APPENDIX A

Notice of Preparation (NOP), Initial Study, Scoping Meeting Materials, and NOP and Scoping Meeting Comments

ESA

A-1 Notice of Preparation

CITY OF LOS ANGELES
DEPARTMENT OF CITY PLANNING
CITY HALL 200 NORTH SPRING STREET LOS ANGELES CA 90012

NOTICE OF PREPARATION

OF ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING

June 30, 2017

CASE NO.: ENV-2016-4676-EIR
PROJECT NAME: Times Mirror Square
PROJECT APPLICANT: Onni Times Square LP
PROJECT ADDRESS: 121, 145, 147 S. Spring Street; 100, 102, 106, 108, 110, 118, 120, 124, 126, 128, 130, 140, 142 S. Broadway; 202, 212, 214, 220, 224, 228, 230, 234 W. 1st Street; 205, 211, 221 W. 2nd Street, Los Angeles, California 90012
COMMUNITY PLANNING AREA: Central City Community Plan Area
COUNCIL DISTRICT: 14 - Huizar
PUBLIC COMMENT PERIOD: June 30, 2017 – July 31, 2017
SCOPING MEETING: 5:00 P.M.–7:00 P.M., July 25, 2017. See below for additional information.

The City of Los Angeles (City) intends to prepare an Environmental Impact Report (EIR) for the proposed Times Mirror Square Project (Project). In accordance with Section 15082 of the California Environmental Quality Act (CEQA) Guidelines, the City has prepared this Notice of Preparation to provide the public, nearby residents and property owners, responsible agencies, and other interested parties with information regarding the Project and its potential environmental effects. The EIR will be prepared by outside consultants under the supervision of the City of Los Angeles, Department of City Planning.

The City requests your written comments as to the scope and contents of the EIR, including mitigation measures or project alternatives to reduce potential environmental impacts from the project. Comments must be submitted in writing according to directions below. If you represent a public agency, the City seeks written comments as to the scope and content of the environmental information in the EIR that are germane to your agency's statutory responsibilities in connection with the project. Your agency may need to use the EIR prepared by the City when considering your permit or other approval for the project.

A Public Scoping Meeting will be held to receive input as to what environmental topics the EIR should study. No decisions about the project are made at the Public Scoping Meeting. Additional project details, meeting information, and instructions for public comment submittal are listed below.

PROJECT LOCATION AND EXISTING ON-SITE USES: The Project Site is located on an approximately 3.6-acre (five parcels totaling approximately 160,578 square feet [sf]) city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway in the Center City/Historic Core District of Downtown Los Angeles. This district, which extends from W. 1st Street to W. 11th Street, between Los Angeles and Hill Streets, includes Los Angeles City Hall, Los Angeles County courts and law library, federal offices and courts, LAPD Headquarters, Caltrans Regional Offices, Grand Park, and other civic facilities. The Project Site is currently occupied by five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage, and the 6-story Executive Building, resulting in a total of approximately 559,863 sf (See attached Project Location Map).

PROJECT DESCRIPTION: The Project would retain and renovate the Times, Plant, and Mirror Buildings to provide approximately 376,105 sf of offices and/or other retail and commercial uses, including an approximately 50,000 sf grocery store. These three buildings are aligned along S. Spring Street, with frontages along both W. 1st Street and W. 2nd Street. The Project proposes to demolish the Parking Garage and Executive Building located on the western half of the Site and construct two mixed-use towers (North and South Towers).

The Project's 37-story North Tower and 53-story South Tower mixed-use components would be constructed in the west sector of the Project Site in the areas currently occupied by the 6-story Executive Building at the corner of W. 1st Street and S. Broadway and the 6-story parking structure at the corner of W. 2nd Street and S. Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. The towers would include approximately 34,572 sf of retail uses, which would be located at ground level. With the addition of retail uses, total new construction would amount to 1,135,803 sf. Inclusive of the existing buildings to be retained and rehabilitated, the project would include a total of 1,511,908 sf of floor area for a resulting floor-area ratio (FAR) of approximately 9.42:1.

The Project would include a pedestrian paseo constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. Approximately 72,902 sf of common open space, including the approximately 15,708 sf paseo, would be provided as part of the North and South Towers component. With the addition of approximately 56,349 sf of private balconies, combined private and common open space would be approximately 129,477 sf.

Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023.

Existing Uses

Existing Uses	Existing Square-Footage
Commercial Land Uses	
Executive Building	
Office*	176,258 sf
Bank*	7,500 sf
Executive Building Subtotal	*183,758 sf*
Times Building	
Office	116,113 sf
Times Building Subtotal	*116,113 sf*
Mirror Building	
Office	169,402 sf
Mirror Building Subtotal	*169,402 sf*
Plant Building	
Cafeteria	11,250 sf
Office	79,340 sf
Plant Building Subtotal	*90,590 sf*
Total	**559,863 sf**
*Indicates uses to be removed. The existing Executive Building at the corner of W. 1st Street and S. Broadway and the parking structure at the corner of W. 2nd Street and S. Broadway would be demolished. The Times, Mirror, and Plant Building would be retained and rehabilitated, and would contain the mix of uses specified below in the Proposed Uses table.	

Proposed Uses

Proposed Uses	Maximum Size
North and South Towers	
Commercial Land Uses	
Retail	34,572 sf
Total Commercial	**34,572 sf**
Residential Land Uses	
	1,127 units
Total Residential	**1,127 units /1,101,231 sf**
Total Proposed Floor Area (New Construction)	**1,135,803 sf**
Times, Plant and Mirror Buildings Rehabilitation	
Commercial Uses	
Office	285,088 sf
Ground-floor Restaurant	18,817 sf
Upper-floor Restaurant	22,200 sf
Grocery Store	50,000 sf
Total Commercial (Times, Plant and Mirror Rehabilitation)	**376,105 sf**
Total Proposed Project Floor Area	**1,511,908 sf**
Open Space	
Level 1 – Paseo/Plaza	15,708 sf
Level 1 – Lounge (North Tower)	1,270 sf
Level 1 – Lounge (South Tower)	1,755 sf
Level 6 – Amenity (North Tower)	13,331 sf
Level 6 – Amenity (South Tower)	12,287 sf
Level 6 – Garden Plaza	28,777 sf
Private Balconies	56,349 sf
Total Open Space	**129,477 sf**

REQUESTED PERMITS/APPROVALS: The project applicant is requesting the following entitlements from the City of Los Angeles:

(1) Transfer of Floor Area Rights (TFAR) greater than 50,000 square feet of floor area for the transfer of 548,440 square feet of floor area from the Los Angeles Convention Center (Donor Site) to the Project Site (Receiver Site);
(2) Vesting Conditional Use Permit to permit floor averaging within a unified development;
(3) Master Conditional Use Permit (MCUB) to permit the on-site and off-site sale and consumption of alcoholic beverages within the Project's commercial retail spaces;
(4) Vesting Tentative Tract Map for the merger and re-subdivision of the Project Site for condominium purposes (LAMC Sec. 17.15). The Applicant is requesting to provide parking per LAMC requirements in lieu of the parking requirements under the Advisory Agency's Parking Policy for Condominiums;
(5) Construction permits, including building, grading, excavation, foundation, and associated permits;
(6) Haul Route Permit, as may be required; and

(7) Other approvals and permits as needed.

POTENTIAL ENVIRONMENTAL EFFECTS OF THE PROJECT: Based on an Initial Study, the proposed project could have potentially significant environmental impacts in the following topic areas, which are to be addressed in the EIR: Air Quality, Cultural Resources, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services, Recreation, Transportation and Traffic, Tribal Cultural Resources, and Utilities and Service Systems.

PUBLIC SCOPING MEETING: A Public Scoping Meeting will be held in **an open house format** to share information regarding the proposed project and the environmental review process and to receive written public comments regarding the scope and content of the environmental analysis to be addressed in the EIR. City staff, environmental consultants, and project representatives will be available, but no formal presentation is scheduled. You may stop by at any time between 5:00 P.M. and 7:00 P.M. to view materials, ask questions, and provide written comments. The City encourages all interested individuals and organizations to attend this meeting. Written comments may be submitted, but there will be no verbal comments or public testimony taken at the Scoping Meeting. No decisions about the project will be made at the Scoping Meeting. A separate public hearing for Municipal Code entitlement requests, will be scheduled after the completion of the EIR. The date, time, and location of the public scoping meeting are as follows:

Date: **Tuesday, July 25, 2017**

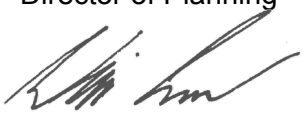
Time: **5:00 P.M. – 7:00 P.M.**

Location: Ronald F. Deaton Civic Auditorium
LAPD Police Administration Building
100 W. 1st Street
Los Angeles, CA 90012

Paid parking is available at: 200 S. Spring Street, Los Angeles, CA 90012.

FILE REVIEW AND COMMENTS: The enclosed materials reflect the scope of the project. The environmental file is available for public review at the City of Los Angeles, Department of City Planning, 200 N. Spring Street, Room 750, Los Angeles, CA 90012, during office hours Monday - Friday, 9:00 A.M. - 4:00 P.M. A copy of this notice and the Initial Study prepared for the project may be viewed with the environmental file or online at http://planning.lacity.org by clicking on the "Environmental Review" tab, then "Notice of Preparation & Public Scoping Meetings".

The City will consider all written comments regarding the potential environmental impacts of the project and issues to be addressed in the EIR. **Written comments must be submitted to this office by 4:00 pm, July 31, 2017.** Written comments will also be accepted at the scoping meeting described above.



Please direct your comments to:

Mail: William Lamborn
City of Los Angeles, Department of City Planning
200 N. Spring Street, Room 750
Los Angeles, CA 90012
E-mail: William.lamborn@lacity.org

ACCOMMODATIONS: As a covered entity under Title II of the Americans with Disabilities Act, the City of Los Angeles does not discriminate on the basis of disability. The Public Scoping Meeting facility and its parking are wheelchair accessible. Sign language interpreters, assistive listening devices, or other auxiliary aids and/or services may be provided upon request. Other services, such as translation between English and other

languages, may also be provided upon written request submitted a minimum of seven (7) working days in advance to: per.planning@lacity.org. Be sure to identify the language you need English to be translated into, and indicate if the request is for oral or written translation services. If translation of a written document is requested, please include the document to be translated as an attachment to your email.

CITY OF LOS ANGELES
DEPARTMENT OF CITY PLANNING
CITY HALL 200 NORTH SPRING STREET LOS ANGELES CA 90012

INITIAL STUDY

Times Mirror Square Project

Case Number: ENV-2016-4676-EIR

Project Addresses: 121, 145, 147 S. Spring Street; 100, 102, 106, 108, 110, 118, 120, 124, 126, 128, 130, 140, 142 S. Broadway; 202, 212, 214, 220, 224, 228, 230, 234 W. 1st Street; 205, 211, 221 W. 2nd Street, Los Angeles, California 90012

Community Plan Area: Central City

Council District: 14 - Huizar

Project Description: The Times Mirror Square Project would develop a new mixed-use development and rehabilitate the Times, Plant, and Mirror Buildings on the approximately 3.6-acre city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway Street in the Center City/Historic Core District of Downtown Los Angeles (Project). New development, consisting of the 37-story "North Tower" and 53-story "South Tower" would be located in the west sector of the block, which is oriented toward S. Broadway, with frontages on W. 1st Street and W. 2nd Street. The existing Executive Building at the corner of W. 1st Street and S. Broadway and parking garage at the corner of W. 2nd Street and S. Broadway would be demolished to allow for the development of the Project's new mixed-use component (North and South Towers). The North and South Towers, which would be constructed above a five-story parking podium, would contain a total of approximately 1,127 residential units and approximately 34,572 square feet of commercial floor area. The parking podium would be an above-ground structure forming the streetfront of the new development and base for the residential towers. The space below the podium would contain an additional nine levels of subterranean parking. The combined commercial and residential floor area would total approximately 1,135,803 square feet. The existing Times, Plant, and Mirror Buildings have a combined floor area of 376,105 square feet. In total, including new construction and existing buildings to remain, the Project proposes approximately 1,511,908 square feet of floor area. This would result in a floor area ratio (FAR) of 9.42:1 Please see Attachment A for further detail.

PROJECT TITLE/NO.	CASE NO.
Times Mirror Square	ENV-2016-4676-EIR

PREVIOUS ACTIONS CASE NO.	
N/A	☐ DOES have significant changes from previous actions. ☒ DOES NOT have significant changes from previous actions.

PROJECT DESCRIPTION:

The Project proposes to construct a new mixed-use development and to rehabilitate the Times, Plant, and Mirror Buildings on the approximately 3.6-acre city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway Street in the Center City/Historic Core District of Downtown Los Angeles ("Project"). New development, consisting of the 37-story "North Tower" and 53-story "South Tower" would be located in the west sector of the block, which is oriented toward S. Broadway, with frontages on W. 1st Street and W. 2nd Street. The existing Executive Building at the corner of W. 1st Street and S. Broadway and parking garage at the corner of W. 2nd Street and S. Broadway would be demolished to allow for the development of the Project's new mixed-use component. The North and South Towers, which would be constructed above a 5-story parking podium, would contain a total of approximately 1,127 residential units and approximately 34,572 square feet of commercial floor area. The parking podium would be an above-ground structure forming the street front of the new development and base for the residential towers. The space below the podium would contain an additional nine levels of subterranean parking. The combined commercial and residential floor area would total approximately 1,135,803 square feet. The existing Times, Plant, and Mirror Buildings have a combined floor area of 376,105 square feet. In total, including new construction and existing buildings to remain, the Project proposes approximately 1,511,908 square feet of floor area. This would result in a floor area ratio ("FAR") of 9.42 on the 3.6-acre site.

An open-to-the-sky pedestrian paseo ("Paseo") leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the renovated Times, Plant, and Mirror Buildings. The First and Broadway Civic Center Park would be visible from throughout the Paseo. Ground level retail uses would be located along the Paseo and along the base of the parking podium facing W. 1st Street, S. Broadway, and W. 2nd Street. A 50,000-square-foot grocery store would be accessed via the Paseo and the location of the original loading docks on S. Spring Street. The Project anticipates the re-use of the Times, Plant, and Mirror Buildings for office, retail, and restaurant purposes appropriate to the Downtown setting, and as the location of the grocery store.

The Project Site is zoned C2-4D-SN, which permits general commercial and multi-family residential uses. The 4D Height District establishes a Floor Area Ratio (FAR) of 6.0:1, but does not specifically limit building heights. The Project Site is also located within the Central City TFAR area, Greater Downtown Housing Incentive Area, Downtown Adaptive Reuse Area, Downtown Design Guide Project area, and the Central City and Downtown parking districts. The Downtown TFAR designation allows for the transfer of floor area rights from a donor site to increase FAR over the existing zoning designation. The Greater Downtown Housing Incentive Area was established to encourage the construction of new, economically diverse urban infill housing. The Project Site is also located within a Transit Priority Area (TPA) because of proximity to Metro's Civic Center/Grand Park Station, located approximately 750 feet to the northwest, and directly across W. 2nd Avenue from Metro's 2nd Street/Broadway Station, one of the three stations on Metro's Regional Connector Line, currently under development.

The entitlements being requested for the Project include, but may not be limited to, the following:

- Transfer of Floor Area Rights (TFAR) greater than 50,000 square feet of floor area for the transfer of 548,440 square feet of floor area from the Los Angeles Convention Center (Donor Site) to the Project Site (Receiver Site) (LAMC Sec. 14.5.6-B).
- Vesting Conditional Use Permit to permit floor averaging within a unified development (LAMC Sec. 12.24-W,19).
- Master Conditional Use Permit (MCUB) to permit the on-site and off-site sale and consumption of alcoholic beverages within the Project's commercial retail spaces (LAMC Sec. 12.24-W,1).
- Vesting Tentative Tract Map for the merger and re-subdivision of the Project Site for condominium purposes (LAMC Sec. 17.15). The Applicant is requesting to provide parking per LAMC requirements in lieu of the parking requirements under the Advisory Agency's Parking Policy for Condominiums.
- Construction permits, including building, grading, excavation, foundation, and associated permits.
- Haul Route Permit, as may be required.
- Other approvals as needed.

ENVIRONMENTAL SETTING:

The Project Site is located within the northern portion of the City of Los Angeles Center City/Historic Core. This district, which extends from W. 1st Street to W. 11th Street, between Los Angeles and Hill Streets, includes Los Angeles City Hall, Los Angeles County courts and law library, federal offices and courts, LAPD Headquarters, CalTrans Regional Offices, Grand Park, and other civic facilities. The Project Site is currently developed with five buildings, including the Times Building, Mirror Building, Plant Building, Executive Building, and a six-level parking structure. The Times, Mirror, and Plant Buildings are listed in the National Register of Historic Places and the California Register of Historic Places. The Mirror Building was also recommended as eligible at the local level through SurveyLA. The City's Historic Core, which is centered on S. Spring Street and S. Broadway, forms the spine through the Downtown that links the Financial District and Bunker Hill to the west, South Park and the Convention Center to the south, the South Markets to the southeast, and Little Tokyo and the Arts District to the east. The Downtown area is characterized by a concentration of government-related uses, high- and mid-rise office buildings, residential buildings, hotels, retail uses, museums, and cultural districts, including the "Arts" and "Markets" districts. The Historic Core/Center City also contains a concentration of architecturally significant buildings, including a number of nationally recognized historic theater buildings, Los Angeles City Hall, Walt Disney Concert Hall, and buildings within the Project Site.

☞ **DETERMINATION (To be completed by Lead Agency)**

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions on the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☒ I find the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☐ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

SIGNATURE

__City Planning Associate_____

TITLE

EVALUATION OF ENVIRONMENTAL IMPACTS:

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less that significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of a mitigation measure has reduced an effect from "Potentially Significant Impact" to "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from "Earlier Analysis," as described in (5) below, may be cross referenced).

5) Earlier analysis must be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR, or negative declaration. Section 15063 (c)(3)(D). In this case, a brief discussion should identify the following:

    a) Earlier Analysis Used. Identify and state where they are available for review.

    b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

    c) Mitigation Measures. For effects that are "Less Than Significant With Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated

7) Supporting Information Sources: A sources list should be attached, and other sources used or individuals contacted should be cited in the discussion.

8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whichever format is selected.

9) The explanation of each issue should identify:

    a) The significance criteria or threshold, if any, used to evaluate each question; and

    b) The mitigation measure identified, if any, to reduce the impact to less than significance.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED:

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

☐ Aesthetics	☒ Hazards & Hazardous Materials	☒ Public Services
☐ Agriculture and Forestry Resources	☒ Hydrology/Water Quality	☒ Recreation
☒ Air Quality	☒ Land Use/Planning	☒ Transportation/Traffic
☐ Biological Resources	☐ Mineral Resources	☒ Tribal Cultural Resources
☒ Cultural Resources	☒ Noise	☒ Utilities/Service Systems
☒ Geology/Soils	☒ Population/Housing	☒ Mandatory Findings of Significance
☒ Greenhouse Gas Emissions		

INITIAL STUDY CHECKLIST (To be completed by the Lead City Agency)

☞ **BACKGROUND**

PROPONENT NAME	**PHONE NUMBER**
Onni Times Square LP	(213) 629-2041

PROPONENT ADDRESS

315 W. 9th Street, Suite 801, Los Angeles, CA 90015

AGENCY REQUIRING CHECKLIST	**DATE SUBMITTED**
City of Los Angeles, Department of City Planning, Major Projects Section	June 30, 2017

PROPOSAL NAME (If Applicable)

Times Mirror Square

☞ **ENVIRONMENTAL IMPACTS** (Explanations of all potentially and less than significant impacts are required to be attached on separate sheets)

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
I. AESTHETICS. Would the project:				
a. Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☒
b. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☒
c. Substantially degrade the existing visual character or quality of the site and its surroundings?	☐	☐	☐	☒
d. Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☒
II. AGRICULTURE AND FORESTRY RESOURCES. In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:				
a. Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
b. Conflict with existing zoning for agricultural use, or a Williamson Act Contract?	☐	☐	☐	☒
c. Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
d. Result in the loss of forest land or conversion of forest land to non-forest use?	☐	☐	☐	☒
e. Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	☐	☐	☐	☒

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
III. AIR QUALITY. Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a. Conflict with or obstruct implementation of the applicable air quality plan?	☒	☐	☐	☐
b. Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☒	☐	☐	☐
c. Result in a cumulatively considerable net increase of any criteria pollutant for which the air basin is non-attainment (ozone, PM_{10}, and $PM_{2.5}$**)** under an applicable federal or state ambient air quality standard?	☒	☐	☐	☐
d. Expose sensitive receptors to substantial pollutant concentrations?	☒	☐	☐	☐
e. Create objectionable odors affecting a substantial number of people?	☐	☐	☒	☐
IV. BIOLOGICAL RESOURCES. Would the project:				
a. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
b. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California of Fish and Game or U.S. Fish and Wildlife Service ?	☐	☐	☐	☒
c. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☒
d. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☐	☒
e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☒	☐
f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☒

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
V. CULTURAL RESOURCES: Would the project:				
a. Cause a substantial adverse change in the significance of a historical resource as defined in State CEQA Guidelines §15064.5?	☒	☐	☐	☐
b. Cause a substantial adverse change in the significance of an archaeological resource pursuant to State CEQA Guidelines §15064.5?	☒	☐	☐	☐
c. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☒	☐	☐	☐
d. Disturb any human remains, including those interred outside of formal cemeteries?	☐	☐	☒	☐
VI. GEOLOGY AND SOILS. Would the project:				
a. Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault, caused in whole or in part by the project's exacerbation of existing environmental conditions. Refer to Division of Mines and Geology Special Publication 42.	☒	☐	☐	☐
ii. Strong seismic ground shaking caused in whole or in part by the project's exacerbation of the existing environmental conditions?	☒	☐	☐	☐
iii. Seismic-related ground failure, including liquefaction caused in whole or in part by the project's exacerbation of the existing environmental conditions?	☒	☐	☐	☐
iv. Landslides caused in whole or in part by the project's exacerbation of the existing environmental conditions?	☐	☐	☐	☒
b. Result in substantial soil erosion or the loss of topsoil?	☒	☐	☐	☐
c. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse caused in whole or in part by the project's exacerbation of the existing environmental conditions?	☒	☐	☐	☐
d. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property caused in whole or in part by the project's exacerbation of the existing environmental conditions?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
e. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☒
VII. GREENHOUSE GAS EMISSIONS. Would the project:				
a. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☒	☐	☐	☐
b. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	☒	☐	☐	☐
VIII. HAZARDS AND HAZARDOUS MATERIALS. Would the project:				
a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☒	☐	☐	☐
b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☒	☐	☐	☐
c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☒	☐	☐	☐
d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment caused in whole or in part from the project's exacerbation of existing environmental conditions?	☒	☐	☐	☐
e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project have the potential to exacerbate current environmental conditions so as to result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒
f. For a project within the vicinity of a private airstrip, would the project have the potential to exacerbate current environmental conditions so as to result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒
g. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
h. Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands, caused in whole or in part from the project's exacerbation of existing environmental conditions?	☐	☐	☐	☒
IX. HYDROLOGY AND WATER QUALITY. Would the project:				
a. Violate any water quality standards or waste discharge requirements?	☒	☐	☐	☐
b. Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned land uses for which permits have been granted)?	☐	☐	☒	☐
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	☒	☐	☐	☐
d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in an manner which would result in flooding on- or off site?	☒	☐	☐	☐
e. Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☒	☐	☐	☐
f. Otherwise substantially degrade water quality?	☒	☐	☐	☐
g. Place housing within a 100-year flood hazard area as mapped on federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☒	☐
h. Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☐	☐	☒	☐
i. Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	☒	☐
j. Inundation by seiche, tsunami, or mudflow?	☐	☐	☐	☒
X. LAND USE AND PLANNING. Would the project:				
a. Physically divide an established community?	☐	☐	☒	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
b. Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☒	☐	☐	☐
c. Conflict with any applicable habitat conservation plan or natural community conservation plan?	☐	☐	☐	☒
XI. MINERAL RESOURCES. Would the project:				
a. Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☒
b. Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☒
XII. NOISE. Would the project result in:				
a. Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☒	☐	☐	☐
b. Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☒	☐	☐	☐
c. A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐
d. A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☒	☐	☐	☐
e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒
f. For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒
XIII. POPULATION AND HOUSING. Would the project:				
a. Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☒	☐	☐	☐
b. Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
c. Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒
XIV. PUBLIC SERVICES. Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
a. Fire protection?	☒	☐	☐	☐
b. Police protection?	☒	☐	☐	☐
c. Schools?	☒	☐	☐	☐
d. Parks?	☒	☐	☐	☐
e. Other public facilities?	☒	☐	☐	☐
XV. RECREATION.				
a. Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☒	☐	☐	☐
b. Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☒	☐	☐	☐
XVI. TRANSPORTATION/TRAFFIC. Would the project:				
a. Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	☒	☐	☐	☐
b. Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	☒	☐	☐	☐
c. Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☐	☒
d. Substantially increase hazards to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
e. Result in inadequate emergency access?	☒	☐	☐	☐
f. Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	☒	☐	☐	☐
XVII. TRIBAL CULTURAL RESOURCES. Would the project:				
a. Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1 (k)?	☒	☐	☐	☐
b. Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is: A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?	☒	☐	☐	☐
XVIII. UTILITIES AND SERVICE SYSTEMS. Would the project:				
a. Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☒	☐	☐	☐
b. Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐
c. Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☒	☐	☐	☐
d. Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	☒	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
e. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☒	☐	☐	☐
f. Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	☒	☐	☐	☐
g. Comply with federal, state, and local statutes and regulations related to solid waste?	☒	☐	☐	☐
XVX. MANDATORY FINDINGS OF SIGNIFICANCE.				
a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	☒	☐	☐	☐
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects).	☒	☐	☐	☐
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☒	☐	☐	☐

☞ DISCUSSION OF THE ENVIRONMENTAL EVALUATION (Attach additional sheets if necessary)

PREPARED BY	TITLE	TELEPHONE #	DATE
Jay Ziff ESA PCR 233 Wilshire Blvd., Ste. 150 Santa Monica, CA 90401	Principal Associate	(310) 451-4488	June 30, 2017

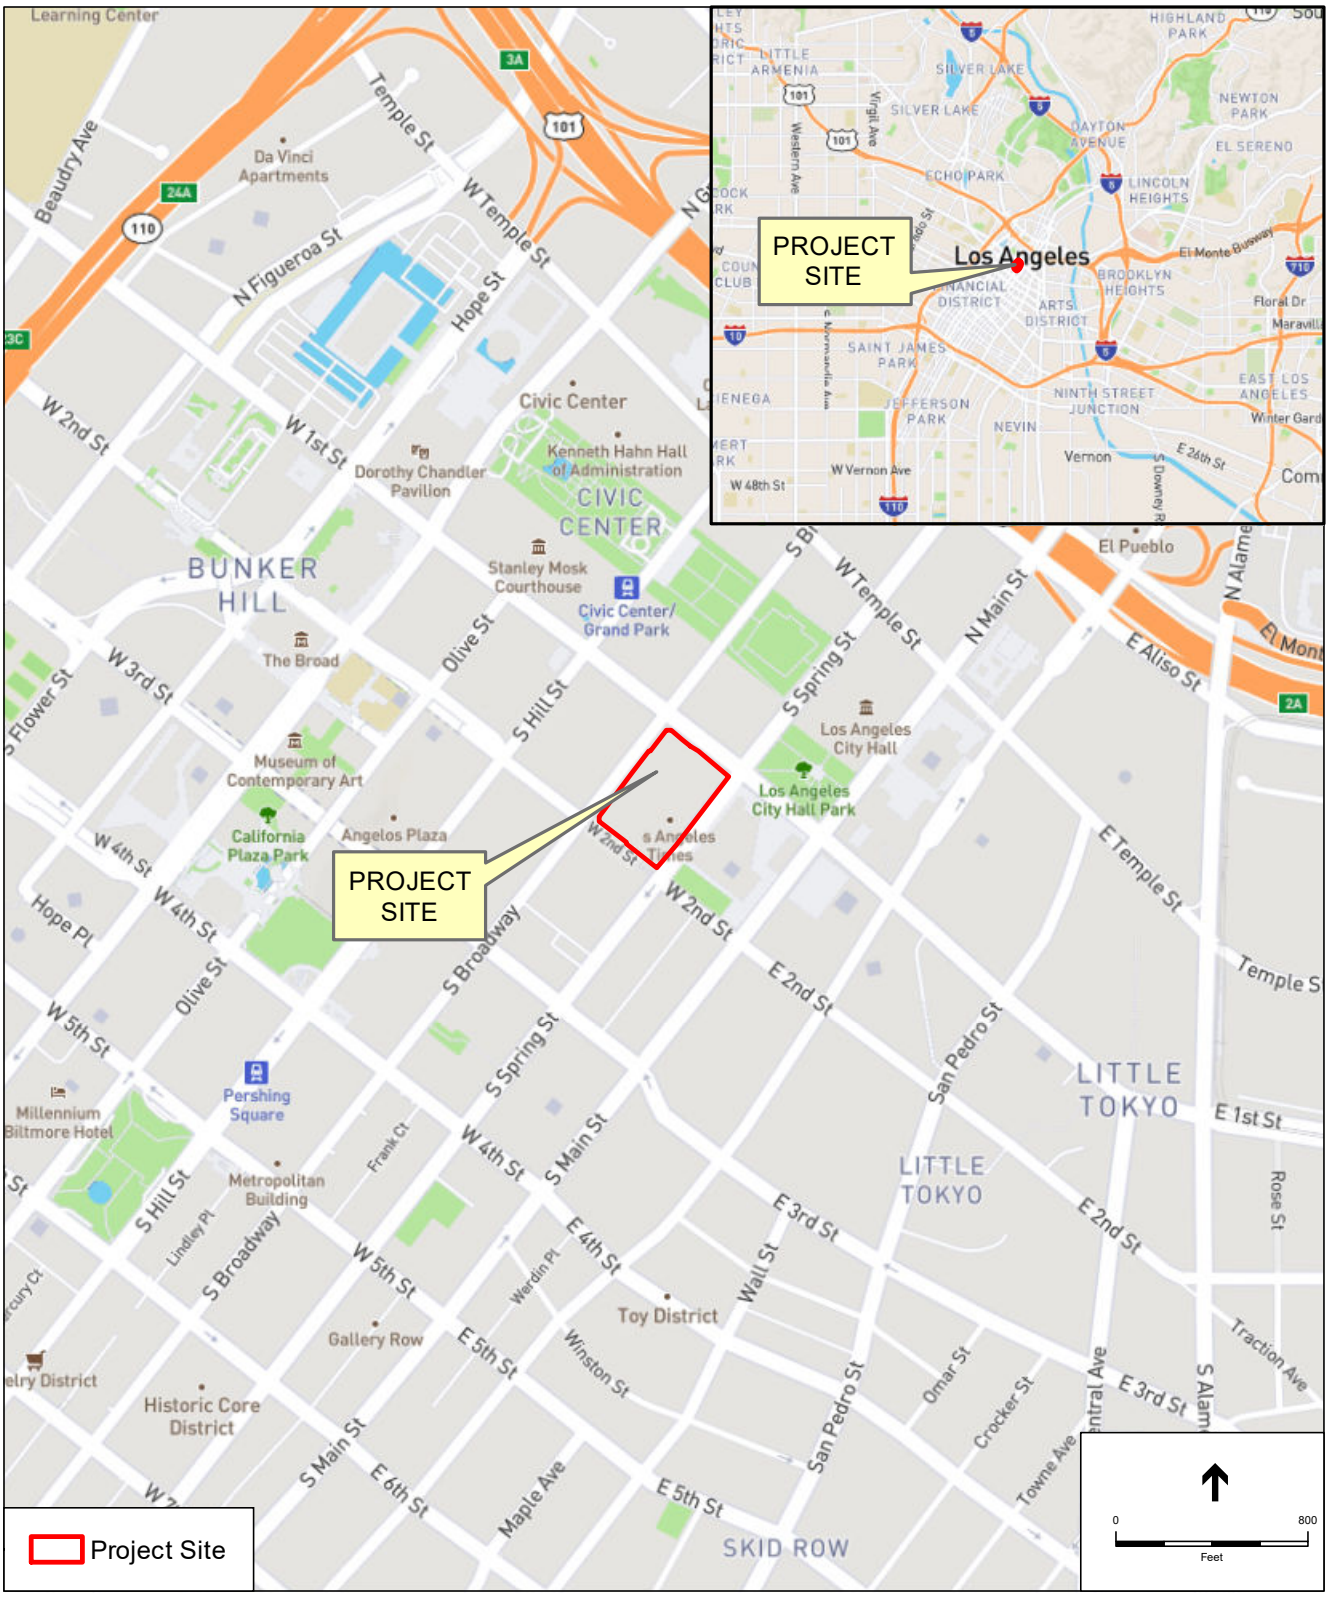
INITIAL STUDY

Attachment A: Project Description

A. Introduction

The Project proposes to develop the Times Mirror Square Project (Project) which would include construction of two new mixed-use towers along with rehabilitation of three existing buildings, including an eight-story building (Times Building), a four-story building (Plant Building) and a 10-story building (Mirror Building) within the Times Mirror Square site. The Times Mirror Square site (Project Site) comprises the city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway. The Project Site totals approximately 160,578 square feet of lot area or approximately 3.6 acres. The proposed rehabilitated buildings, the Times, Plant, and Mirror Buildings, which have a total existing floor area of approximately 376,105 square feet, are located in the east sector of the block aligned with S. Spring Street, with frontages on W. 1st Street and W. 2nd Street. New development, consisting of the 37-story "North Tower" and 53-story "South Tower", would be constructed in the west sector of the block, which is aligned with S. Broadway with frontages on W. 1st Street and W. 2nd Street. The existing Executive Building at the corner of W. 1st Street and S. Broadway and the parking structure at the corner of W. 2nd Street and S. Broadway would be demolished to allow for the development of the Project towers. The North and South Towers, which would be constructed above a five-story parking podium (Podium), would contain a total of approximately 1,127 residential units, approximately 34,572 square feet of commercial floor area, and a combined floor area of approximately 1,135,803 square feet.[1] The Podium would be an above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. Overall, including the existing buildings to remain that total approximately 376,105 square feet, the Project would comprise approximately 1,511,908 square feet of floor area, resulting in a 9.42 FAR. An open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park. Ground level retail uses would be located along the base of the Podium facing W. 1st Street, S. Broadway, and W. 2nd Street, and the Paseo.

1 Project Floor Area numbers throughout this section are calculated in accordance with Los Angeles Municipal Code Section 12.03, unless otherwise noted.



B. Project Location and Surrounding Uses

The Project Site, bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway, is located within the northern portion of the City of Los Angeles (City) Central City Community Plan Center City/Historic Core district, which extends from W. 1st Street to W. 11th Street, between Los Angeles and Hill Streets. As discussed in the Central City Community Plan, the Historic Core, which is centered on S. Spring Street and S. Broadway, forms the spine through Downtown that links the Financial District and Bunker Hill to the west, South Park and the Convention Center to the south, the South Markets to the southeast, and Little Tokyo and the Arts District to the east.[2] Downtown is characterized by a concentration of government-related uses, high- and mid-rise office buildings, residential buildings, hotels, retail uses, museums, and cultural districts, including the Arts and Markets districts. The Historic Core/Center City contains a concentration of historically and architecturally significant buildings, including the iconic City Hall, Walt Disney Concert Hall, and the historic Times, Plant and Mirror Buildings, which are components of the Project. The general vicinity and relationship of the Project Site to surrounding streets is illustrated in **Figure A-1**, *Regional and Project Vicinity Map*. Surrounding land uses are shown in **Figure A-2**, *Aerial View of the Project Site and the Surrounding Uses.*

1. Land Uses to the North

Land uses to the north of W. 1st Street consist of the Los Angeles Civic Center, and Grand Park, a 16-acre park extending from City Hall to the south of N. Spring Street to the Dorothy Chandler Pavilion (Los Angeles Music Center) to the north of Grand Avenue. Immediately to the north of the Project Site is the 1.96-acre First and Broadway Civic Center Park, a public park currently under development and anticipated for completion in 2019. Adjoining the south side of Grand Park along the E. 1st Street frontage are the seven-story Los Angeles County Law Library, the 10-story Los Angeles County Stanley Mosk Courthouse, and the 10-story Kenneth Hahn Hall of Administration. The 20-story Clara Shortridge Folz Criminal Justice Center adjoins the north side of Grand Park directly north of the Project Site. The recently rehabilitated Los Angeles County Hall of Justice is located just to the north of the Criminal Justice Center. City Hall is located just to the northeast of the Project Site and the United States Courthouse is located just to the north of City Hall. The Hollywood Freeway (US-101) is located immediately north of the group of government buildings. Los Angeles Union Station, the region's major transit hub, is located just to the north of the US-101 Freeway.

2. Land Uses to the East

The 10-story Los Angeles Police Department (LAPD) Headquarters Building, which replaced Parker Center as the LAPD headquarters in October 2009, occupies the block bounded by S. Spring Street, E. 1st Street, S. Main Street, and E. 2nd Street, immediately to the east of the Project Site. The approximately 29-story Los Angeles City Hall is located diagonally across S. Spring Street and W. 1st Street from the Project Site. The LAPD Headquarters Building is oriented toward City Hall and is characterized by 75-foot setbacks on three sides. The LAPD Headquarters Building's deep setbacks accommodate a main plaza along E. 1st Street. In addition, the deep setback on the south of the Headquarters Building supports a one-acre park along E. 2nd Street. The park is landscaped open space edged with planters and benches. City Hall Park is located directly across E. 1st Street from the LAPD Headquarters Building's main plaza, at the south side of City Hall. City Hall Park is also aligned across N. Spring Street with the First and Broadway Civic Center Park (under construction), just to the north of N. Spring Street.

Public parks and plazas are also associated with City Hall along N. Main and N. Los Angeles Streets, and include Los Angeles Civic Center Mall. The existing Grand Park, the under-construction Civic Center Park, public plazas and parks at the LAPD Headquarters Building and City Hall will contribute to a growing, inviting pedestrian environment for the area's employees and residents. Land uses to the east of the LAPD Headquarters building include the State of California Caltrans Building, occupying the block bounded by S. Main Street, E. 1st Street, S. Los Angeles Street, and E. 2nd Street. The approximately 21-story Double Tree Hotel is located to the south of the Caltrans Building, south of S. Los Angeles Street. At this point, Los Angeles Street forms the north edge of the City's Little Tokyo Community, which, with the Arts District, is located farther to the east of the Project Site. The Little Tokyo Community features plazas and paseos that further enhance pedestrian activity.

3. Land Uses to the South

Low- and mid-rise office buildings, enclosed parking structures, and surface parking lots are the predominant land uses to the south of the Project Site. A surface parking lot and a 7-level enclosed parking structure are currently located directly across W. 2nd Street from the Project Site. The site was selected for Metro's proposed 2nd and Broadway Subway Station, one of three subway stations making up the Regional Connector Transit Project. Construction for the Regional Connector Transit Project at the 2nd Street and Broadway Station is currently underway. Completion of the entire Regional Connector Transit Project is anticipated in May 2021. A current development proposal for the subway station site includes demolition of the existing parking structure for the construction of a 30-story mixed-use building. The building would integrate the subway station and provide ground level retail uses. Diagonally across W. 2nd Street and S. Spring Street from the Project Site (to the southeast) is a single-story office building, to the south of which is an approximately 6-level enclosed parking building. To the east of the single-story office building is an older, 10-story residential building with ground level retail uses, including a restaurant and shops along E. 2nd Street and S. Spring Street. Directly to the east of the 10-story building, across S. Main Street is the former Cathedral of St. Vibiana. The building and its associated plaza are now owned by the City and used for public events, and the property also houses the Little Tokyo Branch Public Library.

4. Land Uses to the West

The new 10-story Federal Courthouse, completed in October 2016, is located directly to the west of the Project Site in the block bounded by W. 1st Street, S. Broadway, W. 2nd Street, and S. Hill Street. The building rests on a podium structure, which provides a horizontal base relative to the rise along W. 1st Street. The podium structure and the rising topography of the site require broad staircases from S. Broadway and W. 1st Street to reach the building's entrance. The west frontage of the building is at grade with S. Hill Street. The building sits behind a deep setback from W. 2nd Street, which allows exposure of the building to natural sunlight. The Los Angeles County Law Library, which is adjacent to Grand Park, is located diagonally across W. 1st Street and S. Broadway from the Project Site. A modern, 10-story office building with ground floor retail uses is located diagonally across W. 2nd Street and S. Broadway from the Project Site. To the west of the Federal Courthouse, 2nd Street enters the 2nd Street tunnel, passing under Bunker Hill and emerging at S. Figueroa Street. The Bunker Hill District is located approximately one block west of the Project Site and is bounded by W. 1st Street on the north; S. Hill Street on the east, the Pasadena/Santa Monica Freeway (I-10) on the west; and W. 5th Street on the south. Bunker Hill includes a concentration of downtown high rise development, such as the Library Tower, the Wells Fargo Tower, and the California Plaza Towers.

C. Existing Conditions

1. On-Site Conditions

The approximately 3.6-acre Project Site is currently occupied by five structurally distinct but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to 10 stories in height. The buildings include the eight-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the six-story parking structure, and the six-story Executive Building. The Times Building, which occupies the northeast corner of the Project Site, was designed by architect Gordon B. Kaufmann in the P.W.A Moderne style and constructed in 1935. The building's Globe Lobby features 10-foot-high murals painted in 1934 by Hugo Ballin, who also painted the Griffith Observatory rotunda. The Times Building is also noted for the prominent clocks on its north- and south-facing towers. The Plant Building, which was originally constructed with two stories in 1935 and expanded to four stories between 1947 and 1948, is located along the mid-block of S. Spring Street and emulates the Times Building's P.W.A. Moderne architectural style. In 1948, architect Rowland H. Crawford designed the 10-story Mirror Building in the Late Moderne style to emulate the style of the Times Building. The Los Angeles Times continues some newspaper operations out of the Times, Plant, and Mirror Buildings, all three of which are listed in the California Register of Historical Resources.

In 1973, the Executive Building, a six-story glass and steel International Style building, was designed by the architectural firm William L. Pereira & Associates on the northwest corner of the block. Once constructed, this building became the corporate headquarters for the Times-Mirror Company. Pereira's Executive Building abuts the west wall of the Times Building. Bank of

America occupies the ground floor of the Executive Building. The locations of existing on-site buildings are illustrated in **Figure A-3**, *Existing On-Site Uses*.

Combined, the Times, Plant, Mirror, and Executive Buildings have a total floor area of approximately 559,863 square feet. This includes approximately 541,113 square feet of commercial office uses across the four existing buildings, an approximately 7,500 square-foot bank in the Executive Building, and an approximately 11,250 square-foot cafeteria in the Plant Building. Table A-1, *Existing Uses*, provides a breakdown of existing land uses by building on the Project Site.

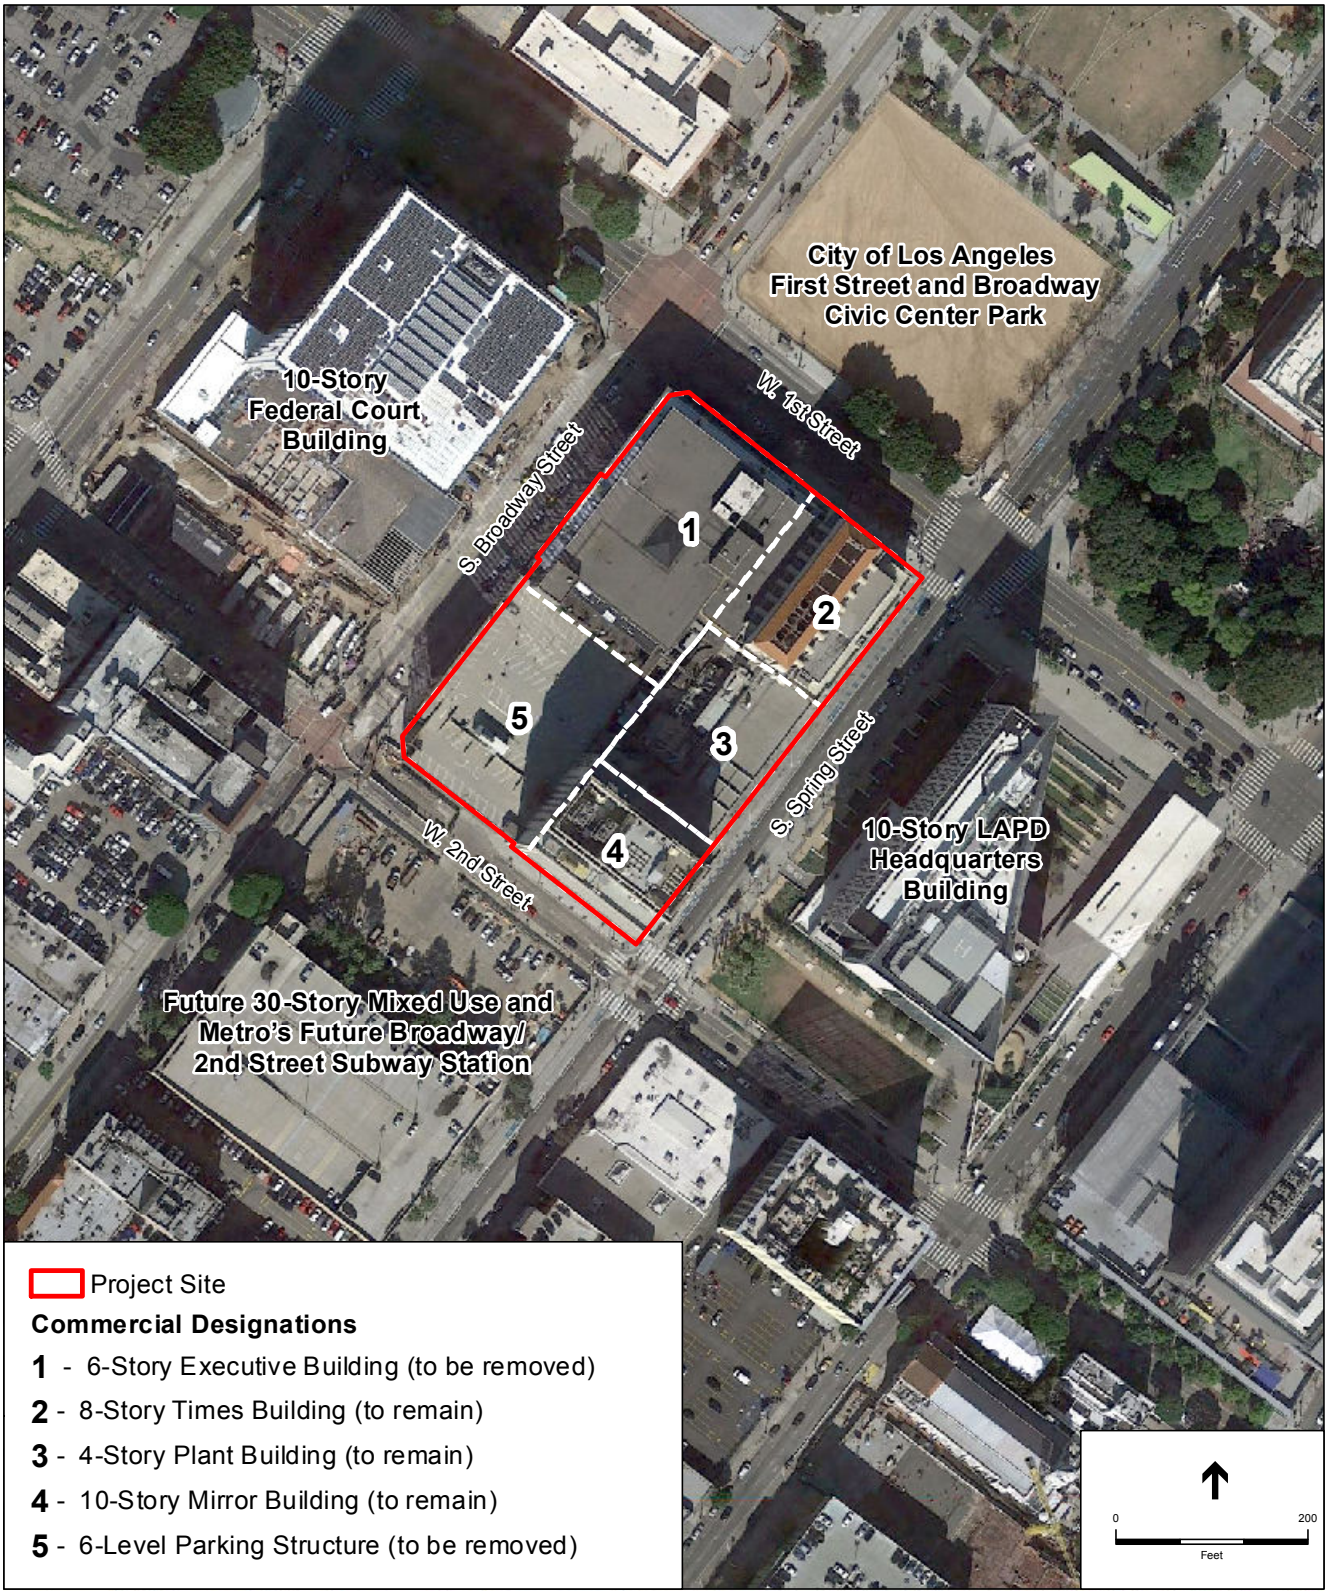

TABLE A-1
EXISTING LAND USES

Building	Use	Developed Floor Area (square feet)
Times	Office	**116,113**
Plant	Office	79,340
	Cafeteria	11,250
	Total Building Subtotal	***90,590***
Mirror	Office	**169,402**
Executive	Office	176,258
	Bank	7,500
	Total Building Subtotal	***183,758***
Total Floor Area		**559,863**

SOURCE: ESA PCR, 2017

The sidewalks adjoining the Project Site are landscaped with 29 uniform and young or mature California sycamore trees, although potted plants or planters are also provided along some sections of W. 1st Street, S. Spring Street, S. Broadway, and the corners of W. 1st Street and Broadway and W. 2nd Street and Broadway. Existing trees are discussed in detail in Subsection E.5, below.

Vehicle access to the existing parking structure is provided via a driveway on S. Broadway and a driveway on W. 2nd Street. These two driveways provide vehicle access for the Times, Executive, Plant, and Mirror Buildings, which all have interior connections to the parking structure. Driveways for interior shipping bays, waste collection, and other vehicle activity at the Mirror Building and Plant Building are located on W. 2nd Street (to the east of the previously described parking structure driveway), and on S. Spring Street. The loading dock driveway is on S. Broadway north of the parking structure driveway. Spring Street, a one-way, southbound roadway, contains a dedicated southbound bike lane. No parking is allowed along the curb lane, which is marked for bus transit and lined with benches and bus stops. Metered, on-street parking is provided along W. 1st Street and S. Broadway, both of which are two-way streets. Pedestrian light standards, consistent with the upright/double light theme throughout the Civic Center are provided on all four street frontages.

Times Mirror Square Project

Figure A-3

Existing On Site Uses

ESA PCR

The entire block was identified by SurveyLA, the citywide historic resources survey of Los Angeles. SurveyLA noted that the Times, Plant, and Mirror Buildings are listed in the California Register and evaluated the Executive Building as eligible for listing in the California Register and for designation as a Los Angeles Historic-Cultural Monument for its association with the growth and maturation of the Los Angeles Times as well as the career of Otis Chandler, who was the newspaper's publisher from 1960 to 1980.

2. Transit Access

Metro's Los Angeles Civic Center/Grand Park Station (Metro Station) is located approximately 750 feet to the northwest of the Project Site.

The Civic Center/Grand Park Station is a heavy rail subway station that serves two subway lines, the Red Line and Purple Line. The Red Line connects the Civic Center to Union Station, Hollywood, and North Hollywood. The Purple Line connects Union Station with the Wilshire/Western Station. The Red and Purple Lines provide further connection to three light rail transit lines serving downtown Los Angeles: the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station.

The Project Site is also located adjacent to Metro's future 2nd Street and Broadway Station, one of the three subway stations that are part of Metro's Regional Connector Project.[3] The Connector Project, a 1.9-mile subway segment, will extend from the Metro Gold Line Little Tokyo/Arts District Station to the 7th Street/Metro Center Station in downtown Los Angeles, with transfers to Blue, Expo, Red and Purple Lines, bypassing Union Station. The 1.9-mile alignment will serve Little Tokyo, the Arts District, Civic Center, the Historic Core, Broadway, Grand Avenue, Bunker Hill, Flower Street and the Financial District. From the Metro Gold Line, passengers will be able to travel from Azusa to Long Beach and from East Los Angeles to Santa Monica without transferring lines. Forecasted opening of the 2nd Street and Broadway Station is 2021. New stations include the Historic Broadway Station at W. 2nd Street and Broadway, adjacent to the Project Site; the Little Tokyo/Arts District Station at E. 1st Street and Central Avenue; and the Grand Avenue Arts/Bunker Hills Station at 2nd Place and Hope Street.

Several bus lines serve the vicinity of S. Spring Street and W. 1st Street, including LADOT's Dash Downtown "D" line, which travels a circuit from the City Hall area throughout the Downtown; Metro's Rapid Line 770, which travels to Union Station and El Monte to the east; Metro's Rapid Line 745, which travels between Downtown and Metro's Harbor Freeway Station; Metro's Rapid Line 733, which travels from the Civic Center to Santa Monica; and Metro's Rapid Line 728, which travels between Union Station and Century City. In addition, numerous local lines are located in the Project vicinity, including Metro's Bus Lines 2, 4, 10, 28, 81, 83, 90, 91, 94, and 302, which run northbound along Broadway and Lines 30, 33, 40, 45, 68, 83, 84, 92, and 330, which run southbound along Spring Street.

3 Los Angeles Metro, Regional Connector Transit Project, https://www.metro.net/projects/connector/. Accessed January 20, 2017.

The Project Site is also well located to allow pedestrian access to numerous county, state, and federal buildings in the Civic Center. The Project Site has direct access to Grand Park, which provides landscaped pedestrian pathways between City Hall, the Los Angeles Music Center, and other uses along Grand Avenue. It is also located a few blocks from Bunker Hill to the west, the City's Financial Center to the southwest, Little Tokyo and the Arts District to the east; and Union Station and Olvera Street to the north. Thousands of jobs within walking distance are represented by the surrounding combination of office towers, the Arts District, and the Civic Center, which constitutes the heaviest concentration of government employment outside of Washington D.C.[4] The Project Site is also served by dedicated bike lanes in southbound Spring Street and northbound Main Street.

3. Circulation

The Project Site is bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway. These four streets are part of the Downtown Los Angeles grid, and even for those streets extending beyond the City center, the heaviest traffic loads are in the vicinity of the Civic Center. In the Project area, W. 1st Street is a designated Modified Boulevard II in the City of Los Angeles Mobility Plan 2035, with a required right-of-way of 110 feet. To the west of the I-110 Freeway, W. 1st Street merges with W. 2nd Street to form Beverly Boulevard. To the east, E. 1st Street ends at Atlantic Boulevard in the City of Monterey Park. In the Project area, W. 1st Street's required half right-of-way would be 55 feet and comprise a 37-foot roadway and 18-foot sidewalk. In addition, the Downtown Design Guide requires an additional 6-foot private easement from the sidewalk public right-of-way.

S. Spring Street, which adjoins the Project Site to the east, is a designated Modified Avenue II and is required to have a right-of-way of 80 feet. To the south, S. Spring Street merges with S. Main Street in the vicinity of S. 9th Street. South Main Street continues south to the City of Carson. To the north, N. Spring Street merges with Caesar Chavez Avenue to the north of the US-101 Freeway. South Spring Street's required half right-of-way in the Project Area would be 40 feet, and would comprise a 26-foot roadway and 14-foot sidewalk. In the Project area, S. Spring Street operates as a one-way, southbound highway, with a dedicated bike lane.

Adjoining the Project Site to the south, 2nd Street is a designated Modified Avenue III and is required to have a right-of-way of 74 feet. To the west at Hill Street, W. 2nd Street passes under the 2nd Street tunnel below Bunker Hill, emerging in the vicinity of Figueroa Street. To the east, E. 2nd Street terminates prior to the railyards and the Los Angeles River. In the Project area, W. 2nd Street's half right-of-way would be 37 feet, and would comprise a 26-foot roadway and 14-foot sidewalk.

Broadway, adjoining the Project Site to the west, is a designated Modified Avenue II and is required to have a right-of-way of 80 feet in the Project area. To the south, S. Broadway follows the Harbor Freeway (I-110) to the approximate vicinity of the San Diego Freeway (I-405), where

4 LA Metro, 2nd St./ Broadway Station, https://www.metro.net/projects/connector/2nd-stbroadway-station/. Accessed January 23, 2017.

is merges with Main Street. To the north, N. Broadway terminates in the community of Lincoln Heights. In the Project area, S. Broadway's half right-of-way would be 40 feet and would comprise a 28-foot roadway and 12-foot sidewalk. In addition, the Downtown Design Guide requires an additional 5-foot private easement from the sidewalk public right-of-way.

D. Planning and Zoning

1. Central City Community Plan

The Project Site is located within the Central City Community Plan area and is designated as Regional Center Commercial. The General Plan Framework designates the entire Central City area as a Downtown Center. Other Planning efforts described in the Central City Community Plan are the Downtown Strategic Plan, the Los Angeles Civic Center Shared Facilities and Management Plan, and Angel's Walk. The Downtown Strategic Plan recognizes the need to significantly increase the residential presence in the Central City community.[5] Angel's Walk is a plan to link transit and pedestrian districts of historic Downtown and ties public investment in bus and rail transit to urban design improvements that make the City attractive to pedestrians.[6] Los Angeles Civic Center Shared Facilities and Management Plan proposes a plan that would induce both economic and environmental benefits by defining the boundaries of the Civic Center as the distance an average person can walk in 10 minutes. Beginning at City Hall, the Angel's Walk area encompasses the Project site Little Tokyo, El Pueblo de Los Angeles, Union Station, the Music Center, Bunker Hill, and Pershing Square.[7] Primary issues presented in the Central City Community Plan are the need to increase housing for all incomes, particularly middle income households; the lack of sufficient housing investment; and the lack of neighborhood businesses to support residential uses.[8] Community Plan Objectives 1-2 and 1-3 are to increase the range of housing choices available to Downtown employees and residents and to foster residential development which can accommodate a full range of incomes.

2. Zoning

The Project Site is zoned Commercial (C2-4D-SN), which permits general commercial and multi-family residential uses. The 4D Height District establishes a Floor Area Ratio (FAR) of 6.0:1, but does not specifically limit building heights.

The SN designation indicates a Signage Supplemental Use, in this case the Historic Broadway Supplemental Sign Use District.[9] The Historic Broadway Supplemental Sign Use District, which applies to S. Broadway between W. 1st Street and W. 12th Street, regulates signage that cannot otherwise be provided for in the underlying C2 zone. The Supplemental Sign Use District allows signage programs that complement and protect the character-defining features of historic

8 Op. Cit, page I-14.
9 The Historic Broadway Sign Supplemental Use District was adopted by City Council, January 20, 2016, under ZI No. 2457.

buildings, encourage new infill investment on Broadway on vacant and underutilized sites, support strong pedestrian activity, reduce blight along the corridor, encourage economic development, and encourage the revitalization of the Broadway Theater and Entertainment District.

The Project Site is also located within the Central City TFAR area, Greater Downtown Housing Incentive Area, Downtown Adaptive Reuse Area, Downtown Design Guide Project area, and the Central City and Downtown parking districts.

The Downtown TFAR designation allows for the transfer of floor area rights from a donor site to increase FAR over the existing zoning designation. The Greater Downtown Housing Incentive Area was established to encourage new, economically diverse urban infill housing.

The Downtown Adaptive Reuse Area designation encourages the adaptation of an economically obsolete building for a more productive purpose through the provision of incentives and certain waivers. The Downtown Design Guide Project establishes context-sensitive street standards that emphasize walkability, sustainability and transit options, and urban design standards to reinforce the community character of Downtown. The Central City and Downtown Parking Districts designation establishes a ratio of parking for residential and commercial uses that reflects the area's greater access to multi-modal transit and lower per capita automobile use.

3. Transit Priority Area

City of Los Angeles Department of Planning, Zoning Information (ZI) File No. 2452 was developed in response to Senate Bill (SB) 743, to allow for transit priority areas (TPAs) and exemptions to aesthetics and parking evaluations within TPAs pursuant to CEQA. Specifically, Section 21099 (d)(1) of the Public Resources Code (PRC) states that a project's aesthetic and parking impacts shall not be considered a significant impact on the environment if (1) the project is a residential, mixed-use residential, or employment center project, and (2) the project is located on an infill site within a transit priority area. PRC Section 21099 defines the criteria for an employment center, infill site, and TPAs. Specifically, "infill site" is defined as a location within an urban area that has been previously developed, or a vacant site where at least 75 percent of the perimeter of the site adjoins an improved public right-of-way. "TPAs" are defined as areas within one-half mile of a major transit stop that is existing or planned. A "major transit stop" is defined as a site containing an existing rail transit station or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. Under ZI File No. 2452, a project shall be considered to be within a TPA if all parcels within the project have no more than 25 percent of their area farther than one-half mile from the major transit stop. The "Citywide Transit Priority Areas" map contained in ZI File No. 2452 illustrates overlapping TPAs within Downtown Los Angeles.

Because the Project comprises mixed uses including residential uses, and the Project Site is a previously developed "infill" site located within 750 feet of Metro's Los Angeles Civic Center/Grand Park Station and directly across W. 2nd Street from Metro's 2nd Street and Broadway Station (currently under construction), the Project meets the criteria of SB 743 and ZI File No. 2542. As discussed in ZI File No. 2542, visual resources, aesthetic character, shade and

shadow, light and glare, and scenic vistas, and any other aesthetic impact as defined in the City's CEQA Threshold Guide shall not be considered an impact, unless evaluation is required under other land use regulations of the Municipal Code.

4. Other Applicable Plans

Los Angeles Enterprise Zone

The Project Site is designated as an Enterprise Zone/Employment and Economic Incentive Program Area (EZ), shown in the City's Zoning Information and Map Access System (ZIMAS) as the Los Angeles State Enterprise Zone.[10] EZs are geographic areas designated by City Council Resolution, with approval by the California Department of Commerce under either the Enterprise Zone Act Program or Employment and Economic Incentive Act Program. Under this designation, federal, state, and city governments may provide economic incentives to stimulate local investment and employment through tax and regulation relief and improvement of public services. As listed in LAMC Section, 12.21-A,4(x)(3), the EZ program allows for lower parking ratios for commercial office, business, retail, restaurant, bar and related uses, trade schools, or research and development buildings.

Greater Downtown Housing Incentive Area

The Project Site is located within the Greater Downtown Housing Incentive Area, which under Los Angeles Zoning Information File ZI No. 2385 (Ordinance No. 179,076) modifies several Municipal Code requirements for projects within the Greater Downtown. Adopted in 2007, the purpose of the Greater Downtown Housing Incentive Area is to provide incentives to produce housing in the designated area. Within the boundaries of the Greater Downtown Housing Incentive Area, the maximum unit per lot area was eliminated and density is unlimited (within the relevant FAR). No yard requirements apply except as required by the Urban Design Standards and Guidelines, prepared by the Community Redevelopment Agency and approved by the City Planning Commission. The Buildable Area is the considered the same as Lot Area and the percentages of private and common open space were eliminated. However, the total per unit open space requirement shall still be provided.

Downtown Streetcar Project Area

The Downtown Streetcar Project Area consists of the construction and operation of streetcar service in downtown Los Angeles, along a 3.8-mile one-way loop. The Project alignment route would begin at 1st Street and Broadway and proceed south, turn west on 11th Street, north on Figueroa, and east on 7th Street, north on Hill Street, back to its beginning at 1st Street. Potential inclusion of a Grand Avenue extension would also provide a two-way alignment spur. All applicants seeking Planning clearance are required to obtain approval from the Bureau of Engineering Streetcar Division to ensure that all construction activity, utility installation and/or

[10] City of Los Angeles Department of City Planning, Zoning Information and Mapping Access System (ZIMAS), Parcel Profile Report: 202-220 W. 1st Street. Generated January 25, 2017.

utility relocation in the public right-of-way shall not conflict with the Downtown Streetcar Project.[11]

Downtown Design Guide

The Downtown Design Guide document is intended to provide guidance for creating a livable and more sustainable Downtown community. The Design Guide places an emphasis on walkability and the making of great streets, districts and neighborhoods. More specifically, the Design Guide focuses on the relationship of buildings to the street, including sidewalk treatment, character of the building as it adjoins the sidewalk, and connections to transit. The Design Guide notes that these key features provide high quality development at a human scale, when paired with the details of a project in the first 30-40 vertical feet. Specific topics that the Design Guide addresses include: Sustainable design; Sidewalks and setbacks; Ground floor treatment; Parking and access; Massing and street wall; On-site open space; Architectural detail; Streetscape improvements; Signage, Public art and; Civic and cultural life. As shown on Figure 1-1, of the Design Guide, the Project Site is located within the Civic Center South District.

Redevelopment Area

It is noted that the Project Site is adjacent to the City Center Redevelopment Project area, which incorporates the Historic Downtown, South Park, and City Markets subareas. The City Center Redevelopment Project area is located to the south of 2nd Street, just to the south of the Project Site. As such, it is not applicable to the Project Site.

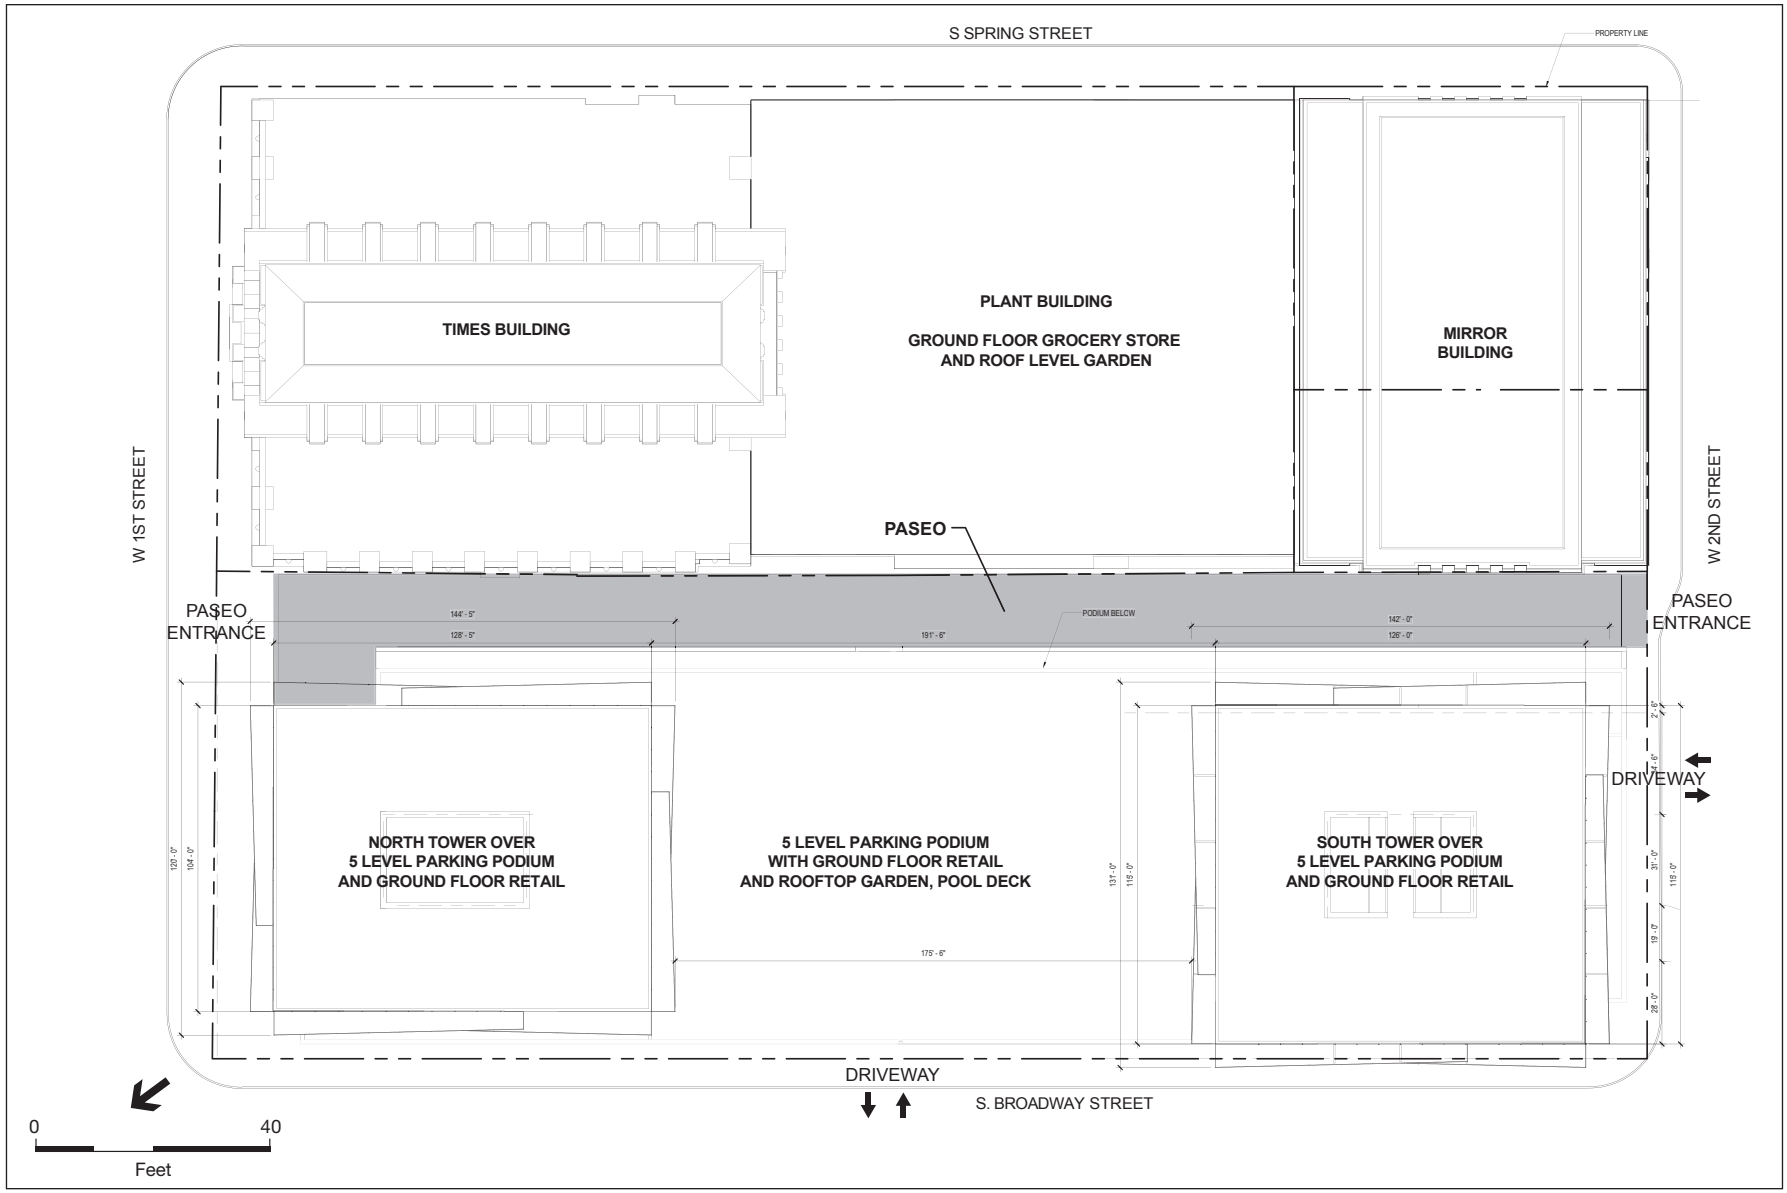
E. Description of Proposed Project

1. Design and Architecture

The Project layout and relative location of Project components are illustrated in **Figure A-4**, *Project Site Plan*. As shown in Figure A-4, the Times, Plant, and Mirror Buildings, which would be preserved, are located along the S. Spring Street frontage. The Executive Building and parking structure would be demolished, and the new North Tower and South Tower would replace these structures along the S. Broadway frontage. The proposed Paseo would separate the existing Times, Plant, and Mirror Buildings from the new towers and intersect the Project Site between the W. 1st Street and W. 2nd Street sidewalks. **Figure A-5**, *Simulated Aerial View of the Project from the Northeast*, provides a conceptual drawing and approximate scale with respect to the Project's Downtown Los Angeles setting. As shown in Figure A-5, the Times Building would regain its original visual character along W. 1st Street by removing the Executive Building, which currently abuts and extends over the Times Building's west façade. The fifth and sixth stories of the Times Building have been altered by rooftop additions dating from the 1940s and 1960s. These alterations would be reversed, with the intent of restoring the original 1935 design. As shown in **Figure A-6**, *Level 6 – Office Terrace*, the mechanical equipment that currently occupies the rooftop of the four-story Plant Building would be relocated and replaced with an office

[11] City of Los Angeles, Zoning Information File ZI-2450, Downtown Streetcar Project, http://zimas.lacity.org/documents/zoneinfo/ZI2450.pdf.

terrace. The office terrace would provide conference/presentation and break space for office employees of the Times/Plant/Mirror Buildings and would not be available to the general public. Views of the office terrace would be visible from surrounding structures higher than four stories, including, but not limited to, the proposed Project to the west, north, and south, City Hall to the northeast, Los Angeles Police Department Headquarters to the east, and the future 232 W. 2nd Street Project to the south. **Figures A-7** through **A-10** show the historic, existing, and future views of the Project Site from 1st Street, 2nd Street, and Broadway. **Figures A-11** through **A-13** show the existing ground level view at 1st Street and the future views of the ground level at 1st Street and the Paseo. **Figures A-14** and **A-15** show the existing and future views at Spring Street.



A key design objective of the Project is to provide a full retail and service base at street level along all four edges of the Podium, including 1st Street, Broadway, 2nd Street, and the Paseo. The four frontages would provide high-quality, interconnected streetscape environments. The design includes articulated retail facades, the use of cantilevered canopies to define retail entries, and landscaping that buffers the scale and height of the new buildings and enhances the pedestrian experience.

The intersection of 1st Street and Broadway provides a gateway to the Civic Center. The design responds by creating an activity-centered place for pedestrians at this corner incorporating retail, shops and restaurants, and the portal entrance to the Paseo. The Paseo, with clearly defined landscaped entrances at 1st and 2nd Streets, provides a pedestrian corridor connecting the Project Site with adjacent areas. With landscaping, benches, pavement treatment and adjacent retail shops, the tree-lined Paseo would facilitate pedestrian use and provide aesthetic and visual relief. Open Space and Landscaping for the Project is discussed in detail in Section 5 of this document.

Key design strategies of the Project include:

- Rehabilitating and reusing the Times, Plant, and Mirror Buildings to add new useful life to the buildings and to benefit the Civic Center and the City through historic preservation;
- Providing architecture and design for new construction that is cohesive with and complements the architecture of the rehabilitated Times, Mirror, and Plant Buildings;
- Strengthening existing and new pedestrian connections and streetscapes through the use of wider sidewalks, landscape, street trees, street furniture, lighting and signage;
- Providing pedestrians a safe, accessible, comfortable and interesting walking space, that includes open space, landscaping and public art;
- Incorporating sidewalk-oriented uses and an urban Paseo to enhance the pedestrian experience, provide pedestrian interaction, and provide pedestrian gathering places and destination points at the corners of the Project Site;
- Using street lighting and architectural lighting to enhance building features, safety and the pedestrian experience.

The Moderne style reflected in the architecture of the Times and Mirror Buildings incorporates the principles of geometric shapes characterized by smooth lines, streamlined forms, strong compositional gestures, horizontal lines, vertical and punched expressions, mass and volume; a base, body and top formal expression, as well as symmetrical and asymmetrical gestures.

The architecture and design of proposed new development is intended to complement to the Moderne style of the existing buildings. The scale of the Podium supporting the new residential towers would be articulated with a contemporary base, body, and rooftop. The Podium would incorporate solid and transparent glazed materials and strong compositional features, punched and vertical articulation, and mass, to complement the architecture of the existing Times, Mirror, and Plant Buildings, which are to be rehabilitated. The solid portions of the Podium base would incorporate similar materials, textures, and color values to the Mirror Building to visually link the entire development.

The residential towers, which would exhibit prominent window elements, would rise from the Podium and incorporate external balconies for residential units on all four sides of each tower. The architecture of the towers would incorporate horizontal and vertical features that would complement the Moderne architectural style of the existing Times, Plant, and Mirror Buildings.

2. Times, Plant, and Mirror Buildings Rehabilitation

Under the Project, the Times Building, Plant Building, and Mirror Building would be rehabilitated and adaptively re-used. The three buildings, which have a total floor area of approximately 376,105 square feet, currently include office and cafeteria uses, and are aligned along S. Spring Street, with frontages along both W. 1st Street and W. 2nd Street. Under the Project, there would be approximately 285,088 square feet of commercial office uses, approximately 41,017 square feet of commercial restaurant uses, and an approximately 50,000 square-foot grocery store. Although the total floor area of 376,105 square feet and the proportional mix of commercial uses would not change, the Project would allow flexibility in how the uses are allocated among the three existing buildings. The three historic buildings would be separated from the west side of the block by the Paseo.

After the Executive Building and parking structure are removed, the lower floors of the western facades of the Times, Plant, and Mirror Buildings would be compatible with the historic character of the three existing buildings, but distinguishable as new.

The interiors of all three historic buildings have been heavily altered over time. The two original and architecturally distinctive interior spaces, the lobbies of the Times Building and Mirror Building, would be preserved. The upper floors contain little if any historic fabric, as it was removed as a result of past structural improvements and office modernizations. The upper floors would be reconfigured for office tenants, if required. The exteriors of all three buildings would be cleaned and repaired as necessary.

Times Building

The rehabilitation of the Times Building would involve reconstruction of the upper floors of the west elevation, which abuts the Executive Building. The reconstruction would be based upon the original plans of the Times Building as well as extant physical evidence. Likewise, the rooftop addition on the fourth story of the east elevation would be removed and the elevation restored to its original character. Thus, the original massing and stepped-down form from the clock tower would be reinstated. The Times Building would continue to be used as an office building.

Plant Building

On the ground level, the original loading docks would be reopened for the proposed grocery store or other commercial use[12] with access to both S. Spring Street and the Paseo. The upper stories would be rehabilitated and used for offices. As shown in Figure A-6, the existing mechanical equipment on the roof of the Plant Building would be relocated and reconfigured for an office terrace, which would be used by office tenants. This area would provide conference/presentation areas and eating/break areas and would not be accessible to the general public. The western façade of the building would remain unchanged.

Mirror Building

The Mirror Building would be rehabilitated and continue to be used as an office building. The exterior of the building would be cleaned and repaired as necessary. As discussed above, the lobby area would be preserved. The west side of the building, which currently provides connections to the existing parking structure, would be altered by the demolition of the parking structure. This side of the building would be evaluated and reconstructed for compatibility with the historic character of the three existing buildings, but distinguishable as new.

Project elevations illustrating the exterior of the Times, Plant, and Mirror Buildings are available in Section 4, Figures A-16 through A-19, of this chapter. **Table A-2**, *Proposed Uses within the Times, Plant, and Mirror Buildings*, shows the proposed land uses and developed floor area for the rehabilitated buildings.

TABLE A-2
PROPOSED USES WITHIN THE TIMES, PLANT, AND MIRROR BUILDINGS

Land Use	Developed Floor Area (sf)
Office	285,088 sf
Ground-floor Restaurant	18,817 sf
Upper-floor Restaurant	22,200 sf
Grocery Store	50,000 sf
Proposed Adaptive Reuse Floor Area	**376,105 sf**

SOURCE: ESA PCR, 2017

3. North and South Towers

The Project's North Tower and South Tower mixed-use components would be constructed on the western side of the Project Site in the area currently occupied by the 6-story Executive Building at the corner of W. 1st Street and S. Broadway and the 6-story parking structure at the corner of W. 2nd Street and S. Broadway. The North Tower would be constructed near W. 1st Street and S. Broadway, and the South Tower would be constructed near W. 2nd Street and S. Broadway. The Towers would be constructed over a 5-story Podium and, from street grade, the North Tower

12 As described, although the total floor area of approximately 376,105 square feet and the proportional mix of commercial uses would not change, the Project would allow flexibility in how the uses are allocated among the three existing buildings.

would rise 37 stories or approximately 495 feet above grade. The South Tower would rise 53 stories or approximately 665 feet above grade.

Table A-3, *Proposed New Development*, below, summarizes the number of proposed residential units, open space, and retail floor area associated with the North and South Towers. As shown in Table A-1, the North Tower would contain 450 residential units and the South Tower would contain 677 residential units, for a total of 1,127 residential units. Total residential floor area within the two towers would be approximately 1,071,692 square feet. With the addition of open space amenities, lounges, loading areas, and retail uses, total new construction would amount to 1,135,803 square feet.

TABLE A-3
PROPOSED NEW DEVELOPMENT[a]

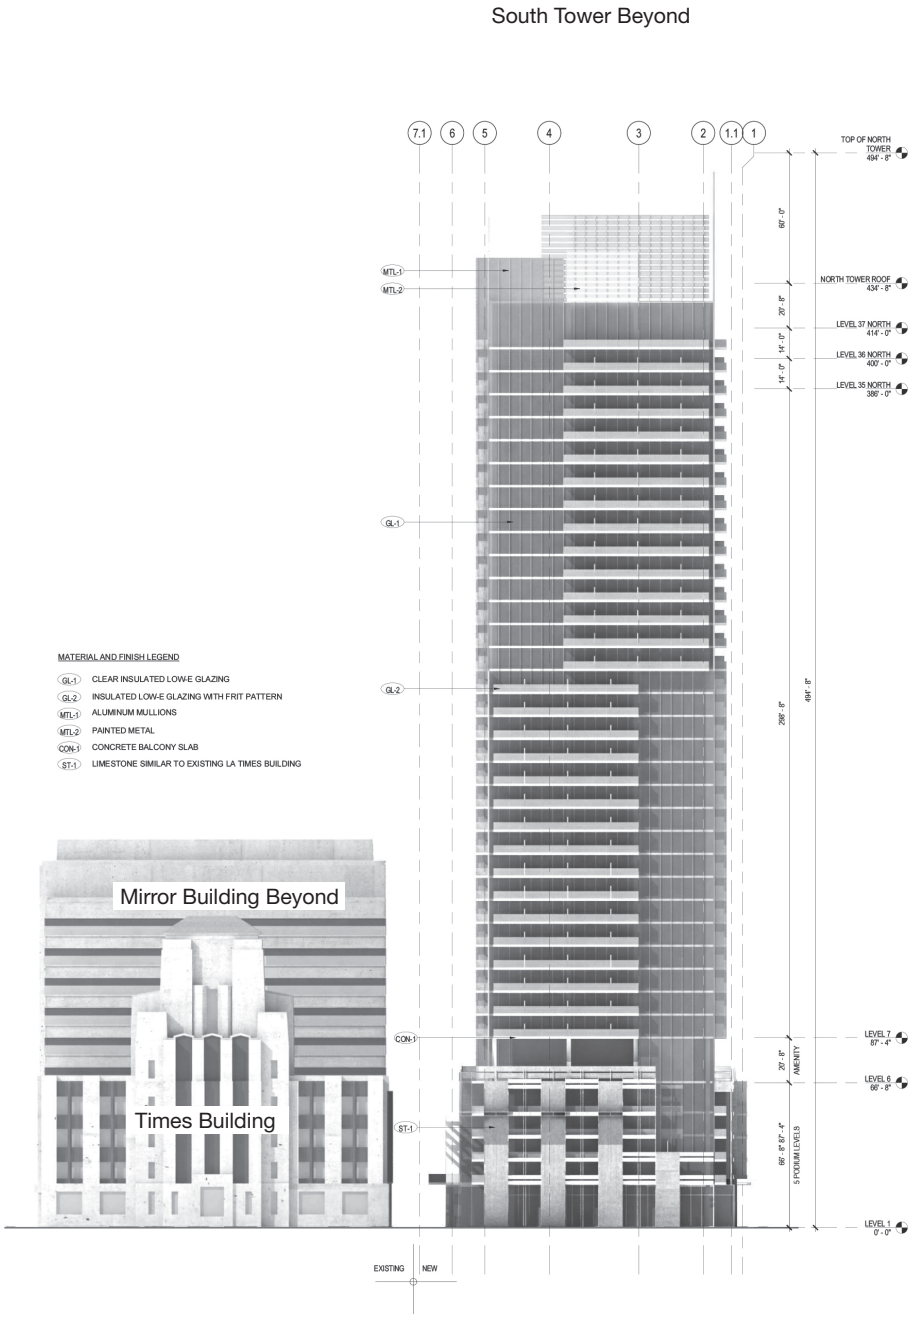
[a] Available for public use

SOURCE: AC Martin, Plans for Onni Times Square, 2017

The towers would include approximately 34,572 square feet of retail uses, which would be located at ground level and oriented to W. 1st Street, S. Broadway, and W. 2nd Street, while also fronting the Paseo. The Paseo would be constructed along the east edge of Tower A and Tower B, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. The open-to-the-sky Paseo would accommodate pedestrian and shopper access through the block, as well as provide an open vista toward Civic Center Park and the First and Broadway Civic Center Park, which is under construction to the north. The Paseo would also serve to physically and visually separate the towers from the original Times, Plant, and Mirror Buildings. Project elevations illustrating the exteriors of the North and South Towers are provided in Section 4, in Figures A-15 through A-18, of this chapter.



As also shown in Table A-3, open space amenities available to residents of the North and South Towers include an approximately 28,777-square-foot residential terrace (Residential Terrace) on the rooftop of the five-story Podium (Level 6). The Residential Terrace is represented in Figure A-22, *Level 6 – Residential Terrace*, below. The Residential Terrace, which is located on the rooftop of the Podium between the North and South Towers, would be open to sky and provide approximately 7,700 square feet of landscaping, a pool deck, a dog run, cabanas, steam room and sauna, and other amenities such as dining tables and fire-side seating. As shown in Table A-1, the Project would provide other amenities at the 6th floor level, as well as ground-floor lounges in each of the tower buildings. These amenity areas are expected to include a gym, club rooms, meeting rooms, film screening room, private dining, and potentially other common areas to serve residents.

Approximately 73,128 square feet of common open space, including the approximately 15,708-square-foot Paseo, would be provided as part of the North and South Towers component. Of the common open space, only the Paseo is available for public access. The remaining 57,420 square feet are provided as common use for the Project's residents. With the addition of approximately 56,349 square feet of private balconies, combined private and common open space would be approximately 129,477 square feet.

4. Project Elevations

Project elevations are provided in Figures A-16 through A-19. The elevations illustrate the relative scale of the Project and the relationship between the rehabilitation component (Times, Plant, and Mirror Buildings) and the North and South Towers. **Figure A-16**, *North Elevation as Viewed from W. 1st Street*, illustrates the Project as it would be viewed from the north, including Grand Park and the City's Civic Center Park. In this elevation, the 37-story North Tower and the 8-story existing Times Building would appear in the foreground, while the upper stories of the 53-story South Tower would appear in the background. Similar to existing conditions, the 10-story Mirror Building would be visible behind the Times Building.

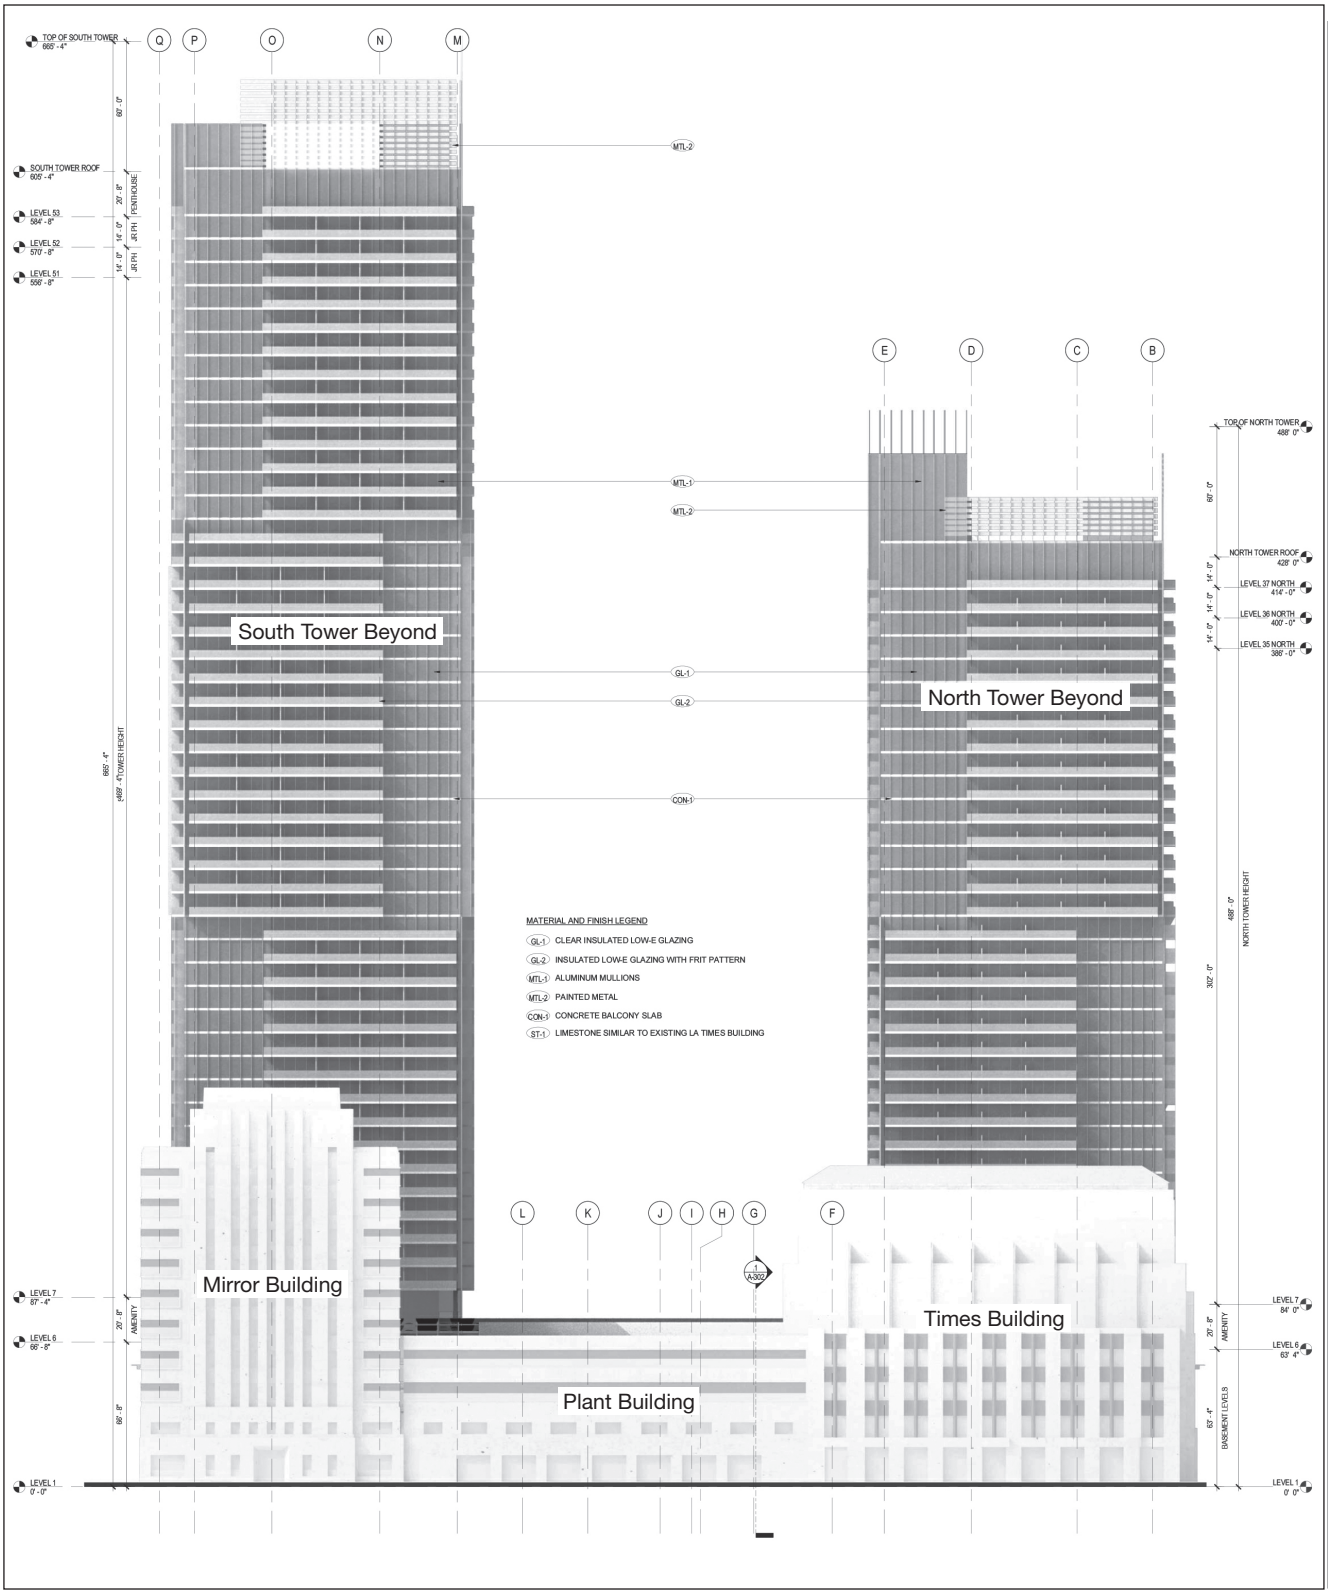
Because of the setback and open space afforded by Grand Park and Civic Center Park, broad views of the Project would be available from land uses to the north of Spring Street, including City Hall, civic buildings lining Civic Center Park, the Los Angeles Music Center, and uses to the north of the Hollywood Freeway.

SOURCE: AC Martin Partners, Inc, 2017

Times Mirror Square Project

Figure A-16

North Elevation as Viewed from W. 1st Street



ESA PCR

Figure A-16 also illustrates the architectural treatment of the North Tower, including the strong horizontal plane at the base of the building and horizontal features that define the vertical walls of the towers. This feature complements the distinctive vertical lines of the Times Building and balances the horizontal planes that define the Mirror Building. The Paseo running between W. 1st Street and W. 2nd Street would separate the Times Building from the North Tower and allow for the rehabilitation of the Times Building's west façade as viewed from the north.

Figure A-17, *East Elevation as Viewed from S. Spring Street*, illustrates the appearance of the Project as viewed from the area to the east of S. Spring Street. The 10-story LAPD Headquarters Building would block most near, direct west-facing views of the Project. However, the Project's east elevation would be visible from the E. 1st Street and E. 2nd Street corridors, from City Hall Park, and from LAPD Headquarters' south plaza. In more distant views from the east, the Project would be a component of the City's skyline, with high-rise buildings in Bunker Hill and the City's Financial District forming the background. Because Bunker Hill and the Financial District are topographically higher than the Project Site, the Project would not obscure the City's existing high-rise profile. As shown in Figure A-17, the strong horizontal planes of the North Tower and South Tower would complement the distinctive horizontal planes of the lower Plant Building separating the two towers and the vertical planes of the Times Building and Mirror Building. The roof of the Plant Building in the foreground would be used as a garden seating area.

Figure A-18, *South Elevation as Viewed from W. 2nd Street*, illustrates the appearance of the Project as viewed from the area to the south. This elevation also illustrates the relative height differences between the 10-story Mirror Building and 53-story South Tower. In this elevation, the 53-story South Tower would obscure the 37-story North Tower. A proposed 30-story building just to the south of W. 2nd Street would block direct views of the Project Site from the south; however, the Project would be visible from the Metro's proposed 2nd Street/Broadway Station, planned just to the south across W. 2nd Street. It would also be highly visible through the S. Spring Street and S. Broadway corridors. The strong horizontal architectural component of the South Tower would complement the horizontal component of the Mirror Building. The proposed Paseo between W. 2nd Street and W. 1st Street would create a visual and physical separation between the South Tower and the Mirror Building.

Figure A-19, *West Elevation as Viewed from S. Broadway*, illustrates the appearance of the Project as viewed from the area to the west. The new 10-story Federal Court Building directly to the west, which is located at a relatively higher ground elevation, would block direct views of the Project Site from the west. However, the Project's South Tower would be visible through the W. 1st Street corridor and the North Tower would be visible through the W. 2nd Street corridor. The base of the two towers provide a strong horizontal component, which forms a continuous retail street front between W. 1st Street and W. 2nd Street. Ground-level retail uses would be located in the 5-level Podium, which occupies the length of the block between W. 1st Street and W. 2nd Street. The roof of the Podium would provide space for an open garden, pool deck, and other recreational amenities for tower residents. The separation between the towers created by the lower 5-level Podium and the 4-story Plant Building in the background would allow light and visual relief from the mass of the North and South Towers, as viewed from the Federal Court Building and other uses to the west.

5. Open Space and Landscaping

Figures A-6, A-20, A-21, and A-22 illustrate proposed landscaping and open space associated with the Proposed Project. **Figure A-20**, *Ground Level Overall Landscape Plan*, shows that the overall landscape plan at the ground level. There are 29 existing California Sycamores, nine trees along W. 1st Street, 7 trees along S. Broadway, and 13 trees along Spring Street, and all would remain in place under the Project. The Project would add an additional four California Sycamores along W. 1st Street to create a double row near the corner of W. 1st Street and S. Broadway. In addition, the Project would add six California Sycamores along S. Broadway to fill in the existing trees on S. Broadway and create a continuous line of California Sycamores along the street edge. The Project would also add three additional California Sycamores along S. Spring Street and four California Sycamores along W. 2nd Street. The Project would plant two trees, Sweet Shade (*Hymenosporum flavum*), at the corner of S. Broadway and W. 2nd Street. The Sweet Shade tree is generally smaller than the California Sycamore but produces clusters of fragrant yellow flowers. Groups of Sweet Shade trees, a total of approximately twenty-five in all, would be planted along the pedestrian Paseo, which bisects the Project Site passing from W. 1st Street to W. 2nd Street.

As shown in Figure A-20 and **Figure A-21**, *Paseo and Outdoor Cafe*, the Paseo would be lined with an outdoor café, food court, and retail uses. Decorative pavement would be installed along W. 2nd Street and W. 1st Street, leading to the Paseo entrance, which would also be similarly paved. Bench planters, public art, bicycle parking, and trees would be located throughout the Paseo, as well as at the corners of W. Broadway and W. 2nd Street. The Paseo would also allow views to Civic Center Park immediately to the north of W. 1st Street. With the proposed landscaping, benches, public art, bicycle parking, pavement treatment, and adjacent retail shops, the tree-lined Paseo would facilitate pedestrian use and provide aesthetic and visual relief.

Figure A-22, *Level 6 – Residential Terrace*, illustrates open space amenities at the roof level of the five-story Podium. This area, which would be used by residents of the North Tower and South Tower, is represented by the setback between the North Tower and the South Tower, shown in Figure A-19, above. The base of the North Tower would be set back from the street edge of the Podium. The setback area would be accessible as a walkway and feature a line of approximately twenty laurel trees along the base of the North Tower, from the pool deck toward W. 1st Street.

Several fruitless olive trees would be planted behind the laurels at the pool deck. As also shown in Figure A-22, approximately twelve Golden Italian Cypress leading from the row of laurels (to the left of the laurels in the Level 6 - Residential Terrace) would be planted along the edge of the rooftop. To the north of the rooftop dog run, these would be backed by a group of After Dark Peppermint trees. A similar grouping would also be planted along the east edge of the Podium, overlooking the ground-level Paseo. Other groups of trees, as shown in Figure A-22, would be planted throughout the Podium rooftop. The trees on the Podium roof would enhance to the visual character of the Project as viewed from S. Broadway and the Paseo. Reductions in water demand for irrigation would be achieved through drought-tolerant/California native plant species selection and artificial turf, landscape contouring to minimize precipitation runoff, irrigation system efficiency, alternative water supplies (e.g., stormwater retention for use in landscaping), smart irrigation systems (e.g., weather-based controls), and water-saving pool equipment.

6. Parking

Table A-4, *Parking Requirements*, presents the LAMC parking requirement and the proposed parking for each of the Project's land uses, including the commercial uses and grocery store associated with the rehabilitated Times, Plant, and Mirror Buildings, and residential and retail uses within the North Tower and South Tower. The residential component consists of 90 studio units, 546 one-bedroom units, 484 two-bedroom or one-bedroom-with-den units, 4 three-bedroom units, and 3 penthouse units for a total of 1,127 units. As shown in Table A-4, the LAMC would require 1,250 vehicle parking spaces for the Project's residential component. The Project's total 410,677 square feet of commercial floor area would require approximately 411 parking spaces. Overall parking required for residential and commercial uses pursuant to the LAMC would total 1,661 parking spaces.

TABLE A-4
PARKING REQUIREMENTS

Use	Parking/Unit	No. of Units or Area	Required Parking
Residential			
Residential Parking 3 Habitable Rooms or Less	1.00	636 Units	636
Residential Parking More than 3 Habitable Rooms	1.25	491 Units	614
Subtotal Residential Parking Required			**1,250**
Residential Short and Long Term Bicycle Parking			1,240
Commercial			
Required Retail Parking New Building	1/1,000 SF	34,572 SF	35
Required Restaurant Parking Rehabilitated Building	1/1,000 SF	41,017 SF	41
Required Grocery Parking	1/1,000 SF	50,000 SF	50
Required Office Parking	1/1,000 SF	285,088 SF	285
Subtotal Commercial Parking Required	**1/1,000 SF**	**410,677 SF**	**411**
Commercial Short and Long Term Bicycle Parking			34
Total LAMC Required Parking			**1,661**

SOURCE: AC Martin Plans for Onni Times Square, 2017.

As shown in **Table A-5**, *Parking Provided*, the Project would provide 1,240 bicycle parking spaces for the residential uses and 34 bicycle parking spaces for the commercial uses. The Project is designed for approximately 1,744 vehicle parking spaces in the five-level above-ground Podium and nine-level subterranean parking structure. The entrance and exit to the residential and retail parking would be located on S. Broadway and W. 2nd Street. There would also be a loading dock entrance and exit on Broadway, north of the residential/retail driveway.

TABLE A-5
PARKING PROVIDED

Location	Residential	Retail/Office	Retail/Grocery	Potential Spaces (Max.)
Podium Level 5	75			75
Podium Level 4	75			75
Podium Level 3	59		16	75

7. Sustainability

The new development associated with the Project would be designed to achieve the equivalent of the United States Green Building Council (USGBC) Leadership in Energy and Environmental Design (LEED) Silver Certification level for new buildings. The Project would be designed to meet the California Green Building Standards (CALGreen) Code, as adopted and amended by the City of Los Angeles, through the incorporation of green building techniques and other sustainability features, including those within the City of Los Angeles Green Building Code, where applicable. Some of the Project's key design features that would contribute to energy efficiencies include the use of glass/window areas for ventilation and daylight accessibility, use of recyclable materials for flooring and demisable partitions in limited amounts, green walls in some areas, low albedo (high reflectivity) color paving to reduce heat island effect, conduit for solar panels installed on roof deck areas pursuant to code requirements, and landscaping of courtyards and roof decks. Other building features would include such items as installation of energy-efficient lighting, heating, ventilation, and air conditioning (HVAC) systems that utilize ozone-friendly refrigerants; use of materials and finishes that emit low quantities of volatile organic compounds (VOCs); use of high efficiency fixtures and appliances; water conservation features;

and dedicated on-site recycling area. The Project's inclusion of bicycle parking, as discussed above, would encourage the use of alternative modes of transportation.

The Project would reduce outdoor potable water use by a minimum of 20 percent compared to baseline water consumption. Reductions would be achieved through drought-tolerant/California native plant species selection and artificial turf, landscape contouring to minimize precipitation runoff, irrigation system efficiency, alternative water supplies (e.g., stormwater retention for use in landscaping), smart irrigation systems (e.g., weather-based controls), and water-saving pool equipment.

In addition, to encourage carpooling and the use of electric vehicles by Project residents and visitors, the Project would designate a minimum of eight percent on on-site parking for carpool and/or alternative-fueled vehicles and shall pre-wire, or install conduit and panel capacity for, electric vehicle charging stations up to a maximum of 20 percent of onsite parking spaces.

CEQA Guidelines Appendix F

In accordance with CEQA Guidelines Appendix F, the EIR will provide further information as to energy conservation, energy implications, and the energy-consuming equipment and processes that would be used during Project construction and operation. Design features of the Project, energy supplies that would serve the Project and total estimated daily vehicle trips that would be generated by the Project will also be analyzed. In addition, while development of the Project would not be anticipated to cause the wasteful, inefficient, and unnecessary consumption of energy and would be consistent with the intent of Appendix F of the CEQA Guidelines, further analysis of the Project's consistency with Appendix F will also be provided in the EIR.

8. Lighting and Signage

New signage would be used for identification of ground level retail and restaurant businesses, building identification, and way finding. No off-site advertising signage is proposed. Street level commercial and restaurant signage would be similar to other signage along the street frontages in the area and, with regard to Broadway, would be consistent with the Historic Broadway Supplemental Sign Use District. The proposed buildings would include accent lighting to complement the building architecture. All lighting would be designed and located to be compatible with the architecture and landscaping of the Project, and would be directed on-site and shielded as appropriate to avoid light spill over onto adjacent properties. Pedestrian areas, including the Paseo, would be well lit for security. Existing light standards along all four street frontages, which are consistent with fixtures used throughout the Civic Center, would be retained. Lighting and signage would be developed in compliance with applicable LAMC requirements.

9. Security Features

The Project would incorporate a 24-hour/seven-day security program to ensure the safety of its residents and visitors. The Project would be designed in consideration of the City's "Design Out Crime" initiative to provide a project design that incorporates strategies from Crime Prevention through Environmental Design (CPTED).

Design strategies within the project design would include, but not limited to, the following:

- Secure access points would be limited and located in areas of high visibilities;
- Hallways and corridors would be straight forward with no dark corners, as possible;
- Outdoor areas would be exposed to windows and allow for natural surveillance;
- Clear transitional zones would be provided between public, semi-public and private spaces;
- Access key cards and cameras would be used; and
- Interior and exterior spaces would be well lit with proper signage to direct the flow of people and decrease opportunities for crime.

In addition, the following security measures would be implemented by the Project:

- Installing and utilizing a 24-hour security camera network throughout the underground and above-grade parking structure; the elevators; the common and amenity spaces; the lobby areas; and the rooftop and ground level outdoor open spaces.
- Maintaining all security camera footage for at least 30 days, and providing such footage to LAPD as needed.
- Controlling access to all building elevators, residences, and resident-only common areas through an electronic key fob specific to each user.
- Training employees on appropriate security policies for the Project's buildings. Duties of the staff would include, but would not be limited to, assisting residents and visitors with site access; monitoring entrances and exits of buildings; managing and monitoring fire/life/safety systems; and monitoring the property.
- Providing a 24-hour/seven-day security program for the Paseo.
- Access to commercial uses would be unrestricted during business hours, with public access discontinued after businesses have closed.

10. Anticipated Construction Schedule and Activities

The Project would be constructed in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023. The Project would require approximately 364,000 cubic yards of soil export and no fill would be required on the Project Site. Construction would be carried out pursuant to a construction management plan subject to review and approval by the City. The plan would include such items as street closure and detour information (if applicable), haul routes, and a staging plan, and would specify actions to reduce effects on the surrounding community. Construction hours would occur in accordance with LAMC requirements, which prohibit construction between the hours of 9:00 P.M. and 7:00 A.M. Monday through Friday, 6:00 P.M. and 8:00 A.M. on Saturday, and at any time on Sunday. The Project Site would be fenced during construction for security purposes with gate-controlled access.

11. FAR, Setbacks and Density

The Project's new development (approximately 1,135,803 square feet) combined with existing floor area to remain (376,105 square feet) would result in approximately 1,511,908 square feet of floor area. The overall FAR (floor area divided by land area) within the approximately 160,578 square-foot Project Site would be approximately 9.42:1. The Project Site is designated as Regional Center in the Central City Community Plan Land Use Map. Under Footnote 3 of the map, which is applicable to the Project Site's Regional Center designation, it indicates an FAR of 6:1 for the respective zoning (D) designation, "except with Transfer of Floor Area (TFAR) up to 10:1 or 13:1, respectively."[13]

The Project would provide 1,127 residential units, which on the approximately 160,578-square-foot site would represent one dwelling unit per 142.48 square feet of lot area, in exceedance of the City's highest density R5 zone (1 unit per 200 square feet of lot area). However, the location of the Project Site within the Greater Downtown Housing Incentive Area allows exemption from several Municipal Code sections, including density requirements. Within the boundaries of the Greater Downtown Housing Incentive Area, the maximum unit per lot area was eliminated and density is unlimited (within the relevant FAR).

No yard requirements apply except as required by the Urban Design Standards and Guidelines. Under the Downtown Design Guide, retail streets in the Project area (Civic Center South) from back of the required sidewalk, no setback is required adjacent to ground-floor retail, a project may be set back within the specified range of 0-5 feet.[14]

F. Necessary Approvals

It is anticipated that approvals required for the Project would include, but may not be limited to, the following:

1. Transfer of Floor Area Rights (TFAR) greater than 50,000 square feet of floor area for the transfer of 548,440 square feet of floor area from the Los Angeles Convention Center (Donor Site) to the Project Site (Receiver Site) (LAMC Sec. 14.5.6-B).
2. Vesting Conditional Use Permit to permit floor averaging within a unified development (LAMC Sec. 12.24-W,19).
3. Master Conditional Use Permit (MCUB) to permit the on-site and off-site sale and consumption of alcoholic beverages within the Project's commercial retail spaces (LAMC Sec. 12.24-W,1).
4. Vesting Tentative Tract Map for the merger and re-subdivision of the Project Site for condominium purposes (LAMC Sec. 17.15). The Applicant is requesting to provide parking

[13] City of Los Angeles Department of Planning, Central City Community Plan, General Plan Land Use Map (as of July 7, 2009) Footnote 3,

[14] City of Los Angeles, Downtown Design Guide, Table 3-1.

per LAMC requirements in lieu of the parking requirements under the Advisory Agency's Parking Policy for Condominiums.

5. Construction permits, including building, grading, excavation, foundation, and associated permits.
6. Haul Route Permit, as may be required.
7. Other approvals as needed.

ATTACHMENT B
Explanation of Checklist Determinations

I. Aesthetics

Senate Bill (SB) 743 [Public Resources Code (PRC) §21099(d)] sets forth new guidelines for evaluating project transportation impacts under CEQA, as follows: "Aesthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area (TPA) shall not be considered significant impacts on the environment." PRC Section 21099 defines a "transit priority area" as an area within 0.5 mile of a major transit stop that is "existing or planned, if the planned stop is scheduled to be completed within the planning horizon included in a Transportation Improvement Program adopted pursuant to Section 450.216 or 450.322 of Title 23 of the Code of Federal Regulations." PRC Section 21064.3 defines "major transit stop" as "a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods." PRC Section 21099 defines an "employment center project" as "a project located on property zoned for commercial uses with a floor area ratio of no less than 0.75 and that is located within a transit priority area. PRC Section 21099 defines an "infill site" as a lot located within an urban area that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins, or is separated only by an improved public right-of-way from, parcels that are developed with qualified urban uses. This state law supersedes the aesthetic impact thresholds in the 2006 L.A. CEQA Thresholds Guide, including those established for aesthetics, obstruction of views, shading, and nighttime illumination.

The related City of Los Angeles Department of City Planning Zoning Information (ZI) File ZI No. 2452 provides further instruction concerning the definition of transit priority projects and that "visual resources, aesthetic character, shade and shadow, light and glare, and scenic vistas or any other aesthetic impact as defined in the City's CEQA Threshold Guide shall not be considered an impact for infill projects within TPAs pursuant to CEQA."[1]

PRC Section 21099 applies to the Project. Therefore, the Project is exempt from aesthetic impacts. The analysis in this initial study (or in the EIR, if any aesthetic impact discussion is included), is for ***informational purposes only*** *and not for determining whether the Project will result in significant impacts to the environment. Any aesthetic impact analysis in this initial study (or the EIR) is included to discuss what aesthetic impacts would occur from the Project if PRC*

1 City of Los Angeles Department of City Planning, Zoning Information (ZI) File No. 2452, Transit Priority Areas (TPAs)/Exemptions to Aesthetics and Parking Within TPAs Pursuant to CEQA. Available at: http://zimas.lacity.org/

Section 21099(d) was not in effect. As such, nothing in the aesthetic impact discussion in this initial study (or the EIR) shall trigger the need for any CEQA findings, CEQA analysis, or CEQA mitigation measures.

Would the project:

a) Have a substantial adverse effect on a scenic vista?

No Impact. The Project Site is located within a highly urbanized area of Downtown Los Angeles in the Civic Center/Historic Core District. Visual resources in the Project vicinity include the Downtown Los Angeles skyline to the west and southwest, the historic Los Angeles City Hall, the recently rehabilitated and historic County Hall of Justice, and other historic and architecturally notable buildings in the area. While the Project's paseo would provide a view corridor toward Grand Park to the north, because the Project would introduce new buildings and increase overall density on the Project Site, it could have an effect on scenic vistas from some locations in the Project vicinity. However, the Project is a mixed-use residential and employment center project that would be located on an infill site within a Transit Priority Area.

Pursuant to SB 743 and ZI 2452, the Project would result in no impact to scenic vistas.

Notwithstanding the above and the exemption of the Project from aesthetic impacts under SB 743, the EIR will include a discussion of the Project's impacts under the City thresholds for informational purposes only. The impact conclusion for aesthetics is no impact.

b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings, or other locally recognized desirable aesthetic natural feature within a state scenic highway?

No Impact. The Project Site is not located within a City- or State-designated scenic highway or associated view corridor.[2,3] However, the Project Site and the surrounding Civic Center/Historic Core District contains historic and locally recognized desirable buildings and other features, such Grand Park. The introduction of new high-rise buildings may indirectly affect some of these scenic resources in the Civic Center/Historic Core and adjacent districts. However, the Project is a mixed-use residential and employment center project that would be located on an infill site within a Transit Priority Area.

Pursuant to SB 743 and ZI 2452, the Project would result in no impact to scenic resources.

Notwithstanding the above and the exemption of the Project from aesthetic impacts under SB 743, the EIR will include a discussion of the Project's impacts under the City thresholds for informational purposes only. The impact conclusion for aesthetics is no impact.

---

2 City of Los Angeles Department of City Planning, Mobility Plan 2035, Map A-5, https://planning.lacity.org/documents/policy/mobilityplnmemo.pdf. Accessed May 9, 2017.

3 State of California, Department of Transportation, Officially Designated State Scenic Highways, http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways. Accessed May 9, 2017

c) Substantially degrade the existing visual character or quality of the site and its surroundings?

No Impact. The Project would rehabilitate the existing Times Building, Plant Building, and Mirror Building, while demolishing and replacing the Executive Building, a glass and steel building on the northwest corner of the block designed by modernist William Pereira. New buildings would include a 37-story, approximately 495-foot-high North Tower and a 53-story, approximately 665-foot-high South Tower. The Project would alter the existing urban visual character of the Project Site and its surroundings by increasing the height and density of on-site development. However, the Project is a mixed-use residential and employment center project that would be located on an infill site within a Transit Priority Area.

Pursuant to SB 743 and ZI 2452, the Project would result in no impact to visual character or quality.

Notwithstanding the above and the exemption of the Project from aesthetic impacts under SB 743, the EIR will include a discussion of the Project's impacts under the City thresholds for informational purposes only. The impact conclusion for aesthetics is no impact.

d) Create a new source of substantial light or glare which would adversely affect daytime or nighttime views in the area?

No Impact. The Project Site is located within a highly urbanized area of Downtown Los Angeles within the Civic Center/Historic Core, which is characterized by moderate to high ambient nighttime artificial light levels. At night, surrounding development typically generates moderate to high levels of exterior lighting for loading dock, security, parking, signage, and some architectural lighting. Street lights and the limited nighttime traffic on local streets also contribute to the light levels in the area. The Project would further contribute to ambient nighttime illumination as the Project's new architectural lighting, security lighting, interior and outdoor lighting from residential and retail areas, and any illuminated signage is expected to increase light levels over existing conditions. In addition, the Project would introduce new building surface materials to the Project Site with the potential to generate glare. However, the Project is a mixed-use residential and employment center project that would be located on an infill site within a Transit Priority Area.

Pursuant to SB 743 and ZI 2452, the Project would result in no impact to light and glare.

Notwithstanding the above and the exemption of the Project from aesthetic impacts under SB 743, the EIR will include a discussion of the Project's impacts under the City thresholds for informational purposes only. The impact conclusion for aesthetics is no impact.

Shading impacts are influenced by the height and bulk of a building or structure, the time of year, the duration of shading during the day, and the proximity of shade-sensitive land uses or receptors. No residential outdoor areas, which are typically shade-sensitive,[4] are currently

[4] City of Los Angeles, L.A. CEQA Thresholds Guide (2006), page A.3-1.

adjacent to the Project Site. However, the Project vicinity is characterized by a number of shade-sensitive uses, including City Hall Park, Grand Park, the City's under-construction First and Broadway Civic Center Park, and the Caltrans Building's open space with seating. The new Federal Courthouse Building to the west relies heavily on natural light for daytime operation and may also be considered shade-sensitive.[5] Because the Project would increase the height of on-site development, it could have an impact on shade-sensitive uses. However, the Project is a mixed-use residential and employment center project that would be located on an infill site within a Transit Priority Area.

Pursuant to SB 743 and ZI 2452, the Project would result in no impact to shading.

Notwithstanding the above and the exemption of the Project from aesthetic impacts under SB 743, the EIR will include a discussion of the Project's impacts under the City thresholds for informational purposes only. The impact conclusion for aesthetics is no impact.

II. Agricultural and Forestry Resources

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment Project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

Would the project:

a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?

No Impact. The Project Site is located within the Civic Center/Historic Core of Downtown Los Angeles and is entirely developed with the several buildings including the Times Building, the Plant Building, the Executive Building, and a parking structure. No agricultural uses or related operations are present on the Project Site or in the surrounding highly urbanized area. Furthermore, the Project Site is not located on designated Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland) as shown on the maps prepared pursuant to the

[5] Skidmore, Owens, and Merrill, SOM's New L.A. Courthouse Needs Almost No Artificial Lighting During the Day (January 16, 2017), http://www.som.com/news/soms_new_la_courthouse_needs_almost_no_artificial_lighting_during_the_day. Accessed January 24, 2017.

Farmland Mapping and Monitoring Program.[6] Since the Project would not convert farmland to non-agricultural uses, there would be no impact. No further analysis of this topic in the EIR is required and no mitigation measures are required.

b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?

No Impact. The Project Site is designated as Regional Center Commercial in the Central City Community Plan, with a corresponding zone of C2-4D-SN, which permits general commercial and multi-family residential uses. The Project Site comprises a completely developed urban parcel. No agricultural zoning is present in the Project vicinity, and no nearby lands are enrolled under the Williamson Act.[7] As such, the Project would not conflict with existing zoning for agricultural uses or a Williamson Act contract, and there would be no impact. No further analysis of this topic in the EIR is required, and no mitigation measures are required.

c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?

No Impact. As discussed in the response to Checklist Question II.b, the Project Site is zoned C2-4D-SN, which permits general commercial and multi-family residential uses. The Project Site is currently entirely developed with five multi-story buildings. Furthermore, consistent with the urbanized area surrounding the Project Site, the larger Project vicinity comprises the Los Angeles Civic Center and other public facilities, and the Project Site is designated for Regional Center Commercial land uses. No forest land or land zoned for timberland production is present on the Project Site or in the surrounding area. As such, the Project would not conflict with existing zoning for forest land or timberland, and there would be no impact. No further analysis of this topic in the EIR is required and no mitigation measures are required.

d) Result in the loss of forest land or conversion of forest land to non-forest use?

No Impact. The Project Site is entirely developed with the LA Times Building and related operations, office buildings, and a multi-story parking structure. No forest land exists on-site or in the Project vicinity. As such, the Project would not result in the loss of forest land or conversion of forest land to non-forest use, and there would be no impact. No further analysis of this topic in the EIR is required and no mitigation measures are required.

7 California Department of Conservation, Division of Land Resource Protection, Los Angeles County Williamson Act Map FY 2015/2016, ftp://ftp.consrv.ca.gov/pub/dlrp/wa/LA_15_16_WA.pdf. Accessed December 1, 2016.

e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use?

No Impact. There are no agricultural uses or related operations on or near the Project Site, which is located in Downtown Los Angeles in the Civic Center/Historic Core District, a highly urbanized portion of the City. Therefore, the Project would not involve the conversion of farmland to other uses, either directly or indirectly. No impacts to agricultural land or uses would occur. No further analysis of this topic in the EIR is required and no mitigation measures are required.

III. Air Quality

Where available, the significance criteria established by the South Coast Air Quality Management District (SCAQMD) may be relied upon to make the following determinations.

Would the project:

a) Conflict with or obstruct implementation of the applicable air quality plan?

Potentially Significant Impact. The Project Site is located within the 6,600-square-mile South Coast Air Basin (Basin). The South Coast Air Quality Management District (SCAQMD), together with the Southern California Association of Governments (SCAG), is responsible for formulating and implementing air pollution control strategies throughout the Basin. The current Air Quality Management Plan (AQMP) was adopted March 3, 2017 and outlines the air pollution control measures needed to meet Federal particulate matter ($PM_{2.5}$) and ozone (O_3) standards. The AQMP also proposes policies and measures currently contemplated by responsible agencies to achieve Federal standards for healthful air quality in the Basin that are under SCAQMD jurisdiction. In addition, the current AQMP addresses several Federal planning requirements and incorporates updated emissions inventories, ambient measurements, meteorological data, and air quality modeling tools from earlier AQMPs.

The Project would support and be consistent with several key policy directives set forth in the AQMP. For example, the Project would provide for new residential uses in the City's Civic Center/Historic Core, which is characterized by high employment density. The Project would also locate new development in proximity to existing public transit facilities, including LADOT's Downtown Dash, Metro's Civic Center Station, Metro's under-construction 2nd and Broadway Station, a range of Metro's Rapid Bus Lines and local bus lines. The Project Site is already served by existing roadway and utility infrastructure. Notwithstanding these attributes, the Project has the potential to increase the amount of traffic in the area, which would consequently generate operational air emissions that could affect implementation of the AQMP. Pollutant emissions resulting from construction of the Project would also have the potential to affect implementation of the AQMP. Therefore, the EIR will provide further analysis of potential impacts to implementation of the AQMP.

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?

Potentially Significant Impact. The Project Site is located within the Basin, which is characterized by relatively poor air quality. According to the 2016 AQMP, the Air Basin is designated non-attainment for federal and State ozone standards, as well as the current $PM_{2.5}$ standards. The Los Angeles County portion of the Basin is also designated a nonattainment area for the federal lead standard on the basis of source-specific monitoring at two locations, as determined by U.S. EPA using 2007–2009 data. However, all other stations in the Basin, including the near-source monitoring in Los Angeles County, have remained below the lead NAAQS for the 2012 through 2015 period. SCAQMD is therefore requesting that U.S. EPA re-designate the Los Angeles County portion of the Basin as attainment for lead. The Project would result in increased air emissions associated with construction and operational traffic. Therefore, the EIR will provide further analysis of potential impacts associated with the Project's construction and operational air pollutant emissions, with the Air Quality analysis accounting for the most recent regulatory changes.

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the air basin is non-attainment (ozone, PM10, and PM2.5) under an applicable federal or state ambient air quality standard?

Potentially Significant Impact. As discussed in the response to Checklist Question III.b, the Project would result in increased air emissions from construction and operational traffic in the Basin, within an air quality management area currently in non-attainment of Federal and State air quality standards for O_3, $PM_{10,}$ and $PM_{2.5}$. As such, implementation of the Project could potentially contribute to cumulatively significant air quality impacts in combination with other existing and future emission sources in the Project area. Therefore, the EIR will provide further analysis of potential cumulative impacts associated with an increase in criteria pollutants.

d) Expose sensitive receptors to substantial pollutant concentrations?

Potentially Significant Impact. The Project Site is located in the downtown area, which includes a high density, concentrated mix of uses, including residential and other sensitive uses in the Project vicinity. Construction activities and operation of the Project could increase air emissions above current levels. Therefore, the EIR will provide further analysis of potential impacts associated with the exposure of sensitive receptors to substantial pollutant concentrations.

e) Create objectionable odors affecting a substantial number of people?

Less Than Significant Impact. Odors are typically associated with industrial projects involving the use of chemicals, solvents, petroleum products, and other strong-smelling elements used in manufacturing processes. Odors are also associated with such uses as sewage treatment facilities and landfills. Activities and materials associated with Project construction would be typical of

construction projects of similar type and size. On-site trash receptacles would be enclosed within the subterranean parking structure or other interior spaces on Level 1, and properly maintained in a manner that promotes odor control. Any odors generated during construction of the Project would be localized and would not be sufficient to affect a substantial number of people or result in a nuisance as defined by South Coast Air Quality Management District (SCAQMD) Rule 402. The Project proposes a mixed-use development that includes residential, office, retail (including grocery store), and restaurants that would not introduce any major odor-producing uses that would have the potential to affect a substantial number of people, such as uses associated with manufacturing, smelting, food packing, and other industrial uses. Odors associated with Project operation would be limited to those associated with on-site waste generation and disposal (e.g., trash cans, dumpsters) and occasional minor odors generated during food preparation activities. Waste would also be regularly collected and, because trash receptacles would be located within the Project's interior, any potential odors from on-site waste disposal would not affect surrounding land uses. Thus, Project operation is not expected to create objectionable odors and odor impacts would be less than significant. Therefore, impacts would be less than significant and no mitigation measures are required. No further analysis of this topic in the EIR is required.

IV. Biological Resources

Would the project:

a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

Less than Significant Impact with Mitigation Incorporated. The Project Site is entirely developed with five buildings and a parking structure and, as such is entirely impermeable. The Project Site has been operating as an urban use for decades. At present, the adjacent street rights-of-ways (ROWs) are planted with 29 ornamental, California Sycamore trees. Of these, 26 are considered to more than 3 inches in truck diameter. All 29 trees would remain under the Project. The Project would add an additional four California Sycamores along W. 1st Street to create a double row near the corner of W. 1st Street and S. Broadway. In addition, the Project would add 10 California Sycamores along S. Broadway Street to fill in the existing trees on S. Broadway and create a continuous line of California Sycamores along the street edge. The Project would also add three additional California Sycamores along S. Spring Street and four California Sycamores along W. 2nd Street. The Project would not remove any existing trees and would add trees and shrubs at the entrances to the Paseo and within the Paseo, which would increase ornamental plants and trees over existing conditions. Thus, the Project would not disturb any native or protected trees as defined by the Los Angeles Municipal Code (LAMC) Section 17.02 and impacts to street trees would be less than significant. In addition, the Project vicinity is highly urbanized and does not support habitat for candidate, sensitive, or special status plant species. Therefore, no impacts to candidate, sensitive, or special status plant species would occur.

However, the potential exists for protected bird species to be nesting in the street trees during Project construction. In order to avoid disturbance of nesting birds a mitigation measure shall be implemented to reduce impacts to nesting birds to a less than significant level. With the implementation of Mitigation Measure BIO-MM-1, impacts to sensitive plant and animal species would be less than significant and no further analysis of this topic in the EIR is required.

Mitigation Measure

BIO-MM-1: Prior to issuance of a grading permit, the Project Applicant shall demonstrate that the following requirements have been included in the Project construction plan:

1. Any construction activities that occur during the nesting season (February 15 to August 31) shall require that all suitable habitat (i.e., street trees and shrubs) be surveyed for the presence of nesting birds by a qualified biologist, retained by the Applicant as approved by the City of Los Angeles Building and Safety, before commencement of clearing and prior to grading permit issuance. The survey shall be conducted within 72 hours prior to the start of construction. A copy of the pre-construction survey shall be submitted to the City of Los Angeles Building and Safety.

2. If the required pre-construction survey detects any active nests, an appropriate buffer as determined by the biological monitor, shall be delineated, flagged, and avoided until the qualified biological monitor has verified that the young have fledged or the nest has otherwise become inactive.

b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?

No Impact. As discussed in the response to Checklist Question IV.a, the Project Site and surrounding area are located in a highly urbanized setting. The Project Site does not contain any drainage channels to the Los Angeles River (located approximately 0.89 mile to the east), riparian habitat, or other sensitive natural communities as indicated in the City or regional plans or in regulations by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS). Furthermore, the Project Site is not located in or adjacent to a Significant Ecological Area (SEA) as defined by the City and County of Los Angeles.[8,9] Therefore, the Project would not have an adverse effect on any riparian habitat or other sensitive natural community. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

8 City of Los Angeles Department of City Planning, Los Angeles Citywide General Plan Framework, Draft Environmental Impact Report at page 2.18-13 (January 19, 1995), http://cityplanning.lacity.org/housinginitiatives/housingelement/frameworkeir/FrameworkFEIR.pdf. Accessed January 24, 2017.

9 County of Los Angeles Department of Regional Planning, County of Los Angeles Significant Ecological Areas Program, Figure 9.3, Significant Ecological Areas and Coastal Resources Areas Policy Map (February 2015), http://planning.lacounty.gov/assets/upl/project/gp_2035_2014-FIG_9-3_significant_ecological_areas.pdf. Accessed January 24, 2017.

c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?

No Impact. As discussed in the response to Checklist Question IV.a, the Project Site is located in a highly urbanized area and is developed with five existing office or light industrial buildings and a parking structure. The surrounding area has been fully developed with urban uses and associated infrastructure. The nearest water body, the Los Angeles River, which is located approximately 0.89 mile to the east, is concrete lined in its nearest stretch to the Project Site (i.e., near the 1st Street Bridge). The Project Site does not contain any wetlands as defined by Section 404 of the Clean Water Act. Therefore, the Project would not have an adverse effect on federally protected wetlands. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

No Impact. As stated in the response to Checklist Question IV.a, the Project Site is currently developed with four commercial buildings and a 6-level parking structure. Because of the highly urbanized nature of the Project Site and surrounding area, the lack of a major water body other than the Los Angeles River, which is concrete lined in the Project vicinity and separated from the Project Site by rail facilities and multiple fence lines, and the lack of trees or natural open space area on the Project Site, the site does not contain substantial habitat for native resident or migratory species, or native nursery sites. Therefore, the Project would not interfere with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Less Than Significant Impact. As stated in the response to Checklist Question IV.a, the Project Site is a developed lot with no trees and no natural open space areas. Trees planted in the adjacent ROWs are ornamental and are not considered protected resources. No locally protected biological resources, such as oak trees or California walnut woodlands, or other trees protected under the City of Los Angeles Protected Tree Ordinance (Chapter IV, Article 6 of the LAMC) exist on the Project Site or in the adjacent street ROWs. In accordance with LAMC Section 12.21.G.2, Open Space Requirement for Six or More Residential Units, the Project would be planting one 24-inch box tree for every four dwelling units, ultimately filling in existing street trees with similar species and planting trees within the site's open space, including the paseo. Project landscaping would comply with all requirements of the LAMC and the City's Urban

Forestry Division's requirements. Therefore, the Project would not conflict with local policies or ordinances protecting biological resources such as a tree preservation policy or ordinance. Impacts would be less than significant and no mitigation measures are required. No further analysis of this topic in the EIR is required.

f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Impact. As discussed in the response to Checklist Question IV.a, the Project Site is located within a developed, urbanized area and does not provide habitat for any sensitive biological resources. The Project Site is not located within a habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan.[10] Therefore, the Project would not conflict with the provisions of any adopted conservation plan. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

V. Cultural Resources

Would the project:

a) Cause a substantial adverse change in the significance of a historical resource as defined in State CEQA Guidelines §15064.5?

Potentially Significant Impact. A historical resource is defined in Section 15064.5(a)(3) of the State CEQA Guidelines as any object, building, structure, site, area, place, record, or manuscript determined to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California. Historical resources are further defined as those associated with significant events, important persons, or distinctive characteristics of a type, period or method of construction; representing the work of an important creative individual; or possessing high artistic values. Resources listed in or determined eligible for the California Register, included in a local register, or identified as significant in a historic resource survey are also considered historical resources under CEQA.

The entire block is identified by SurveyLA, the citywide historic resources survey of Los Angeles. SurveyLA noted that the Times, Plant, and Mirror Buildings are listed in the California Register and evaluated the Executive Building as eligible for listing in the California Register and for designation as a Los Angeles Historic-Cultural Monument for its association with the growth and maturation of the Los Angeles Times as well as the career of Otis Chandler, who was the publisher from 1960 to 1980. Because the Project proposes demolition of the Executive Building abutting the Times Building and new development would contrast in scale to the Times, Plant Building, and Mirror Buildings, the Project has the potential to directly or indirectly impact these

10 California Department of Fish and Wildlife, Habitat Conservation Planning, Natural Community Conservation Planning, Summary of Natural Community Conservation Plans (NCCPs) (August 2015), https://www.wildlife.ca.gov/Conservation/Planning/NCCP/Plans. Accessed January 24, 2017.

historical resources. Therefore, the EIR will provide further analysis of potential impacts to historic resources.

b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to State CEQA Guidelines §15064.5?

Potentially Significant Impact. Section 15064.5(a)(3)(D) of the State CEQA Guidelines generally defines archaeological resources as any resource that "has yielded, or may be likely to yield, information important in prehistory or history." Archaeological resources are features, such as tools, utensils, carvings, fabric, building foundations, etc., that document evidence of past human endeavors and that may be historically or culturally important to a significant earlier community. The Project Site has been previously graded and developed. Thus, surficial archaeological resources that may have existed at one time have been previously disturbed. Nonetheless, Project construction would require grading and excavation activities for building foundations and subterranean parking that could have the potential to disturb existing but undiscovered archaeological resources. Therefore, the EIR will provide further analysis of potential impacts to archaeological resources.

c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Potentially Significant Impact. The Project Site has been previously graded and developed or paved. In addition, no unique geologic features are anticipated to be encountered during Project construction. Therefore, the Project is not expected to directly or indirectly destroy a unique geologic feature. However, the Project would require grading and excavation for building foundations and subterranean parking that could extend into native soils potentially containing undiscovered paleontological resources. Therefore, the EIR will provide further analysis of potential impacts to paleontological resources.

d) Disturb any human remains, including those interred outside of formal cemeteries?

Less than Significant Impact. As previously indicated, the Project Site has been previously graded and developed. Nonetheless, the Project Site would require excavation that would extend into native soils, which could result in the potential to encounter previously unknown human remains during excavation activities. The Project would comply with existing regulatory requirements that would ensure impacts related to human remains are less than significant.

If human remains are encountered unexpectedly during implementation of the Project, State Health and Safety Code Section 7050.5 requires that no further disturbance shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to PRC Section 5097.98. If the remains are determined to be of Native American descent, the coroner has 24 hours to notify the Native American Heritage Commission (NAHC). The NAHC shall then identify the person(s) thought to be the Most Likely Descendant (MLD). The MLD may, with the permission of the land owner, or his or her authorized representative, inspect the site of the

discovery of the Native American remains and may recommend to the owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and any associated grave goods. The MLD shall complete their inspection and make their recommendation within 48 hours of being granted access by the land owner to inspect the discovery. The recommendation may include the scientific removal and nondestructive analysis of human remains and items associated with Native American burials. Upon the discovery of the Native American remains, the landowner shall ensure that the immediate vicinity, according to generally accepted cultural or archaeological standards or practices, where the Native American human remains are located, is not damaged or disturbed by further development activity until the landowner has discussed and conferred, as prescribed in this mitigation measure, with the MLD regarding their recommendations, if applicable, taking into account the possibility of multiple human remains. The landowner shall discuss and confer with the descendants all reasonable options regarding the descendants' preferences for treatment.

Whenever the NAHC is unable to identify a MLD, or the MLD identified fails to make a recommendation, or the landowner or his or her authorized representative rejects the recommendation of the descendants and the mediation provided for in Subdivision (k) of Section 5097.94, if invoked, fails to provide measures acceptable to the landowner, the landowner or his or her authorized representative shall inter the human remains and items associated with Native American human remains with appropriate dignity on the property in a location not subject to further and future subsurface disturbance.

Therefore, the Project would have a less than significant impact with respect to the disturbance of human remains, including those interred outside of formal cemeteries. No mitigation measures are required and no further analysis of this topic in the EIR is required.

VI. Geology and Soils

In 2015, the California Supreme Court in CBIA v. BAAQMD, held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of the project. The revised thresholds are intended to comply with this decision. Specifically, the decision held that an impact from the existing environment to the project, including future users and/or residents, is not an impact for purposes of CEQA. However, if the project, including future users and residents, exacerbates existing conditions that already exist, that impact must be assessed, including how it might affect future users and/or residents of the project.

In accordance with Appendix G of the State CEQA Guidelines and the CBIA v. BAAQMD decision, the project would have a significant impact related to geology and soils if it results in any of the following impacts to future residents or users.

Would the project:

a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:

i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault, caused in whole or in part by the project's exacerbation of the existing environmental conditions. Refer to Division of Mines and Geology Special Publication 42.

Potentially Significant Impact. The seismically active region of Southern California is crossed by numerous active and potentially active faults and is underlain by several blind thrust faults. Based on criteria established by the California Geological Survey (CGS), faults can be classified as active, potentially active, or inactive. Active faults are those that have shown evidence of movement within the past 11,000 years (i.e., during the Holocene Epoch).

Potentially active faults are those that have shown evidence of movement between 11,000 and 1.6 million years ago (i.e., during the Pleistocene Epoch). Inactive faults are those that have exhibited displacement greater than 1.6 million years before the present (i.e., during the Quaternary Epoch). Blind thrust faults are low angle reverse faults with no surface expression. Due to their buried nature, the existence of blind thrust faults is not usually known until they produce an earthquake.

Fault rupture is the displacement that occurs along the surface of a fault during the earthquake. The CGS has established earthquake fault zones known as Alquist-Priolo Earthquake Fault Zones around the surface traces of active faults to assist cities and counties in planning, zoning, and building regulation functions. These zones identify areas where potential surface rupture along an active fault could prove hazardous and identify where special studies are required to characterize hazards to habitable structures. In addition, the City's General Plan Safety Element has designated fault rupture study areas extending along each side of active and potentially active faults to establish areas of hazard potential due to fault rupture.

The Project Site is not located with an Alquist-Priolo Earthquake Fault Zone and the closest fault is the Puente Hills Blind Thrust, located approximately 1.3475 kilometers (0.84 mile) from the Project Site.[11] However, since the Project Site is located within the seismically active Southern California region, the Project could expose people or structures to substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault. Therefore, the EIR will provide further analysis of potential impacts related to fault rupture.

ii) Strong seismic ground shaking caused in whole or in part by the project's exacerbation of the existing environmental conditions?

Potentially Significant Impact. The Project Site is located within the seismically active Southern California region. The level of ground shaking that would be experienced at the Project Site from active or potentially active faults or blind thrust faults in the region would be a function

11 City of Los Angeles Department of City Planning, Zoning Information and Mapping Access System (ZIMAS), Parcel Profile Report: 202-220 W. 1st Street. Generated January 25, 2017.

of several factors including earthquake magnitude, type of faulting, rupture propagation path, distance from the epicenter, earthquake depth, duration of shaking, site topography, and site geology. Active faults that could produce shaking at the Project Site include the Whittier-Elsinore Fault, San Jacinto Fault, San Andreas Fault, and numerous other smaller faults and blind thrust faults (including the Puente Hills Blind Thrust) found throughout the region. As with any new project development in the State of California, Project building design and construction would be required to conform to the current seismic design provisions of the City's Building Code, which incorporates relevant provision of the 2016 California Building Code (CBC), (effective 2017). The 2016 CBC, as amended by the City's Building Code, incorporates the latest seismic design standards for structural loads and materials to provide for the latest in earthquake safety. Nonetheless, the EIR will provide further analysis of potential impacts related to seismic ground shaking.

iii) Seismic-related ground failure, including liquefaction, caused in whole or in part by the project's exacerbation of the existing environmental conditions?

Potentially Significant Impact. Liquefaction is a seismic phenomenon in which loose, saturated, granular soils behave similarly to a fluid when subject to high-intensity ground shaking.

Specifically, liquefaction occurs when the shock waves from an earthquake of sufficient magnitude and duration compact and decrease the volume of the soil; if drainage cannot occur, this reduction in soil volume will increase the pressure exerted on the water contained in the soil, forcing it upward to the ground surface. This process can transform stable soil material into a fluid-like state. This fluid-like state can result in horizontal and vertical movements of soils and building foundations from lateral spreading of liquefied materials and post-earthquake settlement of liquefied materials. Liquefaction occurs when three general conditions exist: 1) shallow groundwater; 2) low density non-cohesive (granular) soils; and 3) high-intensity ground motion.

The CGS has delineated seismic hazard zones in areas where the potential for strong ground shaking, liquefaction, landslides, and other ground failures due to seismic events, which if designated requires cities and counties to regulate certain development projects within these zones until the geologic and soil conditions of a site are investigated and appropriate mitigation measures, if any, are incorporated into development plans. The Project Site is located in a City-designated liquefaction zone.[12] As the Project is located within a designated liquefaction zone, and to provide a conservative analysis of seismic-related ground failure and liquefaction, the EIR will provide further evaluation of this issue.

iv) Landslides caused in whole or in part by the project's exacerbation of the existing environmental conditions?

No Impact. The Project Site is not located within a City-designated Hillside Grading Area, is not subject to the City's Hillside Ordinance, and is not located in a City-designated Landslide

[12] City of Los Angeles Department of City Planning, Zoning Information and Mapping Access System (ZIMAS) Parcel Profile Report: 202-220 W. 1st Street. Generated January 25, 2017.

area.[13,14] Furthermore, the Project Site is located in an urbanized area in which the Project Site and surrounding uses are entirely paved and impermeable, not allowing water to seep into the underlying formation. The Project Site is not located in proximity to any natural mountains or steep slopes and, as well as the surrounding area, does not have a history of landslides. Potential for landslides to occur on or near the Project Site is minimal or nonexistent. Therefore, the Project would not expose people or structures to potential substantial adverse effects involving landslides and would not exacerbate any existing environmental conditions related to landslides. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

b) Result in substantial soil erosion or the loss of topsoil?

Potentially Significant Impact. During construction, the 3.6-acre Project Site would be subject to ground-disturbing activities (e.g., excavation, grading, soil stockpiling, foundation construction, the installation of utilities). These activities would expose soils for a limited time, allowing for possible erosion. In addition, the change in on-site drainage patterns resulting from the Project could also result in limited soil erosion. Thus, the EIR will provide further analysis of the potential for soil erosion resulting from Project construction and operation.

c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse caused in whole or in part by the project's exacerbation of the existing environmental conditions?

Potentially Significant Impact. As previously discussed in response to Checklist Questions VI.a.iii and a.iv, liquefaction hazards were concluded to be potentially significant and landslide hazards were concluded to have no impact. Subsidence occurs when a void is located or created underneath a surface, causing the surface to collapse. Common causes of subsidence include groundwater or oil resources or wells beneath a surface. Subsidence occurs when land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. No oil wells are located on the Project Site; however, the Project Site is located within 0.5 mile from the Union Station Oil Field to the east.[15,16] In addition, the Project Site is located within a potential liquefaction hazard zone and in an area subject to potentially high seismic ground shaking. Therefore, the EIR will provide further analysis of potential impacts related to lateral spreading, subsidence, liquefaction, and collapse.

15 City of Los Angeles Department of City Planning, Zoning Information and Mapping Access System (ZIMAS) Parcel Profile Report: 202-220 W. 1st Street. Generated January 25, 2017.

16 City of Los Angeles, Department of City Planning, Safety Element of the Los Angeles City General Plan, adopted November 26, 1996, Exhibit E–Oil Fields and Oil Drilling Areas in the City of Los Angeles. Available at http://cityplanning.lacity.org/cwd/gnlpln/saftyelt.pdf. Accessed on January 25, 2017.

d) Be located on expansive soil, as defined in Table 18 1 B of the Uniform Building Code (1994), creating substantial risks to life or property caused in whole or in part by the project's exacerbation of the existing environmental conditions?

Potentially Significant Impact. Expansive soils are typically associated with fine-grained clayey soils that have the potential to shrink and swell with repeated cycles of wetting and drying. Because the soils on the Project Site are currently unknown, there is potential for the soils on the Site to be subject to expansion resulting from changes in the moisture content. Therefore, the EIR will provide further analysis of potential impacts related to expansive soils.

e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

No Impact. The Project Site is located in an urbanized area where wastewater infrastructure is currently in place. The Project would connect to existing infrastructure and would not use septic tanks or alternative wastewater disposal systems. Therefore, no impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

VII. Greenhouse Gas Emissions

Would the project:

a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Potentially Significant Impact. Construction and operation of the Project would increase greenhouse gas (GHG) emissions that have the potential to either individually or cumulatively result in a significant impact on the environment. In addition, the Project would generate vehicle trips that would contribute to the emission of GHGs. The amount of GHG emissions associated with the Project has not been estimated at this time. Therefore, the EIR will provide further analysis of the Project's greenhouse gas emissions.

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Potentially Significant Impact. The Project would be required to comply with the City's Green Building Code pursuant to Chapter IX, Article 9, of the LAMC. In conformance with these requirements, the Project would be designed to reduce GHG emissions through various energy conservation measures. In addition, the Project is required to implement applicable energy conservation measures to reduce GHG emissions such as those described in California Air Resources Board AB 32 Scoping Plan, which describes the approaches California will take to achieve the goal of reducing GHG emissions to 1990 levels by 2020. Furthermore, because the Project would be designed to meet LEED Silver standards or the equivalent, the Project would incorporate sustainable elements of design during construction and operation. However, the GHG emissions associated with the Project have not been estimated at this time. Therefore, the

EIR will provide further evaluation of potential conflicts with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions.

VIII. Hazards and Hazardous Materials

In 2015, the California Supreme Court in CBIA v. BAAQMD, held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of the project. The revised thresholds are intended to comply with this decision. Specifically, the decision held that an impact from the existing environment to the project, including future users and/or residents, is not an impact for purposes of CEQA. However, if the project, including future users and residents, exacerbates existing conditions that already exist, that impact must be assessed, including how it might affect future users and/or residents of the project. For example, if construction of the project on a hazardous waste site will cause the potential dispersion of hazardous waste in the environment, the EIR should assess the impacts of that dispersion to the environment, including to the project's residents.

Would the project:

a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Potentially Significant Impact. Construction of the Project would involve the temporary use of hazardous substances in the form of paint, adhesives, surface coatings and other finishing materials, and cleaning agents, fuels, and oils. All materials would be used, stored, and disposed of in accordance with applicable laws and regulations and manufacturers' instructions. Furthermore, any emissions from the use of such materials would be minimal and localized to the Project Site. Operation of the Project would involve the use and storage of small quantities of potentially hazardous materials in the form of cleaning solvents, painting supplies, and pesticides for landscaping. The use of these materials would be in small quantities and in accordance with the manufacturers' instructions for use, storage, and disposal of such products. As with construction, any emissions from the use of such materials regarding the operation of the Project would be minimal and localized to the Project Site. Nevertheless, the EIR will evaluate the potential for the presence of hazardous environmental conditions on the Project Site.

b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Potentially Significant Impact. The Project Site is not located within a City-designated Methane Zone.[17, 18] Buildings demolished on-site may contain hazardous materials, which would require

17 City of Los Angeles, Department of Building and Safety Methane and Methane Buffer Zone Map, 2004. Available at: https://www.partneresi.com/sites/default/files/methane-zone-map-los-angeles.pdf. Accessed on December 4, 2016.

18 City of Los Angeles Department of City Planning, Zoning Information and Mapping Access System (ZIMAS) Parcel Profile Report: 202-220 1st Street. Generated January 25, 2017.

remediation and abatement. Potential soil and water contamination impacts related to the past use of hazardous materials on the Project Site may also exist. Accordingly, the EIR will provide further analysis of potential impacts involving the release of hazardous materials.

c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Potentially Significant Impact. The nearest K through 12 school to the Project Site is the Ramon C. Cortines School of Performing Arts, a private 9-12 school located at 450 N. Grand Avenue. This school is located approximately 0.35 mile to the north of the Project Site, north of the US-101 Freeway. No LAUSD elementary, middle, or high schools are located with 0.25 mile or 0.5 mile of the Project Site. However, in a dense metropolitan area such as Downtown Los Angeles, numerous day care or pre-schools are likely to be associated with many of the civic, business, and residential uses. For instance, the Joy Picus Child Development Center a day care and preschool (0 to 5 years), is located at 111 E. 1st Street, approximately 0.1 mile to the east of the Project Site and the Grace Iino Child Care Center, a day care through kindergarten, is located at 231 E. 3rd Street, approximately 0.11 mile to the south of the Project Site. Because the construction of the Project includes emissions and potential handling and hauling of hazardous materials, and the proximity of these facilities and potentially other similar facilities to the Project Site, the EIR will provide further analysis of this topic.

d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or the environment caused in whole or in part from the project's exacerbation of existing environmental conditions?

Potentially Significant Impact. Government Code Section 65962.5, amended in 1992, requires CalEPA to develop and update annually the Cortese List, which is a list of hazardous waste sites and other contaminated sites. While Government Code Section 65962.5 makes reference to the preparation of a list, many changes have occurred related to web-based information access since 1992 and information regarding the Cortese List is now compiled on the websites of the Department of Toxic Substances Control (DTSC), the State Water Board, and CalEPA. The DTSC maintains the EnviroStor database, which includes sites on the Cortese List and also identifies potentially hazardous sites where cleanup actions (such as a removal action) or extensive investigations are planned or have occurred. The database provides a listing of Federal Superfund sites (National Priorities List); State Response sites; Voluntary Cleanup sites; and School Cleanup sites. Because of the potential for listings associated with the site, as well as potential listed sites in the immediate vicinity (within 0.1 mile), the EIR will provide further evaluation of this issue.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

No Impact. The Project Site is not within an airport land use plan and it is not within two miles of a public airport or public use airport. The nearest airport is the Hawthorne Municipal Airport located approximately 10 miles southwest of the Project Site. Therefore, the Project would not result in an airport-related safety hazard for people residing or working in the Project vicinity. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

No Impact. There are no private airstrips in the vicinity of the Project Site, and the Project Site is not located within a designated airport hazard area. The nearest private airstrip to the Project Site is the Goodyear Blimp Base Airport, located approximately 13.5 miles to the south of the Project Site in the City of Carson. Because no private airstrips are within the Project vicinity, the Project would not result in airport-related safety hazards for the people residing or working in the area. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Potentially Significant Impact. The Project Site is located in an established urban area containing a concentration of critical facilities and lifeline systems.[19] While it is expected that the majority of construction activities for the Project would be confined on-site, short-term construction activities may temporarily affect access on portions of adjacent streets during certain periods of the day. A designated major communication center is located near the Project Site at W. 4th Street and S. Figueroa, and several City-designated Selected Disaster Routes are near and adjacent to the Project Site, including Broadway and Main Street.[20] Project construction activities would have the potential to affect access on the designated Selected Disaster Route on Broadway, as well as other routes in the vicinity. Thus, the EIR will provide further analysis of potential impacts to an adopted emergency response plan or emergency evacuation plan.

19 Lifeline facilities includes distributive systems and related facilities necessary to provide electric power, oil and natural gas, water and wastewater, and communications.

20 City of Los Angeles, Department of City Planning, Safety Element of the Los Angeles City General Plan, adopted November 26, 1996, Exhibit H – Critical Facilities & Lifeline Systems, http://cityplanning.lacity.org/cwd/gnlpln/saftyelt.pdf. Accessed on January 25, 2017.

h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands caused in whole or in part from the project's exacerbation of existing environmental conditions?

No Impact. The Project Site is located in a highly urbanized area. No wildlands are present on the Project Site or surrounding area. Furthermore, the Project Site is not within a City-designated wildfire hazard area.[21] In addition, the Project Site is not located within a City-designated Very High Fire Severity Zone.[22] Therefore, the Project would not expose people or structures to a significant risk involving wildland fires caused in whole or in part from the Project's exacerbation of existing environmental conditions. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

IX. Hydrology and Water Quality

Would the project:

a) Violate any water quality standards or waste discharge requirements?

Potentially Significant Impact. The Project Site is currently developed with five interconnected buildings, including a six-level parking structure. The topography of the site rises to the west, directing stormwater runoff from the Project Site to the City's curb and gutter system to the east of the site. Construction of the Project would require earthwork activities, including grading and excavation of the Project Site, and the transport of potentially contaminated soils. During precipitation events in particular, construction activities associated with the Project have the potential to result in the conveyance of soils due to minor soil erosion during grading and soil stockpiling and subsequent siltation, as well as other pollutants into municipal storm drains. Excavation for the nine-level subterranean parking structure and other subsurface construction activities may require dewatering, depending on seasonal rain and other effects on groundwater table. While the Project would be required to implement design features and regulatory mechanisms related to water quality standards and waste discharge requirements, further evaluation of this topic will be provided in the EIR to identify potential impacts and appropriate mitigation measures.

21 City of Los Angeles, Department of City Planning, Safety Element of the Los Angeles City General Plan, adopted November 26, 1996, Exhibit D – Selected Wildfire Hazard Areas in the City of Los Angeles, http://cityplanning.lacity.org/cwd/gnlpln/saftyelt.pdf. Accessed January 26, 2017.

22 City of Los Angeles Department of City Planning, Zoning Information and Mapping Access System (ZIMAS) Parcel Profile Report: 202-220 1st Street. Generated November 14, 2016.

b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Less Than Significant Impact. The Los Angeles Department of Water and Power (LADWP) is the water purveyor for the City. Water is supplied to the City from three primary sources, including the Metropolitan Water District's Colorado River and Feather River supplies (57 percent, Bay Delta 48 percent, Colorado River 8 percent), snowmelt from the Eastern Sierra Nevada Mountains via the Los Angeles Aqueduct (29 percent), local groundwater from the San Fernando groundwater basin (12 percent), as well as recycled water (2 percent).[23] Based on the City's most current Urban Water Management Plan (UWMP), in 2014 and 2015, LADWP had an available water supply of roughly 611,800 acre-feet, with approximately 18 percent coming from local groundwater.[24] Groundwater levels in the City are actively maintained via spreading grounds and recharge. Furthermore, the Project does not propose groundwater withdrawal. While there is a potential for dewatering during construction, any such dewatering would be limited and required to remove perched groundwater rather than groundwater from the water table; therefore, any dewatering would not have potential to withdraw groundwater from the water table. Lastly, the Project Site is currently approximately 100 percent developed with impervious surfaces, so the development of new impervious surfaces under the Project would not be expected to reduce groundwater recharge at the Project Site. Therefore, impacts would be less than significant and no mitigation measures are required. No further evaluation in the EIR is required.

c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Potentially Significant Impact. The Project Site is currently developed with commercial office uses and a parking garage. No streams are located within the Project vicinity. The Project would involve the demolition of a portion of the Project Site, construct new buildings, install new landscaping, and alter the roof and landscape areas of existing buildings, which would have the potential to alter the existing drainage patterns on the Project Site. While the Project would implement Best Management Practices (BMPs) to capture and treat first flush stormwater flows in accordance with the City's Los Impact Development (LID) Ordinance and Standard Urban Stormwater Mitigation Plan (SUSMP), further evaluation of potential erosion impacts will be provided in the EIR.

---

23 Los Angeles Department of Water and Power: Facts and Figures, https://www.ladwp.com/ladwp/faces/ladwp/aboutus/a-water/a-w-factandfigures?_adf.ctrl-state=j77lkjtqw_4&_afrLoop=357285129360562. Accessed January 26, 2017.

24 Los Angeles Department of Water and Power, 2015 Urban Water Management Plan, Exhibit ES-S – Service Area Reliability Assessment for Average Weather Year, adopted July 1, 2016, https://www.ladwp.com/cs/idcplg?IdcService=GET_FILE&dDocName=QOELLADWP005416&RevisionSelectionMethod=LatestReleased. Accessed December 5. 2016.

d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Potentially Significant Impact. As discussed above under response to Checklist Question IX.c, Hydrology and Water Quality, the Project has the potential to alter the existing drainage patterns on the Project Site. Therefore, the EIR will provide further evaluation of this topic.

e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Potentially Significant Impact. As discussed above under response to Checklist Question IX.a and IX.c, Hydrology and Water Quality, the Project has the potential to alter the existing drainage patterns on the Project Site. Therefore, the EIR will provide further evaluation of potential stormwater drainage and runoff impacts.

f) Otherwise substantially degrade water quality?

Potentially Significant Impact. The Project would be required to implement a Stormwater Pollution Prevention Plan (SWPPP) that includes Best Management Practices to reduce pollutants in stormwater runoff from the Project Site, and also would be required comply with the City's Low Impact Development (LID) Ordinance and Standard Urban Stormwater Mitigation Plan (SUSMP) requirements requirement the implementation of good housekeeping practices intended to preclude sediment and hazardous substances from entering stormwater flows. While these are expected to avoid significant impacts to water quality standards and waste discharge requirements, further analysis of water quality impacts will be provided in the EIR to evaluate potential impacts and identify appropriate design features and regulatory compliance mechanisms.

g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?

h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Less than Significant Impact (g-h). The City's ZIMAS records and the Federal Emergency Management Agency (FEMA) map for the Project Site (Map No. 06037C1636F) do not show the site to be located within a 100-year flood hazard area.[25, 26] Streets in the City are used for curb and gutter drainage and can exhibit flow during a heavy rain. The Project, however, would not

[25] City of Los Angeles Department of City Planning, Zoning Information and Mapping Access System (ZIMAS) Parcel Profile Report: 202-220 1st Street. Generated January 26, 2017.

[26] Federal Emergency Management Agency, Flood Insurance Rate Map, Map Number 06037C1636F, Effective Date: September 26, 2008, https://msc.fema.gov/portal/ #searchresultsanchor. Accessed January 26, 2017.

encroach into the street and gutter drainage system or cause runoff to be impeded or redirected. Although streets in the City can experience surface runoff, flooding from the nearest body of water is not likely since the channelized Los Angeles River is located approximately 0.89 mile from the Project Site and at an elevation of approximately 238 feet above mean sea level (AMSL). The elevation of W. 1st Street in the Project area is approximately 290 feet AMSL, a height differential of approximately 52 feet compared to the Los Angeles River. No rise in the Los Angeles River would cause an inundation more than 50 feet in depth over a radius distance of 0.89 mile from the river. In addition, the Project Site is not located within an inundation area as indicated in the City's General Plan Safety Element.[27] Therefore, flooding impacts would be less than significant and no mitigation measures would be required. No further analysis of this topic in the EIR is required.

i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Less than Significant Impact. The Project Site is not located within a potential inundation area for the Los Angeles River and/or an upstream dam.[28] As shown in the FEMA flood map for the Project area (Map No. 06037C1636F), the nearest flood zone is located in the vicinity of the Los Angeles River, approximately 0.89 mile to the east of the Project Site.[29] Therefore, the Project would not expose people or structures to a significant risk of loss or injury involving flooding. Impacts would be less than significant and no mitigation measures are required. No further analysis of this topic in the EIR is required.

j) Inundation by seiche, tsunami, or mudflow?

No Impact. A seiche is an oscillation of a body of water in an enclosed or semi-enclosed basin, such as a reservoir, harbor, lake, or storage tank. A tsunami is a great sea wave, commonly referred to as a tidal wave, produced by a significant disturbance undersea, such as a tectonic displacement of sea floor associated with large, shallow earthquakes. Mudflows occur as a result of downslope movement of soil and/or rock under the influence of gravity.

The Project Site is located in an area of relatively flat topography and urban development, with no enclosed bodies of water upstream of the Project Site, and as such, there is no potential for inundation resulting from a seiche or mudflows. Although the Los Angeles River is located approximately 0.89 mile east of the Project Site, the river in this area is located within a sunken concrete-lined channel at several feet below the ground elevation of the Project Site, and any seiches that could potentially develop within this stretch of the river during an earthquake would not have the potential to inundate the Project Site. With respect to tsunami hazards, the Project Site is located approximately 16 miles inland (northeast) from the Pacific Ocean, and therefore

27 City of Los Angeles General Plan, Safety Element Exhibit G, Inundation & Tsunami Hazard Areas (March 1994), http://cityplanning.lacity.org/cwd/gnlpln/saftyelt.pdf. Accessed January 26, 2017.

28 Ibid.

29 Federal Emergency Management Agency, Flood Insurance Rate Map, Map Number 06037C1636F, Effective Date: September 26, 2008, https://msc.fema.gov/portal/ #searchresultsanchor. Accessed May 9, 2017.

would not be subject to a tsunami. Furthermore, the Project Site is not located on a City-designated tsunami hazard area.[30] Therefore, no impact would occur due to inundation by tsunami or mudflow and no mitigation measures are required. No further analysis of this topic in the EIR is required.

X. Land Use and Land Use Planning

Would the project:

a) Physically divide an established community?

Less Than Significant Impact. The Project Site is located within the Central City Community Plan area within the fully urbanized Downtown Los Angeles. The Project would be contained within the existing developed block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway, which is currently entirely developed with five interconnected buildings. The Project would not encroach into adjacent streets or require vacations of streets or changes in the City's circulation system that would divide an established community. Implementation of the Project would result in further infill within an already developed urban area, and development of the Project would occur within the boundaries of the Project Site as it currently exists. In addition, the Project would create a mid-block paseo between W. 1St Street and W. 2nd Street that would allow for pedestrian access through the site. This would facilitate pedestrian movement since the block is currently entirely covered by buildings that block any mid-block access. The Paseo would also accommodate public access between W. 1st Street and W. 2nd Street at the time Metro's 2nd Street and Broadway's station is developed to the south of W. 2nd Street, and would reduce the existing division between W. 1st Street and W. 2nd Street. Because the Project would not impede or encroach into the public right-of-way or cause any changes to the City's circulation system, and would improve pedestrian access, it would not result in the division of an established community. Impacts would be less than significant and no mitigation measures are required. No further analysis of this issue in the EIR is required.

b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?

Potentially Significant Impact. The Project Site is located within the Central City Community Plan Area, which designates the Project Site for Regional Commercial land uses. The existing designation allows for a Floor Area Ratio (FAR) of 6:1 with the Transfer of Floor Area as permitted by the Los Angeles Municipal Code. The land use designation corresponds with the zoning designation of C2-4D-SN, which permits general commercial and multi-family residential uses. The 4D Height District establishes a Floor Area Ratio (FAR) of 6.0:1, but does not specifically limit building heights.

30 Ibid.

Other land use plans, policies, or regulations applicable to the Project Site include the Greater Downtown Housing Incentive Area, the Downtown Design Guide Project Area, the Historic Broadway Sign Supplemental Use District, and the Los Angeles State Enterprise Zone. The Project Site is located within a Transit Priority Area and an Adaptive Reuse Incentive Area.

1. The entitlements being requested for the Project include, but may not be limited to, the following: Transfer of Floor Area Rights (TFAR) greater than 50,000 square feet of floor area for the transfer of 548,440 square feet of floor area from the Los Angeles Convention Center (Donor Site) to the Project Site (Receiver Site) (LAMC Sec. 14.5.6-B).

2. Vesting Conditional Use Permit to permit floor averaging within a unified development (LAMC Sec. 12.24-W,19).

3. Master Conditional Use Permit (MCUB) to permit the on-site and off-site sale and consumption of alcoholic beverages within the Project's commercial retail spaces (LAMC Sec. 12.24-W,1).

4. Vesting Tentative Tract Map for the merger and re-subdivision of the Project Site for condominium purposes (LAMC Sec. 17.15). The Applicant is requesting to provide parking per LAMC requirements in lieu of the parking requirements under the Advisory Agency's Parking Policy for Condominiums.

5. Construction permits, including building, grading, excavation, foundation, and associated permits.

6. Haul Route Permit, as may be required.

7. Other approvals as needed.

Because the extent of applicable plans and the need for specific entitlements requiring discretionary action, further evaluation of the relationship of the Project to adopted plans and policies in the EIR is warranted.

c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

No Impact. As discussed in the responses to Checklist Question IV, Biological Resources, the Project Site is located in an urbanized area and is developed with warehouse, wholesale commercial, and associated office, loading dock and parking uses. Although the channelized Los Angeles River is located approximately 0.89 mile east of the Project Site, the Project Site does not contain trees, vegetation and natural habitat, and thus does not support sensitive natural communities.

Furthermore, the Project Site is not located within or adjacent to a Significant Ecological Area (SEA) as defined by the City or County of Los Angeles. [31,32] The Project Site is not located within

31 City of Los Angeles Department of City Planning, Los Angeles Citywide General Plan Framework, Draft Environmental Impact Report, at page 2.18-13 (January 19, 1995),

a habitat conservation plan or natural community conservation plan. Therefore, the Project would not conflict with the provisions of any adopted applicable conservation plan. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

XI. Mineral Resources

Would the project:

a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Impact (a-b). According to the Conservation Element of the City of Los Angeles General Plan, much of Downtown Los Angeles is located within a Mineral Resource Zone (MRZ).[33],[34] However, the Project Site is not designated as an existing Aggregate Production Area by the State of California or the U.S. Geological Survey.[35] The Project Site is located approximately 0.5 mile from the nearest active production field, the Union Station Oil Field to the east.[36] Also, the Project Site is fully developed with urban uses and, has not been the site of mineral resource extraction in the past, and rather than being designated for resource extraction, the Project Site is designated for Regional Commercial use by the City of Los Angeles General Plan. Therefore, Project implementation would not result in the loss of availability of a known mineral resource of value to the region and residents of the State, nor of a locally important mineral resource recovery site. No impacts to mineral resources would occur and no mitigation measures are required. No further analysis of Mineral Resources in the EIR is required.

XII. Noise

Would the project result in:

a) Exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Potentially Significant Impact. Construction of the Project would require the use of heavy construction equipment (e.g., bulldozers, backhoes, cranes, loaders, etc.) that would generate noise on an intermittent, short-term basis. Additionally, operation of the Project may increase existing noise levels as a result of Project-related traffic, the operation of heating, ventilation, and air conditioning (HVAC) systems, vehicles in the surface and subsurface parking levels, loading and unloading of trucks, and resident and visitor activities on the Project Site. The Project may also increase vehicle traffic over existing conditions, which may increase local noise levels. As such, nearby noise-sensitive uses, such as residential uses or libraries, could potentially be affected. Therefore, the EIR will provide further evaluation of the Project's potential to expose sensitive receptors to noise levels in excess of applicable standards.

b) Exposure of persons to, or generation of, excessive groundborne vibration or groundborne noise levels?

Potentially Significant Impact. Construction of the Project may generate groundborne vibration and noise due to site grading, clearing activities, and haul truck travel. In addition, Project construction may require pile-driving. As such, the Project would have the potential to generate or to expose people to excessive groundborne vibration and noise levels during short-term construction activities. In addition to the potential to expose people to groundborne vibration, there is the potential for the Project to generate construction-related vibration that may impact adjacent historical resources. Therefore, the EIR will provide further evaluation of construction-related, groundborne noise levels.

Once construction is complete, Project operation (e.g., residential, office, restaurant, retail (including potential grocery)), would not generate excessive groundborne vibration or groundborne noise. As such, Project operation would not generate groundborne vibration or groundborne noise at levels beyond those which currently exist in an urbanized setting and would not have the potential to expose people to excessive groundborne vibration or groundborne noise, resulting in a less than significant impact. Therefore, no further analysis of operational groundborne vibration or groundborne noise in the EIR is required.

c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Potentially Significant Impact. As discussed in the response to Checklist Question XII.a, Project operation may increase existing noise levels as a result of Project-related traffic, the operation of HVAC systems, loading and unloading of trucks, traffic, and the presence of

residents and visitors at the Project Site. Therefore, the EIR will provide further evaluation of the potential permanent increase in ambient noise levels.

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Potentially Significant Impact. As discussed in the response to Checklist Question XII.a, Project construction would require the use of heavy construction equipment (e.g., bulldozers, backhoes, cranes, loaders, etc.) that would generate noise on a short-term basis. Therefore, the EIR will provide further evaluation of potential impacts associated with a temporary or periodic increase in ambient noise levels.

e) For a project located within an airport land use plan, or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

f) For a project located within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

No Impact (e-f). As discussed in the response to Checklist Question VIII.e, the Project Site is not located within an airport land use plan, within two miles of a public use airport, or within the vicinity of a private airstrip. The nearest public airport is the Hawthorne Municipal Airport located approximately 10 miles southwest of the Project Site and the nearest private airport or airstrip is the Goodyear Blimp Base Airport in the City of Carson, approximately 13.5 miles south of the Project Site. Therefore, the Project would not expose people in the Project vicinity to excessive noise levels from airport use. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

XIII. Population and Housing

Would the project:

a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

Potentially Significant Impact. The Project Site is located within the jurisdiction of the Southern California Association of Governments (SCAG), a Joint Powers Agency established under California Government Code Section 6502 et seq. SCAG's mandated responsibilities include developing plans and policies with respect to the region's population growth, transportation programs, air quality, housing, and economic development. In April 2016, SCAG's Regional Council adopted the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (2016 RTP/SCS). The 2016 RTP/SCS presents the transportation vision for the region through the year 2040 and provides a long-term investment framework for addressing the region's transportation and related challenges. It also includes projections of population, households, and

employment through 2040. Furthermore, the City's General Plan including its community plans address growth in the region.

The replacement of the existing Executive Building and bank with approximately 1,127 residential units would increase residential population in the area. The proposed approximately 50,000-square-foot grocery store and 34,572 square feet of retail uses associated with new development could potentially increase employment opportunities over the replaced uses. A detailed analysis comparing the Project's contribution to population, housing, and employment growth to SCAG's 2016 RTP/SCS, Central City Community Plan policies, and Citywide projections and policies regarding future development is warranted. Therefore, the EIR will provide further evaluation of the Project's potential population and housing impacts.

b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

No Impact (b-c). No dwelling units are currently located on the Project Site. Because no housing would be displaced, the construction of replacement housing elsewhere would not be necessary. No impact would occur and no mitigation measures are required. Further analysis of this topic in the EIR is not required.

XIV. Public Services

Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the following public services:

a) Fire protection?

Potentially Significant Impact. The Los Angeles Fire Department (LAFD) provides fire protection and emergency medical services in the City of Los Angeles. The Project area is located in the LAFD's Central Bureau and served by the Central Division/Station. The nearest stations to the Project Site are LAFD Station 3 at 108 N. Fremont, located approximately 0.51 mile to the northwest, and Station 4 at 450 E. Temple Street, located approximately 0.72 mile to the east. Fire Station No. 4 is the first-in station to calls for service at the Project Site.[37]

Because the Project would increase the developed floor area and height of buildings on the Project Site, and increase the population on the Project Site, it could increase demand on LAFD fire protection and emergency medical services and potentially affect demand on LAFD facilities which could result in the need for new or physically altered governmental facilities to maintain

[37] Los Angeles Fire Department, Find Your Station, http://www.lafd.org/fire-stations/find-your-station. Accessed January 27, 2017.

service. Therefore, the EIR will provide further evaluation of the Project's potential impacts on fire protection services.

b) Police protection?

Potentially Significant Impact. The Los Angeles Police Department (LAPD) provides police protection services in the City of Los Angeles. The LAPD is divided into four Police Station Bureaus: Central Bureau, South Bureau, Valley Bureau, and West Bureau. Each of the Bureaus encompasses several communities. The Project Site is located in LAPD's Central Bureau, which serves the Downtown business district, as well as the communities of Eagle Rock, the Garment District, MacArthur Park, Dodger Stadium, Chinatown, Little Tokyo, Griffith Park, and the Toy District.[38]

Specifically, the Project Site is served by the Central Community Police Station located at 251 E. 6th Street, approximately 0.65-mile south of the Project Site. Because the Project would increase the developed floor area and population on the Project Site, it could increase demand on LAPD police protection services and, potentially, demands on LAPD facilities, which could result in the need for new or physically altered governmental facilities to maintain acceptable service ratios or other performance objectives. Therefore, the EIR will provide further evaluation of the Project's potential impacts on police protection services.

c) Schools?

Potentially Significant Impact. The Project Site is located within the jurisdiction of the Los Angeles Unified School District (LAUSD), and specifically within LAUSD's East Local District.[39] The Project Site is within the attendance boundaries of 9th Elementary School, Hollenbeck Middle School, and Metropolitan Continuation High School, and within a LAUSD Zone of Choice with multiple high school options. Because the Project would introduce a new resident population to the Project Site, a greater demand on LAUSD schools would be generated. Therefore, potential impacts to local schools will be analyzed further in the EIR.

d) Parks?

Potentially Significant Impact. The City of Los Angeles Department of Recreation and Parks provides park facilities and services within the City of Los Angeles. Because the Project would introduce new residents to the Project Site who might visit nearby City parks, greater demand on existing City parks could be generated. The Project would incorporate an open-to-the-sky Paseo, a 15,708-square foot open space available to the public, and 73,128 square feet of common open space for the Project's residents, including a 6th Floor garden terrace and pool deck and other recreational amenities. In addition, the Project would incorporate a rooftop office terrace on the 6th floor of the Plant Building, which would incorporate break lounges and conference areas for use by the employees of the Times, Plant, and Mirror Buildings. Although the Project would

38 Los Angeles Police Department, About Central Bureau, http://www.lapdonline.org/central_bureau/content_basic_view/1908. Accessed January 27, 2017.

39 Los Angeles Unified School District, Local District East Map (June 2015), http://achieve.lausd.net/cms/lib08/CA01000043/Centricity/Domain/33/East.pdf. Accessed January 27, 2017.

include open space areas and recreational amenities that would reduce the Project's demand for parks, overall demand on City parks associated with the Project's permanent residents could increase. Therefore, the EIR will provide further analysis of potential impacts to parks.

e) Other public facilities?

Potentially Significant Impact. The Los Angeles Public Library (LAPL) provides library services to the City of Los Angeles. Because the Project would introduce new residents to the Project Site, demand on LAPL library services could increase. Therefore, the EIR will provide further analysis of potential impacts associated with library services.

During construction and operation of the Project, other governmental services, including roads, would continue to be utilized. Project residents would use the existing road network, without the need for new roadways to serve the Project Site. As discussed in Checklist Question XVI, Transportation/Traffic, the Project could result in an increase in the number of vehicle trips attributable to the Project Site. However, the additional use of roadways would not be excessive and would not necessitate the upkeep of such facilities beyond normal requirements. Any minor roadway improvements (e.g., street dedications), pursuant to City requirements, would be constructed concurrent with the Project and would be analyzed as needed throughout the EIR. Therefore, the Project would result in less-than-significant impacts and no mitigation measures are required. Further analysis of other governmental services related to roadways in the EIR is not required.

XV. Recreation

a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facilities would occur or be accelerated?

Potentially Significant Impact. As discussed in the response to Checklist Question XIV.d, because the Project would introduce new population to the Project Site, greater demand on existing public recreational and park facilities and services could be generated. Therefore, the EIR will provide further evaluation of the Project's potential impacts on recreational services.

b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

Potentially Significant Impact. Although the Project would include the development of on-site open space and recreational amenities (see the response to Checklist Question XIV.d), it could potentially require the development and/or expansion of existing off-site park, open space and recreational amenities. The construction of such amenities could potentially result in adverse physical effects on the environment. Therefore, the EIR will provide further evaluation of the Project's potential impacts related to expansion of recreational services.

XVI. Transportation/Traffic

Would the project:

a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Potentially Significant Impact. The Project Site is subject to the Los Angeles Department of Transportation (LADOT) standards and guidelines regarding trip generation and levels of service (LOS) for the street system. The Project would develop the Project Site with 1,127 residential units and approximately 50,000 square feet of grocery store floor area, and 34,572 square feet of retail floor area. In addition to the grocery store, the rehabilitated Time, Plant, and Mirror buildings would contain 41,017 square feet of new retail/restaurant uses and 285,088 square feet of offices. However, the floor area of the rehabilitated Times, Plant, and Mirror Buildings would be the same as the existing buildings. The Project would substantially increase residential use in the immediate area, although reducing office space uses with the demolition of the on-site Executive Building. The new residential uses would add traffic to local and regional transportation systems. Thus, operation of the Project could adversely affect the existing capacity of the street system or exceed an established LOS standard. Project construction would also result in a temporary increase in traffic due to construction-related truck trips and worker vehicle trips. Therefore, traffic impacts during construction could also adversely affect the street system. As the Project has the potential to result in a significant traffic impact, further analysis of this topic, including mass transit and non-motorized travel, will be provided in the EIR.

b) Conflict with an applicable congestion management program, including, but not limited to, level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Potentially Significant Impact. The CMP is a State-mandated program enacted by the State legislature to address the impacts that urban congestion has on local communities and the region as a whole. Metro is the local agency responsible for implementing the requirements of the CMP. New projects located in the City of Los Angeles must comply with the requirements set forth in the Metro's CMP. These requirements include the provision that all freeway segments where a project could add 150 or more trips in each direction during the peak hours be evaluated. The guidelines also require evaluation of all designated CMP intersections where a project could add 50 or more trips during either peak hour. The Project would generate vehicle trips, which could potentially add trips to a freeway segment or CMP intersection. Thus, the EIR will provide further analysis of this topic.

c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?

No Impact. As discussed in the response to Checklist Question VIII.e, the nearest airport or heliport is the Hawthorne Municipal Airport, approximately 10 miles southwest of the Project Site. As such, the Project Site is not within any flight paths, does not propose any construction that would require notification of the Federal Aviation Administration, and would not result in a change in air traffic patterns, including increases in traffic levels or changes in location that would result in substantial safety risks. No impact would occur and no mitigation measures are required. No further analysis of this topic in the EIR is required.

d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Potentially Significant Impact. Project construction may require temporary lane or sidewalk closures. Access on and near the Project Site could also be temporarily disrupted resulting in conflicts with vehicles, pedestrians and/or bicyclists. Also, Project operation may alter the way vehicles ingress and egress the Project Site, increase trip g**e**neration and driveway use compared to existing on-site uses, and increase traffic on local streets. Considering these factors, the potential for hazardous conditions during Project construction and operation may increase over existing conditions. Therefore, the EIR will provide further analysis of this topic.

e) Result in inadequate emergency access?

Potentially Significant Impact. Immediate vehicular access to the Project Site is provided by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway. While it is expected that the majority of construction activities for the Project would be confined on-site, short-term construction activities may temporarily affect access on portions of adjacent streets during certain periods of the day. In addition, the Project would generate traffic in the Project vicinity and would modify Project Site access from streets that surround the Project Site. Thus, the EIR will provide further analysis of potential impacts to emergency access.

f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Potentially Significant Impact. City plans, such as Angel's Walk, are intended to link transit and pedestrian districts of historic Downtown and to tie public investment in bus and rail transit to urban design improvements that make the City attractive to pedestrians. The Project Site is located in an area well-served by public transportation. Metro's Los Angeles Civic Center/Grand Park Station is located approximately 750 feet to the northwest of the Project Site. Metro's future 2nd Street and Broadway Station, one of the three subway stations in Metro's under-construction Regional Connector Project. Several bus lines serve the vicinity of S. Spring Street and W. 1st Street, including LADOT's Dash Downtown "D" line, Metro's Rapid Line 770, Metro's Rapid

Line 745, and Metro's Rapid Line 733. Numerous local lines are also located in the Project vicinity, including Metro's Lines Bus Lines 2, 4, 10, 28, 81, 83, 90, 91, 94, and 302, which run northbound along Broadway, and Lines 30, 33, 40, 45, 68, 83, 84, 92, and 330, which run southbound along Spring Street.[40] The Project Site is also served by dedicated bike lanes in southbound Spring Street and northbound Main Street. Although the Project Site is well served by public transportation, and would be anticipated to improve the pedestrian experience through the provision of a public paseo between W. 1st Street and W. 2nd Street, the EIR will provide further analysis of the Project's consistency with policies, plans, and programs supporting alternative transportation, such as Angel's Walk.

XVII. Tribal Cultural Resources

Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1 (k)?

b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?

Potentially Significant Impact (a-b). Approved by Governor Brown on September 25, 2014, Assembly Bill 52 (AB 52) establishes a formal consultation process for California Native American Tribes to identify potential significant impacts to tribal cultural resources, as defined in Public Resources Code Section 21074, as part of CEQA. Effective July 1, 2015, AB 52 applies to projects that file a Notice of Preparation or Notice of Negative Declaration/Mitigated Negative Declaration on or after July 1, 2015. As specified in AB 52, lead agencies must provide notice to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project if the tribe has submitted a written request to be notified. The tribe must respond to the lead agency within 30 days of receipt of the notification if it wishes to engage in consultation on the project, and the lead agency must begin the consultation process within 30 days of receiving the request for consultation. Any information gained during the consultation process will be used to analyze impacts to tribal cultural resources in the EIR. The existence of tribal cultural resources on the Project Site is currently unknown; as such, further analysis of this topic will be provided in the EIR to determine the potential for, and significance of, the Project's impacts on tribal cultural resources.

40 LA Metro, Metro Bus and Rail System Map – Downtown Los Angeles Detail (2016), https://media.metro.net/documents/742b6116-1c6a-47af-93f3-514cbc8a4fb8.pdf. Accessed June 12, 2017.

XVIII. Utilities and Service Systems

Would the project:

a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Potentially Significant Impact. The City Department of Public Works (LADPW) provides wastewater services for the Project Site. Any wastewater generated at the Project Site is treated at the Hyperion Treatment Plant (HTP). The HTP is a part of the Hyperion Treatment System, which also includes the Tillman Water Reclamation Plant (TWRP) and the Los Angeles-Glendale Water Reclamation Plant (LAGWRP). The HTP is designed to treat 450 million gallons per day (mgd) HTP has an average dry water flow of approximately 362 mgd, leaving approximately 88 mgd of capacity available.[41,42] The discharge of effluent from the HTP into Santa Monica Bay is regulated by the HTP's National Pollutant Discharge Elimination System (NPDES) Permit issued under the Clean Water Act and is required to meet the Regional Water Quality Control Board (RWQCB)'s requirements for a recreational beneficial use. The Project would result in new sources of wastewater generated at the Project Site with the development of the increase in developed floor area on the Project Site and introduction of 1,127 new residential units and new landscaped areas. The incremental increase in the quantity of wastewater generated by the Project could potentially result in impacts with respect to wastewater treatment. Therefore, the EIR will provide further analysis of this topic.

b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Potentially Significant Impact. Water and wastewater systems consist of two components, the source of the water supply or place of sewage treatment, and the conveyance systems (i.e., distribution lines and mains) that link these facilities to Project Site. Given the Project's proposed increase in developed floor area on the Project Site and introduction of 1,127 new residential units, the EIR will provide further analysis of this topic.

c) Require or result in the construction of new storm water drainage facilities, or expansion of existing facilities, the construction of which could cause significant environmental effects?

Potentially Significant Impact. Under existing conditions, the Project Site is completely developed with five interconnected buildings. Current drainage flows on the Project Site are to

41 The HTP is an end-of-the-line plant, subject to diurnal and seasonal flow variation. It was designed to provide full secondary treatment for a maximum-month flow of 450 mgd, which corresponds to an average daily waste flow of 413 mgd, and peak wastewater flow of 850 mgd. (Information regarding peak flow is included in the City of Los Angeles Department of Public Works, Bureau of Sanitation, Water Integrated Resources Plan (IRP), Volume 1, Wastewater Management, 2006; page 7-3.)

42 City of Los Angeles Department of Public Works, Bureau of Sanitation website, Hyperion Water Reclamation Plant, https://www.lacitysan.org/san/faces/wcnav_externalId/s-lsh-wwd-cw-p-hwrp?_adf.ctrl-state=modqzbl8f_4&_afrLoop=33199812189076655. Accessed January 27, 2017.

the east and collected in the City's existing curb and gutter drainage system. Project implementation would require grading, could result in alterations to the drainage pattern at the Project Site, and would require verification of available capacity in the municipal storm drain system. Therefore, the EIR will provide further analysis of potential impacts related to stormwater drainage.

d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Potentially Significant Impact. The Project would develop 1,127 new residential units, a grocery store, and retail uses, which Project would increase water demand beyond the existing office building and parking structure that would be removed. Sections 10910-10915 of the State Water Code (Senate Bill [SB] 610) requires the preparation of a water supply assessment (WSA) demonstrating sufficient water supplies for a project that includes more than 500 dwelling units. A WSA will be required for the Project include 1,127 dwelling units. Further of this topic will be provided in the EIR in order to assess projected water demand and the sufficiency of current water supplies.

e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Potentially Significant Impact. Given the increase in developed floor area proposed on the Project Site and introduction of 1,127 new residential units, the Project would result in an increase in wastewater generation compared to existing conditions. Therefore, the EIR will provide further analysis of potential impacts related to wastewater capacity.

f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Potentially Significant Impact. Solid waste management in the City of Los Angeles involves both public and private refuse collection services as well as public and private operation of solid waste transfer, resource recovery, and disposal facilities. The City of Los Angeles Bureau of Sanitation (BOS) is responsible for developing strategies to manage solid waste generation and disposal in the City of Los Angeles. The BOS collects solid waste generated primarily by single-family dwellings, small multi-family dwellings, and public facilities. Private hauling companies collect solid waste generated primarily from large multi-family residential, commercial, and industrial properties. The City of Los Angeles does not own or operate any landfill facilities, and the majority of its solid waste is disposed of at County landfills.

The remaining disposal capacity for the County's Class III landfills is estimated at approximately 114 million tons as of December 31, 2015, the most recent data available.[43] In addition to in-County landfills, out-of County disposal facilities may also be available to the City of Los Angeles. Aggressive waste reduction and diversion programs on a Countywide level have helped reduce disposal levels at the County's landfills, and based on the Los Angeles County Integrated Waste Management Plan (ColWMP), the County anticipates that future Class III disposal needs can be adequately met through 2030 through a combination of landfill expansion, waste diversion at the source, out-of-County landfills, and other practices.

The Project would demolish the existing Executive Building, totaling approximately 176,258 square feet, and a 6-level parking structure, thus generating construction debris. Proposed uses include approximately 1,127 new residential units, approximately 34,572 square feet of new retail/restaurant uses, approximately 41,017 square feet of new commercial floor area in the rehabilitated buildings, and a potential 50,000-foot grocery store or other retail use that would generate solid waste during future Project operations. During operation, Project-related waste generation from office uses would be incrementally reduced by incremental reduction in overall office space. Disposal would occur pursuant to City Ordinances that require the use of certified haulers and implementation of practices to recycle exported materials. Because the Project would generate waste and would potentially impact remaining landfill capacity, the EIR will provide further analysis of this topic.

g) Comply with Federal, State, and local statutes and regulations related to solid waste?

Potentially Significant Impact. Disposal and recycling of the construction debris would be required to comply with all Federal, State, and local regulations. All local governments, including the City of Los Angeles, are required under Assembly Bill 939 (AB 939), the Integrated Waste Management Act of 1989, to develop source reduction, reuse, recycling, and composting programs to reduce tonnage of solid waste going to landfills. The California Department of Resources and Recycling and Recovery (CalRecycle) is the California State Agency that promotes the importance of reducing waste and oversees California's waste management and recycling efforts. CalRecycle has issued jurisdiction waste diversion rate targets equivalent to 50 percent of the waste stream as expressing in pounds per person per day. If the City's target is exceeded, the City would be required to pay fines or penalties from the State for not complying with AB 939. Because of several state, county and city plans and policies that address the availability of sufficient landfill capacity and the diversion/recycling of waste debris, further analysis of the Project's waste generation and consistency with plans and policies to increase diversion of waste will be provided in the EIR.

43 County of Los Angeles Department of Public Works, County of Los Angeles Countywide Integrated Waste Management Plan: 2015 Annual Report, https://dpw.lacounty.gov/epd/swims/ShowDoc.aspx?id=6530&hp=yes&type=PDF. Accessed June 12, 2017.

XVX. Mandatory Findings of Significance

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?

Potentially Significant Impact. The Project would not substantially reduce the habitat of fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal. Also, the Project would not eliminate important examples of the major periods of California history or prehistory.

However, as discussed in this Initial Study, the Project could result in environmental impacts that have the potential to degrade the quality of environment as addressed herein. Potentially affected resources include Air Quality, Cultural Resources (Archaeological, Paleontological, and Historical Resources), Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services (Fire, Police, Schools, Parks, and Libraries), Transportation/Circulation (Traffic and Access), Tribal Cultural Resources, and Utilities (Water, Wastewater, and Solid Waste). An EIR will be prepared to analyze and document these potentially significant impacts. Potentially significant impacts on biological resources include construction impacts on protected nesting birds. However, a mitigation measure is provided in the Initial Study that would reduce this impact to a less than significant level. As such, impacts to biological resources will not be further addressed in the EIR.

b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?

Potentially Significant Impact. The potential for cumulative impacts occurs when the independent impacts of a given Project are combined with the impacts of related projects in proximity to the Project Site that would create impacts that are greater than those of the Project alone. Related projects include past, current, and/or probable future projects whose development could contribute to potentially significant cumulative impacts in conjunction with a given project.

Each of the topics determined to have the potential for significant impacts in this Initial Study will be subject to further evaluation in the EIR, including evaluation of the potential for cumulatively significant impacts. Topics for which Initial Study determinations were "No Impact" or "Less Than Significant Impact" have been determined not to have the potential for significant cumulative impacts.

With respect to potential contributions to cumulative impacts for agricultural resources, biological resources, the potential for human remains, and mineral resources, the Project Site is located in an urbanized area, and like the Project, other development occurring in the area would also constitute urban infill in already densely developed areas. Thus, the Project is unlikely to combine with related projects or other cumulative growth to result in significant cumulative impacts with respect to agricultural and mineral resources. With respect to biological resources, the Project would implement Mitigation Measure BIO-MM-1, as stated under Checklist Question IV.a, which would ensure that potential impacts to nesting birds would be reduced to a less than significant level. Impacts to sensitive plant and animal species would not be cumulatively considerable, as no such habitat occurs in the vicinity of the Project Site or related projects due to the existing urban development. Biological resources are generally site-specific and need to be evaluated within the context of each individual project. In regards to human remains, the Project would be required to comply with existing regulatory requirements that would ensure impacts related to human remains are less than significant. Furthermore, related projects would be required to comply with existing regulatory requirements and the City's building permit review and approval process, which address these subjects.

With respect to aesthetics, because the Project is a mixed-use residential and employment center project that would be located on an infill site within a Transit Priority Area, under SB 743, aesthetic impacts of the Project would be considered less than significant. Aesthetic impacts would still be analyzed in the EIR for informational purposes only. The Project Site is not located in areas that are designated by the City or County to be Landslide areas, within a 100-year flood hazard area, inundation area, or a significant ecological area (SEA); therefore, the Project would have no impact and there would be no potential for cumulative impacts. Because the Project Site is already previously developed, approximately 100-percent impermeable, and served by existing wastewater infrastructure, there would be no Project or cumulative impact on septic tanks or the reduction of groundwater recharge. Since the Project Site is not located within two miles of an airport or within any flight paths, any cumulative impacts with regards to airports and air traffic would be less than significant. Impacts regarding dividing a community or displacing housing are site specific, and because the Project would have no impact on those issues, there would be no potential for cumulative impacts. Therefore, Project implementation would not be expected to result in a considerable contribution to cumulatively significant impacts for these resources. No further discussion of potential cumulative effects for these topics is required in the EIR.

c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

Potentially Significant Impact. As discussed in this Initial Study, the Project could result in potentially significant environmental impacts associated with Aesthetics (Aesthetics, Views, Light and Glare, and Shade and Shadow), Air Quality, Cultural Resources (Archaeological, Paleontological, and Historical Resources), Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services (Fire, Police, Schools, Parks, and Libraries), Transportation/ Circulation (Traffic and Access), Tribal Cultural Resources, and Utilities (Water, Wastewater, and Solid Waste). These impacts could have potentially adverse effects on human beings, and the EIR will provide further analysis of these potential impacts.

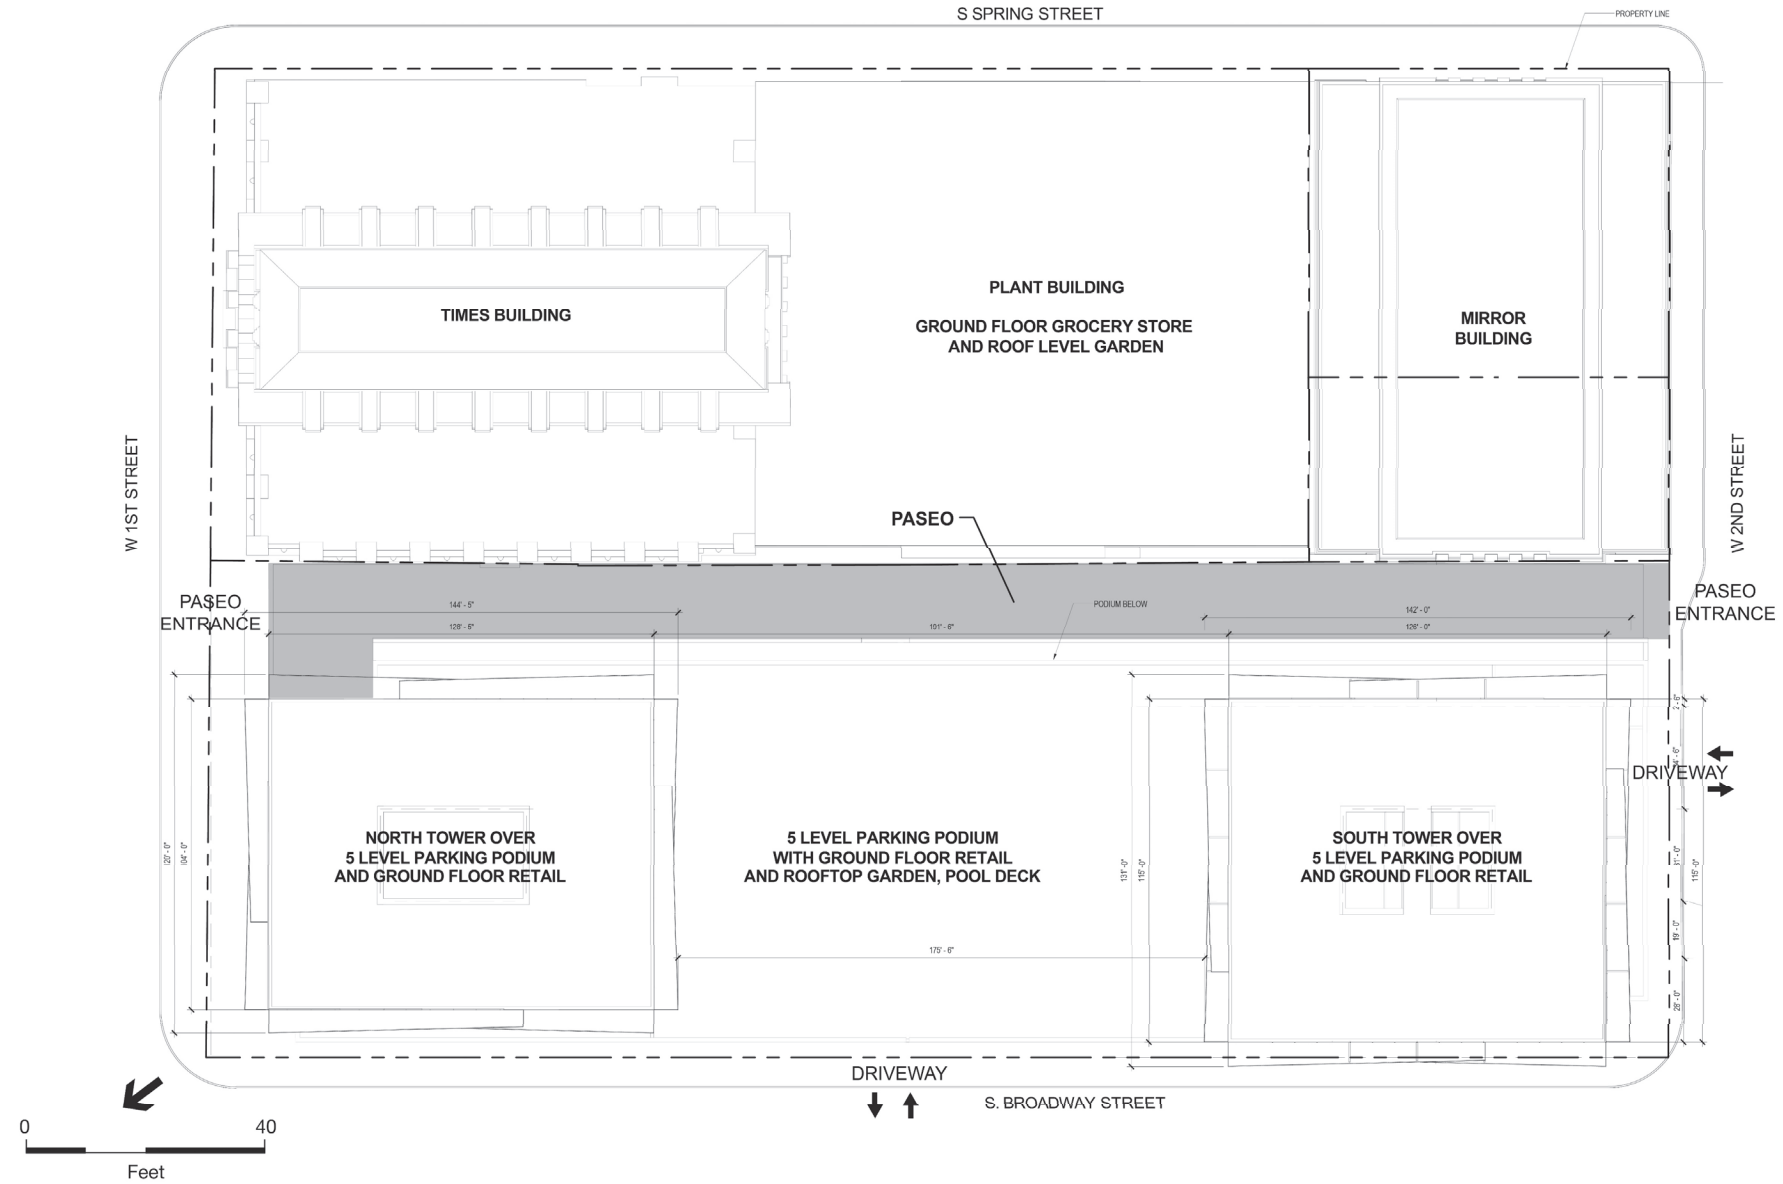
A-3 Scoping Meeting Materials

CITY OF LOS ANGELES SCOPING MEETING

Times Mirror Square Project

Ronald F. Deaton Civic Auditorium

July 25, 2017

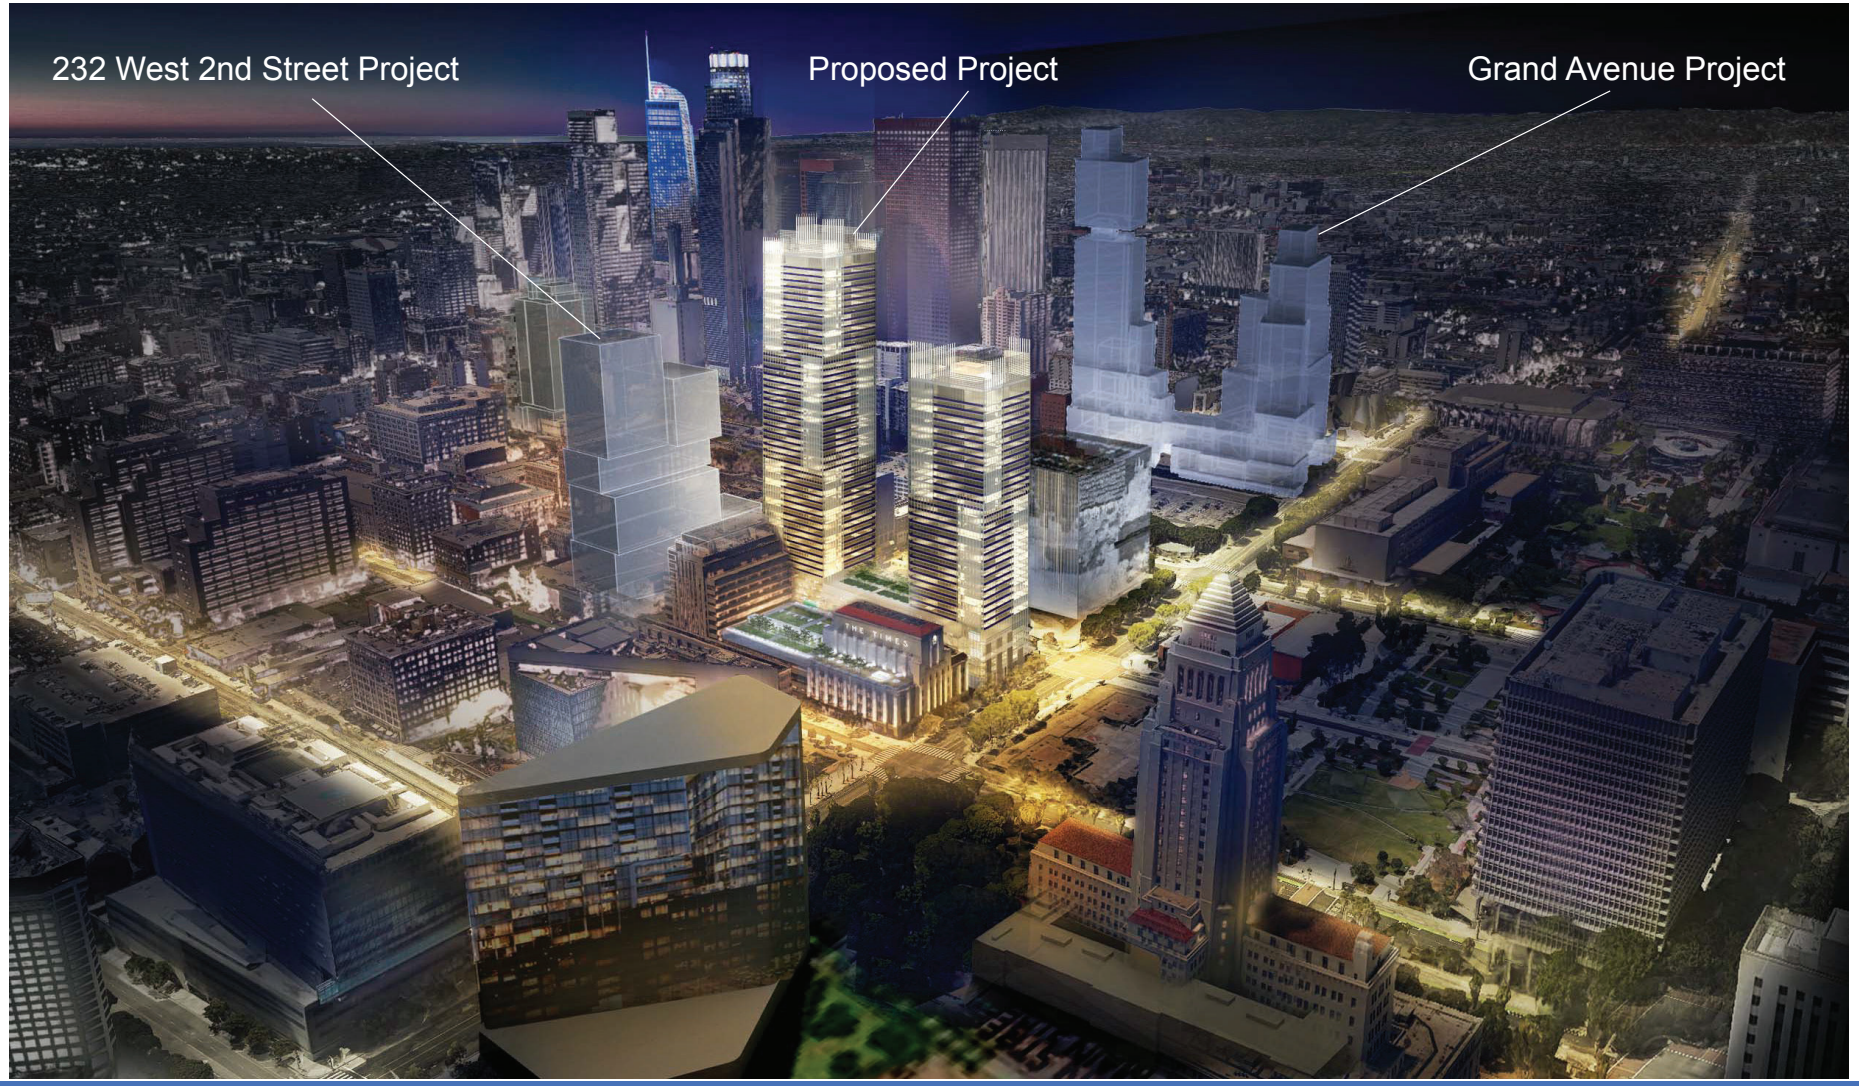


5:00 p.m. – 7:00 p.m.

SCOPING MEETING OBJECTIVES

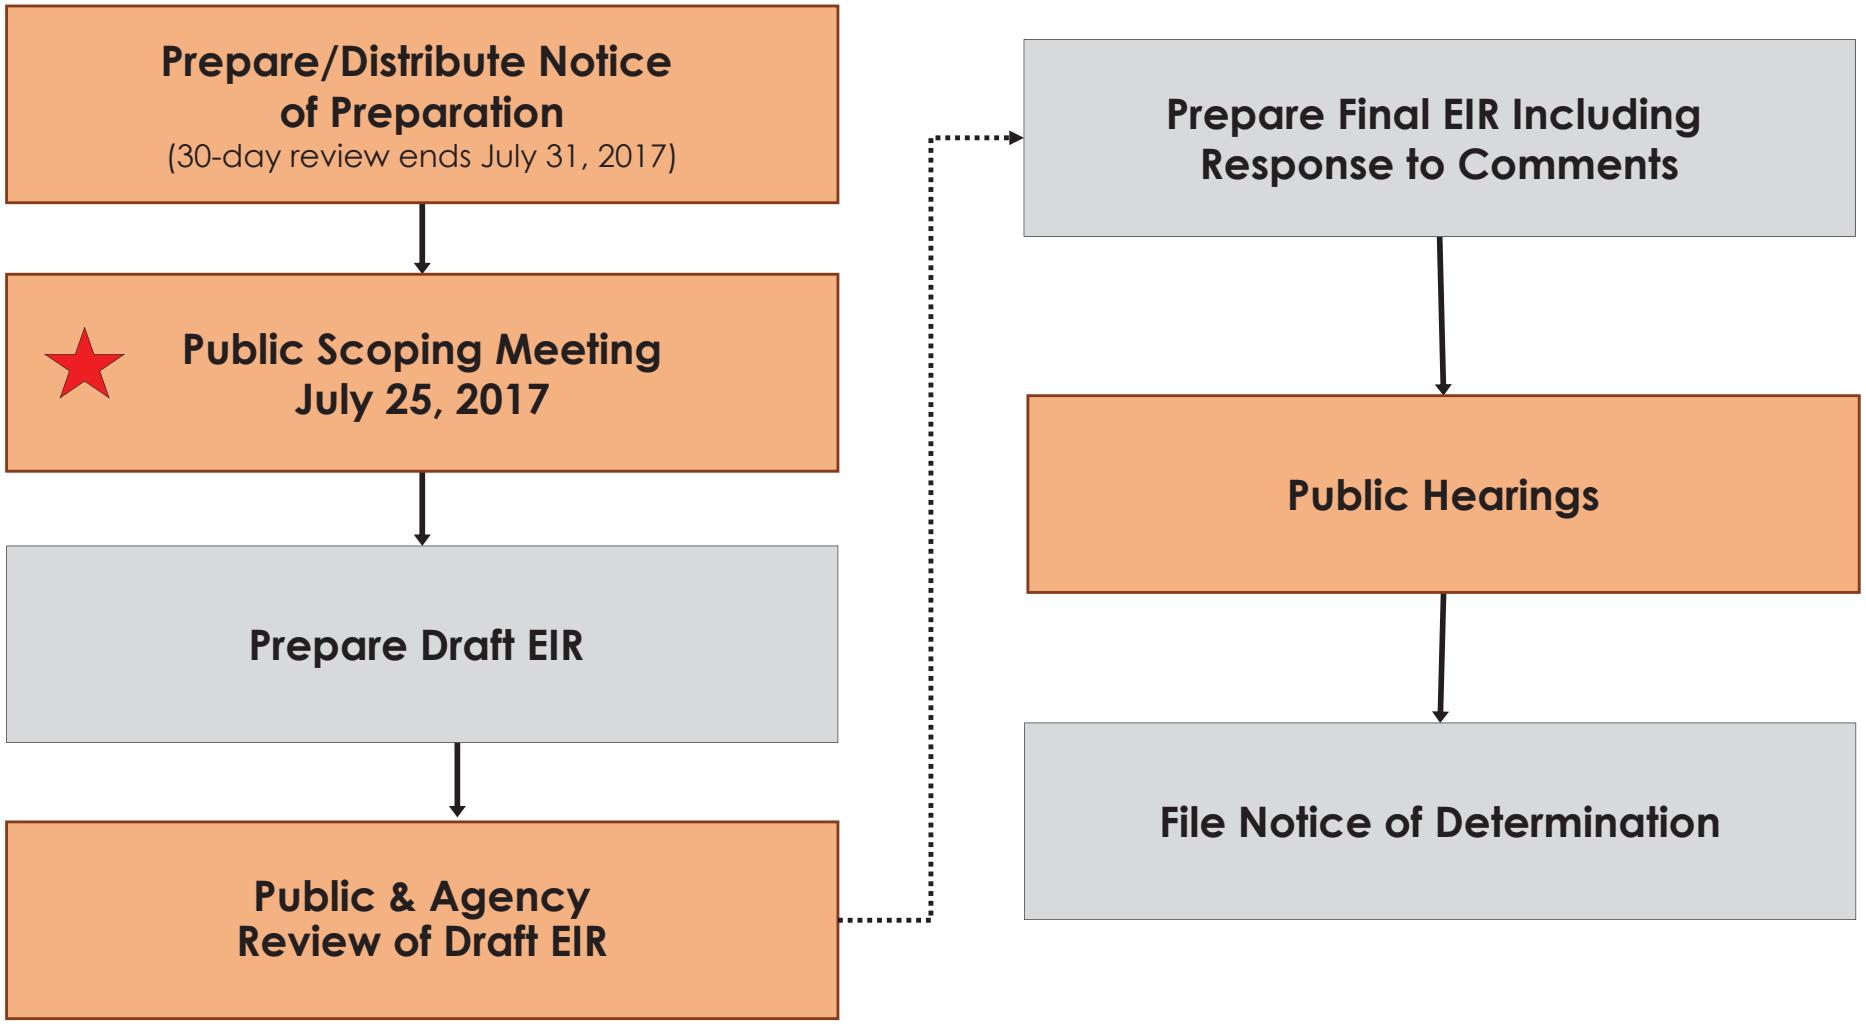
- Provide information about the Times Mirror Square Project
- Provide information on Environmental Impact Report (EIR) process and timeline
- Identify environmental issues for analysis in the EIR
- Solicit community input regarding environmental issues of concern to be analyzed in the EIR

- The intent of the Scoping Meeting is to receive information that helps determine the scope and content of the EIR. The City is at the beginning of the environmental review process and has not yet analyzed all of the potential impacts of the project.



PROJECT SITE PLAN

Simulated View from 1st Street and Broadway



Simulated Aerial View from the Northeast

PROJECT OVERVIEW

- Rehabilitation of the Times, Plant, and Mirror Buildings
- Demolition of existing parking garage and Executive Building to develop the 37-story North Tower and 53-story South Tower
- North and South Towers would contain five-story parking podium, 1,127 residential units, and 34,572 square feet of commercial floor area
- Open-to-sky pedestrian Paseo on ground-level between W. 1st Street and W. 2nd Street
- Development Site: approximately 3.6 acres
- Floor Area Ratio: 9.42:1 proposed
- Total Development: 1,511,908 square feet (including new construction and rehabilitation)
- 129,477 square feet of open space
- 9 levels of subterranean and 5 levels of above-ground podium parking
- 1,744 vehicle parking spaces provided

THE EIR PROCESS

= Opportunities for Public Input

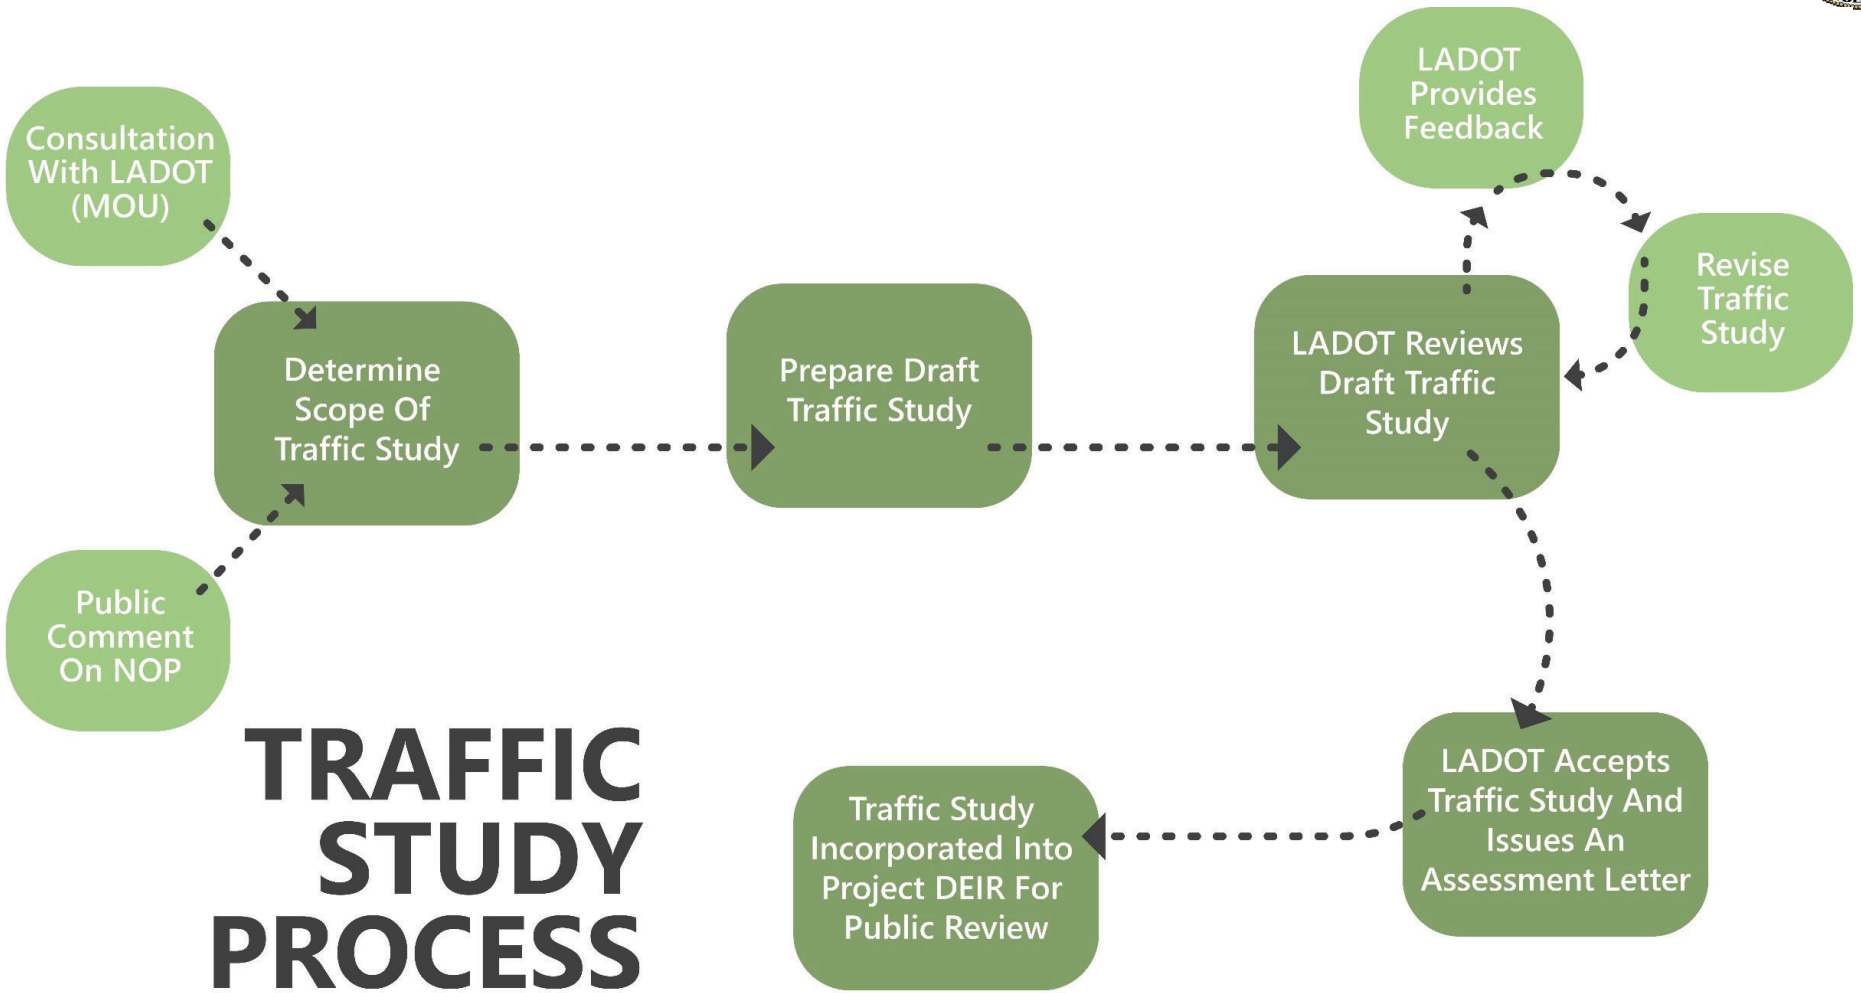
= We are here in the process

SCOPE OF EIR ANALYSIS

- Air Quality
- Cultural Resources
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Population and Housing
- Public Services
  (Police, Fire, Schools, Parks)
- Recreation
- Transportation and Traffic
- Tribal Cultural Resources
- Utilities
  (Water, Wastewater, Solid Waste)
- Energy

SUBMITTAL OF PUBLIC COMMENTS

Submit written comments using pre-addressed forms provided tonight:



1. Leave in box or provide to City staff or EIR consultants.
2. Add postage and mail to City Hall.
   Please direct EIR comments to:

   William Lamborn
   City of Los Angeles
   Department of City Planning
   200 N. Spring Street, Room 750
   Los Angeles, CA 90012
   Reference: Times Mirror Square Project EIR

- Email: William.Lamborn@lacity.org

Written comments must be submitted by 4 pm, July 31, 2017.

Project Site with
Study Intersections and Nearby Transit

PROPOSED ENTITLEMENTS

- Transfer of Floor Area Rights (TFAR) greater than 50,000 square feet of floor area for the transfer of 548,440 square feet of floor area from the Los Angeles Convention Center (Donor Site) to the Project Site (Receiver Site) (LAMC Sec. 14.5.6-B).
- Vesting Conditional Use Permit to permit floor averaging within a unified development (LAMC Sec. 12.24-W,19).
- Master Conditional Use Permit (MCUB) to permit the on-site and off-site sale and consumption of alcoholic beverages within the Project's commercial retail spaces (LAMC Sec. 12.24-W,1).
- Vesting Tentative Tract Map for the merger and re-subdivision of the Project Site for condominium purposes (LAMC Sec. 17.15). The Applicant is requesting to provide parking per LAMC requirements in lieu of the parking requirements under the Advisory Agency's Parking Policy for Condominiums.
- Construction permits, including building, grading, excavation, foundation, and associated permits.
- Haul Route Permit, as may be required.
- Other approvals as needed.

EXISTING USES ON-SITE

A-4 NOP and Scoping Meeting Comments

CITY OF LOS ANGELES
TIMES MIRROR SQUARE PROJECT ENVIRONMENTAL IMPACT REPORT
PUBLIC SCOPING MEETING
CASE NO.: ENV-2016-4676-EIR
JULY 25, 2017

Please include your mailing address if you wish to receive future notices regarding this case, including publication of the Draft and Final EIR.

Name	Organization (if any)	Address	City, Zip Code	E-mail
Shawn McCoy	US General Services Administration	350 W. 1st Street, Suite 2470	Los Angeles, CA 90012	Shawn.mccoy@gsa.gov
Allan Harris	Self	108 W. 2nd St. 1002	CA 90012	HARRISYAMSEK@AOL.COM
Mika Seabrook		108 W. 2nd St. 1005	L.A., CA 90012	rmseabrook@ymail.com

We need your input!

Please take a few minutes to provide your comments and return the completed form to the Department of City Planning.

The purpose of the scoping process is to identify public and agency concerns, define the issues that will be examined in the Environmental Impact Report (EIR), and help to identify project impacts, alternatives, and mitigation measures that can lessen the negative impacts from both temporary construction activities and long-term operation of the proposed Project.

Comments must be provided **in writing** and can be submitted either at the scoping meeting, by mail or e-mail to William.Lamborn@lacity.org.

The deadline for submitting preliminary comments is Monday, July 31, 2017, 4pm. All written comments submitted will be considered during preparation of the Draft EIR, which will be available for public review at a later date. The Initial Study is available for review at the Dept. of City Planning, 200 N. Spring Street, Room 750, Los Angeles, CA 90012.

Thank you for your participation!

ENVIRONMENTAL ISSUES & IMPACTS

CEQA requires consideration of the following topics:

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology/Water Quality
- Land Use and Planning
- Mineral Resources
- Noise
- Population/Housing
- Public Services
- Recreation
- Traffic/Transportation
- Tribal Cultural Resources
- Utilities/Service Systems

Note: Any identifying information provided will become part of the public record and, as such, must be released to any individual upon request.

Written Comment Form

Use the space below to comment on areas of concern regarding the scope and content of the Draft EIR, and offer potential alternatives and/or measures to avoid or reduce environmental impacts.

My concern is the extreme height of the buildings is so out of place for this historical section of downtown. Please rethink these exciting ideas in a building size that better fits the area (Even 20 stories).

Re: Times Mirror Square
SCH# 2017061083

Attached for your review and comment is the Notice of Preparation (NOP) for the Times Mirror Square draft Environmental Impact Report (EIR).

Responsible agencies must transmit their comments on the scope and content of the NOP, focusing on specific information related to their own statutory responsibility, within 30 days of receipt of the NOP from the Lead Agency. This is a courtesy notice provided by the State Clearinghouse with a reminder for you to comment in a timely manner. We encourage other agencies to also respond to this notice and express their concerns early in the environmental review process.

Please direct your comments to:

William Lamborn
City of Los Angeles
200 N. Spring Street, Room 750
Los Angeles, CA 90012

with a copy to the State Clearinghouse in the Office of Planning and Research. Please refer to the SCH number noted above in all correspondence concerning this project.

If you have any questions about the environmental document review process, please call the State Clearinghouse at (916) 445-0613.

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title Times Mirror Square
Lead Agency Los Angeles, City of

Type NOP Notice of Preparation

Description The project would develop a new mixed-use development and rehabilitate the Times, Plant, and Mirror Buildings on the approx. 3.6 acre site in Downtown LA. New development, consisting of the 37-story "North Tower" and 53-story "South Tower" would be located in the west sector of the block. The existing Executive Building and parking garage would be demolished to allow for the project's new mixed-use component. The North and South Towers, which would be constructed above a five-story parking podium, would contain an additional nine levels of subterranean parking. The combined commercial and residential floor area would total approx. 1,135,803 sq. ft. The existing Times, Plant, and Mirror Buildings have a combined floor area of 376,105 sq. ft. In total, including new construction and existing buildings to remain, the Project proposes approx. 1,511,908 sq. ft. of floor area. This would result in a floor area ration (FAR) of 9.42:1.

Project Description: *(please use a separate page if necessary)*

The Project would develop a new mixed-use development and rehabilitate the Times, Plant, and Mirror Buildings on the approximately 3.6-acre site in Downtown Los Angeles. New development, consisting of the 37-story "North Tower" and 53-story "South Tower" would be located in the west sector of the block. The existing Executive Building and parking garage would be demolished to allow for the Project's new mixed-use component. The North and South Towers, which would be constructed above a five-story parking podium, would contain approximately 1,127 residential units and approximately 34,572 square feet of commercial floor area. The space below the podium would contain an additional nine levels of subterranean parking. The combined commercial and residential floor area would total approximately 1,135,803 square feet. The existing Times, Plant, and Mirror Buildings have a combined floor area of 376,105 square feet. In total, including new construction and existing buildings to remain, the Project proposes approximately 1,511,908 square feet of floor area. This would result in a floor area ratio (FAR) of 9.42:1.

Note: The state Clearinghouse will assign identification numbers for all new projects. If a SCH number already exists for a project (e.g. Notice of Preparation or previous draft document) please fill in.

RE: SCH# 2017061083; Times Mirror Square Project, City of Los Angeles; Los Angeles County, California

Dear Mr. Lamborn:

The Native American Heritage Commission has received the Notice of Preparation (NOP) for Draft Environmental Impact Report for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd. (a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a **separate category of cultural resources**, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment (Pub. Resources Code § 21084.2). Please reference California Natural Resources Agency (2016) "Final Text for tribal cultural resources update to Appendix G: Environmental Checklist Form," http://resources.ca.gov/ceqa/docs/ab52/Clean-final-AB-52-App-G-text-Submitted.pdf. Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends **lead agencies consult with all California Native American tribes** that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws**.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a **lead agency** shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
   a. A brief description of the project.
   b. The lead agency contact information.
   c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).
   d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A **lead agency** shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
   a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
   a. Alternatives to the project.
   b. Recommended mitigation measures.
   c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
   a. Type of environmental review necessary.
   b. Significance of the tribal cultural resources.
   c. Significance of the project's impacts on tribal cultural resources.
   d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
   a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
   b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
   a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
   b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
       i. Planning and construction to avoid the resources and protect the cultural and natural context.
       ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
       i. Protecting the cultural character and integrity of the resource.
       ii. Protecting the traditional use of the resource.
       iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

    This process should be documented in the Cultural Resources section of your environmental document.

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires **local governments** to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have been already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Please contact me if you need any additional information at gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

RE: SCH# 2017061083; Times Mirror Square Project, City of Los Angeles; Los Angeles County, California

Dear Mr. Lamborn:

The Native American Heritage Commission has received the Notice of Preparation (NOP) for Draft Environmental Impact Report for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code § 21000 et seq.), specifically Public Resources Code section 21084.1, states that a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines Section 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an environmental impact report (EIR) shall be prepared. (Pub. Resources Code § 21080 (d); Cal. Code Regs., tit. 14, § 15064 subd. (a)(1) (CEQA Guidelines § 15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources with the area of project effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a **separate category of cultural resources**, "tribal cultural resources" (Pub. Resources Code § 21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment (Pub. Resources Code § 21084.2). Please reference California Natural Resources Agency (2016) "Final Text for tribal cultural resources update to Appendix G: Environmental Checklist Form," http://resources.ca.gov/ceqa/docs/ab52/Clean-final-AB-52-App-G-text-Submitted.pdf. Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code § 21084.3 (a)). **AB 52 applies to any project for which a notice of preparation or a notice of negative declaration or mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. § 800 et seq.) may also apply.

The NAHC recommends **lead agencies consult with all California Native American tribes** that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments. **Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws**.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a **lead agency** shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
    a. A brief description of the project.
    b. The lead agency contact information.
    c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code § 21080.3.1 (d)).
    d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code § 21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A **lead agency** shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code § 21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. (Pub. Resources Code § 21080.3.1(b)).
    a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code § 65352.4 (SB 18). (Pub. Resources Code § 21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
    a. Alternatives to the project.
    b. Recommended mitigation measures.
    c. Significant effects. (Pub. Resources Code § 21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
    a. Type of environmental review necessary.
    b. Significance of the tribal cultural resources.
    c. Significance of the project's impacts on tribal cultural resources.
    d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code § 21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code sections 6254 (r) and 6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code § 21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
    a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
    b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code section 21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code § 21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
    a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
    b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code § 21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code section 21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code section 21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code § 21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code section 21084.3 (b). (Pub. Resources Code § 21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
    a. Avoidance and preservation of the resources in place, including, but not limited to:
        i. Planning and construction to avoid the resources and protect the cultural and natural context.
        ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
    b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
        i. Protecting the cultural character and integrity of the resource.
        ii. Protecting the traditional use of the resource.
        iii. Protecting the confidentiality of the resource.
    c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
    d. Protecting the resource. (Pub. Resource Code § 21084.3 (b)).
    e. Please note that a federally recognized California Native American tribe or a nonfederally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code § 815.3 (c)).
    f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code § 5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An environmental impact report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
    a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code sections 21080.3.1 and 21080.3.2 and concluded pursuant to Public Resources Code section 21080.3.2.
    b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
    c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code section 21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code § 21082.3 (d)).

    This process should be documented in the Cultural Resources section of your environmental document.

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires **local governments** to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code § 65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code § 65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code section 65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code sections 5097.9 and 5097.993 that are within the city's or county's jurisdiction. (Gov. Code § 65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have been already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
   a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
   b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
   a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, section 15064.5(f) (CEQA Guidelines section 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
   b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
   c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code section 7050.5, Public Resources Code section 5097.98, and Cal. Code Regs., tit. 14, section 15064.5, subdivisions (d) and (e) (CEQA Guidelines section 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Please contact me if you need any additional information at gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT FOR THE TIMES MIRROR SQUARE PROJECT (PROJECT), ENV-2016-4676-EIR

Dear Mr. Lamborn:

The Department of Toxic Substances Control (DTSC) has received your Notice of Preparation (NOP) of an Environmental Impact Report (EIR) for the above mentioned Project.

Based on the review of the document, the DTSC comments are as follows:

1) The EIR needs to identify and determine whether current or historic uses at the Project site have resulted in any release of hazardous wastes/substances at the Project area.

2) The EIR needs to identify any known or potentially contaminated site within the proposed Project area. For all identified sites, the EIR needs to evaluate whether conditions at the site pose a threat to human health or the environment.

3) The EIR should identify the mechanism to initiate any required investigation and/or remediation for any site that may require remediation, and which government agency will provide appropriate regulatory oversight.

4) If during construction of the project, soil contamination is encountered or suspected, construction in the area should stop and appropriate Health and Safety procedures should be implemented. If it is determined that contaminated soil exists, the EIR should identify how any required investigation and/or remediation will be conducted, and which government agency will provide appropriate regulatory oversight.

Printed on Recycled Paper

DTSC provides guidance for Preliminary Endangerment Assessment (PEA) preparation and cleanup oversight through the Voluntary Cleanup Program (VCP). For additional information on the VCP please visit DTSC's web site at www.dtsc.ca.gov. If you would like to meet and discuss this matter further please contact me at (818) 717-6539 or email juli.propes@dtsc.ca.gov.

Sincerely,

Juli Propes

LA Sanitation

SUBJECT: **TIMES MIRROR SQUARE – NOTICE OF PREPARATION OF ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING**

This is in response to your June 30, 2017 letter requesting a review of your proposed mixed-use project located at 121-147 S. Spring Street, 100-142 S. Broadway, 202-234 W. 1st Street, and 205-221 W. 2nd Street, Los Angeles, CA 90012. The project will consist of residential units, space amenities, lounges, loading areas, retail uses, grocery store, office, restaurant, and a swimming pool. LA Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

LA Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvement projects needed to provide future capacity as the City grows and develops.

Projected Wastewater Discharges for the Proposed Project:

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
Existing			
Office	120 GPD/1000 SQ.FT	541,113 SQ. FT	64,934
Bank	50 GPD/1000 SQ.FT	7,500 SQ. FT	375

Total			**256,943**

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of the proposed project includes an existing 12-inch line on Broadway. The sewage from the existing 12-inch line feeds into 27-inch line on Hill Street before discharging into a 50-inch sewer line on Grand Ave. Figure 1 shows the details of the sewer system within the vicinity of the project. The current flow level (d/D) in the 12-inch line cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
12	Broadway	*	991,386 GPD
12	Broadway	36	968,056 GPD
24	Hill St	23	5.21 MGD
24	Hill St	16	4.80 MGD
27	Hill St	29	6.50 MGD
50	Grand Ave	43	19.81 MGD

* No gauging available

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

If you have any questions, please call Christopher DeMonbrun at (323) 342-1567 or email at chris.demonbrun@lacity.org.

STORMWATER REQUIREMENTS

LA Sanitation, Watershed Protection Program (WPP) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

In accordance with the Municipal Separate Storm Sewer (MS4) National Pollutant Discharge Elimination System (NPDES) Permit (Order No. R4-2012-0175, NPDES No. CAS004001) and the City of Los Angeles Stormwater and Urban Runoff Pollution Control requirements (Chapter VI, Article 4.4, of the Los Angeles Municipal Code), the Project shall comply with all mandatory provisions to the Stormwater Pollution Control Measures for Development Planning (LID Ordinance) and as it may be subsequently amended or modified. Prior to issuance of grading or building permits, the Applicant shall submit a LID Plan to the City of Los Angeles, Bureau of Sanitation, Watershed Protection Division (WPD), for review and approval. The LID Plan shall be prepared consistent with the requirements of the Development Best Management Practices Handbook.

Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lacitysan.org. It is advised that input regarding LID requirements be received in the early phases of the project from WPD's plan-checking staff.

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the LID requirements. Green Street standard plans can be found at: www.eng2.lacity.org/techdocs/stdplans/

CONSTRUCTION REQUIREMENTS

All construction sites are required to implement a minimum set of BMPs for erosion control, sediment control, non-stormwater management, and waste management. In addition, construction sites with active grading permits are required to prepare and implement a Wet Weather Erosion Control Plan during the rainy season between October 1 and April 15. Additionally, construction sites that disturb more than one-acre of land are subject to the NPDES

Construction General Permit issued by the State of California, and are required to prepare, submit, and implement the Storm Water Pollution Prevention Plan (SWPPP).

If there are questions regarding the stormwater requirements, please call WPP's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

GROUNDWATER DEWATERING REUSE OPTIONS

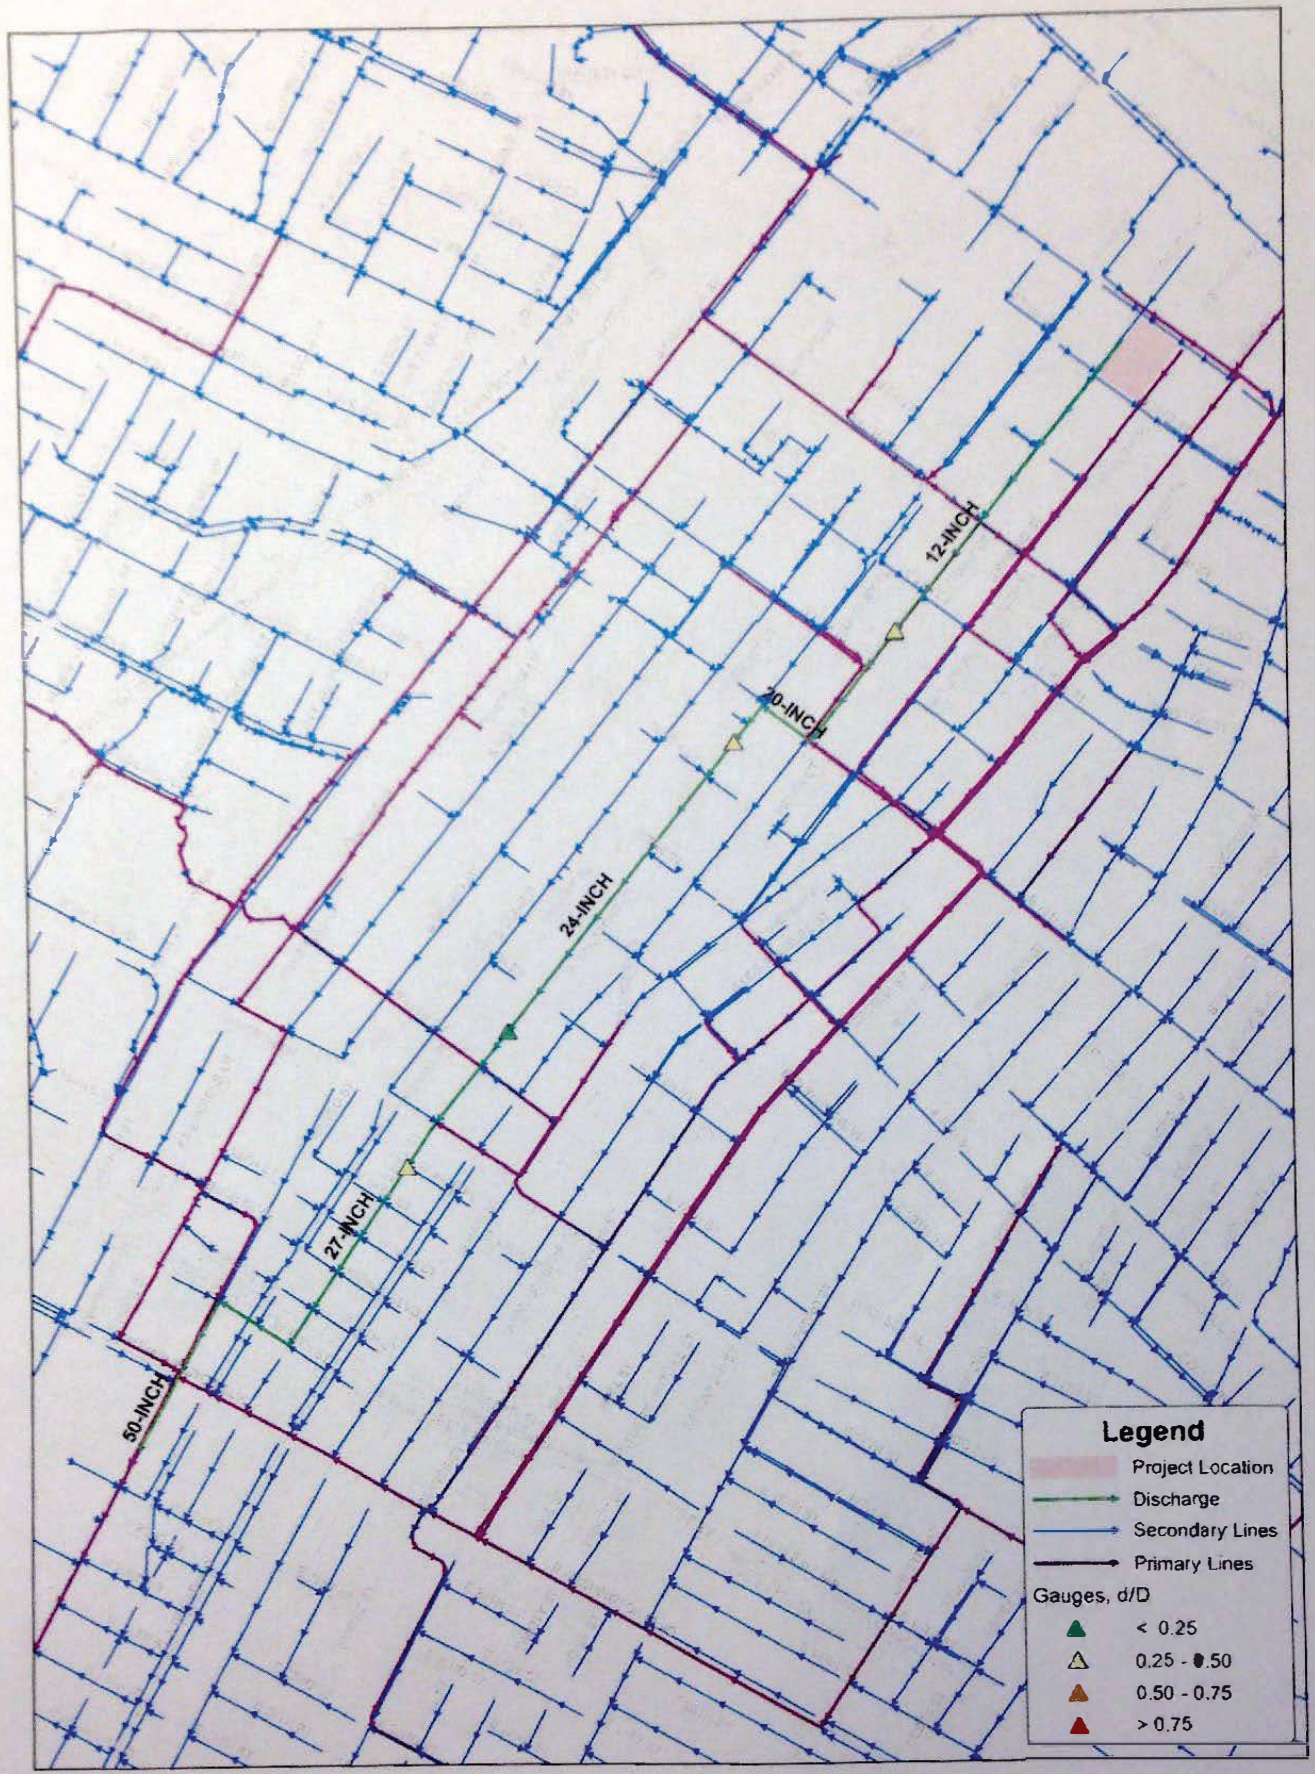
The Los Angeles Department of Water and Power (LADWP) is charged with the task of supplying water and power to the residents and businesses in the City of Los Angeles. One of the sources of water includes groundwater. The majority of groundwater in the City of Los Angeles is adjudicated, and the rights of which are owned and managed by various parties. Extraction of groundwater within the City from any depth by law requires metering and regular reporting to the appropriate Court-appointed Watermaster. LADWP facilitates this reporting process, and may assess and collect associated fees for the usage of the City's water rights. The party performing the dewatering should inform the property owners about the reporting requirement and associated usage fees.

On April 22, 2016 the City of Los Angeles Council passed Ordinance 184248 amending the City of Los Angeles Building Code, requiring developers to consider beneficial reuse of groundwater as a conservation measure and alternative to the common practice of discharging groundwater to the storm drain (SEC. 99.04.305.4). It reads as follows: "Where groundwater is being extracted and discharged, a system for onsite reuse of the groundwater, shall be developed and constructed. Alternatively, the groundwater may be discharged to the sewer."

Groundwater may be beneficially used as landscape irrigation, cooling tower make-up, and construction (dust control, concrete mixing, soil compaction, etc.). Different applications may require various levels of treatment ranging from chemical additives to filtration systems. When onsite reuse is not available the groundwater may be discharged to the sewer system. This allows the water to be potentially reused as recycled water once it has been treated at a water reclamation plant. If groundwater is discharged into the storm drain it offers no potential for reuse. The onsite beneficial reuse of groundwater can reduce or eliminate costs associated with sewer and storm drain permitting and monitoring. Opting for onsite reuse or discharge to the sewer system are the preferred methods for disposing of groundwater.

To help offset costs of water conservation and reuse systems, LADWP offers the Technical Assistance Program (TAP), which provides engineering and technical assistance for qualified projects. Financial incentives are also available. Currently, LADWP provides an incentive of $1.75 for every 1,000 gallons of water saved during the first two years of a five-year conservation project. Conservation projects that last 10 years are eligible to receive the incentive during the first four years. Other water conservation assistance programs may be available from Metropolitan Water District of Southern California. To learn more about available water conservation assistance programs, please contact LADWP Rebate Programs 1-888-376-3314 and LADWP TAP 1-800-544-4498, selection "3".

For more information related to beneficial reuse of groundwater, please contact Greg Reed, Manager of Water Rights and Groundwater Management, at (213)367-2117 or greg.reed@ladwp.com.



SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact Daniel Hackney of the Special Project Division at (213)485-3684.

To: "william.lamborn@lacity.org" <william.lamborn@lacity.org>
Cc: Jillian Wong <jwong1@aqmd.gov>

Dear Mr. Lamborn,

Attached are the SCAQMD staff comments on the Notice of Preparation of an Environmental Impact Report for the Times Mirror Square (ENV-2016-4676-EIR) (SCAQMD Control Number: LAC170705-12). The original, electronically signed letter will be forwarded to your attention by regular USPS mail. Please contact me if you have any questions regarding these comments. Thank you.

Sincerely,

Lijin Sun, J.D.

Notice of Preparation of an Environmental Impact Report for the Times Mirror Square (Case No.: ENV-2016-4676-EIR)

The South Coast Air Quality Management District (SCAQMD) staff appreciates the opportunity to comment on the above-mentioned document. SCAQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the proposed project that should be included in the Environmental Impact Report (EIR). Please send SCAQMD a copy of the EIR upon its completion. Note that copies of the EIR that are submitted to the State Clearinghouse are not forwarded to SCAQMD. Please forward a copy of the EIR directly to SCAQMD at the address shown in the letterhead. **In addition, please send with the EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files[1]. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, SCAQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

The SCAQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. The SCAQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from the SCAQMD's Subscription Services Department by calling (909) 396-3720. More recent guidance developed since this Handbook was published is also available on SCAQMD's website at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993). SCAQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

The SCAQMD has also developed both regional and localized significance thresholds. SCAQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results to the The SCAQMD's CEQA regional pollutant emissions significance thresholds to determine air quality impacts.

[1] Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

The SCAQMD's CEQA regional pollutant emissions significance thresholds can be found here: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf. In addition to analyzing regional air quality impacts, SCAQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the proposed project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by the SCAQMD or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the proposed project and all air pollutant sources related to the proposed project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the proposed project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses (such as placing homes near freeways) can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: http://www.arb.ca.gov/ch/handbook.pdf. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance[2] on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

Mitigation Measures

In the event that the proposed project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying potential mitigation measures for the proposed project, including:

[2] In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's Air Quality and Land Use Handbook: A Community Health Perspective. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: https://www.arb.ca.gov/ch/landuse.htm.

- Chapter 11 of the SCAQMD *CEQA Air Quality Handbook*
- SCAQMD's CEQA web pages available here: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies
- SCAQMD's Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- SCAQMD's Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf?sfvrsn=5
- CAPCOA's *Quantifying Greenhouse Gas Mitigation Measures* available here: http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf

Alternatives

In the event that the proposed project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a "no project" alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project.

Permits

In the event that the proposed project requires a permit from SCAQMD, SCAQMD should be identified as a responsible agency for the proposed project. For more information on permits, please visit the SCAQMD webpage at: http://www.aqmd.gov/home/permits. Questions on permits can be directed to the SCAQMD's Engineering and Permitting staff at (909) 396-3385.

Data Sources

SCAQMD rules and relevant air quality reports and data are available by calling the SCAQMD's Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available at the SCAQMD's webpage (http://www.aqmd.gov).

SCAQMD staff is available to work with the Lead Agency to ensure that project air quality impacts are accurately evaluated and any significant impacts are mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov or call me at (909) 396-3308.

Sincerely,

Lijin Sun

Times Mirror Square Project Comments

Shawn McCoy - 9PLS <shawn.mccoy@gsa.gov> Mon, Jul 31, 2017 at 4:50 PM
To: william.lamborn@lacity.org
Cc: "Norma Quon (9P3PSLS)" <norma.quon@gsa.gov>

Hi William,

I would like to submit comments for the above named project on behalf of the General Services Administration which, on the behalf of the United States Government, owns and manages the United States Courthouse located at 350 W. 1st Street, Los Angeles, CA 90012. We are located directly across Broadway from the proposed project.

The potential impacts to our building are as follows, the particular CEQA consideration is in parenthesis in each section:

- Noise (noise)- During the demolition of the buildings and construction of the new buildings, there is likely to be considerable construction noise. The United States District Court, has courtrooms that back up to Broadway on the East side of our building. All court cases are recorded and any background noise could interfere with their recordings and court proceedings. Is there a way the EIR could address ways to mitigate this concern?

- Ground Vibration (geology/soils/noise)- During the demolition, site prep, and pile driving portions of construction, there will be considerable ground vibration near the building. We would like the EIR to look at ways to mitigate this issue as the vibrations could cause damage to the building.

- Dust (air quality)- Demolition and construction will likely create a lot of dust. The dust has the potential to foul the water in our cooling tower, require more changes to building air filters, and will likely cause our central plant equipment to have to be cleaned out more frequently to remove mud from the condenser water side of the equipment. The dust will also mean we will have to conduct window washing on a more regular basis and will likely increase the cleaning frequency in our courtyards.

- Ingress/Egress Loading Dock Access (traffic/transportation)- The building has one entrance to the loading dock and underground parking. The entrance can only be accessed from Broadway. We want to make sure that the entrance is accessible 24/7 during construction. If there will be a disruption to access, we would like to request that it be outside of normal business hours and that we receive as much advanced notice as possible.

- (Public Services) In reviewing the Public Services portion of the ESA, the United States Courthouse is not mentioned. Please make sure that the fact that the United States Courthouse is located so close to the project site, there is a possibility there will be an impact in the services we can offer during construction, depending on how well the environmental impacts can be remediated.

Thank you,
Shawn McCoy, RPA

Los Angeles, CA 90012

Re: Case No., ENV-2016-4676-EIR
Project Name: Times Mirror Square **July 31, 2017**

Dear Mr. Lamborn,

I am a resident of the Higgins Building at 108 West 2nd Street, a block east of the subject premises. In accordance with the request of the Department of City Planning for comments relating to the preparation of an environmental impact statement, the following are my comments:

!. Parking

There is a serious lack of parking in the area. Residents of the area already have difficulty find a place to park. Given the construction of the Metro Station at 2nd and Broadway, there will be an increased local need for adequate parking.

The proposed project across the street at 2nd and Broadway, 222 West 2nd Street, is estimated to reduce available parking in the area by 601 spaces. The construction of the Metro Station at 2nd and Broadway has has already eliminated an approximately 250 parking spaces to build the station. The completion of this huge project will create a serious parking problem. The developers should be required to provide more public parking.

2. Aesthetics

The proposed project presents two radically modern skyscrapers which at 37 and 53 stories are out of scale with its surrounding neighborhood. There is no building in the near vicinity which mirrors its size and design. These gargantuan proposals will stick out like a sore thumb.

The Project Site is surrounded by a mix of commercial office, government and civic office, retail, and residential uses contained in a range of low-rise to high-

rise buildings, which are physically separated from the Project Site by local roadways. Immediately to the west is the new 11-story Federal Court House on Broadway between 1st and 2nd streets. To the immediate north across 2nd Street is a vacant lot which is scheduled to be a continuation of Grand Park. East of the Project Site across Spring Street in the 10 Story Los Angeles Police Administration Building. To the south is the site of the new metro station at 2nd and Broadway and an existing 6-story parking lot. And most significantly just to the northeast is the majestic 28-story City Hall.

The Project Site lies at the northern end of the Broadway Theater and Entertainment District Community Design Overlay (CDO) area (just north of the 2nd street border), where development is encouraged to reflect the overall vision of a cohesive, pedestrian-friendly, and vibrant entertainment, commercial, and mixed-use district. The immediate area is defined by several iconic buildings, both old and new, including the Bradbury Building to the south, the Los Angeles Times buildings on the subject site and City Hall to the north, the new 11-story U.S. federal courthouse on Broadway between 1st and 2nd Streets to the west, the 10-story Los Angeles Police Department (LAPD) Headquarters, and the 15-story Caltrans buildings to the north and east, respectively. Residential uses in the Project vicinity include the 50-unit Douglas Building Lofts at 257 South Spring Street, the 135-unit Higgins Building Lofts at 108 West 2nd Street, and the seven-story, 40-unit Pan American Lofts at 253 South Broadway.

It should be noted that the Higgins Building is a 10 story building.

It is clear from a review of the surrounding area that the 37 story North Tower and 53 story South Tower are out of scale with the surrounding area and will substantially degrade its existing visual character and quality of its site.

Standard 1C of the Broadway Theater District requires "scale, massing and proportions" that characterize the historic district. There is no such building in the surrounding area that matches the project in size or design.

In order to accomplish the project, the massive transfer of floor area rights (TFAR) of 548, 440 is required.

If one views the area running East to the Los Angeles River, you encounter Little Tokyo and the Arts District, growing and evolving neighborhoods that are harmonious, attractive and of lower scale.

Downtown is sufficiently built up that each section of the downtown has its own scale and character as noted. Out of scale buildings that destroy the character of individual sections as this project should be avoided.

As presently constituted the Los Angeles architectural skyline is well designed with the center and focal point clustered around the US Bank building and new

Wilshire Grand. As proposed. a lofty intrusion into the skyline will erupt with the disturbing vision of the 37 and 53 story towers giving an unpleasant asymmetrical view. This effect has been described by critics as the "Manhattanization of Los Angeles"

Additionally, the effect of large and tall buildings on air quality, air flow and future climate temperature increase should be considered.

3. Aesthetic detriment to City Hall as an Architectural Monument.

Recent proposals in the area of City Hall of buildings far in excess of the height of City Hall, 28 stories, are troubling. The City Hall is a wonderful aesthetic feature of Los Angeles. Not only just in many movies, but in reality it stands perpetually as a splendid example of our city and its architectural beauty. Restrictions against buildings of the size that would mar its majesty in our skyline should be prohibited. Otherwise its incomparable majesty as an architectural masterpiece will be destroyed by a mish mash of tall barbaric monstrosities. The 53 and 37 story towers will dwarf and diminish the importance of City Hall.

4. Denigration of the views of Historic Buildings.

As a corollary to the objection as to the destruction of the significance of City Hall in our skyline, is the further denigration of the ability of residents East of the project to view Disney Hall. Disney Hall is in tandem with City Hall as the two most prominent architectural achievements in Los Angeles. The integrity and visual contributions of historic buildings should be preserved and protected.

5. Excessive Intrusion of Noise and Poor Air Quality.

The residents of the Higgins Building have already been subjected to excessive noise and poor air quality from the construction by Metro of the Broadway and Second Street Metro Station. This will continue for another estimated five years, on top of which the residents will be subjected to another four years of construction of the proposed project with the same poor environmental effect of excessive noise and poor air quality. This is an unreasonable social result and should not be permitted.

Respectfully submitted,

Allan M. Harris, Esq.
The undersigned is a licensed attorney of the States of New York and New Jersey. He is a retired Municipal Court Judge (Fair Lawn N.J.), and former counsel to the Paterson New Jersey Zoning Board of Adjustment.

William Lamborn
City of Los Angeles Department of City Planning
220 N. Spring Street. Room 750
Los Angeles, CA 90012

Dear Mr. Lamborn,

I object to the proposed buildings, Times Mirror Square Project, because it offers **NOTHING** to the surrounding community and the City of Los Angeles.

It **CREATES** the need for more parking places.
It **TAKES** away the view from of our skyline, **DIMINISHES** our landmark buildings, and they will stick up like sore thumbs.

Second Street has a possibility of being a beautiful wide street from the Disney Center and Broad Museum on down to Little Tokyo, if the Times Mirror Square project is **NOT** built as proposed. The proposed Gehry Development on Grand, like the new Federal Court Building is set back and provides green space. Attention was paid in their design not to overwhelm the premiere center of our City–City Hall. This grand building built in 1928 by AC Martin still maintains it grandeur. The earlier built part of the LA Times Building is magnificent, as is the new Police Administration Building (again set back and providing green space to the area), the architectural interesting Caltrans (again set back and provides a green wall and trees to 2nd Street). The historic designated Higgins Building and St. Vibiana (again with green trees lining 2nd street). When you reach the Weller Center–the builders made a point to provide a breathtakingly magnificent view of the city hall all within a profile lower than the grand center of our city–City Hall, itself.

Times Mirror Square offers **NOTHING** but gargantuan high rise apartments and office space. This is an area of historic and architecturally significant buildings, theaters and events **AND** the center of our city is the City Hall.
The LA Times building is magnificent and deserves to showcased, not diminished by these gargantuan monoliths.

They are asking asking for the right to erect two out of size and scale 53 and 37 story towers. This is not a high-rise area–take it to South Park and come up with a plan that fits the lot and the area.

These buildings should be no taller that the apartments on Olive Street, that way they fit with the area and does not disrupt the skyline.

The new buildings should also be moved back from Second Street (which could provide a low-rise park like area on the 2nd street side-not just between two towers as proposed which relates only to the project and not the environment), This would reiterate the wide park-like character of 2nd Street. Build a lower rise project on the property and you would have overwhelming community support and you have enhanced the city for generations.

There are some crappy buildings and vacant lots in this area, but, there are many more fabulous buildings on Broadway–buildings their builders were proud to put their name on, and their money in. Higgins (with architects Haley and A.C. Martin) built the Higgins Building on 2nd Street to be the first steel reinforced concrete building on the WEST Coast. AC Martin went on build some 1500 buildings (including City Hall) contributing to the greatness of the city. The civic buildings in this area are incredible and something our city can be proud of. We need to get it right this time, because the opportunity to build on the shoulders of these great Architects, will not come again. And the crappy new buildings and sore thumbs we allow now, will stand long after their developers sell them off for cash and leave town to blight other cities in their greed.

Cordially,

RE: Scoping Comments on Potential Environmental Impacts of Times Mirror Square Project

Dear Mr. Lamborn:

I am writing on behalf of the Los Angeles County Law Library (the "Law Library") regarding the potential environmental impacts of the Times Mirror Square Project (the "Project").

The Law Library is open to the public six days per week (Monday through Saturday) year-round and provides a broad array of access-to-justice services, ranging from one-on-one assistance, to workshops and classroom, educational programs. The vast majority of the requests we receive are both urgent and The Law Library processes more than 50,000 requests for assistance per year.

The Law Library is located immediately across from the Project at 1st and Broadway (see attached diagram). There is a pedestrian entrance at the corner of 1st and Broadway and a vehicular entrance on Broadway, just north of 1st Street. The vehicular entrance is the exclusive means of access to the parking structure used by both patrons and staff. (There is a public parking structure adjacent to the Law Library on Hill St, but that structure does not connect to the parking structure located on Broadway.) The Law Library requests that the vehicular entrance on Broadway remain open and accessible at all times.

Furthermore, the air filtration system of the Law Library has large air intake openings facing Broadway and is highly susceptible to contamination from dust and other particulates. Dust generated from nearby construction therefore clogs our air filters and impairs the air quality at the Law Library. The Law Library requests that mitigation measures include a requirement of compliance with AQMD Rule 403 regarding fugitive dust emissions.

Accordingly, the Law Library requests that the EIR study any potential impacts resulting from either construction or operation of the Project on the sensitive and vital services provided at the Law Library, including impacts on:

1. access (both vehicular and pedestrian) to this important community resource;

LALAW LIBRARY

2. the quiet environment (necessary to deliver the services provided at a Law Library); and
3. air quality both external and internal to the Law Library.

Thank you for the opportunity to comment and for your efforts to improve and further develop our wonderful downtown community!

Sincerely,

Sandra J Levin
Executive Director, LA Law Library

LALAW LIBRARY

Dear Mr. Lamborn,

Thank you for the opportunity to comment on the proposed Times Mirror Square project in the Center City/Historic Core District of Downtown Los Angeles. Attached is Metro's comment letter, a hard copy of which will follow via mail. You'll also find the attachment documents referenced in the letter above. Please feel free to reach out should you have any questions.

Best regards,

Eddi Zepeda

RE: Times Mirror Square – Notice of Preparation of an Environmental Impact Report

Dear Mr. Lamborn,

Thank you for the opportunity to comment on the proposed Times Mirror Square development (Project) located in the Center City/Historic Core District of Downtown Los Angeles. This letter conveys comments from the Los Angeles County Metropolitan Transportation Authority (Metro) concerning issues that are germane to our agency's statutory responsibility in relation to our facilities and services that may be affected by the proposed Project.

Metro is committed to working with stakeholders across the County to support the development of transit oriented communities (TOCs). TOCs are built by considering transit within a broader community and creating vibrant, compact, walkable, and bikeable places centered around transit stations and hubs with the goal of encouraging the use of transit and other alternatives to driving. Metro collaborates with local municipalities, developers, and other stakeholders in land use planning and development efforts, and to find partnerships that support TOCs across Los Angeles County.

Project Location and Existing On-site Uses

The Project site is located at 121, 145, 147 S. Spring Street; 100, 102, 106, 108, 110, 118, 120, 124, 126, 128, 130, 140, 142 S. Broadway; 202, 212, 214, 220, 224, 228, 230, 234 W. 1st Street; 205, 211, 221 W. 2nd Street in Los Angeles. The site is an approximately 3.6-acre (five parcels totaling approximately 160,578 square feet [sf]) city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway, and is currently occupied by five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage, and the 6-story Executive Building, resulting in a total of approximately 559,863 sf.

Project Description

The Project would retain and renovate the Times, Plant, and Mirror Buildings to provide approximately 376,105 sf of offices and/or other retail and commercial uses, including an approximately 50,000 sf grocery store. These three buildings are aligned along S. Spring Street, with frontages along both W. 1st Street and W. 2nd Street. The Project proposes to demolish the Parking Garage and Executive buildings located on the western half of the site and construct two mixed-use towers (North and South Towers). The Project's 37-story North Tower and 53-story South Tower mixed-use components would be constructed in the areas currently occupied by the 6-story Executive Building at the corner of W. 1st

Street and S. Broadway and the 6-story parking structure at the corner of W. 2nd Street and S. Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. The towers would include approximately 34,572 sf of retail uses, which would be located at ground level. Inclusive of the existing buildings to be retained and rehabilitated, the project would include a total of 1,511,908 sf of floor area for a resulting floor-area ratio (FAR) of approximately 9.42:1.

The Project would include a pedestrian paseo constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. Approximately 72,902 sf of common open space, including the approximately 15,708 sf paseo, would be provided as part of the North and South Towers component. Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023.

Metro Comments

Regional Connector Adjacency

It is noted that the Project site is in close proximity to the Metro Regional Connector subway tunnels and partially overlaps the Historic Broadway subway station. The tunnels and station are currently being constructed by Metro's contractor, Regional Connector Constructors (RCC). While Metro strongly supports development near transit connections, the following concerns related to the Project's proximity to the subway tunnels and station should be addressed:

1. Metro entered into the following agreements with the Project sponsor to facilitate the construction of the subway station and tunnels: "Acquisition Agreement Regarding 2nd/Broadway Station Portal" (executed May 29, 2014) and "Construction Agreement and Right of Entry for Construction Purposed" (executed February 27, 2015). Metro expects that the Project sponsor will continue to comply with the terms of these agreements, collectively referred to as the "Agreements," including:

    a. The sponsor's Project must be designed, constructed, and operated in such a way that ensures Metro and its patrons have clear, unobstructed sight lines and physical access to the station at all times.

    b. The Project sponsor shall at all times provide appropriate safety measures and protection to Metro's patrons from construction activities associated with the proposed Project.

    c. Project sponsor will not connect to Metro's station support walls or any part of station or portal without express written consent and approval by Metro of the Project sponsor's submitted architectural and engineering drawings.

    d. The Project sponsor will provide Metro an exclusive construction right of entry and construction permit to facilitate the construction of the subway station and tunnels for the durations defined in the Agreements.

    e. The sponsor's Project shall comply with Metro Rail Design Criteria Section 05 Structural –Geotechnical, Subsection 5.4.11-Adjacent Public Buildings (attached) to ensure the pressures created by the Project's building foundations do not exceed the design loads on Metro facilities using accepted geotechnical techniques of analysis.

2. The Project sponsor should be advised that the Metro Regional Connector subway may operate peak service as often as every four minutes in both directions and that trains may operate in and out of revenue service, 24 hours a day, seven days a week, in the station and tunnels immediately adjacent to the sponsor's Project.

3. The construction and operation of the sponsor's proposed Project must not disrupt the operation and maintenance activities of the Metro Regional Connector Line or the structural and systems integrity of Metro's subway tunnels or station facilities.

4. Considering the proximity of the sponsor's proposed Project to Metro's subway tunnels and station facilities, it is expected that rail operations may produce noise and vibration. A recorded Noise Easement Deed in favor of Metro is required prior to the completion and/or occupancy of the Project, a form of which is attached. In addition, any noise mitigation required for the Project must be borne by the developers of the Project and not Metro. The easement recorded in the Noise Easement Deed will extend to successors and tenants as well.

5. Consistent with ZI No. 1117, prior to the City issuing a building permit within 100 feet of Metro Rail, clearance shall be obtained from Metro. Metro must review construction plans and operations prior to any permits being issued. Metro will need to review the geotechnical report, structural foundation plans, sections, shoring plan sections, and calculations of the shoring system and permanent structures to ensure Metro's facility is not placed in risk at any time. . Please refer to the attached Metro "Design Criteria and Standards, Volume III - Adjacent Construction Design Manual" for more details regarding submitting drawings and calculations to Metro for review. Please note that Metro requires an Engineering Review Fee for evaluation of any impacts based on adjacency and relationship of the proposed building to the Metro existing structures.

6. Metro staff shall be permitted to monitor construction activity to ascertain any impact to the subway tunnels and station facilities.

7. The Project sponsor should be advised that the Project's concurrent construction with Metro's Regional Connector project construction activities may cause impacts on the decking system on 2nd Street and subway station construction schedule. Metro may request reimbursement for costs incurred as a result of Project construction/operation issues that cause delay or harm to Metro service delivery or infrastructure.

8. The Project sponsor will be required to notify Metro, as the Project develops, of any changes to the construction/ building plans that may or may not impact the subway tunnel and station facilities.

9. As the Project develops, Metro Regional Connector Project Engineering should be contacted regarding the Project's potential impacts on the subway station structures and tunnels. Michael Harrington, Director of Regional Connector Project Engineering, can be reached at 213.893.7163 or by email at HarringtonM@metro.net.

Bus Stop Adjacency

Several Metro bus lines operate on N. Broadway Street, W. 1st Street, S. Spring Street, and W. 2nd Street adjacent to the proposed Project. Three Metro bus stops located along N. Broadway Street , W. 1st Street, and S. Spring Street are adjacent to the proposed Project and serve lines 28, 30/330, 40, 45, 442, and 745. The following comments relate to bus operations and the bus stops:

1. Although the Project is not expected to result in any long-term impacts on bus operations, the developer should be aware of the bus facilities and services that are present. The existing Metro bus stops must be maintained as part of the final Project. During construction, the stops must be maintained or relocated consistent with the needs of Metro Bus Operations.

2. During construction, the stops must be maintained or relocated consistent with the needs of Metro Bus Operations. Please contact Metro Bus Operations Control Special Events Coordinator at 213-922-4632 and Metro's Stops and Zones Department at 213-922-5190 at least 30 days in advance of initiating construction activities. Other municipal buses may also be impacted and should be included in construction outreach efforts.

3. Metro encourages the installation of bus shelters with benches, wayfinding signage, enhanced crosswalks and ramps compliant with the Americans with Disabilities Act (ADA), as well as wide sidewalks, pedestrian lighting, and a continuous canopy of shade trees in paths of travel to access transit stops and other amenities that improve safety and comfort for transit riders. The City should consider requesting the installation of such amenities as part of the development of the site. Further, final design of the bus stops and surrounding sidewalk area must allow passengers with disabilities a clear path of travel to the bus stops from the proposed development.

4. Driveways accessing parking and loading at the Project site should be located away from transit stops, and be designed and configured to avoid potential conflicts with on-street transit services and pedestrian traffic to the greatest degree possible. Vehicular driveways should not be located in or directly adjacent to areas that are likely to be used as waiting areas for transit.

Transit Oriented Development

Considering the proximity of the Project to the future Historic Broadway Station and numerous Metro bus lines, Metro would like to identify the potential synergies associated with transit-oriented development:

1. Metro supports development of commercial and residential properties near transit stations and understands that increasing development near stations represents a mutually beneficial opportunity to increase ridership and enhance transportation options for the users of the developments. Metro encourages the City and Project sponsor to be mindful of the Project's proximity to the Historic Broadway Station, including orienting pedestrian pathways toward the station.

2. Metro would like to inform the Project sponsor of Metro's employer transit pass programs including the Annual Transit Access Pass (A-TAP) and Business Transit Access Pass (B-TAP) programs which offer efficiencies and group rates that businesses can offer employees as an incentive to utilize public transit. For more information on these programs, contact Devon Deming at 213-922-7957 or DemingD@metro.net.

3. Given the location of the project within a very dense walkable urban environment with easy access to numerous rail and bus rapid transit lines, the amount of parking proposed appears to be excessive. Metro encourages the incorporation of transit- and pedestrian-oriented parking provision strategies such as the reduction or removal of minimum parking requirements for specific areas and the exploration of shared parking opportunities or parking benefit districts. These strategies could be pursued to encourage more transit-oriented development and reduce automobile-orientation in design and travel demand.

4. Limiting parking and loading access to 1st Street should be considered to prevent unnecessary pedestrian/car conflicts along the Broadway, Spring Street and 2nd Street frontages, which are likely to have high pedestrian volumes, particularly when both the Historic Broadway Station and the downtown street car line open.

5. With an anticipated increase in traffic, Metro encourages an analysis of impacts on non-motorized transportation modes and consideration of improved non-motorized access to the station including pedestrian connections and bike lanes/paths. Appropriate analyses could include multi-modal LOS calculations, pedestrian audits, etc.

6. The Project should address first-last mile connections to transit, encouraging development that is transit accessible with bicycle and pedestrian-oriented street design connecting stations with housing and employment concentrations. For reference, we would like to direct City staff to view the First Last Mile Strategic Plan, authored by Metro and the Southern California Association of Governments (SCAG), available on line at: https://media.metro.net/docs/sustainability_path_design_guidelines.pdf.

7. Metro encourages the City to work with the applicant to promote bicycle use through adequate short-term bicycle parking, such as ground level bicycle racks and/or curbside bicycle corrals, as well as secure and enclosed long-term bicycle parking for guests, employees, and residents. The Project applicant should coordinate with Metro Bike Share program for potential Bike Share station at this development. Additionally, the applicant should help facilitate safe and convenient connections for pedestrians, people riding bicycles, and transit users to/from the Project site and nearby destinations such as Historic Broadway Station, Civic Center Station, etc. The Project is also encouraged to support these connections with wayfinding signage inclusive of all modes of transportation.

Congestion Management Program

Beyond impacts to Metro facilities and operations, Metro must also notify the applicant of specific City, County, and State requirements. For example, a Transportation Impact Analysis (TIA), with roadway and transit components, is required under the State of California Congestion Management Program (CMP) statute. The CMP TIA Guidelines are published in the "2010 Congestion Management Program for Los Angeles County," Appendix D (attached). The geographic area examined in the TIA must include the following, at a minimum:

1. All CMP arterial monitoring intersections, including monitored freeway on/off-ramp intersections, where the proposed Project will add 50 or more trips during either the a.m. or p.m. weekday peak hour (of adjacent street traffic).

2. If CMP arterial segments are being analyzed rather than intersections, the study area must include all segments where the proposed Project will add 50 or more peak hour trips (total of both directions). Within the study area, the TIA must analyze at least one segment between monitored CMP intersections.

3. Mainline freeway-monitoring locations where the Project will add 150 or more trips, in either direction, during either the a.m. or p.m. weekday peak hour.

4. Caltrans must also be consulted through the NOP process to identify other specific locations to be analyzed on the state highway system.

The CMP TIA requirement also contains two separate impact studies covering roadways and transit, as outlined in Sections D.8.1 – D.9.4. If the TIA identifies no facilities for study based on the criteria above, no further traffic analysis is required. However, projects must still consider transit impacts. For all CMP TIA requirements please see the attached guidelines.

If you have any questions regarding this response, please contact Nick Saponara at 213-922-4313 or by email at DevReview@metro.net. Metro looks forward to reviewing the Draft EIR. Please send it to the following address:

Metro Development Review
One Gateway Plaza MS 99-23-4
Los Angeles, CA 90012-2952

Sincerely,

Nick Saponara
Senior Director, Joint Development

ADJACENT CONSTRUCTION DESIGN MANUAL

1.0 INTRODUCTION

1.1 Parties planning construction over, under or adjacent to ~~a~~ Metropolitan Transportation Authority (MTA) facilit**ies**~~y~~ or structure**s** are advised to submit for review ~~seven (7)~~**two (2) hard** copies **and one (1) electronic copy** of their **design** drawings and ~~four (4) copies of their~~ calculations showing the relationship between their project and the MTA facilities, for MTA review. The purpose of the MTA review is to reduce the chance of conflict, damage, and unnecessary remedial measures for both MTA and the parties. Parties are defined as developers, agencies, municipalities, property owners or similar organizations proposing to perform or sponsor construction work near MTA facilities.

1.2 Sufficient drawings and details shall be submitted at each level of completion such as Preliminary, In-Progress, Pre-final and Final, etc. to facilitate the review of the effects that the proposed project may or may not have on the MTA facilities. An MTA review requires internal circulation of the construction drawings to concerned departments ~~(usually includes Construction, Operations, Maintenance, and Real Estate)~~**for MTA departments review**. Parties shall be responsible for all costs related to **MTA**~~drawing~~ review~~s by MTA~~. MTA costs shall be based upon the actual hours taken for review at the hourly rate of pay plus overhead charges. Drawings normally required for review are:

A. Site Plan

B. Drainage Area Maps and Drainage Calculations

C. Architectural drawings

D. Structural drawings and calculations

E. Civil Drawings

F. Utility Drawings

G. Sections showing Foundations and MTA Structures

H. Column Load Tables

I. Pertinent Drawings and calculations detailing an impact on MTA facilities

J. A copy of the Geotechnical Report.

K. Construction zone traffic safety and detour plans: Provide and regulate positive traffic guidance and definition for vehicular and pedestrian traffic adjacent to the construction site to ensure traffic safety and reduce adverse traffic circulation impact.

L. Drawings and calculations should be sent to:

MTA Third Party Administration (Permits Administration)
Los Angeles County Metropolitan Transportation Authority
One Gateway Plaza
Los Angeles, California 90012

1.3 If uncertainty exists on the possible impacts a project may have on the MTA facilities, and before submitting a formal letter requesting a review of a construction project adjacent to the Metro System, the party or his agent may contact the MTA Third Party Administrator (Permits). The Party shall review the complexity of the project, and **contact MTA to** receive an informal evaluation of the amount of detail required for the MTA review. In those cases, whereby it appears the project will present no risk to MTA, the Third Party Administrator (Permits) shall immediately route the design documents to **Engineering,** Construction, Operations, Maintenance, and Real Estate departments for a preliminary evaluation. If it is then confirmed that MTA risk is not present, the Administrator shall process an approval letter to the party.

1.4 A period of 30 working days should be allowed for review of the drawings and calculations. Thirty (30) work days should be allowed for each successive review as required. It is noted that preliminary evaluations are usually produced within 5 working days.

1.5 The party shall reimburse the MTA for any technical review or support services costs incurred that are associated with his/her request for access to the Metro **Transit**~~Rail~~ System

1.6 The following items must be completed before starting any construction:

A. Each part of the project's design may be reviewed and approved by the MTA. The prime concern of the MTA is to determine the effect of the project on the MTA structure and its transit operations. A few of the other parts of a project to be considered are overhead protection, dust protection, dewatering, and temporary use of public space for construction activities.

B. Once the Party has received written acceptance of the design of a given project then the Party must notify MTA prior to the start of construction, in accordance with the terms of acceptance.

1.7 Qualified Seismic, Structural and Geotechnical Oversight

The design documents shall note the name of the responsible Structural Engineer and Geotechnical Engineer, licensed in the State of California.

2.0 REVIEW PROCEDURE

2.1 All portions of any proposed design that will have a direct impact on an MTA facility or structure will be reviewed to assure that the MTA facility or structure is not placed in risk at any time, and that the design meets all applicable codes and criteria. Any portion of the proposed design that is to form part of an MTA controlled area shall be designed to meet the MTA Design Criteria and Standards.

2.2 Permits, where required by the local jurisdiction, shall be the responsibility of the party. City of L.A. Dept. of Bldg. and Safety and the Bureau of Engineering permit review shall remain in effect. Party shall refer to MTA Third Party Administration policies and procedures, THD5 for additional information.

2.3 Monitoring of the temporary support of excavation structures for adjacent construction shall be required in all cases for excavations within the geotechnical zone of influence of MTA structures. The extent of the monitoring will vary from case to case.

2.4 Monitoring of the inside of MTA tunnels and structures shall be required when the adjacent excavation will unload or load the MTA structure or tunnel. Monitoring of vertical and horizontal distortions will include use of extensometers, inclinometers, settlement reference points, tiltmeters, groundwater observation wells, tape extensometer anchor points and load cells, as appropriately required. Acceptable limits of movement will depend on groundwater conditions, soil types and also the length of service the stations and tunnels have gone through. Escorts will be required for the survey parties entering the Metro operating system in accordance with MTA Operating Rules and Procedures. An MTA account number will be established and the costs for the escort monitoring and surveying service will be billed directly to the party or his agent as in section 1.2.

2.5 The calculations submitted for review shall include the following:

A. A concise statement of the problem and the purpose of the calculation.

B. Input data, applicable criteria, clearly stated assumptions and justifying rationale.

C. References to articles, manuals and source material shall be furnished with the calculations.

D. Reference to pertinent codes and standards.

E. Sufficient sketches or drawing references for the work to be easily understood by an independent reviewer. Diagrams indicating data (such as loads and dimensions) shall be included along with adequate sketches of all details not considered standard by MTA.

F. The source or derivation of all equations shall be shown where they are introduced into the calculations.

G. Numerical calculations shall clearly indicate type of measurement unit used.

H. Identify results and conclusions.

I. Calculations shall be neat, orderly, and legible.

2.6 When computer programs are used to perform calculations, the following information shall accompany the calculation, including the following:

A. Program Name.

B. Program Abstract.

C. Program Purpose and Applications.

D. Complete descriptions of assumptions, capabilities and limitations.

E. Instructions for preparing problem data.

F. Instructions for problem execution.

G. List (and explanation) of program acronyms and error messages.

H. Description of deficiencies or uncorrected errors.

I. Description of output options and interpretations.

J. Sample problem(s), illustrating all input and output options and hardware execution statements. Typically, these problems shall be verified problems.

K. Computer printout of all supporting calculations.

L. The "User's Manual" shall also include a certification section. The certification section shall describe the methods and how they cover the permitted options and uses of the program.

2.7 Drawings shall be drawn, to scale, showing the location and relationship of proposed adjacent construction to existing MTA structures at various stages of construction along the entire adjacent alignment. The stresses and deflections induced in the existing MTA structures should be provided.

2.8 The short-term and long-term effects of the new loading due to the adjacent construction on the MTA structures shall be provided. The soil parameters and other pertinent geotechnical criteria contained in existing contract documents for the affected structure, plus any additional conditions shall be used to analyze the existing MTA structures.

2.9 MTA structures shall be analyzed for differential pressure loadings transferred from the adjacent construction site.

3.0 MECHANICAL CRITERIA

3.1 Existing services to MTA facilities, including chilled water and condenser water piping, potable and fire water, storm and sanitary sewer, piping, are not to be used, interrupted nor disturbed without written approval of MTA.

3.2 Surface openings of ventilation shafts, emergency exits serving MTA underground facilities, and ventilation system openings of surface and elevated facilities are not to be blocked or restricted in any manner. Construction dust shall be prevented from entering MTA facilities.

3.3 Hot or foul air, fumes, smoke, steam, etc., from adjacent new or temporary facilities are not to be discharged within 40 feet of existing MTA ventilation system intake shafts, station entrances or portals. Tunnel ventilation shafts are both intake and discharge structures.

3.4 Clear access for the fire department to the MTA fire department connections shall be maintained at all times. Construction signs shall be provided to identify the location of MTA fire department connections. No interruption to fire protection water service will be permitted at any time.

3.5 Modifications to existing MTA mechanical systems and equipment, including ventilation shafts, required by new connections into the MTA System, shall only be permitted with prior review and approval by MTA. If changes are made to MTA property as built drawings shall be provided reflecting these changes.

At the option of MTA, the adjacent construction party shall be required to perform the field tests necessary to verify the adequacy of the modified system and the equipment performance. This verification shall be performed within an agreed time period jointly determined by MTA and the Party on a case by case basis. Where a modification is approved, the party shall be held responsible to maintain original operating capacity of the equipment and the system impacted by the modification.

4.0 OPERATIONAL REQUIREMENTS

4.1 GENERAL

A. Normal construction practices must be augmented to insure adequate safety for the general public entering Metro Stations and riding on Metro Trains and Buses. Design of a building, structure, or facility shall take into account the special safety considerations required for the construction of the facility next to or around an operating transit system.

B. Projects which require working over or adjacent to MTA station entrances shall develop their construction procedures and sequences of work to meet the following minimum requirements:

1. Construction operations shall be planned, scheduled and carried out in a way that will afford the Metro patrons and the general public a clean, safe and orderly access and egress to the station entrance during revenue hours.

2. Construction activities which involve swinging a crane and suspended loads over pedestrian areas, MTA station entrances and escalators, tracks or Metro bus passenger areas shall not be performed during revenue hours. Specific periods or hours shall be granted on a case-by-case basis**, with the approval of Construction Work Plan by MTA Construction Safety Department**.

3. All cranes must be stored and secured facing away from energized tracks, when appropriate.

4. All activity must be coordinated through the MTA Track Allocation process in advance of work activity. **All members of the work crew will be required to attend MTA Safety Training.**

5. In order to provide a safe zone to maintain adjacent developments. All developments adjacent to Metro At-Grade Stations, Aerial Stations or Track Guideways shall provide a minimum 5 foot setback from the Metro and developer's shared property line to the outside face of the proposed structure at Metro or the developer's property for maintenance to be performed or installed from within the zone created by this setbacks.

4.2 OVERHEAD PROTECTION - Station Entrances

A. Overhead protection from falling objects shall be provided over MTA facilities whenever there is possibility, due to the nature of a construction operation, that an object could fall in or around MTA station entrances, bus stops, elevators, or areas designed for public access to MTA facilities. Erection of the overhead protection for these areas shall be done during MTA non-revenue hours.

1. The design live load for all overhead protection shall be 150 pounds per square foot minimum. The design wind load on the temporary structures shall be 20 pounds per square foot, on the windward and leeward sides of the structure.

2. The overhead protection shall be constructed of fire rated materials. Materials and equipment shall not be stored on the completed shield. The roof of the

shield shall be constructed and maintained watertight.

B. Lighting in public areas and around affected MTA facilities shall be provided under the overhead protection to maintain a minimum level of twenty-five (25) footcandles at the escalator treads or at the walking surface. The temporary lighting shall be maintained by the Party.

C. Wooden construction fencing shall be installed at the boundary of the areas with public access. The fencing shall be at least eight-feet high, and shall meet all applicable code requirements.

D. An unrestricted public access path shall be provided at the upper landing of the entrance escalator-way in accordance with the following:

1. A vertical clearance between the walking surface and the lowest projection of the shield shall be 8'-0".
2. A clear pedestrian runoff area extending beyond the escalator newel shall be provided, the least dimension of which shall be twenty (20) feet.
3. A fifteen (15) foot wide strip (other than the sidewalk) shall be maintained on the side of the escalator for circulation when the escalator is pointed away from a street corner.
4. A clear path from any MTA emergency exit to the public street shall be maintained at all times.

E. Temporary sidewalks or pedestrian ways, which will be in use more than 10 days, shall be constructed of four (4") inch thick Portland cement concrete or four (4") inches of asphaltic concrete placed **over a minimum four (4") inches of untreated base material,** and finished by a machine.

4.3 OVERHEAD PROTECTION - Operating Right-of-Way Trackage

A. MTA Rail Operations Control Center shall be informed of any intent to work above, on, or under the MTA right-of-way. Crews shall be trained and special flagging operations shall be directed by MTA Rail Operations Control Center. The party shall provide competent persons to serve as Flaggers. These Flaggers shall be trained and certified by MTA Rail Operations prior to any work commencing. All costs incurred by MTA shall be paid by the party.

B. A construction project that will require work over, under or adjacent to the at grade and aerial MTA right-of-way should be aware that the operation of machinery, construction of scaffolding or any operation hazardous to the operation of the MTA facility shall require that the work be done during non-revenue hours and authorized through the MTA Track Allocation process.

C. MTA flagmen or inspectors from MTA Operations shall observe all augering, pile driving or other work that is judged to be hazardous. Costs associated with the flagman or inspector shall be borne by the Party.

D. The party shall request access rights or track rights to perform work during non-revenue hours. The request shall be made through the MTA Track Allocation process.-

4.4 OTHER METRO FACILITIES

A. Access and egress from the public streets to fan shafts, vent shafts and emergency exits must be maintained at all times. The shafts shall be protected from dust and debris. See Exhibit A for details.

B. Any excavation in the vicinity of MTA power lines feeding the Metro System shall be through hand excavation and only after authorization has been obtained through the MTA Track Allocation process. MTA Rail Operations Control Center shall be informed before any operations commences near the MTA power system.

C. Flammable liquids shall not to be stored over or within 25 feet horizontally of MTA underground facilities. If installed within 25 to 100 feet horizontally of the structure, protective encasement of the tanks shall be required in accordance with NFPA STD 130. Existing underground tanks located within 100 feet horizontally of MTA facilities and scheduled to be abandoned are to be disposed of in accordance with Appendix C of NFPA STD 130. NFPA STD 130 shall also be applied to the construction of new fuel tanks.

D. Isolation of MTA Facilities from Blast

Subsurface areas of new adjacent private buildings where the public has access or that cannot be guaranteed as a secure area, such as parking garages and commercial storage and warehousing, will be treated as areas of potential explosion. NFPA 130, Standard for Fixed Guideway Transit Systems, life safety separation criteria will be applied that assumes such spaces contain Class I flammable, or Class II or Class III Combustible liquids. For structural and other considerations, isolation for blast will be treated the same as seismic separation, and the more restrictive shall be applied.

E. Any proposed facility that is located within 20 feet radius of an existing Metro facility will require a blast and explosion study and recommendations to be conducted by a specialist who is specialized in the area of blast force attenuation. This study must assess the effect that an explosion in the proposed non-Metro facility will have on the adjacent Metro facility and provide recommendations to prevent any catastrophic damage to the existing Metro facility. Metro must approve the qualifications of the proposed specialist prior to commencement of any work on this specialized study.

4.5 SAFETY REGULATIONS

A. Comply with Cal/OSHA Compressed Air Safety Orders Title 8, Division 1, Chapter 4, Subchapter 3. Comply with California Code of Regulations Title 8, Title 29 Code of Federal Regulations; and/or the Construction Safety and Health Manual (Part F) of the contract whichever is most stringent in regulating the safety conditions to be maintained in the work environment as determined by the Authority. The Party recognizes that government promulgated safety regulations are minimum standards and that additional safeguards may be required

B. Comply with the requirements of Chemical Hazards Safety and Health Plan, (per 29 CFR 1910.120 entitled, (Hazardous Waste Operations and Emergency Response) with respect to the handling of hazardous or contaminated wastes and mandated specialty raining and health screening.

C. Party and contractor personnel while within the operating MTA right-of-way shall coordinate all safety rules and procedures with MTA Rail Operations Control Center.

D. When support functions and electrical power outages are required, the approval MUST be obtained through the MTA Track Allocation procedure. Approval of the support functions and power outages must be obtained in writing prior to shutdown.

5.0 CORROSION

5.1 STRAY CURRENT PROTECTION

A. Because stray currents may be present in the area of the project, the Party shall investigate the site for stray currents and provide the means for mitigation when warranted.

B. Installers of facilities that will require a Cathodic Protection (CP) system must coordinate their CP proposals with MTA. Inquiries shall be routed to the Manager, Third Party Administration.

C. The Party is responsible for damage caused by its contractors to MTA corrosion test facilities in public right-of-way.

End of Section

APPENDIX

D

GUIDELINES FOR CMP TRANSPORTATION IMPACT ANALYSIS

Important Notice to User: This section provides detailed travel statistics for the Los Angeles area which will be updated on an ongoing basis. Updates will be distributed to all local jurisdictions when available. In order to ensure that impact analyses reflect the best available information, lead agencies may also contact MTA at the time of study initiation. Please contact MTA staff to request the most recent release of "Baseline Travel Data for CMP TIAs."

D.1 OBJECTIVE OF GUIDELINES

The following guidelines are intended to assist local agencies in evaluating impacts of land use decisions on the Congestion Management Program (CMP) system, through preparation of a regional transportation impact analysis (TIA). The following are the basic objectives of these guidelines:

- Promote consistency in the studies conducted by different jurisdictions, while maintaining flexibility for the variety of project types which could be affected by these guidelines.
- Establish procedures which can be implemented within existing project review processes and without ongoing review by MTA.
- Provide guidelines which can be implemented immediately, with the full intention of subsequent review and possible revision.

These guidelines are based on specific requirements of the Congestion Management Program, and travel data sources available specifically for Los Angeles County. References are listed in Section D.10 which provide additional information on possible methodologies and available resources for conducting TIAs.

D.2 GENERAL PROVISIONS

Exhibit D-7 provides the model resolution that local jurisdictions adopted containing CMP TIA procedures in 1993. TIA requirements should be fulfilled within the existing environmental review process, extending local traffic impact studies to include impacts to the regional system. In order to monitor activities affected by these requirements, Notices of Preparation (NOPs) must be submitted to MTA as a responsible agency. Formal MTA approval of individual TIAs is not required.

The following sections describe CMP TIA requirements in detail. In general, the competing objectives of consistency & flexibility have been addressed by specifying standard, or minimum, requirements and requiring documentation when a TIA varies from these standards.

D.3 PROJECTS SUBJECT TO ANALYSIS

In general a CMP TIA is required for all projects required to prepare an Environmental Impact Report (EIR) based on local determination. A TIA is not required if the lead agency for the EIR finds that traffic is not a significant issue, and does not require local or regional traffic impact analysis in the EIR. Please refer to Chapter 5 for more detailed information.

CMP TIA guidelines, particularly intersection analyses, are largely geared toward analysis of projects where land use types and design details are known. Where likely land uses are not defined (such as where project descriptions are limited to zoning designation and parcel size with no information on access location), the level of detail in the TIA may be adjusted accordingly. This may apply, for example, to some redevelopment areas and citywide general plans, or community level specific plans. In such cases, where project definition is insufficient for meaningful intersection level of service analysis, CMP arterial segment analysis may substitute for intersection analysis.

D.4 STUDY AREA

The geographic area examined in the TIA must include the following, at a minimum:

- All CMP arterial monitoring intersections, including monitored freeway on- or off-ramp intersections, where the proposed project will add 50 or more trips during either the AM or PM weekday peak hours (of adjacent street traffic).
- If CMP arterial segments are being analyzed rather than intersections (see Section D.3), the study area must include all segments where the proposed project will add 50 or more peak hour trips (total of both directions). Within the study area, the TIA must analyze at least one segment between monitored CMP intersections.
- Mainline freeway monitoring locations where the project will add 150 or more trips, in either direction, during either the AM or PM weekday peak hours.
- Caltrans must also be consulted through the Notice of Preparation (NOP) process to identify other specific locations to be analyzed on the state highway system.

If the TIA identifies no facilities for study based on these criteria, no further traffic analysis is required. However, projects must still consider transit impacts (Section D.8.4).

D.5 BACKGROUND TRAFFIC CONDITIONS

The following sections describe the procedures for documenting and estimating background, or non-project related traffic conditions. Note that for the purpose of a TIA, these background estimates must include traffic from all sources without regard to the exemptions specified in CMP statute (e.g., traffic generated by the provision of low and very low income housing, or trips originating outside Los Angeles County. Refer to Chapter 5, Section 5.2.3 for a complete list of exempted projects).

D.5.1 Existing Traffic Conditions. Existing traffic volumes and levels of service (LOS) on the CMP highway system within the study area must be documented. Traffic counts must

be less than one year old at the time the study is initiated, and collected in accordance with CMP highway monitoring requirements (see Appendix A). Section D.8.1 describes TIA LOS calculation requirements in greater detail. Freeway traffic volume and LOS data provided by Caltrans is also provided in Appendix A.

D.5.2 Selection of Horizon Year and Background Traffic Growth. Horizon year(s) selection is left to the lead agency, based on individual characteristics of the project being analyzed. In general, the horizon year should reflect a realistic estimate of the project completion date. For large developments phased over several years, review of intermediate milestones prior to buildout should also be considered.

At a minimum, horizon year background traffic growth estimates must use the generalized growth factors shown in Exhibit D-1. These growth factors are based on regional modeling efforts, and estimate the general effect of cumulative development and other socioeconomic changes on traffic throughout the region. Beyond this minimum, selection among the various methodologies available to estimate horizon year background traffic in greater detail is left to the lead agency. Suggested approaches include consultation with the jurisdiction in which the intersection under study is located, in order to obtain more detailed traffic estimates based on ongoing development in the vicinity.

D.6 PROPOSED PROJECT TRAFFIC GENERATION

Traffic generation estimates must conform to the procedures of the current edition of Trip Generation, by the Institute of Transportation Engineers (ITE). If an alternative methodology is used, the basis for this methodology must be fully documented.

Increases in site traffic generation may be reduced for existing land uses to be removed, if the existing use was operating during the year the traffic counts were collected. Current traffic generation should be substantiated by actual driveway counts; however, if infeasible, traffic may be estimated based on a methodology consistent with that used for the proposed use.

Regional transportation impact analysis also requires consideration of trip lengths. Total site traffic generation must therefore be divided into work and non-work-related trip purposes in order to reflect observed trip length differences. Exhibit D-2 provides factors which indicate trip purpose breakdowns for various land use types.

For lead agencies who also participate in CMP highway monitoring, it is recommended that any traffic counts on CMP facilities needed to prepare the TIA should be done in the manner outlined in Chapter 2 and Appendix A. If the TIA traffic counts are taken within one year of the deadline for submittal of CMP highway monitoring data, the local jurisdiction would save the cost of having to conduct the traffic counts twice.

D.7 TRIP DISTRIBUTION

For trip distribution by direct/manual assignment, generalized trip distribution factors are provided in Exhibit D-3, based on regional modeling efforts. These factors indicate Regional Statistical Area (RSA)-level tripmaking for work and non-work trip purposes.

(These RSAs are illustrated in Exhibit D-4.) For locations where it is difficult to determine the project site RSA, census tract/RSA correspondence tables are available from MTA.

Exhibit D-5 describes a general approach to applying the preceding factors. Project trip distribution must be consistent with these trip distribution and purpose factors; the basis for variation must be documented.

Local agency travel demand models disaggregated from the SCAG regional model are presumed to conform to this requirement, as long as the trip distribution functions are consistent with the regional distribution patterns. For retail commercial developments, alternative trip distribution factors may be appropriate based on the market area for the specific planned use. Such market area analysis must clearly identify the basis for the trip distribution pattern expected.

D.8 IMPACT ANALYSIS

CMP Transportation Impact Analyses contain two separate impact studies covering roadways and transit. Section Nos. D.8.1-D.8.3 cover required roadway analysis while Section No. D.8.4 covers the required transit impact analysis. Section Nos. D.9.1-D.9.4 define the requirement for discussion and evaluation of alternative mitigation measures.

D.8.1 Intersection Level of Service Analysis. The LA County CMP recognizes that individual jurisdictions have wide ranging experience with LOS analysis, reflecting the variety of community characteristics, traffic controls and street standards throughout the county. As a result, the CMP acknowledges the possibility that no single set of assumptions should be mandated for all TIAs within the county.

However, in order to promote consistency in the TIAs prepared by different jurisdictions, CMP TIAs must conduct intersection LOS calculations using either of the following methods:

- The Intersection Capacity Utilization (ICU) method as specified for CMP highway monitoring (see Appendix A); or
- The Critical Movement Analysis (CMA) / Circular 212 method.

Variation from the standard assumptions under either of these methods for circumstances at particular intersections must be fully documented.

TIAs using the 1985 or 1994 Highway Capacity Manual (HCM) operational analysis must provide converted volume-to-capacity based LOS values, as specified for CMP highway monitoring in Appendix A.

D.8.2 Arterial Segment Analysis. For TIAs involving arterial segment analysis, volume-to-capacity ratios must be calculated for each segment and LOS values assigned using the V/C-LOS equivalency specified for arterial intersections. A capacity of 800 vehicles per hour per through traffic lane must be used, unless localized conditions necessitate alternative values to approximate current intersection congestion levels.

D.8.3 Freeway Segment (Mainline) Analysis. For the purpose of CMP TIAs, a simplified analysis of freeway impacts is required. This analysis consists of a demand-to-capacity calculation for the affected segments, and is indicated in Exhibit D-6.

D.8.4 Transit Impact Review. CMP transit analysis requirements are met by completing and incorporating into an EIR the following transit impact analysis:

- ❑ Evidence that affected transit operators received the Notice of Preparation.
- ❑ A summary of existing transit services in the project area. Include local fixed-route services within a ¼ mile radius of the project; express bus routes within a 2 mile radius of the project, and; rail service within a 2 mile radius of the project.
- ❑ Information on trip generation and mode assignment for both AM and PM peak hour periods as well as for daily periods. Trips assigned to transit will also need to be calculated for the same peak hour and daily periods. Peak hours are defined as 7:30-8:30 AM and 4:30-5:30 PM. Both "peak hour" and "daily" refer to average weekdays, unless special seasonal variations are expected. If expected, seasonal variations should be described.
- ❑ Documentation of the assumption and analyses that were used to determine the number and percent of trips assigned to transit. Trips assigned to transit may be calculated along the following guidelines:
  - ➢ Multiply the total trips generated by 1.4 to convert vehicle trips to person trips;
  - ➢ For each time period, multiply the result by one of the following factors:

    3.5% of Total Person Trips Generated for most cases, except:

    10% primarily Residential within 1/4 mile of a CMP transit center
    15% primarily Commercial within 1/4 mile of a CMP transit center
    7% primarily Residential within 1/4 mile of a CMP multi-modal transportation center
    9% primarily Commercial within 1/4 mile of a CMP multi-modal transportation center
    5% primarily Residential within 1/4 mile of a CMP transit corridor
    7% primarily Commercial within 1/4 mile of a CMP transit corridor
    0% if no fixed route transit services operate within one mile of the project

  To determine whether a project is primarily residential or commercial in nature, please refer to the CMP land use categories listed and defined in Appendix E, *Guidelines for New Development Activity Tracking and Self Certification*. For projects that are only partially within the above one-quarter mile radius, the base rate (3.5% of total trips generated) should be applied to all of the project buildings that touch the radius perimeter.

- ❑ Information on facilities and/or programs that will be incorporated in the development plan that will encourage public transit use. Include not only the jurisdiction's TDM Ordinance measures, but other project specific measures.

- Analysis of expected project impacts on current and future transit services and proposed project mitigation measures, and;
- Selection of final mitigation measures remains at the discretion of the local jurisdiction/lead agency. Once a mitigation program is selected, the jurisdiction self-monitors implementation through the existing mitigation monitoring requirements of CEQA.

D.9 IDENTIFICATION AND EVALUATION OF MITIGATION

D.9.1 Criteria for Determining a Significant Impact. For purposes of the CMP, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$), causing LOS F ($V/C > 1.00$); if the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$). The lead agency may apply a more stringent criteria if desired.

D.9.2 Identification of Mitigation. Once the project has been determined to cause a significant impact, the lead agency must investigate measures which will mitigate the impact of the project. Mitigation measures proposed must clearly indicate the following:

- Cost estimates, indicating the fair share costs to mitigate the impact of the proposed project. If the improvement from a proposed mitigation measure will exceed the impact of the project, the TIA must indicate the proportion of total mitigation costs which is attributable to the project. This fulfills the statutory requirement to exclude the costs of mitigating inter-regional trips.
- Implementation responsibilities. Where the agency responsible for implementing mitigation is not the lead agency, the TIA must document consultation with the implementing agency regarding project impacts, mitigation feasibility and responsibility.

Final selection of mitigation measures remains at the discretion of the lead agency. The TIA must, however, provide a summary of impacts and mitigation measures. Once a mitigation program is selected, the jurisdiction self-monitors implementation through the mitigation monitoring requirements contained in CEQA.

D.9.3 Project Contribution to Planned Regional Improvements. If the TIA concludes that project impacts will be mitigated by anticipated regional transportation improvements, such as rail transit or high occupancy vehicle facilities, the TIA must document:

- Any project contribution to the improvement, and
- The means by which trips generated at the site will access the regional facility.

D.9.4 Transportation Demand Management (TDM). If the TIA concludes or assumes that project impacts will be reduced through the implementation of TDM measures, the TIA must document specific actions to be implemented by the project which substantiate these conclusions.

8. *Coordination of Transit and Project Development*, Orange County Transit District, 1988.
9. *Encouraging Public Transportation Through Effective Land Use Actions*, Municipality of Metropolitan Seattle, May 1987.

B. Live load of 100 plf applied at the free edges of the frame.

C. Wind load of 40 psf on windward side.

D. For traction type elevators, the surface structure shall be designed to support elevator beams. The end reaction of the elevator beams shall be 18,000 lb minimum. The location of the elevator beams varies with the type of elevator and its relative machine room location. The designer shall coordinate with elevator manufacturers regarding elevator beam locations.

5.4.10.6 Escalators

The support elements shall be designed for the end reactions from the escalators. The end reactions will be provided to the designer by Metro.

5.4.11 Adjacent Public Buildings

A. New building by private developers representing commercial interests or other public agencies that are planning pedestrian entrance access to Metro facilities must have their designs reviewed by Metro. It is the general policy of Metro to review designs on a case-by-case basis. This includes not only plans for physical attachment, but also all new construction within the influence zone of the existing Metro facilities.

B. A lateral separation of 8 feet shall be maintained between the finished exterior walls and foundations of underground Metro station facilities and those of new building construction if seismic isolation is to be assumed. Similarly, a vertical separation of 8 feet should be maintained between the finished exterior roofs of underground Metro station facilities and the mat or spread footing foundations of new building construction. All new construction closer than this, the developers shall demonstrate seismic isolation by submitting calculations.

C. High-rise tubular buildings, that create large perimeter loads on their foundations during seismic events, shall be ~~analyzed~~ **analysed** as special cases. This analysis shall demonstrate the pressures created by the building foundations do not exceed the design loads on Metro facilities using accepted geotechnical techniques of analysis.

D. Where joint development passageways interface directly with Metro station facilities, calculations shall be provided to demonstrate the new building elements have sufficient seismic and differential settlement ductility, as not to cause overstress to existing or new structural elements. The details shall be provided to demonstrate that waterproof integrity of the new construction with the existing station structure can be maintained for its anticipated service life.

In areas where the geotechnical investigation for Metro facilities, or that of the planned or joint development construction suggests a potential for the seismic consolidation or liquefaction of the soil, a special structural and geotechnical analysis of both designs shall be undertaken by the developers.

E. Temporary support of Metro facilities during the adjacent excavation for new buildings will be such that at any level, the station shell static lateral displacement shall not exceed 0.0005 times its overall height above the bottom of the base slab. The lateral forces used for the design of temporary excavation support shall consider both the static and dynamic loads for which Metro facility was designed. Where temporary support elements are used, details shall be provided to demonstrate that membrane waterproofing shall not be damaged.

F. Subsurface areas of new buildings where the public has access or that cannot be guaranteed as a secure area, such as parking garages and commercial storage and warehousing, will be treated as areas of potential explosion. NFPA 130, Standard for Fixed Guideway Transit Systems, life safety separation criteria will be applied that assumes such spaces contain Class I flammable, or Class II or Class III combustible liquids. For structural and other considerations, separation and isolation for blast shall be treated the same as for seismic, and the more restrictive shall be applied.

G. All static, dynamic, and geotechnical zone of influence calculations provided in support of the above criteria, will be sealed by a structural or Geotechnical engineer licensed in the State of California. Zone of influence calculation shall be based on intergranular soil pressures that consider the worst possible hydrostatic condition that might occur during the service life of Metro facilities.

5.4.12 Reinforced and Prestressed Concrete

5.4.12.1 Minimum Concrete Design Strengths

A. For all underground reinforced concrete cast-in-place structures including cut and cover box lines and stations, abutments, retaining walls, shafts, cross-passageways, portals, U- sections, spread footings, piles, drilled-in caissons, and basement walls:

- f'c = 4,000 psi.

B. For all aboveground reinforced concrete cast-in-place structures:

- f'c = 4,000 psi.

C. For prestressed concrete

- f'c = 6,000 psi.

D. For precast prestressed members

- f'c = 5,000 psi.

E. For all building foundations, floor slabs, pits and other miscellaneous foundations at yards and shops, miscellaneous foundations other than those specified, and station platform foundations

- f'c = 3,000 psi.

F. In certain cases, strengths of concrete other than those specified above might be required. These cases will be as recommended by the Contractor's Designer and accepted by Metro.

5.4.12.2 Reinforcing and Prestressing Steel

A. Comply with ASTM A706 for reinforcement resisting earthquake-induced flexural and axial forces in frame members and in wall boundary members. ASTM A615 grades 40 and 60 reinforcement are allowed in these members if (a) the actual yield strength based on mill tests does not exceed the specified yield strength by more than 18,000 psi (retests shall not exceed this value by more than an additional 3000 psi) and (b) the ratio of the actual ultimate tensile stress to the actual tensile yield strength is not less than 1.25. For aerial structures and bridges conform to the requirements of Caltrans BDS.

B. Prestressing steel: See Section 5.3.6.1

NOISE EASEMENT DEED

For valuable consideration, receipt of which is hereby acknowledged, **(Name of Owner)**, a _____ , for themselves, their heirs, administrators, executors, successors, assigns, tenants, and lessees do hereby grant, bargain, sell, and convey to the **LOS ANGELES COUNTY METROPOLITAN TRANSPORTATION AUTHORITY,** a public agency existing under the authority of the laws of the State of California ("Grantee"), its successors and assigns, for the use and benefit of the public and its employees, a perpetual, assignable easement in that certain real property in the City of Los Angeles, County of Los Angeles, State of California described in Exhibit "A" attached hereto and incorporated herein by this reference,

Said easement shall encompass and cover the entirety of the Grantors' Property having the same boundaries as the described Property and extending from the sub-surface upwards to the limits of the atmosphere of the earth, the right to cause in said easement area such noise, vibrations, fumes, dust, fuel particles, light, sonic disturbances, and all other effects that may be caused or may have been caused by the operation of public transit vehicles traveling along the Project right of way.

Grantor hereby waives all rights to protest, object to, make a claim or bring suit or action of any purpose, including or not limited to, property damage or personal injuries, against Grantee, its successors and assigns, for any necessary operating and maintenance activities and changes related to the Project which may conflict with Grantors' use of Grantors' property for residential and other purposes, and Grantors hereby grants an easement to the Grantee for such activities.

The granting of said Easement shall also establish the Grantors' right to further modify or develop the Property for any permitted use. However, Grantor's rights of development shall not interfere with the continued operation of Grantee's Project.

It is understood and agreed that these covenants and agreements shall be permanent, perpetual, will run with the land and that notice shall be made to and shall be binding upon all heirs, administrators, executors, successors, assigns, tenants and lessees of the Grantor. The Grantee is hereby expressly granted the right of third party enforcement of this easement.

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Times Mirror Square [SCAG NO. IGR9321]

Dear Mr. Lamborn,

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the Times Mirror Square ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. SCAG is the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372. Additionally, SCAG reviews the Environmental Impact Reports of projects of regional significance for consistency with regional plans pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

SCAG is also the designated Regional Transportation Planning Agency under state law, and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS) pursuant to Senate Bill (SB) 375. As the clearinghouse for regionally significant projects per Executive Order 12372, SCAG reviews the consistency of local plans, projects, and programs with regional plans.[1] SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Community Strategies (RTP/SCS) goals and align with RTP/SCS policies.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Times Mirror Square in Los Angeles County. The proposed project consists of the renovation of three existing buildings, the demolition of two existing buildings and the construction of two new towers with 34,572 square feet (sf) of retail space and 1,127 multi-family residential units on a 3.6 acre site. The proposed renovations of the three existing buildings would include 285,088 sf of office space, 40,387 sf of restaurant space, and 50,000 sf for a new grocery store. A total of 129,477 sf of open space is included in the plans for the proposed project.

When available, please send environmental documentation to *SCAG's office in Los Angeles or by email to au@scag.ca.gov* providing, at a minimum, the full public comment period for review. If you have any questions regarding the attached comments, please contact the Inter-Governmental Review (IGR) Program, attn.: Anita Au, Assistant Regional Planner, at (213) 236-1874 or au@scag.ca.gov. Thank you.

Sincerely,

Ping Chang

Ping Chang
Acting Manager, Compliance and Performance Monitoring

[1] Lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2016 RTP/SCS for the purpose of determining consistency for CEQA. Any "consistency" finding by SCAG pursuant to the IGR process should not be construed as a determination of consistency with the 2016 RTP/SCS for CEQA.

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE TIMES MIRROR SQUARE [SCAG NO. IGR9321]

CONSISTENCY WITH RTP/SCS

SCAG reviews environmental documents for regionally significant projects for their consistency with the adopted RTP/SCS. For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the RTP/SCS.

2016 RTP/SCS GOALS

The SCAG Regional Council adopted the 2016 RTP/SCS in April 2016. The 2016 RTP/SCS seeks to improve mobility, promote sustainability, facilitate economic development and preserve the quality of life for the residents in the region. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health (see http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx). The goals included in the 2016 RTP/SCS may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project within the context of regional goals and policies. Among the relevant goals of the 2016 RTP/SCS are the following:

SCAG 2016 RTP/SCS GOALS	
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*
RTP/SCS G3:	*Ensure travel safety and reliability for all people and goods in the region*
RTP/SCS G4:	*Preserve and ensure a sustainable regional transportation system*
RTP/SCS G5:	*Maximize the productivity of our transportation system*
RTP/SCS G6:	*Protect the environment and health for our residents by improving air quality and encouraging active transportation (e.g., bicycling and walking)*
RTP/SCS G7:	*Actively encourage and create incentives for energy efficiency, where possible*
RTP/SCS G8:	*Encourage land use and growth patterns that facilitate transit and active transportation*
RTP/SCS G9:	*Maximize the security of the regional transportation system through improved system monitoring, rapid recovery planning, and coordination with other security agencies** **SCAG does not yet have an agreed-upon security performance measure.*

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

SCAG 2016 RTP/SCS GOALS		
	Goal	Analysis
RTP/SCS G1:	*Align the plan investments and policies with improving regional economic development and competitiveness*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
RTP/SCS G2:	*Maximize mobility and accessibility for all people and goods in the region*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
etc.		etc.

2016 RTP/SCS STRATEGIES

To achieve the goals of the 2016 RTP/SCS, a wide range of land use and transportation strategies are included in the 2016 RTP/SCS. Technical appendances of the 2016 RTP/SCS provide additional supporting information in detail. To view the 2016 RTP/SCS, please visit: http://scagrtpscs.net/Pages/FINAL2016RTPSCS.aspx. The 2016 RTP/SCS builds upon the progress from the 2012 RTP/SCS and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that the SCAG region strives toward a more sustainable region, while the region meets and exceeds in meeting all of applicable statutory requirements pertinent to the 2016 RTP/SCS. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

DEMOGRAPHICS AND GROWTH FORECASTS

Local input plays an important role in developing a reasonable growth forecast for the 2016 RTP/SCS. SCAG used a bottom-up local review and input process and engaged local jurisdictions in establishing the base geographic and socioeconomic projections including population, household and employment. At the time of this letter, the most recently adopted SCAG jurisdictional-level growth forecasts that were developed in accordance with the bottom-up local review and input process consist of the 2020, 2035, and 2040 population, households and employment forecasts. To view them, please visit http://www.scag.ca.gov/Documents/2016GrowthForecastByJurisdiction.pdf. The growth forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts			Adopted City of Los Angeles Forecasts		
	Year 2020	Year 2035	Year 2040	Year 2020	Year 2035	Year 2040
Population	19,663,000	22,091,000	22,138,800	4,017,000	4,442,500	4,609,400
Households	6,458,000	7,325,000	7,412,300	1,441,400	1,618,900	1,690,300
Employment	8,414,000	9,441,000	9,871,500	1,899,500	2,104,100	2,169,100

MITIGATION MEASURES

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for the 2016 RTP/SCS for guidance, as appropriate. SCAG's Regional Council certified the Final PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on April 7, 2016 (please see: http://scagrtpscs.net/Pages/FINAL2016PEIR.aspx). The Final PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

APPENDIX B
Aesthetics Documentation

ESA

B-1 City of Los Angeles Zoning Information No. 2452

CITY OF LOS ANGELES
DEPARTMENT OF CITY PLANNING
ZONING INFORMATION FILE

ZI NO. 2452

TRANSIT PRIORITY AREAS (TPAs) / EXEMPTIONS TO AESTHETICS AND PARKING WITHIN TPAs PURSUANT TO CEQA

CITYWIDE

Note: This Zoning Information File is for information only and does not require any compliance check from LADBS or DCP.

COMMENTS:

On September 2013, the Governor signed into law Senate Bill (SB) 743, which instituted changes to the California Environmental Quality Act (CEQA) when evaluating environmental impacts to projects located in areas served by transit. While the thrust of SB 743 addressed a major overhaul on how transportation impacts are evaluated under CEQA, it also limited the extent to which aesthetics and parking are defined as impacts under CEQA. Specifically, Section 21099 (d)(1) of the Public Resources Code (PRC) states that a project's aesthetic and parking impacts shall not be considered a significant impact on the environment if:

1. The project is a residential, mixed-use residential, or employment center project, and

2. The project is located on an infill site within a transit priority area.

Section 21099 (a) of the PRC defines the following terms:

(1) "Employment center project" (TPAs) means a project located on property zoned for commercial uses with a floor area ratio of no less than 0.75 and that is located within a transit priority area.

(4) "Infill site" means a lot located within an urban area that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins, or is separated only by an improved public right-of-way from, parcels that are developed with qualified urban uses.

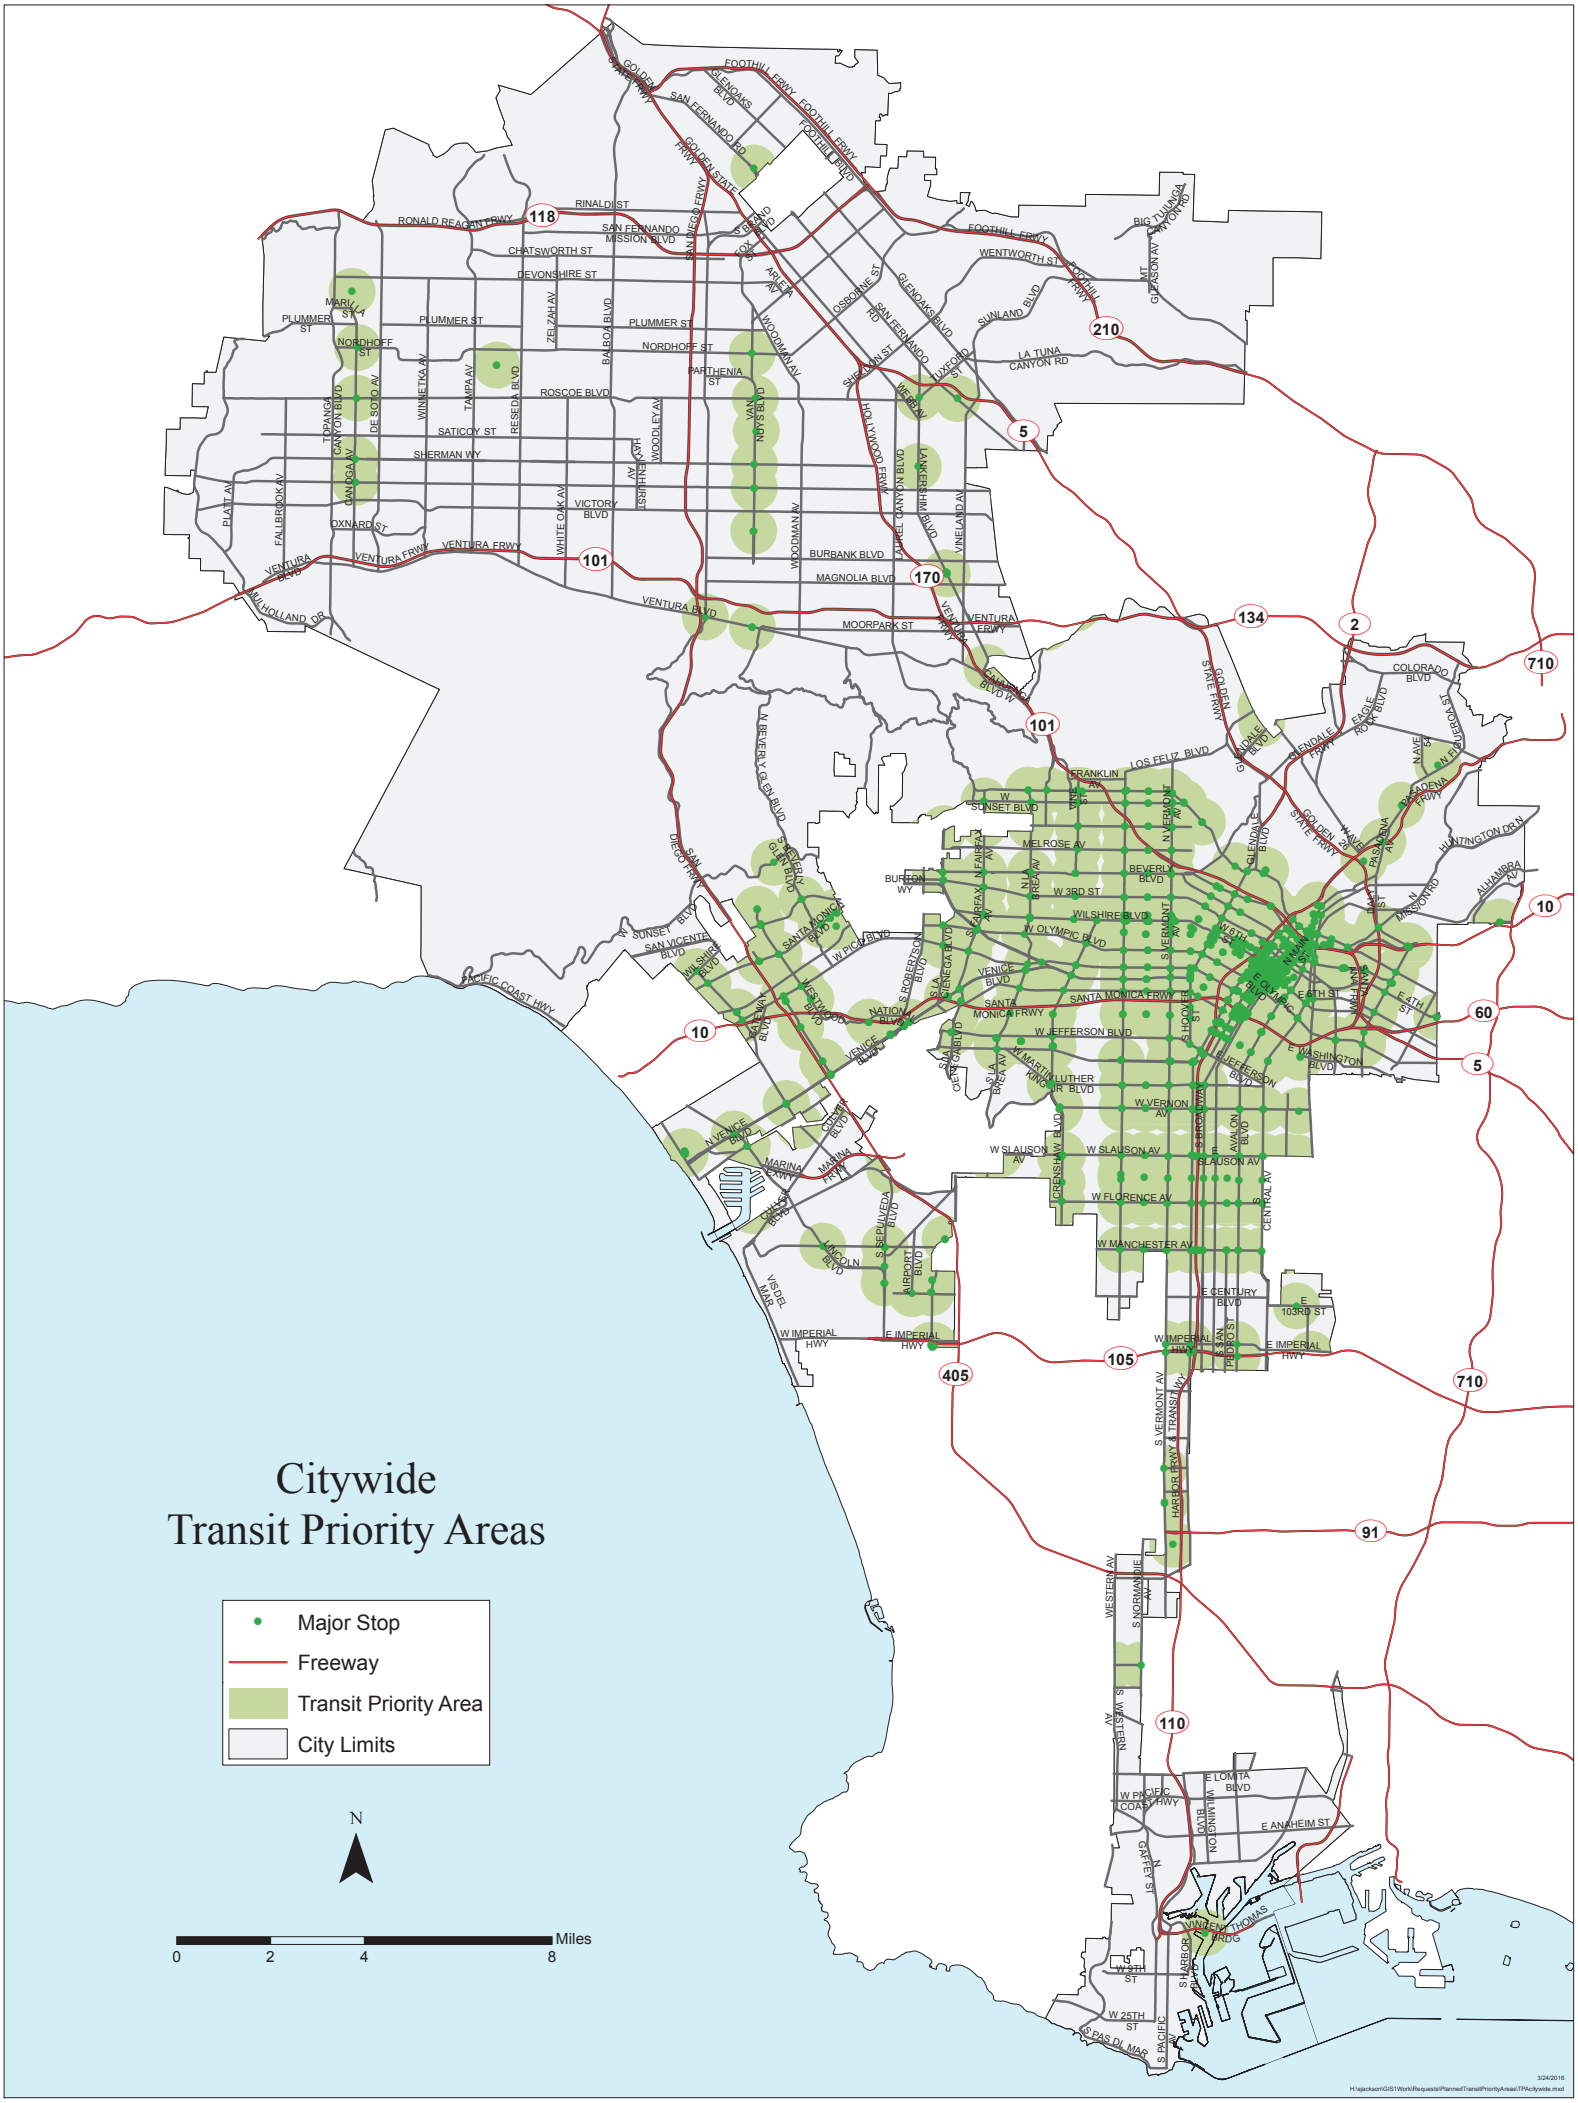
(7) "Transit priority area" means an area within one-half mile of a major transit stop that is existing or planned. Section 21064.3 of the PRC defines a "major transit stop" as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. For purposes of Section 21099 of the PRC, a transit priority area also includes major transit stops in the City of Los Angeles (city) that are scheduled to be completed within the planning horizon of the Southern California Association of Governments (SCAG) Regional Transportation Plan / Sustainable Community Strategy (RTP/SCS).

While the Governor's Office of Planning and Research (OPR) is still in the process of drafting guidance to substantially revise transportation impact methodology for infill projects, the

elimination of aesthetics and parking for infill projects went into effect January 2014. No further action is needed for the elimination of aesthetics and parking for infill projects, defined herein to take effect as part of the City's impact evaluations pursuant to CEQA.

INSTRUCTIONS:

Visual resources, aesthetic character, shade and shadow, light and glare, and scenic vistas or any other aesthetic impact as defined in the City's CEQA Threshold Guide shall not be considered an impact for infill projects within TPAs (shown in the attached map) pursuant to CEQA. However, this law did not limit the ability of the City to regulate, or study aesthetic related impacts pursuant to other land use regulations found in the Los Angeles Municipal Code (LAMC), or the City's General Plan, including specific plans. For example, DCP staff would still need to address a project's shade and shadow impacts if it is expressly required in a specific plan, Community Design Overlays (CDOs), or Historic Preservation Overlay Zones (HPOZs). Also note that the limitation of aesthetic impacts pursuant to Section 21099 of the PRC does not include impacts to historic or cultural resources. Impacts to historic or cultural resources will need to be evaluated pursuant to CEQA regardless of project location.



Find attached a citywide map of TPAs in the City of Los Angeles. Department of City Planning (DCP) staff should use this citywide map in determining if a project is clearly within a TPA, and if aesthetics and parking are not to be included in a project's impact evaluation in a negative declaration (ND), mitigated negative declaration (MND) or environmental impact report (EIR) prepared in accordance with CEQA. Eventually, TPAs will be identified in ZIMAS, however this map is to be referenced on an interim basis. Planners should also consult ZIMAS or Navigate LA if it cannot be determined from the map if a project site is within ½ mile of a major transit stop.

A project shall be considered to be within a TPA if all parcels within the project have no more than 25 percent of their area farther than one-half mile from the major transit stop and if not more than 10 percent of the residential units or 100 units, whichever is less, in the project are farther than one-half mile from the major transit stop. Projects intersecting non-overlapping TPA boundaries would also need to demonstrate they are within one-half mile of a major transit stop based on boarding location information. The burden shall be on the project applicant to demonstrate their project is within a TPA for parcels along a TPA boundary.

For further information regarding TPAs or SB 743, contact David Somers at (213) 978-3307

B-2 Downtown Design Guidelines Analysis

Downtown Design Guide

The Downtown Design Guide encourages Downtown Los Angeles to develop as a more sustainable and livable community. The focus of the Downtown Design Guide is on the relationship of buildings to the street, including sidewalk treatment, character of the building as it adjoins the sidewalk, and connections to transit. To achieve this harmony between buildings and public right-of- ways, the Downtown Design Guide provides design goals and specific requirements for the design of sidewalks and setbacks, ground floor treatment, parking and access, building massing and street wall, on-site open space, architectural detail, streetscape improvements, signage, and public art, and promote civic and cultural life.

The Project would be in substantial compliance with the requirements of the Downtown Design Guide, which applies to all projects in the Central City. As discussed below, the Project would be consistent with the components of the Downtown Design Guide, including sustainable design, sidewalks and setbacks, ground floor treatment, parking and access, massing and street wall, on-site open space, architectural detail, streetscape improvements, signage, and contribution to civic and cultural life. Although the Project would incorporate public art, as recommended under the Downtown Design Guide, no specific details about art installations are currently available. Although no art installations are specifically anticipated, any statuary or water features would be installed out of the public right-of-way in the Paseo area, and would be consistent with the character of the Project's modern component. The Project would not include any wall murals or tall-wall signs along the public (street-facing) façade. As indicated below, the Project would be consistent with the following components of the Downtown Design Guide.

1. Sustainable Design

The Project would be consistent with Downtown Design Guide policies to support sustainability through proximity to transit and the Design Guide's encouraging of the use of transit use through its proximity to transit and orientation to provide convenient access to nearby transit stations. The Project would also be designed to achieve the equivalent of the LEED Silver Certification level for new buildings, per PDF AQ-1. The Project would incorporate green building techniques and other sustainability features, including those within the City of Los Angeles Green Building Code, where applicable. Some of the Project's design features that would contribute to energy efficiencies include the use of glass/window areas for ventilation and daylight accessibility, use of recyclable materials for flooring and removable partitions in limited amounts, on-site landscaping in the form of green walls in some areas, low albedo (high reflectivity) color paving to reduce heat island effect, conduit for solar panels installed on roof deck areas pursuant to code requirements, and landscaping of courtyards and roof decks. Other building features would include such items as installation of energy-efficient lighting, heating, ventilation, and air conditioning (HVAC) systems that utilize ozone-friendly refrigerants; use of

materials and finishes that emit low quantities of volatile organic compounds (VOCs); use of high efficiency fixtures and appliances; water conservation features; and dedicated on-site recycling area. The Project's inclusion of bicycle parking, including on-street, short-term bicycle parking would encourage the use of alternative modes of transportation. The Project would reduce outdoor potable water use by a minimum of 20 percent compared to baseline water consumption. Reductions would be achieved through drought-tolerant/California native plant species selection and artificial turf, landscape contouring to minimize precipitation runoff, irrigation system efficiency, alternative water supplies (e.g., stormwater retention for use in landscaping), smart irrigation systems (e.g., weather-based controls), and water-saving pool equipment. These on-site landscape elements would help reduce energy use as less water would be needed to be transported to the Project Site. In addition, to encourage carpooling and the use of electric vehicles by Project residents and visitors, the Project would designate a minimum of ten (10) percent of Code-required on-site non-residential parking spaces for carpool and/or alternative-fueled vehicles and ensure that at least twenty (20) percent of the total code-required parking spaces provided for all types of parking facilities are capable of supporting future electric vehicle supply equipment (EVSE), with five (5) percent of the Code-required spaces further improved with electric vehicle charging stations, per PDF AQ-2.

2. Sidewalks and Setbacks

The Project would provide for broader sidewalks and include new setbacks to better accommodate pedestrians and provide for sidewalk activity and furnishings, such as sidewalk cafés and seating. Under the Project, the public sidewalk along W. 1st Street would be widened to 36 feet from the existing 19 feet; the sidewalk along S. Broadway would be widened to 15 feet, 2 inches from the existing 10 feet, 2 inches; and the sidewalk along W. 2nd Street would be widened to various widths ranging from 11 feet and 21 feet from the existing 7 feet. The Project would provide an 18 to 24 inch wide access zone next to the curb, which would include the 6 inch curb and 12 inch granite or brick edge band adjacent to the back of the curb.

The Project would provide a landscaped Paseo, which would be constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between W. 1st Street and W. 2nd Street. The landscaped Paseo and ground-level open space areas would help collect and reduce stormwater runoff.

3. Ground Floor Treatment

The Project would be consistent with the retail street frontage requirements of 50 percent to 75 percent of frontages used for retail or professional office uses. The W. 1st Street frontage at the new development site (west sector of the block) would be developed with minimum of 93.4 percent retail, the S. Broadway façade would be developed with 80 percent retail. All retail entrances would be oriented to the fronting street or the Paseo. The Times and Mirror Buildings would provide main entrances to W. 1st Street and W.

2nd Street, respectively, and the Plant Building ground floor would be converted to a grocery retail use that would occupy the frontage along S. Spring Street. In the west sector of the Project Site, the new podium would be lined with ground-floor restaurant or retail uses on the W. 1st Street, S. Broadway, and W. 2nd Street frontages, with the exceptions of the access driveways on S. Broadway and W. 2nd Street. At the intersections of W. 1st Street and Broadway and W. 2nd Street and Broadway, retail uses would wrap around the corners, as recommended by the Downtown Design Guide.

Primary entrances would be kept unlocked during business hours and located on a public street or on a courtyard, plaza or paseo that is connected to and visible from a public street. Street wall massing, articulation and detail, street level building entrances and storefront windows and doors, as well as the use of quality materials and decorative details, would be used to promote pedestrian-scaled architecture along the street. Lobby entrances to residential uses would be on S. Broadway.

The Project would not locate electrical transformers, mechanical equipment, other equipment, enclosed stairs, storage spaces, blank walls, and other elements that are not pedestrian-oriented within 100 feet of the corner on north-south streets and within 50 feet of the corner on east-west streets.

4. Parking and Access

Parking for the Project's range of uses, including customer parking, would be provided within the Podium and a subterranean garage below the Podium. As shown in future renderings (Figures IV.A-1 through IV.A-10), the Podium would be partially lined with habitable space and the design of the Podium would be integrated into the Project design by forming a base structure for the towers. No parking would be visible on the ground floor. The Podium, which would contain the parking areas, would incorporate similar materials, textures, and color values to the Mirror Building to visually link the entire development and provide a screen of the cars within the structure. The Project would provide 1,240 bicycle parking spaces for the residential uses and 34 bicycle parking spaces for the commercial uses (for a total of 1,744 spaces), exceeding the requirements of the Downtown Design Guide. Curbside drop-offs would be provided for both residential towers. There are no proposed interior drop-offs.

The Project would provide a continuous street wall along all four street frontages, with breaks only for the Paseo and the driveway entrances on S. Broadway and W. 2nd Street. The Project's W. 2nd Street driveway would be 25 feet, 8 inches for two lanes and the width of S. Broadway's three lane entrance driveway would be 35 feet, 8 inches. The entry point for the W. 2nd Street driveway would be more than 25 feet from the Paseo entrance, thus reducing pedestrian/vehicle conflicts. The setback of the towers from the podium edge would provide an identifiable break between the building's retail floors and the residential component.

5. Massing and Street Wall

The North Tower would rise 37 stories or approximately 495 feet above grade. The South Tower would rise 53 stories or approximately 665 feet above grade. While the Towers would be more than 300 feet in length, the Towers would contain strong horizontal planes at the base of the buildings and other horizontal features that would define the vertical walls of the Towers. These vertical walls would complement the distinctive vertical lines of the Times Building and would balance the horizontal planes that define the Mirror Building. The scale of the Podium supporting the new residential towers would be articulated with a contemporary base, body, and rooftop and would incorporate solid and transparent glazed materials and strong compositional features and punched and vertical articulation to also complement the architecture of the rehabilitated buildings. The solid portions of the Podium base would incorporate similar materials, textures, and color values to the Mirror Building to visually link the entire development. In accordance with the Downtown Design Guide, the Project would provide visual variety and depth through a variety of textures that bear a direct relationship to the building's massing and structural elements. The Project would have various height components that would contribute to the Downtown Los Angeles skyline. The setback between the two towers would retain views of the sky and add interest to the skyline as viewed from the east and west, and the majority of high-rise buildings in the Financial District and along S. Figueroa Street would continue to be visible as viewed from the north, and the Project's high-rise towers would contribute to the variety of the evolving skyline.

The two proposed towers would be set back from each other approximately 189 feet, thus complying with residential building setback requirements of at least 80 feet from all existing or possible future towers, both on the same block and approximately 55 feet across the street. The distance between the two proposed towers would also exceed residential unit spacing requirements.

The Project would be consistent with tower massing policies of the Downtown Design Guide, which are intended to reduce the overall sense of building mass. The tower footprints would be set back from the edge of the Podium. These setbacks and the distance between towers would reduce the overall appearance of bulk. The separation between the towers created by the lower 5-level Podium and the 4-story Plant Building in the background would allow light and visual relief from the mass of the North and South Towers, as viewed from the Federal Court Building and other uses to the west. The sense of mass would also be reduced by the façade design, which provides distinct vertical lines that although draws the eye upward along three distinct building sections. The roof detail also draws the eye upward to complement the linear aspect of the towers.

The Project would be consistent with policies that recommend simple faceted geometry and employ detailing in the exterior walls and the articulation of a human-scaled base at the street level. In accordance with the Downtown Design Guide, the two towers are complementary and employ the same architectural design approach. The towers represent contemporary interventions in the skyline and are not historicized.

6. On-Site Open Space

The Project would be consistent with the Design Guide's recommendations for open space in that the public open space represented by the 15,708 square-foot Paseo is located at the ground level, is open to the public during daylight hours, exceeds 5,000 square feet in size, is lined with ground floor spaces designed for retail, especially restaurants that include outdoor dining, and provides pedestrian amenities, including seating and landscaping. As recommended under the Downtown Design Guide, the Paseo is located in the center of the city block. The Paseo would be 25 feet wide, exceeding minimum requirements of 15 feet and would have a clear line of sight from W. 1st Street to W. 2nd Street.

The Project, which would provide new Sycamore trees supplementing existing trees along all four street frontages would be consistent with the Design Guide's recommendation that at least 50 percent of new trees be canopy trees that shade open spaces, sidewalks and buildings.

The Paseo would provide landscaped entrances and allow public access during normal business hours. Landscaping, including seating, rows of trees, and planters would be provided in the Paseo.

7. Architectural Detail

The Project would be consistent with the architectural detail recommendations of the Downtown Design Guide in that it would provide for an interactive street front that would avoid extensive blank walls that would detract from the experience and appearance of the streetscape. Building design would employ step-backs at the Podium level to horizontal variation reflect changes in the building uses or structure. The use of horizontal and vertical detail on the proposed tower facades would create scale and three-dimensional qualities. The ground-level Podium would exhibit a different architectural treatment on the ground floor façade than on the upper floors, and feature high quality materials that add scale, texture and variety at the pedestrian level. The step-back and change in architectural character of the towers from the Podium would provide an identifiable break between the building's ground floors and upper floors designed for residential uses. The Podium would incorporate solid and transparent glazed materials and strong compositional features, punched and vertical articulation, and mass, to complement the architecture of the existing Times, Mirror, and Plant Buildings. The solid portions of the Podium base would incorporate similar materials, textures, and color values to the Mirror Building to visually link the entire development and would, thus, be consistent with design recommendations that ground floor facades exhibit durable materials on ground floor façades.

In accordance with the Downtown Design Guide, the Project would provide visual variety and depth through a variety of textures that bear a direct relationship to the building's massing and structural elements. The color palette for a building would reinforce building

identity and complement existing coloration of the Times, Mirror, and Plant Buildings. Ground-floor window and door glazing would be transparent and non-reflective. Architectural lighting for the Project would relate to the pedestrian and accentuate major architectural features. Exterior lighting would be shielded to reduce glare and eliminate light being cast into the night sky. Security lighting would be integrated into the architectural and landscape lighting system. Security lighting would not be distinguishable from the Project's overall lighting system.

Mechanical equipment would be screened from public view or be integrated into the architectural design of the Plant Building and, any roof-top mechanical equipment would be integrated into the design of the tower components, per PDF AES-2. The Project's ventilation intakes/exhausts would be located to minimize adverse effects on pedestrian comfort along the sidewalk. Typically locating vents more than 20 feet vertically and horizontally from a sidewalk and directing the air flow away from the public realm will accomplish this objective. Lighting (exterior building and landscape) would be directed away from adjacent properties and roadways, and shielded as necessary. In particular, no exterior lighting, such as architectural lights or security lights, would be directed at the window of a residential unit either within or adjacent to a project so that the light source would be visible.

8. Streetscape Improvements

The Project would widen the sidewalk rights-of-way and provide streetscape improvements. The Project would provide street trees that would form a generally continuous canopy along the sidewalk. Trees would be planted at minimum 36" box trees. The predominant street light pattern would be continued. Any relocated historic street lights would be refurbished and relocated with supplemental replicas as required by the Bureau of Street Lighting. Project access locations would be designed to City standards and would provide adequate sight distance, sidewalks, crosswalks, and pedestrian movement controls that meet the City's requirements to protect pedestrian safety. Separate pedestrian entrances would provide access from the adjacent streets, parking facilities, and transit stops. Per the City of Los Angeles Broadway Streetscape Master Plan which was adopted on February 14, 2013, curb extensions have replaced travel lanes and left-turn prohibitions at the intersection of South Broadway and W. 2nd Street.

9. Signage

New signage would be used for identification of ground level retail and restaurant businesses, building identification, and way finding. No off-site advertising signage is proposed. Street level commercial and restaurant signage would be similar to other signage along the street frontages in the area and, with regard to Broadway, would be consistent with the Historic Broadway Supplemental Sign Use District. The proposed buildings would include accent lighting to complement the building architecture. All lighting would be designed and located to be compatible with the architecture and landscaping of the Project, and would be directed on-site and shielded as appropriate to

avoid light spill over onto adjacent properties. Pedestrian areas, including the Paseo, would be well lit for security. Existing light standards along all four street frontages, which are consistent with fixtures used throughout the Civic Center, would be retained. Lighting and signage would be developed in compliance with applicable LAMC requirements.

Other than the historic Times Building's illuminated clock and "The Times" building sign, the Project Site does not contain illuminated signage. Existing signage associated with the Times Building, including illuminated building signs and clock would be maintained as original features of the buildings. Signage would be consistent with the Historic Broadway Supplemental Sign Use District, which allows signage programs that complement and protect the character-defining features of Broadway's historic buildings.

12. Civic and Cultural Life

As required under the Downtown Design Guide, the Project would contribute to the civic and cultural life of the Downtown by building on and connecting to existing elements through the rehabilitation of the iconic Times and Mirror Buildings and by expanding services, such as a grocery store, for the growing downtown population. The Project would also contribute to the civic and cultural life of Downtown by introducing high-density housing and restaurant uses that would enliven the Historic Core/Civic Center with 24-hour, seven-day activity.

EXECUTIVE SUMMARY

The ONNI Group (the Applicant) proposes to develop the Times Mirror Square Project (Project), which would include construction of two new mixed-use towers along with rehabilitation of three existing buildings, including an eight-story building (Times Building), a four-story building (Plant Building) and a 10-story building (Mirror Building) within the Times Mirror Square site. The Times Mirror Square site (Project Site) comprises the city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway. The Project Site totals approximately 160,578 square feet of lot area or approximately 3.6 acres.

The proposed rehabilitated buildings, the Times, Plant, and Mirror Buildings, which have a total existing floor area of approximately 376,105 square feet, are located in the east sector of the block aligned with S. Spring Street. The existing Executive Building at the corner of W. 1st Street and S. Broadway and the parking structure at the corner of W. 2nd Street and S. Broadway would be demolished to allow for the development of the Project towers. The North and South Towers, which would be constructed above a five-story parking podium (Podium). The Podium would be an above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. Overall, including the existing buildings to remain that total approximately 376,105 square feet, the Project would comprise approximately 1,511,908 square feet of floor area, resulting in a 9.42 FAR. An open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park.

In accordance with the requirements under the California Environmental Quality Act (CEQA), this Technical Report provides an estimate of air quality emissions for the Project and the potential impacts from associated construction and operational activities. The report includes the categories and types of emission sources resulting from the Project, the calculation procedures used in the analysis, and any assumptions or limitations. This report summarizes the potential for the Project to conflict with an applicable air quality plan, to violate an air quality standard or threshold, to result in a cumulatively net increase of criteria pollutant emissions, to expose sensitive receptors to substantial pollutant concentrations, or to create objectionable odors affecting a substantial number of people. The findings of the analyses are as follows:

- The Project would be consistent with air quality policies set forth by the City of Los Angeles, the SCAQMD, and the Southern California Association of Governments (SCAG).
- Construction of the Project would not exceed the daily regional emission numeric indicators of significance set forth by the South Coast Air Quality Management District (SCAQMD) for volatile organic compounds (VOC), carbon monoxide (CO), sulfur dioxide (SO_2), respirable

particulate matter (PM10), and fine particulate matter (PM2.5) emissions. However, construction of the Project would exceed the daily regional emission numeric indicators of significance for nitrogen oxide (NO_X) on a temporary basis from Project construction. Mitigation measures would be required to reduce emissions to the extent feasible. Implementation of mitigation measures MM AQ-1 and MM AQ-2 would reduce NO_X emissions to less than significant to during all phases of Project construction with the exception of the two continuous concrete pouring activities for foundations. These two activities are expected to last up to approximately two days each and result in NO_X exceedances during the approximately four days total. There are no feasible mitigation measures that would reduce this short-term and temporary NO_X impact to less than significant. Therefore, construction of the project would result in a short-term and temporary significant and unavoidable air quality impact with respect to regional NO_X emissions. Construction of the Project would also result in a cumulatively considerable net increase of non-attainment pollutants on a temporary and short-term basis (up to approximately four days total). However, while maximum regional emissions would be significant and unavoidable during the continuous concrete pouring activity lasting up to approximately four days total, off-site sensitive receptors are not anticipated to be exposed to NO_2 or associated ozone levels in excess of the health-based ambient air quality standards to a degree that measureable and identifiable heath impacts would result.

- The incremental increase in emissions from operation of the Project would not exceed the daily regional emission numeric indicators of significance set forth by the SCAQMD for VOC, CO, SO_2, PM10 and PM2.5 emissions. However, operation of the Project would exceed the daily regional emission numeric indicators of significance for NO_X from Project operation. Mitigation measures would be required to reduce emissions to the extent feasible. Implementation of mitigation measures MM AQ-3, MM AQ-4, and MM AQ-5 would reduce NO_X emissions to less than significant during Project operation. Thus, with incorporation of mitigation measures, operation of the Project would not result in a regional violation of applicable air quality standards or jeopardize the timely attainment of such standards in the South Coast Air Basin. Operation of the Project, with mitigation measures, would also not result in a cumulatively considerable net increase of non-attainment pollutants.

- Construction of the Project would generate localized on-site emissions of NO_X, PM10 and PM2.5 that would exceed the localized significance thresholds set forth by the SCAQMD at sensitive receptors. Localized on-site emissions of CO would not exceed the localized significance thresholds. Thus, the Project would not potentially expose sensitive receptors to substantial levels of localized construction air pollutants and mitigation measures would be required. With implementation of mitigation measures MM AQ-1 and MM AQ-2, localized emissions would be reduced to less than significant during all phases of Project construction. Thus, localized construction impacts would be mitigated to less than significant.

- Operation of the Project would generate localized on-site emissions of NO_X, CO that would not exceed the localized significance thresholds set forth by the SCAQMD. However, localized on-site emissions of PM10 and PM2.5 would potentially exceed the localized significance thresholds. Implementation of mitigation measures MM AQ-3, MM AQ-4, and MM AQ-5 would reduce the impact to below the localized significance thresholds. Therefore, localized operational impacts would be mitigated to less than significant.

- Emissions from the increase in traffic due to operation of the Project would have a less than significant impact for 1-hour or 8-hour local CO concentrations from mobile source emissions.

- Construction of the Project would not result in a long-term (i.e., lifetime or 70-year) exposure to toxic air contaminants (TACs). Construction health risk impacts would less than significant.
- Project operations would not emit substantial TAC emissions and operational health risk impacts would be less than significant.
- Project operations would result in less than significant levels of odors.
- The Project, with implementation of mitigation measures MM AQ-1, MM AQ-2, MM AQ-3, MM AQ-4, and MM AQ-5, would result in a less than significant cumulative air quality impacts during construction and operations of the project, with the exception of significant and unavoidable short-term and temporary NO_X impacts from concrete pouring and foundation activities (up to approximately four days total).

SECTION 1
Introduction

1.1 Existing Conditions

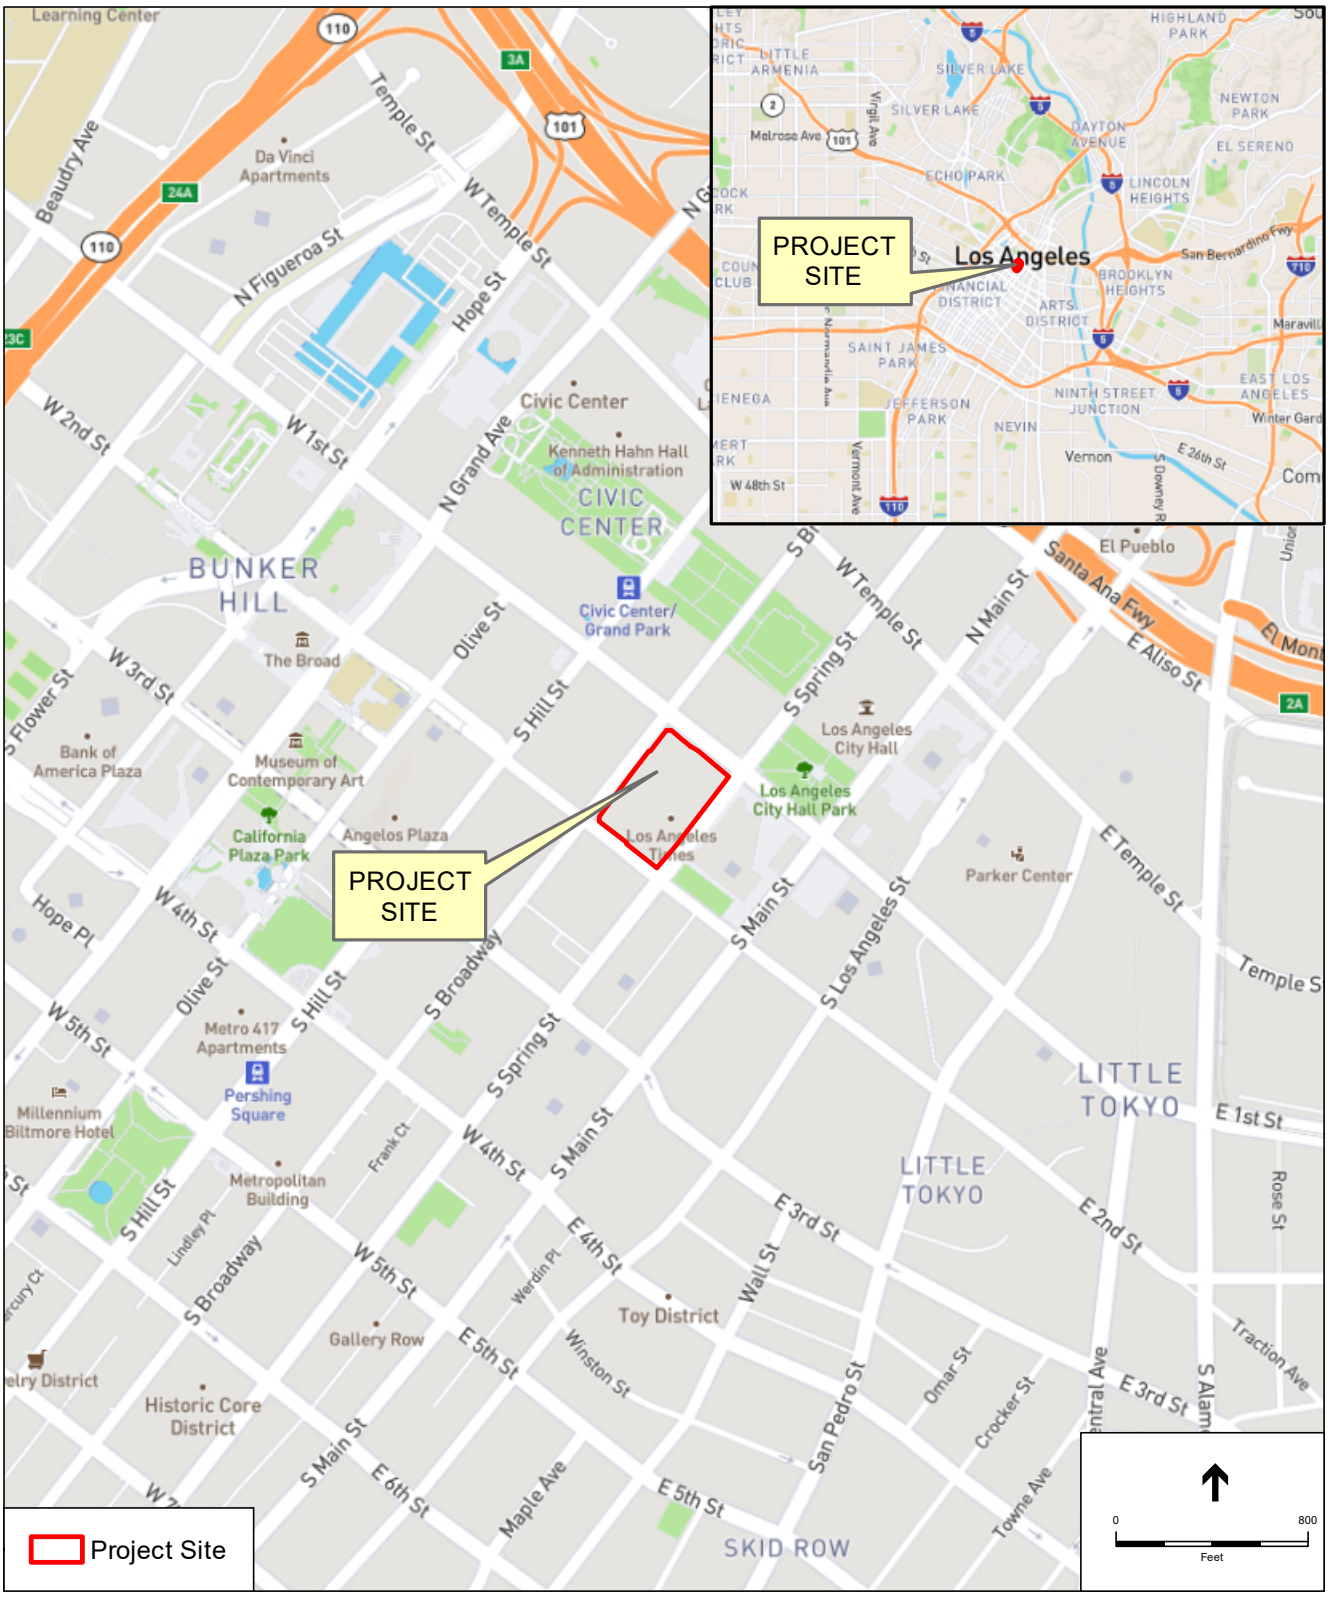
The OMNI Group (the Applicant) proposes to develop the Times Mirror Square Project (Project) which would include construction of two new mixed-use residential and commercial towers along with rehabilitation of three existing buildings at 202 West 1st Street on an approximately 3.6- that comprises the city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway (Project Site).[1] The Project Site location is shown in **Figure 1**, *Vicinity Location Map.*

The Project Site is currently developed with five structurally distinct, but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to ten stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the ten-story Mirror Building, the six-story parking structure, and the six-story Executive Building. This includes approximately 541,113 square feet of commercial office uses across the four existing buildings, an approximately 7,500 square-foot bank in the Executive Building, an approximately 11,250 square-foot cafeteria in the Plant Building. Approximately 223,945 square feet, or 40 percent of the existing uses, are vacant office spaces that have been vacant for 10 years. GHG emissions are currently associated with vehicle trips to and from the existing Project Site (on-road mobile sources), on-site combustion of natural gas for heating and cooking, on-site combustion emissions from landscaping equipment (area source), off-site combustion of fossil fuels for electricity, and off-site emissions from solid waste decomposition, water conveyance, and wastewater treatment.

1.2 Project Description

The Project would demolish the Executive Building and parking structure and develop two high-rise mixed-use towers, the North Tower and South Tower that would replace these structures along the S. Broadway frontage, while the Times, Plant and Mirror Buildings would be renovated and preserved. The proposed Paseo would separate the existing Times, Plant, and Mirror Buildings from the new towers and intersect the Project Site between the W. 1st Street and W. 2nd Street sidewalks.

The North and South Towers, which would be constructed above a five-story parking podium (Podium). The North Tower would contain 450 residential units and the South Tower would contain 677 residential units, for a total of 1,127 residential units and approximately 34,572



[1] The Project Site is zoned Commercial (C2-4D-SN), which permits general commercial and multi-family residential uses.

square feet of commercial floor area. Total residential floor area within the two towers would be approximately 1,071,692 square feet. With the addition of open space amenities, lounges, loading areas, and retail uses, total new construction would amount to 1,135,803 square feet. Open space amenities available to residents of the North and South Towers include an approximately 28,777-square-foot residential terrace (Residential Terrace) on the rooftop of the five-story Podium (Level 6). The Residential Terrace, which is located on the rooftop of the Podium between the North and South Towers, would be open to sky and provide approximately 7,700 square feet of landscaping, a pool deck, a dog run, cabanas, steam room and sauna, and other amenities such as dining tables and fire-side seating. The Project would provide other amenities at the 6th floor level, as well as ground-floor lounges in each of the tower buildings. These amenity areas are expected to include a gym, club rooms, meeting rooms, film screening room, private dining, and potentially other common areas to serve residents.

Approximately 73,128 square feet of common open space, including the approximately 15,708-square-foot Paseo, would be provided as part of the North and South Towers component. Of the common open space, only the Paseo is available for public access. The remaining 57,420 square feet are provided as common use for the Project's residents. With the addition of approximately 56,349 square feet of private balconies, combined private and common open space would be approximately 129,477 square feet.

The Podium would be a five-story above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. The Project is designed for approximately 1,744 vehicle parking spaces in the five-level above-ground Podium and nine-level subterranean parking structure. The Project would also provide 1,240 bicycle parking spaces for the residential uses and 34 bicycle parking spaces for the commercial uses.

The existing buildings to remain approximately total 376,105 square feet. Under the Project, there would be approximately 307,288 square feet of commercial office uses, approximately 18,817 square feet of commercial restaurant uses, an approximately 50,000 square-foot grocery store, and an Office Terrace (Level 6 of the Plant Building). Although the total floor area of 376,105 square feet and the proportional mix of commercial uses would not change, the Project would allow flexibility in how the uses are allocated among the three existing buildings. The interiors of all three historic buildings have been heavily altered over time. The two original and architecturally distinctive interior spaces, the lobbies of the Times Building and Mirror Building, would be preserved. The upper floors contain little if any historic fabric, as it was removed as a result of past structural improvements and office modernizations. The upper floors would be reconfigured for office tenants, if required. The exteriors of all three buildings would be cleaned and repaired as necessary. Overall, including the existing buildings to remain that total approximately 376,105 square feet, the Project would comprise approximately 1,511,908 square feet of floor area, resulting in a 9.42 FAR. The Project Site area and vicinity is provided in **Figure 2**, *Aerial Photograph of Project Site and Vicinity*.

Demolition activities on the subject property would include the removal of two of the five existing buildings. Approximately 35,000 tons of debris would be exported from the Project site. The Project would require the excavation of approximately 364,000 cubic yards of earth for the proposed nine levels of parking, four of which would be constructed above grade in the Podium and five of which would be constructed below grade.

1.3 Anticipated Construction Schedule

Construction of the Project is anticipated to begin in 2019, pending Project consideration and approval, and would be completed in late 2023. Construction of the Project is estimated to require approximately 48 months, starting as early as the third quarter of 2019. Construction activities would include demolition of the Executive Building and existing parking structure, excavation, foundations and concrete pouring, building construction, and architectural coatings. Heavy-duty equipment, vendor supply trucks and concrete trucks would be used during construction of foundations, parking structures, and buildings. Landscaping and architectural coating would occur during the finishing activities. The maximum daily regional emissions from these activities are estimated by construction phase and compared to the SCAQMD significance thresholds. The maximum daily regional emissions are predicted values for the worst-case day and do not represent the emissions that would occur for every day of Project construction. The Project would comply with South Coast Air Quality Management District (SCAQMD) Rule 403 during demolition and grading activities which would limit fugitive dust emissions. A complete listing of the construction equipment by phase and construction phase duration assumptions used in this analysis is included within the California Emissions Estimator Model (CalEEMod) printout sheets that are provided in **Appendix C-2** of this Technical Report.

1.4 Existing Site Emissions

The Project Site is currently developed with five structurally distinct but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings range from four to 10 stories in height. The buildings include the eight-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the six-story parking structure, and the six-story Executive Building. Combined the Times, Plant, Mirror, and Executive Buildings have a total floor area of approximately 559,863 square feet. This includes approximately 541,113 square feet of commercial office uses across the four existing buildings, an approximately 7,500 square-foot bank in the Executive Building, and an approximately 11,250 square-foot cafeteria in the Plant Building. The current site usage generates air quality emissions from operations related to the commercial activities at the site. Approximately 223,945 square feet, or 40 percent of the existing uses, are vacant office spaces that have been vacant for 10 years. Therefore, the analysis assumes no existing emissions or vehicle trips are generated from the 40 percent vacant office spaces. **Table 1**, *Existing Site Operational Emissions*, identifies the existing site uses and emissions.

TABLE 1
EXISTING SITE OPERATIONAL EMISSIONS (POUNDS PER DAY) [a]

Source	VOC	NO_X	CO	SO_2	PM10	PM2.5
Area	8	<1	<1	0	<1	<1
Energy (Natural Gas)	<1	2	1	<1	<1	<1
Motor Vehicles	8	35	97	<1	18	5
Total Existing Emissions	**16**	**37**	**98**	**<1**	**18**	**5**

[a] Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in **Appendix C-1 of this Technical Report**. Approximately 223,945 square feet, or 40 percent of the existing uses, are vacant office spaces that have been vacant for 10 years. Therefore, the analysis assumes no existing emissions or vehicle trips are generated from the 40 percent vacant office spaces.

1.5 Existing Air Quality Conditions

1.5.1 Regional Air Quality

The Project Site is located within the South Coast Air Basin (Air Basin). The Air Basin is an approximately 6,745-square-mile area bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Air Basin consists of Orange County, Los Angeles County (excluding the Antelope Valley portion), and the western, non-desert portions of San Bernardino and Riverside counties, in addition to the San Gorgonio Pass area in Riverside County. The terrain and geographical location determine the distinctive climate of the Air Basin, as it is a coastal plain with connecting broad valleys and low hills.

The Air Basin lies in the semi-permanent high-pressure zone of the eastern Pacific Ocean. The usually mild climatological pattern is interrupted by periods of hot weather, winter storms, or Santa Ana winds. The extent and severity of pollutant concentrations in the Air Basin is a function of the area's natural physical characteristics (weather and topography) and man-made influences (development patterns and lifestyle). Factors such as wind, sunlight, temperature, humidity, rainfall, and topography all affect the accumulation and dispersion of pollutants throughout the Air Basin, making it an area of high pollution potential. The Air Basin's meteorological conditions, in combination with regional topography, are conducive to the formation and retention of ozone, which is a secondary pollutant that forms through photochemical reactions in the atmosphere.

The greatest air pollution impacts throughout the Air Basin typically occur from June through September. This condition is generally attributed to the emissions occurring in the Air Basin, light winds, and shallow vertical atmospheric mixing. These factors reduce the potential for pollutant dispersion, thereby causing elevated air pollutant levels. Pollutant concentrations in the Air Basin vary with location, season, and time of day. Concentrations of ozone, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the Air Basin and adjacent desert.

Sources of Air Pollution

As detailed in the AQMP, the major sources of air pollution in the Air Basin are divided into four major source classifications: point, area, on-road, and off-road sources. Point and area sources are the two major subcategories of stationary sources.[2] Point sources are permitted facilities that contain one or more emission sources at an identified location (e.g., power plants, refineries). Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products and permitted sources) which are distributed across the region. On-road sources and off-road sources are the two main subcategories of mobile sources, such as cars and trucks (on-road sources) and heavy construction equipment (off-road sources).

Criteria Pollutants

Certain air pollutants have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants, due to their presence in elevated concentrations in the atmosphere. Such pollutants have been identified and regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. The following pollutants are regulated by the United States Environmental Protection Agency (USEPA) and are subject to emissions control requirements adopted by federal, state and local regulatory agencies. These pollutants are referred to as "criteria air pollutants" as a result of the specific standards, or criteria, which have been adopted for them. The National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS) for each of the monitored pollutants and their effects on health are summarized in **Table 2,** *Ambient Air Quality Standards*. The NAAQS and CAAQS have been set at levels considered safe to protect public health, including the health of sensitive populations such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. A brief description of the health effects of these criteria air pollutants are provided below.

- **Ozone (O_3):** Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds (VOCs) and nitrogen oxides (NO_X) in the presence of sunlight under favorable meteorological conditions, such as high temperature and stagnation episodes. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable. According to the USEPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath.[3] Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat; inflame and damage the airways; aggravate lung diseases such as asthma, emphysema and chronic bronchitis; increase the frequency of asthma attacks; make the lungs more susceptible to infection; continue to damage the lungs even when the symptoms have

2 South Coast Air Quality Management District, Final 2012 AQMP, 2013. Available at: http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan. Accessed December 2018.

3 United States Environmental Protection Agency, Health Effects of Ozone Pollution, https://www.epa.gov/ground-level-ozone-pollution/health-effects-ozone-pollution, last updated October 10, 2018. Accessed January 2019.

disappeared; and cause chronic obstructive pulmonary disease.[4] Long-term exposure to ozone is linked to aggravation of asthma, and is likely to be one of many causes of asthma development and long-term exposures to higher concentrations of ozone may also be linked to permanent lung damage, such as abnormal lung development in children.[5] According to CARB, inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath.[6] The USEPA states that people most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers.[7] Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure.[8] According to CARB, studies show that children are no more or less likely to suffer harmful effects than adults; however, children and teens may be more susceptible to ozone and other pollutants because they spend nearly twice as much time outdoors and engaged in vigorous activities compared to adults.[9] Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults and are less likely than adults to notice their own symptoms and avoid harmful exposures.[10] Further research may be able to better distinguish between health effects in children and adults.[11]

- **Volatile Organic Compounds (VOCs):** VOCs are organic chemical compounds of carbon and are not "criteria" pollutants themselves; however, they contribute with NO_X to form ozone, and are regulated to prevent the formation of ozone.[12] According to CARB, some VOCs are highly reactive and play a critical role in the formation of ozone, other VOCs have adverse health effects, and in some cases, VOCs can be both highly reactive and have adverse health effects.[13] VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids, internal combustion associated with motor vehicle usage, and consumer products (e.g., architectural coatings, etc.).[14]

  Nitrogen Dioxide (NO_2) and Nitrogen Oxides (NO_X): NO_X is a term that refers to a group of compounds containing nitrogen and oxygen. The primary compounds of air quality concern include NO_2 and nitric oxide (NO). Ambient air quality standards have been promulgated for NO_2, which is a reddish-brown, reactive gas.[15] The principle form of NO_X produced by combustion is NO, but NO reacts quickly in the atmosphere to form NO_2,

creating the mixture of NO and NO_2 referred to as NO_X.[16] Major sources of NO_X include emissions from cars, trucks and buses, power plants, and off-road equipment.[17] The terms NO_X and NO_2 are sometimes used interchangeably. However, the term NO_X is typically used when discussing emissions, usually from combustion-related activities, and the term NO_2 is typically used when discussing ambient air quality standards. Where NO_X emissions are discussed in the context of the thresholds of significance or impact analyses, the discussions are based on the conservative assumption that all NO_X emissions would oxidize in the atmosphere to form NO_2. According to the USEPA, short-term exposures to NO_2 can potentially aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms while longer exposures to elevated concentrations of NO_2 may contribute to the development of asthma and potentially increase susceptibility to respiratory infections.[18] According to CARB, controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics.[19] In addition, a number of epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses.[20] Infants and children are particularly at risk from exposure to NO_2 because they have disproportionately higher exposure to NO_2 than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease.[21] CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for NO_2 and there is only limited information for NO and NO_X, as well as large uncertainty in relating health effects to NO or NO_X exposure.[22]As shown below in Table 4, the Air Basin is designated as attainment for NO_2 and non-attainment for ozone (NAAQS and CAAQS). The primary pollutant of concern during construction and operational activities is NO_X since the Air Basin is non-attainment for ozone and NO_X is an ozone precursor emission.

- **Carbon Monoxide (CO):** Carbon monoxide (CO) is primarily emitted from combustion processes and motor vehicles due to the incomplete combustion of fuel, such as natural gas, gasoline, or wood, with the majority of outdoor CO emissions from mobile sources.[23] According to the USEPA, breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain and at very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death.[24] Very high levels of CO are not likely to occur outdoors; however, when CO levels are elevated outdoors, they can be of

particular concern for people with some types of heart disease since these people already have a reduced ability for getting oxygenated blood to their hearts and are especially vulnerable to the effects of CO when exercising or under increased stress.[25] In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina.[26] According to CARB, the most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain.[27] For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance.[28] Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO.[29]

- **Sulfur Dioxide (SO_2):** According to the USEPA, the largest source of sulfur dioxide (SO_2) emissions in the atmosphere is the burning of fossil fuels by power plants and other industrial facilities while smaller sources of SO_2 emissions include industrial processes such as extracting metal from ore; natural sources such as volcanoes; and locomotives, ships and other vehicles and heavy equipment that burn fuel with a high sulfur content.[30] In 2006, California phased-in the ultra-low-sulfur diesel regulation limiting vehicle diesel fuel to a sulfur content not exceeding 15 parts per million, down from the previous requirement of 500 parts per million, substantially reducing emissions of sulfur from diesel combustion.[31] According to the USEPA, short-term exposures to SO_2 can harm the human respiratory system and make breathing difficult.[32] According to CARB, health effects at levels near the State one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity and exposure at elevated levels of SO_2 (above 1 ppm) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality.[33] Children, the elderly, and those with asthma, cardiovascular disease, or chronic lung disease (such as bronchitis or emphysema) are most likely to experience the adverse effects of SO_2.[34,35]

- **Particulate Matter (PM10 and PM2.5):** Particulate matter air pollution is a mixture of solid particles and liquid droplets found in the air.[36] Some particles, such as dust, dirt, soot, or

smoke, are large or dark enough to be seen with the naked eye while other particles are so small they can only be detected using an electron microscope.[37] Particles are defined by their diameter for air quality regulatory purposes: inhalable particles with diameters that are generally 10 micrometers and smaller (PM10); and fine inhalable particles with diameters that are generally 2.5 micrometers and smaller (PM2.5).[38] Thus, PM2.5 comprises a portion or a subset of PM10. Sources of PM10 emissions include dust from construction sites, landfills and agriculture, wildfires and brush/waste burning, industrial sources, and wind-blown dust from open lands.[39] Sources of PM2.5 emissions include combustion of gasoline, oil, diesel fuel, or wood.[40] PM10 and PM2.5 may be either directly emitted from sources (primary particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO_2, NO_X, and certain organic compounds.[41] According to CARB, both PM10 and PM2.5 can be inhaled, with some depositing throughout the airways; PM10 is more likely to deposit on the surfaces of the larger airways of the upper region of the lung while PM2.5 is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation.[42] Short-term (up to 24 hours duration) exposure to PM10 has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits.[43] The effects of long-term (months or years) exposure to PM10 are less clear, although studies suggest a link between long-term PM10 exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer.[44] Short-term exposure to PM2.5 has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days and long-term exposure to PM2.5 has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children.[45] According to CARB, populations most likely to experience adverse health effects with exposure to PM10 and PM2.5 include older adults with chronic heart or lung disease, children, and asthmatics and children and infants are more susceptible to harm from inhaling pollutants such as PM10 and PM2.5 compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems.[46]

- **Lead (Pb):** Major sources of lead emissions include ore and metals processing, piston-engine aircraft operating on leaded aviation fuel, waste incinerators, utilities, and lead-acid battery manufacturers.[47] In the past, leaded gasoline was a major source of lead emissions; however,

the removal of lead from gasoline has resulted in a decrease of lead in the air by 98 percent between 1980 and 2014.[48] Lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems and the cardiovascular system, and affects the oxygen carrying capacity of blood.[49] The lead effects most commonly encountered in current populations are neurological effects in children, such as behavioral problems and reduced intelligence, anemia, and liver or kidney damage.[50] Excessive lead exposure in adults can cause reproductive problems in men and women, high blood pressure, kidney disease, digestive problems, nerve disorders, memory and concentration problems, and muscle and joint pain.[51]

TABLE 2
AMBIENT AIR QUALITY STANDARDS

Pollutant	Average Time	California Standards [a]		National Standards [b]		
		Concentration [c]	Method [d]	Primary [c,e]	Secondary [c,f]	Method [g]
O_3 [h]	1 Hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m^3)		0.070 ppm (137 µg/m^3)		
NO_2 [i]	1 Hour	0.18 ppm (339 µg/m^3)	Gas Phase Chemiluminescence	100 ppb (188 µg/m^3)	None	Gas Phase Chemiluminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)		53 ppb (100 µg/m^3)	Same as Primary Standard	
CO	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	None	Non-Dispersive Infrared Photometry (NDIR)

[a] California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] Any equivalent procedure which can be shown to the satisfaction of CARB to give equivalent results at or near the level of the air quality standard may be used.

[e] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

[f] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[g] Reference method as described by the USEPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the USEPA.

[h] On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[i] To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb.

[j] On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated non-attainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[k] On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$. The other PM2.5 and PM10 standards were retained.

[l] CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[m] The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

[n] In 1989, the California Air Resources Board converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Toxic Air Contaminants (TACs)

In addition to criteria pollutants, the SCAQMD periodically assesses levels of toxic air contaminants (TACs) in the Air Basin. A TAC is defined by California Health and Safety Code Section 39655:

> *“Toxic air contaminant” means an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health. A substance that is listed as a hazardous air pollutant pursuant to subsection (b) of Section 112 of the federal act (42 U.S.C. Sec. 7412(b)) is a toxic air contaminant.*

Between July 2012 and June 2013, the SCAQMD conducted the Multiple Air Toxics Exposure Study (MATES IV), which is a follow-up to previous air toxics studies conducted in the Air Basin. The MATES IV Final Report was issued in May 2015. The study, based on actual monitored data throughout the Air Basin, consisted of several elements. These included a

monitoring program, an updated emissions inventory of TACs, and a modeling effort to characterize carcinogenic risk across the Air Basin from exposure to TACs. The study concluded that the average of the modeled air toxics concentrations measured at each of the monitoring stations in the Air Basin equates to a background cancer risk from long-term inhalation exposure to TAC emissions of approximately 418 in one million based on the average of 10 fixed monitoring sites and 367 in one million based on a population-weighted average risk. The overall cancer risk was about 65 percent lower for the average of 10 fixed monitoring sites and 57 percent lower for the population-weighted risk than the previous MATES III cancer risks.[52]

Approximately 68 percent of the risk is attributed to diesel particulate matter (DPM) emissions, approximately 22 percent to other toxics associated with mobile sources (including benzene, butadiene, and formaldehyde), and approximately 10 percent of all airborne carcinogenic risk is attributed to stationary sources (which include industries and certain other businesses, such as dry cleaners and chrome plating operations).[53] The study also found lower ambient concentrations of most of the measured air toxics compared to the levels measured in the previous study conducted during 2004 and 2006. Specifically, benzene and 1,3-butadiene, pollutants generated mainly from vehicles, were down 35 percent and 11 percent, respectively.[54] The reductions were attributed to air quality control regulations and improved emission control technologies. In addition to air toxics, MATES IV included continuous measurements of black carbon and ultrafine particles (particles smaller than 0.1 microns in size), which are emitted by the combustion of diesel fuels. Sampling sites located near heavily-trafficked freeways or near industrial areas were characterized by higher levels of black carbon and ultrafine particles compared to more rural sites.

1.5.2 Local Air Quality

Existing Criteria Pollutant Levels at Nearby Monitoring Stations

The SCAQMD maintains a network of air quality monitoring stations located throughout the Air Basin to measure ambient pollutant concentrations. The nearest monitoring station most representative of the Project Site is the Central Los Angeles County Monitoring Station, located 1.35 miles north east of the Project Site at 1603 North Main Street, Los Angeles, CA 90012. Criteria pollutants monitored at this station include O_3, NO_2, CO, SO_2, Pb, PM10 and PM2.5. The most recent data available from the SCAQMD for this monitoring station are from years 2012 to 2016. The pollutant concentration data for these years are summarized in **Table 3,** *Ambient Air Quality Data*. As shown in **Table 3**, the CAAQS and NAAQS were not exceeded in the Project vicinity for most pollutants between 2012 and 2016, except for ozone and particulate matter (PM10 and PM2.5).

Existing Toxic Air Contaminant Risk Levels

The SCAQMD has prepared a series of maps that show regional trends in estimated outdoor long-term inhalation cancer risk from toxic emissions, as part of an ongoing effort to provide insight into relative risks. The maps represent the estimated number of potential cancers per million people associated with a lifetime of breathing air toxics (24 hours per day outdoors for 70 years). The background potential cancer risk per million people using the update OEHHA methodology is estimated at 1,830 per million (compared to an overall South Coast Air Basin-wide risk of 1,023 per million).[55] Generally, the risk from air toxics is lower near the coastline: it increases inland, with higher risks concentrated near diesel sources (e.g., freeways, airports, and ports).

Sensitive Receptors and Locations

Certain population groups, such as children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to the potential effects of air pollution than others. As a result, certain land uses that are occupied by these population groups, such as residences, hospitals and schools, are considered to be air quality sensitive land uses. The Project Site is primarily surrounded by civic and commercial uses, although there are areas of air quality sensitive land uses within 1,000 feet of the Project Site, as shown in **Figure 3,** *Sensitive Receptor Locations Nearest to the Project Site*. Air quality sensitive land uses nearest to the Project Site are described below. Maximum air quality impacts are evaluated for these air quality sensitive land uses. Other air quality sensitive land uses are located farther from the Project Site and would experience lower impacts.

- The City Hall Park is located approximately 150 feet feet to the northeast of the Project Site, respectively.
- Grand Park is located approximately 434 feet to the north of the Project Site.
- The one-acre park just south of the LAPD Headquarters Building is located approximately 80 feet southeast of the Project Site.
- The Higgins Building Lofts apartment complex is located at the corner of S. Main Street and West 2nd Street approximately 250 feet southeast of the Project Site.
- The Douglas Lofts apartment complex is located at the corner of Spring Street and West 3rd Street approximately 530 feet southwest of the Project Site.
- The Victor Clothing apartment complex is located on Broadway approximately 480 feet to the southwest of the of the Project Site.
- The Pan American Lofts building is located at the corner of Broadway and W. 3rd Street approximately 550 feet southwest of the Project Site.

- The newly constructed STOA apartment complex is located on S. Main Street approximately 550 feet southeast of the Project Site.

Future Sensitive Receptors and Locations (Sensitive Receptors Not Built Yet)

Beyond the existing development that could potentially be impacted by Project construction, there are three future projects in the nearby vicinity of the Project Site that could be impacted should they become constructed and occupied prior to the construction of the Project. Future sensitive land uses in close proximity to the Project Site are also shown in **Figure 3**, and include the following:

- A mixed-use residential development is planned for construction over the future Metro station at the corner of 2nd Street and Broadway approximately 50 feet southwest of the Project Site.

- The First and Broadway Civic Center Park will be constructed at the corner of 1st and Broadway approximately 130 feet northwest of the Project Site.

- The Lotus 77 apartment complex will be constructed at 118 Astronaut E S Onizuka Street approximately 1,300 feet southeast of the Project Site.

SECTION 2
Regulatory Setting

A number of statutes, regulations, plans and policies have been adopted which address air quality concerns. The Project Site and vicinity is subject to air quality regulations developed and implemented at the federal, State, and local levels. At the federal level, the United States Environmental Protection Agency (USEPA) is responsible for implementation of the federal Clean Air Act (CAA). Some portions of the CAA (e.g., certain mobile source requirements and other requirements) are implemented directly by the USEPA. Other portions of the CAA (e.g., stationary source requirements) are implemented through delegation of authority to State and local agencies. A number of plans and policies have been adopted by various agencies that address air quality concerns. Those plans and policies that are relevant to the Project are discussed below.

2.1 Federal

The federal Clean Air Act of 1963 was the first federal legislation regarding air pollution control and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990. At the federal level, USEPA is responsible for implementation of certain portions of the Clean Air Act including mobile source requirements. Other portions of the Clean Air Act, such as stationary source requirements, are implemented by state and local agencies.

The Clean Air Act establishes federal air quality standards, known as NAAQS and specifies future dates for achieving compliance. The Clean Air Act also mandates that the state submit and implement a State Implementation Plan for areas not meeting these standards. These plans must include pollution control measures that demonstrate how the standards will be met. The 1990 amendments to the Clean Air Act identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or to meet interim milestones. The sections of the Clean Air Act which are most applicable to the Project include Title I (Non-attainment Provisions) and Title II (Mobile Source Provisions).

Title I requirements are implemented for the purpose of attaining NAAQS for the following criteria pollutants: (1) O_3; (2) NO_2; (3) CO; (4) SO_2; (5) PM10; (6) PM2.5, and (7) lead. The NAAQS were amended in July 1997 to include an 8-hour standard for O_3 and to adopt a NAAQS for PM2.5. The NAAQS were also amended in September 2006 to include an established methodology for calculating PM2.5 as well as revoking the annual PM10 threshold. **Table 3** shows the NAAQS currently in effect for each criteria pollutant.

Table 4, *South Coast Air Basin Attainment Status (Los Angeles County)*, shows the attainment status of the Air Basin for each criteria pollutant. As shown in **Table 4**, the Air Basin is currently in non-attainment for O_3, PM2.5, and one area of the Air Basin for Pb under the NAAQS.

TABLE 4
SOUTH COAST AIR BASIN ATTAINMENT STATUS (LOS ANGELES COUNTY)

Pollutant	National Standards (NAAQS)	California Standards (CAAQS)
O_3 (1-hour standard)	N/A [a]	Non-attainment – Extreme
O_3 (8-hour standard)	Non-attainment – Extreme	Non-attainment
CO	Attainment	Attainment
NO_2	Attainment	Attainment
SO_2	Attainment	Attainment
PM10	Attainment	Non-attainment
PM2.5	Non-attainment – Serious	Non-attainment
Lead (Pb)	Non-attainment (Partial) [b]	Attainment
Visibility Reducing Particles	N/A	Unclassified
Sulfates	N/A	Attainment
Hydrogen Sulfide	N/A	Unclassified
Vinyl Chloride [c]	N/A	N/A

NOTES: N/A = not applicable

[a] The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.

[b] Partial Non-attainment designation – Los Angeles County portion of the Air Basin only for near-source monitors.

[c] In 1990, the California Air Resources Board identified vinyl chloride as a toxic air contaminant and determined that it does not have an identifiable threshold. Therefore, the California Air Resources Board does not monitor or make status designations for this pollutant.

SOURCE: United States Environmental Protection Agency, Non-Attainment Areas for Criteria Pollutants (Greenbook), Last Updated September 30, 2018, https://www.epa.gov/green-book. Accessed December 2018; California Air Resources Board, Area Designations Maps/State and National, Last Reviewed October 18, 2017, http://www.arb.ca.gov/desig/adm/adm.htm. Accessed December 2018.

In addition to criteria pollutants, Title I also includes air toxics provisions which require the USEPA to develop and enforce regulations to protect the public from exposure to airborne contaminants that are known to be hazardous to human health. In accordance with Section 112, the USEPA establishes National Emission Standards for Hazardous Air Pollutants (NESHAPs). The list of hazardous air pollutants (HAPs), or air toxics, includes specific compounds that are known or suspected to cause cancer or other serious health effects.

Title II requirements pertain to mobile sources, such as cars, trucks, buses, and planes. Reformulated gasoline, automobile pollution control devices, and vapor recovery nozzles on gas pumps are a few of the mechanisms the USEPA uses to regulate mobile air emission sources. The provisions of Title II have resulted in tailpipe emission standards for vehicles which have strengthened in recent years to improve air quality. For example, the standards for NO_X emissions have been lowered substantially, and the specification requirements for cleaner burning gasoline are more stringent.

2.2 State of California

2.2.1 California Air Resources Board

CARB, a part of the California Environmental Protection Agency, is responsible for the coordination and administration of both federal and state air pollution control programs within California. In this capacity, CARB conducts research, sets the CAAQS, compiles emission inventories, develops suggested control measures, and provides oversight of local programs. CARB establishes emissions standards for motor vehicles sold in California, consumer products (such as hairspray, aerosol paints, and barbecue lighter fluid), and various types of commercial equipment. It also sets fuel specifications to further reduce vehicular emissions. CARB has primary responsibility for the development of California's State Implementation Plan (SIP), for which it works closely with the federal government and the local air districts. The SIP is required for the State to take over implementation of the federal Clean Air Act from the USEPA.

2.2.2 California Clean Air Act

The California Clean Air Act, signed into law in 1988, requires all areas of the state to achieve and maintain the CAAQS by the earliest practical date. The CAAQS apply to the same criteria pollutants as the federal Clean Air Act but also include state-identified criteria pollutants, which include sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride. CARB has primary responsibility for ensuring the implementation of the California Clean Air Act,[56] responding to the federal Clean Air Act planning requirements applicable to the state, and regulating emissions from motor vehicles and consumer products within the state. **Table 2** shows the CAAQS currently in effect for each of the criteria pollutants as well as the other pollutants recognized by the state. As shown in **Table 2**, the CAAQS include more stringent standards than the NAAQS for most of the criteria air pollutants.

Health and Safety Code Section 39607(e) requires CARB to establish and periodically review area designation criteria. **Table 4** provides a summary of the attainment status of the Los Angeles County portion of the Air Basin with respect to the state standards. The Air Basin is designated as attainment for the California standards for sulfates and unclassified for hydrogen sulfide and visibility-reducing particles.[57] As shown in **Table 4**, the Air Basin is currently in non-attainment for O_3, PM10, and PM2.5 under the CAAQS. Since vinyl chloride is a carcinogenic toxic air contaminant, CARB does not classify attainment status for this pollutant.

2.2.3 Air Quality and Land Use Handbook

CARB published the *Air Quality and Land Use Handbook* in April 2005 to serve as a general guide for considering impacts to sensitive receptors from facilities that emit TAC emissions. The recommendations provided therein are voluntary and do not constitute a requirement or mandate for either land use agencies or local air districts. The goal of the guidance document is to protect

56 Chapter 1568 of the Statutes of 1988.

57 California Air Resources Board, State Area Designations Definitions, 2016, https://www.arb.ca.gov/desig/adm/define.htm. The term unclassified is defined by CARB as a category given to an area with insufficient data and are treated as attainment areas for regulatory purposes.

sensitive receptors, such as children, the elderly, acutely ill, and chronically ill persons, from exposure to TAC emissions. Some examples of CARB's siting recommendations include the following: (1) avoid siting sensitive receptors within 500 feet of a freeway, urban road with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day; (2) avoid siting sensitive receptors within 1,000 feet of a distribution center (that accommodates more than 100 trucks per day, more than 40 trucks with operating transport refrigeration units per day, or where transport refrigeration unit operations exceed 300 hours per week); (3) avoid siting sensitive receptors within 300 feet of any dry cleaning operation using perchloroethylene and within 500 feet of operations with two or more machines; and (4) avoid siting sensitive receptors within 300 feet of a large gasoline dispensing facility (3.6 million gallons per year or more) or 50 feet of a typical gasoline dispensing facility (less than 3.6 million gallons per year).[58]

2.2.4 On-Road and Off-Road Vehicle Rules

In 2004, CARB adopted an Airborne Toxic Control Measure (ATCM) to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to DPM and other TACs (Title 13 California Code of Regulations [CCR], Section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time.

In 2008, CARB approved the Truck and Bus regulation to reduce NO_X, PM10, and PM2.5 emissions from existing diesel vehicles operating in California (13 CCR, Section 2025).[59] The requirements were amended to apply to nearly all diesel-fueled trucks and buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. For the largest trucks in the fleet, those with a GVWR greater than 26,000 pounds, there are two methods to comply with the requirements. The first way is for the fleet owner to retrofit or replace engines, starting with the oldest engine model year, to meet 2010 engine standards, or better. This is phased over 8 years, starting in 2015 and would be fully implemented by 2023, meaning that all trucks operating in the State subject to this option would meet or exceed the 2010 engine emission standards for NO_X and DPM by 2023. The second option, if chosen, requires fleet owners, starting in 2012, to retrofit a portion of their fleet with diesel particulate filters (DPFs) achieving at least 85 percent removal efficiency, so that by January 1, 2016 their entire fleet is equipped with DPFs. However, DPFs do not lower NO_X emissions. Thus, fleet owners choosing the second option must still comply with the 2010 engine emission standards for their trucks and busses by 2020.

In addition to limiting exhaust from idling trucks, CARB also promulgated emission standard for off-road diesel construction equipment of greater than 25 horsepower (hp) such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation adopted by CARB on July 26, 2007 aims to reduce emissions by installation of diesel

[58] California Air Resources Board, Air Quality and Land Use Handbook: A Community Health Perspective, 2005. Available at: https://www.arb.ca.gov/ch/handbook.pdf. Accessed December 2018.

[59] California Air Resources Board, Final Regulation Order, Amendments to the Regulation to Reduce Emissions of Diesel Particulate Matter, Oxides of Nitrogen and Other Criteria Pollutants from In-Use On-Road Diesel-Fueled Vehicles, http://www.arb.ca.gov/msprog/onrdiesel/documents/TBFinalReg.pdf. Accessed December 2018.

soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission controlled models (13 CCR, Section 2449).[60] Implementation is staggered based on fleet size (which is the total of all off-road horsepower under common ownership or control), with large fleets beginning compliance in 2014, medium fleets in 2017, and small fleets in 2019. Each fleet must demonstrate compliance through one of two methods. The first option is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second option is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies (VDECS) on a certain percentage of its total fleet horsepower. The compliance schedule requires that BACT turn overs or retrofits (VDECS installation) be fully implemented by 2023 in all equipment for large and medium fleets and across 100 percent of small fleets by 2028.

2.3 Regional

2.3.1 South Coast Air Quality Management District

The SCAQMD has jurisdiction over air quality planning for all of Orange County, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Air Basin is a subregion within SCAQMD jurisdiction. While air quality in the Air Basin has improved, the Air Basin requires continued diligence to meet the air quality standards.

Air Quality Management Plan

The SCAQMD has adopted a series of AQMPs to meet the CAAQS and NAAQS. The 2012 AQMP incorporates scientific and technological information and planning assumptions, including regional growth projections[61] to achieve federal standards for air quality in the Air Basin. It incorporates a comprehensive strategy aimed at controlling pollution from all sources, including stationary sources, and on-road and off-road mobile sources. The 2012 AQMP includes new and changing federal requirements, implementation of new technology measures, and the continued development of economically sound, flexible compliance approaches. Additionally, it highlights the significant amount of emission reductions needed and the urgent need to identify additional strategies, especially in the area of mobile sources, to meet all federal criteria pollutant standards within the timeframes allowed under the federal Clean Air Act.

The SCAQMD released the Draft 2016 AQMP on June 30, 2016 for public review and comment. A revised Draft 2016 AQMP was released in October 2016 and the SCAQMD

60 California Air Resources Board, Final Regulation Order, Regulation for In-Use Off-Road Diesel-Fueled Fleets, http://www.arb.ca.gov/regact/2010/offroadlsi10/finaloffroadreg.pdf. Accessed December 2018.

61 South Coast Air Quality Management District, 2012 Air Quality Management Plan, 2013, http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan. Accessed February December 2018.

Governing Board adopted the 2016 AQMP on March 3, 2017.[62] CARB approved the 2016 AQMP on March 23, 2017. Key elements of the 2016 AQMP include implementing fair-share emissions reductions strategies at the federal, state, and local levels; establishing partnerships, funding, and incentives to accelerate deployment of zero and near-zero-emissions technologies; and taking credit from co-benefits from greenhouse gas, energy, transportation and other planning efforts.[63] The strategies included in the 2016 AQMP are intended to demonstrate attainment of the NAAQS for the federal non-attainment pollutants ozone and PM2.5.[64] Similar to the 2012 AQMP, the 2016 AQMP relies on "…aggressive mobile source control strategy supplemented with focused and strategic stationary source control measures." The 2016 AQMP also recognizes the reduction in traditional air pollutants which occur as a "co-benefit" with the reduction in climate change-related pollutants achieved through greenhouse gas (GHG) emission reduction programs and policies, and commercial building energy efficiency measures.[65] This analysis considers the 2016 AQMP as the most recent SCAQMD adopted plan.

Air Quality Guidance Documents

The SCAQMD published the California Environmental Quality Act (CEQA) Air Quality Handbook to provide local governments with guidance for analyzing and mitigating project-specific air quality impacts.[66] The CEQA Air Quality Handbook provides standards, methodologies, and procedures for conducting air quality analyses in EIRs and was used extensively in the preparation of this analysis. However, the SCAQMD is currently in the process of replacing the CEQA Air Quality Handbook with the Air Quality Analysis Guidance Handbook. While this process is underway, the SCAQMD recommends that lead agencies avoid using the screening tables in Chapter 6 (Determining the Air Quality Significance of a Project) of the CEQA Air Quality Handbook, because the tables were derived using an obsolete version of CARB's mobile source emission factor inventory, and the trip generation characteristics of the land uses identified in these screening tables were based on the fifth edition of the Institute of Transportation Engineer's Trip Generation Manual, instead of the most current edition. Additionally, the lead agency should avoid using the on-road mobile source emission factors in Table A9-5-J1 through A9-5-L (EMFAC7EP Emission Factors for Passenger Vehicles and Trucks, Emission Factors for Estimating Material Hauling, and Emission Factors for Oxides of Sulfur and Lead). The SCAQMD instead recommends using other approved models to calculate emissions from land use projects, such as the California Emissions Estimator Model (CalEEMod) software.[67] The SCAQMD has published a guidance document called the *Final Localized*

Significance Threshold Methodology that is intended to provide guidance in evaluating localized effects from mass emissions during construction.[68] The SCAQMD adopted additional guidance regarding PM2.5 in a document called *Final Methodology to Calculate Particulate Matter ($PM)_{2.5}$ and PM2.5 Significance Thresholds*.[69] This latter document has been incorporated by the SCAQMD into its CEQA significance thresholds and Localized Significance Threshold Methodology.

SCAQMD Rules and Regulations

Several SCAQMD rules adopted to implement portions of the AQMP may apply to the proposed Project. The Project may be subject to the following SCAQMD rules and regulations:

Regulation IV – Prohibitions: This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air emissions, fuel contaminants, start-up/shutdown exemptions and breakdown events. The following is a list of rules which apply to the Project:

- **Rule 401 – Visible Emissions:** This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.

- **Rule 402 – Nuisance:** This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

- **Rule 403 – Fugitive Dust:** This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM10 emissions to less than 50 micrograms per cubic meter (µg/m3) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Mitigation measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the USEPA.

Regulation XI – Source Specific Standards: Regulation XI sets emissions standards for specific sources. The following is a list of rules which may apply to the Project:

- **Rule 1113 – Architectural Coatings:** This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the

[68] South Coast Air Quality Management District, Final Localized Significance Threshold Methodology, 2008. Available: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds. Accessed December 2018.

[69] South Coast Air Quality Management District, Final Methodology to Calculate Particulate Matter ($PM)_{2.5}$ and $PM_{2.5}$ Significance Thresholds, 2006. Available: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/pm-2-5-significance-thresholds-and-calculation-methodology. Accessed December 2018.

use of these coatings, primarily by placing limits on the VOC content of various coating categories.

- **Rule 1138 – Control of Emissions from Restaurant Operations:** This rule specifies emissions and odor control requirements for commercial cooking operations that use chain-driven charbroilers to cook meat.

- **Rule 1146.2 – Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters:** This rule requires manufacturers, distributors, retailers, refurbishers, installers, and operators of new and existing units to reduce NO_X emissions from natural gas-fired water heaters, boilers, and process heaters as defined in this rule.

- **Rule 1186 – PM10 Emissions from Paved and Unpaved Roads, and Livestock Operations:** This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM10 emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

Regulation XIII – New Source Review (NSR): Regulation XIII sets requirements for preconstruction review required under both federal and state statutes for new and modified sources located in areas that do not meet the Clean Air Act standards ("non-attainment" areas). NSR applies to both individual permits and entire facilities. Any permit that has a net increase in emissions is required to apply BACT. Facilities with a net increase in emissions are required to offset the emission increase by use of Emission Reduction Credits (ERCs). The regulation provides for the application, eligibility, registration, use and transfer of ERCs. For low emitting facilities, the SCAQMD maintains an internal bank that can be used to provide the required offsets. In addition, certain facilities are subject to provisions that require public notice and modeling analysis to determine the downwind impact prior to permit issuance.

Regulation XIV – Toxics and Other Non-Criteria Pollutants: Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria pollutants. The following is a list of rules which may apply to the Project:

- **Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities:** This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.

- **Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines:** This rule applies to stationary compression ignition (CI) engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

2.3.2 Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino and Imperial Counties and addresses regional issues relating to transportation, the economy, community development and the environment. SCAG is the federally designated Metropolitan Planning Organization (MPO) for the majority of the Southern California region and is the largest MPO in the nation, where by law, SCAG is required to ensure that transportation activities are supportive of and comply with the goals of regional and state air quality plans in order to attain the NAAQS. In addition, SCAG co-produces the transportation strategy and transportation control measure sections of the AQMP with the SCAQMD for the Air Basin. With regard to air quality planning, SCAG adopted the 2016 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) in April 2016, which addresses regional development and growth forecasts and forms the basis for the land use and transportation control portions of the AQMP. The growth forecasts are utilized in the preparation of the air quality forecasts and consistency analysis included in the AQMP. The RTP/SCS and AQMP are based on projections originating within local jurisdictions.

SCAG's Sustainable Communities Strategy provides specific implementation strategies. These strategies include supporting projects that encourage a diverse job opportunities for a variety of skills and education, recreation and culture and a full-range of shopping, entertainment and services all within a relatively short distance; encouraging employment development around current and planned transit stations and neighborhood commercial centers; encouraging the implementation of a "Complete Streets" policy that meets the needs of all users of the streets, roads and highways including bicyclists, children, persons with disabilities, motorists, electric vehicles, movers of commercial goods, pedestrians, users of public transportation, and seniors; and supporting alternative fueled vehicles. [70]

In 2008, SCAG released the Regional Comprehensive Plan which addresses regional issues such as housing, traffic/transportation, water, and air quality. The Regional Comprehensive Plan serves as an advisory document to local agencies in the Southern California region for their information and voluntary use for preparing local plans and handling local issues of regional significance. The Regional Comprehensive Plan presents a vision of how Southern California can balance air quality with growth and development by including goals such as: reducing emissions of criteria pollutants to attain federal air quality standards by prescribed dates and stated ambient air quality standards as soon as practicable; reverse current trends in GHG emissions to support sustainability goals for energy, water supply, agriculture, and other resource areas; and to minimize land uses that increase the risk of adverse air pollution-related health impacts from exposure to TACs, particulates (PM10 and PM2.5) and CO.

[70] Southern California Association of Governments, 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, pages 74-101, http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS.pdf. Accessed December 2018.

2.4 Local

Local jurisdictions, such as the City of Los Angeles, have the authority and responsibility to reduce air pollution through its land use decision-making authority. Specifically, the City is responsible for the assessment and mitigation of air emissions resulting from its land use decisions. The City's General Plan Air Quality Element includes city-wide goals, objectives, and policies related to air quality resources. A number of these goals, objectives, and policies are relevant to the Project and are related to traffic mobility, minimizing particulate emissions from construction activities, discouraging single-occupancy vehicle trips, managing traffic congestion during peak hours, and increasing energy efficiency in City facilities and private developments.

The City of Los Angeles is also responsible for the implementation of transportation control measures, as outlined in the AQMP. Through capital improvement programs, local governments can fund infrastructure that contributes to improved air quality by requiring such improvements as bus turnouts as appropriate, installation of energy-efficient streetlights, and synchronization of traffic signals. In accordance with CEQA requirements and the CEQA review process, the City assesses the air quality impacts of new development projects, requires mitigation of potentially significant air quality impacts by conditioning discretionary permits, and monitors and enforces implementation of such mitigation measures.

SECTION 3
Thresholds of Significance

3.1 State CEQA Guidelines Appendix G

In accordance with the State CEQA Guidelines Appendix G (Appendix G), the Project would have a significant impact related to air quality if it would:

a) Conflict with or obstruct implementation of the applicable air quality plan;

b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation;

c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);

d) Expose sensitive receptors to substantial pollutant concentrations; or

e) Create objectionable odors affecting a substantial number of people.

For this analysis, the Appendix G Thresholds are relied upon. The analysis utilizes factors and considerations identified in the 2006 L.A. CEQA Thresholds Guide and criteria from the SCAQMD, as appropriate, to assist in answering the Appendix G Threshold questions.

3.2 2006 L.A. CEQA Thresholds Guide

The L.A. CEQA Thresholds Guide (*Thresholds Guide*), identifies the following factors for consideration on a case-by-case basis to evaluate air quality impacts:

Construction

- Combustion Emissions from Construction Equipment
  - Type, number of pieces and usage for each type of construction equipment;
  - Estimated fuel usage and type of fuel (diesel, natural gas) for each type of equipment; and
  - Emission factors for each type of equipment.
- Fugitive Dust: Grading, Excavation and Hauling

- Amount of soil to be disturbed on-site or moved off-site;
- Emission factors for disturbed soil;
- Duration of grading, excavation and hauling activities;
- Type and number of pieces of equipment to be used; and
- Projected haul route.

– Fugitive Dust: Heavy-Duty Equipment Travel on Unpaved Roads

- Length and type of road;
- Type, number of pieces, weight and usage of equipment; and
- Type of soil.

– Other Mobile Source Emissions

- Number and average length of construction worker trips to project site, per day; and
- Duration of construction activities.

While these factors are important inputs in determining the amounts and nature of air pollution emissions generated by a project during construction, construction air quality emissions are also evaluated in accordance with the most recent criteria adopted by the SCAQMD in connection with its *CEQA Air Quality Handbook, Air Quality Analysis Guidance Handbook,* and subsequent SCAQMD guidance as discussed below.[71]

a) Regional Emissions

The SCAQMD has established regional numerical emission indicators of significance for construction and operational activities. The numerical emission indicators are based on the recognition that the Air Basin is a distinct geographic area with a critical air pollution problem for which ambient air quality standards have been promulgated to protect public health.[72] Given that construction impacts are temporary and limited to the construction phase, the SCAQMD has established numerical indicators of significance specific to construction activity. Based on the indicators in the SCAQMD CEQA Air Quality Handbook,[73] the Project would potentially cause or contribute to an exceedance of an ambient air quality standard if Project construction or operation would generate regional emissions that would exceed the following:

71 While the SCAQMD CEQA Air Quality Handbook contains significance thresholds for lead, project construction and operation would not include sources of lead emissions and would not exceed the established thresholds for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from commercial land use projects such as the Project. As a result, lead emissions are not further evaluated in this Technical Report.

72 South Coast Air Quality Management District, CEQA Air Quality Handbook, (1993).

73 South Coast Air Quality Management District, Air Quality Significance Thresholds, 2015, http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2. Accessed December 2018.

- Construction:
  - 75 pounds a day for VOC
  - 100 pounds per day for NO_X
  - 550 pounds per day for CO
  - 150 pounds per day for SO_2
  - 150 pounds per day for PM10
  - 55 pounds per day for PM2.5
- Operation:
  - 55 pounds a day for VOC
  - 55 pounds per day for NO_X
  - 550 pounds per day for CO
  - 150 pounds per day for SO_2
  - 150 pounds per day for PM10
  - 55 pounds per day for PM2.5

b) Localized Emissions

In addition to the regional numerical emission indicators of significance listed above, the SCAQMD has developed a methodology to assess the potential for localized emissions to cause an exceedance of applicable ambient air quality standards or ambient concentration limits. Impacts would be considered significant if the following would occur:

- Maximum daily localized emissions of NO_X and/or CO during construction or operation are greater than the applicable localized significance thresholds, resulting in predicted ambient concentrations in the vicinity of the Project Site greater than the most stringent ambient air quality standards for NO_2 and/or CO.[74]
- Maximum daily localized emissions of PM10 and/or PM2.5 during construction are greater than the applicable localized significance thresholds, resulting in predicted ambient concentrations in the vicinity of the Project Site to exceed 10.4 $\mu g/m^3$ over 24 hours (SCAQMD Rule 403 control requirement).
- Maximum daily localized emissions of PM10 and/or PM2.5 during operation are greater than the applicable localized significance thresholds, resulting in predicted ambient concentrations in the vicinity of the Project Site to exceed 2.5 $\mu g/m^3$ over 24 hours (SCAQMD Rule 1303 allowable change in concentration).

The SCAQMD has established localized screening criteria that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance thresholds and therefore not cause or contribute to an exceedance of the applicable ambient air quality standards or ambient concentration limits without project-specific dispersion modeling. The use of the localized screening criteria are conservative mass daily emission limits that would satisfy the

74 South Coast Air Quality Management District, Final Localized Significance Threshold Methodology, 2008.

concentration-based limits listed above. This analysis uses the localized screening criteria to evaluate impacts from localized emissions where applicable.

To evaluate potential impacts associated with mobile sources, this assessment evaluates the potential for the Project to cause the following condition to would occur at an intersection or roadway within one-quarter mile of a sensitive receptor:

- The Project would cause or contribute to an exceedance of the CAAQS 1-hour or 8-hour CO standards of 20 or 9.0 parts per million (ppm), respectively.

Based on the criteria set forth by the SCAQMD, the Project would expose sensitive receptors to substantial concentrations of toxic air contaminants if any of the following would occur:[75]

- The Project emits carcinogenic materials or TACs that exceed the maximum incremental cancer risk of ten in one million or a cancer burden greater than 0.5 excess cancer cases (in areas greater than or equal to 1 in 1 million) or an acute or chronic hazard index of 1.0.

Per the 2006 L.A. CEQA Thresholds Guide, the determination of significance shall be made on a case-by-case basis, considering the following factors:

- The regulatory framework for the toxic material(s) and process(es) involved;
- The proximity of the toxic air contaminants to sensitive receptors;
- The quantity, volume and toxicity of the contaminants expected to be emitted;
- The likelihood and potential level of exposure; and
- The degree to which a project's design will reduce the risk of exposure.

[75] South Coast Air Quality Management District, CEQA Air Quality Handbook, 1993.

SECTION 4
Methodology

The evaluation of potential impacts to regional and local air quality that may result from the construction and long-term operations of the Project is conducted as follows. Detailed modeling calculations and supporting files are provided in **Appendix C-1** through **C-5** of this Technical Report.

4.1 Consistency with Air Quality Plan

The SCAQMD is required, pursuant to the Clean Air Act, to reduce emissions of criteria pollutants for which the Air Basin is in non-attainment of the NAAQS (e.g., ozone and PM2.5). The SCAQMD's 2012 Air Quality Management Plan contains a comprehensive list of pollution control strategies directed at reducing emissions and achieving the NAAQS. These strategies are developed, in part, based on regional growth projections prepared by the SCAG. Projects that are consistent with the assumptions used in the Air Quality Management Plan do not interfere with attainment because the growth is included in the projections utilized in the formulation of the Air Quality Management Plan. Thus, projects, uses, and activities that are consistent with the applicable growth projections and control strategies used in the development of the Air Quality Management Plan would be consistent with the Air Quality Management Plan, even if they exceed the SCAQMD's numeric indicators.[76] As noted above, the 2016 AQMP has been adopted by the SCAQMD and CARB. Therefore, this analysis considers the 2016 AQMP. The Project's consistency with the AQMP is evaluated based on consistency with the applicable growth projections and emission control strategies.

4.2 Construction Emissions

Construction of the Project has the potential to generate temporary criteria pollutant emissions through the use of heavy-duty construction equipment, such as excavators and forklifts, and through vehicle trips generated from workers and haul trucks traveling to and from the Project Site, and through building activities, such as the application of paint and other surface coatings. In addition, fugitive dust emissions would result from various soil-handling activities. Mobile source emissions, primarily NO_X, would result from the use of construction equipment such as dozers and loaders. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions.

Construction emissions were estimated assuming an early starting period. In order to provide a conservative emissions analysis, for modeling purposes, construction emissions were modeled

[76] South Coast Air Quality Management District, CEQA Air Quality Handbook, Chapter 12, 1993, page 12-1.

with a starting time period in calendar year 2018. The Project would be expected to be fully built-out will full operation of all uses by calendar year 2023. Daily regional emissions during construction are forecasted by assuming a conservative estimate of construction activities (i.e., assuming all construction occurs at the earliest feasible date) and applying the mobile source and fugitive dust emissions factors. If the onset of construction is delayed to a later date than assumed in the modeling analysis, construction impacts would be less than those analyzed, because a more energy-efficient and cleaner burning construction equipment and vehicle fleet mix would be expected in the future, pursuant to State regulations that require construction equipment fleet operators to phase-in less polluting heavy-duty equipment. As a result, should the Project commence construction on a later date than modeled in this air quality impact analysis, air quality impacts would be less than the impacts disclosed herein. Emissions are estimated using the CalEEMod (Version 2016.3.2) software, which is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions from a variety of land use projects. CalEEMod was developed in collaboration with the air districts of California. Regional data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California air districts to account for local requirements and conditions. The model is considered to be an accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California and is recommended by the SCAQMD.[77]

Daily regional emissions during construction are forecasted by assuming a conservative estimate of construction activities (i.e., assuming all construction occurs at the earliest feasible date) and applying the mobile source and fugitive dust emissions factors. The input values used in this analysis were adjusted to be Project-specific based on equipment types and the construction schedule. Construction haul and vendor truck emissions during demolition, grading, concrete pour and building construction were evaluated using regional heavy-duty truck emission factors from EMFAC2014. Daily truck trips and default trip length data were used to assess roadway emissions from truck exhaust. The maximum daily emissions are estimated values for the worst-case day and do not represent the emissions that would occur for every day of Project construction. The maximum daily emissions are compared to the SCAQMD daily regional numeric indicators. Detailed construction equipment lists, construction scheduling, and emissions calculations are provided in **Appendix C-2** of this Technical Report.

Construction of the Project is estimated to require approximately 48 months, starting as early as the first quarter of 2019. Subphases of construction would include demolition of the Executive Building and parking structure, site preparation, grading and excavation, foundation pouring, building construction, paving, and architectural coating. Demolition activities would generate approximately 35,000 tons of demolition debris (asphalt and general construction debris). The Project would export approximately 364,000 cubic yards of soil during grading and excavation activities. Heavy-duty equipment, vendor supply trucks and concrete trucks would be used during construction of foundations, parking structures, and buildings. Landscaping and architectural

[77] South Coast Air Quality Management District, California Emissions Estimator Model, http://www.aqmd.gov/caleemod/. Accessed December 2018.

coating would occur during the finishing activities. The maximum daily regional emissions from these activities are estimated by construction phase and compared to the SCAQMD significance thresholds. The maximum daily regional emissions are predicted values for the worst-case day and do not represent the emissions that would occur for every day of Project construction. **Table 5**, *Modeled Construction Schedule*, presents the anticipated construction schedule for the Project.

TABLE 5
MODELED CONSTRUCTION SCHEDULE

Phase and Subphase	Start Date [a]	End Date [a]	Work Days
Demolition	7/1/2018	1/31/2019	184
Site Preparation	2/1/2019	2/28/2019	24
Grading	3/1/2019	9/30/2019	183
Foundation (North Tower)	10/1/2019	10/2/2019	2
Foundation (South Tower)	10/3/2019	10/4/2019	2
Subterranean Parking Structure Construction	10/5/2019	6/26/2020	228
Podium Construction	6/27/2020	8/27/2020	53
Building Construction	8/28/2020	10/6/2022	660
Paving	3/1/2022	10/6/2022	189
Architectural Coating	1/1/2021	10/6/2022	552
Renovation [b]	7/1/2018	8/8/2020	660

NOTES:

[a] The emissions were estimated assuming construction begins at the earliest possible date (2018). This provides for a conservative emissions estimate as emission factors decline in future years. Project construction may commence at a later date, which would generally result in similar or reduced emissions, primarily due to vehicles meeting more stringent emissions standards. If construction starts at a later date, emissions could occur in calendar year 2021 and 2022; however, the emissions would be similar or reduced compared to the emissions reported in this Technical Report.

[b] Renovation activity could occur at a later time. In order to provide a conservative assessment, renovation activity was modeled at the earliest possible time since emission factors are higher in earlier years compared to later years.

SOURCE: AC Martin, Plans for Onni Times Square, 2017; ESA, 2018.

Construction haul and vendor truck emissions during grading, concrete pour and building construction were evaluated using regional heavy-duty truck emission factors from EMFAC2014. Daily truck trips and default trip length data were used to assess roadway emissions from truck exhaust, as well as typical CARB idling times of local emissions on-site. Emissions from hauling demolition material and soil are estimated by construction phase. It should be noted that the maximum daily emissions are predicted values for the worst-case day and do not represent the emissions that would occur for every day of Project construction. The maximum daily emissions are compared to the SCAQMD daily regional numeric indicators.

4.2.1 Emissions from Construction Equipment

Mobile source emissions, primarily NO_X and particulate matter, would result from the use of construction equipment such as bulldozers, wheeled loaders, and cranes. During the finishing phase, the application of architectural coatings (i.e., paints) and other building materials would release reactive organic compounds. Construction emissions can vary substantially from day to

day, depending on the level of activity, the specific type of operation and, for dust, the prevailing weather conditions. The assessment of construction air quality impacts considers each of these potential sources.

Truck and construction equipment emissions will vary with engine model years in which newer equipment will emit fewer pollutants. The CalEEMod model uses an emission rate for equipment and trucks which represents an average model year for available equipment unless the specific emissions standards are applied to the equipment. The proposed Project would incorporate into the Project design the use of standardized and environmentally protective construction equipment consistent with state regulations (13 CCR Section 2449) and SCAQMD AQMP control strategies to control emissions (refer to the discussion of PDFs discussed below). CalEEMod calculates the exhaust emissions based on CARB OFFROAD methodology using the equation presented below.

Construction Off-Road Equipment:

$$Emissions_{Diesel}\,[g] = \sum_i (EF_i \times Pop_i \times AvgHP_i \times Load_i \times Activity_i$$

Where:	EF_i	=	Emission factor from OFFROAD [g/bhp-hr]
	Pop_i	=	Population [quantity of same equipment type]
	$AvgHP_i$	=	Maximum rated average horsepower [hp]
	$Load_i$	=	Load Factor [dimensionless]
	$Activity_i$	=	Hours of operation [hours]
	i	=	Summation index

The CalEEMod tool provides options for specifying equipment, horsepower ratings, load factors, and operational hours per day. Construction equipment lists for each phase of activity were provided by the applicant and/or applicant's construction contractor(s) and architect(s). The amount of construction equipment used and the duration of construction activity could have a substantial effect upon the amount of construction emissions, concentrations and the resulting impacts occurring at any one time. As such, the emission forecasts provided reflect a specific set of conservative assumptions based on the expected construction scenario wherein a relatively large amount of construction is occurring in a relatively intensive manner. Fugitive dust emissions during construction activities were estimated in CalEEMod, which are based on the methods described in the USEPA AP-42 Compilation of Air Pollutant Emission Factors.[78]

4.2.2 Emissions from On-Road Trips

Construction generates on-road vehicle exhaust, evaporative, and dust emissions from personal vehicles for worker and vendor commuting, and trucks for soil and material hauling. These emissions are based on the number of trips and VMT along with emission factors from EMFAC2014.

Running emissions for all pollutants and particulate matter emissions from tire and brake wear were divided by the VMT of each respective vehicle class from each scenario year and adjusted

[78] United States Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emissions Factors, Chapter 13: Miscellaneous Sources, https://www3.epa.gov/ttn/chief/ap42/ch13/index.html.

for unit conversions to derive emission factors in units of grams per VMT. All other emissions (including evaporative) were divided by the number of trips to derive emission factors in units of grams per trip. The emissions from mobile sources were calculated with the trip rates, trip lengths and emission factors for running from EMFAC2014 as follows:

Construction On-Road Trips:

$Emissions_{pollutant} = VMT * EF_{running,pollutant}$

Where: $Emissions_{pollutant}$ = emissions from vehicle running for each pollutant [g]
VMT = vehicle miles traveled [miles]
$EF_{running,pollutant}$ = emission factor for running emissions [g/mile]

4.2.3 Emissions from Architectural Coating

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings. The CalEEMod tool calculates the VOC evaporative emissions from application of residential and non-residential surface coatings using the following equation:

Construction Architectural Coating Emissions:

$E_{AC} = EF_{AC} \times F * A_{paint}$

Where: E = emissions [lb VOC]
EF = emission factor [lb/sqft]
A = building surface area [sqft].

The CalEEMod tool assumes the total surface for painting equals 2.7 times the floor square footage for residential and 2 times that for nonresidential square footage defined by the user. All of the land use information provided by a metric other than square footage will be converted to square footage using the default conversions or user defined equivalence.

F = fraction of surface area [%].

The default values based on SCAQMD methods used in their coating rules are 75 percent for the interior surfaces and 25 percent for the exterior shell. Parking areas are based on 6 percent coverage.

The emission factor (EF) is based on the VOC content of the surface coatings and is calculated estimated using the equation below:

Construction Surface Coating Emission Factor:

$EF_{AC} = C_{voc} / 454[g/lb] \times 3.785[L/Gal]/180[sqft]$

Where: EF = emission factor [lb/sqft]
C = VOC content [g/L]. This varies by location and year

The emission factors for coating categories are calculated using the equation above based on default VOC content provided by the air districts or CARB's statewide limits.

4.2.4 Emissions from Paving

While there is no specific screen associated with asphalt paving emissions, CalEEMod estimates VOC off-gassing emissions associated with asphalt paving of parking lots using the following equation:

Construction Paving Emissions:

$E_{AP} = EF_{AP} \times A_{Parking}$

Where: E = emissions [lb]
EF = emission factor [lb/acre]. The SMAQMD default emission factor is 2.62 lb/acre.
A = area of the parking lot [acre]

4.3 Operational Emissions

Operation of the Project has the potential to generate criteria pollutant emissions through vehicle trips traveling to and from the Project Site. In addition, emissions would result from area sources on-site such as natural gas combustion from water heaters, landscaping equipment, and use of consumer products. Stationary sources of emissions may also be generated by on-site charbroiling associated with food preparation activities at the proposed restaurant land uses if the restaurant were to install charbroiling equipment. Criteria pollutant emissions would also be generated by point sources including new cooling towers and new emergency generators. Operational impacts were assessed for the existing uses in the year of 2017 (see Table 1 above), which represents the NOP baseline year, and for the full Project buildout year of 2023. Detailed operational emissions calculations are provided in **Appendix C-3** of this Technical Report.

The California Supreme Court issued an opinion regarding the environmental baseline to be used in an EIR for a long-range transportation improvement in the case *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority,* 57 Cal. 4th 439 (2013) (NFSR) in August 2013. In its decision, the Court held in part that "nothing in CEQA precludes an agency...from considering both types of baseline—existing and future conditions—in its primary analysis of the project's significant adverse effects," but if an agency "chooses to evaluate only the impacts on future conditions, foregoing the existing conditions analysis called for under the State CEQA Guidelines," the agency needs to justify that choice. An air-quality analysis of the conditions when the Project becomes fully operational in 2023 would provide the most accurate and environmentally meaningful assessment of the Project's operational air quality impacts, as the Project could not be operational in 2017 because it is seeking entitlements at this time and would require approximately 48 months of construction once the entitlements have been obtained. Thus, any operational impacts produced by modeling a hypothetical 2017 build out year could not in fact occur, and thereby could not realistically create a significant impact on the environment.

The operational emissions were also estimated using the CalEEMod software. CalEEMod was used to forecast the daily regional emissions from area and stationary sources that would occur during long-term Project operations. In calculating mobile-source emissions, the trip length values were based on the distances provided in CalEEMod. The trip distances were applied to the maximum daily trip estimates, based on the trip rates in the Project Transportation Impact Analysis.[79] The trips take into account trip and vehicle miles traveled (VMT) reductions from Project characteristics, including internal capture from co-locating commercial and residential uses on the Project Site, access to nearby mass transit, and the Project Site's proximity to nearby office, library, retail, restaurant, theater, entertainment, park, and other commercial and recreational uses in Downtown Los Angeles.

Area source emissions are based on natural gas combustion rates for building heating, water heaters and cooking, landscaping equipment fuel combustion, and consumer product usage (including paints) rates provided in CalEEMod. Natural gas usage factors in CalEEMod are based on the California Energy Commission (CEC) California Commercial End Use Survey data set, which provides energy demand by building type and climate zone.[80] The Project does not include fireplaces in the design of the residential towers, which consists primarily of studios, one, and two bedroom apartments. Therefore, residential fireplaces were not included in the emissions analysis.

Stationary-source emissions are estimated separately outside of the CalEEMod software. Stationary sources may include charbroiling of meat that may occur on-site during food preparation activities in the restaurant kitchen. Charbroiling emissions are calculated based on emissions factors available from the SCAQMD. In order to provide a conservative analysis, it was assumed that the restaurant uses would charbroil meat with relatively high emission factors (i.e., hamburger meat and chicken). The quantity of meat charbroiled in the restaurant uses are based on survey data from the SCAQMD and San Joaquin Valley Air Pollution Control District. The estimated emissions account for reductions from compliance with emissions control requirements consistent with SCAQMD Rule 1138.

Stationary sources would also include four on-site cooling towers to assist in dissipating heat from commercial processes of the Project, and would utilize a flow rate of approximately 17,820 gallons per day (refer to Section IV.R, *Water Supply*, of the Project's Draft EIR). Emissions from the cooling tower occur as a result of air containing chemical impurities passing through the cooling water in the tower where some of the liquid water is entrained into the air stream and carried out of the tower as "drift" droplets where the particulate matter constituent of the drift droplets may be classified as an emission. Large drift droplets often settle out of the tower exhaust air stream and deposit near the tower, while other drift droplets may evaporate before being deposited in the area surrounding the tower, and they also can produce PM emissions. To estimate daily emissions, particulate matter emission factors for wet cooling towers calculated by

79 Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, 2018.

80 California Energy Commission, California Commercial End-Use Survey. Available at http://capabilities.itron.com/CeusWeb/Chart.aspx. Accessed December 2018.

the USEPA were used, conservatively assuming it would operate 24 hours a day, every day of the year using the above mentioned daily flow rate.[81]

Stationary source emissions are estimated for new emergency generators expected in each tower (two generators for the Project), rated at approximately 414 kilowatts (555 horsepower) for the North Tower emergency generator and 623 kilowatts (835 horsepower) for the South Tower emergency generator based on preliminary engineering assumptions. The emergency generators would result in emissions during maintenance and testing operations. The emergency generator emissions are calculated based on compliance with the Tier 4 interim emissions standards and compliance with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. Emergency generators are permitted by the SCAQMD and regulated under SCAQMD Rule 1470. Maintenance and testing would not occur daily, but rather periodically, up to 50 hours per year per Rule 1470. For the purposes of estimating daily emissions, it is estimated that the emergency generators would operate for up to two hours on days with maintenance and testing activities.

Operational air quality impacts are assessed based on the incremental increase in emissions compared to baseline conditions. Under CEQA, the baseline environmental setting for an EIR is generally established at or around the time that the Notice of Preparation for the EIR is published. As discussed previously, the Project Site is currently developed with five structurally distinct but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to ten stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the ten-story Mirror Building, the six-story parking structure, and the six-story Executive Building. This includes approximately 541,113 square feet of commercial office uses across the four existing buildings, an approximately 7,500 square-foot bank in the Executive Building, an approximately 11,250 square-foot cafeteria in the Plant Building. Approximately 223,945 square feet, or 40 percent of the existing uses, are vacant office spaces that have been vacant for 10 years. Therefore, the analysis assumes no existing emissions or vehicle trips are generated from the 40 percent vacant office spaces. The net operational emissions generated by the proposed Project are equal to the Project's emissions minus the existing Project Site emissions. The maximum daily net emissions from operation of the Project are compared to the SCAQMD daily regional numeric indicators.

4.3.1 Area Sources (Consumer Products and Coatings)

Area source emissions were calculated using CalEEMod default assumptions for of the multi-family residential, retail, and restaurant land uses. Area sources include hearths, consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating, water heating, and stoves as these are calculated in the building energy use module discussed below.

[81] United States Environmental Protection Agency, Air Pollutant Factors (AP-42), Fifth Edition, Volume I - Chapter 13.4: Wet Cooling Towers, https://www3.epa.gov/ttn/chief/ap42/ch13/final/c13s04.pdf. Accessed December 2018.

Consumer Products

Consumer products are chemically formulated products used by household and institutional consumers, including, but not limited to, detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products; but does not include other paint products, furniture coatings, or architectural coatings. The SCAQMD conducted an evaluation of consumer product use compared to the total square footage of buildings using data from the CARB consumer product Emission Inventory and determined a VOC emission rate for consumer products applicable to areas within the SCAQMD jurisdiction.[82] To calculate the VOC emissions from consumer product use, CalEEMod incorporates the following equation and SCAQMD-approved emission factor:

Consumer Products:

Emissions = EF × Building Area

Where: EF = pounds of VOC per building square foot per day

The factor is 2.04×10^{-5} lbs/sqft/day for SCAQMD areas.

Building Area = The total square footage of all buildings including residential square footage.

Architectural Coatings

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings such as in paints and primers. The methodology for operations is the same as the construction methodology discussed above.

4.3.2 Building Energy Usage

With regard to energy usage, the consumption of fossil fuels to generate electricity and to provide heating and hot water generates criteria pollutants. Future fuel consumption rates are estimated based on specific square footage of the multi-family residential, retail, and restaurant land uses, as well as predicted water supply needs of the Project. Energy usage (off-site electricity generation and on-site natural gas consumption) for the Project is calculated within CalEEMod using the CEC CEUS data set.[83] This data set provides energy intensities of different land uses throughout the state and different climate zones. However, since the data from the CEUS is from 2002, the CalEEMod software incorporates correction factors to account for compliance with the Title 24 Building Standards Code.

Natural gas-related emissions of criteria pollutants associated with operation of the Project are based on the size of the multi-family residential, retail, and restaurant land uses, and the natural gas demand factors for the land uses. Natural gas demand is based on data from the CEUS, which lists energy demand by building type.[84] However, since the data from the CEUS is from 2002,

[82] California Air Pollution Control Officer's Association, California Emissions Estimator Model, Appendix E, Technical Source Documentation, Section 7 Studies on Amount of Parking Lot Area Painted, 2016.

[83] California Energy Commission, California Commercial End-Use Survey.

[84] California Energy Commission, California Commercial End-Use Survey.

CalEEMod incorporates correction factors to account for compliance with the 2008 Title 24 Building Standards Code. Since the Project would also be required to meet the Title 24 standards in effect at the time of building permit application, this analysis incorporates an additional correction factor to account for the updated Title 24 Building Standards Code. The correction factors are applied only to the new building construction.

4.3.3 Mobile Source Emissions

The trip distances were applied to the maximum daily trip estimates, based on the trip generation rates for each land use provided by the Project Transportation Impact Analysis[85] to estimate the total VMT. The VMT estimates take into account trip and VMT reductions from Project land use characteristics including internal capture from co-locating land uses on the Project Site, pedestrian trips, nearby transit options, and nearby off-site recreational, residential, commercial, restaurant, and office land uses.

Trip Type

The trip type breakdown describes the purpose of the trip generated at each land use. For example, the trip type breakdown indicates the percentage of trips generated at single family home for work, for shopping, and for other purposes. Multiplying the total trips for a land use by trip type breakdown percentage yields trips of a given trip type. Two sets of trip type breakdown are used in CalEEMod – residential breakdown and commercial breakdown.

Residential trip type: These include home-work (H-W), home-shop (H-S), or home-other (H-O). A home-work trip represents the trip from the home to the workplace. A home-shop trip represents the trip from the home to a land use where shopping takes place (generally retail). A home-other represents all other types of trips generated from the resident such as school, entertainment, etc. The trip type breakdown is from district supplied information or the 1999 Caltrans Statewide Travel Survey is used as default or specific information obtained from the various air quality management and air pollution control districts.

Commercial trip type: These include commercial-customer (C-C), commercial-work (C-W) and commercial-nonwork (C-NW). A commercial-customer trip represents a trip made by someone who is visiting the commercial land use to partake in the services offered by the Site. The commercial-work trip represents a trip made by someone who is employed by the commercial land use sector. The commercial-nonwork trip represents a trip associated with the commercial land use other than by customers or workers. An example of C-NW trips includes trips made by delivery vehicles of goods associated with the land use. The trip type breakdown from the number or workers and or truck trips from ITE and an analysis of information provided for the SCAB was used as default to assign the trip type breakdowns for all land uses. If an exact match to a land use was not available, data from a similar land use was used as a surrogate.

[85] Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, 2018.

Primary Trip Length

In CalEEMod, each trip type has a primary trip length associated with it. These trip lengths are based on the location and urbanization selected on the project characteristic screen. These values were supplied by the districts or use a default average for the state. Each district (or county) also assigns trip lengths for urban and rural settings.

Pass-by and Diverted Trips

Trip link types further describe the characteristics of the trip attracted to each land use, whether it's a primary trip, a diverted link trip, or a pass-by trip. For example, a commercial customer pass-by trip could be a person going from home to shop on his/her way to work. In addition, a commercial customer diverted-link trip could be a person going from home to work, and on its way making a diversion to shop. Pass-by trips generate virtually no additional running emissions but could generate additional resting and startup emissions. Diverted trips generate less running emissions compared to primary trips, and can also generate additional resting and startup emissions.

Mobile Source Emission Factors

CARB's most recent on-road emissions factor model, EMFAC2014, was used to generate emissions factors for operational mobile sources. The model was run in the emissions mode (also referred to as the "Burden" mode) and used to generate South Coast Air Basin-specific vehicle fleet emission factors in units of grams or metric tons per mile, which is the same methodology that was used by CalEEMod to generate emission factors using the prior EMFAC2011 model. These emission factors are then applied to the daily VMT to obtain daily mobile source emissions.

Modeling for the Project was conducted using the vehicle fleet mix for the South Coast Air Basin as provided in EMFAC2014. Mobile source emissions are generally calculated as follows:

Mobile:

$$\text{Emissions} = \left(\sum_i (\text{Units} \times \text{ADT} \times D_{TRIP} \times \text{EF})_i \right)$$

Where:	Units	=	Number of vehicles (same vehicle model year and class)
	ADT	=	Average daily trip rate [trips/day]
	D_{TRIP}	=	Trip distance [miles/trip]
	EF	=	Emission factor [pounds per mile]
	i	=	Summation index

Emissions from motor vehicles are dependent on model years and the specific types of vehicles that are used to travel to and from the Project Site. The emissions were calculated using a representative motor vehicle fleet mix for the South Coast Air Basin for the opening year of the Project. As discussed above, all vehicle types would visit the Project Site; therefore, the use of the motor vehicle fleet mix for the South Coast Air Basin is an appropriate modeling parameter.

4.3.4 Stationary Source Emissions

Stationary-source emissions are estimated separately outside of the CalEEMod software. Stationary sources may include charbroiling of meat that may occur on-site during food preparation activities in a restaurant kitchen. Stationary source emissions are calculated based on emissions factors available from the SCAQMD for charbroiling.[86] In order to provide a conservative analysis, it was assumed that the restaurant would charbroil meat with relatively high emission factors (i.e., hamburger and chicken meat). The quantity of meat charbroiled in the restaurant is based on survey data from the SCAQMD.[87] The estimated emissions account for reductions from compliance with emissions control requirements consistent with SCAQMD Rule 1138. In general, stationary-source charbroiling emissions are calculated as follows:

Stationary Source Charbroiling:

$$\text{Emissions} = \left(\sum_i (Q_{MEAT} \times EF \times (1 - C)_i \right)$$

Where: Q_{MEAT} = Quantity of meat product charbroiled in a day[pounds/day]
EF = Emission factor [pounds pollutant per pounds meat]
C = Emissions control factor [percent]
i = Summation index

Emissions associated with Stationary sources would also include four on-site cooling towers to assist in dissipating heat from commercial processes of the project, and would utilize a flow rate of approximately 17,820 gallons per day (refer to Section IV.R*, Water Supply*, of the Project's Draft EIR). Emissions from the cooling tower occur as a result of air containing chemical impurities passing through the cooling water in the tower where some of the liquid water is entrained into the air stream and carried out of the tower as "drift" droplets where the particulate matter constituent of the drift droplets may be classified as an emission. Large drift droplets often settle out of the tower exhaust air stream and deposit near the tower, while other drift droplets may evaporate before being deposited in the area surrounding the tower, and they also can produce PM emissions. To estimate daily emissions, particulate matter emission factors for wet cooling towers calculated by the USEPA were used, conservatively assuming it would operate 24 hours a day, every day of the year using the above mentioned daily flow rate.[88]

Stationary Cooling Tower:

$$\text{Emissions} = \left(Q_{WATER} \times EF \times 60 \text{ min} \times 1/1000 \text{ gallons} \times 24 \text{ hrs/day} \right) \times R_{PM2.5}$$

Where: Q_{WATER} = Quantity of Water used by All Cooling Towers [gallons/minute]
EF = Emission factor [pounds PM10 per 1000 gallons of water]
$R_{PM2.5}$ = Ratio of PM2.5 to PM10 (0.857)

87 South Coast Air Quality Management District, Emission Factors for Commercial Cooking Operations.

88 United States Environmental Protection Agency, Air Pollutant Factors (AP-42), Fifth Edition, Volume I - Chapter 13.4: Wet Cooling Towers, https://www3.epa.gov/ttn/chief/ap42/ch13/final/c13s04.pdf. Accessed December 2018.

Emissions associated with periodic maintenance and testing of the emergency generators (approximately rated at 414 kilowatts (555 horsepower) for the North Tower emergency generator and 623 kilowatts (835 horsepower) for the South Tower emergency generator) are estimated separately outside of the CalEEMod software. The emergency generator emissions are calculated based on compliance with the Tier 4 emissions standards and compliance with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. As discussed previously, Rule 1470 applies to stationary compression ignition engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing. In general, stationary-source emergency generator emissions are calculated as follows:

Stationary Source Emergency Generator:

$$Emissions_{Diesel}\,[g] = \sum_i (EF \times Pop \times HP \times Load \times Activity)_i$$

Where:	EF	=	Emission factor [g/bhp-hr]
	Pop	=	Population [quantity of same equipment type]
	HP	=	Maximum rated horsepower [hp]
	Load	=	Load Factor [dimensionless]
	Activity	=	Hours of operation [hours per day, hours per year]
	i	=	Summation index

4.4 Localized Emissions

The localized effects from the on-site portion of the emissions are evaluated at nearby sensitive receptor locations potentially impacted by the Project according to the SCAQMD *Final Localized Significance Threshold Methodology* (June 2003, revised July 2008).[89] The localized significance thresholds are only applicable to NO_X, CO, PM10 and PM2.5. The SCAQMD has established conservative screening criteria that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance thresholds and therefore not cause or contribute to an exceedance of the applicable ambient air quality standards without project-specific dispersion modeling. The localized analysis is based on this SCAQMD screening criteria. The screening criteria depend on: (1) the area in which the Project is located, (2) the size of the Project Site, and (3) the distance between the Project Site and the nearest sensitive receptor. The Project Site is located in the SCAQMD's Central Los Angeles Source Receptor Area 1 and is approximately 3.6 acres in size, with renovations of existing buildings taking place on approximately 1.85 acres of the site and construction of new residential towers on approximately 1.84 acres of the site. In order to provide a conservative assessment of localized construction and operational, the screening criteria used in the analysis were those applicable to a 1.84-acre site for residential tower construction, and a 3.6-acre site for total Project construction activities

[89] South Coast Air Quality Management District, Final Localized Significance Threshold Methodology.

(residential tower construction and renovation activities) and Project operations, in the Central Los Angeles area with sensitive receptors located 25 meters away.

The nearest off-site air quality sensitive receptors are the one-acre park just south of the LAPD Headquarters Building located approximately 25 meters southeast of the Project Site and the Higgins Building Lofts apartment complex located at the corner of S. Main Street and West 2nd Street approximately 75 meters southeast of the Project Site.

Based on available information, the future mixed-use residential development planned for future construction over the future Metro station at the corner of 2nd Street and Broadway approximately 50 feet southwest of the Project Site is not reasonably expected to be in operation and occupied during construction of the Project. The Initial Study[90] for that project states that its construction will not begin until construction of the Metro Regional Connector portal and station within the site is complete. Therefore, construction of this related project would not be anticipated to begin until 2022 and would not be anticipated to be complete until 2025, which would be two years after completion the Project. Therefore, there is no evidence to assume that this future mixed-use residential development would be occupied by residents during construction of the Project, and as such, there would no exposure to these future residents from construction-related localized emissions from the Project.

Operational CO, NO_X, PM10 and PM2.5 localized emissions, which generally consists of both fugitive dust and non-fugitive dust exhaust emissions, such as diesel fuel and natural gas combustion, were analyzed in accordance with the SCAQMD *Final Localized Significance Threshold Methodology* (June 2003, revised July 2008). Therefore, with respect to localized operational CO, NO_X, PM10 and PM2.5, the SCAQMD recommends evaluating impacts at the closest sensitive receptor as sensitive receptors further away in distance would experience lesser impacts. As a conservative assessment, the operational LSTs for CO, NO_X, PM10 and PM2.5 are based on the distance of 25-meters for the most conservative analysis that corresponds to existing sensitive receptors, such as the one-acre park just south of the LAPD Headquarters Building located southeast of the Project Site, as well as the nearest future sensitive receptor that would be located at the corner of 2nd Street and Broadway southwest of the Project Site.

According to the SCAQMD *Final Localized Significance Threshold Methodology*, "projects whose calculated emission budgets for the proposed construction or operational activities are above the LST emission levels found in the LST mass rate look-up tables should not assume that the project would necessarily generate adverse impacts. Detailed air dispersion modeling may demonstrate that pollutant concentrations are below localized significant levels."[91] Thus, if the screening criteria would be exceeded, a project could implement mitigation measures to reduce localized emissions to below the screening criteria or conduct dispersion modeling using the USEPA AMS/EPA Regulatory Model (AERMOD) dispersion model with meteorological data from the closest SCAQMD monitoring station to refine the localized impact analysis.

91 South Coast Air Quality Management District, Final Localized Significance Threshold Methodology, page 1-2.

4.5 CO Hotspots

Localized areas where ambient CO concentrations exceed state and/or federal standards are termed CO hotspots. The potential for the Project to cause or contribute to the formation of off-site CO hotspots are evaluated based on prior dispersion modeling of the four busiest intersections in the Air Basin that has been conducted by the SCAQMD for its CO Attainment Demonstration Plan in the AQMP.[92] The analysis compares the intersections with the greatest peak-hour traffic volumes that would be impacted by the Project to the intersections modeled by the SCAQMD. Project-impacted intersections with peak-hour traffic volumes that are lower than the intersections modeled by the SCAQMD, in conjunction with lower background CO levels, would result in lower overall CO concentrations compared to the SCAQMD modeled values in its AQMP.

4.6 Toxic Air Contaminant Impacts (Construction and Operations)

The greatest potential for construction TAC emissions would be associated with DPM emissions associated from heavy-duty equipment during excavation and grading activities. According to SCAQMD methodology, health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person exposed to concentrations of TACs over a 70-year lifetime will contract cancer based on the use of standard risk-assessment methodology. Additionally, the SCAQMD CEQA guidance does not require a HRA for short-term construction emissions. Construction activities associated with the Project would be sporadic, transitory, and short-term in nature (approximately 48 months). Thus, construction of the Project would not result in a substantial, long-term (i.e., 70-year) source of TAC emissions. Nonetheless, a qualitative assessment of TAC emissions associated with short-term construction TAC emissions is provided in the analysis section below.

During long-term operations, TACs could be emitted as part of periodic maintenance operations, period testing and maintenance of the emergency generator, restaurant charbroiling, cleaning, painting, etc., and from periodic visits from delivery trucks and service vehicles. However, these uses are expected to be occasional and result in minimal exposure to off-site sensitive receptors. As the Project consists of residential, and commercial/restaurant uses, the Project would not include sources of substantial TAC emissions identified by the SCAQMD or CARB siting recommendations.[93, 94] Thus, a qualitative analysis is appropriate for operational emissions.

4.7 Project Design Features

The following Project Design Features (PDFs) are applicable to the Project.

92 South Coast Air Quality Management District, 2012 Air Quality Management Plan.

93 South Coast Air Quality Management District, Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning, 2005, Table 2-3, http://www.aqmd.gov/docs/default-source/planning/air-quality-guidance/complete-guidance-document.pdf?sfvrsn=4. Accessed December 2018.

94 California Air Resources Board, Air Quality and Land Use Handbook: A Community Health Perspective, 2005, Table 1-1.

PDF-AQ-1: Green Building Features: The Project will be designed to achieve the equivalent of the United States Green Building Council (USGBC) Leadership in Energy and Environmental Design (LEED) Silver Certification level for new buildings. The Project will demonstrate compliance with the LEED Silver Certification or equivalent by providing architectural and engineering documentation, building energy modeling simulations, and other supporting evidence consistent with USGBC accepted documentation standards. Pre-construction documentation that indicates the Project is designed to achieve the number of points required for LEED Silver Certification will be provided to the City prior to building permit issuance. Post-construction documentation that indicates the Project operates within the expected parameters to achieve the number of points required for LEED Silver Certification will be provided to the City after completion of LEED Silver Certification commissioning activities.

PDF-AQ-2: Electric Vehicle Parking Features: The Project will designate a minimum of ten (10) percent of the Code-required on-site nonresidential parking for carpool and/or alternative-fueled vehicles. The Project will ensure that at least twenty (20) percent of the total code-required parking spaces provided for all types of parking facilities are capable of supporting future electric vehicle supply equipment (EVSE), with 5 percent of the Code-required spaces further improved with electric vehicle charging stations. Plans will indicate the proposed type and location(s) of EVSE and also include raceway method(s), wiring schematics and electrical calculations to verify that the electrical system has sufficient capacity to simultaneously charge all electric vehicles at all designated EV charging locations at their full rated amperage. Plan design will be based upon Level 2 or greater EVSE at its maximum operating capacity. Only raceways and related components are required to be installed at the time of construction. When the application of the 20 percent results in a fractional space, the Applicant will round up to the next whole number. A label stating “EV CAPABLE” will be posted in a conspicuous place at the service panel or subpanel and next to the raceway termination point.

SECTION 5
Environmental Impacts

5.1 Consistency with Air Quality Plan

Threshold a): Would the Project conflict with or obstruct the implementation of the applicable air quality plan?

5.1.1 Consistency with the Air Quality Plan

The AQMP was adopted by the SCAQMD as a program to lead the Air Basin into compliance with several criteria pollutant standards and other federal requirements and relies on emissions forecasts based on demographic and economic growth projections provided by SCAG's Regional Transportation Plan/Sustainable Communities Strategy.[95] SCAG is charged by California law to prepare and approve "the portions of each AQMP relating to demographic projections and integrated regional land use, housing, employment, and transportation programs, measures and strategies."[96] Projects whose growth is included in the projections used in the formulation of the AQMP are considered to be consistent with the plan and not to interfere with its attainment.

The SCAQMD recommends that, when determining whether a project is consistent with the current AQMP, a lead agency must assess whether the project would directly obstruct implementation of the plan and whether it is consistent with the demographic and economic assumptions (typically land use related, such as resultant employment or residential units) upon which the plan is based.[97] Projects would also be considered to be consistent with the AQMP, in that the Project would be consistent with appropriate control strategies set forth in the AQMP for achieving its emission reduction goals and the Project is consistent with the demographic and economic assumptions upon which the plan is based. The analysis below is organized by discussing the Project's construction and operational consistency with control strategies and growth projections.

Construction

(a) Control Strategies

During its construction phase, the Project would ensure compliance with CARB requirements to minimize short-term emissions from on-road and off-road diesel equipment, and with SCAQMD's regulations such as Rule 403 for controlling fugitive dust and other construction

95 South Coast Air Quality Management District, 2012 Air Quality Management Plan, page 4-14.
96 South Coast Air Quality Management District, 2012 Air Quality Management Plan, page 4-14.
97 South Coast Air Quality Management District, Air Quality Analysis Handbook.

emissions. Furthermore, as described further below, the Project would result in a short-term and temporary significant impact with respect to regional NO_X emissions during construction, even after implementation of feasible mitigation measures. However, the Project would comply with fleet rules to reduce on-road truck emissions (i.e., 13 CCR, Section 2025 (CARB Truck and Bus regulation)) and the impact would be limited to approximately two days each during the two continuous concrete pouring foundation phases. As discussed under Methodology, projects, uses, and activities that are consistent with the applicable growth projections and control strategies used in the development of the Air Quality Management Plan would not jeopardize attainment of the air quality levels identified in the Air Quality Management Plan, even if they exceed the SCAQMD's numeric indicators. The short-term and temporary impact would not conflict with the SCAQMD's long-term plans to achieve the ambient air quality standards. Compliance with these measures and requirements described earlier in the paragraph is consistent with and meets or exceeds the AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities.

(b) Growth Projections

The Project would generate short-term construction jobs, resulting in an increase in short-term employment compared to existing conditions. Construction workers typically travel amongst construction sites as individual projects are completed within a particular area and are not typically brought from other areas to work on developments such as the Project. Moreover, being relatively small in number and temporary in nature, construction jobs under the Project would not conflict with the long-term employment projections upon which the AQMP is based.

Operations

(a) Control Strategies

The Project's location, design, and proposed land uses would be consistent with the AQMP. The AQMP includes transportation control measures that are intended to reduce regional mobile source emissions.[98] While the majority of the measures are implemented by cities, counties, and other regional agencies such as SCAG and SCAQMD, the Project's location, design, and land uses would support measures related to reducing vehicle trips for residents, patrons, and employees by increasing residential and commercial density near public transit, as further discussed below.

The California Air Pollution Control Officers Association (CAPCOA) has provided guidance for mitigating or reducing emissions from land use development projects within its guidance document titled *Quantifying Greenhouse Gas Mitigation Measures*.[99] The land use characteristics listed below are consistent with the CAPCOA guidance document, and would reduce vehicle trips

98 Through capital improvement programs, local governments can fund infrastructure that contributes to improved air quality by requiring such improvements as bus turnouts as appropriate, installation of energy-efficient streetlights, and synchronization of traffic signals.

99 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, 2010, http://capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf. Accessed December 2018.

to and from the Project Site and vehicle trip distances and would achieve a reduction in transportation-related air pollutant and GHG emissions.

- **Increased Density:** Increased density, measured in terms of persons, jobs, and/or dwelling units per unit area, reduces emissions associated with transportation as it reduces the distance people travel for work or services and provides a foundation for the implementation of other strategies such as enhanced transit services. This characteristic corresponds to CAPCOA guidance strategy LUT-1.[100] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill[101] location and is mixed-use; therefore, this characteristic applies to the Project. The Project would increase the Project Site density to approximately 305 dwelling units per acre and would provide approximately 425 jobs per acre (refer to Section IV.J, *Population and Housing*, of the Project's Draft EIR, which provides employment data used to estimate the number of jobs per acre).[102]

- **Location Efficiency:** Location efficiency describes the location of a project relative to the type of urban landscape such as an urban area, compact infill, or suburban center. This measure is not intended as a separate strategy but rather serves as a "cap" for all land use/location strategies. This characteristic corresponds to CAPCOA guidance strategy LUT-2.[103] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the geographic location of the Project within the region. The Project Site represents an urban infill location within Downtown Los Angeles. The Project Site is served by existing public transportation located within a quarter-mile. The Project Site is within an active urban center with many existing off-site commercial, entertainment, hotel, and residential buildings. The location efficiency of the Project Site would reduce vehicle trips and VMT compared to the statewide and South Coast Air Basin average and would result in corresponding reductions in transportation-related emissions.[104]

---

100 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, page 155-158, 2010.

101 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 59-60. The project area meets the characteristics for an urban setting with respect to typical building heights of 6 stories or much higher, grid street pattern, minimal setbacks, constrained parking, high parking prices, high quality rail service (i.e., Metro Red and Purple Lines at the Grand Park/Civic Center Station), location relative to regional cores (5 miles or less) and jobs/housing balance (the Central City Community Plan Area has an existing jobs/housing ratio of approximately 7.3 for year 2017; refer to Section IV.J, *Population and Housing*, of the Project's Draft EIR).

102 Based on employment density factors in the Los Angeles Unified School District, 2016 Developer Fee Justification Study, March 2017.

103 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 159-161.

104 CalEEMod, by default, assumes that trip distances in the South Coast Air Basin are slightly longer than the statewide average. This is due to the fact that commute patterns in the South Coast Air Basin involve a substantial portion of the population commuting relatively far distances, which is documented in the Southern California Association of Governments 2016-2040 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS). The RTP/SCS shows that, even under future Plan conditions, upwards of 50 percent of all work trips would be 10 miles or longer (SCAG, Performance Measures Appendix, page 13, 2016). The RTP/SCS does not specify the current percentage of work trips greater than 10 miles in the region, but it can be assumed that the percentage is currently greater than 50 percent since the goal of the RTP/SCS is to reduce overall VMT in the region. It is thus

- **Increased Land Use Diversity and Mixed-Uses:** Locating different types of land uses near one another can decrease VMT since trips between land use types are shorter and could be accommodated by alternative modes of transportation, such as public transit, bicycles, and walking. This characteristic corresponds to CAPCOA guidance strategy LUT-3.[105] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings (also potentially for rural master-planned communities) for mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the percentage of each land use type in the Project. The Project would co-locate multi-family residences, offices, retail, and restaurant land uses in close proximity to existing off-site commercial and residential uses, as well as major transit facilities. The increases in land use diversity and mix of uses on the Project Site, as well as proximity to transit, would reduce vehicle trips and VMT by encouraging walking and non-automotive forms of transportation.

- **Increased Destination Accessibility:** This characteristic corresponds to CAPCOA guidance strategy LUT-4.[106] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use, including residential, commercial, retail, and restaurant land uses; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the distance to Downtown Los Angeles and Hollywood, which are major job centers. The Project would be located in an area that offers access to multiple other nearby destinations including restaurant, bar, office, retail, entertainment, and residential uses. The Project Site is also located near other job centers in the region and within Downtown Los Angeles. The access to multiple destinations in close proximity to the Project Site would reduce vehicle trips and VMT compared to the statewide and South Coast Air Basin average, encourage walking and non-automotive forms of transportation, and would result in corresponding reductions in transportation-related emissions.

- **Increased Transit Accessibility:** Locating a project with high density near transit facilitates encourages the use of transit by people traveling to or from a project site. This characteristic corresponds to CAPCOA guidance strategy LUT-5.[107] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings (also potentially for rural settings adjacent to a commuter rail station with convenient access to a major employment center) for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include the distance to transit stations near the Project.

reasonable to assume that the trip distances in South Coast Air Basin are analogous to the statewide average given that the default model trip distances in the South Coast Air Basin are slightly longer but still generally similar to the statewide average. Therefore, projects could achieve similar levels of VMT reduction (65 percent in an urban area, 30 percent in a compact infill area, or 10 percent for a suburban center) compared to the South Coast Air Basin average.

105 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 162-166.

106 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 167-170.

107 California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 171-175.

The Project would be located within a quarter-mile of public transportation, including the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line and the future 2nd and Broadway Metro Station being constructed as part of the Regional Connector Project. The Red Line connects the Civic Center to Union Station, Hollywood, and North Hollywood. The Red and Purple Lines provide further connection to three light rail transit lines serving downtown Los Angeles: the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station. In addition, as part of the Metro Regional Connector Project, the future Historic Broadway Station would allow passengers to transfer to Blue, Expo, Red and Purple Lines, bypassing Union Station. The Project is also within a quarter mile of many Metro bus routes (e.g., local 2, 4, 10, 28, 81, 83, 90, 91, 94, and 302, which run northbound along Hill and Lines 30, 33, 40, 45, 68, 83, 84, 92, and 330, which run southbound along Spring Street), LADOT's Dash Downtown "D" line, and Metro's Rapid Lines 728, 733, 745, and 770. The Project would provide access to on-site uses from existing pedestrian pathways. The Project would also provide parking for bicycles on-site to encourage utilization of alternative modes of transportation. The increased transit accessibility would reduce vehicle trips and VMT versus the statewide and South Coast Air Basin average, encourage walking and non-automotive forms of transportation, and would result in corresponding reductions in transportation-related emissions.

- **Improve Design of Development:** Improved street network characteristics within a neighborhood enhances walkability and connectivity. Characteristics include street accessibility usually measured in terms of number of intersections (e.g., 4-way intersections) per square mile. This characteristic corresponds to CAPCOA guidance strategy LUT-9.[108] According to CAPCOA, the reduction in VMT from this characteristic applies to urban and suburban settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this characteristic applies to the Project. The Project would provide an open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street that would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park. The Project would also provide new street trees along W. 1st Street, S. Broadway, S. Spring Street, and W. 2nd Street. The Project would be located in a highly street-accessible area with over 100 four-way intersections within a 1-mile radius of the Project Site (see Appendix C-3 for additional details), which exceeds the standard intersection density assumed in baseline VMT modeling. The Project's addition of the Paseo and new street trees, along with the high intersection density would reduce vehicle trips and VMT versus the statewide and South Coast Air Basin average, encourage walking and non-automotive forms of transportation, and would result in corresponding reductions in transportation-related emissions.

- **Provide Pedestrian Network Improvements:** Providing pedestrian access that minimizes barriers and links a project site with existing or planned external streets encourages people to walk instead of drive. This characteristic corresponds to CAPCOA guidance strategy SDT-1.[109] According to CAPCOA, the reduction in VMT from this characteristic applies to urban, suburban, and rural settings for residential, retail, office, industrial, and mixed-use projects. The Project is located in an urban infill location and is mixed-use; therefore, this

[108] California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 182-185. This measure is incorrectly labeled as LUT-8 in the document; however, it is the 9th measure in the land use transportation category and thus should be labeled as LUT-9.

[109] California Air Pollution Control Officers Association, Quantifying Greenhouse Gas Mitigation Measures, pages 186-189.

characteristic applies to the Project. According to the CAPCOA guidance, factors that contribute to VMT reductions under this characteristic include pedestrian access connectivity within the Project and to/from off-site destinations. The walkability of existing facilities is based in part on the availability of pedestrian routes necessary to accomplish daily tasks without the use of an automobile. These attributes are quantified by WalkScore.com and assigned a score out of 100 points. With the various commercial businesses and recreational and entertainment facilities adjacent to the Project Site and proximity to public transit, the walkability of rating of the Project Site area is approximately 91 points;[110] this compares to the Citywide score of 67 points. As discussed in Chapter 2, *Project Description*, the Project would provide a full retail and service base at street level along all four edges of the Podium, including 1st Street, Broadway, 2nd Street, and the Paseo providing an interconnected streetscape environment connecting 1st Street and 2nd Street with landscaping that buffers the scale and height of the new buildings and enhances the pedestrian experience. The Project would strengthen existing and new pedestrian connections and streetscapes through the use of landscaping and the addition of new trees along the street and Paseo, street furniture, lighting and signage. The Project would provide an internal pedestrian network for Project visitors and employees that links to the existing off-site pedestrian network including existing off-site sidewalks, and would therefore result in some reduction in VMT and associated transportation-related emissions.

The Project Transportation Impact Analysis already accounts for trip reductions from Increased Land Use Diversity and Mixed-Uses (LUT-3) and Increased Transit Accessibility (LUT-5). Therefore, VMT reductions for these characteristics were not included separate from the Transportation Impact Analysis to avoid double counting. Reductions in VMT were calculated for characteristics not included in the Transportation Impact Analysis, which include Increased Density (LUT-1), Location Efficiency (LUT-2), and Increased Destination Accessibility (LUT-4), Improved Design of Development (LUT-9), and Provide Pedestrian Network Improvements (SDT-1). The Project's VMT is reduced by approximately 29.1 percent in addition to the Transportation Impact Analysis trip reductions as a result of those characteristics that are not already reflected in the Transportation Impact Analysis, following the calculation protocol from the CAPCOA guidance.

The Project is proposed on an infill site. The Project would locate residential and retail uses in a Transit Oriented Development (TOD) that would be located within a quarter-mile of multiple public transportation options, including the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line, and the future 2nd and Broadway Metro Station being constructed as part of the Regional Connector, therefore the Project meets the criteria of the State as a Transportation Priority Area (TPA). The Red Line connects the Civic Center to Union Station, Hollywood, and North Hollywood. The Red and Purple Lines provide further connection to three light rail transit lines serving downtown Los Angeles: the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station. As discussed above, the Project is also within a quarter mile of many Metro bus routes (e.g., local 2, 4, 10, 28, 81, 83, 90, 91, 94, and 302, which run northbound along Hill and Lines 30, 33, 40, 45, 68, 83, 84, 92, and 330, which run southbound along Spring Street), LADOT's Dash Downtown "D" line, and Metro's Rapid Lines 728, 733, 745, and 770. As discussed above, the Project has also been designed to

[110] WalkScore.com (www.walkscore.com) rates the Project Site area (202 W. 1st Street, Los Angeles, CA 90012) with a score of 91 of 100 possible points (scores accessed on November 8, 2017). Walk Score calculates the walkability of specific addresses by taking into account the ease of living in the neighborhood with a reduced reliance on automobile travel.

incorporate features to attract pedestrians and to promote non-motorized transportation modes such as walking and biking. Further, its land use characteristics (including increased density, location efficiency, increased land use diversity and mixed-uses, etc.), discussed above, many of which overlap the strategies in the AQMP, have also been shown by CAPCOA to reduce vehicle trips and VMT, and corresponding vehicle emissions; the Project's incorporation of these features further demonstrates its consistency with the AQMP by reducing vehicle trips, VMT and other associated emissions.

(b) Growth Projections

The Project is anticipated to be operational in 2023. As discussed in Section IV.J, *Population, Housing, and Employment*, of the Project's Draft EIR, the Project would result in population growth that would be consistent with the Central City Community Plan and 2016 RTP/SCS, one of the 35 community plans of the Land Use Element of the City's General Plan, and forms the basis of SCAG's growth projections, and incorporated in the SCAQMD AQMP. The Project's growth is consistent with SCAG RTP/SCS goals and objectives under SB 375 to implement "smart growth" and state efforts to meet goals in the reduction of GHG. The SCAG RTP/SCS seeks improved "mobility and accessibility… to reach desired destinations with relative ease and within a reasonable time, using reasonably available transportation choices."[111] The SCAG 2016 RTP/SCS, of which the growth projections are incorporated into the 2016 AQMP, seeks to implement "strategies focused on compact infill development, superior placemaking (the process of creating public spaces that are appealing), and expanded housing and transportation choices."[112] The Project's design and proximity to public transit, including the Metro Civic Center/Grand Park Station, and the future 2nd and Broadway Station as part of the Metro Regional Connector Project would allow the Project's projected growth to be accommodated by the existing and under-construction transportation resources and decreases the time and cost of traveling as well as vehicular demand and associated pollutants. The Project would locate residential uses in close proximity to job centers in Los Angeles where people can live and work and have access to convenient modes of transportation in a manner that provides options for reducing reliance on automobiles. The Project's increase in population, housing, and employment are therefore consistent with SCAG's RTP/SCS goals and would be consistent with the growth projections for the period between 2023 and 2040 for the City as a whole (refer to Section IV.J, *Population and Housing*, of the Project's Draft EIR). The Project would be consistent with the growth projections as contained in SCAG's RTP/SCS, which form the basis of the growth projections in the 2016 AQMP.

5.1.2 General Plan Air Quality Element

The City's General Plan includes Citywide policies regarding a range of City resources and services, some of which are relevant to air quality. **Table 6,** *Comparison of the Project to Applicable Air Quality Policies of the General Plan*, evaluates the consistency of the Project with the applicable air quality goals, objectives, and policies in the Air Quality Element of the General

[111] Southern California Association of Governments, 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, 2016, page 160.

[112] Southern California Association of Governments, 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy, page 14.

Plan. As discussed below, the Project would not conflict with or be inconsistent with applicable air quality policies of the General Plan.

TABLE 6
COMPARISON OF THE PROJECT TO APPLICABLE AIR QUALITY POLICIES OF THE GENERAL PLAN

Recommendation	Analysis of Project Consistency
Air Quality Element	
Goal 1: Good air quality and mobility in an environment of continued population growth and healthy economic structure.	**Consistent.** The Project would be consistent with SCAG RTP/SCS goals and objectives under SB 375 to implement "smart growth." The Project would provide residential uses and employment opportunities in close proximity to existing job centers in downtown Los Angeles where people can live and work and have access to modes of transportation that reduce reliance on automobiles and minimize associated air pollutant emissions. The Project would meet the applicable requirements of the State of California Green Building Standards Code and the City of Los Angeles Green Building Code. In addition, the Project would incorporate PDFs that would go beyond California Green Building Standards Code and the City of Los Angeles Green Building Code (refer to Subsection 4.7, *Project Design Features*, above) The Project would also reduce VMT as a result of its urban infill location, with access to public transportation within a quarter-mile of the Project Site, and its proximity to job centers, retail, recreational amenities and entertainment. As a result, the Project would support objectives to achieve good air quality, mobility and a healthy economic structure.
Objective 1.1: It is the objective of the City of Los Angeles to reduce air pollutants consistent with the Regional Air Quality Management Plan, increase traffic mobility, and sustain economic growth citywide.	**Consistent.** The Project's land use characteristics and Project Design Features would reduce emissions associated with energy and transportation. As discussed under Threshold a), the Project would be consistent with the SCAG growth projections that are used in preparing the AQMP. The Project would occupy a location that is highly accessible by regional and local bus lines and Metro rail. As such, the Project would be supportive of the Transportation Control Measures in the AQMP related to reducing vehicle trips for employees, visitors and residents. The Project would provide infill residential uses, which would allow people to live near work and recreational amenities.
Objective 1.3: It is the objective of the City of Los Angeles to reduce particulate air pollutants emanating from unpaved areas, parking lots, and construction sites.	**Consistent.** The Project would incorporate measures that would reduce particulate air pollutants from unpaved areas, parking lots, and construction sites. The Project would implement required control measures for construction-related fugitive dust pursuant to SCAQMD Rule 403. The Project would also comply with the applicable provisions of the CARB Air Toxics Control Measure regarding idling limitations for diesel trucks reducing exhaust DPM emissions. Project construction would comply with the applicable provisions of the CARB In-Use Off-Road Diesel Vehicle Regulation, which aims to reduce emissions through the installation of DPM filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models. Project construction would also hat comply with the applicable provisions of the CARB Truck and Bus regulation to reduce PM and NO_X emissions from existing diesel trucks. The Project would also implement a Mitigation Measure requiring the use of off-road construction equipment that meets the stringent Tier 4 emissions standards. The Project incorporates landscaped open spaces and trees.
Policy 1.3.1: Minimize particulate emissions from construction sites.	**Consistent.** The Project would incorporate measures that would reduce particulate air pollutants from construction activity as described above under Objective 1.3.
Policy 1.3.2: Minimize particulate emissions from unpaved roads and parking lots associated with vehicular traffic.	**Consistent.** The Project would implement required control measures for construction-related fugitive dust pursuant to SCAQMD Rule 403, which would minimize particulate emissions from unpaved roads and parking lots associated with construction-related vehicular traffic.

Recommendation	Analysis of Project Consistency
Goal 2: Less reliance on single-occupant vehicles with fewer commute and non-work trips.	**Consistent.** The Project's land use characteristics (refer to subsection 5.1.1.Construction.(b), *Control Strategies and Policy Consistency* above) would reduce trips and VMT due to its urban infill location, with nearby access to public transportation within a quarter-mile of the Project site and location in an area with access to multiple other destinations, including job centers, and retail uses.
Objective 2.1: It is the objective of the City of Los Angeles to reduce work trips as a step towards attaining trip reduction objectives necessary to achieve regional air quality goals.	**Consistent.** The Project would be located within a quarter-mile of existing and proposed public transportation, including existing regional and local Metro bus lines and Metro rail. The Project would locate infill residential, office, retail, and restaurant land uses in an area with access to multiple other destinations, including job centers, and retail uses. These features would reduce trips and encourage residents to utilize alternative modes of transportation.
Policy 2.1.1: Utilize compressed work weeks and flextime, telecommuting, carpooling, vanpooling, public transit, and improve walking/bicycling related facilities in order to reduce vehicle trips and/or VMT as an employer and encourage the private sector to do the same to reduce work trips and traffic congestion.	**Consistent.** The Project would be located within a quarter-mile of existing and future public transportation, provide access and pedestrian links to on-site uses from existing pedestrian pathways. The Project would include a pedestrian paseo leading from W. 1st Street to W. 2nd Street that would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park. The Project would provide 1,274 bicycle parking spaces. These features would reduce work trips and encourage employees to utilize alternative modes of transportation including public transportation, walking, and bicycling. The Project would exceed California Green Building Standards Code and the City of Los Angeles Green Building Code standards by designating a minimum of 10 percent of on-site non-residential parking for carpool. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations
Objective 2.2: It is the objective of the City of Los Angeles to increase vehicle occupancy for non-work trips by creating disincentives for single passenger vehicles, and incentives for high occupancy vehicles.	**Consistent.** The Project would exceed California Green Building Standards Code and the City of Los Angeles Green Building Code standards by designating a minimum of 10 percent of on-site non-residential parking for carpool. In addition, the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations. In addition, the Project's location would encourage non-automotive transportation to and from the Project Site. As discussed previously, the Project would be located within a quarter-mile of existing and proposed public transportation, including existing regional and local Metro bus lines and Metro rail, and would provide bicycle parking and pedestrian pathways for building residents, employees, and visitors.
Policy 2.2.1: Discourage single-occupant vehicle use through a variety of measures such as market incentive strategies, mode-shift incentives, trip reduction plans and ridesharing subsidies.	**Consistent.** The Project's location would encourage non-automotive transportation to and from the Project Site. As discussed previously, the Project would be located within a quarter-mile of existing and proposed public transportation, including existing regional and local Metro bus lines and Metro rail, and would provide bicycle parking and pedestrian pathways for building residents, employees, and visitors.

Recommendation	Analysis of Project Consistency
Policy 2.2.2: Encourage multi-occupant vehicle travel and discourage single-occupant vehicle travel by instituting parking management practices.	**Consistent.** In accordance with mitigation measure MM-TRAF-1, the Applicant would implement a comprehensive Travel Demand Management (TDM) Program to promote non-automobile travel and reduce the use of single-occupant vehicle trips during commute hours (refer to Section IV.P, *Transportation and Traffic*, of the Project's Draft EIR). The program could include such strategies as promoting Commute Trip Reduction (CTR) through information sharing and marketing for new employee orientations of trip reductions; providing unbundled parking for residential units; providing a program for discount transit passes for residents/employees; facilitating an on-site car- share program; providing priority locations for carpools and vanpools; accommodating flexible/alternative work schedules and telecommuting programs; including Project design elements to ensure a bicycle, transit and pedestrian friendly environment, providing bicycle parking in conformance with Section 12.21 A.16 of the LAMC and associated bicycle facilities; providing a Covenant and Agreement to ensure that the TDM program will be maintained; making a one-time financial contribution of $100,000 to the City of Los Angeles Department of Transportation to be used in in the implementation of the Mobility Hub in the general area of the Project; making a one-time financial contribution of $100,000 to the City's Bicycle Plan Trust Fund to implement bicycle improvements within the area of the proposed Project and contributing a one-time fixed fee to the City's Bicycle Plan Trust Fund to implement bicycle improvements within the area of the proposed Project.
Goal 4: Minimal impact of existing land use patterns and future land use development on air quality by addressing the relationship between land use, transportation, and air quality.	**Consistent.** The Project's characteristics would reduce trips and VMT due to its infill location, access to public transportation within a quarter-mile of the Project site, close proximity to multiple other destinations including job centers and retail uses, its mix of residential, retail, restaurant and office uses, and is pedestrian and bicycle-friendly.
Objective 4.1: It is the objective of the City of Los Angeles to include the regional attainment of ambient air quality standards as a primary consideration in land use planning.	**Consistent.** The Project analysis of potential air quality impacts relies upon the numeric indicators of significance adopted by the SCAQMD, which considers attainment of the ambient air quality standards. The Project also incorporates land use characteristics that would reduce air pollutant emissions (refer to Subsection 5.1.1. Operations (a), *Control Strategies and Policy Consistency,* above). The Project impacts would be less than significant and would not cause or contribute to an exceedance of the ambient air quality standards, with the exception of NO_X emissions during the two foundation concrete pouring activities lasting up to approximately two days each during construction, which would require mitigation and be significant and unavoidable on a temporary basis.
Policy 4.1.2: Ensure that project level review and approval of land use development remain at the local level.	**Consistent.** The Project environmental review would occur at the local level.
Objective 4.2: It is the objective of the City of Los Angeles to reduce vehicle trips and VMT associated with land use patterns.	**Consistent.** The Project's location and land use characteristics would reduce trips and VMT due to its urban infill location, access to public transportation within a quarter-mile of the Project site, and proximity to existing employment and commercial destinations, as would its mix of residential, office, retail, and restaurant uses on-site, and pedestrian- and bicycle-friendly features.
Policy 4.2.2: Improve accessibility for the City's residents to places of employment, shopping centers and other establishments.	**Consistent.** The Project would provide 1,127 new residential units in an infill location with access to public transportation within a quarter-mile of the Project site. The Project would also be located within a quarter-mile of off-site commercial, retail, restaurant, entertainment and other residential uses.

Recommendation	Analysis of Project Consistency
Policy 4.2.3: Ensure that new development is compatible with pedestrians, bicycles, transit, and alternative fuel vehicles.	**Consistent.** Consistent. The Project is proposed on an infill location and would incorporate pedestrian pathways that would connect to the existing sidewalk network through the Project provided pedestrian paseo leading from W. 1st Street to W. 2nd Street that would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a pedestrian connection towards First and Broadway Civic Center Park and would be within a quarter-mile of existing and future public transportation. The Project would also designate a code-required minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles, and the Project design will go beyond the City code and provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations for up to 20 percent of the code-required parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations.. The Project would provide 1,274 bicycle parking spaces. In accordance with mitigation measure MM-TRAF-1, the Applicant would implement a comprehensive Travel Demand Management (TDM) Program to promote non-automobile travel and reduce the use of single-occupant vehicle trips through such strategies as promoting Commute Trip Reduction (CTR) through information sharing and marketing for new employee orientations of trip reductions; providing unbundled parking for residential units; providing a program for discount transit passes for residents/employees; facilitating an on-site car- share program; providing priority locations for carpools and vanpools; accommodating flexible/alternative work schedules and telecommuting programs; including Project design elements to ensure a bicycle, transit and pedestrian friendly environment, providing bicycle parking in conformance with Section 12.21 A.16 of the LAMC and associated bicycle facilities; providing a Covenant and Agreement to ensure that the TDM program will be maintained; making a one-time financial contribution of $100,000 to the City of Los Angeles Department of Transportation to be used in in the implementation of the Mobility Hub in the general area of the Project; making a one-time financial contribution of $100,000 to the City's Bicycle Plan Trust Fund to implement bicycle improvements within the area of the proposed Project and contributing a one-time fixed fee to the City's Bicycle Plan Trust Fund to implement bicycle improvements within the area of the proposed Project.
Policy 4.2.4: Require that air quality impacts be a consideration in the review and approval of all discretionary projects.	**Consistent.** The Project environmental review includes an analysis of air quality impacts.
Policy 4.2.5: Emphasize trip reduction, alternative transit and congestion management measures for discretionary projects.	**Consistent.** The Project is proposed on an infill site that would be located within a quarter-mile of existing and proposed public transportation, including existing regional and local Metro bus lines and Metro rail. The Project would provide 1,274 bicycle parking spaces. The Project would implement mitigation measure MM-TRAF-1, which requires the Applicant to implement a comprehensive Travel Demand Management (TDM) Program to promote non-auto travel and reduce the use of single-occupant vehicle trips (refer to Section IV.P, *Transportation and Traffic*, of the Project's Draft EIR, for additional information).
Goal 5: Energy efficiency through land use and transportation planning, the use of renewable resources and less polluting fuels, and the implementation of conservation measures, including passive methods such as site orientation and tree planting.	**Consistent.** The Project would be designed and operated to meet the applicable requirements of the State of California Green Building Standards Code, the City of Los Angeles Green Building Code, and LEED Silver equivalence. The Project would incorporate sustainability measures and performance standards including implementing a construction waste management plan to divert all mixed construction and demolition debris to City certified construction and demolition waste processors, consistent with the Los Angeles City Council approved Council File 09-3029. The Project Site would include 3,550 square feet of ground-level paseo/plaza landscaped area including pedestrian scale trees.

Recommendation	Analysis of Project Consistency
Objective 5.1: It is the objective of the City of Los Angeles to increase energy efficiency of City facilities and private developments.	**Consistent.** As noted above, the Project would be designed and operated to meet the applicable requirements of the State of California Green Building Standards Code, the City of Los Angeles Green Building Code, and LEED Silver equivalence.
Policy 5.1.2: Effect a reduction in energy consumption and shift to non-polluting sources of energy in its buildings and operations.	**Consistent.** As noted above, the Project would be designed and operated to meet the applicable requirements of the State of California Green Building Standards Code, the City of Los Angeles Green Building Code, and LEED Silver equivalence. The Project would designate a minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles, and the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations for up to 20 percent of the code-required parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations.
Policy 5.1.4: Reduce energy consumption and associated air emissions by encouraging waste reduction and recycling.	**Consistent.** The Project would implement a construction waste management plan to divert all mixed construction and demolition debris to City certified construction and demolition waste processors, consistent with the Los Angeles City Council approved Council File 09-3029. Municipal solid waste would be collected by haulers that comply with City and state waste diversion (specifically AB 1327 and AB 341) requirements, which may include mixed waste processing that yields diversion results comparable to source separation.
Objective 5.3: It is the objective of the City of Los Angeles to reduce the use of polluting fuels in stationary sources.	**Consistent.** As noted above, the Project would be designed and operated to meet the applicable requirements of the State of California Green Building Standards Code and the City of Los Angeles Green Building Code and LEED silver equivalence.
Policy 5.3.1: Support the development and use of equipment powered by electric or low-emitting fuels.	**Consistent.** As noted above, the Project would be designed and operated to meet the applicable requirements of the State of California Green Building Standards Code, the City of Los Angeles Green Building Code, and LEED Silver equivalence. The Project would also designate a minimum of 10 percent of on-site non-residential parking for carpool and/or alternative-fueled vehicles, and the Project design will provide for the installation of the conduit and panel capacity to accommodate future electric vehicle charging stations into 20 percent of the code-required parking spaces, with 5 percent of the Code-required spaces further improved with electric vehicle charging stations.

SOURCE: ESA, 2018.

5.2 Air Quality Standards

Threshold b): Would the Project violate any air quality standard or contribute substantially to an existing or projected air quality violation?

5.2.1 Construction Emissions

Construction of the Project has the potential to create air quality impacts through the use of heavy-duty construction equipment and through vehicle trips generated from construction workers traveling to and from the Project Site. In addition, fugitive dust emissions would result from demolition and construction activities. During the finishing phase of a building, paving operations and the application of architectural coatings and other building materials would potentially release VOCs. The assessment of construction air quality impacts considers each of

these potential sources. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and for dust, prevailing weather conditions. Construction emissions were compared to SCAQMD prescribed daily regional numerical indicators of significance, as discussed above. If construction emissions were to exceed any of the applicable numerical indicators in the SCAQMD CEQA Air Quality Handbook, the Project would potentially cause or substantially contribute to an exceedance of an ambient air quality standard, thus resulting in an existing or projected air quality violation.

The maximum daily construction emissions for the Project were estimated for each construction phase. Some individual construction phases potentially overlap and the maximum daily emissions include these overlaps by combining the relevant construction phase emissions. The maximum daily emissions are predicted values for a representative worst-case day and do not represent the emissions that would occur for every day of construction. Detailed emissions calculations are provided in **Appendix C-2** of this Technical Report.

The results of the criteria pollutant emissions calculations for VOC, NO_X, CO, SO_X, PM10 and PM2.5 are presented in **Table 7,** *Estimated Maximum Unmitigated Regional Construction Emissions (Pounds Per Day)*. These calculations assume compliance with applicable dust control measures required to be implemented during each phase of construction, as required by SCAQMD Rule 403 (Control of Fugitive Dust). As shown in **Table 7**, construction-related daily emissions would potentially exceed the SCAQMD numeric indicators of significance for NO_X only. All other emissions levels would be below the applicable numeric indicators. The NO_X exceedance results primarily from on-site construction equipment, and on-road hauling and concrete truck emissions generated during truck travel and idling activities during various phases of construction. **Therefore, with respect to regional emissions from construction activities, NO_X impacts would be potentially significant. Therefore, mitigation measures would be required and are further discussed below in Section 7, *Mitigation Measures*. As discussed therein, with the implementation of mitigation measures, regional NO_X emissions would be reduced substantially, but still above the daily emission threshold and be considered significant during the two continuous concrete pouring foundations phases, which are expected to last up to approximately two days each.**

TABLE 7
ESTIMATED MAXIMUM UNMITIGATED REGIONAL CONSTRUCTION EMISSIONS (POUNDS PER DAY) [a]

[a] Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in **Appendix C-2** of this Technical Report.

[b] Emissions include fugitive dust control measures consistent with SCAQMD Rule 403.

[c] Renovations of existing buildings could occur concurrently during any phase of construction of the new residential mixed-use towers, therefore the maximum daily emissions of the existing renovations were added to the maximum daily emissions of residential mixed-use tower maximum daily emissions to serve as a conservative maximum daily emission estimate.

SOURCE: ESA, 2018.

5.2.2 Operational Emissions

Operational criteria air pollutant emissions were assessed for mobile, area, energy (natural gas), and stationary sources. Operational criteria pollutant emissions were calculated for the Project for the full buildout year. The analysis used the daily trip generation rates for the Project provided in the Transportation Impact Analysis.[113] Operational emission estimates include compliance with the Title 24 (2016) building energy efficiency standards, CALGreen Code, and City of Los Angeles Green Building Code.[114] Physical and operational Project characteristics for which sufficient data is available to quantify the Project's building energy and resource consumption have been included in the quantitative analysis, and include the installation of energy efficient appliances, applicable SCAQMD rules regarding Project operations such as Rule 1138 – Control

[113] Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, 2018.

[114] Operational emissions calculations were made based on available client information available about achieving LEED Silver for the Project including requirements fulfilled by meeting Title 24 (2016) building energy efficiency standards, CALGreen Code, and City of Los Angeles Green Building Code. Not all compliance measures to achieve points necessary for LEED Silver certification/ meeting Title 24 (2016) building energy efficiency standards, CALGreen Code, and City of Los Angeles Green Building Code result in quantifiable emissions reductions. Those that led to emissions reductions were included in the Operational Emissions calculations, for additional details see Appendix C-3 of this air quality technical report.

of Emissions from Restaurant Operations and Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines (see subsection 2.3), and building energy demand factors consistent with the Title 24 (2016) building energy efficiency standards, CALGreen Code, and City of Los Angeles Green Building Code. Detailed emissions calculations are provided in **Appendix C-3** of this Technical Report.

The results of the criteria pollutant emission calculations for VOC, NO_X, CO, SO_X, PM10 and PM2.5 are presented in **Table 8,** *Maximum Unmitigated Regional Operational Emissions*. The Project's operational-related daily emissions would potentially exceed the SCAQMD numeric indicators of significance for NO_X. All other emissions levels would be below the applicable numeric indicators. Therefore, with respect to regional emissions from operational activities, NO_X impacts would be potentially significant. Mitigation measures would be required and are further discussed below in Section 7, *Mitigation Measures*, of this Technical Report. Implementation of MM AQ-3, MM AQ-4 and MM AQ-5 would reduce regional NO_X emissions from operations by scheduling routine maintenance of emergency generators so that only one emergency generator is maintained on any given day. **With implementation of MM AQ-3, MM AQ-4 and MM AQ-5, the regional NO_X emissions from operations would be reduced to below the regional numeric indicator and impacts related to regional NO_X operational emissions would be mitigated to less than significant.**

SOURCE: ESA, 2018.

5.3 Cumulatively Considerable Net Increase of Non-attainment Pollutants

Threshold c): Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

The Project would result in the emission of criteria pollutants for which the Project area is in non-attainment during both construction and operation. The Air Basin is currently in non-attainment for ozone (NAAQS and CAAQS), PM10 (CAAQS), and PM2.5 (NAAQS and CAAQS).

5.3.1 Construction Emissions

According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. As shown in **Table 7**, maximum daily emissions from construction of the Project would exceed the applicable SCAQMD regional numerical indicator of significance for NO_X. The Project would therefore have the potential to result in a cumulatively considerable net increase of a criteria pollutant for which the Project region is in non-attainment under an applicable federal or state ambient air quality standard, and impacts would be considered potentially significant. Therefore, mitigation measures would be required and are further discussed below in Section 7, *Mitigation Measures*, of this Technical Report. **With implementation of mitigation measures, regional NOx emissions would be reduced substantially, but still exceed the daily emissions threshold during the two continuous concrete pouring foundations phases, which are**

expected to last up to approximately two days each. Impacts related to regional NO_X construction emissions therefore would be considered significant and unavoidable.

In addition, according to the SCAQMD, individual project-level construction emissions are considered to determine cumulative impacts as well and will be further discussed below in Section 6, *Cumulative Impacts*, of this Technical Report.

5.3.2 Operational Emissions

According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project-specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants. As shown in **Table 8**, maximum daily regional emissions from operation of the Project would exceed the applicable numeric indicators for NOx. Therefore, operational impacts would be considered potentially significant. Mitigation measures would be required and are further discussed below in Section 7, *Mitigation Measures*, of this Technical Report. **With implementation of mitigation measures, regional NO_X emissions from operations would be reduced to below the regional numeric indicators and impacts related to regional NO_X operational emissions would be mitigated to less than significant.**

In addition, according to the SCAQMD, individual project-level operational emissions are considered to determine cumulative impacts as well and will be further discussed below in Section 6, *Cumulative Impacts*, of this Technical Report.

5.4 Expose Sensitive Receptors to Substantial Pollutant Concentrations

Threshold d): Would the project expose sensitive receptors to substantial pollutant concentrations?

5.4.1 Localized Construction Impacts

The localized construction air quality analysis was conducted using the methodology prescribed in the SCAQMD Localized Significance Threshold Methodology (June 2003, revised July 2008). The screening criteria provided in the SCAQMD Final Localized Significance Threshold Methodology were used to determine localized construction emissions thresholds for the Project. The maximum daily localized emissions for each of the construction phases and localized significance thresholds are presented in **Table 9,** *Maximum Unmitigated Localized Construction Emissions for Residential Towers* and **Table 10,** *Maximum Unmitigated Localized Construction Emissions for Residential Towers and Existing Building Renovations*.[115] The same phasing and equipment assumptions, and compliance with SCAQMD Rule 403, were used as for the regional emissions calculations discussed above. As shown below, maximum localized construction emissions for sensitive receptors within 25 meters of the Project Site would exceed the localized

[115] Based on the methodology and assumptions described in Subsection 4.4, *Localized Emissions*, of this Technical Report.

screening indicators for NO_X, PM10, and PM2.5 based on the assumptions described in subsection 4.4 *Localized Emissions*. Therefore, with respect to localized construction emissions, impacts to existing and future receptors would be considered potentially significant. Mitigation measures would be required and are further discussed below in subsection 7, *Mitigation Measures*. **With implementation of mitigation measures, localized NO_X, PM10 and PM2.5 emissions from construction would be reduced to below the localized numeric indicators and impacts related to localized NO_X, PM10 and PM2.5 construction emissions would be mitigated to less than significant**

d Renovations of existing buildings could occur concurrently during any phase of construction of the new residential mixed-use towers, therefore the maximum daily emissions of the existing renovations were added to the maximum daily emissions of residential mixed-use tower maximum daily emissions to serve as a conservative maximum daily emission estimate

SOURCE: ESA, 2018.

As shown in Table 7 above, regional NO_X emissions associated with construction activities would result in a potentially significant impact without the incorporation of mitigation. The localized effects of on-site Project emissions on nearby receptors were evaluated according to the SCAQMD's LST methodology. LSTs represent the maximum emissions from a project that are not expected to cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard, and are developed based on the ambient concentrations of that pollutant for each source receptor area and distance to the nearest sensitive receptor. These ambient air quality standards were established at levels that provide public health protection and allow adequate margin of safety, including protecting the health of sensitive populations such as asthmatics, children, and the elderly. As shown in Table 9 and 10, Project-related construction emissions would potentially exceed the LSTs, including for NO_X, PM10 and PM2.5 emissions. As a result, localized exceedances of the NO_2, PM10 and PM2.5 ambient air quality standards could potentially occur due to the NO_X, PM10 and PM2.5 emissions generated during

construction.[116] Therefore, off-site receptors could be exposed to NO_2, PM10 and PM2.5 levels in excess of the health-based ambient air quality standards. Therefore, mitigation measures would be required and are further discussed below in subsection 7, *Mitigation Measures*.

Given that ozone formation occurs through a complex photo-chemical reaction between NO_X and VOCs in the atmosphere with the presence of sunlight, the impacts of ozone are typically considered on a basin-wide or regional basis instead of a localized basis. The SCAQMD has not established an LST for ozone. The health-based ambient air quality standards for ozone are as concentrations of ozone and not as tonnages of their precursor pollutants (i.e., NO_X and VOCs). It is not necessarily the tonnage of precursor pollutants that causes human health effects, but the concentration of resulting ozone or particulate matter. Because of the complexity of ozone formation and the non-linear relationship of ozone concentration with its precursor gases, and given the state of environmental science modeling in use at this time, it is infeasible to convert specific emissions levels of NO_X or VOCs emitted in a particular area to a particular concentration of ozone in that area. Meteorology, the presence of sunlight, seasonal impacts, and other complex chemical factors all combine to determine the ultimate concentration and location of ozone.[117,118] Nonetheless, since Project construction would potentially exceed the numeric indicator for NO_X emissions, it is possible that Project construction NO_X emissions could result in an increase in ground-level ozone concentrations in proximity to the Project Site or elsewhere in the air basin and impacts would be potentially significant. Therefore, mitigation measures would be required and are further discussed below in subsection 7, *Mitigation Measures*. As discussed below, even with implementation of mitigation measures, regional emissions from construction would still be above the regional numeric indicators. Impacts related to regional NO_X construction emissions would be significant and unavoidable for NO_X emissions during the two continuous concrete pouring foundations phases, which are expected to last up to approximately two days each, and the Project would exceed the NO_X regional air quality threshold for these four days.

As expressed in the *amicus curiae* brief submitted for the *Sierra Club v. County of Fresno* case (*Friant Ranch Case*),[119,120] the CEQA criteria pollutants significance thresholds from the air district were set at emission levels tied to the region's attainment status, they are emission levels

116 Although there is no ambient air quality standard for NO_X, an exceedance of NO_X mass emissions thresholds can contribute to exceedance of local ambient air quality standards for NO_2, as discussed in subsection 1.5.1, *Regional Air Quality*.

at which stationary pollution sources permitted by the air district must offset their emissions and CEQA project must use feasible mitigations, and they are not intended to be indicative of any localized human health impact that a project may have. Therefore, the project's exceedance of the mass regional emissions threshold (i.e., pounds per day NOx thresholds) from project-related activities does not necessarily indicate that the project will cause or contribute to the exposure of sensitive receptors to ground-level concentrations in excess of health-protective levels.

Furthermore, available models today are designed to determine regional, population-wide health impacts, and cannot accurately quantify ozone-related health impacts caused by NO_X or VOCs emissions from project level. Therefore, it is infeasible to connect the Project level NO_X emissions to ozone-related health impact at this time.

The primary health concern with exposure to NO_X emissions is the secondary formation of ozone. Based on discussions with air quality management district staff,[121] and as the *amicus curiae* briefs submitted for the Friant Ranch Case suggested, because of the complexity of ozone formation and given the state of environmental science modeling in use at this time, it is infeasible to determine whether, or the extent to which, a single project's precursor (i.e., NO_X and VOCs) emissions would potentially result in the formation of secondary ground-level ozone and the geographic and temporal distribution of such secondary formed emissions. Meteorology, the presence of sunlight, seasonal impacts, and other complex chemical factors all combine to determine the ultimate concentration and location of ozone. Furthermore, available models today are designed to determine regional, population-wide health impacts, and cannot accurately quantify ozone-related health impacts caused by NO_X or VOCs emissions from local level (project level). Notwithstanding these scientific constraints, the disconnect between Project level NO_X emissions and ozone-related health impact cannot be bridged at this time.

Based on available information, the future mixed-use residential development planned for future construction over the future Metro station at the corner of 2nd Street and Broadway approximately 50 feet southwest of the Project Site is not reasonably expected to be in operation and occupied during construction of the Project. The Initial Study[122] for that project states that its construction will not begin until construction of the Metro Regional Connector portal and station within the site is complete. Therefore, construction of this related project would not begin until 2022 and would not be complete until 2025, which would be two years after completion the Project. Therefore, there is no evidence to assume that this future mixed-use residential development would be occupied by residents during construction of the Project, and as such, there would no exposure to these future residents from construction-related localized emissions from the Project.

5.4.2 Localized Operations Impacts

Existing and Future Sensitive Receptors

The localized operational air quality analysis was conducted using the methodology prescribed in the SCAQMD Localized Significance Threshold Methodology (June 2003, revised July 2008). The screening criteria provided in the Localized Significance Threshold Methodology were used to determine the localized operational emissions numerical indicators of significance for the Project. The same assumptions, including compliance with the Title 24 (2016) building energy efficiency standards, CALGreen Code, and City of Los Angeles Green Building Code, were used in the analysis. The analysis was done to account for existing sensitive receptors and future sensitive receptors that are in the planning stages. As discussed in Section 1.5.2, *Sensitive Receptors and Locations*, the nearest future sensitive receptor is the mixed-use residential developments planned for construction over the future Metro Station at the corner of 2nd Street and Broadway.

The maximum daily localized emissions and localized significance thresholds are presented in **Table 11,** *Maximum Unmitigated Localized Operational Emissions*. As shown therein, the Project's maximum localized operational emissions would not exceed the localized screening indicators for NO_X and CO, but would exceed localized screening criteria for PM10 and PM2.5. Therefore, with respect to localized operational emissions from operational activities, PM10 and PM2.5 impacts would be potentially significant. Mitigation measures would be required and are further discussed in Section 7, *Mitigation Measures*. **With implementation of mitigation measures, localized PM10 and PM2.5 emissions from operations would be reduced to below the localized numeric indicators and impacts related to localized PM10 and PM2.5 operational emissions would be mitigated to less than significant.**

5.4.3 Toxic Air Contaminants

Construction Impacts

Temporary TAC emissions associated with DPM emissions from heavy construction equipment would occur during the construction phase of the Project. According to the Office of Environmental Health Hazard Assessment (OEHHA)and the SCAQMD *Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis* (August 2003),[123] health effects from TACs are described in terms of individual cancer risk based on a lifetime (i.e., 70-year) resident exposure duration. Given the temporary and short-term construction schedule (approximately 48 months), the Project would not result in a long-term (i.e., lifetime or 70-year) exposure as a result of Project construction.

As shown in **Table 8** above, the Project would be consistent with applicable AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities. The Project would comply with the CARB Air Toxics Control Measure that limits diesel powered equipment and vehicle idling to no more than 5 minutes at a location, and the CARB In-Use Off-Road Diesel Vehicle Regulation; compliance with these would minimize emissions of TACs during construction. The Project would also comply with the requirements of SCAQMD Rule 1403 if asbestos is found during the renovation and construction activities. **Therefore, impacts from TACs during construction would be less than significant.**

Operational Impacts

The SCAQMD recommends that operational health risk assessments be conducted for substantial sources of operational DPM (e.g., truck stops and warehouse distribution facilities that generate more than 100 trucks per day or more than 40 trucks with operating transport refrigeration units) and has provided guidance for analyzing mobile source diesel emissions.[124] Project operations would generate only minor amounts of diesel emissions from mobile sources, such as delivery trucks and occasional maintenance activities that would not exceed 100 trucks per day or more than 40 trucks with operating transport refrigeration units. Furthermore, Project trucks are required to comply with the applicable provisions of the CARB 13 CCR, Section 2025 (Truck and Bus regulation) to minimize and reduce PM and NO_X emissions from existing diesel trucks. Therefore, the Project operations would not be considered a substantial source of diesel particulates.

In addition, Project operations would only result in minimal emissions of air toxics from maintenance or other ongoing activities, such as from the use of architectural coatings and other products. Area sources that would generate TAC emissions include charbroiling activities associated with the restaurant uses and consumer products associated with re-applying

[123] South Coast Air Quality Management District, Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, August 2003, http://www.aqmd.gov/docs/default-source/ceqa/handbook/mobile-source-toxics-analysis.doc?sfvrsn=2. Accessed December 2018.

[124] South Coast Air Quality Management District, Health Risk Assessment Guidance for Analyzing Cancer Risks from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis, August 2003.

architectural coatings and cleaning building surfaces. Charbroiling has the potential to generate small amounts of chemicals that are known or suspected by the State of California to cause human health impacts. However, restaurants incorporating charbroiling in the Air Basin would be required to comply with SCAQMD Rule 1138 (Control of Emissions from Restaurant Operations), which requires the installation of emissions controls on charbroilers. The emissions controls would minimize the already small amounts of TAC emissions associated with charbroiling (as seen in **Table 8**) by approximately 83 percent,[125] such that charbroiling would not cause or contribute to adverse health impacts at nearby sensitive receptors. The emergency generator would be required to comply with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines), the purpose of which is to control and limit emissions of TACs from emergency generators and similar equipment. In accordance with Rule 1470, emissions from maintenance and testing would not occur daily, but rather periodically, up to 50 hours per year. Furthermore, the emergency generator would be certified to the most stringent CARB and SCAQMD Rule 1470 standards and minimize emissions to the lowest technically feasible and regulatory required level for equipment of this size and type. As shown in **Table 11**, PM10 and PM2.5 emissions (i.e., DPM emissions) from the emergency generator would be 0.04 pounds per day for only those periodic days in which maintenance and testing would occur. Compliance with Rule 1470 would ensure the TAC emissions from the emergency generator would not cause or contribute to adverse health impacts at nearby sensitive receptors. In addition, the cooling towers would generate small amounts of emissions at 0.3 pounds per day of particulate matter (entrained water droplets) conservatively assuming continuous operation. Therefore, the emissions would not pose a health risk to off-site receptors.

With respect to the use of consumer products and architectural coatings, the residential and retail uses associated with the Project would be expected to generate minimal emissions from these sources. The Project's land uses would not include installation of industrial-sized paint booths or require extensive use of commercial or household cleaning products. **As a result, toxic or carcinogenic air pollutants are not expected to occur in any substantial amounts in conjunction with operation of the proposed land uses within the Project Site. Based on the uses expected on the Project Site, potential long-term operational impacts associated with the release of TACs would be minimal, regulated, and controlled, and would not be expected to exceed the SCAQMD numerical indicator of significance. Therefore, impacts would be less than significant.**

5.4.4 Carbon Monoxide Hotspots

The potential for the Project to cause or contribute to CO hotspots is evaluated by comparing Project intersections (both intersection geometry and traffic volumes) with prior studies conducted by the SCAQMD in support of their AQMPs and considering existing background CO concentrations. As discussed below, this comparison demonstrates that the Project would not cause or contribute considerably to the formation of CO hotspots, that CO concentrations at

[125] United States Environmental Protection Agency, National Emissions Inventory for Commercial Cooking,

Project impacted intersections would remain well below the ambient air quality standards, and that no further CO analysis is warranted or required.

As shown previously in **Table 3**, CO levels in the Project Area are substantially below the federal and state standards. Maximum CO levels in recent years are 3.2 ppm (one-hour average) and 2.0 ppm (eight-hour average) compared to the thresholds of 20 ppm (one-hour average) and 9.0 ppm (eight-hour average). Carbon monoxide decreased dramatically in the Air Basin with the introduction of the catalytic converter in 1975. No exceedances of CO have been recorded at monitoring stations in the Air Basin for some time and the Air Basin is currently designated as a CO attainment area for both the CAAQS and NAAQS. Thus, it is not reasonable to expect that CO levels at intersections analyzed in the Project Transportation Impact Analysis[126] would rise to the level of an exceedance of these standards.

Additionally, the SCAQMD conducted CO modeling for the 2003 AQMP for the four worst-case intersections in the Air Basin. These include: (a) Wilshire Boulevard and Veteran Avenue; (b) Sunset Boulevard and Highland Avenue; (c) La Cienega Boulevard and Century Boulevard; and (d) Long Beach Boulevard and Imperial Highway. In the 2003 AQMP CO attainment demonstration, the SCAQMD notes that the intersection of Wilshire Boulevard and Veteran Avenue is the most congested intersection in Los Angeles County, with an average daily traffic volume of about 100,000 vehicles per day.[127] Relevant information from the 2003 AQMP CO attainment demonstration relied upon in this assessment is provided in **Appendix C-5** of this Technical Report. This intersection is located near the on- and off-ramps to Interstate 405 in West Los Angeles. The evidence provided in Table 4-10 of Appendix V of the 2003 AQMP shows that the peak modeled CO concentration due to vehicle emissions at these four intersections was 4.6 ppm (one-hour average) and 3.2 (eight-hour average) at Wilshire Boulevard and Veteran Avenue.[128]

Based on the Project's Transportation Impact Analysis,[129] under future plus Project (2023) conditions, the intersection of Hill Street and 1st Street would have a maximum traffic volume of approximately 62,220 ADT, which are assumed to operate at very low or idling speeds at a congested roadway intersection.[130] As a result, CO concentrations are expected to be approximately 6.1 ppm (one-hour average) and 4.0 ppm (eight-hour average), which would not exceed the numerical indicators of significance.[131] Total traffic volumes at the maximum

126 Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, 2018.

127 South Coast Air Quality Management District, 2003 Air Quality Management Plan, Appendix V: Modeling and Attainment Demonstrations, page V-4-24, 2003, https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/2003-aqmp. Accessed December 2018.

128 The eight-hour average is based on a 0.7 persistence factor, as recommended by the SCAQMD.

129 Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, 2018.

130 The traffic volume of approximately 62,220 was estimated based on the peak hour intersection volumes under future with Project conditions and the general assumption that peak hour trips represent approximately 10 percent of daily trip volumes (the Federal Highway Administration considers 10 percent to be a standard assumption; seehttp://www.fhwa.dot.gov/planning/tmip/ publications/other_reports/tod_modeling_procedures/ch02.cfm).

131 The one-hour average and eight-hour average CO concentration values calculated for the intersection of Hill Street and 1st Street add the values of vehicle emissions to the ambient and are lower than the 20 ppm (one-hour average) and 9 ppm (eight-hour) CO standards mentioned above.

impacted intersection would likely have to more than double to cause or contribute to a CO hotspot impact given that vehicles operating today have reduced CO emissions as compared to vehicles operating in year 2003 when the SCAQMD conducted the AQMP attainment demonstration modeling.[132] This comparison demonstrates that the Project would not contribute to the formation of CO hotspots and that no further CO analysis is required. The Project would result in less than significant impacts with respect to CO hotspots.

Therefore, as discussed above relative to LSTs, TACs, and CO hotspots, the Project impacts pursuant to this threshold would be less than significant with mitigation.

5.5 Odors

Threshold e): Create objectionable odors affecting a substantial number of people.

As discussed in the Initial Study, which is contained in Appendix A of the Project's Draft EIR, and in Chapter 6.0, Subsection F, *Effects Found Not to be Significant*, of the Project's Draft EIR, odors are typically associated with industrial projects involving the use of chemicals, solvents, petroleum products, and other strong-smelling elements used in manufacturing processes. Odors are also associated with such uses as sewage treatment facilities and landfills. Activities and materials associated with Project construction would be typical of construction projects of similar type and size. Any odors generated during construction of the Project would be localized and would not be sufficient to affect a substantial number of people or result in a nuisance as defined by SCAQMD Rule 402. The Project proposes a mixed-use development that includes residential, office, retail (including grocery store), and restaurants that would not introduce any major odor-producing uses that would have the potential to affect a substantial number of people, such as uses associated with manufacturing, smelting, food packing, and other industrial uses. Waste would also be regularly collected and, because trash receptacles would be located within the Project's interior, any potential odors from on-site waste disposal would not affect surrounding land uses. **Therefore, the Project Site would not create objectionable odors affecting a substantial number of people and a less than significant impact would occur with respect to Threshold e. No further analysis is required.**

132 South Coast Air Quality Management District, 2003 Air Quality Management Plan, Chapter 6 Clean Air Act Requirements.

SECTION 6
Cumulative Impacts

There are a number of cumulative projects in the Project area that have not yet been built or are currently under construction. Since the timing or sequencing of the cumulative projects is unknown, any quantitative analysis to ascertain daily construction emissions that assumes multiple, concurrent construction projects would be speculative. For this reason, the SCAQMD's recommended methodology to assess a project's cumulative impact differs from the cumulative impacts methodology employed elsewhere in this Technical Report. The SCAQMD recommends using two different methodologies: (1) that project-specific air quality impacts be used to determine the potential cumulative impacts to regional air quality;[133] and (2) that a project's consistency with the current AQMP be used to determine its potential cumulative impacts.

6.1 Project-Specific Impacts

The Project would result in the emission of criteria pollutants for which the region is in non-attainment during both construction and operation. Based on the Project-specific level of emissions, the Project's cumulative impacts would be potentially significant for construction due to regional NO_X emissions, and localized NO_X, PM10 and PM2.5 emissions exceeding the numerical indicators of significance as shown in **Table 7** for regional construction emissions and in **Table 9** and **Table 10** for localized construction emissions. Therefore, mitigation measures would be required are further discussed below in Section 7, *Mitigation Measures*, of this Technical Report.

With implementation of mitigation measures, regional emissions from construction would be above the regional numeric indicators. Impacts related to regional NO_X construction emissions would be significant and unavoidable for NO_X emissions during the two continuous concrete pouring foundations phases, which is expected to last up to approximately two days each.

With implementation of mitigation measures, localized emissions from construction would be reduced to below the localized numeric indicators and impacts related to localized NO_X, PM10 and PM2.5 construction emissions would be mitigated to less than significant.

Project-specific operational emissions would result in potentially significant impacts due to regional NOx emissions and localized PM10 and PM2.5 emissions at existing and future sensitive receptor locations exceeding the numerical indicators of significance as shown in **Table 8** for regional operational emissions and in **Table 11** for localized operational emissions. Therefore,

[133] South Coast Air Quality Management District, Potential Control Strategies to Address Cumulative Impacts from Air Pollution White Paper, 1993, http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook. Accessed December 2018.

mitigation measures would be required are further discussed below in Section 7, *Mitigation Measures*, of this Technical Report.

With implementation of mitigation measures, regional and localized emissions from operations would be reduced to below the regional and localized numeric indicators and impacts related to regional NO_X and localized PM10 and PM2.5. operational emissions would be mitigated to less than significant.

The accumulation and dispersion of air pollutant emissions within an air basin is dependent upon the size and distribution of emission sources in the region and meteorological factors such as wind, sunlight, temperature, humidity, rainfall, atmospheric pressure, and topography. The health impacts associated with exposure to criteria pollutants are evaluated by air districts on a regional level based on all sources in the region and the region's attainment of the NAAQS. The mass emissions significance thresholds used in CEQA air quality analysis are not intended to be indicative of any localized human health impact that a project may have; instead, they were tied to the region's attainment status and are emission levels at which stationary pollution sources permitted by the air district must offset their emissions using enhanced control technology and CEQA projects must implement feasible mitigations.[134] Therefore, the Project's exceedance of the mass regional NO_X emissions threshold from temporary construction activities (in this case just for two days during concrete pours)[135] does not necessarily indicate that the Project will cause or contribute to the exposure of sensitive receptors to ground-level concentrations in excess of health-protective levels.

The health concerns associated with NO_X emissions are related to its potential to result in the secondary formation of ground-level ozone. As discussed earlier, the Air Basin is designated as nonattainment for ozone. The formation of ground-level ozone is a complex process due to photochemical reactions of precursor pollutants (i.e., VOC and NO_X emissions) in the atmosphere. It is not necessarily the amount of NO_X and VOCs emitted that cause human health impacts, but the concentration of resulting ozone. Because of the complexity of ozone formation, a specific amount of NO_X or VOC's emitted in a particular area does not equate to a particular concentration of ozone in an area.[136] Environmental science models today cannot determine whether, or the extent to which, a single project's precursor emissions would potentially result in the formation of secondary ground-level ozone and the geographic and temporal distribution of such secondary formed emissions. This is because available models today are designed to determine regional, population-wide health impacts and cannot accurately quantify ozone-related health impacts caused by NO_X or VOCs emissions at a project level.[137] The use of these models

134 April 2015 Amicus Curiae Brief of the South Coast Air Quality Management District in *Sierra Club v. County of Fresno* (CA Supreme Court, S219783).

135 The two concrete pouring phases were described above based on calendar days per concrete pouring phase where each phase will be split over two calendar work days. However, in terms of activity hours, the two concrete pour will require up to 48 hours total, as such the concrete pouring activities will only require only two days in terms of activity hours.

136 April 2015 Amicus Curiae Brief of San Joaquin Valley Unified Air Pollution Control District in *Sierra Club v. County of Fresno* (CA Supreme Court, S219783),

137 Ibid.

for a small source of emissions such as the Project would not produce reliable or meaningful results.[138] Therefore, it is not reasonably feasible to correlate the Project's exceedance of the NO_X significance threshold during four days of concrete pours to ozone-related health impact at this time.

6.2 Consistency with Air Quality Management Plan

Alternatively, the SCAQMD recommends assessing a project's cumulative impacts based on whether it is consistent with the AQMP. Section 15064(h)(3) of the State CEQA Guidelines provides guidance in determining the significance of cumulative impacts. Specifically, Section 15064(h)(3) states in part that:

> *"A lead agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program which provides specific requirements that will avoid or substantially lessen the cumulative problem (e.g., water quality control plan, air quality plan, integrated waste management plan) within the geographic area in which the project is located. Such plans or programs must be specified in law or adopted by the public agency with jurisdiction over the affected resources through a public review process to implement, interpret, or make specific the law enforced or administered by the public agency…"*

For purposes of the cumulative air quality analysis with respect to *CEQA Guidelines* Section 15064(h)(3), the Project's cumulative air quality impacts are determined not to be significant based on its consistency with the SCAQMD's adopted 2012 AQMP and the 2016 AQMP, as discussed above.

The Project has incorporated strategies, as applicable, consistent with the AQMP. Construction of the Project would comply with SCAQMD Rule 403 requirements and the ATCM to limit heavy duty diesel motor vehicle idling to no more than 5 minutes at any given time. In addition, the Project would utilize a construction contractor(s) that complies with required and applicable BACT and the In-Use Off-Road Diesel Vehicle Regulation. Per SCAQMD rules and mandates, as well as the CEQA requirement that significant impacts be mitigated to the extent feasible, these same requirements (i.e., Rule 403 compliance, the implementation of all feasible mitigation measures, and compliance with adopted AQMP emissions control measures) would also be imposed on other construction projects in the Air Basin as required, which would include each of the cumulative projects in the Project Area. As such, Project construction would be consistent with the AQMP and impacts with respect to AQMP consistency would be less than significant.

The Project's location, design, and proposed land uses would be consistent with the AQMP (refer to Section 5.1, *Consistency with Air Quality Plan*, of this Technical Report). The AQMP includes

[138] April 2015 Amicus Curiae Brief of the South Coast Air Quality Management District in Sierra Club v. County of Fresno (CA Supreme Court, S219783)

transportation control measures that are intended to reduce regional mobile source emissions.[139] The Project would locate residential and retail uses in a TOD that would be located within a quarter-mile of multiple public transportation options, including the Metro Civic Center/Grand Park Station that serves two subway lines, the Red Line and Purple Line and the future 2nd and Broadway Metro Station being constructed as part of the Regional Connector. The Red Line connects the Civic Center to Union Station, Hollywood, and North Hollywood. The Red and Purple Lines provide further connection to three light rail transit lines serving downtown Los Angeles: the Blue and Expo Lines at the 7th Street/Metro Center Station and the Gold Line at Union Station. The Project is also within a quarter mile of many Metro bus routes (e.g., local 2, 4, 10, 28, 81, 83, 90, 91, 94, and 302, which run northbound along Hill and Lines 30, 33, 40, 45, 68, 83, 84, 92, and 330, which run southbound along Spring Street), LADOT's Dash Downtown "D" line, and Metro's Rapid Lines 728, 733, 745, and 770. The Project would provide access to on-site uses from existing pedestrian pathways. The Project's proximity to public transit, including the Metro Civic Center Station, would allow the Project's projected growth to be accommodated by existing and under-construction transportation resources and decreases the time and cost of traveling as well as vehicular demand and associated pollutants. The Project's increase in population, housing, and employment would therefore be consistent with SCAG's RTP/SCS goals and would be consistent with SCAG's growth projections for the City as a whole (refer to Section IV.J, *Population and Housing*, of the Project's Draft EIR). The Project would therefore also be consistent with the growth projections as contained in the City's General Plan, and consistent with the growth projections in the AQMP. Moreover, as discussed above, the Project's growth would occur on a site well-served by public transportation and in proximity to existing employment and commercial areas, which would minimize potential growth in transportation-related emissions. As such, as the Project would not conflict with or obstruct implementation of the 2016 AQMP and is would be consistent with the AQMP, the Project's cumulative operational impacts with respect to AQMP consistency would be less than significant.

[139] Through capital improvement programs, local governments can fund infrastructure that contributes to improved air quality by requiring such improvements as bus turnouts as appropriate, installation of energy-efficient streetlights, and synchronization of traffic signals.

SECTION 7
Mitigation Measures

Construction

The Project would require implementation of mitigation measures that would minimize construction emissions. As detailed in mitigation measures MM AQ-1 and MM AQ-2, construction of the Project would be required to utilize off-road diesel-powered construction equipment that meet or exceed the stringent CARB and USEPA Tier 4 off-road emissions standards for those equipment rated at 50 hp or greater during Project construction. The Project would also be required to implement other emissions control strategies such as ensuring equipment are maintained and operated in accordance with manufacturer specifications. These measures are intended to reduce emissions from on-road and off-road heavy-duty vehicles and equipment, and would accelerate the replacement of older engines that produce higher air quality emissions with newer engines that produce lower air quality emissions as a result of meeting the stringent Tier 4 emissions standards.

> **MM-AQ-1:** The Applicant shall implement construction equipment features for equipment operating at the Project Site. These features shall be included in applicable bid documents and successful contractor(s) must demonstrate the ability to supply such equipment. Construction features will include the following:
>
> a. During plan check, the Project representative shall make available to the lead agency and SCAQMD a comprehensive inventory of all off-road construction equipment, equal to or greater than 50 horsepower, that will be used during any of the construction phases. The inventory shall include the horsepower rating, engine production year, and certification of the specified Tier standard. A copy of each such unit's certified tier specification, BACT documentation, and CARB or SCAQMD operating permit shall be provided on-site at the time of mobilization of each applicable unit of equipment to allow the Construction Monitor to compare the on-site equipment with the inventory and certified Tier specification and operating permit. Off-road diesel-powered equipment that will be used an aggregate of 40 or more hours during any portion of the construction activities associated with grading/ excavation/export phase shall meet the Tier 4 standards. Construction contractors supplying heavy duty diesel equipment greater than 50 horsepower shall be encouraged to apply for SCAQMD SOON funds. Information including the SCAQMD website shall be provided to each contractor which uses heavy duty diesel for on-site construction activities.
>
> b. Equipment such as tower cranes and signal boards shall be electric or alternative fueled (i.e., non-diesel). Pole power shall be made available for use for electric tools, equipment, lighting, etc. Construction equipment such as tower cranes and signal boards shall utilize electricity from power poles or alternative fuels (i.e., non-diesel),

rather than diesel power generators and/or gasoline power generators. If stationary construction equipment, such as diesel- or gasoline-powered generators, must be operated continuously, such equipment shall be located at least 100 feet from sensitive land uses (e.g., residences, schools, childcare centers, hospitals, parks, or similar uses), whenever possible.

c. Alternative-fueled generators shall be used when commercial models that have the power supply requirements to meet the construction needs of the Project are commercially available from local suppliers/vendors. The determination of commercial availability of such equipment will be made by the City prior to issuance of grading or building permits based on applicant-provided evidence of the availability or unavailability of alternative-fueled generators and/or evidence obtained by the City from expert sources such as construction contractors in the region.

MM-AQ-2: The Applicant shall implement the following measures to reduce the emissions of air pollutants generated by heavy-duty diesel-powered equipment operating at the Project Site:

a. Contractors shall maintain and operate construction equipment so as to minimize exhaust emissions. During construction, trucks and vehicles in loading and unloading queues shall have their engines turned off after 5 minutes when not in use, to reduce vehicle emissions.

b. All construction equipment shall be properly tuned and maintained in accordance with the manufacturer's specifications. The contractor shall keep documentation on-site demonstrating that the equipment has been maintained in accordance with the manufacturer's specifications. Tampering with construction equipment to increase horsepower or to defeat emission control devices shall be prohibited.

c. Construction activities shall be discontinued during second-stage smog alerts. A record of any second-stage smog alerts and of discontinued construction activities as applicable shall be maintained by the Contractor on-site.

Implementation of MM AQ-1 and MM AQ-2 would minimize localized NO_X, PM10 and PM2.5 emissions from all construction phases to below the localized numeric indicators. Therefore, impacts related to localized NO_X, PM10 and PM2.5 construction emissions would be mitigated to less than significant. The Project's mitigated regional and localized construction emissions are summarized in **Table 12**, *Estimated Maximum Mitigated Regional Construction Emissions,* **Table 13,** *Estimated Maximum Mitigated Localized Construction Emissions for Residential Towers* and **Table 14,** *Estimated Maximum Mitigated Localized Construction Emissions for Residential Towers and Existing Building Renovations.* Implementation of MM AQ-1 and MM AQ-2 would minimize regional NO_X emissions to below the SCAQMD regional numeric indicators for all phases of Project construction except for regional NO_X emissions during the two continuous concrete pouring foundations phases, which would be expected to last up to approximately two days each. Since concrete trucks from a variety of area concrete suppliers would be required to deliver the volume of concrete necessary for the continuous concrete pouring foundations phases, there are no feasible mitigation measures that would reduce the NO_X emissions from the concrete trucks to below the regional numeric indicator. It is not possible to reduce the number of concrete trucks needed to

complete the continuous concrete pouring phase without compromising the integrity of the building foundations. Therefore, impacts related to regional NO_X construction emissions would be temporarily significant during the two continuous concrete pouring foundations phases, which is expected to last up to approximately two days each. Regional construction impacts would be significant and unavoidable for NO_X. The Project's contribution to cumulatively significant construction impacts to air quality would be potentially significant for regional NO_X during the approximately two continuous concrete pouring construction activities lasting up to two days each. While the Project would result in regionally significant and unavoidable NO_X and ozone precursor impacts during the two continuous concrete pouring activities lasting up to two days each, the short-term duration and limited magnitude of the impact limits the potential for exposure and health impacts to sensitive receptors and would not jeopardize long-term air quality plans to attain the health-based ambient air quality standards in the Air Basin. Ozone formation occurs through a complex photo-chemical reaction between NO_X and VOCs in the atmosphere with the presence of sunlight and the impacts of ozone are typically considered on a basin-wide or regional basis. Because the concrete trucks would come from various facilities in the area and would be distributed along the roadway network, the total NO_X emissions from the concrete trucks would not be concentrated at a single site. Through atmospheric and geographical dispersion, NO_X-related health impacts from the short-term concrete pouring activities would not be expected to occur to a measureable degree.

With implementation of feasible mitigation, regional emissions from construction would be above the regional numeric indicators and impacts related to regional NO_X construction emissions and would be significant and unavoidable for NO_X emissions during the two continuous concrete pouring foundations phases, which is expected to last up to approximately two days each and the Project would violate the NO_X regional air quality standard.

In addition, with implementation of MM AQ-1 and MM AQ-2, the localized NO_X, PM10 and PM2.5 emissions from construction would be reduced to below the localized numeric indicators and impacts related to localized NO_X, NO_X, PM10 and PM2.5 construction emissions would be mitigated to less than significant.

Operation

The Project would result in potentially significant regional operational impacts associated with NO_X and localized operational impacts associated with PM2.5 and PM10. Therefore, the mitigation measures listed below would be required.

> **MM-AQ-3: Landscaping Equipment:** The Project representative will require that landscaping equipment used on the Project Site be electric- or battery-powered, rather than liquid fossil-fueled or use equipment that do not require a power or fuel source. Prior to occupancy of the residential towers, the Project representative shall provide documentation to the City of the use of landscaping contractors, service providers, or maintenance crews that will use equipment that meet the specified requirements. Documentation shall be maintained for the duration of landscaping services and made available to the City upon request.
>
> **MM-AQ-4: Restaurant Charbroiling:** The Project representative will limit the number of restaurants permitted to utilize under-fired charbroiling equipment to two restaurants or less. Restaurants with under-fired charbroiling equipment will meet applicable SCAQMD emission control requirements. Prior to occupancy of the designated commercial spaces by restaurant tenants, the Project representative shall provide documentation to the City of the number of Project Site restaurants with under-fired charbroiling equipment. Documentation shall be maintained and made available to the City upon request.
>
> **MM-AQ-5: Emergency Generators:** The Project representative will schedule routine maintenance and testing of the emergency generators installed on the Project Site on different days. Prior to the installation of emergency generators, the Project representative shall supply documentation to the City that emergency generator testing by contractors, service providers, or maintenance crews will be conducted in accordance with the specified requirements. The Project representative shall maintain records of emergency generator testing, including testing dates, which shall be made available to the City upon request.

The Project would result in potentially significant operational impacts due to regional emissions of NO_X above the regional numeric indicator. In addition, the Project would result in potentially significant operational impacts due to localized emissions of PM10 and PM2.5 above the localized numeric indicators. Therefore, mitigation measures MM AQ-3, MM AQ-4 and MM AQ-5 would be required to reduce operations-related emissions. The Project's mitigated regional and localized operational emissions are summarized below in **Table 15**, *Estimated Maximum Mitigated Regional Operational Emissions* and **Table 16**, *Estimated Maximum Mitigated Localized Operational Emissions*.

Implementation of MM AQ-3, MM AQ-4 and MM AQ-5 would minimize regional NO_X emissions from operations by scheduling routine maintenance of emergency generators so that only one emergency generator is maintained on any given day. With implementation of MM AQ-3, MM AQ-4 and MM AQ-5, the regional NO_X emissions from operations would be reduced to below the regional numeric indicator and impacts related to regional NO_X operational emissions would be mitigated to less than significant

Implementation of MM AQ-3, MM AQ-4 and MM AQ-5 would also minimize localized PM10 and PM2.5 emissions from operations of the Project by limiting the number of restaurants permitted to utilize under-fired charbroiling equipment to two restaurants or less. With implementation of MM AQ-3, MM AQ-4 and MM AQ-5, the localized PM10 and PM2.5 emissions from operations would be reduced to below the localized numeric indicators and impacts related to localized PM10 and PM2.5 operational emissions would be mitigated to less than significant.

SECTION 8
Summary of Results

8.1 Construction

Construction of the Project would not exceed the daily regional emission numeric indicators of significance set forth by the South Coast Air Quality Management District (SCAQMD) for volatile organic compounds (VOC), carbon monoxide (CO), sulfur dioxide (SO_2), respirable particulate matter (PM10), and fine particulate matter (PM2.5) emissions. However, construction of the Project would exceed the daily regional emission numeric indicators of significance for nitrogen oxide (NO_X) on a temporary basis from Project construction. As shown in **Table 12**, **Table 13**, and **Table 14**, implementation of MM AQ-1 and MM AQ-2 would minimize regional NO_X emissions to below the SCAQMD regional numeric indicators for all phases of Project construction except for regional NO_X emissions during the two continuous concrete pouring foundations phases, which would be expected to last up to a total of approximately two days each. Since concrete trucks from a variety of area concrete suppliers would be required to deliver the volume of concrete necessary for the continuous concrete pouring foundations phases, there are no feasible mitigation measures that would reduce the NO_X emissions from the concrete trucks to below the regional numeric indicator. It is not possible to reduce the number of concrete trucks needed to complete the continuous concrete pouring phase without compromising the integrity of the building foundations. Therefore, impacts related to regional NO_X construction emissions would be temporarily significant during the two continuous concrete pouring foundations phases, which is expected to last up to approximately two days each. Regional construction impacts would be significant and unavoidable for NO_X. The Project's contribution to cumulatively significant construction impacts to air quality would be potentially significant for regional NO_X during the two continuous concrete pouring construction activities last up to two days each. While the Project would result in regionally significant and unavoidable NO_X and ozone precursor impacts during the two continuous concrete pouring activities lasting up to two days each, the short-term duration and limited magnitude of the impact limits the potential for exposure and health impacts to sensitive receptors and would not jeopardize long-term air quality plans to attain the health-based ambient air quality standards in the Air Basin. Ozone formation occurs through a complex photo-chemical reaction between NO_X and VOCs in the atmosphere with the presence of sunlight and the impacts of ozone are typically considered on a basin-wide or regional basis. Because the concrete trucks would come from various facilities in the area and would be distributed along the roadway network, the total NO_X emissions from the concrete trucks would not be concentrated at a single. Through atmospheric and geographical dispersion, NO_X-related health impacts from the short-term concrete pouring activities would not be expected to occur to a measureable degree.

Implementation of MM AQ-1 and MM AQ-2 would also minimize localized NO_X, PM10 and PM2.5 emissions from all construction phases to below the localized numeric indicators. Therefore, impacts related to localized NO_X construction emissions would be mitigated to less than significant.

8.2 Operation

The Project would result in potentially significant operational impacts due to regional emissions of NO_X above the regional numeric indicator. In addition, the Project would result in potentially significant operational impacts due to localized emissions of PM10 and PM2.5 above the localized numeric indicators. Therefore, mitigation measures MM AQ-3, MM AQ-4 and MM AQ-5 would be required to reduce operations-related emissions. As shown in **Table 15** and **Table 16,** implementation of mitigation measures MM AQ-3, MM AQ-4, and MM AQ-5 would reduce NO_X, PM10 and PM2.5 emissions to less than significant during Project operation. Thus, with incorporation of mitigation measures, operation of the Project would not result in a regional violation of applicable air quality standards or jeopardize the timely attainment of such standards in the South Coast Air Basin. Operation of the Project, with mitigation measures, would also not result in a cumulatively considerable net increase of non-attainment pollutants

8.3 Toxic Air Contaminants

Given the temporary and short-term construction schedule (approximately 48 months), the Project would not result in a long-term (i.e., lifetime or 70-year) exposure as a result of Project construction. The Project would comply with applicable AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities. The Project would comply with the CARB Air Toxics Control Measure that limits diesel powered equipment and vehicle idling to no more than 5 minutes at a location, and the CARB In-Use Off-Road Diesel Vehicle Regulation; compliance with these would minimize emissions of TACs during construction. Therefore, impacts from TACs during construction would be less than significant.

Project operations would generate only minor amounts of diesel emissions from mobile sources, such as delivery trucks and occasional maintenance activities that would not exceed 100 trucks per day or more than 40 trucks with operating transport refrigeration units. Furthermore, Project trucks are required to comply with the applicable provisions of the CARB 13 CCR, Section 2025 (Truck and Bus regulation) to minimize and reduce PM and NO_X emissions from existing diesel trucks. Therefore, the Project operations would not be considered a substantial source of diesel particulates. Project compliance with SCAQMD Rules 1138 and 1470 would ensure the TAC emissions from charbroiling and the emergency generator would not cause or contribute to adverse health impacts at nearby sensitive receptors. In addition, the cooling towers would generate small amounts of emissions at 0.3 pounds per day of particulate matter (entrained water droplets) conservatively assuming continuous operation. Therefore, the emissions would not pose a health risk to off-site receptors. With respect to the use of consumer products and architectural coatings, the residential and retail uses associated with the Project would be expected to generate minimal emissions from these sources. The Project's land uses would not include installation of industrial-sized paint booths or require extensive use of commercial or household cleaning products. As a result, toxic or carcinogenic air pollutants are not expected to occur in any

substantial amounts in conjunction with operation of the proposed land uses within the Project Site. Therefore, impacts would be less than significant.

Existing: Omni Times Square
Draft Environmental Impact Report
Quantifying Greenhouse Gas Mitigation Measures - Transportation (Based on CAPCOA Guidance (August 2010))

Existing

Location Type	Global % VMT Reduction Cap
Urban:	75%
Less than 5 miles from central business district	
Jobs-rich (jobs/housing ratio greater than 1.5)	
Typical buildings are 6 stories or higher	
Grid street pattern	
Minimal setbacks	
Parking constrained on- and off-street	
Parking prices high/highest in the region	
High-quality rail; bus service at 10 min or less in peak hours	

Location Type	Global % VMT Reduction Cap
Suburban Center:	20%
Typically 20 miles or more from central business district	
Balanced jobs-housing	
Typical buildings are 2 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking somewhat constrained on-street; ample off-street	
Parking prices low (if priced at all)	
Bus service at 20 - 30 min and/or commuter rail station	

Compact Infill:	40%
Typically 5 - 15 miles from central business district	
Balanced jobs-housing (jobs/housing ratio from 0.9 to 1.2)	
Typical buildings are 2 - 4 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking constrained	
Parking prices low/moderate	
Rail w/in 2 miles; bus service at 15 min or less in peak hours	

Suburban:	15%
Typically 20 miles or more from central business district	
Housing-rich	
Typical buildings are 1 - 2 stories	
Curvilinear street pattern (cul-de-sac based)	
Parking between street and buildings; large lot residential	
Parking ample; largely surface lot-based	
No parking prices	
Limited bus service at 30 minute headways or more	

Total Global Transportation VMT Reduction =	**28.08%**	Cap: 75%
(Includes double counting correction.)		
Total LUT/SDT/PDT/TST VMT Reduction =	**28.08%**	Cap: 70%

Land Use/Location Transportation Measures (65% Reduction Cap)

Total LUT % VMT Reduction = **27.36%** Cap: 65%

LUT-1 Increase Density

% VMT Reduction = A × B [not to exceed 30%]

A (housing) = (Number of DU/acre - 7.6) / 7.6
A (jobs) = (Number of Jobs/acre - 20) / 20
B = 0.07%

% VMT Reduction =	0.35%	Cap: 30%
Number of DU/acre:	-	A = 0%
Number of Jobs/acre:	646.6	A = 500%

LUT-2 Increase Location Efficiency

% VMT Reduction Cap for all LUT measures

Urban LUT % VMT Reduction Cap:	65%
Compact Infill LUT % VMT Reduction Cap:	30%
Suburban Center LUT % VMT Reduction Cap:	10%

LUT-3 Increase Diversity of Urban and Suburban Developments (Mixed Use)

Urban: The urban project will be predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with functional interrelationships and a coherent physical design.

Suburban: The suburban project will have at least three uses of the following on site and/or offsite within ¼-mile: Residential Development, Retail Development, Park, Open Space, or Office.

(ACOUNTED FOR IN TRAFFIC STUDY)

% VMT Reduction = Land Use × B [not to exceed 30%]
Land Use = % increase in land use index vs. single use
= (Land Use Index - 0.15) / 0.15
Land Use Index = -a / ln(6)
$a = \sum a_i \times \ln(a_i)$
a_i = building floor area / total square feet of area considered
a_1 = single family
a_2 = multi-family
a_3 = commercial B = 0.09
a_4 = industrial
a_5 = institutional
a_6 = park

% VMT Reduction =	0.00%	Cap: 30%
Single family sqft:	-	a_1 = -
Multi-family sqft:	-	a_2 = -
Commercial sqft:	-	a_3 = -
Industrial sqft:	-	a_4 = -
Institutional sqft:	-	a_5 = -
Park sqft:	-	a_6 = -
Total sqft:	-	

(Note: If $a_i = 0$, then set $a_i = 0.0000001$)

LUT-4 Increase Destination Accessibility

% VMT Reduction = Center Distance × B [not to exceed 20%]
Center Distance = (12 - Miles to downtown or job center) / 12
B = 0.20

% VMT Reduction =	7.33%	Cap: 20%
Miles to downtown or job center:	7.6	

(Average distance to: Hollywood and Downtown L.A.
These locations are identified as job centers by Metro and by SCAG.)
(Note: Only effective for 8 miles or less)

LUT-5	Increase Transit Accessibility	% VMT Reduction = Transit × B [not to exceed 30%] Transit = % project transit - % typical ITE transit % project transit = -50x + 38 [where x = 0 - 0.5 miles to transit] -4.4x + 15.2 [where x = 0.5 - 3 miles to transit] % typical ITE transit = 1.3% B = 0.67	% VMT Reduction = 0.00% Miles to transit: (Note: Only effective for 3 miles or less)	Cap: 30%

LA Times Square - Towers

South Coast Air Basin, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	37.60	1000sqft	0.86	37,597.00	0
Enclosed Parking with Elevator	1,754.00	Space	0.68	697,600.00	0
Other Non-Asphalt Surfaces	74.64	1000sqft	0.09	74,643.00	0
City Park	0.92	Acre	0.09	28,777.00	0
Health Club	25.62	1000sqft	0.59	25,618.00	0
Apartments High Rise	1,127.00	Dwelling Unit	0.80	1,071,692.00	1894

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	12			**Operational Year**	2023
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	1227.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

3.1 Mitigation Measures Construction

Use Alternative Fuel for Construction Equipment

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2018

Unmitigated Construction On-Site

LA Times Square - Towers

South Coast Air Basin, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	37.60	1000sqft	0.86	37,597.00	0
Enclosed Parking with Elevator	1,754.00	Space	0.68	697,600.00	0
Other Non-Asphalt Surfaces	74.64	1000sqft	0.09	74,643.00	0
City Park	0.92	Acre	0.09	28,777.00	0
Health Club	25.62	1000sqft	0.59	25,618.00	0
Apartments High Rise	1,127.00	Dwelling Unit	0.80	1,071,692.00	1894

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	12			**Operational Year**	2023
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	1227.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

3.1 Mitigation Measures Construction

Use Alternative Fuel for Construction Equipment

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2018

C-3 Project Operational Emissions

LA Times - Operational - South Coast Air Basin, Summer

LA Times - Operational

South Coast Air Basin, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	285.09	1000sqft	0.95	285,088.00	0
User Defined Commercial	3.02	User Defined Unit	0.04	3,025.00	0
Enclosed Parking with Elevator	1,754.00	Space	0.68	697,600.00	0
Other Non-Asphalt Surfaces	74.64	1000sqft	0.08	74,643.00	0
City Park	0.92	Acre	0.08	28,777.00	0
Health Club	25.62	1000sqft	0.08	25,618.00	0
High Turnover (Sit Down Restaurant)	53.39	1000sqft	0.28	53,389.00	0
Quality Restaurant	22.20	1000sqft	0.20	22,200.00	0
Apartments High Rise	1,127.00	Dwelling Unit	0.80	1,071,692.00	1894
Supermarket	50.00	1000sqft	0.50	50,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	31
Climate Zone	12			**Operational Year**	2023
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	849	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - LADWP CO2 emission factor calculated using 2016 Briefing Book and Utility Energy Supply Plans from 2015: see AQGHG calcs

Land Use - see operational assumptions

Architectural Coating -

Vehicle Trips - see operational assumptions

Woodstoves - see operational assumptions - no fireplaces and stoves

Area Coating -

Energy Use - see operational assumptions

Water And Wastewater - see operational assumptions

Solid Waste - see operational assumptions - based solid waste generation rate of user defined on general office building

Energy Mitigation -

Waste Mitigation -

Stationary Sources - Process Boilers -

Trips and VMT -

Charbroiler - NY Steak	0.86	17.19	12.03	7.22	233.0	86%	83%	83%	0.03	0.48	0.29
Emissions									**0.23**	**1.76**	**1.06**

Notes:

1. Source type is based on the beef, chicken, and fish for under-fired broilers.
2. South Coast Air Quality Management District, Emission Factors for Commercial Cooking Operations, http://www.aqmd.gov/docs/default-source/rule-book/Proposed-Rules/1138/par1138pdsr_appendixi.pdf?sfvrsn=2. Accessed November 2017.
3. South Coast Air Quality Management District, Final –Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds, Appendix A, http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/particulate-matter-(pm)-2.5-significance-thresholds-and-calculation-methodology/final_pm2_5methodology.pdf?sfvrsn=2. Accessed November 2017. Per Appendix A, for cooking (baking, charbroiling, deep fat frying), PM10 is 0.7 fraction of PM and PM2.5 is 0.42 fraction of PM.
4. Quantity of meats charbroiled is based on the average pounds of meat cooked per restaurant with a charbroiler, and assuming multiple restaurants on the project site.
5. South Coast Air Quality Management District Rule 1138 (Control of Emissions from Restaurant Operations) regulates PM10 and VOC emissions from fast-food restaurants with charbroilers. Catalytic oxidizers reduce VOC emissions by approximately 86 percent and PM emissions by approximately 83 percent.

Notes:
1. Emission factors for VOC and NOX: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
2. Emission factors for CO, PM10, and PM2.5: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
3. Emission factor for SO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1.
   Emission Factor for SO2 is based on 15 ppm (0.0015%) S1 from the EPA Nonroad Diesel Fuel Program, and assumes complete conversion to SO2.
1. Emission factor for CO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1.
   Emissions of GHGs assume 99.11% of the CO2e emissions occur as CO2, which is typical for off-road diesel engines.

lbs/hr	0.20	3.88	3.56	0.00	0.01	0.01
lbs/day	**0.41**	**7.76**	**7.11**	**0.00015**	**0.03**	**0.03**
lbs/yr	10.22	194.12	177.77	0.00	0.65	0.64
tons/yr	0.01	0.10	0.09	0.00	0.00	0.00
metric tons/yr	—	—	—	—	—	—

Notes:

1. Emission factors for VOC and NOX: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
2. Emission factors for CO, PM10, and PM2.5: Regulatory Limit per SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines).
3. Emission factor for SO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1.
   Emission Factor for SO2 is based on 15 ppm (0.0015%) S1 from the EPA Nonroad Diesel Fuel Program, and assumes complete conversion to SO2.
1. Emission factor for CO2: U.S. Environmental Protection Agency, AP-42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Section 3.4, Table 3.4-1.
   Emissions of GHGs assume 99.11% of the CO2e emissions occur as CO2, which is typical for off-road diesel engines.

Project: Omni Times Square
Draft Environmental Impact Report
Quantifying Greenhouse Gas Mitigation Measures - Transportation (Based on CAPCOA Guidance (August 2010))

PROJECT

Location Type	Global % VMT Reduction Cap
Urban:	75%
Less than 5 miles from central business district	
Jobs-rich (jobs/housing ratio greater than 1.5)	
Typical buildings are 6 stories or higher	
Grid street pattern	
Minimal setbacks	
Parking constrained on- and off-street	
Parking prices high/highest in the region	
High-quality rail; bus service at 10 min or less in peak hours	
Compact Infill:	40%
Typically 5 - 15 miles from central business district	
Balanced jobs-housing (jobs/housing ratio from 0.9 to 1.2)	
Typical buildings are 2 - 4 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking constrained	
Parking prices low/moderate	
Rail w/in 2 miles; bus service at 15 min or less in peak hours	

Location Type	Global % VMT Reduction Cap
Suburban Center:	20%
Typically 20 miles or more from central business district	
Balanced jobs-housing	
Typical buildings are 2 stories	
Grid street pattern	
Setbacks 0 - 20 feet	
Parking somewhat constrained on-street; ample off-street	
Parking prices low (if priced at all)	
Bus service at 20 - 30 min and/or commuter rail station	
Suburban:	15%
Typically 20 miles or more from central business district	
Housing-rich	
Typical buildings are 1 - 2 stories	
Curvilinear street pattern (cul-de-sac based)	
Parking between street and buildings; large lot residential	
Parking ample; largely surface lot-based	
No parking prices	
Limited bus service at 30 minute headways or more	

Total Global Transportation VMT Reduction =	**29.06%**	Cap:	75%
(Includes double counting correction.)			
Total LUT/SDT/PDT/TST VMT Reduction =	**29.06%**	Cap:	70%
Total LUT % VMT Reduction =	**27.61%**	Cap:	65%

Land Use/Location Transportation Measures (65% Reduction Cap)

LUT-1 Increase Density

% VMT Reduction = A × B [not to exceed 30%]

A (housing) = (Number of DU/acre - 7.6) / 7.6
A (jobs) = (Number of Jobs/acre - 20) / 20
B = 0.07%

% VMT Reduction =	0.70%	Cap:	30%
Number of DU/acre:	305.4	A =	500%
Number of Jobs/acre:	425.7	A =	500%

LUT-2 Increase Location Efficiency

% VMT Reduction Cap for all LUT measures

Urban LUT % VMT Reduction Cap:	65%
Compact Infill LUT % VMT Reduction Cap:	30%
Suburban Center LUT % VMT Reduction Cap:	10%

LUT-3 Increase Diversity of Urban and Suburban Developments (Mixed Use)

Urban: The urban project will be predominantly characterized by properties on which various uses, such as office, commercial, institutional, and residential, are combined in a single building or on a single site in an integrated development project with functional interrelationships and a coherent physical design.

Suburban: The suburban project will have at least three uses of the following on site and/or offsite within ¼-mile: Residential Development, Retail Development, Park, Open Space, or Office.

(ACOUNTED FOR IN TRAFFIC STUDY)

% VMT Reduction = Land Use × B [not to exceed 30%]
Land Use = % increase in land use index vs. single use
= (Land Use Index - 0.15) / 0.15
Land Use Index = -a / ln(6)
$a = \sum a_i \times \ln(a_i)$
a_i = building floor area / total square feet of area considered
a_1 = single family
a_2 = multi-family
a_3 = commercial B = 0.09
a_4 = industrial
a_5 = institutional
a_6 = park

% VMT Reduction =	0.00%	Cap:	30%
Single family sqft:	-	a_1 =	-
Multi-family sqft:	-	a_2 =	-
Commercial sqft:	-	a_3 =	-
Industrial sqft:	-	a_4 =	-
Institutional sqft:	-	a_5 =	-
Park sqft:	-	a_6 =	-
Total sqft:	-		

(Note: If $a_i = 0$, then set $a_i = 0.0000001$)

LUT-4 Increase Destination Accessibility

% VMT Reduction = Center Distance × B [not to exceed 20%]
Center Distance = (12 - Miles to downtown or job center) / 12
B = 0.20

% VMT Reduction =	7.33%	Cap:	20%
Miles to downtown or job center:	7.6		

(Average distance to: Beverly Hills, Century City, Hollywood and Downtown L.A. These locations are identified as job centers by Metro and by SCAG.)
(Note: Only effective for 8 miles or less)

LUT-5 Increase Transit Accessibility

(ACOUNTED FOR IN TRAFFIC STUDY)

% VMT Reduction = Transit × B [not to exceed 30%]
Transit = % project transit - % typical ITE transit
% project transit = -50x + 38 [where x = 0 - 0.5 miles to transit]
-4.4x + 15.2 [where x = 0.5 - 3 miles to transit]
% typical ITE transit = 1.3%
B = 0.67

% VMT Reduction = 0.00% Cap: 30%
Miles to transit:
(Note: Only effective for 3 miles or less)

LUT-6 Integrated Affordable and Below Market Rate Housing

% VMT Reduction = 4% × % units BMR

% VMT Reduction = 0.00%
% of units below market rate: 0.0%
(Note: Only effective up to 30%)

LUT-7 Orient Project Toward Non-Auto Corridor

Not quantified separately; Assumed to be included in LUT-3
(If included in LUT-3, VMT reduction should be at least 0.5% per 1% inprovement in transit frequency and 0.5% per 10% increase in transit ridership)

LUT-8 Locate Project near Bike Path/Bike Lanes

Not quantified separately; Assumed to be included in LUT-4
(If included in LUT-4, VMT reduction should be at least 0.625%)

LUT-9 Improve Design of Development

% VMT Reduction = Intersections × B
Intersections = % increase vs. typical ITE suburban
= (Intersections per square mile of project - 36) / 36
B = 0.12

% VMT Reduction = 21.33%
Intersections per square mile: 100
(Estimated based on count of 4-way intersections within 1 mile radius of project site.)
(Note: Only effective up to 100)

Neighborhood/Site Enhancement Measures (5% Reduction Cap without NEV; 15% Reduction Cap with NEV)

Total SDT % VMT Reduction = 2.00% Cap: 5% without NEV
Cap: 15% With NEV

SDT-1 Provide Pedestrian Network Improvements

VMT reduction based on urban/rural context and pedestrian accomodations

% VMT Reduction = 2.00%

Pedestrian network on-site and connecting off-site (urban/suburban):	X	2%
Pedestrian network on-site (urban/suburban):		1%

(Mark an "X" in one of the above)

SDT-2 Provide Traffic Calming Measures

Marked crosswalks, count-down signal timers, curb extensions, speed tables, rasied crosswalks, raised intersections, median islands, tight corner radii, roundabouts, on-street parking, planter strips with trees, chicanes/chokers, and others.

CHAPTER 4

REVISION TO THE FEDERAL CARBON MONOXIDE ATTAINMENT DEMONSTRATION PLAN

Introduction

Carbon Monoxide Emissions

Modeling Methodology

Carbon Monoxide Control Strategy

Future Air Quality Projections

Conclusion

Hot Spot Analysis

The hot-spot analysis was performed using CAL3QHC. CAL3QHC is a model developed to predict the level of CO or other inert pollutant concentration emitted from motor vehicles at roadway intersections. CAL3QHC inputs include roadway geometry, receptor locations, meteorological conditions and vehicular emissions rate. A general description of the selection of the hot spot intersection, model input assumptions, and model application was presented in the 1992 CO Plan and is not repeated here.

The CAL3QHC model was applied to the four intersections listed in Table 4-7 to estimate the CO impacts from motor vehicles traveling at roadway intersections. CO concentrations were estimated for both the 1997 base year and for the year 2002 based on projected traffic volume and emission factors. The October 31-November 1, 1997 episode specific meteorological conditions for the grid cell hosting the intersection was used for the simulation. Tables 4-8, 4-9, and 4-10 show the model predicted and calculated CO concentration at the selected intersection in the years 1997 and 2002.

TABLE 4-7

Selected Intersections for the CAL3QHC
Hot Spot Modeling Analysis

Intersection	Receptor	Description
Long Beach Blvd. /Imperial Highway	Lynwood Air Monitoring Station	The Lynwood air monitoring stations consistently records the highest 8-hour CO concentrations in the Basin each year
Wilshire Blvd./ Veteran Ave.	No Air Monitoring	The most congested intersection in Los Angeles county. The average daily traffic volume is about 100,000 vehicles/day.
Highland Ave./ Sunset Blvd.	No Air Monitoring Station	One of the most congested intersections in the city of Los Angeles. The intersection study has been conducted and traffic data is available.
Century Blvd./ La Cienega Blvd.	No Air Monitoring Station	One of the most congested intersections in the city of Los Angeles. The intersection study has been conducted and traffic data is available.

\+ Afternoon : 3-4 p.m. for Sunset - Highland, 5-6 p.m. for Wilshire - Veteran, 4-5 p.m. and Long Beach - Imperial, and. 6-7 p.m. for and La Cienega - Century

++ Peak : 11-12 p.m. (concentration at the hour of the observed peak)). Peak is only provided for the Long Beach/Imperial intersection since it is intersection associated with the regional peak at Lynwood.

CARBON MONOXIDE CONTROL STRATEGY

Mobile sources, which are regulated primarily by ARB or U.S. EPA, produce the largest amount of carbon monoxide emissions in the Basin. The on-road motor vehicle control strategy is primarily based on adopted regulations, such as the 1990 ARB Low-Emission Vehicles and Clean Fuels (LEV/Clean Fuels) regulations, Phase 2 Reformulated Gasoline Program, oxygenated fuel regulation, and enhancements to the Inspection and Maintenance (I/M) or Smog Check program. The emission reduction resulting from these already adopted regulations are sufficient to demonstrate attainment in the year 2002, as discussed in a later section.

Contingency Measures

Section 187(a)(3) of the 1990 CAAA requires that adopted and enforceable contingency measures be included in the attainment plan submission. A deviation from the forecasted VMT of more than a given percentage will trigger implementation of contingency measures to offset either excess VMT or carbon monoxide emissions due to the additional VMT. According to the EPA General Preamble [Sect. 532(c)(1)], this percentage is 5 percent in 1994, 4 percent in 1995, and 3 percent for 1996 and subsequent years. The cumulative VMT growth cannot be greater than or equal to 5 percent above the VMT forecast used as the basis of the attainment demonstration.

EXECUTIVE SUMMARY

The Applicant proposes to develop the city block known as Times Mirror Square in Downtown Los Angeles. The block is bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway. Times Mirror Square is occupied by five buildings: the Times Building constructed in 1935, the Plant Building constructed between 1935 and 1955, the Mirror Building constructed in 1948, the Executive Building constructed in 1973, and the Parking Structure also constructed in 1973. GPA Consulting (GPA) was retained to prepare this report as part of the environmental review of the proposed Project in compliance with the California Environmental Quality Act (CEQA). The purpose of this report was to identify historical resources on and in the vicinity of the project site, to analyze impacts on the identified historical resources, and to recommend mitigation measures, as appropriate. Although archaeological sites may be considered historical resources if they are listed or eligible for listing in the California Register of Historical Resources, this report was limited to historical resources that are part of the built environment.

There are four buildings constituting three individual historical resources on the project site and five buildings contributing to a potential historic district. The Times-Plant Complex and Mirror Building were previously determined eligible for listing in the National Register of Historic Places through the Section 106 process in 1978 and 2010, respectively. Properties that are formally determined eligible for listing in the National Register of Historic Places are automatically listed in the California Register of Historical Resources. Additionally, the Times-Plant Complex and Mirror Building are collectively designated as a Los Angeles Historic-Cultural Monument. GPA studied these buildings in greater detail to gain a better understanding of their significance and integrity, and to properly identify their character-defining features. GPA concluded that the Executive Building appears individually eligible for listing in the California Register of Historical Resources for its association with the Times Mirror Company and Otis Chandler. The Parking Structure is not individually ineligible under national, state, or local landmark programs because does not meet the criteria for significance. Furthermore, the City Council excluded the Executive Building and Parking Structure from the Los Angeles Historic-Cultural Monument designation. Nevertheless, GPA conservatively concluded that Times Mirror Square appears eligible for listing in the National Register of Historic Places and California Register of Historical Resources as a potential historic district. The potential historic district is historically significant as a reflection of the ascent of the *Los Angeles Times* to the front ranks of American journalism and the Times Mirror Company to a national media giant. The period of significance is 1935, the year the Times-Plant Complex was completed, to 2000, the year the Times Mirror Company was sold to the Tribune Company. All of the buildings within the block are contributing to the significance of the potential historic district because they were constructed within the period of significance and retain sufficient integrity to convey their significance. Therefore, all of the buildings on the block qualify as historical resources subject to the CEQA.

GPA identified three more historical resources in the vicinity of the project site. These include the Los Angeles Civic Center Historic District, Los Angeles City Hall, and Higgins Building. The Los Angeles Civic Center Historic District was formally determined eligible for listing in the National Register of Historic Places in 2010, and automatically included in the California Register of Historical Resources. Los Angeles City Hall is a contributing building within the Civic Center Historic District and is designated Los Angeles Historic-Cultural Monument No. 150. The Higgins Building is designated Los Angeles Historic-Cultural Monument No. 873. Therefore, these properties qualify as historical resources subject to the CEQA.

The Project as proposed involves three activities: demolition, rehabilitation, and new construction. The Executive Building and Parking Structure would be demolished. This activity would result in a significant adverse impact on the two buildings as well as Times Mirror Square. The Executive Building would no longer be individually eligible for listing in the California Register of Historical Resources. Times Mirror Square would no longer be eligible under national or state historic district programs. Mitigation measures are recommended; however, they would not reduce the impact to less than significant.

The demolition and rehabilitation activities would have a less than significant impact on the Times, Plant, and Mirror Buildings because they would not be materially impaired. While the demolition and rehabilitation components of the Project would require alterations to the Times, Plant, and Mirror Buildings, they would retain sufficient integrity to convey their significance. Indeed, it is more likely that the integrity would be improved rather than diminished by the alterations because the work would be completed in accordance with a Historic Structure Report, a feature of the Project. Thus, they would remain eligible for listing in the National Register of Historic Places, listed in the California Register of Historical Resources, and designated as a Los Angeles Historic-Cultural Monument. Nevertheless, mitigation measures are recommended to minimize the already less than significant impact and to promote the highest level of preservation standards. The potential impacts on the historic buildings from excavation and grading and the use of vibratory equipment during the construction of the new buildings can be avoided by mitigation measures.

In place of the Executive Building and Parking Structure, two towers would be constructed over a five-story podium and, from street grade. The north tower would rise 37 stories or approximately 495 feet above grade, while the south tower would rise 53 stories or approximately 665 feet above grade. A paseo bisecting the middle of the block would physically and visually separate the towers from the Times, Plant, and Mirror Buildings to the east. The new construction would diminish the integrity of the setting of the Times, Plant, and Mirror Buildings, but not to the degree that they would not remain eligible for listing in the National Register of Historic Places, listed in the California Register of Historical Resources, and designated as a Los Angeles Historic-Cultural Monument. The new construction would not diminish the integrity of setting of the Los Angeles Civic Center Historic District, Los Angeles City Hall, or the Higgins Building. These three historical resources are so far removed from the project site that the potential for impact was already minimal. The north and south towers would be physically and visually separated from these historical resources by streets and/or other buildings. Therefore, the indirect impact of the new construction component of the project on the historical resources on the project site and in the vicinity is less than significant and no mitigation is required or recommended. Furthermore, there would be no potential for cumulative impacts as a result of the Project and related projects, when taken as a whole, that substantially diminish the number of historical resources within the same or similar context or property type.

1. INTRODUCTION

1.1 Purpose and Qualifications

The purpose of this report is to analyze whether or not a proposed development project would significantly impact historical resources. The Project involves the city block known as Times Mirror Square in Downtown Los Angeles. The block is bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway (see **Figure 1**). Addresses ranges include: 202-234 W. 1st Street, 121-147 S. Spring Street, 205-221 W. 2nd Street, and 100-142 S. Broadway. Assessor's Parcel Numbers (APN) include: 5149-001-003, 5149-001-004, 5149-001-005, 5149-001-006, and 5149-001-007.

Figure 1: Project Site

Times Mirror Square is occupied by five structurally distinct but internally connected buildings: an eight-story building completed in 1935, referred to in this report as the Times Building; a two-story building completed in 1935 and expanded to four stories in 1955, referred to in this report as the Plant Building; a twelve-story building constructed in 1948, referred to in this report as the Mirror Building; a six-story building constructed in 1973, referred to in this report as the Executive

Building; and a six-story structure constructed in 1973, referred to in this report as the Parking Structure.[1]

The proposed project (Project) would involve the rehabilitation of the Times Building, Plant Building, and Mirror Building, the demolition of the Executive Building and Parking Structure, and the construction two new mixed-use buildings. The Project is described in greater detail in Section 5.3.

GPA Consulting (GPA) was retained to identify historical resources on and in the vicinity of the Project site, to assess any potential impacts the Project may have on the identified historical resources, and to recommend mitigation measures, as warranted, for compliance with the California Environmental Quality Act (CEQA). Teresa Grimes, Laura O'Neill, Emily Rinaldi Williams, Amanda Yoder Duane, and Audrey von Ahrens were responsible for the preparation of this report. They fulfill the qualifications for historic preservation professionals outlined in Title 36 of the Code of Federal Regulations, Part 61. Their résumés are attached in Appendix A.

1.2 Methodology

In preparing this report, GPA performed the following tasks:

1. Conducted a field inspection of the Project site and surrounding area to determine the scope of the study. The study area was defined as the Project site, which comprises the single city block known as Times Mirror Square, and the adjacent parcels within a 550-foot radius. This radius was established to account for potential indirect impacts on historical resources in the vicinity. Thus, the study area includes the opposite and diagonal block faces from the Project site. Historical resources beyond the 550-foot radius were not included in the study area because the Project would have no potential to indirectly impact these resources. These resources are physically and visually separated from the Project site by surface parking lots and buildings constructed during various periods. The Project site cannot be reasonably considered a part of the environmental setting of historical resources beyond the study area.

2. Requested and reviewed a records search from the South Central Coastal Information Center at California State University, Fullerton to determine whether or not any of the buildings on the Project site are currently listed as landmarks at the national, state, or local levels and whether or not they had been previously evaluated as historical resources. Following are the results of the review:

    a. Some portion of Times Mirror Square was evaluated in 1978 as part of the Downtown People Mover Program. Two historical resources inventory forms exist from the evaluation. One appears to address the entire complex of buildings; the other appears to address the Times Building only. The evaluation resulted in a formal determination of eligibility for listing in the National Register of Historic

[1] Technically, there are six buildings on the site. The structural components of a six-story building are located on Broadway at roughly the mid-point of the block. It was constructed by the Times Mirror Company for printing and binding in 1931. The building was completely enveloped in 1973 by the Executive Building and Parking Structure. Due to the existence of large color printing presses in the building, the company chose to incorporate the building's foundation and some walls into the new buildings, instead of trying to remove and relocate the presses. The existence of the structural remnants is only perceptible on the interior of the 1973 buildings and evidenced only by changes in floor level and wall material.

Places, though it is unclear if the determination covered the entire complex or just the Times Building. On June 1, 2010, as part of the Regional Connector Transit Corridor Project, the State Historic Preservation Officer (SHPO) included the "Los Angeles Times Building" at "202 West 1st Street" in a list of historical resources eligible for listing in the National Register of Historic Places, indicating that the formal determination applied to the Times Building only. The California Historical Resource Inventory (HRI) includes two different Historical Resource Status Codes (Status Codes) for the address 202 W. 1st Street: 2S2 (individual property determined eligible for the National Register of Historic Places by a consensus through Section 106 process and listed in the California Register of Historical Resources); and 7K (resubmitted to State Office of Historic Preservation (SOHP) for action but not re-evaluated). The 2S2 Status Code resulted from the 1978 evaluation. It is not clear what resulted in the 7K Status Code. Copies of the inventory forms are located in Appendix B and the Status Codes are further defined in Section 2.2 of this report.

b. The Mirror Building located at 145 S. Spring Street was evaluated as individually eligible for the National Register of Historic Places, California Register of Historical Resources, and as a Los Angeles Historic-Cultural Monument in 2009 as part of the Regional Connector Transit Corridor Project. It was formally determined eligible by the SHPO on June 1, 2010. The Status Code for the building is 2S2 (individual property determined eligible for the National Register of Historic Places by consensus through the Section 106 process; listed in the California Register of Historical Resources). The site of the building is also designated as California Historical Landmark (CHL) #744 as the location of the Butterfield Stage Station (building no longer extant). A copy of the inventory form is located in Appendix B and the Status Codes are further defined in Section 2.2 of this report.

3. Consulted the Los Angeles Office of Historic Resources (OHR) to determine if any of the buildings on the Project site were identified by SurveyLA, the citywide historic resource survey of Los Angeles. The Central City Community Plan Area in which the Project site is located was surveyed in 2016. SurveyLA identified the block as a potential historic district, but did not identify contributing or non-contributing buildings. The Times, Plant, and Mirror Buildings were not re-evaluated by SurveyLA as they were already listed in the California Register of Historical Resources. The Executive Building was evaluated as appearing eligible for listing in California Register of Historical Resources and designation as a Los Angeles Historic-Cultural Monument. The Status Code for the building is 3CS and 5S3.

   During the preparation of this report, interested parties nominated Times Mirror Square as a Los Angeles Historic-Cultural Monument. Ultimately, the City Council designated the Times, Plant and Mirror Buildings, but excluded the Executive Building and Parking Structure.

4. Determined the number and scope of evaluations required to adequately document the block.

   a. The Times Building and the Plant Building were considered jointly as one resource, referred to in this report as the Times-Plant Complex, instead of two individual resources for the following reasons: both buildings were built at the same time

and designed by the same architect, and while their structures are separated by a 6-inch seismic joint, they have always been internally connected and used for purposes directly related to publishing the *Los Angeles Times* newspaper. Although the Times Building is listed in the California Register of Historical Resources, the scope of the previous evaluation was unclear and the documentation out of date, so re-evaluation was necessary to accurately identify periods of significance and character-defining features in this report.

b. The Mirror Building did not require re-evaluation, because the 2009 evaluation conforms to current professional standards, demonstrates a clear scope, uses current inventory forms, and comes to logical conclusions. Minor revisions to the 2009 evaluation based on additional research were suggested, but a complete evaluation was not conducted.

c. The Executive Building and Parking Structure required evaluation under national and state landmark designation programs as the buildings are 45 years of age. The 45-year benchmark recognizes that there may be as much as a five-year lag between the identification of historical resources and the date planning decisions are made. This benchmark is found on page 2 the "Instructions for Recording Historical Resources," State Office of Historic Preservation, March 1995. It encourages the collection of information about properties that may become eligible for listing in the National Register of Historic Places or California Register of Historical Resources within the planning period for a development project. The Executive Building and Parking Structure were evaluated in this report using the same contexts because they were constructed at the same time, designed by the same architecture firm, and used by the Times Mirror Company.

d. As all the buildings within Times Mirror Square are physically and historically related, the block required evaluation as a potential historic district under national and state programs.

5. Conducted additional research to fill information gaps, as necessary. Sources consulted included building plans and permits, Sanborn Fire Insurance maps, historic photograph collections, architectural periodicals, newspapers, and scholarly sources, such as books, articles, and documentaries.

6. Consulted the Context/Theme/Property Type (CTP) eligibility standards formulated for the *Los Angeles Citywide Historic Context Statement* to identify the appropriate CTPs under which to evaluate the Times-Plant Complex, Executive Building, and Parking Structure.

7. Reviewed and analyzed ordinances, statutes, regulations, bulletins, and technical materials relating to federal, state, and local historic preservation designations, and assessment processes and programs to evaluate the significance and integrity of the Times-Plant Complex, Executive Building, and Parking Structure.

8. Summarized the eligibility of the Mirror Building based on the existing inventory forms from 2009.

9. Identified the character-defining features of all buildings evaluated as individual historical resources on the block. The features are listed, described, and pictured in **Appendix B**.

10. Reviewed and analyzed Entitlement Submittal to determine if the Project would have direct or indirect impacts on the identified historical resources as defined by CEQA.

2. REGULATORY ENVIRONMENT

Generally, a lead agency must consider a property a historical resource under CEQA if it is eligible for listing in the California Register of Historical Resources (California Register). The California Register is modeled after the National Register of Historic Places (National Register). Furthermore, a property is presumed to be a historical resource if it is listed in a local register of historical resources or has been identified as a historical resource in a historic resources survey (provided certain criteria and requirements are satisfied) unless a preponderance of evidence demonstrates that the property is not historically or culturally significant.[2] The National Register, California Register, and local landmark and historic district programs are discussed below.

2.1 National Register of Historic Places

The National Register is "an authoritative guide to be used by federal, state, and local governments, private groups, and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[3]

Criteria

To be eligible for listing in the National Register, a property must be at least 50 years of age (unless the property is of "exceptional importance") and possess significance in American history and culture, architecture, or archaeology. A property of potential significance must meet one or more of the following criteria:[4]

A. Associated with events that have made a significant contribution to the broad patterns of our history; or

B. Associated with the lives of persons significant in our past; or

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Yield, or may be likely to yield, information important in prehistory or history.

Context

To be eligible for listing in the National Register, a property must be significant within a historic context. *National Register Bulletin #15* states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning... is made clear."[5] A property must represent an important aspect of the area's history or prehistory and possess the requisite integrity to qualify for the National Register.

[2] Public Resources Code Section 5024.1 and 14 California Code of Regulations Sections 4850 & 15064.5(a)(2).
[3] Title 36 Code of Federal Regulations Part 60.2.
[4] Title 36 Code of Federal Regulations Part 60.4.
[5] *National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation* (Washington D.C.: National Park Service, Department of the Interior, 1997), 7-8.

Integrity

In addition to possessing significance within a historic context, to be eligible for listing in the National Register a property must have integrity. Integrity is defined in *National Register Bulletin #15* as "the ability of a property to convey its significance."[6] Within the concept of integrity, the National Register recognizes the following seven aspects or qualities that, in various combinations, define integrity: feeling, association, workmanship, location, design, setting, and materials. Integrity is based on significance: why, where, and when a property is important. Thus, the significance of the property must be fully established before the integrity is analyzed.

In the case of districts, integrity means the physical integrity of the buildings, structures, or features that make up the district as well as the historic, spatial, and visual relationships of the components. Some buildings or features may have been more altered over time than others. In order to possess integrity a district must, on balance, still communicate its historic identity.

Criteria Consideration G

Certain types of properties are not usually eligible for listing in the National Register. These properties include buildings and sites that have achieved significance within the past 50 years. Fifty years is a general estimate of the time needed to develop historical perspective and to evaluate significance. In addition to being significant under one of the four criteria listed above, these properties must meet a special requirement called a criteria consideration in order to be eligible for listing in the National Register. There are seven criteria considerations. Criteria Consideration G states "a property achieving significance within the last 50 years is eligible if it is of exceptional importance."[7] This criteria consideration guards against the listing of properties of fleeting contemporary interest.

Historic Districts

The National Register includes significant properties, which are classified as buildings, sites, districts, structures, or objects. A historic district "derives its importance from being a unified entity, even though it is often composed of a variety of resources. The identity of a district results from the interrelationship of its resources, which can be an arrangement of historically or functionally related properties."[8]

A district is defined as a geographically definable area of land containing a significant concentration of buildings, sites, structures, or objects united by past events or aesthetically by plan or physical development.[9] A district's significance and historic integrity should help determine the boundaries. Other factors include:

- Visual barriers that mark a change in the historic character of the area or that break the continuity of the district, such as new construction, highways, or development of a different character;
- Visual changes in the character of the area due to different architectural styles, types, or periods, or to a decline in the concentration of contributing resources;

[6] Ibid., 44-45.
[7] Ibid., 41.
[8] Ibid., 5.
[9] Title 36 Code of Federal Regulations Part 60.3(d).

- Boundaries at a specific time in history, such as the original city limits or the legally recorded boundaries of a housing subdivision, estate, or ranch; and
- Clearly differentiated patterns of historical development, such as commercial versus residential or industrial.[10]

Within historic districts, properties are identified as contributing and noncontributing. A contributing building, site, structure, or object adds to the historic associations, historic architectural qualities, or archaeological values for which a district is significant because:

- It was present during the period of significance, relates to the significance of the district, and retains its physical integrity; or
- It independently meets the criterion for listing in the National Register.[11]

2.2 California Register of Historical Resources

In 1992, Governor Wilson signed Assembly Bill 2881 into law establishing the California Register. The California Register is an authoritative guide used by state and local agencies, private groups, and citizens to identify historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse impacts.[12]

The California Register consists of properties that are listed automatically as well as those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed in the National Register and those formally Determined Eligible for the National Register;
- State Historical Landmarks from No. 0770 onward; and
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (SOHP) and have been recommended to the State Historical Resources Commission for inclusion on the California Register.[13]

Criteria and Integrity

For those properties not automatically listed, the criteria for listing in the California Register are based upon National Register criteria, but are identified as 1-4 instead of A-D. To be eligible for listing in the California Register, a property generally must be at least 50 years of age and must possess significance at the local, state, or national level, under one or more of the following criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or

[10] *National Register Bulletin #21: Defining Boundaries for National Register Properties Form* (Washington D.C.: U.S. Department of the Interior, 1997), 12.
[9] *National Register Bulletin #16: How to Complete the National Register Registration Form* (Washington D.C.: U.S. Department of the Interior, 1997), 16.
[12] Public Resources Code Section 5024.1 (a).
[13] Public Resources Code Section 5024.1 (d).

2. It is associated with the lives of persons important to local, California, or national history; or
3. It embodies the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values; or
4. It has yielded, or has the potential to yield, information important in the prehistory or history of the local area, California, or the nation.

Properties eligible for listing in the California Register may include buildings, sites, structures, objects, and historic districts. A property less than 50 years of age may be eligible if it can be demonstrated that sufficient time has passed to understand its historical importance. While the enabling legislation for the California Register is less rigorous with regard to the issue of integrity, there is the expectation that properties reflect their appearance during their period of significance.[14]

The California Register may also include properties identified during historic resource surveys. However, the survey must meet all of the following criteria:[15]

1. The survey has been or will be included in the State Historic Resources Inventory;
2. The survey and the survey documentation were prepared in accordance with office [SOHP] procedures and requirements;
3. The resource is evaluated and determined by the office [SOHP] to have a Status Code of 1 to 5 on a DPR Form 523; and
4. If the survey is five or more years old at the time of its nomination for inclusion in the California Register, the survey is updated to identify historical resources that have become eligible or ineligible due to changed circumstances or further documentation and those that have been demolished or altered in a manner that substantially diminishes the significance of the resource.

SOHP Survey Methodology

The evaluation instructions and classification system prescribed by the SOHP in its *Instructions for Recording Historical Resources* provide a Status Code for use in classifying potential historical resources. In 2003, the Status Codes were revised to address the California Register. These Status Codes are used statewide in the preparation of historical resource surveys and evaluation reports. The first code is a number that indicates the general category of evaluation. The second code is a letter that indicates whether the property is separately eligible (S), eligible as part of a district (D), or both (B). There is sometimes a third code that describes some of the circumstances or conditions of the evaluation. The general evaluation categories are as follows:

1. Listed in the National Register or the California Register.
2. Determined eligible for listing in the National Register or the California Register.
3. Appears eligible for listing in the National Register or the California Register through survey evaluation.

[14] Public Resources Code Section 4852.
[15] Public Resources Code Section 5024.1.

4. Appears eligible for listing in the National Register or the California Register through other evaluation.
5. Recognized as historically significant by local government.
6. Not eligible for listing or designation as specified.
7. Not evaluated or needs re-evaluation.

The specific Status Codes referred to in this report are as follows:

2S2 Individual property determined eligible for the National Register by a consensus through Section 106 process and listed in the California Register.

3S Appears eligible for National Register as an individual property through survey evaluation.

3CB Appears eligible for California Register both individually and as a contributor to an eligible district through a survey evaluation.

3CS Appears eligible for the California Register as an individual property through survey evaluation.

5S1 Individual property that is listed or designated locally.

3D Appears eligible for National Register as a contributor to a National Register eligible district through survey evaluation.

3CD Appears eligible for California Register as a contributor to a California Register eligible district through a survey evaluation.

7K Resubmitted to State Office of Historic Preservation (SOHP) for action but not re-evaluated.

2.3 Los Angeles Cultural Heritage Ordinance

The Los Angeles City Council adopted the Cultural Heritage Ordinance in 1962 and amended it in 2007 (Sections 22.171 et seq. of the Administrative Code). The Ordinance created a Cultural Heritage Commission (Commission) and criteria for designating Historic-Cultural Monuments (HCM). The Commission is comprised of five citizens, appointed by the Mayor, who have exhibited knowledge of Los Angeles history, culture, and architecture. The four criteria for HCM designation are stated below:

- The proposed HCM reflects the broad cultural, economic, or social history of the nation, state or community; or
- The proposed HCM is identified with historic personages or with important events in the main currents of national, state or local history; or
- The proposed HCM embodies the characteristics of an architectural type specimen inherently valuable for a study of a period, style or method of construction;

- The proposed HCM is the notable work of a master builder, designer, or architect whose individual genius influenced his or her age.[16]

Unlike the National and California Registers, the Ordinance makes no mention of concepts such as physical integrity or period of significance. However, in practice it is common for the Commission to consider alterations to nominated properties in making its recommendations on designations. Moreover, properties do not have to reach a minimum age requirement, such as 50 years, to be designated as HCMs.

[16] Los Angeles Administrative Code Section 22.171.7.

3. ENVIRONMENTAL SETTING

3.1 Project Location and Study Area

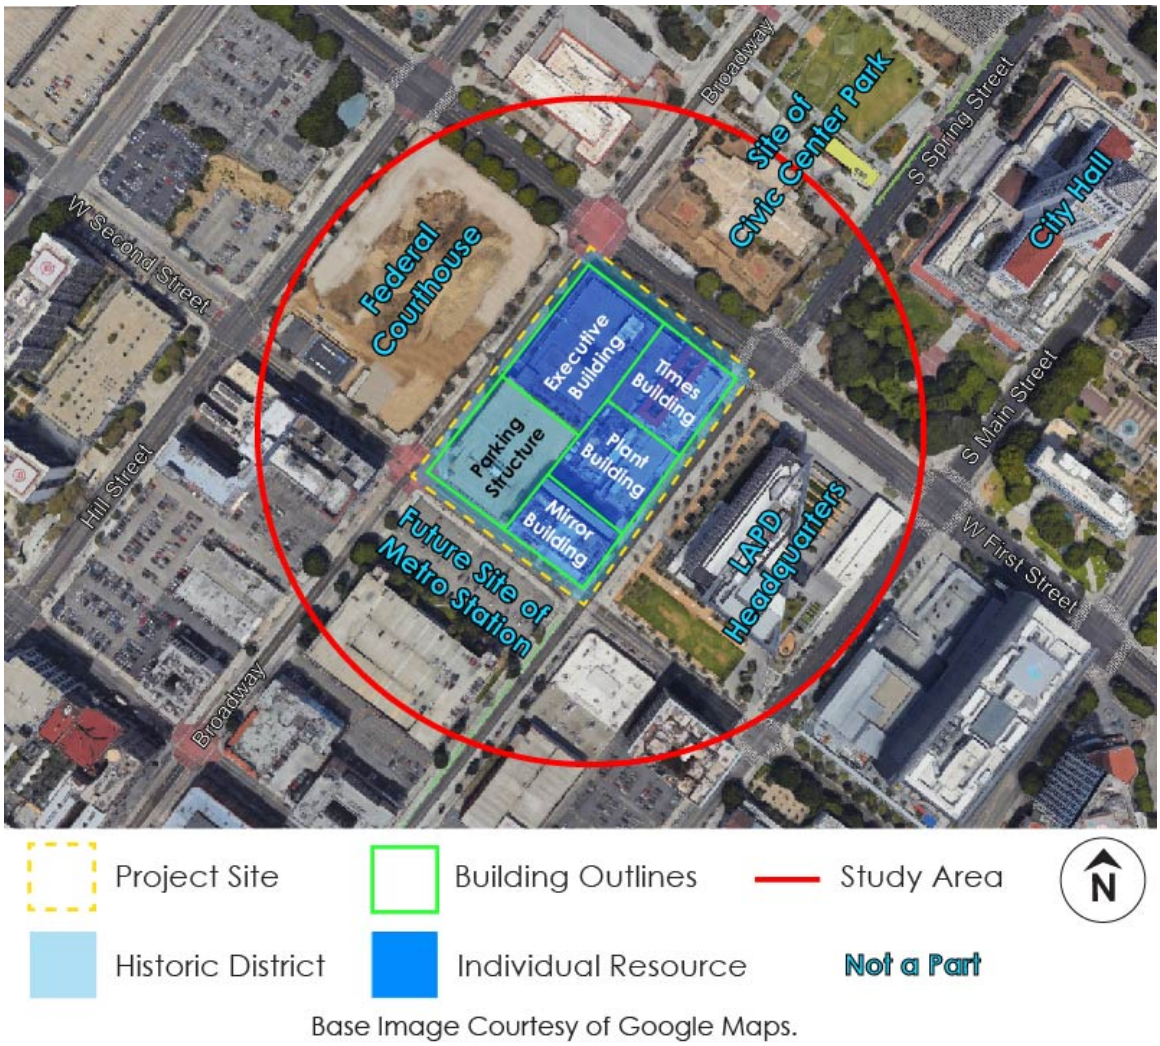

Figure 2: Project Site and Study Area

The Project site is located just south of the Civic Center in Downtown Los Angeles. It is a single city block bounded by W. 1st Street to the north, S. Spring Street to the east, W. 2nd Street to the south, and S. Broadway to the west. The study area encompasses approximately a 550-foot radius from the center of the Project site (see **Figure 2**). Immediately north of the Project site is the 1.96-acre First and Broadway Civic Center Park, a public park currently under development and anticipated for completion in 2019. The Los Angeles County Law Library is located diagonally across S. Broadway and W. 1st Street from the Project site. It ranges in height from one to three stories. The 29-story Los Angeles City Hall is located diagonally across S. Spring Street and W. 1st Street from the Project site. City Hall Park is situated in the setback from W. 1st Street. The 10-story Los Angeles Police Department (LAPD) Headquarters Building occupies the block bounded by S. Spring Street, E. 1st Street, S. Main Street, and E. 2nd Street, immediately to the east of the Project Site. The LAPD Headquarters Building is oriented toward City Hall and is characterized by 75-foot setbacks on three sides. The LAPD Headquarters Building's deep

setbacks accommodate a main plaza along E. 1st Street. In addition, the deep setback on the south of the Headquarters Building supports a one-acre park along E. 2nd Street. The park is landscaped open space edged with planters and benches. The 10-story Federal Courthouse is located directly west of the Project site in the block bounded by W. 1st Street, S. Broadway, W. 2nd Street, and S. Hill Street. The building rests on a podium structure, which provides a horizontal base relative to the rise along W. 1st Street. The podium structure and the rising topography of the site require broad staircases from S. Broadway and W. 1st Street to reach the building's entrance. The west frontage of the building is at grade with S. Hill Street. The building is located within a deep setback from W. 2nd Street. Low- and mid-rise office buildings, enclosed parking structures, and surface parking lots are the predominant land uses to the south of the Project site. A surface parking lot and a 7-level enclosed parking structure are currently located directly across W. 2nd Street from the Project site. The site was selected for Metro's proposed 2nd and Broadway Subway Station, one of three subway stations making up Regional Connector Transit Project. Although construction for the Regional Connector Transit Project is underway, construction at the 2nd Street and Broadway Station hasn't yet begun. Completion of the entire Regional Connector Transit Project is anticipated in May 2021. A current development proposal for the subway station site includes demolition of the existing parking structure for the construction of a 30-story mixed-use building. The building would integrate the subway station and provide ground-level retail uses. East of the future 2nd and Broadway Subway Station and south of the LAPD Headquarters Building is the 10-story Beaux Arts-style Higgins Building.

3.2 History and Description of the Project Site

Times Mirror Square consists of five buildings that were developed at various times by the Times Mirror Company. The five buildings are summarized in the following table and described in detail below.

Table 1: Buildings in Times Mirror Square

No.	Name	Address/Location[17]	Date	Description
1	Times Building	202 W. 1st Street/northeast corner of block	1935	Eight-story PWA Moderne building designed by Gordon B. Kaufmann
2	Plant Building	121 S. Spring Street/between Times and Mirror buildings	1935-55	Four-story PWA Moderne building designed by Gordon B. Kaufmann; addition designed by Rowland H. Crawford
3	Mirror Building	145 S. Spring Street/southeast corner of block	1948	Twelve-story Late Moderne building designed by Rowland H. Crawford
4	Executive Building	234 W. 1st Street/northwest corner of block	1973	Six-story International Style building designed by William L. Pereira & Associates
5	Parking Structure	142 S. Broadway/southwest corner of block	1973	Six-story parking Structure designed by William L. Pereira & Associates

[17] Please note that all buildings have multiple addresses associated with them. Listed addresses are primary addresses based on the locations of entrances and primary building facades.

Times Building

The Times Building was constructed between 1933 to 1935 as the new headquarters of the Times Mirror Company, the parent company of the *Los Angeles Times*.[18] By this time Harry Chandler was the chairman of the company and publisher of the newspaper. The new headquarters replaced the old one his father-in-law, Harrison Gray Otis had constructed at the northeast corner of W. 1st Street and S. Broadway (see **Figure 26**). The architect Gordon B. Kaufmann designed the Times Building, along with the first two stories of the Plant Building (described below) in the PWA Moderne style.

The Times Building is located in the northeast corner of Times Mirror Square and faces north toward W. 1st Street. It has a steel frame structural system and a rectangular plan. The walls are made of reinforced concrete and clad with marble, granite, and limestone. The building originally had a symmetrical massing which stepped down from approximately eight stories at its tallest central tower to six stories and then four stories at its east and west extents. Rooftop additions east and west of the center tower constructed in the 1940s, 1960s, and 1970s altered the purity of the original massing somewhat, yet the design intent remains evident. The roof over the central tower is hipped and clad with clay tiles. The roof over the east wing is flat, while the roof over the west wing is comprised of the fifth and sixth floors of the Executive Building.

The building's north elevation exhibits a strong emphasis on verticality. It is divided into nine bays divided by fluted limestone pilasters and changes in wall plane. The pilasters begin above a decorative band between the first and second stories and travel to varying heights that step down from the tallest, flanking the center bay, to the shortest, flanking the east and west bays. The pilasters framing the three central bays exhibit more ornamentation than the outer pilasters.

The window openings on the north elevation are original, while the window sashes are all non-original replacements. Counting from east to west, the windows in bays 1, 2, 8, and 9 include pairs of fixed metal-sash windows divided vertically by bronze spandrels. The spandrels exhibit fluting similar to the pilasters. Windows in bays 3 and 7 include single recessed fixed metal-sash windows with no frames or surrounds. Windows in bays 4, 5, and 6 include single fixed metal-sash windows. On the lower stories the windows are divided by bronze spandrels; the fourth and fifth story windows are separated by bas-relief terra cotta panels, and the fifth story windows are topped with sculptures by artist Merrell Gage. There are three sculptures in total and each represents a different journalism-related theme. The titles of the sculptures are "Father Time," "Spirit of the Times," and "Gutenberg." Above the sculptures, at the sixth story, the center bay features a carved terra cotta vent. Above the vent is a large clock. The numbers and ticks are carved into the limestone and illuminated by neon backlights. The hands are metal.

The north elevation's first story is separated from the upper stories by a decorative band of sunbursts and a change in wall material from limestone to granite. Windows on the first story consist of pairs of fixed metal-sash windows with decorative bronze frames in bays 1, 2, 8, and 9, and single recessed fixed metal-sash windows with carved, chamfered frames in bays 3, 4, 6, and 7. Bay 5 consists of the main entrance.

[18] Building Permit 1933LA13162, Application for the Erection of Buildings, September 11, 1933.

Figure 3: Times Building, North and East Elevations

Figure 4: Times Building, Top of North Elevation

Figure 5: Times Building, East Elevation

Figure 6: Times Building, North and West Elevations

The building's main entrance is located in the center of the north elevation's first story. It is recessed and framed with marble and two different kinds of granite. The entry doors are four side-by-side doors. Bronze crests, sculpted by Merrell Gage, atop the entry doors are dedicated to the themes of "Liberty under the Law" and "True Industrial Freedom."[19]

The east elevation has nine vertical bays. Like the north elevation, the window openings on the east elevation are original, while the window sashes are all non-original replacements. The first four stories of the bays repeat the same motif evident in bays 1, 2, 8, and 9 on the north elevation. Bays 1 and 9 on the east elevation, counted from south to north, are recessed slightly from the rest of the elevation's bays. The fifth and sixth stories have been altered by rooftop additions dating from 1946 and 1965. The 1946 addition was designed by the architect Rowland H. Crawford. There was an identical addition on the west elevation that was removed for the construction of the Executive Building, described below. The 1965 addition, designed by the firm William L. Pereira & Associates, sits on top of the 1946 addition. The additions block some of the building's original design features, including canted bay windows, metal doors, decorative metalwork, terra cotta vents, and five of the eight thin buttresses that span from the fourth story

[19] "The Los Angeles Times Building," *California Arts and Architecture*, Vol. 48 (October 1935), 22.

roof to above the sixth story roof. Above the buttresses the words "THE TIMES" appear in recessed, neon-lit lettering. Above the lettering is a band of dentils.

Due to the presence of the Plant Building, the south elevation of the Times Building is only visible above the fourth story. On the west elevation of the Times Building, only the central tower is visible due to the presence of the Executive Building. The third through sixth stories appear to have originally been identical to those on the east elevations. All of the original buttresses along the west elevation were demolished in 1971 for the construction of the adjoining Executive Building.

Most of the interior of the Times Building has been altered over time by various tenant improvements (see **Appendix D** for a summary of the building permit history). The one significant exception is the lobby. The lobby retains its original plan and many of its decorative elements. It consists of a two-story rotunda that leads to an elevator lobby. There are one-story display areas to the east and west of the rotunda.

The rotunda features elaborate murals designed by artist Hugo Ballin and a large globe sculpture by Merrell Gage. The murals depict newspaper-related themes such as printing, gathering news, and the service of journalism to the community. The globe is 5.5 feet in diameter and made of aluminum.[20] It originally rotated, making a complete revolution every 15 minutes.[21] Other decorative elements in the rotunda include marble flooring, marble columns, marble trim, and cast metal trim.

The elevator lobby has a bullet-shaped plan. It exhibits marble walls and floors, marble elevator doors, and bronze and aluminum trim. The floor features inlaid bronze panels depicting the previous *Times* buildings. At the south end of the elevator lobby is a large eagle sculpture from the roof of the building that was bombed in 1910, which was reinstalled on top of the Times Building in 1935 and later relocated to the elevator lobby in 1981.

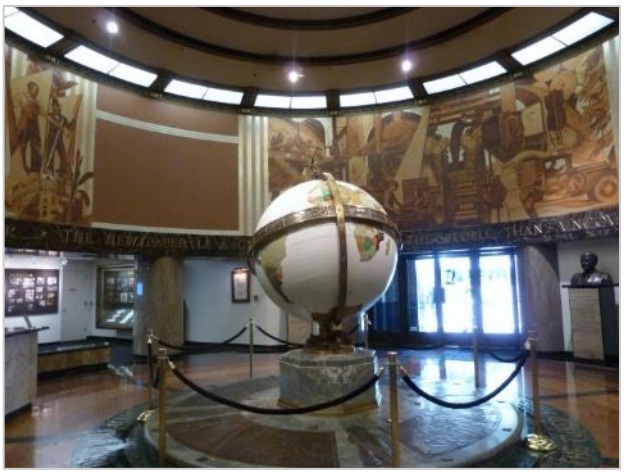

Figure 7: Times Building, Lobby

Figure 8: Times Building, Lobby

[20] The existing globe in the Times Building lobby is likely not original or if it is original, it has been substantially changed. The original globe was painted by John B. Smeraldi.

[21] "The Los Angeles Times Building," *California Arts and Architecture*, Vol. 48 (October 1935), 22.

The display areas to the east and west of the rotunda are rectangular and exhibit non-original features, such as carpeting, drywall, bronze display cases, and T-bar ceiling panel lighting. They were installed in 1981 as part of the Los Angeles Times Centennial Exhibition.

Plant Building

The Plant Building exhibits three distinct phases of construction. The first phase occurred in 1935 in conjunction with the Times Building, under the leadership of publisher Harry Chandler. It was designed by Gordon B. Kaufmann. The second phase occurred in 1946 and included the addition of a third story. The third story was designed by Rowland H. Crawford who worked for Kaufmann and would later design the Mirror Building.[22] Harry's son Norman was in charge of the paper by this time. The third phase occurred in 1955, also designed by Crawford, and consisted of the addition of a fourth story that connected to the Times and Mirror Buildings.[23]

Figure 9: Plant Building, East Elevation

Figure 10: Plant Building, Storefronts

After the two additions in 1946 and 1955, the Plant Building is currently four stories tall and rectangular in plan. It faces east onto S. Spring Street. The building has a steel frame structural system and reinforced concrete walls clad with granite and limestone. It abuts buildings to the north, south, and west, leaving only the east elevation visible. The first story of the east elevation is clad with the same granite as the first story of the Times Building and is divided into nine bays. It originally featured seven large openings for loading docks. The openings remain, but they have been altered. The most recent alterations occurred in 2000. Five of the seven loading dock openings were infilled with curved, butt-glazed storefront windows with marble tile bulkheads and thick aluminum trim. The opening in the seventh bay, when counted from south to north, has been infilled with a flat, glazed storefront with a frameless glass door, butt-glazed sidelights, a marble tile bulkhead, and thick aluminum trim. The eighth bay has a non-original metal roll-up door.

The second story is divided from the first by a decorative band of sunbursts identical to the one on the Times Building. The wall surface changes from granite to limestone above the band. Windows on the second story include recessed fixed metal-sash windows with chamfered openings. In the center above the windows, the words "LOS ANGELES TIMES" and the paper's

[22] "New Building for New Paper," *Architectural Record* (April 1949), 34; Building Permit 1946LA00465, Application to Alter, Repair, Move or Demolish, January 8, 1945.
[23] Building Permit 1955LA22284, Application to Alter, Repair, Move or Demolish, August 11, 1955.

insignia are carved into the limestone. The third and fourth stories consist of continuous bands of fixed metal windows with prismatic glass block transoms.

The interior of the Plant Building originally housed a "giant eighteen-unit press."[24] In 1997, it was remodeled to house a cafeteria and office space. The building connects internally to both the Times Building to the north and the Mirror Building to the south. The buildings are separated structurally by seismic joints.

Mirror Building

The Mirror Building was constructed between 1947 and 1948 for the Times Mirror Company and was designed by Rowland H. Crawford.[25] Norman Chandler was the chairman of the Times Mirror Company and publisher of the *Los Angeles Times* during this period. In 1948, he launched the *Los Angeles Mirror* as an afternoon paper to compete with the *Herald-Express* and *Daily News*. The Mirror Building housed the new paper's offices as well as a mail room, press room, television offices, rental offices, and equipment storage rooms.[26]

Figure 11: Mirror Building, East and North Elevations.

Figure 12: Mirror Building, Window on East Elevation.

Figure 13: Mirror Building, Bottom of East Elevation

Figure 14: Mirror Building, East and South Elevations

[24] "The Los Angeles Times Building," *California Arts and Architecture*, 23.
[25] Building Permit 1946LA23383, Application to Erect a New Building, September 9, 1946.
[26] "New Building for Los Angeles Times Ready in Fall," *Architectural Record* (June 1948), 32-1.

The Mirror Building is located in the southeast corner of Times Mirror Square. It faces east toward S. Spring Street. It has a rectangular plan, a flat roof, and is ten stories tall with a two-story penthouse. The building has a steel-frame structural system and exterior walls clad with Indiana limestone and granite.

The east elevation is symmetrical. Above the second story, it is organized into three vertical sections. The center section has seven bays; the end sections have horizontal bands of ribbon windows. The center section is taller than the end sections.

The seven vertical bays of the center section are recessed and consist of metal windows separated by sculpted bronze spandrels. The windows on the third and fourth stories are fixed single-light replacement windows. The windows on the upper stories are multi-light casements. The five middle bays extend to the parapet and are topped with sculpted figures that were designed by Crawford and represent culture, justice, faith, progress, and equality. The two end bays are shorter and topped with sculpted panels.

The ribbon windows on the two end sections consist of metal windows with prismatic glass block transoms. As in the center section, the windows on the third and fourth stories are non-original. They are fixed single-light windows with metal sashes. The windows on the upper stories are two-light metal-sash awning windows. The window bands wrap around to the north and south elevations.

The east elevation's first story consists of the main entrance and six windows. The main entrance is located in the center of the elevation and surrounded with granite. There are four side-by-side entry doors recessed in an entrance vestibule. The doors are fully glazed with bronze frames and push-bars. The doors are topped with tall single-light transoms. The side walls of the vestibule feature bronze doors flanked and topped with decorative cast bronze panels.

The rest of the first story consists of the following: four recessed single-light fixed metal windows with decorative metal surrounds, a large, non-original, butt-glazed window at the north end with a bronze surround and a granite bulkhead, a large, 11-light window with prismatic glass block in the top three lights and a decorative, coated metal frame, and a granite base.

The east elevation's second story is separated from the first by a decorative band similar to those on the Plant and Times buildings. Above the band there are nine recessed openings. Some are infilled with vents; others include metal-sash windows.

The south elevation repeats many of the features from the south end of the east elevation, including the ribbon windows on the upper stories, recessed windows on the second story, decorative band between the first and second stories, and the granite base on the first story. The first story of the south elevation also includes a band of multi-light windows with glass block top lights and decorative coated metal frames, similar to the one at the south end of the east elevation. Other openings on the first story include large vents, a non-original storefront window, and a vehicular opening with a metal roll-up door.

Most of the west elevation is blocked by the adjacent Parking Structure. The upper stories visible above the Structure exhibit seven vertical bays similar to those on the east elevation, but much simpler in detail. The bays consist of multi-light metal casement windows and limestone spandrels. The north elevation consists of six stories above the adjoining Plant Building. The ribbon windows from the north end of the east elevation wrap the corner of the building on all of the visible stories.

Much of the Mirror Building's interior has been altered by tenant improvements over the years, completed on a floor-by-floor basis from 1959 through the 2000s, with significant concentrations of building activity in the 1960s and 1990s, though the lobby remains largely intact.[27] The lobby consists of three adjoining rectangular spaces forming an L-shaped plan. All of the spaces feature marble walls with bronze trim, travertine floors, and soffited ceilings.

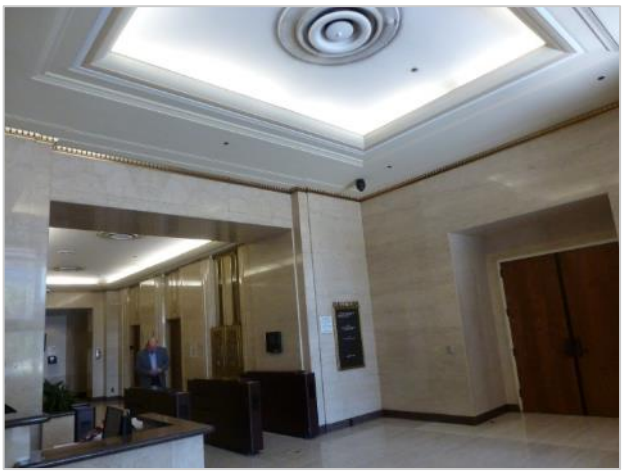

Figure 15: Mirror Building, Lobby

Figure 16: Mirror Building, Lobby

The Mirror Building was seismically retrofitted in 1997. The retrofit included the addition of steel cross-bracing at various locations along the building's perimeter walls. The steel remains exposed on the interior.

Executive Building

The Executive Building was constructed between 1970 and 1973 for the Times Mirror Company.[28] By this time, Franklin David Murphy was chairman of the company, Norman, Dorothy, and Otis Chandler were on the board, and Otis Chandler was the publisher of the *Times*. According to an article in the *Times*, the building was to be called the Chandler Building.[29] Of the three Chandlers, it was Dorothy who was placed in charge of the development of the building. She hired William L. Pereira & Associates as architects. Chandler was already familiar with Pereira & Associates, since the early 1960s the firm was responsible for numerous alterations to the Times, Plant, and Mirror Buildings (see **Appendix D** for a summary of the building permit history).

The Corporate International Style Executive Building faces north onto W. 1st Street. It is six stories in height and has a rectangular plan and a flat roof. The building has a steel frame structural system. The walls are clad with a combination of Norwegian granite and metal coated with a dark bronze silicon copolymer finish. The building's massing consists of large boxy horizontal volumes supported by boxy vertical volumes. The horizontal volumes feature bands of fixed coated aluminum windows with coated spandrels and coated metal paneling, so they have a visually lighter appearance than the granite-clad vertical boxes. The boxes are arranged to create a deep recess at the street level which feature landscaping. The recess wraps the northwest corner of the building. The largest horizontal box protrudes beyond the rest of the building at the fifth story, creating a high overhang for the recessed space below.

[27] City of Los Angeles Building Permits, various dates.
[28] Building Permit 1977LA24124, Application to Alter, Repair, Move or Demolish, April 27, 1971.
[29] "Times Mirror to Build a 6-Story Addition to Downtown Square," *Los Angeles Times*, May 29, 1969.

The building's main entrance is located at the east end of the north elevation. It is deeply recessed from the street and consists of coated aluminum storefront doors with large sidelights and transoms. An additional exterior entrance is located near the center of the west elevation. This entrance consists of a pair of aluminum and glass doors with a fixed aluminum transom. An exterior walkway at the second story extends from the adjacent Parking Structure to the south along the Executive Building's west elevation and onto the north elevation.

Figure 17: Executive Building, North and West Elevations

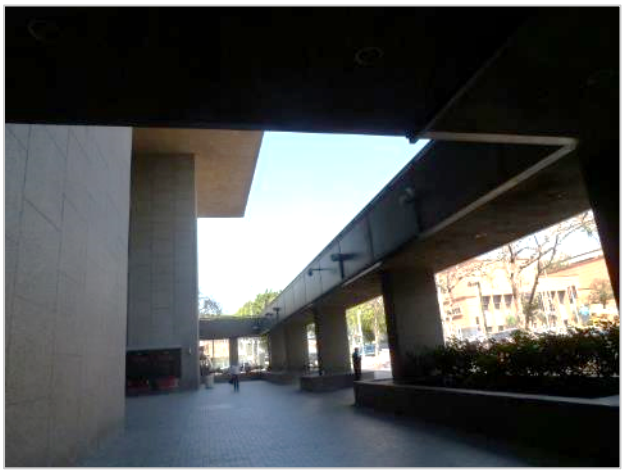

Figure 18: Executive Building, Ground Floor Plaza

Figure 19: Executive Building, North Elevation

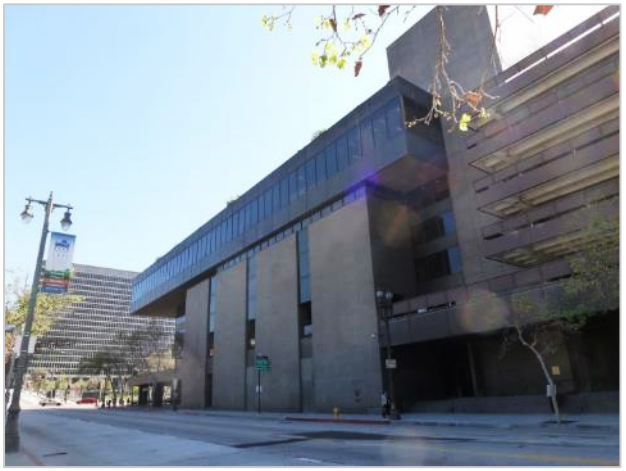

Figure 20: Executive Building, West Elevation

The interior of the Executive Building includes a bank space on the first floor, which appears to retain its original design and most of its original finishes, such as granite flooring, wall panels, coated aluminum doors, and floor-to-ceiling windows. A restaurant planned for the basement was not executed. Floors two through four were not occupied by Times Mirror, but rather leased to second parties for income. They have been altered by tenant improvements over the years. The fifth and sixth floors were designed by Charles Kratka Interior Planning and Design as the executive offices for Times Mirror. While the fifth floor has been altered by tenant improvements, the sixth floor retains its original plan and finishes. Notable interior spaces on the sixth floor include: an atrium created by a pyramidal skylight, original executive offices, and an original boardroom with a built-in circular conference table and corresponding lighting soffit. Notable features and finishes include: tile flooring in the corridors and atrium, wood wall paneling in many

rooms, wood doors, built-in planters in the atrium, and floor-to-ceiling coated aluminum windows in the corridors.

Figure 21: Executive Building, Sixth Floor Atrium

Figure 22: Executive Building, Sixth Floor Boardroom

Parking Structure

The Parking Structure is located at the southwest corner of Times Mirror Square. It was designed by William L. Pereira & Associates in conjunction with the Executive Building, and completed 1973. It has a rectangular plan and a steel-frame structural system. The building's massing consists of a solid, vertical core with open, horizontal parking decks. The core is clad with the same granite as the vertical elements of the Executive Building. The low walls of the parking decks are clad with the same coated metal. Railings along the parking deck walls are also made of coated aluminum. Entrances to the Parking Structure consist of large vehicular gates on the first story of both the south and west elevations. Most of the first story is enclosed with metal slat vents.

4. IDENTIFICATION OF DESIGNATED AND POTENTIAL HISTORICAL RESOURCES

4.1 Study Area

The study area was identified as the Project site and the adjacent parcels within a 550-foot radius. In addition to the individual historical resources and the potential historic district identified on the Project site, three historical resources were identified within the study area to the north, northeast, and southeast of the Project site: the Los Angeles Civic Center Historic District, Los Angeles City Hall, and Higgins Building. These three historical resources within the study area are described below.

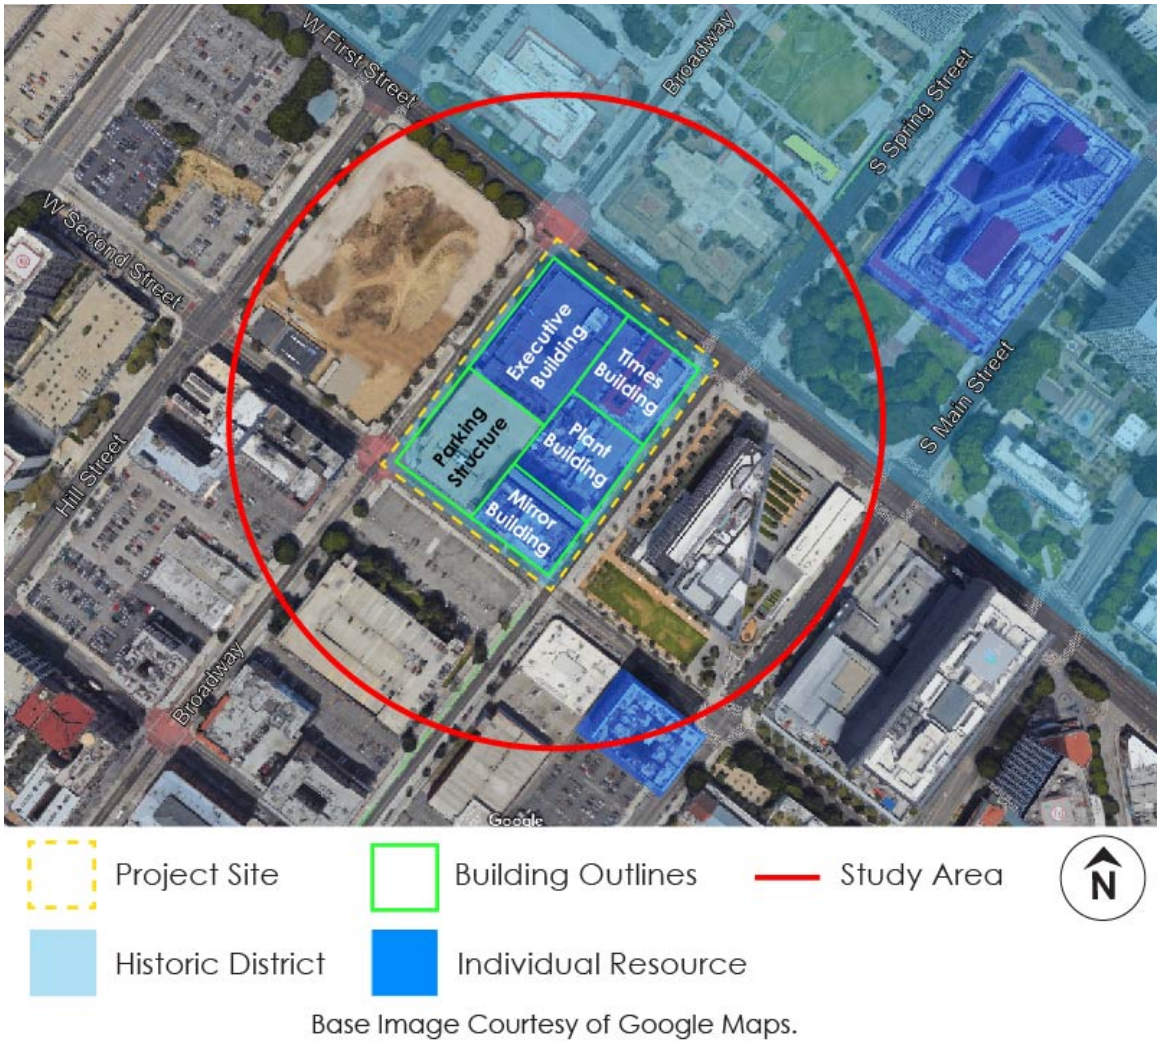

Figure 37: Historical Resources in Study Area

4.1.1 Los Angeles Civic Center Historic District

The Los Angeles Civic Center Historic District (Historic District) is a historical resource subject to CEQA. It was evaluated in 2009 as part of the Regional Connector Transit Corridor project, and was formally determined eligible for listing in the National Register through the Section 106

review process for the Regional Connector Transit Corridor Project in 2010. Consequently, it is listed in the California Register.

The Historic District is a closely built, informally organized complex of government buildings, structures, and landscapes located between W. Temple Street on the north, W. 1st Street on the south, N. Figueroa Street on the east, and S. San Pedro Street on the west. It is comprised of 18 contributing buildings and other related site features that collectively are the nucleus of government operations in Los Angeles. These include the John Ferraro/Department of Water and Power Building (1965); Los Angeles Music Center buildings and landscape, including the Dorothy Chandler Pavilion (1964), Mark Taper Forum (1968), Ahmanson Theatre (1968), and all associated landscape features and public art pieces; Kenneth Hahn Hall of Administration (1960); Stanley Mosk Courthouse (1958); El Paseo de las Pobladores de Los Angeles (1966); Central Heating and Refrigeration Plant (1958); Los Angeles County Hall of Records (1962); Court of Historic American Flags (1971); Los Angeles County Law Library (1953); Hall of Justice (1925); Clara Shortridge Foltz Criminal Justice Center (1972); United States Courthouse and Federal Building (1940); Los Angeles City Hall (1928); City Health Building/City Hall East (1954); Federal Building (1965); Parker Center (1955); historic streetlights on Los Angeles Street and Main Street; and two air raid sirens. The period of significance is 1925 to 1972, the period between the construction of the Hall of Justice (1925) to the construction of the Criminal Justice Center (1972).

Figure 38: Los Angeles County Law Library, view looking northwest from Project site at W. 1st Street and S. Broadway

The parcels within the Historic District that are across W. 1st Street from Times Mirror Square include the Los Angeles County Law Library, the site of the demolished State Office Building, and City Hall Park, a landscaped lawn to the south of Los Angeles City Hall. The Los Angeles County Law Library is a one- and three-story, split-level concrete office building located on the northwest corner of W. 1st Street and Broadway, catty-cornered to Times Mirror Square. The building was constructed in 1953 and designed by the architecture firm, Austin, Fields & Fry. It contributes to the significance of the Historic District for its association with the historic planning and development of the Civic Center in the 1950s and for its architectural design as a prominent example of a civic building with Modernist geometric details. The parcel directly across W. 1st Street from Times Mirror Square between S. Broadway and N. Spring Street is the site of the demolished State Office Building and therefore, does not contribute to the Historic District because it is vacant and unimproved. The First and Broadway Civic Center Park is currently under development on this parcel. Los Angeles City Hall and its associated park are located to the northeast of Times Mirror Square and contribute to the significance of the Historic District. City Hall is also an individual historical resource and is discussed in more detail below. The other contributing buildings are so far removed from the Project site that there is no potential for impact.

4.1.2 Los Angeles City Hall

Los Angeles City Hall is a historical resource subject to CEQA because it was formally determined eligible for listing in the National Register through the Section 106 process for the Downtown People Mover Program in 1978, and therefore, was automatically listed in the California Register. The building was designated as a HCM (No. 150) by the City of Los Angeles in 1976. It also contributes to the Los Angeles Civic Center Historic District (see Section 4.1.1 above).

Figure 39: Los Angeles City Hall view looking northwest from Project site at W. 1st Street and S. Broadway

City Hall is a 29-story, monumental government building with Classical and Mediterranean style elements completed in 1928. Designed by John Parkinson, Albert C. Martin, and John C. Austin, the building and associated landscaping comprise an entire city block between W. Temple Street on the north, W. 1st Street on the south, S. Main Street on the east, and S. Spring Street on the west. It is a steel-framed building clad in white glazed terra cotta with four major masses, including the base, central tower with pyramidal apex, and flanking low-rise office wings. Its rectangular plan oriented to the Downtown street grid is surrounded by lawns and landscaping. The steps from the south entrance to City Hall lead to a park, which is located across W. 1st Street directly to the northeast of Times Mirror Square. This park has tile and concrete paving, decorative ornamental lampposts, and landscaping that consists of mature trees, grass, and small plantings. In 2017, the park was re-landscaped to reduce water consumption. At that time the lawns were reduced and beds of succulents were added. There is also a memorial fountain at the center of the park dedicated to Frank Putnam Flint. City Hall is an important and widely recognized landmark. It is significant for its association with the development of Los Angeles, and the history, planning, and development of the Los Angeles City government. It is also significant for its architectural design, and as an important example of the work of Parkinson, Martin, and Austin.

4.1.3 Higgins Building

The Higgins Building is a historical resource subject to CEQA because it was individually designated as a HCM (No. 873) in 2007. The building is located southeast of Times Mirror Square at 108 W. 2nd Avenue between S. Spring Street and S. Main Street. It is a 10-story Beaux Arts-style building clad in reinforced concrete with decorative elements arranged in a classic base-shaft-capital composition. Developer Thomas P. Higgins commissioned architect Arthur L.

Figure 40: Higgins Building, view looking southeast from Project site at W. 2nd and S. Spring Streets

Haley and engineer Albert C. Martin to design the structure, which was completed in 1910. The Higgins Building is significant for its association with the development of Downtown Los Angeles, and as an excellent example of Beaux Arts architecture. It is also significant as an important early work by master architect Arthur L. Haley, and as a significant example of early monolithic concrete construction in a high-rise building.

4.2 Project Site

During the field inspection and research phases of this report, it was determined that Times Mirror Square, the Project site, should be evaluated as a potential historic district. In addition, there was one designated historical resource requiring re-evaluation, one designated historical resource not requiring re-evaluation, and two potential historical resources requiring evaluation for the first time:

- The Times Building was formally determined eligible for listing in the National Register in 1978, but the scope and details of the evaluation were unclear. Properties that are formally determined eligible for listing in the National Register are automatically listed in the California Register. However, it was unclear if the 1978 evaluation included the adjoining Plant Building, and periods of significance were not defined. As a result, the Times and Plant Buildings, known jointly as the Times-Plant Complex, are re-evaluated below to gain a better understanding of significance, appropriate periods of significance, and to properly identify character-defining features.
- The Mirror Building was formally determined eligible for listing in the National Register in 2010. Properties that are formally determined eligible for listing in the National Register are automatically listed in the California Register. The scope and details of the previous evaluation were well defined, so it was not re-evaluated. The evaluation is summarized below.
- The Executive Building was identified as appearing eligible for listing in the California Register and for designation as a HCM by SurveyLA. It is fully evaluated as an individual potential historical resource below.
- While the Parking Structure was included within the boundaries of Times Mirror Square, which was identified as a potential historic district by SurveyLA, it was not identified or evaluated individually at that time.
- Times Mirror Square was identified as appearing eligible for listing in the National and California Registers and for designation as a HPOZ by SurveyLA. It is fully evaluated as a potential historical district below.

4.2.1 Times-Plant Complex

National Register Evaluation

The Times Building and the Plant Building were considered jointly as one historical resource with two contributing buildings, instead of two individual resources, for the following reasons: both buildings were built at the same time and designed by the same architect, and while their structures are separated by a 6-inch seismic joint, they have always been internally connected and used for purposes directly related to publishing the *Los Angeles Times* newspaper.

The Times-Plant Complex, consisting of the Times Building and the Plant Building, is eligible for listing in the National Register under Criterion A for the period of 1935 to 2000 for its direct association with the *Los Angeles Times* and the history of newspapers and publishing in Los Angeles. It is also eligible under Criterion B for the periods of 1935 to 1944, 1936 to 1968, and 1960 to 1972 for its direct associations with significant *Los Angeles Times* publishers and businessmen Harry Chandler, Norman Chandler, and Otis Chandler. Additionally, the complex is eligible under Criterion C for the period of 1935 as a significant example of PWA Moderne architecture and as a representative work of master architect Gordon B. Kaufmann. And finally, the lobby of the Times Building is eligible under Criterion C for possessing high artistic value. The Times-Plant Complex retains integrity from its various periods of significance. Because it possesses both significance and integrity, it is a historical resource subject to CEQA. The following paragraphs provide a detailed evaluation under each criterion, as well as an analysis of integrity.

Criterion A

In order to qualify under Criterion A, a property must be associated with events or trends that have made a significant contribution to the broad patterns of our history. The *Los Angeles Citywide Historic Context Statement* was used to determine the relevant context for the re-evaluation of the Times-Plant Complex under Criterion A. The most applicable sub-context within the Public and Private Development Context is Newspapers and Publishing.

The *Los Angeles Times* was first published on December 4, 1881, under the name *Los Angeles Daily Times*. When the original founders ran into financial problems the following year, the fledgling newspaper was inherited by its printer, the Mirror Printing Office and Book Binding Company. The company hired as editor former military officer Harrison Gray Otis, who quickly turned the *Los Angeles Daily Times* into a financial success. Otis and a partner purchased the newspaper and company in 1884 and incorporated them as a new company, the Times-Mirror Company. Two years later, Otis purchased his partner's interest in the company. In October 1886, the word "Daily" was removed from the title and the newspaper became the *Los Angeles Times*.

In 1914, Otis transferred his controlling interest in the *Los Angeles Times* to his daughter and son-in-law, Marian and Harry Chandler; however, he continued to direct the day-to-day operations until his death in 1917.[30] Although Harry Chandler then took over as publisher of the *Los Angeles Times*, he was first and foremost a businessman. His real estate holdings extended from the Baja Peninsula in Mexico to the El Tejon Ranch in the pass to central California. He was a major figure in the development of the San Fernando Valley, making a fortune in the process.

The Times-Plant Complex was constructed in 1935 to house the *Los Angeles Times* under the direction of Chandler. Like his father-in-law before him, Chandler used the paper to promote a singularly Republican agenda favoring rapid economic growth and opposing unionized labor.[31] The paper's top competitors in the 1930s included William Randolph Hearst's pro-union *Los Angeles Examiner*, an afternoon paper called the *Los Angeles Express*, and a partisan Democratic paper run by Manchester Boddy called the *Los Angeles Daily News*.

In 1944, Harry Chandler died and his son Norman succeeded him as chairman of the Times Mirror Company and publisher of the *Times.* Norman continued the paper's Republican, pro-growth,

[30] Marshall Berges, *The Life and Times of Los Angeles* (New York, NY: Atheneum, 1984), 33.
[31] David Halberstam, *The Powers That Be: Within the Kingdom of the Media* (New York, NY: Alfred A. Knopf, 1979), 108.

anti-union agenda. By 1947, the *Times* was the top newspaper in the city in terms of circulation. To further its market domination, the Times Mirror Company launched the *Los Angeles Mirror*, an afternoon paper, in 1948 to compete directly with Hearst's *Herald-Express* and Boddy's *Daily News*. The strategy worked, at least in part: the *Mirror* absorbed the *Daily News* just four years later, eliminating one of its biggest competitors.

In the 1950s, Hearst and Chandler battled for newspaper dominance in Los Angeles. The *Herald-Express*, though it started as a pro-union force, became increasingly conservative in the 1940s and 1950s and thus attracted some of the *Times* reader base. In 1962, the *Herald-Express* became the *Herald Examiner*, and in a surprising move, chose to circulate in the afternoon only, leaving the *Los Angeles Times* as the city's only major morning paper. The *Herald Examiner* succeeded for a few years, but eventually its circulation began a rapid decline, while the *Times'* circulation soared. In the late 1960s, *Herald Examiner* workers began a strike that would last an entire decade, further signaling the paper's ultimate demise in 1989.

Meanwhile, the *Times* entered a new era in the 1960s under the leadership of Otis Chandler, Norman's son. When Otis began his tenure as publisher in 1960 he replaced the heads of nearly all of the paper's departments and transformed its prescribed role from right-wing promotional machine to purveyor of serious, unbiased journalism. The paper that was infamously considered the "second worst newspaper in America" in 1957 quickly became one of the leading papers in the country, not just in terms of readership, but in terms of integrity, as well.

Table 2: Important Events in Newspapers and Publishing
Context: Public and Private Institutional Development
Sub-Context: Newspapers and Publishing
Theme: Important Events in Newspapers and Publishing
Eligibility Standards
• Was the founding or long-term location of a publication significant in the history of the press in Los Angeles
Character-Defining/Associative Features
• For National Register, properties associated with events that date from the last 50 years must possess exceptional importance
• Retains most of the essential character-defining features from the period of significance
• Publication may be located in a building designed for another use
• Publication must have occupied the property for a significant period in its history, if it is not the founding location
Integrity Considerations
• Should retain integrity of Location, Feeling, Design, and Association from the period of significance
• Integrity is based on the period during which the significant publication occupied the property
• Setting may have changed

In addition to becoming a Pulitzer Prize-winning institution, the *Los Angeles Times* remained a financial success under Otis' direction and after his departure in 1980, far outlasting its greatest competitors. In 2000, the descendants of the Chandler family sold the paper to the Chicago-based Tribune Company, ending nearly 120 years of family ownership. The Times-Plant Complex is the oldest extant headquarters of the *Los Angeles Times*. The paper originally operated out of a small brick building located at the corner of Temple and New High (now Spring) Streets in

Downtown Los Angeles. Its second location was at the northeast corner of W. 1st Street and S. Broadway, across W. 1st Street from Times Mirror Square. This location was bombed by union leaders in 1910 in response to the paper's anti-union stance. In 1911, construction began on a new headquarters building on the same site. Finally, in 1934, Harry Chandler initiated the construction of the current Times and Plant Buildings, designed by Gordon B. Kaufmann and completed in 1935. The complex remains the center of the *Los Angeles Times* newspaper operations to the present day, despite the change in parent company ownership in 2000.[32] As the longest running and at various times most prominent newspaper in Los Angeles, the *Los Angeles Times* is undoubtedly significant within the history of the city's press. The Times-Plant Complex has a clear and direct association with the *Times* as it is the paper's oldest extant headquarters. Thus, it meets the eligibility standards for the Newspapers and Publishing Sub-Context listed in **Table 3.** The buildings represent multiple periods in the paper's history, and in doing so represent the history of the city itself. As a result, the Times-Plant Complex is significant under Criterion A with a period of significance of 1935, the year the buildings were constructed, to 2000, the year the Tribune Company purchased the Times Mirror Company and by extension the *Los Angeles Times*.

Criterion B

To be eligible for listing in the National Register under Criterion B, a property must be associated with the lives of persons significant in our past. As the Times-Plant Complex has continuously functioned as the headquarters of the *Los Angeles Times* for almost 80 years, it was the workplace for numerous journalists, editors, and publishers over time. Of these, three stand out as potentially significant individuals: the three Chandler publishers Harry, Norman, and Otis. All three had offices in the Times Building for several years during their tenures.

Harry Chandler became publisher of the *Times* in 1917 following the death of his father-in-law, Harrison Gray Otis. Chandler and Otis were not just related; they were friends and business partners with the same interests: Republican politics, union opposition, and economic growth. As a result, when Otis died, Harry continued the partisan reporting and agenda pushing initiated by his predecessor decades earlier. His contributions to the *Times* and the press, therefore, were unremarkable. Harry's real vocation was real estate development, not publishing, and real estate is the field in which he made his most significant contributions to Los Angeles history. He was one of the partners in the 1905 plan to build the Los Angeles Aqueduct, which delivered water to the San Fernando Valley using money provided by city taxpayers, even though the valley was not part of the city at the time. The scheme, notoriously fictionalized in the film *Chinatown*, led to the development of the valley and its ultimate annexation into the city. Harry was also the developer behind such major real estate projects as the suburban community of the Hollywood Hills (originally Hollywoodland) in the 1920s and the town of Dana Point in Orange County. As one of Los Angeles's most prominent and powerful business leaders, he played a role in luring major auto manufacturers to the city and investing in Douglas Aircraft, sparking the development of the aerospace industry in Southern California in the 1920s. Harry was also involved in the development of numerous Los Angeles landmarks, such as the Los Angeles Coliseum for the 1932 Olympic Games and Santa Anita Racetrack in 1934.

[32] During the preparation of this report, new ownership was in the process of acquiring the *Los Angeles Times* and moving its operations to new headquarters.

The Times-Plant Complex has been called Harry's "last great real estate deal."[33] The deal involved selling the 1911 *Los Angeles Times* building at 1st and Broadway to make way for a new rail station on the site. A battle erupted over the purchase price for the property, which Harry pursued all the way to the State Supreme Court. He settled for $1.19 million, a large sum in the midst of the Great Depression, and built the current Times-Plant Complex. Although the old headquarters were ultimately demolished, Los Angeles County supervisors chose a different site in Chinatown for the rail station, conveniently located near some of Harry's other real estate holdings, which subsequently climbed in value.[34]

Table 3: Commercial Merchants, Leaders and Builders
Context: Commercial Development
Theme: Commercial Merchants, Leaders and Builders
Eligibility Standards
• Individual must be proven to have made an important contribution to commercial development in Los Angeles • Directly associated with the productive life of the individual in the area of commercial development
Character-Defining/Associative Features
• For National Register, properties associated with events that date from the last 50 years must possess exceptional importance
• Retains most of the essential character-defining features from the period of significance
• Individual must have resided in the property during the period in which he or she achieved significance
Integrity Considerations
• Should retain integrity of Location, Feeling, Design, and Association from the period of significance
• Integrity is based on the period during which the significant person occupied the property
• Setting may have changed

For his many contributions to Los Angeles development, both famous and infamous, it is clear that Harry Chandler is significant in the Commercial Development Context and Commercial Merchants, Leaders and Builders Theme within the *Los Angeles Citywide Historic Context Statement*. The productive period of his life for which he is significant began in 1905 with the aqueduct project and continued until his death in 1944, although his influence waned in the late 1930s and 1940s when both his health and public approval declined. Harry commissioned the construction of the Times and Plant Buildings. They represent one of his last major real estate deals and housed his personal office from 1935 to 1944. As a result, the Times-Plant Complex meets eligibility standards listed in **Table 3** for the Commercial Merchants, Leaders and Builders Theme for its direct association with Harry Chandler, an important businessman in the history of Los Angeles and Southern California. Therefore, the Times-Plant Complex is significant under Criterion B with a period of significance of 1935, the year the buildings were constructed, to 1944, when Harry Chandler died.

In 1944, Norman Chandler officially took over as publisher of the *Times*. He had been the general manager of the Times Mirror Company since 1936 and president since 1941, when his father

[33] Dennis McDougal, *Privileged Son: Otis Chandler and the Rise and Fall of the L.A. Times Dynasty* (Cambridge, MA: Perseus Publishing, 2001), 128.
[34] McDougal, 130.

appointed him to the position. Like Harry, Norman had the mind of a businessman. The paper's circulation was diminishing when Norman took over, yet by 1947, it had the highest circulation in the city, beating out Hearst and other rivals.[35] The increased circulation led to increased advertising revenue and profits which would last through the 1950s.

While Norman's business savvy made the paper a financial success, the *Times* was still considered a journalistic failure.[36] It continued to offer only biased, one-sided news coverage that provoked NBC news anchor Chet Huntley to exclaim in 1958 that he would "always read the *Los Angeles Times* and know that I can be reasonably accurate by going 180 degrees in the other direction."[37] Norman attempted to improve the quality of the journalism by naming Nick Williams as managing editor. Williams joined the staff of the *Times* in 1931 as a copy editor, and was considered to be a gifted writer.[38] While Williams made modest gains in providing more balanced reporting, progress was slow as Norman did not increase the budget for more or better reporters. As a result, Norman's significant achievements were in the newspaper and publishing business, not journalism. He rescued the paper from declining readership and revenue in the 1940s and enabled its survival. He also spearheaded employee benefit programs, such as medical insurance, a pension plan, and an emergency fund, long before they were the norm in American business. Under Norman's management, the Times Mirror Company grew to become a media conglomerate. In 1948, in addition to launching the *Mirror*, Times Mirror formed a joint partnership with CBS to start the television station KTTV, and purchased the Publishers Paper Company in Oregon. In 1960, Norman stepped down as the publisher of the Times and Mirror to spend more time managing the parent company. He began a series of major acquisitions that included: Jeppesen Sanderson, the world's leading publisher of air navigation information and flight-training systems, in 1961; H.M. Goush Company, a producer of travel maps, also in 1961; Matthew Bender & Company, the largest publisher of legal forms and treatises in the U.S., in 1963; Year Book Medical Publishers, publishers of medical reference books, in 1965; Harry A. Abrams, Inc., the New York-based publisher of art books, in 1966; and C.V. Mosby Company, the leading publisher of health and science books, in 1967. The company's entrance into magazine publishing came in 1967 when it acquired *Popular Science, Outdoor Life, Golf Magazine,* and *Ski Magazine*. In 1968, Franklin David Murphy, former chancellor of the University of California at Los Angeles, was hired as the chief executive officer and replaced Norman as the chairman of Times Mirror.[39]

The Times-Plant Complex meets the eligibility standards for the Newspapers and Publishing Sub-Context for its direct association with Norman Chandler, listed in **Table 4**. His business acumen propelled the Times Mirror Company from a local business with one newspaper to a national enterprise with a variety of publishing and media companies. His period of significant work began in 1936, when he took on a leadership role as general manager of the *Times*, and lasted until 1968, when he retired as the chairman of Times Mirror. Norman's office was located in the Times Building throughout this period. While the Mirror Building was built in 1948 during his tenure,

[35] "The Times' 128-Year History," http://www.latimes.com/about/mediagroup/la-mediacenter-milestones,0,1502162.story?page=2#axzz2vgpZhT1R, accessed July 18, 2017.
[36] Berges, 73-74.
[37] McDougal, 219.
[38] David Shaw, "Nick B. Williams, Former Editor of the Times Dies," *Los Angeles Times*, July 2, 1992. Williams retained his position when Otis Chandler became the publisher, and the two of them transformed the reputation of the paper from mediocrity to excellence; Berges, 75-77; and Halberstam, 283-86.
[39] Margaret Leslie Davis, *The Culture Broker: Franklin D. Murphy and the Transformation of Los Angeles* (Berkeley, CA: University of California Press, 2007), 119-20.

it was not used for executive offices. Rather, it was used for press rooms, mail rooms, department offices, television offices, and rental space.[40] Therefore, as Norman Chandler's place of business, the Times-Plant Complex appears to be significant under Criterion B.

Table 4: Important Persons in Newspapers and Publishing
Context: Public and Private Institutional Development: Newspapers and Publishing
Theme: Important Persons in Newspapers and Publishing
Eligibility Standards
• Individual must be proven to have made an important contribution to the history of the press at the local, state, or national levels
• Directly associated with the productive life of the person who made important contributions to the history of the press
Character-Defining/Associative Features
• For National Register, properties associated with events that date from the last 50 years must possess exceptional importance
• Retains most of the essential character-defining features from the period of significance
Integrity Considerations
• Should retain integrity of Location, Feeling, Design, and Association from the period of significance
• Integrity is based on the period during which the significant person occupied the property
• Setting may have changed

When Otis Chandler assumed control of the *Times* in 1960, he instituted widespread, unprecedented changes that would transform the paper's negative reputation without hurting its profits. Otis replaced the heads of nearly all of the paper's departments and changed its focus from white, right-wing, conservatism to unbiased, hard-nosed journalism. He also expanded the paper's operations internationally, creating numerous foreign bureaus. Otis has been widely recognized as one of the most important newspaper publishers in the U.S., along with Henry Luce and Katherine Graham. As his *New York Times* obituary in 2006 explained, he transformed the *Los Angeles Times* into "one of the most respected, widely read and profitable newspapers in the United States," and he accomplished this in a very short period of time, considering the paper had eight decades of partisan history behind it.[41] In 1980, at the age of 52, Otis stepped down as publisher, although he remained associated with the Times Mirror Company until 1985.

As a result, the Times-Plant Complex meets the eligibility standards for the Newspapers and Publishing Sub-Context listed in **Table 4** for its direct association with Otis Chandler who was important in the history of the press in Los Angeles and the country at large. The Times-Plant Complex is directly associated with Otis for 12 of his 20 years at the helm, and it is significant under Criterion B as such. The period of significance is 1960 to 1972, when he worked out of the Times Building.

Criterion C

To be significant under Criterion C, a property must embody the distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic

[40] "New Building for Los Angeles Times Ready in Fall," *Architectural Record*, 32-1.
[41] Jonathan Kandell, "Otis Chandler, Publisher Who Transformed Los Angeles Times, Dies at 78," *New York Times*, February 28, 2006.

values, or represent a significant and distinguishable entity whose components may lack individual distinction. The Times-Plant Complex was designed in the PWA Moderne style of architecture by Gordon B. Kaufmann. Its sculptures and murals were designed by Merrell Gage and Hugo Ballin, respectively. Within the *Los Angeles Citywide Historic Context Statement*, the PWA Moderne style is a Sub-Theme in the Architecture and Engineering Context and L.A. Modernism Sub-Context.

The Times-Plant Complex is an excellent example of PWA Moderne architecture from the 1930s. The PWA Moderne style developed during the Great Depression as part of various government relief projects sponsored by the Public Works Administration. The government created jobs for architects by putting them to work, designing civic buildings such as post offices, train stations, public schools, bridges, and dams throughout the United States. The style typically exhibited stripped Classical motifs and integrated art including murals, mosaics, and sculptures created by artists also employed by the PWA.

The Times Building is the more ornate and stylized of the two buildings. It possesses many of PWA Moderne's character-defining features, including a symmetrical façade, strong vertical emphasis, thick walls clad with smooth stone and granite, a band of sunbursts, sculptures and carved details, decorative spandrels, and a stepped massing with a central tower. The features are employed with expertise and rendered in beautiful, rich materials. Overall, the Times Building exhibits very high quality of design. The Plant Building exhibits the same basic materials and symmetry as the Times Building, and although it does not have the same elaborate details, it complements the Times Building while reflecting its original industrial use. As a whole, the Times-Plant Complex meets the eligibility standards for the PWA Moderne listed in **Table 5**. As a result, the Times-Plant complex is significant under Criterion C for embodying the distinctive characteristics of the PWA Moderne style. The period of significance is the date of construction, 1935.

Both buildings are the work of master architect Gordon B. Kaufmann. Master architects were not identified in the Architecture and Engineering Context, thus there are no eligibility standards. Kaufmann, however, is widely recognized as one of the best architects working in Los Angeles from the 1910s through the 1940s. In his early career, he perfected his interpretation of the Spanish Colonial and Mediterranean Revival styles, which were very popular at the time. In the late 1920s, he transitioned into the Art Deco and PWA Moderne styles with buildings like the Royal Laundry (1927) in Pasadena, Santa Anita Park (1934) in Arcadia, and the Times and Plant buildings (1935) at Times Mirror Square.[42] Later in the 1930s, Kaufmann's style evolved a step further into Streamline Moderne as evidenced by San Pedro High School (1936) and the Hollywood Palladium (1940).[43]

The Times Building represents Kaufmann's most impressive PWA Moderne design before he transitioned into the curved edges and glass block synonymous with the Streamline Moderne. It is a striking composition that stands out as an important example of his work in the 1930s. The Plant Building, though not one of Kaufmann's most important buildings individually, complements the Times Building and contributes to the design of the resource as a whole. Thus, the Times-Plant Complex is significant under Criterion C as the work of master architect Gordon

[42] Jan Furey Muntz, "Gordon B. Kaufmann: California Classicism," in *Johnson, Kaufmann, Coate: Partners in the California Style*, edited by Jan Bellolli and Lauren Weiss Bricker (Claremont: Scripps College, 1992), 32-37.
[43] Ibid., 37-39.

B. Kaufmann with a period of significance of 1935, the date of the design Kaufmann, however, is widely recognized as one of the best architects working in Los Angeles from the 1910s through the 1940s. In his early career, he perfected his interpretation of the Spanish Colonial and Mediterranean Revival styles, which were very popular at the time. In the late 1920s, he transitioned into the Art Deco and PWA Moderne styles with buildings like the Royal Laundry (1927) in Pasadena, Santa Anita Park (1934) in Arcadia, and the Times and Plant buildings (1935) at Times Mirror Square.[44] Later in the 1930s, Kaufmann's style evolved a step further into Streamline Moderne as evidenced by San Pedro High School (1936) and the Hollywood Palladium (1940).[45]

Table 5: PWA Moderne, 1928-1945
Context: Architecture and Engineering
Context: L.A. Modernism
Theme: Related Responses to Modernism
Sub-Theme: PWA Moderne, 1928-1945
Eligibility Standards
• Retains the essential character-defining features of the PWA Moderne style from the period of significance
• Was constructed during the period of significance
• Exhibits quality of design through distinctive features
Character-Defining/Associative Features
• Emphasis on verticality
• Flat roofs
• Formal symmetry and massing
• Smooth wall surfaces, such as stucco, marble, terrazzo, polished stone (and brick, although rare)
• Pier supports (rather than columns)
• Windows arranged in vertical recessed bays
• Stripped appearance with minimal ornamentation, including some zigzags, medallions, or plaster reliefs
• May have regional influence, exhibiting characteristics of the Spanish Colonial Revival or Mediterranean Revival style
Integrity Considerations
• Replacement of some windows and doors may be acceptable if the openings have not been resized and original fenestration patterns have not been disrupted
• Original use may have changed
• Setting may have changed
• Location, may have been moved for preservation purposes

The Times Building lobby includes sculptures, murals, and other decorative features, which constitute a cohesive work of art. The intricate, detailed pieces created by Gage and Ballin are truly outstanding, as are the marble columns, walls, and floors. As a result, the Times Building lobby is significant under Criterion C for possessing high artistic value. The period of significance is 1935, the date of the design.

[44] Ibid., 32-37.
[45] Ibid., 37-39.

Criterion D

Criterion D was not considered in this report, as it generally applies to archaeological resources and this report only pertains to historical resources that are part of the built environment. Refer to Appendix C-2 of the DEIR for the Phase I Archaeological and Paleontological Resources Report.

Integrity

To be eligible for listing in the National Register, properties must retain their physical integrity from the period in which they gained significance. In the case of architecturally significant properties, the period of significance is normally the date of construction. For historically significant properties, the period of significance is usually measured by the length of the associations. The Times-Plant Complex has multiple periods of significance: under Criterion A the period of significance is 1935 to 2000; under Criterion B there are three periods of significance is 1935 to 1944, 1936 to 1968, and 1960 to 1972 for the first three publishers; and under Criterion C the period of significance is 1935. While some factors of integrity are more important than others depending on the property, a majority of the seven recognized factors should be retained. The Times-Plant Complex retains its integrity of location, workmanship, feeling, and association for each period of significance. Its integrity of design and materials has been diminished by the construction of the roof top additions on the Plant Building and interior alterations to the Times Building and Plant Building with regard to Criterion B and C, but not Criterion A. The immediate setting of the Times Building in particular changed dramatically with the construction of the Executive Building. The Executive Building replaced one and two-story buildings and enveloped an eight-story building. While the scale of the two buildings is similar, the design of the Executive Building is physically imposing on the Times Building. The broader setting of the Times-Plant Complex also changed with the redevelopment of the surrounding blocks. Integrity of setting, however, is not essential to eligibility under Criterion B and C. Despite the alterations and additions, the Times-Plant Complex retains integrity as a whole under Criteria A, B, and C for each period of significance.

California Register Evaluation

The Times-Plant Complex was automatically included in the California Register when it was signed into law in 1992. The California Register was modeled on the National Register. The criteria for eligibility for listing in the California Register are virtually the same as the National Register. Therefore, the Times-Plant Complex remains eligible for listing in the California Register for the same reasons noted above.

4.2.2 Mirror Building

National Register Evaluation

The Mirror Building was evaluated by SWCA Environmental Consultants in 2009 as part of the Regional Connector Transit Corridor Project. The evaluation concluded that the building was eligible for listing in the National Register under Criteria A, C, and D. As such, it is a historical resource subject to CEQA. The following paragraphs summarize the 2009 evaluation and provide some suggestions for minor revisions. A copy of the 2009 inventory forms is located in **Appendix A**.

The Mirror Building is eligible under Criterion A for its direct association with the Times Mirror Company and the history of the press in Los Angeles. The period of significance identified on the

2009 inventory form for this criterion extends from 1948 to 1959. While the 1948 start date is accurate as it relates to the year of construction, a more appropriate end date would be 1962 when the Times Mirror Company ceased publication of the *Times*' afternoon edition, the *Los Angeles Mirror*. The building was constructed to house the *Mirror*'s offices, and as a result, its significance is most accurately reflected by the time period associated with the *Mirror's* publication.

Table 6: Late Moderne, 1936-1960
Context: Architecture and Engineering
Context: L.A. Modernism
Theme: Related Responses to Modernism
Sub-Theme: Late Moderne, 1936-1960
Eligibility Standards
• Retains the essential character-defining features of the Late Moderne style from the period of significance
• Was constructed during the period of significance
• Exhibits quality of design through distinctive features
Character-Defining/Associative Features
• Horizontal orientation
• Flat or nearly flat roofs
• Smooth stucco cladding
• Unadorned wall surfaces with minimal ornamentation
• Windows "punched" into walls with no surrounds
• Horizontal bands of bezeled windows with projecting frames
• Metal, often steel sash, windows
Integrity Considerations
• Should retain integrity of Location, Feeling, and Association from the period of significance
• Replacement of some windows and doors may be acceptable if the openings have not been resized and original fenestration patterns have not been disrupted
• Original use may have changed
• Location, may have been moved for preservation purposes

The Mirror Building is eligible under Criterion C for embodying the distinctive characteristics of the Late Moderne style of architecture. The 2009 evaluation classifies the building as PWA Moderne, but Late Moderne is a more appropriate classification due to the building's 1948 construction date and design details. The eligibility standards for the Late Moderne Sub-Theme within the *Los Angeles Citywide Historic Context Statement* are listed in **Table 7.** The building is also eligible under Criterion C as the work of master architect Rowland H. Crawford. The period of significance under Criterion C is 1948, the date of construction.

The 2009 evaluation concluded that the site on which the Mirror Building is located is eligible under Criterion D, because of its CHL designation as the location of the Butterfield Stage Station. As the site of an important historical place, it has the potential to yield important information about the prehistory or history of the area. However, it should be noted that because the Mirror Building has multiple floors below grade, it is likely that any intact archaeological resources were disturbed or removed during its 1948 construction.

For a resource to be eligible for the National Register, it must reflect its appearance from its period of significance. The 2009 inventory form did not provide a detailed assessment of integrity

but concluded that the Mirror Building is able to convey its significance. The Mirror Building has multiple periods of significance and it reflects its appearance from each of them: under Criterion A the period of significance is 1948 to 1962 and under Criterion C the period of significance is 1948. Although the interior has been substantially altered, the exterior is essentially intact. The integrity of setting has changed with the construction of the Parking Structure and the redevelopment of the surrounding blocks. Integrity of setting, however, is not essential to eligibility under Criterion C.

California Register Evaluation

The Mirror Building was automatically included in the California Register when it was determined eligible for listing in the National Register in 2010. The California Register was modeled on the National Register. The criteria for eligibility for listing in the California Register are virtually the same as the National Register. Therefore, the Mirror Buildings remains eligible for listing in the California Register for the same reasons noted above.

4.2.3 Executive Building and Parking Structure

National Register Evaluation

The Executive Building and Parking Structure are ineligible for the listing in the National Register because they are not of exceptional significance, which is required for properties less than 50 years of age. The following paragraphs provide a detailed evaluation under each criterion, as well as an analysis of integrity.

Criterion A

In order to qualify under Criterion A, a resource must be associated with events or trends that have made a significant contribution to the broad patterns of our history. The *Los Angeles Citywide Historic Context Statement* was used to determine the relevant context for the evaluation of the Executive Building and Parking Structure under Criterion A. The most applicable sub-context within the Public and Private Development Context is Newspapers and Publishing.

The Executive Building and Parking Structure were constructed between 1970 and 1973 to house the executive offices of the Times Mirror Company, as well as office rental and bank space and parking spaces under the direction of Dorothy Chandler. Times Mirror was an American newspaper and print media publisher that grew to include televisions stations. It had its roots in the Mirror Printing and Binding House, established in 1873 primarily for commercial printing. In 1881, the Mirror Printing and Binding House agreed to print a new daily newspaper called the *Los Angeles Daily Times,* soon renamed the *Los Angeles Times*.[46] The publishers abandoned the project shortly after it was launched, although the printers kept the newspaper going. Seven months later, Harrison Gray Otis was named full-time editor.[47] In 1884, Otis and Colonel H.H. Boyce purchased both the newspaper and the printing company, incorporating them into The Times-Mirror Company.[48] The hyphen was dropped before long. Two years later, Otis bought out Boyce for full ownership of the company.

[46] Berges, 6, 12.
[47] Berges, 12.
[48] Berges, 13.

Before World War II, the *Los Angeles Times* remained the company's only newspaper. During this period, Harry Chandler was the publisher, but his main interest was real estate development. Norman Chandler assumed control over the company and the newspaper in 1944 after the death of his father. It was Norman who began to develop the company into a media empire. In 1948, Times Mirror made its first acquisition, the Publishers Paper Company. In the 1980s, Publishers Paper would emerge as the third-largest newsprint producer in the United States, and about 70 percent of the newsprint produced by Publishers Paper in the early 1990s was sold to Times Mirror.

By 1963, Times Mirror was expanding through the acquisition of art, legal, medical, and science book companies throughout the U.S. The purpose was to reduce the company's dependence on the *Los Angeles Times*.[49] To help execute his plans, Norman hired Albert V. Casey, former vice president and treasurer of Railway Express, a shipping company that used railroad infrastructure to make mail and parcel deliveries.[50] The Times Mirror went public in 1964, with the Chandlers as the largest stockholders. The company's entrance into magazine publishing came in 1967 with the acquisition of *Popular Science, Outdoor Life, Golf Magazine,* and *Ski Magazine*. Within 20 years of that acquisition, Times Mirror Magazines, Inc. had more than nine million readers and operated two national book clubs with annual sales in excess of two million books. Times Mirror's other strategic move came in 1968 when it purchased Co-Axial Systems Engineering Company and its seven cable franchises in Southern California.[51]

In 1968, Franklin David Murphy succeeded Norman Chandler as the chairman of the company. At this time, Times Mirror was only outranked by Time, Inc. and the McGraw Hill Book Company in the world of publishing and printing.[52] Murphy continued to expand the company with the formation of Times Mirror Broadcasting in 1970, which initially comprised KDFW-TV, Dallas, Texas; KTBC-TV in Austin, Texas; KTVI-TV in St. Louis, Missouri; WVTM-TV in Birmingham, Alabama; WHTM-TV in Harrisburg, Pennsylvania; WSTM-TV in Syracuse, New York; and WETM-TV in Elmira, New York.

Times Mirror kept returning to its newspaper roots, however, for acquisitions that strengthened both its editorial clout and revenue base. Between 1977 and 1984, it purchased the Southern Connecticut Newspapers Inc.; the Sporting News Publishing Company of St. Louis, Missouri; the *Hartford Courant* of Connecticut, the nation's oldest continuously published newspaper; the *Denver Post, and the* Call-Chronicle Newspapers, Inc., now *The Morning Call,* serving a nine-county region in eastern Pennsylvania and in New Jersey.[53]

In 1984, Times Mirror profits were at an all-time high and the company began a restructuring process that ended two years later in a flurry of buying and selling. After 1986, Times Mirror turned its attention to capital expenditures, particularly in its newspaper operations, where equipment had to be updated. In 1987 it launched a five-year $385 million capital investment plan, bringing a new plant and facilities to the *Los Angeles Times.* In 1987, David Laventhol succeeded Robert Erburu as president of *Times Mirror* although Erburu continued as chairman and chief executive officer of the company.

[49] Davis, 120.
[50] Davis, 121. Casey left Times Mirror in 1974 to become the chief executive officer of American Airlines.
[51] McDougal, 230-31.
[52] Davis, 120.
[53] McDougal, 342-43.

By 1990, Times Mirror had become the 12th-largest multiple cable system operator in the country and operated four network television affiliates. It spent $1.5 billion acquiring new businesses throughout the 1980s: $583 million on newspaper properties; $595 million on book, magazine, and other publishing acquisitions; $235 million on cable TV systems; and $82 million on broadcast properties. Capital expenditures during the decade totaled $2.53 billion–more than half of which was concentrated in its newspaper operations. During that same period, revenues grew from $1.87 billion to $3.52 billion.[54]

Notwithstanding the capital investments in the 1980s, Times Mirror's core newspaper segment, which continued to account for close to 60 percent of its overall corporate revenues, struggled. After revenues fell to a five-year low in 1994, Mark Willes was hired as the new chief executive officer. He began a process of downsizing the company by reducing jobs and selling assets. But there was no arguing with the economic reality that newspaper circulation was on the decline while newsprint prices and other costs continued to rise. In 2000, the Times Mirror Company was sold to the Tribune Company, making Los Angeles the largest city in the country without a locally owned daily newspaper.[55]

The Times Mirror Company is undoubtedly significant in the Sub-Context Newspapers and Publishing. It was one of the oldest and largest companies in Los Angeles before it was sold in 2000. Properties like the Executive Building that have achieved significance within the past 50 years, must meet Criteria Consideration G to be eligible for listing in the National Register. Criteria Consideration G states "a property achieving significance within the last 50 years is eligible if it is of exceptional importance."[56] For a variety of reasons, the Executive Building is not of exceptional importance for its association with the Times Mirror Company. First, it is not the founding location of the company. The original and earlier buildings have been demolished. Between 1935 and 1972 the company was located in the extant Times Building to the east. In its 116-year history, the company was located in the Executive Building for 27 years, 1973 to 2000. Second, no information was found to indicate that events of exceptional importance occurred during this period. The growth of the company into a media giant began in the 1950s and continued in the 1960s when it was located in the Times Building. Thus, the Executive Building is ineligible for listing under Criterion A as it does not meet the eligibility standards listed in **Table 3.** The Parking Structure is ineligible for listing under Criterion A because it is a purely functional building without a direct association with the activities of the Times Mirror Company.

Criterion B

To be eligible for listing in the National Register under Criterion B, a property must be associated with the lives of persons significant in our past. As the headquarters of the Times Mirror Company for the last 27 years of its history, it was the workplace for numerous executives and directors. However, the three most closely associated with the building were Otis Chandler, Franklin Murphy, and Dorothy Chandler. All three are undeniably significant in the history of Los Angeles, and their many accomplishments are well documented. Other individuals that could be

[54] "The Times Mirror Company History," http://www.fundinguniverse.com/company-histories/the-times-mirror-company-history/ accessed, July 30, 2017.
[55] David Shaw and Sallie Hofmeister, "Time Mirror Agrees to Merger with Tribune," *Los Angeles Times*, March 13, 2000.
[56] *National Register Bulletin #15,* 41.

significant include, but are not discussed below, Albert Casey and Robert Erburu.[57] As *National Register Bulletin #15* explains, "For properties associated with several community leaders…, it is necessary to identify specific individuals and to explain their significant accomplishments."[58] The bulletin further explains that for a property associated with numerous individuals to be significant, "the significance of one or more specific [individuals must be] explicitly justified."[59] It goes on to clarify that if the significance of the historic property is related to "the cumulative importance of prominent [persons]," then the property would not be eligible under Criterion B; but rather, it might be eligible under Criterion A.[60] As noted above, however, the Executive Building and Parking Structure do not meet Criterion A.

When the buildings were completed in 1973, Otis Chandler was the publisher of the *Los Angeles Times* as well as a director of the Times Mirror Company of which his family was the largest stockholder. Murphy was the chairman and chief executive officer of the company. Dorothy Chandler was also a director of the company and the person Murphy charged with developing the Executive Building and Parking Structure. Dorothy explained, "I used the same approach with this building [Executive Building] that I had used in the planning of the Music Center. I approved the concept, the architecture and all of the materials used, right down to the ashtrays."[61]

When Otis Chandler assumed control of the *Times* in 1960, he instituted unprecedented widespread reform that would transform the paper's negative reputation without hurting its profits. Otis replaced the heads of nearly all of the paper's departments and changed its focus from political and cultural conservatism to unbiased journalism. He also expanded the paper's operations internationally, creating numerous foreign bureaus. Otis has been widely recognized as an incredibly important newspaper publisher. As his *New York Times* obituary in 2006 explained, he transformed the *Los Angeles Times* into "one of the most respected, widely read and profitable newspapers in the United States," and he accomplished this in a very short period of time, considering the paper had eight decades of partisan history behind it.[62] In 1980, at the age of 52, Otis stepped down as publisher and appointed an outsider, not a family member, to the post for the first time in the paper's history. That outsider was Tom Johnson who served in the role of publisher until 1989 when he became president of the Cable News Network (CNN).

Franklin Murphy was a physician, educator, businessman, and civic and cultural leader. Murphy was born in Kansas City, Missouri in 1916, the son and grandson of physicians. His mother was a concert pianist and one of his aunts a painter, so art, as well as medicine, was an essential part of his life from the beginning. Murphy received his medical degree from the University of Pennsylvania in 1941. During World War II, he served in a medical unit. After the war, he joined the faculty of the University of Kansas. When he was only 32 years old, he became the dean of the medical school, and three years later he was chosen as the chancellor of the university. In 1959, Murphy accepted the position of chancellor at the University of California, Los Angeles

[57] Albert Casey was hired by Norman Chandler in 1963. In 1968 when Norman retired, the company was effective run by Murphy as the chief executive officer, Otis as the vice president in charge of the newspapers, and Casey as the president in charge of operations, acquisitions, non-newspaper subsidiaries. Robert Erburu was appointed the general counsel in 1961, joined the board of directors in 1968, and in 1969 he was appointed senior vice president. Erburu replaced Casey as the president in 1974.
[58] *National Register Bulletin #15*, 14-15

[62] Kandell.

(UCLA). During his tenure at UCLA, Murphy plunged deeply into community affairs, developed a program of interdisciplinary institutes and study centers, and restructured the College of Applied Arts into the College of Fine Arts. During his administration two new professional schools were established, the School of Library Service and the School of Architecture and Urban Planning. He played important roles in the development of Pauley Pavilion, the creation of the Jules Stein Eye Institute, and the passage of the 1962, 1964, and 1966 bond issues, which provided UCLA with $95,000,000 in construction funds.[63]

In 1966, Norman Chandler approached Otis about assuming more duties in the Times Mirror Company. Otis carried the title of senior vice president, and it was assumed that he would one day become the chairman and chief executive officer. However, he told his father that he would be of more benefit to the company as the publisher; after only six years in the position there was so much more he could accomplish.[64] Thus, Norman and Dorothy began casting for a new leader for the parent company. Dorothy was familiar with Murphy through her role on the board of regents of the University of California. The two had much in common politically and artistically, so she recommended his appointment to the board of Times Mirror in 1965. Frustrated by the student protests on campus and conservative politics of the governor, Murphy left UCLA in 1968 when offered the position of chairman and chief executive officer of Times Mirror. He saw the company grow and expand into new fields as publishing and the wider market of communications grew. It also became a base from which he could extend himself to the world of philanthropy. In Los Angeles, he was one of those who founded the Los Angeles County Museum of Art on its present site. He was also a trustee of the J. Paul Getty Trust and chairman of its finance committee, as well as chairman of the Samuel Kress Foundation. He succeeded Paul Mellon as chairman of the trustees of the National Gallery of Art in Washington D.C.[65] Robert F. Erburu succeeded Murphy as chief executive officer at Times Mirror in 1980.

Dorothy Buffum Chandler was a business, civic, and cultural leader, and widely recognized as one of the most influential women in the history of Los Angeles. She was born into the Long Beach family that owned Buffum's, a Southern California chain of department stores. She attended Stanford University where she met her future husband, Norman Chandler. She became involved in cultural affairs by rescuing the Hollywood Bowl from financial failure in 1951 and promoting cultural exchange with the Soviet Union in 1958. During that same period, she spearheaded the fundraising drive to establish the Los Angeles County Music Center, which lasted from 1954 to 1964. The Dorothy Chandler Pavilion is named in honor of her critical role in the development of the Music Center.[66] She was also instrumental in bringing Zubin Meta to Los Angeles as conductor of the Philharmonic in 1965.

Dorothy was a political moderate who used her influence with her husband and son to soften the conservative editorial perspective of the *Los Angeles Times*. As a member of the University of California Board of Regents, she generally sided with the liberal wing, like the time she backed Murphy for chancellor. However, she was a member of the Republican Party and campaigned for the presidential candidacy of Eisenhower over Taft in 1952, and Rockefeller over Goldwater

[66] Halberstam, 272-75.

in 1964.[67] Dorothy worked for the Times Mirror Company from 1948 to 1976. She was a director of Times Mirror from 1955 until 1973, when she was named director emeritus. Although Dorothy exerted enormous influence, she publicly downplayed her position at the newspaper and the company. "I fix the facilities, but I don't tell them what to put in the paper." She told *Women's Wear Daily* her responsibilities at the company were focused on the management of public relations and facilities.[68] At the opening ceremony, Murphy gave Dorothy and Charles Kratka, the interior designer, the credit for the Executive Building. "What you and your staff and Mrs. Chandler have finally pulled together is not only exciting, but exceedingly tasteful."[69] After the death of his father, Otis urged Murphy to force his mother out of the company. Bitter about being expelled from the company she helped create, Dorothy told friends that Murphy's performance as chief executive officer was one of the biggest disappointments of her life.[70]

The significance of the Executive Building rests in the cumulative contributions of the important individuals who were instrumental in the management of the Times Mirror Company, rather than the specific contributions of one, or even a few, individuals. Otis Chandler, Franklin Murphy, and Dorothy Chandler[71] all played important roles in the company, and are associated with the Executive Building; however, the individual association of each is not particularly strong. From 1960 to 1972, Otis Chandler's office was located in the Times Building. During that period, he had already transformed the *Times* from a local publication to a national newspaper with a reputation for excellence. He moved his office to the Executive Building in 1973. From 1973 to 1980, he continued to serve as the publisher of the *Los Angeles Times* and the vice president for newspapers at Times Mirror. He stepped down as the publisher in 1980 and became the chairman of Times Mirror, but the position of chief executive officer was filled by Robert Erburu. Chandler kept an office in the Executive Building but reduced his role in the day-to-day operations of the company to focus on other interests. He was ousted as chairman of Times Mirror in 1985. Murphy was influential in the educational, political, and cultural development of Los Angeles, if not the United States.[72] The length of his association with the Executive Building is not long enough to be considered significant. In the 116-year history of the company, Murphy was the chairman and chief executive officer of Times Mirror for 12 years (1968 to 1980) and his office was in the building for seven years (1973 to 1980). Furthermore, his specific accomplishments at the company during this period are not well documented. While Dorothy Chandler by all accounts had more to do with construction of the Executive Building than any other individual, she only maintained an office in the building until 1976. From 1974 to 1976 she was relegated to emeritus director and it is unclear how much time she spent in the building. Arguably, Chandler would consider her life's work to be the Los Angeles Music Center.

Therefore, the Executive Building does not appear to be eligible for listing in the National Register under Criterion B and in any event is not of exceptional importance. The Parking Structure is ineligible for listing under Criterion B because it is a purely functional building without a direct association with significant persons.

Criterion C

To be significant under Criterion C, a resource must embody the distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction. The Executive Building and Parking Structure were designed in 1970 in the Corporate International Style of architecture by William L. Pereira & Associates. Within the *Los Angeles Citywide Historic Context Statement*, the International Style is a Sub-Theme in the Architecture and Engineering Context and L.A. Modernism Sub-Context.

Table 7: Corporate International Style, 1946-1976
Context: Architecture and Engineering
Context: L.A. Modernism
Theme: Post-War Modernism
Sub-Theme: Corporate International Style, 1946-1976
Eligibility Standards
• Retains the essential character-defining features of the Corporate International Style from the period of significance
• Was constructed during the period of significance
• Exhibits quality of design through distinctive features
Character-Defining/Associative Features
• Box-shaped form
• Constructed of concrete, steel, and glass
• Flat roofs, either with flush eaves or cantilevered slabs
• Casement windows, often steel
• Horizontal bands of flush, metal framed windows, or curtain walls
• Lack of applied ornament
• Articulated ground story, often double-height and set back behind columns or pilotis
• Integral parking lot, either subterranean or above grade
• Landscaped plaza or integral plantings at ground floor
• For National Register, property must possess exceptional importance if less than 50 years of age
Integrity Considerations
• Replacement of some windows and doors may be acceptable if the openings have not been resized and original fenestration patterns have not been disrupted
• Original use may have changed
• Original setting may not be intact (this applies to individual resources only; buildings associated with corporate or institutional campuses must maintain integrity of setting)
• The modification of signage may be acceptable only if the signage itself was not a major character-defining feature

The International Style developed in the 1920s and 1930s as a reaction to the excessive and popular period revival styles of the day. It began in Europe with architects like Walter Gropius, Mies van der Rohe, and Le Corbusier, and spread to the U.S. through immigrants like Richard Neutra and Rudolph Schindler. The style evolved with advances in technology and was practiced through the 1970s. In its early years, the style was commonly applied to small-scale residences, but as it developed, it became a popular aesthetic for low-rise commercial buildings, skyscrapers, corporate office and industrial parks, university buildings, and government offices.

In postwar America, the socially oriented tenets of European modernism were absorbed and transformed by big American companies (themselves a post–World War II phenomenon) into effective marketing and branding tools rendered in glass, concrete, and steel buildings. An important feature of many of these Corporate International style buildings is that they are often free-standing objects in the urban landscape, exemplified by the Department of Water and Power Building (1965, Los Angeles, renamed the John Ferraro Building) by A.C. Martin and Associates on Bunker Hill, or the Occidental Life Insurance Building (1965, Los Angeles, commonly known as the Transamerica Building and renamed AT&T Center) by William L. Pereira & Associates in South Park. These buildings reflect the changing patterns in urban design and transportation modes that increasingly revolved around the automobile, the freeway, and the parking lot.[73]

The Corporate International Style also demonstrated a progressive approach to construction methods. This approach to smart experimentation owes a great deal to the proximity of the aerospace industry, close in both geography and in time. For example, Welton Becket & Associates developed panels for the Beverly Hilton hotel (1955, Beverly Hills) that were based on new aircraft technology, a product of design research in Becket's office. These "privacy panels," colored in bright pastels and meant to define private balconies were sandwiches of metal skins adhered to a paper honeycomb mesh to achieve a divider that was very light in weight, but flexible and stiff – all good attributes in reducing costs without sacrificing style on behalf of a corporate client.[74]

The Los Angeles region has countless examples of Corporate International Style buildings, many of which are considered extremely significant. These include everything from office buildings like the American Cement Building (1961, Los Angeles) by DMJM, hotels like the Century Plaza Hotel (1966, Los Angeles) by Minoru Yamasaki, hospitals like the Century City Medical Plaza (1969, Los Angeles) by Cesar Pelli and Anthony Lumsden for DMJM, and numerous banks buildings like Great Western Savings (1972, Beverly Hills, renamed the Flynt Building) by William L. Pereira & Associates and Bank of America Plaza (1974, Los Angeles) by A.C. Martin and Associates as well as campuses for new technology firms like Xerox (Craig Ellwood, 1966, El Segundo) and TRW (A.C. Martin and Associates, 1967, El Segundo).

For the Executive Building and Parking Structure to be significant under Criterion C for their Corporate International design, they must not just be examples of the style; they must also be important examples. This is not the case with either building. While the Executive Building employs several elements of the Corporate International Style listed in **Table 8** such as the box-shaped forms, horizontal bands of windows and stone panels, and landscaped plaza, it is clear that it is not a significant example when compared with the landmark examples noted above and numerous others. Rather, the building is a late, average example of the style applied to a mid-rise corporate building. Additionally, research on the building in architectural periodicals and books did not yield any results indicating that it was considered an important work during its time or in subsequent decades. The only mentions of the building were in the *Los Angeles Times*, which gave it glowing reviews, for obvious, promotional reasons. While the Parking Structure was designed in conjunction with the Executive Building, it was not referred to in the article. Furthermore, it does not exhibit the elements of the Corporate International Style, or any other

[73] Barbara Lamprecht, "L.A. Modernism," Los Angeles Citywide Historic Context Statement, City of Los Angeles Office of Historic Resources, June 2008, 22.
[74] Ibid., 25.

styles within the Modern movement. As the Executive Building and Parking Structure are not significant examples of an architectural style, the buildings do not appear to be significant for embodying the distinctive characteristics of its type or period of construction. Additionally, they did not involve any novel or noteworthy construction techniques, so they do not appear to be significant for embodying the distinctive characteristics of a method of construction.

The Executive Building and Parking Structure were designed by the architecture firm William L. Pereira & Associates. The firm's namesake was born and educated in Chicago before moving to Los Angeles in the 1930s. He worked on his own as an architect and as an art director for several Hollywood films. In 1949, he became a professor at the University of Southern California (USC) where he connected with Charles Luckman. The two formed Pereira & Luckman in 1950. The firm was remarkably successful and designed numerous noteworthy buildings in Southern California, such as CBS Television City (1953, Los Angeles), the Disneyland Hotel (1958, Anaheim), and parts of the Los Angeles International Airport (1958, Los Angeles). In 1959, Pereira started his own firm, William L. Pereira & Associates. He continued with the firm until his death in 1985.[75]

Pereira's design style evolved over time from minimal and rigid in the 1950s and early 1960s, though he was never as dogmatic as contemporaries Frank Lloyd Wright and Richard Neutra, to more sculptural and expressive in the 1970s and 1980s. His earliest work mixed elements of the International and Mid-Century Modern styles as evidenced by his designs for CBS Television City (1953, Los Angeles), the Southern California Institute of Technology (1956, Claremont), Santa Rosa Hall (1954) at the University of California, Santa Barbara, and the Beckman Helipot building (1958, Newport Beach).

With Pereira & Associates, Pereira became more heavily involved with master plans. He had done some planning work with Luckman, but his work in the field dramatically increased in the 1960s with projects like the University of Southern California Master Plan (1960, Los Angeles) and Irvine Ranch Master Plan (1961, Irvine), which evolved to include the University of California, Irvine campus (1964, Irvine). Pereira's list of projects from 1960 through 1985 contains nearly 70 master plans in geographical locations ranging from Hawaii to Doha, Qatar. Some of his notable individual buildings from the period include the University of California San Diego Central Library (1965, San Diego) and the Transamerica Corporate Headquarters Tower (1973, San Francisco). These buildings, with their sculpted concrete forms, exhibit expressive qualities much different than architect's earlier minimalist work. (See Appendix E for a list of William L. Pereira Projects.)

The remarkable number of commissions completed by Pereira's firm reveals what James Steele called his "decidedly anti-Modernist willingness to delegate."[76] Rather than designing every detail of a project himself or micro-managing his employees, Pereira was known for delegating work to others and guiding them. He was also known to assign the same project to multiple designers at once, using competition as a means of arriving at the best design.[77] This managerial style, indicative of the corporate future of the architecture profession, yielded customer

[76] James Steele, "Introduction – Pereira as Part of a Changing Ethos," in *William Pereira*, edited by James Steele (Los Angeles: University of Southern California Architectural Guild Press, 2002), 16.
[77] Ibid.

satisfaction and numerous repeat clients, but it also resulted in a lack of a definitive Pereira style.[78]

Regardless of this lack of a singular style, Pereira's contributions to the fields of architecture and planning cannot be overlooked. Steele defines him as a man of "matchless vision and countless innovations."[79] His importance during his own time is obvious based not on the number but on the prestige of the commissions he received – universities, museums, major corporation headquarters, large-scale land developments, etc. In his 1985 *Los Angeles Times* obituary, writer Michael Seiler called Pereira's body of work "an architectural and planning honor roll of livable and workable Southern California places."[80] He also noted that the architect was praised by critics for "his ability to combine form and function in an optimistic and congenial body of work."[81] Further evidencing Pereira's far-reaching influence, he was one of a select few architects ever to be featured on the cover of *Time* magazine (September 6, 1963).[82]

Although some of Pereira's work has become controversial in recent years as new development projects loom, his status as a master architect and planner is undeniable. As Seiler pointed out, "…as much as any other one man, [Pereira] was responsible for the artistic topography of the (Los Angeles] and exurbs," and his influence was not just local.[83] His remarkable, forward-thinking designs landed him commissions all over the US and internationally. While Pereira designed a number of iconic individual buildings, like the Transamerica Tower, for example, James Steele explains that many of the architect's most notable contributions have come in the form of master plans. In fact, Steele credits him with "virtually inventing the profession of regional master planning in America."[84]

As the product of the William L. Pereira & Associates firm, the Executive Building and Parking Structure have been presumed to be the product of master architect William Pereira; however, the identity of the designer is unclear. Only the name of the firm appears on the drawings and permits, and there is conflicting information in the *Los Angeles Times* about the partner in charge of the project. A 1972 article stated that Pereira was the partner in charge with John C. Knight as the project director and Shreve Babcock as deputy project director.[85] That team was apparently replaced as a 1973 article stated that Gin Wong was the partner in charge, and that Roy G. Schmidt was the project director. Pereira & Associates was responsible for the interior of the bank on the ground floor, and Sue Wilson acted as the designer. The interiors of the fifth and sixth floors, which were the executive offices of the Times Mirror Company, were designed by Charles Kratka Interior Planning and Design. Jan Hornbeck was in charge of the project for Kratka.[86] As so many individuals apparently contributed to the design, the extent of Pereira's involvement in the design of the Executive Building and Parking Structure is uncertain. Additionally, the buildings are not included in the extensive chronology of projects provided in

[86] Dick Turpin, "Times Mirror Building Puts Accent on Beauty," *Los Angeles Times*, July 1, 1973.

Steele's book. Steele explains that his list is "selective in the sense that it only includes projects with clear provenance."[87]

Even if Pereira designed the Executive Building and Parking Structure, they are not important or distinctive examples of his work. In order to be eligible under Criterion C as the work of a master, the buildings would have to express a particular phase in the development of Pereira's career, an aspect of his work, or a particular idea or theme in his craft. By the early 1970s, when the Executive Building and Parking Structure were constructed, Pereira's work on singular buildings had shifted away from the minimalist toward more expressive, monumental forms often rendered in concrete, and his practice in general had shifted from individual buildings to large-scale master plans. Thus, his work from the period is better represented by buildings like the Pacific Life Building (1972) and Marriot Hotel (1973) in Newport Beach (1975) Transamerica Tower (1972) in San Francisco and his numerous master plans, especially those for airports and college campuses. In short, the Executive Building and Parking Structure do not appear to be eligible under Criterion C as a representative work of master architect William L. Pereira.

The last two aspects of Criterion C, possessing high artistic values, or representing a significant and distinguishable entity, whose components may lack individual distinction, apply to works of art and historic districts, respectively. The Executive Building and Parking Structure are neither. Therefore, for all of the reasons described above, they do not appear to be significant under Criterion C and in any event are not of exceptional importance.

Criterion D

Criterion D was not considered in this report, as it generally applies to archaeological resources, and this report only pertains to historical resources that are part of the built environment. Refer to Appendix C-2 of the DEIR for the Phase I Archaeological and Paleontological Resources Report.

Integrity

As the Executive Building and Parking Structure do not appear eligible for listing in the National Register, an assessment of its integrity is not required. However, it may be noted that the exteriors are substantially unaltered. Alterations have been limited to the interior of the Executive Building. In 1980, Charles Kratka remodeled the third floor and in 1987, Stokes & Bojorquez remodeled the bank space on the first floor. The most substantial alterations occurred in 1997 with the first and second floors were seismically strengthened. While some of the furnishing and finishes on the sixth floor have been removed or replaced, the spaces themselves are intact. Therefore, the building retains all aspects of integrity.

California Register Evaluation

The California Register was modeled on the National Register; however, there are differences in the 50-year threshold. A property less than 50 years of age may be eligible for listing in the California Register if it can be demonstrated that sufficient time has passed to obtain scholarly perspective on the events and/or individuals associated with the property. In other words, a property less than 50 years of age does not need to be of exceptional importance to be eligible for listing in the California Register. The California Register statute allows CEQA Lead Agencies a fair amount of flexibility in justifying that a property is significant, even if that property is less than

[87] James Steele, "Chronology of Projects," in *William Pereira*, James Steele, ed. (Los Angeles: University of Southern California Architectural Guild Press, 2002), 192.

50 years old. In evaluating such properties for California Register eligibility, the focus is on the evidence for significance as opposed to the age of the property. The *Los Angeles Times*, Times Mirror Company, and Chandler family have received a fair amount of scholarly attention. The early history of the *Los Angeles Times* and its subsequent transformation was chronicled in the unauthorized history, *Thinking Big* in 1977, and was one of four papers profiled by David Halberstam in *The Powers That Be* in 1979. Halberstam also discusses the Chandler family in his book, but to a lesser extent the Times Mirror Company. The newspaper has also been the whole or partial subject of numerous dissertations and theses in communications or social science in the past four decades.[88] Dennis McDougal wrote a biography of Otis Chandler, *Privileged Son and the Rise and Fall of the Los Angeles Times Dynasty* in 2001 and Margaret Leslie Davis wrote a biography of Franklin Murphy, *The Culture Broker, Franklin D. Murphy and the Transformation of Los Angeles* in 2007. Both books place their subjects in the context of the newspaper and the company as well as national, state, and trends.

Based upon these scholarly sources, the Executive Building appears to be eligible under California Register Criterion 1 for its association with the Times Mirror Company. The Executive Building was the first building ever constructed specifically to house the company in its century-plus history. From the 1970s to the 1990s the company continued to grow. By 1990, Times Mirror had become the 12th-largest multiple cable system operator in the country and the *Los Angeles Times* reached the apex of its circulation. During the 1990s, the company, like all newspaper and publishing outlets in the country, began a steady decline as their customers and advertisers migrated to mobile networks and electronic books and magazines. When Times Mirror was purchased by Tribune in 2000, the Atlantic Richfield Company remained the only Fortune 500 Company in Downtown Los Angeles.[89] The period of significance under Criterion 1 is 1973, the year the building was completed, to 2000, the year the Tribune Company purchased the Times Mirror Company.

In addition, the Executive Building appears to be eligible under California Register Criterion 2 for its association with Otis Chandler. Chandler was the publisher of the *Los Angeles Times* for 20 years (1960 to 1980). He moved his office from the Times Building to the Executive Building when it was completed in 1973. From 1973 to 1980, Chandler continued to modernize the *Los Angeles Times* and to expand its reach. In 1979, there were 31 foreign and domestic bureaus and for the 25th consecutive year the paper published more advertising than any other in the world.[90] The period of significance under Criterion 2 is 1973 to 1985 when Chandler retained an office in the Executive Building.

The Parking Structure is ineligible for listing under Criteria 1 and 2 because it is a purely functional building and is not directly associated with the activities of the Times Mirror Company or Otis Chandler.

The Executive Building and Parking Structure do not appear to be eligible under California Register Criteria 3 and 4 for the same reasons noted in the National Register Criteria C, and D evaluations.

[90] Joe Mozingo, "A Brief History of the Los Angeles Times," http://www.latimes.com/local/california/la-me-los-angeles-times-history-20180617-story.html, accessed, June 29, 2018.

4.2.4 Times Mirror Square

As noted above, Times Mirror Square is occupied by five structurally distinct but internally connected buildings: the Times Building completed in 1935; the Plant Building constructed in three phases between 1935 and 1955; the Mirror Building completed in 1948; the Executive Building completed in 1973; and the Parking Structure completed in 1973. As the buildings are historically and functionally related, they qualify as a potential historic district. To be eligible, a historic district must be significant as well as being an identifiable entity. Thus, a historic district will usually meet the last portion of Criterion C "represent a significant and distinguishable entity whose components may lack individual distinction" plus Criterion A, Criterion B, other portions of Criterion C, and/or Criterion D.

Times Mirror Square appears eligible for listing in the National Register under Criteria A and C and California Criteria 1 and 3 for its association with the *Los Angeles Times* and the Times Mirror Company. Under Criterion A/1 it is significant in the Sub-Context Newspapers and Publishing for its association with important events that have made a significant contribution to broad patterns in our history, and under Criterion C/3 it represents a significant and distinguishable entity. The *Los Angeles Times* was first published in 1881 and the Times Mirror Company was founded in 1884. The first home of the *Los Angeles Times* was in the Downey Block at Temple and Spring Streets. By 1887, the company and the newspaper were located at the northeast corner of W. 1st Street and S. Broadway. After the building was bombed by labor union sympathizers, a new larger building rose on the same site. In 1931, the company expanded south of W. 1st Street and had constructed a printing and binding facility at 110 S. Broadway. After the Times-Plant Complex was completed in 1935, the building at W. 1st Street and S. Broadway was demolished. Although the Times Mirror Company did not own the entire block until the late 1960s when it began to develop plans for the Executive Building and Parking Structure, it was commonly referred to as Times Mirror Square. Times Mirror Square is historically significant as a reflection of the ascent of the *Los Angeles Times* to the front ranks of American journalism and the Times Mirror Company to a national media giant. The period of significance is 1935, the year the Times-Plant Complex was completed, to 2000, the year the Times Mirror Company was sold to the Tribune Company.

All of the buildings within the block are contributing to the significance of the potential historic district because they were constructed within the period of significance and retain sufficient integrity to convey their significance. Thus, the potential historic district also retains integrity as a whole. Although two of the five contributing buildings are less than 50 years of age, Criteria Consideration G is not required. *National Register Bulletin #15* states "a historic district in which a few properties are newer than 50 years old, but the majority of the properties and the most important period of significance are greater than 50 years old" do not need to meet Criteria Consideration G.[91] *National Register Bulletin #22* provides further guidance on evaluation of historic districts. "Properties less than 50 years old may be integral parts of a district when there is sufficient perspective to consider the properties as historic. This is accomplished by demonstrating that: (a) the district's period of significance is justified as a discrete period with a defined beginning and end; (b) the character of the district's historic resources is clearly defined and assessed; (c) specific resources in the district are demonstrated to date from that discrete era; and, (d) the majority of district properties are over 50 years old. In these instances it is not necessary to prove exceptional importance of either the district itself or of the less-than-50-year-old properties."[92]

[91] *National Register Bulletin #15*, 41.
[92] *National Register Bulleting #22: Guidelines for Evaluating and Nominating Properties That Have Achieved Significance Within the Past Fifty Years* (Washington D.C.: U.S. Department of the Interior, revised 1998), 10.

The criteria for eligibility for listing in the California Register are similar to the National Register criteria. Furthermore, the California Register statute treats properties less than 50 years of age differently than the National Register. A property less than 50 years of age may be eligible for listing in the California Register if it can be demonstrated that sufficient time has passed to obtain scholarly perspective on the events and/or individuals associated with the property. Therefore, Times Mirror Square appears to be eligible for listing in the California Register as a historic district for the same reasons noted above.

As previously stated, Times Mirror Square was nominated as a HCM by interested parties. OHR's staff report to the Cultural Heritage Commission concluded that the Times-Plant Complex and Mirror Building were architecturally significant but concluded that the Executive Building and Parking Structure were not architecturally significant. On September 20, 2018, the Cultural Heritage Commission recommended the designation of the entire block and found that the Executive Building and Parking Structure were significant for their association with the architect William L. Pereira. After a public hearing on November 27, 2018, the City Council's Planning and Land Use Management recommended that the designation exclude the Executive Building and Parking Structure. On December 5, 2018, the City Council concurred with this recommendation. As a result, only the Times-Plant Complex and Mirror Building are now collectively designated as a HCM.

4.2.5 Conclusions

There are four buildings constituting three individual historical resources on the block and five buildings contributing to a potential historic district. The Times-Plant Complex and Mirror Building were formally determined eligible for listing in the National Register and automatically included in the California Register. The Executive Building appears individually eligible for listing in the California Register. The Times-Plant Complex and Mirror Building are collectively designated as a HCM. Notwithstanding the City Council's action on the Times Mirror Square HCM nomination, all of the buildings within the block, including the Executive Building and Parking Structure, contribute to a potential historic district that appears eligible for listing in the National and California Registers. Therefore, all of the buildings qualify as historical resources subject to the CEQA. See Section 2.2 for an explanation of the Status Codes.

Table 8: Historical Resources on Project Site Subject to CEQA

No.	Name	Individual Eligibility			District Eligibility		Status Code

5. PROJECT IMPACTS

5.1 Determining the Significance of Impacts on Historical Resources

The State CEQA Guidelines set the standard for determining the significance of impacts to historical resources in Title 14 California Code of Regulations Section 15064.5(b), which states:

> A project with an effect that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

Title 14 California Code of Regulations Section 15064.5(b)(1) further clarifies "substantial adverse change" as follows:

> Substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.

Title 14 California Code of Regulations Section 15064.5(b)(2) in turn explains that a historical resource is "materially impaired" when a project:

> Demolishes or materially alters in an adverse manner those physical characteristics that convey its significance and that justify its inclusion in or eligibility for inclusion in the California Register, local register, or its identification in a historic resources survey.

The following factors are set forth in the City of Los Angeles' "L.A. CEQA Thresholds Guide," which states that a project would normally have a significant impact on a historical resource if it would result in a substantial adverse change in the significance of the historical resource. A substantial adverse change in significance occurs if the project involves:

- Demolition of a significant resource;
- Relocation that does not maintain the integrity and (historical/architectural) significance of a significant resource;
- Conversion, rehabilitation, or alteration of a significant resource which does not conform to the Secretary of the Interior's Standards for Rehabilitation and Guidelines for Rehabilitating Historic Buildings; or
- Construction that reduces the integrity or significance of important resources on the site or in the vicinity.

As such, the test for determining whether or not a proposed project will have a significant impact on an identified historical resource is whether or not the project will alter in an adverse manner the physical integrity of the historical resource such that it would no longer be eligible for listing in the National or California Registers or other landmark programs such as the list of HCMs.

5.2 Secretary of the Interior's Standards

Projects that may affect historical resources are considered to be mitigated to a level of less than significant if they are consistent with the Secretary of the Interior's Standards for the

Treatment of Historic Properties (Standards).[93] Projects with no other potential impacts qualify for a Class 31 exemption under CEQA if they meet the Standards.[94] The Standards were issued by the National Park Service. The Standards are accompanied by Guidelines for four types of treatments for historical resources: Preservation, Rehabilitation, Restoration, and Reconstruction. The most common treatment is rehabilitation and is the treatment that applies to the proposed Project. The definition of rehabilitation assumes that at least some repair or alteration of the historic building will be needed in order to provide for an efficient contemporary use; however, these repairs and alterations must not damage or destroy materials, features, or finishes that are important in defining the building's historic character.

The Standards for Rehabilitation are as follows:

1. A property will be used as it was historically or be given a new use that requires minimal change to its distinctive materials, features, spaces and spatial relationships.
2. The historic character of a property will be retained and preserved. The removal of distinctive materials or alteration of features, spaces, and spatial relationships that characterize a property will be avoided.
3. Each property will be recognized as a physical record of its time, place and use. Changes that create a false sense of historical development, such as adding conjectural features or elements from other historic properties, will not be undertaken.
4. Changes to a property that have acquired significance in their own right will be retained and preserved.
5. Distinctive materials, features, finishes and construction techniques or examples of craftsmanship that characterize a property will be preserved.
6. Deteriorated historic features will be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and where possible, materials. Replacement of missing features will be substantiated by documentary and physical evidence.
7. Chemical or physical treatments, if appropriate, will be undertaken using the gentlest means possible. Treatments that cause damage to historic materials will not be used.
8. Archeological resources will be protected and preserved in place. If such resources must be disturbed, mitigation measures will be undertaken.
9. New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work shall be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment.
10. New additions and adjacent or related new construction will be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

[93] 14 CCR Section 15126.4(b).
[94] 14 CCR Section 155331.

It is important to note that the Standards are not intended to be prescriptive, but instead provide general guidance. They are intended to be flexible and adaptable to specific project conditions to balance continuity and change, while retaining materials and features to the maximum extent feasible. Their interpretation requires exercising professional judgment and balancing the various opportunities and constraints of any given project. Not every Standard necessarily applies to every aspect of a project, nor is it necessary to comply with every Standard to achieve compliance.

5.3 Project Description

The proposed Project would involve the construction of two new mixed-use buildings along with the rehabilitation of three existing buildings, including the Times, Plant, and Mirror Buildings. These existing buildings, which are situated on the east half of the block, would be rehabilitated. These three buildings would provide approximately 376,105 square feet of offices and/or other retail and commercial uses. New development, consisting of the "North Tower" and "South Tower" would occur on the west half of the block. The existing Executive Building and Parking Structure would be demolished to allow for the development of the two new buildings.

A feature of the Project would be a Historic Structure Report (HSR) that would further document the history of the Times, Plant, and Mirror Buildings and guide their rehabilitation in compliance with the Secretary of the Interior's Standards for Rehabilitation. As such, the HSR would be completed prior to the development of architectural or engineering plans for the rehabilitation. The HSR would be prepared based upon the National Park Service's *Preservation Brief #43: The Preparation and Use of Historic Structure Reports.* The character-defining features of these three buildings are identified in Appendix C. The HSR would provide documentary, graphic, and physical information about the existing conditions of the character-defining features and make recommendations for both changes to the buildings to suit new uses and modern amenities as well as their on-going maintenance after Project completion. The HSR would specifically address the treatment of the west elevations with regard to the demolition of the Executive Building and Parking Structure as well as a new design that combines the rehabilitation of the lower stories and reconstruction of the upper stories.

The North and South Towers would be constructed above a five-story parking podium, an above ground structure forming the street front of the new development and base for the towers. The space below the podium would contain an additional nine levels of subterranean parking. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. The towers would include approximately 34,572 square feet of retail uses, which would be located at ground level. With the addition of retail uses, total new construction would amount to 1,135,803 square feet. Inclusive of the existing buildings to be retained and rehabilitated, the project would include a total of 1,511,908 square feet of floor area for a resulting floor-area ratio (FAR) of approximately 9.42:1.

The Project would include a pedestrian paseo (Paseo) passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street and bisecting the block between the new buildings and Times, Plant, and Mirror Buildings, and would provide a visual connection to the First and Broadway Civic Center Park. Ground level retail uses would be located along the Paseo and the base of the parking podium facing W. 1st Street, S. Broadway, and W. 2nd Street. A 50,000 square foot grocery store would be accessed via the Paseo and the location of the original loading docks in the Plant Building on S. Spring Street.

5.4 Analysis of Project Impacts

The proposed Project involves three activities that have the potential to directly and indirectly impact the identified historical resources on the Project site: demolition, rehabilitation, and new construction. The Project also has the potential to indirectly impact the historical resources in the study area, but only with regard to new construction. Additionally, the Project and related projects in the vicinity could have the potential to cumulatively impact historical resources; therefore, cumulative impacts are also considered. The following discussion analyzes the potential impacts of the Project.

5.4 1 Potential Impacts from the Project on Historical Resources on Site

Demolition

The Project would involve the demolition of the Executive Building and Parking Structure, which are historical resources. The Executive Building is a historical resource because it appears to be individually eligible for listing in the California Register. Times Mirror Square as a whole is a historical resource because it appears to be eligible for listing as a historic district in the National and California Registers. The Executive Building and Parking Structure are contributing to the potential historic district, occupying the west half of the block.

In most circumstances, the demolition of a historical resource cannot be mitigated to a less than significant level. As explicitly defined by CEQA, a substantial adverse change to a historical resource means demolition, destruction, relocation, or alteration of the resource such that its significance is materially impaired.[95] The Executive Building would be materially impaired by the Project because it would no longer be eligible for listing in the California Register if it were demolished. Likewise, Times Mirror Square would be materially impaired by the Project because it would no longer be eligible for listing as a historic district in the National and California Registers if the Executive Building and Parking Structure were demolished. The historic district, which is already small with five contributing buildings, would be reduced to three contributing buildings, which represent a significant but earlier period in the history of the *Los Angeles Times* and Times Mirror Company. So, the breadth of history represented by Times Mirror Square would be lost. Therefore, the Project would have a significant adverse impact on historical resources. The only way of reducing the impact on the historical resources would be redesigning the Project to preserve the Executive Building and Parking Structure, the feasibility of which is addressed in the DEIR.

The demolition of the Executive Building and Parking Structure would have a less than significant impact on the Times, Plant, or Mirror Buildings. The latter three buildings are historical resources because they are formally determined eligible for listing in the National Register, listed in the California Register, and designated as a HCM. The significance of these buildings as individual historical resources is not predicated on the Executive Building or Parking Structure. As the buildings are physically connected along the middle of the block, the demolition of the Executive Building and Parking Structure would require alterations to the west elevations of the Times, Plant, and Mirror Buildings. In the case of the Plant Building, the west elevation is not visible in any of the available historic photographs. Based upon Sanborn maps and historic aerial photographs, the north half of the west elevation has always abutted an adjacent building while the south half was open to a surface parking lot, sometimes referred to as the Broadway Yard

[95] Public Resource Code Section 5020.1(q).

(see **Figure 45**). There is no reason to believe the demolition of the Executive Building and Parking Structure would negatively affect the integrity of the Plant Building. Prior to the construction of the Parking Structure, the Mirror Building shared a west elevation with a three-story commercial building. Thus, the first three stories were never visible. Therefore, the demolition of the Parking Structure would not negatively affect the integrity of the Mirror Building. Given the fact that the Executive Building physically imposes on the Times Building, its removal would improve the integrity of the Times Building with regard to design and setting in the context of its architectural significance. As discussed in greater detail below, the Project proposes to rehabilitate the west elevations of the Times, Plant, and Mirror Buildings, which would be visible along the proposed Paseo.

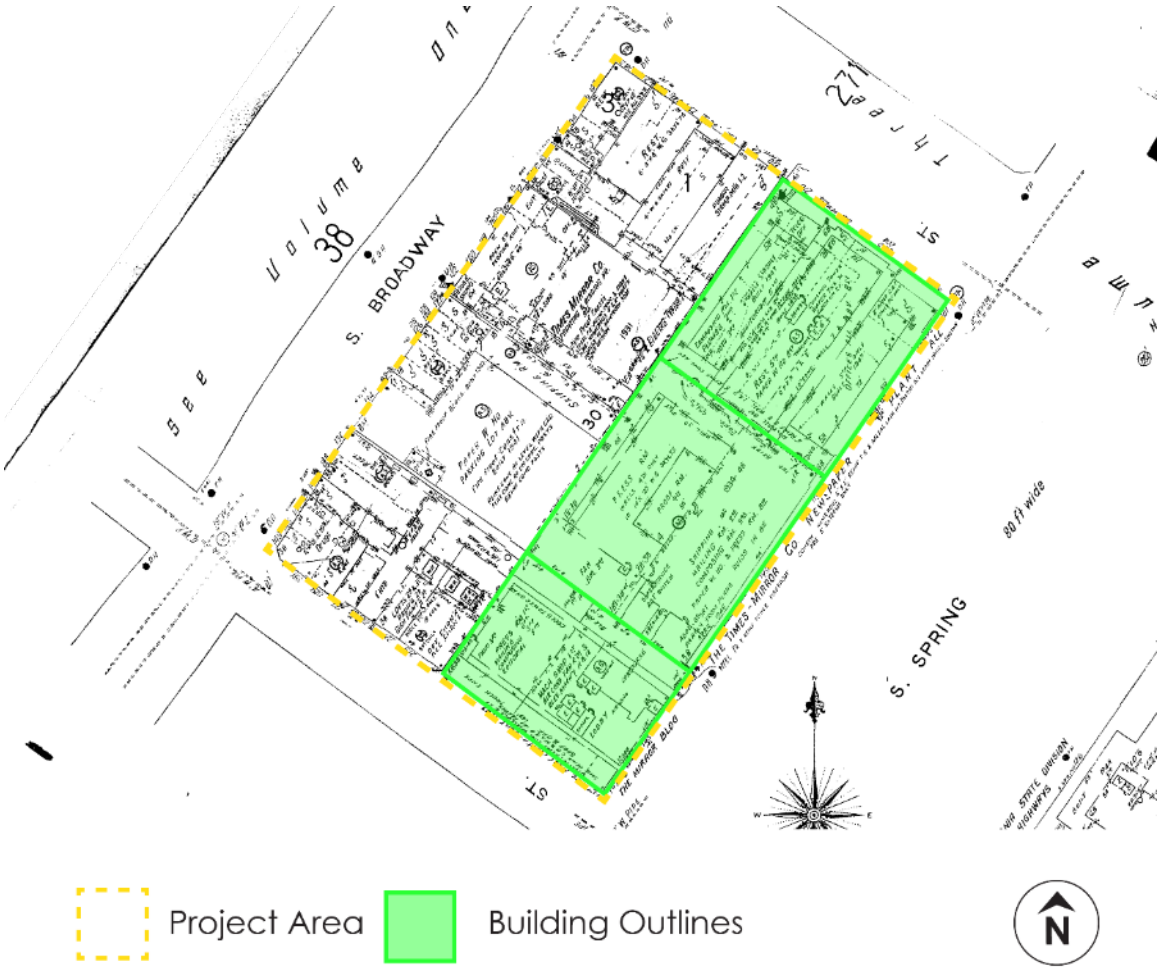

Figure 45: 1950 Sanborn Fire Insurance Map depicting non-extant buildings to the west of the Times, Plant, and Mirror Buildings (LAPL)

Significant adverse impacts from the demolition of the Executive Building and Parking Structure on the Times, Plant, and Mirror Buildings are not anticipated, because the rehabilitation of the west elevations would comply with the Standards as required in the mitigation measure below. Projects that comply with the Standards are considered mitigated to a less than significant level. An additional mitigation measure is recommended to ensure the Times, Plant, and Mirror

Buildings are protected from collateral damage as the Executive Building and Parking Structure are demolished.

Rehabilitation

Under the Project, the Times, Plant, and Mirror Buildings would be rehabilitated and adaptively re-used in accordance with the HSR and in compliance with the Standards to provide approximately 376,105 square feet of offices and/or other retail and commercial uses and an approximately 50,000-square-foot grocery store. The three buildings would be separated from the west side of the block by the Paseo. Each building to be preserved is described in Section 3.2 and the character-defining features are listed, described, and pictured in **Appendix C**.

Figure 46: Times Building, view looking east on W. 1st Street, 1949 (LAPL)

After the demolition of the Executive Building and Parking Structure, the lower stories of the west elevations would be designed in compliance with the Standards. Prior to the construction of the Executive Building and Parking Structure, the west half of the block was occupied by a surface parking lot and two, three, and eight-story buildings. The lower stories of the Times, Plant, and Mirror Buildings abutted these buildings on the west until they were demolished and replaced with the Executive Building and Parking Structure in 1973 (see **Figure 43**). Thus, it may be safely assumed that the lower stories of the west elevations of the three buildings were utilitarian party walls. The construction of the Executive Building; however, destroyed the upper stories of the Times Building that was originally exposed and mirrored the east elevation in design and

materials according to the original architectural plans (see **Figure 44**). The Project proposes to reconstruct the upper stories of the Times Building based upon the original architectural plans and extant physical evidence, if any.

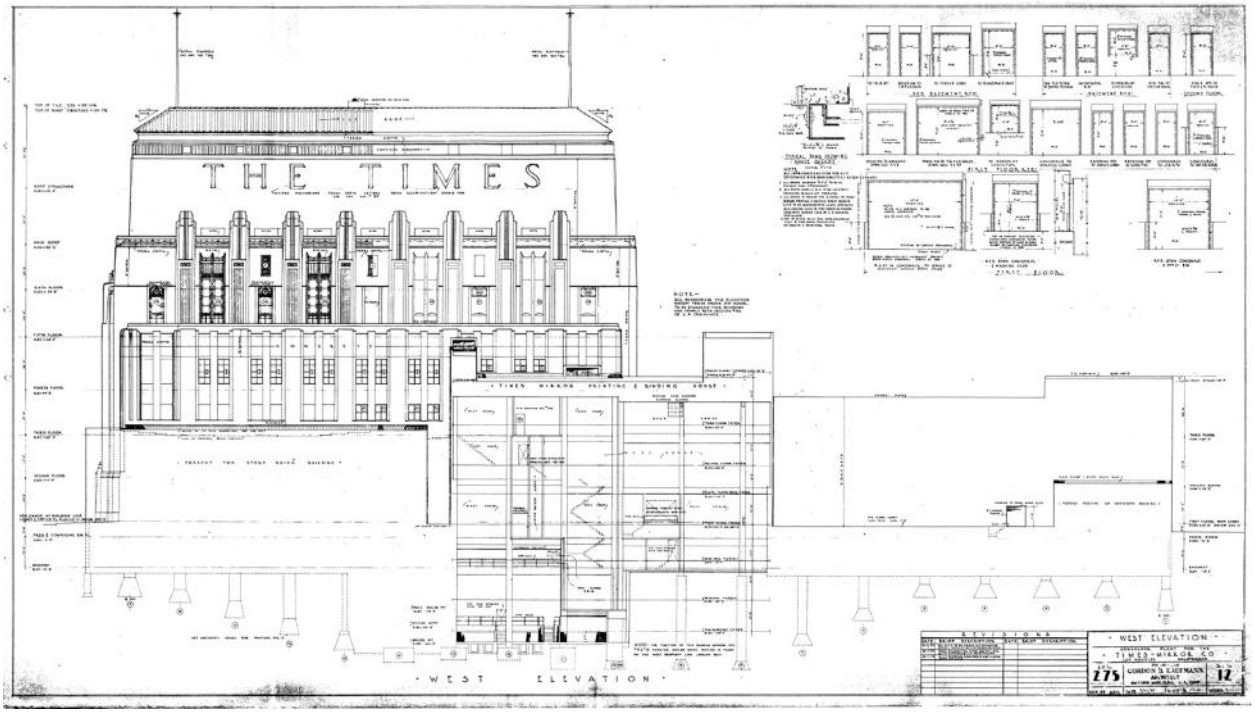

Figure 47: West elevation of Times Building, 1934 (Gordon B. Kaufmann, Architect)

The exteriors of all three buildings would be cleaned and repaired as necessary. The other proposed alterations to the exterior of the Times Building include the removal of the non-original rooftop additions on the fifth and sixth stories of the east elevation. The elevation would be reconstructed based upon the architectural plans and extant physical evidence, if any. On the ground level of the Plant Building, the original loading docks would be reopened for the proposed grocery store or other commercial use. The existing mechanical equipment on the roof of the Plant Building would be relocated and reconfigured for an office terrace, which would be used by office tenants. This area would provide conference/presentation areas and eating/break areas and would not be accessible to the general public. No major alterations to the Mirror Building are proposed, other than the aforementioned reconstruction of the west elevation after the Parking Structure is demolished.

The interiors of all three historic buildings have been heavily altered over time. The two original and architecturally distinctive interior spaces, the lobbies of the Times and Mirror Buildings, would be preserved. The upper floors contain little if any historic fabric, as it was removed as a result of past structural improvements and office modernizations. The upper floors would be reconfigured for office tenants, if required.

In summary, the Project would retain and rehabilitate the primary character-defining features of and remove the non-character defining additions to the Times, Plant, and Mirror Buildings. The rehabilitation portion of the Project would not materially impair the three buildings. As a whole, the appearance, condition, and integrity of all three buildings would be enhanced by the

rehabilitation portion of the Project. The potential impact on the integrity of setting of the three buildings from the new construction portion of the Project is analyzed below. The Times, Plant, and Mirror Buildings would continue to convey their significance. Each would remain eligible for listing in the National Register, listed in the California Register, and designated as a HCM.

Significant adverse impacts from the rehabilitation of the Times, Plant, and Mirror Buildings are not anticipated, because this aspect of the Project would comply with the Standards. Projects that comply with the Standards are considered mitigated to a less than significant level. However, mitigation measures are recommended to ensure conformance with the Standards during the design and development process.

New Construction

The direct impacts from the demolition of the Executive Building and Parking Structure and rehabilitation of the Times, Plant, and Mirror Buildings are discussed and analyzed above. The new construction has the potential to directly impact the Times, Plant, and Mirror Buildings. The buildings could be damaged as a result of excavation/shoring and construction vibration. Thus, mitigation measures are recommended to avoid these impacts. With regard to excavation/shoring, a mitigation measure is prescribed below. A mitigation measure regarding construction vibration is included in the noise section of the DEIR for the Project.

CEQA also requires the analysis of indirect impacts. A substantial adverse change in the significance of these historical resources would occur if the new construction reduced their integrity to the degree they would no longer qualify as historical resources. According to *National Register Bulletin #15*, there are seven aspects of integrity: feeling, association, workmanship, location, design, setting, and materials. The only relevant aspect with respect to the indirect impact of a new building on a historic building is setting. Setting refers to the character of the place in which the property played its historical role.

At the outset, it should be noted that setting is not identified as an essential factor of integrity in the eligibility standards for the contexts, sub-contexts, themes, and sub-themes for which the Times, Plant, and Mirror Buildings are significant (see tables in Section 4 above). The completion of the Executive Building and Parking Structure in 1973, diminished the integrity of setting of the Times, Plant, and Mirror Buildings in the context of their architectural significance, but not necessarily in the context of their historical significance because the period of significance under National Register Criterion A extends to 2000 when the ownership of the *Los Angeles Times* changed.

Prior to the completion of the Executive Building and Parking Structure in 1973, the west half of the block was occupied by two to eight-story buildings that predated the construction of the Times, Plant, and Mirror Buildings between 1935 and 1948. Up to the 1960s, the blocks to the east, west, and south were occupied by low-rise commercial buildings and the block to the north was occupied by a state office building (constructed in 1931 and demolished in 1976). Beginning in the 1960s, many of the small commercial buildings in the area were simply demolished and used as surface parking lots. West of Broadway, they were replaced by another state office building that was recently demolished for the 10-story Federal Courthouse.

The present setting of the Times, Plant, and Mirror Buildings includes the 10-story Los Angeles Police Department Headquarters Building located on the opposite side of S. Spring Street and the 29-story Los Angeles City Hall located diagonally across S. Spring Street and W. 1st Street. The

First and Broadway Civic Center Park is currently under development on the block across W. 1st Street. A surface parking lot and a seven-level enclosed parking structure are currently located across W. 2nd Street. A proposed development for the site includes the demolition of the existing parking structure for the construction of a 30-story mixed-use building.

The North and South Towers would be constructed on the west half of the block in the area currently occupied by the six-story Executive Building at the corner of W. 1st Street and S. Broadway and the six-story Parking Structure at the corner of W. 2nd Street and S. Broadway. The North Tower would be constructed near W. 1st Street and S. Broadway, and the South Tower would be constructed near W. 2nd Street and S. Broadway. The towers would be constructed over a five-story podium and, from street grade, the North Tower would rise 37 stories or approximately 495 feet above grade. The South Tower would rise 53 stories or approximately 665 feet above grade. The Paseo bisecting the middle of the block would physically and visually separate the Towers from the Times, Plant, and Mirror Buildings to the east.

At 37 and 53 stories in height, the North and South Towers would introduce new visual elements to the setting of the Times, Plant, and Mirror Buildings. The new buildings would not be compatible with the size or scale of the historic buildings that range from four to 12-stories in height. Notwithstanding the obvious differences in the height between the new and historic buildings, one of the goals of the Project is to create a visually cohesive design that uses the architecture of Times, Plant, and Mirror Buildings as a reference. The scale of the podium supporting the towers would be articulated with a contemporary base, body, and rooftop. The podium would incorporate solid and transparent glazed materials and strong compositional features, punched and vertical articulation, and massing to complement the architecture of the Times, Plant, and Mirror Buildings. The solid portions of the podium base would incorporate similar materials, textures, and color values to the historic buildings to visually link the entire development.

Even if the integrity of setting of the Times, Plant, and Mirror Buildings was lost as a result of the proposed new construction, they would continue to possess the other aspects of integrity, including feeling, association, workmanship, location, design, and materials. Accordingly, they would continue to convey their significance. Each would remain eligible for listing in the National Register, listed in the California Register, and designated as a HCM.

While the North and South Towers could be considered "related new construction" to the Times, Plant, and Mirror Buildings, the Standards for Rehabilitation are not directly applicable. To that end Standards #9 and #10 are relevant but not determinative in analyzing indirect impacts of new construction on adjacent historic buildings. Standards #9 and #10 primarily address additions to historic buildings or new construction within the boundaries of a historic property or district, which is not the case with the Project as Times Mirror Square would no longer remain eligible as a historic district if the Executive Building and Parking Structure were demolished. Nevertheless compliance with Standards #9 and #10 are discussed below.

Standard #9 states: "New additions, exterior alterations, or related new construction will not destroy historic materials, features, and spatial relationships that characterize the property. The new work will be differentiated from the old and will be compatible with the historic materials, features, size, scale and proportion, and massing to protect the integrity of the property and its environment."

As the North and South Towers would be physically separated from of the Times, Plant, and Mirror Buildings by the Paseo, the new buildings would not destroy historic materials, features, and spatial relationships that characterize the historic buildings. Compliance with this aspect of Standard #9 with regard to the demolition of the Executive Building and Parking Structure and rehabilitation and reconstruction of the west elevations Times, Plant, and Mirror Buildings is analyzed above. Additionally, the west elevations would be addressed in the HSR and monitored by a mitigation measure in Section 5.5. The spatial relationship between the Times, Plant, and Mirror Buildings and their immediate environment would remain intact. These three buildings are oriented towards Spring Street on the east. Notably, the Times Building faces W. 1st Street and is cater-corner to Los Angeles City Hall indicating its position of influence in the city. This spatial relationship would not be affected by the new construction. As previously stated, the size and scale of the North and South Towers are not compatible with the size and scale of the Times, Plant, and Mirror Buildings. However, the podium supporting the towers is designed to relate to the materials, features, size, scale, and proportion, and massing of the historic buildings as described above. In conclusion, the Project complies with Standard #9 to the extent appropriate for this area of Downtown Los Angeles.

Standard #10 states: "New additions and adjacent or related new construction will be undertaken in such a manner that, if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired."

The Project complies with Standard #10. The North and South Towers would be separated from the Times, Plant, and Mirror Buildings by the Paseo. If the new buildings were removed in the future, the adjacent historical resources would not be materially affected. The essential form and integrity of the historical resources and their environment would be unimpaired.

Thus, the indirect impact of the new construction on the remaining historical resources on the Project site would be less than significant and no mitigation is required or recommended.

5.4.2 Potential Impacts from the Project on Historical Resources in the Study Area

The new construction component of the Project would have no impact on the historical resources in the study area. The historical resources in the study area are the Los Angeles Civic Center Historic District (which includes 18 contributors), Los Angeles City Hall, and Higgins Building (see **Figure 48**). The physical characteristics that convey their significance would not be altered in any way by the Project. With regard to the Civic Center, the parcel directly across W. 1st Street between S. Broadway and S. Spring Street is not contributing to the Historic District. The closest contributing building to the Project site is the County Law Library, which would be cater-corner from the North Tower. The immediate setting of the County Law Library has already been altered by the construction of the new Federal Courthouse. Furthermore, the North Tower would not block the view of the County Law Library from within the Civic Center Historic District. Therefore, there is no significant impact on the County Law Library. City Hall is a contributing building to the Civic Center Historic District as well as being a designated HCM. It would be visually separated from the new construction by the Times, Plant, and Mirror Buildings as well as the intersection of W. 1st and S. Spring Streets and City Hall Park. Thus, the contrast between the heights of the North and South Towers and the height of City Hall has been reduced by the physical distance and intervening buildings and features.

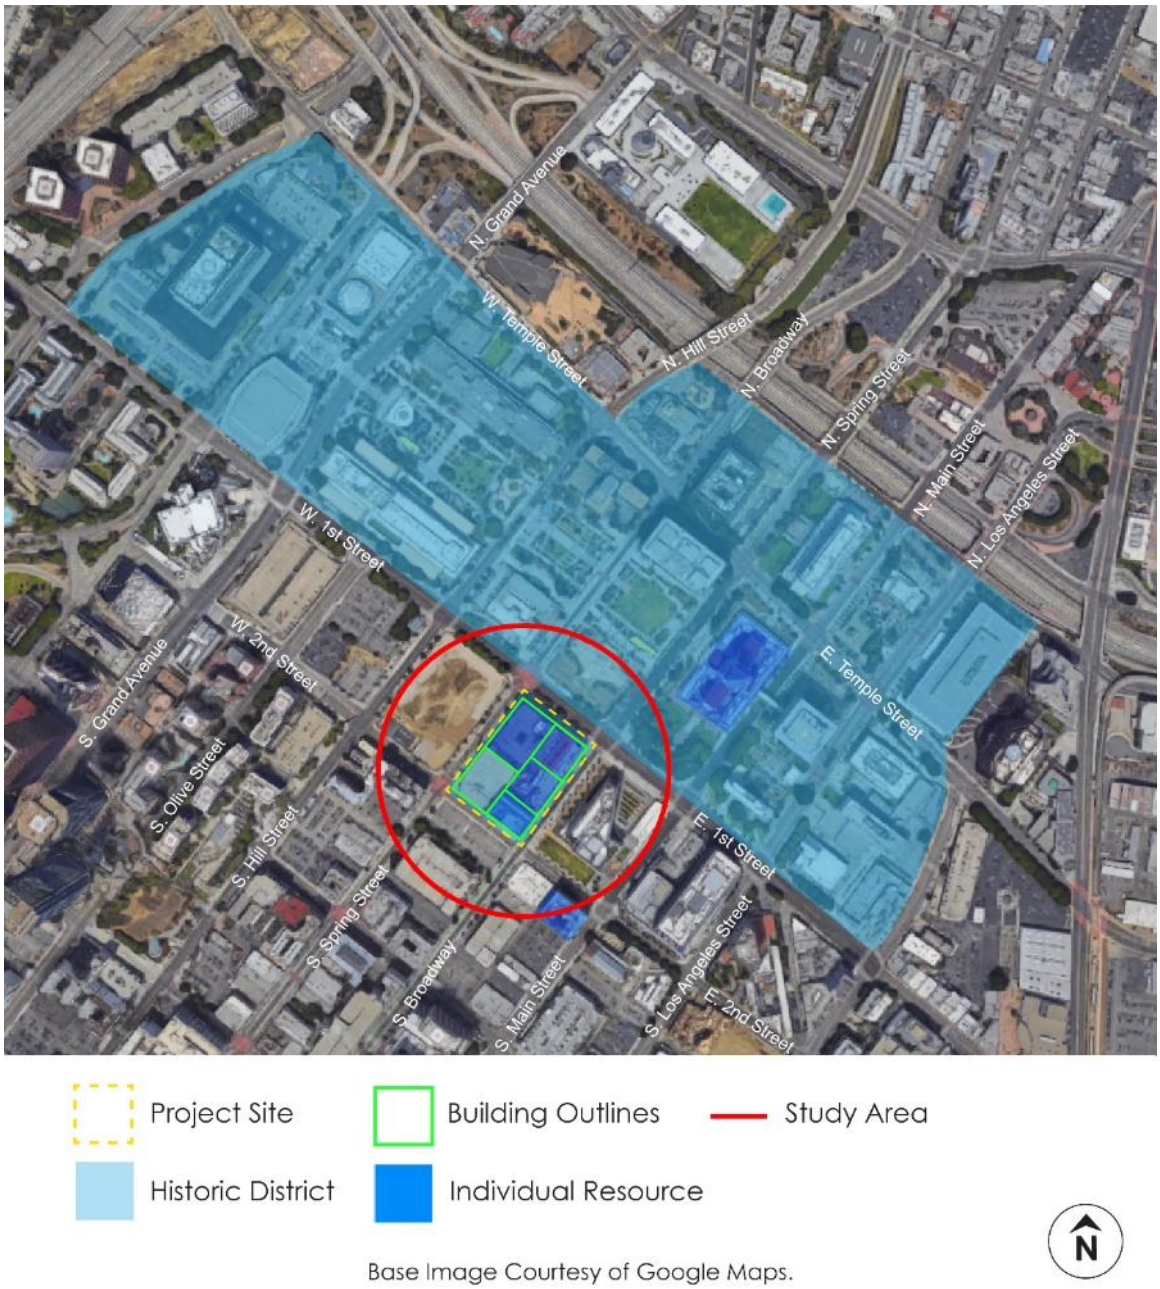

Figure 48: Historical Resources in Study Area

Until 1964, City Hall was the tallest building in Los Angeles and the most prominent element of the Downtown skyline. The Wilshire Grand Center is now the tallest building in Downtown at 1,100 feet and there are 28 other buildings in Downtown that are taller than City Hall. However, City Hall is still the tallest building in the Civic Center Historic District. Therefore, there is no significant impact on City Hall. The North and South Towers would not block the view of City Hall from within the Civic Center Historic District. The other contributing buildings in the Civic Center Historic District are more distant than the County Law Library and City Hall. Therefore, there is no significant impact on the remainder of the contributing buildings or features. As none of the contributors are significantly impacted, there is no significant impact on the Civic Center Historic

District as a whole. The Higgins Building is a designated HCM. The South Tower at the corner of W. 2nd and Broadway would be two blocks away from the Higgins Building at W. 2nd Street and S. Main Street. The two buildings would also be visually separated from each other by the Mirror Building as well as other buildings on the south side of W. 2nd Street. Furthermore, the setting of the Higgins Building has already been altered by the construction of the new LAPD Headquarters. Therefore there is no significant impact on the Higgins Building.

5.4.3. Potential Cumulative Impacts

Cumulative impacts refer to impacts of the Project and related projects in the vicinity, when taken as a whole, that substantially diminish the number of historical resources within the same or similar context or property type. Impacts to historical resources, if any, tend to be site specific. However, cumulative impacts would occur if the Project and related projects cumulatively affect historical resources in the immediate vicinity, contribute to changes within the same historic district, or involve resources that are examples of the same property type as those within the Project site.

There are 170 related projects, four of which are located within 550 feet of the Project site. The four related projects include two development projects located at 201 S. Broadway and 222 W. 2nd Street as well as two infrastructure projects, the Regional Connector Project and Broadway Civic Center Park. These four related projects would not materially impair any historical resources, and as discussed above, the Project would have no indirect impacts on historical resources in the study area. Therefore, there would be no potential for cumulative impact to historical resources in the immediate vicinity.

Cumulative impacts to historical resources must also consider changes within the same historic district. The direct and indirect impacts of the Project on the potential Times Mirror Square historic district are discussed above. As the Project site encompasses the entire historic district, there are no other projects located within the boundaries of the potential Times Mirror Square historic district.

Additionally, cumulative impacts to historical resources must consider whether a project substantially diminishes the number of historical resources of the same property type, even if such other structures are not otherwise on the related projects list. The Executive Building appears to be significant under California Register Criterion 1 within the Sub-Context of Newspapers and Publishing for its association with the Times Mirror Company. Other properties that share the Newspapers and Publishing property type include the 1930 Hollywood Citizen News Building at 1545 Wilcox Avenue, the 1914 Herald Examiner Building at 1111 South Broadway, and the 1937 Hollywood Reporter Building at 6713 Sunset Boulevard. The Hollywood Citizen News Building was identified as eligible for listing in the National Register in the Historic Resources Survey of the Hollywood Redevelopment Area in March 2009 and is currently under consideration for designation as an HCM as of the date of this report, the Herald Examiner Building is a designated HCM and is listed on the National Register, and the Hollywood Reporter Building is a designated HCM and was found eligible for listing in the California Register in the Historic Resources Survey of the Hollywood Redevelopment Area in March 2009.

There is currently a project related to the Herald Examiner Building and a project related to the Hollywood Reporter Building, both of which are not otherwise on the related projects list. According to the Herald Examiner Project Final EIR published in July 2006, the Herald Examiner Building would be rehabilitated in compliance with the Standards to include 20,000 square feet

of retail space, 9,000 square feet of indoor amenities, and 39,725 square feet of office space.[96] It concludes that the impact of the project on the Herald Examiner Building would be less than significant. According to the Crossroads Hollywood Project Final EIR published in May 2017, the Hollywood Reporter Building would be rehabilitated in compliance with the Standards to include 18,000 square feet of retail/restaurant space. [97] The EIR also concludes that the impact of the Crossroads Hollywood Project on the Hollywood Reporter Building would be less than significant. There are no projects proposed with the potential to impact the Hollywood Citizen News Building.

The Executive Building also appears significant under California Register Criterion 2 for its association with Otis Chandler. Besides the Times-Plant Complex, there are no other properties that have been identified as significant for their association with Otis Chandler. The Parking Structure is not significant under California Register Criteria 1 and 2 because it is a purely functional building and is not directly associated with the activities of the Times Mirror Company or Otis Chandler.

Furthermore, the Executive Building's significance is unique to its association with the Times Mirror Company and the career of Otis Chandler. It does not have a relationship to other properties within the Newspapers and Publishing Sub-Context that is relevant to its significance. An analysis of cumulative impacts of the Project and related projects on historical resources of the same property type is more appropriate for historical resources that have a relationship that is relevant to their significance, such as being designed by the same architect or being an example of the same architectural style. Therefore, there are no cumulative impacts on historical resources that are examples of the same property type as those within the Project site.

5.4.4 Conclusions

The Project as proposed involves three activities: demolition, rehabilitation, and new construction. The demolition of the Executive Building and Parking Structure would result in a significant adverse impact on the Executive Building as an individual historical resource as well as Times Mirror Square as a historic district. These resources would be materially impaired by the demolition component of the Project. These resources would no longer be able to convey their significance that justified their eligibility for listing in the National and/or California Registers. Mitigation measures are prescribed below; however, they would not reduce the impact to less than significant. The demolition, rehabilitation, and new construction activities would have a less than significant impact on the Times, Plant, and Mirror Buildings because they would not be materially impaired. While the demolition and rehabilitation components of the Project would require alterations to the Times, Plant, and Mirror Buildings, they would retain sufficient integrity to convey their significance. Indeed, it is more likely that the integrity would be improved rather than diminished by the alterations. Thus, they would remain eligible for listing in the National Register, listed in the California Register, and designated as a HCM. Nevertheless, mitigation measures are recommended below to minimize the already less than significant impact and to promote the highest level of preservation standards. The potential impacts on the historic buildings from excavation and grading and the use of vibratory equipment during the

[96] City of Los Angeles Department of City Planning, Herald Examiner Project, Final Environmental Impact Report: Herald Examiner Project, https://planning.lacity.org/eir/HeraldExaminer/FEIR/index.html. Accessed March 7, 2018.
[97] City of Los Angeles Department of City Planning, Crossroads Hollywood Project, Final Environmental Impact Report, https://planning.lacity.org/eir/CrossroadsHwd/deir/index.html. Accessed March 7, 2018.

construction of the new buildings can be avoided by mitigation measures. One is recommended below and the other is in the noise section of the Project DEIR. The new construction would diminish the integrity of the setting of the Times, Plant, and Mirror Buildings, but not to the degree that they would not remain eligible for listing in the National Register, listed in the California Register, and designated as a HCM. The new construction would also not negatively affect the integrity of the historical resources in the study area. All would continue to convey their significance that justified their listing or evaluation as eligible for listing under national, state, or local landmark or historic district programs. Therefore, the impact of the new construction component of the Project is less than significant and no mitigation is required or recommended. Furthermore, there would be no potential for cumulative impacts as a result of the Project and related projects, when taken as a whole, that substantially diminish the number of historic resources within the same or similar context or property type.

5.5 Mitigation Measures

The Project as currently proposed would have a significant adverse impact on the Executive Building and Parking Structure as well as Times Mirror Square. It would have a less than significant impact on the Times, Plant, and Mirror Buildings. For compliance with CEQA, the lead agency–in this case, the City of Los Angeles–is required to identify potentially feasible measures to mitigate significant impacts and to ensure that any adopted measures are fully enforceable through permit conditions, agreements, or other measures. The intent of the measures is to avoid or minimize impacts to historical resources through feasible, enforceable means while achieving the Project goals and objectives. The following sections summarize the recommended mitigation measures for the Project.

Historic American Building Survey (HABS)

Prior to the issuance of a demolition permit, the Applicant shall have prepared HABS Level II documentation for the Executive Building and Parking Structure according to the *Secretary of the Interior's Standards and Guidelines for Architectural and Engineering Documentation.* The HABS report shall:

1. Be prepared by historic preservation professionals meeting the Secretary of the Interior's Professional Qualifications Standards with demonstrated experience in creating HABS Level II documentation.
2. Include photographs taken with large format (4 X 5), black and white film.
    a. Photographs shall include a minimum of 40 views of the following:
        i. setting of Times Mirror Square from various oblique and cardinal angles,
        ii. exterior views of each elevation of the Executive Building and Parking Structure as well as an assortment of significant architectural features and details, and
        iii. interior views of significant spaces and details.
    b. Photographs or a high-resolution digital scan of original drawings, if available
3. Include written historical descriptive data, index to photographs, and photo key plan.

4. Include copies of historic photographs, if available.

5. Be distributed to the following repositories for use by future researchers and educators. Before submitting any documents, each repository must be contacted to ensure that they are willing and able to accept the items:

    a. Library of Congress - One unbound archival copy including all of the above and one set of negatives.

    b. Los Angeles Public Library - One bound archival copy including all of the above and one set of negatives.

    c. OHR - One high-quality bound copy with digitally printed photographs per HABS guidelines.

Secretary of the Interior's Standards for the Rehabilitation

The Times, Plant, and Mirror Buildings shall be rehabilitated in accordance with the HSR and Secretary of the Interior's Standards for Rehabilitation. The rehabilitation plans shall be:

1. Created by a licensed architect meeting the Secretary of the Interior's Professional Qualifications Standards for historic architecture with at least five years of demonstrated experience in the rehabilitation of historic buildings.

2. Reviewed for compliance with the Standards by a historic preservation professional meeting the Secretary of the Interior's Professional Qualifications Standards for historic architecture with at least five years of demonstrated experience in applying the Standards to such projects.

    a. Reviewer shall create a technical memorandum at each phase (schematic, design and development, and construction documents) of the architectural design process. In the event, the plans do not comply with the Standards, the memorandum shall make recommendations for changes to bring them into compliance.

    b. Reviewer shall submit the memoranda to OHR for concurrence. Building permits may be issued after OHR has concurred the plans comply with the Standards.

Compliance with the Standards shall be disclosed in the lease agreements, agreed upon in writing, and mutually enforced by the Applicant and the City. The tenants shall not be permitted to conduct work that does not comply with the Standards.

Construction Monitoring (Structural)

The Project as it relates to the demolition of the Executive Building and Parking Structure and construction of the North and South Towers shall be monitored to minimize damage to the Times, Plant, and Mirror Buildings. The construction monitoring shall:

1. Be performed by a licensed structural engineer with at least five years of demonstrated experience in rehabilitating historic buildings of similar size.

2. Include a survey the existing foundations and other structural aspects of the Times, Plant, and Mirror Buildings to establish baseline conditions and provide a shoring design to

protect the historical resources from potential damage.

a. Survey shall take place prior to any construction activities.

b. Pot holing or other destructive testing of the below grade conditions on the Project Site and immediately adjacent to the Times, Plant, and Mirror Buildings may be necessary to establish baseline conditions and prepare the shoring design.

c. Monitor shall submit to OHR a pre-construction survey that establishes baseline conditions to be monitored during construction, prior to issuance of any building permit for the Project.

3. Include a meeting with the Project contractor prior to the demolition of the Executive Building and Parking Structure to discuss minimizing collateral damage to the Times, Plant, and Mirror Buildings.

Construction Monitoring (Architectural)

The construction of the Project as it relates to the rehabilitation of the Times, Plant, and Mirror Buildings shall be monitored for compliance with the Standards. The construction monitoring shall:

1. Be performed by a professional meeting the Secretary of the Interior's Professional Qualifications Standards for historic architecture with at least five years of demonstrated experience in rehabilitating historic buildings of similar size.

2. Be performed by the professional at regular intervals during the rehabilitation of the Times, Plant, and Mirror Buildings. The intervals shall include, but not necessarily limited to 50%, 90%, and 100% construction.

a. Monitor shall create a technical memorandum at each interval summarizing the findings, making recommendations as necessary to ensure compliance with the Standards, and documenting construction with digital photographs. Compliance with the Standards shall include the review specifications, tests, and mock-ups for the treatment of historic building materials.

b. Monitor shall submit the memoranda to OHR for concurrence. In the event OHR does not concur, all activities shall cease until compliance with the Standards is resolved and concurrence is obtained.

Appendix A: Résumés

TERESA GRIMES is a Principal Architectural Historian at GPA. She has over 25 years of experience in the field of historic preservation in the private, public, and non-profit sectors. Teresa is widely recognized as an expert in the identification and evaluation of historical resources having successfully prepared dozens of landmark and historic district applications for a wide variety of property types. Her many projects have included historic context statements for Riverside, Calabasas, Glendale, and Carmel-by-the-Sea, and historic resource surveys in Riverside, Whittier, Calabasas, Pasadena, Whittier, and Los Angeles. Teresa has also completed numerous environmental compliance documents involving major landmarks; examples include the United Artist Theater, Cinerama Dome, Dodger Stadium, Los Angeles Sports Arena, Beverly Hills Post Office, and Baldwin Hills Shopping Center.

Educational Background:

- M.A., Architecture, University of California, Los Angeles, 1992
- B.A., Political Science, University of California, Los Angeles, 1986

Professional Experience:

- GPA Consulting, Principal Architectural Historian, 2009-Present
- Christopher A. Joseph & Associates, Senior Architectural Historian, 2006-2009
- Teresa Grimes/Historic Preservation, Principal, 1999-2005, 1993-1994, 1991-1992
- Historic Resources Group, Project Manager/Architectural Historian, 1994-1998
- Getty Conservation Institute, Research Associate, 1992-1993
- Los Angeles Conservancy, Preservation Officer, 1988-1991

Qualifications:

- Meets the Secretary of the Interior's Professional Qualifications Standards for history and architectural history pursuant to the Code of Federal Regulations, 36 CFR Part 61, Appendix A.

Professional Activities:

- Pasadena Heritage Board Member, 2008-2012
- Highland Park Heritage Trust, Board Member, 1996-1998
- West Hollywood Cultural Heritage Advisory Board, 1990-1994

Selected Projects:

- Los Angeles County Museum of Art Master Plan, Los Angeles County, CEQA Historical Resource Report, 2018
- Vine/Afton/DeLongpre, Los Angeles CEQA Historical Resource Report, 2018
- Times Mirror Square, Los Angeles, CEQA Historical Resource Report, 2018
- Figueroa & Flower, Los Angeles, CEQA Historical Resource Report, 2018

- Claremont McKenna College Master Plan, CEQA Historical Resource Report, 2008

LAURA O'NEILL is a Senior Architectural Historian and Designer at GPA. She has been professionally involved in the field of historic preservation since 2006. Laura's experience with GPA has included the preparation of CEQA and Section 106 reports for numerous projects throughout the state. These have ranged from co-authoring the CEQA report for the Nelles Correctional Facility Specific Plan to managing the Section 106 documents for the SR91 West Bound Widening Project. Laura has managed and contributed to a variety of historic context statements and MPD forms including the Latinos in Twentieth Century California MPD, San Diego LGBTQ Historic Context Statement, Late Nineteenth and Early Twentieth Century Development and Architecture in Pasadena MPD, and Postwar Development and Architecture in Fremont Historic Context Statement. Laura uses her educational background in architecture to assist clients in rehabilitating historic buildings in compliance with the Standards. Her recent projects have included assisting the City of Los Angeles with the Mills Act inspection program, completing the Federal Rehabilitation Tax Credit application for the Hotel Rosslyn Annex, preparing a Historic Structure Report for the John Anson Ford Theatres, and consulting on the adaptive reuse of the Spruce Goose Hangar.

Educational Background:

- M.Arch. I, California State Polytechnic University, Pomona, 2009
- B.A., Political Science, Lehigh University, 2002

Professional Experience:

- GPA Consulting, Senior Architectural Historian and Designer, 2008-Present
- Philadelphia Historical Commission, Graduate Intern, 2008
- California State Polytechnic University, Graduate Assistant, 2007-2008

Qualifications:

- Meets the Secretary of the Interior's Professional Qualifications Standards for history, architectural history, and historic architecture pursuant to the Code of Federal Regulations, 36 CFR Part 61, Appendix A.

Professional Activities:

- Santa Monica Landmarks Commissioner, 2014-Present

Selected Projects:

- Los Angeles County Museum of Art Master Plan, Los Angeles County, CEQA Historical Resource Report, 2018
- 1718 N. Vine Street, Los Angeles, CEQA Historical Resource Report, 2018
- Villa Carlotta, Los Angeles, CEQA Historical Resource Report, 2016
- Mira Loma Detention Center Women's Facility, Los Angeles County, CEQA Historical Resource Report, 2016
- Nelles Correctional Facility Specific Plan, Whittier, CEQA Historical Resource Report, 2015
- Evanston Inn, Pasadena, CEQA Historical Resource Report, 2013
- 500 Broadway, Santa Monica, Historical Resource Evaluation Report, 2013
- 21200 Victory Boulevard, Los Angeles, Historical Resource Evaluation Report, 2013
- 1318 2nd Street, Santa Monica, CEQA Historical Resource Report, 2012
- 213 Pomona Avenue, Fullerton, CEQA Historical Resource Report, 2012
- House of Hope, Duarte, CEQA Historical Resource Report, 2010
- Moore House, Palos Verdes Estates, CEQA Historical Resource Report, 2010
- Hollywood Center Studios, Los Angeles, Historical Resources Evaluation Report, 2010
- Wilshire Grand Hotel, Los Angeles, Historical Resource Evaluation Report, 2009

AMANDA YODER is an Associate Architectural Historian at GPA. She has been professionally involved in the field of historic preservation since 2011. Amanda's experience with GPA has included the preparation of CEQA and Section 106 reports for numerous projects throughout the state; design guidelines for historic districts in the City of Long Beach; several architectural and cultural themes for the Los Angeles Citywide Historic Context Statement; Historic American Buildings Survey/Historic American Engineering Record reports for numerous properties including Orange Coast College; National Register of Historic Places and Los Angeles Historic-Cultural Monument nominations for a variety of property types; and Part I Federal Rehabilitation Tax Credit applications for several buildings in downtown Los Angeles. Amanda has also contributed to several large-scale historic resources surveys including the East San Fernando Valley Transit Corridor, High-Speed Rail from Los Angeles to Burbank, I-710 from Los Angeles to Long Beach, Whittier Non-Residential Historic Resources Survey, and SurveyLA.

Educational Background:

- B.F.A, Historic Preservation, Savannah College of Art and Design, 2011

Professional Experience:

- GPA Consulting, Associate Architectural Historian, 2012-Present
- Architectural Resources Group, Intern, 2012
- City of Los Angles, Office of Historic Resources, Intern, 2011-2012

Qualifications:

- Meets the Secretary of the Interior's Professional Qualifications Standards for architectural history pursuant to the Code of Federal Regulations, 36 CFR Part 61, Appendix A.
- National Preservation Institute, Section 106: An Introduction

Professional Activities:

- California Preservation Foundation Conference Programs Committee, 2017

Selected Projects:

- High Speed Rail, Los Angeles to Burbank, CEQA/NEPA Historical Resource Report, 2016-2018
- Rose Hill Courts, Los Angeles, Historical Resource Report, 2015-2017
- Oakwood School Master Plan, Los Angeles, Historical Resource Report, 2016
- Villa Carlotta, Los Angeles, CEQA Historical Resource Report, 2016
- Mira Loma Detention Center Women's Facility, Los Angeles County, CEQA Historical Resource Report, 2016

- Hollywood and Cherokee, Los Angeles, CEQA Historical Resource Report, 2014
- LA Biomed, Torrance, CEQA Historical Resource Report, 2014
- Willys Knight Building, Los Angeles, CEQA Historical Resource Report, 2013
- 8899 Beverly Boulevard, West Hollywood, CEQA Historical Resource Report, 2013
- High Desert Corridor, Los Angeles County, Historical Resource Evaluation Report, Section 106 Review, 2013
- Claremont Graduate University Master Plan, CEQA Historical Resource Report, 2013

EMILY RINALDI is an Associate Architectural Historian at GPA. She has been involved in the field of historic preservation since 2011. Emily's experience with GPA has included the preparation of CEQA and Section 106 reports for numerous projects throughout the state. She has completed architectural surveys for several buildings in Los Angeles, including the Los Angeles Stock Exchange Building, Musicians Union Local 47 Building, Hollywood Sears, Roebuck and Company Department Store, and Barker Brothers Building.

Prior to joining GPA, Emily worked with Building Conservation Associates (BCA) in New York City. At BCA, she prepared Federal Rehabilitation Tax Credit and New York City Landmark applications and assisted with the preparation of the Township Master Plan for Montclair, New Jersey.

Educational Background:

- M.S., Historic Preservation, Columbia University, 2013
- B.A., History, New York University, 2009
- B.A., Political Science, New York University, 2009

Professional Experience:

- GPA Consulting, Associate Architectural Historian, 2017-Present
- Building Conservation Associates, Inc., Historic Preservationist, 2015-2017
- Avery Drawings & Archives, Columbia University, Graduate Intern, 2012-2013
- Docomomo, US, Intern, 2012

Qualifications:

- Meets the Secretary of the Interior's Professional Qualifications Standards for history and architectural history pursuant to the Code of Federal Regulations, 36 CFR Part 61, Appendix A.

Professional Activities:

- Vernacular Architecture Forum, Image Editor for *Buildings & Landscapes*, 2014-Present

21. DESCRIPTION

The building is a monitor shaped, multi-story structure ranging from five to eight stories in height with a basement and sub-basement. The building is of Class A fireproof construction , with skeleton steel frame, and reinforced concrete filler walls, floors and roof slabs. Granite and Indiana limestone are the primary facing materials. Exterior spandrel are of deplated aluminum and the showcase windows are set in bronze. The form of the building is stepped in a symmetrical and pyramidal manner with a central entrance on First Street. The facade is articulated throug the use of grooved vertical ribs dividing the window bays. Ornamentation is confined primarily to spandrel panels although there is some decorative detail surrounding the showcase windows, a repeating eagle motiff in stone and three carved figures above the central entrance. The building is designed in the Moderne style, representing the importance of structural form and utility in design rather than ornamentation.

There have been several additions to the Kaufmann designed Times Structure These additions now comprise the Times Mirror Square

(Continued on following page)

22. SIGNIFICANCE

The structure was designed by the prominent Southern California Architect, Gordon B. Kaufmann. This structure is perhaps the best example of what has come to be known as the WPA moderne in the downtown area.

When it was built the Times Building was the largest structure in the west designed for and occupied entirely by a daily newspaper. It embodied the latest ideas in planning, construction and equipment and was a symbol of the growth and progress of the Los Angeles Times.

Two of the most outstanding construction features were the earthquake resistant design and the building air-conditioning plant. The building was actually designed as two separate structural units. A space of six inches separates the two units and they are connected by slip joints of metal. This insured that the building components would have two different periods of oscillation, and would be safer in the event of a severe earthquake. The air-conditioning system was then the most extensive and comple of any in the west. It included special humidity controls designed to maintain the proper moisture level in the mechanical and printing departments.

The building itself must also be viewed as part of growth of the Times Mirror Company. The first issue of the T imes appeared on December 4, 18 Six months later the orginal publishers sold an interest in the paper to

(Continued on following page)

23. REPRESENTATION IN EXISTING SURVEYS

The Times Building is not represented in any survey other than the initial Los Angeles Downtown People Mover Historical Resources inventory. A form does, however exist for the Butterfield Stage Station which was locat at the site of the present Times Complex, the form is California Historica Resources Inventory #466.

21. DESCRIPTION (Continued)

a complex of structures devoted entirely to the publishing industry. The most notable addition is located at the corner of Broadway and First Street and is directly adjacent to the older Kaufmann designed building. This newer building was erected in 1973 and is in a form influenced by the corporate international style. All of the addition are compatible with the original.

The interior of the building has been remodeled to accommodate the growth of the newspaper. The lobby remains, however much in its original condition. Floors are of inlaid marble with bronze relief; panels surround a large, centrally located globe. The elevator waiting area is ornamented in a mixture of deco and streamline modern motifs. The only major alteration to the lobby area consists of the covering up of a large circular painted mural with metal screening.

22. SIGNIFICANCE (Continued)

Harrison Gray Otis, a prominent and influential citizen. As the majo stockholder Otis moved the paper to the Broadway and First Street location in downtown Los Angeles.

This structure was destroyed by a bombing in 1910, but a new building was erected on the same site. This structure served as the Times office until the Kaufmann designed building was erected.

The Times building must therefore, be considered as significant not only for its design and structural characteristics, but as a symbol of the growth of the Times Mirror Company.

24. BIOGRAPHICAL NOTES ON THE ARCHITECT

Kaufmann, Gordon B. (1888 - 3/1/1949)

Kaufmann was born in London, England. He was educated at the London Polytechnic Institute, and graduated at the age of twenty. He moved to and established residence in Los Angeles, California in 1914 and, in 1920 formed a partnership with Reginald Johnson and Roland Coate.

The partnership produced a considerable number of residential and public buildings, perhaps the most notable of which is St. Pauls Cathedral.

continued on next page

25. ADDITIONAL HISTORICAL NOTES

Leadership of the Times passed to Harry Chandler in 1917, upon the death of his father-in-law Otis. The Times has since remained under the guidance of the Chandler family. Today the Times is the third ranked newspaper in the nation according to a publishers survey.

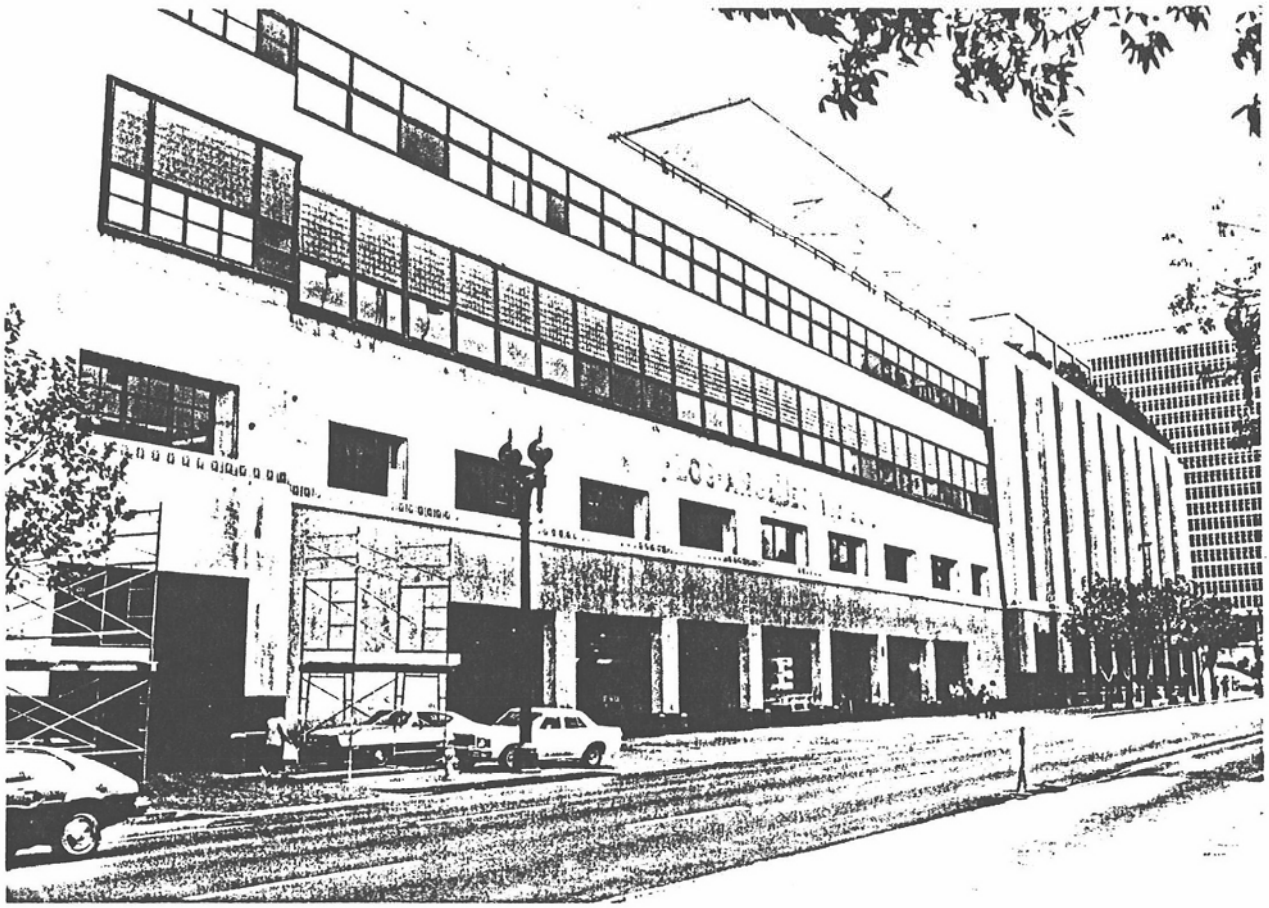
24. BIOGRAPHICAL NOTES ON THE ARCHITECT cont....

Kaufmann designed the Times building as an independent project and it is generally regarded as the outstanding example of his architectural creativity, although he was equally familiar with a number of other styles including Italian, Spanish, French, English, and Old World Renaissance.



Kaufmann designed structures throughout Southern California, and was a well known and respected member of the American Institute of Architects.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The subject property building was described in the *Architectural Guidebook to Los Angeles*: "In 1948, Rowland H. Crawford designed a ten-story addition [to the main *Times-Mirror* Building,]…. It too …(like the main building) is PWA [Public Works Administration] Moderne, but in this case the classical monumentality has mellowed quite a bit. Nevertheless… the sculptured central parapet… helps the building… read with authority."

The three-bay-wide, ten story building is finished in smooth concrete, with Indiana limestone, granite and bronze features and is rectangular in plan. The base features a black watertable, with continuous, low exhibit windows, storefront and glass block, all framed in bronze, and with granite above. The deeply inset entrance is beyond a simply detailed, central opening on the Spring Street elevation. The lower level terminates in simple, Roman grille motif at the beltcourse. Set on the beltcourse, wide, deeply punched windows unique to that level suggest fortification. In the tall, central bay, recessed windows are arranged vertically, with embossed, bronze spandrel panels punctuating interstitial areas.

*B10. Significance: Theme: Commercial Development in Los Angeles, 20th Century Area: Los Angeles region

Period of Significance: 1948-1959 Property Type: commercial building Applicable Criteria: A/1, C/3, D/4

The subject property "office building and plant extension" was designed by prominent local architect Rowland Crawford and completed in 1948. It was built for the *Times Mirror* Company as an addition to the more monumentally scaled, PWA Moderne main Los Angeles *Times* building (see page 1). PWA Moderne was a classically influenced version of the Moderne style, also known as Stripped Classicism. The building's PWA characteristics are its heroic scale, rich imagery and civic-themed sculpture. Moderne elements include the sleek, abbreviated lines and subtle interplay among exposed concrete planes. Like the main building, symbolism in the annex building's details, include use of eagles and the impressive masthead in backlit lettering, intended to conjure images of power, influence and authority. Described as "serious art" embellishments were intended to be didactic, "to inspire, to promote faith in the American way, in American history, [and] in the virture of work" (Gebhard and von Bretton). The location of the complex, directly across the street from City Hall complements the government-related inference.

The history of the venerable *Los Angeles Times* parallels the development of the community. Established as the *Los Angeles Daily Times* in 1881, the irregularly published periodical quickly failed. The printer, Mirror Company, placed General Harrison Gray Otis in charge. Otis (1837-1917) quickly made the fledgling paper a success. The paper and community grew as railroads spurred exponential growth in what had been a tiny pueblo. The *Times-Mirror* Company was established in 1884, merging the printing company with the daily paper. Otis was fiercely opposed to organized labor, he invested heavily in real estate and transit, notoriously supported the region's water rights over those of others, shaping and promoting his ideal community with unmatched fervor. The *Times* was the site of a particularly vicious bombing during a labor dispute in 1910. The crime resulted in loss of lives, conviction of union organizers and their celebrity lawyer was unsuccessfully tried for bribing a juror.

(Sketch Map with north arrow required.)

***P3a. Description:** (continued from page 1)

Although the bronze panels read horizontally, the windows are vertically oriented. Side bays feature bronze-framed, continuous, fixed and double-hung ribbon-type windows, which elegantly wrap around neatly chamfered corners. Continuous glass block transoms follow the window arrangements including the clipped corner detail. Tension between horizontal and vertical elements is articulated in the shaft details: in varying fenestration on the central and side bays. Floor and window heights are subtly differentiated, higher at lower levels and window arrangements vary in restrained compositions. Sculpted eagles at the cornice frame the main decorative elements. An understated, stepped cornice features vertically interposed central human figures in *bas-relief*, above which, a continuous step leads to the central flagpole. The figures represent abstractions of tenets of American principals, including the scales of justice. The building is at the northeast corner of 2nd and Spring streets, and occupies the entire parcel, in the densely built-up Central Business District, and is surrounded by other mid- and high-rise commercial and institutional buildings. The building abuts the *Los Angeles Times* Central Plant (completed 1935) and Executive Parking Structure (1972).

***B10. Significance:** (continued from page 3)

During the twentieth century, the paper evolved from being overtly conservative to non-partisan, which increased its international coverage and overtook its rivals. The corporation was recently sold out of Otis family descendants' ownership. The paper continues to publish and is currently the second largest in the U.S. Despite its achievements over the past 130 years, like its peers, the company is struggling to stay profitable.

The architect, Rowland Henry Crawford (1902- 1973) attended University of Southern California (USC) and Stanford before graduating from the University of Pennsylvania in 1925. Crawford was a partner of Gordon B. Kaufmann, architect of the main *Times* building, beginning in 1930 for about three years. In that position, he served as chief architect for both the original *Times* Building and the Santa Anita Racetrack. In 1938, Crawford established his own firm. His independent works include Brown Derby, East Hollywood (1941), Town & Country Market (1942, no longer extant), Sears (Santa Monica, 1947), Hills Brother Coffee Co. and Brentwood Country Market (1948), USC, Harris School of Architecture building, and additions to the Fine Arts Building (both 1949), El Rancho Shopping Center (Arcadia, 1955) and Beverly Hills High School plant and library (c. 1967). The designer became Supervising Architect for the *Times-Mirror* Company (1945-1956), and served as an advisor to Janss Investment Corporation (1938 -1955), Brown Derby Restaurant Corporation (c. 1938-1956) and Union Federal Savings & Loan Corporation. In his *Times* role, the architect designed their Operations Building, Telephone Directory Plant and Boys Club ("Rowland H. Crawford"). Crawford oversaw minor alterations to the subject property until about 1956. The *Times* Annex was executed using faultless interpretation of the style and a keen eye for proportion, scale and detail. It is his finest individual work, and is a noteworthy example of PWA Moderne design in the region.

Alterations to the subject property building have included the application of reflective tint to windows and recent conversion of Spring Street-fronting loading docks to storefronts (dates unknown). The site is California Historical Landmark #744, because of its former use as the Butterfield Stagecoach Station. Despite described alterations, the building retains sufficient integrity to be recognizable to its original appearance, and is a significant example of the Moderne style. The building is eligible for listing in the National and California Registers under Criteria A/1,C/3, and perhaps D/4. It is directly associated with events that made significant contributions to the broad patterns of our history, the *Los Angeles Times* has undeniably influenced the development and popular opinion of Los Angeles, as its most successful and influential newspaper (Criteria A/1). The building embodies the distinctive characteristics of the PWA Moderne style, the late 1940s period, the reinforced concrete method of construction, and it represents the work of a master architect (Criteria C/3). The building does not represent a significant and distinguishable entity whose components lack individual distinction to be considered a contributor to a large historic district. Because the site was once the Butterfield Stage station, it may yield important information about prehistory or history (Criteria D/4). Because of its association with development of the community and region, as a fine example of PWA Moderne design, use of Portland cement, as the work of a master and as it may provide consequential archaeological information, the *Los Angeles Times* Annex is eligible for listing in the California and National registers at the state level of significance.

DESCRIPTION

6. Briefly describe the present physical appearance of the site or structure and describe any major alterations from its original condition: The building consists of a multi-story structure ranging up to ight stories with basement. The structure is built of steel frame construction ith reinforced concrete, metal lath, and reinforced concrete floors and decking. e exterior facade is of marble at the base, and stone facing with spandrel anels capped by a tile roof above the central clock tower. The form of the uilding is stepped in a symmetrical and pyramidal manner with a central entranc ne building is articulated through the use of grooved vertical ribs dividing ne window base. Ornamentation is confined to spandrel panels and tops of piers. e uilding shows a simplicity of detailing and massiveness of form characterist: WPA moderne. The Times Mirror complex consists of several associated and djacent structures including a press, warehouse, mailing room, machine shops, anc ffices. The most notable addition is located at the corner of Broadway and First is addition consists of metal panels and stone facing in a form influenced by th corporate international style.

***D3. Detailed Description**:

Times Mirror Square is located in the densely developed heart of downtown Los Angeles. The surrounding area consists primarily of civic buildings, such as the Los Angeles Civic Center, U.S. Courthouse, and Los Angeles Police Department Headquarters. North of W. 1st Street, this part of downtown has a slight grade, making Times Mirror Square topographically lower than the buildings to the north. The buildings around Times Mirror Square were constructed at various dates; some date from the early twentieth century, while others are as recent as the 2000s.

The district consists of five buildings (see table below) that were developed over time by the Times Mirror Company. The buildings are described in more detail in the attached Primary Records. Each of the buildings abut each other and the sidewalk and take up the entire city block. There is no greenspace around the buildings, nor passageways between them. Each of the five buildings contributes to the significance of the historic district; some district contributors are also individually significant.

No.	Name	Address/Location	Date	Description	Status Code(s)
1	Times Building	202 W. 1st Street	1935	Eight-story PWA Moderne building designed by Gordon B. Kaufmann	2S2 3D 3CB 5S1
2	Plant Building	121 S. Spring Street	1935-55	Four-story PWA Moderne building designed by Gordon B. Kaufmann; addition designed by Rowland H. Crawford	2S2 3D 3CB 5S1
3	Mirror Building	145 S. Spring Street	1948	Twelve-story Late Moderne building designed by Rowland H. Crawford	3B 3CB 5S1
4	Executive Building	234 W. 1st Street	1973	Six-story International Style building designed by William L. Pereira & Associates	3D 3CB
5	Parking Structure	142 S. Broadway	1973	Six-story parking structure designed by William L. Pereira & Associates	3D 3CD

***D4. Boundary Description**:

The district takes up the Los Angeles city block that is bounded by W. 1st Street to the north, S. Spring Street to the east, W. 2nd Street to the south and S. Broadway to the west.

***D5. Boundary Justification:**

The boundaries comprise the five historically, geographically, and functionally related buildings that were constructed for the *Los Angeles Times* and Times Mirror Company.

D6. Significance (Continued from page 2).

Times Mirror Square appears eligible for listing in the National Register as a historic district under Criteria A and C and California Criteria 1 and 3 for its association with the *Los Angeles Times* and the Times Mirror Company. Under Criterion A it is significant in the Sub-Context Newspapers and Publishing for its association with important events that have made a significant contribution to broad patterns in our history, and under Criterion C it represents a significant and distinguishable entity. The *Los Angeles Times* was first published in 1881 and the Times Mirror Company was founded in 1884. The first home of the *Los Angeles Times* was in the Downey Block at Temple and Spring Streets. By 1887, the company and the newspaper were located at the northeast corner of W. 1st Street and S. Broadway. After the building was bombed by labor union sympathizers, a new larger building rose on the same site. In 1931, the company expanded south of W. 1st Street and had constructed a printing and binding facility at 110 S. Broadway. After the Times-Plant Complex was completed in 1935, the building at W. 1st Street and S. Broadway was demolished. Although the Times Mirror Company did not own the entire block until the late 1960s when it began to develop plans for the Executive Building and Parking Structure, it was commonly referred to as Times Mirror Square. Times Mirror Square is historically significant as a reflection of the ascent of the *Los Angeles Times* to the front ranks of American journalism and the Times Mirror Company to a national media giant. The period of significance is 1935, the year the Times-Plant Complex was completed, to 2000, the year the Times Mirror Company was sold to the Tribune Company.

All of the buildings within the block are contributing to the significance of the historic district because they were constructed within the period of significance and retain sufficient integrity to convey their significance. Thus, the historic district also retains integrity as a whole. Although two of the five contributing buildings are less than 50 years of age, Criteria Consideration G is not required. *National Register Bulletin #15* states "a historic district in which a few properties are newer than 50 years old, but the majority of the properties and the most important period of significance are greater than 50 years old" do not need to meet Criteria Consideration G. *National Register Bulletin #22* provides further guidance on evaluation of historic districts. "Properties less than 50 years old may be integral parts of a district when there is sufficient perspective to consider the properties as historic. This is accomplished by demonstrating that: (a) the district's period of significance is justified as a discrete period with a defined beginning and end; (b) the character of the district's historic resources is clearly defined and assessed; (c) specific resources in the district are demonstrated to date from that discrete era; and, (d) the majority of district properties are over 50 years old. In these instances it is not necessary to prove exceptional importance of either the district itself or of the less-than-50-year-old properties."

The criteria for eligibility for listing in the California Register are similar to the National Register criteria. Furthermore, the California Register statute treats properties less than 50 years of age differently than the National Register. A property less than 50 years of age may be eligible for listing in the California Register if it can be demonstrated that sufficient time has passed to obtain scholarly perspective on the events and/or individuals associated with the property. Therefore, Times Mirror Square appears to be eligible for listing in the California Register as a historic district for the same reasons noted above.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Times Building was constructed between 1933 to 1935 as the new headquarters of the Times Mirror Company, the parent company of the *Los Angeles Times*. The architect Gordon B. Kaufmann designed the Times Building, along with the first two stories of the Plant Building in the PWA Moderne style. The Times Building is located in the northeast corner of Times Mirror Square and faces north toward W. 1st Street. It has a steel frame structural system and a rectangular plan. The walls are made of reinforced concrete and clad with marble, granite, and limestone. (Continued on Page 7.)

P3a. Description (Continued from Page 7):

The building originally had a symmetrical massing which stepped down from approximately eight stories at its tallest central tower to six stories and then four stories at its east and west extents. Rooftop additions east and west of the center tower constructed in the 1940s, 1960s, and 1970s altered the purity of the original massing somewhat, yet the design intent remains evident. The roof over the central tower is hipped and clad with clay tiles. The roof over the east wing is flat, while the roof over the west wing is comprised of the 5th and 6th floors of the Executive Building.

The building's north elevation exhibits a strong emphasis on verticality. It is divided into nine bays divided by fluted limestone pilasters and changes in wall plane. The pilasters begin above a decorative band between the first and second stories and travel to varying heights that step down from the tallest, flanking the center bay, to the shortest, flanking the east and west bays. The pilasters framing the three central bays exhibit more ornamentation than the outer pilasters.

The window openings on the north elevation are original, while the window sashes are all non-original replacements. Counting from east to west, the windows in bays 1, 2, 8, and 9 include pairs of fixed metal-sash windows divided vertically by bronze spandrels. The spandrels exhibit fluting similar to the pilasters. Windows in bays 3 and 7 include single recessed fixed metal-sash windows with no frames or surrounds. Windows in bays 4, 5, and 6 include single fixed metal-sash windows. On the lower stories the windows are divided by bronze spandrels; the fourth and fifth story windows are separated by bas-relief terra cotta panels, and the fifth story windows are topped with sculptures by artist Merrell Gage. There are three sculptures in total and each represents a different journalism-related theme. The titles of the sculptures are "Father Time," "Spirit of the Times," and "Gutenberg." Above the sculptures, at the sixth story, the center bay features a carved terra cotta vent. Above the vent is a large clock. The numbers and ticks are carved into the limestone and illuminated by neon backlights. The hands are metal.

The north elevation's first story is separated from the upper stories by a decorative band of sunbursts and a change in wall material from limestone to granite. Windows on the first story consist of pairs of fixed metal-sash windows with decorative bronze frames in bays 1, 2, 8, and 9, and single recessed fixed metal-sash windows with carved, chamfered frames in bays 3, 4, 6, and 7. Bay 5 consists of the main entrance.

The building's main entrance is located in the center of the north elevation's first story. It is recessed and framed with marble and two different kinds of granite. The entry doors are four side-by-side doors. Bronze crests, sculpted by Merrell Gage, atop the entry doors are dedicated to the themes of "Liberty under the Law" and "True Industrial Freedom."

The east elevation has nine vertical bays. Like the north elevation, the window openings on the east elevation are original, while the window sashes are all non-original replacements. The first four stories of the bays repeat the same motif evident in bays 1, 2, 8, and 9 on the north elevation. Bays 1 and 9 on the east elevation, counted from south to north, are recessed slightly from the rest of the elevation's bays. The fifth and sixth stories have been altered by rooftop additions dating from 1946 and 1965. The 1946 addition was designed by the architect Rowland H. Crawford. There was an identical addition on the west elevation that was removed for the construction of the Executive Building, described below. The 1965 addition, designed by the firm William L. Pereira & Associates, sits on top of the 1946 addition. The additions block some of the building's original design features, including canted bay windows, metal doors, decorative metalwork, terra cotta vents, and five of the eight thin buttresses that span from the fourth story roof to above the sixth story roof. Above the buttresses the words "THE TIMES" appear in recessed, neon-lit lettering. Above the lettering is a band of dentils.

Due to the presence of the Plant Building, the south elevation of the Times Building is only visible above the fourth story. On the west elevation of the Times Building, only the central tower is visible due to the presence of the Executive Building. The third through sixth stories appear to have originally been identical to those on the east elevations. All of the original buttresses along the west elevation were demolished in 1971 for the construction of the adjoining Executive Building.

The Times Building and the Plant Building were considered jointly as one historical resource with two contributing buildings, instead of two individual resources, for the following reasons: both buildings were built at the same time and designed by the same architect, and while their structures are separated by a 6-inch seismic joint, they have always been internally connected and used for purposes directly related to publishing the Los Angeles Times newspaper.

The Plant Building is located directly south of the Times Building on S. Spring Street between W. 1st Street and W. 2nd Street. It exhibits three distinct phases of construction. The first phase occurred in 1935 in conjunction with the Times Building. It included the first two stories and was designed by Gordon B. Kaufmann in the PWA Moderne style. The second phase occurred in 1946 and included the addition of a third story. The third story was designed by Rowland H. Crawford who worked for Kaufmann and would later design the Mirror Building. The third phase occurred in 1955, also designed by Crawford, and consisted of the addition of a fourth story that connected to the Times and Mirror Buildings. (Continued on Page 10.)

P3a. Description (Continued from Page 9):

After the two additions in 1946 and 1955, the Plant Building is currently four stories tall and rectangular in plan. It faces east onto S. Spring Street. The building has a steel frame structural system and reinforced concrete walls clad with granite and limestone. It abuts buildings to the north, south, and west, leaving only the east elevation visible. The first story of the east elevation is clad with the same granite as the first story of the Times Building and is divided into nine bays. It originally featured seven large openings for loading docks. The openings remain, but they have been altered. The most recent alterations occurred in 2000. Five of the seven loading dock openings were infilled with curved, butt-glazed storefront windows with marble tile bulkheads and thick aluminum trim. The opening in the seventh bay, when counted from south to north, has been infilled with a flat, glazed storefront with a frameless glass door, butt-glazed sidelights, a marble tile bulkhead, and thick aluminum trim. The eighth bay has a non-original metal roll-up door.

The second story is divided from the first by a decorative band of sunbursts identical to the one on the Times Building. The wall surface changes from granite to limestone above the band. Windows on the second story include recessed non-original fixed metal-sash windows with chamfered openings. In the center above the windows, the words "LOS ANGELES TIMES" and the paper's insignia are carved into the limestone. The third and fourth stories consist of continuous bands of non-original fixed metal windows with original prismatic glass block transoms.

The Times Building and the Plant Building were considered jointly as one historical resource with two contributing buildings, instead of two individual resources, for the following reasons: both buildings were built at the same time and designed by the same architect, and while their structures are separated by a 6-inch seismic joint, they have always been internally connected and used for purposes directly related to publishing the Los Angeles Times newspaper.

Period of Significance 1935-2000 (A); 1935-1944, 1936-1968, 1960-1972 (B), 1935 (C) **Property Type** Commercial
Applicable Criteria A/1, B/2, C/3

The Times-Plant Complex, consisting of the Times and Plant Buildings, was formally determined eligible for listing in the National Register in 1978. Properties that are formally determined eligible for listing in the National Register through the Section 106 process are automatically listed in the California Register. Thus, the complex is listed in the California Register. Additionally, the complex is designated a Los Angeles Historic-Cultural Monument (HCM) along with the Mirror Building. The significance and integrity of the complex under the National Historic Preservation Act are summarized below.

National Register Evaluation

Criterion A

In order to qualify under Criterion A of the National Register, a property must be associated with events or trends that have made a significant contribution to the broad patterns of our history. The Times-Plant Complex is significant in the context of newspapers and publishing for its direct association with the Times Mirror Company and *Los Angeles Times*. The Times-Plant Complex is the oldest extant headquarters of the company and newspaper. The original location was a small brick building located at the corner of Temple and New High (now Spring) Streets. The second location was at the northeast corner of W. 1st Street and S. Broadway. Union leaders bombed this location in 1910 in response to the paper's anti-union stance. (Continued on page 12.)

(This space reserved for official comments.)

(Sketch Map with north arrow required.)

***B10: Significance** (Continued from Page 11):

In 1911, construction began on a new headquarters building on the same site. In 1934, Harry Chandler initiated the construction of the current Times and Plant Buildings, designed by Gordon B. Kaufmann and completed in 1935. The complex remains the center of the *Los Angeles Times* newspaper operations to the present day, despite the change in parent company ownership in 2000. As the longest running and at various times most prominent newspaper in Los Angeles, the *Los Angeles Times* is undoubtedly significant within the history of the city's press. The period of significance under Criterion A begins in 1935, the year the buildings were constructed, and extends to 2000, the year the Tribune Company purchased the Times Mirror Company and by extension the *Los Angeles Times*.

Criterion B

To be eligible for listing in the National Register under Criterion B, a property must be associated with the lives of persons significant in our past. As the Times-Plant Complex has continuously functioned as the headquarters of the *Los Angeles Times* for almost 80 years, it was the workplace for numerous journalists, editors, and publishers over time. Of these, three stand out as potentially significant individuals: the three Chandler publishers Harry, Norman, and Otis. All three had offices in the Times Building for several years during their tenures: Harry from 1935 to 1944, Norman from 1936 to 1960, and Otis from 1960 to 1972.

Harry Chandler is more significant for his contribution to the commercial development of Southern California than the history of newspapers and publishing. The productive period of his life for which he is significant began in 1905 with the aqueduct project and continued until his death in 1944, although his influence waned in the late 1930s and 1940s when both his health and public approval declined. Harry commissioned the construction of the Times and Plant Buildings. They represent one of his last major real estate deals and housed his personal office from 1935 to 1944.

Norman Chandler is significant in the context of newspapers and publishing. His business acumen propelled the Times Mirror Company from a local business with one newspaper, the *Los Angeles Times*, to a national enterprise with a variety publishing and media companies. His period of significant work began in 1936, when he took on a leadership role as general manager of the *Times*, and lasted until 1968, when he retired as the chairman of Times Mirror. Norman's office was located in the Times Building throughout this period.

Otis Chandler is widely recognized as one of the most important newspaper publishers in the U.S., along with Henry Luce and Katherine Graham. As his *New York Times* obituary in 2006 explained, he transformed the *Los Angeles Times* into "one of the most respected, widely read and profitable newspapers in the United States," and he accomplished this in a very short period of time, considering the paper had eight decades of partisan history behind it. In 1980, at the age of 52, Otis stepped down as publisher and appointed an outsider, not a family member, to the post for the first time in the paper's history. Otis worked out of the Times Building for 12 of the 20 years he was publisher

Criterion C

To be significant under National Register Criterion C, a property must embody the distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction.

The Times-Plant Complex is significant as an excellent example of PWA Moderne architecture from the 1930s. The Times Building is the more ornate and stylized of the two buildings. It possesses many of PWA Moderne's character-defining features, including a symmetrical façade, strong vertical emphasis, thick walls clad with smooth stone and granite, a band of sunbursts, sculptures and carved details, decorative spandrels, and a stepped massing with a central tower. The features are employed with expertise and rendered in beautiful, rich materials. Overall, the Times Building exhibits very high quality of design. The Plant Building exhibits the same basic materials and symmetry as the Times Building, and although it does not have the same elaborate details, it complements the Times Building while reflecting its original industrial use.

Additionally, the complex is eligible under Criterion C as a representative work of master architect Gordon B. Kaufmann. The Times Building represents Kaufmann's most impressive PWA Moderne design before he transitioned into the curved edges and glass block synonymous with the Streamline Moderne. It is a striking composition that stands out as an important example of his work in the 1930s. The Plant Building, though not one of Kaufmann's most important buildings individually, complements the Times Building and contributes to the design of the resource as a whole.

And finally, the Times Building is eligible under Criterion C for possessing high artistic value. The lobby includes sculptures, murals, and other decorative features, which constitute a cohesive work of art. The intricate, detailed pieces created by Merrell Gage and Hugo Ballin are truly outstanding, as are the marble columns, walls, and floors.

The period of significance under these components of Criterion C is 1935, the date of the design.

Criterion D

Criterion D was not considered in this evaluation, as it generally applies to archaeological resources.

Integrity

To be eligible for listing in the National Register, properties must retain their physical integrity from the period in which they gained significance. In the case of architecturally significant properties, the period of significance is normally the date of construction. For historically significant properties, the period of significance is usually measured by the length of the associations. The Times-Plant Complex has multiple periods of significance: under Criterion A the period of significance is 1935 to 2000; under Criterion B there are three periods of significance is 1935 to 1944, 1936 to 1968, and 1960 to 1972 for the first three publishers; and under Criterion C the period of significance is 1935. While some factors of integrity are more important than others depending on the property, a majority of the seven recognized factors should be retained. The Times-Plant Complex retains its integrity of location, workmanship, feeling, and association for each period of significance.

Its integrity of design and materials has been diminished by the construction of the roof top additions on the Plant Building and interior alterations to both buildings with regard to Criterion B and Criterion C, but not Criterion A. The immediate setting of the Times Building in particular changed dramatically with the construction of the Executive Building. The Executive Building replaced one and two-story buildings on W. 1st Street and enveloped an eight-story building on S. Broadway. While the scale of the two buildings is similar, the design of the Executive Building is physically imposing on the Times Building. The broader setting of the Times-Plant Complex also changed with the redevelopment of the surrounding blocks. Integrity of setting, however, is not essential for eligibility under Criterion B and C. Despite the alterations and additions, the Times-Plant Complex retains integrity as a whole under Criteria A, B, and C for each period of significance.

California Register Evaluation

The Times-Plant Complex was automatically included in the California Register when it was signed into law in 1992. The California Register was modeled on the National Register. The criteria for eligibility for listing in the California Register are virtually the same as the National Register. Therefore, the Times-Plant Complex remains eligible for listing in the California Register for the same reasons noted above.

P3a. Description (Continued from Page 14):

The east elevation is symmetrical. Above the second story, it is organized into three vertical sections. The center section has seven bays; the end sections have horizontal bands of ribbon windows. The center section is taller than the end sections. The seven vertical bays of the center section are recessed and consist of metal windows separated by sculpted bronze spandrels. The windows on the third and fourth stories are fixed single-light replacement windows. The windows on the upper stories are multi-light casements. The five middle bays extend to the parapet and are topped with sculpted figures that were designed by Crawford and represent culture, justice, faith, progress, and equality. The two end bays are shorter and topped with sculpted panels.

The ribbon windows on the two end sections consist of metal windows with prismatic glass block transoms. As in the center section, the windows on the third and fourth stories are non-original. They are fixed single-light windows with metal sashes. The windows on the upper stories are two-light metal-sash awning windows. The window bands wrap around to the north and south elevations.

The east elevation's first story consists of the main entrance and six windows. The main entrance is located in the center of the elevation and surrounded with granite. There are four side-by-side entry doors recessed in an entrance vestibule. The doors are fully glazed with bronze frames and push-bars. The doors are topped with tall single-light transoms. The side walls of the vestibule feature bronze doors flanked and topped with decorative cast bronze panels.

The rest of the first story consists of the following: four recessed single-light fixed metal windows with decorative metal surrounds, a large, non-original, butt-glazed window at the north end with a bronze surround and a granite bulkhead, a large, 11-light window with prismatic glass block in the top three lights and a decorative, coated metal frame, and a granite base.

The east elevation's second story is separated from the first by a decorative band similar to those on the Plant and Times buildings. Above the band there are nine recessed openings. Some are infilled with vents; others include metal-sash windows.

The south elevation repeats many of the features from the south end of the east elevation, including the ribbon windows on the upper stories, recessed windows on the second story, decorative band between the first and second stories, and the granite base on the first story. The first story of the south elevation also includes a band of multi-light windows with glass block top lights and decorative coated metal frames, similar to the one at the south end of the east elevation. Other openings on the first story include large vents, a non-original storefront window, and a vehicular opening with a metal roll-up door.

Most of the west elevation is blocked by the adjacent Parking Structure. The upper stories visible above the Structure exhibit seven vertical bays similar to those on the east elevation, but much simpler in detail. The bays consist of multi-light metal casement windows and limestone spandrels. The north elevation consists of six stories above the adjoining Plant Building. The ribbon windows from the north end of the east elevation wrap the corner of the building on all of the visible stories.

B9a. Architect: Rowland H. Crawford b. Builder: PJ Walker Co.
***B10. Significance: Theme** Newspapers and Publishing/Late Moderne Architecture **Area** Los Angeles
Period of Significance 1948-1962 (A); 1948 (C) **Property Type** Commercial **Applicable Criteria** A/1, C/3

The Mirror Building was evaluated by SWCA Environmental Consultants in 2009 as part of the Regional Connector Transit Corridor Project. The evaluation concluded that the building was eligible for listing in the National Register under Criteria A, C, and D. As such, it is a historical resource subject to CEQA. Additionally, the building is designated a Los Angeles Historic-Cultural Monument (HCM) along with the Times-Plant Complex. The following paragraphs summarize the 2009 evaluation and provide some suggestions for minor revisions.

National Register Evaluation

Criterion A

The Mirror Building is eligible under Criterion A for its direct association with the *Los Angeles Times* and the history of the press in Los Angeles. The period of significance identified on the 2009 inventory form for this criterion extends from 1948 to 1959. While the 1948 start date is accurate as it relates to the year of construction, a more appropriate end date would be 1962 when the Times Mirror Company ceased publication of the *Times*' afternoon edition, the *Los Angeles Mirror*. The building was constructed to house the *Mirror*'s offices, and as a result, its significance is most accurately reflected by the time period associated with the *Mirror's* publication. (Continued on Page 17.)

B11. Additional Resource Attributes: (List attributes and codes) _____

***B12. References:**

See Page 3.

B13. Remarks:

None.

***B14. Evaluator:** GPA Consulting
***Date of Evaluation:** 12/5/2018

(This space reserved for official comments.)

(Sketch Map with north arrow required.)

B10. Significance (Continued from Page 16):

Criterion C

The Mirror Building is eligible under Criterion C for embodying the distinctive characteristics of the Late Moderne style of architecture. The 2009 evaluation classifies the building as PWA Moderne, but Late Moderne is a more appropriate classification due to the building's 1948 construction date and design details. The building is also eligible under Criterion C as the work of master architect Rowland H. Crawford. The period of significance under Criterion C is 1948, the date of construction.

Criterion D

The 2009 evaluation concluded that the site on which the Mirror Building is located is eligible under Criterion D, because of its CHL designation as the location of the Butterfield Stage Station. As the site of an important historical place, it has the potential to yield important information about the prehistory or history of the area. However, it should be noted that because the Mirror Building has multiple floors below grade, it is likely that any intact archaeological resources were disturbed or removed during its 1948 construction.

Integrity

For a resource to be eligible for the National Register, it must reflect its appearance from its period of significance. The 2009 inventory form did not provide a detailed assessment of integrity but concluded that the Mirror Building is able to convey its significance. The Mirror Building has multiple periods of significance and it reflects its appearance from each of them: under Criterion A the period of significance is 1948 to 1962 and under Criterion C the period of significance is 1948. Although the interior has been substantially altered, the exterior is essentially intact. The integrity of setting has changed with the construction of the Parking Structure and the redevelopment of the surrounding blocks. Integrity of setting, however, is not essential to eligibility under Criterion C.

California Register Evaluation

The Mirror Building was automatically included in the California Register when it was determined eligible for listing in the National Register in 2010. The California Register was modeled on the National Register. The criteria for eligibility for listing in the California Register are virtually the same as the National Register. Therefore, the Mirror Buildings remains eligible for listing in the California Register for the same reasons noted above.

P3a. Description (Continued from Page 18):

The building's massing consists of large boxy horizontal volumes supported by boxy vertical volumes. The horizontal volumes feature bands of fixed coated aluminum windows with coated spandrels and coated metal paneling, so they have a visually lighter appearance than the granite-clad vertical boxes. The boxes are arranged to create a deep recess at the street level which feature landscaping. The recess wraps the northwest corner of the building. The largest horizontal box protrudes beyond the rest of the building at the fifth story, creating a high overhang for the recessed space below.

The building's main entrance is located at the east end of the north elevation. It is deeply recessed from the street and consists of coated aluminum storefront doors with large sidelights and transoms. An additional exterior entrance is located near the center of the west elevation. This entrance consists of a pair of aluminum and glass doors with a fixed aluminum transom. An exterior walkway at the second story extends from the adjacent Parking Structure to the south along the Executive Building's west elevation and onto the north elevation.

The Parking Structure is located at the northeast corner of S. Broadway and W. 2nd Street. It was designed by William L. Pereira & Associates in conjunction with the Executive Building, located directly north of the Parking Structure, and completed in 1973. It has a rectangular plan and a steel-frame structural system. The building's massing consists of a solid, vertical core with open, horizontal parking decks. The core is clad with the same granite as the vertical elements of the Executive Building. The low walls of the parking decks are clad with the same coated metal. Railings along the parking deck walls are also made of coated aluminum. Entrances to the Parking Structure consist of large vehicular gates on the first story of both the south and west elevations. Most of the first story is enclosed with metal slat vents.

Period of Significance 1973-2000 **Property Type** Commercial **Applicable Criteria** 1/2

The Executive Building is ineligible for the listing in the National Register because it is not of exceptional significance, which is required for properties less than 50 years of age. The following paragraphs provide a detailed evaluation under each criterion, as well as an analysis of integrity.

National Register Evaluation

Criterion A

The Executive Building was constructed between 1970 and 1973 to house the executive offices of the Times Mirror Company, as well as office rental and bank space under the direction of Dorothy Chandler. Times Mirror was an American newspaper and print media publisher that grew to include television stations. It had its roots in the Mirror Printing and Binding House, established in 1873 primarily for commercial printing. In 1881, the Mirror Printing and Binding House agreed to print a new daily newspaper called the *Los Angeles Daily Times*, soon renamed the *Los Angeles Times*. (Continued Page 22.)

B10. Significance (Continued from Page 20):

During the twentieth century, through a series of acquisitions including publishing companies, broadcasting stations, and magazines the Times Mirror Company became a media empire with nearly $4 billion in revenue during the 1990s. The Times Mirror Company is undoubtedly significant in the Sub-Context Newspapers and Publishing. It was one of the oldest and largest companies in Los Angeles before it was sold in 2000. However, properties like the Executive Building that have achieved significance within the past 50 years, must meet Criteria Consideration G to be eligible for listing in the National Register. Criteria Consideration G states "a property achieving significance within the last 50 years is eligible if it is of exceptional importance." For a variety of reasons, the Executive Building is not of exceptional importance for its association with the Times Mirror Company. First, it is not the founding location of the company. The original and earlier buildings have been demolished. Between 1935 and 1972 the company was located in the extant Times Building to the east. In its 116-year history, the company was located in the Executive Building for 27 years, 1973 to 2000. Second, no information was found to indicate that events of exceptional importance occurred during this period. The growth of the company into a media giant began in the 1950s and continued in the 1960s when it was located in the Times Building, not the Executive Building.

Criterion B

To be eligible for listing in the National Register under Criterion B, a property must be associated with the lives of persons significant in our past. As the headquarters of the Times Mirror Company for the last 27 years of its history, it was the workplace for numerous executives and directors. However, the three most closely associated with the building were Otis Chandler, Franklin Murphy, and Dorothy Chandler. All three are undeniably significant in the history of Los Angeles, and their many accomplishments are well documented. Other individuals that could be significant include, but are not discussed below, Albert Casey and Robert Erburu. As National Register Bulletin #15 explains, “For properties associated with several community leaders…, it is necessary to identify specific individuals and to explain their significant accomplishments.” The bulletin further explains that for a property associated with numerous individuals to be significant, “the significance of one or more specific [individuals must be] explicitly justified.” It goes on to clarify that if the significance of the historic property is related to “the cumulative importance of prominent [persons],” then the property would not be eligible under Criterion B; but rather, it might be eligible under Criterion A. As noted above, however, the Executive Building and Parking Structure do not meet Criterion A.

The significance of the Executive Building rests in the cumulative contributions of the important individuals who were instrumental in the management of the Times Mirror Company, rather than the specific contributions of one, or even a few, individuals. Otis Chandler, Franklin Murphy, and Dorothy Chandler[1] all played important roles in the company, and are associated with the Executive Building; however, the individual association of each is not particularly strong. From 1960 to 1972, Otis Chandler's office was located in the Times Building. During that period, he had already transformed the *Times* from a local publication to a national newspaper with a reputation for excellence. He moved his office to the Executive Building in 1973. From 1973 to 1980, he continued to serve as the publisher of the *Los Angeles Times* and the vice president for newspapers at Times Mirror. He stepped down as the publisher in 1980 and became the chairman of Times Mirror, but the position of chief executive officer was filled by Robert Erburu. Chandler kept an office in the Executive Building but reduced his role in the day-to-day operations of the company to focus on other interests. He was ousted as chairman of Times Mirror in 1985. Murphy was influential in the educational, political, and cultural development of Los Angeles, if not the United States.[2] The length of his association with the Executive Building is not long enough to be considered significant. In the 116-year history of the company, Murphy was the chairman and chief executive officer of Times Mirror for 12 years (1968 to 1980) and his office was in the building for seven years (1973 to 1980). Furthermore, his specific accomplishments at the company during this period are not well documented. While Dorothy Chandler by all accounts had more to do with construction of the Executive Building than any other individual, she only maintained an office in the building until 1976. From 1974 to 1976 she was relegated to emeritus director and it is unclear how much time she spent in the building. Arguably, Chandler would consider her life's work to be the Los Angeles Music Center.

[1] Others could include Albert Casey and Robert Erburu.
[2] Davis, 119-37.

Therefore, the Executive Building does not appear to be eligible for listing in the National Register under Criterion B and in any event is not of exceptional importance.

Criterion C

To be significant under Criterion C, a resource must embody the distinctive characteristics of a type, period, or method of construction, represent the work of a master, possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction. The Executive Building and Parking Structure were designed in 1970 in the Corporate International Style of architecture by William L. Pereira & Associates.

The Los Angeles region has countless examples of Corporate International Style buildings, many of which are considered extremely significant. These include everything from office buildings like the American Cement Building (1961, Los Angeles) by DMJM, hotels like the Century Plaza Hotel (1966, Los Angeles) by Minoru Yamasaki, hospitals like the Century City Medical Plaza (1969, Los Angeles) by Cesar Pelli and Anthony Lumsden for DMJM, and numerous banks buildings like Great Western Savings (1972, Beverly Hills, renamed the Flynt Building) by William L. Pereira & Associates and Bank of America Plaza (1974, Los Angeles) by A.C. Martin and Associates as well as campuses for new technology firms like Xerox (Craig Ellwood, 1966, El Segundo) and TRW (A.C. Martin and Associates, 1967, El Segundo).

For the Executive Building and Parking Structure to be significant under Criterion C for their Corporate International design, they must not just be examples of the style; they must also be important examples. This is not the case with either building. While the Executive Building employs several elements of the Corporate International Style such as box-shaped forms, horizontal bands of windows and stone panels, and a landscaped plaza, it is clear that it is not a significant example when compared with the landmark examples noted above and numerous others. Rather, the building is a late, average example of the style applied to a mid-rise corporate building. Additionally, research on the building in architectural periodicals and books did not yield any results indicating that it was considered an important work during its time or in subsequent decades. The only mentions of the building were in the Los Angeles Times, which gave it glowing reviews, for obvious, promotional reasons. While the Parking Structure was designed in conjunction with the Executive Building, it was not referred to in the article. Furthermore, it does not exhibit the elements of the Corporate International Style, or any other styles within the Modern movement. As the Executive Building and Parking Structure are not significant examples of an architectural style, the buildings do not appear to be significant for embodying the distinctive characteristics of its type or period of construction. Additionally, they did not involve any novel or noteworthy construction techniques, so they do not appear to be significant for embodying the distinctive characteristics of a method of construction.

As the product of the William L. Pereira & Associates firm, the Executive Building and Parking Structure have been presumed to be the product of master architect William Pereira; however, the identity of the designer is unclear. Only the name of the firm appears on the drawings and permits, and there is conflicting information in the *Los Angeles Times* about the partner in charge of the project. A 1972 article stated that Pereira was the partner in charge with John C. Knight as the project director and Shreve Babcock as deputy project director. That team was apparently replaced as a 1973 article stated that Gin Wong was the partner in charge, and that Roy G. Schmidt was the project director. Pereira & Associates was responsible for the interior of the bank on the ground floor, and Sue Wilson acted as the designer. The interiors of the fifth and sixth floors, which were the executive offices of the Times Mirror Company, were designed by Charles Kratka Interior Planning and Design. Jan Hornbeck was in charge of the project for Kratka. As so many individuals apparently contributed to the design, the extent of Pereira's involvement in the design of the Executive Building and Parking Structure is uncertain. Additionally, the buildings are not included in the extensive chronology of projects provided in Steele's book. Steele explains that his list is "selective in the sense that it only includes projects with clear provenance."

Even if Pereira designed the Executive Building and Parking Structure, they are not important or distinctive examples of his work. In order to be eligible under Criterion C as the work of a master, the buildings would have to express a particular phase in the development of Pereira's career, an aspect of his work, or a particular idea or theme in his craft. By the early 1970s, when the Executive Building and Parking Structure were constructed, Pereira's work on singular buildings had shifted away from the minimalist toward more expressive, monumental forms often rendered in concrete, and his practice in general had shifted from individual buildings to large-scale master plans. Thus, his work from the period is better represented by buildings like the Pacific Life Building

(1972) and Marriot Hotel (1973) in Newport Beach (1975) Transamerica Tower (1972) in San Francisco and his numerous master plans, especially those for airports and college campuses. In short, the Executive Building and Parking Structure do not appear to be eligible under Criterion C as a representative work of master architect William L. Pereira.

The last two aspects of Criterion C, possessing high artistic values, or representing a significant and distinguishable entity whose components may lack individual distinction, apply to works of art and historic districts, respectively. The Executive Building and Parking Structure are neither. Therefore, for all of the reasons described above, they do not appear to be significant under Criterion C and in any event are not of exceptional importance.

Criterion D

Criterion D was not considered in this evaluation, as it generally applies to archaeological resources.

Integrity

As the Executive Building and Parking Structure do not appear eligible for listing in the National Register, an assessment of its integrity is not required. However, it may be noted that the exteriors are substantially unaltered. Alterations have been limited to the interior of the Executive Building. In 1980, Charles Kratka remodeled the third floor and in 1987, Stokes & Bojorquez remodeled the bank space on the first floor. The most substantial alterations occurred in 1997 with the first and second floors were seismically strengthened. While some of the furnishing and finishes on the sixth floor have been removed or replaced, the spaces themselves are intact. Therefore, the building retains all aspects of integrity.

California Register Evaluation

The California Register was modeled on the National Register; however, there are differences in the 50-year threshold. A property less than 50 years of age may be eligible for listing in the California Register if it can be demonstrated that sufficient time has passed to obtain scholarly perspective on the events and/or individuals associated with the property. In other words, a property less than 50 years of age does not need to be of exceptional importance to be eligible for listing in the California Register. The California Register statute allows CEQA Lead Agencies a fair amount of flexibility in justifying that a property is significant, even if that property is less than 50 years old. In evaluating such properties for California Register eligibility, the focus is on the evidence for significance as opposed to the age of the property. The *Los Angeles Times*, Times Mirror Company, and Chandler family have received a fair amount of scholarly attention. The early history of the *Los Angeles Times* and its subsequent transformation was chronicled in the unauthorized history, *Thinking Big* in 1977, and was one of four papers profiled by David Halberstam in *The Powers That Be* in 1979. Halberstam also discusses the Chandler family in his book, but to a lesser extent the Times Mirror Company. The newspaper has also been the whole or partial subject of numerous dissertations and theses in communications or social science in the past four decades. Dennis McDougal wrote a biography of Otis Chandler, *Privileged Son and the Rise and Fall of the Los Angeles Times Dynasty* in 2001 and Margaret Leslie Davis wrote a biography of Franklin Murphy, *The Culture Broker, Franklin D. Murphy and the Transformation of Los Angeles* in 2007. Both books place their subjects in the context of the newspaper and the company as well as national, state, and trends.

Based upon these scholarly sources, the Executive Building appears to be eligible under California Register Criterion 1 for its association with the Times Mirror Company. The Executive Building was the first building ever constructed specifically to house the company in its century-plus history. From the 1970s to the 1990s the company continued to grow. By 1990, Times Mirror had become the 12th-largest multiple cable system operator in the country and the *Los Angeles Times* reached the apex of its circulation. During the 1990s, the company, like all newspaper and publishing outlets in the country, began a steady decline as their customers and advertisers migrated to mobile networks and electronic books and magazines. When Times Mirror was purchased by Tribune in 2000, the Atlantic Richfield Company remained the only Fortune 500 Company in Downtown Los Angeles. The period of significance under Criterion 1 is 1973, the year the building was completed, to 2000, the year the Tribune Company purchased the Times Mirror Company.

In addition, the Executive Building appears to be eligible under California Register Criterion 2 for its association with Otis Chandler. Chandler was the publisher of the Los Angeles Times for 20 years (1960 to 1980). He moved his office from the Times Building to the Executive Building when it was completed in 1973. From 1973 to 1980, Chandler continued to modernize the Los Angeles Times and to expand its reach. In 1979, there were 31foreign and domestic bureaus and for the 25th consecutive year the paper published

more advertising than any other in the world. The period of significance under Criterion 2 is 1973 to 1985 when Chandler retained an office in the Executive Building.

The building does not appear to be eligible under California Register Criteria 3 and 4 for the same reasons noted in the National Register Criteria C, and D evaluations.

Appendix C: Character-Defining Features Tables

Character-defining features are the architectural components that contribute to a building's sense of time and place. *Preservation Brief #17: Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving Their Character* notes:

> A complete understanding of any property may require documentary research about its style, construction, function, its furnishings or contents; knowledge about the original builder, owners, and later occupants; and knowledge about the evolutionary history of the building. Even though buildings may be of historic, rather than architectural significance, it is their tangible elements that embody its significance for association with specific events or persons and it is those tangible elements both on the exterior and interior that should be preserved.[98]

The character-defining features of buildings can be generally grouped into three categories: the overall visual character of a building, the exterior materials and craftsmanship, and the interior spaces, features, and finishes. The relative importance of character-defining features depends on the level of craftsmanship, visibility, and integrity. In addition, some character-defining features are more important than others in conveying the significance of the building. Thus, the character-defining features listed in the tables on the following pages are described as either "primary" or "secondary." Primary character-defining features are considered the most important elements contributing to the significance of the building, while secondary features are considered less important.

[98] *National Register Preservation Brief #17,* p. 1.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Immediate Setting • Setback from street abutting sidewalk		X			Highly visible, retains integrity.
	General Setting • Surrounding neighborhood • Streetscape				X	The surrounding area has been altered since the end of the period of significance, primarily in the form of modern infill.
	Original Massing • Rectangular plan • Four-eight stories • Hipped roof • Symmetrical massing • Tripartite		X			Original and highly visible. While the building has experienced a few additions, the original massing remains evident and intact.

[99] Photographs are of representative examples of the character-defining features outlined in the table. Every instance of every feature was not photographed or included in this table.

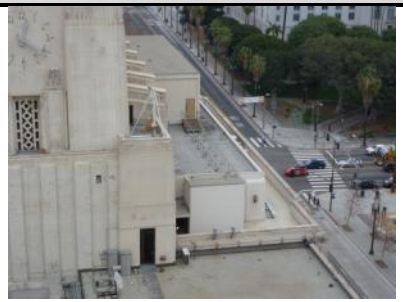

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Addition on North End of East Elevation • One story • 1946				X	The 1946 addition is not a character-defining feature because its doors, windows, and exterior wall materials were replaced, likely in 1973; therefore, the addition no longer retains physical integrity.
	Addition on North End of East Elevation • One story • 1965			X		Although not original to the building, the addition is directly associated with William L. Pereira & Associates as well as the period of significance associated with Otis Chandler (1960-1972).
	Roof Design • Hipped with flush eaves • Flat with raced parapet, forming outer decks			X		The roof design dates from within the period of significance; however, it is not highly visible from the public right-of-way. The pitch and form of the hipped roof is highly intact, but the 1946, 1965, and 1972 additions have altered the roof decks. The hipped roof originally had an eagle sculpture at the north end, likely the 1887 Los Angeles Times Eagle displayed in the elevator lobby, and flag poles to the north and south. Roofs to the east and west of the

Table C-1: Times Building Character-Defining Features

						central tower originally had skylights and tile flooring.
Overall Visual Character	Roof Material • Clay tile			X		Original and intact, but not highly visible from the public right-of-way.
	North Elevation • Primary street-facing elevation • 4-8 stories • Symmetrical design • Central entrance		X			Original, highly visible, and retains integrity.

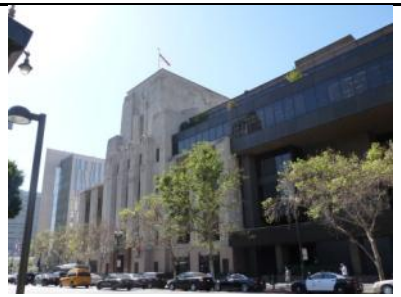

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	East Elevation • Street-facing elevation • 4-8 stories • Symmetrical design		X			Original, highly visible, and retains overall integrity. While additions have been constructed, the original design and massing remain evident.
	South Elevation • 8 stories • Symmetrical design			X		This elevation, while at least partially intact, is obscured from view by third and fourth story additions to the Plant Building and is not clearly visible from the public-right-of way.
	West Elevation • 4-8 stories				X	Much of the west elevation was demolished in 1971 for the construction of the Executive Building. Portions of the original west elevation remain intact above the fifth floor.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
	Main Entrance • Centralized • Recessed • Double door • Full-height transom • Decorative surround		X			Original, highly visible, retains integrity and is directly related to the use and PWA Moderne style of the building.
Overall Visual Character	First Story Windows (Large) • Symmetrically-arranged • Fixed • Decorative surround		X			The window openings and surrounds are original, highly visible, retain integrity and are directly related to the PWA Moderne style of the building. The window sashes are non-original, and therefore, are not character-defining features.
	First Story Windows (Small) • Symmetrically-arranged • Fixed metal panels • Decorative surround		X			The window openings and surrounds are original, highly visible, retain integrity and are directly related to the PWA Moderne style of the building. The fixed metal panels are non-original, and therefore, are not character-defining features.

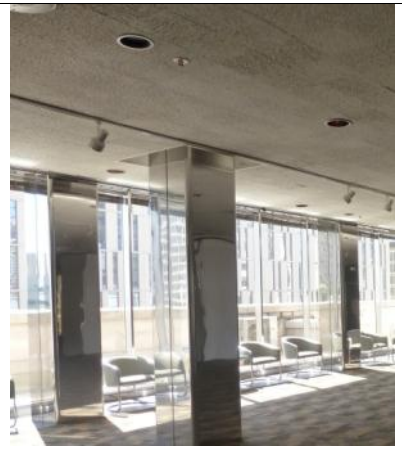

Table C-1: Times Building Character-Defining Features						
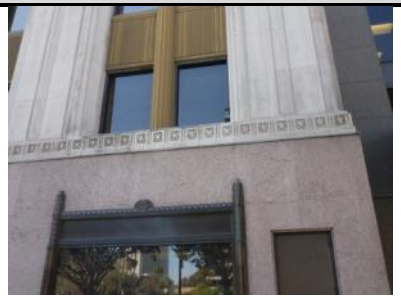
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
	Upper-story Windows • Single-light fixed • Divided by bronze spandrels		X			The window openings and bronze spandrels are original, highly visible, retain integrity and are directly related to the PWA Moderne style of the building. The window sashes are non-original, and therefore, are not character-defining features.
Overall Visual Character	1946 Addition Windows (pictured from the interior) • On 1946 addition at north end of east elevation • Full-height fixed				X	The 1946 addition is not character-defining because it no longer retains physical integrity. Non-original windows and openings; windows were originally multi-light window sash set in projecting metal frames.
	1965 Addition Windows (pictured from the interior) • On 1965 addition at north end of east elevation • Full-height metal-framed fixed			X		Windows date from William L. Pereira & Associates' 1965 design. Although the 1965 addition is not original to the building, it is directly associated with Pereira & Associates as well as the period of significance associated with Otis Chandler (1960-1972).



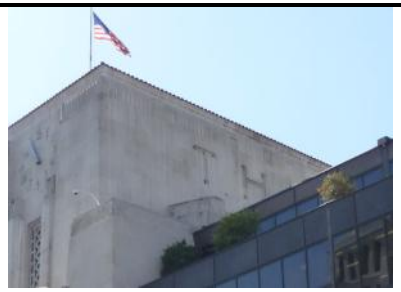


Table C-1: Times Building Character-Defining Features						
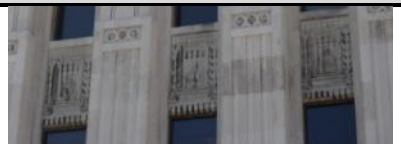
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Exterior Materials • All elevations • Granite (pink and gray) • Terra Cotta • Limestone • Bronze		X			Original, highly visible, and retain integrity.
	"The Times" Carving • East and west elevations • Carved into limestone • Neon illumination		X			Original, highly visible, retains integrity and is directly related to the use and PWA Moderne style of the building.
	Carved sculptures • North elevation • Fifth floor • The sculptures represent "Father Time," "Spirit of the Times," and "Gutenberg"		X			Original, highly visible, retains integrity and is directly related to the use and PWA Moderne style of the building.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Clock • Penthouse • North elevation • Numbers and ticks carved into limestone • Metal hands • Neon illumination		X			Original, highly visible, retains integrity and is directly related to the use and PWA Moderne style of the building.
	Eagles • North elevation • Just below penthouse		X			Original, highly visible, retains integrity and is directly related to the ecclesiastical PWA Moderne style of the building.
	Grille • North elevation • Sixth floor • Terra Cotta		X			Original, highly visible, retains integrity and is directly related to the PWA Moderne style of the building.



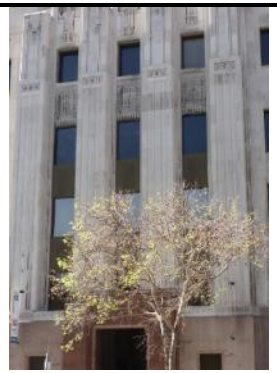


Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Bas Relief Panels • North elevation • Fourth floor • Terra Cotta		X			Original, highly visible, retains integrity and is directly related to the ecclesiastical PWA Moderne style of the building.
	Pilasters • North and east elevations • Second to fifth floors • Limestone • Carved		X			Original, highly visible, retains integrity and is directly related to the PWA Moderne style of the building
	Window Surrounds • First story • North and east elevations • Cast bronze		X			Original, highly visible, retains integrity and is directly related to the PWA Moderne style of the building

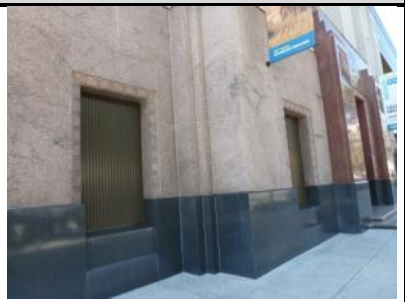

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Window Surrounds • First story • North and east elevations • Carved granite		X			Original, highly visible, retains integrity and is directly related to the PWA Moderne style of the building
	Spandrel Panels and Pilasters • North and east elevations • Upper stories • Fluted pilasters • Carved spandrel panels • Spandrel panel at fourth floor is more elaborately carved with dentils and medallions	 	X			Original, highly visible, retains integrity and is directly related to the PWA Moderne style of the building
	Belt Course • North and east elevations • Between first and second stories • Terra cotta, repeating sunburst pattern		X			Original, highly visible, retains integrity and is directly related to the PWA Moderne style of the building.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Main Entry Surround • Carved granite • Two bas relief eagles at the corners • "Los Angeles Times" at the center		X			Original, highly visible, retains integrity and is directly related to the use and PWA Moderne style of the building.
	Main Entry Door • North elevation • First story • Bronze with marble and granite surround • Cast crests • Double doors with sidelights		X			Original, highly visible, retains integrity and is directly related to the use and PWA Moderne style of the building.
	Vestibule Ceiling • North elevation • First story • Smooth stucco • Recessed Lights				X	Not original and consists of common materials. The vestibule ceiling was originally covered in aluminum leaf, glazed to a pale gold. There was also originally an ornamental hanging light fixture.

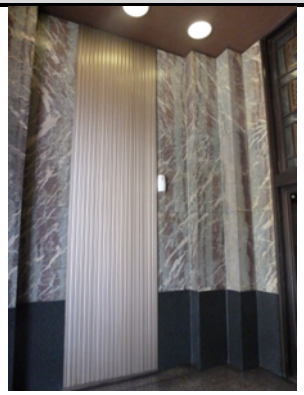

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Metal Panels • North elevation • First story • Within vestibule • Aluminum				X	Not original; likely covered original window openings with metal panels in 1981 when the Centennial Exhibition was installed.
	Vestibule Floor • North elevation • First story • Granite		X			Original, highly visible, retains integrity.
	Corner Stones/Plaques • North elevation, first story • Carved into granite • One on each side of entrance and on east and west walls of vestibules		X			Original, highly visible, retains integrity.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Globe Lobby Ceiling • Circular configuration • Recessed lighting • Divided lights along circumference • Circular fixture at center			X		Original configuration remains, but circular light fixture has been replaced and the ceiling painted. The lobby ceiling was originally covered in aluminum leaf, glazed to a pale gold.
	Cornice • Cast metal		X			Original, highly visible, retains integrity.
	Hugo Ballin Murals • Murals depicting journalism and newspaper themes		X			Original, highly visible, retains integrity, and directly related to the use of the building. Of high artistic value.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Marble Band • Marble carved with the words, "There is no dimming/No effacement here/Each new pulsation keeps the record clear/The newspaper is a greater treasure to the people than uncounted millions of gold," at the bottom of the murals		X			Original, highly visible, retains integrity, and directly related to the use of the building.
	Globe Sculpture • Located in center of Globe Lobby • Sculpted by Merrell Gage • Aluminum • 5.5' in diameter • Originally rotated, making a full revolution every 15 minutes • Marble base with bas-relief figures		X			Original, highly visible, retains integrity and is directly related to the use of the building. Of high artistic value.
	Marble Floor • Different colored marble inlay forms a compass rose		X			Original, highly visible, retains integrity and is directly related to the use of the building. Of high artistic value.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Exhibit Areas • Surrounding the globe lobby • Carpeted • Fluorescent lighting • Drop ceiling				X	The exhibit areas have been altered with new and common materials; installed in 1981 as part of the Los Angeles Times Centennial Exhibit.
	Elevator Lobby Ceiling • Rounded aluminum light fixture		X			Original, highly visible, retains integrity.
	Marble Walls • Elevator lobby		X			Original, highly visible, retains integrity.
	Art Deco Doors • Elevator lobby • Wood with bronze hardware, inlay and decorative surround		X			Original, highly visible, retains integrity.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Mail Tubes • Elevator lobby • Bronze inlay and marble		X			Original, highly visible, retains integrity.
	Elevator Doors • Elevator lobby • Bronze inlay • Decorative bronze surround		X			Original, highly visible, retains integrity.
	Marble Floor • Elevator lobby • Multiple colors of marble with three bronze plates depicting the three previous homes of the LA Times		X			Original, highly visible, retains integrity.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
						
Interior Spaces, Features, and Finishes	Auditorium • On fifth floor		X			The volume of space is original and directly related to the original use of the building. The finishes and features are non-original, dating from 1935 through more recent alterations; therefore, their integrity is diminished due to a loss of consistency and cohesiveness. Finishes and features are not associated with one specific period of significance; therefore, they have not gained significance in their own right.
	1946 Addition • Acoustic drop ceiling • Drywall • Carpeting • Recessed and track lighting • Double doors • Reflective piers				X	The 1946 addition is not character-defining because it no longer retains physical integrity; therefore, the interior space, finishes, and features are also not character-defining.

Table C-1: Times Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[99]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	1965 Addition • Acoustic ceiling • Wood paneling • Carpeting • Recessed lighting			X		The space, finishes, and features date from William L. Pereira & Associates' 1965 design. Although not original to the building, the finishes and features are directly associated with Pereira as well as the period of significance associated with Otis Chandler (1960-1972).
	Interior Office Spaces • Upper stories • Acoustic drop ceilings • Carpeting • Drywall • Fluorescent lighting • Temporary cubicle partitions				X	These non-public spaces have been heavily altered throughout the years from tenant improvements. The spaces consist of non-original, contemporary, common materials.

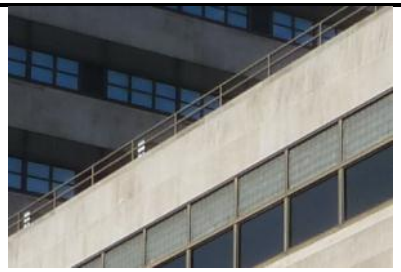
Table C-2: Plant Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[100]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Immediate Setting • Setback from street abutting sidewalk		X			Highly visible, retains integrity.
	General Setting • Surrounding neighborhood • Streetscape				X	The surrounding area has been altered since the end of the period of significance, primarily in the form of modern infill.
	Original Massing • Rectangular plan • Two stories • Flat roof • Symmetrical massing		X			Original and highly visible. While the building has experienced a few additions, the original massing remains evident and intact; furthermore, the additions were designed in a manner consistent with the original building and contribute to the visual connection between the Times and Mirror buildings. They reflect the growth of the Times-

[100] Photographs are of representative examples of the character-defining features outlined in the table. Every instance of every feature was not photographed or included in this table.

Table C-2: Plant Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[100]**	**Primary**	**Secondary**	**Not**	**Reason**
						Mirror Company in the postwar period.
Overall Visual Character	Third Story Addition • One story • 1946		X			The addition was directly related to the construction of the Mirror Building in 1948. It was designed in a manner consistent with the original building and contributes to the visual connection between the Times and Mirror buildings. It reflects the growth of the Times-Mirror Company in the postwar period.
	Fourth Story Addition • One story • 1955		X			The addition was designed in a manner consistent with the original building and contributes to the visual connection between the Times and Mirror buildings. It reflects the growth of the Times-Mirror Company in the postwar period.
	Roof Design • Flat with raised parapet			X		Original, but not clearly visible from the public right-of-way.

Table C-2: Plant Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[100]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	East Elevation • Only street-facing elevation • 4 stories • Symmetrical design		X			While the building has experienced a few additions, the original massing remains evident and intact; furthermore, the additions were designed in a manner consistent with the original building and contributes to the visual connection between the Times and Mirror buildings. They reflect the growth of the Times-Mirror Company in the postwar period.
	First Story Openings • East elevation • Symmetrically arranged • Recessed		X			Openings are original, highly visible, and retain integrity. The infill is non-original, added in 1997, and therefore, is not a character-defining feature. The openings originally had roll-up metal doors.
	Second Story Windows • East elevation • Symmetrically-arranged • Recessed		X			Openings are original, highly visible, and retain integrity. The windows are non-original, likely installed in the 1970s, and therefore, are not a character-defining features. The windows were originally multi-light windows with operable pivot sash.

Table C-2: Plant Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[100]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Upper-Story Windows • East elevation • On third and fourth story additions • Ribbons • Glass block and single-light fixed • Metal surround		X			Original, highly visible, retain integrity. The glass block is original. The windows are non-original and therefore, are not character-defining features. The windows were originally multi-light awning windows that were removed sometime before 1980.
Exterior Materials and Craftsmanship	Exterior Materials • East elevation • Granite (pink and gray) • Terra Cotta • Limestone		X			Original, highly visible, and retains integrity.



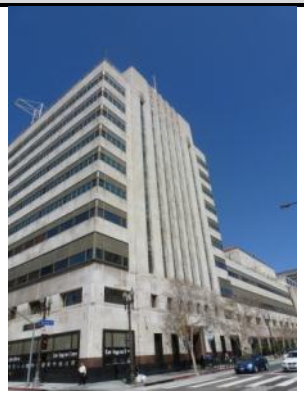


Table C-2: Plant Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[100]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Belt Course • East elevation • Between first and second stories • Terra Cotta, repeating sunburst pattern		X			Original, highly visible and retains integrity.
	Carved Signage • East elevation • Second story • Reads "Los Angeles," with eagle and crest		X			Not indicated on original architectural drawings, but is highly visible, retains integrity and is directly related to the use of the building.
	Railing • Along roofline • Metal				X	Non-original, consists of contemporary, common material.

Table C-2: Plant Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[100]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Rounded Bays • South elevation • First story • Marble • Butted glass • Aluminum				X	Non-original (1997), consists of common, contemporary materials.
	Entrance • Frameless glass door • Marble • Butted glass • Aluminum				X	Non-original (1997), consists of common, contemporary materials.
	Loading Dock • Roll-up metal vehicular entrance				X	Non-original, consists of common, contemporary materials.

Table C-2: Plant Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[100]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Cafeteria	 			X	Non-original (1997) space has been re-partitioned for use as a cafeteria, and consists of new and common materials.
	Interior Office Spaces • Upper stories • Acoustic drop ceilings • Carpeting • Drywall • Fluorescent lighting • Temporary cubicle partitions				X	These non-public spaces have been heavily altered throughout the years from tenant improvements. The spaces consist of non-original, contemporary, common materials. (The Times Building interior is pictured here, but the space is representative of most interior office spaces in the buildings).

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Immediate Setting • Setback from street abutting sidewalk		X			Highly visible, retains integrity.
	General Setting • Surrounding neighborhood • Streetscape				X	The surrounding area has been altered since the end of the period of significance, primarily in the form of modern infill.

[101] Photographs are of representative examples of the character-defining features outlined in the table. Every instance of every feature was not photographed or included in this table.

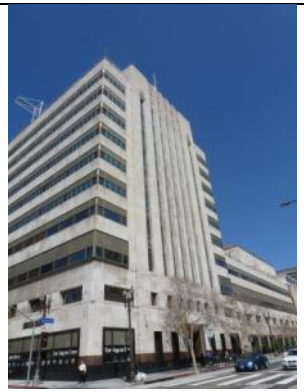

Table C-3: Mirror Building Character-Defining Features						
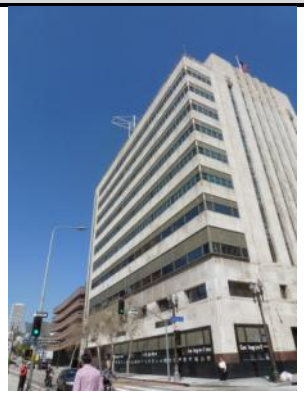
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Original Massing • Rectangular plan • Ten stories • Flat roof • Symmetrical massing		X			Original, intact and highly visible.
	Roof Design • Flat with raised parapet			X		Original and appears to be intact; however, not highly visible from the public right-of-way.
	East Elevation • Primary street-facing elevation • 10 stories • Symmetrical design • Central entrance		X			Original, highly visible, and retains integrity.



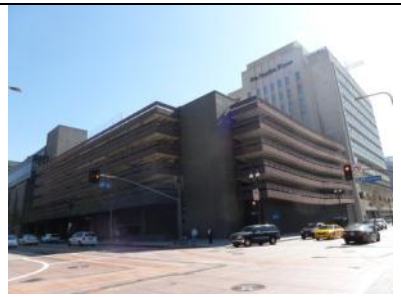


Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	South Elevation • Street-facing elevation • 10 stories • Symmetrical design		X			Original, highly visible, and retains overall integrity.
	West Elevation • 10 stories • Symmetrical design		X			Original, highly visible, and retains overall integrity.

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	North elevation • 10 stories • Symmetrical design		X			Original, highly visible, and retains overall integrity.
	Main Entrance • East elevation • Centralized • Recessed • Four doors • Full-height transom • Decorative surround		X			Original, highly visible, retains integrity.
	First Story Windows (Large) • East and south elevations • Symmetrically-arranged • Glass block • Fixed and awning (non-operable) • Decorative surround • Display areas		X			Original, highly visible, retains integrity.

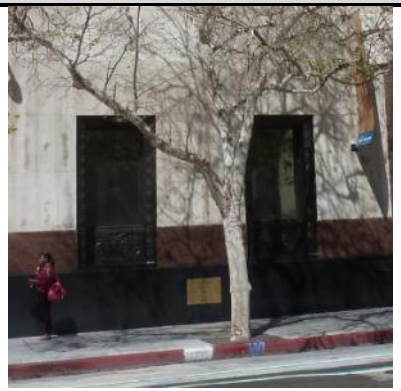

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	First Story Windows (Small) • Symmetrically-arranged • Single-light fixed • Decorative surround		X			Original, highly visible, retains integrity. The window sashes are non-original, and therefore, are not character-defining features. The original window sash was deeply recessed within the opening.
	Upper Story Windows (Center) • East and west elevations • Arranged in vertical bands • Single-light, multi-light fixed • Divided by metal spandrels		X			Original and highly visible. While some windows have been replaced with single-lights, the original design is evident and the openings are intact.
	Upper Story Windows (North and south wings) • All elevations • Glass block • Multi-light fixed • Single-light fixed		X			Original, intact and highly visible. While some windows have been replaced with single-lights, the original design is evident and the openings are intact.

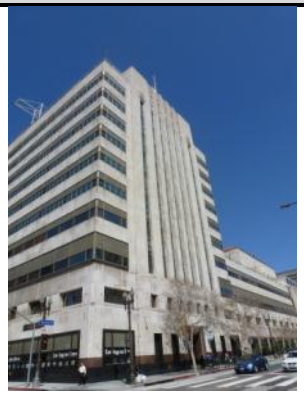

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Exterior Materials • All elevations • Limestone • Granite (red and black)		X			Original, highly visible, and retain integrity.
	Sculptures • East elevation • Tenth floor • Carved limestone • Five figures designed by architect to represent culture, justice, faith, progress, and equality		X			Original, highly visible, retains integrity.
	Eagle Panels • East elevation • Tenth floor • Carved limestone or terra cotta		X			Original, highly visible, retains integrity.

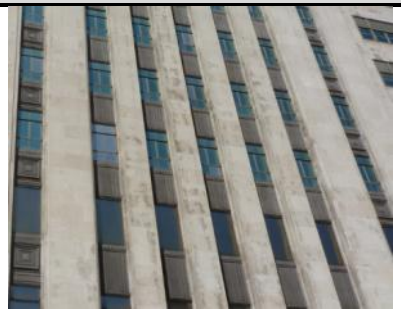

Table C-3: Mirror Building Character-Defining Features						
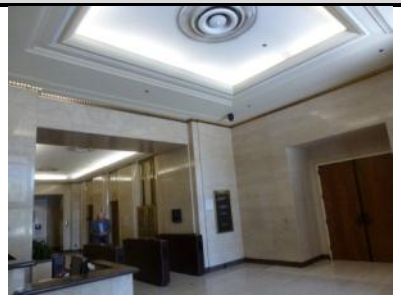
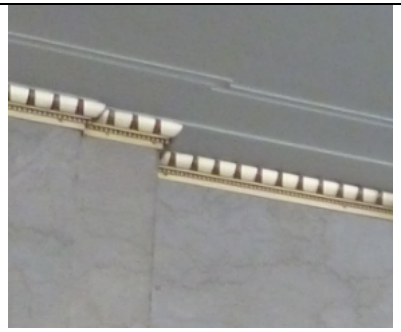
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Metal Spandrels • East and west elevations • Upper stories • Fluted metal panels • Outermost bays have more elaborate panels		X			Original, highly visible, retains integrity.
	Belt Course • East elevation • Between first and second stories • Terra cotta, repeating sunburst pattern		X			Original, highly visible, retains integrity.
	Main Entry Surround • East elevation • First story • Carved granite		X			Original, highly visible, retains integrity.

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Vestibule • East elevation • First story • Granite • Pierced decorative metal screens with lotus pattern; bronze, doors.		X			Original, highly visible, retains integrity.
	Main Entry • East elevation • First story • Double fully-glazed metal doors flanked by single fully-glazed metal doors • Full-height transom • "Los Angeles Times"		X			Original, highly visible, retains integrity.
	Vestibule Ceiling • Dentilled crown molding • Circular light fixture		X			Original, highly visible, retains integrity.

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Window Surrounds • First story • East and south elevations • Coated metal • Display cases		X			Original, highly visible, retains integrity.
	Window Surrounds • First story • East elevation • Coated metal and bronze • Lotus pattern		X			Original, highly visible, retains integrity.
	Railing • South elevation • Tenth story				X	Non-original, consists of contemporary, common material.





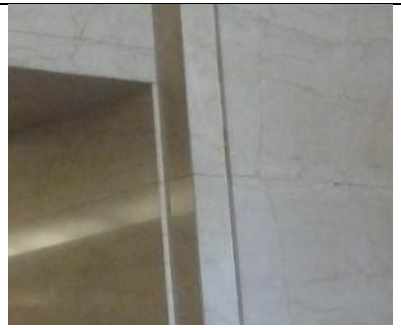


Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Main Lobby Ceiling • Circular fixture at center • Square • Soffited		X			Original configuration remains, but security cameras and fire sprinklers have been added very visibly. The central vent fixture is possibly original as is the location of the lighting, though the light fixtures themselves are likely replacements.
	Crown Molding • Main lobby • Dentillated		X			Original, highly visible, retains integrity.
	Walls • Main lobby • Veined marble panels		X			Original, highly visible, retains integrity.

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Phone Booths • Main lobby • Bronze and wood		X			Original, highly visible, retains integrity and is directly related to the use of the building and construction time period.
	Secondary Lobby Space • Drywall • Carpeting • Drop acoustic ceiling and fluorescent lighting • Structural steel cross-bracing				X	Space is made up of non-original, common materials; the cross-bracing is a major detraction from the space's integrity.
	Elevator Lobby • Circular fixtures and recessed lighting on ceiling • Rectangular • Bronze elevator doors • Mail chutes • Marble paneled floor and walls		X			Original, highly visible, retains overall integrity.

Table C-3: Mirror Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[101]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Interior Office Spaces • Upper stories • Acoustic drop ceilings • Carpeting • Drywall • Fluorescent lighting • Temporary cubicle partitions				X	These non-public spaces have been heavily altered throughout the years from tenant improvements. The spaces consist of non-original, contemporary, common materials. (The Times Building interior is pictured here, but the space is representative of all interior office spaces in the Mirror Building).

Table C-4: Executive Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Immediate Setting • Setback from street abutting sidewalk		X			Highly visible, retains integrity.
	General Setting • Surrounding neighborhood • Streetscape				X	The surrounding area has been altered since the end of the period of significance, primarily in the form of modern infill.
	Original Massing • Rectangular plan • Six stories • Flat roof • Intersecting geometric volumes		X			Original, intact and highly visible.

[102] Photographs are of representative examples of the character-defining features outlined in the table. Every instance of every feature was not photographed or included in this table.

Table C-4: Executive Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Roof Design • Flat with mechanical penthouses and pyramidal skylight • Plantings			X		Original and appears to be intact; however, not highly visible from the public right-of-way.
	North Elevation • Primary street-facing elevation • Six stories • Asymmetrical • Ground floor recessed behind piers, creating plaza		X			Original, highly visible, retains integrity and is directly related to the building's architectural style.
	West Elevation • Street-facing elevation • Six stories • Asymmetrical		X			Original, highly visible, and retains overall integrity.

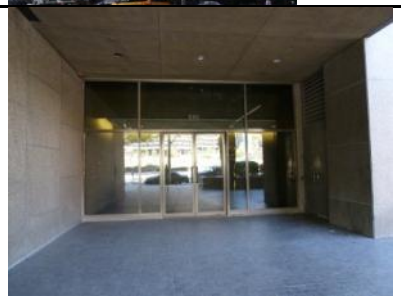

Table C-4: Executive Building Character-Defining Features						
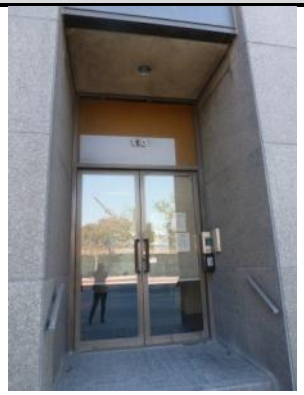
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	South Elevation • Six stories				X	South elevation abuts Parking Garage and is not visible from the public right-of-way.
	East elevation • Six stories				X	East elevation abuts the Times Building and is not visible.
	Main Entrance • North elevation, east end • Recessed • Double door • Sidelights • Full-height transoms		X			Original, highly visible, retains integrity.



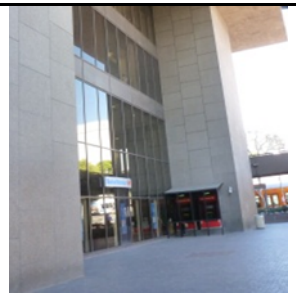


Table C-4: Executive Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	Secondary Entrance • West elevation • Recessed • Double door • Transom			X		Original, retains integrity, common materials, located on secondary elevation.
	Bank Entrance • North and West elevations • Within recessed plaza • Double doors		X			Original, highly visible, retains integrity and is directly related to the building's original use.
	Ground Floor Plaza • Integrated planters • Raised walkways		X			Original, highly visible, retains integrity and is directly related to the building's architectural style.

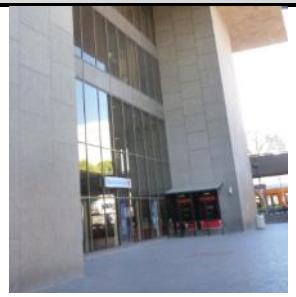

Table C-4: Executive Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Overall Visual Character	First Story Windows • North elevation • Curtain Wall		X			Original, highly visible, retains integrity and is directly related to the building's architectural style.
	Upper-story Windows • North and west elevations • Arranged in vertical bands • Single-light fixed • Divided by metal spandrels		X			Original, highly visible, retains integrity and is directly related to the building's architectural style.
Exterior Materials and Craftsmanship	Exterior Materials • Norwegian granite • Bronze silicon co-polymer coated metal		X			Original, highly visible, retains integrity and is directly related to the building style and construction period.

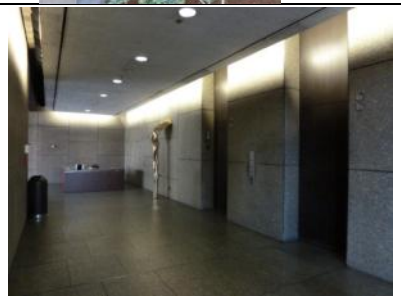

Table C-4: Executive Building Character-Defining Features						
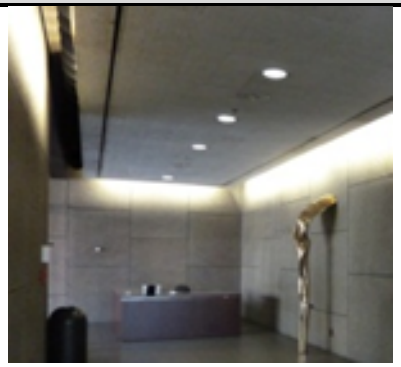
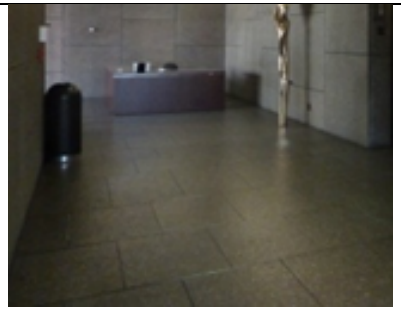
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Exterior Materials and Craftsmanship	Integrated Planters • First and second stories • Tiled • Rectangular volumes		X			Original, highly visible, retains integrity and is directly related to the building style.
	Plaza • First story • North and east elevations • Tiled plaza floor extends to street		X			Original, highly visible, retains integrity and is directly related to the building style.
Interior Spaces, Features, and Finishes	Main Lobby Ceiling • Main lobby • First story • Acoustic drop ceiling • Recessed lights			X		Original, highly visible, retains integrity but consists of common materials.





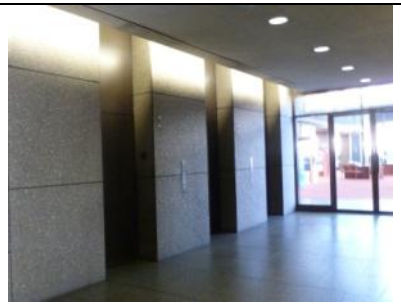


Table C-4: Executive Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Main Lobby Walls • Main lobby • Granite panels		X			Original, highly visible, retains integrity.
	Main Lobby Floor • Main lobby • Granite		X			Original, highly visible, retains integrity.
	Elevators • Main lobby • Scored metal • Three elevators		X			Original, highly visible, retains integrity.

Table C-4: Executive Building Character-Defining Features						
Type	**Feature**	**Photo (if applicable)[102]**	**Primary**	**Secondary**	**Not**	**Reason**
Interior Spaces, Features, and Finishes	Atrium • Sixth floor • Pyramidal skylight • Tile floors			X		Original and distinctive space, retains integrity; however, space is private.
	Conference Room • Sixth floor • Circular light soffit • Wood-paneling • Acoustic drop ceiling			X		Original and distinctive space, retains integrity; however, space is private.
	Interior Office Spaces • Upper stories • Acoustic drop ceilings • Carpeting • Drywall • Fluorescent lighting • Temporary cubicle partitions				X	These non-public spaces have been heavily altered throughout the years from tenant improvements. The spaces consist of non-original, contemporary, common materials. (The Times Building interior is pictured here, but the space is representative of all interior office spaces in the Executive Building, other than the first and the sixth).

Appendix D: Building Permit Tables

Times-Plant Complex

Table D-1: Building Permit History for Times-Plant Complex				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
09/11/33	Foundation only	Application for concrete foundation.	$10,000	Gordon B. Kaufmann/ None listed
09/21/33	Foundation only	Proposed 165' x 365' foundation made of 3,000 lbs. of cement and 100 tons of reinforcing steel.	$40,000	Gordon B. Kaufmann/ None listed
10/13/33	Entire lot	Application to erect a new 364'-9" x 163'-10" newspaper plant complex; six stories on north side and two stories on south side, with basement under both. Made of reinforced concrete, terra cotta, and tile.	$1,650,000	Gordon B. Kaufmann/ P. J. Walker Co.
12/19/34	Interior of northeast corner store	Complete interior of unfinished corner store by the Owl Drug. Co,	$9,500	Gordon B. Kaufmann/ P. J. Walker Co.
08/28/35	Smoke stack	Replace Thermax partition construction of north and south walls of smoke stack shaft; covering smoke stack with cement and magnesium block.	$5,000	Gordon B. Kaufmann/ P. J. Walker Co.
02/18/36	Stores	Two terra cotta tile partitions, metal lath and plaster ceiling; granite and bronze store fronts; plate glass windows.	$3,000	Gordon B. Kaufmann/ None listed
11/23/45	Not indicated	Remove existing partition, provide new entry to stairs, rework display windows to match existing, upgrade heating and ventilation system.	$15,000	Rowland H. Crawford/ P. J. Walker Co.
01/08/46	Third floor addition over Plant Building	Application for 133' x 184' third floor addition and miscellaneous alterations to Plant Building; additional toilet and locker rooms, mechanical equipment, electrical facilities, and stairways.	$285,000	Rowland H. Crawford/ P. J. Walker Co.
05/28/46	First and second floors	Enlarge press room by removing rooms from first and second floor.	$135,000	Rowland H. Crawford/ P. J. Walker Co.
08/16/46	Fifth floor addition over Times Building	8,100 sf of additional rooms created on fifth floor for recreation and cafeteria.	$78,000	Rowland H. Crawford/ P. J. Walker Co.
01/17/47	Not indicated	Close opening between rooms, rearrange existing women's locker and toilet rooms, and install new non-bearing office partitions and cabinets.	$2,000	Rowland H. Crawford/ P. J. Walker Co.
05/17/47	Third floor	Relocate partitions and widen existing ramp.	$4,900	Rowland H. Crawford/ P. J. Walker Co.

Table D-1: Building Permit History for Times-Plant Complex				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
05/17/47	Not indicated	Remove existing non-bearing partitions and addition of new enlarge kitchen with dressing room. Provide new cabinet work and add two toilet rooms.	$5,000	Rowland H. Crawford/ P. J. Walker Co.
04/26/49	Stores	General repair to correct termite and or fungus damage; no structural changes.	$1,430	None listed/ Abbatto Building Service
1/19/50	Roof	Addition of roof slab and new wall openings. New electric outlets and fixtures. New sprinkler heads and rework roof drains and downspouts.	$4,500	Rowland H. Crawford/ P. J. Walker Co.
05/31/51	Fourth floor	Frame skylight and install tile.	$3,534	None listed/ Harold E. Shagart
06/14/51	Second floor	Addition to existing loading dock in concourse, cutting two new openings in second floor and closing up two existing openings in second floor.	$4,250	Rowland H. Crawford/ P. J. Walker Co.
12/18/51	Not indicated	Insert acoustical ceiling of 1,500 sf to existing wood __, install electric wiring fixtures, repair worn out wood floor; no additions or structural changes.	$1,500	None listed/ Ross Construction Corp.
05/29/52	West elevation of Times Building	Alter first floor glass front; install steel column and two main beams, one crane beam and two supporting beams; install two reinforcing concrete press pits, repair floors, cut some openings in non-bearing stud walls, some new stud plaster walls, or partitions; install a few 7' high plywood office partitions, new ceiling, same new plumbing, with mostly old fixtures.	$8,000	David J. Witmer/ Ross Construction Corp.
06/19/52	Third floor and basement	Addition of 20' x 78' roof deck and suspended plaster ceiling, electric outlets, sprinkler heads and fixtures on third floor. Additional beams in basement.	$20,000	Rowland H. Crawford/ P. J. Walker Co.
10/15/52	Not indicated	Addition of non-bearing partitions, suspended plaster ceiling and new plumbing fixtures.	$8,000	Rowland H. Crawford/ P. J. Walker Co.
12/17/52	First floor	Addition to existing platform interior of first floor.	$1,500	Rowland H. Crawford/ P. J. Walker Co.

Table D-1: Building Permit History for Times-Plant Complex				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
07/30/53	First floor and basement	Addition of beams for new press in basement. Addition of new locker and toilet rooms in basement. Removal and addition of non-bearing partitions on first floor. Alteration to women's restroom and locker room on first floor. Addition of roller steel door and second street truck entrance.	$48,000	Rowland H. Crawford/ P. J. Walker Co.
09/18/53	Not indicated	Make alterations to doors and exits and other corrections/	$1,850	Rowland H. Crawford/ None listed
02/11/54	Third floor	Certificate of Occupancy: Enclose 20' x 78' light court at third floor and add 20' x 78' roof deck above an existing three and ten story.		
09/13/54	Basement	Fill in existing tack depressions and construct new islands at tracks near presses in basement area paper storage; including floor drain changes.	$9,500	Rowland H. Crawford/ P. J. Walker Co.
10/13/54	First floor	Remove existing paper conveyer to basement and install new elevator in same place; including moving air conditioning unit at first floor, plumbing, fire sprinkler and electrical changes to accommodate new shaft and incidental work.	$19,850	Rowland H. Crawford/ P. J. Walker Co.
10/27/54	First floor	Install new and move existing partitions on first floor.	$5,216	None listed/ E. F. Hauserman Co.
02/14/55	Basement	Interior alterations adding toilet room in basement.	$8,000	Rowland H. Crawford/ P. J. Walker Co.
08/11/55	Fourth floor	Remove stone facing and steel sash on south wall at fourth floor. Remove column fireproofing for connections.	$12,500	Rowland H. Crawford/ P. J. Walker Co.
09/08/55	Fourth floor addition over Plant Building	Stone veneer and partial demolish.	$250,000	Rowland H. Crawford/ P. J. Walker
09/16/55	Not indicated	New equipment bases.	$15,000	Rowland H. Crawford/ P. J. Walker Co.
02/07/56	Not indicated	Install interior partitions.	$14,000	Rowland H. Crawford/ P. J. Walker Co.
02/28/56	Not indicated	Repair fire damage.	$30,000	Rowland H. Crawford/ P. J. Walker Co.
05/03/56	Not indicated	Interior partition changes.	$50,000	Rowland H. Crawford/ P. J. Walker Co.
09/17/56	Fourth floor	Certificate of Occupancy: 61' x 164' partial fourth floor addition to an existing offices and printing plant.		

Table D-1: Building Permit History for Times-Plant Complex				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
12/12/56	Not indicated	Air conditioning equipment platform; interior partitions and ceiling changes.	$295,000	Rowland H. Crawford/ P. J. Walker Co.
03/28/57	Not indicated	Interior partition changes no change to exterior of building.	$15,000	Rowland H. Crawford/ P. J. Walker Co.
05/29/57	First floor	Build new power dock on interior.	$10,000	Rowland H. Crawford/ P. J. Walker Co.
05/29/57	First floor	Add to existing loading dock on interior.	$10,000	Rowland H. Crawford/ P. J. Walker Co.
05/29/57	Not indicated	Strengthen slab.	$3,000	Rowland H. Crawford/ P. J. Walker Co.
11/18/57	Loading dock	Certificate of Occupancy: One-story 21' x 39' addition to an existing 15' x 31' loading dock		
02/17/58	Third floor	New interior openings in existing wall only.	$1,500	Rowland H. Crawford/ P. J. Walker Co.
07/28/58	Basement	New 15' 4" x 6' 8" lead pot equipment.	$12,500	Rowland H. Crawford/ P. J. Walker Co.
09/30/58	Not indicated	Interior partition changes.	$4,000	Rowland H. Crawford/ P. J. Walker Co.
02/04/59	South side of lot	Demolish; subject to retaining wall plans for basement walls.	$12,000	None listed/ Cleveland Wrecking Co.
09/23/59	Not indicated	Partition and ceiling changes to rooms.	$18,000	Rowland H. Crawford/ P. J. Walker Co.
10/20/59	North elevation of Times Building	Remove existing front and replace with brick veneer and glass; plaster existing wall.	$5,000	W. Craig Bullock/ P.J. Walker Co.
12/09/59	First floor	Interior partition changes on the first floor.	$5,000	Rowland H. Crawford/ P. J. Walker Co.
04/05/60	Not indicated	Comply with corrections of survey letter.	$3,000	None listed/ None listed
11/9/60	First floor	Interior partitions on first floor with new concrete floor and filling.	$3,500	Rowland H. Crawford/ P. J. Walker Co.
04/25/61	First floor	Interior of main lobby and waiting room.	$15,000	W. L. Pereira & Associates/ none listed
06/27/61	First floor	New concrete stair on first floor.	$1,000	Rowland H. Crawford/ P. J. Walker Co.
08/08/61	Foundation	New black and white press supports foundation only (1 of 2 permits).	$25,000	Rowland H. Crawford/ P. J. Walker Co.
08/14/61	Not indicated	New steel equipment stair only.	$1,500	Rowland H. Crawford/ P. J. Walker Co.
09/25/61	Fifth floor	New light baffle and platform steps in auditorium.	$25,000	W. L. Pereira & Associates/None listed
09/25/61	Foundation	New black and white press (2 of 2 permits).	$15,000	Rowland H. Crawford/ P. J. Walker Co.

Table D-1: Building Permit History for Times-Plant Complex				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
10/10/61	Press room floor	New steel beam and plate floor in press room added to plans.	$4,000	Rowland H. Crawford/ P. J. Walker Co.
01/15/62	First floor	New removable concrete floor panels.	$1,000	Rowland H. Crawford/ P. J. Walker Co.
02/26/62	First floor and basement	Three new waste paper chutes.	$1,800	Rowland H. Crawford/ P. J. Walker Co.
04/13/62	First floor	New wall, floor and roof openings for waste paper conveyor	$2,000	Rowland H. Crawford/ P. J. Walker Co.
04/20/62	First floor	New raised first floor office-plant section.	$1,500	Rowland H. Crawford/ P. J. Walker Co.
05/18/62	Second and eighth floors (may be Mirror Building)	New partitions, cabinets, floor covering, lighting, and air conditioning.	$130,000	W. L. Pereira & Associates/None listed
07/23/62	West elevation of Plant Building	Repair concrete dock slab off Broadway yard.	$3,500	Rowland H. Crawford/ C. W. Driver Inc.
08/24/62	Second floor	New partitions, ceilings, doors, lighting, and flooring.	$32,000	W. L. Pereira & Associates/ C. W. Driver Inc.
10/30/62	West elevation of Plant Building	Repair concrete dock slab and new concrete framing near Broadway parking lot.	$1,500	Rowland H. Crawford/ C. W. Driver Inc.
12/10/62	Conference room	Change interior finish of conference room only.	$2,000	W. L. Pereira & Associates/ C. W. Driver Inc.
02/27/63	Interior	New partitions, ceilings, lighting, air conditioning, and flooring.	$60,000	W. L. Pereira & Associates/ None listed
04/01/63	Roof	13' x 20' metal canopy on fifth floor roof deck.	$1,000	W. L. Pereira & Associates/ None listed
01/08/64	West elevation of Plant Building	Repair concrete dock slab and new concrete framing near Broadway parking lot.	$1,500	Rowland H. Crawford/ None listed
02/24/64	Third floor	Interior partitions, ceiling lights, and air conditioning on the third floor only.	$300,000	W. L. Pereira & Associates/ None listed
03/11/64	Boiler room	Incinerator in existing boiler room.	$1,200	None listed/ Smith Engineering Co.
04/27/65	Sixth floor addition over Times Building	20' x 74' addition on fifth floor roof; interior partitions, ceilings, lights, fir covering, air conditioning.	$98,000	W. L. Pereira & Associates/ None listed
09/28/65	Roof	Change of sixth floor addition plans.	$2,500	W. L. Pereira & Associates/ C. W. Driver Inc.
04/06/66	Not indicated	Ceiling tile, partitions, air-conditioning, and doors.	$20,000	W. L. Pereira & Associates/ C. W. Driver Inc.

Table D-1: Building Permit History for Times-Plant Complex				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
04/26/66	Second floor	New opening in existing floor and concrete wall on second floor.	$4,000	Rowland H. Crawford/ C.W. Driver Inc.
06/08/66	Fourth floor	Plan check on fourth floor partitions.	$1,500	W. L. Pereira & Associates/ C. W. Driver Inc.
07/01/66	First floor	Remove partitions, new plaster, partitions ceiling toilets, air conditioning, and lighting on first floor.	$20,000	W. L. Pereira & Associates/ C. W. Driver Inc.
09/27/66	Sixth floor	Certificate of occupancy: 26' x 74' newspaper plant addition to sixth floor for assembly room. 100 maximum occupancy load.		
01/31/67	First floor	New concrete work for electric power docks on first floor.	$7,000	Rowland H. Crawford/ C. W. Driver Inc.
06/29/67	Not indicated	Demolish existing partitions and ceiling; install new partitions, ceiling, raised floor, and lighting.	$65,000	W. L. Pereira & Associates/ C. W. Driver Inc.
02/13/68	Second floor	Remove existing walls, install new metal stud walls, suspended ceiling, floor and wall finishes on second floor.	$15,000	W. L. Pereira & Associates/ C. W. Driver Inc.
07/17/68	Fifth floor	Office remodeling, remove existing cafeteria equipment, patch walls, add new light fixtures; all work on fifth floor and no structural alteration.	$8,000	Charles Kratka I.P. & D./ C. W. Driver Inc.
05/29/70	First floor	Install new equipment on first floor; remove non-structural stud walls.	$4,000	Woodward Tom Associates/ C. W. Driver Inc.
07/23/70	West elevation Times Building	Fill in four skylights at roof.	$20,000	W. L. Pereira & Associates/ C.L. Peck
01/05/71	West elevation of Times Building	Hand-demolish penthouse and parapet wall (30' x 100')	$35,000	W. L. Pereira & Associates/ Cleveland Wrecking
04/03/72	Fifth and sixth floors	Interior remodeling on sixth and fifth floors.	$500,000	Charles Kratka I.P. & D./ C. L. Peck
08/03/72	Fourth floor	New ceiling light, air conditioning partitions on fourth floor.	$75,000	Charles Kratka I.P. & D./ C. W. Driver Inc.
08/28/73	Basement	Change in use of basement level B2 to health center.	$100,000	Charles Kratka I.P. & D./ None listed
11/08/73	Fifth floor	Redecoration of fifth floor only; relocate reception room to auditorium.	$200,000	Charles Kratka I.P. & D./ C. W. Driver Inc.
01/28/74	Fourth floor	New partitions in existing space on the fourth floor.	$80,000	Charles Kratka I.P. & D./ C. W. Driver Inc.

Table D-1: Building Permit History for Times-Plant Complex				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
12/15/74	Fourth floor roof	Building connection across existing roof (walkway) on the fourth floor for newspaper plant; proposed between Times and Plant Buildings.	$50,000	None listed/ Not selected
12/06/74	Third floor	Interior remodeling and alterations on third floor of Times Building.	$30,000	Charles Kratka I.P. & D./ Not selected
03/06/75	Third floor	Move toilet room on third floor.	$2,000	Warren Steele & Associates/ C. W. Driver, Inc.
05/02/75	Second floor	New lights and wall covering paint on second floor office.	$52,000	Charles Kratka I.P. & D./ None listed

01/24/55	Not indicated	Non-bearing concrete block partition.	$2,000	Rowland H. Crawford/ P. J. Walker Co.
08/11/55	North elevation	Remove glass block and steel sash windows along fourth floor	$12,500	Rowland H. Crawford/ P. J. Walker Co.
03/13/59	West elevation	Plaster exterior wall of west elevation after removal of adjacent Hellman Building.	$6,000	Rowland H. Crawford/ P. J. Walker Co.
06/15/59	Not indicated	Add additional plastering and furring on exterior; wall not shown on drawings permit LA26517	$7,000	Rowland H. Crawford/ P. J. Walker Co.
07/16/59	Second floor	Toilet room alterations.	$5,000	Rowland H. Crawford/ P. J. Walker Co.
11/30/59	Fifth floor	Interior partition changes.	$8,000	Rowland H. Crawford/ P. J. Walker Co.
04/06/61	Seventh floor	Interior remodel.	$75,000	W. L. Pereira & Associates/ None listed
10/09/64	Not indicated	New ceilings, partitions, lighting, air conditioning, and flooring.	$100,000	W.L. Pereira / None listed
08/27/65	Fourth floor	New ceiling, partitions, lighting, air conditioning, raised floor for computers, and flooring	$60,000	W. L. Pereira & Associates/ C. W. Driver, Inc.
11/01/65	Tenth floor	New ceilings, partitions, kitchen lighting, air conditioning, and flooring.	$300,000	W. L. Pereira & Associates/ C. W. Driver, Inc.

Table D-2: Building Permit History for Mirror Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
01/11/66	Not indicated	Construct new duct opening in penthouse floor and roof.	$2,000	W. L. Pereira & Associates/ C. W. Driver, Inc.
03/23/66	Ninth floor	New ceiling, partitions, flooring, covering, toilet fixture change, air-conditioning, and wiring.	$200,000	W. L. Pereira & Associates/ None listed
02/28/67	Fourth floor	New ceilings, partitions, lighting, air conditioning, and flooring.	$20,000	W. L. Pereira & Associates/ C. W. Driver, Inc.
10/06/67	Fourth floor	Modernize corridors for the air-conditioning ducts.	$10,000	W. L. Pereira & Associates/ C. W. Driver, Inc.
04/15/68	Sixth floor	New ceiling, partitions, and flooring.	$175,000	W. L. Pereira & Associates/ C. W. Driver, Inc.
11/21/68	Sixth floor	New partitions, lighting, and air conditioning.	$75,000	Charles Kratka I.P. & D./ C. W. Driver Inc.
12/02/70	Fourth and fifth floors	Dumbwaiter partitions.	$1,500	None listed / William H. Roether, Inc.
12/29/70	Not indicated	Structural work; cut floor for dumbwaiter shaft.	$1,500	None listed / William H. Roether, Inc.
12/27/78	Not indicated	Add raised floor; remove and add non bearing wall.	$8,000	None listed / C. W. Driver Inc.
11/26/90	Not indicated	Tenant improvements (6500 sf).	$162,500	None listed / Smithwick-Driver
06/12/92	Second floor	Tenant improvements (1600 sf) new partitions, doors, ceilings, and restrooms.	$320,000	David Weaver/ None listed
07/02/92	Second floor	Suspended chilled water air handling units.	$2,550	David Weaver/ Swinerton & Walberg
09/14/92	Second floor	Elevator lobby enclosure and sprinklers retrofit.	$135,000	David Weaver/ Swinerton & Walberg
04/15/93	Not indicated	Tenant improvements (12,800 sf) new partitions, doors, and ceilings.	$320,000	David Weaver/ Swinerton & Walberg
05/10/93	Second floor	Revise elevator; lobby enclosure.	$5,000	David Weaver/ Swinerton & Walberg
05/14/93	First floor	Tenant improvements (1700 sf) new partitions and ceilings.	$42,000	David Weaver/ Swinerton & Walberg
12/27/93	Fifth floor	Tenant improvements; upgrade floor and restrooms.	$25,000	David Weaver/ Peck & Jones
03/21/94	Fifth floor	Tenant improvements; new partitions.	$145,000	David Weaver/ None listed
03/21/94	Fifth floor	Tenant improvements; elevator and lobby enclosure.	$96,000	David Weaver/ Peck Jones

Table D-2: Building Permit History for Mirror Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
03/21/94	Second floor	Tenant improvements; elevator and lobby enclosure.	$5,500	David Weaver/ Peck Jones
09/05/94	Second floor	Tenant improvements (3,600 sf) partitions, doors, ceilings, and handicap accessibility ramp.	$72,000	David Weaver/ Peck Jones
07/28/94	Third floor	Tenant improvement (1100 sf) new partitions, doors, ceilings, and HCP restroom remodel.	$30,000	David Weaver/ Peck Jones
06/19/96	Third, fourth, seventh, and tenth floors	Remodel four pairs of restrooms.	$150,000	David Weaver/JJS FNC
07/29/96	Roof and basement	Repair cooling tower and chiller replacement.	$300,000	None listed / CMM Constructors
03/18/97	Not indicated	Install supports for mechanical equipment.	$40,000	None listed / CMM Constructors
05/01/97	First, second, third, fourth, and ninth floors	Handicap upgrade of two restrooms (Men and Women) on first, second, third, and ninth floors, and four restrooms (Men and Women) on fourth floor.	$300,000	David Weaver/ Swinerton & Walberg
05/27/97	Basement and first floor	Add new shear walls at basement and ground floor, and new CMU partitions.	$50,000	David Weaver/ Coast Machinery Movers
10/24/97	First and second floors	Addition of concrete shear walls; seismic upgrade; infill existing openings at first and second floors.	$1,820,000	David Weaver/ Coast Machinery Movers
11/24/97	Basement level B2	Structural strengthening of floor slab at B2 level to support backup power system. This area is an un-occupied facility.	$106,000	None listed / CMM Constructors
04/06/98	Not indicated	New freight elevator.	$45,000	None listed / Sanders Development Co
08/26/98	Roof	Replace tile roof with new tile; weight does not exceed original weight.	$42,000	None listed / CMM Constructors
09/03/98	First and second floors	Addition of concrete shear walls, seismic upgrades, and infill existing openings at basement, first, and second floors (1267 sf).	$500,000	David Weaver/ Smithwick-Driver
09/15/98	Not indicated	Structural strengthening.	$2,000,000	None listed / CMM Constructors
11/05/98	Penthouse and basement	Tenant improvements; remodel 70 linear feet of G.B. partition wall; cut one door opening in penthouse wall; and cut four doors opening in basement elevator shaft.	$50,000	David Weaver/ Heron Associates

Table D-2: Building Permit History for Mirror Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
01/13/99	Not indicated	Replace equipment platform with new steel platform to supply air handler.	$60,000	None listed / CMM Constructors
02/16/99	Basement, first and second floors	Tenant improvements; new partitions, ceilings, doors and finishes, restrooms, and electrical rooms.	$100,000	David Weaver/ CMM Constructors
06/18/99	Tenth floor	Tenant improvements (16,000 sf) new ceilings, flooring; new elevator lobby enclosure; new partitions and doors to create office spaces and fill in small mechanical openings at existing concrete floor.	$400,000	David Weaver/ Rellos Construction Inc.
07/29/99	Basement, first and second floors	Tenant improvements (32,000 sf) new partitions, doors, ceilings, and finishes.	$960,000	David Weaver/ CMM Constructors
12/17/99	First floor	Install security barriers in three lobbies and guard desk in one lobby.	$30,000	David Weaver/ CMM Constructors
12/21/99	First floor	Change of use and occupancy, convert portion (742 sf) of truck loading area to office and add new store front.	$720,000	David Weaver/ CMM Constructors
06/08/00	Basement level B2; third, fourth, sixth, eighth, and ninth floors	New rated elevator vestibules on south side for five floors, and for north side of basement level B2.	$62,000	David Weaver/ Rellos Construction Inc.
06/08/00	Seventh floor	Tenant improvements; new doors, partitions, ceilings, elevator lobby, and exit corridor.	$519,000	David Weaver/ Rellos Construction Inc.
10/19/00	Second floor	Tenant improvements; remove and replace partitions, install new ceiling grid, new shower and test kitchen, shaft/hood under separate permit.	$300,000	David Weaver/ Rellos Construction Inc.
08/06/01	Eighth floor	Office tenant improvements (17,300 sf) remove and replace doors, partitions, ceilings, restrooms, new rated elevator lobby and exit corridor.	$490,000	David Weaver/ Rellos Construction Inc.
10/01/02	Basement levels B2 and B3	Elevator lobby enclosure on levels B2 and B3.	$8,000	David Weaver/ Rellos Construction Inc.
07/31/03	Basement through second floor	Replace existing fire rated shaft enclosure (16' X 10'); new partitions and doors at fan room (760 sf) at level B1.	$37,000	David Weaver/ CMM Constructors

Table D-2: Building Permit History for Mirror Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
08/25/03	First floor	Tenant improvements; new partitions, doors, and ceilings.	$52,000	David Weaver/ Rellos Construction Inc.
10/27/03	Second floor	Tenant improvements (8,700 sf) new partitions, doors, ceilings, and flooring.	$260,000	David Weaver/ Rellos Construction Inc.
10/26/04	Fourth floor	Remove non-structural brick partition and door, provide rated partitions and doors.	$15,000	David Weaver/ CMM Constructors
10/26/04	Fourth floor	Tenant improvements; extend existing corridor and create 18' long concrete ramp; includes new partitions and ceiling systems; relocate existing steel bracing one bay over for corridor relocation.	$20,000	David Weaver/ CMM Constructors
12/16/04	Fourth floor	Tenant improvements; new partitions, ceilings, and finishes.	$200,000	David Weaver/ Rellos Construction Inc.
10/17/05	Third floor	Tenant improvement (16,800 sf)-remodel; partitions, doors, ceilings, restrooms.	$500,000	David Weaver/ Rellos Construction Inc.
01/18/07	Fifth floor	Tenant improvements; new doors, partitions, and ceilings; no exterior alterations.	$500,000	David Weaver/ Rellos Construction Inc.
09/18/07	Not indicated	Complete work (30% pending) under original permit for structural strengthening.	$600,000	David Weaver/ CMM Constructors
07/09/08	Tenth floor	Tenant improvements (16,000 sf) new partitions, ceilings, doors, finishes, new door and opening on the stair shaft.	$640,000	David Weaver/ Rellos Construction Inc.
01/13/09	Ninth floor	Tenant improvements; new partitions, doors, ceilings, and finishes.	$700,000	David Weaver/ Rellos Construction Inc.
03/30/10	Eighth floor	Tenant improvements (14,500 sf) new partitions, doors, ceilings, and finishes.	$500,000	David Weaver/ Rellos Construction Inc.
10/05/10	Seventh floor (Southeast area)	Tenant improvements (10,000 sf) new partitions, doors, ceilings, and finishes.	$300,000	David Weaver/ Rellos Construction Inc.
03/29/11	Sixth floor (Southeast area)	Tenant improvements; remove and replace partitions, doors, ceilings, finishes, corridors, and restrooms.	$800,000	None listed / Rellos Construction Inc.
01/05/12	Eighth floor	Tenant improvements (5,600 sf) new partitions, doors, ceilings, finishes, and mill work.	$148,400	None listed / Rellos Construction Inc

Table D-2: Building Permit History for Mirror Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
07/16/14	Seventh floor	Tenant improvements.	$100,000	None listed / Interscape Construction Inc.

Executive Building

Table D-3: Building Permit History for Executive Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
06/19/70	Foundation only	Installation of foundation shoring.	Not indicated	None listed/ C. L. Peck Contractor
10/13/70	Foundation only	Construction of foundation.	$3,500,000	W. L. Pereira & Associates/ C. L. Peck Contractor
01/13/71	Foundation only	Construction of foundation.	$125,000	W. L. Pereira & Associates/ C. L. Peck Contractor
04/17/71	Entire lot	Construction of 6-story addition and parking garage.	$11,000,000	W. L. Pereira & Associates/ C.L. Peck Contractor
06/17/71	Entire lot	Construction of new structural floor system at grade.	$40,000	W. L. Pereira & Associates/ C. L. Peck Contractor
03/26/73	First floor	Installation of new wall sign.	$3,000	None listed/ Triple A Neon
01/28/74	Fourth floor	Construction of new partitions in existing space.	$80,000	Charles Kratka/ C. W. Driver
12/05/74	Fourth floor	Construction of walkway to Times-Plant Complex on existing roof.	$50,000	None listed/ None listed
12/06/74	Third floor	Interior remodeling and alterations.	$30,000	Charles Kratka/ None listed
03/06/75	Third floor	Relocate toilet room.	$2,000	Warren Steele & Assoc./ C. W. Driver, Inc.
05/02/75	Second floor	Tenant improvements; new lights, wall covering, and paint.	$52,000	Charles Kratka/ None listed
06/27/75	Fourth floor	Construction of new partitions.	$47,000	Charles Dratila Int. Planning & Design/ None listed
08/20/75	Basement level B2	Change in use to health center.	$100,000	Charles Kratka/ None listed
09/16/75	First floor	Tenant improvements; new partitions and ceilings.	$18,000	Charles Kratka/ None listed
11/19/75	Fourth floor	Tenant improvements; new partitions, ceilings, and flooring.	$50,000	Charles Kratka/ None listed
02/02/77	North elevation, first floor	Slab over opening, closing up entrance to stairs on Broadway.	$7,000	None listed/ C. W. Driver, Inc.
03/29/77	Basement level B1	New partitions, ceilings, and flooring.	$110,000	None listed/ None listed
09/07/77	Third floor	New partitions and flooring.	$95,000	Charles Kratka/ None listed

Table D-3: Building Permit History for Executive Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
12/06/77	Third floor	New door and controls, plaster patching, and veneer.	$5,000	Charles Kratka/ None listed
01/18/78	Sixth floor	Construction of new drywall partition.	$1,500	None listed/ None listed
02/18/78	Basement*	Cut two openings through slab at basement floor.	$2,000	None listed/ Weatherite
06/08/78	Basement level B1	Add floor level between basement and first floor for flammable storage.	$30,000	None listed/ C. W. Driver, Inc.
06/08/78	Second floor	Construction of stairway and drywall partitions.	$9,500	None listed/ C. W. Driver, Inc.
06/12/78	Second floor*	New drywall partitions for offices, suspended ceiling, and hole in floor slab.	$20,000	None listed/ C. W. Driver, Inc.
06/12/78	Third floor*	Add interior partitions and three dumbwaiters.	$20,000	None listed/ C. W. Driver, Inc.
08/23/78	First to third floors*	Construction of new elevator openings.	$25,000	None listed/ C. W. Driver, Inc.
10/11/78	Basement	Construction of new partition and ceiling for spa and deck.	$25,000	Charles Kratka/ C. W. Driver, Inc.
12/6/78	Not indicated*	Installation of new acoustic tile ceiling.	$15,000	None listed/ C. W. Driver, Inc.
01/31/80	Third floor	New partitions, ceilings, and flooring.	$575,000	Charles Kratka/ C. W. Driver, Inc.
07/03/80	First floor	Installation of night teller machine.	$3,800	Roy Sealey/ Transpac Electric Cons. Co.
10/15/85	Not indicated	New corridor doors and partitions.	$3,500	None listed/ R. B. Paterson, Inc.
11/03/87	First floor	Tenant improvements; new partitions, ceilings, and air conditioning.	$350,000	Stokes & Bojoguez/ R. B. Paterson, Inc.
01/21/88	Not indicated*	Alter walls, construct raised floor, and add new doors.	$45,000	David Roger Weaver/ Smithwick-Driver
08/03/89	First floor	Installation of ATM.	$6,000	L.A. Architects/ J. H. Bryant Jr., Inc.
05/21/90	Roof	Installation of satellite antenna.	$10,000	None listed/ J. H. Bryant Jr., Inc.
02/23/93	First floor	Replacement two existing ATMs with new ATMS.	$78,000	Viktor R. Petris, Inc./ Evans & Sons, Inc.
05/06/93	North and east elevations, first floor	Installation of two signs, one on Broadway and one on First Street.	$2,720	None listed/ Acme Wiley Corp.

Table D-3: Building Permit History for Executive Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
08/02/92	Roof	Replacement of roofing materials with 110 sas of US intec modified bitumen.	$24,500	None listed/ Bilt-Well Roofing
06/23/95	First floor	Replacement of four existing ATMs with new ATMs.	$6,000	None listed/ Evans & Son, Inc.
03/06/97	Fourth floor	Remodel men's and women's restrooms.	$50,000	David Roger Weaver/ Swinerton & Walberg Co.
10/24/97	First and second floors	Addition of concrete shear walls, seismic upgrades, and infill existing openings.	$1,820,000	David Roger Weaver/ Coast Machinery Movers
11/24/97	Basement level B2	Structural strengthening of floor slab to support backup power system.	$106,000	None listed/ C. M. M. Constructors
03/26/98	Third floor	Tenant improvements (5,000 sf) remodel offices.	$20,000	David Roger Weaver/ None listed
05/22/98	Fourth and fifth floors	Fireproofing respray (15,000 sf).	$30,000	None listed/ Versatile Coatings, Inc.
05/22/98	Fourth and fifth floors	Asbestos abatement (15,000 sf).	$2,000	None listed/ Myers R. M. Corporation
06/25/98	Fourth floor	Tenant improvements; new ceiling, doors, and walls.	$420,000	David Roger Weaver/ Rellos Construction, Inc.
06/25/98	Third floor	Tenant improvements (4,200 sf) remove and replace partitions and ceilings; new elevator lobby.	$126,000	David Roger Weaver/ Rellos Construction, Inc.
07/17/98	West elevation	Installation of sign reading "LOS ANGELES TIMES."	$14,000	None listed/ AD Impact
09/03/98	Basement to second floors	Addition of concrete sheer walls, seismic upgrades, and infill existing openings (12,675 sf).	$500,000	David Roger Weaver/ Coast Machinery Movers
04/15/99	Second floor	Tenant improvements (5,400 sf; new walls, doors, ceilings, finishes, and new raised floor.	$135,000	David Roger Weaver/ Rellos Construction, Inc.
11/17/99	Third floor	Tenant improvements; new ceilings, removal of existing wood floor, and replacement with light weight concrete.	$74,000	David Roger Weaver/ Rellos Construction, Inc.
06/23/00	Not indicated	Construction of new exit corridor.	$15,000	David Roger Weaver/ C. M. M. Constructors
10/25/01	First floor	Tenant improvements (1,400 sf) new partitions, doors, and ceilings.	$42,000	None listed/ Rellos Construction, Inc.
03/28/02	First floor	Removal of all existing signs and replace with illuminated sign.	$1,950	None listed/ Acme Wiley Corp.

Table D-3: Building Permit History for Executive Building				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
08/5/03	Basement level B1	Tenant improvements (1,900 sf) new doors, partitions, and ceilings, and conversion of storage area into office.	$57,000	David Roger Weaver/ Rellos Construction, Inc.
11/20/03	Fourth floor	Tenant improvements (400 sf) new door and partition separating elevator lobby and new corridor partition to exit stair.	$12,000	David Roger Weaver/ Rellos Construction, Inc.
12/18/03	Second floor	Tenant improvements; new partitions to create a hallway and convert dark room into an office, and construction of a new opening into office area.	$6,000	David Roger Weaver/ Rellos Construction, Inc.
04/01/04	Third floor	Replacement of two doors in elevator lobby.	$3,000	David Roger Weaver/ Rellos Construction, Inc.
09/03/04	Basement	Add concrete pad to existing chiller pad in basement for mechanical unit.	$4,500	None listed/ C. M. M. Constructors
06/08/05	Second to sixth floors	Elevator lobby retrofit at 12 places; doors, partitions; ceilings; HCP restroom updates, doors, partitions, and plumbing fixtures at four restrooms.	$220,000	None listed/ None listed
08/22/05	Not indicated	Installation of emergency back-up generator, and re-striping of parking lot.	$250,000	David Roger Weaver/ C. M. M. Constructors
06/19/09	First floor	Installation of security glass wall on top of existing teller line counters and nonbearing glass wall.	$25,000	Paul Veryle Morford/ Evans & Son, Inc.
05/10/12	Fifth floor	Tenant improvements; new partitions, finishes, ceilings.	$160,000	David Roger Weaver/ Rellos Construction, Inc.
08/06/12	Third floor	Tenant improvements; new partitions, ceilings, doors, plumbing fixtures, and finishes for restroom remodel.	$50,000	None listed/ Rellos Construction, Inc.
10/04/12	Second floor	Tenant improvements (5,000 sf) new partitions, doors, and ceilings.	$245,000	None listed/ Rellos Construction, Inc.
10/04/12	Third floor	Tenant improvements (5,000 sf) partitions, doors, and ceilings.	$225,000	None listed/ Rellos Construction, Inc.
09/05/13	Fifth floor	Tenant improvements (450 sf) conversion of two offices into three offices.	$25,000	None listed/ None listed
* Times Mirror Square Complex Building where permitted work took place not clearly indicated on permit.				

Parking Structure

Table D-4: Building Permit History for Parking Structure				
Date	**Floor/Area as Described on 2017 Plans**	**Description from Building Permit**	**Value**	**Architect/Builder**
This table only includes building permits for alterations. The permits for the original construction are listed in Table D-3: Building Permit History for Executive Building.				
05/17/71	Roof	Installation of steel support for after burner on roof to press building.	$5,000	W. L. Pereira & Associates/ C. L. Peck Contractor
05/17/71	Foundation only	Change of plans/change of foundation of parking structure.	$23,000	W. L. Pereira & Associates/ C. L. Peck Contractor
06/02/71	Basement	Construction of foundations and walls only to ground level of added basement in garage only.	$56,000	W. L. Pereira & Associates/ C. L. Peck Contractor
10/03/79	First floor*	Installation of bascule bridge.	$40,000	None listed/ None listed
09/04/86	Not indicated*	Interior renovation of walls (to include electrical and mechanical)	$43,000	None listed/ Smithwick-Driver
08/22/05	Not indicated	Installation of emergency back-up generator, and re-striping of parking lot.	$250,000	David Roger Weaver/ C. M. M. Constructors
05/05/14	Basement	New concrete pad for installation of three diesel storage tanks and installation of a three-hour non-load bearing partition wall.	$100,000	Not indicated/ El Captain Environment Service
* Times Mirror Square Complex Building where permitted work took place not clearly indicated on permit.

EXECUTIVE SUMMARY

Times Mirror Square Project - Archaeological Resources Assessment Report

Environmental Science Associates (ESA) has been retained by Onni Group (Applicant), to conduct an Archaeological Resources Assessment for the Times Mirror Square Project (Project) in support of an Environmental Impact Report (EIR). The Applicant proposes to construct two new mixed-use towers along with rehabilitation of three existing buildings within the Times Mirror Square site (Project Site) in the city of Los Angeles. The Project Site is currently occupied by five structurally distinct but internally connected buildings occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings include the Times Building, the Plant Building, the Mirror Building, the Executive Building, and a parking structure. The Project would include demolition of the Executive Building and parking structure, and would construct two mixed-use towers (North and South Towers) in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror Building. The City of Los Angeles (City) is the lead agency pursuant to the California Environmental Quality Act (CEQA). The 3.6-acre Project Site is located within the northern portion of downtown Los Angeles and comprises the city block bounded by W. 1st Street to the northeast, S. Spring Street to the southeast, W. 2nd Street to the southwest, and S. Broadway to the northwest.

A records search for the Project was conducted on May 4, 2017 at the California Historical Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC) housed at California State University, Fullerton. The records search results indicate that 98 studies that included some form of field study including survey, excavation, or monitoring have been conducted within ½ mile of the Project Site. Approximately 70 percent of the ½-mile records search radius has been included in previous cultural resources field studies. Of the 98 previous field studies, one (LA-10507) overlaps the Project Site. Approximately 90 percent of the Project Site has been included as part of this previous study.

The records search results indicate that 15 resources have been previously recorded within the ½-mile records search radius. These resources include 14 archaeological resources and one California Historic Landmark (CHL #744). Of the 14 archaeological resources, 13 are historic-period archaeological sites and one is a historic-period isolate. One of the historic-period archaeological sites (P-19-004451) was identified during construction of the Los Angeles Federal Courthouse and is located approximately 100 feet from of the Project Site. Resource P-19-174925 includes CHL #744 identified as the site of the first brick school house in Los Angeles between 1854 and 1855, as well as the site of the Butterfield Overland Mail Company office and corrals between 1858 and 1861, and the U.S. Army Quartermaster in 1861, all of which were previously

located within the eastern portion of the Project Site within the current footprint of the Mirror Building. The Project Site is commemorated by a plaque affixed to the south-facing façade of the Mirror Building. The area of the Project Site, which is the subject of the commemoration, would continue to function as CHL#744 after the implementation of the Project and the plaque would be retained in its current location.

The California Native American Heritage Commission (NAHC) maintains a confidential Sacred Lands File (SLF) which contains sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted on August 11, 2017 to request a search of the SLF. The NAHC responded to the request in a letter dated August 23, 2017. The NAHC's letter states that sites are known to be located within the Project Site, but did not provide specific information regarding these sites.

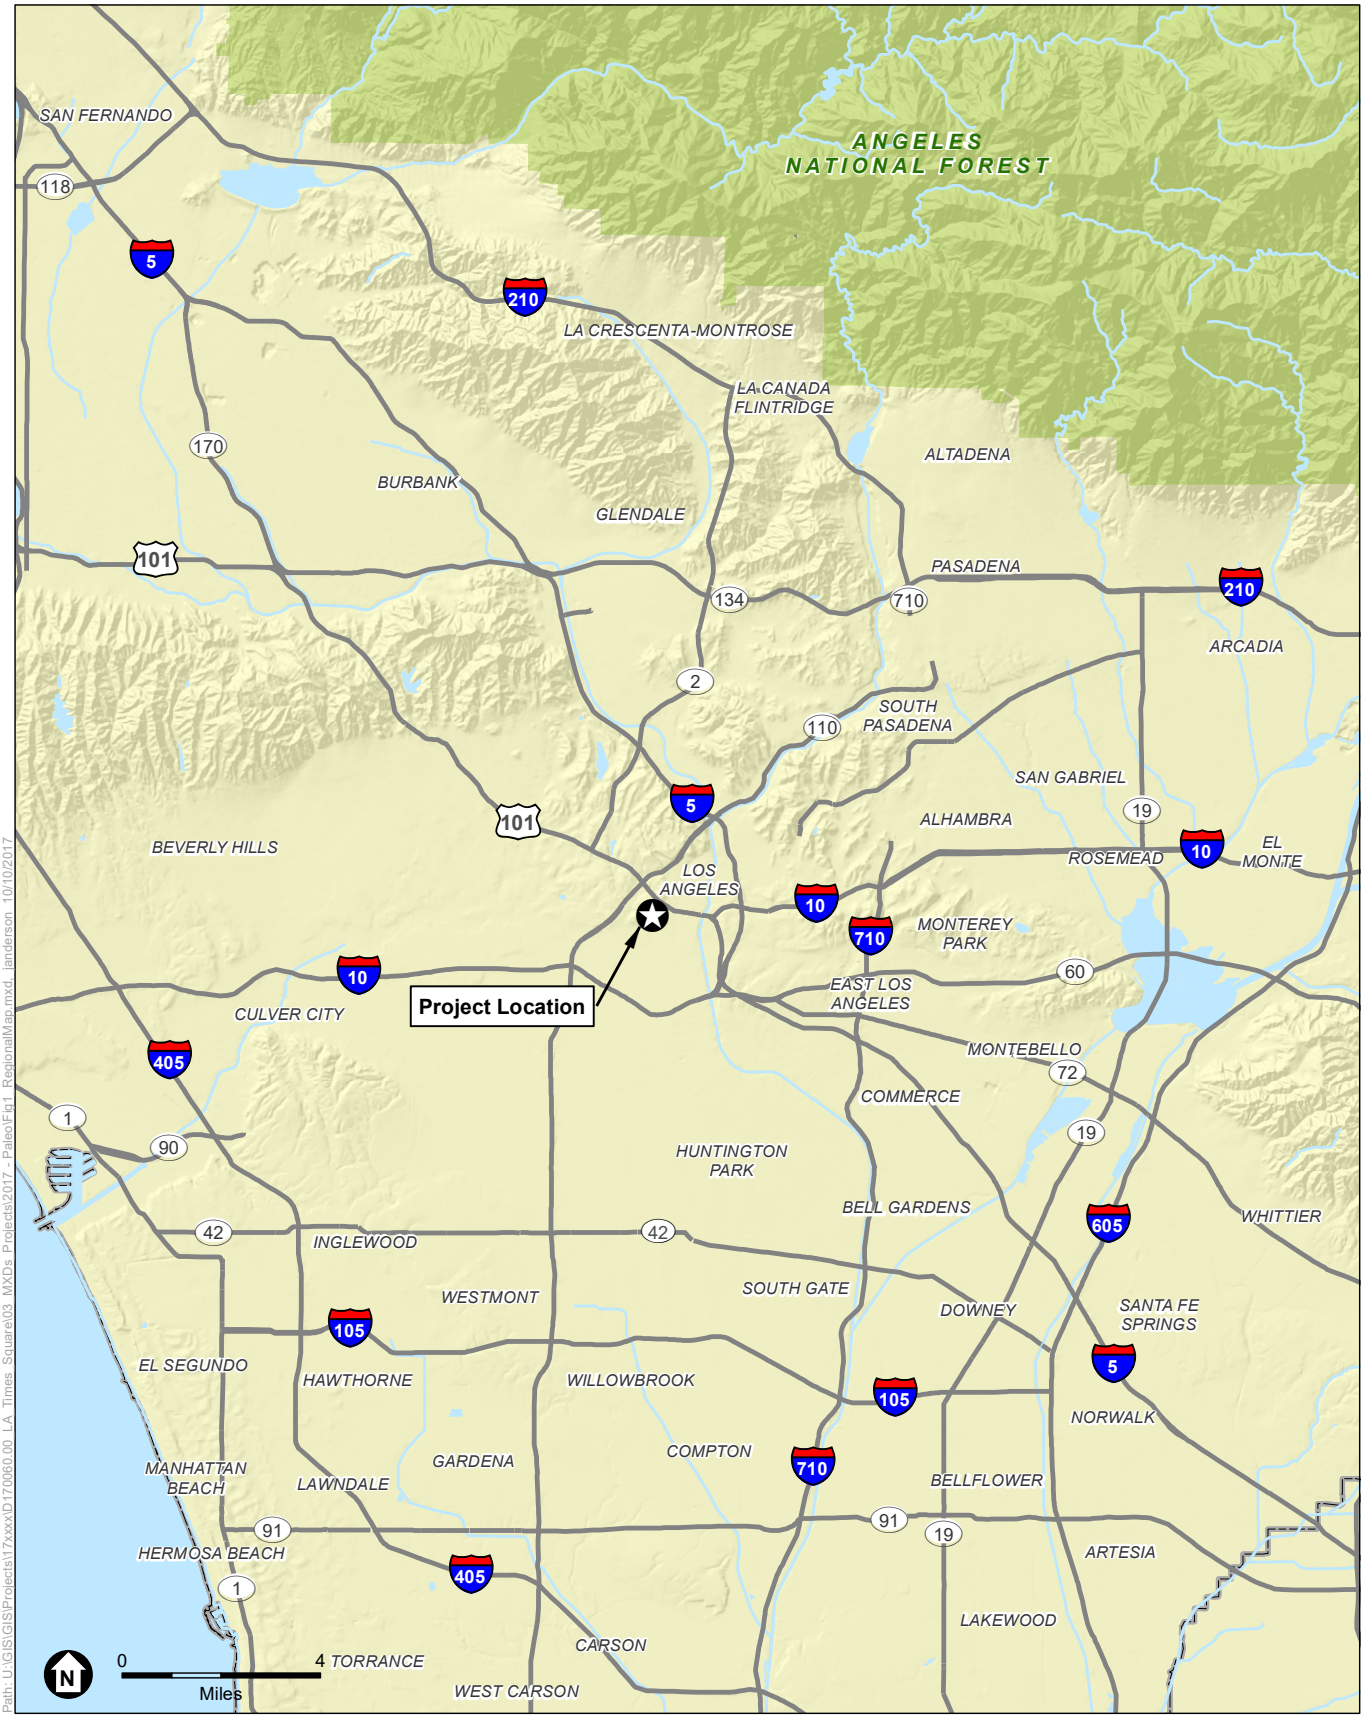
Historic maps and aerial photographs were examined to provide historical information about the Project Site and to contribute to an assessment of the Project Site's archaeological sensitivity. Available maps include the 1888, 1894, 1906, and 1950 Sanborn Fire Insurance Maps. Historic aerial photographs of the Project Site from the years 1948, 1952, 1964, 1977, 1972, 1980, 2012 were also examined. The historic review indicates that the Project Site has been developed and used for residential and commercial purposes since the late 19th century. Beginning in the mid-20th century the eastern half of the Project Site was drastically changed as all of the buildings present since the late 19th century were demolished and replaced with the Times Building, the Plant Building, and the Mirror Building. Similarly, the buildings in the western half of the Project Site were destroyed when the Executive Building and parking structure were constructed in the 1960s and 1970s. The buildings that are currently present within the Project Site all contain basements, and the construction of these buildings and their subgrade components likely destroyed any subsurface remnants associated with the multi-story buildings that were constructed in the late 19th century.

Given the developed nature of the Project Site and the lack of visible ground surface, an archaeological resources survey for the Project was not conducted.

Given the high degree of disturbance associated with the construction of the buildings currently present within the Project Site, there is a low likelihood of encountering subsurface archaeological deposits during Project implementation. Although the likelihood of encountering subsurface archaeological resources is low, the Project would include ground disturbing activities associated with the demolition of the Executive Building and parking structures, and the construction of Towers 1 and 2. Accordingly, there is a possibility that ground disturbing activities could impact pockets of undisturbed soil containing previously unidentified archaeological deposits that may qualify as historical resources and/or unique archeological resources pursuant to CEQA. As such, ESA recommends mitigation measures for the retention of a qualified archaeological monitor, cultural resources sensitivity training, and protocols to be carried out should archaeological resources be inadvertently discovered. These measures are included in the *Conclusions and Recommendations* Section at the close of this report.

TIMES MIRROR SQUARE PROJECT

Archaeological Resources Assessment Report



Introduction

Environmental Science Associates (ESA) has been retained by Onni Group (Applicant), to conduct an Archaeological Resources Assessment for the Times Mirror Square Project (Project) in support of an Environmental Impact Report (EIR). The Applicant proposes to construct two new mixed-use towers along with rehabilitation of three existing buildings within the Times Mirror Square site (Project Site) in the city of Los Angeles. The Project Site is currently occupied by five structurally distinct but internally connected buildings occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings include the Times Building, the Plant Building, the Mirror Building, the Executive Building, and parking structure. The Project would include demolition of the Executive Building and parking structure, and would construct two mixed-used towers (North and South Towers) in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror Building. The City of Los Angeles (City) is the lead agency pursuant to the California Environmental Quality Act (CEQA).

ESA personnel involved in the preparation of this report are as follows: Monica Strauss, M.A., R.P.A., Project Director and Principal Investigator; Sara Dietler, B.A., Project Manager; Fatima Clark, B.A. report author; Michael Vader, B.A., report author. Resumes of key personnel are included in **Appendix A**.

Project Location

The 3.6-acre Project Site is located within the northern portion of downtown Los Angeles (**Figure 1**). Specifically, the Project Site is located in an unsectioned portion of Township 1 South, Range 13 West on the Los Angeles, CA USGS 7.5-minute topographic quadrangle (**Figure 2**). The Project Site comprises the city block bounded by W. 1st Street to the northeast, S. Spring Street to the southeast, W. 2nd Street southwest, and S. Broadway to the northwest (**Figure 3**).

Project Description

The Project Site encompasses five structurally distinct but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to 10 stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the 10-story Mirror Building, the six-story Executive Building, and the six-story parking structure. The Project would include demolition of the Executive Building and parking structure, and would construct the two mixed-used North and South Towers in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror Building.

The proposed 37-story North Tower and 53-story South Tower would be constructed in the west sector of the block, which is aligned with S. Broadway with frontages on W. 1st Street and W. 2nd Street. The North and South Towers, which would be constructed above a five-story parking podium (Podium), would contain a total of approximately 1,127 residential units, approximately 34,572 square feet of commercial floor area, and a combined floor area of approximately 1,135,803 square feet. The Podium would be an above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. An open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park. Ground level retail uses would be located along the base of the Podium facing W. 1st Street, S. Broadway, and W. 2nd Street, and the Paseo.

Setting

Natural Setting

The Project is located in a relatively flat area of the western Los Angeles Basin. The basin is formed by the Santa Monica Mountains to the northwest, the San Gabriel Mountains to the north, and the San Bernardino and San Jacinto Mountains to the east. The basin was formed by alluvial and fluvial deposits derived from these surrounding mountains. Prior to urban development and the channeling of the Los Angeles River, the Project Site, which is located 0.90 miles west of the Los Angeles River Channel, was likely covered with marshes, thickets, dense woodland, and grassland. The floodplain forest of the Los Angeles Basin formed one of the most biologically rich habitats in southern California. Willow, cottonwood and sycamore, and dense underbrush of alder, hackberry, and shrubs once lined the Los Angeles River as it passed near present-day downtown Los Angeles. Although historically most of the Los Angeles River was dry for at least part of the year, shallow bedrock in the Elysian Park area north of downtown forced much of the river's underground water to the surface. This allowed for a steady year-round flow of water through the area that later became known as downtown Los Angeles. Currently, the Project Site is completely developed and encompasses five existing buildings. A geotechnical study prepared in support of the Project indicates that the Project Site is likely underlain by small amounts of artificial fill but does not provide exact depth or ages of the fill (Geocon West, Inc., 2017).

Prehistoric Setting Overview

The chronology of southern California is typically divided into three general time periods: the Early Holocene (11,000 to 7,600 Before Present [B.P.]), the Middle Holocene (7,600 to 3,600 B.P.), and the Late Holocene (3,600 B.P. to A.D. 1769). Within this timeframe, the archaeology of southern California is generally described in terms of cultural "complexes." A complex is a specific archaeological manifestation of a general mode of life, characterized archaeologically by technology, particular artifacts, economic systems, trade, burial practices, and other aspects of culture.

While it is not certain when humans first came to California, their presence in southern California by about 11,000 B.P. has been well documented. At Daisy Cave, on San Miguel Island, cultural remains have been radiocarbon dated to between 11,100 and 10,950 B.P. (Byrd and Raab, 2007). The first evidence of human occupation in the Los Angeles area dates to at least 9000 years B.P. and is associated with the Millingstone cultures (Wallace, 1955; Warren, 1968). Millingstone cultures were characterized by the collection and processing of plant foods, particularly acorns, and the hunting of a wider variety of game animals (Byrd and Raab, 2007; Wallace, 1955). Millingstone cultures also established more permanent settlements that were located primarily on the coast and in the vicinity of estuaries, lagoons, lakes, streams, and marshes where a variety of resources, including seeds, fish, shellfish, small mammals, and birds, were exploited. Early Millingstone occupations are typically identified by the presence of handstones (manos) and millingstones (metates), while those Millingstone occupations dating later than 5000 B.P. contain a mortar and pestle complex as well, signifying the exploitation of acorns in the region.

During the Middle Holocene (7,600 to 3,600 B.P.), there is evidence for the processing of acorns for food and a shift toward a more generalized economy. Around 7,000 B.P., the climate of southern California became warmer and more arid and the human population, residing mainly in coastal or inland desert areas, began exploiting a wider range of plant and animal resources (Byrd and Raab, 2007).

During the Late Holocene (3,600 B.P. to A.D. 1769), many aspects of Millingstone culture persisted, but a number of socioeconomic changes occurred (Erlandson, 1994; Wallace, 1955; Warren, 1968). The native populations of southern California were becoming less mobile and populations began to gather in small sedentary villages with satellite resource-gathering camps. Increasing population size necessitated the intensified use of existing terrestrial and marine resources (Erlandson, 1994). Evidence indicates that the overexploitation of larger, high-ranked food resources may have led to a shift in subsistence, towards a focus on acquiring greater amounts of smaller resources, such as shellfish and small-seeded plants (Byrd and Raab, 2007). Around 1,000 B.P., an episode of sustained drought, known as the Medieval Warm Period, occurred. While this climatic event did not appear to reduce the human population, it did lead to a change in subsistence strategies in order to deal with the substantial stress on resources. The Late Holocene marks a period in which specialization in labor emerged, trading networks became an increasingly important means by which both utilitarian and non-utilitarian materials were acquired, and travel routes were extended. Although the intensity of trade had already been increasing, it now reached its zenith, with asphaltum (tar), seashells, and steatite being traded

from southern California to the Great Basin. Major technological changes appeared as well, particularly with the advent of the bow and arrow, which largely replaced the use of the dart and atlatl. Small projectile points, ceramics, including Tizon brownware pottery, and obsidian from Obsidian Butte (Imperial County), are all representative artifacts of the Late Holocene.

Ethnographic Setting

The Project Site is located in a region traditionally occupied by the Takic-speaking Gabrielino Indians. The term "Gabrielino" is a general term that refers to those Native Americans who were administered by the Spanish at the Mission San Gabriel Arcángel. Prior to European colonization, the Gabrielino occupied a diverse area that included: the watersheds of the Los Angeles, San Gabriel, and Santa Ana rivers; the Los Angeles basin; and the islands of San Clemente, San Nicolas, and Santa Catalina (Kroeber, 1925). Their neighbors included the Chumash to the north, the Juañeno to the south, and the Serrano and Cahuilla to the east. The Gabrielino are reported to have been second only to the Chumash in terms of population size and regional influence (Bean and Smith, 1978). The Gabrielino language is part of the Takic branch of the Uto-Aztecan language family.

The Gabrielino were hunter-gatherers and lived in permanent communities located near the presence of a stable food supply. Subsistence consisted of hunting, fishing, and gathering. Small terrestrial game were hunted with deadfalls, rabbit drives, and by burning undergrowth, while larger game such as deer were hunted using bows and arrows. Fish were taken by hook and line, nets, traps, spears, and poison (Bean and Smith, 1978). The primary plant resources were the acorn, gathered in the fall and processed in mortars and pestles, and various seeds that were harvested in late spring and summer and ground with manos and metates. The seeds included chia and other sages, various grasses, and islay or holly-leafed cherry.

Community populations generally ranged from 50 to 100 inhabitants, although larger settlements may have existed. The Gabrielino-Tongva are estimated to have had a population numbering around 5,000 in the pre-contact period (Kroeber, 1925). Villages are reported to have been the most abundant in the San Fernando Valley, the Glendale Narrows area north of downtown, and around the Los Angeles River's coastal outlets (Gumprecht, 2001). The village of *Yaanga* was located approximately 0.25 miles from the present-day location of the Project Site (Morris et al., 2016). Of the approximately 100 known Gabrielino villages, *Yaanga* was one of the largest and leaders from other Gabrielino villages would regularly converge on *Yaanga* to hold councils (Rasmussen, 1997). The Gabrielino leaders would meet beneath the branches of a large sycamore tree known as the council tree, or *El Aliso*, which served as a regional landmark and meeting place. The 400-year old tree died and was cut down in 1892 as downtown Los Angeles's industrial expansion surrounded it (Rasmussen, 1997). Recent research indicates that El Aliso was located south of what is presently the Metropolitan Transit Authority's headquarters within the median of the Hollywood Freeway, located approximately 0.5 miles east of the Project Site (Rasmussen, 1997).

Based on baptismal records, *Yaanga* appears to have been occupied until at least 1813. But by the early 1820s, *Yaanga's* Gabrielino residents were displaced to an area south of the village site in what is presently the block north of Los Angeles Street and W. 1st Street, approximately 530 feet

east of the Project Site (Morris et al., 2016). By 1836, the community in which the displaced Gabrielino lived was known as *Rancho de los Pablinos*, and Los Angeles residents began complaining about the Gabrielino bathing in the irrigation ditches known as Zanjas (Morris et al., 2016). As a result of the complaints, the Gabrielino were once again displaced further to the east approximately 0.44 miles from the Project Site. By 1847, the Gabrielino from *Yaanga* were displaced once again and left without a space in which to form a new community. As a result, the Gabrielino dispersed throughout Los Angeles.

Historic Setting

Regional Setting

Spanish Period (A.D. 1769-1821)

Although Spanish explorers made brief visits to the region in 1542 and 1602, sustained contact with Europeans did not commence until the onset of the Spanish Period. In 1769 Gaspar de Portolá led an expedition from San Diego, passing through the Los Angeles Basin and the San Fernando Valley, on its way to the San Francisco Bay (McCawley, 1996). This was followed in 1776 by the expedition of Father Francisco Garcés (Johnson and Earle, 1990).

In the late 18th century, the Spanish began establishing missions in California and forcibly relocating and converting native peoples. The nearest mission to the Project Site was Mission San Gabriel Arcángel, founded in 1771, located approximately 8 miles to the northeast.

In an effort to promote Spanish settlement of Alta California, Spain granted several large land concessions from 1784 to 1821. At this time, unless certain requirements were met, Spain retained title to the land (State Lands Commission [SLC], 1982).

Mexican Period (A.D. 1821-1848)

The Mexican Period began when Mexico won its independence from Spain in 1821. Mexico continued to promote settlement of California with the issuance of land grants. In 1833, Mexico began the process of secularizing the missions, reclaiming the majority of mission lands and redistributing them as land grants. According to the terms of the Secularization Law of 1833 and Regulations of 1834, at least a portion of the lands would be returned to the Native populations, but this did not always occur (Milliken et al., 2009).

Many ranchos continued to be used for cattle grazing by settlers during the Mexican Period. Hides and tallow from cattle became a major export for Californios (native Hispanic Californians), many of whom became wealthy and prominent members of society. The Californios led generally easy lives, leaving the hard work to vaqueros (Hispanic cowhands) and Indian laborers (Pitt, 1994; Starr, 2007).

American Period (A.D. 1848-present)

In 1846, the Mexican-American War broke out. Mexican forces were eventually defeated in 1847 and Mexico ceded California to the United States as part of the Treaty of Guadalupe Hildalgo in 1848. California officially became one of the United States in 1850. While the treaty recognized right of Mexican citizens to retain ownership of land granted to them by Spanish or Mexican

authorities, the claimant was required to prove their right to the land before a patent was given. The process was lengthy, and generally resulted in the claimant losing at least a portion of their land to attorney's fees and other costs associated with proving ownership (Starr, 2007).

When the discovery of gold in northern California was announced in 1848, a huge influx of people from other parts of North America flooded into California. The increased population provided an additional outlet for the Californios' cattle. As demand increased, the price of beef skyrocketed and Californios reaped the benefits. However, a devastating flood in 1861, followed by droughts in 1862 and 1864, led to a rapid decline of the cattle industry; over 70 percent of cattle perished during these droughts (McWilliams, 1946; Dinkelspiel, 2008). This event, coupled with the burden of proving ownership of their lands, caused many Californios to lose their lands during this period (McWilliams, 1946). Former ranchos were subsequently subdivided and sold for agriculture and residential settlement.

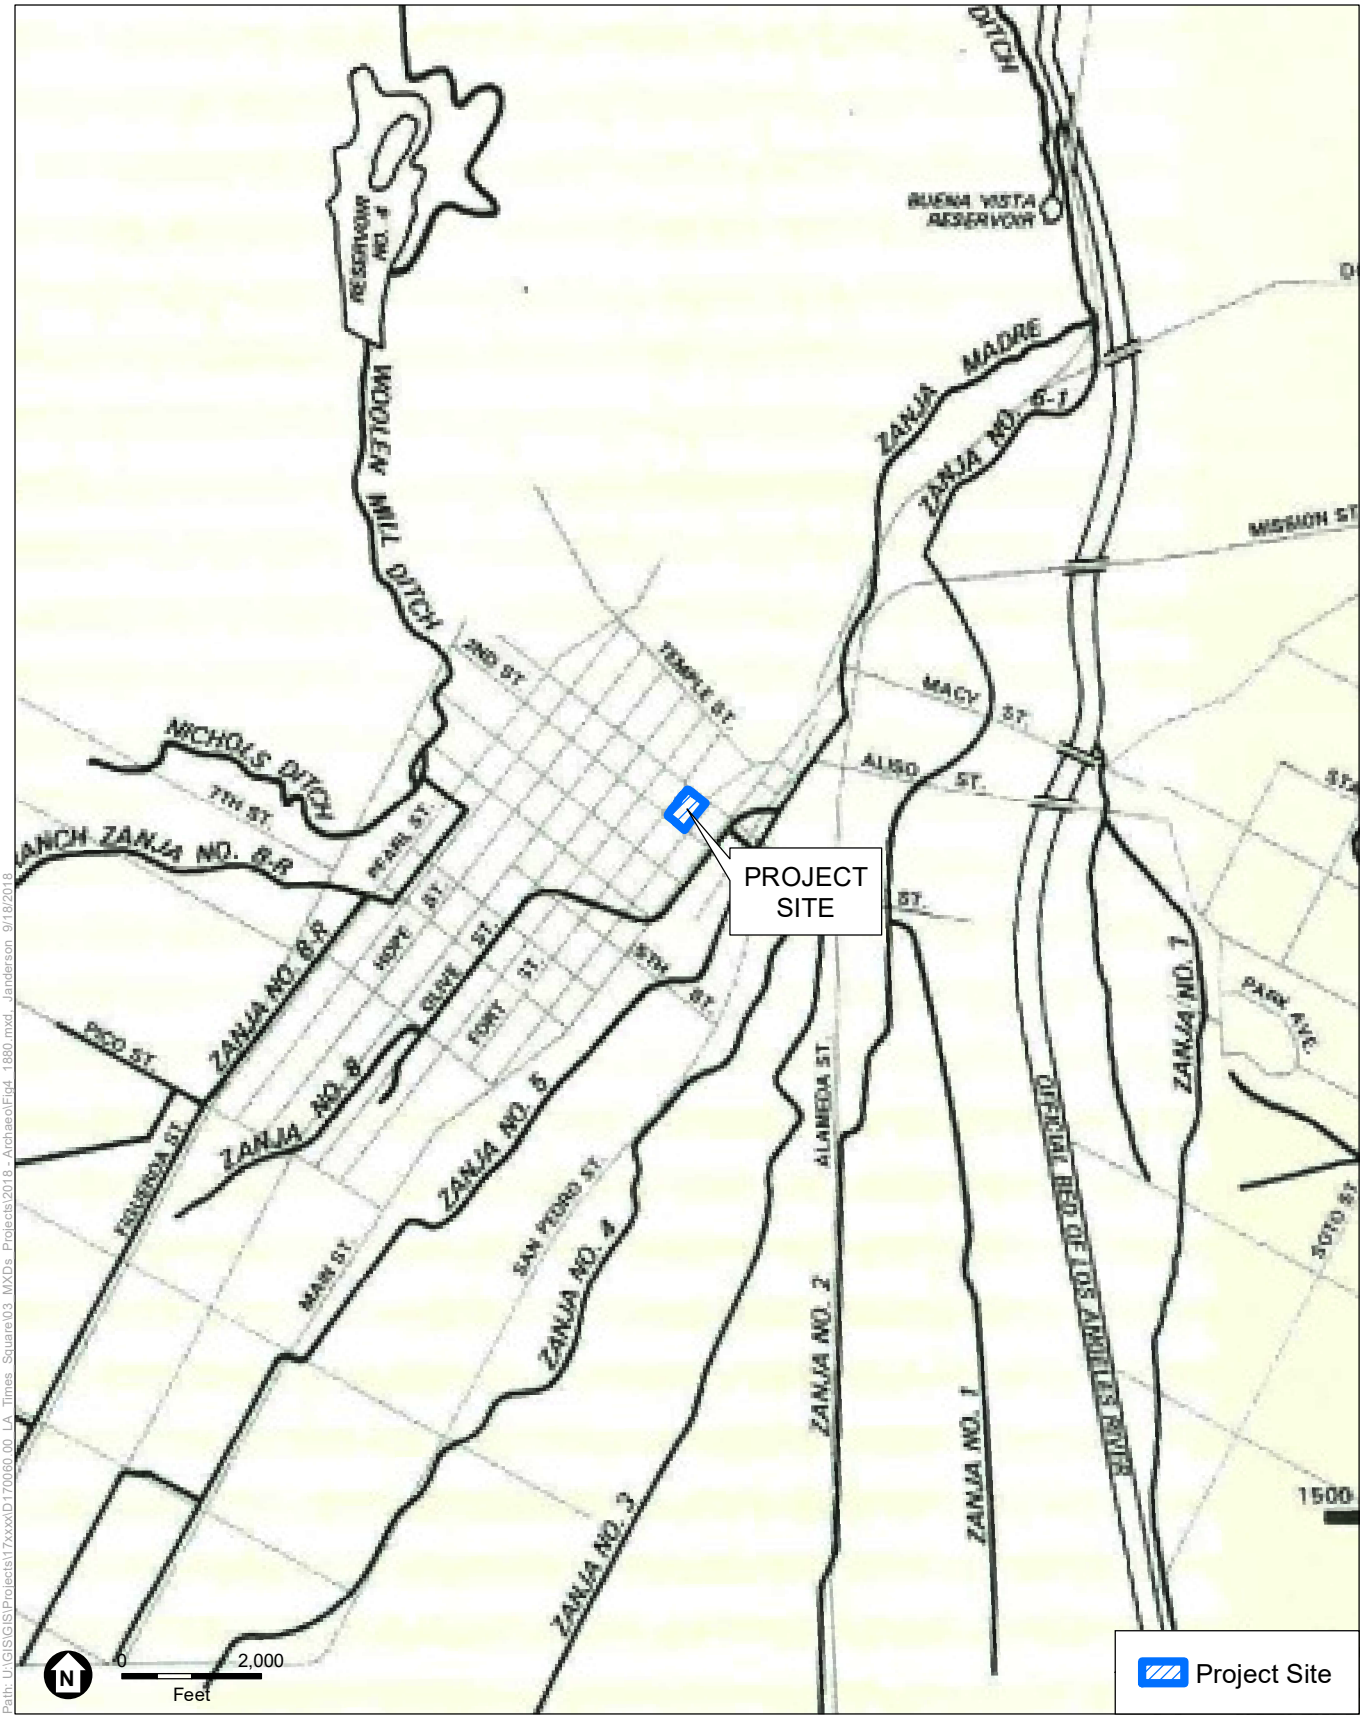
The first transcontinental railroad was completed in 1869, connecting San Francisco with the eastern United States. Newcomers poured into northern California. Southern California experienced a trickle-down effect, as many of these newcomers made their way south. The Southern Pacific Railroad extended the line from San Francisco to Los Angeles in 1876. The second transcontinental line, the Santa Fe, was completed in 1886 and caused a fare war, driving fares to an unprecedented low. Settlers flooded into the region and the demand for real estate skyrocketed. As real estate prices soared, land that had been farmed for decades outlived its agricultural value and was sold to become residential communities. The subdivision of the large ranchos took place during this time (Meyer, 1981; McWilliams, 1946). During the first three decades of the 20th century, more than 2 million people moved to Los Angeles County, transforming it from a largely agricultural region into a major metropolitan area.

City of Los Angeles

On September 4, 1781, El Pueblo de la Reina de los Angeles was established not far from the site where Portolá and his men camped during their 1769 excursion. Father Juan Crespi, who accompanied the 1769 expedition, had noted the suitability of the area for supporting a large settlement. He named the river El Rio de Nuestra Senora la Reyna de Los Angeles de Porciuncula (The River of Our Lady the Queen of the Angels of Porciuncula) (Gumprecht, 2001).

The pueblo was first established in response to the increasing agricultural needs of Spanish missions and presidios in Alta California. A land grant of 28 acres was issued to California Governor Felipe de Neve in 1781. A small group of colonists from Mexico then set out to develop a pueblo near the river. The original pueblo consisted of a central square surrounded by twelve houses and a series of agricultural fields. Thirty-six fields occupied 250 acres between the town and the river to the east (Gumprecht, 2001). An irrigation system that would carry water from the river to the fields and the pueblo was the communities' first priority and was constructed almost immediately. The main irrigation ditch, or Zanja Madre, was completed by the end of October 1781. It was constructed in the area of present-day Elysian Park, and carried water south along Alameda Street to the pueblo and then beyond (Gumprecht 2001). As the water needs of Los Angeles increased, additional ditches that branched off of the Zanja Madre were excavated. Maps provided by Gumprecht (2001), Stevenson (1884), and Rowan and Koeberle (1887) depict

Zanja No. 8 running in what is presently Main Street located approximately 450 southeast of the Project Site (**Figures 4, 5, and 6**). Zanja No. 8 was a branch of the Zanja Madre and consisted of an 8,300-foot long, 16-inch diameter cement pipe (Hall 1888).



By 1786, the flourishing pueblo attained self-sufficiency and funding by the Spanish government ceased (Gumprecht, 2001). Fed by a steady supply of water and an expanding irrigation system, agriculture and ranching grew, and by the early 1800s the pueblo produced surplus wheat, corn, barley, and beans for export. A large number of livestock, including cattle and sheep, grazed in the surrounding lands. Wine production gained importance and vineyards blanketed the landscape between present-day San Pedro Street and the river (Gumprecht, 2001).

After Mexico gained its independence from Spain, Los Angeles became the capital of its California territory in 1835. But few visited the area and the town remained a "sleepy agricultural village" until the Gold Rush in 1848 (Gumprecht, 2001).

When Los Angeles was connected to the transcontinental railroad via San Francisco on September 5, 1876, it experienced a significant boost in population. The city would experience its greatest growth in the 1880s when two more direct rail connections to the East Coast were constructed. The Southern Pacific completed its second transcontinental railway, the Sunset Route from Los Angeles to New Orleans, in 1883 (Orsi, 2005). In 1885, the Santa Fe Railroad completed a competing transcontinental railway to San Diego, with connecting service to Los Angeles (Mullaly and Petty, 2002). The resulting fare wars led to an unprecedented real estate boom, as well as affordable cross-country fares for immigrants. Despite a subsequent collapse of the real estate market, the population of Los Angeles increased 350 percent in the decade between 1880 and 1890 (Dinkelspiel, 2008).

The population boom of the 1880s drove the demand for real estate in Los Angeles. Farmland south and east of the city began to be replaced by residential and commercial development. Large tracts of agricultural land, now far more valuable for residential development, were subdivided and sold (Gumprecht, 1999).

From 1890 to 1900, the city continued to grow, and many infrastructure projects were completed during this decade (McWilliams, 1946). E.L. Doheny discovered oil in 1892, adding fuel to the flame. From 1900 to 1920, Los Angeles became a tourist mecca (McWilliams, 1946). The Los Angeles Aqueduct was constructed and a large portion of the San Fernando Valley annexed to the city during the first decade of the 20th century. From 1920 to 1930, Los Angeles experienced another population explosion, due in part to the automobile and the development of the movie industry. All told, between 1890 and 1930, the population of Los Angeles increased from 50,000 to 1.2 million people (Wild, 2005).

History of the Project Site

The Project Site has been continuously occupied and evolved through multiple phases of development since the mid-1850s. In late 1854 and early 1855 the first brick schoolhouse, known as School No. 1, was constructed northwest of the intersection of Spring Street and W. 2nd Street in the southeast portion of the Project Site (Arbuckle, 1979). In late 1859, the Butterfield Overland Mail Company purchased a lot southwest of the intersection of Spring Street and W. 1st Street, in the northeastern portion of the Project Site, and constructed a brick building to house offices and living quarters, with stables and shops in the rear of the building (Arbuckle, 1979). The mail company's Los Angeles station was second only to their El Paso station in terms of its size and equipment (Arbuckle, 1979). By 1860, the Butterfield Overland Mail Company discontinued use of their office on Spring Street and W. 1st Street, and in 1861 the building became the headquarters of the office of the U.S Quartermaster (Arbuckle, 1979).

In 1883, the Los Angeles Board of Education sold their lot in what is the southeast portion of the Project Site to the City for $30,000, and the City replaced Schoolhouse No. 1 with a new City Hall building (Arbuckle, 1979). By 1887, the remainder of the lot was sold to John Bryson and George H. Bonebrake who constructed an 8-story office building known as the Bryson-Bonebrake Block in 1889 (Arbuckle, 1979). The building was designed by Joseph Cather Newsom and was the most architecturally ornate office building in Los Angeles at the time (Shannon, 2009). The building housed one bank, 126 rooms, a lodge room, and included 120 feet of frontage on Spring Street and 103 feet of frontage on W. 2nd Street (Shannon, 2009). In 1934, the Bryson-Bonebrake Block office building was demolished to make way for the Times Mirror Square that occupies the Project Site today.

The buildings currently within the Project Site include the Times Building, the Plant Building, the Mirror Building, the Executive Building, and a parking structure. The Times Building was built between 1933 and 1935 and designed by the architect Gordon B. Kaufman to serve as the new headquarters replacing the previous headquarters which was located immediately northeast of the Project Site on W. 1st Street and Broadway. The location of the old headquarters was bombed in 1910 by union leaders in response to the paper's anti-union stance (GPA Consulting, 2017). The Times Building has a steel frame structural system and a rectangular plan, with walls composed of reinforced concrete and clad with marble, granite, and limestone (GPA Consulting, 2017).

The Plant Building was constructed in three different phases. The first phase was undertaken in 1935 along with the construction of the Times Building and designed by Gordon B. Kaufmann. The second phase occurred in 1946 and consisted of the addition of a third story to the building, designed by Rowland H. Crawford. The third phase (also designed by Crawford), which entailed the addition of a fourth story that connected to the Times and Mirror Buildings, was carried out in 1955 (GPA Consulting, 2017).

The Mirror Building was designed by Rowland Crawford and constructed between 1947 and 1948. In 1948, Norman Chandler, the Chairman of the Times Mirror Company, started the Los Angeles Mirror as an afternoon paper to compete with the *Herald-Express and Daily News*. The Mirror Building housed the new paper's offices, as well as a mail room, press room, television offices, rental offices, and equipment storage rooms (GPA Consulting, 2017).

The Executive Building was constructed between 1970 and 1973, during the time when Franklin David Murphy was chairman of the company. Norman, Dorothy, and Otis Chandler were on the board, and Otis Chandler was the publisher of the *Los Angeles Times*. Dorothy Chandler was in charge of the development of the building, which has a rectangular plan, a flat roof with a steel frame structural system, and a 2-story basement. The walls are clad with a combination of Norwegian granite and metal coated with a dark bronze silicon copolymer finish (GPA Consulting, 2017).

The parking structure was constructed 1973. The building consists of horizontal parking decks, with, and most of the first story is enclosed with metal slat vents. The Parking Structure has a rectangular plan, is six stories high, and includes a basement (GPA Consulting, 2017).

In 1949, the Native Daughters of the Golden West (NDGW), a non-profit organization for women born in California, commemorated the Mirror Building as the site of the first brick school house in Los Angeles, the Butterfield Overland Stage Station, and the U.S Army's Quartermasters headquarters, which were present from the 1850s through the 1880s. NDGW was founded by Lily O. Reiclhling in 1886 in the northern California town of Jackson. Jackson's Pioneer Hall became the headquarters of the first local chapter, known as a Parlor, and, by 1887, 17 Parlors had been established throughout the state (NDGW, 2017). Today, there are over 75 Parlors throughout the state, many within major cities.

Regulatory Framework

Numerous laws and regulations require federal, state, and local agencies to consider the effects a project may have on cultural resources. These laws and regulations stipulate a process for compliance, define the responsibilities of the various agencies proposing the action, and prescribe the relationship among other involved agencies.

Federal

National Historic Preservation Act

The principal federal law addressing historic properties is the National Historic Preservation Act (NHPA), as amended (54 United States Code of Laws [USC] 300101 et seq.), and its implementing regulations (36 CFR Part 800). Section 106 requires a federal agency with jurisdiction over a proposed federal action (referred to as an "undertaking" under the NHPA) to take into account the effects of the undertaking on historic properties, and to provide the Advisory Council on Historic Preservation (ACHP) an opportunity to comment on the undertaking.

The term "historic properties" refers to "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register" (36 CFR Part 800.16(*l*)(1)). The implementing regulations (36 CFR Part 800) describe the process for identifying and evaluating historic properties, for assessing the potential adverse effects of federal undertakings on historic properties, and seeking to develop measures to avoid, minimize, or mitigate adverse effects. The Section 106 process does not require the preservation of historic

properties; instead, it is a procedural requirement mandating that federal agencies take into account effects to historic properties from an undertaking prior to approval.

The steps of the Section 106 process are accomplished through consultation with the State Historic Preservation Officer (SHPO), federally-recognized Indian tribes, local governments, and other interested parties. The goal of consultation is to identify potentially affected historic properties, assess effects to such properties, and seek ways to avoid, minimize, or mitigate any adverse effects on such properties. The agency also must provide an opportunity for public involvement (36 CFR 800.1(a)). Consultation with Indian tribes regarding issues related to Section 106 and other authorities (such as NEPA and Executive Order No. 13007) must recognize the government-to-government relationship between the Federal government and Indian tribes, as set forth in Executive Order 13175, 65 FR 87249 (Nov. 9, 2000), and Presidential Memorandum of Nov. 5, 2009.

National Register of Historic Places

The National Register of Historic Places (National Register) was established by the NHPA of 1966, as "an authoritative guide to be used by federal, State, and local governments, private groups and citizens to identify the Nation's historic resources and to indicate what properties should be considered for protection from destruction or impairment" (36 CFR 60.2) (U.S. Department of the Interior, 2002). The National Register recognizes a broad range of cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes. As noted above, a resource that is listed in or eligible for listing in the National Register is considered "historic property" under Section 106 of the NHPA.

To be eligible for listing in the National Register, a property must be significant in American history, architecture, archaeology, engineering, or culture. Properties of potential significance must meet one or more of the following four established criteria:

A. Are associated with events that have made a significant contribution to the broad patterns of our history;

B. Are associated with the lives of persons significant in our past;

C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or

D. Have yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one or more of the criteria of significance, a property must have integrity. Integrity is defined as "the ability of a property to convey its significance" (U.S. Department of the Interior, 2002). The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance.

Ordinarily religious properties, moved properties, birthplaces or graves, cemeteries, reconstructed properties, commemorative properties, and properties that have achieved significance within the past 50 years are not considered eligible for the National Register unless they meet one of the Criteria Considerations (A-G), in addition to meeting at least one of the four significance criteria and possessing integrity (U.S. Department of the Interior, 2002).

State

California Environmental Quality Act

CEQA is the principal statute governing environmental review of projects occurring in the state and is codified at *Public Resources Code (PRC) Section 21000 et seq.* CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA (Section 21084.1), a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

The *CEQA Guidelines* (Title 14 California Code of Regulations [CCR] Section 15064.5) recognize that historical resources include: (1) a resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources (California Register); (2) a resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record. The fact that a resource does not meet the three criteria outlined above does not preclude the lead agency from determining that the resource may be an historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

If a lead agency determines that an archaeological site is a historical resource, the provisions of Section 21084.1 of CEQA and Section 15064.5 of the *CEQA Guidelines* apply. If an archaeological site does not meet the criteria for a historical resource contained in the *CEQA Guidelines*, then the site may be treated in accordance with the provisions of Section 21083, which is as a unique archaeological resource. As defined in Section 21083.2 of CEQA a "unique" archaeological resource is an archaeological artifact, object, or site, about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or,
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If an archaeological site meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site is to be treated in accordance with the provisions of Section 21083.2, which state that if the lead agency determines that a project would have a significant effect on unique archaeological resources, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place (Section 21083.1(a)). If preservation in place is not feasible, mitigation measures shall be required. The *CEQA Guidelines* note that if an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment (*CEQA Guidelines* Section 15064.5(c)(4)).

A significant effect under CEQA would occur if a project results in a substantial adverse change in the significance of a historical resource as defined in *CEQA Guidelines* Section 15064.5(a). Substantial adverse change is defined as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired" (*CEQA Guidelines* Section 15064.5(b)(1)). According to *CEQA Guidelines* Section 15064.5(b)(2), the significance of a historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that:

A. Convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

B. Account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in a historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

C. Convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a Lead Agency for purposes of CEQA.

In general, a project that complies with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings (Standards) is considered to have mitigated its impacts to historical resources to a less-than-significant level (CEQA Guidelines Section 15064.5(b)(3)).

California Register of Historical Resources

The California Register is "an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Section 5024.1[a]). The criteria for eligibility for the California Register are based upon National Register criteria (PRC Section 5024.1[b]). Certain resources are determined by the statute to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register.

To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, state, and/or federal level under one or more of the following four criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;
2. Is associated with the lives of persons important in our past;
3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
4. Has yielded, or may be likely to yield, information important in prehistory or history.

A resource eligible for the California Register must meet one of the criteria of significance described above, and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and,
- Those California Points of Historical Interest that have been evaluated by the OHP and have been recommended to the State Historical Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historical resources contributing to historic districts; and,
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

California Health and Safety Code Section 7050.5

California Health and Safety Code Section 7050.5 requires that in the event human remains are discovered, the County Coroner be contacted to determine the nature of the remains. In the event the remains are determined to be Native American in origin, the Coroner is required to contact the California Native American Heritage Commission (NAHC) within 24 hours to relinquish jurisdiction.

California Public Resources Code Section 5097.98

California PRC Section 5097.98, as amended by Assembly Bill 2641, provides procedures in the event human remains of Native American origin are discovered during project implementation. PRC Section 5097.98 requires that no further disturbances occur in the immediate vicinity of the discovery, that the discovery is adequately protected according to generally accepted cultural and archaeological standards, and that further activities take into account the possibility of multiple burials. PRC Section 5097.98 further requires the NAHC, upon notification by a County Coroner, designate and notify a Most Likely Descendant (MLD) regarding the discovery of Native American human remains. Once the MLD has been granted access to the site by the landowner and inspected the discovery, the MLD then has 48 hours to provide recommendations to the landowner for the treatment of the human remains and any associated grave goods.

In the event that no descendant is identified, or the descendant fails to make a recommendation for disposition, or if the land owner rejects the recommendation of the descendant, the landowner may, with appropriate dignity, reinter the remains and burial items on the property in a location that will not be subject to further disturbance.

Local

City of Los Angeles General Plan

The City of Los Angeles General Plan (adopted 2001) states as its objective, to "protect the City's archaeological and paleontological resources for historical, cultural, research, and/or educational purposes" by continuing "to identify and protect significant archaeological and paleontological resources known to exist or that are identified during land development, demolition, or property modification activities."

In addition, the City will:

> *continue to protect historic and cultural sites and/or resources potentially affected by proposed land development, demolition, or property modification activities…The City's environmental guidelines require the applicant to secure services of a bona fide archaeologist to monitor excavations or other subsurface activities associated with a development project in which all or a portion is deemed to be of archaeological significance. Discovery of archaeological materials may temporarily halt the project until the site has been assessed, potential impacts evaluated and, if deemed appropriate, the resources protected, documented and/or removed (City of Los Angeles, 2001).*

In addition to the National Register and the California Register, three additional types of historic designations may apply at a local level:

1. Historic-Cultural Monument
2. Designation by the Community Redevelopment Agency as being of cultural or historical significance within a designated redevelopment area

3. Classification by the City Council as an Historic Preservation Overlay Zone

The City of Los Angeles Cultural Heritage Ordinance states that a Historic-Cultural Monument designation is reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature and meet one of the following criteria (City of Los Angeles Department of City Planning, 2009). A historical or cultural monument is any site, building, or structure of particular historical or cultural significance to the City of Los Angeles, such as historic structures or sites:

- in which the broad cultural, political, economic, or social history of the nation, state, or community is reflected or exemplified; or
- which are identified with historic personages or with important events in the main currents of national, state, or local history; or
- which embody the distinguishing characteristics of an architectural-type specimen, inherently valuable for a study of a period, style, or method of construction; or
- which are a notable work of a master builder, designer, or architect whose individual genius influenced his or her age.

In addition, the Los Angeles Municipal Code (LAMC) Section 91.106.4.5 states that the Building Department "shall not issue a permit to demolish, alter or remove a building or structure of historical, archaeological or architectural consequence if such building or structure has been officially designated" by a federal, state, or local authority.

Archival Research

SCCIC Records Search

A records search for the Project was conducted on May 4, 2017 at the California Historical Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC) housed at California State University, Fullerton. The records search included a review of all recorded cultural resources and previous studies within the Project Site as well as a ½-mile radius.

Previous Cultural Resources Investigations

The records search results indicate that 152 cultural resources studies have been conducted within a ½-mile radius of the Project Site. Of these 152 previous studies, 98 included some form of field study including survey, excavation, or monitoring. (**Table 1**). Approximately 70 percent of the ½-mile records search radius has been included in previous cultural resources field studies. Of the 98 previous field studies, one (LA-10507) overlaps the Project Site. Approximately 90 percent of the Project Site has been included as part of this previous study.

Previously Recorded Cultural Resources

The records search results indicate that 15 resources have been previously recorded within the ½-mile records search radius (**Table 2**). These resources include 14 archaeological resources and one California Historic Landmark (CHL #744). Of the 14 archaeological resources, 13 are historic-period archaeological sites (CA-LAN-2741H, -3097H, -3129H, -3337H, -3347, -3566, -3588H, -3767H, -3862H, -4114H, -4171H, -4196H and P-19-004451), and one is a historic-

period isolate (P-19-100311). CHL #744 (P-19-174925) is the site of the site of the first brick school house in Los Angeles, the Butterfield Overland Mail Company office and corrals, and the U.S. Army Quartermaster, which existed during the mid-19th century. The CHL is marked by a commemorative plaque affixed to the Mirror Building. Of the 14 previously recorded archaeological resources, one (P-19-004451) is located within 100 feet the Project Site. CHL #744 (P-19-174925) is located within the Project Site itself. Detailed descriptions of these resources are provided below.

TABLE 2
PREVIOUSLY RECORDED CULTURAL RESOURCES

Primary Number (P-19-)	Trinomial (CA-LAN-)	Description	Date Recorded
002741	2741H	Historic-period archaeological site: buried mortared red brick footing or wall.	1998
003097	3097H	Historic-period archaeological site: brick and concrete structural foundations and privies.	2002
003129	3129H	Historic-period archaeological site: four discrete refuse deposits dating to the late 19th and early 20th centuries.	2003
003337	3337H	Historic-period archaeological site: refuse deposit	2000
003347	3347H	Historic-period archaeological site: granite-block pavement	2004
003566	3566H	Historic-period archaeological site: Los Angeles's first cemetery and refuse deposits	2000
003588	3588H	Historic-period archaeological site: foundations and a refuse deposit.	2006
003767	3767H	Historic-period archaeological site: three structural foundations, basements, pads and associated historic refuse from the late 19th and early 20th centuries.	2007
003862	3862H	Historic-period archaeological site: brick alignment.	2009
004114	4114H	Historic-period archaeological site:11 structural features, seven refuse deposit features and isolated artifacts.	2008
004171	4171H	Historic-period archaeological site: refuse deposits and features from the mid-19th century to the mid- 20th century.	2007
004196	4196H	Historic-period archaeological site (Zanja Madre and associated artifacts)	2011
004451**	-	Historic-period archaeological site: privies, foundation walls, building foundations, and refuse deposits.	2014
100311	-	Historic-period isolate: one black glass bottle fragment.	1998
174925*	-	CHL# 744: Site of the first brick schoolhouse in Los Angeles, Butterfield Overland Mail Company, and U.S. Army Quartermaster	1979

*Indicates resource within Project site

**Indicates resource within 100 feet of Project site

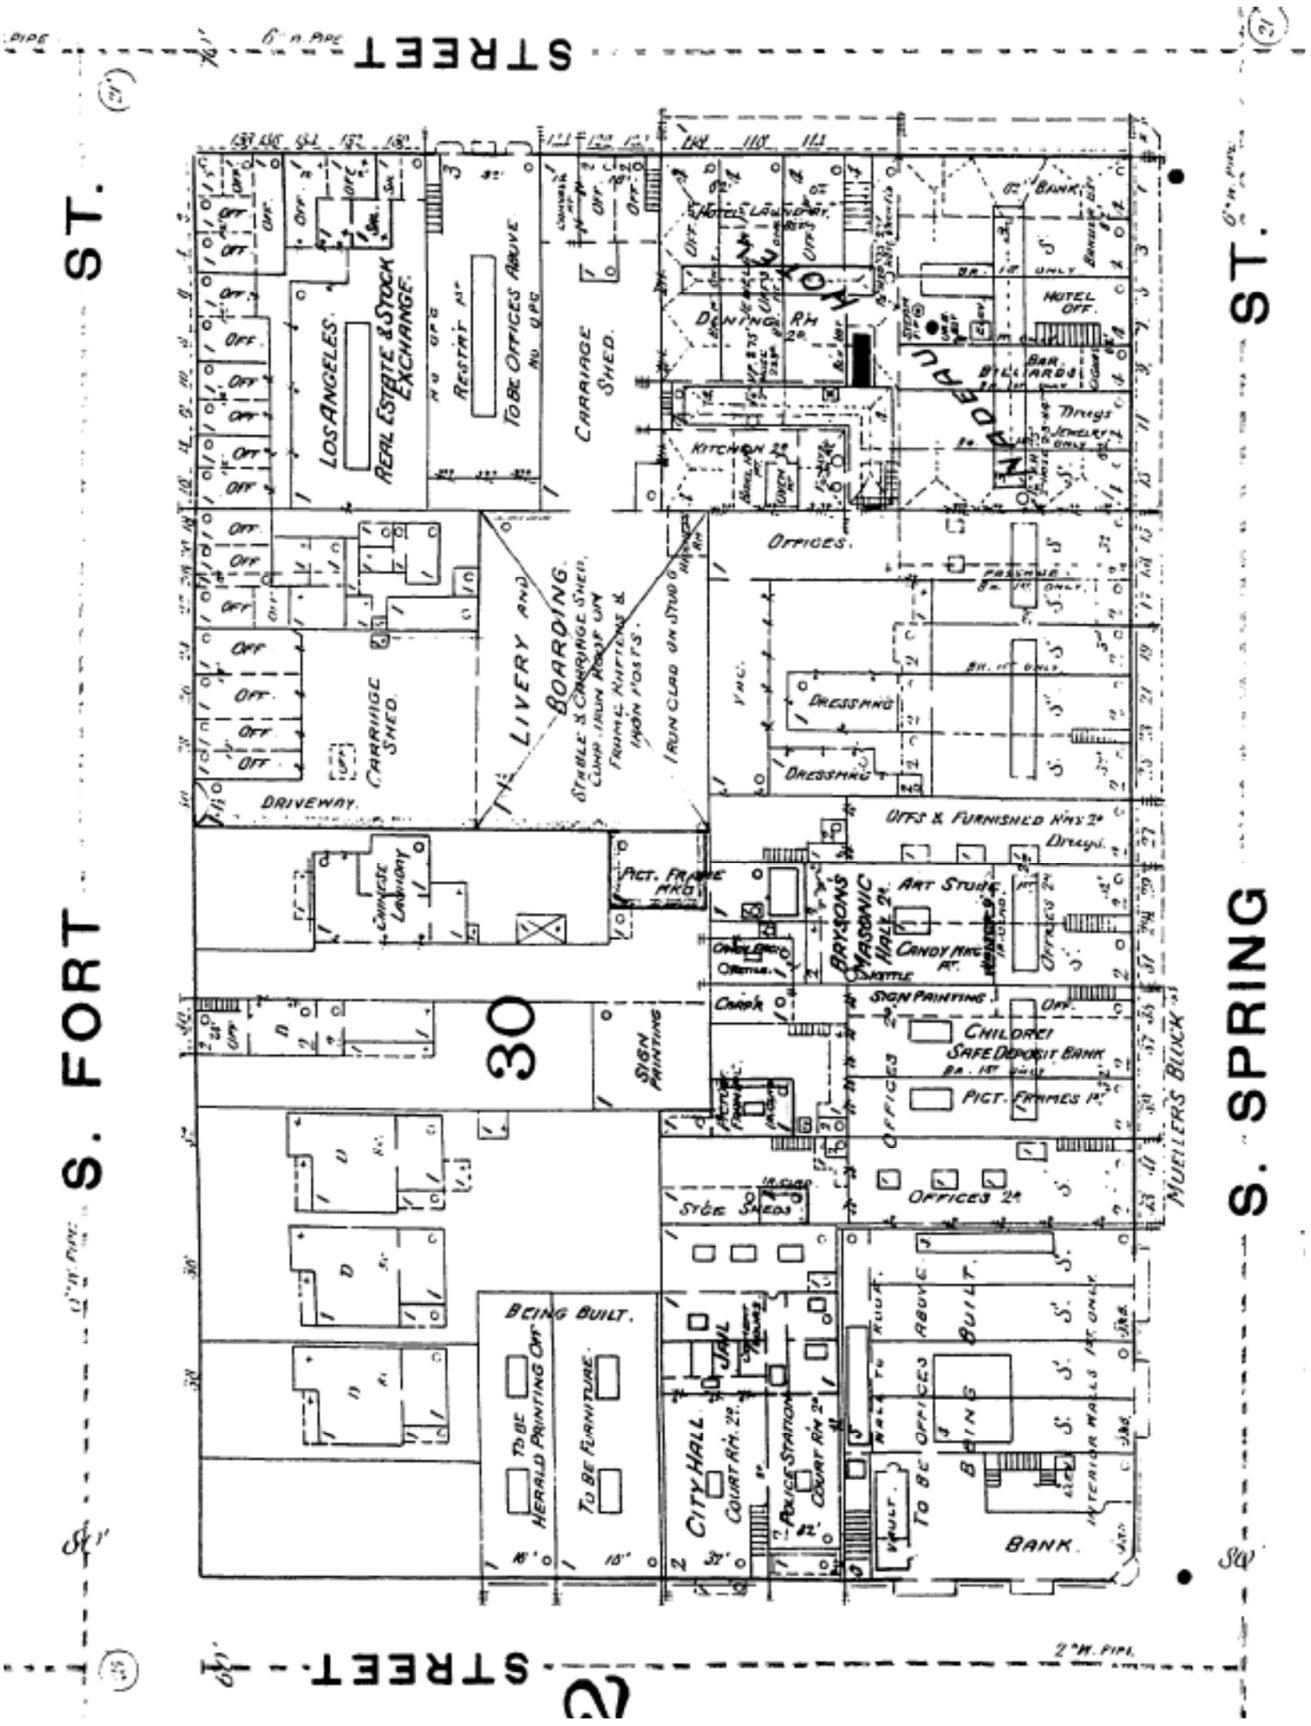
P-19-004451

Resource P-19-004451 is a historic-period archaeological site that is comprised of nine features discovered during archaeological monitoring between 2013 and 2014 (Garrison, 2014). The features include privy deposits, foundations, and refuse deposits. The resource is located

approximately 100 feet from the Project Site. Given that the site was buried or destroyed by the construction of the courthouse, and because it is not located within the Project Site, Project-related ground disturbing activities would not impact the resource.

P-19-174925 (CHL #744)

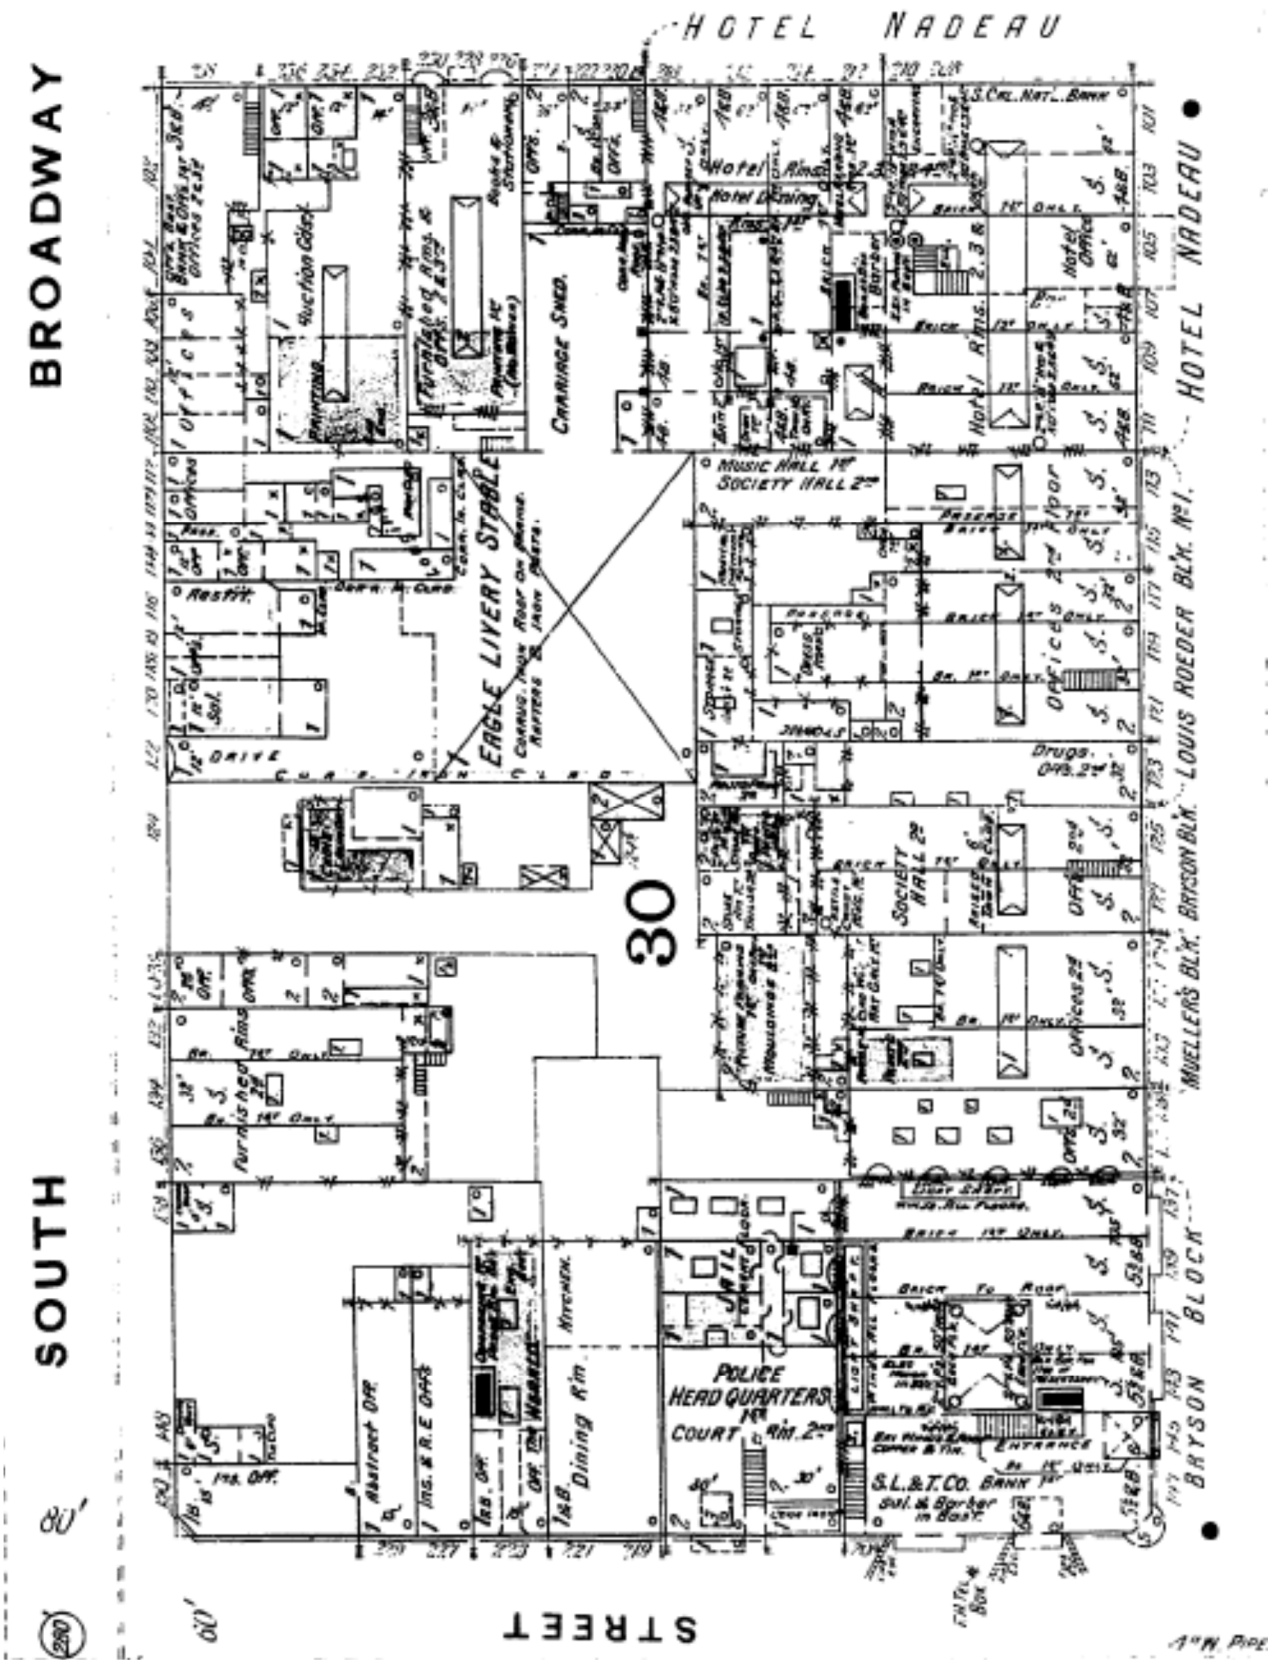
Resource P-19-174925 includes CHL #744 which commemorates the site of the first brick school house in Los Angeles (1854 - 1855), as well as the site of the Butterfield Overland Mail Company office and corrals (1858 -1861), and the U.S. Army Quartermaster (1861). All of these structures were located in the eastern portion of the Project Site within the current footprint of the Mirror Building during the mid-19th century.



Historic Map and Aerial Photograph Review

Historic maps and aerial photographs were examined to provide historical information about the Project Site and to contribute to an assessment of the Project Site's archaeological sensitivity. Available maps include the 1888, 1894, 1906, and 1950 Sanborn Fire Insurance Maps. Historic aerial photographs of the Project Site from the years 1948, 1952, 1964, 1977, 1972, 1980, 2012 were also examined (historicaerials.com, 2017).

The 1888 Sanborn Map depicts a number of multistory buildings within the Project site (**Figure 7**). The buildings in the western portion of the Project site house restaurants, offices, the Los Angeles Real Estate & Stock Exchange, livery stables, a Chinese laundry, family dwellings, and the Herald Printing Office. The buildings in the eastern portion of the Project Site were occupied by the Nadeau Hotel, retail stores, the Bryson's Masonic Hall, offices, City Hall, a police station, a jail, a bank, and a children's safe deposit bank. The map indicates that only one building, located in the northeastern portion of the Project Site, has a 1-story basement.



The 1894 and 1906 maps indicate little has changed in the western half of the Project Site since the 1888 map, and show that a printing facility and retail stores have replaced the Los Angeles Real Estate & Stock Exchange and the family dwellings. However, the eastern portion of the Project Site has changed dramatically with the construction of the Bryson-Bonebrake Building, which encompasses the entire eastern half of the Project Site. The map indicates that a number of 1-story basements underlie the buildings located in the southeast, south-central, southwestern, and northeastern portions of the Project Site (**Figure 8**).

The 1950 Sanborn Map shows Bryson-Bonebrake Building, which encompassed the entire eastern half of the Project Site, has been demolished and replaced by the Times Building, the Plant Building, and the Mirror Building. The map also shows that the western half of the Project Site changed little since the 1888 and 1906 maps, and still consists of multistory buildings that house retail stores and restaurants.

SOURCE: Los Angeles Public Library, 2017

Figure 7
1888 Sanborn Fire Insurance Map

SOURCE: Los Angeles Public Library, 2017

Figure 8
1894 Sanborn Fire Insurance Map

The historic aerial photographs reflect what is depicted by the Sanborn Maps: that the entire Project Site has been intensively developed. The 1948 and 1952 photographs show the Project Site includes six buildings including the Times Building, the Plant Building, and the Mirror Building in the eastern half, and three multi-story buildings in the western half. The 1964 photograph shows that the building located in the southwestern portion of the Project Site has been demolished and replaced with a parking lot. The 1972 photograph shows that the buildings previously depicted in the northwestern portion of the Project Site have been demolished and the construction of the Executive Building is underway. The 1972 photograph also indicates that the parking lot depicted in the 1964 photograph has been removed and replaced by a dirt lot used for staging equipment as part of the Executive Building construction. The 1980 and 2012 photographs show the parking structure is located in the southwestern portion of the Project Site, and the Executive Building is located in the northwestern portion of the Project Site.

In sum, the historic map and aerial review indicates that the Project Site has been developed and used for residential and commercial purposes since the late 19th century. Beginning in the mid-20th century the eastern half of the Project Site was drastically changed as all of the buildings present since the late 19th century were demolished and replaced with the Times Building, the Plant Building, and the Mirror Building. Similarly, the buildings in the western half of the Project Site were destroyed when the Executive Building and parking structure were constructed in the 1960s and 1970s. The buildings that are currently present within the Project Site all contain basements, and the construction of these buildings and their subgrade components likely destroyed any subsurface remnants associated with the multi-story buildings that were constructed in the late 19th century.

Archaeological Resources Survey

Given the developed nature of the Project Site and the lack of visible ground surface, an archaeological resources survey for the Project was not conducted.

Conclusions and Recommendations

The archival research conducted as part of this cultural resources assessment did not identify the presence of cultural resources that qualify as historical resources and/or unique archaeological resources pursuant to CEQA. Therefore, the Project would not significantly impact known historical and/or unique archaeological resources.

The SCCIC records search identified one resource (CHL #744 [P-19-174925]) within the Project Site. CHL #744 commemorates the site of the first brick school house in Los Angeles between 1854 and 1855, as well as the site of the Butterfield Overland Mail Company office and corrals between 1858 and 1861, and the U.S. Army Quartermaster in 1861. The site, which is the subject of the commemoration, will continue to function as CHL#744 after the implementation of the Project and the plaque would be retained in its current location on the Mirror Building. Resource P-19-004451 is a historic-period archaeological site comprised of nine features discovered during the construction monitoring 100 feet from the Project Site and would not be impacted by the Project.

Although, no known historical or unique archaeological resources were identified by the archival research, there exists the possibility, nonetheless, that pockets of undisturbed soil containing archaeological resources that qualify as historical resources or unique archaeological resources under CEQA could be encountered during Project implementation; therefore, impacts are conservatively considered to be significant. The Project Site has undergone multiple phases of development from the 1850s onward. This development began with the construction of the first brick schoolhouse in Los Angeles, as well as the Butterfield Overland Mail Company station in the 1850s, followed by the Bryson-Bonebrake Block office building in the 1880s. The final phase of development included the construction of the Times, Plant, and Mirror Buildings in the 1930s and 1940s, followed by the construction of the Executive Building and parking structure in the 1970s. Based on the historic map review, the types of archaeological resources that may exist within the Project Site would consist of historic-period archaeological deposits associated with basements and/or privy's associated the Project Site's previous historic uses. These types of resources would likely not exceed a depth of 10 – 15 feet, and it is likely that the construction of the existing buildings on site, which all contain at least one-story basements, destroyed any historic-period archaeological features associated with the late 19th century to the mid-20th century use of the Project site. Given the high degree and depths of disturbance associated with the construction of the buildings currently present within the Project Site, any subsurface archaeological features have likely been destroyed. As a result, the likelihood of encountering these types of deposits during Project implementation is low.

Although the likelihood of encountering subsurface archaeological resources is low due to the subgrade components of the existing buildings, the Project would include ground disturbing activities associated with the demolition of the Executive Building and parking structure, and the construction of the North and South Towers. As such, the following three mitigations measures are proposed for implementation to reduce potential impacts to unknown archaeological resources to a less than significant level.

1. **Retention of a Qualified Archaeologis**t: Prior to the start of ground-disturbing activities, the Applicant shall retain a qualified archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards for archaeology (U.S. Department of the Interior 2008) to carry out the following measures.
2. **Construction Worker Cultural Resources Sensitivity Training:** ESA recommends that construction personnel be trained in the identification of cultural resources. Prior to earth moving activities, the qualified archaeologist shall conduct cultural resources sensitivity training for all construction personnel. Construction personnel shall be informed of the types of archaeological resources that may be encountered, and of the proper procedures be to enacted in the event of an inadvertent discovery of archaeological resources or human remains. The Applicant shall ensure that construction personnel are made available for and attend the training and retain documentation demonstrating attendance.
3. **Inadvertent Discoveries of Archaeological Resources:** In the event of the unanticipated discovery of archaeological materials, the contractor shall immediately cease all work activities in the area (within approximately 100 feet) of the discovery until it can be evaluated by a qualified archaeologist. Prehistoric archaeological materials might include obsidian and chert flaked-stone tools (e.g., projectile points, knives, scrapers) or tool-making debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, handstones, or milling slabs);

and battered stone tools, such as hammerstones and pitted stones. Historic-period materials might include stone or concrete footings and walls; filled wells or privies; and deposits of metal, glass, and/or ceramic refuse. Construction shall not resume until the qualified archaeologist has conferred with the City on the significance of the resource.

If it is determined that the discovered archaeological resource constitutes a historical resource under CEQA, avoidance and preservation in place is the preferred manner of mitigation. Preservation in place maintains the important relationship between artifacts and their archaeological context and also serves to avoid conflict with traditional and religious values of groups who may ascribe meaning to the resource. Preservation in place may be accomplished by, but is not limited to, avoidance, incorporating the resource into open space, capping, or deeding the site into a permanent conservation easement. In the event that preservation in place is demonstrated to be infeasible and data recovery through excavation shall be documented in , a Cultural Resources Treatment Plan shall be prepared and implemented by a qualified archaeologist in consultation with the Applicant and the City that provides for the adequate recovery of the scientifically consequential information contained in the archaeological resource. The Applicant and the City shall consult with appropriate Native American representatives in determining treatment for prehistoric or Native American resources to ensure cultural values ascribed to the resource, beyond that which is scientifically important, are considered.

Appendix A
Personnel

Monica Strauss, RPA

Director, Southern California Cultural Resources Group

Monica has successfully completed dozens of cultural resources projects throughout California and the greater southwest, where she assists clients in navigating cultural resources compliance issues in the context of CEQA, NEPA, and Section 106. Monica has extensive experience with archaeological resources, historic buildings and infrastructure, landscapes, and Tribal resources, including Traditional Cultural Properties. Monica manages a staff of cultural resources specialists throughout the region who conduct Phase 1 archaeological/ paleontological and historic architectural surveys, construction monitoring, Native American consultation, archaeological testing and treatment, historic resource significance evaluations, and large-scale data recovery programs. She maintains excellent relationships with agency staff and Tribal representatives.

Relevant Experience

Los Angeles Unified School District, Central Los Angeles High School #9. Los Angeles, CA. *Project Director.* ESA contributed to Data Recovery Report sections for Los Angeles Unified School District's Central High School #9, constructed in downtown Los Angeles. Between 2004 and 2009, Monica led a team of archaeological staff of ten who conducted archaeological monitoring and data recovery of archaeological materials in connection with the 19th century Los Angeles City Cemetery. She coordinated with the Los Angeles County Coroner and office of Vital Statistics to obtain disinterment permits and developed a mitigation plan incorporating components related to the future disposition of remains, artifact curation, and commemoration. She directed an extensive historical research effort to identify the human remains, and at the request of the client, participated in public outreach and coordination with media.

Alameda Street Improvement Archaeological Monitoring and Assessment. Los Angeles CA. *Project Director.* Monica directed archaeological monitoring conducted during the construction of roadway improvements in downtown Los Angeles. She responded to the discovery of historic resources including the *Zanja Madre* and the historic brick Alameda Street. She developed mitigation recommendations to address impacts to these resources from the project including an adaptive re-use of the recovered brick materials in the landscape design of the project. Monica provided oversight to laboratory analysts who catalogued the artifact collection.

City of Los Angeles, Department of Public Works, Public Safety Facilities Master Plan Phase I Archaeological Resources Evaluation. Los Angeles County, CA. *Project Director.* Monica directed a Phase I archaeological resources evaluation of an approximately five-square block area in downtown Los Angeles. Project work involved an extensive investigation of the area during the cities' early pueblo years and specifically the Zanja Madre irrigation system. Monica prepared a technical report with findings and recommendations for further work, pursuant to CEQA requirements.

Sara Dietler

Archaeologist

EDUCATION

19 YEARS EXPERIENCE

CERTIFICATIONS/ REGISTRATION

California BLM Permit, Principal Investigator, Statewide

Nevada BLM Permit, Paleontology, Field Agent, Statewide

PROFESSIONAL AFFILIATIONS

Society for American Archaeology (SAA)

Society for California Archaeology (SCA)

Sara is a senior archaeology and paleontology lead with 20 years of experience in cultural resources management in Southern California. As a senior project manager, she manages technical studies including archaeological and paleontological assessments and surveys, as well as monitoring and fossil salvage for many clients, including public agencies and private developers. She is a cross-trained paleontological monitor and supervisor, familiar with regulations and guidelines implementing the National Historic Preservation Act (NHPA), National Environmental Policy Act (NEPA), California Environmental Quality Act (CEQA), and the Society of Vertebrate Paleontology guidelines. She has extensive experience providing oversight for long-term monitoring projects throughout the Los Angeles Basin for archaeological, Native American, and paleontological monitoring compliance projects and provides streamlined management for these disciplines.

Relevant Experience

Los Angeles Unified School District (LAUSD) Central Los Angeles High School #9; Los Angeles, CA. *Senior Project Archaeologist & Project Manager*. Sara conducted on-site monitoring and investigation of archaeological sites exposed as a result of construction activities. During the data recovery phase in connection with a 19th century cemetery located on-site, she participated in locating of features, feature excavation, mapping, and client coordination. She organized background research on the cemetery, including genealogical, local libraries, city and county archives, other local cemetery records, internet, and local fraternal organizations. Sara advised on the lab methodology and setup and served as project manager. Sara was a contributing author and editor for the published monograph, which was published as part of a technical series, “Not Dead but Gone Before: The Archaeology of Los Angeles City Cemetery.”

Downtown Cesar Chavez Median Project, City of Los Angeles, CA. *Project Manager*. Sara assisted the City of Los Angeles Department of Public Works Bureau of Engineering with a Local Assistance Project requiring consultations with Caltrans cultural resources. Responsible for Caltrans coordination, serving as contributing author and report manager for required ASR, HPSR, and HRER prepared for the project.

Elysian/USC Water Recycling Project Initial Study/Environmental Assessment, Los Angeles, CA. *Project Manager.* Sara worked on the Initial Study/Mitigated Negative Declaration and an Environmental Assessment/Finding of No Significant Impact to construct recycled water pipelines for irrigation and other industrial uses serving Los Angeles Department of Water and Power customers in downtown Los Angeles, including Elysian Park. The U.S. Environmental Protection Agency is the federal lead agency.

Fatima Clark

Archaeologist

Fatima Clark has eight years of hands-on archaeological experience and is practiced in project management and client and agency coordination. Her field experience is complimented by the course study and participation in numerous archaeological excavations in California, Arizona, and Peru. Fatima has written California Environmental Quality Act (CEQA)-level technical reports, Environmental Impact Report (EIR) sections, Initial Study sections, archaeological peer reviews, archaeological monitoring reports, and reports pursuant to Caltrans requirements. She is also experienced in performing archaeological testing, site recordation, laboratory analysis, pedestrian surveys, records searches through several California Historical Resources Information Systems-Information Centers, and monitoring for a wide variety of projects, including mixed-use, residential, and energy, water, and road infrastructure projects. In addition to her archaeology background, Fatima has been cross-trained in conducting paleontological surveys and monitoring and has co-authored and managed associated reports.

Relevant Experience

Ivy Station Mixed-Use Development MND, Los Angeles/Culver City, CA. *Archaeologist.* Fatima performed historical records searches through CHRIS, conducted the field survey, and provided technical information and recommendations for the Initial Study to support an MND to address the proposed development of a stand-alone five-story office building with ground-level retail. The project also included two interconnected five- and six-story buildings, including a 148-room boutique hotel and a 200-unit residential complex with amenities atop a podium.

750 North Edinburgh Avenue Project MND, Los Angeles, CA. *Archaeologist.* Fatima performed historical record searches through CHRIS, conducted the field survey, and provided technical information and recommendations for the Initial Study to support an MND. The proposed project would remove extant uses on the project site, subdivide the parcel into eight lots, and develop on each lot a three-story single-family residence, two covered parking spaces, and private patio/yard areas.

3240 Wilshire Boulevard Project, Los Angeles, CA. *Archaeologist.* Fatima performed historical record searches through CHRIS, conducted the field survey, and provided technical information and recommendations in the form of a letter report and Initial Study section to support an MND. The proposed project involved the conversion of the I. Magnin department store building (currently known as the Wilshire Galleria) into a hotel and the construction of a mid-rise apartment building, high-rise condominium tower and commercial space, in addition to the existing 138,500-square-foot I. Magnin building.

Michael is cultural resources specialist with experience working on survey, data recovery, and monitoring projects. Michael has experience with project management, has led crews on multiple surveys and excavations, and is familiar with environmental compliance documents. He has worked on a variety of energy and water infrastructure projects throughout California, including projects in Riverside, San Diego, Imperial, San Bernardino, Los Angeles, Orange, Santa Barbara, San Luis Obispo, Kern, Fresno, Madera, and Inyo Counties, as well as in Clark County Nevada. Michael regularly works as part of a team, coordinating with field staff and agency leads.

Relevant Experience

San Gabriel River Confluence with Cattle Canyon Improvements Project, Los Angeles National Forest, Los Angeles County, CA. *Archaeologist*. ESA has been retained by BlueGreen Consultants to prepare a joint EIS/R for the San Gabriel River Confluence with Cattle Canyon Improvements Project. The Project consists of recreational improvements and ecological restoration opportunities to address resource management challenges resulting from high public use of a 2.5-mile reach of the East Fork of the San Gabriel River, near its confluence with Cattle Canyon Creek in the Angeles National Forest. Michael led the cultural resources survey and prepared the Phase I cultural resources study report in support of the EIS/R.

Ballona Wetlands Ecological Reserve Restoration Project, Los Angeles, CA. *Archaeologist.* The California State Coastal Conservancy retained ESA to conduct an Extended Phase I investigation at 20 previously recorded shell scatters and Phase II archaeological testing of four historic-period archaeological sites in support of an Environmental Impact Statement/Environmental Impacts Report being prepared for the proposed Ballona Ecological Reserve Restoration Plan Project which would restore native coastal wetland and upland habitats within the 600-acre Ballona Wetlands Ecological Reserve. Michael led the extended Phase I and Phase II fieldwork and assisted in the preparation of the technical report presenting the results and conclusions of the study.

City of Los Angeles Department of Water and Power, City Trunk Line Unit 3 Project, Los Angeles, CA. *Archaeologist.* ESA has conducted a Phase 1 cultural resources assessment for the Los Angeles Department of Water and Power (LADWP), City Trunk Line Unit 3 Project. LADWP plans replacing a portion of the City Trunk Line on Coldwater Canyon Avenue between Vanowen Street and Magnolia Boulevard, within the City of Los Angeles. The proposed Project would involve the installation of approximately 10,250 linear feet of 60-inch diameter water pipeline constructed of welded steel. Michael led the Phase 1 cultural resources survey of the Project area and prepared the technical report and the cultural resources ISMND section.

Subject: Sacred Lands File Search Request: Proposed Omni LA Times Square Project, Downtown Los Angeles, California.

Dear Native American Heritage Commission Representative:

ESA is preparing environmental documentation for the proposed Omni LA Times Square Project ("the Project").

The Project would involve the redevelopment of the Times Mirror Square site (Project Site) located in Downtown Los Angeles and bounded by West 1st Street, South Spring Street, West 2nd Street, and South Broadway. The Project would include the retention and renovation of the on-site Times, Plant and Mirror Buildings on the eastern half of the Project Site. The Project would also demolish the four-level Parking Garage and Executive Building located on the western half of the Project Site and construct two towers with residential units. The Project would provide nine new subterranean levels of parking and five above-ground podium levels.

To ensure that any areas containing previously recorded cultural resources and sacred lands are identified and considered, ESA is requesting a Sacred Lands File search of the Project Site. The Project Site is located in an unsectioned portion of Township 1 South, Range 13 West of the Los Angeles, CA United States Geological Survey 7.5' topographic quadrangle map (**Figure 1**, attached).

Thank you for your assistance with our efforts to address possible Native American concerns that may be affected by the proposed project. If you have any questions or need additional information, please contact me at (949) 753-7001 or via email at fclark@esassoc.com.

Sincerely,

Fatima Clark
Archaeologist

RE: Proposed Omni LA Times Square Project, City of Los Angeles; Los Angeles USGS Quadrangle, Los Angeles County, California

Dear Ms. Clark:

Attached is a list of tribes that have cultural and traditional affiliation to the areas of potential project effect (APE) referenced above. I suggest you contact all of those listed, if they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult, as may be required under particular state statutes. If a response has not been received within two weeks of notification, the Native American Heritage Commission (NAHC) requests that you follow-up with a telephone call to ensure that the project information has been received.

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* (SLF) was completed for the area of potential project effect (APE) for the above referenced project. Sites have been located within the APE you provided that may be impacted by the project. Please immediately contact Gabrieleno Band of Mission Indians – Kizh Nation at (626) 926-4131 for more information about these sites.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions, please contact me at my email address: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

EXECUTIVE SUMMARY

Times Mirror Square Project - Paleontological Resources Assessment Report

Environmental Science Associates (ESA) has been retained by Onni Group (Applicant), to conduct an Archaeological Resources Assessment for the Times Mirror Square Project (Project) in support of an Environmental Impact Report (EIR). The Applicant proposes to construct two new mixed-use towers along with rehabilitation of three existing buildings within the Times Mirror Square site (Project Site) in the city of Los Angeles. The Project Site is currently occupied by five structurally distinct but internally connected buildings occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings include the Times Building, the Plant Building, the Mirror Building, a parking structure, and the Executive Building. The Project would include demolition of the Executive Building and parking structure, and would construct two mixed-use towers (North and South Towers) in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror Building. The City of Los Angeles (City) is the lead agency pursuant to the California Environmental Quality Act (CEQA). The 3.6-acre Project Site is located within the northern portion of downtown Los Angeles and comprises the city block bounded by W. 1st Street to the northeast, S. Spring Street to the southeast, W. 2nd Street to the southwest, and S. Broadway to the northwest.

The Project Site was the subject of thorough background research and analysis. The research included a paleontological locality records search from the Natural History Museum of Los Angeles County (LACM), as well as geologic map and literature reviews. The Project Site and its vicinity have also been the subject of a geotechnical study. The archival research indicates that the Project Site is underlain by Quaternary younger alluvium (Qa), Quaternary older alluvium (Qoa), the Fernando Formation (Tfr), and the Puente Formation (Tush). Based on the archival research, the following paleontological sensitivity has been assigned to the geologic units underlying the Project Site. The Quaternary younger alluvium has low sensitivity. The older Quaternary alluvium and the Fernando and Puente formations have high sensitivity.

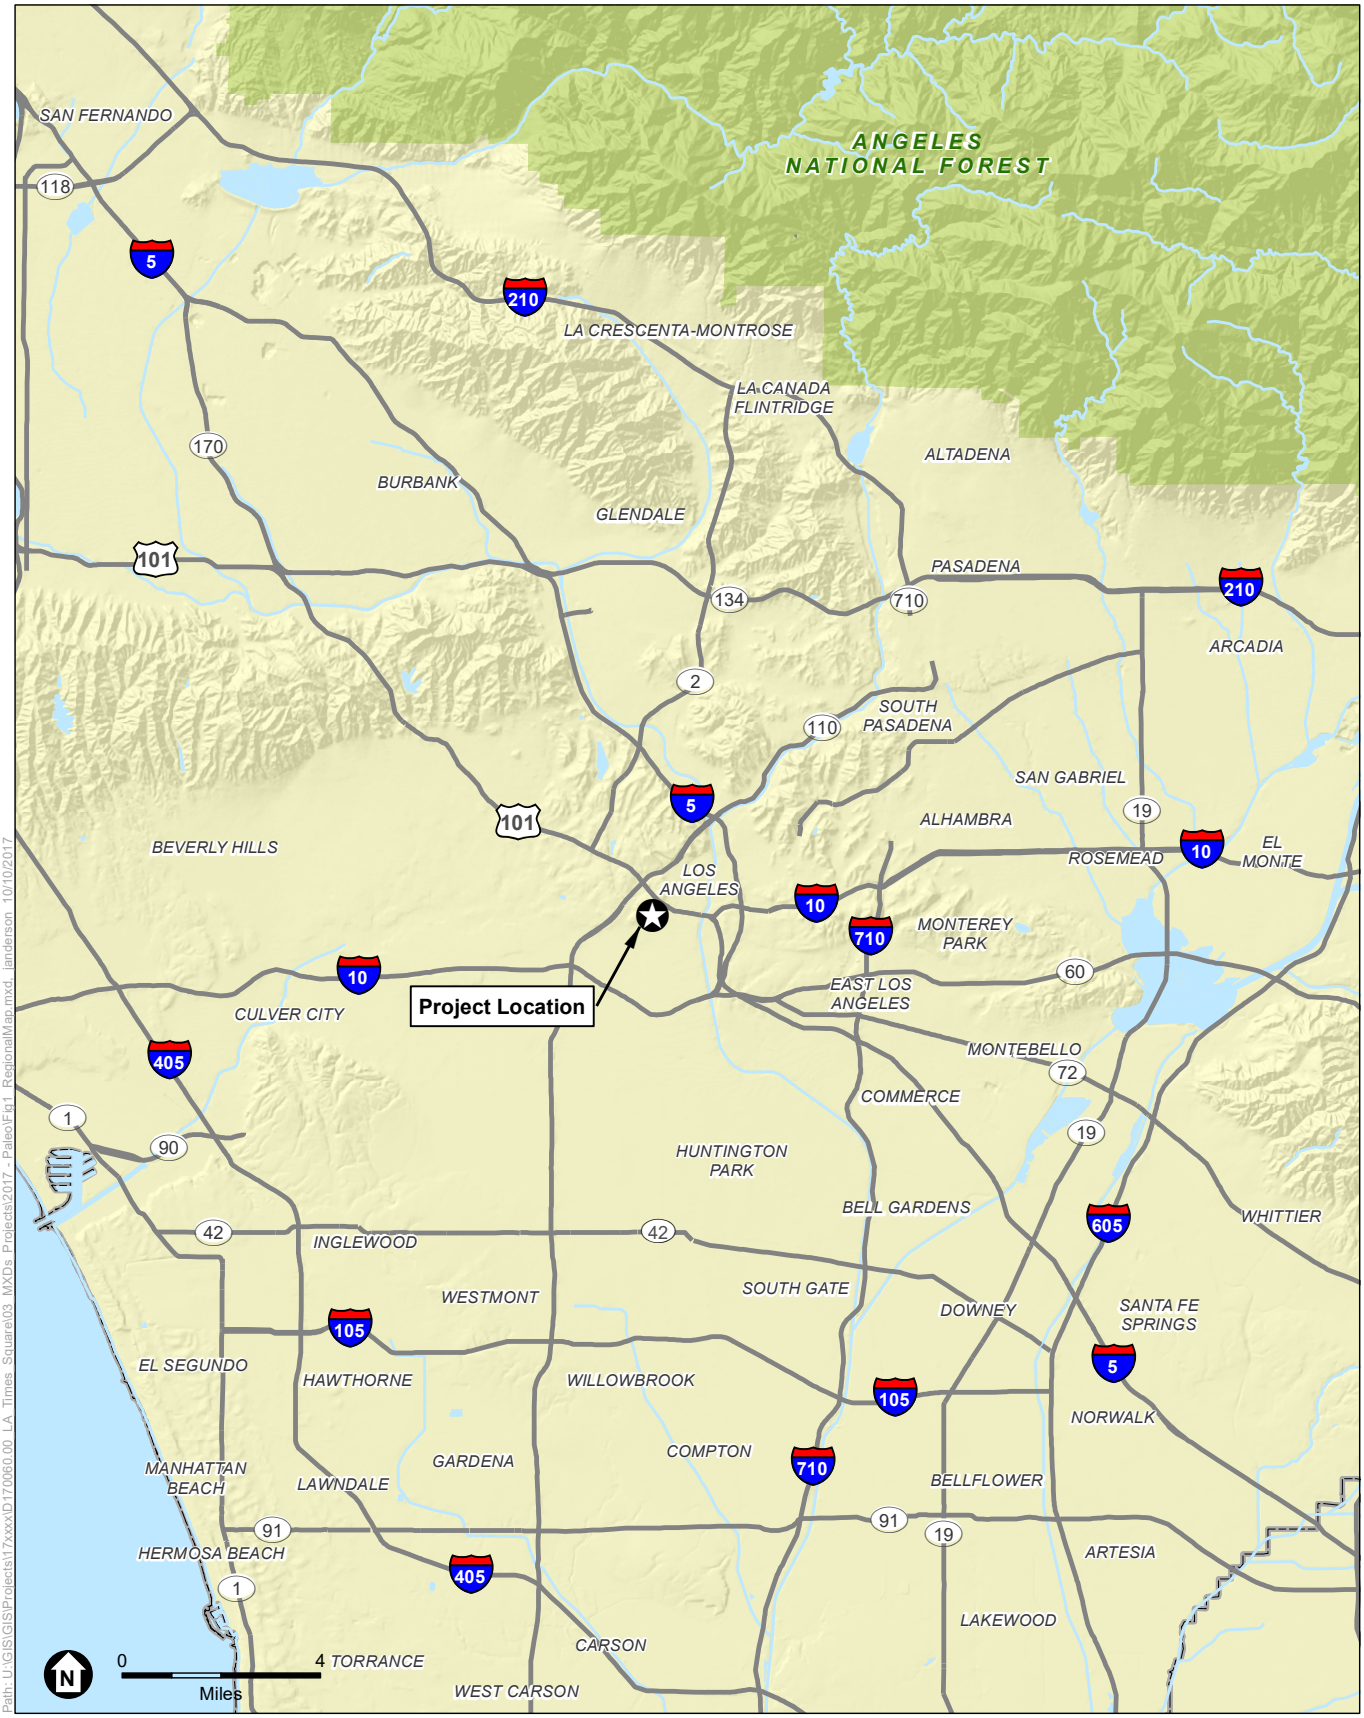
As a result of this study, the surficial sediments of the Project Site identified as younger Quaternary alluvium are too young to preserve fossils and, therefore, have low paleontological sensitivity. However, older Quaternary alluvium, the Fernando Formation, and the Puente Formation are present in the subsurface of the Project Site and have high paleontological sensitivity. Substantial excavation within the Project Site during construction for subterranean parking, deep excavation for excavation shoring, and ancillary uses or improvements (e.g., sewer, electrical, water) is planned at such depths as to impact these formations determined as having a high sensitivity for fossils as a result of the research presented in this study. As such, recommendations for the retention of a Qualified Paleontologist, paleontological resources sensitivity training, paleontological monitoring, and protocols to be carried out in the case of inadvertent discoveries are included in the *Conclusions and Recommendations* section at the close of this report.

TIMES MIRROR SQUARE PROJECT

Paleontological Resources Assessment Report

Introduction

Environmental Science Associates (ESA) has been retained by Onni Group (Applicant), to conduct an Archaeological Resources Assessment for the Times Mirror Square Project (Project) in support of an Environmental Impact Report (EIR). The Applicant proposes to construct two new mixed-use towers along with rehabilitation of three existing buildings within the Times Mirror Square site (Project Site) in the city of Los Angeles. The Project Site is currently occupied by five structurally distinct but internally connected buildings occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings include the Times Building, the Plant Building, the Mirror Building, a parking structure, and the Executive Building. The Project would include demolition of the Executive Building and parking structure, and would construct two mixed-used towers (North and South Towers) in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror Building. The City of Los Angeles (City) is the lead agency pursuant to the California Environmental Quality Act (CEQA).



ESA personnel involved in the preparation of this report are as follows: Sara Dietler, project manager; Alyssa Bell, Ph.D., Principal Investigator and report author; and Jaclyn Anderson, GIS specialist. Resumes of key personnel are included in **Appendix A**.

Project Location

The 3.6-acre Project Site is located within the northern portion of downtown Los Angeles (**Figure 1**). Specifically, the Project Site is located in an unsectioned portion of Township 1 South, Range 13 West on the Los Angeles, CA USGS 7.5-minute topographic quadrangle (**Figure 2**). The Project Site comprises the city block bounded by W. 1st Street to the northeast, S. Spring Street to the southeast, W. 2nd Street southwest, and S. Broadway to the northwest (**Figure 3**).

Project Description

The Project Site is currently occupied by five structurally distinct but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to 10 stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the 10-story Mirror Building, the six-story parking structure, and the six-story Executive Building. The Project would include demolition of the Executive Building and parking structure, and would construct two mixed-used towers (North and South Towers) in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror building.

Project Site

ESA

The proposed 37-story North Tower and 53-story South Tower would be constructed in the west sector of the block, which is aligned with S. Broadway with frontages on W. 1st Street and W. 2nd Street. The North and South Towers, which would be constructed above a five-story parking podium (Podium), would contain a total of approximately 1,127 residential units, approximately 34,572 square feet of commercial floor area, and a combined floor area of approximately 1,135,803 square feet. The Podium would be an above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. An open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park. Ground level retail uses would be located along the base of the Podium facing W. 1st Street, S. Broadway, and W. 2nd Street, and the Paseo.

Regulatory Framework

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value that are afforded protection under state laws and regulations. The following section summarizes the applicable federal and state laws and regulations, as well as professional standards provided by the Society for Vertebrate Paleontology (SVP).

State Regulations

California Environmental Quality Act

The CEQA Guidelines (Title 14, Chapter 3 of the California Code of Regulations, Section 15000 *et seq*.), define the procedures, types of activities, individuals, and public agencies required to comply with CEQA. As part of CEQA's Initial Study process, one of the questions that must be answered by the lead agency relates to paleontological resources: "Will the proposed project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?" (CEQA Guidelines Section 15023, Appendix G, Section XIV, Part a).

The loss of any identifiable fossil that could yield information important to prehistory, or that embodies the distinctive characteristics of a type of organism, environment, period of time, or geographic region, would be a significant environmental impact. Direct impacts to paleontological resources primarily concern the potential destruction of nonrenewable paleontological resources and the loss of information associated with these resources. This includes the unauthorized collection of fossil remains. If potentially fossiliferous bedrock or surficial sediments are disturbed, the disturbance could result in the destruction of paleontological resources and subsequent loss of information (significant impact). At the project-specific level, direct impacts can be mitigated to a less than significant level through the implementation of paleontological mitigation.

The CEQA threshold of significance for a significant impact to paleontological resources is reached when a project is determined to "directly or indirectly destroy a significant paleontological resource or unique geologic feature." In general, for project sites that are

underlain by paleontologically sensitive geologic units, the greater the amount of ground disturbance, the higher the potential for significant impacts to paleontological resources. For project sites that are directly underlain by geologic units with no paleontological sensitivity, there is no potential for impacts on paleontological resources unless sensitive geologic units which underlie the non-sensitive unit are also affected.

Public Resources Code Section 5097.5 and Section 30244

Other state requirements for paleontological resource management are included in PRC Section 5097.5 and Section 30244. These statutes prohibit the removal of any paleontological site or feature from public lands without permission of the jurisdictional agency, define the removal of paleontological sites or features as a misdemeanor, and require reasonable mitigation of adverse impacts to paleontological resources from developments on public (state, county, city, district) lands.

Society for Vertebrate Paleontology

The SVP has established standard guidelines (SVP, 1995 and 2010) that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as specifically provided in its standard guidelines. Most state regulatory agencies with paleontological resource-specific Laws, Ordinances, Regulations, and Standards (LORS) accept and use the professional standards set forth by the SVP.

As defined by the SVP (1995), significant nonrenewable paleontological resources are:

> *Fossils and fossiliferous deposits here restricted to vertebrate fossils and their taphonomic and associated environmental indicators. This definition excludes invertebrate or paleobotanical fossils except when present within a given vertebrate assemblage. Certain invertebrate and plant fossils may be defined as significant by a project paleontologist, local paleontologist, specialists, or special interest groups, or by lead agencies or local governments.*

As defined by the SVP (1995:26), significant fossiliferous deposits are:

> *A rock unit or formation which contains significant nonrenewable paleontologic resources, here defined as comprising one or more identifiable vertebrate fossils, large or small, and any associated invertebrate and plant fossils, traces, and other data that provide taphonomic, taxonomic, phylogenetic, ecologic, and stratigraphic information (ichnites and trace fossils generated by vertebrate animals, e.g., trackways, or nests and middens which provide datable material and climatic information). Paleontologic resources are considered to be older than recorded history and/or older than 5,000 years BP [before present].*

Based on the significance definitions of the SVP (1995), all identifiable vertebrate fossils are considered to have significant scientific value. This position is adhered to because vertebrate

fossils are relatively uncommon, and only rarely will a fossil locality yield a statistically significant number of specimens of the same genus. Therefore, every vertebrate fossil found has the potential to provide significant new information on the taxon it represents, its paleoenvironment, and/or its distribution. Furthermore, all geologic units in which vertebrate fossils have previously been found are considered to have high sensitivity. Identifiable plant and invertebrate fossils are considered significant if found in association with vertebrate fossils or if defined as significant by project paleontologists, specialists, or local government agencies.

A geologic unit known to contain significant fossils is considered to be "sensitive" to adverse impacts if there is a high probability that earth-moving or ground-disturbing activities in that rock unit will either directly or indirectly disturb or destroy fossil remains. Paleontological sites indicate that the containing sedimentary rock unit or formation is fossiliferous. The limits of the entire rock formation, both areal and stratigraphic, therefore define the scope of the paleontological potential in each case (SVP, 1995).

Fossils are contained within surficial sediments or bedrock, and are therefore not observable or detectable unless exposed by erosion or human activity. In summary, paleontologists cannot know either the quality or quantity of fossils prior to natural erosion or human-caused exposure. As a result, even in the absence of surface fossils, it is necessary to assess the sensitivity of rock units based on their known potential to produce significant fossils elsewhere within the same geologic unit (both within and outside of the study area), a similar geologic unit, or based on whether the unit in question was deposited in a type of environment that is known to be favorable for fossil preservation. Monitoring by experienced paleontologists greatly increases the probability that fossils will be discovered during ground-disturbing activities and that, if these remains are significant, successful mitigation and salvage efforts may be undertaken in order to prevent adverse impacts to these resources.

Paleontological Sensitivity

Paleontological sensitivity is defined as the potential for a geologic unit to produce scientifically significant fossils. This is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific survey. In its "Standard Guidelines for the Assessment and Mitigation of Adverse Impacts to Non-renewable Paleontologic Resources," the SVP (1995:23) defines four categories of paleontological sensitivity (potential) for rock units: high, low, undetermined, and no potential:

- **High Potential.** Rock units from which vertebrate or significant invertebrate fossils or suites of plant fossils have been recovered and are considered to have a high potential for containing significant nonrenewable fossiliferous resources. These units include, but are not limited to, sedimentary formations and some volcanic formations that contain significant nonrenewable paleontologic resources anywhere within their geographical extent and sedimentary rock units temporally or lithologically suitable for the preservation of fossils. Sensitivity comprises both (a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, or botanical; and (b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, ecologic,

or stratigraphic data. Also classified as significant are areas that contain potentially datable organic remains older than Recent, including deposits associated with nests or middens, and areas that may contain new vertebrate deposits, traces, or trackways.

- **Low Potential.** Reports in the paleontological literature or field surveys by a qualified vertebrate paleontologist may allow determination that some areas or units have low potentials for yielding significant fossils. Such units will be poorly represented by specimens in institutional collections.
- **Undetermined Potential.** Specific areas underlain by sedimentary rock units for which little information is available are considered to have undetermined fossiliferous potentials.
- **No Potential.** Metamorphic and granitic rock units generally do not yield fossils and therefore have no potential to yield significant non-renewable fossiliferous resources.

For geologic units with high potential, full-time monitoring is generally recommended during any project-related ground disturbance. For geologic units with low potential, protection or salvage efforts will not generally be required. For geologic units with undetermined potential, field surveys by a qualified vertebrate paleontologist should be conducted to specifically determine the paleontologic potential of the rock units present within the study area.

Paleontological Resources Significance Criteria

Fossils are considered to be significant if one or more of the following criteria apply:

1. The fossils provide information on the evolutionary relationships and developmental trends among organisms, living or extinct;
2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;
3. The fossils provide data regarding the development of biological communities or interaction between paleobotanical and paleozoological biotas;
4. The fossils demonstrate unusual or spectacular circumstances in the history of life; or
5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

Significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important. Significant fossils can include remains of large to very small aquatic and terrestrial vertebrates or remains of plants and animals previously not represented in certain portions of the stratigraphy. Assemblages of fossils that might aid stratigraphic correlation, particularly those offering data for the interpretation of tectonic events, geomorphologic evolution, and paleoclimatology are also critically important (Scott and Springer, 2003; Scott et al., 2004).

Archival Research

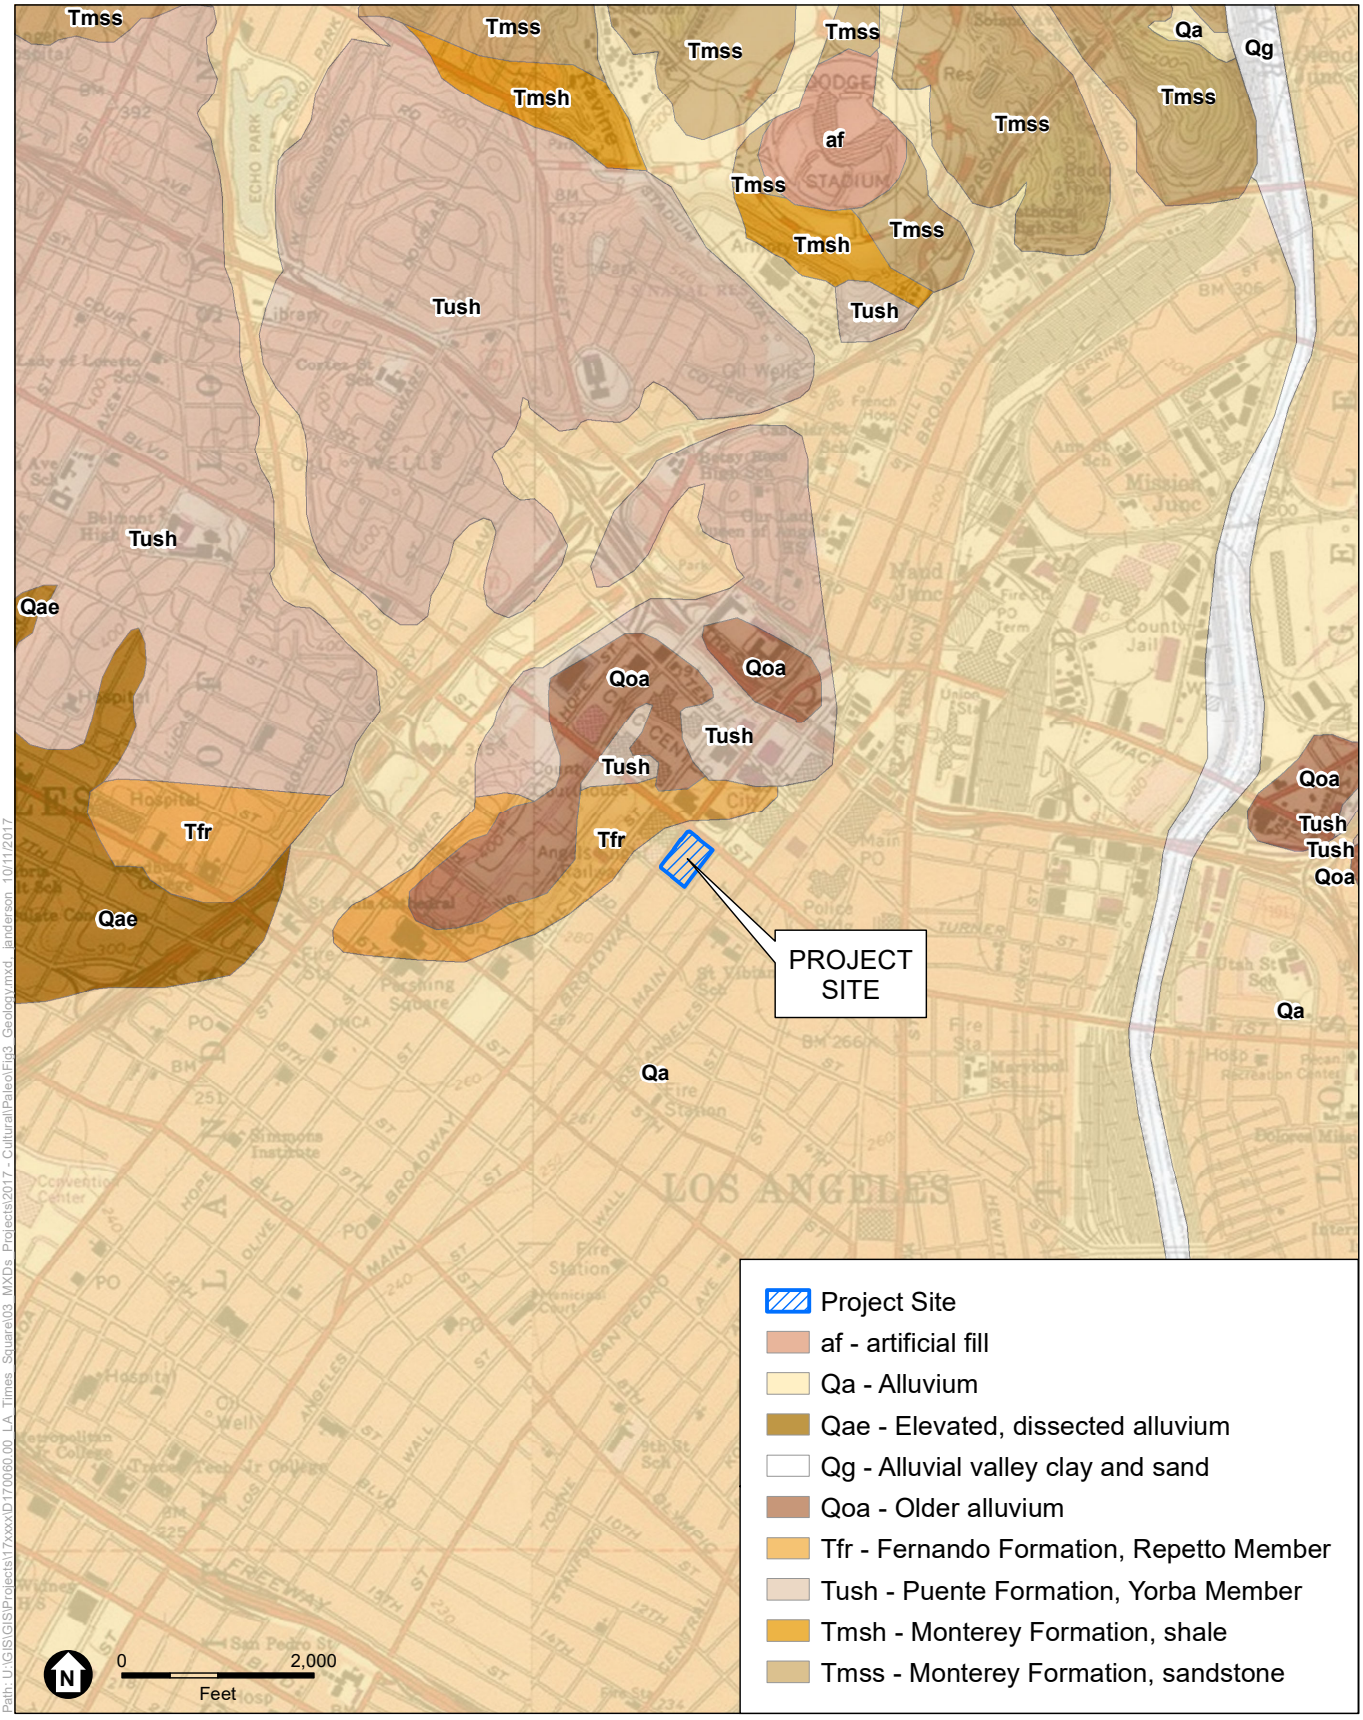
The Project Site was the subject of thorough background research and analysis. The research included a paleontological locality records search from the Natural History Museum of Los Angeles County (LACM), as well as geologic map and literature reviews. The Project Site and its vicinity have also been the subject of a geotechnical study (GEOCHON West, Inc., 2013; Kleinfelder, 2005; MACTEC Engineering and Consulting, 2003).

LACM Records Search

On August 11, 2017, a paleontological resources database search was requested from the Natural History Museum of Los Angeles County (LACM) for records of fossil localities in the Project Site. The purpose of the records search was to: (1) determine whether any previously recorded fossil localities occur in the Project Site; (2) assess the potential for disturbance of these localities during construction; and (3) evaluate the paleontological sensitivity in the Project Site. The records search returned no known localities within the Project Site (**Appendix B**). However, a number of vertebrate fossils are known from similar sedimentary deposits in downtown Los Angeles (McLeod, 2017).

The records search indicates that Holocene and Pleistocene-aged older alluvial (Qoa) sediments underlie the surficial alluvium in the Project vicinity. These sediments have yielded fossils of numerous Ice Age animals in the Los Angeles area. The closest locality indicated by the LACM is approximately 1.3 miles from the Project Site, where a fossil horse (*Equus*) was recovered from a depth of 43 feet below ground surface (bgs) (McLeod, 2017). Approximately 1.9 miles from the Project Site, ,fossil specimens of pond turtle, (*Clemmys mamorata*), ground sloth (*Paramylodon harlani*), mastodon (*Mammut americanum*), mammoth (*Mammuthus imperator*), horse (*Equus*), and camel (*Camelops*) were recovered from depths of 20-35 feet bgs (McLeod, 2017). Just north of this locality, approximately 2 miles from the Project Site, excavations for a storm drain recovered fossil specimens of turkey (*Meleagris californicus*), sabre-toothed cat (*Smilodon fatalis*), horse (*Equus*), and deer (*Odocoileus*) at unstated depths (McLeod, 2017).

The records search also indicates that the Pliocene-aged Fernando Formation (Tfr) is mapped at the ground surface in Bunker Hill, approximately 0.3 miles northwest of the Project Site. A number of fossil localities are known from this formation in downtown Los Angeles. The closest of these is located approximately 450 feet from the Project Site. Other fossil localities occur approximately 0.3 miles, 0.4 miles, and 1 mile from the Project Site. These nearby Fernando Formation localities have produced a composite fauna including fossil specimens of stingray (*Dasyatis*), eagle ray (*Myliobatis*), skate (*Raja*), chimaerid (*Chimaeriformes*), bull shark (*Carcharhinus leucas*), dusky shark (*Carcharhinus obscurus*), hammerhead shark (*Sphyrna*), sixgill shark (*Hexanchiformes*), bonito shark (*Isurus oxyrinchus*), salmon shark (*Lamna ditropis*), white sharks (*Carcharodon sulcidens* and *Carcharodon carcharias*), herring (*Clupeidae*), hake (*Merluccius*), sheepshead (*Semicossyphus*), mackerel (*Scomber*), rorqual baleen whale (Balaenopteridae), toothed whale (Odontoceti), and bird (Aves) (McLeod, 2017).



The Miocene-aged Puente Formation (Tush) is also mapped as occurring at the surface in Bunker Hill. The Puente has also produced numerous significant fossils in the Project vicinity. The

closest known locality is located approximately 425 feet from the Project Site, where a fossil specimen of the deep sea fish Bristlemouth (*Cyclothone*) was recovered (McLeod, 2017). Additional fossil localities within the Puente Formation have been identified approximately 0.20 miles from the Project Site. These localities have produced fossil fish including slickheads (Alepocephalidae), argentinas (Argentinidae), deep sea smelts (Bathylagidae), viperfish (*Chauliodus*), herring (Clupeidae), cod (Gadiformes), bristlemouths (Gonostomidae), mackerel (Scombridae), and dragonfish (Stomiatidae) (McLeod, 2017).

Geological Map, Geotechnical Studies, and Literature Review

Geological mapping by Dibblee and Ehrenspeck (1989) indicates that the surface of the Project Site is covered with Quaternary alluvium (Qa) (**Figure 4**) . At the surface these sediments are relatively recent in age and, as such, are not old enough to contain fossil remains. However, these alluvial sediments progress in age with depth, such that the underlying alluvial sediments date to the Late Holocene or Pleistocene and therefore may preserve fossil resources. The older underlying alluvial sediments were deposited on the ancient floodplain of the Los Angeles River and consist of well-sorted silts and sands, interbedded with stream channel deposits of sands and gravels.

Geotechnical studies of the Project Site indicate that artificial fill underlies the Project Site at depths ranging from 2-18 feet bgs (GEOCHON West, Inc., 2013; Kleinfelder, 2005; MACTEC Engineering and Consulting, 2003). The geotechnical studies do not indicate the exact depth at which the Quaternary alluvium becomes old enough to preserve fossils, but the LACM records search indicated fossils have been recovered at depths of 20 feet bgs from alluvial deposits in the Project vicinity (McLeod, 2017). As described above, the LACM records search has identified a number of fossil localties which have been within the Pleistocene alluvium in the vicinity of the Project Site. some of which have also been reported in the scientific literature (e.g. Brattstrom and Sturn, 1959; Steadman, 1980)

SOURCE: ESRI; Dibblee and Minch 1989

Times Mirror Square Project

Figure 4
Geologic Map

ESA

The geotechnical studies have encountered the Pliocene-age Fernando Formation as bedrock underlying the Quaternary alluvium at depths of 8 to 28 feet bgs within the Project Site (GEOCHON West, Inc., 2013, 2017; Kleinfelder, 2005; MACTEC Engineering and Consulting, 2003). The Fernando Formation is a marine and nonmarine semi-friable, massively bedded sandstone that crops out at the surface nearby at Bunker Hill (Dibblee and Ehrenspeck, 1989; GEOCHON West, Inc., 2017). As described above, the LACM the records search has identified numerous fossil localities within the Fernando Formation in the vicinity of the Project Site (McLeod, 2017). Additionally, numerous scientifically significant fossil discoveries have been reported in the scientific literature from the Fernando Formation (e.g. Lamar 1970; Woodring, 1938; Yerkes, 1965).

The Puente Formation also crops out near to the Project Site at Bunker Hill, and is therefore also expected to be present in the subsurface of the Project Site, albeit at great depth (Dibblee and Ehrenspeck, 1989). Geotechnical studies in and around the Project Site extended to depths of 60 - 81 feet bgs and did not encounter the Puente Formation, therefore it's depth is expected to be at greater than 60 feet bgs within the Project Site (GEOCHON West, Inc., 2013, 2017; Kleinfelder, 2005; MACTEC Engineering and Consulting, 2003). The Puente Formation consists of thin bedded silty clay shale, sometimes interbedded with fine sandstone (Dibblee and Ehrenspeck, 1989). As detailed by the records search of the LACM (McLeod, 2017; see above), numerous fossils have been recovered from the Puente Formation in Los Angeles, some of which have been reported in the scientific literature (e.g., David, 1943).

Paleontological Resources Survey

Due to the intensively developed nature of the Project Site and the lack of exposed fossil-bearing geologic units, a paleontological resources survey was determined not to be required as part of the investigation.

Paleontological Sensitivity Analysis

Based on the archival research conducted for the Project, paleontological sensitivity has been assigned to the geologic units underlying the Project Site. The sensitivity assignments follow the SVP guidelines (1995, 2010) and are as follows:

- **Quaternary younger alluvium (Qa) –** Surficial sediments; **low-to-high sensitivity**, increasing with depth. High sensitivity sediments are estimated to occur at around 15 feet bgs, as indicated by fossil discoveries reported by the LACM (McLeod, 2017).
- Quaternary older alluvium (Qoa) – Subsurface, approximately 15 feet bgs; high sensitivity
- **Fernando Formation (Tfr)** – Subsurface, approximately 8-28 feet bgs; **high sensitivity**
- **Puente Formation (Tush) -** Subsurface, over approximately 60 feet bgs; **high sensitivity**

Conclusions and Recommendations

As a result of this study, the surficial sediments of the Project Site identified as younger Quaternary alluvium are too young to preserve fossils and, therefore, have low paleontological

sensitivity. However, the Late Holocene – Pleistocene older alluvium, the Fernando Formation, and the Puente Formation are present in the subsurface of the Project Site and have high paleontological sensitivity. Substantial excavation within the Project Site during construction for subterranean parking, deep excavation for excavation shoring, and ancillary uses or improvements (e.g., sewer, electrical, water) is planned at such depths as to impact these formations determined as having a high sensitivity for fossils as a result of the research presented in this study.

The following recommendations are made and would serve to reduce impacts to unique paleontological resources or unique geological feature to a less than significant level:

1. A qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards (SVP, 2010) (Qualified Paleontologist) shall be retained prior to the approval of demolition or grading permits. The Qualified Paleontologist shall provide technical and compliance oversight of all work as it relates to paleontological resources, shall attend the Project kick-off meeting and Project progress meetings on a regular basis, and shall report to the site in the event potential paleontological resources are encountered.
2. The Qualified Paleontologist shall conduct construction worker paleontological resources sensitivity training prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.). In the event construction crews are phased, additional trainings shall be conducted for new construction personnel. The training session shall focus on the recognition of the types of paleontological resources that could be encountered within the Project Site and the procedures to be followed if they are found. Documentation shall be retained demonstrating that all construction personnel attended the training.
3. Full-time paleontological resources monitoring shall be conducted for all ground disturbing activities occurring in previously undisturbed sediments of older alluvium, the Fernando Formation, and the Puente Formation. The surficial alluvium, as well as any artificial fill present, has low paleontological sensitivity and so work in the upper 15 feet of the Project Site does not need to be monitored. The depth of 15 feet is derived from the records search of the LACM, which reports fossils recovered in older alluvium from depths of 20 feet in the vicinity of the Project Site (McLeod, 2015). The Qualified Paleontologist shall spot check the excavation on an intermittent basis and recommend whether the depth of required monitoring should be revised based on his/her observations. Paleontological resources monitoring shall be performed by a qualified paleontological monitor (meeting the standards of the SVP) under the direction of the Qualified Paleontologist. Monitors shall have the authority to temporarily halt or divert work away from exposed fossils in order to recover the fossil specimens. Any significant fossils collected during Project-related excavations shall be prepared to the point of identification and curated into an accredited repository with retrievable storage. Monitors shall prepare daily logs detailing the types of activities and soils observed, and any discoveries. The Qualified Paleontologist shall prepare a final monitoring and mitigation report to document the results of the monitoring effort.
4. If construction or other Project personnel discover any potential fossils during construction, regardless of the depth of work or location, work at the discovery location shall cease in a 50-foot radius of the discovery until the Qualified Paleontologist has assessed the discovery and made recommendations as to the appropriate treatment. If the find is deemed significant, it should be salvaged following the standards of the SVP (SVP, 2010) and curated with a certified repository.

Sara is a senior archaeology and paleontology lead with 20 years of experience in cultural resources management in Southern California. As a senior project manager, she manages technical studies including archaeological and paleontological assessments and surveys, as well as monitoring and fossil salvage for many clients, including public agencies and private developers. She is a cross-trained paleontological monitor and supervisor, familiar with regulations and guidelines implementing the National Historic Preservation Act (NHPA), National Environmental Policy Act (NEPA), California Environmental Quality Act (CEQA), and the Society of Vertebrate Paleontology guidelines. She has extensive experience providing oversight for long-term monitoring projects throughout the Los Angeles Basin for archaeological, Native American, and paleontological monitoring compliance projects and provides streamlined management for these disciplines.

Relevant Experience

Los Angeles Unified School District (LAUSD) Central Los Angeles High School #9; Los Angeles, CA. *Senior Project Archaeologist & Project Manager*. Sara conducted on-site monitoring and investigation of archaeological sites exposed as a result of construction activities. During the data recovery phase in connection with a 19th century cemetery located on-site, she participated in locating of features, feature excavation, mapping, and client coordination. She organized background research on the cemetery, including genealogical, local libraries, city and county archives, other local cemetery records, internet, and local fraternal organizations. Sara advised on the lab methodology and setup and served as project manager. Sara was a contributing author and editor for the published monograph, which was published as part of a technical series, “Not Dead but Gone Before: The Archaeology of Los Angeles City Cemetery.”

Downtown Cesar Chavez Median Project, City of Los Angeles, CA. *Project Manager*. Sara assisted the City of Los Angeles Department of Public Works Bureau of Engineering with a Local Assistance Project requiring consultations with Caltrans cultural resources. Responsible for Caltrans coordination, serving as contributing author and report manager for required ASR, HPSR, and HRER prepared for the project.

Elysian/USC Water Recycling Project Initial Study/Environmental Assessment, Los Angeles, CA. *Project Manager.* Sara worked on the Initial Study/Mitigated Negative Declaration and an Environmental Assessment/Finding of No Significant Impact to construct recycled water pipelines for irrigation and other industrial uses serving Los Angeles Department of Water and Power customers in downtown Los Angeles, including Elysian Park. The U.S. Environmental Protection Agency is the federal lead agency.

10 YEARS EXPERIENCE

Alyssa Bell, PhD

Paleontologist

Dr. Alyssa Bell has supervised and peformed field work, authored project reports, and provided scientific and compliance direction and quality control for paleontological projects throughout Southern California. Dr. Bell has accumulated a wealth of field experience, working with crews from a variety of institutions on field sites in California, Arizona, New Mexico, South Dakota, and Utah, and has led her own expeditions in Montana. She has performed all manner of investigations from surveys and assessments to monitoring and fossil idenfitication over the last 15 years as a part of her academic pursuits and professional consultation, with the last three years being exclusively professional endeavors.

In addition to consulting, Dr. Bell serves as a postdoctoral fellow at the Dinosaur Institute of the Natural History Museum of Los Angeles County (LACM). There she is involved in pursuing her own research into fossil birds as well as working with the Institute's field projects and museum-wide education and outreach initiatives. She has also published peer-reviewed articles and book chapters and given numerous presentations at scientific conferences on both her paleontological and microbiological research.

Relevant Experience

ICHA Area 10 (PA 10-2 & 10-4) Archaeological and Paleontological Monitoring, Irvine, CA. *Principal Investigator & Project Paleontologist.* Dr. Bell managed the curatorial process for fossils collected during monitoring of pre-construction activities at the University of California, Irvine, and authored the final report.

Suncrest Reactive Power Support Project, San Diego County, CA. *Principal Investigator.* Dr. Bell authored the paleontological assessment for the Proponent's Environmental Assessment (PEA) in support for a dynamic reactive power support facility and associated 230-kilovolt (kV) transmission line near Alpine, California. The application for Certificate of Public Convenience and Necessary was filed in summer 2015 and the PEA was deemed complete in December 2015.

Washington National Archaeological and Paleontological Monitoring (Access Culver City), Culver City, CA. *Principal Investigator & Project Paleontologist.* Dr. Bell managed the curatorial process for fossils collected during monitoring of pre-construction activities at the Washington national site in Culver City, CA and authored the final report.

OTO Hotels Santa Monica Archaeological and Paleontological Service, Santa Monica, CA. *Principal Investigator.* Dr. Bell supervised paleontological monitoring and mitigation services during construction excavations and grading. Services included implementation of a paleontological mitigation monitoring program and reporting.

Sacred Heart Specific Plan Environmental Impact Report (EIR), La Canada Flintridge, CA. *Principal Investigator.* Dr. Bell prepared paleontological studies and

developed monitoring & mitigation recommendations for the Sacred Heart development project.

Sixth & Bixel Paleontological Monitoring Services Project, Los Angeles, CA. *Principal Investigator & Project Paleontologist.* Dr. Bell supervised paleontological monitoring of preconstruction activities in support of a development project encompassing two parcels in downtown Los Angeles. During these activities, monitors identified and recovered numerous significant vertebrate fossils. Dr. Bell supervised the excavation of fossilized whale remains discovered on-site, and oversaw the collection and curation of all fossil specimens.

Natural and Cultural Support for the Gordon Mull Subdivision EIR, Glendora, CA. *Principal Investigator.* Dr. Bell collected the necessary data to prepare the technical sections and mitigation recommendations to support an EIR prepared by another firm to address the Gordon Mull Subdivision in the city of Glendora. The project is proposes to redevelop a 71-acre, 19-lot located in the San Gabriel Foothills.

Lake Elsinore Lakeshore Town Center Permitting, Riverside County, CA. *Principal Investigator.* Dr. Bell provided paleontological studies and developed monitoring and mitigation recommendations for the Lake Elsinore Town Center project in Riverside County.

San Pedro Plaza Park - Phase III Archaeological Monitor, Los Angeles, CA. *Principal Investigator.* Dr. Bell identified fossils during the mitigation measurement-required archaeological monitoring of earthmoving activities in San Pedro Park Plaza. She is also responsible for curation of the fossil material and authorship of the paleontological section of the final report.

City of Hope Specific Plan and EIR, Duarte, CA. *Principal Investigator.* Dr. Bell provided paleontological resource studies for the City of Hope Specific Plan Project.

Blythe Solar Power Project, Units 1 & 2, Riverside County, CA. *Project Paleontologist.* Dr. Bell supervised paleontological monitoring of preconstruction activities for a solar photo-voltaic cell power-generating facility outside the city of Blythe. As a part of her role, she provided oversight and management of paleontological monitors and development of the final monitoring report.

Industrial Project Environmental Impact Report, Colton, CA. *Principal Investigator.* Dr. Bell provided a paleontological resources study for a six-acre industrial project site at the southwest corner of Agua Mansa Road and Rancho Avenue in the city of Colton.

Mojave Solar Project Paleontological Reporting, San Bernardino County, CA. *Principal Investigator.* Dr. Bell managed curation of fossil materials and authored the final report of paleontological monitoring services provided for construction activities in support of a solar field development project in San Bernardino County.

El Camino Real Bridge Replacement Environmental Services, Atascadero, CA. *Principal Investigator.* Dr. Bell provided environmental services, including preparation of all California Environmental Quality Act (CEQA)/National Environmental Policy Act (NEPA) documentation, technical studies, and permitting, for the replacement of the El Camino Real Bridge over Santa Margarita Creek in Atascadero.

re: Paleontological Records Check for the proposed Omni LA Times Square Project, in the City of Los Angeles, Los Angeles County, project area

Dear Fatima:

I have conducted a thorough search of our Vertebrate Paleontology records for the proposed Omni LA Times Square Project, in the City of Los Angeles, Los Angeles County, project area as outlined on the portion of the Los Angeles USGS topographic quadrangle map that you sent to me via e-mail on 11 August 2017. We do not have any vertebrate fossil localities that lie directly within the proposed project area, but we do have localities nearby from the same sedimentary deposits that probably occur subsurface in the proposed project area.

The entire proposed project site area has surficial deposits of younger Quaternary Alluvium, derived as fluvial deposits from the flood plain of the Los Angeles River that currently flows in a concrete channel just to the east. These younger Quaternary deposits usually do not contain significant fossil vertebrates, at least in the uppermost layers, but the underlying older sedimentary deposits found at varying depths may well contain significant vertebrate fossils.

Our closest vertebrate fossil locality from the older Quaternary deposits is LACM 1755, southwest of the proposed project area near the intersection of Hill Street and 12th Street, that produced a fossil specimen of horse, *Equus*, at a depth of 43 feet below the street. Our next closest vertebrate fossil locality from older Quaternary deposits beneath the younger Quaternary Alluvium is LACM 2032, east-northeast of the of the proposed project area near the intersection

of Mission Road and Daly Street around the Golden State Freeway (I-5), that produced fossil specimens of pond turtle, *Clemmys mamorata*, ground sloth, *Paramylodon harlani*, mastodon, *Mammut americanum*, mammoth, *Mammuthus imperator*, horse, *Equus*, and camel, *Camelops*, at a depth of 20-35 feet below the surface. The pond turtle specimens from locality LACM 2032 were figured in the scientific literature by B.H. Brattstrom and A. Sturn (1959. A new species of fossil turtle from the Pliocene of Oregon, with notes on other fossil *Clemmys* from western North America. Bulletin of the Southern California Academy of Sciences, 58(2):65-71). At our locality LACM 1023, just north of locality LACM 2032 near the intersection of Workman Street and Alhambra Avenue, excavations for a storm drain recovered fossil specimens of turkey, *Meleagris californicus,* sabre-toothed cat, *Smilodon fatalis*, horse, *Equus*, and deer, *Odocoileus*, at unstated depth. A specimen of the turkey, *Meleagris*, from this locality was published in the scientific literatus by D. W. Steadman (1980. A Review of the Osteology and Paleontology of Turkeys (Aves: Meleagridinae). Contributions in Science, Natural History Museum of Los Angeles County, 330:131-207).

Immediately to the north of the proposed project area, north of the intersection of Broadway and 1st Street, there are exposures of the marine Pliocene Fernando Formation and the marine late Miocene Yorba Member of the Puente Formation (also referred to as an Unnamed Shale in this area), that also may occur at depth in the proposed project area.

We have a series of vertebrate fossil localities from the Fernando Formation nearby including LACM 7730, immediately to the east of the proposed project area near the intersection of Main Street and 2nd Street; LACM 4726, just southwest of the proposed project area near the corner of 4th and Hill Streets; LACM 6971, further to the west of locality LACM 4726 west of Pershing Square near the corner of 6th and Flower Streets; and LACM 3868, due west of the proposed project area north of 6th Street between Lucas Avenue and South Bixel Street. These nearby Fernando Formation localities have produced a composite fauna including fossil specimens of stingray, *Dasyatis*, eagle ray, *Myliobatis*, skate, *Raja*, chimaerid, Chimaeriformes, bull shark, *Carcharhinus leucas*, dusky shark, *Carcharhinus obscurus*, hammerhead shark, *Sphyrna*, sixgill shark, Hexanchiformes, bonito shark, *Isurus oxyrinchus*, salmon shark, *Lamna ditropis*, white sharks, *Carcharodon sulcidens* and *Carcharodon carcharias*, herring, Clupeidae, hake, *Merluccius*, sheepshead, *Semicossyphus*, mackerel, *Scomber*, bird, Aves, rorqual baleen whale, Balaenopteridae, and toothed whale, Odontoceti.

Our Puente Formation locality LACM 5961 occurs just north of the proposed project area just north of the intersection of Hill Street and 1st Street. Locality LACM 5961, discovered during excavation for the Metrorail station at unknown depth, produced a specimen of the fossil bristlemouth fish, *Cyclothone*. Our next closest vertebrate fossil locality from the Puente Formation is LACM 7990, northeast of the proposed project area north of Temple Street between Broadway and Spring Street, that produced fossil fish including slickheads, Alepocephalidae, argentinas, Argentinidae, deep sea smelts, Bathylagidae, viperfish, *Chauliodus*, herring, Clupeidae, cod, Gadiformes, bristlemouths, Gonostomidae, mackerel, Scombridae, and dragonfish, Stomiatidae.

Shallow excavations in the younger Quaternary Alluvium exposed throughout the proposed project area are unlikely to uncover significant fossil vertebrate remains. Deeper excavations in the proposed project area that extend down into older sedimentary deposits, however, may well encounter significant vertebrate fossils. Any substantial excavations in the proposed project area, therefore, should be closely monitored to quickly and professionally recover any potential vertebrate fossils without impeding development. Also, sediment samples should be collected and processed to determine the small fossil potential in the proposed project area. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod, Ph.D.

Dear Mr. Spector:

In accordance with your authorization of our proposal dated November 18, 2016, we have prepared a geotechnical investigation report for the proposed Times Mirror Square project located 201 West First Street in the City of Los Angeles, California. The accompanying report presents the findings of our study, and our conclusions and recommendations pertaining to the geotechnical aspects of proposed design and construction. Based on the results of our investigation, it is our opinion that the site can be developed as proposed, provided the recommendations of this report are followed and implemented during design and construction.

If you have any questions regarding this report, or if we may be of further service, please contact the undersigned.

Very truly yours,

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for the proposed Times Mirror Square project located at 201 West First Street in the City of Los Angeles, California (see Vicinity Map, Figure 1). The purpose of the investigation was to evaluate subsurface soil and geologic conditions underlying the site and based on assumed conditions, to provide conclusions and recommendations pertaining to the geotechnical aspects of design and construction.

The scope of this investigation included a site reconnaissance, review of previous geotechnical reports for developments adjacent to the site, including the MTA Regional Connector – Broadway and 2nd Street Station on the south, the Federal Courthouse on the west, the Los Angeles Police Department Headquarters on the east, and Civic Center Park on the north. We also reviewed information on the City of Los Angeles Navigate LA website and on file at the city records department, we have reviewed historic plans provided to us, and have reviewed existing published geologic information as it pertains to the proposed project, and prepared this report.

Two borings were attempted: one on West First Street immediately adjacent to the northern site boundary and one on South Broadway immediately adjacent to the southwest corner of the site. Multiple attempts were made at each boring location; however, the borings could not be advanced more than a few feet beneath the existing ground surface due to the presence of multiple mapped and unmapped underground utilities.

References reviewed to prepare this report are provided in the *List of References* section. No subsurface explorations were performed as part of this evaluation.

2. SITE AND PROJECT DESCRIPTION

The subject site consists of a city block in downtown Los Angeles bounded by South Broadway to the northwest, by South Spring Street to the southeast, by West 1st Street to the north, and by West 2nd Street to the south. The western half of the site is occupied by a six-story office building (Executive Building) and parking structure. Based on the historic drawings, these existing structures are underlain by up to three subterranean levels. The eastern half of the site is occupied by a ten-story structure underlain by up to three subterranean levels (Mirror Building); a four-story structure underlain by one subterranean level (Plant Building); and an eight-story structure underlain by up to three subterranean levels (Times Building). The site slopes gently to the south, with no pronounced highs or lows. Surface water drainage at the site appears to be by sheet flow along the existing ground contours to the city streets.

Based on the information provided by the Client, it is our understanding that the Executive Building and parking structure will be demolished and a new development constructed in its place. The proposed construction consists of two towers (one 37-story and one 53-story tower) underlain by up to nine levels of subterranean parking. The proposed development is depicted on the Site Plan and Geologic Sections

(see Figures 2 and 3). The existing Mirror Building, Plant Building, and Times Building will remain and are proposed for rehabilitation and reuse.

Based on the preliminary nature of the design at this time, wall and column loads were not available. It is anticipated that a bearing pressure of 15,000 psf may be required for support of the proposed towers.

Once the design phase and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Any changes in the design, location or elevation of any structure, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

3. PRIOR INVESTIGATIONS

Geologic and geotechnical data is available from prior geotechnical investigations on the sites located to the north, south, east and west of the subject site. A summary of the prior geotechnical investigation reports reviewed as a part of this report preparation is provided below.

Geocon West, Inc. has reviewed the referenced reports and addenda by Geocon West, Inc. (2013), Kleinfelder (2005), MACTEC (2003), and The Connector Partnership (2013), and we agree with the recommendations presented therein. Furthermore, we assume responsibility for the utilization of the exploration and laboratory data presented within those reports.

Civic Center Park

Geocon previously investigated the site to the north of the subject site for the proposed Civic Center Park. Our prior geotechnical investigation report is entitled:

> *Geotechnical Investigation, Proposed 1st and Broadway Civic Center Park, 217 West 1st Street, Los Angeles, California, prepared for the City of Los Angeles Geotechnical Engineering Group,* dated December 20, 2013 (Project No. A8950-06-01).

Geocon performed three borings as a part of the study performed in 2013. Sedimentary bedrock of the Fernando Formation was encountered at depths ranging between 20 and 23 feet beneath the existing ground surface, corresponding to elevations of 273 to 277 feet Mean Sea Level (MSL). The bedrock is reported to be massive siltstone. Groundwater seepage was encountered above the bedrock contact. Laboratory testing performed included direct shear, grain size analysis, consolidation, plasticity index, corrosivity, and insitu density and moisture content. The prior geotechnical investigation addressed the demolition and backfill of the prior structure, including subterranean levels, which occupied the site for the construction of the proposed park. A copy of the previous Geocon West, Inc. report (2013) is presented in Appendix A.

Los Angeles Police Department Headquarters

Kleinfelder performed a geotechnical investigation for the Los Angeles Police Department Headquarters, located to the east of the subject site. The prior geotechnical investigation report is entitled:

> *Geotechnical Engineering Report, New Police Headquarters Facility, City Block Bounded by First Street on the North, Main Street on the East, Second Street on the South, and Spring Street on the West (120 South Spring Street, 141 South Main Street, and 106 through 132 West First Street), Tract L A C A Map No. 94, Lots PCL 14 and 15 and Ord's Survey Tract, Block 1, Lots 4 and 8), Downtown Los Angeles,* prepared by Kleinfelder, dated February 15, 2005, WO E170910B, GED File 04-120.

Multiple addenda and response letters were prepared subsequent to the above referenced report, and copies are included in Appendix B.

Kleinfelder performed 15 borings as a part of the study performed in 2005; however, several of the borings encountered relatively shallow refusal. The borings were advanced to depths between 2 and 81½ feet below the ground surface. Based on our review of the report, Fernando Formation was encountered at elevations of approximately 251 to 269½ feet MSL (depths of 8 to 28½ feet beneath the existing ground surface). The bedrock is generally described as massive, and lacking distinct discontinuities and bedding planes. However, locally, some weakly developed bedding is reported. Minor groundwater seepage was encountered above the bedrock contact in several borings. Laboratory testing performed included direct shear, grain size analysis, consolidation, plasticity index, and in-situ density and moisture content. The prior geotechnical investigation addressed the construction of an eleven-story structure underlain by three levels of subterranean parking. Based on the depth of the proposed structure, an evaluation of liquefaction was not necessary. Initial recommendations included foundations deriving support in bedrock. In a later addendum report, additional recommendations were provided for foundations deriving support in alluvium. Copies of the previous Kleinfelder report (2005) and addenda are presented in Appendix B.

Los Angeles Federal Courthouse

MACTEC Engineering and Consulting (MACTEC) performed a geotechnical investigation for the Los Angeles Federal Courthouse, located to the west of the subject site. The prior geotechnical investigation report is entitled:

> *Report of Geotechnical Investigation, Proposed Los Angeles Federal Courthouse, Between Broadway and Hill Street and First and Second Streets, Los Angeles, California, Prepared for General Services Administration, San Francisco, California,* prepared by MACTEC Engineering and Consulting, dated January 15, 2003 (MACTEC Project No. 4953-03-3881).

MACTEC performed four borings as a part of the study performed in 2003. The borings were advanced to depths between 25 and 75 feet below the ground surface. In addition, MACTEC had previously investigated the site by drilling 16 prior borings to depths ranging from 14 to 68 feet below the ground surface. Based on our review of the report, Fernando Formation was encountered at elevations of approximately 262 to 273 feet MSL, corresponding to 9 to 52 feet beneath the existing ground surface. The bedrock is described as generally massive, and lacking distinct discontinuities and bedding planes. Locally, the bedrock is described as laminated. Minor groundwater seepage was encountered several feet above the bedrock contact in the majority of the borings. Laboratory testing performed included direct shear, consolidation, and insitu density and moisture content. The prior geotechnical investigation addressed the construction of a 24-story structure underlain by four or five levels of subterranean parking. Based on the depth of the proposed structure, an evaluation of liquefaction was not necessary. Recommendations included conventional spread foundations deriving support in bedrock. A copy of the previous MACTEC report (2003) is presented in Appendix C.

MTA Regional Connector – Broadway and 2nd Street Station

The Connector Partnership (TCP) prepared a geotechnical data report (GDR) and geotechnical baseline report (GBR) for the Regional Connector Transit Corridor Project, which includes an MTA station at the intersection of South Broadway and West 2nd Street, located to the south of the subject site. The GBR is entitled:

> *Geotechnical Baseline Report Rev. 1a, Regional Connector Transit Corridor Project, Task No. PH2.7.9.14, Prepared for METRO (Contract No. E0119),* prepared by The Connector Partnership, dated August 1, 2013.

TCP collected geotechnical data along the Regional Connector Transit Corridor project from prior projects along the alignment, as well as from the project's geotechnical design report (GDR). Three borings utilized for the GDR (RCT-76, -77, and -78) are historical LeRoy Crandall borings, drilled in 1969 within the limits of the southern portion of the site (see Figure 2). The reports present a summary of available data, and anticipated geologic conditions at the proposed South Broadway and West 2nd Street station. The reports anticipate approximately 15 to 25 feet of artificial fill and alluvial material underlain by Fernando Formation bedrock. Laboratory testing performed included unconfined compressive strength, plasticity index, grain size analysis, and insitu density and moisture content. Copies of the previous TCP reports (2013) are presented in Appendix D.

4. GEOLOGIC SETTING

The site is located along the southern edge of the Elysian Hills, approximately 1 mile west of the Los Angeles River. Locally, the site is situated at the base of the local topographic feature known as Bunker Hill, a bedrock high that has been significantly altered by grading related to previous development in the area (lowered up to 50 feet in elevation). Bunker Hill is composed primarily of sedimentary bedrock of the Miocene age Puente Formation and the Pliocene age Fernando Formation. The Puente Formation is typically well-bedded in contrast to the Fernando Formation that is typically poorly bedded to massive. The structure of the bedrock in the area represents the south limb of an anticline that dips to the south and southeast at inclinations ranging from approximately 65 to 75 degrees (Dibblee, 1989; Lamar, 1970). A thin veneer of Quaternary age alluvium, either Pleistocene age remnant terraces or Holocene age overbank channel deposits, overlie the bedrock in the immediate area as shown on Figure 4, Local Geologic Map.

Regionally, the site is located within the northernmost portion of the Peninsular Ranges geomorphic province. This geomorphic province bounded by the Sierra Madre-Raymond-Hollywood-Santa Monica Fault System on the north, the San Andreas Fault Zone on the east, and the Pacific Ocean on the west and south. The Peninsular Ranges geomorphic province is characterized by northwest-trending physiographic and geologic features such as the Newport-Inglewood Fault Zone located approximately 7.0 miles to the west-southwest.

5. SOIL AND GEOLOGIC CONDITIONS

Based on our review of prior reports prepared for projects to the north, south, east, and west of the site, as well as published geologic maps of the area, we conclude that the site is locally underlain by minor amounts of artificial fill over Holocene age and Pleistocene age alluvial deposits consisting of interbedded sand and silt with varying amounts of gravel, cobbles, and boulders (Lamar, 1970; Dibblee, 1989). The alluvial sediments are underlain by sedimentary bedrock units of the Pliocene age Fernando Formation (Dibblee, 1989; Lamar, 1970).

5.1 Artificial Fill

Only minor amounts of artificial fill are anticipated to exist at the site. In the eastern portion of the site, the structures will remain and, therefore, any artificial fill present at the site will remain. Based on historic drawings for the existing structures at the site, existing foundations appear to derive support in bedrock; however, historic foundation drawings which confirm the depths of the existing foundation system are not available. In the western portion of the site, the existing structures will be demolished and the proposed tower structures are anticipated to have up to nine subterranean levels. It is anticipated that artificial fill present in the western portion of the site will be removed as part of the planned development.

5.2 Alluvium

The Holocene age and Pleistocene age alluvial deposits in the immediate area generally consist of interlayered fine-grained flood plain deposits (sandy silt, sandy clay and clay) and granular stream channel deposits (silty sand and poorly graded to well graded sand with various amounts of gravel. The soils are primarily moist, medium dense to dense or firm to stiff, and become denser with increased depth. Raveling within the alluvial sediments was documented in the majority of the borings drilled at the Federal Courthouse site to the west (MACTEC, 2003) and in historical borings utilized as part of the Regional Connector Transit Corridor (RCTC) project to the south. Also, cobbles and boulders were locally encountered in the alluvial deposits in the borings drilled for the Civic Center Park project to the north (Geocon West, Inc., 2013), the RCTC project to the south (The Connector Partnership, 2013) and the Federal Courthouse project (MACTEC, 2003) to the west.

5.3 Fernando Formation

The Fernando Formation was encountered in the field explorations on the adjacent sites at elevations ranging from 256 feet MSL (boring RCT-6 located near the intersection of Spring Street and 2nd Street) to 277 feet MSL (at the Civic Center Park site to the north). Based on the geotechnical reports for the adjacent sites, the bedrock consists predominantly of olive brown or brownish gray to dark gray, massive to poorly bedded siltstone and clayey siltstone. The bedrock is predominantly massive (lacking through-going bedding), but locally it is described as thinly laminated, slightly fractured, and weakly to moderately jointed (MACTEC, 2003; The Connector Partnership, 2013) and locally bedded (Kleinfelder, 2005). The bedrock can be characterized as moderately to highly weathered and predominantly soft. Locally, well-cemented beds were encountered in the adjacent borings Also, because of the primarily soft nature and high silt and clay content of the siltstone, the bedrock is prone to slaking (The Connector Partnership, 2013).

Although published geologic maps indicate the bedrock underling the site and in the general site vicinity generally strikes East-West to N85°E and dips of 65° to 75° to the south (Dibblee 1989; Lamar, 1970), the prior reports for the Police Headquarters to the east (Kleinfelder, 2005), the Civic Center Park to the north (Geocon West, Inc. 2013), the Federal Courthouse to the west (MACTEC, 2003) and the GDR (The Connector Partnership, 2013) describe the bedrock as predominantly massive and lacking distinct discontinuities and bedding planes. Consequently, no bedding orientations were reported in these previous reports. Also, photographs of core samples presented in the GDR for boring GS-8, located immediately adjacent to the southern site boundary confirm that the Fernando Formation bedrock is primarily massive to the total depth explored (120 feet).

6. GROUNDWATER

Based on a review of the Seismic Hazard Zone Report for the Los Angeles 7.5 Minute Quadrangle, Los Angeles County, California (California Division of Mines and Geology [CDMG], 1998), the historically highest groundwater level in the area is reported to be approximately 20 to 25 feet beneath the ground surface. Groundwater information presented in this document is generated from data collected in the early 1900's to the late 1990's. Based on current groundwater basin management practices, it is unlikely that groundwater levels will ever reach the historic high levels.

Considering the shallow depth to bedrock, the reported historic high groundwater level in the area is interpreted to represent to be perched water on top of the less permeable bedrock, and not the true groundwater table. This interpretation is evidenced by the seepage encountered approximately ½-foot to 4 feet above the bedrock contact in the majority of borings drilled on adjacent sites. Localized seepage was encountered within the bedrock in the historical borings RCT-76, RCT-77, and RCT-78 drilled within the southwestern portion of the site either at or within 2 feet above the bedrock contact. Also, it should be noted that in several of the borings, localized seepage was encountered at random depths within the bedrock, occurring along joints or fractures in the bedrock. Based depth of the proposed excavations, it is anticipated that seepage will be encountered during construction of the proposed subterranean levels. As previously indicated, it is our opinion that the groundwater seepage encountered in borings on the adjacent sites does not represent the static groundwater table, but represents discontinuous perched zones within the saturated granular soils overlying the relatively impermeable siltstone.

It should be noted that it is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially in impermeable fine-grained soils or bedrock which are heavily irrigated or after seasonal rainfall. In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the region. Proper surface drainage of irrigation and precipitation will be critical for future performance of the project. Recommendations for drainage are provided in the S*urface Drainage* section of this report (see Section 8.26).

7. GEOLOGIC HAZARDS

7.1 Surface Fault Rupture

The numerous faults in Southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geological Survey (CGS, formerly known as CDMG) for the Alquist-Priolo Earthquake Fault Zone Program (Bryant and Hart, 2007). By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years), but has had no known Holocene movement. Faults that have not moved in the last 1.6 million years are considered inactive.

The site is not within a currently established state-designated Alquist-Priolo Earthquake Fault Zone (CGS, 2017) or a city-designated Preliminary Fault Rupture Study Area (City of Los Angeles, 2017) for surface fault rupture hazards. No active or potentially active faults with the potential for surface fault rupture are known to pass directly beneath the site. Therefore, the potential for surface rupture due to faulting occurring beneath the site during the design life of the proposed development is considered low. The site, however, is located in the seismically active Southern California region, and could be subjected to moderate to strong ground shaking in the event of an earthquake on one of the many active Southern California faults. The faults in the vicinity of the site are shown in Figure 5, Regional Fault Map. A list of major active faults and local potentially active faults in the Los Angeles area are presented on Table 1 and Table 2, respectively.

The closest fault with the potential for surface fault rupture is the active Hollywood Fault located approximately 4.5 miles north of the site (CGS, 2014; CGS, 2017). Other nearby active faults are the Raymond Fault, the Verdugo Fault, the Newport-Inglewood Fault Zone, the Santa Monica Fault, and the Sierra Madre Fault located approximately 5.2 miles north-northeast (CGS, 2017), 6½ miles north, 7 miles west-southwest, 10½ miles west, and 10½ miles north-northeast of the site, respectively (Ziony and Jones, 1989). The active San Andreas Fault zone is located approximately 34 miles northeast of the site.

The closest potentially active fault to the site is the MacArthur Park Fault located approximately 0.6 mile to the southwest. Other nearby potentially active faults are the Coyote Pass Fault, the Overland Fault, and the Charnock Fault located 2.1 miles southeast, 9.4 miles southwest, and 10.4 miles southwest of the site, respectively (Ziony and Jones, 1989).

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3.0 kilometers. The October 1, 1987 M_w 5.9 Whittier Narrows earthquake, and the January 17, 1994 M_w 6.7 Northridge earthquake were a result of movement on the Puente Hills Blind Thrust and the Northridge Thrust, respectively. The site is located within the vertical projection of the Los Angeles segment of the Puente Hills Blind Thrust and the Elysian Park Blind Thrust. These thrust faults are not exposed at the surface and do not pose a surface fault rupture hazard at the site. However, these deep thrust faults are considered active features capable of generating future earthquakes that could result in moderate to significant ground shaking at the site

7.2 Seismicity

As with all of Southern California, the site has experienced historic earthquakes from various regional faults. The seismicity of the region surrounding the site was formulated based on research of an electronic database of earthquake data. The epicenters of recorded earthquakes with magnitudes equal to or greater than 5.0 in the site vicinity are depicted on Figure 6, Regional Seismicity Map. A partial list of moderate to major magnitude earthquakes that have occurred in the Southern California area within the last 100 years is included in the following table.

LIST OF HISTORIC EARTHQUAKES

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (Miles)	Direction to Epicenter
San Jacinto-Hemet area	April 21, 1918	6.8	74	ESE
Near Redlands	July 23, 1923	6.3	57	E
Long Beach	March 10, 1933	6.4	34	SE
Tehachapi	July 21, 1952	7.5	80	NW
San Fernando	February 9, 1971	6.6	28	NNW
Whittier Narrows	October 1, 1987	5.9	10	ENE
Sierra Madre	June 28, 1991	5.8	21	NE
Landers	June 28, 1992	7.3	104	E
Big Bear	June 28, 1992	6.4	82	E
Northridge	January 17, 1994	6.7	21	NW
Hector Mine	October 16, 1999	7.1	119	ENE

The site could be subjected to strong ground shaking in the event of an earthquake. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated if the proposed structures are designed and constructed in conformance with current building codes and engineering practices.

7.3 Seismic Design Criteria

The following table summarizes summarizes site-specific design criteria obtained from the 2016 California Building Code (CBC; Based on the 2015 International Building Code [IBC] and ASCE 7-10), Chapter 16 Structural Design, Section 1613 Earthquake Loads. The data was calculated using the computer program *U.S. Seismic Design Maps*, provided by the USGS. The short spectral response uses a period of 0.2 second. We evaluated the Site Class based on the discussion in Section 1613.3.2 of the 2016 CBC and Table 20.3-1 of ASCE 7-10. The values presented below are for the risk-targeted maximum considered earthquake (MCE_R).

2016 CBC SEISMIC DESIGN PARAMETERS

Parameter	Value	2016 CBC Reference
Site Class	C	Table 1613.3.2
MCE_R Ground Motion Spectral Response Acceleration – Class B (short), S_S	2.434g	Figure 1613.3.1(1)
MCE_R Ground Motion Spectral Response Acceleration – Class B (1 sec), S_1	0.854g	Figure 1613.3.1(2)
Site Coefficient, F_A	1.0	Table 1613.3.3(1)
Site Coefficient, F_V	1.3	Table 1613.3.3(2)
Site Class Modified MCE_R Spectral Response Acceleration (short), S_{MS}	2.434g	Section 1613.3.3 (Eqn 16-37)
Site Class Modified MCE_R Spectral Response Acceleration – (1 sec), S_{M1}	1.110g	Section 1613.3.3 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	1.623g	Section 1613.3.4 (Eqn 16-39)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.740g	Section 1613.3.4 (Eqn 16-40)

The table below presents the mapped maximum considered geometric mean (MCE_G) seismic design parameters for projects located in Seismic Design Categories of D through F in accordance with ASCE 7-10.

ASCE 7-10 PEAK GROUND ACCELERATION

Parameter	Value	ASCE 7-10 Reference
Mapped MCE_G Peak Ground Acceleration, PGA	0.920g	Figure 22-7
Site Coefficient, F_{PGA}	1.0	Table 11.8-1
Site Class Modified MCE_G Peak Ground Acceleration, PGA_M	0.920g	Section 11.8.3 (Eqn 11.8-1)

The Maximum Considered Earthquake Ground Motion (MCE) is the level of ground motion that has a 2 percent chance of exceedance in 50 years, with a statistical return period of 2,475 years. According to the 2016 California Building Code and ASCE 7-10, the MCE is to be utilized for the evaluation of liquefaction, lateral spreading, seismic settlements, and it is our understanding that the intent of the Building code is to maintain "Life Safety" during a MCE event. The Design Earthquake Ground Motion (DE) is the level of ground motion that has a 10 percent chance of exceedance in 50 years, with a statistical return period of 475 years.

Deaggregation of the MCE peak ground acceleration was performed using the USGS online BETA Unified Hazard Tool, 2008 Conterminous U.S. Dynamic edition. The result of the deaggregation analysis indicates that the predominant earthquake contributing to the MCE peak ground acceleration is characterized as a 6.66 magnitude event occurring at a hypocentral distance of 5.14 kilometers from the site.

Deaggregation was also performed for the Design Earthquake (DE) peak ground acceleration, and the result of the analysis indicates that the predominant earthquake contributing to the DE peak ground acceleration is characterized as a 6.63 magnitude occurring at a hypocentral distance of 7.87 kilometers from the site.

Conformance to the criteria in the above tables for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur if a large earthquake occurs. The primary goal of seismic design is to protect life, not to avoid all damage, since such design may be economically prohibitive.

7.4 Liquefaction Potential, Seismically-Induced Settlements, and Lateral Spreading

Liquefaction is a phenomenon in which loose, saturated, relatively cohesionless soil deposits lose shear strength during strong ground motions. Primary factors controlling liquefaction include intensity and duration of ground motion, gradation characteristics of the subsurface soils, in-situ stress conditions, and the depth to groundwater. Liquefaction is typified by a loss of shear strength in the liquefied layers due to rapid increases in pore water pressure generated by earthquake accelerations.

The current standard of practice, as outlined in the "Recommended Procedures for Implementation of DMG Special Publication 117, Guidelines for Analyzing and Mitigating Liquefaction in California" and "Special Publication 117A, Guidelines for Evaluating and Mitigating Seismic Hazards in California" requires liquefaction analysis to a depth of 50 feet below the lowest portion of the proposed structure. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

The State of California Seismic Hazard Zone Map for the Los Angeles Quadrangle (CGS, 2017; CDMG, 1999) indicates that the site is located in an area identified as having a potential for liquefaction (see Figure 7, Seismic Hazard Zone Map). However, the foundations for the proposed tower structures and subterranean levels are anticipated to extend through the alluvial soils and into bedrock which is not susceptible to liquefaction or lateral spreading. In addition, historic drawings of the three structures to remain (Mirror Building, Plant Building, and Times Building) indicate that existing foundations appear to derive support in bedrock. Therefore, based on the anticipated depth of bedrock (20 to 25 feet below existing ground surface) and the historical perched groundwater depth of 20 to 25 feet, liquefaction and associated ground deformation, including seismically-induced settlements and lateral spreading, is not considered a potential hazard for the proposed structures or existing structures to remain.

7.5 Slope Stability and Landslides

Topography at the site and surrounding vicinity is relatively flat to gently sloping to the south. The site is not located a city-designated Hillside Grading Area or a Hillside Ordinance Area (City of Los Angeles, 2017). According to the County of Los Angeles Safety Element (Leighton, 1990), the site is not within an area identified as being in a Hillside Area or an area having a potential for slope instability. Additionally, a review of the State of California Seismic Hazard Zone Map for the Los Angeles Quadrangle Map (CGS, 2017; CDMG, 1999) indicates that the site is not within an area identified as having a potential for seismic slope instability. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Therefore, the potential for slope instability or landslides to adversely affect the proposed development is considered very low.

The proposed excavation is anticipated to be on the order of 85 feet in depth, including foundation depths and assuming seven levels of subterranean parking is constructed. The upper 20 to 25 feet of the excavation is anticipated to expose artificial fill and granular alluvial deposits. As previously described, caving and raveling of the alluvial deposits was observed in many of the previous borings adjacent to the site. Bedrock of the Fernando Formation will be exposed below a depth of approximately 25 feet. The bedrock is generally massive and bedding is not well-developed. However, the bedrock is documented as locally exhibiting moderately developed to well-developed joints and unsupported joint sets could result in localized wedge failures.

7.6 Earthquake-Induced Flooding

Earthquake-induced flooding is inundation caused by failure of dams or other water-retaining structures due to earthquakes. Review of the Los Angeles County Safety Element (Leighton, 1990), indicates that the site is not located within an area identified as having a potential for inundation. Therefore, the potential for earthquake-induced inundation at the site is considered very low.

7.7 Tsunamis, Seiches, and Flooding

The site is not located within a coastal area. Therefore, tsunamis, seismic sea waves, are not considered a significant hazard at the site.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. No major water-retaining structures are located immediately up gradient from the project site. Flooding from a seismically-induced seiche is considered unlikely.

The site is within an area of minimal flooding (Zone X) as defined by the Federal Emergency Management Agency (FEMA 2017; LACDPW, 2017b).

7.8 Oil Fields & Methane Potential

According to the California Division of Oil, Gas and Geothermal Resources (DOGGR, 2017), the site is not located within the boundaries of an oil field. No oil wells are located in the immediate vicinity of the site. However, due to the voluntary nature of record reporting by the oil well drilling companies, wells may be improperly located or not shown on the location map. Undocumented wells could be encountered during construction. Any wells encountered will need to be properly abandoned in accordance with the current requirements of the DOGGR.

The site is not located within the boundaries of a city-designated methane zone or a methane buffer zone (City of Los Angeles, 2017). Therefore, the potential for methane or other volatile gases to be present at the site is considered very low. However, should it be determined that a methane study is required for the proposed development, we recommend that a qualified methane consultant be retained to perform the study and provide mitigation measures as necessary.

7.9 Subsidence

Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils that are particularly subject to subsidence include those with high silt or clay content. The site is not located within an area of known ground subsidence. No large-scale extraction of groundwater, gas, oil, or geothermal energy is occurring or planned at the site or in the general site vicinity. Also, the foundations of the proposed tower structures will be founded in bedrock. Therefore, there appears to be little or no potential for ground subsidence due to withdrawal of fluids or gases to impact the site.

7.10 Hydroconsolidation

Hydroconsolidation (i.e., collapse) is the tendency of unsaturated soil structure to collapse upon saturation resulting in the overall settlement of the affected soil and overlying foundations or improvements supported thereon. Potentially compressible soils underlying the site are typically removed and recompacted during remedial site grading. However, if compressible soil is left in-place, a potential for settlement due to hydroconsolidation of the soil exists.

Based on the anticipated depth of bedrock (20 to 25 feet below existing ground surface), and proposed depth of excavation, hydrocollapse is not considered a potential hazard.

7.11 Erosion

Based on the consideration of the highly developed and paved nature of the site and surrounding areas, the potential for erosion to occur is considered low. Provided the engineering recommendations are followed to mitigate erosion, and the grading plans are prepared to generally-accepted regional standards, erosion is not expected to be a major impact to development.

7.12 Expansive Soils

Expansive soils are soils that swell when subjected to moisture and shrink when dried, and are typically associated with clayey soils. The effects of expansive soils are most severe when found near the ground surface, where changes in moisture content can be frequent with little to no confinement. The effects of expansive soils can typically be mitigated by construction in accordance with current building codes and engineering practices. Based on depth of the proposed subterranean levels and anticipated building loads, the proposed structure would not be prone to the effects of expansive soils.

8. CONCLUSIONS AND RECOMMENDATIONS

8.1 General

8.1.1 It is our opinion that neither soil nor geologic conditions have been encountered during adjacent geotechnical investigations that would preclude the construction of the proposed development provided the recommendations presented herein are followed and implemented during design and construction. The geotechnical design parameters presented herein should be reviewed and updated once structural loads are established.

8.1.2 Prior to issuance of grading permits, a final design-level geotechnical investigation report (Final Geotechnical Report) should be submitted to the Los Angeles Department of Building and Safety Grading Department for review and approval. The Final Geotechnical Report shall be used for final design of the foundation system for the structures and should take into consideration the engineering properties beneath the proposed structures and the anticipated loads. The Project shall be subject to the specific performance criteria recommended in the Final Geotechnical Report, in addition to all applicable State and local codes and building standards. The Final Geotechnical Report should contain an analysis of the expected ground motions at the Project Site from known active faults using accepted methodologies; and determination of the final design parameters for walls, foundations, foundation slabs, utilities, roadways, parking, sidewalks, and other related improvements. The final plans for the Project's foundation design, earthwork, and site preparation shall incorporate all of the recommendations in the Final Geotechnical Report.

8.1.3 The purpose of this report is to provide design recommendations and discuss construction considerations based on the boring and laboratory data available from the four adjacent geotechnical investigations located on each side of the property (see Section 3, Prior Investigations).

8.1.4 It is our opinion that neither soil nor geologic conditions are known to exist that would preclude the construction of the proposed project and that the conclusions and recommendations presented herein may be applied to the design of the project. It is recommended that confirmatory borings be performed subsequent to demolition of the existing site structures to verify the assumptions and the recommendations presented herein. Additional and/or revised recommendations may be necessary based on the findings of that exploration.

8.1.5 Artificial fill may be present within the limits of the subject site, and would likely be associated with past grading and construction activities at the site. Furthermore, alluvium on the order of 20 to 25 feet in thickness has been encountered during the adjacent geotechnical investigations. Demolition of the existing structures which occupy the site will likely disturb the upper few feet of soil at the base of the existing structures. It is assumed that existing fill, if present, as well as the existing alluvial soils and bedrock are suitable for re-use as engineered fill provided the recommendations in the *Grading* section of this report are followed (see Section 8.6).

8.1.6 Excavation for the subterranean levels is anticipated to penetrate through the existing artificial fill and alluvium, and is expected to expose Fernando Formation bedrock throughout the excavation bottom.

8.1.7 It is anticipated that the tower structure will be supported on reinforced concrete mat foundations, and that the subterranean parking underlying the podium levels may be supported on conventional spread foundations. All foundations must derive support in competent bedrock generally found at the bottom of subterranean excavation. Recommendations for mat foundations and conventional spread foundations are provided herein as Sections 8.8 through 8.11. For the purposes of this report, the foundation depth has been assumed to be at or below 90 feet below the existing ground surface which corresponds to nine levels of subterranean parking. It is our understanding that up to nine levels of subterranean parking may be constructed; however, the design is still preliminary at this time. Foundations will likely need to be designed to prevent a surcharge on the adjacent MTA Station Box structure. Foundations should be deepened as necessary to extend into satisfactory soils and must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

8.1.8 Once proposed building loads become available, additional analyses may be required to evaluate the anticipated total and differential settlements between the foundation elements for verification that the settlements are in conformance with the City of Los Angeles policy. Updated foundation design recommendations will be provided as necessary in an addendum report.

8.1.9 It is anticipated that the Mirror, Plant, and Times Buildings will be rehabilitated and adaptively reused; however, the scope of the proposed rehabilitation is unknown at this time. The project structural engineer should provide information on the scope of the rehabilitation for our review and development of geotechnical recommendations. Based on our review of the historic foundation drawings, there appears to be sufficient information to perform an analysis of the existing foundation bearing capacity in accordance with ASCE 41-13. These recommendations can be provided under separate cover as the project proceeds.

8.1.10 The existing structures to remain and located immediately to the east of the proposed high-rise structure will require consideration with respect to shoring design, underpinning, and surcharge loads. These design considerations should be addressed by the project structural and shoring engineers. The existing structures to the east (Mirror, Plant, and Times Buildings) are shallower than the bottom of the proposed high-rise structure. Historic foundation drawings from the construction of the Plant and Times Buildings and renovation drawings for the Mirror Building indicate that the existing structures are supported on a combination of belled caissons and conventional foundations at varying elevations, all of which appear to derive support in bedrock (see Site Plan and Cross-Sections, Figures 2 and 3).

8.1.11 Due to the preliminary nature of the design at this time, it is unknown if the proposed high-rise structure will be shallower or deeper than the MTA station and tunnels that are currently under construction to the south (see Site Plan and Cross-Sections, Figures 2 and 3). The MTA station box and tunnels are reported to have a lowest excavation bottom of approximately 199 feet above MSL, where adjacent to the site. Based on the project team's initial conversations with MTA, it is our understanding that MTA will require detailed soil-structure interaction analyses which demonstrate that the proposed structure will not negatively impact the station box and tunnels. These analyses are beyond the scope of work of this report, and cannot be prepared without detailed Project structural plans that are not available at this time.

8.1.12 Groundwater seepage was encountered during adjacent geotechnical investigations at elevations ranging from 261 to 279 feet above MSL. Seepage was primarily encountered above the bedrock contact, but also within the bedrock itself, likely in fractured and granular layers. Excavations for the subterranean levels are anticipated to extend below the encountered groundwater seepage.

8.1.13 Based on the subterranean nature of the proposed structure and the conditions encountered during site exploration of the adjacent properties, groundwater will likely be encountered during construction activities. Temporary dewatering measures will be required to mitigate groundwater seepage during excavation. Recommendations for temporary dewatering are discussed in Section 8.2 of this report.

8.1.14 The Fernando Formation bedrock is reportedly prone to slaking behavior due to changes in the moisture content. The presence of groundwater seepage within the excavation may soften and weaken the bedrock depending on the duration of the exposure. In order to protect the excavation bottom, consideration should be given to the use of waste slabs at the bottom of foundation excavations and exposed concrete slab-on-grade subgrade. Alternatively, the slab subgrade may be left 8 to 12 inches high while foundations are constructed to minimize disturbance to the bedrock which will support the floor slab.

8.1.15 The historic high groundwater level is reported at a depth of 20 to 25 feet below the ground surface. If the subterranean portion of the structure which extends below a depth of 20 feet is not designed for full hydrostatic pressure, a permanent dewatering system will be required to relieve and mitigate the water pressure. Recommendations for permanent dewatering are discussed in Section 8.3 of this report.

8.1.16 Excavations of the proposed subterranean levels will expose bedrock throughout a majority of the sidewalls. Although the bedrock is reported as generally massive and does not have through-going planes of weakness, joint sets and fractures have been observed within the Fernando Formation during the adjacent geotechnical investigations. Excavations must be conducted in a manner that maintains stability. Excavations into bedrock must be observed and approved in writing by the Project Geologist (a representative of Geocon West, Inc.) during excavation in order to identify any unforeseen variations within the bedrock. Any necessary recommendations to eliminate or support unfavorable conditions will be made at that time.

8.1.17 Due to the depth of the excavation and the proximity to the property lines, city streets, and adjacent on-site structures, excavation of the proposed subterranean levels will require sloping and/or shoring measures in order to provide a stable excavation. Where shoring is required it is recommended that a soldier pile shoring system be utilized. Where excavation depths exceed 12 feet or surcharges are imposed on the shoring system, raker braces or tie-back anchors may be required in conjunction with the soldier piles. The need for lateral bracing and the acceptable shoring deflection should be determined by the project shoring engineer.

8.1.18 The utilization of underpinning piles may be considered as a part of the shoring system where adjacent to existing structures which have subterranean components. All piles utilized for shoring can also be incorporated into a permanent shotcrete retaining wall system. The design of the shoring and any underpinning should be performed by a qualified structural and/or shoring engineer.

8.1.19 Due to the nature of the proposed design and intent for a subterranean level, waterproofing of subterranean walls and slabs is suggested. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

8.1.20 Based on the geologic conditions underlying the site, stormwater infiltration is not recommended for this project. It is suggested that stormwater be retained, filtered and discharged in accordance with the requirements of the local governing agency.

8.1.21 Once the design and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Any changes in the design, location or elevation of any structure, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

8.2 Temporary Dewatering

8.2.1 Groundwater seepage was encountered during adjacent geotechnical investigations at elevations ranging from 261 to 279 feet above MSL. Seepage was primarily encountered above the bedrock contact, but also within the bedrock itself, likely in fractured and granular layers. Excavations for the subterranean levels are anticipated to extend below the encountered groundwater seepage and groundwater will likely be encountered during construction activities. The depth to groundwater seepage at the time of construction may be further verified during initial dewatering well or shoring pile installation. If groundwater seepage is present above the depth of the subterranean level, temporary dewatering will be necessary to maintain a safe working environment during excavation and construction activities.

8.2.2 It is recommended that a qualified dewatering consultant be retained to design the dewatering system. Recommendations for design flow rates for the temporary dewatering system should be determined by a qualified contractor or dewatering consultant. Temporary dewatering may consist of perimeter wells with interior well points as well as gravel filled trenches (French drains) placed adjacent to the shoring system and interior of the site. The number and locations of the wells or French drains can be adjusted during excavation activities as necessary to collect and control any encountered seepage. The French drains will then direct the collected seepage to a sump where it will be pumped out of the excavation.

8.2.3 The embedment of perimeter shoring piles should be deepened as necessary to take into account any required excavations necessary to place an adjacent French drain system, or sub-slab drainage system, should it be deemed necessary. It is not anticipated that a perimeter French drain will be more than 24 inches in depth below the proposed excavation bottom. If a French drain is to remain on a permanent basis, it must be lined with filter fabric to prevent soil migration into the gravel.

8.2.4 Based on the consideration that the Fernando Formation bedrock is prone to slaking when exposed to changes in moisture content, consideration should be given to the use of waste slabs at the excavation bottom.

8.2.5 Geocon can assist with water quality testing as well as obtaining discharge permits required for dewatering.

8.3 Permanent Dewatering

8.3.1 If the subterranean portion of the structure is not designed for full hydrostatic pressure and buoyancy, a permanent dewatering system will be required to relieve and mitigate the water pressure. A subdrainage system consisting of perforated pipe placed in gravel-filled trenches may be installed beneath the subterranean slab-on-grade to intercept and control groundwater. This system can be combined with the perimeter retaining wall drainage system provided backflow valves are installed at the base of the wall drainage system. It is our understanding that if a permanent dewatering system is implemented, dewatered groundwater will be reinjected or infiltrated back into the ground.

8.3.2 A typical permanent sub-slab drainage system would consist of a 12-inch-thick layer of ¾-inch gravel that is placed upon a layer of filter fabric (Miami 500X or equivalent), and vibrated to a dense state. Subdrain pipes leading to sump areas, provided with automatic pumping units, should drain the gravel layer. The drain lines should consist of perforated pipe, placed with perforations down, in trenches that are at least 6 inches below the gravel layer. The excavation bottom, as well as the trench bottoms should be lined with filter fabric prior to placing and compacting gravel. The trenches should be spaced approximately 40 feet apart at most, within the interior, and should extend along to the perimeter of the building. Subsequent to the installation of the drainage system, the waterproofing system and building slab may then be placed on the densified gravel. A waste slab may be placed over the waterproofing system for protection during placement of rebar and mat slab construction.

8.3.3 Recommendations for design flow rates for the permanent dewatering system should be determined by a qualified contractor or dewatering consultant.

8.4 Soil and Excavation Characteristics

8.4.1 The in-situ soils can be excavated with moderate effort using conventional excavation equipment. Due to the predominantly granular nature of the alluvium, caving should be anticipated in unshored excavations within the alluvium, especially where granular and/or saturated soils are encountered. As encountered in the adjacent geotechnical investigations, cobbles and/or occasional boulders may be encountered within the alluvium. In general, the bedrock is highly weathered and should be rippable with conventional equipment; however, concretions or well cemented layers were encountered during the adjacent geotechnical investigations. Generally, the concretions were less than 1-foot-thick; however, concretions up to 6 feet thick have been observed in the site vicinity. Coring or jack-hammering may be required if concretions are encountered. The contractor should be aware that drilling conditions may be difficult due to the potential for caving, the presence of cobbles and boulders, as well as the potential for concretions within the bedrock and should be prepared for these conditions.

8.4.2 All cuts which expose bedrock must be observed and approved in writing by a Project Geologist (a representative of Geocon) in order to identify any unforeseen variations within the bedrock. Any necessary recommendations to eliminate or support unfavorable conditions will be made at that time.

8.4.3 It is the responsibility of the contractor to ensure that all excavations and trenches are properly shored and maintained in accordance with applicable OSHA rules and regulations to maintain safety and maintain the stability of adjacent existing improvements.

8.4.4 All onsite excavations must be conducted in such a manner that potential surcharges from existing structures, construction equipment, and vehicle loads are resisted. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation or vehicle load. Penetrations below this 1:1 projection will require special excavation measures such as sloping and shoring. Excavation recommendations are provided in the *Temporary Excavations* section of this report (see Section 8.19).

8.4.5 Expansive soils are soils that swell when subjected to moisture and shrink when dried, and are typically associated with clayey soils. The effects of expansive soils are most severe when found near the ground surface, where changes in moisture content can be frequent with little to no confinement. The effects of expansive soils can typically be mitigated by construction in accordance with current building codes and engineering practices. Based on depth of the proposed subterranean levels and anticipated building loads, the proposed structure would not be prone to the effects of expansive soils.

8.5 Minimum Resistivity, pH, and Water-Soluble Sulfate

8.5.1 Potential of Hydrogen (pH), resistivity testing, and chloride content testing have been performed during the adjacent geotechnical investigations on representative samples to generally evaluate the corrosion potential to surface utilities. The tests indicate that the soils have a pH that range from 6.0 to 7.63; resistivity that ranges from 400 to 1100 ohm-cm; and chloride content that ranges from 0.004 to 0.0095 percent. Based on the results, the soils are considered “severely corrosive” with respect to corrosion of buried ferrous metals on site. The prior results are presented in Appendix A through D and should be considered for design of underground structures.

8.5.2 Laboratory tests were performed during the adjacent geotechnical investigations on representative samples to measure the percentage of water-soluble sulfate content. Results indicate that the soils and bedrock near the site have a water-soluble sulfate content ranging from 0.0252 to 0.6 percent, which is considered a "severe" sulfate expose to concrete structures as defined by 2016 CBC Section 1904.3 and ACI 318-11 Section 4.2 and 4.3. The following table presents a summary of concrete requirements set forth by 2016 CBC Section 1904.3 and ACI 318. The presence of water-soluble sulfates is not a visually discernible characteristic; therefore, other soil samples from the site could yield different concentrations.

REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS

Sulfate Exposure	Exposure Class	Water-Soluble Sulfate Percent by Weight	Cement Type	Maximum Water to Cement Ratio by Weight	Minimum Compressive Strength (psi)
Not Applicable	S0	0.00-0.10	--	--	2,500
Moderate	S1	0.10-0.20	II	0.50	4,000
Severe	S2	0.20-2.00	V	0.45	4,500
Very Severe	S3	> 2.00	V+Pozzolan or Slag	0.45	4,500

8.5.3 It should be noted that the samples on which the corrosivity tests results are associated with range from near the ground surface to up to 80 feet below the existing ground surface.

8.5.4 If corrosion sensitive improvements are planned, a corrosion engineer should be retained to perform testing on representative samples of the onsite soil and bedrock, evaluate the test results, and provide recommendations to avoid premature corrosion of buried metal pipes and concrete structures in direct contact with the soils. Corrosion mitigation recommendations can be provided once utility and building materials are established.

8.6 Grading

8.6.1 A preconstruction conference should be held at the site prior to the beginning of grading operations with the owner, contractor, civil engineer and geotechnical engineer in attendance. Special soil handling requirements can be discussed at that time.

8.6.2 Earthwork should be observed, and compacted fill tested by representatives of Geocon West, Inc. The existing fill and alluvial soil encountered during exploration are suitable for re-use as an engineered fill, provided any encountered oversize material (greater than 6 inches) and any encountered deleterious debris are removed. If bedrock is to be utilized as an engineered fill, it may be blocky and may have to be crushed, moisture conditioned, and well blended with other onsite material prior to utilization.

8.6.3 Grading should commence with the removal of all existing vegetation and existing improvements from the area to be graded. Deleterious debris such as wood and root structures should be exported from the site and should not be mixed with the fill soils. Asphalt and concrete should not be mixed with the fill soils unless approved by the Geotechnical Engineer. All existing underground improvements planned for removal should be completely excavated and the resulting depressions properly backfilled in accordance with the procedures described herein. Once a clean excavation bottom has been established it must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.) and the City of Los Angeles Inspector.

8.6.4 Excavations of the proposed subterranean levels will expose bedrock throughout a majority of the sidewalls. Although the bedrock is reported as generally massive and does not have through-going planes of weakness, joint sets and fractures have been observed within the Fernando Formation during the adjacent geotechnical investigations. Excavations must be conducted in a manner that maintains stability. Excavations into bedrock must be observed and approved in writing by the Project Geologist (a representative of Geocon West, Inc.) during excavation in order to identify any unforeseen variations within the bedrock. Any necessary recommendations to eliminate or support unfavorable conditions will be made at that time. Recommendations for temporary excavations are provided in Section 8.19 of this report.

8.6.5 All foundations must derive support in the competent bedrock found at the bottom of the subterranean level. For the purposes of this report, the foundation depth has been assumed to be 70 feet below the existing ground surface. Foundations should be deepened as necessary to extend into satisfactory soils and must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

8.6.6 Prior to placing engineered fill over bedrock, the bedrock exposed at the excavation bottom must be cut or benched to create horizontal planes so that fill can be placed and compacted on horizontal surfaces. All excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.) prior to the placement of engineered fill.

8.6.7 The City of Los Angeles Department of Building and Safety requires a minimum compactive effort of 95 percent of the laboratory maximum dry density in accordance with ASTM D 1557 (latest edition) where the soils to be utilized in the fill have less than 15 percent finer than 0.005 millimeters. Soils with more than 15 percent finer than 0.005 millimeters may be compacted to 90 percent of the laboratory maximum dry density in accordance with ASTM D 1557 (latest edition). All fill and backfill soils should be placed in horizontal loose layers approximately 6 to 8 inches thick, moisture conditioned to optimum moisture content, and properly compacted to the required degree of compaction in accordance with ASTM D 1557 (latest edition).

8.6.8 Prior to construction of exterior slabs, the upper 12 inches of the subgrade should be moisture conditioned to optimum moisture content and properly compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D1557 (latest edition).

8.6.9 Although not anticipated for this project, all imported fill shall be observed, tested, and approved by Geocon West, Inc. prior to bringing soil to the site. Rocks larger than 6 inches in diameter shall not be used in the fill. If necessary, import soils used as structural fill should have an expansion index less than 50 and corrosivity properties that are equally or less detrimental to that of the existing onsite soils.

8.6.10 Utility trenches should be properly backfilled in accordance with the requirements of the Green Book (latest edition). The pipe should be bedded with clean sands (Sand Equivalent greater than 30) to a depth of at least 1 foot over the pipe, and the bedding material must be inspected and approved in writing by the Geotechnical Engineer (a representative of Geocon). The use of gravel is not acceptable unless used in conjunction with filter fabric to prevent the gravel from having direct contact with soil. The remainder of the trench backfill may be derived from onsite soil or approved import soil, compacted as necessary, until the required compaction is obtained. The use of minimum 2-sack slurry is also acceptable as backfill (see Section 8.7). Prior to placing any bedding materials or pipes, the excavation bottom must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon).

8.6.11 All trench and foundation excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon), prior to placing bedding material, fill, steel, gravel or concrete.

8.7 Controlled Low Strength Material (CLSM)

8.7.1 Controlled Low Strength Material (CLSM) may be utilized in lieu of compacted soil as engineered fill where approved in writing by the Geotechnical Engineer. Where utilized within the City of Los Angeles use of CLSM is subject to the following requirements:

Standard Requirements

1. CLSM shall be ready-mixed by a City of Los Angeles approved batch plant;
2. CLSM shall not be placed on uncertified fill, on incompetent natural soil, nor below water;
3. CLSM shall not be placed on a sloping surface with a gradient steeper than 5:1 (horizontal to vertical);
4. Placement of the CLSM shall be under the continuous inspection of a concrete deputy inspector;

5. The excavation bottom shall be accepted by the soil engineer and the City Inspector prior to placing CLSM.

Requirements for CLSM that will be used for support of footings

1. The cement content of the CLSM shall not be less than 188 pounds per cubic yard (min. 2 sacks);
2. The excavation bottom must be level, cleaned of loose soils and approved in writing by Geocon prior to placement of the CLSM;
3. The ultimate compressive strength of the CLSM shall be no less than 100 pounds per square inch (psi) when tested on the 28th-day per ASTM D4832 (latest edition), Standard Test Method for Preparation and Testing of Controlled Low Strength Material Test Cylinders. Compression testing will be performed in accordance with ASTM C39 and City of Los Angeles requirements;
4. Samples of the CLSM will be collected during placement, a minimum of one test (two cylinders) for each 50 cubic yards or fraction thereof;
5. Overexcavation for CLSM placement shall extend laterally beyond the footprint of any proposed footings as required for placement of compacted fill, unless justified otherwise by the soil engineer that footings will have adequate vertical and horizontal bearing capacity.

8.8 Foundation Design

8.8.1 It is anticipated that the tower structure will be supported on reinforced concrete mat foundations, and that the subterranean parking underlying the podium levels may be supported on conventional spread foundations. Recommendations for mat foundations and conventional spread foundations are provided herein as Sections 8.8 through 8.11. All foundations must derive support in competent bedrock generally found at the anticipated bottom of subterranean excavation. For the purposes of this report, the foundation depth has been assumed to be at or below 90 feet below the existing ground surface, which corresponds to nine levels of subterranean parking. It is our understanding that up to nine levels of subterranean parking may be constructed; however, the design is still preliminary at this time. Foundations will likely need to be designed to prevent a surcharge on the adjacent MTA Station Box structure. Foundations should be deepened as necessary to extend into satisfactory soils and must be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.).

8.8.2 Once proposed building loads become available, additional analyses may be required to evaluate the anticipated total and differential settlements between the foundation elements for verification that the settlements are in conformance with the City of Los Angeles policy. Updated foundation design recommendations will be provided as necessary in an addendum report.

8.8.3 The existing structures to remain and located immediately to the east of the proposed high-rise structure will require consideration with respect to shoring design, underpinning, and surcharge loads. These design considerations should be addressed by the project structural and shoring engineers. The existing structures to the east (Mirror, Plant, and Times Buildings) are shallower than the bottom of the proposed high-rise structure. Historic foundation drawings from the construction of the Plant and Times Buildings and renovation drawings for the Mirror Building indicate that the existing structures are supported on a combination of belled caissons and conventional foundations at varying elevations, all of which appear to derive support in bedrock (see Site Plan and Cross-Sections, Figures 2 and 3).

8.8.4 Due to the preliminary nature of the design at this time, it is unknown if the proposed high-rise structure will be shallower or deeper than the MTA station and tunnels that are currently under construction to the south (see Site Plan and Cross-Sections, Figures 2 and 3). The MTA station box and tunnels are reported to have a lowest excavation bottom of approximately 199 feet above MSL where adjacent to the site. Based on the project team's initial conversations with MTA, it is our understanding that MTA will require detailed soil-structure interaction analyses which demonstrate that the proposed structure will not negatively impact the station box and tunnels. These analyses are beyond the scope of work of this report and will be performed by other members of the project team.

8.8.5 No special subgrade presaturation is required prior to placement of concrete. However, the slab and foundation subgrade should be sprinkled as necessary; to maintain a moist condition as would be expected in any concrete placement. Based on the consideration that the Fernando Formation bedrock is prone to slaking when exposed to changes in moisture content, consideration should be given to the use of waste slabs at the excavation bottom to better control the moisture content of the exposed subgrade.

8.8.6 Waterproofing of subterranean walls and slabs is recommended for this project for any portions of the structure that will be constructed below the groundwater table. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

8.8.7 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to the placement of the methane system, reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

8.8.8 This office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

8.9 Conventional Foundation Design

8.9.1 Continuous footings may be designed for an allowable bearing capacity of 4,500 pounds per square foot (psf), and should be a minimum of 12 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing material.

8.9.2 Isolated spread foundations may be designed for an allowable bearing capacity of 5,000 psf, and should be a minimum of 24 inches in width, 18 inches in depth below the lowest adjacent grade, and 12 inches into the recommended bearing material.

8.9.3 The allowable soil bearing pressure above may be increased by 350 psf and 700 psf for each additional foot of foundation width and depth, respectively, up to a maximum allowable soil bearing pressure of 8,500 psf.

8.9.4 The allowable bearing pressures may be increased by one-third for transient loads due to wind or seismic forces.

8.9.5 If depth increases are utilized for the perimeter foundations, this office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

8.9.6 Continuous footings should be reinforced with four No. 4 steel reinforcing bars, two placed near the top of the footing and two near the bottom. Reinforcement for spread footings should be designed by the project structural engineer.

8.9.7 The above foundation dimensions and minimum reinforcement recommendations are based on soil conditions and building code requirements only, and are not intended to be used in lieu of those required for structural purposes.

8.10 Mat Foundation Design

8.10.1 It is anticipated that the mat foundation constructed for support of the tower will impart an average pressure of approximately 10,000 psf to 15,000 psf. The recommended maximum allowable bearing value is 15,000 psf. The allowable bearing pressure may be increased by up to one-third for transient loads due to wind or seismic forces.

8.10.2 A vertical modulus of subgrade reaction of 50 pounds per cubic inch (pci) may be used in the design of mat foundations deriving support in competent bedrock generally found at or below the anticipated foundation depth. For the purposes of this report, the foundation depth has been assumed to be 70 feet below the existing ground surface. This value takes into consideration the estimated mat foundation size, but should be reevaluated once foundation loads and dimensions become available.

8.10.3 The thickness of and reinforcement for the mat foundation should be designed by the project structural engineer.

8.10.4 If the proposed structure is to be designed for full hydrostatic pressure, the recommended uplift pressure to be used in design would be 62.4(H) in units of pounds per square foot, where "H" is the height of the water above the bottom of the mat foundation in feet. For design purposes the water table may be assumed at a depth of 25 feet below existing ground surface.

8.10.5 For seismic design purposes, a coefficient of friction of 0.35 may be utilized between the concrete mat and alluvium without a moisture barrier, and 0.15 for slabs underlain by a moisture barrier.

8.11 Foundation Settlement

8.11.1 The maximum static settlement for conventional foundations deriving support in the recommended bearing materials and designed with a maximum bearing pressure of 8,500 psf is estimated to be negligible based on the overburden to be removed for the subterranean excavation.

8.11.2 The maximum expected static settlement for a mat foundation deriving support in competent bedrock and utilizing a maximum allowable bearing pressure of 15,000 psf is estimated to be less than 3½ inches and occur below the central portion of the mat. The differential settlement between the center and corner of the mat is estimated to be less than 2 inches.

8.11.3 Differential settlement between the mat foundations and conventional foundations is expected to be less than 2 inches.

8.11.4 A majority of the settlement of the foundation system is expected to occur on initial application of loading; however, minor additional settlements are expected within the first 12 months.

8.11.5 Once the design and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. The settlement estimates provided above are based on the assumption that 70 feet of overburden will be removed. Based on the final foundation depths and loading configuration, the potential for settlement should be reevaluated by this office.

8.12 Lateral Design

8.12.1 Resistance to lateral loading may be provided by friction acting at the base of foundations, slabs and by passive earth pressure. An allowable coefficient of friction of 0.35 may be used with the dead load forces in the bedrock.

8.12.2 Passive earth pressure for the sides of foundations and slabs poured against bedrock may be computed as an equivalent fluid having a density of 1,000 pcf with a maximum earth pressure of 10,000 pcf. When combining passive and friction for lateral resistance, the passive component should be reduced by one-third.

8.13 Concrete Slabs-on-Grade

8.13.1 The project structural engineer may determine and design the necessary slab thickness and reinforcing for this structure. Unless specifically analyzed and designed by the project structural engineer, the slab-on-grade and ramp for the subterranean parking garage should be a minimum of 5 inches concrete reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions and positioned vertically near the slab midpoint. The concrete slab-on-grade may bear directly on undisturbed bedrock.

8.13.2 Slabs-on-grade at the ground surface that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder placed directly beneath the slab. The vapor retarder and acceptable permeance should be specified by the project architect or developer based on the type of floor covering that will be installed. The vapor retarder design should be consistent with the guidelines presented in Section 9.3 of the American Concrete Institute's (ACI) Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials (ACI 302.2R-06) and should be installed in general conformance with ASTM E 1643 (latest edition) and the manufacturer's recommendations. A minimum thickness of 15 mils extruded polyolefin plastic is recommended; recycled content or woven materials are not recommended. The material should have a permeance of less than 0.01 perms demonstrated by testing before and after mandatory conditioning. The vapor retarder should be installed in direct contact with the concrete slab with proper perimeter seal. If the Los Angeles Green Building Code requirements apply to this project, the vapor retarder should be underlain by 4 inches of clean aggregate. It is important that the vapor retarder be puncture resistant since it will be in direct contact with angular gravel. As an alternative to the clean aggregate suggested in the Los Angeles Green Building Code, it is our opinion that the concrete slab-on-grade may be underlain by a vapor retarder over 4-inches of clean sand (sand equivalent greater than 30), since the sand will serve a capillary break and will minimize the potential for punctures and damage to the vapor barrier.

8.13.3 Waterproofing of subterranean walls and slabs is recommended for this project for any portions of the structure that will be constructed below the groundwater table. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

8.13.4 For seismic design purposes, a coefficient of friction of 0.35 may be utilized between concrete slabs and soil without a moisture barrier and 0.15 for slabs underlain by a vapor retarder or methane barrier.

8.13.5 Exterior slabs, not subject to traffic loads, should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. Prior to construction of slabs, the upper 12 inches of subgrade should be moisture conditioned to optimum moisture content and properly compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Crack control joints should be spaced at intervals not greater than 10 feet and should be constructed using saw-cuts or other methods as soon as practical following concrete placement. Crack control joints should extend a minimum depth of one-fourth the slab thickness. The project structural engineer should design construction joints as necessary.

8.13.6 The recommendations of this report are intended to reduce the potential for cracking of slabs due to settlement. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade may exhibit some cracking due to minor soil movement or concrete shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

8.14 Retaining Walls Design

8.14.1 The recommendations presented below are generally applicable to the design of rigid concrete or masonry retaining walls having a maximum height of 75 feet. In the event that walls significantly higher than 75 feet are planned, Geocon should be contacted for additional recommendations.

8.14.2 Retaining wall foundations may be designed in accordance with the recommendations provided in the *Foundation Design* sections of this report (see Section 8.8 through 8.11).

8.14.3 Excavations into bedrock must be observed and approved in writing by the Project Geologist (a representative of Geocon West, Inc.) during excavation in order to identify any unforeseen variations within the bedrock which may require revised retaining wall recommendations.

8.14.4 Assuming that proper drainage and permanent dewatering is maintained, retaining walls with a level backfill surface that are not restrained at the top should be designed utilizing a triangular distribution of pressure (active pressure) of 30 pcf.

8.14.5 Restrained walls are those that are not allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall in feet) at the top of the wall. Where walls are restrained from movement at the top, walls may be designed utilizing a triangular distribution of pressure (at-rest pressure) of 50 pcf. Calculation of the recommended earth pressures is provided as Figure 8.

8.14.6 The wall pressures provided above assume that the retaining wall will be properly drained preventing the buildup of hydrostatic pressure. If retaining wall drainage is not implemented, the equivalent fluid pressure to be used in design of undrained walls is 90 pcf. The value includes hydrostatic pressures plus buoyant lateral earth pressures.

8.14.7 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic, or adjacent structures. Recommendations for the incorporation of surcharges are provided in section 8.25 of this report. Once the design becomes more finalized, an addendum letter can be prepared revising recommendations and addressing specific surcharge conditions throughout the project, if necessary.

8.14.8 In addition to the recommended earth pressure, the upper 10 feet of the subterranean wall adjacent to the street and parking lot should be designed to resist a uniform lateral pressure of 100 pounds per square foot, acting as a result of an assumed 300 psf surcharge behind the walls due to normal street traffic. If the traffic is kept back at least 10 feet from the subterranean walls, the traffic surcharge may be neglected.

8.14.9 Seismic lateral forces should be incorporated into the design as necessary, and recommendations for seismic lateral forces are presented below.

8.15 Dynamic (Seismic) Lateral Forces

8.15.1 The structural engineer should determine the seismic design category for the project in accordance with Section 1613 of the CBC. If the project possesses a seismic design category of D, E, or F, proposed retaining walls in excess of 6 feet in height should be designed with seismic lateral pressure (Section 1803.5.12 of the 2016 CBC).

8.15.2 A seismic load of 10 pcf should be used for design of walls that support more than 6 feet of backfill in accordance with Section 1803.5.12 of the 2016 CBC. The seismic load is applied as an equivalent fluid pressure along the height of the wall and the calculated loads result in a maximum load exerted at the base of the wall and zero at the top of the wall. This seismic load should be applied in addition to the active earth pressure. The earth pressure is based on half of two thirds of PGA_M calculated from ASCE 7-10 Section 11.8.3.

8.16 Retaining Wall Drainage

8.16.1 Retaining walls should be provided with a drainage system. At the base of the drain system, a subdrain covered with a minimum of 12 inches of gravel should be installed, and a compacted fill blanket or other seal placed at the surface (see Figure 9). The clean bottom and subdrain pipe, behind a retaining wall, should be observed by the Geotechnical Engineer (a representative of Geocon), prior to placement of gravel or compacting backfill.

8.16.2 As an alternative, a plastic drainage composite such as Miradrain or equivalent may be installed in continuous, 4-foot-wide columns along the entire back face of the wall, at 8 feet on center. The top of these drainage composite columns should terminate approximately 18 inches below the ground surface, where either hardscape or a minimum of 18 inches of relatively cohesive material should be placed as a cap (see Figure 10). These vertical columns of drainage material would then be connected at the bottom of the wall to a collection panel or a 1-cubic-foot rock pocket drained by a 4-inch subdrain pipe.

8.16.3 Subdrainage pipes at the base of the retaining wall drainage system should outlet to an acceptable location via controlled drainage structures. Drainage should not be allowed to flow uncontrolled over descending slopes.

8.16.4 Moisture affecting below grade walls is one of the most common post-construction complaints. Poorly applied or omitted waterproofing can lead to efflorescence or standing water. Particular care should be taken in the design and installation of waterproofing to avoid moisture problems, or actual water seepage into the structure through any normal shrinkage cracks which may develop in the concrete walls, floor slab, foundations and/or construction joints. The design and inspection of the waterproofing is not the responsibility of the geotechnical engineer. A waterproofing consultant should be retained in order to recommend a product or method, which would provide protection to subterranean walls, floor slabs and foundations.

8.17 Elevator Pit Design

8.17.1 The elevator pit slab and retaining wall should be designed by the project structural engineer. Elevator pit walls may be designed in accordance with the recommendations in the *Retaining Wall Design* section of this report (see Section 8.14).

8.17.2 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent foundations and should be designed for each condition as the project progresses.

8.17.3 If retaining wall drainage is to be provided, the drainage system should be designed in accordance with the *Retaining Wall Drainage* section of this report (see Section 8.16).

8.17.4 It is suggested that the exterior walls and slab be waterproofed to prevent excessive moisture inside of the elevator pit. Waterproofing design and installation is not the responsibility of the geotechnical engineer.

8.18 Elevator Piston

8.18.1 If a plunger-type elevator piston is installed for this project, a deep drilled excavation will be required. It is important to verify that the drilled excavation is not situated immediately adjacent to a foundation or shoring pile, or the drilled excavation could compromise the existing foundation or pile support, especially if the drilling is performed subsequent to the foundation or pile construction.

8.18.2 Due to the preliminary nature of the project at this time, it is unknown if a plunger-type elevator piston will be included for this project. If in the future it is determined that a plunger-type elevator piston will be constructed, the location of the proposed elevator should be reviewed by the Geotechnical Engineer to evaluate the setback from foundations and shoring piles. Additional recommendations will be provided as necessary.

8.18.3 Casing may be required in the drilled excavation. The contractor should be prepared to use casing and should have it readily available at the commencement of drilling activities. The contractor should be prepared to mitigate the buoyant forces on the casing due to groundwater seepage, if encountered. Continuous observation of the drilling and installation of the elevator piston by the Geotechnical Engineer (a representative of Geocon West, Inc.) is required.

8.18.4 The annular space between the piston casing and drilled excavation wall should be filled with a minimum of 1½-sack slurry pumped from the bottom up. As an alternative, pea gravel may be utilized. The use of soil to backfill the annular space is not acceptable.

8.19 Temporary Excavations

8.19.1 Excavations on the order of 85 feet in height are anticipated for excavation and construction of the proposed subterranean level, including foundation excavations. The excavations are expected to expose artificial fill, alluvial soils, and bedrock, which are suitable for vertical excavations up to 5 feet where loose soils or caving sands are not present or where not surcharged by adjacent traffic or structures.

8.19.2 Excavations into bedrock must be observed by the Project Geologist (a representative of Geocon West, Inc.) during excavation to check for the presence of jointing or bedding which may require special recommendations for sloping and/or shoring. Any recommendations deemed necessary will be provided at that time.

8.19.3 Vertical excavations greater than 5 feet will require sloping and/or shoring measures in order to provide a stable excavation. Where sufficient space is available, temporary unsurcharged embankments could be sloped back at a uniform 1:1 slope gradient or flatter, up to a maximum of 12 feet in height. A uniform slope does not have a vertical portion. Where space is limited, shoring measures will be required. *Shoring* data is provided in Section 8.20 of this report.

8.19.4 Where temporary construction slopes are utilized, the top of the slope should be barricaded to prevent vehicles and storage loads at the top of the slope within a horizontal distance equal to the height of the slope. If the temporary slopes are to be maintained during the rainy season, berms are suggested along the tops of the slopes where necessary to prevent runoff water from entering the excavation and eroding the slope faces. Geocon personnel should inspect the soils exposed in the cut slopes during excavation so that modifications of the slopes can be made if variations in the soil conditions occur. All excavations should be stabilized within 30 days of initial excavation.

8.20 Shoring – Soldier Pile Design and Installation

8.20.1 The following information on the design and installation of shoring is preliminary. Review of the final shoring plans and specifications should be made by this office prior to bidding or negotiating with a shoring contractor.

8.20.2 One method of shoring would consist of steel soldier piles, placed in drilled holes and backfilled with concrete. The steel soldier piles may also be installed utilizing high frequency vibration. Where maximum excavation heights are less than 12 feet the soldier piles are typically designed as cantilevers. Where excavations exceed 12 feet or are surcharged, soldier piles may require lateral bracing utilizing drilled tie-back anchors or raker braces to maintain an economical steel beam size and prevent excessive deflection. The size of the steel beam, the need for lateral bracing, and the acceptable shoring deflection should be determined by the project shoring engineer.

8.20.3 The design embedment of the shoring pile toes must be maintained during excavation activities. The toes of the perimeter shoring piles should be deepened to take into account any required excavations necessary for foundations and/or adjacent drainage systems.

8.20.4 The proposed soldier piles may also be designed as permanent piles and may be utilized to underpin the existing offsite structures. The required pile depth, dimension, spacing and underpinning connection to existing offsite foundation should be determined and designed by the project structural and shoring engineers. All piles utilized for shoring can also be incorporated into a permanent retaining wall system (shotcrete wall) provided they are designed in accordance with the earth pressure provided in the *Retaining Wall Design* section of this report (see Section 8.14).

8.20.5 Drilled cast-in-place soldier piles should be placed no closer than two diameters on center. The minimum diameter of the piles is 18 inches. Structural concrete should be used for the soldier piles below the excavation; lean-mix concrete may be employed above that level. As an alternative, lean-mix concrete may be used throughout the pile where the reinforcing consists of a wideflange section. The slurry must be of sufficient strength to impart the lateral bearing pressure developed by the wideflange section to the soil. For design purposes, an allowable passive value for the soils below the bottom plane of excavation may be assumed to be 1,000 pounds per square foot. Where piles are installed by vibration techniques, the passive pressure may be assumed to mobilize across a width equal to the two times the dimension of the beam flange. The allowable passive value may be doubled for isolated piles spaced a minimum of three the pile diameter. To develop the full lateral value, provisions should be implemented to assure firm contact between the soldier piles and the undisturbed bedrock.

8.20.6 Local seepage may be encountered during excavations for the proposed soldier piles, especially if conducted during the rainy season. If more than 6 inches of water is present in the bottom of the excavation, a tremie is required to place the concrete into the bottom of the hole. A tremie should consist of a rigid, water-tight tube having a diameter of not less than 6 inches with a hopper at the top. The tube should be equipped with a device that will close the discharge end and prevent water from entering the tube while it is being charged with concrete. The tremie should be supported so as to permit free movement of the discharge end over the entire top surface of the work and to permit rapid lowering when necessary to retard or stop the flow of concrete. The discharge end should be closed at the start of the work to prevent water entering the tube and should be entirely sealed at all times, except when the concrete is being placed. The tremie tube should be kept full of concrete. The flow should be continuous until the work is completed and the resulting concrete seal should be monolithic and homogeneous. The tip of the tremie tube should always be kept about 5 feet below the surface of the concrete and definite steps and safeguards should be taken to insure that the tip of the tremie tube is never raised above the surface of the concrete.

8.20.7 A special concrete mix should be used for concrete to be placed below water. The design should provide for concrete with an unconfined compressive strength psi of 1,000 pounds per square inch (psi) over the initial job specification. An admixture that reduces the problem of segregation of paste/aggregates and dilution of paste should be included. The slump should be commensurate to any research report for the admixture, provided that it should also be the minimum for a reasonable consistency for placing when water is present.

8.20.8 Caving is anticipated to occur where granular soils are encountered and the contractor should have casing available prior to commencement of pile excavation. When casing is used, extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than 5 feet. Continuous observation of the drilling and pouring of the piles by the Geotechnical Engineer (a representative of Geocon West, Inc.), is required.

8.20.9 The contractor should be aware that some difficult drilling conditions could be encountered in the alluvium and bedrock. Cobbles and/or occasional boulders may be encountered within the alluvium, and concretions or well cemented layers may be encountered in the bedrock. Coring or jack-hammering may be required if concretions or well cemented layers are encountered. The contractor should be prepared for these conditions prior to commencement of drilling activities.

8.20.10 If a vibratory method of solider pile installation is utilized, predrilling may be performed prior to installation of the steel beams. If predrilling is performed, it is recommended that the bore diameter be at least 2 inches smaller than the largest dimension of the pile to prevent excessive loss in the frictional component of the pile capacity. Predrilling should not be conducted below the proposed excavation bottom.

8.20.11 If a vibratory method is utilized, the owner should be aware of the potential risks associated with vibratory efforts, which typically involve inducing settlement within the vicinity of the pile which could result in a potential for damage to existing improvements in the area.

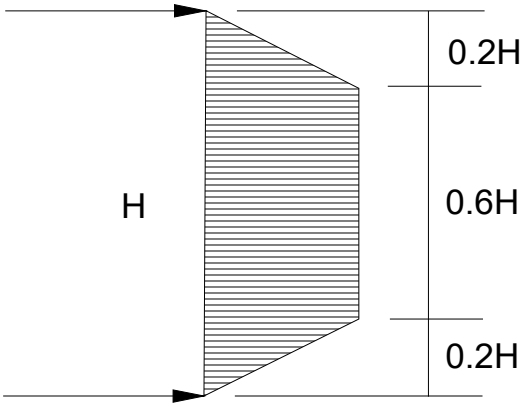
8.20.12 The level of vibration that results from the installation of the piles should not exceed a threshold where occupants of nearby structures are disturbed, despite higher vibration tolerances that a building may endure without deformation or damage. The main parameter used for vibration assessment is peak particle velocity in units of inch per second (in/sec). The acceptable range of peak particle velocity should be evaluated based on the age and condition of adjacent structures, as well as the tolerance of human response to vibration.

8.20.13 Based on Table 19 of the *Transportation and Construction Induced Vibration Guidance Manual* (Caltrans 2013), a continuous source of vibrations (ex. vibratory pile driving) which generates a maximum peak particle velocity of 0.5 in/sec is considered tolerable for modern industrial/commercial buildings and new residential structures. The Client should be aware that a lower value may be necessary if older or fragile structures are in the immediate vicinity of the site.

8.20.14 Vibrations should be monitored and record with seismographs during pile installation to detect the magnitude of vibration and oscillation experienced by adjacent structures. If the vibrations exceed the acceptable range during installation, the shoring contractor should modify the installation procedure to reduce the values to within the acceptable range. Vibration monitoring is not the responsibility of the Geotechnical Engineer.

8.20.15 Geocon does not practice in the field of vibration monitoring. If construction techniques will be implemented, it is recommended that qualified consultant be retained to provide site specific recommendations for vibration thresholds and monitoring.

8.20.16 The frictional resistance between the soldier piles and retained soil may be used to resist the vertical component of the anchor load. The coefficient of friction may be taken as 0.35 based on uniform contact between the steel beam and lean-mix concrete and retained earth. The portion of soldier piles below the plane of excavation may also be employed to resist the downward loads. The downward capacity may be determined using a frictional resistance of 1,000 psf per foot.



8.20.17 Due to the nature of the site soils and potential for joints and fractures within the bedrock, it is expected that continuous lagging between soldier piles will be required. However, it is recommended that the exposed soils be observed by the Geotechnical Engineer (a representative of Geocon West, Inc.), to verify the presence of any competent, cohesive soils and the areas where lagging may be omitted.

8.20.18 The time between lagging excavation and lagging placement should be as short as possible soldier piles should be designed for the full-anticipated pressures. Due to arching in the soils, the pressure on the lagging will be less. It is recommended that the lagging be designed for the full design pressure but be limited to a maximum of 400 pounds per square foot.

8.20.19 For the design of shoring, it is recommended that an equivalent fluid pressure be utilized for design. A trapezoidal distribution of lateral earth pressure may be used where shoring will be restrained by bracing or tie backs. The recommended active and trapezoidal pressures are provided in the following table. A diagram depicting the trapezoidal pressure distribution of lateral earth pressure is provided below the table Calculation of the recommended shoring pressures is provided as Figure 11.

HEIGHT OF SHORING (FEET)	EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (ACTIVE PRESSURE)	EQUIVALENT FLUID PRESSURE (Pounds Per Square Foot per Foot) Active Trapezoidal (Where H is the height of the shoring in feet)
Up to 95	25	16H

Trapezoidal Distribution of Pressure

8.20.20 It is very important to note that active pressures can only be achieved when movement in the soil (earth wall) occurs. If movement in the soil is not acceptable, such as adjacent to an existing structure, an at-rest pressure of 45 pcf should be considered for design purposes.

8.20.21 Where a combination of sloped embankment and shoring is utilized, the pressure will be greater and must be determined for each combination. Additional active pressure should be added for a surcharge condition due to slopes, vehicular traffic or adjacent structures and should be designed for each condition. The surcharge pressure should be evaluated in accordance with the recommendations in Section 8.25 of this report.

8.20.22 In addition to the recommended earth pressure, the upper 10 feet of the shoring adjacent to the street or driveway areas should be designed to resist a uniform lateral pressure of 100 psf, acting as a result of an assumed 300 psf surcharge behind the shoring due to normal street traffic. If the traffic is kept back at least 10 feet from the shoring, the traffic surcharge may be neglected.

8.20.23 It is difficult to accurately predict the amount of deflection of a shored embankment. It should be realized that some deflection will occur. It is recommended that the deflection be minimized to prevent damage to existing structures and adjacent improvements. Where public right-of-ways are present or adjacent offsite structures do not surcharge the shoring excavation, the shoring deflection should be limited to less than 1 inch at the top of the shored embankment. Where offsite structures are within the shoring surcharge area it is

recommended that the beam deflection be limited to less than ½ inch at the elevation of the adjacent offsite foundation, and no deflection at all if deflections will damage existing structures. The allowable deflection is dependent on many factors, such as the presence of structures and utilities near the top of the embankment, and will be assessed and designed by the project shoring engineer.

8.20.24 Because of the depth of the excavation, some means of monitoring the performance of the shoring system is suggested. The monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of all soldier piles and the lateral movement along the entire lengths of selected soldier piles.

8.20.25 Due to the depth of the depth of the excavation and proximity to adjacent structures, it is suggested that prior to excavation the existing improvements be inspected to document the present condition. For documentation purposes, photographs should be taken of preconstruction distress conditions and level surveys of adjacent grade and pavement should be considered. During excavation activities, the adjacent structures and pavement should be periodically inspected for signs of distress. In the even that distress or settlement is noted, an investigation should be performed and corrective measures taken so that continued or worsened distress or settlement is mitigated. Documentation and monitoring of the offsite structures and improvements is not the responsibility of the geotechnical engineer.

8.21 Temporary Tie-Back Anchors

8.21.1 Temporary tie-back anchors may be used with the solider pile wall system to resist lateral loads. Post-grouted friction anchors are recommended. For design purposes, it may be assumed that the active wedge adjacent to the shoring is defined by a plane drawn 35 degrees with the vertical through the bottom plane of the excavation. Friction anchors should extend a minimum of 20 feet beyond the potentially active wedge and to greater lengths if necessary to develop the desired capacities. The locations and depths of all offsite utilities should be thoroughly checked and incorporated into the drilling angle design for the tie-back anchors.

8.21.2 The capacities of the anchors should be determined by testing of the initial anchors as outlined in a following section. Only the frictional resistance developed beyond the active wedge would be effective in resisting lateral loads. Anchors should be placed at least 6 feet on center to be considered isolated. For preliminary design purposes, it is estimated that drilled friction anchors constructed without utilizing post-grouting techniques will develop average skin frictions as follows:

- 10 feet below the top of the excavation – 1,500 pounds per square foot
- 30 feet below the top of the excavation – 3,000 pounds per square foot
- 50 feet below the top of the excavation – 3,900 pounds per square foot
- 70 feet below the top of the excavation – 4,500 pounds per square foot

8.21.3 Only the frictional resistance developed beyond the active wedge should be utilized in resisting lateral loads.

8.22 Anchor Installation

8.22.1 Tied-back anchors are typically installed between 20 and 40 degrees below the horizontal; however, occasionally alternative angles are necessary to avoid existing improvements and utilities. The locations and depths of all offsite utilities should be thoroughly checked prior to design and installation of the tie-back anchors. Caving of the anchor shafts, particularly within sand and gravel deposits or seepage zones, should be anticipated during installation and provisions should be implemented in order to minimize such caving. It is suggested that hollow-stem auger drilling equipment be used to install the anchors. The anchor shafts should be filled with concrete by pumping from the tip out, and the concrete should extend from the tip of the anchor to the active wedge. In order to minimize the chances of caving, it is recommended that the portion of the anchor shaft within the active wedge be backfilled with sand before testing the anchor. This portion of the shaft should be filled tightly and flush with the face of the excavation. The sand backfill should be placed by pumping; the sand may contain a small amount of cement to facilitate pumping.

8.23 Anchor Testing

8.23.1 All of the anchors should be tested to at least 150 percent of design load. The total deflection during this test should not exceed 12 inches. The rate of creep under the 150 percent test load should not exceed 0.1 inch over a 15-minute period in order for the anchor to be approved for the design loading.

8.23.2 At least ten percent of the anchors should be selected for "quick" 200 percent tests and three additional anchors should be selected for 24-hour 200 percent tests. The purpose of the 200 percent tests is to verify the friction value assumed in design. The anchors should be tested to develop twice the assumed friction value. These tests should be performed prior to installation of additional tiebacks. Where satisfactory tests are not achieved on the initial anchors, the anchor diameter and/or length should be increased until satisfactory test results are obtained.

8.23.3 The total deflection during the 24-hour 200 percent test should not exceed 12 inches. During the 24-hour tests, the anchor deflection should not exceed 0.75 inches measured after the 200 percent test load is applied.

8.23.4 For the "quick" 200 percent tests, the 200 percent test load should be maintained for 30 minutes. The total deflection of the anchor during the 200 percent quick tests should not exceed 12 inches; the deflection after the 200 percent load has been applied should not exceed 0.25 inch during the 30-minute period.

8.23.5 After a satisfactory test, each anchor should be locked-off at the design load. This should be verified by rechecking the load in the anchor. The load should be within 10 percent of the design load. A representative of this firm should observe the installation and testing of the anchors.

8.24 Internal Bracing

8.24.1 Rakers may be utilized to brace the soldier piles in lieu of tieback anchors. The raker bracing could be supported laterally by temporary concrete footings (deadmen) or by the permanent, interior footings. For design of such temporary footings or deadmen, poured with the bearing surface normal to rakers inclined at 45 degrees, a bearing value of 6,000 psf may be used, provided the shallowest point of the footing is at least 1 foot below the lowest adjacent grade. The structural engineer should review the shoring plans to determine if raker footings conflict with the structural foundation system. The client should be aware that the utilization of rakers could significantly impact the construction schedule do to their intrusion into the construction site and potential interference with equipment.

8.25 Surcharge from Adjacent Structures and Improvements

8.25.1 Additional pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures and should be designed for each condition as the project progresses.

8.25.2 It is recommended that line-load surcharges from adjacent wall footings, use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.20 \times \left(\frac{z}{H}\right)}{\left[0.16 + \left(\frac{z}{H}\right)^2\right]^2} \times \frac{Q_L}{H}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.28 \times \left(\frac{x}{H}\right)^2 \times \left(\frac{z}{H}\right)}{\left[\left(\frac{x}{H}\right)^2 + \left(\frac{z}{H}\right)^2\right]^2} \times \frac{Q_L}{H}$$

where x is the distance from the face of the excavation or wall to the vertical line-load, H is the distance from the bottom of the footing to the bottom of excavation or wall, z is the depth at which the horizontal pressure is desired, Q_L is the vertical line-load and $\sigma_{H(z)}$ is the horizontal pressure at depth z.

8.25.3 It is recommended that vertical point-loads, from construction equipment outriggers or adjacent building columns use horizontal pressures generated from NAV-FAC DM 7.2. The governing equations are:

$$For\ {}^{x}/_{H} \leq 0.4$$

$$\sigma_H(z) = \frac{0.28 \times \left(\frac{z}{H}\right)^2}{\left[0.16 + \left(\frac{z}{H}\right)^2\right]^3} \times \frac{Q_P}{H^2}$$

and

$$For\ {}^{x}/_{H} > 0.4$$

$$\sigma_H(z) = \frac{1.77 \times \left(\frac{x}{H}\right)^2 \times \left(\frac{z}{H}\right)^2}{\left[\left(\frac{x}{H}\right)^2 + \left(\frac{z}{H}\right)^2\right]^3} \times \frac{Q_P}{H^2}$$

then

$$\sigma'_H\,(z) = \sigma_H(z) cos^2(1.1\theta)$$

where x is the distance from the face of the excavation/wall to the vertical point-load, H is distance from the outrigger/bottom of column footing to the bottom of excavation, z is the depth at which the horizontal pressure is desired, Q_p is the vertical point-load, $\sigma_H(z)$ is the horizontal pressure at depth z, θ is the angle between a line perpendicular to the excavation/wall and a line from the point-load to location on the excavation/wall where the surcharge is being evaluated, and $\sigma_H(z)$ is the horizontal pressure at depth z.

8.26 Surface Drainage

8.26.1 Proper surface drainage is critical to the future performance of the project. Uncontrolled infiltration of irrigation excess and storm runoff into the soils can adversely affect the performance of the planned improvements. Saturation of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the original designed engineering properties. Proper drainage should be maintained at all times.

8.26.2 All site drainage should be collected and controlled in non-erosive drainage devices. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. The site should be graded and maintained such that surface drainage is directed away from structures in accordance with 2016 CBC 1804.4 or other applicable standards. In addition, drainage should not be allowed to flow uncontrolled over any descending slope. Discharge from downspouts, roof drains and scuppers are not recommended onto unprotected soils within five feet of the building perimeter. Planters which are located adjacent to foundations should be sealed to prevent moisture intrusion into the soils providing foundation support. Landscape irrigation is not recommended within 5 feet of the building perimeter footings except when enclosed in protected planters.

8.26.3 Positive site drainage should be provided away from structures, pavement, and the tops of slopes to swales or other controlled drainage structures. The building pad and pavement areas should be fine graded such that water is not allowed to pond.

8.26.4 Landscaping planters immediately adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Either a subdrain, which collects excess irrigation water and transmits it to drainage structures, or an impervious above-grade planter boxes should be used. In addition, where landscaping is planned adjacent to the pavement, it is recommended that consideration be given to providing a cutoff wall along the edge of the pavement that extends at least 12 inches below the base material.

8.27 Plan Review

8.27.1 Grading, foundation, and shoring plans should be reviewed by the Geotechnical Engineer (a representative of Geocon West, Inc.), prior to finalization to verify that the plans have been prepared in substantial conformance with the recommendations of this report and to provide additional analyses or recommendations.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon West, Inc. should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon West, Inc.

2. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

3. The findings of this report are valid as of the date of this report. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

4. The firm that performed the geotechnical investigation for the project should be retained to provide testing and observation services during construction to provide continuity of geotechnical interpretation and to check that the recommendations presented for geotechnical aspects of site development are incorporated during site grading, construction of improvements, and excavation of foundations. If another geotechnical firm is selected to perform the testing and observation services during construction operations, that firm should prepare a letter indicating their intent to assume the responsibilities of project geotechnical engineer of record. A copy of the letter should be provided to the regulatory agency for their records. In addition, that firm should provide revised recommendations concerning the geotechnical aspects of the proposed development, or a written acknowledgement of their concurrence with the recommendations presented in our report. They should also perform additional analyses deemed necessary to assume the role of Geotechnical Engineer of Record.

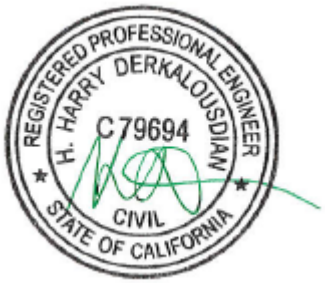
Dear Mr. Johnson:

In accordance with your authorization of our proposal dated August 29, 2013, we have prepared this geotechnical investigation report for the proposed 1st and Broadway Civic Center Park to be located at 217 West 1st Street in Los Angeles, California. The accompanying report presents the findings of our study, and our conclusions and recommendations pertaining to the geotechnical aspects of proposed design and construction. Based on the results of our investigation, it is our opinion that the site can be developed as proposed provided the recommendations in this report are followed and implemented during design and construction.



If you have any questions regarding this report, or if we may be of further service, please contact the undersigned.

Very truly yours,

GEOCON WEST, INC.

GEOTECHNICAL INVESTIGATION

1. PURPOSE AND SCOPE

This report presents the results of a geotechnical investigation for the proposed 1st and Broadway Civic Center Park to be located at 217 West 1st Street in Los Angeles, California (see Vicinity Map, Figure 1). The purpose of the investigation was to evaluate subsurface soil and geologic conditions underlying the site and based on conditions encountered to provide conclusions and recommendations pertaining to the geotechnical aspects of proposed design and construction.

The scope of our investigation included a site reconnaissance, field exploration, laboratory testing, engineering analysis, and the preparation of this report. The site was explored on October 3 and 4, 2013 by excavating three 8-inch diameter borings utilizing a truck-mounted hollow-stem auger drilling machine. The borings were each excavated to depths of 60½ feet below the existing ground surface. Boring HSA-1 is located approximately 11 feet from the southwest property line along West 1st Street and approximately 160 feet from the northwest property line along North Broadway. Boring HSA-2 is located approximately 21 feet from the northeast property line and approximately 93 feet from the northwest property line along North Broadway. Boring HSA-3 is located approximately 30 feet from the northeast property line and approximately 26 feet from the southeast property line along South Spring Street. The approximate locations of the exploratory borings are depicted on the Site Plan (see Figure 2). A detailed discussion of the field investigation, including boring logs, is presented in Appendix A.

Laboratory tests were performed on selected soil samples obtained during the investigation to determine pertinent physical and chemical soil properties. Appendix B presents a summary of the laboratory test results.

The recommendations presented herein are based on analysis of the data obtained during the investigation and our experience with similar soil and geologic conditions. References reviewed to prepare this report are provided in the *List of References* section.

If project details vary significantly from those described above, Geocon should be contacted to determine the necessity for review and possible revision of this report.

2. SITE AND PROJECT DESCRIPTION

The subject site is located at 217 West 1st Street in Los Angeles, California. The site consists of an approximately 1.96-acre rectangular-shaped parcel which is currently occupied by an existing subterranean parking structure (Structure A) that extends to depths of approximately 34 feet below the existing ground surface, a partially demolished building with a basement level (Structure B) that is anticipated to extend to depths of approximately 25 feet below the existing ground surface, vacant dirt lots, an asphalt paved parking lot, and a concrete ramp with corresponding retaining walls descending from Broadway to the basement of the partially demolished building (see Site Plan and Cross-Sections, Figures 2 and 4). The site is bounded by a

park, concrete driveway and a single-story structure to the northeast; by North Spring Street to the southeast; by West 1st Street to the southwest; and by North Broadway to the northwest. The site is gently sloping to the south with approximately 19 feet of vertical relief across the site. Additionally, there is a small southwest-facing to southeast-facing slope adjacent to the southwestern and southeastern property line, and a small southwestern-facing slope adjacent to the concrete ramp along the northern portion of the site. The slope heights range between 6 and 8 feet, with slope gradients of 2½:1(horizontal to vertical) or flatter. Surface water drainage at the site appears to be by sheet flow along the existing ground contours towards the city streets. Vegetation on the site consists of grasses, shrubs and trees located around the perimeters of the building footprints and in the unpaved portions of the site.

Information concerning the proposed development was furnished by the client. It is our understanding that the proposed project consists of demolishing the existing site structures, backfilling the resulting excavations with site soils and imported soils, and constructing a park at or near the ground surface. The configuration of the proposed park is preliminary at this time; however, it is anticipated to include a small single-story building, shade structures, landscaping, walkways, paving, and light poles. It is unknown at this time where the proposed small single-story building will be located on site; therefore, all engineered fill on site shall be compacted to be primary structural fill. Due to the preliminary nature of the design at this time, it has been estimated that column loads for proposed structures may be up to 50 kips and wall loads may be up to 2 kips per linear foot.

As-built plans of the existing Structure A indicate that the depth to the bottom of the deepest foundation is approximately 34 feet below the ground surface. As-built plans for the existing Structure B were not available, but the subterranean portion is assumed to be two-stories below the existing ground surface. Demolition and removal of the subterranean portions of these structures will require special excavation measures in order to maintain lateral support of adjacent sidewalks, streets, and existing improvements.

Once the design phase and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Any changes in the design, location or elevation of any structure, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

3. GEOLOGIC SETTING

The site is located along the southern edge of the Elysian Park Hills. The Elysian Park – Repetto Hills area consist of a series northwest/southeast-trending uplifted hills situated along the northeast edge of the Los Angeles Basin. The Los Angeles River flows along a flood plain channel between the Elysian Park Hills and the Repetto Hills flowing southward into the Los Angeles Basin. The Arroyo Seco flows through the Repetto Hills just south of Mt. Washington and joins the Los Angeles River near the southeastern edge of the Elysian Park Hills. The Elysian Park Hills and the Repetto Hills are predominantly composed of uplifted Pliocene to Miocene Age soft sedimentary bedrock incised by elevated flood plain and uplifted alluvial valley deposits. The site is shown with respect to local and regional geologic features on Figure 3, Local Geologic Map.

4. GEOLOGIC MATERIALS

Based on our field investigation and published geologic maps of the area, the site is underlain by artificial fill over Holocene Age alluvial deposits consisting of varying amounts of sand, silt, and gravel (Lamar, 1970). These Holocene Age sediments are underlain by sedimentary bedrock units of the Pliocene Age Fernando Formation (Lamar, 1970). Detailed stratigraphic profiles of our site explorations are provided on the Boring Logs in Appendix A. Geologic cross-sections are provided on Figure 4, Geologic Sections A-A' & B-B'.

4.1 Artificial Fill

Between 2 and 14 feet of artificial fill was encountered during the site exploration with the thickest accumulations in the vicinity of HSA-1. The artificial fill generally consists of brown to yellowish brown silty sand and sandy silt with various amounts of gravel and construction debris. The artificial fill is characterized as slightly moist and loose or soft to firm, and is likely the result of past grading and or construction activities at the site. Deeper fill may exist between excavations and in other portions of the site that were not directly explored.

4.2 Alluvium

The artificial fill is underlain by relatively flat-lying Holocene age alluvial deposits. The alluvium was observed in our field exploration at depths between 2 and 23 feet below the existing ground surface. The alluvium generally consists of approximately 9 to 10 feet of yellowish brown to olive brown sandy silt, sandy clay and clay underlain by approximately 8 to 9 feet of silty sand and poorly graded to well graded sand with varied amounts of gravel and cobbles. The soils are primarily moist, medium dense to dense or firm to stiff, and become denser with increased depth. The soils likely represent interlayered stream channel and flood plain sediments deposited by the ancestral Los Angeles River.

4.3 Fernando Formation

The artificial fill and alluvium are underlain by sedimentary bedrock units of the Pliocene Age Fernando Formation (Lamar, 1970). The Fernando Formation was encountered in our field exploration at depths ranging between 20 and 23 feet below the existing ground surface. As observed during our field investigation, the bedrock mainly consists of olive brown to dark brownish gray, poorly-bedded, massive siltstone. The bedrock is highly weathered, slightly fractured and soft. Based on our review of available geologic maps, the bedrock underling the site generally strikes E-W to N85°E with dips of 65° to 75° to the south (Lamar, 1970 & Dibblee 1989).

5. GROUNDWATER

Based on a review of the Seismic Hazard Zone Report for the Los Angeles 7.5 Minute Quadrangle, Los Angeles County, California (California Division of Mines and Geology, 1998), the historically highest groundwater level in the area is inferred to be approximately 25 feet beneath the ground surface. Groundwater information presented in this document is generated from data collected in the early 1900's to the late 1990's. Based on current groundwater basin management practices, it is unlikely that groundwater levels will ever reach the historic high levels.

Groundwater seepage was encountered just above the bedrock contact in borings HSA-2 and HSA-3 at depths of 19.8 and 21.0 feet below the ground surface, respectively. It is our opinion that the groundwater seepage encountered does not represent the static groundwater table, but rather exists in discontinuous perched zones within the saturated granular soils overlying the relatively impermeable clayey siltstone bedrock units across the site. It is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially in impermeable fine-grained soils or bedrock which are heavily irrigated or after seasonal rainfall. In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the region. Proper surface drainage of irrigation and precipitation will be critical for future performance of the project. Recommendations for drainage are provided in the S*urface Drainage* section of this report (see Section 7.24).

6. GEOLOGIC HAZARDS

6.1 Faulting

The numerous faults in Southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the CGS (California Geological Survey, formerly known as the California Division of Mines and Geology [CDMG]) for the Alquist-Priolo Earthquake Fault Zone Program (Bryant and Hart, 2007). By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years), but has had no known Holocene movement. Faults that have not moved in the last 1.6 million years are considered inactive.

The site is not within a currently established Alquist-Priolo Earthquake Fault Zone for surface fault rupture hazards (Bryant and Hart, 2007). No active or potentially active faults with the potential for surface fault rupture are known to pass directly beneath the site. Therefore, the potential for surface rupture due to faulting occurring beneath the site during the design life of the proposed development is considered low. The site, however, is located in the seismically active Southern California region, and could be subjected to moderate to strong ground shaking in the event of an earthquake on one of the many active Southern California faults. The faults in the vicinity of the site are shown in Figure 5, Regional Fault Map.

The closest fault with the potential for surface fault rupture is the active Hollywood fault located approximately 4.5 miles north of the site (Ziony and Jones, 1989). Other nearby active faults are the Raymond fault, the Verdugo fault, the Newport-Inglewood fault zone, the Santa Monica fault, and the Sierra Madre fault located 5.2 miles north-northeast (CDMG, 1977), 6.5 miles north, 7.0 miles west-southwest, 10½ miles southeast, and 10½miles north-northeast of the site, respectively (Ziony and Jones, 1989). The active San Andreas Fault zone is located approximately 34 miles northeast of the site.

The closest potentially active fault to the site is the MacArthur Park Fault located approximately 0.6 miles to the southwest (Jennings and Bryant, 2010). Other nearby potentially active faults are the Coyote Pass Fault, the Overland Fault, and the Charnock Fault located 2.1 miles southeast, 9.4 miles southwest, and 10.4 miles southwest of the site, respectively (Ziony and Jones, 1989).

Several buried thrust faults, commonly referred to as blind thrusts, underlie the Los Angeles Basin at depth. These faults are not exposed at the ground surface and are typically identified at depths greater than 3.0 kilometers. The October 1, 1987 M_w 5.9 Whittier Narrows earthquake, and the January 17, 1994 M_w 6.7 Northridge earthquake were a result of movement on the buried thrust faults. The site is located within the vertical projection of the Los Angeles segment of the Puente Hills Blind Thrust Fault and the Elysian Park Blind Thrust Fault. These thrust faults are not exposed at the surface and do not present a potential surface fault rupture hazard; however, these active features are capable of generating future earthquakes.

6.2 Seismicity

As with all of Southern California, the site has experienced historic earthquakes from various regional faults. The seismicity of the region surrounding the site was formulated based on research of an electronic database of earthquake data. The epicenters of recorded earthquakes with magnitudes equal to or greater than 4.0 within a radius of 60 miles of the site are depicted on Figure 6, Regional Seismicity Map. A partial list of earthquakes of moderate to major magnitude that have occurred in the Southern California area within the last 100 years is included in the following table.

LIST OF HISTORIC EARTHQUAKES

Earthquake (Oldest to Youngest)	Date of Earthquake	Magnitude	Distance to Epicenter (Miles)	Direction to Epicenter
San Jacinto-Hemet area	April 21, 1918	6.8	74	ESE
Near Redlands	July 23, 1923	6.3	57	E
Long Beach	March 10, 1933	6.4	34	SSE
Tehachapi	July 21, 1952	7.5	79	NW
San Fernando	February 9, 1971	6.6	26	NNW
Whittier Narrows	October 1, 1987	5.9	10	E
Sierra Madre	June 28, 1991	5.8	20	NE
Landers	June 28, 1992	7.3	104	E
Big Bear	June 28, 1992	6.4	82	E
Northridge	January 17, 1994	6.7	20	NW
Hector Mine	October 16, 1999	7.1	119	NE

The site could be subjected to strong ground shaking in the event of an earthquake. However, this hazard is common in Southern California and the effects of ground shaking can be mitigated if the proposed structures are designed and constructed in conformance with current building codes and engineering practices.

6.3 Estimation of Peak Ground Accelerations

The seismic exposure of the site may be investigated in two ways. The deterministic approach recognizes the Maximum Earthquake, which is the theoretical maximum event that could occur along a fault. The deterministic method assigns a maximum earthquake to a fault derived from formulas that correlate the length and other characteristics of the fault trace to the theoretical maximum magnitude earthquake. The

probabilistic method considers the probability of exceedance of various levels of ground motion and is calculated by consideration of risk contributions from regional faults.

6.3.1 Deterministic Analysis

Table 1 shows known faults within a 60 mile radius of the site. The maximum earthquake magnitude is indicated for each fault. In order to measure the distance of known faults to the site, the computer program *EQFAULT*, (Blake, 2000), was utilized. Principal references used within *EQFAULT* in selecting faults to be included are Jennings (1994), Anderson (1984) and Wesnousky (1986). For this investigation, the ground motion generated by maximum earthquakes on each of the faults is assumed to attenuate to the site per the attenuation relation by Sadigh et al. (1997). The resulting calculated peak horizontal accelerations at the site are shown on Table 1. These values are one standard deviation above the mean.

Using this methodology, the maximum earthquake resulting in the highest peak horizontal accelerations at the site would be a magnitude 6.4 event on the Upper Elysian Park Blind Thrust Fault. Such an event would be expected to generate peak horizontal accelerations at the site of 0.857g.

While listing of peak accelerations is useful for comparison of potential effects of fault activity in a region, other considerations are important in seismic design, including the frequency and duration of motion and the soil conditions underlying the site.

The site could be subjected to moderate to severe ground shaking in the event of a major earthquake on any of the faults referenced above or other faults in Southern California. With respect to seismic shaking, the site is considered comparable to the surrounding developed area.

6.3.2 Probabilistic Analysis

The computer program *FRISKSP* (Blake, 2000) was used to perform a site-specific probabilistic seismic hazard analysis. The program is a modified version of FRISK (McGuire, 1978) that models faults as lines to evaluate site-specific probabilities of exceedance of given horizontal accelerations for each line source. Geologic parameters not included in the deterministic analysis are included in this analysis. The program operates under the assumption that the occurrence rate of earthquakes on each mapped Quaternary Fault is proportional to the fault's slip rate. The program accounts for fault rupture length as a function of earthquake magnitude, and site acceleration estimates are made using the earthquake magnitude and closest distance from the site to the rupture zone.

Uncertainty in each of following are accounted for: (1) earthquake magnitude, (2) rupture length for a given magnitude, (3) location of the rupture zone, (4) maximum magnitude of a given earthquake, and (5) acceleration at the site from a given earthquake along each fault.

After calculating the expected accelerations from all earthquake sources, the program then calculates the total average annual expected number of occurrences of the site acceleration greater than a specified value. Attenuation relationships suggested by Sadigh et al. (1997) were utilized in the analysis.

The Maximum Considered Earthquake Ground Motion (MCE) is the level of ground motion that has a 2 percent chance of exceedance in 50 years, with a statistical return period of 2,500 years. According to 2011 Los Angeles Building Code and ASCE 7-05, the MCE is to be utilized for the design of critical structures such as schools and hospitals. The Design-Basis Earthquake Ground Motion (DBE) is the level of ground motion that has a 10 percent chance of exceedance in 50 years, with a statistical return period of 475 years. The DBE is typically used for the design of non-critical structures.

Based on the computer program *FRISKSP* (Blake, 2000), the MCE and DBE is expected to generate ground motions at the site of approximately 0.93g and 0.59g, respectively. Graphical representation of the analysis is presented on Figure 7.

6.4 Seismic Design Criteria

The following table summarizes site-specific design criteria obtained from the 2011 Los Angeles Building Code (LABC; Based on the 2009 International Building Code [IBC]), Chapter 16 Structural Design, Section 1613 Earthquake Loads. The values were derived using the computer program Seismic Hazard Curves and Uniform Hazard Response Spectra, provided by the USGS. The short spectral response uses a period of 0.2 second.

LABC SEISMIC DESIGN PARAMETERS

Parameter	Value	2011 LABC Reference
Site Class	D	Table 1613.5.2
Spectral Response – Class B (short), S_S	2.193g	Figure 1613.5(3)
Spectral Response – Class B (1 sec), S_1	0.738g	Figure 1613.5(4)
Site Coefficient, F_a	1.0	Table 1613.5.3(1)
Site Coefficient, F_v	1.5	Table 1613.5.3(2)
Maximum Considered Earthquake Spectral Response Acceleration (short), S_{MS}	2.193g	Section 1613.5.3 (Eqn 16-36)
Maximum Considered Earthquake Spectral Response Acceleration – (1 sec), S_{M1}	1.106g	Section 1613.5.3 (Eqn 16-37)
5% Damped Design Spectral Response Acceleration (short), S_{DS}	1.462g	Section 1613.5.4 (Eqn 16-38)
5% Damped Design Spectral Response Acceleration (1 sec), S_{D1}	0.738g	Section 1613.5.4 (Eqn 16-39)

Conformance to the criteria in the previous table for seismic design does not constitute any kind of guarantee or assurance that significant structural damage or ground failure will not occur if a large earthquake occurs. The intent of the code is “Life Safety,” not to completely prevent damage to the structure, since such design may be economically prohibitive.

6.5 Liquefaction Potential

Liquefaction is a phenomenon in which loose, saturated, relatively cohesionless soil deposits lose shear strength during strong ground motions. Primary factors controlling liquefaction include intensity and duration of ground motion, gradation characteristics of the subsurface soils, in-situ stress conditions, and the depth to groundwater. Liquefaction is typified by a loss of shear strength in the liquefied layers due to rapid increases in pore water pressure generated by earthquake accelerations.

The current standard of practice, as outlined in the "Recommended Procedures for Implementation of DMG Special Publication 117A, Guidelines for Analyzing and Mitigating Liquefaction in California" requires liquefaction analysis to a depth of 50 feet below the lowest portion of the proposed structure. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

According to the County of Los Angeles Seismic Safety Element (Leighton, 1990) and the City of Los Angeles Seismic Safety Element (1996), the subject property is not located within an area identified as having a potential for liquefaction. However, a review of the State of California Seismic Hazard Zone, Los Angeles Quadrangle Map (CDMG, 1999) indicates that the site is situated within an area identified as having a potential for liquefaction. The site is presented with respect to areas identified by the state as having a potential for liquefaction on Figure 8, Seismic Hazard Zone Map.

As discussed in Section 5.0, the historic high groundwater is inferred to be about 25 feet below the ground surface. Our borings encountered Pliocene Age bedrock consisting of well consolidated siltstone between 20 and 23 feet below ground surface. Due to the nature of the project and the requirement for placement of engineered backfill, a large portion of the site will consist of newly placed engineered fill. Neither bedrock nor engineered fill are considered to be liquefiable. Also, the alluvium at depths where water seepage was encountered is not considered to be liquefiable due to the dense nature of the alluvium. Based on these considerations, it is our opinion that the potential for liquefaction and associated ground deformations beneath the site is considered to be low, and no surface manifestations of liquefaction are expected at the subject site.

6.6 Seismically-Induced Settlement

Dynamic compaction of dry and loose sands may occur during a major earthquake. Typically, settlements occur in thick beds of such soils. The soils underlying the site consist predominantly of silt and sand that is generally dense to very dense and well consolidated. Future grading will consist of the placement and compacted of engineered fill. Based on these conditions, appreciable seismically-induced settlements are not anticipated subsequent to the recommended grading.

6.7 Slope Stability

According to the Los Angeles County Seismic Safety Element (Leighton, 1990), the site is not within an area identified as having a potential for slope instability. Additionally, a review of the State of California Seismic Hazard Zone, Los Angeles Quadrangle Map (CDMG, 1999) indicates that the site is not within an area identified as having a potential for seismic slope instability. The site and surrounding vicinity is relatively flat to gently sloping to the south. There are no known landslides near the site, nor is the site in the path of any known or potential landslides. Therefore, the potential for slope stability hazards to adversely affect the proposed development is considered low.

6.8 Earthquake-Induced Flooding

Earthquake-induced flooding is inundation caused by failure of dams or other water-retaining structures due to earthquakes. Review of the Los Angeles County Seismic Safety Element (Leighton, 1990), indicates that the site is not located within an inundation boundary. The probability of earthquake-induced inundation is considered very low.

6.9 Tsunamis, Seiches and Flooding

The site is not located within a coastal area. Therefore, tsunamis, seismic sea waves, are not considered a significant hazard at the site.

Seiches are large waves generated in enclosed bodies of water in response to ground shaking. No major water-retaining structures are located immediately up gradient from the project site. Flooding from a seismically-induced seiche is considered unlikely.

The site is in an area of minimal flooding potential (Zone X) as defined by the Federal Emergency Management Agency (FEMA, 2013).

6.10 Oil Fields & Methane

Based on a review of the California Division of Oil, Gas and Geothermal Resources (DOGGR) Oil and Gas Well Location Map W1-5, Sheet 119, the site is not located within the boundaries of an oil field. No oil wells are located in the immediate vicinity of the site. However, due to the voluntary nature of record reporting by the oil well drilling companies, wells may be improperly located or not shown on the location map. Undocumented wells could be encountered during construction. Any wells encountered will need to be properly abandoned in accordance with the current requirements of the DOGGR.

The site is not located within the boundaries of a methane zone or a methane buffer zone, as defined by the City of Los Angeles (2004).

6.11 Subsidence

Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils that are particularly subject to subsidence include those with high silt or clay content. The site is not located within an area of known ground subsidence. No large-scale extraction of groundwater, gas, oil, or geothermal energy is occurring or planned at the site. There appears to be little or no potential for ground subsidence due to withdrawal of fluids or gases at the site.

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 General

7.1.1 It is our opinion that neither soil nor geologic conditions were encountered during the investigation that would preclude the construction of the proposed development provided the recommendations presented herein are followed and implemented during design and construction.

7.1.2 Up to 14 feet of existing artificial fill was encountered during site exploration. The existing fill encountered is believed to be the result of past grading and construction activities at the site. Deeper fill may exist in other areas of the site that were not directly explored. The existing fill soils in their present condition are not considered suitable for support of proposed foundations or additional fill; however, the existing fill soils are suitable for re-use as engineered fill provided the recommendations in the *Grading* section of this report are followed (see Section 7.5).

7.1.3 As-built plans of the existing Structure A indicate that the depth to the bottom of the deepest foundation is approximately 34 feet below the ground surface. As-built plans for the existing Structure B were not available, but the subterranean portion is assumed to be two-stories below the existing ground surface. Due to the depth of the excavation and the proximity to the property lines, city streets, and adjacent improvements, excavation and demolition of the subterranean portions of Structures A and B will require sloping and shoring measures in order to maintain a stable excavation. Where shoring is required, it is recommended that a soldier pile shoring system with tie-backs be utilized. Where excavation depths exceed 12 feet or surcharges are imposed on the shoring system, tie-back anchors may be required in conjunction with the soldier piles. Acceptable shoring deflections should be limited to ½-inch. Recommendations for shoring are provided in Section 7.19 of this report.

7.1.4 As an alternative to completely removing the existing subterranean structures, it is considered acceptable to allow the existing perimeter walls and slab-on-grade to remain. The existing perimeter subterranean walls of the structure can be braced and utilized as the temporary shoring system during demolition and backfill. This can be accomplished by bracing the existing perimeter wall with tiebacks, soldier piles, or any combination thereof, to maintain the necessary lateral support. The design of the temporary lateral support components and their connection to the existing perimeter wall should be provided by a qualified Structural Engineer and/or Shoring Engineer.

7.1.5 If the existing slab-on-grade in the lowest portion of the subterranean level is to remain it must be punctured to prevent the accumulation and ponding of water on the slab surface. Therefore, it is recommended that slab be punctured every ten feet on center in each direction (using a typical Hydraulic hammer or breaker) prior to placing any backfill.

7.1.6 Groundwater seepage was encountered just above the bedrock contact in borings HSA-2 and HSA-3 at depths of 19.8 and 21.0 feet below the ground surface, respectively. It is our opinion that the groundwater seepage encountered does not represent the static groundwater table, but rather exists in discontinuous perched zones within the saturated granular soils overlying the relatively impermeable clayey siltstone bedrock units across the site. Groundwater will likely be encountered during demolition and construction activities, and temporary dewatering measures will be required to mitigate groundwater seepage. Recommendations for temporary dewatering are discussed in Section 7.2 of this report.

7.1.7 Once the existing structures have been demolished and removed from the site, the void created by the excavations will be backfilled with site soils or approved import soils. Parameters for suitable import soils are provided in the *Grading* section of this report (see Section 7.5).

7.1.8 Subsequent to demolition and completion of backfilling activities a conventional foundation system may be utilized for support of proposed structures and improvements provided foundations derive support in the newly placed engineered fill. As a minimum, all existing fill materials shall be over-excavated to suitable, undisturbed natural soil and replaced with engineered fill. The site shall be over-excavated to a depth of 5 feet below existing site grade or to a depth of 3 feet below the bottom of proposed footings, whichever is deeper, and replaced with engineered fill. The excavation for building pad areas should extend laterally a minimum distance of 5 feet beyond the building footprint area or for a distance equal to the depth of fill below the foundation, whichever is greater. Recommendations for earthwork are provided in the *Grading* section of this report (see Section 7.5).

7.1.9 Proposed light poles or monument signs may be supported on a deepened foundation system consisting of drilled cast-in-place concrete friction piles or end bearing piers deriving support in newly placed engineered fill and/or undisturbed alluvial soils. Recommendations for design and installation of deepened foundations are provided in the *Deepened Foundations* section of this report (see Section 7.8).

7.1.10 Foundations for small outlying structures, such as block walls less than 6 feet high, planter walls or trash enclosures, which will not be tied-in to the proposed structure, may be supported on conventional foundations bearing on a minimum of 12 inches of newly placed engineered fill. Where excavation and compaction cannot be performed, such as adjacent to property lines, foundations may bear in the undisturbed alluvial soil at or below a depth of 2 feet. If the soils

exposed in the excavation bottom are soft, over-excavation and re-compaction of the soft soils are required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative.

7.1.11 The configuration of the proposed park is preliminary at this time. Once the design and foundation loading configuration proceeds to a more finalized plan, the recommendations within this report should be reviewed and revised, if necessary. Based on the final foundation loading configurations, the potential for settlement should be re-evaluated by this office.

7.1.12 Any changes in the design, location or elevation, as outlined in this report, should be reviewed by this office. Geocon should be contacted to determine the necessity for review and possible revision of this report.

7.2 Temporary Dewatering

7.2.1 Groundwater seepage was encountered just above the bedrock contact in borings HSA-2 and HSA-3 at depths of 19.8 and 21.0 feet below the ground surface, respectively. It is our opinion that the groundwater seepage encountered does not represent the static groundwater table, but rather exists in discontinuous perched zones within the saturated granular soils overlying the relatively impermeable clayey siltstone bedrock units across the site. Excavation for the demolition of the subterranean level is anticipated to extend below the encountered groundwater seepage. Based on the conditions encountered at the time of exploration, groundwater will likely be encountered during construction activities. The depth to groundwater at the time of construction can be further verified during initial dewatering well or shoring pile installation. If groundwater is present above the depth of the lowest subterranean level, temporary dewatering will be necessary to maintain a safe working environment during excavation and construction activities.

7.2.2 It is recommended that a qualified dewatering consultant be retained to design the dewatering system. Temporary dewatering may consist of perimeter wells with interior well points as well as gravel filled trenches (French drains) placed adjacent to the shoring system and interior of the site. The number and locations of the wells or French drains can be adjusted during excavation activities as necessary to collect and control any encountered seepage. The French drains will then direct the collected seepage to a sump where it will be pumped out of the excavation.

7.2.3 The embedment of perimeter shoring piles should be deepened as necessary to take into account any required excavations necessary to place an adjacent French drain system should it be deemed necessary. It is not anticipated that a perimeter French drain will be more than 24 inches in depth below the proposed excavation bottom. The temporary French drain shall be removed prior to commencement of backfilling operations.

7.2.4 Appreciable settlement is not expected as a result of the temporary dewatering system.

7.3 Soil and Excavation Characteristics

7.3.1 The in-situ soils can be excavated using conventional excavation equipment. Caving should be anticipated in unshored excavations, especially where granular soils are encountered.

7.3.2 It is the responsibility of the contractor to ensure that all excavations and trenches are properly sloped, shored and maintained in accordance with applicable OSHA rules and regulations to maintain safety and maintain the stability of adjacent existing improvements.

7.3.3 All onsite excavations must be conducted in such a manner that potential surcharges from existing structures, construction equipment, and vehicle loads are resisted. The surcharge area may be defined by a 1:1 projection down and away from the bottom of an existing foundation or vehicle load. Penetrations below this 1:1 projection will require special excavation measures such as sloping and shoring. Excavation recommendations are provided in the *Temporary Excavations* section of this report (see Section 7.18).

7.3.4 The soils encountered during the investigation are variable and range from a "non-expansive" (EI=3) to "expansive" (EI=71) based on the 2011 Los Angeles Building Code (LABC) Section 1803.5.3. Recommendations presented herein assume that the future building foundations and slabs will derive support in these materials.

7.4 Minimum Resistivity, pH and Water-Soluble Sulfate

7.4.1 Potential of Hydrogen (pH) and resistivity testing, as well as chloride content testing, were performed on representative samples of on-site soil to generally evaluate the corrosion potential to surface utilities. The tests were performed in accordance with California Test Method Nos. 643 and 422 and indicate that a potential for corrosion of buried ferrous metals exists on site. The results are presented in Appendix B (Figure B7) and should be considered for design of improvements in contact with the site soils.

7.4.2 Laboratory tests were performed on one sample of the on-site soil to measure the percentage of water-soluble sulfate content. Results from the laboratory water-soluble sulfate tests are presented in Appendix B (Figure B7) and indicate that the on-site soil possess a "severe" sulfate exposure to concrete structures as defined by 2011 LABC Section 1904.3 and ACI 318-08 Section 4.2 and 4.3. Table 7.2 presents a summary of concrete requirements set forth by 2011 LABC Section 1904.3 and ACI 318-08 Section 4.2 and 4.3. The presence of water-soluble sulfates is not a visually discernible characteristic; therefore, other soil samples from the site could yield different concentrations. Additionally, over time landscaping activities (i.e., addition of fertilizers and other soil nutrients) may affect the concentration.

TABLE 7.2
REQUIREMENTS FOR CONCRETE EXPOSED TO SULFATE-CONTAINING SOLUTIONS

Sulfate Exposure	Water-Soluble Sulfate Percent by Weight	Cement Type	Maximum Water to Cement Ratio by Weight	Minimum Compressive Strength (psi)
Negligible	0.00-0.10	--	--	--
Moderate	0.10-0.20	II	0.50	4000
Severe	**0.20-2.00**	**V**	**0.45**	**4500**
Very Severe	> 2.00	V	0.45	4500

7.4.3 Geocon West, Inc. does not practice in the field of corrosion engineering and mitigation. If corrosion sensitive improvements are planned, it is recommended that a corrosion engineer be retained to evaluate corrosion test results and incorporate the necessary precautions to avoid premature corrosion of buried metal pipes and concrete structures in direct contact with the soils.

7.5 Grading

7.5.1 Earthwork should be observed, and compacted fill tested by representatives of Geocon West, Inc. The existing fill encountered during exploration is suitable for re-use as an engineered fill, provided any encountered oversize material (greater than 3 inches, maximum dimension) and any encountered deleterious debris are removed.

7.5.2 A preconstruction conference should be held at the site prior to the beginning of grading operations with the owner, contractor, civil engineer, and geotechnical engineer in attendance. Special soil handling requirements can be discussed at that time.

7.5.3 The existing concrete rubble generated during demolition may be crushed and blended into the soils that will be utilized as engineered fill. All imported soil intended for use as engineered fill shall be observed, tested, and approved by Geotechnical Engineer of Record prior to bringing soil to the site. The Geotechnical Engineer of Record shall be notified a minimum of three working days prior to scheduled importing of soil to project site. Rocks or concrete fragments larger than three inches in diameter (maximum dimension) shall not be used in the fill. Import soil shall be free of organic or inorganic debris and contamination. In order to achieve the geotechnical design values provided herein, the imported soil must meet the following soil parameters:

Cohesion: minimum of 200 psf (unless Phi Angle is greater than 33 degrees)
Phi Angle: minimum of 28 degrees
Expansion Index: less than 40

Water-Soluble Sulfate content: less than 0.10 percent (higher sulfate content will require special cement type)

Predominantly granular (minimum 80 percent passing No. 4 sieve and 35 percent or less passing the No. 200 sieve)

7.5.4 Grading should commence with the removal of all existing vegetation and existing improvements from the area to be graded. Deleterious debris such as wood and root structures should be exported from the site and should not be mixed with the fill soils. All existing underground improvements planned for removal should be completely excavated and the resulting depressions properly backfilled in accordance with the procedures described herein. Once a clean excavation bottom has been established it must be observed and approved in writing by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record) and the City of Los Angeles Grading Inspector.

7.5.5 As a minimum, it is recommended that the upper 5 feet of existing site soils in proposed building footprint areas be excavated, well blended, and properly compacted for foundation and slab support. Excavations should be conducted as necessary to remove all existing fill in building footprint areas at the direction of the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record). The excavation for building pad areas should extend laterally a minimum distance of 5 feet beyond the building footprint area or for a distance equal to the depth of fill below the foundation, whichever is greater.

7.5.6 All fill and backfill soils should be placed in horizontal loose layers approximately 6 to 8 inches thick, moisture conditioned to between 0 and 2 percent above optimum moisture content, and properly compacted. It is unknown at this time where the proposed structures will be located on site; therefore all engineered fill on site shall be compacted to be primary structural fill. Clayey fill soils (soils with 15 percent, or more, finer than 0.005 mm) placed shall be compacted to a minimum of 90 percent of the maximum dry density in accordance with ASTM D 1557 (latest edition). Fill soils with less than 15 percent finer than 0.005 mm shall be compacted to a minimum 95 percent of the maximum dry density in accordance with ASTM D 1557 (latest edition). It is important to note that the direct shear test (see Figure B3) was performed on a soil sample that was remolded to 90 percent of the maximum dry density. Compaction requirements during construction will require that soils be compacted to 95 percent of the maximum dry density; therefore, the results presented are considered to be conservative.

7.5.7 Where new surface paving is to be placed, it is recommended that all existing fill and soft or unsuitable alluvial soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all soft or unsuitable alluvial soils in the area of new paving is not required, however, paving constructed over existing unsuitable soils may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased

maintenance costs. As a minimum, the upper twelve inches of soil should be scarified, moisture conditioned to near optimum moisture content and properly compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

7.5.8 Foundations for small outlying structures, such as block walls less than 6 feet high, planter walls or trash enclosures, which will not be structurally supported by the proposed building, may be supported on conventional foundations bearing on a minimum of 12 inches of newly placed engineered fill which extends laterally at least 12 inches beyond the foundation area. Where excavation and proper compaction cannot be performed or is undesirable, foundations may derive support directly in the undisturbed alluvial soils found at or below a depth of 2 feet below the existing ground surface, and should be deepened as necessary to maintain a minimum 12 inch embedment into undisturbed alluvial soil. If the alluvial soil exposed in the excavation bottom is loose or disturbed, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative.

7.5.9 Utility trenches should be properly backfilled in accordance with the requirements of the Green Book (latest edition). The pipe should be bedded with clean sands (Sand Equivalent greater than 30) to a depth of at least one foot over the pipe, and the bedding material must be inspected and approved in writing by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record). The use of gravel is not acceptable unless used in conjunction with filter fabric to prevent the gravel from having direct contact with soil. The remainder of the trench backfill may be derived from onsite soil or approved import soil, compacted as necessary, until the required compaction is obtained. The use of minimum 2-sack Controlled Low Strength Material (CLSM) is also acceptable (see Section 7.6). Prior to placing any bedding materials or pipes, the excavation bottom must be observed and approved in writing by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record).

7.5.10 All trench and foundation excavation bottoms must be observed and approved in writing by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record), prior to placing bedding materials, fill, steel, gravel or concrete.

7.6 Controlled Low Strength Material (CLSM)

7.6.1 Controlled Low Strength Material (CLSM) may be utilized in lieu of compacted soil as engineered fill where approved in writing by the Geotechnical Engineer. Where utilized within the City of Los Angeles use of CLSM is subject to the following requirements:

Standard Requirements

1. CLSM shall be ready-mixed by a City of Los Angeles approved batch plant;
2. CLSM shall not be placed on uncertified fill, on incompetent natural soil, nor below water;

3. CLSM shall not be placed on a sloping surface with a gradient steeper than 5: 1 (horizontal to vertical);

4. Placement of the CLSM shall be under the continuous inspection of a concrete deputy inspector;

5. The excavation bottom shall be accepted by the soil engineer and the City Inspector prior to placing CLSM.

Requirements for CLSM that will be used for support of footings

1. The cement content of the CLSM shall not be less than 188 pounds per cubic yard (min. 2 sacks) with a water cement ratio of 0.5 or less;

2. The excavation bottom must be level, cleaned of loose soils and approved in writing by Geocon prior to placement of the CLSM;

3. The ultimate compressive strength of the CLSM shall be no less than 100 pounds per square inch when tested on the 28th-day per ASTM D4832 (latest edition), Standard Test Method for Preparation and Testing of Controlled Low Strength Material Test Cylinders. Compression testing will be performed in accordance with ASTM C39 and City of Los Angeles requirements;

4. Samples of the CLSM will be collected during placement, a minimum of one test (two cylinders) for each 50 cubic yards or fraction thereof;

5. Overexcavation for CLSM placement shall extend laterally beyond the footprint of any proposed footings as required for placement of compacted fill, unless justified otherwise by the soil engineer that footings will have adequate vertical and horizontal bearing capacity.

7.7 Foundation Design

7.7.1 Subsequent to the recommended grading, a conventional shallow foundation system may be utilized for support of the proposed single-story structure provided foundations derive support in the newly placed engineered fill.

7.7.2 Continuous footings may be designed for an allowable bearing capacity of 2,000 pounds per square foot, and should be a minimum of 18 inches in width, 18 inches in depth below the lowest adjacent grade.

7.7.3 Isolated spread foundations may be designed for an allowable bearing capacity of 2,300 pounds per square foot, and should be a minimum of 24 inches in width, 18 inches in depth below the lowest adjacent grade.

7.7.4 The allowable soil bearing pressure above may be increased by 300 psf and 600 psf for each additional foot of foundation width and depth, respectively, up to a maximum allowable soil bearing pressure of 4,000 psf.

7.7.5 The allowable bearing pressures for both continuous and isolated spread foundations may be increased by one-third for transient loads due to wind or seismic forces.

7.7.6 Continuous footings should be reinforced with a minimum of four No. 4 steel reinforcing bars, two placed near the top of the footing and two near the bottom. The reinforcement for isolated spread footings should be designed by the project structural engineer.

7.7.7 If depth increases are utilized for the exterior wall footings, this office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

7.7.8 The above foundation dimensions and minimum reinforcement recommendations are based on soil conditions and building code requirements only, and are not intended to be used in lieu of those required for structural purposes.

7.7.9 No special subgrade presaturation is required prior to placement of concrete. However, the moisture in the foundation subgrade should be sprinkled as necessary to maintain a moist condition at the time of concrete placement.

7.7.10 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record), prior to the placement of reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated. If unanticipated soil conditions are encountered, foundation modifications may be required.

7.7.11 This office should be provided a copy of the final construction plans so that the excavation recommendations presented herein could be properly reviewed and revised if necessary.

7.8 Deepened Foundations

7.8.1 A deepened foundation system consisting of drilled cast-in-place concrete friction piles or end bearing piers deriving support in undisturbed alluvial soils or newly placed engineered fill may be utilized for support of proposed light poles or monument signs. Piles should be a minimum of 18 inches in diameter, should be embedded a minimum of six feet in depth below the ground surface. If the excavation bottom is cleaned of all loose soils the end bearing properties of the soils may be utilized and foundation may be designed for an allowable bearing capacity of 3,000 pounds per square foot. The allowable soil bearing pressure above may be increased 600 psf for each additional

foot of foundation depth, up to a maximum allowable soil bearing pressure of 5,000 psf. A one-third increase in the capacity may be used for wind or seismic loads.

7.8.2 Light poles may be supported on drilled cast-in-place friction piles deriving support in undisturbed alluvial soils or newly placed engineered fill. For drilled cast-in-place friction piles, the coefficient of friction may be taken as 0.35 based on uniform contact between the concrete and undisturbed alluvium and engineered fill. The piles may be designed based on a skin friction capacity of 250 pounds per square foot, and do not require the complete removal of all loose earth materials from the bottom of the excavation, since end-bearing capacity is not being considered. However, a cleanout of the excavation bottom will be required. Piles may be assumed fixed at an embedment depth of 5 feet below the ground surface. A one-third increase in the capacity may be used for wind or seismic loads.

7.8.3 For design purposes, an allowable passive value in the undisturbed alluvium and engineered fill may be assumed to be 200 pounds per square foot per foot with a maximum allowable passive earth pressure is 2,000 pcf. The allowable passive value may be doubled for isolated piles placed at least three times the pile diameter. To develop the full lateral value, provisions should be implemented to assure firm contact between the piles and the undisturbed soils.

7.8.4 All drilled pile excavations should be continuously observed by personnel of this firm to verify adequate penetration into the recommended bearing materials. The capacity presented is based on the strength of the soils. The compressive and tensile strength of the pile sections should be checked to verify the structural capacity of the piles.

7.9 Deepened Foundation Installation

7.9.1 Some caving is anticipated especially where granular soils are encountered. The contractor should have casing available and should be prepared to use it. If casing is used, extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than five feet. Continuous observation of the drilling and pouring of the piles by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record), is required.

7.9.2 Seepage was encountered during exploration and the contractor should be prepared for groundwater during pile installation. Piles placed below the water level require the use of a tremie to place the concrete into the bottom of the hole. A tremie shall consist of a water-tight tube, with a hopper at the top. The tube shall be equipped with a device that will close the discharge end and prevent water from entering the tube while it is being charged with concrete. The tremie shall be supported so as to permit free movement of the discharge end over the entire top surface of the work and to permit rapid lowering when necessary to retard or stop the flow of concrete. The discharge end shall be closed at the start of the work to prevent water entering the tube and shall be entirely sealed at all times, except when the concrete is being placed. The tremie tube shall be kept full of

concrete. The flow shall be continuous until the work is completed and the resulting concrete seal shall be monolithic and homogeneous. The tip of the tremie tube shall always be kept about five feet below the surface of the concrete and definite steps and safeguards should be taken to insure that the tip of the tremie tube is never raised above the surface of the concrete.

7.9.3 A special concrete mix should be used for concrete to be placed below water. The design shall provide for concrete with a strength of 1,000 psi over the initial job specification. An admixture that reduces the problem of segregation of paste/aggregates and dilution of paste shall be included. The slump shall be commensurate to any research report for the admixture, provided that it shall also be the minimum for a reasonable consistency for placing when water is present. Extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than 5 feet. Continuous observation of the drilling and pouring of the piles by a representative of this firm is required.

7.9.4 Closely spaced piles should be drilled and filled alternately, with the concrete permitted to set at least eight hours before drilling an adjacent hole. Pile excavations should be filled with concrete as soon after drilling and inspection as possible; the holes should not be left open overnight.

7.10 Miscellaneous Foundations

7.10.1 Foundations for small outlying structures, such as block walls up to 6 feet high, planter walls or trash enclosures, which will not be tied-in to the proposed structure, may be supported on conventional foundations bearing on a minimum of 12 inches of newly placed engineered fill. Where excavation and compaction cannot be performed, foundations may bear in the undisturbed alluvial soils found at or below a depth of 2 feet below the existing ground surface. If the soils exposed in the excavation bottom are loose, compaction of the soils will be required prior to placing steel or concrete. Compaction of the foundation excavation bottom is typically accomplished with a compaction wheel or mechanical whacker and must be observed and approved by a Geocon representative. Miscellaneous foundations may be designed for a bearing value of 1,500 pounds per square foot, and should be a minimum of 12 inches in width, 24 inches in depth below the lowest adjacent grade and 12 inches into the recommended bearing material. The allowable bearing pressure may be increased by up to one-third for transient loads due to wind or seismic forces.

7.10.2 Foundation excavations should be observed and approved in writing by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record), prior to the placement of reinforcing steel and concrete to verify that the excavations and exposed soil conditions are consistent with those anticipated.

7.11 Foundation Settlement

7.11.1 The maximum expected total settlement for a structure supported on a conventional foundation system designed with the maximum allowable bearing value of 4,000 psf and deriving support in newly placed engineered fill is estimated to be approximately ¾ inch and occur below the heaviest loaded structural element. Settlement of the foundation system is expected to occur on initial application of loading. Differential settlement is expected to be less than ½ inch over a distance of twenty feet.

7.11.2 Once the design and foundation loading configurations for the proposed structures proceeds to a more finalized plan, the estimated settlements presented in this report should be reviewed and revised, if necessary. If the final foundation loading configurations are greater than the assumed loading conditions (column loads of up to 50 kips, wall loads of up to 2 kips per linear foot), the potential for settlement should be reevaluated by this office.

7.11.3 The settlement for the 34 feet of backfill compacted to 95 percent is anticipated to be approximately 1 to 3 inches based on typical strength parameters of engineered fill.

7.12 Lateral Design

7.12.1 Resistance to lateral loading may be provided by friction acting at the base of foundations, slabs and by passive earth pressure. An allowable coefficient of friction of 0.35 may be used with the dead load forces in the undisturbed alluvial soils and in newly compacted engineered fill.

7.12.2 Based on a factor of safety of 2, the passive earth pressure for the sides of foundations and slabs poured against undisturbed alluvial soils or newly compacted engineered fill may be computed as an equivalent fluid having a density of 200 pcf with a maximum earth pressure of 2,000 pcf. When combining passive and friction for lateral resistance, the passive component should be reduced by one-third.

7.13 Concrete Slabs-on-Grade

7.13.1 Exterior slabs, not subject to traffic loads, should be at least 4 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions, positioned near the slab midpoint. Prior to construction of slabs, the upper 12 inches of subgrade should be moistened between 0 and 2 percent above optimum moisture content and properly compacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition). Crack control joints should be spaced at intervals not greater than 10 feet and should be constructed using saw-cuts or other methods as soon as practical following concrete placement. Crack control joints should extend a minimum depth of one-fourth the slab thickness. The project structural engineer should design construction joints as necessary.

7.13.2 Slabs-on-grade at the ground surface that may receive moisture-sensitive floor coverings or may be used to store moisture-sensitive materials should be underlain by a vapor retarder placed directly beneath the slab. The vapor retarder and acceptable permeance should be specified by the project architect or developer based on the type of floor covering that will be installed. The vapor retarder design should be consistent with the guidelines presented in Section 9.3 of the American Concrete Institute's (ACI) *Guide for Concrete Slabs that Receive Moisture-Sensitive Flooring Materials* (ACI 302.2R-06) and should be installed in general conformance with ASTM E 1643-09 and the manufacturer's recommendations. If the Los Angeles Green Building Code requirements apply to this project, the vapor retarder should be underlain by 4 inches of ½-inch clean aggregate and the vapor retarder should be in direct contact with the concrete slab. It is important that the vapor retarder be puncture resistant since it will be in direct contact with angular gravel. As an alternative to the clean aggregate suggested in the Los Angeles Green Building Code, it is our opinion that the concrete slab-on-grade may be underlain by a vapor retarder over 4-inches of clean sand (sand equivalent greater than 30), since the sand will serve a capillary break and will minimize the potential for punctures and damage to the vapor barrier.

7.13.3 For seismic design purposes, a coefficient of friction of 0.35 may be utilized between concrete slabs and subgrade soils.

7.13.4 The recommendations of this report are intended to reduce the potential for cracking of slabs due to settlement. However, even with the incorporation of the recommendations presented herein, foundations, stucco walls, and slabs-on-grade may exhibit some cracking due to minor soil movement and/or concrete shrinkage. The occurrence of concrete shrinkage cracks is independent of the supporting soil characteristics. Their occurrence may be reduced and/or controlled by limiting the slump of the concrete, proper concrete placement and curing, and by the placement of crack control joints at periodic intervals, in particular, where re-entrant slab corners occur.

7.14 Preliminary Pavement Recommendations

7.14.1 Where new surface paving is to be placed, it is recommended that all existing fill and soft or unsuitable alluvial soils be excavated and properly compacted for paving support. The client should be aware that excavation and compaction of all soft or unsuitable alluvial soils in the area of new paving is not required, however, paving constructed over existing unsuitable soils may experience increased settlement and/or cracking, and may therefore have a shorter design life and increased maintenance costs. As a minimum, the upper twelve inches of soil should be scarified and recompacted to at least 95 percent relative compaction, as determined by ASTM Test Method D 1557 (latest edition).

7.14.2 The following pavement sections are based on an assumed R-Value of 20. Once site grading activities are complete, it is recommended that laboratory testing confirm the properties of the soils serving as paving subgrade prior to placing pavement. The Traffic Indices listed below are estimates. Geocon does not practice in the field of traffic engineering. The actual Traffic Index for each area should be determined by the project civil engineer. If pavement sections for Traffic Indices other than those listed below are required, Geocon should be contacted to provide additional recommendations. Pavement thicknesses were determined following procedures outlined in the *California Highway Design Manual* (Caltrans). It is anticipated that the majority of traffic will consist of automobile.

PRELIMINARY PAVEMENT DESIGN SECTIONS

Location	Estimated Traffic Index (TI)	Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
Automobile Parking And Driveways	5	3	7
Trash Truck & Fire Lanes	7	4	12.5

7.14.3 Asphalt concrete should conform to Section 203-6 of the "*Standard Specifications for Public Works Construction"* (Green Book). Class 2 aggregate base materials should conform to Section 26-1.02A of the "*Standard Specifications of the State of California, Department of Transportation"* (Caltrans). Crushed Miscellaneous Base should conform to Section 200-2.4 of the "*Standard Specifications for Public Works Construction"* (Green Book).

7.14.4 Unless specifically designed and evaluated by the project structural engineer, where exterior concrete paving will be utilized for support of vehicles, it is recommended that the concrete be a minimum of 6 inches thick and reinforced with No. 3 steel reinforcing bars placed 18 inches on center in both horizontal directions. Concrete paving supporting vehicular traffic should be underlain by a minimum of 4 inches of aggregate base and a properly compacted subgrade. The subgrade and base material should be compacted to at least 95 percent relative compaction as determined by ASTM Test Method D 1557 (latest edition).

7.14.5 The performance of pavements is highly dependent upon providing positive surface drainage away from the edge of pavements. Ponding of water on or adjacent to the pavement will likely result in saturation of the subgrade materials and subsequent cracking, subsidence and pavement distress. If planters are planned adjacent to paving, it is recommended that the perimeter curb be extended at least 12 inches below the bottom of the aggregate base to minimize the introduction of water beneath the paving.

7.15 Retaining Walls

7.15.1 The recommendations presented below are generally applicable to the design of rigid concrete or masonry retaining walls having a maximum height of 6 feet. In the event that walls higher than 6 feet are planned, Geocon should be contacted for additional recommendations.

7.15.2 Retaining wall foundations may be designed in accordance with the recommendations provided in the *Foundation Design* sections of this report (see Section 7.7). Continuous footings may be designed for an allowable bearing capacity of 2,000 pounds per square foot, and should be a minimum of 18 inches in width, 18 inches in depth below the lowest adjacent grade. The allowable soil bearing pressure above may be increased by 300 psf and 600 psf for each additional foot of foundation width and depth, respectively, up to a maximum allowable soil bearing pressure of 4,000 psf. The allowable bearing pressure may be increased by one-third for transient loads due to wind or seismic forces.

7.15.3 Retaining walls with a level backfill surface that are not restrained at the top should be designed utilizing a triangular distribution of pressure (active pressure) of 30 pcf.

7.15.4 Restrained walls are those that are not allowed to rotate more than 0.001H (where H equals the height of the retaining portion of the wall in feet) at the top of the wall. Where walls are restrained from movement at the top, walls may be designed utilizing a triangular distribution of pressure (at-rest pressure) of 50 pcf.

7.15.5 The wall pressures provided above assume that the retaining wall will be properly drained preventing the buildup of hydrostatic pressure. If retaining wall drainage is not implemented, walls shall be designed for hydrostatic pressures.

7.15.6 Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic or adjacent structures and should be designed for each condition as the project progresses.

7.15.7 Seismic lateral forces should be incorporated into the design as necessary, and recommendations for seismic lateral forces are presented below.

7.16 Dynamic (Seismic) Lateral Forces

7.16.1 In accordance with the 2011 Los Angeles Building Code, if the project possesses a seismic design category of D, E, or F, the proposed retaining walls should be designed with seismic lateral pressure. The structural engineer should determine the seismic design category for the project. The maximum dynamic active pressure is equal to the sum of the initial static pressure and the dynamic (seismic) pressure increment.

7.16.2 Braced retaining walls should be designed for the greater of either the at-rest earth pressure or the dynamic (seismic) lateral earth pressure (sum of the static active pressure and the dynamic (seismic) pressure increment).

7.16.3 The application of seismic loading should be performed at the discretion of the project Structural Engineer and in accordance with the requirements of the Building Official. If seismic loading is to be applied, we recommend a seismic load of 35 pounds per cubic foot be used for design applied as a triangular distribution of pressure along the wall height, in accordance with Chapter 7 of the National Cooperative Highway Research Program (NCHRP), Report 611. This dynamic (seismic) pressure increment is for horizontal backfill behind the wall and does not account for an inclined backfill surface. The seismic pressure is based on a ground acceleration of 0.58 (S_{DS}/2.5 ground motion) and by applying a pseudo-static coefficient of 0.5.

7.17 Retaining Wall Drainage

7.17.1 Retaining walls should be provided with a drainage system extended at least two-thirds the height of the wall. At the base of the drain system, a subdrain covered with a minimum of 12 inches of gravel should be installed, and a compacted fill blanket or other seal placed at the surface (see Figure 9). The clean bottom and subdrain pipe, behind a retaining wall, should be observed by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record), prior to placement of gravel or compacting backfill.

7.17.2 Subdrainage pipes at the base of the retaining wall drainage system should outlet to an acceptable location via controlled drainage structures.

7.18 Temporary Excavations

7.18.1 Excavations on the order of 34 feet in height may be required for demolishing the existing subterranean structures. The excavations are expected to expose artificial fill, alluvial soils, and Fernando Formation bedrock. Unshored vertical excavations up to 5 feet in height may be attempted where loose soils or caving sands are not present, and where excavations are not surcharged. Vertical excavations greater than five feet will require sloping and/or shoring measures in order to provide a stable excavation. Where sufficient space is available, temporary unsurcharged embankments may be sloped back at a uniform 1.5:1 (H:V) slope gradient or flatter. A uniform slope does not have a vertical portion. Where excavations are surcharged or space is limited, shoring measures will be required. *Shoring* data is provided in Section 7.19 of this report.

7.18.2 Where sloped embankments are utilized, the top of the slope should be barricaded to prevent vehicles and storage loads at the top of the slope within a horizontal distance equal to the height of the slope. If the temporary construction embankments are to be maintained during the rainy season, berms are suggested along the tops of the slopes where necessary to prevent runoff water from entering the excavation and eroding the slope faces. Geocon personnel should inspect the soils exposed in the cut slopes during excavation so that modifications of the slopes can be made if variations in the soil conditions occur. All excavations should be stabilized within 30 days of initial excavation.

7.19 Shoring – Soldier Pile Design and Installation

7.19.1 The following information on the design and installation of shoring is preliminary. Review of the final shoring plans and specifications should be made by this office prior to bidding or negotiating with a shoring contractor.

7.19.2 As an alternative to completely demolishing and removing the existing subterranean structures, the perimeter subterranean walls of the structure can be protected and incorporated into the temporary shoring system. Where necessary, temporary lateral support for the existing wall can be provided by installing tiebacks, soldier piles, or any combination thereof. The design of the temporary lateral support components and their connection to the existing perimeter wall should be provided by a qualified Structural Engineer and/or Shoring Engineer.

7.19.3 One method of shoring would consist of steel soldier piles, placed in drilled holes and backfilled with concrete. Where maximum excavation heights are less than 12 feet the soldier piles are typically designed as cantilevers. Where excavations exceed 12 feet or are surcharged, soldier piles may require lateral bracing utilizing drilled tie-back anchors to maintain an economical steel beam size and prevent excessive deflection. The size of the steel beam, the need for lateral bracing, and the acceptable shoring deflection should be determined by the project shoring engineer.

7.19.4 The design embedment of the shoring pile toes must be maintained during excavation activities. The toes of the perimeter shoring piles should be deepened to take into account any required excavations necessary for foundations or adjacent drainage systems.

7.19.5 Drilled cast-in-place soldier piles should be placed no closer than 2 diameters on center. The minimum diameter of the piles is 18 inches. Structural concrete should be used for the soldier piles below the excavation; lean-mix concrete may be employed above that level. For design purposes, an allowable passive value for the soils below the bottom plane of excavation may be assumed to be 200 pounds per square foot per foot. The allowable passive value may be doubled for isolated piles, spaced a minimum of three times the pile diameter. To develop the full lateral value, provisions should be implemented to assure firm contact between the soldier piles and the undisturbed alluvium and bedrock.

7.19.6 Some caving is anticipated especially where granular soils are encountered. The contractor should be prepared to use casing and should have it readily available at the commencement of drilling activities. When casing is used, extreme care should be employed so that the pile is not pulled apart as the casing is withdrawn. At no time should the distance between the surface of the concrete and the bottom of the casing be less than five feet. Continuous observation of the drilling and pouring of the piles by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record), is required.

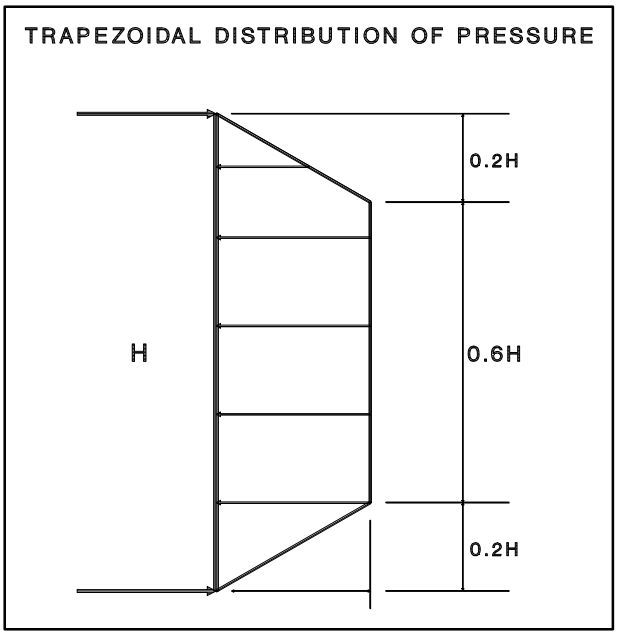
7.19.7 The frictional resistance between the soldier piles and retained soil may be used to resist the vertical component of the anchor load. The coefficient of friction may be taken as 0.40 based on uniform contact between the steel beam and lean-mix concrete and retained earth. The portion of soldier piles below the plane of excavation may also be employed to resist the downward loads. The downward capacity may be determined using an allowable adhesion of 1,000 pounds per square foot.

7.19.8 Seepage was encountered during exploration and the contractor should be prepared for groundwater during pile installation should the need arise. Piles placed below the water level require the use of a tremie to place the concrete into the bottom of the hole. A tremie should consist of a rigid, water-tight tube having a diameter of not less than 6 inches with a hopper at the top. The tube should be equipped with a device that will close the discharge end and prevent water from entering the tube while it is being charged with concrete. The tremie should be supported so as to permit free movement of the discharge end over the entire top surface of the work and to permit rapid lowering when necessary to retard or stop the flow of concrete. The discharge end should be closed at the start of the work to prevent water entering the tube and should be entirely sealed at all times, except when the concrete is being placed. The tremie tube should be kept full of concrete. The flow should be continuous until the work is completed and the resulting concrete seal should be monolithic and homogeneous. The tip of the tremie tube should always be kept about 5 feet below the surface of the concrete and definite steps and safeguards should be taken to insure that the tip of the tremie tube is never raised above the surface of the concrete.

7.19.9 A special concrete mix should be used for concrete to be placed below water. The design should provide for concrete with an unconfined compressive strength psi of 1,000 pounds per square inch (psi) over the initial job specification. An admixture that reduces the problem of segregation of paste/aggregates and dilution of paste should be included. The slump should be commensurate to any research report for the admixture, provided that it should also be the minimum for a reasonable consistency for placing when water is present.

7.19.10 Due to the nature of the site soils, continuous lagging between soldier piles will be required. However, it is recommended that the exposed soils be observed by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record.).

7.19.11 The time between lagging excavation and lagging placement should be as short as possible. Soldier piles should be designed for the full-anticipated pressures. Due to arching in the soils, the pressure on the lagging will be less. It is recommended that the lagging be designed for the full design pressure but be limited to a maximum of 400 pounds per square foot.



7.19.12 For design of shoring, it is recommended that an equivalent fluid pressure based on the following table, be utilized for design. Calculation of the recommended shoring pressure is provided on Figure 11.

HEIGHT OF SHORING (FEET)	**EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (ACTIVE PRESSURE)**	**EQUIVALENT FLUID PRESSURE (Pounds Per Cubic Foot) (AT-REST PRESSURE)**
Up to 34	25	45

7.19.13 It is very important to note that active pressures can only be achieved when movement in the soil (earth wall) occurs. If movement in the soil is not acceptable, such as adjacent to an existing structure, or the pile is restrained from movement by bracing or a tie back anchor, the at-rest pressure should be considered for design purposes.

7.19.14 A trapezoidal distribution of lateral earth pressure would be appropriate where shoring is to be restrained at the top by bracing or tie backs. The lateral earth pressure to be used for design of temporary shoring is provided in the table below:

HEIGHT OF SHORING "H" (Feet)	**LATERAL EARTH PRESSURE (Where H is the height of the shoring in feet, plus the surcharge loading occurring due to traffic in the streets or any surcharge loading imposed by any adjacent structures.)**
Up to 34	28.5H

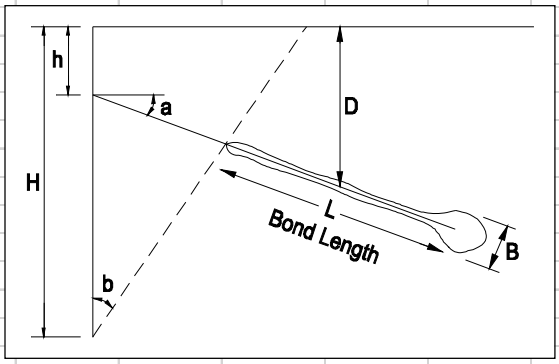
7.19.15 Where a combination of sloped embankment and shoring is utilized, the pressure will be greater and must be determined for each combination. Additional active pressure should be added for a surcharge condition due to sloping ground, vehicular traffic, or adjacent structures and must be determined for each combination.

7.19.16 In addition to the recommended earth pressure, the upper ten feet of the shoring adjacent to the street or driveway areas should be designed to resist a uniform lateral pressure of 100 psf, acting as a result of an assumed 300 psf surcharge behind the shoring due to normal street traffic. If the traffic is kept back at least ten feet from the shoring, the traffic surcharge may be neglected.

7.19.17 It is difficult to accurately predict the amount of deflection of a shored embankment. It should be realized that some deflection will occur. It is recommended that the deflection be minimized to prevent damage to existing structures and adjacent improvements. Where public right-of-ways are present or adjacent offsite structures do not surcharge the shoring excavation, the shoring deflection should be limited to less than 1 inch at the top of the shored embankment. Where offsite structures are within the shoring surcharge area it is recommended that the beam deflection be limited to less than ½ inch at the elevation of the adjacent offsite foundation, and no deflection at all if deflections will damage existing structures. The allowable deflection is dependent on many factors, such as the presence of structures and utilities near the top of the embankment, and will be assessed and designed by the project shoring engineer.

7.19.18 Because of the depth of the excavation, some means of monitoring the performance of the shoring system is suggested. The monitoring should consist of periodic surveying of the lateral and vertical locations of the tops of all soldier piles and the lateral movement along the entire lengths of selected soldier piles.

7.20 Tie-Back Anchors

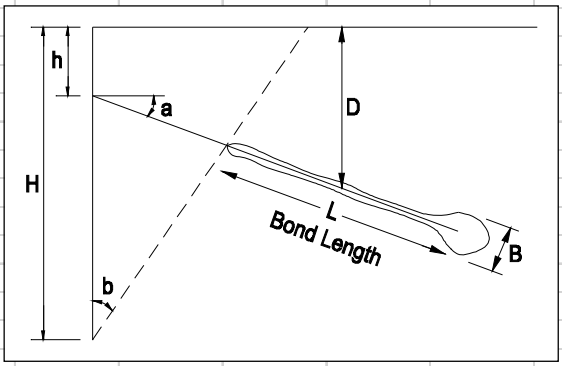


7.20.1 Tie-back anchors may be used to resist lateral loads. Friction anchors are recommended. For design purposes, it may be assumed that the active wedge adjacent to the shoring is defined by a plane drawn 35 degrees with the vertical through the bottom plane of the excavation. Anchors should extend a minimum of 20 feet beyond the potentially active wedge and to greater lengths if necessary to develop the desired capacities.

7.20.2 The locations and depths of all offsite utilities should be thoroughly checked and incorporated into the drilling angle design for the tie-back anchors. Cross sections shall be developed illustrating the existing utilities and structures at the locations of the tiebacks.

7.20.3 The capacities of the anchors should be determined by testing of the initial anchors as outlined in a following section. Only the frictional resistance developed beyond the active wedge would be effective in resisting lateral loads. Anchors should be placed at least 6 feet on center to be considered isolated. Based on the height of the proposed excavation, two rows of anchors may be required. For preliminary design purposes, it is estimated that drilled friction anchors constructed utilizing gravity grouting techniques will develop average skin frictions as follows:

- 7 feet below the top of the excavation – 1,000 pounds per square foot (see diagram below).



Depth of Tie-back Anchor (ft.)		h =	7.0
Height of Excavation (ft.)		H =	34.0
Bond Length (ft.)		L =	20.0
Shaft or Bell Diameter (ft.)		B =	1.0
Angle of Active Wedge from Vert. (deg.)		b =	35.0
Angle of Anchor below Horiz. (deg.)		a =	20.0
	Wet Density =	125.0	pcf
	Cohesion =	550.0	deg.
	Phi Angle =	29.0	deg.
	Factor of Safety =	1.5	
Unbonded Length =	16.0	ft.	
Total Length =	36.0	ft.	
Depth to Midpoint of Bonded Zone =	15.9	ft.	

Allowable Skin Friction = 1101.3 psf

- Up to 20 feet below the top of the excavation – 1,500 pounds per square foot (see diagram below).

Depth of Tie-back Anchor (ft.)		h =	20.0
Height of Excavation (ft.)		H =	34.0
Bond Length (ft.)		L =	20.0
Shaft or Bell Diameter (ft.)		B =	1.0
Angle of Active Wedge from Vert. (deg.)		b =	35.0
Angle of Anchor below Horiz. (deg.)		a =	20.0
	Wet Density =	125.0	pcf
	Cohesion =	550.0	deg.
	Phi Angle =	29.0	deg.
	Factor of Safety =	1.5	
Unbonded Length =	8.3	ft.	
Total Length =	28.3	ft.	
Depth to Midpoint of Bonded Zone =	26.3	ft.	

Allowable Skin Friction = 1579.8 psf

7.20.4 Depending on the techniques utilized, and the experience of the contractor performing the installation, a maximum allowable friction capacity of 5.0 kips per linear foot for post-grouted anchors (for a 20 foot length beyond the active wedge) may be assumed for design purposes. Only the frictional resistance developed beyond the active wedge should be utilized in resisting lateral loads.

7.21 Anchor Installation

7.21.1 All tieback anchors should be installed and tested in accordance with the requirements of the Los Angeles Department of Building and Safety Research Report No. RR23835 titled "Requirements for Temporary Tieback Earth Anchors".

7.21.2 Tied-back anchors are typically installed between 15 and 30 degrees below the horizontal; however, occasionally alternative angles are necessary to avoid existing improvements and utilities. The locations and depths of all offsite utilities should be thoroughly checked prior to design and installation of the tie-back anchors. Caving of the anchor shafts, particularly within sand and gravel deposits or seepage zones, should be anticipated during installation and provisions should be implemented in order to minimize such caving. It is suggested that hollow-stem auger drilling equipment be used to install the anchors. The anchor shafts should be filled with concrete by pumping from the tip out, and the concrete should extend from the tip of the anchor to the unbound zone. In order to minimize the chances of caving, it is recommended that the portion of the anchor shaft within the active wedge be backfilled with sand or slurry before testing the anchor. This portion of the shaft should be filled tightly and flush with the face of the excavation. The sand backfill should be placed by pumping; the sand may contain a small amount of cement to facilitate pumping.

7.22 Anchor Testing

7.22.1 All of the anchors should be tested to at least 125 percent of design load. The total deflection during this test should not exceed 4 inches. The rate of creep under the 150 percent test load should not exceed 0.1 inch over a 15-minute period in order for the anchor to be approved for the design loading.

7.22.2 All anchors shall be proof tested to 150 percent of design load for 15 minutes by the following procedure:

1. A nominal alignment load shall be applied and axial elongation established with respect to a fixed reference point independent of the shoring system.

2. The axial load shall be applied in increments of 25 percent of the design load. Each incremental load shall be maintained for a period of 1 minute with axial elongation measured at the beginning and end of this period.

3. Upon reaching 150 percent of design load, the load shall be maintained for a period of 15 minutes. The axial elongation from the time of application of the 150 percent load to the conclusion of the 15 minutes shall not exceed 0.10 inch. Total elongation from the initial alignment load application to the conclusion of the test shall not exceed 4 inches.

4. If movement exceeds 0.10 inch after 15 minutes, the tieback may be rejected or the load may be reduced and maintained for additional 15 minute increments at the discretion of the Geotechnical Engineer until a load resulting in a movement of less than 0.10 inch during the 15 minute interval is determined. Once the Geotechnical Engineer has determined the sustainable load, the down-rated design load shall be taken as the sustainable load divided by 1.75.

5. If the deflection measurements are acceptable to the Geotechnical Engineer, the tieback shall be locked off at 100 percent of the design load.

7.22.3 After a satisfactory test, each anchor should be locked-off at the design load. This should be verified by rechecking the load in the anchor. The load should be within 10 percent of the design load. A representative of this firm should observe the installation and testing of the anchors.

7.23 Internal Bracing

7.23.1 Internal braced shoring may be utilized to brace the soldier piles in lieu of tieback anchors. A rectangular distribution of lateral earth pressure should be used for design of internal braced shoring system and is provided in the table below:

HEIGHT OF SHORING "H" (Feet)	LATERAL EARTH PRESSURE (Where H is the height of the shoring in feet, plus the surcharge loading occurring due to traffic in the streets or any surcharge loading imposed by any adjacent structures.)
Up to 34	18H

7.24 Surface Drainage

7.24.1 Proper surface drainage is critical to the future performance of the project. Uncontrolled infiltration of irrigation excess and storm runoff into the foundation supporting soils can adversely affect the performance of the planned improvements. Saturation of a soil can cause it to lose internal shear strength and increase its compressibility, resulting in a change in the original designed engineering properties. Proper drainage should be maintained at all times.

7.24.2 All site drainage should be collected and controlled in non-erosive drainage devices. Drainage should not be allowed to pond anywhere on the site, and especially not against any foundation or retaining wall. The site should be graded and maintained such that surface drainage is directed away from structures in accordance with 2011 LABC 1804.3 or other applicable standards. In addition, drainage should not be allowed to flow uncontrolled over any descending slope. The proposed structure should be provided with roof gutters. Discharge from downspouts, roof drains and scuppers not recommended onto unprotected soils within five feet of the building perimeter. Planters which are located adjacent to foundations should be sealed to prevent moisture intrusion into the engineered fill providing foundation support. Landscape irrigation is not recommended within five feet of the building perimeter footings except when enclosed in protected planters.

7.24.3 Positive site drainage should be provided away from structures, pavement, and the tops of slopes to swales or other controlled drainage structures. The building pad and pavement areas should be fine graded such that water is not allowed to pond.

7.24.4 Landscaping planters immediately adjacent to paved areas are not recommended due to the potential for surface or irrigation water to infiltrate the pavement's subgrade and base course. Either a subdrain, which collects excess irrigation water and transmits it to drainage structures, or an impervious above-grade planter boxes should be used. In addition, where landscaping is planned adjacent to the pavement, it is recommended that consideration be given to providing a cutoff wall along the edge of the pavement that extends at least 12 inches below the base material.

7.25 Plan Review

7.25.1 Grading, foundation and, shoring plans should be reviewed by the Geotechnical Engineer (a representative of the Geotechnical Engineer of Record), prior to finalization to verify that the plans have been prepared in substantial conformance with the recommendations of this report and to provide additional analyses or recommendations.

LIMITATIONS AND UNIFORMITY OF CONDITIONS

1. The recommendations of this report pertain only to the site investigated and are based upon the assumption that the soil conditions do not deviate from those disclosed in the investigation. If any variations or undesirable conditions are encountered during construction, or if the proposed construction will differ from that anticipated herein, Geocon West, Inc. should be notified so that supplemental recommendations can be given. The evaluation or identification of the potential presence of hazardous or corrosive materials was not part of the scope of services provided by Geocon West, Inc.

2. This report is issued with the understanding that it is the responsibility of the owner, or of his representative, to ensure that the information and recommendations contained herein are brought to the attention of the architect and engineer for the project and incorporated into the plans, and the necessary steps are taken to see that the contractor and subcontractors carry out such recommendations in the field.

3. The findings of this report are valid as of the present date. However, changes in the conditions of a property can occur with the passage of time, whether they are due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation or the broadening of knowledge. Accordingly, the findings of this report may be invalidated wholly or partially by changes outside our control. Therefore, this report is subject to review and should not be relied upon after a period of three years.

45 FAULTS FOUND WITHIN THE SPECIFIED SEARCH RADIUS.
THE UPPER ELYSIAN PARK BLIND THRUST FAULT IS CLOSEST TO THE SITE.
IT IS ABOUT 2.2 MILES (3.5 km) AWAY.
LARGEST MAXIMUM-EARTHQUAKE SITE ACCELERATION: 0.8568 g

APPENDIX A

FIELD INVESTIGATION

The site was explored on October 3 and 4, 2013 by excavating three 8-inch diameter borings utilizing a truck-mounted hollow-stem auger drilling machine. The borings were excavated to depths of 60½ feet below the existing ground surface. Representative and relatively undisturbed samples were obtained by driving a 3 inch O. D., California Modified Sampler into the "undisturbed" soil mass with blows from a 140-pound auto-hammer falling 30 inches. The California Modified Sampler was equipped with 1-inch high by 2⅜-inch diameter brass sampler rings to facilitate removal and testing.

The soil conditions encountered in the borings were visually examined, classified and logged in general accordance with the Unified Soil Classification System (USCS). Logs of the borings are presented on Figures A-1 through A-3. The logs depict the soil and geologic conditions encountered and the depth at which samples were obtained. The approximate locations of the borings are indicated the Site Plan (see Figure 2).

APPENDIX B

LABORATORY TESTING

Laboratory tests were performed in accordance with generally accepted test methods of the "American Society for Testing and Materials (ASTM)", or other suggested procedures. Selected samples were tested for direct shear strength, consolidation and expansion characteristics, moisture density relationships, Atterberg limits, grain size analysis, grain size distribution, corrosivity, in-place dry density and moisture content. The results of the laboratory tests are summarized in Figures B1 through B20. The in-place dry density and moisture content of the samples tested are presented in the boring logs, Appendix A.

1.0 INTRODUCTION

This report presents the results of a geotechnical investigation conducted for the New Police Headquarters Facility that will be located within the city block bounded by First Street on the north, Main Street on the east, Second Street on the south and Spring Street on the west in downtown Los Angeles. This investigation was conducted to determine subsurface characteristics and to provide geotechnical recommendations for design and construction of the project. The Geotechnical Engineering Division (GED) prepared this report in response to the Proposition Q Bond Programs request dated August 19, 2004 and Notice to Proceed dated November 17, 2004.

This report is based on document review, visual observation of the site, subsurface investigation and laboratory testing. At the request of GED, Kleinfelder Inc. (Kleinfelder) performed subsurface exploration at the site and laboratory testing of samples collected from the site. The results of their field investigation and laboratory tests are included in their Geotechnical Data Report (Appendix A) dated January 26, 2005. GED has reviewed the Kleinfelder report and concurs with and accepts responsibility for the use of the contents.

2.0 SITE DESCRIPTION

The site is bounded by First Street on the north, Main Street on the east, Second Street on the south and Spring Street on the west. A map of the site is shown on Figure 1, "Vicinity Map." At the time this report was prepared the site was occupied with a former bank building in the northwest corner of the site, a small commercial building in the northeast corner of the site and two former Caltrans buildings in the southern portion of the site. The remainder of the site was paved primarily with asphalt with some landscaped areas. Ground surface elevations of the site vary from approximately 287-1/2 feet, 282 feet, 283 feet and 280 feet at the northwest, northeast, southwest and southeast corners of the site, respectively. For the purpose of this report, First and Second streets are considered to have east-west alignments and Spring and Main streets north-south alignments.

The former bank building, in the northwest corner of the site, is a two-story building with a subterranean parking level. This building was a footprint of approximately 120 feet north-south by 150 feet east-west. The elevation of the floor slab of the subterranean parking level is on the order of 275 feet. An access ramp extends beneath the building down to the parking level from the eastern edge of the building.

The commercial building, former gift shop and existing hamburger shop, in the northeast corner of the site is a one-story building with a foot-print of approximately 20 feet north-south by 45 feet east–west. This building is not believed to have a subterranean level.

Two former Caltrans buildings occupy the majority of the southern portion of the site. The western building, with an address of 120 S. Spring Street, is a 5-story building with a basement level and a foot-print of approximately 17,000 square feet. Based on our review of foundation

10108282006 35900

plans we understand this building is founded on continuous and spread footing foundations with bearing elevations typically varying between approximately 270 feet to 273 feet. The finish floor elevation of the basement level floor slab is indicted to be primarily at 276.36 feet.

The eastern building, fronting on Main Street, is also a 5-story building with a subterranean level and a foot-print of approximately 75,000 square feet including the subterranean level south of the building that fronts on Spring Street. The subterranean level was used primarily for parking and vehicle maintenance. Access to the subterranean level is via a ramp off Main Street, located along the northern edge of the building, and a second ramp off Spring Street that extends along the northern edge of the subterranean level south of the building fronting on Spring Street. Foundation plans for this building indicate that this building is also supported on continuous and spread footing foundations. The majority of the foundations are indicated to have bearing elevations varying between approximately 262 feet to 264 feet. Bearing elevations of foundations adjacent to the western building are indicated to vary from approximately 268.9 feet to 270.4 feet. The plans indicate that the lowest foundations bear at elevations of approximately 259 feet. The finish floor elevation of the subterranean level of this building is indicted to be at 271.5 feet for the majority of the building. The finish floor elevation is indicated to be 270 feet in the portion of the subterranean level south of the western building and 261.2 to 265.5 in the mechanical area along the southern portion of the building.

In addition to the structures that occupied the site at the time of the field investigation we understand that the site was also previously occupied with additional structures. Previous structures existed in some of the areas that were paved with asphalt at the time of field investigation and within the areas of some of the existing buildings.

3.0 PROJECT SCOPE
