, Inc. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of Partner.

Signatures of Participating Professionals

Thank you for the opportunity to be of service. If you have any questions regarding this investigation, please contact the undersigned at (310) 615-4500.

Sincerely,

Eric Patschull
Project Geologist

Joseph P. Derhake, PE
President

Geophysical Survey Report

May 1, 2011

Eric Patschull
Partner Engineering

Eric,

Ground Penetrating Radar Systems, Inc recently completed a GPR project at 1625 & 1631 S. Magnolia Ave, as well as 410 West Evergreen in Vernon, CA. The GPR scanning took place on June 29, 2011. The purpose of the GPR survey was to scan for underground utilities prior to soil boring in 34 locations, as well as scan for possible drywells/cess pools. The following is information concerning the GPR work.

Equipment Used

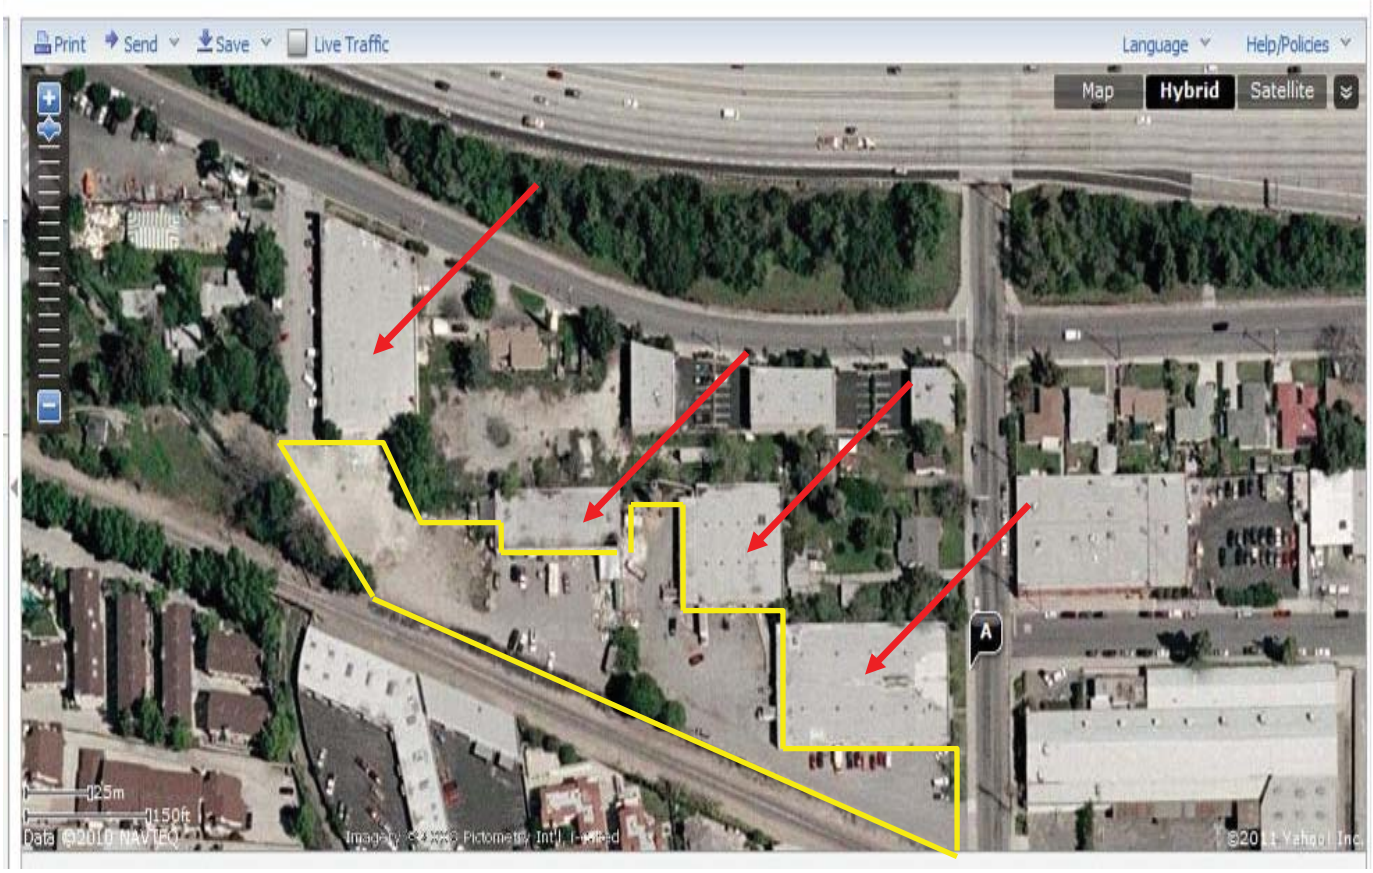
GPRS used ground penetrating radar equipment manufactured by GSSI (model SIR-3000) in conjunction with a 400MHz antenna. The 400MHz antenna is capable at scanning up to 8 feet in depth; however, the maximum depth penetration of this antenna is determined by the soil conditions at the site.

Additionally, radio detection equipment (model # RD 7000) was used to locate live power/data signals. This equipment can also clamp onto exposed pipes and send a tone through them to help in the location process.

GPR Scanning Methods

The 400MHz antenna is mounted on to a baby stroller frame and is pushed across the surface. The information from the 400MHz antenna is real time, which allows us to mark all findings directly on the surface with spray paint, or chalk.

GPRS was able to scan approximately 4.5 - 5 feet in depth in this area.



The GPR scanning process was done with scans approximately 12" on center throughout the area. Additionally, diagonal scans are done to ensure the path was scanned thoroughly. The bottom of the antenna must maintain contact with the surface for the antenna to work optimum capability.

Findings

During the entire scanning process, GPRS not locate any underground drywells/cess pools.

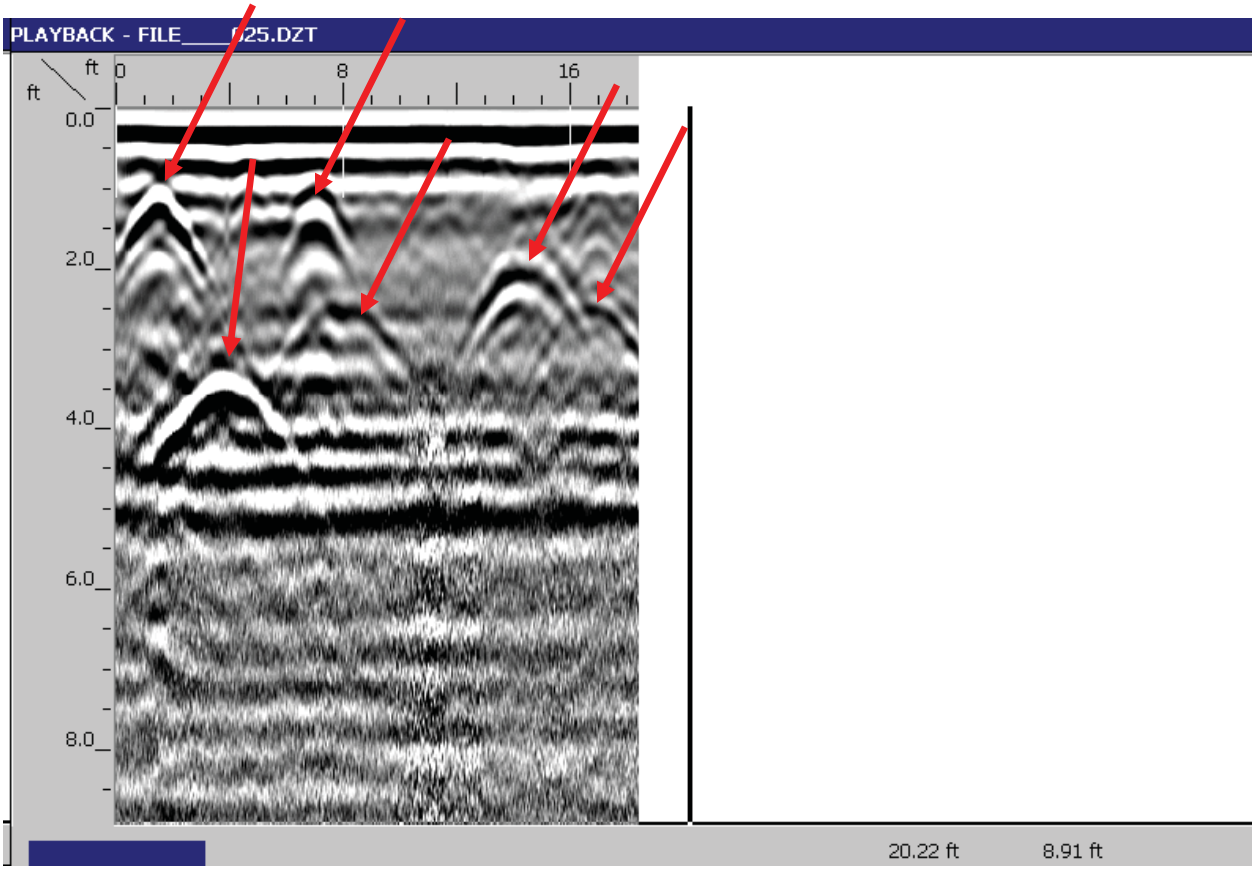
However, GPRS did locate numerous utilities near the soil boring locations. All of these findings were marked directly on the surface and discussed with the customer onsite.

Area Scanned

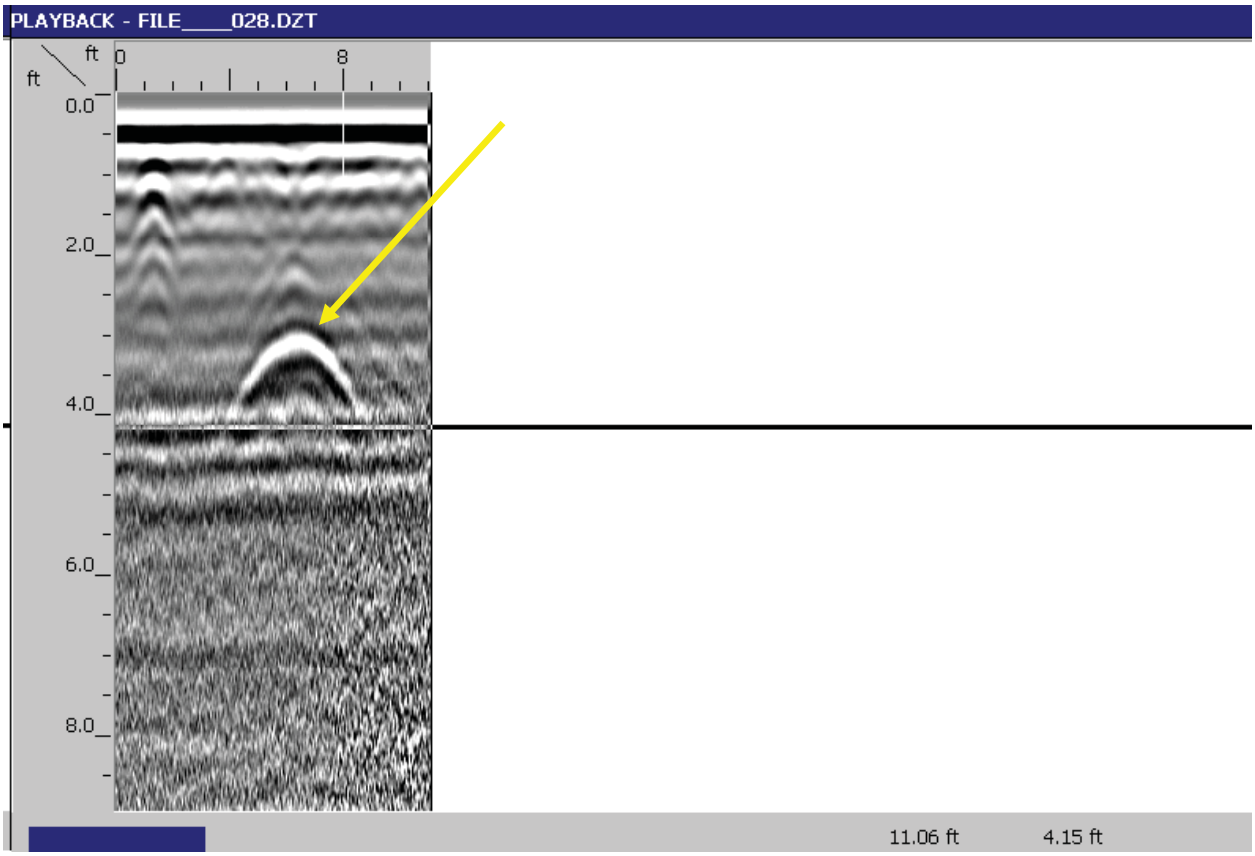
Here is an aerial image with the approximate location of the GPR work highlighted with yellow lines. Additionally, there were 4 buildings where GPRS scanned inside of the structures, indicated with the red arrows.

Photos

Prior to arriving onsite, the soil boring locations had been marked out. If there were no utilities in the vacinity, they were marked "OK" by GPRS.



Here is a photo from an area scanned. In this photo you can see that there was a live electrical conduit running directly in the path of the original soil boring location.



Here is another photo of an area where there were multiple lines located near the original soil boring location.

Data

Here is the image received from the GPR equipment from an area scanned in the property. The red arrows are indicating the location of underground utilities.

Here is anther image from the GPR system. This image is of the gas line that was running on the perimeter of the property. The gas line was marked out near all intended soil boring locations.

Please feel free to contact me if you have any questions.

Appendix B:

Health And Safety Plan

Partner Site-Specific Health and Safety Plan

Introduction

Partner Engineering and Science, Inc. (Partner) has been retained by Sierra Autocars, Inc. to conduct a Phase II Environmental Site Assessment at the subject property. This Health and Safety Plan (HASP) document identifies the Health and Safety procedures that are intended to guide the field activities at the site. The details of this plan apply to employees of Partner and its subcontractors. Regulatory agencies are expected to observe the safety rules and regulations established by their respective organizations in addition to the requirements of this document.

This plan must be reviewed and acknowledged by all personnel prior to entering the exclusion zone. In general, a "Tailgate Safety Meeting" is conducted at the initiation of on-site activities and at the beginning of each day thereafter until the completion of the project. However, the actual briefing may be conducted off-site (e.g., in the office) if conditions preclude or render impractical its completion on-site.

This HASP will be a living document in that it will be continually updated and/or revised as the site conditions and knowledge of the operations develop further. The development and preparation of the HASP has been based on past experiences and site specific information at the time of preparation. If actual site conditions or operations vary from the data used to prepare this HASP, amendments shall be made to reflect those changes.

This HASP has been developed with consideration to current safety standards, health effects, and standards for known contaminants and procedures designed to account for potential hazards from known and/or suspected substances. In preparing this document, Partner has specifically reviewed Occupational Safety & Health Administration (OSHA) Title 29 Code of Federal Regulations (CFR) 1910 & 1926, California Occupational Safety & Health Administration (Cal/OSHA) Title 8 California Code of Regulations (CCR) 5192, the National Institute of Occupational Safety & Health (NIOSH)/OSHA/United States Coast Guard (USCG)/Environmental Protection Agency (EPA) Occupational Safety and Health Guidance Manual for Hazardous Waste Site Activities, NIOSH Pocket Guide to Chemical Hazards, and the American Conference of Governmental Industrial Hygienists, Inc. (ACGIH) Threshold Limit Values for Chemical Substances and Chemical Agents.

Project Information

Project Type:	Phase II Environmental Site Assessment (ESA)
Site Name:	Industrial Complex
Address:	1625/1625B, 1631 South Magnolia Avenue and 410 W. Evergreen Ave. Monrovia, California 91016
Partner Project Number:	11-76495.9

Project Scope of Work

Conduct Phase II ESA in order to determine the presence or absence of soil and/or soil-vapor contamination from the former and potentially current industrial use of the subject property.

Utility Clearance

Have necessary underground utility notifications for subsurface work been made? ☒ Yes ☐ Not Applicable

Specify clearance dates, ticket confirmation number, and other relevant information:

June 21, 2011 at 910 am. Ticket Number A11720332

Site Safety Officers

The Site Safety Officer (SSO) is the individual who is capable of identifying existing and predictable hazards in surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them. The SSO is designated on a site-by-site basis based on the site conditions, scope-of-work, and the individual's ability to recognize site-specific hazards and take appropriate corrective actions. It is the responsibility of all employees to work in a manner that will prevent injury and exposure to themselves and to other employees. Every employee is responsible for obeying safety rules and regulations, and reporting unsafe conditions or acts to their supervisors.

Oversight Agency: N/A

List of Potential Hazardous Materials

According to preliminary site information including evaluation of the hazards at the site and Partner's experience, the following potential hazardous materials may be present at the subject property:

- Gasoline, including BTEX compounds and fuel oxygenates (e.g., MTBE)
- Chlorinated solvents, including PCE and TCE
- Metals

Please refer to the Chemical Hazards Section for more information related to the above listed materials, including chemical information, potential health effects, and exposure limits.

EMERGENCY CONTINGENCY INFORMATION

Evacuation Routes and Procedures

In case of evacuation, all vehicles/equipment should be turned off and personnel should immediately leave the work area. Personnel should reconnoiter at the specified meeting area located upwind of the affected area, such as the building exterior, site field office, property boundary, or other pre-designated location, where all personnel will be accounted for.

IF AN EMERGENCY ARISES, THE DESIGNATED RECONNOITER LOCATION FOR THIS PROJECT IS THE SOUTHWEST CORNER OF WEST EVERGREEN AVENUE AND SOUTH MAGNOLIA AVENUE, NORTH OF THE SUBJECT PROPERTY, AT THE PARTNER FIELD OFFICE (VEHICLE).

This location is located up-wind of the subject property, but is subject to change if prevailing weather conditions alter typical wind direction. Personnel should not reenter the work area following evacuation until 1.) the

condition causing the emergency has been corrected, 2.) all hazards have been assessed, 3.) the HASP has been reviewed, and 4.) personnel have been oriented on any changes in the HASP. All emergencies should be promptly reported to the SSO.

Emergency Response Facilities

DIRECTIONS TO HOSPITAL EMERGENCY ROOM ATTACHED IN APPENDIX A

Air Monitoring

Air quality in the breathing zone will be monitored continuously with a MiniRae2000 photoionization detector (PID) calibrated to isobutylene. Work will proceed in Level D while PID readings are between 0 and 10 parts per million (ppm). In the event that breathing zone readings exceed 100 ppm, all personnel will discontinue work at the location and withdraw from the work area. The appropriate vapor control measures will be implemented (e.g., application of vapor suppression), the necessary emergency response authorities will be notified, and/or the work area will be re-sampled until vapor levels are within acceptable levels prior to reentering the work zone.

Please refer to the table below for the Operational Action Levels.

Contaminants	Action Level	Action to Take
VOCs (PID)	**1 to 10 PPM** Above background at the breathing zone and sustained for 5 minutes	Level D, continuous air monitoring
	10 to 100 PPM Above background at the breathing zone and sustained for 5 minutes	Upgrade to Level C, continuous air monitoring and ventilate space
	100 to 300 PPM Above background at the breathing zone and sustained for 1 minute	Upgrade to Level B, continuous air monitoring and ventilate space, or stop work and ventilate
	>300 PPM Above background at the breathing zone and sustained for 1 minute	Stop work, Evacuate work zones
Combustible Gas in Air (LEL meter)	Less than 10% lower explosive limit (LEL)	Continue with caution and air monitoring (combustible gas monitoring)
	Greater than 10% LEL	Stop work, immediately withdrawal personnel, and ventilate space with manhole blower
Oxygen in Air (O2 Meter)	Less than 19.5%	Stop work and ventilate or upgrade to Level B
	19.5 to 21.5%	Level D, continue work with air monitoring
	Greater than 21.5%	Stop work, immediately withdrawal personnel, and evaluate

The PID will be calibrated daily by Partner personnel prior to use. Calibration will be performed in accordance with the manufacturer specifications and recorded in a log book kept with the instrument. Ambient breathing space measurements should be collected every 15 minutes.

Personal Protection Equipment

Based on the preliminary site information including evaluation of the hazards at the site and Partner's experience, personal protective equipment (PPE) will be required for all personnel and visitors entering the controlled portion of the site. PPE for each potential level of protection is described below. Both Level C and D PPE should be available on-site during all phases of the project, as conditions may change and require additional PPE. Work should be conducted in Level D and no breathing protection will be required as long as monitored breathing zone vapor concentrations remain in the nominal operation action level.

If on-site personnel find that breathing zone concentrations remain above nominal operation action level for more than 5 minutes, then the SSO or PM will make a determination if breathing protection is needed. At this time, all work in the affected area should be suspended until a decision is made. Implementation of Level C PPE will be required if work continues during elevated breathing zone concentrations. Donning and use of respirators shall be performed in accordance with manufacturer specifications. Replacement of respirator cartridges shall be performed in accordance with manufacturer specifications. All respirators and cartridges shall be stored in air tight bags while not in use.

Please refer to the PPE Levels of Protection for a detailed description of the equipment associated for each level of PPE.

PPE Levels of Protection

Level D (to be used at all times) is as follows:

- Full-length pants and shirt;
- Sturdy steel-toe work boots;
- Hard hat;
- Safety glasses.

Modified Level D (used as appropriate) is as follows:

- Regular Tyvek coveralls;
- Outer gloves: leather, cotton, or nitrile;
- Inner gloves: latex or nitrile;
- Sturdy steel-toe work boots;
- Hard hat;
- Safety glasses.

Level C (used as appropriate) is as follows:

- Half-face air purifying, canister equipped respirator (NIOSH-approved) equipped with Organic Vapor/HEPA cartridges/filters;
- Regular Tyvek coveralls;
- Outer gloves: leather, cotton, or nitrile;
- Inner gloves: latex or nitrile;
- Sturdy steel-toe work boots;
- Hard hat;
- Safety glasses.

Level B (used as appropriate) is as follows:

- Positive-pressure, full-face piece, self-contained breathing apparatus (SCBA) or positive-pressure supplied air respirator with escape SCBA (NIOSH-approved);
- Disposable chemical-resistant coveralls (Polycoated Tyvek);
- Outer gloves: neoprene or nitrile;
- Inner gloves: latex or nitrile;
- Sturdy steel-toe work boots;
- Petroleum-resistant covers over work boots;
- Hard hat.

Decontamination Procedures

Drilling and sampling equipment will arrive decontaminated and clean. All downhole soil and groundwater sampling equipment (e.g., sampling tubes, split spoons, hand augers, Hydropunch, etc.), tools, purge pumps, water level indicators, etc. will be decontaminated before, between, and after use with Alconox or an equivalent phosphate-free detergent solution to reduce the risk of cross-contamination. Decontamination of all sampling equipment will consist of submerging the equipment in a detergent solution bath and scrubbing it with dedicated brushes. The equipment will then be placed in a rinse bath and agitated. A second rinse bath should occur if needed. All drilling equipment such as augers and drilling rods should be thoroughly steam cleaned and rinsed.

Nitrile outer gloves will be worn whenever handling samples, equipment, or any other potentially contaminated items. Skin exposed to direct contact with contaminants of concern will be immediately flushed with water.

Work Zone Delineation

A 15-foot exclusion zone will be delineated with caution cones as necessary to denote the work zone and area restricted to authorized project personnel.

Traffic Control

Traffic control is not anticipated to be required for this project.

Adverse Weather

The work area will be secured and all personnel will discontinue work at the location and withdraw from the work area in the event that adverse weather is encountered (e.g., heavy rain, lightning).

Emergency Equipment

A first aid kit and fire extinguisher will be located in the work vehicle in a location that is easily accessible and highly visible. The SSO will be responsible for knowing the location of and accessing the emergency equipment as needed.

Hazard Assessment

(☒ = Applies, or required item(s) available. ☐ = Not Applicable.)

Hazard Assessment: Physical Hazards and Related Concerns

☐ **Confined Space Entry (CSE)**. Confined space entry means the potentially hazardous entry into any space which, by design, has limited openings for entry and exit and unfavorable natural ventilation that could contain or produce dangerous air contaminants and is not intended for continuous employee occupancy. Confined spaces include, but are not limited to, storage tanks, compartments of ships, process vessels, pits, silos, vats, degreasers, reaction vessels, boilers, ventilation and exhaust ducts, sewers, tunnels, underground utility vaults, and pipelines. Other environments which must be treated as confined spaces include test pits, basements, garages, warehouses, and other indoor areas where mechanical (i.e., diesel, propane, gasoline or similarly powered) equipment must be operated for drilling or excavation purposes. Confined space entry should be allowed only when absolutely necessary.

☒ **Construction Hazards, Drill Rigs, Backhoes, etc.** The use of drill rigs, backhoes, and other heavy equipment represent potentially serious construction hazards. Whenever such equipment is used, personnel in the vicinity should be limited to those who must be there to complete their assigned duties. All personnel must avoid standing within the turning radius of the equipment or below any suspended load. Job sites must be kept as clean, orderly, and sanitary as possible. When water is used, care must be taken to avoid creating muddy or slippery conditions. If slippery conditions are unavoidable, barriers and warning signs must be used to warn of these dangers.

Never turn your back to operating machinery. Never wear loose clothing jewelry, hair, or other personal items around rotating equipment or other equipment that could catch or ensnare personal items. Always stand far enough away from operating machinery to prevent accidental contact, which may result from mechanical or human error.

Additionally, the following basic personal protective measures must be observed: **Hardhats** must be worn to protect against bumps or falling objects. **Safety glasses** must be worn by all workers in the vicinity of drill rigs or other sources of flying objects. **Goggles,** face shields, or other forms of eye protection must be worn when necessary to protect against chemicals or other hazards. **Steel-toed safety shoes or boots** are also required. The shoes must be chemically resistant or protected with appropriately selected boots/coverings where necessary. Unless otherwise specified, normal **work clothes** must be worn. Long sleeves and gloves are also required whenever necessary to protect against hazardous contact, cuts, abrasions or other possible skin hazards.

☐ **Electrical**. OSHA regulations require that employees who may be exposed to electrical equipment be trained to recognize the associated hazards and the appropriate control methods. All **extension cords** used for portable tools or other equipment must be designed for hard or extra usage and be (three-wire) grounded. All 120-volt, single-phase 15- and 20-ampere receptacle outlets on construction sites and other locations where moisture/water contact may occur must be equipped with **ground-fault circuit interrupters (GFCI)** units. GFCI units must be attached directly to or as close as possible to the receptacle. GFCI located away from the receptacle will not protect any wiring between the receptacle and the GFCI unit. Only the wiring plugged into the GFCI and outward will be protected by the GFCI. All **(temporary lighting)** lamps for general illumination must be protected from accidental breakage. Metal case sockets must be grounded. Portable lighting in wet or conductive locations should be 12 volts or less.

☐ **Drums and Buried Drums**. As a precautionary measure, personnel must assume that labeled and unlabeled drums encountered during field activities contain hazardous materials until their contents can be confirmed and characterized. Personnel should recognize that drums are frequently mislabeled, particularly drums that are reused.

Only trained and authorized personnel should be allowed to perform drum handling. Prior to any handling, drums must be visually inspected to gain as much information as possible about their contents. Trained field personnel must look for signs of deterioration such as corrosion, rust or leaks, and for signs that the drum is under pressure such as swelling or bulging. Drum-type and drumhead configuration may provide the observer with information about the type of material inside (e.g., a removable lid is designed to contain solids, while the presence of a bung indicates liquid storage).

Although not usually anticipated, buried drums can be encountered when digging test pits. Therefore, the following provisions must be observed if drums are encountered: Machine excavation (e.g., backhoe) should cease immediately anytime a drum is encountered. The appropriate management personnel should be notified immediately. All personnel should be instructed to immediately leave the work area.

Even authorized personnel must not enter an excavation where drums have been uncovered, even for monitoring purposes, unless all provisions of OSHA's trenching and excavation standard have been met and the appropriate level of PPE is utilized. Sampling of unknown drums usually requires Level B protection. Buried drums must not be moved unless it can be accomplished in a safe manner and overpack drums are available.

☒ **Fire and Explosion**. The possibility of flammable materials being encountered during field activities must be recognized and the appropriate steps necessary to minimize fire and explosion must be observed. This includes situations where excessive organic vapors or free product are encountered. When this occurs, monitoring with a combustible gas indicator (CGI) is required.

Excessive organic vapors, for the purposes of initiating the use of a CGI, are defined as sustained readings (i.e., continuous for at least 5 minutes) at or above 250 units or as an instantaneous reading at or above 1,000 units on the PID or FID, in close proximity (within 1 foot or less) of the borehole, test pit, sampling location, or other area of potential exposure.

In situations where hexane and/or methanol are needed for field activities, the following precautions must be observed: Keep flammable and combustible materials away from heat, sparks and open flames; do not smoke around flammable or combustible materials; and keep all flammable and combustible liquids in approved and properly labeled safety containers.

☐ **Landfill/Methane Hazards**. Fire and explosion should be regarded as one of, if not the, most significant potential hazards associated with drilling operations and other intrusive work conducted at a landfill. Accordingly, all sources of ignition must be fully controlled. Failure to control ignition sources could result in fire, explosion, and pose a serious threat to life and health. Control methods may include forced ventilation and/or filling the borehole with enough water to inhibit the release of methane and other gases that would otherwise escape through the top of the borehole.

If forced (mechanical) ventilation is to be used, all such equipment must be approved for Class I, Division I hazardous atmospheres. The blower must be positioned to blow across the top of the borehole so that gases and vapors may be diluted as they exit the borehole. Do not attempt to suck out the gases or vapors. Blowers, all other mechanical equipment, and tools taht could release sparks or static electricity must be bonded and grounded.

Regardless of the gas/vapor control method used, the atmosphere surrounding the borehole must be frequently monitored using direct reading instruments approved for Class I, Division I hazardous atmospheres. Monitoring should be conducted within 1 to 2 feet of the top of the borehole. Do not insert sampling devices into the borehole. Never approach the auger or drill shaft while it is in operation.

Regardless of actual instrument readings, if all sources of ignition cannot be controlled, operations should be immediately shut down and the area evacuated if readings equal or exceed 10% of LEL until ignition sources have been eliminated. Ignition sources include, but are not limited to, smoking, static electricity, lighting, open flames, spontaneously ignitable substances, frictional heat or sparks, hot surfaces, radiant heat, electrical sparks, stray currents, cutting and welding, ovens, furnaces, and heating equipment.

☐ **Heat and Cold Stress**. Overexposure to temperature extremes can represent significant risks to personnel if simple precautions are not observed. Typical control measures designed to prevent **heat stress** include dressing properly, drinking plenty of the right fluids, and establishing an appropriate work/break regimen. Typical control measures designed to prevent **cold stress** also include dressing properly, and establishing an appropriate work/break regimen.

☒ **Moving Vehicles, Traffic Safety**. All vehicular traffic routes that could impact worker safety must be identified and communicated. Whenever necessary, barriers or other methods must be established to prevent injury from moving vehicles. This is particularly important when field activities are conducted in parking lots, driveways, ramps or roadways. OSHA 1926.201 specifies that when signs, signals or barricades do not provide adequate protection from highway or street traffic, flagmen must be utilized. Flagmen must wear red or orange garments. Garments worn at night must be reflective.

☒ **Noise**. Noise exposure can be affected by many factors including the number and types of noise sources (continuous vs. intermittent or impact) and the proximity to noise intensifying structures (e.g., walls or buildings) that cause noise to bounce back or echo. The single most important factor effecting total noise exposure is distance from the source. The closer one is to the source, the louder the noise. The operation of a drill rig, backhoe, or other mechanical equipment can be sources of significant noise exposure. In order to reduce the exposure to this noise, personnel working in areas of excessive noise must use hearing protectors (e.g., ear plugs, ear muffs).

Rule-of-Thumb: Wherever actual data from sound level meters or noise dosimeters is unavailable and it is necessary to raise one's voice above a normal conversational level to communicate with others within 3 to 5 feet away, hearing protection should be worn.

☒ **Overhead Utilities and Hazards**. Overhead hazards can include low hanging structures that can cause injury due to bumping into them. Other overhead hazards include falling objects, suspended loads, swinging loads, and rotating equipment. Hardhats must be worn by personnel in areas were these types of physical hazards may be encountered. Barriers or other methods must also be used to exclude personnel from these areas where appropriate. Electrical wires are another significant overhead hazard. According to OSHA (29 CFR 1926.550), the minimum clearance that must be maintained from overhead electrical wires is 10 feet from an electrical source rated $\leq$ 50 kV. Sources rated $>$ 50 kV require a minimum clearance of 10 feet plus 0.4 inch per kV above 50 kV.

☒ **Pedestrian Traffic**. The uncontrolled presence of pedestrians on a drilling or excavation site can be hazardous to both pedestrians and site workers. Prior to the initiation of site activities, the site should be surveyed to determine if, when, and where pedestrian may gain access. This includes walkways, parking lots, gates, and doorways. Barriers or caution tape should be used to exclude all pedestrian traffic. Exclusion of pedestrian traffic is intended to prevent injury to the pedestrians and eliminate distractions that could cause injury to Partner personnel or other site workers.

☐ **Test Pit and/or other Excavations**. All provisions of the OSHA trenching and excavation standard (29 CFR 1926.650-652) must be followed during excavation activities. This includes all test pit excavation and sampling activities. The estimated location of utility installations such as sewer, telephone, electric, water lines, and other underground installations that may reasonably be expected to be encountered during excavation work, must be determined prior to opening an excavation.

Excavations in contaminated or potentially contaminated areas must be tested for confined spaces atmospheric hazards prior to entry. Excavations should not be entered if other means are available to perform the task requiring entry. If entry into an excavation is required, the atmosphere within the space must be monitored by a trained person to assure that oxygen concentrations are at greater than or equal to 19.5 percent, that combustible gas levels are less than 10 percent, and that vapor levels are within applicable safe exposure (PEL and TLV) limits.

A ladder or similar means of egress must be located in excavations greater than 4 feet in depth so as to require no more than 25 feet of lateral travel for employees. No person should be allowed to enter an excavation greater than 5 feet in depth unless the walls of the excavation have been protected using an approved shield (trench box), an approved shoring system, or the walls have been sloped back an appropriate angle, the excavation is free of accumulated water, and the excavation has been tested for hazardous atmospheres as noted previously. If personnel enter an excavation, the spoils pile and all materials must be placed at least 2 feet from the edge of the excavation to prevent the materials from rolling into the excavation. Personnel must remain at least 2 feet away from the edge of the excavation at all times. Upon completion of a test pit exploration, the excavation should be backfilled and graded. Excavations should never be left open unless absolutely necessary, and then only with proper barricading and controls to prevent accidental injury.

☒ **Underground Utilities and Hazards**. The identification of underground storage tanks (USTs), pipes, utilities, and other underground hazards is critically important prior to all drilling, excavating and other intrusive activities. In accordance with OSHA 29 CFR 1926.650, the estimated location of utility installations, such as sewer, telephone, electric, water lines and other underground installations that may reasonably be expected to be encountered during excavation work, must be determined prior to opening an excavation. The same requirements apply to drilling operations and the use of soil-gas probes. Where public utilities may exist, the utility agencies or operators must be contacted directly or through a utility-sponsored service such as Dig-Safe. Where other underground hazards may exist, reasonable attempts must be made to identify their locations as well. Failure to identify underground hazards can lead to fire, explosion, flooding, electrocution, or other life threatening accidents.

☐ **Water Hazards and Boat Sampling**. The collection of water or sediment samples on or immediately adjacent to a body of water can pose significant hazards. In addition to the slip, trip, and fall hazards associated with wet surfaces, the potential for drowning accidents must be recognized. These hazards can be intensified by the use of some PPE, particularly if respiratory protection is worn. OSHA 29 CFR 1926.106 requires that all employees working over or near water, where the danger of drowning exists, must wear a U.S. Coast Guard-approved life jacket or buoyant work vest. Ring buoys and emergency standby personnel must also be in place.

Hazard Assessment: Chemical Hazards and Related Concerns

☒ **Chemicals Subject to OSHA Hazard Communication**. All chemicals used in field activities such as solvents, reagents, decontamination solutions, or any other hazardous chemical must be accompanied by the required labels, Material Safety Data Sheets (MSDS), and employee training documentation (OSHA 1910.1200).

☐ **Asbestos**. Disturbance of building materials in buildings built prior to 1980 must be evaluated for the presence of asbestos-containing materials by an accredited Partner inspector. The inspection and/or removal of asbestos-based or asbestos-containing building materials is regulated by some major cities and several states. Regulations require individuals who conduct building inspections for the presence of asbestos or collect samples of asbestos containing materials to be licensed or certified. Partner employees must determine the applicability of these regulations prior to any activities involving asbestos. The primary health effects of asbestos exposure include asbestosis (a scarring of the lungs), lung cancer, mesothelioma, and other forms of cancer. Exposure to asbestos is regulated by a comprehensive OSHA standard (29 CFR 1910.1001).

☒ **BTEX Compounds**. Exposure to the vapors of **benzene, ethyl benzene, toluene,** and **xylenes** above their respective permissible exposure limits (PELs), as defined by OSHA, may produce irritation of the mucous membranes of the upper respiratory tract, nose, and mouth. Overexposure may also result in the depression of the central nervous system. Symptoms of such exposure include drowsiness, headache, fatigue, and drunken-like behavior. Benzene has been determined to be carcinogenic, targeting blood-forming organs and bone marrow. The odor threshold for benzene is higher than the PEL and employees may be overexposed to benzene without sensing its presence; therefore, detector tubes must be utilized to evaluate airborne concentrations.

The vapor pressures of these compounds are high enough to generate significant quantities of airborne vapor. On sites where high concentrations of these compounds are present, a potential inhalation hazard to the field team during subsurface investigations can result. However, if the site is open and the anticipated quantities of BTEX contamination are small (e.g., part per million concentrations in the soil or groundwater), overexposure potential will also be small.

☒ **Carbon Monoxide**. Carbon monoxide (CO) is a gas usually formed by the incomplete combustion of various fuels. Welding, cutting, and the operation of internal combustion engines can produce significant quantities of CO. Amounts of CO can quickly rise to hazardous levels in poorly ventilated areas. CO is odorless and colorless. It cannot be detected without appropriate monitoring equipment. LEL/O_2 meters and H-Nu/PID are <u>not</u> appropriate for the detection of CO. A direct reading instrument, calibrated for CO, should be used. Common symptoms of overexposure include pounding of the heart, a dull headache, flashes before the eyes, dizziness, ringing in the ears, and nausea. These symptoms must not be relied upon in place of an appropriately calibrated monitoring instrument. Exposures should not exceed 15 ppm. Exposures above 15 ppm require the use of supplied air respirators. Air purifying respirators are not approved for protection against CO.

☐ **Chlorinated Organic Compounds**. Exposure to the vapors of many chlorinated organic compounds such as vinyl chloride; tetrachloroethene; 1,1,1-trichloroethane; trichloroethene; and 1,2-dichloroethene above their respective PELs will result in similar symptoms. The actual PELs as set by OSHA vary depending on the specific compound.

Overexposure to the vapor of these compounds can cause irritation of the eyes, nose, and throat. The liquid, if splashed in the eyes, may cause burning irritation and damage. Repeated or prolonged skin contact with the liquid may cause dermatitis. Acute overexposure to chlorinated hydrocarbons depresses the central nervous system exhibiting such symptoms as drowsiness, dizziness, headache, blurred vision, in-coordination, mental confusion, flushed skin, tremors, nausea, vomiting, fatigue, and cardiac arrhythmia. Alcohol may make symptoms of overexposure worse. If alcohol has been consumed, the overexposed worker may become flushed. Some of these compounds are considered to be potential human carcinogens. Exposure to vinyl chloride is regulated by a comprehensive OSHA standard (29 CFR 1910.1017).

☒ **Chromium Compounds**. Hexavalent chromium compounds, upon contact with the skin, can cause ulceration and possibly an allergic reaction. Inhalation of hexavalent chromium dusts is irritating and corrosive to the mucous membranes of the upper respiratory tract. Chrome ulcers and chrome dermatitis are common occupational health effects from prolonged and repeated exposure to hexavalent chromium compounds. Acute exposures to hexavalent chromium dusts may cause coughing or wheezing, pain on deep inspiration, tearing, inflammation of the conjunctiva, nasal itch, and soreness or ulceration of the nasal septum. Certain forms of hexavalent chromium have been found to cause increased respiratory cancer among workers.

Trivalent chromium compounds (chromic oxide) are generally considered to be of lower toxicity, although dermatitis may occur as a result of direct handling.

☐ **Cutting Oils**. Cutting oils may produce a condition known as "cutting oil acne," a specific dermatosis associated with prolonged and repeated direct contact. Other problems associated with continued occupational exposure to cutting fluids include allergic skin sensitization, folliculitis, and squamous cell carcinoma due to the presence of nitrosamines.

☒ **Fuel Oil**. See Petroleum Hydrocarbons (PHC)

☒ **Gasoline**. See BTEX Compounds, and Tetraethyl and Tetramethyl Lead.

☐ **Herbicides**. Some of the commonly used herbicides present a low toxicity to man. However, other herbicides pose more serious problems. Organophosphorus and carbamate herbicides, if inhaled or ingested, can interfere with the functioning of the central nervous system. Many herbicides can be readily absorbed through the skin to cause systemic effects. In addition to being absorbed through the skin, many herbicides, upon contact with the skin, may cause discoloring, skin irritation, or dermatitis. Contaminants of commercial preparations of chlorinated phenoxy herbicides such as 2,4,5-T include 2,3,7,8-tetrachlorodibenzo-p-dioxin (dioxin). Dioxin is a known mutagen and a suspect carcinogen.

☐ **Hydrogen Sulfide (H_2S)**. H_2S, characterized by its "rotten egg" odor, is produced by the decomposition of sulfur-containing organic matter. It is found in many of the same areas where methane is found such as landfills, swamps, sewers, and sewer treatment facilities. An important characteristic of H_2S is its ability to cause a decrease in one's ability to detect its presence by smell. So although one may no longer be able to smell it, it could still be present in harmful concentrations.

The symptoms of overexposure include headache, dizziness, staggering, and nausea. Severe overexposure can cause respiratory failure, coma, and death. The current OSHA PEL is 10 ppm as an 8-hour time-weighted average (TWA). The ACGIH TLV is the same.

☐ **Lead Paint**. The inspection and/or removal, sanding, grinding, etc. of lead-based or lead-containing paints is now strictly regulated by OSHA. States may require individuals who conduct lead paint inspections or collect samples of lead paint to be licensed or certified. Partner employees must determine the applicability of these regulations prior to any activities involving lead paint. For additional health information, see Metal Compounds.

☒ **Metal Compounds**. Overexposure to metal compounds has been associated with a variety of local and systemic health hazards, both acute and chronic in nature, with chronic effects being most significant. Direct contact with the dusts of some metal compounds can result in contact or allergic dermatitis. Repeated contact with arsenic compounds may result in hyperpigmentation. Cases of skin cancer due to the trivalent inorganic arsenic compounds have been documented. The moist mucous membranes, particularly the conjunctivae, are most sensitive to the irritating effects of arsenic. Copper particles embedded in the eye result in a pronounced foreign body reaction with a characteristic discoloration of eye tissue.

Inhalation of copper and zinc dusts and fumes above their established PELs may result in flu-like symptoms known as "metal fume fever." Prolonged and repeated inhalation of the dusts of inorganic arsenic compounds above the established PEL may result in weakness, loss of appetite, a sense of heaviness in the stomach, and vomiting. Respiratory problems such as cough, hoarseness, and chest pain usually precede the gastrointestinal problems. Chronic overexposure to the dusts of inorganic arsenic may result in lung cancer.

The early symptoms of lead poisoning are usually nonspecific. Symptoms include sleep disturbances, decreased physical fitness, headache, decreased appetite, and abdominal pains. Chronic overexposure may result in severe colic and severe abdominal cramping. The central nervous system (CNS) may also be adversely effected when lead is either inhaled or ingested in large quantities for extended periods of time. The peripheral nerve is usually affected. "Wrist drop" is peculiar to such CNS damage. Lead has also been characterized as a male and female reproductive toxin as well as a fetotoxin. Exposure to lead (Pb) is regulated by a comprehensive OSHA standard (29 CFR 1910.1025).

☐ **Methane**. Methane is an odorless, colorless, tasteless, gas that cannot be detected by an H-Nu/PID. When present in high concentrations in air, methane acts primarily as a simple asphyxiant without other significant physiologic effects. Simple asphyxiants dilute or displace oxygen below that required to maintain blood levels sufficient for normal tissue respiration.

Methane has a LEL of 5 percent and an upper explosive limit (UEL) of 15 percent. The LEL of a substance is the minimum concentration of gas or vapor in air below which the substance will not burn when exposed to a source of ignition. This concentration is expressed in percent by volume. Below this concentration, the mixture is "too lean" to burn or explode. The UEL of a substance is the maximum concentration of gas or vapor in air above which the substance will not burn when exposed to a source of ignition. Above this concentration, the mixture is "too rich" to burn or explode. The explosive range is the range of concentrations between the LEL and UEL where the gas-air mixture will support combustion. For methane this range is 5 to 15 percent.

☒ **Pesticides**. Pesticides can be grouped into three major categories: organophosphates, carbamate, and organochlorates. The actual PELs as set by the OSHA vary depending on the specific compound. Organophosphates, including diazinon, malathion and parathion, are quickly absorbed into the body by inhalation, ingestion, and direct skin contact. The symptoms of exposure include headache, fatigue, dizziness, blurred vision, sweating, cramps, nausea, and vomiting. More severe symptoms can include tightness of the chest, muscle spasms, seizures, and unconsciousness. It should also be noted that the malathion and parathion PELs both carry the Skin notation, indicating that these compounds adversely affect or penetrate the skin. OSHA specifies that skin exposure to substances carrying this designation should be prevented or reduced through the use of the appropriate PPE.

Organochlorates such as chlordane, DDT and heptachlor can cause dizziness, nausea, abdominal pain, and vomiting. The more severe symptoms include epileptic-like seizures, rapid heartbeat, coma, and death. These compounds also carry the OSHA Skin notation. The symptoms of exposure to carbamate such carbaryl (also known as sevin) is similar to those described for the organophosphates. However, the OSHA exposure limit for carbaryl does not carry the Skin notation.

☒ **Petroleum Hydrocarbons (PHCs)**. Petroleum hydrocarbons such as fuel oil are generally considered to be of low toxicity. Recommended airborne exposure limits have not been established for these vapors. However, inhalation of low concentrations of the vapor may cause mucous membrane irritation. Inhalation of high concentrations of the vapor may cause pulmonary edema. Repeated or prolonged direct skin contact with the oil may produce skin irritation as a result of defatting. Protective measures, such as the wearing of chemically resistant gloves, to minimize contact are addressed elsewhere in this plan. Because of the relatively low vapor pressures associated with PHCs, an inhalation hazard in the outdoor environment is not likely.

☒ **Polychlorinated Biphenyls (PCBs)**. Prolonged skin contact with PCBs may cause the formation of comedones, sebaceous cysts, and/or pustules (a condition known as chloracne). PCBs are considered to be suspect carcinogens and may also cause reproductive damage.

The OSHA PELs for PCBs are as follows:

Compound	*PEL (8-hour TWA)*
Chlorodiphenyl (42% Chlorine)	1 mg/m^3-Skin
Chlorodiphenyl (54% Chlorine)	0.5 mg/m^3 -Skin

It should be noted that PCBs have extremely low vapor pressures (0.001 millimeters of mercury (mm Hg) at 42% Chlorine and 0.00008 mm Hg at 54% Chlorine). This makes it unlikely that any significant vapor concentration (i.e., exposures above the OSHA PEL) will be created in the ambient environment. This minimizes the potential for any health hazards to arise due to inhalation unless the source is heated or generates an airborne mist. If generated, vapor or mists above the PEL may cause irritation of the eyes, nose, and throat. The exposure limits noted above are considered low enough to prevent systemic effects, but it is not known if these levels will prevent local effects. It should also be noted that both PELs carry the Skin notation, indicating that these compounds adversely affect or penetrate the skin. OSHA specifies that skin exposure to substances carrying this designation be prevented or reduced through the use of the appropriate PPE.

☒ **Polycyclic Aromatic Hydrocarbons (PAHs)**. Due to the relatively low vapor pressure of PAH compounds, vapor hazards at ambient temperatures are not expected to occur. However, if site conditions are dry, the generation of contaminated dusts may pose a potential inhalation hazard. Therefore, dust levels should be controlled with wetting, if necessary. Repeated contact with certain PAH compounds has been associated with the development of skin cancer. Contact of PAH compounds with the skin may cause photosensitization of the skin, producing skin burns after subsequent exposure to ultraviolet radiation. Protective measures, such as the wearing of chemically resistant gloves, are appropriate when handling PAH-contaminated materials.

☐ **Tetraethyl and Tetramethyl Lead**. Both compounds are used as anti-knock ingredients in gasoline. The inhalation of tetraethyl lead dusts may result in irritation of the respiratory tract. This dust, when in contact with moist skin or eye membranes, may cause itching, burning, and transient redness.

The direct absorption of a sufficient quantity of tetraethyl lead, whether briefly at a high rate, or for prolonged periods at a low rate, may cause acute intoxication of the central nervous system. Mild degrees of intoxication may cause headache, anxiety, insomnia, nervous excitation, and minor gastrointestinal disturbances.

☒ **Volatile Organic Compounds (VOCs)**. See BTEX compounds and Chlorinated Organic Compounds.

☒ **Waste Oil**. See Petroleum Hydrocarbons (PHCs) and Cutting Oil.

Hazard Assessment: Biological Hazards and Related Concerns

☒ **Insects**. Insects represent significant sources (vectors) of disease transmission. Therefore, precautions to avoid or minimize potential contact should be considered prior to all field activities. Disease or harmful effects can be transmitted through bites, stings, direct contact with insects, or ingestion of foods contaminated by certain insects. Examples of diseases transmitted by insect bites include encephalitis and malaria from contaminated mosquitoes and Lyme disease and spotted fever from contaminated ticks. Stinging insects, such as bees and wasps, are prevalent throughout the country, particularly during the warmer months. The stings of these insects can be painful and cause serious allergic reactions to some individuals.

☐ **Lyme Disease**. Lyme disease is an infection caused by the bite of certain ticks, primarily deer, dog and wood ticks. The symptoms of Lyme disease usually start out as a skin rash then progress to more serious symptoms. The more serious symptoms can include lesions, headaches, arthritis, and permanent damage to the neurological system. If detected early, the disease can be treated successfully with antibiotics. The following steps are recommended for prevention of Lyme disease and other diseases transmitted by ticks: a) Beware of tall grass, bushes, woods, and other areas where ticks may live; b) Wear good shoes, long pants tucked into socks, a shirt with a snug collar, good cuffs around the wrists, and tails tucked into the pants. Insect/tick repellents may also be useful; c) Carefully monitor for the presence of ticks. Carefully inspect clothes and skin when undressing. If a tick is attached to the skin, it should be removed with fine-tipped tweezers. You should be alert for early symptoms over the next month or so. If you suspect that you have been bitten by a tick, you should contact a physician for medical advice.

☐ **Medical Wastes and Bloodborne Diseases**. Any field activity where exposure to medical wastes or other sources of bloodborne pathogens can be reasonably anticipated must be conducted in accordance with the OSHA (29 CFR 1910.1030) Bloodborne Pathogens

standard. According to the OSHA definition, Bloodborne Pathogens mean pathogenic microorganisms that are present in human blood and can cause disease in humans. These pathogens include, but are not limited to, hepatitis B virus (HBV) and human immunodeficiency virus (HIV). Wherever there is a potential for employee skin, eye, mucous membrane, or parenteral (skin or membrane piercing) contact with blood or other potentially infectious sources, employers must develop a Written Exposure Control Plan.

☐ **Poisonous Plants**. The possible presence of poisonous plants should be anticipated for field activities in wooded or heavily vegetated areas. Poison ivy is a climbing plant with alternate green to red leaves (arranged in threes) and white berries. Poison oak is similar to poison ivy and sumac, but its leaves are oak-like in form. The leaves of these poisonous plants produce irritating oil that causes an intensely itching skin rash and characteristic blister-like lesions. Contact with these plants should be avoided.

☐ **Rats, Snakes and Other Vermin**. Certain animals, particularly those that feed on garbage and other wastes, can represent significant sources (vectors) of disease transmission. Therefore, precautions to avoid or minimize potential contact with (biting) animals (such as rats) or animal waste (such as pigeon droppings) should be considered prior to all field activities. Rats, snakes, and other wild animals can inflict painful bites. The bites can poisonous (as in the case of some snakes) or disease causing (as in the case of rabid animals). Avoidance of these animals is the best protection.

☐ **Waste Water and Sewage**. Sewage and waste water contaminated with raw, untreated sewage can represent significant sources of bacterial, viral, or fungal contamination. Adverse effects due to contact can range from mild skin reactions or rashes to life threatening diseases. Diseases are easily transmitted by accidental ingestion or through skin contact, particularly if the skin is broken. Avoidance of direct contact and good personal hygiene are the best protection from these hazards.

SITE INSPECTION LOG/HASP SIGNATURE PAGE

PROJECT NAME: Industrial Complex	LOCATION: 1625 and 1631 S. Magnolia Ave. and 410 W. Evergreen Ave, Monrovia
PROJECT NUMBER: 11-76495.9	DATE:
PROJECT MANAGER: Eric Patschull	COMPLETED BY:
SITE DESCRIPTION AND NATURE OF WORK: Phase II ESA	

HAZARD COMMUNICATION
[ ]Chemical hazards identified
[ ]All containers properly labeled
[ ]MSDS/workplace notebook on-site
[ ]Site safety briefing completed and documented

ACCIDENTS/EMERGENCY INFO
[ ]First aid personnel identified
[ ]Hospital location identified
[ ]Police/fire/ambulance phone numbers available
[ ]Fire extinguisher present

STORAGE
[ ]Tools/drill equipment/supplies safely stacked to prevent rolling or collapse
[ ]Work areas and passage ways kept clear

UNDERGROUND HAZARDS
[ ]All underground hazards identified and communicated to workers on-site
[ ]Utility/USA clearance confirmed
[ ]Clearance dates: _____
[ ]Clearance ID#: _____

OVERHEAD HAZARDS
[ ]15-foot minimum clearance maintained
[ ]All sources of falling objects/swinging loads/ rotating equipment identified
[ ]Barriers or other methods in place to prevent injury due to overhead hazards

EXCAVATIONS and TRENCHES
[ ]All personnel and storage at least 2 feet from top edge of excavation
[ ]Ladder in place
[ ]Guarding/barriers in place

VEHICULAR TRAFFIC
[ ]All vehicular traffic routes which could impact worker safety identified and communicated
[ ]Barriers or other methods established to prevent injury from moving vehicles

PEDESTRIAN TRAFFIC/SITE CONTROL
[ ]All walkways which could be impacted by site activities identified and communicated
[ ]Barriers or other methods established to prevent pedestrian injury from site activities

AIR MONITORING
[ ]PID on-site for air monitoring of work breathing space
[ ]PID calibrated daily and recorded in log book
[ ]Operational action levels communicated and PPE present for use, if required

COMMENTS/OTHER HAZARDS _____

x = OK *NA = Not Applicable*

Signing below indicates that the individual understands the hazards involved with the project and the necessary procedures in the event of an emergency.

Name	Signature	Company	Date
ERIC PATSCHULL	Eric Patschull	Partner	6-30-11
SHARIDAN ASHCROFT	Sharidan Ashcroft	KTE	6/30/11
JOE TARANTINO		KTE	6/30/11
7-1-11 ERIC PATSCHULL	Eric Patschull	Partner	7/1/11
SHARIDAN ASHCROFT	Sharidan Ashcroft	KTE	7/1/11
JOE TARANTINO		KTE	7/1/11
7-6-11 ERIC PATSCHULL	Eric Patschull	Partner	7-6-11

Additional Signature Page

JONES ENVIRONMENTAL
LABORATORY RESULTS

Client:	Partner Engineering & Science, Inc.	**Report Date:**	7/6/2011
Client Address:	1990 E. Grand Ave., Suite 100 El Segundo, CA 90245	**JEL Ref. No.:**	B-5183B
		Client Ref. No.:	11-76495.9
		Date Sampled:	6/30-7/1/2011 & 7/6/2011
Attn:	Eric Patschull	**Date Received:**	6/30-7/1/2011 & 7/6/2011
Project	Industrial Complex		
Project Address:	1625-1631 S. Magnolia Ave. Monrovia, CA 91016	**Date Analyzed:**	6/30-7/1/2011 & 7/6/2011
		Physical State:	Soil Gas

ANALYSES REQUESTED

1. EPA 8260B - Volatile Organics by GC/MS + Oxygenates

Sampling – Soil Gas samples were collected in glass gas-tight syringes equipped with Teflon plungers. Tubing placed in the ground for soil gas sampling was purged three different times as recommended by DTSC/RWQCB regulations. This purge test determined how many purges of the soil gas tubing were needed throughout the project. One, three and seven purge volumes were analyzed to make this determination.

A tracer gas, n-Propanol, was placed at the tubing-surface interface before sampling. This compound was analyzed during the 8260B analytical run to determine if there were surface leaks into the subsurface due to improper installation of the probe. No n-Propanol was found in any of the samples reported herein.

The sampling rate was approximately 200 cc/min except when noted differently on the chain of custody record using a gas tight syringe. 3 purge volumes were used since this purging level gave the highest results for the compound(s) of greatest interest.

Prior to purging and sampling of soil gas at each point, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of 100 inches of water, sealing the entire system and watching the vacuum for some length of time. A vacuum gauge attached in parallel to the apparatus measured the vacuum. If there was any observable loss of vacuum, the fittings were adjusted as needed until the vacuum did not change noticeably. The soil gas sample was then taken.

Analytical – Soil Gas samples were analyzed using EPA Method 8260 that includes extra compounds required by DTSC/RWQCB (such as Freon 113). Instrument Continuing Calibration Verification, QC Reference Standards, Instrument Blanks and Ambient Air Blanks were analyzed every 12 hours as prescribed by the method. In addition, Matrix Spike (MS) and Matrix Spike Duplicates (MSD) were analyzed with each batch of Soil Gas samples. A duplicate sample was analyzed each day of the sampling activity.

All samples were analyzed within 30 minutes of sampling.

Approval:

SAMPLE RECEIVING REVIEW SHEET

BATCH # T110886

Client Name: Partner Project: Monrovia Industrial Complex

Received by: Dan M Date/Time Received: 6/30/11 1500

Delivered by : ☐ Client ☒ SunStar Courier ☐ GSO ☐ FedEx ☐ Other _____

Total number of coolers received 1 **Temp criteria = 6°C > 0°C (no frozen containers)**

Temperature: cooler #1 4.2 °C +/- the CF (- 0.2°C) = 4.0 °C corrected temperature

cooler #2 _____ °C +/- the CF (- 0.2°C) = _____ °C corrected temperature

cooler #3 _____ °C +/- the CF (- 0.2°C) = _____ °C corrected temperature

Samples outside temp. but received on ice, w/in 6 hours of final sampling.	☒Yes	☐No*	☐N/A
Custody Seals Intact on Cooler/Sample	☐Yes	☐No*	☒N/A
Sample Containers Intact	☒Yes	☐No*	
Sample labels match COC ID's	☒Yes	☐No*	
Total number of containers received match COC	☒Yes	☐No*	
Proper containers received for analyses requested on COC	☒Yes	☐No*	
Proper preservative indicated on COC/containers for analyses requested	☐Yes	☐No*	☒N/A

Complete shipment received in good condition with correct temperatures, containers, labels, volumes preservatives and within method specified holding times. ☒ **Yes** ☐ **No***

* Complete Non-Conformance Receiving Sheet if checked Cooler/Sample Review - Initials and date DM 6/30/11

SAMPLE RECEIVING REVIEW SHEET

BATCH # T110410

Client Name: Partner Project: Monrovia Industrial Complex

Received by: Dan M Date/Time Received: 7/6/11 1507

Delivered by : ☐ Client ☒ SunStar Courier ☐ GSO ☐ FedEx ☐ Other _____

Total number of coolers received 1 **Temp criteria = 6°C > 0°C (no frozen containers)**

Temperature: cooler #1 8.6 °C +/- the CF (- 0.2°C) = 8.4 °C corrected temperature

cooler #2 _____ °C +/- the CF (- 0.2°C) = _____ °C corrected temperature

cooler #3 _____ °C +/- the CF (- 0.2°C) = _____ °C corrected temperature

Samples outside temp. but received on ice, w/in 6 hours of final sampling.	☒ Yes	☐ No*	☐ N/A
Custody Seals Intact on Cooler/Sample	☐ Yes	☐ No*	☒ N/A
Sample Containers Intact	☒ Yes	☐ No*	
Sample labels match COC ID's	☒ Yes	☐ No*	
Total number of containers received match COC	☒ Yes	☐ No*	
Proper containers received for analyses requested on COC	☒ Yes	☐ No*	
Proper preservative indicated on COC/containers for analyses requested	☐ Yes	☐ No*	☒ N/A

Complete shipment received in good condition with correct temperatures, containers, labels, volumes preservatives and within method specified holding times. ☒ **Yes** ☐ **No***

* Complete Non-Conformance Receiving Sheet if checked Cooler/Sample Review - Initials and date 7/6/11

Re: **Asbestos Inspection**
418 W. Evergreen Property
418 W. Evergreen
Monrovia, CA 91016

Project No: LA82769

Dear Mr. Bower,

On January 6, 2016, California DOSH Certified Site Surveillance Technician, Mr. Victor Ruiz (CSST 03-3510) of Patriot Environmental Laboratory Services, Inc. (Patriot) performed an asbestos inspection at the above subject property located in Monrovia, California. **The purpose of the inspection was to determine if asbestos is present in any of the building materials soon to be disturbed during an upcoming demolition at the subject property.**

Summary of Findings

The following asbestos containing materials were identified:

Material Description	Sample Number	Material Location	Material Condition	Estimated Percent Damaged	Approximate Quantity	Percent & Type of Asbestos
9"x9" Brown Vinyl Floor Tile with Mastic	11,12,13 14,15,16	Living Room, Hallway and Bedroom 2 Floors	Good	0%	700 SF	2-5% Chrysotile
Yellow Linoleum (Bottom Layer)	17,18,19 20,21,22	Kitchen Floor	Good	0%	100 SF	5-15% Chrysotile
9"x9"Black Vinyl Floor Tile	41,43,45	Workshop Floor	Good	0%	20 SF	2% Chrysotile

***Note: The quantities of asbestos containing material identified in this report are approximations. It is the responsibility of the abatement contractor to verify the actual quantities of materials to be abated during their job walk for preparation of their bid.**

*see attached drawing

Property Description

The subject property is a single-family residential structure. The subject building is a single-story wood frame building set on a cement slab foundation. At the time of this inspection, the identified asbestos-containing materials were in good condition.

Scope of Work

On January 6, 2016, Mr. Victor Ruiz (CSST 03-3510) of Patriot conducted a limited asbestos inspection at the subject property. The interior and exterior of the building was visually inspected for the purpose of inventorying any suspect asbestos containing materials soon to be disturbed during an upcoming demolition at the subject property. Once the inventory of suspect materials was created, physical bulk samples were collected of the materials from representative locations. Samples were collected in airtight containers. Upon collection, sample numbers, descriptions, and collection locations were entered on to a chain of custody for transportation to Patriot's NVLAP accredited laboratory.

Sampled Suspect Materials

Samples of the following suspect materials were collected:

Drywall & Joint Compound	Plaster with Button Board	9”x9” Brown Vinyl Floor Tile with Mastic
Yellow Linoleum with Mastic Bottom Layer	12”x12” White Vinyl Floor Self Adhesive	Stucco
Vapor Barrier	2’x4’ Ceiling Tiles	1’x1’ Ceiling Tiles
9”x9”Black Vinyl Floor Tile with Glue	Roof Core	Roof Mastic
Window Putty	--	--

Sample Protocol/Analysis

Samples were collected in accordance with the Asbestos School Hazard Emergency Response Act (40 CFR 763 Subpart E) as mandated by Cal/OSHA (Title 8 Section 1529) and South Coast Air Quality Management District (Rule 1403).

Physical bulk samples were analyzed by Patriot. Patriot is accredited by the National Voluntary Laboratory Accreditation Program (200358-0). The method of analysis was Polarized Light Microscopy (EPA 600/M4-82-020).

Recommendations

If any of the asbestos containing materials identified in this report is scheduled to be impacted by renovation or demolition activities, an asbestos abatement contractor must remove them prior to disturbance. Asbestos abatement contractors must be registered with the Division of Occupational Safety and Health.

Disclaimer

Limited destructive sampling was conducted at the subject property. If additional suspect materials are discovered during renovation, all work should cease until a Certified Asbestos Consultant is contracted to ascertain the possibility of asbestos content. This inspection was performed in accordance with current regulations and state of the art practices. The inventory of asbestos containing materials and determination of their condition are based upon conditions observed at the time of inspection. Patriot does not assume responsibility for future regulatory changes or changes in the condition of the building.

Enclosed is the laboratory analysis report. Please contact our office if there are any questions regarding this inspection.

Sincerely,

Fernando Najera

Fernando Najera-Hernandez
Certified Asbestos Consultant No. 11-4771

Ian Reyes - Approved By

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR 763, Subpart F, Appendix A; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples).Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%. This report was issued by a NIST/NVLAP (Lab Code 201014-0) and CADOHS- ELAP (Cert. No. 2893) accredited laboratory and may not be reproduced, except in full without the expressed written consent of Patriot Environmental Laboratory Services, Inc. This report may not be used to claim product certification, approval or endorsement by NIST, NVLAP, ELAP or any government agency.

Peter Mai - Analyst

Ian Reyes - Approved By

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR 763, Subpart F, Appendix A; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples).Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%. This report was issued by a NIST/NVLAP (Lab Code 201014-0) and CADOHS- ELAP (Cert. No. 2893) accredited laboratory and may not be reproduced, except in full without the expressed written consent of Patriot Environmental Laboratory Services, Inc. This report may not be used to claim product certification, approval or endorsement by NIST, NVLAP, ELAP or any government agency.

Re: **Limited Asbestos Inspection**
1613 S. Magnolia Ave. Property
1613 S. Magnolia Ave.
Monrovia, CA 91016

Project No: LA77343

Dear Mr. Bower,

On June 3, 2015, California DOSH Certified Site Surveillance Technician, Mr. Victor Ruiz (CSST 03-3510) of Patriot Environmental Laboratory Services, Inc. (Patriot) performed a limited asbestos inspection at the above subject property located in Monrovia, California. **The purpose of the inspection was to determine if asbestos is present in any of the building materials for an upcoming complete demolition at the subject property.**

Summary of Findings

The following asbestos containing materials were identified:

Material Description	Sample Number	Material Location	Material Condition	Estimated Percent Damaged	Approximate Quantity	Percent & Type of Asbestos
Window Putty	16,17,18	Exterior Windows Throughout	Good	0%	100 SF	3% Chrysotile
Roof Mastic	25,26,27	Roof Penetrations and Chimney Seams	Good	0%	25 SF	5% Chrysotile
Transite Pipe	N/A	Assumed	Good	0%	6 LF	Assumed

***Note: The quantities of asbestos containing material identified in this report are approximations. It is the responsibility of the abatement contractor to verify the actual quantities of materials to be abated during their job walk for preparation of their bid.**

*see attached drawing

Property Description

The subject property is a single-family residential structure. The subject building is a single-story wood frame building set on a raised foundation. At the time of this inspection, the identified asbestos-containing materials were in good condition.

Scope of Work

On June 3, 2015, Mr. Victor Ruiz (CSST 03-3510) of Patriot conducted a limited asbestos inspection at the subject property. The interior and exterior of the building was visually inspected for the purpose of inventorying any suspect asbestos containing materials for an upcoming complete demolition at the subject property. Once the inventory of suspect materials was created, physical bulk samples were collected of the materials from representative locations. Samples were collected in airtight containers. Upon collection, sample numbers, descriptions, and collection locations were entered on to a chain of custody for transportation to Patriot's NVLAP accredited laboratory.

Sampled Suspect Materials

Samples of the following suspect materials were collected:

Plaster and Button Board	12”x12” Black Vinyl Floor Tile with Glue	Carpet Glue
Window Putty	Exterior Stucco	Roof Core Sample
Roof Mastic	--	--

Sample Protocol/Analysis

Samples were collected in accordance with the Asbestos School Hazard Emergency Response Act (40 CFR 763 Subpart E) as mandated by Cal/OSHA (Title 8 Section 1529) and South Coast Air Quality Management District (Rule 1403).

Physical bulk samples were analyzed by Patriot. Patriot is accredited by the National Voluntary Laboratory Accreditation Program (200358-0). The method of analysis was Polarized Light Microscopy (EPA 600/M4-82-020).

Recommendations

If any of the asbestos containing materials identified in this report is scheduled to be impacted by renovation or demolition activities, an asbestos abatement contractor must remove them prior to disturbance. Asbestos abatement contractors must be registered with the Division of Occupational Safety and Health.

Disclaimer

Limited destructive sampling was conducted at the subject property. If additional suspect materials are discovered during renovation, all work should cease until a Certified Asbestos Consultant is contracted to ascertain the possibility of asbestos content. This inspection was performed in accordance with current regulations and state of the art practices. The inventory of asbestos containing materials and determination of their condition are based upon conditions observed at the time of inspection. Patriot does not assume responsibility for future regulatory changes or changes in the condition of the building.

Enclosed is the laboratory analysis report. Please contact our office if there are any questions regarding this inspection.

Sincerely,

Fernando Najera-Hernandez
Certified Asbestos Consultant No. 11-4771

Peter Mai - Analyst

Ian Reyes - Approved By

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR 763, Subpart F, Appendix A; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples).Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%. This report was issued by a NIST/NVLAP (Lab Code 201014-0) and CADOHS- ELAP (Cert. No. 2893) accredited laboratory and may not be reproduced, except in full without the expressed written consent of Patriot Environmental Laboratory Services, Inc. This report may not be used to claim product certification, approval or endorsement by NIST, NVLAP, ELAP or any government agency.

Bulk sample(s) submitted was (were) analyzed in accordance with the procedure outlined in the US Federal Register 40 CFR 763, Subpart F, Appendix A; EPA-600/R-93/116 (Method for Determination of Asbestos in Building Materials), and EPA-600/M4-82-020 (US EPA Interim Method for the Determination of Asbestos in Bulk Insulation Samples).Samples were analyzed using Calibrated Visual Estimations (CVES); therefore, results may not be reliable for samples of low asbestos concentration levels. Samples of wall systems containing discrete and separable layers are analyzed separately and reported as composite unless specifically requested by the customer to report analytical results for individual layers. This report applies only to the items tested. Results are representative of the samples submitted and may not represent the entire material from which the samples were collected. "None Detected" means that no asbestos was observed in the sample. "<1%" (less than one percent) means that asbestos was observed in the sample but the concentration is below the quantifiable level of 1%. This report was issued by a NIST/NVLAP (Lab Code 201014-0) and CADOHS- ELAP (Cert. No. 2893) accredited laboratory and may not be reproduced, except in full without the expressed written consent of Patriot Environmental Laboratory Services, Inc. This report may not be used to claim product certification, approval or endorsement by NIST, NVLAP, ELAP or any government agency.

Re: **Lead-based Paint Inspection**
418 W. Evergreen Property
418 W. Evergreen
Monrovia, CA 91016

Project No: LA82769

Dear Mr. Bower,

On January 6, 2016 Patriot Environmental Laboratory Services Inc. (Patriot) was contracted to perform lead-based paint sample collection services for the site listed above. The structures surveyed included a single-story single-family residential structure. Twenty-two (22) paint chip samples were collected from various locations throughout the interior and exterior of the subject structure.

FINDINGS

The samples were collected at these locations and yielded the following results:

MATERIAL / SAMPLE #	LOCATION SAMPLE WAS COLLECTED	LEAD CONTENT (mg/kg)
(L-1) Tan Paint Chip	Wall at Living Room	2800
(L-2) Purple Paint Chip	Wall at Bedroom 1	<140
(L-3) White Paint Chip	Wall at Hall Bathroom	<140
(L-4) White Paint Chip	Door Casing at Hallway	<120
(L-5) White Paint Chip	Door at Bedroom 2	<150
(L-6) White Paint Chip	Baseboard at Hall Bathroom	870
(L-7) White Paint Chip	Window Sill at Living Room	180

(L-8) Brown Paint Chip White Paint Chip	Window Casing at Living Room	<160
(L-9) Tan Paint Chip	Door Casing at Kitchen	540
(L-10) Tan Paint Chip	Window Sill at Kitchen	<130
(L-11) Tan Paint Chip	Window Casing at Kitchen	1700
(L-12) Tan Paint Chip	Cabinet Linen at Hallway	520
(L-13) White Paint Chip	Closet Door Casing at Bedroom 2	3600
(L-14) Tan Paint Chip	Kitchen Cabinets at Kitchen	590
(L-15) White Paint Chip	Exterior Window Sill at Kitchen	440
(L-16) White Paint Chip	Exterior Window Casing at Kitchen	600
(L-17) White Paint Chip	Exterior Wall at Front of House	<150
(L-18) Grey Paint Chip	Wall at Hall Bathroom	<130
(L-19) Grey Paint Chip	Floor at Hall Bathroom	<170
(L-20) Tan Paint Chip	**Siding at Back of House at Garage**	**22000**
(L-21) White Paint Chip	Fascia at Exterior North End	4800
(L-22) White Paint Chip	Eave at Exterior North End	4100

Note: As established by the HUD Guidelines, the definition of a Lead-based paint (LBP) is any paint, varnish, lacquer, putty, plaster, or similar coating material which contains lead or its compounds in excess of 5,000 parts per million (ppm) by dry weight or more of lead.
The consumer products safety commission defines lead-based paint as any paint, varnish, lacquer, putty, plaster, or similar coating material, which contains lead or its compounds in excess of 600 ppm.

FINDINGS

The table above indicates that several painted surfaces throughout the subject structure contain lead. These sample results are indicative of all similar building components located throughout the surveyed structure. One (1) of the twenty two (22) paint chip samples was determined to contain lead above 5,000 ppm. A complete copy of all laboratory data is provided as an attachment to this document. On the day the inspection was conducted the interior and exterior painted surfaces of the building were in good condition.

CONCLUSIONS / RECOMMENDATIONS

Patriot recommends that waste characterization sampling be conducted on components and waste streams that were determined to be lead-containing to establish which waste disposal requirements a required for these items. Physical removal of the components should only be conducted in accordance with Title 17, CCR, Division 1, Chapter 8: Accreditation, Certification, and Work Practices for Lead-Based Paint and Lead Hazards.

It is important to note that lower concentrations of lead were detected on other components throughout the site structures (see lead-based paint summary data). Therefore, Patriot recommends that any contractor who would disturb any lead-laden surfaces be notified of the hazard and their requirement to comply with the OSHA Lead in Construction Standard (1926.62) and Cal/OSHA CONSTRUCTION SAFETY ORDERS, LEAD SECTION 1532.1, Title 8, California Code of Regulations (CCR), effective November 4, 1993 (revised March 7, 1997).

All lead related construction work performed in the State of California must be in compliance with Title 17, CCR, Division 1, Chapter 8: Accreditation, Certification, and Work Practices for Lead-Based Paint and Lead Hazards.

Patriot would be pleased to answer any questions that you may have regarding this report.

Sincerely,

Chris Blake

Reporting Limit: 20ug or 100ppm for samples weighed >200mg under normal preparatory conditions. Reporting limit may change depending on the amount of material weighed for analysis and/or the final preparatory dilution. EPA Renovation, Repair, and Painting Rule (40CFR745) Guidelines: 0.5% lead by weight of paint or 5000ppm. Condition of samples as received is fair unless otherwise noted. The results reported pertain only to the items tested. Test data are accurate to two significant figures. Data have not been corrected with instrument or process blanks. Unless otherwise noted, the reported test results have passed necessary quality control requirements. Reference Method: EPA 3050B/7420. This report was issued by a DOHS ELAP (Lab No.2540) accredited laboratory and may not be reproduced, except in full, without the expressed written consent of Patriot Environmental Laboratory Services, Inc. This report must not be used to claim product certification, approval or endorsement by DOHS ELAP or any government agency.

Valued Customer,

Please find attached lead laboratory results for your project. For your convenience the following regulatory information is provided.

Through the **EPA**[1], the RRP (Renovation, Repair, and Painting Rule) defines lead based paint as any paint, varnish, lacquer, putty, plaster, or similar coating material which contains lead or its compounds in excess of 5,000 parts per million (ppm) by dry weight.

OSHA[2] regulates any and all levels of lead in paint when that paint is disturbed and exposed to the employee above the action level of 30 micrograms per square meter of air.

The attached laboratory data should be provided to any contactor or individual that may disturb painted surfaces with any amount of lead at your project.

If you have any questions regarding your results do not hesitate to contact the Field Department at 714.548.3300. We will be more than happy to assist you with any inquiries you may have regarding this project.

Regards,

The Field Department

ORIGINAL ASBESTOS SURVEY REPORTS

INTRODUCTION

Many buildings constructed during the 20th Century through the mid to late 1970's utilized some degree of asbestos in the construction process; which practice was formerly a standard in the building trade. Asbestos is a naturally-occurring family of fibrous minerals, which was used in building materials mainly as a fire-proofing and insulating agent, and is typically encountered in wrapped heating system insulation, structural fire-proofing, acoustical ceilings, vinyl flooring and roofing mastics. Asbestos was regularly used in many other non-building products as well. The Environmental Protection Agency (EPA) estimates the asbestos-containing materials (ACM) can currently be found in more than 31,000 schools and 733,000 other public and commercial buildings. In fact, asbestos fibers are generally present in urban air and water.

Extensive governmental regulation of asbestos now exists, and proposals have been made for additional regulations. No federal laws, regulations or standards, however, require wholesale removal of asbestos from an occupied building. Indeed, the EPA has concluded that "[T]he presence of asbestos in a building does not mean that the health of building occupants is endangered. If asbestos-containing material remains in good condition and is unlikely to be disturbed, exposure will be negligible." The truth of both current EPA and OSHA requirements and non-binding guidance is to identify the materials that are releasing or could release asbestos fibers into the air (inhalation of which could present a health hazard), implement proper response actions when such materials are located, maintain asbestos in good condition, and follow appropriate work practices when disturbance of asbestos is unavoidable.

PROGRAM MANAGEMENT

The Sierra Auto Properties, LLC Manager (Peter Hoffman) or his designee is responsible for ensuring that the procedures set forth in this manual are followed. Health Science Associates (HSA) was retained by Sierra Auto Properties to generate this Asbestos Management / Operations and Maintenance Plan.

BASIS OF MANUAL

Pursuant to Sierra Auto Properties, LLC Management this Asbestos Management Manual was prepared utilizing the Asbestos related surveys performed by Partner Engineering and Science, Inc. in 2011.

LOCATION OF ACM IN THE BUILDING

Partner Engineering and Science's survey of the Monrovia, CA Sierra Auto Properties, LLC buildings on Magnolia and Evergreen Avenues disclosed no Asbestos Containing Material (ACM), defined as any material containing greater than one percent asbestos.

The following material was determined to be Asbestos Containing Construction Material (ACCM), defined by the State of California as any construction material containing greater than 0.1 percent asbestos, utilizing the PLM Method:

- Joint Compound at 1671 South Magnolia Avenue (approximately 100 sq. ft.)

A complete description of the samples collected and their results are located in the original Partner Engineering and Science, Inc. Phase I Environmental Site Assessment Reports. Similar materials in color, texture and appearance as the one identified as ACCM, located in any other section of the 1671 South Magnolia building are to be considered asbestos until undergoing further testing.

REMOVAL OF ACM

Sierra Auto Properties, LLC does not currently have an asbestos removal plan nor does it plan to do any removal in the near future. The policy is to manage the asbestos in place.

OPERATIONS AND MAINTENANCE (O&M) PROGRAM

As long the ACCM remains in the building the O&M Program will be operational. The primary purpose of the O&M Program is to avoid inadvertent disturbances of ACM/ACCM and to ensure proper control of necessary actual or potential disturbances.

Building services and contractor staff whose work may place them in contact with ACM/ACCM must first notify the Sierra Auto Properties, LLC Manager, who are responsible for the implementation of the O&M Program.

For any work (small scale, short duration) to be performed involving the removal of small quantities of the ACCM as may be required in the performance of another maintenance activity and not intended as asbestos abatement, that will involve minor repairs to damaged ACCM, or any type of limited removal or significant abrasion of wall joint compound, the practices and procedures specified in Appendix B are mandatory.

The Sierra Auto Properties, LLC Manager and/or his designee may direct the performance of such small scale, short duration work (see paragraph above), utilizing the procedures in Appendix B. Such work may not exceed amounts greater than those which can be contained in a single prefabricated mini-enclosure. Such an enclosure shall conform spatially and geometrically to the localized work area, in order to perform its intended containment function.

ASBESTOS AWARENESS PROGRAM

1. Summary of Program

   An Asbestos Awareness Program addresses the potential adverse health effects due to asbestos exposure. Relevant federal, state and local regulations are reviewed. The location of known ACCM within the facility is identified. Finally, the O&M Program is presented. Individuals who will be authorized to perform small scale, short duration ACCM-related work must attend both the Asbestos Awareness Program and Personal Protection and Work Practice Control/Training in Asbestos Control Measures Program. Certificates of attendance will be prepared for each employee and retained in the employee's personnel file.

2. Who Should Attend

All maintenance and custodial personnel are to attend the Asbestos Awareness Program.

3. How Often

The program will be presented annually to all maintenance and custodial personnel. Additional training is available on an as-requested basis. Attendance sheets are also to be completed.

4. New Employee Orientation

All new employees who may need to impact ACCM will attend an Asbestos Awareness Program. In addition, those employees whose duties require the use of protective equipment will attend the Personal Protection and Work-Practice Control/Training in Asbestos Control Measures Program.

ASBESTOS AWARENESS PROGRAM OUTLINE

I. Introduction

II. Background Information

What asbestos is.

Kinds of materials in which asbestos has been used.

What are the potential hazards.

How health risks can be minimized.

III. Asbestos Control Program

IV. Questions and Answers

PERSONAL PROTECTION AND WORK PRACTICE CONTROL/TRAINING IN ASBESTOS CONTROL MEASURES

1. Annual Training

   Specialized training shall be offered annually to any maintenance and custodial personnel whose duties include the removal of small quantities of ACCM as may be required in the performance of another maintenance activity and not intended as asbestos abatement, that will involve minor repairs or impact to damaged drywall joint compound. This training addresses the use of respiratory protection, protective clothing and equipment, and includes the hands-on use of each.

2. Annual Fit Testing

   Respirator fit-testing will be conducted annually, as necessary.

3. New Employees

   All new employees whose duties include the activities as listed in item 1. above will receive the specialized training as part of their new employee orientation.

TRAINING IN ASBESTOS CONTROL MEASURES

I. BACKGROUND INFORMATION

- A. Goals of Course
- B. Background & History
- C. Regulatory Development

II. RECOGNITION AND USES OF ASBESTOS

- A. Physical Characteristics
- B. Products Containing Asbestos
- C. Identification

III. HEALTH EFFECTS

- A. Respiratory System
- B. Types of Disease
- C. Hazards to Family Members
- D. Relationship to Smoking

IV. REGULATIONS

- A. EPA
- B. OSHA
- C. STATE

V. METHODS OF MONITORING

- A. Bulk Samples
- B. Air Samples
- C. Analysis

VI. WORKER PROTECTION

- A. Clothing
- B. Respiratory Protection
- C. Types, Limitations, Use, and Fit-Testing

VII. ENGINEERING CONTROLS

- A. Hazard Assessment
- B. Material Repair
- C. Glove Bag Practice
- D. Containment Construction
- E. Respiratory Fit-Testing
- F. General Safety

VIII. PRACTICAL INSTRUCTION

IX. REVIEW AND QUESTIONS

RESPIRATORY PROTECTION AND MEDICAL SURVEILLANCE

The respiratory protection program (Appendix B) and medical surveillance program (Appendix C) are **only** applicable to the employees and service/contractor personnel who may disturb ACCM in the course of their work within the 1671 South Magnolia Avenue building.

CONTRACTOR WORK

California regulations require that any contractor performing asbestos-related activities be licensed by the Contractor State Licensing Board. They further stipulate that Owners are responsible for determining whether their contractors are indeed Licensed. Contractor compliance can be verified by calling 1-800-321-CSLB (2752), the California CSLB.

All contractor work at the 1671 South Magnolia Avenue building will be evaluated prior to start-up to identify all instances where the potential for contact with ACCM exists. Preventive steps will be taken as needed to insure that uncontrolled disturbance of ACCM does not occur.

Prior to contract work being performed in the 1671 South Magnolia Avenue building, a walk-around at the site will be conducted with the contractor by the Sierra Auto Properties, LLC Manager and/or his designee to identify the exact location(s) where ACCM may be encountered. All locations where ACCM may be disturbed will be noted and, if necessary, Health Science Associates (HSA) will be available to determine the protective procedures/practices necessary to control the release of asbestos fibers and prevent the spread of ACCM contamination.

Air monitoring will be conducted in any construction areas, as needed, to verify that ACCM is not disturbed. If ACCM is disturbed, contractors will be instructed to notify the Sierra Auto Properties, LLC Manager and/or his designee who will notify HSA immediately. Upon notification of the occurrence of ACCM disturbance, HSA will initiate episodic contamination control, if necessary. The contractor will not be allowed to resume working in the area until it has been decontaminated.

MINIMIZATION CLEANING

Under certain conditions, special cleaning procedures will be employed. Minimization cleaning lowers the potential for excessive airborne fiber concentrations resulting from the uncontrolled disturbance of asbestos-contaminated surfaces.

Minimization cleaning consists of wet wiping all smooth surfaces, such as walls and furniture, and HEPA vacuuming of rough surfaces, such as carpets and drapery. Areas where minimization cleaning may be necessary include:

- Areas where elevated ambient air levels are recorded,
- Areas where small-scale, short-duration removal was employed,
- Areas where episodic contamination occurs,
- Areas following significant renovation,

Air monitoring may be performed following minimization cleaning. Minimization cleaning includes the following:

When the Sierra Auto Properties, LLC Manager or his designee learns that minimization cleaning is necessary, appropriate custodial and/or contractor personnel will immediately take action. Access to the area will be restricted and the area decontaminated as quickly as possible following these general procedures:

a. Upon notification, the Sierra Auto Properties, LLC Manager or his designee will direct the appropriate personnel to take the emergency response kit to the area where the damage or significant impact has occurred. If the area can be quickly cleaned up without assistance, the appropriately trained and qualified personnel will proceed. If the damage is extensive, contact is to be made with the Sierra Auto Properties, LLC Manager. HSA and a certified asbestos contractor may be contacted for assistance.

b. Workers shall, as appropriate, don respiratory protection and protective clothing.

c. Any large pieces of debris shall be immediately wetted with amended water.

d. Warning signs shall be posted at the entrances to the area and access shall be restricted.

e. Seal doorways and shut down the ventilation system to prevent contamination of other areas in the building.

f. The large pieces of debris that have already been wetted with amended water shall be placed in a 6 mil plastic bag for disposal in accordance with procedures in the section "ACCM WASTE HANDLING."

g. All contaminated surfaces shall be thoroughly cleaned by HEPA vacuuming of any remaining loose material followed by wet wiping of all surfaces.

h. The damaged area shall be repaired.

i. After clean-up and repairs are completed, workers shall place wet rags used for wipe-down and disposable protective clothing in a 6-mil bag labeled for disposal as non-hazardous asbestos waste.

j. After decontamination is complete, air sampling may be conducted, if necessary. The area samples must indicate fiber concentrations below 0.01 fibers/cc for re-entry by unprotected personnel into the area.

k. Air sampling results, if collected, will be attached to the report of damaged ACCM and retained in the asbestos file.

ASBESTOS EMERGENCY RESPONSE KIT

- 1 or 2 gallon hand pump sprayer containing amended water
- HEPA vacuum
- Glove bag(s)
- Utility knife
- Duct tape
- Roll of 6 mil polyethylene plastic sheeting
- Appropriately labeled 6 mil bags for disposal of asbestos waste
- Cotton rags
- Respirator and protective clothing
- Aerosol Adhesive
- Barrier Flagging
- Asbestos Warning Labels

1671 South Magnolia Avenue building

REPORT OF DAMAGED ASBESTOS-CONTAINING MATERIALS
(To be completed by Building Maintenance or Custodial Personnel)

1. Building address and room number of area involved.

2. Room or area description/location of damaged material (i.e., boiler room, floor adjacent to fire exit door)

3. Description of material involved (i.e., ACCM Joint Compound)

4. Description of damage:

5. Cause of damage (if known):

6. Actions taken:

7. Signature:

   Date:

ACCM WASTE HANDLING

The State of California Health and Safety Code considers ACM to be a hazardous waste when the asbestos content is 1% or greater and it is friable. A registered waste hauler must transport the waste and a waste manifest is necessary. Asbestos waste that is less than 1% may be treated as Non-Hazardous Asbestos Waste.

All ACCM waste less than 50 lbs. shall be placed wet into 6-mil thick bags. The individual filling the bag will seal the bag shut with tape. Sealed bags are then placed inside another 6-mil bag or other impermeable container. The outer surfaces of the sealed containers will be wet wiped and then cleaned with a HEPA vacuum.

No hazardous waste labeling is required for Non-Hazardous Asbestos waste.

The clean, sealed container(s) filled with ACCM waste will be stored in a secure area until transported to an authorized disposal site. This storage will be considered as a temporary measure until such time as arrangements can be made for final disposal. The available storage capacity on site must not be exceeded.

Local, state and federal permits shall be obtained for the transportation and disposal of asbestos materials and all procedures shall be followed. For less than 50 lbs, transport should be in a closed vehicle in closed containers that are packed in a manner that prevents tipping, spilling, or breaking during transport. No mixing of different hazardous wastes in one container is allowed during transportation. The California Health and Safety Code requirement for a Uniform Hazardous Waste Manifest is not required (Health and Safety Code section 25163(c). A simple transportation manifest is appropriate.

Activities involving removal of ACCM waste from the facility and disposal at the landfill shall be documented. A landfill manifest shall be completed when ACCM waste is disposed of at an appropriate landfill.

Procedures outlined above are intended for the disposal of ACCM waste generated from episodic contamination and small-scale, short- duration removal. Transportation and disposal requirements during abatement projects are more extensive.

ON-GOING BUILDING SURVEILLANCE

A periodic visual inspection (at least semi-annual) of all areas of the building known to contain asbestos materials should be conducted by the Sierra Auto Properties, LLC Manager and/or his designee. The purpose of the inspection will be to check for any damage or deterioration of asbestos containing materials (delamination, water damage, vandalism, etc.). The following forms may be used to facilitate this inspection. Additional inspections will be conducted whenever renovation or other activities are conducted which might disturb the asbestos- containing construction material. All inspection reports should be reviewed and signed by the Sierra Auto Properties, LLC Manager, who will arrange for any necessary repairs. The inspection reports should be retained in the building asbestos file.

1671 South Magnolia Avenue building

SEMI-ANNUAL BUILDING INSPECTION FORM

Date_____ Inspector_____

Building_____ Location_____

Activity of Area_____

1. Friable asbestos-containing materials present? __yes __no

2. Is material severely damaged?

   ___ no damage noted

   ___ friable, but no debris noted on surfaces

   ___ friable material noted on tiles

3. Is there evidence of water damage?

   ___ none noted

   ___ some stains noted, but no damage

   ___ stains noted, loose debris below

4. Is there evidence of excessive wear?

   __ none noted

   __ surface coating and/or finishing is impacted, but not damaged

   __ surface is damaged and shows signs of significant deterioriation

6. Are there any other changes that should be noted?

AIR MONITORING

Air monitoring is utilized in conjunction with visual inspections to verify the effectiveness of control measures and protective clothing. Techniques employed are consistent with the recommended methods as described in Cal/OSHA Regulations CCR Title 8 §5208 and CCR Title 8 §1529 . Phase contrast microscopy (PCM) is the method of analysis that will continue until such time as revisions are warranted. A secondary method of analysis employing electron microscopy shall be used on a portion of the samples to properly characterize the asbestos air quality in the building in relationship to outside air quality, if necessary.

Air monitoring may be conducted, as necessary, to measure:

1. Levels during and following asbestos impact related maintenance work.

2. Levels before, during and following abatement projects.

3. Levels before and following asbestos related renovation projects.

4. Levels during (if possible) and following episodic contamination.

5. Annually to maintain surveillance of general air quality.

The specific air sampling strategies to be used will depend on the activity of interest and will be determined in coordination with the Sierra Auto Properties, LLC Manager. HSA is available to perform as needed air monitoring services.

PROGRAM REVIEW

An annual O&M Program Review will be conducted. Participants will include the Sierra Auto Properties, LLC Manager and HSA.

The program review will address any problems encountered in the previous year. Revisions in the program will be made as necessary.

A written report will be generated identifying any problems encountered or the identification of any necessary changes that result in the need to issue an updated manual.

III. WORK PRACTICES 2

IV. MONITORING 4

V. AUTHORIZED PERSONS 4

VI. MEDICAL SURVEILLANCE 5

VI. MEDICAL SURVEILLANCE 5

VIII. OUTSIDE CONTRACTORS 5

I. INTRODUCTION

This program is not applicable to work involving the removal or other abatement of asbestos containing material (ACM), nor is it applicable to renovation work that might disturb ACM. It is applicable to work that may involve incidental contact with the existing ACCM joint compound materials and any settled particulate.

There will be no purposeful removal of ACCM. Any visible dust associated with the joint compound materials shall not be dusted or swept dry, or vacuumed without using a HEPA filter.

Personnel contact with joint compound materials may occur during certain work. The joint compound material is an integral part of the wall system in this building and is considered non-friable and will not pulverize or create dust with normal hand pressure in its intact state.

There is the potential for ACCM contamination of occupied areas during any ACCM impact work. Precautions as identified in this document should be provided for any purposeful ACCM contact.

II. OBJECTIVES

The goals of this asbestos control program are:

A. To maintain 8-hour time-weighted average (TWA) occupational exposures to airborne asbestos fibers well below 0.1 f/cc (fibers per cubic centimeter of air), the OSHA Permissible Exposure Limit (PEL).

B. To prevent ACCM contamination of occupant/tenant areas and of the return-air plenums of the air conditioning systems and thereby prevent exposure to building occupants.

C. To establish work practices that will accomplish A and B, above, and reduce personnel exposures to the lowest practicable levels.

D. To provide a record of compliance with the program itself.

III. WORK PRACTICES

When work involving intentional or likely removal or abrasion to the ACCM joint compound materials, the following work practices are to be followed.

A. The work area is to be secured so as to prevent unauthorized personnel from entering and posted with a conspicuous sign which states: "DANGER ASBESTOS CANCER AND LUNG DISEASE HAZARD. AUTHORIZED PERSONNEL ONLY."

B. At each location requiring the removal, replacement, or likely damaging impact of ACCM joint compound material, 6 mil plastic should be in the area and available to be placed on the floor over an area large enough to accommodate any debris that might be generated. If necessary, temporarily move furniture out of the way. When removing wall materials potentially containing the ACCM joint compound, the perimeter of this work shall additionally be curtained with 6 mil poly from floor to ceiling and the enclosure so prepared shall be exhaust ventilated with a HEPA vacuum.

C. The following protective clothing and equipment is to be worn.

1. NIOSH approved half-face respirator with HEPA cartridges fitted in accordance with Cal/ OSHA Regulations CCR Title 8 §5208 and CCR Title 8 §1529.
2. Disposable coveralls if the work will involve the removal of ACCM joint compound materials.

D. Carefully remove only the least amount of wall material as necessary to accomplish the work at hand. Use a HEPA vacuum to clean the work area before removal. The wall area should be handled gently and vacuumed at the point of removal.

E. Any visible ACCM debris that is too large for HEPA vacuuming is to be picked up and placed in plastic bags for disposal as Non-Hazardous asbestos waste. Any ACCM dislocated during the work is to be handled similarly. The area should be inspected for any dislocated ACCM before replacement wall materials are put in place. All ACCM waste will be placed in 6 mil plastic bags.

F. When work requires impact to ACCM whereby it may be physically abraded or disrupted, the ACCM shall be dampened using a fine spray of water.

G. When the work is finished, replace any removed wall material, then use the HEPA vacuum to clean all of the following in the order listed.

1. Equipment and tools used during the work. Wet wiping may be used instead.
2. Your protective clothing and equipment (while still wearing them) and the rest of your body.
3. The plastic on the floor.
4. The floor under and around where the plastic was placed.

All items so cleaned may be considered non-contaminated.

H. Routine care of asbestos-containing wall material shall include the following prohibitions and requirements.

- Dry sanding of asbestos-containing wall material is **prohibited**.

Waste and debris and accompanying dust in an area containing accessible ACCM and/or visibly deteriorated ACCM, shall not be dusted or swept dry, or vacuumed without using a HEPA filter.

IV. ACCM WASTE HANDLING

A. The State of California Health and Safety Code considers ACCM to be a non-hazardous waste when the asbestos content is less than 1% . A registered waste hauler is not required for transport of the waste and a waste manifest is not necessary.

B. All ACCM waste less than 50 lbs. shall be placed wet into 6-mil thick bags. The individual filling the bag will seal the bag shut with tape. Sealed bags are then placed inside another 6-mil bag or other impermeable container. The outer surfaces of the sealed containers will be wet wiped and then cleaned with a HEPA vacuum.

C. No hazardous waste labeling is required for Non-Hazardous Asbestos waste.

D. The clean, sealed container(s) filled with ACCM waste will be stored in a secure area until transported to an authorized disposal site. This storage will be considered as a temporary measure until such time as arrangements can be made for final disposal. The available storage capacity on site must not be exceeded.

E. Local, state and federal permits shall be obtained for the transportation and disposal of asbestos materials and all procedures shall be followed. For less than 50 lbs, transport should be in a closed vehicle in closed containers that are packed in a manner that prevents tipping, spilling, or breaking during transport. No mixing of different hazardous wastes in one container is allowed during transportation. The California Health and Safety Code requirement for a Uniform Hazardous Waste Manifest is not required (Health and Safety Code section 25163(c). A simple transportation manifest is appropriate.

F. Activities involving removal of ACCM waste from the facility and disposal at the landfill shall be documented. A landfill manifest shall be completed when ACCM waste is disposed of at an appropriate landfill.

G. Procedures outlined above are intended for the disposal of ACCM waste generated from episodic contamination and small-scale, short- duration removal. Transportation and disposal requirements during abatement projects are more extensive.

V. MONITORING

During normal operations the Sierra Auto Properties, LLC Manager shall schedule Industrial Hygiene monitoring of representative typical work subject to this control program. The monitoring shall include:

A. Pre-job baseline.

B. Personnel and area during work and cleanup.

C. Post-job clearance. Concentrations below pre-job baseline or less than 0.01 fiber per cubic centimeter of air (f/cc) in accordance with NIOSH 7400A, whichever is greater, shall be considered "clear".

VI. AUTHORIZED PERSONS

Only authorized persons, either Sierra Auto Properties, LLC personnel or contractor personnel, shall be allowed to perform this work. To be authorized such persons shall have received asbestos awareness training and respirator fit testing as required by Cal/ OSHA Regulations CCR Title 8 §5208 and CCR Title 8 §1529 and shall have been trained in the requirement of these specifications.

This training and fit testing shall be conducted by or under the direction of a Certified Industrial Hygienist (CIH). Evidence of this training and fit testing, such as a certificate signed by the CIH, shall be made available to the Sierra Auto Properties, LLC Manager or his designee prior to the commencement of this work.

VII. MEDICAL SURVEILLANCE

Compliance with these specifications is expected to result in 8-hour time-weighted TWA exposures well below 0.1 f/cc. However, medical examinations will be provided in accordance with Cal/ OSHA Regulations CCR Title 8 §5144, §5208 and CCR Title 8 §1529 for persons required to wear respiratory protection. At the same time the requirements for an asbestos physical will be met.

VIII. RECORDKEEPING

A. For each job performed within the scope of this control program a job report will be completed (see attached form). Monitoring reports, as generated for the applicable jobs, shall be included with the appropriate job reports.

B. The Sierra Auto Properties, LLC Manager is responsible to ensure that this recordkeeping requirement is met. It is essential that there is this record of each ACCM related job and compliance with these specifications. A file of these job reports shall be permanently maintained in the office of the Sierra Auto Properties, LLC manager or his designee.

IX. OUTSIDE CONTRACTORS

A. A copy of these specifications shall be provided to each outside contractor (including subcontractors) who will perform work involving suspected ACCM impact. Such

contractors shall submit the required evidence of training and respirator fit testing for each person who will be assigned such work.

B. The full monitoring requirement shall apply to each outside contractor.

APPENDIX B
RESPIRATORY PROTECTION PROGRAM

RESPIRATORY PROTECTION PROGRAM

1. Introduction

This written Respiratory Protection Program has been established in accordance with the respiratory protection requirements of Cal/ OSHA Regulations CCR Title 8 §5144, §5208 and §1529 and meets or exceeds the standard set by OSHA.

During activities at the 1671 South Magnolia Avenue building involving ACCM, employees may be exposed to concentrations of asbestos fibers higher than background levels for short periods of time. When an employee is exposed to concentrations of airborne toxic materials which are above the maximum standards established by OSHA, implementation of feasible engineering controls and/or administrative controls to reduce employee exposure are required. For some activities these controls may not be feasible, and as an alternative, the employer may provide respiratory protection for employees conducting work on or near asbestos-containing materials. In addition to providing respiratory equipment, the employer has the responsibility of implementing a Respiratory Protection Program. The Respiratory Protection Program provides standard operating procedures for respiratory protection.

2. Designation of a Program Administrator

The Sierra Auto Properties, LLC Manager is responsible for the designation of an appropriate Program Administrator who will be in charge of, and responsible for the implementation of and adherence to, the provisions of the Respiratory Protection Program for the 1671 South Magnolia Avenue building for work performed by Sierra Auto Properties, LLC employees where the use of respiratory protection is required or allowed.

3. Selection and Use of Respiratory Protection Equipment

Respirators used shall be selected from those approved by the National Institute for Occupational Safety and Health (NIOSH) for use in atmospheres containing asbestos fibers. A NIOSH approved respirator contains the following: an assigned identification number placed on each unit; a label identifying the type of hazard the respirator is designed to protect against; and additional information on the label which indicates limitations and identifies the component parts approved for use with the basic unit. Single-use or disposable respirators are not to be used.

The approved respirator shall be used as follows:

a. Air-purifying respirators. A reusable air-purifying respirator, or a powered air-purifying respirator (PAPR), shall be used to reduce the concentration of airborne asbestos fibers in the respirator below the 8-hour, time-weighted average (TWA) OSHA permissible exposure limit (PEL) and NIOSH-recommended exposure limit of 0.1 fibers per cubic centimeter of air (fibers/cc),when the 8-hour TWA concentrations of asbestos fibers are reasonably expected to not exceed more than 10 times the OSHA 8-hour PEL of 0.1 fibers/cc (1.0 fiber/cc).

b. Powered air-purifying respirators (PAPR). A full face piece PAPR, or a type "C" supplied air respirator shall be used to reduce the concentration of airborne asbestos fibers in the respirator below the 8-hour, TWA OSHA and NIOSH-recommended exposure limit of 0.1 fibers/cc, when the 8-hour TWA

concentrations of asbestos fibers are reasonably expected to not exceed more than 25 times the OSHA 8-hour PEL of 0.1 f/cc (2.5 f/cc).

No exposures above 2.5 f/cc are expected for any operations approved to be performed by Sierra Auto Properties, LLC personnel or contractors, other than approved, licensed and registered Asbestos Abatement Contractors. Work that would likely produce airborne personal exposures above the 2.5 f/cc criterion will require additional project specific Asbestos Abatement Specifications.

4. The Potential Hazard is Asbestos

For the purpose of this program, the only hazard considered is airborne asbestos fibers. Accordingly, only maintenance, clean-up, small scale short duration ACCM joint compound removal and waste removal activities are authorized where persons may disturb asbestos. For these activities air- purifying respirators or PAPRs will be worn.

5. Surveillance

Only those individuals who are medically able to wear respiratory protective equipment shall be issued such equipment. Before being issued a respirator, the employee will receive pertinent tests for medical and physical conditions. Medical tests to be considered by a physician include: pulmonary function tests (FVC and FEV), chest x-ray (ILO), and any other deemed appropriate by the examining physician. Medical factors to be considered by a physician include: emphysema, asthma, chronic bronchitis, heart disease, anemia, hemophilia, poor eyesight, poor hearing, hernia, lack of use of fingers or hands, epileptic seizures, and other factors which might inhibit the ability of an employee to wear respiratory equipment.

6. Respirator Fit-Tests

Each employee determined medically fit to wear a respirator will be qualitatively fit-tested upon receiving the equipment and annually thereafter. The type of fit-test conducted depends on the respirator type. Methods of fit-testing shall comply with the OSHA mandatory fit testing procedures.

Problems in fitting a respirator may result if facial hair prevents a good seal from forming between the skin and sealing surface. Corrective lenses that have temple bars or straps may prevent proper sealing and should not be used when a full-face respirator is worn. An adaptor kit to accommodate eyeglasses may be purchased from the manufacturer. Contact lenses should not be worn while wearing a respirator. A properly fitted respirator may stretch the skin around the eyes, thus increasing the possibility that the contact lens will fall out.

7. Respirator Assignment and Maintenance

Where practicable, respirators should be assigned to individual workers for their exclusive use. A system of recordkeeping will be established to document all employees who have respiratory protection equipment, and the regular inspection of this equipment. These records will be kept on file in Facilities Services.

Respirators shall be regularly cleaned and disinfected. Those issued for the exclusive use of one worker shall be cleaned after each day's use, or more often, if necessary. This procedure is described as follows:

- Before leaving the work area, each user must "wipe down" the respirator with a wet cloth to remove any asbestos-containing material which may have settled on the equipment.

- Respiratory equipment shall be washed with detergent in warm water using a brush. If possible, detergents containing a bactericide should be used. Organic solvents should not be used, as they deteriorate the rubber facepiece. If bactericide detergent is not available, the detergent wash should be followed with a disinfecting rinse. Two types of disinfectants may be made from readily available household solutions.

- A hypochlorite solution (50 ppm) can be made by adding two tablespoons of chlorine bleach to one gallon of water.

- An aqueous solution of iodine (50 ppm) can be made by adding one teaspoon tincture of iodine to one gallon of water.

- A two-minute immersion of the respirator into either solution should be sufficient for disinfection.

Respiratory equipment shall be thoroughly rinsed in warm, clean water (approximately 120 F maximum) to remove all traces of detergent, cleaner and sanitizer, and disinfectant.

Respiratory equipment shall be allowed to air dry on a clean surface.

When not in use, clean respiratory equipment shall be sealed in plastic bags and stored in a single layer with the facepiece and valves in a non-distorted position. A metal cabinet with shelves is well suited for this purpose.

Repair or replacement of component parts must be done by qualified individuals. Substitution of parts from a different brand or type of respirator will invalidate the approval of the respirator.

Inspection for defects in respiratory equipment must be done before and after each use and during cleaning. The primary defects to look for in the inspection of component parts of the respiratory equipment and corrective actions where appropriate are itemized below:

a. Air-purifying respirators (half-mask and full facepiece).

(1) Rubber facepiece - check for:

- excessive dirt - clean all dirt from facepiece.

- cracks, tears, or holes - obtain new facepiece.

- distortion - allow facepiece to "sit" free from any constraints and see is distortion disappears; if not, obtain new facepiece, and

- cracked, scratched, or loose fitting lenses - contact respirator manufacturer to see if replacement is possible; otherwise obtain new facepiece.

(2) Headstraps - check for:

- breaks or tears - replace headstraps
- loss of elasticity - replace headstraps
- broken or malfunctioning buckles to attachments - obtain new buckle, and
- facepiece slipping - replace headstraps.

(3) Inhalation valve, exhalation valve - check for:

- detergent residue, dust particles, or dirt on valve or valve seat - clean residue with soap and water
- cracks, tears, or distortion in the valve material or valve seat - contact manufacturer for instructions, and
- missing or defective valve cover-obtain valve cover from manufacturer.

(4) Filter element(s) - check for:

- proper filter for the hazard
- approval designation
- missing or worn gaskets - contact manufacturer for replacement
- worn threads - both filter threads and facepiece threads - replace filter or facepiece, whichever is applicable
- cracks or dents in filter housing - replace filter, and
- missing or loose hose clamps - obtain new clamps.

b. Atmosphere Supplying Respirators [Would not be expected for use for this Program]

(1) Check facepiece, headstraps, valves, and breathing tube, as for air-purifying respirators.

(2) Hood, helmet, blouse, or full suit, if applicable - check for:

- headgear suspension - adjust properly for you
- cracks or breaks in faceshield - replace face-shield, and
- protective screen to see that it is intact and fits correctly over the faceshield, abrasive blasting hoods, and blouses - obtain new screen.

(3) Air supply system - check for: [Would not be expected for use for this Program]

- breathing air quality
- breaks or kinks in air supply hoses and end fitting attachments - replace hose and/or fitting
- tightness of connections
- proper setting of regulators and valves - consult manufacturer's recommendations, and
- correct operation of air-purifying elements and carbon monoxide or high-temperatures alarms.

8. Employee Training Program

A training session with required employee attendance, will be conducted by qualified personnel to ensure that employees understand the limitations, use, and maintenance of respiratory equipment, and other important aspects of the Respiratory Protection Program. Upon completion of the fit-testing and training, each employee shall receive documentation of same.

9. Surveillance of Working Conditions

Air sampling will be conducted before, during and after selected projects requiring respiratory equipment. Respiratory equipment used must be suitable for the asbestos concentrations expected to occur in the work area. Employees shall be instructed to immediately leave the work area should they experience physical stress such as difficulty in breathing or dizziness.

10. Respiratory Program Supervision

The Respiratory Program shall be evaluated at least annually with program adjustments, as appropriate, made to reflect the evaluation results. Compliance with the following points of the program should be reviewed: respirator selections, purchase of approved equipment, medical screening of employees, fit-testing, issuance of equipment and associated maintenance, storage, repair, inspection, and appropriate surveillance of work area conditions.

Attention should be given to proper recordkeeping regarding the Respirator Program Supervision. Records which will be kept include: a list of the employees who are trained in respirator use; documentation of the care and maintenance of respirators; medical records of each respirator user; airborne concentrations of asbestos fibers before, during and after work is conducted; and any problems encountered during renovation activities.

RESPIRATORY PROTECTION TRAINING PROGRAM

Before signing, be sure you understand each of the following:

1. Explanation of the ramification of misuse
2. Discussion of why engineering controls cannot be used instead of respiratory equipment
3. Why the particular respirator was selected
4. Limitation of the selected respirator
5. Putting on the respirator
6. Wearing the respirator
7. Maintenance of the respirator
8. Recognizing and handling emergency situations
9. Inspecting the respirator
10. Use of air-purifying respirator
11. Use of air-supplied respiratory equipment
12. Purpose of medical evaluation
13. Proper fit-testing techniques

APPENDIX C
MEDICAL SURVEILLANCE PROGRAM

Medical Surveillance Program

Implementation of a Medical Surveillance Program provides for the assessment of an employee's medical status and compliance with OSHA standards. Medical surveillance is required under the Cal/ OSHA Regulations CCR Title 8 §5144, §5208 and §1529 for all personnel who may be exposed to asbestos fibers in concentrations greater than 0.1 fibers/cc (8-hour, time-weighted average). Additionally, any employee who wears a tight-fitting respirator as a routine part of his or her job must also be initially and annually medically evaluated. This type of respiratory protection is anticipated to ONLY be required for the asbestos related work within the 1671 South Magnolia Avenue building.

At the 1671 South Magnolia Avenue building this criterion will only affect very limited and specified personnel, if any. As appropriate, these employees will be provided a Medical Surveillance Program to determine their baseline health status (health status before beginning work) to monitor their health during the duration of their employment, and also to provide documentation of their health status along with their work history upon completion of their employment. Therefore, employees in this surveillance program will be given pre-placement, annual, and termination examinations unless there is documentation the employee had an equivalent examination within the past one-year period.

The medical examination will include, at a minimum, an occupational/environmental history, a chest x-ray (posterior-anterior, 14 x 17 inches) read by the ILO method, a medical history to determine the presence of any possible respiratory diseases, and pulmonary function evaluations including forced vital capacity (FVC) and forced expiratory volume at one second (FEV 1.0). OSHA requires, on initial examination, a standardized questionnaire to be completed. In addition, a periodic medical questionnaire is required to be completed on annual examination.

The examining physician will be provided a copy of the OSHA Asbestos Standards and appendices, a description of the employees' duties, the employees' representative exposure level or anticipated exposure level, a description of personal protective and respiratory equipment to be used, and information from previous medical examinations.

The examining physician will sign a statement that the medical examination given is consistent with OSHA requirements and the examined employee is physically able to perform the required work which may include wearing an air-purifying respirator.

Contractor personnel involved in asbestos abatement work should have an equivalent Medical Surveillance Program.

All records will be maintained on file for the length of employment plus 30 years and be available to each employee participating in the Medical Surveillance Program.

The examining physician should be notified that he or she will be the primary holder of medical records. The records must contain the hard copy of the x-ray. Prior to disposal of any of these records, the Director of Risk Management and Environmental Health must be notified.

EXECUTIVE SUMMARY

Purpose of Report

EnviroBusiness Inc. (dba EBI Consulting) has been contracted by Mobilitie to conduct radio frequency electromagnetic (RF-EME) modeling for Sites IE808 and CA45397 located at 410 W Evergreen Avenue in Monrovia, California to determine RF-EME exposure levels from existing wireless communications equipment at this site. As described in greater detail in Appendix A of this report, the Federal Communications Commission (FCC) has developed Maximum Permissible Exposure (MPE) Limits for general public exposures and occupational exposures. This report summarizes the results of RF-EME modeling in relation to relevant FCC RF-EME compliance standards for limiting human exposure to RF-EME fields.

This report contains a detailed summary of the RF EME analysis for the site.

Modeling results included in this report are based on worst case assumptions based on typical operating powers for each carrier. Subsequent changes to the drawings or site design may yield changes in the MPE levels or FCC Compliance recommendations.

Maximum Permissible Exposure (MPE) Summary			
Location	**% of FCC General Public/Uncontrolled Exposure Limit**	**% of FCC Occupational/Controlled Exposure Limit**	**Power Density (mW/cm^2)**
All Carrier Equipment			
Ground	10.20	2.04	0.1020
Roof Deck	1.29	0.26	0.0129

These results are calculated based on max power assumptions for this site.

The roof deck is located ~200' to the SW of the poles. The deck is assumed to be at the same height of the antennas for the most conservative results.

Statement of Compliance

Based on worst-case predictive modeling, there are no modeled exposures on any accessible ground-level or adjacent building walking/working surface related to existing equipment in the area that exceed the FCC's occupational and/or general public exposure limits at this site. As such, the existing project is in compliance with FCC rules and regulations.

1.0 LOCATION OF ALL EXISTING ANTENNAS AND FACILITIES AND EXISTING RF LEVELS

Sprint and T-Mobile antennas are located on adjacent monotrees. T-Mobile has nine (9) antennas total with three (3) antennas per sector. Sprint has a total of six (6) antennas total with (2) antennas per sector. Both antennas are mounted between 55' and 60' above ground level.

2.0 ESTIMATED AMBIENT RADIO FREQUENCY FIELDS FOR THE EXISTING SITE

Based on worst-case predictive modeling, there are no modeled exposures on any accessible ground-level or adjacent building walking/working surface related to existing equipment in the area that exceed the FCC's occupational and/or general public exposure limits at this site. As such, the existing project is in compliance with FCC rules and regulations.

Maximum Permissible Exposure (MPE) Summary			
Location	**% of FCC General Public/Uncontrolled Exposure Limit**	**% of FCC Occupational/Controlled Exposure Limit**	**Power Density (mW/cm^2)**
All Carrier Equipment			
Ground	10.20	2.04	0.1020
Roof Deck	1.29	0.26	0.0129

It is recommended that the general public maintain a 3ft setback from the antenna. The inputs used in the modeling are summarized in the RoofView® export file presented in Appendix C.

There are no modeled areas on the ground that exceed the FCC's limits for general public or occupational exposure in front of the other carrier antennas.

3.0 SIGNAGE AT THE FACILITY IDENTIFYING ALL WTS EQUIPMENT AND SAFETY PRECAUTIONS FOR PEOPLE NEARING THE EQUIPMENT AS MAY BE REQUIRED BY THE APPLICABLE FCC ADOPTED STANDARDS

Signs are the primary means for control of access to areas where RF exposure levels may potentially exceed the MPE. However, it is not recommended that signage be placed in highly public areas where there are no exposures above the FCC general public limits. Signage has been installed following carrier and local jurisdiction requirements. Additionally, any elevated workers should be alerted to any potential exposures at the antenna face. There are no exposures above the FCC limits at ground level and therefore barriers are not recommended.

Workers that are elevated above the ground may be exposed to power densities greater than the applicable FCC limits. Workers should be informed via signage about the presence of antennas and their associated fields and practice RF Safety Procedures.

Access to this site is accomplished by walking up to either monopole. Access to the antenna(s) is gained via a lift or climbing with fall protection and therefore the antennas are considered not accessible to the general public.

4.0 STATEMENT ON PRODUCTION OF THIS REPORT AND QUALIFICATIONS

Please see the certifications attached in Appendix B below.

5.0 LIMITATIONS

This report was prepared for the use of Mobilitie. It was performed in accordance with generally accepted practices of other consultants undertaking similar studies at the same time and in the same locale under like circumstances. The conclusions provided by EBI are based solely on the information provided by the client. The observations in this report are valid on the date of the investigation. Any additional information that becomes available concerning the site should be provided to EBI so that our conclusions may be revised and modified, if necessary. This report has been prepared in accordance with Standard Conditions for Engagement and authorized proposal, both of which are integral parts of this report. No other warranty, expressed or implied, is made.

6.0 SUMMARY AND CONCLUSIONS

EBI has prepared this Radiofrequency Emissions Compliance Report for the existing telecommunications equipment at the site located at 410 W Evergreen Avenue in Monrovia, California.

EBI has conducted theoretical modeling to estimate the worst-case power density from the existing antenna to document potential MPE levels at this location and ensure that site control measures are adequate to meet FCC and OSHA requirements. As presented in the preceding sections, based on worst-case predictive modeling, there are no modeled exposures on any accessible ground-level or adjacent building walking/working surface related to existing equipment in the area that exceed the FCC's occupational and/or general public exposure limits at this site. As such, the existing project is in compliance with FCC rules and regulations.

Signage has been installed at the site as presented in Section 9.0.

Appendix A

Federal Communications

Commission (FCC) Requirements

The FCC has established Maximum Permissible Exposure (MPE) limits for human exposure to Radiofrequency Electromagnetic (RF-EME) energy fields, based on exposure limits recommended by the National Council on Radiation Protection and Measurements (NCRP) and, over a wide range of frequencies, the exposure limits developed by the Institute of Electrical and Electronics Engineers, Inc. (IEEE) and adopted by the American National Standards Institute (ANSI) to replace the 1982 ANSI guidelines. Limits for localized absorption are based on recommendations of both ANSI/IEEE and NCRP.

The FCC guidelines incorporate two separate tiers of exposure limits that are based upon occupational/controlled exposure limits (for workers) and general public/uncontrolled exposure limits for members of the general public.

Occupational/controlled exposure limits apply to situations in which persons are exposed as a consequence of their employment and in which those persons who are exposed have been made fully aware of the potential for exposure and can exercise control over their exposure. Occupational/ controlled exposure limits also apply where exposure is of a transient nature as a result of incidental passage through a location where exposure levels may be above general public/uncontrolled limits (see below), as long as the exposed person has been made fully aware of the potential for exposure and can exercise control over his or her exposure by leaving the area or by some other appropriate means.

General public/uncontrolled exposure limits apply to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Therefore, members of the general public would always be considered under this category when exposure is not employment-related, for example, in the case of a telecommunications tower that exposes persons in a nearby residential area.

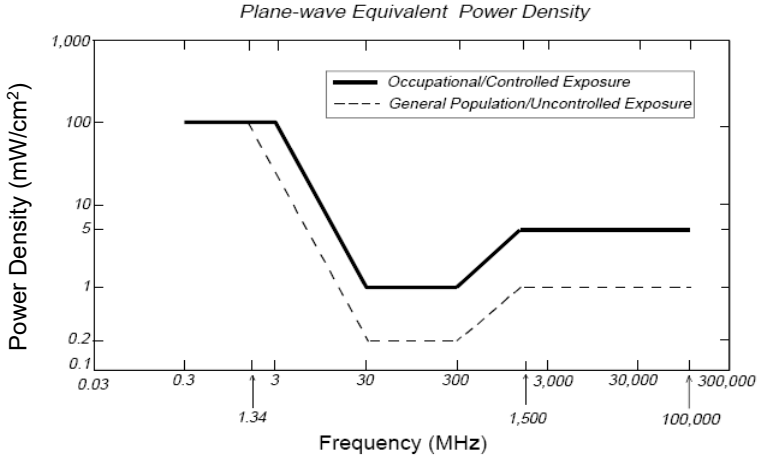

Table 1 and Figure 1 (below), which are included within the FCC's OET Bulletin 65, summarize the MPE limits for RF emissions. These limits are designed to provide a substantial margin of safety. They vary by frequency to take into account the different types of equipment that may be in operation at a particular facility and are "time-averaged" limits to reflect different durations resulting from controlled and uncontrolled exposures.

The FCC's MPEs are measured in terms of power (mW) over a unit surface area (cm^2). Known as the power density, the FCC has established an occupational MPE of 5 milliwatts per square centimeter (mW/cm^2) and an uncontrolled MPE of 1 mW/cm2 for equipment operating in the 1900 MHz and 2500 MHz frequency ranges.

Table 1: Limits for Maximum Permissible Exposure (MPE)				
(A) Limits for Occupational/Controlled Exposure				
Frequency Range (MHz)	**Electric Field Strength (E) (V/m)**	**Magnetic Field Strength (H) (A/m)**	**Power Density (S) (mW/cm^2)**	**Averaging Time $[E]^2$, $[H]^2$, or S (minutes)**
0.3-3.0	614	1.63	(100)*	6
3.0-30	1842/f	4.89/f	($900/f^2$)*	6
30-300	61.4	0.163	1.0	6
300-1,500	--	--	f/300	6
1,500-100,000	--	--	5	6
(B) Limits for General Public/Uncontrolled Exposure				
Frequency Range (MHz)	**Electric Field Strength (E) (V/m)**	**Magnetic Field Strength (H) (A/m)**	**Power Density (S) (mW/cm^2)**	**Averaging Time $[E]^2$, $[H]^2$, or S (minutes)**
0.3-1.34	614	1.63	(100)*	30
1.34-30	824/f	2.19/f	($180/f^2$)*	30
30-300	27.5	0.073	0.2	30
300-1,500	--	--	f/1,500	30
1,500-100,000	--	--	1.0	30

f = Frequency in (MHz)
* Plane-wave equivalent power density

Figure 1. FCC Limits for Maximum Permissible Exposure (MPE)

Based on the above, the most restrictive thresholds for exposures of unlimited duration to RF energy for several personal wireless services are summarized below:

Personal Wireless Service	Approximate Frequency	Occupational MPE	Public MPE
Personal Communication (PCS)	1,950 MHz	5.00 mW/cm^2	1.00 mW/cm^2
Cellular Telephone	870 MHz	2.90 mW/cm^2	0.58 mW/cm^2
Specialized Mobile Radio	855 MHz	2.85 mW/cm^2	0.57 mW/cm^2
Most Restrictive Freq, Range	30-300 MHz	1.00 mW/cm^2	0.20 mW/cm^2

MPE limits are designed to provide a substantial margin of safety. These limits apply for continuous exposures and are intended to provide a prudent margin of safety for all persons, regardless of age, gender, size, or health.

Personal Communication System (PCS) facilities used by carriers in this area operate within a frequency range of 800-1900 MHz. Facilities typically consist of: 1) electronic transceivers (the radios or cabinets) connected to wired telephone lines; and 2) antennas that send the wireless signals created by the transceivers to be received by individual subscriber units (PCS telephones). Transceivers are typically connected to antennas by coaxial cables.

Advanced Wireless Services (AWS) facilities used by the carrier in this area operate within a frequency range of 2496 - 2690 MHz. Facilities typically consist of: 1) electronic transceivers (the radios or cabinets); and 2) antennas that send the wireless signals created by the transceivers to be received by individual subscriber units. Transceivers are typically connected to antennas by coaxial cables.

Because of the short wavelength of PCS/AWS services, the antennas require line-of-site paths for good propagation, and are typically installed above ground level. Antennas are constructed to concentrate energy towards the horizon, with as little energy as possible scattered towards the ground or the sky. This design, combined with the low power of PCS facilities, generally results in no possibility for exposure to approach Maximum Permissible Exposure (MPE) levels, with the exception of areas directly in front of the antennas.

FCC Compliance Requirement

A site is considered out of compliance with FCC regulations if there are areas that exceed the FCC exposure limits and there are no RF hazard mitigation measures in place. Any carrier which has an installation that contributes more than 5% of the applicable MPE must participate in mitigating these RF hazards.

Appendix B

Certifications

Preparer Certification

I, Stephanie Penta, state that:

- I am an employee of EnviroBusiness Inc. (d/b/a EBI Consulting), which provides RF-EME safety and compliance services to the wireless communications industry.
- I have successfully completed RF-EME safety training, and I am aware of the potential hazards from RF-EME and would be classified "occupational" under the FCC regulations.
- I am familiar with the FCC rules and regulations as well as OSHA regulations both in general and as they apply to RF-EME exposure.
- I have reviewed the data provided by the client and incorporated it into this Site Compliance Report such that the information contained in this report is true and accurate to the best of my knowledge.

1.0 Introduction

1.1 Project Description

The subject site is located at 1625 South Magnolia Avenue Monrovia, California. The site is bordered by existing open channel to the west, by S. Magnolia Avenue to the east, by S. Evergreen Avenue to the north and by Atchison Topeka and Santa Fe railroad to the south. Project site is approximately 6.72 acres and it is presently resided by commercial and industrial buildings, paved parking surfaces, hardscape and landscaping. The existing site drains approximately southwest into the existing open channel through sheet flow and concrete gutter.

The proposed project will include the demolition of the existing buildings and pavement areas and the construction of multi-story residential buildings and a multi-story parking structure. The provided preliminary site plan shows with four driveways site access with only one access to the multi-story parking and buildings are systematically grouped for accessibility.

1.2 Scope of work

This report will describe the predeveloped and post developed conditions and the proposed storm water quality design that will meet the requirements of the Los Angeles County Hydrology and LID Design Manual.

2.0 Hydrology

2.1 General Approach

The project site is identified for the predeveloped and post developed conditions. The post developed site needs to be lower than or equal to the predeveloped runoff to satisfy LA County Q-allowable requirements. In order to comply with LID requirements, pretreatment devices, infiltration dry wells are proposed on the site. City of Monrovia uses LA County LID manual for standards and requirements.

Los Angeles County DPW approved computer programs, Hydrocalc and WMS are used to estimate the time of concentration, runoff flow rate and volume for the 85th percentile storm and 50-year storm events, which is in accordance with LACDPW requirements.

2.2 Data Sources

The primary sources of data were the and the *LACDPW: Low Impact Development (LID) Standard Manual* (February 2014) and Los Angeles County Hydrology website GIS.

2.3 Watershed Characteristics

Rainfall and soil characteristics for the project site is illustrated in the Mount Wilson Hydrologic Map Figure LACDPW 1-H1.30 (*Appendix 1*). The 50-year (24-hour) rainfall isohyet nearest the project area is approximately 7.2 inches.

In addition to the isohyet data, the hydrologic map shows the classification of the soil type. The project site falls within soil classification area 006. The project area to be disturbed is approximately 6.72 acres in size.

Under predeveloped condition, the site drains, southerly flow direction through concrete swale and pavement sheet flow into the southwest existing concrete channel. The City owns and maintains this channel that bordered the westerly portion of the site. Hydrocalc program is used to calculate the flow runoff and volume. See Table 1 and refer to predeveloped condition Hydrocalc *Appendix 3* and map *Appendix 5.*

Table 1 Pre- developed Condition 50-year Storm Frequency

Drainage Area	Area (Ac)	Percent Imperviousness	Q_{50} (cfs)	V_{50} (ac-ft)
1A	6.72	90%	20.7	3.33

Proposed site plan is divided into three drainage areas and it is identified on the post developed plan as northwest, northeast and southwest. Northwest drainage area discharges into a street catch basin located in S. Evergreen Avenue, which includes 18" pipe and onsite catch basins. Similarly, northeast drainage area drains into street catch basin located in S. Magnolia Avenue, southwest drainage area drains into the existing concrete channel located in the southwest of the site. For all the drainage areas, HydroCalc *1.0.2* program is used to calculate the time of concentration for the subareas and WMS is used to calculate peak runoff flow rates and volume. Drywells in the drainage areas are simulated on the WMS program as detention basins with outlet pipe set above the volume to be retained on-site. See Table 2 and refer to post developed condition Hydrocalc and WMS on *Appendix 3* and map on *Appendix 5*.

Table 2 Postdeveloped Condition 50-year Storm Frequency

Drainage Subarea	Area (Ac)	Percent Imperviousness	Q_{50} (cfs)	V_{50} (ac-ft)
NW	1.71	90%	4.1	0.42
NE	3.58	90%	6.9	1.08
SW	1.43	90%	3.6	0.42
Total	6.72	90%	14.6	

County requires post developed Q to be less than or equal to predeveloped Q. Table 3 shows the relationship between the two conditions.

Table 3 Comparison of Pre and Post Conditions 50-year Storm Frequency

Drainage Subarea	Area (Ac)	Q_{50} (cfs)
Predeveloped	6.72	20.7
Postdeveloped	6.72	15.3
Difference	0	5.4

The water quality design components associated with the proposed project meets the requirements of Los Angeles County LID design manual. Every drainage area has its own pretreatment devices to capture pollutants and dry well to retain and infiltrate the "first flush" or the 85th percentile storm runoff of the site. Storm water will be pretreated by devices, for building roof runoff by downspout filter and pavement runoff by catch basin filter insert prior to ground infiltration. Site has low infiltration rate (0.48 in/hr) and the upper 14 feet of existing soils may be subject to hydroconsolidation as stated by geotechnical report (refer to geotechnical report Appendix 6). Given the soil condition, we preliminary decided to utilize a wide footprint drywell. Details of the drywell will be shown on the grading plans. County LID manual requires retention time is limited to 96 hours, which controlled the depth and area of the drywell. HydroCalc program is used

to calculate the volume runoff and spreadsheet using LID method to determine the required area. See table 4 and table 5. Refer to Drywell calculation spreadsheet *Appendix 4* and Hydrology LID BMP map *Appendix 5.*

Table 4 Water Quality Volume Calculation			
Drainage Subarea	Area (Ac)	Percent Imperviousness	Water Quality Volume (cu-ft)
1A	0.46	90%	1,495
2A	0.41	90%	1,332
3A	0.53	90%	1,722
4A	0.31	90%	1,008
5A	1.98	90%	6,430
6A	1.6	90%	5,196
7A	1.43	90%	4,644
Total Site	6.72	90%	21,827

Table 5 Dry Well Area Calculations					
Drainage Subarea	Area (Ac)	Water Quality Volume (cu-ft)	dmax (ft), see below note	Area Required (sf)	Area Required (sf)
1A	0.46	1,495	3.84	974	1,024
2A	0.41	1,332	3.84	868	900
3A	0.53	1,722	3.84	1,122	1,156
4A	0.31	1,008	3.84	657	676
5A	1.98	6,430	3.84	4,186	4,225
6A	1.6	5,196	3.84	3,383	3,480
7A	1.43	4,644	3.84	3,023	3,025
Total Site	6.72	21,827		14,213	14,487
Note: Bottom of drywell is set at 15 feet below ground. It is subject to change per soils engineer.					

2.4 Conclusions

This report demonstrates that the post developed condition complies with the limited flow requirements ($Q_{PRE}<Q_{POST}$). Post developed flows routed through the drywells will be less than the predeveloped runoff.

Proposed infiltration dry wells were selected as the appropriate treatment system based on the site condition and the LACDPW LID method to calculate the volume and area required to be retained on-site.

3.0 Limitations

This report was prepared to comply with the guidelines established by the County of Los Angeles and their representatives. Evaluation of the appropriateness of these guidelines and the accuracy of the County data were beyond the scope of this work.

Usage of this report is limited to address the purpose and scope previously defined by the project owner. Psomas shall not be held responsible for any unauthorized application of this report and the contents therein.

The opinions represented in this report have been derived in accordance with current standards of civil engineering practice. No other warranty is expressed or implied.

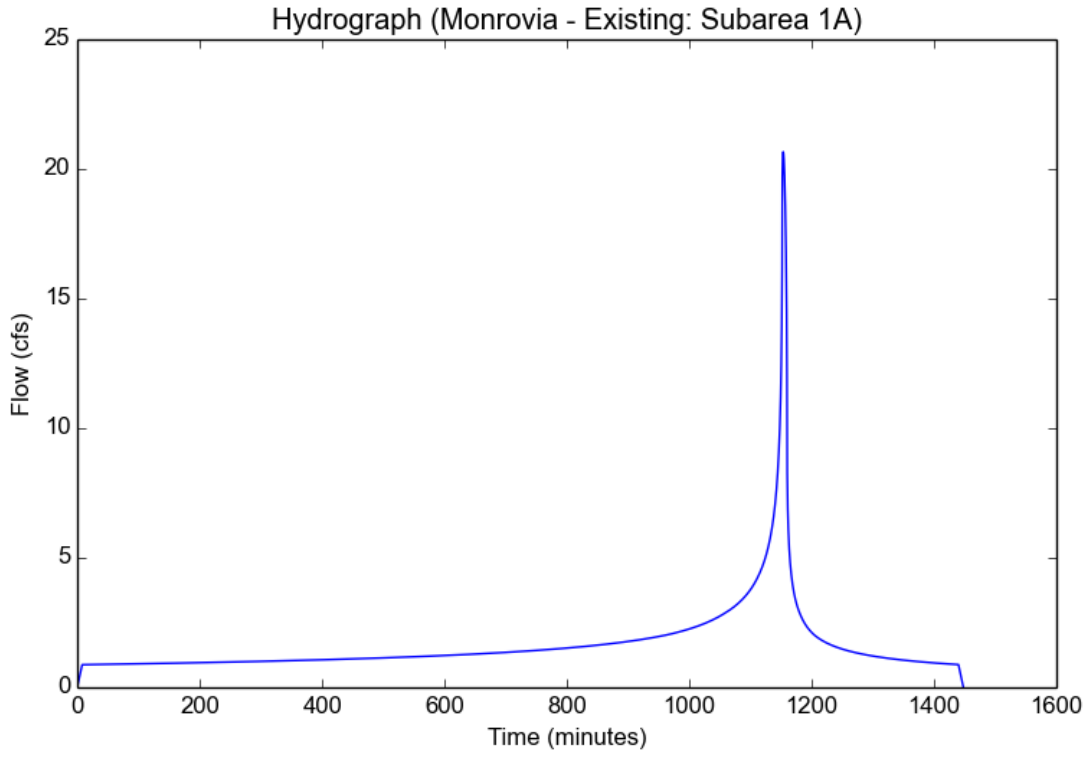
Peak Flow Hydrologic Analysis



File location: V:/1MAP030400/ENGR/DESIGN/HYDR/HydroCalc/Delta Q/Monrovia - Existing - Subarea 1A.pdf
Version: HydroCalc 1.0.2

Input Parameters

Project Name	Monrovia - Existing
Subarea ID	Subarea 1A
Area (ac)	6.7
Flow Path Length (ft)	810.0
Flow Path Slope (vft/hft)	0.0105
50-yr Rainfall Depth (in)	7.2
Percent Impervious	0.9
Soil Type	6
Design Storm Frequency	50-yr
Fire Factor	0
LID	False

Output Results

Modeled (50-yr) Rainfall Depth (in)	7.2
Peak Intensity (in/hr)	3.4443
Undeveloped Runoff Coefficient (Cu)	0.8535
Developed Runoff Coefficient (Cd)	0.8953
Time of Concentration (min)	8.0
Clear Peak Flow Rate (cfs)	20.6617
Burned Peak Flow Rate (cfs)	20.6617
24-Hr Clear Runoff Volume (ac-ft)	3.3262
24-Hr Clear Runoff Volume (cu-ft)	144889.4987

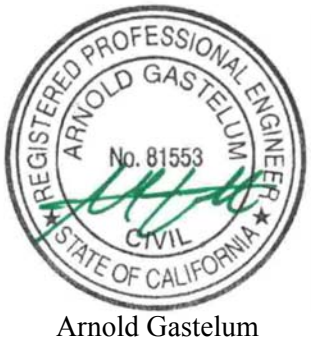
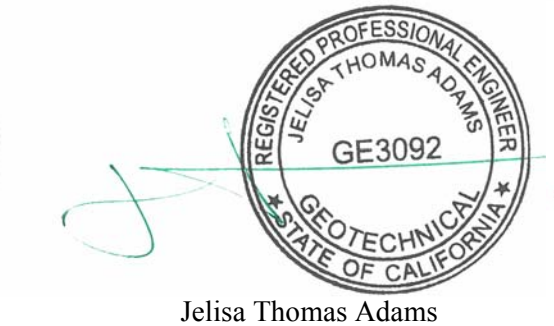
Attention: Mr. Bryce Tabb

Subject: GEOTECHNICAL INVESTIGATION
PROPOSED MULTI-FAMILY RESIDENTIAL DEVELOPMENT
1625 SOUTH MAGNOLIA AVENUE
MONROVIA, CALIFORNIA



Dear Mr. Tabb:

In accordance with your authorization of our proposal dated March 23, 2017, we have performed a geotechnical investigation for the proposed multi-family residential development located at 1625 South Magnolia Avenue in the City of Monrovia, California. The accompanying report presents the findings of our study, and our conclusions and recommendations pertaining to the geotechnical aspects of proposed design and construction. Based on the results of our investigation, it is our opinion that the site can be developed as proposed, provided the recommendations of this report are followed and implemented during design and construction.



If you have any questions regarding this report, or if we may be of further service, please contact the undersigned.

Very truly yours,

GEOCON WEST, INC.

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for the proposed multi-family residential development located at 1625 South Magnolia Avenue in the City of Monrovia, California (see Vicinity Map, Figure 1). The purpose of the investigation was to evaluate subsurface soil and geologic conditions underlying the site and, based on conditions encountered, to provide conclusions and recommendations pertaining to the geotechnical aspects of design and construction.

The scope of this investigation included a site reconnaissance, field exploration, laboratory testing, engineering analysis, and the preparation of this report. The site was explored on June 12, 2017, by excavating six 8-inch diameter borings to depths of approximately 25½ feet below the existing ground surface utilizing a truck-mounted hollow-stem auger drilling machine. The approximate locations of the exploratory borings are depicted on the Site Plan (see Figure 2). A detailed discussion of the field investigation, including boring logs, is presented in Appendix A.

Laboratory tests were performed on selected soil samples obtained during the investigation to determine pertinent physical and chemical soil properties. Appendix B presents a summary of the laboratory test results.

The recommendations presented herein are based on analysis of the data obtained during the investigation and our experience with similar soil and geologic conditions. References reviewed to prepare this report are provided in the *List of References* section.

If project details vary significantly from those described above, Geocon should be contacted to determine the necessity for review and possible revision of this report.

2. SITE AND PROJECT DESCRIPTION

The subject site is located at 1625 South Magnolia Avenue in the City of Monrovia, California. The site consists of a 5.73-acre irregularly shaped parcel which is currently an automobile distribution lot. The site is occupied by four existing commercial/industrial structures, paved surface parking lots, and associated hardscape and landscaping. Two single-story residential structures also occupy a portion of the site adjacent to Evergreen Avenue. The site is bounded by Magnolia Avenue to the east, by a railroad right-of-way to the south, by residential and industrial structures to the west, by Evergreen Avenue to the north and northwest, and by commercial structures and associated surface parking lots to the east. The site is relatively level, with no pronounced highs or lows. The topography at the site and in the general site vicinity slopes downward toward the south and southwest. Surface water drainage at the site appears to be by sheet flow along the existing ground contours to the city streets. Vegetation consists of some isolated trees and sparse grass and shrubbery in isolated planter areas.

Based on the information provided by the Client, it is our understanding that the proposed project will consist of a Type III wrap development including five-story residential buildings and a seven-level parking structure. The development will include approximately 436 residential housing units. It is our further understanding that the proposed structures will be constructed at or near present site grade. The footprints of the proposed structures are shown on Figure 2 (Site Plan).

Due to preliminary nature of the design at this time, wall and column loads were not available. It is anticipated that column loads for the proposed residential buildings will be up to 200 kips, and wall loads will be up to 5 kips per linear foot. It is anticipated that column loads for the proposed parking structure will be up to 800 kips, and wall loads will be up to 10 kips per linear foot.

Once the design phase and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Any changes in the design, location or elevation of any structure, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

3. GEOLOGIC SETTING

The site is located in the northeastern San Gabriel Valley. The San Gabriel Valley is an alluvial filled valley bounded by the Sierra Madre Fault Zone and San Gabriel Mountains on the north, by the Puente Hills on the south, by the Covina and Indian Hills on the east, and by the Raymond Basin on the west. The alluvial deposits are derived from erosion of the San Gabriel Mountains to the north and subsequent deposition by the San Gabriel River and other local drainages. The alluvium is estimated to be approximately 200 feet thick at the base of the mountains, extending to hundreds of feet thick in the central portion of the valley.

Regionally, the site is located within the northern portion of the Peninsular Ranges geomorphic province. This geomorphic province is characterized by northwest-trending physiographic and geologic features such as the Whittier Fault located approximately 7.2 miles to the southwest. The active Raymond Fault, located approximately 1.4 miles to the northwest of the site, forms the boundary between the Peninsular Ranges Geomorphic Province and the Transverse Ranges Geomorphic Province to the north.

4. SOIL AND GEOLOGIC CONDITIONS

Based on our field investigation and published geologic maps of the area, the site is underlain by artificial fill and Holocene are young alluvial fan deposits consisting of varying amounts of sand, silt, clay and gravel (California Geological Survey [CGS], 2010). Detailed stratigraphic profiles are provided on the boring logs in Appendix A.

4.1 Artificial Fill

Artificial fill was encountered in the exploratory borings to a maximum depth of 2½ feet below existing ground surface. The artificial fill generally consists of light yellowish brown, grayish brown and dark brown silty sand with lesser amounts of sandy silt and varying amounts of fine gravel and trace roots. The fill is characterized as moist and loose to medium dense. The fill is likely the result of past grading or construction activities at the site. Deeper fill may exist between excavations and in other portions of the site that were not directly explored.

4.2 Alluvium

Holocene age young alluvial deposits were encountered beneath the artificial fill and consist primarily of light gray, yellowish brown, dark brown, and reddish brown interbedded silty sand, poorly graded and well-graded sand, sandy silt, and silt with varying amounts of fine gravel. The soil is characterized as slightly moist to moist and loose to very dense or firm.

5. GROUNDWATER

Based on a review of the Seismic Hazard Evaluation of the Mount Wilson Quadrangle, Los Angeles County, California (California Division of Mines and Geology [CDMG], 1998), the historically highest groundwater level in the area is approximately 145 feet beneath the ground surface. Groundwater information presented in this document is generated from data collected in the early 1900's to the late 1990s. Based on current groundwater basin management practices, it is unlikely that groundwater levels will ever exceed the historic high levels.

Considering the historic high groundwater level (CDMG, 1998), the lack of groundwater encountered in our borings, and the depth of the proposed construction, it is unlikely that groundwater will be encountered during construction. However, it is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially in impermeable fine-grained soils which are heavily irrigated or after seasonal rainfall. In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the immediate site vicinity. Proper surface drainage of irrigation and precipitation will be critical for future performance of the project. Recommendations for drainage are provided in the S*urface Drainage* section of this report (see Section 7.21).

6. GEOLOGIC HAZARDS

6.1 Surface Fault Rupture

The numerous faults in Southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geological Survey (CGS, formerly known as CDMG) for the Alquist-Priolo Earthquake Fault Zone Program (Bryant and Hart, 2007). By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years), but has had no known Holocene movement. Faults that have not moved in the last 1.6 million years are considered inactive.

The site is not within a currently established State of California Alquist-Priolo Earthquake Fault Zone for surface fault rupture hazards (CGS, 2017). In addition, the site is not located within the Raymond Hill Fault Zone as defined by the City of Monrovia Safety Element of the General Plan (2002). No active or potentially active faults with the potential for surface fault rupture are known to pass directly beneath the site. Therefore, the potential for surface rupture due to faulting occurring beneath the site during the design life of the proposed development is considered low. However, the site is located in the seismically active Southern California region, and could be subjected to moderate to strong ground shaking in the event of an earthquake on one of the many active Southern California faults. The faults in the vicinity of the site are shown in Figure 3, Regional Fault Map.

The closest active fault to the site is the Raymond Fault located approximately 1.4 miles to the northwest (CDMG, 2007). Other nearby active faults are the Duarte Fault, the Sierra Madre Fault, the Verdugo Fault, the Whittier Fault, the Hollywood Fault, and the Cucamonga Fault, located approximately 1.6 miles northeast, 2.1 miles north-northeast, 7.1 miles west, 7.2 miles southwest, 13½ miles west, and 19 miles east of the site, respectively. (Ziony and Jones, 1989). The active San Andreas Fault Zone is located approximately 23 miles north-northeast of the site.

The closest potentially active faults to the site are the San Jose Fault and the Indian Hill Fault located approximately 7.4 miles to the southeast and 7.5 miles to the southeast, respectively. The potentially active San Gabriel Fault located is located approximately 7.7 miles north of the site (Ziony and Jones, 1989).

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3.0 kilometers. The October 1, 1987 M_w 5.9 Whittier Narrows earthquake and the January 17, 1994, M_w 6.7 Northridge earthquake were a result of movement on the Puente Hills Blind Thrust and the Northridge Thrust, respectively. These thrust faults and others in the Los Angeles area do not present a potential surface fault rupture hazard at the site. However, these deep thrust faults are considered active features capable of generating future earthquakes that could result in moderate to significant ground shaking at the site.

6.2 Seismicity

As with all of Southern California, the site has experienced historic earthquakes from various regional faults. The seismicity of the region surrounding the site was formulated based on research of an electronic database of earthquake data. The epicenters of recorded earthquakes with magnitudes equal to or greater than 5.0 in the site vicinity are depicted on Figure 4, Regional Seismicity Map. A partial list of moderate to major magnitude earthquakes that have occurred in the Southern California area within the last 100 years is included in the following table.

LIST OF HISTORIC EARTHQUAKES

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (Miles)	Direction to Epicenter
San Jacinto-Hemet area	April 21, 1918	6.8	63	ESE
Near Redlands	July 23, 1923	6.3	44	ESE
Long Beach	March 10, 1933	6.4	36	S
Tehachapi	July 21, 1952	7.5	83	NW
San Fernando	February 9, 1971	6.6	29	NW
Whittier Narrows	October 1, 1987	5.9	7	SW
Sierra Madre	June 28, 1991	5.8	9	N
Landers	June 28, 1992	7.3	90	E
Big Bear	June 28, 1992	6.4	68	E
Northridge	January 17, 1994	6.7	31	W
Hector Mine	October 16, 1999	7.1	104	ENE

The site could be subjected to strong ground shaking in the event of an earthquake. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated if the proposed structures are designed and constructed in conformance with current building codes and engineering practices.

6.3 Seismic Design Criteria

The following table summarizes summarizes site-specific design criteria obtained from the 2016 California Building Code (CBC; Based on the 2015 International Building Code [IBC] and ASCE 7-10), Chapter 16 Structural Design, Section 1613 Earthquake Loads. The data was calculated using the computer program *U.S. Seismic Design Maps*, provided by the USGS. The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.3.2 of the 2016 CBC and Table 20.3-1 of ASCE 7-10. The values presented below are for the risk-targeted maximum considered earthquake (MCE_R).

2016 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2016 CBC Reference
Site Class	D	Section 1613.3.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	2.157g	Figure 1613.3.1(1)
MCE_R Ground Motion Spectral Response Acceleration – Class B (1 sec), S_1	0.834g	Figure 1613.3.1(2)
Site Coefficient, F_A	1.0	Table 1613.3.3(1)
Site Coefficient, F_V	1.5	Table 1613.3.3(2)
Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	2.157g	Section 1613.3.3 (Eqn 16-37)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	1.251g	Section 1613.3.3 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	1.438g	Section 1613.3.4 (Eqn 16-39)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.834g	Section 1613.3.4 (Eqn 16-40)

The table below presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with ASCE 7-10.

ASCE 7-10 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-10 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.819g	Figure 22-7
Site Coefficient, F_{PGA}	1.0	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.819g	Section 11.8.3 (Eqn 11.8-1)

The Maximum Considered Earthquake Ground Motion (MCE) is the level of ground motion that has a 2 percent chance of exceedance in 50 years, with a statistical return period of 2,475 years. According to the 2016 California Building Code and ASCE 7-10, the MCE is to be utilized for the evaluation of liquefaction, lateral spreading, seismic settlements, and it is our understanding that the intent of the Building code is to maintain "Life Safety" during a MCE event. The Design Earthquake Ground Motion (DE) is the level of ground motion that has a 10 percent chance of exceedance in 50 years, with a statistical return period of 475 years.

Deaggregation of the MCE peak ground acceleration was performed using the USGS online BETA Unified Hazard Tool, 2008 Conterminous U.S. Dynamic edition. The result of the deaggregation analysis indicates that the predominant earthquake contributing to the MCE peak ground acceleration is characterized as a 6.7 magnitude event occurring at a hypocentral distance of 6.87 kilometers from the site.

Deaggregation was also performed for the Design Earthquake (DE) peak ground acceleration, and the result of the analysis indicates that the predominant earthquake contributing to the DE peak ground acceleration is characterized as a 6.7 magnitude occurring at a hypocentral distance of 10.44 kilometers from the site.

Conformance to the criteria in the above tables for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur if a large earthquake occurs. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

6.4 Liquefaction Potential

Liquefaction is a phenomenon in which loose, saturated, relatively cohesionless soil deposits lose shear strength during strong ground motions. Primary factors controlling liquefaction include intensity and duration of ground motion, gradation characteristics of the subsurface soils, in-situ stress conditions, and the depth to groundwater. Liquefaction is typified by a loss of shear strength in the liquefied layers due to rapid increases in pore water pressure generated by earthquake accelerations.

The current standard of practice, as outlined in the "Recommended Procedures for Implementation of DMG Special Publication 117, Guidelines for Analyzing and Mitigating Liquefaction in California" and "Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California" requires liquefaction analysis to a depth of 50 feet below the lowest portion of the proposed structure. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

The Seismic Hazards Zone Map for the Mount Wilson 7.5 Minute Quadrangle (CGS, 2017; CDMG, 1999) indicates that the site is not located within a zone of required investigation for liquefaction. In addition, the County of Los Angeles Safety Element (Leighton, 1990), indicates that the site is not located in a liquefiable area. Groundwater was not encountered in our borings drilled to a maximum depth of 25½ feet beneath the existing ground surface and the historic high groundwater level in the area is reported to be approximately 145 feet beneath the existing ground surface (CDMG, 1998). Based on these considerations, it is our opinion that the potential for liquefaction and associated ground deformations beneath the site is very low.

6.5 Slope Stability

The site is relatively level and the topography in the site vicinity slopes downward toward the south and southwest. The County of Los Angeles Safety Element (Leighton, 1990), indicates that the site is not located in a hillside area. Also, the State of California Seismic Hazard Zone Map for the Mount Wilson Quadrangle (CGS, 2017; CDMG, 1999) indicates that the site is not located within a zone of required investigation for earthquake-induced landslides. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Therefore, the potential for slope stability hazards to adversely impact the site is considered low.

6.6 Earthquake-Induced Flooding

Earthquake-induced flooding is inundation caused by failure of dams or other water-retaining structures due to earthquakes. The City of Monrovia Safety Element (2002) and the Los Angeles County Safety Element (Leighton, 1990) indicates that the site is located within the potential inundation area for Big Santa Anita Dam, Sierra Madre Dam, and Saw Pit Dam. However, these reservoirs, as well as others in California, are continually monitored by various governmental agencies (such as the State of California Division of Safety of Dams and the U.S. Army Corps of Engineers) to guard against the threat of dam failure. Current design, construction practices, and ongoing programs of review, modification, or total reconstruction of existing dams are intended to ensure that all dams are capable of withstanding the maximum considered earthquake (MCE) for the site. Therefore, the potential for inundation at the site as a result of an earthquake-induced dam failure is considered low.

6.7 Tsunamis, Seiches, and Flooding

The site is not located within a coastal area. Therefore, tsunamis, seismic sea waves, are not considered a significant hazard at the site.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. No major water-retaining structures are located immediately up gradient from the project site. Therefore, flooding from a seismically-induced seiche is considered unlikely.

The majority of the site is within an area of minimal flooding (zone X) as defined by the Federal Emergency Management Agency, however the eastern portion of the site (adjacent to Magnolia Avenue) is within a flood zone D for possible but undetermined flood hazards (FEMA, 2017; LACDPW, 2017b).

6.8 Oil Fields & Methane Potential

Information on the California Division of Oil, Gas and Geothermal Resources (DOGGR) Well Finder Website (DOGGR, 2017) indicates the site is not located within the limits of an oilfield and oil or gas wells are not located within a mile of the site vicinity. However, due to the voluntary nature of record reporting by the oil well drilling companies, wells may be improperly located or not shown on the location map and undocumented wells could be encountered during construction. Any wells encountered during construction will need to be properly abandoned in accordance with the current requirements of the DOGGR.

As previously indicated, the site is not located within an oilfield. Therefore, the potential for methane or other volatile gases to occur at the site is considered very low. However, should it be determined that a methane study is required for the proposed development it is recommended that a qualified methane consultant be retained to perform the study and provide mitigation measures as necessary.

6.9 Subsidence

Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils that are particularly subject to subsidence include those with high silt or clay content. The site is not located within an area of known ground subsidence. No large-scale extraction of groundwater, gas, oil, or geothermal energy is occurring or planned at the site or in the general site vicinity. There appears to be little or no potential for ground subsidence due to withdrawal of fluids or gases at the site.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 General

7.1.1 It is our opinion that neither soil nor geologic conditions were encountered during this investigation that would preclude the construction of the proposed development provided the recommendations presented herein are followed and implemented during design and construction.

7.1.2 Up to 2½ feet of existing artificial fill was encountered during site exploration. The existing fill encountered is believed to be the result of past grading and construction activities at the site. Deeper fill may exist in other areas of the site that were not directly explored. It is our opinion that the existing fill, in its present condition, is not suitable for direct support of proposed foundations or slabs. The existing fill and site soils are suitable for re-use as engineered fill provided the recommendations in the Grading section of this report are followed (see Section 7.5).

7.1.3 As a minimum, the upper 5 feet of existing soils within the footprint areas of the proposed residential buildings and parking structure should be excavated and properly compacted for foundation and slab support. The engineered fill blanket should extend at least 5 feet beyond the edge of foundations or for a distance equal to the depth of fill below the foundations, whichever is greater. Where the recommended grading cannot be performed, such as adjacent to property lines, alternate grading and foundation design recommendations may be required. Proposed foundations should be underlain by at least 3 feet of newly compacted engineered fill. Foundations with an embedment greater than 2 feet will require deeper grading in order to maintain the required 3-foot-thick fill blanket beneath foundations. It is recommended that the grading contractor verify the depth of all building foundations prior to commencement of site grading activities in order to correctly determine the required excavation depth. Deeper fill or soft soils encountered during site grading operations should be excavated as necessary at the direction of the Geotechnical Engineer. The limits of existing fill and/or soft soil removal will be verified by the Geocon representative during site grading operations.

7.1.4 Subsequent to the recommended grading, the proposed residential buildings and parking structure may be supported on conventional foundation systems deriving support the newly placed engineered fill. All foundation excavations must be observed and approved in writing by the Geotechnical Engineer prior to placement of steel or concrete. Recommendations for *Conventional Foundation Design* are provided in Sections 7.7 through 7.9 of this report.

7.1.5 It is recommended that a seismic separation or flexible connection be utilized where adjacent structures abut. The design of the connection is at the discretion of the project structural engineer.

7.1.6 It is recommended that flexible utility connections be utilized for all rigid utilities to minimize or prevent damage to utilities from minor differential movements.

7.1.7 It is anticipated that stable excavations for the recommended grading associated with the proposed structures can be achieved with sloping measures. However, if excavations in close proximity to an adjacent property line and/or existing structure are required, special excavation measures such as slot-cutting may be necessary in order to maintain lateral support of offsite improvements. Excavation recommendations for *Temporary Excavations* and *Slot Cutting* are provided in Sections 7.18 and 7.19.

7.1.8 Foundations for small outlying structures, such as block walls up to 6 feet high, planter walls or trash enclosures, which will not be tied to the proposed structure, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and proper compaction cannot be performed or is undesirable, foundations may derive support directly in the undisturbed alluvial soils found at or below a depth of 12 inches, and should be deepened as necessary to maintain a minimum 12-inch embedment into the recommended bearing materials. If the soils exposed in the excavation bottom are soft or loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved in writing by a Geocon representative.

7.1.9 Where new paving is to be placed, it is recommended that all existing fill and soft alluvial soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all existing fill and soft soils in the area of new paving is not required; however, paving constructed over existing uncertified fill or unsuitable alluvium may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of soil should be scarified and properly compacted for paving support. *Preliminary Pavement Recommendations* are provided in Section 7.13.

7.1.10 Based on the results of percolation testing performed at the site, a stormwater infiltration system is considered feasible for this project. Recommendations for *Stormwater Infiltration* are provided in Section 7.20.

7.1.11 Once the design and foundation loading configuration for the proposed structure proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Based on the final foundation loading configurations, the potential for settlement should be re-evaluated by this office.

7.1.12 Any changes in the design, location or elevation, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

7.1.13 The most recent ASTM standards apply to this project and must be utilized, even if older ASTM standards are indicated in this report.

7.2 Soil and Excavation Characteristics

7.2.1 The in-situ soils can be excavated with moderate effort using conventional excavation equipment. Due to the loose and granular nature of the soils, minor caving should be anticipated in unshored excavations. In addition, the contractor should be aware that formwork may be required to prevent caving of shallow spread foundation excavations.

7.2.2 It is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with applicable OSHA rules and regulations to maintain safety and maintain the stability of adjacent existing improvements.

7.2.3 All onsite excavations must be conducted in such a manner that potential surcharges from existing structures, construction equipment, and vehicle loads are resisted. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation or vehicle load. Penetrations below this 1:1 projection will require special excavation measures such as sloping and shoring. Excavation recommendations are provided in the *Temporary Excavations* section of this report (see Section 7.18).

7.2.4 The existing site soils encountered during the field investigation near the ground surface are considered to have a "very low" (EI = 4) expansive potential and are classified as "non-expansive" in accordance with the 2016 California Building Code (CBC) Section 1803.5.3. The recommendations presented herein assume that the building foundations and slabs will derive support in these materials.

7.3 Hydroconsolidation

7.3.1 Hydroconsolidation is the tendency of unsaturated soil structure to collapse upon saturation resulting in the overall settlement of the effected soil and overlying foundations or improvements supported thereon. Potentially compressible soils underlying the site are typically removed and recompacted during remedial site grading. However, if compressible soil is left in-place, a potential for settlement due to hydroconsolidation of the soil exists.

7.3.2 The laboratory test results presented herein, indicate that the potential for hydroconsolidation for the soils located near Borings B1 and B6, between 10 and 14 feet in depth ranges from about 1.7 to 2.2 percent. Therefore, the potential for settlement due to hydroconsolidation is up to 1 inch in those areas, should those soils become saturated.

7.3.3 Minimal infiltration of surface runoff is anticipated in property paved and maintained parking areas. Provided proper drainage measures are designed and implemented, the potential for saturation of the soils and subsequent hydroconsolidation will be minimized. Maintaining proper site drainage is discussed in Section 7.21 of the referenced report.

7.4 Minimum Resistivity, pH, and Water-Soluble Sulfate

7.4.1 Potential of Hydrogen (pH) and resistivity testing, as well as chloride content testing, were performed on representative samples of on-site material to generally evaluate the corrosion potential to surface utilities. The tests were performed in accordance with California Test Method Nos. 643 and 422 and indicate that the soils are considered "moderately corrosive" with respect to corrosion of buried ferrous metals on site. The results are presented in Appendix B (Figure B9) and should be considered for design of underground structures.

7.4.2 Laboratory tests were performed on representative samples of the on-site materials to measure the percentage of water-soluble sulfate content. Results from the laboratory water-soluble sulfate tests are presented in Appendix B (Figure B9) and indicate that the on-site materials possess "not applicable" sulfate exposure to concrete structures as defined by 2016 CBC Section 1904 and ACI 318-11 Sections 4.2 and 4.3.

7.4.3 Geocon West, Inc. does not practice in the field of corrosion engineering and mitigation. If corrosion sensitive improvements are planned, it is recommended that a corrosion engineer be retained to evaluate corrosion test results and incorporate the necessary precautions to avoid premature corrosion of buried metal pipes and concrete structures in direct contact with the soils.

7.5 Grading

7.5.1 Grading is anticipated to include excavation of site soils for the proposed residential buildings, parking structure, foundations, and utility trenches, as well as placement of backfill for foundations, walls, and trenches.

7.5.2 Earthwork should be observed, and compacted fill tested by representatives of Geocon West, Inc. The existing fill encountered during exploration is suitable for re-use as an engineered fill, provided any encountered oversize material (greater than 6 inches) and any encountered deleterious debris are removed.

7.5.3 A preconstruction conference should be held at the site prior to the beginning of grading operations with the owner, contractor, civil engineer and geotechnical engineer in attendance. Special soil handling requirements can be discussed at that time.

7.5.4 Grading should commence with the removal of all existing vegetation and existing improvements from the area to be graded. Deleterious debris such as wood and root structures should be exported from the site and should not be mixed with the fill soils. Asphalt and concrete should not be mixed with the fill soils unless approved by the Geotechnical Engineer. All existing underground improvements planned for removal should be completely excavated and the resulting depressions properly backfilled in accordance with the procedures described herein. Once a clean excavation bottom has been established it must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

7.5.5 As a minimum, the upper 5 feet of existing soils within the footprint areas of the proposed residential buildings and parking structure should be excavated and properly compacted for foundation and slab support. The engineered fill blanket should extend at least 5 feet beyond the edge of foundations or for a distance equal to the depth of fill below the foundations, whichever is greater. Where the recommended grading cannot be performed, such as adjacent to property lines, alternate grading and foundation design recommendations may be required. Proposed foundations at or near existing grade should be underlain by at least 3 feet of newly compacted engineered fill. Foundations with an embedment greater than 2 feet will require deeper grading in order to maintain the required 3-foot-thick fill blanket beneath foundations. It is recommended that the grading contractor verify the depth of all building foundations prior to commencement of site grading activities in order to correctly determine the required excavation depth. Deeper fill or soft soils encountered during site grading operations should be excavated as necessary at the direction of the Geotechnical Engineer. The limits of existing fill and/or soft soil removal will be verified by the Geocon representative during site grading operations.

7.5.6 It is anticipated that stable excavations for the recommended grading associated with the proposed structures can be achieved with sloping measures. However, if excavations in close proximity to an adjacent property line and/or existing structure are required, special excavation measures such as slot-cutting may be necessary in order to maintain lateral support of offsite improvements. Excavation recommendations for *Temporary Excavations* and *Slot Cutting* are provided in Sections 7.18 and 7.19.

7.5.7 Excavated soil generally free of deleterious debris can be placed as fill and compacted in layers to the design finish grade elevations. Fill and backfill soil should be placed in horizontal loose layers approximately 6 to 8 inches thick, moisture conditioned to optimum moisture content, and compacted to a dry density of at least 90 percent of the laboratory maximum dry density as determined by ASTM D 1557 (latest edition).

7.5.8. Where new paving is to be placed, it is recommended that all existing fill and soft alluvium be excavated and properly compacted for paving support. As a minimum, the upper 12 inches of soil should be scarified, moisture conditioned to optimum moisture content, and compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Paving recommendations are provided in *Preliminary Pavement Recommendations* section of this report (see Section 7.13).

7.5.9 Foundations for small outlying structures, such as block walls up to 6 feet high, planter walls or trash enclosures, which will not be tied to the proposed structure, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and proper compaction cannot be performed or is undesirable, foundations may derive support directly in the undisturbed alluvial soils found at or below a depth of 12 inches, and should be deepened as necessary to maintain a minimum 12-inch embedment into the recommended bearing materials. If the soils exposed in the excavation bottom are soft or loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved in writing by a Geocon representative

7.5.10 It is recommended that flexible utility connections be utilized for all rigid utilities to minimize or prevent damage to utilities from minor differential soil movements. Utility trenches should be properly backfilled in accordance with the requirements of the Green Book (latest edition). The pipe should be bedded with clean sands (Sand Equivalent greater than 30) to a depth of at least 1 foot over the pipe, and the bedding material must be inspected and approved in writing by the Geotechnical Engineer (a representative of Geocon). The use of gravel is not acceptable unless used in conjunction with filter fabric to prevent the gravel from having direct contact with soil. The remainder of the trench backfill may be derived from onsite soil or approved import soil, compacted as necessary, until the required compaction is obtained. The use of minimum 2-sack slurry as backfill is also acceptable as backfill. Prior to placing any bedding materials or pipes, the excavation bottom must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon).

7.5.11 Although not anticipated for this project, all imported fill shall be observed, tested, and approved by Geocon West, Inc. prior to bringing soil to the site. Rocks larger than 6 inches in diameter shall not be used in the fill. If necessary, import soils used as structural fill should have an expansion index less than 20 and soil corrosivity properties that are equally or less detrimental to that of the existing onsite soils (see Figure B9).

7.5.12 All trench and foundation excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon), prior to placing bedding materials, fill, steel, gravel or concrete.

7.6 Earthwork Grading Factors

7.6.1 Shrinkage results when a volume of material removed at one density is compacted to a higher density. A shrinkage factor of between 5 and 10 percent should be anticipated when excavating and compacting the existing earth materials on the site to an average relative compaction of 92 percent.

7.6.2 If import soils will be utilized in the building pad, the soils must be placed uniformly and at equal thickness at the direction of the Geotechnical Engineer (a representative of Geocon West, Inc.). Soils can be borrowed from non-building pad areas and later replaced with imported soils.

7.7 Conventional Foundation Design – Residential Buildings

7.7.1 Subsequent to the recommended grading, a conventional foundation system may be utilized for support of the proposed residential buildings provided foundations derive support in newly placed engineered fill. Foundations should be underlain by a minimum of 3 feet of newly placed engineered fill.

7.7.2 Continuous footings may be designed for an allowable bearing capacity of 2,200 pounds per square foot (psf), and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.7.3 Isolated spread foundations may be designed for an allowable bearing capacity of 2,500 psf, and should be a minimum of 24 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.7.4 The allowable soil bearing pressure above may be increased by 500 psf and 800 psf for each additional foot of foundation width and depth, respectively, up to maximum allowable bearing value of 3,300 psf should be utilized.

7.7.5 The allowable bearing pressures may be increased by one-third for transient loads due to wind or seismic forces.

7.7.6 Continuous footings should be reinforced with a minimum of four No. 4 steel reinforcing bars, two placed near the top of the footing and two near the bottom. The reinforcement for isolated spread footings should be designed by the project structural engineer.

7.7.7 If depth increases are utilized for the exterior wall footings, this office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary. Additional grading should be performed as necessary in order to maintain the required 3-foot-thick engineered fill blanket beneath building foundations.

7.7.8 The above foundation dimensions and minimum reinforcement recommendations are based on soil conditions and building code requirements only, and are not intended to be used in lieu of those required for structural purposes.

7.7.9 No special subgrade presaturation is required prior to placement of concrete. However, the foundation subgrade should be sprinkled as necessary to maintain a moist condition at the time of concrete placement.

7.7.10 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

7.7.11 This office should be provided a copy of the final construction plans so that the foundation recommendations presented herein could be properly reviewed and revised if necessary.

7.8 Conventional Foundation Design – Parking Structure

7.8.1 Subsequent to the recommended grading, a conventional foundation system may be utilized for support of the proposed residential structures provided foundations derive support in newly placed engineered fill. Foundations should be underlain by a minimum of 3 feet of newly placed engineered fill.

7.8.2 Continuous footings may be designed for an allowable bearing capacity of 3,000 psf, and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.8.3 Isolated spread foundations may be designed for an allowable bearing capacity of 3,500 psf, and should be a minimum of 24 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing materials.

7.8.4 The allowable soil bearing pressure above may be increased by 500 psf and 800 psf for each additional foot of foundation width and depth, respectively, up to maximum allowable bearing value of 4,500 psf should be utilized.

7.8.5 The allowable bearing pressures may be increased by one-third for transient loads due to wind or seismic forces.

7.8.6 Continuous footings should be reinforced with a minimum of four No. 4 steel reinforcing bars, two placed near the top of the footing and two near the bottom. The reinforcement for isolated spread footings should be designed by the project structural engineer.

7.8.7 If depth increases are utilized for the exterior wall footings, this office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary. Additional grading should be performed as necessary in order to maintain the required 3-foot-thick engineered fill blanket beneath building foundations.

7.8.8 The above foundation dimensions and minimum reinforcement recommendations are based on soil conditions and building code requirements only, and are not intended to be used in lieu of those required for structural purposes.

7.8.9 No special subgrade presaturation is required prior to placement of concrete. However, the foundation subgrade should be sprinkled as necessary to maintain a moist condition at the time of concrete placement.

7.8.10 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

7.8.11 This office should be provided a copy of the final construction plans so that the foundation recommendations presented herein could be properly reviewed and revised if necessary.

7.9 Conventional Foundation Settlement

7.9.1 The maximum expected total settlement for the residential buildings supported on a conventional foundation system with a maximum allowable bearing pressure of 3,300 psf is estimated to be less than 1 inch and occur below the heaviest loaded structural element. Settlement of the foundation system is expected to occur on initial application of loading. Differential settlement is expected to be less than ½ inch over a distance of 20 feet.

7.9.2 The maximum expected total settlement for the parking structure supported on a conventional foundation system with a maximum allowable bearing pressure of 4,500 psf deriving support in the recommended bearing material is estimated to be less than 1½ inches and occur below the heaviest loaded structural element. Settlement of the foundation system is expected to occur on initial application of loading. Differential settlement is expected to be less than ¾ inch over a distance of 20 feet.

7.9.3 It is recommended that a seismic separation or flexible connection be utilized where adjacent structures abut. The design of the connection is at the discretion of the project structural engineer.

7.9.4 If side by side construction is planned for the residential structure and parking structure it is recommended that the parking structure be constructed prior to the adjacent residential structure in order to allow the majority of the static settlement to occur. This will help to minimize differential settlements between the two structures. The utilization of a lesser bearing value would further reduce the anticipated settlements and could be evaluated further once the design becomes more finalized.

7.9.5 Once the design and foundation loading configurations for the proposed structures proceeds to a more finalized plan, the estimated settlements presented in this report should be reviewed and revised, if necessary. If the final foundation loading configurations are greater than the assumed loading conditions, the potential for settlement should be reevaluated by this office.

7.10 Miscellaneous Foundations

7.10.1 Foundations for small outlying structures, such as block walls up to 6 feet in height, planter walls or trash enclosures, which will not be structurally supported by the proposed building, may be supported on conventional foundations deriving support on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and compaction cannot be performed, such as adjacent to property lines, foundations may derive support in the undisturbed alluvial soils found at or below a depth of 12 inches, and should be deepened as necessary to maintain a minimum 12-inch embedment into the recommended bearing materials.

7.10.2 If the soils exposed in the excavation bottom are soft, compaction of the soft soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative. Miscellaneous foundations may be designed for a bearing value of 1,500 psf, and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade and 12 inches into the recommended bearing material. The allowable bearing pressure may be increased by up to one-third for transient loads due to wind or seismic forces.

7.10.3 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated.

7.11 Lateral Design

7.11.1 Resistance to lateral loading may be provided by friction acting at the base of foundations, slabs and by passive earth pressure. An allowable coefficient of friction of 0.40 may be used with the dead load forces in the undisturbed alluvial soils or newly placed engineered fill.

7.11.2 Passive earth pressure for the sides of foundations and slabs poured against undisturbed alluvial soils may be computed as an equivalent fluid having a density of 270 pounds per cubic foot (pcf) with a maximum earth pressure of 2,700 psf. When combining passive and friction for lateral resistance, the passive component should be reduced by one-third.

7.12 Concrete Slabs-on-Grade

7.12.1 Concrete slabs-on-grade subject to vehicle loading should be designed in accordance with the recommendations in the *Preliminary Pavement Recommendations* section of this report (Section 7.13).

7.12.2 The project structural engineer may determine and design the necessary slab thickness and reinforcing for this structure. Unless specifically evaluated and designed by a qualified structural engineer, the slab-on-grade in the residential building should be a minimum of 4 inches of concrete reinforced with No. 4 steel reinforcing bars placed 16 inches on center in both horizontal directions and positioned vertically near the slab midpoint. The concrete slab-on-grade may bear directly on the newly placed engineered fill. Any disturbed soils should be properly compacted for slab support.

7.12.3 Slabs-on-grade at the ground surface that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder placed directly beneath the slab. The vapor retarder and acceptable permeance should be specified by the project architect or developer based on the type of floor covering that will be installed. The vapor retarder design should be consistent with the guidelines presented in Section 9.3 of the American Concrete Institute's (ACI) *Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials* (ACI 302.2R-06) and should be installed in general conformance with ASTM E 1643 (latest edition) and the manufacturer's recommendations. A minimum thickness of 15 mils extruded polyolefin plastic is recommended; vapor retarders which contain recycled content or woven materials are not recommended. The vapor retarder should have a permeance of less than 0.01 perms demonstrated by testing before and after mandatory conditioning. The vapor retarder should be installed in direct contact with the concrete slab with proper perimeter seal. If the California Green Building Code requirements apply to this project, the vapor retarder should be underlain by 4 inches of clean aggregate. It is important that the vapor retarder be puncture resistant since it will be in direct contact with angular gravel. As an alternative to the clean aggregate suggested in the California Green Building Code, it is our opinion that the concrete slab-on-grade may be underlain by a vapor retarder over 4 inches of clean sand (sand equivalent greater than 30), since the sand will serve a capillary break and will minimize the potential for punctures and damage to the vapor barrier.

7.12.4 For seismic design purposes, a coefficient of friction of 0.40 may be utilized between concrete slabs and subgrade soils without a moisture barrier, and 0.15 for slabs underlain by a moisture barrier.

7.12.5 Exterior slabs, not subject to traffic loads, should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. Prior to construction of slabs, the upper 12 inches of subgrade should be moistened to optimum moisture content and properly compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Crack control joints should be spaced at intervals not greater than 10 feet and should be constructed using saw-cuts or other methods as soon as practical following concrete placement. Crack control joints should extend a minimum depth of one-fourth the slab thickness. The project structural engineer should design construction joints as necessary.

7.12.6 The recommendations of this report are intended to reduce the potential for cracking of slabs due to settlement. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade may exhibit some cracking due to minor soil movement and/or concrete shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

7.13 Preliminary Pavement Recommendations

7.13.1 Where new paving is to be placed, it is recommended that all existing fill and soft or unsuitable soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all soft or unsuitable soils in the area of new paving is not required, however, paving constructed over existing unsuitable soils may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper 12 inches of soil should be scarified and recompacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

7.13.2 The following pavement sections are based on an assumed R-Value of 35. Once site grading activities are complete, it is recommended that laboratory testing confirm the properties of the soils serving as paving subgrade prior to placing pavement.

7.13.3 The Traffic Indices listed below are estimates. Geocon does not practice in the field of traffic engineering. The actual Traffic Index for each area should be determined by the project civil engineer. If pavement sections for Traffic Indices other than those listed below are required, Geocon should be contacted to provide additional recommendations. Pavement thicknesses were determined following procedures outlined in the *California Highway Design Manual* (Caltrans). It is anticipated that the majority of traffic will consist of automobile and large truck traffic.

PRELIMINARY PAVEMENT DESIGN SECTIONS

Location	Estimated Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Automobile Parking	3.5	3	4
Driveways	5	3	5
Trash Truck & Fire Lanes	7	4	8

7.13.4 Asphalt concrete should conform to Section 203-6 of the "*Standard Specifications for Public Works Construction"* (Green Book). Class 2 aggregate base materials should conform to Section 26-1.02A of the "*Standard Specifications of the State of California, Department of Transportation"* (Caltrans). The use of Crushed Miscellaneous Base (CMB) in place of Class 2 aggregate base is acceptable. Crushed Miscellaneous Base should conform to Section 200-2.4 of the "*Standard Specifications for Public Works Construction"* (Green Book).

7.13.5 Unless specifically designed and evaluated by the project structural engineer, where concrete paving will be utilized for support of vehicles, we recommend that the concrete be a minimum of 6 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions. Concrete paving supporting vehicular traffic should be underlain by a minimum of 4 inches of aggregate base and a properly compacted subgrade. The subgrade and base material should be compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

7.13.6 The performance of pavements is highly dependent upon providing positive surface drainage away from the edge of pavements. Ponding of water on or adjacent to the pavement will likely result in saturation of the subgrade materials and subsequent cracking, subsidence and pavement distress. If planters are planned adjacent to paving, it is recommended that the perimeter curb be extended at least 12 inches below the bottom of the aggregate base to minimize the introduction of water beneath the paving.

7.14 Retaining Wall Design

7.14.1 The recommendations presented below are generally applicable to the design of rigid concrete or masonry retaining walls having a maximum height of 6 feet. In the event that walls significantly higher than 6 feet are planned, Geocon should be contacted for additional recommendations.

7.14.2 Retaining wall foundations may be designed in accordance with the recommendations provided in the *Conventional Foundation Design* sections of this report (see Sections 7.7 through 7.9).

7.14.3 Retaining walls with a level backfill surface that are not restrained at the top should be designed utilizing a triangular distribution of pressure (active pressure). Restrained walls are those that are not allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall in feet) at the top of the wall. Where walls are restrained from movement at the top, walls may be designed utilizing a triangular distribution of pressure (at-rest pressure). The table below presents recommended pressures to be used in retaining wall design, assuming that proper drainage will be maintained. Calculations of the recommended retaining wall pressures are provided as Figure 5.

RETAINING WALL WITH LEVEL BACKFILL SURFACE

HEIGHT OF RETAINING WALL (Feet)	ACTIVE PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)	AT-REST PRESSURE EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot)
Up to 6	39	59

7.14.4 The wall pressures provided above assume that the retaining wall will be properly drained preventing the buildup of hydrostatic pressure. If retaining wall drainage is not implemented, the equivalent fluid pressure to be used in design of undrained walls is 90 pcf. The value includes hydrostatic pressures plus buoyant lateral earth pressures.

7.14.5 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures and should be designed for each condition as the project progresses.

7.14.6 It is recommended that line-load surcharges from adjacent wall footings, use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.20\times\left(\frac{z}{H}\right)}{\left[0.16+\left(\frac{z}{H}\right)^2\right]^2}\times\frac{Q_L}{H}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.28\times\left(\frac{x}{H}\right)^2\times\left(\frac{z}{H}\right)}{\left[\left(\frac{x}{H}\right)^2+\left(\frac{z}{H}\right)^2\right]^2}\times\frac{Q_L}{H}$$

where x is the distance from the face of the excavation to the vertical line-load, H is the distance from the bottom of the footing to the bottom of excavation, z is the depth at which the horizontal pressure is desired, QL is the vertical line-load and σH is the horizontal pressure at depth z.

7.14.7 It is recommended that vertical point-loads, from construction equipment outriggers or adjacent building columns use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.28\times\left(\frac{z}{H}\right)^2}{\left[0.16+\left(\frac{z}{H}\right)^2\right]^3}\times\frac{Q_P}{H^2}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.77\times\left(\frac{x}{H}\right)^2\times\left(\frac{z}{H}\right)^2}{\left[\left(\frac{x}{H}\right)^2+\left(\frac{z}{H}\right)^2\right]^3}\times\frac{Q_P}{H^2}$$

then

$$\sigma'_H(z) = \sigma_H(z)cos^2(1.1\theta)$$

where x is the distance from the face of the excavation to the vertical point-load, H is distance from the outrigger/bottom of column footing to the bottom of excavation, z is the depth at which the horizontal pressure is desired, Q_P is the vertical point-load, σ is the vertical pressure at depth z, Θ is the angle between a line perpendicular to the bulkhead and a line from the point-load to half the pile spacing at the bulkhead, and σ_H is the horizontal pressure at depth z.

7.14.8 In addition to the recommended earth pressure, the upper ten feet of the retaining wall adjacent to the street or driveway areas should be designed to resist a uniform lateral pressure of 100 psf, acting as a result of an assumed 300 psf surcharge behind the wall due to normal street traffic. If the traffic is kept back at least ten feet from the wall, the traffic surcharge may be neglected.

7.15 Retaining Wall Drainage

7.15.1 Retaining walls should be provided with a drainage system extended at least two-thirds the height of the wall. At the base of the drain system, a subdrain covered with a minimum of 12 inches of gravel should be installed, and a compacted fill blanket or other seal placed at the surface (see Figure 6). The clean bottom and subdrain pipe, behind a retaining wall, should be observed by the Geotechnical Engineer (a representative of Geocon), prior to placement of gravel or compacting backfill.

7.15.2 As an alternative, a plastic drainage composite such as Miradrain or equivalent may be installed in continuous, 4-foot wide columns along the entire back face of the wall, at 8 feet on center. The top of these drainage composite columns should terminate approximately 18 inches below the ground surface, where either hardscape or a minimum of 18 inches of relatively cohesive material should be placed as a cap (see Figure 7). These vertical columns of drainage material would then be connected at the bottom of the wall to a collection panel or a 1-cubic-foot rock pocket drained by a 4-inch subdrain pipe.

7.15.3 Subdrainage pipes at the base of the retaining wall drainage system should outlet to an acceptable location via controlled drainage structures.

7.15.4 Moisture affecting below grade walls is one of the most common post-construction complaints. Poorly applied or omitted waterproofing can lead to efflorescence or standing water. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

7.16 Elevator Pit Design

7.16.1 The elevator pit slab and retaining wall should be designed by the project structural engineer. As a minimum the slab-on-grade for the elevator pit bottom should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. The elevator slab and retaining wall footings may derive support in either newly placed engineered fill or the alluvial soils found at or below a depth of 5 feet if exposed in the elevator pit excavation bottom. Elevator pit walls may be designed in accordance with the recommendations in the *Conventional Foundation Design* and *Retaining Wall Design* section of this report (see Sections 7.7 through 7.9, and 7.14).

7.16.2 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent foundations and should be designed for each condition as the project progresses.

7.16.3 If retaining wall drainage is to be provided, the drainage system should be designed in accordance with the *Retaining Wall Drainage* section of this report (see Section 7.15).

7.16.4 It is suggested that the exterior walls and slab be waterproofed to prevent excessive moisture inside of the elevator pit. Waterproofing design and installation is not the responsibility of the geotechnical engineer.

7.17 Elevator Piston

7.17.1 If a plunger-type elevator piston is installed for this project, a deep drilled excavation will be required. It is important to verify that the drilled excavation is not situated immediately adjacent to a foundation, or the drilled excavation could compromise the existing foundation support, especially if the drilling is performed subsequent to the foundation construction.

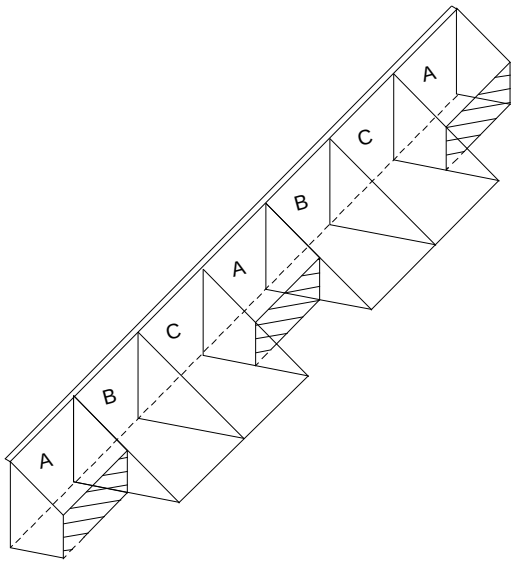
7.17.2 Casing will be required since caving is expected in the drilled excavation and the contractor should be prepared to use casing and should have it readily available at the commencement of drilling activities. Continuous observation of the drilling and installation of the elevator piston by the Geotechnical Engineer (a representative of Geocon West, Inc.) is required.

7.17.3 The annular space between the piston casing and drilled excavation wall should be filled with a minimum of 1½-sack slurry pumped from the bottom up. As an alternative, pea gravel may be utilized. The use of soil to backfill the annular space is not acceptable.

7.18 Temporary Excavations

7.18.1 Excavations on the order of 5 feet in height may be required for excavation and construction of the proposed foundations. The excavations are expected to expose artificial fill and alluvial soils, which may be subject to caving where loose and granular soils are exposed. Vertical excavations up to 5 feet in height may be attempted where not surcharged by adjacent traffic or structures.

7.18.2 Vertical excavations greater than 5 feet or where surcharged by existing structures or traffic loads will require sloping or slot-cutting measures to provide a stable excavation. Where sufficient space is available, temporary unsurcharged embankments could be sloped back at a uniform 1:1 slope gradient or flatter up to a maximum height of 7 feet. A uniform slope does not have a vertical portion.



7.18.3 Performing continuous vertical excavations along property lines or adjacent to an existing structure could remove support from the property and/or structure which is not acceptable. Excavations in close proximity to an adjacent property may require special excavation measures, such as slot-cutting. Recommendations for slot-cutting are provided in the following sections.

7.18.4 Where sloped embankments are utilized, the top of the slope should be barricaded to prevent vehicles and storage loads at the top of the slope within a horizontal distance equal to the height of the slope. If the temporary construction embankments are to be maintained during the rainy season, berms are suggested along the tops of the slopes where necessary to prevent runoff water from entering the excavation and eroding the slope faces. Geocon personnel should inspect the soils exposed in the cut slopes during excavation so that modifications of the slopes can be made if variations in the soil conditions occur. All excavations should be stabilized within 30 days of initial excavation.

7.19 Slot Cutting

7.19.1 The slot-cutting method employs the earth as a buttress and allows the earth excavation to proceed in phases. Where slot-cutting is used for foundation construction, the proposed construction techniques should be discussed with the structural engineer so that appropriate modifications can be made to the foundation design; such as additional reinforcing or details for doweling.

7.19.2 It is recommended that the initial temporary excavation along the property line be sloped back at a uniform 1:1 (H:V) slope gradient or flatter for excavation of the existing soils to the necessary depth. The temporary excavation should not extend below the surcharge area of any adjacent foundations. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation. The temporary slope may then be excavated using the slot-cutting (see illustration below).

7.19.3 Alternate "A" slots of 5½ feet in width may be worked. The remaining earth buttresses ("B" and "C" slots) should also be 5½ feet in width. The wall, foundation, or backfill should be completed in the "A" slots to a point where support of the offsite property and/or any existing structures is restored before the "B" slots are excavated. After completing the wall, foundation, or backfill in the "B" slots, finally the "C" slots may be excavated. Slot-cutting is not recommended for vertical excavations greater than 5 feet in height. The slot-cut calculation should be revised as needed for each surcharge condition as the project progresses. A slot-cut calculation is provided on the following page.

Slot Cut Calculation

Input:

Height of Slots	(H)	5.0	feet
Unit Weight of Soils	(γ)	120.0	pcf
Friction Angle of Soils	(ϕ)	33.0	degrees
Cohesion of Soils	(c)	50.0	psf

Critical Slot Width with Factor of Safety equal or exceeding 1.5:

d_{allow} = 5.6 feet

7.20 Stormwater Infiltration

7.20.1 During the June 12, 2017 site exploration, boring B6 was excavated and utilized to perform percolation testing. The boring was advanced to the depth listed in the table below. A slotted casing was placed in the boring, and the annular space between the casing and excavation was filled with filter pack. The boring was then filled with water to pre-saturate the soils. On June 13, 2017, the casing was refilled with water and percolation test readings were performed after repeated flooding of the cased excavation. Based on the test results, the average infiltration rate (adjusted percolation rate) for the earth materials encountered is listed in the following table. Additional correction factors may be required and should be applied by the engineer in responsible charge of the design of the stormwater infiltration system and based on applicable guidelines. Percolation test data sheet is included herein as Figure 8.

Boring	Infiltration Depth (ft.)	Average Infiltration Rate (in / hour)
B6	10-25	0.48

7.20.2 Based on the results of the subsequent laboratory testing, the upper 14 feet of existing site soils may be subject to hydroconsolidation when saturated. Therefore, it is recommended that infiltration of storm water occur below a depth of 15 feet to minimize saturation of the soils supporting the proposed structures. In addition, it is suggested that additional infiltration and laboratory testing be performed in stormwater infiltration is proposed at a location other than near where the above test was performed.

7.20.3 Provided that infiltration occurs below a depth of 15 feet, it is our opinion that the soil encountered at the depths and location as listed in the table above are suitable for infiltration of stormwater and will not create a perched groundwater condition, will not affect soil structure interaction of existing or proposed foundations due to expansive soils, will not saturate soils supported by existing or proposed retaining walls, and will not increase the potential for liquefaction. Resulting settlements are anticipated to be less than ¼ inch, if any.

7.20.4 Where infiltration systems will be utilized, it is recommended that a minimum 10-foot horizontal and vertical setback be maintained from existing or proposed foundations. The boundary of the zone of saturation may be assumed to project downward from the discharge of the infiltration facility at a gradient of 1:1. Additional setbacks may be required by the governing jurisdiction and should be incorporated into the stormwater infiltration system design as necessary.

7.20.5 Subsequent to the placement of the infiltration system, it is acceptable to backfill the resulting void space between the excavation sidewalls and the infiltration system with minimum two-sack slurry provided the slurry is not placed in the infiltration zone. It is recommended that gravel, approved by the project civil engineer, be utilized adjacent to the infiltration zone so communication of water to the soil is not hindered.

7.20.6 Due to the preliminary nature of the project at this time, the type of stormwater infiltration system and location of the stormwater infiltration systems has not yet been determined. The design drawings should be reviewed and approved by the Geotechnical Engineer. The installation of the stormwater infiltration system should be observed and approved by the Geotechnical Engineer (a representative of Geocon).

7.21 Surface Drainage

7.21.1 Proper surface drainage is critical to the future performance of the project. Uncontrolled infiltration of irrigation excess and storm runoff into the supporting soils can adversely affect the performance of the planned improvements. Saturation of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the original designed engineering properties. Proper drainage should be maintained at all times.

7.21.2 All site drainage should be collected and controlled in non-erosive drainage devices. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. The site should be graded and maintained such that surface drainage is directed away from structures in accordance with 2016 CBC 1804.4 or other applicable standards. In addition, drainage should not be allowed to flow uncontrolled over any descending slope. Discharge from downspouts, roof drains and scuppers are not recommended onto unprotected soils within 5 feet of the building perimeter. Planters which are located adjacent to foundations should be sealed to prevent moisture intrusion into the soils providing foundation support. Landscape irrigation is not recommended within 5 feet of the building perimeter footings except when enclosed in protected planters.

7.21.3 Positive site drainage should be provided away from structures, pavement, and the tops of slopes to swales or other controlled drainage structures. The building pad and pavement areas should be fine graded such that water is not allowed to pond.

7.21.4 Landscaping planters immediately adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Either a subdrain, which collects excess irrigation water and transmits it to drainage structures, or an impervious above-grade planter boxes should be used. In addition, where landscaping is planned adjacent to the pavement, it is recommended that consideration be given to providing a cutoff wall along the edge of the pavement that extends at least 12 inches below the base material.

7.22 Plan Review

7.22.1 Grading and foundation plans should be reviewed by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to finalization to verify that the plans have been prepared in substantial conformance with the recommendations of this report and to provide additional analyses or recommendations.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon West, Inc. should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon West, Inc.

2. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

3. The findings of this report are valid as of the date of this report. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

4. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project geotechnical engineer of record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

JULY 2017	PROJECT NO. A9621-06-01	FIG. 2

Geologic Time Scale			Years Before Present (Approx.)	Fault Symbol	Frequency of Movement	Description: On Land	Description: Offshore
Quaternary	Late Quaternary	Historic	200			Displacement during histoic time (e.g. San Andreas fault 1906). Includes areas of known fault creep	
		Holocene	11,700			Displacement during Holocene time.	Fault offsets seafloor sediments or strata of Holocene age.
	Early Quaternary	Pleistocene	700,000			Faults showing evidence of displacement during late Quaternary time.	Fault cuts strata of Late Pleistocene age.
			1,600,000			Undivided Quaternary faults - most faults in this category show evidence of displacement during the last 1,600,000 years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age.	Fault cuts strata of Quaternary age.
Pre-Quaternary			4.5 billion (Age of Earth)			Faults without recognized Quaternary displacement or showing evidence of no displacement or showing evidence of no displacement during Quaternary time. Not necessarily inactive.	Fault cuts strata of Pliocene or older age.

*Quaternary now recognized as extending to 2.6 Ma (Walker and Geissman, 2009). Quaternary faults in the map were established using the pervious 1.6 Ma criterion

PERCOLATION TEST RESULTS

Boring B6

Project No:	A9621-06-01	Boring Diameter, DIA:	8	inches
Project Name:	1625 Magnolia Ave.	Boring Depth:	25.5	feet
Testing Date:	6/13/2017	Boring Depth:	306	inches
Tested By:	MA	Height of Pipe above Ground:	0.0	feet

Reading Number	Initial Water Depth (ft)	Final Water Depth (ft)	Adjusted Initial Water Depth (ft)	Adjusted Final Water Depth (ft)	Water Drop (ft)	Water Drop (in)	ΔT (min)	Percolation Rate (in/hour)
1	10.00	10.98	10.00	10.98	0.98	11.76	30.00	23.52
2	10.00	10.92	10.00	10.92	0.92	11.04	30.00	22.08
3	10.00	10.86	10.00	10.86	0.86	10.32	30.00	20.64
		Average Readings:	10.00	10.92		Preadjusted Perc Rate*		22.08

* Based only on Stabilized Readings

Initial Water Depth, d_1 =	186	inches
Final Water Depth, d_2 =	174.96	inches
Water Level Drop, Δd =	11.04	inches
Boring Diameter, DIA =	8	inches

$$R_f = \left(\frac{2d_1 - \Delta d}{DIA}\right) + 1$$

Reduction Factor, R_f = 46.12

Infiltration Rate = 0.48 inches/hour

APPENDIX A

APPENDIX A

FIELD INVESTIGATION

The site was explored on June 12, 2017, by excavating six 8-inch diameter borings to depths of approximately 25½ feet below the existing ground surface utilizing a truck-mounted hollow-stem auger drilling machine. Representative and relatively undisturbed samples were obtained by driving a 3 inch, O. D., California Modified Sampler into the "undisturbed" soil mass with blows from a 140-pound auto-hammer falling 30 inches. The California Modified Sampler was equipped with 1-inch high by 2 3/8-inch diameter brass sampler rings to facilitate soil removal and testing. Bulk samples were also obtained.

The soil conditions encountered in the borings were visually examined, classified and logged in general accordance with the Unified Soil Classification System (USCS). Logs of the borings are presented on Figures A1 through A6. The logs depict the soil and geologic conditions encountered and the depth at which samples were obtained. The locations of the borings are shown on Figure 2.
