The project will involve demolition and removal of the existing buildings (including subterranean levels) asphalt pavements, planters and landscaping areas. Our understanding of the proposed construction as described herein is based on the 100% Schematic Design drawings dated January 7, 2005. We understand that the new construction is planned to consist of an eleven-story police headquarters office tower in the central portion of the site, an auditorium, café and utility structures along the east side of the site, subterranean levels and hardscaped/landscaped areas.

The office tower is planned to have a footprint similar to the shape on the letter "L" with a north-south wing and an east-west wing. Preliminary plans indicate the tower will have overall dimensions on the order of 300 feet north-south by 200 feet east-west with a total footprint on the order of 42,000 square feet. The lowest level (B1 level) of the southern portion of the office tower is planned to contain utility equipment with the majority of the level having a finish floor elevation of 259 feet. The chiller plant room and domestic water boiler and heater room are planned to have finished floor elevations of 255 feet. The northern portion of the tower is planned to extend down to the 01 (Lower Plaza) Level with a finish floor elevation of 274 feet. A

10108282006 35900

helipad and cooling tower will be constructed on the roof of the building. TMAD engineers, the structural engineers for the project, provided estimated interior and exterior column loads of 3,500 kips (2000 kip dead load plus 1,500 kip live load) and 1,950 kips (1200 kip dead load plus 750 kip live load) for the office tower building.

Subterranean parking is planned for the 01, B1 and B2 levels that will extend around the perimeter of the office tower. With the exception of the office tower, the subterranean parking levels will underlie the entire site, property line to property line. The lowest parking level, B2, is planned to have a finish floor elevation on the order of 249 feet adjacent to the northwest corner of the planned office tower and the northwest corner of the site. The finish floor elevation will transition down to an elevation of approximately 245 feet in the northeast corner of the site and then transition upward to an elevation of approximately 258 feet in the southeast corner of the site. Along the southern edge of the site this parking level will ascend up to the B1 level. The B1 level will have finish floor elevations on approximately 261 feet, 259 feet, 255 feet and 268 feet in the southwest, northwest, northeast and southeast corners of the site, respectively. Along the southern edge of the site the B1 parking level will ascend up to the 01 (Lower Plaza) level. The 01 level will provide parking along the south, west and north sides of the office tower. Car and truck ingress and egress ramps are planned in the northeast portion of the site to provide access to the lower plaza level from Main Street. In addition, an egress ramp is planned along the west side of the office tower to permit exiting of car traffic from the lower plaza level to Spring Street. A café and utility rooms will be constructed on the 01 level east of the office tower and south of the ingress and egress ramps from Main Street. An auditorium will be constructed at the upper plaza level, above the parking levels, along the east edge of the site. The exterior area of the majority of the upper plaza level will consist of landscaping and hardscaping. TMAD engineers, the structural engineers for the project, provided estimated column loads of 1,200 kips (900 kip dead load plus 300 kip live load) for the parking structure.

Earthwork for the project is expected to consist of excavation for the proposed subterranean levels of the facility, backfill of new retaining walls, backfill of utility trenches and other miscellaneous site grading.

If design loadings and/or proposed structural conditions are significantly different from those described above, we should be notified to reevaluate the conclusions and recommendations contained in this report.

4.0 EXPLORATION PROGRAM

A total of fifteen exploratory borings were drilled for the project. One of the borings (B-1) was drilled in First Street, east of Spring Street, and two borings (B-11 and B-13) were drilled in Main Street between First and Second Streets. The remaining 12 borings were drilled within the site with six in existing asphalt paved areas, one in a landscaped area, one in the subterranean level of the former bank building and four in the subterranean parking level of the Caltrans building. Borings B-1 through B-6, B-8, B-11 and B-13 were drilled on December 13 through

10108282006 35900

December 17, 2004 using a truck-mounted drill rig equipped with 8-inch hollow-stem augers. Borings B-1A, B-7, B-9, B-12 and B-13A were drilled on December 20 and 21, 2004 and January 5, 2005 using a track mounted limited access drill rig. Boring B-10 was not drilled.

Boring B-1 was terminated at a depth of approximately two feet below the ground surface due to interference by a buried utility line. Borings B-8, B-8A, B-12 and B-13, and B-13A encountered drilling refusal at depths of approximately 12 feet, 2 feet, 16 feet, 16 feet and 25 feet below the ground surface. Borings B-2, B-3, B-4, B-5 and B-6 were drilled to depths of approximately 56-1/2 feet to 81-1/2 feet below the ground surface. Borings B-1A, B-7, and B-9 were drilled to depths of approximately 14-1/2 feet to 29-1/2 feet below the ground surface. Approximate locations of the borings are depicted on Figure 2, Boring Location Map.

Relatively undisturbed ring or Standard Penetration Test (SPT) samples were typically collected from the borings at depths of approximately 2-1/2 feet, 5 feet, 7-½ feet, 10-feet and every 5 feet thereafter to the explored depths in the borings. Samples were driven into the bottom of the borings with successive drops of a 140-pound automatic-trip hammer falling 30 inches. For the SPT samples, the number of hammer blows required to advance the SPT sampler the last 12 inches of an 18-inch sample interval is the SPT field "N" value. Blows required to advance the ring and SPT samplers the last 12 inches of penetration are shown on the boring logs (Appendix A). Bulk samples were also collected from the upper few feet of each boring.

Each collected sample was inspected and described in general conformance with the Unified Soil Classification System (USCS). The descriptions were entered on the boring logs, which are included within the Data Report presented in Appendix A of this report. All samples were sealed and packaged for transportation to the consultants laboratory. After completion of drilling, borings within the site were backfilled with soil cuttings and patched with asphalt cold patch or quickest concrete at the ground surface where pavements were penetrated. Borings in the streets were backfilled with bentonite cement slurry and capped with quickset concrete.

Screening in the field for volatile organic compounds (VOCs) was performed to evaluate whether fuel spills or other contamination of the soil has occurred in the project area. Soil samples collected from the borings were screened in the field with a portable Photo-Ionic Detector (PID) for the presence of VOCs. PID readings ranged from zero to 2 parts per million (ppm) in the borings. A multigas detector was used as a screening tool for methane (Lower Explosive Limit or LEL), oxygen, carbon dioxide and hydrogen sulfide. No methane or hydrogen sulfide was detected. The site is not located in a methane area as designated by the City of Los Angles Department of Building and Safety.

5.0 LABORATORY TESTING

Selected soil and bedrock samples were tested for the following properties:

- In-Place Dry Density and/or Field Moisture (ASTM D2937)

10109282006 35900

- Laboratory Maximum Dry Density and Optimum Moisture Content (ASTM D1557)
- Consolidation (ASTM D2435)
- Direct Shear (ASTM D3080)
- Grain Size Analysis (ASTM D422)
- Atterberg Limits
- R-Value (ASTM D2844)
- pH (CA DOT Method)
- Sulfate Content (CA DOT Method)
- Chloride Content (CA DOT Method)
- Electrical Resistivity

Laboratory test results are presented in the consultants Geotechnical Data Report (Appendix A).

6.0 GEOLOGIC CONDITIONS

6.1 Regional Geology

The project site is located south of the Santa Monica Mountains and west of the Los Angeles River in the northeastern portion of the Los Angeles Basin. The Los Angeles Basin is roughly a north-south trending depositional trough located in the northwestern portion of the Peninsular Ranges geomorphic province.

Geologic structures within this region reflect the resolution of tectonic forces as the northwest trending structures of the northern Peninsular Range Province, exemplified by the right-lateral strike slip Whittier-Elsinore Fault, meet the east-west trending reverse left-lateral Santa Monica-Hollywood-Raymond Fault of the Transverse Range Province. A segment of the boundary between the Peninsular Range and Transverse Range provinces is characterized by the Elysian Park anticline—a large fold associated with the uplift of the Elysian and Repetto Hills, which are located north and east of downtown Los Angeles, respectively. The Elysian and Repetto Hills are underlain by sedimentary bedrock of both marine and non-marine origin, which has become folded into a series of low relief, east-west trending hills. The geology of the site area is presented on Figure 3, Regional Geology.

6.2 Stratigraphy

6.2.1 Fill (Af)

Previously placed fill materials, consisting primarily of sandy soils with varying percentages of silt, clay and gravel were encountered in the majority of the borings drilled for the project. The fill depths generally ranged from less than 3 feet to approximately 9 feet below the ground

10108282006 35900

surface at the boring locations. Deeper fill depths may exist in some areas of the site. Based on our site observations, the subsurface exploration, and our understanding of the site history, fill materials are generally expected to exist throughout the site. Construction debris consisting of concrete, asphalt and brick fragments were encountered in some of the fill soils. Larger sized pieces and other types of construction debris may exist within fill materials at the site.

6.2.2 Alluvium (Qal)

Alluvium immediately underlies the fill and was encountered in all of the borings to depths ranging approximately 7 feet to 24 feet below the ground surface at the boring locations. The alluvium generally consists of light brown to dark brown, dense to very dense, sand and gravel with varying percentages of silt, clay and cobbles. Layers of silty and/or sandy clay and sandy silts were logged immediately above the bedrock materials in some of the borings. These materials may be severely weathered bedrock. More detailed descriptions of the alluvium can be found in the boring logs presented in data report in Appendix A.

The drilling and sampling methods performed for this study does not allow for full identification of cobbles and boulders in the alluvial deposits. However, based on past experiences in the site area, the alluvium materials are expected to contain significant amounts of cobbles and occasional boulders.

6.2.3 Bedrock – Fernando Formation (Tfr)

The Fernando Formation is an Upper Miocene to Pleistocene formation of sedimentary rocks underlying the alluvial deposits. The formation consists of relatively massive beds of siltstone and claystone, is olive gray to black in color, stiff to hard and slightly to moderately weathered. Published geologic maps by both Lamar and Dibblee assign similar described bedrock, which is located approximately 800 feet northwest of the site, to the Pliocene-age Fernando Formation.

The Fernando Formation consists mainly of fine-grained silts and clay sized particles. The formation is generally massive and exhibits very little, if any, joints and other discontinuities except for bedding planes.

6.3 Geologic Structure

The site is generally underlain by a sequence of fill soils over alluvium that overlies bedrock of the Fernando Formation. Due to the massive nature of the bedrock, bedding orientations were not obtained during fieldwork activities. Regional mapping by both Dibblee and Lamar indicate that bedrock of the Fernando Formation located northwest of the site primarily strikes to the northeast and dips between 65 to 70 degrees to the southeast.

The site is located on the southwest-dipping limb of the northwest/southeast trending Elysian Park Anticline—an approximate 12 mile long, 6 mile wide fold that is believed to be the near surface expression of the Elysian Park Blind Thrust Fault. Located on the southern limb of the

10108282006 35900

Elysian Park Anticline and extending through downtown and east Los Angeles is a series of roughly parallel, east-west trending parasitic anticlinal folds or flexures.

The largest of these folds is the Coyote Pass escarpment, a topographic scarp that is theorized to be a secondary fold structure related to the Elysian Park Blind Thrust Fault. The Coyote Pass escarpment extends west to northwest from the southern portion of the Repetto Hills to the Los Angeles River where its surface expression becomes buried in alluvial sediments of the floodplain. It has been theorized that the escarpment extends across the floodplain and connects with the MacArthur Pass escarpment, a fold that has been mapped along the southern edge of the Elysian Hills to the northwest. Recent fieldwork by Earth Consultants International indicates the Coyote Pass escarpment is located south of the corner of 1st and Alameda Streets. As a result, the escarpment's trace is extrapolated to be south of the project site.

6.4 Groundwater

Groundwater was encountered at elevations of approximately 18 to 20 feet below the ground surface in the surface borings and at a depth of approximately 8 feet below one of the borings drilled in the subterranean level of the existing Caltrans building. These depths correspond to elevations of approximately 262 feet to 267 feet. Groundwater data obtained from the California Division of Mines and Geology (CDMG, 1998) indicates that the historically reported shallowest depth to groundwater was on the order of 20 feet or more below the ground surface. Fluctuations in the groundwater level may occur due to seasonal variations in rainfall, pumping from wells, and possibly as the result of other factors that were not evident at the time of the field investigation.

7.0 FAULTING AND SEISMICITY

The fault classification system adopted by the CDMG, relative to the State legislation delineating Earthquake Fault Zones along active or potentially active faults (Alquist-Priolo Act), is used for structures. CDMG defines an active fault (or fault zone) as a fault that has moved within Holocene time (about the last 11,000 years). Faults with no known displacement within Holocene time that showed evidence of movement during Quaternary time (the last 1.6 million years) have been defined as potentially active.

Ground surface rupturing along faults, ground shaking and liquefaction are three of the important seismic considerations for properties in Southern California. The site is <u>not</u> located within an Alquist-Priolo Earthquake Fault Zone ((formerly named Special Studies Zones) (Hart, 1997)). Thus, the potential for ground surface rupture impacting the site is considered low. As shown on Figure 4, "Seismic Hazard Zones," the site is within a liquefaction Seismic Hazard Zone but not a landslide Seismic Hazard Zone (CDMG, 1999). The site lies within Seismic Zone 4 of the 2002 Los Angeles Building Code (LABC), (1997 Uniform Building Code (UBC)).

10108282006 35900

Based on the current understanding of the geologic framework of the site area, the seismic hazard which is expected to have the highest probability of affecting the site is ground shaking resulting from an earthquake occurring along any of several major active and potentially active faults in Southern California. Known regional faults that could produce significant ground shaking at the site include the Elysian Park Thrust, Hollywood, Raymond, Compton Thrust, Newport-Inglewood, Verdugo, Santa Monica, Sierra Madre, and Whittier Faults, among others. The closest of these are the Elysian Park Thrust, Hollywood and Raymond Faults with surface projections of potential rupture area located at distances of approximately 3 kilometers (km), 7 km and 8 km from the site, respectively.

7.1 Ground Motion

A probabilistic seismic hazard analysis was performed using the computer program FRISKSP (Blake, 1998b) in order to estimate the Peak Ground Acceleration (PGA) that could occur at the site, based on recurrence interval. The probabilistic analysis considered various magnitudes of earthquakes, along their respective fault lengths, that could occur along active or potentially active faults within a 100-km radius of the site. Standard deviation was applied during the analysis to assess the uncertainty inherent in the calculation with respect to magnitude, distance, and ground motion. An average of three attenuation relationships (Abrahamson & Silva, 1997; Bozorgnia et al, 1999; and Sadigh, 1997) were used to estimate ground motions at the site for multiple distance/magnitude calculation combinations inherent in the probabilistic analysis.

The results of the probabilistic seismic hazard analysis suggest a 10 percent probability of exceedance in 50 years (475 year return period, Maximum Probable Earthquake, MPE) ground acceleration of 0.53g for the site. The 10 percent probability of exceedance in 100 years (950 year return period, Upper Bound Earthquake, UBE) ground acceleration was estimated to be approximately 0.65g. The results of the probabilistic analysis in terms of probability of exceedance, as well as average return period (ARP), are included in Appendix B of this report.

7.2 Liquefaction

The site is shown on the State of California Seismic Hazard Zones map as being within an area that has potential for liquefaction. Liquefaction typically occurs when near surface (usually upper 50 feet), saturated, clean, fine-grained loose sands are subject to intense ground shaking.

Groundwater was encountered at depths of approximately 18 to 20 feet below the ground surface in the borings. Groundwater data obtained from CDMG indicates that the historically reported shallowest depth to groundwater was on the order of 20 feet or more below the ground surface in the site area. Drive sampler blow counts indicate that the granular soils below the measured shallow ground water levels, which are shallower than the historically reported shallowest depth to groundwater, are dense to very dense. Based on this data and with consideration to the fact that foundations will be founded on bedrock beneath the alluvial soils, the potential for liquefaction impacting the planned construction is considered low.

10108282006 35900

7.3 Other Seismic Hazards

In addition to surface fault rupture, ground shaking and liquefaction, other effects of seismic activity include landsliding, lateral spreading, earthquake-induced flooding, seiches, and tsunamis. Results of a site-specific evaluation of the potential for these effects affecting the project site are presented below:

- Landslides: Seismically-induced landslides and other slope failures are common occurrences during or soon after earthquakes. The project site and surrounding area is relatively flat. In the absence of significant ground slopes, the potential for seismically induced landslides to affect the site is considered to be negligible.
- Lateral Spreading: Seismically-induced lateral spreading involves primarily lateral movement of earth materials due to ground shaking. It differs from slope failure in that complete ground failure involving large movement does not occur due to the relatively smaller gradient of the initial ground surface. Lateral spreading is demonstrated by near-vertical cracks with predominantly horizontal movement of the soil mass involved. Based on the materials encountered in the exploratory borings, the potential for lateral spreading of the project site is low.
- Earthquake-Induced Flooding: This is flooding caused by failure of dams or other water-retaining structures as a result of earthquakes. The potential for earthquake induced flooding impacting the site is considered very low.
- Seiches: Seiches are large waves generated in enclosed bodies of water in response to ground shaking. The site is not located adjacent to any enclosed large bodies of water that could experience seiches during an earthquake. Thus, the potential for seiches impacting the site is considered very low.
- Tsunamis: Tsunamis are tidal waves generated in large bodies of water by fault displacement or major ground movement. Based on the location and elevation of the site, tsunamis do not pose a hazard to the project.

7.4 Seismic Design Parameters

Section 1636 of the 2002 LABC defines six different soil profile types ($S_A - S_F$). These soil profile types are used to determine seismic coefficients C_a and C_v from Tables 16-Q and 16-R respectively. These coefficients, together with the near source factors are used to calculate the pseudo-static base shear force that structures must be designed to withstand.

Soil Profile Types are based on the average properties of the upper 100 feet of soil/bedrock at the site. The appropriate soil profile type is chosen by referencing the average shear wave velocity, average Standard Penetration Test (SPT) blow counts, and/or the undrained shear strength of the soil. Based on the field and field and laboratory data, Soil Profile Type S_C was selected for this site.

Near source factors are also used to determine seismic coefficients C_a and C_v. Near source

10108282006 35900

factors N_a and N_v can be determined from 2002 LABC Tables 16-S and 16-T respectively. In order to use the tables it is necessary to know the distance and type of the nearest controlling fault. The State of California Department of Conservation "Active Fault Near-Source Zones" maps are typically used for this determination. According to these maps, a portion of which is included herein on Figure 5, the nearest controlling fault is the Hollywood Fault (a type "B" fault) at a distance of approximately 7-km.

Using the above information and the appropriate tables within the 2002 LABC, the near source factors and seismic coefficient can be determined. These values are summarized in Table 1, Seismic Design Data.

Table 1 – Seismic Design Data

Seismic Zone Factor (Z)	0.4
Soil Profile Type	S_C
Near Source Factor, N_a	1.0
Near Source Factor N_v	1.1
Seismic Coefficient C_a	0.40Na
Seismic Coefficient C_v	0.56Nv

Uniform hazard response spectra for 5 percent damping for hazard levels of 10 percent probability of exceedance in 50 years (475 ARP) and 10 percent probability of exceedance in 100 years (949 ARP) are presented in graphical and tabular form in Figures 6 and 7, respectively.

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1 General

Based on the available data, the primary geotechnical considerations with respect to the proposed construction will be the control of groundwater and support of proposed excavations. We recommend that new structures be founded on spread footing foundations and/or Cast-In-Drilled-Hole (CIDH) pile foundations bearing into suitable undisturbed bedrock formational materials. Any CIDH piles will need to be temporary cased to facilitate hand cleaning and inspection of the pile bottoms.

Based on our review of the 100% Schematic plans we anticipate that suitable formational bearing materials will generally be encountered at depths of three feet or less below the planned slab on grade elevations with the exception of two areas. One area is the northern portion of the office tower where the slab on grade is planned to have a finish elevation on the order of 274 feet.

10108282006 35900

Suitable bearing materials are expected at elevations of approximately 258 feet in this area. The other area is within the southern half of the eastern edge of the site where suitable bearing materials are expected at elevations of approximately 252 feet.

Dewatering will be necessary during construction. The dewatering system implemented for the project will need to consider the effects on adjacent structures. In addition long-term permanent dewatering will be required for the portion of the structure below groundwater to reduce the potential for the development of hydrostatic uplift and lateral pressures against the structural components. Permanent dewatering could increase the risk of pulling contaminated groundwater to the site that could require more elaborate treatment of the water prior to discharging. Alternatively, the portion of the structure below the design groundwater level could be designed and constructed as a water tight structure resistant to the effects of hydrostatic uplift and lateral pressures.

Detailed geotechnical engineering recommendations addressing the surficial soils, site preparation, site earthwork, groundwater control, shoring, foundations, slabs-on-grade, retaining walls and pavements are presented in the remaining portions of this report. The following opinions, conclusions, and recommendations are based on the properties of the materials encountered in the exploratory borings and the results of laboratory tests.

A representative of GED will need to provide observation and testing services during installation of shoring, site earthwork and construction of foundations. This will allow us the opportunity to compare actual conditions with those encountered in the exploratory borings and, if necessary, to expedite supplemental recommendations if warranted by the exposed subsurface conditions. We shall also review your preliminary foundation and earthwork plans and specifications. This review will provide us an opportunity to detect misinterpretation or misunderstandings of our recommendations prior to the start of construction.

8.2 Site Preparation and Earthwork

8.2.1 Site Clearing

Prior to construction, all organic or inorganic materials and debris shall be removed from the construction area and disposed of outside the site. Any existing structural elements within these areas, including any foundation elements, shall be demolished and removed from the site. Any utilities, whether active or inactive, shall be identified and removed from the site or relocated per project plans and specifications. Any cavities resulting from removal of any existing foundations or utility lines that are below planned subgrade elevations should be properly backfilled and compacted in accordance with the following sections.

8.2.2 Dewatering

Perched groundwater was typically encountered in the alluvial soils above the bedrock in the exploratory borings drilled for the project. Groundwater will be encountered during excavation for

10108282006E5900

the planned subterranean levels and will need to be controlled during construction. Data for the site vicinity indicates that the groundwater gradient is downward to the southeast. Thus, greater groundwater seepage is expected to enter through the north and west sides of the planned excavation during construction. The dewatering system implemented for the project will need to consider the effects on adjacent structures.

An environmental analysis of the groundwater was not part of the scope of this investigation. Water discharged into the storm drain system will have to meet the current NPDES discharge permit. For discharge into the sewer system an Industrial Wastewater permit can be obtained from the City of Los Angeles Bureau of Sanitation. Localized contaminated groundwater could also be encountered during construction. Groundwater removed from the site shall be discharged in accordance with all applicable environmental regulations.

The amount of groundwater flow into the excavation during construction will be a function of the permeability of the alluvial soils and the seepage area. In general, we anticipate that groundwater flow can be controlled during construction with sump pumps located along the edge of the excavation. If the groundwater inflows cannot be controlled with sump pumps then a combination of sump pumps and well points can be used. If desirable, a pump test could be performed prior to construction to provide a better estimate of the flow quantity. The groundwater control system should be designed, constructed and operated to control the inflow of groundwater into the site without significantly impacting groundwater levels outside the site.

If the portion of the structure below the design groundwater level is designed and constructed as a water tight structure then permanent groundwater control would not be required. However, groundwater control will need to be maintained until construction has progressed above the design groundwater level, and sufficient structural dead-load and lateral support have been provided to counteract hydrostatic pressures.

8.2.3 Temporary Excavations

Based on our observations during subsurface investigation and results of laboratory tests, the materials at the site should be readily excavated by conventional earthmoving equipment in good operating condition. Remnants of previous construction and construction materials of variable size should be expected in the existing fill materials. Cobbles and boulders should also be expected in the existing fill soils and alluvial soils. Bedrock will most likely require ripping to facilitate excavation. All temporary excavations shall conform to the State of California Construction Safety Orders (CAL/OSHA). Unsurcharged, temporary vertical excavations can be a maximum depth of 4 feet. Unsurcharged excavations 4 to 8 feet in depth shall be sloped at a 3/4:1 (H:V) or flatter inclinations or should be shored. Unsurcharged excavations 8 to 12 feet in depth shall be sloped at a 1:1 (H:V) or flatter inclinations or should be shored. Unsurcharged excavations greater than 12 feet to a maximum of 20 feet shall be sloped at a 1-1/2:1 (H:V) or flatter inclination or should be shored. All excavating shall be performed under the observation of a representative of the geotechnical engineer.

10108282006135900

8.2.4 Temporary Shoring

Shoring shall be installed where excavations can not be safely performed with temporary slopes. Soldier piles or sheet piles may be used to support vertical cuts. Cantilevered shoring shall be designed to withstand an active equivalent fluid pressure (EFP) of 35 pcf. Braced/tieback shoring is recommended in areas where shoring will be located close to existing streets and/or utilities to limit shoring deflections. Braced shoring can be designed using a uniform rectangular soil pressure of 22H pounds per square foot, where H is equal to the depth of the excavation in feet being shored. This design assumes a level backslope and that no hydrostatic pressure is allowed to develop behind the shoring. Cantilevered shoring is not recommended for support of structures or utilities that cannot tolerate ½ inch or more lateral or vertical movement.

In addition to the above lateral pressure from retained earth, lateral pressures from other superimposed loads, such as those from vehicle traffic and adjacent structures, shall be added to the above recommended lateral earth pressures, if the loads fall within a 1:1 projection of the shoring. A surcharge load equivalent to an additional 2 feet of retained soil shall be applied to the upper 10 feet of shoring if light vehicular traffic is expected adjacent to the excavation. If heavier traffic loads are anticipated near the top of the shoring, additional analysis will be required.

The shoring design must consider support of the proposed adjacent pavements, structures, and/or underground utilities. Also, the effects of shoring deflection on supported pipelines and structures shall be considered.

Continuous lagging shall be provided between soldier piles to control sloughing of the existing fill and alluvial soils. Generally, we anticipate that lagging of the bedrock formational materials will not be required. However, final determination of the need for lagging of these materials shall be made a representative of the geotechnical engineer during construction. A uniform pressure of 350 psf may be used for lagging design. Any voids between the lagging and supported materials shall be immediately filled with compacted sand or slurry.

Drilled holes for soldier piles shall be backfilled with Controlled Low Strength Material (CLSM, *Standard Specifications for Public Works Construction* (Greenbook), Section 201,with a minimum of one sack of Portland cement per cubic yard of slurry and a maximum of two sacks of Portland cement per cubic yard of slurry) from the bottom of the drilled hole to the ground surface. Alternatively, drilled holes can be backfilled with structural concrete from the bottom of the drilled hole to the proposed depth of excavation and slurry above the proposed excavation depth. Structural concrete shall be a minimum 560-C-3250 (Greenbook, Section 201).

Resistance of shoring to lateral loads will be provided by passive earth pressure. An allowable passive bearing against the onsite dense alluvial soils may be taken as an equivalent fluid of 300 and 150 pcf, above and below groundwater, respectively, to a maximum of 3,000 psf. An allowable uniform passive resistance of 4,000 psf can be used in the bedrock formation material. Passive resistance may be considered as starting at 1' below the bottom of excavation. Passive

10108282006 35900

pressures presented in this report are based on the assumption that slurry or concrete will be used to backfill the soldier piles. Use of granular backfill would result in larger deflections and a significant decrease in the allowable passive resistance and therefore is not acceptable. If slurry is used as backfill below the proposed depth of excavation, then the effective width of the pile for the purpose of calculating passive resistance shall be taken as the width of the steel beam. If structural concrete is used then the effective width of the pile for the purpose of calculating passive resistance shall be taken as the width of the drilled hole. To account for the effect of "passive arching" the effective width can be doubled for piles spaced a minimum of 2-1/2 diameters on center.

Soldier pile installation shall be performed under the continuous observation of a representative of the geotechnical engineer. The Contractor shall provide all necessary facilities, at the contractor's expense, to accommodate the observations. Hole excavations shall be plumb to a tolerance of not more than 1/2-inch per 1 foot. At the completion of drilling, secure covers shall be placed over the excavations. Concrete placement shall be completed within the same day of drilling.

Casing or other methods approved by the geotechnical engineer shall be used to support the sides of excavations. Cobbles and occasional boulders should be anticipated during the installation of shoring. The inside diameter of casing shall be at least as large as the diameter of the pile as indicated on the plans. Drilling shall be accomplished within the casing. Drilling fluids shall not be used to support the sides of the excavation without the review and approval of GED.

Concrete pumps, tremies, chutes or other such devices shall be used to place slurry/concrete. In dry holes, slurry/concrete placement shall be done in a manner such that the slurry/concrete does not hit the side of the drilled hole and so that the alignment of the steel pile is not affected. The web of the steel section may be used as a vertical chute for the placement of slurry or concrete provided the slurry/concrete does not impact the sides of the drilled hole during placement.

Temporary casing shall be raised slowly as the pile excavation is filled with slurry/concrete, provided that the bottom of the casing is always a minimum of 3 feet below the level of the slurry/concrete.

GED shall review the plans and specifications for proposed shoring and a GED representative shall observe the installation of shoring. Lateral deflection of the shoring system should be verified periodically during construction so that if excessive deflections occur, they can be detected early and appropriate measures can be taken. A licensed surveyor should be retained to establish monuments on the shoring and the surrounding ground prior to excavation. Such monuments should be monitored for horizontal and vertical movement during construction. Results of the monitoring program should be provided immediately to the project structural (shoring) engineer and GED for review and evaluation.

Shoring design shall be subject to review and approval of the Geotechnical Engineering Division (GED) and the Department of Building and Safety (B&S). Excavation shall proceed in such a

10108282006 35900

manner that no voids are developed between the shoring and supported soil. Any voids between the shoring and supported soils shall be immediately filled with compacted sand or slurry. All shoring shall conform to Section 306-1.1 of the Standard Specifications for Public Works Construction, 2000 Edition (Standard Specifications).

Tie-backs/braces should be installed and pre-loaded as the excavation progresses to reduce shoring deflections and to maintain at-rest earth pressures within the retained soil mass. Tieback anchor design shall conform to the requirements of this report and Department of Building and Safety Research Report No. RR23835 "Requirements for Temporary Tieback Earth Anchors." GED's acceptance criteria for tieback anchors are below. For design of tied-back shoring, it should be assumed that the potential wedge of failure is determined by a plane at 30 degrees from the vertical, through the bottom of the excavation. Tie-back anchors may be installed at angles of 10 to 35 degrees below horizontal. Tieback anchored in the dense alluvial soils, above and below groundwater, can be designed using a skin friction of $55H_s$ and $25\ H_s$, respectively, pounds per square foot, where H_s is the average depth of the anchored zone of the tie-back below the ground surface measured in feet. An allowable adhesion of 1,500 psf can be used for the portion of tiebacks beyond the potential failure wedge anchored in the bedrock formational materials. A factor of safety of at least two should be applied to determine the allowable tie-back design load. Soldier piles for tieback restrained shoring shall be designed to resist the downward vertical load imposed by the tieback anchors. Only the portion of the grouted tieback that is beyond the failure plane shall be considered as bonded length.

All tieback anchors shall be installed and tested conforming to the Department of Building and Safety Research Report RR23835 on requirements for Temporary Earth Anchors and the criteria presented in this section.

Installation

1. Tieback anchors shall be installed at the angle of declination indicated in the approved shoring plans with a tolerance of ±3 degrees.
2. The contractor shall provide all equipment and instrumentation necessary for the inspector to verify placement of concrete within the anchor zone.
3. Note that the use of high pressure grouted tiebacks is not currently accepted by the Department of Building and Safety.
4. Backfilling the unbonded zone of the tieback shall be accomplished by a method acceptable to the geotechnical engineer.
5. Tiebacks spaced closer than 2 ½ diameters center-to-center shall be drilled and placed alternately.

Testing

1. The allowable design capacities of all tiebacks shall be verified by a program of proof tests and performance tests.
2. A minimum of 2 percent of all tiebacks shall be performance tested to 200 percent of design load for 24 hours by the following procedure.
   A. A nominal alignment load shall be applied and axial elongation with respect to a

10108282006 35900

fixed reference independent of the shoring established.

B. The axial loading shall be applied in increments of 25 percent of design load. Each incremental load shall be maintained for a period of 1 minute with the axial elongation measured at the beginning and end of this period, and the load released to the alignment load and the axial elongation shall be measured following each successive maximum. For example, the load sequence as a percentage of design load would be: Alignment load, increase to 25 percent of design load, release to Alignment load, increase to 25 percent of design load, increase to 50 percent of design load, release to Alignment load, increase to 25 percent of design load, increase to 50 percent of design load, increase to 75 percent of design load, release to Alignment load, etc.

C. Upon reaching 200 percent of design load, the load shall be maintained for a period of 24 hours. The axial elongation from the time of application of the 200 percent load to the conclusion of the 24 hours shall not exceed 0.50 inch. Total elongation from the initial alignment load application to the conclusion of the test shall not exceed 4 inches.

D. If movement exceeds 0.50 inches after 24 hours, the tieback may be rejected or the load may be reduced starting with 150 percent of design load or lower and maintained for additionall 5 minute increments at the discretion of the geotechnical engineer until a load resulting in a movement of less than 0.10 inch during a 15 minute interval is determined. Once the geotechnical engineer has determined the sustainable load, the down-rated design load shall be taken as the sustainable load divided by 1.75.

E. Upon completion of the test period, the load shall be incrementally reduced while taking measurements.

F. If the deflection measurements are acceptable to the geotechnical engineer, the tieback shall be locked-off at 100 percent of rated design load.

3. In addition to the above performance tests, a minimum of 10 percent of all tiebacks shall be proof tested to 200 percent of design load for 30 minutes by the following procedure.

A. Follow steps 2A and 2B for performance tests shown above.

B. Upon reaching 200 percent of design load, the load shall be maintained for a period of 30 minutes. The axial elongation from the time of application of the 200 percent load to the conclusion of the 30 minutes shall not exceed 0.25 inch. Total axial elongation from the initial alignment load application to the conclusion of the test shall not exceed 4 inches.

C. If movement exceeds 0.25 inch after 30 minutes, the tieback may be rejected or the load may be reduced starting with 150 percent of the design load or lower and maintained for additional 15 minute increments at the discretion of the geotechnical engineer until a load resulting in a movement of less than 0.10 inch during a 15 minute interval is determined. Once the geotechnical engineer had determined the sustainable load, the down-rated design load shall be taken as the

sustainable load divided by 1.75.

D. Upon completion of the test period, the load shall be incrementally reduced while taking measurements.

E. If the deflection measurements are acceptable to the geotechnical engineer the tieback shall be locked-off at 100 percent of rated design load.

4. All remaining anchors shall be proof tested to 150 percent of design load for 15 minutes by the following procedure.

A. Follow step 2A for performance tests shown above.

B. Axial load shall be applied in increments of 25 percent of design load. Each incremental load shall be maintained for a period of 1 minute with axial elongation measured at the beginning and end of this period, and the load released to alignment load and axial elongation measured following each successive maximum. For example, the load sequence as a percentage of design load would be: Alignment load, increase to 25 percent of design load, release to Alignment load, increase to 25 percent of design load, increase to 50 percent of design load, release to Alignment load, increase to 25 percent of design load, increase to 50 percent of design load, increase to 75 percent of design load, release to Alignment load, etc. The immediate alignment readings may be omitted at the discretion of the geotechnical engineer.

C. Upon reaching 150 percent of design load, the load shall be maintained for a period of 15 minutes. The axial elongation from the time of application of the 150 percent load to the conclusion of the 15 minutes shall not exceed 0.10 inch. Total axial elongation from the initial alignment load application to the conclusion of the test shall not exceed 4 inches.

D. If movement exceeds 0.10 inch after 15 minutes, the tieback may be rejected or the load may be reduced and maintained for additional 15 minute increments at the discretion of the geotechnical engineer until a load resulting in a movement of less than 0.10 inch during the 15 minute interval is determined. Once the geotechnical engineer had determined the sustainable load, the down-rated design load shall be taken as the sustainable load divided by 1.75.

E. If the deflection measurements are acceptable to the geotechnical engineer the tieback shall be locked-off at 100 percent of rated design load.

8.2.5 Subgrade Preparation

All exposed subgrade soil surfaces should be observed by a representative of the GED and the City of Los Angeles Grading Inspector prior to placement of any fill or being covered with subsequent construction. If soft, yielding, or unsuitable soils are exposed at the subgrade surface, then the unsuitable soils should be removed and replaced with properly compacted fill soils.

Alluvial subgrade surfaces suitable for fill placement or slab-on-grade construction should be

scarified to a depth of 6 inches, moisture-conditioned between optimum moisture content and a few percent above the optimum moisture content and compacted. Alluvial subgrade soils shall be compacted to a minimum of 95 percent of the ASTM Test Method D1557-91 laboratory maximum density to a depth of 6 inches below the surface grade. After the completion and acceptance of the subgrade preparation, fill material may be placed in accordance with the following recommendations. Bedrock subgrades shall be observed, probed and possibly proof-rolled prior to the placement of subsequent construction. Bedrock subgrade soils shall not be allowed to dry out and shall be maintained at the natural moisture content until covered with subsequent construction.

8.2.6 Fill Materials

Fill soils shall consist of on-site granular soils or approved import material. The on-site granular soils encountered during the geotechnical investigation are acceptable for use as fill material for this project. Before being used as fill, on-site soils shall be cleaned of all organic or inorganic debris and all materials with any dimension larger than 3 inches. Import material for use as fill for this project shall be predominantly granular in nature with less than 35% mostly non-plastic material passing the No. 200 sieve. Import material shall be non-expansive (EI less than 20) and shall be free of organic or inorganic debris, contamination and materials with any dimension larger than 3 inches. Import material shall be tested and approved by GED prior to importing to the job site. GED shall be notified a minimum of three working days prior to the scheduled importing of the soil to the project site.

8.2.7 Fill and Backfill Placement

Fill shall only be placed on approved surfaces/subgrades prepared in accordance with Section 8.2.5 of this report. Fill shall be placed in loose lifts not exceeding 8 inches in thickness, moisture-conditioned between optimum moisture content and a few percent above the optimum moisture content and mechanically compacted. Fill soils placed in the foot-print of structures shall be compacted to a minimum of 95 percent relative compaction, as determined by ASTM Test Method D1557-91. Fill soils placed in other areas such as wall backfill, sidewalk and landscaped areas shall be compacted to a minimum of 90 percent relative compaction, as determined by ASTM Test Method D1557-91. Any aggregate base should be moisture-conditioned between optimum and two percent above optimum-moisture and compacted to a minimum of 95 percent relative compaction. Fill compaction shall be tested and recorded by a certified compaction testing agency working under the direct supervision of GED. Densification by flooding or jetting is not allowed.

8.2.8 Trench Backfill

Trench excavations for utility pipes may be backfilled with onsite soils under the observation of a representative of GED. After utility pipes have been laid and properly bedded, the space around the pipe should be backfilled with clean sand (having sand equivalent of 30 or greater) or gravel to a depth of approximately 1 foot over the top of the pipe, before the controlled backfill is

10108282006E5900

placed. Controlled backfill shall be moisture conditioned, placed and compacted in accordance with the recommendations presented in Section 8.2.7 of this report.

8.3 Uplift and Hydrostatic Pressures

The portions of the structure that extend below the design groundwater level shall be provided with sub-drains to reduce the potential for the development of hydrostatic pressures. Alternatively, these portions of the structure can be designed to resist hydrostatic uplift and lateral pressures. A design groundwater elevation of 270 feet can be assumed for design purposes. Hydrostatic pressures may be calculated using the depth of the structural penetration below the design groundwater level and a water density of 62.4 pounds per cubic foot (pcf).

Uplift may be resisted by a combination of dead weight of the structure and protective backfill cover. Backfill may be assumed to have a unit weight of 110 pounds per cubic foot (pcf) above the highest anticipated water level. Submerged backfill may be assumed to have a buoyant unit weight of 42 pcf.

8.4 Structure Foundations

Based on our understanding of the proposed construction and the characteristics of the on-site earth materials, proposed structures may be supported on conventional continuous and/or spread footings and/or end bearing CIDH piles. All footings/piles shall be founded at least 24 inches below the lowest adjacent grade and shall bear on undisturbed Siltstone/Claystone bedrock. Some footings may have to be deepened during construction to extend through natural soils to bear a minimum of two feet into the Siltstone/Claystone formation materials. A minimum width of 24 inches for continuous footings and 36 inches for column footings is recommended. A minimum diameter of 36 inches is recommended for CIDH piles to facilitate hand cleaning and inspection of the pile bearing surfaces. CIDH piles shall be temporary cased to allow for safe cleaning and inspection of the pile bottoms. Placement of concrete in piles shall be performed on the same day that they are drilled. Spread footing foundations with these minimum sizes may be designed for a net allowable vertical bearing pressure of 5,000 pounds per square foot (psf) for dead-plus-live loads. Pile foundations with a minimum diameter of 36 inches can be designed for a net allowable vertical bearing pressure of 5,000 pounds per square foot (psf) for dead-plus-live loads. These allowable bearing pressures may be increased by 500 psf for each additional foot of footing width or depth to a maximum of 10,000 psf. The allowable bearing pressures include a factor of safety of 3. A 1/3 increase may be used for short term loading conditions such as wind or seismic forces.

We recommend that all continuous footings be reinforced with a minimum of two No.5 steel reinforcing bars at the top and bottom to provide structural continuity and to permit spanning of local irregularities. The structural engineer should design the actual footing reinforcement.

Resistance to lateral loads can be provided by friction acting at the base of foundations and by passive earth pressure. A coefficient of friction of 0.35 may be assumed with dead-load forces.

10108282006 35900

An allowable passive lateral earth pressure of 700 psf per foot of depth, to a maximum of 7,000 psf, may be used for sides of footings poured against undisturbed bedrock formation materials. This allowable passive pressure is applicable for level (ground slope equal to or flatter than 5H:1V) conditions only. The allowable passive pressure may be increased by 33 percent of lateral loading due to wind or seismic forces.

A coefficient of vertical subgrade reaction, for a 1-foot-square loaded area, of 350 kips per cubic foot (kcf) may be used for design of foundations bearing on bedrock. Vertical subgrade modulus, k, can be calculated as $k = 350\ (1/B)$, where B is the foundation width in feet.

Total static settlement of the proposed foundations, designed and constructed in accordance with the recommendations presented herein, should not exceed 1/2-inch. Differential settlements should not exceed one-half of the total settlement between adjacent foundations. The majority of these settlements are expected during construction and initial occupation of the building as the loads are applied.

GED shall observe all foundation excavations prior to the placement of reinforcing steel and concrete. Following GED's observation, the contractor shall be responsible for protecting footing excavations from inundation and erosion during wet weather, maintaining the excavations free of loose and/or disturbed material, and maintaining the proper moisture content of the footing excavations (existing in-situ moisture content) until the placement of concrete. The sides and bottom of the footing excavations shall not be allowed to dry and crack.

All aspects of CIDH pile installation shall comply with the acceptance criteria for cast-in-drilled-hole piles presented in the following paragraphs.

1. Pile installation shall be performed under the continuous observation of the geotechnical engineer of record to confirm that the recommended earth materials are penetrated, and that pile installation has been performed as recommended herein. The Contractor shall provide necessary facilities at his expense to accommodate pile observations.
2. The pile excavation shall be plumb to a tolerance of not more than 1/2-inch for 3 feet.
3. Where caving soils are encountered, casing or other methods approved by the geotechnical engineer of record shall be used to support the sides of the pile excavation. The inside diameter of casing shall be at least as large as the diameter of the pile as indicated on the plans. Drilling shall be accomplished within the casing.
4. Pumps and sumps shall be used, as necessary, to remove any encountered groundwater to facilitate cleaning and inspection of the pile bottoms. The contractor shall provide all necessary equipment to facilitate safe cleaning and inspection of the pile bottoms.
5. At the completion of drilling, secure covers shall be placed over the pile

10108282006 35900

excavation. Concrete placement shall begin within 8 hours after completion of drilling. Placed concrete shall have a slump of 6 inches, with a tolerance of 1 inch.

6. Concrete placed in dry holes shall not be allowed to fall freely more than 5 feet. Concrete pumps, tremies or other such devices shall be used to comply with these requirements.

7. Concrete shall always be placed under water using concrete pumps and hoses, or equal, extending to the bottom of the pile excavation. A head of at least 4 feet of concrete shall always be maintained over the end of the concrete pump pipe so that water and disturbed soils are forced from the excavation. Also, the concrete strength shall be increased by 1000 psi over the design strength.

8. Any temporary casing shall be raised slowly as the pile excavation is filled with concrete, provided that the bottom of the casing is always a minimum of 3 feet below the level of the concrete.

9. Concrete placement shall continue until suitable concrete extends to the top of the pile excavation. The tremie or concrete pump pipe shall be slowly raised as the pile excavation is filled with concrete, provided that the bottom of the pipe is never more than 5 feet above the level of the concrete.

10. Piles spaced closer than 2.5 pile diameters center to center shall be drilled and concreted alternately, allowing at least 12 hours after concrete placement in one pile before drilling of an adjacent pile.

8.5 Retaining Walls

Cantilevered retaining walls that retain a level granular (Expansion Index < 20 and sand equivalent of 30 or greater) backfill for a horizontal distance equal to or greater than the height of the wall may be designed for an active equivalent fluid pressure of 35 pcf. Walls that are fixed against rotation (no movement allowed) that retain a level granular (Expansion Index < 20 and sand equivalent of 30 or greater) backfill for a horizontal distance equal to or greater than the height of the wall can be designed using at-rest equivalent fluid pressures of 55 pcf. Earth pressures presented herein assume that sufficient drainage will be provided behind the walls to reduce the build-up of hydrostatic pressures from surface and subsurface water infiltration. If not, groundwater pressures should be added to the above lateral earth pressures.

In addition, lateral pressures from other superimposed loads, such as those from vehicle traffic and adjacent structures, shall be added to the above recommended lateral earth pressures if the loads fall within a 1:1 projection of the walls. A surcharge load equivalent to an additional two feet of retained soil shall be applied to the upper 10 feet of walls if light vehicular traffic is expected adjacent to the excavation. If heavier traffic loads are anticipated near the top of the walls, additional analysis will be required.

10108282006 35900

For structural analyses, average horizontal modulus of subgrade reaction values of 20 pci, 120 pci, and 150 pci can be assumed for the existing fill soils, alluvial soils and bedrock materials, respectively. For analysis purposes, we recommend a soil profile consisting of 15 feet of fill, over 10 feet of alluvium over bedrock for the subterranean walls.

Backfill against retaining walls should consist of free-draining granular soil with an Expansion Index less than 20 and sand equivalent of 30 or greater. Backfill should be placed in 8-inch or thinner loose lifts and compacted to a minimum of 90 percent of the ASTM Test Method D1557 maximum density. Compaction should be performed by mechanical means only and monitored by testing during construction. Care should be taken not to damage walls during backfill operations. Concrete should attain the strength specified by the structural engineer prior to placement of large quantities of backfill.

Earth pressures presented herein also assume that only hand operated compaction equipment will be used within five feet of walls to limit compaction lateral stresses. The operation of compaction equipment behind retaining walls can induce horizontal pressures in excess of the at-rest pressures on the wall. To help reduce the development of excessive horizontal pressures over compaction should be avoided.

Earth pressures used in the design of the walls should be indicated on the retaining wall plans. All retaining wall designs and plans should be reviewed by the project geotechnical consultant to confirm that the appropriate soil parameters are used.

Final surface grades should be sloped at a gradient such that surface water drains away from the structures and retaining walls. All retaining walls not designed to resist hydrostatic pressure should be adequately drained to prevent the buildup of hydrostatic pressures behind the walls due to groundwater, storm water, nuisance surface water, and/or utility line leaks. To provide adequate drainage, the retaining walls can be covered with a geotechnical drainage fabric connected to a 4-inch diameter perforated drain pipe extending along the bottom of the wall. This pipe should be placed with perforations sideways or down, and surrounded with Class 2 Caltrans permeable material (Section 68-1.025 of the Caltrans Standard Specifications) wrapped in filter fabric. Drain pipes should flow to a sump with a pump, or by gravity to a suitable outlet.

8.6 Slab-on-Grade

All slab-on-grade areas shall be prepared in accordance with Section 8.2 of this report. As a minimum, we suggest that conventional slabs-on-grade within structures that will not be subjected to vehicular traffic be a minimum of 5 inches thick and reinforced with No. 4 deformed steel reinforcing bars at 16 inches on center each way placed at mid-depth through the slab. The actual thickness and reinforcing of concrete slabs shall be determined by the project civil or structural engineer.

The minimum recommended steel will not prevent the development of slab cracks but will aid in keeping joints relatively tight and will reduce the potential for differential movement between

10108282006 35900

adjacent panels. Care should be taken to avoid slab curling if slabs are poured in hot weather. Slabs should be designed and constructed as promulgated by the Portland Cement Association (PCA). Prior to the slab pour, all utility trenches should be properly backfilled and compacted.

In areas where a moisture-sensitive floor covering (such as vinyl, tile, or carpet) is used, slabs can be protected by a minimum 10-mil-thick polyethylene vapor retarder between the slab and compacted subgrade. Where the vapor retarder is used, it can be placed between two 1-inch layers of sand to protect it from punctures and to aid in the concrete cure. Vapor retarder seams should be overlapped a minimum of 6 inches and taped or otherwise sealed.

If the slabs on grade are not designed to resist the buoyant forces of groundwater then a drainage system be constructed beneath the slabs on grade. The drainage system should consist of a blanket of crushed rock, Class II permeable base material, or drain rock. Perforated pipes leading to pumps should be provided in the drainage blanket. The system should be designed to maintain the groundwater level a minimum of three feet below the slabs-on-grade. Design of the drainage system should be based on input from the project structural engineer, civil engineer, and geotechnical engineer.

8.7 Cement Type and Corrosion Measures

Based on the corrosivity test results, the near-surface soils may be corrosive to concrete and buried metals. A corrosion engineer should be retained to provide specific recommendations for design of concrete and metals in contact with the site earth materials. As a minimum, the following corrosion mitigation measures are considered appropriate for the site soils:

- All steel and wire concrete reinforcement should have at least 3 inches of concrete cover where cast against soil, unformed.
- As a minimum, below grade ferrous metals should be given a high-quality protective coating, such as 20-mil plastic tape, extruded polyethylene, coal-tar enamel, or Portland Cement mortar.
- Below grade metals should be electrically insulated (isolated) from above grade metals by means of dielectric fittings in ferrous utilities and/or exposed metal structures breaking grade.

9.0 SUPPLEMENTAL GEOTECHNICAL SERVICES

9.1 Review of Plans and Specifications

This report shall be included as part the plans and specifications for this project in accordance with BOE Special Order Number 0040400. It is recommended that GED review preliminary plans to provide timely geotechnical comments for design consideration. GED shall review the plans and specifications as part of the final plan check stage.

10108282005E5900

9.2 Geotechnical Observation and Testing During Construction

All grading, excavation, and construction of foundations should be performed under the observation and testing of the Geotechnical Engineer at the following stages:

- Upon completion of site clearing;
- During installation of shoring;
- During subgrade preparation;
- During fill placement;
- After excavation of footings and immediately prior to placement of foundation concrete;
- During construction of any CIDH piles;
- During backfilling of retaining walls;
- During excavation and backfilling of all utility trenches; and
- When any unusual or unexpected geotechnical conditions are encountered.

9.3 Closure

If there are any questions regarding this report, please contact Benjamin Moore at (213) 485-8362 or Patrick J. Schmidt at (213) 847-4046.

Proposed New Police Headquarters Facility
City Block Bounded by First Street on the North, Main Street on the East, Second Street on the South, and Spring Street on the West
Work Order E170910B - GED File 04-120
Contract No. C-98923
Los Angeles, California

Dear Mr. Johnson:

Kleinfelder, Inc. (Kleinfelder), is pleased to present this data report summarizing our geotechnical field exploration and laboratory testing performed for the proposed New Police Headquarters Facility, located in the city block bounded by First Street on the North, Main Street on the East, Second Street on the South, and Spring Street on the west in Downtown Los Angeles, California. This data report presents the results of our soil borings conducted at the subject site and the laboratory testing results. Engineering analysis and geotechnical recommendations for the subject site were beyond our authorized scope of work.

PROJECT DESCRIPTION AND SCOPE OF WORK

The proposed new police headquarters facility was investigated at the subject city block. The site is currently occupied by the former CALTRANS building. The site also contains two commercial structures located along First Street. The project will include demolition of the existing facilities and construction of the new Police Headquarters facility. The new construction is expected to include a 10 to 14-story building with two to three levels of below grade parking. The site was investigated adjacent to the existing structures as well as within the existing below grade parking garage. The location of the site is shown on Plate 1, Site Location Map.

KLEINFELDER 1370 Valley Vista Drive, Suite 150, Diamond Bar, CA 91765-3910 (909) 396-0335 (909) 396-1324 fax
10108282006 35900

The authorized scope of work for this project consisted of the following tasks:

- A site walk, record review and USA clearance;
- Drilling and sampling a total of 15 borings on the site (original proposal scope (9/15/04) included 13 borings with only three in basement level. Scope revised by GED to 15 borings during fieldwork);
- Performance of a laboratory testing program;
- Preparation of this data report.

FIELD EXPLORATION

Borings B-1, B-11, and B-13 were advanced on First and Main Street on December 13, 2004, Borings B-2 and B-3 were drilled on December 15, 2004, Borings B-4 and B-5 were advanced on December 16, 2004, and Borings B-6, B-8, and B-8A were advanced on December 17, 2004. The borings performed between December 13, 2004 and December 17, 2004 were advanced with a truck mounted hollow stem auger rig provided by CalPac Drilling of Calimesa, California.

Borings B-7 and B-12, Borings B-1A and B-13A, and Boring B-9, were advanced on December 20 and 21, 2004, and on January 5, 2005, respectively. The five borings completed on December 20 and 21, 2004, and January 5, 2005 were advanced using a track mounted hollow-stem limited access rig provided by Pacific Drilling of San Diego, California.

The borings were advanced to depths ranging from approximately 2 feet to approximately 81½ feet below existing grade. Borings B-1 and B-13 encountered refusal at depths of approximately 2 feet and 16 feet below existing adjacent grade. These two borings were relocated (as B-1A and B-13A) to the basement parking garage area as directed by Mr. Schmidt. Boring B-8 was relocated in close proximity (B-8A) due to refusal at two feet below the surface. Boring B-10 to be performed in the basement level was cancelled by Mr. Schmidt.

Jeff Waller and Debbie DeWolf, staff professionals with Kleinfelder, logged the borings, measured the VOC's using a PID, and collected the geotechnical soil samples. Selected relatively undisturbed samples were retrieved, sealed and transported to our laboratory for further evaluation and testing. Soil samples were driven into the bottom of the hollow stem auger borings with a 140-lb hammer falling 30 inches. The number of blows necessary to drive a California-type and Standard Penetration Test (SPT) sampler 12 inches were recorded on the logs. At the completion of drilling and sampling, Borings B-1, B-11, and B-13 were backfilled with cement slurry. All remaining borings were backfilled and tamped with soil cuttings from the boring. Borings in the roadway, parking garage, and access driveway were capped with quickset concrete. Boring B-2 and B-3 were excavated in asphalt parking areas and were capped with cold patch asphalt. Boring B-6 was located in a landscape area and was not capped. Latitude and longitude as well as a description of boring positions measured from permanent features are presented on the boring logs. The Latitude and Longitude of the borings performed in the below grade parking garage is not presented due to satellite interference by the building. The soil materials encountered were classified and logged in accordance with the Unified Soil Classification System (USCS). An explanation of the logs is presented on Plates A-1a and A-1b. The Logs of Borings are presented on the attached Plates A-2 through A-16. The approximate locations of the borings are shown on Plate 2, Plot Plan.

LABORATORY TESTING

Geotechnical laboratory tests were performed on representative disturbed and relatively undisturbed soil samples to estimate engineering characteristics of the various earth materials encountered. Testing was performed in accordance with one of the following references:

1) Lambe, T. William, Soil Testing for Engineers, Wiley, New York, 1951
2) Laboratory Soils Testing, U.S. Army, Office of the Chief of Engineers, Engineering Manual No. 1110-2-1906, November 30, 1970
3) ASTM Standards for Soil Testing, latest revisions
4) Uniform Building Code, 1997 edition

The type and number of tests performed were selected the City of Los Angeles, Department of Public Works / Geotechnical Engineering Division (GED). A summary of the tests performed is presented in the following sections.

Laboratory Moisture and Dry Unit Weight Determinations

Natural moisture content and dry density tests were performed on selected relatively undisturbed samples collected. The moisture content tests were performed in general accordance with ASTM Test Method D 2216. The results are presented on the Logs of Borings and are summarized in Table B-1, Moisture Content and Dry Unit Weight Determinations.

Sieve Analysis

Sieve analyses were performed on six (6) samples of the materials encountered at the site to evaluate the grain size distribution characteristics of the soils and to aid in their classification. The tests were performed in general accordance with ASTM Test Method D 422. The test results are presented in Table B-2, Sieve Analysis Test Results, and as Plate B-1, Grain Size Distribution.

Plasticity Index

Plasticity index testing was performed on three (3) selected samples of the on-site soils to determine plasticity characteristics and to aid in the classification of the soil. The tests were performed in accordance with ASTM Standard Test Method D 4318. The results are presented in Table B-3, Plasticity Index Test Results, and as Plate B-2, Plasticity Chart.

Direct Shear

Direct shear testing was performed on ten (10) relatively undisturbed samples. The tests were conducted to evaluate the soil shear strength parameters in general accordance with ASTM Standard Test Method D 3080. The soil samples were soaked to near saturation prior to testing. The results are presented on Plates B-3 through B-13, Direct Shear Test.

Consolidation

Consolidation testing was performed on nine (9) relatively undisturbed samples in accordance with ASTM Standard Test Method D 2435. The test results are presented as Plates B-14 through B-22, Consolidation Test.

10108282006 35900

R-Value Test

Resistance value (R-value) testing was performed on one (1) sample to evaluate pavement support characteristics of the near-surface onsite soils. R-value testing was performed in accordance with Caltrans Standard Test Method 301. The test result is presented in Table B-4.

Corrosion Test

A series of chemical tests were performed on a selected sample of the onsite soils and a composite sample of bedrock material retained from different depths and boring. The tests were performed to estimate pH, resistivity, sulfate and chloride contents. The test results are presented in Table B-5, Corrosion Test Results.

LIMITATION

This report has been prepared for the exclusive use of the City of Los Angeles, Department of Public Works, Geotechnical Engineering Division for specific application to the subject development in the City of Los Angeles, California. The findings and testing results presented in this report were prepared in accordance with generally accepted geotechnical engineering practice. No other warranty, expressed or implied, is made.

The authorized scope of our preliminary geotechnical services did not include the presence of wetlands, geotechnical engineering analysis, earthquake engineering study, foundation analysis, or construction recommendations.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party.

CLOSURE

We appreciate the opportunity to be of service on this project. If you have any questions or require additional information, please do not hesitate to contact our office.

Respectfully submitted,

NOTES ON FIELD INVESTIGATION

1. SAMPLE – Graphical representation of sample type as shown below.
   - Split Spoon – Standard Penetration Test Sample (SPT)
   - Drive Sample – California Sample (Cal)
   - Bulk Sample – Obtained by collecting cuttings in a plastic bag
   - Tube Sample – Shelby/Pitcher Tube Sample

2. SAMPLE NO. – Sample Number

3. BLOWS/FT – Number of blows required to advance sampler 1 foot (unless a lesser distance is specified). Samplers in general were driven into the soil at the bottom of the hole with a standard (140 lb) hammer dropping a standard 30 inches. Drive samples collected in bucket auger borings may be obtained by dropping non-standard weight from variable heights. When a SPT sampler is used the blow count conforms to ASTM D-1586.

   SCR/ROD – Sample Core Recovery (SCR) in percent (%) and Rock Quality Designation (ROD) in percent (%). ROD is defined as the percentage of core in each run which the spacing between natural fractures is greater than 4 inches. Mechanical breaks of the core are not considered.

4. GRAPHIC LOG – Standard symbols for soil and rock types, as shown on plate B-1b.

5. GEOTECHNICAL DESCRIPTION

   Soil – Soil classifications are based on the Unified Soil Classification System per ASTM D-2487, and designations include consistency, moisture, color and other modifiers. Field descriptions have been modified to reflect results of laboratory analyses where deemed appropriate.

   Rock – Rock classifications generally include a rock type, color, moisture, mineral constituents, degree of weathering, alteration, and the mechanical properties of the rock. Fabric, lineations, bedding spacing, foliations, and degree of cementation are also presented where appropriate.

   Description of soil origin or rock formation is placed in brackets at the beginning of the description where applicable, for example, Residual Soil.

6. DRY DENSITY, MOISTURE CONTENT: As estimated by laboratory or field testing.

7. ADDITIONAL TESTS – (Indicates sample tested for properties other than the above):

MAX – Maximum Dry Density	SG – Specific Gravity	PP – Pocket Penetrometer
GS – Grain Size Distribution	HA – Hydrometer Analysis	WA – Wash Analysis
SE – Sand Equivalent	AL – Atterberg Limits	DS – Direct Shear
EI – Expansion Index	RV – R-Value	CP – Collapse Potential
CHEM – Sulfate and Chloride Content, pH, Resistivity	CN – Consolidation	UC – Unconfined Compression
PM – Permeability	CU – Consolidation Undrained Triaxial	T – Torvane
UU – Unconsolidated Undrained Triaxial	CD – Consolidated Drained Triaxial	

8. ATTITUDES – Orientation of rock discontinuity observed in bucket auger boring or rock core, expressed in strike/dip and dip angle, respectively, preceeded by a one-letter symbol denoting nature of discontinuity as shown below.

   B: Bedding Plane J: Jointing C: Contact F: Fault S: Shear

CONSISTENCY CRITERIA BASED ON FIELD TESTS

RELATIVE DENSITY: COARSE-GRAINED SOIL

RELATIVE DENSITY	SPT * (# blows/ft)	RELATIVE DENSITY (%)
Very Loose	<4	0 - 15
Loose	4 - 10	15 - 35
Medium Dense	10 - 30	35 - 65
Dense	30 - 50	65 - 85
Very Dense	>50	85 - 100

CONSISTENCY: FINE-GRAINED SOIL

CONSISTENCY	SPT (# blows/ft)	TORVANE UNDRAINED SHEAR STRENGTH (tsf)	POCKET ** PENETROMETER UNCONFINED COMPRESSIVE STRENGTH (tsf)
Very Soft	<2	<0.13	<0.25
Soft	2 - 4	0.13 - 0.25	0.25 - 0.5
Medium Stiff	4 - 8	0.25 - 0.5	0.5 - 1.0
Stiff	8 - 15	0.5 - 1.0	1.0 - 2.0
Very Stiff	15 - 30	1.0 - 2.0	2.0 - 4.0
Hard	>30	>2.0	>4.0

* NUMBER OF BLOWS OF 140 POUND HAMMER FALLING 30 INCHES TO DRIVE A 2 INCH O.D. (1 3/8 INCH I.D.) SPLIT BARREL SAMPLER (ASTM-1586 STANDARD PENETRATION TEST)

** UNCONFINED COMPRESSIVE STRENGTH IN TONS/SQ.FT. READ FROM POCKET PENETROMETER

MOISTURE CONTENT

DESCRIPTION	FIELD TEST
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

CEMENTATION

DESCRIPTION	FIELD TEST
Weakly	Crumbles or breaks with handling or slight finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

KLEINFELDER

EXPLANATION OF LOGS

PLATE A-1b

10108282006359OO

Date Drilled:	12/16/04	Water Depth:	> 2 feet
Drilled By:	CalPac Drilling	Date Measured:	12/13/04
Drilling Method:	Hollow Stem Auger	Elevation:	286 feet
Logged By:	J. Waller	Datum:	MSL

Elevation (feet) Depth	Sample Type	Sample Number	Graphic Log	SOIL DESCRIPTION AND CLASSIFICATION	Dry Density (pcf)	Moisture Content (%)	Additional Tests
		1		**Asphaltic Concrete (AC):** approximately 6.5 inches thick.			
				Silty Sand (SM): brown moist.			
				Sand (SP): light brown moist, with gravel.			

Boring terminated due to utility interference.
Total depth: 2 feet.
Groundwater not encountered.
Boring backfilled with Quikset concrete.

59 feet east of Spring Street east curb, 104 feet west of west side of Clark Constriction driveway, 4 feet north of 7th Street south curb.

Latitude: N 34.0527 degrees.
Longitude: W 118.2434 degrees.

CURRENT REFERENCE REPORT/LETTER(S)	REPORT NO.	DATE(S) OF DOCUMENT	PREPARED BY
Soil Report	04-120	02/15/2005	Geotech. Eng. Div.
Field & Laboratory Testing	52307-1	01/26/2005	Kleinfelder

The referenced reports providing recommendations for the proposed New Police Headquarters Facility have been reviewed by the Grading Division of the Department of Building and Safety. According to the report dated 02/15/2005, the project will consist of a eleven-story structure tower in the central portion of the site, an auditorium, café and utility structures along the east side of the site, and subterranean levels.

The site soils consist of up to 10 feet of uncertified fill underlain by natural sands, silts and clays. The clays, in turn are underlain by siltstone/claystone bedrock. The bedrock was encountered from 7 to 27 feet below the grade. According to the boring logs provided, the bedrock contains bedding planes. Excavations up to 20 deep are planned. The referenced Kleinfelder report was not signed by a certified engineering geologist. Consequently, no information on a bedding plane orientation, jointing and other geologic features was provided, which may be crucial for a shoring and retaining wall design.

The report cannot be approved as it lacks sufficient information to determine the stability or safety of the proposed development. An addendum to the report shall be submitted which contains the following information:

AN EQUAL EMPLOYMENT OPPORTUNITY - AFFIRMATIVE ACTION EMPLOYER

1. Provide a geologic report for the site signed by a certified engineering geologist.

2. Provide the most critical geologic cross-sections, generally in N-S and E-W directions and show the existing and proposed grades and structures.

3. Revise recommendations for shoring and retaining wall design to include surcharge from bedding. Active pressure analyses shall utilize the limit equilibrium method (free-body-diagram, and vectors) for a minimum factor of safety of 1.25 and 1.5 for temporary and permanent conditions, respectively. Note, that re-sheared strength for bedrock along a bedding shall be used in the calculations.

4. In addition to the fee for the review of the response to this letter, a fee shall be paid for the review of a geologic report .

The geologist and/or soil engineer shall prepare a report containing the corrections indicated in this letter. The report shall be in the form of an itemized response. It is recommended that once all correction items have been addressed in a response report, to contact the report review engineer and/or geologist to schedule a verification appointment to demonstrate compliance with all the corrections. Do not schedule an appointment until all corrections have been addressed. Bring three copies of the response report, including one unbound wet-signed original for microfilming in the event that the report is found to be acceptable.

Subject: **SUPPLEMENTAL GEOTECHNICAL ENGINEERING REPORT-NEW POLICE HEADQUARTERS FACILITY, CITY BLOCK BOUNDED BY FIRST STREET ON THE NORTH, MAIN STREET ON THE EAST, SECOND STREET ON THE SOUTH, AND SPRING STREET ON THE WEST, DOWNTOWN LOS ANGELES, WO E170910B, GED FILE 04-120**

This report has been prepared in response to the "Soil Report Correction Letter" letter received from the City of Los Angeles Department of Building & Safety (CLADBS) Grading Division. The letter was prepared in regards to the Geotechnical Engineering Division's (GED) Geotechnical Engineering Report for the New Police Headquarters Facility dated February 15, 2005. The geotechnical report was submitted to the CLADBS on March 4, 2005 under Log No 47253. A copy of the "Soil Report Correction Letter" is presented in Appendix A of this letter report. GED received the "Soil Report Correction Letter" on April 7, 2005.

This report responds to the "Soil Report Correction Letter" and request's approval of the geotechnical report. For ease of reference, each of the review comments/requests is repeated with our response.

Comment No. 1

"Provide a geologic report for the site signed by a certified engineering geologist."

Response: The submitted report was a combined soils engineering and geology report for the project. The report contains geologic data for the site and was signed by a certified engineering geologist. The report was submitted to CLADBS for review as a combined Soils Engineering & Geology report. A copy of the "Application for Review of Technical Reports and Import-Export Routes" under which the report was submitted to CLADBS is presented in Appendix B of this letter report.

10210172006 38640

Comment No. 2

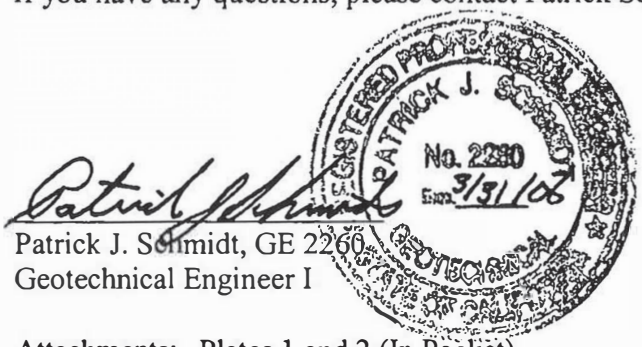
"Provide the most critical geologic cross-sections, generally in the N-S and E-W directions and show the existing and proposed grades and structures."

Response: Proposed site grades will not be greatly different from existing site grades. However, as requested, cross sections were prepared and are attached.

Comment No. 3

Revise recommendations for shoring and retaining wall design to include surcharge from bedding. Active pressure analyses shall utilize the limit equilibrium method (free-body-diagram and vectors) for a minimum factor of safety of 1.25 and 1.5 for temporary and permanent conditions, respectively. Note, that re-sheared strength for bedrock along a bedding shall be used in the calculations.

Response: Additional direct shear testing was performed to determine the re-shear strength for a representative sample of the formational materials that underlie the site. The direct shear test results are presented in Appendix C of this letter report. The repeat shear strength parameters were used to calculate lateral earth pressures using vector analyses. The results of the analyses are presented in Appendix D. The results confirm that the earth pressures presented in the referenced February 15, 2005 geotechnical report are reasonable for the project.



Comment No. 4

In addition to the fee for review of the response to this letter, a fee shall be paid for the review of a geologic report.

Response: As stated in the response to Comment No. 1, the report was submitted to CLADBS for review as a combined Soils Engineering & Geology report. At the time the report was submitted a few was paid for geological review.

Soil Report	04-120	02/15/2005	Geotech. Eng. Div.
Field & Laboratory Testing	52307-1	01/26/2005	Kleinfelder

The current referenced report responding to the Department Correction Letter dated 04/07/20045 has been reviewed by the Grading Division of the Department of Building and Safety.

The referenced reports provide recommendations for the proposed New Police Headquarters Facility. According to the report dated 02/15/2005, the project will consist of a eleven-story structure tower in the central portion of the site, an auditorium, café and utility structures along the east side of the site, and subterranean levels.

The site soils consist of up to 10 feet of uncertified fill underlain by natural sands, silts and clays. The clays, in turn are underlain by siltstone/claystone bedrock. The bedrock was encountered from 7 to 27 feet below the grade. According to the boring logs provided, the bedrock contains bedding planes. Excavations up to 20 deep are planned. The referenced Kleinfelder report was not signed by a certified engineering geologist. Consequently, no information on a bedding plane orientation, jointing and other geologic features was provided, which may be crucial for a shoring and retaining wall design.

AN EQUAL EMPLOYMENT OPPORTUNITY - AFFIRMATIVE ACTION EMPLOYER

The report cannot be approved as it lacks sufficient information to determine the stability or safety of the proposed development. An addendum to the report shall be submitted which contains the following information:

1. Provide a geologic report for the site signed by a certified engineering geologist, as previously requested. Note, that the report by Kleinfelder indicates bedding planes present (Boring B-1A @ 25', Boring B-3 @ 20', Boring B-4 @ 18' etc.), however no bedding attitudes are given.

2. Provided re-shear strength of the claystone bedrock appears to be to high. In addition, reported shearing of the sample for only 5 cycles may not result in the lowest shear strength. Provide additional testing to justified the values given in the report together with the laboratory "raw" data. The depth of a sample selected for testing shall match but need not to exceed the depth of the proposed excavation.

3. Revise recommendations for shoring and retaining wall design to include surcharge from bedding. It is not clear were the angle "alpha." equals to 55 degrees was obtained from. The calculations shall also utilize the angle of bedding given by the engineering geologist..

4. Provide dry density of the sheared sample to demonstrate the saturation prior to testing.

5. Revise cross-sections to show the bedding attitudes.

The geologist and/or soil engineer shall prepare a report containing the corrections indicated in this letter. The report shall be in the form of an itemized response. It is recommended that once all correction items have been addressed in a response report, to contact the report review engineer and/or geologist to schedule a verification appointment to demonstrate compliance with all the corrections. Do not schedule an appointment until all corrections have been addressed. Bring three copies of the response report, including one unbound wet-signed original for microfilming in the event that the report is found to be acceptable.

Subject: **SUPPLEMENTAL GEOTECHNICAL ENGINEERING REPORT-NEW POLICE HEADQUARTERS FACILITY, CITY BLOCK BOUNDED BY FIRST STREET ON THE NORTH, MAIN STREET ON THE EAST, SECOND STREET ON THE SOUTH, AND SPRING STREET ON THE WEST, DOWNTOWN LOS ANGELES, WO E170910B, GED FILE 04-120**

This report was prepared in response to a telephone message received from Mr. Andrzej Szpikowski with the City of Los Angeles Department of Building & Safety (CLADBS) Grading Division on August 8, 2005. In the telephone message Mr. Szpikowski stated that it is the CLADBS policy that the most conservative, worst case shear strength be used for the calculation of earth pressures. In this case, Mr. Szpikowski is requiring the lowest re-shear strength be used for the analyses.

BACKGROUND

The Geotechnical Engineering Division's (GED) Geotechnical Engineering Report for the New Police Headquarters Facility is dated February 15, 2005. The geotechnical report was submitted to the CLADBS on March 4, 2005 under Log No 47253. A "Soil Report Correction Letter", dated April 7, 2005, was received from CLADBS. GED responded to the CLADBS "Soil Report Correction Letter" in a letter dated May 24, 2005. A second "Soil Report Correction Letter", dated June 21, 2005, was received from CLADBS on June 28, 2005. GED responded to the second CLADBS "Soil Report Correction Letter" in a letter report dated July 28, 2005.

As noted in our February 15, 2005 report, the bedrock is generally massive. Prior to the preparation of our July 28, 2005 response letter report, a geologist re-observed samples obtained from the borings in an effort to more clearly define the bedding conditions of the bedrock beneath the site. Of the samples collected from the exploratory borings, approximately 70 were logged as bedrock. Of these, Kleinfelder was only able to clearly identify bedding on seven samples. Of the samples where bedding was observed, the

10211142006406 01

bedding was faint with no signs of previous shearing. Based on this information, there appears to be no justification for the use of re-shear strengths for the design of shoring and subterranean walls for the project. The data indicates that the use of peak or possibly ultimate shear strength parameters is more appropriate for the design of shoring and subterranean walls for the project.

However, in accordance with the requirements of the reviewer, additional analyses was performed using the lowest re-shear (residual) shear strength parameters obtained for the project consisting of 50 pounds per square foot cohesion and a friction angle of 30 degrees. As requested by the reviewer, analyses were performed in five-degree intervals for bedding varying from 10 to 60 degrees with additional analyses for angles of plus and minus 2 and 4 degrees of the critical angle determined from the analyses performed at 5 degree increments. The vector analyses results are presented in Appendix A of this letter report. For these analyses, the largest equivalent fluid pressure values were calculated for an "alpha" angle of 55 degrees.

Based on the results of these additional analyses, braced shoring for the project can be designed using a uniform rectangular soil pressure of 24H pounds per square foot, where H is equal to the depth of the excavation in feet being shored. The subterranean basement walls of the structure, fixed against rotation (no movement allowed), that retain a level backfill for a horizontal distance equal to or greater than the height of the wall can be designed using at-rest equivalent fluid pressure of 56 pounds per cubic foot (pcf). Alternatively, braced subterranean walls retaining level backfills can be designed using a uniform rectangular soil pressure of 28H pounds per square foot, where H is equal to the depth of the excavation in feet being shored. These earth pressures presented herein assume that sufficient drainage will be provided behind the walls to reduce the build-up of hydrostatic pressures from surface and subsurface water infiltration. All other recommendations for shoring and subterranean retaining walls presented in the February 15, 2005 geotechnical report are still valid.

If you have any questions, please contact Patrick Schmidt at (213) 847-4046.

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

Date: July 28, 2005

To: Sam S. Tanaka
Prop Q Program Manager

Attention: Robert Lomelin, Project Manager

From: Christopher F. Johnson, Group Manager
Geotechnical Engineering Division (GED)

Subject: **SUPPLEMENTAL GEOTECHNICAL ENGINEERING REPORT-NEW POLICE HEADQUARTERS FACILITY, CITY BLOCK BOUNDED BY FIRST STREET ON THE NORTH, MAIN STREET ON THE EAST, SECOND STREET ON THE SOUTH, AND SPRING STREET ON THE WEST, DOWNTOWN LOS ANGELES, WO E170910B, GED FILE 04-120**

This report has been prepared in response to the "Soil Report Correction Letter" letter received from the City of Los Angeles Department of Building & Safety (CLADBS) Grading Division on June 28, 2005. The Geotechnical Engineering Division's (GED) Geotechnical Engineering Report for the New Police Headquarters Facility is dated February 15, 2005. The geotechnical report was submitted to the CLADBS on March 4, 2005 under Log No 47253. A "Soil Report Correction Letter", dated April 7, 2005, was received from CLADBS. GED responded to the CLADBS "Soil Report Correction Letter" in a letter dated May 24, 2005. A second "Soil Report Correction Letter", dated June 21, 2005, was received from CLADBS on June 28, 2005. A copy of the June 21, 2005 correction letter s is presented in Appendix A of this letter report.

This report responds to the second "Soil Report Correction Letter" and request's approval of the geotechnical report. For ease of reference, each of the review comments/requests is repeated with our response.

Project Description

Since the issuance of the February 15, 2005 geotechnical report and May 24, 2005 supplement report, the project scope has been revised to remove the lowest parking level and a portion of the second lowest parking level. As a result, the lowest subterranean parking level is now expected to extend down to an elevation of approximately 260 feet. This corresponds to depths of approximately 20 to 27 feet below the ground surface. This is expected to result in excavations extending to depths of approximately 10 feet or less into the underlying bedrock.

1021114200640601

Comment No. 1

"Provide a geologic report for the site signed by a certified engineering geologist, as previously requested. Note, that the report by Kleinfelder indicates bedding plans present (Boring B-1A@ 25', Boring B-3 @ 20', Boring B-4 @ 18' etc.), however no bedding attitudes given."

Response: The February 15, 2005 GED report was a combined soils engineering and geology report that contained geologic data for the site and was signed by a certified engineering geologist. A Geotechnical Data Report prepared by Kleinfelder was presented as Appendix A of the GED report. A geologist did not sign this data report. At the request of CLADBS, Kleinfelder's geotechnical data report was revised to include the signature of a geologist and was submitted to CLADBS on June 24, 2005. Based on our correspondence with CLADBS we understand that the submittal of this data report has adequately addressed Comment No. 1.

Comment No. 2

"Provided re-shear strength of the claystone bedrock appears to be high. In addition, reported shearing of the sample for only 5 cycles may not result in the lowest shear strength. Provide additional testing to justified the values given in the report together with the laboratory "raw" data. The depth of the sample selected for testing shall match but not exceed the depth of proposed excavation."

Response: It is our opinion that the use of re-shear test results for the determination of earth pressures for design of temporary shoring and subterranean walls for the project is overly conservative. Re-shear testing was not performed or even considered during the geotechnical design of the new Caltrans District 7 headquarters building located across Main Street from the proposed project site. Subterranean levels of the Caltrans building extend deeper into bedrock than the proposed Police headquarters building. As noted in the February 15, 2005 report, the bedrock is generally massive. The response to comment No. 5, presented herein, goes into more detail about the lack of distinguishable bedding for the majority of the bedrock samples collected from the site. Where bedding was identifiable, it was typically faint with no observed indication of previous shearing. Based on all these considerations, it is our opinion that peak or possibly ultimate shear strength parameters are more appropriate for the design of shoring and subterranean walls for the project.

However, in accordance with the requirements of the reviewer, an additional re-shear direct shear test was performed for another sample of the site bedrock. Plots of the direct shear test results, stress-strain plots and test data are presented in Appendix B of this report. The previous re-shear test yielded re-shear (residual) shear strength parameters of 150 pounds per square foot cohesion and a friction angle of 31 degrees. This test was ran for five cycles, which was sufficient as indicated by the data. The most recent test yielded re-shear (residual) shear strength parameters of 50 pounds per square foot cohesion and a

10211142006040601

friction angle of 30 degrees. This test was stopped after four cycles since the fourth cycle resulted in higher strength than the third cycle. The values presented herein are based on the results of the third, more conservative cycle.

Comment No. 3

Revise recommendations for shoring and retaining wall design to include surcharge from bedding. It is not clear where the angle "alpha" equals to 55 degrees was obtained from. The calculations shall also utilize the angle of bedding given by the engineering geologist.."

Response: As presented in the response to Comment No. 5, the majority of the bedrock beneath the site is massive with indistinctive bedding. Of the small percentage of samples were bedding could be determined the bedding ranged from 30 to 60 degrees. Bedding was undeterminable in the majority of the samples. The angle "alpha" of 55 degrees was presented in the May 24, 2005 letter because it resulted in the highest equivalent fluid earth pressure.

Additional analyses were performed as requested by the reviewer. As requested by the reviewer we have performed the analyses for five-degree intervals for bedding varying from 10 to 60 degrees. As also requested, we have performed additional analyses for angles of plus and minus 2 and 4 degrees of the critical angle determined from the analyses performed at 5 degree increments. To avoid adding conservatism to conservatism, we believe that if we are required to used re-shear strength parameters for the analyses of earth pressures for the design of shoring and subterranean walls that it is only appropriate to use the average of the two re-shear (residual) strength tests. Thus, we have used re-shear (residual) shear strength parameters of 100 pounds per square foot cohesion and a friction angle of 30 degrees. The vector analyses results are presented in Appendix C of this letter report. For these analyses, the largest equivalent fluid pressure values were calculated for an "alpha" angle of 55 degrees.

Based on the results of these additional analyses, braced shoring for the project can be designed using a uniform rectangular soil pressure of 23H pounds per square foot, where H is equal to the depth of the excavation in feet being shored. The subterranean basement walls of the structure, fixed against rotation (no movement allowed), that retain a level backfill for a horizontal distance equal to or greater than the height of the wall can be designed using at-rest equivalent fluid pressure of 55 pounds per cubic foot (pcf). Alternatively, braced subterranean walls retaining level backfills can be designed using a uniform rectangular soil pressure of 28H pounds per square foot, where H is equal to the depth of the excavation in feet being shored. These earth pressures presented herein assume that sufficient drainage will be provided behind the walls to reduce the build-up of hydrostatic pressures from surface and subsurface water infiltration. All other recommendations for shoring and subterranean retaining walls presented in the February 15, 2005 geotechnical report are still valid.

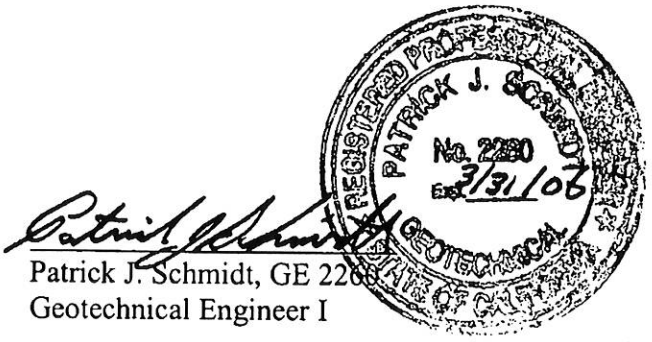
10211142006406 01

Comment No. 4

"Provide dry density of the sheared sample to demonstrate the saturation prior to shearing."

Response: The direct shear plots presented in Appendix B of this report provide the dry densities of the samples.

Comment No. 5



"Re-vise cross-sections to show bedding attitudes."

Response: As stated in the February 15, 2005 report, bedrock beneath the site is generally massive in nature. As a result it was difficult to obtain bedding orientations for the formation. However, in order to respond to the reviewer's request a geologist re-observed samples obtained from the borings in an effort to more clearly define the bedding conditions of the bedrock beneath the site.

Of the samples collected from the exploratory borings, approximately 70 were logged as bedrock. Of these, Kleinfelder was only able to clearly identify bedding on seven samples. Of the samples where bedding was observed, the bedding was faint with no signs of previous shearing. Based on these additional observations, Kleinfelder has prepared a cover letter and revised boring logs which are presented in the attached Appendix D. As stated in Kleinflelder's cover letter, the bedrock beneath the site has been confirmed to be generally massive with indistinctive bedding. Of the seven samples that showed evidence of bedding, the bedding ranged from 30 to 60 degrees. GED has reviewed the Kleinfelder report presented in Appendix D, concurs with and accepts responsibility for the use the data. Due the lack of distinct bedding in the majority of the samples, the cross-sections have not been revised to show bedding attitudes.

Test type	controlled - strain test		
Rate of shear - in/min	0.004		
Normal Stress - psf	1000	2000	4000
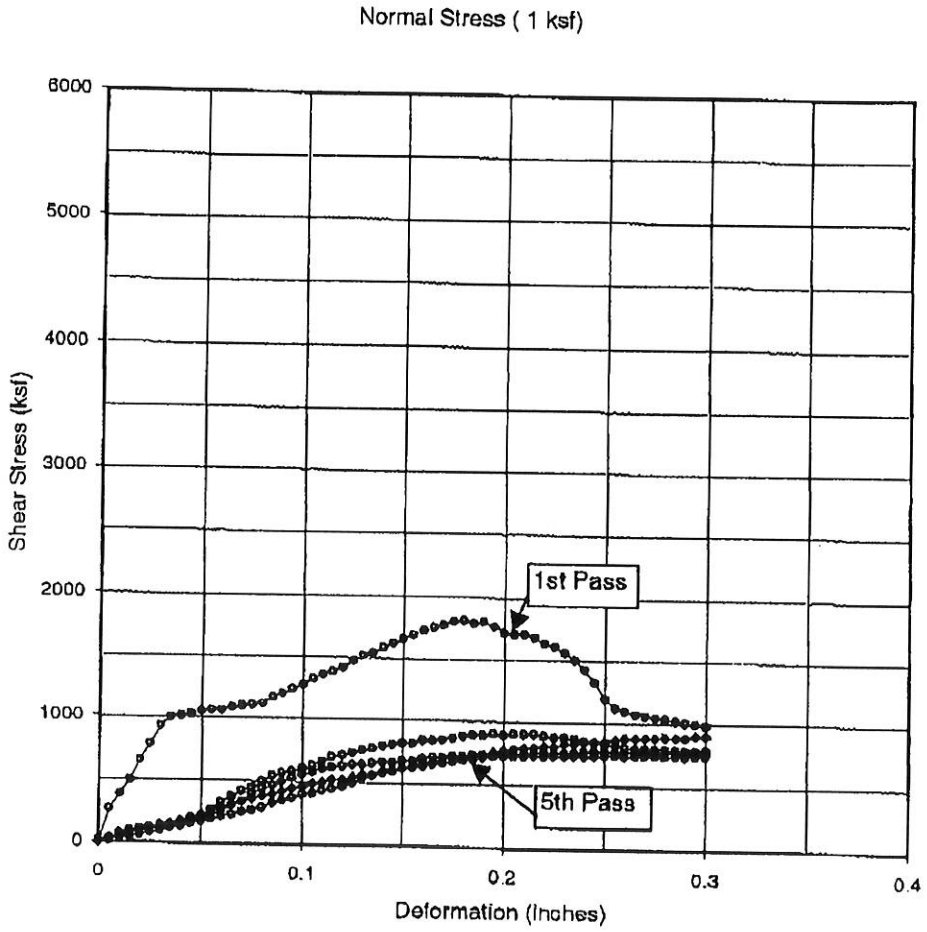
Maximum Shear - psf	1812	2940	4716
Residual Shear - psf	768	1344	2568

Moisture Content Before Test= 26.5 %
Moisture Content After Test = 36.1 %
Initial Dry Density = 85 pcf
Sample was resheared for 5 cycles

Sample	B-4
Depth - ft	35.0
Description	Claystone
Classification	--

Shear Strength	Peak	Residual
Cohesion - ksf	0.80	0.15
Friction Angle - deg	45	31

KLEINFELDER



PROJECT NO. 52307

New Police Headquarters Facility
City Block Bounded by 1st, Main, 2nd and Spring St
Los Angeles, California

Lateral Earth Pressure by Vector Analysis

10211142006406O1

LATERAL EARTH PRESSURE BY VECTOR ANALYSIS

Project: Police Headquarters
File:

W.O. No.: E170910B

		Radians
C (psf)	100	
Phi (degrees)	30	0.523599
Density (pcf)	125	

C=Cohesion based on residual direct shear test
Phi=Internal friction angle from direct shear test
Density=In-place density

C(m)	80	
Phi(m)	24.79128	0.432689

C(m)=C divided by a Factor of Safety (C4/C13)

Subject: **Revised Borings Logs**
Proposed New Police Headquarters Facility
Work Order E170910B - GED File 04-120
Contract No. C-98923
Los Angeles, California

Dear Mr. Johnson:

As requested by Mr. Patrick Schmidt of the GED, we are presenting this letter and revised boring logs as attached indicating the approximate observable bedrock bedding dip angles for the subject site.

We understand that City of Los Angeles grading reviewer has requested for this information to be presented on the boring logs. Our information is based on review of the remaining available disturbed and relatively undisturbed samples collected during our original geotechnical investigation for the site. Our original scope did not include downhole logging of the borings. The results presented on the revised boring logs indicate the observed dip angles only based on the available samples reviewed. Trend directions were not obtainable as the borings and samples were not directionally drilled.

The bedrock underlying the site appears to be generally massive with indistinctive bedding. The bedding dip angles observed on the available samples reviewed that showed evidence of bedding range between 30 to 60 degrees from the horizontal. As mentioned above, trend direction was not obtainable.

The findings and results presented in this report were prepared in accordance with generally accepted geotechnical engineering practice. No other warranty, expressed or implied, is made.

Soil Report	04-120	02/15/2005	Geotech. Eng. Div.
Field & Laboratory Testing	52307-1	01/26/2005	Kleinfelder

The referenced reports by the Geotechnical Engineering Division (GED) and Kleinfelder, Inc. concerning the proposed construction on the subject lots of the New Police Headquarters Facility have been reviewed by the Grading Division of the Department of Building and Safety. According to report dated 02/15/2005, the project will consist of an eleven story office tower in the central portion of the site, an auditorium, cafe and utility structures along the east side of the site and two to three levels of subterranean garages.

As stated previously in the referenced reports and Department Letters, sedimentary bedrock is present below the naturally-occurring alluvium at the locations explored. The bedrock orientation cited from the published regional maps and the approximate observations from the exploration conducted indicate south to slightly east-of-south dips. Temporary excavations facing the dip direction will expose unsupported bedding planes and temporary shoring will be required to support the excavation and to maintain support for the adjoining public streets. It will also be required that portions of the future basement building walls be designed to retain the bedding planes.

The thickness of the exposed bedrock during excavation for building construction is now anticipated to be approximately 10 feet pursuant to revision of the project scope (subterranean parking) as indicated on page 1 of the 07/28/2005 report. The 07/28/2005 report by GED and the 07/13/2005 report by Kleinfelder, Inc. were signed by the geologist. It is recommended on page 10 of the 02/15/2005 GED report that all new structures be founded using conventional and/or cast-in-drilled-hole (CIDH) pile foundations that bear entirely in bedrock. Recommendations for the design of dewatering systems both for temporary and permanent conditions were discussed in section 8.2.2 (pages 11 and 12) of the 02/15/2005 report.

It is indicated in the reports that the proposed structures will be supported in bedrock and that the potential for liquefaction is considered low. This satisfies the requirement of the State of California Public Resources Code, Section 2690 et seq. (Seismic Hazard Mapping Act).

Engineering analyses provided by GED is based on field and laboratory testing performed by Kleinfelder, Inc. GED has assumed responsibility for use of the data in accordance with Code section 91.7008.5 of LABC.

The referenced reports are acceptable, provided the following conditions are complied with during site development:

(Note: Numbers in parenthesis ( ) refer to applicable sections of the 2002 City of LA Building Code. P/BC numbers refer the applicable Information Bulletin. Information Bulletins can be accessed on the internet at LADBS.ORG.)

1. Prior to issuance of any permits, a supplemental report with a map based on the final plans shall be submitted to the Grading Division. The purpose of the report will be to provide any necessary design recommendation updates based on: (a) the final plans, (b) the thickness of the exposed bedrock/excavation height anticipated from the final plans, and (c) to provide any other revised design recommendations that may be required.

2. Prior to issuance of any permits, written clearance for dewatering shall be procured from the California Regional Water Quality Control Board.

3. Prior to issuance of a grading permit, a supplemental report addressing the effect of dewatering on any adjacent structures (see page 12 of the 02/12/2005 GED report) shall be submitted to the Department for review and approval.

4. Prior to the issuance of any permit which authorizes an excavation where the excavation is to be of a greater depth than are the walls or foundation of any adjoining building or structure and located closer to the property line than the depth of the excavation, the owner of the subject site shall provide the Department with evidence that the adjacent property owner has been given a 30-day written notice of such intent to make an excavation. (3301.2.1)

5. A grading permit shall be obtained. (106.1.2)

6. All recommendations of the reports which are in addition to or more restrictive than the conditions contained herein shall be incorporated into the plans.

7. A copy of the subject and appropriate referenced reports and this approval letter shall be attached to the District Office and field set of plans. Submit one copy of the above reports to the Building Department Plan Checker prior to issuance of the permit. (7006.1)

8. The geologist and soils engineer shall review and approve the detailed plans prior to issuance of any permits. This approval shall be by signature on the plans which clearly indicates that the geologist and soils engineer have reviewed the plans prepared by the design engineer and that the plans

include the recommendations contained in their reports.

9. The applicant is advised that the approval of this report does not waive the requirements for excavations contained in the State Construction Safety Orders enforced by the State Division of Industrial Safety. (3301.1)

10. Prior to excavation, an initial inspection shall be called at which time sequence of shoring, protection fences and dust and traffic control will be scheduled.

11. The geologist and soils engineer shall inspect all excavations to determine that conditions anticipated in the report have been encountered and to provide recommendations for the correction of hazards found during grading. (7008.2)

12. Temporary excavations shall be shored and/or sloped back as recommended.

13. Basement excavations shall be performed under the continuous inspection and approval of the soils engineer.

14. A structure shall be considered surcharging an excavation if the structure is located within a horizontal distance from the top of the excavation equal to the depth of the excavation. (3301.2.3.2)

15. Temporary shoring shall be deigned for active pressure of 24H as recommended on page 2 of the report dated 08/09/2005

16. Installation of shoring shall be performed under the continuous inspection and approval of the soils engineer. A registered grading deputy inspector approved by and responsible to the geotechnical engineer shall be required to provide continuous inspection for the proposed shoring. (1701.5.13)

17. A shoring monitoring program shall be implemented to the satisfaction of the soils engineer.

18. Existing uncertified fill shall not be used for support of footings, concrete slabs or new fill. (7011.3 & 1806.1)

19. All proposed structures shall be founded using conventional and/or cast-in-drilled-hole (CIDH) pile foundations that bear entirely in bedrock, as recommended.

20. Pile caisson and/or isolated foundation ties are required by Code Section 91.1807.2. Exceptions and modification to this requirement are provided in Information Bulletin P/BC2001-30.

21. All friction pile or caisson drilling and installation shall be performed under the continuous inspection and approval of the soils engineer. (1807.1)

22. Existing uncertified fill shall not be used for lateral support of deep foundation. (7011.3)

23. Slabs placed on approved compacted fill shall be at least 3½ inches thick and shall be reinforced with ½-inch diameter (#4) reinforcing bars spaced maximum of 16 inches on center each way. Concrete floor slabs placed on expansive soil shall be placed on a 4-inch fill of coarse aggregate or on a moisture barrier membrane. The slabs shall be at least 3½ inches thick and shall be reinforced with ½-inch diameter (#4) reinforcing bars spaced maximum of 16 inches on center each way.

24. Slabs shall be designed for uplift or a drainage system beneath the slab shall be constructed, as recommend.

25. Basement building retaining walls, fixed against rotation, up to a maximum height of 35 feet with

a level backslope shall be designed for a minimum equivalent fluid pressure of 56 pcf, or for uniform rectangular active pressure of a minimum of 28H, as recommended, on page 2 of the report dated 08/9/2005

26. All retaining walls shall be provided with a subdrain system to prevent possible hydrostatic pressure behind the wall. Prior to issuance of any permit, the retaining wall subdrain system recommended in the soil report shall be incorporated into the foundation plan which shall be reviewed and approved by the soils engineer of record. (7015.5 & 108.9)

27. Installation of the subdrain system shall be inspected and approved by the soils engineer of record and the City grading/building inspector. (7015.5 & 108.9)

28. All retaining walls shall be provided with a standard surface backdrain system and all drainage shall be conducted to the street in an acceptable manner and in a non-erosive device. (7013.11)

29. Basement walls and slab shall be waterproofed with an L.A. City-approved "Below-grade waterproofing" material with a research report number.

30. Prefabricated drainage composites (Miradrain) (Geotextiles) may be only used in addition to traditionally accepted methods of draining retained earth.

31. All roof and pad drainage shall be conducted to the street in an acceptable manner. (7013.10)

32. All man-made fill shall be compacted to a minimum 90 percent of the maximum dry density of the fill material per the latest version of ASTM D 1557. Where cohesionless soil having less than 15 percent finer than 0.005 millimeters is used for fill, it shall be compacted to a minimum of 95 percent relative compaction based on maximum dry density (D1556). Placement of gravel in lieu of compacted fill is allowed only if complying with Section 91.7011.3 of the Code.(7011.3)

33. Prior to the placing of compacted fill, a representative of the consulting soils engineer shall inspect and approve the bottom excavations. He shall post a notice on the job site for the LADBS Grading Inspector and the Contractor stating that the soil inspected meets the conditions of the report, but that no fill shall be placed until the LADBS Grading Inspector has also inspected and approved the bottom excavations. A written certification to this effect shall be filed in the final compaction report filed with the Grading Division of the Department. All fill shall be placed under the inspection and approval of the soils engineer. A compaction report together with the approved soil report and Department approval letter shall be submitted to the Grading Division of the Department upon completion of the compaction. The engineer's certificate of compliance shall include the grading permit number and the legal description as described in the permit (7011.3).

34. If compacted fill is to support the slab-on-grade, no slab shall be poured until the compaction report is submitted and approved by the Grading Division of the Department.

35. Prior to the pouring of concrete, a representative of the consulting soils engineer shall inspect and approve the footing excavations. He shall post a notice on the job site for the LADBS Building Inspector and the Contractor stating that the work so inspected meets the conditions of the report, but that no concrete shall be poured until the LADBS Building Inspector has also inspected and approved the footing excavations. A written certification to this effect shall be filed with the Department upon completion of the work. (108.9 & 7008.2)

36. The LABC Soil Type underlying the site is S_C. (1636A)

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

Date: November 21, 2005

To: Sam S. Tanaka
Prop Q Program Manager

Attention: Robert Lomelin, Project Manager

From: Christopher F. Johnson, Group Manager
Geotechnical Engineering Division (GED)

Subject: **SUPPLEMENTAL GEOTECHNICAL ENGINEERING REPORT-NEW POLICE HEADQUARTERS FACILITY, CITY BLOCK BOUNDED BY FIRST STREET ON THE NORTH, MAIN STREET ON THE EAST, SECOND STREET ON THE SOUTH, AND SPRING STREET ON THE WEST, DOWNTOWN LOS ANGELES, WO E170910B, GED FILE 04-120**

This report was prepared to comply with Conditions of Approval Items 1 through 4 of the City of Los Angeles Department of Building & Safety (LADBS), Grading Division "Geology and Soil Report Approval Letter" (Log # 47253-02) dated August 9, 2005. The approval letter included four conditions that GED was to address prior to the issuance of any permits for the project. For ease of reference, each of the conditions is repeated with our response.

BACKGROUND

The Geotechnical Engineering Division's (GED) Geotechnical Engineering Report for the New Police Headquarters Facility is dated February 15, 2005. The geotechnical report was submitted to the LADBS on March 4, 2005 under Log No 47253. A "Soil Report Correction Letter", dated April 7, 2005, was received from LADBS. GED responded to the LADBS "Soil Report Correction Letter" in a letter dated May 24, 2005. A second "Soil Report Correction Letter", dated June 21, 2005, was received from LADBS on June 28, 2005. GED responded to the second LADBS "Soil Report Correction Letter" in a letter report dated July 28, 2005. In addition, GED prepared a third letter report dated August 9, 2005 to respond to a telephone request received from Mr. Andrzej Szpikowski with the LADBS Grading Division on August 8, 2005. The LABDS then issued a Geology and Soil Report Approval Letter on August 9, 2005.

10103092007 45798

Condition No. 1

"Prior to issuance of any permits, a supplemental report with a map based on the final plans shall be submitted to the Grading Division. The purpose of the report will be to provide any necessary design recommendation updates based on: (a) the final plans, (b) the thickness of the exposed bedrock/excavation height anticipated from the final plans, and (c) to provide any other revised design recommendations that may be required."

Response:

GED has reviewed the "Plan Check" set of project plans dated September 29, 2005. Sheet C0-101, Site Survey, indicates existing ground surface elevations of approximately 287-1/2 feet, 282 feet, 283 feet and 280 feet at the northwest, northeast, southwest and southeast corners of the site, respectively. Elevations presented on Sheets A2-2P1 and A2-2P2 indicate that the lowest subterranean parking levels will have finish floor elevations of approximately 267 feet, 251-1/2 feet, 269 feet and 266-1/2 feet in the northwest, northeast, southwest and southeast corners of the site, respectively. In addition, the structural plans indicate that the parking structure perimeter wall footings, adjacent to the site property lines, will typically be founded at depths of 4-1/2 feet to five feet below the top of the floor slabs. Thus, excavation depths on the order of 18 feet to 25 feet below the ground surface will be needed adjacent to the property lines with the exception of the northeast corner where excavation depths of about 36 feet will be required. Updated cross sections are attached.

Borings B-1A, B-3, B-12 and B-13A were located in close proximity to the northwest, northeast, southwest and southeast corners of the site respectively. These boring logs indicate top of bedrock elevations of approximately 266-1/2 feet, 263 feet, 260 feet and 257 feet for borings B-1A, B-3, B-12 and B-13A respectively. Thus, we anticipate that excavations into the bedrock for the subterranean parking levels will be on the order of five feet or less adjacent to Spring Street, five to 17 feet adjacent to First Street, and zero to 17 feet adjacent to Main Street. Excavations are not expected to extend into bedrock adjacent to Second Street.

Previously analyses were performed for excavation depths up to 35 feet into the bedrock. Excavations are now expected to be a maximum of approximately 17 feet into the bedrock. No additional design recommendations are deemed necessary for the planned excavations, temporary shoring and subterranean walls.

Condition No. 2

"Prior to issuance of any permits, written clearance for dewatering shall be procured from the California Regional Water Quality Control Board".

10103092007 45798

Response:

In accordance with the Bureau of Engineering policy, the dewatering system will discharge into the sanitary sewer. An industrial waste permit will be obtained from the Bureau of Sanitation. Therefore, clearance from the California Regional Water Quality Control Board is not applicable.

Condition No. 3

"Prior to issuance of a grading permit, a supplemental report addressing the effect of dewatering on any adjacent structures (see page 12 of the 02/15/2005 GED report) shall be submitted to the Department for review and approval."

Response:

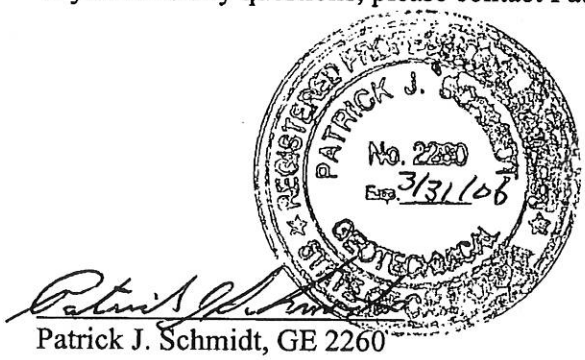
The project will occupy the entire city block bounded by First Street on the north, Main Street on the east, Second Street on the south and Spring Street on the west. Thus, there are no adjacent properties with buildings. The right of way widths of the surrounding streets are 100 feet, 80 feet, 60 feet and 80 feet for First Street, Main Street, Second Street and Spring Street, respectively.

Some of the borings drilled as part of the geotechnical investigation encountered perched groundwater in the alluvial soils immediately above the bedrock contact. As stated in the referenced February 15, 2005 geotechnical report, we anticipate that groundwater flow can be controlled during construction with sump pumps located along the edge of the excavation. Thus, we are anticipating one or more sumps removing water as it enters the excavation. Such a system is not expected to significantly impact the groundwater levels outside the construction areas.

In addition, the boring logs indicate that the native alluvial soils consist of dense to very dense granular soils and stiff to hard fine grained soils. These materials have most likely experienced several occurrences of groundwater level fluctuations and should not be significantly impacted by a small amount of drawdown.

Considering the distance between the project site and the closest building, the subsurface conditions and anticipated dewatering methods during construction, it is our opinion that there is a very low potential for the proposed construction impacting any existing building is the vicinity of the site.

Condition No. 4



"Prior to issuance of any permit which authorizes an excavation where the excavation is to be of a greater depth than are the walls or foundation of any adjoining building or structure and located closer to the property line than the depth of excavation, the owner of

the subject site shall provide Department with evidence that the adjacent property owner has been given a 30-day written notice of such intent to make an excavation."

Response:

As stated previously, the project will occupy the entire city block bounded by First Street on the north, Main Street on the east, Second Street on the south and Spring Street on the west. Thus, there are no adjacent properties with buildings or adjacent property owners to contact.

If you have any questions, please contact Patrick Schmidt at (213) 847-4046.

From: Christopher F. Johnson, Group Manager
Geotechnical Engineering Division (GED)

Subject: **SUPPLEMENTAL FOUNDATION RECOMMENDATIONS FOR SPREAD FOOTINGS ON ALLUVIAL SOIL - NEW POLICE HEADQUARTERS FACILITY, WO E170910B, GED FILE 04-120**

The Geotechnical Engineering Division (GED) has prepared this letter to present supplemental recommendations for the subject project. Supplemental recommendations are presented herein for support of the parking structure spread footing foundations on alluvial soils. Recommendations presented herein are intended to supplement the recommendations presented in GED's geotechnical engineering report for the project dated February 15, 2005. All foundations of the office tower shall be founded on undisturbed Siltstone/Claystone bedrock in accordance with the recommendations of the referenced February 15, 2005 report.

BACKGROUND

At the time the referenced geotechnical report was prepared the project was planned to consist of an office tower surrounded by subterranean parking levels. The lowest parking level was planned to have a finish floor elevations on the order of 249 feet, 245 feet, 258 feet and 261 feet in the northwest, northeast, southeast and southwest corners of the site, respectively. The referenced Geotechnical Engineering Report recommended that all office tower and parking structure foundations be supported in undisturbed bedrock with allowable bearing capacities of 5,000 to 10,000 pounds per square foot (psf).

Since the issuance of the referenced geotechnical report the number of subterranean parking levels has been decreased. Our understanding of the finish floor elevations of the lowest parking levels are based on the information presented in the "Plan Set" set of project plans dated September 29, 2005. Our understanding of these elevations are summarized in the following table.

10103092007 45798

BOUNDING GRID LINES	LOWEST PARKING LEVEL FINISH FLOOR ELEVATION
Lines A, B, 14.4 and 17	Approximately 251-1/2 feet
A, B, 14.4 and 8	Sloping, approximately 251-1/2 feet at Grid Line 14.2 to approximately 252-1/2 feet at Grid Line 8
B, J.8, 8, 11.2	Sloping, approximately 252-1/2 feet at Grid Line B to approximately 262 feet at Grid Line J.8
J.8, L, 8 and 14	Approximately 262 feet
B, H, 11.2 and 14	Sloping upward to Level P1
B, S, 14.4, 17	Sloping, approximately 251-1/2 feet at Grid Line B to approximately 266-1/2 feet at Grid Line S
S, Y, 14.4, 17	Approximately 266-1/2 feet
S, Y, 4, 14.4	Sloping, approximately 266-1/2 feet at Grid Line 14.4 to approximately 269 feet at Grid Line 4
S, Y, 1, 4	Approximately 269 feet
B, S, 1, 4	Sloping, approximately 269 feet at Grid Line S to approximately 267 feet at Grid Line B
A, B, 1, 4	Approximately 267 feet
A, B, 4, 8	Transitioning down from approximately 267 feet at Grid Line 4 to 266-1/2 feet at Grid Line 8

The following structural loading information for the parking structure foundations were provided to GED;

FOOTING LOCATION	DESIGN DEAD LOAD	DESIGN LIVE LOAD
West Portion of North Perimeter Wall (klf)*	13.2	2.8
East Portion of North Perimeter Wall (klf)	20.2	5.1
South Portion of East Perimeter Wall (klf)	18	2.9
West Perimeter Wall (klf)	17	2.9
South Perimeter Wall (klf)	11	2.4
H-3, K-3, M-3 (kips)	1,300	250
V-6 to 9	2,000	1,200
Other Individual Column Footings	$\leq$ 1,000	200-250

* Kips per Linear Foot

In addition, we understand that the structural design of the parking structure footings will have the footings bearing at depths of at least 4-1/2 feet to five feet below the finish floor elevations of the slabs-on-grade of the parking levels. If the information presented in the above table or the depth of the footings below the lowest parking level slabs-on-grade are incorrect, GED will need to re-evaluate and possibly revise the recommendations and conclusions presented herein.

10103092007 45798

DISCUSSION

GED compared the proposed depths of the bottom of the footings with the corresponding expected depth of the bedrock at the site. Based on the borings drilled for the project we estimate that suitable bedrock for support of foundations will generally be encountered between elevations of 252 and 269 feet above Mean Sea Level (MSL). In general, the depth of the bedrock increases from northwest to southeast. Based on our review of the referenced plan set, we expect that the parking structure footings will bear on suitable bedrock with the exception of footings in the southern portion of the site. For footings founded 4-1/2 feet to five feet below the slabs-on-grade, we estimate that footings in the southwest portion of the parking structure will be underlain with five feet or less of alluvium. Similarly, for these conditions we estimate that footings in the southeast portion of the parking structure will be underlain with approximately five to eight feet or less of alluvium.

For the loading conditions and footing elevations described herein, GED performed analysis to calculate allowable bearing capacity of the alluvial soil corresponding to a maximum differential settlement of ½-inch. The results of the analysis and our conclusions and recommendations are summarized herein.

CONCLUSIONS AND RECOMMENDATIONS

Based on the slab-on-grade elevations of the lowest parking levels as presented herein, and the structural loading information and minimum footing depths (4-1/2 to 5 feet below finish floor slab) provided by the structural engineer, footings for the parking structure may be founded in the alluvial soils. Continuous and isolated column footings of the parking structure bearing on alluvial soils with minimum widths of 24 inches and 36 inches, respectively, may be designed for an allowable bearing capacity of 3,500 psf. This allowable bearing pressure may be increased by 250 psf for each additional foot of footing width or depth to a maximum of 5,000 psf. This bearing capacity is based on a maximum differential settlement of ½-inch between foundations bearing alluvial soils and between foundations bearing on bedrock and alluvial soils. The project designers shall consider these magnitudes of differential settlement in their designs, including locations where footings transition between different supporting materials. In addition, all foundations of the parking structure shall be founded at or below the bearing elevations of the former Caltrans buildings. Disturbance of the subgrade in these and other areas from demolition and/or construction activities may require further deepening of the footings. All foundations of the office tower shall be founded on undisturbed Siltstone/Claystone bedrock in accordance with the recommendations of the referenced February 15, 2005 report.

Subject: **SUPPLEMENTAL GEOTECHNICAL RECOMMNEDATIONS- NEW POLICE HEADQUARTERS FACILITY, CITY BLOCK BOUNDED BY FIRST STREET ON THE NORTH, MAIN STREET ON THE EAST, SECOND STREET ON THE SOUTH, AND SPRING STREET ON THE WEST, DOWNTOWN LOS ANGELES, WO E170910B, GED FILE 04-120**

The Geotechnical Engineering Division (GED) has prepared this letter to present supplemental recommendations for the subject project. Supplemental recommendations are presented herein for design and construction of the drainage blanket that will be installed beneath the floor slabs of the lowest subterranean parking levels. Recommendations presented herein are intended to supplement the recommendations presented in GED's geotechnical engineering report for the project dated February 15, 2005.

The drainage blanket shall be a minimum of 12 inches in thickness and underlain with a geotextile filter fabric. The drainage system material shall consist of crushed rock, Caltrans Class II permeable base material, or drain rock. The drainage blanket shall be protected during construction by covering with a filter fabric and a minimum of 6 inches of gravel or a mud slab.

The drainage blanket shall be underlain with 6-inch diameter perforated sub-drains constructed on centers of 30 feet or less. The sub-drains shall be installed in 12-inch wide trenches that extend a minimum of 12 inches below the bottom of the drainage blanket. The walls and bottom of the trenches shall be covered with a filter fabric prior to the placement of the sub-drain pipe and gravel. Pipes shall be placed with the perforations down and shall connect to the sumps. As a minimum, the system shall include two 75 gallon per minute sump pumps. The sump pump vaults shall be constructed of sufficient size to accommodate pumps having capacities of 125 gallon per minute.

The referenced current reports concerning the proposed construction on the subject lots of the New Police Headquarters Facility have been reviewed by the Grading Division of the Department of Building and Safety.

The Department previously approved with conditions in the referenced 08/09/2005 letter (Log # 47253-02) the proposed building project as presented in the referenced previous reports. The project will consist of an eleven story office tower in the central portion of the site, an auditorium, cafe and utility structures along the east side of the site and two to three levels of subterranean garages.

Currently, recommendations for design of a drainage blanket are provided in the 10/05/2005 report to be constructed/installed beneath the floor slabs of the lowest parking level.

In the 11/21/2005 report with revised footing recommendations, it is concluded based on the current plan that the main office tower and most of the surrounding parking structure footings will bear in competent bedrock with the exception of footings in the southern portion of the site which will bear in alluvium about 5 to 8 feet in thickness.

It is indicated based on the subsurface conditions, distance to the buildings surrounding the project and the anticipated de-watering methods to be employed during construction that the potential for the proposed construction to impact any existing buildings in the vicinity of the project is very low.

Responses with explanations to previous conditions 1, 2, 3 and 4 in the Department's letter of approval were provided in the 11/21/2005 report with respect to final excavation heights/design recommendations, obtaining permits for construction-related de-watering, effect of de-watering on adjacent buildings and written notices to adjacent property owners.

The referenced current reports and the recommendations provided therein are acceptable, provided the following conditions are complied with during site development:

1. A permanent drainage blanket shall be installed beneath the floor slabs of the lowest sub-terranean level as recommended in the referenced 10/05/2005 report. The final plans shall be verified in order that all details and specifications for the drainage blanket installation are clearly shown on the plans. This shall include but not be limited to overall sub-drain trench/pipe locations, elevations, recommended grade for gravity flow, specifications for pipe diameter/filter fabric/gravel etc., the perimeter sump locations with access and the recommended pump capacities.

2. The proposed office tower shall be founded using conventional and/or cast-in-drilled-hole (CIDH) pile foundations that bear entirely in bedrock, as recommended.

3. Footings for a portion of the parking structures in the southern portion of the project where the depth to bedrock is the greatest may be supported either in bedrock or firm undisturbed naturally-occurring alluvium, as recommended.

4. The building design shall incorporate provisions for anticipated differential settlements in excess of one-fourth inch. (1806.2)

4. All conditions contained in the previous Department Letter dated 08/09/2005, Log # 47253-02, with the exception of conditions 1, 2, 3, 4 and condition number 19 modified herein, shall continue to remain applicable to the proposed project and shall be complied with.

Supplemental Geotechncial Report

SUPPLEMENTAL GEOTECHNICAL REPORT – TEMPORARY DEMOLITION EXCAVATION SLOPE ALONG EAST SIDE OF SITE – POLICE HEADQUARTERS FACILITY (CITY BLOCK BOUNDED BY FIRST STREET ON THE NORTH, MAIN STREET ON THE EAST, SECOND STREET ON THE SOUTH, AND SPRING STREET ON THE WEST, DOWNTOWN LOS ANGELES)
W.O. E170910B
GED FILE NO. 04-120

INTRODUCTION

The Geotechnical Engineering Division (GED) is providing this report to offer supplemental recommendations for the subject project. The recommendations presented herein are supplemental to the recommendations of the previous report dated February 15, 2005 and all supplemental reports. All previous recommendations shall apply except as specifically modified herein.

BACKGROUND

The site for the new police headquarters facility is currently occupied by a partially demolished structure. Foundations of this structure will be removed as part of the on-going demolition activities. The existing foundations along the east property line of the site are approximately 18 feet below the ground surface. Per Section 8.2.3 of the original geotechnical report, excavations to this depth should be sloped at an angle of 1½:1 or shored.

The demolition contractor has proposed the use of a temporary slope configuration as shown on the attached Figure 1 to facilitate the removal of the existing foundations along the eastern side of the site. As shown on the attached figure, the proposed method consists of a temporary 1:1 (horizontal to vertical) slope descending downward from four feet west of the Main Street curb to the site property line (exterior side of the existing foundation stem wall). This temporary slope will have an initial height of approximately 12 feet. Following excavation of this slope, the basement wall, slab-on-grade and the portion of the stem wall above the elevation of the toe of this slope will be removed. A four-foot wide bench will then be constructed into the site and a temporary 1 to 1 slope will be excavated down to the proposed subgrade elevation which corresponds to the elevation of the bottom of the existing footings to be removed.

Slot cuts with maximum widths of eight feet and heights of eight feet or less will then be cut into the lower 1 to 1 slope. The portion of the stem wall and footing exposed at the back of the slots will be removed and the slots backfilled to the face of the lower 1 to 1 slope and up to the elevation of the four-foot wide bench. This sequence will be repeated for the other slots. Following removal of the foundations, the area outside of the property line will be backfilled to the side walk elevation and a 1-1/2 to 1 (horizontal to vertical) or flatter temporary slope will be constructed to descend down to the subgrade elevation in the site.

10103272007 46420

CONCLUSIONS AND RECOMMENDATIONS

The proposed excavation procedure described in the previous paragraphs is acceptable to GED with the following conditions.

- Slots shall be constructed in an A, B, C sequence with neither adjacent slot excavated until the slot is completely backfilled to the grade of the initial 1:1 slope (horizontal to vertical).
- Maximum width of slots shall not exceed 8 feet and maximum height of slots shall not exceed 8 feet.
- After the foundation is removed and prior to placing of any fill in any slots, the bottom of the slot, shall be scarified to a minimum depth of 6-inches, moisture-conditioned and mechanically compacted in accordance with the requirements of Section 8.2.5 of the Feburary 15, 2005 geotechnical report.
- All excavation of the slots shall be performed under the continuous observation of the geotechnical engineer of record or a GED representative working under direct supervision of the geotechnical engineer of record.
- The GED representative working under the supervision of the geotechnical engineer of record shall be able to act as a Building and Safety Deputy-Grading inspector for the purposes of slot-cut observation.
- Following completion of the slot cutting, fill shall be placed against the initial 1:1 slopes to construct a 1-1/2 to 1 (horizontal to vertical) or flatter temporary slope with the crest of the slope at or slightly inside the site property line. Fill shall be benched into the 1 to 1 slope face in accordance with the 1999 LABC requirements.
- Backfill placed in the slots and fill placed to the sidewalk elevation outside the property line and to construct the 1-1/2 to 1 temporary slope shall be tested for compaction as it is placed.
- All fill and backfill shall be placed in lifts not exceeding 8-inches in thickness shall be moisture conditioned and compacted in accordance with the requirements of Section 8.2.7 of the February 15, 2005 geotechnical report. Also, each lift shall be moisture-conditioned between optimum-moisture content and a few percent above the optimum and mechanically compacted.

If excessive sloughing and caving occurs, slot cuts shall be backfilled immediately and shoring shall be installed.

CURRENT REFERENCE REPORT/LETTER(S)	REPORT NO.	DATE(S) OF DOCUMENT	PREPARED BY
Soil Report	04-120	03/08/2006	Geotech. Eng. Div.

PREVIOUS REFERENCE REPORT/LETTER(S)	REPORT NO.	DATE(S) OF DOCUMENT	PREPARED BY
Dept. Approval Letter	47253-02	08/09/2005	LADBS

The referenced report providing supplemental recommendations for the proposed New police Headquarters Facility has been reviewed by the Grading Division of the Department of Building and Safety.

The Department approved construction of an eleven story office tower in the central portion of the site, an auditorium, cafe and utility structures along the east side of the site and two to three levels of subterranean garages on 08/09/2005.

The current report recommends utilizing slot-cutting for the temporary excavation along the east property line in lieu of slopping the excavation at a gradient not to exceed 1 ½ :1 (horizontal to vertical) or shoring previously recommended by the consultants and approved by the Department

The referenced report is acceptable, provided the following conditions are complied with during site development:

(Note: Numbers in parenthesis ( ) refer to applicable sections of the 2002 City of LA Building Code. P/BC numbers refer the applicable Information Bulletin. Information Bulletins can be accessed on the internet at LADBS.ORG.)

10103272007 46420

1. All conditions of the Department Letter dated 08/09/2005, Log # 472534-02, shall apply with the exception of condition #12, revised below.

2. Sequence of the excavation shall comply to the procedure given on page 2 and Fig. 1 of the current report.

3. Surcharged A-B-C slot-cut method may be used for temporary excavations with each slot cut not exceeding 8 feet in height and not exceeding 8 feet in width, as recommended. The surcharge load shall not exceed value given in the report. The soils engineer shall determine the clearance between the excavation and the existing foundation. Each slot shall be inspected by the soils engineer and approved in writing prior to any worker access.

4. Slot cutting excavations shall be performed under the continuous inspection and approval of the soils engineer and deputy grading inspector approved by and responsible to the geotechnical engineer. (1701.5.13)

SUPPLEMENTAL GEOTECHNICAL REPORT- NEW POLICE HEADQUARTERS FACILITY, 100 WEST 1ST STREET, LOS ANGELES, CA 90012
GED FILE NO. 04-120 **WO NO. E170910B**

INTRODUCTION

The Geotechnical Engineering Division (GED) is providing this report to offer supplemental recommendations in response to a request from Los Angeles Department of Building and Safety. The recommendations presented herein are supplemental to the recommendations presented in GED's geotechnical engineering report for the project dated February 15, 2005. All previous recommendations shall apply except as specifically modified herein.

BACKGROUND

GED received an email from the project manager requesting additional recommendations for the project site. The item of concern is stated below:

- Provide approval of proposed "rock pocket" design and recommendations for subdrainage.

In the geotechnical engineering report, Section 8.5, Retaining Walls, GED recommended that to provide adequate drainage, the retaining walls can be covered with a geotechnical drainage fabric connected to a 4-inch diameter perforated drain pipe extending along the bottom of the wall. This pipe should be placed with perforations sideways or down and surrounded with Class 2 Caltrans permeable material (Section 68-1.025 of the Caltrans Standard Specifications) wrapped in filter fabric. Drain pipes should flow to a sump with a pump, or by gravity to a suitable outlet.

Due to the site conditions and proposed shoring design and construction methods, an alternate "rock pocket" subdrain design as shown on detail C1 of Sheet A4-271, attached, of the project plans was recommended. This design was determined to be insufficient by Building and Safety. GED has been requested to support the current design or issue additional recommendations.

RECOMMENDATIONS

GED recommends a new waterproofing and drainage panel design as shown in Figure 1.

10107302007 51953

CITY OF LOS ANGELES
INTER-DEPARTMENTAL CORRESPONDENCE

Date: October 16, 2006

To: Sam Tanaka
Proposition Q Bond Program Manager

Attention: Julie Sauter, Project Manager

From: Christopher F. Johnson, Group Manager
Geotechnical Engineering Division (GED)

Subject: SUPPLEMENTAL GEOTECHNICAL REPORT- NEW POLICE HEADQUARTERS FACILITY, CITY BLOCK BOUNDED BY FIRST STREET ON THE NORTH, MAIN STREET ON THE EAST, SECOND STREET ON THE SOUTH, AND SPRING STREET ON THE WEST, DOWNTOWN LOS ANGELES
GED File No. 04-120 **WO No. E170910B**

In response to a request from Proposition Q on October 11, 2006, the Geotechnical Engineering Division (GED) has prepared this letter to provide supplemental recommendations for design and construction of the sub-drain for the walls of the subterranean parking garage. The recommendations presented herein are supplemental to the recommendations presented in GED's geotechnical engineering report for the project dated February 15, 2005 and all previous supplemental reports. All previous recommendations shall apply except as specifically modified herein.

BACKGROUND

Section 8.5 of the referenced February 15, 2005 geotechnical states "All retaining walls not designed to resist hydrostatic pressure should be adequately drained to prevent the buildup of hydrostatic pressures behind the walls due to groundwater, storm water, nuisance surface water, and/or utility line leaks. To provide adequate drainage, the retaining walls can be covered with a geotechnical drainage fabric connected to a 4-inch diameter perforated drain pipe extending along the bottom of the wall. This pipe should be placed with perforations sideways or down, and surrounded with Class 2 Caltrans permeable material (Section 68-1.025 of the Caltrans Standard Specifications) wrapped in filter fabric. Drain pipes should flow to a sump with a pump, or by gravity to a suitable outlet."

Due to the site conditions and proposed shoring design and construction methods, an alternate "rock pocket" subdrain design was developed by the project consultants as shown on Detail C1 of Sheet A4-271 (Attachment) of the project plans. The GED was requested to review and approve the design shown on Detail C1 of Sheet A4-271 of the project plans or issue additional recommendations.

10107302007 51953

RECOMMENDATIONS

GED recommends the sub-drain detail shown on Figure 1 be used along the base of the subterranean walls of the project. The design shown on Figure 1 is recommended for all retaining walls except as specifically noted in the field by GED. The design shown in Detail C1 of Sheet A4-271 of the project plans shall only be used in areas where the Geotechnical Engineer provides written approval during construction.

If you have any questions, please contact Amy Bi at (213) 847-0478 or Patrick Schmidt at (213) 847-0535.

ACTION BY: _____ _____ _____ _____

For Geology *Date* *For Soils* *Date*

The review will be continued upon submittal of an addendum to the reports which includes, but need not be limited to, the following:

1. Provide calculations to justify the recommended width of the slot cuts, as previously requested.

2. Provide 3 complete copies of the report dated 10/17/2006. Note, that the originally submitted report was dated 10/16/2006. Since the project address was not shown, the Department requested a replacement first page with the address. The submitted replacement page is dated 10/17/2007, and does not mach the second page, which has been already submitted.

3. Revise recommendations regarding wrapping the end of a drain pipe. The Department requires that the 12" x 12" x 12" gravel pocket be wrapped with burlap bag or wire mesh. Use of geotextile fabric is not acceptable. Wrapping the end of the drain pipe is also not acceptable. Note, that this issue was addressed in the Modification Request dated 10/31/2006, File #14233.

The soil engineer shall prepare a report containing the corrections indicated in this letter. The report shall be in the form of an itemized response. It is recommended that once all correction items have been addressed in a response report, to contact the report review engineer to schedule a verification appointment to demonstrate compliance with all the corrections. Do not schedule an appointment until all corrections have been addressed. Bring three copies of the response report, including one unbound wet-signed original for microfilming in the event that the report is found to be acceptable.

SUPPLEMENTAL GEOTECHNICAL REPORT – ADDITIONAL RECOMMENDATIONS RELATED TO TEMPORARY SHORING – NEW POLICE HEADQUARTERS FACILITY (100 WEST 1ST STREET AKA 120 SOUTH SPRING STREET, 141 SOUTH MAIN STREET AND 106 THROUGH 132 WEST FIRST STREET – TRACT L A C A MATP NO. 94, LOTS PCL 14 AND PCL 15 AND ORD'S SURVEY TRACT, BLOCK 1, LOTS 4 AND 8)
W.O. E170910B **GED FILE NO. 04-120**

INTRODUCTION

The Geotechnical Engineering Division (GED) is providing this report to offer supplemental recommendations in response to field conditions at the project site. The recommendations presented herein are supplemental to the recommendations of the original geotechnical report dated February 15, 2005, supplemental report dated August 9, 2005, and Los Angeles Department of Building and Safety (LADBS) letter of approval dated August 9, 2005 under Log Number 47253-02. All previous recommendations shall apply except as specifically modified herein.

BACKGROUND

While installing tiebacks for the shoring system at the project site, several utilities were encountered which blocked the installations. The contractor has proposed to excavate against the back side of the shoring and revise the tieback location. The proposed modifications to the shoring system are shown in the attached cross-section SK-1 and SK-2 prepared by Cefali & Associates, Inc., the shoring designers for the project. GED has been requested to review the proposed modifications and provide revised soil pressure recommendations for shoring and tieback design.

The supplemental report dated August 9, 2005 provided a uniform design pressure of 24H psf, where H is the height of the shoring in feet, for braced shoring retaining level backfill.

RECOMMENDATIONS

Contrary to the configurations shown in Figures SK-1 and SK-2, attached, GED recommends that temporary excavation behind the shoring be no steeper than 1.5:1 (horizontal:vertical). This would result in a maximum cut height behind the shoring of 12 feet for both configurations. GED also strongly recommends that the temporary excavation slopes be protected against erosion.

Temporary braced shoring for the SK-1 configuration shall be designed with a uniform soil pressure of 39H psf where H is the height of retention in feet (26 feet in the revised configuration with a 1.5:1 (h:v) slope). This load shall be applied only to the height of retained soil.

Temporary braced shoring for the SK-2 configuration shall be designed with a uniform soil pressure

of 41H psf where H is the height of retention (14 feet in the revised configuration of 1.5:1 (horizontal:vertical) slope). This load shall be applied only to the height of retained soil.

Calculations for the above recommendations are attached.. For the SK-1 configuration, an alpha value of 55 degrees was used in the analysis. For the SK-2 configuration, an alpha value of 57 degrees was used. Based on multiple analysis with similar angles, these values were determined to be the most conservative giving the highest shoring pressure for each configuration. A factor of safety of 1.25 is used in the analysis.

CLOSURE

If you have any questions about this report, please contact Patrick Schmidt at (213) 847-4046 or Ben Moore at (213) 485-8362.

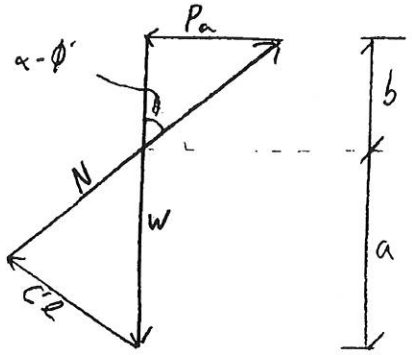
$\phi' = 24.8°$

$$h_c = \frac{c'}{\gamma \sin\alpha \cos\alpha - \gamma \cos^2\alpha \tan\phi'}$$

Failure Volume $= V = \frac{H^2 - h_c^2}{2\tan\alpha} - 108\ ft^2$



Weight $= W = \gamma V$

$$\ell = \frac{H - h_c}{\sin\alpha}$$

SK-1 H = 38'
H' = 26'

SK-2 H = 26'
H' = 14'

$b = W - a$

$$a = \frac{c'\ell \sin(90 + \phi')}{\sin(\alpha - \phi')}$$

$P_a = b\tan(\alpha - \phi')$

SK-1, use $\alpha = 57°$, $h_c = 1.0$

$V = \frac{38^2 - 1^2}{2\tan(57)} - 108 = 360$

$W = 125(360) = 45{,}000$

$\ell = \frac{38 - 1}{\sin(57)} = 44$

$a = \frac{40(44)\sin(90 + 24.8)}{\sin(57 - 24.8)} = 2{,}998$

$b = 45{,}000 - 2{,}998 = 42{,}002$

$P_a = 26{,}450$

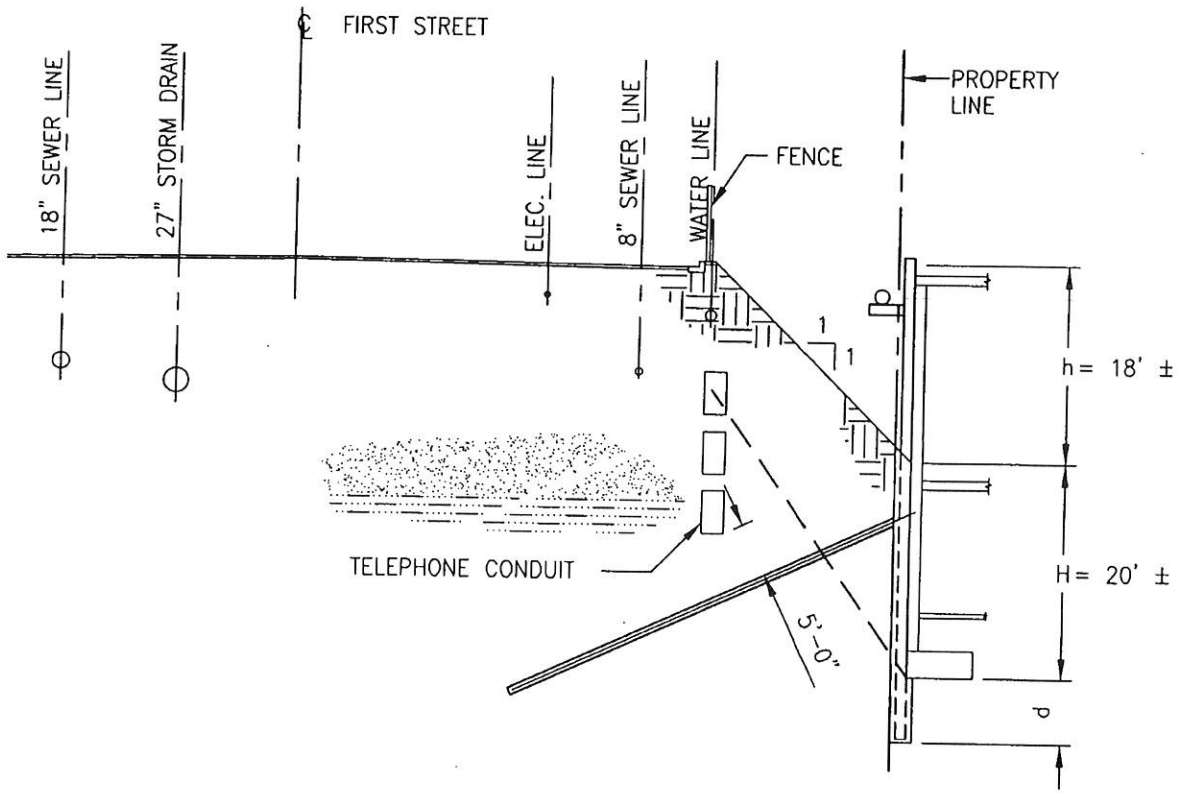
$39H$ psf

SK-2, use $\alpha = 55°$, $h_c = 1.0$

$V = \frac{26^2 - 1^2}{2\tan(55)} - 108 = 128$

$W = 125(128) = 16{,}000$

$\ell = 30$



$a = \frac{40(30)\sin(90 + 24.8)}{\sin(55 - 24.8)} = 2{,}165$

$b = 16{,}000 - 2{,}165 = 13{,}835$

$P_a = 6{,}051$

$41H$ psf

CURRENT REFERENCE REPORT/LETTER(S)	REPORT NO.	DATE(S) OF DOCUMENT	PREPARED BY
Soil Report	04-120	01/10/2007	Geotech. Eng. Div.
PREVIOUS REFERENCE REPORT/LETTER(S)	**REPORT NO.**	**DATE(S) OF DOCUMENT**	**PREPARED BY**
Dept. Approval Letter	47253-02	08/09/2005	LADBS

The referenced report providing supplemental recommendations for the New Police Headquarters Facility has been reviewed by the Grading Division of the Department of Building and Safety. The Department approved construction of an eleven story office tower in the central portion of the site, an auditorium, cafe and utility structures along the east side of the site and two to three levels of subterranean garages on 08/09/2005, LOG #47253-02.

The current report provides revised earth pressure for the design of shoring system shown on cross-sections SK-1 and SK-2. The presence of utility lines blocking the tie-back installation at the location previously selected resulted in the need for the required modification.

The referenced report is acceptable, provided the following conditions are complied with during site development:

(Note: Numbers in parenthesis ( ) refer to applicable sections of the 2002 City of LA Building Code. P/BC numbers refer the applicable Information Bulletin. Information Bulletins can be accessed on the internet at LADBS.ORG.)

1. All conditions of the Department Approval Letter dated 08/09/2005, LOG #47253-02, with the exception of condition #15, revised below only for the tie backs to be installed where the utility lines

AN EQUAL EMPLOYMENT OPPORTUNITY - AFFIRMATIVE ACTION EMPLOYER

are present.

2. The upper 12 feet of the cut shall be trimmed at the gradient not steeper that 1½ :1 (horizontal to vertical), as recommended.

3. Temporary shoring for SK-1 configuration shall be deigned for active pressure of 39H (or thrust of 26,450 lbs), and assuming rectangle earth pressure distribution. Temporary shoring for SK-2 configuration shall be deigned for active pressure of 41H (or thrust of 8,051 lbs) and assuming rectangle earth pressure distribution. Recommended H for the SK-1 and SK-2 configurations shall not exceed 26 and 14 feet, respectively, as recommended.

MACTEC Project 4953-03-3881

Dear Mr. Palfalvi:

We are pleased to submit the results of our geotechnical investigation for the proposed Los Angeles Federal Courthouse to be constructed in Los Angeles, California. This investigation was conducted in general accordance with our proposal dated December 2, 2003 and the terms and conditions of our existing agreement with General Services Administration for engineering services (GSA Contract No. GS-23F-0054L).

The scope of our services was planned with you. Mr. Kai-Chen Tu of John A. Martin & Associates advised us of the structural features of the proposed building.

We were also furnished with geotechnical reports dated January 17, and 18, 2002, prepared by Ninyo & Moore for the subject project. The explorations performed by Ninyo & Moore for the subject project were performed in the existing parking area, adjacent to the existing buildings.

The results of our investigation and design recommendations are presented in this report. Please note that you or your representative should submit copies of this report to the appropriate governmental agencies for their review and approval prior to obtaining a building permit.

MACTEC Engineering and Consulting

SUMMARY

We have completed our geotechnical investigation of the site of the proposed Los Angeles Federal Courthouse in Los Angeles, California. Our subsurface explorations, engineering analyses, and foundation design recommendations are summarized below.

The proposed project will consist of constructing a 24-story building with four to five subterranean levels below grade.

To supplement our current geotechnical analyses, we also reviewed results of prior geotechnical investigations on the site that were summarized in reports dated April 9, 1975 and May 2, 1969 (prepared by our predecessor firm, LeRoy Crandall & Associates). The geotechnical recommendations in this report were developed in part using information from our prior investigations.

We explored the soil conditions during our current investigation by drilling four borings to depths ranging from 25 to 75 feet below the existing grade. We previously explored the soil conditions beneath the site by drilling 16 borings to depths ranging from 14 to 68 feet below the existing grade.

Fill soils, up to 18-feet thick, were found in our current borings. The existing fill consists of medium stiff to stiff silty clay with gravel and miscellaneous debris (metal, brick and concrete). The natural soils ranging from 8- to 21-feet thick, consists of stiff to very stiff sandy silts and sandy clays and dense to very dense well graded sands with gravel that are underlain by very stiff siltstone.

Based on the available geologic data, active or potentially active faults with the potential for surface fault rupture are not known to be located beneath or projecting toward the site. In our opinion, the potential for surface rupture at the site due to fault plane displacement propagating to the ground surface during the design life of the project is considered low. Although the site could be subjected to strong ground shaking in the event of an earthquake, this hazard is common in Southern California

and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

The site is currently occupied by an abandoned State of California office building and adjoining parking structures. The remainder of the site, approximately the southeast quarter, is occupied by an asphalt-paved parking lot. There are no slopes at the site and the absence of nearby slopes precludes slope stability hazards. The potential for other geologic hazards such as liquefaction, seismic-induced settlement, tsunamis, inundation, seiches, flooding, and subsidence affecting the site is considered low.

The proposed lowest floor level of the courthouse basement floor will place the building foundations into the siltstone bedrock material. The proposed structure can be supported on spread footings established in the undisturbed siltstone. The basement floor slab can be supported on the undisturbed siltstone.

The mass excavation for the proposed building, and locally for the building foundations will encounter ground-water seepage. The amount of ground-water seepage is difficult to estimate, however, based on our experience with similar projects in downtown Los Angeles, the ground-water seepage will impact the proposed construction. Provisions to address and control the ground-water seepage will be required during construction. In addition, the installation of internal sumps to collect water seepage and also to convey off-site will likely be required. Placement of gravel or crushed rock at the excavation bottom may also facilitate ground-water control as well as improve equipment maneuverability.

The presence of ground water within the excavation would soften and weaken the siltstone bedrock materials, depending on the duration of the exposure. Depending on the amount of water seepage and the construction sequencing, it may be desirable to construct waste slabs at the bottom of the foundation excavations. To facilitate floor slab construction, it may be prudent to consider leaving the mass excavation 6 to 12 inches above the planned elevation while the foundations are constructed, to minimize the amount of disturbance to the materials that will support the floor slab.

The location of the Metro Rail Redline Subway Station and/or tunnels in Hill Street should be located and identified. If these structures are within the zone of influence of the proposed courthouse building, additional recommendations will be necessary. The zone of influence is estimated to be below a 1:1 plane extending downward from the bottom of the outside edge proposed courthouse footings.

1.0 SCOPE

This report provides geotechnical recommendations for the proposed design and construction of the proposed Los Angeles Federal Courthouse. The locations of the proposed building, existing buildings, and our current and prior exploration borings are shown in Figure 1, Site Plan.

Our predecessor firm, LeRoy Crandall and Associates (LCA) we previously performed two foundation investigations at the site and submitted the results in reports dated April 9, 1975 and May 2, 1969 (LCA Job Nos. 56251 and A-69104, respectively). The investigations were for the existing buildings on the site and for a structure that was not constructed on the currently vacant portion of the site. We have reviewed the prior reports and we accept responsibility for the use and interpretation of the data presented in the reports.

This investigation was authorized to determine the static physical characteristics of the soils at the site of the proposed building, and to provide recommendations for foundation design, for floor slab support, for walls below grade, for temporary shoring, for excavation and for earthwork. We were to evaluate the existing soil and ground-water conditions and provide the following information:

- Summary of current and prior subsurface explorations and laboratory tests, with a description of the soil, bedrock and ground-water conditions encountered;
- Results of our geologic-seismic hazards evaluation;
- A site-specific ground motion study in accordance with ASCE-7-02;
- A determination of the applicable site class definition based on ASCE-7-02;
- Results of liquefaction evaluation of the site;
- Recommendations for design of foundations to be used for support of the proposed building, including allowable increases for wind and seismic loads;
- Estimated settlement for the anticipated loads;
- Recommendations regarding frictional and passive values for resistance of lateral forces;

- Recommendations for design of walls below grade;
- Recommendations for floor slab support;
- Recommendations for temporary shoring; and
- Recommendations for earthwork, including site preparation, excavation and placing of any required compacted fill.

Our recommendations are based on the results of our current and previous field explorations, laboratory tests, and appropriate engineering analyses. The results of the current and previous field explorations and laboratory tests are presented in the Appendices A and B, respectively.

Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable geotechnical consultants practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional advice included in this report. This report has been prepared for General Services Administration and their design consultants to be used solely in the design of the proposed Los Angeles Federal Courthouse. The report has not been prepared for use by other parties, and may not contain sufficient information for purpose of other parties or other uses.

2.0 PROJECT DESCRIPTION AND SITE CONDITIONS

The proposed Los Angeles Federal Courthouse will be located between Broadway and Hill Street and First and Second Streets in downtown Los Angeles, California. The majority of the site is currently occupied by an abandoned State of California office building and adjoining parking structure. The remainder of the site, approximately the southerly quarter of the site, is occupied by an asphalt-paved parking lot.

It is our understanding the existing Metro Red Line Subway Civic Center Station and/or tunnels are located beneath Hill Street, on the westerly side of the subject site. We have not been provided with information regarding the relative location of the existing tunnel to the proposed development.

Excavations on the order of 40 to 45 feet deep will be required to allow construction of the proposed building. Temporary tie-back shoring will be required to support the proposed excavation.

The ground surface level at the site slopes to the south with an approximate difference in elevation of about 16 feet between Hill Street and Broadway.

The proposed Courthouse building will be of steel construction over a reinforced concrete subterranean structure and will be about 24 stories in height (about 400 feet) with four to five subterranean levels below grade subterranean levels that will extend about 40 to 45 feet below the Broadway street grade.

The building will be set back horizontally from Hill Street about 40 feet and a 2:1 (horizontal to vertical) descending slope is planned from Hill Street to the building. The footprint of the proposed building may not extend to the streets and will be partially within the footprints of the existing building on the site. Mr. Kai-Chen Tu of John A. Martin and Associates furnished us with preliminary column loadings for the building. Mr. Tu estimates the maximum column dead-plus live loading to be on the order of about 5,000 kips.

3.0 EXPLORATIONS AND LABORATORY TESTS

We explored the subsurface conditions during the current investigation by drilling four borings to depths ranging from 25 to 75 feet below the existing grade. Borings 1 and 1b were terminated at 25 feet due to the presence of potentially contaminated soils. Our predecessor firm, LCA, previously explored the subsurface conditions beneath the site by drilling 16 borings to depths ranging from 14 to 68 feet below the existing grade. The locations of our current and the prior explorations LCA are shown on Figure 1. Details of the current and prior explorations are presented in Appendices A and B, respectively.

Laboratory tests were performed on selected samples obtained from our current and prior borings to aid in the classification of the soils and to determine the pertinent engineering properties of the soil and bedrock material at the site. The following tests were performed:

- Moisture content and dry density determinations.
- Direct shear.
- Consolidation.

All testing was done in general accordance with applicable ASTM specifications. Details of the current and prior laboratory testing program and test results are presented in the Appendices A and B, respectively.

4.0 GEOLOGY

4.1 GEOLOGIC SETTING

The site is located near the Los Angeles Civic Center, approximately 1.6 kilometers (1 mile) west of the Los Angeles River. Locally, the site is situated at the base of the southeast flank of Bunker Hill. Bunker Hill, a bedrock high composed primarily of Miocene and Pliocene age sedimentary bedrock. Bunker Hill has been significantly altered by grading, being topographically lowered up to 15 meters (50 feet in elevation), as part of past development activities in the downtown Los Angeles area.

Regionally, the site is in the northern portion of the Peninsular Ranges geomorphic province that is bounded by the Santa Monica, Hollywood, Raymond, Sierra Madre, and Cucamonga fault zones on the north, the San Andreas fault zone on the east, the Pacific Ocean coastline on the west, and extends beyond the Mexican border on the south. The province is characterized by elongate, northwest-trending mountain ridges separated by straight-sided sediment-filled valleys. The northwest trend is further reflected in the direction of the dominant geologic structural features of the province that are northwest to west-northwest trending folds and faults, such as the Newport-Inglewood fault zone, located approximately 12 kilometers southwest of the site.

The relationship of the site to local geologic features is depicted in Figure 2, Local Geology, and the faults in the vicinity of the site are shown in Figure 3, Regional Faults. Figure 4, Regional Seismicity, shows the locations of major faults and earthquake epicenters in Southern California.

4.2 GEOLOGIC MATERIALS

The site is predominantly underlain by bedrock of the Pliocene age Fernando Formation, mantled by Quaternary age alluvial sediments in the southeast half of the site. Artificial fill is present at the site, as a result of past uses. As encountered in our borings, the artificial fill consists of silty clay with bedrock fragments and locally cobbles and pieces of construction debris. The fill was encountered in each of the current borings ranging from 2.2 to 5.5 meters (7 ¼ to 18 feet) in thickness. Alluvial deposits were encountered below the fill materials in the borings, ranging from about 2.4 to 6.4 meters (8 to 21 feet) thick. The alluvial deposits at the site consist of interbedded sandy silt to silty sand, silty clay, sandy clay, and well graded sand and gravel. These material are underlain by bedrock of the Pliocene age Fernando Formation. As encountered in our borings, the Fernando Formation is dark olive gray, massive clayey siltstone. No planes of weakness such as bedding or through-going joints were observed in the bedrock, which exhibits a concoidal fracture pattern. The bedrock was encountered in our current borings at depths ranging from 5.9 to 8.5 meters (19½ to 28 feet) below the existing ground surface (both depths corresponding to approximately Elevation 264). The top of the bedrock surface encountered in our previous borings at the site ranged from Elevation 266 to Elevation 277. Based on our current and previous investigations at the site, the bedrock is anticipated to be the shallowest along First Street, about mid-way between Broadway and Hill Street

4.3 GROUND WATER

The site is located in Section 28 of Township 1 South, Range 13 West, within the Central Hydrologic Subarea in the Los Angeles-San Gabriel River Hydrologic Unit. According to the California Geological Survey, the historic high water level in the area is 7.6 to 9.1meters (25 to 30 feet) below the ground surface (California Division of Mines and Geology, 1998).

According to the Los Angeles County Department of Public Works, there are currently no operating ground-water monitoring wells within a kilometer of the site (County of Los Angeles, Hydrologic Records Division, 2004). The closest ground-water monitoring well was Los Angeles County Well No. 2765, located approximately 1.3 kilometers to the south-southeast. This well has been destroyed and the most recently recorded water level was measured on March 13, 1979 when the depth to water was about 33.2 meters (109 feet) beneath the existing ground surface. This

depth corresponds to a water surface elevation of about 45.7 meters (150 feet) above mean sea level.

The site is situated near the base of Bunker Hill and the bedrock beneath the site is relatively shallow. The site is not located within the limits of the regional ground-water basin. Therefore, ground water is not anticipated to be present in significant quantities in the alluvial deposits overlying the bedrock.

Ground water was not encountered within the 22.8-meter (75-foot) depth explored by our borings at the site. However, slight water seepage (in very limited quantities) was encountered in Borings 1c and 2 at depths of 8.2 meters and 5.6 meters (27 feet and 18½ feet), respectively. This seepage was observed near the base of the alluvial deposits, approximately 0.3 meter (1 foot), above the top of the less permeable bedrock. This is typical of the ground-water conditions in the downtown area.

4.4 FAULTS

The numerous faults in Southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geological Survey (previously the California Division of Mines and Geology) for the Alquist-Priolo Earthquake Fault Zoning Program (Hart, 1999). By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault is a fault that has demonstrated surface displacement of Quaternary age deposits (last 1.6 million years). Inactive faults have not moved in the last 1.6 million years. A list of nearby active faults and the distance in kilometers between the site and the nearest point on the fault, the maximum magnitude, and the slip rate for the fault is given in Table 1. A similar list for potentially active faults is presented in Table 2. The faults in the vicinity of the site are shown in Figure 3.

Active Faults

Hollywood Fault

The closest active fault to the site, with the potential for surface fault rupture, is the Hollywood fault located approximately 8.0 kilometers to the north-northwest. This fault trends east-west along the base of the Santa Monica Mountains from the West Beverly Hills Lineament in the West

Hollywood-Beverly Hills area (Dolan and Sieh, 1992) to the Los Feliz area of Los Angeles. The fault is a ground-water barrier within Holocene sediments (Converse et al., 1981). Scarps 1.8 to 2.7 meters (6 to 9 feet) high in Holocene flood plain deposits have been suggested along the fault trace in the Atwater area (Weber et al. 1980). Studies by several investigators (Dolan et al., 2000b; Dolan et al., 1997; Dolan and Sieh, 1992; and Crook and Proctor, 1992) indicated that the fault is active, based on geomorphic evidence, stratigraphic correlation between exploratory borings, and fault trenching studies. Additionally, recent investigations performed in the Hollywood area by Law/Crandall (2000) have demonstrated that Holocene age alluvial sediments have been offset by several strands of the Hollywood fault. An Alquist-Priolo Earthquake Fault Zone has not been established for the Hollywood fault. However, the Hollywood fault is considered active by the State Geologist. Also, the City of Los Angeles considers the Hollywood fault active for planning purposes.

Raymond Fault

The active Raymond fault is located approximately 8.4 kilometers north-northeast of the site. The fault is a high-angle reverse fault, thrusting basement rocks north of the fault over alluvial sediments south of the fault. The Raymond fault has long been recognized as a ground-water barrier in the Pasadena/San Marino area and numerous geomorphic features along its entire length (such as fault scarps, sag ponds, springs, and pressure ridges) attest to the fault's activity during the Holocene epoch (last 11,000 years). Within the last 36,000 years, eight separate earthquake events have been recognized along the Raymond fault (Crook et al., 1987). The most recent fault movement, based on radiocarbon ages from materials collected in an excavation exposing the fault, occurred sometime between 2,160 ± 105 and 1,630 ± 100 years before present (LeRoy Crandall and Associates, 1978; Crook et al., 1987).

Verdugo Fault

The active Verdugo fault zone is composed of several faults including the Verdugo fault, the San Rafael fault, and the Eagle Rock fault. The Verdugo fault is located approximately 11 kilometers north of the site. The most recent documented activity along this fault occurs in the Holocene age alluvial deposits along the western flank of the Verdugo Mountains in the Burbank area (County of Los Angeles Seismic Safety Element, 1990). Additionally, this portion of the fault is considered

active by the State Geologist (Jennings, 1994). An Alquist-Priolo Earthquake Fault Zone has not been established for the Verdugo fault by the State Geologist. However, a fault rupture hazard zone has been designated by the City of Burbank for the Verdugo fault. It is our opinion that the Verdugo fault should be considered active for planning purposes.

San Andreas Fault Zone

The active San Andreas fault zone is located about 53 kilometers north-northeast of the site. This fault zone, California's most prominent geological feature, trends generally northwest for almost the entire length of the state. The southern segment of the fault is approximately 450 kilometers long and extends from the Transverse Ranges west of Tejon Pass on the north to the Mexican border and beyond on the south. Wallace (1968) estimated the recurrence interval for a magnitude 8.0 earthquake along the entire fault zone to be between 50 and 200 years. Sieh (1984) estimated a recurrence interval of 140 to 200 years. The 1857 Fort Tejon earthquake was the last major earthquake along the San Andreas fault zone in Southern California.

Blind Thrust Faults

Several buried thrust faults, commonly referred to as blind thrusts, are postulated to underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3 kilometers. These faults do not present a potential surface fault rupture hazard. However, the following described blind thrust faults are considered active and potential sources for future earthquakes.

Puente Hills Blind Thrust

The Puente Hills Blind-Thrust fault system (PHBT) is defined based on seismic reflection profiles, petroleum well data, and precisely located seismicity (Shaw and others, 2002). This blind thrust fault system extends eastward from downtown Los Angeles to Brea (in northern Orange County) and overlies the Elysian Park Thrust. The PHBT includes three north-dipping segments, named from east to west as the Coyote Hills segment, the Santa Fe Springs segment, and the Los Angeles segment. These segments are overlain by folds expressed at the surface as the Coyote Hills, Santa Fe Springs Anticline, and the Montebello Hills. The PHBT is believed to be the causative fault of the October 1, 1987 Whittier Narrows Earthquake (Shaw and others, 2002). The PHBT underlies

the site at depth. Postulated earthquake scenarios for the PHBT include single segment fault ruptures capable of producing an earthquake of moment magnitude 6.6 (Mw) and a multiple segment fault rupture capable of producing an earthquake of moment magnitude 7.1 (Mw). The PHBT is not exposed at the ground surface and does not present a potential for surface fault rupture. However, based on deformation of late Quaternary age sediments above this fault system and the occurrence of the Whittier Narrows earthquake, the PHBT is considered an active fault capable of generating future earthquakes beneath the Los Angeles Basin. An average slip rate of 0.7 mm/yr and a maximum magnitude of 7.1 are estimated by the California Geological Survey (2003) for the Puente Hills Blind Thrust.

Upper Elysian Park

The Upper Elysian Park fault is a blind thrust fault that overlies the Los Angeles and Santa Fe Springs segments of the Puente Hills Thrust (Oskin et al., 2000 and Shaw et al., 2002). The eastern edge of the Upper Elysian Park fault is defined by the northwest-trending Whittier fault zone. The Upper Elysian Park fault underlies the site at depth. Like other blind thrust faults in the Los Angeles area, the Upper Elysian Park fault is not exposed at the surface and does not present a potential surface rupture hazard; however, the Upper Elysian Park fault should be considered an active feature capable of generating future earthquakes. An average slip rate of 1.3 mm/yr and a maximum magnitude of 6.4 are estimated by the California Geological Survey (2003) for the Upper Elysian Park fault.

Northridge Thrust

The Northridge Thrust, as defined by Petersen et al. (1996), is an inferred deep thrust fault that is considered the eastern extension of the Oak Ridge fault. The Northridge Thrust is located beneath the majority of the San Fernando Valley and is believed to be the causative fault of the January 17, 1994 Northridge earthquake. This thrust fault is not exposed at the surface and does not present a potential surface fault rupture hazard. However, the Northridge Thrust is an active feature that can generate future earthquakes. The vertical surface projection of the Northridge Thrust is approximately 24 kilometers northwest of the site at the closest point. The California Geological Survey (2003) estimates an average slip rate of 1.5 mm/yr. and a maximum magnitude of 7.0 for the Northridge Thrust.

San Joaquin Hills Thrust

Until recently, the southern Los Angeles Basin has been estimated to have a low seismic hazard relative to the greater Los Angeles region (Working Group on California Earthquake Probabilities, 1995; Dolan et al., 1995). This estimation is generally based on the fewer number of known active faults and the lower rates of historic seismicity for this area. However, several recent studies by Grant et al. (2000, 2002) suggest that an active blind thrust fault system underlies the San Joaquin Hills. This postulated blind thrust fault is believed to be a faulted anticlinal fold, parallel to the Newport-Inglewood fault zone (NIFZ) but considered a distinctly separate seismic source (Grant et al., 2002). The recency of movement and Holocene slip rate of this fault are not known. However, the fault, if it exists, has been estimated to be capable of producing a Magnitude 6.8 to 7.3 earthquake (Grant et al., 2002). This estimation is based primarily on coastal geomorphology and age-dating of marsh deposits that are elevated above the current coastline.

The vertical surface projection of the San Joaquin Hills Thrust is approximately 72 kilometers southeast of the site at the closest point. This thrust fault is not exposed at the surface and does not present a potential surface fault rupture hazard. However, the San Joaquin Hills Thrust is an active feature that can generate future earthquakes. The California Geological Survey (2003) considers this fault to be active and estimates an average slip rate of 0.5 mm/yr and a maximum magnitude of 6.6 for the San Joaquin Hills Thrust.

Potentially Active Faults

MacArthur Park Fault

The potentially active MacArthur Park fault is located approximately 1.4 kilometers south of the site. The fault, inferred west of downtown Los Angeles, has been located based on south-facing scarps, truncated drainages, and other geomorphic features (Dolan and Sieh, 1993). The fault is approximately 8 kilometers long, extending northwest from the Pershing Square area in downtown Los Angeles through MacArthur Park to the Paramount Studios area in Hollywood. Current information suggests the fault is potentially active.

Coyote Pass Fault

The potentially active Coyote Pass fault is located about 4.0 kilometers east-southeast of the site. This fault trends east-west across the southerly flank of the Repetto Hills for a distance of about 5 kilometers (California Department of Water Resources, 1961). Based on available information, the fault is a northerly-dipping reverse fault with rocks of the Pliocene age Fernando Formation, north of the fault, thrust over younger Pleistocene age sediments, south of the fault. There is no evidence that this fault has offset late Pleistocene or Holocene age alluvial deposits (County of Los Angeles Seismic Safety Element, 1990). Ziony and Jones (1989) indicate that the fault is potentially active (no displacement of Holocene age alluvium). Additionally, Jennings (1994) indicates the fault is potentially active.

Overland Fault

The potentially active Overland fault is located about 14½ kilometers southwest of the site. The Overland fault trends northwest between the Charnock fault and the Newport-Inglewood fault zone. The fault extends from the northwest flank of the Baldwin Hills to Santa Monica Boulevard in the vicinity of Overland Avenue. Based on water level measurements, displacement along the fault is believed to be vertical, with an offset of about 9 meters (Poland, 1959). The west side of the fault has apparently moved downward, relative to the east side, forming a graben between the Charnock and Overland faults. However, there is no evidence that this fault has offset late Pleistocene or Holocene age alluvial deposits (County of Los Angeles County Seismic Safety Element, 1990). Ziony and Jones (1989) indicate that the fault is potentially active (no displacement of Holocene age alluvium). Additionally, the State Geologist considers this fault to be potentially active (Jennings, 1994).

Charnock Fault

The potentially active Charnock fault is located approximately 16½ kilometers southwest of the site. The Charnock fault trends northwest-southeast, subparallel to the trend of the Newport-Inglewood fault zone and the Overland fault. Differential water levels across the fault occur in the early Pleistocene age San Pedro Formation. However, there is no evidence that this fault has offset late Pleistocene or Holocene age alluvial deposits (County of Los Angeles Seismic Safety

Element, 1990). Ziony and Jones (1989) indicate that the fault is potentially active (no displacement of Holocene age alluvium). Additionally, the State Geologist considers this fault to be potentially active (Jennings, 1994).

4.5 GEOLOGIC-SEISMIC HAZARDS

Fault Rupture

The site is not within a currently established Alquist-Priolo Earthquake Fault Zone for surface fault rupture hazards. The closest Alquist-Priolo Earthquake Fault Zone, established for the active Raymond fault, is located approximately 7.9 kilometers north-northeast of the site. Additionally, the site is not within a City of Los Angeles Fault Rupture Study area. Based on the available geologic data, active or potentially active faults with the potential for surface fault rupture are not known to be located directly beneath or projecting toward the site. Therefore, the potential for surface rupture due to fault plane displacement propagating to the surface at the site during the design life of the project is considered low.

Seismicity

Earthquake Catalog Data

The seismicity of the region surrounding the site was determined from research of an electronic database of seismic data (Southern California Seismographic Network, 2004). This database includes earthquake data compiled by the California Institute of Technology from 1932 through 2003 and data for 1812 to 1931 compiled by Richter and the U.S. National Oceanic Atmospheric Administration (NOAA). The search for earthquakes that occurred within 100 kilometers of the site indicates that 409 earthquakes of Richter magnitude 4.0 and greater occurred from 1932 through 2003; 2 earthquakes of magnitude 6.0 or greater occurred between 1906 and 1931; and 1 earthquake of magnitude 7.0 or greater occurred between 1812 and 1905. A list of these earthquakes is presented as Table 3. Epicenters of moderate and major earthquakes (greater than magnitude 6.0) are shown in Figure 4.

The information for each earthquake includes date and time in Greenwich Civil Time (GCT), location of the epicenter in latitude and longitude, quality of epicentral determination (Q), depth in

kilometers, distance from the site in kilometers, and magnitude. Where a depth of 0.0 is given, the solution was based on an assumed 16-kilometer focal depth. The explanation of the letter code for the quality factor of the data is presented on the first page of the table.

Historic Earthquakes

A number of earthquakes of moderate to major magnitude have occurred in the Southern California area within about the last 70 years. A partial list of these earthquakes is included in the following table.

List of Historic Earthquakes

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (Kilometers)	Direction to Epicenter
Long Beach	March 10, 1933	6.4	55	SE
Tehachapi	July 21, 1952	7.5	135	NW
San Fernando	February 9, 1971	6.6	42	NNW
Whittier Narrows	October 1, 1987	5.9	16	E
Sierra Madre	June 28, 1991	5.8	34	NE
Landers	June 28, 1992	7.3	164	E
Big Bear	June 28, 1992	6.4	130	E
Northridge	January 17, 1994	6.7	32	NW
Hector Mine	October 16, 1999	7.1	193	NE

The site could be subjected to strong ground shaking in the event of an earthquake. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

Slope Stability

The site is currently occupied by an abandoned State of California office building and adjoining parking structure. The remainder of the site, approximately the southeast quarter, is occupied by an asphalt-paved parking lot. There are no slopes at the site and the absence of slopes precludes both stability problems and the potential for lurching (earth movement at right angles to a cliff or steep slope during ground shaking). According to the City of Los Angeles Safety Element (1996) and the County of Los Angeles Seismic Safety Element (1990), the site is not within an area identified as

having a potential for slope instability. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Additionally, the site is not located within an area identified as having a potential for seismic slope instability (California Division of Mines and Geology, 1999).

An approximate 13.7- to 14-meter-deep (40 to 45-foot-deep) basement excavation is planned as part of the proposed development. The upper portions of the excavation will expose alluvial deposits and fill materials; bedrock will be exposed in the lower portions of the excavation. The alluvial deposits are horizontally stratified and lack any well-defined planar features or discontinuities (such as bedding or joints) which would act as planes of weakness. The bedrock that will be exposed in the lower portions of the excavation is anticipated to be similar in nature to the bedrock encountered in our current borings at the site. The bedrock is massive in nature and lacks well-defined bedding planes or other well-defined planes of weakness and is not anticipated to adversely affect the proposed basement construction.

The geologic conditions at the site will not result in lateral surcharge loading on the proposed basement walls. However, the sandy alluvial deposits will be prone to local raveling or caving, particularly when combined with local groundwater seepage, and a temporary shoring system with lagging could be required.

Temporary and permanent retaining walls should be designed for the recommended lateral earth pressures and provided with a good drainage system, as recommended, to mitigate the potential for instability due to the proposed excavation at the site.

Liquefaction

Liquefaction potential is greatest where the ground-water level is shallow, and submerged loose, fine sands occur within a depth of about 50 feet or less. Liquefaction potential decreases as grain size and clay and gravel content increase. As ground acceleration and shaking duration increase during an earthquake, liquefaction potential increases.

The Quaternary age alluvial deposits will be removed during the proposed excavation for the proposed subterranean levels. The siltstone beneath the site at the proposed foundation level is very stiff and cohesive and is not considered to be subject to liquefaction.

Tsunamis, Inundation, Seiches, and Flooding

The site is not in a coastal area. Therefore, tsunamis (seismic sea waves) are not considered a significant hazard at the site.

According to the City of Los Angeles Safety Element (1990) and the County of Los Angeles Seismic Safety Element (1990), the site is not located downslope of any large bodies of water that could adversely affect the site in the event of earthquake-induced dam failures or seiches (wave oscillations in an enclosed or semi-enclosed body of water). Therefore, the potential for inundation at the site as a result of an earthquake-induced dam failure or seiche is considered low.

The site is in an area of minimal flooding potential (Zone C) as defined by the Federal Insurance Administration.

Subsidence

The site is not within an area of known subsidence associated with fluid withdrawal (ground water or petroleum), peat oxidation, or hydrocompaction.

4.6 CONCLUSIONS

Based on the available geologic data, active or potentially active faults with the potential for surface fault rupture are not known to be located beneath or projecting toward the site. In our opinion, the potential for surface rupture at the site due to fault plane displacement propagating to the ground surface during the design life of the project is considered low. Although the site could be subjected to strong ground shaking in the event of an earthquake, this hazard is common in Southern California and the effects of ground shaking can be mitigated by proper engineering design and construction in conformance with current building codes and engineering practices.

The site is currently occupied by an abandoned State of California office building and adjoining parking structures. The remainder of the site, approximately the southeast quarter, is occupied by an asphalt-paved parking lot. There are no slopes at the site and the absence of slopes precludes slope stability hazards. The potential for other geologic hazards such as liquefaction, seismic-induced settlement, tsunamis, inundation, seiches, flooding, and subsidence affecting the site is considered low.

5.0 SITE-SPECIFIC GROUND MOTION

A site-specific ground motion study was performed in accordance with Section 9.4.1.3 of the Structural Engineering Institute/American Society of Civil Engineers publication titled "Minimum Design Loads for Buildings and Other Structures", SEI/ASCE 7-02, 2002.

The site-specific response spectra for a Maximum Considered Earthquake (MCE) ground motion having a 2% probability of being exceeded in 50 years was determined by a Probabilistic Seismic Hazard Analysis (PSHA) using the computer program EZFRISK, Version 6.1. The faults used in the study are shown in Tables 1 and 2 along with the maximum magnitude and the slip rate assigned to each fault. The response spectra were developed using the average of the spectra obtained using the attenuation relationships discussed in Abrahamson and Silva (1997), Boore et al. (1997) and Sadigh et al. (1997) for a "soil" site type with a shear wave velocity in the upper 30 meters of about 400 meters per second based on our prior shear wave velocity measurements near the site.

The deterministic maximum considered earthquake ground motion was examined for a variety of nearby faults. The deterministic MCE ground motions were determined to be controlled by a Moment Magnitude 7.5 event occurring on the Puente Hills blind thrust fault. The analysis provided ground motion estimates for the median of the attenuation relations.

The probabilistic and deterministic maximum considered earthquake ground motions are presented in Table 4 and in Figure 6. The site-specific design ground motion response spectra as determined by the procedures described in Section 9.4.1.3.4 of the SEI/ASCE-7 publication is presented in Table 4 and in Figure 7.

6.0 RECOMMENDATIONS

The proposed lowest floor level of the courthouse basement floor will place the building foundations into the siltstone bedrock material. The proposed structure can be supported on spread footings established in the undisturbed siltstone. The basement floor slab can be supported on the undisturbed siltstone.

Although ground water was not encountered during our investigation, and the amount of ground-water seepage during our borings was relatively minor, mass excavation for the proposed building and locally for the building foundations, will encounter ground-water seepage. The amount of ground-water seepage is difficult to estimate, however, based on our experience with similar projects in downtown Los Angeles, the ground-water seepage will impact the proposed construction. Provisions to address and control the ground-water seepage will be required during construction.

The presence of ground water within the excavation would soften and weaken the siltstone bedrock materials, depending on the duration of the exposure. Depending on the amount of water seepage and the construction sequencing, it may be desirable to construct waste slabs at the bottom of the foundation excavations.

To facilitate floor slab construction, it may be prudent to consider leaving the mass excavation 6 to 12 inches above the planned elevation while the foundations are constructed, to minimize the amount of disturbance to the materials that will support the floor slab.

It should also be noted that the location of the Metro Red Line Subway station and/or tunnels should be located and identified. If the station and/or tunnels are in the zone of influence of the proposed courthouse, additional recommendations will be necessary. The zone of influence is estimated to be below a 1:1 plane extending downward from the bottom of the outside edge of the proposed Courthouse footings.

6.1 FOUNDATIONS

In this section, data are given for the following foundation design considerations:

- Bearing value for both major structures and structurally separate minor structures.
- Estimated settlement of the building.
- Lateral resistance.

Bearing Value

Spread footings below the lowest basement floor, carried at least 1 foot into the undisturbed siltstone and at least 2 feet below the lowest adjacent grade or floor level can be designed to impose a net dead-plus-live load pressure of 15,000 pounds per square foot. The excavations should be deepened as necessary to extend into satisfactory materials.

A one-third increase can be used for wind or seismic loads. The recommended bearing value is a net value, and the weight of concrete in the footings can be taken as 50 pounds per cubic foot; the weight of soil backfill can be neglected when determining the downward loads.

Footings for minor structures (loading dock walls, minor retaining walls, and free-standing walls) that are structurally separate from the building can be designed to impose a net dead-plus-live load pressure of 1,500 pounds per square foot at a depth of 1½ feet below the lowest adjacent grade. Such footings can be established in either properly compacted fill soils or undisturbed natural soils.

Settlement

We estimate the settlement of the building, supported on spread footings in the manner recommended, will be 1 inch or less. Differential settlement between adjacent columns is expected to be about ¼ inch or less.

Lateral Resistance

Lateral loads can be resisted by soil friction and by the passive resistance of the bedrock. A coefficient of friction of 0.4 can be used between the footings and the floor slab and the supporting bedrock. The passive resistance of the bedrock can be assumed to be equal to 1,000 pounds per square foot at the surface and increasing by 400 pounds per square foot for each additional foot of depth up to a maximum value of 8,000 pounds per square foot. The passive resistance of the fill and alluvial soils, if utilized, can be assumed to be equal to the pressure developed by a fluid with a density of 250 pounds per cubic foot up to a maximum value of 3,000 pounds per square foot. However, please note that if the passive resistance of the soils or bedrock behind the building walls below grade is relied on, we do not recommend limiting the passive value.

A one-third increase in the passive value can be used for wind or seismic loads. The frictional resistance and the passive resistance of the soils can be combined without reduction in determining the total lateral resistance.

Construction Considerations

As mentioned above, the mass excavation and foundation excavations will likely encounter ground-water seepage. To control ground-water seepage, the installation of internal sumps to collect water seepage and a system to convey the water off-site will likely be required. Placement of gravel or crushed rock at the excavation bottom may also facilitate ground-water control as well as improve equipment maneuverability.

The presence of ground water within the excavation would soften and weaken the siltstone bedrock materials, depending on the duration of the exposure. Depending on the amount of water seepage and the construction sequencing, it may be desirable to construct waste slabs at the bottom of the foundation excavations.

If the ground-water seepage is excessive, it may be beneficial to utilize waste slabs to construct the building foundations (and floor slabs). Waste slab construction consists of over-excavation of about 8 inches of upper materials, the placement of 4 inches of crushed rock and the subsequent placement of 3 to 4 inch thick concrete slab to provide a firm working surface. The strength of the

waste slab concrete should be equal to or greater than the foundation concrete strength. The building foundations can be constructed directly on the waste slabs.

6.2 SITE CLASS DEFINITION

The bedrock materials beneath the proposed current anticipated building foundation level site may be classified as Soil Class Definition "C" in accordance with Table 9.4.1.2 of SEI/ASCE 7-02, Section 9.4.1.2.1.

6.3 FLOOR SLAB SUPPORT

If the subgrade is prepared as recommended in the following section on grading, the building floor slab can be supported on the undisturbed siltstone bedrock.

Construction activities and exposure to the environment can cause deterioration of the prepared subgrade. Therefore, we recommend our that our field representative observe the condition of the final subgrade soils immediately prior to slab-on-grade construction, and, if necessary, perform further density and moisture content tests to determine the suitability of the final prepared subgrade.

To facilitate floor slab construction, it may be prudent to leave the mass excavation 6 to 12 inches above the planned elevation while the foundations are constructed, to minimize the amount of disturbance to the materials that will support the floor slab.

If the ground-water seepage is excessive, it may be desirable to utilize waste slabs to further facilitate the construction of the floor slab. As stated in Section 6.1, waste slab construction consists of over-excavation of about 8 inches of upper materials, the placement of 4 inches of crushed rock and the subsequent placement of 3 to 4 inch thick concrete slab to provide a firm working surface. The strength of the waste slab concrete should be equal or greater than the floor slab concrete strength. The building floor slab can be constructed directly on the waste slab. Please note that if waste slabs are utilized for the floor slab construction, the capillary break, recommended in the following paragraph, should be installed beneath (prior to the installation of) the waste slab.

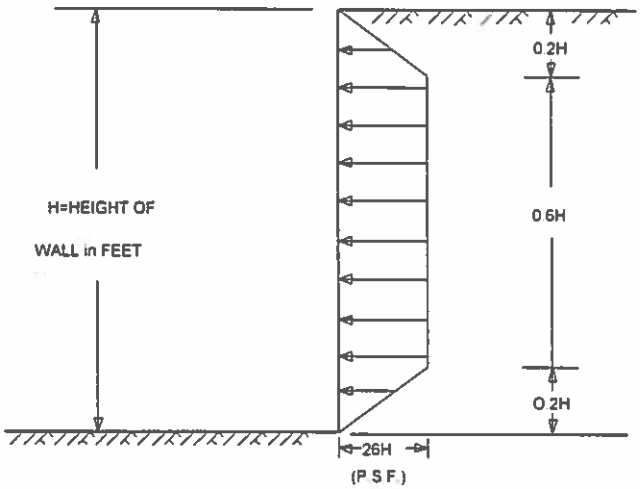
If vinyl or other moisture-sensitive floor covering is planned on the lower floor, we recommend that the floor slab in those areas be underlain by a capillary break consisting of a vapor-retarding membrane over a 4-inch-thick layer of gravel. A 2-inch-thick layer of sand should be placed between the gravel and the membrane to decrease the possibility of damage to the membrane. We suggest the following gradation for the gravel:

Sieve Size	Percent Passing
¾"	90 – 100
No. 4	0 – 10
No. 100	0 - 3

A low-slump concrete should be used to reduce possible curling of the slab. A 2-inch-thick layer of coarse sand can be placed over the vapor retarding membrane to reduce slab curling. If this sand bedding is used, care should be taken during the placement of the concrete to prevent displacement of the sand. The concrete slab should be allowed to cure properly before placing vinyl or other moisture-sensitive floor covering.

6.4 SUBDRAIN SYSTEM

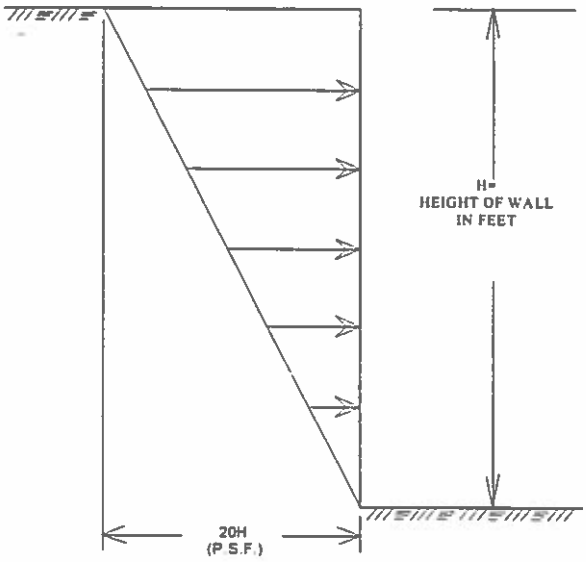
For a subdrain system, we recommend that the lower floor of the building be underlain by a layer of filter material approximately 1 foot thick. The filter material should be drained by subdrain pipes leading to sump areas equipped with automatic pumping units. We suggest that the filter material meet the requirements of Class 2 Permeable Material as defined in Section 68 of the latest edition of the State of California, Department of Transportation, Standard Specifications. If Class 2 material is not available, ¾-inch crushed rock separated from the adjacent soils by a filter fabric may be used. The crushed rock should have less than 5% passing a No. 200 sieve. The drain lines should consist of perforated pipe placed, with the perforations down, in trenches extending at least 1 foot below the filter material. The trenches should be backfilled with material meeting the requirements of the Class 2 Permeable Material or lined with filter fabric and filled with ¾-inch crushed rock. The drain lines should extend around the perimeter of the building and should be spaced approximately 40 feet apart within the interior of the building. A slope of at least 2 inches per 100 feet should be used for the drain lines. Although water will not initially flow into



the subdrain system, we suggest that the pumps and sumps be sized for a total inflow into the system of 300 gallons per minute. The actual inflow into the subdrain system is expected to be less.

A permit from the State of California Regional Water Quality Control board will have to be obtained to discharge the subdrain water into the storm drain. To obtain such a permit, chemical tests will have to be performed on ground water samples obtained at the site to verify that chemicals or pollutants within the water do not exceed the allowable limits for discharging into the storm drain.

6.5 WALLS BELOW GRADE



Lateral Pressure

Where the surface at the top of the retaining wall is flat, we recommend that the basement walls be designed to resist a trapezoidal pressure distribution, as shown on the following figure, where H is the retained height of the wall in feet, and 26H (in units of pounds per square foot) is the recommended maximum lateral earth pressure.

Please note that the lateral earth pressure is given above is based on level grade at the top of the wall. If the backfill is sloped at a 2:1 (horizontal:vertical), the increase to the lateral earth pressure recommended above should be 150%.

In addition to the static lateral earth pressure, the west and north wall sections that are above the designated ground level (the portion of the northeast, or Hill Street side wall, that is above the ground surface level of Broadway in the south side of the building should also be designed to support temporary seismic loading. For temporary seismic loading, we recommended an inverted triangular pressure distribution as illustrated in the following figure, where H is the height of the wall in feet and the maximum pressure is equal to 20H (in units of pounds per square foot).

Where the surface is inclined at 2:1 (horizontal:vertical) as planned for the west (Hill Street) side of the building, the maximum seismic pressure should be increased to 25H (in units of pounds per square foot).

In addition to the recommended earth pressure, the upper 10 feet of adjacent to driveways and streets should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pounds per square foot surcharge behind the shoring due to normal traffic and/or vehicle storage.

Drainage

The proposed walls should be designed to resist hydrostatic pressures or be provided with suitable backdrainage to prevent the development of hydrostatic pressures behind the walls.

The wall backdrainage system could consist of drainage board materials, such as Miradrain strips or equivalent, spaced at a maximum of 4 horizontal feet on-center and extending no closer than 2 feet from the finish ground surface behind the wall to minimize the potential for introducing surface water into the wall backdrain system. The drainage materials should be connected to a 4-inch-diameter perforated pipe placed with perforations down at the base of the wall. The pipe should be sloped at least 2 inches in 100 feet and surrounded by filter gravel. The filter gravel should in turn be placed within a geotextile drainage fabric to minimize the potential for clogging the pipe perforations and the filter gravel. The filter gravel should meet the requirements of Class 2 Permeable Material as defined in the current State of California, Department of Transportation, Standard Specifications.

If Class 2 Permeable Material is not available, ¾-inch crushed rock or gravel separated from the on-site soils by an appropriate filter fabric can be used. The crushed rock or gravel should have less than 5% passing a No. 200 sieve.

The installed drainage system should be observed by personnel from our firm. Inspection of the drainage system may also be required by the reviewing governmental agencies.

Please note that a discharge permit from the State of California Regional Water Quality Control Board is required to allow discharge from the wall backdrainage system into the storm drain. To obtain a discharge permit, chemical testing is required on water samples to evaluate if chemicals or pollutants within the water exceed the allowable limits for discharging into the storm drain.

6.6 EXCAVATION AND SLOPES

Excavation up to about 50 feet deep will be required for the lower subterranean parking level of the proposed development. Where the necessary space is available, temporary unsurcharged embankments may be sloped back at 1:1 without shoring. Adjacent to existing structures, the

bottom of any unshored excavation should be restricted so as not to extend below a plane drawn at 1½:1 (horizontal to vertical) downward from the foundations of existing structures. Where space is not available, shoring will be required. Data for design of shoring are presented in a following section.

Where sloped embankments are used, the tops of the slopes should be barricaded to prevent vehicles and storage loads within 10 feet of the tops of the slopes. A greater setback may be necessary when considering heavy vehicles, such as concrete trucks and cranes; we should be advised of such heavy vehicles, such as concrete trucks and cranes so that specific setback requirements can be established. If the temporary construction embankments are to be maintained during the rainy season, berms are suggested along the tops of the slopes, where necessary, to prevent runoff water form entering the excavation and eroding the slope faces.

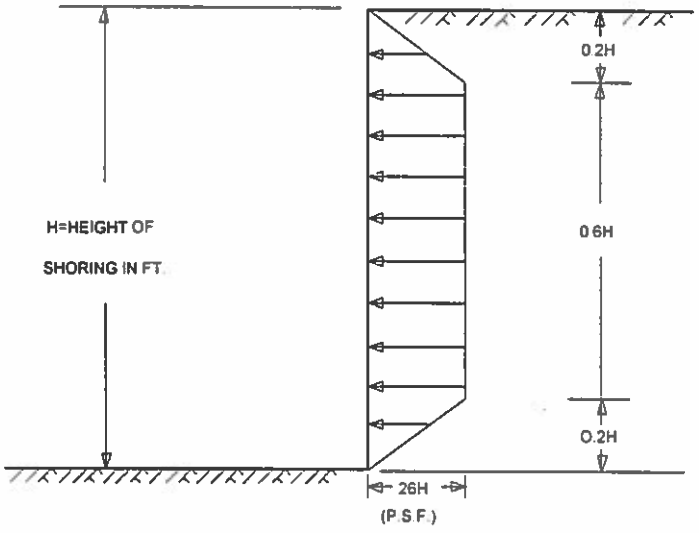
The excavation should be observed by personnel of our firm so that any necessary modifications based on variations in the soil conditions encountered can be made. All applicable safety requirements, including OSHA requirements, should be met.

6.7 TEMPORARY SHORING

General

Where there is not sufficient space for sloped embankments, shoring will be required. One method of shoring would consist of steel soldier piles placed in drilled holes, backfilled with concrete, and tied back with earth anchors. Some difficulty may be encountered in the drilling of the soldier piles and the anchors because of caving in the sandy deposits. Special techniques and measures will be necessary in some areas to permit the proper installation of the soldier piles and/or tie-back anchors. In addition, if there is not sufficient space to install the tie-back anchors to the desired lengths on any side of the excavation, the soldier piles of the shoring system could be internally braced.

Recommendations are presented herein for conventional soldier pile, lagging, and tie-back shoring design. Soil-nail walls for temporary support of the excavation could be used as an alternative



method. Evaluation of the feasibility of and recommendations for soil nail walls were beyond the scope of this investigation.

Lateral Pressures

Typically, where excavations are less than about 15 feet in height, cantilevered shoring is feasible. Although not anticipated for the mass excavation, local excavations less than about 15 feet deep may require temporary shoring.

For design of cantilevered shoring, a triangular distribution of lateral earth pressure may be used. It may be assumed that the retained soils with a level surface behind the cantilevered shoring will exert a lateral pressure equal to that developed by a fluid with a density of 30 pounds per cubic foot.

For the design of tied-back or braced shoring, we recommend the use of a trapezoidal distribution of earth pressure. The recommended pressure distribution, for the case where the grade is level behind the shoring, is illustrated in the following diagram with the maximum pressure equal to 26H in pounds per square foot, where H is the height of the shoring in feet.

For temporary cantilevered shoring and temporary braced shoring, if the retained surface is sloped, the lateral earth pressure should be increased in accordance with the values presented in the following table.

Increase in Static Lateral Pressure for Slopes

Slope of Soil behind Top of Shoring (horizontal to vertical)	Percent Increase in Lateral Earth Pressure
1:1	200
1½:1	165
2:1	150

In addition to the recommended earth pressure, the upper 10 feet of shoring adjacent to the streets and vehicular traffic areas should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 pounds per square foot surcharge behind the shoring due to normal street traffic. If the traffic is kept back at least 10 feet from the shoring, the traffic surcharge may be neglected.

Furthermore, adjacent to existing structures, the shoring system should be designed for the appropriate lateral surcharge pressures imposed by the adjacent foundations of the structures unless the foundations are underpinned, or, as planned, the proper setback is incorporated.

Any lateral surcharge pressures imposed by the adjacent foundations could be computed when the locations, sizes, and loads of these foundations are known.

The shoring system should also be designed to support the lateral surcharge pressures imposed by concrete trucks and other heavy construction equipment placed near the shoring system. We can evaluate these loadings, when sufficient information is available, if authorized.

Design of Soldier Piles

For the design of soldier piles spaced at least two diameters on centers, the allowable lateral bearing value (passive value) of the siltstone materials below the level of excavation may be assumed to be 2000 pounds per square foot at the level of excavation, increasing by 800 pounds per square foot per foot of depth, up to a maximum of 8,000 pounds per square foot. Please note

that this value includes a 200% increase for the case of isolated poles, acting independently. To develop the full lateral value, provisions should be taken to assure firm contact between the soldier piles and the undisturbed soils. The concrete placed in the soldier pile excavations may be a lean-mix concrete. However, the concrete used in that portion of the soldier pile, which is below the planned excavated level, should be of sufficient strength to adequately transfer the imposed loads to the surrounding soils.

The frictional resistance between the soldier piles and the retained earth may be used in resisting the downward component of the anchor load. The coefficient of friction between the soldier piles and the retained earth may be taken as 0.3. This value is based on the assumption that uniform full bearing will be developed between the steel soldier beam and the lean-mix concrete and between the lean-mix concrete and the retained earth. In addition, provided that the portion of the soldier piles below the excavated level is backfilled with structural concrete, the soldier piles below the excavated level may be used to resist downward loads. For resisting the downward loads, the frictional resistance between the concrete soldier piles and the soils below the excavated level may be taken equal to 400 pounds per square foot.

Lagging

Continuous lagging will be required between the soldier piles. The soldier piles and anchors should be designed for the full anticipated lateral pressure. However, the pressure on the lagging will be less due to arching in the soils. For clear spans of up to 6 feet, we recommend that the lagging be designed for a semi-circular distribution of earth pressure where the maximum pressure is 400 pounds per square foot at the mid-line between soldier piles, and 0 pounds per square foot at the soldier piles. Lagging may be omitted in the siltstone bedrock materials. The exception should be observed by personnel of our firm to confirm that lagging may be omitted.

Anchor Design

Tie-back friction anchors may be used to resist lateral loads. For design purposes, it may be assumed that the active wedge adjacent to the shoring is defined by a plane drawn at 35 degrees with the vertical through the bottom of the excavation. The anchors should extend at least 30 feet

beyond the potential active wedge and to a greater length if necessary to develop the desired capacities.

The capacities of anchors should be determined by testing of the initial anchors as outlined in a following section. The following table presents the estimated frictional resistance for tie-back anchors based on the average depth below the ground surface within the bonded length of the anchor.

Average Depth of Embedment (ft)	Estimated Tie-back Frictional Resistance (psf)
20	600
30	900
40	1100
50	1400

If post-grouted anchors are utilized, we estimate that the anchors will develop resistance on the order of three times the estimated values presented in the above table.

Only the frictional resistance developed beyond the active wedge would be effective in resisting lateral loads. If the anchors are spaced at least 6 feet on centers, no reduction in the capacity of the anchors needs to be considered due to group action.

Anchor Installation

The anchors may be installed at angles of 15 to 40 degrees below the horizontal. Caving of the anchor holes should be anticipated and provisions made to minimize such caving. The anchors should be filled with concrete placed by pumping from the tip out, and the concrete should extend from the tip of the anchor to the active wedge. To minimize chances of caving, we suggest that the portion of the anchor shaft within the active wedge be backfilled with sand before testing the anchor. This portion of the shaft should be filled tightly and flush with the face of the excavation. The sand backfill may contain a small amount of cement to allow the sand to be placed by

pumping. For post-grouted anchors of 8-inch diameter or less, the anchor may be filled with concrete to the surface of the shoring.

Anchor Testing

Our representative should select at least six of the initial anchors for 24-hour 200% test, and 12 additional anchors for quick 200% tests. The purpose of the 200% test is to verify the friction value assumed in design. The anchors should be tested to develop twice the assumed friction value. Where satisfactory tests are not achieved on the initial anchors, the anchor diameter and/or length should be increased until satisfactory test results are obtained.

For post-grouted anchors where concrete is used to backfill the anchor along its entire length, the test load should be computed as that required to develop the appropriate friction along the entire bonded length of the anchor. The test load should therefore be computed as:

$$P_{test} = P_{design} * \frac{L_b}{L_a} * M$$

where L_a=Length of Anchor beyond the Active Wedge
L_b=Bonded Length of Anchor
M=150% or 200%, depending on the test performed

The total deflection during the 24-hour 200% test should not exceed 12 inches during loading; the anchor deflection should not exceed 0.75 inch during the 24-hour period, measured after the 200% test load is applied. If the anchor movement after the 200% load has been applied for 12 hours is less than 0.5 inch, and the movement over the previous 4 hours has been less than 0.1 inch, the test may be terminated.

For the quick 200% tests, the 200% test load should be maintained for 30 minutes. The total deflection of the anchor during the 200% quick test should not exceed 12 inches; the deflection after the 200% test load has been applied should not exceed 0.25 inch during the 30-minute period. Where satisfactory tests are not achieved on the initial anchors, the anchor diameter and/or length should be increased until satisfactory test results are obtained.

All of the production anchors should be pretested to at least 150% of the design load; the total deflection during the tests should not exceed 12 inches. The rate of creep under the 150% test should not exceed 0.1 inch over a 15-minute period for the anchor to be approved for the design loading.

After a satisfactory test, each production anchor should be locked-off at the design load. The locked-off load should be verified by rechecking the load in the anchor. If the locked-off load varies by more than 10% from the design load, the load should be reset until the anchor is locked-off within 10% of the design load.

The installation of the anchors and the testing of the completed anchors should be observed by our firm.

Internal Bracing

Raker bracing may be used to internally brace the soldier piles. If used, raker bracing could be supported laterally by temporary concrete footing (deadmen) or by the permanent interior footings. For design of such temporary footings, poured with the bearing surface normal to the rakers inclined at 45 to 60 degrees with the vertical, a bearing value of 4,000 pounds per square foot may be used for footings on the stiff undisturbed siltstone bedrock, provided the shallowest point of the footing is at least 1 foot below the lowest adjacent grade. To reduce the movement of the shoring, the rakers should be tightly wedged against the footings and/or shoring system.

Deflection

It is difficult to accurately predict the amount of deflection of a shored embankment. It should be realized, however, that some deflection will occur. We estimate that this deflection could be on the order of 1 inch at the top of the shored embankment. If greater deflection occurs during construction, additional bracing may be necessary to minimize settlement of the utilities in the adjacent streets. If it is desired to reduce the deflection of the shoring, a greater active pressure could be used in the shoring design.

Monitoring

Some means of monitoring the performance of the shoring system is recommended. The monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of all the soldier piles. We will be pleased to discuss this further with the design consultants and the contractor when the design of the shoring system has been finalized.

We recommend that the adjacent existing buildings be surveyed for horizontal and vertical locations. Also, a careful survey of existing cracks and offsets in the adjacent buildings should be performed and recorded and photographic records made.

6.8 GRADING

To provide support for minor structures spread footings, and for at grade concrete walks and slab adjacent to the main building, all existing fill and disturbed natural soils should be excavated and replaced with properly compacted fill, and all required additional fill should be properly compacted. It is anticipated that fill will be required between the limits of the demolished structures and the exterior walls of the proposed building. Some settlement of the compacted backfill should be anticipated.

The footings of the minor structures may be established in properly compacted fill and/or undisturbed natural soils.

Site Preparation and Moisture Conditioning

After excavating as recommended, the exposed soils in areas to receive additional fill should be inspected and any disturbed deposits should be excavated. The moisture content of the soils should be determined, and the soils should be slowly and uniformly moistened (or dried) as necessary to bring the soils to a uniformly moist condition. The moisture content of the clay soils and compacted fill should be brought to between 2% and 4% over optimum moisture content to a depth of 6 inches. The moisture content of any non-expansive materials should be brought to within 2% of optimum moisture content. The moisture content of the subgrade should be checked and approved prior to placing the required fill.

Subgrade Preparation

After moistening as required, the exposed soils should be compacted to at least 90% of the maximum dry density obtainable by the ASTM Designation D1557-91 method of compaction. The upper clay soils have a high moisture content, and it will be necessary to allow the surface to dry out prior to compacting. As an alternative, a layer of coarse crushed rock about 12 inches thick could be placed over the exposed soils to provide a base for the compaction of the required fill. A geotextile fabric could be placed to help stabilize the subgrade soils and reduce the amount of gravel required. Where grading is interrupted by rain, fill operations should not be resumed until the moisture content and dry density of the placed fill are satisfactory.

Compaction

After compacting the exposed soils, or after placing the gravel layer, the required fill should be placed in horizontal lifts not more than 8 inches thick and compacted to at least 90%. Relatively non-expansive soils shall be compacted at a moisture content varying no more than 2% below or above optimum moisture content. It is recommended that the moisture content of the on-site expansive soils at the time of compaction be brought to between 2% and 4% over optimum moisture content.

Material for Fill

The on-site soils, less debris or organic materials within any existing fill soils, may be used in the required fills. All required imported fill and at least the upper 2 feet of fill beneath adjacent concrete slabs and walks adjacent to the building should consist of relatively non-expansive soils. The Expansion Index of the selected relatively non-expansive material should be less than 35. Any import material should contain sufficient fines (binder material) so as to provide a compacted fill that will be relatively impermeable and will be stable in shallow trenches.

6.9 GEOTECHNICAL OBSERVATION

The reworking of the upper soils and the compaction of all required fill should be observed and tested during placement by a representative of our firm. This representative should perform at least the following duties:

- Observe the clearing and grubbing operations for proper removal of all unsuitable materials.
- Observe the exposed subgrade in areas to receive fill and in areas where excavation has resulted in the desired finished subgrade. The representative should also observe proofrolling and delineation of areas requiring overexcavation.
- Evaluate the suitability of on-site and import soils for fill placement; collect and submit soil samples for required or recommended laboratory testing where necessary.
- Observe the fill and backfill for uniformity during placement.
- Test backfill for field density and compaction to determine the percentage of compaction achieved during backfill placement.
- Observe and probe foundation materials to confirm that suitable bearing materials are present at the design foundation depths.
- Observe installation of soldier piles, lagging and tie-backs for temporary shoring.
- Observe and record test results for tie back anchors.

The governmental agencies having jurisdiction over the project should be notified prior to commencement of grading so that the necessary grading permits can be obtained and arrangements can be made for required inspection(s). The contractor should be familiar with the inspection requirements of the reviewing agencies.

7.0 BASIS FOR RECOMMENDATIONS

The recommendations provided in this report are based upon our understanding of the described project information and on our interpretation of the data collected during our current and previous subsurface explorations. We have made our recommendations based upon experience with similar subsurface conditions under similar loading conditions. The recommendations apply to the specific project discussed in this report; therefore, any change in the structure configuration, loads, location, or the site grades should be provided to us so that we can review our conclusions and recommendations and make any necessary modifications.

The recommendations provided in this report are also based upon the assumption that the necessary geotechnical observations and testing during construction will be performed by representatives of our firm. The field observation services are considered a continuation of the geotechnical investigation and essential to verify that the actual soil conditions are as expected. This also provides for the procedure whereby the client can be advised of unexpected or changed conditions that would require modifications of our original recommendations. In addition, the presence of our representative at the site provides the client with an independent professional opinion regarding the geotechnically related construction procedures. If another firm is retained for the geotechnical observation services, our professional responsibility and liability would be limited to the extent that we would not be the geotechnical engineer of record.

03-11-1933	04:36:00	33.75 N	118.08 W	C	37	.0	4.6
03-11-1933	04:39:00	33.75 N	118.08 W	C	37	.0	4.9
03-11-1933	04:40:00	33.75 N	118.08 W	C	37	.0	4.7
03-11-1933	05:10:22	33.70 N	118.07 W	C	43	.0	5.1
03-11-1933	05:13:00	33.75 N	118.08 W	C	37	.0	4.7
03-11-1933	05:15:00	33.75 N	118.08 W	C	37	.0	4.0
03-11-1933	05:18:04	33.58 N	117.98 W	C	58	.0	5.2
03-11-1933	05:21:00	33.75 N	118.08 W	C	37	.0	4.4
03-11-1933	05:24:00	33.75 N	118.08 W	C	37	.0	4.2
03-11-1933	05:53:00	33.75 N	118.08 W	C	37	.0	4.0
03-11-1933	05:55:00	33.75 N	118.08 W	C	37	.0	4.0

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

01-15-1937	18:35:47	33.56 N	118.06 W	B	57	10.0	4.0

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

06-22-1971	10:41:19	33.75 N	117.48 W	B	79	8.0	4.2

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

NOTE: Q IS A FACTOR RELATING THE QUALITY OF EPICENTRAL DETERMINATION

A = +- 1 km horizontal distance; +- 2 km depth
B = +- 2 km horizontal distance; +- 5 km depth
C = +- 5 km horizontal distance; no depth restriction
D = >+- 5 km horizontal distance

Event qualities are highly suspect prior to 1990. Many of these event qualities are based on incomplete information according to Caltech.

LEGEND:

QUATERNARY

af / Qg / Qc / Qa — Qls

SURFICIAL SEDIMENTS
unconsolidated detrital sediments; generally undissected
af *artificial cut and fill* Qls *landslide debris*
Qg *gravel and sand of major stream channels*
Qc *clay and sand of pre-development marshlands*
Qa *alluvium: clay, sand and gravel; includes gravel and sand of minor stream channels*

Qae / Qop / Qos

OLDER SURFICIAL SEDIMENTS
unconsolidated to weakly consolidated; dissected and eroded where elevated; late Pleistocene age
Qae *similar to* Qa, *but slightly elevated and dissected; includes alluvial fan sediments*
Qop *paleosoil in Baldwin Hills (Fox Hills residual paleosoil of Weber et al. 1982); moderately indurated, erosion-resistant, gray to rusty brown pebbly and sandy paleosoil or "hardpan" on* Qos
Qos *older alluvium, gray to light brown pebble-gravel, sand, silt, and clay of detritus derived from Santa Monica Mountains; similar to* Qae, *but slightly consolidated; in Baldwin Hills designated as Baldwin Hills sandy gravel (Weber et al. 1982), where it is much dissected and eroded*

—UNCONFORMITY—

TERTIARY

Tfsc / Tfr

FERNANDO FORMATION
marine and nonmarine; early to late (?) Pliocene age
Tfr *marine claystone (Repetto Member): gray, soft, vaguely bedded claystone, early Pliocene age (Repettian Stage) in lower part, middle and late (?) Pliocene age (Wheelerian Stage) in upper third*

Tuss / Tush

UNNAMED SHALE
(Yorba Member of Puente Formation of Schoellhamer, et al., 1965; included in Puente Formation by Lamar, 1970, and Weber, 1980; equivalent to Upper Modelo Formation of Hoots, 1931, in Santa Monica Mtns., and to Sisquoc Shale of Ventura Basin)
marine; late Miocene age ("Delmontian" and late Mohnian Stages)
Tush *gray to light brown, thin bedded, silty clay shale, locally contains scattered large calcareous nodules; in places contains thin interbeds of fine-grained sandstone; lower part locally contains thin lenses of light tan, platy, semi-siliceous or diatomaceous shale*

Tmss / Tmsh / Tmsl

MONTEREY FORMATION
(La Vida and Soquel Members of Puente Formation of Schoellhamer, et al., 1965; Puente Formation of Lamar, 1970; Weber, 1980)
marine; middle(?) and late Miocene age
Tmsh *white-weathering, thin bedded, platy, siliceous shale, locally porcelaneous and silty; Mohnian Stage*
Tmss *tan to light gray semi-friable arkosic sandstone; includes some interbedded silty shale*
Tmsl *gray, micaceous silty shale and siltstone; includes some semi-siliceous to siliceous shale and thin sandstone beds; Mohnian and Luisian Stages (includes upper part of Topanga Formation of Lamar, 1970)*

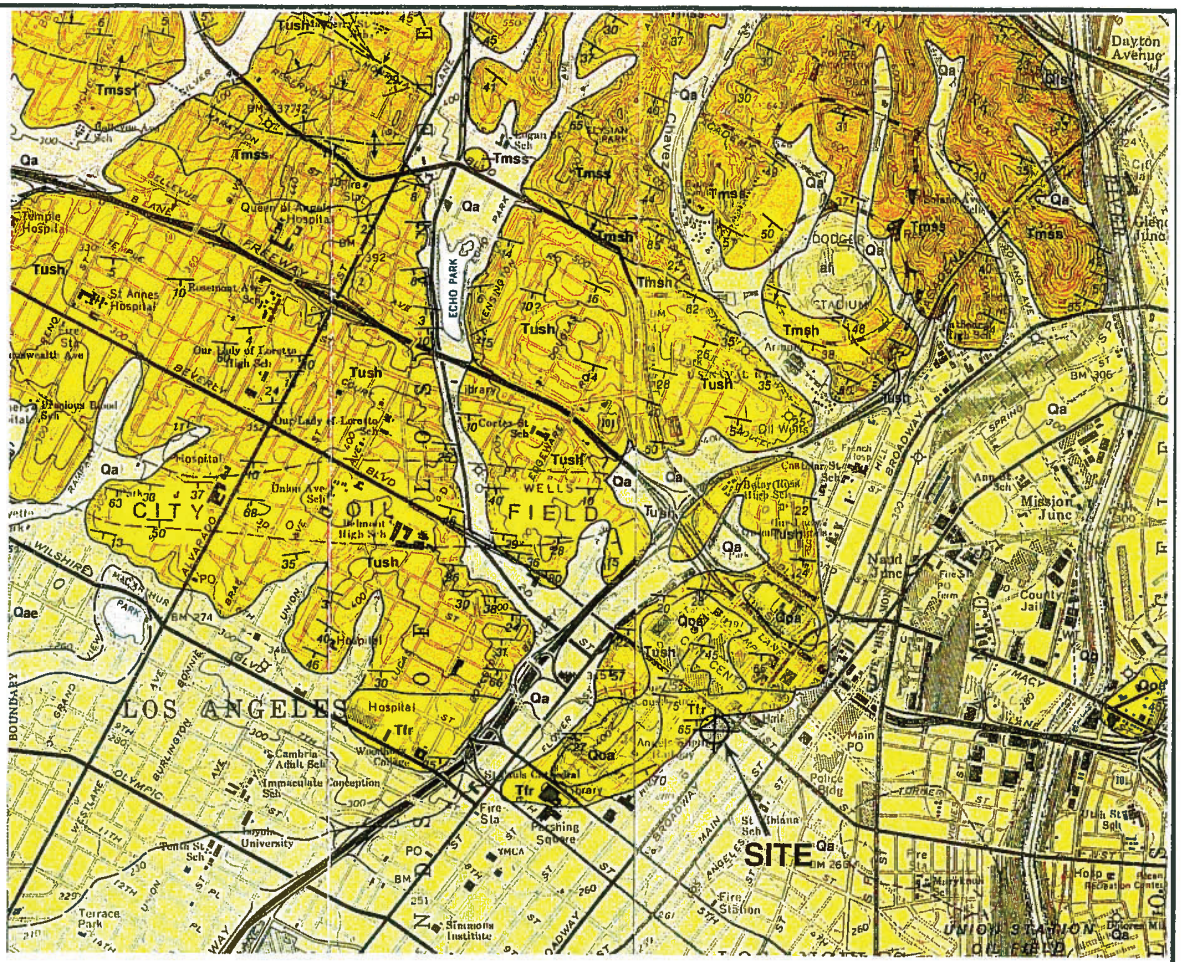
SYMBOLS:

FORMATION CONTACT — *dashed where inferred or indefinite*
MEMBER CONTACT — *between units of a formation*

CONTACT BETWEEN SURFICIAL SEDIMENTS
located only approximately in places

U / D — 25

FAULT
Dashed where indefinite or inferred, dotted where concealed, queried where existence is doubtful. Parallel arrows indicate inferred relative lateral movement. Relative vertical movement is shown by U/D (and U=upthrown side, D=downthrown side). Short arrow indicates dip of fault plane. Sawteeth are on upper plate of low angle thrust fault.



ANTICLINE — SYNCLINE
arrow on axis indicates direction of plunge, dotted where concealed by surficial sediments

horizontal — 24 inclined — 50 inclined (approx.) — vertical — 80 overturned — 75 inclined and vertical — *melamorphic or igneous rock foliation*

STRIKE AND DIP OF STRATIFIED ROCKS

DIRECTION OF LANDSLIDE MOVEMENT — SANDSTONE MARKER BED — CONGLOMERATE MARKER BED

MICROFOSSIL LOCALITIES (of Lagoe, 1989) Mohnian Stage — TAR SEEP — SPRING — ABANDONED EXPLORATORY OIL (OR GAS) WELL

APPENDIX A

CURRENT EXPLORATIONS AND LABORATORY TESTS

APPENDIX A

CURRENT EXPLORATIONS AND LABORATORY TESTS

EXPLORATIONS

The soil conditions beneath the site were currently explored by drilling four borings at the locations shown in Figure l. The borings were drilled to depths of 25 to 75 feet below the existing grade using 24-inch-diameter bucket-type drilling equipment. Borings 1 and 1b were terminated at a depth of 25 feet due to the presence of potentially contaminated soils. Raveling of the boring walls occurred as indicated on the boring logs; however, casing or drilling mud was not used to extend the borings to the depths drilled.

The soils encountered were logged by our field technician, and undisturbed and bulk samples were obtained for laboratory inspection and testing. The logs of the borings are presented in Figures A-1.1 and A-1.4b; the depths at which undisturbed samples were obtained are indicated to the left of the boring logs. The number of blows required to drive the Crandall sampler 12 inches and the hammer weight and drop are indicated on the logs. The soils are classified in accordance with the Unified Soil Classification System described in Figure A-2.

LABORATORY TESTS

Laboratory tests were performed on selected samples obtained from the borings to aid in the classification of the soils and to determine their engineering properties.

The field moisture content and dry density of the soils encountered were determined by performing tests on the undisturbed samples. The results of the tests are shown to the left of the boring logs.

Direct shear tests were performed on selected undisturbed samples to determine the strength of the soils. The tests were performed at field moisture content and after soaking to near-saturated moisture content and at various surcharge pressures. The yield-point values determined from the direct shear tests are presented in Figure A-3, Direct Shear Test Data.

Confined consolidation tests were performed on three undisturbed samples to determine the compressibility of the soils. The results of the tests are presented in Figures A-4.1 and A-4.2, Consolidation Test Data.

BORING 1

DATE DRILLED: December 8, 2003
EQUIPMENT USED: Bucket Auger
HOLE DIAMETER (in.): 24
ELEVATION: 94.4 **

THIS RECORD IS A REASONABLE INTERPRETATION OF SUBSURFACE CONDITIONS AT THE EXPLORATION LOCATION. SUBSURFACE CONDITIONS AT OTHER LOCATIONS AND AT OTHER TIMES MAY DIFFER. INTERFACES BETWEEN STRATA ARE APPROXIMATE. TRANSITIONS BETWEEN STRATA MAY BE GRADUAL.

ELEVATION (ft)	DEPTH (ft)	MOISTURE (% of dry wt.)	DRY DENSITY (pcf)	BLOW COUNT* (blows/ft)	SAMPLE LOC.		
90	5	26.6	97	3		CL-ML	4" Thick Asphaltic Paving FILL - SILTY CLAY - stiff, moist, mottled brown, with shales and pieces of metal, brick and concrete Few gravel and cobbles Little cobbles
85	10	5.4	125	2			Becomes slightly moist
80	15	14.2	122	2			Becomes moist
75	20	19.2	109	2		ML	SANDY SILT - very stiff, moist, grey, gasoline odor
70	25	13.4	117	5			Becomes slightly moist END OF BORING AT 25'
65	30	8.5	108	4			
60	35						
55	40						

NOTES: Water not encountered. No Caving. Moved boring to location 1b due to contaminated soils. Boring backfilled with clean soil cuttings and tamped and patched. Contaminated soils were drummed for disposal.

* Number of blows required to drive the Crandall sampler 12 inches using a hammer falling 12 inches, depth and hammer weight as follows:
0 to 25' using a 3200 pound,
25' to 44' (Boring 1c) using a 1600 pound,
25' to 54' (Boring 2) using a 1600 pound,
44' to 54' (Boring 1c) using a 800 pound,
54' to 69' (Boring 1c) using a 2000 pound,
54' to 69' (Boring 2) using a 800 pound,
69' to 75' (Boring 1c) using a 1200 pound,
69' to 75' (Boring 2) using a 2000 pound.

** Elevations based on assumed benchmark; benchmark shown on Figure 1.

APPENDIX B

PRIOR EXPLORATIONS AND LABORATORY TESTS

APPENDIX B

PRIOR EXPLORATIONS AND LABORATORY TESTS

PRIOR EXPLORATIONS

The soil conditions beneath the site were previously explored by drilling 16 borings to depths ranging from 14 to 68 feet below the existing grade using 18-inch diameter bucket auger-type drilling equipment and using rotary wash-type drilling equipment. The locations of our prior explorations are shown on Figure 1.

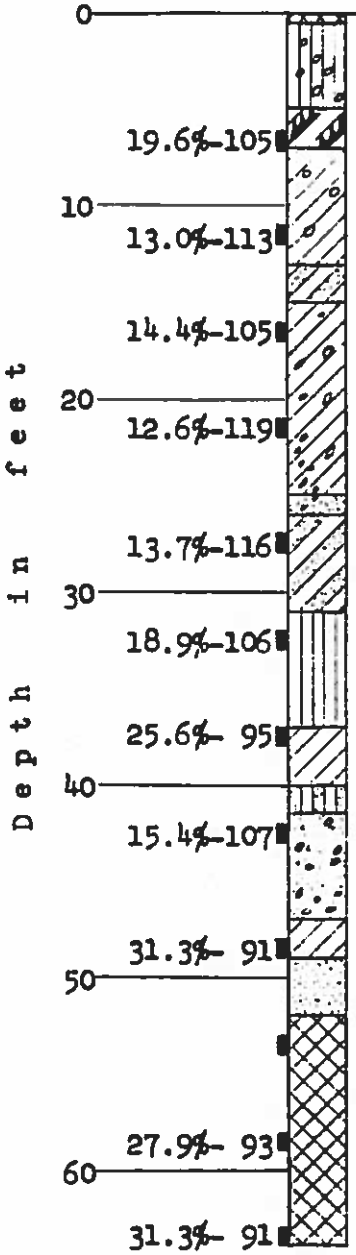
The soils encountered were logged by our field technician, and undisturbed and bulk samples were obtained for laboratory inspection and testing. The logs of the prior borings are presented in Figures B-1.1 through B-1.16. The depths at which the undisturbed samples were obtained are indicated to the left of the boring logs. The number of blows required to drive the Crandall sampler 12 inches and hammer weight are indicated on the logs. The soils are classified in accordance with the Unified Soil Classification System described in Figure B-2.

PRIOR LABORATORY TESTS

Laboratory tests were performed on selected samples obtained from the borings to aid in the classification of the soils and to determine their engineering properties.

The field moisture content and dry density of the soils encountered were determined by performing tests on the undisturbed samples. The results of the tests are shown to the left of the boring logs.

Direct shear tests were performed on selected undisturbed samples to determine the strength of the soils. The tests were performed at field moisture content and after soaking to near-saturated moisture content and at various surcharge pressures. The yield-point values determined from the direct shear tests are presented in Figure B-3, Direct Shear Test Data.



Confined consolidation tests were performed on undisturbed samples to determine the compressibility of the soils. The results of the tests are presented in Figures B-4.1 and B-4.2, Consolidation Test Data.

(PREVIOUS INVESTIGATION 56251)

LOG OF BORING 1

Elevation 318.5 (U.S.G.S. Datum)

A.C. Paving
FILL - SILT - contains large amount of clay, pieces of brick and concrete, brown
FAT CLAY - few small gravel, dark brown
LEAN CLAY - contains medium amount of well graded sand, approximately 5% gravel and small cobbles, dark brown

Layer of CLAYEY SAND - sand well graded, large amount of clay, light brown
Contains medium amount of silt, small amount of fine sand, approximately 5% gravel and small cobbles, brown

Grading sandier with more gravel

Layer of WELL GRADED SAND
CLAYEY SAND - sand well graded, large amount of clay, trace of cobbles, brown

SILT - contains medium amount of clay, small amount of well graded sand, yellowish-brown

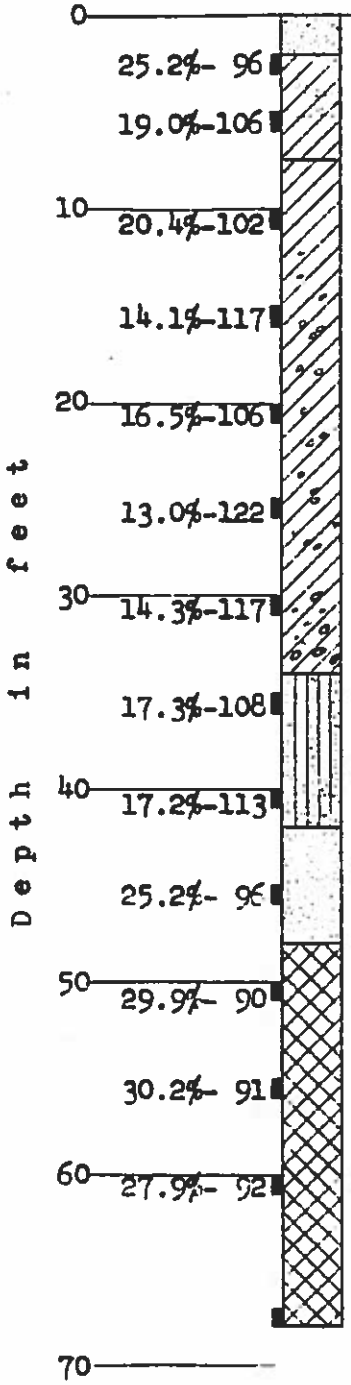
LEAN CLAY - contains trace of fine sand, yellowish-brown
SILTY SAND - sand very fine, yellowish-brown
WELL GRADED SAND - clean, contains approximately 35% small gravel and small cobbles, brown

LEAN CLAY - contains small amount of silt, yellowish-brown
POORLY GRADED SAND - predominantly fine, clean, light greyish-brown
SHALE - contains thin laminations, bluish-grey

NOTE: Heavy water seepage noted at 42'; caving from 42' to 47'; driller's mud used below 47'.

KEY:

31.3%- 91 — Indicates depth at which undisturbed sample obtained
Dry density in lbs./cu.ft.
Field moisture content in percent of dry weight



Soils classified in accordance with the United States Bureau of Reclamation system.

LOG OF BORING 2

FILL - WELL GRADED SAND - gravel, brown

FILL - LEAN CLAY - contains small amount of silt, trace of fine sand, mottled yellowish-brown

Contains thin layers of WELL GRADED SAND

LEAN CLAY - contains trace of medium to coarse sand, dark bluish-grey

Contains approximately 10% small gravel, brown

Contains layers of well graded sand

Layer of poorly graded sand with approximately 40% gravel and cobbles

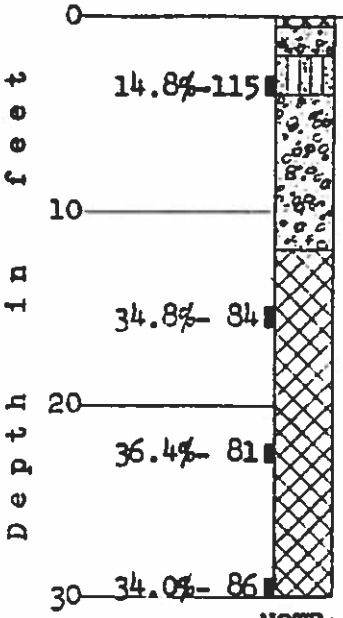
SILTY SAND - sand fine, small to medium amount of silt, brown

Contains layers of WELL GRADED and POORLY GRADED SAND

POORLY GRADED SAND - predominantly fine, clean, grey

SHALE - contains thin laminations, bluish-grey

NOTE: Groundwater level not measured; driller's mud used during drilling.



LEROY CRANDALL & ASSOCIATES

IDENTIFICATION, CLASSIFICATION AND DESCRIPTION OF SOILS

U. S. BUREAU OF RECLAMATION

MAJOR DIVISIONS & SUBDIVISIONS			STANDARD NAMES AND SOIL GROUP DESCRIPTIONS	SYMB.	DESCRIPTIVE INFORMATION TO BE ADDED TO THE STANDARD NAMES FOR DESCRIPTION
COARSE GRAINED SOILS Less than one-half the total soil passing the 200 mesh sieve.	GRAVELLY SOILS Less than one-half the coarse grains passing the No. 4 sieve	GRAVELS "clean" material Little or no fines	WELL GRADED GRAVEL Well-graded gravels or gravel-sand mixtures, little or no fines.		Maximum size, angularity and surface conditions, friability or hardness, and approximate percentage of sand, if any.
			POORLY GRADED GRAVEL Poorly graded gravels or sand-gravel mixtures, little or no fines.		Maximum size, predominant size, angularity, surface conditions, friability or hardness, and approximate percentage of sand, if any.
		GRAVEL WITH FINES "dirty" material Apprec. amount of fines	SILTY GRAVEL Silty gravels, or poorly graded gravel-sand-silt mixtures.		Maximum size, predominant size, friability or hardness; describe fines as being very silty, moderately silty, or slightly silty.
			CLAYEY GRAVEL Clayey gravels or gravel-sand-clay mixtures.		Well or poorly graded, maximum size, predominant size if poorly graded, angularity, friability or hardness; describe fines as slightly, moderately, or very clayey or type of binder in well graded gravels with clay binder.
	SANDY SOILS More than one-half the coarse grains passing the No. 4 sieve.	SANDS "clean" material Little fines	WELL GRADED SAND Well graded sands or gravelly sands, little or no fines.		Angularity, particle shape, friability or hardness, approximate color, percentage of gravel, if any.
			POORLY GRADED SAND Poorly graded sands or gravelly sands, little or no fines.		Coarse, medium, or fine particle, particle shape, clean or slightly dirty, approximate percentage of gravel, if any.
		SANDS WITH FINES "dirty" material Apprec. amount of fines	SILTY SAND Silty sands or poorly graded sand-silt mixtures.		Fine, medium, or coarse particles, shape and hardness of particles, large, medium or small proportion of silt, color, approximate percentage of gravel, if any.
			CLAYEY SAND Clayey sands or sand-clay mixture.		Well graded or poorly graded, predominant size if poorly graded, quality of binder if well graded, large medium, or small amount of clay, color, approximate percentage of gravel, if any.
FINE GRAINED SOILS More than one-half the total soil passing the 200 mesh sieve.	SILT AND CLAY SOILS with low compressibility		SILT Inorganic silts and very fine sand, silty or clayey fine sands.		Presence of clay or sand, and color, degree of plasticity, if any.
			LEAN CLAY Inorganic clays of low to medium plasticity, gravelly or sandy.		Degree of plasticity, silt, sand, or gravel content, and color.
			ORGANIC SILT Organic silts and organic silt-clays of low plasticity.		Visibility of organic material, odor, plasticity, and color.
	SILT AND CLAY SOILS with high compressibility		ELASTIC SILT Very compressible silts, micaceous or diatomaceous sandy or silt soil.		Presence of clay, degree of plasticity, and color.
			FAT CLAY Very compressible clays, inorganic clays of high plasticity.		Color, presence of gravel and other significant factors.
			ORGANIC CLAY Organic clays of medium to high plasticity, very compressible.		Odor, degree of plasticity, and color.
ORGANIC SOILS			PEAT Peat and other highly organic swamp soils.		Odor, presence of fibrous material, color.

Re: Revised Geotechnical Baseline Report (GBR)
Regional Connector Transit Corridor (RCTC) Project
Los Angeles, California

Dear Mr. Roy,

We are pleased to submit this revised Geotechnical Baseline Report (GBR). The report entitled Geotechnical Baseline Report Rev.1a supersedes the earlier version dated April 20, 2012.

This report is updated for editorial revision and corrections including:

- Revision of the cover page
- Refinement of alignment station numbers
- Correction of section cross-references
- Contaminated soil quantities

The Geologic Profile dated June 12, 2013 has not been revised.

For any question regarding this report, please feel free to contact us. Thank you.

Very truly yours,

William H. Hansmire, PhD., PE.
Design Manager/Deputy Project Manager

1.0 INTRODUCTION

1.1 Purpose of the Geotechnical Baseline Report

This Geotechnical Baseline Report (GBR) is issued by the Los Angeles County Metropolitan Transportation Authority (Metro) as part of the Design-Build Contract Documents for construction of the underground facilities of the Regional Connector Transit Corridor (RCTC) project, Contract No. C0980. The GBR was prepared based on an evaluation and interpretation of the boring logs and other geotechnical data in the Geotechnical Data Report (GDR), inspection of soil/rock samples, review of regional and local geology, and on past experience in drilling, excavating, and tunneling in Los Angeles. This GBR Rev 1 is the update of the GBR dated April 20, 2012 on the basis of the additional exploration and studies conducted since that time.

The purposes of this GBR are to:

1. Provide a summary of the ground conditions, ground behavior, groundwater, in-ground obstructions, contamination, and gas conditions in order to facilitate the Contractor's and owner's project management team's understanding of the geotechnical features and ground behavior to be addressed during proposal preparation and during design and construction of the underground facilities.
2. Establish baselines for the anticipated geotechnical conditions, to be relied upon in the preparation of proposals, in bid submittals, and in the design and the construction of the underground facilities.
3. Assist in administering the differing site conditions clause contained in the Contract Documents by providing a basis for their evaluation.

The GBR describes and baselines ground conditions and basic tunnel-ground behavior. Ground behavior described in the GBR is based on assumptions regarding construction means and methods. If different methods are employed, ground behavior may differ from that described. The Design-Builder must complete its own independent review and evaluation of the Contract Documents, GBR, GDR, and other geotechnical information and consider how its selected means and methods and designs will affect ground behavior and the construction of the underground facilities. The Contractor team is required to have a qualified geotechnical engineer/engineering geologist throughout the proposal, design and construction phases of the project to review and evaluate the GBR and its baselines, the GDR and other geotechnical information, to inspect boring samples, and to consider the application of the geotechnical information to the Contractor's design and construction plans.

Proper geotechnical and civil design requires that material parameters be selected based on representative exploration data and test results and geologic information and that the inherent variability of geologic materials be taken into account in selecting probable ranges of soil parameters to be incorporated into the design process.

The GBR is contractually binding and must be read in conjunction with the Geotechnical Data Report (GDR) and other Contract Documents. The order of precedence in the Contract provides that the GBR takes precedence over the GDR, as well as and any other geotechnical information, references or interpretations.

1.2 Scope of the Geotechnical Baseline Report

This GBR pertains to the underground portions of the RCTC project. As described in more detail in the following sections, the underground portions of the project include the bored tunnels, cut-and-cover tunnels, portal and station excavations, crossover structures, transition structures as well as cross-passages and sump structures. Section 2 provides a summary of these project elements. The Project Definition Documents including Project Definition Drawings, General and Technical Requirements are to be consulted for specific details.

1.3 Sources of Geologic and Geotechnical Data

Geotechnical data along the RCTC project alignment are available from several sources. A significant amount of data is available from geotechnical and environmental investigations carried out for other projects, such as the numerous buildings along the alignment. More recent data were collected specifically for the RCTC project. The data sources are summarized below and in the GDR, which was prepared and revised by AMEC (2013).

1.3.1 Previous Investigations

The proposed project alignment extends through a portion of downtown Los Angeles where there are numerous existing buildings and other engineered structures. As a result, the RCTC design team utilized geotechnical information from these previous investigations. However, many of these prior investigations did not address the specific data needs for underground construction and the RCTC project. Nonetheless, those investigations provide a useful source of information regarding the subsurface distribution of geologic units and some of their basic engineering properties. The results from the previous investigations are incorporated in the GDR and were considered in preparing this GBR.

In all, the GDR includes geologic and geotechnical data from 103 “historic” borings that were drilled in the vicinity of the RCTC alignment, post 1950. These borings were drilled by AMEC and its predecessor firms, namely MACTEC, LeRoy Crandall and Associates and Law/Crandall. For the purposes of including information from these borings in the Regional Connector project without duplicating boring numbers, these historic borings were renumbered as borings P-1 through P-110 (as indicated on the boring logs that are reproduced in the GDR).

More recently, site investigation was performed in support of a Draft Environmental Impact Statement (DEIS) / Draft Environmental Impact Report (DEIR) for the Regional Connector project. The final report of that investigation was completed in November 2010 by MACTEC (now AMEC), for Camp Dresser & McKee (CDM) and Metro. That investigation included: the compilation of previous data (the historic borings noted above); drilling of 10 additional borings (geotechnical and environmental); installation of groundwater and gas monitoring wells; and laboratory testing of selected samples. These borings were numbered 2 through 11 and the results are included in the GDR.

1.3.2 Preliminary Engineering Investigations

In support of the Advanced Conceptual Engineering/Preliminary Engineering/Advanced Preliminary Engineering (ACE/PE/APE) phase studies by AMEC, working through the Connector Partnership Joint Venture (CPJV), performed a supplemental geotechnical investigation. The investigation was directed toward providing information to address recent modifications to the project, including alignment, grade, station locations, and presumed

construction methods. The investigation included 32 borings, soil testing, groundwater testing, groundwater/gas monitoring, and preparation and revision of a GDR (AMEC, 2013).

2.0 PROJECT DESCRIPTION

2.1 Project Description

As shown on Figure 1, the RCTC project provides a 1.86 mile-long connection between the Gold Line LRT lines from Pasadena and East Los Angeles, to the Blue Line to Long Beach and new Expo Line to Culver City, with the provision of new tracks through downtown Los Angeles mainly within twin tunnels. In the direction of tunnel drive (i.e. decreasing stationing from east to west), the underground components of the project are included in Table 2-1.

Table 2-1: Underground Components

Underground Component	Start Station	End Station	Approx. Length (ft)
Mangrove Site			
• TBM Launch Pit	-	-	257
• TBM Launch Temporary Tunnel	-	-	150
East End Wye			
• 1st Street Cut/Cover (east branch of Wye)	R 84+39	R 80+20	419
• 1st Street Open Trench (east branch of Wye)	R 88+40	R 84+39	401
• Alameda Street Cut/Cover (north branch of Wye)	R1 88+32	R1 80+20	812
• Alameda Street Open Trench (north branch of Wye)	R1 92+41	R1 88+32	409
1st/Central Avenue Station Cut-&-Cover	R 80+20	R 76+45	375
Bored tunnel from 1st/Central Avenue Station to Crossover Cavern	R 76+45	R 56+61	1984
Crossover Cavern SEM Section	R 56+61	R 53+72	289
2nd/Broadway Station Cut-&-Cover	R 53+72	R 49+11	461
Bored tunnel from 2nd/Broadway Station to 2nd/Hope Street Station	R 49+11	R 32+81	1630
2nd/Hope Street Station	R 32+81	R 29+37	344
Bored tunnel from Flower Street Cut-&-Cover to 2nd/Hope Street Station	R 29+37	R 19+02	1035
Flower Street Cut-&-Cover Tunnels	R 19+02	R 5+48	1354

Notes: R indicates right track stationing and includes 1st Street branch of Wye; R1 indicates right track stationing for Alameda Street branch of Wye.

The project components are listed above from east to west to be consistent with the required tunnel drive direction, although the project stationing increases from west to east. By type of construction, the project components are summarized in Sections 2.1.1 through 2.1.6. For details regarding the project components, the reader should consult the Project Definition Documents.

2.1.1 Mangrove Site – Potential TBM Launch Area

As shown on Figure 1, the "Mangrove" site is located between the 1st Street and Alameda Street branches of the alignment. This area will be provided for the Design-Build Contractor's use and will provide space for a TBM launch pit and staging. Currently the Mangrove site is occupied by a parking lot. Historical aerial photographs and previous site investigation reports indicate that the site was occupied by one- to five- story buildings, which were demolished and some of which are believed to have had basements. Although foundation details are lacking, it is believed that all of the buildings had shallow foundations. These abandoned basement structures and foundations are expected to be encountered in the TBM launch pit excavation up to 30 feet below the ground surface. Refer to Section 4.2 for more details.

According to the Environmental Impact Statement (EIS) and the Mitigation Monitoring Reporting Program (MMRP), the TBM staging and tunneling is only allowed in the Mangrove site.

Consequently, tunnel drives may begin at the Mangrove site, or begin in the 1st/Central Avenue Station excavation pit by dragging the TBM from the Mangrove site through the cut-and-cover excavation under the intersection of 1st Street and Alameda Street. The position of the launch pit and the construction schedule will be the responsibility of the Contractor. As such, a length of temporary tunnel from the launch pit to the 1st/Central Street Station listed in the table above is assumed and approximated.

2.1.2 East End "Wye"

East of Station R 80+20 (where the 1st/Central Avenue cut-and-cover station ends beneath the intersection of 1st Street and Alameda Street), the alignment splits into two directions. This "Wye" (two legs of a true wye) will be constructed by cut-and-cover excavation methods, with branches extending to the east and north. The eastern branch (adjacent to 1st Street) extends approximately 419 feet within a cut-and-cover excavation, to the beginning of an open trench structure. The open trench structure extends approximately 401 feet farther east, toward the end of the alignment along 1st Street. The northern branch (adjacent to Alameda Street) extends approximately 812 feet within a cut-and-cover excavation, to the beginning of an open trench structure. The open trench structure extends approximately 409 feet farther to the north, to the beginning of an above grade section. The depth of excavation will range from a few feet to approximately 45 feet.

2.1.3 Flower Street Cut–and–Cover

The southwest end of the project is at the existing 7th Street/Metro Center Station, at approximately Station R 5+48. From this intersection to Station R 19+02 (at the southwest end of the bored tunnels), construction of the twin tunnels will be performed by cut-and-cover methods. This method of construction was selected because of anticipated conflicts with abandoned tieback anchors from existing buildings along this part of the alignment and considering the relatively shallow excavation depth. Also, the cut-and-cover excavation of this section will encounter the abandoned Pacific Electric tunnel crossing perpendicular to the proposed alignment near West 4th Street. The Contractor is required to demolish the abandoned tunnel lining within the excavation and backfill abandoned tunnel spaces between the proposed box structure and the adjacent property lines as described in the Project Definition Documents. Along this 1,354-foot long section of cut-and-cover tunnels, the depth of excavation will range from approximately 50 to 55 feet.

2.1.4 Stations

The project includes three underground stations, anticipated to be constructed using conventional cut-and-cover construction methods. They are summarized below, from east to west.

2.1.4.1 1st/Central Avenue Station

This station is located on the south side of 1st Street, diagonally between Central Avenue and Alameda Street and will be constructed using conventional cut-and-cover construction methods. This is a relatively shallow underground center platform station with no mezzanine. The station alignment and box location were established to meet the requirements of the tunnel portal locations on 1st Street and Alameda Street, as well as providing connection to the existing north bound and east bound Gold Line tracks. The provision of a "Wye" intersection to the north and east bound tracks also influenced the location of the station box. The depth of excavation will be approximately 45 to 50 feet below the existing ground surface.

2.1.4.2 2nd/Broadway Station

The 2nd/Broadway Station will be constructed beneath 2nd Street and between Broadway and Main streets, within a relatively narrow right-of-way. The station will be constructed using conventional cut-and-cover construction methods, and the depth of excavation will be approximately 95 to 100 feet below the existing ground surface.

2.1.4.3 2nd/Hope Street Station

The 2nd/Hope Street Station is an underground LRT center platform station and is diagonally oriented between 3rd Street and 2nd Street, and between South Flower Street and South Hope Street. The depth of the excavation is approximately 105 feet below the sidewalk elevation adjacent to Hope Street and General Thaddeus Kosciuszko Way (GTK Way) and approximately 85 feet below the existing ground surface at the west end of the station. The existing surface street of West GTK Way and the 2nd Place Bridge will be demolished and the area above the station/ancillary box will be re-graded.

2.1.5 Crossover Cavern

The project includes one mined crossover structure, which is located immediately east of the 2nd/Broadway station. It is 289 feet in length and the finished internal dimensions of the cavern would be approximately 56 feet wide and 30 feet high. Ground cover over the cavern is approximately 60 feet. It is anticipated that this structure will be constructed using Sequential Excavation Methods (SEM) to enlarge the previously bored tunnels.

2.1.6 Bored Tunnels

The limits of the stations, crossover cavern, the two end sections, and the cut-and-cover tunnel section (described above) result in three reaches of twin-bored tunnels. These tunnels are required to be constructed with a pressurized-face Tunnel Boring Machine (TBM) and will have an excavated diameter of approximately 22 feet, and a widely variable depth of cover. Because it is required that the tunnels would be driven starting at the east end of the project, these reaches are numbered herein starting with Reach 1 at the east.

Reach 1 extends from Station R 76+45 to Station R 53+72 (decreasing stationing in the direction of tunnel drive), a distance of 2,273 feet. These tunnels will be beneath the Japanese Village Plaza and the 2nd Street. The depth of cover will range from approximately 25 to 65 feet between tunnel crown and existing ground surface. From Station R 76+10 to R 70+50, the tunnels will be constructed beneath the Japanese Village Plaza, which includes a parking structure and retail store buildings, with a distance from tunnel crown to existing buildings/structure foundations of approximately 15 to 35 feet that is subject to field verification by the Contractor. From Station R 71+50 to R 44+00, the Regional Connector tunnels will be constructed beneath an existing storm drain, with a distance from tunnel crown to storm drain invert of approximately 20 to 44 feet. This reach includes two cross passages, located at Stations R 62+50 and R 69+00. This reach is divided into Reaches 1A and 1B for anticipated ground conditions discussed later.

Reach 2 extends east/southeast from the 2nd/Hope Station, beginning at Station R 49+11 and ending at Station R 32+81, a distance of 1,630 feet. The depth of cover (tunnel crown to ground surface) ranges from approximately 70 feet to 130 feet along this reach. This reach includes one cross passage, located at Station R 41+15. From Station R 49+11 to R 43+20, a distance of 591 feet, the tunnels will be beneath the existing storm drain, with a distance from tunnel crown

to storm drain invert of approximately 25 to 45 feet. From Station R 43+40 to R 36+50, a distance of 690 feet, the tunnels will be beneath the existing 2nd Street tunnel, where the distance between the 2nd Street tunnel invert and the crown of the Regional Connector tunnels will range from approximately 45 to 70 feet. Where the Regional Connector tunnels cross beneath Hill Street, they will cross under the existing Metro Red Line tunnels. The distance between the crown of the Regional Connector tunnels and the invert of the Red Line tunnels is expected to be approximately five feet.

Reach 3 extends from Station R 29+37 to R 19+02, a distance of 1035 feet with one cross passage at Station R 24+00. The majority of this tunnel reach will be beneath South Flower Street, with a depth of cover (above tunnel crown) ranging from approximately 30 to 60 feet. These tunnels pass between the existing pile foundations for the 4th Street overpass, as shown on the Project Definition Drawings. This leaves little clearance between the edge of the tunnel excavations and the existing pile foundations, and results in a reduced pillar width between the tunnels. Also, the reduced pillar width between 3rd and 4th Streets provides clearance between the tunnel excavation and a number of existing tieback anchors that remain from the construction of adjacent buildings. Generally, the clearance between the left and right tunnel alignment and the nearest tieback anchors is at least five feet. From Station R 25+15 to R 26+20, the abandoned tieback anchors from the Bank of America building near the intersection of West 3rd Street and South Flower Street are expected to be encountered in the right tunnel. The Contractor will be required to take pre-tunneling mitigation measures to remove the abandoned tieback anchors prior to the tunneling advance in this area. In addition, based on field measurement, invert of an existing sanitary sewer manhole at Station R 19+70 will be within two feet from the proposed tunnel lining. The outside dimension of the manhole structure is unknown. This reach is divided into Reaches 3A, 3B, and 3C for anticipated ground conditions discussed later.

3.0 GEOLOGIC CONDITIONS

The following information is summarized from the Geotechnical Data Report (GDR), and formed the basis for establishing the baselines in Section 4.

3.1 Geologic Setting

3.1.1 Regional, Tectonic, and Seismic Setting

As shown on Figure 2, the alignment traverses the southeastern end of the Elysian Park Hills and a portion of the ancient Los Angeles River floodplain. The Elysian Hills comprise the low-lying hills west of the Los Angeles River and southeast of the eastern end of the Santa Monica Mountains. The alignment along Flower, 2nd, 1st, and Alameda Streets will encounter artificial fill and geologic units that range in age from Miocene to Holocene. From oldest to youngest in geologic age are the Pliocene-age sedimentary strata of the Fernando Formation, Pleistocene-age alluvium (referred to in this report as Qal2 alluvium), and Holocene-age alluvium (Qal1).

Miocene-age bedrock of the Puente Formation has been mapped at the surface on Bunker Hill to the north of the alignment. The upper contact of the Puente Formation forms a slight angular unconformity with the overlying Fernando Formation and the contact appears to extend beneath the planned excavations for this project. Borehole data support this and indicate that the Puente Formation will not be encountered along the project alignment.

The bedrock formations are unconformably overlain by Pleistocene- and Holocene-age alluvial sediments. The Pleistocene sediments are present as remnant depositional terraces in the Bunker Hill area, whereas, the more recent Holocene alluvial sediments are present along the floodplain east of Bunker Hill and filling in the paleo-drainage along portions of Flower Street.

Artificial fill has been placed at various locations along the alignment including areas overlying both existing and abandoned tunnels.

3.1.2 Bedding Orientation, Local Faulting and Folding

As discussed in the GDR, geologic maps prepared by Soper and Grant (1932) and Lamar (1970) show that the dip of bedding in the local bedrock formations ranges from 32 to 83 degrees to the southeast and south. Bedding dips ranging from 22 to 42 degrees to the southwest and southeast in former cut slopes adjacent to 4th Street, between Flower and Hope Streets were reported by Glen A. Brown and Associates (1969).

Bedding in the Fernando Formation is generally indistinct. However, where present, it consists of poorly developed bedding plane separations or very thin sandy interbeds.

Borehole surveys performed as part of the ACE/PE/APE investigation indicate a strong trend of bedding orientations with nearly due south dips, at approximately 65 to 80 degrees within the portion of the alignment along 2nd Street and west of San Pedro Street. Bedding inclinations are less steep east of San Pedro Street with southerly dips varying from about 25 to 35 degrees. Bedding inclinations dip to the south at about 30 to 65 degrees within the portion of the alignment along Flower Street.

For more information on discontinuity orientation and frequency, refer to Figure 21A to 21C.

The bedrock is locally cut by small shears that have minor displacement. Thin clay gouge seams have been reported along some shears (Hood and Schmidt, Inc., 1966).

3.1.2.1 Faults

Faults that have surface evidence of past rupture include those classified by the California Geological Survey (Hart, 1999) as active, potentially active, and inactive. Based on the available data, no active or potentially active surface faults are known to cross the proposed project alignment (AMEC, 2013). In addition to these surface faults, two buried thrust faults commonly referred to as blind thrusts, are interpreted to underlie the project area at depth. These are the Puente Hills Blind Thrust fault (PHBT) and the Upper Elysian Park fault. Rupture surfaces for these faults are not exposed at the ground surface and thus these faults do not present a potential surface fault-rupture hazard for this project. However, they are considered active in the sense that they are potential sources for future earthquakes.

Uplift along the Elysian Park Anticline is believed to have been produced by movement along the Elysian Park blind thrust. The south flank of this anticline has been called the Coyote Pass Escarpment and is identified by a south-facing slope that trends approximately east-west. Previously, the possibility of the escarpment to pass south of the 1st/Central Avenue Station was considered. However, based on a separate exploration and study during APE, the escarpment was found not to be located near the proposed tunnel alignment and 1st/Central Avenue Station, and is not expected to impact the Project. Refer to the Report of Geologic Investigation of Coyote Pass Escarpment by AMEC (2013) for more details.

3.1.2.2 Seismic Ground Movement

In accordance with Metro Rail Design Criteria, the design of underground structure shall be based on two probabilistic levels:

- Maximum Design Earthquake (MDE) - defined as an event with a 4% probability of exceedance in 100 years (corresponding to a return period of 2,475 years).
- Operating Design Earthquake (ODE) - defined as an event with a 50% probability of exceedance in 100 years (corresponding to a return period of 150 years).

A probabilistic Seismic Hazard Analysis (PSHA) and response spectra matching with three existing time histories were performed in order to estimate the ground motions corresponding to the material at a depth of 145 feet below ground surface for each probabilistic level. Then using the outcropping ground motions, one-dimensional non-homogeneous site response analyses were performed to provide a non-linear distribution of free-field displacement at each underground structure. Details and results are presented in the Results of One-dimensional Site Response Analyses by AMEC (2013) for the seismic design of underground structures. The time histories of shear strains and horizontal ground displacement are presented for each proposed structure for each design earthquake level in the referenced report.

3.1.2.3 Liquefaction

In general, the potential for liquefaction is characterized as “high” within saturated upper (Qal1/younger) alluvium that is within 40 feet of the ground surface. The potential for liquefaction in the upper alluvium is considered “low” where it is not saturated. Because the lower (Qal2/older) alluvium is relatively dense, its liquefaction potential is characterized as “low”,

irrespective of the degree of saturation. Areas where a high potential for liquefaction is considered to exist within the planned excavations include:

- Portions of the upper alluvium within the cut-and-cover reach along Flower Street, between the 7th/Flower Station and the bored tunnels
- Limited portions of upper alluvium above the 2nd/Broadway Station

In these areas, settlement of the proposed underground structures due to liquefaction is not expected since the proposed structures will be constructed deeper in the Fernando Formation. However, the additional lateral earth pressure due to liquefaction is to be considered for the final structure within the "high" potential soil layers for liquefaction.

The alignment along Alameda (north branch of Wye) and First Streets (east branch of Wye) will be constructed in upper alluvial soils in which the potential for liquefaction is considered "low".

3.2 Geologic Units

The planned excavations will encounter the following units: artificial fill, alluvium, and the Fernando Formation. The characteristics of these units are described below. Baselines for the various characteristics are provided in Section 4 according to tunnel reach, Station, etc.

3.2.1 Artificial Fill

Artificial fill of variable thickness underlies the ground surface along much of the alignment. The fill consists of mixtures of gravel, sand, silt, and clay, with construction debris. At some locations, artificial fill contains up to 60 percent construction debris, which includes pieces of brick, asphalt, plaster, metal, wire, timber, and concrete. Typically, the construction debris ranges in size from gravel to cobbles. However, fragments that are several feet in maximum dimension (i.e. boulder size) are present.

Deep areas of fill, to depths of approximately 25 to 35 feet below ground surface, are located along and adjacent to Flower Street from 2nd Place to 4th Street above the abandoned Pacific Electric tunnel, the storm drain excavations, and other structure excavations that have been backfilled.

3.2.2 Alluvium

Holocene to probable late Pleistocene age alluvial deposits are present along the alignment beneath variably thick artificial fill. The alluvium overlies an erosional contact with the Fernando Formation and thins out laterally against an irregularly sloping contact with the Fernando Formation at variable depths in the subsurface.

The alluvial deposits thicken southward along South Flower Street between 2nd Street and 6th Street. The elevation of the alluvium/bedrock contact along Flower Street is near the proposed tunnel crown elevation. Data from prior geotechnical/foundation investigations and current boring data indicate an eastward increase in alluvial deposit thickness and increased depth to the Fernando Formation beneath 2nd Street between Main Street and Alameda Street.

Geologic maps prepared by Soper and Grant (1932) and Lamar (1970) show the alluvial deposits in depositional contact (i.e., the alluvium laterally thins or pinches out) against bedrock near the intersection of Hill Street and 2nd Street. Geologic maps prepared by the CGS (2010)

and the U.S. Geological Survey (2005) have delineated the alluvial deposits beneath Flower Street and 2nd Street as separate alluvial units. The alluvial deposits along Flower Street were deposited within a relatively small drainage area, whereas, the alluvial deposits along 2nd Street were deposited in a higher energy environment, primarily as floodplain, channel, and sheet flow deposits derived from the Los Angeles River.

Based on the characteristics described above, on Plate 1, the alluvial deposits are subdivided into two units: Qal1 which is typically finer grained and Qal2 which is typically coarser grained. In addition to this general difference in soil type, the subdivision of the alluvium is based on penetration blow count data and geologic observations of drive samples and sonic cores that indicate the coarser grained alluvial deposits beneath 2nd Street and Alameda Street (Qal2) are notably denser than the upper alluvial deposits (Qal1). In addition to this density contrast, locally the Qal2 unit has slight cementation. Together, these characteristics suggest that the lower coarser-grained alluvial unit (Qal2) is notably older, probably early Holocene to late Pleistocene age. A similar condition exists locally along Flower Street.

3.2.2.1 Qal1

A review of available boring logs along the project alignment was made to estimate the distribution of USCS soil types and maximum layer thickness within Qal1. The results are shown on Figure 3, which shows that Qal1 is dominantly comprised of sandy soils. Figure 3 also shows the number of gradation tests performed on each soil type.

The dry density of Qal1 has a broad range, varying from approximately 80 to 140 pounds per cubic foot (pcf), and based on a total of 308 tests, the average dry density is approximately 108 pcf. The moisture content ranges from a few percent to approximately 45 percent, and based on 310 tests averages approximately 14 percent. The wet density ranges from approximately 100 to 150 pcf and has an average of approximately 122 pcf. Figures 4, 5, and 6 show the distribution of dry density, moisture content, and wet density within the Qal1 unit.

The relative density (from sampler penetration blow counts) of the Qal1 varies widely, depending on soil type, with blow counts ranging from approximately 13 blows per foot (bpf) to 50+ blows for a few inches of sampler penetration. The instances of high blow counts (i.e. approximately 50 blows for a few inches of penetration) are generally limited to within the gravelly and cobbly soils.

Figure 7 shows the results of all gradation tests performed in Qal1. It is noted that the results of the gradation tests reflect the particle size of the soil samples actually obtained, and for coarse grained samples, these results do not accurately represent the in situ material. This is because coarse-grained materials commonly contain particles larger than the sampler opening and thus are not sampled.

Hydraulic conductivity within the Qal1 alluvium varies widely based on soil type. No hydraulic conductivity testing was performed in the Qal1 alluvium during the recent EIR or ACE/PE/APE studies. However three results are available from investigations performed by CEG Consultants (1981, 1983) where results ranged from 2.9×10^{-5} cm/s to 4.4×10^{-4} cm/s. Layers of relatively clean sand and gravel are expected to have higher hydraulic conductivity, ranging up to 10^{-2} cm/s. Based on the compilation of data from boring logs shown on Figure 3, such higher conductivity layers comprise up to 36 percent of the Qal1 alluvium unit.

3.2.2.2 Qal2

A review of available boring logs along the project alignment was made to illustrate the distribution of USCS soil types and maximum layer thickness within the Qal2 unit. The results are shown on Figure 8, which shows that the Qal2 is dominantly comprised of sandy soils. In comparing Figures 3 and 8, it is apparent that the Qal2 contains more poorly graded and well graded sand, more gravely soils, and much less silty and clayey soils, as compared to the Qal1. For reference, Figure 8 also shows the number of gradation tests performed on each soil type.

The dry density of the Qal2 has a broad range, varying from approximately 80 to 140 pcf, and based on a total of 207 tests, the average density is approximately 115 pcf. The moisture content ranges from a few percent to approximately 40 percent, and based on 212 tests, averages approximately 10 percent. The wet density ranges from approximately 100 to 160 pcf and has an average of approximately 126 pcf. Figures 4, 5, and 6 show the distribution of dry density, moisture content, and wet density within the Qal2.

The relative density of the Qal2 varies with soil type, and overall, this unit is denser than the Qal1. Where it is gravelly/cobbly, penetration resistance within Qal2 is commonly over 50 bpf or 50+ blows for a few inches of sampler penetration.

Figure 9 shows the results of all gradation tests performed in Qal2. As with the Qal1, the results of the gradation tests for the Qal2 reflect the particle size of the soil samples actually obtained, and for coarse grained samples, these results do not accurately represent the in situ material.

One hydraulic conductivity test (a slug test using the standpipe piezometer installed in boring G2-15) was performed in the Qal2 during the ACE/PE/APE studies. The test zone primarily included poorly to well graded sands with silt and some gravel, with approximately 3% to 9% fines (passing the #200 sieve). The test result indicates an average conductivity of approximately 4×10^{-4} cm/s. One test result is available from investigations performed by CEG Consultants (1983) with a result of 2.3×10^{-6} cm/s. Local layers of clean sand and gravel are present and are expected to have hydraulic conductivity ranging up to 10^{-3} cm/s. As part of the ACE/PE/APE geotechnical investigation, the relative abrasiveness of the Qal2 was tested by performing Soil Abrasion Tests (SAT) and Miller abrasion tests. The results of these tests are summarized on Figures 10 and 11. As shown on Figure 10, the three samples of Qal2 showed “medium” abrasiveness based on a comparison to the rock abrasivity scale of the Abrasion Value Steel (AVS). As shown on Figure 11, the three samples that were subjected to Miller Abrasion testing to evaluate the abrasiveness of the material in slurry, ranked as high to very high.

3.2.2.3 Alluvium at South Flower Street

Alluvial deposits along South Flower Street consist primarily of interlayered silty clays, sandy silts, clayey sands, and silty sands with some sand layers containing variable gravel and few cobbles, overlain by a variable thickness of fill. The depth of the alluvial/bedrock contact beneath South Flower Street ranges from 20 feet to 45 feet bgs. South of 6th Street, coarser-grained alluvium was encountered beneath the upper finer-grained alluvium at depths of approximately 20 feet below ground surface (bgs). This coarser-grained alluvium consists of poorly- to well-graded sand with variable gravel and cobble content.

3.2.2.4 Alluvium at 2nd Street

Alluvial deposits beneath 2nd Street are overlain by a variable thickness of fill. The depth of the alluvial/bedrock contact beneath 2nd Street ranges from 15 feet to 47 feet bgs. From Central Avenue to Alameda Street, the depth of the alluvial/bedrock contact ranges between approximately 45 and 50 feet bgs. From Hill Street to Alameda Street, the alluvial deposits consist of variably thick layers of silty sand, poorly- to well-graded sand, sand with gravel and poorly- to well-graded gravel.

The upper portion of the alluvial deposits from about San Pedro Street eastward to Alameda Street consist primarily of silty sand, poorly graded fine- to medium-grained sand, and well-graded sand with generally less than 20 percent gravel content. A coarser-grained alluvial unit was encountered beneath artificial fill between Broadway and San Pedro Street and beneath the upper alluvial unit from about San Pedro Street eastward to Alameda Street. The base of this lower alluvial unit forms an erosional contact with the underlying Fernando Formation at variable depth. The coarser-grained alluvial unit consists primarily of poorly- to well-graded sand, sand with gravels, and poorly- to well-graded gravel with cobbles. East of Main Street, gravel content ranges to 50 percent and cobble content ranges to 20 percent. Boulders up to 20 inches in diameter have been reported in the historical borings. Boulders up to 4 feet in maximum dimension were reported on other local projects. Cobbles and boulders are dominantly igneous and metamorphic rocks that are fresh to slightly weathered and strong to very strong.

3.2.3 Colluvium

Deposits inferred to be of colluvial origin were encountered beneath thick artificial fill on the western flank of Bunker Hill between 3rd Street and Hope Street. These deposits were about five feet thick and primarily consist of medium dense clayey sand and stiff to very stiff, sandy to clayey silt.

3.2.4 Fernando Formation

The Fernando Formation (bedrock) consists of a poorly bedded to massive clayey siltstone to silty claystone that is poorly cemented and extremely weak to very weak (per ISRM, 1978). Although its appearance in excavations is massive, on close inspection the formation does contain bedding, which is commonly apparent as bedding plane partings. The formation includes sandy layers, concretions, and nodules that range from moderately to strongly cemented and range in strength from weak to strong (per ISRM, 1978).

3.2.4.1 Weathering

The Fernando Formation commonly exhibits a weathered profile, which as described on some boring logs ranges from “moderately weathered” to “highly weathered”, this being in comparison to the underlying “slightly weathered” to “fresh” bedrock (refer to the GDR Figure A-1.1b for an explanation of weathering grades). The thickness of the more weathered, weaker bedrock ranges from 0 to approximately 60 feet along the project alignment. As shown on Plate 1, the thickest weathering underlies the high terrain in the vicinity of 2nd and Hope Streets (i.e. from approximately Station R 29+00 to R 45+00), where the depth to slightly weathered/fresh bedrock ranges from approximately 30 to 60 feet below the top of bedrock. The thickness of the more highly weathered bedrock decreases toward the flanks of the hill.

3.2.4.2 Sampler Penetration Resistance

Within the moderately to highly weathered zones, the consistency of the Fernando Formation, as evidenced by sampler penetration resistance, is as low as approximately 10 bpf and as high as approximately 50 bpf. Where slightly weathered to fresh, the penetration resistance is markedly higher, typically 50 bpf or higher.

3.2.4.3 Cemented Materials

Borehole Data

Some intervals in the Fernando Formation are notably stronger than is typical for the formation. These materials have been described in logs of borings made over several decades in a variety of ways, including:

> Carbonate cemented siltstone; carbonate cemented zone; cemented layer; cemented layer of limestone; cemented lens; cemented lumps; cemented nodules; cemented siltstone and sandstone; cemented zone; concretion; hard layer; hard cemented layer; hard layer; hard lens; highly cemented layer; layer of cemented lumps; layer of limestone; layer of limestone gravel; limestone nodule; siltstone concretion; trace cemented shell fragments; very hard cemented lens; well cemented siltstone; calcium carbonated-cemented zone; cemented siltstone zone; carbonate cemented siltstone; cemented siltstone lens; dolomitic/cemented zone; cemented siltstone layer; calcareous cemented siltstone; cemented layer of limestone; cemented limestone nodules.

Field observations of excavations in downtown Los Angeles indicate that with few exceptions these cemented materials are concretions. A concretion is a hard, compact mass of sedimentary rock formed by the precipitation of mineral cement within the spaces between the sediment grains, typically in irregular shapes and variable sizes from a few to ten feet. Field observations indicate that these concretions extend laterally for a distance of 3 to 5 times their thickness and are typically elongate in shape.

To evaluate the size of the concretions, borehole data were evaluated and as shown on Figure 12, 85% of the concretions encountered in borings were 1 foot or less in thickness. Field observations indicate that the maximum size of concretions is approximately 10 feet.

Plate 1 illustrate the locations where these concretions were encountered in borings, and as shown, their frequency is greater in the area between approximately Stations R 1+65 to (immediately south of project limit) R 28+00, and Stations R 49+00 to R 54+00, as compared to other locations along the alignment.

The stronger layers encountered in boring G2-4 were identified as sandstone layers in the Puente Formation, which stratigraphically underlies the Fernando Formation. The Puente Formation including sandstone layers was studied to evaluate its potential to be intersected in excavations for the Regional Connector project. It was determined that, based on nearby borings and dip of the formation, the Puente Formation encountered in boring G2-4 will not intersect the planned excavations.

Red Line Tunnels

Information regarding the distribution of concretions within the Fernando Formation is available from construction records for the Red Line tunnels. A review was made of those records, for the

area between Civic Center Station and Westlake/MacArthur (Wilshire/Alvarado) Station, where the Fernando Formation was encountered.

For the tunnels between Civic Center Station and Pershing Square (5th/Hill) Station (a portion of Metro Construction Contract A-141), information on ground conditions encountered was recorded by the construction management team and the construction contractor. For the tunnels between 7th/Metro Center (7th/Flower) Station and Westlake/MacArthur Station (Metro Construction Contract A-171), information on ground conditions is only available from the construction management team.

Based on the available information, the strong cemented materials were described by the Construction Management team using the following terms:

> Some concretions; 18" concretion; small concretions; several concretions; scattered concretions; 6"-8" concretions; concretion nodules; some concretion nodules; concretions of 2"-3" diameter; seam(s) of concretions; scattered concretions < 2' across; concretions to 6" diameter and nodules; concretions 3' x 1" and 4' x 18"; 10" seam of hardened siltstone; bands of concretions; concretion layer.

Similar to field observations, with few exceptions the tunnel logs refer to the strong cemented materials as concretions. The records suggest that the concretions were encountered at individual locations and also scattered along tunnel intervals that were a few hundred feet long. With few exceptions, the records indicate that the concretions ranged to approximately 1 foot in thickness and approximately 4 feet in lateral extent. The construction management records do not indicate that there was difficulty in excavating the concretions with the digger shields that were used.

Using the construction records, an estimate was developed for the lengths of the AR and AL tunnels where concretions were observed. The results are summarized below:

Table 3-1: Summary of Cemented Materials (Concretions) In Red Line Tunnels

Tunnel Segment	Tunnel Segment Length (ft)	Estimated Total Length of Tunnel Where Concretions were Reported in Construction Documents			
		AR Tunnel		AL Tunnel	
		Feet	% of Tunnel Segment	Feet	% of Tunnel Segment
Contract A-141: Civic Center Station to Pershing Square Station	1772	457	26	210	12
Contract A-171: 7th/Metro Center Station and Westlake/MacArthur Station	4937	1066	22	2550	52

Note: Estimates based on construction management team descriptions cited by Mahar (1994).

For the tunnels from Civic Center Station to 5th/Hill Station, the construction records also contain observations from the construction contractor. Those reports do not describe the stronger materials as concretions, as did the construction management team, but rather as "rock", "rocky", "hard rock", or "hard ground"; this description being in contrast to the description of "good" or "good ground" that the construction contractor used otherwise.

In evaluating this information, it was noticed that the locations of cemented materials identified by the construction contractor do not align well with the locations where the construction

management team identified concretions. As a result, it is interpreted that the construction contractor was referring to stronger layers within the Fernando Formation, and not isolated concretions. Based on where the stronger material (i.e. rock, hard rock) was reported by the construction contractor, the following summary was developed:

Table 3-2: Summary of "Hard Rock" In Red Line Tunnels

Tunnel Segment	Tunnel Segment Length (ft)	Estimated Total Length of Tunnel Where Hard Rock was Reported in Construction Documents			
		AR Tunnel		AL Tunnel	
		Feet	% of Tunnel Segment	Feet	% of Tunnel Segment
Contract A-141: Civic Center Station to Pershing Square Station	1772	180	10	410	23
Contract A-171: 7th/Metro Center Station and Westlake/MacArthur Station	Data not available				

Note: Estimates based on construction contractor descriptions cited by Mahar (1994).

The tunnel reaches where rock/hard rock was encountered range in length from approximately 5 to 50 feet. Within these reaches, the largest recorded size of hard rock was 8 feet by 12 feet (presumed to be length and width of the layer). The largest dimension overall was 14 feet long. These dimensions are considered more representative than can be estimated using boring data, however the maximum observable dimension is still limited to the width of the tunnel and depends on the dip orientation of the formation. The thickness of the seams/layers of "hard rock" is not well documented, but appears to be limited to approximately 2 feet. In one instance, in the AR tunnel between 2nd Street and the 5th/Hill station, it was reported that the tunnel encountered "hard rock" in the invert and that the shield was possibly damaged.

3.2.4.4 Density and Moisture Content

The dry density of the Fernando Formation ranges from approximately 70 to 120 pcf, and based on a total of over 1,100 tests, the average dry density is approximately 93 pcf. The moisture content ranges from approximately 6 to 55 percent, and based on over 1,100 tests, averages approximately 29 percent. The wet density ranges from approximately 101 to 140 pcf and averages approximately 120 pcf. Figures 4, 5, and 6 show the distribution of dry density, moisture content, and wet density within the Fernando Formation.

In reviewing the moisture-density data, it is recognized that there are some locations where light weight (<90 pcf dry density) and/or high water content (>40%) materials are present. The locations where laboratory tests are available to identify these materials are shown on Plate 1 and as shown, the light weight/high water content materials appear to be more common in the vicinity of Bunker Hill.

3.2.4.5 Gradation

Figure 13 shows the results of all gradation tests performed on samples of Fernando Formation. To perform these tests, the bedrock samples had to be disaggregated in the laboratory to form a soil. All of the available gradation data were used to create Figure 14, which summarizes the minimum, maximum, and average gradation, together with one standard deviation above and below the average gradation.

3.2.4.6 Plasticity

Figure 15 shows the distribution of soil plasticity testing results for samples of the Fernando Formation. These results are for samples that were processed to disaggregate the otherwise firm bedrock material to a soil material that could be subjected to Atterberg Limits testing. As shown on Figure 15, the results indicate that the material is near the silt/clay borderline, and ranges in plasticity from low to high.

3.2.4.7 Stickiness

The available plasticity and moisture content data were used to determine Consistency Index. The Consistency Index values are plotted together with the plasticity indices on Figure 16, which illustrates the relative potential for the formation to exhibit clogging behavior during Tunnel Boring Machine (TBM) excavation. The “low”, “medium”, and “high” categories for potential for clogging that, shown on Figure 16, are based on Thewes and Burger (2005) for tunneling in clay. Based on the results shown on Figure 16, the Fernando Formation will exhibit a “medium” to “high” potential for clogging. However, Figure 16 is based on Atterberg Limit tests which require a high degree sample disaggregation of the sample, while the TBM, during excavation at the face, muck mixing in the plenum, and throughout the muck transport process, is not anticipated to disaggregate the formation to a high degree. The actual tendency of the excavated materials for clogging will be less than suggested by Figure 16. The actual tendency for clogging will be low to medium.

3.2.4.8 Strength

The unconfined compressive strength of the typical weakly to uncemented siltstone/claystone of the Fernando Formation ranges from approximately 25 psi to 300 psi. As discussed above, the formation contains cemented materials that are notably stronger than the typical siltstone/claystone material. For comparison, carbonate cemented materials range in unconfined compressive strength from 5,000 to 13,000 psi.

The strength testing results from the ACE/PE/APE investigations, excluding strongly cemented materials, are shown in Figure 17, which indicates a trend of increasing strength with depth below the bedrock surface. This increase in strength with depth below top of bedrock may be due, in part, to the effects of decrease in degree of weathering with depth.

Figure 18 shows the distribution of strength results for all tested samples of Fernando Formation, including the test results for cemented materials. Figure 18 illustrates the significant strength difference between the typical Fernando Formation and those materials that are moderately to highly cemented. Based on the strength classifications of ISRM (1978), the typical Fernando Formation is considered “extremely weak” to “very weak” rock and the cemented materials are considered to be very strong rock.

Figure 19 provides an expanded distribution chart for the lower end of the strength range, to illustrate the distribution of strength within the typical “extremely weak” to “very weak” Fernando Formation.

3.2.4.9 Slake Durability

Being a weak rock that is composed of silt/clay, the Fernando Formation is subject to slaking and will disintegrate or crumble due to changes in moisture content. Testing of 14 bedrock samples shows that the second cycle slake durability index ranges from 0.3 to 69 with an

average of 34. Figure 20 graphically shows the distribution of these test results. As shown on Figure 20, over 90% of the Formation has a low to very low durability.

3.2.4.10 Abrasion

The relative abrasiveness of the bedrock was tested by performing Soil Abrasion Tests (SAT) and Miller abrasion tests. The results of these tests are summarized on Figures 10 and 11 (together with results for samples of alluvium). As shown on Figure 10, the six tested samples showed "very low" to "low" abrasiveness. As shown on Figure 11, seven samples that were subjected to Miller Abrasion testing ranked as "low" to "moderate". Also Cerchar Abrasion Tests were performed on four cemented material samples from the Fernando Formation. The Cerchar Index ranges from 1.2 to 1.9.

3.2.4.11 Hydraulic Conductivity

Due to its fine grained texture, typical massive condition (i.e. lack of well developed bedding planes), and lack of open fractures, the Fernando Formation has a relatively low hydraulic conductivity. Information from previous investigations (i.e. for the Red Line tunnels) indicates that the hydraulic conductivity in the bedrock ranges from approximately 10^{-8} cm/s to 10^{-6} cm/s. The field measurements obtained during the ACE/PE/APE investigation shows the hydraulic conductivity in the bedrock ranges from approximately $4x10^{-7}$ cm/s to $2x10^{-4}$ cm/s. Based on the available information, the overall average hydraulic conductivity of the rock mass is 10^{-6} cm/s, except where specific values are given in Section 4 for inflow baselines.

3.2.4.12 Discontinuities

The bedrock contains discontinuities that include bedding planes (bedding plane partings/bedding plane joints), joints and shears. The results from recent acoustic televiewer (ATV) surveys are summarized on Figures 21A to 21C.

As part of the ACE/PE/APE investigation, in late August 2011, a review was made of the foundation excavation for the future Broad Museum, which is bounded by South Hope Street, South Grand Avenue, West 2nd Street, and GTK Way. This development exposed the bedrock in an excavation similar to that envisioned for the proposed cut-and-cover subway stations, and also because the RCTC alignment passes beneath a portion of that site. The foundation excavation primarily exposed Fernando Formation bedrock, part of which was exposed across the bottom of the excavation at the time of the field visit.

The exposed bedrock was predominantly a massive, gray, and slightly weathered to fresh, clayey siltstone, as shown in Figure 22, which shows a footing excavation in the bottom of the building excavation. Although the footing excavation depicted in Figure 22 is relatively shallow (on the order of three to five feet deep), the vertical walls are stable, with the exception of local overbreak (small wedge failures and spalling) that formed along joint surfaces. Figure 23 shows a closer view of the same excavation, pointing out the exposed joint surfaces. These joints are narrow to tight in aperture, approximately planar, and are variably coated with iron oxides.

Figure 24 shows the typical appearance of the moderately to highly weathered bedrock. As shown, where moderately to highly weathered, the bedrock is typically yellow brown to brown in color and the joints tend to be wider in aperture with more iron oxide accumulation. Because the more deeply weathered material is weaker in strength, with more pronounced joints,

excavations tend to experience a greater degree of small wedge failures (i.e. raveling and spalling).

As noted above, the bedrock is subject to slaking behavior due to changes in moisture content. Figure 25 shows a bedrock exposure (within the Broad Museum foundation excavation) that has begun to crack due to desiccation.

During observation of the Broad Museum foundation excavation, three to possibly four joint sets were apparent as indicated in Figure 21B. The joint surfaces were commonly coated with iron-oxides, appeared wavy and slightly rough, and had lateral persistence on the order of at least five to ten feet along strike. Bedding was not observed in the foundation excavations where the access was limited.

3.3 Groundwater Conditions

Perched groundwater generally exists within the lower portion of the alluvial deposits, due to the relatively low permeability of underlying Fernando formation. In addition, a regional water level is present within the Fernando Formation.

Perched and regional water levels measured during drilling or in piezometers are shown on Plate 1. Using those data points, the elevation of the perched and regional water levels were interpreted and are shown on Plate 1. These groundwater elevations are expected to vary due to seasonal rainfall, with elevations varying five feet above and below the levels shown on Plate 1.

3.4 Hazardous Gas

As presented in the GDR, the Regional Connector alignment crosses a portion of the Union Station Oil Field, which has been delineated as a Methane Zone by the City of Los Angeles Department of Public Works, Bureau of Engineering, and crosses a Methane Buffer Zone that has been delineated by the City of Los Angeles Department of Public Works along the south margin of the Los Angeles Oil Field. Field evidence for naturally occurring gas (i.e. methane and/or hydrogen sulfide) along the project alignment includes:

- Of a total of 11 field methane measurements taken during the ACE/PE/APE investigation, four measurements (MB2-10', MB2-35', MB9-50' and MG2-16-35') detected a methane concentration of 0.1 % by volume or 1,000 ppmv.
- Of a total of 9 field hydrogen sulfide measurements taken during the ACE/PE/APE investigation, three measurements from boring G2-16 (MG2-16) at depths of 15, 35 and 55 feet were detected with H_2S concentrations of 0.004, 0.004 and 0.003 ppmv, respectively.
- A total of 9 soil gas samples were tested in the laboratory for VOCs, methane and fixed gases, and methane was detected above the minimum detection limit (MDL) of 10 ppmv in four samples. The maximum concentration was 640 ppmv detected from the sample at MB9-50'.
- Boring E2-2: Strong sulfur odor in Fernando Formation between depths of 38 feet and 60 feet, and field readings of 1 to 5 ppm H_2S in bedrock down to 55 feet. The maximum field H_2S reading of 5 ppm was detected at 45 feet bgs.

Information regarding gas encountered with construction of the Red Line tunnels and with nearby buildings is available from the Construction History records as follows:

Construction Contract A-141 (Union Station to Pershing Square Station) included 5,122 feet for the AL tunnel and 5,190 feet for the AR tunnel, which were reportedly excavated through the Alluvium, Puente Formation, and Fernando Formation. In the AL tunnel, the gas tester registered 20% Lower Explosive Limit (LEL) methane at about 450 feet west of the Union Station which was accompanied by evacuating the tunnel and an order for no tunnel excavation for about following 10 days; hydrogen sulfide at a concentration of 4 ppm was detected at about 550 feet west of the Union Station; and gas (presumably methane) at concentrations of 1 to 3% LEL was reported at about 600 feet west of the Union Station and about 200 feet south of the Civic Center Station. These occurrences apparently resulted in delays of construction with down time.

For the AR tunnel, records indicate five locations where gas was encountered; two locations were methane, one location did not indicate the type of gas, and two locations were hydrogen sulfide. The locations where methane was reported at concentrations of 3% LEL and 0.5% methane were located approximately 500 feet west of the Union Station and approximately 300 feet south of the Civic Center Station, respectively. Where the methane concentration was reported at 0.5%, the tunnel was evacuated until no methane was detected. The location where the type of gas was not noted occurred approximately 600 feet south of the Civic Center Station. This encounter apparently required a shut down. For the two locations where hydrogen sulfide was encountered, one location occurred approximately 1,000 feet south of the Civic Center Station; the other occurred between approximately 1,250 and 1,350 feet south of the Civic Center Station. Within these two locations of hydrogen sulfide gas, records indicate strong odors and/or concentrations ranging from 5 to 27 ppm. Tunnel excavation was either slowed or temporarily shut down within these two locations for mitigations.

Construction Contract A-171 (7th/Metro Center Station to Westlake/MacArthur Park Station) included a total of 4,937 feet of twin bore tunnel, nearly all of which encountered the Fernando Formation. For the AR tunnel, neither the construction management team nor the construction team noted encountering methane or hydrogen sulfide gas. However, for the AL tunnel, the construction management team recorded hydrogen sulfide gas at four locations, located between approximately 400 and 700 feet west of the 7th/Metro Center Station. Three of these locations reported a hydrogen sulfide concentration of 6 ppm, whereas the fourth location reported a hydrogen sulfide odor.

Los Angeles Central Library Addition Project (5th Street between Grand Avenue and Hope Street) included demolition of the previous east wing, excavation of the new basement ranging from 50 to 70 feet below ground surface, and construction of the new three-story east wing addition to the existing building. During the site investigation phase, six borings were drilled encountering fill, natural overburden soils, and massive siltstone with cemented beds. According to the boring logs, hydrogen sulfide odor was noted in four of six borings at depths within the siltstone near the bedrock contact with overburden soil. The source of the odor was not established and no tests were performed to determine the quantity of hydrogen-sulfide in the soils. During the construction, gas investigation was conducted related to methane gas intrusion from the soil at the main library. During the gas investigation, combustible gas was monitored in the air space inside the basement of the library, in one auger hole at the new east wing excavation, and from five shallow probes constructed under the lower level slab by 4-inch coring and pre-fabricated soil gas monitoring probes. The air space monitoring measured 1 to 2 % LEL

methane in the southwest quadrant of the old library lower level; the auger hole gas monitoring found 70 % LEL methane; and the probe readings on October 2, 1989 were as high as 56 % combustible gas by volume (Sepich, 1989). The gas investigation concluded that gas control measures were needed to be implemented. In November 1989, canister samples of gas taken from probes were tested in the laboratory. The test data showed 33 % methane below the Goodhue (main) library slab and 87 % methane below the east wing site (Sepich, 1989). The west end of the main library building is located at about 290 feet east from the center of South Flower Street, and the west end of the east wing is located at about 520 feet east from the center of South Flower Street.

550 South Hope Street Project (Lincoln Property Company) is a 30-story tower constructed over a 45- to 60-ft deep basement structure. During the site investigation phase, three borings were drilled encountering fill, natural overburden soils, and siltstone. According to the boring logs, hydrogen sulfide odor was noted in two of three borings at depths within the siltstone. No further record of gas investigation was found. The west end of the tower is located at about 440 feet east from the center of South Flower Street.

3.5 Contaminated Soil and Groundwater

Contamination of soil and groundwater is locally evident, based on historic and recent boring information. Field evidence for contamination along the project alignment includes:

- Strong hydrocarbon odor that was detected in the alluvial soils at a depth of approximately 45 feet below the ground surface at the northwest corner of 1st and Alameda Streets (LeRoy Crandall and Associates, 1989).
- Petroliferous odors reported by LeRoy Crandall and Associates (1964) in several borings drilled north of 3rd Street between Flower Street and Grand Avenue.
- Boring E2-1: Petroleum odor was reported within fill at a depth of approximately 7 to 15 feet bgs. The maximum field VOCs reading was 2.2 parts per million (ppm) detected at 30 feet bgs (7 feet below the top of the Fernando Formation).
- Boring E2-2: The maximum field VOCs reading was 1.5 ppm detected at 90 feet bgs (in Fernando Formation). A sample of Fernando Formation from a depth of 65 feet bgs was tested for semi volatile organic compounds (SVOC) and benzopyrene was detected with a concentration of 480 micrograms per kilogram (µg/kg). This concentration is above the Environmental Protection Agency (US EPA) Region IX Regional Screening Levels (RSLs) of 210 µg/kg. A soil sample from a depth of 50 feet bgs was found to contain petroleum hydrocarbons.
- Boring E2-3: The maximum field VOCs measurement was 2.8 ppm detected at 10 feet bgs, in fill material. A soil sample from a depth of 35 feet bgs was found to contain petroleum hydrocarbons.
- Boring E2-4: The maximum field VOCs measurement was 2.2 ppm, detected at 15 feet bgs, in alluvium. Soil samples from depths of 35, 40, and 50 feet bgs were found to contain petroleum hydrocarbons.
- Boring E2-5: The maximum field VOC measurement was 1.0 ppm, detected at 25 feet bgs, in Fernando Formation.
- Boring E2-6: Petroleum odor was reported in an approximate 10 foot interval between 30 and 40 feet bgs. The maximum field VOC measurement was 24.2 ppm, detected at 30 feet

bgs, in fill. Soil samples from depths of 30, 35, and 45 feet bgs were found to contain petroleum hydrocarbons. A groundwater sample from boring E2-6 was analyzed for Title 22 Metals and all metals with concentrations above the laboratory PQL were below their respective PHGs for drinking water, except for mercury, which was detected with a concentration of 5.3 µg/L [or 5.3 parts per billion (ppb)], exceeding the PHG of 1.2 ppb.

- Boring E2-7: Petroleum odor was noted during water sampling. VOCs, SVOCs, and petroleum hydrocarbons were not detected in soil. A groundwater sample from a depth of 46 feet bgs were found to contain no petroleum hydrocarbons but found to contain 0.78 µg/L of benzene and 38 µg/L of toluene. All metals with concentrations above the laboratory PQL were below both the total threshold limit concentration and ten times the soluble threshold limit concentration.

These findings indicate that contaminated soil and groundwater is locally present and will be encountered sporadically. As a result, appropriate handling and disposal will be required, and will be dependent on the contaminant concentrations encountered. Volumes of soil that are expected to require special treatment/disposal are discussed in Section 4.

3.6 Soil Corrosivity

Based on the laboratory tests conducted on 23 soil/rock samples throughout the project site during ACE/PE/APE phases, the ground is classified as:

- Severely corrosive to ferrous metals
- Aggressive to copper
- Severe for sulfate attack on concrete
- Aggressive with respect to exposure of reinforcing steel to the migration of chloride
- Aggressive with respect to exposure of concrete to acid attack
- Subject metal to microbial induced corrosion

Table 3-3 is a summary of the laboratory test results. Also refer to the Soil Corrosivity Evaluation report included in the GDR Appendix B-1 for more details.

Table 3-3: Ground Corrosivity Summary

Geologic Unit	Lab Tests	Min.	Max.	Average	Unit
Alluvium	Resistivity as-received	2,200	4,400,000	450,000	Ohm-cm
	Resistivity minimum	840	15,680	6,792	Ohm-cm
	pH	6.3	8.5	7.7	-
	Electrical Conductivity	0.03	0.97	0.14	mS/cm
	Chloride Content	2.8	51.0	12.8	mg/kg
	Sulfate Content	12	1,840	188	mg/kg
Fernando Formation	Resistivity as-received	560	110,000	12,000	Ohm-cm
	Resistivity minimum	264	1,120	543	Ohm-cm
	pH	3.8	8.1	7.2	-
	Electrical Conductivity	0.29	3.02	1.72	mS/cm
	Chloride Content	9.1	413.0	99.1	mg/kg
	Sulfate Content	317	10,300	3,781	mg/kg

4.0 ANTICIPATED GROUND CONDITIONS

This section provides baseline conditions for the project elements identified in Section 2. Baselines are provided for ground, groundwater and gas/contamination conditions. For convenience, ground and groundwater conditions are depicted on Plate 1. Ground behaviors described in the Sub-sections are according to the descriptions provided in Table 4-1.

Table 4-1: Ground Behavior Terms

Ground Behavior Terms and Descriptions
Firm rock or soil is a material which will stand unsupported in a tunnel for several days or longer. The term includes a great variety of materials: sands and sand-gravels with clay binder, stiff unfissured clays at moderate depths, and massive rock.
Massive, moderately jointed rock contains joints and cracks, but the blocks between joints are locally grown together or are so intimately interlocked that vertical surfaces do not require lateral support.
Blocky and seamy rock consists of chemically intact or nearly intact rock fragments, separated from each other by joints or other discontinuities that are imperfectly interlocked. In such rock, vertical surfaces may require support. When individual blocks are larger than one foot, the rock is called moderately blocky; when blocks are smaller than one foot, the rock is called very blocky and seamy.
Crushed rock consists of chemically intact rock fragments that have the character of crusher run. Individual particles are of gravel size or smaller. This material behaves like gravel or sand.
Squeezing ground slowly advances into the tunnel without perceptible volume increases. Squeezing conditions are associated with a high percentage of microscopic and sub-microscopic particles of micaceous minerals or of clay minerals with a low swelling capacity. A prerequisite for squeeze is an overstress of the material close to the tunnel opening, hence, for a given material the overburden stress is an important parameter.
Swelling ground advances into the tunnel chiefly on account of expansion. The capacity to swell seems to be limited to those rocks which contain clay minerals such as montmorillonite, with a high swelling capacity.
Raveling ground is used to describe a material which gradually breaks up into chunks, flakes, or angular fragments after the ground has been exposed in the tunnel. The process is time dependent and materials may be classified by the rate of disintegration as fast or slow raveling. If the raveling process starts within a few minutes, the ground is fast raveling. Otherwise, it is referred to as slow raveling. Examples are fine moist sand, and gravels with some clay binder, stiff fissured clays, jointed rocks, and weak rocks.
Running ground indicates a material which will invade the tunnel until a stable slope is formed at the face. Stand-Up time is zero or nearly zero. Examples are clean medium to coarse sands and gravels above the groundwater level. If running ground has a trace of cohesion, then the run is preceded by a brief period of progressive raveling. Materials intermediate between running and raveling are described as cohesive-running.
Flowing ground acts as a thick liquid and differs from running ground in that it invades the tunnel not only from above and from the slides, but also through the bottom. If the flow is not arrested, it continues until the tunnel is completely filled.

Modified from Terzaghi in Proctor and White (1946), Heuer (1974), and Deere et al. (1969).

4.1 Anticipated Gas Condition

Methane and hydrogen sulfide gases are anticipated to be encountered during the tunnel drive and the open cut excavations. These gasses are expected to exist and seep through pore spaces and discontinuities, and will be generated from off-gassing of groundwater that flows into the excavation. Also the excavated material exposed to the underground environment will emit these gases during handling and hauling. The concentration, pressure, and volume of these gasses are expected to be sufficiently low that the inflow and off-gassing of these gasses can be mitigated within the open cut, crossover cavern, crosspassage, and bored tunnel excavations through adequate ventilation, proper shotcrete application, and pressurized-face TBM tunneling with a precast concrete segmental tunnel lining as described in the Project Requirements. The underground work has been classified as “potentially gassy” by the State of California, Department of Industrial Relations, Division of Occupational Safety and Health Administration (CAL/OSHA).

4.2 Mangrove Site – TBM Launch Area

Currently the site is a parking lot used by the City of Los Angeles. It was previously occupied by the Los Angeles Soap Company also known as White King, Inc. There were one- to five-story buildings that have been demolished sometime around 1990. The extent of demolition of the underground elements (basements and foundations) is unknown. As a result, it is assumed that abandoned shallow foundations and basement slabs/walls exist in the area, and that these building remnants will be encountered during excavation of the TBM launch pit and also in the TBM drive within the limits of the site.

According to a report by LeRoy Crandall Associates (1990), some of the building basements were used to collect "sludge", the characteristics of which are not well known at this time. Several holding tanks were present in a building on the site. These tanks reportedly contained wastewater generated during industrial processes on site. The basement of the building, below the tanks, contained an undetermined thickness of sludge, which is presumably residue from the wastewater operations. The LeRoy Crandall Associates report also indicates there were five underground storage tanks within the limits of the Mangrove site and that these tanks were removed. One of those underground tanks contained diesel oil, which is reported to have leaked into surrounding soils. The location of identified underground tanks and known extent of contamination is described in that report. The extent of site clean-up is not known. For the baseline purpose, 5% of the excavated material from this site will require special treatment/disposal of soil due to contamination.

An additional environmental site assessment was performed near an abandoned underground storage tank (UST) north of the anticipated TBM launch pit (southeast corner of Temple and Alameda Streets), and findings were presented in a report by LeRoy Crandall Associates (1991). Based on the assessment, no significant release of fuel hydrocarbons was detected in the vicinity of the abandoned UST.

Another investigation was performed in 1992 to assess the groundwater conditions at the Mangrove site, and confirmed the groundwater beneath the site generally contains elevated TDS and dewatering operations would require treatment prior to discharge into local storm drains, as presented in a report by LeRoy Crandall Associates (1992).

In addition, a site investigation consisting of a geophysical survey, one test boring (E2-7), and geotechnical and environmental laboratory testing was conducted during APE phase. A buried structure with at least two levels of reinforcement is identified at 2 to 4 feet below the ground surface by geophysical investigation, and it appears that orientation of this anomaly matches with the old Banning Street that used to traverse the site. The buried structure is interpreted as footings or other structural element related to former buildings. Findings from the environmental tests on Borehole E2-7 are summarized in Section 3.5. More details and geotechnical findings are presented in the Mangrove site investigation report by AMEC (2013).

4.3 East End "Wye"

This section of the project (described in Table 2-1) will be excavated in artificial fill and alluvium as shown on Plate 1. The artificial fill ranges from five to ten feet thick. Soil types in the fill and alluvium are variable but primarily include silty to gravelly, poorly graded sand and well graded sand. The upper 20% of the soils within the planned excavation have a loose consistency. The

underlying 80% is medium dense to very dense. The soils typically become more gravelly with depth.

Cobbles and boulders that are strong to very strong (based on the categories defined by ISRM, 1978) are common in the alluvium, and similar size fragments of construction debris are contained within the fill. On a volume basis, 5% cobbles and 2% boulders will make up both the fill and alluvium. The fill and alluvium soils will be moderately to highly abrasive.

The fill and alluvium will exhibit slow to fast raveling in unsupported vertical walls and poorly graded sands will run. As a result, these soils will require immediate support in excavation walls. Groundwater control or ground reinforcement will be required to mitigate fast raveling, running and/or flowing conditions.

The regional groundwater elevation is below the base of the excavation throughout this section. However, local perched groundwater will be present. As a result, minor (less than 5 gpm) inflows are expected to occur locally. These inflows will diminish to slow seeps with time. Sustained inflow in this section will range from drips to slow seeps.

Artificially occurring petroleum may be present in the groundwater in the area, but will be below the bottom of the proposed excavation. However on the past history of site use, for the baseline purpose, 5% of the excavated material from this section will require special treatment/disposal of soil due to contamination.

4.4 Flower Street Cut–and–Cover

As shown on Plate 1, this cut-and-cover excavation will encounter artificial fill, alluvium, and the Fernando Formation. The base of this excavation will encounter Fernando Formation throughout. Subsurface excavations for some of the adjacent buildings along this section are known to have been supported by tieback anchors. This is a primary reason for excavation by cut-and-cover construction methods for most of this section of the project. Based on existing as-built drawings included in the Project Reference Documents, several hundred tieback anchors are expected to be encountered in this cut-and-cover excavation.

The fill soils are dominantly (75% to 80%) low plasticity clays and silts, with 20% to 25% silty sands that range from poorly to well graded. The upper alluvium (Qal1) is comprised of 60% to 65% low plasticity clays and silts, 20% to 25% silty and clayey sands, and 10% to 15% poorly to well graded sand. The lower alluvium (Qal2) is comprised of 15% to 20% low plasticity clays and silts, 20% to 25% silty sand, 10% to 15% poorly graded sand, and 50% to 55% well graded sand. The soils are medium dense to dense sands with local intervals of loose or very dense sands or very soft clays and silts.

Cobbles and boulders that are strong to very strong (ISRM, 1978) are common in the alluvium. The fill contains a variety of construction debris, which ranges in size from gravel to boulders up to 4 feet across. It is expected that on a volume basis, the fill and alluvium will contain cobbles (5%) and boulders (2%). The alluvium and fill soils will be moderately to highly abrasive.

Above the groundwater level, the artificial fill and alluvium will exhibit slow raveling behavior in unsupported vertical cuts. Below groundwater, these materials will exhibit fast raveling to flowing behavior in unsupported vertical cuts. As a result, these materials will require immediate support in excavation walls below groundwater. Groundwater control measures or ground

stabilization will be required to prevent loss of ground due to fast raveling to flowing conditions below the groundwater level.

The characteristics of the bedrock are as described in Section 3.2.4. As discussed, concretions are common and they are significantly stronger than the typical bedrock. It is expected that 95 percent of the concretions are cemented with calcium carbonate and five percent are dolomitic. The distribution in thickness of these concretions is depicted on Figure 12. The lateral dimensions vary from 3 to 5 times the thickness. As shown on Plate 1, there is a higher frequency of cemented materials in the bedrock along this section, as compared to elsewhere along the alignment. These cemented materials will comprise 5% of the bedrock (by volume).

Where the Fernando Formation bedrock is encountered in excavation walls, it will exhibit firm to slow raveling conditions. Raveling will occur at joint intersections, as shown in the photographs of the foundation excavation for the Broad Museum in Figures 22 and 23. Local wedge failures are expected to occur along adversely oriented intersections of joints, bedding planes, and/or shears. Three joint sets are present based on ATV surveys shown on Figure 21A. Randomly oriented joints will also be present:

- Joint Set 1 - Dipping 30 to 80 degrees with dip direction ranging from 150 to 190 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 350 to 10 degrees
- Joint Set 3 - Dipping 60 to 80 degrees with dip direction ranging from 220 to 260 degrees

In addition to three joint sets, there will be some poorly developed bedding that will dip subparallel to Joint Set 1 at about 30 to 60 degrees based on prior mapping by others in the area.

Groundwater is present in the alluvium in a perched condition above the top of the Fernando Formation. A regional groundwater level is also present. The perched and regional groundwater elevations are shown on Plate 1, and will vary by plus or minus five feet from the elevation shown. Where the excavation is below these groundwater elevations, inflows will occur as seeps and discrete flows from the fill and alluvium. Inflows will also occur from joints/shears in the bedrock and these will be limited to slow seeps. Total sustained inflows from this cut-and-cover section will not exceed 100 gpm.

Petroleum odors were reported in borings at the northeast end of this section, and there is evidence of Volatile Organic Compounds (VOC's) in the same area. As a result, it is expected that the groundwater will contain VOC's, SVOC's and/or petroleum hydrocarbons, and as such will require special treatment/disposal. 5% of the excavated material will require special handling, treatment and disposal.

4.5 Stations

4.5.1 1st/Central Station

The excavation will encounter artificial fill and alluvium. Fernando Formation bedrock is beneath the bottom of the excavation. At this location, the fill is comprised of 0% to 5% low plasticity clayey and silty soils, 40% to 45% silty sand, 5% to 10% poorly graded sand, and 40% to 45% well graded sand. The upper alluvium (Qal1) is comprised of 5% to 10% low plasticity silt and clay, 20% to 25% silty sand, 40% to 45% poorly graded sand, and 20% to 25% well graded sand. The lower alluvium (Qal2) is comprised of 10% to 15% silty sand, 25% to 35% poorly

graded sand, 10% to 15% well graded sand, 5% to 10% poorly graded gravel, and 30% to 35% well graded gravel.

Cobbles and boulders that are strong to very strong (ISRM, 1978) are contained in the alluvium, and cobble and boulder size obstructions are contained in the fill. The cobbles and boulders will comprise 3% and 1%, respectively, of the excavated volume both the fill and alluvium. The alluvium and fill soils will be moderately to highly abrasive.

As shown on Plate 1, the majority of this station will be above the groundwater level except the west end of the station. Above the groundwater elevation, the alluvium will exhibit slow raveling behavior in vertical cuts. Within the limited area (at the west end of the station) where the alluvium will be encountered below the groundwater elevation, these materials will exhibit fast raveling to flowing behavior in vertical cuts.

The groundwater level will range from below the base of the excavation to approximately 10 feet above the base at the western end of the station. Sustained inflows are expected not to exceed 30 gpm.

Artificially occurring petroleum may be present in the groundwater in the area, but will be below the bottom of the proposed excavation, except for the western portion where groundwater is above the bottom of the excavation. Therefore it is expected that special handling and treatment/disposal of groundwater (due to contamination) will be required, and that 5% of the excavated material will require special treatment/disposal of soil due to contamination.

4.5.2 2nd/Broadway Station

The excavation will encounter approximately 15 to 25 feet of artificial fill and alluvium, underlain by bedrock of the Fernando Formation. The depth of moderately to highly weathered bedrock is shown on Plate 1.

At this location, the fill is comprised of 40% to 45% low plasticity clayey and silty soils, 30% to 35% silty sand, 5% to 10% poorly graded sand, and 10% to 15% well graded sand. The alluvium is comprised of 80% to 85% silty sand and 15% to 20% well graded sand. Cobbles and boulders that are strong to very strong (ISRM, 1978) are contained in the alluvium and cobble- and boulder-size obstructions are expected in the fill. The fill and alluvium will contain cobble- and boulder-size materials at 5% and 2%, respectively, of the excavated volume of the fill and alluvium. The alluvium and fill soils will be moderately to highly abrasive.

The characteristics of the bedrock are as described in Section 3.2.4. As discussed, concretions are common and they are significantly stronger than the typical bedrock. It is expected that 95 percent of the concretions are cemented with calcium carbonate and five percent are dolomitic. The distribution in thickness of these concretions is depicted on Figure 12. The lateral dimensions vary from 3 to 5 times the thickness. As shown on Plate 1, there is a higher frequency of concretions in the bedrock along this section, as compared to elsewhere along the alignment. These concretions will comprise 3% of the bedrock (by volume). Above the groundwater level, the artificial fill and alluvium will exhibit slow raveling behavior in vertical cuts. Below groundwater elevation, these materials will exhibit fast raveling to flowing behavior in vertical cuts, and require immediate support in the excavation walls. Groundwater control or ground stabilization will be required to prevent ground loss due to fast raveling to flowing conditions below the groundwater level.

Where the Fernando Formation bedrock is encountered in the excavation walls, it will exhibit firm to slow raveling conditions. Raveling will occur at joint intersections, as shown in the photographs of the foundation excavation for the Broad Museum in Figures 22 and 23. Local wedge failures are expected to occur along adversely oriented intersections of joints, bedding planes, and/or shears. Three joint sets with scattered random joints are present as discussed below and shown on Figures 21B:

- Joint Set 1 - Dipping 65 to 80 degrees with dip direction ranging from 160 to 220 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 245 to 295 degrees
- Joint Set 3 - Dipping 80 to 90 degrees with dip direction ranging from 70 to 110 degrees

In addition to three joint sets, there will some poorly developed bedding that will dip subparallel to Joint Set 1.

Perched and regional groundwater levels will be encountered at the elevations shown on Plate 1, plus or minus five feet. Local groundwater inflows from the fill and alluvium will be limited to slow to fast seeps. Inflows from the bedrock will occur from joints/shears and will be limited to slow seeps. Total sustained inflows in this section will not exceed 110 gpm.

Evidence for contaminated soils in this area includes a strong petroleum odor within the alluvium at a depth of 15 feet in historic boring No. 80. As a result, it is expected that groundwater inflows into the excavation will require special treatment/disposal, and 5% of the excavated material will require special treatment/disposal of soil due to contamination.

4.5.3 2nd/Hope Station

As shown on Plate 1, the excavation will encounter 10 to 30 feet of artificial fill and colluvium, and the Fernando Formation below. The upper moderately to highly weathered portion of the Fernando Formation extends deeper at this location than elsewhere along the alignment. As shown on Plate 1, slightly weathered to fresh bedrock will be exposed at the bottom 5 to 30 feet of the excavation.

At this location, the fill is comprised largely (85% to 90%) of low plasticity clayey and silty soils. The remainder of the fill is comprised of silty to clayey sand (5% to 10%) and well graded sand (<5%). The colluvium is comprised of low plasticity silt. Cobbles and boulders are not expected in the colluvium, however cobble and boulder size obstructions that are strong to very strong (ISRM, 1978) are expected in the fill and these will comprise 3% and 1% of the volume of the unit, respectively. The alluvium and fill soils will be moderately to highly abrasive to digging equipment.

Above the groundwater level, the artificial fill and colluvium will exhibit slow raveling behavior in vertical cuts. Where seeps occur, these materials will exhibit fast raveling to flowing behavior in vertical cuts, and will require immediate support in excavation walls. Groundwater control or ground stabilization will be required to mitigate ground loss due to fast raveling to flowing conditions below the groundwater level.

The characteristics of the bedrock are as described in Section 3.2.4. As discussed, concretions are common and they are significantly stronger than the typical bedrock. It is expected that 95 percent of the concretions are cemented with calcium carbonate and five percent are dolomitic. The distribution in thickness of these concretions is depicted on Figure 12. The lateral

dimensions vary from 3 to 5 times the thickness. As shown on Plate 1, there is a higher frequency of concretions in the bedrock along this section, as compared to elsewhere along the alignment. These concretions will comprise 5% of the bedrock (by volume).

Where the Fernando Formation bedrock is encountered in the excavation walls, it will exhibit firm to slow raveling conditions. Raveling will occur at joint intersections, as shown in the photographs of the foundation excavation for the Broad Museum in Figures 22 and 23. Local wedge failures are expected to occur along adversely oriented intersections of joints, bedding planes, and/or shears. Three joint sets with scattered random joints are present as discussed below and shown on Figure 21B:

- Joint Set 1 - Dipping 65 to 80 degrees with dip direction ranging from 160 to 220 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 245 to 295 degrees
- Joint Set 3 - Dipping 80 to 90 degrees with dip direction ranging from 70 to 110 degrees

In addition to three joint sets, there will be some poorly developed bedding that will dip subparallel to Joint Set 1.

Perched and regional groundwater elevations are as shown on Plate 1, plus or minus five feet. Local groundwater inflows from the fill and colluvium will be limited to drips and slow seeps. Inflows from the bedrock will occur from joints/shears and will be limited to slow seeps. Total sustained inflows in this section will not exceed 100 gpm.

Evidence for contaminated soils was observed as petroleum odors in the fill encountered in historic boring No.48, and as low concentrations of VOC's in the upper portion of recent boring G2-3. As a result, it is expected that groundwater inflows into the excavation will require special treatment/disposal, and that 5% of the excavated material will require special treatment/disposal of soil due to contamination.

4.6 Crossover Cavern

The excavation for the crossover cavern will encounter Fernando Formation bedrock, with the same characteristics as described below for Reach 1B, except that the rock will range from slightly weathered to fresh and the strength of this rock will vary in unconfined compressive strength from 100 to 300 psi.

The bedrock will exhibit firm to slow raveling conditions, and based on the material strength and ground cover, will exhibit a tendency toward stress slabbing. Raveling will occur at joint intersections and bedding planes. Local wedge failures are expected to occur along adversely oriented intersections of joints, bedding planes, and/or shears. Three joint sets with scattered random joints are present as discussed below and shown on Figures 21B.

- Joint Set 1 - Dipping 65 to 80 degrees with dip direction ranging from 160 to 220 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 245 to 295 degrees
- Joint Set 3 - Dipping 80 to 90 degrees with dip direction ranging from 70 to 110 degrees

In addition to three joint sets, there will be some poorly developed bedding that will dip subparallel to Joint Set 1.

The perched and regional groundwater level at this location will be as shown on Plate 1, plus or minus five feet. This will lead to minor inflows (drips and slow seeps) along joints and/or shears in the bedrock. Total unrestricted sustained inflows in this section will not exceed 80 gpm.

Contamination is expected to be in alluvium sediments above the cavern. Groundwater within the bedrock joints might have been impacted by contamination in the overlying alluvium, and as such, inflows to the cavern from the bedrock will require special treatment/disposal. For the baseline purpose, 5% of the excavated material from the cavern will require special handling and treatment/disposal due to contamination.

4.7 Bored Tunnels

4.7.1 Reach 1: Station R 76+45 to R 53+72 (1st/Central Avenue to 2nd/Broadway Station)

Based on subsurface conditions, this reach is divided into two sub-reaches: Reach 1A and 1B. The boundary between these reaches is approximate and is to be anticipated to vary plus or minus 50 feet from the indicated station.

4.7.1.1 Reach 1A

From Station R 76+45 to R 70+50 the tunnels will encounter a mixed face condition of alluvium over Fernando Formation bedrock. The alluvium includes a wide variety of sandy and gravely soils, ranging from poorly graded to well graded sands and gravels. As described in Sections 3.2.2, overall, the upper Qal1 alluvium contains a greater percentage of fine grained soils and is less dense than the lower Qal2 alluvium. Both alluvium units contain cobbles and boulders. Within the tunnel excavation the Qal1 and Qal2 alluvium in this reach are expected to include a total of 30% to 35% poorly graded sand, which occurs in layers that range in thickness from 3 feet to 25 feet. The remainder of the alluvium includes well graded sand, silty sand, and clayey sand. A total of 100 cobbles and 10 boulders up to 4 feet in maximum dimension are expected within this reach of alluvium. The cobbles and boulders are expected to be strong to very strong (ISRM, 1978).

Within Reach 1A, the Fernando Formation bedrock is expected to range from highly weathered to fresh. The characteristics of the bedrock are as described in Section 3.2.4. In this reach the bedrock will range in unconfined compressive strength from 25 psi to 300 psi. As discussed in Section 3.2.4, concretions are common and they are significantly stronger than the typical bedrock. It is expected that 95 percent of the concretions are cemented with calcium carbonate and five percent are dolomitic. The distribution in thickness of these concretions is depicted on Figure 12. The lateral dimensions vary from 3 to 5 times the thickness. These concretions will comprise 2% of the bedrock (by volume).

Where the Fernando Formation bedrock is encountered it will exhibit firm to slow raveling conditions. Raveling will occur at joint intersections, as shown in the photographs of the foundation excavation for the Broad Museum in Figures 22 and 23.

Conditions in this reach will be influenced by perched and regional groundwater elevations, which occur as shown on Plate 1, plus or minus five feet.

Contamination in the form of VOC's, SVOC's, and/or petroleum hydrocarbons has also been detected and therefore it is expected that groundwater inflows will require special

treatment/disposal. In addition, for the two tunnel bores, 5% of the excavated material in this Reach is expected to require special handling and treatment/disposal.

4.7.1.2 Reach 1B

From Station R 70+50 to R 53+72 the tunnels will encounter a full face of Fernando Formation bedrock, which will vary from highly weathered to fresh. The characteristics of the bedrock in Reach 1B are the same as described above for Reach 1A.

The perched and regional groundwater level along this reach will be as shown on Plate 1, plus or minus five feet.

If unsupported, the bedrock will exhibit firm to slow raveling behavior in the slightly weathered to fresh bedrock and slow to fast raveling behavior in moderately to highly weathered bedrock. The bedrock will also exhibit a tendency for stress slabbing where blocks and wedges of unstable rock fall out of the crown or sidewalls. Local wedge failures are expected along joints, bedding planes, and/or shears. Raveling will occur at joint intersections and bedding planes. If allowed to desiccate, the bedrock will slake, and if the invert is not protected, construction equipment traffic and water will cause the bedrock to breakdown and become soft and muddy.

Contamination is expected to be in alluvium sediments above the tunnel. Groundwater within the bedrock joints might have been impacted by contamination in the overlying alluvium, and as such, inflows to the tunnel from the bedrock will require special treatment/disposal. For the baseline purpose, 5% of the excavated material from this reach will require special handling and treatment/disposal due to contamination.

4.7.2 Reach 2: Station R 49+11 to R 32+81 (2nd/Broadway Station to 2nd/Hope Street)

The entire length of the tunnels in Reach 2 will encounter slightly weathered to fresh bedrock of the Fernando Formation. The characteristics of the bedrock are as described in Section 3.2.4. However, bedrock in the Reach will range in unconfined compressive strength from 100 psi to 300 psi. As discussed in Section 3.2.4, concretions are common and they are significantly stronger than the typical bedrock. It is expected that 95 percent of the concretions are cemented with calcium carbonate and five percent are dolomitic. The distribution in thickness of these concretions is depicted on Figure 12. The lateral dimensions vary from 3 to 5 times the thickness. These concretions will comprise 3% of the bedrock (by volume).

The perched and regional groundwater elevations are as shown on Plate 1, plus or minus five feet.

In an unsupported excavation, the bedrock will exhibit firm to slow raveling behavior, with local wedge failures along joints, bedding planes, and/or shears. Raveling will occur at joint intersections, as shown in the photographs of the foundation excavation for the Broad Museum in Figures 22 and 23.

Indications of petroleum contamination are present near the top of the Fernando Formation, and such contamination is considered to be restricted to within the overlying alluvium. Therefore, it is not expected that petroleum contamination will be encountered in the tunnels within this reach. However, if groundwater inflows to the tunnel are allowed, it is expected that the water will be

impacted by contamination within the alluvium, and thus special treatment/disposal will be required.

4.7.3 Reach 3: Station R 29+37 to R 19+02 (2nd/Hope Street to 4th/Flower Street)

Based on subsurface conditions, this reach is divided into three sub-reaches: Reach 3A, 3B, and 3C. The boundaries of these reaches are approximate and are to be anticipated to vary plus or minus 50 feet from the indicated stations.

4.7.3.1 Reach 3A

The tunnels will encounter a full face of Fernando Formation bedrock from Station R 29+37 to R 26+80. Within Reach 3A the bedrock will vary from highly weathered to fresh. The characteristics of the bedrock are as described for Reach 2, except that the concretions will be more frequent, and will comprise 5% of the excavated material, by volume.

The perched and regional groundwater elevations are as shown on Plate 1, plus or minus five feet.

In an unsupported condition, the bedrock will exhibit firm to fast raveling behavior, with local wedge failures along joints, adversely oriented intersections of bedding planes, and/or shears. The ground will also exhibit a tendency for stress slabbing.

Indications of petroleum contamination have been identified within the bedrock and above the tunnel crown. The source of this contamination is from the overlying fill/alluvium. It is expected that groundwater that inflows into this reach will require special treatment/disposal, and approximately 5% of the volume of tunnel spoil from the two tunnel bores in this reach will require special handling and treatment/disposal.

4.7.3.2 Reach 3B

From Station R 26+80 to R 21+50 the tunnels will encounter a mixed face condition of alluvium and/or artificial fill over Fernando Formation bedrock. The fill/alluvium will be present in the upper portion of the tunnel face and consist of a wide range of soil types, including: silt, clay, and silty sand (70% to 80%); poorly graded sand (10% to 15%); and well graded sand (10% to 15%). Where fill is present, it will contain cobble and boulder size fragments of construction debris. These fragments are expected to be strong to very strong (ISRM, 1978). A total of 20 cobble size objects and five boulder size objects are expected in this reach. The bedrock will vary from highly to moderately weathered. The characteristics of the bedrock are as described for Reach 3A.

Perched and regional groundwater elevations are as shown on Plate 1, plus or minus five feet.

In an unsupported condition, the bedrock will present firm to slow raveling behavior in the slightly weathered to fresh bedrock and slow to fast raveling behavior in the moderately to highly weathered bedrock. Local wedge failures along joints, adversely oriented intersections of bedding planes, and/or shears are expected, as well as a tendency for stress slabbing. The fill/alluvium will exhibit fast raveling to flowing behavior.

Petroleum contamination is expected within the fill/alluvium and to a lesser degree within fractures in the bedrock. Therefore, groundwater that inflows into this sub-reach will require

special treatment/disposal, and approximately 5% of the excavated material from the two tunnels in this reach will require special handling and treatment/disposal.

4.7.3.3 Reach 3C

The tunnels will encounter a full face of Fernando Formation from Station R 21+50 to R 19+00 (end of tunnel drive). Within this sub-reach, the upper portion of the face will expose moderately to highly weathered bedrock, and slightly weathered to fresh bedrock below. The characteristics of the bedrock are as described for Reach 3A.

Perched and regional groundwater elevations are as shown on Plate 1, plus or minus five feet.

In an unsupported condition, the bedrock will present firm to slow raveling behavior in the slightly weathered to fresh bedrock and slow to fast raveling behavior in the moderately to highly weathered bedrock. Local wedge failures will occur along joints, adversely oriented intersections of bedding planes, and/or shears.

Indications of petroleum contamination have been identified within the alluvium and at shallow depth into the bedrock. It is expected that the source of this contamination is from the overlying fill/alluvium. As a result, groundwater that inflows into this reach will require special treatment/disposal, and approximately 5% of the volume of tunnel spoils from the two tunnel bores in this reach will require special handling and treatment/disposal.

4.8 Cross Passages

A total of four cross passages will be constructed using Sequential Excavation Method (SEM). Ground and groundwater conditions for each of these cross passages are expected as follows.

4.8.1 Cross Passage at Station R 69+00

This cross passage will be mostly in the Fernando Formation bedrock, and expected to encounter moderately to highly weathered and weaker bedrock in the crown. The characteristics of the bedrock are described above for Reach 1B. Concretions are expected in the cross passage excavation, with the same characteristics as described for Reach 1B. Local wedge failures are expected to occur along adversely oriented intersections of joints, bedding planes, and/or shears. Three joint sets with scattered random joints are present as discussed below and shown on Figures 21B:

- Joint Set 1 - Dipping 65 to 80 degrees with dip direction ranging from 160 to 220 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 245 to 295 degrees
- Joint Set 3 - Dipping 80 to 90 degrees with dip direction ranging from 70 to 110 degrees

In addition to three joint sets, there will be some poorly developed bedding that will dip subparallel to Joint Set 1.

Perched and regional groundwater levels are shown on Plate 1, plus or minus five feet. Unrestricted inflows from the bedrock will be limited to drips and slow seeps that will occur along joints, shears, and/or bedding planes.

Slightly weathered to fresh bedrock will exhibit firm to slow raveling and a tendency for stress slabbing behavior with local unstable wedges along joints, bedding planes, and/or shears. Moderately to highly weathered bedrock will exhibit slow raveling and/or slabbing behavior.

4.8.2 Cross Passage at Station R 62+50

This cross passage will be completely in unweathered bedrock of the Fernando Formation. The characteristics of the Fernando Formation bedrock are described above for Reach 1B. Concretions are expected in the cross passage excavation, with the same characteristics as described for Reach 1B. Local wedge failures are expected to occur along adversely oriented intersections of joints, bedding planes, and/or shears. Three joint sets with scattered random joints are present as discussed below and shown on Figures 21B:

- Joint Set 1 - Dipping 65 to 80 degrees with dip direction ranging from 160 to 220 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 245 to 295 degrees
- Joint Set 3 - Dipping 80 to 90 degrees with dip direction ranging from 70 to 110 degrees

In addition to three joint sets, there will be some poorly developed bedding that will dip subparallel to Joint Set 1.

Perched and regional groundwater elevations are as shown on Plate 1. Unrestricted inflows from the bedrock will occur as drips to slow seeps that will occur along joints, shears, and/or bedding planes.

The slightly weathered to fresh bedrock will exhibit firm to slow raveling behavior with stress slabbing in the crown. Local unstable wedges will form along random joints, bedding planes, and/or shears in the walls and crown.

4.8.3 Cross Passage at Station R 41+15

This cross passage will be completely in unweathered bedrock of the Fernando Formation. The characteristics of the Fernando Formation bedrock are described above for Reach 2. Concretions are expected in the cross passage excavation, with the same characteristics as described for Reach 2. Local wedge failures are expected to occur along adversely oriented intersections of joints, bedding planes, and/or shears. Three joint sets with scattered random joints are present as discussed below and shown on Figures 21B:

- Joint Set 1 - Dipping 65 to 80 degrees with dip direction ranging from 160 to 220 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 245 to 295 degrees
- Joint Set 3 - Dipping 80 to 90 degrees with dip direction ranging from 70 to 110 degrees

In addition to three joint sets, there will be some poorly developed bedding that will dip subparallel to Joint Set 1.

Perched and regional groundwater elevations will be as shown on Plate 1, plus or minus five feet. Inflows from the bedrock will occur as drips to fast seeps that will occur along joints, shears, and/or bedding planes.

The slightly weathered to fresh bedrock will exhibit firm to slow raveling behavior with a tendency for stress slabbing. Local unstable wedges will form along random joints, bedding planes, and/or shears in the walls and crown.

4.8.4 Cross Passage at Station R 24+00

This cross passage will be mostly in the Fernando Formation, but will encounter artificial fill and/or alluvium in the crown. The bedrock will range from highly weathered to fresh and its characteristics are as described above in Reach 3B. Concretions are expected in the cross passage excavation, with the same characteristics as described for Reach 3B. Three joint sets with scattered random joints are present as discussed below and shown on Figures 21A:

- Joint Set 1 - Dipping 30 to 80 degrees with dip direction ranging from 150 to 190 degrees
- Joint Set 2 - Dipping 55 to 80 degrees with dip direction 350 to 10 degrees
- Joint Set 3 - Dipping 60 to 80 degrees with dip direction ranging from 220 to 260 degrees

In addition to three joint sets, there will some poorly developed bedding that will dip subparallel to Joint Set 1.

Perched and regional groundwater elevations are as shown on Plate 1, plus or minus five feet. Inflows from the bedrock will be limited to drips and slow seeps that will occur along joints, shears, and/or bedding planes. Inflows from artificial fill/alluvium will occur as a maximum of 25 gpm flush flows that will subside to maximum sustained flows of 10 gpm. Pre-tunneling mitigation measures to control groundwater inflow will be required to meet the project requirements.

Slightly weathered to fresh bedrock will exhibit firm to slow raveling behavior with tendency for stress slabbing, and local unstable wedges will form along joints, bedding planes and/or shears. Moderately to highly weathered bedrock will exhibit slow to fast raveling and/or a tendency for slabbing behavior. Where artificial fill/alluvium is encountered, it will contain variable amounts of construction debris and cobbles, and because it will contain groundwater it will exhibit fast raveling to flowing behavior.

Groundwater that inflows into this crosspassage will require special treatment/disposal, and approximately 5% of the excavated material in this section will require special handling and treatment/disposal.

Figure 12: Summary of Cemented Layers in Fernando Formation

Some intervals in the Fernando Formation are notably stronger than typical for the formation. These materials have been described in boring logs in a variety of ways, including:

Carbonate cemented siltstone; carbonate cemented siltstone; carbonate cemented zone; cemented layer; cemented layer of limestone; cemented lens; cemented lumps; cemented nodules; cemented zone; concretion; hard layer; hard cemented layer; hard layer; hard lens; highly cemented layer; layer of cemented lumps; layer of limestone; layer of limestone gravel; limestone nodule; siltstone concretion; trace cemented shell fragments; very hard cemented lens; well cemented siltstone; calcium carbonated-cemented zone; cemented siltstone zone; carbonate cemented siltstone; cemented siltstone lens; dolomitic/cemented zone; cemented siltstone layer; calcareous cemented siltstone; cemented layer of limestone; cemented limestone nodules.

Field observations of outcrops and excavations indicate the above materials, with rare exceptions, are concretions.

EXECUTIVE SUMMARY

The ONNI Group (the Applicant) proposes to develop the Times Mirror Square Project (Project) which would include construction of two new mixed-use towers along with rehabilitation of three existing buildings, including an eight-story building (Times Building), a four-story building (Plant Building) and a 10-story building (Mirror Building) within the Times Mirror Square site. The Times Mirror Square site (Project Site) comprises the city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway. The Project Site totals approximately 160,578 square feet of lot area or approximately 3.6 acres.

The proposed rehabilitated buildings, the Times, Plant, and Mirror Buildings, which have a total existing floor area of approximately 376,105 square feet, are located in the east sector of theblock aligned with S. Spring Street. The existing Executive Building at the corner of W. 1st Streetand S. Broadway and the parking structure at the corner of W. 2nd Street and S. Broadway wouldbe demolished to allow for the development of the Project towers. The North and South Towers, which would be constructed above a five-story parking podium (Podium). The Podium would be an above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. Overall, including the existing buildings to remain that total approximately 376,105 square feet, the Project would comprise approximately 1,511,908 square feet of floor area, resulting in a 9.42 FAR. An open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a connection to First and Broadway Civic Center Park.

In accordance with the requirements under the California Environmental Quality Act (CEQA), this Greenhouse Gas Emissions (GHG) Technical Report provides an estimate of GHG emissions for the proposed project and predicts the potential impacts from construction and operation activities. The report includes the categories and types of emission sources resulting from the Project, the calculation procedures used in the analysis, and any assumptions or limitations. The Project would introduce short-term and temporary GHG emissions from construction and long-term GHG emissions from operation. The following emission sources, associated with the Project, have been evaluated:

- *Construction* – Activities associated with construction of the Project, such as combustion of fossil fuels for demolition, grading, building erection, paving and painting, would result in temporary and incremental increases in GHG emissions.

- *Operation* – Operation of the Project would cause the emission of GHGs from activities such as heating, cooling, and electricity, lawn care and maintenance activities, the treatment and

conveyance of water; and combustion of fossil fuels for transportation and power. However, the Project would implement Project Design Features that would be consistent with State and City recommended GHG reduction strategies and are predicted to lessen emissions of GHGs.

This report summarizes the potential for the Project to generate GHG emissions that may have a significant impact on the environment and its potential to conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. The findings of the analyses are as follows:

- Greenhouse gas emissions associated with the Project would be consistent with the applicable portions of City of Los Angeles Green LA Plan, Sustainable City pLAn, and Green Building Ordinance. In addition, the Project would be consistent with applicable Southern California Association of Governments (SCAG) Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS) policies intended to meet the region's GHG reduction targets as assigned by the California Air Resources Board (CARB). Thus, the Project's GHG emissions would be consistent with regulatory schemes intended to reduce GHG emissions. Therefore, the Project would result in less than significant GHG emissions based on applicable thresholds of significance as evaluated in this GHG Technical Report.

- The Project would be consistent with the HSC Division 25.5 goals and CARB guidelines for assessing GHG emissions. Further, the Project would include land use characteristics and design features that would be consistent with State, Regional, and Local Regulations for reducing GHG emissions. Therefore, as the Project would be consistent with applicable plans, policies and regulations adopted for the purpose of reducing GHG emissions, impacts regarding GHG reduction plans would be less than significant.

- Furthermore, the Project would implement green building measures that would reduce the Project's direct and indirect GHG emissions. With the implementation of the Project's green building measures, the Project would achieve substantial GHG reductions as compared to a comparable No-Action-Taken (NAT) scenario.

SECTION 1
Introduction

1.1 Existing Conditions

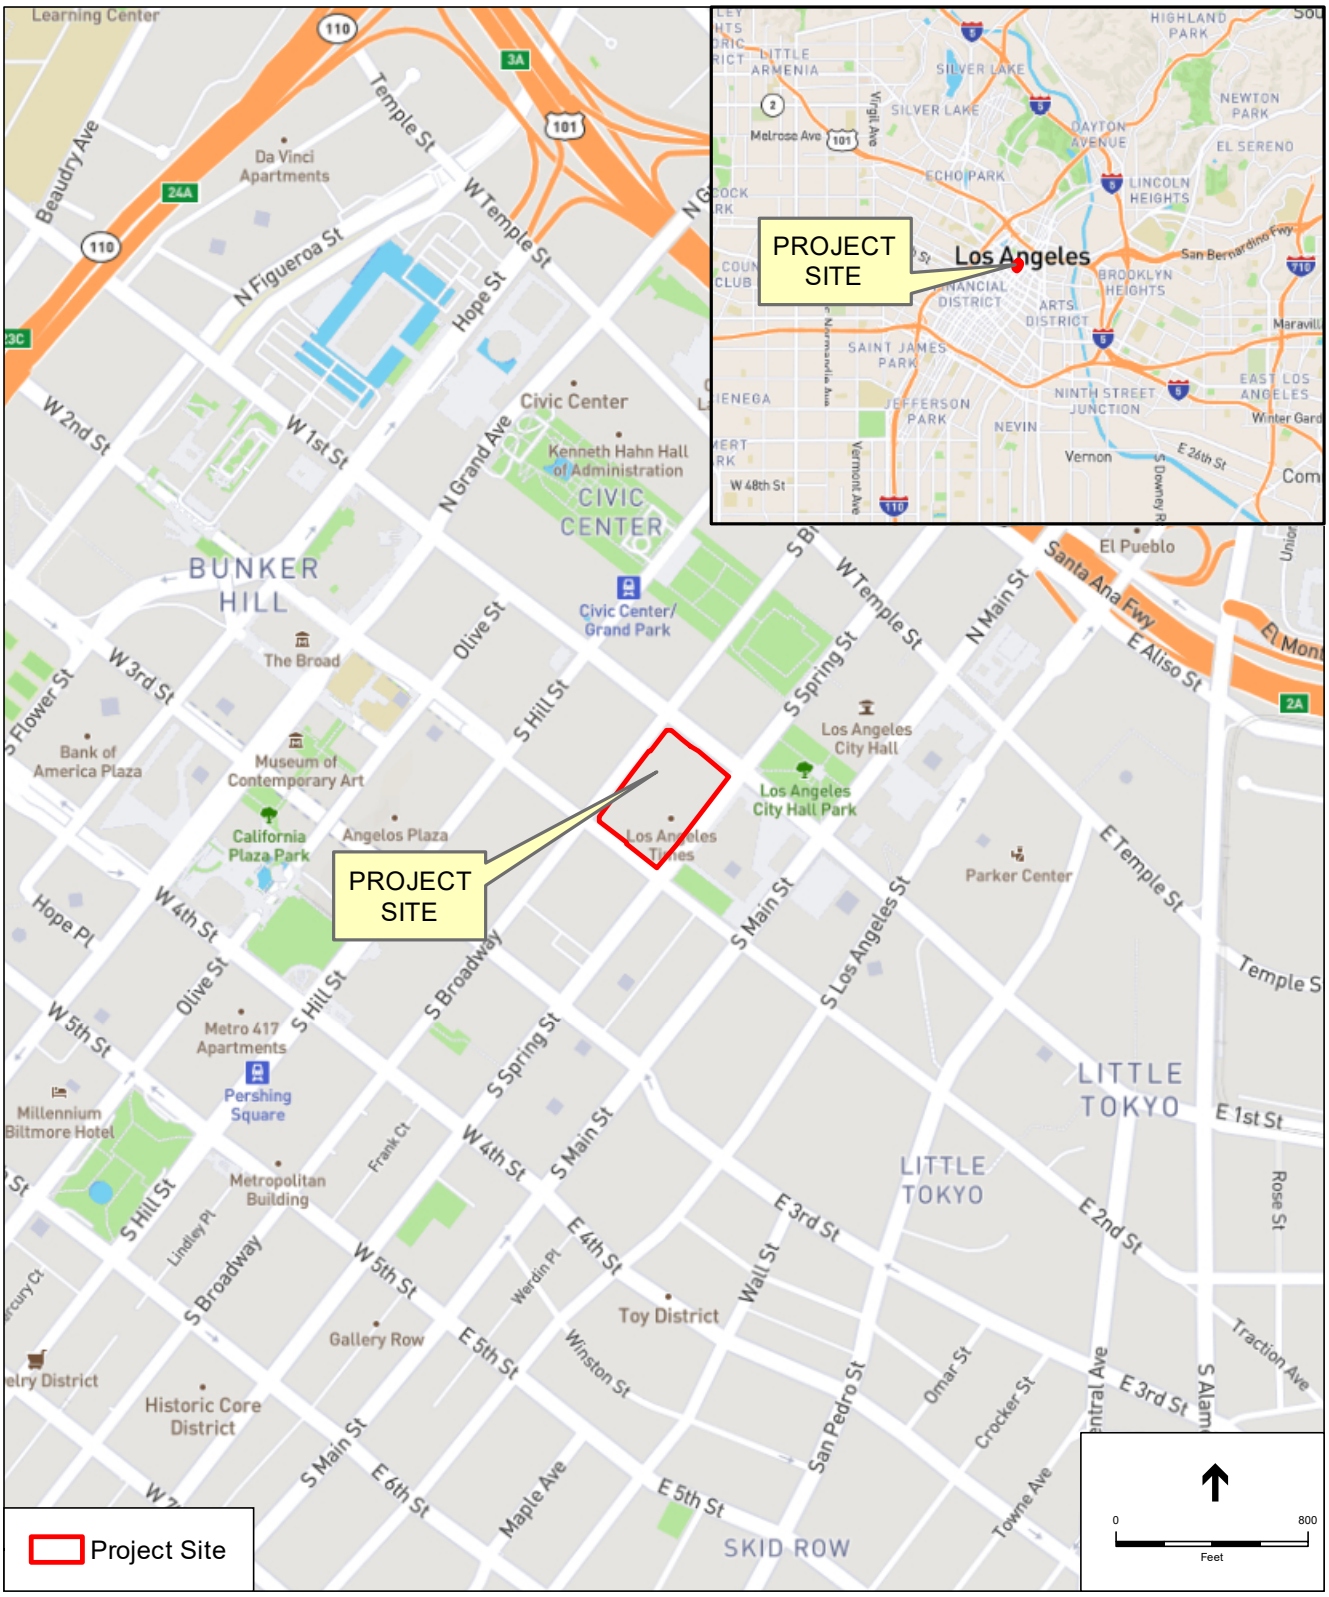
The ONNI Group (the Applicant) proposes to develop the Times Mirror Square Project (Project) which would include construction of two new mixed-use residential and commercial towers along with rehabilitation of three existing buildings at 202 West 1st Street on an approximately 3.6- that comprises the city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway (Project Site).[1] The Project Site location is shown in **Figure 1**, *Vicinity Location Map.*

The Project Site is currently developed with five structurally distinct, but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to ten stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the ten-story Mirror Building, the six-story parking structure, and the six-story Executive Building. This includes approximately 541,113 square feet of commercial office uses across the four existing buildings, an approximately 7,500 square-foot bank in the Executive Building, an approximately 11,250 square-foot cafeteria in the Plant Building. Approximately 223,945 square feet, or 40 percent of the existing uses, are vacant office spaces that have been vacant for 10 years. GHG emissions are currently associated with vehicle trips to and from the existing Project Site (on-road mobile sources), on-site combustion of natural gas for heating and cooking, on-site combustion emissions from landscaping equipment (area source), off-site combustion of fossil fuels for electricity, and off-site emissions from solid waste decomposition, water conveyance, and wastewater treatment.

1.2 Project Description

The Project would demolish the Executive Building and parking structure and develop two high-rise mixed-use towers, the North Tower and South Tower, that would replace these structures along the S. Broadway frontage, while the Times, Plant, and Mirror Buildings would be renovated and preserved. The proposed Paseo would separate the existing Times, Plant, and Mirror Buildings from the new towers and intersect the Project Site between the W. 1st Street and W. 2nd Street sidewalks.

The North and South Towers, which would be constructed above a five-story parking podium (Podium). The North Tower would contain 450 residential units and the South Tower would contain 677 residential units, for a total of 1,127 residential units and approximately 34,572



[1] The Project Site is zoned Commercial (C2-4D-SN), which permits general commercial and multi-family residential uses.

square feet of commercial floor area. Total residential floor area within the two towers would be approximately 1,071,692 square feet. With the addition of open space amenities, lounges, loading areas, and retail uses, total new construction would amount to 1,135,803 square feet. Open space amenities available to residents of the North and South Towers include an approximately 28,777-square-foot residential terrace (Residential Terrace) on the rooftop of the five-story Podium (Level 6). The Residential Terrace, which is located on the rooftop of the Podium between the North and South Towers, would be open to sky and provide approximately 7,700 square feet of landscaping, a pool deck, a dog run, cabanas, steam room and sauna, and other amenities such as dining tables and fire-side seating. The Project would provide other amenities at the 6th floor level, as well as ground-floor lounges in each of the tower buildings. These amenity areas are expected to include a gym, club rooms, meeting rooms, film screening room, private dining, and potentially other common areas to serve residents.

Approximately 73,128 square feet of common open space, including the approximately 15,708-square-foot Paseo, would be provided as part of the North and South Towers component. Of the common open space, only the Paseo is available for public access. The remaining 57,420 square feet are provided as common use for the Project's residents. With the addition of approximately 56,349 square feet of private balconies, combined private and common open space would be approximately 129,477 square feet.

The Podium would be a five-story above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. The Project is designed for approximately 1,744 vehicle parking spaces in the five-level above-ground Podium and nine-level subterranean parking structure. The Project would also provide 1,240 bicycle parking spaces for the residential uses and 34 bicycle parking spaces for the commercial uses.

The existing buildings to remain approximately total 376,105 square feet. Under the Project, there would be approximately 307,288 square feet of commercial office uses, approximately 18,817 square feet of commercial restaurant uses, an approximately 50,000 square-foot grocery store,and an Office Terrace (Level 6 of the Plant Building). Although the total floor area of 376,105 square feet and the proportional mix of commercial uses would not change, the Project would allow flexibility in how the uses are allocated among the three existing buildings. The interiors of all three historic buildings have been heavily altered over time. The two original and architecturally distinctive interior spaces, the lobbies of the Times Building and Mirror Building, would be preserved. The upper floors contain little if any historic fabric, as it was removed as a result of past structural improvements and office modernizations. The upper floors would be reconfigured for office tenants, if required. The exteriors of all three buildings would be cleaned and repaired as necessary. Overall, including the existing buildings to remain that total approximately 376,105 square feet, the Project would comprise approximately 1,511,908 square feet of floor area, resulting in a 9.42 FAR. The Project Site area and vicinity is provided in **Figure 2**, *Aerial Photograph of Project Site and Vicinity*.

Figure 2

Aerial Photograph of Project Site and Vicinity

ESA

Demolition activities on the subject property would include the removal of two of the five existing buildings. Approximately 35,000 tons of debris would be exported from the Project site. The Project would require the excavation of approximately 364,000 cubic yards of earth for the proposed nine levels of parking, four of which would be constructed above grade in the Podium and five of which would be constructed below grade.

1.3 Anticipated Construction Schedule

Construction of the Project is anticipated to begin in 2019, pending Project consideration and approval, and would be completed in late 2023. Construction of the Project is estimated to require 48 months, starting as early as the first quarter of 2019.Construction activities would include demolition of the Executive Building and existing parking structure, excavation, foundations and concrete pouring, building construction, and architectural coatings. Heavy-duty equipment, vendor supply trucks and concrete trucks would be used during construction of foundations, parking structures, and buildings. Landscaping and architectural coating would occur during the finishing activities. The maximum daily regional emissions from these activities are estimated by construction phase and compared to the South Coast Air Quality Management District (SCAQMD) significance thresholds. The maximum daily regional emissions are predicted values for the worst-case day and do not represent the emissions that would occur for every day of Project construction. The Project would comply with SCAQMD Rule 403 during demolition and grading activities which would limit fugitive dust emissions. A complete listing of the construction equipment by phase and construction phase duration assumptions used in this analysis is included within the California Emissions Estimator Model (CalEEMod) printout sheets that are provided in **Appendix F-2** of this Technical Report.

1.4 Existing Greenhouse Gas Environment

1.4.1 Greenhouse Gases

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation and storms. Historical records indicate that global climate changes have occurred in the past due to natural phenomena; however, current data increasingly indicate that the current global conditions differ from past climate changes in rate and magnitude. Global climate change attributable to anthropogenic (human) GHG emissions is currently one of the most important and widely debated scientific, economic and political issues in the United States and the world. The extent to which increased concentrations of GHGs have caused or will cause climate change and the appropriate actions to limit and/or respond to climate change are the subject of significant and rapidly evolving regulatory efforts at the federal and state levels of government.

GHGs are compounds in the Earth's atmosphere which play a critical role in determining temperature near the Earth's surface. More specifically, these gases allow high-frequency shortwave solar radiation to enter the Earth's atmosphere, but retain some of the low frequency infrared energy which is radiated back from the Earth towards space, resulting in a warming of the atmosphere. Not all GHGs possess the same ability to induce climate change; as a result,

GHG contributions are commonly quantified in the units of equivalent mass of carbon dioxide (CO_2e). Mass emissions are calculated by converting pollutant specific emissions to CO_2e emissions by applying the proper global warming potential (GWP) value.[2] These GWP ratios are provided by the Intergovernmental Panel on Climate Change (IPCC) in its Fourth Assessment Report (AR4).[3] By applying the GWP ratios, project-related CO_2e emissions can be tabulated in metric tons per year. Typically, the GWP ratio corresponding to the warming potential of CO_2 over a 100-year period is used as a baseline. The CO_2e values are calculated for construction years as well as existing and project build-out conditions in order to generate a net change in GHG emissions for construction and operation. Compounds that are regulated as GHGs are discussed below.

- **Carbon Dioxide (CO_2):** CO_2 is the most abundant anthropogenic GHG in the atmosphere and is primarily generated from fossil fuel combustion from stationary and mobile sources. CO_2 is the reference gas (GWP of 1) for determining the GWPs of other GHGs.

- **Methane (CH_4):** CH_4 is emitted from biogenic sources (i.e., resulting from the activity of living organisms), incomplete combustion in forest fires, anaerobic decomposition of organic matter in landfills, manure management, and leaks in natural gas pipelines. The GWP of CH_4 is 21 in the IPCC SAR and 25 in the IPCC AR4.

- **Nitrous Oxide (N_2O):** N_2O produced by human-related sources including agricultural soil management, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuel, adipic acid production, and nitric acid production. The GWP of N_2O is 310 in the IPCC SAR and 298 in the IPCC AR4.

- **Hydrofluorocarbons (HFCs):** HFCs are fluorinated compounds consisting of hydrogen, carbon, and fluorine. They are typically used as refrigerants in both stationary refrigeration and mobile air conditioning systems. The GWPs of HFCs range from 140 for HFC-152a to 11,700 for HFC-23 in the IPCC SAR and 124 for HFC-152a to 14,800 for HFC-23 in the IPCC AR4.

- **Perfluorocarbons (PFCs):** PFCs are fluorinated compounds consisting of carbon and fluorine. They are primarily created as a byproduct of aluminum production and semiconductor manufacturing. The GWPs of PFCs range from 6,500 to 9,200 in the IPCC SAR and 7,390 to 17,700 in the IPCC AR4.

- **Sulfur Hexafluoride (SF_6):** SF_6 is a fluorinated compound consisting of sulfur and fluoride. It is a colorless, odorless, nontoxic, nonflammable gas. It is most commonly used as an electrical insulator in high voltage equipment that transmits and distributes electricity. SF_6 has a GWP of 23,900 in the IPCC SAR and 22,800 in the IPCC AR4.

---

2 GWPs and associated CO_2e values were developed by the Intergovernmental Panel on Climate Change (IPCC), and published in its Second Assessment Report (SAR) in 1996. Historically, GHG emission inventories have been calculated using the GWPs from the IPCC's SAR. The IPCC updated the GWP values based on the latest science in its Fourth Assessment Report (AR4). The California Air Resources Board (CARB) reports GHG emission inventories for California using the GWP values from the IPCC AR4. Therefore, the analysis below reflected the GWP values from IPCC AR4. Although the IPCC has released AR5 with updated GWPs, CARB reports the statewide GHG inventory using the AR4 GWPs, which is consistent with international reporting standards.

1.4.2 Existing Conditions

Existing Site Greenhouse Gas Emissions

The Project Site is located within Downtown Los Angeles, and is currently developed with five structurally distinct but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings range from four to ten stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the ten-story Mirror Building, the six-story parking structure, and the six-story Executive Building. This includes approximately 541,113 square feet of commercial office uses across the four existing buildings, an approximately 7,500 square-foot bank in the Executive Building, an approximately 11,250 square-foot cafeteria in the Plant Building. Approximately 223,945 square feet, or 40 percent of the existing uses, are vacant office spaces that have been vacant for 10 years. GHG emissions are currently associated with vehicle trips to and from the existing Project Site (on-road mobile sources), on-site combustion of natural gas for heating and cooking, on-site combustion emissions from landscaping equipment (area source), off-site combustion of fossil fuels for electricity, and off-site emissions from solid waste decomposition, water conveyance, and wastewater treatment.

Existing Project Site emissions were estimated using the California Emissions Estimator Model (CalEEMod) software version 2016.3.2. The existing Project Site emissions are summarized in **Table 1,** *Estimated Existing Site Greenhouse Gas Emissions*. As shown, the primary sources of emissions are from transportation and energy demand (electricity and natural gas). Detailed emissions calculations are provided in **Appendix F-1** of this Technical Report.

TABLE 1
ESTIMATED EXISTING SITE GREENHOUSE GAS EMISSIONS

Emissions Sources	CO_2e (Metric Tons per Year) [a]
Existing Site	
On Road Mobile Sources	4,016
Area (landscaping)	<1
Electricity	2,671
Natural Gas	324
Water Conveyance and Wastewater Treatment	61
Solid Waste	53
Subtotal	**7,125**

[a] Totals may not add up exactly due to rounding in the modeling calculations.

[b] CO_2e emissions are calculated using the global warming potential values from the IPCC AR4. Although the IPCC has released AR5 with updated GWPs, CARB reports the statewide GHG inventory using the AR4 GWPs, which is consistent with international reporting standards.

Source: ESA, 2018.

Existing Statewide Greenhouse Gas Emissions Inventory

The California Air Resources Board (CARB) compiles GHG inventories for the State of California. Based on the 2016 GHG inventory data (i.e., the latest year for which data are available from CARB) prepared by CARB in 2018, California emitted 429.4 million metric tons of CO_2e ($MMTCO_2e$) including emissions resulting from imported electrical power.[4] Between 1990 and 2016, the population of California grew by approximately 9.5 million (from 29.8 to 39.3 million).[5,6] This represents an increase of approximately 32 percent from 1990 population levels. In addition, the California economy, measured as gross state product, grew from $773 billion in 1990 to $2.62 trillion in 2016 representing an increase of approximately three times the 1990 gross state product).[7] Despite the population and economic growth, California's net GHG emissions were reduced to below 1990 levels in 2016. According to CARB, the declining trend coupled with the state's GHG reduction programs (such as the Renewables Portfolio Standard, Low Carbon Fuel Standard, vehicle efficiency standards, and declining caps under the Cap and Trade Program) demonstrate that California is on track to meet the 2020 GHG reduction target codified in California Health and Safety Code (HSC), Division 25.5, also known as The Global Warming Solutions Act of 2006 (AB 32).[8] **Table 2**, *State of California Greenhouse Gas Emissions,* identifies and quantifies statewide anthropogenic GHG emissions and sinks (e.g., carbon sequestration due to forest growth) in 1990 and 2016. As shown in the table, the transportation sector is the largest contributor to statewide GHG emissions at approximately 39 percent in 2016.

Effects of Global Climate Change

The scientific community's understanding of the fundamental processes responsible for global climate change has improved over the past decade, and its predictive capabilities are advancing. However, there remain significant scientific uncertainties in, for example, predictions of local effects of climate change, occurrence, frequency, and magnitude of extreme weather events, effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in oceanic circulation. Due to the complexity of the Earth's climate system and inability to accurately model it, the uncertainty surrounding climate change may never be completely eliminated. Nonetheless, the IPCC's *Fifth Assessment Report, Summary for Policy Makers* states that, "it is *extremely likely* that more than half of the observed increase in global average surface temperature from 1951 to 2010 was caused by the anthropogenic increase in greenhouse gas concentrations and other anthropogenic forc[es [*sic*] together."[9] A report from the National Academy of Sciences concluded that 97 to 98 percent of the climate researchers most actively

9 Intergovernmental Panel on Climate Change, Fifth Assessment Report, Summary for Policy Makers, page 5, 2013, http://ipcc.ch/pdf/assessment-report/ar5/syr/AR5_SYR_FINAL_SPM.pdf. Accessed September 27, 2018.

publishing in the field support the tenets of the IPCC in that climate change is very likely caused by human (i.e., anthropogenic) activity.[10]

According to CARB, the potential impacts in California due to global climate change may include: loss in snow pack; sea level rise; more extreme heat days per year; more high ozone days; more large forest fires; more drought years; increased erosion of California's coastlines and sea water intrusion into the Sacramento and San Joaquin Deltas and associated levee systems; and increased pest infestation.[11] Below is a summary of some of the potential effects that could be experienced in California as a result of global warming and climate change.

Air Quality

Higher temperatures, conducive to air pollution formation, could worsen air quality in California. Climate change may increase the concentration of ground-level ozone, but the magnitude of the effect and, therefore, its indirect effects, are uncertain. If higher temperatures are accompanied by drier conditions, the potential for large wildfires could increase, which, in turn, would exacerbate air quality. Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state.[12] However, if higher temperatures are accompanied by wetter, rather than drier conditions, the rains would temporarily clear the air of particulate pollution and reduce the incidence of large wildfires, thus ameliorating the pollution associated with wildfires.

In 2009, the California Natural Resources Agency (CNRA) published the *California Climate Adaptation Strategy* as a response to the Governor's Executive Order S-13-2008.[13] The CNRA report lists specific recommendations for state and local agencies to best adapt to the anticipated risks posed by a changing climate. In accordance with the *California Climate Adaptation Strategy*, the California Energy Commission (CEC) was directed to develop a website on climate change scenarios and impacts that would be beneficial for local decision makers.[14] The website, known as Cal-Adapt, became operational in 2011.[15] The information provided on the Cal-Adapt website represents a projection of potential future climate scenarios. The data are comprised of the average values (i.e., temperature, sea-level rise, snowpack) from a variety of scenarios and models and are meant to illustrate how the climate may change based on a variety of different potential social and economic factors. According to the Cal-Adapt website, the portion of the city

15 The Cal-Adapt website address is: http://cal-adapt.org.

in which the Project Site is located could result in an average increase in temperature of approximately 5.4 to 8.0°F by 2070–2099, compared to the baseline 1961–1990 period.

Water Supply

Uncertainty remains with respect to the overall impact of global climate change on future water supplies in California. Studies have found that, "Considerable uncertainty about precise impacts of climate change on California hydrology and water resources will remain until we have more precise and consistent information about how precipitation patterns, timing, and intensity will change."[16] For example, some studies identify little change in total annual precipitation in projections for California while others show significantly more precipitation.[17] Warmer, wetter winters would increase the amount of runoff available for groundwater recharge; however, this additional runoff would occur at a time when some basins are either being recharged at their maximum capacity or are already full. Conversely, reductions in spring runoff and higher evapotranspiration because of higher temperatures could reduce the amount of water available for recharge.[18]

The California Department of Water Resources report on climate change and effects on the State Water Project (SWP), the Central Valley Project, and the Sacramento-San Joaquin Delta, concludes that "climate change will likely have a significant effect on California's future water resources…[and] future water demand." It also reports that "much uncertainty about future water demand [remains], especially [for] those aspects of future demand that will be directly affected by climate change and warming. While climate change is expected to continue through at least the end of this century, the magnitude and, in some cases, the nature of future changes is uncertain."[19] It also reports that the relationship between climate change and its potential effect on water demand is not well understood, but "[i]t is unlikely that this level of uncertainty will diminish significantly in the foreseeable future." Still, changes in water supply are expected to occur, and many regional studies have shown that large changes in the reliability of water yields from reservoirs could result from only small changes in inflows.[20] In its *Fifth Assessment Report*, the IPCC states "Changes in the global water cycle in response to the warming over the 21st

Accessed December 2018.

century will not be uniform. The contrast in precipitation between wet and dry regions and between wet and dry seasons will increase, although there may be regional exceptions."[21]

Hydrology and Sea Level Rise

As discussed above, climate change could potentially affect: the amount of snowfall, rainfall and snow pack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide and high runoff events); sea level rise and coastal flooding; coastal erosion; and the potential for salt water intrusion. Sea level rise can be a product of global warming through two main processes: expansion of seawater as the oceans warm, and melting of ice over land. A rise in sea levels could result in coastal flooding and erosion and could jeopardize California's water supply. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events.

Agriculture

California has a $30 billion agricultural industry that produces half the country's fruits and vegetables. Higher CO_2 levels can stimulate plant production and increase plant water-use efficiency. However, if temperatures rise and drier conditions prevail, water demand could increase; crop-yield could be threatened by a less reliable water supply; and greater ozone pollution could render plants more susceptible to pest and disease outbreaks. In addition, temperature increases could change the time of year certain crops, such as wine grapes, bloom or ripen, and thus affect their quality.[22]

Ecosystems and Wildlife

Increases in global temperatures and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increasing concentrations of GHGs are likely to accelerate the rate of climate change. Scientists expect that the average global surface temperature could rise by 2-11.5°F (1.1-6.4°C) by 2100, with significant regional variation.[23] Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. Sea level could rise as much as 2 feet along most of the United States coastline. Rising temperatures could have four major impacts on plants and animals: (1) timing of ecological events; (2) geographic range; (3) species' composition within communities; and (4) ecosystem processes such as carbon cycling and storage.[24]

SECTION 2
Regulatory Setting

2.1 Federal

The United States Environmental Protection Agency (USEPA) is responsible for implementing federal policy to address GHGs. The federal government administers a wide array of public-private partnerships to reduce the GHG intensity generated in the United States. These programs focus on energy efficiency, renewable energy, methane and other non-CO_2 gases, agricultural practices, and implementation of technologies to achieve GHG reductions. The USEPA implements numerous voluntary programs that contribute to the reduction of GHG emissions. These programs (e.g., the ENERGY STAR labeling system for energy-efficient products) play a significant role in encouraging voluntary reductions from large corporations, consumers, industrial and commercial buildings, and many major industrial sectors.

2.1.1 Clean Air Act

In *Massachusetts v. Environmental Protection Agency* (Docket No. 05–1120), the U.S. Supreme Court held in April of 2007 that the USEPA has statutory authority under Section 202 of the federal Clean Air Act (CAA) to regulate GHGs. The court did not hold that the USEPA was required to regulate GHG emissions; however, it indicated that the agency must decide whether GHGs cause or contribute to air pollution that is reasonably anticipated to endanger public health or welfare. On December 7, 2009, the USEPA Administrator signed two distinct findings regarding GHGs under Section 202(a) of the CAA. The USEPA adopted a Final Endangerment Finding for the six defined GHGs (CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6) on December 7, 2009. The Endangerment Finding is required before USEPA can regulate GHG emissions under Section 202(a)(1) of the CAA consistently with the United States Supreme Court decision. The USEPA also adopted a Cause or Contribute Finding in which the USEPA Administrator found that GHG emissions from new motor vehicle and motor vehicle engines are contributing to air pollution, which is endangering public health and welfare. These findings do not, by themselves, impose any requirements on industry or other entities. However, these actions were a prerequisite for implementing GHG emissions standards for vehicles.

2.1.2 Energy Independence and Security Act

The Energy Independence and Security Act of 2007 (EISA) facilitates the reduction of national GHG emissions by requiring the following:

- Increasing the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) that requires fuel producers to use at least 36 billion gallons of biofuel in 2022;

- Prescribing or revising standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances;

- Requiring approximately 25 percent greater efficiency for light bulbs by phasing out incandescent light bulbs between 2012 and 2014; requiring approximately 200 percent greater efficiency for light bulbs, or similar energy savings, by 2020; and

- While superseded by the USEPA and NHTSA actions described above, (i) establishing miles per gallon targets for cars and light trucks and (ii) directing the NHTSA to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for trucks.

Additional provisions of EISA address energy savings in government and public institutions, promote research for alternative energy, additional research in carbon capture, international energy programs, and the creation of green jobs.[25]

2.1.3 Executive Order 13432

In response to the Massachusetts v. Environmental Protection Agency ruling, the President signed Executive Order 13432 on May 14, 2007, directing the USEPA, along with the Departments of Transportation, Energy, and Agriculture, to initiate a regulatory process that responds to the Supreme Court's decision. Executive Order 13432 was codified into law by the 2009 Omnibus Appropriations Law signed on February 17, 2009. The order sets goals in the areas of energy efficiency, acquisition, renewable energy, toxics reductions, recycling, sustainable buildings, electronics stewardship, fleets, and water conservation. Light-Duty Vehicle Greenhouse Gas and Corporate Average Fuel Economy Standards

On May 19, 2009, President Obama announced a national policy for fuel efficiency and emissions standards in the United States auto industry. The adopted federal standard applies to passenger cars and light-duty trucks for model years 2012 through 2016. The rule surpasses the prior Corporate Average Fuel Economy standards (CAFE)26 and requires an average fuel economy standard of 35.5 miles per gallon (mpg) and 250 grams of CO2 per mile by model year 2016, based on USEPA calculation methods. These standards were formally adopted on April 1, 2010. In August 2012, standards were adopted for model year 2017 through 2025 for passenger cars and light-duty trucks. By 2025, vehicles are required to achieve 54.5 mpg (if GHG reductions are achieved exclusively through fuel economy improvements) and 163 grams of CO2 per mile. According to the USEPA, a model year 2025 vehicle would emit one-half of the GHG emissions

25 A green job, as defined by the United States Department of Labor, is a job in business that produces goods or provides services that benefit the environment or conserve natural resources.

26 The Corporate Average Fuel Economy standards are regulations in the United States, first enacted by Congress in 1975, to improve the average fuel economy of cars and light trucks. The U.S Department of Trasnportation has delegated the National Highway Traffic Safety Administration as the regulatory agency for the Corporate Average Fuel Economy standards.

from a model year 2010 vehicle.27 In 2017, the USEPA recommended no change to the GHG standards for light-duty vehicles for model years 2022-2025.

In August 2018, the USEPA and NHTSA proposed the Safer Affordable Fuel-Efficient Vehicles Rule that would, if adopted, maintain the CAFE and CO_2 standards applicable in model year 2020 for model years 2021 through 2026. The estimated CAFE and CO_2 standards for model year 2020 are 43.7 mpg and 204 grams of CO_2 per mile for passenger cars and 31.3 mpg and 284 grams of CO_2 per mile for light trucks, projecting an overall industry average of 37 mpg, as compared to 46.7 mpg under the standards issued in 2012. The proposal, if adopted, would also exclude CO_2-equivalent emission improvements associated with air conditioning refrigerants and leakage (and, optionally, offsets for nitrous oxide and methane emissions) after model year 2020.[28]

2.2 State of California

2.2.1 California Air Resources Board

CARB, a part of the California Environmental Protection Agency (CalEPA), is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets state ambient air quality standards (California Ambient Air Quality Standards [CAAQS]), compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions.

In 2004, the California Air Resources Board (CARB) adopted an Airborne Toxic Control Measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter and other toxic air contaminants (Title 13 California Code of Regulations [CCR], Section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure generally does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given location with certain exemptions for equipment in which idling is a necessary function such as concrete trucks. While this measure primarily targets diesel particulate matter emissions, it has co-benefits of minimizing GHG emissions from unnecessary truck idling.

In 2008, CARB approved the Truck and Bus regulation to reduce particulate matter and nitrogen oxide emissions from existing diesel vehicles operating in California (13 CCR, Section 2025, subsection (h)). CARB has also promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes and forklifts, as

28 National Highway Traffic Safety Administration (NHTSA) and U.S. Environmental Protection Agency (USEPA), 2018. Federal Register / Vol. 83, No. 165 / Friday, August 24, 2018 / Proposed Rules, The Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021–2026 Passenger Cars and Light Trucks 2018. Available at: https://www.gpo.gov/fdsys/pkg/FR-2018-08-24/pdf/2018-16820.pdf. Accessed December 2018.

well as many other self-propelled off-road diesel vehicles. The regulation, adopted by the CARB on July 26, 2007, aims to reduce emissions by installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission controlled models. Refer to Section IV.B, *Air Quality*, of this Draft EIR for additional details regarding these regulations. While these regulations primarily target reductions in criteria air pollutant emission, they have co-benefits of minimizing GHG emissions due to improved engine efficiencies.

2.2.2 California Greenhouse Gas Reduction Targets

Executive Order S-3-05

Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05,[29] the following GHG emission reduction targets:

- By 2010, California shall reduce GHG emissions to 2000 levels;
- By 2020, California shall reduce GHG emissions to 1990 levels; and
- By 2050, California shall reduce GHG emissions to 80 percent below 1990 levels.

In accordance with Executive Order S-3-05, the Secretary of CalEPA is required to coordinate efforts of various agencies, which comprise the California Climate Action Team (CAT), in order to collectively and efficiently reduce GHGs. These agencies include CARB, the Secretary of the Business, Transportation and Housing Agency, Department of Food and Agriculture, the Resources Agency, the California Energy Commission, and the Public Utilities Commission. The CAT provides periodic reports to the Governor and Legislature on the state of GHG reductions in the state as well as strategies for mitigating and adapting to climate change. The first CAT Report to the Governor and the Legislature, in 2006, contained recommendations and strategies to help meet the targets in Executive Order S-3-05. The 2010 CAT Report, finalized in December 2010, expands on the policies in the 2006 assessment.[30] The new information detailed in the CAT Report includes development of revised climate and sea-level projections using new information and tools that became available and an evaluation of climate change within the context of broader social changes, such as land-use changes and demographic shifts.

Executive Order B-30-15

On April 29, 2015, Governor Brown issued Executive Order B-30-15. Therein, the Governor directed the following:

- Established a new interim statewide reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030.

29 Center for Climate Strategies, Executive Order S-3-05, http://www.climatestrategies.us/library/library/download/294. Accessed December 2018.

30 California Environmental Protection Agency, Climate Action Team, Climate Action Team Report to Governor Schwarzenegger and the Legislature, 2010, http://www.energy.ca.gov/2010publications/CAT-1000-2010-005/CAT-1000-2010-005.PDF. Accessed December 2018.

- Ordered all state agencies with jurisdiction over sources of GHG emissions to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 reduction targets.

- Directed CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent.

2.2.3 California Health and Safety Code, Division 25.5 – California Global Warming Solutions Act of 2006

In 2006, the California State Legislature adopted Assembly Bill (AB) 32 (codified in the California Health and Safety Code [HSC], Division 25.5 – California Global Warming Solutions Act of 2006), which focuses on reducing GHG emissions in California to 1990 levels by 2020. HSC Division 25.5 defines GHGs as CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6 and represents the first enforceable statewide program to limit emissions of these GHGs from all major industries with penalties for noncompliance. The law further requires that reduction measures be technologically feasible and cost effective. Under HSC Division 25.5, CARB has the primary responsibility for reducing GHG emissions. CARB is required to adopt rules and regulations directing state actions that would achieve GHG emissions reductions equivalent to 1990 statewide levels by 2020.

Senate Bill 32 and Assembly Bill 197

In 2016, the California State Legislature adopted Senate Bill (SB) 32 and its companion bill AB 197, and both were signed by Governor Brown. SB 32 and AB 197 amends HSC Division 25.5 and establishes a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and includes provisions to ensure the benefits of state climate policies reach into disadvantaged communities.

Climate Change Scoping Plan (2008)

A specific requirement of AB 32 was to prepare a Climate Change Scoping Plan for achieving the maximum technologically feasible and cost-effective GHG emission reduction by 2020 (Health and Safety Code section 38561 (h)). CARB developed an AB 32 Scoping Plan that contains strategies to achieve the 2020 emissions cap.[31] The initial Scoping Plan was approved in 2008, and contains a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the State's long-range climate objectives.[32]

In its Climate Change Scoping Plan, CARB has acknowledged that land use-driven emissions are highly complex: "While it is possible to illustrate the [GHG] inventory many different ways, no chart or graph can fully display how diverse economic sectors fit together. California's economy

31 California Air Resources Board, Initial AB 32 Climate Change Scoping Plan Document, https://www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm. Accessed December 2018.

32 California Air Resources Board, Initial AB 32 Climate Change Scoping Plan Document.

is a web of activity where seemingly independent sectors and subsectors operate interdependently and often synergistically."[33] GHG emissions and reductions in the land use sector are complicated to assess given that emissions are influenced by reduction measures separate from the land use sector, such as the Low Carbon Fuel Standard (LCFS)[34], vehicle emissions standards, and entities regulated under the Cap-and-Trade program[35] including refineries and utility providers. These measures will affect other sectors of the economy and will also impact existing development in addition to new land use development.

As required by HSC Division 25.5, CARB approved the 1990 GHG emissions inventory, thereby establishing the emissions limit for 2020. The 2020 emissions limit was originally set at 427 $MMTCO_2e$ using the GWP values from the IPCC SAR. CARB also projected the state's 2020 GHG emissions under no-action-taken (NAT) conditions – that is, emissions that would occur without any plans, policies, or regulations to reduce GHG emissions. CARB originally used an average of the state's GHG emissions from 2002 through 2004 and projected the 2020 levels at approximately 596 $MMTCO_2e$ (using GWP values from the IPCC SAR). Therefore, under the original projections, the state must reduce its 2020 NAT emissions by 28.4 percent in order to meet the 1990 target of 427 $MMTCO_2e$.

First Update to the Climate Change Scoping Plan (2014)

The First Update to the Scoping Plan was approved by CARB in May 2014 and builds upon the initial Scoping Plan with new strategies and recommendations.[36] In 2014, CARB revised the target using the GWP values from the IPCC AR4 and determined that the 1990 GHG emissions inventory and 2020 GHG emissions limit is 431 $MMTCO_2e$. CARB also updated the State's 2020 NAT emissions estimate to account for the effect of the 2007–2009 economic recession, new estimates for future fuel and energy demand, and the reductions required by regulation that were recently adopted for motor vehicles and renewable energy. CARB's projected statewide 2020 emissions estimate using the GWP values from the IPCC AR4 is 509.4 $MMTCO_2e$.

Therefore, the emission reductions necessary to achieve the 2020 emissions target of 431 $MMTCO_2e$ would be 78.4 $MMTCO_2e$, or a reduction of GHG emissions by approximately 15.4 percent. In the 2017 Climate Change Scoping Plan, CARB provides the estimated projected statewide 2030 emissions and the level of reductions necessary to achieve the 2030 target of 40 percent below 1990 levels. CARB's projected statewide 2030 emissions takes into account 2020 GHG reduction policies and programs.

2017 Climate Change Scoping Plan

In response to the 2030 GHG reduction target, CARB adopted the 2017 Climate Change Scoping Plan at a public meeting held in December 2017.[37] The 2017 Scoping Plan outlines the strategies the State will implement to achieve the 2030 GHG reduction target of 40 percent below 1990 levels, which build on the Cap-and-Trade Regulation,[38] the LCFS,[39] improved vehicle, truck and freight movement emissions standards, increasing renewable energy, and strategies to reduce methane emissions from agricultural and other wastes by using it to meet our energy needs. The 2017 Scoping Plan also addresses GHG emissions from natural and working lands of California, including the agriculture and forestry sectors. The 2017 Scoping Plan considered the Scoping Plan Scenario and four alternatives for achieving the required GHG reductions but ultimately selected the Scoping Plan Scenario.

CARB states that the Scoping Plan Scenario "is the best choice to achieve the State's climate and clean air goals."[40] Under the Scoping Plan Scenario, the majority of the reductions would result from the continuation of the Cap-and-Trade regulation. Additional reductions are achieved from electricity sector standards (i.e., utility providers to supply at least 50 percent renewable electricity by 2030), doubling the energy efficiency savings at end uses, additional reductions from the LCFS, implementing the short-lived GHG strategy (e.g., hydrofluorocarbons), and implementing the mobile source strategy and sustainable freight action plan. The alternatives were designed to consider various combinations of these programs, as well as consideration of a carbon tax in the event the Cap-and-Trade regulation is not continued. However, in July 2017, the California Legislature voted to extend the Cap-and-Trade regulation to 2030.

A summary of the GHG emissions reductions required under HSC Division 25.5 is provided in **Table 3**, *Estimated Greenhouse Gas Emissions Reductions Required by HSC Division 25.5*.

TABLE 3
ESTIMATED GREENHOUSE GAS EMISSIONS REDUCTIONS REQUIRED BY HSC DIVISION 25.5

Emissions Scenario	GHG Emissions ($MMTCO_2e$)
2008 Scoping Plan (IPCC SAR)	
2020 NAT Forecast (CARB 2008 Scoping Plan Estimate)	596
2020 Emissions Target Set by HSC Division 25.5 (i.e., 1990 Level)	427
Reduction below NAT Necessary to Achieve 1990 Levels by 2020	169 (28.4%) [a]
2011 Scoping Plan (GHG Estimates Updated in 2014 to Reflect IPCC AR4 GWPs)	
2020 NAT Forecast (CARB 2011 Scoping Plan Estimate)	509.4
2020 Emissions Target Set by HSC Division 25.5 (i.e., 1990 Level)	431
Reduction Necessary to Achieve 1990 Levels by 2020	78.4 (15.4%) [b]

Land Use Sector

In its report, *California Environmental Quality Act Guidelines Update Proposed Thresholds of Significance*, the Bay Area Air Quality Management District (BAAQMD) evaluated the reduction in land use emissions needed in order to be consistent with AB 32.[41] CARB included the following sectors for land use emissions: Transportation (on-road passenger vehicles; on-road heavy-duty), electric power (electricity; cogeneration), commercial and residential (residential fuel use; commercial fuel use) and recycling and waste (domestic wastewater treatment). [42] Table 2 of the BAAQMD document present the results of this analysis, which shows that a 26.2 percent reduction from statewide land-use driven GHG emissions would be necessary to meet the AB 32 goal of returning to the 1990 emission levels by 2020, which is lower than the statewide reduction of 28.4 percent required based on the original 2008 Climate Change Scoping Plan projections.

2.2.4 Land Use and Transportation Planning

SB 375 (Chapter 728, Statutes of 2008), which establishes mechanisms for the development of regional targets for reducing passenger vehicle greenhouse gas emissions, was adopted by the State on September 30, 2008. Under SB 375, CARB is required, in consultation with the state's Metropolitan Planning Organizations, to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035. In February 2011, CARB adopted the final GHG emissions reduction targets for the State's Metropolitan Planning Organizations, including a reduction target of 8 percent by 2020 and 13 percent by 2035 relative to 2005 GHG emissions for SCAG, which is the Metropolitan Planning Organization for the region in which the City is located.[43] Of note, the proposed reduction targets explicitly exclude emission reductions expected from the AB 1493 and the low carbon fuel standard regulations.

43 California Air Resources Board, Sustainable Communities, Final Regional GHG Emissions Reduction Targets Adopted by ARB, https://ww3.arb.ca.gov/cc/sb375/final_targets.pdf. Accessed December 2018.

Under SB 375, the reduction target must be incorporated within that region's Regional Transportation Plan (RTP), which is used for long-term transportation planning, in a Sustainable Communities Strategy (SCS). Certain transportation planning and programming activities would then need to be consistent with the SCS; however, SB 375 expressly provides that the SCS does not regulate the use of land, and further provides that local land use plans and policies (e.g., general plan) are not required to be consistent with either the RTP or SCS.

In addition, on April 7, 2016, SCAG adopted the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), which is an update to the previous 2012-2035 RTP/SCS. Using growth forecasts and economic trends, the 2016-2040 RTP/SCS provides a vision for transportation throughout the region for the next 25 years. The 2016-2040 RTP/SCS successfully achieves and exceeds the GHG emission-reduction targets set by CARB.

2.2.5 Transportation Sector

In response to the transportation sector accounting for a large percentage of California's CO_2 emissions, AB 1493 (HSC Section 42823 and 43018.5) (also referred to as the Pavley standards), enacted on July 22, 2002, required CARB to set GHG emission standards for passenger vehicles, light duty trucks, and other vehicles whose primary use is non-commercial personal transportation manufactured in and after 2009. In setting these standards, CARB must consider cost effectiveness, technological feasibility, economic impacts, and provide maximum flexibility to manufacturers. The federal CAA ordinarily preempts state regulation of motor vehicle emission standards; however, California is allowed to set its own standards with a federal CAA waiver from the USEPA. In June 2009, the USEPA granted California the waiver.

However, as discussed previously, the USEPA and United States Department of Transportation (USDOT) adopted federal standards for model year 2012 through 2016 light-duty vehicles, which corresponds to the vehicle model years regulated under the State's Pavley Phase I standards. In addition, the USEPA and USDOT have adopted GHG emission standards for model year 2017 through 2025 vehicles, which corresponds to the vehicle model years regulated under the State's Pavley Phase II standards. These standards are slightly different from the State's model year 2017 through 2025 standards, but the State of California has agreed not to contest these standards, in part due to the fact that while the national standard would achieve slightly less reductions in California, it would achieve greater reductions nationally and is stringent enough to meet state GHG emission reduction goals. In 2012, CARB adopted regulations that allow manufacturers to comply with the 2017 through 2025 national standards to meet State law (i.e., the State's Pavley Phase II standards still apply by law; however, meeting the national standards for model year 2017 through 2025 also meets State law).

In January 2007, Governor Brown enacted Executive Order S-01-07, which mandates the following: (1) establish a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020; and (2) adopt an LCFS for transportation fuels in California. CARB identified the LCFS as one of the nine discrete early actions in the Climate Change Scoping Plan. The LCFS regulations were approved by CARB in 2009 and established a reduction in the carbon intensity of transportation fuels by 10 percent by 2020 with implementation beginning on January 1, 2011. In September 2015, CARB approved the re-

adoption of the LCFS, which became effective on January 1, 2016, to address procedural deficiencies in the way the original regulation was adopted. In April 2017, the LCFS was brought before the Court of Appeal challenging the analysis of potential nitrogen dioxide impacts from biodiesel fuels. The Court directed CARB to conduct an analysis of nitrogen dioxide impacts from biodiesel fuels and froze the carbon intensity targets for diesel and biodiesel fuel provisions at 2017 levels until CARB has completed this analysis. On March 6, 2018 CARB issued its *Draft Supplemental Disclosure Discussion of Oxides of Nitrogen Potentially Caused by the Low Carbon Fuel Standard Regulation*.[44] CARB posted modifications to the amendments on August 13, 2018, with a public comment period through August 30, 2018. The hearing date for final approval of regulatory changes from CARB's analysis of nitrogen dioxide impacts from biodiesel fuels had not yet been announced.[45] The 2017 Climate Change Scoping Plan also calls for increasing the mandatory reduction in carbon intensity of transportation fuels from 10 percent to 18 percent by 2030.

2.2.6 Energy Sector and CEQA Guidelines Appendix F

The CEC first adopted Energy Efficiency Standards for Residential and Nonresidential Buildings (CCR, Title 24, Part 6) in 1978 in response to a legislative mandate to reduce energy consumption in the state. Although not originally intended to reduce GHG emissions, increased energy efficiency and reduced consumption of electricity, natural gas, and other fuels would result in fewer GHG emissions from residential and nonresidential buildings subject to the standard. The standards are updated periodically (typically every three years) to allow for the consideration and inclusion of new energy efficiency technologies and methods. The 2016 update to the Energy Efficiency Standards for Residential and Nonresidential Buildings focuses on several key areas to improve the energy efficiency of renovations and addition to existing buildings as well as newly constructed buildings and renovations and additions to existing buildings. The major efficiency improvements to the residential Standards involve improvements for attics, walls, water heating, and lighting, whereas the major efficiency improvements to the nonresidential Standards include alignment with the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) 90.1-2013 national standards. Furthermore, the 2016 update requires that enforcement agencies determine compliance with CCR, Title 24, Part 6 before issuing building permits for any construction.[46]

Part 11 of the Title 24 Building Energy Efficiency Standards is referred to as the California Green Building Standards (CALGreen) Code. The purpose of the CALGreen Code is to "improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices in the following categories: (1) Planning and

44 California Air Resources Board, Low Carbon Fuel Standard and Alternative Diesel Fuels Regulation 2018, https://www.arb.ca.gov/regact/2018/lcfs18/lcfs18.htm. Accessed August 2018.

45 California Air Resources Board, Low Carbon Fuel Standard and Alternative Diesel Fuels Regulation 2018, https://www.arb.ca.gov/regact/2018/lcfs18/lcfs18.htm. Accessed August 2018.

46 California Energy Commission, 2016 Building Energy Efficiency Standards, June 2015, http://www.energy.ca.gov/2015publications/CEC-400-2015-037/CEC-400-2015-037-CMF.pdf. Accessed December 2018.

design; (2) Energy efficiency; (3) Water efficiency and conservation; (4) Material conservation and resource efficiency; and (5) Environmental air quality."[47] As of January 1, 2011, the CALGreen Code is mandatory for all new buildings constructed in the state. The CALGreen Code establishes mandatory measures for new residential and non-residential buildings. Such mandatory measures include energy efficiency, water conservation, material conservation, planning and design, and overall environmental quality. The CALGreen Code was most recently updated in 2016 to include new mandatory measures for residential and nonresidential uses; the new measures took effect on January 1, 2017.[48]

The State has adopted regulations to increase the proportion of electricity from renewable sources. In November 2008, Governor Schwarzenegger signed Executive Order S-14-08,[49] which expands the State's Renewables Portfolio Standard to 33 percent renewable power by 2020. On April 12, 2011, Governor Jerry Brown signed SB X1-2 to increase California's Renewables Portfolio Standard to 33 percent by 2020. SB 350 (Chapter 547, Statues of 2015) further increased the Renewables Portfolio Standard to 50 percent by 2030. The legislation also included interim targets of 40 percent by 2024 and 45 percent by 2027. On September 10, 2018, Governor Jerry Brown signed SB 100, which further increased California's Renewables Portfolio Standard and requires retail sellers and local publicly owned electric utilities to procure eligible renewable electricity for 44 percent of retail sales by December 31, 2024, 52 percent by December 31, 2027, and 60 percent by December 31, 2030, and that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by December 31, 2045.

2.2.7 Senate Bill 97

SB 97, enacted in 2007, directed the State Office of Planning and Research (OPR) to develop California Environmental Quality Act (CEQA) Guidelines (*CEQA Guidelines*) "for the mitigation of GHG emissions or the effects of GHG emissions." In December 2009, OPR adopted amendments to the *CEQA Guidelines*, (Guidelines Amendments), Appendix G, Environmental Checklist, which created a new resource section for GHG emissions and indicated criteria that may be used to establish significance of GHG emissions.

However, neither a threshold of significance nor any specific mitigation measures are included or provided in the Guidelines Amendments. The Guidelines Amendments require a lead agency to make a sincere effort, based on scientific and factual data to the extent possible, to describe, calculate, or estimate the amount of GHG emissions resulting from a project. The Guidelines Amendments give discretion to the lead agency, and allow the lead agency to choose whether to: (1) use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use; or (2) rely on a qualitative analysis or performance-

47 California Building Standards Commission, 2010 California Green Building Standards Code, (2010).

48 California Building Standards Commission, 2016 CALGreen (Part 11 of Title 24), http://www.bsc.ca.gov/Home/CALGreen.aspx. Accessed December 2018.

49 Center for Climate Strategies, Executive Order S-14-08. Downloaded From: http://www.climatestrategies.us/library/library/download/292. Accessed December 2018.

based standards. Furthermore, the Guidelines Amendments identify three factors that should be considered in the evaluation of the significance of GHG emissions:

1. The extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting;

2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and

3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

The administrative record for the Guidelines Amendments also clarifies "that the effects of greenhouse gas emissions are cumulative, and should be analyzed in the context of California Environmental Quality Act's requirements for cumulative impact analysis."[50]

Appendix F of the *CEQA Guidelines* states that, in order to ensure that energy implications are considered in project decisions, the potential energy implications of a project shall be considered in an EIR, to the extent relevant and applicable to the project. Appendix F of the *CEQA Guidelines* further states that a project's energy consumption and proposed conservation measures should be addressed, as relevant and applicable, in the Project Description, Environmental Setting, and Impact Analysis portions of technical sections, as well as through mitigation measures and alternatives. In accordance with Appendix F of the *CEQA Guidelines*, relevant information that addresses the energy implications of the Project is provided in Section IV.U, *Energy*, of the Project's Draft EIR.

2.2.8 Cap-and-Trade Program

The Climate Change Scoping Plan identifies a Cap-and-Trade Program as a key strategy CARB will employ to help California meet its GHG reduction targets for 2020 and 2030, and ultimately achieve an 80 percent reduction from 1990 levels by 2050. Pursuant to its authority under AB 32, CARB has designed and adopted a California Cap-and-Trade Program to reduce GHG emissions from major sources (deemed "covered entities") by setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve AB 32's emission-reduction mandate of returning to 1990 levels of emissions by 2020.[51] Under Cap-and-Trade program, an overall limit is established for GHG emissions from capped sectors (e.g., electricity generation, petroleum refining, cement production, and large industrial facilities that emit more than 25,000 metric tons CO_2e per year) and declines over time, and facilities subject to the cap can trade permits to emit GHGs. The statewide cap for GHG emissions from the capped sectors commenced in 2013 and declines over time, achieving GHG emission reductions throughout the Program's duration.[52] On

50 Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources, dated April 13, 2009, http://www.opr.ca.gov/docs/Transmittal_Letter.pdf. Accessed December 2018.

51 17 CCR §§ 95800 to 96023.

52 See generally 17 CCR §§ 95811, 95812.

July 17, 2017 the California legislature passed Assembly Bill 398, extending the Cap-and-Trade program through 2030.

The Cap-and-Trade Regulation provides a firm cap, ensuring that the 2020 statewide emission limit will not be exceeded. An inherent feature of the Cap-and-Trade Program is that it does not guarantee GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are only guaranteed on an accumulative basis.

If California's direct regulatory measures reduce GHG emissions more than expected, then the Cap-and-Trade Program will be responsible for relatively fewer emissions reductions. If California's direct regulatory measures reduce GHG emissions less than expected, then the Cap-and-Trade Program will be responsible for relatively more emissions reductions. In sum, the Cap-and-Trade Program will achieve aggregate, rather than site-specific or project-level, GHG emissions reductions. Also, due to the regulatory framework adopted by CARB, the reductions attributed to the Cap-and-Trade Program can change over time depending on the State's emissions forecasts and the effectiveness of direct regulatory measures.

2.3 Regional

2.3.1 South Coast Air Quality Management District

The Project Site is located in the South Coast Air Basin (Air Basin), which consists of Orange County, Los Angeles County (excluding the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside Counties, in addition to the San Gorgonio Pass area in Riverside County. The SCAQMD is responsible for air quality planning in the Air Basin and developing rules and regulations to bring the area into attainment of the ambient air quality standards. This is accomplished though air quality monitoring, evaluation, education, implementation of control measures to reduce emissions from stationary sources, permitting and inspection of pollution sources, enforcement of air quality regulations, and by supporting and implementing measures to reduce emissions from motor vehicles.

The SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives:[53]

- Phase out the use and corresponding emissions of chlorofluorocarbons, methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;

- Phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons by the year 2000;

53 South Coast Air Quality Management District, CEQA Air Quality Handbook, April 1993, p. 3-7.

- Develop recycling regulations for hydrochlorofluorocarbons (e.g., SCAQMD Rules 1411 and 1415);
- Develop an emissions inventory and control strategy for methyl bromide; and
- Support the adoption of a California GHG emission reduction goal.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds.[54,55] On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold of 10,000 $MTCO_2e$ per year for stationary source/industrial projects where the SCAQMD is Lead Agency. However, the SCAQMD has not adopted a GHG significance threshold for land use development projects (e.g., mixed-use/commercial projects). A GHG Significance Threshold Working Group was formed to further evaluate potential GHG significance thresholds.[56] The aforementioned Working Group has been inactive since 2011 and the SCAQMD has not formally adopted any GHG significance threshold for land use development projects.

2.3.2 SCAG Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS)

In February 2011, CARB adopted the final GHG emissions reduction targets for the SCAG, which is the Metropolitan Planning Organization for the region in which the City of Los Angeles is located.[57] The target includes a per capita reduction of 8 percent for 2020 and 13 percent for 2035 compared to the 2005 baseline. On April 7, 2016, SCAG adopted the 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), which is an update to the previous 2012 RTP/SCS.[58] Using growth forecasts and economic trends, the 2016 RTP/SCS provides a vision for transportation throughout the region for the next 25 years. It considers the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address mobility needs. The 2016 RTP/SCS describes how the region can attain the GHG emission-reduction targets set by CARB by achieving an 8 percent reduction by 2020, 18 percent reduction by 2035, and 21 percent

54 South Coast Air Quality Management District, Board Meeting, December 5, 2008, Agenda No. 31, http://www3.aqmd.gov/hb/2008/December/0812ag.html. Accessed December 2018.

55 South Coast Air Quality Management District, Greenhouse Gases, CEQA Significance Thresholds, Board Letter – Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans, December 5, 2008, http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgboardsynopsis.pdf?sfvrsn=2. Accessed December 2018. The performance standards primarily focus on energy efficiency measures beyond Title 24 and a screening level of 3,000 $MTCO_2e$ per year for residential and commercial sector projects. The SCAQMD adopted a GHG significance threshold of 10,000 $MTCO_2e$ per year for industrial stationary source projects for which the SCAQMD is the lead agency.

58 Southern California Association of Governments, 2016 RTP/SCS, 2016, http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS.pdf. Accessed December 2018.

reduction by 2040 compared to the 2005 level on a per capita basis.[59] Compliance with and implementation of 2016 RTP/SCS policies and strategies would have co-benefits of reducing per capita criteria air pollutant emissions associated with reduced per capita vehicle miles traveled (VMT).

The 2016 RTP/SCS states that the SCAG region is home to approximately 18.3 million people in 2012 and currently includes approximately 5.9 million homes and 7.4 million jobs. By 2040, the integrated growth forecast projects that these figures will increase by 3.8 million people, with nearly 1.5 million more homes and 2.4 million more jobs. High Quality Transit Areas (HQTAs), which are defined by the 2016 RTP/SCS as generally walkable transit villages or corridors that are within 0.5 mile of a well-serviced transit stop or a transit corridor with 15-minute or less service frequency during peak commute hours, will account for 3 percent of regional total land, but are projected to accommodate 46 percent and 55 percent of future household and employment growth respectively between 2012 and 2040.[60] The 2016 RTP/SCS overall land use pattern reinforces the trend of focusing new housing and employment in the region's HQTAs. HQTAs are a cornerstone of land use planning best practice in the SCAG region because they concentrate roadway repair investments, leverage transit and active transportation investments, reduce regional life cycle infrastructure costs, improve accessibility, create local jobs, and have the potential to improve public health and housing affordability.

SCAG's 2016 RTP/SCS provides specific strategies for implementation. These strategies include supporting projects that encourage a diverse job opportunities for a variety of skills and education, recreation and cultures and a full-range of shopping, entertainment and services all within a relatively short distance; encouraging employment development around current and planned transit stations and neighborhood commercial centers; encouraging the implementation of a "Complete Streets" policy that meets the needs of all users of the streets, roads and highways including bicyclists, children, persons with disabilities, motorists, electric vehicles, movers of commercial goods, pedestrians, users of public transportation, and seniors; and supporting alternative fueled vehicles. [61]

In addition, the 2016 RTP/SCS includes strategies to promote active transportation, support local planning and projects that serve short trips, expand understanding and consideration of public health in the development of local plans and projects, and supports improvements in sidewalk quality, local bike networks, and neighborhood mobility areas. It also proposes increasing access to the California Coast Trail, light rail and bus stations, and promoting corridors that support biking and walking, such as through a regional greenway network and local bike networks. The 2016 RTP/SCS proposes to better align active transportation investments with land use and transportation strategies, increase competitiveness of local agencies for federal and state funding, and to expand the potential for all people to use active transportation. CARB has accepted the SCAG GHG quantification determination in the 2016 RTP/SCS and that the 2016 RTP/SCS, if

61 Southern California Association of Governments, 2016 RTP/SCS, pages 170-181.

implemented, would achieve the 2020 and 2035 GHG emission reduction targets established by CARB.[62,63]

Although there are no per capita GHG emission reduction targets for passenger vehicles set by CARB for 2040, the 2016 RTP/SCS GHG emission reduction trajectory shows that more aggressive GHG emission reductions are projected for 2040. By meeting and exceeding the SB 375 targets for 2020 and 2035, as well as achieving an approximately 21-percent decrease in per capita GHG emissions by 2040 (an additional 3-percent reduction in the five years between 2035 [18 percent] and 2040 [21 percent]), the 2016 RTP/SCS is expected to fulfill and exceed its portion of SB 375 compliance with respect to meeting the state's GHG emission reduction goals.

In March 2018, the CARB updated the SB 375 targets to require 8 percent reduction by 2020 and a 19 percent reduction by 2035 in per capita passenger vehicle GHG emissions.[64] As this reduction target was updated after the 2016-2040 RTP/SCS, it is expected that the next iteration of the RTP/SCS will be updated to include this target.

2.4 City of Los Angeles

2.4.1 City of Los Angeles LA Green Plan

In acknowledgment of the overlap between land use and GHG emissions, the city of Los Angeles, in May 2007, published *Green LA, An Action Plan to Lead the Nation in Fighting Global Warming*[65] *(LA Green Plan)*, outlining the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities. According to the *LA Green Plan*, the city of Los Angeles is committed to the goal of reducing emissions of CO_2 to 35 percent below 1990 levels by 2030. To achieve this, the City will:

- Increase the generation of renewable energy;
- Improve energy conservation and efficiency; and
- Change transportation and land use patterns to reduce dependence on automobiles

In 2008, the City released an implementation program for the LA Green Plan referred to as ClimateLA, which includes a baseline GHG inventory for the City and provides detailed information about each action item discussed in the LA Green Plan framework. [66] Action items range from harnessing wind power for electricity production and energy efficiency retrofits in city buildings, to converting the City's fleet vehicles to cleaner and more efficient models, and

reducing water consumption. Information about proposed and/or ongoing programs, opportunities for achieving the City's goals, specific challenges, and a list of milestones is provided for each action item. The scope of these actions range from those impacting only municipal facilities, such as retrofitting City Hall with high-efficiency lighting systems, to those facilitating changes in the private sector, such as rebates for the purchase of energy-efficient appliances.

2.4.2 City of Los Angeles Sustainable City pLAn

The *Sustainable City pLAn* is a comprehensive and actionable directive from the Mayor to improve the environmental, economic, and equitable conditions in the city of Los Angeles.[67] The pLAn is a tool that the Mayor will use to manage the City and establish visions, goals, and metrics for City departments. The Sustainable City pLAn sets targets to reduce GHG emissions below the 1990 baseline by 45 percent by 2025, 60 percent by 2035, and 80 percent by 2050, and establishes the following visions for City departments for the following categories:

- Environment**:** Local Water (lead the nation in water conservation and source the majority of water locally); Local Solar (increase Los Angeles's clean and resilient energy supplies by capturing energy from abundant sunshine); Energy Efficient Buildings (save money and energy by increasing the efficiency of buildings); Carbon and Climate Leadership (as a proactive leader on climate issues, strengthen Los Angeles's economy by dramatically reducing GHG emissions and rallying other cities to follow Los Angeles's lead); and Waste and Landfills (become the first big city in the United States to achieve zero-waste, and recycle and reuse most of its waste locally).

- Economy: Housing and Development (address Los Angeles's housing shortage, ensure that most new units are accessible to high-quality transit, and close the gap between income and rents); Mobility and Transit (invest in rail, bus lines, pedestrian/bike safety, and complete neighborhoods that provide more mobility options and reduce vehicle miles traveled); Prosperity and Green Jobs (strengthen and grow the economy including through increased jobs and investments in clean technology sectors); and Preparedness and Resiliency (prepare for natural disasters and decrease vulnerability to climate change).

- Equity: Air Quality (healthy air to breathe); Environmental Justice (ensure the benefits of the pLAn extend to all Angelenos); Urban Ecosystem (have access to parks, open space, including a revitalized Los Angeles River Watershed); and Livable Neighborhoods (live in safe, vibrant, well-connected, and healthy neighborhoods).

2.4.3 City of Los Angeles Green Building Code

In 2011, 2014, and 2016, Chapter IX of the Los Angeles Municipal Code (LAMC), referred to as the L.A. Green Building Code, was amended to incorporate various provisions of the CALGreen Code. The City's Green Building Code includes mandatory requirements and elective measures for three categories of buildings: (1) low-rise residential buildings; (2) non-residential and high-rise residential buildings; and (3) additions and alterations to residential and non-residential buildings.

67 City of Los Angeles, Mayor's Office of Sustainability, Sustainable City pLAn, 2015, http://plan.lamayor.org/wp-content/uploads/2017/03/the-plan.pdf. Accessed December 2018.

2.4.4 Transportation Impact Study Guidelines

The City of Los Angeles Department of Transportation (LADOT) has developed the *Transportation Impact Study Guidelines* (TISG) (December 2016) to provide the public, private consultants, and City staff with standards, guidelines, objectives, and criteria to be used in the preparation of a traffic impact study. The TISG emphasize sustainability, smart growth, transportation demand management strategies, multi-modal strategies, and reduction of GHG emissions in addition to traditional traffic flow considerations when evaluating and minimizing impacts to the City's transportation system as a result of land use policy decisions. The TISG establish the reduction of vehicle trips and VMT as a policy goal and thus is an implementing mechanism of the City's strategy to reduce land use transportation-related GHG emissions consistent with HSC Division 25.5 and SB 375.

SECTION 3
Significance Thresholds

3.1 Appendix G of State CEQA Guidelines

Until the passage of AB 32, CEQA documents generally did not evaluate GHG emissions or impacts on global climate change. Rather, the primary focus of air pollutant analysis in CEQA documents was the emission of criteria pollutants, or those identified in the California and federal CAAs as being of most concern to the public and government agencies (e.g., toxic air contaminants). With the passage of AB 32 and SB 97, CEQA documents now contain a more detailed analysis of GHG emissions. However, the analysis of GHGs is different from the analysis of criteria pollutants. Since the half-life of CO_2 is approximately 100 years, GHGs affect the global climate over a relatively long timeframe. Conversely, for criteria pollutants, significance thresholds/impacts are based on daily emissions; and the determination of attainment or non-attainment is based on the daily exceedance of applicable ambient air quality standards (e.g., 1-hour and 8-hour exposures). Also, the scope of criteria pollutant impacts is local and regional, while the scope of GHG impacts is global.

OPR's recommended amendments to the *CEQA Guidelines* for GHGs were adopted by the California Natural Resources Agency on December 30, 2009. The following two questions relating to the effects of GHGs were added to the *CEQA Guidelines*, Appendix G (Environmental Checklist).

a. Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or

b. Would the project conflict with any applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

Amendments to Section 15064.4 of the State *CEQA Guidelines* were adopted to assist lead agencies in determining the significance of the impacts of GHG emissions. Consistent with existing CEQA practice, Section 15064.4 gives lead agencies the discretion to determine whether to assess those emissions quantitatively or qualitatively. If a qualitative analysis is used, in addition to quantification, this section recommends certain qualitative factors that may be used in the determination of significance (i.e., extent to which the project may increase or reduce GHG emissions compared to the existing environment; whether the project exceeds an applicable significance threshold; and extent to which the project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs). The amendments to Section 15064.4 do not establish a threshold of significance; rather, lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including looking to thresholds developed by other public agencies, or suggested by other experts, such as the California Air

Pollution Control Officers Association (CAPCOA), so long as any threshold chosen is supported by substantial evidence (see Section 15064.7(c)).

The California Natural Resources Agency has also clarified that the Guidelines Amendments focus on the effects of GHG emissions as cumulative impacts, and that they should be analyzed in the context of CEQA's requirements for cumulative impact analysis (see Section 15064(h)(3)).[68] As indicated above, the *CEQA Guidelines* were amended in response to SB 97. In particular, the *CEQA Guidelines* were amended to specify that compliance with a GHG emissions reduction plan renders a cumulative impact insignificant.

Although GHG emissions can be quantified as discussed under the Methodology section above, CARB, SCAQMD, and the City have not adopted quantitative project-level significance thresholds for GHG emissions that would be applicable to the Project. The Governor's Office of Planning and Research (OPR) released a technical advisory on CEQA and climate change that provided some guidance on assessing the significance of GHG emissions, and states that "lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice," and that while "climate change is ultimately a cumulative impact, not every individual project that emits GHGs must necessarily be found to contribute to a significant cumulative impact on the environment."[69] Furthermore, the technical advisory states that "CEQA authorizes reliance on previously approved plans and mitigation programs that have adequately analyzed and mitigated GHG emissions to a less than significant level as a means to avoid or substantially reduce the cumulative impact of a project."[70]

Per State *CEQA Guidelines* Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project would comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project.[71] To qualify, such a plan or program must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency.[72] Examples of such programs include a "water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plan, [and] plans or regulations for the reduction of greenhouse gas emissions."[73]

---

68 See generally California Natural Resources Agency, Final Statement of Reasons for Regulatory Action, December 2009, pages 11-13, 14, and 16; see also Letter from Cynthia Bryant, Director of the Office of Planning and Research to Mike Chrisman, Secretary for Natural Resources, April 13, 2009, http://www.opr.ca.gov/docs/Transmittal_Letter.pdf. Accessed December 2018.

69 Governor's Office of Planning and Research, Technical Advisory – CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review, 2008.

70 Governor's Office of Planning and Research, Technical Advisory – CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review, 2008.

71 California Code of Regulations (CCR), Title 14, Section 15064(h)(3).

72 California Code of Regulations (CCR), Title 14, Section 15064(h)(3).

73 California Code of Regulations (CCR), Title 14, Section 15064(h)(3).

Thus, State *CEQA Guidelines* Section 15064(h)(3) allows a lead agency to make a finding of non-significance for GHG emissions if a project complies with a program and/or other regulatory schemes to reduce GHG emissions.[74]

In the absence of any adopted numeric threshold, the significance of the Project's GHG emissions is evaluated consistent with CEQA Guidelines Section 15064.4(b) by considering whether the Project complies with applicable plans, policies, regulations and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions. The 2016–2040 RTP/SCS is designed to achieve regional GHG reductions from the land use and transportation sectors as required by SB 375 and the state's long-term climate goals. CARB's Climate Change Scoping Plan, SCAG's 2016 RTP/SCS; the City's LA Green Plan; and Sustainable City pLAn all apply to the Project and are all intended to reduce GHG emissions to meet the statewide targets set forth in AB 32. Thus, the Lead Agency has determined that the Project would not have a significant effect on the environment if the Project is found to be consistent with the applicable regulatory plans and policies to reduce GHG emissions, including the emissions reduction measures discussed within CARB's 2017 Climate Change Scoping Plan, SCAG's 2016 RTP/SCS, and the City's LA Green Plan, and Sustainable City pLAn.

74 See, for example, San Joaquin Valley Air Pollution Control District (SJVAPCD), CEQA Determinations of Significance for Projects Subject to ARB's GHG Cap-and-Trade Regulation, APR-2025 (June 25, 2014), in which the SJVAPCD "determined that GHG emissions increases that are covered under ABR's Cap-and-Trade regulation cannot constitute significant increases under CEQA…" Furthermore, the SCAQMD has taken this position in CEQA documents it has produced as a lead agency. The SCAQMD has prepared three Negative Declarations and one Draft Environmental Impact Report that demonstrate the SCAQMD has applied its 10,000 $MTCO_2e$/yr significance threshold in such a way that GHG emissions covered by the Cap-and-Trade Program do not constitute emissions that must be measured against the threshold. See SCAQMD, Final Negative Declaration for Ultramar Inc. Wilmington Refinery Cogeneration Project, SHC No. 2012041014 (October 2014); SCAQMD Final Negative Declaration for Phillips 99 Los Angeles Refinery Carson Plant—Crude Oil Storage Capacity Project, SCH No. 2013091029 (December 2014); SCAQMD Final Mitigated Negative Declaration for Toxic Air Contaminant Reduction for Compliance with SCAQMD Rules 1420.1 and 1402 at the Exide Technologies Facility in Vernon, CA, SCH No. 2014101040 (December 2014); and SCAQMD Final Environmental Impact Report for the Breitburn Santa Fe Springs Blocks 400/700 Upgrade Project, SCH No. 2014121014 (August 2015).

SECTION 4
Methodology

The evaluation of potential impacts to GHG emissions that may result from the construction and long-term operations of the Project is conducted as followsbecau. Detailed modeling calculations and supporting files are provided in **Appendix F-1** through **F-3** of this Technical Report.

Because there is no applicable adopted or accepted numerical threshold of significance for GHG emissions, the methodology for evaluating the Project's impacts related to GHG emissions focuses on its consistency with statewide, regional, and local plans adopted for the purpose of reducing and/or mitigating GHG emissions. This evaluation of consistency with such plans is the sole basis for determining the significance of the Project's GHG-related impacts on the environment.

However, for informational purposes, the analysis also calculates the amount of GHG emissions that would be attributable to the Project using recommended air quality models, as described below. The primary purpose of quantifying the Project's GHG emissions is to satisfy State CEQA Guidelines Section 15064.4(a), which calls for a good-faith effort to describe and calculate emissions. The estimated emissions inventory is also used to determine if there would be a reduction in the Project's incremental contribution of GHG emissions as a result of compliance with regulations and requirements adopted to implement plans for the reduction or mitigation of GHG emissions. The significance of the Project's GHG emissions impacts is not based on the amount of GHG emissions resulting from the Project.

4.1 Greenhouse Gas Emissions Estimates

The Climate Action Registry General Reporting Protocol provides procedures and guidelines for calculating and reporting GHG emissions from general and industry-specific activities. Although no numerical thresholds of significance have been adopted, and no specific protocols are available for land use projects, the General Reporting Protocol provides a framework for calculating and reporting GHG emissions from the Project. The GHG emissions provided in this report are consistent with the General Reporting Protocol framework. For the purposes of this report, total GHG emissions from the Project were quantified to provide information to decision makers and the public regarding the level of the Project's annual GHG emissions. The General Reporting Protocol recommends separating GHG emissions into three categories that reflect different aspects of ownership or control over emissions. They include the following:

- Scope 1: Direct, on-site combustion of fossil fuels (e.g., natural gas, propane, gasoline, and diesel).

- Scope 2: Indirect, off-site emissions associated with purchased electricity or purchased steam.

- Scope 3: Indirect emissions associated with other emissions sources, such as third-party vehicles and embodied energy.[75]

CARB believes that consideration of so-called indirect emissions provides a more complete picture of the GHG footprint of a facility: "As facilities consider changes that would affect their emissions – addition of a cogeneration unit to boost overall efficiency even as it increases direct emissions, for example – the relative impact on total (direct plus indirect) emissions by the facility should be monitored. Annually reported indirect energy usage also aids the conservation awareness of the facility and provides information" to CARB to be considered for future strategies by the industrial sector. For these reasons, CARB has proposed requiring the calculation of direct and indirect GHG emissions as part of the HSC Division 25.5 reporting requirements. Additionally, the Office of Planning and Research directs lead agencies to "make a good-faith effort, based on available information, to calculate, model, or estimate…GHG emissions from a project, including the emissions associated with vehicular traffic, energy consumption, water usage and construction activities." Therefore, direct and indirect emissions have been calculated for the Project.

For purposes of this analysis, direct and indirect sources if GHG emissions were included. It is considered reasonable and consistent with criteria pollutant calculations to consider those GHG emissions resulting from Project-related incremental (net) increases from emissions sources mentioned in the scope categories above such as emissions from the use of on-road mobile vehicles, electricity, and natural gas compared to existing conditions. This includes Project construction activities such as demolition, hauling, and construction worker trips. This analysis also considers indirect GHG emissions from water conveyance, wastewater generation, and solid waste handling. Since potential impacts resulting from GHG emissions are long-term rather than acute, GHG emissions are calculated on an annual basis.

A fundamental challenge in the analysis of GHG emissions is the global nature of the existing and cumulative future conditions. Changes in GHG emissions can be difficult to attribute to a particular project because the project may cause a shift in the locale for some type of GHG emissions, rather than simply causing "new" GHG emissions. As a result, there is a lack of clarity as to whether a project's GHG emissions represent a net global increase, reduction, or no change in GHGs that would exist if the project were not implemented. Therefore, the analysis of the Project's GHG emissions is particularly conservative in that it assumes all of the GHG emissions are new additions to the atmosphere.

The General Reporting Protocol provides a range of basic calculation methods. However, they are typically designed for existing buildings or facilities and are not directly applicable to planning and development situations where the buildings or facilities do not yet exist. As a result, this section relies on calculation guidance from state and regional agencies with scientific expertise in quantifying GHG emissions, such as CARB and the SCAQMD. GHG emissions are estimated using the California Emissions Estimator Model (CalEEMod), which is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land

[75] Embodied energy includes energy required for water pumping and treatment for end-uses. Third-party vehicles include vehicles used visitors of the Project Site.

use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions from a variety of land use projects. CalEEMod was developed in collaboration with the air districts of California. Regional data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California air districts to account for local requirements and conditions. The model is considered to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California.[76]

The CAPCOA has provided guidance on mitigating or reducing GHG emissions from land use development projects. In September 2010, CAPCOA released a guidance document titled *Quantifying Greenhouse Gas Mitigation Measures* which provides GHG reduction values for recommended mitigation measures.[77] The CAPCOA guidance document was utilized in this analysis for quantifying reductions from physical and operational Project characteristics and Project Design Features in CalEEMod.

4.2 Construction Emissions

Construction of the proposed Project has the potential to generate GHG emissions through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the Project site. Construction emissions can vary from day to day, depending on the level of activity, the specific type of operation, and the prevailing weather conditions. The number and types of construction equipment, vendor trips (e.g., transport of building materials), and worker trips were based on relatively conservative assumptions for a project of this type and scale as provided in the CalEEMod model. These values were then applied to the same construction phasing assumptions used in the criteria pollutant analysis (see the Project's Air Quality Technical Report) to generate GHG emissions values for each construction year. GHG emissions during construction are forecasted by assuming a conservative estimate of construction activities (i.e., assuming all construction occurs at the earliest feasible date). If the onset of construction is delayed to a later date than assumed in the modeling analysis, construction impacts would be less than those analyzed, because a more energy-efficient and cleaner burning construction equipment and vehicle fleet mix would be expected in the future, pursuant to State regulations that require construction equipment fleet operators to phase-in less polluting heavy-duty equipment and trucks. As a result, should the Project commence construction on a later date than modeled in this GHG impact analysis, GHG impacts would be less than the impacts disclosed herein. A complete listing of the construction equipment by phase and construction phase duration assumptions used in this analysis is included within the CalEEMod printout sheets that are provided in **Appendix F-2** of this Technical Report.

GHG emissions are estimated using CalEEMod, which is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions from a variety of land use projects. CalEEMod was developed in collaboration with the air districts of California. Regional data (e.g., emission factors, trip lengths, meteorology, source

76 See: http://www.aqmd.gov/caleemod/.

77 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, 2010.

inventory, etc.) have been provided by the various California air districts to account for local requirements and conditions. The model is considered to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California.[78]

The Project's construction emissions were calculated using CalEEMOD Version 2016.3.2. Construction of the Project is estimated to require approximately 48 months, starting as early as the third quarter of 2019. Subphases of construction would include demolition of the Executive Building and parking structure, site preparation, grading and excavation, foundation pouring, building construction, paving, and architectural coating. Demolition activities would generate approximately 35,000 tons of demolition debris (asphalt and general construction debris). The Project would export approximately 364,000 cubic yards of soil during grading and excavation activities. Heavy-duty equipment, vendor supply trucks and concrete trucks would be used during construction of foundations, parking structures, and buildings. Landscaping and architectural coating would occur during the finishing activities. **Table 4**, *Anticipated Project Construction Schedule*, presents the anticipated construction schedule for the Project. Project construction is anticipated to begin in 2019. However, for modeling purposes, in order to provide a conservative and environmentally protective air quality analysis, the emissions were modeled in CalEEMod assuming construction would begin one year earlier in 2018. This is more conservative because emission factors are higher for 2018 than 2019 as equipment and vehicles are anticipated to produce fewer GHG emissions over time due to more stringent requirements. Project construction that commences at a later date would result in similar or reduced emissions, primarily due to vehicles meeting more stringent emissions standards. Therefore, since Project construction is anticipated to start at a later date than modeled in CalEEMod, the emissions would be similar or reduced compared to the emissions reported in this Technical Report.

TABLE 4
ANTICIPATED PROJECT CONSTRUCTION SCHEDULE

Phase and Subphase	Start Date [a]	End Date [a]	Work Days
Demolition	7/1/2019	1/31/2020	184
Site Preparation	2/1/2020	2/28/2020	24
Grading	3/1/2020	9/30/2020	183
Foundation (North Tower)	10/1/2020	10/1/2020	1
Foundation (South Tower)	10/2/2020	10/2/2020	1
Subterranean Parking Structure Construction	10/3/2020	6/26/2021	230
Podium Construction	6/27/2021	8/27/2021	53
Building Construction	8/28/2021	10/6/2023	660
Paving	3/1/2023	10/6/2023	189
Architectural Coating	1/1/2022	10/6/2023	552
Renovation	7/1/2019	8/8/2021	660

NOTES:

78 South Coast Air Quality Management District, California Emissions Estimator Model (CalEEMod), http://www.aqmd.gov/caleemod/.

[a] The emissions were estimated assuming construction begins at the earliest possible date (2018). This provides for a conservative emissions estimate as emission factors decline in future years. Project construction may commence at a later date, which would generally result in similar or reduced emissions, primarily due to vehicles meeting more stringent emissions standards. If construction starts at a later date, emissions could occur in calendar year 2022 and 2023; however, the emissions would be similar or reduced compared to the emissions reported in this Technical Report.

SOURCE: AC Martin, Plans for Onni Times Square, 2017; ESA, 2018

Construction haul and vendor truck emissions during grading, concrete pour and building construction were evaluated using regional heavy-duty truck emission factors from EMFAC2014. Truck trips and default trip length data were used to assess roadway emissions from truck exhaust, as well as typical CARB idling times of local emissions on-site.

The CO_2e emissions are calculated for the construction period and future Project build-out conditions in order to estimate the net change in GHG emissions for Project construction and operation. The SCAQMD recognizes that construction-related GHG emissions from projects "occur over a relatively short-term period of time" and that "they contribute a relatively small portion of the overall lifetime project GHG emissions."[79] The SCAQMD recommends that construction project GHG emissions should be "amortized over a 30-year project lifetime, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies."[80] As such, GHG emissions from construction have been amortized over the 30-year lifetime of the Project (i.e., total construction GHG emissions were divided by 30 to determine an annual construction emissions estimate comparable to operational emissions).

4.2.1 Emissions from Construction Equipment

Construction of the Project would result in one-time GHG emissions of CO_2 and smaller amounts of CH_4 and N_2O from heavy-duty construction equipment. Construction emissions are forecasted by assuming all construction occurs at the earliest feasible date and applying the off-road emissions factors. The emissions are estimated using the CalEEMod tool, which incorporates the CARB OFFROAD and EMFAC models. The output values used in this analysis were adjusted to be Project-specific based on equipment types and the construction schedule. These values were then applied to the same construction phasing assumptions used in the criteria pollutant analysis (see Section IV.B, *Air Quality*, of the Project's Draft EIR) to generate GHG emissions values for each construction year. Construction GHG emissions are generally calculated in CalEEMod as follows:

<u>Construction Off-Road Equipment:</u>

$$Emissions_{Diesel}\ [MTCO_2e] = (\sum_i (EF_i \times Pop_i \times AvgHP_i \times Load_i \times Activity_i) \div 10^6$$

Where: EF_i = Emission factor from OFFROAD [g/bhp-hr]
Pop_i = Population [quantity of same equipment type]

79 South Coast Air Quality Management District, Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold, 2008, page 3-9, http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgattachmente.pdf. Accessed December 2018.

80 South Coast Air Quality Management District, Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold, 2008, page 3-9.

$AvgHP_i$ = Maximum rated average horsepower [hp]
$Load_i$ = Load Factor [dimensionless]
$Activity_i$ = Hours of operation [hours]
10^6 = Conversion factor [g/MT]
i = Summation index

The CalEEMod tool provides options for specifying equipment, horsepower ratings, load factors, and operational hours per day. Construction equipment lists for each phase of activity were provided by the applicant and/or applicant's construction contractor(s) and architect(s). The amount of construction equipment used and the duration of construction activity could have a substantial effect upon the amount of construction emissions, concentrations and the resulting impacts occurring at any one time. As such, the emission forecasts provided reflect a specific set of conservative assumptions based on the expected construction scenario wherein a relatively large amount of construction is occurring in a relatively intensive manner.

4.2.2 Emissions from On-Road Trips

Construction of the Project would also contribute to regional GHG emissions from haul trucks and worker vehicles. The emissions are estimated using the CalEEMod tool, which incorporates the CARB OFFROAD and EMFAC models for on-road emission factors. Running GHG emissions were divided by the VMT of each respective vehicle class from each scenario year and adjusted for unit conversions to derive emission factors in units of grams per VMT. The emissions from mobile sources were calculated with the trip rates, trip lengths and emission factors for running from EMFAC2014 as follows:

Construction On-Road Trips:

$$Emissions_{pollutant}\ [MTCO_2e] = (VMT \times EF_{running,pollutant}) \div 10^6$$

Where:
VMT = vehicle miles traveled [miles]
$EF_{running,pollutant}$ = emission factor for running emissions [g/mile]
10^6 = Conversion factor [g/MT]

4.3 Operational Emissions

Similar to construction, operational emissions are also estimated using the CalEEMod software version 2016.3.2 and CARB's on-road vehicle emissions factor (EMFAC2014) model on-road emissions factor model. CalEEMod was used to estimate GHG emissions from electricity, natural gas, solid waste, water and wastewater, mobile sources, and landscaping equipment. Operational emissions for the Project Site were calculated for the following two scenarios:

- **Project Without GHG Reduction Characteristics, Features, and Measures**: represents emissions based on a scenario consistent with CARB's Scoping Plan statewide NAT forecast for the AB 32 target year of 2020, includes LADWP's emission factor for 2009 of 1,145 lbs/MWh, certain VMT reductions from the traffic report and the CAPCOA measures, but does not include project design features.

- **Proposed Project**: represents emissions from the project in the year 2023, includes LADWP's estimated electricity emission factor for compliance with the 2020 Renewables Portfolio Standard of 849 lbs CO_2/MWh, and includes all project design features and VMT reductions from the traffic report and the CAPCOA measures.[81, 82]

The GHG emissions calculations for the Project include credits or reductions for implementation of relevant project design features set forth in Section IV.E, *Greenhouse Gas Emissions*, of the Project's Draft EIR. The analysis of Project GHG emissions at buildout also takes into account actions and mandates already approved and expected to be in force by Project buildout (e.g., Pavley I and II Standards and implementation of California's Statewide Renewables Portfolio Standard beyond current levels of renewable energy). In addition, as mobile source GHG emissions are directly dependent on the number of vehicle trips and annual VMT, a decrease in the number of Project-generated trips and vehicle distances traveled as a result of Project characteristics (e.g., close proximity to transit) would provide a proportional reduction in mobile source GHG emissions compared to a generic project without such locational benefits. Emissions reductions regarding Cap-and-Trade were not included in this analysis.

The sections below discuss methods for each scenario for each source of emissions in more detail. Emissions calculations include credits or reductions for the Project Design Features and GHG reducing measures, some of which are required by regulation, such as reductions in energy and water demand.

Operational GHG emissions are assessed based on the Project-related incremental increase in GHG emissions compared to baseline conditions. Under CEQA, the baseline environmental setting is established as the time the Notice of Preparation for the Project's EIR circulated on June 28, 2017. The trip generation forecasts provided in the Project Transportation Impact Analysis[83] include trip rates for the existing land uses to be removed on the existing Project Site. Thus, the net change in Project trips are based on the Project trips minus the existing trips generated at the Project Site. Similarly, the net change in the Project's energy, waste, and water GHG emissions are based on the Project's emissions minus the emissions from the entitled land uses on the existing Project Site. Detailed GHG emissions calculations are provided in **Appendix F-3** of this Technical Report.

The CAPCOA has provided guidance on mitigating or reducing GHG emissions from land use development projects. In September 2010, CAPCOA released a guidance document titled *Quantifying Greenhouse Gas Mitigation Measures* which provides GHG reduction values for recommended mitigation measures.[84] The CAPCOA guidance document was utilized in this

analysis for quantifying reductions from physical and operational Project characteristics and Project Design Features in CalEEMod.

4.3.1 Area Sources

Area sources of GHG emissions resulting from the operation of the existing land uses at the Project Site under the Project include equipment used to maintain landscaping. The combustion of fossil fuels to operate these equipment results in GHG emissions of CO_2 and smaller amounts of CH_4 and N_2O. The emissions occur on-site and are a direct result of activity from the existing land uses; therefore, the GHG emissions are considered to be direct.

The emissions of GHGs associated with operational area sources under the Project are calculated using the CalEEMod tool. The emissions for landscaping equipment are based on the size of the residential, commercial and restaurant land uses, the GHG emission factors for fuel combustion, and the GWP values for the GHGs emitted. Annual GHG emissions from landscaping equipment in units of $MTCO_2e$ are generally calculated in CalEEMod as follows:

Landscaping Equipment:

Annual Emissions $[MTCO_2e] = (\sum_i (Units \times EF_{LE} \times A_{LE} \times GWP)_i) \div 10^6$

Where:

$Units$	=	Number of land use units (same land use type) [1000 sqft]
EF_{LE}	=	GHG emission factor [grams (g)/1000 sqft/day]
A_{LE}	=	Landscaping equipment operating days per year [day/year]
GWP	=	Global warming potential [$CO_2 = 1$, $CH_4 = 25$, $N_2O = 298$]
10^6	=	Conversion factor [g/MT]
i	=	Summation index

CalEEMod uses landscaping equipment GHG emission factors from the CARB OFFROAD model and the CARB *Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment (6/13/2003)*.[85] CalEEMod estimates that landscaping equipment operate for 250 days per year in the South Coast Air Basin. Area source emissions are constant for the two Project scenarios.

4.3.2 Energy Use

With regard to energy usage, the consumption of fossil fuels to generate electricity and to provide heating and hot water generates GHG emissions. Future fuel consumption rates are estimated based on specific square footage of the residential, retail, and restaurant land uses, as well as predicted water supply needs of the Project. Energy usage (off-site electricity generation and on-site natural gas consumption) for the Project is calculated within CalEEMod using the CEC's *California Commercial End Use Survey* (CEUS) data set, which provides energy demand by

85 California Air Resources Board, OFFROAD Modeling Change Technical Memo: Change in Population and Activity Factors for Lawn and Garden Equipment, June 13, 2003, http://www.arb.ca.gov/msei/2001_residential_lawn_and_garden_changes_in_eqpt_pop_and_act.pdf. Accessed December 2018.

building type and climate zone.[86] This data set provides energy intensities of different land uses throughout the state and different climate zones. However, since the data from the CEUS is from 2002, the CalEEMod software incorporates correction factors to account for consistency with the Title 24 Building Energy Efficiency Standards, which would have been in place for each scenario. This assessment also includes electricity-related GHG emissions from the proposed subterranean parking, which would include elevators, lighting, and a ventilation system.

Electricity

The generation of electricity in California is achieved through the combustion of fossil fuels, primarily natural gas, using steam boilers, internal combustion engines, and combustion turbines. A portion of the electricity in California is imported from outside the state and is derived from the combustion of coal and other non-gaseous fossil fuels. The combustion of fossil fuels to produce electricity results in GHG emissions of CO_2 and smaller amounts of CH_4 and N_2O. The electricity generation occurs off-site; therefore, electricity use results in GHG emissions that are considered to be indirect.

Emissions of GHGs associated with operation of the existing site uses and the Project's proposed uses are based on the size of the residential, office, restaurant, retail, and parking structure land uses, the electrical demand factors for the land uses, the GHG emission factors for the electricity utility provider, and the GWP values for the GHGs emitted. This assessment also includes electricity-related GHG emissions from the parking lot, which would include lighting electricity. Annual electricity GHG emissions in units of $MTCO_2e$ are calculated as follows:

Electricity:

$$\text{Annual Emissions } [MTCO_2e] = \left(\sum_i (\text{Units} \times D_E \times EF_E \times GWP)_i \right) \div 2204.6$$

Where:

Units	=	Number of land use units (same land use type) [1000 sqft]
D_E	=	Electrical demand factor [megawatt-hour (MWh)/1000 sqft/year]
EF_E	=	GHG emission factor [pounds per megawatt-hour (MWh)]
GWP	=	Global warming potential [$CO_2 = 1$, $CH_4 = 25$, $N_2O = 298$]
2204.6	=	Conversion factor [pounds/MT]
i	=	Summation index

Since the Project would also be required to meet the Title 24 standards in effect at the time of building permit application (potentially the 2019 standards if adopted at the time of building permit application), this analysis conservatively applies the 2016 Title 24 Building Standards Code for the 2023 Project buildout year scenario.

For the Project and existing Project Site GHG emissions, building electricity usage rates are based on CalEEMod factors. For the Proposed Project scenario, the 2016 Title 24 standards were used. For the Project Without GHG Reduction Characteristics, Features, and Measures scenario,

86 California Energy Commission, California Commercial End-Use Survey, http://capabilities.itron.com/CeusWeb/Chart.aspx. Accessed December 2018.

the 2008 Title 24 standards were used, which is consistent with CARB's statewide NAT forecast, which is based on 2009-2011 average emissions.

The Los Angeles Department of Water and Power (LADWP) provides electric service to the Project Site. Emission factors for CO_2 due to electrical generation to serve the electrical demands of the Project were obtained from the LADWP *2016 Power Integrated Resource Plan*, which accounts for the generation mix using renewable and non-renewable sources.[87] Emission factors for CH_4 and N_2O were obtained from CalEEMod. LADWP currently provides 20 percent of electricity via renewable sources[88] but has committed to providing an increasing percentage from renewable sources that exceed the Renewables Portfolio Standard requirements by providing 50 percent by 2025, 55 percent by 2030, and 65 percent by 2036.[89] Based on data in CalEEMod and from LADWP, the estimated CO_2 intensity for electricity sales used for the existing conditions was approximately 1,228 lbs CO_2/MWh. Based on LADWP future projections for the Project opening year of 2023, an estimated emission factor of 849 lbs CO_2/MWh was calculated based on LADWP projections for compliance with the Renewables Portfolio Standard.[90,91] For the Project Without GHG Reduction Characteristics, Features, and Measures scenario, the 2009 emission factor of approximately 1,145 lbs/MWh was used, which is consistent with CARB's approach for assessing the statewide NAT forecast.

Natural Gas

Natural gas-related emissions of GHGs associated with operation of the Project are based on the size of the existing site uses and the Project's proposed uses, the natural gas demand factors for the land uses, the GHG emission factors for the natural gas combustion, and the GWP values for the GHGs emitted. Annual natural gas GHG emissions in units of $MTCO_2e$ are calculated as follows:

Natural Gas:

$$\text{Annual Emissions } [MTCO_2e] = \left(\sum_i (\text{Units} \times D_{NG} \times EF_{NG} \times GWP)_i \right) \div 2204.62$$

Where:

Units	=	Number of land use units (same land use type) [1000 sqft]
D_{NG}	=	Natural gas combustion factor [MMBtu/1000 sqft/year]
EF_{NG}	=	GHG emission factor [pounds/MMBtu]
GWP	=	Global warming potential [CO_2 = 1, CH_4 = 25, N_2O = 298]
2204.6	=	Conversion factor [pounds/MT]

87 Los Angeles Department of Water and Power, 2016 Power Integrated Resource Plan, December 2016, page C-12, https://www.ladwp.com/cs/idcplg?IdcService=GET_FILE&dDocName=OPLADWPCCB562207&RevisionSelectionMethod=LatestReleased. Accessed December 2018.

89 Los Angeles Department of Water and Power, 2016 Power Integrated Resource Plan, page ES-1.

90 Los Angeles Department of Water and Power, 2016 Briefing Book, https://www.ladwp.com/cs/idcplg?IdcService=GET_FILE&dDocName=OPLADWPCCB423407&RevisionSelectionMethod=LatestReleased. Accessed December 2018.

91 California Energy Commission, Utility Energy Supply Plans from 2015, 2016, http://www.energy.ca.gov/almanac/electricity_data/s-2_supply_forms_2015/LADWP%20%20PUBLIC%20S-2%20supply%20form%2006-29-2016%20revision.xlsx. Accessed December 2018.

i = Summation index

Natural gas demand is based on data from the CEUS, which lists energy demand by building type.[92] However, since the data from the CEUS is from 2002, correction factors are applied to account for compliance with the updated 2016 Title 24 Building Standards Code. The correction factors are applied only to the new building construction. The Project would meet the amended standards. For the Project and existing Project Site GHG emissions, natural gas usage rates are based on CalEEMod factors.The combustion of natural gas results in relatively equal amounts of GHG emissions per unit of gas combusted in the state. Emission factors for GHGs due to natural gas combustion to serve the heating and cooking demands of the Project were obtained from the CalEEMod tool, which provides statewide emission factors.[93] The emissions of GHGs due to natural gas demand would be relatively steady for the years assessed.

4.3.3 Mobile Sources

Mobile source emissions are estimated based on CARB's updated version of the on-road vehicle emissions factor (EMFAC) model. The most recent version is EMFAC2014, which "represents [California Air Resources Board's] current understanding of motor vehicle travel activities and their associated emission levels."[94] Mobile source emissions are also based on the trip generation rates provided in the Project's Transportation Impact Analysis, which accounts for trip reductions from pedestrian trips, existing public transportation options, and pass-by trips.[95]

In calculating mobile-source emissions, the trip length values for the mixed-use project are based on air basin-specific values in CalEEMod for the relevant land uses (residential, commercial restaurant, and parking structure land uses). Trip distances in the South Coast Air Basin are slightly longer than the statewide average due to the fact that commute patterns in the South Coast Air Basin involve a substantial portion of the population commuting relatively far distances, as documented in the SCAG *2016 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS)*. The RTP/SCS shows that, even under future Plan conditions, upwards of 50 percent of all work trips are 10 miles or longer.[96] For the purposes of this analysis, trip distances in South Coast Air Basin are considered to be generally analogous to the statewide average given that the CalEEMod model trip distances in the South Coast Air Basin are slightly longer, but still generally similar to, the statewide average. The trip distances for the various operational activities were multiplied by the average daily trip estimates for each land use based on the data provided by the Project Transportation Impact Analysis to estimate the VMT for the

92 California Energy Commission, California Commercial End-Use Survey, http://capabilities.itron.com/CeusWeb/ChartsSF/Default2.aspx. Accessed December 2018.

94 California Air Resources Board, Mobile Source Emissions Inventory. http://www.arb.ca.gov/msei/categories.htm#emfac2014. Accessed December 2018.

95 Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, (2017).

96 Southern California Association of Governments, 2016 Regional Transportation Plan/ Sustainable Communities Strategy, Performance Measures Appendix, 2016, page 13. The RTP/SCS does not specify the existing non-plan percentage of work trips greater than 10 miles in the region; however, it can be assumed that the percentage under existing non-plan conditions is greater than 50 percent since the goal of the RTP/SCS is to reduce overall VMT in the region.

Project.[97] The estimated VMT reductions takes into account trip reductions based on applicable physical and operational Project characteristics including internal capture from co-locating residential, office, restaurant, and retail uses on the Project Site, job densities, neighborhood and site walkability and connectivity, and proximity to public transit (including high-quality rail transit via the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line) and job centers. The estimated VMT reductions are calculated using the equations and methodologies prescribed in the CAPCOA guidance document, *Quantifying Greenhouse Gas Mitigation Measures*, which provides reduction calculation formulas for transportation characteristics and measures.[98]

Emissions of GHGs associated with mobile sources from operation of the Project are based on the average daily trip rate, trip distance, the GHG emission factors for the mobile sources, and the GWP values for the GHGs emitted. The types of vehicles that would visit the Site include all vehicle types including automobiles, light-duty trucks, delivery trucks, and waste haul trucks. Modeling for the Project was conducted using the vehicle fleet mix for the South Coast Air Basin as provided in EMFAC2014 and CalEEMod. Annual mobile source GHG emissions in units of $MTCO_2e$ are generally calculated as follows:

Mobile:

$$\text{Annual Emissions } [MTCO_2e] = \left(\sum_i (\text{Units} \times \text{ADT} \times D_{TRIP} \times \text{Days} \times \text{EF} \times \text{GWP})_i \right) \div 2204.6$$

Where:

Units	=	Number of vehicles (same vehicle model year and class)
ADT	=	Average daily trip rate [trips/day]
DTRIP	=	Trip distance [miles/trip]
Days	=	Number of days per year [days/year]
EF	=	GHG emission factor [pounds per mile]
GWP	=	Global warming potential [$CO_2 = 1$, $CH_4 = 25$, $N_2O = 298$]
2204.6	=	Conversion factor [pounds/MT]
i	=	Summation index

Emissions of GHGs from motor vehicles are dependent on model years and the specific types of vehicles that are used to travel to and from the existing Project Site. The emissions were calculated using a representative motor vehicle fleet mix for the South Coast Air Basin for the opening year of the Project. As discussed above, all vehicle types would visit the Project Site; therefore, the use of the motor vehicle fleet mix for the South Coast Air Basin is an appropriate modeling parameter.

For the Project Without GHG Reduction Characteristics, Features, and Measures scenario, the average of years 2009-2011 vehicle fleet and emission factors from EMFAC2014 were used, which is consistent with CARB's statewide NAT forecast. Trip rates for the Project are from the traffic report, and do not include trip reductions from walk/transit characteristics and TDM measures. Trip lengths are based on model defaults and do not include the adjustment for additional CAPCOA VMT reductions discussed below under *Land Use Characteristics*. This

97 Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, (2017).

98 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, 2010.

allows for an accurate estimate of No-Action-Taken emissions for the Project in 2023, consistent with CARB's statewide NAT forecast for 2020.

For the Proposed Project scenario, the year 2020 vehicle fleet and emission factors from EMFAC2014 was used as a conservative assessment. Future year vehicle emission factors would likely be slightly lower in 2023 as a portion of the vehicle fleet would meet more stringent emissions standards. Trip rates for the Project are from the traffic report, and include trip reductions from walk/transit characteristics and TDM measures. Trip lengths include the adjustment for additional CAPCOA VMT reductions discussed below under *Land Use Characteristics*.

4.3.4 Water Supply, Treatment and Distribution

Water and wastewater generated from the land uses under the Project would require energy to supply, distribute and treat. The combustion of fossil fuels to produce electricity results in GHG emissions of CO_2 and smaller amounts of CH_4 and N_2O. The electricity generation occurs off-site; therefore, the electricity use from water and wastewater results in GHG emissions that are considered to be indirect. Wastewater also results in emissions of GHGs from wastewater treatment systems (e.g., septic, aerobic, or lagoons) as well as from solids that are digested either through an anaerobic digester or with co-generation from combustion of digester gas.

The emissions of GHGs associated with wastewater treatment process emissions are also calculated using CalEEMod. The emissions are based on the type of treatment (e.g., aerobic, facultative lagoons, septic systems). The emissions are calculated using the default settings in CalEEMod for the type of wastewater treatment and water usage rates from the Utility Technical Report for the Project.[99] Calculation formulas are described in detail in the *California Emissions Estimator Model User's Guide, Appendix A*.[100] Annual water demand and wastewater GHG emissions due to electricity are generally calculated in CalEEMod as follows for indoor and outdoor water demand:

<u>Water Supply, Treatment, and Distribution; Wastewater Treatment (electricity):</u>

$$\text{Annual Emissions } [MTCO_2e] = \left(\sum_i (\text{Units} \times D_W \times (EI_W \div 1000) \times EF_W \times GWP)_i \right) \div 2204.62$$

Where:

Units	=	Number of land use units (same land use type) [1000 sqft]
D_W	=	Water demand factor [million gallons (Mgal)/1000 sqft/year]
EI_W	=	Electricity intensity factor [kilowatt-hours (kWh)/Mgal]
1000	=	Conversion factor [kWh/MWh]
EF_W	=	GHG emission factor [pounds/MWh]
GWP	=	Global warming potential [CO_2 = 1, CH_4 = 25, N_2O = 298]
2204.6	=	Conversion factor [pounds/MT]
i	=	Summation index

99 Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, (2017).

100 California Air Pollution Control Officers Association, California Emissions Estimator Model User's Guide, 2017.

The CEC's estimate for energy intensity of the water use cycle in Southern California, as provided in the 2006 CEC report *Refining Estimates of Water-Related Energy Use in California*, is used to calculate the energy usage related to water supply, treatment, and distribution and wastewater treatment.[101] The same electricity GHG emissions factors discussed above are used for water and wastewater energy usage.

As stated in the *User's Guide*, the GHGs emitted from each type of wastewater treatment are based on the CARB's *Local Government Operations Protocol* (LGOP),[102] which are in turn based on USEPA methodologies.[103] The default CalEEMod settings for wastewater treatment are: 10.33 percent septic tank, 87.46 percent aerobic, 2.21 percent facultative lagoons and 100 percent anaerobic combustion of gas.

4.3.5 Solid Waste

The Project would generate solid waste from day-to-day operational activities, which generally consists of product packaging, grass clippings, furniture, clothing, bottles, food scraps, newspapers, plastic, and other items routinely disposed of in trash bins. A portion of the waste is diverted to waste recycling and reclamation facilities. Waste that is not diverted is usually sent to local landfills for disposal. waste that is disposed in landfills results in GHG emissions of CO_2 and CH_4 from the decomposition of the waste that occurs over the span of many years.

Emissions of GHGs associated with solid waste disposal under the Project's proposed land uses are calculated using the CalEEMod tool. The emissions are based on the size of the residential, commercial restaurant, and parking structure land uses, the waste disposal rate for the land uses, the waste diversion rate, the GHG emission factors for solid waste decomposition, and the GWP values for the GHGs emitted. Annual waste disposal GHG emissions in units of $MTCO_2e$ are generally calculated in CalEEMod as follows:

Waste:

$$\text{Annual Emissions } [MTCO_2e] = \left(\sum_i (\text{Units} \times D_W \times EF_W \times GWP)_i \right) \div 1.1023$$

Where:

Units	=	Number of land use units (same land use type) [1000 sqft]
D_W	=	Waste disposal rate [tons/1000 sqft/year]
EF_W	=	GHG emission factor [tons/ton waste]
GWP	=	Global warming potential [CO_2 = 1, CH_4 = 25, N_2O = 298]
1.1023	=	Conversion factor [tons/MT]
i	=	Summation index

101 California Energy Commission, Refining Estimates of Water-Related Energy Use in California, PIER Final Project Report, CEC-500-2006-118, 2006.

102 California Air Resources Board, Local Government Operations Protocol, Chapter 10: Wastewater Treatment Facilities, 2008.

103 United States Environmental Protection Agency, Inventory of US Greenhouse Gas Emissions and Sinks: 1990-2006, Chapter 8: Waste, 2008.

CalEEMod allows the input of several variables to quantify solid waste emissions. The model requires the amount of waste disposed, which is the product of the waste disposal rate times the land use units. The total amount of waste disposed was reduced by the diversion rate for the City of Los Angeles of 76 percent, according to the most recent data available.[104] The GHG emission factors, particularly for CH_4, depend on characteristics of the landfill, such as the presence of a landfill gas capture system and subsequent flaring or energy recovery. The default values, as provided in CalEEMod, for landfill gas capture (e.g., no capture, flaring, energy recovery) are statewide averages and are used in this assessment. Solid waste emissions are constant for the two Project scenarios.

4.3.6 Stationary Source Emergency Generator:

Stationary source emissions may include emissions from maintenance and testing operations of two emergency generators, one in each residential tower. The North Tower will include a 414 kW generator and the South Tower will include a 623 kW generator. Emergency generator emissions are calculated based on emissions factors available from CARB and the SCAQMD in compliance with applicable regulations. Emergency generator emissions include compliance with CARB and SCAQMD regulations including the Tier 4 emissions standards and SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. As discussed previously, Rule 1470 applies to stationary compression ignition engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing. In general, stationary-source emergency generator emissions are calculated as follows. Emergency generator GHG emissions are constant for the two Project scenarios.

$$\text{Emissions}_{\text{Diesel}}\,[\text{g}] = \Sigma_i\,(\text{EF} \times \text{Pop} \times \text{HP} \times \text{Load} \times \text{Activity})_i$$

Where:

EF	=	Emission factor [g/bhp-hr]
Pop	=	Population [quantity of same equipment type]
HP	=	Maximum rated horsepower [hp]
Load	=	Load Factor [dimensionless]
Activity	=	Hours of operation [hours per day, hours per year]
i	=	Summation index

4.3.7 Stationary Source Cooling Tower:

Stationary source emissions may include emissions from using electricity in order to supply, treat, and distribute water used by the four cooling towers and the treatment of subsequently generated wastewater by the cooling towers on the Project Site Cooling tower emissions are calculated based on CalEEMod water electricity and GHG intensity emissions factors. Cooling tower GHG emissions are constant for the two Project scenarios.

[104] City of Los Angeles, Department of Public Works, LA Sanitation, Zero Waste Progress Report, March 2013, https://bioenergyproducers.files.wordpress.com/2016/11/la-zero-waste-report.pdf. Accessed December 2018.

$$ED = \Sigma_i [((WA \times E_S) + (WA \times E_T) + (WA \times E_D) + (WA \times E_{WT})) \div 1{,}000]_i$$

Where:

WA	=	Water Amount Used [Mgal/year]
E_S	=	Electricity Demand Factor to Supply (kWh/Mgal)
E_T	=	Electricity Demand Factor to Treat (kWh/Mgal)
E_D	=	Electricity Demand Factor to Distribute (kWh/Mgal)
E_{TW}	=	Electricity Demand Factor for Wastewater Treatment (kWh/Mgal)
ED	=	Electricity Demand of Cooling Towers (MWh/year)
i	=	Summation index

$$Emissions = \Sigma_i [((I_{CO2} \times GWP) + (I_{CH4} \times GWP) + (I_{N2O} \times GWP)) \times ED \div 2204.6]_i$$

Where:

I_{CO2}	=	Electricity CO_2 Intensity Factor (lbs/MWh)
I_{CH4}	=	Electricity CH_4 Intensity Factor (lbs/MWh)
I_{N2O}	=	Electricity N_2O Intensity Factor (lbs/MWh)
ED	=	Electricity Demand of Cooling Towers (MWh/year)
GWP	=	Global warming potential [CO_2 = 1, CH_4 = 25, N_2O = 298]
2204.6	=	Conversion factor [pounds/MT]
i	=	Summation index

4.4 Comparison to Project without GHG Reduction Characteristics, Features, and Measures

As discussed previously, state, regional, and local GHG reduction plans and policies, such as CARB's Climate Change Scoping Plan, SB 375 and City of Los Angeles plans (LA Green Plan, Sustainable City pLAn) would be applicable to the Project. These plans and policies are intended to reduce GHG emissions in accordance with the goals of HSC Division 25.5. In order to evaluate the efficacy of the GHG reduction characteristics, features, and measures that would be implemented as part of the Project as required by these GHG reduction plans and policies, this analysis compares the Project's GHG emissions to the emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures. This approach mirrors the concepts used in CARB's Climate Change Scoping Plan, which demonstrates GHG reductions compared to a NAT scenario. This comparison is provided only to evaluate the Project's efficiency with respect to GHG reduction plans and policies, but is not relied on a threshold of significance.

The GHG emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures is quantified based on specific and defined circumstances in the context of relevant state activities and mandates. Since this comparison is intended to mirror the concepts used in CARB's Climate Change Scoping Plan, the GHG emissions for the Project without implementation of GHG reduction characteristics, features, and measures is evaluated based on the specific and defined circumstances that CARB relied on when it projected the State's GHG emissions in the absence of GHG reduction measures in the First Update to the Climate Change Scoping Plan.

The specific and defined circumstances used by CARB include conditions that existed during the 2009 to 2011 period, which include the vehicle fleet that existed during the 2009 to 2011 period and the 2008 Title 24 Building Energy Efficiency Standards. Furthermore, the specific Project Site characteristics and Project Design Features (PDF) such as PDF AQ-1, Green Building Features (refer to Section IV.B, *Air Quality*, of the Project's Draft EIR), and PDF WS-1, Water Conservation Features (refer to Section IV.R, *Water Supply*, of the Project's Draft EIR) are not included as they encompass GHG reduction strategies and features that would be consistent with state, regional, and local GHG reduction plans and policies or would go above and beyond regulatory requirements. The emissions are estimated using the CalEEMod software, and the model inputs are adjusted to account for the specific and defined circumstances and described above. The analysis assumes the Project without implementation of GHG reduction characteristics, features, and measures would incorporate the same land uses and building square footage as the proposed Project.

4.5 Project Design Features

4.5.1 Project Design Features

The Project would be designed to incorporate green building techniques and other sustainability features, however there are no Project Design Features proposed specifically to reduce GHG emissions. The Project Design Features (PDFs) described in IV.B, *Air Quality* and IV.R, *Water Supply* sections of the Project's Draft EIR would have the beneficial result of reducing greenhouse gas emissions, as discussed below in the Environmental Impacts section where applicable. To the extent they can be quantified, these features have been assumed in the emissions calculations, but all of these features are considered in the consistency analysis.

SECTION 5
Environmental Impacts

Threshold a): Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.

Threshold b): Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

5.1 Consistency with Applicable GHG Reduction Plans and Policies

As described above, compliance with a GHG emissions reduction plan renders a less-than-significant impact. The following section describes the extent the Project is consistent with regulations and policies and complies with or exceeds the performance-based standards included in the regulations outlined in the 2017 Climate Change Scoping Plan, the Regional Transportation Plan/Sustainable Communities Strategy, the LA Green Plan, and Sustainable City pLAn. As shown herein, the Project would be consistent with the applicable GHG reduction plans and policies.

5.1.1 CARB's Climate Change Scoping Plan

At the state level, Executive Orders S-3-05 and B-30-15 are orders from the State's Executive Branch for the purpose of reducing GHG emissions. Executive Order S-3-05's goal to reduce GHG emissions to 1990 levels by 2020 was adopted by the Legislature as the 2006 Global Warming Solutions Act (AB 32) and codified into law in HSC Division 25.5. Executive Order B-30-15's goal to reduce GHG emissions to 40 percent below 1990 levels by 2030 was adopted by the Legislature in SB 32 and also codified into law in HSC Division 25.5.

In support of HSC Division 25.5, the State has promulgated specific laws and strategies aimed at GHG reductions applicable to the Project. The primary focus of many of the statewide and regional plans, policies and regulations is to address worldwide climate change. Due to the complex physical, chemical, and atmospheric mechanisms involved in global climate change, there is no basis for concluding that the Project's increase in annual GHG emissions would cause a measurable change in global GHG emissions necessary to influence global climate change. Newer construction materials and practices, energy efficiency requirements, and newer appliances tend to emit lower levels of air pollutant emissions, including GHGs, as compared to those built years ago; however, the net effect is difficult to quantify. The GHG emissions of the Project alone would not likely cause a direct physical change in the environment. According to

CAPCOA, "GHG impacts are exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective."[105] It is global GHG emissions in their aggregate that contribute to climate change, not any single source of GHG emissions alone.

Table 5, *Consistency with Applicable 2017 Climate Change Scoping Plan Greenhouse Gas Reduction Strategies*, contains a list of GHG-reducing strategies applicable to the Project. The analysis describes the consistency of the Project with these laws and strategies outlined in the State's 2017 Climate Change Scoping Plan to reduce GHG emissions. The Climate Change Scoping Plan outlines a framework that relies on a broad array of GHG reduction actions, which include direct regulations, alternative compliance mechanisms, incentives, voluntary actions, and market-based mechanisms such as the Cap-and-Trade program. As discussed below, the Project would implement PDFs and incorporate characteristics to reduce energy use, conserve water, reduce waste generation, and reduce vehicle travel consistent with statewide strategies and regulations. As a result, the Project would not conflict with applicable Climate Change Scoping Plan strategies and regulations to reduce GHG emissions.

TABLE 5
CONSISTENCY WITH APPLICABLE 2017CLIMATE CHANGE SCOPING PLAN GREENHOUSE GAS REDUCTION STRATEGIES

Sector / Source	Category / Description	Consistency Analysis
Area		
SCAQMD Rule 445 (Wood Burning Devices)	Restricts the installation of wood-burning devices in new development.	**Consistent.** The Project will comply with this regulatory mandate. All cooking stoves would either be electric or natural gas.
Energy		
California Renewables Portfolio Standard	Increases the proportion of electricity from renewable sources to 33 percent renewable power by 2020.	**Consistent.** The Project would use electricity provided by LADWP, which is which is required to obtain 33 percent renewable power by 2020 and has committed to achieving 50 percent renewables by 2025.[106] Furthermore, per SB 100, signed by Governor Brown on September 10, 2018, LADWP would be required to procure eligible renewable electricity for 44 percent of retail sales by December 31, 2024, 52 percent by December 31, 2027, and 60 percent by December 31, 2030.
California Renewables Portfolio Standard, SB 350 and SB 100	Increases the proportion of electricity from renewable sources to 33 percent renewable power by 2020. SB 350 requires 50 percent by 2030. It also requires the State Energy Resources Conservation and Development Commission to double the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.	**Consistent.** The Project would use electricity provided by LADWP, which is required to meet the 2020, 2030, 2045, and 2050 performance standard (refer to Appendix F-3 of this Technical Report for additional details). The Project would also meet or exceed the applicable requirements of the 2016 Title 24 Building Energy Efficiency Standards and CALGreen Code or applicable version at the time of building permit issuance. The Project would incorporate energy efficiency measures as outlined in PDF AQ-1.

105 California Air Pollution Control Officers Association, CEQA & Climate change: Evaluating and Addressing Greenhous Gas Emissions from Projects Subject to the California Environmental Quality Act, (2008).

106 Los Angeles Department of Water and Power, 2016 Power Integrated Resource Plan, page ES-1.

Sector / Source	Category / Description	Consistency Analysis
CCR, Title 24, Building Standards Code	Energy Efficiency Standards for Residential and Nonresidential Buildings	**Consistent.** The Project would meet or exceed the applicable requirements of the 2016 Title 24 Building Energy Efficiency Standards and CALGreen Code or applicable version at the time of building permit issuance, and LEED Silver Certification Requirements ore quivalent as committed to in PDF AQ-1. The Project would incorporate energy efficiency measures as outlined in the PDF AQ-1, PDF AQ-2 and PDF WS-1.
Assembly Bill 1109	The Lighting Efficiency And Toxics Reduction Act (AB 1109) prohibits manufacturing specified general purpose lights that contain levels of hazardous substances prohibited by the European Union. AB 1109 also requires a reduction in average statewide electrical energy consumption by not less than 50 percent from the 2007 levels for indoor residential lighting and not less than 25 percent from the 2007 levels for indoor commercial and outdoor lighting by 2018	**Consistent.** According to the CEC, energy savings from AB 1109 are achieved through codes and standards. Energy savings from AB 1109 are calculated as part of codes and standards savings.[107] The Project would incorporate energy efficient lighting. As discussed above, the Project would meet or exceed the applicable requirements of the 2016 Title 24 Building Energy Efficiency Standards and CALGreen Code and the 2016 City of Los Angeles Green Building Code, or applicable version at the time of building permit issuance, and would also incorporate energy efficiency measures as outlined in PDF AQ-1.
California Green Building Standards Code Requirements	All bathroom exhaust fans shall be ENERGY STAR compliant.	**Consistent.** The Project would utilize energy efficiency appliances, including bathroom exhaust fans, and equipment and would meet or exceed the applicable energy standards in the 2016 Title 24 Building Energy Efficiency Standards and CALGreen Code, or applicable version at the time of building permit issuance.
	HVAC Systems will be designed to meet ASHRAE standards.	**Consistent.** The Project would utilize energy efficiency appliances and equipment and would meet or exceed the applicable energy standards in ASHRAE 90.1-2013 Appendix G and the 2016 Title 24 Building Energy Efficiency Standards and CALGreen Code, or applicable version of these standards at the time of building permit issuance.
	Energy commissioning shall be performed for buildings larger than 10,000 square feet.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements and LEED Silver Certification Requirements or equivalent as commited to in PDF AQ-1.
	Air filtration systems are required to meet a minimum efficiency reporting value (MERV) 8 or higher.	**Consistent.** The Project would meet or exceed the requirement of MERV 8 as part of its compliance with the City's requirements, and the CALGreen Code.
	Refrigerants used in newly installed HVAC systems shall not contain any CFCs.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements and the CALGreen Code.
	Parking spaces shall be designed for carpool or alternative fueled vehicles. Up to eight percent of total parking spaces will be designed for such vehicles.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements and the CALGreen Code. The Project would designate a minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations.

[107] California Energy Commission, 2013 California Energy Efficiency Potential and Goals Study, Appendix Volume I, February 5, 2014, http://www.cpuc.ca.gov/WorkArea/DownloadAsset.aspx?id=4021. Accessed December 2018.

Sector / Source	Category / Description	Consistency Analysis
	Long-term and short-term bike parking shall be provided for up to five percent of vehicle trips.	**Consistent.** The Project would meet this requirement by providing 1,274 bicycle spaces as part of its compliance with the City's requirements and the CALGreen Code.
	Stormwater Pollution Prevention Plan (SWPPP) required.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements and the CALGreen Code (See Section IV.G, *Hydrology and Water Quality*, of the Project's Draft EIR).
	Indoor water usage must be reduced by 20% compared to current California Building Code Standards for maximum flow.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements, the CALGreen Code, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1.
	All irrigation controllers must be installed with weather sensing or soil moisture sensors.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements, the CALGreen Code, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1.
	Wastewater usage shall be reduced by 20 percent compared to current California Building Standards.	**Consistent.** The Project would meet or exceed this requirement as part of its compliance with the City's requirements and the CALGreen Code.
	Requires a minimum of 50 percent recycle or reuse of nonhazardous construction and demolition debris.	**Consistent.** The Project would meet or exceed this requirement as part of its compliance with the City's requirements and the CALGreen Code.
	Requires documentation of types of waste recycled, diverted or reused.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements and the CALGreen Code.
	Requires use of low VOC coatings consistent with AQMD Rule 1168.	**Consistent.** The Project would be consistent with this regulation and would meet or exceed the low VOC coating requirements.
	100 percent of vegetation, rocks, soils from land clearing shall be recycled or stockpiled on-site.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements and the CALGreen Code.
SB 1368, CCR Title 20, Cap and Trade Program		**Consistent.** The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, whether generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects' electricity usage are covered by the Cap-and-Trade Program. Therefore, GHG emissions associated with the Project's 14.26 million kWh of electricity usage per year presented in Section IV.U, *Energy*, of the Project's Draft EIR, would be covered by the Cap-and-Trade Program as LADWP would be a covered entity.)

Sector / Source	Category / Description	Consistency Analysis
Mobile Sources		
Mobile Source Strategy (Cleaner Technology and Fuels)	Reduce GHGs and other pollutants from the transportation sector through transition to zero-emission and low-emission vehicles, cleaner transit systems and reduction of vehicle miles traveled.	**Consistent.** The Project would be consistent with this strategy by supporting the use of zero-emission and low-emission vehicles. The Project would designate a minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations. Furthermore, the Project would also reduce VMT as a result of its urban infill location, with access to public transportation within a quarter-mile of the Project Site, and its proximity to other destinations including off-site residential, retail, and entertainment. The Project is also located within a HQTA as designated by SCAG.
AB 1493 (Pavley Regulations)	Reduces GHG emissions in new passenger vehicles from model year 2012 through 2016 (Phase I) and model years 2017–2025 (Phase II). Also reduces gasoline consumption to a rate of 31 percent of 1990 gasoline consumption (and associated GHG emissions) by 2020.	**Consistent.** The Project would be consistent with this regulation and would not conflict with implementation of the vehicle emissions standards. Mobile emissions associated with the Project in Table 10 reflect compliance with this regulation. GHG emissions related to vehicular travel by the Project would benefit from this regulation because vehicle trips associated with the Project would be affected by AB 1493. Mobile source emissions generated by the Project would be reduced with implementation of AB 1493 consistent with reduction of GHG emissions under AB 32
Low Carbon Fuel Standard (Executive Order S-01-07)	Establishes protocols for measuring life-cycle carbon intensity of transportation fuels and helps to establish use of alternative fuels. This executive order establishes a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020	**Consistent.** The Project would be consistent with this regulation and would not conflict with implementation of the transportation fuel standards. Mobile emissions associated with the project in Table 10 reflect compliance with this regulation. GHG emissions related to vehicular travel by the Project would benefit from this regulation and mobile source emissions generated by the Project would be reduced with implementation of LCFS consistent with reduction of GHG emissions under AB 32.
Advanced Clean Cars Program	In 2012, CARB adopted the Advanced Clean Cars (ACC) program to reduce criteria pollutants and GHG emissions for model year vehicles 2015 through 2025. ACC includes the Low-Emission Vehicle (LEV) regulations that reduce criteria pollutants and GHG emissions from light- and medium-duty vehicles, and the Zero-Emission Vehicle (ZEV) regulation, which requires manufacturers to produce an increasing number of pure ZEVs (meaning battery electric and fuel cell electric vehicles), with provisions to also produce plug-in hybrid electric vehicles (PHEV) in the 2018 through 2025 model years.	**Consistent.** The standards would apply to all vehicles used by visitors, employees, apartment residents, and customers associated with the Project. The Project would designate a minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations.
SB 375	SB 375 establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions. Under SB 375, CARB is required, in consultation with the state's Metropolitan Planning Organizations, to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035.	**Consistent.** The Project would be consistent with SCAG RTP/SCS goals and objectives under SB 375 to implement "smart growth." The Project would provide employment opportunities in close proximity to off-site residential and other job centers in downtown Los Angeles where people can live and work and have access to modes of transportation that provide options for reducing reliance on automobiles and minimizing associated air pollutant emissions.

Sector / Source	Category / Description	Consistency Analysis
		The Project would incorporate PDF AQ-1 and PDF AQ-2 that would meet the applicable requirements of CALGreen and the City of Los Angeles Green Building Code. The Project would also reduce VMT as a result of its urban infill location, with access to public transportation within a quarter-mile of the Project Site, and its proximity to other destinations including off-site residential, retail, and entertainment. The Project is also located within a HQTA as designated by SCAG. Furthermore, implementation of the transportation strategies in the 2016 RTP/SCS would result in an estimated 18 percent decrease in per capita GHG emissions by 2035 and 21 percent decrease in per capita GHG emissions by 2040. As discussed above, CARB updated the SB 375 targets for the SCAG region, requiring a 19-percent decrease in per capita VMT by 2035. Implementation of the 2016–2040 RTP/SCS or the next plan is expected to fulfill and exceed the region's obligations under SB 375 with respect to meeting the State's GHG emission reduction goals.As project-related emissions are reduced by approximately 36 percent compared to NAT (see Table 10), therefore the Project would be consistent with SB 375 and the 2016 RTP/SCS.
Water		
CCR, Title 24	Title 24 includes water efficiency requirements for new residential and non-residential uses.	**Consistent.** See discussion under 2016 Title 24 Building Standards Code and California Green Building Standards Code Requirements above.
Senate Bill X7-7	The Water Conservation Act of 2009 sets an overall goal of reducing per capita urban water use by 20 percent by December 31, 2020. Each urban retail water supplier shall develop water use targets to meet this goal. This is an implementing measure of the Water Sector of the AB 32 Scoping Plan. Reduction in water consumption directly reduces the energy necessary and the associated emissions to convene, treat, and distribute the water; it also reduces emissions from wastewater treatment.	**Consistent.** See discussion under 2016 Title 24 Building Standards Code, California Green Building Standards Code Requirements above, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1.
Solid Waste		
California Integrated Waste Management Act (IWMA) of 1989 and Assembly Bill (AB) 341	The IWMA mandated that state agencies develop and implement an integrated waste management plan which outlines the steps to be taken to divert at least 50 percent of their solid waste from disposal facilities. AB 341 directs CalRecycle to develop and adopt regulations for mandatory commercial recycling and sets a statewide goal for 75 percent disposal reduction by the year 2020.	**Consistent.** GHG emissions related to solid waste generation from the Project would benefit from this regulation as it would decrease the overall amount of solid waste disposed of at landfills. The decrease in solid waste would then in return decrease the amount of methane released from the decomposing solid waste. The Project would be served by a solid waste collection and recycling service that include mixed waste processing, and that yields waste diversion results comparable to source separation and consistent with Citywide recycling targets. According to the City of Los Angeles *Zero Waste Progress Report* (March 2013), the City achieved a landfill diversion rate of approximately 76 percent by year 2012.[108]

108 City of Los Angeles, Department of Public Works, LA Sanitation, Zero Waste Progress Report, March 2013, https://bioenergyproducers.files.wordpress.com/2016/11/la-zero-waste-report.pdf . Accessed December 2018.

Sector / Source	Category / Description	Consistency Analysis
Other Sources		
Climate Action Team (CAT) works to coordinate statewide efforts to implement global warming emission reduction programs and the state's Climate Adaptation Strategy.	Reduce diesel-fueled commercial motor vehicle idling.	**Consistent.** The Project would be consistent with the CARB Air Toxics Control Measure to limit heavy duty diesel motor vehicle idling to no more than 5 minutes at any given time. This would also be applicable to the NAT scenario since the underlying Airborne Toxic Control Measure (ATCM) that limits heavy-duty diesel motor vehicle idling (Title 13 California Code of Regulations [CCR], Section 2485) was adopted by CARB in 2004.
	Achieve California's 50 percent waste diversion mandate (Integrated Waste Management Act of 1989) to reduce GHG emissions associated with virgin material extraction.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's waste diversion requirements and the CALGreen Code. The Project would be served by a solid waste collection and recycling service that include mixed waste processing, and that yields waste diversion results comparable to source separation and consistent with Citywide recycling targets.
	Plant five million trees in urban areas by 2020 to effect climate change emission reductions.	**Consistent.** The Project would provide appropriate landscaping on the Project Site including vegetation and approximately 194 trees.
	Implement efficient water management practices and incentives, as saving water saves energy and GHG emissions.	**Consistent.** The Project would meet this requirement as part of its compliance with the City's requirements, the CALGreen Code, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1.
	Reduce GHG emissions from electricity by reducing energy demand. The California Energy Commission updates appliance energy efficiency standards that apply to electrical devices or equipment sold in California. Recent policies have established specific goals for updating the standards; new standards are currently in development.	**Consistent.** The Project would utilize energy efficiency appliances and equipment and would meet or exceed the energy standards in the 2016 Title 24 Building Energy Efficiency Standards and the CALGreen Code or applicable version at the time of building permit issuance, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1.
	Apply strategies that integrate transportation and land-use decisions, including but not limited to promoting jobs/housing proximity, high-density residential/commercial development along transit corridors, and implementing intelligent transportation systems.	**Consistent.** The Project would incorporate physical and operational Project characteristics that would reduce vehicle trips and VMT and encourage alternative modes of transportation for guests and employees. The Project would reduce VMT as a result of its urban infill location, with nearby access to public transportation within a quarter-mile of the Project Site, and its proximity to other destinations including off-site residential, retail, and entertainment (refer to discussion of VMT-reducing Project land use characteristics in subsection 5.2.2.
	Reduce energy use in private buildings.	**Consistent.** The Project would replace older buildings that are energy inefficient with new energy efficient buildings. The Project would utilize energy efficiency appliances and equipment and would meet or exceed the energy standards in the 2016 Title 24 Building Energy Efficiency Standards and the CALGreen Code or applicable version at the time of building permit issuance. Renovated buildings would also utilize energy efficient appliances and equipment consistent with the 2016 Title 24 standards and CALGreen Code or applicable version at the time of building permit issuance, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1.

SOURCE: ESA, 2018.

Furthermore, in addition to the Project's consistency with applicable GHG reduction laws and strategies, the Project would not conflict with the future anticipated statewide GHG reductions goals. CARB has outlined a number of potential strategies for achieving the 2030 reduction target of 40 percent below 1990 levels, as mandated by SB 32. These potential strategies include renewable resources for half of the State's electricity by 2030, increasing the fuel economy of vehicles and the number of zero-emission or hybrid vehicles, reducing the rate of growth in VMT, supporting high-speed rail and other alternative transportation options, and use of high-efficiency appliances, water heaters, and HVAC systems.[109] The Project would benefit from statewide and utility-provider efforts towards increasing the portion of electricity provided from renewable resources. As previously discussed, the utility provider for the Project, LADWP, currently provides 20 percent of electricity via renewable sources but has committed to providing an increasing percentage from renewable sources that exceed the Renewables Portfolio Standard requirements by providing 50 percent by 2025, 55 percent by 2030, and 65 percent by 2036.[110] The Project would use energy-efficient appliances and equipment, water efficient fixtures, and would achieve the LEED Silver Certification level or equivalent as committed to in PDF AQ-1. The Project would also benefit from statewide efforts towards increasing the fuel economy standards of vehicles. The Project would support reducing VMT growth given its location at an infill site close to existing and future transit (including the Red and Purple Lines at the Metro Civic Center/Grand Park Station and future 2nd and Broadway Metro Station being constructed as part of the Regional Connector).

As discussed in **Table 5** above, the Project would be consistent with applicable GHG reduction strategies in the 2017 Climate Change Scoping Plan. The 2017 Scoping Plan also outlines strategies to reduce GHG emissions to achieve the 2030 target from sectors that are not directly controlled or influenced by the Project, but nonetheless contribute to Project-related GHG emissions. For instance, the Project itself is not subject to the Cap-and-Trade regulation; however, Project-related emissions would decline pursuant to the regulation as utility providers and transportation fuel producers are subject to renewable energy standards, Cap-and-Trade, and the LCFS. The 2017 Scoping Plan also calls for the doubling of the energy efficiency savings, including utility demand-response flexibility for 10 percent of residential and commercial electric space heating, water heating, air conditioning and refrigeration. The strategy is in the process of being designed specifically to accommodate existing residential and commercial uses under the CEC's Existing Building Energy Efficiency Action Plan.[111] While CARB is in the process of expanding the regulatory framework to meet the 2030 reduction target based on the existing laws and strategies in the 2017 Scoping Plan, the Project would support or not impede implementation of these potential GHG reduction strategies identified by CARB.

5.1.2 SCAG's 2016 RTP/SCS

Transportation-related GHG emissions would be the largest sector of emissions from the Project. This finding is consistent with the findings in regional plans, such as the SCAG 2016 RTP/SCS, which recognizes that the transportation sector is the largest contributor to the State's GHG emissions. The purpose of the SCAG RTP/SCS is to achieve the regional per capita GHG reduction targets for the passenger vehicle and light-duty truck sector established by CARB pursuant to SB 375. SCAG's Program EIR for the 2016 RTP/SCS, released in December 2015, states that "[e]ach [Metropolitan Planning Organization] is required to prepare an SCS in conjunction to [sic] with the RTP in order to meet these GHG emissions reduction targets by aligning transportation, land use, and housing strategies with respect to [Senate Bill] 375."[112] As part of the 2016 SCS/RTP, "transportation network improvements would be included, and more compact, infill, walkable and mixed-use development strategies to accommodate new region's growth would be encouraged to accommodate increases in population, households, employment, and travel demand."[113] Moreover, the 2016 RTP/SCS states that while "[p]opulation and job growth would induce land use change (development projects) and increase VMT, and would result in direct and indirect GHG emissions," the 2016 RTP/SCS would "supports sustainable growth through a more compact, infill, and walkable development pattern."[114]

Consistent with SCAG's 2016 RTP/SCS alignment of transportation, land use, and housing strategies, the Project would accommodate increases in population, households, employment, and travel demand. As discussed previously, the Project Site is an infill location close to jobs, off-site housing, shopping and entertainment uses and in close proximity to existing and future public transit stops, which would result in reduced VMT, as compared to a project of similar size and land uses at a location without close and walkable access to off-site destinations and public transit stops. As discussed previously, following the calculation protocol from the CAPCOA guidance, based on land use characteristics LUT-1, LUT-2, LUT-4, LUT-9, and SDT-1, in addition to the Transportation Impact Analysis trip rate reductions, the Project's VMT would be reduced by approximately 32.2 percent overall in comparison to the NAT scenario and would be greater than the reduction in transportation emission per capita provided in the 2016 RTP/SCS. Transportation Impact Analysis

As discussed further below, the Project would also be consistent with the following key GHG reduction strategies in SCAG's 2016 RTP/SCS, which are based on changing the region's land use and travel patterns:

- Compact growth in areas accessible to transit;
- New multi-family housing (1,127 residential units) in an infill location with neighborhood-serving retail and restaurant uses;

112 Southern California Association of Governments, Program Environmental Impact Report – 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, 2015, page 3.8-37.

113 Southern California Association of Governments, Program Environmental Impact Report – 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, 2015, page 3.8-35.

114 Southern California Association of Governments, Program Environmental Impact Report – 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, 2015, page 3.8-36.

- Jobs and housing closer to transit;
- New housing and job growth focused in HQTAs; and
- Biking and walking infrastructure to improve active transportation options and transit access.

The Project represents an infill development within an existing urbanized area that would concentrate new residential and neighborhood-serving commercial retail and restaurant uses within an HQTA, which is defined by the 2016 RTP/SCS as generally walkable transit villages or corridors that are within 0.5 mile of a well-serviced transit stop or a transit corridor with 15-minute or less service frequency during peak commute hours. The Project Site is located within a quarter-mile of public transportation, including the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line and the future 2nd and Broadway Metro Station being constructed as part of the Regional Connector Project. The Project is also within a quarter mile of many Metro bus routes (e.g., local 2, 4, 10, 28, 81, 83, 90, 91, 94, and 302, which run northbound along Hill and Lines 30, 33, 40, 45, 68, 83, 84, 92, and 330, which run southbound along Spring Street), LADOT's Dash Downtown "D" line, and Metro's Rapid Lines 728, 733, 745, and 770. In addition, the Project would also provide bicycle storage areas for Project residents and guests. The Project would provide residents and visitors with access to public transit and opportunities for walking and biking, which would facilitate a reduction in VMT and related vehicular GHG emissions. These and other measures would further promote a reduction in VMT and subsequent reduction in GHG emissions, which would be consistent with the goals of SCAG's 2016 RTP/SCS.

The estimated reduction in VMT (refer to discussion of VMT-reducing Project land use characteristics in subsection 5.2.2) for the Project is supported by area-specific data in the Health Atlas, published by the City in June 2013.[115] The Health Atlas is not a plan specifically developed to reduce GHG emissions. Nonetheless, while the primary focus of the Health Atlas is on factors that affect the health behaviors and health status of residents and workers in the City, some of the data is relevant to land use GHG emissions as those emissions reflect similar issues regarding land use patterns, urban design, and transportation systems. Data from the Health Atlas regarding the land use diversity, employment density, walkability, and transportation options for the Central City Community Plan Area is used to provide additional location-specific supporting evidence with respect to the Project's land use characteristics that would minimize VMT and that would support regional planning efforts in accordance with SCAG's 2016 RTP/SCS to reduce VMT and associated emissions.

As detailed below, data collected by the City in support of its Health Atlas demonstrates that the Project would be located in an area that would substantially reduce mobile source GHG emissions relative to the citywide and statewide average. The Health Atlas includes a number of findings related to land use mix and diversity, employment density, walkability, access to public transit, and other land use transportation findings organized by Community Plan Area. The Project is

115 City of Los Angeles, Health Atlas for the City of Los Angeles, June 2013, http://healthyplan.la/the-health-atlas/. Accessed December 2018.

located in the Central City Community Plan Area. A summary and analysis of the Health Atlas findings relative to the Central City Community Plan Area are provided below.

- **Land Use Diversity:** The Health Atlas evaluates land use diversity based on the presence of 19 types of uses or amenities, including supermarkets, convenience stores, banks, gyms, department stores, farmer's markets, libraries, and parks, grouped into four categories: food retail, community-serving retail, services, civic and community facility. The Central City Community Plan Area scored relatively high out of the 35 Community Plan Areas, indicating that the area has a high number of different types of amenities available in the Community Plan Area (a score of 11, which is in the highest one-third of the scores). The data indicates that the Central City Community Plan Area has a high potential for walkability and offers a high number of destinations available for non-motorized trips. These findings are substantiated by the CAPCOA guidance, *Quantifying Greenhouse Gas Mitigation Measures*. CAPCOA measure LUT-3 (Increase Diversity of Urban and Suburban Developments [Mixed Use]) states that "different types of land uses near one another can decrease VMT since trips between land use types are shorter and may be accommodated by non-auto modes of transport."[116] These land use diversity characteristics also relate to the goals and benefits of the SCAG 2016 RTP/SCS, which seeks improved access and mobility by placing "destinations closer together, thereby decreasing the time and cost of traveling between them."[117] According to SCAG, giving people more transportation choices and providing greater opportunities for biking and walking reduces the number of people who drive alone and encourages people to use alternative modes of travel.[118] The high scores for the number of destinations available for non-motorized trips within the Central City Community Plan Area supports the expectation that projects located in the area would achieve substantial reductions in VMT and associated mobile source emissions relative to the citywide average. Therefore, based on City data and expert guidance from state and regional agencies, the Project would result in a substantial reduction in emissions from mobile sources and would have a substantially greater level of transportation efficiency when compared to the citywide and statewide average. Furthermore, the land use diversity scores for the Central City Community Plan Area in the Health Atlas indicate that the Project would be located in an area consistent with the regional SCAG 2016 RTP/SCS goals to improve mobility and access to diverse destinations, and to reduce vehicular demand and associated emissions.

- **Employment Density**: The Health Atlas evaluates employment density as the number of jobs per square mile. The Central City Community Plan Area has the highest employment density of the 35 Community Plan Areas in the city with nearly 80,000 jobs per square mile. The citywide average employee density is approximately 1,185 jobs per square mile.[119] The data indicates that the Central City Community Plan Area has a high potential for walkability and making use of frequent and comprehensive transit services, such as the Metro Red Line and connecting bus lines. These findings are substantiated by the CAPCOA guidance measure LUT-1 (Increase Density), which states that "[i]ncreased densities affect the distance people

116 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, page 162.

117 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 16.

118 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 14.

119 City of Los Angeles, Health Atlas for the City of Los Angeles, page 102.

travel and provide greater options for the mode of travel they choose."[120] Measure LUT-1 also states that increased densities "provides a foundation for implementation of many other strategies which would benefit from increased densities" such as "enhanced transit service."[121] The Health Atlas employment density findings are also related to the goals and benefits of the SCAG 2016 RTP/SCS, which seeks improved mobility and access and implementation of land use strategies that encourage walking, biking, and transit use, resulting in reduced vehicular demand and associated pollutant emissions.[122] The high employment density of the Central City Community Plan Area supports the expectation that projects located in the area would have high levels of walkability and high potential for transit usage. As a result, the Project would be expected to achieve substantial reductions in VMT and associated mobile source emissions relative to the citywide and statewide average. Therefore, based on city data and expert guidance from state and regional agencies, the Project's location in an employment dense area would result in a substantial reduction in emissions from mobile sources and would have a substantially greater level of transportation efficiency when compared to the citywide and statewide average. Furthermore, the land employment density score for the Central City Community Plan Area in the Health Atlas indicates that the Project would be located in an area consistent with the regional SCAG 2016 RTP/SCS goals to improve mobility and access to diverse destinations, and to reduce vehicular demand and associated emissions.

- **Walkability:** The Health Atlas provides a quantitative analysis of the walkability of each Community Plan Area using a Walkability Index based on four components: land use mix, residential density, retail density, and intersection density. Higher scores represent more walkable areas. The Central City Community Plan Area has the highest Walkability Index of the 35 Community Plan Areas in the city. Furthermore, as discussed previously, the walkability score for the Project area, as quantified by WalkScore.com, is approximately 91 points[123] out of a possible 100, compared to the citywide score of 67 points. The data indicates that the Central City Community Plan Area is a highly walkable area. These findings are substantiated by the CAPCOA guidance measure LUT-9 (Improve Design of Development), which indicates that design elements that enhance walkability and connectivity, such as intersection density, reduce VMT and associated GHG emissions. The Health Atlas findings are also related to the goals and benefits of the SCAG RTP/SCS, which seeks better "placemaking," defined as "the process of developing options for locations where they can live and work that include a pleasant and convenient walking environment that reduces their reliance on their car."[124] The high Walkability Index of the Central City Community Plan Area supports the expectation that projects located in the area would have a highly walkable environment. As a result, the Project would be expected to achieve substantial reductions in VMT and associated mobile source emissions relative to the citywide and statewide average. Therefore, based on city data and expert guidance from state

120 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, page 155.

121 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, page 155.

122 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, pages 13-15.

123 WalkScore.com (www.walkscore.com) rates the Project Site area (202 W 1st Street, Los Angeles, CA 90012) with a score of 91 of 100 possible points (scores accessed on November 8, 2017). Walk Score calculates the walkability of specific addresses by taking into account the ease of living in the neighborhood with a reduced reliance on automobile travel.

124 Southern California Association of Governments, 2012-2035 Regional Transportation Plan/Sustainable Communities Strategy, page 112, http://rtpscs.scag.ca.gov/Documents/2012/final/f2012RTPSCS.pdf. Accessed December 2018.

and regional agencies, the Project's location in a walkable area would result in a substantial reduction in emissions from mobile sources and would have a substantially greater level of transportation efficiency when compared to the citywide and statewide average. Furthermore, the land employment density score for the Central City Community Plan Area in the Health Atlas indicates that the Project would be located in an area consistent with the regional SCAG 2016 RTP/SCS goals to provide better "placemaking" and to reduce vehicular demand and associated emissions.

- **Workers Commuting by Walking, Biking, and Public Transportation:** The Health Atlas also indicates that the Central City Community Plan Area has a high percentage of workers that commute to work by walking, biking, and public transportation. The Central City Community Plan Area has the 2nd highest percentage of workers that commute to work by walking, biking, and public transportation, at about 37 percent for the area as a whole, based on 2010 data. The statewide percentage of workers that commute to work by walking, biking, and public transportation is approximately 9 percent, based on census data for the 2010 to 2014 period.[125] As discussed previously, the Central City Community Plan Area is a highly walkable area and the area is also well served by frequent and comprehensive transit including the Metro Blue, Expo, Red, Purple, and Gold Lines, which provides convenient access to locations within Downtown Los Angeles and a multitude of locations outside the downtown area, and multiple bus lines. Thus, the data indicates that the Central City Community Plan Area substantially exceeds the statewide average for the percentage of workers that commute to work by walking, biking, and public transportation. The Health Atlas findings are further substantiated by the CAPCOA guidance measures LUT-1, LUT-3, and LUT-9, as discussed previously, and also by LUT-5 (Increase Transit Accessibility), which indicates that "high density near transit will facilitate the use of transit by people."[126] The Health Atlas findings are also related to the goals and benefits of the SCAG 2016 RTP/SCS, which seeks to implement "strategies focused on compact infill development, superior placemaking (the process of creating public spaces that are appealing), and expanded housing and transportation choices"[127] The high proportion of workers that commute to work by walking, biking, and public transportation in the Central City Community Plan Area supports the expectation that projects located in the area would be accessible to alternative forms of transportation. As a result, the Project would be expected to achieve substantial reductions in VMT and associated mobile source emissions relative to the citywide and statewide average. Therefore, based on city data and expert guidance from state and regional agencies, the Project's location in an area accessible to alternative forms of transportation including walking, bicycling, and transit, and with the Project's incorporation of the Paseo through the Project Site connecting 1st and 2nd Streets, would result in a substantial reduction in emissions from mobile sources and would have a substantially greater level of transportation efficiency and increase the walkability of the area when compared to the citywide and statewide average. Furthermore, the Project would be located in an area

125 United States Census Bureau, American FactFinder, Data Set B08301 (Means of Transportation to Work, California, 2010-2014), https://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?pid=ACS_14_5YR_B08301&prodType=table. Accessed December 2018.

126 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, page 171.

127 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 14.

consistent with the regional SCAG 2016 RTP/SCS goals to provide more transportation choices and to reduce vehicular demand and associated emissions.

As discussed in the above analysis and below in **Table 6**, *Consistency with Applicable 2016 SCAG RTP/SCS Actions and Strategies*, the Project would be consistent with and support the goals and benefits of the SCAG 2016 RTP/SCS, which seeks "improved mobility and accessibility… to reach desired destinations with relative ease and within a reasonable time, using reasonably available transportation choices."[128] The SCAG 2016 RTP/SCS seeks to implement "strategies focused on compact infill development, superior placemaking (the process of creating public spaces that are appealing), and expanded housing and transportation choices."[129] The Project would concentrate new multi-family housing and neighborhood-serving commercial retail and restaurant uses within an HQTA in an urban infill location in proximity to multiple public transit stops. The Project would also provide bicycle storage areas for Project residents and guests, and a mid-block pedestrian paseo, which would support active transportation options and transit access. The high scores for walkability and number of destinations available for non-motorized trips within the Central City Community Plan Area indicate that the existing infrastructure and built environment is sufficiently developed such that projects located in the area would be expected to achieve substantial and credible reductions in trip distances and overall VMT. The high employment density of the Central City Community Plan Area supports the expectation that projects located in the area would provide high levels of walkability and high potential for transit usage by Project employees and visitors. The high number of workers that commute to work by walking, biking, and public transportation in the Central City Community Plan Area is additional proof that projects located in the area would provide access to more transportation choices for Project employees and visitors and that projects would have a substantially greater level of transportation efficiency when compared to the citywide and statewide average.

At the regional level, the 2016 RTP/SCS is an applicable plan adopted for the purpose of reducing GHGs. In order to assess the Project's potential to conflict with 2016 RTP/SCS, this section analyzes the Project's land use assumptions for consistency with those utilized by SCAG in its SCS. **Table 6** contains a list of GHG-reducing actions and strategies from the 2016 SCAG RTP/SCS that are applicable to the Project. The analysis describes the consistency of the Project with these strategies. Generally, projects are considered consistent with the provisions and general policies of applicable City and regional land use plans and regulations, such as SCAG's SCS, if they are compatible with the general intent of the plans and would not preclude the attainment of their primary goals. **Table 6** demonstrates the Project's consistency with the Actions and Strategies set forth in the 2016 RTP/SCS. As discussed further below, the Project would be consistent with the SCAG 2016 RTP/SCS goals and benefits intended to improve mobility and access to diverse destinations, provide better "placemaking," provide more transportation choices, and reduce vehicular demand and associated emissions. Therefore, the

128 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 160.

129 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 14.

Project would be consistent with the GHG reduction-related actions and strategies contained in the 2016 RTP/SCS.

TABLE 6
CONSISTENCY WITH APPLICABLE 2016 SCAG RTP/SCS ACTIONS AND STRATEGIES

Actions and Strategies	Responsible Party(ies)	Consistency Analysis
Land Use Actions and Strategies		
Encourage the use of range-limited battery electric and other alternative fueled vehicles through policies and programs, such as, but not limited to, neighborhood oriented development, complete streets, and Electric (and other alternative fuel) Vehicle Supply Equipment in public parking lots.	Local Jurisdictions, COGs, SCAG, CTCs	**Consistent.** While the use of alternative-fueled vehicles is beyond the direct control or influence of the Project, the Project would not impair the City's or SCAG's ability to encourage the use of alternative-fueled vehicles through various policies and programs. Specifically, the Project would support a land use pattern that provides increased opportunity of use of alternative transportation modes. Additionally, the Project would encourage the use of alternative-fueled vehicles by designating a minimum of10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations.
Support projects, programs, and policies that support active and healthy community environments that encourage safe walking, bicycling, and physical activity by children, including, but not limited to development of complete streets, school siting policies, joint use agreements, and bicycle and pedestrian safety education.	Local Jurisdictions, SCAG	**Consistent.** The Project would facilitate pedestrian and bicycle movements including through the ground level Paseo and around the Project Site and would provide 1,274 bicycle spaces. It would also connect to the surrounding commercial and recreational areas where the Project provided pedestrian paseo leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a connection to First and Broadway Civic Center Park. The Project would locate residential, commercial, retail, and restaurant uses within an area that has public transit, employment opportunities, restaurants and entertainment all within walking distance.
Collaborate with the region's public health professionals to enhance how SCAG addresses public health issues in its regional planning, programming, and project development activities.	SCAG, State, Local Jurisdictions	**Consistent.** The Project would not impair the City's, SCAG's, or the State's ability to collaborate with the region's public health professionals regarding the integration of public health issues in regional planning. The Project would also incorporate measures to reduce air pollutant emissions, minimize hazards, and ensure water quality. As an example, the Project would comply with fugitive dust control measures included in SCAQMD Rule 403. The Project would result in a potentially significant air quality impact during construction from exhaust emissions of nitrogen oxides (NO_X) (refer to Section IV.B, *Air Quality*, of the Project's Draft EIR). However, the Project would be required to implement mitigation measure MM AQ-1 requiring the use of construction equipment that meet the most stringent Tier 4 emissions standards, which would reduce emissions to less than significant with the exception of exception of a temporary and short-term NO_X emissions impact that would be significant and unavoidable during the continuous concrete pour foundation activities lasting up to approximately four days.

Actions and Strategies	Responsible Party(ies)	Consistency Analysis
Update local zoning codes, General Plans, and other regulatory policies to promote a more balanced mix of residential, commercial, industrial, recreational and institutional uses located to provide options and to contribute to the resiliency and vitality of neighborhoods and districts.	Local Jurisdictions	**Consistent.** The Project would support this action/strategy by creating a mixed-use infill development comprising complementary uses that offer employment and other community-serving opportunities. The Project would support the development of complete communities by co-locating complementary commercial/restaurant and residential land uses in close proximity to existing off-site commercial and residential uses, being located within a quarter-mile of off-site commercial and residential uses, and being located in a highly walkable area well-served by transit within a quarter-mile of the Project Site.
Support projects, programs, policies and regulations that encourage the development of complete communities, which includes a diversity of housing choices and educational opportunities, jobs for a variety of skills and education, recreation and culture, and a full-range of shopping, entertainment and services all within a relatively short distance.	Local Jurisdictions, SCAG	**Consistent.** The Project would support the development of complete communities by co-locating complementary commercial and residential land uses in close proximity to existing off-site commercial and residential uses, and being located in a highly walkable area served by frequent and comprehensive transit within a quarter-mile of the Project Site. The increases in land use diversity and mix of uses on the Project Site would reduce vehicle trips and VMT by encouraging walking and non-automotive forms of transportation, which would result in corresponding reductions in transportation-related emissions.
Pursue joint development opportunities to encourage the development of housing and-mixed use projects around existing and planned rail stations or along high-frequency bus corridors, in transit-oriented development areas, and in neighborhood-serving commercial areas.	Local Jurisdictions, CTCs	**Not Applicable.** This strategy is not applicable to the Project because it is not a joint development. However, the Project would generally support the intent of this strategy because it would be located within a quarter mile of the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line, and provides further connection to the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station, as well as the future 2nd and Broadway Metro Station being constructed as part of the Regional Connector; multiple bus and shuttle lines; the regional freeway system; bicycle lanes; and an established pedestrian grid; would maximize mobility and the accessibility to the Project Site. Additionally, the Project would provide distinctive sidewalks, landscaping, wayfinding signage, neighborhood-serving commercial uses, and outdoor activity to attract and serve Civic Center visitors and neighborhood residents.
Consider developing healthy community or active design guidelines that promote physical activity and improved health.	Local Jurisdictions	**Consistent.** The Project would facilitate pedestrian and bicycle movements through and around the Project Site where the Project provided pedestrian paseo leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a connection to First and Broadway Civic Center Park, and the Project would provide 1,274 bicycle parking spaces It would also connect to the surrounding commercial and recreational areas, and would provide onsite amenities, such as open space and a gym, that encourage recreational opportunities. The Project would locate residential, retail, and restaurant uses within an area that has public transit, and employment opportunities, restaurants and entertainment all within walking distance.

Actions and Strategies	Responsible Party(ies)	Consistency Analysis
Create incentives for local jurisdictions and agencies that support land use policies and housing options that achieve the goals of SB 375.	State, SCAG	**Not Applicable.** This strategy is not applicable to the Project because implementation is the responsibility of local jurisdictions and agencies and not private developers. However, the Project would generally support the intent of this strategy because the Project would be consistent with the goals of SB 375, including the goal to reduce VMT and the corresponding emission of GHGs. The Project would locate complementary commercial/restaurant and residential land uses in close proximity to existing off-site commercial and residential uses, being located within a quarter-mile of off-site commercial and residential uses, and being located in HQTA as designated by SCAG, which is a highly walkable area served by frequent and comprehensive transit within a quarter-mile of the Project Site.[130] The increases in land use diversity and mix of uses on the Project Site would reduce vehicle trips and VMT by encouraging walking and non-automotive forms of transportation, which would result in corresponding reductions in transportation-related emissions.
Transportation Network Actions and Strategies		
Prioritize transportation investments to support compact infill development that includes a mix of land uses, housing options, and open/park space, where appropriate, to maximize the benefits for existing communities, especially vulnerable populations, and to minimize any negative impacts.	SCAG, CTCs, Local Jurisdictions	**Consistent.** The Project provides a mix of uses, including 1,127 residential units and multiple commercial/retail uses including office space, restaurants and a grocery store. The Project would provide open space amenities available to residents of the North and South Towers, which would include landscaping, a pool deck, a dog run, cabanas, steam room and sauna, and tables and seating, and would also provide a publicly accessible Paseo running between W. 1st Street and W. 2nd Street. The Project Site is an infill location close to jobs, off-site housing, shopping and entertainment uses and in close proximity to existing and future public transit stops, which would result in reduced VMT, as compared to a project of similar size and land uses at a location without close and walkable access to off-site destinations and public transit stops. The proximity of the Project to alternative transit modes, including regional rail and bus lines, would support the region's transportation investment and the sustainability of the regional transportation system.
Explore and implement innovative strategies and projects that enhance mobility and air quality, including those that increase the walkability of communities and accessibility to transit via non-auto modes, including walking, bicycling, and neighborhood electric vehicles (NEVs) or other alternative fueled vehicles.		**Consistent.** The Project would facilitate pedestrian and bicycle movements through and around the Project Site where the Project provided pedestrian paseo leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a connection to First and Broadway Civic Center Park, and the Project would provide 1,274 bicycle parking spaces. It would also connect to the surrounding commercial and recreational areas. The Project would locate residential, retail, office and restaurant uses within an area that is well-served by public transit, and employment opportunities, restaurants and entertainment all within walking distance. Further, the Project would promote the use of electric vehicles by designating a minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations.

130 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 77.

Actions and Strategies	Responsible Party(ies)	Consistency Analysis
Collaborate with local jurisdictions to plan and develop residential and employment development around current and planned transit stations and neighborhood commercial centers.	SCAG, CTCs, Local Jurisdictions	**Consistent.** Project would intensify development in an area served by the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line, and provides further connection to the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station, as well as the future 2nd and Broadway Metro Station being constructed as part of the Metro Regional Connector project; the regional freeway system; and multiple bus and shuttle lines. Furthermore, the Project would provide a high-density residential and retail/restaurant use in an area with pedestrian access to a large range of entertainment and commercial uses opportunities in downtown Los Angeles.
Collaborate with local jurisdictions to provide a network of local community circulators that serve new TOD, HQTAs, and neighborhood commercial centers providing an incentive for residents and employees to make trips on transit.	SCAG, CTCs, Local Jurisdictions	**Not Applicable.** This strategy is not applicable to the Project because implementation is the responsibility of local jurisdictions and agencies and not private developers. However, the Project would generally support the intent of this strategy because the Project would locate complementary commercial and residential uses in close proximity to existing off-site commercial and residential uses, within a quarter-mile of off-site commercial and residential uses, in a highly walkable area well-served by transit, as the Project is located in an HQTA as designated by SCAG.[131] The increases in land use diversity and mix of uses on the Project Site would reduce vehicle trips and VMT by encouraging walking and other non-automotive forms of transportation, which would result in corresponding reductions in transportation-related emissions. The Project would improve pedestrian connectivity by providing a mid-block paseo between W. 1st Street and W. 2nd Street. Further, the Project would provide distinctive sidewalks, landscaping, wayfinding signage, ground-floor retail uses, and outdoor activity areas to attract and accommodate Civic Center visitors and neighborhood residents.

131 Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 77.

Actions and Strategies	Responsible Party(ies)	Consistency Analysis
Develop first-mile/last-mile strategies on a local level to provide an incentive for making trips by transit, bicycling, walking, or neighborhood electric vehicle or other ZEV options.	CTCs, Local Jurisdictions	**Consistent.** The Project would facilitate pedestrian and bicycle movements through and around the Project Site where the Project provided pedestrian paseo leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a connection to First and Broadway Civic Center Park, and the Project would provide 1,274 bicycle parking spaces The Project would designate a minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations . The Project would provide residents and retail/restaurant visitors with available LADOT and Metro regional transit information through the Transportation Demand Management (TDM) program (finalized TDM program to be reviewed and approved by the LADOT). The TDM program would incorporate commute trip reduction (CTR) marketing that may include: new employee orientation of trip reduction and alternative mode options, event promotions, and publications. The Project's TDM may also include providing on-site car share amenities, and providing rideshare program and a rideshare information center that provides assistance for Project employees and tenants regarding forming carpools or accessing transit alternatives (refer to Section IV.P, *Transportation and Traffic,* of the Project's Draft EIR, for additional information).
Encourage transit fare discounts and local vendor product and service discounts for residents and employees of TOD/HQTAs or for a jurisdiction's local residents in general who have fare media.	Local Jurisdictions	**Consistent.** The Project is located in a HQTA as designated by SCAG. In addition, the Project TDM program (finalized TDM program to be reviewed and approved by the LADOT) would include a variety of measures that would promote transit use by residents and employees through incentives. Incentives would be analyzed in the Project TDM and could include transit fare discounts (refer to Section IV.P, *Transportation and Traffic*, of the Project's Draft EIR for additional information).
Continue to support the California Interregional Blueprint as a plan that links statewide transportation goals and regional transportation and land use goals to produce a unified transportation strategy.	SCAG	**Not Applicable.** This strategy is not applicable to the Project because implementation is the responsibility of local jurisdictions and agencies and not private developers. However, the Project would generally support transportation and land use goals via the development of a mixed-use commercial and residential project in close proximity to existing off-site commercial and residential and commercial uses, and existing and future public transit. In addition, the Project is located in a HQTA, which is defined by the 2016 RTP/SCS as generally walkable transit villages or corridors that are within 0.5 mile of a well-serviced transit stop or transit corridor with 15-minute or less service frequency during peak commute hours.[132]
Transportation Demand Management (TDM) Actions and Strategies		
Support work-based programs that encourage emission reduction strategies and incentivize active transportation commuting or ride-share modes.	SCAG, Local Jurisdictions	**Consistent.** As part of the TDM program (finalized TDM program to be reviewed and approved by the LADOT), the Project would include programs that encourage emission reduction strategies, such as carpools and rideshare, bicycle by providing racks and showers, incentives for use of alternative travel modes, and parking incentives for carpools/vanpools.

[132] Southern California Association of Governments, The 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, pages 75-77.

Actions and Strategies	Responsible Party(ies)	Consistency Analysis
Develop infrastructure plans and educational programs to promote active transportation options and other alternative fueled vehicles, such as neighborhood electric vehicles (NEVs), and consider collaboration with local public health departments, walking/biking coalitions, and/or Safe Routes to School initiatives, which may already have components of such educational programs in place.	Local Jurisdictions	**Consistent.** As part of the TDM program (finalized TDM program to be reviewed and approved by the LADOT), the Project would incorporate commute trip reduction (CTR) marketing that may include: new employee orientation of trip reduction and alternative mode options, event promotions, and publications. The Project's TDM may also include providing on-site car share amenities, and providing rideshare program and a rideshare information center that provides assistance for Project employees and tenants regarding forming carpools or accessing transit alternatives.
Clean Vehicle Technology Actions and Strategies		
Support subregional strategies to develop infrastructure and supportive land uses to accelerate fleet conversion to electric or other near zero-emission technologies. The activities committed in the two subregions (Western Riverside COG and South Bay Cities COG) are put forward as best practices that others can adopt in the future.	SCAG, Local Jurisdictions	**Consistent.** As discussed above, while the use of alternative-fueled vehicles is beyond the direct control or influence of the Project, the Project would not impair the City's or SCAG's ability to encourage the use of alternative-fueled vehicles through various policies and programs. Specifically, the Project would support a land use pattern that provides increased opportunity of use of alternative transportation modes by adding a high-density mixed-use development in downtown area located near transit and nearby land uses including retail, entertainment destinations, employment, etc. Additionally, the Project would encourage the use of alternative-fueled vehicles by designating a minimum of 8 percent of on-site parking for carpool and/or alternative-fueled vehicles, and the Project design would provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces.

SOURCE: ESA, 2018.

5.1.3 City of Los Angeles LA Green Plan

The Project would be consistent with the City of Los Angeles *Green LA: An Action Plan to Lead the Nation in Fighting Global Warming* (LA Green Plan). The LA Green Plan outlines the goals and actions the City has established to reduce the generation and emission of GHGs from both public and private activities. **Table 7**, *Consistency with City of Los Angeles LA Green Plan*, provides a discussion of the Project's consistency with applicable GHG-reducing actions from the LA Green Plan. As discussed below, the Project would be consistent with the applicable goals and actions of the LA Green Plan.

5.1.4 City of Los Angeles Sustainable City pLAn

As discussed above, the Sustainable City pLAn includes both short-term and long-term aspirations through the year 2035 in various topic areas, including: water, solar power, energy-efficient buildings, carbon and climate leadership, waste and landfills, housing and development, mobility and transit, and air quality, among others. The Sustainable City pLAn provides information as to what the City will do with buildings and infrastructure in their control. Specific targets related to housing and development, and mobility and transit, include the construction of new housing units within 1,500 feet of transit by 2017, reducing vehicle miles traveled per capita by five percent by 2025, and increasing trips made by walking, biking or transit by at least 35 percent by 2025. As discussed in **Table 8**, *Consistency with City of Los Angeles Sustainable City*

pLAn, the Project would generally comply with these aspirations as the Project. Therefore, the Project would be consistent with the Sustainable City pLAn.

TABLE 7
CONSISTENCY WITH CITY OF LOS ANGELES GREEN LA PLAN

Action		Description	Consistency Analysis
Focus Area: Energy			
E6	Present a comprehensive set of green building policies to guide and support private sector development.	The City embarked on an effort to establish green building requirements, paired with incentives, for medium- to large-private projects. Buildings account for a majority of electricity use. Each building site is a microcosm of the environmental issues faced by the City, so addressing each site in a comprehensive manner will provide a variety of environmental benefits.	**Consistent.** The Project would be designed and operated to meet or exceed the applicable requirements of the State of California Green Building Standards Code, the City of Los Angeles Green Building Code, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1. The Project would incorporate energy efficiency measures as outlined in PDF AQ-1 and PDF AQ-2. As a result, the Project would be consistent with City's green building policies.
Focus Area: Water			
W1	Meet all additional demand for water resulting from growth through water conservation and recycling.	The Mayor's Office and LADWP developed the *Securing LA's Water Future* plan, which is an aggressive, multi-faceted approach to developing a locally sustainable water supply. The plan includes a set of key short-term and long-term strategies to secure our water future, such as: Short-Term Conservation Strategies: • Enforcing prohibited uses of water (levying fines and sanctions against water abusers and increase water conservation awareness). • Expanding the list of prohibited uses of water (possible further restrictions on watering landscape and washing/rinsing vehicles without a self-closing nozzle). • Extending outreach efforts, water conservation incentives, and rebates. • Encouraging regional conservation measures (encourage all water agencies in the region to adopt water conservation ordinances which include prohibited uses and enforcement). Long-Term Conservation Strategies: • Increasing water conservation through reduction of outdoor water use and new technology. • Maximizing water recycling. • Enhancing stormwater capture • Accelerating clean-up of the groundwater basin. • Expanding groundwater storage.	**Consistent.** While this action primarily applies to the City and LADWP, the Project would comply with the applicable requirements of the State of California Green Building Standards Code and the City of Los Angeles Green Building Code and incorporate water efficiency measures defined in PDF AQ-1, PDF AQ-2 and PDF WS-1. The reductions would be achieved through the installation of water efficient fixtures that exceed applicable standards, drought-tolerant/California native plant species selection, irrigation system efficiency. As a result, the Project would be consistent with the applicable short- and long-term water conservation strategies.
W2	Reduce per capita water consumption by 20 percent.	See W1, above.	See W1, above.

Action		Description	Consistency Analysis
W3	Implement the City's innovative water and wastewater integrated resources plan that will increase conservation, and maximize use of recycled water, including capture and reuse of stormwater.	See W1, above.	See W1, above.
Focus Area: Transportation			
T8	Promote walking and biking to work, within neighborhoods, and to large events and venues.	Promoting alternate modes of travel will reduce the carbon emissions associated with single occupancy vehicles (SOVs). As described in Action Items LU1 and LU2, the City is promoting high-density and mixed-use housing close to major transportation arteries. Such developments will also support the advancement of Action Item T8, by improving accessibility for those who wish to walk and bike to work.	**Consistent.** The Project would facilitate pedestrian and bicycle movements through and around the Project Site where the Project provided pedestrian paseo leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a connection to First and Broadway Civic Center Park, and the Project would provide 1,274 bicycle parking spaces. It would also connect to the surrounding commercial and recreational areas. The Project would locate residential, retail, and restaurant uses within an area that is well-served by public transit, and has employment opportunities, restaurants and entertainment within walking distance. As a result, the Project would be consistent with this action.
Focus Area: Land Use			
LU1	Promote high-density housing close to major transportation arteries.	Promoting higher density housing in areas close to transportation stops is an important component of the City's General Plan. Higher density housing with good access to transit helps accommodate the City's growing population and helps relieve traffic congestion, by increasing ridership on public transit.	**Consistent.** The Project's residential uses are proposed on a Project Site in an urban infill location within the Downtown area of the City of Los Angeles. The Project would be located in a highly walkable area well-served by transit within a quarter-mile of the Project Site, including the existing Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line, and provides further connection to the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station, as well as the future 2nd and Broadway Metro Station being constructed as part of the Metro Regional Connector project; the regional freeway system; and multiple bus and shuttle lines. The Project's location and design are consistent with this City action.
LU2	Promote and implement transit-oriented development (TOD).	Transit Oriented Districts represent opportunities for creating cohesive, vibrant, walkable communities where fragmented, auto-dependent corridors now exist. TODs are a positive alternative to low-density traditional land use patterns that typically segregate housing, jobs and neighborhood services from one another. In contrast, TODs cluster these community elements in close proximity, so a greater portion of trips can be made by transit, bike, or on foot.	**Consistent.** The Project has many TOD features, such as co-locating complementary office, restaurant and residential land uses in close to proximity to existing off-site commercial and residential uses, being located within a quarter-mile of off-site commercial and residential uses, and being located in a highly walkable area well-served by transit within a quarter-mile of the Project Site. The increases in land use diversity and mix of uses on the Project Site would reduce vehicle trips and VMT by encouraging walking and non-automotive forms of transportation, which would result in corresponding reductions in transportation-related emissions. As a result, the Project is consistent with this City action.

Action		Description	Consistency Analysis
Focus Area: Waste			
WsT1	Reduce or recycle 70% of trash by 2015.	Source reduction and recycling programs not only conserve natural resources and landfill space, but also confer climate benefits.	**Consistent.** The Project would be served by a solid waste collection and recycling service that will include mixed waste processing, and that yields waste diversion results comparable to source separation and consistent with citywide recycling targets. According to the City of Los Angeles *Zero Waste Progress Report* (March 2013), the City achieved a landfill diversion rate of approximately 76 percent by year 2012.[133] The Project would also comply with the City of Los Angeles Space Allocation Ordinance (171,687) which requires that developments include a recycling area or a room of a specified size on the Project Site.

SOURCE: City of Los Angeles, LA Green Plan, 2008; ESA, 2018.

TABLE 8
CONSISTENCY WITH CITY OF LOS ANGELES SUSTAINABLE CITY PLAN

Action	Description	Consistency Analysis
Focus Area: Environment		
Local Water	Lead the nation in water conservation and source the majority of water locally.	**Consistent**. The Project would comply with the applicable requirements of the State of California Green Building Standards Code and the City of Los Angeles Green Building Code and incorporate water efficiency measures as defined in the PDF WS-1. The reductions would be achieved through the installation of water efficient fixtures that exceed applicable standards, drought-tolerant/California native plant species selection, and irrigation system efficiency. The Project would not impair the City's and LADWP's ability to provide locally sourced water.
Local Solar	Increase Los Angeles' clean and resilient energy supplies by capturing energy from abundant sunshine.	**Consistent**. Building rooftop areas without landscaping, pool, deck, garden or other improvements will be constructed as solar-ready for the future installation of on-site solar photovoltaic (PV) or solar water heating (SWH) systems as required by the 2016 Title 24 Building Energy Efficiency Standards or applicable version at the time of building permit issuance.
Energy Efficient Buildings	Save money and energy by increasing the efficiency of buildings.	**Consistent**. The Project would be designed and operated to meet or exceed the applicable requirements of the State of California Green Building Standards Code, the City of Los Angeles Green Building Code, and LEED Silver Certification Requirements or equivalent as committed to in PDF AQ-1. The Project would incorporate energy efficiency measures as defined in the PDF AQ-1 and PDF AQ-2.

133 City of Los Angeles Department of Public Works, LA Sanitation, Zero Waste Progress Report, March 2013.

Action	Description	Consistency Analysis
Carbon and Climate Leadership	As a proactive leader on climate issues, strengthen Los Angeles' economy by dramatically reducing GHG emissions and rallying other cities to follow Los Angeles' lead.	**Consistent**. The Project would be designed to incorporate energy and water efficient designs that meet or exceed the 2016 Title 24 Building Energy Efficiency Standards and CALGreen Code standards and incorporate energy and water efficiency measures as defined in the PDF AQ-1, PDF AQ-2, and PDF WS-1, which would result in GHG emissions reductions. The Project would also be located in an area well served by multiple public transportation options and in a highly walkable environment, which would reduce transportation-related GHG emissions. Following the calculation protocol from the CAPCOA guidance, based on land use characteristics LUT-1, LUT-2, LUT-4, LUT-9, and SDT-1, in addition to the Transportation Impact Analysis trip rate reductions, the Project's VMT would be reduced by approximately 32.2 percent overall.
Waste and Landfills	Become the first big city in the United States to achieve zero-waste, and recycle and reuse most of its waste locally.	**Consistent**. The Project would be served by a solid waste collection and recycling service that may include mixed waste processing, and that yields waste diversion results comparable to source separation and consistent with citywide recycling targets. The Project would also comply with the City of Los Angeles Space Allocation Ordinance (171,687) which requires that developments include a recycling area or a room of a specified size on the Project Site.
Focus Area: Economy		
Mobility and Transit	Invest in rail, bus lines, pedestrian/bike safety, and complete neighborhoods that provide more mobility options and reduce vehicle miles traveled.	**Consistent**. The Project would provide 1,127 residential units, a mix of retail and restaurant uses, and office uses in an area well served by multiple public transportation options and in a highly walkable environment, which would reduce vehicle miles traveled and transportation-related GHG emissions.

Action	Description	Consistency Analysis
Preparedness and Resiliency	Prepare for natural disasters and decrease vulnerability to climate change.	**Consistent**. The Project would be constructed to meet or exceed applicable requirements for fire, seismic, and other building safety standards. The Project would meet the applicable fire safety standards for residential and commercial buildings of the 2016 Title 24 California Building Code and California Fire Code or applicable version at the time of building permit issuance (refer to Section IV.L, *Fire Protection*, of the Project's Draft EIR for additional information). The Project would be constructed to meet the applicable seismic safety standards related to structural strength, means of egress to facilities (entering and exiting), and general stability of buildings of the 2016 Title 24 California Building Code or applicable version at the time of building permit issuance (refer to Section IV.D, *Geology and Soils*, of the Project's Draft EIR for additional information). As discussed in Section IV.G, *Hydrology and Water Quality*, of the Project's Draft EIR, the Project would result in less than significant impacts on drainage/flooding conditions. The Project would include emergency generators that would be tested and maintained to provide emergency lighting and electricity in the event of a power supply interruption.
Focus Area: Equity		
Air Quality	Healthy air to breathe.	**Consistent**. The Project would implement PDF AQ-1 which requires the Project's new buildings to meet the LEED Silver Certification Requirements or equivalent. As such, Project operations would include indoor air quality controls such as use of MERV 8 or higher air filtration systems, and the planting of 194 new trees, which would improve air quality. During construction, the Project would comply with applicable rules to minimize air pollutant emissions. As an example, the Project would comply with fugitive dust control measures included in SCAQMD Rule 403. The Project would result in a potentially significant air quality impact during construction from exhaust emissions of NO_X (refer to Section IV.B, *Air Quality*, of the Project's Draft EIR). However, the Project would be required to implement mitigation measure MM AQ-1 requiring the use of construction equipment that meet the most stringent Tier 4 emissions standards, which would reduce emissions to less than significant with the exception of a temporary and short-term NO_X emissions impact that would be significant and unavoidable during the continuous concrete pour foundation activities lasting up to approximately four days.

Action	Description	Consistency Analysis
Urban Ecosystem	Have access to parks, open space, including a revitalized Los Angeles River Watershed.	**Consistent**. As discussed in Section IV.N, *Parks and Recreation*, of the Project's Draft EIR, the Project would be located within a few miles of several nearby parks and within less than a quarter mile of Grand Park, City Hall Park, and dog park at 2nd Street and Spring Street, just south of the Los Angeles Police Department Headquarters, as well as the future Civic Center and Broadway park.
Livable Neighborhoods	Live in safe, vibrant, well-connected, and healthy neighborhoods.	**Consistent**. The Project would be support the development of vibrant, safe, and well-connected neighborhoods. The Project would provide landscaping that would complement the aesthetic character of the Project Site and its relationship to surrounding buildings where the Project-provided pedestrian paseo leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a connection to First and Broadway Civic Center Park. All of the open space areas would have landscaping, including a total of approximately 194 trees, and well-detailed hardscape.

SOURCE: City of Los Angeles, Sustainable City pLAn, 2008; ESA, 2018.

The analysis above describes the consistency of the Project with the applicable City GHG emissions reduction plans, policies, and regulations, including the City's LA Green Plan and the City's Sustainable City pLAn. As discussed in **Table 7** and **Table 8**, generally, the Project's consistency with the plans and policies should be demonstrated by a combination of regulatory compliance (green building code etc.) as well as project-specific characteristics and voluntary measures (e.g., PDFs). The Project would implement PDFs and incorporate water conservation, energy conservation, tree-planting, and other features consistent with these plans. Therefore, the Project would be consistent with the City's applicable plans, policies, or regulations for the reduction of GHG emissions.

5.1.4 Green Building Code

The Project would comply with the 2016 Los Angeles Green Building Code to reduce GHG emissions by increasing energy-efficiency beyond requirements, reducing indoor and outdoor water demand, installing energy-efficient appliances and equipment, and complying with 2016 California Title 24 Building Energy Efficiency Standards, as amended by the City. The Project would also meet the mandatory measures of the CALGreen Code as amended by the City by incorporating strategies such as low-flow toilets, low-flow faucets, low-flow showers, and other energy and resource conservation measures. The heating, ventilation, and air conditioning (HVAC) system would be sized and designed in compliance with the CALGreen Code to maximize energy efficiency caused by heat loss and heat gain.

5.1.5 Consistency with Executive Orders S-3-05 and B-30-15

The Executive Orders establish a goals to reduce GHG emissions to 80 percent below 1990 levels by 2050. This goal has not been codified by the Legislature and CARB has not adopted a strategy

or regulations to meet the 2050 goal. However, studies have shown that, in order to meet the 2050 goal, aggressive technologies in the transportation and energy sectors, including electrification and the decarbonization of fuel, will be required. In its original *Climate Change Scoping Plan*, CARB acknowledged that the "measures needed to meet the 2050 goal are too far in the future to define in detail."[134] In the First Update, CARB generally described the type of activities required to achieve the 2050 target: "energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and rapid market penetration of efficiency and clean energy technologies that requires significant efforts to deploy and scale markets for the cleanest technologies immediately."[135] The 2017 Scoping Plan recognizes that additional work is needed to achieve the more stringent 2050 target: "While the Scoping Plan charts the path to achieving the 2030 GHG emissions reduction target, we also need momentum to propel us to the 2050 statewide GHG target (80 percent below 1990 levels). In developing this Scoping Plan, we considered what policies are needed to meet our mid-term and long-term goals."[136] For example, the 2017 Scoping Plan acknowledges that "though Zero Net Carbon Buildings are not feasible at this time and more work needs to be done in this area, they will be necessary to achieve the 2050 target. To that end, work must begin now to review and evaluate research in this area, establish a planning horizon for targets, and identify implementation mechanisms."[137]

- **Energy Sector:** Continued improvements in California's lighting, appliance, and building energy efficiency programs and initiatives, such as the State's building energy efficiency standards and zero net energy building goals, would serve to reduce the Project's emissions level.[138] Additionally, further technological improvements and additions to California's renewable resource portfolio would favorably influence the Project's emissions level.[139]

- **Transportation Sector:** Anticipated deployment of improved vehicle efficiency, zero emission technologies, lower carbon fuels, and improvement of existing transportation systems all will serve to reduce the Project's emissions level.[140]

- **Water Sector:** The Project's emissions level will be reduced as a result of further enhancements to water conservation technologies.[141]

- **Waste Management Sector:** Plans to further improve recycling, reuse, and reduction of solid waste will beneficially reduce the Project's emissions level.[142]

This GHG Technical Report was prepared after thorough investigation of feasible methodologies to determine the potential GHG impacts associated with the Project. Due to the technological

shifts required and the unknown parameters of the regulatory framework in 2050, quantitatively analyzing the Project's impacts further relative to the 2050 goal is speculative for purposes of CEQA. Despite thorough investigation, due to the uncertainty regarding specific state and local actions that will be implemented to achieve the 2050 GHG emission reduction targets, calculating Project emissions levels for 2050 would be highly speculative. Nonetheless, statewide efforts are underway to facilitate the State's achievement of those goals and it is reasonable to expect the Project's emissions level to decline as the regulatory initiatives identified by CARB in the 2017 Scoping Plan are implemented, and other technological innovations occur. Stated differently, the Project's emissions total at buildout represents the maximum emissions inventory for the Project as California's emissions sources are being regulated (and foreseeably expected to continue to be regulated in the future) in furtherance of the State's environmental policy objectives. As such, given the reasonably anticipated decline in Project emissions once fully constructed and operational, the Project would be consistent with the Executive Orders' goals.

In conclusion, the Project's consistency with applicable GHG reduction plans and policies plan as presented through **Tables 5, 6, 7,** and **8**, demonstrate that the Project is consistent with regulations and policies and comply with or exceed the regulations and reduction actions/strategies outlined in the Climate Change Scoping Plan, 2016 RTP/SCS, the LA Green Plan, and Sustainable City pLAn. Therefore, the Project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing emissions of GHGs, and Project-specific impacts with regard to greenhouse gas emissions.

5.2 Greenhouse Gas Emissions

As described above, compliance with a GHG emissions reduction plan renders a project less than significant. In support of the consistency analysis which describes the Project's compliance with or exceedance of performance-based standards included in the regulations and policies outlined in the applicable portions of the *Climate Change Scoping Plan*, the 2016–2040 RTP/SCS, the LA Green Plan, and the Sustainable City pLAn, quantitative calculations are provided below. The Project would generate an incremental contribution to and a cumulative increase in GHG emissions. A specific discussion regarding potential GHG emissions associated with the construction and operational phases of the Project is provided below.

5.2.1 Construction Emissions

The emissions of GHGs associated with construction of the Project were calculated for each year of construction activity using CalEEMod. Results of the GHG emissions calculations are presented on **Table 9**, *Estimated Unmitigated Construction Greenhouse Gas Emissions*. As presented therein, construction of the Project is anticipated to generate approximately 22,339 $MTCO_2e$. Construction of the Project is anticipated to begin in 2019, pending Project consideration and approval, and would be completed in late 2023. Construction of the Project is estimated to require approximately 48 months, starting as early as the third quarter of 2019. However, construction emissions were estimated assuming an earlier starting period. In order to provide a conservative emissions analysis, for modeling purposes, construction emissions were modeled with a starting time period in calendar year 2018. This is more conservative because

emission factors are higher for 2018 than 2019 as equipment and vehicles are anticipated to produce fewer GHG emissions over time due to more stringent requirements. It is estimated that 364,000 cubic yards (cy) of soil would be hauled from the Project Site during the grading and excavation phase. It should be noted that the GHG emissions shown in **Table 9** are based on construction equipment operating continuously throughout the work day. In reality, construction equipment tends to operate periodically or cyclically throughout the work day. Therefore, the GHG emissions shown reflect a conservative estimate.

Although GHGs are generated during construction and are accordingly considered one-time emissions, it is important to include them when assessing all of the long-term GHG emissions associated with a project. The draft SCAQMD indicators of significance recommend that construction-related GHG emissions be amortized over a project's 30-year lifetime in order to include these emissions as part of a project's annualized lifetime total emissions, so that GHG reduction measures will address construction GHG emissions as part of the operational GHG reduction strategies. In accordance with this methodology, the estimated Project's construction GHG emissions have been amortized over a 30-year period and are included in the annualized operational GHG emissions.

Due to the potential persistence of GHGs in the environment, impacts are based on annual emissions and, in accordance with SCAQMD methodology, construction-period impacts are not assessed independent of operational-period impacts, which are discussed in the next section.[143]

TABLE 9
ESTIMATED UNMITIGATED CONSTRUCTION GREENHOUSE GAS EMISSIONS

	$MTCO_2e$ per Year [a,b]	
Construction Year	**Project Without GHG Reduction Characteristics, Features, and Measures**	**Proposed Project**
Year 1 (2019) – Project (Tower Construction)	1,202	1,202
Year 2 (2020) – Project (Tower Construction)	5,153	5,153
Year 3 (2021) – Project (Tower Construction)	5,283	5,283
Year 4 (2022) – Project (Tower Construction)	4,981	4,981
Year 5 (2023) – Project (Tower Construction)	4,274	4,274
Year 1 (2019) – Renovations	350	350
Year 2 (2020) – Renovations	686	686
Year 3 (2021) – Renovations	410	410
Total	**22,339**	**22,339**
Amortized Emissions (30-years)	**745**	**745**

[a] Totals may not add up exactly due to rounding in the modeling calculations.

[b] CO_2e emissions are calculated using the global warming potential values from the Intergovernmental Panel on Climate Change Fourth Assessment Report: 25 for CH_4 and 298 for N_2O (Intergovernmental Panel on Climate Change, Fourth Assessment Report: The Physical Science Basis, Summary for Policy Makers, (2007))

143 South Coast Air Quality Management District, Greenhouse Gas CEQA Significance Threshold Stakeholder Working Group #12, http://www.aqmd.gov/ceqa/handbook/GHG/2009/july29mtg/ghgmtg12.pdf. December 2018.

SOURCE: ESA, 2018.

5.2.2 Operational Emissions

GHG emissions associated with operation of the Project were calculated to disclose operational emissions from the Project and were estimated using the CalEEMod model. The Project is designed to include green building techniques and other sustainability features. The Project must comply with the portions of City's 2016 Green Building Code applicable to mixed-use/commercial development. Additionally, physical and operational Project characteristics for which sufficient data is available to quantify the reductions from building energy and resource consumption have been included in the quantitative analysis, and include, the following measures: installation of energy efficient appliances; low-water fixtures; water efficient irrigation; and building energy usage consistent with the 2016 California Title 24 Building Energy Efficiency Standards.

The Project's estimated mobile source emissions reflect the transportation-efficient location of the Project Site. The Project would represent an urban infill development, since it would be undertaken on a currently developed property, and would be located near existing off-site commercial, residential, and retail destinations and in close proximity to existing public transit stops. Infill development results in reduced vehicle trips and VMT, and reduced associated transportation-related emissions compared to a project without these characteristics. As discussed below under land use characteristic "Increased Transit Accessibility", because the Project comprises mixed uses including residential uses, and the Project Site is a previously developed "infill" site located within 750 feet of Metro's Los Angeles Civic Center/Grand Park Station and directly across W. 2nd Street from Metro's 2nd Street and Broadway Station (currently under construction), the Project meets the criteria of the City as a Transportation Priority Area (TPA).

As discussed above, CAPCOA has provided guidance for reducing emissions from land use development projects within its guidance document titled *Quantifying Greenhouse Gas Mitigation Measures.* The land use characteristics of the Project listed below are consistent with the CAPCOA guidance document, and would reduce vehicle trips to and from the Project Site and vehicle trip distances. These characteristics would, therefore, result in a corresponding reduction in transportation-related air pollutant and GHG emissions.

- **Increased Density:** Increased density, measured in terms of persons, jobs, and/or dwelling units per unit area, reduces emissions associated with transportation as it reduces the distance people travel for work or services and provides a foundation for the implementation of other strategies such as enhanced transit services. This characteristic corresponds to CAPCOA guidance strategy LUT-1.[144] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill[145] location and is mixed-use;

144 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 155-158.

145 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, p. 59-60. The project area meets the characteristics for an urban setting with respect to typical building heights of 6

therefore, this characteristic applies to the Project. The Project would increase the Project Site density to approximately 305 dwelling units per acre and would provide approximately 425 jobs per acre (refer to Section IV.J, *Population, Housing, and Employment*, Table IV.J-2 of the Project's Draft EIR, which provides employment data used to estimate the number of jobs per acre).[146]

- **Location Efficiency:** Location efficiency describes the location of a project relative to the type of urban landscape such as an urban area, compact infill, or suburban center. In general, compared to the statewide average, a project could realize VMT reductions up to 65 percent in an urban area, up to 30 percent in a compact infill area, or up to 10 percent in a suburban center for land use/location strategies.[147] This characteristic corresponds to CAPCOA guidance strategy LUT-2.[148] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location within Downtown Los Angeles and is mixed-use; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the geographic location of the Project within the region. The Project Site is served by existing public transportation located within a quarter-mile. The Project Site is within an active urban center with many existing off-site commercial, entertainment, hotel, and residential buildings. The location efficiency of the Project Site would reduce vehicle trips and VMT compared to the statewide and South Coast Air Basin average and would result in corresponding reductions in transportation-related emissions.

- **Increased Land Use Diversity and Mixed-Uses:** Locating different types of land uses near one another can decrease VMT since trips between land use types are shorter and could be accommodated by alternative modes of transportation, such as public transit, bicycles, and walking. This characteristic corresponds to CAPCOA guidance strategy LUT-3.[149] According

stories or much higher, grid street pattern, minimal setbacks, constrained parking, high parking prices, high quality rail service (i.e., Metro Red and Purple Lines at the Grand Park/Civic Center Station), location relative to regional cores (5 miles or less) and jobs/housing balance (the Central City Community Plan Area has an existing jobs/housing ratio of approximately 7.3 for year 2017; refer to Section IV.J, *Population and Housing*, of the Project's Draft EIR).

146 Based on employment density factors in the Los Angeles Unified School District, 2016 Developer Fee Justification Study, March 2017. As indicated in Section IV.J, *Population, Housing, and Employment*, Table IV.J-2, of the Project's Draft EIR, the projected employees would be 1,606. Given a Project size of 3.69 acres, the estimated jobs per acre would be 1,606 / 3.69 = 435.

147 CalEEMod, by default, assumes that trip distances in the South Coast Air Basin are slightly longer than the statewide average. This is due to the fact that commute patterns in the South Coast Air Basin involve a substantial portion of the population commuting relatively far distances, which is documented in the Southern California Association of Governments 2016-2040 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS). The RTP/SCS shows that, even under future Plan conditions, upwards of 50 percent of all work trips would be 10 miles or longer (SCAG, Performance Measures Appendix, page 13, 2016). The RTP/SCS does not specify the current percentage of work trips greater than 10 miles in the region, but it can be assumed that the percentage is currently greater than 50 percent since the goal of the RTP/SCS is to reduce overall VMT in the region. It is thus reasonable to assume that the trip distances in South Coast Air Basin are analogous to the statewide average given that the default model trip distances in the South Coast Air Basin are slightly longer but still generally similar to the statewide average. Therefore, projects could achieve similar levels of VMT reduction (65 percent in an urban area, 30 percent in a compact infill area, or 10 percent for a suburban center) compared to the South Coast Air Basin average.

148 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 159-161.

149 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 162-166.

to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings (also potentially for rural master-planned communities) for mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the percentage of each land use type in the Project. The Project would co-locate multi-family residential, office, retail, and restaurant land uses in close proximity to existing off-site commercial and residential uses, as well as major transit facilities. The increases in land use diversity and mix of uses on the Project Site, as well as proximity to transit, would reduce vehicle trips and VMT by encouraging walking and non-automotive forms of transportation.

- **Increased Destination Accessibility:** This characteristic corresponds to CAPCOA guidance strategy LUT-4.[150] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use, including residential, commercial, office, retail, and restaurant land uses; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the distance to Downtown Los Angeles or major job center. The Project Site is also located near other job centers in the region and within Downtown Los Angeles. The access to multiple destinations in close proximity to the Project Site would reduce vehicle trips and VMT compared to the statewide and South Coast Air Basin average, encourage walking and non-automotive forms of transportation, and would result in corresponding reductions in transportation-related emissions.

- **Increased Transit Accessibility:** Locating a project with high density near transit facilitates encourages the use of transit by people traveling to or from a project site. This characteristic corresponds to CAPCOA guidance strategy LUT-5.[151] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings (also potentially for rural settings adjacent to a commuter rail station with convenient access to a major employment center) for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the distance to transit stations near the Project. The Project would be located within a quarter-mile of public transportation, including the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line and the future 2nd and Broadway Metro Station being constructed as part of the Regional Connector Project. The Red Line connects the Civic Center to Union Station, Hollywood, and North Hollywood. The Red and Purple Lines provide further connection to three light rail transit lines serving downtown Los Angeles: the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station. In addition, as part of the Metro Regional Connector Project, the future Historic Broadway Station would allow passengers to transfer to Blue, Expo, Red and Purple Lines, bypassing Union Station. The Project is also within a quarter mile of many Metro bus routes (e.g., local 2, 4, 10, 28, 81, 83, 90, 91, 94, and 302, which run northbound along Hill and Lines 30, 33, 40, 45, 68, 83, 84, 92, and 330, which run southbound along Spring Street), LADOT's Dash Downtown "D" line, and Metro's Rapid Lines 728, 733, 745, and 770. The Project would provide access to on-site

150 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 167-170.

151 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 171-175.

uses by providing a mid-block paseo to connect to existing pedestrian pathways. The Project would also provide parking for bicycles on-site to encourage utilization of alternative modes of transportation. The increased transit accessibility would reduce vehicle trips and VMT versus the statewide and South Coast Air Basin average, encourage walking and non-automotive forms of transportation, and result in corresponding reductions in transportation-related emissions.

- **Improve Design of Development:** Improved street network characteristics within a neighborhood enhances walkability and connectivity. Characteristics include street accessibility usually measured in terms of number of intersections (e.g., 4-way intersections) per square mile. This characteristic corresponds to CAPCOA guidance strategy LUT-9.[152] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. The Project would be located in a highly street-accessible area with over 100 four-way intersections within a 1-mile radius of the Project Site, which exceeds the standard intersection density assumed in baseline VMT modeling of 36 four-way intersections within a 1-mile radius per the CAPCOA guidance. The increased intersection density would reduce vehicle trips and VMT versus the statewide and South Coast Air Basin average, encourage walking and non-automotive forms of transportation, and would result in corresponding reductions in transportation-related emissions.

- **Provide Pedestrian Network Improvements:** Providing pedestrian access that minimizes barriers and links a project site with existing or planned external streets encourages people to walk instead of drive. This characteristic corresponds to CAPCOA guidance strategy SDT-1.[153] According to CAPCOA, the reduction in VMT from this characteristic applies to urban, suburban, and rural settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include pedestrian access connectivity within the Project and to/from off-site destinations. As discussed in Section 4.17, *Transportation and Traffic*, the walkability of existing facilities is based on the availability of pedestrian routes necessary to accomplish daily tasks without the use of an automobile. These attributes are quantified by WalkScore.com and assigned a score out of 100 points. With the various commercial businesses and recreational and entertainment facilities adjacent to the Project Site and proximity to public transit, the walkability of rating of the Project Site area is approximately 91 points;[154] this compares to the Citywide score of 67 points. As discussed in Chapter 2, *Project Description*, the Project would provide a full retail and service base at street level along all four edges of the Podium, including 1st Street, Broadway, 2nd Street, and the Paseo providing an interconnected streetscape environment with landscaping that buffers the scale and height of the new buildings. The Project would strengthen existing and new pedestrian connections and streetscapes through the use of landscaping, street trees, street furniture, lighting and signage. The Project would provide an internal pedestrian

152 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 182-185.

153 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 186-189.

154 WalkScore.com (www.walkscore.com) rates the Project Site area (202 W 1st Street, Los Angeles, CA 90012) with a score of 91 of 100 possible points (scores accessed on November 8, 2017). Walk Score calculates the walkability of specific addresses by taking into account the ease of living in the neighborhood with a reduced reliance on automobile travel.

network for Project visitors and employees that links to the existing off-site pedestrian network including existing off-site sidewalks, and would therefore result in some reduction in VMT and associated transportation-related emissions.

The Project Transportation Impact Analysis already accounts for trip reductions from Increased Land Use Diversity and Mixed-Uses (LUT-3) and Increased Transit Accessibility (LUT-5). Therefore, VMT reductions for these characteristics were not included separate from the Transportation Impact Analysis to avoid double counting. Reductions in VMT were calculated for characteristics not included in the Transportation Impact Analysis, which include Increased Density (LUT-1), Location Efficiency (LUT-2), and Increased Destination Accessibility (LUT-4), Improved Design of Development (LUT-9), and Provide Pedestrian Network Improvements (SDT-1). Following the calculation protocol from the CAPCOA guidance, based on land use characteristics LUT-1, LUT-2, LUT-4, LUT-9, and SDT-1, in addition to the Transportation Impact Analysis trip rate reductions, the Project's VMT would be reduced by approximately 32.2 percent overall (refer to Appendix F-3 of this Technical Report for calculation details).

Maximum annual net GHG emissions resulting from motor vehicles, energy (i.e., electricity, natural gas), water conveyance and wastewater treatment, and solid waste were calculated for the expected opening year (2023). The maximum opening year GHG emissions from operation of the Project are shown in **Table 10**, *Project Annual Greenhouse Gas Emissions*. In addition, in order to evaluate the efficacy of the GHG reduction characteristics, features, and measures that would be implemented as part of the Project, this analysis compares the Project's GHG emissions to the emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures. This comparison is provided to evaluate the Project's efficiency with respect to GHG emissions but is not the threshold of significance used for impact analysis. Also, as shown above in **Table 5**, *Comparison of Project with Climate Change Scoping Plan GHG Reduction Measures,* this quantitative disclosure is correlated to the Climate Change Scoping Plan to the extent feasible.

As discussed previously, state, regional, and local GHG reduction plans and policies, such as CARB's Climate Change Scoping Plan, SB 375, and City of Los Angeles plans (LA Green Plan, Sustainable City pLAn) would be applicable to the Project. These plans and policies are intended to reduce GHG emissions in accordance with the goals of HSC Division 25.5. In order to evaluate the efficacy of the GHG reduction characteristics, features, and measures that would be implemented as part of the Project as required by these GHG reduction plans and policies, this analysis compares the Project's GHG emissions to the emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures. This approach mirrors the concepts used in CARB's Climate Change Scoping Plan, which demonstrates GHG reductions compared to a NAT scenario.

It is well documented that CARB's Climate Change Scoping Plan's comparison to a NAT scenario was used to determine statewide efforts necessary to meet the 2020 AB 32 mandated levels, and not as a measure of GHG reduction efforts for a specific land use development. In addition, while other methodologies for calculating Project GHG reduction efficiencies exist, a comparison of Project GHG reduction efforts compared to an NAT provides valuable information regarding the efficiency of the Project's GHG reduction measures and is presented here for

informational purposes only. This analysis compares the Project's GHG emissions to the emissions that would be generated by the Project in the absence of any GHG reduction measures (i.e., the NAT scenario, which is also sometimes referred to as the No Implementation of Emission Reduction Measures ["NIERM"] calculation). It is not a threshold of significance, and is not used as the basis for any significance finding. Furthermore, this analysis is consistent with the most current regulatory policies and GHG quantification methods, however the scientific, regulatory environment regarding GHG reduction, and CEQA approaches for GHG analysis are constantly evolving and will continue to do so into the future.

The GHG emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures is quantified based on specific and defined circumstances in the context of relevant state activities and mandates. Since this comparison is intended to mirror the concepts used in CARB's Climate Change Scoping Plan, the GHG emissions for the Project without implementation of GHG reduction characteristics, features, and measures is evaluated based on the specific and defined circumstances that CARB relied on when it projected the State's GHG emissions in the absence of GHG reduction measures in the First Update to the Climate Change Scoping Plan.

The specific and defined circumstances used by CARB include conditions that existed during the 2009 to 2011 period, which include the vehicle fleet that existed during the 2009 to 2011 period and the 2008 Title 24 Building Energy Efficiency Standards. Furthermore, the specific Project Site characteristics and Project Design Features (PDF) such as PDF AQ-1, Green Building Features (refer to Section IV.B, *Air Quality*, of the Project's Draft EIR), and PDF WS-1, Water Conservation Features (refer to Section IV.R, *Water Supply*, of the Project's Draft EIR) are not included in the Project without implementation of GHG reduction characteristics as they encompass GHG reduction strategies and features that would be consistent with state, regional, and local GHG reduction plans and policies adopted after the 2009 to 2011 period or would go above and beyond regulatory requirements. The emissions for the Project without implementation of GHG reduction characteristics scenario are estimated using the CalEEMod software, and the model inputs are adjusted to account for the specific and defined circumstances and described above. The analysis assumes the Project without implementation of GHG reduction characteristics, features, and measures would incorporate the same land uses and building square footage as the proposed Project.

TABLE 10
ANNUAL GREENHOUSE GAS EMISSIONS

	Project CO_2e (Metric Tons per Year) [a]	
Emissions Sources	**Project Without GHG Reduction Characteristics, Features, and Measures**	**Proposed Project**

SOURCE: ESA, 2018.

When considering only the Project's emissions and excluding the existing site emissions that would no longer occur after Project implementation, **Table 10** shows that the Project's operational emissions of 22,047 $MTCO_2e$ would be approximately 28 percent below the emissions that would be generated by the Project without implementation of GHG reduction characteristics, features, and measures. Thus, this analysis quantitatively demonstrates the efficacy of the Project GHG reduction measures as set forth in the applicable GHG reduction plans and policies. The 28 percent reduction in emissions is due to the following primary factors:

- **Reduction in vehicle trips and VMT associated with the Project's land use characteristics.** As discussed previously in subsection 5.1, the Project is an infill site located within a quarter-mile of public transportation, including the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line and the future 2nd and Broadway Metro Station being constructed as part of the Regional Connector Project in a highly walkable environment. These characteristics account for an approximately 32 percent reduction in Project VMT and associated emissions, and an approximately 18 percent reduction in total Project emissions.

- **Water conservation features.** (Refer to Section IV.R*, Water Supply*, of the Project's Draft EIR.) The Project would incorporate the following specific additional water conservation features.

    - High Efficiency Toilets with flush volume of 1.00 gallons per flush or less;

    - ENERGY STAR Certified Residential Clothes Washers – Front-loading with an Integrated Water Factor off 3.6 or less and a capacity of 4.3 cubic feet (cu ft);

- Showerheads with a flow rate of 1.5 gpm or less;
- Domestic Water Hearing System located close in proximity to point(s) of use;
- Individual Metering and billing for water use for commercial space;
- Drip/Surface Irrigation (Micro-Irrigation);
- Proper Hydro-zoning/Zoned Irrigation (group plants with similar water requirements together); and
- Drought Tolerant Plants – 70 percent of total landscaping.

The characteristics account for an approximately 24 percent reduction in Project water conveyance and wastewater treatment source emissions, and an approximately 0.5 percent reduction in total Project emissions.

- **Lower carbon intensity of electricity.** Under the Renewables Portfolio Standard, LADWP is required to reduce the carbon intensity of their electricity. The carbon intensity of LADWP electricity is 1,145 lbs/MWh for the "Project Without GHG Reduction Characteristics, Features, and Measures" scenario. Under the proposed Project buildout scenario, with implementation of the Renewables Portfolio Standard, the carbon intensity of LADWP electricity would be approximately 849 lbs/MWh (based on LADWP estimated 2020 GHG emissions and electricity supply, refer to Appendix F-3 of this Technical Report for additional details).[155,156] These characteristics account for an approximately 27 percent reduction in Project electricity emissions, and an approximately 9 percent reduction in total Project emissions.

The 2017 Climate Change Scoping Plan proposes a comprehensive set of actions designed to reduce overall carbon GHG emissions in California, improve the environment, reduce dependence on oil, diversify energy sources, save energy, create new jobs, and enhance public health. The Climate Change Scoping Plan has a range of GHG reduction actions, which include direct regulations, alternative compliance mechanisms, monetary and non-monetary incentives, voluntary actions, market-based mechanisms such as a cap-and-trade system, and an AB 32 implementation fee to fund the program.

Table 11, *Comparison of Project with Climate Change Scoping Plan GHG Reduction Measures,* demonstrates how the Project's GHG reductions correlate to the emission reductions identified in the Climate Change Scoping Plan. It lists the GHG reduction measures identified in the Climate Change Scoping Plan and shows quantified estimates how of the emission reductions of the Project would be aligned with the estimated reductions from the Climate Change Scoping Plan. As stated above, this analysis is not presented as the method to analyze GHG impacts. Instead, the analysis is presented to quantify the Project's potential GHG emissions and correlate to GHG reduction policies in the Climate Change Scoping Plan, and thereby inform the threshold of significance

155 Los Angeles Department of Water and Power, 2016 Briefing Book, https://www.ladwp.com/cs/idcplg?IdcService=GET_FILE&dDocName=OPLADWPCCB423407&RevisionSelectionMethod=LatestReleased. Accessed December 2018.

5.3 Conclusion

As set forth above, the Project would generate incrementally increased GHG emissions over existing conditions. However, even a very large individual project would not generate enough GHG emissions on its own to significantly influence global climate change. Moreover, as discussed above, the Project would be consistent with the Climate Change Scoping Plan, 2016 RTP/SCS, the LA Green Plan, and the Sustainable City pLAn. The Project's consistency with these applicable regulatory plans and policies to reduce GHG emissions, along with implementation of PDFs as discussed in the Project's Draft EIR, particularly PDF AQ-1 (Green Building Features) in Section IV.B, *Air Quality*, of the Project's Draft EIR, would minimize the Project's GHG emissions. In summary, the plan consistency analysis provided above demonstrates that the Project's design features are consistent with regulations and policies and comply with or exceed the regulations and reduction actions/strategies outlined in the Climate Change Scoping Plan, 2016 RTP/SCS, the LA Green Plan, and Sustainable City pLAn. **Therefore, the Project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing emissions of GHGs, and Project-specific impacts with regard to climate change would be less than significant.**

SECTION 6
Cumulative Impacts

Although the Project is expected to emit GHGs, the emission of GHGs by a single project into the atmosphere is not itself necessarily an adverse environmental effect. Rather, it is the increased accumulation of GHG from more than one project and many sources in the atmosphere that may result in global climate change. The resultant consequences of that climate change can cause adverse environmental effects. A project's GHG emissions typically would be very small in comparison to state or global GHG emissions and, consequently, they would, in isolation, have no significant direct impact on climate change. The state has mandated a goal of reducing statewide emissions to 1990 levels by 2020, even though statewide population and commerce are predicted to continue to expand. In order to achieve this goal, CARB is in the process of establishing and implementing regulations to reduce statewide GHG emissions. Currently, there are no applicable CARB, SCAQMD, or City of Los Angeles significance thresholds or specific reduction targets, and no approved policy or guidance to assist in determining significance at the project or cumulative levels. Additionally, there is currently no generally accepted methodology to determine whether GHG emissions associated with a specific project represents new emissions or existing, displaced emissions. Therefore, consistent with CEQA Guidelines Section 15064h(3),[157] the City, as lead agency, has determined that the Project's contribution to cumulative GHG emissions and global climate change would be less than significant if the Project is consistent with the applicable regulatory plans and policies to reduce GHG emissions: AB 32 Climate Change Scoping Plan, SCAG's Regional Transportation Plan/Sustainable Communities Strategy, the City of Los Angeles' LA Green Plan, and Sustainable City pLAn.

Table 10 on page 85 illustrates that implementation of the Project's regulatory requirements and project design features, including state mandates, would contribute to GHG reductions. These reductions represent a reduction from NAT and support state goals for GHG emissions reduction. The methods used to establish this relative reduction are consistent with the approach used in CARB's Climate Change Scoping Plan for the implementation of AB 32.

[157] The State CEQA Guidelines were amended in response to SB 97. In particular, the State CEQA Guidelines were amended to specify that compliance with a GHG emissions reduction program renders a cumulative impact insignificant. Per State CEQA Guidelines Section 15064(h)(3), a project's incremental contribution to a cumulative impact can be found not cumulatively considerable if the project will comply with an approved plan or mitigation program that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area of the project. To qualify, such a plan or program must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency. Examples of such programs include a "water quality control plan, air quality attainment or maintenance plan, integrated waste management plan, habitat conservation plan, natural community conservation plan, [and] plans or regulations for the reduction of greenhouse gas emissions."

The Project is consistent with the approach outlined in CARB's Climate Change Scoping Plan, particularly its emphasis on the identification of emission reduction opportunities that promote economic growth while achieving greater energy efficiency and accelerating the transition to a low-carbon economy. In addition, as recommended by CARB's Climate Change Scoping Plan, the Project would use "green building" features as a framework for achieving GHG emissions reductions as new buildings would be designed to achieve the standards of the Silver Rating under LEED.

As part of SCAG's 2016 RTP/SCS, a reduction in VMT within the region is a key component to achieving the 2020 and 2035 GHG emission reduction targets established by CARB. As discussed previously, Project would result in a VMT reduction of approximately 32 percent (based on calculation protocol from the CAPCOA guidance, which includes reductions for land use characteristics LUT-1, LUT-2, LUT-4, LUT-9, and SDT-1) in comparison to the NAT scenario and would be consistent with the reduction in transportation emission per capita provided in the 2016 RTP/SCS.

Additionally, the Project has incorporated sustainability design features in accordance with regulatory requirements as provided throughout the Project's Draft EIR, mitigation measures, and project design features to reduce VMT and to reduce the Project's potential impact with respect to GHG emissions. With implementation of these features, the Project results in a 36-percent reduction in net GHG emissions from the NAT scenario. The Project's GHG reduction measures make the Project consistent with AB 32.

As discussed in Section IV.B, *Air Quality*, and in Section IV.H, *Land Use and Planning*, of the Project's Draft EIR, the Project would be consistent with applicable land use policies of the City of Los Angeles and SCAG pertaining to air quality, including reducing GHG emissions.

The Project also would comply with the LA Green Plan, as shown in **Table 7**, which emphasizes improving energy conservation and energy efficiency, increasing renewable energy generation, and changing transportation and land use patterns to reduce auto dependence. The Project would also comply with the City of Los Angeles Green Building Code, which emphasizes improving energy conservation and energy efficiency, and increasing renewable energy generation. The Project's regulatory requirements and project design features provided above and throughout the Project's Draft EIR would advance these objectives. Furthermore, the related projects would also be anticipated to comply with many of these same emissions reduction goals and objectives (e.g., City of Los Angeles Green Building Code).

As discussed above, the Project is consistent with the applicable GHG reduction plans and policies. The NAT comparison demonstrates the efficacy of the measures contained in these policies. Moreover, while the Project is not directly subject to the Cap-and-Trade Program, that Program will indirectly reduce the Project's GHG emissions by regulating "covered entities" that affect the Project's GHG emissions, including energy, mobile, and construction emissions. More importantly, the Cap-and-Trade Program will backstop the GHG reduction plans and policies applicable to the Project in that the Cap-and-Trade Program will be responsible for relatively more emissions reductions if California's direct regulatory measures reduce GHG emissions less

than expected. The Cap-and-Trade Program will ensure that the GHG reduction targets of AB 32 are met.

Recent studies show that the State's existing and proposed regulatory framework will allow the State to reduce its GHG emissions level to 40 percent below 1990 levels by 2030, and to 80 percent below 1990 levels by 2050. Even though these studies did not provide an exact regulatory and technological roadmap to achieve the 2030 and 2050 goals, they demonstrated that various combinations of policies could allow the statewide emissions level to remain very low through 2050, suggesting that the combination of new technologies and other regulations not analyzed in the studies could allow the State to meet the 2050 target. Subsequent to the findings of these studies, SB 32 was passed on September 8, 2016, which would require CARB to ensure that statewide GHG are reduced to 40 percent below the 1990 emissions level by 2030. As discussed above, the new plan, outlined in SB 32, involves increasing renewable energy use, imposing tighter limits on the carbon content of gasoline and diesel fuel, putting more electric cars on the road, improving energy efficiency, and curbing emissions from key industries.

As discussed above, SCAG's 2016-2040 RTP/SCS establishes a regulatory framework for achieving GHG reductions from the land use and transportation sectors pursuant to SB 375 and the state's long-term climate policies. The 2016-2040 RTP/SCS ensures VMT reductions and other measures that reduce regional emissions from the land use and transportation sectors. Specifically, the 2016–2040 RTP/SCS would result in an estimated 8 percent decrease in per capita GHG emissions by 2020, an 18-percent decrease in per capita GHG emissions by 2035, and a 21-percent decrease in per capita GHG emissions by 2040. By meeting and exceeding the SB 375 targets for 2020 and 2035, as well as achieving an approximately 21-percent decrease in per capita GHG emissions by 2040 (an additional 3-percent reduction in the five years between 2035 [18 percent] and 2040 [21 percent]), the 2016–2040 RTP/SCS is expected to fulfill and exceed its portion of SB 375 compliance with respect to meeting the state's GHG emission reduction goals.

The Project is the type of land use development that is encouraged by the RTP/SCS to reduce VMT and expand multi-modal transportation options in order for the region to achieve the GHG reductions from the land use and transportation sectors required by SB 375, which, in turn, advances the state's long-term climate policies. By furthering implementation of SB 375, the Project supports regional land use and transportation GHG reductions consistent with state climate targets for 2020 and beyond. In addition, as demonstrated above in **Table 6**, the Project would be consistent with the Actions and Strategies set forth in the 2016–2040 RTP/SCS. Therefore, the Project would be consistent with the 2016–2040 RTP/SCS.

Thus, given the Project's consistency with state, SCAG, and City of Los Angeles GHG emission reduction goals and objectives, the Project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of GHGs. **In the absence of adopted standards and established significance thresholds, and given this consistency, it is concluded that the Project's incremental contribution to greenhouse gas emissions and their effects on climate change would not be cumulatively considerable.**

SECTION 7
Summary of Results

Greenhouse gas emissions associated with the Project have been evaluated to determine the level of impact from construction activities and future operations of the Project. The Project would be consistent with the City of Los Angeles LA Green Plan and Sustainable City pLAn and is consistent with applicable SCAG 2016 RTP/SCS policies intended to meet the region's GHG reduction targets as assigned by CARB. The Project would also substantially comply with or exceed the GHG reduction actions and strategies outlined in CARB's Climate Change Scoping Plan. Thus, the Project's GHG emissions are consistent with regulatory schemes intended to reduce GHG emissions. Therefore, the Project would result in less than significant GHG emissions based on its consistency with local and regional GHG emissions reduction strategies.

Emissions associated with construction and operation were estimated for the Project. Construction of the Project would result in temporary and incremental increases to GHG emissions through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the Project Site. GHG emissions associated with Project operations would be generated by the consumption of electricity and natural gas and by the operation of on-road vehicles. The Project would implement green building measures that reduce the Project's direct and indirect GHG emissions. With the implementation of the Project's green building measures, the Project would be consistent with local, regional, and State's plans and programs adopted for the purpose of reducing the emissions of GHGs. Accordingly, the project would not result in a cumulatively considerable impact to global climate change.

The GHG emissions analysis in this Technical Report was performed in accordance with SCAQMD and CARB guidance developed in compliance with, and as a result of, those regulations and programs. The result of the analysis of the Project's potential impacts in terms of GHG and global climate change indicates that the Project-related GHG emissions would not be expected to cause a direct physical change in the environment. Therefore, the Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.

Draft Environmental Impact Report
Quantifying Greenhouse Gas Mitigation Measures - Transportation (Based on CAPCOA Guidance (August 2010))

Existing

Location Type	Global % VMT Reduction Cap
Urban:	75%
Less than 5 miles from central business district	
Jobs-rich (jobs/housing ratio greater than 1.5)	
Typical buildings are 6 stories or higher	
Grid street pattern	
Minimal setbacks	
Parking constrained on- and off-street	
Parking prices high/highest in the region	
High-quality rail; bus service at 10 min or less in peak hours	

Location Type	Global % VMT Reduction Cap
Suburban Center:	20%
Typically 20 miles or more from central business district	
Balanced jobs-housing	
Typical buildings are 2 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking somewhat constrained on-street; ample off-street	
Parking prices low (if priced at all)	
Bus service at 20 - 30 min and/or commuter rail station	

Compact Infill:	40%
Typically 5 - 15 miles from central business district	
Balanced jobs-housing (jobs/housing ratio from 0.9 to 1.2)	
Typical buildings are 2 - 4 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking constrained	
Parking prices low/moderate	
Rail w/in 2 miles; bus service at 15 min or less in peak hours	

Suburban:	15%
Typically 20 miles or more from central business district	
Housing-rich	
Typical buildings are 1 - 2 stories	
Curvilinear street pattern (cul-de-sac based)	
Parking between street and buildings; large lot residential	
Parking ample; largely surface lot-based	
No parking prices	
Limited bus service at 30 minute headways or more

3.1 Mitigation Measures Construction

Use Alternative Fuel for Construction Equipment

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2018

Unmitigated Construction On-Site

3.0 Construction Detail

Construction Phase

Phase Number	Phase Name	Phase Type	Start Date	End Date	Num Days Week	Num Days	Phase Description
1	Subterranean Parking Structure	Building Construction	10/5/2019	6/26/2020	6	228	

Acres of Grading (Site Preparation Phase): 0

Acres of Grading (Grading Phase): 0

Acres of Paving: 0

Residential Indoor: 0; Residential Outdoor: 0; Non-Residential Indoor: 0; Non-Residential Outdoor: 0; Striped Parking Area: 0

OffRoad Equipment

Phase Name	Offroad Equipment Type	Amount	Usage Hours	Horse Power	Load Factor
Subterranean Parking Structure	Bore/Drill Rigs	1	12.00	221	0.50
Subterranean Parking Structure	Generator Sets	0	8.00	84	0.74
Subterranean Parking Structure	Cranes	0	6.00	231	0.29
Subterranean Parking Structure	Forklifts	0	6.00	89	0.20
Subterranean Parking Structure	Tractors/Loaders/Backhoes	0	6.00	97	0.37
Subterranean Parking Structure	Welders	0	8.00	46	0.45

Trips and VMT

Phase Name	Offroad Equipment Count	Worker Trip Number	Vendor Trip Number	Hauling Trip Number	Worker Trip Length	Vendor Trip Length	Hauling Trip Length	Worker Vehicle Class	Vendor Vehicle Class	Hauling Vehicle Class
Subterranean Parking Structure	1	4.00	0.00	0.00	14.70	6.90	20.00	LD_Mix	HDT_Mix	HHDT

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

Omni Times Square
Draft Environmental Impact Report
Quantifying Greenhouse Gas Mitigation Measures - Transportation (Based on CAPCOA Guidance (August 2010))

No Action Taken

Location Type	Global % VMT Reduction Cap
Urban:	75%
Less than 5 miles from central business district	
Jobs-rich (jobs/housing ratio greater than 1.5)	
Typical buildings are 6 stories or higher	
Grid street pattern	
Minimal setbacks	
Parking constrained on- and off-street	
Parking prices high/highest in the region	
High-quality rail; bus service at 10 min or less in peak hours	
Compact Infill:	40%
Typically 5 - 15 miles from central business district	
Balanced jobs-housing (jobs/housing ratio from 0.9 to 1.2)	
Typical buildings are 2 - 4 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking constrained	
Parking prices low/moderate	
Rail w/in 2 miles; bus service at 15 min or less in peak hours	

Location Type	Global % VMT Reduction Cap
Suburban Center:	20%
Typically 20 miles or more from central business district	
Balanced jobs-housing	
Typical buildings are 2 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking somewhat constrained on-street; ample off-street	
Parking prices low (if priced at all)	
Bus service at 20 - 30 min and/or commuter rail station	
Suburban:	15%
Typically 20 miles or more from central business district	
Housing-rich	
Typical buildings are 1 - 2 stories	
Curvilinear street pattern (cul-de-sac based)	
Parking between street and buildings; large lot residential	
Parking ample; largely surface lot-based	
No parking prices	
Limited bus service at 30 minute headways or more	

Total Global Transportation VMT Reduction =	**2.69%**	Cap:	75%
(Includes double counting correction.)

Total LUT % VMT Reduction =	**0.70%**	Cap:	65%

Land Use/Location Transportation Measures (65% Reduction Cap)

LUT-1 Increase Density

% VMT Reduction = A × B [not to exceed 30%]

A (housing) = (Number of DU/acre - 7.6) / 7.6
A (jobs) = (Number of Jobs/acre - 20) / 20
B = 0.07%

% VMT Reduction =	0.70%	Cap:	30%
Number of DU/acre:	305.4	A =	500%
Number of Jobs/acre:	425.7	A =	500%

LUT-2 Increase Location Efficiency

% VMT Reduction Cap for all LUT measures

Urban LUT % VMT Reduction Cap:	65%
Compact Infill LUT % VMT Reduction Cap:	30%
Suburban Center LUT % VMT Reduction Cap:	10%

LUT-3 Increase Diversity of Urban and Suburban Developments (Mixed Use)

Urban: The urban project will be predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with functional interrelationships and a coherent physical design.

Suburban: The suburban project will have at least three uses of the following on site and/or offsite within ¼-mile: Residential Development, Retail Development, Park, Open Space, or Office.

(ACOUNTED FOR IN TRAFFIC STUDY)

% VMT Reduction = Land Use × B [not to exceed 30%]
Land Use = % increase in land use index vs. single use
= (Land Use Index - 0.15) / 0.15
Land Use Index = -a / ln(6)
$a = \sum a_i \times \ln(a_i)$
a_i = building floor area / total square feet of area considered
a_1 = single family
a_2 = multi-family
a_3 = commercial B = 0.09
a_4 = industrial
a_5 = institutional
a_6 = park

% VMT Reduction =	0.00%	Cap:	30%
Single family sqft:	-	a_1 =	-
Multi-family sqft:	-	a_2 =	-
Commercial sqft:	-	a_3 =	-
Industrial sqft:	-	a_4 =	-
Institutional sqft:	-	a_5 =	-
Park sqft:	-	a_6 =	-
Total sqft:	-		

(Note: If $a_i = 0$, then set $a_i = 0.0000001$)

LUT-4 Increase Destination Accessibility

% VMT Reduction = Center Distance × B [not to exceed 20%]
Center Distance = (12 - Miles to downtown or job center) / 12
B = 0.20

% VMT Reduction =	0.00%	Cap:	20%
Miles to downtown or job center:	-		

(Average distance to: Beverly Hills, Century City, Hollywood and Downtown L.A.
These locations are identified as job centers by Metro and by SCAG.)
(Note: Only effective for 8 miles or less)

LUT-5 Increase Transit Accessibility

(ACOUNTED FOR IN TRAFFIC STUDY)

% VMT Reduction = Transit × B [not to exceed 30%]
Transit = % project transit - % typical ITE transit
% project transit = -50x + 38 [where x = 0 - 0.5 miles to transit]
-4.4x + 15.2 [where x = 0.5 - 3 miles to transit]
% typical ITE transit = 1.3%
B = 0.67

% VMT Reduction = 0.00% Cap: 30%
Miles to transit:
(Note: Only effective for 3 miles or less)

LUT-6 Integrated Affordable and Below Market Rate Housing

% VMT Reduction = 4% × % units BMR

% VMT Reduction = 0.00%
% of units below market rate: 0.0%
(Note: Only effective up to 30%)

LUT-7 Orient Project Toward Non-Auto Corridor

Not quantified separately; Assumed to be included in LUT-3
(If included in LUT-3, VMT reduction should be at least 0.5% per 1% inprovement in transit frequency and 0.5% per 10% increase in transit ridership)

LUT-8 Locate Project near Bike Path/Bike Lanes

Not quantified separately; Assumed to be included in LUT-4
(If included in LUT-4, VMT reduction should be at least 0.625%)

LUT-9 Improve Design of Development

% VMT Reduction = Intersections × B
Intersections = % increase vs. typical ITE suburban
= (Intersections per square mile of project - 36) / 36
B = 0.12

% VMT Reduction = 0.00%
Intersections per square mile: -
(Estimated based on count of 4-way intersections within 1 mile radius of project site.)
(Note: Only effective up to 100)

Neighborhood/Site Enhancement Measures (5% Reduction Cap without NEV; 15% Reduction Cap with NEV)

Total SDT % VMT Reduction = 2.00% Cap: 5% without NEV

Project: Omni Times Square
Draft Environmental Impact Report
Quantifying Greenhouse Gas Mitigation Measures - Transportation (Based on CAPCOA Guidance (August 2010))

PROJECT

Location Type	Global % VMT Reduction Cap
Urban:	75%
Less than 5 miles from central business district	
Jobs-rich (jobs/housing ratio greater than 1.5)	
Typical buildings are 6 stories or higher	
Grid street pattern	
Minimal setbacks	
Parking constrained on- and off-street	
Parking prices high/highest in the region	
High-quality rail; bus service at 10 min or less in peak hours	
Compact Infill:	40%
Typically 5 - 15 miles from central business district	
Balanced jobs-housing (jobs/housing ratio from 0.9 to 1.2)	
Typical buildings are 2 - 4 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking constrained	
Parking prices low/moderate	
Rail w/in 2 miles; bus service at 15 min or less in peak hours	

Location Type	Global % VMT Reduction Cap
Suburban Center:	20%
Typically 20 miles or more from central business district	
Balanced jobs-housing	
Typical buildings are 2 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking somewhat constrained on-street; ample off-street	
Parking prices low (if priced at all)	
Bus service at 20 - 30 min and/or commuter rail station	
Suburban:	15%
Typically 20 miles or more from central business district	
Housing-rich	
Typical buildings are 1 - 2 stories	
Curvilinear street pattern (cul-de-sac based)	
Parking between street and buildings; large lot residential	
Parking ample; largely surface lot-based	
No parking prices	
Limited bus service at 30 minute headways or more	

Total Global Transportation VMT Reduction =	**29.06%**	Cap:	75%
(Includes double counting correction.)			
Total LUT/SDT/PDT/TST VMT Reduction =	**29.06%**	Cap:	70%
Total LUT % VMT Reduction =	**27.61%**	Cap:	65%

Land Use/Location Transportation Measures (65% Reduction Cap)

LUT-1 Increase Density

% VMT Reduction = A × B [not to exceed 30%]

A (housing) = (Number of DU/acre - 7.6) / 7.6
A (jobs) = (Number of Jobs/acre - 20) / 20
B = 0.07%

% VMT Reduction =	0.70%	Cap:	30%
Number of DU/acre:	305.4	A =	500%
Number of Jobs/acre:	425.7	A =	500%

LUT-2 Increase Location Efficiency

% VMT Reduction Cap for all LUT measures

Urban LUT % VMT Reduction Cap:	65%
Compact Infill LUT % VMT Reduction Cap:	30%
Suburban Center LUT % VMT Reduction Cap:	10%

LUT-3 Increase Diversity of Urban and Suburban Developments (Mixed Use)

Urban: The urban project will be predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with functional interrelationships and a coherent physical design.

Suburban: The suburban project will have at least three uses of the following on site and/or offsite within ¼-mile: Residential Development, Retail Development, Park, Open Space, or Office.

(ACOUNTED FOR IN TRAFFIC STUDY)

% VMT Reduction = Land Use × B [not to exceed 30%]
Land Use = % increase in land use index vs. single use
= (Land Use Index - 0.15) / 0.15
Land Use Index = -a / ln(6)
$a = \sum a_i \times \ln(a_i)$
a_i = building floor area / total square feet of area considered
a_1 = single family
a_2 = multi-family
a_3 = commercial B = 0.09
a_4 = industrial
a_5 = institutional
a_6 = park

% VMT Reduction =	0.00%	Cap:	30%
Single family sqft:	-	a_1 =	-
Multi-family sqft:	-	a_2 =	-
Commercial sqft:	-	a_3 =	-
Industrial sqft:	-	a_4 =	-
Institutional sqft:	-	a_5 =	-
Park sqft:	-	a_6 =	-
Total sqft:	-		

(Note: If $a_i = 0$, then set $a_i = 0.0000001$)

LUT-4 Increase Destination Accessibility

% VMT Reduction = Center Distance × B [not to exceed 20%]
Center Distance = (12 - Miles to downtown or job center) / 12
B = 0.20

% VMT Reduction =	7.33%	Cap:	20%
Miles to downtown or job center:	7.6		

(Average distance to: Beverly Hills, Century City, Hollywood and Downtown L.A. These locations are identified as job centers by Metro and by SCAG.)
(Note: Only effective for 8 miles or less)

LUT-5 Increase Transit Accessibility

(ACOUNTED FOR IN TRAFFIC STUDY)

% VMT Reduction = Transit × B [not to exceed 30%]
Transit = % project transit - % typical ITE transit
% project transit = -50x + 38 [where x = 0 - 0.5 miles to transit]
-4.4x + 15.2 [where x = 0.5 - 3 miles to transit]
% typical ITE transit = 1.3%
B = 0.67

% VMT Reduction = 0.00% Cap: 30%
Miles to transit:
(Note: Only effective for 3 miles or less)

LUT-6 Integrated Affordable and Below Market Rate Housing

% VMT Reduction = 4% × % units BMR

% VMT Reduction = 0.00%
% of units below market rate: 0.0%
(Note: Only effective up to 30%)

LUT-7 Orient Project Toward Non-Auto Corridor

Not quantified separately; Assumed to be included in LUT-3
(If included in LUT-3, VMT reduction should be at least 0.5% per 1% inprovement in transit frequency and 0.5% per 10% increase in transit ridership)

LUT-8 Locate Project near Bike Path/Bike Lanes

Not quantified separately; Assumed to be included in LUT-4
(If included in LUT-4, VMT reduction should be at least 0.625%)

LUT-9 Improve Design of Development

% VMT Reduction = Intersections × B
Intersections = % increase vs. typical ITE suburban
= (Intersections per square mile of project - 36) / 36
B = 0.12

% VMT Reduction = 21.33%
Intersections per square mile: 100
(Estimated based on count of 4-way intersections within 1 mile radius of project site.)
(Note: Only effective up to 100)

Neighborhood/Site Enhancement Measures (5% Reduction Cap without NEV; 15% Reduction Cap with NEV)

Total SDT % VMT Reduction = 2.00% Cap: 5% without NEV
Cap: 15% With NEV

SDT-1 Provide Pedestrian Network Improvements

VMT reduction based on urban/rural context and pedestrian accomodations

% VMT Reduction = 2.00%

Pedestrian network on-site and connecting off-site (urban/suburban):	X	2%
Pedestrian network on-site (urban/suburban):		1%

(Mark an "X" in one of the above)

SDT-2 Provide Traffic Calming Measures

Marked crosswalks, count-down signal timers, curb extensions, speed tables, rasied crosswalks, raised intersections, median islands, tight corner radii, roundabouts, on-street parking, planter strips with trees, chicanes/chokers, and others.

% VMT Reduction = 0.00%

Notes:

1. Emission factors for VOC and NOX: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
2. Emission factors for CO, PM10, and PM2.5: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
3. Emission factor for SO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1.
   Emission Factor for SO2 is based on 15 ppm (0.0015%) S1 from the EPA Nonroad Diesel Fuel Program, and assumes complete conversion to SO2.
1. Emission factor for CO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1.
   Emissions of GHGs assume 99.11% of the CO2e emissions occur as CO2, which is typical for off-road diesel engines.

Subject: **Phase I and II Environmental Site Assessment**
LA Times Property
Los Angeles, California 90012

Dear Mr. Bell:

Advantage Environmental Consultants, LLC (AEC) has performed a Phase I and II Environmental Site Assessment (ESA) in conformance with the scope and limitations of American Society for Testing and Materials Practice E 1527-13 and 40 Code of Federal Regulations Part 312, of the LA Times property located at 202 and 234 W 1st Street, 118 and 140 S Broadway, and 145 S Spring Street, in the City of Los Angeles, California. This ESA included public environmental agency and historical record reviews, interviews, site observations, and report preparation. This report includes AEC's findings, conclusions, recommendations, and supporting documentation.

We appreciate the opportunity to be of service on this project. If you should have any questions regarding this report, or if we can be of further assistance, please contact us at (760) 744-3363.

Sincerely,

ADVANTAGE ENVIRONMENTAL CONSULTANTS, LLC

Todd Jacquay

12.6 Boring Location Plan
12.7 Analytical Laboratory Reports
12.8 Qualifications of the Environmental Professionals

1.0 Introduction

1.1 Purpose

The purpose of this Phase I Environmental Site Assessment (ESA) prepared by Advantage Environmental Consultants, LLC (AEC) is to provide a professional opinion on the presence of recognized environmental conditions (RECs) and other suspect environmental conditions in connection with the Site, as they existed on the date of the site inspection, and to recommend whether further investigation is required. American Society for Testing and Materials (ASTM) Standard Practice E 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (the Pracitce), defines good commercial and customary practice for conducting an environmental site assessment of a parcel of commercial real estate with respect to the range of contaminants pertinent to the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), as well as petroleum products. As such, this ESA is intended to satisfy one of the threshold criteria for satisfying the landowner liability protections to CERCLA liability assuming compliance with other elements of the defense. In other words, this ESA represents one of the practices that constitute “all appropriate inquiry” into the previous ownership and uses of the property consistent with good commercial or customary practice, as defined in 42 USC Section 9601(35)(B) and 40 CFR Part 312.

The goal of the process is to identify RECs, which are defined by the Practice as “the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: 1) due to any release to the environment; 2) under conditions indicative of a release to the environment; or 3) under conditions that pose a material threat of a future release to the environment. The term recognized environmental condition includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

The term "environment" is defined in CERCLA 42 USC 9601(8) as "(A) the navigable waters, the water of the contiguous zone, and the ocean waters of which the natural resources are under the exclusive management authority of the United States under the Magnuson-Stevens Fishery conservation and Management Act, and (B) any other surface water, ground water, drinking water supply, land surface or subsurface strata, or ambient air within the United States or under the jurisdiction of the United States.

The term “release” means any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles containing any hazardous substance or pollutant or contaminant), but excludes (A) any release which results in exposure to persons solely within a workplace, with respect to a claim which such persons may assert against the employer of such persons, (B) emissions from the engine exhaust of a motor vehicle, rolling stock, aircraft, vessel, or pipeline pumping station engine, (C) release of source, byproduct, or special nuclear material from a nuclear incident, as those terms are defined in the Atomic Energy Act of 1954 [42 U.S.C. 2011 et seq.], if such release is subject to requirements with respect to financial protection established by the Nuclear Regulatory Commission under section 170 of such Act [42 U.S.C. 2210], or, for the purposes of 42 USC 9604 or any other response action, any release of source byproduct, or special nuclear material from any processing

site designated under section 7912(a)(1) or 7942(a) of this title, and (D) the normal application of fertilizer.

1.2 Detailed Scope of Services

The Phase I ESA was conducted in accordance with generally accepted Phase I industry standards using ASTM Standard Practice E 1527-13, 40 Code of Federal Regulations (CFR) Part 312, and the Scope of Work proposed by AEC (Proposal Number P16-074SD) dated April 20, 2016. The following services were provided for this assessment:

- A review of title information pertaining to the Site.
- Review and summary of prior environmental documents pertaining to the Site.
- An evaluation of standard environmental record sources contained within Federal, State and local environmental databases within specific search distances.
- An evaluation of additional environmental record sources obtained from local regulatory departments/agencies.
- A qualitative evaluation of the physical characteristics of the Site through a review of published topographic, geologic, and hydrogeologic maps; published groundwater data; and area observations to characterize surface water flow in the Site area.
- An evaluation of past Site and adjacent/nearby property uses through a review of historical resources.
- A physical inspection of the Site (interior and exterior) conducted to search for conditions indicative of potential environmental concerns including underground storage tanks (USTs), aboveground storage tanks (ASTs), associated tank piping; stained soil or pavement; equipment that may contain or have historically contained polychlorinated biphenyls (PCBs); and other potential environmental concerns as defined in the ASTM E 1527-13 standard.
- A physical assessment of indications of past uses and visual observations of adjacent and surrounding properties (from curbside or public spaces) to assess potential impacts to the Site.
- Interviews completed with the client, a representative of the Site owner and a local regulatory official.
- The preparation of this Phase I ESA report, which includes the findings of the study and our opinion regarding their level of significance. Conclusions have been drawn based on the significance levels of the findings with subsequent recommendations provided.

A Phase II ESA of the Site was also conducted concurrently with this Phase I ESA, the results of which are described in Section 7.0 of this report. The Phase II ESA consisted of the drilling of eight soil borings and sampling for soil, soil gas and/or sub-slab vapor for various constituents of potential concern.

1.3 Significant Assumptions

This Phase I ESA was conducted in accordance with ASTM guidelines, CFR Part 312, and the Scope of Work proposed by AEC (Proposal Number P16-074SD) dated April 20, 2016 for the performance of such assessment. No other warranties either express or implied are made by AEC. AEC's evaluations, analyses, and opinions should not be taken as representations regarding subsurface conditions or the actual value of the Site. Subsurface conditions may differ from the conditions implied by the surficial observations, and can only be reliably evaluated through intrusive techniques.

Documentation and data provided by the client, designated representatives, other interested third parties, or from the public domain, and referred to in the preparation of this assessment, are assumed to be complete and correct and have been used and referenced with the understanding that AEC assumes no responsibility or liability for their accuracy. AEC's conclusions are based upon such information and documentation and on our observations of Site conditions, as they existed on the date of the site inspection. Because Site conditions may change significantly over a short period of time and additional data may become available, data reported and conclusions drawn in this report are limited to current conditions and may not be relied upon on a significantly later date.

1.4 Limitations and Exceptions

Reasonable efforts have been made during this assessment to uncover evidence of USTs, ASTs and ancillary equipment associated with such features. "Reasonable efforts" are limited to information gained from visual observation of unobstructed areas, recorded database information held in public record, and available information gathered from interviews. Such methods may not identify subsurface equipment that may have been hidden from view due to paving, construction or debris pile storage, or incorrect information from sources.

This investigation was not an environmental compliance audit. While some observations and discussion in this report may address conditions and/or operations that may be regulated, the regulatory compliance of those conditions and/or operations is outside the scope of this investigation. Nothing in this report constitutes a legal opinion or legal advice. For information regarding specific individual or organizational liability, AEC recommends consultation with independent legal counsel.

According to 40 CFR Part 312, Standards and Practices for All Appropriate Inquiry: Final Rule, CERCLA liability rests with the owner or operator of a property and not with an environmental professional hired by the prospective landowner and who is not involved with the ownership or operation of the property. This report meets the requirements set forth in 40 CFR Part 312 Standards and Practices for All Appropriate Inquiries; Final Rule. However, in order to qualify for certain landowner liability protections under CERCLA. Bona Fide Prospective Purchasers, Contiguous Property Owners, and/or Innocent Landowners must meet additional requirements of CERCLA (42 U.S.C. 9601 (35)(B)).

This ESA does not address non-scope ASTM considerations including asbestos, lead-based paint, radon gas, mold, lead in drinking water, wetlands, protected environments and habitat, industrial hygiene concerns, indoor air quality (unrelated to releases of hazardous substances and petroleum products) and high voltage power lines.

1.5 Special Terms and Conditions

No special terms and conditions between AEC and the client pertinent to the findings of this ESA or methodology used to complete this assessment are noted. In addition, AEC does not have a financial interest in the Site.

1.6 User Reliance

This report was prepared for use solely and exclusively by the client and is not for the use or benefit of, nor may it be relied upon by, any other person or entity for any purpose without the advance written consent of AEC. AEC makes no representation to any third party except that it has used the degree of care and skill ordinarily exercised by a reasonable prudent environmental professional in the same community and in the same time frame given the same or similar facts and circumstances. No other use or disclosure is intended or authorized by AEC. In the preparation of this ESA, AEC has used the degree of care and skill ordinarily exercised by a reasonably prudent environmental professional in the same community and in the same time frame given the same or similar facts and circumstances. No other warranties are made to any third party, either express or implied.

1.7 Regulatory Setting

The City of Los Angeles (City) is preparing an Environmental Impact Report (EIR) for the proposed Times Mirror Square Project (Project), including the following entitlements from the City: (1) Transfer of Floor Area Rights (TFAR) of 548,440 sf from the Los Angeles Convention Center (Donor Site) to the Project Site (Receiver Site); (2) Vesting Conditional Use Permit to permit floor averaging within a unified development; (3) Master Conditional Use Permit (MCUB) to permit the on-site and off-site sale and consumption of alcoholic beverages within the Project's commercial retail spaces; (4) Vesting Tentative Tract Map for the merger and re-subdivision of the Project Site for condominium purposes (including parking per LAMC requirements in lieu of the parking requirements under the Advisory Agency's Parking Policy for Condominiums; (5) Construction permits, including building, grading, excavation, foundation, and associated permits; (6) Haul Route Permit; (7) certification of the EIR; and (8) other approvals and permits as needed.

2.0 Site Description

2.1 Location and Legal Description

The Site includes the city block bound generally to the north by W 1st Street, to the south by W 2nd Street, to the east by S Spring Street, and to the west by S Broadway. The Site consists of five rectangular-shaped parcels currently developed for commercial purposes that total a reported 160,578 square feet (3.6 acres) in size. The Site includes the following legal parcels:

Table 1

Addresses	APNs
145 S Spring Street 147 S Spring Street 205 W 2nd Street 211 W 2nd Street	5149-001-003
124 S Broadway 126 S Broadway 128 S Broadway 140 S Broadway 142 S Broadway 221 W 2nd Street	5149-001-004
110 S Broadway 118 S Broadway 120 S Broadway	5149-001-005
202 W 1st Street 212 W 1st Street 214 W 1st Street 220 W 1st Street 121 S Spring Street	5149-001-006
224 W 1st Street 228 W 1st Street 230 W 1st Street 234 W 1st Street 100 S Broadway 102 S Broadway 106 S Broadway 108 S Broadway	5149-001-007

A Vicinity Map depicting the general location of the Site is included in Section 12.1.

2.2 Site and Vicinity General Characteristics

The Site and its adjacent/nearby properties are comprised of commercial properties in the densely developed Center City/Historic Core District of Downtown Los Angeles. This district, which extends from W. 1st Street to W. 11th Street, between Los Angeles and Hill Streets, includes Los Angeles City Hall, Los Angeles County courts and law library, federal offices and courts, LAPD Headquarters, CalTrans Regional Offices, Grand Park, and other civic facilities.

2.3 Current Use of the Site

The Site is currently developed for commercial purposes. The majority of the Site is occupied by varying divisions of the LA Times (i.e. offices, former production areas, service related, etc.). Other portions of the Site are leased by other entities (Bank of America and other various businesses). The Site building also includes a parking structure.

2.4 Description of Structures, Roads, Other Improvements on the Site

The Site is currently occupied by five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage, and the 6-story Executive Building, resulting in a total of approximately 559,853 sf. Potable water and sanitary sewer service is provided to the area by the City of Los Angeles. Electricity and natural gas are supplied to the area by the Southern California Gas Company. Each building is underlain by a subterranean basement (one to three levels in depth). A Site Plan depicting each Site building is included in Section 12.2. Photographs taken of the Site are included in Section 12.3.

2.5 Current Uses of the Adjoining Properties

The area surrounding the Site consists generally of commercial businesses and residential properties. AEC performed a visual inspection of adjoining properties from adjacent sidewalks and other access points. The following table identifies the adjacent property uses:

Table 2

Direction	Adjoining Property Use
North	W 1st Street, then a vacant lot and commercial buildings
South	W 2nd Street, then a parking lot and commercial buildings.
East	S Main Street, then commercial buildings
West	S Spring Street, then a construction site (Federal courthouse building)

No significant environmental concerns to the Site relative to the adjacent properties were noted.

3.0 User Provided Information

3.1 Title Records

AEC was provided with a preliminary title report for the Site prepared by Chicago Title Insurance Company and dated September 27, 2016. The Site is currently vested in Onni Times Square LP, a Nevada limited partnership. No environmentally related liens, deed restrictions or activity and use limitations pertaining to the Site were noted in the title report or during research completed with the County of Los Angeles Tax Assessor. In addition, the client is unaware of such encumbrances recorded against the Site.

3.2 Environmental Liens or Activity and Use Limitations

The client is unaware of environmental related liens or activity use limitations (i.e. engineering or institutional controls) that are related to potential environmental issues at the Site.

3.3 Specialized Knowledge

The client is unaware of specialized knowledge pertinent to potential recognized environmental conditions at the Site.

3.4 Commonly Known or Reasonably Ascertainable Information

The client is unaware of commonly known or reasonably ascertainable information pertinent to potential recognized environmental conditions at the Site.

3.5 Valuation Reduction for Environmental Issues

The client is unaware of information pertaining to the relationship of the purchase price to the estimated fair market value of the Site that might indicate that significant contamination exists.

3.6 Owner, Property Manager, and Occupant Information

The Site is currently vested in CA Los Angeles Times Square LLC. The Site owner is considered to be the property manager. Site occupants include the Los Angeles Times, Bank of America and other various businesses (office related).

3.7 Reason for Performing Phase I ESA

AEC has been retained to conduct this Phase I ESA to identify environmental issues which may be present at the Site and in connection with the planned purchase of the Site.

3.8 Other

Prior environmental reports were provided to and reviewed by AEC during the preparation of this Phase I ESA. A summary of such reports follows:

Converse Environmental Consultants, 1988, Proposed Program for Permitting Underground Tanks at Times Mirror Square, Los Angeles, California

According to the report, a total of nine USTs are associated with the Times Mirror Square property and the parking lot located adjacent to the south of the Site across West 2nd Street. Of the nine USTs, two 6,000-gallon USTs of diesel fuel and one 3,000-gallon UST of gasoline are reportedly located beneath the sidewalk bordering the eastern adjacent South Spring Street. The remaining USTs are located off-Site to the south in a parking lot. The two 6,000-gallon USTs were reportedly installed at 40 feet below grade and encased in a concrete vault during the construction of the building in 1935.

Converse Environmental Consultants, April 26, 1989, UST Abandonment-In-Place, Los Angeles Times, Times Mirror Square Facility, 135 South Spring Street, Los Angeles, California

According to the report, a 3,000-gallon capacity UST is located beneath the eastern Site sidewalk bordering South Spring Street. On February 19, 1989, two soil borings were advanced near the UST to depths up to 40 feet below grade. Groundwater was not encountered in the borings. Soil samples collected from the borings were analyzed for total fuel hydrocarbons and BTEX via EPA Methods 8015 and 8020. The results of analytical testing revealed no detection of total fuel hydrocarbons above 5 milligrams per kilogram (mg/kg). Concentrations of BTEX in soil were reported by Converse as less than 0.05 mg/kg in all samples. Further evaluation of the analytical report indicates the soil samples from 15 feet below grade contain the highest reported concentrations of benzene at 0.021 mg/kg, toluene 0.011 mg/kg, ethylbenzene 0.031 mg/kg and xylenes at 0.041 mg/kg. Such concentrations are considered to be insignificant. On March 28, 1988, a precision test was performed on the UST indicating no evidence of leakage. As a result of the soil sampling activities and precision testing, Converse concluded that the UST had not leaked into the surrounding soils. No further abandonment documentation was found in the LAFD records (i.e. closure letter or tank closure inspection report).

Healy Environmental, Inc, May 25, 1990, Report on Tank Closure, Los Angeles Times, 130 South Broadway, Los Angeles, California

According to the report, two 5,000-gallon diesel USTs were closed in place at the Site (identified as the same tanks discussed previously as 6,000-gallon USTs). One soil boring was advanced near the USTs to a depth of 60 feet. Groundwater was not encountered in the boring. Soil samples were collected from 50 and 60 feet below grade and analyzed for EPA Methods 8015 and 8020. According to Healy, the analytical results revealed undetectable concentrations of all contaminants. The USTs were reportedly emptied, rinsed of diesel fuel, and filled with concrete slurry on May 8, 1990. The USTs are no longer used during the course of normal Site operations and are not considered to be current RECs in connection with the Site.

Geomatrix, March 2008, Phase I Environmental Site Assessment, Times Mirror Square, APNs 5149-001-003, -004, -005, -006, and -007, Los Angeles, California.

According to the report, the Site is identified as Times Mirror Square and is comprised of five multi-story buildings connected to one another at various floors. In addition to the buildings, the Site is also developed with concrete paved parking areas and includes six generators associated with six diesel ASTs, nine sumps, a paint storage room, and a hazardous waste storage area. At the time of the 2008 Phase I ESA, the Site buildings were identified as Times South at 145 S Spring Street (current Mirror Building), Times North at 202 W 1st Street (current Times Building), Times West at 220 W 1st Street and 100 S Broadway (current Executive Building), the Broadway

Building at 130 S Broadway (current Executive Building), and the Corporate Garage (221 W 2nd Street). Site operations included newspaper publishing administration, banking (Bank of America), and automobile parking. Printing of newspapers was reportedly conducted at the Site from 1935 to the early 1990s. By the time of the 2008 Phase I ESA, all equipment related to the former printing operations had been removed from the Site. In addition, an abandoned clarifier paved in concrete was reportedly observed in the Times South Building (currently considered the Mirror Building).

A review of records maintained by the City of Los Angeles Fire Department (LAFD) was conducted for the Site during the preparation of the 2008 Phase I ESA. The records identified the use of hazardous materials and three historical underground storage tanks at the Site. Records from 1989 and 1990 indicate the three USTs (two 6,000-gallon diesel USTs and one 3,000-gallon gasoline UST) were reportedly abandoned in place at the Site. Further details of the LAFD records for the Site are discussed below. No recognized environmental conditions in connection with the Site were identified during the completion of the prior Phase I ESA.

ARCADIS US Inc., December 8, 2014, Project Completion Report, Underground Storage Tank Removal, Los Angeles County Metropolitan Transportation Authority, Regional Connector Project – LA Time Location, 221 W. 2nd Street, Los Angeles, California

According to the report, a 15,000-gallon emergency generator diesel tank was removed from the Site parking structure at 221 W. 2nd Street. Concrete saw cutting and removal of the tank reportedly commenced on October 6, 2014. Product, return, and vent pipelines were reportedly cut and capped in the northeast portion of the work zone and left in place below W. 2nd Street. On October 8, 2014, the UST was removed from the excavation and transported for disposal at Ecology Auto Parks in Santa Fe Springs, California. The excavation was reportedly conducted to a maximum depth of 15 feet below ground surface with no staining observed in any portion of the material removed during the UST excavation. Following the removal of the UST and underground product lines, two soil samples were collected at a depth of approximately 5 feet bgs (2 feet below product and return lines). In addition, due to the presence of a concrete pad below the UST, three samples were collected using a hollow stem drill rig from below the UST at a depth of approximately 17 feet bgs. Excavated material and soil from beneath the UST were sampled and analyzed for total petroleum hydrocarbons as diesel (TPHd by USEPA Method 8015) and volatile organic compounds including BTEX and fuel oxygenates (VOCs by USEPA Method 8260B). TPHd and VOCs were not detected above laboratory reporting limits in any of the samples collected. Pea gravel was reportedly used as additional backfill material to level the excavation to within 10 inches of the surface, followed by six inches of compacted road base, and topped with four inches of asphalt to match existing surface conditions.

4.0 Records Review

4.1 Standard Environmental Record Sources

AEC reviewed Federal and State environmental databases provided by EDR of Shelton, Connecticut for information pertaining to documented and/or suspected releases of regulated hazardous substances and/or petroleum products within specified search distances. A copy of the EDR report is included in Section 12.4.

AEC also reviewed unmappable sites listed in the environmental database report by cross-referencing addresses and site names. Unmappable sites are sites that cannot be plotted with confidence, but can be located by zip code or city name. In general, a site cannot be mapped because of inaccurate or missing location information in the record provided by the regulatory agency. Any unmappable sites that AEC identifies within the specified search radii were evaluated as part of the preparation of this report.

The following Federal databases related to potential on-site and off-site sources of contamination were reviewed and interpreted by AEC:

Table 3	
Federal Databases	**Search Distance From Site**
National Priorities List (NPL)	One mile
Delisted NPL	One mile
Superfund Enterprise Management System, former CERCLIS - (SEMS)	One-half mile
Superfund Enterprise Management System Archive, former CERCLIS NFRAP - (SEMS ARCHIVE)	One-half mile
Resource Conservation and Recovery Act (RCRA) CORRACTS Hazardous Waste Treatment, Storage and Disposal (TSD) Facilities	One mile
RCRA non-CORRACTS Hazardous Waste TSD Facilities	One-half mile
RCRA Hazardous Waste Generators (RCRA GEN)	One-eighth mile
Emergency Response Notification System (ERNS)	One-eighth mile
Federal Institutional/Engineering Control Registries (IC/EC)	One-half mile

The following State/local databases related to potential on-site and off-site sources of contamination were also searched and reviewed:

Table 4	
State/Local Databases	**Search Distance From Site**
State-equivalent NPL and CERCLIS (RESPONSE and ENVIROSTOR)	One mile
State Voluntary Cleanup Sites (VCP)	One-half mile
State Landfill and/or Solid Waste Disposal Sites (SWF/LF)	One-half mile
State Leaking Storage Tank (LUST, SLIC)	One-half mile
State Registered Storage Tank (UST, AST)	One-eighth mile

Descriptions/sources of each of the above referenced regulatory databases and the dates these databases were last updated by the applicable regulatory agencies are included in the EDR report.

Subject Site

Several listings for the Site are identified in the standard ASTM regulatory databases search by EDR. The table below summarized the Site listings as presented in the EDR database report:

Table 5

Site Listing and Address	Database(s)	Details
Los Angeles Times 130 S Broadway	UST	Referenced with a historical UST and no indication of a reported release.
TransAmerica Occidental 150 S Broadway	UST	Referenced with a historical UST and no indication of a reported release.
LA Times Bldg 120 S Spring St	ERNS	Referenced with a "pint bomb exploded by city police and neutralized by the fire department." No indication of a reported release.
The Time Mirror Company 220 W 1st Street	RCRA-SQG	Referenced as a small quantity generator of hazardous waste with no violations found and no indication of a reported release.
Los Angeles Times 202 W 1st St	RCRA-SQG UST	Referenced as a small quantity generator of hazardous waste with a historical UST. No indication of a reported release.
Times Mirror Company 145 S Spring St	LUST	Referenced with a case closed regulatory status as of March 30, 1989.

Please refer to Section 3.8 of this report for additional information pertaining to prior environmental investigations completed at the Site.

Adjoining and Nearby Properties

Several listings were mapped in the standard regulatory databases within one-eighth mile of the Site. The table below presents a summary of the listed facility and an opinion regarding the potential impact to the Site.

Table 6

Listed Property and Address	Database(s)	Mapped Distance and Direction From Site	Details	Likely Concern To Site?
Los Angeles State Office Bldg, California Dept of Justice 107 S Broadway	UST, RCRA-SQG	0.006-mile North	Referenced as a small quantity generator with a historical UST and no indication of a reported release.	No
The Los Angeles Times 214 W 2nd St	UST	0.008-mile SSW	Referenced with a historical UST and no indication of a reported release.	No

Table 6				
Listed Property and Address	**Database(s)**	**Mapped Distance and Direction From Site**	**Details**	**Likely Concern To Site?**
Caltrans District 7, State of California, 07 District Office 120 S Spring St	UST, RCRA-SQG	0.008-mile East	Referenced as a small quantity generator with a historical UST and no indication of a reported release.	No
Los Angeles Air Force Base	LUST	0.072-mile ESE	Referenced as a LUST with no additional information.	No
Office of Fleet Administration, Calif State Garage 122 S Hill ST	UST, RCR-SQG	0.075-mile NW	Referenced as a small quantity generator with a historical UST and no indication of a reported release.	No
Current Occupant 208 S Hill St	UST	0.078-mile West	Referenced on the UST database with no indication of a reported release.	No
High Performance Magazine 240 S Broadway 5th Floor	RCRA-SQG	0.080-mile SW	Referenced as a small quantity generator with no violations found and no indication of a reported release.	No
Webster Career College 222 S Hill St	UST	0.083-mile West	Referenced on the UST database with no indication of a reported release.	No
Chandler Lease Property Main St	SLIC	0.084-mile ESE	Referenced with a case closed regulatory status as of August 12, 1995.	No
Caltrans Equipment Shop 100 S Main St	RCRA-SQG	0.087-mile ESE	Referenced as a small quantity generator with no violations found and no indication of a reported release.	No
County Courthouse, LA County FMD 111 N Hill St	UST	0.094-mile NNW	Referenced on the UST database with no indication of a reported release.	No
Times Mirror 240 S Hill St	LUST	0.097-mile West	Referenced with a case closed regulatory status as of August 19, 1997.	No
Los Angeles City Hall – South 111 E 1st St	UST RCRA-SQG	0.097-mile ESE	Referenced as a small quantity generator with four USTs and no indication of a reported release.	No
The Angelus Plaza 245 S Hill St	UST	0.102-mile West	Referenced on the UST database with no indication of a reported release.	No
Los Angeles City Bur Sanitation, LA City Repair Shops 200 N Main St	RCRA-SQG	0.103-mile East	Referenced as a small quantity generator with no violations found and no indication of a reported release.	No
City Hall East 200 N Main St	RCRA-LQG UST	0.103-mile East	Referenced as a large quantity generator with a historical UST. No indication of a reported release.	No
The RHF Bunker Hill Corp 255 S Hill St	UST	0.109-mile West	Referenced on the UST database with no indication of a reported release.	No

The properties listed in the table above are not considered to be significant environmental concerns to the Site. In addition, several properties mapped between one-eighth and one-mile from the Site also appear on various regulatory databases (1 SEMS ARCHIVE, 49

ENVIROSTOR, 2 SWL/LF, 19 LUST, and four SLIC). These properties are also not considered to be significant environmental concerns to the Site. These opinions are based on several factors including the nature of the regulatory database listings, distance of the off-Site listed properties from the Site, orientation of the listed properties relative to the Site, interpreted direction of groundwater flow, and/or regulatory case status information for the various properties as described in the database report.

Non-ASTM Database Reviews

Below is a list of non-ASTM databases searched by EDR and reviewed by AEC during the preparation of this assessment. The descriptions of each database and their data release frequency are included in the EDR report, included in Section 12.4.

Local Brownfield Lists
US BROWNFIELDS - A Listing of Brownfields Sites

Non-ASTM Database Listings

No non-ASTM database listings are mapped for the Site. Multiple off-Site properties (one Brownfields, four CHMIRS, one RCRA NonGen / NLR, and two Los Angeles Co. HMS) are identified on the non-ASTM databases within their respective search distances. The Brownfields listing is identified as Adelante Eastside at 100 Broadway S (mapped 0.003-mile northeast of the Site). Adelante Eastside is an approximately 2,200 acre industrial and commercial redevelopment project containing the areas south of Olympic Boulevard to the city limits of Vernon from the Los Angeles River to Indiana Street; North Main Street east to Valley Boulevard and Alhambra Avenue to the city limits of Alhambra; and all east - west commercial streets in Boyle Heights such as Cesar Chavez Avenue, First Street, Fourth Street and Whittier Boulevard from the Los Angeles River to Indiana Street. The western limits of this redevelopment area are situated at least one mile to the east of the subject Site. As such, the association of the Adelante Eastside redevelopment area to the Site and the address assigned to the Adelante Eastside is in error by the regulatory database provider. Regardless, the Brownfields database listing in question is associated with a federally funded grant issued to the City of Los Angeles for the completion of a Phase I ESA within the redevelopment area and is not related to the cleanup of hazardous waste or a reported release. As such, the Adelante Eastside regulatory database listing is not considered to be an environmental concern to the Site. The CHMIRS listings include Chandler Lease Property at Main Street (0.084 mile east-southeast) and three unnamed listings mapped at First St and Broadway (0.007-mile north), 120 South Spring Street (0.008-mile east), and 200 N. Main Street. City Hall East @ P2 (0.098-mile east). The RCRA NonGen / NLR listing is identified as Caltrans District 7 at 120 S Spring St (0.008-mile east). The Los Angeles Co. HMS listings include Caltrans-District 7 Referrals at 120 S Spring St (0.008-mile east) and LA Co ISD L A Court House at 111 N Hill St (0.094-mile north-northwest. The off-Site non-ASTM database listings are not expected to have adversely impacted the Site. This opinion is based on several factors including distance of the off-Site listed properties from the Site, orientation of the listed properties relative to the Site, interpreted direction of groundwater flow, and/or regulatory case status information for the various properties as described in the database report.

4.2 Additional Environmental Record Sources

Los Angeles Fire Department (LAFD) – Records Review

AEC reviewed LAFD records pertaining to the Site. The records identified the following hazardous materials at the Site: Freon gas, microcide 98, sulfuric acid, paint, waste paint, thinner, batteries, PCBs, waste oil/solvent, acetylene, argon, liquid soaps, nitrogen, oxygen, potassium hydroxide, sodium bisulfate, and sodium hydroxide. In addition, the LAFD records indicate three abandoned USTs are located on the eastern portion of the Site. Results of soil sampling adjacent to the USTs did not indicate significant evidence of a release from these tanks. Prior environmental activities related to the abandonment of the three on-Site USTS is included in Section 3.8 above.

City of Los Angeles Department of Building and Safety

AEC reviewed building records dating from 1905 to 1981 and provided in the prior Phase I ESA for the Site. Records for the Site date back to a 1905 building permit for the construction of a residence at the Site address of 101-111 S Spring Street. The Site address of 114 S Broadway was occupied by a printing shop in 1915. Times Mirror Company is identified in Site records dating from the early 1930s to the 1980s. None of the records were indicative of USTs or unauthorized releases of hazardous substances or petroleum products.

California State Water Resources Control Board (Geotracker)

AEC searched for information regarding a possible release at the Site on the Geotracker database maintained by the California Water Resources Control Board. Times Mirror Corporation, at the Site address of 145 S Spring Street, is identified on Geotracker as a cleanup site in which gasoline may have impacted soil. Details regarding the Site listing are limited, with no soil or groundwater data submitted to Geotracker. The case was initially reported on April 27, 1988 and has a case closed status as of March 30, 1989. Based on the dates of the regulatory activities, it appears the listing is associated with the abandonment of a 3,000-gallon UST as discussed in Section 3.8 above. No additional information for the Site was revealed in the Geotracker database.

4.3 Physical Setting Sources

The following physical setting sources were reviewed to provide information about the topographic, hydrologic, geologic and/or hydrogeologic characteristics of the Site.

4.3.1 Topography and Hydrology

USGS Topographic Quadrangle

The Site is depicted on the United States Geological Survey (USGS) 7.5 Minute Series, Hollywood, California topographic quadrangle map dated 1991 and Photorevised in 1994. The Site is shown on the map as being relatively level and located at an elevation of approximately 280 feet above mean sea level. Regional topography is shown as sloping to the south-southwest. No Site specific structures are depicted on the map. The Site and surrounding area are shaded red, indicating urban development. Streets/roadways bordering the Site are shown in their current configuration.

Hydrology/Storm Water Management

Surface drainage at the Site is facilitated by nearby municipal storm drains along public roadways and maintained by the City of Los Angeles. The Site does not appear to receive significant drainage from off-Site properties.

4.3.2 Geology

The Site lies within the Peninsular Ranges Geologic Province of California. This geomorphic province is traversed by a group of northwest trending sub-parallel fault zones and encompasses an area that extends 125 miles from the Transverse Ranges and the Los Angeles Basin south to the Mexican Border and beyond another 775 miles to the tip of Baja California. Rocks within the

Peninsular Range Province were emplaced during Cretaceous age orogenic events and uplifted into the present mountain ranges during the late Tertiary and Quaternary. Igneous, metamorphic and sedimentary rocks are all found within the Peninsular Ranges. The area is seismically active, with several known active faults crossing the Province.

The Site is located in the northern portion of the Los Angeles Basin on a gently east-southeast sloping alluvial surface. Site geology reportedly consists of artificial fill, Holocene age alluvium, and siltstone and sandstone bedrock of the Puente Formation.

4.3.3 Hydrogeology

According to the Water Quality Control Plan for the Los Angeles Basin, the Site is located within the Coastal Plain of Los Angeles-Central Hydrologic Sub-Area of the Los Angeles Hydrologic Area of the Los Angeles River Hydrologic Unit (RWQCB, 1994). Groundwater in the Coastal Plain of Los Angeles-Central Hydrologic Sub-Area has existing beneficial uses for municipal, industrial, process supply and agriculture purposes. Prior environmental investigations conducted at the Site indicate groundwater was not encountered in borings advanced to 40 feet and 60 feet below ground surface (bgs). According to a geotechnical report conducted for the Site, any groundwater identified at depths shallower than 150 feet to 200 feet bgs are likely to be perched. Groundwater flow direction beneath the Site is anticipated to the south-southwest. In addition, it should be noted that during AEC's reconnaissance of the Site, groundwater was observed to be infiltrating in to the 3rd level of the basement of the Executive Building. Such groundwater is reportedly captured by a series of piping systems that lead to sumps and ultimately the sanitary sewer system. No odors, sheens or other suspect conditions were noted in the areas of groundwater observed.

4.3.4 Radon Zone

The Site is located within US EPA Radon Zone 2 which has a moderate potential for radon accumulation with an indoor average level between 2 and 4 picoCuries per liter (pCi/L). The US EPA action level for radon is > 4 pCi/L. Therefore, radon is not considered to be a significant concern at the Site.

4.4 Historical Use Information

Historical sources (as described in the following sections) were reviewed to develop a history of the previous uses of the Site and adjacent/nearby properties to help identify the likelihood of past uses having led to recognized environmental conditions in connection with the Site.

4.4.1 Fire Insurance Maps

Sanborn fire insurance maps were reviewed for the years of 1888, 1894, 1906, 1920, 1950, 1953, 1954, 1959, 1960, 1967, and 1970. The results of the map review are summarized in the following table and the Sanborn maps are included in Section 12.5.

Table 7 Sanborn Review	
Year	**Observations**
1888	**SITE:** The Site is depicted as a developed city block comprised of storefronts, offices, and residences. The northern portion along W 1st Street includes the Los Angeles Real Estate & Stock Exchange, offices, a restaurant, carriage shed, and Nadeau Hotel. The southern portion along W 2nd Street includes a newly constructed building, City Hall, a police station/jail, and a bank. The western portion along S Fort Street (current S Broadway) includes dwellings, offices, a Chinese Laundry, and a Livery and Boarding stable. The eastern portion along S Spring Street includes storefronts and offices. **SURROUNDING AREA:** Surrounding roads are depicted similar to their current configurations with S Fort Street identified to the west (currently S Broadway). Properties to the west and south are not depicted on the map. Properties to the north across W 1st Street and to the east across S Spring Street are depicted with storefronts and offices.
1894	**SITE:** The Site is depicted similar to the 1888 map with storefronts in the previous location of dwellings in the southwest portion and printing identified in the previous location of the LA Real Estate & Stock Exchange in northwest portion. **SURROUNDING AREA:** Surrounding properties are depicted similar to the 1888 fire insurance map. S Broadway is identified west of the Site (formerly S Fort Street).
1906	**SITE:** The Site is depicted similar to the 1894 map with new storefronts and the Herald and Chamber of Commerce identified on the western portion along S Broadway. **SURROUNDING AREA:** The surrounding areas are not depicted on the map.
1920	**SITE:** The Site is depicted as a developed city block with multiple buildings. Detailed information is not depicted on the map for the Site or surrounding properties. **SURROUNDING AREA:** The surrounding properties are developed with multiple buildings beyond the current configuration of streets in all directions.
1950, 1953, 1954	**SITE:** The majority of the Site is depicted as the Times – Mirror Co. Newspaper Plant with several lofts and storefronts in the southwest portion and storefronts and restaurants in the northwest portion. **SURROUNDING AREA:** The surrounding properties are not depicted on the map with the exception of offices for the California State Division of Highways and the Wilson Bldg depicted to the east across S Spring Street.
1959, 1960, 1967	**SITE:** The Site is similar to the 1954 map with vacant land in the southwest portion and a bank in the northwest corner. **SURROUNDING AREA:** The surrounding properties are depicted similar to the 1954 map.
1970	**SITE:** The Site is similar to the 1967 map with vacant land in the southwest and corners. **SURROUNDING AREA:** The surrounding properties are depicted similar to the 1954 map.

4.4.2 Aerial Photographs

AEC reviewed aerial photographs from 1928, 1938, 1947, 1956, 1965, 1976, 1989, 1994, 2002, 2005, 2009, and 2012. The Site and surrounding areas appear to be developed with commercial buildings and associated parking areas in aerial photographs dating back to 1928. Streets in the vicinity of the Site appear similar to their current configurations in all of the aerial photographs.

The development of the Site and surrounding area is consistent with that identified during review of the fire insurance maps of similar time frames.

4.4.3 City Directories

AEC reviewed historical city directory listings provided in the prior Phase I ESA for the Site. Listings for the Site date back to at least 1924 in which the Site address of 118 S Broadway is identified as Times Mirror Printing & Binding House. Additional historical Site listings include multiple offices, restaurants, and stores. The surrounding area is also listed with stores and offices dating back to at least 1924 which is consistent with the findings of the fire insurance map and aerial photograph reviews.

4.4.4 State of California Division of Oil and Gas Records

According to online resources provided by the California Department of Conservation, Division of Oil, Gas and Geothermal Resources, there are no oil, gas or geothermal wells located on the Site or its adjacent properties.

5.0 Site Reconnaissance

The objective of the Site reconnaissance was to obtain information indicating the likelihood of recognized environmental conditions in connection with the Site. Multiple visits to the Site were conducted by Mr. Dan Weis of AEC's Western Regional office. Mr. Weis was escorted by designated representatives of the Site owner during each Site reconnaissance.

5.1 Methodology and Limiting Conditions

The Site reconnaissance consisted of walking the Site and along public sidewalks (for viewing of adjacent/nearby properties). AEC assessed the majority of the lowest levels of each basement area of the Site buildings and intermittent areas of basement levels above (where applicable). In addition, the ground-level (street grade) spaces were observed as were limited areas of above-grade levels above. The level of the Site reconnaissance was adequate for AEC to render opinions regarding environmental conditions at the Site. As stated previously, a Site Plan is included in Section 12.2. Photographs of the Site were taken to document existing Site conditions and are included and described in Section 12.3.

5.2 General Site Setting

The Site and its adjacent/nearby properties are comprised of commercial properties in the densely developed downtown area of the City of Los Angeles. The Site is currently developed for commercial purposes. The majority of the Site is occupied by varying divisions of the LA Times (i.e. offices, former production areas, service related, etc.). Other portions of the Site are leased by other entities (Bank of America and other various businesses). The Site building also includes a parking structure.

5.3 Site Observations

AEC examined accessible portions of the Site for evidence of the following potential environmental concerns:

Table 8

Conditions	Not Observed or Noted	Observed or Noted	Recognized Environmental Concern?
Hazardous Substances/Petroleum Products		X	No
Waste Generation/Storage/Disposal		X	No
ASTs		X	No
USTs		X	No
PCB Containing Equipment		X	No
Chemical/Petroleum Odors	X		
Pools of Liquid	X		
Floor Drains/Sumps/Wells		X	No
Drums		X	No
Stains or Corrosion	X		
Unidentified Substance Containers	X		
Stained Soil or Pavement	X		
Stressed Vegetation	X		

Table 8			
Conditions	**Not Observed or Noted**	**Observed or Noted**	**Recognized Environmental Concern?**
Pits, Ponds or Lagoons	X		
Wastewater Discharges/Disposal Systems		X	No
Septic Systems/Cesspools	X		
Non-Hazardous Solid Waste Disposal Areas		X	No
Drinking Water Systems/Water Wells	X		
Other Wells	X		
Asbestos and Lead-Based Paint		X	No

The noted items in the table above are discussed below:

Hazardous Substances/Petroleum Products - Waste Generation/Storage/Disposal - Drums

Containers of hazardous materials and wastes varying in capacity from retail-sized (5-gallons or less) to 55-gallons (drums) were observed in limited areas of each of the Site buildings. The majority of such containers were observed at the ground-level of the Parking Structure building. Substances stored included paints, paint thinners, sulfuric acid, biocides (algae control), various boiler treatment fluids, hydraulic oil, used oil, paint sludge/waste, batteries (new and used), universal waste (light ballasts, light tubes, etc.) and others. In addition, diesel fuel is stored in multiple emergency generators in each of the Site buildings. No staining, suspect conditions or indications of releases were noted in the areas of such containers.

Above Ground Storage Tanks (ASTs)

Multiple emergency generators are present at the Site (in each of the Site buildings). Such generators contain diesel fuel ASTs ranging in capacity from 55-gallons to 1,000 gallons. AEC observed emergency generators with associated diesel fuel ASTs. No evidence of staining or leakage adjacent to or below the ASTs was noted.

Underground Storage Tanks (USTs)

As stated in Section 3.7 of this report, three USTs associated with the Plant Building have been abandoned in place at the Site under oversight of the LAFD. The areas of the former tanks were noted by Site owner representatives and observed by AEC during our Site visits. No environmental concerns associated with the three abandoned in place USTs were observed during the field reconnaissance.

PCB Containing Equipment

It is possible that older light ballasts within the Site buildings contain PCBs. In addition, older transformers present within LADPW maintained electrical rooms in each of the Site buildings (no access granted) may also contain PCBs. Visible transformers observed appeared to be in good condition with no staining, suspect conditions or indications of releases noted in the areas of such systems.

Floor Drains/Sumps/Wells - Wastewater Discharges/Disposal Systems

There are numerous floor drains within the interior of each of the Site buildings and area drains in exterior portions of the Site. There are also a series of sumps in each of the Site buildings. The

interior drains and sumps reportedly lead to the sanitary sewer system. The sumps are reportedly used to capture both drainage from slab surfaces and also groundwater that may infiltrate in to the Site buildings, especially at the lowest levels of basements. Exterior area drains reportedly lead to the stormwater conveyance system. An abandoned clarifier (filled with concrete) was also observed in the Mirror Building. No significant staining, suspect conditions or indications of releases were noted in the areas of such systems.

Non-Hazardous Solid Waste Disposal Areas

Dumpsters were observed within the Parking Structure Building at the Site. With the exception of typical staining and odors (non-chemical in nature) commonly observed in the areas of large trash dumpsters, no significant staining or suspect conditions were noted. In addition, no evidence of unauthorized waste disposal was observed.

Asbestos and Lead-Based Paint

AEC was informed by the seller of the Site that significant abatement of asbestos and lead-based paint had been previously completed at the property. However, based on the size of the Site structures and observations made during our visits to the Site, it can be reasonably assumed that such materials remain in the Site buildings. Prior to the disturbance of building materials during future demolition and/or renovation activities, surveys for asbestos and lead-based paint should be completed, with abatement conducted as necessary prior to any construction work. Asbestos and lead-based paint are not considered to be RECs in connection with the Site, but are conditions that will require typical management during construction as necessary.

6.0 Interview Information

6.1. Interview With Owner

The Site is currently owned by CA Los Angeles Times Square LLC. The Site owner referred AEC to prior environmental reports pertaining to the Site for information pertaining to their knowledge of environmental conditions at the Site. In addition, during AEC's Site visits, representatives of the Site owner were interviewed and were unaware of RECs in connection with the Site.

6.2 Interview With Site Manager

The Site owner is also considered to be the Site Manager. Please refer to Section 6.1 above.

6.3 Interviews With Occupants

No formal interviews were conducted with Site occupants. Given the knowledge of Site owner representatives regarding Site history and facilities, the lack of formal interviews with Site occupants does not alter AECs conclusions and recommendations regarding the Site.

6.4 Interview With Local Government Official

During the preparation of this assessment, AEC consulted with various regulatory agency sources regarding potential environmental concerns at the Site.

6.5 Interview With Others

No interviews with other persons knowledgeable of the historical use of the Site were conducted during the preparation of this ESA.

7.0 Phase II Environmental Site Assessment

A Phase II ESA was performed to identify environmental issues which may be present at the Site and in connection with its historical use. Eight soil borings (identified as B1 through B8) were advanced at the Site using a stainless steel hand auger and an electric rotary hammer (where applicable). The soil borings were advanced by Astech Environmental of Santa Ana, California (H&P) at the following locations:

- B1 and B2 – Basement of Parking Structure
- B3 – Basement (third level below grade) of Executive Building
- B4 – Basement of Executive Building
- B5 - Basement (third level below grade) of Mirror Building
- B6 and B7 - Basement of Plant Building
- B8 – Basement of Times Building

Soil borings B1 through B3 were advanced to depths of five feet below the adjacent concrete slabs and soil borings B4 through B8 were advanced to depths of one foot below the adjacent concrete slabs. Soil borings B1 through B3 were advanced to depths of three feet using the hand auger, followed by driving using the electric rotary hammer to the total depth of 5 feet. The remaining soil borings (B4 through B8) were advanced using the hand auger. Drilling conditions at some boring locations were difficult due to the presence of pea gravel type material beneath the slabs that was consistently caving during advancement of the boreholes. A Boring Location Plan (three pages) is included in Section 12.6. The analytical laboratory reports (including quality control data) and chain of custody documentation are included in Section 12.7 of this report.

Pre-Field Activities

Prior to the commencement of field sampling, AEC prepared a health and safety plan that outlined the procedures that AEC's personnel followed to minimize the potential for health and safety hazards during the course of work performed at the Site. In addition, AEC notified Underground Service Alert (USA) utility marking service prior to drilling activities. USA member agencies identified known utility locations in the public right of way adjacent to the Site and on select areas of the Site. Concrete coring was also completed at the boring locations.

Geophysical Survey

Southwest Geophysics, Inc., a subcontractor to AEC, completed a geophysical survey to clear the proposed soil boring locations of subsurface conflicts by way of the geophysical survey methods. Geophysical survey methods utilized included ground-penetrating radar, electromagnetic technologies and other methods as described in the attached geophysical survey report.

Soil Sampling and Laboratory Analysis

Soil samples were retained for potential laboratory analysis from the following depths within each soil boring:

- B1 – 0.5, 1 and 3 feet
- B2 - 0.5, 1 and 3 feet
- B3 - 0.5, 1 and 3 feet
- B5, B6, B7 and B8 – 1 foot

Soil samples were collected from the teeth of the hand auger and transferred in to laboratory provided four ounce glass jars. The samples were then labeled, secured in Ziplock® bags, recorded onto chain-of-custody documentation, and placed into a chilled cooler for transport to a laboratory for analysis. All soil samples were screened for undifferentiated VOCs using a photo-ionization detector (PID) during the sampling event. Detectable concentrations of VOCs were not detected in most of the samples. Minor concentrations of VOCs (less than 5 parts per million) were detected in shallow soil samples obtained from borings B1 and B8. Soil sampling equipment was decontaminated between uses by washing with a non-phosphate detergent solution followed successive rinses in drinking water.

The samples obtained from the 0.5-foot depths of borings B1 and B8 were analyzed for total petroleum hydrocarbons (TPH) by EPA test Method 8015B. Four of the samples were also analyzed for VOCs by United States EPA test Method 8260B. Such samples included the 3-foot samples from borings B1, B2 and B3 and the 1-foot sample from boring B8. Ten of the samples were analyzed for Title 22 Metals by United States EPA test Methods 6010B/7471A as follows:

- B1, B2 and B3 - 0.5 and 3 feet
- B5, B6, B7 and B8 – 1 foot

Soil Gas Sampling and Laboratory Analysis

Soil gas probes were installed at depths of 5 feet below the bottom of the concrete slabs at boring locations B1, B2 and B3. One-eighth inch nylon tubing was inserted into the open boreholes. The probes were then gently lifted up from the bottom of the borehole and sand was poured down the borehole to encase the filter with a minimum of six inches of sand pack. Approximately six inches to one foot of dry granular bentonite was then placed on top of the sand pack. The temporary soil gas wells were then completed to the surface with hydrated bentonite. Sub-slab soil vapor probes were installed immediately below the concrete slabs at the remaining boring locations (B4 through B8). Such probes were constructed of similar materials to those described above (5 foot deep soil gas probes). The probes were allowed to set for at least two hours prior to sampling to allow the bentonite time to properly seal. All soil gas samples collected during this assessment were transported to an off-Site analytical laboratory under chain of custody documentation.

Soil gas was withdrawn from the end of the inert nylaflow tubing that runs from the sampling tip to the surface using evacuated Tedlar™ bags and associated vacuum and flow control systems. Soil gas samples were logged on to chain of custody forms and analyzed for VOCs by EPA test Method 8260B and methane by ASTM method D1946.

Upon completion of sampling, the probes were removed from the ground and the probe holes were backfilled with soil cuttings and hydrated bentonite to depth of approximately one to two inches below the bottom of the adjoining concrete slab. Following backfilling of the boreholes, the cold joints of the cored areas were lined with and adhesive followed by Waterstop-RX™. The remaining areas of the boreholes were then backfilled with concrete to meet adjacent slab grades. The used tubing along with other non-hazardous wastes generated during the field activities were bagged and are being disposed of by Astech Environmental.

Results

A summary of the TPH and VOC data is included in the table below.

Soil Analytical Data Summary

Table 9				
Soil Boring	**Soil Sample**	**Depth (Feet)**	**TPH**	**VOCs**
B1	B1-0.5	0.5	5.90 mg/kg - Diesel	--
B1	B1-3	3	--	None Detected
B2	B2-3	3	--	None Detected
B3	B3-3	3	--	None Detected
B8	B8-1	1	422 mg/kg – Diesel 377 mg/kg - Oil	None Detected

mg/kg – milligrams per kilogram

As shown in the table above, TPH in the diesel range were detected at 5.90 mg/kg and 422 mg/kg in soil borings B1 and B8. In addition, TPH in the oil range was detected at 377 mg/kg. VOCs were not detected at or above the laboratory reporting limits in any of the soil samples analyzed for such constituents. No hydrocarbon staining or odors were noted in soil sample B1-0.5 which had the reported detection of 5.90 mg/kg in the diesel range. This concentration is considered to be negligible and does not represent an REC. Evidence of low to moderate hydrocarbon staining was noted in soil obtained from boring B8. TPH concentrations in soil sample B8-1, while more elevated than those reported in sample B1-0.5, are not considered to be significant relative to potential human health risk as such soil is encapsulated by a concrete slab. In addition, such soil is unlikely to be displaced in the future as the potential for demolition of the Times building (location of boring B8) to occur is considered to be very low. Further, VOCs were not detected at or above the laboratory reporting limits in the same soil sample.

One or more metals were detected in each of the ten soil samples analyzed for such constituents. Detected metals included arsenic, barium, chromium, cobalt, copper, lead, mercury, molybdenum, nickel, vanadium and zinc. The highest detectable concentration for each respective metal constituent and the corresponding sample identification is as follows:

- Arsenic – 6.18 mg/kg (B2-3)
- Barium – 691 mg/kg (B2-3)
- Chromium – 41.9 mg/kg (B1-3)
- Cobalt – 30.6 mg/kg (B7-1)
- Copper – 39.8 mg/kg (B1-3)
- Lead – 95.8 mg/kg (B7-1)
- Mercury - 0.157 mg/kg (B8-1)
- Molybdenum – 3.60 mg/kg (B5-1)
- Nickel – 34.7 mg/kg (B2-3)
- Vanadium – 48.5 mg/kg (B1-3)
- Zinc – 74.3 mg/kg (B1-0.5)

Total arsenic concentrations are not considered to be elevated and are within the range of naturally concentrations of this element in southern California soils. For the remaining metals, concentrations are below applicable United States EPA Regional Screening Levels (RSLs) for

commercial soil. . None of the metals concentrations are considered to be elevated relative to potential human health risk. Also of note is that the highest concentration of lead (95.8 mg/kg) detected is situated within the Plant Building. Soil beneath this building is unlikely to be displaced in the future as the potential for demolition of the Plant Building to occur is considered to be very low.

VOCs were not detected in any of the soil gas or sub-slab vapor samples. In addition, methane was not detected in any of the samples.

Limitations

The services provided by AEC have been performed in accordance with practices and standards generally accepted by environmental scientists practicing in this industry. No other warranty, either express or implied, is made. The results and conclusions described herein are based on a limited subsurface evaluation and sampling program and do not purport to identify any and all sources or locations of potentially impacted soil, soil gas and sub-slab vapor that may exist at the Site. Levels of contaminants measured at a given location may not be representative of conditions in other areas on the Site. In addition, conditions may change at any particular location as a function of time in response to natural conditions, chemical reactions and other factors. Our conclusions regarding the condition of the Site does not represent a warranty that all areas of the Site are similar to those sampled. AEC is not responsible for the conclusions, opinions, or recommendations made by others based on this information.

8.0 Findings, Opinions, Conclusions and Recommendations

Advantage Environmental Consultants, LLC has performed a Phase I Environmental Site Assessment, in conformance with the scope and limitations of ASTM Practice E 1527-13 and 40 CFR Part 312 of the LA Times Property located in the City of Los Angeles, California. A Phase II ESA consisting of soil, soil gas and sub-slab vapor sampling and analysis was also conducted concurrently with the Phase I ESA. Any exceptions to, or deletions from, this practice are described in Section 8.0 of this report.

This Phase I ESA has revealed no evidence of current recognized environmental conditions in connection with the Site. Abandoned USTs, former processes associated with the production of newspapers and soil containing petroleum hydrocarbons noted in shallow soil of soil boring B8 (refer to Section 7.0) are considered to be historical recognized environmental conditions that do not require additional assessment at this time. Such areas are not present in portions of the Site that will be subject to future building demolition and excavation for the future subterranean parking garage. The Phase II ESA did not reveal current RECs in the areas evaluated. In the event that unforeseen suspect impacted soil is encountered during mass excavation activities for the future subterranean parking garage, such soil can be properly profiled and managed under a conventional soil management plan to be implemented by the project excavation contractor and environmental consultant.

9.0 Deviations and Data Gaps

The oldest historical resource reviewed during the preparation of this assessment was a Sanborn fire insurance map from 1888, which showed portions of the Site as being developed with storefronts, offices, and residences. The lack of review of historical sources dating back to a time when the Site was undeveloped is considered a data gap as defined by ASTM-2013 but does not alter AEC's conclusions and recommendations regarding the Site.

No deviations from the ASTM-2013 standard or other data gaps as defined in the ASTM-2013 standard are noted.

10.0 References

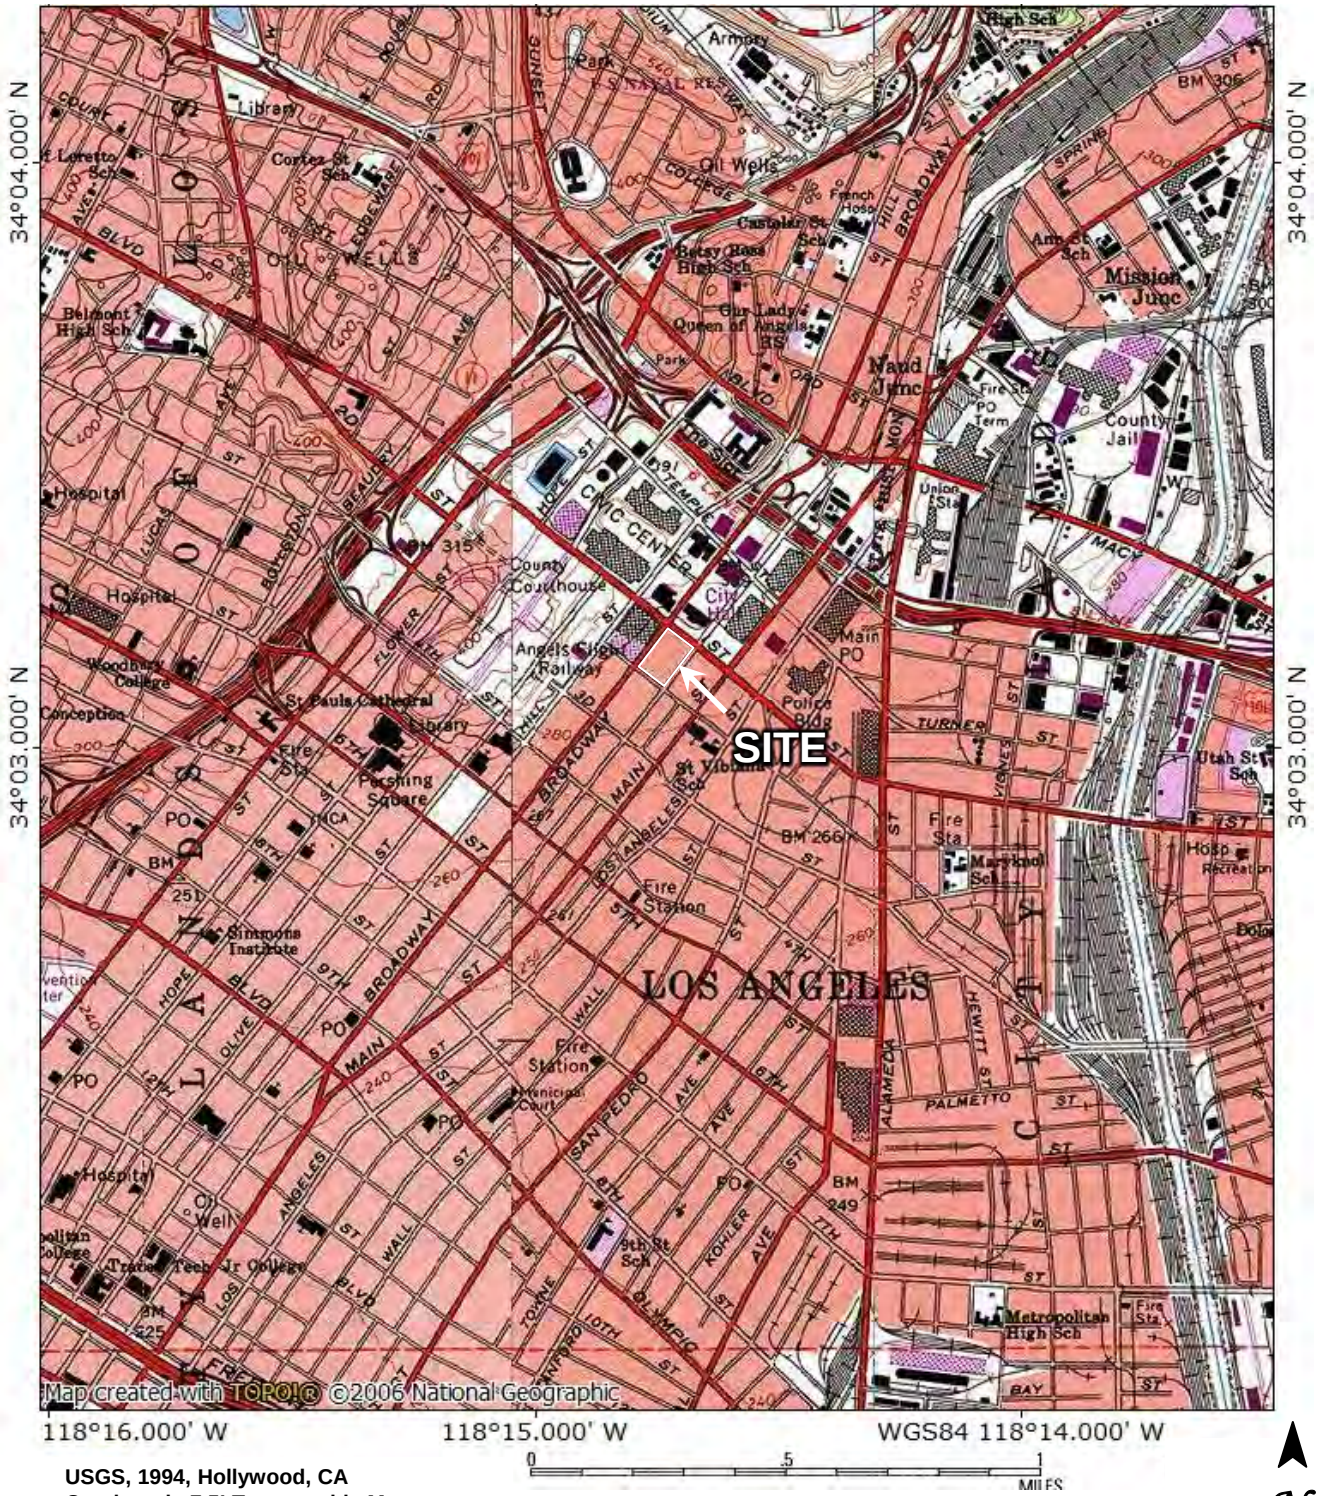
11.0 Signatures and Qualifications of Environmental Professionals

We declare that, to the best of my professional knowledge and belief, we meet the definition of Environmental Professional as defined in 40 CFR 312.10. We have the specific qualifications based on education, training and experience to assess a property of the nature, history and setting of the subject Site. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Todd Jacquay
Project Manager



Daniel Weis, R.E.H.S.
Branch Manager
Western Regional Office

Qualifications for the environmental professionals involved in the performance of the Phase I ESA are included in Section 12.8.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL ---------- National Priority List
Proposed NPL ---------- Proposed National Priority List Sites
NPL LIENS ---------- Federal Superfund Liens

Federal Delisted NPL site list

Delisted NPL ---------- National Priority List Deletions

Federal CERCLIS list

FEDERAL FACILITY ---------- Federal Facility Site Information listing
SEMS ---------- Superfund Enterprise Management System

Federal RCRA CORRACTS facilities list

CORRACTS ---------- Corrective Action Report

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF ---------- RCRA - Treatment, Storage and Disposal

Federal RCRA generators list

RCRA-CESQG ---------- RCRA - Conditionally Exempt Small Quantity Generator

Federal institutional controls / engineering controls registries

LUCIS ---------- Land Use Control Information System
US ENG CONTROLS ---------- Engineering Controls Sites List
US INST CONTROL ---------- Sites with Institutional Controls

State- and tribal - equivalent NPL

CA RESPONSE ---------- State Response Sites

State and tribal leaking storage tank lists

INDIAN LUST ---------- Leaking Underground Storage Tanks on Indian Land

EXECUTIVE SUMMARY

State and tribal registered storage tank lists

FEMA UST ---- Underground Storage Tank Listing
CA AST ---- Aboveground Petroleum Storage Tank Facilities
INDIAN UST ---- Underground Storage Tanks on Indian Land

State and tribal voluntary cleanup sites

INDIAN VCP ---- Voluntary Cleanup Priority Listing

State and tribal Brownfields sites

CA BROWNFIELDS ---- Considered Brownfieds Sites Listing

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Landfill / Solid Waste Disposal Sites

CA WMUDS/SWAT ---- Waste Management Unit Database
CA SWRCY ---- Recycler Database
CA HAULERS ---- Registered Waste Tire Haulers Listing
DEBRIS REGION 9 ---- Torres Martinez Reservation Illegal Dump Site Locations
ODI ---- Open Dump Inventory

Local Lists of Hazardous waste / Contaminated Sites

CA AOCONCERN ---- San Gabriel Valley Areas of Concern
US HIST CDL ---- Delisted National Clandestine Laboratory Register
CA HIST Cal-Sites ---- Historical Calsites Database
CA CDL ---- Clandestine Drug Labs
CA Toxic Pits ---- Toxic Pits Cleanup Act Sites
US CDL ---- National Clandestine Laboratory Register

Local Land Records

CA LIENS ---- Environmental Liens Listing
LIENS 2 ---- CERCLA Lien Information

Records of Emergency Release Reports

HMIRS ---- Hazardous Materials Information Reporting System
CA LDS ---- Land Disposal Sites Listing
CA SPILLS 90 ---- SPILLS 90 data from FirstSearch

Other Ascertainable Records

FUDS ---- Formerly Used Defense Sites
DOD ---- Department of Defense Sites
SCRD DRYCLEANERS ---- State Coalition for Remediation of Drycleaners Listing
US FIN ASSUR ---- Financial Assurance Information
EPA WATCH LIST ---- EPA WATCH LIST
2020 COR ACTION ---- 2020 Corrective Action Program List
TSCA ---- Toxic Substances Control Act

TRIS ---- Toxic Chemical Release Inventory System
SSTS ---- Section 7 Tracking Systems
ROD ---- Records Of Decision
RMP ---- Risk Management Plans
RAATS ---- RCRA Administrative Action Tracking System
PRP ---- Potentially Responsible Parties
PADS ---- PCB Activity Database System
ICIS ---- Integrated Compliance Information System
FTTS ---- FIFRA/ TSCA Tracking System - FIFRA (Federal Insecticide, Fungicide, & Rodenticide Act)/TSCA (Toxic Substances Control Act)
MLTS ---- Material Licensing Tracking System
COAL ASH DOE ---- Steam-Electric Plant Operation Data
COAL ASH EPA ---- Coal Combustion Residues Surface Impoundments List
PCB TRANSFORMER ---- PCB Transformer Registration Database
RADINFO ---- Radiation Information Database
HIST FTTS ---- FIFRA/TSCA Tracking System Administrative Case Listing
DOT OPS ---- Incident and Accident Data
CONSENT ---- Superfund (CERCLA) Consent Decrees
INDIAN RESERV ---- Indian Reservations
FUSRAP ---- Formerly Utilized Sites Remedial Action Program
UMTRA ---- Uranium Mill Tailings Sites
LEAD SMELTERS ---- Lead Smelter Sites
US AIRS ---- Aerometric Information Retrieval System Facility Subsystem
US MINES ---- Mines Master Index File
UXO ---- Unexploded Ordnance Sites
DOCKET HWC ---- Hazardous Waste Compliance Docket Listing
CA BOND EXP. PLAN ---- Bond Expenditure Plan
CA Cortese ---- "Cortese" Hazardous Waste & Substances Sites List
CA CUPA Listings ---- CUPA Resources List
CA DRYCLEANERS ---- Cleaner Facilities
CA Financial Assurance ---- Financial Assurance Information Listing
CA HWP ---- EnviroStor Permitted Facilities Listing
CA HWT ---- Registered Hazardous Waste Transporter Database
CA MINES ---- Mines Site Location Listing
CA MWMP ---- Medical Waste Management Program Listing
CA PEST LIC ---- Pesticide Regulation Licenses Listing
CA PROC ---- Certified Processors Database
CA Notify 65 ---- Proposition 65 Records
CA UIC ---- UIC Listing
CA WASTEWATER PITS ---- Oil Wastewater Pits Listing
CA WDS ---- Waste Discharge System
CA WIP ---- Well Investigation Program Case List
FUELS PROGRAM ---- EPA Fuels Program Registered Listing

EDR RECOVERED GOVERNMENT ARCHIVES

Exclusive Recovered Govt. Archives

CA RGA LF ---- Recovered Government Archive Solid Waste Facilities List

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 2 RCRA-LQG sites within approximately 0.125 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/09/2015 has revealed that there are 10 RCRA-SQG sites within approximately 0.125 miles of the target property.

Federal ERNS list

ERNS: The Emergency Response Notification System records and stores information on reported releases of oil and hazardous substances. The source of this database is the U.S. EPA.

A review of the ERNS list, as provided by EDR, and dated 03/28/2016 has revealed that there is 1 ERNS site within approximately 0.125 miles of the target property.

State- and tribal - equivalent CERCLIS

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 02/01/2016 has revealed that there are 49 CA ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

CA SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the CA SWF/LF list, as provided by EDR, and dated 02/15/2016 has revealed that there are 2 CA SWF/LF sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: The EPA's listing of Brownfields properties from the Cleanups in My Community program, which provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

A review of the US BROWNFIELDS list, as provided by EDR, and dated 12/22/2015 has revealed that there are 2 US BROWNFIELDS sites within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Records of Emergency Release Reports

CA CHMIRS: The California Hazardous Material Incident Report System contains information on reported hazardous material incidents, i.e., accidental releases or spills. The source is the California Office of Emergency Services.

A review of the CA CHMIRS list, as provided by EDR, and dated 12/16/2015 has revealed that there are 4 CA CHMIRS sites within approximately 0.125 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/09/2015 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.125 miles of the target property.

EDR RECOVERED GOVERNMENT ARCHIVES

Exclusive Recovered Govt. Archives

CA RGA LUST: The EDR Recovered Government Archive Leaking Underground Storage Tank database provides a list of LUST incidents derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the State Water Resources Control Board in California.

A review of the CA RGA LUST list, as provided by EDR, has revealed that there are 32 CA RGA LUST sites within approximately 0.5 miles of the target property.

Description:	Handler: generates 1,000 kg or more of hazardous waste during any calendar month; or generates more than 1 kg of acutely hazardous waste during any calendar month; or generates more than 100 kg of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month; or generates 1 kg or less of acutely hazardous waste during any calendar month, and accumulates more than 1 kg of acutely hazardous waste at any time; or generates 100 kg or less of any residue or contaminated soil, waste or other debris resulting from the cleanup of a spill, into or on any land or water, of acutely hazardous waste during any calendar month, and accumulates more than 100 kg of that material at any time

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Violation Status: No violations found

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Supplemental Site Investigation Report
Completed Date: 12/17/2003
Comments: DTSC approved the Supplemental Site Investigation (SSI) and determined neither an actual or a potential release of hazardous material, nor the presence of naturally occurring hazardous material indicated at the site pose a threat to human health or the environment under any land use. Therefore, DTSC concurred that no further environmental investigation or cleanup was required at this site, and approved the SSI. Cert site, Cert RA-RAC apprvd.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Voluntary Cleanup Agreement
Completed Date:	10/20/2000
Comments:	DTSC entered into a Voluntary Cleanup Agreement (Agreement) with Southern California Gas Company (Proponent). The purpose of this Agreement is for the Proponent to conduct a Remedial Investigation/Feasibility Study to further characterize the existing soil and groundwater contamination and, if necessary, to prepare a removal action workplan and implement a removal action under the oversight of DTSC. If appropriate, the Proponent has agreed to implement a deed restriction for the Site.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Consent Order
Completed Date:	08/15/1996
Comments:	On 08/15/1996 DTSC & The Gas Company executed a Consent Order for a Preliminary Endangerment Assessment for a portio (Sector A) of the former Aliso Manufactured Gas Plant Site - which is being investigated in 5 sectors or units. The "530 Ramirez" site (CalSites

SO CAL GAS/ALISO MGP, SECTOR A - EAST PARCEL (Continued) **S102564461**

19490235) is a portion of Sector A.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Amendment - Order/Agreement
Completed Date:	01/04/1999
Comments:	Transition to Chapter 6.5 - Amendment to the existing Consent Order, No. 96/97-008, signed by the RP.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Workplan
Completed Date:	01/26/2004
Comments:	Notices of Determination for Aliso Street Section A West Parcel and Sector A East Parcel were hand-delivered to the Governor's Office of Planning and Research on 1/26/2004.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Remedial Investigation / Feasibility Study
Completed Date:	12/13/2002
Comments:	Feasibility Study Report for Aliso Street Sector A.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Preliminary Endangerment Assessment Report
Completed Date:	06/26/1997
Comments:	PEA completed. Further investigation (RI/FS) warranted for the site as PAH, VOC, TPH, metals and cyanide contamination exist in both soil and groundwater.

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	10/10/2007
Comments:	DTSC provided a partial site certification letter, dated 10/10/07. Full site certification due upon investigation and remediation of groundwater.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 07/26/2004
Comments: Block L - Polycyclic aromatic hydrocarbon (PAH) and volatile organic hydrocarbon (VOC) contaminated soil was excavated and thermally treated offsite. Site has been backfilled with clean soil. Subsurface contamination did not extend laterally to offsite areas. Contamination was found, as expected, at the ground water table, and will be addressed in a later, regional effort. As the soil was remediated to industrial cleanup goals, a deed restriction will limit use of the site, preventing residential or other sensitive uses on this parcel.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 09/10/2003
Comments: Block L - The Special initial Study described the proposed polycyclic aromatic hydrocarbon (PAH) and volatile organic hydrocarbon (VOC) contaminated soil remediation activity and its insignificant impact upon the environment.

Completed Area Name: PROJECT WIDE

SO CAL GAS/ALISO SECTOR C, BLOCK L (Continued) **S107616211**

Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 02/27/2003
Comments: Block L - PEA-E investigated the former manufactured gas plant and petroleum transfer site. VOCs, SVOCs, PAHs and hydrocarbons were found to impact the site. A Renivak Action Work Plan will address clean up of this contamination. PEA-E completion was delayed due to further Site Characterization activities and delays in receiving the Human Human Health Risk Assessment reports associated with the PEA-E.

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Amendment - Order/Agreement
Completed Date: 01/04/1999
Comments: Transition to Chapter 6.5 - Amendment to the existing Consent Order, No. 96/97-064 signed by the RP.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Voluntary Cleanup Agreement
Completed Date: 07/07/1997
Comments: DTSC and The Gas Company signed a Consent Order calling for the preparation of a Removal Action Workplan and the implementation of a remedial action at the site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Voluntary Cleanup Agreement
Completed Date: 08/16/1994
Comments: A Remedial Action Consent Order is executed by the Depart- ment. The Order provides for the completion of a Remedial Investigation/Feasibility Study to determine the extent of removal/remedial action necessary to allow planned highway construction.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 02/01/2007
Comments: VOC & PAH contaminated soil removed. Residual contamination to be addressed in overall groundwater investigation proposed for the entire 52-acre site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Workplan
Completed Date: 06/16/1998
Comments: On June 16, 1998, DTSC approved the RAW for removal of contaminated soil at the site. Approximately 9000 cubic yards of contaminated soil will be removed. Soil contamination includes PAHs, VOCs and Metals.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Investigation / Feasibility Study
Completed Date: 03/27/1997
Comments: RI/FS for soil only. Groundwater to be evaluated as part of the Towne Gas Study. Interim measures include, capping and removal of

SO CAL GAS/ALISO MGP, SECTOR A - WEST PARCEL (Continued) **S102564460**

contaminated soil from top two feet.

Completed Date: 06/08/2007
Comments: Site is in compliance with the LUC restrictions.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Land Use Restriction
Completed Date: 03/30/2006
Comments: LAND USE COVENANT (LUC) DOCUMENT FOR THE FORMER MACY STREET SITE WAS RECORDED WITH LOS ANGELES COUNTY RECORD OFFICE.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 06/30/2004
Comments: Contaminated soil was excavated in accordance with the approved RAW.
As contamination remains in deeper soils, DTSC requires a deed restriction. Also, groundwater monitoring should continue on schedule.

Completed Date: 02/04/2004
Comments: Public Comment Period was from December 16, 2002 to January 17, 2003.

SANTA FE/MACY STREET (Continued) **S102564449**

No response from public, Removal Action Work Plan was finalized on February 4, 2003.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Endangerment Assessment Report
Completed Date: 06/29/2001
Comments: RI report for Macy Street Site accepted on 06/29/01 closing the RI phase. DTSC expects RAW by 8/31. Origianlly an RI/FS was planned for the Site. However, since no feasibility study was needed an RI (PEAe commitment) was done instead. DTSC has approved the RI Report. Removal Action Plan due on 8/15/01.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 03/07/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HAZNET: Facility and Manifest Data
Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

American Environmental Testing Laboratory Inc.

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

California Regional Water Quality Control Board/DTSC

Client Name:	Advantage Environmental Consultants, LLC
Project Name:	130 S. Broadway
Project Address:	130 S. Brpadway, Los Angeles
Date(s) Sampled:	6/15/16
Date(s) Received:	6/15/16
Date(s) Reported:	6/15/16
Chain of Custody Received:	Yes
Comments:	Sample Matrix: Vapor

California Regional Water Quality Control Board/DTSC

Laboratory Report Form (Cover Page 2)

Organic Analyses	Number of Samples	Number of Samples Subcontracted
VOC's (EPA 8260B)	10 Samples	0
Methane (ASTM D1946)	10 Samples	0

(Includes samples, duplicates, & blanks)

Sample Condition: good

Inorganic Analyses	Number of Samples	Number of Samples Subcontracted

Sample Condition:

Microbiological Analyses	Number of Samples	Number of Samples Subcontracted

Sample Condition:

Other Types of Analyses	Number of Samples	Number of Samples Subcontracted

Sample Condition:

Project Name: 130 S. Broadway (MS Excel Duplicate of RWQCB LabForm10A; Ver12/96)

12.8 Qualifications of the Environmental Professionals

Advantage Environmental Consultants, LLC

ENVIRONMENTAL DUE DILIGENCE AND REMEDIATION SPECIALISTS

TODD JACQUAY
Project Engineer

EDUCATION

B.S.E. Geological Engineering, Purdue University, West Lafayette, IN (2000)

PROFESSIONAL REGISTRATIONS, LICENSES, AND CERTIFICATIONS

- EIT, Engineer-In-Training
- OSHA 40-hour Hazardous Waste Operations Worker and Supervisor Certifications and annual Refreshers

PROFESSIONAL SUMMARY

Mr. Jacquay has over ten years of experience in the field of environmental consulting. He has conducted numerous Phase I and Phase II Environmental Site Assessments throughout the State of California. His project management experience includes on-site environmental investigation, data evaluation, workplan development, health risk modeling, and technical report writing. His field experience includes environmental site characterization, construction management, subcontractor oversight, soil and groundwater sampling, UST removals, remedial excavation, waste characterization, operation and maintenance of remedial systems, and stormwater pollution prevention and monitoring.

PROFESSIONAL EXPERIENCE

School Projects - Mr. Jacquay has conducted Preliminary Endangerment Assessments (PEA) for school districts in southern and central California. The PEAs were completed according to guidance requirements established by the California Department of Toxic Substance Control (DTSC). The PEAs addressed environmental impacts associated with historical use of organochlorine pesticides, lead, termiticides, arsenic, petroleum hydrocarbons, volatile organic compounds, and polychlorinated biphenyls (PCBs). Following data collection and interpretation, Mr. Jacquay prepared human health risk models and conducted remedial excavations, as needed, under oversight of DTSC.

Energy/Utility Companies – Performed construction monitoring during pipeline realignments and repairs for utility companies in Orange and Los Angeles Counties. Responsibilities included implementation of Site Safety Plan, segregation and stockpiling of fuel impacted soil, and monitoring ambient air to protect worker's health from elevated levels of volatiles.

Residential Developments - Completed Phase I and Phase II Environmental Site Assessments for single and multi-family residential developments throughout the State of California. The historic uses of the proposed developments included former or current agricultural properties, ranches, and manufacturing/industrial facilities.

Urban Redevelopment Projects – Performed site assessments, subsurface investigations, and implemented remedial action programs at urban redevelopment sites in downtown San Diego. Downtown redevelopment projects included railroad yards, former gasoline service stations and automotive repair facilities. Suspected and known contaminants included burn ash, lead, polychlorinated biphenyls, volatile organic compounds, semi-volatile compounds, and petroleum hydrocarbons. Mr. Jacquay has performed such assessments on behalf of private developers and

redevelopment agencies. Many of the projects have been subject to regulatory oversight by local or State level regulatory agencies, including voluntary cleanup programs.

Retail/Commercial Projects - Conducted numerous Phase I and Phase II Environmental Site Assessments for new and existing small to large-scale retail/commercial properties throughout California. Many retail/commercial centers included gasoline service stations and heavy equipment maintenance centers with documented leaking underground storage tank cases. In particular, completed several Phase I ESAs and subsequent Phase II ESAs for adjacent parcels slated for retail development in the City of Scotts Valley, CA. Review of historic aerials and documents provided by the City of Scotts Valley revealed the historic use of the site as an airport with areas of fill material from an unknown source. Several Phase II subsurface evaluations were conducted to assess the project site for lead and petroleum hydrocarbons contamination.

Remedial Excavation and Monitoring - Conducted monitoring and segregation of soil during remedial excavation of petroleum hydrocarbon contaminated soil from sites throughout Southern California. Collected confirmation soil samples from the sidewalls and bottom of each remedial excavation according to guidelines established by the acting regulatory agency. Profiled the soil for regulated disposal and coordinated transportation of contaminated soil for removal from site.

Groundwater Assessments - Performed groundwater assessments through the installation and sampling of a series of groundwater monitoring wells at sites throughout California. In addition several human health risk assessments were completed for future occupants of the project sites based on the concentrations found in the groundwater.

Dry Cleaning Facilities - Performed soil, groundwater, and soil vapor investigations throughout Southern California at locations with known subsurface impacts from dry cleaning solvents such as PCE, TCE, and Vinyl Chloride. In addition conducted pilot testing to determine the radius of influence for each chemical of concern. Installation of soil vapor extraction systems and preparation of human health risk assessments were completed for future occupants of the project sites based on contamination results. Performed groundwater sampling, operations and maintenance of soil vapor extraction units, completed quarterly reporting, and coordinated with applicable regulatory agencies throughout the terms of the projects.

Property Condition Assessments and Seismic Evaluations – Under the direct oversight of a professional engineer, Mr. Jacquay assisted with inspecting the condition of structural features of site buildings, building systems and other on-site improvements. In addition, Mr. Jacquay has performed calculations of seismic stability for site buildings in terms of the Probable Maximum Loss (PML). The PML is expressed in terms of a percentage of the total replacement cost of the building.

SPECIFIC PROJECT EXPERIENCE

Spring Valley Insulation, San Diego County, California - A 2,000-gallon single-wall steel UST formerly used to store unleaded gasoline was removed from the property under oversight of the County of San Diego County DEH. DEH directives required that groundwater in the vicinity of the former UST be evaluated for the potential presence of contamination. Following field reconnaissance to evaluate the feasibility of proposed fieldwork and boring locations, completed and received approval of a work plan for further assessment as required by DEH. Work carried out as specified in the work plan included the installation of four groundwater monitoring wells, the collection of soil and groundwater samples, and an estimation of the vertical and horizontal extent of petroleum hydrocarbon impacted soil at the property. Based on the findings of the investigation, the information presented in the report, and additional groundwater assessment conducted at the property, the DEH issued a no further action letter for the property.

Proposed Medical Building Site, SEC Culver Blvd. and Ince Blvd., Culver City, California – Project manager and lead for the completion of a Phase I ESA at the proposed redevelopment property located at the southeast corner of Culver Boulevard and Ince Boulevard in Culver City, Los

Angeles County, California. Redevelopment plans for the property included a medical-related commercial structure with a subterranean parking garage. Past uses of the property (including but not limited to automobile repair and possible dry-cleaning operations) as revealed during historical research completed during the Phase I ESA were considered to be suspect and a recognized environmental condition in connection with the property and a subsurface assessment at the property (consisting of soil and soil vapor sampling) was recommended. Mr. Jacquay continued project management duties on this project in conducting a Phase II ESA at the property which included the drilling of eight soil borings using a truck-mounted, direct-push sampling rig. The sampling probes were advanced by hydraulically driving an approximately two-inch diameter stainless steel rod equipped with a soil sampling tool. Soil borings were drilled to depths of 10 to 15 feet with soil amples collected at varying depths between one and fifteen feet. Four of the soil borings were converted to dual nested soil vapor probes installed at 5 and 15 feet bgs in each borehole. Select soil samples were analyzed onsite using a mobile laboratory for petroleum hydrocarbons and associated constituents. In addition, several near surface soil samples obtained from the soil borings were analyzed for Title 22 Metals and/or total lead. Soil samples collected but not analyzed were archived at the analytical laboratories. Soil vapor samples were analyzed for VOCs. A remediation cost estimate pertaining to lead-impacted soil removal to be completed at the property was also prepared and is being used by the developer in finalizing construction budgets.

North County Transit District (NCTD) Bus Maintenance Facility, Escondido, California – Project manager and lead field representative for the completion of turn-key limited excavation and soil sampling activities at a NCTD bus maintenance facility due to the discovery of petroleum hydrocarbon-impacted soil during a hydraulic hoist removal from a vehicle service bay. Prior to the commencement of field activities, Mr. Jacquay pre-profiled the impacted soil with a Class III recycling facility using analytical data obtained prior to excavation activities (stockpile testing associated with the initial hoist removal). A subcontracted excavation contractor, working under the direct supervision of Mr. Jacquay, completed the field activities (i.e. excavation with a designated area around the former hoist, stockpiling and loading on to trucks). Contaminated soil was excavated from the former hoist area using a backhoe and bobcat skid-steer and placed onto trucks for off-Site disposal under appropriate manifests issued by the receiving facility. Following the completion of the excavation activities, Mr. Jacquay collected soil samples from the base and sidewalls of the hoist excavation to verify removal and/or extent of the contamination left in-place. Soil samples were also collected from the stockpile of excavated soil for use by the recycling facility to finalize treatment options. A total of 39.88 tons of petroleum-hydrocarbon impacted soil were transported under proper manifesting protocol to the recycling facility. The results of the soil sampling and analysis indicated that petroleum hydrocarbon-impacted soil remained in place in the vicinity of the former hoist. However, due to several constraints, including limits of the concrete opening, depth of the excavation in relation to reach of the excavation equipment and the proximity of the excavation bottom to groundwater, additional excavation was not conducted.

Emergency Land Outfall Replacement, Oceanside, California - Soil/Water/Air Sampling and Analysis

13200 South Avalon Boulevard (31,000 Square Foot Former Industrial Laundry Facility) – Los Angeles, California - Phase I and II Environmental Site Assessment

City of San Diego, California Fleet Services Division Gasoline Fueling Stations (Multiple Locations) – Water Pollution Control Plan and Weather Triggered Action Plan Preparation

State of California Department of Transportation (CalTrans) Kearny Mesa Operations Center, San Diego, California – Underground Storage Tank Removal Oversight

Former Nassco Shipyard Gasoline Station, San Diego, California - Regulatory Permitting, Soil Sampling During Removal of Underground Storage Tanks and Regulatory Reporting

ENVIRONMENTAL DUE DILIGENCE AND REMEDIATION SPECIALISTS

DANIEL A. WEIS, R.E.H.S.
Branch Manager – Western Regional Office

EDUCATION

- Bachelor of Arts - University of Delaware, Newark, DE (1995)
- Master of Science – Public Health, San Diego State University, San Diego, CA (1998)

PROFESSIONAL REGISTRATIONS, LICENSES, AND CERTIFICATIONS

- Registered Environmental Health Specialist #8172 in the State of California
- OSHA 40-hour Hazardous Waste Operations Worker and Supervisor Certifications and Annual Refreshers

PROFESSIONAL SUMMARY

Mr. Weis is the branch manager of AEC's western regional office based in the City of San Marcos, San Diego County, California. He has 14 years of experience in the environmental sciences and consulting fields and is supported by Professional Geologists, Engineers and other technical team members of AEC staff. His responsibilities at AEC include client development and management, project management, technical oversight and quality control for assessment and remediation services, project staffing, and office financial management. Mr. Weis also completes technical services (including field activities) required of select projects completed by AEC. He has a proven ability to manage multiple personnel and technical projects, negotiate with regulatory agencies and maintain strong and trusting client relationships. Such clientele include but are not limited to local government entities, redevelopment agencies, affordable housing developers, Federal government entities, environmental and land use attorneys, architectural and engineering firms, commercial lending institutions, conservancies, commercial/industrial real estate owners/managers, insurance companies, wireless telecommunication carriers and real estate developers. He is also very experienced in the completion of assessment, construction and remediation quality assurance during the completion of urban redevelopment/brownfields projects, many of which have been located in downtown San Diego, Los Angeles and other urban communities throughout the State of California. Mr. Weis has a deep understanding of environmental due diligence guidelines including:

- American Society for Testing and Materials (ASTM) E1527-13, Standard Practice for Environmental Site Assessments (ESAs)
- ASTM E2247-08, Standard Practice for ESA: Phase I ESA Process for Forestland or Rural Properties
- ASTM E1903-97 (Re-approved 2002), Standard Practices for Environmental Site Assessments: Phase II ESA Process
- ASTM E2600-10, Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions
- 40 Code of Federal Regulations (CFR) Part 312 Standards for Conducting All Appropriate Inquiry (AAI)
- 33 CFR Part 137 Oil Spill Liability Standards for Conducting AAI
- United States Department of Housing and Urban Development Guide to Multifamily Accelerated Processing
- Other financial institution specific guidelines including The United States Small Business Administration, Fannie Mae and Freddie Mac

PROFESSIONAL EXPERIENCE

Mr. Weis has completed over 1,000 due diligence related environmental assessments (i.e. Phase I ESAs, Transaction Screen Analyses, etc.) and has managed over 200 subsurface environmental investigations of soil gas, soil and/or groundwater. Such investigations have also included human health and ecological risk assessments, evaluations of indoor air conditions based on interpretations of subsurface conditions, underground storage tank (UST) evaluation/closure and hazardous waste characterization/management. Subsurface activities performed include the completion of soil borings using various drilling technologies, soil and groundwater sampling, installation and sampling of groundwater monitoring wells, free product evaluations, exploratory trenching and real-time delineation using mobile analytical laboratories and other soil screening technology. Assets evaluated include industrial, commercial, residential, agricultural and vacant land sites throughout the State of California and numerous additional states of the Nation, with many of the assessments completed under the regulatory oversight of local environmental regulatory agencies, the California Regional Water Quality Control Boards (RWQCBs) and the California Environmental Protection Agency Department of Toxic Substances Control (DTSC). Mr. Weis has also conducted and/or managed hundreds of public/environmental health related assessments including electromagnetic field surveys, radionuclide surveys, indoor air quality investigations, radon surveys, drinking water assessments, asbestos containing materials (ACM) and lead-based paint (LBP) surveys and mold/microbial evaluations.

Mr. Weis has managed over 50 remediation related projects primarily related to source removal of subsurface contaminants including but not limited to petroleum hydrocarbons, chlorinated solvents, heavy metals, organochlorine pesticides and other agricultural related chemicals, dioxins and furans and polychlorinated biphenyls (PCBs). Cost effective solutions and various remedial action options are provided prior to remedial action implementation. He is very proficient in developing remediation cost estimates and evaluating multiple remedial strategies on specific projects and conducting budget tracking to ensure the accuracy of such estimates during remedial implementation. Mr. Weis also assists clients with the preparation of contractor bid specifications, contractor bid and change order reviews for such projects, contractor agreements and project status reports/updates and has conducted presentations to client personnel, regulatory agencies and/or the public pertaining to such remediation related projects. He has also assisted numerous clients in cost recovery efforts from private parties and State/Federal funding programs for environmental assessment and remediation work.

SPECIFIC PROJECT EXPERIENCE

48 Property State Lands Exchange Project, Various Locations Throughout San Bernardino and Inyo Counties, California - Project director for the completion of a Phase I ESA in accordance with ASTM Practice E 1527-05, 40 CFR Part 312 Standards for Conducting AAI, and other Federal Agency specific guidelines at forty eight State of California School Lands properties ranging in size from 40 acres to 666.54 acres, located in San Bernardino and Inyo Counties, California and either partially or entirely within Death Valley National Park or the Mojave National Preserve. Due to the remoteness of the properties, the site reconnaissance was conducted via helicopter flyover with intermittent landings as needed to evaluate conditions on the properties. Prior to the site reconnaissance, Geographical Information Systems (GIS) technology was utilized to determine the coordinates of each property (corners and center) and such data was subsequently provided to the aviation company in a format compatible with the helicopter's navigation system. Additional components of the ESA (i.e. interviews, regulatory research and historical research) were completed in strict accordance with the applicable guidelines. The assessment revealed no evidence of recognized environmental conditions (RECs) in connection with the properties and additional assessment was not recommended. The assessment also included an evaluation of several non-scope ASTM considerations including ACM, LBP, radon potential and lead in drinking water. None of the non-scope ASTM evaluation items were found to be a potential concern with respect to the subject properties.

Industrial Facility, West Bradley Avenue, El Cajon, California – Technical lead on pre-business acquisition due diligence (i.e. Phase I/II ESAs) at a facility that conducts the manufacturing of forged metal products for the medical field and aerospace/defense industry and that was historically used for related industrial purposes. Investigation revealed releases of chlorinated solvents to the vadose zone and groundwater underlying the facility, as well as off-site sources of chlorinated solvents to the property in groundwater. Two phases of due diligence related subsurface investigation consisted of 25 direct-push soil

borings and the collection of soil, groundwater, and soil gas samples. The analytical laboratory data was evaluated, deliverables were prepared and preliminary evaluations of risk conducted using County of San Diego Department of Environmental Health and DTSC Johnson and Ettinger vapor intrusion risk models. The case was subsequently referred to the DTSC due to permit by rule conditions and Mr. Weis oversaw and participated in the preparation a current conditions report, Facility Investigation (FI) Work plan and Community Profile for the property under a Corrective Action Consent Agreement between the interested parties and the DTSC. The FI Work Plan described the investigation objectives, pertinent background information related to the facility, current conditions, and a description of each identified Solid Waste Management Unit and Area of Concern identified at the facility. The document also included a Quality Assurance Project Plan (QAPP), data management plan and information pertaining to the proposed reporting structure. Mr. Weis also served as the project lead/coordinator for the implementation of the FI Work Plan which included the installation of sub-slab and at-depth soil gas probes and multiple groundwater monitoring wells, and the drilling of several direct-push soil borings. On-going regulatory negotiation is being conducted in efforts to reach a quantifiable approach to future monitoring of subsurface conditions at the property.

Santa Monica Beach Public Restroom Facilities Replacement Project, Santa Monica, California - Project director and lead on the completion of a Phase I ESA in accordance with ASTM Practice E 1527-05 of eight public restroom facilities on the Santa Monica State Beach in the City of Santa Monica, Los Angeles County, California. ACM, LBP and PCB surveys were also completed in conjunction with the ESA. All components of the ESA were completed in strict accordance with the applicable guidelines. The assessment revealed no evidence of RECs in connection with the properties and additional assessment was not recommended. Recommendations were provided regarding abatement of ACM and LBP identified at the facilities.

Seventh and Market Street Property - 7th and 8th Avenues and Market Street, San Diego, California - Project lead and manager for remediation planning assistance associated with a proposed 55,000 square foot mixed-use redevelopment project including a multiple level subterranean parking garage) in downtown San Diego. Subsurface characterization utilized in conjunction with prior site data included the drilling of ten soil borings using a hollow-stem auger drill rig, excavation of ten exploratory test pits using a backhoe and sampling/analysis of soil samples for various contaminants of concern. The additional data obtained was used for evaluating the feasibility of alternative remedial strategies, revising remedial cost estimates for multiple redevelopment scenarios and preparation of a mitigation plan and community health and safety plan for the project. Eligible costs for the site characterization related work were recovered from the State Water Resources Control Board (SWRCB) Orphan Site Cleanup Account (OSCA) program on behalf of the client. Although redevelopment plans for the project changed due to various factors, funding remained secured for the project and remediation work consisting of a removal action of lead and petroleum hydrocarbon impact soil was conducted. Over 15,000 tons of contaminated soil was removed from the property during the remediation effort. Mr. Weis served as the project lead and manager for the remediation phase of work which included the excavation and segregation of lead and petroleum hydrocarbon contaminated soils within an approximately 30,000 square foot remediation area, backfilling the excavation with non-contaminated soil generated from the proposed excavation as well as soil to be imported to the property and reconstruction of the property to City of San Diego surface parking lot standards. The remediation activities required the displacement of approximately 27,000 cubic yards of soil. Pre-remediation work completed by Mr. Weis included revising the mitigation plan to account for changes to the project plan, assistance with the preparation of technical bid specifications pertaining to the proposed site remediation, pre-bid meeting representation and responding to questions/inquiries from prospective bidders regarding the technical specifications, drawings and other items related to the proposed remediation effort and associated construction activity. Over 99% of $1,500,000 in SWRCB OSCA grant funds for the cleanup was recovered on behalf of the client.

Proposed Charter School Athletic Field Complex, Temple Avenue and Hoover Street, Los Angeles, California - Project lead and manager for the completion of a Phase I and II ESA during a property acquisition due diligence period at this approximately one-acre property located in the northern portion of the downtown area of the City of Los Angeles. The Phase I ESA was completed under ASTM-2005/AAI protocol and supplemental DTSC guidelines. Prior uses of the property included metal plating activity and a gasoline service station. Other deliverables provided and approved by the DTSC included a Preliminary

Environmental Assessment (PEA) Work Plan, QAPP and a Site Specific Health and Safety Plan. Additional subsurface investigation was subsequently completed to close data gaps pertaining to contaminant distribution and remediation costs prior to a removal action completed at the property. Such investigation included the drilling of over 70 soil borings and sample collection/analysis of soil, soil gas and groundwater samples. Remediation (excavation) at the property was completed by on a turn-key basis and consisted of the excavation and disposal of approximately 2,500 cubic yards of metals contaminated soil and removal of a UST under Los Angeles Fire Department oversight. Other duties completed during the course of the project included regulatory negotiation and litigation support. Community outreach associated with the project included a public hearing with the Los Angeles Department of Building and Safety pertaining to the site permit grading and haul route for trucking of contaminated soil and mass mailing of fieldwork notification activities to all properties situated within a 300 foot radius of the property.

Strata - 9th and 10th Avenues and Market Street, San Diego, California – Project manager for the completion of California SWRCB OSCA Program application assistance pertaining to a portion (former gasoline station) of this downtown San Diego redevelopment site, which included a four-level subterranean parking garage. Initial tasks included a review of prior environmental assessments, written response to SWRCB inquiries pertaining to historical site uses and principal contamination sources and preparation of select sections of OSCA Pre-Assessment and Cleanup Grants. Portions of the Grants included a summary of background information pertaining to the property, detailed scopes of work pertaining to prior eligible assessment response work and proposed cleanup response actions and specific budget details. Cost recovery efforts from the OSCA program were successful. Mr. Weis also served as the project lead for general remediation planning assistance which included the preparation of multiple variations of remediation cost estimates for the project and attendance of meetings with the development team. The remediation cost estimate variations were broken down by physical address (parcel) and three contaminant types (lead, chlorinated solvents and petroleum hydrocarbons) and differing combinations of the referenced parameters. The cost estimation included interface with UST removal, excavation, shoring and dewatering contractors, landfill/recycling facilities, trucking companies, vapor barrier design and installation companies and analytical laboratories. Mr. Weis oversaw subsequent third-party oversight activities on behalf of the client as the property was sold to a third-party and included field oversight of remediation activities, budget tracking, invoice approval, compliance with the OSCA Grant conditions, attendance at meetings and other tasks.

Tijuana River Watershed Project, San Diego State University Graduate School of Public Health - In early stages of the project, implemented a stormwater sampling program within various areas of watershed including the use of auto sampling apparatus triggered by rainfall and flow of rivers and creeks of interest. Personally performed analytical laboratory analysis of water and sediment samples using University owned instruments for constituents of concern including heavy metals, nutrients, and bacteriological indicators and maintained chemistry and flow databases for the development of pollutographs, mass loading estimates and calibration of GIS models.
