1. INTRODUCTION

1.1. PROJECT LOCATION AND EXISTING ON-SITE USES:

The Project Site is located on an approximately 3.6-acre (five parcels totaling approximately 160,578 square feet [sf]) city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway Street in the Center City/Historic Core District of Downtown Los Angeles. This district, which extends from W. 1st Street to W. 11th Street, between Los Angeles and Hill Streets, includes Los Angeles City Hall, Los Angeles County courts and law library, federal offices and courts, LAPD Headquarters, CalTrans Regional Offices, Grand Park, and other civic facilities. The Project Site is currently occupied by five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage, and the 6-story Executive Building, resulting in a total of approximately 559,863 sf. See attached Project Location Map.

1.2. PROJECT DESCRIPTION

The Times Mirror Square Project (Proposed Project) would retain and renovate the Times, Plant, and Mirror Buildings to provide approximately 307,288 sf of commercial office uses, 18,817 sf of commercial restaurant uses and a 50,000 sf grocery store. Of the 307,288 sf of commercial office use, 93,432 sf will be new development. The remaining 213,856 sf of office space is existing and will remain after the rehabilitation of the Times, Plant, and Mirror Buildings. The three buildings, which have a combined total floor area of approximately 376,105 sf, are aligned along S. Spring Street, with frontages along both W. 1st Street and W. 2nd Street. The Project proposes to demolish the Parking Garage and Executive Building located on the western half of the Site and construct two mixed-use towers (North and South Towers).

The Project's North Tower and South Tower mixed use components would be constructed in the west sector of the Project Site in the areas currently occupied by the 6-story Executive Building at the corner of W. 1st Street and S. Broadway and the 6-story parking structure at the corner of W. 2nd Street and S. Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. Total residential floor area would be 1,071,692 sf. With the addition of open space amenities, lounges, loading areas, and retail uses, total new construction would amount to 1,135,803 sf. The towers would include approximately 34,572 f of retail uses, which would be located at ground level and oriented to W. 1st Street, S. Broadway, and W. 2nd Street, while also fronting the Paseo. The Paseo would be constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. The resulting floor-area ratio (FAR) would be approximately 9.42:1. Approximately 72,902 sf of common open space, including the approximately 15,708 sf Paseo, would be provided as part of the North and South Towers

component. With the addition of approximately 56,350 sf of private balconies, combined private and common open space would be approximately 129,252 sf.

Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023.

1.3. SCOPE OF WORK

This report provides a description of the existing site conditions and analyzes the Project's potential impacts to surface water hydrology, surface water quality, groundwater level, and groundwater quality.

2. REGULATORY FRAMEWORK

2.1. SURFACE WATER HYDROLOGY

County of Los Angeles Hydrology Manual

Per the City of Los Angeles (City) Special Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County (County) Department of Public Works Hydrology Manual as its basis of design for storm drainage facilities. The Hydrology Manual requires that a storm drain conveyance system be designed for a 25-year storm event and that the combined capacity of a storm drain and street flow system accommodate flow from a 50-year storm event. Areas with sump conditions are required to have a storm drain conveyance system capable of conveying flow from a 50-year storm event.[1] The County also limits the allowable discharge into existing storm drain facilities based on the municipal separate storm sewer systems (MS4) Permit, which is enforced on all new developments that discharge directly into the County's storm drain system. Any proposed drainage improvements of County owned storm drain facilities such as catch basins and storm drain lines require review and approval from the County Flood Control District department.

Los Angeles Municipal Code

Any proposed drainage improvements within the street right of way or any other property owned by or under the control of the City requires the approval of a B-permit (Section 62.105, Los Angeles Municipal Code (LAMC)). Under the B-permit process, storm drain installation plans are subject to review and approval by the City of Los Angeles Department of Public Works, Bureau of Engineering. Additionally, any connections to the City's storm drain system from a private property to a City catch basin or a underground storm drain

[1] Los Angeles County Department of Public Works Hydrology Manual, January 2006, http://ladpw.org/wrd/publication/index.cfm, accessed February 14, 2017.

pipe requires a storm drain connection permit from the City of Los Angeles Department of Public Works, Bureau of Engineering.

2.2. SURFACE WATER QUALITY

Clean Water Act

The Clean Water Act was first introduced in 1948 as the Water Pollution Control Act. The Clean Water Act authorizes Federal, state, and local entities to cooperatively create comprehensive programs for eliminating or reducing the pollution of state waters and tributaries. The primary goals of the Clean Water Act are to restore and maintain the chemical, physical, and biological integrity of the nation's waters and to make all surface waters fishable and swimmable. As such, the Clean Water Act forms the basic national framework for the management of water quality and the control of pollutant discharges. The Clean Water Act also sets forth a number of objectives in order to achieve the above-mentioned goals. These objectives include regulating pollutant and toxic pollutant discharges; providing for water quality that protects and fosters the propagation of fish, shellfish and wildlife; developing waste treatment management plans; and developing and implementing programs for the control of non-point sources of pollution.[2]

Since its introduction, major amendments to the Clean Water Act have been enacted (e.g., 1961, 1966, 1970, 1972, 1977, and 1987). Amendments enacted in 1970 created the U.S. Environmental Protection Agency (USEPA), while amendments enacted in 1972 deemed the discharge of pollutants into waters of the United States from any point source unlawful unless authorized by a USEPA National Pollutant Discharge Elimination System (NPDES) permit. Amendments enacted in 1977 mandated development of a "Best Management Practices" Program at the state level and provided the Water Pollution Control Act with the common name of "Clean Water Act," which is universally used today. Amendments enacted in 1987 required the USEPA to create specific requirements for discharges.

In response to the 1987 amendments to the Clean Water Act and as part of Phase I of its NPDES permit program, the USEPA began requiring NPDES permits for: (1) municipal separate storm sewer systems (MS4) generally serving, or located in, incorporated cities with 100,000 or more people (referred to as municipal permits); (2) 11 specific categories of industrial activity (including landfills); and (3) construction activity that disturbs five acres or more of land. Phase II of the USEPA's NPDES permit program, which went into effect in early 2003, extended the requirements for NPDES permits to: (1) numerous small municipal separate storm sewer systems,[3] (2) construction sites of one to five acres, and

---

[2] Non-point sources of pollution are carried through the environment via elements such as wind, rain, or stormwater and are generated by diffuse land use activities (such as runoff from streets and sidewalks or agricultural activities) rather than from an identifiable or discrete facility.

[3] A small municipal separate storm sewer system (MS4) is any MS4 not already covered by the Phase I program as a medium or large MS4. The Phase II Rule automatically covers on a nationwide basis all small MS4s

(3) industrial facilities owned or operated by small municipal separate storm sewer systems. The NPDES permit program is typically administered by individual authorized states.

In 2008, the USEPA published draft Effluent Limitation Guidelines (ELGs) for the construction and development industry. On December 1, 2009 the EPA finalized its 2008 Effluent Guidelines Program Plan.

In California, the NPDES stormwater permitting program is administered by the State Water Resources Control Board (SWRCB). The SWRCB was created by the Legislature in 1967. The joint authority of water distribution and water quality protection allows the Board to provide protection for the State's waters, through its nine Regional Water Quality Control Boards (RWQCBs). The RWQCBs develop and enforce water quality objectives and implement plans that will best protect California's waters, acknowledging areas of different climate, topography, geology, and hydrology. The RWQCBs develop "basin plans" for their hydrologic areas, issue waste discharge requirements, enforce action against stormwater discharge violators, and monitor water quality.[4]

Federal Anti-Degradation Policy

The Federal Anti-degradation Policy (40 Code of Federal Regulations 131.12) requires states to develop statewide anti-degradation policies and identify methods for implementing them. Pursuant to the Code of Federal Regulations (CFR), state anti-degradation policies and implementation methods shall, at a minimum, protect and maintain (1) existing in-stream water uses; (2) existing water quality, where the quality of the waters exceeds levels necessary to support existing beneficial uses, unless the state finds that allowing lower water quality is necessary to accommodate economic and social development in the area; and (3) water quality in waters considered an outstanding national resource.

California Porter-Cologne Act

The Porter-Cologne Water Quality Control Act established the legal and regulatory framework for California's water quality control. The California Water Code authorizes the SWRCB to implement the provisions of the CWA, including the authority to regulate waste disposal and require cleanup of discharges of hazardous materials and other pollutants.

located in "urbanized areas" as defined by the Bureau of the Census (unless waived by the NPDES permitting authority), and on a case-by-case basis those small MS4s located outside of urbanized areas that the NPDES permitting authority designates.

[4] USEPA. U.S. Environmental Protection Agency - Clean Water Act. July 2011. <http://www.epa.gov/lawsregs/laws/cwa.html>., accessed February 14, 2017.

As discussed above, under the California Water Code (CWC), the State of California is divided into nine RWQCBs, governing the implementation and enforcement of the CWC and CWA. The Project Site is located within Region 4, also known as the Los Angeles Region. Each RWQCB is required to formulate and adopt a Basin Plan for its region. This Plan must adhere to the policies set forth in the CWC and established by the SWRCB. The RWQCB is also given authority to include within its regional plan water discharge prohibitions applicable to particular conditions, areas, or types of waste.

California Anti-Degradation Policy

The California Anti-degradation Policy, otherwise known as the *Statement of Policy with Respect to Maintaining High Quality Water in California* was adopted by the SWRCB (State Board Resolution No. 68-16) in 1968. Unlike the Federal Anti-degradation Policy, the California Anti-degradation Policy applies to all waters of the State, not just surface waters. The policy states that whenever the existing quality of a water body is better than the quality established in individual Basin Plans, such high quality shall be maintained and discharges to that water body shall not unreasonably affect present or anticipated beneficial use of such water resource.

California Toxic Rule

In 2000, the EPA promulgated the California Toxic Rule, which establishes water quality criteria for certain toxic substances to be applied to waters in the State. The EPA promulgated this rule based on the EPA's determination that the numeric criteria are necessary in the State to protect human health and the environment. The California Toxic Rule establishes acute (i.e., short-term) and chronic (i.e., long-term) standards for bodies of water such as inland surface waters and enclosed bays and estuaries that are designated by the Los Angeles RWQCB (LARWQCB) as having beneficial uses protective of aquatic life or human health.

Board Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties

As required by the California Water Code, the LARWQCB has adopted a plan entitled "Water Quality Control Plan, Los Angeles Region: Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties" (Basin Plan). Specifically, the Basin Plan designates beneficial uses for surface and groundwaters, sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's anti-degradation policy, and describes implementation programs to protect all waters in the Los Angeles Region. In addition, the Basin Plan incorporates (by reference) all applicable State and Regional Board plans and policies and other pertinent water quality

policies and regulations. Those of other agencies are referenced in appropriate sections throughout the Basin Plan.[5]

The Basin Plan is a resource for the LARWQCB and others who use water and/or discharge wastewater in the Los Angeles Region. Other agencies and organizations involved in environmental permitting and resource management activities also use the Basin Plan. Finally, the Basin Plan provides valuable information to the public about local water quality issues.

NPDES Permit Program

The NPDES permit program was first established under authority of the CWA to control the discharge of pollutants from any point source into the waters of the United States. As indicated above, in California, the NPDES stormwater permitting program is administered by the SWRCB through its nine RWQCBs.

The General Permit

SWRCB Order No. 2012-0006-DWQ known as "The General Permit" was adopted on July 17, 2012. This NPDES permit establishes a risk-based approach to stormwater control requirements for construction projects by identifying three project risk levels. The main objectives of the General Permit are to:

1. Reduce erosion;
2. Minimize or eliminate sediment in stormwater discharges;
3. Prevent materials used at a construction site from contacting stormwater;
4. Implement a sampling and analysis program;
5. Eliminate unauthorized non-stormwater discharges from construction sites;
6. Implement appropriate measures to reduce potential impacts on waterways both during and after construction of projects; and
7. Establish maintenance commitments on post-construction pollution control measures.

California mandates all construction activities disturbing more than one acre of land to develop and implement Stormwater Pollution Prevention Plans (SWPPP). The SWPPP documents the selection and implementation of Best Management Practices (BMPs) for a

[5] Los Angeles Regional Water Quality Control Board. LARWQCB Basin Plan. <http://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/> accessed February 14, 2017.

specific construction project, charging owners with stormwater quality management responsibilities. A construction site subject to the General Permit must prepare and implement a SWPPP that meets the requirements of the General Permit.[6, 7]

Los Angeles County Municipal Storm Water System (MS4) Permit

As described above, USEPA regulations require that MS4 permittees implement a program to monitor and control pollutants being discharged to the municipal system from both industrial and commercial projects that contribute a substantial pollutant load to the MS4.

On November 8, 2012, the LARWQCB adopted Order No. R4-2012-0175 under the CWA and the Porter-Cologne Act. This Order is the NPDES permit or MS4 permit for municipal stormwater and urban runoff discharges within Los Angeles County. The requirements of this Order (the "Permit") cover 84 cities and most of the unincorporated areas of Los Angeles County. Under the Permit, the Los Angeles County Flood Control District (LACFCD) is designated as the Principal Permittee. The Permittees are the 84 Los Angeles County cities (including the City of Los Angeles) and Los Angeles County. Collectively, these are the "Co-Permittees". The Principal Permittee helps to facilitate activities necessary to comply with the requirements outlined in the Permit but is not responsible for ensuring compliance of any of the Permittees.

Stormwater Quality Management Program (SQMP)

In compliance with the Permit, the Co-Permittees are required to implement a stormwater quality management program (SQMP) with the goal of accomplishing the requirements of the Permit and reducing the amount of pollutants in stormwater runoff. The SWMP requires the County of Los Angeles and the 84 incorporated cities to:

- Implement a public information and participation program to conduct outreach on storm water pollution;
- Control discharges at commercial/industrial facilities through tracking, inspecting, and ensuring compliance at facilities that are critical sources of pollutants;
- Implement a development planning program for specified development projects;
- Implement a program to control construction runoff from construction activity at all construction sites within the relevant jurisdictions;

---

[6] State Water Resources Control Board. State Water Resources Control Board. July 2012, http://www.swrcb.ca.gov/water_issues/programs/npdes/.

[7] USEPA. U.S. Environmental Protection Agency - NPDES. July 2012, https://www.epa.gov/npdes.

- Implement a public agency activities program to minimize storm water pollution impacts from public agency activities; and

- Implement a program to document, track, and report illicit connections and discharges to the storm drain system.

The Permit contains the following provisions for implementation of the SQMP by the Co-Permittees:

1. General Requirements:

    - Each permittee is required to implement the SQMP in order to comply with applicable stormwater program requirements.

    - The SQMP shall be implemented and each permittee shall implement additional controls so that discharge of pollutants is reduced.

2. Best Management Practice Implementation:

    - Permittees are required to implement the most effective combination of BMPs for stormwater/urban runoff pollution control. This should result in the reduction of storm water runoff.

3. Revision of the SQMP:

    - Permittees are required to revise the SQMP in order to comply with requirements of the RWQCB while complying with regional watershed requirements and/or waste load allocations for implementation of Total Maximum Daily Loads (TMDLs) for impaired waterbodies.

4. Designation and Responsibilities of the Principal Permittee:

    The Los Angeles County Flood Control District is designated as the Principal Permittee who is responsible for:

    - Coordinating activities that comply with requirements outlined in the NPDES Permit;

    - Coordinating activities among Permittees;

    - Providing personnel and fiscal resources for necessary updates to the SQMP;

    - Providing technical support for committees required to implement the SQMP; and

- Implementing the Countywide Monitoring Program required under this Order and assessing the results of the monitoring program.

5. Responsibilities of Co-Permittees:

   Each Co-Permittee is required to comply with the requirements of the SQMP as applicable to the discharges within its geographical boundaries. These requirements include:

   - Coordinating among internal departments to facilitate the implementation of the SQMP requirements in an efficient way;

   - Participating in coordination with other internal agencies as necessary to successfully implement the requirements of the SQMP; and

   - Preparing an annual Budget Summary of expenditures for the storm water management program by providing an estimated breakdown of expenditures for different areas of concern, including budget projections for the following year.

6. Watershed Management Committees (WMCs):

   - Each WMC shall be comprised of a voting representative from each Permittee in the Watershed Management Area (WMA).

   - Each WMC is required to facilitate exchange of information between co-permittees, establish goals and deadlines for WMAs, prioritize pollution control measures, develop and update adequate information, and recommend appropriate revisions to the SQMP.

7. Legal Authority:

   - Co-Permittees are granted the legal authority to prohibit non-storm water discharges to the storm drain system including discharge to the MS4 from various development types.

City of Los Angeles Water Quality Compliance Master Plan for Urban Runoff

On March 2, 2007, City Council Motion 07-0663 was introduced by the City of Los Angeles City Council to develop a water quality master plan with strategic directions for planning, budgeting and funding to reduce pollution from urban runoff in the City of Los Angeles. The Water Quality Compliance Master Plan for Urban Runoff was developed by the Bureau of Sanitation, Watershed Protection Division in collaboration with stakeholders to address the requirements of this Council Motion. The primary goal of the Water Quality Compliance Master Plan for Urban Runoff is to help meet water quality regulations. Implementation of the Water Quality Compliance Master Plan for Urban Runoff is

intended over the next 20 to 30 years to result in cleaner neighborhoods, rivers, lakes and bays, augmented local water supply, reduced flood risk, more open space, and beaches that are safe for swimming. The Water Quality Compliance Master Plan for Urban Runoff also supports the Mayor and Council's efforts to make Los Angeles the greenest major city in the nation.

- The Water Quality Compliance Master Plan for Urban Runoff identifies and describes the various watersheds in the City, summarizes the water quality conditions of the City's waters, identifies known sources of pollutants, describes the governing regulations for water quality, describes the BMPs that are being implemented by the City, discusses existing TMDL Implementation Plans and Watershed Management Plans. Additionally, the Water Quality Compliance Master Plan for Urban Runoff provides an implementation strategy that includes the following three initiatives to achieve water quality goals:

- Water Quality Management Initiative, which describes how Water Quality Management Plans for each of the City's watershed and TMDL-specific Implementation Plans will be developed to ensure compliance with water quality regulations.

- The Citywide Collaboration Initiative, which recognizes that urban runoff management and urban (re)development are closely linked, requiring collaborations of many City agencies. This initiative requires the development of City policies, guidelines, and ordinances for green and sustainable approaches for urban runoff management.

- The Outreach Initiative, which promotes public education and community engagement with a focus on preventing urban runoff pollution.

- The Water Quality Compliance Master Plan for Urban Runoff includes a financial plan that provides a review of current sources of revenue, estimates costs for water quality compliance, and identifies new potential sources of revenue.

City of Los Angeles Stormwater Program

The City of Los Angeles supports the policies of the General Permit and the Los Angeles County NPDES permit through the *Development Best Management Practices Handbook. Part A Construction Activities,* 3rd Edition, and associated ordinances were adopted in September 2004. *Part B Planning Activities*, 4th Edition was adopted in June 2011. The Handbook provides guidance for developers in complying with the requirements of the Development Planning Program regulations of the City's Stormwater Program. Compliance with the requirements of this manual is required by City of Los Angeles Ordinance No. 173,494. The handbook and ordinances also have specific minimum BMP requirements for all construction activities and require dischargers whose construction projects disturb one acre or more of soil to prepare a SWPPP and file a Notice of Intent

(NOI) with the SWRCB. The NOI informs the SWRCB of a particular project and results in the issuance of a Waste Discharger Identification (WDID) number, which is needed to demonstrate compliance with the General Permit.

The City of Los Angeles implements the requirement to incorporate stormwater BMPs through the City's plan review and approval process. During the review process, project plans are reviewed for compliance with the City's General Plan, zoning ordinances, and other applicable local ordinances and codes, including storm water requirements. Plans and specifications are reviewed to ensure that the appropriate BMPs are incorporated to address storm water pollution prevention goals. The Standard Urban Stormwater Mitigation Plan (SUSMP) provisions that are applicable to new residential and commercial developments include, but are not limited to, the following:[8]

- Peak Storm Water Runoff Discharge Rate: Post-development peak stormwater runoff discharge rates shall not exceed the estimated pre-development rate for developments where the increased peak storm water discharge rate will result in increased potential for downstream erosion;

- Provide storm drain system Stenciling and Signage (only applicable if a catch basin is built on-site);

- Properly design outdoor material storage areas to provide secondary containment to prevent spills;

- Properly design trash storage areas to prevent off-site transport of trash;

- Provide proof of ongoing BMP Maintenance of any structural BMPs installed;

Design Standards for Structural or Treatment control BMPs:

- Conserve natural and landscaped areas;

- Provide planter boxes and/or landscaped areas in yard/courtyard spaces;

- Properly design trash storage areas to provide screens or walls to prevent off-site transport of trash;

- Provide proof on ongoing BMP maintenance of any structural BMPs installed;

Design Standards for Structural or Treatment Control BMPs:

---

[8] City of Los Angeles Stormwater Program website, http://www.lastormwater.org/green-la/standard-urban-stormwater-mitigation-plan/; accessed February 14, 2017.

- Post-construction treatment control BMPs are required to incorporate, at minimum, either a volumetric or flow based treatment control design or both, to mitigate (infiltrate, filter or treat) storm water runoff.

In addition, project applicants subject to the SUSMP requirements must select source control and, in most cases, treatment control BMPs from the list approved by the RWQCB. The BMPs must control peak flow discharge to provide stream channel and over bank flood protection, based on flow design criteria selected by the local agency. Further, the source and treatment control BMPs must be sufficiently designed and constructed to collectively treat, infiltrate, or filter stormwater runoff from one of the following:

- The 85th percentile 24-hour runoff event determined as the maximized capture stormwater volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ASCE Manual of Practice No. 87, (1998)*;

- The volume of annual runoff based on unit basin storage water quality volume, to achieve 80 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook—Industrial/ Commercial, (1993)*;

- The volume of runoff produced from a 0.75-inch storm event, prior to its discharge to a stormwater conveyance system; or

- The volume of runoff produced from a historical-record based reference 24-hour rainfall criterion for "treatment" (0.75-inch average for the Los Angeles County area) that achieves approximately the same reduction in pollutant loads achieved by the 85th percentile 24-hour runoff event.

Los Angeles Municipal Code

Section 64.70 of the LAMC sets forth the City's Stormwater and Urban Runoff Pollution Control Ordinance. The ordinance prohibits the discharge of the following into any storm drain system:

- Any liquids, solids, or gases which by reason of their nature or quantity are flammable, reactive, explosive, corrosive, or radioactive, or by interaction with other materials could result in fire, explosion or injury.

- Any solid or viscous materials, which could cause obstruction to the flow or operation of the storm drain system.

- Any pollutant that injures or constitutes a hazard to human, animal, plant, or fish life, or creates a public nuisance.

- Any noxious or malodorous liquid, gas, or solid in sufficient quantity, either singly or by interaction with other materials, which creates a public nuisance, hazard to life, or inhibits authorized entry of any person into the storm drain system.

- Any medical, infectious, toxic or hazardous material or waste.

Additionally, unless otherwise permitted by a NPDES permit, the ordinance prohibits industrial and commercial developments from discharging untreated wastewater or untreated runoff into the storm drain system. Furthermore, the ordinance prohibits trash or any other abandoned objects/materials from being deposited such that they could be carried into the storm drains. Lastly, the ordinance not only makes it a crime to discharge pollutants into the storm drain system and imposes fines on violators, but also gives City public officers the authority to issue citations or arrest business owners or residents who deliberately and knowingly dump or discharge hazardous chemicals or debris into the storm drain system.

Earthwork activities, including grading, are governed by the Los Angeles Building Code, which is contained in LAMC, Chapter IX, Article 1. Specifically, Section 91.7013 includes regulations pertaining to erosion control and drainage devices, and Section 91.7014 includes general construction requirements, as well as requirements regarding flood and mudflow protection.

Low Impact Development (LID)

In October 2011, the City of Los Angeles passed an ordinance (Ordinance No. 181899) amending LAMC Chapter VI, Article 4.4, Sections 64.70.01 and 64.72 to expand the applicability of the existing SUSMP requirements by imposing rainwater Low Impact Development (LID) strategies on projects that require building permits. The LID ordinance became effective on May 12, 2012.

LID is a stormwater management strategy with goals to mitigate the impacts of increased runoff and stormwater pollution as close to its source as possible. LID promotes the use of natural infiltration systems, evapotranspiration, and the reuse of stormwater. The goal of these LID practices is to remove nutrients, bacteria, and metals from stormwater while also reducing the quantity and intensity of stormwater flows. Through the use of various infiltration strategies, LID is aimed at minimizing impervious surface area. Where infiltration is not feasible, the use of bioretention, rain gardens, green roofs, and rain barrels that will store, evaporate, detain, and/or treat runoff may be used. [9]

The intent of the City of Los Angeles LID standards is to:

[9] City of Los Angeles. "Development Best Management Practices Handbook." June, 2011

- Require the use of LID practices in future developments and redevelopments to encourage the beneficial use of rainwater and urban runoff;
- Reduce stormwater/urban runoff while improving water quality;
- Promote rainwater harvesting;
- Reduce offsite runoff and provide increased groundwater recharge;
- Reduce erosion and hydrologic impacts downstream; and
- Enhance the recreational and aesthetic values in our communities.

The City of Los Angeles Bureau of Sanitation, Watershed Protection Division will adopt the LID standards as issued by the LARWQCB and the City of Los Angeles Department of Public Works. The LID Ordinance will conform to the regulations outlined in the NPDES Permit and SUSMP.

2.3. GROUNDWATER

Board Basin Plan for the Coastal Watersheds of Los Angeles and Ventura Counties

As required by the California Water Code, the LARWQCB has adopted the Basin Plan. Specifically, the Basin Plan designates beneficial uses for surface and ground waters, sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's anti-degradation policy, and describes implementation programs to protect all waters in the Los Angeles Region. In addition, the Basin Plan incorporates (by reference) all applicable State and Regional Board plans and policies and other pertinent water quality policies and regulations. Those of other agencies are referenced in appropriate sections throughout the Basin Plan.

The Basin Plan is a resource for the Regional Board and others who use water and/or discharge wastewater in the Los Angeles Region. Other agencies and organizations involved in environmental permitting and resource management activities also use the Basin Plan. Finally, the Basin Plan provides valuable information to the public about local water quality issues.

Safe Drinking Water Act (SDWA)

The Federal Safe Drinking Act, established in 1974, sets drinking water standards throughout the country and is administered by the USEPA. The drinking water standards established in the SDWA, as set forth in the Code of Federal Regulations (CFR), are referred to as the National Primary Drinking Water Regulations (Primary Standards, Title 40, CFR Part 141) and the National Secondary Drinking Water Regulations (Second Standards, 40 CFR Part 143). California passed its own Safe Drinking Water Act in 1986 that authorizes the State’s Department of Health Services (DHS) to protect the public from

contaminants in drinking water by establishing maximum contaminants levels (MCLs), as set forth in the CCR, Title 22, Division 4, Chapter 15, that are at least as stringent as those developed by the USEPA, as required by the federal Safe Drinking Water Act.

California Water Plan

The California Water Plan (the Plan) provides a framework for water managers, legislators, and the public to consider options and make decisions regarding California's water future. The Plan, which is updated every five years, presents basic data and information on California's water resources including water supply evaluations and assessments of agricultural, urban, and environmental water uses to quantify the gap between water supplies and uses. The Plan also identifies and evaluates existing and proposed statewide demand management and water supply augmentation programs and projects to address the State's water needs.

The goal for the California Water Plan Update is to meet Water Code requirements, receive broad support among those participating in California's water planning, and be a useful document for the public, water planners throughout the state, legislators and other decision-makers.

3. ENVIRONMENTAL SETTING

3.1. SURFACE WATER HYDROLOGY

3.1.1. REGIONAL

The Project Site is located within the Los Angeles River Watershed Reach 2 (from Carson to Figueroa Street) in the Los Angeles Central Basin.

The Watershed encompasses a land area of approximately 834 square miles. The eastern portion spans from the Santa Monica Mountains to Simi Hills and in the west from the Santa Susana Mountains to the San Gabriel Mountains.

The watershed is shaped by the path of the Los Angeles River, which flows from its headwaters in the mountains eastward toward the northern corner of Griffith Park. There the channel turns southward through Glendale Narrows before it flows across the coastal plan and into San Pedro near Long Beach.

The Los Angeles River has evolved from an uncontrolled, meandering river providing a valuable source of water for early inhabitants to a major flood protection waterway.

The City of Los Angeles River Watershed Section is tasked with finding ways to restore or revitalize the channels within the watershed and thereby provide significant opportunities for recreation and aesthetic improvement for the Los Angeles metropolitan area while protecting the Los Angeles Basin from major flooding. Refer to Figure 1 for Los Angeles River Watershed Map.

3.1.2. LOCAL

There is an existing 21-inch underground storm drain pipe located along 1st Street that flows towards the southeast. Two catch basins located at the intersection of 1st Street and S. Spring Street connects to this underground storm drain line. In addition, there is a 14-inch underground storm drain pipe located along 2nd Street that flows also toward to the southeast. There is one catch basin located at the intersection of 2nd Street and S Broadway and two catch basins located at the intersection of 2nd Street and S. Spring street that connect to this underground storm drain. All of these pipes and catch basins system are owned and maintained by the City of Los Angeles.

Stormwater runoff from the Project Site will discharge toward the offsite catch basins and underground storm drain pipes that convey stormwater through various underground pipe networks into the Los Angeles River. The Los Angeles River flows generally southward, ultimately discharging into the Pacific Ocean at the San Pedro Bay, near Long Beach. The Los Angeles River was designed to discharge up to approximately 183,000 cubic feet of stormwater per second from a 50-year frequency storm event.[10]

3.1.3. ON SITE

The subject site consists of one city block in downtown Los Angeles bounded by S. Broadway, S. Spring Street, W. 1st Street, and W. 2nd Street. The eastern portion of the site is currently occupied by the historic Los Angeles Times North building, the Los Angeles Times South building, and the Plant building. The western portion of the site is occupied by a multi-story office building (Chandler building) and parking structure. Based on the historic drawings, the existing structures are underlain by up to three subterranean levels. The total site area is approximately 160,578 square feet.

Based on the existing site orientation and location of the main storm drain pipes, it has been assumed that the eastern portion of the site discharging to Spring Street and the western portion to Broadway. It appears that there is not any storm drainage infrastructure on the existing site.

See attached Figure 2 for existing on-site drainage pattern and Figure 4 for hydrology calculations.

Table 1 below shows existing volumetric flow rate generated by the 50-year storm event.

Table 1- Existing Drainage Stormwater Runoff Calculations		
Drainage Area	Area (Acres)	Q50 (cfs) (volumetric flow rate measured in cubic feet per second)
Sub-area A (West portion)	1.8	5.8582
Sub-area B (East portion)	1.8	5.8266

[10] http://www.ladpw.org/wmd/watershed/bc/; accessed Feburary 14, 2017

3.2. SURFACE WATER QUALITY

3.2.1. REGIONAL

As stated above, the Project Site lies within the Los Angeles River Watershed. Constituents of concern listed for Los Angeles River under California's Clean Water Act Section 303(d) List include cadmium (sediment), Trash, coliform bacteria, copper (dissolved), lead, Escherichia (E.Coli), selenium, sediment toxicity, Shellfish Harvesting Advisory, silver, toxicity, trash, viruses (Enteric), and zinc. No TMDL data have been recorded by EPA for this waterbody[11].

3.2.2. LOCAL

In general, urban stormwater runoff occurs following precipitation events, with the volume of runoff flowing into the drainage system depending on the intensity and duration of the rain event. Contaminants that may be found in stormwater from developed areas include sediments, trash, bacteria, metals, nutrients, organics and pesticides. The source of contaminants includes surface areas where precipitation falls, as well as the air through which it falls. Contaminants on surfaces such as roads, maintenance areas, parking lots, and buildings, which are usually contained in dry weather conditions, may be carried by rainfall runoff into drainage systems. The City of Los Angeles typically installs catch basins with screens to capture debris before entering the storm drain system. In addition, the City conducts routine street cleaning operations, as well as periodic cleaning and maintenance of catch basins, to reduce stormwater pollution within the City.

3.2.3. ON SITE

LA Times Building and other buildings on the block were roughly built in 1930's. Based on the year those buildings were built, it is assumed, the Project Site currently does not implement Best Management Practices (BMPs). As it has been explained earlier in this report, it has been assumed that the eastern portion of the site is discharging to the Spring Street and the western portion to Broadway.

It appears that the runoff water does not get treated on site before get discharged to main storm drain facility. Please see Figure 2 for existing drainage exhibit.

[11] https://iaspub.epa.gov/waters10/attains_waterbody.control?p_au_id=CAR4051501019990202085021&p_cycle=2012; accessed Feburary 14, 2017.

3.3. GROUNDWATER HYDROLOGY

3.3.1. REGIONAL

Groundwater within Los Angeles County is stored in ground water basins underlying five major geographic areas. The Los Angeles River traverses over two of these geographic areas; San Fernando Valley and Coastal Plain. These areas contain three ground water Basins which underlay the river for its entire length; San Fernando Main Basin, Central Basin, and West Coast Basin. The largest basin is the San Fernando Main Basin.

Groundwater use for domestic water supply is a major beneficial use of groundwater basins in Los Angeles County. The City of Los Angeles overlies the Los Angeles Coastal Plain Groundwater Basin (Basin). The Basin is comprised of the Hollywood, Santa Monica, Central, and West Coast Groundwater Subbasins. Groundwater flow in the Basin is generally south-southwesterly and may be restricted by natural geological features. Replenishment of groundwater basins occurs mainly by percolation of precipitation throughout the region via permeable surfaces, spreading grounds, and groundwater migration from adjacent basins, as well as injection wells designed to pump freshwater along specific seawater barriers to prevent the intrusion of salt water. Refer to Figure 5 for the groundwater basin exhibit.

3.3.2. LOCAL

The Project Site specifically overlies northeastern portion of the Central Subbasin. The Central Subbasin is bounded on the north by the Santa Monica Mountains and the Hollywood fault, on the east by the Elysian Hills, on the west by the Inglewood fault zone, and on the south by the La Brea high, formed by an anticline that brings impermeable rocks close to the surface.[12]

Groundwater in the Subbasin is replenished by percolation of precipitation and stream flow from the Santa Monica Mountains to the north. Over time, urbanization has decreased the amount of pervious surfaces limiting natural recharge through direct percolation. The natural safe yield of the Subbasin is estimated to be approximately 3,000 acre-feet per year (AFY).

3.3.3. ON-SITE

The entire existing site is approximately 100% impervious. Stormwater runoff will leave the site and drains through the curb drain in the street. Therefore the existing site does not have any impact to ground water. Refer to Figure 2 for the existing on-site drainage pattern.

---

[12] http://www.water.ca.gov/groundwater/bulletin118/basindescriptions/4-11.04.pdf

Based on, Geotechnical investigation prepared for the project site, review of the Seismic Hazard Zone Report for the Los Angeles 7.5 Minute Quadrangle, Los Angeles County, California (California Division of Mines and Geology [CDMG], 1998), the historically highest groundwater level in the area is reported to be approximately 25 feet beneath the ground surface.

Groundwater information presented in geotechnical report is generated from data collected in the early 1900's to the late 1990's. Based on current groundwater basin management practices, it is unlikely that groundwater levels will ever reach the historic high levels.

Considering the reported historic high groundwater level (CDMG, 1998), the seepage encountered above the bedrock contact in the majority of borings drilled on adjacent sites, and the depth of the proposed excavations, it is anticipated that seepage will be encountered during construction of the proposed subterranean levels. Geotechnical engineer believes that the groundwater seepage encountered in borings on the adjacent sites does not represent the static groundwater table, but represents discontinuous perched zones within the saturated granular soils overlying the relatively impermeable siltstone.

It is not uncommon for groundwater levels to vary seasonally or for groundwater seepage conditions to develop where none previously existed, especially in impermeable fine-grained soils or bedrock which are heavily irrigated or after seasonal rainfall.

In addition, recent requirements for stormwater infiltration could result in shallower seepage conditions in the region. Proper surface drainage of irrigation and precipitation will be critical for future performance of the project[13].

[13] GEOCON WEST INC. Preliminary geotechnical evaluation Project No. A9521-06-01, Nov 29 2016

3.4. GROUNDWATER QUALITY

3.4.1. REGIONAL

As stated above, the City of Los Angeles overlies the Los Angeles Coastal Plain Groundwater Basin, which falls under the jurisdiction of the Los Angeles Regional Water Quality Control Board (LARWQCB). According to LARWQCB's Basin Plan, objectives applying to all ground waters of the region include bacteria, chemical constituents and radioactivity, mineral quality, nitrogen (nitrate, nitrite), and taste and odor.[14]

3.4.2. LOCAL

As stated above, the Project Site specifically overlies the Central Subbasin. Based upon LARWQCB's Basin Plan, constituents of concern listed for the Central Subbasin include boron, chloride, sulfate, and Total Dissolved Solids (TDS)

3.4.3. ON-SITE

The existing Project Site is fully improved with the existing buildings and mostly paved hardscape surfaces, and therefore does not substantially contribute to groundwater recharge. Therefore, the existing Project Site does not contribute to groundwater pollution or otherwise adversely impact groundwater quality.

Other types of risk such as underground storage tanks have a greater potential to impact groundwater.It appears no underground storage tanks are currently operated by the Project. Per the Phase I and II Environmental Site Assessment performed by Advantage Environmental Consultants on August 28, 2017 for the LA Times Property, it appears that there are three underground storage tanks in the vicinity of the site that have been abandoned (two 6,000-gallon diesel underground storage tanks and one 3,000 gallon gasoline underground storage tank.

4. SIGNIFICANCE THRESHOLDS

4.1. SURFACE WATER HYDROLOGY

Appendix G of the State of California's CEQA Guidelines provides a set of sample questions that address impacts with regard to surface water hydrology. These questions are as follows:

Would the project:

---

[14] Los Angeles Regional Water Quality Control Board, Basin Plan, March 2013, http://www.waterboards.ca.gov/losangeles/water_issues/programs/basin_plan/electronics_documents/Final%20Chapter%203%20Text.pdf accessed February 14, 2017.

- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site;

- Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in flooding on- or off-site;

- Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff

- Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map;

- Place within a 100-year flood hazard area structures which would impede or redirect flood flows;

- Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as result of the failure of levee or dam;

In the context of these questions from Appendix G of the CEQA Guidelines, the City of Los Angeles CEQA Thresholds Guide (*L.A. CEQA Thresholds Guide*) states that a project would normally have a significant impact on surface water hydrology if it would:

- Cause flooding during the projected 50-year developed storm event, which would have the potential to harm people or damage property or sensitive biological resources;

- Substantially reduce or increase the amount of surface water in a water body; or

- Result in a permanent, adverse change to the movement of surface water sufficient to produce a substantial change in the current or direction of water flow.

4.2. SURFACE WATER QUALITY

Appendix G of the CEQA Guidelines provides a set of sample questions that address impacts with regard to surface water quality. These questions are as follows:

Would the project:

- Violate any water quality standard or waste discharge requirements; or
- Otherwise substantially degrade water quality.

In the context of the above questions from Appendix G, the *L.A. CEQA Thresholds Guide* states that a project would normally have a significant impact on surface water quality if it would result in discharges that would create pollution, contamination or nuisance, as defined in Section 13050 of the California Water Code (CWC) or that cause regulatory standards to be violated, as defined in the applicable NPDES stormwater permit or Water Quality Control Plan for the receiving water body.

The CWC includes the following definitions:

- "Pollution" means an alteration of the quality of the waters of the state to a degree which unreasonably affects either of the following: 1) the waters for beneficial uses or 2) facilities which serve these beneficial uses. "Pollution" may include "Contamination".
- "Contamination" means an impairment of the quality of the waters of the state by waste to a degree, which creates a hazard to the public health through poisoning or though the spread of disease. "Contamination" includes any equivalent effect resulting from the disposal of waste, whether or not waters of the state are affected.
- "Nuisance" means anything which meets all of the following requirements: 1) is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; 2) affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; and 3) occurs during, or as a result of, the treatment or disposal of wastes.[15]

4.3. GROUNDWATER HYDROLOGY

Appendix G of the CEQA Guidelines provides a sample question that addresses impacts with regard to groundwater. This question is as follows:

Would the project:

- Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or lowering of the local groundwater table;

In the context of the above question from Appendix G, the *L.A. CEQA Thresholds Guide* states that a project would normally have a significant impact on groundwater if it would:

- Change potable water levels sufficiently to:
    - Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported

[15] City of Los Angeles.LA. CEQA Thresholds Guide. 2006 http://www.environmentla.org/programs/Thresholds/Complete%20Threshold%20Guide%202006.pdf

water, summer/winter peaking, or to respond to emergencies and drought;

- Reduce yields of adjacent wells or well fields (public or private); or
- Adversely change the rate or direction of flow of groundwater; or

- Result in demonstrable and sustained reduction of groundwater recharge capacity.

4.4. GROUNDWATER QUALITY

With respect to groundwater quality, and in the context of the above question from Appendix G pertaining to groundwater, the *L.A. CEQA Thresholds Guide* states that a project would normally have a significant impact on groundwater quality if it would:

- Affect the rate or change the direction of movement of existing contaminants;
- Expand the area affected by contaminants;
- Result in an increased level of groundwater contamination (including that from direct percolation, injection or salt water intrusion); or
- Cause regulatory water quality standards at an existing production well to be violated, as defined in the California Code of Regulations (CCR), Title 22, Division 4, and Chapter 15 and in the Safe Drinking Water Act.

5. METHODOLOGY

5.1. SURFACE WATER HYDROLOGY

The Project Site is located within the City of Los Angeles, and drainage collection, treatment and conveyance are regulated by the City. Per the City's Special Order No. 007-1299, December 3, 1999, the City has adopted the Los Angeles County Department of Public Works (LACDPW) Hydrology Manual as its basis of design for storm drainage facilities. The LACDPW Hydrology Manual requires projects to have drainage facilities that meet the Urban Flood level of protection. The Urban Flood is runoff from a 25-year frequency design storm falling on a saturated watershed. A 25-year frequency design storm has a probability of 1/25 of being equaled or exceeded in any year. The *L.A. CEQA Thresholds Guide*, however, establishes the 50-year frequency design storm event as the threshold to analyze potential impacts on surface water hydrology as a result of development. To provide a more conservative analysis, this report analyzes the larger storm event threshold, i.e., the 50-year frequency design storm event.

The Modified Rational Method was used to calculate storm water runoff. The "peak" (maximum value) runoff for a drainage area is calculated using the formula, **Q = CIA**

Where,

Q = Volumetric flow rate (cfs)
C = Runoff coefficient (dimensionless)
I = Rainfall Intensity at a given point in time (in/hr)
A = Basin area (acres)

The Modified Rational Method assumes that a steady, uniform rainfall rate will produce maximum runoff when all parts of the basin area are contributing to outflow. This occurs when the storm event lasts longer than the time of concentration. The time of concentration (Tc) is the time it takes for rain in the most hydrologically remote part of the basin area to reach the outlet.

The method assumes that the runoff coefficient (C) remains constant during a storm. The runoff coefficient is a function of both the soil characteristics and the percentage of impervious surfaces in the drainage area.

LACDPW has developed a time of concentration calculator, Hydrocalc, to automate time of concentration calculations as well as the peak runoff rates and volumes using the Modified Rational Method design criteria as outlined in the Hydrology Manual. The data input requirements include: sub-area size, soil type, land use, flow path length, flow path slope and rainfall isohyet. The Hydrocalc Calculator was used to calculate the storm water peak runoff flow rate for the Project conditions by evaluating an individual sub-area independent of all adjacent subareas. See Figure 4 for the Hydrocalc Calculator results and Figure 7 for the Isohyet Map.

5.2. SURFACE WATER QUALITY

5.2.1. CONSTRUCTION

Construction BMPs will be designed and maintained as part of the implementation of the SWPPP in compliance with the General Permit. The SWPPP shall begin when construction commences, before any site clearing and grubbing or demolition activity. During construction, the SWPPP will be referred to regularly and amended as changes occur throughout the construction process. The Notice of Intent (NOI), Amendments to the SWPPP, Annual Reports, Rain Event Action Plans (REAPs), and Non-Compliance Reporting will be posted to the State's SMARTS website in compliance with the requirements of the General Permit.

5.2.2. OPERATION

The Project will meet the requirements of the City's LID standards.[16] Under section 3.1.3. of the LID Manual, post-construction stormwater runoff from a new development must be

[16] The Development Best Management Practices Handbook, Part B Planning Activities, 5th edition was adopted by the City of Los Angeles, Board of Public Works on July 1, 2011 to reflect Low Impact Development (LID) requirements that took effect May 12, 2012.

infiltrated, evapotranspirated, captured and used, and/or treated through high efficiency BMPs onsite for at least the volume of water produced by the greater of the 85th percentile storm or the 0.75 inch storm event. The LID Manual prioritized the selection of BMPs used to comply with stormwater mitigation requirement. The order of priority is:

1. Infiltration Systems
2. Stormwater Capture and Use
3. High Efficient Biofiltration/Bioretention Systems
4. Combination of Any of the Above

Feasibility screening delineated in the LID manual is applied to determine which BMP will best suit the Project. Specifically, LID guidelines require that infiltration systems maintain at least 10 feet of clearance to the groundwater, property line, and any building structure. Per the Project Geotechnical Report, groundwater seepage was encountered above the sedimentary bedrock of the Fernando Formation at depths ranging between 20 and 23 feet beneath the existing ground surface.

The historic high groundwater level is approximately 25 feet below the ground surface. Hence, taking the historic high groundwater level and the Project's planned depth of approximately 90 feet below the ground surface, infiltration is not considered feasible. In addition, in the Geotechnical investigation prepared for the project site[17], , infiltration is not considered feasible due to the proximity of the existing and proposed structures to the groundwater.

Therefore, stormwater capture and use will likely be required. Approximately 12,240 square feet of landscaping would be required to justify the feasibility of a stormwater Capture and Use system per LID guidelines. The storage volume of 82,301 gallon is required for capturing the runoff water from the roof and surface drains, for feeding landscaped areas. However, if capture and use is later determined to not be feasible, the Project would then be required to implement High Efficiency Biofiltration/Bioretention Systems. In that case, 10,275 square feet of Biofiltration Planter would be required on the structure. See Figure 6 for LID calculations.

According to the City's LID Handbook, all cisterns shall be sized to capture the runoff generated from the greater of the 85th percentile storm and the 0.75-inch storm event at a minimum:

Vdesign (gallons) = (85th percentile or 0.75 inch * 7.48 gallons/cubic foot) * Catchment Area (sq. ft.)

Where:

[17] GEOCON WEST INC. Preliminary geotechnical evaluation Project No. A9521-06-01, Nov 29 2016

Catchment Area = (Impervious Area x 0.9) + [(Pervious Area + Undeveloped Area) x 0.1]

For catchment areas given in acres, multiply the above equation by 43,560 sq. ft./acre.

5.3. GROUNDWATER

The significance of this Project as it relates to the level of the underlying groundwater table of the Central Subbasin Groundwater Basin included a review of the following considerations:

Analysis and Description of the Project's Existing Condition

- Identification of the Central Subbasin as the underlying groundwater basin, and description of the level, quality, direction of flow, and existing uses for the water;
- Description of the location, existing uses, production capacity, quality, and other pertinent data for spreading grounds and potable water wells in the vicinity (usually within a one-mile radius), and;
- Area and degree of permeability of soils on the Project Site, and;

Analysis of the Proposed Project Impact on Groundwater Level

- Description of the rate, duration, location and quantity of extraction, dewatering, spreading, injection, or other activities;
- The projected reduction in groundwater resources and any existing wells in the vicinity (usually within a one-mile radius); and
- The projected change in local or regional groundwater flow patterns.

In addition, this report discusses the impact of both existing and proposed activities at the Project Site on the groundwater quality of the underlying Central Subbasin.

Short-term groundwater quality impacts could potentially occur during construction of the Project as a result of soil or shallow groundwater being exposed to construction materials, wastes, and spilled materials. These potential impacts are qualitatively assessed.

6. PROJECT IMPACT ANALYSIS

6.1. CONSTRUCTION

6.1.1. SURFACE WATER HYDROLOGY

The subject site consists of one city block in downtown Los Angeles bounded by S. Broadway, S. Spring Street, W. 1st Street, and W. 2nd Street. The eastern portion of the site is currently occupied by the historic Times building, the Mirror building, and the Plant building. The western portion of the site is occupied by a multi-story office building (Executive Building) and parking structure. Based on the historic drawings, the existing structures are underlain by up to three subterranean levels.

Construction activities for the Project include demolition of Executive Building and parking structure, site clearing and excavating down approximately 90 feet below the 1st Street sidewalk elevation to construct 9 subterranean parking levels.

It is anticipated that approximately 364, 000 cubic yards of soil would need to be exported as a result of the Project. These activities will temporarily expose the underlying soils and may make the Project Site temporarily more permeable. Also, exposed and stockpiled soils could be subject to wind and conveyance into nearby storm drains during storm events. In addition, on-site watering activities to reduce airborne dust could contribute to pollutant loading in runoff.

However, as the construction site would be greater than one acre, the Project would be required to obtain coverage under the NPDES General Construction stormwater permit. In accordance with the requirements of this permit, the Project would implement a SWPPP that specifies BMPs and erosion control measures to be used during construction to manage runoff flows and prevent pollution. BMPs would be designed to reduce runoff and pollutant levels in runoff during construction. The NPDES and SWPPP measures are designed to (and would in fact) contain and treat, as necessary, stormwater or construction watering on the Project site so runoff does not impact off-site drainage facilities or receiving waters. Construction activities are temporary and flow directions and runoff volumes during construction will be controlled.

In addition, the Project will comply with all applicable City grading permit regulations, plans, and inspections to reduce sedimentation and erosion. Thus, through compliance with NPDES General Construction Permit requirements, implementation of BMPs, and compliance with applicable City grading regulations, the Project would not substantially alter the Project Site drainage patterns in a manner that would result in substantial erosion or siltation. The Project would not result in a permanent adverse change to the movement of surface water. Therefore, construction-related impacts to surface water hydrology would be less than significant.

6.1.2. SURFACE WATER QUALITY

Construction activities such as earth moving, maintenance of construction equipment, handling of construction materials, and dewatering, can contribute to pollutant loading in stormwater runoff.

However, as previously discussed, construction contractors disturbing greater than on acre of soil would be required to obtain coverage under the NPDES General Construction

Permit (order No. 2012-0006-DWQ). In accordance with the requirements of the permit, the Project Applicants would prepare and implement a site-specific SWPPP adhering to the California Stormwater Quality Association (CASQA) BMP Handbook. The SWPPP would specify BMPs to be used during construction. BMPs would include but not be limited to: erosion control, sediment control, non-stormwater management, and materials management BMPs. Refer to Exhibit 1 for typical SWPPP BMPs to be implemented during construction of the Project.

The Project is expected to require dewatering during construction. Dewatering operations are practices that discharge non-stormwater, such as groundwater, that must be removed from a work location to proceed with construction into the drainage system. Discharges from dewatering operations can contain high levels of fine sediments, which if not properly treated, could lead to exceedance of the NPDES requirements. During construction, temporary pumps and filtration would be utilized in compliance with the NPDES permit. The temporary system would comply with all relevant NPDES requirements related to construction and discharges from dewatering operations.

With implementation of the Erosion Control Plan, site-specific BMPs would reduce or eliminate the discharge of potential pollutants from stormwater runoff. In addition, the Project Applicant would be required to comply with City grading permit regulations and inspections to reduce sedimentation and erosion. Construction of the Project would not result in discharge that would cause: (1) pollution which would alter the quality of the water of the State (i.e., Los Angeles River) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the water of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes. Furthermore, construction of the Project would not result in discharges that would cause regulatory standards to be violated in the Los Angeles River Watershed. Therefore, temporary construction-related impacts on surface water quality would be less than significant.

6.1.3. GROUNDWATER HYDROLOGY

As stated above, construction activities for the Project would include excavating down approximately 90 feet for subterranean parking, building up the structure, and hardscape and landscape around the structure. As described in the Geotechnical Investigation[18] prepared for the Project Site, groundwater was observed at 23 to 25 feet below ground surface. During construction, temporary dewatering would occur if required. The temporary system would comply with all relevant NPDES requirements related to construction and discharges from dewatering operations. Similar to the Construction General Permit, in order to be authorized to discharge under this Permit, the developer must submit a NOI to discharge groundwater generated from dewatering operations during

[18] GEOCON WEST INC. Preliminary geotechnical evaluation Project No. A9521-06-01, Nov 29 2016

construction. Due to the operation of dewatering systems being temporary, local groundwater hydrology in the immediate vicinity of the Site is minimally affected. The purpose of dewatering operations is for the protection of both existing and proposed building structures. Due to the limited and temporary nature of temporary dewatering operations, regional impacts to groundwater flow and level are not considered to be significant. Therefore, as Project development would not adversely impact the rate or direction of flow of groundwater and no water supply wells would be affected, the Project would not result in a significant impact on groundwater hydrology during construction.

6.1.4. GROUNDWATER QUALITY

As discussed above, the Project would include excavations to a maximum depth of approximately90feet below ground surface. The Project would also result in a net export of existing soil material. Although not anticipated at the Project Site, any contaminated soils found would be captured within that volume of excavated material, removed from the Project Site, and remediated at an approved disposal facility in accordance with regulatory requirements.

During on-site grading and building construction, hazardous materials, such as fuels, paints, solvents, and concrete additives, could be used and would therefore require proper management and, in some cases, disposal. The management of any resultant hazardous wastes could increase the opportunity for hazardous materials releases into groundwater. Compliance with all applicable federal, state, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater that could affect existing contaminants, expand the area or increase the level of groundwater contamination, or cause a violation of regulatory water quality standards at an existing production well. Due to compliance with measures as listed above and the implementation of BMPs, though there are groundwater production wells or public water supply wells within one mile of the Project Site, construction activities would not be anticipated to affect existing wells. Therefore, the Project would not result in any substantial increase in groundwater contamination through hazardous materials releases and impacts on groundwater quality would be less than significant.

6.2. OPERATION

6.2.1. SURFACE WATER HYDROLOGY

The project site is expected to decrease the overall percentage of impervious area from the current condition of the project site. The project will develop a building and paved area creating a post-project condition of approximately 92% impervious surface area. Due to LID requirement, project is required to provide at least equivalent of 8% of the site, landscape or biofiltration planter for treating the runoff water.

Accordingly, there is no incremental increase in the imperviousness of the project site. Therefore, peak flow rates would not increase and the runoff volumes into the existing storm drain system would decrease.

Table 2 below shows the existing and proposed peak flow rates stormwater runoff calculations for the 50-year frequency design storm event. A comparison of the pre and post peak flow rates indicates no increase in stormwater runoff. Rather, a slight decrease in the flow rate is anticipated in the post-project condition. Consequently, the Project would not cause flooding during the 50-year developed storm event, would not create runoff which would exceed the capacity of existing or planned drainage systems, would not require construction of new stormwater drainage facilities or expansion of existing facilities, would not substantially reduce or increase the amount of surface water in a water body, or result in a permanent adverse change to the movement of surface water. As such, operation of the Project would result in a less than significant impact on surface water hydrology.

Table 2 – Existing and Proposed Stormwater Runoff Calculations

Drainage Area	Project Site Area (Acres)[(b)]	Pre-Project Q_{50} (cfs)[(a)]	Post-Project Q_{50} (cfs)[(a)]	Incremental Increase from Existing to Proposed Condition
Sub-area A (West portion)	1.8	5.8582	5.8392	-0.32%
Sub-area B (East portion)	1.8	5.8266	5.8076	-0.32%

(a) peak volumetric flow rate measured in cubic feet per second
(b) It is assumed the proposed 8% landscape or planter area has been divided equally between Sub-area A & B.

The LID requirements for the Project Site would outline the stormwater treatment post-construction BMPs required to control pollutants associated with storm events up to the 85th percentile storm event. The Project BMPs will mitigate the stormwater runoff quality and quantity.

Lastly, no water bodies are located on or within the immediate vicinity of the Project Site, and as such, the Project would not substantially reduce or increase the amount of surface water in a local water body. The Project would result in a slight (0.64 cfs) decrease in the peak flow rate of stormwater runoff discharging to the Los Angeles River (the local receiving water). However, this decrease would be negligible when compared to the approximately 183,000 cfs capacity of the Los Angeles River, and would not substantially affect the surface water levels of the River.

The Project would not cause flooding during the 50-year developed storm event, would not create runoff which would exceed the capacity of existing or planned drainage systems, would not require construction of new stormwater drainage facilities or expansion of existing facilities, would not substantially reduce or increase the amount of surface water in a water body, or result in a permanent adverse change to the movement of surface water. Therefore, potential operational impacts to site surface water hydrology would be less than significant.

The Project Site is not located within a 100-year flood plain or within an area that could be impacted by a seiche, tsunami or mudflow. Dam safety regulations are the primary means of reducing damage or injury due to inundation occurring from dam failure. The California Division of Safety of Dams regulates the siting, design, construction, and periodic review of all dams in the State. In addition, the Los Angeles Department of Water and Power (LADWP) operate the dam and mitigate the potential for overflow and seiche hazard through control of water levels and dam wall height. These measures include seismic retrofits and other related dam improvements completed under the requirements of the 1972 State Dam Safety Act. The City's Local Hazard Mitigation Plan,[19] which was adopted in July 2011, provides a list of existing programs, proposed activities and specific projects that may assist the City of Los Angeles in reducing risk and preventing loss of life and property damage from natural and human-caused hazards, including dam failure. The Hazard Mitigation Plan evaluation of dam failure vulnerability classifies dam failure as a moderate risk rating. Therefore, considering the above information and risk reduction projects, the risk of flooding from inundation by a seiche or dam failure is considered low and impacts are less than significant.

6.2.2. SURFACE WATER QUALITY

The Project Site will not increase concentrations of the items listed as constituents of concern for the Los Angeles River Watershed.

Under section 3.1.3. of the LID Manual, post-construction stormwater runoff from new projects must be infiltrated, evapotranspirated, captured and used, and/or treated through high efficiency BMPs onsite for the volume of water produced by the 85th percentile storm event. As indicated in section 5.2.2. of this report, stormwater capture and use will likely be required. A storage tank/s with a volume of 82,301 gallons is required for capturing the runoff water from the roof and surface drains, for feeding approximately 12,240 square feet landscape areas. If high efficiency biofiltration/bioretention is selected instead, roof/surface drains,cisterns, and 10,275 sf of on-site biofiltration planter area, would be provided. The stormwater will be pumped to the landscape planters from storage tank, for irrigation. Any excess rainfall volume will be conveyed to the adjacent streets by means of curb drain outlets.

---

[19] City of Los Angeles Emergency Management Department, *Local Hazard Mitigation Plan,* July 1, 2011.

The Project will implement either Capture and Use System, or Biofiltration Planters for managing stormwater runoff in accordance with current LID requirements.

Operation of the Project would not result in discharges that would cause: (1) pollution which would alter the quality of the waters of the State (i.e., Los Angeles River) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes.

As is typical of most urban developments, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. Anticipated and potential pollutants generated by the Project include sediment, nutrients, pesticides, metals, pathogens, and oil and grease. The pollutants listed above would be mitigated through the implementation of approved LID BMPs.

Furthermore, operation of the Project would not result in discharges that would cause regulatory standards to be violated. A portion of the Project Site will be allocated to stormwater mitigation, in compliance with LID BMP requirements, to control and treat stormwater runoff to mitigate the 85th percentile storm event. The installed BMP systems will be designed with an internal bypass overflow system to prevent upstream flooding during major storm events. Implementation of LID BMPs will mitigate operational impacts on surface water quality.

6.2.3. GROUNDWATER HYDROLOGY

Regarding groundwater recharge, the entire Project Site is virtually impervious in the existing condition, and there is minimal groundwater recharge potential. The Project will develop hardscape and structures that cover approximately 100% of the Project Site with impervious surfaces and is not anticipated to have any impact on the groundwater recharge potential. As stated above, any stormwater that bypasses the BMP systems would discharge to an approved discharge point in the public right-of-way and not result in infiltration of a large amount of rainfall that would affect groundwater hydrology, including the direction of groundwater flow. Therefore, the Project's potential impact on groundwater recharge is less than significant.

As discussed above, the Project would include excavations to a maximum depth of approximately 90 feet below ground surface. The Project would also result in a net export of existing soil material. Although not anticipated at the Project Site, any contaminated soils found would be captured within that volume of excavated material, removed from the Project Site, and remediated at an approved disposal facility in accordance with regulatory requirements.

As described in the Geotechnical Investigation Report prepared by Geocon West, Inc for the Project Site, the historic groundwater level in the vicinity of the Project site was on the

order of 20 to 25 feet below grade. Based on the subterranean nature of the proposed structure and the conditions encountered during site exploration of the adjacent properties, it is expected that groundwater would be encountered. That would require either the subterranean portion of the structure to be designed for full hydrostatic pressure and buoyancy or a permanent dewatering system be implemented to relieve and mitigate the water pressure. Permanent dewatering operations utilized are to be in compliance with all relevant NPDES requirements related to dewatering operations. In addition, any dewatered groundwater shall be reinjected into the ground. Therefore, operation of the project would result in a less than significant impact on groundwater hydrology, including groundwater levels.

During on-site grading and building construction, hazardous materials, such as fuels, paints, solvents, and concrete additives, could be used and would therefore require proper management and, in some cases, disposal. The management of any resultant hazardous wastes could increase the opportunity for hazardous materials releases into groundwater. Compliance with all applicable federal, state, and local requirements concerning the handling, storage and disposal of hazardous waste, would reduce the potential for the construction of the Project to release contaminants into groundwater that could affect existing contaminants, expand the area or increase the level of groundwater contamination, or cause a violation of regulatory water quality standards at an existing production well. Due to compliance with measures as listed above and the implementation of BMPs, though there are groundwater production wells or public water supply wells within one mile of the Project Site, construction activities would not be anticipated to affect existing wells. Therefore, the Project would not result in any substantial increase in groundwater contamination through hazardous materials releases and impacts on groundwater quality would be less than significant.

6.2.4. GROUNDWATER QUALITY

The Project does not include the installation of water wells, or any extraction or recharge system that is in the vicinity of the coast, an area of known groundwater contamination or seawater intrusion, a municipal supply well or spreading ground facility.

Operational activities which could affect groundwater quality include hazardous material spills and leaking underground storage tanks. No underground storage tanks are currently operated or will be operated by the Project. The Project would not expand any potential areas of contamination, increasing the level of contamination, or cause regulatory water quality standard violations, as defined in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act.

The Project is not anticipated to result in releases or spills of contaminants that could reach a groundwater recharge area or spreading ground or otherwise reach groundwater through percolation. The Project does not involve drilling to or through a clean or contaminated aquifer. Therefore, the Project's potential impact on groundwater recharge is less than significant.

6.3. CUMULATIVE IMPACT ANALYSIS

6.3.1. SURFACE WATER HYDROLOGY

The geographic context for the cumulative impact analysis on surface water hydrology is the Los Angeles River Watershed. In accordance with City requirements, the Project and related projects would be required to implement BMPs to manage stormwater runoff in accordance with LID guidelines. Furthermore, the City of Los Angeles Department of Public Works reviews projects on a case-by-case basis to ensure sufficient local and regional infrastructure is available to accommodate stormwater runoff. Therefore, potential cumulative impacts associated with the Project on surface water hydrology would be less than significant.

6.3.2. SURFACE WATER QUALITY

Future growth in the Los Angeles River Watershed would be subject to NPDES requirements relating to water quality for both construction and operation. The Project Site is located in a highly urbanized area and it is anticipated that future development projects would also be subject to LID requirements. The Project would comply with all applicable laws, rules and regulations, so cumulative impacts to surface water quality would be less than significant.

6.3.3. GROUNDWATER HYDROLOGY

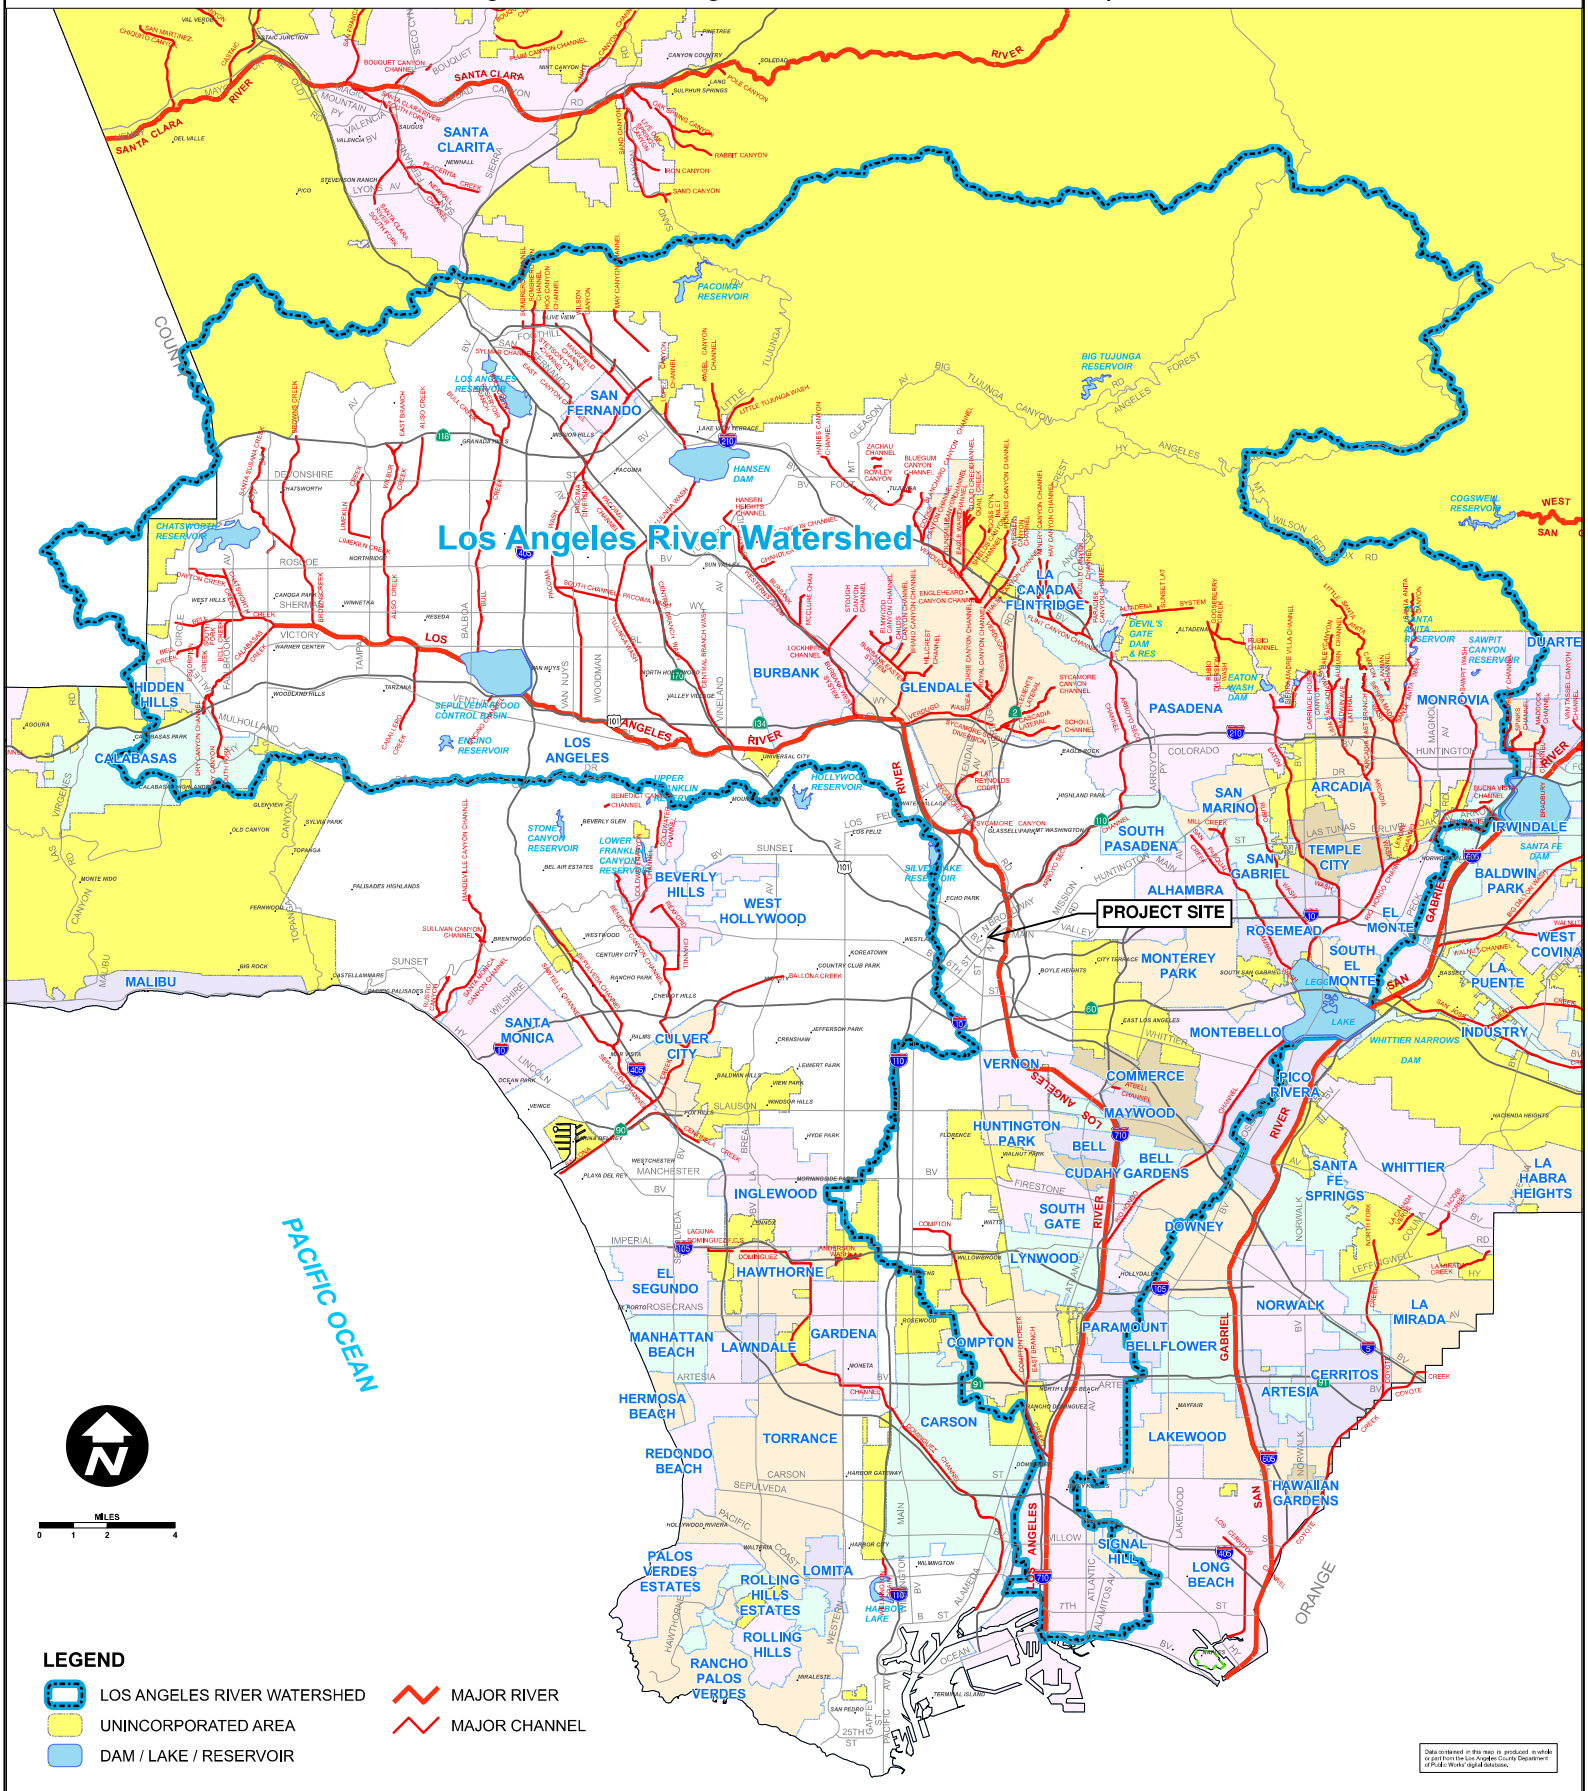
The geographic context for the cumulative impact analysis on groundwater level is the Central Subbasin. No water supply wells, spreading grounds, or injection wells are located within a one-mile radius of the Project Site and the Project would not have an adverse impact on groundwater levels.

The Projects is located in a highly urbanized area so any potential reduction or increase in groundwater would be minimal in the context of the regional groundwater basin. Therefore, cumulative impacts to groundwater hydrology would be less than significant.

6.3.4. GROUNDWATER QUALITY

Future growth in the Central Subbasin would be subject to LARWQCB requirements relating to groundwater quality. The Project would not expand any potential areas of contamination, increasing the level of contamination, or cause regulatory water quality standard violations, as defined in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. The Project would comply with all applicable laws, rules and regulations, so cumulative impacts to surface water quality would be less than significant.

7. LEVEL OF SIGNIFICANCE



Based on the analysis contained in this report, no significant impacts have been identified for surface water hydrology, surface water quality, groundwater hydrology or groundwater quality for this Project.

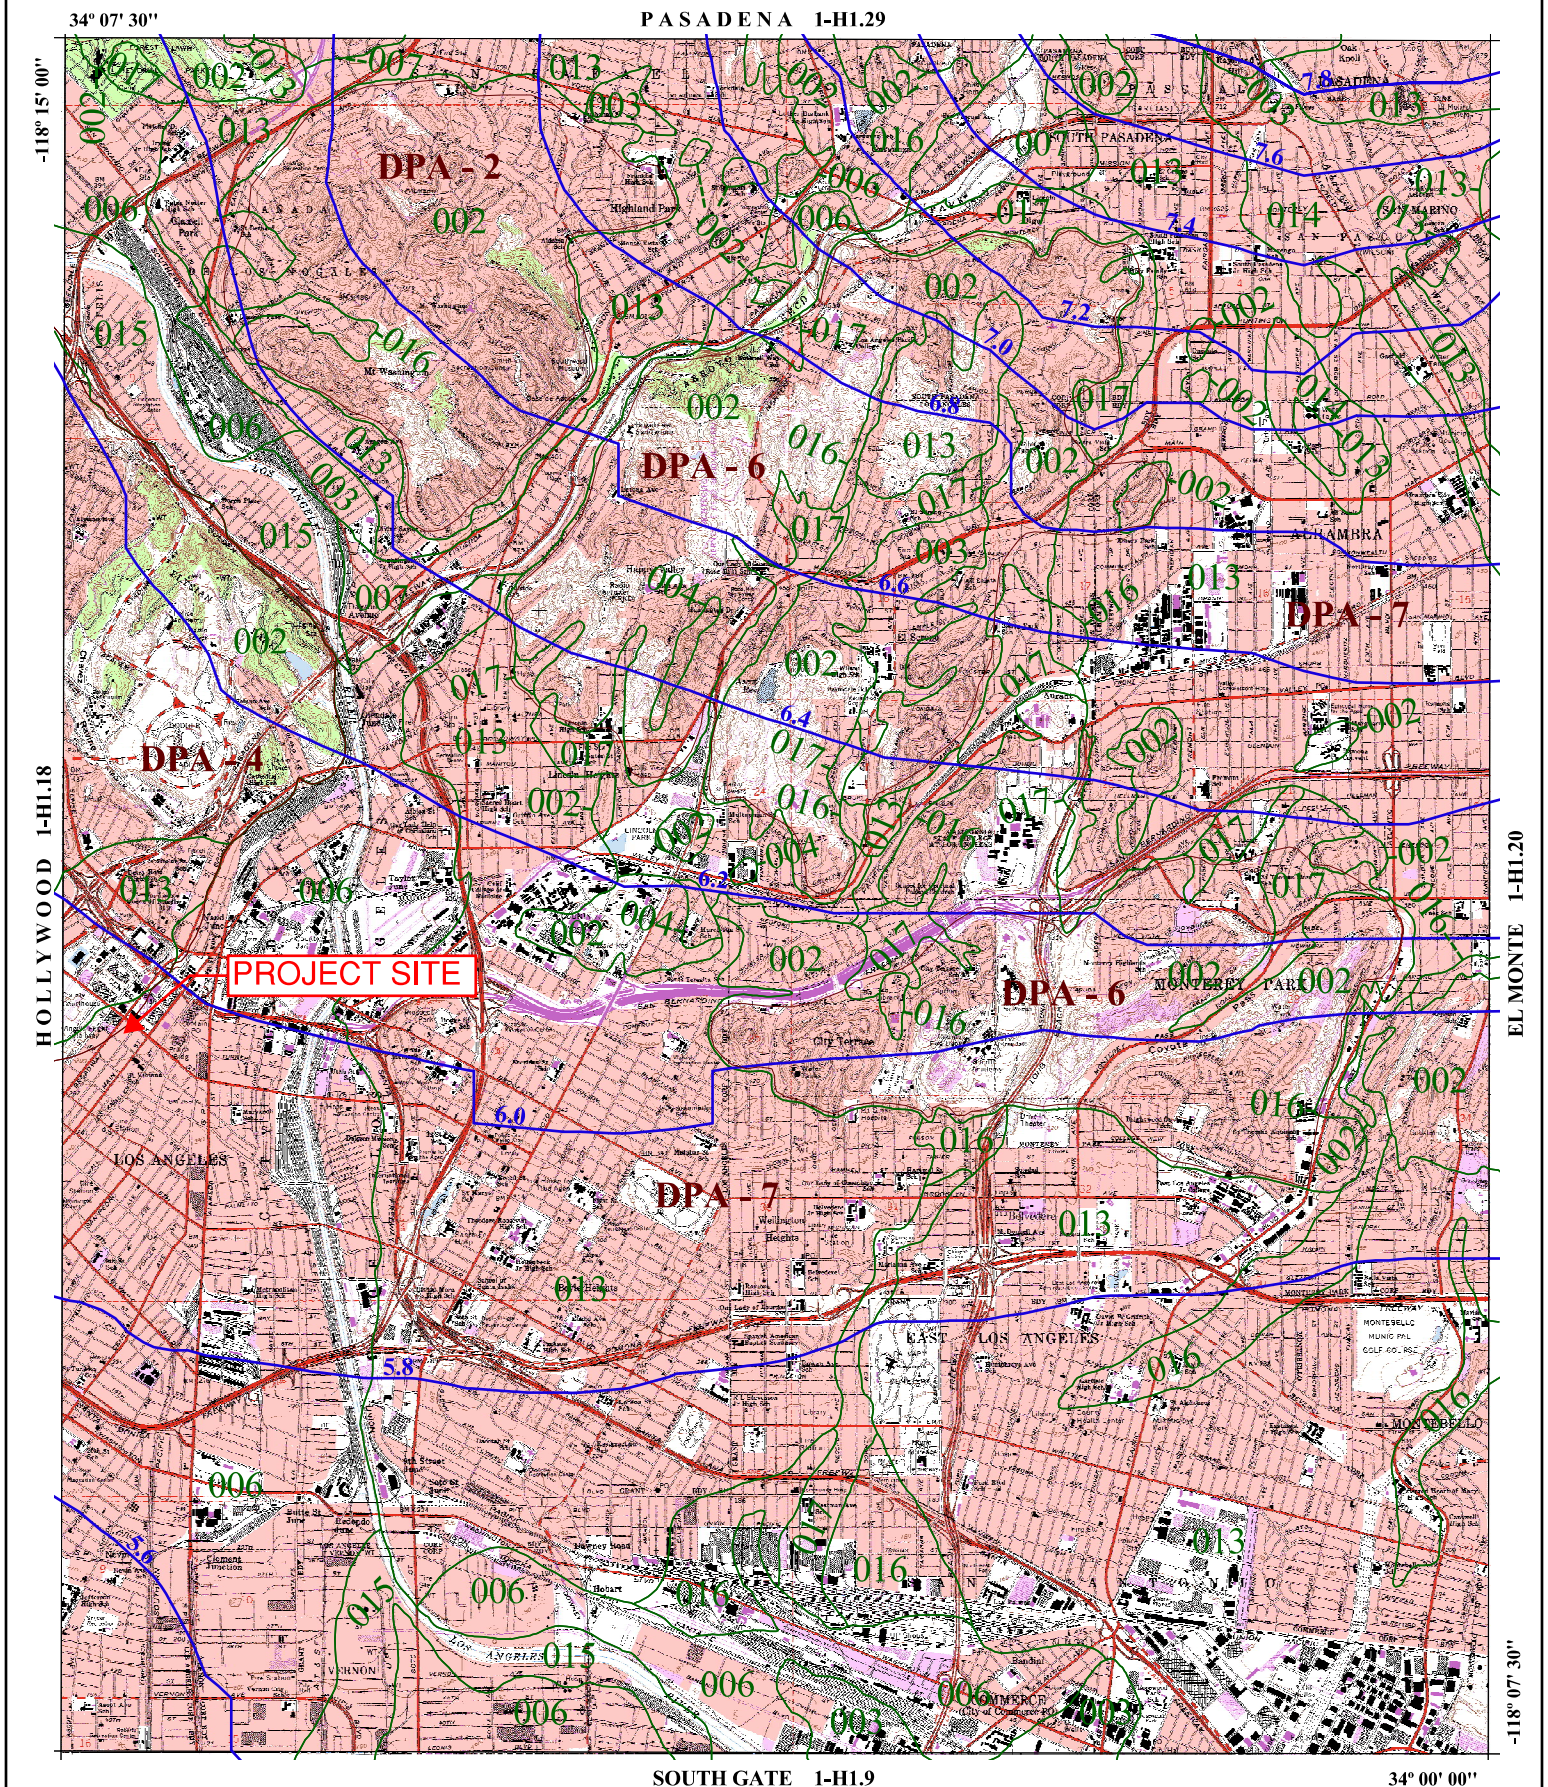
Figure 7- 50-year 24-Hour Isohyet Map



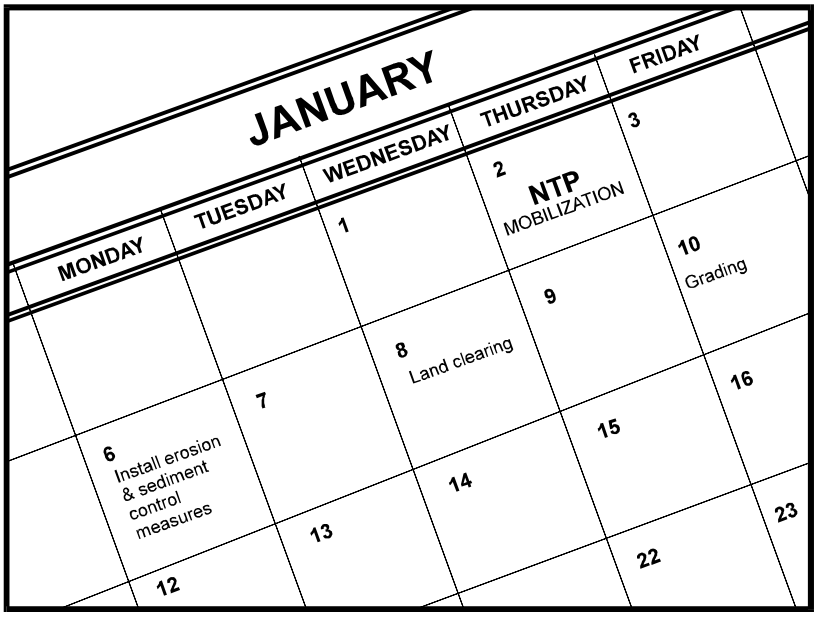


EXHIBIT 1: TYPICAL SWPPP BMPS

Scheduling

EC-1

Description and Purpose

Scheduling is the development of a written plan that includes sequencing of construction activities and the implementation of BMPs such as erosion control and sediment control while taking local climate (rainfall, wind, etc.) into consideration. The purpose is to reduce the amount and duration of soil exposed to erosion by wind, rain, runoff, and vehicle tracking, and to perform the construction activities and control practices in accordance with the planned schedule.

Suitable Applications

Proper sequencing of construction activities to reduce erosion potential should be incorporated into the schedule of every construction project especially during rainy season. Use of other, more costly yet less effective, erosion and sediment control BMPs may often be reduced through proper construction sequencing.

Limitations

- Environmental constraints such as nesting season prohibitions reduce the full capabilities of this BMP.

Implementation

- Avoid rainy periods. Schedule major grading operations during dry months when practical. Allow enough time before rainfall begins to stabilize the soil with vegetation or physical means or to install sediment trapping devices.
- Plan the project and develop a schedule showing each phase of construction. Clearly show how the rainy season relates

Preservation Of Existing Vegetation EC-2

Description and Purpose

Carefully planned preservation of existing vegetation minimizes the potential of removing or injuring existing trees, vines, shrubs, and grasses that protect soil from erosion.

Suitable Applications

Preservation of existing vegetation is suitable for use on most projects. Large project sites often provide the greatest opportunity for use of this BMP. Suitable applications include the following:

- Areas within the site where no construction activity occurs, or occurs at a later date. This BMP is especially suitable to multi year projects where grading can be phased.
- Areas where natural vegetation exists and is designated for preservation. Such areas often include steep slopes, watercourse, and building sites in wooded areas.
- Areas where local, state, and federal government require preservation, such as vernal pools, wetlands, marshes, certain oak trees, etc. These areas are usually designated on the plans, or in the specifications, permits, or environmental documents.
- Where vegetation designated for ultimate removal can be temporarily preserved and be utilized for erosion control and sediment control.

Earth Dikes and Drainage Swales EC-9

Description and Purpose

An earth dike is a temporary berm or ridge of compacted soil used to divert runoff or channel water to a desired location. A drainage swale is a shaped and sloped depression in the soil surface used to convey runoff to a desired location. Earth dikes and drainage swales are used to divert off site runoff around the construction site, divert runoff from stabilized areas and disturbed areas, and direct runoff into sediment basins or traps.

Suitable Applications

Earth dikes and drainage swales are suitable for use, individually or together, where runoff needs to be diverted from one area and conveyed to another.

- Earth dikes and drainage swales may be used:
  - To convey surface runoff down sloping land
  - To intercept and divert runoff to avoid sheet flow over sloped surfaces
  - To divert and direct runoff towards a stabilized watercourse, drainage pipe or channel
  - To intercept runoff from paved surfaces
  - Below steep grades where runoff begins to concentrate
  - Along roadways and facility improvements subject to flood drainage

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

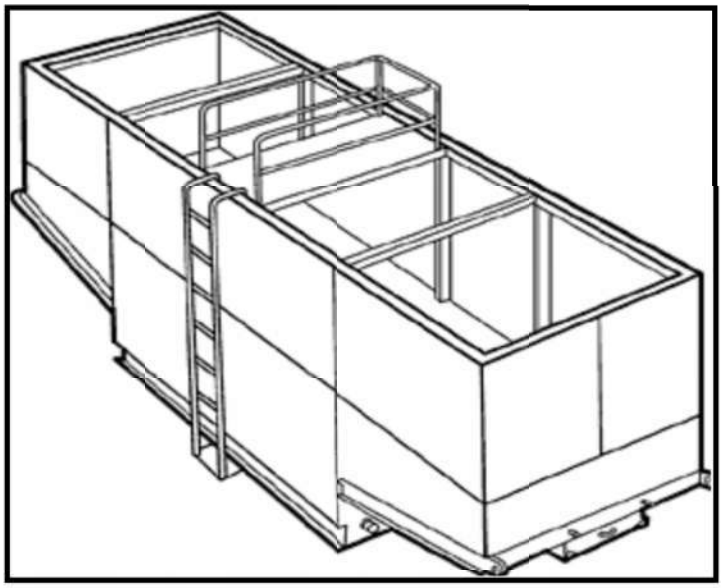
Description and Purpose

Water conservation practices are activities that use water during the construction of a project in a manner that avoids causing erosion and the transport of pollutants offsite. These practices can reduce or eliminate non-stormwater discharges.

Suitable Applications

Water conservation practices are suitable for all construction sites where water is used, including piped water, metered water, trucked water, and water from a reservoir.

Limitations



- None identified.

Implementation

- Keep water equipment in good working condition.
- Stabilize water truck filling area.
- Repair water leaks promptly.
- Washing of vehicles and equipment on the construction site is discouraged.
- Avoid using water to clean construction areas. If water must be used for cleaning or surface preparation, surface should be swept and vacuumed first to remove dirt. This will minimize amount of water required.

SE-5: Fiber Roll

SE-6: Gravel Bag Berm

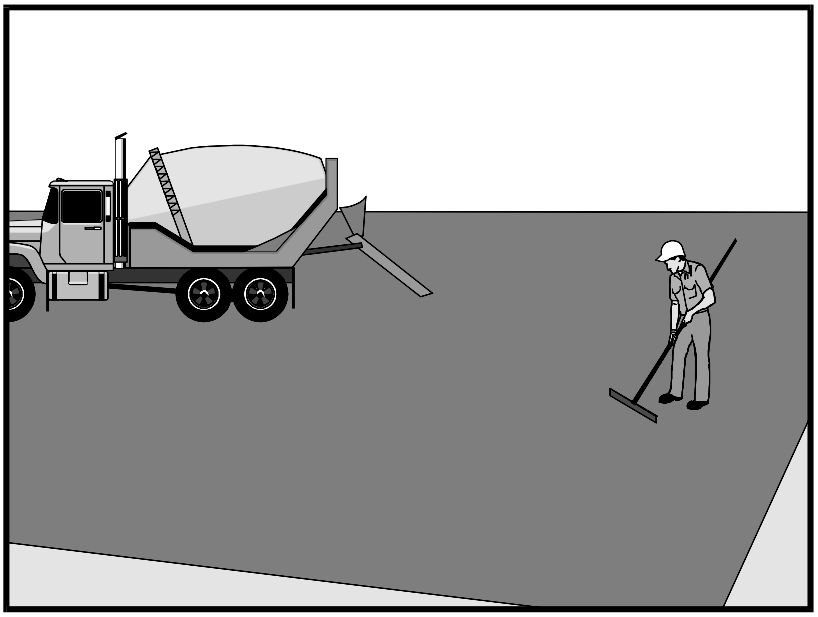
If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Dewatering operations are practices that manage the discharge of pollutants when non-stormwater and accumulated precipitation (stormwater) must be removed from a work location to proceed with construction work or to provide vector control.

The General Permit incorporates Numeric Action Levels (NAL) for turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Discharges from dewatering operations can contain high levels of fine sediment that, if not properly treated, could lead to exceedances of the General Permit requirements or Basin Plan standards.



The dewatering operations described in this fact sheet are not Active Treatment Systems (ATS) and do not include the use of chemical coagulations, chemical flocculation or electrocoagulation.

Suitable Applications

These practices are implemented for discharges of non-stormwater from construction sites. Non-stormwaters include, but are not limited to, groundwater, water from cofferdams, water diversions, and waters used during construction activities that must be removed from a work area to facilitate construction.

Practices identified in this section are also appropriate for implementation when managing the removal of accumulated

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

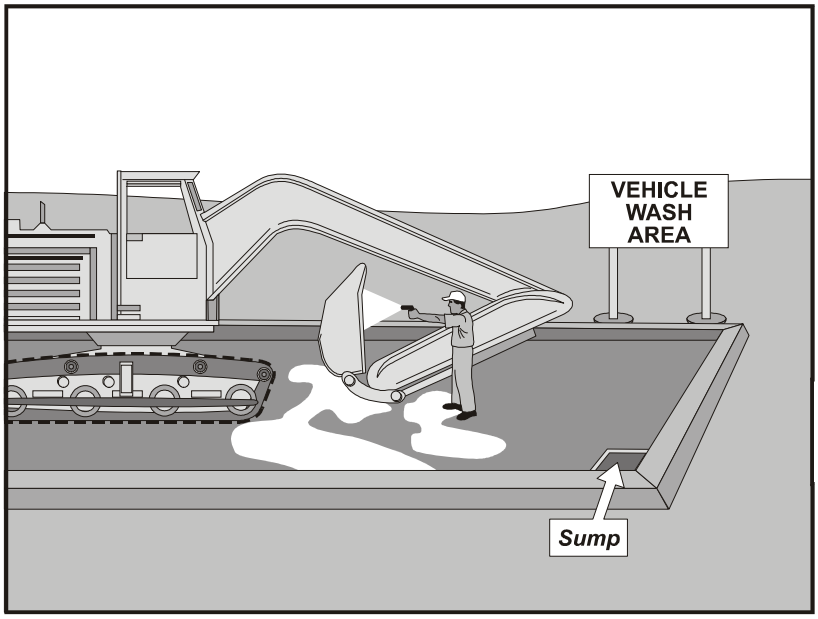
Description and Purpose

Prevent or reduce the discharge of pollutants from paving operations, using measures to prevent runon and runoff pollution, properly disposing of wastes, and training employees and subcontractors.

The General Permit incorporates Numeric Action Levels (NAL) for pH and turbidity (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Many types of construction materials associated with paving and grinding operations, including mortar, concrete, and cement and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications



These procedures are implemented where paving, surfacing, resurfacing, or sawcutting, may pollute stormwater runoff or discharge to the storm drain system or watercourses.

Limitations

- Paving opportunities may be limited during wet weather.

  Discharges of freshly paved surfaces may raise pH to environmentally harmful levels and trigger permit violations.

Vehicle and Equipment Cleaning NS-8

Bacteria	
Oil and Grease	☑
Organics	☑

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

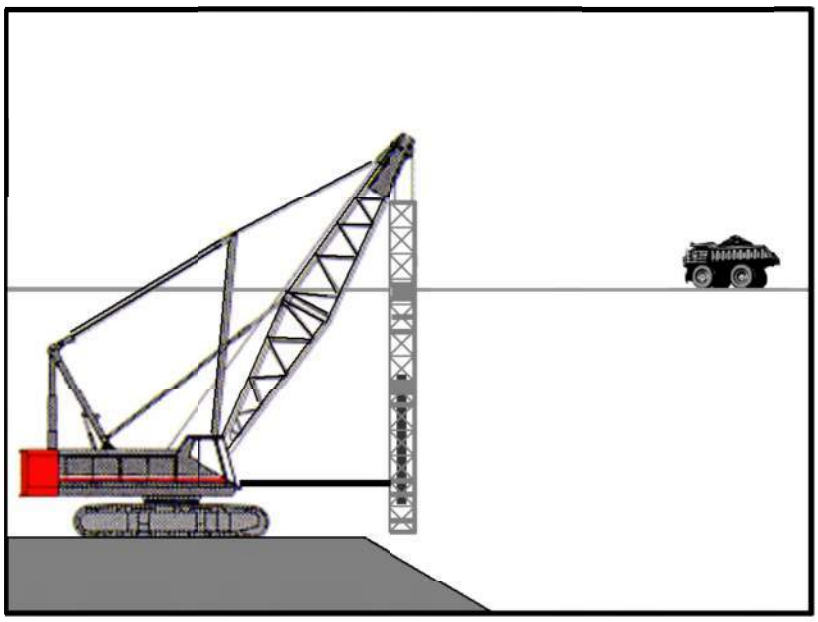
Vehicle and equipment cleaning procedures and practices eliminate or reduce the discharge of pollutants to stormwater from vehicle and equipment cleaning operations. Procedures and practices include but are not limited to: using offsite facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water; and training employees and subcontractors in proper cleaning procedures.

Suitable Applications

These procedures are suitable on all construction sites where vehicle and equipment cleaning is performed.

Limitations

Even phosphate-free, biodegradable soaps have been shown to be toxic to fish before the soap degrades. Sending vehicles/equipment offsite should be done in conjunction with TC-1, Stabilized Construction Entrance/Exit.



Implementation

Other options to washing equipment onsite include contracting with either an offsite or mobile commercial washing business. These businesses may be better equipped to handle and dispose of the wash waters properly. Performing this work offsite can also be economical by eliminating the need for a separate washing operation onsite.

If washing operations are to take place onsite, then:

Potential Alternatives

None

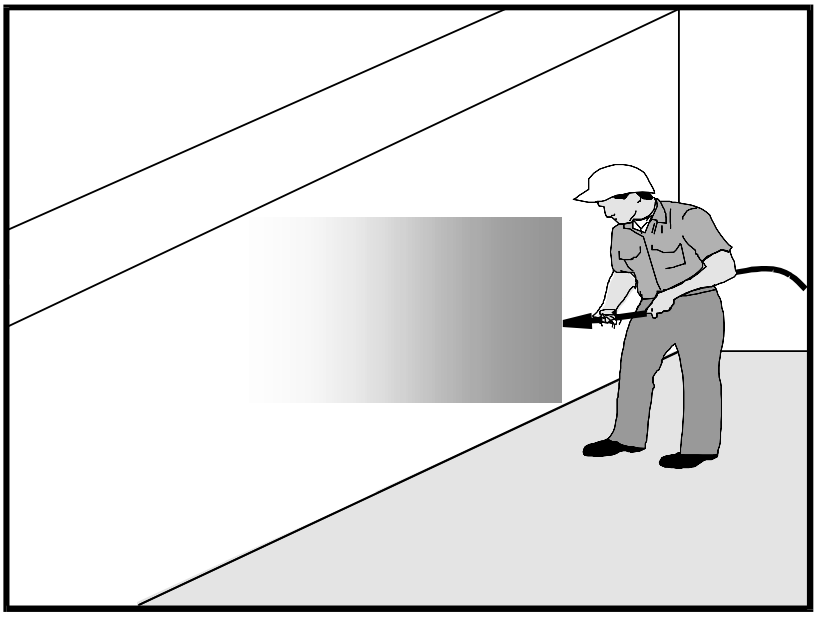
If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

The construction and retrofit of bridges and retaining walls often include driving piles for foundation support and shoring operations. Driven piles are typically constructed of precast concrete, steel, or timber. Driven sheet piles are also used for shoring and cofferdam construction. Proper control and use of equipment, materials, and waste products from pile driving operations will reduce or eliminate the discharge of potential pollutants to the storm drain system, watercourses, and waters of the United States.

Suitable Applications

These procedures apply to all construction sites near or adjacent to a watercourse or groundwater where permanent and temporary pile driving (impact and vibratory) takes place, including operations using pile shells as well as construction of cast-in-steel-shell and cast-in-drilled-hole piles.



Limitations

None identified.

Implementation

- Use drip pans or absorbent pads during vehicle and equipment operation, maintenance, cleaning, fueling, and storage. Refer to NS-8, Vehicle and Equipment Cleaning, NS-9, Vehicle and Equipment Fueling, and NS-10, Vehicle and Equipment Maintenance.

Concrete Curing NS-12

Categories		
EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☑
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**

Targeted Constituents	
Sediment	☑
Nutrients	
Trash	
Metals	☑
Bacteria	
Oil and Grease	☑
Organics	

Potential Alternatives

None

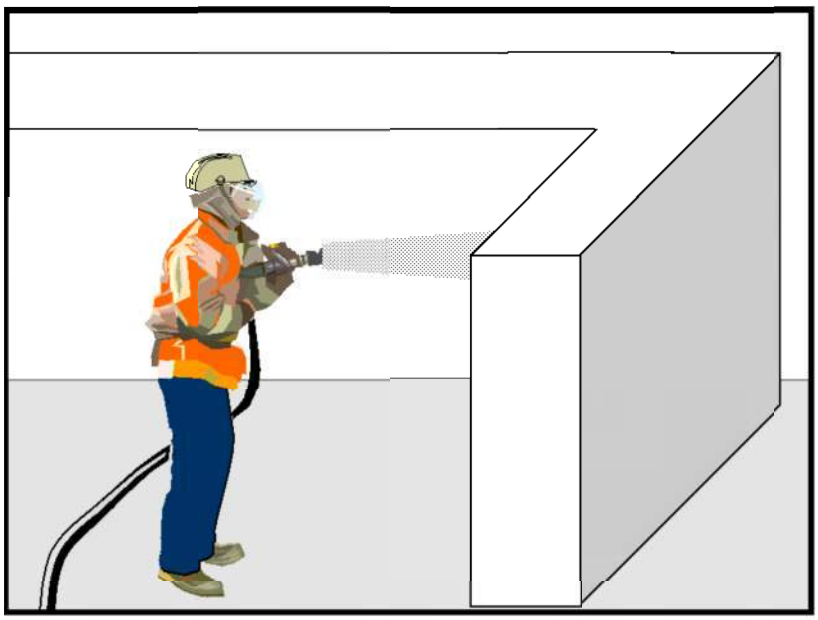
If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete curing is used in the construction of structures such as bridges, retaining walls, pump houses, large slabs, and structured foundations. Concrete curing includes the use of both chemical and water methods.

Concrete and its associated curing materials have basic chemical properties that can raise the pH of water to levels outside of the permitted range. Discharges of stormwater and non-stormwater exposed to concrete during curing may have a high pH and may contain chemicals, metals, and fines. The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Proper procedures and care should be taken when managing concrete curing materials to prevent them from coming into contact with stormwater flows, which could result in a high pH discharge.



Suitable Applications

Suitable applications include all projects where Portland Cement Concrete (PCC) and concrete curing chemicals are placed where they can be exposed to rainfall, runoff from other areas, or where runoff from the PCC will leave the site.

Limitations

- Runoff contact with concrete waste can raise pH levels in the water to environmentally harmful levels and trigger permit violations.

Concrete Finishing NS-13

Categories		
EC	Erosion Control	
SE	Sediment Control

Metals	☑
Bacteria	
Oil and Grease	
Organics	☑

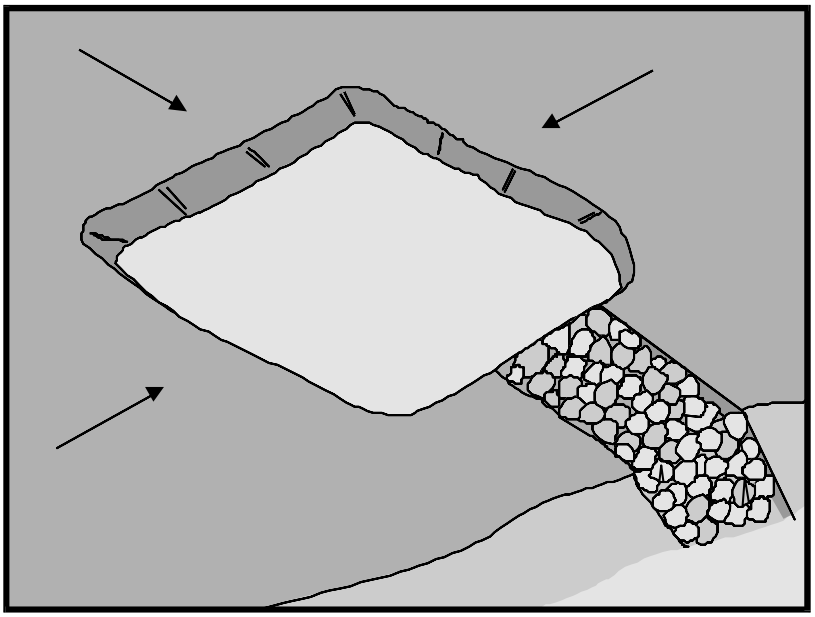
Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Concrete finishing methods are used for bridge deck rehabilitation, paint removal, curing compound removal, and final surface finish appearances. Methods include sand blasting, shot blasting, grinding, or high pressure water blasting. Stormwater and non-stormwater exposed to concrete finishing by-products may have a high pH and may contain chemicals, metals, and fines. Proper procedures and implementation of appropriate BMPs can minimize the impact that concrete-finishing methods may have on stormwater and non-stormwater discharges.



The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).

Concrete and its associated curing materials have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows, which could lead to exceedances of the General Permit requirements.

Suitable Applications

These procedures apply to all construction locations where concrete finishing operations are performed.

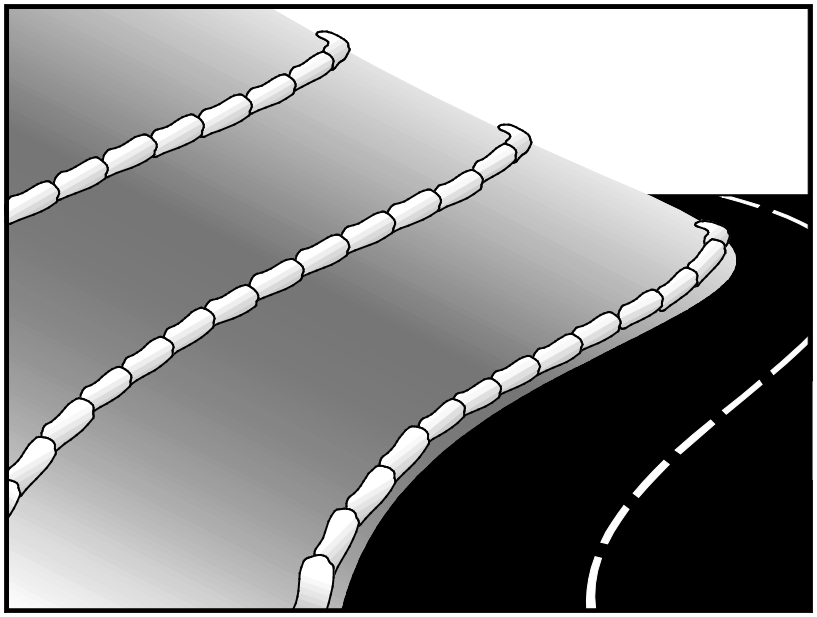
SE-2 Sediment Basin (for larger areas)

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

A sediment trap is a containment area where sediment-laden runoff is temporarily detained under quiescent conditions, allowing sediment to settle out or before the runoff is discharged by gravity flow. Sediment traps are formed by excavating or constructing an earthen embankment across a waterway or low drainage area.



Trap design guidance provided in this fact sheet is not intended to guarantee compliance with numeric discharge limits (numeric action levels or numeric effluent limits for turbidity). Compliance with discharge limits requires a thoughtful approach to comprehensive BMP planning, implementation, and maintenance. Therefore, optimally designed and maintained sediment traps should be used in conjunction with a comprehensive system of BMPs.

Suitable Applications

Sediment traps should be considered for use:

- At the perimeter of the site at locations where sediment-laden runoff is discharged offsite.
- At multiple locations within the project site where sediment control is needed.
- Around or upslope from storm drain inlet protection measures.
- Sediment traps may be used on construction projects where the drainage area is less than 5 acres. Traps would be

Gravel Bag Berm SE-6

Description and Purpose

A gravel bag berm is a series of gravel-filled bags placed on a level contour to intercept sheet flows. Gravel bags pond sheet flow runoff, allowing sediment to settle out, and release runoff slowly as sheet flow, preventing erosion.

Suitable Applications

Gravel bag berms may be suitable:

- As a linear sediment control measure:
  - Below the toe of slopes and erodible slopes
  - As sediment traps at culvert/pipe outlets
  - Below other small cleared areas
  - Along the perimeter of a site
  - Down slope of exposed soil areas
  - Around temporary stockpiles and spoil areas
  - Parallel to a roadway to keep sediment off paved areas
  - Along streams and channels
- As a linear erosion control measure:
  - Along the face and at grade breaks of exposed and erodible slopes to shorten slope length and spread runoff as sheet flow.

Organics	

Potential Alternatives

None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

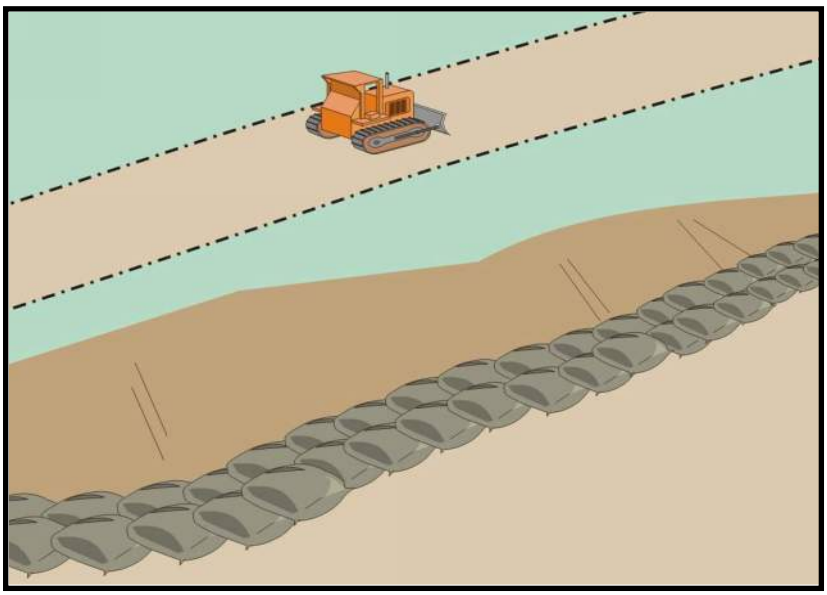
Description and Purpose

Street sweeping and vacuuming includes use of self-propelled and walk-behind equipment to remove sediment from streets and roadways, and to clean paved surfaces in preparation for final paving. Sweeping and vacuuming prevents sediment from the project site from entering storm drains or receiving waters.

Suitable Applications

Sweeping and vacuuming are suitable anywhere sediment is tracked from the project site onto public or private paved streets and roads, typically at points of egress. Sweeping and vacuuming are also applicable during preparation of paved surfaces for final paving.

Limitations



Sweeping and vacuuming may not be effective when sediment is wet or when tracked soil is caked (caked soil may need to be scraped loose).

Implementation

- Controlling the number of points where vehicles can leave the site will allow sweeping and vacuuming efforts to be focused, and perhaps save money.
- Inspect potential sediment tracking locations daily.
- Visible sediment tracking should be swept or vacuumed on a daily basis.

Sandbag Barrier SE-8

Categories		
EC	Erosion Control	☒
SE	Sediment Control	☑
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Description and Purpose

A sandbag barrier is a series of sand-filled bags placed on a level contour to intercept or to divert sheet flows. Sandbag barriers placed on a level contour pond sheet flow runoff, allowing sediment to settle out.

Suitable Applications

Sandbag barriers may be a suitable control measure for the applications described below. It is important to consider that sand bags are less porous than gravel bags and ponding or flooding can occur behind the barrier. Also, sand is easily transported by runoff if bags are damaged or ruptured. The SWPPP Preparer should select the location of a sandbag barrier with respect to the potential for flooding, damage, and the ability to maintain the BMP.

- As a linear sediment control measure:
  - Below the toe of slopes and erodible slopes.
  - As sediment traps at culvert/pipe outlets.
  - Below other small cleared areas.
  - Along the perimeter of a site.
  - Down slope of exposed soil areas.

Storm Drain Inlet Protection SE-10

Description and Purpose

Storm drain inlet protection consists of a sediment filter or an impounding area in, around or upstream of a storm drain, drop inlet, or curb inlet. Storm drain inlet protection measures temporarily pond runoff before it enters the storm drain, allowing sediment to settle. Some filter configurations also remove sediment by filtering, but usually the ponding action results in the greatest sediment reduction. Temporary geotextile storm drain inserts attach underneath storm drain grates to capture and filter storm water.

Suitable Applications

- Every storm drain inlet receiving runoff from unstabilized or otherwise active work areas should be protected. Inlet protection should be used in conjunction with other erosion and sediment controls to prevent sediment-laden stormwater and non-stormwater discharges from entering the storm drain system.

Limitations

- Drainage area should not exceed 1 acre.
- In general straw bales should not be used as inlet protection.
- Requires an adequate area for water to pond without encroaching into portions of the roadway subject to traffic.
- Sediment removal may be inadequate to prevent sediment discharges in high flow conditions or if runoff is heavily sediment laden. If high flow conditions are expected, use

Potential Alternatives

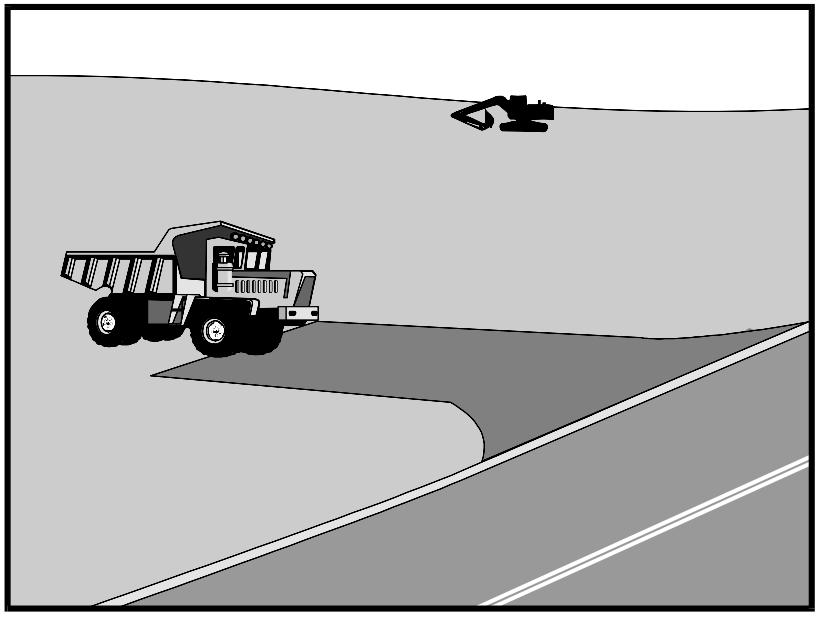
None

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Active Treatment Systems (ATS) reduce turbidity of construction site runoff by introducing chemicals to stormwater through direct dosing or an electrical current to enhance flocculation, coagulation, and settling of the suspended sediment. Coagulants and flocculants are used to enhance settling and removal of suspended sediments and generally include inorganic salts and polymers (USACE, 2001). The increased flocculation aids in sedimentation and ability to remove fine suspended sediments, thus reducing stormwater runoff turbidity and improving water quality.



Suitable Applications

ATS can reliably provide exceptional reductions of turbidity and associated pollutants and should be considered where turbid discharges to sediment and turbidity sensitive waters cannot be avoided using traditional BMPs. Additionally, it may be appropriate to use an ATS when site constraints inhibit the ability to construct a correctly sized sediment basin, when clay and/or highly erosive soils are present, or when the site has very steep or long slope lengths.

Limitations

Dischargers choosing to utilize chemical treatment in an ATS must follow all guidelines of the Construction General Permit Attachment F – Active Treatment System Requirements. General limitations are as follows:

Stabilized Construction Entrance/Exit TC-1

Categories		
EC	Erosion Control	☒
SE	Sediment Control	☒
TC	Tracking Control	☑
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	

Legend:
☑ **Primary Objective**
☒ **Secondary Objective**

Description and Purpose

A stabilized construction access is defined by a point of entrance/exit to a construction site that is stabilized to reduce the tracking of mud and dirt onto public roads by construction vehicles.

Suitable Applications

Use at construction sites:

- Where dirt or mud can be tracked onto public roads.
- Adjacent to water bodies.
- Where poor soils are encountered.
- Where dust is a problem during dry weather conditions.

Limitations

- Entrances and exits require periodic top dressing with additional stones.
- This BMP should be used in conjunction with street sweeping on adjacent public right of way.
- Entrances and exits should be constructed on level ground only.
- Stabilized construction entrances are rather expensive to construct and when a wash rack is included, a sediment trap of some kind must also be provided to collect wash water runoff.

Entrance/Outlet Tire Wash TC-3

Description and Purpose

A tire wash is an area located at stabilized construction access points to remove sediment from tires and under carriages and to prevent sediment from being transported onto public roadways.

Suitable Applications

Tire washes may be used on construction sites where dirt and mud tracking onto public roads by construction vehicles may occur.

Limitations

- The tire wash requires a supply of wash water.
- A turnout or doublewide exit is required to avoid having entering vehicles drive through the wash area.
- Do not use where wet tire trucks leaving the site leave the road dangerously slick.

Implementation

- Incorporate with a stabilized construction entrance/exit. See TC-1, Stabilized Construction Entrance/Exit.
- Construct on level ground when possible, on a pad of coarse aggregate greater than 3 in. but smaller than 6 in. A geotextile fabric should be placed below the aggregate.
- Wash rack should be designed and constructed/manufactured for anticipated traffic loads.

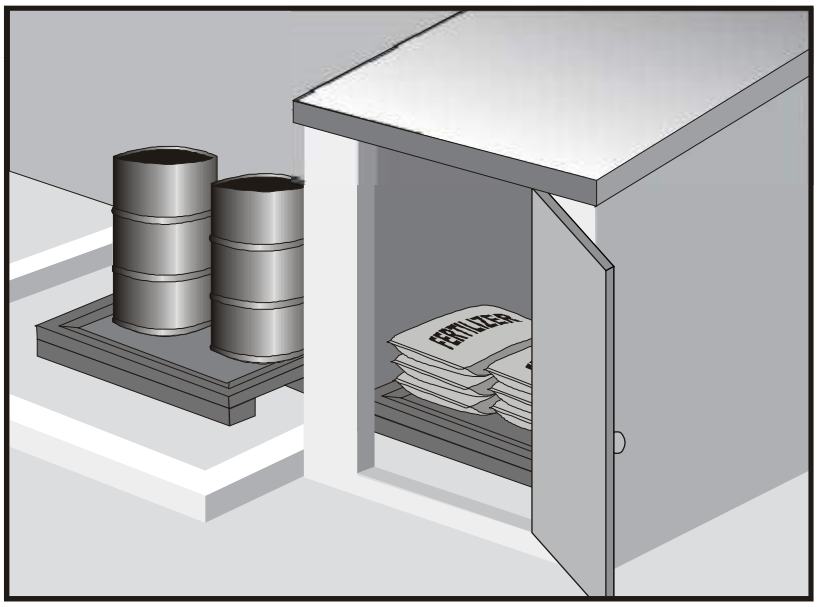
EC-5 Soil Binders

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

Wind erosion or dust control consists of applying water or other chemical dust suppressants as necessary to prevent or alleviate dust nuisance generated by construction activities. Covering small stockpiles or areas is an alternative to applying water or other dust palliatives.



California's Mediterranean climate, with a short "wet" season and a typically long, hot "dry" season, allows the soils to thoroughly dry out. During the dry season, construction activities are at their peak, and disturbed and exposed areas are increasingly subject to wind erosion, sediment tracking and dust generated by construction equipment. Site conditions and climate can make dust control more of an erosion problem than water based erosion. Additionally, many local agencies, including Air Quality Management Districts, require dust control and/or dust control permits in order to comply with local nuisance laws, opacity laws (visibility impairment) and the requirements of the Clean Air Act. Wind erosion control is required to be implemented at all construction sites greater than 1 acre by the General Permit.

Suitable Applications

Most BMPs that provide protection against water-based erosion will also protect against wind-based erosion and dust control requirements required by other agencies will generally meet wind erosion control requirements for water quality protection. Wind erosion control BMPs are suitable during the following construction activities:

CASQA
CALIFORNIA STORMWATER QUALITY ASSOCIATION

Material Delivery and Storage WM-1

Categories		
EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Description and Purpose

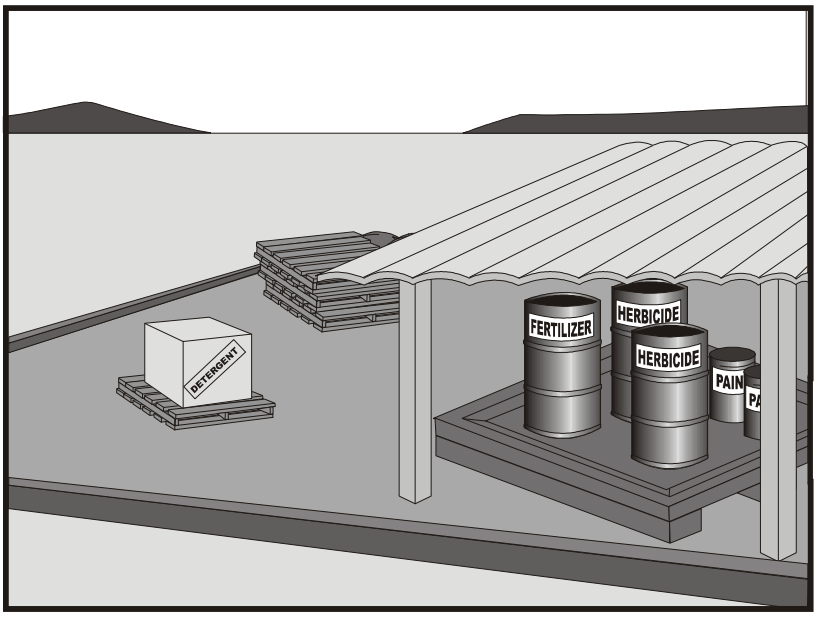
Prevent, reduce, or eliminate the discharge of pollutants from material delivery and storage to the stormwater system or watercourses by minimizing the storage of hazardous materials onsite, storing materials in watertight containers and/or a completely enclosed designated area, installing secondary containment, conducting regular inspections, and training employees and subcontractors.

This best management practice covers only material delivery and storage. For other information on materials, see WM-2, Material Use, or WM-4, Spill Prevention and Control. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

These procedures are suitable for use at all construction sites with delivery and storage of the following materials:

- Soil stabilizers and binders
- Pesticides and herbicides
- Fertilizers
- Detergents
- Plaster
- Petroleum products such as fuel, oil, and grease



Targeted Constituents

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Material Use WM-2

Description and Purpose

Prevent or reduce the discharge of pollutants to the storm drain system or watercourses from material use by using alternative products, minimizing hazardous material use onsite, and training employees and subcontractors.

Suitable Applications

This BMP is suitable for use at all construction projects. These procedures apply when the following materials are used or prepared onsite:

- Pesticides and herbicides
- Fertilizers
- Detergents
- Petroleum products such as fuel, oil, and grease
- Asphalt and other concrete components
- Other hazardous chemicals such as acids, lime, glues, adhesives, paints, solvents, and curing compounds
- Other materials that may be detrimental if released to the environment

Stockpile Management WM-3

Categories		
EC	Erosion Control	
SE	Sediment Control	☒
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	☒
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Category**
☒ **Secondary Category**

Description and Purpose

Stockpile management procedures and practices are designed to reduce or eliminate air and stormwater pollution from stockpiles of soil, soil amendments, sand, paving materials such as portland cement concrete (PCC) rubble, asphalt concrete (AC), asphalt concrete rubble, aggregate base, aggregate sub base or pre-mixed aggregate, asphalt minder (so called "cold mix" asphalt), and pressure treated wood.

Suitable Applications

Implement in all projects that stockpile soil and other loose materials.

Limitations

- Plastic sheeting as a stockpile protection is temporary and hard to manage in windy conditions. Where plastic is used, consider use of plastic tarps with nylon reinforcement which may be more durable than standard sheeting.
- Plastic sheeting can increase runoff volume due to lack of infiltration and potentially cause perimeter control failure.
- Plastic sheeting breaks down faster in sunlight.
- The use of Plastic materials and photodegradable plastics should be avoided.

Implementation

Protection of stockpiles is a year-round requirement. To properly manage stockpiles:

Spill Prevention and Control WM-4

Description and Purpose

Prevent or reduce the discharge of pollutants to drainage systems or watercourses from leaks and spills by reducing the chance for spills, stopping the source of spills, containing and cleaning up spills, properly disposing of spill materials, and training employees.

This best management practice covers only spill prevention and control. However, WM-1, Materials Delivery and Storage, and WM-2, Material Use, also contain useful information, particularly on spill prevention. For information on wastes, see the waste management BMPs in this section.

Suitable Applications

This BMP is suitable for all construction projects. Spill control procedures are implemented anytime chemicals or hazardous substances are stored on the construction site, including the following materials:

- Soil stabilizers/binders
- Dust palliatives
- Herbicides
- Growth inhibitors
- Fertilizers
- Deicing/anti-icing chemicals

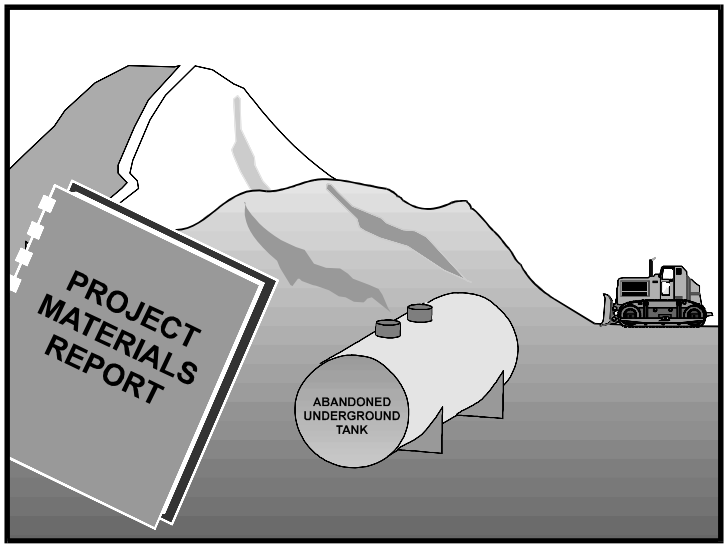
Description and Purpose

Solid waste management procedures and practices are designed to prevent or reduce the discharge of pollutants to stormwater from solid or construction waste by providing designated waste collection areas and containers, arranging for regular disposal, and training employees and subcontractors.



Suitable Applications

This BMP is suitable for construction sites where the following wastes are generated or stored:

- Solid waste generated from trees and shrubs removed during land clearing, demolition of existing structures (rubble), and building construction
- Packaging materials including wood, paper, and plastic
- Scrap or surplus building materials including scrap metals, rubber, plastic, glass pieces, and masonry products
- Domestic wastes including food containers such as beverage cans, coffee cups, paper bags, plastic wrappers, and cigarettes
- Construction wastes including brick, mortar, timber, steel and metal scraps, pipe and electrical cuttings, non-hazardous equipment parts, styrofoam and other materials used to transport and package construction materials

EC	Erosion Control	
SE	Sediment Control	
TC	Tracking Control	
WE	Wind Erosion Control	
NS	Non-Stormwater Management Control	
WM	Waste Management and Materials Pollution Control	☑

Legend:
☑ **Primary Objective**
☒ **Secondary Objective**

Description and Purpose

Prevent or reduce the discharge of pollutants to stormwater from contaminated soil and highly acidic or alkaline soils by conducting pre-construction surveys, inspecting excavations regularly, and remediating contaminated soil promptly.

Suitable Applications

Contaminated soil management is implemented on construction projects in highly urbanized or industrial areas where soil contamination may have occurred due to spills, illicit discharges, aerial deposition, past use and leaks from underground storage tanks.

Limitations

Contaminated soils that cannot be treated onsite must be disposed of offsite by a licensed hazardous waste hauler. The presence of contaminated soil may indicate contaminated water as well. See NS-2, Dewatering Operations, for more information.

The procedures and practices presented in this BMP are general. The contractor should identify appropriate practices and procedures for the specific contaminants known to exist or discovered onsite.

Implementation

Most owners and developers conduct pre-construction environmental assessments as a matter of routine. Contaminated soils are often identified during project planning and development with known locations identified in the plans, specifications and in the SWPPP. The contractor should review applicable reports and investigate appropriate call-outs in the

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

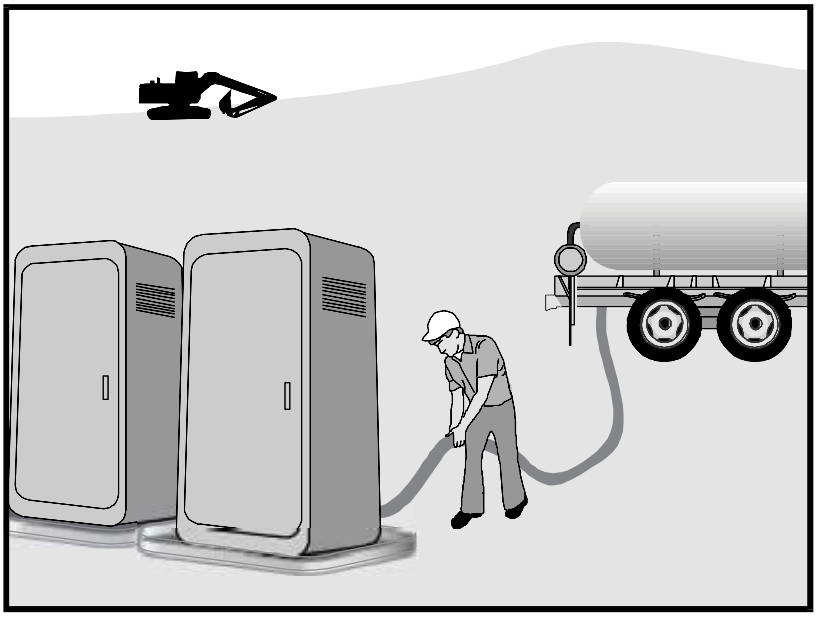
Description and Purpose

Prevent the discharge of pollutants to stormwater from concrete waste by conducting washout onsite or offsite in a designated area, and by employee and subcontractor training.

The General Permit incorporates Numeric Action Levels (NAL) for pH (see Section 2 of this handbook to determine your project's risk level and if you are subject to these requirements).



Many types of construction materials, including mortar, concrete, stucco, cement and block and their associated wastes have basic chemical properties that can raise pH levels outside of the permitted range. Additional care should be taken when managing these materials to prevent them from coming into contact with stormwater flows and raising pH to levels outside the accepted range.

Suitable Applications

Concrete waste management procedures and practices are implemented on construction projects where:

- Concrete is used as a construction material or where concrete dust and debris result from demolition activities.
- Slurries containing portland cement concrete (PCC) are generated, such as from saw cutting, coring, grinding, grooving, and hydro-concrete demolition.
- Concrete trucks and other concrete-coated equipment are washed onsite.

Sanitary/Septic Waste Management WM-9

If User/Subscriber modifies this fact sheet in any way, the CASQA name/logo and footer below must be removed from each page and not appear on the modified version.

Description and Purpose

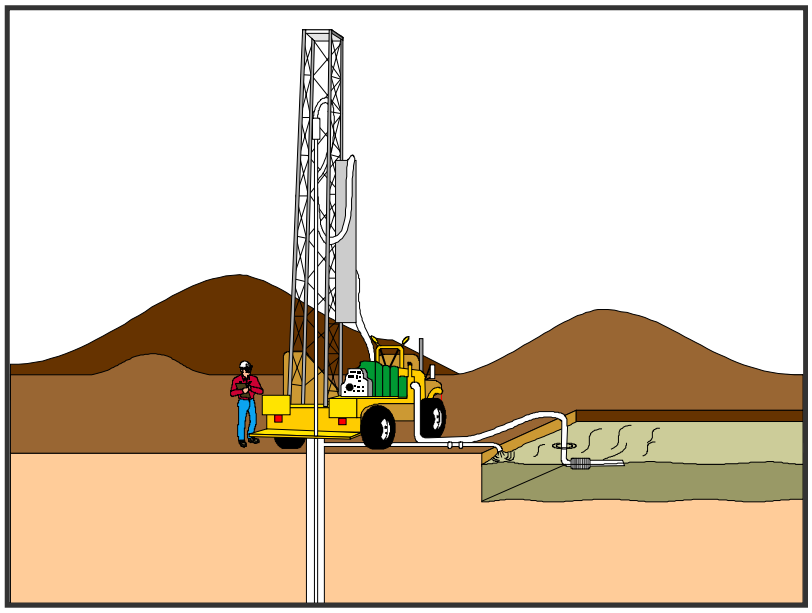
Proper sanitary and septic waste management prevent the discharge of pollutants to stormwater from sanitary and septic waste by providing convenient, well-maintained facilities, and arranging for regular service and disposal.

Suitable Applications

Sanitary septic waste management practices are suitable for use at all construction sites that use temporary or portable sanitary and septic waste systems.

Limitations

None identified.



Implementation

Sanitary or septic wastes should be treated or disposed of in accordance with state and local requirements. In many cases, one contract with a local facility supplier will be all that it takes to make sure sanitary wastes are properly disposed.

Storage and Disposal Procedures

- Temporary sanitary facilities should be located away from drainage facilities, watercourses, and from traffic circulation. If site conditions allow, place portable facilities a minimum of 50 feet from drainage conveyances and traffic areas. When subjected to high winds or risk of high winds, temporary sanitary facilities should be secured to prevent overturning.

Liquid Waste Management WM-10

Description and Purpose

Liquid waste management includes procedures and practices to prevent discharge of pollutants to the storm drain system or to watercourses as a result of the creation, collection, and disposal of non-hazardous liquid wastes.

Suitable Applications

Liquid waste management is applicable to construction projects that generate any of the following non-hazardous by-products, residuals, or wastes:

- Drilling slurries and drilling fluids
- Grease-free and oil-free wastewater and rinse water
- Dredgings
- Other non-stormwater liquid discharges not permitted by separate permits

Limitations

- Disposal of some liquid wastes may be subject to specific laws and regulations or to requirements of other permits secured for the construction project (e.g., NPDES permits, Army Corps permits, Coastal Commission permits, etc.).
- Liquid waste management does not apply to dewatering operations (NS-2 Dewatering Operations), solid waste management (WM-5, Solid Waste Management), hazardous wastes (WM-6, Hazardous Waste Management), or

EXECUTIVE SUMMARY

The ONNI Group (the Applicant) proposes to develop the Times Mirror Square Project (Project), which would include construction and operation of two new, mixed-use towers, along with rehabilitation of three existing buildings, including an eight-story building (Times Building), a four-story building (Plant Building), and a 10-story building (Mirror Building), located within the Times Mirror Square site (Project Site). The Project Site comprises the city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway. The Project Site totals approximately 160,578 square feet (3.6 acres) of lot area.

The proposed rehabilitated buildings, the Times, Plant, and Mirror Buildings, which have a total existing floor area of approximately 376,105 square feet, are located in the east sector of the block aligned with S. Spring Street. The existing Executive Building at the corner of W. 1st Street and S. Broadway and the parking structure at the corner of W. 2nd Street and S. Broadway would be demolished to allow for the development of the Project towers. The North and South Towers, which would be constructed above a five-story parking podium (Podium). The Podium would be an above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. Overall, including the existing buildings to remain that total approximately 376,105 square feet, the Project would comprise approximately 1,511,908 square feet of floor area, resulting in a 9.42 FAR. An open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park.

The analysis describes the existing noise environment in the Project area, estimates future noise and vibration levels at surrounding land uses resulting from construction and operation of the Project, and identifies the potential for significant impacts. An evaluation of the Project's contribution to potential cumulative noise impacts is also provided. Noise worksheets and technical data used in this analysis are provided in the Appendices. The report summarizes the potential for the Project to conflict with applicable noise and vibration regulations, standards, and thresholds. The findings of the analyses are as follows:

- Project on-site construction activities would result in sporadic, and temporary noise increases adjacent to the Project area, which would exceed established thresholds. With implementation of the technically feasible mitigation measures, construction noise would be reduced but impacts would be significant and unavoidable.

- Project off-site construction traffic would result in sporadic, and temporary noise increases adjacent to the Project area, but would not exceed established thresholds during daytime hours. However, potential nighttime off-site construction traffic would exceed established thresholds during nighttime hours. There are no feasible mitigation measures; therefore, impacts would be significant and unavoidable.
- Project operational off-site traffic would increase noise levels at off-site noise-sensitive uses in the Project area. Increases in ambient noise levels due to operational traffic would not exceed the established thresholds. Operational traffic-related noise impacts would be less than significant.
- Project operational on-site stationary noise sources would not result in a substantial permanent increase in ambient noise levels in the project vicinity. The Project's noise impacts on existing development from operational on-site stationary noise sources would be less than significant, as well as, composite noise impacts would be less than significant.
- Project construction vibration impacts for potential structural damage to the on-site Times, Plant, and Mirror Buildings would be potentially significant and mitigation measures would be required. With implementation of construction vibration mitigation measures, on-site construction vibration impacts would be mitigated to less than significant. Project construction vibration impacts for potential structural damage to off-site buildings would be less than significant.
- Project construction vibration impacts for potential human annoyance would be potentially significant due to off-site truck traffic. There are no feasible mitigation measures and impacts would be significant and unavoidable.
- Project operation would not generate excessive vibration levels at nearby sensitive receptor locations. Thus, operational vibration impacts would be less than significant.
- Noise associated with cumulative construction activities would be reduced to the degree reasonably and technically feasible through proposed mitigation measures for each individual project and compliance with locally adopted and enforced noise ordinances. However, even with implementation of proposed design features and mitigation measures, if nearby cumulative projects were constructed concurrently with the Project, significant and unavoidable cumulative construction noise impacts could result at the nearby noise sensitive receptors. Furthermore, should Related Project No. 110 be constructed concurrently with the Project, this would result in a unique situation as it is a large project in very close proximity to the proposed Project. In this unique situation, construction truck traffic from the Project, Related Project No. 110, and other nearby related projects have the potential to exceed the ambient noise levels along S. Los Angeles Street in excess of standards. As such, cumulative daytime noise impacts from off-site construction are conservatively considered to be significant. Off-site construction noise impacts during the nighttime would be cumulatively considerable and cumulative off-site construction nighttime noise impacts would be cumulatively significant.

SECTION 1
Introduction

This report analyzes potential noise and vibration impacts that would result from the Times Mirror Square Project (Project). The analysis describes the existing noise environment in the vicinity of the Times Mirror Square site (Project Site), estimates future noise and vibration levels at surrounding sensitive land uses resulting from construction and operation of the Project, evaluates the potential for significant impacts, and provides mitigation measures to address any significant impacts. In addition, this section evaluates the potential cumulative noise and vibration impacts resulting from the Project together with related projects and other future growth. Noise calculation worksheets and technical data used in this analysis are provided in the Appendices at the end of this report. This report demonstrates that with implementation of mitigation measures, noise and vibration impacts associated with construction and operation of the Project would be less than significant.

1.1 Existing Conditions

The ONNI Group (the Applicant) proposes to develop the Times Mirror Square Project (Project) which would include construction of two new mixed-use residential and commercial towers along with rehabilitation of three existing buildings at 202 West 1st Street on an approximately 3.6- that comprises the city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway (Project Site).[1] The Project Site location is shown in **Figure 1**, *Vicinity Location Map.*

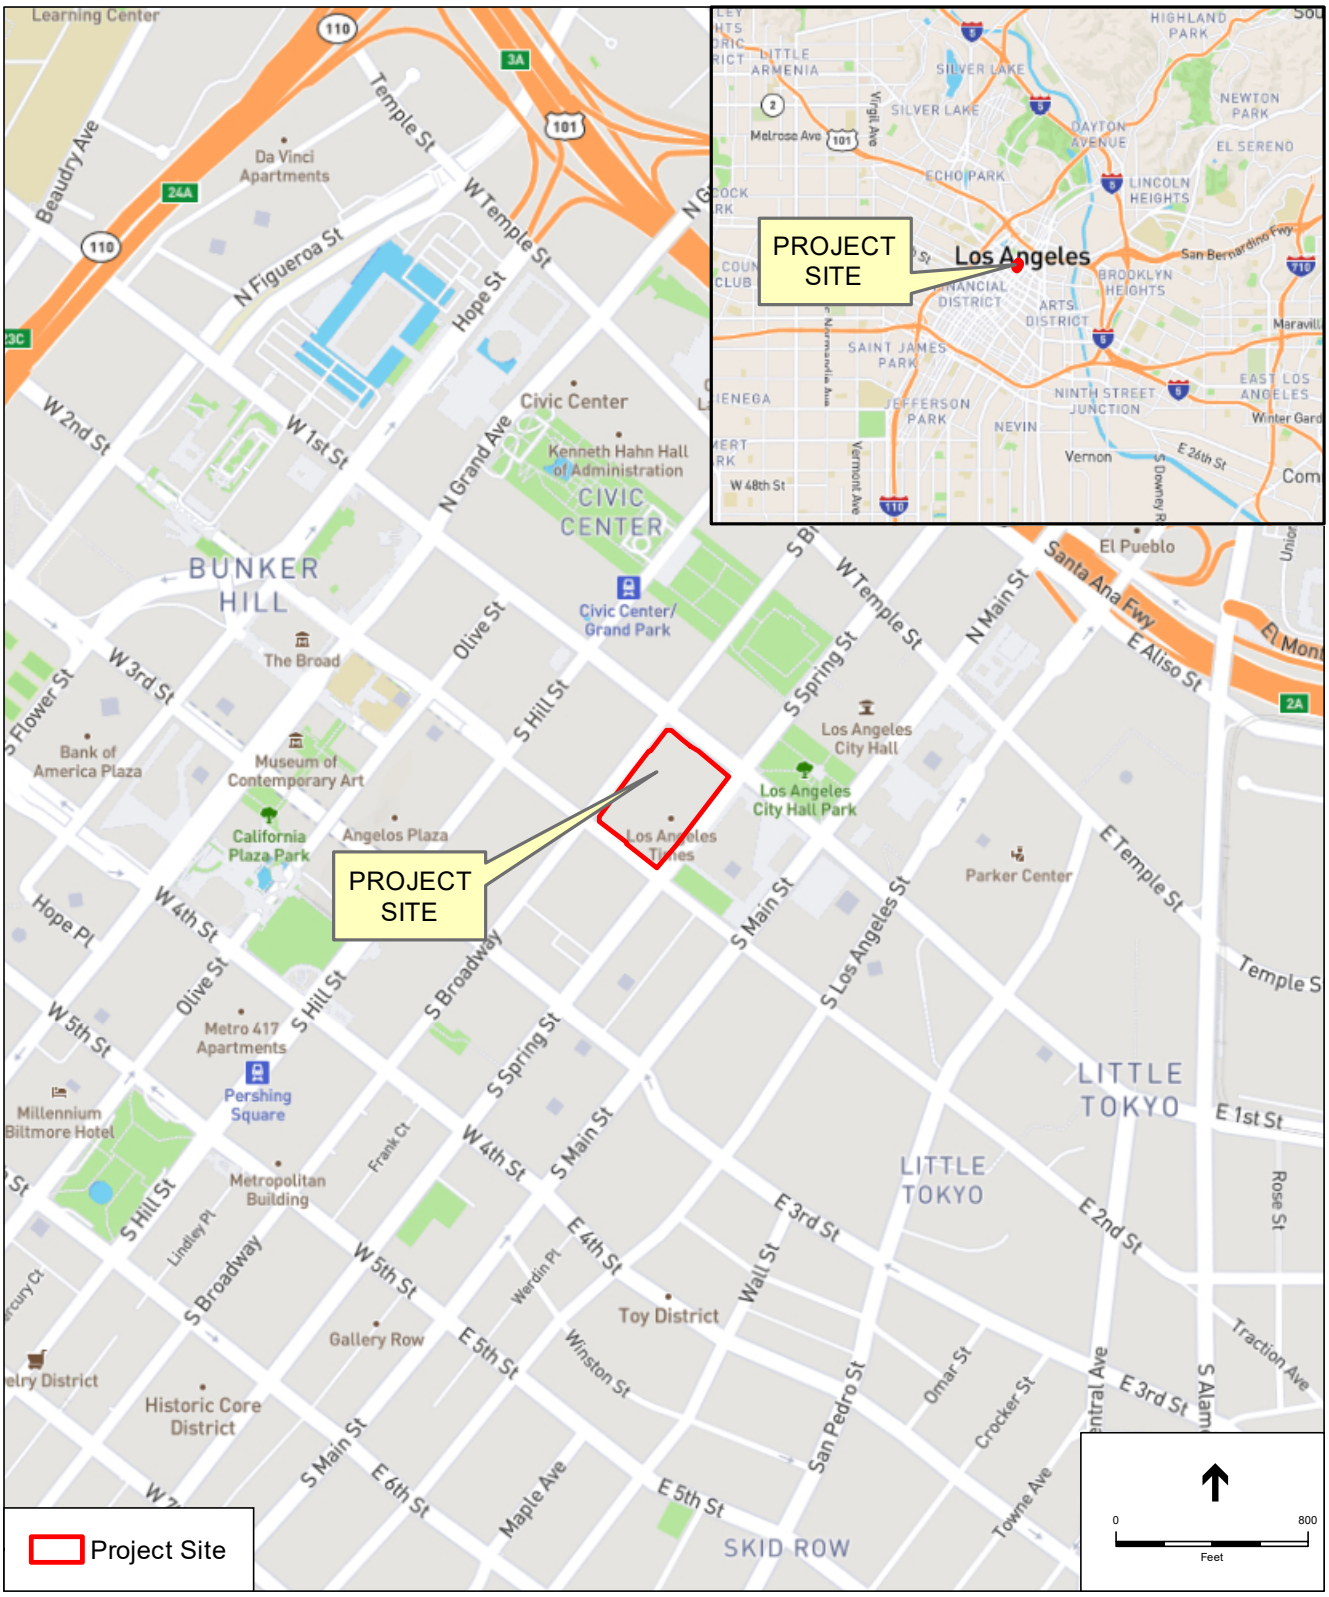
The Project Site is currently developed with five structurally distinct, but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to ten stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the ten-story Mirror Building, the six-story parking structure, and the six-story Executive Building. This includes approximately 541,113 square feet of commercial office uses across the four existing buildings, an approximately 7,500 square-foot bank in the Executive Building, an approximately 11,250 square-foot cafeteria in the Plant Building. Approximately 223,945 square feet, or 40 percent of the existing uses, are vacant office spaces that have been vacant for 10 years. GHG emissions are currently associated with vehicle trips to and from the existing Project Site (on-road mobile sources), on-site combustion of natural gas for heating and cooking, on-site combustion emissions from landscaping equipment (area source), off-site combustion of fossil fuels for electricity, and off-site emissions from solid waste decomposition, water conveyance, and wastewater treatment.

[1] The Project Site is zoned Commercial (C2-4D-SN), which permits general commercial and multi-family residential uses.

1.2 Project Description

The Project would demolish the Executive Building and parking structure and develop two high-rise mixed-use towers, the North Tower and South Tower that would replace these structures along the S. Broadway frontage, while the Times, Plant and Mirror Buildings would be renovated and preserved. The proposed Paseo would separate the existing Times, Plant, and Mirror Buildings from the new towers and intersect the Project Site between the W. 1st Street and W. 2nd Street sidewalks.

The North and South Towers, which would be constructed above a five-story parking podium (Podium). The North Tower would contain 450 residential units and the South Tower would contain 677 residential units, for a total of 1,127 residential units and approximately 34,572 square feet of commercial floor area. Total residential floor area within the two towers would be approximately 1,071,692 square feet. With the addition of open space amenities, lounges, loading areas, and retail uses, total new construction would amount to 1,135,803 square feet. Open space amenities available to residents of the North and South Towers include an approximately 28,777-square-foot residential terrace (Residential Terrace) on the rooftop of the five-story Podium (Level 6). The Residential Terrace, which is located on the rooftop of the Podium between the North and South Towers, would be open to sky and provide approximately 7,700 square feet of landscaping, a pool deck, a dog run, cabanas, steam room and sauna, and other amenities such as dining tables and fire-side seating. The Project would provide other amenities at the 6th floor level, as well as ground-floor lounges in each of the tower buildings. These amenity areas are expected to include a gym, club rooms, meeting rooms, film screening room, private dining, and potentially other common areas to serve residents.



Approximately 73,128 square feet of common open space, including the approximately 15,708-square-foot Paseo, would be provided as part of the North and South Towers component. Of the common open space, only the Paseo is available for public access. The remaining 57,420 square feet are provided as common use for the Project's residents. With the addition of approximately 56,349 square feet of private balconies, combined private and common open space would be approximately 129,477 square feet.

The Podium would be a five-story above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. The Project is designed for approximately 1,744 vehicle parking spaces in the five-level above-ground Podium and nine-level subterranean parking structure. The Project would also provide 1,240 bicycle parking spaces for the residential uses and 34 bicycle parking spaces for the commercial uses.

The existing buildings to remain approximately total 376,105 square feet. Under the Project, there would be approximately 307,288 square feet of commercial office uses, approximately 18,817 square feet of commercial restaurant uses, an approximately 50,000 square-foot grocery store, and an Office Terrace (Level 6 of the Plant Building). Although the total floor area of 376,105 square feet and the proportional mix of commercial uses would not change, the Project would allow flexibility in how the uses are allocated among the three existing buildings. The interiors of all three

historic buildings have been heavily altered over time. The two original and architecturally distinctive interior spaces, the lobbies of the Times Building and Mirror Building, would be preserved. The upper floors contain little if any historic fabric, as it was removed as a result of past structural improvements and office modernizations. The upper floors would be reconfigured for office tenants, if required. The exteriors of all three buildings would be cleaned and repaired as necessary. Overall, including the existing buildings to remain that total approximately 376,105 square feet, the Project would comprise approximately 1,511,908 square feet of floor area, resulting in a 9.42 FAR. The Project Site area and vicinity is provided in **Figure 2**, *Aerial Photograph of Project Site and Vicinity*.

Demolition activities on the subject property would include the removal of two of the five existing buildings. Approximately 35,000 tons of debris would be exported from the Project site. The Project would require the excavation of approximately 364,000 cubic yards of earth for the proposed nine levels of parking, four of which would be constructed above grade in the Podium and five of which would be constructed below grade.

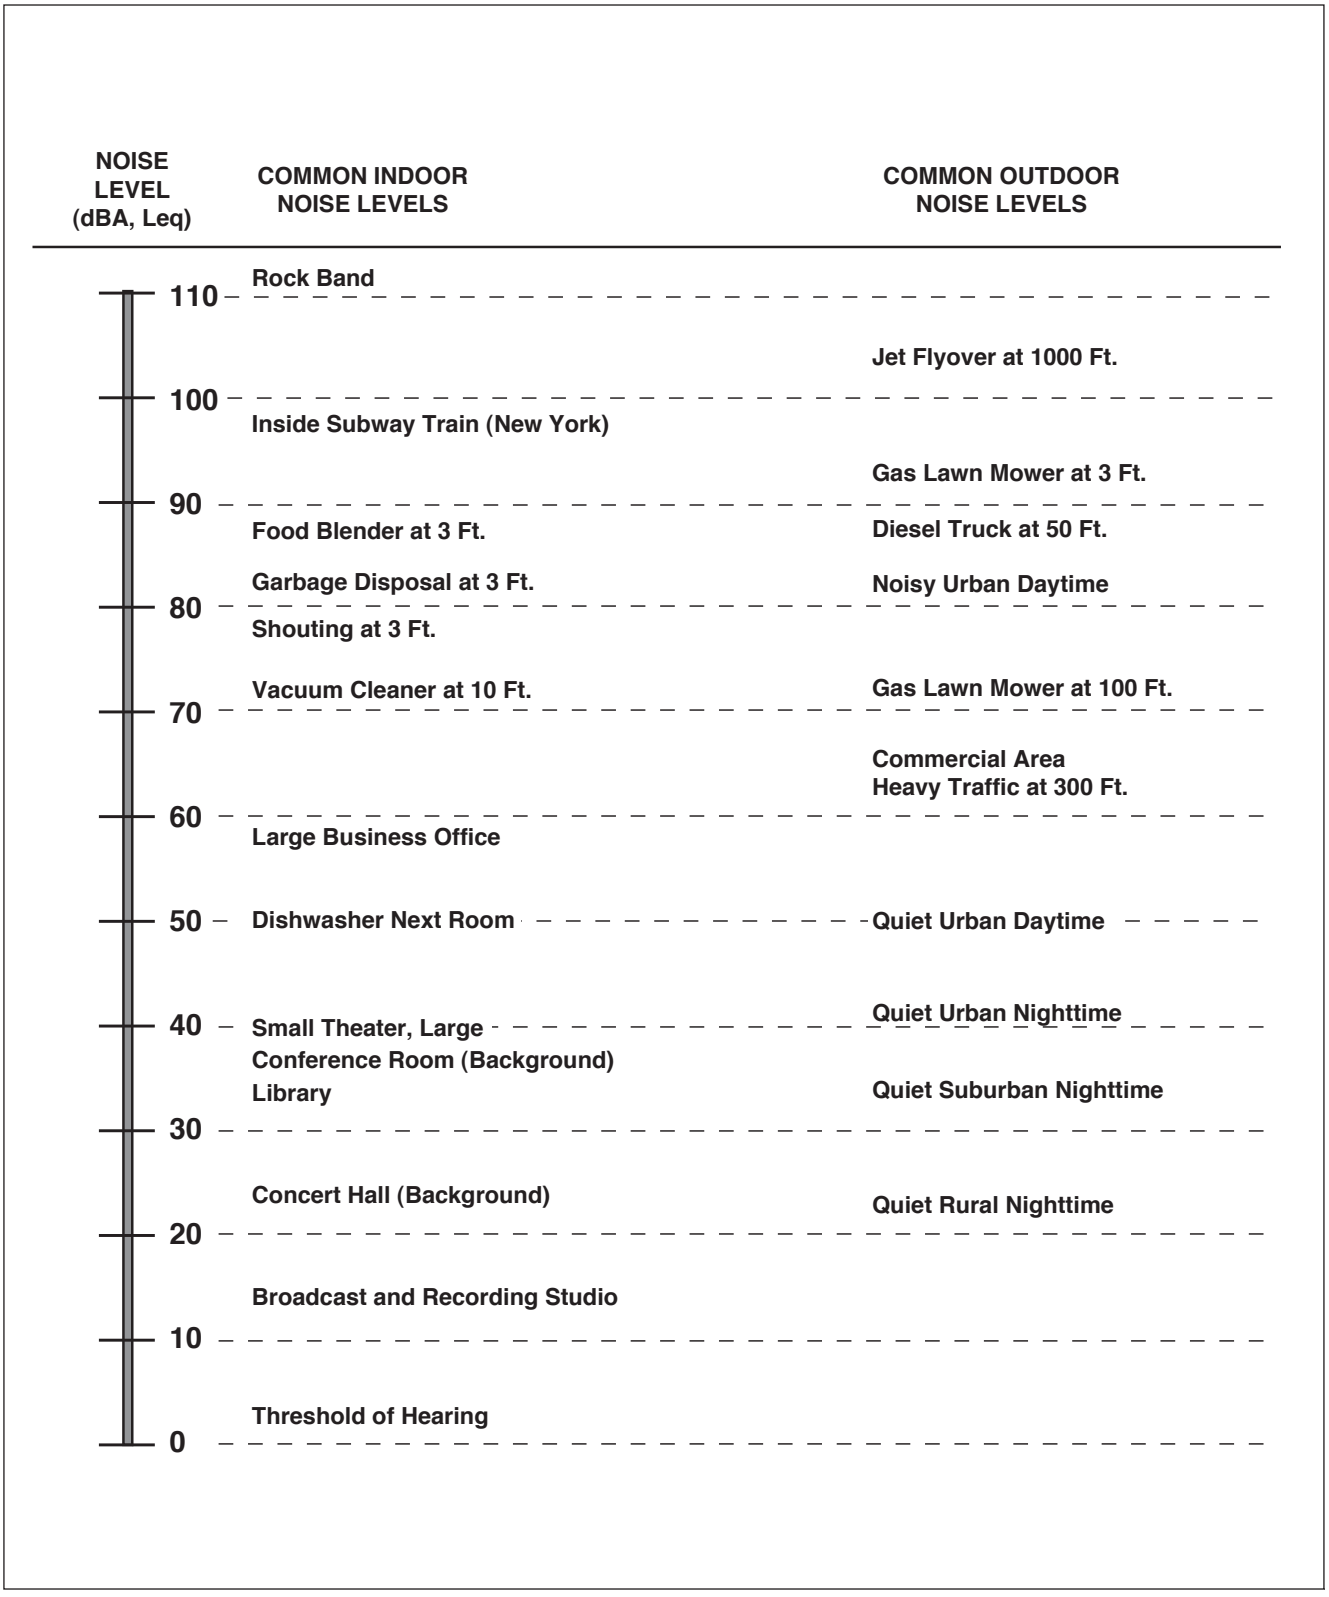
1.3 Environmental Setting

1.3.1 Noise and Vibration Basics



Noise Principals and Descriptors

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air). Noise is generally defined as unwanted sound (i.e., loud, unexpected, or annoying sound). Acoustics is defined as the physics of sound. In acoustics, the fundamental scientific model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receiver determines the sound level and characteristics of the noise perceived by the receiver. Acoustics addresses primarily the propagation and control of sound.[2]

Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) that is measured in decibels (dB), which is the standard unit of sound amplitude measurement. The dB scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound, with 0 dB corresponding roughly to the theoretical threshold of human hearing and 120 to 140 dB corresponding to the threshold of pain. Pressure waves traveling through air exert a force registered by the human ear as sound.[3]

Sound pressure fluctuations can be measured in units of hertz (Hz), which correspond to the frequency of a particular sound. Typically, sound does not consist of a single frequency, but rather a broad band of frequencies varying in levels of magnitude. When all the audible frequencies of a sound are measured, a sound spectrum is plotted consisting of a range of frequency spanning 20 to 20,000 Hz. The typical human ear is not equally sensitive to this frequency range. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 Hz and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to these extremely low and extremely high frequencies. This method of frequency filtering or weighting is referred to as A-weighting, expressed in units of A-weighted decibels (dBA), which is typically applied to community noise measurements.[4] Some representative common outdoor and indoor noise sources and their corresponding A-weighted noise levels are shown in **Figure 3**, *Decibel Scale and Common Noise Sources*.

Noise Exposure and Community Noise

An individual's noise exposure is a measure of noise over a period of time; a noise level is a measure of noise at a given instant in time, as presented in **Figure 3**. However, noise levels rarely persist at that level over a long period of time. Rather, community noise varies continuously over a period of time with respect to the sound sources contributing to the community noise environment. Community noise is primarily the product of many distant noise sources, which constitute a relatively stable background noise exposure, with many of the individual contributors unidentifiable. The background noise level changes throughout a typical day, but does so gradually, corresponding with the addition and subtraction of distant noise sources, such as changes in traffic volume. What makes community noise variable throughout a day, besides the slowly changing background noise, is the addition of short-duration, single-event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual.[5]

These successive additions of sound to the community noise environment change the community noise level from instant to instant, requiring the noise exposure to be measured over periods of time to legitimately characterize a community noise environment and evaluate cumulative noise impacts. The following noise descriptors are used to characterize environmental noise levels over time, which are applicable to the Project.[6]

L_{eq}: The equivalent sound level over a specified period of time, typically, 1 hour ($L_{eq(1)}$). The L_{eq} may also be referred to as the average sound level.

L_{max}: The maximum, instantaneous noise level experienced during a given period of time.

L_{min}: The minimum, instantaneous noise level experienced during a given period of time.

L_x: The noise level exceeded a percentage of a specified time period. For instance, L_{50} and L_{90} represent the noise levels that are exceeded 50 percent and 90 percent of the time, respectively.

L_{dn}: The average A-weighted noise level during a 24-hour day, obtained after an addition of 10 dB to measured noise levels between the hours of 10:00 P.M. to 7:00 A.M. to account for nighttime noise sensitivity. The L_{dn} is also termed the day-night average noise level (DNL).

CNEL: The Community Noise Equivalent Level (CNEL) is the average A-weighted noise level during a 24-hour day that includes an addition of 5 dB to measured noise levels between the hours of 7:00 A.M. to 10:00 P.M. and an addition of 10 dB to noise levels between the hours of 10:00 P.M. to 7:00 A.M. to account for noise sensitivity in the evening and nighttime, respectively.

5 California Department of Transportation, *Technical Noise Supplement* (TeNS), Section 2.2.2.1, September, 2013.
6 California Department of Transportation, *Technical Noise Supplement* (TeNS), Section 2.2.2.2, September, 2013.

Effects of Noise on People

Noise is generally loud, unpleasant, unexpected, or undesired sound that is typically associated with human activity that is a nuisance or disruptive. The effects of noise on people can be placed into four general categories:

- Subjective effects (e.g., dissatisfaction, annoyance);
- Interference effects (e.g., communication, sleep, and learning interference);
- Physiological effects (e.g., startle response); and
- Physical effects (e.g., hearing loss).

Although exposure to high noise levels has been demonstrated to cause physical and physiological effects, the principal human responses to typical environmental noise exposure are related to subjective effects and interference with activities. Activities most affected by noise include rest, relaxation, recreation, study, and communications.[7]

With regard to the subjective effects, the individuals' responses to similar noise events are diverse and influenced by many factors, including the type of noise, the perceived importance of the noise, the appropriateness of the noise to the setting, the duration of the noise, the time of day and the type of activity during which the noise occurs, and individual noise sensitivity. Overall, there is no completely satisfactory way to measure the subjective effects of noise, or the corresponding reactions of annoyance and dissatisfaction on people. A wide variation in individual thresholds of annoyance exists, and different tolerances to noise tend to develop based on an individual's past experiences with noise. Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which a person has adapted (i.e., comparison to the ambient noise environment). In general, the more a new noise level exceeds the previously existing ambient noise level, the less acceptable the new noise level will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships generally occur:[8]

- Except in carefully controlled laboratory experiments, a change of 1 dBA in ambient noise levels cannot be perceived.
- Outside of the laboratory, a 3 dBA change in ambient noise levels is considered to be a barely perceivable difference.
- A change in ambient noise levels of 5 dBA is considered to be a readily perceivable difference.
- A change in ambient noise levels of 10 dBA is subjectively heard as doubling of the perceived loudness.

These relationships occur in part because of the logarithmic nature of sound and the dB scale. The human ear perceives sound in a non-linear fashion; therefore, the dBA scale was developed. Because the dBA scale is based on logarithms, two noise sources do not combine in a simple

7 California Department of Transportation, *Technical Noise Supplement* (TeNS), Section 2.2.4.2, September 2013.
8 California Department of Transportation, *Technical Noise Supplement* (TeNS), Section 2.2.1, September 2013.

additive fashion, but rather logarithmically. Under the dBA scale, a doubling of sound energy corresponds to a 3 dBA increase. In other words, when two sources are each producing sound of the same loudness, the resulting sound level at a given distance would be approximately 3 dBA higher than one of the sources under the same conditions. For example, if two identical noise sources produce noise levels of 50 dBA, the combined sound level would be 53 dBA, not 100 dBA. Under the dB scale, three sources of equal loudness together produce a sound level of approximately 5 dBA louder than one source, and ten sources of equal loudness together produce a sound level of approximately 10 dBA louder than the single source.[9]

Noise Attenuation

When noise propagates over a distance, the noise level reduces with distance depending on the type of noise source and the propagation path. Noise from a localized source (i.e., point source) propagates uniformly outward in a spherical pattern, referred to as "spherical spreading." Stationary point sources of noise, including stationary mobile sources such as idling vehicles, attenuate (i.e., reduce) at a rate between 6 dBA for acoustically "hard" sites and 7.5 dBA for "soft" sites for each doubling of distance from the reference measurement, as their energy is continuously spread out over a spherical surface (e.g., for hard surfaces, 80 dBA at 50 feet attenuates to 74 at 100 feet, 68 dBA at 200 feet, etc.). Hard sites are those with a reflective surface between the source and the receiver, such as asphalt or concrete surfaces or smooth bodies of water. No excess ground attenuation is assumed for hard sites and the reduction in noise levels with distance (drop-off rate) is simply the geometric spreading of the noise from the source. Soft sites have an absorptive ground surface, such as soft dirt, grass, or scattered bushes and trees, which in addition to geometric spreading, provides an excess ground attenuation value of 1.5 dBA (per doubling distance).[10]

Roadways and highways consist of several localized noise sources on a defined path, and hence are treated as "line" sources, which approximate the effect of several point sources. Noise from a line source propagates over a cylindrical surface, often referred to as "cylindrical spreading."[11] Line sources (e.g., traffic noise from vehicles) attenuate at a rate between 3 dBA for hard sites and 4.5 dBA for soft sites for each doubling of distance from the reference measurement.[12] Therefore, noise due to a line source attenuates less with distance than that of a point source with increased distance.

Additionally, receptors located downwind from a noise source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Atmospheric temperature inversion (i.e., increasing temperature with elevation) can increase sound levels at long distances (e.g., more than 500 feet). Other factors such as air temperature, humidity, and turbulence can also have significant effects on noise levels.[13]

13 California Department of Transportation, *Technical Noise Supplement* (TeNS), Section 2.1.4.3, September 2013.

1.3.2 Foundations of Vibration

Vibration can be interpreted as energy transmitted in waves through the ground or man-made structures, which generally dissipate with distance from the vibration source. Because energy is lost during the transfer of energy from one particle to another, vibration becomes less perceptible with increasing distance from the source.

As described in the Federal Transit Administration's (FTA) *Transit Noise and Vibration Impact Assessment*, ground-borne vibration can be a serious concern for nearby neighbors of a transit system route or maintenance facility, causing buildings to shake and rumbling sounds to be heard.[14] In contrast to airborne noise, ground-borne vibration is not a common environmental problem, as it is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. Some common sources of ground-borne vibration are trains, heavy trucks traveling on rough roads, and construction activities, such as blasting, pile-driving, and operation of heavy earth-moving equipment.[15]

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal in inches per second (in/sec), and is most frequently used to describe vibration impacts to buildings. The root mean square (RMS) amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body. Decibel notation (VdB) is commonly used to measure RMS. The relationship of PPV to RMS velocity is expressed in terms of the "crest factor," defined as the ratio of the PPV amplitude to the RMS amplitude. PPV is typically a factor of 1.7 to 6 times greater than RMS vibration velocity.[16] The decibel notation VdB acts to compress the range of numbers required to describe vibration. Typically, ground-borne vibration generated by man-made activities attenuates rapidly with distance from the source of the vibration. Sensitive receptors for vibration include buildings where vibration would interfere with operations within the building or cause damage (especially older masonry structures), locations where people sleep, and locations with vibration sensitive equipment.[17]

The effects of ground-borne vibration include movement of the building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. In extreme cases, the vibration can cause damage to buildings. Building damage is not a factor for most projects, with the occasional exception of blasting and pile-driving during construction. Annoyance from vibration often occurs when the vibration levels exceed the threshold of perception by only a small margin. A vibration level that causes annoyance will be well below the damage threshold for normal buildings.

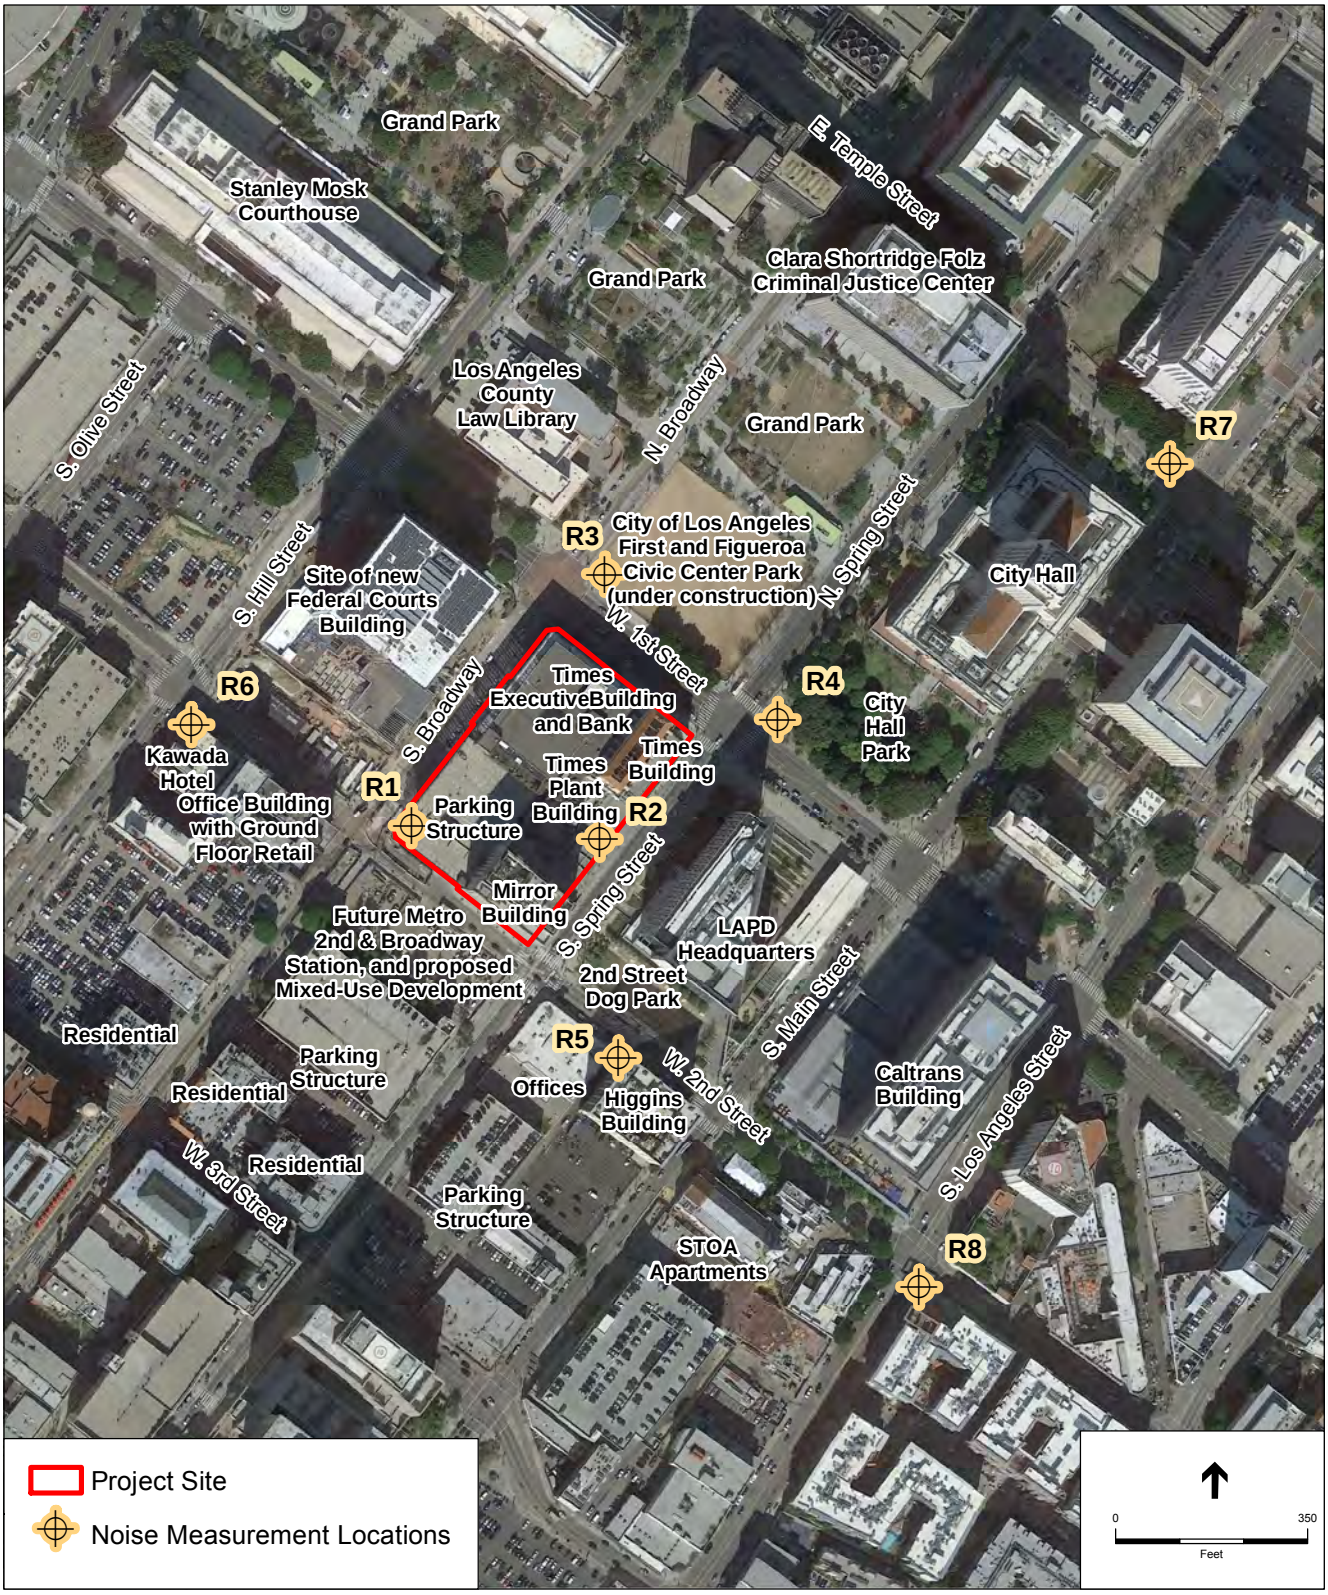
1.4 Existing Conditions

1.4.1 Noise-Sensitive Receptors Locations



Some land uses are considered more sensitive to noise than others due to the types of activities typically involved at the receptor location, and the effect that noise can have on those activities and the persons engaged in them. The City of Los Angeles CEQA Thresholds Guide (*Thresholds Guide)* states that residences, transient lodgings, schools, libraries, churches, hospitals, nursing homes, auditoriums, concert halls, amphitheaters, playgrounds and parks are noise-sensitive land uses.[18] Therefore, the existing on-site office buildings are not considered as noise-sensitive uses. Existing noise-sensitive uses within 500 feet of the Project Site include the following, as shown in **Figure 4,** *Noise Measurement Locations and Surrounding Uses*:

- The Federal Courthouse, approximately 80 feet to the west of the Project Site;
- The Los Angeles County Law Library and Grand Park, approximately 180 feet and 434 feet to the north of the Project Site, respectively;
- The City Hall Park, approximately 150 feet to the northeast of the Project Site;
- The Higgins Building Lofts apartment complex at the corner of S. Main Street and West 2nd Street, approximately 250 feet southeast of the Project Site, and the one-acre park just south of the LAPD Headquarters Building, approximately 80 feet southeast of the Project Site;
- The Kawada Hotel, approximately 300 feet to the west of the Project Site along W. 2nd Street;
- The Douglas Lofts apartment complex at the corner of Spring Street and West 3rd Street, approximately 530 feet southwest of the Project Site;
- The Victor Clothing apartment complex on Broadway, approximately 480 feet to the southwest of the of the Project Site;
- The Pan American Lofts building, at the corner of Broadway and W. 3rd Street, approximately 550 feet southwest of the Project Site; and
- The STOA apartment complex, on S. Main Street approximately 550 feet southeast of the Project Site.

Future sensitive receptor locations (not yet built) include:

- A mixed-use residential development, planned for construction over the Metro station at the corner of 2nd Street and Broadway, approximately 50 feet southwest of the Project Site;
- The First and Broadway Civic Center Park planned for construction at the corner of 1st and Broadway, approximately 130 feet northwest of the Project Site; and

Noise Measurement Locations and Surrounding Uses

ESA

- The Etco Homes apartment complex, planned for construction on Astronaut E. S. Onizuka Street, approximately 1,300 feet southeast of the Project Site.

All other noise-sensitive uses regulated by the City of Los Angeles are located at greater distances from the Project Site, and therefore, would experience lower noise levels from the potential noise sources on the Project Site, due to the attenuation of noise with distance.

1.4.2 Vibration-Sensitive Receptor Locations

Typically, groundborne vibration generated by man-made activities (i.e., rail and roadway traffic, operation of mechanical equipment and typical construction equipment) diminishes rapidly with distance from the vibration source. With respect to potential structural damage, FTA considers four categories of buildings, as shown in Section 2 in **Table 3**, below. With respect to potential human annoyance, the FTA considers three land use categories for human annoyance, as shown in Section 2 in **Table 4**, below, and uses a screening distance of: 100 feet for highly vibration-sensitive buildings (e.g., hospitals with vibration sensitive equipment) (Category 1), and 50 feet for residential uses (Category 2) and schools (Category 3). When vibration-sensitive buildings are within these distances from a project site, vibration impact analysis is required.

Regarding potential structural damage impacts, there are no existing extremely vibration-susceptible buildings located within 150 feet of the Project Site. The Times, Plant, and Mirror Buildings are located on the Project Site within the area of potential building vibration impacts (within 50 feet) due to short-term Project construction and long-term Project operation. According to Section IV.C, *Cultural Resources*, of the Project's Draft Environmental Impact Report (EIR), the Times, Plant, and Mirror Buildings have a steel frame structural system and the walls are made of reinforced concrete.[19] Therefore, for potential structural damage due to vibration, the Times, Plant, and Mirror Buildings are considered in the FTA's *Transit Noise and Vibration Impact Assessment*, as Category I buildings for structural damage. The Federal Courthouse has a steel frame structural system,[20] and therefore, is also considered as a Category I building for structural damage

With respect to potential human annoyance impacts, FTA's *Transit Noise and Vibration Impact Assessment* identifies residential and institutional buildings as vibration sensitive receptors. Therefore, the Federal Courthouse and Los Angeles County Law Library buildings nearby the Project Site would be considered as vibration sensitive receptors for human annoyance.

The closest future vibration sensitive receptor for potential structural damage and human annoyance is a mixed-use residential development planned at the corner of 2nd Street and Broadway, approximately 50 feet southwest of the Project Site. All other vibration-sensitive uses

[19] GPA Consulting, Times Mirror Square, Los Angeles, California – Historic Resource Technical Report, pages 13, 16, and 18, 2018. Provided in Appendix D-1 of the Project's Draft EIR.

are located at distances greater than 50 feet from the Project Site; and therefore, would experience lower vibration levels associated with the Project.

1.4.3 Ambient Noise Levels

The predominant existing noise source surrounding the Project Site is vehicle traffic, including buses and trucks, traveling on the roadways adjacent to the Project Site (W. 1st Street to the north, W. 2nd Street to the south, and Broadway to the west, Spring Street to the east) and on other roadways in the Project vicinity. Secondary noise sources include general commercial-related activities, such as, loading dock/delivery truck activities, trash compaction, and refuse service activities. Other existing noise sources would include occasional outdoor gatherings or events at or near City Hall or at nearby parks.[21]

To establish ambient noise levels, ambient noise measurements were conducted at eight locations, representing the nearby land uses in the vicinity of the Project Site. The measurement locations and existing development are shown on **Figure 4**.

The ambient noise measurements were conducted using the Larson-Davis 820 Precision Integrated Sound Level Meter ("SLM"). The Larson-Davis 820 SLM is a Type 1 standard instrument as defined in the American National Standard Institute S1.4. All instruments were calibrated and operated according to the applicable manufacturer specification. The SLM microphone was placed at a height of 5 feet above the local grade, at the following locations, as shown in **Figure 4**:

- R1: the northeast corner of Broadway and 2nd Street, which represents the existing noise environment of the west corner the Project Site and the Federal Courthouse and Future Mixed-Use Residential Development at the corner of 2nd Street and Broadway.

- R2: the southeastern boundary of the Los Angeles Times Building along Spring Street, which represents the existing noise environment of the Los Angeles Times Building.

- R3: the southeast corner of Broadway and 1st Street, which represents the existing noise environment of the Los Angeles County Law Library and the future First and Broadway Civic Center Park at the corner of Broadway and 1st Street north of the Project Site.

- R4: the southwest corner of the park at Spring Street and 1st Street, which represents the existing noise environment of the City Hall Park at the corner of Spring Street and 1st Street, east of the Project Site.

- R5: along south side of 2nd Street, midway between Main Street and Spring Street, which represents the existing noise environment of the Higgins Building Lofts apartment complex at

[21] Metro station construction was not occurring during the ambient noise measurements. The Metro station construction area was fenced off and marked, but no construction activities were observed. The Project would be under construction at the same time as the Metro station (at least until 2021). However, construction noise would be intermittent, temporary, and would cease at the end of the construction phase. Furthermore, not including Metro station construction noise as part of the existing ambient noise environment is a more conservative approach for assessing potential Project impacts because it results in lower significance thresholds as the thresholds are based on noise increases above ambient conditions. Therefore, Metro station construction noise shall not be considered as part of the existing ambient noise environment for Project impact analysis purposes. However, with respect to potential cumulative construction noise impacts, Metro station construction noise is included in the cumulative impacts analysis for the Project and is discussed in Section 6), Cumulative Impacts.

the corner of S. Main Street and West 2nd Street and the one-acre park just south of the LAPD Headquarters Building.

- R6: near the southeast corner of Hill Street and 2nd Street, which represents the existing noise environment of the Kawada Hotel on 2nd Street between Hill Street and Broadway, west of the Project Site.

- R7: at the northwest corner of intersection of E. Temple Street and S. Main Street, which represents the existing noise environment along the Project's haul route on Main Street.

- R8: at the southeast corner of the intersection of W. 2nd Street and S. Los Angeles Street, which the existing noise environment along the Project's haul route on Los Angeles Street.

To characterize the existing noise environment in the Project vicinity, long-term (24-hour) noise measurements were conducted at locations R1 and R2, and short-term (15-minute) daytime and nighttime noise measurements were conducted at locations R3 through R8. The long-term measurements were conducted from 11:00 A.M. on Tuesday, August 8, to 11:00 A.M. on Wednesday, August 9, 2017. The short-term daytime measurements were conducted between 11:00 A.M. and 1:00 P.M. on Wednesday, August 9, 2017, and at 2:00 p.m. on Monday, October 8, 2018. Short-term nighttime measurements were conducted between 10:00 P.M. and 12:00 A.M. on Monday, October 8, 2018. A summary of noise measurement results is provided in **Table 1**, *Summary of Ambient Noise Measurements*. As shown in **Table 1**, daytime hourly average noise levels ranged from approximately 60.3 dBA to 72.8 dBA, L_{eq}, and nighttime hourly average noise levels ranged from approximately 54.1 dBA to 67.1 dBA, L_{eq}.

Existing Roadway Noise Levels

Existing roadway noise levels were calculated for 47 roadway segments located in the vicinity of the Project Site. The roadway segments selected for analysis includes the roadways that are located near and immediately adjacent to the Project Site. These roadways, when compared to roadways located further away from the Project Site, would experience the greatest percentage increase in traffic generated by the Project (as distances are increased from the Project Site, traffic is spread out over a greater geographic area and its effects are reduced).

Existing roadway noise levels were calculated using the Federal Highway Administration's (FHWA's) Traffic Noise Model (TNM) and traffic volumes on roadway segments analyzed in the Project's traffic study prepared by Fehr & Peers, provided in Appendix L of the Project's Draft EIR.[22] The model calculates the average noise level at specific locations based on traffic volumes, average speeds, and site environmental conditions. The average daily noise levels at these roadway intersections are presented in **Table 2**, *Existing Roadway Noise Levels*. As shown in **Table 2**, the ambient noise environment of the project vicinity can be characterized by 24-hour CNEL levels attributable to existing traffic on local roadways. As indicated in **Table 2**, the calculated CNEL from actual existing traffic volumes on the analyzed roadway segments ranged from 66.0 dBA to 71.2 dBA CNEL for residential areas, parks, lodging, concert halls, and commercial uses.

Existing Groundborne Vibration Levels

Aside from periodic construction work occurring throughout the city, field observations noted that sources of groundborne vibration in the Project Site vicinity would be limited to heavy-duty vehicular travel (refuse trucks, delivery trucks, etc.) on local roadways. Trucks traveling at a

[22] Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, 2018.

distance of 50 feet typically generate groundborne vibration velocity levels of 63 VdB (approximately 0.006 in/sec PPV).[23]

SOURCE: ESA, 2018

SECTION 2
Regulatory Setting

2.1 Federal

Under the authority of the Noise Control Act of 1972, the United States Environmental Protection Agency (USEPA) established noise emission criteria and testing methods published in Parts 201 through 205 of Title 40 of the Code of Federal Regulations (CFR) that apply to some transportation equipment (e.g., interstate rail carriers, medium trucks, and heavy trucks) and construction equipment. In 1974, USEPA issued guidance levels for the protection of public health and welfare in residential land use areas[24] of an outdoor L_{dn} of 55 dBA and an indoor L_{dn} of 45 dBA. These guidance levels are not considered as standards or regulations and were developed without consideration of technical or economic feasibility. There are no federal noise standards that directly regulate environmental noise related to the construction or operation of the proposed Project.

Under the Occupational Safety and Health Act of 1970 (29 U.S.C. §1919 et seq.), the Occupational Safety and Health Administration (OSHA) has adopted regulations designed to protect workers against the effects of occupational noise exposure. These regulations list permissible noise level exposure as a function of the amount of time during which the worker is exposed. The regulations further specify a hearing conservation program that involves monitoring the noise to which workers are exposed, ensuring that workers are made aware of overexposure to noise, and periodically testing the workers' hearing to detect any degradation.

Federal Vibration Guidelines

FTA has adopted vibration criteria that are used to evaluate potential structural damage to buildings by building category from construction activities. The vibration damage criteria adopted by FTA are shown in **Table 3,** *Construction Vibration Damage Criteria***.**

TABLE 3
CONSTRUCTION VIBRATION DAMAGE CRITERIA

Building Category	PPV (in/sec)
I. Reinforced-concrete, steel, or timber (no plaster)	0.5
II. Engineered concrete and masonry (no plaster)	0.3
III. Non-engineered timber and masonry buildings	0.2
IV. Buildings extremely susceptible to vibration damage	0.12

SOURCE: FTA, Transit Noise and Vibration Impact Assessment. 2018.

[24] United States Environmental Protection Agency, EPA Identifies Noise Levels Affecting Health and Welfare, April 1974.

FTA has also adopted vibration criteria associated with the potential for human annoyance from groundborne vibration for the following three land-use categories: Category 1 – High Sensitivity, Category 2 – Residential, and Category 3 – Institutional. FTA defines Category 1 as buildings where vibration would interfere with operations within the building, including vibration-sensitive research and manufacturing facilities, hospitals with vibration-sensitive equipment, and university research operations. Vibration-sensitive equipment includes, but is not limited to, electron microscopes, high-resolution lithographic equipment, and normal optical microscopes. Category 2 refers to all residential land uses and any buildings where people sleep, such as hotels and hospitals. Category 3 refers to institutional land uses such as schools, churches, other institutions, and quiet offices that do not have vibration-sensitive equipment but still have the potential for activity interference. The vibration criteria associated with human annoyance for these three land-use categories are shown in **Table 4**, *Groundborne Vibration Impact Criteria for General Assessment*. No vibration criteria have been adopted or recommended by FTA for commercial and office uses.

TABLE 4
GROUNDBORNE VIBRATION IMPACT CRITERIA FOR GENERAL ASSESSMENT

Land Use Category	Frequent Events[a]	Occasional Events[b]	Infrequent Events[c]
Category 1: Buildings where vibration would interfere with interior operations.	65 VdB[d]	65 VdB[d]	65 VdB[d]
Category 2: Residences and buildings where people normally sleep.	72 VdB	75 VdB	80 VdB
Category 3: Institutional land uses with primarily daytime use.	75 VdB	78 VdB	83 VdB

[a] "Frequent Events" is defined as more than 70 vibration events of the same source per day.
[b] "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
[c] "Infrequent Events" is defined as fewer than 30 vibration events of the same kind per day.
[d] This criterion is based on levels that are acceptable for most moderately sensitive equipment such as optical microscopes.

SOURCE: FTA, Transit Noise and Vibration Impact Assessment. 2018.

2.2 State

2.2.1 California Noise Standards

The State of California does not have statewide standards for environmental noise, but the Governor's Office of Planning and Research (OPR) has established general plan guidelines for evaluating the compatibility of various land uses as a function of community noise exposure, as presented in **Figure 5**, *Guidelines for Noise Compatible Land Use*. [25] The purpose of these guidelines is to maintain acceptable noise levels in a community setting for different land use types. Noise compatibility by different land uses types is categorized into 4 general levels: "normally acceptable," "conditionally acceptable," "normally unacceptable," and "clearly unacceptable." For instance, a noise environment ranging from 50 dBA CNEL to 65 dBA CNEL is considered to be "normally acceptable" for multi-family residential uses, while a noise environment of 75 dBA

[25] State of California, General Plan Guidelines, Governor's Office of Planning and Research, 2003.

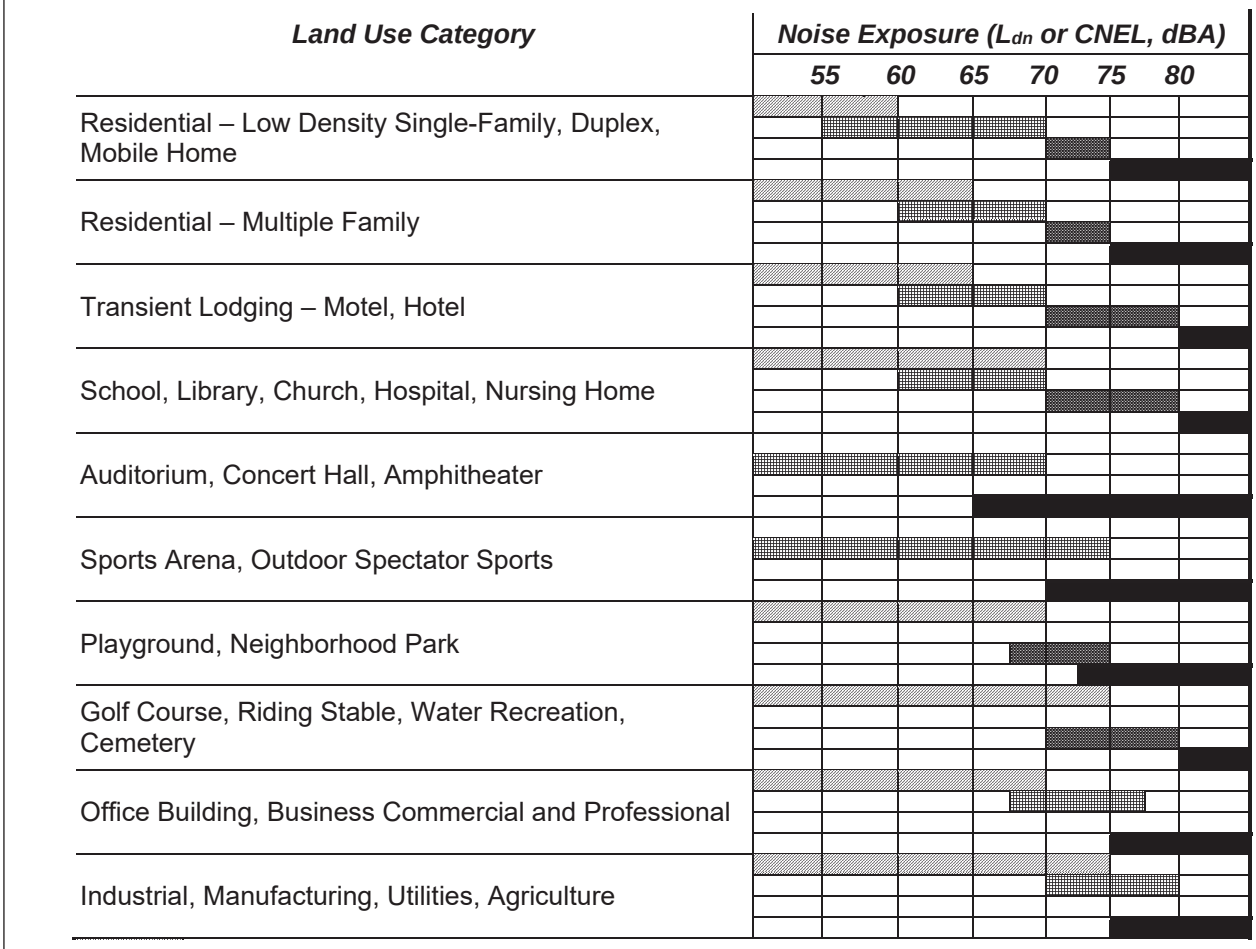
CNEL or above for multi-family residential uses is considered to be "clearly unacceptable." In addition, California Government Code Section 65302(f) requires each County and City in the state to prepare and adopt a comprehensive long-range General Plan for its physical development, with Section 65302(g) requiring a noise element to be included in the General Plan. The noise element must: (1) identify and appraise noise problems in the community; (2) recognize Office of Noise Control guidelines; and (3) analyze and quantify current and projected noise levels.

The State of California has also established noise insulation standards for new multi-family residential units, hotels, and motels that would be subject to relatively high levels of transportation-related noise. These requirements are collectively known as the California Noise Insulation Standards (Title 24, California Code of Regulations). The noise insulation standards set forth an interior standard of 45 dBA CNEL in any habitable room. They require an acoustical analysis demonstrating how dwelling units have been designed to meet this interior standard where such units are proposed in areas subject to noise levels greater than 60 dBA CNEL. Title 24 standards are typically enforced by local jurisdictions through the building permit application process.

2.3 Local

2.3.1 City of Los Angeles General Plan, Noise Element

The Noise Element of the City's General Plan establishes CNEL guidelines for land use compatibility as shown in **Table 5** and includes a number of goals, objectives, and policies for land use planning purposes. The overall purpose of the Noise Element of the City's General Plan is to guide policymakers in making land use determinations and in preparing noise ordinances that would limit exposure of citizens to excessive noise levels. The following policies and objectives from the Noise Element of the General Plan are applicable to the Project.[26]



Objective 2 (Non-airport): Reduce or eliminate non-airport related intrusive noise, especially relative to noise sensitive uses.

Policy 2.2: Enforce and/or implement applicable city, state, and federal regulations intended to mitigate proposed noise producing activities, reduce intrusive noise and alleviate noise that is deemed a public nuisance.

Objective 3 (Land Use Development): Reduce or eliminate noise impact associated with proposed development of land and changes in land use.

Policy 3.1: Develop land use policies and programs that will reduce or eliminate potential and existing noise impacts.

[26] Noise Element of the General Plan, adopted February 3, 1999.

NORMALLY ACCEPTABLE: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.

CONDITIONALLY ACCEPTABLE: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design.

NORMALLY UNACCEPTABLE: New construction or development should be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirement must be made and needed noise insulation features included in the design.

CLEARLY UNACCEPTABLE: New construction or development should generally not be undertaken. Construction costs to make the indoor environmental acceptable would be prohibitive and the outdoor environment would not be usable.

Times Mirror Square

Figure 5

Guidelines for Noise Compatible Land Use

2.3.2 Los Angeles Municipal Code

The City also has regulations to control unnecessary, excessive, and annoying noise, as set forth in Chapter XI of the Los Angeles Municipal Code (LAMC). The City's Noise Regulation establishes acceptable ambient sound levels to regulate intrusive noises (e.g., stationary mechanical equipment and vehicles other than those traveling on public streets) within specific land use zones and provides procedures and criteria for the measurement of the sound level of noise sources. These procedures recognize and account for differences in the perceived level of different types of noise and/or noise sources.

Section 111.01 and Section 111.03 of the LAMC define the ambient noise as the actual measured ambient noise level or the City's presumed ambient noise level, whichever is greater. The actual ambient noise level is the measured noise level averaged over a period of at least 15 minutes L_{eq}.

Section 111.02 of the LAMC provides procedures and criteria for the measurement of the sound level of "offending" noise sources. In accordance with the LAMC, a noise level increase of 5 dBA over the existing average ambient noise level at an adjacent property line is considered a noise violation. To account for people's increased tolerance for short-duration noise events, the Noise Regulation provides a 5 dBA allowance for noise occurring more than five but less than fifteen minutes in any one-hour period and an additional 5 dBA allowance (total of 10 dBA) for noise occurring five minutes or less in any one-hour period.[27] Section 112.01 of the LAMC prohibits noise from any radio, musical instrument, phonograph, television receiver, or other machine or device for the producing, reproducing or amplification of the human voice, music, or any other sound, in such a manner, as to disturb the peace, quiet, and comfort of neighbor occupants or any reasonable person residing or working in the area or that exceeds the ambient noise level on the premises of any other occupied property, or if a condominium, apartment house, duplex, or attached business, within any adjoining unit, by more than 5 dBA.

Section 112.02 limits increases in noise levels from air conditioning, refrigeration, heating, pumping and filtering equipment. Such equipment may not be operated in such manner as to create any noise which would cause the noise level on the premises of any other occupied property, or, if a condominium, apartment house, duplex, or attached business, within any adjoining unit, to exceed the ambient noise level by more than 5 dBA.

Section 112.05 of the LAMC sets a maximum noise level for construction equipment of 75 dBA at a distance of 50 feet when operated within 500 feet of a residential zone. Compliance with this standard is required only where "technically feasible."[28] Section 41.40 of the LAMC prohibits construction between the hours of 9:00 P.M. and 7:00 A.M. Monday through Friday, 6:00 P.M. and 8:00 A.M. on Saturday, and at any time on Sunday (i.e., construction is allowed Monday through Friday between 7:00 A.M. to 9:00 P.M.; and Saturdays and National Holidays between 8:00 A.M. to 6:00 P.M.). In general, the City's Department of Building and Safety enforces noise ordinance provisions relative to equipment and the Los Angeles Police Department enforces provisions

[27] LAMC, Chapter XI, Article I, Section 111.02-(b).

[28] In accordance with the City's Noise Ordinances, "technically feasible" means that the established noise limitations can be complied with at a project site, with the use of mufflers, shields, sound barriers, and/or other noise reduction devices or techniques employed during the operation of equipment.

relative to noise generated by people. However, the provisions of Section 41.40(a) shall not apply to any person who performs the construction, repair or excavation work involved pursuant to the express written permission of the Board of Police Commissioners through its Executive Director. The Executive Director on behalf of the Board, may grant this permission, upon application in writing, where the work purposed to be done is in the public interest, or where hardship or injustice, or unreasonable delay would result from its interruption during the hours mentioned above, or where the building or structure involved is devoted or intended to be to be developed to a use immediately related to public defense.

Section 113.01 of LAMC prohibits collecting or disposing of rubbish or garbage, to operate any refuse disposal truck, or collecting, loading, picking up, transferring, unloading, dumping, discarding, or disposing of any rubbish or garbage, as such terms are defined in Section 66.00 of LAMC, within 200 feet of any residential building between the hours of 9:00 P.M. and 6:00 A.M. of the following day, unless a permit therefore has been duly obtained beforehand from the Board of Police Commissioners.

The City allows project applicants to obtain permission to conduct construction outside of the hours specified above. In these cases, a project applicant must obtain the express written permission of the Board of Police Commissioners through its Executive Director. The Executive Director, on behalf of the Board, may grant this permission upon application in writing where the work purposed to be done is in the public interest, or where hardship or injustice, or unreasonable delay would result from its interruption during the hours mentioned above.

2.3.3 Guidelines for Noise-Compatible Land Uses

In addition, the City's Thresholds Guide provides criteria for evaluating the noise impacts of a project. These criteria are described further below. The City has adopted local guidelines based, in part, on the community noise compatibility guidelines established by the State OPR for use in assessing the compatibility of various land use types with a range of noise levels. These guidelines are set forth in the *Thresholds Guide* in terms of the CNEL. CNEL guidelines for specific land uses are classified into four categories: (1) "normally acceptable," (2) "conditionally acceptable," (3) "normally unacceptable," and (4) "clearly unacceptable." As shown in **Table 5,** *City of Los Angeles Land Use Compatibility for Community Noise*, a CNEL value of 70 dBA is the upper limit of what is considered a "conditionally acceptable" noise environment for multi-family residential uses, although the upper limit of what is considered "normally acceptable" for multi-family residential uses is set at 65 dBA CNEL.[29] New development should generally be discouraged within the "normally unacceptable" or "clearly unacceptable" categories. However, if new development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

CITY OF LOS ANGELES LAND USE COMPATIBILITY FOR COMMUNITY NOISE

	Community Noise Exposure CNEL (dBA)			
Land Use	**Normally Acceptable**	**Conditionally Acceptable**	**Normally Unacceptable**	**Clearly Unacceptable**
Single-Family, Duplex, Mobile Homes	50 to 60	55 to 70	70 to 75	Above 70
Multi-Family Homes	50 to 65	60 to 70	70 to 75	Above 70
Schools, Libraries, Churches, Hospitals, Nursing Homes	50 to 70	60 to 70	70 to 80	Above 80
Transient Lodging—Motels, Hotels	50 to 65	60 to 70	70 to 80	Above 80
Auditoriums, Concert Halls, Amphitheaters	—	50 to 70	—	Above 65
Sports Arena, Outdoor Spectator Sports	—	50 to 75	—	Above 70
Playgrounds, Neighborhood Parks	50 to 70	—	67 to 75	Above 72
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50 to 75	—	70 to 80	Above 80
Office Buildings, Business and Professional Commercial	50 to 70	67 to 77	Above 75	—
Industrial, Manufacturing, Utilities, Agriculture	50 to 75	70 to 80	Above 75	—

Normally Acceptable: Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.
Conditionally Acceptable: New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.
Normally Unacceptable: New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.
Clearly Unacceptable: New construction or development should generally not be undertaken.

Source: City of L.A. CEQA Thresholds Guide, 2006.

SECTION 3
Significance Thresholds

3.1 State CEQA Guidelines Appendix G

In accordance with Appendix G of the State *CEQA Guidelines,* the project would have a significant impact related to Noise if it would result in:

a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;

b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;

c) A substantial permanent increase in ambient noise levels in the vicinity of the Project above levels existing without the Project;

d) A substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project.

e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

For this analysis, the Appendix G Thresholds are relied upon. The analysis utilizes factors and considerations identified in the *2006 L.A. CEQA Thresholds Guide (Thresholds Guide)*, as appropriate, to assist in answering the Appendix G Threshold questions.

The *Thresholds Guide*, identifies the following factors for consideration on a case-by-case basis to evaluate noise impacts:

3.2.1 Construction Noise

The *Thresholds Guide* identifies the following criteria to evaluate construction noise:

- Construction activities lasting more than one day would exceed existing ambient exterior noise levels by 10 dBA L_{eq} or more at a noise sensitive use;
- Construction activities lasting more than 10 days in a three-month period would exceed existing ambient exterior noise levels by 5 dBA L_{eq} or more at a noise sensitive use; or

- Construction activities would exceed the ambient noise level by 5 dBA L_{eq} at a noise sensitive use between the hours of 9:00 P.M. and 7:00 A.M. Monday through Friday, before 8:00 A.M. or after 6:00 P.M. on Saturday, or at any time on Sunday.

As discussed in Chapter II, *Project Description*, of the Project's Draft EIR, construction of the Project is anticipated to commence in 2019 and be completed in 2023. Therefore, since construction activities would occur over a period longer than 10 days for all phases, the corresponding criteria used in the construction noise analysis presented in this report is an increase in the ambient exterior noise levels of 5 dBA L_{eq} or more at a noise sensitive use.

3.2.2 Operational Noise

The following criteria are applied to the Project, as set forth in the *Thresholds Guide* and the City's Noise Regulations, with the more restrictive provisions applied, to evaluate operational noise. The Project would have a significant impact from operations if:

- The Project causes the ambient noise levels measured at the property line of affected uses to increase by 3 dBA CNEL to or within the "normally unacceptable" or "clearly unacceptable" categories; or
- The Project causes the ambient noise levels measured at the property line of affected uses to increase by 5 dBA CNEL or more increase in noise level; or
- Project-related operational on-site (i.e., non-roadway) noise sources such as outdoor building mechanical/electrical equipment, outdoor activities, or parking facilities increase the ambient noise level (L_{eq}) at noise sensitive uses by 5 dBA L_{eq}.

In summary, for operational noise, the criteria for on-site operations is an increase in ambient noise level of 5 dBA L_{eq} at an adjacent property line, in accordance with the LAMC. The LAMC does not apply to the off-site traffic (i.e., vehicle traveling on public roadways). Therefore, the criteria for off-site traffic noise associated with Project operations is based on the *Thresholds Guide*. In addition, the criteria for composite noise levels (on-site and off-site sources) are also based on the *Thresholds Guide*, as again, the LAMC does not apply to off-site traffic noise. The criteria used below in the noise analysis for off-site operations and the composite operational noise is therefore an increase in the ambient noise level of 3 dBA or 5 dBA CNEL, depending on the existing conditions at the affected noise-sensitive land use.

3.2.3 Ground-Borne Vibration

The City of Los Angeles has not adopted criteria to assess vibration impacts during construction. Thus, for this Project, the City has determined to use the FTA's criteria for structural damage and human annoyance, as described in Tables IV.I-3 and IV.I-4, respectively, above, to evaluate potential impacts related to Project construction and operation.

- Potential Building Damage – Project construction activities that cause groundborne vibration levels to exceed the potential structural damage threshold of 0.5-in/sec PPV at the nearest off-site buildings of Building Category I, Reinforced-concrete, steel, or timber (no plaster).

- Potential Human Annoyance – Project construction and operation activities that cause groundborne vibration levels to exceed 72 VdB at nearby residential uses and 75 VdB for institutional land uses with primarily daytime use (including the Federal Courthouse)

SECTION 4
Methodology

An acoustical study was conducted for the Project with respect to potential noise and vibration impacts with construction activities, surface transportation, and other aspects of Project operations that are noise and vibration intensive and that have the potential to impact noise sensitive land uses. It is possible that off-hour construction could occur during the foundation/continuous concrete pour activities, which would need to extend beyond daytime hours (one nighttime and early morning period each) due to the need for concrete pours to be continuous (for example, up to 18 hours). This would be outside of the City's allowable construction hours specified in the LAMC and, as such, the Project would file an application to obtain permission pursuant to City regulations. A discussion of the Project Design Features that were taken into account in the quantitative noise and vibration assessment is provided below in Section 4.5.

4.1 On-Site Construction Noise

On-site construction noise impacts were evaluated by determining the noise levels generated by the different types of construction activity anticipated, calculating the construction-related noise levels produced by the mix of equipment assumed for all construction activities at nearby sensitive receptor locations, and comparing these construction-related noise levels to existing ambient noise levels (i.e., noise levels without construction noise) at those receptors. More, specifically, the following steps were undertaken to assess construction-period noise impacts.

1. Ambient noise levels at surrounding sensitive receptor locations were estimated based on field measurement data (see **Table 1**);

2. Typical noise levels for each type of construction equipment were obtained from the Federal Highway Administration Roadway Construction Noise Model;

3. It is anticipated that concrete pour would occur off-hours during the foundation/continuous concrete pour activities.

4. Distances between construction site locations (noise sources) and surrounding sensitive receptors were measured using Project architectural drawings, site plans, and Google Earth;

5. The construction noise level was then calculated, in terms of hourly L_{eq}, for sensitive receptor locations based on the standard point source noise-distance attenuation factor of 6.0 dBA for each doubling of distance;

6. The Project will not require or allow blasting involving the use of explosives (refer to PDF NOISE-1 below in Subsection 4.5);

7. To provide a more conservative analysis, the construction noise modeling assumed that diesel/gasoline generators would be used during Project construction instead of electricity from power poles and/or solar-powered generators (refer to PDF NOISE-2 below in Section 4.5); and

8. Construction noise levels were then compared to the construction noise daytime/nighttime significance thresholds identified below.

4.2 Off-Site Roadway Noise (Construction and Operation)

Roadway noise impacts were evaluated using the FHWA TNM and the Caltrans Technical Noise Supplement (TeNS) method based on the roadway traffic volume data provided in the Traffic Study prepared for the Project and included in Appendix L of the Project's Draft EIR.[30] This method allows for the definition of roadway configurations, barrier information (if any), and receiver locations. Roadway noise attributable to Project development was calculated and compared to baseline noise levels that would occur under the "Without Project" condition.

4.3 Stationary Point-Source Noise (Operations)

Stationary point-source noise impacts were evaluated by identifying the noise levels generated by outdoor stationary noise sources, such as rooftop mechanical equipment and loading area activity, calculating the hourly L_{eq} noise level from each noise source at sensitive receptor property lines, and comparing such noise levels to existing ambient noise levels. More specifically, the following steps were undertaken to calculate outdoor stationary point-source noise impacts:

1. Ambient noise levels at surrounding sensitive receptor locations were estimated based on field measurement data (see **Table 1**);

2. Distances between stationary noise sources and surrounding sensitive receptor locations were measured using Project architectural drawings, Google Earth, and site plans;

3. Stationary-source noise levels were then calculated for each sensitive receptor location based on the standard point source noise-distance attenuation factor of 6.0 dBA for each doubling of distance;

4. Noise level increases were compared to the stationary source noise significance thresholds identified below; and

5. For outdoor mechanical equipment, the operation of any and all outdoor mechanical equipment would be subject to the noise control requirements of the City's noise ordinance and municipal codes.

6. Parking related noise levels were estimated by using the methodology recommended by FTA for the general assessment of stationary transit noise source. Using the methodology, the

[30] Fehr & Peers, Times Mirror Square Project Transportation Impact Analysis, 2018.

project's peak hourly noise level that would be generated by the onsite parking levels was estimated using the following FTA equation for a parking lot:[31]

$L_{eq}(h) = SEL_{ref} + 10\log(NA/1000) - 35.6$, where

$L_{eq}(h)$ = hourly L_{eq} noise level at 50 feet

SEL_{ref} = reference noise level for stationary noise source represented in sound exposure level (SEL) at 50 feet

N_A = number of automobiles per hour

7. The combined noise levels from each operational noise source were estimated and the combined noise level increases were compared to the significance thresholds identified below.

4.4 Groundborne Vibration (Construction and Operations)

Groundborne vibration impacts were evaluated by identifying potential vibration sources, measuring the distance between vibration sources and surrounding structure locations, identifying the building categories of the surrounding structures, and making a significance determination based on the FTA's criteria previously described in **Table 3** and **Table 4**.

Surrounding structures were determined to be in Building Category I – Reinforced-concrete, steel, or timber (no plaster) with construction vibration damage criteria of 0.5 in/sec PPV, as shown in **Table 3**.

On-site Project construction activities by heavy construction equipment would generate an unknown number of vibration events from the same source throughout a construction day. As shown in **Table 4**, FTA provides thresholds based on the estimated number of vibration events per source per day. To be conservative, the number of events for the Project were estimated to "Frequent Events", i.e., greater than 70 vibration events for FTA thresholds in **Table 4**.

During peak off-site construction truck activity, approximately 1,406 concrete truck trips would occur per day during the foundation/continuous concrete pour activities; and therefore, would be considered as "Frequent Events" for FTA thresholds in **Table 4**. Activities from on-site operational equipment, such as air handling units, condenser units, and exhaust fans would also be considered as "Frequent Events" for FTA thresholds in **Table 4**.

4.5 Project Design Features

The following Project Design Features would reduce the noise levels generated by the Project:

PDF NOISE-1: The Project will not require or allow blasting, involving the use of explosives, during construction activities.

[31] Federal Transit Administration, Transit Noise and Vibration Impact Assessment, Table 4-13 and Table 4-14, 2018.

PDF NOISE-2: Where power poles are available, electricity from power poles and/or solar-powered generators rather than temporary diesel or gasoline generators shall be used during construction.

PDF NOISE-3: The Project will not require or allow operation of any amplified sound system in the outdoor plaza areas, including the residential and office terraces, outdoor dining areas, and paseo.

PDF NOISE-4: The Project will limit the maximum occupancy of the Office Terrace to 150 people and the Residential Terrace to 200 people at any one time. A sign will be posted at the main entrances to these areas of the occupancy limit.

PDF NOISE-5: Emergency generators would be designed to meet the requirements of LAMC Chapter XI, Section 112.02. Section 112.02 of the LAMC requires that any mechanical system within any zone of the City not cause an increase in ambient noise levels on any other occupied property or if a condominium, apartment house, duplex, or attached business, within any adjoining unit to exceed the ambient noise level by more than 5 dBA.

The noise and vibration analysis incorporates into the quantitative analysis PDF NOISE-1, which states that the Project will not require or allow blasting, involving the use of explosives, during construction activities, and PDF NOISE-3, which states that the Project will not require or allow operation of any amplified sound system in the outdoor plaza areas, including the residential and office terraces, outdoor dining areas, and paseo. While PDF NOISE-2 would require the Project to use power poles and/or solar-powered generators are available rather than temporary diesel or gasoline generators during construction, the quantitative analysis includes the use of diesel or gasoline generators during phases of construction that would use such equipment, as a conservative assumption, in the event pole power and solar-power generators are not available. PDF NOISE-4, would limit maximum occupancy on the terraces, respectively; thereby, reducing the number of people that would potentially congregate and converse socially, thereby reducing conversation noise levels.

SECTION 5
Environmental Impacts

Threshold a): Would the Project result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

5.1 Construction and Operational Noise

Several Project characteristics have the potential to reduce noise and vibration generation and were taken into account in the analysis of potential impacts. In accordance with LAMC requirements, construction hours for exterior construction and hauling activities would be limited to between the hours of 7:00 A.M. and 9:00 P.M., Monday through Friday, and 8:00 A.M. and 6:00 P.M. on Saturday. However, it is anticipated that construction activities could occur outside of these hours but would be limited to concrete pouring. The Project contractor(s) would equip all construction equipment, fixed or mobile, with properly operating and maintained noise mufflers, consistent with manufacturers' standards.

5.1.1 On-Site Construction Noise

Construction of the Project would require the use of heavy equipment during the demolition, grading, and excavation activities at the Project Site. During each stage of development, a different mix of equipment would be used. As such, construction activity noise levels at and near the Project Site would fluctuate depending on the particular type, number, and duration of use of the various pieces of construction equipment.

Individual pieces of construction equipment expected to be used during Project construction could produce maximum noise levels of 75 dBA to 101 dBA L_{max} at a reference distance of 50 feet from the noise source, as shown in **Table 6***, Construction Equipment Noise Levels*. These maximum noise levels would occur when equipment is operating at full power. The estimated usage factor for the equipment is also shown in **Table 6**. The usage factors are based on FHWA's Roadway Construction Noise Model (RCNM) User's Guide.[32]

[32] Federal Highway Administration, Roadway Construction Noise Model User's Guide, p. 3, (2006).

TABLE 6
CONSTRUCTION EQUIPMENT NOISE LEVELS

Construction Equipment	Estimated Usage Factor, %	Noise Level at 50 Feet (dBA, Lmax)
Air Compressors	40%	78
Bore/Drill Rig	20%	79
Cement and Mortar Mixer	40%	79
Compactor	20%	83
Concrete Saw	20%	90
Crane	16%	81
Dumpers/Tenders	40%	76
Excavator	40%	81
Forklift	10%	75
Generator Sets	50%	81
Jackhammers	20%	89
Off-highway Trucks	20%	76
Other Equipment	50%	85
Paver	50%	77
Paving Equipment	20%	90
Roller	20%	80
Rough Terrain Forklift	10%	75
Rubber Tired Loader	50%	79
Surfacing Equipment	50%	85
Tractor/Loader/Backhoe	25%	80
Vacuum Street Sweeper	10%	82
Vibratory Pile Driver	20%	101

FHWA, 2006

During Project construction, the nearest and most affected off-site noise sensitive receptors that would be exposed to increased noise levels would be the existing residential uses, a hotel, libraries, and parks located in proximity to the Project Site. Specifically, the nearest off-site noise sensitive receptors include the following:

- R1: The Federal Courthouse is located approximately 80 feet to the west of the Project Site.
- R3: The First and Broadway Civic Center Park and the Los Angeles County Law Library are located approximately 130 feet and 180 feet to the north of the Project Site, respectively.
- R4: The City Hall Park is located approximately 150 feet to the northeast of the Project Site.

- R5: The one-acre park just south of the LAPD Headquarters Building and Higgins Building Lofts apartment complex are located approximately 80 feet and 250 feet to the southeast of the Project Site, respectively.

- R6: Kawada Hotel is located approximately 300 feet to the west of the Project Site along W. 2nd Street.

Location R2 is not included in the list above because it corresponds to the Los Angeles Times Building on the Project Site itself. This building would be part of Project-related construction activities and would not be a noise-sensitive receptor. Locations R7 and R8 are not included in the list above because they do not represent the nearest noise sensitive receptors. In addition, due to the distances from the Project Site, father than 1,000 feet, and existing buildings between Locations R7 and R8 and the Project Site, construction noise levels at Location R7 and R8 would be well below the construction noise levels at Location R4 and R5, respectively. As such, construction noise impacts from onsite sources at Receptors R7 and R8 would be less than significant.

Over the course of a construction day, the highest noise levels would be generated when multiple pieces of construction equipment would be being operated concurrently. The Project's estimated construction noise levels were calculated for a scenario in which all construction equipment was assumed to be operating simultaneously and located at the construction area nearest the affected receptors to present a conservative impact analysis. The estimated noise levels at the off-site sensitive receptors were calculated using the FHWA's RCNM, and were based on a maximum concurrent operation of construction equipment (i.e., air compressors, cranes, tractor/loader/backhoe, forklift, generator sets, welders, etc.), which is considered a worst-case evaluation because the Project would typically use less overall equipment on a daily basis, and as such would generate lower noise levels. In addition, the noise levels were estimated including the assumption that there will be building construction phase overlap into paving and architectural coating phases. **Table 7**, *Estimate of Construction Noise levels (L_{eq}) at Existing Off-Site Sensitive Receptor Locations,* shows the estimated construction noise levels that would occur at the nearest off-site sensitive uses during a peak day of construction activity at the Project Site.

As shown in **Table 7**, construction noise levels are estimated to reach a maximum of 90 dBA L_{eq} at the nearest sensitive receptor (at measurement location R1, The Federal Courthouse). This would exceed the 70.4 dBA L_{eq} significance threshold at R1 (lowest hourly L_{eq} daytime ambient noise level of 65.4 dBA L_{eq} at R1 in **Table 1** plus 5 dBA). Sensitive receptor locations R3, R4, R5, and R6 would be exposed to construction noise levels which would exceed the daytime significance thresholds of 77.8 dBA L_{eq} at R3, 73.5 dBA L_{eq} at R4, 70.0 dBA L_{eq} at R5, and 71.3 dBA L_{eq} at R6.

Construction noise during the foundation/continuous concrete phase is included in the construction noise levels shown in **Table 7** and detailed in Appendix I-2 of this report. The concrete pour activities on-site would last up to two days each for the two continuous concrete pouring foundation phases, which would need to extend beyond daytime hours (one nighttime and early morning period each) due to the need for concrete pours to be continuous (for example, up to 18 hours). For the construction calculations used in **Table 7** and detailed in Appendix I-2, nighttime construction noise levels during the on-site foundation concrete pours would be 78 dBA L_{eq} at R1, 74 dBA L_{eq} at R3, 68 dBA L_{eq} at R4, 64 dBA L_{eq} at R5, and 62 dBA L_{eq} at R6. These noise levels would exceed

the respective significance threshold of 65.4 dBA at R1, 67.7 dBA L_{eq} at R4, and 59.1 dBA L_{eq} at R6; however, they would not exceed the 68.4 dBA L_{eq} threshold at R5.

As such, the Project would have a potentially significant construction noise impact on the nearby sensitive receptors. Impacts at all other sensitive receptor locations would be less than significant. Mitigation measures are identified to reduce construction noise levels to the nearby sensitive receptors, as presented below in Section 7, Mitigation Measures. However, implementation of mitigation measures could not reduce temporary or periodic increases in ambient noise levels in the Project vicinity above levels existing without the Project to below the significance thresholds established by the City, and therefore these temporary impacts would be significant and unavoidable.

TABLE 7
ESTIMATE OF CONSTRUCTION NOISE LEVELS (L_{EQ}) AT EXISTING OFF-SITE SENSITIVE RECEIVER LOCATIONS

Off-site Sensitive Land Uses [a]	Location	Nearest Distance from Construction Activity to Noise Receptor (ft.) [b]	Estimated Maximum Construction Noise Levels (dBA L_{eq}) [c] Daytime/ Nighttime	Significance Threshold [e] Daytime/ Nighttime	Exceed Significance Thresholds?
R1	West of the Project Site along Broadway	80	90 / 78	70.4 / 65.4	Yes / Yes
R3	North of the Project Site along Broadway/1st Street	130	87 / 74	77.8 / NA[f]	Yes / NA[f]
R4	East of the Project Site along 1st Street	150	81 / 68 [d]	73.5 / 67.7	Yes / Yes
R5	South of the Project Site along 2nd Street	250	77 / 64 [d]	70.0 / 68.4	Yes / No
R6	West of the Project Site along 2nd/Hill Street	300	75 / 62 [d]	71.3 / 59.1	Yes / Yes

[a] Construction noise levels at location R2 are not estimated since R2 represent the noise environment at the Project Site. Locations R7 and R8 are not included because they do not represent the nearest noise sensitive receptors. In addition, due to the distances from the Project Site, father than 1,000 feet, and existing buildings between Locations R7 and R8 and the Project Site, construction noise levels at Location R7 and R8 would be well below the construction noise levels at Location R4 and R5, respectively. As such, construction noise impacts from onsite sources at Receptors R7 and R8 would be less than significant.

[b] The distance represents the nearest construction area on the Project Site to the property line of the off-site receptor.

[c] The daytime construction noise levels were estimated including assumption that there will be some Building Construction phase overlap into Paving. Concrete pour noise levels provided for occurring off-hours without daytime construction.

[d] Receptors are partially shielded from the construction site by existing buildings; and the result of 5 dBA reduction by the shielding is included in the analyses.

[e] The significance thresholds are the lowest hourly Leq day/night ambient noise levels, as shown in **Table 1**, plus 5 dBA.

[f] Location R3 represents the Los Angeles County Law Library and the future First and Broadway Civic Center Park. No nighttime occupants are anticipated.

NA = not applicable.

SOURCE: ESA, 2018

Based on available information, the Initial Study[33] for Related Project No. 110 states that its construction would not begin until construction of Related Project No. 168, the Metro Regional Connector portal and station, within the site is complete. Therefore, construction of Related Project No. 110 would not begin until 2022 and would not be complete until 2025, which would be two years after expected completion of the Project. In addition, Related Project No. 168, Metro Regional Connector is currently under construction and is slated to be completed in 2021. **Therefore, this future mixed-use residential development would not be occupied by residents during construction of the Project, and as such, there would no impacts to these future residents from construction-related noise from the Project.**

5.1.2 Off-Site Construction Noise

Construction truck trips would occur throughout the construction period. Haul trucks would travel on approved truck routes designated within the City. Given the Project Site's proximity to State Route (SR) 110 and 101, heavy truck traffic would take the most direct route to the appropriate freeway ramps. An estimated maximum of approximately 38 daily worker vehicle trips and approximately 1,406 concrete truck trips (equal to approximately 2,812 passenger car equivalent [PCE]) would occur per day (up to approximately 78 concrete truck trips per hour) during the foundation/continuous concrete pour activities. The foundation/continuous concrete pour activities would generate the maximum number of trucks trips, but would only last up to two days during each of the two continuous concrete pouring foundation phases. If renovation activities would overlap, approximately 124 additional daily worker vehicle trips would occur. Trucks would exit the Project Site from N. Broadway and turn right, head eastbound on W. 1st Street to Main Street, head north on Main Street to Aliso Street, turn right onto Aliso Street, and merge on to the SR-101 southbound on-ramp. Empty trucks would take the exit on Los Angeles Street, head south to 2nd Street, make a right on W. 2nd Street, turn right on N. Broadway, and right into the Project Site. Sensitive receptors along these routes include the City Hall Park on the west side of S. Main Street, multi-family-uses on the south side of W. 2nd Street, the 2nd Street Dog Park on the north side of W. 2nd Street, and the Federal Courthouse on the west side of S. Broadway. The anticipated truck route would be subject to review and approval by the City. Construction worker vehicle trips would be dispersed along various roadways and would contribute a very small number of vehicle trips when compared to existing traffic volumes on these same roadways and compared to the truck trips along the route. Construction worker vehicles would need to travel on N. Broadway to access the Project Site. The majority of construction worker vehicle trips would not result in travel on Main Street, W. 1st Street, and 2nd Street, as most workers would commute to and from their homes using a variety of different commuting routes. However, for the purposes of this analysis, it was conservatively assumed that construction worker vehicle trips would travel on the same roadway segments as the heavy trucks to evaluate maximum potential offsite noise impacts.

As shown in **Table 8**, *Estimate Off-Site Construction Traffic Noise,* the Project's truck trips and worker trips would generate maximum noise levels of approximately 68.8 dBA L_{eq} along W. 2nd Street.

[33] City of Los Angeles, Initial Study, 222 West 2nd Project, Case No. ENV 2016-3809-EIR, January 2017, https://planning.lacity.org/eir/nops/222West2nd/nop.pdf. Accessed December 2018.

TABLE 8
ESTIMATE OFF-SITE CONSTRUCTION TRAFFIC NOISE LEVELS

		Calculated Traffic Noise Levels On Roadway dBA L_{eq}		
		Daytime	Nighttime	Exceed Threshold?
Roadway Segment	Construction Traffic	Significance Threshold	Significance Threshold	Daytime/Nighttime
S. Broadway (R1)	66.0	70.4	65.4	No / Yes
Main Street (R7)	68.2	77.6	N/A [b]	No / – [b]
Los Angeles Street (R8)	63.3	74.8	61.8	No / Yes
W. 1st Street (R3/R4)	67.3	73.5	N/A [b]	No / – [b]
W. 2nd Street (R5)	68.8	70.0	68.4	No / Yes

[a] The significance thresholds are the lowest hourly L_{eq} day/nighttime ambient noise levels, as shown in **Table 1**, plus 5 dBA.

[b] Sensitive receptors located along Main Street (the City Hall Park) and W. 1st Street (Los Angeles County Law Library and City of LA First and Broadway Civic Center Park) are not occupied during the nighttime hours.

SOURCE: ESA, 2018

As shown in **Table 8**, off-site construction traffic noise levels generated by construction worker and truck trips would not exceed the daytime significance thresholds along the truck routes, but would exceed the applicable nighttime significance thresholds along the truck route on S. Broadway, Los Angeles Street, and W. 2nd Street. **Therefore, off-site construction traffic noise impacts would be significant during nighttime hours.**

5.1.3 Off-site Operational Noise

Impacts Under Existing Traffic Baseline Conditions

Existing roadway noise levels were calculated along various arterial segments adjacent to the Project Site. Roadway noise attributable to Project operation was calculated using the traffic noise model previously described and was compared to existing noise levels in the vicinity.

Project impacts are shown in **Table 9**, *Off-Site Traffic Noise Impacts – Existing with Project Conditions*. As indicated, the maximum increase in Project-related traffic noise levels over existing traffic noise levels would be 0.6 dBA CNEL, which would occur at the roadway segment of N./S. Broadway, between W. 1st Street and W. 2nd Street adjacent to Federal Courthouse and commercial uses. This increase in sound level would be well below the most stringent significance threshold of 3 dBA CNEL increase over ambient noise levels; and is also below the other standards of within the "normally unacceptable" or "clearly unacceptable" category, or any 5 dBA CNEL or greater noise increase (see **Table 5**). The increase in sound levels would be lower at the remaining roadway segments analyzed. Accordingly, the Project-related noise increases would be less than the applicable thresholds. **Therefore, operation of the Project would not result in off-site traffic-related noise impacts in excess of City standards and impacts would be less than significant.**

TABLE 9
OFF-SITE TRAFFIC NOISE IMPACTS – EXISTING WITH PROJECT CONDITIONS

Roadway Segment	Calculated Traffic Noise Levels On Roadway CNEL (dBA) Existing (A)	Existing with Project (B)	Project Increment (B-A)	Significance Threshold [a]	Exceed Threshold?
W. Sunset Boulevard/E. Cesar Chavez Avenue					
West of N. Figueroa Street	70.6	70.7	0.1	3	No
East of N. Figueroa Street	70.4	70.4	0.0	3	No
W. Aliso Street					
Between Broadway and N. Spring Street	66.0	66.0	0.0	5	No

[a] The Project related traffic would cause any ambient noise levels measured at the property line of affected uses to increase by 5 dBA CNEL or more; or cause ambient noise levels measured at the property line of affected uses to increase by 3 dBA in CNEL or more to or within the "normally unacceptable" or "clearly unacceptable category."

SOURCE: ESA, 2018

Impacts Under Future (2023) Traffic Conditions

Future roadway noise levels were also calculated along various arterial segments adjacent to the Project as compared to 2023 traffic noise levels that would occur with implementation of the Project. Future traffic noise levels were calculated based on the roadway traffic volume data provided in the Traffic Impact Analysis prepared for the Project and included in Appendix L of the Project's Draft EIR. According to the Traffic Impact Analysis, the future baseline traffic volumes reflect traffic increases as a result of both regional ambient traffic growth and traffic generated by specific developments in the vicinity of the Project (related projects).[34] Project impacts are shown in **Table 10**, *Off-Site Traffic Noise Impacts – Future (2023) With Project Conditions*. As indicated, the maximum increase in Project-related traffic noise levels over the future traffic noise levels would be 0.4 dBA CNEL, which would occur at the roadway segments of W. 2nd Street, between S. Broadway and S. Spring Street adjacent to a school and commercial uses and N./S. Broadway, between W. 1st Street and W. 2nd Street adjacent to Federal Courthouse and commercial uses. This increase in sound level would be below the significance threshold of 3 dBA CNEL increase to or within the "normally unacceptable" or "clearly unacceptable" category, or any 5 dBA CNEL or greater noise increase (see **Table 5**), and the increase in sound level would be lower at the remaining roadway intersections analyzed. **The Project-related noise increases would be less than the threshold established by the City and, therefore, impacts would be less than significant. No mitigation measures would be required.**

Impacts from On-Site Stationary Noise Sources

Open Space

The Project's North Tower and South Tower mixed-use components would be constructed on the western side of the Project Site. The towers would include restaurant uses, which would be located at ground level and oriented to W. 1st Street, S. Broadway, and W. 2nd Street, while also fronting the Paseo. The Paseo would be constructed along the east edge of the North Tower and the South Tower, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. The occupant load of Paseo area was estimated based on the occupancy load factor of 15 square feet per person for an assembly area without fixed seats from the California Building Code Table 1004.1.2 Maximum Floor Area Allowances Per Occupant. These values were applied to the Project's estimated the Paseo area (approximately 15,708 square feet), which results in approximately 1,000 people.[35] Noise from human conversation is approximately 55 dBA at a distance of 3 feet.[36] Assuming 500 visitors talking simultaneously, the continuous noise level would be up to 82 dBA at 3 feet. Based on a noise level source strength of 82 dBA at a reference distance of 3 feet, and accounting for distance attenuation (6 dBA per doubling of distance, a minimum of 29 dBA attenuation or more for 80 feet distance to the nearest sensitive receptor location R1, future mixed-use residential development) and barrier-insertion loss by the Project buildings (minimum 5 dBA insertion loss), the Paseo related noise would be reduced to 48 dBA, which would be inaudible at the noise sensitive receptor location R1 (future mixed-use residential development) and would not exceed the lowest hourly L_{eq} daytime significance threshold of 70.4 dBA L_{eq} and the nighttime significance threshold of 65.4 dBA L_{eq}. **Therefore, the Paseo operations would not result in a**

[36] American Journal of Audiology Vol.7 21-25 October 1998. doi:10.1044/1059-0889(1998/012).

substantial increase in ambient noise levels, and impacts would be less than significant, and no mitigation measures would be required.

The mechanical equipment that currently occupies the rooftop of the four-story Plant Building would be relocated and replaced with an Office Terrace. The Office Terrace would provide conference/presentation and break space for office employees of the Time/Plant/Mirror Buildings and would not be available to the general public. Views of the Office Terrace would be visible from surrounding structures higher than four stories, including, but not limited to, the proposed Project to the west, north, and south, City Hall to the northeast, Los Angeles Police Department Headquarters to the east, and the future 232 W. 2nd Street Project to the south. The Office Terrace would be located approximately 80 feet from the one-acre park south of the LAPD Headquarters Building (R5), which is the closest noise-sensitive receptor, and therefore, all other receptors including the future mixed-use residential development to the south across 2nd Street, which would be located approximately 170 feet from the Office Terrace, are located farther away where impacts would be less than those at R5.

According to the Project Architect and as set forth in PDF NOISE-4, there could be up to approximately 150 visitors to the Office Terrace at one time on a peak weekend day. Noise from human conversation is approximately 55 dBA at a distance of 3 feet.[37] Assuming 75 visitors talking simultaneously, the continuous noise level would be up to 74 dBA at 3 feet. Based on a noise level source strength of 74 dBA at a reference distance of 3 feet, and accounting for distance attenuation (6 dBA per doubling of distance, a minimum of 29 dBA attenuation or more[38] for 80 feet distance to the sensitive receptor location R5), the Office Terrace-related noise would be reduced to 45 dBA, which would be inaudible at the noise sensitive receptor location R5 and would not exceed the daytime significance threshold of 70.0 dBA and the nighttime significance threshold of 68.4 dBA. **Therefore, Office Terrace operations would not result in a substantial increase in ambient noise levels. Impacts would be less than significant, and no mitigation measures would be required.**

A Residential Terrace would be located at the roof level of the five-story Podium, which connects the two residential towers. This area, which would be used by residents of the North Tower and South Tower, would be located between the North Tower and the South Tower, as shown in Figure II-22. The Residential Terrace would be located approximately 80 feet from the nearest sensitive receptor location R1 (Federal Court), which is the closest receptor, and therefore, all other receptors including the future noise sensitive uses across 2nd Street, which would be located approximately 150 feet from the Residential Terrace are located farther away where impacts would be less than those at R1.

37 American Journal of Audiology Vol.7 21-25 October 1998. doi:10.1044/1059-0889(1998/012).

38 Stationary point sources of noise attenuate at a rate of 6 dBA for acoustically hard site. For an example, noise level of 55 dBA at a distance of 3 feet would be reduced to 49 dBA at a distance of 6 feet and 43 dBA at a distance of 12 feet.

According to the Project Architect, there could be up to approximately 200 visitors to the Residential Terrace at one time on a peak weekend day. Noise from human conversation is approximately 55 dBA at a distance of 3 feet.[39] Assuming 100 visitors talking simultaneously, the continuous noise level would be up to 75 dBA at 3 feet. Based on a noise level source strength of 75 dBA at a reference distance of 3 feet, and accounting for distance attenuation (6 dBA per doubling of distance, a minimum of 29 dBA attenuation or more for 80 feet distance to the nearest sensitive receptor location R1) and barrier-insertion loss by the Project buildings (minimum 5 dBA insertion loss), the Residential Terrace related noise would be reduced to 41 dBA, which would be inaudible at the noise sensitive receptor location R1 and would not exceed the lowest hourly L_{eq} daytime significance threshold of 70.4 dBA L_{eq}. The operation hours of the Federal Courthouse are from 8:30 a.m. to 4:30 p.m. Therefore, nighttime noise impacts would not be expected at the Federal Courthouse. For the future mixed-uses residential development (R1) to the south across W. 2nd Street, the Residential Terrace related noise would be reduced to 36 dBA due to the 150 feet distance and barrier-insertion loss by the Project buildings, which would not exceed the lowest hourly L_{eq} nighttime significance threshold of 65.4 dBA. **Therefore, Residential Terrace operations would not result in a substantial increase in ambient noise levels.**

In summary, open space noise impacts would be less than significant and no mitigation measures would be required.

Fixed Mechanical Equipment

With respect to Project operation, all building outdoor mounted mechanical and electrical equipment would be designed to meet the requirements of LAMC Chapter XI, Section 112.02. Section 112.02 of the LAMC requires that any heating, ventilation, and air conditioning (HVAC) system within any zone of the City not cause an increase in ambient noise levels on any other occupied property or if a condominium, apartment house, duplex, or attached business, within any adjoining unit to exceed the ambient noise level by more than 5 dBA.

The operation of mechanical equipment typical for developments like the Project, such as air conditioners, fans, generators, and related equipment, may generate audible noise levels. Project mechanical equipment would be located on rooftops or within buildings, and would be shielded from nearby land uses to attenuate noise and avoid conflicts with adjacent uses. In addition, all mechanical equipment would be designed with appropriate noise control devices, such as sound attenuators, acoustics louvers, or sound screen/parapet walls, to comply with noise limitation requirements provided in Section 112.02 of the LAMC, which prohibit the noise from such equipment causing an increase in the ambient noise level by more than five decibels. The Project would comply with the requirement to install mechanical equipment that would generate noise levels below this threshold, consistent with applicable regulatory requirements.

Exterior reference noise levels for air condenser units, fans, and related equipment, the primary sources of noise from fixed mechanical equipment, would be 81.9 dBA L_{eq} measured at a distance of 5 feet (based on noise data from large shopping center projects in Southern California).[40] Noise

[39] American Journal of Audiology Vol.7 21-25 October 1998. doi:10.1044/1059-0889(1998/012).

[40] Refer to: City of Moreno Valley, Moreno Valley Walmart Noise Impact Analysis, Table 9-1, Page 71, February 10, 2015; and City of Pomona, Pomona Ranch Plaza Walmart Expansion Project, Table 4.4-5, Pg. 4.4-33, August 2014.

control devices, such as sound attenuators, acoustics louvers, or sound screen/parapet walls would achieve a minimum 5 dBA reduction in noise level due to partial noise shielding, although 10 dBA or more could be achieved from blocking the line of sight completely. A 5 dBA reduction is assumed to provide a conservative assessment. The nearest sensitive receptor is approximately 80 feet from the Project Site at measurement location R1 (Federal Courthouse). At this distance, the noise level would attenuate to 53 dBA (6 dBA attenuation per doubling of distance, a minimum of 24 dBA attenuation or more[41] for 80 feet distance to the sensitive receptor location R1), assuming a minimum 5 dBA reduction in noise level due to partial noise shielding (although a reduction of 10 dBA or more could be achieved). This would be 12 dBA below the lowest hourly L_{eq} daytime ambient noise level of 65.4 dBA L_{eq} (see **Table 1**), which would increase the daytime average ambient noise level by 0.2 dBA, and would not result in an increase by 5 dBA or more over ambient levels. The operation hours of the Federal Courthouse are from 8:30 a.m. to 4:30 p.m. Therefore, nighttime noise impacts would not be expected at the Federal Courthouse. For the future mixed-uses residential development to the south across W. 2nd Street, the mechanical equipment related noise would be reduced to 57 dBA due to the 50 feet distance and barrier-insertion loss by partial noise shielding, which would not exceed the nighttime significance threshold of 68.8 dBA L_{eq}. Therefore, operation of mechanical equipment would not exceed the City's thresholds of significance. **Impacts from fixed mechanical equipment noise would be less than significant, and no mitigation measures would be required.**

Refuse Collection Areas

Refuse collection areas would be located within parking garage level P-1. Loading dock and refuse service-related activities such as truck movements/idling and loading/unloading operations generate noise levels that have a potential to adversely impact adjacent land uses during long-term Project operations. However, since the loading and refuse service areas would be enclosed within the parking garage and shielded from surrounding off-site development, there would be no perceptible increases in noise from loading dock and refuse collection areas at off-site sensitive receptor locations. **As such, impacts from refuse collection area noise would be less than significant and no mitigation measures would be required.**

Loading Dock Areas

Loading dock activities such as truck movements/idling and loading/unloading operations generate noise levels that have the potential to adversely impact adjacent land uses during long-term Project operations. The Project will not allow any delivery truck idling for more than 5 consecutive minutes in the loading area pursuant to State regulation (Title 13 California Code of Regulations [CCR], Section 2485. Signs will be posted in delivery loading areas specifying this idling restriction. In addition, the loading area would be located in the middle of the North Tower and South Tower on the ground level and would be screened from public view and shielded from surrounding off-site development by the Project buildings. Based on a noise survey that was conducted at a loading

[41] Stationary point sources of noise attenuate at a rate of 6 dBA for acoustically hard site. For an example, noise level of 55 dBA at a distance of 3 feet would be reduced to 49 dBA at a distance of 6 feet and 43 dBA at a distance of 12 feet.

dock facility by ESA, loading dock activity (namely idling semi-trucks and backup alarm beeps) would generate noise levels of approximately 70 dBA L_{eq} at a reference distance of 50 feet from the noisiest portion of the truck (i.e., to the side behind the cab and in line with the engine and exhaust stacks).[42] The nearest noise sensitive uses to the west of the Project Site, represented by measurement location R1 (Federal Courthouse) would be located approximately 150 feet or more from the loading dock area. The loading dock area would be located approximately 200 feet from the future mixed use residential development. Based on a noise level source strength of 70 dBA at a reference distance of 50 feet, and accounting for barrier-insertion loss by the Project buildings (minimum 15 dBA insertion loss) and distance attenuation (minimum 10 dBA loss), loading dock noise would be approximately 45 dBA at these noise sensitive uses and therefore would not increase the daytime average ambient noise levels of 67.7 dBA L_{eq} when combining the ambient noise levels and noise from the loading areas. **Because the loading area noise would not increase ambient noise levels at the noise sensitive receptor location R1 by 5 dBA, impacts would be less than significant, and no mitigation measures would be required.**

Emergency Generator

The Project would include two on-site emergency generators located at the North Tower with an estimated rating of approximately 414 kilowatts (approximately 555 HP) and at the South Tower with an estimated rating of approximately 623 kilowatts (approximately 835 HP). The emergency generators may be used in the event of a power outage to provide electricity for emergency safety lighting and other emergency electricity needs. Maintenance and testing of the emergency generator would not occur daily, but rather periodically, up to 50 hours per year per SCAQMD 1470. The emergency generators would be located southwest corner of P1 Level and screened from public view and shielded from surrounding off-site development by the Project buildings.

For the purposes of providing a conservative noise assessment, it is assumed the emergency generators could be located as close as approximately 80 feet from the nearest noise-sensitive uses to the west of the Project Site, which would be the Federal Courthouse represented by measurement location R1. Other off-site noise-sensitive receptors would be farther away or would not have a line-of-site to the emergency generator and would be less impacted by noise from this source. Based on a noise survey that was conducted for an equivalent generator by ESA, the generator would generate noise levels of approximately 96 dBA (L_{eq}) at 25 feet without any sound attenuations.[43] As set forth in PDF NOISE-5, emergency generators would be designed not to exceed the ambient noise level by more than 5 dBA. Therefore, the emergency generators would be designed to generate noise levels of approximately 81 dBA (L_{eq}) at 25 feet with the noise attenuation devices and enclosures. Based on a noise level source strength of 81 dBA at a reference distance of 25 feet,

[42] The loading dock facility noise measurements were conducted at a loading dock facility at a Wal-Mart store using the Larson-Davis 820 Precision Integrated Sound Level Meter ("SLM") in May 2003. The Larson-Davis 820 SLM is a Type 1 standard instrument as defined in the American National Standard Institute S1.4. All instruments were calibrated and operated according to the applicable manufacturer specification. The microphone was placed at a height of approximately 5 feet above the local grade.

[43] The generator noise measurements were conducted at a Verizon facility using the Larson-Davis 820 Precision Integrated Sound Level Meter (SLM) in November 2000. The Larson-Davis 820 SLM is a Type 1 standard instrument as defined in the American National Standard Institute S1.4. All instruments were calibrated and operated according to the applicable manufacturer specification. The microphone was placed at a height of approximately 5 feet above the local grade.

and accounting for distance attenuation (minimum 10 dBA loss) and barrier-insertion loss by the Project buildings (minimum 10 dBA insertion loss), generator-related activity noise would be approximately 61 dBA and would increase the daytime average ambient noise level of 67.7 dBA L_{eq} by 0.8 dBA at the noise-sensitive uses (the Federal Courthouse and future mixed-use residential development to the south) represented by measurement location R1. Therefore, operation of the emergency generators would not exceed the City's thresholds of significance. **Impacts from the emergency generator noise would be less than significant, and no mitigation measures would be required.**

Parking Structure

The Project is designed for approximately 1,744 vehicle parking spaces in the five-level above-ground Podium and nine-level subterranean parking structure. The entrance and exit to the residential and retail parking would be located on S. Broadway and W. 2nd Street.

Sources of noise associated with parking facilities typically include engines accelerating, doors slamming, car alarms, tire squeals, and people talking. Noise levels at these facilities would fluctuate throughout the day with the amount of vehicle and human activity. Noise levels would generally be the highest in the morning and evening peak traffic hours when the largest number of automobiles would enter and exit the parking facility.

For the purpose of providing a conservative, quantitative estimate of the noise levels that would be generated from vehicles entering and exiting the project's parking structure, the methodology recommended by FTA for the general assessment of stationary transit noise sources is used discussed in the Methodology Section.

Based on the Project's traffic study prepared by Fehr & Peers,[44] provided in Appendix L of the Project's Draft EIR, the Project is forecasted to generate 12,358 total project external daily vehicle trips, including an anticipated 889 trips and 854 trips during the A.M. and P.M. peak hours, respectively. Using the FTA's reference noise level of 92 dBA sound exposure level (SEL)[45] at 50 feet from the noise source for a parking lot, it was determined that the Project's highest peak hour vehicle trips, which would be 889 trips during the A.M. peak hour, would generate noise levels of approximately 56 dBA L_{eq} at 50 feet from the Project's parking entrance. The nearest noise sensitive use to the entrance on W. 2nd Street would be approximately 50 feet, at measurement location R1 (Future Mixed-Use Residential Development). Based on this distance, the vehicle related noise levels would be approximately 56 dBA L_{eq} at measurement location R1, which would increase the daytime average ambient noise level of 67.7 dBA by 0.1 dBA and nighttime average ambient noise level of 63.8 dBA by 0.7 dBA. All other noise sensitive uses would experience lower parking structure noise levels. This also conservatively assumes the peak hour traffic would all utilize one entrance. These noise levels analysis would not increase the daytime average ambient noise levels of 68 dBA L_{eq} at these noise sensitive uses by 5 dBA. **As such, impacts parking structure noise would be less than significant, and no mitigation measures would be required.**

45 Federal Transit Administration, Transit Noise and Vibration Impact Assessment, 2018.

Composite Noise Level Impacts from Project Operations

An evaluation of the combined noise from the Project's various noise sources (i.e., composite noise level) was conducted to conservatively ascertain the potential maximum Project-related noise level increase that may occur at the noise-sensitive receptor locations included in this analysis. Noise sources associated with the Project would include traffic on nearby roadways, open space, on-site mechanical equipment, refuse collection area, loading dock area, emergency generator, and parking structure. The noise level from stationary noise sources were converted from the maximum L_{eq} noise levels discussed above to CNEL by conservatively assuming the maximum L_{eq} noise levels would occur during the operational hours for each stationary noise source. Open space noise was assumed to occur from 12:00 pm to 12:00 am; mechanical equipment noise was assumed to occur 24-hours per day; loading dock noise was assumed to occur from 7:00 am to 9:00 pm; emergency generator noise from testing and maintenance was assumed to occur for approximately one hour during the daytime; and parking structure noise was assumed to occur 24-hours per day.

Based on the location of the Project noise sources, the only noise-sensitive locations at which composite noise impacts could occur are the future residences located to the southwest of the Project Site and the Federal Courthouse located to the west of the Project Site (both represented by Location R1). The noise-sensitive location R1 is the nearest sensitive receptor and if a noise impact at the location R1 is less than significant, noise impacts at all other noise sensitive receptors will be less than significant because of distance attenuations. The predominant Project noise source that could potentially affect these off-site sensitive receptors would be noise-generating activities at loading dock areas, emergency generators, and parking structure.

Noise associated with activities in the refuse collection areas would not increase the overall ambient noise levels in the project vicinity. As shown in **11**, *Composite Noise Levels At Sensitive Receptor Location R1 From Project Operations*, based on the future without Project traffic noise level of 69.6 dBA at S. Broadway, between W. 1st Street and W. 2nd Street in the vicinity of R1, project-related traffic would contribute approximately 59.0 dBA of sound energy, which would increase the existing roadway noise levels by 0.4 dBA. Mechanical equipment would contribute a maximum of 59.7 dBA of sound energy at R1. Loading dock areas would contribute a maximum of 46.2 dBA of sound energy each at R1. Emergency generator use would contribute a maximum of 61.0 dBA of sound energy at R1. The parking structure would contribute a maximum of 62.7 dBA of sound energy at R1. Overall, relative to the existing noise environment, the Project would be estimated to increase the exterior ambient noise level by approximately 1.3 dBA at the Federal Courthouse (R1) to the west, which would not exceed the significance threshold of a 3 dBA increase. This analysis conservatively assumes that the Project's operational noise sources would generate maximum noise levels simultaneously. **Therefore, the Project's operational composite noise would be less than significant.**

TABLE 11
COMPOSITE NOISE LEVELS AT SENSITIVE RECEPTOR LOCATION R1 FROM PROJECT OPERATIONS

Operational Noise Sources	Noise Levels, dBA CNEL Location R1
Existing (Ambient) Noise Level (A)	**71.8** [a]
Project Composite Noise Sources	
Open spaces	52.8 (48 dBA L_{eq})
Mechanical equipment	59.7 (53 dBA L_{eq})
Refuse collection areas	0
Loading dock areas	46.2 (45 dBA L_{eq})
Emergency generator	61.0 (61 dBA L_{eq})
Parking Structure	62.7 (56 dBA L_{eq})
Offsite traffic (S. Broadway, between W. 1st Street and W. 2nd Street)	
Future without Project traffic noise level	*69.6*
Future plus Project traffic noise level	*69.2*
Estimated Project-only traffic noise level	59.0
Project Composite Noise Level (B)	**67.1**
Existing Plus Project Composite Noise Level (C)	**73.1**
Project Increment (C-A)	1.3
Exceeds Threshold (3 dBA increase)?	No

[a] CNEL level is from Appendix I-3.
[b] CNEL levels for each noise source are calculated based on operational hours of each noise source.

SOURCE: ESA, 2018.

Therefore, as discussed above, the Project would result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. As discussed below in Section 8, impacts to on-site construction noise would be significant with the incorporation of mitigation measures. In addition, there are no feasible mitigation measures to reduce the noise impacts due to off-site truck trips during the nighttime along the truck routes. Therefore, temporary off-site construction noise impacts during the nighttime would be significant and unavoidable. Operational off-site traffic noise and on-site composite operational noise would be less than significant, and operational noise mitigation measures would not be required.

Site Compatibility (Proposed On-Site Noise-Sensitive Uses)

The Project would locate new noise-sensitive uses on the Project Site in an existing urban setting, which may subject future residents of the Project to typical types of urban noise sources, such as traffic noise.

As discussed above, the City of Los Angeles prohibits interior noise levels from all exterior sources to exceed 45 dBA CNEL in any habitable room (LAMC 91.1207.14.2), and exterior noise levels of greater than 65 dBA CNEL for outdoor living areas (excluding balconies) (LAMC 91.1208). As

indicated by the predicted vehicular traffic noise levels presented in **Table 2**, the Project's western perimeter at the ground level along Broadway would be exposed to maximum ambient noise levels of up to 73.8 dBA CNEL (also see **Table 9** and **Table 10**), which is within the "Normally Unacceptable" category for multi-family residential uses. In accordance with the City's Building Code, the Project would be required to include noise insulation features for multi-family buildings in the design of the residential buildings, such as insulated windows and doors, in order to achieve the interior noise limits of 45 dBA CNEL. The Project would be required to comply with these regulations and, therefore, impacts would be less than significant.

Threshold b): Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

5.2 Groundborne Vibration

5.2.1 Structural Damage Impacts

Construction activities at the Project Site have the potential to generate relatively low levels of groundborne vibration, as the operation of heavy equipment (e.g., vibratory pile driver, backhoe, dozer, excavators, drill rig, loader, scraper, and haul trucks) generates vibrations that propagate though the ground and diminish in intensity with distance from the source. No rock blasting with explosives would be used during Project construction

Project construction would generate varying degrees of ground vibration, depending on the construction procedures and the construction equipment used. The PPV vibration velocities for several types of construction equipment measured at increasing distances are identified in **Table 12,** *Vibration Source PPV Levels for Construction Equipment*.

TABLE 12
VIBRATION SOURCE PPV LEVELS FOR CONSTRUCTION EQUIPMENT

	Approximate PPV (in/sec)			
Equipment	**25 Feet**	**50 Feet**	**75 Feet**	**100 Feet**
Vibratory Pile Driver (sonic) (typical soil conditions)	0.17	0.06	0.033	0.021
Large Bulldozer	0.089	0.031	0.017	0.011
Bore/Drill Rig	0.089	0.031	0.017	0.011
Loaded Trucks	0.076	0.027	0.015	0.010
Jackhammer	0.035	0.012	0.007	0.004
Small Bulldozer	0.003	0.001	0.0006	0.0004

SOURCE: FTA, Transit Noise and Vibration Impact Assessment, 2018; ESA, 2018.

As shown in **Table 12**, at a distance of 100 feet, the maximum vibration levels at off-site receptors would be up to approximately 0.021 in/sec PPV from the operation of a vibratory pile driver (sonic)

with typical soil conditions. The vibration criteria for potential structural damage for the Project construction is 0.5 in/sec PPV at the nearest buildings, which have been determined to be of FTA Building Category I – Reinforced-concrete, steel, or timber (no plaster).

The Times, Plant, and Mirror Buildings are components of the Project that would be subject to vibration from construction activities. The Times, Plant, and Mirror Buildings are located on the Project Site and Project construction activities could be as close as approximately 1 foot from the buildings.

The nearest off-site sensitive buildings to the Project Site that could be exposed to vibration levels generated from Project construction include the Federal Courthouse structure, approximately 100 feet to the west of the Project Site and the Metro Station structure to the south of the Project Site.[46]

Table 13, *Groundborne Vibration Levels at Sensitive Uses Compared to FTA's Vibration Criteria for Building Damage,* provides the estimated vibration levels at the Times, Plant, and Mirror Buildings, and the Federal Courthouse.

As shown in **Table 13**, at the closest distance to construction activities (1 foot), the Times, Plant, and Mirror Buildings could be exposed to vibration velocities up to 3.07 in/sec PPV from the operation of a large dozer and 5.864 in/sec PPV from the operation of a vibratory pile driver, assuming vibration-generating equipment are used as close as approximately 1 foot from the Times, Plant, and Mirror Buildings.[47] This value would exceed the 0.50 in/sec PPV significance threshold for potential building damage for on-site structures. **Therefore, structural damage vibration impacts to the Times, Plant, and Mirror Buildings would be potentially significant prior to the implementation of mitigation measures.**

Under the FTA's construction vibration damage criteria, the Project would not generate vibration levels at nearby offsite buildings that would exceed the significance criterion of 0.5 in/sec PPV. **As such, the potential vibration impacts for structural damage at offsite buildings would be less than significant; therefore, no mitigation measures would be required.**

According to the FTA's *Transit Noise and Vibration Impact Assessment*, haul truck trips on roadways rarely create vibration levels that exceed 70 VdB, which would be equivalent to 0.012 in/sec PPV, which would not exceed the significance threshold for building damage of 0.50 in/sec PPV.[48] **Therefore, the potential vibration impacts for building damage due to off-site haul trucks would be less than significant, and no mitigation measures would be required.**

46 The distance of 80 feet shown in **Table 7** is from the Project construction boundary nearest to the Federal Courthouse property line. The distance of 100 feet shown in **Table 13** is from the Project construction site boundary nearest to the Federal Courthouse building, which is the appropriate distance for evaluating structural vibration impacts.

47 Vibrations estimates are based on guidance in the Transportation- and Construction-Induced Vibration Guidance Manual, California Department of Transportation, Environmental Program, Environmental Engineering, Noise, Vibration, and Hazardous Waste Management Office, June 2004: $PPV_{equip} = PPV_{ref} (25/D)^n$; where PPV_{ref} = reference source vibration, D = Distance, n =factor for soil attenuation.

in/sec = inches per second.

[a] Approximate distances are measured from the nearest construction area within the Project Site where vibration levels would be generated to the nearest off-site structure.
[b] FTA's' Vibration Damage Potential Thresholds were taken from **Table 3**.

SOURCE: FTA, Transit Noise and Vibration Impact Assessment. 2018; ESA, 2018.

5.2.2 Human Annoyance

Construction

With respect to human annoyance, the FTA's *Transit Noise and Vibration Impact Assessment* identifies residential and institutional buildings as sensitive receptors. Therefore, courthouse and library buildings nearby the Project Site would be considered as vibration sensitive receptors for human annoyance.

The RMS vibration velocities for several types of construction equipment that can generate perceptible vibration levels are identified in **Table 14,** *Vibration Source RMS Levels for Construction Equipment*.

TABLE 14
VIBRATION SOURCE RMS LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	Approximate RMS (VdB) 25 Feet	50 Feet	75 Feet	100 Feet
Vibratory Pile Driver (sonic) (typical soil conditions)	93	84	78	74

SOURCE: FTA, Transit Noise and Vibration Impact Assessment, 2018; ESA, 2018.

The closest off-site sensitive land use to the Project Site is the Federal Courthouse (R1) to the west. Under the FTA's vibration criteria for potential human annoyance (refer to **Table 4**), vibration levels exceeding 75 VdB would be considered a human annoyance impact. As shown in **Table 15**, *Groundborne Vibration Levels at Sensitive Uses Compared to FTA's Vibration Impact Criteria For Human Annoyance*, the Federal Courthouse (R1) to the west of the Project Site could be exposed to vibration levels up to 74 VdB, which would not exceed the FTA's 75 VdB human annoyance criterion for frequent events for institutional land uses. **Thus, vibration impacts related to human annoyance due to on-site construction would be less than significant.**

TABLE 15
GROUNDBORNE VIBRATION LEVELS AT SENSITIVE USES COMPARED TO FTA'S VIBRATION IMPACT CRITERIA FOR HUMAN ANNOYANCE

Sensitive Land Use	Approximate Distance to Project Site [a]	Estimated PPV and VdB for Large Dozer : Vibratory Pile Driver (sonic) (typical soil conditions)	FTA's Vibration Critieria Potential for Human Annoyance[b]	Exceed FTA's Vibration Threshold? (Yes or No)
	feet	VdB	VdB	
Times Building, Plant Building, and Mirror Building	1	118 : 123	NA	NA
R1 – Federal Courthouse Building: west of the Project Site	100	69 : 74	75	No

[a] Approximate distances are measured from the nearest construction area within the Project Site where vibration levels would be generated to the nearest off-site structure.

[b] FTA's' Vibration Criteria for Human Annoyance Potential were taken from **Table 4**. Groundborne vibration impact criterion of frequent events was applied since frequent events is defined as more than 70 vibration events of the same source per day.

[c] Metro Station is considered to be a commercial use and not a sensitive receptor for human annoyance.

[d] On-site Times Building, Plant Building, and Mirror Buildings are office uses. Therefore, the existing on-site office buildings are not sensitive receptors for human annoyance.

SOURCE: FTA, Transit Noise and Vibration Impact Assessment. 2018; ESA, 2018.

For off-site haul truck vibration, as discussed above, loaded trucks would exit the Project Site from N. Broadway and turn right, head eastbound on W. 1st Street to Main Street, head north on Main Street to Aliso Street, turn right on Aliso Street, and merge on to the SR-101 southbound on-ramp. Empty trucks would take exit on Los Angeles Street, head south to 2nd Street, make a right on W. 2nd Street, turn right on N. Broadway, and right into the Project Site.

According to the FTA's *Transit Noise and Vibration Impact Assessment*, haul trucks rarely create vibration levels that exceed 70 VdB unless there are bumps in the road.[49] However, haul trucks would generate groundborne noise levels of approximately 75 VdB when they travel rough roads or uneven road surfaces, which would exceed the human annoyance significance threshold of 72 VdB for frequent events for residential uses.[50] **Even though haul trucks would pass vibration sensitive receptors along the haul routes for only a few seconds, groundborne noise impacts on sensitive receptors for human annoyance along the haul routes could be conservatively considered to be significant.**

As discussed previously, based on available information, the Future Mixed-Use Residential Development planned for future construction over the future Metro Station at the corner of 2nd Street and Broadway, approximately 50 feet southwest of the Project Site, is not expected to be in operation and occupied during construction of the Project. **As such, there would be no impacts to these future residents from construction-related vibration from the Project.**

Operations

The Project's day-to-day operations would include typical commercial-grade stationary mechanical and electrical equipment, such as air handling units, condenser units, and exhaust fans, which would produce vibration at low levels that would not cause damage or annoyance impacts to the Project buildings or on-site occupants and would not cause vibration impacts to the off-site environment. In addition, the primary sources of transient vibration would include passenger vehicle circulation within the proposed parking area. According to America Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE), pumps or compressor would generate groundborne vibration levels of 0.5 in/sec PPV at 1 foot. The nearest vibration sensitive structures are located approximately 100 feet from the Project Site. Groundborne vibration generated by each of the above-mentioned equipment and activities would generate approximately up to 0.0007 in/sec PPV (42 VdB) at the nearest sensitive receptor location (R1 and R5) approximately 80 feet from the Project Site.[51] The potential vibration levels from all Project operational sources at the closest existing building and human annoyance receptor locations would be less than the significance criteria for building damage and human annoyance of 0.5 in/sec PPV and 72 VdB, respectively. **As such, vibration impacts associated with operation of the Project would be below the significance threshold and impacts would be less than significant.**

Therefore, as discussed above, the Project would result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels with respect to construction-related potential structural damage impacts to the on-site Times, Plant, and Mirror Buildings and human annoyance impacts from off-site truck traffic. As discussed below in subsection I.3.g, building damage impacts to on-site structures associated with construction vibration would be less than significant with the incorporation of mitigation measures. There are no feasible mitigation measures for human annoyance impacts due to

49 Federal Transit Administration, Transit Noise and Vibration Impact Assessment, page 113, 2018.

50 Federal Transit Administration, Transit Noise and Vibration Impact Assessment, Table 6-3, 2018.

51 America Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., Heating, Ventilating, and Air-Conditioning Applications, 1999.

off-site truck trips along the truck routes when trucks travel rough roads or uneven road surfaces. Therefore, temporary human annoyance impacts would be significant and unavoidable. Project operation would not generate excessive vibration levels at sensitive receptor locations. Thus, operational impacts would be less than significant.

Threshold c: Would the project result in a substantial permanent increase in ambient noise levels in the vicinity of the Project above levels existing without the Project?

5.3 Permanent Increase in Ambient Noise Levels

The existing noise environment in the Project area is dominated by traffic noise from nearby roadways, as well as nearby residential and commercial activities. Long-term operation of the proposed Project would not have a significant effect on the community noise environment in proximity to the Project Site. Noise sources that would have potential noise impacts include: off-site vehicle traffic; open spaces; mechanical (i.e., air-conditioning) equipment; loading areas; emergency generators; and parking structure. Motor vehicle travel on local roadways attributable to the proposed Project, as discussed above, would have a less-than-significant impact on community noise levels. Noise levels associated with on-site operations (e.g., parking and mechanical equipment) are also considered less than significant as discussed in Threshold a). Therefore, noise impacts with respect to threshold c) are also less than significant.

Threshold d: Would the project result in a substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project?

5.4 Temporary Increase in Ambient Noise Levels

Construction activities associated with the proposed Project would occur during the allowable construction hours under LAMC. However, it is anticipated that concrete pours require continuous hours of pouring, which would require occuring during off-hours; i.e., outside of the LAMC's allowable daytime construction hours. As indicated in **Table 7**, construction noise levels are estimated to reach a maximum of 90 dBA L_{eq} at the nearest sensitive receptor (at measurement location R1, the Federal Courthouse). This would exceed the 70.4 dBA significance threshold at R1 (average daytime noise level of 65.4 dBA at R1 in **Table 1** plus 5 dBA). The sensitive receptor locations R3, R4, R5, and R6 would be exposed to construction noise levels which would exceed the significance thresholds of 77.8 dBA L_{eq} at R3, 73.5 dBA L_{eq} at R4, 70.0 dBA L_{eq} at R5, and 71.3 dBA L_{eq} at R6. As such, construction of the proposed Project would cause a substantial temporary and periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project. A potentially significant impact would occur. Mitigation measures are identified to reduce on-site construction noise levels to the nearby sensitive receptors, as presented below in Section 7, Mitigation Measures. However, noise impacts from on-site construction would remain significant and unavoidable.

As discussed previously under Threshold a), the Project's construction truck trips would exceed the nighttime ambient noise levels by 5 dBA along the haul routes. As such, construction noise impacts associated with off-site construction vehicles would be significant and unavoidable since there are no feasible mitigation measures to reduce the noise impacts.

Therefore, as discussed in Threshold a), the Project would result in substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without the Project without the incorporation of mitigation measures. As discussed below in Section 7, impacts from on-site and off-site construction noise would be significant and unavoidable with the incorporation of mitigation measures.

Threshold e: Would the project expose people residing or working in the project area to excessive noise levels (for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport)?

5.5 Public Airport or Public Use Airport

As discussed in the Initial Study (Appendix A-2 to the Project's Draft EIR), the Project is not located within an airport land use plan and is not within two miles of a public use airport or within the vicinity of a private airstrip. The nearest public airport is the Hawthorne Municipal Airport located approximately 10 miles southwest of the Project Site. **Therefore, the Project would not expose people in the Project vicinity to excessive noise levels from airport use. No impact would occur, and no mitigation measures are required.**

Threshold f: Would the project expose people residing or working in the project area to excessive noise levels (for a project within the vicinity of a private airstrip)?

5.6 Private Airstrip

As discussed in the Initial Study (Appendix A-2 to the Project's Draft EIR), the Project is not located within the vicinity of a private airstrip. The nearest private airport or airstrip is the Goodyear Blimp Base Airport in the City of Carson, approximately 13.5 miles south of the Project Site. **Therefore, the Project would not expose people in the Project vicinity to excessive noise levels from airport use. No impact would occur, and no mitigation measures are required.**

SECTION 6
Cumulative Impacts

The geographic context for the analysis of cumulative noise impacts depends on the impact being analyzed. Noise from stationary sources is by definition a localized phenomenon, and significantly reduces in magnitude as the distance from the source increases. As such, only related projects and growth due to occur in the immediate Project area would contribute to cumulative on-site stationary source noise impacts. However, cumulative off-site mobile source noise impacts would be created by traffic from all related projects throughout a larger vicinity.

6.1 Cumulative Construction Noise Impacts

The potential for cumulative construction noise impacts from on-site construction activities to occur is based on the distance between the Project and each of the related projects. Noise from construction activities would normally affect the areas immediately adjacent to each of the construction sites, specifically areas that are less than 500 feet from a construction site (500 feet is the distance identified in the *Thresholds Guide* as the Screening Criterion with respect to construction activities). That is, cumulative noise impacts could occur at receptor locations that are within 500 feet from two different construction sites. Therefore, based on the 500-foot Screening Criterion distance, the cumulative construction noise impacts analysis is limited to related projects within 1,000 feet of the Project Site. The 1,000-foot distance is based on an assumption that a noise-sensitive receptor would be located halfway between the Project Site and the related project.

As discussed in Chapter III, *General Description of Environmental Setting*, subsection III.2, Related Projects, of the Project's Draft EIR, there are 170 related projects identified in the vicinity of the Project Site. The three development projects plus the regional connector and Civic Center Park infrastructure project closest to the Project Site are situated approximately 50 feet to 960 feet from the Project Site, respectively: Related Project No. 25, the Mixed-Use Residential Development located at 201 S. Broadway; Related Project No. 110, the Mixed-Use Residential Development located at 222 W. 2nd Street; Related Project No. 130, the TV Studio and Auditorium project at 237 S. Los Angeles Street; and Related Project No. 168, Metro Regional Connector project located at southeastern corner of E. 2nd Street and S. Broadway. In addition, the Civic Center Park project is located at 1st Street and Broadway. All other related projects are located a minimum of 1,100 feet away from the Project Site and are thus not within the *Thresholds Guide* Screening Criterion distance.

Noise from on-site construction activities are localized and would normally affect the areas within 500 feet from the individual construction sites. The nearest existing sensitive/residential uses to the Project Site that would be subject to cumulative noise impacts are the Federal Courthouse (R1),

Los Angeles County Library (R3), City Hall Park (R4), the Higgins Building Lofts apartment complex (R5), and Kawada Hotel (R6).

Related Project No. 130 would be located approximately 400 feet from the sensitive receptor R5. Existing buildings are located between the Related Project No. 130 and the sensitive receptor R5. Accounting for noise attenuation from a distance of 400 feet and barrier insertion loss by the existing buildings (minimum 10 dBA insertion loss), the maximum construction noise levels from Related Project No. 130 would be approximately 65 dBA L_{eq} at the sensitive receptor R5. Construction noise levels of 77 dBA from the Project would be reduced to 72 dBA L_{eq} with implementation of prescribed mitigation measures because implementation of MM-NOISE-1 would reduce the Project's construction noise levels at least 5 dBA at R5. Implementation of MM-NOISE-2 requires that construction equipment be equipped with noise mufflers; however, as a conservative assumption, no quantified reduction was taken. The combined construction noise levels of 65 dBA L_{eq} from Related Project No. 130 and 72 dBA L_{eq} from the Project would be 72.8 dBA L_{eq} at sensitive receptor R5, which would exceed the significance threshold of 70 dBA L_{eq}. Therefore, if construction of the Related Project No. 130 were to overlap with construction of the Project, the cumulative noise level would exceed the significance threshold at sensitive receptor R5. As such cumulative construction noise impacts would occur.

The related projects closest to the R5 residences and R6 hotels are: Related Project No. 25, a Mixed-Use Residential Development; Related Project No. 110, a Mixed-Use Residential Development; and Related Project No. 168, the Metro Regional Connector project. If construction of the Related Projects No. 25, No. 110, or No. 168 would overlap with construction of the Project, cumulative construction noise level increases could occur at the sensitive receptor locations along S. Broadway, W. 1st Street, and W. 2nd Street. The City of Los Angeles does not have any noise studies for those related projects or quantitative analysis that shows that particular construction activities for the related projects would occur concurrently. However, as a worst-case scenario, this EIR assumes that construction of the related projects No. 25, No. 110, or No. 168 would overlap with construction of the Project, and that short-term cumulative construction noise impacts would be significant at the noise sensitive receptors at R3 through R6. **Therefore, cumulative construction noise impacts from on-site construction activities are conservatively considered to be significant and unavoidable.**

In contrast to cumulative on-site construction noise impacts, which are confined to a very limited geography surrounding the Project Site, off-site construction haul trucks would have the potential to result in cumulative impacts if the trucks associated with the related projects and the Project were to utilize the same haul route(s) over the same time periods. Related Project No. 25 would be located close to the Project Site, approximately 100 feet to the west of the Project Site. The Initial Study[52] for Related Project No. 110 states that its construction would not begin until construction of Related Project No. 168, the Metro Regional Connector portal and station, within the site is complete. Therefore, construction of Related Project No. 110 would not begin until 2022 and would not be complete until 2025, which would be two years after expected completion of the Project. In addition, Related Project No. 168, Metro Regional Connector is currently under construction and

52 City of Los Angeles, Initial Study, 222 West 2nd Project, Case No. ENV 2016-3809-EIR, January 2017, https://planning.lacity.org/eir/nops/222West2nd/nop.pdf. Accessed December 2018.

is slated to be completed in 2021. Therefore, Related Project No. 25, and Related Projects No. 110, or No. 168 would be under construction concurrently with the Project. It is anticipated that Related Project No. 25 and Related Projects No. 110 and No. 168 would use similar truck routes, which would be W. 2nd Street, S. Main Streets, and N. Los Angeles Street, as the Project since these Related Projects are located in proximity to the Project Site. Related Project No. 130 would be located at 237 S. Los Angeles Street, approximately 800 feet southeast of the Project Site. It is anticipated that Related Project No. 130 would use similar truck routes to access SR-101 freeway. Receptor location R8 along Los Angeles Street would be located along the truck route for Related Project No. 130.

The Project construction would generate a maximum of approximately 38 daily worker vehicle trips and approximately 1,406 daily concrete truck trips (equal to approximately 2,812 PCE) during the foundation/concrete pour phase. If renovation activities would overlap, approximately 124 additional daily worker vehicles trips would occur. As shown in **Table 8**, the Project's off-site construction traffic would generate maximum noise levels of approximately 68.8 dBA L_{eq}, on W. 2nd Street. The Project would not exceed the daytime significance thresholds for offsite construction noise, but would exceed the nighttime significance threshold on S. Broadway, Los Angeles Street, and W. 2nd Street during the two continuous concrete pour activities that would only last up to two days each (one nighttime and early morning period each).

Construction-related trips from the Project and related projects could combine to exceed ambient noise levels by 5 dBA at sensitive receptors adjacent to street segments along the Project truck route and, thus, exceed the significance criteria. Truck traffic related to construction of the Project could combine with the potentially concurrent construction of Related Project No. 110, located at 222 W. 2nd Street, immediately south of the Project Site. The Project is unique as it is one of two large projects in very close proximity that have the potential to be constructed concurrently. According to information on file with the Planning Department, heavy construction truck traffic from Related Project No. 110 would utilize segments of S. Los Angeles Street, same as the Project. In addition, construction traffic from other related projects could potentially use these street segments.[53] As previously discussed, it is not certain whether Project construction would occur concurrently with that of Related Project No. 110. However, given the possible unique circumstance of concurrent construction activities (including the possible overlapping renovation work for the Project) of these two large scale projects located across the street from one another and utilizing overlapping haul routes, it is conservatively assumed herein that these projects, combined with other related projects in the area noted in this section, could cumulatively generate sufficient truck trips to trigger a significant noise impact along segments of S. Los Angeles Street. It is noted, however, that should the Project's construction activities involving peak construction

[53] Related projects located along or near Spring Street, 3rd Street, or 4th Street that could potentially use those roadways to access the nearest freeway on- or off-ramp include Related Project Nos. 14, 38, 39, 49, 61, 77, 111, and 130. Related projects located along or near Los Angeles Street that could potentially use that roadway to access the nearest freeway on- or off-ramp include Related Project Nos. 16, 53, 61, 89, 97, 109, and 130. While some of these related projects may already be underway, may be operational prior to the start of Project construction, and/or may only involve interior renovations and therefore not require a haul route, other development projects in the surrounding area also could contribute to truck trips along the identified routes.

truck traffic be completed prior to commencement of construction of Related Project No. 110, this cumulative construction noise impact may not occur.

In addition, according to information on file with the Department of City Planning, the haul route for Related Project No. 110 is not anticipated to use W. 1st Street, W. 2nd Street,[54] S. Main Street, Aliso Street, or N. Broadway. Accordingly, even if the Project and Related Project No. 110 were to be constructed concurrently, unless Related Project No. 110 were to change its haul route to use W. 1st Street, S. Main Street, Aliso Street, or N. Broadway, that related project's construction truck trips would not contribute to cumulative off-site construction noise along those street segments. As such, the Project, combined with other related projects in the area, may not cumulatively generate sufficient truck trips to trigger a significant noise impact along W. 1st Street, W. 2nd Street, S. Main Street, Aliso Street, or N. Broadway.

In sum, based on the above, it is conservatively assumed that truck traffic related to construction of the Project, combined with Related Project No. 110 and other nearby related projects noted in this section, would occur throughout the day and could overlap, and, thus, could cumulatively exceed ambient noise levels by 5 dBA at sensitive receptors adjacent to S. Los Angeles Street.

Therefore, should Related Project No. 110 be constructed concurrently with the Project, cumulative noise due to construction truck traffic from the Project and other nearby related projects noted in this section has the potential to exceed the ambient noise levels along S. Los Angeles Street by 5 dBA. As such, cumulative daytime noise impacts from off-site construction are conservatively considered to be significant.

During the nighttime, the Project would exceed the nighttime significance threshold along the truck route. The Project's maximum truck trips would occur for a short duration during the continuous concrete pour activity, which would last one nighttime and early morning period for each residential tower for a total of up to two nighttime and early morning periods. Each project applicant would be required to prepare and submit to LADOT for approval a construction management plan that would be based on the nature and timing of the specific construction and other projects in the vicinity of the development site. Thus, while it would not be expected that related projects would contribute a maximum number truck trips during the same nighttime periods as the proposed Project, it is possible that related projects could require some nighttime construction work and generate some level of construction truck or worker trips along the same truck route at the Project. **Therefore, off-site construction noise impacts during the nighttime would be cumulatively considerable and cumulative off-site construction nighttime noise impacts would be cumulatively significant.**

As indicated above, each project applicant would be required to prepare and submit to LADOT for approval a construction management plan that would be based on the nature and timing of the

[54] While the haul routes for both the Project and Related Project No. 110 would include portions of W. 2nd Street, based on information on file with the Department of City Planning, the only overlapping segment would be located between the Related Project No. 110's driveway and Spring Street. Since the only sensitive receptors adjacent to this segment are the future residential uses in the Project, construction of these two projects could not combine to create a cumulative mobile noise impact since the future residential uses would not be occupied until after the Project has been completed and heavy construction ceased.

specific construction and other projects in the vicinity of the development site. Thus, it is unlikely that there would be simultaneous continuous concrete pouring activities during the nighttime and early morning hours from multiple related projects given that such activities are limited to a few specific days.

6.2 Cumulative Operational Noise Impacts

Cumulative off-site noise impacts would occur primarily as a result of increased traffic on local roadways due to operation of the Project and the related projects, as traffic is the greatest source of operational noise in the Project area. Cumulative off-site traffic-generated noise impacts were assessed based on a comparison of the future cumulative base traffic volumes with the Project to the existing base traffic volumes without the Project. The future cumulative base traffic volumes with the Project represent an estimate of the ambient background growth, related projects traffic, and the Project traffic volumes. Therefore, cumulative increase represents the increment by the ambient background growth, related project traffic, and the Project traffic volumes over the existing conditions. The results of that comparison are provided in **Table 16**, *Off-Site Traffic Noise Impacts – Future 2023 Cumulative Increment*. **Table 16** shows the Project's contribution to the cumulative noise levels. The maximum cumulative noise increase from the Project plus related project traffic would be 2.9 dBA CNEL, which would occur along N./S. Grand Avenue, south of W. 1st Street near concert hall and commercial uses. This increase in sound level would not exceed the significance thresholds of an increase of 3 or 5 dBA CNEL. **As a result, the Project's contribution to off-site traffic-related noise would not be cumulatively considerable and impacts would be less than significant.**

TABLE 16
OFF-SITE TRAFFIC NOISE IMPACTS – FUTURE 2023 CUMULATIVE INCREMENT

	Calculated Traffic Noise Levels On Roadway CNEL (dBA)				
Roadway Segment	**Existing (A)**	**Future with Project (B)**	**Cumulative Increment (B-A)**	**Significance Threshold [a]**	**Exceed Threshold?**

[a] The Project related traffic would cause any ambient noise levels measured at the property line of affected uses to increase by 5 dBA CNEL or more; or cause ambient noise levels measured at the property line of affected uses to increase by 3 dBA in CNEL or more to or within the "normally unacceptable" or "clearly unacceptable category."

SOURCE: ESA, 2018

As is true for the Project, compliance with the LAMC-required provisions that limit stationary source noise from items such as rooftop mechanical equipment would ensure that noise levels would be less than significant at the property line for each related project. However, the Project requires mitigation for operational on-site noise. As discussed below, with mitigation, the Project's

operational on-site noise impacts would be reduced to a less than significant level. In addition, on-site noise generated by each related project would be sufficiently low and sufficiently distant from the Project Site that it would not result in an additive increase to Project-related noise levels. Further, noise from other on-site sources, including parking structures, open space activity, emergency generator, and loading docks would be limited to areas in the immediate vicinity of each related project. Although each related project could potentially impact an adjacent sensitive use, that potential impact would be localized to that specific area and would not contribute to cumulative noise conditions at or adjacent to the proposed Project Site. **Therefore, cumulative stationary source noise impacts would be less than cumulatively significant.**

6.3 Cumulative Groundborne Vibration

Due to the rapid attenuation characteristics of groundborne vibration and distance from each of the related projects to the Project Site, there is no potential for cumulative construction- or operational-period impacts with respect to groundborne vibration. However, as the related projects would be anticipated to use similar trucks as the Project, it is expected that construction trucks from the related projects would generate similar vibration levels along the anticipated haul routes. If the Project and related projects would have the same haul routes and at least two trucks would pass together a sensitive receptor, cumulative groundborne noise impacts would occur. **Therefore, potential cumulative groundborne noise impacts for human annoyance would be cumulatively significant.**

The Metro Station site is located approximately 80 feet from the Project. As demonstrated in **Table 13**, with 80 feet distance, construction related vibration from the Metro Station construction would not exceed the 0.50 inches per second PPV significance threshold for potential building damage for the Times Building, the Plant Building, and the Mirror Building. **Therefore, cumulative vibration impacts for structural damage would not occur.**

SECTION 7
Mitigation Measures

7.1 Construction

Construction-related noise has the potential to result in significant noise impacts at the noise sensitive uses in the vicinity of the Project Site. However, the following mitigation measure would reduce construction-related noise impacts:

MM-NOISE-1: The Project shall provide a temporary 10-foot-tall construction fence equipped with noise reduction materials such as noise blankets rated to achieve sound level reductions of at least 5 dBA between the Project Site and the sensitive receptor locations R1 and R3 through R6.[55] Temporary noise barriers shall be used to block the line-of-sight between the construction equipment and the noise-sensitive receptor during early Project construction phases (up to the start of framing) when the use of heavy equipment is prevalent. The noise barrier shall have a minimum sound transmission class (STC) of 25 and noise reduction coefficient (NRC) of 0.75.[56, 57] At Plan Check, building plans shall include documentation prepared by a noise consultant verifying compliance with this measure.

MM-NOISE-2: Contractors shall ensure that all construction equipment, fixed or mobile, are equipped with properly operating and maintained noise shielding and muffling devices, consistent with manufacturers' standards. Construction contractor shall keep documentation on-site demonstrating that the equipment has been maintained in accordance with the manufacturers' specifications. Contractor shall also keep documentation on-site prepared by a noise consultant verifying compliance with this measure.

MM-NOISE-3: In order to reduce high noise levels at the Federal Courthouse located at 350 W. 1st St, Los Angeles, across S. Broadway from the Project Site, construction activities shall be scheduled to avoid operating several pieces of Heavy-Duty Equipment simultaneously. Heavy-Duty Equipment subject to the restrictions provided herein applies to all equipment generating noise levels of greater than 75 dBA Leq as measured at 50 feet from the source. The restrictions for Heavy-Duty Equipment on the Project Site during construction include:

55 R1: Federal Courthouse, R3: First and Broadway Civic Center Park and Los Angeles County Law Library, R4: City Hall Park, R5: One-acre park south of the LAPD Headquarters Building and Higgins Building Lofts apartment complex, R6: Kawada Hotel.

56 Sound Transmission Class (STC) is an integer rating of how well a wall attenuates airborne sound and Noise Reduction Coefficient (NRC) is a scalar representation of the amount of sound energy absorbed upon striking a wall.

57 M. David Egan, Architectural Acoustics, Chapter 2 and Chapter 4.

- A maximum of two (2) pieces of Heavy-Duty Equipment within 100 feet from the Courthouse;

- A maximum of four (4) pieces of Heavy-Duty Equipment between 100 feet and 150 feet from the Courthouse; and,

- A maximum of six (6) pieces of Heavy-Duty Equipment 150 feet or more from the Courthouse.

MM-NOISE-4: In order to reduce high noise levels at the Federal Courthouse across S. Broadway from the operation of a vibratory pile driver, the Project shall provide a temporary pile driver enclosure equipped with noise blankets rated to achieve sound level reductions of at least 10 dBA between the Project Site and the Federal Courthouse. The temporary noise barrier shall be used to block the line-of-sight between the construction equipment and the Federal Courthouse during the operation of vibratory pile driver. The noise barrier shall have a minimum sound transmission class (STC) of 25 and noise reduction coefficient (NRC) of 0.75.[58] Contractor shall keep documentation on-site prepared by a noise consultant verifying compliance with this measure.

MM-NOISE-5: The operation of a vibratory pile driver shall be prohibited within 60 feet of the Times Building, the Plant Building, and the Mirror Building and within 160 feet of the Federal Courthouse building. Instead, a drill rig shall be used within these areas.

MM-NOISE-6: To avoid or minimize potential construction vibration damage to structures and finish materials on the Times Building, the Plant Building, and the Mirror Building, the condition of structures and finish materials shall be documented by a qualified preservation consultant, prior to initiation of construction. Prior to construction, the Applicant shall retain the services of a qualified acoustical engineer to review the proposed construction equipment and develop and implement a vibration monitoring program capable of documenting the construction-related ground vibration levels at the Times, Plant, and Mirror Buildings. During construction, the contractor shall install and maintain at least one continuously operational automated vibrational monitor on the Times Building, the Plant Building, and the Mirror Building. The monitor(s) shall be capable of being programmed with two predetermined vibratory velocities levels: a first-level alarm equivalent to a 0.45 inches per second PPV at the face of the building and a regulatory alarm level equivalent to 0.5 inches per second at the face of the building. The monitoring system shall produce real-time specific alarms (for example, via text message and/or email to on-site personnel) when velocities exceed either of the predetermined levels.

In the event of a first-level alarm, feasible steps to reduce vibratory levels shall be undertaken, including but not limited to halting/staggering concurrent activities and utilizing lower-vibratory techniques. In the event of an exceedance of the regulatory level, work in the vicinity shall be halted and the Times Building, the Plant Building, and the Mirror Building visually inspected for damage. Results of the inspection shall be logged. In the event damage occurs to finish materials due to construction vibration, such materials shall be repaired in consultation with a qualified preservation consultant, and if warranted, in a manner that meets the Secretary of the Interior's Standards.

58 M. David Egan, Architectural Acoustics, Chapter 2 and Chapter 4.

As shown in **Table 17**, *Construction Noise Levels After Mitigation***,** implementation of MM-NOISE-1 would reduce daytime construction and nighttime off-hours concrete pour noise levels at least 5 dBA at the nearby noise sensitive receptor locations at R1 and R3 through R6. However, the Federal Courthouse located at 350 W 1st St, Los Angeles is taller than the prescribed noise barrier. Therefore, upper levels of the Federal Courthouse building would not have any noise reduction by MM-NOISE-1. Implementation of MM-NOISE-2 requires that construction equipment be equipped with noise mufflers. Absorptive mufflers are generally considered commercially available, state-of-the-art noise reduction for heavy duty equipment.[59] Implementation of MM-NOISE-3 would reduce construction noise levels at least 5 dBA at the Federal Courthouse (see Appendix I, Noise and Vibration Technical Report). Implementation of MM-NOISE-4 would reduce the operation of vibratory pile driver noise levels at least 10 dBA at the Federal Courthouse (location R1) and R3 through R6. However, the noise levels during construction would exceed the applicable noise standards. Therefore, construction of the Project would result in the on-site generation of construction noise levels in excess of standards established by the City, and these impacts would be significant with mitigation incorporated. **Implementation of MM-NOISE-1, MM-NOISE-2, MM-NOISE-3, and MM-NOISE-4 would not reduce temporary or periodic increases in ambient noise levels in the Project vicinity above levels existing without the Project to below the significance thresholds established by the City and these temporary impacts would be significant and unavoidable.**

There are no feasible mitigation measures to reduce the Project's noise impacts due to off-site truck trips during the nighttime along the truck routes. There are no feasible mitigation measures to reduce the Project's cumulative noise impacts due to off-site truck trips during the daytime or nighttime along the truck routes. **Therefore, temporary off-site Project construction noise impacts during the nighttime would be significant and unavoidable. Temporary off-site cumulative construction noise impacts during the daytime and nighttime would be significant and unavoidable.**

TABLE 17
CONSTRUCTION NOISE LEVELS AFTER MITIGATION

Construction Noise Levels after Mitigation Measures [b]	**75 (ground level) / 80 (upper levels)**	**70 (ground level) / 75 (upper levels)**	**74**	**69**	**65**	**62**	**65 (ground level) / 70 (upper levels)**	**60 (ground level) / 65 (upper levels)**	**65 (ground level) / 70 (upper levels)**	**57 (ground level) / 62 (upper levels)**
Significance Threshold	**70.4**		**77.8**		**73.5**		**70.0**		**71.3**	
Exceeds Threshold?	**Yes**		**No**		**No**		**Yes**		**No**	

[a] The maximum construction noise levels with the use of a vibratory pile would be up to 90 dBA at R1, 87 dBA at R3, 81 dBA at R74, 77 dBA at R5, and 75 dBA at R6. The construction noise levels without the use of a vibratory pile would be up to 85 dBA at R1, 82 dBA at R3, 74 dBA at R74, 72 dBA at R5, and 73 dBA at R6. This distinction is being made in the analysis to evaluate the noise levels for construction activities where a vibratory would be used and activities where a vibratory would not be used.

[b] Noise barriers by MM-NOISE-1 would be 10-feet-tall. Therefore, sensitive receptors located 10 feet above the ground level would not have noise reductions by noise barriers. Receptor locations R3 and R4 are public parks. Therefore, no sensitive receptors 10 feet above the ground level would be expected at these locations.

[c] Mitigation Measure MM-NOISE-4 is for vibratory pile driver only.

[d] Receptor Locations R1, R5, and R6 have upper floors where noise barrier cannot provide noise reduction. Therefore, noise reductions by noise barrier would not be provided.

SOURCE: ESA, 2018.

With respect to vibration, implementation of MM-NOISE-5 would reduce vibration velocities at the Federal Courthouse to 69 VdB at 100 feet with the use of a drill rig instead of a vibratory pile driver, which would be below the threshold levels for human annoyance. With the implementation of MM-NOISE-6 for structural damage on the on-site buildings, vibration velocities in excess of the threshold would transmit an alarm to on-site personnel with authorization to halt work in the vicinity. Furthermore, in the event damage occurs to structures and finish materials of the on-site buildings due to construction vibration, such materials would be repaired in consultation with a qualified preservation consultant in a manner that meets the Secretary of the Interior's Standards. Thus, vibration impacts on human annoyance at the Federal Courthouse and on structural damage to the on-site buildings would be mitigated to less than significant.

There are no feasible mitigation measures for groundborne noise impacts due to off-site truck trips along the truck routes when trucks travel rough roads or uneven road surfaces. **Therefore, temporary groundborne noise impacts on human annoyance would be significant and unavoidable.**

7.2 Operational

As discussed above, the Project would result in less-than-significant impacts associated with operational noise Therefore, no operational noise mitigation measure would be required.

As discussed above, the Project would not result in significant impacts associated with operational vibration. Therefore, no operational vibration mitigation measures would be required.

SECTION 8
Summary of Results

8.1 Construction

Construction of the Project would have a potentially significant construction noise impact on the nearby sensitive receptors. Mitigation measures are identified to reduce construction noise levels to the nearby sensitive receptors. Implementation of MM-NOISE-1, MM-NOISE-2, MM-NOISE-3, and MM-NOISE-4 would not reduce temporary or periodic increases in ambient noise levels in the Project vicinity above levels existing without the Project to below the significance thresholds established by the City and these temporary impacts would be significant and unavoidable.

There are no feasible mitigation measures to reduce the Project's noise impacts due to off-site truck trips during the nighttime along the truck routes. There are no feasible mitigation measures to reduce the Project's cumulative noise impacts due to off-site truck trips during the daytime or nighttime along the truck routes. Therefore, temporary off-site Project construction noise impacts during the nighttime would be significant and unavoidable. Temporary off-site cumulative construction noise impacts during the daytime and nighttime would be significant and unavoidable.

With respect to vibration, implementation of MM-NOISE-5 would reduce vibration velocities at the Federal Courthouse to 69 VdB at 100 feet with the use of a drill rig instead of a vibratory pile driver, which would be below the threshold levels for human annoyance. With the implementation of MM-NOISE-6 for structural damage on the on-site buildings, vibration velocities in excess of the threshold would transmit an alarm to on-site personnel with authorization to halt work in the vicinity. Furthermore, in the event damage occurs to structures and finish materials of the on-site buildings due to construction vibration, such materials would be repaired in consultation with a qualified preservation consultant in a manner that meets the Secretary of the Interior's Standards. Thus, vibration impacts on human annoyance at the Federal Courthouse and on structural damage to the on-site buildings would be mitigated to less than significant.

There are no feasible mitigation measures for groundborne noise impacts due to off-site truck trips along the truck routes when trucks travel rough roads or uneven road surfaces. Therefore, temporary groundborne noise impacts on human annoyance would be significant and unavoidable.

8.2 Operational

The Project would result in less-than-significant impacts associated with operational noise and vibration.

Measured Ambient Noise Levels

Project: LA Times
Location: R2
Sources: Ambient

Date: 8/8/2017

TIME	HNL, dB(A)
11:00 AM	63.8
12:00 PM	65.3
1:00 PM	64.5
2:00 PM	64.4
3:00 PM	64.7
4:00 PM	65.7
5:00 PM	65.4
6:00 PM	66.9
7:00 PM	64.7
8:00 PM	61.4
9:00 PM	60.3
10:00 PM	59.7
11:00 PM	58.8
12:00 AM	60.1
1:00 AM	56.7
2:00 AM	56.8
3:00 AM	59.1
4:00 AM	61.2
5:00 AM	62.0
6:00 AM	65.1
7:00 AM	65.7
8:00 AM	65.4
9:00 AM	65.8
10:00 AM	65.3
CNEL, dB(A):	**68.3**

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Model Notes:
The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
Noise propagation greater than 50 feet is based on the following assumptions:
For hard ground, the propagation rate is 3 dB per doubling the distance.
For soft ground, the propagation rate is 4.5 dB per doubling the distance.
Vehicles are assumed to be on a long straight roadway with cruise speed.
Roadway grade is less than 1.5%.
CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

TOTALS						111,640	45,914

Notes:

du = dwelling units

ksf = one thousand square feet

[a] Related Projects List was prepared as a component of the Traffic Study, Appendix L of this Draft EIR. Calculations do not include Project 168 (Metro), 169 (Main and Spring Bike Lane Project), and 170 (First and Broadway Civic Center Park) as they do not have specific land uses and development square footages tied to them.

[c] Estimated household size reflects the Citywide Person Per Household factor for multi-family units as published in the 2016 American Community Survey.

Compiled by ESA, 2018.

Notes:
du = dwelling units
ksf = one thousand square feet
[a] Related Projects List was prepared as a component of the Traffic Study, Appendix L of this Draft EIR. Calculations do not include Project 168 (Metro), 169 (Main and Spring Bike LaneProject), and 170 (First and Broadway Civic Center Park) as they do not have specific land uses and development square footages tied to them.
[b] Employee Generation Rates for these uses are based on data provided in the Los Angeles Unified School District, 2016 Developer Fee Justification Study. Selected representative/conservative categories include: Neighborhood Shopping Center, Standard Commercial Office, and Lodging.
[c] It is assumed that each hotel room is approximately 500 square feet.
[d] The employee generation factor for schools is based on dividing the total school district employees by the total student enrollment, which results in 0.084 employees per student. Data is provided in the LAUSD 2017-2018 Fingertip Facts, https://achieve.lausd.net/cms/lib/CA01000043/Centricity/Domain/32/NewlyUpdatedFingertip%20Facts2017-18_English.pdf.
[e] The projects that fall under Other include a variety of uses, including bus facility, museums, and others that do not have a speific genreation rate. In those cases, the closest possible generation factor is used.
[f] It is assumed that cinema, theater, auditorium, convention center, and other entertainment facilities will require approximately 9 square feet per seat.

Per Sergeant Tango, here are updated stats:

The distance from Central Police Station on 251 East 6th Street to the Times Square Project located at 1st Street and Broadway (202 West 1st Street) is **0.9 miles** using Google maps.

We do not have response time for the entire City of LA as we discussed over the phone

There are no plans to expand Central Station

Hello Officer Gibson,

I have received the letter. Within the letter, you say that the project site is located approximately 0.9 miles from the Central Community Police Station. Google Maps is pointing me at approximately 1.8 to 1.9 miles. Could you please confirm which is the correct distance?

Additionally, could you please provide the crime statistics specifically for RD 0123 for 2015 and 2016 (same categories as the YTD info provided in the letter for the Central Area)?

Lastly, are there any current plans to expand the Central Community Police Station or increase the number of personnel assigned to the Central Area?

If you could please provide responses at your earliest convenience, it would be extremely helpful. Thank you so much, and have a wonderful weekend!

Dear Officer Gibson,

In coordination with the City of Los Angeles Department of City Planning, ESA is preparing an Environmental Impact Report (EIR) for the proposed Times Mirror Square Project located generally at 100 S. Broadway within the Central City Community Plan Area pursuant to the California Environmental Quality Act (CEQA). Since the Project is located within the jurisdiction of the Los Angeles Police Department, we are requesting information from your agency with regards to police protection services and facilities. In order to maintain the schedule for the EIR, we respectfully request your input by **July 24, 2017**. Attached is an information request letter, and a hard copy will follow in the mail. Please let me know if you have any further questions. Your assistance is much appreciated. Thanks!

LOS ANGELES POLICE DEPARTMENT

CHARLIE BECK
Chief of Police

ERIC GARCETTI
Mayor

P. O. Box 30158
Los Angeles, Calif. 90030
Telephone: (213) 486-6000
TDD: (877) 275-5273
Ref #:14.7

July 24, 2017

Mr. Jessie Fan
ESA
233 Wilshire Boulevard, Suite 150
Santa Monica, California 90401

Dear Mr. Fan:

The proposed Times Mirror Square Project falls within the geographical boundaries of the Los Angeles Police Department's Central Area. A project of this size could have a moderate impact on police services in the Central Area. The Department is available to advise you on crime prevention features appropriate for the design of the property in this project. The Department strongly recommends that the developers contact Community Relationship Division, Crime Prevention Through Environmental Design, Officer Christopher Gibson, at (213) 486-6000.

Upon completion of the project, you are encouraged to provide the Central Area Commanding Officer with a diagram of each portion of the property. The diagram should include access routes and any additional information that might facilitate police response.

Should you have any questions regarding this response, please contact Sergeant David Tango, Community Relationship Division, at (213) 486-6000.

Very truly yours,

CHARLIE BECK
Chief of Police

FOR:

AL NEAL, Captain
Commanding Officer
Community Relationship Division

Enclosure

The proposed Times Mirror Square Project will be under the jurisdiction of Central Community Police Station, located at 251 East 6th Street, Los Angeles, CA 90014. Telephone Number (213) 833-3707.

The project site is approximately 0.9 miles and 6 minutes without traffic from the Police Station in Reporting District (RD) 0123.

Central Geographic Area is approximately 4.5 square miles and consists of 52 Reporting Districts. The service boundaries for Central Area are as follows: Stadium Way, Pasadena Freeway to the North, Washington Boulevard, 7th Street to the South, Los Angeles River to the East, and the Harbor Freeway to the West.

It has approximately 370 sworn personnel and 30 civilian support staff assigned. It is a culturally diverse community with a population of approximately 40,000 people. The officer to resident ratio is; 1 officer to 108 residents in Central Area. Additionally, there are special service teams available within the LAPD to service Central Area.

Central Station's emergency response system is directly linked to the Los Angeles Police Department Communications Division's Dispatch Centers. Communications Division has the responsibility to staff and answer, on a 24-hour basis, the telephones upon which calls for service are received. This includes 911 emergency calls (police, fire, and paramedic). Communication Division handles only police related calls for the City.

The average response time to emergency calls for service in Central Area during 2016 was 2.7 minutes. The average response time for non-emergency calls for service in Central Area during 2016 was 13.7 minutes.

Crime Statistics for all Central Area:

From: Los Angeles City Fire Department

Subject: Request for Fire Services Report

PROJECT NAME: **Times Mirror Square Project**
PROJECT APPLICANT: **Onni Contracting, CA Inc.**
PROJECT LOCATION: **100 S. BROADWAY, LOS ANGELES, CA 90015**

PROPOSED PROJECT:

The Project would retain and renovate the Times, Plant, and Mirror Buildings to provide approximately 376,105 sf of offices and/or other retail and commercial uses, including an approximately 50,000 sf grocery store. These three buildings are aligned along S. Spring Street, with frontages along both W. 1st Street and W. 2nd Street. The Project proposes to demolish the Parking Garage and Executive Building located on the western half of the Site and construct two mixed-use towers (North and South Towers). The Project's 37-story North Tower and 53-story South Tower mixed-use components would be constructed in the west sector of the Project Site in the areas currently occupied by the 6-story Executive Building at the corner of W. 1st Street and S., Broadway and the 6-story parking structure at the corner of W. 2nd Street and S. Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units,. The towers would include approximately 34,572 sf of retail uses, which would be located at ground level. With the addition of retail uses, total new construction would amount to 1,135,803 sf. Inclusive of the existing buildings to be retained and rehabilitated, the Project would include a total of 1,511,908 sq of floor area for a resulting floor-area ratio (FAR) of approximately 9.42;1.

The Project would include a pedestrian paseo constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. Approximately 72,902 sf of common open space, including the approximately 15,708 sq paseo, would provided as part of the North and South Tower component. With the addition of approximately 56,349 sf of private balconies, combined private and common open space would be approximately 129,477 sf. Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023.

The following comments are furnished in response to your request for this Department to review the proposed development:

FIRE FLOW:

The adequacy of fire protection for a given area is based on required fire-flow, response distance from existing fire stations, and this Department's judgment for needs in the area. In general, the required fire-flow is closely related to land use. The quantity of water necessary for fire protection varies with the type of development, life hazard, occupancy, and the degree of fire hazard.

Fire-flow requirements vary from 2,000 gallons per minute (G.P.M.) in low density residential areas to 12,000 G.P.M. in high-density commercial or industrial areas. A minimum residual water pressure of 20 pounds per square inch (P.S.I.) is to remain in the water system, with the required gallons per minute flowing. The required fire-flow for this project has been set at **6,000 to 9,000 G.P.M. from four to six fire hydrants flowing simultaneously.**

Improvements to the water system in this area may be required to provide 6,000 to 9,000 G.P.M. fire-flow. The cost of improving the water system may be charged to the developer. For more detailed information regarding water main improvements, the developer shall contact the Water Services Section of the Department of Water and Power.

RESPONSE DISTANCE:

Based on a required fire-flow of 6,000 to 9,000 G.P.M., the first-due Engine Company should be within 1 mile(s), the first-due Truck Company within 1 ½ mile(s).

FIRE STATIONS:

The Fire Department has existing fire stations at the following locations for initial response into the area of the proposed development: **100 S. BROADWAY**

DISTANCE	**Fire Station No. 3**	**EQUIPMENT & SERVICES**	**STAFF**
0.6	108 N. Fremont Avenue Los Angeles, CA 90012	Engine, Truck, Task Force, Paramedic Rescue Ambulance, BLS Rescue Ambulance, Emergency Lighting Unit, Command Post Vehicle, Medical Supply Trailer and Back-up US&R Apparatus	**16**
0.8	**Fire Station No. 4** 450 E, Temple Street Los Angeles, CA 90012	Assessment Engine, Paramedic Rescue Ambulance, EMS Battalion Captain and BLS Rescue Ambulance	**14**
1.1	**Fire Station No. 11** 1819 W. 7th Street Los Angeles, CA 90057	Assessment Engine, Paramedic Rescue Ambulance, BLS Rescue Ambulance, Light Force	**14**
1.2	**Fire Station No. 9** 430 E. 7th Street Los Angeles, CA 90014	Assessment Engine, Assessment Truck and BLS Rescue Ambulance	**12**
1.7	**Fire Station No. 10** 1335 S. Olive Street Los Angeles, CA 90015	Assessment Truck, Paramedic Rescue Ambulance, BLS Rescue Ambulance and Assessment Light Force	**14**

(Equipment listed for each Fire Station is subject to change)

Based on these criteria (response distance from existing fire stations), fire protection would be considered **adequate.**

At present, there are no immediate plans to increase Fire Department staffing or resources in those areas, which will serve the proposed project.
The inclusion of the above listed recommendations, along with any additional recommendations made during later reviews of the proposed project will reduce the impacts to an acceptable level.

Definitive plans and specifications shall be submitted to this Department and requirements for necessary permits satisfied prior to commencement of any portion of this project.

The Los Angeles Fire Department continually evaluates fire station placement and overall Department services for the entire City, as well as specific areas. The development of this proposed project, along with other approved and planned projects in the immediate area, may result in the need for the following:

1. Increased staffing for existing facilities. (I.E., Paramedic Rescue Ambulance and EMT Rescue Ambulance resources.)
2. Additional fire protection facilities.
3. Relocation of present fire protection facilities.

For additional information, please contact the Fire Development Services Section, Hydrants & Access Unit at **(213) 482-6543.**

RALPH M. TERRAZAS,
Fire Chief

Kristin Crowley, Fire Marshal

Robert E. Duff, Fire Inspector II
Fire Development Svcs/ Hydrants & Access Los Angeles Fire Department
201 N. Figueroa St. Ste 300
Los Angeles, CA 90012
(213) 482-6502

LOS ANGELES FIRE DEPARTMENT

Hydrants and Access Unit

Request For Fire Services Information: FAQ's

Q. Fire Stations that would serve the Project including the address and distance to the Project Site, as well as an identification of the first-in and backup stations.

A. Information can be attained at www.lafd.org (Fire Stations)

Q. A map of the service area and associated population for each of the fire stations that serve the Project Site.

A. Information can be attained at www.lafd.org (Fire Stations)

Q. Existing staffing levels (e.g., Captains, Firefighters, Paramedics, EMT's, HazMat-trained personnel) for each fire station serving the Project Site.

A. Information can be attained at www.lafd.org (Contact Area Fire Station)

Q. Equipment for each fire station serving the Project Site, including number of engines, trucks, rescue ambulances.

A. Information can be attained at www.lafd.org (Contact Area Fire Station)

Q. A description of any plans by LAFD to construct new or expand existing fire stations that would serve the Project. Incident data, by type of incident, on a monthly and annual basis for each fire station that would serve the project, and provide monthly data for the last two years and annual data for the last five years;

A. None Scheduled at this time.

Q. Indication of whether the response times and distances for each fire station serving the Project Site meet the performance standards of the LAFD.

A. Information can be attained at www.lafd.org (FIRESTATLA)

Q. The fire flow, hydrant, and residual water pressure requirements for the Project.

A. An Inspector will be assigned to forward requirements/recommendations.

K-3 Los Angeles Unified School District Correspondence

LOS ANGELES UNIFIED SCHOOL DISTRICT

Facilities Services Division

DATE: July 11, 2017

TO: Jessie Fan, Senior Associate
ESA | Environmental Science Associates
80 South Lake Avenue, Suite 570
Pasadena, CA 91101

FROM: Rena Perez, Director
Master Planning & Demographics

SUBJECT: Environmental Impact Report Information Requested for: ***TIMES MIRROR SQUARE PROJECT,*** *located generally at 100 S. Broadway within the Central City Community Plan area of the City of Los Angeles. The project site is located on an approximately 3.6 acre (five parcels totaling 160,578 square feet) city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway in the Center City/Historic Core District of Downtown Los Angeles. The project will generate a total of 1,127 residential units, and retail uses.*

Included please find a ***LAUSD Schools Enrollments and Capacities Report*** for the schools that may be impacted by the development project(s) in question. This report contains data on each school's current and projected capacities, enrollments, and school calendars, and is designed to address any questions pertaining to overcrowding and factors related to school capacity.

Please note that no new school construction is planned and the data in this report *already take into account* portable classrooms on site, additions being built onto existing schools, student permits and transfers, specific educational programs running at the schools, and any other operational activities or educational programming that affects the capacities and enrollments of LAUSD's schools.

Additional information on LAUSD's Capital Improvement programs can be found on LAUSD's Facilities Services Division main webpage at www.laschools.org.

MASTER PLANNING AND DEMOGRAPHICS RESPONSE TO SPECIFIC QUESTIONS

Questions: 1, 3, 5-6 The project is located in a **High School** attendance choice/option area. Please see LAUSD Schools Enrollments and Capacities Report details;

Question: 2 Please contact the LAUSD Developer Fee Program Office (DFPO) at (213) 241-0715 for more information regarding fees and student generation rates.

ATTACHMENTS

[a] Schools & programs that are part of a "school choice area" pull enrollments from the school(s) that have resident areas, as defined by attendance boundaries.

The individual school and calculated total capacities and enrollments for school choice areas are reported to show current and projected seating overage/shortage and overcrowding (shaded green color).

If any of the school choice area schools is multi-track, then the service area is considered overcrowded.

Schools Planned to Relieve Known Overcrowding

NONE

see next page

NOTES:

[1] School's ID code.

[2] School's name

[3] The current calendar the school is operating on. Schools operate on a 'multi-track' calendar (listed as 4 TRK), because of overcrowded conditions.

[4] School's current operating capacity, or the maximum number of students the school can serve while operating on its current calendar. Excludes capacity allocated to charter co-locations. Includes capacity for magnet program.

[5] The total number of students living in the school's attendance area and who are eligible to attend the school plus students enrolled at any on-site magnet centers.
-Multi-track calendars are utilized as one method of providing relief to overcrowded schools by increasing enrollment capacities.
-A key goal of the Superintendent and Board of Education is to return all schools to a traditional 2-semester calendar (1 TRK).

[6] The number of students actually attending the school now, including magnet students.

[7] Current seating overage or (shortage): equal to (current capacity) - (resident enrollment).

[8] Current overcrowding status of school. The school is currently overcrowded if any of these conditions exist:
-School is currently on a multi-track calendar.
-There is currently a seating shortage.
-There is currently a seating overage of LESS THAN or EQUAL TO a 'safety margin' of 20 seats.

[9] School planning capacity. Formulated from a baseline calculation of the number of eligible classrooms after implementing LAUSD operational goals and shifting to a 2-semester (1 TRK) calendar. Includes capacity allocated to by charter co-locations. Includes capacity for magnet programs.

[10] Projected 5-year total number of students living in the school's attendance area and who are eligible to attend the school. Includes magnet students.

[11] Projected seating overage or (shortage): equal to (projected capacity) - (projected enrollment).

[12] Projected overcrowding status of school. The school will be considered overcrowded in the future if any of these conditions exist:
-School remains on a multi-track calendar.
-There is a seating shortage in the future.
-There is a seating overage of LESS THAN or EQUAL TO a 'safety margin' of 20 seats in the future.

* Independent Charter: Capacity and/or enrollment information may not be reported for some independent charters.

‡ Magnet Schools with Resident Kindergarten Enrollment: Resident enrollment is reported for Kindergarten only. Actual enrollment is reported for all grades in school. Projected capacities and enrollments not reported.

LAUSD SCHOOLS ENROLLMENTS AND CAPACITIES

PROJECT SERVED: Times Mirror Square Project, located generally at 100 S. Broadway within the Central City Community Plan area of the City of Los Angeles. The project site is located on an approximately 3.6 acre (five parcels totaling 160,578 square feet) city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway in the Center City/Historic Core District of Downtown Los Angeles. The project will generate a total of 1,127 residential units, and retail uses.

SCHOOL YEAR: 2016-2017

[a] Schools & programs that are part of a "school choice area" pull enrollments from the school(s) that have resident areas, as defined by attendance boundaries.

The individual school and calculated total capacities and enrollments for school choice areas are reported to show current and projected seating overage/shortage and overcrowding (shaded green color).

If any of the school choice area schools is multi-track, then the service area is considered overcrowded.

Schools Planned to Relieve Known Overcrowding

NONE

see next page

NOTES:

[1] School's ID code.

[2] School's name

[3] The calendar the school is operating on for the reported school year. Schools operate on a 'multi-track' calendar (listed as 4 TRK), because of overcrowded conditions.

[4] School's operating capacity for the reported school year. The maximum number of students the school can serve during the reported school year, with the school's classroom utilization, and while operating on its reported calendar. Excludes capacity allocated to charter co-locations. Includes capacity for magnet programs.

[5] The total number of students living in the school's attendance area and who are eligible to attend the school at the start of the reported school year, plus students enrolled at any on-site magnet centers.

-Multi-track calendars are utilized as one method of providing relief to overcrowded schools by increasing enrollment capacities.

-A key goal of the Superintendent and Board of Education is to return all schools to a traditional 2-semester calendar (1 TRK).

[6] The number of students actually attending the school in the reported school year, including magnet students.

[7] Reported school year seating overage or (shortage): equal to (capacity) - (resident enrollment).

[8] Reported school year overcrowding status of school. The school is overcrowded if any of these conditions exist:

-School is on a multi-track calendar.

-There is a seating shortage.

-There is a seating overage of LESS THAN or EQUAL TO a 'safety margin' of 20 seats.

[9] School planning capacity. Formulated from a baseline calculation of the number of eligible classrooms and classroom utilization after implementing LAUSD operational goals, which include operating on a 2-semester (1 TRK) calendar and assumed budget resources which allow for reductions in class size. Includes capacity allocated to charter co-locations. Includes capacity for magnet programs.

[10] Projected 5-year total number of students living in the school's attendance area and who are eligible to attend the school as of the start of the school year. Includes magnet students.

[11] Projected seating overage or (shortage): equal to (projected capacity) - (projected enrollment).

[12] Projected overcrowding status of school. The school will be considered overcrowded in the future if any of these conditions exist:

-School remains on a multi-track calendar.

-There is a seating shortage in the future.

-There is a seating overage of LESS THAN or EQUAL TO a 'safety margin' of 20 seats in the future.

* Independent Charter: Capacity and/or enrollment information may not be reported for some independent charters.

‡ Magnet Schools with Resident Kindergarten Enrollment: Resident enrollment is reported for Kindergarten only. Actual enrollment is reported for all grades in school. Projected capacities and enrollments not reported.

REQUEST FOR INFORMATION REGARDING RECREATIONAL AND PARK SERVICES FOR THE TIMES MIRROR SQUARE PROJECT IN THE CITY OF LOS ANGELES

Dear Ms. Fan:

The following information has been prepared in response to your request for Recreation and Parks information relative to the proposed Times Mirror Square Project. This proposed mixed-use project describes the new development up to 1,127 residential units and 34,572 square feet of commercial space, and the renovation of approximately 376,105 square feet of commercial space, on an approximately 3.6-acre site generally bounded at 100 S. Broadway in the Central City Community Plan area of the City of Los Angeles.

1. The name, location, size and park classification (regional, community, neighborhood, or special use), and available facilities within the parks that would serve the Project site.

The following Department of Recreation and Parks facilities are classified as a neighborhood parks and are located within a two-mile radius of the project site:

- 6th and Gladys Street Park, located at 824 E. 6th Street.
- Arts District Park, located at 501 S. Hewitt Street.
- Hope and Peace Park, located at 843 Bonnie Brae Street.
- Patton Street Pocket Park, located at 317-327 Patton Street.
- Prospect Park, located at 612 N. Echandia Street.
- Rockwood Community Park, located at 1571 Rockwood Street.
- Spring Street Park, located at 428 S. Spring Street.
- Unidad Park, located at 1644-48 Beverly Boulevard.

The following Department of Recreation and Parks facilities are classified as community parks and are located within a five-mile radius of the project site:

- Aliso-Pico Recreation Center, located at 370 S. Clarence Street.
- Alpine Recreation Center, located at 817 Yale Street.
- Bellevue Recreation Center, located at 826 Lucille Avenue.
- Boyle Heights Sports Center, located at 933 S. Mott Street.
- Carlin G. Smith Recreation Center, located at 511 W. Avenue 46.
- Central Recreation Center, located at 1357 E. 22nd Street.

- Cypress Recreation Center, located at 2630 Pepper Avenue.
- Denker Recreation Center, located at 1550 W. 35th Place.
- Downey Pool, located at 1775 N. Spring Street.
- Downey Recreation Center, located at 1772 N. Spring Street.
- Echo Park, located at 751 Echo Park Boulevard.
- Echo Park Boys and Girls, located at 303 Patton Street.
- Echo Park Deep Pool, located at 1419 Colton Street.
- Elysian Valley Recreation Center, located at 1811 Ripple Street.
- Evergreen Recreation Center, located at 2839 E. 4th Street.
- EXPO Center, located at 3980 S. Menlo Avenue.
- Hazard Park, located at 2230 Norfolk Street.
- Hollenbeck Park, located at 415 S. St. Louis Street.
- Hoover Recreation Center, located at 1010 W. 25th Street.
- James Slauson Recreation Center, located at 5306 S. Compton Avenue.
- Lafayette Park, located at 2830 W. 6th Street.
- Lake Street Park, located at 227 N. Lake Street.
- Lemon Grove Recreation Center, located at 4959 Lemon Grove Avenue.
- Lincoln Heights Recreation Center, located at 2303 Workman Avenue.
- Lincoln Heights Youth Center, located at 2500 Griffin Avenue.
- Lincoln Park, located at 3501 Valley Boulevard.
- MacArthur Park, located at 2230 W. 6th Street.
- Martin Luther King Jr. Park, located at 3934 S. Western Avenue.
- Miguel Contreras Learning Center Pool, located at 322 S. Lucas Avenue.
- Msgr. Ramon D. Garcia Recreation Center, located at 1016 S. Fresno Avenue.
- Normandie Recreation Center, located at 1550 S. Normandie Avenue.
- Parkview Photo Center, located at 2332 W. 4th Street.
- Pecan Recreation Center, located at 127 S. Pecan Street.
- Pershing Square, located at 525 S. Olive Street.
- Pueblo del Rio Recreation Center, located at 5350 Alba Street.
- Queen Anne Recreation Center, located at 1240 West Boulevard.
- Ramona Gardens Park, located at 2830 Lancaster Avenue.
- Ramona Gardens Recreation Center, located at 2830 Lancaster Avenue.
- Ramona Hall Community Center, located at 4580 N. Figueroa Street.
- Rio de Los Angeles State Park, located at 1900 N. San Fernando Road.
- Roosevelt High School Pool, located at 456 S. Mathews Street.
- Ross Snyder Recreation Center, located at 1501 W. 41st Street.
- Seoul International Park, located at 3250 San Marino Street.
- Shatto Recreation Center, located at 3191 W. 4th Street.
- Silverlake Recreation Center and Dog Park, located at 1850 W. Silverlake Boulevard.
- South Los Angeles Sports Activity Center, located at 7020 S. Figueroa Street.
- South Park Recreation Center, located at 345 E. 51st Street.
- South Seas House Park, located at 2301 W. 24th Street.
- State Street Recreation Center, located at 716 N. State Street.
- Toberman Recreation Center, located at 1725 Toberman Street.
- Tommy Lasorda's Field of Dreams, located at 1901 Waterloo Street.
- Trinity Recreation Center, located at 2415 Trinity Street.
- Vista Hermosa Soccer Field, located at 1301 W. 1st Street.
- Wabash Recreation Center, located at 2765 Wabash Avenue.

The following Department of Recreation and Parks facilities classified as regional parks and are located within a ten-mile radius of the project site:

- Armand Hammer Golf Course, located at 601 Club View Drive (at Holmby Park).
- Arroyo Seco Park, located at 5568 Via Marisol.
- Ascot Hills Park, located at 4371 Multnomah Street.
- Barnsdall Park, located at 4800 Hollywood Boulevard.
- Bronson Canyon, located at 3200 Canyon Road.
- Campo de Cahuenga, located at 3919 Lankershim Boulevard.
- Cheviot Hills Park, located at 2551 Motor Avenue.
- Elysian Park, located at 929 Academy Road.
- Ernest E. Debs Regional Park, located at 4235 Monterey Road.
- Exposition Park Rose Garden, located at 701 State Drive.
- Griffith Park, located at 4730 Crystal Springs Drive.
- Harding Golf Course, located at 4730 Crystal Springs Drive (in Griffith Park).
- Heritage Square, located at 3800 Homer Street.
- Holmby Park, located at 601 Club View Drive.
- Los Feliz Golf Course, located at 3207 Los Feliz Boulevard.
- Rancho Park Golf Course, located at 10460 Pico Boulevard.
- Roosevelt Golf Course, located at 2650 N. Vermont Avenue (in Griffith Park).
- Runyon Canyon Park, located at 2000 N. Fuller Avenue.
- South L.A. Wetlands Park, located at 5413 S. Avalon Boulevard.
- Wattles Garden Park, located at 1824 N. Curson Avenue.
- Wilson Golf Course, located at 4730 Crystal Springs Drive (in Griffith Park).

For additional information regarding facilities and features available in these parks visit our website: www.laparks.org.

2. Existing ratios of developed parkland per resident on a citywide basis and within the Central City North Community Plan area.

The City of Los Angeles overall has a ratio of 0.76 acres of neighborhood and community parkland per 1,000 residents. The Central City Los Angeles Community Plan area has a ratio of 0.10 acres of neighborhood and community parkland per 1,000 residents.

3. Current capacity and level of use of recreational facilities and parks near the Project Site.

While data regarding the level of use for the recreational facilities that serve the project site is not available, parks within the surrounding community are heavily utilized and often overburdened.

4. Any planned improvements to the parks and recreational facilities in the service area of the Project site (i.e., construction or expansion, new facilities, etc.)? If so, please describe.

The Department is currently developing a park at 1st and Broadway.

5. Would Project implementation require the physical expansion of an existing park(s) or a new park serving the Project site? If so, please describe.

Given that the existing recreational facilities in the project are heavily utilized, and that the project proposed the development of an additional 1,127 residential units, additional capacity through retrofit, expansion or new acreage would be necessary to keep the area at the current level of service.

6. City-adopted parks and recreation standards and acreage goals to be used in analyzing the Project.

The Public Recreation Plan, a section of the Service Systems Element of the Los Angeles General Plan, has a standard of four acres per 1,000 residents of neighborhood and community parks (two acres of neighborhood parks and two acres of community parks per 1,000 residents). The existing ratio of neighborhood and community parks within the Central City Community Plan area is well below the standards proscribed by the City adopted General Plan.

7. Any other design features or special parks and recreation requirements due to the specific attributes of the project?

This project is likely to trigger the requirement for an early consultation with the Department prior to the filing. Options for land dedication, recreation credits and fees will be discussed at that time.

Thank you for the opportunity to provide information relative to the proposed project's impact on recreation and park services. If you have any questions or comments regarding this information please contact Melinda Gejer, of my staff, at (213) 202-2657 or melinda.gejer@lacity.org.

Sincerely,

MICHAEL A. SHULL
General Manager

Subject: LAPL Information Request - Times Mirror Square Project

Dear Mr. Jung,

In coordination with the City of Los Angeles Department of City Planning, ESA is preparing an Environmental Impact Report (EIR) for the proposed Times Mirror Square Project located generally at 100 S. Broadway within the Central City Community Plan Area pursuant to the California Environmental Quality Act (CEQA). Since the Project is located within the jurisdiction of the Los Angeles Public Library, we are requesting information from your agency with regards to library services and facilities. In order to maintain the schedule for the EIR, we respectfully request your input by **July 24, 2017**. Attached is an information request letter, and a hard copy will follow in the mail. Please let me know if you have any further questions. Your assistance is much appreciated. Thanks!

Jessie Fan

Re: Times Mirror Square Project

The following is our response to your questions:

Richard J. Riordan Central Library

1. Libraries that would serve the proposed project:

Richard J. Riordan Central Library
630 W. 5th Street
Los Angeles, CA 90071

Hours of Operation:

Monday-Thursday	10 am – 8 pm
Friday, Saturday	9:30 am – 5:30 pm
Sunday	1 pm – 5 pm

2a. Size (Square Feet):
538,000 sq. ft. facility.

2b. Staffing Levels:
390.0 Full-time Employees + 284 Volunteers

2c. Collection size/Circulation and Amenities:
2.6 million volumes; Circulation – 1.2 million

Amenities: See "Special facilities available for public use" below

2d. Programmed or Target Service Population:

The Los Angeles Public Library (LAPL) does not make programmed or targeted projections.

The Central Library draws patrons not only from the City of Los Angeles, but also from the County of Los Angeles as well as from all of the United States and many foreign countries. Any increase in the residential/business/commercial population that is in close proximity to the Central Library has a direct impact on library services with increased demands for library staffing, materials, computers and information services.

2e. Current Service Population:
3,792,621 per Census 2010 est.
9,818,605 per Census 2010 est. County of Los Angeles

2f. Census Tracts:
The Los Angeles Public Library no longer uses Census tracts but derives its library service populations from Mapping LA from the Los Angeles Times. The Central Library

draws patrons from throughout the entire City and County of Los Angeles as well as throughout the nation and world.

3. **Planned, funded, and/or scheduled service improvements or expansions to City library facilities that would serve the project.**

There are no planned improvements to add capacity through expansion. There are no plans for the development of any other new libraries to serve this community.

4. **Would Project implementation require physical expansion of an existing library(s), or a new library serving the project site? If so, please describe.**

No, as there are no plans to add capacity through expansion of an existing library or through the construction of a new library facility.

5. **Please confirm LAPL's standards and goals used to assess the adequacy of library services and facilities and potential impact from project development.**

On February 8, 2007, The Board of Library Commissioners approved a new Branch Facilities Plan. This Plan includes Criteria for new Libraries, which recommends new size standards for the provision of LAPL facilities – 12,500 s.f. for community with less than 45,000 population and 14,500 s.f. for community with more than 45,000 population and up to 20,000 s.f. for a Regional branch. It also recommends that when a community reaches a population of 90,000, an additional branch library should be considered for the area.

Any increase in the residential/business/commercial population that is in close proximity to this branch has a direct impact on library services with increased demands for library staff, materials, computers and information services.

The Los Angeles Public Library recommends a mitigation fee of $200 per capita based upon the projected residential/business population of the development. The funds will be used for staff, books, computers and other library materials. It is recommended that mitigation fees be paid by the developer.

- Special facilities available for public use:

Little Tokyo Branch Library

Libraries that would serve the proposed project:

1. Little Tokyo Branch Library
203 S. Los Angeles St.
Los Angeles, CA. 90012

Hours of Operation:

Monday, Wednesday	10 am – 8 pm
Tuesday, Thursday	12:00 pm – 8 pm
Friday, Saturday	9:30 am – 5:30 pm
Sunday	CLOSED

2a. Size (Square Feet):
12,500 sq. ft. facility.

2b. Staffing Levels:
10.0 Full-time Employees + 43 Volunteers

2c. Collection size/Circulation and Amenities:
66,634 Volumes/Circulation – 143,317

Amenities: See "Special facilities available for public use" below

2d. Programmed or Target Service Population:

The Los Angeles Public Library (LAPL) does not make programmed or targeted projections.

2e. Current Service Population:
45,796 est. per the Los Angeles Times Mapping LA.

2f. Census Tracts:
The LAPL no longer uses census tracts to determine a branch library's service population.

3. Planned, funded, and/or scheduled service improvements or expansions to City library facilities that would serve the project.

There are no planned improvements to add capacity through expansion. There are no plans for the development of any other new libraries to serve this community.

4. **Would Project implementation require physical expansion of an existing library(s), or a new library serving the project site? If so, please describe.**

No, as there are no plans to add capacity through expansion of an existing library or through the construction of a new library facility.

5. **Please confirm LAPL's standards and goals used to assess the adequacy of library services and facilities and potential impact from project development.**

On February 8, 2007, The Board of Library Commissioners approved a new Branch Facilities Plan. This Plan includes Criteria for new Libraries, which recommends new size standards for the provision of LAPL facilities – 12,500 s.f. for community with less than 45,000 population and 14,500 s.f. for community with more than 45,000 population and up to 20,000 s.f. for a Regional branch. It also recommends that when a community reaches a population of 90,000, an additional branch library should be considered for the area.

Currently, the Little Tokyo branch at 12,500 square feet does not meet the standard of 14,500 square feet for a service population in excess of 45,000. Any increase in the residential/business/commercial population that is in close proximity to this branch has a direct impact on library services with increased demands for library staffing, materials, computers and information services. Therefore, mitigation measures are necessary in order to lessen the impact to these services to a level that is appropriate for a given service population in accordance to the February 8, 2007 Board of Library Commissioners approved Branch Facilities Plan.

The Los Angeles Public Library recommends a mitigation fee of $200 per capita based upon the projected residential/business population of the development. The funds will be used for staff, books, computers and other library materials. It is recommended that mitigation fees be paid by the developer.

  Free Public Wi-Fi
  Wireless Printing
  Reserve a Computer
  Meeting Room Rentals
  Zoom Text Computer for the Visually Impaired

Chinatown Branch Library

Libraries that would serve the proposed project:

1. Chinatown Branch Library
639 N. Hill St.
Los Angeles, CA. 90012

Hours of Operation:

Monday, Wednesday	10 am – 8 pm
Tuesday, Thursday	12:00 pm – 8 pm
Friday, Saturday	9:30 am – 5:30 pm
Sunday	CLOSED

2a. **Size (Square Feet):**
14,500 sq. ft. facility.

2b. **Staffing Levels:**
13.5 Full-time Employees

2c. **Collection size/Circulation and Amenities:**
74,709 Volumes/Circulation – 238,872

Amenities: See "Special facilities available for public use" below

2d. **Programmed or Target Service Population:**

The Los Angeles Public Library (LAPL) does not make programmed or targeted projections.

2e. **Current Service Population:**
11,225 est. per Los Angeles Times Mapping LA.

2f. **Census Tracts**:

The LAPL no longer uses census tracts to determine a branch library's service population.

3. **Planned, funded, and/or scheduled service improvements or expansions to City library facilities that would serve the project.**

There are no planned improvements to add capacity through expansion. There are no plans for the development of any other new libraries to serve this community.

4. **Would Project implementation require physical expansion of an existing library(s), or a new library serving the project site? If so, please describe.**

No, as there are no plans to add capacity through expansion of an existing library or through the construction of a new library facility.

5. **Please confirm LAPL's standards and goals used to assess the adequacy of library services and facilities and potential impact from project development.**

On February 8, 2007, The Board of Library Commissioners approved a new Branch Facilities Plan. This Plan includes Criteria for new Libraries, which recommends new size standards for the provision of LAPL facilities – 12,500 s.f. for community with less than 45,000 population and 14,500 s.f. for community with more than 45,000 population and up to 20,000 s.f. for a Regional branch. It also recommends that when a community reaches a population of 90,000, an additional branch library should be considered for the area.

Currently, the Chinatown branch at 14,500 square feet does meet the standard of 12,500 square feet for a service population of less than 45,000. However, any increase in the residential/business/commercial population that is in close proximity to this branch has a direct impact on library services with increased demands for library staffing, materials, computers and information services. It should be noted that the Chinatown branch has an extraordinarily high circulation number compared to its service population. It is one of the busiest branches in the LAPL system due to nearby schools. Therefore, mitigation measures may be necessary in order to lessen the impact to these services to a level that is appropriate for a given service population in accordance to the February 8, 2007 Board of Library Commissioners approved Branch Facilities Plan.

The Los Angeles Public Library recommends a mitigation fee of $200 per capita based upon the projected residential/business population of the development. The funds will be used for staff, books, computers and other library materials. It is recommended that mitigation fees be paid by the developer.

Echo Park Branch Library

Libraries that would serve the proposed project:

1. Echo Park Branch Library
1410 West Temple Street
Los Angeles, CA 90026

Hours of Operation:

Monday, Wednesday	10 am – 8 pm
Tuesday, Thursday	12:00 pm – 8 pm
Friday, Saturday	9:30 am – 5:30 pm
Sunday	CLOSED

2a. Size (Square Feet):
17,543 sq. ft. facility.

2b. Staffing Levels:
10.5 Full-time Employees

2c. Collection size/Circulation and Amenities:
43,908 Volumes/Circulation – 111,188

Amenities: See "Special facilities available for public use" below

2d. Programmed or Target Service Population:

The Los Angeles Public Library (LAPL) does not make programmed or targeted projections.

2e. Current Service Population:
52,842 est. per Los Angeles Times Mapping LA.

2f. Census Tracts:

The LAPL no longer uses census tracts to determine a branch library's service population.

3. Planned, funded, and/or scheduled service improvements or expansions to City library facilities that would serve the project.

There are no planned improvements to add capacity through expansion. There are no plans for the development of any other new libraries to serve this community.

4. **Would Project implementation require physical expansion of an existing library(s), or a new library serving the project site? If so, please describe.**

No, as there are no plans to add capacity through expansion of an existing library or through the construction of a new library facility.

5. **Please confirm LAPL's standards and goals used to assess the adequacy of library services and facilities and potential impact from project development.**

On February 8, 2007, The Board of Library Commissioners approved a new Branch Facilities Plan. This Plan includes Criteria for new Libraries, which recommends new size standards for the provision of LAPL facilities – 12,500 s.f. for community with less than 45,000 population and 14,500 s.f. for community with more than 45,000 population and up to 20,000 s.f. for a Regional branch. It also recommends that when a community reaches a population of 90,000, an additional branch library should be considered for the area.

Currently, the Echo Park branch at 17,543 square feet does meet the standard of 14,500 square feet for a service population in excess of 45,000, however, any increase in the residential/business/commercial population that is in close proximity to this branch has a direct impact on library services with increased demands for library staffing, materials, computers and information services. Therefore, mitigation measures may be necessary in order to lessen the impact to these services to a level that is appropriate for a given service population in accordance to the February 8, 2007 Board of Library Commissioners approved Branch Facilities Plan.

The Los Angeles Public Library recommends a mitigation fee of $200 per capita based upon the projected residential/business population of the development. The funds will be used for staff, books, computers and other library materials. It is recommended that mitigation fees be paid by the developer.

Lincoln Heights Park Branch Library

Libraries that would serve the proposed project:

1. Lincoln Heights Branch Library
2530 Workman Street
Los Angeles, CA 90031

Hours of Operation:

Monday, Wednesday	10 am – 8 pm
Tuesday, Thursday	12:00 pm – 8 pm
Friday, Saturday	9:30 am – 5:30 pm
Sunday	CLOSED

2a. Size (Square Feet):
12,912 sq. ft. facility.

2b. Staffing Levels:
10.5 Full-time Employees

2c. Collection size/Circulation and Amenities:
41,549 Volumes/Circulation – 127,624

Amenities: See "Special facilities available for public use" below

2d. Programmed or Target Service Population:

The Los Angeles Public Library (LAPL) does not make programmed or targeted projections.

2e. Current Service Population:
34,651 est. per Los Angeles Times Mapping LA.

2f. Census Tracts:

The LAPL no longer uses census tracts to determine a branch library's service population.

3. Planned, funded, and/or scheduled service improvements or expansions to City library facilities that would serve the project.

There are no planned improvements to add capacity through expansion. There are no plans for the development of any other new libraries to serve this community.

4. **Would Project implementation require physical expansion of an existing library(s), or a new library serving the project site? If so, please describe.**

No, as there are no plans to add capacity through expansion of an existing library or through the construction of a new library facility.

5. **Please confirm LAPL's standards and goals used to assess the adequacy of library services and facilities and potential impact from project development.**

On February 8, 2007, The Board of Library Commissioners approved a new Branch Facilities Plan. This Plan includes Criteria for new Libraries, which recommends new size standards for the provision of LAPL facilities – 12,500 s.f. for community with less than 45,000 population and 14,500 s.f. for community with more than 45,000 population and up to 20,000 s.f. for a Regional branch. It also recommends that when a community reaches a population of 90,000, an additional branch library should be considered for the area.

Currently, the Lincoln Heights branch at 12,912 square feet does meet the standard of 12,500 square feet for a service population of less than 45,000, however, any increase in the residential/business/commercial population that is in close proximity to this branch has a direct impact on library services with increased demands for library staffing, materials, computers and information services. Therefore, mitigation measures may be necessary in order to lessen the impact to these services to a level that is appropriate for a given service population in accordance to the February 8, 2007 Board of Library Commissioners approved Branch Facilities Plan.

The Los Angeles Public Library recommends a mitigation fee of $200 per capita based upon the projected residential/business population of the development. The funds will be used for staff, books, computers and other library materials. It is recommended that mitigation fees be paid by the developer.

Edendale Branch Library

Libraries that would serve the proposed project:

1. Edendale Branch Library
2011 W. Sunset Blvd
Los Angeles, CA 90026

Hours of Operation:

Monday, Wednesday	10 am – 8 pm
Tuesday, Thursday	12:00 pm – 8 pm
Friday, Saturday	9:30 am – 5:30 pm
Sunday	CLOSED

2a. Size (Square Feet):
12,500 sq. ft. facility.

2b. Staffing Levels:
9.0 Full-time Employees

2c. Collection size/Circulation and Amenities:
45,466 Volumes/Circulation – 154,974

Amenities: See "Special facilities available for public use" below

2d. Programmed or Target Service Population:

The Los Angeles Public Library (LAPL) does not make programmed or targeted projections.

2e. Current Service Population:
23,254 est. per Los Angeles Times Mapping LA.

2f. Census Tracts:

The LAPL no longer uses census tracts to determine a branch library's service population.

3. Planned, funded, and/or scheduled service improvements or expansions to City library facilities that would serve the project.

There are no planned improvements to add capacity through expansion. There are no plans for the development of any other new libraries to serve this community.

4. **Would Project implementation require physical expansion of an existing library(s), or a new library serving the project site? If so, please describe.**

No, as there are no plans to add capacity through expansion of an existing library or through the construction of a new library facility.

5. **Please confirm LAPL's standards and goals used to assess the adequacy of library services and facilities and potential impact from project development.**

On February 8, 2007, The Board of Library Commissioners approved a new Branch Facilities Plan. This Plan includes Criteria for new Libraries, which recommends new size standards for the provision of LAPL facilities – 12,500 s.f. for community with less than 45,000 population and 14,500 s.f. for community with more than 45,000 population and up to 20,000 s.f. for a Regional branch. It also recommends that when a community reaches a population of 90,000, an additional branch library should be considered for the area.

Currently, the Edendale branch at 12,500 square feet does meet the standard of 12,500 square feet for a service population of less than 45,000, however, any increase in the residential/business/commercial population that is in close proximity to this branch has a direct impact on library services with increased demands for library staffing, materials, computers and information services. Therefore, mitigation measures may be necessary in order to lessen the impact to these services to a level that is appropriate for a given service population in accordance to the February 8, 2007 Board of Library Commissioners approved Branch Facilities Plan.

The Los Angeles Public Library recommends a mitigation fee of $200 per capita based upon the projected residential/business population of the development. The funds will be used for staff, books, computers and other library materials. It is recommended that mitigation fees be paid by the developer.

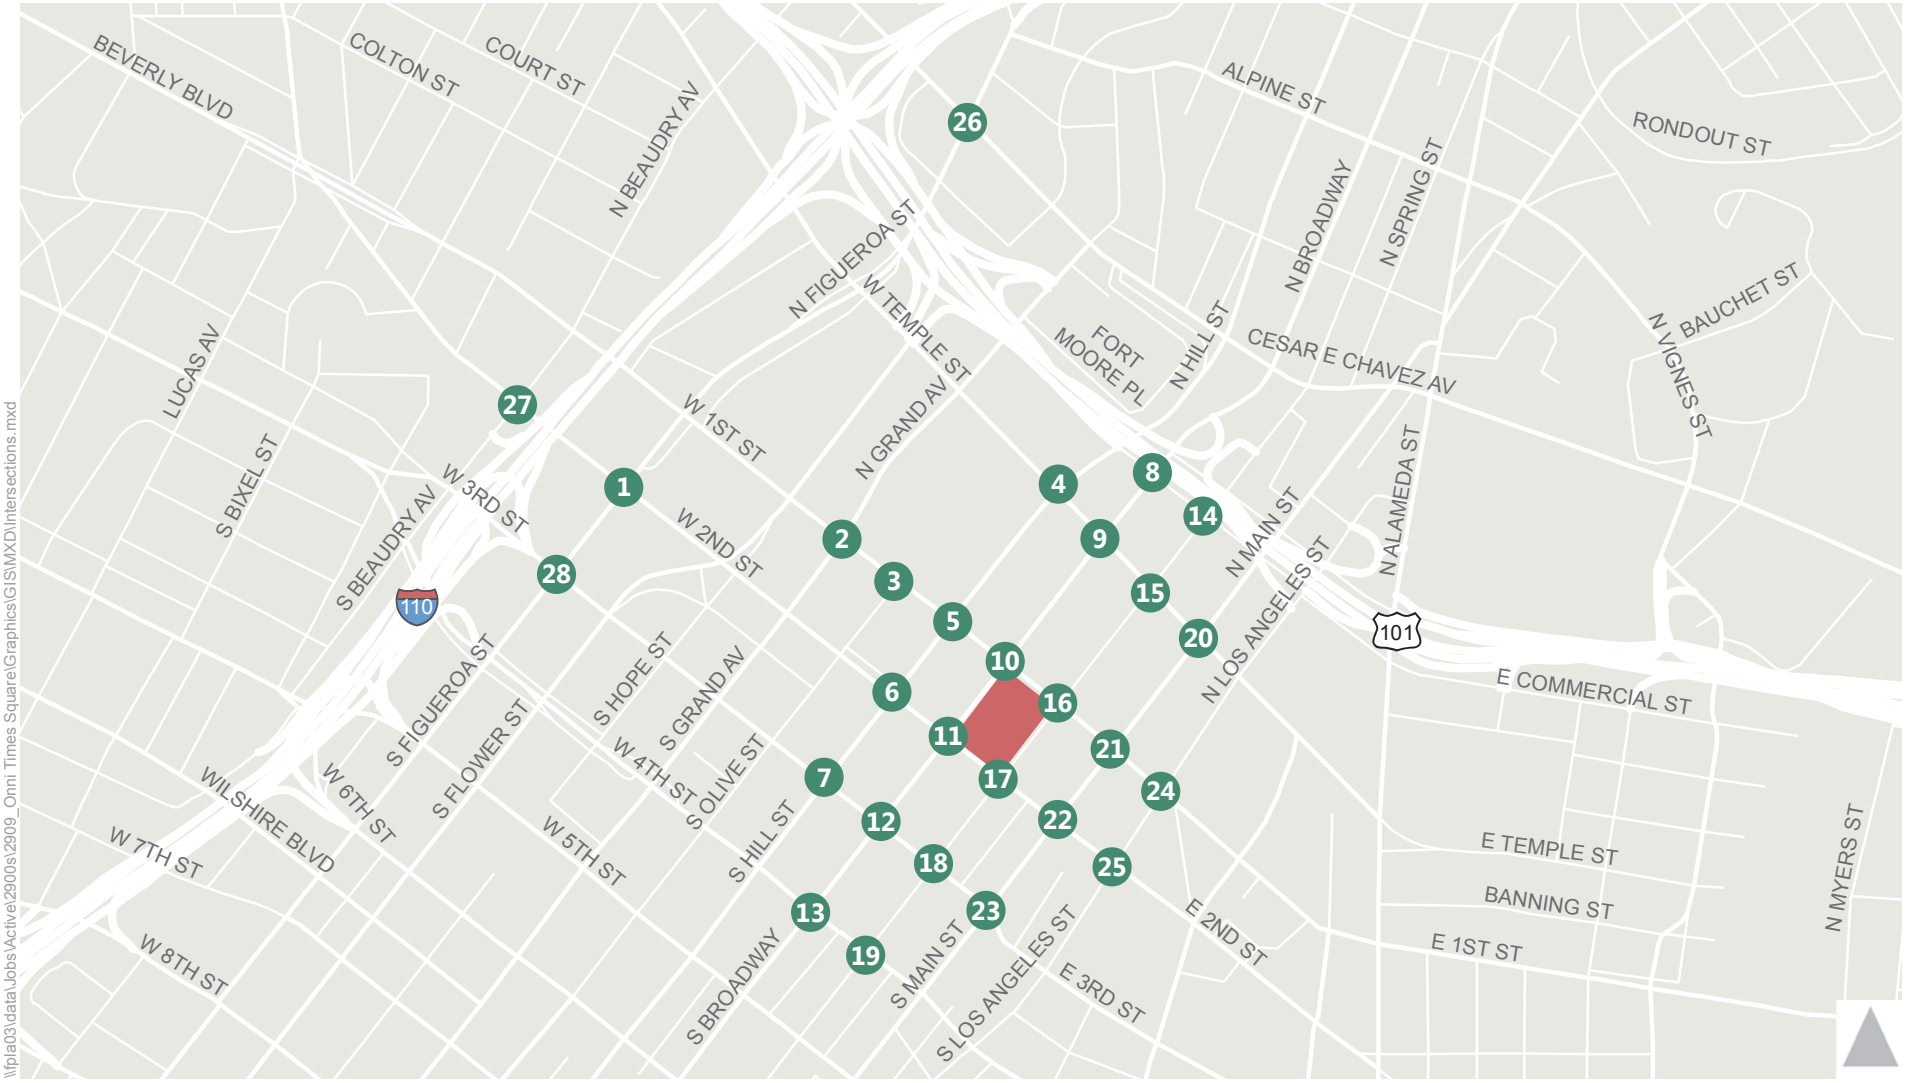
1. INTRODUCTION

This report documents the assumptions, methodologies, and findings of a study conducted by Fehr & Peers to evaluate the potential traffic impacts of the proposed Times Mirror Square Project (the Project), located on the city block bounded by West 1st Street, South Spring Street, West 2nd Street, and South Broadway, in Downtown Los Angeles. This study was conducted as part of an environmental document being prepared for the proposed Project.

PROJECT DESCRIPTION



The Project would retain and renovate the existing Times, Plant, and Mirror Buildings to provide 307,288 square feet of office space, 18,817 square feet of restaurant space, and a 50,000 square foot grocery store. These three buildings are aligned along South Spring Street, with frontages along both West 1st Street and West 2nd Street. The Project proposes to demolish the Parking Garage and Executive Building located on the western half of the site and construct two mixed-use towers (North and South Towers).

The Project's 37-story North Tower and 53-story South Tower mixed-use components would be constructed in the west sector of the Project Site in the areas currently occupied by the 6-story Executive Building at the corner of West 1st Street and South Broadway and the 6-story parking structure at the corner of West 2nd Street and South Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. The towers would include 34,572 square feet of restaurant space, located at ground level. The Project would include a pedestrian paseo constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between West 1st Street to West 2nd Street.

Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023. The project site is currently occupied by five buildings used by the Los Angeles Times, a bank, and other office uses.

A five-level above-ground parking podium and a nine-level subterranean garage will be included as part of the construction of the two towers along the Broadway frontage. Access to the site will be provided through three driveways: one on West 2nd Street between Broadway and South Spring Street, and two on Broadway, both between West 1st Street and West 2nd Street.

The adjacent land uses include the Los Angeles Civic Center, Grand Park, and the First and Broadway Civic Center Park (anticipated for completion in 2019) to the north, office buildings, parking structures, and parking lots to the south, the Los Angeles Police Department Headquarters Building to the east, and the Federal Courthouse to the west. Figure 1 illustrates the location of the proposed Project in relation to the surrounding street system. Regional access to the Project site is provided by two freeways: Interstate 110 (I-110) with access ramps approximately 0.75 miles to the west and the Hollywood Freeway United States 101 (US-101) with access ramps approximately 0.25 miles to the north. The Project is located less than 750 feet southeast of the Metro Purple/Red Line Civic Center/Grand Park Station and immediately north of the Metro Regional Connector Historic Broadway Station (currently under construction).

Site Plan

STUDY SCOPE

The scope of work for this study was determined in consultation with the Los Angeles Department of Transportation (LADOT). The base assumptions and technical methodologies were discussed with LADOT as part of the study approach and agreed to in a memorandum of understanding dated March 2017 (MOU). The MOU is included in Appendix A to this document.

TRAFFIC SCENARIOS

The study assumes that the Project would be completed by year 2023 and is directed at analyzing the potential Project-generated traffic impact on local street system under both existing and future year traffic conditions. The following traffic scenarios have been developed and analyzed as part of this study:

- Existing Conditions – The existing conditions analysis includes a description of the transportation system serving the project site, existing traffic volumes, and an assessment of the operating conditions at the study analysis locations described below.

- Existing Base Conditions – Traffic counts were taken during a period when 2nd Street was closed between Spring and Broadway to through traffic due to construction of the Regional Connector transit line. Therefore, a baseline traffic scenario was developed to provide a basis for the remainder of the study, which represents traffic conditions without the effect of the Regional Connector construction on study intersections.

- Existing Base plus Project Conditions – This traffic scenario provides projected traffic volumes and an assessment of operating conditions under Existing Base conditions with the addition of Project-generated traffic. The impacts of the proposed Project on existing traffic operating conditions were then identified.

- Future Base (Year 2023) Conditions – Future traffic projections without the proposed Project were developed for the year 2023. The objective of this analysis was to project future traffic growth and operating conditions that could be expected to result from regional growth, related projects, and transportation network changes in the vicinity of the project site by the year 2023.

- Future (Year 2023) plus Project Conditions – This traffic scenario provides projected traffic volumes and an assessment of operating conditions under future conditions with the addition of Project-generated traffic. The impacts of the proposed Project on future traffic operating conditions were then identified.

STUDY LOCATIONS

Signalized Intersections

The following 28 signalized intersections, illustrated in Figure 1, were analyzed as part of the scope of work for this Project:

1. South Figueroa Street & West 2nd Street
2. South Grand Avenue & West 1st Street
3. South Olive Street & West 1st Street
4. North Hill Street & West Temple Street
5. Hill Street & West 1st Street
6. Hill Street & West 2nd Street

7. Hill Street & West 3rd Street
8. North Broadway & Aliso Street
9. North Broadway & West Temple Street
10. Broadway & West 1st Street
11. South Broadway & West 2nd Street
12. South Broadway & West 3rd Street
13. South Broadway & West 4th Street
14. North Spring Street & Aliso Street
15. North Spring Street & West Temple Street
16. Spring Street & West 1st Street
17. South Spring Street & West 2nd Street
18. South Spring Street & West 3rd Street
19. South Spring Street & West 4th Street
20. North Main Street & East Temple Street
21. Main Street & 1st Street
22. South Main Street & 2nd Street
23. South Main Street & 3rd Street
24. Los Angeles Street & East 1st Street
25. South Los Angeles Street & East 2nd Street
26. North Figueroa Street & West Cesar Estrada Chavez Avenue / Sunset Boulevard
27. South Beaudry Avenue & West 2nd Street
28. South Figueroa Street & West 3rd Street

Freeway Analysis

The *Congestion Management Program for Los Angeles* County (CMP) (Metro, 2010) requires that all CMP mainline freeway monitoring locations where a proposed project will add 150 or more trips, in either direction, during either the AM or PM peak hours be analyzed. The proposed Project is not expected to add 150 or more vehicle trips during the AM or PM peak hours on nearby freeways (see Chapter 5). Therefore, no analysis of freeway segments is required for CMP purposes.

The *Agreement Between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures* (October 2013, as amended in December 2015), sets forth criteria for when a freeway impact analysis should be conducted. LADOT determined as part of the traffic study memorandum of understanding for this Project that the Project would not meet the criteria requiring a freeway impact analysis (see Appendix A). Accordingly, no further analysis under the City's amended agreement with Caltrans was required.

ORGANIZATION OF REPORT

This report is divided into nine chapters, including this introduction. Chapter 2 describes the existing conditions, including an inventory of the streets, highways, and transit service in the study area, a summary of existing traffic volumes, and an assessment of existing operating conditions. The methodologies used to develop traffic forecasts for the Existing, Existing plus Project, Future Base, and Future plus Project scenarios and the forecasts themselves are included in Chapter 3. Chapter 4 presents an assessment of potential intersection traffic impacts of the proposed Project under both Existing and Future conditions. The results of the regional transportation system impact analysis are provided in Chapter 5. Chapter 6 provides an assessment of the proposed Project's access scheme, and Chapter 7 an analysis of parking for the Project. Chapter 8 summarizes the construction impact analysis. Chapter 9 provides the summary and conclusions.

2. EXISTING CONDITIONS

A comprehensive data collection effort was undertaken to develop a detailed description of existing conditions in the study area. The assessment of conditions relevant to this study includes a description of the study area, an inventory of the local street system in the vicinity of the Project site, a review of traffic volumes on these facilities, an assessment of the resulting operating conditions, and a summary of the current transit service and bicycle and pedestrian facilities in the study area. A detailed description of these elements is presented in this chapter.

STUDY AREA

The Project site is within the Central City Community Plan area of the City of Los Angeles. The study area selected for analysis extends to include Beaudry Avenue to the west, Los Angeles Street to the east, Cesar Estrada Chavez Avenue/Sunset Boulevard to the north, and 4th Street to the south. All of the streets in the study area are under the jurisdiction of the City of Los Angeles.

EXISTING STREET SYSTEM

Interstate 110 lies approximately 0.75 miles west of the site and US-101 lies approximately 0.25 miles northeast of the site. Each of these interstates provides regional access to and from the study area.

The characteristics of the major roadways serving the study area and are part of a study intersection are described below. The street descriptions include the designation of the roadway under the *Mobility Plan 2035, An Element of the General Plan* adopted by the Los Angeles City Council in September 2016.

FREEWAYS

- **Interstate 110** runs in northeast/southwest in the vicinity of the study area. The freeway provides four lanes in each direction plus auxiliary lanes. Ramps are provided at 3rd Street.
- **US-101** runs in the southeast/northwest direction, extending from downtown Los Angeles through Hollywood and the San Fernando Valley and beyond. In the vicinity of the study area, the Hollywood freeway provides four lanes in each direction plus auxiliary lanes. Ramps are provided at Broadway and Los Angeles Street.

EAST/WEST STREETS

- **Cesar Estrada Chavez Avenue (east of North Figueroa Street) / Sunset Boulevard (west of North Figueroa Street)** has two travel lanes in each direction with a center turn lane. Lanes are 10 feet wide and metered parking is available on portions of both sides of the street between North Beaudry Avenue and North Grand Avenue with AM and PM peak hour restrictions. During peak hours, the area otherwise available for metered parking serves as a bus and right-turn lane. Cesar E. Chavez Avenue is designated as an Avenue I roadway in the Los Angeles Mobility Plan 2035.
- **Aliso Street** is an eastbound one-way street, north of the Project site. Aliso provides three travel lanes that are 10 feet wide. Aliso Street is designated as a local street in the Los Angeles Mobility Plan 2035.

- **Temple Street** has two travel lanes in each direction with a two-way center left-turn lane. Lanes are 10 feet wide. Temple Street is designated as an Avenue II roadway in the Los Angeles Mobility Plan 2035.

- **1st Street** has two travel lanes in each direction with a two-way center left-turn. Lanes are 10 feet wide. Metered parking is available on portions of both sides of the street with AM and PM peak hour restrictions. 1st Street is designated as a Boulevard II roadway in the Los Angeles Mobility Plan 2035, within the study area.

- **2nd Street** has one to two travel lanes in each direction with a two-way center left-turn in some portions. The 2nd street tunnel, which runs from Figueroa Street to Hill Street, has one travel lane in each direction. Lanes are 10 feet wide and metered parking is available on the south side of the street between Spring Street and Los Angeles Street with AM and PM peak hour restrictions. 2nd Street is designated as an Avenue III roadway between Figueroa Street and San Pedro Street, and an Avenue II roadway west of Figueroa Street.

- **3rd Street** is a one-way westbound street with two to three travel lanes that are 10 feet wide. Metered parking is available on portions of both sides of the street with AM and PM peak hour restrictions. 3rd Street is designated as an Avenue III roadway between Hope Street and Los Angeles Street, and an Avenue II roadway both west and east of those boundaries.

- **4th Street** is a one-way eastbound street with four travel lanes that are 10 feet wide. Metered parking is available on the north side of portions of the street, with inconsistent AM and PM peak hour restrictions. 4th Street is designated as an Avenue III roadway in the Los Angeles Mobility Plan 2035, within the study area.

NORTH/SOUTH STREETS

- **Beaudry Avenue** is a two-way street that runs south until the north side of 6th Street. It continues on the south side of 6th Street, before terminating at Ingraham Street. It is two-way throughout except for a short portion between 6th Street and Wilshire Boulevard where through northbound traffic is prohibited. Travel lanes are 10 feet wide. There is limited, intermittent parking (both free and metered) on either side of Beaudry Avenue. Within the study area, Beaudry Avenue is designated as an Avenue II roadway in the Los Angeles Mobility Plan 2035.

- **Figueroa Street** is a northbound one-way street until 3rd Street, where the street becomes a two-way street. Travel lanes are 10 feet wide. There is limited metered parking on either side of Figueroa Street. Within the study area, Figueroa Street is designated as a Boulevard II roadway in the Los Angeles Mobility Plan 2035.

- **Grand Avenue** is a two-way street that runs south until 5th Street, where it continues as a southbound one-way street. The two-way portion has two 10 foot lanes in each direction. The one-way portion has three 10 foot lanes. Within the study area, Grand Avenue is designated as a Boulevard II roadway in the Los Angeles Mobility Plan 2035.

- **Olive Street** is a northbound one-way street until 5th Street, where it becomes a two-way street, after which it generally has two lanes in each direction, with a two-way center left-turn. Lanes are 10 feet and there is metered parking on both sides of Olive Street north of 5th Street. Olive Street is designated as an Avenue II roadway in the Los Angeles Mobility Plan 2035.

- **Hill Street** has one to two travel lanes in each direction with a two-way center left-turn. Lanes are 10 feet wide and metered parking is available on both sides of the street, south of 2nd Street. Parking on the west side of the street is restricted during the PM peak hour and parking on the east side of the street is restricted during the AM peak hour. Hill Street is designated as an Avenue II roadway in the Los Angeles Mobility Plan 2035.

- **Broadway** has two travel lanes running north and one travel lane running south in each direction with a two-way center left-turn north of 1st Street. Lanes are 10 feet wide and metered parking is available on both sides of the street, south of 2nd Street. Broadway is designated as an Avenue II roadway in the Los Angeles Mobility Plan 2035.

- **Spring Street** is a southbound one-way street with three travel lanes running south and two lanes between 1st Street and 3rd Street. Travel lanes are 10 feet wide. There is metered parking with AM and PM peak hour restrictions on the east side of the street, between 1st Street and 3rd Street, and south of 4th Street. Spring Street also has two contraflow bus lanes, north of 1st Street. South of 1st Street, Spring Street is designated as an Avenue II roadway in the Los Angeles Mobility Plan 2035. Between 1st Street and Cesar E. Chavez Avenue, Spring Street is designated as an Avenue I roadway.

- **Main Street** is a northbound one-way street with two travel lanes running north south of 2nd Street, three lanes south of 1st Street, and four lanes south of Aliso Street. Lane widths range from 10-12 feet wide. Metered parking is available on both sides of the street south of 2nd Street, with PM peak hour restrictions on the west side of Spring Street. Between 1st Street and Temple Street, Main Street is designated as an Avenue I roadway in the Los Angeles Mobility Plan 2035. Elsewhere in the study area, Main Street is designated as an Avenue II roadway.

- **Los Angeles Street** has two 10-foot travel lanes in each direction, with a two-way center left-turn between 1st and 2nd Street. Metered parking is available on both sides of the street, south of 2nd street, with no peak hour restrictions. Within the study area, Los Angeles Street is designated as an Avenue II roadway in the Los Angeles Mobility Plan 2035.

Lane configurations of the study intersections are provided in Appendix B.

EXISTING PUBLIC TRANSIT SERVICE

The Project site is served by a high level of public transit. Figures 3A and 3B show the various local Metro bus routes, rapid bus Metro routes, and other municipal bus services in the study area. The project is located within the heart of Downtown Los Angeles, which serves as the center of the Los Angeles regional transit system. The Project is located less than 750 feet southeast of the Metro Purple/Red Line Civic Center/Grand Park Station and within ¼ mile of 64 bus transit lines, which provide service to regional centers such as Century City, Santa Monica, Burbank, Long Beach, Pasadena, and the Inland Empire as well as to major transit stations including Union Station and 7th and Metro Center Station. Table 1 details the transit service near the project site.

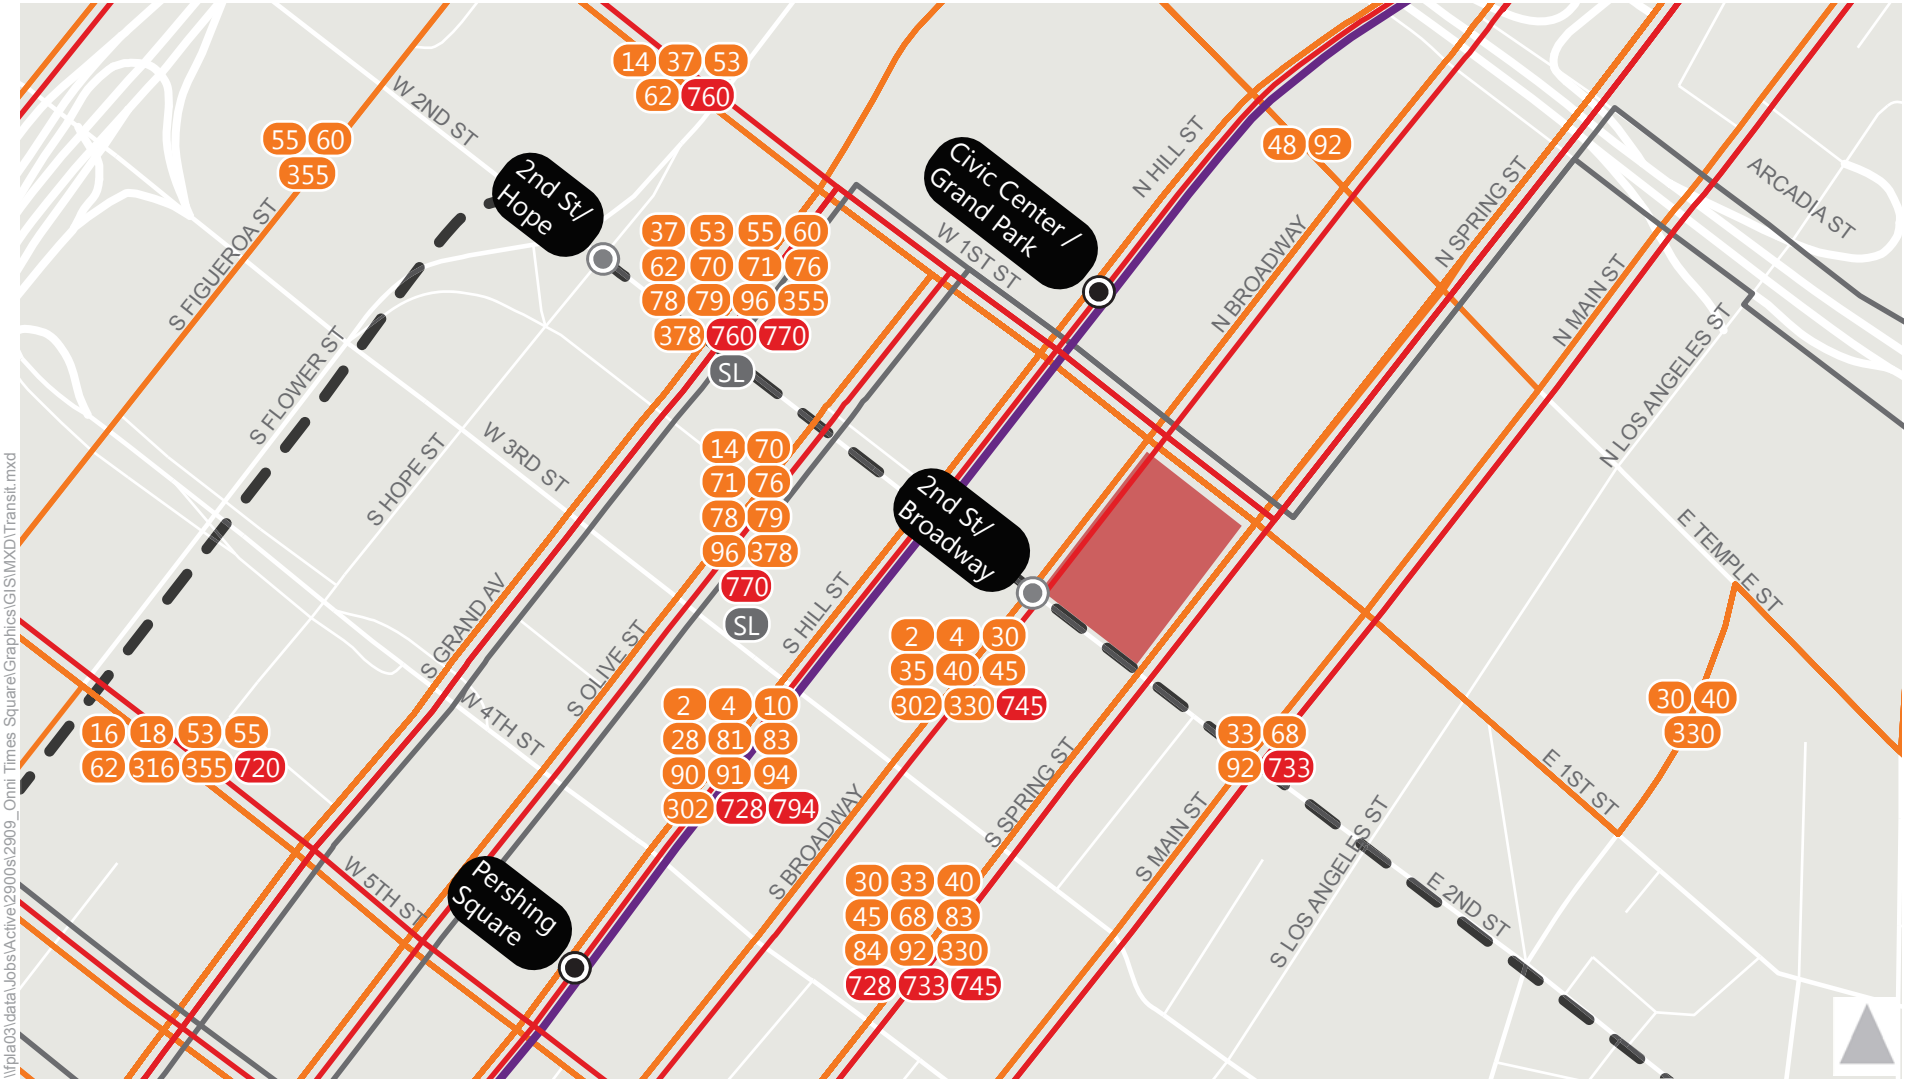
FUTURE REGIONAL CONNECTOR TRANSIT CORRIDOR

The Project site is located adjacent to the future Historic Broadway Station for the Regional Connector Transit Corridor that will connect the Blue and Exposition Light Rail lines to the current Gold Line and Union Station. When completed, the 1.9 mile alignment will allow transit riders to transfer between Blue, Expo, Red and Purple Lines, bypassing Union Station. Passengers will also be able to travel from Azusa to Long Beach and from East

Los Angeles to Santa Monica without transferring lines. Forecasted opening for the Regional Connector is 2021.

EXISTING BICYCLE AND PEDESTRIAN FACILITIES

Figure 4 shows existing and planned designated bicycle facilities in the Project area. As shown in the figure, there are existing bike lanes along Figueroa Street, Spring Street, Main Street, 1st Street, and 2nd Street west of Spring Street in the study area. There are sharrowed routes along Broadway south of 3rd Street and along 2nd Street west of Spring Street. The only cycle track in the study area exists along Los Angeles Street north of 1st Street. The study area has a mature network of pedestrian facilities including sidewalks, crosswalks and pedestrian safety features. Sidewalks are generally 12-feet wide throughout the study area.



Metro's *Active Transportation Strategic Plan (ATSP)* identifies corridors proposed to receive improved bicycle and pedestrian infrastructure improvements. The ATSP identifies improvements along a portion of 1st Street, 2nd Street, Spring Street, and Main Street with the addition of a cycle track. There are also planned bike lanes along portions of Hill Street and 2nd Street within the study area.

In the immediate vicinity of the Project, the City has identified the one-way pair of Spring Street and Main Street in Downtown Los Angeles to receive bicycle and pedestrian safety upgrades as part of the Main and Spring Forward project. The project aims to improve intersections and crossings for people walking, upgrade the existing buffered bicycle lanes to protected bicycle lanes, reduce bus-bicycle conflicts, and maximize parking/loading. These changes will be implemented along Spring Street between 1st Street and 9th Street, and Main Street between Cesar Chavez Avenue and 9th Street. Phase One improvements include: higher-visibility crosswalks, protected bike lanes, bike signals, and dedicated left-turn pockets. Planned Phase Two improvements include pedestrian islands at intersections and full-length concrete curbs to buffer parked cars from bike lanes. Construction on Phase One improvements began in January 2018. Phase Two improvements are proposed for 2018/2019.

STREET CLASSIFICATION AND HIGH INJURY NETWORK

As seen in Figure 5A, the Downtown Los Angeles street network is characterized by several different roadway classifications, according to the Los Angeles Mobility Plan 2035. The Project site is bounded by Broadway and Spring Street (Avenue II), 1st Street (Boulevard II), and 2nd Street (Avenue III). Figure 5A also shows the location of the High Injury Network (HIN) in the study area. The HIN is a component of LADOT's Vision Zero plan to eliminate traffic fatalities by 2020. The HIN comprises 6% of Los Angeles' street miles and 65% of all deaths and severe injuries involving people walking and biking. The project site is bounded by four streets that are part of the HIN: 1st Street, Spring Street, Broadway, and 2nd Street.

Figure 5B shows the Mobility Plan 2035 Enhanced Street Network. The Mobility Plan is a component of the General Plan that classifies streets based on the user groups that improvements are targeted towards: the vehicle enhanced network (VEN) consists of roadways designed to provide access to and from the region's freeways, the transit enhanced network (TEN) will provide upgrades to roadways to improve line performance as well as accessibility for transit users, the bicycle enhanced network (BEN) will improve facilities to encourage bicycle use and increase safety, and the neighborhood enhanced network (NEN) will slow down neighborhood streets and add amenities to improve the walking, cycling, and other slow-moving vehicle access. Within the study area are mainly bicycle and transit enhanced network roadways. There are no vehicle enhanced network roadways or neighborhood enhanced network roadways within the study area.

EXISTING TRAFFIC VOLUMES AND LEVEL OF SERVICE

This section presents existing base peak hour traffic volumes, describes the methodology used to assess the traffic conditions at each intersection, and analyzes the resulting operating conditions at each, indicating volume-to-capacity (V/C) ratios and levels of service (LOS).

EXISTING TRAFFIC VOLUMES

New weekday AM and PM peak hour turning movement counts were collected at the study intersections on Thursday, March 23, 2017 and Tuesday, October 17, 2017. The existing weekday morning and afternoon peak hour volumes at the study intersections are provided in Appendix B. Count sheets for these intersections are contained in Appendix C.

LEVEL OF SERVICE METHODOLOGY

A variety of standard methodologies are available to analyze LOS. According to *Transportation Impact Study Guidelines* (LADOT, December 2016), this study is required to use the Critical Movement Analysis (CMA) method of intersection capacity calculation (Transportation Research Board, 1980) to analyze signalized intersections in the City of Los Angeles. The V/C ratio is then used to find the corresponding LOS based on the definitions in Table 2A. Under the CMA methodology, a V/C ratio is generated for each study intersection based on factors such as the volume of traffic and the number of lanes providing for such vehicle movement and an LOS grade.

For the driveway analysis in Chapter 6, the *Highway Capacity Manual* (HCM) (Transportation Research Board, 2010) methodology was used to analyze the delay. Under HCM methodology, delay is calculated in seconds and given an LOS grade, as shown in Table 2B.

The City of Los Angeles' Automated Traffic Surveillance and Control (ATSAC) system is a computer-based traffic signal control system that monitors traffic conditions and system performance to allow ATSAC-operations to manage signal timing to improve traffic flow conditions. The Adaptive Traffic Control System (ATCS) is an enhancement to ATSAC and provides fully traffic-adaptive signal control based on real-time traffic conditions. All of the study intersections located in the City of Los Angeles are currently operating under the City's ATSAC system and ATCS control. ATSAC and ATCS provide improved operating conditions. Therefore, in accordance with City of Los Angeles procedures, a credit of 0.07 V/C reduction was applied at each intersection where ATSAC is implemented and an additional 0.03 V/C reduction was applied at each intersection where ATCS is implemented.

EXISTING LEVELS OF SERVICE

Existing year traffic volumes presented in Appendix B were analyzed using the intersection capacity analysis methodology described above to determine the existing operating conditions at the study intersections. Table 3 summarizes the results of the analysis of the existing weekday morning and afternoon peak hour V/C ratio and corresponding LOS at each of the analyzed intersections. All of the 28 intersections operate at LOS C or better during both peak periods. Analysis sheets are provided in Appendix D.

TABLE 2A
LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS
CMA METHODOLOGY

Level of Service	Volume/Capacity Ratio	Definition
A	0.000 - 0.600	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	>0.600 - 0.700	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat what restricted within groups of vehicles.
C	>0.700 - 0.800	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	>0.800 - 0.900	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	>0.900 - 1.000	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 1.000	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths

EXISTING BASE CONDITIONS

As discussed previously, existing counts were collected during the construction of the Regional Connector transit project, resulting in the closure of 2nd Street between Spring Street and Broadway during the time of the traffic counts. This construction resulted in temporary lane configuration changes at the following study intersections:

11. South Broadway & West 2nd Street
16. Spring Street & West 1st Street
17. South Spring Street & West 2nd Street

When Regional Connector construction is completed in 2021, 2nd Street will reopen to through traffic and the lane geometry configuration will revert to pre-construction conditions. As the build out year for the Times Mirror Square Project is 2023, the Regional Connector project will be completed; therefore, an Existing Base Conditions configuration was established as the basis for developing forecast future conditions. Under the Existing Base Conditions, the lane geometry for the three intersections outlined above reflect the pre- and post- Regional Connector lane geometry.

In addition to the change in lane configurations, the temporary closure also resulted in the shift of traffic volumes to parallel streets due to the closure of eastbound and westbound traffic on 2nd Street between Spring Street and Broadway. Therefore, traffic counts for eastbound and westbound traffic, as well as related turning movements, were replaced with pre-construction counts from 2009 at the following study intersections:

11. South Broadway & West 2nd Street
17. South Spring Street & West 2nd Street
22. South Main Street & 2nd Street
25. South Los Angeles Street & East 2nd Street

Volumes were not adjusted at the intersection of Spring Street & West 1st Street due to the absence of suppressed existing traffic counts, when compared with pre-construction volumes. An ambient growth rate of 1% per year was applied to the 2009 counts to reflect 2017 Existing Base Conditions absent the Regional Connector construction activity. Additional localized adjustments to traffic volumes were included to reflect pre- and post- Regional Connector traffic volumes. Level of service results for Existing plus Project conditions will be compared to Existing Base conditions for the purpose of impact analysis. Table 4 summarizes the results of the analysis of Existing Base conditions V/C ratio and corresponding LOS at each of the analyzed intersections. All of the 28 intersections operate at LOS C or better during both peak periods. Analysis sheets are provided in Appendix D.

3. TRAFFIC PROJECTIONS

PROJECT TRAFFIC

PROJECT TRIP GENERATION

As discussed in Chapter 1, the proposed Project consists of 1,127 apartment units, 307,288 square feet of office space, 50,000 square feet of supermarket space, and 53,389 square feet of quality restaurant space. This development is located within one of the denser urban environments in the City of Los Angeles where alternative travel mode opportunities (i.e., auto, bike, pedestrian and transit) are readily available. If vehicle trip reduction of mixed-use dense urban developments such as this are understated, the result can be excessive traffic impacts and mitigation that can discourage development of otherwise desirable projects or transportation infrastructure that is not sized to the urban setting of the development. Trip generation rates from *Trip Generation, 9th Edition* (Institute of Transportation Engineers [ITE], 2012) were used to estimate the number of trips associated with the Project and are presented in Table 5 The total number of trips generated by the new development were adjusted to account for internalization, transit, pass-by, and trips generated by the existing land uses.

Internal trip credits are a reduction to the trip generation estimates for individual land uses in a mixed-use development to account for trips internal to the site. These are trips usually made via walking within the site. Transportation Research Board (TRB) National Cooperative Highway Research Program (NCHRP) Report 684: *Enhancing Internal Trip Capture Estimation for Mixed-Use Developments* was used to determine the internal trip credits for each of the land uses. Based on the NCHRP analysis, the internal trip credits shown in Appendix A were used.

According to the *Transportation Impact Study Guidelines* (LADOT, December 2016), projects above or adjacent to Metro Rail, Metrolink, or Orange Line station, or to a similar dedicated transit line station with convenient pedestrian access to the station may qualify for a maximum 25% transit credit. The Project will be located adjacent to the future Historic Broadway Station of the Regional Connector, which is set to open in 2021. As such, a 25% transit credit was applied to all land uses, except the high-rise residential land use as the ITE trip generation rates for this land use already account for travel behavior in urban environments with access to high frequency fixed transit.

Pass-by trips measure the level of traffic that was already on the roadway system that became customers of new retail or restaurant uses. These trips are not considered new trips generated by the project because they were already on adjacent roadways, though they are accounted for at driveway access locations. Per LADOT's *Transportation Impact Study Guidelines,* Attachment I Policy on Pass-By Trips, pass-by credits were applied to portions of the development. A 40% pass-by credit was applied to the proposed supermarket use, and a 10% pass-by credit was applied to the proposed quality restaurant use.

Lastly, an existing credit was applied to the trip generation to account for the existing office space and bank uses and their associated vehicle trips. At the time of the traffic counts, the existing office space was approximately 60% occupied; therefore, the existing use credit for the office space reflects only trip generated by the occupied portion of the office space. A 15% transit credit was applied to these existing uses during the peak hour as they are currently only within ¼-mile walking distance to a transit station or Rapid Bus service. A 20% pass-by credit was applied to the existing bank use. The existing trips of 454 AM peak hour trips (397 inbound/57 outbound) and 522 PM peak hour trips (125 inbound/397 outbound) were subtracted from the Project's overall trip generation as an existing use credit. Table 5 provides a summary of the proposed Project trip generation. With the existing land use credit, the Project is estimated to generate a net increase of 6,994 daily trips; 300 AM peak hour trips (9 inbound, 291 outbound) and 279 PM peak hour trips (253 inbound, 26 outbound).

Notes:

[a] Source: Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition, 2012.

[b] Internal capture represents the percentage of trips between land uses that occur within the site. This percentage is informed by the Trip Generation for Mixed-Use Development calculation methodology described in Chapter 6 of the ITE *Trip Generation Handbook*, 3rd edition, 2014. Internalization percentages are derived from *NCHRP Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*, Transportation Research Board, 2011. See Attachment B for detailed calculation tables. The daily credit is assumed to be 75% of peak hour credits taken.

[c] The transit credit is based on LADOT's *Transportation Impact Study Guidelines*, December 2016. The guidelines state that up to 25% transit/walk credit may be taken for projects adjacent to a transit station or RapidBus Stop. Projects within 1/4 mile walking distance of a transit station or of a RapidBus stop may take up to a 15% transit/walk credit. The Metro Red/Purple Line Civic Center Station is one block from the project site, and RapidBus routes provide service on Broadway, Spring Street, and 1st Street immediately adjacent to the project site. The future 2nd St/Broadway Regional Connector Station will be located directly adjacent to the project site. The daily credit is assumed to be 75% of peak hour credits taken.

[d] The pass-by credit is based on Attachment D of LADOT's *Transportation Impact Study Guidelines*, December 2016.

[e] For flexibility, the trip generation analysis uses the most conservative (highest) rates for high-rise apartments versus high-rise condominiums: ITE code 222 (high-rise apartment) for daily trips and ITE code 232 (high-rise condominium) for peak hour trips. Since the high-rise residences in the ITE database are generally in urban areas with transit service, no additional transit credit was taken to provide a conservative estimate.

[f] 60% of the existing 559.863 ksf floor area (335.918 ksf) is currently occupied. 7.5 ksf of the occupied space is a bank. The remaining 328.418 ksf is office uses. Source: Onni Group.

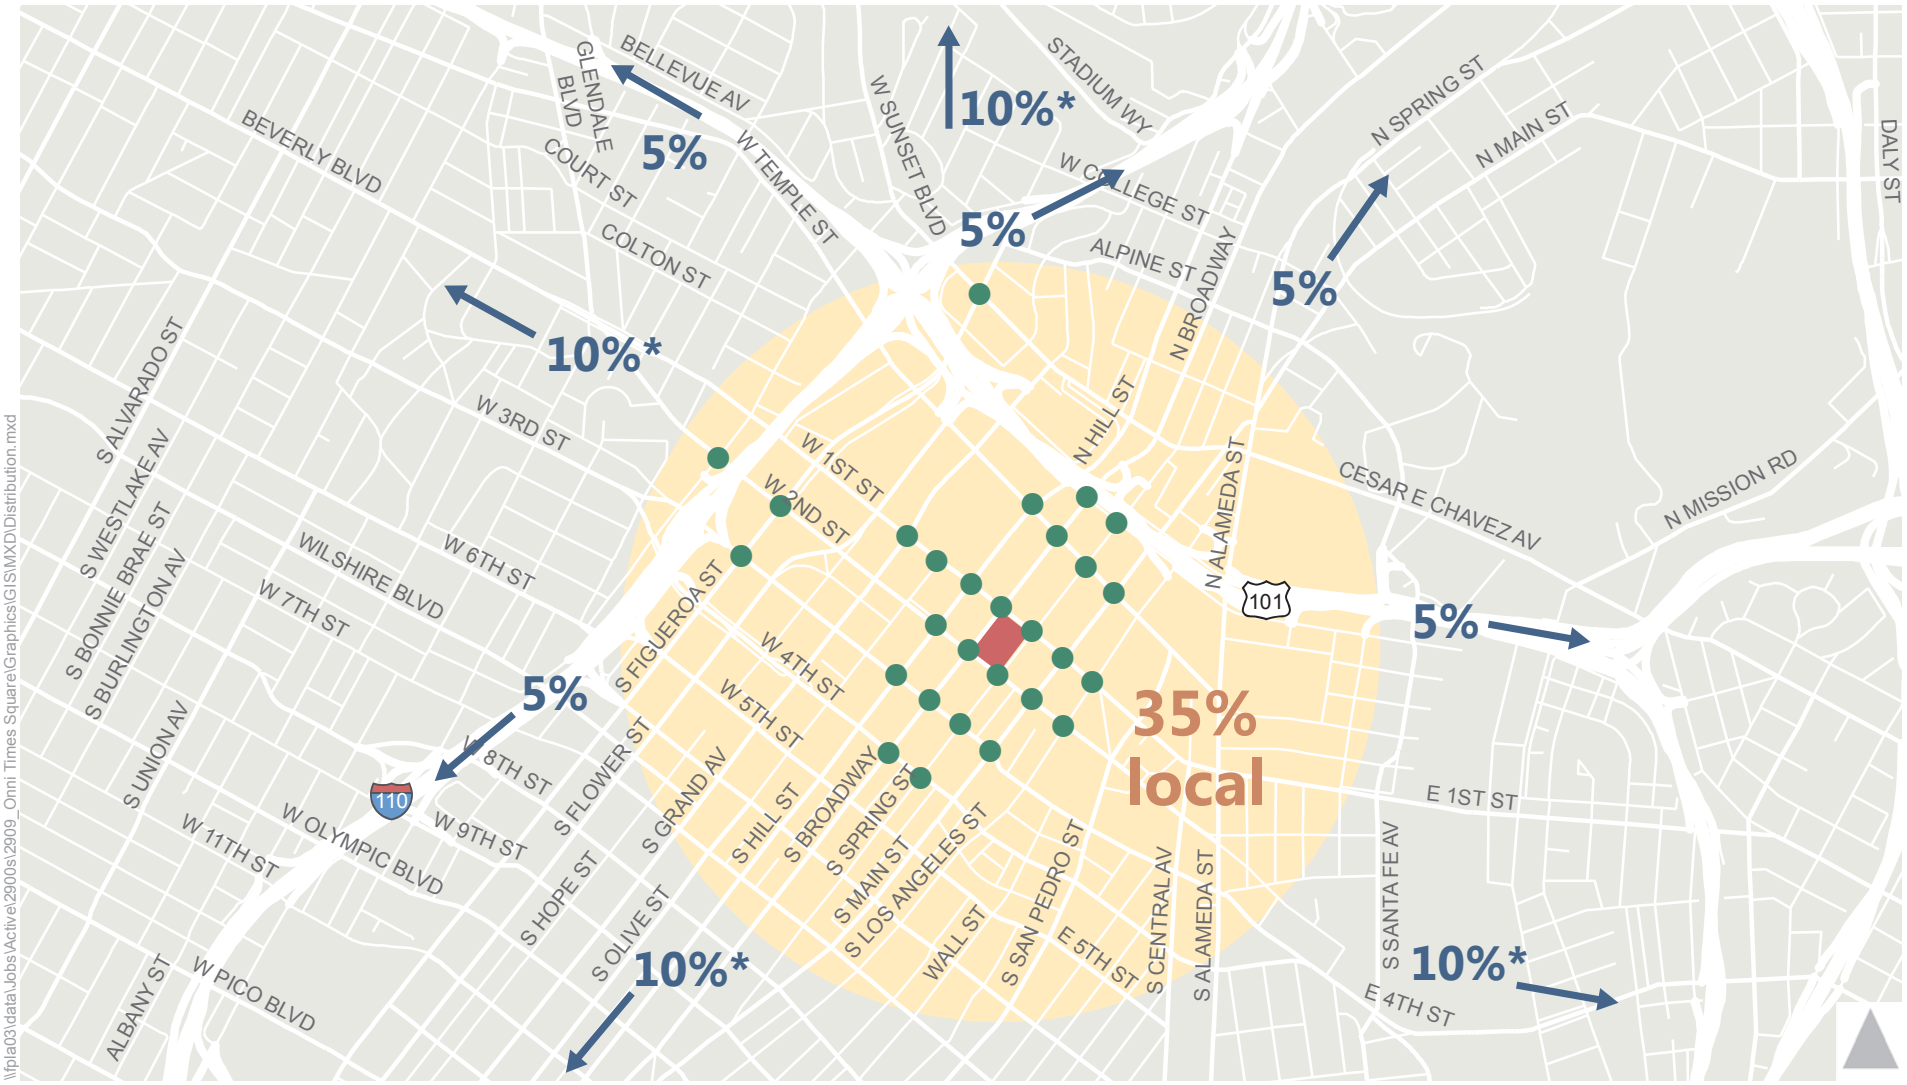
[g] Daily and AM peak hour rates not available for Walk-In Bank (ITE code 911). Rate for Drive-In Bank (ITE code 912) was used instead.

[h] AM Peak Hour directional distribution not available. Used directional distribution for High-Turnover Restaurant.

PROJECT TRAFFIC DISTRIBUTION

The geographic distribution of trips generated by the proposed Project is dependent on characteristics of the street system serving the Project site; the level of accessibility of routes to and from the proposed Project site; locations of employment and commercial centers to which residents of the Project would be drawn; and residential areas from which the commercial visitors and office employees would be drawn. A select zone analysis was conducted for the proposed uses using the City of Los Angeles Travel Demand Model to inform the general distribution pattern for this study. The distribution of Project trips is illustrated in Figure 6.

PROJECT TRAFFIC ASSIGNMENT



The traffic to be generated by the proposed Project was assigned to the street network using the distribution pattern described in Figure 6. Appendix B provides the assignment of the proposed Project-generated peak hour traffic volumes at the analyzed intersections during the AM and PM peak hours. The assignment of traffic volumes took into consideration the locations of the proposed Project driveways on Broadway and West 2nd Street, as well as peak hour turning movement restrictions in the vicinity of the site.

PROJECT DRIVEWAYS

Three driveways will provide access to the Project, with one driveway on West 2nd Street and two on Broadway. All driveways will provide full access to and from the site. The north driveway on Broadway will provide one ingress lane and two egress lanes (one left-turn and one right-turn). The 2nd Street driveway will provide one ingress lane and one egress lane. All three driveways will provide access to all project land uses. Loading will be accommodated internally to the site.

EXISTING PLUS PROJECT TRAFFIC CONDITIONS

The Project traffic estimated and assigned to the study intersections was added to the Existing Base traffic volumes to estimate Existing plus Project traffic volumes. Turning movement traffic volumes for the Existing plus Project scenario are provided in Appendix B. Analysis sheets are provided in Appendix D.

Project Site Study Intersections

*Some trips ultimately distributed onto freeways.

Figure 6

Trip Distribution

FUTURE YEAR 2023 TRAFFIC CONDITIONS

To evaluate the potential impacts of the proposed Project on Future (Year 2023) conditions, it was necessary to develop estimates of future traffic conditions in the area both without and with Project traffic. First, estimates of traffic growth were developed for the study area to forecast Future conditions without the Project. These forecasts included traffic increases as a result of both regional ambient traffic growth and traffic generated by specific developments in the vicinity of the Project (related projects).

These projected traffic volumes, identified herein as the Future Base conditions, represent the future conditions without the proposed Project. The traffic generated by the proposed Project was then estimated and assigned to the surrounding street system. Project traffic was added to the Future Base conditions to form Future (Year 2023) plus Project traffic conditions, which were analyzed to determine the incremental traffic impacts attributable to the Project itself.

The assumptions and analysis methodology used to develop each of the future year scenarios discussed above are described in more detail in the following sections.

BACKGROUND OR AMBIENT GROWTH

Based on historic trends and at the direction of LADOT, it was established that an ambient growth factor of 1% per year should be applied to adjust the existing base year traffic volumes to reflect the effects of regional growth and development by year 2023. This adjustment was applied to the Existing (Year 2017) traffic volume data to reflect the effect of ambient growth by the year 2023.

RELATED PROJECT TRAFFIC GENERATION AND ASSIGNMENT

Future Base traffic forecasts include the effects of known specific projects, called related projects, expected to be implemented in the vicinity of the proposed Project site prior to the buildout date of the proposed Project. The list of related projects was prepared based on data from LADOT and the City of Los Angeles Department of City Planning. A total of 170 related projects were identified in the study area; these projects are listed in Table 6 and illustrated in Figure 7.

Trip Generation

Trip generation estimates for the related projects were calculated using a combination of previous study findings, publicly available environmental documentation, and trip generation rates contained in *Trip Generation, 9th Edition*. Table 6 presents the resulting trip generation estimates for these related projects. These projections are conservative in that they do not in every case account for either the existing uses to be removed or the possible use of non-motorized travel modes (transit, walking, etc.). Traffic mitigation measures associated with the related projects are also not in every case accounted for in the analysis.

Related Projects

Trip Distribution

The geographic distribution of the traffic generated by the related projects is dependent on several factors. These factors include the type and density of the proposed land uses, the geographic distribution of population from which employees and potential patrons of proposed commercial developments may be drawn, the locations of employment and commercial centers to which residents of residential projects may be drawn, and the location of the projects in relation to the surrounding street system. Additionally, if the traffic study or environmental document for a related project was available, the trip distribution from that study was used.

Traffic Assignment

Using the estimated trip generation and trip distribution patterns described above, traffic generated by the related projects was assigned to the street network.

TRANSPORTATION INFRASTRUCTURE PROJECTS

Network changes related to the planned Main and Spring Forward project are included in the Future Year analysis. This project results in future lane configuration changes to the following study intersections:

16. Spring Street & West 1st Street
17. South Spring Street & West 2nd Street
18. South Spring Street & West 3rd Street
19. South Spring Street & West 4th Street
20. North Main Street & East Temple Street
21. Main Street & 1st Street
22. South Main Street & 2nd Street
23. South Main Street & 3rd Street

As previously discussed, the Project site is located adjacent to the future Historic Broadway Station for the Regional Connector Transit Corridor that will connect the Blue and Exposition Light Rail lines to the current Gold Line and Union Station. When completed, the 1.9 mile alignment will allow transit riders to transfer between Blue, Expo, Red and Purple Lines, bypassing Union Station. Passengers will also be able to travel from Azusa to Long Beach and from East Los Angeles to Santa Monica without transferring lines. Forecasted opening for the Regional Connector is 2021.

FUTURE YEAR 2023 BASE TRAFFIC VOLUMES

Future (Year 2023) Base weekday AM and PM peak hour traffic volumes and lane geometries for the analyzed intersections are provided in Appendix B. The Future Base traffic conditions represent an estimate of future conditions without the proposed Project inclusive of the ambient background growth and related projects traffic.

FUTURE PLUS PROJECT TRAFFIC PROJECTIONS

The proposed Project traffic volumes were added to the year 2023 Future Base traffic projections, resulting in Future (Year 2023) plus Project AM and PM peak hour traffic volumes. As provided in Appendix B, the Future (Year 2023) plus Project scenario presents future traffic conditions with the completion of the proposed Project.

4. INTERSECTION TRAFFIC IMPACT ANALYSIS

The traffic impact analysis evaluates the projected LOS at each study intersection under the Existing plus Project and Future (Year 2023) plus Project conditions to estimate the incremental increase in the V/C ratio caused by the proposed Project. This provides the information needed to assess the potential impact of the Project using significance criteria established by LADOT.

CRITERIA FOR DETERMINATION OF SIGNIFICANT TRAFFIC IMPACT

The City of Los Angeles has established threshold criteria to determine significant traffic impact of a proposed project in its jurisdiction. Under the LADOT guidelines, an intersection would be significantly impacted with an increase in V/C ratio equal to or greater than 0.04 for intersections operating at LOS C, equal to or greater than 0.02 for intersections operating at LOS D, and equal to or greater than 0.01 for intersections operating at LOS E or F after the addition of project traffic. Intersections operating at LOS A or B after the addition of the project traffic are not considered significantly impacted regardless of the increase in V/C ratio. The following summarizes the impact criteria:

LOS	Final V/C Ratio	Project-Related Increase in V/C
C	> 0.700 - 0.800	equal to or greater than 0.040
D	> 0.800 - 0.900	equal to or greater than 0.020
E or F	> 0.900	equal to or greater than 0.010

EXISTING PLUS PROJECT IMPACT ANALYSIS

EXISTING PLUS PROJECT TRAFFIC LEVEL OF SERVICE

The Existing plus Project traffic volumes presented in Appendix B were analyzed to determine the projected V/C ratios and LOS for each of the analyzed intersections under this scenario. Table 7 summarizes the Existing plus Project LOS. Analysis sheets are provided in Appendix D. As indicated in Table 7, all 28 study intersections are projected to operate at LOS D or better during both peak hours under Existing plus Project conditions.

EXISTING PLUS PROJECT INTERSECTION IMPACTS

As shown in Table 7, after applying the aforementioned City of Los Angeles significant impact criteria, it is determined that the proposed Project would result in a significant impact under Existing plus Project conditions at one study intersection, when compared to the Existing Base results:

11. South Broadway & West 2nd Street (AM & PM peak hours)

[a] Existing Base results reflects typical intersection operations without the effects of Regional Connector construction.

FUTURE PLUS PROJECT IMPACT ANALYSIS

FUTURE BASE TRAFFIC CONDITIONS

The year 2023 Future Base peak hour traffic volumes were analyzed to determine the projected V/C ratio and LOS for each of the analyzed intersections. Table 8 summarizes the future LOS. Twenty of the 28 study intersections are projected to operate at LOS D or better during the morning and afternoon peak hours under Future Base conditions. The following eight intersections are projected to operate at LOS E or worse during one or both of the peak hours under Future Base conditions:

1. South Figueroa Street & West 2nd Street (LOS E during PM)
5. Hill Street & West 1st Street (LOS F during AM & PM)
7. Hill Street & West 3rd Street (LOS E during AM)
10. Broadway & West 1st Street (LOS E during AM & LOS F during PM)
11. South Broadway & West 2nd Street (LOS E during AM and LOS F during PM)
17. South Spring Street & West 2nd Street (LOS E during AM)
22. South Main Street & 2nd Street (LOS E during PM)
25. South Los Angeles Street & East 2nd Street (LOS E during AM & LOS F during PM)

FUTURE PLUS PROJECT TRAFFIC CONDITIONS

The resulting Future (Year 2023) plus Project peak hour traffic volumes, provided in Appendix B, were analyzed to determine the projected future operating conditions with the addition of the proposed Project traffic. The results of the Future (Year 2023) plus Project analysis are also presented in Table 8, with analysis sheets provided in Appendix D. Nineteen of the 28 study intersections are projected to operate at LOS D or better during the morning and afternoon peak hours under Future (Year 2023) plus Project conditions. The following nine intersections are projected to operate at LOS E or worse during one or both of the peak hours under Future (Year 2023) plus Project conditions:

1. South Figueroa Street & West 2nd Street (LOS E during PM)
4. North Hill Street & West Temple Street (LOS E during PM)
5. Hill Street & West 1st Street (LOS F during AM & PM)
7. Hill Street & West 3rd Street (LOS E during AM)
10. Broadway & West 1st Street (LOS E during AM & LOS F during PM)
11. South Broadway & West 2nd Street (LOS F during AM & PM)
17. South Spring Street & West 2nd Street (LOS E during AM)
22. South Main Street & 2nd Street (LOS E during PM)
25. South Los Angeles Street & East 2nd Street (LOS E during AM & LOS F during PM)

FUTURE (YEAR 2023) PLUS PROJECT INTERSECTION IMPACTS

As shown in Table 8, using the criteria for determination of significant impacts, the proposed Project is expected to result in significant impacts at six intersections under Future (Year 2023) plus Project conditions:

1. South Figueroa Street & West 2nd Street (PM peak hour)
5. Hill Street & West 1st Street (AM peak hour)
10. Broadway & West 1st Street (both peak hours)
11. South Broadway & West 2nd Street (both peak hours)
12. South Broadway & West 3rd Street (AM peak hour)
17. South Spring Street & West 2nd Street (AM peak hour)

MITIGATION MEASURES

This section describes the proposed transportation mitigation program for the Project and evaluates the effectiveness of the program in mitigating the significant project impacts described in the previous section. The mitigation program has been developed in discussions with LADOT, which has approved the approaches, analysis methods, and assumptions used to complete this analysis.

MITIGATION PROGRAM ELEMENTS

The mitigation program for the Project consists of a travel demand management (TDM) program to reduce Project-generated vehicle trips. Physical and operational improvements to study intersections were investigated but were determined to be infeasible.

TRANSPORTATION DEMAND MANAGEMENT PLAN

A TDM program will be implemented as part of the mitigation package for the Project. Several TDM program elements are project design features that are currently proposed for implementation. Other TDM program elements would be developed as part of preparation of a detailed TDM plan, to be approved by LADOT prior to approval of a final certificate of occupancy for the Project.

Several project design features will encourage the usage of walking, biking, and transit modes as alternatives to the automobile, including the following:

- Wide sidewalks and pedestrian plazas/paseos accessible to the neighborhood
- Street trees and landscaped pathways between buildings
- Improved street and pedestrian lighting

Additional TDM program elements could include unbundled parking, rideshare programs, discounted transit passes, etc., although the exact measures to be implemented will be determined when the plan is prepared, prior to issuance of a final certificate of occupancy for the Project. The TDM programs identified as applicable for the residential and office land uses include the following:

- Unbundled Parking (Residential) – Unbundled parking (also known as decoupled parking) separates the cost of parking from property costs, requiring those who wish to purchase parking spaces to do so at an additional cost beyond the rent. This removes the burden from those who do not wish to utilize a parking space and provides a financial incentive for residents to lease only the amount of parking they need, which in turn may prompt some residents to reduce the number of cars that they own and prompt residents to make more trips by other modes. Unbundled residential parking can also provide a substantial financial benefit that increases housing affordability. Studies indicate that charging separately for parking can be a highly effective strategy to reduce vehicle trips (California Air Pollution Control Officers Association, 2010).

- Car Share Program – The Project could allow space for a car share service within its proposed parking facilities. A car share program is a model of car rental where people rent cars for short periods of time, often by the hour. The programs are attractive to customers who make only occasional use of a vehicle, as well as others who would like occasional access to a vehicle of a different type than they use day-to-day.

- Rideshare Programs – Rideshare programs typically include the provision of an on-site transit and rideshare information center that provides assistance to help people form carpools or access transit alternatives. Rideshare programs often also include priority parking for carpools.

- Commute Trip Reduction (CTR) Marketing – The Project could implement marketing strategies to reduce commute trips. Information sharing and marketing are important components to successful commute trip reduction strategies. Marketing strategies may include:

    - New employee orientation of trip reduction and alternative mode options
    - Event promotions
    - Publications

- Bicycle Parking – As described in Chapter 7, the Project will provide both long term and short term bicycle parking. In addition, the Project could provide complementary amenities such as a self-service bike repair area.

While the overall reduction in the trips due to these TDM measures could be high, to maintain a conservative approach, a TDM credit was not applied to the incremental V/C increase attributable to the Project.

PHYSICAL IMPROVEMENTS DETERMINED TO BE INFEASIBLE

Provided below is a discussion of physical measures that were explored, but due to physical constraints or potential secondary impacts, these mitigation measures have been determined by LADOT to be infeasible. However, this summary is provided to provide the opportunity for further public input on potential improvements explored:

1. South Figueroa Street & West 2nd Street

A mitigation measure was analyzed at this location that would modify the northbound approach on Figueroa Street to convert the existing dedicated right-turn lane to a shared through/right-turn lane. The shared through/right-turn lane would enable right-turns onto 2nd Street and the through vehicles would proceed directly to the ramp up to 1st Street. This mitigation would necessitate an additional receiving lane. To accommodate a third receiving lane for northbound through traffic, the raised median would need to be removed and narrowed. This mitigation measure was determined by LADOT to be infeasible as the proposed design was non-standard.

5. Hill Street & West 1st Street

A mitigation measure was analyzed at this location that would modify the southbound approach on Hill Street to convert the existing dedicated right-turn lane to a shared through/right-turn lane. This mitigation would necessitate an additional receiving lane. To accommodate a third receiving lane for southbound through traffic, the existing bicycle lane striping would need to be removed from the south leg of the intersection. This mitigation measure was determined to be infeasible by LADOT due to the presence of existing on-street bicycle facilities.

10. Broadway & West 1st Street

A mitigation measure was analyzed at this location that would modify the southbound approach on Broadway to convert the existing dedicated right-turn lane to a shared through/right-turn lane. This mitigation would necessitate an additional receiving lane. To accommodate a third receiving lane for southbound through traffic, the existing loading zone would need to be removed from the south leg

of the intersection. This mitigation measure was determined to be infeasible by LADOT due to the presence of the existing on-street loading zone.

11. South Broadway & West 2nd Street

A mitigation measure was analyzed at this location that would modify Broadway by restriping the roadway to add dedicated left-turn lanes in both the northbound and southbound directions. The intersection of South Broadway & West 2nd Street falls within the boundaries of the City of Los Angeles Broadway Streetscape Master Plan, which was adopted by the Los Angeles City Planning Commission on February 14, 2013 (City of Los Angeles Broadway Streetscape Master Plan, February 2013). The Plan outlines streetscape strategies focused on creating a "multi-modal, pedestrian-focused street that will support a thriving, revitalized historic theatre district." The City has implemented Phase I of this project, which includes roadway right-of-way reconfigurations, such as paint and bollard curb extensions to replace travel lanes and left-turn prohibitions. Phase II of this project will replace the paint and bollard curb extensions with permanent features on a block-by-block basis as new construction projects are approved and/or public funding becomes available. During Phase I of this project, the northbound and southbound left-turn lanes were removed at the Broadway & 2nd Street intersection. This mitigation measure was determined to be infeasible as it would conflict with the existing Broadway Streetscape project which required the removal of the northbound and southbound left-turn lanes as part of the project.

12. *South Broadway & West 3rd Street*

A mitigation measure was analyzed at this location that would modify the westbound approach on 3rd Street to convert the existing dedicated left-turn lane to a shared through/left-turn lane. This mitigation would necessitate an additional receiving lane. To accommodate a fourth receiving lane for westbound through traffic, an existing loading zone and three metered spaces would need to be removed from the west leg of the intersection. This mitigation measure was determined to be infeasible by LADOT due to the loss of existing on-street parking.

17. South Spring Street & West 2nd Street

A mitigation measure was analyzed at this location that would modify the eastbound approach on 2nd Street to convert the existing dedicated right-turn lane to a shared through/right-turn lane. This mitigation would necessitate an additional receiving lane. To accommodate a second receiving lane for eastbound through traffic, the existing loading zone and five metered spaces would need to be removed from the east leg of the intersection. This mitigation measure was determined to be infeasible by LADOT due to the loss of existing on-street parking.

5. REGIONAL TRANSPORTATION SYSTEM IMPACT ANALYSIS

This section presents an analysis of potential impacts on the regional transportation system. This analysis was conducted in accordance with the procedures outlined in *Congestion Management Program for Los Angeles County* (CMP) (Metro, 2010). The CMP requires that, when an environmental impact report is prepared for a project, traffic and transit impact analyses be conducted for select regional facilities based on the quantity of project traffic expected to use those facilities.

In addition, *Agreement Between City of Los Angeles and Caltrans District 7 on Freeway Impact Analysis Procedures* sets forth criteria for when a freeway impact analysis should be conducted. LADOT determined as part of the MOU (see Appendix A) that the Project would not meet these criteria for requiring a freeway impact analysis. In December 2015, the City of Los Angeles and Caltrans District 7 signed an extension of the agreement and adjusted the ramp capacity to 850 vehicles per hour per lane for the freeway ramp screening analysis. Under this amended agreement, the Project would also not qualify for a freeway analysis.

REGIONAL TRAFFIC IMPACT ANALYSIS

The CMP guidelines require that the first issue to be addressed is the determination of the geographic scope of the study area. The criteria for determining the study area for CMP arterial monitoring intersections and for freeway monitoring locations are:

- All CMP arterial monitoring intersections where the proposed project will add 50 or more trips during either the AM or PM peak hours of adjacent street traffic.
- All CMP mainline freeway monitoring locations where the proposed project will add 150 or more trips, in either direction, during either the AM or PM peak hours.

Significant Traffic Impact Criteria

The CMP traffic impact analysis guidelines establish that a significant project impact occurs when a certain threshold is exceeded. If the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$), causing LOS F ($V/C > 1.00$), a significant impact would occur. If the facility is already at LOS F, a significant impact occurs when the proposed project increases traffic demand on a CMP facility by 2% of capacity ($V/C \geq 0.02$).

ARTERIAL MONITORING ANALYSIS

The CMP arterial monitoring station closest to the proposed project site is at Wilshire Boulevard & Alvarado Street located approximately 1.7 miles west of the proposed Project site. Based on the Project trip distribution and trip generation, the proposed Project would not exceed the arterial analysis criteria of 50 vehicle trips at the above-mentioned location. The Project would increase traffic by less than three trips in the PM peak hour (which is the CMP analysis hour with the greatest proposed project trip generation). Since the Project adds fewer than 50 trips at Wilshire Boulevard & Alvarado Street, no further CMP arterial analysis is required.

FREEWAY ANALYSIS

Regional access to the Project site is provided by the US 101 Freeway located approximately one quarter-mile north of the project site, and the Interstate 110 (I-110) located approximately one half-mile to the west of the project site, respectively. The CMP freeway monitoring stations closest to the Project site include the I-110 freeway south of Stadium Way, I-110 freeway south of West Temple Street, and the US-101 freeway east of North Alameda Street.

Based on the Project distribution patterns shown in Figure 6, approximately 5% of Project traffic is expected to travel through the US-101 freeway monitoring station at N Alameda Street, 5% is expected to travel through the I-110 freeway monitoring station at Figueroa Street, and 5% is expected to travel through the I-110 freeway monitoring station at W Temple Street. The Project is projected to result in an increase of 15 trips in the morning peak hour and 14 trips in the evening peak hour through the CMP freeway monitoring stations described above.

Since fewer than 150 trips would be added during the AM or PM peak hours in either direction at any of the freeway segments in the vicinity of the study area, no further analysis of the freeway segments is required for CMP purposes.

REGIONAL TRANSIT IMPACT ANALYSIS

Potential increases in transit person trips generated by the proposed Project were estimated. Appendix B-4 of the 2010 CMP provides a methodology for estimating the number of transit trips expected to result from a proposed project based on the projected number of vehicle trips. This methodology assumes an average vehicle ridership (AVR) factor of 1.4 in order to estimate the number of person trips to and from the project and then provides guidance regarding the percentage of person trips assigned to public transit depending on the type of use (commercial/other versus residential) and the proximity to transit services. Appendix B-4 of the 2004 CMP recommends observing the fixed-route local bus services within ¼ mile of the project site and express bus routes and rail service within two miles of the project site.

Due to its location in downtown Los Angeles, the Project is served by a wide variety of transit options, ranging from heavy rail, rapid bus, local bus, and express bus services. The Project is located within a ¼-mile walking distance of the Metro Red and Purple Lines at the Civic Center/Grand Park Station, and just over a ½-mile walk from Union Station, where patrons can access the Gold Line as well as Metrolink commuter rail services. Table 1 details the transit service near the Project site.

Excluding the transit credit in Table 5, the proposed Project would have an estimated increase in vehicle trip generation of approximately 362 net vehicle trips during the AM peak hour and 396 during the PM peak hour before the transit credit. Applying the AVR factor of 1.4 to the estimated vehicle trips would result in an estimated increase of approximately 507 and 554 person trips during the AM and PM peak hours, respectively. As discussed in Chapter 3, a 25% transit credit was applied to Project trip generation estimates to account for trips made to and from the Project site using modes other than automobiles. Following this approach, the Project would generate an estimated increase of 127 transit trips during the AM peak hour and 139 transit trips during the PM peak hour.

The Project location is well served by numerous established local and regional transit routes (including the Metro Red/Purple Line, the future Metro Regional Connector at 2nd and Broadway, and 64 bus lines within one-quarter mile); therefore, Project-related impacts are not expected to be significant. The headway service for local, commuter routes, rapid and express routes are on average every 15 minutes during both peak periods. DASH operates with 25- to 30-minute headways during the peak hours and other shuttles operate on 60 minute headways. The bus services have an estimated seating capacity of approximately 10,330 persons during the peak hours based on a bus seating capacity of 30 persons for a DASH bus and shuttles, 40 persons for a standard and commuter bus, and 65 persons for a Rapid articulated bus. The Metro Red Line and Purple Line, with 10-minute headways in both AM and PM peak hours has an estimated capacity of over 6,000 persons and 4,000 persons, respectively, during the peak periods. With a total estimated seating capacity of approximately 20,330 persons in the peak hours, the proposed Project would utilize less than one-percent of available transit capacity during the peak hours. Given the high quality and frequency of the transit service in close proximity to the Project site, the incremental transit riders resulting from the project are not anticipated to result in a significant impact on the transit lines serving the area.

6. SITE ACCESS

Three driveways will provide access to the Project:

- A full-access driveway on Broadway approximately mid-block between West 1st Street and West 2nd Street, with one ingress lane and two egress lanes (one left-turn and one right-turn)
- A full-access driveway on Broadway near West 2nd Street with one ingress lane and one egress lane
- A full-access driveway on West 2nd Street with one ingress lane and one egress lane

Loading for the site will be served internally to the site. The project will also provide a two-way left turn lane on Broadway between 1st Street and 2nd Street to accommodate left-turn vehicles entering the site from Broadway. Figure 8 shows the conceptual design of the two-way left-turn lane on Broadway.

LEVEL OF SERVICE ANALYSIS FOR PROJECT DRIVEWAYS

A level of service analysis was conducted to evaluate the ability of the Project's access plan to accommodate the anticipated traffic levels at the driveway access points.

The driveway locations below will be unsignalized and stop-controlled and were analyzed using the 2-way Stop methodology from the HCM. The HCM methodology determines the average vehicle delay for the stop-controlled approach to find the corresponding LOS based on the definitions presented in Table 2B. Driveway analysis LOS worksheets are included in Appendix D. Table 9 shows the results of the LOS analysis at the unsignalized driveways.

TABLE 9 – DRIVEWAY LOS ANALYSIS

Driveway Location	Movement	Peak Hour	Existing plus Project (2017)		Future plus Project (2023)	
			Delay (seconds)	LOS	Delay (seconds)	LOS
Broadway Driveway North	Outbound Westbound Right-Turn	AM	13.4	B	16.5	C
		PM	23.3	C	33.4	D
	Outbound Westbound Left-Turn	AM	18.8	C	29.8	D
		PM	32.7	D	66.2	F
	Inbound Southbound Left-Turn	AM	11.7	B	14.7	B
		PM	17.8	C	23.8	C
Broadway Driveway South	Outbound Westbound	AM	16.2	C	23.9	C
		PM	34.9	D	84.6	F
	Inbound Southbound Left-Turn	AM	11.9	B	14.9	B
		PM	17.2	C	22.7	C
2nd Street Driveway	Outbound Southbound	AM	21.3	C	37.2	E
		PM	34.6	D	105.5	F
	Inbound Eastbound Left-Turn	AM	9.1	A	9.6	A
		PM	10	A	11	B

The northern Broadway driveway would provide a separate outbound left-turn and right-turn lane. The right-turns out of the northern Broadway driveway are projected to operate at LOS B and C under the Existing plus Project and at LOS C and D under Future plus Project scenarios. The outbound left-turns are projected to operate at LOS C in the AM peak hour and LOS D in the PM peak hour under Existing plus Project conditions. Under the Future plus Project scenario, the outbound left-turns would operate at LOS D in the AM peak hour and LOS F in the PM peak hour. These delays would be experienced by vehicles queuing on-site, not in the public street.

The inbound southbound left-turn movement on Broadway will operate at LOS B and C under both Existing plus Project and Future plus Project conditions in the AM and PM peak hours, respectively. Vehicles waiting to turn left into the site would be able to queue in the proposed two-way continuous left-turn lane.

The southern Broadway driveway would provide a single outbound lane for left- and right-turn movements. The outbound movement is projected to operate at LOS C in the AM peak hour and LOS D in the PM peak hour under the Existing plus Project conditions. In the Future plus Project scenario, the outbound lane would operate at LOS C in the AM peak hour and LOS F in the PM peak hour. These delays would be experienced by vehicles queuing on-site, not in the public street. The inbound southbound left-turn movement on Broadway will operate at LOS B and C under both Existing plus Project and Future plus Project conditions in the AM and PM peak hours, respectively.

The 2nd Street driveway would provide a single outbound lane for left- and right-turn movements. The 2nd Street southbound outbound movement is projected to operate at LOS C and LOS D under Existing plus Project, and at LOS E and LOS F under Future plus Project conditions, in the AM and PM peak hours, respectively. The LOS F conditions at the driveway would be experienced by vehicles making a left or right out of the 2nd Street driveway. 2nd Street does not provide a two-way center left-turn lane in front of the Project; therefore, eastbound left-turn vehicles entering the site may queue on 2nd Street. The inbound eastbound left-turn movement on 2nd Street is projected to operate at LOS A in the AM and PM peak hours under Existing plus Project, while operating at LOS A in the AM peak hour and LOS B in the PM peak hour under Future plus Project conditions.

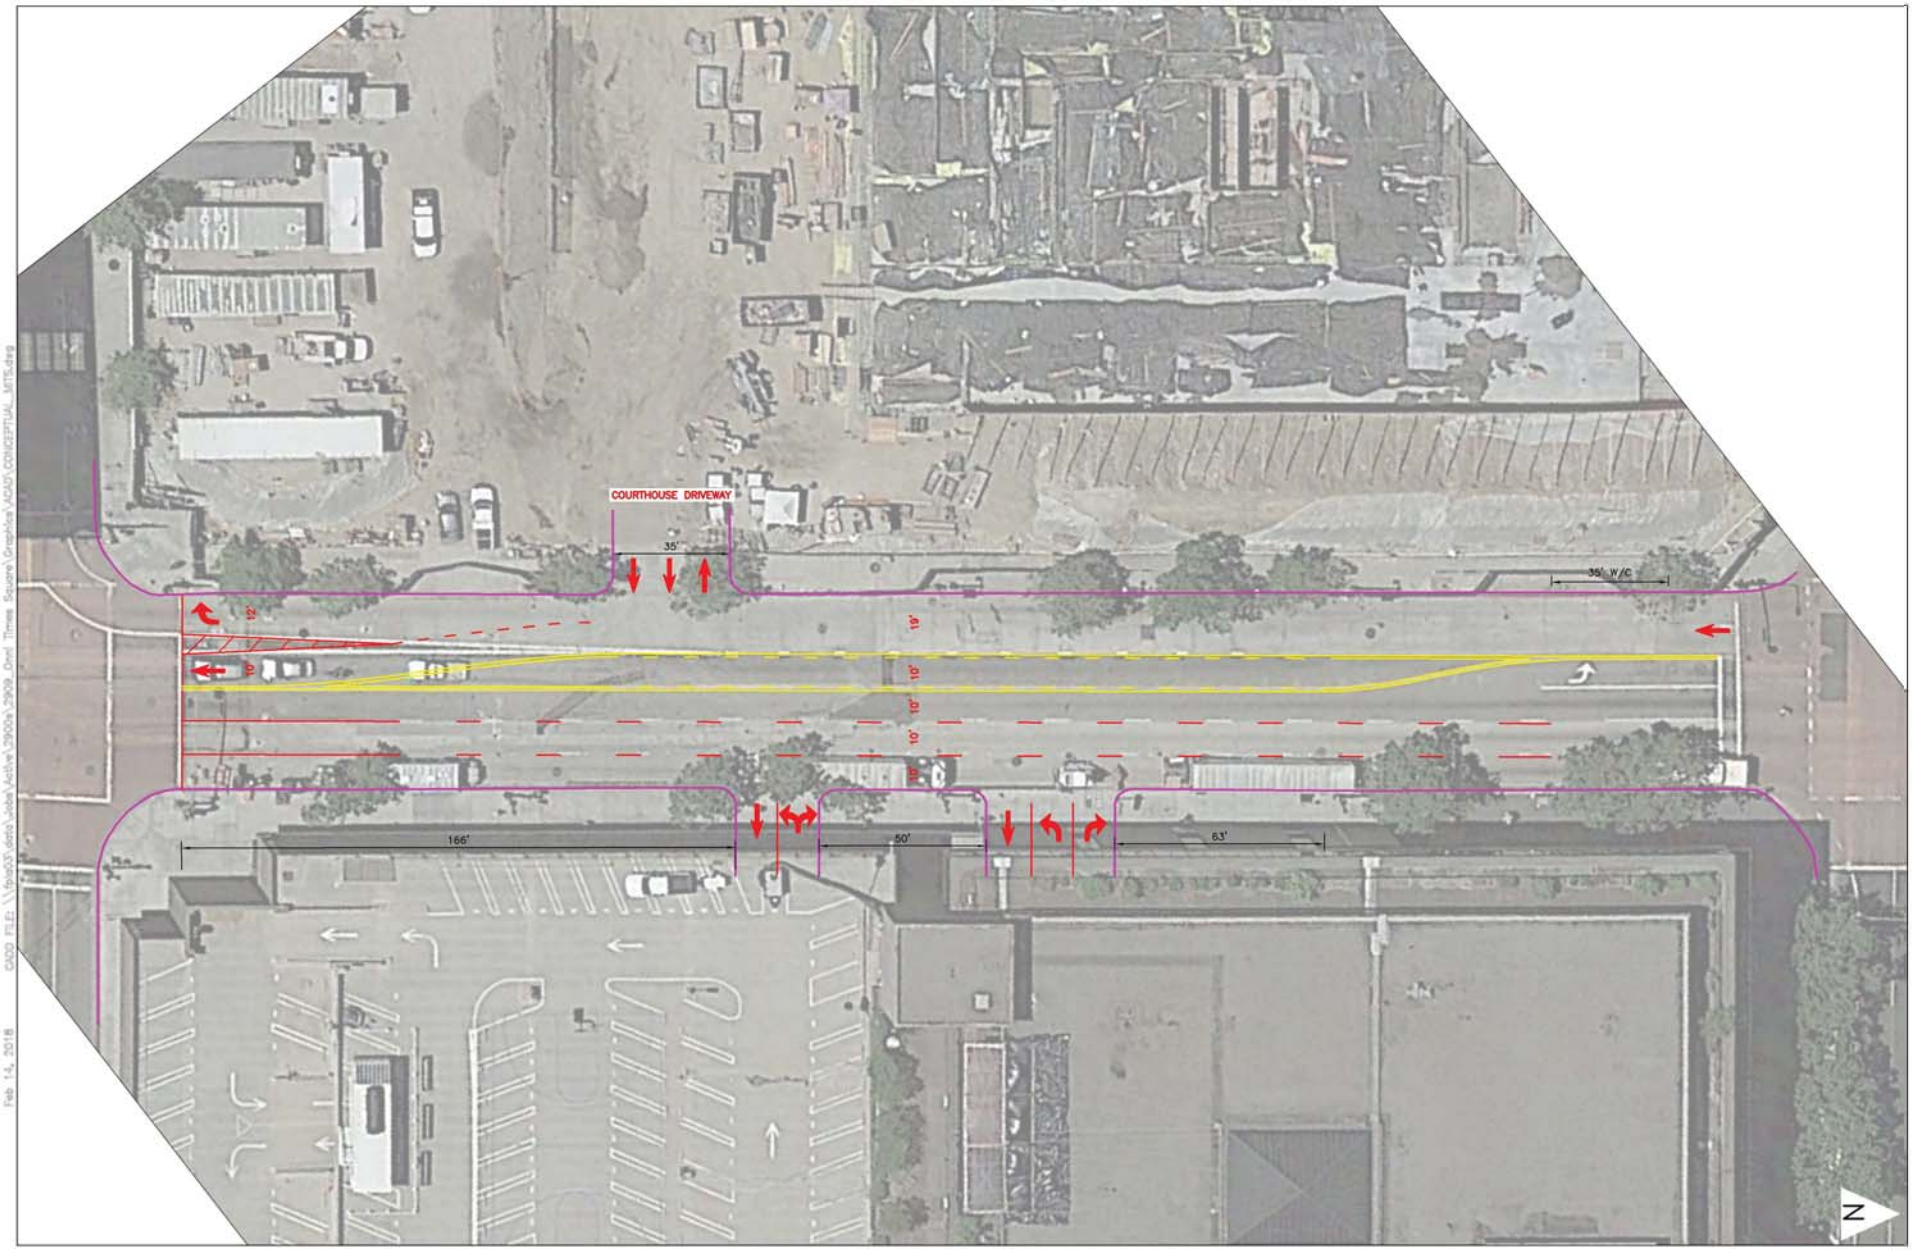

Figure 8

Conceptual Center Left-Turn Median
Project Driveways on Broadway

7. PARKING

This section presents the analysis of the Project's parking requirements using the City of Los Angeles' municipal parking code (LAMC). The LAMC contains a series of provisions affecting the required parking supply for the Times Mirror Square Project. The applicable LAMC code requirements are as follows:

- LAMC Section 12.21A4, which establishes the basic ratios for required vehicle parking spaces for various land uses. The Project is located in the Central City Area per LAMC Section 12.21A.4(p). As such, the Project qualifies to use one space per unit with three or fewer habitable rooms, and 1.25 spaces per unit with four or more habitable rooms, for residential uses.

- LAMC Section 12.21A.4(i), establishes the required parking spaces for office, commercial and business space in the Downtown Business District. For each of these uses, a rate of one space per 1,000 square feet applies.

- LAMC Section 12.21A16, which implements the City's Ordinance No. 182386 by establishing minimum requirements for bicycle parking spaces. It also permits reductions in the required number of vehicle spaces at a ratio of one vehicle space reduced for every four bicycle spaces provided, up to a maximum of 15% of the required vehicle spaces for residential uses and 30% of the required vehicle spaces for non-residential uses within 1,500 feet of a portal to a fixed-rail transit station. Bicycle parking space requirements do not apply to the existing rehabilitated building.

Table 10A summarizes the basic vehicle parking requirement for the Project per LAMC. As shown in Table 10A, the basic code requirement for the proposed Project is 1,661 vehicle spaces. Table 10B summarizes the bicycle parking requirement for the Project per LAMC Section 12.21A16. As shown in the table, the Project would be required to provide a minimum of 1,274 bicycle parking spaces (130 short-term and 1,144 long-term) for the new uses. As indicated in Table 10C, the number of required vehicle spaces could be reduced by 196 spaces with the provision of bicycle spaces. With this reduction, the total number of required vehicle spaces would be 1,465.

SB 743 as implemented in California Public Resources Code Section 21099 provides that parking impacts of a residential, mixed- use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment. This guidance supersedes the significance guidance in the *LA CEQA Threshold Guide*.

TABLE 10A

Notes:

[a] Source: City of Los Angeles Municipal Code, Section 12.21A.4.

[b] Per LAMC 12.21A.4(p), project site is located in the Central City Area. As such, reduced parking rates of 1 space per dwelling unit with three or less habitable rooms, and 1.25 spaces per unit with four or more habitable rooms apply.

[c] Per LAMC 12.21A.4(i), project site is located in the Downtown Business District. As such, reduced parking rates of 1 spaces per 1,000 sf of office, commercial, and business space applies.

[d] Source: City of Los Angeles Municipal Code, Section 12.21A.16.

[e] Bicycle parking analysis provided for new uses only. The rehabilitated existing buildings are not required to provide bicycle parking.

8. CONSTRUCTION PERIOD IMPACT ANALYSIS

Analysis of this proposed Project is provided in the context of significant construction throughout downtown Los Angeles generated by the Regional Connector project. Given that the proposed Project is immediately adjacent to the under-construction Historic Broadway Station, it is important to note that there are ongoing effects of construction (from both the station and accompanying subway tunnel) in the vicinity of the proposed Project. Regional Connector construction is expected to last through 2021, and thus would occur concurrently with construction of the proposed Project for up to two years.

CONSTRUCTION IMPACT CRITERIA

LADOT generally considers construction-related traffic to cause adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary. LADOT requires implementation of worksite traffic control plans to ensure that any construction-related effects are minimized to the greatest extent possible.

The *LA CEQA Thresholds Guide* provides four categories be considered in regards to in-street construction impacts: temporary traffic impacts, temporary loss of access, temporary loss of bus stops or rerouting of bus lines, and temporary loss of on-street parking (*LA CEQA Threshold Guide*, pages L.8-2 through L.8-4). The factors in each of these categories as established in the *LA CEQA Threshold Guide* are as follows:

- Temporary Traffic Impacts:
  - The length of time of temporary street closures or closures of two or more traffic lanes;
  - The classification of the street (major arterial, state highway) affected;
  - The existing traffic levels and LOS on the affected street segments and intersections;
  - Whether the affected street directly leads to a freeway on- or off-ramp or other state highway;
  - Potential safety issues involved with street or lane closures;
  - The presence of emergency services (fire, hospital, etc.) located nearby that regularly use the affected street.
- Temporary Loss of Access:
  - The length of time of any loss of vehicular or pedestrian access to a parcel fronting the construction area;
  - The availability of alternative vehicular or pedestrian access within ¼ mile of the lost access;
  - The type of land uses affected, and related safety, convenience, and/or economic issues.
- Temporary Loss of Bus Stops or Rerouting of Bus Lines:
  - The length of time that an existing bus stop would be unavailable or that existing service would be interrupted;
  - The availability of a nearby location (within ¼ mile) to which the bus stop or route can be temporarily relocated;
  - The existence of other bus stops or routes with similar routes/ destinations within a ¼mile radius of the affected stops or routes;
  - Whether the interruption would occur on a weekday, weekend or holiday, and whether the existing bus route typically provides service that/those day(s).
- Temporary Loss of On-Street Parking:
  - The current utilization of existing on-street parking;

- The availability of alternative parking locations or public transit options (e.g. bus, train) within ¼ mile of the project site;
- The length of time that existing parking spaces would be unavailable.

It should be noted, however, that SB 743 as implemented in California Public Resources Code Section 21099 provides that parking impacts of a residential, mixed- use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment. This guidance supersedes the significance guidance in the *LA CEQA Threshold Guide*. The proposed Project falls within a transit priority area, as shown in the map included in the City of Los Angeles Department of City Planning Zoning Information File Number 2452.

The LAMC provides that construction activities are limited to the hours from 7:00 AM to 9:00 PM on weekdays and from 8:00 AM to 6:00 PM on Saturdays and holidays. No construction is permitted on Sundays.

CONSTRUCTION TRAFFIC

Construction activities are expected to begin in 2019 and are anticipated to take a total of approximately 4 years to complete. The construction is anticipated to involve six key phases:

1. Demolition, implementation of off-site utilities, excavation
2. Renovation of existing buildings that will remain (may overlap with any other phases)
3. Site preparation: establishing site boundaries, setting up operations, establishing access for trucks
4. Grading: includes excavation, grading, and shoring
5. Foundation/concrete pour
6. Construction: including paving and architectural coating

CONSTRUCTION TRUCKS

Haul Trucks

Hauling activity is expected to occur during Phase 1 demolition and Phase 4 grading. Up to 10 haul trucks per day are anticipated on peak haul days during Phase 1. Up to 140 haul trucks per day are anticipated on peak haul days during Phase 4.

Hauling hours are anticipated to begin between 7:00-9:00 AM and end between 3:00-5:00 PM depending on the approval haul hours, Monday through Friday. The delivery/equipment trucks are anticipated to arrive and depart between 7:00 AM and 5:00 PM, Monday through Friday. The haul route for the Project will most likely proceed westbound on 1st Street, northbound on Broadway to the US-101 Freeway. Trucks are expected to be staged off-site and dispatched to the Project site as needed.

Equipment and Delivery Trucks

In addition to haul trucks, concrete trucks would access the site during the foundation/concrete pour in Phase 5 and the site is also expected to generate delivery truck activity during Phase 6. Materials could include plumbing supplies, electrical fixtures, and items used in furnishing the buildings. These materials would be delivered to the site and stored on-site. These deliveries are expected to occur in variously sized vehicles including small delivery trucks to concrete mixer trucks and 18-wheel trucks. Phase 5, which is

expected to occur over the course of four days, is anticipated to involve 703 concrete trucks on the peak activity day. Phase 6 is anticipated to involve 179 delivery trucks per day on peak activity days.

In addition to delivery trucks, occasional equipment delivery is expected to occur during all phases. This equipment could include cranes, bulldozers, excavators, and other large items of machinery. Most of the heavy equipment is expected to be transported to the site on large trucks such as 18-wheelers or other similar vehicles.

CONSTRUCTION EMPLOYEES

The number of construction workers would vary throughout the construction period with the building construction phase generating the highest number of trips. Phases 1 is expected to involve a total of 29 workers on site daily; Phase 2 is expected to involve a total of 62 workers on site daily and could overlap with any of the other phases; Phase 3 will involve approximately 29 workers daily; Phase 4 will involve 30 workers daily; Phase 5 will involve 19 workers daily; and Phase 6 will involve up to 728 workers daily.

CONSTRUCTION WORKER PARKING

Construction employees will park offsite during all construction phases.

CONSTRUCTION IMPACT ASSESSMENT

The *LA CEQA Thresholds Guide* provides four categories to be considered in regards to in-street construction impacts: temporary traffic impacts, temporary loss of access, temporary loss of bus stops or rerouting of bus lines, and temporary loss of on-street parking (*LA CEQA Threshold Guide*, pages L.8-2 through L.8-4). The factors to be considered in each of these categories, and the assessment of the project against these factors, is presented in Table 11 and discussed below.

TEMPORARY TRAFFIC IMPACTS

Temporary travel lane and bike lane closures during the period of construction are anticipated on Broadway, 1st Street, and Spring Street. Because of Regional Connector construction, any closures that may occur on 2nd Street will be subject to Metro's review and approval before they can go forward.

The streets that may be affected by any temporary lane or sidewalk closures are Broadway and Spring Street (Avenue II), 1st Street (Boulevard II), and 2nd Street (Avenue III). The intersection of Broadway & 1st currently operates at LOS A in the AM and LOS B in the PM. The intersection of Broadway & 2nd currently operates at LOS A in the AM and PM. The intersection of Spring & 1st currently operates at LOS A in the AM and PM. The Intersection of Spring & 2nd currently operates at LOS A in the AM and PM.

Worksite traffic control plans would be prepared for any temporary vehicle lane, bicycle lane, or sidewalk closures in accordance with applicable City and California Manual of Uniform Traffic Control Devices (MUTCD) guidelines.

TEMPORARY LOSS OF ACCESS

Full-time closures to the sidewalk are anticipated for the Project along 1st Street, 2nd Street, Broadway, and Spring Street during construction. Pedestrian and vehicular access to existing uses on the Project site will be maintained for the duration of construction and protective canopies around entrances will be provided,

as required. Pedestrian and vehicular access to nearby businesses will remain open during the construction period. Temporary loss of access impacts would be less than significant.

TEMPORARY LOSS OF BUS STOPS OR REROUTING OF BUS LINES

There are four existing bus stops along the Project frontage. The stop on Broadway at 1st Street serves the Metro 30, 40 and 330 lines. The stop on 1st Street at Broadway serves the LADOT Commuter Express Route 534 and Metro line 442. The stop on 1st Street at Spring Street serves the Dash Route A. The stop on Spring between 1st and 2nd Streets serves the Dash Route D, Metro lines 28, 30, 40, 45, 330, and 745, as well as Montebello Express commuter services. Additional bus stops are located on all adjacent blocks and could serve as temporary bus stops without service interruptions or detours, should Project frontage bus stops need to be temporarily closed due to construction. As such, temporary bus impacts would be less than significant.

TEMPORARY LOSS OF ON-STREET PARKING

Construction may require temporary parking restrictions along the Project frontage on 1st Street to accommodate the construction area footprint. A total of six metered spaces would require temporary parking restrictions. 2nd Street, Broadway, and Spring Street would be unaffected since there is no on-street parking on these streets.

Per the provisions in the California Public Resources Code Section 21099, which implements SB 743, parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment (City of Los Angeles Department of City Planning Zoning Information File No. 2452). As such, temporary parking impacts would be less than significant.

TABLE 11
TIMES MIRROR SQUARE
CONSTRUCTION IMPACT SIGNIFICANCE FACTORS

Significance Factor [a]	**Assessment**	**Conclusion**
Per the *LA CEQA Thresholds Guide* , the determination of significance shall be made on a case-by-case basis, considering the following factors:		
Temporary Traffic Impacts:		
• The length of time of temporary street closures or closures of two or more traffic lanes; • The classification of the street (major arterial, state highway) affected; • The existing traffic levels and level of service (LOS) on the affected street segments and intersections; • Whether the affected street directly leads to a freeway on- or off-ramp or other state highway; • Potential safety issues involved with street or lane closures; • The presence of emergency services (fire, hospital, etc.) located nearby that regularly use the affected street.	• Temporary full street closures or closures of two or more traffic lanes are not anticipated. • The streets that may be affected by any temporary traffic lane, bicycle lane, or sidewalk closures are Broadway and Spring Street (Avenue II), 1st Street (Boulevard II), and 2nd Street (Avenue III). • The intersection of Broadway/1st currently operates at LOS A in the AM and LOS B in the PM. The intersection of Broadway/2nd currently operates at LOS A in the AM and PM. The intersection of Spring/1st currently operates at LOS A in the AM and PM. The Intersection of Spring/1st currently operates at LOS A in the AM and PM. • None of the affected streets directly lead to a freeway on- or off-ramp or other state highways. • Worksite traffic control plans would be prepared for any temporary lane or sidewalk closures in accordance with applicable City and Manual of Uniform Traffic Control Devices (MUTCD) guidelines. • The adjacent Los Angeles Police Department Headquarters will retain full access to the driveway on Spring Street.	• Less than significant.
Temporary Loss of Access:		
• The length of time of any loss of vehicular or pedestrian access to a parcel fronting the construction area; • The availability of alternative vehicular or pedestrian access within ¼ mile of the lost access; • The type of land uses affected, and related safety, convenience, and/or economic issues.	• Blockage of existing vehicle or pedestrian access to parcels fronting the construction area is not anticipated. Pedestrian and vehicular access to nearby businesses will remain open during the construction period. Existing uses on the Project site will have their access maintained by providing protective canopies around the entrances when required.	• Less than significant.
Temporary Loss of Bus Stops or Rerouting of Bus Lines:		
• The length of time that an existing bus stop would be unavailable or that existing service would be interrupted; • The availability of a nearby location (within ¼ mile) to which the bus stop or route can be temporarily relocated; • The existence of other bus stops or routes with similar routes/ destinations within a ¼mile radius of the affected stops or routes; • Whether the interruption would occur on a weekday, weekend or holiday, and whether the existing bus route typically provides service that/those day(s).	• There are four existing bus stops along the Project frontage. The stop on Broadway at 1st Street, which serves the Metro 30, 40 and 330 lines. The stop on 1st Street at Broadway serves the LADOT Commuter Express Route 534 and Metro line 442. The stop on 1st Street at Spring Street serves the Dash Route A. The stop on Spring between 1st and 2nd Streets serves the Dash Route D, Metro lines 28, 30, 40, 45, 330, and 745, as well as Montebello Express commuter services. Additional bus stops are located on all adjacent blocks and could serve as temporary bus stops without service interruptions or detours, should Project frontage bus stops need to be temporarily closed due to construction.	• Less than significant.
Temporary Loss of On-Street Parking:		
• The current utilization of existing on-street parking; • The availability of alternative parking locations or public transit options (e.g. bus, train) within ¼ mile of the project site; • The length of time that existing parking spaces would be unavailable.	• Construction may require temporary parking restrictions along the project frontage on 1st Street to accommodate the construction area footprint. A total of six metered spaces would require temporary parking restrictions for the duration of construction. • Public transit options are available within 1/4 mile of the Project site, including: Civic Center/Grand Park Metro Station, and local and regional bus routes on Broadway, 1st Street, Spring Street, Hill Street, and Main Street. In addition, there are various off-street parking lot locations nearby, such as the Grand Park public parking lot located on Broadway north of 1st Street and two public lots located directly south of 2nd Street.	• Less than significant in accordance with SB 743/Public Resources Code Section 21099.
Note: SB 743 as implemented in California Public Resources Code Section 21099 provides that parking impacts of a residential, mixed- use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment. This guidance supersedes the significance guidance in the *LA CEQA Threshold Guide* .		

CONSTRUCTION PERIOD TRIP GENERATION

Based on the aforementioned information, a construction period trip generation analysis was conducted for each phase of construction to estimate daily, morning and evening peak hour passenger car equivalent (PCE) trips. Construction workers often travel to and from a worksite outside of the typical peak commute hours. For the purpose of the analysis, it was assumed that up to 40% of the construction workers will arrive during the peak morning commute hour and 40% will depart during the peak evening commute hour. Haul and delivery/equipment trucks were assumed to occur evening throughout the hauling and delivery periods. For the purposes of the trip generation analysis, the hauling hours were assumed to occur from 7:00 AM to 5:00 PM, a 10-hour period, which would generate the highest number of haul trips in the peak hours. Should the hauling hours be restricted to begin at 9:00 AM and end at 3:00 PM, the project would not generate any peak hour hauling truck trips. However, restricting the duration of the hauling period may extend the construction schedule. The delivery/equipment trucks are anticipated to arrive and depart between 7:00 AM and 5:00 PM, a 10-hour period, except during Phase 5, which will require a 12-hour delivery period to facilitate the concrete pour.. A PCE factor of 2.0 was used for vendor and delivery trucks and a PCE factor of 2.5 was assumed for haul trucks.

Table 12 shows a summary of construction period trip generation under each phase of construction. As shown, the peak construction activity day would occur during the Phase 5 foundation/concrete pour, with the potential for the renovation phase to be conducted concurrently. On a peak construction activity day during Phase 5 with the Phase 2 renovation trips, a total of up to 2,974 daily PCE trips are estimated to occur. If the renovation phase occurs concurrently with Phase 6, the highest level of activity during peak hours is anticipated to result in 388 PCE trips occurring during each of the morning and evening peak hours. As such, the peak construction activity would generate fewer daily and peak hour trips than are projected for the Project once it is completed and occupied.

Although significant construction impacts are not anticipated, the influx of this material and equipment could create less than significant impacts on the adjacent roadway network based on the following considerations:

- There may be intermittent periods when large numbers of material deliveries are required, such as when concrete trucks will be needed for the parking garage and the buildings.
- Some of the materials and equipment could require the use of large trucks (18-wheelers), which could create additional congestion on the adjacent roadways.
- Delivery vehicles may need to park temporarily on adjacent roadways as they deliver their items. Based on experience, it is not uncommon for these types of deliveries to result in temporary lane closures.

TABLE 12
TIMES MIRROR SQUARE

PCE - Passenger car equivalent

Notes:

[1] - Daily trips were calculated by counting two trips, one inbound and one outbound trip for each vehicle

[2] - Up to 40% of the construction workers were assumed to arrive during the morning peak hour of adjacent street traffic. A total of up to 40% worker were assumed to depart during the evening peak hour.

[3] - Daily haul, delivery/equipment, and trash truck trips were assumed to occur evenly throughout an 10-hour construction day. Trips for the concrete pour were assumed to occur on a 12-hour day. Therefore, the daily truck trips for haul and delivery/equipment were divided by 10 hours to calculate morning and evening peak hour truck trips. The daily concrete truck trips were divided by 12 hours to calculate peak hour truck trips.

[4] The Renovation phase is expected to last approximately two years and may occur concurrently with any other phases.

CONSTRUCTION MITIGATION MEASURES

As shown in Table 12, impacts related to construction traffic were found to be less than significant. In addition, the peak construction activity will generate fewer daily and peak hour trips than are projected for the Project once it is completed and occupied. While mitigation measures are not required to mitigate significant impacts, to be conservative a Construction Traffic Management Plan and Construction Worker Parking Plan should be implemented.

A Construction Traffic Management Plan will be developed by the Project applicant for approval by the City of Los Angeles to alleviate construction period impacts. The Construction Traffic Management Plan may include but is not limited to the following measures:

- Provide off-site truck staging in a legal area furnished by the construction truck contractor. Anticipated truck access to the project site will be off Broadway and 2nd Street.
- Schedule deliveries and pick-ups of construction materials during non-peak travel periods to the extent possible and coordinate to reduce the potential of trucks waiting to load or unload for protracted periods.
- As parking lane and/or sidewalk closures are anticipated, worksite traffic control plan(s), approved by the City of Los Angeles, should be implemented to route vehicular traffic, bicyclists, and pedestrians around any such closures.
- Establish requirements for loading/unloading and storage of materials on the project site, where parking spaces would be encumbered, length of time traffic travel lanes can be encumbered, sidewalk closings or pedestrian diversions to ensure the safety of the pedestrian and access to local businesses and residences.
- Ensure that access will remain unobstructed for land uses in proximity to the project site during project construction.
- Coordinate with the City and emergency service providers to ensure adequate access is maintained to the project site and neighboring businesses and residences.
- Coordinate with affected transit providers (Metro, LADOT Dash, Montebello) to temporarily relocate bus stops as necessary.

A Construction Worker Parking Plan will also be developed by the Project applicant for approval by the City of Los Angeles to identify and enforce parking location requirements for construction workers. The Construction Worker Parking Plan could include but is not limited to the following measures:

- During construction activities when construction worker parking cannot be accommodated on the project site, the plan shall identify alternate parking location(s) for construction workers and the method of transportation to and from the project site (if beyond walking distance) for approval by the City 30 days prior to commencement of construction.
- Provide all construction contractors with written information on where their workers and their subcontractors are permitted to park, and provide clear consequences to violators for failure to follow these regulations.
- The Construction Traffic Management Plan and the Construction Worker Parking Plan will need to be approved by LADOT prior to the issuance of building permits. LADOT will be the responsible agency for monitoring and enforcement of the plans.

9. SUMMARY AND CONCLUSIONS

This study was undertaken to analyze the potential traffic impacts of the proposed development of the Times Mirror Square Project. The following summarizes the results of this analysis:

- The Project involves the construction of 1,127 apartment units, 307,288 square feet of office space, 50,000 square feet of grocery space, and 53,389 square feet of quality restaurant. The Project will preserve three existing historic structures and include the construction of two mixed-use towers, as well as a five-level parking podium with ground-floor commercial space. A pedestrian paseo will be provided, linking 1st Street and 2nd Street through the site.

- Three driveways will provide access to the Project, with two driveways on Broadway and one driveway on West 2nd Street. All three driveways will provide full access to and from the site.

- The Project would generate an estimated net increase of 6,994 daily vehicle trips, including 300 trips during the AM peak hour and 279 trips during the PM peak hour.

- The LOS analysis for the Existing plus Project scenario determined that the Project would result in a significant impact during both the AM and PM peak hours at the intersection of Broadway & West 2nd Street. The LOS analysis for the Future plus Project scenario determined that the Project would result in significant impacts at six study area intersections as shown on Table 8. Physical mitigations were considered, but cannot be implemented at the impacted locations, due to roadway width and on-street facility constraints. The Project would, however, implement a TDM program to reduce Project-generated vehicle trips. All six intersections would remain significantly and unavoidably impacted.

- The Project is required to provide a total of 1,661 vehicle parking spaces using the basic code requirements. With the provision 1,274 total bicycle spaces, the required parking would be reduced to 1,465 vehicle spaces. The Project will meet the required vehicular and bicycle according to the LAMC.

- Significant CMP arterial, CMP freeway or transit impacts would not be created by the Project; therefore, no mitigation measures would be required.

- Impacts related to construction traffic were found to be less than significant. In addition, the peak construction activity will generate fewer daily and peak hour trips than are projected for the Project once it is completed and occupied. While mitigation measures are not required to mitigate significant impacts, a Construction Traffic Management Plan and Construction Worker Parking Plan should be implemented.

LADOT

Transportation Impact Study Memorandum of Understanding (MOU)

This MOU acknowledges that the Transportation Impact Study for the following Project will be prepared in accordance with the latest version of LADOT's Transportation Impact Study Guidelines:

I. PROJECT INFORMATION

Project Name: Times Mirror Square

Project Address: 202 W. 1st Street, Los Angeles, CA 90012

Project Description: See Figure 1. Project includes 1,127 residential units, 285,088 square feet of office space, a 50,000 square foot grocery store, 22,200 square feet of quality restaurant, and 53,389 square feet of high-turnover restaurant.

LADOT Project Case Number: _____ Project Site Plan attached? *(Required)* ■ Yes ☐ No

II. TRIP GENERATION See figure 2

Geographic Distribution: N _____ % S _____ % E _____ % W _____ %

Illustration of Project trip distribution percentages at Study intersections attached? *(Required)* ■ Yes ☐ No

Trip Generation Adjustments *(Exact amount of credit subject to approval by LADOT)*

	Yes	No
Transit Usage	■	☐
Transportation Demand Management	☐	■
Existing Active Land Use	■	☐
Previous Land Use	☐	■
Internal Trip	■	☐
Pass-By Trip	■	☐

Source of Trip Generation Rate(s)? ■ ITE 9th Edition ☐ Other: _____

Trip generation table including a description of the proposed land uses, ITE rates, estimated morning and afternoon peak hour volumes (ins/outs/totals), proposed trip credits, etc. attached? *(Required)* ■ Yes ☐ No See Table 1

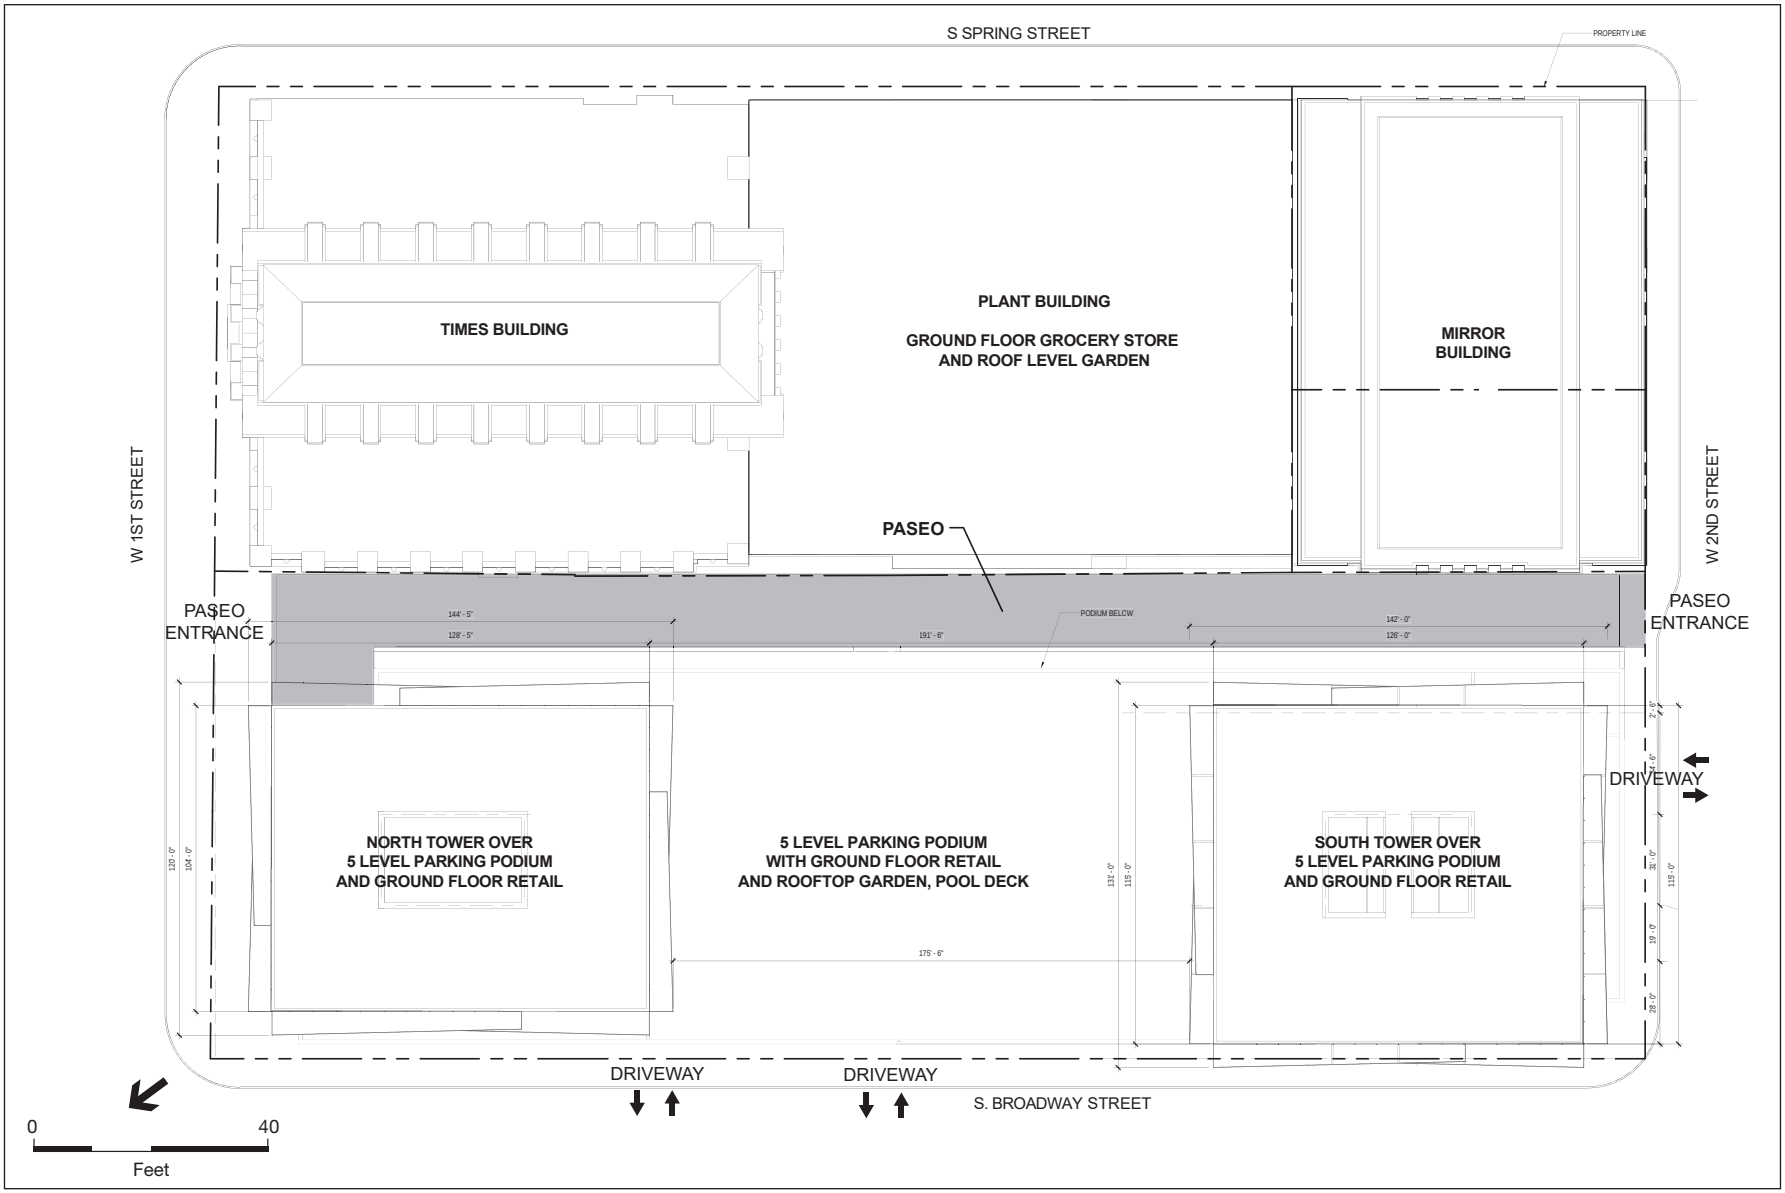
	IN	OUT	TOTAL
AM Trips	94	341	435
PM Trips	294	38	332

III. STUDY AREA AND ASSUMPTIONS

Project Buildout Year: 2022 Ambient or CMP Growth Rate: 1 % Per Yr.

Related Projects List, researched by the consultant and approved by LADOT, attached? *(Required)* ■ Yes ☐ No See Table 2 and Figure 3

Subject to Freeway Impact Analysis, in addition to CMP Analysis? *(Freeway analysis screening filter must be included in this MOU; selecting "yes" implies that at least one criteria was satisfied)* ☐ Yes ■ No See Attachment A



Map of Study Intersections attached? *(May be subject to LADOT revision after initial impact analysis)* ■ Yes ☐ No See Figure 4

Is this Project located on a street within the High Injury Network? ■ Yes ☐ No

Notes:

[a] Source: Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition, 2012.

[b] Internal capture represents the percentage of trips between land uses that occur within the site. This percentage is informed by the Trip Generation for Mixed-Use Development calculation methodology described in Chapter 6 of the ITE *Trip Generation Handbook*, 3rd edition, 2014. Internalization percentages are derived from *NCHRP Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*, Transportation Research Board, 2011. See Attachment B for detailed calculation tables. The daily credit is assumed to be 75% of peak hour credits taken.

[c] The transit credit is based on LADOT's *Transportation Impact Study Guidelines*, December 2016. The guidelines state that up to 25% transit/walk credit may be taken for projects adjacent to a transit station or RapidBus Stop. Projects within 1/4 mile walking distance of a transit station or of a RapidBus stop may take up to a 15% transit/walk credit. The Metro Red/Purple Line Civic Center Station is one block from the project site, and RapidBus routes provide service on Broadway, Spring Street, and 1st Street immediately adjacent to the project site. The future 2nd St/Broadway Regional Connector Station will be co-located with the project site. The daily credit is assumed to be 75% of peak hour credits taken.

[d] The pass-by credit is based on Attachment D of LADOT's *Transportation Impact Study Guidelines*, December 2016.

[e] For flexibility, the trip generation analysis uses the most conservative (highest) rates for high-rise apartments versus high-rise condominiums: ITE code 222 (high-rise apartment) for daily trips and ITE code 232 (high-rise condominium) for peak hour trips. Since the high-rise residences in the ITE database are generally in urban areas with transit service, no additional transit credit was taken to provide a conservative estimate.

[f] 60% of the existing 559.863 ksf floor area (335.918 ksf) is currently occupied. 7.5 ksf of the occupied space is a bank. The remaining 328.418 ksf is office uses. Source: Onni Group.

[g] Daily and AM peak hour rates not available for Walk-In Bank (ITE code 911). Rate for Drive-In Bank (ITE code 912) was used instead.

[h] AM Peak Hour directional distribution not available. Used directional distribution for High-Turnover Restaurant.

MOU ATTACHMENT A
FREEWAY SCREENING FOR TIMES MIRROR SQUARE PROJECT IN ACCORDANCE WITH SCREENING CRITERIA DESCRIBED IN SECTION 3 OF THE "AGREEMENT BETWEEN CITY OF LOS ANGELES AND CALTRANS DISTRICT 7 ON FREEWAY IMPACT ANALYSIS PROCEDURES" (DECEMBER 2015)

INTRODUCTION

Section 3.1 of the "Agreement Between City of Los Angeles and Caltrans District 7 On Freeway Impact Analysis Procedures" originally dated October 2013 specifies the freeway mainline and ramp screening criteria for development projects in the City of Los Angeles. Section 3.1 was amended in December of 2015 with the following threshold criteria:

> "City will require Project applicants to work with Caltrans and prepare a Freeway Impact Analysis, utilizing Caltrans' "Guide for the Preparation of Traffic Impact Studies" ("TIS Guide"), for land use proposals that meet any of the following criteria:
> - The project's peak hour trips would result in a 1-percent or more increase to the freeway mainline capacity of a freeway segment operating at level-of-service (LOS) E or F (based on an assumed capacity of 2,000 vehicles per hour per lane); or
> - The project's peak hour trips would result in a 2-percent or more increase to the freeway mainline capacity of a freeway segment operating at LOS D (based on an assumed capacity of 2,000 vehicles per hour per lane); or
> - The project's peak hour trips would result in a 1-percent or more increase to the capacity of a freeway off-ramp operating at LOS E or F (based on an assumed ramp capacity of 850 vehicles per hour per lane); or
> - The project's peak hour trips would result in a 2-percent or more increase to the capacity of a freeway off-ramp operating at LOS D (based on an assumed ramp capacity of 850 vehicles per hour per lane)."

The purpose of this analysis is to apply the screening criteria to determine whether a Freeway Impact Analysis would be required for the project. The methodologies used to conduct the screening analysis for the project, and the results of the screening, are described below.

FREEWAY MAINLINE SEGMENT SCREENING

The Times Mirror Square project is located at 202 W 1st Street, Los Angeles, CA 90012 with direct regional access provided by two freeways: Interstate 110 (I-110) and the United States 101 (US 101) freeway. Four sections of these two freeways were selected for a freeway screening analysis:

- US 101 Freeway south of Spring Street – 4 lanes northbound and 4 lanes southbound
- US 101 Freeway north of I-110 – 4 lanes northbound and 4 lanes southbound
- I-110 Freeway south of 4th Street – 3 lanes northbound and 5 lanes southbound
- I-110 Freeway north of Hill Street – 4 lanes northbound and 4 lanes southbound

Project trips on the freeway facilities are shown in Table A1 and the mainline screening analysis is shown in Table A2. As shown in Table A2, the freeway capacity is 10,000 for 5 lanes, 8,000 vph for 4 lanes, and 6,00 vph for 3 lanes. The most rigorous trigger criteria for LOS E/F operations was used for the screening analysis. For LOS E or F operations, the threshold test is whether the project would use 1% of the available capacity (1,400 vph for 7 lanes, 1,200 vph for 6 lanes, 100 vph for 5 lanes, and 80 vph for 4 lanes). Because no more than 22 project trips are expected to occur in any analyzed peak hour on any particular segment, the mainline screening threshold is not met and therefore a Freeway Impact Analysis is not required.

FREEWAY RAMP SCREENING

Project trips on the freeway off-ramp facilities are shown in Table A1 and the freeway off-ramp screening analysis is shown in Table A3. Four freeway off-ramps were selected for a freeway screening analysis. The most rigorous trigger criteria for LOS E/F operations was used for the screening analysis. To provide a conservative freeway ramp screening analysis, traffic volumes were consolidated onto just one off-ramp per direction of travel on the US 101 and I-110 freeways. For LOS E or F operations, the threshold test is whether the project would use 1% of the capacity (based on an assumed ramp capacity of 850 vehicles per hour per lane), or approximately 9 vph for 1 lane, 17 vph for 2-lanes, and 26 vph for 3-lanes. Peak hour project trips do not exceed the trigger for analysis at the Hill, Broadway and Spring off-ramps. At the 4th Street off-ramp, the ramp does not terminate at an intersection, but rather results in a lane addition onto 4th Street, and therefore the project trips on that ramp do not exceed the analysis trigger. The freeway off-ramp screening thresholds are not met at any of the ramp locations and a Freeway Impact Analysis is not required.

# of Lanes [a]	4	4	4	4
Capacity	8,000	8,000	8,000	8,000
Worst-case LOS	**E/F**	**E/F**	**E/F**	**E/F**
Trigger % [b]	1%	1%	1%	1%
Trigger	80	80	80	80
Project Trips	5	17	15	2
Exceed Trigger?	no	no	no	no
US 101 n/o I-110	**SB**	**NB**	**SB**	**NB**
# of Lanes [a]	4	4	4	4
Capacity	8,000	8,000	8,000	8,000
Worst-case LOS	**E/F**	**E/F**	**E/F**	**E/F**
Trigger % [b]	1%	1%	1%	1%
Trigger	80	80	80	80
Project Trips	5	17	15	2
Exceed Trigger?	no	no	no	no
I-110 s/o 4th Street	**NB**	**SB**	**NB**	**SB**
# of Lanes [a]	3	5	3	5
Capacity	6,000	10,000	6,000	10,000
Worst-case LOS	**E/F**	**E/F**	**E/F**	**E/F**
Trigger % [b]	1%	1%	1%	1%
Trigger	60	100	60	100
Project Trips	5	17	15	2
Exceed Trigger?	no	no	no	no
I-110 n/o Hill Street	**SB**	**NB**	**SB**	**NB**
# of Lanes [a]	4	4	4	4
Capacity	8,000	8,000	8,000	8,000
Worst-case LOS	**E/F**	**E/F**	**E/F**	**E/F**
Trigger % [b]	1%	1%	1%	1%
Trigger	80	80	80	80
Project Trips	5	17	15	2
Exceed Trigger?	no	no	no	no

Notes:

a. # of lanes does not include auxiliary or HOV lanes.

b. The worst-case assumption of LOS was used with the most strigent trigger thresholds: LOS E/F Threshold: 1% of capacity if LOS E or F, 2% of capacity if LOS D, using 2,000 vphpl capacity

TABLE A3
TIMES MIRROR SQUARE - FREEWAY IMPACT ANALYSIS - FREEWAY RAMP SCREENING

PROJECT TRIP GENERATION

	AM Peak Hour		PM Peak Hour	
	In	Out	In	Out
Project Trip Generation	94	341	294	38

RAMP SCREENING

Off-Ramp	Peak Hour	Worst-Case Off-Ramp LOS [a]	Ramp Terminus # of Lanes	Ramp Terminus Trigger	Project Trips	Exceed Trigger?
I-110 NB 4th St Off	AM	Freeflow		n/a	5	no [b]
	PM	Freeflow		n/a	15	no [b]
I-110 SB Hill Off	AM	E/F	2	17	5	no
	PM	E/F		17	15	no
US 101 SB Broadway/Aliso Off	AM	E/F	3	26	5	no
	PM	E/F		26	15	no
US 101 NB Spring Off	AM	E/F	2	17	5	no
	PM	E/F		17	15	no

Notes:

a. The worst-case assumption of LOS was used with the most stringent trigger thresholds: LOS E/F Threshold: 1% of capacity if ramp at LOS E or F, 2% if ramp at LOS D, using 850 vphpl ramp capacity

b. The I-110 NB 4th Street Off-Ramp terminus is a freeflow ramp that results in a lane-add onto 4th Street, and thus does not exceed the capacity trigger. The downstream intersection is located at 4th Street and Olive Street.

[1]Land Use Codes (LUCs) from *Trip Generation Informational Report*, published by the Institute of Transportation Engineers.

[2]Total estimate for all other land uses at mixed-use development site-not subject to internal trip capture computations in this estimator

[3]Vehicle-trips computed using the mode split and vehicle occupancy values provided in Table 2-P

[4]Person-Trips

*Indicates computation that has been rounded to the nearest whole number.

Estimation Tool Developed by the Texas Transportation Institute

Project Name:	Times Mirror Square
Analysis Period:	**PM Street Peak Hour**

Table 7-P: Conversion of Vehicle-Trip Ends to Person-Trip Ends

L-2 LADOT Correspondence Approving the Traffic Study

FORM GEN. 160A (Rev. 1/82)

CITY OF LOS ANGELES

INTER-DEPARTMENTAL CORRESPONDENCE

222 W. 1st St
DOT Case No. CEN 17-45603

Date: May 21, 2018

To: Luciralia Ibarra, Senior City Planner
Department of City Planning

From: Wes Pringle, Transportation Engineer
Department of Transportation

Subject: **TRANSPORTATION IMPACT ANALYSIS FOR THE PROPOSED MIXED-USE DEVELOPMENT LOCATED AT 202 WEST 1st STREET (ENV-2017-433-EIR/CPC-2017-432-CPU-CA/VTT-74761)**

The Department of Transportation (DOT) has reviewed the transportation impact analysis dated May, 2018, prepared by Fehr & Peers, for the proposed Times Mirror Square Project located on a city block bounded by West 1st Street, South Spring Street, West 2nd Street, and South Broadway, in Downtown Los Angeles. In order to evaluate the effects of the project's traffic on the available transportation infrastructure, the significance of the project's traffic impacts is measured in terms of change to the volume-to-capacity (V/C) ratio between the "future no project" and the "future with project" scenarios. This change in the V/C ratio is compared to DOT's established threshold standards to assess the project-related traffic impacts. The transportation impact analysis included the detailed analysis of 28 signalized intersections and three unsignalized intersections. Based on DOT's current traffic impact criteria[1], six (6) of these signalized intersections would be significantly impacted by project-related traffic prior to mitigation. The results of the transportation impact analysis, which accounted for the other known development projects in evaluating potential cumulative impacts, adequately evaluated the project's traffic impacts on the surrounding community and is summarized in **Attachment 1**.

DISCUSSION AND FINDINGS

A. Project Description

The project site is currently divided in the two portions: the eastern portion is occupied by the Times, Plant, and Mirror buildings and the western portion is occupied by the 6-story parking structure and the 6-story Executive Building. The proposed project consists of renovating the existing Times, Plant, and Mirror buildings and constructing two mixed-use towers. The existing Times, Plant, and Mirror buildings would be retained and renovated to provide 307,288 square feet of office space, 18,817 square feet of restaurant space, and a 50,000 square foot grocery space. The existing 6-story parking structure and 6-story Executive Building would be demolished and

[1] Per the DOT Transportation Impact Study Guidelines, a significant impact is identified as an increase in the Critical Movement Analysis (CMA) value, due to project related traffic, of 0.01 or more when the final ("with project") Level of Service (LOS) is LOS E or F; an increase of 0.020 or more when the final LOS is LOS D; or an increase of 0.040 or more when the final LOS is LOS C.

replaced with a 37-story Tower (North Tower) at the corner of West 1st Street and South Broadway and 53-story Tower (South Tower) at the corner of West 2nd Street and South Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. The towers would include 34,572 square feet of restaurant space at ground level. A pedestrian paseo would be constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between West 1st Street and West 2nd Street.

A five-level above-ground parking podium and a nine-level subterranean garage would be included as part of the construction of the two towers along the Broadway frontage. The project would provide a total of 1,465 vehicular parking spaces and 1,274 bicycle parking spaces (130 short-term and 1,144 long-term). Access to the site will be provided through three full-access driveways: one on West 2nd Street between Broadway and South Spring Street and two on Broadway between West 1st Street and West 2nd Street. The project is expected to be completed by 2023.

B. Trip Generation

The project is estimated to generate a net increase of approximately 6,994 daily trips, a net increase of 300 trips in the a.m. peak hour, and a net increase of 279 trips in the p.m. peak hour. The trip generation estimates are based on formulas published by the Institute of Transportation Engineers (ITE) Trip Generation, 9th Edition, 2012. . These trip generation rates are typically derived from surveys of similar stand-alone (single) land use projects in suburban areas with little to no transit service. Therefore, DOT's transportation impact study guidelines allow projects to reduce their total trip generation to account for potential transit usage to and from the site and for the internal-trip making opportunities that are afforded by mixed-use projects. Consistent with these guidelines, the estimated trip generation includes trip credits to account for the mixed-use nature of the project and for the expected transit mode share. A copy of the trip generation table can be found in **Attachment 2**.

C. Freeway Analysis

The traffic study included a freeway impact analysis that was prepared in accordance with the State-mandated Congestion Management Program (CMP) administered by the Los Angeles County Metropolitan Transportation Authority (MTA). According to this analysis, the project would not result in significant traffic impacts on any of the evaluated freeway mainline segments. To comply with the Freeway Analysis Agreement executed between Caltrans and DOT in December 2015, the study also included a screening analysis to determine if additional evaluation of freeway mainline and ramp segments was necessary beyond the CMP requirements. Exceeding one of the four screening criteria would require the applicant to work directly with Caltrans to prepare more detailed freeway analyses. According to this analysis, the project would not exceed the freeway mainline and off-ramp screening criteria at four locations; therefore, no further analysis of the freeway segment is required for CMP purposes.

D. Traffic Impacts

The study determined that the project would result in significant traffic impacts (pre-mitigation) at the following intersections for future plus project 2023 traffic conditions:

1. South Figueroa Street and West 2nd Street (P.M. Peak Hour)
5. Hill Street and West 1st Street (A.M. Peak Hour)

10. Broadway and West 1st Street (both Peak Hours)
11. South Broadway and West 2nd Street (both Peak Hours)
12. South Broadway and West 3rd Street (A.M. Peak Hour)
17. South Spring Street and West 2nd Street (A.M. Peak Hour)

In consideration of the City's goals to reduce greenhouse gas emissions, the transportation study proposed a transportation demand management program designed to reduce project-related trips and promote other travel modes. The transportation demand management (TDM), described below, would partially but not fully mitigate the project's significant traffic impacts during the peak commute hours at the above intersections.

Physical improvements and intersection modification options at the impacted intersections were considered in an attempt to fully mitigate the impacts. However, these mitigation measures have been determined to be infeasible due to the constraints of the existing physical conditions, secondary impacts to the existing on-street parking and loading zones, the recent adoption of Vision Zero, Mobility Plan 2035, and Complete Streets Design Guide. Therefore, all six intersections would remain significantly and unavoidably impacted event after the implementation of TDM program.

E. Construction Impacts

DOT recommends that a construction work site traffic control plan be submitted to DOT's Citywide Temporary Traffic Control Section or Permit Plan Review Section for review and approval prior to the start of any construction work. Refer to http://ladot.lacity.org/what-we-do/plan-review to determine which section to coordinate review of the work site traffic control plan. The plan should show the location of any roadway or sidewalk closures, traffic detours, haul routes, hours of operation, protective devices, warning signs and access to abutting properties. DOT also recommends that all construction related truck traffic be restricted to off-peak hours.

PROJECT DESIGN FEATURE

Install Two-Way Left-Turn Lane On Broadway

The project proposes to restripe Broadway between 1st Street and 2nd Street and install a two-way left-turn lane that will facilitate left-turn movements to and from the driveways. DOT conceptually approves of the improvement.

The applicant shall be responsible for the cost and implementation of the two-way left-turn channelization improvement described above. All improvement work within the City of Los Angeles must be **guaranteed** through Bureau of Engineering's (BOE) B-Permit process, prior to the issuance of any building permits and **completed** prior to the issuance of any certificates of occupancy. Temporary certificates of occupancy may be granted in the event of any delay through no fault of the applicant, provided that, in each case, the applicant has demonstrated reasonable efforts and due diligence to the satisfaction of DOT. Prior to setting the bond amount, BOE shall require that the developer's engineer or contractor email DOT's B-Permit Coordinator at ladot.planprocessing@lacity.org to arrange a pre-design meeting to finalize the proposed design needed for the project.

PROJECT REQUIREMENTS

A. Traffic Demand Management and Mitigation Program

Consistent with City policies on sustainability and smart growth and with DOT's trip reduction and multi-modal transportation goals, the project includes the development of a trip reduction program and solutions that promote other modes of travel. The traffic demand management and mitigation program includes the following improvements:

1. **Transportation Demand Management (TDM)**

The purpose of a TDM plan is to reduce the use of single occupant vehicles (SOV) by increasing the number of trips by walking, bicycle, carpool, vanpool and transit. A TDM plan should include design features, transportation services, education, and incentives intended to reduce the amount of SOV during commute hours. Through strategic building design and orientation, this project can facilitate access to transit, can provide a pedestrian-friendly environment, can promote non-automobile travel and can support the goals of a trip-reduction program.

A preliminary TDM program shall be prepared and provided for DOT review prior to the issuance of the first building permit for this project and a final TDM program approved by DOT is required prior to the issuance of the first certificate of occupancy for the project. The TDM program should include, but not be limited to, the following strategies:

- Promote Commute Trip Reduction (CTR) through information sharing and marketing for new employee orientations of trip reduction, even promotions, and publications;
- Provide unbundled parking that separates the cost of obtaining assigned parking spaces from the cost of purchasing or renting residential units;
- Provide a program to discount transit passes for residents/employees possibly through negotiated bulk purchasing of passes with transit providers;
- Facilitate a Car-Share Program by allowing a car share service within the project parking facilities. A car share program is a model of car rental where people rent cars for short periods of time, often by the hour.
- Facilitate rideshare programs with provision to include on-site transit and rideshare information center.
- Provide priority locations for carpools and vanpools within the parking garages;
- Accommodate flexible/alternative work schedules and telecommuting programs;
- Project design elements to ensure a bicycle, transit, and pedestrian friendly environment;
- Provide bicycle parking in conformance with Section 12.21 A.16 of the LAMC with safe and convenient access to bicycle facilities;
- A Covenant and Agreement to ensure that the TDM program will be maintained;
- Make a one-time financial contribution of **$100,000** to the City of Los Angeles Department of Transportation to be used in the implementation of the Mobility Hub in the general area of the Project;
- Make a one-time fixed-fee financial contribution of **$100,000** to the City's Bicycle Plan Trust Fund to implement bicycle improvements in the general

Downtown Los Angeles area of the Project.

2. **Downtown Transportation Management Organization (TMO)**
The project should participate in the Downtown Transportation Management Organization (TMO) when the TMO has been formally established. Project representatives would attend organization meetings for the TMO, provide parking and travel demand data to the TMO, pay any established dues to the TMO, and make available information to project tenants relative to the services provided by the TMO.

- The TMO would offer similar services to those described above but would have a much wider reach than the project's local TDM plan and can result in much greater trip reduction benefits. The TMOs in other major employment centers of Los Angeles County have proved beneficial in reducing traffic and improving air quality. A TMO in Downtown can be instrumental in promoting the use of transit and the City's bike share and car share programs that will be installed in the coming years within the Downtown area. The TMO's activities would help augment or implement some of the strategies described above for the project specific TDM plan. TMOs typically implement and promote TDM strategies such as the following:
- Employee flex time and modified work schedules;
- Vanpool and carpool programs;
- Provide information on rail, bus, and shuttle services;
- Satellite parking;
- Non- vehicular commuting;
- Parking management strategies;
- Telecommuting programs;
- Matching services for multi-employer carpools/vanpools (to serve areas that are identified as underserved by transit;
- Promotion and implementation of pedestrians, bicycle, and transit stop enhancements (such as transit/bicycle lanes).

B. Highway Dedication and Street Widening Requirements

On January 20, 2016, the City Council adopted the Mobility Plan 2035 which is the new Mobility Element of the General Plan. A key feature of the updated plan is to revise street standards in an effort to provide a more enhanced balance between traffic flow and other important street functions including transit routes and stops, pedestrian environments, bicycle routes, building design and site access, etc. Per the new Mobility Element, **Broadway** has been designated as Modified Avenue II, which would require a 28-foot half-width roadway within a 40-foot half-width right-of-way. **Spring Street** has been designated as Modified Avenue II, which would require a 26-foot half-width roadway within a 40-foot half-width right-of-way. **West 1st Street** has been designated as a Modified Boulevard II, which would require a 37-foot half-width roadway within a 55-foot half-width right-of-way. **West 2nd Street** has been designated as a Modified Avenue III, which would require a 22-foot half-width roadway within a 37-foot half-width right-of-way. The applicant should check with BOE's Land Development Group to determine the specific highway dedication, street widening and/or sidewalk requirements for this project.

C. Parking Requirements

The project will provide 1,465 vehicular parking spaces and 1,274 bicycle parking spaces (130 short-term and 1,144 long-term) within a five-level above-ground parking podium and a nine-level subterranean garage. The applicant should also check with the Department of Building and Safety on the number of Code-required parking spaces needed for the project.

D. Driveway Access and Circulation

The project proposed to provide three full-access driveways, two driveways on Broadway and another driveway on West 2nd Street as illustrated in **Attachment 3**. Conceptually, the proposed site plan is acceptable to DOT. The review of this study does not constitute approval of the driveway dimensions, access and circulation scheme, and loading/unloading area for the project. Any changes to the project's site access, circulation scheme, or loading/unloading area after issuance of this report would require separate review and approval and should be coordinated with DOT's Citywide Planning Coordination Section at 201 N. Figueroa Street, 5th Floor, Room 550, at (213) 482-7024. The applicant should contact DOT for driveway width and internal circulation requirements prior to the commencement of building or parking layout design efforts so that such traffic flow considerations are designed and incorporated early into the building and parking layout plans. All driveways should be Case 2 driveways and 30 feet for two-way operations or 18 feet for one-way operations. All delivery truck loading and unloading should take place on site with no vehicles having to back into the project via any of the project driveways.

E. Development Review Fees

An ordinance adding Section 19.15 to the Los Angeles Municipal Code relative to application fees paid to DOT for permit issuance activities was adopted by the Los Angeles City Council in 2009 and updated in 2014. This ordinance identifies specific fees for transportation impact analysis review, condition clearance, and permit issuance. The applicant shall comply with any applicable fees per this ordinance.

If you have any questions, please contact me at (213) 972-8482.

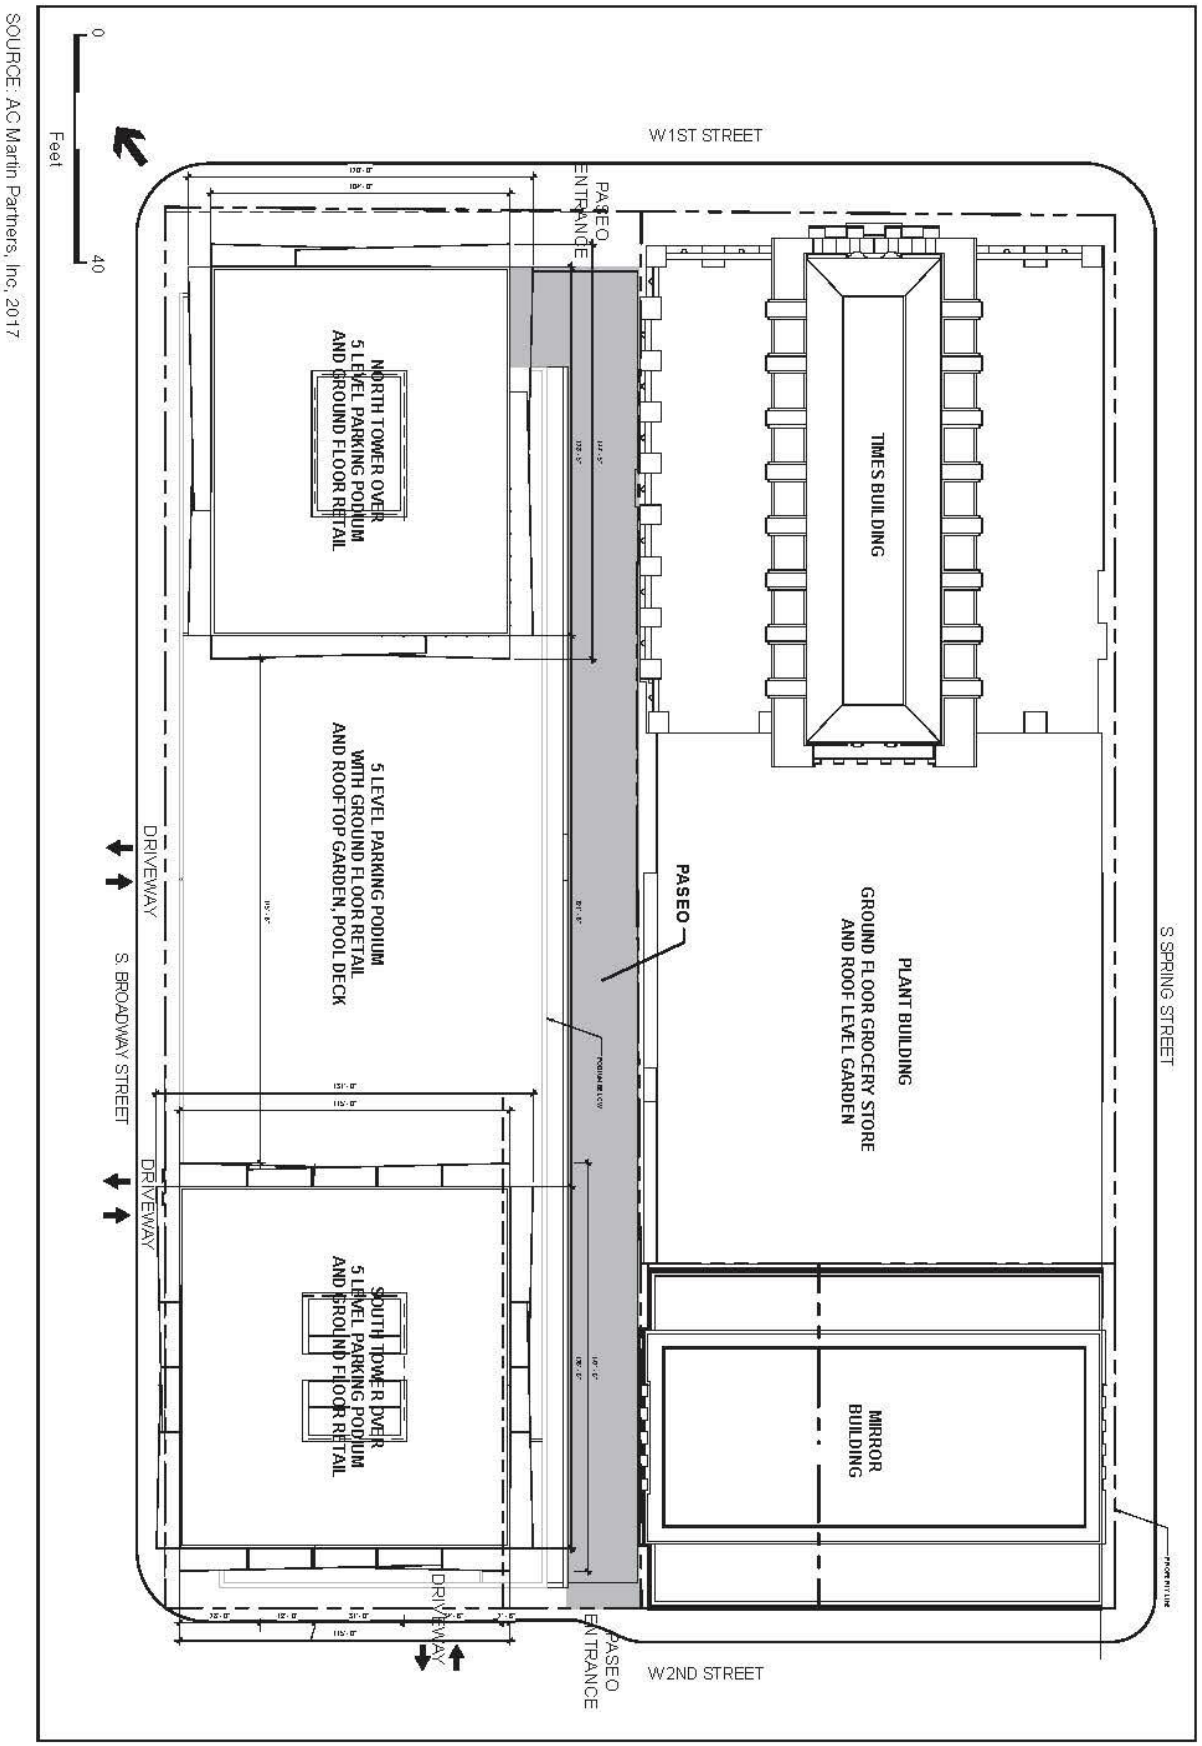
Notes:

[a] Source: Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition, 2012.

[b] Internal capture represents the percentage of trips between land uses that occur within the site. This percentage is informed by the Trip Generation for Mixed-Use Development calculation methodology described in Chapter 6 of the ITE *Trip Generation Handbook*, 3rd edition, 2014. Internalization percentages are derived from *NCHRP Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*, Transportation Research Board, 2011. See Attachment B for detailed calculation tables. The daily credit is assumed to be 75% of peak hour credits taken.

[c] The transit credit is based on LADOT's *Transportation Impact Study Guidelines*, December 2016. The guidelines state that up to 25% transit/walk credit may be taken for projects adjacent to a transit station or RapidBus Stop. Projects within 1/4 mile walking distance of a transit station or of a RapidBus stop may take up to a 15% transit/walk credit. The Metro Red/Purple Line Civic Center Station is one block from the project site, and RapidBus routes provide service on Broadway, Spring Street, and 1st Street immediately adjacent to the project site. The future 2nd St/Broadway Regional Connector Station will be located directly adjacent to the project site. The daily credit is assumed to be 75% of peak hour credits taken.

[d] The pass-by credit is based on Attachment D of LADOT's *Transportation Impact Study Guidelines*, December 2016.



[e] For flexibility, the trip generation analysis uses the most conservative (highest) rates for high-rise apartments versus high-rise condominiums: ITE code 222 (high-rise apartment) for daily trips and ITE code 232 (high-rise condominium) for peak hour trips. Since the high-rise residences in the ITE database are generally in urban areas with transit service, no additional transit credit was taken to provide a conservative estimate.

[f] 60% of the existing 559.863 ksf floor area (335.918 ksf) is currently occupied. 7.5 ksf of the occupied space is a bank. The remaining 328.418 ksf is office uses. Source: Onni Group.

[g] Daily and AM peak hour rates not available for Walk-In Bank (ITE code 911). Rate for Drive-In Bank (ITE code 912) was used instead.

[h] AM Peak Hour directional distribution not available. Used directional distribution for High-Turnover Restaurant.

L-3 Technical Memorandum

FEHR PEERS

TECHNICAL MEMORANDUM

Date: December 20, 2018

To: Wes Pringle, LADOT

From: Tom Gaul and Amanda Heinke, Fehr & Peers

Subject: ***Updated Construction Analysis for LA Times Project***

Ref: LA17-2909

This technical memorandum summarizes the updated construction trip generation for the Times Mirror Square Project. The Times Mirror Square Project Traffic Study was approved by LADOT in May 2018. Subsequently, the anticipated duration of the concrete pour has been updated; thus requiring an update to the construction trip generation. This memorandum summarizes the changes to the construction assumptions and construction trip generation.

PROJECT DESCRIPTION

The Project would retain and renovate the existing Times, Plant, and Mirror Buildings to provide 307,288 square feet of office space, 18,817 square feet of restaurant space, and a 50,000 square foot grocery store. These three buildings are aligned along South Spring Street, with frontages along both West 1st Street and West 2nd Street. The Project proposes to demolish the Parking Garage and Executive Building located on the western half of the site and construct two mixed-use towers (North and South Towers).

The Project's 37-story North Tower and 53-story South Tower mixed-use components would be constructed in the west sector of the Project Site in the areas currently occupied by the 6-story Executive Building at the corner of West 1st Street and South Broadway and the 6-story parking structure at the corner of West 2nd Street and South Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. The towers would include 34,572 square feet of restaurant space, located at ground level. The Project would include a pedestrian paseo constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between West 1st Street to West 2nd Street.

Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023. The project site is currently occupied by five buildings used by the Los Angeles Times, a bank, and other office uses.

CONSTRUCTION ASSUMPTIONS

As documented in the May 2018 Traffic Study, the delivery/equipment trucks during Phase 5 Foundation/Concrete Pour were anticipated to arrive and depart over a 12-hour delivery period to facilitate the concrete pour. However, additional information regarding the concrete pour has

revealed that the concrete pour will be a continuous pour. With a continuous pour method, it is anticipated that the concrete pour would occur over an 18-hour period over two consecutive days.

CONSTRUCTION PERIOD TRIP GENERATION

Based on the aforementioned information, the construction period trip generation analysis was updated to reflect the updated concrete pour duration. Table 1 shows the construction trip generation from the May 2018 Traffic Study.

Table 2 shows the updated construction period trip generation under each phase of construction. Increasing the duration of the concrete pour affects the peak hour trips shown in Phase 5 in the trip generation, but the daily number of trips remain the same. With the change, the Phase 5 peak hour trips would be reduced from 242 PCE trips to 164 PCE trips.

As discussed in the Traffic Study, the highest number of peak hour trips would occur during the overlap of Phase 2 and Phase 6 which would result in 388 PCE trips occurring during each of the morning and evening peak hours. As the updated concrete pour duration to 18-hours only affects Phase 5, the trip generation in Phase 2 and 6 would remain the same as shown in the Traffic Study and the highest number of peak hour trips would continue to be 388 PCE trips.

As such, the peak construction activity would continue to generate fewer daily and peak hour trips than are projected for the Project once it is completed and occupied.

SUMMARY

The updated trip generation due to a longer duration of the concrete pour would result in a reduction in peak hour trips in Phase 5 than previously found in the May 2018 Traffic Study. However, the highest number of peak hour trips would continue to be 388 PCE trips as disclosed in the May 2018 Traffic Study.

PCE - Passenger car equivalent

Notes:

[1] - Daily trips were calculated by counting two trips, one inbound and one outbound trip for each vehicle

[2] - Up to 40% of the construction workers were assumed to arrive during the morning peak hour of adjacent street traffic. A total of up to 40% worker were assumed to depart during the evening peak hour.

[3] - Daily haul, delivery/equipment, and trash truck trips were assumed to occur evenly throughout an 10-hour construction day. Trips for the concrete pour were assumed to occur on a 12-hour day. Therefore, the daily truck trips for haul and delivery/equipment were divided by 10 hours to calculate morning and evening peak hour truck trips. The daily concrete truck trips were divided by 12 hours to calculate peak hour truck trips.

[4] The Renovation phase is expected to last approximately two years and may occur concurrently with any other phases.

1. INTRODUCTION

1.1. PROJECT LOCATION AND EXISTING ON-SITE USES:

The Project Site is located on an approximately 3.6-acre (five parcels totaling approximately 160,578 square feet [sf]) city block bounded by W. 1st Street, S. Spring Street, W. 2nd Street, and S. Broadway Street in the Center City/Historic Core District of Downtown Los Angeles. This district, which extends from W. 1st Street to W. 11th Street, between Los Angeles and Hill Streets, includes Los Angeles City Hall, Los Angeles County courts and law library, federal offices and courts, LAPD Headquarters, Caltrans Regional Offices, Grand Park, and other civic facilities. The Project Site is currently occupied by five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage, and the 6-story Executive Building, resulting in a total of approximately 559,863 sf. See attached Project Location Map.

1.2. PROJECT DESCRIPTION

The Times Mirror Square Project (Proposed Project) would retain and renovate the Times, Plant, and Mirror Buildings to provide approximately 307,288 sf of commercial office uses, 18,817 sf of commercial restaurant uses and a 50,000 sf grocery store. Of the 307,288 sf of commercial office use, 93,432 sf will be new development. The remaining 213,856 sf of office space is existing and will remain after the rehabilitation of the Times, Plant, and Mirror Buildings. The three buildings, which have a combined total floor area of approximately 376,105 sf, are aligned along S. Spring Street, with frontages along both W. 1st Street and W. 2nd Street. The Project proposes to demolish the parking garage and Executive Building located on the western half of the Site and construct two mixed-use towers (North and South Towers).

The Project's North Tower and South Tower mixed use components would be constructed in the west sector of the Project Site in the areas currently occupied by the 6-story Executive Building at the corner of W. 1st Street and S. Broadway and the 6-story parking structure at the corner of W. 2nd Street and S. Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. Total residential unit floor area would be 1,071,692 sf. With the addition of open space amenities, lounges, loading areas, and retail uses, total new construction would amount to 1,135,803 sf. The towers would include approximately 34,572 sf of retail uses, which would be located at ground level and oriented to W. 1st Street, S. Broadway, and W. 2nd Street, while also fronting the Paseo. The Paseo would be constructed along the east edge of the North and South Towers, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. The resulting floor-area ratio (FAR) would be approximately 9.42:1. Approximately 73,128 sf of common open space, including the approximately 15,708 sf Paseo, would be provided as part of the North and South Towers component. With the addition of approximately

56,350 sf of private balconies, combined private and common open space would be approximately 129,252 sf.

Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four-year construction period ending with buildout and occupancy in 2023.

1.3. SCOPE OF WORK

As a part of the Environmental Impact Report for the Project, the purpose of this report is to analyze the potential impact of the Project to the existing water, wastewater, and energy infrastructure system.

2. REGULATORY FRAMEWORK

2.1. WATER

The City of Los Angeles Department of Water and Power (LADWP) is responsible for providing water supply to the City while complying with Local, State, and Federal regulations.

Below are the State and Regional water supply regulations:

- Metropolitan Water District (MWD) official reports and policies as outlined in its Regional Urban Water Management Plan, Water Surplus and Drought Management Plan, Water Supply Allocation Plan, and Integrated Resources Plan.
- California Code of Regulations, Title 20, Chapter 4, Article 4, Section 1605 establishes water efficiency standards for all new plumbing fixtures and Section 1608 prohibits the sale of fixtures that do not comply with the regulations.
- 2013 California Green Building Standards Code, CCR, Title 24, Part 11, adopted on January 1, 2014, updated in the 2016 California Green Building Standards Code, Title 24, Part 11, effective January 2017, requires a water use reduction of 20% above the baseline cited in the CALGreen code book. The code applies to family homes, state buildings, health facilities, and commercial buildings.
- California Urban Water Management Planning Act of 1984 requires water suppliers to adopt an Urban Water Management Plan (UWMP).
- LADWP's 2015 UWMP outlines the City's long-term water resources management strategy. The 2015 UWMP was approved by the LADWP Board of Water and Power Commissioners on June 7, 2016.
- Senate Bill 610 and Senate Bill 221, approved on October 9, 2001, require land use agencies to perform a detailed analysis of available water supply when approving large developments. Historically, public water suppliers (PWS) simply provided a "will serve" letter to developers. SB 610, Public Resources Code (PRC) and Section 10910-10915 of the State Water Code requires lead agencies

to request a Water Supply Assessment (WSA) from the local water purveyor prior to project approval. If the projected water demand associated with a proposed development is included in the most recent UWMP, the development is considered to have sufficient water supply per California Water Code Section 10910, and a WSA is not required. All projects that meet any of the following criteria require a WSA:

1) A proposed residential development of more than 500 dwelling units.

2) A proposed shopping center or business establishment of more than 500,000 square feet of floor space or employing more than 1,000 persons.

3) A proposed commercial office building of more than 250,000 square feet of floor space or employing more than 1,000 persons.

4) A proposed hotel or motel of more than 500 rooms.

5) A proposed industrial, manufacturing, or processing plant or industrial park of more than 40 acres of land, more than 650,000 square feet of floor area, or employing more than 1,000 persons.

6) A mixed use project that falls in one or more of the above-identified categories.

7) A project not falling in one of the above-identified categories but that would demand water equal or greater than the amount required by a 500-dwelling unit project.

As this Project is a mixed-use development that meets three of the above thresholds, numbers 1, 3, and 6, a WSA will be required for this Project.

2.2. WASTEWATER

The City of Los Angeles has one of the largest sewer systems in the world including more than 6,600 miles of sewers serving a population of more than four million. The Los Angeles sewer system is comprised of three systems: Hyperion Sanitary Sewer System, Terminal Island Water Reclamation Plant Sanitary Sewer System, and Regional Sanitary Sewer System. To comply with Waste Discharge Requirements (WDRs), a Sewer System Management Plan (SSMP) was prepared for each of these systems.

The Project Site lies within the Hyperion Service Area served by the Hyperion Sanitary Sewer System. In February 2017, a Sewer System Management Plan (SSMP) was prepared for the Hyperion Sanitary Sewer System pursuant to the State Water Resources Control Board's (SWRCB) May 2, 2006 Statewide General Waste Discharge

Requirements (WDRs)[1].

Sewer permit allocation for projects that discharge into the Hyperion Treatment Plant is regulated by Ordinance No. 166,060 adopted by the City in 1990. The Ordinance established an additional annual allotment of 5.0 million gallons per day, of which 34.5 percent (1.725 million gallons per day) is allocated for priority projects, 8 percent (0.4 million gallons per day) for public benefit projects, and 57.5 percent (2.875 million gallons per day) for non-priority projects (of which 65 percent is for residential project and 35 percent for non-residential projects).

The City of Los Angeles Municipal Code (LAMC) includes regulations that allow the City to assure available sewer capacity for new projects and fees for improvements to the infrastructure system. LAMC Section 64.15 requires that the City perform a Sewer Capacity Availability Request (SCAR) when any person seeks a sewer permit to connect a property to the City's sewer collection system, proposes additional discharge through their existing public sewer connection, or proposes a future sewer connection or future development that is anticipated to generate 10,000 gallons or more of sewage per day. A SCAR is an analysis of the existing sewer collection system to determine if there is adequate capacity existing in the sewer collection system to safely convey the newly generated sewage to the appropriate sewage treatment plant.

LAMC Section 64.11.2 requires the payment of fees for new connections to the sewer system to assure the sufficiency of sewer infrastructure. New connections to the sewer system are assessed a Sewerage Facilities Charge. The rate structure for the Sewerage Facilities Charge is based upon wastewater flow strength, as well as volume. The determination of wastewater strength for each applicable project is based on City guidelines for the average wastewater concentrations of two parameters (biological oxygen demand and suspended solids) for each type of land use. Fees paid to the Sewerage Facilities Charge fees are deposited in the City's Sewer Construction and Maintenance Fund for sewer and sewage-related purposes, including but not limited to industrial waste control and water reclamation purposes.

In addition, the City establishes design criteria for sewer systems to assure that new infrastructure provides sewer capacity and operating characteristics to meet City Standards (Bureau of Engineering Special Order No. SO06-0691). Per the Special Order, laterals sewers, which are sewers 18 inches or less in diameter, must be designated for a planning period of 100 years. The Special Order also requires that sewers be designated so that the peak dry weather flow depth during their planning period shall not exceed

[1] City of Los Angeles Department of Public Works, Bureau of Sanitation, Sewer System Management Plan Hyperion Sanitary Sewer System, February 2017.

one-half the pipe diameter.[2]

In 2006 the City approved the Integrated Resources Plan, which incorporates a Wastewater Facilities Plan.[3] The Integrated Resources Program was developed to meet future wastewater needs of more than 4.3 million residents expected to live within the City by 2020. In order to meet future demands posed by increased wastewater generation, the City has chosen to expand its current overall treatment capacity, while maximizing the potential to reuse recycled water through irrigation, and other approved uses.

2.3. ENERGY

2.3.1. ELECTRICITY

The *2015 Power Integrated Resource Plan* (IRP) [4]document serves as a comprehensive 20 year roadmap that guides the Los Angeles Department of Water and Power's (LADWP) Power System in its efforts to supply reliable electricity in an environmentally responsible and cost effective manner. This year's 2015 IRP re-examines and expands its analysis on the 2014 IRP recommended case with updates in line with latest regulatory framework, primarily the recently approved state legislation of a 50 percent renewable portfolio standard by 2030.

The 2015 IRP provides detailed analysis and results of several new IRP resource cases which investigated the economic and environmental impact of increased local solar and various levels of transportation electrification. In analyzing the IRP cases and recommending a strategy to best meet the future electric needs of Los Angeles, the IRP uses system modeling tools to analyze and determine the long-term economic, environmental, and operational impact of alternative resource portfolios by simulating the integration of new resource alternatives within our existing mix of assets and providing the analytic results to inform the selection of a recommended case. However, for the purpose of load-following as well as backstopping intermittent renewable resource generation, gas-fired generation will continue to be the primary technology to meet the ever-growing demand for electric power.

The IRP also includes a general assessment of the revenue requirements and rate impacts that support the recommended resource plan through 2035. While this assessment will not be as detailed and extensive as the financial analysis to be completed for the ongoing rate action for the 2015/16 fiscal year and beyond, it clearly outlines the general requirements. As a long-term planning process, the IRP examines a 20-year horizon in

---

4 LADWP, 2015 Power Integrated Resource Plan, December 2015

order to secure adequate supplies of electricity. In that respect, it is LADWP's desire that the IRP contribute towards future rate actions, by presenting and discussing the programs and projects required to fulfill its City Charter mandate of delivering reliable electric power to the City of Los Angeles.

Regulatory interpretations of primary regulations and state laws affecting the Power System, including AB 32, SB 1368, SB 1, SB 2 (1X), SB 350, SB 32, US EPA Rule 316(b), and US Clean Power Plan continue to evolve particularly with certification requirements of existing renewable projects and their applicability towards meeting in-state or out-of-state qualifications. The 2015 IRP attempts to incorporate the latest interpretation of these major regulations and state laws as we understand them today.

2.3.2. NATURAL GAS

The *2016 California Gas Report*[5] presents a comprehensive outlook for natural gas requirements and supplies for California through the year 2035. This report is prepared in even-numbered years, followed by a supplemental report in odd-numbered years, in compliance with California Public Utilities Commission Decision D.95-01-039. The projections in the California Gas Report are for long-term planning and do not necessarily reflect the day-to-day operational plans of the utilities.

California natural gas demand, including volumes not served by utility systems, is expected to decrease at a rate of 1.4 percent per year from 2016 to 2035. The forecast decline is a combination of moderate growth in the Natural Gas Vehicle (NGV) market and across-the-board declines in all other market segments: residential, commercial, electric generation, and industrial markets.

Residential gas demand is expected to decrease at an annual average rate of 0.5 percent over the same period mentioned above. Demand in the commercial and industrial markets are expected to decline at an annual rate of 0.24 percent. Aggressive energy efficiency programs make a significant impact in managing growth in the residential, commercial, and industrial markets. For the purpose of load-following as well as backstopping intermittent renewable resource generation, gas-fired generation will continue to be the primary technology to meet the ever-growing demand for electric power. However, overall gas demand for electric generation is expected to decline at 1.3 percent per year for the next 20 years due to more efficient electrical power plants, statewide efforts to minimize greenhouse gas (GHG) emissions through aggressive programs pursuing demand-side reductions, and the acquisition of preferred power generation resources that produce little or no carbon emissions.

2.3.3 NATURAL GAS AND ELECTRICITY LEGISLATION

In 2015, the state enacted legislation intended to improve air quality, provide aggressive

[5] California Gas and Electric Utilities, 2016 California Gas Report, 2016.

reductions in energy dependency and boost the employment of renewable power. The first legislation, the 2015 Clean Energy and Pollution Reduction Act, also known as Senate Bill (SB) 350, requires the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by December 31, 2030. SB 350 establishes annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses by January 1, 2030. Second, the Energy Efficiency Act (AB 802) provides aggressive state directives to increase the energy efficiency of existing buildings, requires that access to building performance data for nonresidential buildings be provided by energy utilities and encourages pay-for performance incentive-based programs. This paradigm shift will allow California building owners a better and more effective way to access whole-building information and at the same time will help to address climate change, and deliver cost-effective savings for ratepayers. The Energy Efficiency Act (AB 793) is intended to promote and provide incentives to residential or small and medium-sized business utility customers that acquire energy management technology for use in their home or place of business. AB 793 requires energy utilities to develop a plan to educate residential customers and small and medium business customers about the incentive program.[6]

Last, California Global Warming Solutions Act of 2006 (SB 32) requires the state board to ensure that statewide greenhouse gas emissions are reduced to at least 40% below the 1990 level by 2030.[7]

3. ENVIRONMENTAL SETTING

The Project Site is currently bounded by South Broadway, South Spring Street, West 1st Street and West 2nd Street. The site consists of two lots and two parcels along Broadway, one lot and 2 parcels along Spring and 2 lots along 1st street.

The Project Site is currently occupied by one city block in downtown Los Angeles. The eastern portion of the site is currently occupied by the historic Times Building, Mirror Building and Plant Building. The western portion of the site is occupied by a parking garage and Executive Building. Based on the historic drawings, the existing structures are underlain by up to three subterranean levels.

3.1. WATER

LADWP is responsible for providing water supply to the City while complying with County, State, and Federal regulations.

3.1.1. REGIONAL

[6] C.A. Legislative Assembly, SB 32, 2015-2016.
[7] C.A. Legislative Assembly, SB 32, 2015-2016.

Primary sources of water for the LADWP service area are the Los Angeles Aqueduct (LAA), State Water Project (supplied by MWD) and local groundwater. The LAA has been the primary source of the City's water supply. In recent years, however, the amount of water supplies from the LAA has been limited due to environmental concerns, and the City's water supply relied heavily (average of 57% in recent years) on the purchased water from MWD delivered from the Colorado River or from the Sacramento-San Joaquin Delta. Local ground water has been a reliable water source, providing an average of 12% of the total water supply, but there have been concerns in recent years due to declining groundwater level and contamination issues. Lastly, the City's recycled water supply is limited to specific projects within the City at this time.[8]

3.1.2. LOCAL

The Project Site is currently occupied by five structurally separate but internally connected buildings used by Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage and the 6-story Executive Building. The total approximate floor area of these buildings is 559,863 square feet. Approximately 223,945 square feet (40 percent) of the existing uses are vacant office spaces that have been vacant for 10 years.

LADWP maintains water infrastructure to the Project Site. Based on available record data provided by LADWP, there is an 18-inch water main in Broadway, a 12-inch water main in Spring Street, an 8-inch water main in 2nd Street and a 12-inch main in 1st Street. Based on existing record information the Project Site has multiple domestic water and fire water connections coming off of all four adjacent streets. The following is a detailed account of the existing water infrastructure serving the project site (Please see Exhibit 6 for their approximate location and details):

- Broadway:
    - In front of Executive Building:
        - 8 Water Meters
        - 1 Fire Hydrant (FH ID: 6913)
        - 1 Fire Department Connection
    - In front of corporate garage:
        - 2 Water Meters
        - 1 Fire Hydrant
- 1st Street:
    - In front of Executive Building:
        - 1 Fire Hydrant (FH ID: 6832)
    - In front of Times Building:

[8] LADWP, 2015 Urban Water Management Plan, October 2016.

        - 1 Water Meter
- Spring Street:
    - In front of Times Building:
        - 2 Water Meters
        - 1 Fire Hydrant (FH ID: 6904)
        - 1 Fire Department Connection
    - In front of Plant Building:
        - 1 Fire Hydrant (FH ID: 6902)
    - In front of Mirror Building:
        - 2 Water Meters
- 2nd Street;
    - In front of Mirror Building:
        - 1 Water Vault
    - In front of parking garage:
        - 1 Fire Hydrant (FH ID: 6911)
        - 1 Fire Department Connection

Existing water consumption estimates were based on billing records from the average available billing years from Fiscal Year 2010 to 2015 as indicated on footnote 3 of Table 1 of the WSA. The total existing water demand is approximately double of the existing water demand to be removed and is reflected in Table 1 below.

Table 1 – Existing Water Demand

Land Use	**Quantity**	**Water Demand**	
		(gpd)	**(afy)**
Office	103,312 sf	n/a	n/a
Bank	7,500 sf	n/a	n/a
Cafeteria	11,250 sf (750 seats)	n/a	n/a
6 Story Parking Structure	44,306 sf	n/a	n/a
Total Existing Water Demand to be Removed[a]		**20,137**	**22.56**
Total Existing Water Demand[b]		**40,000**	**45**

Notes:

[a] Total existing water demand to be removed provided by Table 1 of the Water Supply Assessment for the Times Mirror Square Project dated September 19, 2017. Of the 176,258 sf existing office space in

Table 1 – Existing Water Demand			
Land Use	Quantity	Water Demand	
		(gpd)	(afy)
the Executive Building that would be removed, approximately 103,312 sf or 60 percent of the space has been used/occupied in the last 10 years. Given this use of the space, approximately 103,312 sf of office uses are considered in the water demand estimate for the existing executive building that would be removed.			
[b] The total existing demand of the project site is approximately double of the existing water demand to be removed based on billing records from the average available billing years from Fiscal Year 2010 to 2015, not through generation factors.			

There are 3 existing Fire Department Connections to charge fire sprinklers on the building face along Broadway, Spring Street and 2nd Street that appears to be serving the existing Executive Building parking garage, Mirror Building, Plant Building and Times Building. In addition, as indicated in Exhibit 6, one or more fire hydrants exist along each of the Project's four street frontages, and additional fire hydrants exist in the greater vicinity of the Project Site.

The existing 18" water main in Broadway that appears to service the existing parking garage and Executive Buildings has an existing capacity of 2500 gpm at 50 psi, as per Exhibit 1.

The renovation and reuse of the existing Times Building, Mirror Building and Plant Building has the potential to increase the water and fire demand of these existing buildings. An IFFAR (Information of Fire Flow Availability-Exhibit 3) has been obtained and approved for the Project, indicating that the instantaneous impact that results from the required fire flow demand, will not adversely affect the existing water infrastructure servicing the existing Times, Mirror and Plant Building. An approved IFFAR signifies that the existing infrastructure has the capability and capacity to service the proposed renovated buildings. Furthermore, a WSA was also obtained and approved, therefore the existing facilities have the required capacity to serve the proposed renovated buildings.

An SAR for Spring Street has also been requested to determine if the existing infrastructure has the capacity to accept the proposed flows of the renovated Times, Plant and Mirror buildings. The existing infrastructure has the existing capacity of 2500 gpm at 50 psi per Exhibit 1.

3.2. WASTEWATER

3.2.1. REGIONAL

The Bureau of Sanitation (BOS) operates and maintains the wastewater treatment, reclamation and collection facilities serving most of the City of Los Angeles incorporated areas as well as several other cities and unincorporated areas in the Los Angeles basin

and San Fernando Valley. The collection infrastructure consists of over 6,700 miles of local, trunk, mainline and major interceptor sewers, five major outfall sewers, and 46 pumping plants. The wastewater generated by the Project ultimately flows to the Hyperion Treatment Plant (HTP) System. The existing design capacity of the Hyperion Service Area is approximately 550 million gallons per day (mgd) and the existing average daily flow for the system is approximately 300 mgd.[9] However, the LA Sanitation's Customer Care Center Facts & Figures for Wastewater Collection and Treatment dated 01/14/2017 indicates the existing average daily flow for the system is approximately 362 mgd. As such, the more conservative value of 362 mgd has been used in the analysis.

3.2.2. LOCAL

Sanitary sewer is provided by the City of Los Angeles Bureau of Sanitation (BOS). It appears that there are 4 existing sewer laterals serving the existing Times Building, Mirror Building and Plant Building. Also there are 4 existing sewer laterals serving the existing Executive Building and parking garage. Please see Exhibit 6 for existing sewer lines and their size, direction of flow and slope.

There are existing 8-inch Vitrified Clay Pipe (VCP) sewer lines in 1st Street & 2nd Street, a 12-inch main line along Broadway and 18-inch line along Spring Street. Based on LA Bureau of Engineering's online Navigate LA database, the above mentioned sewer lines along 1st Street, 2nd Street, Broadway and Spring street, have capacities of 1.17 cfs (756,043 gpd), 0.55 cfs (355,405 gpd), 3.31 cfs (2,138,891 gpd) and 8.78 cfs (5,673,552 gpd), respectively.[10]

The City sewer network ultimately conveys wastewater to the Hyperion Sewage Treatment Plant.

Wastewater generation estimates have been prepared for the existing on-site uses based on the City of LA Bureau of Sanitation sewerage generation factors for commercial categories, and are summarized in Table 2 below.

Table 2 – Existing Wastewater Generation

Land Use	Size	Generation Rate (gpd)[a]	Wastewater Generation	
			(gpd)	(mgd)
Office	317,168 sf[b]	120/1,000 sf	38,060	0.038
Bank	7,500 sf	50/1,000 sf	375	0.00038

[9] City of Los Angeles Department of Public Works, Bureau of Sanitation, Sewer System Management Plan Hyperion Sanitary Sewer System, February 2017.

Cafeteria	11,250 sf	50/1000 sf	563	0.00056
Total Existing Wastewater Generation			**38,998**	**0.0389**

Notes:

[a] City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation rates.

[b] There are 541,113 sf of existing office uses on the Project Site, of which approximately 40 percent has been vacant for 10 years. Given this vacancy and per correspondence between the City's Department of City Planning and LA Sanitation on December 6, 2018, the WWSI has been revised to take into account the 40 percent vacancy in the existing office uses. Correspondence with City Planning and LA Sanitation can be found in Exhibit 2.

3.3. ENERGY

3.3.1. ELECTRICITY

LADWP is responsible for providing power supply to the City while complying with County, State, and Federal regulations.

3.3.1.1. REGIONAL

LADWP's Power system is the nation's largest municipal electric utility, and serves a 465-square-mile area in Los Angeles. The system supplies more than 26 million megawatt-hours (MWh) of electricity a year for the City of Los Angeles' 1.4 million residential and business customers as well as over 5,000 customers in the Owens Valley. LADWP has over 7,460 megawatts (MW) of generation capacity from a diverse mix of energy sources including Renewable energy, Natural Gas, Nuclear, Large Hydro, coal and other sources. The distribution network includes 6,800 miles of overhead distribution lines and 3,597 miles of underground distribution cables.[11]

3.3.1.2. LOCAL

Based on available substructure maps from the City of LA Bureau of Engineering's online Navigate LA database, the Project Site receives electric power service from LADWP via existing underground conduits from Broadway, Spring Street and 1st Street.

Electricity demand estimates have been prepared based on the existing building program and are summarized in Table 3 below.

[11] LADWP, 2015 Power Integrated Resource Plan, December 2015.

Table 3- Estimated Existing Electricity Demand			
Existing Use Description	Average Daily Use (kWhr/unit)[(a)]	Quantity	Average Yearly Demand (kWhr/year)
Office[(b)]	13.32/gsf	317,168 gsf	4,224,678
Bank	11.31/gsf	7,500 gsf	84,825
Cafeteria	44.79/gsf	11,250 gsf	503,888
Total Existing Electricity Demand			**4,813,391**

(a) CalEEmod version 2016.3.1 was used to calculate the electricity demand based on land use.
(b) Electricity demand included in the table assumed 60% percent occupancy because approximately 223,945 SF (40 percent) of the office uses have been vacant for 10 years.

3.3.2. NATURAL GAS

SoCal Gas is responsible for providing natural gas supply to the City and is regulated by the California Public Utilities Commission and other state and federal agencies.

3.3.2.1. REGIONAL

Southern California Gas Company (SoCalGas) is the principal distributor of natural gas in Southern California, providing retail and wholesale customers with transportation, exchange and storage services and also procurement services to most retail core customers. SoCalGas is a gas-only utility and, in addition to serving the residential, commercial, and industrial markets, provides gas for enhanced oil recovery (EOR) and electric generation (EG) customers in Southern California. SoCalGas' natural gas system is the nation's largest natural gas distribution utility, and serves a 20,000 square-mile area in Central and Southern California. The system supplies natural gas to 21.6 million customers through 5.9 million meters in more than 500 communities.[12]

3.3.2.2. LOCAL

Based on substructure maps provided by the City, the Project Site receives natural gas service via existing underground conduits from Spring Street and 2nd Street from SoCalGas. Natural gas demand estimates have been prepared based on the existing

[12] LADWP, 2015 Power Integrated Resource Plan, December 2015.
Report.

equipment program and are summarized in Table 4 below.

Table 4- Estimated Existing Natural Gas Demand

Existing Use Description	Average Daily Use (KBTU/unit)[(a)]	Quantity	Average Yearly Demand (KBTU/year)
Office[(b)]	10.46/gsf	317,168 gsf	3,317,578
Bank	18.16/gsf	7,500 gsf	136,200
Cafeteria	230.97/gsf	11,250 gsf	2,598,413
Total Existing Gas Demand			**6,052,191**

(a) CalEEmod version 2016.3.1 was used to calculate the natural gas demand based on land use.
(b) Natural Gas demand included in the table assumed 60% percent occupancy because approximately 223,945 SF (40 percent) of the office uses have been vacant for 10 years.

4. SIGNIFICANCE THRESHOLDS

4.1. WATER

In accordance with State CEQA Guidelines Appendix G (Appendix G), the Project would have a significant impact related to water supply and infrastructure if it would:

- Require or result in the construction of new water facilities or expansion of existing facilities, the construction of which could cause significant environmental effects; or

- Have insufficient water supplies available to serve the project from existing entitlements and resources, thereby requiring new or expanded water entitlements.

For this analysis, the Appendix G Thresholds are relied upon. The analysis utilizes factors and considerations identified in the 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions.

The L.A. CEQA Thresholds Guide (Thresholds Guide) identifies the following criteria to evaluate water supply and infrastructure impacts:

- The total estimated water demand for the project;

- Whether sufficient capacity exists in the water infrastructure that would serve the project, taking into account the anticipated conditions at project buildout;
- The amount by which the project would cause the projected growth in population, housing, or employment for the Community Plan area to be exceeded in the year of project completion; and
- The degree to which scheduled water infrastructure or project design features would reduce or offset service impacts.

4.2. WASTEWATER

In accordance with Appendix G, the Project would have a significant impact related to wastewater if it would:

- Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board;
- Require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which would cause significant environmental effects; or
- Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

For this analysis, the Appendix G Thresholds are relied upon. The analysis utilizes factors and considerations identified in the 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions.

The Thresholds Guide identifies the following criteria to evaluate wastewater:

- The project would cause a measurable increase in wastewater flows at a point where, and a time when, a sewer's capacity is already constrained or that would cause a sewer's capacity to become constrained; or
- The project's additional wastewater flows would substantially or incrementally exceed the future scheduled capacity of any one treatment plant by generating flows greater than those anticipated in the Wastewater Facilities Plan or General Plan and its elements.

4.3. ENERGY

Appendix F of the CEQA Guidelines states that the potentially significant energy implications of a project should be considered in an EIR. Environmental impacts, as noted in Appendix F, may include:

- The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project's life cycle including construction, operation, maintenance and/or removal. if appropriate, the energy intensiveness of materials may be discussed;
- The effects of the project on local and regional energy supplies and on requirements for additional capacity;
- The effects of the project on peak and base period demands for electricity and other forms of energy;
- The degree to which the project complies with existing energy standards;
- The effects of the project on energy resources;
- The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

In the context of the above thresholds, the *L.A. CEQA Thresholds Guide* states that a determination of significance shall be made on a case-by case basis, considering the following factors:

- The extent to which the project would require new (off-site) energy supply facilities and distribution infrastructure; or capacity enhancing alterations to existing facilities;
- Whether and when the needed infrastructure was anticipated by adopted plans; and
- The degree to which the project design and/or operations incorporate energy conservation measures, particularly those that go beyond City requirements.

5. METHODOLOGY

5.1. WATER

The methodology for determining the significance of a project as it relates to a project's impact on water supply and distribution infrastructure is based on the *L.A. CEQA Thresholds Guide*. This methodology involves a review of the project's environmental setting, project impacts, cumulative impacts, and mitigation measures (if required). The following has been considered as part of the determination for this Project:

Environmental Setting

- Description of major water infrastructure serving the Project site, including the type of facilities, location and sizes, and any planned improvements.

- Description of the water conditions for the Project area and known improvement plans.

Project Impacts

- Evaluate the Project's water demand, taking into account design or operational features that would reduce or offset water demand.

- Determine what improvements would be needed, if any, to adequately serve the Project.

- Describe the degree to which presently scheduled off-site improvements offset impacts.

This report analyzes the potential impacts of the Project on the existing public water infrastructure by comparing the estimated Project demand with the calculated available capacity of the existing facilities.

The existing and proposed water demand is based upon available site and occupancy information from the WSA.

LADWP performed a hydraulic analysis of their water system to determine if adequate fire flow is available to the fire hydrants surrounding the Project Site. LADWP's approach consists of analyzing their water system model near the Project Site. Based on the results, LADWP determines whether they can meet the project fire hydrant flow needs based on existing infrastructure. See Exhibit 3 for the results of the Information of Fire Flow Availability Request (IFFAR).In addition, LADWP performed a flow test to determine if available water conveyance exists for future development. LADWP's approach consists of data ranging from available static pressure (meaning how much pressure is available at the source before applying the project's demand), to the available pressure at the maximum demand needed for the project. Based on the results, LADWP determines whether they can meet the project needs based on existing infrastructure. See Exhibit 1 for the results of the Service Advisory Request (SAR).

Project water demand estimates incorporate proposed water conservation measures identified later in this report under Section 6: Project Characteristics.

5.2. WASTEWATER

The methodology for determining the significance of a project as it relates to a project's impact on wastewater collection and treatment infrastructure is based on the *L.A. CEQA*

Thresholds Guide. This methodology involves a review of the project's environmental setting, project impacts, cumulative impacts, and mitigation measures (if required). The following has been considered as part of the determination for this Project:

Environmental Setting

- Location of the Project and appropriate points of connection to the wastewater collection system on the pertinent Wye Map;

- Description of the existing wastewater system which would serve the Project, including its capacity and current flows.

- Summary of adopted wastewater-related plans and policies that are relevant to the Project area.

Project Impacts

- Evaluate the Project wastewater needs (anticipated daily average wastewater flow), taking into account design or operational features that would reduce or offset service impacts;

- Compare the Project's wastewater needs to the appropriate sewer's capacity and/or the wastewater flows anticipated in the Wastewater Facilities Plan or General Plan.

This report analyzes the potential impacts of the Project on the existing public sewer infrastructure by comparing the estimated Project wastewater generation with the calculated available capacity of the existing facilities.

Pursuant to LAMC Section 64.15, BOS Wastewater Engineering Division made a preliminary analysis of the local and regional sewer conditions to determine if available wastewater conveyance and treatment capacity exists for future development of the Project Site. BOS's approach consisted of the study of a worst-case scenario which envisions peak demands from the relevant facilities occurring simultaneously on the wastewater system. A combination of flow gauging data and computed results from the City's hydrodynamic model were used to project current and future impacts due to additional sewer discharge. The data used in this report are based on the findings of the BOS preliminary analysis. Refer to Exhibit 2 for the SCAR prepared for the Project, which contains the results of the BOS preliminary analysis.

5.3. ENERGY

The methodology for determining the significance of a project as it relates to a project's impact on wastewater collection and treatment infrastructure is based on the *L.A. CEQA Thresholds Guide*. This methodology involves a review of the project's environmental setting, project impacts, cumulative impacts, and mitigation measures as required. The following has been considered as part of the determination for this Project:

Environmental Setting

- Description of the electricity and natural gas supply and distribution infrastructure serving the project site. Include plans for new transmission facilities or expansion of existing facilities; and

- Summary of adopted energy conservation plans and policies relevant to the project

Project Impacts

- Evaluation of the new energy supply and distribution systems which the project would require.

- Describe the energy conservation features that would be incorporated into project design and/or operation that go beyond City requirements, or that would reduce the energy demand typically expected for the type of project proposed.

- Consult with the DWP or The Gas Company, if necessary to gauge the anticipated supply and demand conditions at project buildout.

This report analyzes the potential impacts of the Project on existing energy infrastructure by comparing the estimated Project energy demand with the available capacity. Will-serve letters from LADWP and SoCalGas (Exhibits 4 and 5) demonstrate the availability of sufficient energy resources to supply the Project's demand.

In addition, potential energy impacts were analyzed by evaluating the energy demand and energy conserving features of the Project to determine whether the Project would involve the wasteful, inefficient, and unnecessary use of energy resources.

6. PROJECT CHARACTERISTICS

6.1. WATER

The proposed renovated Times Building, Plant Building and Mirror Building are anticipated to be serviced by the existing water main in Spring Street. New domestic water laterals are expected to be required to service the North and South Tower Buildings. Water laterals are proposed to connect to the existing 18" main in Broadway. Furthermore, the project is expected to reduce outdoor potable water use by a minimum of 20 percent compared to baseline water consumption pursuant to the City of Los Angeles No 184248, 2013 California Plumbing Code, 2013 California Green Building Code (CALGreen), 2014 Los Angeles Plumbing Code, and 2014 Los Angeles Green Building Code. In addition to Title 24 requirements, such as water conserving water closets, urinals and showerheads, reductions in water consumption would be achieved through:

- High Efficiency Toilets with flush volume of 1.0 gallons per flush or less;
- ENERGY STAR Certified Residential Clothes Washers – Front-loading with an Integrated Water Factor of 3.6 or less and capacity of 4.3 cubic feet (cu ft);
- Showerheads with a flow rate of 1.5 gpm or less;
- Domestic Water Hearing System located close in proximity to point(s) of use;
- Individual Metering and billing for water use for commercial space;
- Drip/Subsurface Irrigation (Micro-Irrigation);
- Proper Hydro-zoning/Zoned Irrigation (group plants with similar water requirements together); and
- Drought Tolerant Plants – 70 percent of total landscaping.

The proposed renovated Times Building, Plant Building and Mirror Building are anticipated to be serviced by the existing 12" main in Spring Street. As stated prior, the existing main has adequate capacity to serve the aforementioned buildings. However, since the existing Executive Building and parking garage are to be demolished, it is expected that the Fire Department Connections serving these structures would be removed. New connections to meet all Fire Department and Department of Building and Safety regulations would be provided to serve the proposed North and South Towers.

6.1.1. WASTEWATER

The proposed renovation and reuse of the existing Times Building, Mirror Building and Plant Building are anticipated to utilize existing sewer infrastructure. The sanitary sewer connections to the proposed renovated buildings is expected to come from the existing 18-inch sewer main along Spring Street that flows south with a capacity of 8.78 cfs (5,673,552 gpd).[13]

The proposed North and South Tower is anticipated to require new laterals in 1st Street and 2nd Street, to serve the proposed buildings. The sanitary sewer connections for the proposed North Tower is expected to connect to the existing 8-inch sewer main along 1st Street that flows toward Spring Street with a capacity of 1.17 cfs (756,043 gpd). The proposed lateral for the South Tower is anticipated to connect to the existing 8-inch sewer main along 2nd Street that flows towards Spring Street with a capacity of 0.55 cfs (355,405 gpd). Additionally, both the North and South Tower are anticipated to utilize existing connections to the existing 12" main along Broadway that flows south towards 2nd Street with a capacity of 3.31 cfs (2,138,891 gpd). Refer to Exhibit 7 for a diagrammatical representation of proposed and existing sewer lateral locations.

[13] http://navigatela.lacity.org/navigatela/ Accessed September 26, 2018

7. PROJECT IMPACTS

7.1. CONSTRUCTION

7.1.1. WATER

Water demand for construction of the Project would be required for dust control, cleaning of equipment, excavation/export, removal and re-compaction, etc. Based on a review of construction projects of similar size and duration, a conservative estimate of construction water use ranges from 1,000 to 2,000 gallons per day (gpd). Considering temporary construction water use would be substantially less than the existing water consumption at the Project Site (estimated to be approximately 20,137 gpd), it is anticipated that the existing water infrastructure would meet the limited and temporary water demand associated with construction of the Project. Impacts on the water infrastructure due to construction activity would therefore be less than significant.

The Project will require construction of new, on-site water distribution lines to serve the new buildings and facilities of the proposed Project. Construction impacts associated with the installation of water distribution lines would primarily involve trenching in order to place the water distribution lines below surface and would be limited to on-site water distribution, and minor off-site work associated with connections to the public main. Prior to ground disturbance, Project contractors would coordinate with LADWP to identify the locations and depth of all lines. Further, LADWP would be notified in advance of proposed ground disturbance activities to avoid water lines and disruption of water service.

Additionally, a Construction Management Plan would be implemented to reduce any temporary pedestrian and traffic impacts. The contractor would implement the Construction Management Plan, which would ensure safe pedestrian access and vehicle travel and emergency vehicle access throughout the construction phase. Overall, when considering impacts resulting from the installation of any required water infrastructure, all impacts are of a relatively short-term duration (i.e., months) and would cease to occur once the installation is complete. Therefore, Project impacts on water infrastructure associated with construction activities would be less than significant.

7.1.2. WASTEWATER

Construction activities for the Project would not result in wastewater generation as construction workers would typically utilize portable restrooms, which would not contribute to wastewater flows to the City's wastewater system. Thus, wastewater generation from Project construction activities is not anticipated to cause a measurable increase in wastewater flows. Therefore, Project impacts associated with construction-period wastewater generation would be less than significant.

The Project will require construction of new on-site infrastructure to serve the new buildings. Construction impacts associated with wastewater infrastructure would primarily be confined to trenching for connections to public infrastructure. Installation of wastewater infrastructure will be limited to on-site wastewater distribution, and minor off-site work associated with connections to the public main. No upgrades to the public main are anticipated.

A Construction Management Plan would be implemented to reduce any temporary pedestrian and traffic impacts. The contractor would implement the Construction Management Plan, which would ensure safe pedestrian access and vehicle travel and emergency vehicle access throughout the construction phase. Overall, when considering impacts resulting from the installation of any required wastewater infrastructure, all impacts are of a relatively short-term duration (i.e., months) and would cease to occur once the installation is complete. Therefore, Project impacts on wastewater associated with construction activities would be less than significant.

7.1.3. ENERGY

Electrical power would be consumed to construct the new buildings and facilities of the proposed Project. Typical uses include temporary power for lighting, equipment, construction trailers, etc. Overall, demolition and construction activities would require minimal electricity consumption and would not be expected to have any adverse impact on available electricity supplies and infrastructure. Therefore, impacts on electricity supply associated with short-term construction activities would be less than significant.

No natural gas usage is expected to occur during construction. Therefore, impacts on natural gas supply associated with short-term construction activities would be less than significant.

Construction impacts associated with the Project's electrical and gas infrastructure upgrades would primarily be confined to trenching. Infrastructure improvements will comply with all applicable LADWP, SoCalGas, and City of LA requirements, which are expected to and would in fact mitigate impact to existing energy systems and adjacent properties. As stated above, to reduce any temporary pedestrian access and traffic impacts during any necessary off-site energy infrastructure improvements, a Construction Management Plan would be implemented to ensure safe pedestrian and vehicular travel.

Therefore, Project impacts on energy infrastructure associated with construction activities would be less than significant.

7.2. OPERATION

7.2.1. WATER

7.2.1.1. INFRASTRUCTURE CAPACITY

When analyzing the Project for infrastructure capacity, the projected demands for both fire suppression and domestic water are considered. Although domestic water demand is the Project's main contributor to water consumption, fire flow demands have a much greater instantaneous impact on infrastructure, and therefore are the primary means for analyzing infrastructure capacity. Nevertheless, conservative analysis for both fire suppression and domestic water flows has been completed by LADWP for the Project. See Exhibit 3 and Exhibit 1 for the results of the IFFAR and SAR, respectively, which together demonstrate that adequate water infrastructure capacity exists.

7.2.1.2. FIRE WATER DEMAND

Based on fire flow standards set forth in Section 57.507.3 of the LAMC, the Project falls within the industrial and commercial category, which has a required fire flow of 6,000 to 9,000 gallons per minute (gpm) from four to six adjacent hydrants flowing simultaneously with a residual pressure of 20 pounds per square inch (psi). This translates to a required flow of 1,500 gpm for each hydrant. An IFFAR was submitted to LADWP regarding available fire hydrant flow to demonstrate compliance. The completed IFFAR, attached as Exhibit 3, shows six nearby hydrants flowing simultaneously for a combined 9,000 gpm with a residual pressure of 20 psi. Thus, as shown by the IFFAR, the Project Site has adequate fire flow available to demonstrate compliance with Section 57.507.3 of the LAMC under the Project.

Furthermore, LAMC Section 57.513, Supplemental Fire Protection, states that:

> Where the Chief determines that any or all of the supplemental fire protection equipment or systems described in this section may be substituted in lieu of the requirements of this chapter with respect to any facility, structure, group of structures or premises, the person owning or having control thereof shall either conform to the requirements of this chapter or shall install such supplemental equipment or systems. Where the Chief determines that any or all of such equipment or systems is necessary in addition to the requirements of this chapter as to any facility, structure, group of structures or premises, the owner thereof shall install such required equipment or systems.

The Project will incorporate a fire sprinkler suppression system to reduce or eliminate the public hydrant demands, which will be subject to Fire Department review and approval

during the design and permitting of the Project. Based on Section 94.2020.0 of the LAMC that adopts by reference NFPA 14-2013 including Section 7.10.1.1.5, the maximum allowable fire sprinkler demand for a fully or partially sprinklered building would be 1,250 gpm. As noted, a SAR was submitted to LADWP to determine if the existing public water infrastructure could meet the demands of the Project. The approved SAR, attached as Exhibit 1, shows a static pressure of 52 pounds per square inch and that a flow of up to 2,500 gpm can be delivered to the Project Site with a residual pressure of 50 pounds per square inch, which exceeds the 20 pounds per square inch requirement for the surrounding public hydrants. As shown by the SAR, and through compliance with LAFD and LADWP requirements, the Project's fire flow impacts to water infrastructure would be less than significant.

7.2.1.3. DOMESTIC WATER DEMAND

Water consumption estimates have been prepared based on the WSA and summarized in Table 5 below. The approved SAR indicates that 2500 gpm (3,600,000 gpd) is available from existing 18" Water Main in Broadway. Also, the calculation summarized in Table 5 below shows the total water demand for the new development as 256,069 gpd (286.86 afy). Therefore, SAR result confirms that sufficient infrastructure capacity is available for the Project. The Project proposes to connect to the existing 18-inch main in Broadway with laterals that will be adequately sized to simultaneously accommodate fire demand and domestic demand. In addition, the services will include backflows and be metered separately per City requirements. Therefore, the Project's impacts on water supply would be less than significant.

As far as the existing Times Building, Mirror Building and Plant Building that are proposed rehabilitated, it is expected that, there will be an increase in water demand as compared to the previous uses. (A WSA has been submitted and approved for the proposed demand of the Project and the results are reflected in the table below.)

Table 5 – Project Water Demand

Total Water Demand Upon Project Buildout (Net + Existing)					**256,069**	**286.86**

[a] Provided by City of Los Angeles Department of City Planning in the Request for Water Supply Assessment letter and Scope Confirmation e-mail.

[b] Of the 176,258 sf of existing office space in the Executive Building that will be removed, 103,313 sf has been used/occupied in the last 10 years. In other words, only 103,312 sf of office is considered having water demand in the existing Executive building that will be removed.

[c] The existing water demand is based on the LADWP billing data (average of varied available billing years from Fiscal Year 2010 to 2015).

[d] There are 541,131 sf of existing office uses on the Project Site. Of the existing office uses, 176,258 sf of those uses would be removed with the demolition of the Executive Building and 151,017 sf would be converted into grocery store, restaurant, and new office uses. The remaining 213,856 sf would remain as existing office uses.

[e] The water demand generated by the existing office uses to remain on the Project Site is calculated by multiplying the square footage by the conservative older Sewer Generation Rate for office uses of 150 gpd/1,000 sf.

[f] Proposed indoor water uses are based on 2012 City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation Rates table available at: http://www.lacitysan.org/fmd/odf/sfcfeerates.pdf.

[g] The proposed development land uses will conform to City of Los Angeles ordinance No. 184248, 2013 California Plumbing Code, 2013 California Green Building Code (CALGreen), 2014 Los Angeles Plumbing Code, and 2014 Los Angeles Green Building Code.

[h] Base Demand Adjustment is the estimated savings due to Ordinance No. 180822 already accounted for in the current version of Bureau of Sanitation Sewer Generation Rates.

i The Gym/Fitness Center space is currently unprogrammed amenity space. The "Gym" sewage generation factor is used to present a conservative analysis as it provides the highest generation factor for a similar uses.

[j] Garden Plaza not shown here does not have additional water demand.

[k] This office square footage includes the remaining 93,432 sf of new office spaces that would be retrofitted with new water-efficient fixtures. Therefore, LADWP takes a more conservative approach in estimating water demand for these office spaces by using an older Sewer Generation Rate available at: http://www.environmetia.org/programs/Thresholds/M-Public%20Utilities.pdf.

[l] Landscaping water use is estimated per California Code of Regulations title 23, Division 2, Chapter 2.7, Model Water Efficient Landscape Ordinance.

[m] Parking structure water uses are based on City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation Rates table, and 12 times/year clearing assumptions.

[n] The office and restaurant square footages are based on the most current Project Description, where the upper floor restaurant square footage in the Times, Mirror, and Plant Buildings has been reallocated to office space (new total 93,342 sf) and the retail space in the North and South Towers has been reallocated to restaurant uses (new total 53,389 sf). The WSA, approved by the Board of Water and Power on September 19, 2017, reflected a prior version of the Project with a net new water demand of 196,773 gpd and 220.42 afy. As determined by LADWP in correspondence dated February 8, 2018, and as included as Exhibit 2, LADWP recalculated the Project's water demand based on

revisions to the scope of the Project, including the updated restaurant and office space, and determined that sufficient water supplies would be available from existing entitlements to meet the increased demand during average, single-dry, and multiple-dry years hydrologic conditions. Thus, no new WSA is required for the revisions because the changes in the Project do not result in a substantial increase in water demand for this Project relative to available supplies. This table has been updated from the WSA to show the amounts that would be generated by the updated uses in the Project Description. The Required Ordinance Water Savings for the uses that were updated were not proportionally increased as a smaller amount would provide for a more conservative new water demand for the listed use. Analysis based on the Project's water demand from the table would be considered to be conservative. The cumulative discussion below will rely on this number for the Project's net additional water demand.

[o] Water conservation due to additional conservation commitments agreed by the Applicant under PDF WS-1. From Table II of the WSA.

SOURCE: Los Angeles Department of Water and Power, Water Supply Assessment, pages 8 and 9.

7.2.2. WASTEWATER

7.2.2.1. SEWER GENERATION

The Project will generate approximately 328,328 gross gallons per day (gpd) of wastewater (a net increase of 289,330 gpd over existing wastewater generation at the Project Site). Wastewater generation estimates have been prepared based on the existing and proposed wastewater demand provided in the "Notice of Preparation of Environmental Impact Report and Public Scoping Meeting" letter prepared by Los Angeles Sanitation and LA Sanitation's email correspondence dated December 6, 2018, included as Exhibit 2 in the Appendix.

Table 6 – Project Waste Water Demand

Existing Uses	**Size**	**Generation Factor (gpd)[a]**	**Average Daily Flow (gpd)**
Existing Wastewater			
Offices[b]	317,168 sf	120/1,000 sf	38,060
Bank	7,500 sf	50/1,000 sf	375
Cafeteria	11,250 sf	50/1,000 sf	563
		Existing Subtotal	**38,998**

Type of Use[d]	Size	Generation Factor (gpd)[c]	Average Daily Flow (gpd)
Residential			
Studio	90 du	75/du	6,750
1 Bedroom	546 du	110/du	60,060
1 Bedroom + Den	160 du	190/du[e]	30,400
2 Bedroom	324 du	150/du	48,600
3 Bedroom	4 du	190/du	760
Penthouse	3 du	230/du	690
Amenities + Lounges + Loading[f]	29,539 sf	350/1,000 sf	10,339
Open Space	129,477 sf	350/1,000 sf	45,317
Restaurant	53,389 sf	300/1,000 sf	16,017
Grocery Store (Plant Building)	50,000 sf	50/1,000 sf	2,500
Office[g]	307,288 sf	120/1,000 sf	36,875
Swimming Pool[h]	9,000 cf	7.78/cf	70,020
Proposed Subtotal			**328,328**
Less Existing to be Removed Total			-38,998
Net Additional Wastewater Generation			**289,330**

[a] Proposed generation rates are based on 2012 City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation Rates table available at http://www.lacotysan.org/fmd/pdf/sfcfeerates.pdf.

[b] There are 541,113 sf of existing office uses on the Project Site, of which approximately 40 percent has been vacant for 10 years. Given this vacancy, the analysis assumes that 317,168 sf of uses are currently in use.

[c] Per correspondence between the City's Department of City Planning and LA Sanitation on December 6, 2018, the WWSI has been revised to take into account the approximately 40 percent vacancy in the existing office uses. Refer to Exhibit 2 for aforementioned correspondence.

[d] Provided by LA Sanitation in the WWSI, provided as Exhibit 2 of the Utility Technical Report. The office and restaurant square footages in this table are based on the most current Project Description, where the upper floor restaurant square footage has been reallocated to office space. As stated in LA Sanitation's email correspondence, dated July 16, 2018, the Project Description was updated to reallocate upper-floor restaurant square footage to office space and to reallocate retail space into ground-floor restaurant space. As stated by LA Sanitation, the revised wastewater demand would still be accommodated and no revisions to the wastewater demand estimates in the WWSI are required.

[e] The wastewater generation rate applied here for the 1 Bedroom + Den use is higher than the standard wastewater generation rate for a 2 Bedroom use (150 gpd/du). Therefore, the overall wastewater generation from the Project is more conservative.

[f] The wastewater generation from amenities and lounges are typically subsumed within the respective uses (e.g., amenities within residential uses, lounges within open space). Wastewater generation from loading docks are not typically calculated as part of the Project. Therefore, by including these uses within the wastewater

generation under the Project, the total wastewater generated will be more conservative.

[g] This office square footage includes 213,856 sf that currently exist and are occupied and would continue to exist and be occupied after rehabilitation of the Times, Mirror and Plant Buildings as well as 213,856 square feet of existing office uses that would remain, but would not be retrofitted.

[h] This calculation is extremely conservative as it assumes the pool will be drained and refilled daily.

A Notice of Preparation of Environmental Impact Report and Public Scoping Meeting (NOP) letter was issued for the Times Mirror Square Project to evaluate the local sewer conditions and to determine if available wastewater capacity exists for future developments. This evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvement projects needed to provide future capacity as the City of LA grows and develops. The sewer infrastructure in the vicinity of the project include an existing 8-inch Vitrified Clay Pipe (VCP) sewer lines in 1st Street & 2nd Street, a 12-inch main line along Broadway and an 18-inch pipe along Spring Street. Based on the estimated flows, shown in Table 6 above, it appears the sewer system might be able to accommodate the total flow for the proposed renovation of the Times, Plant and Mirror development. As mentioned within the footnote b of Table 6, the Project Description has been updated to include additional office space that was not in the original project description. However, based on the LA Sanitation's email correspondence, dated December 6, 2018, the revised wastewater demand of 289,330 gpd will still be accommodated and no revisions to the wastewater demand estimates shown above are necessary. See Exhibit 2 for the email correspondence and LA Sanitation's NOP.

With respect to wastewater treatment capacity, as indicated previously, the existing design capacity of the Hyperion Service Area is approximately 550 million gallons per day, while the existing average daily flow treated by the System is approximately 362 mgd.[14] The Project's estimated net increase in wastewater generation of approximately 0.289 mgd would be far less than one percent of the Hyperion Treatment Plant's remaining available capacity. Consequently, adequate wastewater treatment capacity exists to serve the Project, and Project impacts on wastewater treatment capacity would be less than significant.

Due to this fact, the NOP, and LA Sanitation's email correspondence, dated December 6, 2018, that states that the above estimates are adequate, impacts on wastewater infrastructure conveyance capacity would be less than significant.

Total Proposed Electricity Demand for Project Site			13,250,270
Existing Total Electricity Demand for Project Site			4,813,391
Net Increase in Electricity Demand for Project Site Due to Project			8,436,879

[a] The average projected load based on estimates from CalEEMod.

[b] 1 MW (megawatt) = 1,000,000 Watts.

[c] Electricity demand included in the table assumed 60% percent occupancy because approximately 223,945 SF (40 percent) of the office uses have been vacant for 10 years**.**

7.2.3.2. A will serve letter was sent to LADWP to determine if there is sufficient capacity to serve the Project. Based on the response from LADWP (see Exhibit 4), impacts related to electrical services would be less than significant.

7.2.3.2. NATURAL GAS.

Project operations will increase the demand for natural gas resources. Based on analysis by CalEEMod software, the estimated projected natural gas loads are provided in Table 8 below.

A will serve letter was sent to SoCal Gas to determine if there is sufficient capacity to serve the Project. Based on the response from SoCalGas (see Exhibit 5), impacts related to natural gas would be less than significant.

Table 8- Estimated Proposed Natural Gas Demand			
Existing Use Description	Average Daily Use (KBTU/unit)[a]	Quantity	Average Yearly Demand (KBTU/year)

(b) Electricity demand included in the table assumed 60% percent occupancy because approximately 223,945 SF (40 percent) of the office uses have been vacant for 10 years**.**

7.3. CUMULATIVE IMPACTS

7.3.1. WATER

The geographic context for the cumulative impact analysis on water supply is the LADWP service area (i.e., the City). LADWP, as a public water service provider, is required to prepare and periodically update an Urban Water Management Plan to plan and provide for water supplies to serve existing and projected demands. The 2015 UWMP prepared by LADWP accounts for existing development within the City, as well as projected growth through the year 2040.

Additionally, under the provisions of Senate Bill 610, LADWP is required to prepare a comprehensive water supply assessment for every new development "project" (as defined by Section 10912 of the Water Code) within its service area that reaches certain thresholds. The types of projects that are subject to the requirements of Senate Bill 610 tend to be larger projects that may or may not have been included within the growth projections of the 2015 UWMP. The water supply assessment for projects would evaluate the quality and reliability of existing and projected water supplies, as well as alternative sources of water supply and measures to secure alternative sources if needed.

Furthermore, through LADWP's 2015 UWMP process and the City's Securing L.A.'s Water Supply, the City will meet all new demand for water due to projected population growth to the year of 2040, through a combination of water conservation and water recycling. These plans outline the creation of sustainable sources of water for the City of Los Angeles to reduce dependence on imported supplies. LADWP is planning to achieve

these goals by expanding its water conservation program. To increase recycled water use, LADWP is expanding the recycled water distribution system to provide water for irrigation, industrial use, and groundwater recharge.

There are approximately 170 projects within a 1.5 mile radius of the Project Site. Of the 170 related projects, 134 consist of multifamily residential, schools, hotels, theaters, and commercial uses. The total increase in water demand for the related projects is approximately 10.94 millions gallons per day (mgd). Combined with the Proposed Project, the net increase in water demand is approximately 11.17 mgd. Refer to Exhibit 8 for a breakdown of the related projects and associated water consumption. The 2015 UWMP has estimated a water demand of 475 mgd by the year 2025, which means the proposed project combined with the related projects would account for approximately 2.3% percent of the total daily demand. Compliance of the Project and future development projects with regulatory requirements that promote water conservation such as the Los Angeles Municipal Code, including the City's Green Building Code, as well as AB 32, would also assist in assuring that adequate water supply is available on a cumulative basis.

Based on the above, it is anticipated that LADWP would be able to supply the water demands of the Project as well as future growth. Therefore, cumulative impacts on water supply would be less than significant.

7.3.2 WASTEWATER

The Proposed Project will result in the additional generation of sewer flow. However, as discussed above the Bureau of Sanitation will conduct an analysis of existing and planned capacity and will determine that adequate capacity exists to serve the Project. Related projects connecting to the same sewer system are required to obtain a sewer connection permit and submit a Sewer Capacity Availability Request to the Bureau of Sanitation as part of the related project's development review. Impact determination will be provided following the completion of the SCAR analysis. If system upgrades are required as a result of a given project's additional flow, arrangements would be made between the related project and the Bureau of Sanitation to construct the necessary improvements. At this time, the City's BOS has found that it has the capacity to serve the Project and related projects anticipated in growth forecast with the existing infrastructure. There are approximately 170 projects within a 1.5 mile radius of the Project Site. Of the 170 related projects, 134 consist of multifamily residential, schools, hotels, theaters, and commercial uses. Based on these forecasts and the Project-specific information reviewed by the City's BOS, the Project's increase in wastewater generation is not cumulatively considerable and would be adequately accommodated by the Hyperion Treatment Plant. Refer to Exhibit 9 for a complete breakdown of wastewater demand for related projects and associated wastewater consumption. In addition, the City's BOS analysis confirms that the Hyperion Treatment Plant has sufficient capacity and regulatory allotment for the

Project and anticipated growth of cumulative projects. Therefore, operation of the Project would have a less than significant impact on wastewater treatment facilities.

7.3.3 ENERGY

The geographic context for the cumulative analysis of electricity is LADWP's service area and the geographic context for the cumulative analysis of natural gas is SoCal Gas' service area. The geographic context for transportation energy use is the City of Los Angeles. Growth within these geographies is anticipated to increase the demand for electricity, natural gas, and transportation energy, as well as the need for energy infrastructure, such as new or expanded energy facilities.

Buildout of the Project, the related projects, and additional growth forecasted to occur in the City would increase electricity consumption during project construction and operation and, thus, cumulatively increase the need for energy supplies and infrastructure capacity, such as new or expanded energy facilities. LADWP forecasts that its net energy for load in the 2023 fiscal year (the project buildout year) will be 28,253 GWhr of electricity.[15] Based on the Project's estimated net new electrical consumption of 13.4 GWhr and LADWP's forecast of 28,253 GWhr, the Project would account for less than 1 percent of LADWP's projected net energy load for the Project's build-out year. Furthermore, there are approximately 170 related projects within a 1.5-mile radius. Of the related projects 134 consist of multifamily residential, schools, hotels, theaters, and commercial uses. The total increase in energy demand for the related projects is approximately 518 GWhr. Combined with the proposed project, the net increase in energy demand is approximately 531.5 GWhr. The estimated net increase in energy demand resulting from the build-out of related projects combined with the proposed project, would represent approximately 1.9 percent of the LADWPs forecast for the net energy load in the fiscal year 2023. Refer to Exhibit 10 for a breakdown of the related projects and associated energy consumption. Although future development would result in the irreversible use of renewable and non-renewable electricity resources during project construction and operation which could limit future availability, the use of such resources would be on a relatively small scale and would be consistent with growth expectations for LADWP's service area. Furthermore, like the Project, during construction and operation, other future development projects would be expected to incorporate energy conservation features, comply with applicable regulations including CALGreen and State energy standards under Title 24, and incorporate mitigation measures, as necessary. Accordingly, the Project's contribution to cumulative impacts related to electricity consumption would not be cumulatively considerable and, thus, would be less than significant.

Electricity infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by LADWP are ongoing. As described in LADWP's 2015 Power Integrated Resource Plan, LADWP would continue to expand delivery capacity as needed to meet demand increases within its service area at the lowest

[15] LADWP, 2015 Power Integrated Resource Plan, Appendix A, Table A-1.

cost and risk consistent with LADWP's environmental priorities and reliability standards. LADWP has indicated that the Power Integrated Resource Plan incorporates the estimated electricity requirement for the Project. The Power Integrated Resource Plan takes into account future energy demand, advances in renewable energy resources and technology, energy efficiency, conservation, and forecast changes in regulatory requirements. Development projects within the LADWP service area would also be anticipated to incorporate site- specific infrastructure improvements, as necessary. Each of the related projects would be reviewed by LADWP to identify necessary power facilities and service connections to meet the needs of their respective projects. Project applicants would be required to provide for the needs of their individual projects, thereby contributing to the electrical infrastructure in the Project area. As such, the Project's contribution to cumulative impacts with respect to electricity infrastructure would not be cumulatively considerable and, thus, would be less than significant.

Buildout of the Project and related projects in SoCalGas' service area is expected to increase natural gas consumption during project construction and operation and, thus, cumulatively increase the need for natural gas supplies and infrastructure capacity. Based on the 2016 California Gas Report, the California Energy Commission estimates natural gas availability within SoCalGas' planning area will be approximately 2,456 million cubic feet/day in 2025.[16] Based on the Project's estimated net new daily natural gas consumption of 0.09 million cubic feet per day, and SoCalGas' projected 2,456 million cubic feet capacity in 2025, the Project would account for less than 1 percent of SoCalGas projected additional capacity for the Project's build-out year. There are approximately 170 related projects within a 1.5 mile radius. Of the 170 related projects,134 consist of multifamily residential, schools, hotels, theaters, and commercial uses. The total increase in gas demand for the related projects is approximately 3.26 million cubic feet per day. Combined with the proposed project, the net increase in gas demand is approximately 3.35 million cubic feet per day. The estimated net increase in gas demand resulting from the build-out of related projects combined with the proposed project, would represent approximately less than 1 percent of the SoCalGas forecast for the peak demand in the fiscal year 2023. Refer to Exhibit 11 for a breakdown of the related projects and associated gas consumption. SoCal Gas' forecasts take into account projected population growth and development based on local and regional plans. Although future development projects would result in the irreversible use of natural gas resources which could limit future availability, the use of such resources would be on a relatively small scale and would be consistent with regional and local growth expectations for SoCal Gas' service area. Furthermore, like the Project, during project construction and operation other future development projects would be expected to incorporate energy conservation features, comply with applicable regulations including CALGreen and State energy standards under Title 24, and incorporate mitigation measures, as necessary. Accordingly, the Project's contribution to cumulative impacts related to natural gas consumption would not be cumulatively considerable and, thus,

[16] California Gas and Electric Utilities, 2016 California Gas Report, p. 97.

would be less than significant.

Natural gas infrastructure is typically expanded in response to increasing demand, and system expansion and improvements by SoCalGas occur as needed. It is expected that SoCalGas would continue to expand delivery capacity if necessary to meet demand increases within its service area. Development projects within its service area would also be anticipated to incorporate site-specific infrastructure improvements, as appropriate. As such, cumulative impacts with respect to natural gas infrastructure would not be cumulatively considerable and, thus, would be less than significant.

8. LEVEL OF SIGNIFICANCE

Based on the analysis contained in this report no significant impacts have been identified for water, wastewater, or energy for this Project.

To: Christopher DeMonbrun <chris.demonbrun@lacity.org>

Hi Chris,
As discussed on the phone late last week, the subject project has undergone a couple of minor revisions relative to the project description that was accounted for in LASAN's 7/20/2017 comment letter (attached). The primary difference would be a shift in retail, restaurant and office space, as shown in the attached scope revision chart. There is no change in the overall square footage of the project or number of residential units.

Thank you and we look forward to your comments.

Please note that as of April 9, 2018, Major Projects has moved to Fig Plaza:

221 N. Figueroa, Suite 1350, Los Angeles, CA 90012

New Phone Number: (213) 847-3637.

William Lamborn
Major Projects
Department of City Planning
221 N. Figueroa, Suite 1350
Ph: 213.847.3637
Please note that I am out of the office every other Friday.

To: William Lamborn <william.lamborn@lacity.org>

Hello William,

Thank you for the follow up. I have looked over the modifications shown in your attachments and re-evaluated the conveyance system with the change in projected flow. Based on the available gauging, it appears as though the wastewater conveyance system might be able to accommodate the total flow for this project. As with the previous response, further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this wastewater will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

If you have any questions or comments regarding this information, do not hesitate to contact me.

Best regards,

Chris

LA Sanitation

SUBJECT: **TIMES MIRROR SQUARE – NOTICE OF PREPARATION OF ENVIRONMENTAL IMPACT REPORT AND PUBLIC SCOPING MEETING**

This is in response to your June 30, 2017 letter requesting a review of your proposed mixed-use project located at 121-147 S. Spring Street, 100-142 S. Broadway, 202-234 W. 1st Street, and 205-221 W. 2nd Street, Los Angeles, CA 90012. The project will consist of residential units, space amenities, lounges, loading areas, retail uses, grocery store, office, restaurant, and a swimming pool. LA Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

LA Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvement projects needed to provide future capacity as the City grows and develops.

Projected Wastewater Discharges for the Proposed Project:

Total			**256,943**

SEWER AVAILABILITY

The sewer infrastructure in the vicinity of the proposed project includes an existing 12-inch line on Broadway. The sewage from the existing 12-inch line feeds into 27-inch line on Hill Street before discharging into a 50-inch sewer line on Grand Ave. Figure 1 shows the details of the sewer system within the vicinity of the project. The current flow level (d/D) in the 12-inch line cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
12	Broadway	*	991,386 GPD
12	Broadway	36	968,056 GPD
24	Hill St	23	5.21 MGD
24	Hill St	16	4.80 MGD
27	Hill St	29	6.50 MGD
50	Grand Ave	43	19.81 MGD

* No gauging available

Based on the estimated flows, it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this sewage flow will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

If you have any questions, please call Christopher DeMonbrun at (323) 342-1567 or email at chris.demonbrun@lacity.org.

STORMWATER REQUIREMENTS

LA Sanitation, Watershed Protection Program (WPP) is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

In accordance with the Municipal Separate Storm Sewer (MS4) National Pollutant Discharge Elimination System (NPDES) Permit (Order No. R4-2012-0175, NPDES No. CAS004001) and the City of Los Angeles Stormwater and Urban Runoff Pollution Control requirements (Chapter VI, Article 4.4, of the Los Angeles Municipal Code), the Project shall comply with all mandatory provisions to the Stormwater Pollution Control Measures for Development Planning (LID Ordinance) and as it may be subsequently amended or modified. Prior to issuance of grading or building permits, the Applicant shall submit a LID Plan to the City of Los Angeles, Bureau of Sanitation, Watershed Protection Division (WPD), for review and approval. The LID Plan shall be prepared consistent with the requirements of the Development Best Management Practices Handbook.

Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lacitysan.org. It is advised that input regarding LID requirements be received in the early phases of the project from WPD's plan-checking staff.

GREEN STREETS

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-away to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local ground water basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the LID requirements. Green Street standard plans can be found at: www.eng2.lacity.org/techdocs/stdplans/

CONSTRUCTION REQUIREMENTS

All construction sites are required to implement a minimum set of BMPs for erosion control, sediment control, non-stormwater management, and waste management. In addition, construction sites with active grading permits are required to prepare and implement a Wet Weather Erosion Control Plan during the rainy season between October 1 and April 15. Additionally, construction sites that disturb more than one-acre of land are subject to the NPDES

Construction General Permit issued by the State of California, and are required to prepare, submit, and implement the Storm Water Pollution Prevention Plan (SWPPP).

If there are questions regarding the stormwater requirements, please call WPP's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 3rd Fl, Station 18.

GROUNDWATER DEWATERING REUSE OPTIONS

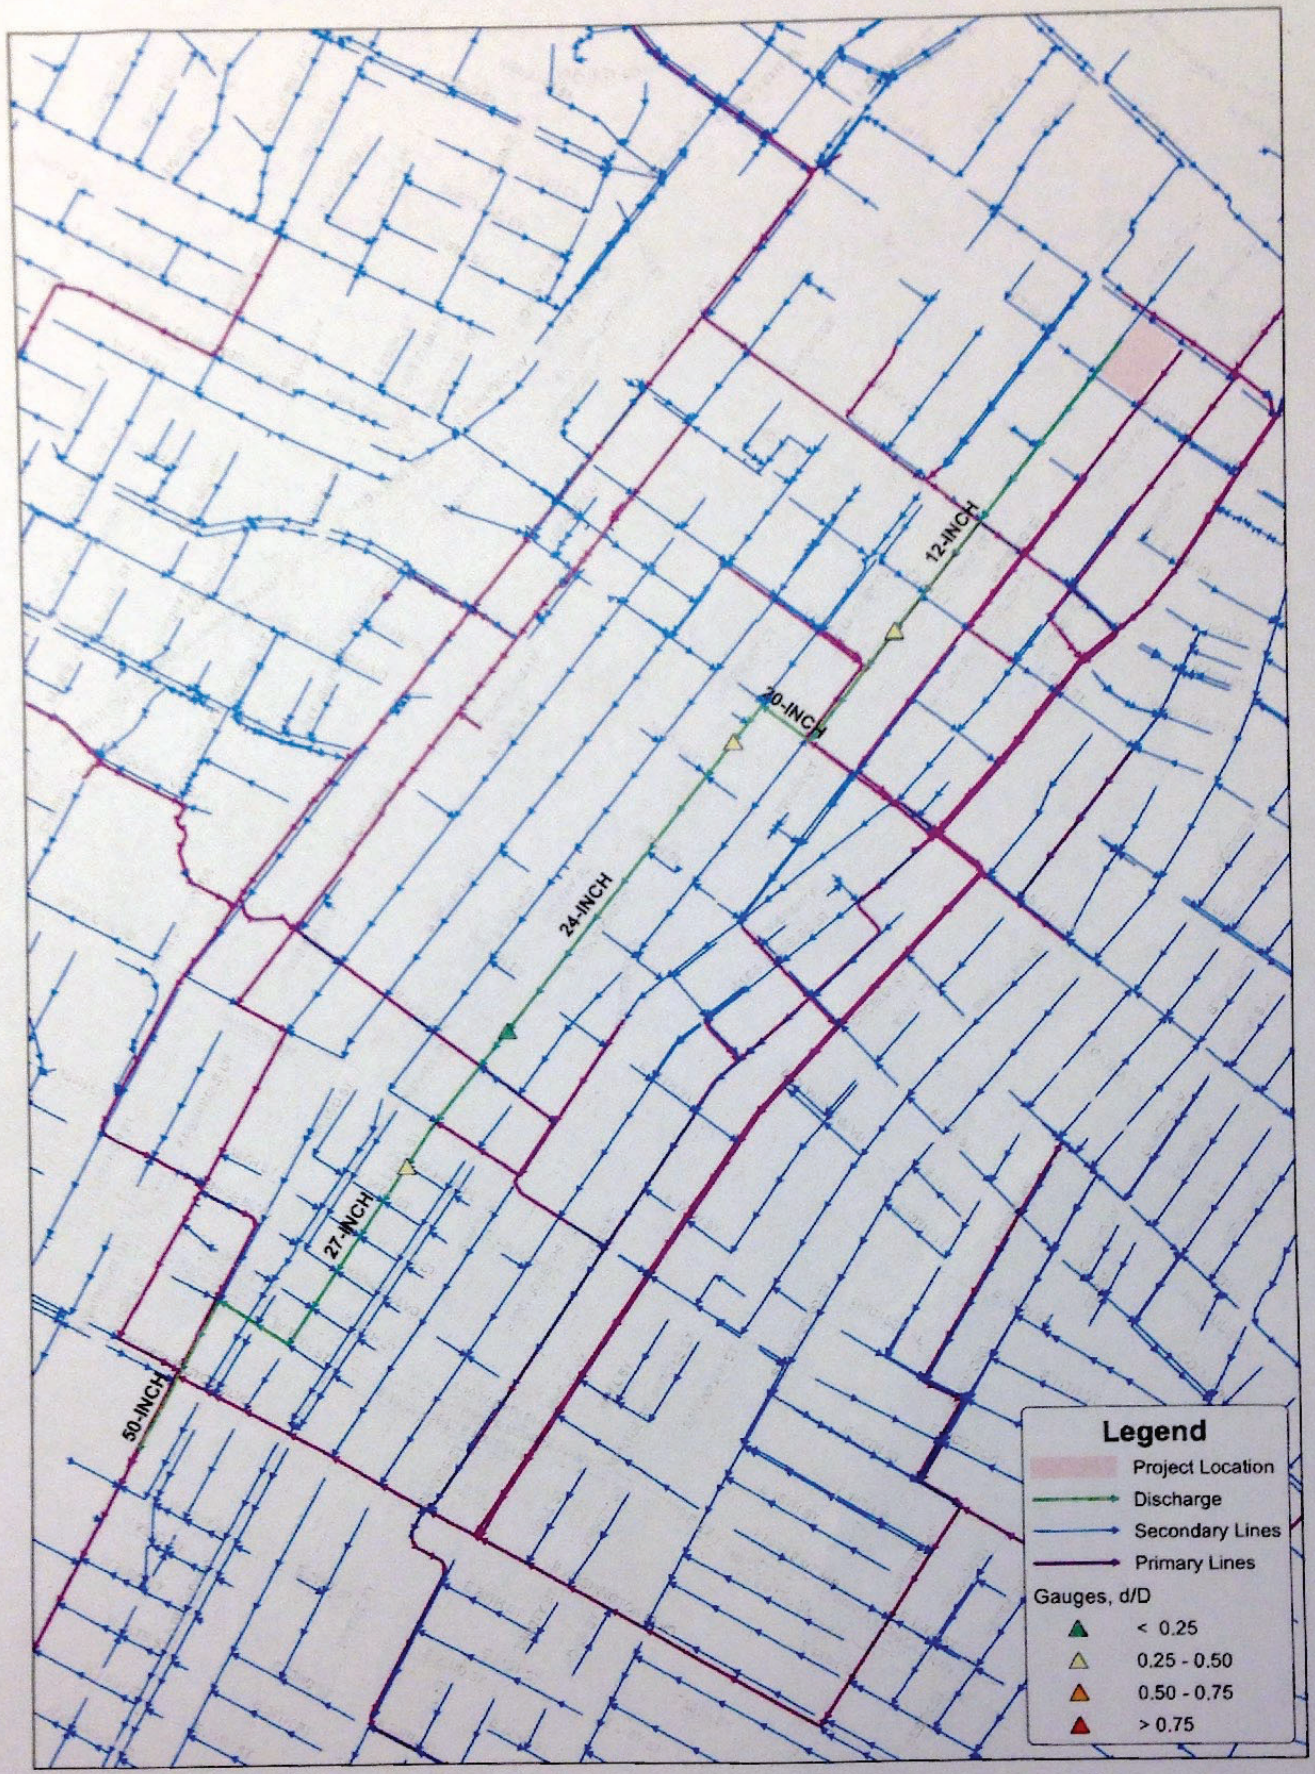
The Los Angeles Department of Water and Power (LADWP) is charged with the task of supplying water and power to the residents and businesses in the City of Los Angeles. One of the sources of water includes groundwater. The majority of groundwater in the City of Los Angeles is adjudicated, and the rights of which are owned and managed by various parties. Extraction of groundwater within the City from any depth by law requires metering and regular reporting to the appropriate Court-appointed Watermaster. LADWP facilitates this reporting process, and may assess and collect associated fees for the usage of the City's water rights. The party performing the dewatering should inform the property owners about the reporting requirement and associated usage fees.

On April 22, 2016 the City of Los Angeles Council passed Ordinance 184248 amending the City of Los Angeles Building Code, requiring developers to consider beneficial reuse of groundwater as a conservation measure and alternative to the common practice of discharging groundwater to the storm drain (SEC. 99.04.305.4). It reads as follows: "Where groundwater is being extracted and discharged, a system for onsite reuse of the groundwater, shall be developed and constructed. Alternatively, the groundwater may be discharged to the sewer."

Groundwater may be beneficially used as landscape irrigation, cooling tower make-up, and construction (dust control, concrete mixing, soil compaction, etc.). Different applications may require various levels of treatment ranging from chemical additives to filtration systems. When onsite reuse is not available the groundwater may be discharged to the sewer system. This allows the water to be potentially reused as recycled water once it has been treated at a water reclamation plant. If groundwater is discharged into the storm drain it offers no potential for reuse. The onsite beneficial reuse of groundwater can reduce or eliminate costs associated with sewer and storm drain permitting and monitoring. Opting for onsite reuse or discharge to the sewer system are the preferred methods for disposing of groundwater.

To help offset costs of water conservation and reuse systems, LADWP offers the Technical Assistance Program (TAP), which provides engineering and technical assistance for qualified projects. Financial incentives are also available. Currently, LADWP provides an incentive of $1.75 for every 1,000 gallons of water saved during the first two years of a five-year conservation project. Conservation projects that last 10 years are eligible to receive the incentive during the first four years. Other water conservation assistance programs may be available from Metropolitan Water District of Southern California. To learn more about available water conservation assistance programs, please contact LADWP Rebate Programs 1-888-376-3314 and LADWP TAP 1-800-544-4498, selection "3".

For more information related to beneficial reuse of groundwater, please contact Greg Reed, Manager of Water Rights and Groundwater Management, at (213)367-2117 or greg.reed@ladwp.com.



SOLID RESOURCE REQUIREMENTS

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact Daniel Hackney of the Special Project Division at (213)485-3684.

Total			**262,456** ~~**256,943**~~

Below is an itemized list for each highlighted change and associated change in GPD above:

1. The previous retail use in the North and South Towers Development of 34,572 square feet is now going to be ground-floor restaurant. The LA Sanitation letter received on July 20, 2017 had this square footage marked as 34,527 square feet, so we are also requesting for it to be corrected to 34,572 square feet.

2. The restaurant square footage previously accounted for both a ground-floor and upper-floor restaurant in the Times, Plant, and Mirror Buildings rehabilitation. The upper-floor restaurant will be replaced with office (see following item), so the restaurant square footage will be 18,817 square feet, in addition to the new restaurant from Item 1.

3. The Times, Plant, and Mirror Buildings Rehabilitation will now contain an additional 22,200 square feet of office space, in addition to the previously accounted for 285,088 square feet. The total office space is now 307,288 square feet.

Exhibit 2- LA Sanitation Email Correspondence dated 12/6/2018

Times Mirror Square - LASAN Comment Letter

William Lamborn <william.lamborn@lacity.org> Wed, Dec 5, 2018 at 4:52 PM
To: Christopher DeMonbrun <chris.demonbrun@lacity.org>
Cc: Albert Lew <albert.lew@lacity.org>

Hello Chris and Albert,
As discussed over the phone, for the subject project, 40% of the existing uses are office spaces that have been vacant for 10 years. The proposed project's new wastewater generation is exactly the same as your 7/16/2018 review. However, when accounting for this existing office vacancy, and resulting reduction in existing office square footage, the project's net wastewater generation would change. We are therefore requesting that you review the revised net wastewater generation consistent with this existing 40% vacancy (please see attached revised net wastewater generation chart).

Thanks so much for your assistance, and we look forward to your comments.

> Hello William,
>
> Thank you for the follow up. I have looked over the modifications shown in your attachments and re-evaluated the conveyance system with the change in projected flow. Based on the available gauging, it appears as though the wastewater conveyance system might be able to accommodate the total flow for this project. As with the previous response, further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer has insufficient capacity then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at that time. Ultimately, this wastewater will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

Hello William,

We've reviewed the revised discharge at 289,330 GPD and based on the available gauging, there may be capacity in the wastewater conveyance system to accommodate that flow. As with Chris's earlier email, further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point, especially when a final approval for sewer capacity (SCAR) and connection permit will be required. If the public sewer has insufficient capacity, the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. Ultimately, this wastewater will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

Please let me know if you have any questions.

Thanks,
Albert

Subject: Times Mirror Square Project
202 W. 1st Street

Dear Mr. Banzil:

This is in response to your submittal regarding electric service for the proposed project located at the above address.

Electric Service is available and will be provided in accordance with the Los Angeles Department of Water and Power's (Department) Rules Governing Water and Electric Service. The availability of electricity is dependent upon adequate generating capacity and adequate fuel supplies. The estimated power requirement for this proposed project is part of the total load growth forecast for the City of Los Angeles and has been taken into account in the planned growth of the City's power system.

If you have any questions regarding this matter, please contact me at telephone number (213) 367-2725.

Sincerely,

VINCENT G. ZABUKOVEC
Engineer of Customer Station Design

Exhibit 5- SoCal Gas Approved Will-Serve Letter

Southern California Gas Company

A Sempra Energy utility®

May 5, 2017

KPFF Consulting Engineers
700 S Flower St., Suite 2100
Los Angeles, CA 90017

Attn: Sam Sanatnama

RE: Will Serve Letter Request for – Job I.D. #43-2017-04-00032
202 W. 1st St., Los Angeles, CA 90017

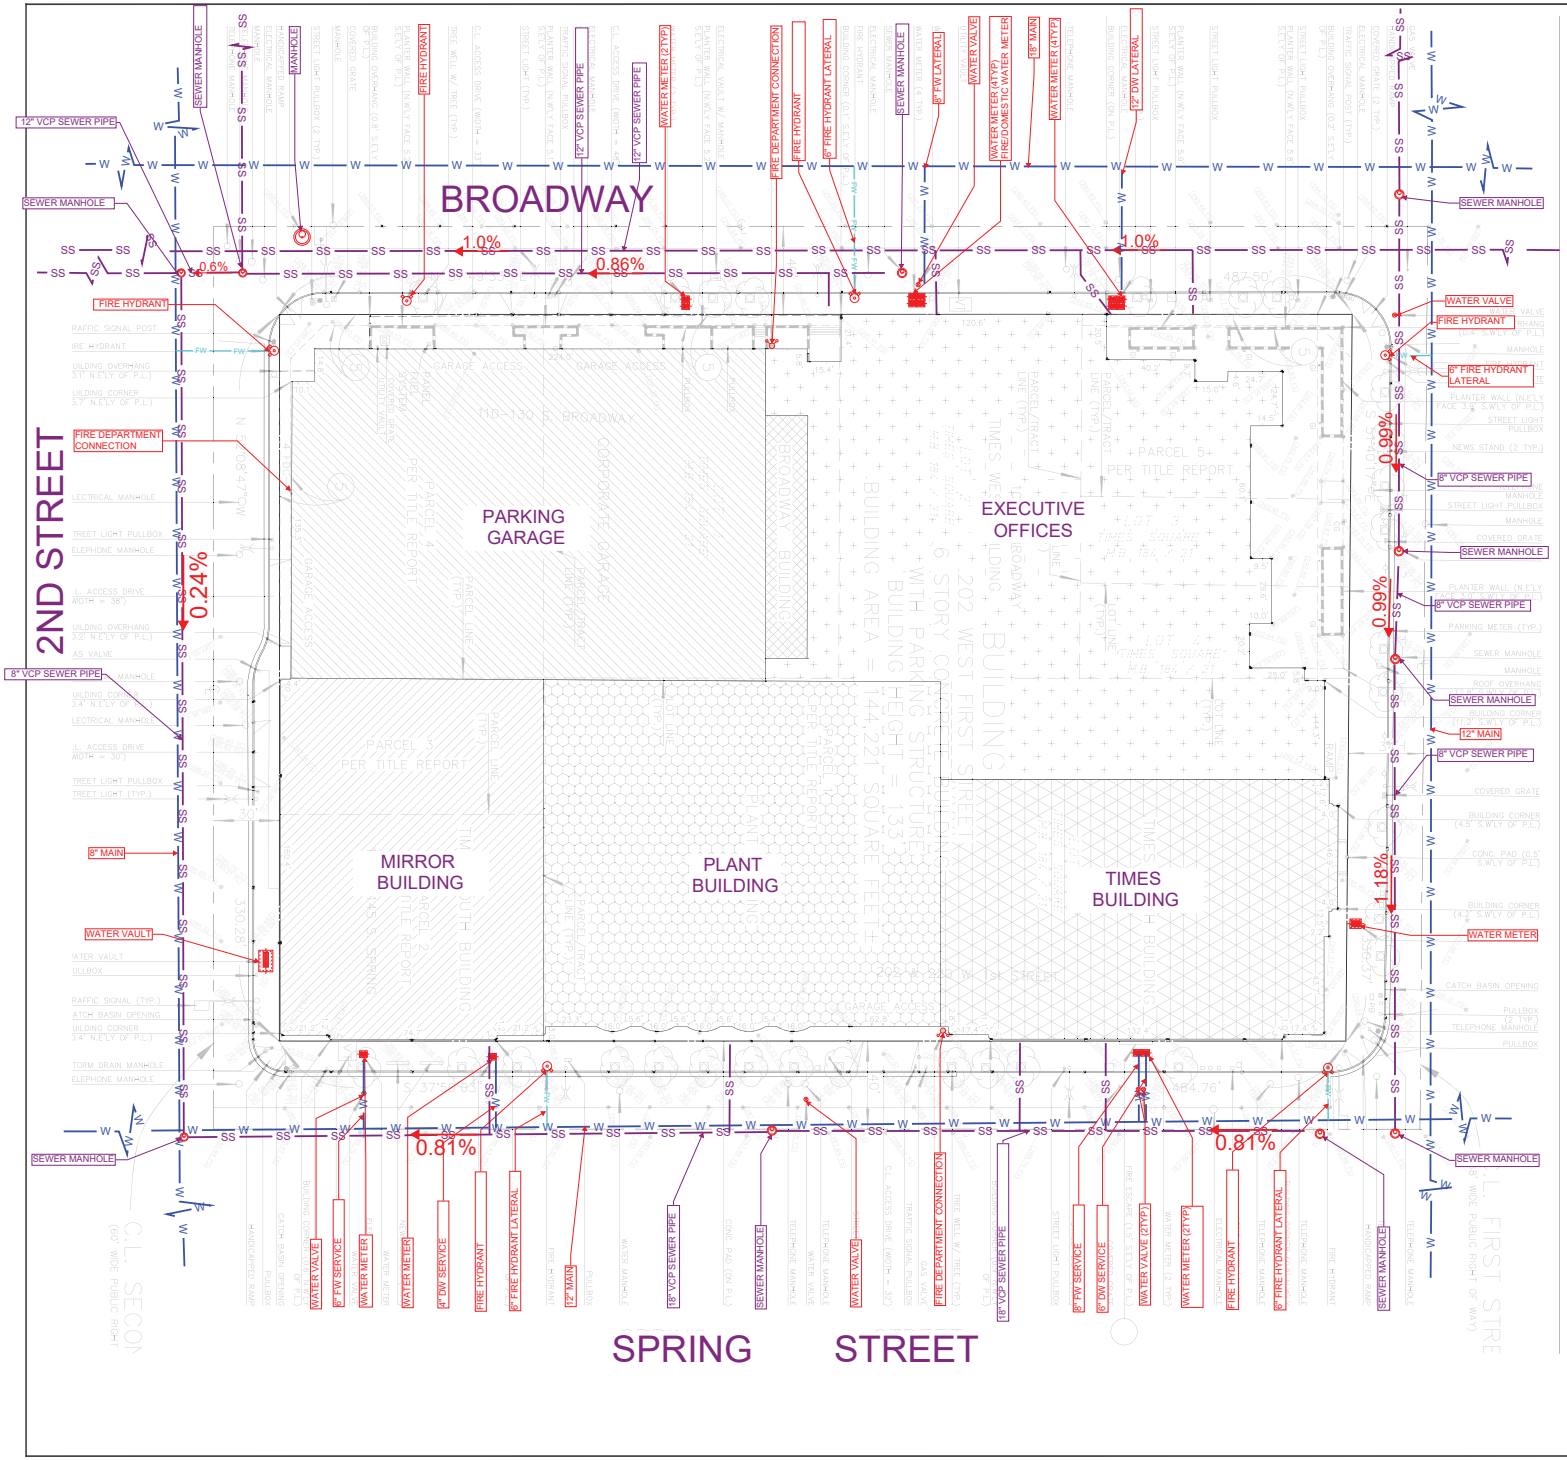
Dear Sir/Madam:

Thank you for inquiring about the availability of natural gas service for your project. We are pleased to inform you that Southern California Gas Company (SoCalGas) has facilities in the area where the above named project is being proposed. The service would be in accordance with SoCalGas' policies and extension rules on file with the California Public Utilities Commission (Commission) at the time contractual arrangements are made.

This letter should not be considered a contractual commitment to serve the proposed project, and is only provided for informational purposes only. The availability of natural gas service is based upon natural gas supply conditions and is subject to changes in law or regulation. As a public utility, SoCalGas is under the jurisdiction of the Commission and certain federal regulatory agencies, and gas service will be provided in accordance with the rules and regulations in effect at the time service is provided. Natural gas service is also subject to environmental regulations, which could affect the construction of a main or service line extension (for example, if hazardous wastes were encountered in the process of installing the line). Applicable regulations will be determined once a contract with SoCalGas is executed.

If you need assistance choosing the appropriate gas equipment for your project, or would like to discuss the most effective applications of energy efficiency techniques, please contact our area Service Center at 800-427-2200.

Thank you again for choosing clean, reliable, and safe natural gas, your best energy value.



Sincerely,

Zakee Singleton

Planning Associate

M-2 Water Supply Assessment

Los Angeles Department of Water & Power

BOARD LETTER APPROVAL

RESOLUTION NO. _____

RICHARD F. HARASICK
Senior Assistant General Manager
Water System

MARTIN L. ADAMS
Chief Operating Officer

DAVID H. WRIGHT
General Manager

DATE: August 24, 2017

SUBJECT: Water Supply Assessment – Times Mirror Square Project

SUMMARY

The Water Supply Assessment (WSA) is for the Times Mirror Project (Times Project) located within the Central City Community Plan area of the City of Los Angeles (City). LADWP staff determined the total net additional water demand for the Times Project is 220 acre-feet per year (AFY) and has concluded this additional water demand can be accommodated. The Times Project's base water demand was further reduced by 66 AFY through implementation of the conservation ordinance and code requirements and an additional 7 AFY through the project implementing additional voluntary conservation measures. WSA will meet the requirements of California Water Code Sections 10910-10915. The governing body of each public water system is required to make a determination on WSAs for major projects.

City Council approval is not required.

RECOMMENDATION

It is recommended that the Board of Water and Power Commissioners (Board) adopt the attached Resolution authorizing the WSA for the Times Project.

ALTERNATIVES CONSIDERED

LADWP is required by state law, as set forth in California Water Code Sections 10910-10915, to prepare this WSA for the Times Project. There are no other alternatives.

FINANCIAL INFORMATION

The Onni Times Square LP (Applicant) paid $17,000 to cover LADWP's expenses for preparation of this WSA.

BACKGROUND

WSAs are prepared in conformance with California law and the City ordinances to ensure proposed projects that utilize water resources are consistent with the City's conservation goals and long-term water supply availability, as detailed in LADWP's 2015 Urban Water Management Plan (UWMP). LADWP's 2015 UWMP is the water supply planning document for the City and is prepared by LADWP.

Each WSA performed by LADWP is carefully evaluated within the context of LADWP's most recent UWMP and current conditions, such as restrictions on State Water Project (SWP) pumping from the Sacramento-San Joaquin River Delta (Delta) imposed by a Federal Court. The Metropolitan Water District of Southern California (MWD), from whom the City purchases its SWP and Colorado River water supplies, has also been actively developing plans and making efforts to provide additional water supply reliability for the entire Southern California region. LADWP coordinates closely with MWD to ensure implementation of MWD's water resource development plans.

Part of MWD's planning effort is the update and implementation of its Integrated Water Resources Plan (IRP) and its UWMP, which are designed to address potential reductions in water supply due to the effects of variable hydrologic conditions and regulatory restrictions on exports from the Delta. The 2015 IRP update resulted in the development of the following six main findings and conclusions: action is needed to minimize unacceptable level of shortage allocation frequency in the future, maintain Colorado River supplies, stabilize SWP supplies, develop/protect local supplies and water conservation, maximize effectiveness of storage and transfers, and continue with adaptive management approach.

LADWP's 2015 UWMP contains a water shortage contingency plan for multi-year dry hydrological periods. This water shortage contingency plan was implemented on June 1, 2009, when the Board adopted Shortage Year Rates and the City Council implemented the landscape irrigation and prohibited use restrictions contained in the City's Water Conservation Ordinance. The City's Water Rate Ordinance, adopted June 1995 was last amended by the Board, effective April 15, 2016. The new water rate structure increases the number of tiers from two to four for single-family residential

customers. The goal is to incentivize conservation while recovering the higher costs of providing water to high volume users. In keeping with cost of service principles, the incremental pricing for the tiers is based on the cost of water supply and, for the third and fourth tiers, added pumping and storage costs.

Various conservation measures are also required through the following regulations: the City's Green Building Codes Revision/Use of Greywater Systems/Water Conservation Measures Ordinance No. 184248, the City's Water Efficiency Requirements Ordinance No. 180822, 2013 California Plumbing Code, 2013 California Green Building Code (CALGreen), 2014 Los Angeles Plumbing Code, and 2014 Los Angeles Green Building Code. All codes became effective January 1, 2014, except Ordinance No. 184248, effective June 2016, and Ordinance No. 180822, effective December 2009.

Projected Water Use and Conservation

On May 15, 2017, the Los Angeles Department of City Planning (Planning Department), lead agency for the Times Project, requested LADWP perform a WSA. Based on information obtained from Planning Department, the Times Project will redevelop an approximately 3.68-acre site of commercial land uses within the Central City Community Plan area of the City for residential and commercial land uses. The Times Project is generally bounded by South Broadway Street to the west, West 1st Street to the north, South Spring Street to the east, and West 2nd Street to the south.

The Times Project's site currently contains five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage, and the 6-story Executive Building. The buildings, excluding the parking structure, contain a total 559,863 square feet (sq ft) of floor area, and approximately 223,945 sq ft (40 percent) of the existing uses are office spaces that have been vacant for 10 years. As part of the project, the existing 44,306 sq ft Parking Garage and Executive Building, which contains 176,258 sq ft of office space, and the 7,500 sq ft bank, will be demolished to support the development of the Times Project. Additionally, an 11,250 sq ft cafeteria in the Mirror Building will be renovated to become part of a grocery store. The existing water demand to be removed is approximately 23 AFY.

The Times Project proposes retention and renovation of the Times, Plant, and Mirror Buildings on the eastern half of the project site comprised of 376,104 sq ft of existing floor area, approximately 285,088 sq ft will be office space that would remain of which 71,232 sq ft will be new renovated offices. The western half of the project site will be developed with two new mixed-use towers called the North Tower (37-stories) and South Tower (53-stories), containing residential units and ground-floor retail uses. The Times Project will develop approximately 1,127 apartment units, 34,572 sq ft of commercial retail uses, 41,017 sq ft of restaurant (ground floor and upper floor), and a

50,000 sq ft grocery store. Residential amenities will include 3,025 sq ft of lobby/lounge areas, 25,618 sq ft of fitness centers, a 2,250 sq ft pool, a Paseo/Plaza area at grade, and open space and amenities at the Level 6 Garden Plaza. The Times Project will also include 988,000 sq ft of covered parking, 16,242 sq ft of landscaping, and cooling towers.

LADWP staff recommended implementation of additional voluntary water conservation measures to maximize the potential water-use efficiency for the Times Project. Recommended voluntary conservation measures are in addition to those required by the City's current codes and ordinances. Based on LADWP staff recommendations, Applicant has voluntarily committed to implement the following additional measures that are beyond those required by law:

- High Efficiency Toilets with flush volume of 1.0 gallons of water per flush, or less
- ENERGY STAR Certified Residential Clothes Washers – Front-loading with Integrated Water Factor of 3.6 or less and capacity of 4.3 cubic feet (cu ft)
- Showerheads with flow rate of 1.5 gallons per minute, or less
- Domestic Water Heating System located close proximity to point(s) of use
- Individual Metering and billing for water use for commercial space will be used
- Drip/Subsurface Irrigation (Micro-Irrigation)
- Proper Hydro-zoning/Zoned Irrigation (groups plants with similar water requirements together)
- Drought Tolerant Plants – 70 percent of total landscaping

A written commitment of the Times Project's planned voluntary water conservation measures was submitted by Applicant and is attached with WSA in Appendix B.

With the addition of these voluntary water conservation measures, which yield additional savings of approximately 7 AFY, the total net additional water demand is approximately 220 AFY.

The Applicant has also committed to comply with the City of Los Angeles Low Impact Development Ordinances (City Ordinance No. 181899 and No.183833) and to implement Best Management Practices that have stormwater recharge or reuse benefits for the entire Project where feasible:

- Infiltration Basin (drainage area of 5-50 acres) – captures first-flush stormwater, removes particulate pollutants and some soluble pollutants, and contributes toward recharging groundwater
- Infiltration Trench (drainage area of less than 5 acres) – similar to infiltration basin but used for smaller drainage areas to capture and infiltrate rainwater
- Catch Basin Insert – a device that can be inserted into an existing catch basin design to provide some level of runoff contaminant removal
- Catch Basin Screens

- Pervious Pavements – captures runoff by allowing stormwater to pass through the pavement surface and then infiltrate into the groundwater basin
- Cistern – captures stormwater runoff as it comes down through the roof gutter system

The Times Project is determined by Planning Department to be consistent with the demographic projections for the City from both the 2012 and 2016 Regional Transportation Plans (RTP) by the Southern California Association of Governments (SCAG). The City's water demand projection in 2015 UWMP was developed based on the 2012 RTP demographic projection using the 2010 U.S. Census for the City. LADWP used a modified-unit-use approach to develop its service area-wide water demand projections. This methodology does not rely on individual development demands to determine area-wide growth. 2015 UWMP concluded there are adequate water supplies to meet projected water demand through 2040. Therefore, projected water supply available during normal, single-dry, and multiple-dry water years as included in the 25-year projection of 2015 UWMP is sufficient to meet the projected water demand associated with the Times Project, in addition to the existing and planned future demand on LADWP.

ENVIRONMENTAL DETERMINATION

Determine item is exempt pursuant to the California Environmental Quality Act (CEQA) Guidelines 15268 (b) (4). In accordance with Section 15268 (b)(4) of the CEQA Guidelines, Ministerial projects such as Approval of individual utility service connections and disconnections are exempt from the requirements of CEQA.

CITY ATTORNEY

The Office of the City Attorney reviewed and approved the Resolution as to form and legality.

ATTACHMENTS

- Resolution
- Water Supply Assessment

RESOLUTION NO. _____

WHEREAS, Los Angeles Department of Water and Power (LADWP) constitutes a "public water system" pursuant to California Water Code Section 10912, subdivision (c); and

WHEREAS, the Times Mirror Square Project (Times Project) qualifies as a "project" under California Water Code Section 10912, subdivision (a) (7); and

WHEREAS, the Times Project is located in the service area of LADWP's water supply system, and LADWP would serve the area of the Times Project development; and

WHEREAS, on May 15, 2017, the City of Los Angeles (City) Department of City Planning (Planning Department) requested the LADWP conduct a Water Supply Assessment (WSA) for the Times Project pursuant to California Water Code Sections 10910-10915; and

WHEREAS, the Times Project would redevelop an approximately 3.68-acre site of commercial land uses within the Central City Community Plan area of the City for residential and commercial land uses; and

WHEREAS, LADWP's Water Resources Division has prepared a WSA for the Times Project in compliance with California Water Code Sections 10910-10915; and

WHEREAS, the Times Project is determined by Planning Department to be consistent with the demographic projections for the City from both the 2012 and 2016 Regional Transportation Plans by the Southern California Association of Governments; and

WHEREAS, LADWP staff performed the water demand analysis and determined the net increase in total water demand for the Times Project is 220 acre-feet per year; and

WHEREAS, Onni Times Square LP (Applicant) has agreed to implement additional conservation measures, as described in WSA, that are in addition to those required by law; and

WHEREAS, LADWP anticipates that its projected water supply available during normal, single-dry, and multiple-dry water years as included in the 25-year projection contained in its adopted 2015 Urban Water Management Plan can accommodate the projected water demand associated with the Times Project, in addition to the existing and planned future demands on LADWP; and

WHEREAS, the Board of Water and Power Commissioners (Board) adopted a Water Rate Ordinance for water service effective April 15, 2016. The Board believes that the price signals contained in the Water Rate Ordinance encourages conservation and will help to contribute to reductions in City-wide demands to meet demand projections; and

WHEREAS, in accordance with Water Code Section 10910 (g) (1) the Board has the responsibility for approval and certification of WSA's prepared by LADWP; and

WHEREAS, the Board has independently reviewed and considered the WSA and documentation making up the administrative record; and

WHEREAS, a publicly noticed Board hearing was held with respect to this item on September 19, 2017, and the Board considered evidence presented by LADWP's Water Resources Section staff, the staff recommendation to approve the WSA, and other comments from interested parties at the public hearing.

NOW, THEREFORE, BE IT RESOLVED that the Board finds that LADWP can provide sufficient domestic water supplies to the Times Project area and approves the WSA prepared for the Times Project, now on file with the Secretary of the Board, and directs that WSA and a certified copy of Resolution be transmitted to Planning Department.

BE IT FURTHER RESOLVED that the Board finds that LADWP's total projected water supplies available during normal, single-dry, and multiple-dry water years during a 20-year projection will meet the projected water demands associated with the Times Project in addition to existing and planned future uses including agricultural and industrial uses.

BE IT FURTHER RESOLVED that the Board has considered the WSA prior to making a decision to approve the WSA, and finds that the WSA is adequate and was prepared in accordance with Water Code Section 10910 (c) (2), and meets the requirements of Water Code Section 10910 (d), (e), (f), and (g).

I HEREBY CERTIFY that the foregoing is a full, true, and correct copy of a Resolution adopted by the Board of Water and Power Commissioners of the City of Los Angeles at its meeting held

G. Water Supply Assessment Checklist

Introduction

Proposed major projects subject to certain requirements in the California Water Code Sections 10910-10915 require that a city or county identify any public water system that may supply water to the Times Mirror Square Project (Times Project) and request the public water system provide a Water Supply Assessment (WSA). The WSA is a determination by the water supplier that the demands associated with the Times Project were included in its most recently adopted 2015 UWMP showing that there is an adequate 20-year water supply.

The City of Los Angeles (City) Department of City Planning (Planning Department), serving as the lead agency as prescribed by the California Environmental Quality Act (CEQA) (Public Resources Code Section 21000 et seq.), for the Times Project, has identified LADWP as the public water system that will supply water. In response to Planning Department's request for a WSA, LADWP has performed the assessment contained herein.

LADWP has supplied the City with a safe and reliable water supply for over a century. Over time, the City's water supplies have evolved from primarily local groundwater to predominantly imported supplies. Today, the City relies on over 85 percent of its water from imported sources. As such, LADWP has taken an active role in regional and statewide water management. The sustainability of Los Angeles' local water supplies are dependent on the City's ability to maximize water conservation, increase recycled water use, expand stormwater capture, and accomplish other local water resource goals.

WSA is prepared to meet the applicable requirements of state law as set forth in California State Water Code Sections 10910-10915. Significant references and data for WSA are from the City's 25-year water resource plan, entitled *Los Angeles Department of Water and Power Urban Water Management Plan 2015*, adopted by the Board of Water and Power Commissioners (Board) on June 7, 2016. LADWP's 2015 UWMP is incorporated by reference and is available for review through LADWP's Web site, www.ladwp.com/uwmp.

Findings

The Times Project is estimated to increase the total net water demand within the site by 220 acre-feet (AF) annually based on review of information submitted by Planning Department. Onni Times Square LP (Applicant) has committed to implement additional water use efficiency measures that are beyond those required by current law.

LADWP's WSA finds adequate water supplies will be available to meet the total additional water demand of 220 AF annually for the Times Project. LADWP anticipates the projected water demand from the Times Project can be met during normal, single-

dry, and multiple-dry water years, in addition to the existing and planned future demands on LADWP.

WSA approval addresses the City's long-term water supply and demand forecasts to accommodate the Times Project, and is not an approval for water service connection. A separate request shall be made to LADWP requesting an evaluation of water service connection for the Times Project.

The basis for approving WSAs for developments is LADWP's most recently adopted UWMP. LADWP's water demand forecast, as contained in LADWP's 2015 UWMP, uses long-term demographic projections for population, housing, and employment. The California Urban Water Management Planning Act requires water suppliers to develop a UWMP every five years to identify short-term and long-term water resources management measures to meet growing water demands during normal, single-dry, and multiple-dry years. If the projected water demand associated with the Times Project was not accounted for in the most recently adopted LADWP 2015 UWMP, WSA must include a discussion with regard to whether LADWP's total projected water supplies available during normal, single-dry, and multiple-dry water years during a 20-year projection will meet the projected water demand associated with the Times Project, in addition to LADWP's existing and planned future uses.

The City's water demand projection in LADWP's 2015 UWMP was developed based on the 2012 Regional Transportation Plan (RTP) demographic projection by the Southern California Association of Governments (SCAG) using the 2010 United States (U.S.) Census for the City. LADWP's 2015 UWMP concluded there are adequate water supplies to meet projected water demands through 2040. Therefore, the City's water supply projections in LADWP's 2015 UWMP are sufficient to meet the City's water demand projections based on the 2012 RTP.

Planning Department has determined that the Times Project conforms with the use and intensity of development permitted by the City's General Plan, and that it is consistent with the demographic projection for the City from both the 2012 and 2016 RTPs. Therefore, anticipated water demand for the Times Project falls within LADWP's 2015 UWMP's projected water supplies for normal, single-dry, and multiple-dry years through the year 2040 and is within the LADWP 2015 UWMP's 25-year water demand growth projection. This WSA can be approved based on the fact that the Times Project's water demand falls within the LADWP 2015 UWMP's projected increase in citywide water demands, while anticipating multi-dry year water supply conditions occurring at the same time.

Additionally, LADWP's 2015 UWMP contains a water shortage contingency plan for multi-year dry hydrological periods. This water shortage contingency plan was implemented on June 1, 2009, when the Board adopted Shortage Year Rates, and the City Council implemented the landscape irrigation and prohibited use restrictions contained in the City's Water Conservation Ordinance (Ordinance).

The City's Water Rate Ordinance, adopted in June 1995, was last amended by the Board, effective April 15, 2016. The revised rate ordinance restructured the rates to help further promote conservation. For example, single family rates switched to a four-tier system that sends a strong price signal to deter against wasteful water use. The Board finds that the price signals contained in the Water Rate Ordinance encourage conservation and support further reduction in City-wide demand. Past and current implementation of water rate price signals and higher ordinance phases have resulted in reducing the total customer water usage, on average, by approximately 19.7 percent over the time period from June 2009 to May 2017.

The Times Project Description

The following project information was obtained from Planning Department's WSA Request Letter and the scope confirmation e-mail (Appendix A):

Project Name:	Times Mirror Square Project
Lead Agency:	Planning Department
Planning Community:	Central City Community Plan

The Times Project will redevelop an approximately 3.68-acre site of commercial land uses within the Central City Community Plan area of the City for residential and commercial land uses. The Times Project is generally bounded by South Broadway Street to the west, West 1st Street to the north, South Spring Street to the east, and West 2nd Street to the south.

The Times Project's site currently contains five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, 4-story Plant Building, 10-story Mirror Building, 6-story parking garage, and 6-story Executive Building. The buildings, excluding the parking structure, contain a total 559,863 square feet (sq ft) of floor area, and approximately 223,945 sq ft (40 percent) of the existing uses are office spaces that have been vacant for 10 years. As part of the project, the existing 44,306 sq ft Parking Garage and Executive Building, which contains 176,258 sq ft of office space, and the 7,500 sq ft bank, will be demolished to support the development of the Times Project. Additionally, an 11,250 sq ft cafeteria in the Mirror Building will be renovated to become part of a grocery store. The existing water demand to be removed is approximately 23 AFY.

The Times Project proposes retention and renovation of the Times, Plant, and Mirror Buildings on the eastern half of the project site comprised of 376,104 sq ft of existing floor area, approximately 285,088 sq ft will be office space that would remain of which 71,232 sq ft will be new renovated offices. The western half of the project site will be developed with two new mixed-use towers called the North Tower (37-stories) and South Tower (53-stories), containing residential units and ground-floor retail uses. The Times Project will develop approximately 1,127 apartment units, 34,572 sq ft of commercial retail uses, 41,017 sq ft of restaurant (ground floor and upper floor), and a

50,000 sq ft grocery store. Residential amenities will include 3,025 sq ft of lobby/lounge areas, 25,618 sq ft of fitness centers, 2,250 sq ft pool, Paseo/Plaza area at grade, and open space and amenities at the Level 6 Garden Plaza. The Times Project will also include 988,000 sq ft of covered parking, 16,242 sq ft of landscaping, and cooling towers.

LADWP staff performed the water demand analysis and determined the net increase in water demand for the Times Project is 220 AFY.

A subsequent revised WSA may be required if one or more of the following occurs: (1) changes in the Times Project result in a substantial increase in water demand for the Times Project; (2) changes in the circumstances or conditions substantially affecting the ability of LADWP to provide a sufficient supply of water for the Times Project; or (3) significant new information becomes available which was not known and could not have been known at the time when WSA was prepared. If deemed necessary, Applicant may request a revised WSA through lead agency.

The Times Project Water Demand Estimate

Projected total net water demand increase for the Times Project is estimated to be 220 AF annually which includes annual water conservation. Savings due to water conservation ordinances are approximately 66 AFY, and savings due to additional voluntary conservation measures are approximately 7 AFY.

In evaluating the Times Project's water demand, the Sewer Generation Factors (SGF), published by City of Los Angeles Department of Public Works Bureau of Sanitation (LASAN) in 2012, are applied to the Times Project scope for calculating indoor water use. SGFs are factors of how much wastewater is generated (gallons per day) per unit (per sq ft, per dwelling unit, per seat, etc.). LASAN publishes a list of SGFs for approximately 175 different building use types in the City, and updates factors to make adjustments necessary due to water conservation efforts and increased efficiencies in new appliances and plumbing fixtures. Outdoor landscape water demand is estimated per California Code of Regulations Title 23 Division 2 Chapter 2.7 Model Water Efficient Landscape Ordinance. Historical billing records are used to establish existing baseline water demand on the property. LADWP also encouraged the Times Project to implement additional water conservation measures above and beyond the current water conservation ordinance requirements.

The net increase in water demand, which is the projected additional water demand of the Times Project, is calculated by subtracting the existing baseline water demand and water saving amount from the total proposed water demand.

Table I shows a breakdown of the existing and proposed new types of uses for the Times Project, and the corresponding estimated volume of water usage with the implementation of the conservation measures for the Times Project.

Types of use were derived from WSA request letter and the scope confirmation e-mail in Appendix A.

Table II estimates the total volume of water conservation based on conservation measures the Applicant has committed to for the Times Project (Appendix B).

TABLE I
Times Mirror Square Project
Calculated Total Additional Water Demand

Existing Use[1]	Quantity	Unit				Existing Water Use to be Removed (gpd)	(af/y)
Executive Building Offices[2]	103,312	sf					
Executive Building Bank	7,500	sf					
Mirror Building Cafeteria	11,250	sf					
6-story Parking Structure	44,306	sf					
Existing to be Removed Total[3]						**20,137**	**22.56**
Proposed Use[1]	**Quantity**	**Unit**	**Water Use Factor[4] (gpd/unit)**	**Base Demand (gpd)**	**Required Ordinances Water Savings[5] (gpd)**	**Proposed Water Demand (gpd)**	**(af/y)**
Residential: Studio	90	du	75.00	6,750			
Residential: 1 bd	706	du	110.00	77,660			
Residential: 2 bd	324	du	150.00	48,600			
Residential: 3 bd	7	du	190.00	1,330			
Base Demand Adjustment (Residential Units)[6]				14,206			
Residential Units Total	**1,127**	**du**		**148,546**	32,100	**116,446**	**130.45**
Gym/Fitness Center	25,618	sf	0.65	16,652			
Lobby	3,025	sf	0.05	151			
Pool	2,250	sf		211			
Residential Amenities Total[7]				**17,014**	3,727	**13,287**	**14.88**

			Proposed Subtotal	**281,646**	**58,801**	**222,845**	**249.63**
					Less Existing to be Removed Total	-20,137	-22.56
					Less Additional Conservation[11]	-5,935	-6.65
					Net Additional Water Demand	**196,773 gpd**	**220.42 af/y**

[1] Provided by City of Los Angeles Department of City Planning In the Request for Water Supply Assessment letter and Scope Confirmation e-mail. See Appendix A.

[2] Of the 176,258 sf existing office space In the Executive Building that will be removed, 103,312 sf has been used/occupied in the last 10 year. In other words, only 103,312 sf of of office is considered having water demand in the existing executive building that will be removed

[3] The existing water demand is based on the LADWP billing data (average of varied available billing years from Fiscal Year 2010 to 2015).

[4] Proposed indoor water uses are based on 2012 City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation Rates table available at http://www.lacitysan.org/fmd/pdf/sfcfeerates.pdf.

[5] The proposed development land uses will conform to City of Los Angeles Ordinance No. 184248, 2013 California Plumbing Code, 2013 California Green Building Code (CALGreen), 2014 Los Angeles Plumbing Code, and 2014 Los Angeles Green Building Code.

[6] Base Demand Adjustment is the estimated savings due to Ordinance No. 180822 accounted for in the current version of Bureau of Sanitation Sewer Generation Rates.

[7] Garden Plaza not shown here does not have additional water demand.

[8] 71,232 sf of additional office spaces are expected to be occupied and have a water demand after the rehabilitation of the Times, Plant and Mirror Buildings. In addition, the project will assume that the water fixtures in these office spaces will not be upgraded, and therefore take a more conservative approach in estimating water demand by using an older Sewer Generation Rate available at http://www.environmentla.org/programs/Thresholds/M-Public%20Utilities.pdf

[9] Landscaping water use is estimated per California Code of Regulations Title 23. Division 2. Chapter 2.7. Model Water Efficient Landscape Ordinance.

[10] Auto parking water uses are based on City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation Rates table, and 12 times/year cleaning assumption.

[11] Water conservation due to additional conservation commitments agreed by the Applicant. See Table II.

Water Demand Forecast

LADWP's 2015 UWMP projects yearly water demand to reach 675,700 AF by fiscal-year-ending (FYE) 2040 with passive water conservation, or an increase of 31.6 percent from FYE 2015 actual water demand. Water demand projections in five-year increments through FYE 2040 are available in LADWP's 2015 UWMP for each of the major customer classes: single-family, multifamily, commercial/governmental, and industrial. Demographic data from the Southern California Association of Government's 2012 RTP, as well as billing data for each major customer class, weather, conservation, price of water, personal income, family size, economy, and drought conservation effect were factors used in forecasting future water demand growth.

LADWP's 2015 UWMP used a modified-unit-use approach to develop its service area-wide water demand projections. This methodology does not rely on individual development demands to determine area-wide growth, because such an inventory in LADWP service area in the next 25 years is only a subset of the total development potential. Therefore, the growth or decline in population, housing units, and employment for the entire service area was considered in developing long-term water projections for the City through FYE 2040. The historical water demand for a unit of customer class, such as gallons-per-day per single family, is modified to account for future changes, including water conservation, and applied to the 2012 RTP demographic projections by SCAG. This modified-unit-use-approach has proven to be a reliable forecast historically, when compared with actual consumption, excluding the effects of conservation.

LADWP's 2015 UWMP is updated every five years as required by California law. This process entails, among other requirements, an update of water supply and water demand projections for water agencies.

Collaboration between LADWP and MWD is critical in ensuring that the City's anticipated water demands are incorporated into the development of MWD's long-term Integrated Water Resources Plan (IRP). MWD's IRP directs a continuous regional effort to develop regional water resources involving all of MWD's member agencies including the City. Successful implementation of MWD's IRP has resulted in reliable supplemental water supplies for the City from MWD.

State law further regulates distribution of water in extreme dry weather conditions. Section 350-354 of the California Water Code states that when a governing body of a distributor of a public water supply declares a water shortage emergency within its service area, water will be allocated to meet needs for domestic use, sanitation, fire protection, and other priorities. This will be done equitably and without discrimination between customers using water for the same purpose(s).

LADWP – 2015 UWMP

The California Urban Water Management Planning Act (first effective on January 1, 1984) requires every urban water supplier prepare and adopt a UWMP every five years. The main goals of UWMPs are to forecast future water demands and water supplies under average and dry year conditions, identify future water supply projects such as recycled water, provide a summary of water conservation Best Management Practices (BMP), and provide a single and multi-dry year management strategy.[1]

LADWP's 2015 UWMP, available for reference through www.ladwp.com/uwmp, serves two purposes: (1) achieve full compliance with requirements of California's Urban Water Management Planning Act; and (2) serve as a master plan for water supply and resources management consistent with the City's goals and policy objectives.[2]

A number of important changes have occurred since LADWP prepared its 2010 UWMP. The year 2012 marked the start of the current multi-year drought in California. In January 2014, Governor Jerry Brown proclaimed a drought state of emergency. In July 2014, the State Water Resources Control Board (SWRCB) implemented its Emergency Water Conservation Regulation (Emergency Regulation), as directed by Governor Brown, to take actions to reduce water use by 20 percent Statewide, which was later increased to 25 percent statewide, with adjustments to account for different climates, expected growth, investment made to create drought-resilient water supplies by different cities through October 2016. In October 2014, Mayor Eric Garcetti issued Executive Directive No. 5 (ED5) Emergency Drought Response which set goals to reduce per capita water use, reduce purchases of imported potable water by 50 percent, and create an integrated water strategy to increase local supplies and improve water security considering climate change and seismic vulnerability. Lastly, in April 2015, the Mayor's Sustainable City pLAn (pLAn) was released establishing targets for the City over the next 20 years to strengthen and promote sustainability. The pLAn included a number of water resources goals, including reduce average per capita potable water use by 20 percent from Fiscal Year (FY) 2013/14 by 2017, reduce average per capita potable water use by 22.5 percent from FY 2013/14 by 2025, reduce imported water purchases from MWD by 50 percent from 2013/14 by 2025, reduce per capita potable water use by 25 percent from 2013/14 by 2035, and expand all local sources of water so that they account for at least 50 percent of the total supply by 2035. The pLAn included a multi-faceted approach to developing a locally sustainable water supply to reduce reliance on imported water, reducing per capita water use through conservation, and increasing local water supply availability.

A number of new requirements have been added to the Urban Water Management Planning Act since completion of LADWP's 2010 UWMP, including: an extension of the submittal deadline from December 31, 2015 to July 1, 2016, a narrative description of water demand measures implemented over the past five years and future measures

[1] *City of Los Angeles Department of Water and Power 2015 Urban Water Management Plan*, at ES-2.
[2] *Id.* at ES-2.

planned to meet 20 percent demand reduction targets by 2020, implementation of a standard methodology for calculating system water loss, a mandatory electronic filing of UWMPs, a voluntary reporting of passive conservation savings, energy intensity, and climate change, and a requirement to analyze and define water features that are artificially supplied with water.

LADWP's 2015 UWMP projects a seven percent lower water demand trend than what was projected in the previous LADWP 2010 UWMP. It outlines plans, as described below, to provide a highly reliable water supply by FYE 2040, by implementing cost-effective conservation, recycled water, and stormwater capture programs, ultimately meeting the targets established in ED5 and pLAn, including reducing imported water purchases from MWD.

Near-Term Conservation Strategies

Enforcing prohibited uses of water. Prohibited uses of water are intended to eliminate waste and increase awareness of the need to conserve water. In effect at all times, prohibited uses have been in place since the early 1990s. Under enforcement, failure to comply would be subject to penalties, which can range from a written warning for a first violation to monetary fines and water service shutoff for continued non-compliance.

Expanding the prohibited uses of water. In August 2009, and again in August 2010, the City updated the Emergency Water Conservation Plan Ordinance (No. 181288) by clarifying prohibited uses of water, modifying certain water conservation requirements, and developing new phases of conservation depending on the severity of water shortages. In June 2015, the City amended Ordinance No. 181288 with the new Ordinance No. 183608. Ordinance No. 183608 clarified prohibited uses and added an additional phase to allow for outdoor watering two days a week. In April 2016, the City once again amended Ordinance No. 183608 with the Ordinance No. 184250, which defined and added fines for unreasonable uses of water. The Ordinance is expected to improve the City's ability to comply with current regulations and respond to the ongoing drought conditions. Prohibited uses in effect at all times (Phase I) include[3]:

- Water leaks allowed to go unattended
- Outdoor irrigation between the hours of 9 a.m. to 4 p.m.
- Outdoor irrigation that results in excess water flow leaving the property
- Outdoor irrigation during and 48 hours after rain events
- Outdoor irrigation with spray head sprinklers and bubblers for more than ten minutes per watering day per station
- Outdoor irrigation with standard rotors and multi-stream rotary heads for more than 15 minutes per cycle and up to two cycles per watering day per station
- Large landscape irrigation systems without automatic shutoff rain sensors

[3] *Id.* at 3-11.

- Washing paved surfaces (sidewalks, walkways, driveways, or parking areas) unless using a LADWP-approved water conserving spray cleaning device
- Water for decorative fountains, ponds, or lakes unless the water is part of a recirculating system
- Installation of single-pass cooling systems in buildings requesting new water service
- Installation of non-recirculating systems in new commercial laundry facilities
- Installation of non-recirculating systems in new conveyor car washes
- Car washing with a hose, unless an automatic shut-off device is attached
- Water served to customers in eating establishments, unless requested
- Daily towel and linen service option must be offered to hotel and motel guests

Phase II of the Water Conservation Ordinance was enacted in August 2010 and is currently in effect. In addition to the restrictions in Phase I, Phase II also limits landscape irrigation to three days per week, Monday, Wednesday, and Friday for odd-numbered street addresses and Tuesday, Thursday, and Sunday for even-numbered street addresses. Watering times for non-conserving nozzles (spray head sprinklers and bubblers) are limited to eight minutes per watering day per station.

On January 17, 2014, with California facing water shortfalls in the driest year in recorded state history, Governor Brown proclaimed a Drought State of Emergency. Local urban water suppliers and municipalities were called upon to implement their local water shortage contingency plans. Responding to the executive order, in 2015, SWRCB imposed mandatory cutbacks ranging from four percent to 36 percent. LADWP was required to reduce its water use by 16 percent compared to the 2013 levels. LADWP met the state mandated reduction goal and saved 16.1 percent between June 2015 and May 2016. In 2016, following a relatively wet winter in Northern California, SWRCB replaced the regulations by a localized "stress test" approach, which LADWP successfully met.

On April 7, 2017, Governor Jerry Brown issued Executive Order B-40-17 formally ending the drought emergency. The Governor lifted the drought emergency in all California counties except Fresno, Kings, Tulare and Tuolumne where emergency drinking water projects will continue to help address diminished groundwater supplies. The order also rescinds two drought-related emergency proclamations and four drought-related executive orders. Cities and water districts throughout the state are required to continue reporting their water use each month, according to the order, which also bans wasteful practices, such as hosing off sidewalks and running sprinklers when it rains.

As the Governor ended the drought emergency, five state agencies unveiled a long-range plan to rein in water use, called "Making Water Conservation a California Way of Life." This plan builds on the successes and lessons learned from California's five-year drought and establishes a framework for long-term efficient water use that reflects the state's diverse climate, landscape, and demographic conditions.

Achieving the plan's goals will help all of California better prepare for longer and more severe droughts caused by climate change. Among other things, the plan will require all urban agencies to meet new targets, based on their local climates, land-use characteristics and other factors. The urban agencies would set the targets themselves, based on parameters set by the state.

On October 14, 2014, Mayor Garcetti issued his Executive Directive No. 5 (ED5) to set accelerated short-term conservation targets to address the drought and set long-term water reliability goals. Shortly after, the Mayor published the City's Sustainability pLAn (pLAn) on April 8, 2015. The pLAn builds upon the goals in ED5 to establish the following water resources related goals to achieve long-term water reliability for the City: per capita water use reduction goals of 20 percent by 2017, 22.5 percent by 2025, and 25 percent by 2035; a reduction in LADWP purchases of imported potable water by 50 percent by 2025; and expanding local water supplies to account for 50 percent of total supplies by 2035. LADWP's 2015 UWMP incorporates the pLAn goals in its local water supply plans to reduce reliance on purchased water in the future. These plans include increased stormwater capture, groundwater clean-up, recycled water, and conservation.

Most significant among them is an increased goal for conservation. On January 1, 2017, the City was able to meet the short-term target of 20 percent reduction through drought response measures that dropped per capita water use to 104 gallons per day. While this extraordinary achievement will have lasting effects on the City's water use efficiency, LADWP will need to work together with residents and businesses to achieve additional permanent conservation savings needed to maintain these drought savings and further reduce per capita water use by 25 percent by 2035. Achieving the pLAn and LADWP 2015 UWMP per capita water use reduction goals will help reduce the City's reliance on imported water while providing drought-resilient supplies that are not subject to increasingly frequent hotter weather conditions.

Among the actions required by ED5 that have been implemented are the following:

- Increase rebates for rain barrels, including interconnection piping and control systems, to $100 per barrel.
- Increase LADWP's California Friendly Landscape Incentive rebate funding to $1.75 per sq ft.

In addition to mandatory action items including those listed above, ED5 also calls for residents to:

- Voluntarily reduce their outdoor watering from three to two days.
- Replace turf lawns with native and climate-appropriate landscaping during the optimal Fall/Winter planting season, utilizing LADWP rebates for turf removal.
- Replace any remaining high water use plumbing fixtures and appliances with low-flow fixtures and appliances using consumer rebates provided by LADWP.
- Ensure swimming pools have covers to reduce water evaporation.

ED5 goals were later enhanced/modified by the Mayor's pLAn in April 2015. Strategies under pLAn sought to execute key conservation steps outlined in ED5 as well as expand the scope and financing for conservation programs and incentives.

Extending outreach efforts. Over the last several years, LADWP has expanded conservation outreach and education. Some activities to promote conservation include: increased communication with ratepayers through Twitter, Facebook, newspapers, radio, television, bus benches/shelters, and movie theaters, among other types of media; outreach to Homeowner Associations and Neighborhood Councils; distribution of hotel towel door hangers and restaurant table tent cards; and ramping up marketing of expanded water conservation incentive and rebate programs.

On April 9, 2015, the new "Save the Drop" Water Conservation Outreach Campaign was launched. This campaign is a partnership between LADWP and the Mayor's Office. Outreach materials include new public service announcements, radio spots, event handouts, and signage on the sides of LASAN trucks. The campaign has partnered with celebrities such as Steve Carrell, Jaime Camil, and Moby for public service announcements airing on TV, cinema, and radio.

Encouraging regional conservation measures. LADWP has worked with MWD to encourage all water agencies in the region to promote water conservation and adopt water conservation ordinances which include prohibited uses and enforcement.

Long-Term Local Supply Strategies

In April 2015, the Mayor released the City's first ever Sustainable City pLAn that focuses on sustainability, with special focus on the environment, the economy, and equity. The pLAn enhances ED5 goals, and incorporates water savings goals of reduction in per capita potable water by 20 percent by 2017, by 22.5 percent by 2025, and by 25 percent by 2035. The pLAn goals also include a reduction in imported water purchases from MWD by 50 percent from 2013/14 levels by 2025 and expansion of all local sources of water so that they account for at least 50 percent of the total supply by 2035. The pLAn includes specific strategies and desired outcomes for conservation, recycled water, and stormwater capture. Some of the strategies to meet these goals include investments in state-of-the art technology, rebates and incentives promoting water-efficient appliances, tiered water pricing, Technical Assistance Program (TAP) for business and industry, and large landscape irrigation and efficiency programs.

1.0 Increase Water Conservation Through Reduction of Outdoor Water Use and New Technology

Goal

Increase water conservation savings to achieve ED5 and pLAn water conservation goals by cutting back on outdoor water use, expanding rebates and incentives, improving water efficiency at public facilities, and enhancing savings through review of

new developments. LADWP plans to achieve additional water conservation savings of 108,100 AFY during average years and 143,500 AFY during single/multi-dry years by year 2040[4].

Action Plan

Conservation Rebates and Incentives. LADWP is continuing to expand rebates and incentives for homeowners and business owners to encourage them to purchase water-saving technology. Rebate and incentive programs include the following: Commercial Rebate Program, Residential Rebate Program, Direct Install Partnership Program, and Technical Assistance Program. In addition, as part of the City's ongoing effort to encourage customers to adopt active water conservation measures (i.e., measures that can help customers conserve water on a daily basis without thinking about it) in their homes and businesses, LADWP continues to distribute water-saving bathroom and kitchen faucet aerators and shower heads free-of-charge. In an effort to reduce outdoor water use, LADWP launched the California Friendly Landscape Incentive Program in 2009. Between November 1, 2014, and July 9, 2015, this Program provided rebates for turf removal to residential customers of $3.75 per sq ft for the first 1,500 sq ft and $2.00 per sq ft with no cap thereafter, and to commercial customers of up to $3.75 per sq ft. MWD is no longer offering turf removal incentives to new applicants, effective July 9, 2015, because available funding has been fully allocated.

LADWP has relaunched the California Friendly Landscape Incentive Program to continue a utility-sponsored rebate program for its customers. Effective July 15, 2015, residential customers are eligible to receive a rebate of $1.75 per sq ft for 1,500 sq ft maximum, while commercial customers are eligible for a rebate of $1.00 per sq ft for the first 10,000 sq ft and $0.50 per sq ft thereafter up to 43,560 sq ft maximum.

Some highlights from the list of LADWP's numerous water conservation accomplishments are:

- LADWP's Water Conservation Program has achieved a total cumulative hardware water savings of over 125,000 AFY, mainly through installation of conservation devices subsidized by rebates and incentives, since the inception of the program in FYE 1991 to FYE 2016.
- Water conservation achievements have resulted in Los Angeles using just as much as it did 45 years ago despite a population increase of over one million people.
- California Friendly Landscape Incentive Program – In total (Residential and Commercial Turf removal), LADWP has removed over 48 million sq ft of turf, saving over 1.9 billion gallons of water per year.
- LADWP's 100-percent volumetric tiered rate structure has been providing financial incentives to all customers for efficient water use since 1993.

[4] *Id.* at 11-11 to 11-13.

- Water Meter Replacement Program started in 2006 and is ongoing. The current program goal is to replace 25,000 meters per year out of approximately 700,000 existing small meters, which equates to a 28-year replacement. Over the next five years, LADWP plans to ramp up to a replacement cycle of 20 years. This program provides customers with greater accuracy in metering water use and a higher degree of accountability for water that is delivered by the City's distribution system.
- TAP for business and industry have been created to provide incentives for retrofitting water-intensive industrial equipment with high efficiency devices. A large effort is currently being expended using TAP to increase water-efficiency of commercial cooling towers and expand the program for small business participation.

Action by Public Agencies. LADWP assists City Departments and other public agencies in leveraging incentive funds to retrofit their facilities with water-efficient hardware. Significant accomplishments include the following highlights:

- In an effort to reduce water waste and identify areas of potential water conservation, LADWP provided on-site water audit training for the City's Department of General Services (GSD) plumbers, Department of Recreation and Parks (RAP) landscapers and Port of Los Angeles (POLA) staff, and conducted nearly 500 facility audits.
- In January 2009, a Memorandum of Understanding (MOU) was signed between LADWP and GSD to install 875 water-efficient urinals and 325 high-efficiency toilets in City facilities.
- Ten high-use City facilities have been retrofitted with water-efficient toilets, urinals, and faucets saving approximately 23 AFY. Locations include City Hall, City Hall East, Pershing Square, and LADWP headquarters.
- Utilizing a $3 million per year grant from LADWP, RAP has retrofitted 23 parks with California Friendly landscape and water-efficient irrigation. Through this MOU, RAP completed the Los Feliz Golf Course project in July 2014. Golf course improvements include a fully automated recycled water system, and six acres of grass have been replaced with California Friendly landscaping. Annually 5.5 million gallons of water will be saved due to the changes.

Enhancing Conservation through New Developments. LADWP continues to work with the City's Green Building Team to pursue desired changes in local codes and standards to promote water efficiency in new construction projects and major building renovations. One of the significant accomplishments was the approval of the Water-Efficiency Requirements Ordinance No. 180822 by the City Council, which modifies City Municipal Code to establish new requirements for water conservation in construction of new buildings, and the installation of new plumbing fixtures in existing buildings to minimize the effects of any water shortages on the customers of the City, effective December 1, 2009. Additional conservation measures are also required through the following regulations which were effective January 1, 2014: 2013 California Plumbing Code, 2013 California Green Building Code (CALGreen), 2014 Los Angeles Plumbing

Code, and 2014 Los Angeles Green Building Code. On April 8, 2015, the California Energy Commission adopted new efficiency standards for toilets, faucets and other appliances effective January 1, 2016. Also, on July 15, 2015, in response to Governor Brown's Executive Order B-29-15, the California Water Commission approved the revised Model Water Efficient Landscape Ordinance, which reduces the maximum amount of water allowed from the 2009 version of the ordinance. The California Department of Water Resources (DWR) estimates that a new home will use 20 percent less landscape water than allowed by the 2009 ordinance, and commercial landscape will cut water use by 35 percent. Also, Ordinance No. 184248, *Green Building Codes Revision, Use of Greywater Systems, Water Conservation Measures*, became effective June 6, 2016, and mandates a number of new fixture requirements and methods of construction for plumbing and irrigation systems. California Plumbing Code, Los Angeles City Plumbing Code and amending ordinances apply to all newly constructed buildings, additions and alterations whenever new fixtures are installed in existing buildings. CALGreen, the LA Green Building Code and the amending ordinances also apply to new construction projects, but are limited to additions and alterations to existing buildings that either increase the building's conditioned volume or have a valuation of $200,000 or more. For this development, all requirements above resulted in savings of approximately 66 AFY.

In addition, the City adopted Ordinance No. 181899, also known as the "Low Impact Development" Ordinance, and Ordinance No. 183833, entitled "Stormwater and Urban Runoff Pollution Control." The purpose of these Ordinances includes rainwater harvesting and stormwater runoff management, water conservation, and recycled water reuse and gray water use. Ordinance No. 181899 was effective as of November 14, 2011, and Ordinance No. 183833 was effective October 3, 2015.

***Future Programs*[5].** In December 2014, LADWP started its Home Water Use Report Pilot Study, which provides 72,000 single family customers bi-monthly home water use reports on their water usage, statistics on how they compare to similar households with average and efficient water use, and customized water saving tips and rebate recommendations. The pilot study group also has access to online on historical water use, estimated breakdown of how the customer is using their water, and additional information on how to save water in their homes. Upon completion of the pilot study by the end of 2017, LADWP will analyze results to determine the savings potential and cost-effectiveness of the program, which will assist LADWP in planning a long-term program that targets the entire single family customer sector.

Also, LADWP is currently working on pilot projects to test installation of Advanced Metering Infrastructure, which is the use of radio-based technology that would provide for two-way communication between water meters and LADWP's system. The Advanced Metering Infrastructure would provide real-time water meter data to both the end user and LADWP, which would allow LADWP to find leaks at an earlier stage and reduce non-revenue water losses. It would also allow customers to determine their water use more often than a traditional bi-monthly or monthly bill, and motivate them to

[5] *Id.* at 3-33.

proactively increase conservation sooner rather than after they receive their bill. Customers can also receive instant alerts if their usage is abnormally high.

***LADWP Water Conservation Potential Study*[6].** In fall of 2014, LADWP initiated the Water Conservation Potential Study, the largest and most comprehensive conservation study in the U.S. The study will provide a better understanding of how historical water conservation investment efforts have impacted existing water use efficiency and device saturation levels and help LADWP prioritize future water conservation investments in the City by identifying remaining water conservation opportunities to increase City's water use efficiency into the future. Phase 1 of the study estimated conservation potential, and data from extensive and comprehensive residential surveys were used to determine the current saturation of conserving devices and practices. For example, preliminary study results show that 80 percent of single family homes in LADWP have high efficiency toilets, indicating that toilet rebate programs are reaching a saturation threshold. For non-residential sectors, a combination of previous studies conducted by both LADWP and MWD were used, as well as expert judgement from water conservation professionals with substantial experience in commercial and industrial water use and efficiency. Phase 2, currently ongoing, will incorporate results from a comprehensive water survey of 100 City-owned facilities. City-owned facility water surveys are still being fully analyzed and will be incorporated into a revised conservation potential that will be presented in the final report.

Initial results of LADWP Water Conservation Potential Study show that the additional, naturally occurring water conservation potential, post FYE 2015, will reach approximately 71,000 AFY by FYE 2040. Naturally occurring savings represent conservation from natural replacement, new development adhering to building/plumbing codes, and ordinances for landscape water use. With increased LADWP funding for conservation programs, possibly requiring a level double of current program levels, conservation potential may increase to a cost-effective maximum potential of approximately 120,000 AFY by FYE 2040, inclusive of the 71,000 AFY of naturally occurring conservation. The maximum achievable conservation level for FYE 2040, inclusive of and beyond cost-effective maximum potential, is projected to be 218,000 AFY.

2.0 Water Recycling

LADWP's 2015 UWMP identifies the goal of delivering 75,400 AFY by 2040 to off-set imported water.[7] This will increase recycled water use in the City more than six-fold as a percentage of supply, from the current two percent to 13 percent by 2040. Some of the examples of the steps the City is taking in order to achieve this goal are listed below. Other projects not listed below will also contribute to recycled water use in City's service area.

[6] *Id.* at 3-34.
[7] *Id.* at 4-27.

Recycled Water Master Planning (RWMP). In 2012, LADWP completed a three-year RWMP. RWMP documents guide near-term recycled water planning through 2035, as well as long-term recycled water planning for up to 50 years beyond the 2035 horizon. RWMP documents include an evaluation of recycling alternatives that integrate two strategies to increase recycling: Groundwater Replenishment (GWR), and non-potable reuse (NPR). The GWR Project will replenish San Fernando Basin (SFB) with up to 30,000 AFY of recycled water. NPR projects will increase NPR recycled water use to 45,400 AFY by 2040 by increasing deliveries to irrigation and industrial customers throughout the City.

pLAn. The Mayor's Sustainable City pLAn established goals to increase recycled water use by expanding recycled water by an additional 6 million gallons per day by 2017 at Terminal Island Water Reclamation Plant, converting 85 percent of public golf courses to recycled water, developing a strategy to convert the City's lakes to recycled water and implement a pilot project, and expanding recycled water production, treatment, and distribution to incorporate indirect potable reuse and direct potable reuse.[8]

GWR Project. The Final Environmental Impact Report for the GWR Project was certified by the Los Angeles Board of Water and Power Commissioners on December 6, 2016. A pilot study to optimize the recycled water purification process by evaluating various technologies and their combinations is underway. This project would replenish SFB with up to 30,000 AFY of purified recycled water from the Donald C. Tillman Water Reclamation Plant (DCTWRP). Achieving this replenishment goal would entail operating DCTWRP at the plant's full existing capacity to treat up to 80 million gallons per day of wastewater.

The Machado Lake Pipeline Project (MLPP). MLPP is a part of a joint agency project between Los Angeles Sanitation, Los Angeles Bureau of Engineering, and LADWP to serve the Los Angeles Harbor area customers up to an additional 6 million gallons per day of advanced treated recycled water from an expanded Terminal Island Treatment Plant. The MLPP will construct 8,800 linear feet (LF) of 24-inch ductile iron pipeline that connects two segments of existing pipeline infrastructure within the Los Angeles Harbor Area and creates a loop between the charged southern system and the uncharged northern system. The project is split into two construction phases. Construction on Phase I will begin early 2017 and construction on Phase II will begin late 2017. Phase I includes installation of 3,300 LF of 24-inch pipeline along Figueroa Street between Harry Bridges Boulevard and Anaheim Street. Phase II includes installation of 5,500 LF of 24-inch pipeline along Quay Avenue from East Street to Anaheim Street and on Anaheim Street to Alameda Street.

Elysian Park Water Recycling Project. The Elysian Park Water Recycling Project will not only irrigate the Elysian Fields Park and parts of the Elysian Park neighborhood, but also provide reliability to the recycled water system overall. Project proposes the installation of a nearly two miles of pipeline, two pump stations, and a one or two million gallon storage tank. Its construction will ensure dependable service to meet

[8] *Id.* at 4-26.

Los Angeles' growing demand for recycled water in the Metro area. Project will include demolition of the existing 500,000 gallon tank at Elysian Park and install separate new potable water pipelines for restrooms and drinking fountains in the park. Recycled water will be supplied from the Los Angeles-Glendale Water Reclamation Plant. Anticipated project completion is 2021.

Downtown Water Recycling Project. The Los Angeles-Glendale Water Reclamation Plant will supply recycled water for the Downtown Water Recycling Project. Project proposes installation of up to 82,500 LF of 16-inch purple pipe into and through Downtown Los Angeles. The project will supply up to 2,170 AFY of recycled water for non-potable demands – irrigation and industrial uses. Potential anchor customers include University of Southern California and Matchmaster. Anticipated project completion is 2022.

Recycled Water Outreach. The City developed RWMP documents with input from stakeholders through ongoing outreach activities beginning in 2009, including interaction with the Recycled Water Advisory Group (RWAG) and key stakeholders. Presentations were given to elected official, Kindergarten-12 grade students, and Neighborhood Councils and community groups. RWAG, made up of approximately 70 stakeholders representing neighborhood councils, environmental groups, business organizations, civic groups, and other interests has recently been integrated into the One Water L.A. Stakeholder Group. They provide the City with input and feedback on many water related issues including the water recycling program. The One Water L.A. Stakeholder Group continues to participate in workshops, facility tours, and update sessions, and provide insightful feedback to the City as projects are implemented.

3.0 Enhancing Stormwater Capture

Stormwater runoff from urban areas is an underutilized resource. Within the City, the majority of stormwater runoff is directed to storm drains and ultimately channeled into the ocean. Unused stormwater reaching the ocean carries with it many pollutants that are harmful to marine life. In addition, local groundwater aquifers that should be replenished by stormwater are receiving less recharge than in the past due to increased urbanization. Urbanization has increased the City's hardscape, which has resulted in less infiltration of stormwater and a decline in groundwater elevations. The estimated current stormwater capture in the City is approximately 64,000 AFY. LADWP's 2015 UWMP projects to double the amount of stormwater capture under a conservative scenario. Centralized stormwater capture projects will increase stormwater capture by approximately 35,000 AFY by year 2035.[9] Centralized stormwater capture projects are large-scale operated projects that are designed specifically to infiltrate large amounts of runoff into underlying groundwater aquifers. Distributed stormwater capture projects, such as dry-wells and cisterns, will also provide 33,000 AFY of additional stormwater capture and infiltration/reuse in the SFB, for a total of 68,000 AFY including centralized

[9] *Id.* at 7-10.

capture by year 2035.[10] Distributed stormwater/runoff capture refers to capturing localized dry and wet weather runoff.

The Stormwater Capture Master Plan defines stormwater capture targets over the next 20 years in five-year increments to year 2035, and identifies future centralized stormwater capture projects and program types for distribution stormwater capture such as on-site infiltration, on-site direct use, green streets, sub-regional infiltration, and sub-regional direct use. LADWP began its initial research for the Stormwater Capture Master Plan in the fall of 2013 and completed a final plan in late 2015. Stormwater Capture Master Plan goals were integrated into LADWP's 2015 UWMP.

Specific strategies under the Mayor's pLAn to increase stormwater capture include identifying funding mechanisms to implement the Enhanced Watershed Management Plans necessary for MS4 permit compliance, expanding use of permeable pavement sites and green streets (e.g., bioswales, infiltration cut-outs, permeable pavement, and street trees), and expanding the Rain Barrel Program.

LADWP's 2015 UWMP projects that there will be a minimum of 15,000 AFY of increased groundwater pumping in SFB due to water supply augmentation through centralized stormwater infiltration by year 2040. Anticipating that stored groundwater will rebound in response to enhanced groundwater replenishment, LADWP will work with the Upper Los Angeles River Area Watermaster to continue observing actual water levels and re-evaluate basin safe yield to allow additional increases in groundwater production over time as SFB elevations rebound.[11]

In addition, development has encroached onto waterway floodplains requiring the channelization of these waterways that once recharged the groundwater aquifers with large volumes of stormwater runoff. When the floodplains were undergoing rapid development, LADWP and the Los Angeles County Flood Control District reserved several parcels of land for use as spreading facilities. These facilities are adjacent to some of the largest tributaries of the Los Angeles River, and the Pacoima and Tujunga Washes.

During average and below average years, these spreading facilities are very effective at capturing a large portion of the stormwater flowing down the tributaries. However, they are incapable of capturing a significant portion of the flows during wet and extremely wet years. Weather patterns in Los Angeles are highly variable, with many periods of dry years and wet years. Some climate studies predict that these patterns may become more extreme in the future.

LADWP is currently partnering with other government and non-governmental agencies in various stormwater enhancement studies and projects that include the following:

[10] *Id.* at 7-10.
[11] *Id.* at 7-29.

Completed Centralized Projects

Implemented centralized projects have increased the amount of stormwater captured by an average of 10,600 AFY since 2013. Below is a sample of recently implemented centralized projects:

- **Sheldon-Arleta Gas Management System**
  Completed in 2009. Scope included the installation of a methane gas abatement system mitigating methane migration during groundwater recharge operations at Tujunga Spreading Grounds. Project increases regional annual average stormwater recharge by 4,000 AFY.

- **Big Tujunga Seismic Retrofit Project**
  Completed in 2012. Scope included the retrofit of the Big Tujunga Dam to meet state seismic and spillway requirements and increase the reservoir's storage capacity. Project increases regional annual average stormwater capture by 4,500 AFY.

- **Hansen Spreading Grounds Upgrade**
  Completed in 2013. Scope included combining and deepening the spreading basins as well as upgrading the intake structure to increase recharge capacity. Project increases regional annual average stormwater recharge by 2,100 AFY.

Completed Distributed Projects

LADWP's already implemented distributed projects that have increased the amount of stormwater captured by an average of 333 AFY. Following is a sample of recently implemented distributed projects:

- **Sun Valley Park Stormwater Infiltration Project**
  Completed in 2010. Scope included installing a stormwater pretreatment system, infiltration gallery, and retention system for infiltration. Project increases regional annual average stormwater capture by 30 AFY.

- **Elmer Avenue Neighborhood Green Street/Elmer Paseo Green Alley Stormwater Infiltration Projects**
  Completed in 2011 - Scope for Elmer Avenue Green Street included installing stormwater underground retention infiltration system under the street, and vegetated swales and rain gardens in the parkway and private property. Completed in 2013 - Scope for Elmer Paseo Green Alley included installing underground retention infiltration system and vegetated swales to increase stormwater capture. Combined projects increase regional annual average stormwater capture by 41 AFY.

- **Garvanza Park Stormwater Capture Use and Infiltration Project**
  Completed in 2012. Scope included installing a stormwater pretreatment system, infiltration gallery, and retention system for use at the Garvanza Park. Project increases regional annual average stormwater capture by 51 AFY.

- **North Hollywood Alley Retrofit BMP Demonstration Project**
  Completed in 2013. Scope included retrofitting four alleys with pervious surfaces to facilitate stormwater infiltration. Project increases regional annual average stormwater capture by 29 AFY.

- **Glenoaks-Sunland Stormwater Infiltration Project**
  Completed in 2013. This project included construction of dry wells and parkway infiltration swales along a portion of the sidewalks of Glenoaks Boulevard which currently have no storm drains. Project increases regional annual average stormwater capture by 28 AFY.

- **Woodman Avenue Median Stormwater Infiltration Project**
  Completed in 2014. Scope included replacing an existing concrete median with vegetated swales and an underground retention system for infiltration. Project increases regional annual average stormwater capture by 55 AFY.

- **Avalon Alley South**
  Completed in September 2015. This project implements low impact development (LID) stormwater capture and infiltration BMP's in the alley to capture, infiltrate, and retain stormwater runoff from a 4.3 acre area and provides stormwater capture of 1 million gallons per year (3.1 AFY). The BMPs include permeable pavers, dry wells, cisterns, and rain gardens. The Project improves water quality, attenuates peak storm flows, and increases stormwater capture and water supply and is a joint partnership between the City of Los Angeles Sanitation, the Trust for Public Land, and the Council for Watershed Health in South Los Angeles.

- **Sun Valley Economic Development Administration Public Improvement Project**
  Completed in 2016. Scope included the installation of 46 dry wells within the public right of way in an area with limited storm drainage. Project increases regional annual average stormwater capture by 93 AFY.

- **Broadway Greenway**
  Completed in 2016. The Project is a pilot phase of a larger project being explored by the Water Replenishment District (WRD) involving strategic implementation of neighborhood BMP retrofits through the region. Four levels of BMPs are being developed. This includes stormwater capture infrastructure on: residential parcel-based scale, neighborhood-scale, green street commercial, and a sub-regional scale infiltration gallery. The sub-regional BMP will capture up to a 2 inch rain event from at 58 acre tributary area. The Project is expected to recharge

groundwater aquifers by 40 AFY. The project was implemented by the City's Bureau of Engineering.

- **Hollywood/Los Angeles Beautification Stormwater Capture Project**
  This is a demonstration project to encourage stormwater capture. The City of Los Angeles Department of Public Works, Bureau of Street Services and LASAN will provide in-kind design services, while the Sun Valley Beautiful Committee, Council District 6, and the Los Angeles Unified School District (LAUSD) are project sponsors and partners. Project increases regional annual average stormwater capture by 6 AFY.

Current/Future Centralized Projects

Within the next five years, the following centralized projects are expected to be implemented that will provide an estimated 25,279 AF of increased stormwater capture annually. Following is a short description of these future projects:

- Big Tujunga Dam Sediment Removal Project
- Branford Spreading Basin Upgrade
- Bull Creek Stormwater Capture Project
- Canterbury Power Line Easement Stormwater Capture Project
- East Valley Baseball Stromwater Capture Project
- Fernangeles Park Stormwater Capture Project
- Lopez Spreading Grounds Upgrade
- Pacoima Dam Sediment Removal Project
- Pacoima Spreading Grounds Upgrade
- Penmar Water Quality Improvement Project
- Riviera County Club Stormwater Capture Project
- Rory M. Shaw Wetlands Park Project (Strathern Pit)
- Tujunga Spreading Grounds Upgrade (in construction)
- Valley Generating Station Stormwater Capture Project
- Whitnall Highway Power Line Easement Stormwater Capture Project

Current/Future Distributed Projects

Within the next five years, the following distributed projects are expected to be implemented that will provide an estimated 1,659 AFY of increased stormwater capture. Below is a short description of these future projects:

- Agnes Avenue – Vanowen to Kittridge Stormwater Capture Project
- Arundo Donax Removal Project (in construction)
- Branford Street – Laurel Canyon to Pacoima Wash Stormwater Capture Project
- Burbank Boulevard Stormwater Capture Project
- Glenoaks and Filmore Stormwater Capture Project
- Glenoaks-Nettleton Stormwater Infiltration Project

- Great Street – Hollywood Avenue – La Brea to Gower Project
- Great Street – Lankershim Boulevard (Chandler to Victory) Project
- Great Street – Reseda Boulevard – Plummer to Parthenia Project
- Great Street – Van Nuys Boulevard (Laurel Canyon to San Fernando) Project
- Great Street – Western Avenue – Melrose to 3rd Project
- Laurel Canyon Boulevard Green Street Stormwater Infiltration Project (in construction)
- LAUSD Conserving for Our Kids Program (in construction)
- Maclay Middle School – LAUSD Project
- Northridge Middle School Project
- Tyrone Yard – New LADWP Valley Center Project
- Valley Center Stormwater Capture Project
- Van Nuys Boulevard Median Stormwater Capture Project
- Van Nuys Boulevard Median Stormwater Capture Project
- Victory-Encino Stormwater Infiltration Project
- Victory-Goodland Median Stormwater Capture Project
- Water LA Phase 2
- Whitnall Gardens Project

4.0 Accelerating Clean-Up of SFB

LADWP groundwater production wells in SFB have been impacted by contamination caused by improper storage, handling and disposal of hazardous chemicals used in the aircraft manufacturing industry, as well as commercial activities associated with automobile and equipment repair, dry cleaners, paint shops, chrome plating, textile manufacturing and fuel storage and dispensing dating back to the 1940s.

Since the 1980 discovery of volatile organic compound (VOC) contamination of groundwater in SFB, LADWP has been working with state and federal agencies to contain and remediate man-made contaminants in SFB. Chlorinated solvents such as trichloroethylene (TCE), perchloroethylene (PCE) and carbon tetrachloride account for the majority of this groundwater contamination.

In 2009, LADWP began an $11.5 million, six-year study and development of a comprehensive remediation and cleanup strategy for all groundwater basin contamination in SFB. This study was completed in February 2015.[12]

Development of State-of-the-Art Groundwater Basin Remediation Facilities

- Based on the available groundwater quality information, a groundwater basin remediation program consisting of centralized as well as localized/well head remediation facilities will be needed for public and environmental benefits as well as to prevent further loss of groundwater.

[12] *Id.* at 6-9.

- Design and construction of the groundwater basin remediation facilities is estimated to cost approximately $600 million, and operation and maintenance is estimated to cost an additional $50 million per year.

Groundwater and Treatment System Monitoring

- In order to fully characterize SFB groundwater quality as required by SWRCB Board's Division of Drinking Water guidelines and policies, LADWP has drilled 25 new monitoring wells in SFB to fill in data gaps and utilized a network of over 70 existing monitoring and production wells.

- Cost to install the monitoring wells is approximately $22 million.

With completion of SFB groundwater characterization, LADWP is proceeding with the necessary environmental reviews, design, permitting, construction, and start-up of the groundwater basin remediation program to effectively clean and remove contaminants from SFB. The groundwater basin remediation program is anticipated to be operational by FYE 2022.

LADWP's groundwater remediation facilities now operating within SFB include:

- ***NHOU.*** Under the direction of USEPA, LADWP operates and maintains NHOU pursuant to a Cooperative Agreement between the two agencies. Since the 1980 discovery of VOC contamination in SFB, LADWP worked closely with the state and federal regulators to implement facilities that will contain and remediate the contaminant plume. NHOU began operations in the late-1980s utilizing an aeration tower for VOC removal followed by vapor-phase Granular Activated Carbon (GAC) to control air emissions. However, changing conditions in the aquifer and discovery of new contaminants including Hexavalent Chromium and 1,4 dioxane, found in concentrations greater than state health standards, have impacted a number of NHOU production wells and continues to threaten other wells. In response to the continued movement of the contaminated groundwater and the presence of new contaminants in the NHOU, EPA conducted a Focus Feasibility Study (FFS) to evaluate alternatives for improving the groundwater cleanup plan. Following completion of the FFS in 2009, EPA signed the 2009 Record of Decision (ROD) selecting the Second Interim Remedy for the NHOU. The availability of new information regarding the nature and the extent of the contamination plume within the NHOU has allowed EPA to refine its understanding of the extent of the groundwater contamination. As a result, EPA has recently proposed to expand the second remedy to increase extraction rate from 2000 gpm to 6500 gpm, add more extraction wells, and design a more efficient treatment system that will treat for emerging contaminants and ensure more reliable and effective remedy.

- ***Liquid-Phase GAC Pilot Treatment Plant at Tujunga Wellfield.*** The Liquid-Phase GAC Pilot Treatment Plant removes VOC from two of the twelve production wells in the Tujunga Wellfield, and treats the extracted groundwater for potable use. The pilot facility treats approximately 8,000 gallons-per-minute of groundwater, removes contaminants, and discharges the treated effluent into LADWP's water distribution system for beneficial use pursuant to California Water Code. This pilot facility is a joint project with MWD to demonstrate the effectiveness of utilizing certain liquid phase GAC media for removal of VOC from the groundwater.

- ***Pollock Wells Treatment Plant.*** The plant provides four liquid-phase GAC vessels to remove VOC contamination from two groundwater wellheads. LADWP has identified hexavalent chromium as an emerging contaminant that may impair the operation of the Pollock Wells Treatment Plant. In response, LADWP has initiated studies and the development of additional remediation systems to remove the hexavalent chromium and other emerging contaminants that are not addressed by the GAC treatment system.

The overall purpose of the San Fernando Groundwater Basin Remediation Project is to restore and protect the full use of the San Fernando Groundwater Basin as a source of water consistent with LADWP's long-term water rights and historic groundwater use.

Water Supplies

The Los Angeles Aqueducts (LAA), local groundwater, purchased water from MWD, and recycled water are the primary sources of water supplies for the City. Table III shows LADWP water supplies from 2007 to 2016 from these sources. The total required water supply to meet water demand shows an overall declining trend over this time period due to reductions in total demand. However, sufficient water supplies were available in each of the years to meet the total demand. In 2009, the total water demand decreased due to conservation efforts by mandatory conservation imposed in the City following drier hydrologic conditions coinciding with an economic recession. In 2013, drought conditions returned and have triggered State and City mandatory conservation measures.

TABLE III
LADWP Water Supply

Calendar Year	Los Angeles Aqueducts	Local Groundwater	MWD	Recycled Water	Transfer, Spread, Spills, and Storage	Total
2007	127,392	88,041	439,353	3,595	-57	658,438
2008	148,407	64,604	427,422	7,048	1,664	645,817
2009	137,261	66,998	351,959	7,570	554	563,234
2010	251,126	68,346	205,240	6,900	-938	532,550
2011	357,752	49,915	119,481	7,708	-153	535,009
2012	166,858	59,109	326,122	5,965	1,182	556,872
2013	64,690	66,272	438,534	9,253	-2,404	581,153
2014	62,088	94,280	391,320	11,307	2,080	556,915
2015	26,828	81,618	378,439	9,844	432	496,297
2016	87,892	73,304	317,767	8,730	-984	488,677

Note: Units are in AF

Los Angeles Aqueducts

Snowmelt runoff from the Eastern Sierra Nevada Mountains is collected and conveyed to the City via LAA. LAA supplies come primarily from snowmelt and secondarily from groundwater pumping, and can fluctuate yearly due to the varying hydrologic conditions. In recent years, LAA supplies have been less than the historical average because of environmental restoration obligations in Mono and Inyo Counties.

The City holds water rights in the Eastern Sierra Nevada where LAA supplies originate. These supplies originate from both streams and from groundwater. In 1905, the City approved a bond measure for purchase of land and water rights in the Owens River Valley. By 1913, the first LAA began its deliveries of water to the City primarily from surface water diversions from the Owens River and its tributaries. Historically, these supplies were augmented from time to time by groundwater extractions from beneath the lands that the City had purchased in the Owens Valley.

In 1940, the first LAA was extended north to deliver Mono Basin water to the City pursuant to water rights permits and licenses granted by the SWRCB. In 1970, the second LAA was completed increasing total delivery capacity of the LAA system to approximately 561,000 AF per year. The second LAA was to be filled by completing the Mono Basin diversions originally authorized in 1940, by a more effective use of water for agricultural purposes on City-owned lands in the Owens Valley and Mono Basin and by increased groundwater pumping from the City's lands in the Owens Valley.

In 1972, Inyo County filed a CEQA lawsuit challenging the City's groundwater pumping program for the Owens Valley. The lawsuit was finally ended in 1997, with the County of Inyo and the City entering into a long-term water agreement for the management of groundwater in the Owens Valley. That water agreement, entered as a judgment of the Superior Court in the County of Inyo (County of Inyo vs. City of Los Angeles, Superior

Court No. 12908) outlines the management of the City's Owens Valley groundwater resources. As a result of this water agreement and subsequent MOU, LADWP has dedicated 37,000 AF of water annually for enhancement and mitigation projects throughout Owens Valley which includes the re-watering of 62 miles of the Lower Owens River. LADWP also provides approximately 80,000 AF of water annually for other uses in the Owens Valley such as irrigation, town water supplies, stockwater, wildlife and recreational purposes.

Further, in December 1989, the Superior Court entered an injunction, ordering LADWP to allow sufficient flow to pass through the Mono Basin diversion facilities to maintain water level in Mono Lake at 6,377 feet from sea level and also to restore streams and protection of fishery in these streams. As a result, the City did not export any water from Mono Basin until 1994, when SWRCB issued Decision 1631. In September 1994, by virtue of the public trust doctrine, the SWRCB issued Decision 1631, an amendment to the license for LADWP exports from Mono Basin which placed conditions on LADWP's water gathering activities from Mono Basin. Under Decision 1631, LADWP's allowable amount of export for a given runoff year (RY), April - March is dependent on the Mono Lake elevation. For RY 2016-2017, LADWP plans to export approximately 4,500 AF of water from Mono Basin, the same amount as for RY 2015-2016, as Mono Lake's elevation measured on April 1, 2017 was below 6,380 feet but above 6,377 feet. LADWP has implemented an extensive restoration and monitoring programs in Mono Basin to increase the level of Mono Lake and to improve stream conditions, fisheries and waterfowl habitats in Walker, Parker, Rush and Lee Vining Creeks. With reduced diversions from the Mono Basin and favorable hydrologic conditions, Mono Lake's elevation has risen overtime. Once the elevation of Mono Basin reaches 6,391-feet above mean sea level, a moderate increase in water exports from the Mono Basin will be permitted pursuant to the Decision 1631.

In July 1998, LADWP and the Great Basin Unified Air Pollution Control District (GBUAPCD) entered into a Memorandum of Agreement to mitigate dust emissions from Owens Lake. Diversion of water from Owens River, first by farmers in the Owens Valley and then by the City beginning in 1913, resulted in the exposed lakebed becoming a major source of windblown dust. LADWP has spent $1.6 billion and used substantial quantities of water since it started diverting water from LAA to mitigate dust emissions at Owens Lake. As of December 31, 2008, LADWP mitigated dust emissions from 29.8 square-miles of Owens Lake in accordance with GBUAPCD's 2003 revised State Implementation Plan. As of April 1, 2010, LADWP mitigated an additional 9.2 square - miles in accordance with GBUAPCD's 2008 State Implementation Plan. Upon completion of Phase 8 in October 2012, LADWP has mitigated dust emissions from a total of approximately 42 square-miles of Owens Lake. Phase 7a was completed by the regulatory compliance deadline of December 31, 2015, and upon its completion, LADWP has mitigated dust emissions on 45 square-miles. Phase 7a is a water neutral project.

On November 14, 2014, an historic agreement between LADWP and GBUAPCD was reached which for the first time established an upper limit of 53.4 square miles that LADWP could potentially be ordered to mitigate dust emissions from Owens Lake playa

by the GBUAPCD. As part of this historic agreement, LADWP has agreed to mitigate dust emissions for an additional 3.62 square miles of Owens Lake playa. The Phase 9/10 Project is to be completed by December 31, 2017, and is anticipated to result in further water conservation at Owens Lake through increasing use of water efficient and waterless dust mitigation measures. Upon completion of Phase 9/10 Project, LADWP will mitigate approximately 48.6 square miles of dust missions in Owens Lake playa. Hence, GBUAPCD's potential future dust mitigation orders to LADWP cannot exceed an additional 4.8 square miles. The agreement allows LADWP to use water efficient and waterless dust mitigation measures, while maintaining existing wildlife habitat on the lakebed. As a result, LADWP expects to save significant amounts of water in coming years with implementation of the Owens Lake Master Project and other water conservation projects.

Average deliveries from LAA system have been approximately 111,293 AF of water annually from FY 2011/12 to 2015/16. During this period, the record low snowpack for LAA watershed in the Eastern Sierra Nevada Mountains was recorded on April 1, 2015. Supply conditions have changed drastically since 2015. Snowpack in the Eastern Sierra was at 203 percent of an average year on April 1, 2017. On March 20, 2017, Mayor Garcetti had proclaimed a state of local emergency for LAA as a response to the snowpack levels in the Eastern Sierra. The proclamation was issued to assist LADWP in taking immediate steps to protect infrastructure and manage runoff in the Owens Valley including, but not limited to, protection of facilities and diversion of conveyance flows.

The average annual long-term LAA delivery between 2015 and 2040, using the 50-year average hydrology from FY 1961/62 to 2010/11, is expected to be approximately 278,000 AFY and gradually decline to 267,000 AFY due to projected climate change impacts. However, with the anticipated completion of the Owens Lake Master Project by 2024, the projected LAA delivery may increase to 286,000 AFY due to water conserved at Owens Lake which would off-set most of the anticipated long-term losses.[13]

Groundwater

The SFB and Sylmar Basin are subject to the judgment in the City of San Fernando vs. the City of Los Angeles, et al. Groundwater pumping by LADWP and other parties is tracked and reported to the court-appointed Upper Los Angeles River Area (ULARA) Watermaster. The Central Basin is also subject to court judgments. Pumping is reported to the Water Replenishment District of California (WRD), the administrative member of the Central Basin Water Rights Panel.

SFB is the largest of four basins within ULARA. The basin consists of 112,000-acres of land and comprises 91.2 percent of ULARA valley fill. The City has accumulated 537,622 AF of stored groundwater in SFB as of October 1, 2014. This is water the City can withdraw from the basin during normal and dry years or in an emergency, in

[13] *Id.* at 5-15.

addition to the City's approximately 87,000 AF annual entitlement in the basin. With SFB remediation facilities in operation by FYE 2022, groundwater storage credit will be used to maximize pumping in the future above City's annual entitlement in SFB. The majority of the City's groundwater is extracted from SFB. Sylmar Basin is located in the northern part of ULARA, consists of 5,600 acres, and comprises 4.6 percent of ULARA valley fill. City's current annual entitlement per latest Sylmar Safe Yield is 3,570 AF. Sylmar Basin production will increase to 4,170 AFY from FYE 2016 to FYE 2039 to utilize groundwater the City has accumulated into storage and then return to the entitlement of 3,570 AFY in FYE 2040.[14]

A Court decision on pumping rights in ULARA was implemented in a judgment on January 26, 1979. Enclosed with the assessment are copies of those pages from the judgment showing the entitlements (see Appendix D). Further information about ULARA is in the ULARA Watermaster Report. ULARA Watermaster Report and some background information on the judgment are available for review at the office of the ULARA Watermaster or on-line at www.ularawatermaster.com.

City additionally has adjudicated rights to extract groundwater from the Central Basin. Annual entitlement to Central Basin is 17,236 AF. City has accumulated groundwater into storage in Central Basin, and pumping can be temporarily increased until stored water credits have been expended.[15] See Appendix D for copies of relevant portions of the third amended judgment. Judgment is available for review on the WRD Web site at http://wrdwater.org/.

For the period of July 2014 to June 2015, City extracted 80,097 AF and 6,948 AF from the San Fernando and Central Basins, respectively. City plans to continue production from its groundwater basins in the coming years to offset reductions in imported supplies. However, extraction from the basins may be limited by water quality, sustainable pumping practices, and groundwater elevation.

Groundwater produced by City from the San Fernando, Sylmar, and Central Basins for the last available five years are shown on Table IV, as well as groundwater pumping projections for average, single-dry, and multi-year dry weather conditions in five-year increments. Table IV excludes 15,000 AFY of anticipated pumping in SFB from stormwater recharge as well as 30,000 AFY of additional groundwater recharge with highly treated water from DCTWRP planned for 2024 and beyond.

MWD

MWD is the largest water wholesaler for domestic and municipal uses in Southern California. As one of 26 member agencies, LADWP purchases supplemental water from MWD in addition to the supplies from local groundwater and LAA. MWD imports a portion of its water supplies from Northern California through the State Water Project's (SWP) California Aqueduct and from the Colorado River through MWD's own Colorado River Aqueduct (CRA). LADWP will continue to rely on MWD to meet its current and future water needs.

In ongoing efforts to evaluate MWD's own import reliability, an assessment was done to address changes in demand and supply conditions, and to provide additional resource reserves to mitigate against uncertainties in demand projections and risks in implementing supply programs. All these efforts went into MWD's 2015 UWMP.

All 26 member agencies have preferential rights to purchase water from MWD. Pursuant to Section 135 of MWD Act, "Each member public agency shall have a preferential right to purchase from the district for distribution by such agency, or any public utility therein empowered by such agency for the purpose, for domestic and municipal uses within the agency a portion of the water served by the district which shall, from time to time, bear the same ratio to all of the water supply of the district as the total accumulation of amounts paid by such agency to the district on tax assessments and otherwise, excepting purchase of water, toward the capital cost and operating expense of the district's works shall bear to the total payments received by the district on account of tax assessments and otherwise, excepting purchase of water, toward such capital cost and operating expense." This is known as preferential rights.

As of June 30, 2016, LADWP has a preferential right to purchase 19.94 percent of MWD's total water supply.

LADWP has worked with MWD in developing a plan for allocating water supplies during periods of shortage. On February 12, 2008, MWD Board adopted its Water Supply Allocation Plan (WSAP). LADWP supported the adoption of this plan to acquire its dry weather condition supplies from MWD.

In response to 2009 regulatory restrictions on water supplies from Northern California, MWD Board announced on April 14, 2009, that supply deliveries to the member agencies would be reduced by 10 percent. Reduced supply allocation was to be effective from July 1, 2009 through June 30, 2010, but in April 2010, MWD Board approved an extension of the reduced supply allocation through June 30, 2011, primarily to restore storage balances in MWD's groundwater and surface storage facilities.

On March 31, 2011, California Governor Brown declared an end to the statewide drought emergency that had been proclaimed earlier on February 27, 2009, by then Governor of California Arnold Schwarzenegger. MWD's Board subsequently voted on April 12, 2011, to end implementation of the 2010/11 water supply allocation. In the same decision, MWD Board also voted against implementing a water supply allocation for 2011/12. These actions restored full imported water deliveries to member agencies without risk of allocation penalties effective April 2011.

On January 17, 2014, Governor Brown proclaimed a drought State of Emergency. At the end of March 2015, state hydrologists measured a record low five percent of normal snow pack in the Sierra Nevada Mountains. As a result, on April 1, 2015, Governor Brown issued Executive Order B-29-15 to achieve a statewide 25 percent reduction compared to 2013 usage levels in urban water use through February 28, 2016. On May 18, 2016, due to improved hydrologic conditions, SWRCB adopted a revised emergency water conservation regulation, effective June 2016 through February 2017, requiring locally developed conservation standards based upon each agency's specific circumstances.

The record dry and hot conditions of 2014 significantly impacted the water resources of both the State of California and MWD. DWR limited supplies from SWP to only five percent of the contractors' SWP Table A amounts in 2014. This allocation was the lowest ever in the history of SWP. MWD was able to meet demands in 2014 by relying heavily on storage reserves to make up for the historically low allocation on SWP. MWD's dry-year storage reserves ended 2014 at approximately 1.2 million AF.

On April 14, 2015, to support Governor Brown's Executive Order B-29-15, and to reduce withdrawals from MWD's dry-year storage reserves, MWD implemented WSAP at a Level 3 Regional Shortage Level, effective July 1, 2015, though June 30, 2016. MWD's dry-year storage reserves ended 2015 at approximately 0.87 million AF.

On May 10, 2016, citing the improved water supply conditions and reduced water use due to conservation, MWD voted to end the current WSAP allocation and rescind WSAP Regional Shortage Level 3 and declared a Condition 2 Water Supply Alert for allocation year 2016/17. MWD, however, called for member agencies to continue with conservation efforts to safeguard against future dry years. On April 9, 2017, citing the improved water supply conditions, the actions taken by the Governor and the projected storage reserves, MWD voted to declare a Condition 1 Water Supply Watch.

Purchases from MWD have averaged 64 percent of the City's water supply over a five-year period from FY 2011/12 to 2015/16. The sustainable pLAn calls for a reduction in purchased imported water by 50 percent by 2025 from the FY 2013/14 level, which was approximately 441,870 AF. To meet targets established by the pLAn, LADWP plans to reduce water demand through increased conservation as well as increase local supply development. Local supply development includes enhancing the ability for groundwater pumping through increased stormwater capture projects and groundwater replenishment with highly treated recycled water as well as remediation of contaminated groundwater supplies in SFB. LADWP also plans to increase recycled water use for non-potable purposes. With these initiatives and under average hydrologic conditions, LADWP's 2015 UWMP projects MWD purchases to be approximately 65,930 AFY in 2025.

Recent Issues Related to the State Water Project

Federal Endangered Species Act (ESA) Litigation filed by several environmental interest groups in the United States District Court for the Eastern District of California alleged that existing biological opinions and incidental take statements inadequately analyzed impacts on listed species under the Federal ESA. On May 25, 2007, Federal District Judge Wanger issued a decision on summary judgment finding the United States Fish and Wildlife Service's (USFWS) biological opinion for Delta smelt was invalid. On December 14, 2007, Judge Wanger issued his Interim Remedial Order requiring that SWP and Central Valley Project operate according to certain specified criteria until a new biological opinion for the Delta smelt is issued. USFWS released the new biological opinion on December 15, 2008. Based on the Water Allocation Analysis released by DWR on December 19, 2008, which analyzed the biological opinion's effects on SWP operations, export restrictions under median hydrologic conditions reduce deliveries to MWD by approximately 500,000 AF.

MWD and other impacted agencies and stakeholders filed separate lawsuits in federal district court challenging the biological opinion, which the federal court consolidated under the caption "Delta Smelt Consolidated Cases." On December 14, 2010, Judge Wanger issued a decision on summary judgment finding that there were major scientific and legal flaws in the Delta smelt biological opinion and remanded the biological opinion to USFWS for reconsideration. The court's decision invalidated some of the restrictions on project operations contained in the Delta smelt biological opinion. On May 18, 2011, Judge Wanger issued a final decision, amended judgment directing USFWS to complete a new draft biological opinion by October 1, 2011, and to complete a final biological opinion with environmental documentation by December 1, 2013. Later

stipulations and orders changed the October 1, 2011, due date for a draft biological opinion to December 14, 2011, and changed the December 1, 2013, due date for the final biological opinion to December 1, 2014.

A draft biological opinion was issued on December 14, 2011. The draft biological opinion deferred specification of a reasonable and prudent alternative and an incidental take statement pending completion of environmental impact review under the National Environmental Policy Act (NEPA). The federal defendants and environmental interveners appealed the final judgment invalidating the 2008 Delta smelt biological opinion to the United States Court of Appeals for the Ninth Circuit. SWP and Central Valley Project contractor plaintiffs, including MWD, cross-appealed from the final judgment. Those appeals and cross-appeals were argued on September 10, 2012. On March 13, 2014, the Ninth Circuit reversed in part and affirmed in part the district court's decision. The Ninth Circuit reversed those portions of the district court decision which had found the 2008 Delta smelt biological opinion to be arbitrary and capricious, and held, instead, that the 2008 biological opinion was valid and lawful. MWD's deliveries from SWP were previously restricted under the 2008 biological opinion for a period prior to 2011. One practical result of the Ninth Circuit's decision was to legally approve the water supply restrictions in the 2008 biological opinion. These water supply restrictions could have a range of impacts on MWD's deliveries from SWP depending on hydrologic conditions. MWD and others subsequently filed motions for reconsideration of the Ninth Circuit's decision.

On May 25, 2010, the court granted the plaintiffs' request for a preliminary injunction in the Consolidated Salmon Cases, restraining enforcement of two requirements under the salmon biological opinion that limit exported water during the spring months based on San Joaquin River flows into the Bay-Delta and reverse flows on the Old and Middle Rivers. Hearings on motions for summary judgment in the Consolidated Salmon Cases were held on December 16, 2010. On September 20, 2011, Judge Wanger issued a decision on summary judgment, finding that the salmon biological opinion was flawed, and that some, but not all, of the project restrictions in the biological opinion were arbitrary and capricious. On December 12, 2011, Judge O'Neill (who was assigned to this case following Judge Wanger's retirement) issued a final judgment in the Consolidated Salmon Cases. The final judgment remands the 2009 salmon biological opinion to the National Marine Fisheries Service. It also directs that a new draft salmon biological opinion be issued by October 1, 2014, and that a final biological opinion be issued by February 1, 2016, after completion of environmental impact review under NEPA. The due date for the salmon biological opinion was later extended to February 1, 2017.

In January and February 2012, the federal defendants and environmental interveners filed appeals of the final judgment in the Consolidated Salmon Cases, and SWP and Central Valley Project contractors filed cross-appeals. On December 22, 2014, the Ninth Circuit reversed in part and affirmed in part the district court's decision. The Ninth Circuit reversed those portions of the district court decision which had found the 2009 salmon biological opinion to be arbitrary and capricious, and held, instead, that the 2009

biological opinion was valid and lawful. Any adverse impacts of this ruling on MWD's SWP supplies have not been determined.

These events have highlighted the challenges that water suppliers throughout the state currently face regarding supplies from the Delta.

On November 28, 2016, in consideration of several factors including existing storage in State Water Project conservation reservoirs, conservation constraints such as the conditions of the recent Biological Opinions for delta smelt and salmonids, the longfin smelt incidental take permit, and 2017 contractor demands, DWR announced an initial SWP allocation of 20 percent for 2017. On December 21, 2016, due to recent precipitation, runoff and water supply conditions, DWR increased the allocation from 20 percent to 45 percent, and on January 18, 2017, announced another increase from 45 to 60 percent for similar reasons. On April 14, 2017, DWR increased the allocation from 60 to 85 percent.

On February 7, 2017, the main flood control spillway at Oroville Dam, a primary reservoir on the SWP, experienced significant damage as DWR increased releases to manage higher inflows driven by continued precipitation in the Feather River basin. DWR halted releases on this spillway and diverted water over the emergency spillway for the first time ever. However, the emergency spillway quickly eroded, causing officials to order the temporary evacuation of downstream residents while ramping up water releases over the main spillway to control lake levels. The evacuation order was lifted on February 14, 2017. A multi-agency investigation and recovery design followed and demolition of Oroville Dam's flood-control spillways began in May, 2017. Repairs are expected to take two years, although DWR officials say the spillways will be functional by the November 1, 2017 start of the rainy season. Work to be completed prior to that time will include reinforcing of the structurally sound upper portion of the main spillway, demolition and replacement of the badly damaged lower portion of the main spillway, and construction of a cut-off wall downhill of the emergency spillway. The upper section of the main spillway will be replaced in 2018. Despite the damage to the main spillway, water supplies are not expected to be adversly affected. This would result in an allocation that is higher than average, and higher than any allocation since 2011. Future water supplies are expected to be primarily dependent on hydrology.

Delta Policy

In November 2009, the State Legislature and then Governor Arnold Schwarzenegger passed the 2009 Comprehensive Water Package, which set a statewide conservation target for urban per capita water use of 20 percent reductions by 2020 and consisted of four policy bills and an $11.14 billion bond proposal designed to ensure a reliable water supply for California's future and to restore the Delta and other ecologically sensitive areas.

Senate Bill (SB) X7-1 (Simitian) of the 2009 Water Package established the coequal goals for the Delta: to provide a more reliable water supply for California, and to protect,

restore, and enhance the Delta ecosystem. SB X7-1 also established a framework to achieve the co-equal goals for the Delta by creating a new Delta governance structure - including the Delta Stewardship Council, Delta Conservancy, and Delta Protection Commission - and laying out a process for determining the consistency of the Bay Delta Conservation Plan (BDCP) with the co-equal goals.

Implementation of the four policy bills in the 2009 Water Package achieved several major milestones. For example, the Delta Plan, a comprehensive, long-term management plan for the Delta, was adopted by the Delta Stewardship Council on May 16, 2013.

The goal of BDCP was to provide the basis for the issuance of endangered species permits for the operation of SWP and Central Valley Project, and for Delta conveyance improvements.

On April 30, 2015, state and federal agencies proposed a new sub-alternative, Alternative 4A, which would replace Alternative 4 (the proposed BDCP) as the State's proposed project. Alternative 4A reflected the state's proposal to separate the conveyance facility and habitat restoration measures into two separate efforts: California WaterFix and California EcoRestore.

The California EcoRestore is a California Natural Resources Agency initiative to advance the restoration of at least 30,000 acres of Sacramento-San Joaquin Delta habitat by 2020. The restoration will be implemented on an accelerated timeline independent of the proposed water conveyance facilities included in the California WaterFix.

The environmental analysis of California WaterFix, as well as two other additional alternatives, and updated information from the 2013 BDCP Draft EIR/EIS were included in BDCP/California WaterFix Partially Recirculated Draft EIR/Supplemental Draft EIS (RDEIR/SDEIS). The RDEIR/SDEIS was released for public review on July 10, 2015. The comment period ended on October 30, 2015.

The California Department of Water Resources and the U.S. Bureau of Reclamation (BOR), the Lead Agencies, have completed the Bay Delta Conservation Plan/California WaterFix Final EIR/EIS. The Lead Agencies for the EIR/EIS analyzed in detail 18 action alternatives, as well as the No Action Alternative. Alternative 4A, or California WaterFix, is the preferred alternative. The Final EIR/EIS, released on December 22, 2016, discusses potential environmental impacts, and identifies mitigation measures that would help avoid or minimize impacts. It also provides responses to all substantive comments received on the 2013 Draft EIR/EIS and 2015 RDEIR/SDEIS. The Notice of Availability of the Final EIR/EIS was published by BOR in the Federal Register on December 30, 2016. On June 26, 2017, the U.S. Fish and Wildlife Service and the National Marine Fisheries Service issued final biological opinions on the proposed construction of California WaterFix. These biological opinions allow California WaterFix to continue moving toward construction as early as 2018 and conclude that

construction and operations of California WaterFix, as proposed, would not jeopardize the continued existence of ESA-listed species or destroy or adversely modify critical habitat for those species. The biological opnions recognize the uncertainty inherent in the dynamic ecology of the Delta and include a strong adaptive management component to guide future operation of the new intakes. Once the EIR has been certified through completion of the CEQA process, the California Department of Fish and Wildlife will be able to consider whether to issue an "incidental take" permit for the construction and operation of California WaterFix under the California Endangered Species Act.

On July 21, 2017, DWR issued its Notice of Determination (NOD) for California WaterFix, indicating the project meets requirements of CEQA. In addition to the NOD certification, DWR filed a validation action with the Sacramento County Superior Court to affirm the department's authority to, among other things, issue revenue bonds to finance the planning, design, construction and other capital costs of California WaterFix. The validation action will provide assurances to the financial community for the sale of the revenue bonds for California WaterFix.

Responsibilities of entities created by SB X7-1 are as follows:

- Delta Stewardship Council – Independent agency of the state composed of seven members with the responsibility to oversee and coordinate state agency actions within the Delta.
  - Develop a Delta Plan that will include all state and federal Delta ecosystem, flood management, water supply, and local economic sustainability efforts and serve as a guide for state and local agencies to ensure that their actions are consistent with their policies.
  - Develop performance measures to assess the progress of achieving the goals of the Delta Plan.
  - Determine compliance with the Delta Plan and serve as the appellate body in the event of disputes over the consistency of a project with the Delta Plan.
  - Ensure consistency of BDCP with the co-equal goals of water supply reliability and Delta restoration.

- Delta Conservancy – State entity governed by an eleven-member board with the responsibility to implement ecosystem restoration in the Delta and support efforts to advance environmental protection and the economic well-being of Delta residents.
  - Develop and adopt a strategic plan that will coordinate investments in the Delta's natural and cultural resources.
  - Promote the economic vitality in the Delta through increased tourism and the promotion of Delta legacy communities.
  - Promote environmental education about, and the public use of, public lands in the Delta.

- Delta Protection Commission – State commission with fifteen members charged with recognizing, preserving, protecting, and enhancing the unique resources of the Delta as an evolving place.
  - Provide a forum for Delta residents to engage in decisions regarding actions to recognize and enhance the cultural, recreational, and agricultural resources of the Delta.
  - Adopt an economic sustainability plan for the Delta, which is to include flood protection recommendations to state and local agencies, and is to be included in the Delta Stewardship Council's Delta Plan.

- Delta Watermaster
  - Exercise authority of the SWRCB and monitor and enforce orders, as well as license and permit terms and conditions, relating to water diversions in the Delta.

- Delta Independent Science Board – Standing board of no more than ten members made up of nationally or internationally prominent scientists with appropriate expertise to evaluate a broad range of scientific programs that support adaptive management of the Delta.
  - Provide oversight of the scientific research, monitoring, and assessment programs that support adaptive management of the Delta.

- Delta Science Program – Led by a Delta Stewardship Council-appointed lead scientist.
  - Provide unbiased scientific information to inform decision-making in the Delta.

The $11.14 billion "Water Bond" was originally scheduled to be on the 2010 statewide ballot for voter consideration, but was postponed twice – initially to 2012 and then to 2014. In 2014 the legislature replaced the 2010 Water Bond with a new bond measure to provide $7.545 billion to fund investments in water projects and programs as part of a statewide, comprehensive water plan for California. This new measure, Proposition 1 – the Water Quality, Supply, and Infrastructure Improvement Act of 2014, was approved by the voters on November 4, 2014.

Colorado River

MWD owns and operates the CRA, which since 1942 has delivered water from the Colorado River to Southern California. The Colorado River currently supplies approximately 17 percent of Southern California's water needs, and on average makes up about 15 percent of LADWP's purchases from MWD. This source of supply has been secured to MWD through long-standing legal entitlements. However, extended drought conditions and increased demands by other users have recently impacted its reliability.

The Colorado River supplies come from watersheds of the Upper Colorado River Basin in the states of Colorado, Utah, and Wyoming. Due to the way that Colorado River supplies are apportioned, snowpack and runoff levels do not impact MWD water

supplies in the current year. Instead, snowpack and runoff would impact storage levels at Lake Powell and Lake Mead, which would then affect the likelihood of surplus or shortage conditions in the future.

By MWD having two principal sources of supply that draw from two different watersheds, MWD is able to utilize supplies from the Colorado River to offset reductions in SWP supplies and buffer impacts of the California drought. MWD plans to use CRA deliveries, storage reserves and supplemental water transfers and purchases to meet regional demands.

Under a permanent service contract with the U.S. Secretary of the Interior (Secretary), MWD is entitled to receive water from the Colorado River and its tributaries. This water is also available to other users in California, as well as users in the states of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming (Basin States). Under a 1944 treaty, Mexico is allotted 1.5 million AF annually, except in extraordinary circumstances. There is long history of competition among users, but current conditions necessitate increased cooperation.

California is apportioned 4.4 million AF, annually, plus one-half of any surplus that may be available for use, collectively, in Arizona, California, and Nevada. In addition, California has historically been allowed to use Colorado River water apportioned to, but not used by, Arizona or Nevada. Since 2003, due to increased consumption, there has been no such unused, apportioned water available to California. Of the California apportionment, MWD holds the fourth priority right to 550,000 AFY under a 1931 priority system governing allotments to California. This is the last priority within California's basic apportionment of 4.4 million AF. Beyond the basic apportionment, MWD holds the fifth priority right to 662,000 AF of water. See Appendix F for more details.

Historically, MWD has been able to claim most of its legal entitlement of Colorado River water and could divert over 1.2 million AF in any year, but persistent drought conditions since 1999 have contributed to a decrease in these claims. The recent 16-year drought has been so severe that it has resulted in major reductions in water deliveries from the Colorado River. MWD's total CRA supply for calendar year 2016 was 985,000 AF and included a base supply 935,000 AF and water management actions of 50,000 AF.

Under the Colorado River Basin Project Act of 1968, the Secretary is required to issue an Annual Operating Plan describing CRA operations and projected releases. Considering drought conditions and declining storages, the 2014 release for Lake Powell was 7.48 million AF, which was the lowest since the filling of the reservoir in the 1960s. Moreover, reservoir storages along the CRA have declined dramatically.

The shortage predicament has increased management efforts by the Federal Government and states holding water rights. In May 2005, the Secretary directed the U. S. Bureau of Reclamation (BOR) to initiate the "Development of Lower Colorado River Basin Shortage Guidelines and Coordinated Management Strategies for Lakes Powell and Mead Under Low Reservoir Conditions." These were the first such

guidelines to address shortage conditions, as opposed to normal and surplus conditions. Since May of 2005, and in response to the Secretary's directive, the seven Basin States have reached agreement to transform management of the Colorado River system water through conjunctive management of Lakes Mead and Powell, and the adoption of shortage guidelines.

In November 2007, BOR issued a Final EIS including new federal guidelines concerning the operation of the Colorado River system reservoirs. The Secretary issued the final guidelines through a Record of Decision signed in December 2007. The Record of Decision and accompanying agreement among the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encouraging agencies to develop conservation programs, and allowing the states to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from shortages in all but the most extreme hydrologic conditions.

In January 2017, the 24-month look-ahead-study by BOR reported that Lake Powell's operations in water year 2017 will be governed by the Upper Elevation Balancing Tier, with an initial water year release volume of 8.23 million AF and the potential for an April adjustment to equalization or balancing releases in April 2017. The January 2017 24-Month Study indicated that an April adjustment to balancing releases is projected to occur and Lake Powell is projected to release 9.0 million AF in water year 2017.

Reliability Efforts for Southern California

MWD has been developing plans and making efforts to provide additional water supply reliability for the entire Southern California region. LADWP coordinates closely with MWD to ensure implementation of these water resource development plans. MWD's long-term plans to meet its member agencies' growing reliability needs are through: improvements to SWP as outlined in the California WaterFix and EcoRestore plans, conjunctive management efforts on the Colorado River, water transfer programs, outdoor conservation measures, and development of additional local resources, such as recycling, brackish water desalination, and seawater desalination. These plans are contained in MWD's 2015 IRP and 2015 UWMP, which can be found at the following links:

- MWD 2015 IRP: http://mwdh2o.com/PDF_About_Your_Water/2015%20IRP%20Update%20Report%20(web).pdf

- MWD 2015 UWMP: http://www.mwdh2o.com/PDF_About_Your_Water/2.4.2_Regional_Urban_Water_Management_Plan.pdf

Additionally, MWD has more than 5.0 million AF of storage capacity available in reservoirs and banking/transfer programs, with approximately 1.25 million AF, inclusive of Intentionally Created Surplus, in that storage, and 626,000 AF in emergency storage as of January 1, 2017. MWD plans to add to storage in 2017. Storage was previously estimated to range from 2.0 to 2.2 million AF by the end of 2017 assuming 60 percent and 70 percent SWP allocations, respectively. The allocation was subsequently increased to 85 percent. MWD will exercise flexibility and opportunities within the storage program to increase storage depending on the final SWP allocation and supply/demand balance.

MWD's 2015 IRP builds upon the strong foundation of diversification and adaptation developed in previous IRPs. 2015 IRP reinforces MWD commitment to meeting the region's water supply needs through an evolving long-term strategy that calls for maintaining and stabilizing existing resources along with developing more conservation and new local supplies.

MWD's 2015 UWMP reports on water reliability and identifies projected supplies to meet the long-term demand within MWD's service area. Table V summarizes MWD's reliability in five-year increments extending to 2040 and is based on information contained in MWD's 2015 UWMP. As reported, MWD has supply capabilities that would be sufficient to meet expected demands from 2020 through 2040 under average year, single dry-year and multiple dry-year hydrologic conditions. An in depth discussion on MWD is attached in Appendix F.

Table V
MWD System Forecast Supplies and Demands, Average Year (1922 - 2012 Hydrology)

Forecast year	Supply (Thousands of AF per Year)				
	2020	2025	2030	2035	2040
Current Programs					
In-Region Supplies and Programs	693	774	852	956	992
State Water Project[1]	1,555	1,576	1,606	1,632	1,632
Colorado River Aqueduct					
Colorado River Aqueduct Supply[2]	1,468	1,488	1,484	1,471	1,460
Aqueduct Capacity Limit[3]	1,200	1,200	1,200	1,200	1,200
Colorado Aqueduct Capability	1,200	1,200	1,200	1,200	1,200
Capability of Current Programs	**3,448**	**3,550**	**3,658**	**3,788**	**3,824**
Demands					
Total Demands on MWD	1,586	1,636	1,677	1,726	1,765
Imperial Irrigation District - San Diego County Water Authority Transfers and Canal Linings[4]	274	282	282	282	282
Total Demands on MWD	**1,860**	**1,918**	**1,959**	**2,008**	**2,047**
Surplus	**1,588**	**1,632**	**1,699**	**1,780**	**1,777**
Programs Under Development					
In-Region Supplies and Programs	43	80	118	160	200
State Water Project	20	20	268	268	268
Colorado River Aqueduct					
Colorado River Aqueduct Supply	5	25	25	25	25
Aqueduct Capacity Limit[2]	0	0	0	0	0
Colorado River Aqueduct Capability	0	0	0	0	0
Capability of Programs Under Development	**63**	**100**	**386**	**428**	**468**
Maximum MWD Supply Capability	**3,511**	**3,650**	**4,044**	**4,216**	**4,292**
Potential Surplus	**1,651**	**1,732**	**2,085**	**2,208**	**2,245**

1. Includes water transfers and groundwater banking associated with SWP.
2. Includes 296 TAF of non-MWD supplies conveyed in CRA for Imperial Irrigation District - San Diego County Water Authority Transfers and Canal Linings.
3. CRA has a capacity constraint of 1.20 MAF per year.
4. Does not include 16 TAF subject to satisfaction of conditions specified in agreement among MWD, the US, and the San Luis Rey Settlement.

Secondary Sources and Other Considerations

Stormwater capture, water conservation, and recycling will play an increasing role in meeting future water demands. LADWP has implemented stormwater capture, conservation and recycling programs with efforts under way to further promote and

increase the level of these programs. LADWP is committed to supply a higher percentage of the City's water demand through local water supply development.

LADWP works closely with MWD, LASAN (wastewater agency), other regional water providers, and various stakeholders to develop and implement programs that reduce overall water use. One example of such collaboration is an integrated resources planning process.

City's IRP is a unique approach of technical integration and community involvement to guide policy decisions and water resources facilities planning. IRP recognizes the inter-relationship of water, wastewater, and runoff management. Initiation of IRP began in 1999 and culminated in its adoption in 2006. Through the stakeholder driven IRP process, detailed facilities plans were developed for the City's wastewater and stormwater systems through the planning horizon of 2020.

One Water LA 2040 (One Water LA) plan is an initiative building upon the success of the IRP. One Water LA extends IRP planning period to year 2040 and takes into consideration an additional emphasis on environmental, social, and sustainability factors. The overarching goal of One Water LA is to maximize resources through the integration of multi-beneficial collaborative programs and projects to make the City greener and more sustainable. One Water LA will follow in the footsteps of IRP and will be a stakeholder driven process with a goal of increased public involvement to represent Los Angeles' diversity in geography, interests, and demographics.

Summary of Water Demand and Supply Projections for 20 Years

Table VI tabulates the service reliability assessment for average weather year. Existing water conservation has been subtracted already from projected demands, but new water conservation is included as a supply source.

Table VI
Service Area Reliability Assessment for Average Weather Year

Demand and Supply Projections (in acre-feet)	Average Weather Conditions (FY 1961/62 to 2010/11) Fiscal Year Ending on June 30				
	2020	2025	2030	2035	2040
Total Water Demand[1]	**611,800**	**644,700**	**652,900**	**661,800**	**675,700**
pLAn Water Demand Target	**485,600**	**533,000**	**540,100**	**551,100**	**565,600**
Existing / Planned Supplies					
Conservation (Additional Active[2] and Passive[3] after FY14/15)	125,800	110,900	111,600	109,100	108,100
Los Angeles Aqueduct[4]	275,700	293,400	291,000	288,600	286,200
Groundwater[5] (Net)	112,670	110,670	106,670	114,670	114,070
Recycled Water					
- Irrigation and Industrial Use	19,800	29,000	39,000	42,200	45,400
- Groundwater Replenishment	0	30,000	30,000	30,000	30,000
Stormwater Capture					
- Stormwater Reuse (Harvesting)	400	800	1,200	1,600	2,000
- Stormwater Recharge (Increased Pumping)	2,000	4,000	8,000	15,000	15,000
Subtotal	536,370	578,770	587,470	601,170	600,770
MWD Water Purchases					
With Existing/Planned Supplies	75,430	65,930	65,430	60,630	74,930
Total Supplies	**611,800**	**644,700**	**652,900**	**661,800**	**675,700**
Potential Supplies					
Water Transfers[6]	40,000	40,000	40,000	40,000	40,000
Subtotal	40,000	40,000	40,000	40,000	40,000
MWD Water Purchases					
With Existing/Planned/Potential Supplies	35,430	25,930	25,430	20,630	34,930
Total Supplies	**611,800**	**644,700**	**652,900**	**661,800**	**675,700**

[1] Total Demand with existing passive conservation

[2] Cumulative hardware savings since late 1980s reached 118,034 AFY by 2014-15.

[3] Additional non-hardware conservation required to meet water use reduction goals set in the Sustainable City pLAn.

[4] LADWP anticipates conserving 20,000 AFY of water usage for dust mitigation on Owens Lake after the Master Project is implemented in FY 2023-24. Los Angeles Aqueduct supply is estimated to decrease 0.1652% per year due to climate change impact.

[5] Net GW excludes Stormwater Recharge and Groundwater Replenishment supplies that contribute to increased pumping. The LADWP Groundwater Remediation project in the San Fernando Basin is expected in operation in 2021-22. Storage credit of 5,000 AFY will be used to maximize pumping in 2019-20 and thereafter. Sylmar Basin production will increase to 4,170 AFY from 2015-16 to 2038-39 to avoid the expiration of stored water credits, then go back to its entitlement of 3,570 AFY in 2039-40.

[6] Potential water transfer occurs in dry years with stored water acquired in average and wet years.

Service area reliability assessments for single-dry year and multiple-dry year conditions are shown in LADWP 2015 UWMP Exhibits 11F through 11H. Demands are met by the available supplies under all scenarios.

Rates

Capital costs to finance facilities for the delivery of water supply to LADWP's service area are supported through customer-billed water rates. The Board sets rates subject to approval of City Council by ordinance. The Board is obligated by City Charter to establish water rates and collect charges in an amount sufficient to service the water system indebtedness and to meet its expenses for operation and maintenance.

On March 15, 2016, City Council approved the new water rates and rate structure. New water rates, which became effective April 15, 2016, through Ordinance 184130 provide for modest rate increases each year over a five-year period for infrastructure improvements, meeting regulatory water quality requirements, Owens Valley mitigation measures, and expanding the local water supply, which includes recycled water, stormwater capture, conservation, and groundwater remediation. New water rate structure increases the number of tiers from two to four for single-family residential customers. Goal is to incentivize conservation while recovering the higher costs of providing water to high volume users. In keeping with cost of service principles, the incremental pricing for the tiers is based on the cost of water supply.

Findings

The Times Project is estimated to increase the total water demand within the site by 220 AF annually. This additional water demand has been accounted for in the City's overall total demand projections in the LADWP 2015 UWMP using a service area-wide approach that does not rely on individual development demand. The LADWP 2015 UWMP utilized SCAG's RTP data that provide for more reliable water demand forecasts, taking into account changes in population, housing units, and employment.

Based on Planning Department's determination that the Times Project is consistent with the demographic forecasts for the City from the 2012 SCAG RTP, LADWP finds that the Times Project water demand is included in the City's LADWP 2015 UWMP water demand projection. Furthermore, the LADWP 2015 UWMP forecasts adequate water supplies to meet all projected water demands in the City through the year 2040.

LADWP therefore concludes that the 220 AFY increase in the total water demand for the Times Project falls within the available and projected water supplies for normal, single-dry, and multiple-dry years through the year 2040, as described in LADWP's 2015 UWMP. LADWP finds it will be able to meet the proposed water demand of the Times Project, as well as existing and planned future water demands of its service area.

Los Angeles, CA 90012-5701

RE: REQUEST FOR WATER SUPPLY ASSESSMENT FOR PROJECT LOCATED AT 100 SOUTH BROADWAY, LOS ANGELES, CA 90012 (TIMES MIRROR SQUARE)

Dear Mr. Harasick:

The Department of City Planning is preparing an Environmental Impact Report in accordance with the California Environmental Quality Act (CEQA) for the proposed Times Mirror Square Project located at 100 S. Broadway, Los Angeles, CA 90012 (Project). Pursuant to CEQA Guidelines Section 15206(b)(2)(B), this Project meets the criteria for being of "regional significance" because it includes the development of more than 500 dwelling units, a shopping center or business establishment encompassing more than 500,000 square feet of floor space or employing more than 1,000 persons, and a commercial office building encompassing more than 250,000 square feet of floor space or employing more than 1,000 persons.

For this reason, the Project must comply with the water supply assessment requirements of State Water Code (Section 10910-10915). As such, we are requesting that the Los Angeles Department of Water & Power prepare a water supply assessment to determine its ability to meet the water demands of this Project. Provided below is a description of the Proposed Project.

Project Location

The Times Mirror Square Project site is located at 100 S. Broadway, just south of the Civic Center in Downtown Los Angeles (Project Site), in the Central City Community Plan area. The Project Site occupies the City block bounded by West 1st Street to the north, South Spring Street to the east, West 2nd Street to the south, and South Broadway Street to the west. The Project Site consists of five parcels totaling approximately 160,578 square feet (3.6 acres). A list of the property addresses and assessor parcel numbers associated with the Project Site are identified in Table 1, Project Site Addresses and Assessor Parcel Numbers. A Project Location Map is shown in Figure 1, Regional and Site Location Map.

Table 1
Project Site Addresses and APNs

Address	APN
145 South Spring Street 147 South Spring Street 205 West 2nd Street 211 West 2nd Street	5149-001-003
124 South Broadway 126 South Broadway 128 South Broadway 130 South Broadway 140 South Broadway 142 South Broadway 221 West 2nd Street	5149-001-004
110 South Broadway 118 South Broadway 120 South Broadway	5149-001-005
202 West 1st Street 212 West 1st Street 214 West 1st Street 220 West 1st Street 121 South Spring Street	5149-001-006
100 South Broadway 102 South Broadway 106 South Broadway 108 South Broadway 224 West 1st Street 228 West 1st Street 230 West 1st Street 234 West 1st Street	5149-001-007

Existing Uses

The Project Site is currently occupied by five structurally distinct, but internally connected buildings used by the Los Angeles Times, a bank, and other office uses. These include the 8-story Times Building, the 4-story Plant Building, the 10-story Mirror Building, the 6-story parking garage, and the 6-story Executive Building. As summarized in Table 2 below, and as shown in Figure 2, Existing On Site Uses, the buildings total approximately 559,863 square feet of floor area. Approximately 223,945 square feet (40 percent) of the existing uses are vacant office spaces that have been vacant for 10 years.

Table 2
Existing Land Uses on the Project Site

Land Use Type	Developed Floor Area (square feet)
Executive Building	
Office[a]	176,258
Bank[b]	7,500
Executive Building Subtotal	183,758
Times Building	
Office[a]	116,113
Times Building Subtotal	116,113
Mirror Building	
Cafeteria[c]	11,250
Office[a]	158,152
Mirror Building Subtotal	169,402
Plant Building	
Office[a]	90,590
Plant Building Subtotal	90,590
Total	**559,863 sf**

Notes:

[a] A total of 176,258 square feet of office space would be demolished.
[b] 7,500 square feet of bank would be demolished.
[c] The cafeteria would be converted into the grocery store.

Source: ESA PCR, 2017.

The existing uses water demand was estimated based on the above information pertaining to the existing land uses and 120 percent of the estimated sewer generation rates provided by the Bureau of Sanitation. As shown in Table 3, below, the existing uses on the Project Site currently generate a demand of approximately 138,467 gallons per day (gpd) of water.

Table 3
Existing Conditions Water Demands

Land Use	Size (sf)	Water Demand Rates (gpd/unit)[a]	Total Water Demand (gpd)
Office[b]	541,113[c]	204 gpd/1,000 sf	110,387
Bank[d]	7,500	144 gpd/1,000 sf	1,080
Cafeteria[e]	11,250	36 gpd/seat	27,000
		Total Water Demand Based on Developed Area	***138,467***

Notes:

[a] Water demand rates are based on 120 percent of the wastewater generation rates provided in the City of Los Angeles CEQA Thresholds Guide (2006), Exhibit M.2-12. This increased generation rate is used to compensate and account for any water loss via evaporation, recycling, etc. and results in a more conservative water demand.
[b] Office Building with Cooling Tower was used to be more conservative.
[c] Demands included in the table assumed 100 percent occupancy of all uses. However, it is noted that approximately 223,945 SF (40 percent) of the office uses have been vacant for 10 years.
[d] Bank: Headquarters was used to be more conservative.
[e] Cafeteria sewage generation factor is based on seats. It is assumed that each seat will occupy approximately 15 square feet.

Source: ESA PCR, 2017.

The following is a list of the meter/service numbers which cover domestic, irrigation, and fire protection for the Project Site:

- Fire Water Meter # 1626099
- Fire Domestic Water Meter # 5272552
- Fire Domestic Water Meter # 90154214, 90154213, 90119351
- Domestic Water # 3151370
- Fire Domestic Water Meter # 3306872
- Domestic Water Meter # 2200536
- Fire Water Meter # F1286

Project Characteristics

The Proposed Project would retain and renovate the Times, Plant, and Mirror Buildings to provide approximately 376,105 square feet of offices and/or other retail and commercial uses, including an approximately 50,000 square-foot grocery store. The three buildings, which have a combined total floor area of approximately 376,105 square feet, are aligned along S. Spring Street, with frontages along both W. 1st Street and W. 2nd Street. The Project proposes to demolish the Parking Garage and Executive Building located on the western half of the Site and construct two mixed-use towers.

The Project's North Tower and South Tower mixed use components would be constructed in the west sector of the Project Site in the areas currently occupied by the 6-story Executive Building at the corner of W. 1st Street and S. Broadway and the 6-story parking structure at the corner of W. 2nd Street and S. Broadway. The North Tower would contain 450 residential units and the South Tower would contain 677 residential units for a total of 1,127 residential units. Total residential floor area would be 1,071,692 square feet. With the addition of open space amenities, lounges, loading areas, and retail uses, total new construction would amount to 1,135,803 square feet. The towers would include approximately 34,572 square feet of retail uses, which would be located at ground level and oriented to W. 1st Street, S. Broadway, and W. 2nd Street, while also fronting the Paseo. The Paseo would be constructed along the east edge of Tower A and Tower B, passing from sidewalk to sidewalk between W. 1st Street to W. 2nd Street. The resulting floor-area ratio (FAR) would be approximately 9.42:1. Approximately 72,902 square feet of common open space, including the approximately 15,708-square-foot Paseo, would be provided as part of the North and South Towers component. With the addition of approximately 56,350 square feet of private balconies, combined private and common open space would be approximately 129,252 square feet.

Development of the Project would occur in one phase, with initiation of construction expected in 2019, followed by an approximate four year construction period ending with buildout and occupancy in 2023. A summary of the land uses and amount of square feet of development as defined by the Los Angeles Municipal Code (LAMC) is presented in Table 4. A site plan and illustrative rendering are provided in Figures 3 and 4, respectively.

Table 4

Table 5 below shows the water and sewer calculations for the Proposed Project. Two 350 ton Evapco Cooling Towers and two 400 ton Evapco Cooling Towers will be used depending on load demand. It is assumed to have an average usage of 8 hours/day, 7 days/week, and 52 weeks/year at approximately 75% capacity.

Table 5
Wastewater and Sewer Calculations

Type of Use	Size	Consumption Rate (gpd)[a]	Water Consumption (gpd)	Water Consumption (afy)
North and South Tower Residential

Office Uses[e] (Times, Plant, Mirror, and Executive Buildings)	541,113 sf	170/1,000 sf	91,989	101.19
Bank (Executive Building)[i]	7,500 sf	120/1,000 sf	900	0.98
Cafeteria (Plant Building)[j]	11,250 sf	30/seat	22,500	24.75
Subtotal Existing Uses	559,863 sf			
		Existing Water Consumption	**(115,389)**	**(126.93)**
		Total Proposed Net Water Consumption	**155,068**	**170.60**

Notes:

[a] Consumption rates are based on the City of Los Angeles Department of Public Works, Bureau of Sanitation Sewer Generation rates.
[b] Penthouses are assumed to have four bedrooms to be conservative.
[c] Amenities and Lounges both use the Lounge generation factor.
[d] Loading docks use the Storage: Building/Warehouse generation factor.
[e] The Office Uses component of the Project will use the Office Building with Cooling Tower generation factor.
[f] Restaurants assume that each seat will occupy approximately 15 sf.
[g] The Grocery Store will use the Commercial generation factor.
[h] The Landscape Irrigation amount is the Total Maximum Applied Water Allowance (MAWA) for the year (228,359 gal/year) divided by 365 days to provide the gpd amount. The provided number is a worst case calculation and is about 10% over the

MAWA allowance. The overage is due to the burden imposed by the existing street trees, Platanus racemose – Syamores, which are relatively high water users because the Project must irrigate street trees and the street tree irrigation is part of the water budget, the amount of landscape irrigation will be higher than normal.
[I] The Bank will use the Bank: Headquarters generation factor.
[J] The Cafeteria assumes that each seat will occupy approximately 15 sf. The cafeteria within the Plant Building will be converted to be part of the 50,000 sf grocery store.

Project Conformance with Existing Zoning and the General Plan

As proposed, the project does not generally conform with the use and intensity of development permitted by the General Plan for this site without land use entitlement(s) to permit deviations from the Zoning Code. In order to develop the project as proposed, the following approvals are required:

1. Vesting Tentative Tract Map for the merger and re-subdivision of the Project Site for residential and commercial condominium purposes (LAMC Sec. 17.15)
2. Transfer of Floor Area Rights (TFAR) greater than 50,000 square feet of floor area for the transfer of 548,440 square feet of floor area from the Los Angeles Convention Center (Donor Site) to the Project Site (Receiver Site) (LAMC Sec. 14.5.6)
3. Vesting Conditional Use Permit to permit floor averaging within a unified development (LAMC Sec. 12.24 U.19 and 12.24.T)
4. Master Conditional Use Permit (MCUB) to permit the onsite and offsite sale and consumption of alcoholic beverages within the Project's commercial retail spaces (LAMC Sec. 12.24.W. 1)
5. Construction permits, including building, grading, excavation, foundation, and associated permits.

6. Haul Route Permit, as may be required.
7. Other approvals as needed.

The Project Site is currently designated for Regional Center Commercial land uses by the General Plan. The General Plan Framework designates the entire Central City area as a Downtown Center. The Project Site is zoned C2-4D-SN, which permits general commercial and multi-family residential uses. The 4D Height District establishes a maximum Floor Area Ratio (FAR) of 6.0:1, but does not specifically limit building heights.

Land Use Consistency and Growth Projections

The Proposed Project is consistent with the demographic projections in the 2016 SCAG Regional Transportation Plan/Sustainability Communities Strategy (2016 RTP/SCS). The Project's contribution to population, housing, and employment opportunities is shown below in Table 7. These Project increases are used to confirm the Project's consistency with the 2016 SCAG RTP/SCS.

Table 7
Project Increases in Population, Housing, and Employment

Housing Units and Population			
Total Housing Units		**Average Household Size[a]**	**Total Population**
1,127		1.68	1,894
Employees			
Use	**Amount (sf)**	**Employment Generation Factor (per sf)[b]**	**Number of Employees**
Retail	34,572	0.00271	94
Office	285,088	0.00431	1,229
Ground-floor Restaurant	18,817	0.00271	51
Upper-floor Restaurant	22,200	0.00271	61
Grocery	50,000	0.00271	136
Total Proposed Uses	**410,677 sf**	**Projected Employees**	**1,571**
Existing Uses			
Office	541,113 sf	0.00431	2,333
Bank	7,500 sf	0.00283	22
Cafeteria	11,250 sf	0.00271	31
Total Existing Uses	559,863 sf	**Projected Existing Employees**	2,386

Notes:

[a] *The average household size reflects the average household size for the Central City Community Plan area, based on the 2015 Demographics Statistics Report by the City of Los Angeles Department of City Planning Demographics Research Unit.*

[b] *The employee generation factors are taken from the Los Angeles Unified School District, 2014 Developer Fee Justification Study, March 2014. As a separate rate is not provided for the retail, grocery, and cafeteria, the Neighborhood Shopping Centers was used.*

2017 - 2040 Projection Horizon			
Central City North Community Plan Area	-815	29,855	-2.7%
City of Los Angeles	-815	345,751	-0.2%

Source: ESA PCR, 2017. Based on SCAG 2016 RTP/SCS projections.

Landscaping/Open Space

Figures 5 and 6 illustrate proposed landscaping and open space on Levels 1 and 6. Open space amenities would be available to tower residents and would include an approximately 28,777-square-foot garden plaza (Garden Plaza) at the rooftop of the 5-story Podium (Level 6). The Garden Plaza would be open to sky and provide

approximately 7,700 square feet of landscaping, a pool deck, a dog run, cabanas, steam room and sauna, and other amenities such as dining tables and fire-side seating. As shown in Table 3, the Project would provide other amenities at the 6th floor level, as well as ground-floor lobbies in each of the tower buildings. These amenity areas are expected to include a gym, club rooms, meeting rooms, film screening room, private dining, and potentially other common areas to serve residents. Approximately 72,902 square feet of common open space, including the approximately 15,708-square-foot Paseo, would be provided as part of the North and South Towers component. With the addition of approximately 56,350 square feet of private balconies, combined private and common open space would be approximately 129,252 square feet.

The thirteen existing California Sycamores, six trees along West 1st Street and seven trees along South Broadway would remain in place under the Project. The Project would add an additional four California Sycamores along West 1st Street to create a double row near the corner of West 1st Street and South Broadway. In addition, the Project would add ten California Sycamores along South Broadway to fill in the existing trees on South Broadway and create a continuous line of California Sycamores along the street edge. The Project would plant two trees, "Hymenosporum flavum," also known as "Sweet Shade," at the corner of South Broadway and West 2nd Street. The Sweet Shade tree is generally smaller than the California Sycamore, but produces clusters of fragrant yellow flowers. Groups of Sweet Shade trees, a total of approximately twenty-five, would be planted along the pedestrian Paseo, which bisects the Project Site passing from West 1st Street to West 2nd Street.

The street front of the Tower component, including South Broadway, West 1st Street, West 2nd Street, and the Paseo would be lined with retail uses. Decorative pavement would be installed along West 2nd Street, leading to the Paseo entrance, which would also be similarly paved. Bench planters and trees would be located throughout the Paseo, as well as at the corners of West Broadway and West 2nd Street. The Paseo would also allow views to Civic Center Park immediately to the north of West 1st Street. With the proposed landscaping, benches, pavement treatment and adjacent retail shops, the tree-lined Paseo would facilitate pedestrian use and provide aesthetic and visual relief.

As shown in Figure 6, the pool deck would be surrounded by a variety of trees. The eastern and western sides of the building would be lined with Grecian Laurels and Golden Italian Cypresses that would overlook the ground-level Paseo. There would also be a dog run on the western side of the building and a steam room and sauna on the eastern side of the building. Other groups of trees would be planted throughout the Podium rooftop. The trees along the Podium roof would enhance to the visual character of the Project as viewed from South Broadway and the Paseo.

A total of approximately 129,252 square feet of open space is proposed across the Project Site, which exceeds the LAMC requirement for 125,325 square feet for the proposed mix of uses. Of the approximately 129,252 square feet of open space proposed across the Project Site, approximately 11,250 square feet is proposed to be landscaped; this exceeds the LAMC requirement of 11,121 square feet of landscaped common open space.

Table 9 below shows the plant factors and the square footages of each Hydrozone Area.

Table 9 Hydrozone Area Information		
Hydrozone	**PF**	**Hydrozone Area (sf)**
Very Low	0.1	1,017 sf
Low	0.3	10,158 sf
Moderate	0.6	4,911 sf
Total		16,086 sf
Source: Carter, Romanek Landscape Architects Inc., 2017.		

As shown in Figure 7, the Project's landscaping and open space is designed for almost entirely low water use hydrozones for all of the on-site areas. The calculation in Table 9 has a larger total hydrozone area square footage because it includes the landscaped terrace for the office side. The office terrace is not available for the apartment residents and are not counted towards the City's multi-family housing common open space requirement (which is detailed in Figure 5 and 6). In addition, the 6th Floor Garden Plaza landscaped area (which shows 7,700 sf) includes both the pool and the dog run at 1,200 sf and 5,525 sf, respectively. The calculation above in Table 9 excludes the dog run as it is synthetic grass and will not be irrigated. Similarly, the streetscape areas, including street trees and tree well planters, are not included in the Figure 5 and Figure 6 landscaped open plan calculations as they are public right-of-way and cannot be counted towards common open space.

Parking

Parking for the Project will be provided in accordance with the LAMC requirements. The Project includes the construction of parking at, above, and below grade. The Project proposes nine levels of below grade parking, mezzanine level parking, and four levels of above-grade podium parking. The LAMC would require 1,250 and 411 vehicle parking spaces for the Project's residential and commercial components, respectively, resulting in a total of 1,661 parking spaces. The Project would provide approximately 1,744 on-site vehicle parking spaces.

Approximately 684,000 square feet will be used for the subterranean parking structure, and 304,000 square feet will be used for the above grade parking structure. The total parking area will encompass 988,000 square feet, excluding utility rooms and elevator shafts/stairs. No restrooms will be provided in the parking areas.

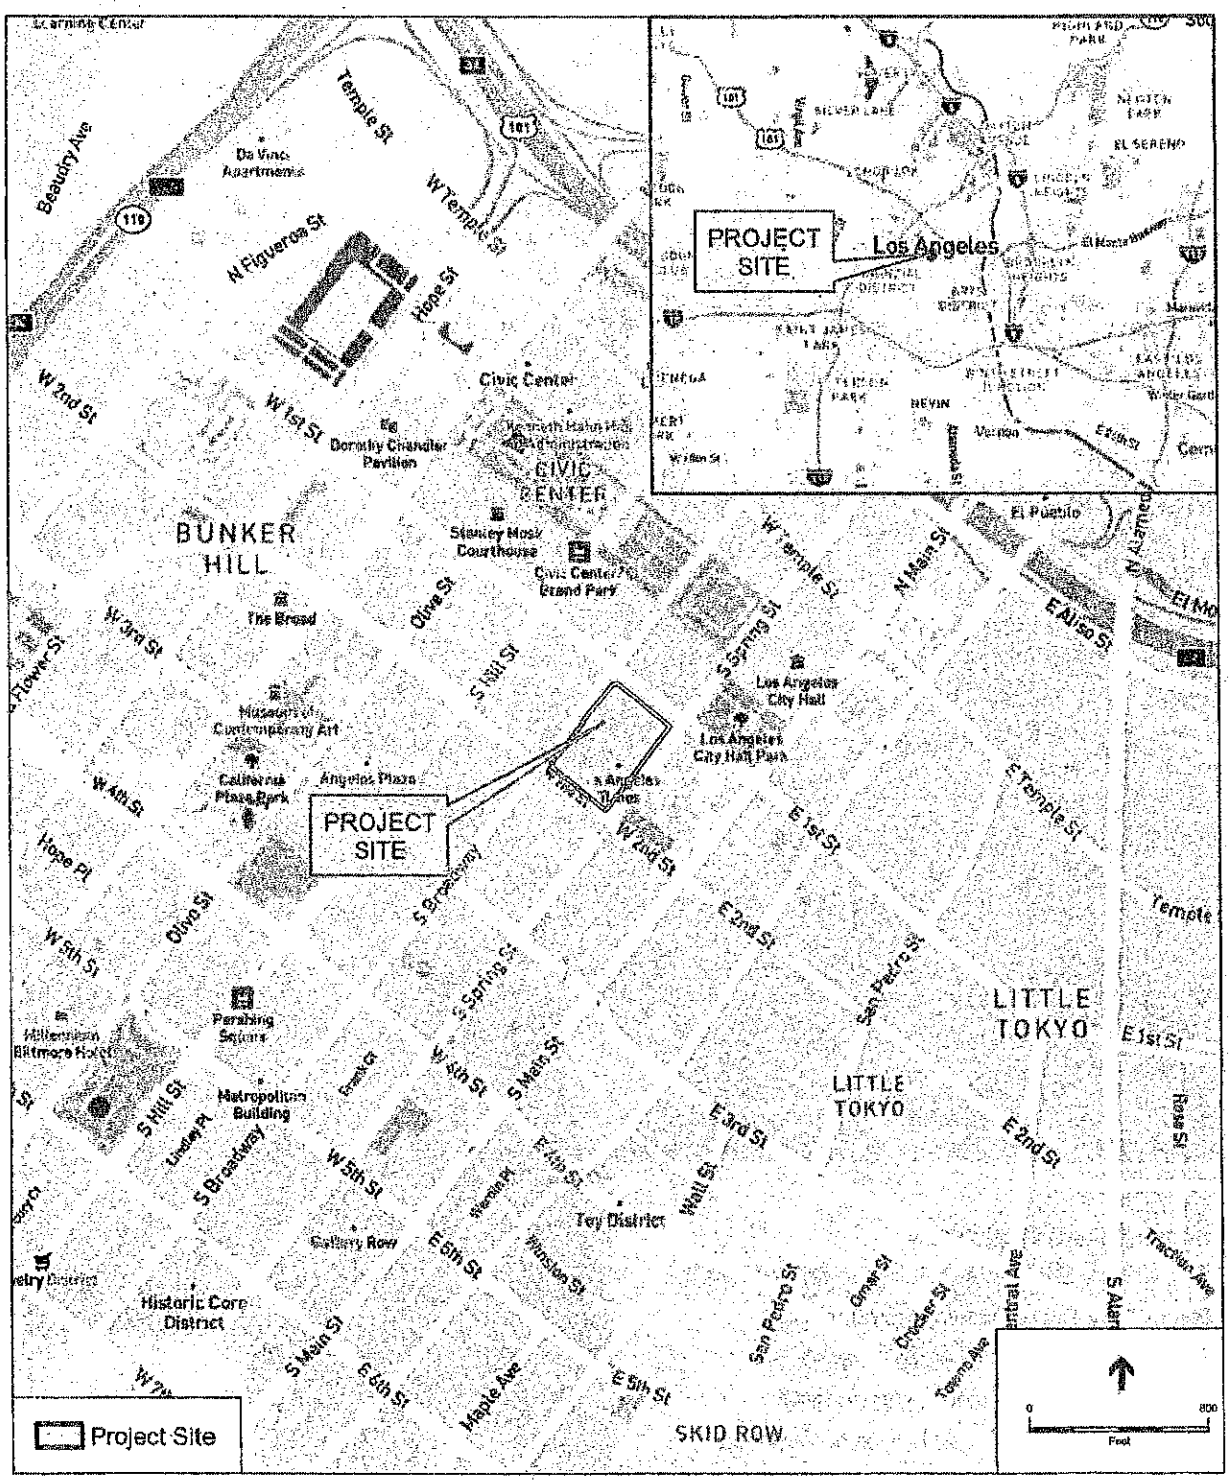
Environmental Design Features

The Project would be designed to achieve the equivalent of the United States Green Building Council (USGBC) Leadership in Energy and Environmental Design (LEED) Silver Certification level for new buildings. The Project would be designed to meet the California Green Building Standards (CALGreen) Code as adopted and amended by the City of Los Angeles through the incorporation of green building techniques and other sustainability features, including those within the City of Los Angeles Green Building Code, where applicable. Some of the Project's key design features that would contribute

to energy efficiencies include the use of glass/window areas for ventilation and daylight accessibility, use of recyclable materials for flooring and demisable partitions in limited amounts, green walls in some areas, low albedo (high reflectivity) color paving to reduce heat island effect, conduit for solar panels installed on roof deck areas pursuant to code requirements, and landscaping of courtyards and roof decks. Other building features would include such items as installation of energy-efficient lighting, heating, ventilation, and air conditioning (HVAC) systems that utilize ozone-friendly refrigerants; use of materials and finishes that emit low quantities of volatile organic compounds (VOCs); use of high efficiency fixtures and appliances; water conservation features; and dedicated on-site recycling area. The Project's inclusion of bicycle parking, as discussed above, would encourage the use of alternative modes of transportation.

The Project would reduce outdoor potable water use by a minimum of 20 percent compared to baseline water consumption. Reductions would be achieved through drought-tolerant/California native plant species selection and artificial turf, landscape contouring to minimize precipitation runoff, irrigation system efficiency, alternative water supplies (e.g., stormwater retention for use in landscaping), smart irrigation systems (e.g., weather-based controls), and water-saving pool equipment.

In addition, to encourage carpooling and the use of electric vehicles by Project residents and visitors, the Project would designate a minimum of eight percent on on-site parking for carpool and/or alternative-fueled vehicles and shall pre-wire, or install conduit and panel capacity for, electric vehicle charging stations up to a maximum of 20 percent of onsite parking spaces.



Thank you for your assistance with this request. Your expert evaluation will help to ensure that our analysis of the proposed project's impacts on water demand is accurate and complete. If you have any questions or comments, please contact me at (213) 978-1470.

Sincerely,

William Lamborn

Water Conservation Commitment Letter

July 28, 2017

Richard F. Harasick
Senior Assistant General Manager for Water Systems
Los Angeles Department of Water & Power
111 North Hope Street, Room 1455
Los Angeles, CA 90012-5701

Re: WATER CONSERVATION COMMITMENTS FOR THE TIMES MIRROR SQUARE PROJECT

Dear Mr. Harasick:

Onni Times Square LP (Applicant) proposes to develop the Times Mirror Square Project (the Project) within the Central City Community Plan Area. The Project Site, which encompasses approximately 3.68 acres is generally bounded by West 1st Street to the north, South Spring Street to the east, West 2nd Street to the south, and South Broadway Street to the west. The Project Site is currently occupied by the eight story "Times Building", the four-story "Plant Building", the ten-story "Mirror Building", the six-story parking garage, and the six-story "Executive Building." The Project proposes retention and renovation of the Times, Plant, and Mirror Buildings on the eastern half of the Project Site comprised of approximately 376,105 square feet of existing floor area. The Executive Building and parking garage on the western half of the Project Site would be demolished for the construction of the North and South Tower which would contain residential units and ground-floor retail uses. The proposed Project would develop approximately 34,572 square feet of commercial retail uses, 1,127 apartment units, , 41,017 square feet of restaurant (ground floor and upper floor), and a 50,000 square foot grocery store. The Project would also include approximately 15,708 square feet of Paseo/Plaza at grade, 28,777 square feet of open space and amenities at the Level 6 Garden Plaza, and 28,643 square feet of internal amenities (lounges and fitness centers), resulting in a total of 72,902 square feet of common open space. An additional 56,350 square feet would be included for private balconies. The Project would also include five levels of above grade podium parking as well as nine levels of subterranean parking.

The Applicant understands the City of Los Angeles' policy that future water needs shall be met by expanding water recycling and conservation. The Applicant has committed to implement the following water conservation measures that are in addition to those required by codes and ordinances for the entire Project:

- High Efficiency Toilets with flush volume of 1.0 gallons of water per flush, or less.
- ENERGY STAR Certified Residential Clothes Washers– Front-loading with Integrated Water Factor of 3.6 or less and capacity of 4.3 cu ft.
- Showerheads with flow rate of 1.5 gallons per minute, or less
- Domestic Water Heating System located close proximity to point(s) of use
- Individual Metering and billing for water use for commercial space will be used.
- Drip/Subsurface Irrigation (Micro-Irrigation)
- Proper Hydro-zoning/Zoned Irrigation (groups plants with similar water requirements together)
- Drought Tolerant Plants – 70% of total landscaping

Onni Times Square LP has also committed to comply with the City of Los Angeles Low Impact Development Ordinances (City Ordinance No. 181899 and No. 183833) and to implement Best Management Practices that have stormwater recharge or reuse benefits for the entire Project as applicable—and subject to design approval by the Department of Public Works.

- Infiltration Basin (drainage area of 5-50 acres) – captures first-flush stormwater, removes particulate pollutants and some soluble pollutants, and contributes toward recharging groundwater.
- Infiltration Trench (drainage area of less than 5 acres) – similar to infiltration basin but used for smaller drainage areas to capture and infiltrate rainwater.
- Catch Basin Insert - a device that can be inserted into an existing catch basin design to provide some level of runoff contaminant removal.
- Catch Basin Screens
- Pervious Pavements – captures runoff by allowing stormwater to pass through the pavement surface and then infiltrate into the groundwater basin.
- Cistern - captures stormwater runoff as it comes down through the roof gutter system.

The following is the information on plumbing fixture/appliance counts/estimates for the Times Mirror Square Project:

	Residential Dwelling Unit	Residential Common Area	Restaurant / Bar	Retail/ Commercial
Toilets	1465	15	15	15
Urinals	N/A	N/A	10	10
Bath Faucets	1465	15	15	15
Kitchen Faucets	1127	5	N/A	N/A
Commercial Kitchen Pre-Rinse Spray Faucets	15	N/A	15	N/A
Showerheads	1465	5	N/A	N/A
Clothes washer (Residential)	1127	2	N/A	N/A
Clothes washer (Commercial)	N/A	N/A	N/A	N/A
Dishwasher (Residential)	1127	5	N/A	N/A
Dishwasher (Commercial)	15	N/A	15	N/A

Adjudicated Groundwater Basin Judgments

- San Fernando Basin – Judgment No. 650079
- Sylmar Basin – Judgment No. 650079
- Central Basin – Judgment No, 786656

SUPERIOR COURT OF THE STATE OF CALIFORNIA

FOR THE COUNTY OF LOS ANGELES

THE CITY OF LOS ANGELES, Plaintiff, vs. CITY OF SAN FERNANDO, ET AL. Defendants.	No. 650079 JUDGMENT

There follows by consecutive paging Recitals (page 1), Definitions and List of Attachments (pages 1 to 6), Designation of Parties (page 6), Declaration re Geology and Hydrology (pages 6 to 12), Declaration of Rights (pages 12 to 21), Injunctions (pages 21 to 22), Continuing Jurisdiction (page 23), Watermaster (pages 23 to 29), Physical Solution (pages 29 to 34), and Miscellaneous Provisions (pages 34 to 35), and Attachments (pages 36 to 46). Each and all of said several parts constitute a single integrated Judgment herein.

4.2.3 Separate Ground Water Basins. The physical and geologic characteristics of each of the ground water basins, Eagle rock, Sylmar, Verdugo and San Fernando, cause impediments to inter-basin ground water flow whereby there is created separate underground reservoirs. Each of said basins contains a common source of water supply to parties extracting ground water from each of said basins. The amount of underflow from Sylmar Basin, Verdugo Basin and Eagle Rock Basin to San Fernando Basin is relatively small, and on the average has been approximately 540 acre feet per year from the Sylmar Basin; 80 acre feet per year from Verdugo Basin; and 50 acre feet per year from Eagle Rock Basin. Each has physiographic, geologic and hydrologic differences, one from the other, and each meets the hydrologic definition of "basin". The extractions of water in the respective basins affect the other water users within that basin but do not significantly or materially affect the ground water levels in any of the other basins. The underground reservoirs of Eagle Rock, Verdugo and Sylmar Basins are independent of one another and of the San Fernando Basin.

4.2.4 Safe Yield and Native Safe Yield. The safe yield and native safe yield, stated in acre feet, of the three largest basins for the year 1964-65 was as follows:

Basin	Safe Yield	Native Safe Yield
San Fernando	90,680	43,660
Sylmar	6,210	3,850
Verdugo	7,150	3,590

The safe yield of Eagle Rock Basin is derived from imported water delivered by Los Angeles. There is no measurable native safe yield.

4.2.5 Separate Basins -- Separate Rights. The rights of the parties to extract ground water within ULARA are separate and distinct as within each of the several ground water basins within said watershed.

4.2.6 Hydrologic Condition of Basins. The several basins within ULARA are in varying hydrologic conditions, which result in different legal consequences.

4.2.6.1 San Fernando Basin. The first full year of overdraft in San Fernando Basin was 1954-55. It remained in overdraft continuously until 1968, when an injunction

SUPERIOR COURT OF THE STATE OF CALIFORNIA

FOR THE COUNTY OF LOS ANGELES

CENTRAL AND WEST BASIN WATER REPLENISHMENT DISTRICT, etc., Plaintiff, v. CHARLES E. ADAMS, et al., Defendants. CITY OF LAKEWOOD, a municipal corporation, Cross-Complaint, v. CHARLES E. ADAMS, et al., Cross-Defendants.	No. 786,656 SECOND AMENDED JUDGMENT (Declaring and establishing water rights in Central Basin and enjoining extractions therefrom in excess of specified quantities.)

The above-entitled matter duly and regularly came on for trial in Department 73 of the above-entitled Court (having been transferred thereto from Department 75 by order of the presiding Judge), before the Honorable Edmund M. Moor, specially assigned Judge, on May 17, 1965, at 10:00 a.m. Plaintiff was represented by its attorneys BEWLEY, KNOOP,

of the close of the water year ending September 30, 1978 in accordance with the Watermaster Reports on file with this Court and the records of the Plaintiff. This tabulation does not take into account additions or subtractions from any Allowed Pumping Allocation of a producer for the 1978-79 water year, nor other adjustments not representing change in fee title to water rights, such as leases of water rights, nor does it include the names of lessees of landowners where the lessees are exercising the water rights. The exercise of all water rights is subject, however, to the provisions of this Judgment is hereinafter contained. All of said rights are of the same legal force and effect and are without priority with reference to each other. Each party whose name is hereinafter set forth in the tabulation set forth in Appendix "2" of this judgment, and after whose name there appears under the column "Total Water Right" the figure "0" owns no rights to extract any ground water from Central Basin, and has no right to extract any ground water from Central Basin.

(b) Defendant The City of Los Angeles is the owner of the right to extract fifteen thousand (15,000) acre feet per annum of ground water from Central Basin. Defendant Department of Water and Power of the City of Los Angeles has no right to extract ground water from Central Basin except insofar as it has the right, power, duty or obligation on behalf of defendant The City of Los Angeles to exercise the water rights in Central Basin of defendant The City of Los Angeles. The exercise of said rights are subject, however, to the provisions of this judgment hereafter contained, including but not limited to, sharing with other parties in any subsequent decreases or increases in the quantity of extractions permitted from Central Basin, pursuant to continuing jurisdiction of the Court, on the basis that fifteen thousand (15,000) acre feet bears to the Allowed Pumping Allocations of the other parties.

(c) No party to this action is the owner of or has any right to extract ground water from Central Basin except as herein affirmatively determined.

2. Parties Enjoined as Regards Quantities of Extractions.

Appendix E

Water Supply Assessment Provisions
California Water Code Section 10910-10915

WATER CODE
SECTION 10910-10915

10910. (a) Any city or county that determines that a project, as defined in Section 10912, is subject to the California Environmental Quality Act (Division 13 (commencing with Section 21000) of the Public Resources Code) under Section 21080 of the Public Resources Code shall comply with this part.

(b) The city or county, at the time that it determines whether an environmental impact report, a negative declaration, or a mitigated negative declaration is required for any project subject to the California Environmental Quality Act pursuant to Section 21080.1 of the Public Resources Code, shall identify any water system that is, or may become as a result of supplying water to the project identified pursuant to this subdivision, a public water system, as defined in Section 10912, that may supply water for the project. If the city or county is not able to identify any public water system that may supply water for the project, the city or county shall prepare the water assessment required by this part after consulting with any entity serving domestic water supplies whose service area includes the project site, the local agency formation commission, and any public water system adjacent to the project site.

(c) (1) The city or county, at the time it makes the determination required under Section 21080.1 of the Public Resources Code, shall request each public water system identified pursuant to subdivision (b) to determine whether the projected water demand associated with a proposed project was included as part of the most recently adopted urban water management plan adopted pursuant to Part 2.6 (commencing with Section 10610).

(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f), and (g).

(3) If the projected water demand associated with the proposed project was not accounted for in the most recently adopted urban water management plan, or the public water system has no urban water management plan, the water supply assessment for the project shall include a discussion with regard to whether the public water system's

total projected water supplies available during normal, single dry, and multiple dry water years during a 20-year projection will meet the projected water demand associated with the proposed project, in addition to the public water system's existing and planned future uses, including agricultural and manufacturing uses.

(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.

(d) (1) The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.

(2) An identification of existing water supply entitlements, water rights, or water service contracts held by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall be demonstrated by providing information related to all of the following:

(A) Written contracts or other proof of entitlement to an identified water supply.

(B) Copies of a capital outlay program for financing the delivery of a water supply that has been adopted by the public water system.

(C) Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.

(D) Any necessary regulatory approvals that are required in order to be able to convey or deliver the water supply.

(e) If no water has been received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts, the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall also include in its water supply assessment pursuant to subdivision (c), an

identification of the other public water systems or water service contractholders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts, to the same source of water as the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has identified as a source of water supply within its water supply assessments.

(f) If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment:

(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.

(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as overdrafted or has projected that the basin will become overdrafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long-term overdraft condition.

(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historic use records.

(4) A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available,

including, but not limited to, historic use records.

(5) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project.

A water supply assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.

(g) (1) Subject to paragraph (2), the governing body of each public water system shall submit the assessment to the city or county not later than 90 days from the date on which the request was received. The governing body of each public water system, or the city or county if either is required to comply with this act pursuant to subdivision (b), shall approve the assessment prepared pursuant to this section at a regular or special meeting.

(2) Prior to the expiration of the 90-day period, if the public water system intends to request an extension of time to prepare and adopt the assessment, the public water system shall meet with the city or county to request an extension of time, which shall not exceed 30 days, to prepare and adopt the assessment.

(3) If the public water system fails to request an extension of time, or fails to submit the assessment notwithstanding the extension of time granted pursuant to paragraph (2), the city or county may seek a writ of mandamus to compel the governing body of the public water system to comply with the requirements of this part relating to the submission of the water supply assessment.

(h) Notwithstanding any other provision of this part, if a project has been the subject of a water supply assessment that complies with the requirements of this part, no additional water supply assessment shall be required for subsequent projects that were part of a larger project for which a water supply assessment was completed and that has complied with the requirements of this part and for which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has concluded that its water supplies are sufficient to meet the projected water demand associated with the proposed project, in addition to the existing and planned future uses, including, but not limited to, agricultural and industrial uses, unless one or more of the following changes occurs:

(1) Changes in the project that result in a substantial increase

in water demand for the project.

(2) Changes in the circumstances or conditions substantially affecting the ability of the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), to provide a sufficient supply of water for the project.

(3) Significant new information becomes available which was not known and could not have been known at the time when the assessment was prepared.

10911. (a) If, as a result of its assessment, the public water system concludes that its water supplies are, or will be, insufficient, the public water system shall provide to the city or county its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. If the city or county, if either is required to comply with this part pursuant to subdivision (b), concludes as a result of its assessment, that water supplies are, or will be, insufficient, the city or county shall include in its water supply assessment its plans for acquiring additional water supplies, setting forth the measures that are being undertaken to acquire and develop those water supplies. Those plans may include, but are not limited to, information concerning all of the following:

(1) The estimated total costs, and the proposed method of financing the costs, associated with acquiring the additional water supplies.

(2) All federal, state, and local permits, approvals, or entitlements that are anticipated to be required in order to acquire and develop the additional water supplies.

(3) Based on the considerations set forth in paragraphs (1) and (2), the estimated timeframes within which the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), expects to be able to acquire additional water supplies.

(b) The city or county shall include the water supply assessment provided pursuant to Section 10910, and any information provided pursuant to subdivision (a), in any environmental document prepared for the project pursuant to Division 13 (commencing with Section 21000) of the Public Resources Code.

(c) The city or county may include in any environmental document an evaluation of any information included in that environmental

document provided pursuant to subdivision (b). The city or county shall determine, based on the entire record, whether projected water supplies will be sufficient to satisfy the demands of the project, in addition to existing and planned future uses. If the city or county determines that water supplies will not be sufficient, the city or county shall include that determination in its findings for the project.

10912. For the purposes of this part, the following terms have the following meanings:

(a) "Project" means any of the following:

(1) A proposed residential development of more than 500 dwelling units.

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

(b) If a public water system has fewer than 5,000 service connections, then "project" means any proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of the public water system's existing service connections, or a mixed-use project that would demand an amount of water equivalent to, or greater than, the amount of water required by residential development that would represent an increase of 10 percent or more in the number of the public water system's existing service connections.

(c) "Public water system" means a system for the provision of piped water to the public for human consumption that has 3000 or more service connections. A public water system includes all of the

following:

(1) Any collection, treatment, storage, and distribution facility under control of the operator of the system which is used primarily in connection with the system.

(2) Any collection or pretreatment storage facility not under the control of the operator that is used primarily in connection with the system.

(3) Any person who treats water on behalf of one or more public water systems for the purpose of rendering it safe for human consumption.

10914. (a) Nothing in this part is intended to create a right or entitlement to water service or any specific level of water service.

(b) Nothing in this part is intended to either impose, expand, or limit any duty concerning the obligation of a public water system to provide certain service to its existing customers or to any future potential customers.

(c) Nothing in this part is intended to modify or otherwise change existing law with respect to projects which are not subject to this part.

(d) This part applies only to a project for which a notice of preparation is submitted on or after January 1, 1996.

10915. The County of San Diego is deemed to comply with this part if the Office of Planning and Research determines that all of the following conditions have been met:

(a) Proposition C, as approved by the voters of the County of San Diego in November 1988, requires the development of a regional growth management plan and directs the establishment of a regional planning and growth management review board.

(b) The County of San Diego and the cities in the county, by agreement, designate the San Diego Association of Governments as that review board.

(c) A regional growth management strategy that provides for a comprehensive regional strategy and a coordinated economic development and growth management program has been developed pursuant to Proposition C.

(d) The regional growth management strategy includes a water element to coordinate planning for water that is consistent with the

requirements of this part.

(e) The San Diego County Water Authority, by agreement with the San Diego Association of Governments in its capacity as the review board, uses the association's most recent regional growth forecasts for planning purposes and to implement the water element of the strategy.

(f) The procedures established by the review board for the development and approval of the regional growth management strategy, including the water element and any certification process established to ensure that a project is consistent with that element, comply with the requirements of this part.

(g) The environmental documents for a project located in the County of San Diego include information that accomplishes the same purposes as a water supply assessment that is prepared pursuant to Section 10910.

INTRODUCTION

This Appendix A provides general information regarding The Metropolitan Water District of Southern California ("Metropolitan"), including information regarding Metropolitan's operations and finances. Statements included or incorporated by reference in this Appendix A constitute "forward-looking statements." Such statements are generally identifiable by the terminology used such as "plan," "project," "expect," "estimate," "budget" or other similar words. Such statements are based on facts and assumptions set forth in Metropolitan's current planning documents including, without limitation, its most recent biennial budget. The achievement of results or other expectations contained in such forward-looking statements involve known and unknown risks, uncertainties and other factors which may cause actual results, performance or achievements to be materially different from any future results, performance or achievements expressed or implied by such forward-looking statements. Actual results may differ from Metropolitan's forecasts. Metropolitan is not obligated to issue any updates or revisions to the forward-looking statements in any event.

Metropolitan maintains a website that may include information on programs or projects described in this Appendix A; however, none of the information on Metropolitan's website is incorporated by reference or intended to assist investors in making an investment decision or to provide any additional information with respect to the information included in this Appendix A. The information presented on Metropolitan's website is not part of the Official Statement and should not be relied upon in making investment decisions.

Formation and Purpose

Metropolitan is a metropolitan water district created in 1928 under authority of the Metropolitan Water District Act (California Statutes 1927, Chapter 429, as reenacted in 1969 as Chapter 209, as amended (herein referred to as the "Act")). The Act authorizes Metropolitan to: levy property taxes within its service area; establish water rates; impose charges for water standby and service availability; incur general obligation bonded indebtedness and issue revenue bonds, notes and short-term revenue certificates; execute contracts; and exercise the power of eminent domain for the purpose of acquiring property. In addition, Metropolitan's Board of Directors (the "Board") is authorized to establish terms and conditions under which additional areas may be annexed to Metropolitan's service area.

Metropolitan's primary purpose is to provide a supplemental supply of water for domestic and municipal uses at wholesale rates to its member public agencies. If additional water is available, such water may be sold for other beneficial uses. Metropolitan serves its member agencies as a water wholesaler and has no retail customers.

The mission of Metropolitan, as promulgated by the Board, is to provide its service area with adequate and reliable supplies of high quality water to meet present and future needs in an environmentally and economically responsible way.

Metropolitan's charges for water sales and availability are fixed by its Board, and are not subject to regulation or approval by the California Public Utilities Commission or any other state or federal agency. Metropolitan imports water from two principal sources: northern California via the Edmund G. Brown California Aqueduct (the "California Aqueduct") of the State Water Project owned by the State of California (the "State" or "California") and the Colorado River via the Colorado River Aqueduct ("CRA") owned by Metropolitan.

Member Agencies

Metropolitan is comprised of 26 member public agencies, including 14 cities, 11 municipal water districts, and one county water authority, which collectively serve the residents and businesses of more than 300 cities and numerous unincorporated communities. Member agencies request water from Metropolitan at

various delivery points within Metropolitan's system and pay for such water at uniform rates established by the Board for each class of water service. Metropolitan's water is a supplemental supply for its member agencies, most of whom have other sources of water. See "METROPOLITAN REVENUES–Principal Customers" in this Appendix A for a listing of the ten member agencies with the highest water purchases from Metropolitan during the fiscal year ended June 30, 2016. Metropolitan's member agencies may, from time to time, develop additional sources of water. No member is required to purchase water from Metropolitan, but all member agencies are required to pay readiness-to-serve charges whether or not they purchase water from Metropolitan. See "METROPOLITAN REVENUES–Rate Structure", "–Member Agency Purchase Orders" and "–Other Charges" in this Appendix A.

The following table lists the 26 member agencies of Metropolitan.

Municipal Water Districts		Cities		County Water Authority
Calleguas	Las Virgenes	Anaheim	Los Angeles	San Diego[1]
Central Basin	Orange County	Beverly Hills	Pasadena	
Eastern	Three Valleys	Burbank	San Fernando	
Foothill	West Basin	Compton	San Marino	
Inland Empire Utilities Agency		Fullerton	Santa Ana	
Upper San Gabriel Valley		Glendale	Santa Monica	
Western of Riverside County		Long Beach	Torrance	

(1) The San Diego County Water Authority, currently Metropolitan's largest customer, is a plaintiff in litigation challenging the allocation of costs to certain rates adopted by the Board and asserting other claims. See "METROPOLITAN REVENUES–Litigation Challenging Rate Structure" in this Appendix A.

Service Area

Metropolitan's service area comprises approximately 5,200 square miles and includes portions of the six counties of Los Angeles, Orange, Riverside, San Bernardino, San Diego and Ventura. When Metropolitan began delivering water in 1941, its service area consisted of approximately 625 square miles. Its service area has increased by 4,500 square miles since that time. The expansion was primarily the result of annexation of the service areas of additional member agencies.

Metropolitan estimates that approximately 18.8 million people lived in Metropolitan's service area in 2016, based on official estimates from the California Department of Finance and on population distribution estimates from the Southern California Association of Governments ("SCAG") and the San Diego Association of Governments ("SANDAG"). Population projections prepared by SCAG in 2012 and SANDAG in 2013, as part of their planning process to update regional transportation and land use plans, show expected population growth of about 18 percent in Metropolitan's service area between 2010 and 2035. The economy of Metropolitan's service area is exceptionally diverse. In 2015, the economy of the six counties which contain Metropolitan's service area had a gross domestic product larger than all but eleven nations of the world. Metropolitan has historically provided between 40 and 60 percent of the water used annually within its service area. For additional economic and demographic information concerning the six county area containing Metropolitan's service area, see Appendix E–"SELECTED DEMOGRAPHIC AND ECONOMIC INFORMATION FOR METROPOLITAN'S SERVICE AREA."

The climate in Metropolitan's service area ranges from moderate temperatures throughout the year in the coastal areas to hot and dry summers in the inland areas. Annual rainfall in an average year has historically been approximately 13 to 15 inches along the coastal area, up to 20 inches in foothill areas and less than 10 inches inland.

GOVERNANCE AND MANAGEMENT

Board of Directors

Metropolitan is governed by a 38-member Board of Directors, made up of representatives from all of Metropolitan's member agencies. Each member public agency is entitled to have at least one representative on the Board, plus an additional representative for each full five percent of the total assessed valuation of property in Metropolitan's service area that is within the member public agency. Changes in relative assessed valuation do not terminate any director's term. Accordingly, the Board may, from time to time, have more or fewer than 38 directors.

The Board includes business, professional and civic leaders. Directors are appointed by member agencies in accordance with those agencies' processes. They serve on the Board without compensation from Metropolitan. Voting is based on assessed valuation, with each member agency being entitled to cast one vote for each $10 million or major fractional part of $10 million of assessed valuation of property within the member agency, as shown by the assessment records of the county in which the member agency is located. The Board administers its policies through the Metropolitan Water District Administrative Code (the "Administrative Code"), which was adopted by the Board in 1977. The Administrative Code is periodically amended to reflect new policies or changes in existing policies that occur from time to time.

Management

Metropolitan's day-to-day management is under the direction of its General Manager, who serves at the pleasure of the Board, as do Metropolitan's General Counsel, General Auditor and Ethics Officer. Following is a biographical summary of Metropolitan's principal executive officers.

Jeffrey Kightlinger, General Manager – Mr. Kightlinger was appointed as General Manager in February 2006, leaving the position of General Counsel, which he had held since February 2002. Before becoming General Counsel, Mr. Kightlinger was a Deputy General Counsel and then Assistant General Counsel, representing Metropolitan primarily on Colorado River matters, environmental issues, water rights and a number of Metropolitan's water transfer and storage programs. Prior to joining Metropolitan in 1995, Mr. Kightlinger worked in private practice representing numerous public agencies including municipalities, redevelopment agencies and special districts. Mr. Kightlinger earned his bachelor's degree in history from the University of California, Berkeley, and his law degree from Santa Clara University.

Marcia Scully, General Counsel – Ms. Scully assumed the position of General Counsel in March 2012. She previously served as Metropolitan's Interim General Counsel from March 2011 to March 2012. Ms. Scully joined Metropolitan in 1995, after a decade of private law practice, providing legal representation to Metropolitan on construction, employment, Colorado River and significant litigation matters. From 1981 to 1985 she was assistant city attorney for the City of Inglewood. Ms. Scully served as president of University of Michigan's Alumnae Club of Los Angeles and is a recipient of the 1996 State Bar of California, District 7 President's Pro Bono Service Award and the Southern California Association of Non-Profit Housing Advocate of the Year Award. She is also a member of the League of Women Voters for Whittier and was appointed for two terms on the City of Whittier's Planning Commission, three years of which were served as chair. Ms. Scully earned a bachelor's degree in liberal arts from the University of Michigan, a master's degree in urban planning from Wayne State University and law degree from Loyola Law School.

Gerald C. Riss, General Auditor – Mr. Riss was appointed as Metropolitan's General Auditor in July 2002 and is responsible for the independent evaluation of the policies, procedures and systems of control throughout Metropolitan. Mr. Riss is a certified fraud examiner, certified financial services auditor and certified risk professional with more than 25 years of experience in accounting, audit and risk management. Prior to joining Metropolitan, Mr. Riss was Vice President and Assistant Division Head of Risk Management

Administration at United California Bank/Bank of the West. He also served as Senior Vice President, director of Risk Management and General Auditor of Tokai Bank of California from 1988 until its reorganization as United California Bank in 2001. He earned a bachelor's degree in accounting and master's degree in business administration from Wayne State University in Detroit, Michigan.

Deena Ghaly, Ethics Officer – Ms. Ghaly was appointed Ethics Officer in November 2012. Ms. Ghaly joined Metropolitan with over 20 years of legal and ethics-related experience. Prior to joining Metropolitan, she served as an administrative law judge for the California Office of Administrative Hearings. She previously was head of enforcement and general counsel for the Los Angeles City Ethics Commission, which administers and enforces the laws regarding campaign contributions, lobbying, and government ethics for the City of Los Angeles. Before moving to Southern California in 2001, Ms. Ghaly worked in New York City, where she headed the labor department in the general counsel's office of a large city agency. Licensed to practice law in California, New York and New Jersey, Ms. Ghaly is knowledgeable in workplace investigations, government ethics, regulatory affairs, and labor and employment matters. She has lectured throughout the nation on various topics, including parallel criminal and administrative prosecution, due process in administrative procedures, and effective internal investigations. Ms. Ghaly earned a bachelor's degree in philosophy from Wellesley College in Massachusetts and a law degree from Cornell Law School.

Gary Breaux, Assistant General Manager/Chief Financial Officer – Mr. Breaux has had extensive experience working for local governments since 1983. From 1994 until joining Metropolitan in October 2011, he served as Director of Finance for East Bay Municipal Utility District ("EBMUD"). At EBMUD, he was responsible for all financial areas, including treasury operations, debt management, rates, internal audit, accounting and reporting, risk management and customer and community services. Prior to joining EBMUD, he was Director of Finance for the City of Oakland, California. A native of Colorado, Mr. Breaux received a Bachelor of Science degree in Business from the University of Colorado in 1977 and a master's degree in Public Administration in 1987 from Virginia Commonwealth University.

Debra Man, Assistant General Manager/Chief Operating Officer – Ms. Man was appointed to her current position in December 2003. Ms. Man has worked at Metropolitan since 1986, beginning as an engineer and advancing to Chief of the Planning and Resources Division. As Chief of Planning and Resources she was responsible for major initiatives adopted by Metropolitan's Board, such as the Integrated Water Resources Plan, rate structure, and facility plans for expansion of Metropolitan's distribution system. In 1999, she was appointed as Vice President of Water Transfers and Exchanges, responsible for securing water supplies through agreements and partnerships with other water and agricultural interests in San Joaquin Valley and Southern California and demonstrating Metropolitan's water supply reliability in compliance with current laws. Ms. Man is a registered professional civil engineer in California and Hawaii. She has a bachelor's degree in civil engineering from the University of Hawaii and a master's degree in civil/environmental engineering from Stanford University.

Roger Patterson, Assistant General Manager/Strategic Initiatives – Mr. Patterson was appointed Assistant General Manager in March 2006. He is responsible for overseeing water supply and planning issues, including the Colorado River and State Water Project. He previously served as a consultant to Metropolitan on Colorado River issues. Mr. Patterson was the director of the Nebraska Department of Natural Resources from 1999 to 2005, where he was responsible for water administration, water planning, flood-plain delineation, dam safety and the state databank. Prior to his work in Nebraska, Mr. Patterson spent 25 years with the U.S. Bureau of Reclamation ("Bureau of Reclamation"), retiring from the Bureau of Reclamation as the Regional Director for the Mid-Pacific Region. He is a registered professional engineer in Nebraska and Colorado, and earned bachelor's and master's degrees in engineering from the University of Nebraska.

Fidencio M. Mares, Interim Assistant General Manager/Chief Administrative Officer – Mr. Mares was appointed the Interim Assistant General Manager/Chief Administrative Officer in July 2015 and is

responsible for the strategic direction and management of Metropolitan's administrative functions. His primary responsibilities include managing human resources, information technology, real property and administrative services. Prior to joining Metropolitan, Mr. Mares was the owner of the Mares Company, where he served as a consultant to companies in the overall assessment of their management programs and processes. Prior to becoming a consultant, Mares worked both in the private and public sectors, serving as vice president of human resources and corporate communications for Beckham Coulter and as chief administrative officer of BHP/Pacific Resources and President & CEO of Gas Operations. He worked for more than 15 years for The Gas Company in Hawaii and Southern California Edison Company. A graduate of the California State University, Fresno, he also serves on the National Board of Visitors (Distinguished Graduates) for the University.

Dee Zinke, Assistant General Manager/Chief External Affairs Officer– Ms. Zinke was appointed Assistant General Manager in January 2016. She is responsible for Metropolitan's communications, business outreach, education and legislative matters. She joined Metropolitan in 2009 as Manager of the Legislative Services Section. Before coming to Metropolitan, Ms. Zinke was the Manager of Governmental and Legislative Affairs at the Calleguas Municipal Water District for nearly 10 years, where she received recognition for her significant contributions to the Association of California Water Agencies, the Ventura County Special Districts Association and the Association of Water Agencies of Ventura County. During her tenure at Calleguas, she was named Chair of the Ventura County Watersheds Coalition and appointed by then-Secretary of Resources Mike Chrisman to the State Watershed Advisory Committee. Prior to her public service, she worked in the private sector as the Executive Officer and Senior Legislative Advocate for Building Industry Association of Greater Los Angeles and Ventura Counties and as Director of Communications for E-Systems, a defense contractor specializing in communication, surveillance and navigation systems in Washington, D.C. Ms. Zinke holds a Bachelor of Arts degree in Communication and Psychology from Virginia Polytechnic Institute and State University.

Employee Relations

The total number of regular full-time Metropolitan employees on January 1, 2017 was 1,765, of whom 1,223 were represented by AFSCME Local 1902, 95 by the Supervisors Association, 294 by the Management and Professional Employees Association and 129 by the Association of Confidential Employees. The remaining 24 employees are unrepresented. The four bargaining units represent 99 percent of Metropolitan's employees. The Memorandum of Understanding ("MOU") with each of the Association of Confidential Employees, the Management and Professional Employees Association and AFSCME Local 1902 covered the period January 1, 2011 through December 31, 2016. The MOU with the Supervisors Association covered the period September 13, 2011 to December 31, 2016. Although the contracts with the bargaining units are expired, the provisions of such contracts will govern until a successor contract is negotiated. The Board authorized the General Manager to exercise discretion under Administrative Code Section 6101(k) to enter into a successor MOU with the Management and Professional Employees Association on February 14, 2017. Negotiations with the remaining bargaining units are underway and are currently expected to be completed in early 2017.

Risk Management

Metropolitan is exposed to various risks of loss related to the design and construction of facilities, and the treatment and delivery of water. With the assistance of third party claims administrators, Metropolitan is self-insured for liability, property and workers' compensation. Metropolitan self-insures the first $25 million per liability occurrence, with commercial liability coverage of $75 million in excess of the self-insured retention. The $25 million self-insured retention is maintained as a separate restricted reserve. Metropolitan is also self-insured for loss or damage to its property, with the $25 million self-insured retention also being accessible for emergency repairs and Metropolitan property losses. In addition, Metropolitan obtains other excess and specialty insurance coverages such as directors' and officers' liability, fiduciary liability and aircraft hull and liability coverage.

Metropolitan self-insures the first $5 million for workers' compensation with statutory excess coverage. The self-insurance retentions and reserve levels currently maintained by Metropolitan may be modified by the Board at its sole discretion.

Information Security

Metropolitan has adopted and maintains an active Information Security program ("ISP") that includes comprehensive policies and procedures reviewed annually by its internal Information Security Team, Audit and independent third party auditors and consultants. Metropolitan has appointed an Information Security Manager who is responsible for overseeing the annual review of the ISP and its alignment with the strategic plan and direction of Metropolitan. Metropolitan's policies and procedures are consistent with public agency standards as well as staying aligned with governance, risk, and compliance. All Metropolitan users are required to participate in Metropolitan's Information Security education and awareness training. Metropolitan's Information Security Team is responsible for providing guidance and education on the implementation of new technologies based on Metropolitan's ISP as well as overseeing the monitoring of potential threats and vulnerabilities, utilizing and executing security controls to validate policy enforcement, protecting against virus and malware attacks, and investigating any potential unauthorized activity on Metropolitan's network.

METROPOLITAN'S WATER SUPPLY

General

Metropolitan's principal sources of water supplies are the State Water Project and the Colorado River. Metropolitan receives water delivered from the State Water Project under State Water Contract provisions, including contracted supplies, use of carryover storage in San Luis Reservoir, and surplus supplies. Metropolitan holds rights to a basic apportionment of Colorado River water and has priority rights to an additional amount depending on availability of surplus supplies. Water management programs supplement these Colorado River supplies. To secure additional supplies, Metropolitan also has groundwater banking partnerships and water transfer and storage arrangements within and outside its service area. Metropolitan's principal water supply sources, and other supply arrangements and water management are more fully described herein.

Metropolitan faces a number of challenges in providing adequate, reliable and high quality supplemental water supplies for southern California. These include, among others: (1) population growth within the service area; (2) increased competition for low-cost water supplies; (3) variable weather conditions; (4) increased environmental regulations; and (5) climate change. Metropolitan's resources and strategies for meeting these long-term challenges are set forth in its Integrated Water Resources Plan, as updated from time to time. See "–Integrated Water Resources Plan." In addition, Metropolitan manages water supplies in response to the prevailing hydrologic conditions by implementing its Water Surplus and Drought Management ("WSDM") Plan, and in times of prolonged or severe shortages, the Water Supply Allocation Plan (the "Water Supply Allocation Plan"). See "CONSERVATION AND WATER SHORTAGE MEASURES–Water Surplus and Drought Management Plan" and "–Water Supply Allocation Plan."

Hydrologic conditions can have a significant impact on Metropolitan's imported water supply sources. For Metropolitan's State Water Project supplies, precipitation in California's northern Sierra Nevada during the fall and winter helps replenish storage levels in Lake Oroville, a key State Water Project facility. The subsequent runoff from the spring snowmelt helps satisfy regulatory requirements in the San Francisco Bay/Sacramento-San Joaquin River Delta ("Bay-Delta") bolstering water supply reliability in the same year. See "–State Water Project – Bay-Delta Proceedings Affecting State Water Project." The source of Metropolitan's Colorado River supplies is primarily the watersheds of the Upper Colorado River basin in

the states of Colorado, Utah, and Wyoming. Although precipitation is primarily observed in the winter and spring, summer storms are common and can affect water supply conditions.

Uncertainties from potential future temperature and precipitation changes in a climate driven by increased concentrations of atmospheric carbon dioxide also present challenges. Areas of concern to California water planners identified by researchers include: reduction in Sierra Nevada and Colorado Basin snowpack; increased intensity and frequency of extreme weather events; and rising sea levels resulting in increased risk of damage from storms, high-tide events, and the erosion of levees and potential cutbacks of deliveries of imported water. While potential impacts from climate change remain subject to study and debate, climate change is among the uncertainties that Metropolitan seeks to address through its planning processes.

Current Water Conditions

Following the drought period from 2012-2015, current hydrologic conditions have improved. As of February 1, 2017, the northern Sierra precipitation was 197 percent of normal with a snowpack accumulation that was 140 percent of normal. Lake Oroville, the principal State Water Project reservoir, began flood control releases in early January. See "–Recent Events at Oroville Dam" below. On January 18, 2017, the California Department of Water Resources ("DWR") notified State Water Contractors that its calendar year 2017 allocation estimate to State Water Contractors was 60 percent of contracted amounts, or 1,146,900 acre-feet for Metropolitan. (An acre-foot is the amount of water that will cover one acre to a depth of one foot and equals approximately 326,000 gallons, which represents the needs of two average families in and around the home for one year.) See "–State Water Project."

As of February 1, 2017, the Upper Colorado River Basin snowpack measured 156 percent of normal and total system storage in the Colorado River Basin was 49 percent of capacity. As of such date, the projected base supply of Colorado River water in calendar year 2017 was estimated to be 960,000 acre-feet. See "–Colorado River Aqueduct."

See also "–Storage Capacity and Water in Storage."

Recent Events at Oroville Dam

Oroville Dam, the earthfill embankment dam on the Feather River which impounds Lake Oroville, is operated by DWR as a facility of the State Water Project. On February 7, 2017, the main flood control spillway at Oroville Dam, a gated and concrete lined facility, experienced significant damage as DWR increased releases to 55,000 cubic feet per second to manage higher inflows driven by continued precipitation in the Feather River basin. Subsequently, DWR halted releases at the main spillway to inspect the damage and conduct flow tests. After testing, the main spillway was returned to service on February 8 at a reduced flow rate to offset inflows into Lake Oroville. On February 11, the water elevation in Lake Oroville reached 901 feet, leading water to flow over the emergency spillway structure, an ungated, 1,730 foot long concrete barrier located adjacent to and north of the main flood control spillway structure. Releases from the emergency spillway flow uncontrolled down an earthen hillside to the Feather River. On February 12, erosion began to progress up the right side of the emergency spillway. Concerns about the erosion at the emergency spillway prompted DWR to increase releases through the damaged main spillway and led the Butte County Sheriff to evacuate downstream communities for two days to ensure the safety of the residents. As of February 14, water levels in Lake Oroville were 13 feet below the crest of the emergency spillway and the mandatory evacuation order was lifted. DWR has begun repairs to the erosion areas below the emergency spillway. As of February 15, 2017, the cause of the damage to the main spillway was unknown.

The State has requested federal emergency funding to help offset costs related to the response efforts. The Federal Emergency Management Agency has approved the State's request for federal assistance.

Following the rainy season, the spillways will be repaired on a more permanent basis in preparation for the following winter. DWR's initial assessments indicate costs may range from $100-200 million. These estimates are subject to revision as more detailed information becomes known. Metropolitan is unable to assess at this time what costs, if any, it will incur as a State Water Contractor, associated with the spillway repairs.

State Water Project water allocations to State Water Contractors for calendar year 2017 are currently estimated to be 60 percent of contracted amounts. In spite of the damage to the main spillway and the unknowns associated with DWR's corresponding repair plan, the State Water Project allocation is expected to increase from the current estimate of 60 percent. If realized, this would result in an allocation that is higher than average, and likely higher than any allocation since 2011. Nonetheless, future water supplies will be primarily dependent on hydrology.

Integrated Water Resources Plan

Overview. The Integrated Water Resources Plan ("IRP") is Metropolitan's principal water resources planning document. Metropolitan, its member agencies, subagencies and groundwater basin managers developed their first IRP as a long-term planning guideline for resources and capital investments. The purpose of the IRP was the development of a portfolio of preferred resources to meet the water supply reliability and water quality needs for the region in a cost-effective and environmentally sound manner. The first IRP was adopted by the Board in January 1996 and has been subsequently updated in 2004, 2010 and 2015.

On January 12, 2016, Metropolitan's Board adopted the most recent IRP update (the "2015 IRP Update") as a strategy to set goals and a framework for water resources development. This strategy enables Metropolitan and its member agencies to manage future challenges and changes in California's water conditions and to balance investments with water reliability benefits. The 2015 IRP Update provides an adaptive management approach to address future uncertainty, including uncertainty from climate change. It was formulated with input from member agencies, retail water agencies, and other stakeholders including water and wastewater managers, environmental and business interests and the community.

The 2015 IRP Update seeks to provide regional reliability through 2040 by stabilizing Metropolitan's traditional imported water supplies and continuing to develop additional conservation programs and local resources, with an increased emphasis on regional collaboration. It also advances long-term planning for potential future contingency resources, such as storm water capture and seawater desalination.

Specific projects that may be developed by Metropolitan in connection with the implementation of the 2015 IRP Update will be subject to future Board consideration and approval, as well as environmental and regulatory documentation and compliance. The 2015 IRP Update and associated materials are available on Metropolitan's website at: http://www.mwdh2o.com/AboutYourWater/Planning/Planning-Documents/Pages/default.aspx. The information set forth on Metropolitan's website is not incorporated by reference.

An Adaptive Management Strategy. Adaptive water management, as opposed to a rigid set of planned actions over the coming decades, is the most nimble and cost-effective manner for Metropolitan and local water districts throughout Southern California to effectively prepare for the future. An adaptive management approach began to evolve with Metropolitan's first IRP in 1996, after drought-related shortages in 1991 prompted a rethinking of Southern California's long-term water strategy. Reliance on imported supplies to meet future water needs has decreased steadily over time, replaced by plans for local actions to

meet new demands. The 2015 IRP Update continues to build a robust portfolio approach to water management.

The following paragraphs describe the goals, approaches and targets for each of the resource areas that are needed to ensure reliability under planned conditions.

State Water Project. The State Water Project is one of Metropolitan's two major sources of water. The goal for State Water Project supplies is to adaptively manage flow and export regulations in the near term and to achieve a long-term Bay-Delta solution that addresses ecosystem and water supply reliability challenges. Achieving this goal will require continued participation and successful outcomes in the California WaterFix and the California EcoRestore efforts. See "–State Water Project" and "REGIONAL WATER RESOURCES–Local Water Supplies" in this Appendix A. The stated goal of the IRP is to manage State Water Project supplies in compliance with regulatory restrictions in the near-term for an average of 980,000 acre-feet of annual supplies, and to pursue a successful outcome in the California WaterFix and California EcoRestore efforts for long-term average supplies of approximately 1.2 million acre-feet annually from this resource. See "–State Water Project – Bay-Delta Proceedings Affecting State Water Project."

Colorado River Aqueduct. The CRA delivers water from the Colorado River, Metropolitan's original source of supply. Metropolitan has helped to fund and implement agricultural conservation programs, improvements to river operation facilities, land management programs and water transfers and exchanges through agreements with agricultural water districts in southern California, entities in Arizona and Nevada that use Colorado River water, and the Bureau of Reclamation. See "–Colorado River Aqueduct" and "–Water Transfer, Storage and Exchange Programs – Colorado River Aqueduct." The stated goal of the IRP for the CRA supplies is to maintain current levels of water supplies from existing programs, while also developing flexibility through dry-year programs and storage to ensure that a minimum of 900,000 acre-feet of CRA deliveries are available when needed, with a target of 1.2 million acre-feet in dry years.

Water Transfers and Exchanges. Under voluntary water transfer or exchange agreements, agricultural communities using irrigation water may periodically sell or conserve some of their water allotments for use in urban areas. The water may be delivered through existing State Water Project or CRA facilities, or may be exchanged for water that is delivered through such facilities. Metropolitan's policy toward potential transfers states that the transfers will be designed to protect and, where feasible, enhance environmental resources and avoid the mining of local groundwater supplies. See "–Water Transfer, Storage and Exchange Programs." The stated goal of the IRP is to pursue transfers and exchanges to hedge against shorter-term water demand and supply imbalances while long-term water supply solutions are developed and implemented.

Water Conservation. Conservation and other water use efficiencies are integral components of Metropolitan's IRP. Metropolitan has invested in conservation programs since the 1980s. Historically, most of the investments have been in water efficient fixtures in the residential sector. With outdoor water use comprising at least 50 percent of residential water demand, Metropolitan has increased its conservation efforts to target outdoor water use reduction in its service area. See "CONSERVATION AND WATER SHORTAGE MEASURES." The stated goal of the IRP is to pursue further water conservation savings of 485,000 acre-feet annually by 2040 through continued increased emphasis on outdoor water-use efficiency using incentives, outreach/education and other programs.

Local Water Supplies. Local supplies are a significant and growing component to the region's diverse water portfolio. While the extent to which each member agency's water supply is provided by imported water purchased from Metropolitan varies, in the aggregate, local supplies can provide over half of the region's water in a given year, and the maintenance of these supplies remain an integral part of the IRP. Similar to water conservation, local supplies serve the important function of reducing demands for imported water supplies and thereby making regional water system capacity and storage available and accessible to

meet the needs of the region. Local water supply projects may include, among other things, recycled water, groundwater recovery, conjunctive use, and seawater desalination. Metropolitan offers financial incentives to member agencies to help fund the development of a number of these types of local supply projects. The stated goal of the IRP is to seek to develop 230,000 acre-feet of additional local supplies produced by existing and future projects, with the region reaching a target of 2.4 million acre-feet of total dependable local supply by 2040. See "REGIONAL WATER RESOURCES–Local Water Supplies" in this Appendix A.

State Water Project

Background

One of Metropolitan's two major sources of water is the State Water Project, which is owned by the State, and managed and operated by DWR. The State Water Project is the largest state-built, multipurpose, user-financed water project in the country. It was designed and built primarily to deliver water, but also provides flood control, generates power for pumping, is used for recreation, and enhances habitat for fish and wildlife. The State Water Project provides irrigation water to 750,000 acres of farmland, mostly in the San Joaquin Valley, and provides municipal and industrial water to approximately 25 million of California's estimated 39.2 million residents, including the population within the service area of Metropolitan.

The State Water Project's watershed encompasses the mountains and waterways around the Feather River, the principal tributary of the Sacramento River, in the Sacramento Valley of Northern California. Through the State Water Project, Feather River water stored in and released from Oroville Dam (located about 70 miles north of Sacramento, east of the city of Oroville, California) and unregulated flows diverted directly from the Bay-Delta are transported south through the Central Valley of California, over the Tehachapi Mountains and into Southern California, via the California Aqueduct, to four delivery points near the northern and eastern boundaries of Metropolitan's service area. The total length of the California Aqueduct is approximately 444 miles long. See "METROPOLITAN'S WATER DELIVERY SYSTEM–Primary Facilities and Method of Delivery – State Water Project" in this Appendix A.

State Water Contract

In 1960, Metropolitan signed a water supply contract (as amended, the "State Water Contract") with DWR to receive water from the State Water Project. Metropolitan is one of 29 agencies and districts that have long-term contracts for water service from DWR (known collectively as the "State Water Contractors" and sometimes referred to herein as "Contractors"). Metropolitan is the largest of the State Water Contractors in terms of the number of people it serves (approximately 18.8 million), the share of State Water Project water that it has contracted to receive (approximately 46 percent), and the percentage of total annual payments made to DWR by agencies with State water contracts (approximately 52 percent for 2016). Metropolitan received its first delivery of State Water Project water in 1972.

Pursuant to the terms of the State water contracts, all water-supply related expenditures for capital and operations, maintenance, power, and replacement costs associated with the State Water Project facilities are paid for by the State Water Contractors. In exchange, Contractors have the right to participate in the system, with an entitlement to water service from the State Water Project and the right to use the portion of the State Water Project conveyance system necessary to deliver water to them. Each year DWR estimates the total State Water Project water available for delivery to the State Water Contractors and allocates the available project water among the State Water Contractors in accordance with the State water contracts. DWR's total water supply availability projections are refined over the course of the winter season based upon updated rainfall and snowpack values and allocations to the State Water Contractors are adjusted accordingly.

Metropolitan's State Water Contract has been amended a number of times since its original execution and delivery. Several of the amendments, entered into by DWR and various subsets of State Water Contractors, relate to the financing and construction of a variety of State Water Project facilities and

improvements and impose certain cost responsibility therefor on the affected Contractors, including Metropolitan. For a description of Metropolitan's financial obligations under its State Water Contract, including with respect to such amendments, see "METROPOLITAN EXPENSES–State Water Contract Obligations" in this Appendix A.

Amendments, approved by Metropolitan's Board in 1995, and since executed by DWR and 27 of the State Water Contractors (collectively known as the "Monterey Amendment"), among other things, made explicit that the Contractors' rights to use the portion of the State Water Project conveyance system necessary to deliver water to them also includes the right to convey non-State Water Project water at no additional cost as long as capacity exists. These amendments also expanded the ability of the State Water Contractors to carry over State Water Project water in State Water Project storage facilities, allowed participating Contractors to borrow water from terminal reservoirs, and allowed Contractors to store water in groundwater storage facilities outside a Contractor's service area for later use. These amendments provided the means for individual Contractors to increase supply reliability through water transfers and storage outside their service area. Metropolitan has subsequently developed and actively manages a portfolio of water supplies to convey through the California Aqueduct pursuant to these contractual rights. See "–Water Transfer, Storage and Exchange Programs." The Monterey Amendment is the subject of ongoing litigation. See "–Related Litigation – Monterey Amendment Litigation" below.

Under its State Water Contract, Metropolitan has a contractual right to its proportionate share of the State Water Project water that DWR determines annually is available for allocation to the Contractors. This determination is made by DWR each year based on existing supplies in storage, forecasted hydrology, and other factors. Available State Water Project water is then allocated to the Contractors in proportion to the amounts set forth in "Table A" of their respective State water contract. Pursuant to Table A of its State Water Contract, Metropolitan is entitled to approximately 46 percent of the total annual allocation made available to State Water Contractors each year.

Metropolitan's State Water Contract, under a 100 percent allocation, provides Metropolitan 1,911,500 acre-feet of water. The 100 percent allocation is referred to as the contracted amount. Late each year, DWR announces an initial allocation estimate for the upcoming year, but periodically provides subsequent estimates throughout the year if warranted by developing precipitation and water supply conditions. From calendar years 2004 through 2016, the amount of water received by Metropolitan from the State Water Project, including water from water transfer, groundwater banking and exchange programs delivered through the California Aqueduct (described under "–Water Transfer, Storage and Exchange Programs"), varied from a low of 593,000 acre-feet in calendar year 2015 to a high of 1,800,000 acre-feet in 2004. In calendar year 2016, DWR's allocation to State Water Contractors was 60 percent of contracted amounts, or 1,146,000 acre-feet, for Metropolitan.

On December 1, 2016, DWR announced an initial calendar year 2017 allocation of 20 percent. On December 21, 2016, DWR increased the allocation estimate to 45 percent. On January 18, 2017, DWR increased the allocation estimate to 60 percent of contracted amounts based on runoff from storms that increased the combined storage in Oroville and San Luis Reservoir by over 600,000 acre-feet. This increased allocation estimate reflects improving hydrologic conditions in California and increasing storage levels in the State's major reservoirs, but also takes into account federally mandated environmental restrictions that have been imposed upon water deliveries from the Bay-Delta, including the biological opinions discussed below. See "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project – Delta Smelt and Salmon Federal ESA Biological Opinions." If necessary, Metropolitan may augment its State Water Project deliveries using withdrawals from its storage programs along the State Water Project and through water transfer and exchange programs. However, in light of current water conditions in California and the estimated 2017 allocation, supplies are expected to exceed projected demands and Metropolitan anticipates it will add water to its storage programs. See "–Water Transfer, Storage and Exchange Programs."

The term of Metropolitan's State Water Contract currently extends to December 31, 2035. Upon expiration of the State Water Contract term, Metropolitan has the option to continue service under substantially the same terms and conditions. Metropolitan and other State Water Contractors have undertaken negotiations with DWR to extend their State water contracts. In June 2014, DWR and the State Water Contractors reached an Agreement in Principle (the "Agreement in Principle") on an amendment to the State water contract to extend the contract and to make certain changes related to financial management of the State Water Project in the future. DWR and 25 of the State Water Contractors, including Metropolitan, have signed the Agreement in Principle. Under the Agreement in Principle, the term of the State water contract for each Contractor that signs an amendment would be extended until December 31, 2085. The Agreement in Principle will serve as the "proposed project" for purposes of environmental review under the California Environmental Quality Act ("CEQA"). DWR issued a Notice of Availability of the Draft Environmental Impact Report ("EIR") for the proposed project on August 17, 2016. The review period ended October 17, 2016. Following CEQA review, a State Water Project contract amendment will be prepared. Such amendment will be subject to review by the Legislature.

Bay-Delta Proceedings Affecting State Water Project

General. In addition to being a source of water for diversion into the State Water Project, the Bay-Delta is also the source of water for local agricultural, municipal and industrial needs, and, in addition, supports significant resident and anadromous fish and wildlife resources and important recreational uses of water. Both the State Water Project's upstream reservoir operations and its Bay-Delta diversions can at times affect these other uses of Bay-Delta water directly, or indirectly, through impacts on Bay-Delta water quality. A variety of proceedings and other activities are ongoing with the participation of various State and federal agencies, as well as California's environmental, urban and agricultural communities, in an effort to develop long-term, collectively-negotiated solutions to the environmental and water management issues concerning the Bay-Delta, and Metropolitan actively participates in these proceedings. Metropolitan cannot predict the ultimate outcome of any of the litigation or regulatory processes described below, but believes that a materially adverse impact on the operation of State Water Project pumps, Metropolitan's State Water Project deliveries or Metropolitan's water reserves could result.

SWRCB Regulatory Activities and Decisions. The State Water Resources Control Board (the "SWRCB") is the agency responsible for setting water quality standards and administering water rights throughout California. The SWRCB exercises its regulatory authority over the Bay-Delta by means of public proceedings leading to regulations and decisions that can affect the availability of water to Metropolitan and other users of State Water Project water. These include the Water Quality Control Plan ("WQCP") for the San Francisco Bay/Sacramento-San Joaquin Delta Estuary, which establishes the water quality objectives and proposed flow regime of the estuary, and water rights decisions, which assign responsibility for implementing the objectives of the WQCP to users throughout the system by adjusting their respective water rights permits.

The WQCP gets reviewed periodically and new standards and allocations of responsibility can be imposed on the State Water Project as a result. The last review was completed in 2006, and the current review has been ongoing since approximately 2010.

Since 2000, SWRCB's Water Rights Decision 1641 ("D-1641") has governed the State Water Project's ability to export water from the Bay-Delta for delivery to Metropolitan and other agencies receiving water from the State Water Project. D-1641 allocated responsibility for meeting flow requirements and salinity and other water quality objectives established earlier by the WQCP. In response to ongoing drought conditions in 2014 and 2015, DWR and the Bureau of Reclamation requested temporary relief from certain WQCP standards and filed petitions requesting changes to D-1641 terms that govern outflows and salinity standards in the Bay-Delta. The SWRCB approved temporary urgency changes in the Bay-Delta in 2014 and 2015, enabling water to be conserved in reservoirs in case of continued drought.

Bay-Delta Planning Activities. In 2000, several State and federal agencies released the CALFED Bay Delta Programmatic Record of Decision ("ROD") and Environmental Impact Report/Environmental Impact Statement ("EIR/EIS") that outlined and disclosed the environmental impacts of a 30-year plan to improve the Bay-Delta's ecosystem, water supply reliability, water quality, and levee stability. The CALFED ROD remains in effect and many of the State, federal, and local projects begun under CALFED continue.

Building on CALFED and other Bay-Delta planning activities, in 2006 multiple State and federal resource agencies, water agencies, and other stakeholder groups entered into a planning agreement for the Bay-Delta Conservation Plan ("BDCP"). The BDCP was originally conceived as a comprehensive conservation strategy for the Bay-Delta designed to restore and protect ecosystem health, water supply, and water quality within a stable regulatory framework to be implemented over a 50-year time frame with corresponding long-term permit authorizations from fish and wildlife regulatory agencies. The BDCP includes both alternatives for new water conveyance infrastructure and extensive habitat restoration in the Bay-Delta.

In 2015, the State and federal lead agencies proposed an alternative implementation strategy and new alternatives to the BDCP to provide for the protection of water supplies conveyed through the Bay-Delta and the restoration of the ecosystem of the Bay-Delta, termed "California WaterFix" and "California EcoRestore," respectively. In this alternative approach, DWR and the Bureau of Reclamation would implement planned water conveyance improvements (California WaterFix) as a stand-alone project that would seek incidental take authorization for an unspecified period and would include only limited amounts of habitat restoration. The habitat restoration to be required would be that directly related to construction mitigation and the associated costs of such mitigation which would be underwritten by the public water agencies participating in the California WaterFix project. Ecosystem improvements and habitat restoration more generally (California EcoRestore) would be undertaken under a more phased approach than previously contemplated by the BDCP and would not be linked with the California WaterFix project or permits. Accelerated restoration actions totaling 30,000 acres of tidal marsh habitat were proposed to be undertaken in the coming decade to provide public benefits for listed fish in the Bay-Delta. (See also "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project.") Subsequent actions would be based on the proven merits of restoration. Preliminary cost estimates for the WaterFix alternative are currently estimated to be $17 billion. When a decision selecting the final project has been made, costs will be updated and allocated. Metropolitan anticipates that it could bear approximately 25 percent of the costs of the project. The Final EIR/EIS for the BDCP/California WaterFix was completed and made available to the public and other agencies on December 22, 2016. The Notice of Availability of the Final EIR/EIS was published by the Bureau of Reclamation in the Federal Register on December 30, 2016. On January 4, 2017, the U.S. Secretary of the Interior issued an order to federal agencies involved in the California WaterFix stating the U.S. Fish and Wildlife Service will issue a final biological opinion by April 2017. A similar schedule is anticipated for the biological opinion to be issued by the National Marine Fisheries Service. Upon receipt of the biological opinions, the Bureau of Reclamation will be able to issue a Record of Decision for the project. Certification of the EIR/EIS under CEQA and final decision-making by DWR is expected at that same time. See also "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project."

Related Litigation

California Water Impact Network Litigation. On September 3, 2010, the California Water Impact Network and two other non-profit organizations filed a petition for writ of mandate and for declaratory and injunctive relief in Sacramento Superior Court against the SWRCB and DWR. The petition alleges that by permitting and carrying out the export of large volumes of water from the Bay-Delta through the State Water Project, the SWRCB and DWR have failed to protect public trust fishery resources in the delta; have been diverting water from the Bay-Delta wastefully and unreasonably in violation of the prohibition against waste

and unreasonable use in the California Constitution; and have failed to enforce and comply with water quality and beneficial use standards in D-1641, the 1995 WQCP, and the federal Porter-Cologne Act. Among the relief sought in the petition is an injunction against Bay-Delta exports by the State Water Project pending compliance with the various laws and administrative orders that are alleged to have been violated. The State Water Contractors filed a motion to intervene in this action, which was granted on March 25, 2011. In August 2016, the court dismissed the case without prejudice based on the failure of the petitioners to bring the case to trial within five years of filing their original petition.

Monterey Amendment Litigation. On May 4, 2010, DWR completed an EIR and concluded a remedial CEQA review for the Monterey Amendment, which reflects the settlement of certain disputes regarding the allocation of State Water Project water. See "– State Water Contract" above. Central Delta Water Agency, South Delta Water Agency, California Water Impact Network, California Sportfishing Protection Alliance, and the Center For Biological Diversity filed a lawsuit against DWR in Sacramento County Superior Court challenging the validity of the EIR under CEQA and the validity of underlying agreements under a reverse validation action (the "Central Delta I" case). In January 2013, the Court ruled that the validation cause of action in Central Delta I was time barred by the statute of limitations. The court also held that DWR must complete a limited scope remedial CEQA review addressing the potential impacts of the Kern Water Bank, a portion of the Monterey Amendment that does not directly affect Metropolitan. The court also ruled that the State Water Project may continue to be operated under the terms of the Monterey Amendment while the remedial CEQA review is prepared and leaves in place the underlying project approvals while DWR prepares the remedial CEQA review. Plaintiffs appealed. Briefing by the parties was completed, but no date for oral argument has been set. Any adverse impact of this litigation and rulings on Metropolitan's State Water Project supplies cannot be determined at this time.

In September 2016, DWR certified the Final Revised Draft EIR for the Monterey Amendment, recorded a Notice of Determination, and filed papers in the trial demonstrating compliance with the court's order for remedial CEQA review. On October 21, 2016, the petitioner group from Central Delta I and a new lead petitioner, Center for Food Safety, filed litigation against DWR challenging this EIR and named Metropolitan and the other State Water Project contractors as respondent parties. Any adverse impact of this litigation and rulings on Metropolitan's State Water Project supplies cannot be determined at this time.

Colorado River Aqueduct

Background

The Colorado River was Metropolitan's original source of water after Metropolitan's establishment in 1928. Metropolitan has a legal entitlement to receive water from the Colorado River under a permanent service contract with the Secretary of the Interior. Water from the Colorado River and its tributaries is also available to other users in California, as well as users in the states of Arizona, Colorado, Nevada, New Mexico, Utah, and Wyoming (collectively, the "Colorado River Basin States"), resulting in both competition and the need for cooperation among these holders of Colorado River entitlements. In addition, under a 1944 treaty, Mexico has an allotment of 1.5 million acre-feet of Colorado River water annually except in the event of extraordinary drought or serious accident to the delivery system in the United States, in which event the water allotted to Mexico would be curtailed. Mexico can also schedule delivery of an additional 200,000 acre-feet of Colorado River water per year if water is available in excess of the requirements in the United States and the 1.5 million acre-feet allotted to Mexico.

Construction of the CRA, which is owned and operated by Metropolitan, was undertaken by Metropolitan to provide for the transportation of its Colorado River water entitlement to its service area. The CRA originates at Lake Havasu on the Colorado River and extends approximately 242 miles through a series of pump stations and reservoirs to its terminus at Lake Mathews in Riverside County. Up to 1.25 million acre-feet of water per year may be conveyed through the CRA to Metropolitan's member agencies, subject to

availability of Colorado River water for delivery to Metropolitan as described below. Metropolitan first delivered CRA water to its member agencies in 1941.

Colorado River Water Apportionment and Seven-Party Agreement

Pursuant to the federal Boulder Canyon Project Act of 1928, California is apportioned the use of 4.4 million acre-feet of water from the Colorado River each year plus one-half of any surplus that may be available for use collectively in Arizona, California and Nevada (the "Lower Basin States"). Under an agreement entered into in 1931 among the California entities that expected to receive a portion of California's apportionment of Colorado River water (the "Seven-Party Agreement") and which has formed the basis for the distribution of Colorado River water made available to California, Metropolitan holds the fourth priority right to 550,000 acre-feet per year. This is the last priority within California's basic apportionment. In addition, Metropolitan holds the fifth priority right to 662,000 acre-feet of water, which is in excess of California's basic apportionment. Until 2003, Metropolitan had been able to take full advantage of its fifth priority right as a result of the availability of surplus water and water apportioned to Arizona and Nevada that was not needed by those states. However, during the 1990s Arizona and Nevada increased their use of water from the Colorado River, and by 2002 no unused apportionment was available for California. As a result, California has limited its annual use to 4.4 million acre-feet since 2003, not including supplies made available under water supply programs such as intentionally-created surplus and certain conservation and storage agreements. In addition, a severe drought in the Colorado River Basin from 2000-2004 reduced storage in system reservoirs, ending the availability of surplus deliveries to Metropolitan. Prior to 2003, Metropolitan could divert over 1.25 million acre-feet in any year, but since that time, Metropolitan's net diversions of Colorado River water have ranged from a low of nearly 633,000 acre-feet in 2006 to a high of approximately 1,179,000 acre-feet in 2015, and totaled over 996,000 acre-feet in 2016. Average annual net deliveries for 2007 through 2016 were approximately 962,000 acre-feet, with annual volumes dependent primarily on programs to augment supplies, including transfers of conserved water from agriculture. See "– Quantification Settlement Agreement" and "– Colorado River Operations: Surplus and Shortage Guidelines – Interim Surplus Guidelines" below. See also "–Water Transfer, Storage and Exchange Programs – Colorado River Aqueduct."

The following table sets forth the existing priorities of the California users of Colorado River water established under the 1931 Seven-Party Agreement.

[Remainder of page intentionally left blank.]

PRIORITIES UNDER THE 1931 CALIFORNIA SEVEN-PARTY AGREEMENT[1]

Priority	Description	Acre-Feet Annually
1	Palo Verde Irrigation District gross area of 104,500 acres of land in the Palo Verde Valley	3,850,000
2	Yuma Project in California not exceeding a gross area of 25,000 acres in California	
3(a)	Imperial Irrigation District and other lands in Imperial and Coachella Valleys[2] to be served by All-American Canal	
3(b)	Palo Verde Irrigation District - 16,000 acres of land on the Lower Palo Verde Mesa	
4	Metropolitan Water District of Southern California for use on the coastal plain	550,000
	SUBTOTAL	4,400,000
5(a)	Metropolitan Water District of Southern California for use on the coastal plain	550,000
5(b)	Metropolitan Water District of Southern California for use on the coastal plain[3]	112,000
6(a)	Imperial Irrigation District and other lands in Imperial and Coachella Valleys to be served by the All-American Canal	300,000
6(b)	Palo Verde Irrigation District - 16,000 acres of land on the Lower Palo Verde Mesa	
	TOTAL	5,362,000
7	Agricultural use in the Colorado River Basin in California	Remaining surplus

Source: Metropolitan.

(1) Agreement dated August 18, 1931, among Palo Verde Irrigation District, Imperial Irrigation District, Coachella Valley County Water District, Metropolitan, the City of Los Angeles, the City of San Diego and the County of San Diego. These priorities were memorialized in the agencies' respective water delivery contracts with the Secretary of the Interior.

(2) The Coachella Valley Water District serves Coachella Valley.

(3) In 1946, the City of San Diego, the San Diego County Water Authority, Metropolitan and the Secretary of the Interior entered into a contract that merged and added the City and County of San Diego's rights to storage and delivery of Colorado River water to the rights of Metropolitan.

Quantification Settlement Agreement

The Quantification Settlement Agreement ("QSA"), executed by the Coachella Valley Water District ("CVWD"), Imperial Irrigation District ("IID") and Metropolitan in October 2003, establishes Colorado River water use limits for IID and CVWD, and provides for specific acquisitions of conserved water and water supply arrangements for up to 75 years. The QSA and related agreements provide a framework for Metropolitan to enter into other cooperative Colorado River supply programs and set aside several disputes among California's Colorado River water agencies.

. Specific programs under the QSA and related agreements include lining portions of the All-American and Coachella Canals, which were completed in 2009 and conserve approximately 96,000 acre-feet annually. As a result, about 80,000 acre-feet of conserved water is delivered to the San Diego County Water Authority ("SDCWA") by exchange with Metropolitan. Metropolitan takes delivery of the remaining 16,000 acre-feet annually. The 16,000 acre-feet provided annually to Metropolitan will eventually be made available for the benefit of the La Jolla, Pala, Pauma, Rincon and San Pasqual Bands of Mission Indians, the San Luis Rey River Indian Water Authority, the City of Escondido and the Vista Irrigation District, upon completion of a water rights settlement. Also included under the QSA is a delivery and exchange agreement between Metropolitan and CVWD that provides for Metropolitan, when requested, to deliver annually up to 35,000 acre-feet of Metropolitan's State Water Project contractual water to CVWD by exchange with Metropolitan's available Colorado River supplies. The QSA and related agreements also authorized the transfer of water (up to a maximum expected amount in 2021 of 205,000 acre-feet) annually by IID to SDCWA. See description below under the caption "– Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" below; see also "METROPOLITAN REVENUES–Principal Customers" in this Appendix A. With full implementation of the programs identified in the QSA, at times when California is limited to its basic apportionment of 4.4 million acre-feet per year, Metropolitan expects to be able to annually divert to its service area approximately 850,000 acre-feet of Colorado River water plus water from other water augmentation programs it develops, including the Palo Verde Land Management, Crop Rotation and Water Supply Program (described under "Water Transfer, Storage and Exchange Programs–Colorado River Aqueduct" below), which provides up to approximately 133,000 acre-feet of water per year. (Amounts of Colorado River water received by Metropolitan in 2007 through 2016 are discussed under the heading "– Colorado River Aqueduct–Colorado River Water Apportionment and Seven-Party Agreement" above.)

A complicating factor in completing the QSA was the fate of the Salton Sea. The Sea and its environs provide a habitat complex supporting more than 400 species of birds. Located at the lowest elevation of an inland basin and fed primarily by agricultural drainage with no outflows other than evaporation, the Salton Sea was naturally trending towards hyper-salinity, which had already impacted the Salton Sea's fishery. Without mitigation, the transfer of water from IID to SDCWA, one of the core programs implemented under the QSA, would reduce the volume of agricultural drainage from IID's service area flowing into the Salton Sea, which would reduce the volume of water in the Sea, exposing shoreline and accelerating the natural trend of the Salton Sea to hyper-salinity. See "– Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" below. In 2002, the SWRCB issued Water Rights Order 2002-0013, which gave approval for the transfer of water from IID to SDCWA and CVWD, and which required Salton Sea mitigation water deliveries from 2003 through 2017.

In 2003, to facilitate implementation of the QSA, the Legislature directed the Secretary for the California Natural Resources Agency to undertake a restoration study to determine a preferred alternative for the restoration of the Salton Sea ecosystem and the protection of wildlife dependent on that ecosystem. In May 2007, the Secretary submitted his $8.9 billion preferred alternative to the Legislature. While withholding authorization of the preferred alternative, in 2008 the Legislature directed the California Natural Resources Agency to undertake demonstration projects and investigations called for in the Secretary's May 2007 recommendation. Since then, the California Natural Resources Agency and the U.S. Fish and Wildlife Service have been developing various pilot-scale projects which are at various stages of planning and implementation.

Concerned that the California Natural Resources Agency has not made sufficient progress to develop a long-term restoration plan for the Salton Sea, in November 2014, IID filed a petition with the SWRCB asking it to modify the SWRCB's 2002 order. IID stated that it is concerned that the scheduled termination of mitigation water deliveries to the Salton Sea at the end of 2017 will result in the shrinking of the Sea and an increase in exposed playa and fugitive dust emissions. IID's petition requested that the SWRCB modify its order to include a requirement that "the State fulfill its statutory obligation to restore the Salton Sea as a

condition of the QSA transfers." See "– Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" below. The SWRCB has held various workshops to receive input on the petition.

During the spring of 2015, the Governor tasked a number of individuals from his staff, known as the "Salton Sea Task Force," to look into actions that could be taken at the Sea. In October 2015, the Salton Sea Task Force announced that it would implement a number of actions to address the Salton Sea ecosystem, including immediate implementation and further development of the Salton Sea management plan, meeting a short-term goal by 2020 of 9,000-12,000 acres of habitat creation and dust suppression projects and a medium-term goal after 2020 of 18,000-25,000 acres of habitat creation and dust suppression projects. In August 2016, the U.S. Department of the Interior and the California Natural Resources Agency entered into an MOU which outlines the manner in which federal agencies would cooperate with State and local agencies to assist the Salton Sea Task Force in achieving its stated goals. While projects that are currently underway or are anticipated to begin in 2017 are not expected to meet the Salton Sea Task Force's short-term goal, the Salton Sea Task Force continues its efforts to identify a long-term plan for the Salton Sea for construction to begin as early as 2018. In the absence of a Salton Sea restoration project, the QSA and related agreements provide for the control of exposed playa by IID as a mitigation measure funded by CVWD, IID, and SDCWA, with the State of California obligated to meet all mitigation costs that exceed $133 million in 2003 dollars. Metropolitan has no obligation to pay any costs associated with restoration of the Salton Sea.

Sale of Water by the Imperial Irrigation District to San Diego County Water Authority

On April 29, 1998, SDCWA and IID executed an agreement (the "Transfer Agreement") for SDCWA's purchase from IID of Colorado River water that is conserved within IID. An amended Transfer Agreement, executed as one of the QSA agreements, set the maximum transfer amount at 205,000 acre-feet in 2021, with the transfer gradually ramping up to that amount over an approximately twenty-year period, then stabilizing at 200,000 acre-feet per year beginning in 2023.

No facilities exist to deliver water directly from IID to SDCWA. Accordingly, Metropolitan and SDCWA entered into an exchange agreement, pursuant to which SDCWA makes available to Metropolitan at its intake at Lake Havasu on the Colorado River the conserved Colorado River water acquired by SDCWA from IID and water allocated to SDCWA that has been conserved as a result of the lining of the All-American and Coachella Canals. See "–Quantification Settlement Agreement" above. Metropolitan delivers an equal volume of water from its own sources of supply through portions of its delivery system to SDCWA. The deliveries to both Metropolitan and SDCWA are deemed to be made in equal monthly increments. In consideration for the conserved water made available to Metropolitan by SDCWA, a lower rate is paid by SDCWA for the exchange water delivered by Metropolitan. The price payable by SDCWA is calculated using the charges set by Metropolitan's Board from time to time to be paid by its member agencies for the conveyance of water through Metropolitan's facilities. See "METROPOLITAN REVENUES–Litigation Challenging Rate Structure" in this Appendix A for a description of Metropolitan's charges for the conveyance of water through Metropolitan's facilities and litigation in which SDCWA is challenging such charges. In 2016, 178,493 acre-feet were delivered to Metropolitan by SDCWA for exchange, consisting of 100,000 acre-feet of IID conservation plus 78,493 acre-feet of conserved water from the Coachella Canal and All-American Canal lining projects.

Colorado River Operations: Surplus and Shortage Guidelines

General. The Secretary of the Interior is vested with the responsibility of managing the mainstream waters of the lower Colorado River pursuant to federal law. Each year, the Secretary of the Interior is required to declare the Colorado River water supply availability conditions for the Lower Basin States in terms of "normal," "surplus" or "shortage" and has adopted operations criteria in the form of guidelines to determine the availability of surplus or potential shortage allocations among the Lower Basin States and reservoir operations for such conditions.

Interim Surplus Guidelines. In January 2001, the Secretary of the Interior adopted guidelines (the "Interim Surplus Guidelines"), initially for use through 2016, in determining if there is surplus Colorado River water available for use in California, Arizona and Nevada. The Interim Surplus Guidelines were amended in 2007 and now extend through 2026. The purpose of the Interim Surplus Guidelines was to provide mainstream users of Colorado River water, particularly those in California who utilize surplus flows, a greater degree of predictability with respect to the availability and quantity of surplus water.

Under the Interim Surplus Guidelines, Metropolitan initially expected to divert up to 1.25 million acre-feet of Colorado River water annually under foreseeable runoff and reservoir storage scenarios from 2004 through 2016. However, an extended drought in the Colorado River Basin reduced these initial expectations. In May 2002, the Southern Nevada Water Authority ("SNWA") and Metropolitan entered into an Agreement Relating to Implementation of Interim Colorado River Surplus Guidelines, in which SNWA and Metropolitan agreed to the allocation of unused apportionment as provided in the Interim Surplus Guidelines and on the priority of SNWA for interstate banking of water in Arizona. SNWA and Metropolitan entered into a storage and interstate release agreement on October 21, 2004. Under this agreement, SNWA can request that Metropolitan store unused Nevada apportionment in California. The amount of water stored through 2014 under this agreement was approximately 205,000 acre-feet. In subsequent years, SNWA may request recovery of the stored water. As part of a 2012 executed amendment to the agreement, it is expected that SNWA will not request return of the water stored with Metropolitan before 2022. In October 2015, SNWA and Metropolitan executed an additional amendment to the agreement under which Metropolitan paid SNWA approximately $44.4 million and SNWA stored an additional 150,000 acre-feet with Metropolitan during 2015. Of that amount, 125,000 acre-feet has been added to SNWA's storage account with Metropolitan, increasing the total amount of water stored to approximately 330,000 acre-feet. When SNWA requests the return of any of the stored 125,000 acre-feet, SNWA will reimburse Metropolitan for an equivalent proportion of the $44.4 million plus inflation based on the amount of water returned. The stored water allowed Metropolitan to have a full water supply from the Colorado River in 2015.

Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead. In May 2005, the Secretary of the Interior directed the Bureau of Reclamation to develop additional strategies for improving coordinated management of the reservoirs of the Colorado River system. In November 2007, the Bureau of Reclamation issued a Final Environmental Impact Statement ("EIS") regarding new federal guidelines concerning the operation of the Colorado River system reservoirs, particularly during drought and low reservoir conditions. These guidelines provide water release criteria from Lake Powell and water storage and water release criteria from Lake Mead during shortage and surplus conditions in the Lower Basin, provide a mechanism for the storage and delivery of conserved system and non-system water in Lake Mead and extend the Interim Surplus Guidelines through 2026. The Secretary of the Interior issued the final guidelines through a Record of Decision signed in December 2007. The Record of Decision and accompanying agreement among the Colorado River Basin States protect reservoir levels by reducing deliveries during drought periods, encourage agencies to develop conservation programs and allow the Colorado River Basin States to develop and store new water supplies. The Colorado River Basin Project Act of 1968 insulates California from shortages in all but the most extreme hydrologic conditions. Consistent with these legal protections, under the guidelines, Arizona and Nevada are first subject to the initial annual shortages identified by the Secretary up to 500,000 acre-feet.

The guidelines also created the Intentionally Created Surplus ("ICS") program, which allows the Lower Basin States to store conserved water in Lake Mead. Under this program, ICS water (water that has been conserved through an extraordinary conservation measure, such as land fallowing) is eligible for storage in Lake Mead by Metropolitan. See the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage" below. The Secretary of the Interior delivers the stored ICS water to Metropolitan in accordance with the terms of December 13, 2007, January 6, 2010, and November 20, 2012 Delivery Agreements between the United States and Metropolitan. As of January 1, 2017, Metropolitan had an estimated 71,000 acre-feet in its ICS accounts. These surplus accounts are made

up of water conserved by fallowing in the Palo Verde Valley, projects implemented with IID in its service area, groundwater desalination, the Warren H. Brock Reservoir Project, and the Yuma Desalting Plant pilot run, which have not been delivered to the region.

Related Litigation

Navajo Nation Litigation. The Navajo Nation filed litigation against the Department of the Interior, specifically the Bureau of Reclamation and the Bureau of Indian Affairs, in 2003, alleging that the Bureau of Reclamation has failed to determine the extent and quantity of the water rights of the Navajo Nation in the Colorado River and that the Bureau of Indian Affairs has failed to otherwise protect the interests of the Navajo Nation. The complaint challenges the adequacy of the environmental review for the Interim Surplus Guidelines (described under "– Colorado River Operations: Surplus and Shortage Guidelines" above) and seeks to prohibit the Department of the Interior from allocating any "surplus" water until such time as a determination of the rights of the Navajo Nation is completed. Metropolitan and other California water agencies filed motions to intervene in this action. In October 2004 the court granted the motions to intervene and stayed the litigation to allow negotiations among the Navajo Nation, federal defendants, Central Arizona Water Conservation District ("CAWCD"), State of Arizona and Arizona Department of Water Resources. After years of negotiations, a tentative settlement was proposed in 2012 that would provide the Navajo Nation with specified rights to water from the Little Colorado River and groundwater basins under the reservation, along with federal funding for development of water supply systems on the tribe's reservation. The proposed agreement was rejected by tribal councils for both the Navajo and the Hopi, who were seeking to intervene. On May 16, 2013, the stay of proceedings was lifted. On June 3, 2013, the Navajo Nation moved for leave to file a first amended complaint, which the court granted on June 27, 2013. The amended complaint added a legal challenge to the Lower Basin Shortage Guidelines adopted by the Secretary of the Interior in 2007 that allow Metropolitan and other Colorado River water users to store water in Lake Mead (described under "– Colorado River Operations: Surplus and Shortage Guidelines" above). Metropolitan has used these new guidelines to store over 500,000 acre-feet of water in Lake Mead, a portion of which has been delivered, and the remainder of which may be delivered at Metropolitan's request in future years. On July 22, 2014, the district court dismissed the lawsuit in its entirety, ruling that the Navajo Nation lacked standing and that the claim was barred against the federal defendants. The district court denied a motion by the Navajo Nation for leave to amend the complaint further after the dismissal. On September 19, 2014, the Navajo Nation appealed the dismissal of its claims related to the Interim Surplus Guidelines, the Lower Basin Shortage Guidelines, and breach of the federal trust obligation to the tribe. Briefing by the parties was completed by May 20, 2015. Oral argument in the Ninth Circuit Court of Appeals has been set for February 14, 2017. Metropolitan is unable to assess at this time the likelihood of success of this appeal or any future claims, or their potential effect on Colorado River water supplies.

Endangered Species Act and Other Environmental Considerations

Endangered Species Act Considerations – State Water Project

General. DWR has altered the operations of the State Water Project to accommodate species of fish listed as threatened or endangered under the Federal ESA or California ESA. Currently, five species (the winter-run and spring-run Chinook salmon, Delta smelt, North American green sturgeon and Central Valley steelhead) are listed under the ESAs. In addition, the longfin smelt is listed as a threatened species under the California ESA. These changes in project operations have limited the flexibility of the State Water Project and adversely affected State Water Project deliveries to Metropolitan. State Water Project operational requirements may be further modified in the future under new biological opinions for listed species under the Federal ESA or by the California Department of Fish and Wildlife's issuance of incidental take authorizations under the California ESA. Additionally, new litigation, listings of additional species or new regulatory requirements could further adversely affect State Water Project operations in the future by requiring additional export reductions, releases of additional water from storage or other operational changes impacting the water supply available for export. Such operational constraints are likely to continue until long-term solutions to the problems in the Bay-Delta are identified and implemented. See also "–State Water Project – Bay-Delta Proceedings Affecting State Water Project."

The Federal ESA requires that before any federal agency authorizes funds or carries out an action that may affect a listed species or designated critical habitat, it must consult with the appropriate federal fishery agency to determine whether the action would jeopardize the continued existence of any threatened or endangered species, or adversely modify habitat critical to the species' needs. The result of the consultation is known as a "biological opinion." In the biological opinion the federal fishery agency determines whether the action would cause jeopardy to a threatened or endangered species or adverse modification to critical habitat, and recommends reasonable and prudent alternatives or measures that would allow the action to proceed without causing jeopardy or adverse modification. The biological opinion also includes an "incidental take statement." The incidental take statement allows the action to go forward even though it will result in some level of "take," including harming or killing some members of the species, incidental to the agency action, provided that the agency action does not jeopardize the continued existence of any threatened or endangered species and complies with reasonable mitigation and minimization measures recommended by the federal fishery agency.

Delta Smelt and Salmon Federal ESA Biological Opinions. The United States Fish and Wildlife Service (USFWS) released a biological opinion on December 15, 2008 on the impacts of the State Water Project and the federal Central Valley Project on Delta smelt. On June 4, 2009, the National Marine Fisheries Service (NMFS) released a biological opinion for salmonid species. The water supply restrictions imposed by these biological opinions on Delta smelt and salmonid species have a range of impacts on Metropolitan's deliveries from the State Water Project, depending on hydrologic conditions. The impact on total State Water Project deliveries to State Water Contractors attributable to the Delta smelt and salmonid species biological opinions combined is estimated to be one million acre-feet in an average year, reducing total State Water Project deliveries to State Water Contractors from approximately 3.3 million acre-feet to approximately 2.3 million acre-feet for the year under average hydrology. Reductions are estimated to range from 0.3 million acre-feet during critically dry years to 1.3 million acre-feet in above normal water years. Total State Water Project delivery impacts to Metropolitan for calendar years 2008 through 2016 are estimated to be 2.0 million acre-feet.

Endangered Species Act Considerations - Colorado River

Federal and state environmental laws protecting fish species and other wildlife species have the potential to affect Colorado River operations. A number of species that are on either "endangered" or "threatened" lists under the ESAs are present in the area of the Lower Colorado River, including among others, the bonytail chub, razorback sucker, southwestern willow flycatcher and Yuma clapper rail. To address this issue, a broad-based state/federal/tribal/private regional partnership that includes water, hydroelectric power and wildlife management agencies in Arizona, California and Nevada have developed a multi-species conservation program for the main stem of the Lower Colorado River (the Lower Colorado River Multi-Species Conservation Program or "MSCP"). The MSCP allows Metropolitan to obtain federal and state permits for any incidental take of protected species resulting from current and future water and power operations of its Colorado River facilities and to minimize any uncertainty from additional listings of endangered species. The MSCP also covers operations of federal dams and power plants on the river that deliver water and hydroelectric power for use by Metropolitan and other agencies. The MSCP covers 27 species and habitat in the Lower Colorado River from Lake Mead to the Mexican border for a term of 50 years (commencing in 2005). Over the 50-year term of the program, the total cost to Metropolitan will be about $88.5 million (in 2003 dollars), and annual costs will range between $0.8 million and $4.7 million (in 2003 dollars).

Invasive Species - Mussel Control Programs

Zebra and quagga mussels are established in many regions of the United States. Mussels can reproduce quickly and, if left unmanaged, can clog intakes and raw water conveyance systems, alter or destroy fish habitats and affect lakes and beaches. Quagga mussels were introduced in the Great Lakes in the late 1980s. These organisms infest much of the Great Lakes basin, the St. Lawrence Seaway, and much of the Mississippi River drainage system. In January 2007 quagga mussels were discovered in Lake Mead. The

most likely source of the quagga mussel infestation in the Colorado River was recreational boats with exposure to water bodies around the Great Lakes. Metropolitan developed a program in 2007 to address the long term introduction of mussel larvae into the CRA from the Lower Colorado River, which is now heavily colonized from Lake Mead through Lake Havasu. The quagga mussel control program consists of surveillance activities and control measures. Surveillance activities are conducted annually in conjunction with regularly scheduled two- to three-week long CRA shutdowns, which have the added benefit of desiccating exposed quagga mussels. Control activities consist of continuous chlorination at Copper Basin, Lake Skinner outlet conduit, and Lake Mathews Forebay, quarterly chlorination of the outlet towers at Lake Skinner and Mathews, and physical removal of mussels from the trash racks in Lake Havasu. Recent shutdown inspections have demonstrated that the combined use of chlorine and regular cleaning during scheduled shutdowns effectively control mussel infestation in the CRA. Metropolitan's costs for controlling quagga mussels in the CRA are between $4 million and $5 million per year.

Quagga and zebra mussel populations are located within 16 miles of the State Water Project. An isolated population of zebra mussels is established in San Justo Reservoir in Central California and Lake Piru in Southern California has been infested with quagga mussels since 2013. To prevent the further spread of the mussels into the State Water Project, the Bay-Delta and other bodies of water and water systems, DWR has joined the California Department of Fish and Wildlife, as the lead agency, and other state and federal agencies on a number of activities. These include boat inspections, monitoring of water bodies and water systems and education of the public. In addition, DWR has developed a Rapid Response Plan, Vector Management Plan, and Long-Term Mussel Management and Control Plan as mandated by the California Fish and Game Code.

In December 2016, DWR found dead adult mussels in the Angeles Tunnel, which connects Pyramid Lake to Castaic Lake. Through DNA testing, they were confirmed to be quagga mussels. As a result of such findings, the California Department of Fish and Wildlife has deemed the State Water Project West Branch (including Pyramid and Castaic Lakes) to be infested with quagga mussels and has implemented boat inspection requirements on boats leaving Pyramid Lake and Castaic Lake to help prevent the spreading of the invasive species.

In February 2017, DWR detected mussel veligers (microscopic, free-floating larval lifestage) in water samples collected on the State Water Project East Branch at the North Park valve of the Santa Ana Valley Pipeline, which transports water from Silverwood Lake located in San Bernardino County to Lake Perris located in Riverside County. Extensive sampling has occurred upstream and downstream of the North Park valve and no mussels have been detected. Currently, there is no evidence of mussels in Silverwood Lake or Lake Perris.

There are no impacts on State Water Project allocation or deliveries at this time and the future level of mussel impacts is unknown. Metropolitan will coordinate with other agencies to increase the monitoring of mussels and adapt the existing quagga mussel control program for the State Water Project as required.

Water Transfer, Storage and Exchange Programs

General

To supplement its State Water Project and Colorado River water supplies, Metropolitan has developed and actively manages a portfolio of water supply programs, including water transfer, storage and exchange agreements, the supplies created by which are conveyed through the California Aqueduct of the State Water Project, utilizing Metropolitan's rights under its State Water Contract to use the portion of the State Water Project conveyance system necessary to deliver water to it, or through available CRA capacity. Consistent with its IRP, Metropolitan will continue to pursue voluntary water transfer and exchange programs with State, federal, public and private water districts and individuals to help mitigate supply/demand imbalances and provide additional dry-year supply sources. A summary description of certain of Metropolitan's supply programs are set forth below. In addition to the arrangements described

below, Metropolitan is entitled to storage and access to stored water in connection with various other storage programs and facilities. See "–Colorado River Aqueduct" above in this Appendix A, as well as the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

State Water Project

In addition to the basic State Water Project contract provisions, Metropolitan has other contract rights that accrue to the overall value of the State Water Project. Because each contractor is paying for physical facilities, they also have the right to use the facilities to move water supplies associated with agreements, water transfers and water exchanges. Metropolitan has entered into agreements and exchanges that provide additional water supplies.

Castaic Lake and Lake Perris. Metropolitan has contractual rights to store up to 65,000 acre-feet of water in Lake Perris (East Branch terminal reservoir) and 153,940 acre-feet of water in Castaic Lake (West Branch terminal reservoir). This storage provides Metropolitan with additional options for managing State Water Project deliveries to maximize yield from the project. Any water used must be returned to the State Water Project within five years or it is deducted from allocated amounts in the sixth year.

Metropolitan Article 56 Carryover. Metropolitan has the right to store its allocated contract amount for delivery in the following year. Metropolitan can store between 100,000 and 200,000 acre-feet, depending on the final water supply allocation percentage.

California's agricultural activities consume approximately 34 million acre-feet of water annually, which is approximately 80 percent of the total water used in the State for agricultural and urban uses and 40 percent of the water used for all consumptive uses, including environmental demands. Voluntary water transfers and exchanges can make a portion of this agricultural water supply available to support the State's urban areas. Such existing and potential water transfers and exchanges are an important element for improving the water supply reliability within Metropolitan's service area and accomplishing the reliability goal set by Metropolitan's Board. The portfolio of supplemental supplies that Metropolitan has developed to be conveyed through the State Water Project California Aqueduct extend from north of the Bay-Delta to Southern California. Certain of these arrangements are described below.

Yuba River Accord. Metropolitan entered into an agreement with DWR in December 2007 to purchase a portion of the water released by the Yuba County Water Agency ("YCWA"). YCWA was involved in a SWRCB proceeding in which it was required to increase Yuba River fishery flows. Within the framework of agreements known as the Yuba River Accord, DWR entered into an agreement for the long-term purchase of water from YCWA. The agreement permits YCWA to transfer additional supplies at its discretion. Metropolitan, other State Water Contractors, and the San Luis Delta Mendota Water Authority entered into separate agreements with DWR for the purchase of portions of the water made available. Metropolitan's agreement allows Metropolitan to purchase, in dry years through 2025, available water supplies which have ranged from approximately 6,555 acre-feet to 67,068 acre-feet per year.

In addition to water made available under the Yuba River Accord, Metropolitan has developed groundwater storage agreements that allow Metropolitan to store available supplies in the Central Valley for return later. Metropolitan has also developed exchanges and transfers with other State Water Contractors.

Arvin-Edison/Metropolitan Water Management Program. In December 1997, Metropolitan entered into an agreement with the Arvin-Edison Water Storage District ("Arvin-Edison"), an irrigation agency located southeast of Bakersfield, California. Under the program, Arvin-Edison stores water on behalf of Metropolitan. In January 2008, Metropolitan and Arvin-Edison amended the agreement to enhance the program's capabilities and to increase the delivery of water to the California Aqueduct. Up to 350,000 acre-feet of Metropolitan's water may be stored and Arvin-Edison is obligated to return up to 75,000 acre-feet of stored water in any year to Metropolitan, upon request. The agreement will terminate in 2035 unless

extended. To facilitate the program, new wells, spreading basins and a return conveyance facility connecting Arvin-Edison's existing facilities to the California Aqueduct have been constructed. The agreement also provides Metropolitan priority use of Arvin-Edison's facilities to convey high quality water available on the east side of the San Joaquin Valley to the California Aqueduct. Metropolitan's current storage account under the Arvin-Edison/Metropolitan Water Management Program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

Semitropic/Metropolitan Groundwater Storage and Exchange Program. In 1994, Metropolitan entered into an agreement with the Semitropic Water Storage District ("Semitropic"), located adjacent to the California Aqueduct north of Bakersfield, to store water in the groundwater basin underlying land within Semitropic. The minimum annual yield available to Metropolitan from the program is 39,700 acre-feet of water and the maximum annual yield is 231,200 acre-feet of water depending on the available unused capacity and the State Water Project allocation. Metropolitan's current storage account under the Semitropic program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

Kern Delta Storage Program. Metropolitan entered into an agreement with Kern Delta Water District ("Kern Delta") in May 2003, for a groundwater banking and exchange transfer program to allow Metropolitan to store up to 250,000 acre-feet of State Water Contract water in wet years and to permit Metropolitan, at Metropolitan's option, a return of up to 50,000 acre-feet of water annually during hydrologic and regulatory droughts.

Mojave Storage Program. Metropolitan entered into a groundwater banking and exchange transfer agreement with Mojave Water Agency ("Mojave") in October 2003. This agreement was amended in 2011 to allow for the cumulative storage of up to 390,000 acre-feet. The agreement allows for Metropolitan to store water in an exchange account for later return. Through 2021, and when the State Water Project allocation is 60 percent or less, Metropolitan can annually withdraw Mojave's State Water Project contractual amounts in excess of a 10 percent reserve. When the State Water Project allocation is over 60 percent, the reserved amount for Mojave's local needs increases to 20 percent. Under a 100 percent allocation, the State Water Contract provides Mojave 82,800 acre-feet of water. Metropolitan's current storage account under this program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage."

Antelope Valley East Kern Storage and Exchange Program. In 2016, Metropolitan entered into an agreement with the Antelope Valley-East Kern Water Agency ("AVEK"), the third largest State Water Project Contractor, to both exchange supplies and store water in the Antelope Valley groundwater basin. Under this agreement, AVEK would provide at least 30,000 acre-feet over ten years of its unused Table A State Water Project water to Metropolitan. For every two acre-feet provided to Metropolitan as part of the exchange, AVEK would receive back one acre-foot in the future. For the one acre-foot that is retained by Metropolitan, Metropolitan would pay AVEK under a set price schedule based on the State Water Project allocation at the time. The payment would range from $587/acre-foot under a 5 percent State Water Project allocation to $38/acre-foot under an 86 percent State Water Project allocation.

San Bernardino Valley Municipal Water District Coordinated Operating Agreement. Metropolitan entered into an agreement with the San Bernardino Valley Municipal Water District ("SBVMWD") in April 2001 to coordinate the use of facilities and State Water Project water supplies. The agreement allows Metropolitan a minimum purchase of 20,000 acre-feet on an annual basis with the option to purchase additional water when available. The program includes 50,000 acre-feet of storage capacity for the carryover of water purchased from SBVMWD. In addition to water being supplied using the State Water Project, the previously stored water can be returned using an interconnection between the San Bernardino Central Feeder and Metropolitan's Inland Feeder.

San Gabriel Valley Municipal Water District and Other Exchange Programs. In 2013, Metropolitan entered into an agreement with the San Gabriel Valley Municipal Water District ("SGVMWD"). Under this agreement, Metropolitan delivers treated water to a SGVMWD subagency in exchange for twice as much untreated State Water Project supplies delivered into the groundwater basin that supplies this agency and metropolitan subagencies. Metropolitan can purchase at least 5,000 acre-feet per year, in excess of the unbalanced exchange amount. This program has the potential to increase Metropolitan's reliability by providing 115,000 acre-feet through 2035.

Metropolitan has been negotiating, and will continue to pursue, water purchase, storage and exchange programs with other agencies in the Sacramento and San Joaquin Valleys. These programs involve the storage of both State Water Project supplies and water purchased from other sources to enhance Metropolitan's dry-year supplies and the exchange of normal year supplies to enhance Metropolitan's water reliability and water quality, in view of dry conditions and potential impacts from the ESA cases discussed above under the heading "–Endangered Species Act and Other Environmental Considerations–Endangered Species Act Considerations - State Water Project." In 2016, Metropolitan entered into an agreement with the State Water Contractors, Inc. to pursue water transfer supplies. These purchases were not completed, however due to the 60 percent State Water Project allocation, which resulted in no conveyance capacity to move the transfer supplies to Metropolitan.

Metropolitan has also entered into an agreement with certain State Water Contractors for the exchange of a portion of its Colorado River supply for their State Water Project contracted amounts. One benefit of the agreement is reducing Metropolitan's State Water Project fixed costs in wetter years when there are more than sufficient supplies to meet Metropolitan's water management goals, while preserving its dry-year State Water Project Supply.

Metropolitan/CVWD/Desert Water Agency Exchange and Advance Delivery Agreement. Metropolitan has agreements with the CVWD and the Desert Water Agency ("DWA") in which Metropolitan exchanges its Colorado River water for those agencies' State Water Project contractual water on an annual basis. Because CVWD and DWA do not have a physical connection to the State Water Project, Metropolitan takes delivery of CVWD's and DWA's State Water Project supplies and delivers a like amount of Colorado River water to the agencies. In accordance with an advance delivery agreement executed by Metropolitan, CVWD and DWA, Metropolitan has delivered Colorado River water in advance to these agencies for storage in the Upper Coachella Valley groundwater basin. In years when it is necessary to augment available supplies to meet local demands, Metropolitan has the option to meet the exchange delivery obligation through drawdowns of the advance delivery account, rather than deliver its Colorado River supply. Metropolitan's current storage account under the CVWD/DWA program is shown in the table "Metropolitan's Water Storage Capacity and Water in Storage" under the heading "–Storage Capacity and Water in Storage." In addition to the CVWD/DWA exchange agreements, Metropolitan has entered into separate agreements with CVWD and DWA for delivery of non-State Water Project supplies acquired by CVWD or DWA. Similarly, Metropolitan takes delivery of these supplies from State Water Project facilities and incurs an exchange obligation to CVWD or DWA. From 2008 through 2016, Metropolitan has received a net additional supply of 88,527 acre-feet of water acquired by CVWD and DWA.

Colorado River Aqueduct

Metropolitan has taken steps to augment its share of Colorado River water through agreements with other agencies that have rights to use such water, including through cooperative programs with other water agencies to conserve and develop supplies and through programs to exchange water with other agencies. These supplies are conveyed through the CRA. Metropolitan determines the delivery schedule of these supplies throughout the year based on changes in the availability of State Water Project and Colorado River water. Under certain of these programs, water may be delivered to Metropolitan's service area in the year made available or in a subsequent year as ICS water from Lake Mead storage. See "–Colorado River

Aqueduct – Colorado River Operations: Surplus and Shortage Guidelines – Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead."

IID/Metropolitan Conservation Agreement. Under a 1988 water conservation agreement, as amended in 2003 and 2007 (the "1988 Conservation Agreement") between Metropolitan and IID, Metropolitan provided funding for IID to construct and operate a number of conservation projects that have conserved up to 109,460 acre-feet of water per year that has been provided to Metropolitan. As amended, the agreement's initial term has been extended to at least 2041 or 270 days after the termination of the QSA. In 2016, 105,000 acre-feet of conserved water was made available by IID to Metropolitan. Under the QSA and related agreements, Metropolitan, at the request of CVWD, forgoes up to 20,000 acre-feet of this water each year for diversion by CVWD. In 2015 and 2016, CVWD's requests were for 6,715 and an estimated 15,942 acre-feet, respectively, leaving 101,105 acre-feet in 2015 and an estimated 89,058 acre-feet in 2016 for Metropolitan. See "–Colorado River Aqueduct – Quantification Settlement Agreement."

Palo Verde Land Management, Crop Rotation and Water Supply Program. In August 2004, Metropolitan and the Palo Verde Irrigation District ("PVID") signed the program agreement for a Land Management, Crop Rotation and Water Supply Program. Under this program, participating landowners in the PVID service area are compensated for reducing water use by not irrigating a portion of their land. This program provides up to 133,000 acre-feet of water to be available to Metropolitan in certain years. The term of the program is 35 years. Fallowing began on January 1, 2005. In March 2009, Metropolitan and PVID entered into a supplemental fallowing program within PVID that provided for the fallowing of additional acreage in 2009 and 2010. In calendar years 2009 and 2010, an additional 24,100 acre-feet and 32,300 acre-feet of water, respectively, were saved and made available to Metropolitan under the supplemental program. The following table shows annual volumes of water saved and made available to Metropolitan under the Land Management, Crop Rotation and Water Supply Program with PVID:

WATER AVAILABLE FROM PVID LAND MANAGEMENT, CROP ROTATION AND WATER SUPPLY PROGRAM

Calendar Year	Volume (acre-feet)
2006	105,000
2007	72,300
2008	94,300
2009[(1)]	144,300
2010[(1)]	148,600
2011	122,200
2012	73,700
2013	32,750
2014	43,010
2015	94,480
2016[(2)]	125,000

(1) Includes water from the supplemental fallowing program that provided for fallowing of additional acreage in 2009 and 2010.
(2) Estimate.

Lake Mead Storage Program. As described under "–Colorado River Aqueduct–Colorado River Operations: Surplus and Shortage Guidelines–Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead," in December 2007, Metropolitan entered into agreements to set forth the guidelines under which ICS water is developed, and stored in and delivered from Lake Mead. The amount of water stored in Lake Mead must be created through extraordinary conservation,

system efficiency, or tributary conservation methods. Metropolitan has participated in projects to create ICS as described below:

Drop 2 (Warren H. Brock) Reservoir. In May 2008, Metropolitan provided $28.7 million to join the CAWCD and the SNWA in funding the Bureau of Reclamation's construction of an 8,000 acre-foot off-stream regulating reservoir near Drop 2 of the All-American Canal in Imperial County (officially named the Warren H. Brock Reservoir). Construction was completed in October 2010 and the Bureau of Reclamation refunded approximately $3.71 million in unused contingency funds to Metropolitan. The Warren H. Brock Reservoir conserves about 70,000 acre-feet of water per year by capturing and storing water that would otherwise be lost from the system. In return for its funding, Metropolitan received 100,000 acre-feet of water that was stored in Lake Mead for its future use, and has the ability to receive up to 25,000 acre-feet of water in any single year. Besides the additional water supply, the addition of the Warren H. Brock reservoir adds to the flexibility of Colorado River operations by storing underutilized Colorado River water orders caused by unexpected canal outages, changes in weather conditions, and high runoff into the Colorado River. As of January 1, 2016, Metropolitan had taken delivery of 43,992 acre-feet of this water, and had 56,008 acre-feet remaining in storage.

Yuma Desalting Plant. In September 2009, Metropolitan authorized participation with SNWA, the Colorado River Commission of Nevada, the CAWCD and the Bureau of Reclamation in the pilot operation of the Yuma Desalting Plant. The Bureau of Reclamation concluded the pilot operation of the Yuma Desalting Plant in March 2011. Metropolitan's contribution for the funding agreement was approximately $8.4 million, of which approximately $1.1 million was refunded to Metropolitan. Metropolitan's yield from the pilot run of the project was 24,397 acre-feet. As of January 1, 2016, that water was stored in Lake Mead for Metropolitan's future use.

Mexico Pilot Project. In November 2012, Metropolitan executed agreements in support of a program to augment Metropolitan's Colorado River supply from 2013 through 2017 through an international pilot project in Mexico. Metropolitan's total share of costs was $5 million for 47,500 acre-feet of project supplies. In December 2013, Metropolitan and IID executed an agreement under which IID has paid half of Metropolitan's program costs, or $2.5 million, in return for half of the project supplies, or 23,750 acre-feet. In addition, 23,750 acre-feet of conserved water will be credited to Metropolitan's binational ICS water account no later than December 31, 2017. See "–Colorado River Aqueduct – Colorado River Operations: Surplus and Shortage Guidelines – Lower Basin Shortage Guidelines and Coordinated Management Strategies for Lake Powell and Lake Mead."

Storage Capacity and Water in Storage

Metropolitan's storage capacity, which includes reservoirs, conjunctive use and other groundwater storage programs within Metropolitan's service area and groundwater and surface storage accounts delivered through the State Water Project or CRA, is approximately 5.83 million acre-feet. In 2016, approximately 626,000 acre-feet of stored water was emergency storage that was reserved for use in the event of supply interruptions from earthquakes or similar emergencies (see "METROPOLITAN'S WATER DELIVERY SYSTEM–Seismic Considerations" in this Appendix A), as well as extended drought. Metropolitan's emergency storage requirement is established periodically to provide a six-month water supply at 75 percent of member agencies' retail demand under normal hydrologic conditions. Metropolitan's ability to replenish water storage, both in the local groundwater basins and in surface storage and banking programs, has been limited by Bay-Delta pumping restrictions under the biological opinions issued for listed species. See "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project – Delta Smelt and Salmon Federal ESAs Biological Opinions." Metropolitan replenishes its storage accounts when available imported supplies exceed demands. Effective storage management is dependent on having sufficient years of excess supplies to store water so that it can be used during times of shortage. Historically, excess supplies have been available in about seven of every ten years. Metropolitan forecasts that, with anticipated supply reductions from the State Water Project due to pumping

restrictions, it will need to draw down on storage in about seven of ten years and will be able to replenish storage in about three years out of ten. This reduction in available supplies extends the time required for storage to recover from drawdowns and could require Metropolitan to implement its Water Supply Allocation Plan during extended dry periods. See "CONSERVATION AND WATER SHORTAGE MEASURES--Water Supply Allocation Plan." As a result of increased State Water Project supplies and reduced demands from 2010 to 2012, Metropolitan rebuilt its storage after several years of withdrawals to approximately 3.375 million acre-feet, including emergency storage. This was the highest end-of-year total water reserves in Metropolitan's history. In 2014, Metropolitan withdrew approximately 1.2 million acre-feet from storage, reducing overall storage to approximately 1.8 million acre-feet. Approximately 300,000 acre-feet were withdrawn from storage reserves in 2015, leaving approximately 1.5 million acre-feet in storage reserves as of January 1, 2016. Approximately 350,000 acre-feet were returned to storage reserves in 2016, providing for nearly 1.9 million acre-feet in reserves as of January 1, 2017. The following table shows three years of Metropolitan's water in storage as of January 1, including emergency storage.

METROPOLITAN'S WATER STORAGE CAPACITY AND WATER IN STORAGE[1]
(in Acre-Feet)

Water Storage Resource	Storage Capacity	Water in Storage January 1, 2017	Water in Storage January 1, 2016	Water in Storage January 1, 2015
Colorado River Aqueduct				
Desert / CVWD Advance Delivery Account	800,000	38,000	200,000	249,000
Lake Mead ICS	1,500,000	71,000	80,000	151,000

(footnotes on next page)

(footnotes to table on prior page)

(1) Water storage capacity and water in storage are measured based on engineering estimates and are subject to change.
(2) Flexible storage allocated to Metropolitan under its State Water Contract. Withdrawals must be returned within 5 years.
(3) Article 56 Carryover storage capacity is dependent on the annual State Water Project allocation, which varies from year to year. Article 56 supplies represent water that is allocated to a State Water Project contractor in a given year and carried over to the next year pursuant to the State Water Contract. The January 1, 2017 value includes 42,000 acre-feet of Article 56 carried over by Metropolitan on behalf of Desert Water Agency and Coachella Valley Water District.
(4) Includes Article 56 Carryover from prior years, non-project carryover, and carryover of curtailed deliveries pursuant to Article 14(b) of Metropolitan's State Water Contract.
(5) The Mojave Storage Program agreement was amended in 2011 to allow for cumulative storage of up to 390,000 acre-feet.
(6) Metropolitan's State Water Project carryover capacity ranges from 100,000 to 200,000 acre-feet, on a sliding scale that depends on the final State Water Project allocation. At allocations of 50 percent or less, Metropolitan may store 100,000 acre-feet, and at allocations of 75 percent or greater, Metropolitan may store up to 200,000 acre-feet. For the purposes of this table, the highest possible carryover capacity is displayed.
(7) Includes 298,000 acre-feet of emergency storage in Metropolitan's reservoirs in 2015, 2016, and 2017.

CONSERVATION AND WATER SHORTAGE MEASURES

General

The central objective of Metropolitan's water conservation program is to help ensure adequate, reliable and affordable water supplies for Southern California by actively promoting efficient water use. The importance of conservation to the region has increased in recent years because of drought conditions in the State Water Project watershed and court-ordered restrictions on Bay-Delta pumping, as described under "METROPOLITAN'S WATER SUPPLY–State Water Project – Bay-Delta Proceedings Affecting Water Supply" and "–Endangered Species Act and Other Environmental Considerations – Endangered Species Act Considerations – State Water Project – Delta Smelt and Salmon Federal ESAs Biological Opinions." Conservation reduces the need to import water to deliver to member agencies through Metropolitan's system. Water conservation is an integral component of Metropolitan's IRP, WSDM Plan and Water Supply Allocation Plan.

Metropolitan's conservation program has largely been developed to assist its member agencies in meeting the "best management practices" ("BMPs") of the California Urban Water Conservation Council's Memorandum of Understanding Regarding Urban Water Conservation in California ("CUWCC MOU") and to meet the conservation goals of the most recent IRP Update. See "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan." Under the terms of the CUWCC MOU and Metropolitan's Conservation Credits Program, Metropolitan administers regional conservation programs and also co-funds member agency conservation programs designed to achieve greater water use efficiency in residential, commercial, industrial, institutional and landscape uses. Metropolitan uses its Water Stewardship Rate, which is charged for every acre-foot of water conveyed by Metropolitan, together with available grant funds, to fund conservation incentives and other water management programs. All users of Metropolitan's system benefit from the system capacity made available by investments in demand management programs like the Conservation Credits Program. See "METROPOLITAN REVENUES–Rate Structure – Water Stewardship Rate" in this Appendix A. Direct spending by Metropolitan on active conservation incentives, including rebates for water-saving plumbing fixtures, appliances and equipment, from fiscal year 1989-90 through fiscal year 2015-16 was about $731 million. The 2015 IRP Update estimates that 1,197,000 acre-feet of water will be conserved annually in southern California by 2025. See also "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan" in this Appendix A and "–Drought Response Actions" below.

In addition to ongoing conservation, Metropolitan has developed a WSDM Plan, which splits resource actions into two major categories: Surplus Actions and Shortage Actions. See "–Water Surplus and Drought Management Plan." Conservation and water efficiency programs are part of Metropolitan's resource management strategy which makes up these Surplus and Shortage actions.

Metropolitan's Water Supply Allocation Plan allocates Metropolitan's water supplies among its member agencies, based on the principles contained in the WSDM Plan, to reduce water use and drawdowns from water storage reserves. See "–Water Supply Allocation Plan." Metropolitan's member agencies and retail water suppliers in Metropolitan's service area also have the ability to implement water conservation and allocation programs, and some of the retail suppliers in Metropolitan's service area have initiated conservation measures. The success of conservation measures in conjunction with the Water Supply Allocation Plan is evidenced as a contributing factor in the lower than budgeted water sales during fiscal years 2009-10, 2010-11, 2011-12 and 2015-16.

Legislation approved in November 2009 sets a statewide conservation target for urban per capita water use of 20 percent reductions by 2020 (with credits for existing conservation) at the retail level, providing an additional catalyst for conservation by member agencies and retail suppliers. Metropolitan's water sales projections incorporate an estimate of conservation savings that will reduce retail demands. Current projections include an estimate of additional water use efficiency savings that would result from local agencies reducing their per capita water use in response to the 20 percent by 2020 conservation savings goals required by the 2009 legislation, as well as an estimate of additional conservation that would have to occur to reach Metropolitan's IRP goal of reducing overall regional per capita water use by 20 percent by 2020.

Water Surplus and Drought Management Plan

In addition to the long-term planning guidelines and strategy provided by its IRP, Metropolitan has developed its WSDM Plan for the on-going management of its resources and water supplies in response to hydrologic conditions. The WSDM Plan, which was adopted by Metropolitan's Board in April 1999, evolved from Metropolitan's experiences during the droughts of 1976-77 and 1987-92. The WSDM Plan is a planning document that Metropolitan uses to guide inter-year and intra-year storage operations, and splits resource actions into two major categories: surplus actions and shortage actions. The surplus actions emphasize storage of surplus water inside the region, followed by storage of surplus water outside the region. The shortage actions emphasize critical storage programs and facilities and conservation programs that make up part of Metropolitan's response to shortages. Implementation of the plan is directed by a WSDM team, made up of Metropolitan staff, that meets regularly throughout the year and more frequently between November and April as hydrologic conditions develop. The WSDM team develops and recommends storage actions to senior management on a regular basis and provides updates to the Board on hydrological conditions, storage levels and planned storage actions through detailed reports.

Water Supply Allocation Plan

In times of prolonged or severe water shortages, Metropolitan manages its water supplies through the implementation of its Water Supply Allocation Plan. The Water Supply Allocation Plan was originally approved by Metropolitan's Board in February 2008, and has been implemented three times since its adoption, including most recently in April 2015. The Water Supply Allocation Plan provides a formula for equitable distribution of available water supplies in case of extreme water shortages within Metropolitan's service area. In December 2014, the Board approved certain adjustments to the formula for calculating member agency supply allocations during subsequent periods of implementation of the Water Supply Allocation Plan. Although the Act gives each of Metropolitan's member agencies a preferential entitlement to purchase a portion of the water served by Metropolitan (see "METROPOLITAN REVENUES–Preferential Rights"), historically, these rights have not been used in allocating Metropolitan's water. Metropolitan's member agencies and retail water suppliers in Metropolitan's service area also may implement water conservation and allocation programs within their respective service territories in times of shortage. See also "–Drought Response Actions."

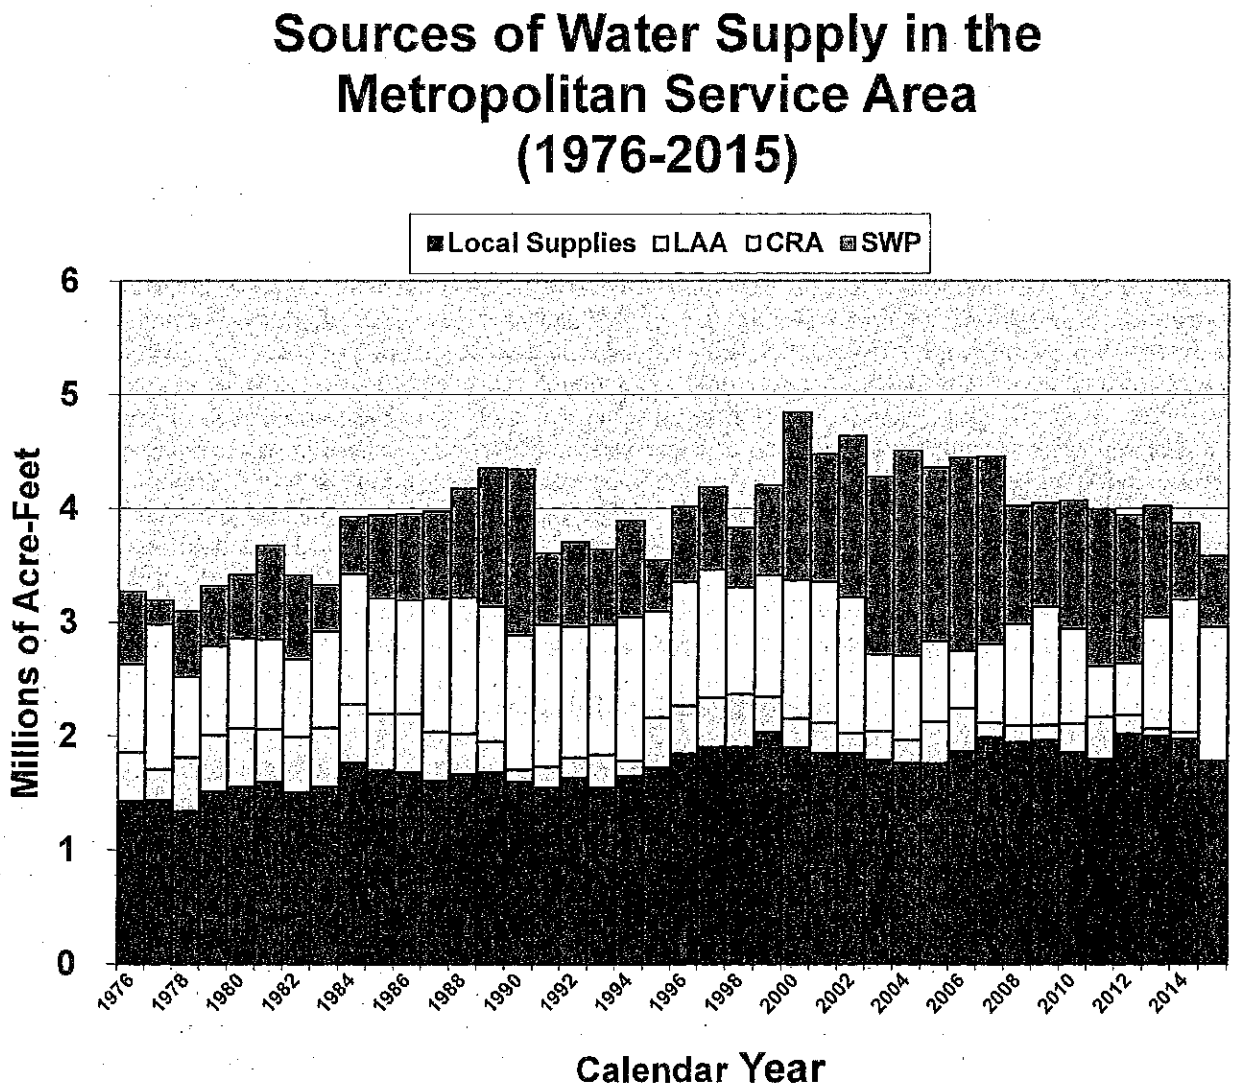
On April 14, 2015, the Board declared a Water Supply Condition 3 and the implementation of the Water Supply Allocation Plan at a Level 3 Regional Shortage Level, effective July 1, 2015 through June 30, 2016. Implementation of the Water Supply Allocation Plan at a Level 3 Regional Shortage Level, and

response to the Governor's Order and related implementing regulations (described under "–Drought Response Actions"), reduced supplies delivered by Metropolitan to Metropolitan's member agencies to approximately 1.6 million acre-feet in fiscal year 2015-16. See also "CONSERVATION AND WATER SHORTAGE MEASURES–General." Due to improved hydrologic conditions, on May 10, 2016, the Board rescinded the Water Supply Allocation Plan, declared a Condition 2 Water Supply Alert, and decided not to implement the Water Supply Allocation Plan for fiscal year 2016-17. In April 2017, the Board will evaluate current water supply conditions and determine if implementation of the Water Supply Allocation Plan is needed for fiscal year 2017-18. In light of current hydrologic conditions and current DWR State Water Project allocation estimates, implementation of the Water Supply Allocation Plan for fiscal year 2017-18 is not currently expected.

Drought Response Actions

The most recent drought of 2012-2015 represents one of the driest periods in the hydrologic record since 1931-1934. In calendar years 2012-2015, to offset reductions in State Water Project supplies and mitigate impacts of the California drought, in addition to utilizing the limited available supplies from the Colorado River and State Water Project deliveries, Metropolitan met water demands in its service area by supplemental water transfers and purchases, and drawing on storage reserves, while also encouraging responsible and efficient water use to lower demands.

As noted under "–Water Supply Allocation Plan" above, actions taken in response to the drought by the State, Metropolitan's Board, and Metropolitan member agencies have contributed to reduced demands in Metropolitan's service area. Following the declaration by Governor Brown on January 17, 2014 of a drought state of emergency for California, on April 1, 2015 Governor Brown issued an Executive Order ("Order") calling for a 25 percent reduction in consumer water use in response to the historically dry conditions. The Governor's Order was implemented through emergency regulation adopted by the SWRCB. On May 18, 2016, the SWRCB adopted modifications to the emergency regulation which replace the state-mandated conservation targets with a supply-based approach that mandates urban water suppliers take actions to ensure at least a three year supply of water to their customers under drought conditions. As a wholesale water agency providing a supplemental water supply to its member agencies, Metropolitan is not subject to the requirements of the Order, which applies to retail water agencies. However, water sales of Metropolitan's member agencies have declined as a result of conservation efforts and other actions taken to comply with the Order and implementing regulation. In addition, since Governor Brown's initial drought emergency proclamation in January 2014, Metropolitan has worked proactively with its member agencies to conserve water supplies in its service area, and significantly expanded its water conservation and outreach programs and increased funding for conservation incentive programs. See "CONSERVATION AND WATER SHORTAGE MEASURES–General." In calendar year 2016, Metropolitan returned approximately 350,000 acre-feet of water to storage and continued to encourage responsible and efficient water use.



REGIONAL WATER RESOURCES

The water supply for Metropolitan's service area is provided in part by Metropolitan and in part by non-Metropolitan sources available to members. Approximately 60 percent of the water supply for Metropolitan's service area is imported water received by Metropolitan from the CRA and the State Water Project and by the City of Los Angeles (the "City") from the Los Angeles Aqueduct. While the City is one of the largest water customers of Metropolitan, it receives a substantial portion of its water from the Los Angeles Aqueduct and local groundwater supply. The balance of water within the region is produced locally, primarily from groundwater supplies and runoff.

Metropolitan's member agencies are not required to purchase or use any of the water available from Metropolitan. Some agencies depend on Metropolitan to supply nearly all of their water needs, regardless of the weather. Other agencies, with local surface reservoirs or aqueducts that capture rain or snowfall, rely on Metropolitan more in dry years than in years with heavy rainfall, while others, with ample groundwater supplies, purchase Metropolitan water only to supplement local supplies and to recharge groundwater basins.

The demand for supplemental supplies provided by Metropolitan is dependent on water use at the retail consumer level and the amount of locally supplied and conserved water. See "CONSERVATION AND WATER SHORTAGE MEASURES" in this Appendix A and "–Local Water Supplies" below. Consumer demand and locally supplied water vary from year to year, resulting in variability in water sales. Future reliance on Metropolitan supplies will depend on, among other things, local projects and the amount of water, if any, that may be derived from sources other than Metropolitan. In recent years, supplies and demands have been affected by drought, water use restrictions, economic conditions, weather conditions and environmental laws, regulations and judicial decisions, as described in this Appendix A under "METROPOLITAN'S WATER SUPPLY." For information on Metropolitan's water sales revenues, see "METROPOLITAN REVENUES" and "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

The following graph shows a summary of the regional sources of water supply for the years 1976 to 2015. Local supplies available within Metropolitan's service area are augmented by water imported by the City through the Los Angeles Aqueduct and Metropolitan supplies provided through the CRA and State Water Project.

Source: Metropolitan.

The major sources of water available to some or all of Metropolitan's member agencies in addition to supplies provided by Metropolitan are described below.

Los Angeles Aqueduct

The City, through its Department of Water and Power ("LADWP"), operates its Los Angeles Aqueduct system to import water from the Owens Valley and the Mono Basin on the eastern slopes of the Sierra Nevada in eastern California. Prior to the 1990-1991 drought, the City had imported an average of 440,000 acre-feet of water annually from the combined Owens Valley/Mono Basin system, of which about 90,000 acre-feet came from the Mono Basin. Under the Mono Lake Basin Water Right Decision (Decision 1631) issued in September 1994, which revised LADWP's water rights licenses in the Mono Basin, the City is limited to export 4,500 acre-feet annually when Mono Lake elevation is between 6,377 to 6,380 feet above mean sea level, and 16,000 acre-feet annually when the elevation is between 6,380 to 6,391 feet above mean sea level, on April 1 of the runoff year. On April 1, 2016, the water level of Mono Lake was 6,378.1 feet above mean sea level. Therefore, Mono Basin water exports for runoff year 2016 were limited to 4,500 acre-feet. The 4,500 acre-feet export limit will remain until the water level in Mono Lake reaches 6,380 feet above mean sea level. Once the elevation of Mono Lake reaches 6,391 feet above mean sea level, a moderate increase in water exports from the Mono Basin above the 16,000 acre-feet limit will be permitted pursuant to Decision 1631.

Pursuant to the City's turnout agreement with DWR, AVEK and Metropolitan, LADWP commenced construction in 2010 of the turnout facilities along the California Aqueduct within AVEK's service area. Upon completion, which is expected in 2017, the turnout will enable delivery of water from the California Aqueduct to the Los Angeles Aqueduct. Conditions precedent to such delivery of water include obtaining agreements for the transfer of non-State Water Project water directly from farmers, water districts or others in Northern and Central California, available capacity in the California Aqueduct and compliance with State Water Project water quality requirements. The agreement allows for use of the turnout for delivery of non-State Water Project water to the City in amounts not to exceed the supplies lost to the City as a result of its Eastern Sierra environmental obligations.

Historically, the Los Angeles Aqueduct and local groundwater supplies have been nearly sufficient to meet the City's water demands during normal water supply years. As a result, prior to the 1990-1991 drought, only about 13 percent of the City's water needs (approximately 82,000 acre-feet) were supplied by Metropolitan. From fiscal year 2000-01 to fiscal year 2015-16, approximately 31 to 75 percent of the City's total water requirements were met by Metropolitan. For the five fiscal years ended June 30, 2016, the City's water deliveries from Metropolitan averaged approximately 348,680 acre-feet per year, which constituted approximately 64 percent of the City's total water supply. Deliveries from Metropolitan to the City during this period varied between approximately 166,000 acre-feet per year and approximately 442,000 acre-feet per year. See "METROPOLITAN REVENUES–Principal Customers" in this Appendix A. According to LADWP's 2015 Urban Water Management Plan, the City is planning to increase locally-developed supplies including recycled water, new conservation, stormwater capture and local groundwater from the average for the five-year period ending June 30, 2015 of 14 percent to 47 percent of its normal year supplies by fiscal year 2039-40. Accordingly, the City's reliance on Metropolitan supplies is expected to decrease from the five year average ending June 30, 2016 of 64 percent to 11 percent of its normal year supplies by fiscal year 2039-40. However, the City may still purchase up to 311,000 acre-feet per year or 44 percent of its dry year supplies from Metropolitan until 2040. This corresponds to an increase from normal to dry years of approximately 237,000 acre-feet in potential demand for supplies from Metropolitan.

LADWP analyzed the additional impacts to the Los Angeles Aqueduct's water supply deliveries for various environmental projects aimed at improving air quality and fish and riparian habitat in the Owens Valley. In November 2014, LADWP reached an agreement over implementation of dust control measures on Owens Lake which saved approximately 12,000 to 14,000 acre-feet of water in 2015 and is expected to expand water savings in the future. LADWP reports that in 2016, 71,400 acre-feet of water was devoted to

dust and environmental mitigation projects in the Owens Valley and Eastern Sierra, resulting in the need to purchase an equivalent amount of Metropolitan supply.

Local Water Supplies

Local water supplies are made up of groundwater, groundwater recovery, surface runoff, recycled water, and seawater desalination. Metropolitan supports local resources development through its Local Resources Program ("LRP"), which provides financial incentives up to $340 per acre-foot of water production from local water recycling, groundwater recovery and seawater desalination projects. Metropolitan utilizes conjunctive use of groundwater to encourage storage in groundwater basins. Member agencies and other local agencies have also independently funded and developed additional local supplies, including groundwater clean-up, recycled water and desalination of brackish or high salt content water.

Metropolitan's water sales projections are based in part on projections of locally-supplied water. Projections of future local supplies are based on estimated yields from sources and projects that are currently producing water or are under construction at the time a water sales projection is made. Additional reductions in Metropolitan's water sales projections are made to account for future local supply augmentation projects, based on the IRP Update goals. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES–Water Sales Projections" and "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan" in this Appendix A.

Groundwater. Demands for about 1.35 million acre-feet per year, about one-third of the annual water demands for approximately 18.8 million residents of Metropolitan's service area, are met from groundwater production. Local groundwater supplies are supported by recycled water, which is blended with imported water and recharged into groundwater basins, and also used for creating seawater barriers that protect coastal aquifers from seawater intrusion.

Member Agency Storage Programs. Metropolitan has developed a number of local programs to work with its member agencies to increase storage in groundwater basins. Metropolitan has encouraged storage through its cyclic and conjunctive use storage programs. These programs allow Metropolitan to deliver water into a groundwater basin in advance of agency demands. Metropolitan has drawn on dry-year supply from cyclic storage accounts and nine contractual conjunctive use storage programs to address shortages from the State Water Project and the CRA.

Cyclic storage agreements allow pre-delivery of imported water for recharge into groundwater basins in excess of an agency's planned and budgeted deliveries making best use of available capacity in conveyance pipelines, use of storm channels for delivery to spreading basins, and spreading basins. This water is then purchased at a later time when the agency has a need for groundwater replenishment deliveries.

Conjunctive use agreements provide for storage of imported water that can be called for use by Metropolitan during dry, drought, or emergency conditions. During a dry period, Metropolitan has the option to call water stored in the groundwater basins pursuant to its contractual conjunctive use agreements. At the time of the call, the member agency pays Metropolitan the prevailing rate for that water. Nine conjunctive use projects provide about 210,000 acre-feet of groundwater storage and have a combined extraction capacity of about 70,000 acre-feet per year. As of January 2017, the balance in the nine accounts was approximately 1,000 acre-feet. See table "Metropolitan's Water Storage Capacity and Water in Storage" under "METROPOLITAN'S WATER SUPPLY–Storage Capacity and Water in Storage" in this Appendix A.

Recovered Groundwater. Contamination of groundwater supplies is a growing threat to local groundwater production. Metropolitan has been supporting increased groundwater production and improved regional supply reliability by offering financial incentives to agencies for production and treatment of degraded groundwater since 1991. Metropolitan has executed agreements with local agencies to provide financial incentives to 25 projects that recover contaminated groundwater with total contract yields of about

118,000 acre-feet per year. During fiscal year 2015-16, Metropolitan provided incentives for approximately 49,000 acre-feet of recovered water under these agreements. Total groundwater recovery use under executed agreements is expected to grow to 79,000 acre-feet in 2020.

Surface Runoff. Local surface water resources consist of runoff captured in storage reservoirs and diversions from streams. Since 1980, agencies have used an average of 116,000 acre-feet per calendar year of local surface water. Local surface water supplies are heavily influenced by year to year local weather conditions, varying from a high of 188,000 acre-feet in calendar year 1998 to a low of 65,000 acre-feet in calendar year 2003.

Recycled Water. Metropolitan has supported recycled water use to offset water demands and improve regional supply reliability by offering financial incentives to agencies for production and sales of recycled water since 1982. Metropolitan has executed agreements with local agencies to provide financial incentives to 82 recycled water projects with total contract yields of about 323,000 acre-feet per year. During fiscal year 2015-16, Metropolitan provided incentives for approximately 179,000 acre-feet of reclaimed water under these agreements. Total recycled water use under executed agreements is expected to be approximately 193,000 acre-feet by 2020.

Seawater Desalination. Metropolitan's IRP includes seawater desalination as a part of the region's local supply that could help increase supply reliability in Metropolitan's service area. The IRP also supports foundational actions to lay the groundwork for accelerating seawater desalination development as needed in the future. To encourage local development, Metropolitan has signed Seawater Desalination Program ("SDP") incentive agreements with three of its member agencies: Long Beach, Municipal Water District of Orange County ("MWDOC") and West Basin Municipal Water District. The SDP agreements provide incentives to the member agencies of up to $250 per acre-foot when the desalinated supplies are produced. Agreement terms are for the earlier of 25 years or through 2040 and are designed to phase out if Metropolitan's rates surpass the unit cost of producing desalinated seawater. SDP agreements are subject to final approval by Metropolitan's Board after review of the complete project description and environmental documentation. These projects are currently in the development phase and collectively, if completed, are anticipated to produce up to 46,000 acre-feet annually. Each agreement automatically terminates in 2020 if the related project is not operational by that time. In October 2014, seawater desalination projects became eligible for funding under Metropolitan's Local Resources Program.

In late 2015, Poseidon Resources LLC ("Poseidon") completed and began operating the 56,000 acre-foot capacity Carlsbad Desalination Project ("Carlsbad Project") and associated pipeline. The SDCWA has a purchase agreement with Poseidon for a minimum of 48,000 acre-feet per year with an option to purchase an additional 8,000 acre-feet per year. Other seawater desalination projects that could provide supplies to Metropolitan's service area are under development or consideration. In partnership with the Orange County Water District, Poseidon is also developing a 56,000 acre-feet per year plant in Huntington Beach which is currently in the permitting phase. SDCWA is also studying the potential for a seawater desalination plant in Camp Pendleton which would initially produce up to 56,000 acre-feet per year and potentially up to 168,000 acre-feet per year with a phased build out. Calleguas Municipal Water District is studying the potential for a 20,000 to 80,000 acre-feet per year project in Ventura County. Otay Water District, located in San Diego County along the Mexico border, is considering the feasibility of purchasing water from a seawater desalination project in Rosarito Beach, Mexico. The 56,000 to 112,000 acre-feet per year project is in the pre-construction phase, and could also supply Metropolitan's service area through exchange agreements. Approvals from a number of U.S. and Mexican federal agencies, along with State and local approvals, would be needed for the cross-border project to proceed.

METROPOLITAN'S WATER DELIVERY SYSTEM

Primary Facilities and Method of Delivery

Metropolitan's water delivery system is made up of three basic components: the CRA, the California Aqueduct of the State Water Project and Metropolitan's internal water distribution system. Metropolitan's delivery system is integrated and designed to meet the differing needs of its member agencies. Metropolitan seeks redundancy in its delivery system to assure reliability in the event of an outage. Improvements are designed to increase the flexibility of the system. Since local sources of water are generally used to their maximum each year, growth in the demand for water is partially met by Metropolitan. Accordingly, the operation of Metropolitan's water system is being made more reliable through the rehabilitation of key facilities as needed, improved preventive maintenance programs and the upgrading of Metropolitan's operational control systems. See "CAPITAL INVESTMENT PLAN" in this Appendix A.

Colorado River Aqueduct. Work on the CRA commenced in 1933 and water deliveries started in 1941. Additional facilities were completed by 1961 to meet additional requirements of Metropolitan's member agencies. The CRA is 242 miles long, starting at the Lake Havasu intake and ending at the Lake Mathews terminal reservoir. Metropolitan owns all of the components of the CRA, which include five pumping plants, 64 miles of canal, 92 miles of tunnels, 55 miles of concrete conduits and 144 underground siphons totaling 29 miles in length. The pumping plants lift the water approximately 1,617 feet over several mountain ranges to Metropolitan's service area. See "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct" in this Appendix A.

State Water Project. The initial portions of the State Water Project serving Metropolitan were completed in 1973. The State Water Project, managed and operated by DWR, is one of the largest water supply projects undertaken in the history of water development. The State Water Project facilities dedicated to water delivery consist of a complex system of dams, reservoirs, power plants, pumping plants, canals and aqueducts to deliver water. Water from rainfall and snowmelt runoff is captured and stored in State Water Project conservation facilities and then delivered through State Water Project transportation facilities to water agencies and districts located throughout the Upper Feather River, Bay Area, Central Valley, Central Coast, and Southern California. Metropolitan receives water from the State Water Project through the main stem of the aqueduct system, the California Aqueduct, which is 444 miles long and includes 381 miles of canals and siphons, 49 miles of pipelines or tunnels and 13 miles of channels and reservoirs.

As described herein, Metropolitan is the largest (in terms of number of people it serves, share of State Water Project water it has contracted to receive, and percentage of total annual payments made to DWR therefor) of twenty-nine agencies and districts that have entered into contracts with DWR to receive a water entitlement from the State Water Project. Contractors pay all costs of the facilities in exchange for participation rights in the system. Thus, Contractors also have the right to use the portion of the State Water Project conveyance system necessary to deliver water to them at no additional cost as long as capacity exists. See "METROPOLITAN'S WATER SUPPLY–State Water Project" in this Appendix A.

Internal Distribution System. Metropolitan's internal water distribution system includes components that were built beginning in the 1930s and through the present. Metropolitan owns all of these components, including 14 dams and reservoirs, five regional treatment plants, over 800 miles of transmission pipelines, feeders and canals, and 16 hydroelectric plants with an aggregate capacity of 131 megawatts.

Diamond Valley Lake. Diamond Valley Lake, a man-made reservoir, built, owned and operated by Metropolitan, is located southwest of the city of Hemet, California. It covers approximately 4,410 acres and has capacity to hold approximately 810,000 acre-feet or 265 billion gallons of water. Diamond Valley Lake was constructed to serve approximately 90 percent of Metropolitan's service area by gravity flow. Imported water is delivered to Diamond Valley Lake during surplus periods. The reservoir provides more reliable delivery of imported water from the State Water Project and the CRA during summer months, droughts and emergencies. In addition, Diamond Valley Lake is capable of providing more than one-third of Southern

California's water needs from storage for approximately six months after a major earthquake (assuming that there has been no impairment of Metropolitan's internal distribution network). See the table "Metropolitan's Water Storage Capacity and Water in Storage" under "METROPOLITAN'S WATER SUPPLY–Storage Capacity and Water in Storage" in this Appendix A for the amount of water in storage at Diamond Valley Lake. Excavation at the project site began in May 1995. Diamond Valley Lake was completed in March 2000, at a total cost of $2 billion, and was in full operation in December 2001.

Inland Feeder. Metropolitan's Inland Feeder is a 44-mile-long conveyance system that connects the State Water Project to Diamond Valley Lake and the CRA. The Inland Feeder provides greater flexibility in managing Metropolitan's major water supplies and allows greater amounts of State Water Project water to be accepted during wet seasons for storage in Diamond Valley Lake. In addition, the Inland Feeder increases the conveyance capacity from the East Branch of the State Water Project by 1,000 cubic feet per second, allowing the East Branch to operate up to its full capacity. Construction of the Inland Feeder was completed in September 2009 at a total cost of $1.14 billion.

Operations Control Center. Metropolitan's water conveyance and distribution system operations are coordinated from the Operations Control Center ("OCC") located in the Eagle Rock area of Los Angeles. The OCC plans, balances and schedules daily water and power operations to meet member agencies' demands, taking into consideration the operational limits of the entire system.

Water Treatment

Metropolitan filters and disinfects water at five water treatment plants: the F.E. Weymouth Treatment Plant, the Joseph Jensen Treatment Plant, the Henry J. Mills Treatment Plant, the Robert B. Diemer Treatment Plant, and the Robert A. Skinner Treatment Plant. In recent years, the plants typically treat between 0.8 billion and 1.0 billion gallons of water per day, and have a maximum capacity of approximately 2.6 billion gallons per day. Approximately 50 percent of Metropolitan's water deliveries are treated water.

Federal and state regulatory agencies continually monitor and establish new water quality standards. New water quality standards could affect availability of water and impose significant compliance costs on Metropolitan. The federal Safe Drinking Water Act ("SDWA") establishes drinking water quality standards, monitoring, and public notification and enforcement requirements for public water systems. To achieve these objectives, the USEPA, as the lead regulatory authority, promulgates national drinking water regulations and develops the mechanism for individual states to assume primary enforcement responsibilities. The SWRCB Division of Drinking Water ("DDW"), formerly the Drinking Water Program under the California Department of Public Health ("CDPH"), has primary responsibility for the regulation of public water supply systems in the State. Drinking water delivered to customers must comply with statutory and regulatory water quality standards designed to protect public health and safety that are now administered by DDW. Metropolitan operates its five water treatment plants under a domestic water supply permit issued by DDW which is amended, as necessary, such as when significant facility modifications occur. Metropolitan operates and maintains water storage, treatment and conveyance facilities, implements watershed management and protection activities, performs inspections, monitors drinking water quality, and submits monthly and annual compliance reports. In addition, public water system discharges to state and federal waters are regulated under general National Pollutant Discharge Elimination System ("NPDES") permits. The SWRCB issued these NPDES permits to Metropolitan which contain numerical effluent limitations, monitoring, reporting, and notification requirements for water discharges from the facilities and pipelines of Metropolitan's water supply and distribution system.

Metropolitan continually monitors new water quality laws and regulations and frequently comments on new legislative proposals and regulatory rules. Metropolitan is currently operating in compliance with all state and federal drinking water regulations and permit requirements.

Seismic Considerations

General. Although the magnitude of damages resulting from a significant seismic event are impossible to predict, Metropolitan's water conveyance and distribution facilities are designed either to withstand a maximum probable seismic event or to minimize the potential repair time in the event of damage. The five pumping plants on the CRA have been buttressed to better withstand seismic events. Other components of the CRA are monitored for any necessary rehabilitation and repair. Metropolitan personnel and independent consultants periodically reevaluate the internal water distribution system's vulnerability to earthquakes. As facilities are evaluated and identified for seismic retrofitting, they are prioritized, with those facilities necessary for delivering or treating water scheduled for upgrade before non-critical facilities. However, major portions of the California Aqueduct and the CRA are located near major earthquake faults, including the San Andreas Fault. A significant earthquake could damage structures and interrupt the supply of water, adversely affecting Metropolitan's revenues and its ability to pay its obligations. Therefore, emergency supplies are stored for use throughout Metropolitan's service area, and a six-month reserve supply of water normally held in local storage (including emergency storage in Diamond Valley Lake) provides reasonable assurance of continuing water supplies during and after such events (assuming there has been no impairment of Metropolitan's internal distribution network).

Metropolitan has an ongoing surveillance program that monitors the safety and structural performance of its 14 dams and reservoirs. Operating personnel perform regular inspections that include monitoring and analyzing seepage flows and pressures. Engineers responsible for dam safety review the inspection data and monitor the horizontal and vertical movements for each dam. Major on-site inspections are performed at least twice each year. Instruments that transmit seismic acceleration time histories for analysis any time a dam is subjected to strong motion during an earthquake are located at a number of selected sites.

In addition, Metropolitan has developed an emergency plan that calls for specific levels of response appropriate to an earthquake's magnitude and location. Included in this plan are various communication tools, as well as a structured plan of management that varies with the severity of the event. Pre-designated personnel follow detailed steps for field facility inspection and distribution system patrol. Approximately 40 employees are designated to respond immediately under certain identifiable seismic events. An emergency operations center is maintained at the OCC. The OCC, which is specifically designed to be earthquake resistant, contains communication equipment, including a radio transmitter, microwave capability and a response line linking Metropolitan with its member agencies, DWR, other utilities and the State's Office of Emergency Services.

Metropolitan also maintains machine, fabrication and coating shops at its facility in La Verne, California. Several construction projects have been completed to upgrade and expand these shops. A total of nearly $40 million has been invested to enhance Metropolitan's capacity not only to provide fabrication and coating services for planned rehabilitation work, maintenance activities, and capital projects, but also to perform emergency fabrication support to Metropolitan and its member agencies. Metropolitan has also maintained reimbursable agreements with DWR to perform machining, fabrication, and coating services for critical repair and rehabilitation of State Water Project facilities. These agreements have enhanced timely and cost-effective emergency response capabilities. Materials to fabricate pipe and other appurtenant fittings are kept in inventory at the La Verne site. In the event of earthquake damage, Metropolitan has taken measures to provide the design and fabrication capacity to fabricate pipe and related fittings. Metropolitan is also staffed to perform emergency repairs and has pre-qualified contractors for emergency repair needs at various locations throughout Metropolitan's service area.

State Water Project Facilities- California Aqueduct. The California Aqueduct crosses all major faults either by canal at ground level or by pipeline at very shallow depths to ease repair in case of damage from movement along a fault. State Water Project facilities are designed to withstand major earthquakes along a local fault or magnitude 8.1 earthquakes along the San Andreas Fault without major damage. Dams, for example, are designed to accommodate movement along their foundations and to resist earthquake forces

on their embankments. Earthquake loads have been taken into consideration in the design of project structures such as pumping and power plants. The location of check structures on the canal allows for hydraulic isolation of the fault-crossing repair.

While the dams, canals, pump stations and other constructed State Water Project facilities have been designed to withstand earthquake forces, the critical supply of water from Northern California must traverse the Bay-Delta through hundreds of miles of varying levels of engineered levees that are susceptible to major failures due to flood and seismic risk. In the event of a failure of the Bay-Delta levees, the quality of the Bay-Delta's water could be severely compromised as salt water comes in from the San Francisco Bay. Metropolitan's supply of State Water Project water would be adversely impacted if pumps that move Bay-Delta water southward to the Central Valley and Southern California are shut down to contain the salt water intrusion. Metropolitan estimates that stored water supplies, CRA supplies and local water resources that would be available in case of a levee breach or other interruption in State Water Project supplies would meet demands in Metropolitan's service area for approximately twelve months. See "METROPOLITAN'S WATER SUPPLY–Storage Capacity and Water in Storage" in this Appendix A. Since the State and federal governments control the Bay-Delta levees, repair of any levee failures would be the responsibility of and controlled by the State and federal governments.

Metropolitan, in cooperation with the State Water Contractors, developed recommendations to DWR for emergency preparedness measures to maintain continuity in export water supplies and water quality during emergency events. These measures include improvements to emergency construction materials stockpiles in the Bay-Delta, improved emergency contracting capabilities, strategic levee improvements and other structural measures of importance to Bay-Delta water export interests, including development of an emergency freshwater pathway to export facilities in a severe earthquake. DWR utilized $12 million in fiscal year 2007-08 for initial stockpiling of rock for emergency levee repairs and development of Bay-Delta land and marine loading facilities and has identified future funding for expanded stockpiles.

State Water Project-Perris Dam. Perris Dam forms Lake Perris, the southernmost terminal reservoir for the State Water Project in Riverside County, with maximum capacity of approximately 130,000 acre-feet of water. Metropolitan uses water from Lake Perris for delivery to customers in Riverside and San Diego counties. Deliveries from the lake are used as a redundant source for the Mills Water Treatment Plant, drought supply from a flexible storage account, and for consumptive use by Metropolitan's customers. DWR reported in July 2005 that seismic studies indicate that DWR's Perris Dam facility could sustain damage from moderate earthquakes along the San Jacinto or San Andreas faults due to potential weaknesses in the dam's foundation. In late 2005, DWR lowered the water level in the reservoir by about 25 feet and reduced the amount of water stored in the reservoir to about 75,000 acre-feet as DWR evaluated alternatives for repair of the dam. In December 2006, DWR completed a study identifying various repair options, began additional geologic exploration along the base of Perris Dam and started preliminary design. DWR's preferred alternative is to repair the dam to restore the reservoir to its historical level. On November 11, 2011, DWR certified the final EIR and filed a Notice of Determination stating its intent to proceed with the preferred alternative. DWR estimates that repairs will cost approximately $141 million to be completed in mid-2017. Under the original allocation of joint costs for this facility, the State would have paid approximately six percent of the repair costs. However, because of the recreational benefit this facility provides to the public, the Legislature has approved a recommendation from DWR that the State assume 32.2 percent of these repair costs. The remaining 67.8 percent of repairs costs will be paid for by the three agencies that use the water stored in Lake Perris: Metropolitan (42.9 percent), DWA (3.0 percent) and CVWD (21.9 percent). DWR recovers the cost of repairs through its annual statement of charges sent to each agency. See "METROPOLITAN EXPENSES–State Water Contract Obligations" in this Appendix A.

Security Measures

Metropolitan conducts ground and air patrols of the CRA and monitoring and testing at all treatment plants and along the CRA. Similarly, DWR has in place security measures reasonably designed to protect critical facilities of the State Water Project, including both ground and air patrols of the State Water Project.

Although Metropolitan has constructed redundant systems and other safeguards to ensure its ability to continually deliver water to its customers, and DWR has made similar efforts, a terrorist attack or other security breach against water facilities could materially impair Metropolitan's ability to deliver water to its customers, its operations, and revenues and its ability to pay its obligations.

CAPITAL INVESTMENT PLAN

General Description

Metropolitan's current Capital Investment Plan (the "Capital Investment Plan" or "CIP") involves expansion and rehabilitation of existing facilities and construction of new facilities to meet future water demands, ensure system reliability as well as enhance operational efficiency and flexibility, and comply with water quality regulations. Metropolitan's CIP is regularly reviewed and updated. Metropolitan's biennial budget process includes a review of the projected long-term capital needs and the development of a capital expenditure forecast for the ten-year financial forecast, as well as the identification of the capital priorities of Metropolitan over the biennial budget term. Implementation and construction of specific elements of the program are subject to Board approval, and the amount and timing of borrowings will depend upon, among other factors, status of construction activity and water demands within Metropolitan's service area. From time to time, projects that have been undertaken are delayed, redesigned or deferred by Metropolitan for various reasons, and no assurance can be given that a project in the CIP will be completed in accordance with its original schedule or that any project will be completed as currently planned. In addition, from time to time, when circumstances warrant, Metropolitan's Board may approve capital expenditures other than or in addition to those contemplated by the CIP at the time of the then current biennial budget.

Projection of Capital Investment Plan Expenditures

The table below sets forth the projected CIP expenditures in the adopted biennial budget for fiscal years 2016-17 and 2017-18, including replacement and refurbishment expenditures, by project type for the fiscal years ending June 30, 2017 through 2021. This estimate is updated every two years as a result of the periodic review and adoption of the capital budget by Metropolitan's Board of Directors. See "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

CAPITAL INVESTMENT PLAN
PROJECTION OF EXPENDITURES[1] [2]
(Fiscal Years Ended June 30 - Dollars in Thousands)

Cost of Service	2017	2018	2019	2020	2021	Total
Conveyance & Aqueduct	$ 19,772	$ 32,934	$ 32,433	$ 30,396	$ 29,042	$ 144,578
Storage	1,455	--	--	--	--	1,455
Distribution	50,818	80,197	95,411	107,446	126,015	459,887
Treatment	88,345	67,691	55,746	50,292	37,678	299,753
Administrative and General	36,649	18,846	16,325	11,398	7,229	90,448
Hydroelectric	2,960	332	84	468	36	3,880
Total[2]	$200,000[3]	$200,000	$200,000	$200,000	$200,000	$1,000,000

Source: Metropolitan.

(1) Fiscal years 2016-17 and 2017-18 based on the adopted biennial budget for fiscal years 2016-17 and 2017-18. Fiscal years 2018-19 through 2020-21 based on the ten-year financial forecast provided in the adopted biennial budget. Totals are rounded.

(2) Annual totals include replacement and refurbishment expenditures for fiscal years 2016-17 through 2020-21 of $115 million, $159 million, $176 million, $182 million, and $192 million, respectively, for a total of $823 million for fiscal years 2016-17 through 2020-21.

(3) Fiscal year 2016-17 capital expenditures are currently estimated to be approximately $212 million.

The above projections do not include amounts for contingencies, but include escalation at 2.77 percent per year for projects for which formal construction contracts have not been awarded. Additional

capital costs may arise in the future as a result of, among other things, federal and State water quality regulations, project changes and mitigation measures necessary to satisfy environmental and regulatory requirements, and for additional facilities. See "METROPOLITAN'S WATER DELIVERY SYSTEM–Water Treatment" in this Appendix A.

Capital Investment Plan Financing

The CIP requires funding from debt financing (see "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A) as well as from pay-as-you-go funding. The Board has adopted an internal funding objective to fund 60 percent of capital program expenditures from current revenues. The remainder of capital program expenditures will be funded through the issuance from time to time of water revenue bonds, which are payable from Net Operating Revenues. However, as in prior years, pay-as-you-go funding may be reduced or increased by the Board during the fiscal year.

On April 8, 2014, Metropolitan's Board approved a total of $466 million for pay-as-you-go expenditures as part of the biennial budget for fiscal year 2014-15 and fiscal year 2015-16. These pay-as-you-go funds, together with funds available in the Replacement and Refurbishment Fund, were expected to fund $513 million in capital expenditures for fiscal year 2014-15 and fiscal year 2015-16. On October 13, 2015, Metropolitan's Board adopted an ordinance finding that the interests of the district require the use of new revenue bonds in an amount not to exceed $500 million. On December 17, 2015, Metropolitan issued its $208,255,000 Water Revenue Bonds, 2015 Authorization Series A to reimburse certain pay-as-you-go capital expenditures and to fund a portion of fiscal year 2016-17 capital expenditures.

Metropolitan's budget assumptions for the adopted biennial budget for fiscal years 2016-17 and 2017-18 and projections for later years provide for the issuance of approximately $80 million of additional water revenue bonds to fund or to reimburse prior capital expenditures in each of fiscal years 2016-17 through 2020-21. These revenue bonds could be issued either as Senior Revenue Bonds under the Senior Debt Resolutions or as Subordinate Revenue Bonds under the Subordinate Debt Resolutions (each as defined under "METROPOLITAN EXPENSES–Limitations on Additional Revenue Bonds" in this Appendix A). The cost of these projected bond issues are reflected in the financial projections under, "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A. Metropolitan expects to issue its $80,000,000 Water Revenue Bonds, 2017 Authorization Series A in March 2017 for the purposes of financing a portion of its capital expenditures through fiscal year 2017-18.

Other Capital Expenses

On July 14, 2015, Metropolitan's Board approved $264 million to acquire various properties in Riverside and Imperial Counties, with $160 million funded from the Replacement and Refurbishment Fund and the remaining amount from unrestricted reserves.

On March 8, 2016, Metropolitan's Board authorized the General Manager to enter into an agreement to purchase certain property from Delta Wetlands Properties, LLC in Contra Costa, San Joaquin, and Solano Counties (the "Delta Islands"). Although no determination has been made, potential applications for these properties include: (1) tidal wetlands; (2) water quality; (3) studies and research; (4) re-creation of food web; (5) subsidence studies or prevention; (6) habitat restoration; (7) mitigation credits; (8) carbon sequestration; (9) emergency preparedness, including seismic preparation and study; (10) water transfers; and (11) using portions for access or staging of a future Delta fix, like the proposed California Water Fix project. On July 18, 2016, escrow closed and purchase of these properties was completed. On December 21, 2016, Metropolitan issued its $175,000,000 Subordinate Water Revenue Bonds, 2016 Authorization Series A (Taxable) to reimburse itself for the purchase. See "METROPOLITAN EXPENSES–Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations" in this Appendix A.

Major Projects of Metropolitan's Capital Investment Plan

Oxidation Retrofit Facilities. The oxidation retrofit facilities program includes the design and construction of oxidation facilities and appurtenances at all five of Metropolitan's treatment plants. This program is intended to allow Metropolitan to meet drinking water standards for disinfection by-products and reduce taste and odor incidents. The oxidation retrofit improvements have been completed at three treatment plants: the Henry J. Mills Treatment Plant, the Joseph Jensen Treatment Plant and the Robert B. Diemer Treatment Plant. Completion of the improvements at the F.E. Weymouth plant is expected in 2017. Total oxidation program costs at the F.E. Weymouth plant are estimated to be $270.0 million. Oxidation retrofit at the Robert A. Skinner plant was substantially completed in December 2009 and operational in 2010, with additional follow-up work planned for completion in June 2018. The total estimated cost for all prior and projected oxidation retrofit facilities program improvements at the five treatment plants is approximately $1.12 billion, with $1.07 billion spent through September 2016. Budgeted aggregate capital expenditures for improvements remaining to be completed at the F.E. Weymouth and Robert A. Skinner plants for fiscal years 2016-17 and 2017-18 are $25 million.

F.E. Weymouth Treatment Plant Improvements. The F.E. Weymouth Treatment Plant, built in 1938, is Metropolitan's oldest water treatment facility. It has been subsequently expanded several times since its original construction. Metropolitan has completed several upgrades and refurbishment/replacement projects to maintain the plant's reliability and improve its efficiency. These include power systems upgrades, a residual solids dewatering facility, refurbishment/replacement of the mechanical equipment in two of the eight flocculation and settling basins, a new plant maintenance facility, new chemical feed systems and storage tanks, replacement of the plant domestic/fire water system, seismic upgrades to the plant inlet structure and filter buildings, and a new chlorine handling and containment facility. Planned projects over the next several years include refurbishment of the plant's filters and settling basins, seismic retrofits to the administration building, and replacement of the valves used to control filter operation. The cost estimate for all prior and projected improvements at the Weymouth plant, not including the ozone facilities, is approximately $407.1 million, with $243 million spent through September 2016. Budgeted aggregate capital expenditures for improvements at the Weymouth plant for fiscal years 2016-17 and 2017-18 are $31.5 million.

Robert B. Diemer Treatment Plant Improvements. The Robert B. Diemer Treatment Plant, built in in 1963 and subsequently expanded in 1968, is Metropolitan's second oldest water treatment facility. Several upgrades and refurbishment/replacement projects have been completed at the Diemer plant, including power system upgrades, a new residual solids dewatering facility, new vehicle and plant maintenance facilities, new chemical feed systems and storage tanks, a new chlorine handling and containment facility, construction of a roller-compacted concrete slope stabilization system and a new secondary access road. Planned projects over the next several years include refurbishment of the plant's settling basins, seismic retrofits to the filter buildings and administration building, and replacement of the valves used to control filter operation. The current cost estimate for all prior and projected improvements at the Diemer Treatment Plant, not including the ozone facilities, is approximately $381.1 million, with $234.5 million spent through September 2016. Budgeted aggregate capital expenditures for improvements at the Diemer plant for fiscal years 2016-17 and 2017-18 are $42.3 million.

Colorado River Aqueduct Facilities. As previously noted, deliveries through the CRA began in 1941. Through annual inspections and maintenance activities, the performance and reliability of the various components of the CRA are regularly evaluated. Projects under the CRA facilities program are designed to replace or refurbish facilities and components on the CRA system in order to reliably convey water from the Colorado River to Southern California. A variety of projects have been completed over the past 10 years, including, among other things, replacement of high voltage circuit breakers and transformers at the five pumping plant switchyards, refurbishment of operators and power centers on the head gates downstream of the pumping plants, replacement of several miles of deteriorated concrete canal liner, new wastewater systems at the Hinds and Eagle Mountain Pumping Plants, and replacement of the outlet gates and appurtenant electrical, mechanical, and control systems at the Copper Basin Reservoir. Refurbishment or

replacement of many of the electrical system components, including the transformers, circuit breakers and motor control centers, is currently under way. Additionally, many of the mechanical and electrical components at all five pumping plants will be evaluated and replaced or refurbished over the next several years. The currently projected cost estimate for all prior and planned refurbishment or replacement projects is $650.2 million. Costs through September 2016 were $208.2 million. Budgeted aggregate capital expenditures for improvements on the CRA for fiscal years 2016-17 and 2017-18 are $87.9 million.

Distribution System – Prestressed Concrete Cylinder Pipe. Metropolitan's distribution system is comprised of approximately 830 miles of pipelines ranging in diameter from 30 inches to over 200 inches. (See "METROPOLITAN'S WATER DELIVERY SYSTEM" in this Appendix A.) 163 miles of the distribution system is made up of prestressed concrete cylinder pipe ("PCCP"). In response to PCCP failures experienced by several water agencies, Metropolitan initiated the PCCP Assessment Program in December 1996 to evaluate the condition of Metropolitan's PCCP lines and investigate inspection and refurbishment methods. As a result, Metropolitan has identified and made repairs to several sections of PCCP. The costs for these repairs through September 2016 were $90.3 million. Rather than continue to make spot repairs to pipe segments, Metropolitan has initiated a long-term capital program to rehabilitate approximately 100 miles of PCCP in five pipelines. The estimated cost to reline all 100 miles of PCCP is approximately $2.6 billion and is expected to be undertaken over a period of approximately 20 years. Budgeted aggregate capital expenditures for PCCP rehabilitation for fiscal years 2016-17 and 2017-18 are $39.3 million.

Distribution System – Refurbishments and Improvements. In addition to the long-term program to rehabilitate Metropolitan's PCCP lines, several other components of the distribution system are being refurbished and/or improved. Ongoing projects to ensure the reliability of the distribution system, primarily due to age, include multiple replacements or refurbishments of isolation and control valves and gates, lining replacement on the Etiwanda Pipeline and portions of the Orange County Feeder, a new steel liner for the Bernasconi Tunnel, seismic upgrades to the Santa Ana River Bridge, refurbishment to pressure control and hydroelectric power facilities, system improvements to provide drought relief, and various other upgrades totaling approximately $228.2 million through September 2016. The currently projected cost estimate for the prior and planned refurbishment or replacement projects, other than the PCCP relining, is $749.3 million. For fiscal years 2016-17 and 2017-18, budgeted aggregate capital expenditures for improvements on the distribution system, other than PCCP rehabilitation, are $74.2 million.

METROPOLITAN REVENUES

General

Until water deliveries began in 1941, Metropolitan's activities were, by necessity, supported entirely through the collection of *ad valorem* property taxes. Since the mid-1980s, water sales revenues have provided approximately 75 to 85 percent of total revenues and *ad valorem* property taxes have accounted for about 10 percent of revenues, declining to seven percent of revenues in fiscal year 2015-16. See "–Revenue Allocation Policy and Tax Revenues." The remaining revenues have been derived principally from the sale of hydroelectric power, interest on investments and additional revenue sources (water standby charges and availability of service charges) beginning in 1992. *Ad valorem* taxes do not constitute a part of Operating Revenues and are not available to make payments with respect to the water revenue bonds issued by Metropolitan.

The basic rate for untreated water service for domestic and municipal uses is $666 per acre-foot at the Tier 1 level, which became effective January 1, 2017. This rate will increase to $695 effective January 1, 2018. See "–Rate Structure" and "–Water Rates." The *ad valorem* tax rate for Metropolitan purposes has gradually been reduced from a peak equivalent rate of 0.1250 percent of full assessed valuation in fiscal year 1945-46 to 0.0035 percent of full assessed valuation for fiscal year 2016-17. The rates charged by Metropolitan represent the cost of Metropolitan wholesale water service to its member agencies, and not the cost of water to the ultimate consumer. Metropolitan does not exercise control over the rates charged by its member agencies or their subagencies to their customers.

Summary of Revenues by Source

The following table sets forth Metropolitan's sources of revenues for the five fiscal years ended June 30, 2016. The table provides cash basis information for fiscal year 2012, and modified accrual basis information for fiscal years 2013-2016. All information is unaudited. Audited financial statements for the fiscal years ended June 30, 2016 and June 30, 2015 and unaudited financial statements for the six months ended December 31, 2016 and December 31, 2015 are provided in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

SUMMARY OF REVENUES BY SOURCE[1]
Fiscal Years Ended June 30
(Dollars in Millions)

	2012	2013	2014	2015	2016
Water Sales[2]	$1,062	$1,283	$1,485	$1,383	$1,166
Net Tax Collections[3]	90	95	95	104	108
Additional Revenue Sources[4]	167	173	182	199	200
Interest on Investments	18	(2)	19	16	17
Hydroelectric Power Sales	31	25	15	8	7
Other Revenues [5]	54	23	19	163	246
Total Receipts	$1,422	$1,597	$1,815	$1,873	$1,744

Source: Metropolitan.

(1) Does not include any proceeds from the sale of bonded indebtedness.
(2) Gross revenues in each year are for sales in the twelve months ended June 30 of such year. Water sales revenues include revenues from water wheeling and exchanges.
(3) *Ad valorem* taxes levied by Metropolitan are applied solely to the payment of outstanding general obligation bonds of Metropolitan and to State Water Contract obligations.
(4) Includes receipts derived from water standby charges, readiness-to-serve, and capacity charges.
(5) Includes miscellaneous revenues and Build America Bonds (BABs) subsidy payment of $13.3 million, $12.7 million, $12.3 million, $12.3 million, and $12.3 million, in fiscal years 2011-12 through 2015-16, respectively. In fiscal years 2014-15 and 2015-16, includes $142 million and $222 million of water conservation and water purchase expenditures, funded from a like amount of funds transferred from the Water Management Fund.

Revenue Allocation Policy and Tax Revenues

The Board determines the water revenue requirement for each fiscal year after first projecting the *ad valorem* tax levy for that year. The tax levy for any year is subject to limits imposed by the State Constitution, the Act and Board policy and to the requirement under the State Water Contract that in the event that Metropolitan fails or is unable to raise sufficient funds by other means, Metropolitan must levy upon all property within its boundaries not exempt from taxation a tax or assessment sufficient to provide for all payments under the State Water Contract. See "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A. From fiscal year 1990-91 through 2012-13, and pursuant to the Act, the tax levy was set to not exceed the amount needed to pay debt service on Metropolitan's general obligation bonds and to satisfy a portion of Metropolitan's State Water Contract obligation. However, Metropolitan has authority to impose a greater tax levy to pay debt service on Metropolitan's general obligation bonds and to satisfy Metropolitan's State Water Contract obligations in full if, following a public hearing, the Board finds that such revenue is essential Metropolitan's fiscal integrity. For each fiscal year since 2013-14, the Board has exercised that authority and voted to suspend the tax limit clause in the Act, maintaining the fiscal year 2012-13 *ad valorem* tax rate for fiscal years 2013-14 through 2016-17. Any deficiency between tax levy receipts and Metropolitan's share of debt service obligations on general obligation bonded debt issued by the State is expected to be paid from Operating Revenues, as defined in the Senior Debt Resolutions (defined herein under "METROPOLITAN EXPENSES–Limitations on Additional Revenue Bonds").

Water Sales Revenues

General; Authority. Water rates are established by the Board and are not subject to regulation or approval by the Public Utilities Commission of California or by any other local, State or federal agency. In accordance with the Act, water rates must be uniform for like classes of service. Metropolitan currently provides two classes of water service (1) full service treated and untreated, and (2) wheeling service. See "–Classes of Water Service."

No member agency of Metropolitan is obligated to purchase water from Metropolitan. However, 21 of Metropolitan's 26 member agencies have entered into 10-year voluntary water supply purchase orders ("Purchase Orders") effective through December 31, 2024. See "–Member Agency Purchase Orders." Consumer demand and locally supplied water vary from year to year, resulting in variability in water sales revenues. Metropolitan uses its financial reserves and budgetary tools to manage the financial impact of the variability in revenues due to fluctuations in annual water sales. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

Payment Procedure. Water is delivered to the member agencies on demand and is metered at the point of delivery. Member agencies are billed monthly and a late charge of one percent of the delinquent payment is assessed for a payment that is delinquent for no more than five business days. A late charge of two percent of the amount of the delinquent payment is charged for a payment that is delinquent for more than five business days for each month or portion of a month that the payment remains delinquent. Metropolitan has the authority to suspend service to any member agency delinquent for more than 30 days. Delinquencies have been rare; in such instances late charges have been collected. No service has been suspended because of delinquencies.

Water Sales. The following table sets forth the acre-feet of water sold and water sales (including sales from water wheeling and exchanges) for the five fiscal years ended June 30, 2016. Water sales revenues of Metropolitan for the four fiscal years ended June 30, 2013 through June 30, 2016, respectively, on an accrual basis, are shown in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

SUMMARY OF WATER SOLD AND WATER SALES
Fiscal Years Ended June 30

Year	Acre-Feet[1] Sold	Water Sales[2] (in millions)	Dollars Per Acre-Foot[3]	Average Dollars Per 1,000 Gallons
2012	1,676,855	$1,062.5	$634	$1.94
2013	1,856,685	1,282.5	691	2.12
2014	2,043,720	1,484.6	726	2.23
2015	1,905,502	1,383.0	726	2.23
2016	1,623,052	1,166.0	718	2.20

Source: Metropolitan.

(1) Year ended April 30 for fiscal year 2011-12, water sales recorded on a cash-basis. Beginning fiscal year 2012-13, water sales recorded on an accrual basis, with water sales for the fiscal year ended June 30.

(2) Water Sales in fiscal year 2011-12 are recorded on a cash basis for sales in the twelve months ended April 30 of such year, with rates and charges invoiced in May and payable by the last business day of June of each year. Water sales for fiscal years 2012-13 through 2015-16 are recorded on a modified accrual basis for sales in the twelve months ended June 30 of such year, with rates and charges recorded as revenues in the same months as invoiced. Includes revenues from water wheeling and exchanges.

(3) Gross water sales divided by acre-feet sold. An acre-foot is approximately 326,000 gallons. See table entitled "SUMMARY OF WATER RATES" under "–Water Rates" for a description of water rates and classes of service.

Principal Customers

Total water sales accrued for the fiscal year ended June 30, 2016 were 1.62 million acre-feet, generating $1.17 billion in water sales revenues for such period. Metropolitan's ten largest water customers in the year ended June 30, 2016 are shown in the following table, on an accrual basis. The SDCWA has filed litigation challenging Metropolitan's rates. See "–Litigation Challenging Rate Structure."

TEN LARGEST WATER CUSTOMERS
Year Ended June 30, 2016
Accrual Basis (Dollars in Millions)

Agency	Water Sales Revenues[1]	Percent of Total	Water Sales in Acre-Feet[1]	Percent of Total
San Diego County Water Authority	$ 270.9	23.2%	465,568	28.7%
City of Los Angeles	224.3	19.2	332,527	20.5
MWD of Orange County	140.3	12.0	171,666	10.6
West Basin MWD	100.0	8.6	107,319	6.6
Calleguas MWD	77.7	6.7	83,346	5.1
Eastern MWD	53.1	4.6	62,631	3.9
Western MWD	51.6	4.4	65,532	4.0
Three Valleys MWD	42.5	3.6	54,356	3.3
Central Basin MWD	35.5	3.0	46,745	2.9
City of Long Beach	24.3	2.1	27,684	1.7
Total	$1,020.2	87.5%	1,417,374	87.3%
Total Water Sales Revenues	$1,166.0	**Total Acre-Feet**	1,623,052	

Source: Metropolitan.

(1) Includes wheeling and exchange water sales, revenues and deliveries.

Rate Structure

The following rates and charges are elements of Metropolitan's rate structure for full service water deliveries:

Tier 1 and Tier 2 Water Supply Rates. The rate structure recovers supply costs through a two-tiered price structure. The Tier 1 Supply Rate supports a regional approach through the uniform, postage stamp rate. The Tier 1 Supply Rate is calculated as the amount of the total supply revenue requirement that is not covered by the Tier 2 Supply Rate divided by the estimated amount of Tier 1 water sales. The Tier 2 Supply Rate is a volumetric rate that reflects Metropolitan's cost of purchasing water transfers north of the Delta. Member agencies are charged the Tier 1 or Tier 2 Water Supply Rate for water purchases, as described under "–Member Agency Purchase Orders."

System Access Rate. The System Access Rate (SAR) recovers the cost of the Conveyance and Distribution System that is used on an average annual basis through a uniform, volumetric rate. The SAR is charged for each acre-foot of water transported by Metropolitan, regardless of the ownership of the water being transported. All users (including member agencies and third-party wheelers) using the Metropolitan system to transport water pay the same SAR for the use of the system conveyance and distribution capacity to meet average annual demands.

Water Stewardship Rate. The Water Stewardship Rate (WSR) provides a dedicated source of funding for conservation and local resources development through a uniform, volumetric rate. The WSR is

charged to each acre-foot of water delivered by Metropolitan, regardless of the water being transported. All users (member agencies and third-party wheelers) benefit from the system capacity made available by investments in Demand Management Programs like Metropolitan's Conservation Credits Program and Local Resources Program. Therefore, all users pay the WSR.

System Power Rate. The System Power Rate (SPR) recovers the cost of energy required to pump water to Southern California through the State Water Project and CRA. The cost of power is recovered through a uniform, volumetric rate. The SPR is applied to all deliveries of Metropolitan water to member agencies. Wheeling parties pay for actual cost (not system average) of power needed to move the water. Member agencies engaging in wheeling transaction of up to one year pay the wheeling rate (consisting of the actual cost of power, SAR, WSR, and an administrative fee). Other wheeling transactions are pursuant to individual contracts.

Treatment Surcharge. The Treatment Surcharge recovers all of the costs of providing treatment capacity and operations through a uniform, volumetric rate per acre-foot of treated water sales. The Treatment Surcharge is charged to all treated water sales.

The amount of each of these rates since January 1, 2012, is shown in the table entitled "SUMMARY OF WATER RATES" under "–Water Rates."

Member Agency Purchase Orders

The current rate structure allows member agencies to choose to purchase water from Metropolitan by means of a Purchase Order. Purchase Orders are voluntary agreements that determine the amount of water that a member agency can purchase at the Tier 1 Supply Rate. They allow member agencies to purchase a greater amount of water at the lower Tier 1 Supply Rate than would otherwise be authorized by the Administrative Code. In exchange for the higher Tier 1 Maximum, the member agency commits to purchase a specific amount of water (based on past purchase levels) over the term of the agreement. Such agreements allow member agencies to manage costs and provide Metropolitan with a measure of secure revenue.

In November 2014, the Metropolitan Board approved new Purchase Orders effective January 1, 2015 through December 31, 2024 (the "Purchase Order Term"). Twenty-one of the twenty-six member agencies have Purchase Orders, which commit the member agencies to purchase a minimum amount of supply from Metropolitan (the "Purchase Order Commitment").

The key terms of the Purchase Orders include:

- A ten-year term, effective January 1, 2015 through December 31, 2024;
- A higher Tier 1 limit based on the Base Period Demand, determined by the member agency's choice between (1) the Revised Base Firm Demand, which is the highest fiscal year purchases during the 13-year period of fiscal year 1989-90 through fiscal year 2001-02, or (2) the highest year purchases in the most recent 12-year period of fiscal year 2002-03 through 2013-14. The demand base is unique for each member agency, reflecting its use of Metropolitan's system water over time;
- An overall purchase commitment by the member agency based on the Demand Base period chosen, times ten to reflect the ten-year Purchase Order term. Those agencies choosing the more recent 12-year period may have a higher Tier 1 Maximum and commitment. The commitment is also unique for each member agency;
- The opportunity to reset the Base Period Demand using a five-year rolling average;

- Any obligation to pay the Tier 2 Supply Rate will be calculated over the ten-year period, consistent with the calculation of any Purchase Order commitment obligation; and

- An appeals process for agencies with unmet purchase commitments that will allow each acre-foot of unmet commitment to be reduced by the amount of production from a local resource project that commences operation on or after January 1, 2014.

Member agencies that do not have Purchase Orders in effect are subject to Tier 2 Supply Rates for amounts exceeding 60 percent of their base amount (equal to the member agency's highest fiscal year demand between 1989-90 and 2001-02) annually.

Other Charges

The following paragraphs describe the additional charges for the availability of Metropolitan's water:

Readiness-to-Serve Charge. The Readiness-to-Serve Charge ("RTS") recovers the cost of the portion of the system that is available to provide emergency service and available capacity during outages and hydrologic variability. The RTS is a fixed charge that is allocated among the member agencies based on a ten-fiscal year rolling average of firm demands. Water transfers and exchanges are included for purposes of calculating the ten-fiscal-year rolling average. The Standby Charge, described below, will continue to be collected at the request of member agency and applied as a direct offset to the member agency's RTS obligation. The RTS generated $154.0 million in fiscal year 2013-14, $162.0 million in 2014-15, and $155.5 million in 2015-16. Based on the adopted rates and charges, the RTS is projected to generate $144 million in fiscal year 2016-17 and $137.5 million in fiscal year 2017-18.

Water Standby Charges. The Standby Charge is authorized by the State Legislature and has been levied by Metropolitan since fiscal year 1992-93. Metropolitan will continue to levy the Standby Charge only within the service areas of the member agencies that request that the Standby Charge be utilized to help fund a member agency's RTS obligation. See "– Readiness-to-Serve Charge" above. The Standby Charge for each acre or parcel of less than an acre will vary from member agency to member agency, reflecting current rates, which have remained the same since fiscal year 1993-94, and range from $6.94 to $15 for each acre or parcel less than an acre within Metropolitan's service area, subject to specified exempt categories. Standby charges are assessments under the terms of Proposition 218, a State constitutional ballot initiative approved by the voters on November 5, 1996, but Metropolitan's current standby charges are exempt from Proposition 218's procedural requirements. See "–California Ballot Initiatives."

Twenty-two member agencies collect their RTS charges through standby charges. For fiscal years 2013-14, 2014-15, and 2015-16, RTS charges collected by means of such standby charges were $41.7 million, $41.7 million, and $42.8 million, respectively.

Capacity Charge. The Capacity Charge recovers costs incurred to provide peaking capacity within Metropolitan's distribution system. The Capacity Charge provides a price signal to encourage agencies to reduce peak demands on the distribution system and to shift demands that occur during the May 1 through September 30 period into the October 1 through April 30 period. This results in more efficient utilization of Metropolitan's existing infrastructure and deferring capacity expansion costs. Each member agency will pay the Capacity Charge per cubic feet per second based on a three-year trailing maximum peak day demand. Effective January 1, 2014, the Capacity Charge was $8,600 per cubic feet per second. The Capacity Charge was $11,100 per cubic feet per second on January 1, 2015, and $10,900 per cubic feet per second on January 1, 2016, and will be $8,000 per cubic feet per second on January 1, 2017, and $8,700 per cubic feet per second on January 1, 2018. The Capacity Charge is projected to generate $39.7 million in fiscal year 2016-17 and $35.2 million in fiscal year 2017-18.

Classes of Water Service

Metropolitan offers two classes of water service:

(1) *Full Service Water* - Full service water service, formerly known as non-interruptible water service, includes water sold to member agencies for domestic and municipal uses; and

(2) Wheeling Service - Wheeling Service refers to the use of Metropolitan's facilities, including its rights to use State Water Project facilities, to transport water not owned or controlled by Metropolitan to its member public agencies, in transactions entered into by Metropolitan for a period of up to one year.

The applicable rate components and fixed charges for each class of water service are shown in the chart below.

Current Services and Rate Components

	Rates & Charges That Apply					
Service	System Access	Water Stewardship	System Power	Tier 1/ Tier 2	Readiness to Serve	Capacity Charge
Full Service (Treated or Untreated)	Yes	Yes	Yes	Yes	Yes	Yes
Wheeling Service	Yes	Yes	No	No	Yes	Yes

Metropolitan offers two programs that encourage the member agencies to increase groundwater and emergency storage and for which certain Metropolitan charges are inapplicable.

(1) Conjunctive Use Program. The Conjunctive Use Program is operated through individual agreements with member and retail agencies for groundwater storage within Metropolitan's service area. Wet-year imported supplies are stored to enhance reliability during dry, drought, and emergency conditions. Metropolitan has the option to call water stored in the groundwater basins for the participating member agency pursuant to its contractual conjunctive use agreement. At the time of the call, the member agency pays the prevailing rate for that water, but the deliveries are excluded from the calculation of the Capacity Charge because Conjunctive Use Program deliveries are made at Metropolitan's Discretion. See "REGIONAL WATER RESOURCES–Local Water Supplies."

(2) Emergency Storage Program. The Emergency Storage Program is used for delivering water for emergency storage in surface water reservoirs and storage tanks. Emergency Storage Program purposes include initially filling a newly constructed reservoir or storage tank and replacing water used during an emergency.

The applicable rate components and fixed charges applicable for each such program are shown in the following chart.

Current Programs and Rate Components

	Rates & Charges That Apply					
Full Service Program	System Access	Water Stewardship	System Power	Tier 1/ Tier 2	Readiness to Serve	Capacity Charge
Conjunctive Use Program	Yes	Yes	Yes	Yes	Yes	No
Emergency Storage Program	Yes	Yes	Yes	No*	No	No

*Emergency Storage Program pays the Tier 1 Supply Rate; purchases under Emergency Storage program do not count towards a member agency's Tier 1 Maximum.

Water Rates

The following table sets forth Metropolitan's water rates by category beginning January 1, 2012. See also "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES–Water Sales Revenues" in this Appendix A. In addition to the base rates for untreated water sold in the different classes of service, the columns labeled "Treated" include the surcharge that Metropolitan charges for water treated at its water treatment plants. See "–Rate Structure" and "–Classes of Water Service" above for a description of current rates. See also "–Litigation Challenging Rate Structure" for a description of litigation challenging Metropolitan's water rates.

SUMMARY OF WATER RATES
(Dollars per Acre-Foot)

	SUPPLY RATE		SYSTEM ACCESS RATE	WATER STEWARDSHIP RATE	SYSTEM POWER RATE	TREATMENT SURCHARGE
	Tier 1	Tier 2				
January 1, 2012	$164[1]	$290	$217	$43	$136	$234
January 1, 2013	$140	$290	$223	$41	$189	$254
January 1, 2014	$148	$290	$243	$41	$161	$297
January 1, 2015	$158	$290	$257	$41	$126	$341
January 1, 2016	$156	$290	$259	$41	$138	$348
January 1, 2017*	$201	$295	$289	$52	$124	$313
January 1, 2018*	$209	$295	$299	$55	$132	$320

	FULL SERVICE TREATED[2]		FULL SERVICE UNTREATED[3]		INTERIM AGRICULTURAL PROGRAM		REPLENISHMENT RATE	
	Tier 1	Tier 2	Tier 1	Tier 2	Treated	Untreated	Treated	Untreated
January 1, 2012	$794	$920	$560	$686	$765	$537	$651	$442
January 1, 2013	$847	$997	$593	$743	**	**	**	**
January 1, 2014	$890	$1,032	$593	$735	**	**	**	**
January 1, 2015	$923	$1,055	$582	$714	**	**	**	**
January 1, 2016	$942	$1,076	$594	$728	**	**	**	**
January 1, 2017*	$979	$1,073	$666	$760	**	**	**	**
January 1, 2018*	$1,015	$1,101	$695	$781	**	**	**	**

Source: Metropolitan.

* Rates effective January 1, 2017 and January 1, 2018 were adopted by Metropolitan's Board on April 12, 2016.

** The Interim Agricultural Water Program and Replenishment Service Program were discontinued after 2012. The Interim Agricultural Water Program provided a discounted rate for agricultural water users that, pursuant to the Act, were permitted to receive only surplus water not needed for domestic or municipal purposes. Under the Replenishment Service Program, water was sold at a discounted rate to member agencies, subject to interruption upon notice by Metropolitan. The program allowed Metropolitan to deliver surplus imported water to local groundwater basins and surface storage facilities when supplies were available, with the intent that member agencies could reduce imported water deliveries from Metropolitan during periods of high demand, emergencies or times of shortage.

(1) Includes $58 per acre-foot Delta Supply Surcharge for January 1, 2012.

(2) Full service treated water rates are the sum of the applicable Supply Rate, System Access Rate, Water Stewardship Rate, System Power Rate and Treatment Surcharge.

(3) Full service untreated water rates are the sum of the applicable Supply Rate, System Access Rate, Water Stewardship Rate and System Power Rate.

Financial Reserve Policy

Metropolitan's reserve policy currently provides for a minimum unrestricted reserve balance at June 30 of each year that is based on probability studies of the wet periods that affect Metropolitan's water sales. The policy establishes a minimum targeted unrestricted reserve level based on an 18-month revenue shortfall estimate and a target level based on an additional two years revenue shortfall estimate. Funds representing the minimum reserve level are held in the Revenue Remainder Fund, and any funds in excess of the minimum reserve level are held in the Water Rate Stabilization Fund. Metropolitan established the Water Rate Stabilization Fund for the principal purpose of maintaining stable and predictable water rates and charges. If Metropolitan's fixed charge coverage ratio, which measures the total coverage of all fixed obligations (which includes all revenue bond debt service obligations, State Water Contract capital payments paid from current year operations and subordinate obligations) after payment of operating expenditures, is less than 1.2 times, funds above the target reserve level may be utilized for funding of capital expenditures or for the redemption, defeasance or purchase of outstanding bonds or commercial paper, as determined by the Board. If Metropolitan's fixed charge coverage ratio, is at or above 1.2 times, funds above the target may be used for any lawful purpose of Metropolitan, as determined by the Board. See "CAPITAL INVESTMENT PLAN–Capital Investment Plan Financing" in this Appendix A.

At June 30, 2016, unrestricted reserves, which consist of the Water Rate Stabilization Fund and the Revenue Remainder Fund, totaled $475 million on a modified accrual basis. As of June 30, 2016, the minimum reserve requirement was $205 million and the target reserve level was $490 million.

From time to time, Metropolitan's Board approves the use of unrestricted reserves. On May 26, 2015, Metropolitan's Board approved the use of $160 million of unrestricted reserves, above the target reserve level, for conservation incentives. In addition, $50 million from the Water Stewardship Fund and $140 million from the Water Management Fund funded conservation incentives. On July 14, 2015, Metropolitan's Board approved $264 million to acquire various properties in Riverside and Imperial Counties, with $160 million funded from the Replacement and Refurbishment Fund and the remaining amount from unrestricted reserves. On September 22, 2015, Metropolitan's Board approved $44.4 million to pay SNWA to store 150,000 acre-feet of water with Metropolitan. Metropolitan took delivery of this water in 2015. When SNWA requests the return of any of the stored water, SNWA will reimburse Metropolitan for an equivalent proportion of the $44.4 million, based on the amount of water returned plus inflation. See "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct – Colorado River Operations: Surplus and Shortage Guidelines – Interim Surplus Guidelines" in this Appendix A.

Due to SDCWA's litigation challenging Metropolitan's rates and pursuant to the exchange agreement between Metropolitan and SDCWA, Metropolitan is required to set aside funds based on the quantities of exchange water that Metropolitan provides to SDCWA and the amount of charges disputed by SDCWA. This amount included disputed payments and interest earned thereon, which is based on the rate earned by Metropolitan's investment portfolio. In April 2016, Metropolitan transferred these funds from unrestricted financial reserves to a new designated fund, the Exchange Agreement Set-Aside Fund. As of December 31, 2016, Metropolitan had set aside $278.7 million in the Exchange Agreement Set-Aside Fund. This amount includes disputed payments and interest earned thereon based on the rate earned by Metropolitan's investment portfolio. The amounts held do not include the statutory prejudgment interest, post-judgment interest, attorneys' fees, or costs awards, none of which the exchange agreement requires to be held. Amounts held pursuant to the exchange agreement will continue to accumulate based on the quantities of exchange water that Metropolitan provides to SDCWA and the payments disputed by SDCWA, until the litigation, including all appeals, is concluded. See "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct – Sale of Water by the Imperial Irrigation District to San Diego County Water Authority" and "METROPOLITAN REVENUES–Litigation Challenging Rate Structure" in this Appendix A.

As described below, Metropolitan has executed two $200 million Short-Term Revolving Credit Facilities (as defined below), under which Metropolitan may borrow from time-to-time. Funds drawn under

the Short-Term Revolving Credit Facilities may be used for any lawful purpose. In April 2016, Metropolitan drew $125 million from each Short-Term Revolving Credit Facility (as defined below), for a total of $250 million, and deposited these amounts in Metropolitan's unrestricted financial reserves. An additional draw of approximately $50 million is expected by the end of June 2017, with such amount to be deposited in Metropolitan's unrestricted financial reserves. See "METROPOLITAN EXPENSES–Outstanding Senior Revenue Bonds and Senior Parity Obligations – Senior Parity Obligations – Short-Term Revolving Credit Facilities" in this Appendix A.

Metropolitan projects that its unrestricted reserves as of June 30, 2017 will be approximately $378 million. This amount does not include funds held in the Exchange Agreement Set-Aside Fund. This projection is based on the assumptions set forth in the table entitled "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" under "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A. In addition, this projection is based on the assumption that Metropolitan's Board will not authorize the use of any additional amounts in the unrestricted reserves.

California Ballot Initiatives

Proposition 218, a State ballot initiative known as the "Right to Vote on Taxes Act," was approved by the voters on November 5, 1996 adding Articles XIIIC and XIIID to the California Constitution. Article XIIID provides substantive and procedural requirements on the imposition, extension or increase of any "fee" or "charge" levied by a local government upon a parcel of real property or upon a person as an incident of property ownership. As a wholesaler, Metropolitan serves water to its member agencies, not to persons or properties as an incident of property ownership. Thus, water rates charged by Metropolitan to its member agencies are not property related fees and charges and therefore are exempt from the requirements of Article XIIID. Fees for retail water service by Metropolitan's member agencies or their agencies are subject to the requirements of Article XIIID.

Article XIIID also imposes certain procedures with respect to assessments. Under Article XIIID, "standby charges" are considered "assessments" and must follow the procedures required for "assessments," unless they were in existence on the effective date of Article XIIID. Metropolitan has imposed its water standby charges since 1992 and therefore its current standby charges are exempt from the Article XIIID procedures. Changes to Metropolitan's current standby charges could require notice to property owners and approval by a majority of such owners returning mail-in ballots approving or rejecting any imposition or increase of such standby charge. Twenty-two member agencies have elected to collect all or a portion of their readiness-to-serve charges through standby charges. See "–Other Charges – Readiness-to-Serve Charge" and "– Water Standby Charges" above. Even if Article XIIID is construed to limit the ability of Metropolitan and its member agencies to impose or collect standby charges, the member agencies will continue to be obligated to pay the readiness-to-serve charges.

Article XIIIC makes all taxes general or special taxes and imposes voting requirements for each kind of tax. It also extends the people's initiative power to reduce or repeal previously authorized local taxes, assessments, fees and charges. This extension of the initiative power is not limited by the terms of Article XIIIC to fees imposed after November 6, 1996 or to property-related fees and charges and absent other authority could result in retroactive reduction in existing taxes, assessments or fees and charges.

Proposition 26, a State ballot initiative aimed at restricting regulatory fees and charges, was approved by the California voters on November 2, 2010. Proposition 26 broadens the definition of "tax" in Article XIIIC of the California Constitution to include levies, charges and exactions imposed by local governments, except for charges imposed for benefits or privileges or for services or products granted to the payor (and not provided to those not charged) that do not exceed their reasonable cost; regulatory fees that do not exceed the cost of regulation and are allocated in a fair or reasonable manner; fees for the use of local governmental property; fines and penalties imposed for violations of law; real property development fees; and assessments and property-related fees imposed under Article XIIID of the California Constitution.

Special taxes imposed by a special district such as Metropolitan are subject to approval by two-thirds of the electorate voting on the ballot measure for authorization. Proposition 26 applies to charges imposed or increased by local governments after the date of its approval. Metropolitan believes its water rates and charges are not taxes under Proposition 26. SDCWA's lawsuit challenging the rates adopted by Metropolitan in April 2012, part of which became effective January 1, 2013 and part of which became effective January 1, 2014, alleged that such rates violate Proposition 26. On April 24, 2014, a trial court decision stated such rates, effective in 2013 and 2014, violate Proposition 26. The trial court's rulings, including the decision that specific rates violate certain laws, are on appeal. (See "–Litigation Challenging Rate Structure.")

Propositions 218 and 26 were adopted as measures that qualified for the ballot pursuant to the State's initiative process. From time to time, other initiative measures could be adopted or legislative measures could be approved by the Legislature, which may place limitations on the ability of Metropolitan or its member agencies to increase revenues or to increase appropriations. Such measures may further affect Metropolitan's ability to collect taxes, assessments or fees and charges, which could have an effect on Metropolitan's revenues.

Preferential Rights

Section 135 of the Act gives each of Metropolitan's member agencies a preferential entitlement to purchase a portion of the water served by Metropolitan, based upon a ratio of all payments on tax assessments and otherwise, except purchases of water, made to Metropolitan by the member agency compared to total payments made by all member agencies on tax assessments and otherwise since Metropolitan was formed, except purchases of water. Historically, these rights have not been used in allocating Metropolitan's water. The California Court of Appeal has upheld Metropolitan's methodology for calculation of the respective member agencies' preferential rights under Section 135 of the Act. SDCWA's litigation challenging Metropolitan's water rates also challenges Metropolitan's exclusion of payments for exchange water from the calculation of SDCWA's preferential right. On August 28, 2015, the trial court ruled that SDCWA "is entitled to a judicial declaration (a) that Metropolitan's current methodology for calculating San Diego's preferential rights violates Section 135 of the Metropolitan Water District Act; and (b) directing Metropolitan to include San Diego's payments for the transportation of water under the Exchange Agreement in Metropolitan's calculation of San Diego's preferential rights." This ruling is subject to appeal. See "–Litigation Challenging Rate Structure."

Litigation Challenging Rate Structure

SDCWA filed *San Diego County Water Authority v. Metropolitan Water District of Southern California, et al.* on June 11, 2010. The complaint alleges that the rates adopted by the Board on April 13, 2010, which became effective January 1, 2011 and January 1, 2012, misallocate certain State Water Contract costs to the System Access Rate and the System Power Rate, and thus to charges for transportation of water, and that this results in an overcharge to SDCWA by at least $24.5 million per year. The complaint alleges that all State Water Project costs should be allocated instead to Metropolitan's Supply Rate, even though under the State Water Contract Metropolitan is billed separately for transportation, power and supply costs. It states additionally that Metropolitan will overcharge SDCWA by another $5.4 million per year by including the Water Stewardship Rate in transportation charges. Eight of Metropolitan's member agencies (the Cities of Glendale, Los Angeles and Torrance, MWDOC and Foothill, Las Virgenes, Three Valleys and West Basin Municipal Water Districts) answered the complaint in support of Metropolitan. IID joined the litigation in support of SDCWA's challenge to Metropolitan's charges for transportation of water, but withdrew and dismissed all claims against Metropolitan with prejudice on October 30, 2013.

The complaint requested a court order invalidating the rates adopted April 13, 2010, and that Metropolitan be mandated to allocate costs associated with the State Water Contract and the Water Stewardship Rate to water supply rates and not to transportation rates. Rates in effect in prior years are not

challenged in this lawsuit. Metropolitan contends that its rates are reasonable, equitably apportioned among its member agencies and lawful, and were adopted under a valid rate structure and cost of service approach developed in a multi-year collaborative process with its member agencies that was adopted in 2001 and has been in place since 2003. Nevertheless, to the extent that a final court ruling invalidates Metropolitan's adopted rates, Metropolitan will be obligated to reconsider and modify rates to comply with any final court rulings related to Metropolitan's rates. While components of the rate structure and costs may change as a result of any final ruling, Metropolitan expects that aggregate rates and charges would still recover Metropolitan's cost of service. As such, revenues would not be affected. If Metropolitan's rates are revised in the manner proposed by SDCWA in the complaint, other member agencies may pay higher rates unless other actions are taken by the Board.

SDCWA filed its First Amended Petition for Writ of Mandate and Complaint on October 27, 2011, adding five new claims to this litigation, two of which were eliminated from the case on January 4, 2012. The three remaining new claims are for breach of the water exchange agreement between Metropolitan and SDCWA (described herein under "METROPOLITAN'S WATER SUPPLY–Colorado River Aqueduct–Sale of Water by the Imperial Irrigation District to San Diego County Water Authority") based on allegedly illegal rates; improper exclusion of SDCWA's payments under this exchange agreement from calculation of SDCWA's preferential rights to purchase Metropolitan supplies (see "–Preferential Rights"); and illegality of the "rate structure integrity" provision in conservation and local resources incentive agreements between Metropolitan and SDCWA. The "rate structure integrity" provision permits the Board to terminate incentives payable under conservation and local resources incentive agreements between Metropolitan and a member agency due to certain actions by the member agency to challenge the rates that are the source of incentive payments. In June 2011, Metropolitan's Board authorized termination of two incentive agreements with SDCWA under the "rate structure integrity" provision in such agreements after SDCWA filed its initial complaint challenging Metropolitan's rates. SDCWA filed a Second Amended Petition for Writ of Mandate and Complaint on April 17, 2012, which contains additional allegations but no new causes of action.

On June 8, 2012, SDCWA filed a new lawsuit challenging the rates adopted by Metropolitan on April 10, 2012 and effective on January 1, 2013 and January 1, 2014. See "–Rate Structure" above and "–Water Rates" for a description of Metropolitan's water rate structure and the rates and charges adopted on April 10, 2012. The complaint contains allegations similar to those in the Second Amended Petition for Writ of Mandate and Complaint and new allegations asserting that Metropolitan's rates, adopted in April 2012, violate Proposition 26. See "–California Ballot Initiatives" for a description of Proposition 26. Metropolitan contends that its rates adopted on April 10, 2012 are reasonable, equitably apportioned among its member agencies and lawful and were adopted under a valid rate structure and cost of service approach. Ten of Metropolitan's member agencies (the eight member agency parties to SDCWA's first lawsuit, Eastern Municipal Water District and Western Municipal Water District of Riverside County) answered the complaint in support of Metropolitan and IID joined the litigation in support of SDCWA. Subsequently, IID dismissed all claims with prejudice in this second case too, and the City of Glendale withdrew from both cases.

SDCWA filed a Third Amended Petition for Writ of Mandate and Complaint on January 23, 2013, to add new allegations that Metropolitan's rates adopted in April 2010 did not meet the requirements of Proposition 26, approved by California voters in November 2010. The court granted Metropolitan's motion to strike allegations relating to Proposition 26 on March 29, 2013, expressly ruling that SDCWA may not allege a violation of Proposition 26 in its challenge to the rates adopted in April 2010. This ruling does not affect SDCWA's separate challenge to Metropolitan's rates adopted in April 2012, which also includes Proposition 26 allegations. On December 4, 2013, the court granted Metropolitan's motion for summary adjudication of the cause of action alleging illegality of the "rate structure integrity" provision in conservation and local resources incentive agreements, dismissing this claim in the first lawsuit.

Trial of the first phase of both lawsuits before the Superior Court of California, County of San Francisco (Case Nos. CPF-10-510830 and CPF-12-512466) concluded January 23, 2014. This phase concerned the challenges to Metropolitan's rates. On April 24, 2014, the trial court issued its "Statement of Decision on Rate Setting Challenges," determining that SDCWA prevailed on two of its claims and that Metropolitan prevailed on the third claim. The trial court found that there was not sufficient evidence in the administrative record to support Metropolitan's inclusion in its transportation rates, and hence in its wheeling rate, of 100 percent of (1) payments it makes to the California Department of Water Resources for the State Water Project, or (2) the costs incurred by Metropolitan for conservation and local water supply development programs recovered through the Water Stewardship Rate. The trial court decision stated that the System Access Rate, System Power Rate, Water Stewardship Rate and wheeling rate violate specified statutes and the common law and such rates effective in 2013 and 2014 violate Proposition 26. The trial court's decision was based on its conclusion that these rates are unfair to wheelers. The trial court found that SDCWA failed to prove its "dry-year peaking" claim that Metropolitan's rates do not adequately account for variations in member agency purchases.

SDCWA's claims asserting breach of the exchange agreement and miscalculation of preferential rights were tried in a second phase of the case which concluded April 30, 2015. On August 28, 2015, the trial court issued a final statement of decision for the second phase. The decision found in favor of SDCWA on both claims and that SDCWA is entitled to contract damages in the amount of $188,295,602 plus interest. On October 9 and 30, 2015, the trial court granted SDCWA's motion for prejudgment interest at the statutory rate of 10 percent on these damages. The prejudgment interest award through entry of judgment is $46,637,180. After entry of judgment, post-judgment interest began accruing at the statutory rate of 7 percent. On November 18, 2015, the court issued the Final Judgment and a Peremptory Writ of Mandate in the 2010 and 2012 SDCWA v. Metropolitan cases. On January 21, 2016, the trial court awarded $320,084 in costs to SDCWA, after deducting amounts based on Metropolitan's motion. On March 24, 2016, the trial court awarded $8,910,354 in attorneys' fees to SDCWA, rejecting its demand for over $17.0 million. Metropolitan filed a Notice of Appeal of the Judgment and Writ in each case, and SDCWA filed a Notice of Cross-Appeal of the court's ruling on the rate structure integrity provision claim and the attorneys' fees order. Appellate briefing by the parties was completed on October 28, 2016. No date for oral argument has been set. Metropolitan is unable to assess at this time the likelihood of success of this litigation, including the appeal, or any future claims.

Due to SDCWA's litigation challenging Metropolitan's rates, and pursuant to the exchange agreement between Metropolitan and SDCWA, as of December 31, 2016, Metropolitan held $278.7 million in a designated fund, the Exchange Agreement Set-Aside Fund. See "–Financial Reserve Policy." This amount includes both SDCWA's disputed payments and interest earned thereon, which is based on the rate earned by Metropolitan's investment portfolio. Amounts held pursuant to the exchange agreement will continue to accumulate based on the quantities of exchange water that Metropolitan provides to SDCWA and the payments disputed by SDCWA, until the litigation, including all appeals, is concluded. The amounts held do not include the statutory prejudgment interest, post-judgment interest, attorneys' fees, or costs awards, none of which the exchange agreement requires to be held.

In May 2014, SDCWA filed a new lawsuit asserting essentially the same rate claims and breach of contract claim in connection with the Board's April 2014 rate adoption. Metropolitan filed its answer on June 30, 2014. On February 9, 2015, pursuant to stipulation by the parties, the San Francisco Superior Court ordered that the case be stayed. The stay may be lifted upon motion by any party. On November 20, 2015, SDCWA filed a motion to partially lift the stay. On December 21, 2015, the trial court decided that motion and the case remains stayed. Metropolitan is unable to assess at this time the likelihood of success of this case, any possible appeal or any future claims.

On April 13, 2016, SDCWA filed a new lawsuit that alleges all rates and charges for 2017 and 2018 adopted by Metropolitan's Board on April 12, 2016 violate the California Constitution, statutes, and common

law. The Petition for Writ of Mandate and Complaint asserts misallocation of costs as alleged in the previous cases listed above and additional claims of over-collection and misallocation of costs and procedural violations, and states SDCWA intends to amend to allege further claims including breach of contract. In a claim letter dated May 2, 2016, SDCWA asserted three breaches of the exchange agreement: the same breach alleged in the previous cases listed above, breach of the set-aside provision noted above, and breach of a provision concerning characterizing exchange water for certain purposes in the same manner as local water of other member agencies. On June 30, 2016, the nine member agencies that are interested parties to the 2010, 2012, and 2014 cases filed answers to also join the 2016 case as interested parties in support of Metropolitan. On October 27, 2016, SDCWA filed a Motion for Leave to File Amended Complaint alleging the same exchange agreement breach alleged in the previous cases listed above and breach of the set-aside provision noted above relating to the manner in which Metropolitan has set aside the amounts. The proposed amended petition/complaint also requests a judicial declaration that, if a judgment is owed to SDCWA under the exchange agreement, SDCWA will not be required to pay any portion of that judgment, and requests a refund to SDCWA of any amount Metropolitan has collected in excess of the reasonable costs of services provided or, alternatively, a reduction in SDCWA's future fees. On September 27, 2016, the case was transferred to San Francisco Superior Court. On November 10, 2016, pursuant to stipulation by the parties, the court ordered that the case be stayed pending final resolution of the appeals of the 2010 and 2012 SDCWA v. Metropolitan cases. Metropolitan is unable to assess at this time the likelihood of success of this case, any possible appeal or any future claims.

Other Revenue Sources

Hydroelectric Power Recovery Revenues. Metropolitan has constructed 16 small hydroelectric plants on its distribution system. The plants are located in Los Angeles, Orange, Riverside and San Diego Counties at existing pressure control structures and other locations. The combined generating capacity of these plants is approximately 131 megawatts. The total capital cost of the 16 facilities is approximately $176.1 million. Since 2000, annual energy generation sales revenues have ranged between $7.5 million and nearly $29.6 million. Energy generation sales revenues were $8.5 million in fiscal year 2014-15 and $7.5 million in fiscal year 2015-16. Low State Water Project supplies and reduced demands due to mandatory conservation resulted in diminished flows thorough Metropolitan's pipelines and hydroelectric power plants and decreased revenues.

Investment Income. In fiscal years 2013-14, 2014-15, and 2015-16, Metropolitan's earnings on investments, including adjustments for gains and losses and premiums and discounts, including construction account and trust fund earnings, excluding gains and losses on swap terminations, on an accrual basis (audited) were $21.2 million, $22.3 million, and $19.4 million, respectively.

Investment of Moneys in Funds and Accounts

All moneys in any of the funds and accounts established pursuant to Metropolitan's water revenue or general obligation bond resolutions are invested by the Treasurer in accordance with Metropolitan's Statement of Investment Policy. All Metropolitan funds available for investment are currently invested in United States Treasury and agency securities, commercial paper, negotiable certificates of deposit, banker's acceptances, corporate notes, municipal bonds, asset-backed securities, mortgage-backed securities and the California Local Agency Investment Fund ("LAIF"). The LAIF is a voluntary program created by statute as an investment alternative for California's local governments and special districts. LAIF permits such local agencies to participate in an investment portfolio, which invests billions of dollars, using the investment expertise of the State Treasurer's Office.

The Statement of Investment Policy provides that in managing Metropolitan's investments, the primary objective shall be to safeguard the principal of the invested funds. The secondary objective shall be to meet all liquidity requirements and the third objective shall be to achieve a return on the invested funds. Although the Statement of Investment Policy permits investments in some asset-backed securities, the

portfolio does not include any of the special investment vehicles related to sub-prime mortgages. The Statement of Investment Policy allows Metropolitan to exceed the portfolio and single issuer limits for purchases of California local agency securities when purchasing Metropolitan tendered bonds in conjunction with its self-liquidity program. See "METROPOLITAN EXPENSES–Outstanding Senior Revenue Bonds and Senior Parity Obligations – Variable Rate and Swap Obligations" in this Appendix A. Metropolitan's current investments comply with the Statement of Investment Policy.

As of December 31, 2016, the total market value (cash-basis) of all Metropolitan funds was $1.37 billion, including bond reserves of $53.9 million. The market value of Metropolitan's investment portfolio is subject to market fluctuation and volatility and general economic conditions. Over the three years ended December 31, 2016, the market value of the month-end balance of Metropolitan's investment portfolio (excluding bond reserve funds) averaged approximately $1.23 billion. The minimum month-end balance of Metropolitan's investment portfolio (excluding bond reserve funds) during such period was approximately $936.3 million on August 31, 2016. See Footnote 3 to Metropolitan's audited financial statements in Appendix B for additional information on the investment portfolio.

Metropolitan's administrative code requires that (1) the Treasurer provide an annual Statement of Investment Policy for approval by Metropolitan's Board, (2) the Treasurer provide a monthly investment report to the Board and the General Manager showing by fund the description, maturity date, yield, par, cost and current market value of each security, and (3) the General Counsel review as to eligibility the securities invested in by the Treasurer for that month and report his or her determinations to the Board. The Board approved the Statement of Investment Policy for fiscal year 2016-17 on June 14, 2016.

Subject to the provisions of Metropolitan's water revenue or general obligation bond resolutions, obligations purchased by the investment of bond proceeds in the various funds and accounts established pursuant to a bond resolution are deemed at all times to be a part of such funds and accounts and any income realized from investment of amounts on deposit in any fund or account therein will be credited to such fund or account. The Treasurer is required to sell or present for redemption any investments whenever it may be necessary to do so in order to provide moneys to meet required payments or transfers from such funds and accounts. For the purpose of determining at any given time the balance in any such funds, any such investments constituting a part of such funds and accounts will be valued at the then estimated or appraised market value of such investments.

All investments, including those authorized by law from time to time for investments by public agencies, contain certain risks. Such risks include, but are not limited to, a lower rate of return than expected and loss or delayed receipt of principal. The occurrence of these events with respect to amounts held under Metropolitan's water revenue or general obligation revenue bond resolutions, or other amounts held by Metropolitan, could have a material adverse effect on Metropolitan's finances. These risks may be mitigated, but are not eliminated, by limitations imposed on the portfolio management process by Metropolitan's Statement of Investment Policy.

The Statement of Investment Policy requires that investments have a minimum credit rating of "A1/P1/F1" for short-term securities and "A" for longer-term securities at the time of purchase. If immediate liquidation of a security downgraded below these levels is not in the best interests of Metropolitan, the Treasurer or investment manager, in consultation with an ad hoc committee made up of the Chairman of the Board, the Chairman of the Finance and Insurance Committee and the General Manager, and with the concurrence of the General Counsel, may dispose of the security in an orderly and prudent manner considering the circumstances, under terms and conditions approved by a majority of the members of such ad hoc committee. The Treasurer is required to include a description of any securities that have been downgraded below investment grade and the status of their disposition in the Treasurer's monthly report.

The Statement of Investment Policy also limits the amount of securities that can be purchased by category, as well as by issuer, and prohibits investments that can result in zero interest income. Metropolitan's securities are settled on a delivery versus payment basis and are held by an independent third-party custodian. See APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)" for a description of Metropolitan's investments at September 30, 2016.

Metropolitan retains two outside investment firms to manage the long-term portion of Metropolitan's portfolio. The outside managers are required to adhere to Metropolitan's Statement of Investment Policy. As of December 31, 2016, such managers were managing approximately $342.3 million in investments on behalf of Metropolitan. Metropolitan's Statement of Investment Policy may be changed at any time by the Board (subject to State law provisions relating to authorized investments). There can be no assurance that the State law and/or the Statement of Investment Policy will not be amended in the future to allow for investments that are currently not permitted under State law or the Statement of Investment Policy, or that the objectives of Metropolitan with respect to investments or its investment holdings at any point in time will not change.

METROPOLITAN EXPENSES

General

The following table sets forth a summary of Metropolitan's expenses, by major function, for the five years ended June 30, 2016. The table provides cash basis information for fiscal year 2012, and modified accrual basis information for fiscal years 2013-2016. All information is unaudited. Expenses of Metropolitan for the fiscal years ended June 30, 2016 and June 30, 2015, on an accrual basis, are shown in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

SUMMARY OF EXPENSES
Fiscal Years Ended June 30
(Dollars in Millions)

	2012	2013	2014	2015	2016
Operation and Maintenance Costs[1]	$ 425	$ 456	$ 512	$ 697	$ 799
Total State Water Project[2]	536	480	465	436	512
Total Debt Service	323	339	384	303	332
Construction Disbursements from Revenues[3]	44	55	117	210	273
Other[4]	3	5	6	7	6
Total Disbursements (net of reimbursements)	$1,331	$1,335	$1,484	$1,653	$1,922

Source: Metropolitan.

(1) Includes operation and maintenance, debt administration, conservation and local resource programs, CRA power, and water supply expenses. For fiscal years 2014-15 and 2015-16, includes $142 million, and $222 million, respectively, of conservation projects funded from transfers from the Water Management Fund.

(2) Includes both operating and capital expense portions.

(3) At the discretion of the Board, in any given year, Metropolitan may increase or decrease funding available for construction disbursements to be paid from revenues. Includes $160 million for acquiring properties in Riverside and Imperial Counties, funded by $160 million from the Replacement and Refurbishment Fund Reserves. Does not include expenditures of bond proceeds.

(4) Includes operating equipment.

Revenue Bond Indebtedness and Other Obligations

As of February 1, 2017, Metropolitan had total outstanding indebtedness, secured by a lien on Net Operating Revenues, of $4.49 billion. This indebtedness is comprised of $4.06 billion water revenue bonds, issued under the Senior Debt Resolutions (defined below), which includes $3.01 billion fixed rate revenue bonds, and $1.04 billion variable rate revenue bonds; $250.0 million Short-Term Revolving Credit Facilities, which pay a variable rate, and are on parity with the senior lien water revenue bonds; $175.0 million subordinate water revenue bonds issued under the Subordinate Debt Resolutions (defined below), which pay a variable rate; and $8.6 million State of California Revolving Fund Loan, on parity with the subordinate water revenue bonds. In addition, Metropolitan has $493.6 million of fixed-payor interest rate swaps which provides a fixed interest rate hedge to an equivalent amount of variable rate debt. Metropolitan's revenue bonds and other revenue obligations are more fully described in this section below.

Limitations on Additional Revenue Bonds

Resolution 8329, adopted by Metropolitan's Board on July 9, 1991, as amended and supplemented (collectively with all such supplemental resolutions, the "Senior Debt Resolutions"), provides for the issuance of Metropolitan's senior lien water revenue bonds. The Senior Debt Resolutions establish limitations on the issuance of additional obligations payable from Net Operating Revenues. Under the Senior Debt Resolutions, no additional bonds, notes or other evidences of indebtedness payable out of Operating Revenues may be issued having any priority in payment of principal, redemption premium, if any, or interest over any water revenue bonds authorized by the Senior Debt Resolutions ("Senior Revenue Bonds") or other obligations of Metropolitan having a lien and charge upon, or being payable from, the Net Operating Revenues on parity with such Senior Revenue Bonds ("Senior Parity Obligations"). No additional Senior Revenue Bonds or Senior Parity Obligations may be issued or incurred unless the conditions of the Senior Debt Resolutions have been satisfied.

Resolution 9199, adopted by Metropolitan's Board on March 8, 2016, as amended and supplemented (collectively with all such supplemental resolutions, the "Subordinate Debt Resolutions," and together with the Senior Debt Resolutions, the "Revenue Bond Resolutions"), provides for the issuance of Metropolitan's subordinate water revenue bonds and other obligations secured by a pledge of Net Operating Revenues that is subordinate to the pledge securing Senior Revenue Bonds and Senior Parity Obligations. The Subordinate Debt Resolutions establish limitations on the issuance of additional obligations payable from Net Operating Revenues. Under the Subordinate Debt Resolutions, with the exception of Senior Revenue Bonds and Senior Parity Obligations, no additional bonds, notes or other evidences of indebtedness payable out of Operating Revenues may be issued having any priority in payment of principal, redemption premium, if any, or interest over any subordinate water revenue bonds authorized by the Subordinate Debt Resolutions ("Subordinate Revenue Bonds" and, together with Senior Revenue Bonds, "Revenue Bonds") or other obligations of Metropolitan having a lien and charge upon, or being payable from, the Net Operating Revenues on parity with the Subordinate Revenue Bonds ("Subordinate Parity Obligations"). No additional Subordinate Revenue Bonds or Subordinate Parity Obligations may be issued or incurred unless the conditions of the Subordinate Debt Resolutions have been satisfied.

The laws governing Metropolitan's ability to issue water revenue bonds currently provide two additional limitations on indebtedness that may be incurred by Metropolitan. The Act provides for a limit on general obligation bonds, water revenue bonds and other evidences of indebtedness at 15 percent of the assessed value of all taxable property within Metropolitan's service area. As of February 1, 2017, outstanding general obligation bonds, water revenue bonds and other evidences of indebtedness in the amount of $4.58 billion represented approximately 0.18 percent of the fiscal year 2016-17 taxable assessed valuation of $2,583 billion. The second limitation under the Act specifies that no revenue bonds may be issued, except for the purpose of refunding, unless the amount of net assets of Metropolitan as shown on its balance sheet as of the end of the last fiscal year prior to the issuance of such bonds, equals at least 100 percent of the aggregate amount of revenue bonds outstanding following the issuance of such bonds. The net

assets of Metropolitan at June 30, 2016 were $6.68 billion. The aggregate amount of revenue bonds outstanding as of February 1, 2017 was $4.23 billion. The limitation does not apply to other forms of financing available to Metropolitan. Audited financial statements including the net assets of Metropolitan as of June 30, 2016 and June 30, 2015, respectively, are shown in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2015 AND JUNE 30, 2014 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Metropolitan provides no assurance that the Act's limitations on indebtedness will not be revised or removed by future legislation. Limitations under the Revenue Bond Resolutions respecting the issuance of additional obligations payable from Net Operating Revenues on parity with the Senior Revenue Bonds and Subordinate Revenue Bonds of Metropolitan will remain in effect so long as any Senior Revenue Bonds and Subordinate Revenue Bonds authorized pursuant to the Revenue Bond Resolutions are outstanding, provided however, that the Revenue Bond Resolutions are subject to amendment and supplement in accordance with their terms.

Variable Rate Exposure Policy

As of February 1, 2017, Metropolitan had outstanding $1.30 billion of variable rate obligations issued under the Senior Debt Resolutions, including variable rate Senior Revenue Bonds (described under "–Outstanding Senior Revenue Bonds and Senior Parity Obligations– Variable Rate and Swap Obligations") and Senior Parity Obligations incurred pursuant to Short-Term Revolving Credit Facilities (described under "–Outstanding Senior Revenue Bonds and Senior Parity Obligations–Senior Parity Obligations–Short-Term Revolving Credit Facilities" below). In addition, as of February 1, 2017, all of Metropolitan's $175 million of outstanding Subordinate Revenue Bonds issued under the Subordinate Debt Resolutions were variable rate obligations (described under "–Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations–Subordinate Revenue Bonds" below.

As of February 1, 2017, of Metropolitan's $1.47 billion of variable rate obligations, $493.6 million of such variable rate demand obligations are treated by Metropolitan as fixed rate debt, by virtue of interest rate swap agreements (described under "–Outstanding Senior Revenue Bonds and Senior Parity Obligations–Variable Rate and Swap Obligations–Interest Rate Swap Transactions"), for the purpose of calculating debt service requirements. The remaining $974.7 million of variable rate obligations represent approximately 21.7 percent of total outstanding water revenue secured indebtedness (including Senior Revenue Bonds and Senior Parity Debt and Subordinate Revenue Bonds and Subordinate Debt), as of February 1, 2017.

Metropolitan's variable rate exposure policy requires that variable rate debt be managed to limit net interest cost increases within a fiscal year as a result of interest rate changes to no more than $5 million. In addition, the maximum amount of variable interest rate exposure (excluding variable rate bonds associated with interest rate swap agreements) is limited to 40 percent of total outstanding water revenue bond debt. Variable rate debt capacity will be reevaluated as interest rates change and managed within these parameters.

Outstanding Senior Revenue Bonds and Senior Parity Obligations

Senior Revenue Bonds

The water revenue bonds issued under the Senior Debt Resolutions outstanding as of February 1, 2017, are set forth below:

Name of Issue	Principal Outstanding
Water Revenue Refunding Bonds, 1993 Series A	$ 70,340,000
Water Revenue Bonds, 2000 Authorization, Series B-3[1]	88,800,000
Water Revenue Bonds, 2006 Authorization, Series A	302,245,000
Water Revenue Refunding Bonds, 2008 Series B	119,830,000
Water Revenue Refunding Bonds, 2008 Series C	27,255,000
Water Revenue Bonds, 2008 Authorization, Series A	174,530,000
Water Revenue Refunding Bonds, 2009 Series A-2[1]	104,180,000
Water Revenue Refunding Bonds, 2009 Series B	106,690,000
Water Revenue Refunding Bonds, 2009 Series C	91,165,000
Water Revenue Bonds, 2008 Authorization, Series B	10,360,000
Water Revenue Bonds, 2008 Authorization, Series C[2]	78,385,000
Water Revenue Bonds, 2008 Authorization, Series D[2]	250,000,000
Water Revenue Refunding Bonds, 2009 Series D	50,005,000
Water Revenue Refunding Bonds, 2009 Series E	12,715,000
Water Revenue Bonds, 2010 Authorization, Series A[2]	250,000,000
Water Revenue Refunding Bonds, 2010 Series B	74,325,000
Water Revenue Refunding Bonds, 2011 Series A-1[1]	64,305,000
Water Revenue Refunding Bonds, 2011 Series A-2[1]	49,920,000
Water Revenue Refunding Bonds, 2011 Series A-3[1]	64,300,000
Water Revenue Refunding Bonds, 2011 Series A-4[1]	49,920,000
Water Revenue Refunding Bonds, 2011 Series B	5,080,000
Water Revenue Refunding Bonds, 2011 Series C	147,435,000
Water Revenue Refunding Bonds, 2012 Series A	181,180,000
Water Revenue Refunding Bonds, 2012 Series B-1 and B-2[1]	98,585,000
Water Revenue Refunding Bonds, 2012 Series C	175,635,000
Water Revenue Refunding Bonds, 2012 Series F	59,335,000
Water Revenue Refunding Bonds, 2012 Series G	111,890,000
Special Variable Rate Water Revenue Refunding Bonds, 2013 Series D[1]	87,445,000
Special Variable Rate Water Revenue Refunding Bonds, 2013 Series E[1]	104,820,000
Water Revenue Refunding Bonds, 2014 Series A	95,935,000
Water Revenue Refunding Bonds, 2014 Series B	10,575,000
Water Revenue Refunding Bonds, 2014 Series C-1–C-3	30,335,000
Special Variable Rate Water Revenue Refunding Bonds, 2014 Series D[1]	38,465,000
Water Revenue Refunding Bonds, 2014 Series E	86,060,000
Water Revenue Refunding Bonds, 2014 Series G-2–G-5	43,275,000
Special Variable Rate Water Revenue Refunding Bonds, 2015 Series A-1 and A-2[1]	188,900,000
Water Revenue Bonds, 2015 Authorization, Series A	208,255,000
Water Revenue Refunding Bonds, 2016 Series A	239,455,000
Special Variable Rate Water Revenue Refunding Bonds, 2016 Series B-1 and B-2[1]	103,670,000
Total	**$4,055,600,000**

Source: Metropolitan.

(1) Outstanding variable rate obligation.

(2) Designated as "Build America Bonds" pursuant to the American Recovery and Reinvestment Act of 2009.

Variable Rate and Swap Obligations

As of February 1, 2017, Metropolitan had outstanding $1.30 billion of variable rate obligations issued under the Senior Debt Resolutions, including variable rate Senior Revenue Bonds (described under this caption "–Variable Rate and Swap Obligations") and Senior Parity Obligations incurred pursuant to Short-Term Revolving Credit Facilities (described under "–Short-Term Revolving Credit Facilities" below).

The outstanding variable rate Senior Revenue Bonds include bonds bearing interest in the Index Mode or Flexible Index Mode (the "Index Tender Bonds"), special variable rate bonds initially designated as self-liquidity bonds (the "Self-Liquidity Bonds") and variable rate demand obligations supported by standby bond purchase agreements between Metropolitan and various liquidity providers.

Index Tender Bonds. The Index Tender Bonds have substantially similar terms and conditions; however, the mandatory tender dates and related tender periods for the Index Tender Bonds may differ. The

Index Tender Bonds bear interest at a rate that fluctuates weekly based on the SIFMA Municipal Swap Index published weekly by Municipal Market Data plus a spread. The Index Tender Bonds outstanding as of February 1, 2017, are summarized in the following table:

Index Tender Bonds

Series	Date of Issuance	Original Principal Amount Issued	Next Scheduled Mandatory Tender Date	Maturity Date
2009 A-2	May 20, 2009	$104,180,000	July 10, 2017	July 1, 2030
2011 A-1	June 2, 2011	64,305,000	July 10, 2017	July 1, 2036
2011 A-2	June 2, 2011	49,920,000	March 27, 2018	July 1, 2036
2011 A-3	June 2, 2011	64,300,000	July 10, 2017	July 1, 2036
2011 A-4	June 2, 2011	49,920,000	March 27, 2018	July 1, 2036
2012 B-1	April 27, 2012	49,295,000	March 27, 2018	July 1, 2027
2012 B-2	April 27, 2012	49,290,000	March 27, 2018	July 1, 2027
2013 E[(1)]	July 2, 2013	104,820,000	June 5, 2017	July 1, 2030
Total		**$536,030,000**		

Source: Metropolitan.

(1) Flexible Index Mode Bonds. The terms and conditions of Flexible Index Mode Bonds are substantially similar to Index Mode Bonds except that each tender period may not exceed 270 days.

The Index Tender Bonds are subject to mandatory tender under certain circumstances, including on certain scheduled mandatory tender dates (unless earlier remarketed or otherwise retired). Metropolitan anticipates that it will pay the purchase price of tendered Index Tender Bonds from the proceeds of remarketing such Index Tender Bonds or from other available funds. Metropolitan's obligation to pay the purchase price of any tendered Index Tender Bonds is an unsecured, special limited obligation of Metropolitan payable from Net Operating Revenues. Purchase price payments of Index Tender Bonds are subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to the Subordinate Revenue Bonds and Subordinate Parity Obligations. Metropolitan has not secured any liquidity facility or letter of credit to support the payment of the purchase price of Index Tender Bonds in connection with a scheduled mandatory tender. If the purchase price of the Index Tender Bonds of any Series is not paid from the proceeds of remarketing or other funds following a scheduled mandatory tender, such Index Tender Bonds then will bear interest at a default rate of up to 12 percent per annum until purchased by Metropolitan or redeemed. Failure to pay the purchase price of a series of Index Tender Bonds on a scheduled mandatory tender date is a default under the related paying agent agreement, upon the occurrence and continuance of which a majority in aggregate principal amount of the owners of such series of Index Tender Bonds may elect a bondholders' committee to exercise rights and powers of such owners under such paying agent agreement. Failure to pay the purchase price of a series of Index Tender Bonds on a scheduled mandatory tender date is not a default under the Senior Debt Resolutions. If the purchase price of the Index Tender Bonds of any series is not paid on a scheduled mandatory tender date, such Index Tender Bonds will also be subject to special mandatory redemption, in part, 18, 36 and 54 months following the purchase default. Any such special mandatory redemption payment will constitute an obligation payable on parity with the Senior Revenue Bonds and Senior Parity Obligations and senior to the Subordinate Revenue Bonds and Subordinate Parity Obligations.

Self-Liquidity Bonds. As of February 1, 2017, Metropolitan had $314.8 million of outstanding Self-Liquidity Bonds issued under the Senior Debt Resolutions. The Self-Liquidity Bonds are subject to optional tender upon seven days' notice by the owners thereof and mandatory tender upon specified events. Metropolitan is irrevocably committed to purchase all Self-Liquidity Bonds tendered pursuant to any optional or mandatory tender to the extent that remarketing proceeds are insufficient therefor and no standby bond purchase agreement or other liquidity facility is in effect. Metropolitan's obligation to pay the purchase

price of any tendered Self-Liquidity Bonds is an unsecured, special limited obligation of Metropolitan payable from Net Operating Revenues. Purchase price payments of Self-Liquidity Bonds are subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to the Subordinate Revenue Bonds and Subordinate Parity Obligations. In addition, Metropolitan's investment policy permits it to purchase tendered Self-Liquidity Bonds as an investment for its investment portfolio (other than from amounts in its investment portfolio consisting of bond reserve funds). Thus, while Metropolitan is only obligated to purchase tendered Self-Liquidity Bonds from Net Operating Revenues, it may use the cash and investments in its investment portfolio (other than amounts in its investment portfolio consisting of bond reserve funds and amounts posted as collateral with interest rate swap counterparties as described below) to purchase tendered Self-Liquidity Bonds. Metropolitan has not secured any liquidity facility or letter of credit to pay the purchase price of any tendered Self-Liquidity Bonds; however, Metropolitan has entered into a Revolving Credit Agreement (as described below) pursuant to which it may make borrowings for the purpose of paying the purchase price of Self-Liquidity Bonds. See "–Senior Parity Obligations – Wells Fargo Revolving Credit Agreement." Failure to pay the purchase price of Self-Liquidity Bonds upon optional or mandatory tender is not a default under the related paying agent agreement or a default under the Senior Debt Resolutions.

The following table lists the outstanding Self-Liquidity Bonds as of February 1, 2017.

Self-Liquidity Bonds

Name of Issue	Principal Outstanding
Special Variable Rate Water Revenue Refunding Bonds, 2013 Series D	$ 87,445,000
Special Variable Rate Water Revenue Refunding Bonds, 2014 Series D	38,465,000
Special Variable Rate Water Revenue Refunding Bonds, 2015 Series A-1 and A-2	188,900,000
Total	$314,810,000

Source: Metropolitan.

Liquidity Supported Bonds. The interest rates for Metropolitan's other variable rate demand obligations issued under the Senior Debt Resolutions, totaling $192.5 million as of February 1, 2017, are reset on a daily basis. Such variable rate demand obligations are supported by Standby Bond Purchase Agreements between Metropolitan and liquidity providers that provide for purchase of variable rate bonds by the applicable liquidity provider upon tender of such variable rate bonds and a failed remarketing. Metropolitan has secured its obligation to repay principal and interest advanced under the Standby Bond Purchase Agreements as Senior Parity Obligations. A decline in the creditworthiness of a liquidity provider will likely result in an increase in the interest rate of the applicable variable rate bonds, as well as an increase in the risk of a failed remarketing of such tendered variable rate bonds. Variable rate bonds purchased by a liquidity provider bear interest at a significantly higher interest rate and Metropolitan's obligation to reimburse the liquidity provider may convert the term of the variable rate bonds purchased by the liquidity provider into a term loan amortizable under the terms of the current liquidity facilities over a period of up to three years, depending on the applicable liquidity facility.

The following table lists the liquidity providers, the expiration date of each facility and the principal amount of outstanding variable rate demand obligations covered under each facility as of February 1, 2017.

Liquidity Facilities and Expiration Dates

Liquidity Provider	Bond Issue	Principal Outstanding	Facility Expiration
Wells Fargo Bank, N.A.	2000 Authorization Series B-3	$ 88,800,000	April 2017[1]
Landesbank Hessen-Thuringen Girozentrale (Helaba)	2016 Series B-1 and Series B-2	$103,670,000	September 2019
Total		$192,470,000	

Source: Metropolitan.

(1) Metropolitan expects to replace such liquidity facility prior to its expiration date.

Interest Rate Swap Transactions. By resolution adopted on September 11, 2001, Metropolitan's Board authorized the execution of interest rate swap transactions and related agreements in accordance with a master swap policy, which was subsequently amended by resolutions adopted on July 14, 2009 and May 11, 2010. Metropolitan may execute interest rate swaps if the transaction can be expected to reduce exposure to changes in interest rates on a particular financial transaction or in the management of interest rate risk derived from Metropolitan's overall asset/liability balance, result in a lower net cost of borrowing or achieve a higher net rate of return on investments made in connection with or incidental to the issuance, incurring or carrying of Metropolitan's obligations or investments, or manage variable interest rate exposure consistent with prudent debt practices and Board-approved guidelines. The Chief Financial Officer reports to the Finance and Insurance Committee of Metropolitan's Board each quarter on outstanding swap transactions, including notional amounts outstanding, counterparty exposures and termination values based on then-existing market conditions.

Metropolitan currently has one type of interest rate swap, referred to in the table below as "Fixed Payor Swaps." Under this type of swap, Metropolitan receives payments that are calculated by reference to a floating interest rate and makes payments that are calculated by reference to a fixed interest rate.

Metropolitan's obligations to make regularly scheduled net payments under the terms of the interest rate swap agreements are payable on a parity with the Senior Parity Obligations. Termination payments under the 2002A and 2002B interest rate swap agreements would be payable on a parity with the Senior Parity Obligations. Termination payments under all other interest rate swap agreements would be on parity with the Subordinate Parity Obligations.

The following swap transactions were outstanding as of February 1, 2017:

FIXED PAYOR SWAPS:

Designation	Notional Amount Outstanding	Swap Counterparty	Fixed Payor Rate	MWD Receives	Maturity Date
2002 A	$75,838,400	Morgan Stanley Capital Services, Inc.	3.300%	57.74% of one-month LIBOR	7/1/2025
2002 B	28,371,600	JPMorgan Chase Bank	3.300	57.74% of one-month LIBOR	7/1/2025
2003	158,597,500	Wells Fargo Bank	3.257	61.20% of one-month LIBOR	7/1/2030
2003	158,597,500	JPMorgan Chase Bank	3.257	61.20% of one-month LIBOR	7/1/2030
2004 C	7,760,500	Morgan Stanley Capital Services, Inc.	2.980	61.55% of one-month LIBOR	10/1/2029
2004 C	6,349,500	Citigroup Financial Products, Inc.	2.980	61.55% of one-month LIBOR	10/1/2029
2005	29,057,500	JPMorgan Chase Bank	3.360	70% of 3-month LIBOR	7/1/2030
2005	29,057,500	Citigroup Financial Products, Inc.	3.360	70% of 3-month LIBOR	7/1/2030
Total	$493,630,000				

Source: Metropolitan.

These interest rate swap agreements entail risk to Metropolitan. The counterparty may fail or be unable to perform, interest rates may vary from assumptions, Metropolitan may be required to post collateral in favor of its counterparties and Metropolitan may be required to make significant payments in the event of an early termination of an interest rate swap. Metropolitan believes that if such an event were to occur, it would not have a material adverse impact on its financial position. Metropolitan seeks to manage counterparty risk by diversifying its swap counterparties, limiting exposure to any one counterparty, requiring collateralization or other credit enhancement to secure swap payment obligations, and by requiring minimum credit rating levels. Initially swap counterparties must be rated at least "Aa3" or "AA-", or equivalent by any two of the nationally recognized credit rating agencies; or use a "AAA" subsidiary as rated by at least one nationally recognized credit rating agency. Should the credit rating of an existing swap counterparty drop below the required levels, Metropolitan may enter into additional swaps if those swaps are "offsetting" and risk-reducing swaps. Each counterparty is initially required to have minimum capitalization of at least $150 million. See Note 5(f) in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Early termination of an interest rate swap agreement could occur due to a default by either party or the occurrence of a termination event. As of December 31, 2016, Metropolitan would have been required to pay to its counterparties termination payments if some of its swaps were terminated on that date. Metropolitan's net exposure to its counterparties for all such termination payments on that date was approximately $75.3 million. Metropolitan does not presently anticipate early termination of any of its interest rate swap agreements due to default by either party or the occurrence of a termination event. However, effective June 28, 2012, Metropolitan exercised optional early termination provisions to terminate all or a portion of certain interest rate swap agreements totaling a notional amount of $322 million. Effective February 12, 2014, Metropolitan exercised optional early termination provisions to terminate a portion of certain interest rate swap agreements, totaling a notional amount of $147 million. Effective July 29, 2014,

Metropolitan optionally terminated portions of certain interest rate swap agreements totaling a notional amount of $163 million.

Metropolitan is required to post collateral in favor of a counterparty to the extent that Metropolitan's total exposure for termination payments to that counterparty exceeds the threshold specified in the applicable swap agreement. Conversely, the counterparties are required to release collateral to Metropolitan or post collateral for the benefit of Metropolitan as market conditions become favorable to Metropolitan. As of December 31, 2016, Metropolitan had no collateral posted with any counterparty. The highest, month-end, amount of collateral posted was $36.8 million, on June 30, 2012, which was based on an outstanding swap notional amount of $1.4 billion. The amount of required collateral varies from time to time due primarily to interest rate movements and can change significantly over a short period of time. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. In the future, Metropolitan may be required to post additional collateral, or may be entitled to a reduction or return of the required collateral amount. Collateral deposited by Metropolitan is held by the counterparties; a bankruptcy of any counterparty holding collateral posted by Metropolitan could adversely affect the return of the collateral to Metropolitan. Moreover, posting collateral limits Metropolitan's liquidity. If collateral requirements increase significantly, Metropolitan's liquidity may be materially adversely affected. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A.

Term Mode Bonds

As of February 1, 2017, Metropolitan had outstanding $73.6 million of Senior Revenue Bonds bearing interest in a term mode, comprised of $30.3 million of 2014 Series C Bonds in three series, and $43.3 million of 2014 Series G in four series (collectively, the "Term Mode Bonds"). The Term Mode Bonds initially bear interest at a fixed rate for a specified period from their date of issuance, after which there shall be determined a new interest mode for each series (which may be another term mode, a daily mode, a weekly mode, a short-term mode or an index mode) or the Term Mode Bonds may be converted to bear fixed interest rates through the maturity date thereof. The owners of the Term Mode Bonds of a series must tender for purchase, and Metropolitan must purchase, all of the Term Mode Bonds of such series on the specified scheduled mandatory tender date of each term period for such series. The Term Mode Bonds outstanding as of February 1, 2017, are summarized in the following table:

Term Mode Bonds

Series	Original Principal Amount Issued	Next Scheduled Mandatory Tender Date
2014 C-1	$13,505,000	October 1, 2019
2014 C-2	14,020,000	October 1, 2020
2014 C-3	2,810,000	October 1, 2021
2014 G-2	14,300,000	October 1, 2017
2011 G-3	11,165,000	October 1, 2018
2012 G-4	11,605,000	October 1, 2019
2012 G-5	6,205,000	October 1, 2020
Total	**$73,610,000**	

Source: Metropolitan.

Metropolitan will pay the principal of, and interest on, the Term Mode Bonds on parity with its other Senior Revenue Bonds. Metropolitan anticipates that it will pay the purchase price of tendered Term Mode Bonds from the proceeds of remarketing such Term Mode Bonds or from other available funds. Metropolitan's obligation to pay the purchase price of any tendered Term Mode Bonds is an unsecured, special limited obligation of Metropolitan payable from Net Operating Revenues. Purchase price payments of Term Mode Bonds are subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to

the Subordinate Revenue Bonds and Subordinate Parity Obligations. Metropolitan has not secured any liquidity facility or letter of credit to support the payment of the purchase price of Term Mode Bonds in connection with any scheduled mandatory tender. If the purchase price of the Term Mode Bonds of any series is not paid from the proceeds of remarketing or other funds following a scheduled mandatory tender, such Term Mode Bonds will then bear interest at a default rate of up to 12 percent per annum until purchased by Metropolitan or redeemed. Failure to pay the purchase price of a series of Term Mode Bonds on a scheduled mandatory tender date is a default under the related paying agent agreement, upon the occurrence and continuance of which a majority in aggregate principal amount of the owners of such series of Term Mode Bonds may elect a bondholders' committee to exercise rights and powers of such owners under such paying agent agreement. Failure to pay the purchase price of a series of Term Mode Bonds on a scheduled mandatory tender date is not a default under the Senior Debt Resolutions. If the purchase price of the Term Mode Bonds of any series is not paid on a scheduled mandatory tender date, such Term Mode Bonds will also be subject to special mandatory redemption, in part, 18, 36 and 54 months following the purchase default. Any such special mandatory redemption payment will constitute an obligation payable on parity with the Senior Revenue Bonds and Senior Parity Obligations.

Build America Bonds

Metropolitan previously issued and designated three series of Senior Revenue Bonds in the aggregate principal amount of $578,385,000 as "Build America Bonds" under the provisions of the American Recovery and Reinvestment Act of 2009 (the "Build America Bonds"). Metropolitan currently expects to receive cash subsidies from the United States Treasury (the "Interest Subsidy Payments") equal to 35 percent of the interest payable on all such outstanding Build America Bonds less any federal budget sequestration offsets as described in the following paragraph. The Interest Subsidy Payments in connection with the Build America Bonds do not constitute Operating Revenues under the Senior Debt Resolutions or the Subordinate Debt Resolutions. Such Interest Subsidy Payments will constitute Additional Revenues, which Metropolitan may take into consideration when establishing its rates and charges and will be available to Metropolitan to pay principal of and interest on Metropolitan's Bonds.

The Budget Control Act of 2011 (the "Budget Control Act") provided for increases in the federal debt limit and established procedures designed to reduce the federal budget deficit. The Budget Control Act provided that a failure to reduce the deficit would result in sequestration, which are automatic, generally across-the-board, spending reductions. These reductions began on March 1, 2013 pursuant to an executive order that reduced budgetary authority for expenditures subject to sequestration, including subsidies for Build America Bonds. Pursuant to this executive order, the approximately $6.64 million Interest Subsidy Payment that Metropolitan was to receive on or about July 1, 2013 was reduced by 8.7 percent, or $578,000, to $6.06 million. Interest Subsidy Payments processed in the federal fiscal year ended September 30, 2014 were reduced by the federal fiscal year 2014 sequestration rate of 7.2 percent and Interest Subsidy Payments processed in the federal fiscal year ended September 30, 2015 were reduced by the federal fiscal year 2015 sequestration rate of 7.3 percent. Interest Subsidy Payments processed in the federal fiscal year ended September 30, 2016 were reduced by the federal fiscal year 2016 sequestration rate of 6.8 percent, and Interest Subsidy Payments processed on or after October 1, 2016 and on or before September 30, 2017 are anticipated to be reduced by the federal fiscal year 2017 sequestration rate of 6.9 percent. The sequestration reduction rate will be applied unless and until a law is enacted that cancels or otherwise impacts the sequester, at which time the sequestration reduction rate is subject to change. Metropolitan can offer no assurances as to future subsidy payments and expects that once it receives less than any full 35 percent subsidy payment, the United States Treasury will not thereafter reimburse Metropolitan for payments not made.

Senior Parity Obligations

Short-Term Revolving Credit Facilities. In April 2016, Metropolitan entered into a noteholder's agreement with RBC Municipal Products, LLC ("RBC") for the purchase by RBC and sale by Metropolitan of Metropolitan's Index Notes, Series 2016 ("RBC Facility"). Also in April 2016, Metropolitan entered into

a note purchase and continuing covenant agreement with U.S. Bank National Association ("US Bank"), for the purchase by US Bank and sale by Metropolitan of Metropolitan's Flexible Rate Revolving Notes, Series 2016 ("US Bank Facility," and together with the RBC Facility, the "Short-Term Revolving Credit Facilities"). Metropolitan is permitted to sell up to $200 million of notes (including, subject to certain terms and conditions, notes to refund maturing notes) under each of the Short-Term Revolving Credit Facilities during the term of the respective bank's commitment to purchase notes thereunder, which currently extends to April 5, 2019, for an aggregate amount of available borrowings of $400 million. Metropolitan may borrow, pay down and re-borrow amounts under each of the Short-Term Revolving Credit Facilities. Currently, Metropolitan has sold approximately $250 million of notes under the Short-Term Revolving Credit Facilities ($125 million under the RBC Facility and approximately $125 million under the US Bank Facility). Of that amount, Metropolitan has deposited $250 million in its unrestricted financial reserves. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. An additional draw of approximately $50 million is expected by the end of June 2017. Subject to the satisfaction of certain terms and conditions, unpaid principal remaining outstanding at the April 5, 2019 commitment end date may be amortizable over a period of approximately one to three years, depending on the applicable facility.

Each of the Short-Term Revolving Credit Facilities bears interest at a variable rate of interest. The US Bank Facility bears interest at a spread to one-month London interbank offering rate ("LIBOR") for taxable borrowings or to 70 percent of one-month LIBOR for tax-exempt borrowings, while the RBC Facility bears interest at a spread to one-month LIBOR for taxable borrowings or to the SIFMA Municipal Swap Index for tax-exempt borrowings. Under the Short-Term Revolving Credit Facilities, upon a failure by Metropolitan to perform or observe its covenants, a default in other specified indebtedness of Metropolitan, or other specified events of default, each bank could terminate its commitments and declare all amounts then outstanding to be immediately due and payable. Metropolitan has secured its obligation to pay principal and interest under the Short-Term Credit Facilities as Senior Parity Obligations.

In the Short-Term Revolving Credit Facilities agreements, Metropolitan designated the principal and interest payable as Excluded Principal Payments under the Senior Debt Resolutions and thus, for purposes of calculating Maximum Annual Debt Service, included the amount of principal and interest due and payable under the Short-Term Revolving Credit Facilities on a schedule of Assumed Debt Service. This schedule of Assumed Debt Service assumes that Metropolitan will pay the principal under the Short-Term Revolving Credit Facilities over a period of 30 years at a fixed interest rate of approximately 3.3 percent.

Wells Fargo Revolving Credit Agreement. On July 1, 2015, Metropolitan executed a revolving credit agreement with Wells Fargo Bank, N.A. (the "Wells Fargo Revolving Credit Agreement"). Under the terms and conditions of the Wells Fargo Revolving Credit Agreement, Metropolitan will be able to borrow up to $180 million for purposes of paying the purchase price of any Self-Liquidity Bonds. The scheduled expiration date of the Wells Fargo Revolving Credit Agreement is July 1, 2018. On November 4, 2015, Wells Fargo Bank assigned $100 million of its share of the Wells Fargo Revolving Credit Agreement to the Industrial and Commercial Bank of China ("ICBC"). Wells Fargo will retain the remaining $80 million commitment. ICBC assumed all of Wells Fargo's obligations with respect to its $100 million share under the Wells Fargo Revolving Credit Agreement.

Under the Wells Fargo Revolving Credit Agreement, a failure by Metropolitan to perform or observe certain covenants could result in a termination of Wells Fargo Bank and ICBC's commitments and entitle them to declare all amounts then outstanding to be immediately due and payable. Metropolitan has secured its obligation to pay principal and interest under the Wells Fargo Revolving Credit Agreement as Senior Parity Obligations. Metropolitan has no obligation to make borrowings under, maintain, or renew the Wells Fargo Revolving Credit Agreement. See "–Limitations on Additional Revenue Bonds" above.

In the Wells Fargo Revolving Credit Agreement, Metropolitan designated the principal and interest payable as Excluded Principal Payments under the Senior Debt Resolutions and thus, for purposes of calculating Maximum Annual Debt Service, included the amount of principal and interest due and payable

under the Revolving Credit Agreements on a schedule of Assumed Debt Service. This schedule of Assumed Debt Service assumes that Metropolitan will pay the principal under the Revolving Credit Agreements over a period of 30 years at a fixed interest rate of 3.75 percent. Pursuant to the terms of the Senior Debt Resolutions, while the Wells Fargo Revolving Credit Agreement is in force and effect, when Metropolitan calculates its covenant relating to the creation or incurrence of additional indebtedness, it will add an amount to its Net Operating Revenues relating to an assumed annual debt service payment that Metropolitan would receive if it were to use the proceeds of the Wells Fargo Revolving Credit Agreement to purchase Self-Liquidity Bonds.

Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations

Subordinate Revenue Bonds

In December 2016, Metropolitan entered into a Continuing Covenant Agreement with Bank of America, N.A. ("BANA", and the "2016 BANA Agreement"), for the purchase by BANA and sale by Metropolitan of Metropolitan's $175 million Subordinate Water Revenue Bonds, 2016 Authorization Series A (the "Subordinate 2016 Series A Bonds"), which is the first series of bonds issued under the Subordinate Debt Resolutions. Proceeds were used to reimburse Metropolitan for the purchase of the Delta Islands in the San Francisco Bay\Sacramento-San Joaquin River Delta that was funded from Metropolitan's reserves in July 2016. See "CAPITAL INVESTMENT PLAN–Other Capital Expenses" and "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A.

The Subordinate 2016 Series A Bonds bears interest at a variable rate of interest, at a spread to one-month LIBOR. Under the 2016 BANA Agreement, upon a failure by Metropolitan to perform or observe its covenants, a default in other specified indebtedness of Metropolitan, or other specified events of default, BANA could terminate its commitments and declare all amounts then outstanding to be immediately due and payable. Metropolitan has secured its obligation to pay principal and interest under the 2016 BANA Agreement as a Subordinate Parity Obligation. The Subordinate 2016 Series A Bonds are Index Tender Bonds and are subject to mandatory tender for purchase on the scheduled mandatory tender date of December 21, 2018, or, if directed by BANA upon the occurrence and continuance of an event of default under the 2016 BANA Agreement, five business days after receipt of such direction. On or before the scheduled mandatory tender date, Metropolitan may request an extension of the 2016 BANA Agreement for another tender period or may request BANA to purchase the Subordinate 2016 Series A Bonds in another interest rate mode, or Metropolitan may seek to remarket the 2016 Series A Bonds to another bank or in the public debt markets. In the event the 2016 BANA Agreement is not extended, Metropolitan is obligated under the 2016 BANA Agreement to cause unremarketed Subordinate 2016 Series A Bonds to be redeemed five business days after the scheduled mandatory tender date in the event the purchase price of the Subordinate 2016 Series A Bonds is not paid from the proceeds of a remarketing or other funds on the scheduled mandatory tender date. A failure to pay the purchase price of the Subordinate 2016 Series A Bonds upon a mandatory tender would constitute a default under the Subordinate Debt Resolutions if not remedied within five business days.

The water revenue bonds issued under the Subordinate Debt Resolutions outstanding as of February 1, 2017, are set forth below:

Name of Issue	Principal Outstanding
Subordinate Water Revenue Bonds, 2016 Authorization Series A[(1)]	$175,000,000

Source: Metropolitan.

(1) Outstanding variable rate obligation.

Subordinate Parity Obligations

In 2003, Metropolitan obtained a $20 million California Safe Drinking Water Revolving Fund Loan in 2003 at an interest rate of 2.39 percent per annum to reimburse construction costs for oxidation retrofit facilities at the Henry J. Mills Treatment Plant in Riverside County. The loan payment obligation is subordinate to the Senior Revenue Bonds and Senior Obligations and on parity with the Subordinate Revenue Bonds. As of February 1, 2017, the principal balance outstanding was $8.6 million.

Other Junior Obligations

Metropolitan currently is authorized to issue up to $400,000,000 of Commercial Paper Notes payable from Net Operating Revenues on a basis subordinate to both the Senior Revenue Bonds and Senior Parity Obligations and to the Subordinate Revenue Bonds and Subordinate Parity Obligations. Although no Commercial Paper Notes are currently outstanding, the authorization remains in full force and effect and Metropolitan may issue Commercial Paper Notes from time to time.

General Obligation Bonds

As of February 1, 2017, $92,865,000 aggregate principal amount of general obligation bonds payable from *ad valorem* property taxes were outstanding. See "METROPOLITAN REVENUES–General" and "–Revenue Allocation Policy and Tax Revenues" in this Appendix A. Metropolitan's revenue bonds are not payable from the levy of *ad valorem* property taxes.

General Obligation Bonds	Amount Issued[1]	Principal Outstanding
Waterworks General Obligation Refunding Bonds, 2009 Series A	$45,515,000	$30,745,000
Waterworks General Obligation Refunding Bonds, 2010 Series A	39,485,000	23,065,000
Waterworks General Obligation Refunding Bonds, 2014 Series A	49,645,000	39,055,000
Total	$134,645,000	$92,865,000

Source: Metropolitan.

(1) Voters authorized Metropolitan to issue $850,000,000 of Waterworks General Obligation Bonds, Election 1966, in multiple series, in a special election held on June 7, 1966. This authorization has been fully utilized. This table lists bonds that refunded such Waterworks General Obligation Bonds, Election 1966.

State Water Contract Obligations

General. As described herein, in 1960, Metropolitan entered into its State Water Contract with DWR to receive water from the State Water Project. All expenditures for capital and operations, maintenance, power and replacement costs associated with the State Water Project facilities used for water delivery are paid for by the 29 Contractors that have executed State Water Contracts with DWR, including Metropolitan. Contractors are obligated to pay allocable portions of the cost of construction of the system and ongoing operating and maintenance costs through at least 2035, regardless of quantities of water available from the project. Other payments are based on deliveries requested and actual deliveries received, costs of power required for actual deliveries of water, and offsets for credits received. In exchange, Contractors have the right to participate in the system, with an entitlement to water service from the State Water Project and the right to use the portion of the State Water Project conveyance system necessary to deliver water to them at no additional cost as long as capacity exists. Metropolitan's State Water Contract accounts for nearly one-half of the total entitlement for State Water Project water contracted for by all Contractors.

DWR and other State Water Project Contractors, including Metropolitan, have reached an Agreement in Principle to extend their State Water Contracts to 2085 and to make certain changes related to the financial management of the State Water Project in the future. See "METROPOLITAN'S WATER SUPPLY–State Water Project" in this Appendix A.

Metropolitan's payment obligation for the State Water Project for the fiscal year ended June 30, 2016 was $511 million; which amount reflects prior year's credits of $61.6 million. For the fiscal year ended June 30, 2016, Metropolitan's payment obligations under the State Water Contract were approximately 27 percent of Metropolitan's total annual expenses. A portion of Metropolitan's annual property tax levy is for payment of State Water Contract obligations, as described above under "METROPOLITAN REVENUES–General" in this Appendix A. See Note 9(a) to Metropolitan's audited financial statements in Appendix B for an estimate of Metropolitan's payment obligations under the State Water Contract. Also see "–Power Sources and Costs" below for a description of current and future costs for electric power required to operate State Water Project pumping systems and a description of litigation involving the federal relicensing of the Hyatt-Thermalito hydroelectric generating facilities at Lake Oroville.

The State Water Contract requires that in the event that Metropolitan fails or is unable to raise sufficient funds by other means, Metropolitan must levy upon all property within its boundaries not exempt from taxation a tax or assessment sufficient to provide for all payments under the State Water Contract. Currently, a portion of the capital costs under the State Water Contract are paid from *ad valorem* taxes levied by Metropolitan. In the opinion of Metropolitan's General Counsel, a tax increase to provide for additional payments under the State Water Contract would be within the exemption permitted under Article XIIIA of the State Constitution as a tax to pay pre-1978 voter approved indebtedness.

Metropolitan capitalizes its share of the State Water Project capital costs as participation rights in State Water Project facilities as such costs are costs paid in exchange for participation in the system, regardless of whether there is water available to be delivered. Unamortized participation rights essentially represent a prepayment for future costs as Metropolitan will likely continue to participate in the system at least through 2035. Metropolitan's share of system operating and maintenance costs are annually expensed.

DWR and various subsets of the State Water Contractors have entered into amendments to the State Water Contract related to the financing of certain State Water Project facilities. The amendments establish procedures to provide for the payment of construction costs financed by DWR bonds by establishing separate subcategories of charges to produces the revenues required to pay all of the annual financing costs (including coverage on the allocable bonds) relating to the financed project. If any affected Contractor defaults on payment under certain of such amendments, the shortfall may be collected from the non-defaulting affected Contractors, subject to certain limitations.

These amendments represent additional long-term obligations of Metropolitan, as described below.

Devil Canyon-Castaic Contract. On June 23, 1972, Metropolitan and five other southern California public agencies entered into a contract (the "Devil Canyon-Castaic Contract") with DWR for the financing and construction of the Devil Canyon and Castaic power recovery facilities, located on the aqueduct system of the State Water Project. Under this contract, DWR agreed to build the Devil Canyon and Castaic facilities, using the proceeds of revenue bonds issued by DWR under the State Central Valley Project Act. DWR also agreed to use and apply the power made available by the construction and operation of such facilities to deliver water to Metropolitan and the other contracting agencies. Metropolitan, in turn, agreed to pay to DWR 88 percent of the debt service on the revenue bonds issued by DWR. For calendar year 2016, this represented a payment of $7.8 million. In addition, Metropolitan agreed to pay 78.5 percent of the operation and maintenance expenses of the Devil Canyon facilities and 96 percent of the operation and maintenance expenses of the Castaic facilities. Metropolitan's obligations under the Devil Canyon-Castaic Contract continue until the bonds are fully retired in 2022 even if DWR is unable to operate the facilities or deliver power from these facilities.

Off-Aqueduct Power Facilities. In addition to system "on-aqueduct" power facilities costs, DWR has, either on its own or by joint venture, financed certain off-aqueduct power facilities. The power generated is utilized by the system for water transportation and other State Water Project purposes. Power

generated in excess of system needs is marketed to various utilities and the California Independent System Operator. Metropolitan is entitled to a proportionate share of the revenues resulting from sales of excess power. By virtue of a 1982 amendment to the State Water Contract and the other water supply contracts, Metropolitan and the other water contractors are responsible for paying the capital and operating costs of the off-aqueduct power facilities regardless of the amount of power generated. Other costs of Metropolitan in relation to the State Water Project and the State Water Contract may increase as a result of restructuring of California's electric utility industry and new Federal Energy Regulatory Commission ("FERC") regulations.

East Branch Enlargement Amendment. In 1986, Metropolitan's State Water Contract and the water supply contracts of certain other State Water Project Contractors were amended for the purpose, among others, of financing the enlargement of the East Branch of the California Aqueduct. Under the amendment, enlargement of the East Branch can be initiated either at Metropolitan's request or by DWR finding that enlargement is needed to meet demands.

The amendment establishes a separate subcategory of the Transportation Charge under the State Water Contract for the East Branch Enlargement and provides for the payment of costs associated with financing and operating the East Branch Enlargement. Under the amendment, the annual financing costs for such facilities financed by bonds issued by DWR are allocated among the participating contractors based upon the delivery capacity increase allocable to each participating contractor. Such costs include, but are not limited to, debt service, including coverage requirements, deposits to reserves, and certain operation and maintenance expenses, less any credits, interest earnings or other moneys received by DWR in connection with this facility.

If any participating contractor defaults on payment of its allocable charges under the amendment, among other things, the non-defaulting participating contractors may assume responsibility for such charges and receive delivery capability that would otherwise be available to the defaulting participating contractor in proportion to the non-defaulting contractor's participation in the East Branch Enlargement. If participating contractors fail to cure the default, Metropolitan will, in exchange for the delivery capability that would otherwise be available to the defaulting participating contractor, assume responsibility for the capital charges of the defaulting participating contractor.

Water System Revenue Bond Amendment. In 1987, the State Water Contract and other water supply contracts were amended for the purpose of financing State Water Project facilities through revenue bonds. This amendment establishes a separate subcategory of the Delta Water Charge and the Transportation Charge for projects financed with DWR water system revenue bonds. This subcategory of charge provides the revenues required to pay the annual financing costs of the bonds and consists of two elements. The first element is an annual charge for repayment of capital costs of certain revenue bond financed water system facilities under the existing water supply contract procedures. The second element is a water system revenue bond surcharge to pay the difference between the total annual charges under the first element and the annual financing costs, including coverage and reserves, of DWR's water system revenue bonds.

If any contractor defaults on payment of its allocable charges under this amendment, DWR is required to allocate a portion of the default to each of the nondefaulting contractors, subject to certain limitations, including a provision that no nondefaulting contractor may be charged more than 125 percent of the amount of its annual payment in the absence of any such default. Under certain circumstances, the nondefaulting contractors would be entitled to receive an allocation of the water supply of the defaulting contractor.

The following table sets forth Metropolitan's projected costs of State Water Project water based upon DWR's Annual Billing to Metropolitan for calendar year 2017 and, for fiscal year 2016-17, preliminary financial results through December 30, 2016. For all other years the projections are based on Metropolitan's adopted biennial budget for fiscal years 2016-17 and 2017-18 and the ten-year financial forecast included in

the adopted budget. See "METROPOLITAN'S WATER SUPPLY–State Water Project – Bay-Delta Proceedings Affecting State Water Project – Bay-Delta Planning Activities" in this Appendix A.

PROJECTED COSTS OF METROPOLITAN FOR STATE WATER PROJECT WATER[1]
(Dollars in Millions)

Year Ending June 30	Capital Costs	Minimum OMP&R[2]	Power Costs[3]	Refunds & Credits	Total[4]
2017	$173.4	$225.0	$150.0	$(46.4)	$502.0
2018	184.2	294.7	158.4	(37.9)	599.4
2019	195.3	315.9	170.4	(36.1)	645.5
2020	212.1	340.5	191.1	(35.0)	708.7
2021	236.3	264.8	212.1	(34.7)	778.6

Source: Metropolitan.

(1) Projections are based upon DWR's Annual Billing to Metropolitan for 2017 and attachments (dated July 1, 2015) and, for fiscal year 2016-17, preliminary financial results through December 31, 2016. For other years, the projections are based on Metropolitan's adopted biennial budget for fiscal years 2016-17 and 2017-18, and the ten-year financial forecast included in the adopted budget. All costs are adjusted from calendar year to fiscal year periods ending June 30. The total charges shown above differ from those shown in Note 9 of Metropolitan's audited financial statements for the fiscal year ended June 30, 2016 and June 30, 2015, in Appendix B, due to the inclusion of allowances for inflation and anticipated construction of additional State Water Project facilities. See "METROPOLITAN EXPENSES–Power Sources and Costs – State Water Project" in this Appendix A.

(2) Minimum Operations, Maintenance, Power and Replacement ("OMP&R") represents costs which are fixed and do not vary with the amount of water delivered.

(3) Assumptions for water deliveries through the California Aqueduct (not including SBVMWD and DWA/CVWD transfers and exchanges) into Metropolitan's service area and to storage programs are as follows: 0.75 million acre-feet for fiscal year 2016-17, 0.77 million acre-feet for fiscal year 2017-18, 0.82 million acre-feet for fiscal year 2018-19, 0.88 million acre-feet for fiscal year 2019-20, and 0.93 million acre-feet for fiscal year 2020-21. Availability of State Water Project supplies vary and deliveries may include transfers and storage. All deliveries are within maximum contract amount and are based upon availability, as determined by hydrology, water quality and wildlife conditions. See "METROPOLITAN'S WATER SUPPLY–State Water Project" and "–Endangered Species Act and Other Environmental Considerations" in this Appendix A.

(4) Annual totals include California WaterFix related costs for the fiscal years ended June 30, 2017 through June 30, 2021 of $-0- in fiscal year 2016-17 and fiscal year 2017-18, $20 million in fiscal year 2018-19, $38 million in fiscal year 2019-20, and $63 million in fiscal year 2020-21. Projected California WaterFix costs are reflected in the ten-year financial forecast provided in the biennial budget for fiscal years 2016-17 and 2017-18 that was approved by Metropolitan's Board on April 12, 2016.

Other Long-Term Commitments

Metropolitan also has various ongoing fixed annual obligations under its contract with the United States Department of Energy for power from the Hoover Power Plant. Under the terms of the Hoover Power Plant contract, Metropolitan purchases energy to pump water through the CRA. In fiscal year 2015-16 Metropolitan paid approximately $15.7 million under this contract. Payments made under the Hoover Power Plant contract are treated as operation and maintenance expenses. On March 12, 2014, Metropolitan and the other Hoover Contractors funded the defeasance of $124 million of bonds issued by the U.S. Treasury Department for facilities related to the Hoover Dam and Power Plant. Following this repayment, Metropolitan expects to reduce its annual payment for Hoover power by approximately $2.3 million.

Power Sources and Costs

Current and future costs for electric power required for operating the pumping systems of the CRA and the State Water Project are a substantial part of Metropolitan's overall expenses. Expenses for electric power for the CRA (not including credits from power sales and related revenues) for the fiscal years 2014-15 and 2015-16 were approximately $39.2 million, and $35.5 million, respectively. Expenses for electric power

and transmission service for the State Water Project for fiscal years 2014-15 and 2015-16 were approximately $140.8 million and $125.4 million, respectively. Given the continuing uncertainty surrounding the electricity markets in California and in the electric industry in general, Metropolitan is unable to give any assurance with respect to the magnitude of future power costs.

Colorado River Aqueduct. Generally, 55 to 70 percent of the annual power requirements for pumping at full capacity (1.25 million acre-feet of Colorado River water) in Metropolitan's CRA are secured through long-term contracts with the United States Department of Energy for energy generated from facilities located on the Colorado River (Hoover Power Plant and Parker Power Plant) and Southern California Edison ("Edison"). These contracts provide Metropolitan with reliable and economical power resources to pump Colorado River water to Metropolitan's service area.

The Hoover Power Allocation Act of 2011 (H.R. 470) requires the Western Area Power Administration (Western) to renew existing contracts for electric energy generated at the Hoover Power Plant for an additional 50 years through September 2067. The contractors will retain 95 percent of their existing power rights. Metropolitan and Western have completed negotiations and have executed the new contract.

As provided for under the Hoover Power Allocation Act of 2011 (H.R. 470), Metropolitan has executed a 50-year agreement with the Western Area Power Administration for the continued purchase of electric energy generated at the Hoover Power Plant through September 2067. Under the successor agreement (which will replace Metropolitan's existing Hoover contract expiring in 2017), Metropolitan will retain 95 percent of its existing power rights.

The remaining approximately 30 to 45 percent of annual pumping power requirements for full capacity pumping on the CRA is obtained through energy purchases from municipal and investor-owned utilities or power marketers. Gross diversions of water from Lake Havasu for the fiscal years ended June 30, 2015 and June 30, 2016 were approximately 1.2 million acre-feet and 1.1 million acre-feet, respectively, including Metropolitan's basic apportionment of Colorado River water and supplies from water transfer and storage programs.

The Metropolitan-Edison 1987 Service and Interchange Agreement includes provisions for the sharing of the benefits realized by the integrated operation of Edison's and Metropolitan's electric systems. Under this agreement, with a prior year pumping operation of 1 million acre-feet, Edison provides Metropolitan additional energy (benefit energy) sufficient to pump approximately 140,000 acre-feet annually. As the amount of pumping is increased, the amount of benefit energy provided by Edison is reduced.

Depending on pumping conditions, Metropolitan can require additional energy in excess of the base resources available to Metropolitan from the Hoover Power Plant, the Parker Power Plant, and Edison benefit energy. Metropolitan is a member of the Western Systems Power Pool ("WSPP"), and utilizes its industry standard form contract to make wholesale power purchases at market cost. Metropolitan also purchases California market-priced power through its agreement with Edison. In fiscal years 2014-15 and 2015-16, Metropolitan purchased approximately 710,000 and 690,000 megawatt-hours, respectively, of additional energy.

The Metropolitan-Edison 1987 Service and Interchange Agreement will expire on September 30, 2017. Metropolitan is negotiating with several parties on successor agreements. In particular, Metropolitan will no longer receive benefit energy from Edison. Metropolitan anticipates market power purchases will replace benefit energy and has reflected the additional costs in the CRA power cost projections for fiscal year 2017-18 and the ten-year financial forecast.

State Water Project. The State Water Project's power requirements are met from a diverse mix of resources, including State-owned hydroelectric generating facilities. DWR has long-term contracts with Metropolitan (hydropower), Kern River Conservation District (hydropower), Northern California Power Agency (natural gas generation), Alameda Municipal Power (geothermal and landfill gas), Sun Power Corporation (solar) and Dominion Solar Holdings (solar). The remainder of its power needs is met by short-term purchases. Metropolitan pays approximately 70 percent of State Water Project power costs.

DWR is seeking renewal of the license issued by FERC for the State Water Project's Hyatt-Thermalito hydroelectric generating facilities at Lake Oroville. A Settlement Agreement containing recommended conditions for the new license was submitted to FERC in March 2006. That agreement was signed by over 50 stakeholders, including Metropolitan and other State Water Contractors. With only a few minor modifications, FERC staff recommended that the Settlement Agreement be adopted as the condition for the new license. DWR issued a Final EIR for the relicensing project on July 22, 2008. On August 21, 2008, Butte County and Plumas County filed separate lawsuits against DWR challenging the adequacy of the Final EIR. This lawsuit also named all of the signatories to the Settlement Agreement as "real parties in interest," since they could be adversely affected by this litigation. On May 16, 2012, the trial court found that the EIR prepared in conjunction with the relicensing was adequate and dismissed the lawsuit against DWR. On August 7, 2012, Butte and Plumas Counties filed a notice of appeal. Briefing on the appeal was completed in May 2013. Supplemental briefing was completed in the fall of 2016. No date has been set for oral argument. Regulatory permits and authorizations are also required before the new license can take effect. In December 2016, the National Marine Fisheries Service issued a biological opinion setting forth the terms and conditions under which the relicensing project must operate in order to avoid adverse impacts to threatened and endangered species. This was the last major regulatory hurdle prior to FERC issuing a new license. Metropolitan anticipates that FERC will issue the new license in 2017. However, FERC has issued one-year renewals of the existing license since its initial expiration date on January 31, 2007, and is expected to issue successive one-year renewals until a new license is obtained.

DWR receives transmission service from the California Independent System Operator ("CAISO"), a nonprofit public benefit corporation formed in 1996 pursuant to legislation that restructured and deregulated the electric utility industry in California. The transmission service providers participating in the CAISO may seek increased transmission rates, subject to the approval of FERC. DWR has the right to contest any such proposed increase. DWR may be subject to increases in the cost of transmission service as new electric grid facilities are constructed.

Defined Benefit Pension Plan and Other Post-Employment Benefits

Metropolitan is a member of the California Public Employees' Retirement System ("PERS"), a multiple-employer pension system that provides a contributory defined-benefit pension for substantially all Metropolitan employees. PERS provides retirement and disability benefits, annual cost-of-living adjustments and death benefits to plan members and beneficiaries. PERS acts as a common investment and administrative agent for participating public entities within the State. PERS is a contributory plan deriving funds from employee contributions as well as from employer contributions and earnings from investments. A menu of benefit provisions is established by State statutes within the Public Employees' Retirement Law. Metropolitan selects optional benefit provisions from the benefit menu by contract with PERS.

Metropolitan makes contributions to PERS based on actuarially determined employer contribution rates. The actuarial methods and assumptions used are those adopted by the PERS Board of Administration. Employees are required to contribute seven percent of their earnings (excluding overtime pay) to PERS. Pursuant to the current memoranda of understanding, Metropolitan contributes the requisite seven percent contribution for all employees represented by the Management and Professional Employees Association, the Association of Confidential Employees, Supervisors and Professional Personnel Association and AFSCME Local 1902 and who were hired prior to January 1, 2012. Employees in all four bargaining

units who were hired on or after January 1, 2012, pay the full seven percent employee contribution to PERS. Metropolitan contributes the entire seven percent on behalf of unrepresented employees. Employees hired on or after January 1, 2013 and who are "new" PERS members as defined by Public Employees' Pension Reform Act of 2013 pay a member contribution of 6.75 and 6.00 percent in fiscal years 2016-17 and 2017-18, respectively. In addition, Metropolitan is required to contribute the actuarially determined remaining amounts necessary to fund the benefits for its members.

The contribution requirements of the plan members are established by State statute and the employer contribution rate is established and may be amended by PERS. The fiscal year 2015-16 contribution is based on the June 30, 2013 valuation report, the fiscal year 2016-17 contribution is based on the June 30, 2014 valuation report, and the fiscal year 2017-18 contribution is based on the June 30, 2015 valuation report. The PERS' projected investment return (the discount rate) for each of these fiscal years is 7.5 percent.

For fiscal year 2015-16, Metropolitan contributed 19.74 percent of annual covered payroll. The fiscal year 2015-16 annual pension cost was $50.8 million, of which $12.4 million was for Metropolitan's pick-up of the employees' seven percent share. For fiscal years 2016-17 and 2017-18, Metropolitan is required to contribute 20.75 and 22.89 percent of annual covered payroll, respectively, in addition to member contributions paid by Metropolitan.

Metropolitan's required contributions to PERS fluctuate each year and include a normal cost component and a component equal to an amortized amount of the unfunded liability. Many assumptions are used to estimate the ultimate liability of pensions and the contributions that will be required to meet those obligations. The PERS Board of Administration has adjusted and may in the future further adjust certain assumptions used in the PERS actuarial valuations, which adjustments may increase Metropolitan's required contributions to PERS in future years. Accordingly, Metropolitan cannot provide any assurances that its required contributions to PERS in future years will not significantly increase (or otherwise vary) from any past or current projected levels of contributions.

On April 17, 2013, the PERS Board of Administration approved changes to the amortization and rate smoothing policies to spread all gains and losses over a fixed 30-year period from a rolling 30-year period, and to recognize increases or decreases in investment returns over a 5-year period versus a 15-year period beginning with the June 30, 2013 valuations. In addition, PERS no longer uses an actuarial valuation of assets and instead uses the market value of assets to determine contribution rates per PERS direct smoothing policy. These changes will result in higher employer contribution rates in the near term but lower rates in the long term. The new policies are effective for determining contribution requirements beginning fiscal year 2015-16. On December 21, 2016 the PERS Board of Administration approved lowering the discount rate to 7.00 percent over a three year period. As a result, the discount rate for fiscal year 2018-19 will be 7.375 percent, for fiscal year 2019-20 it will be 7.25 percent, and for fiscal year 2020-21 it will be 7.00 percent. PERS has estimated that with a reduction in the rate of return to 7.00 percent, most employers could expect a 1 to 3 percent increase in the normal cost for miscellaneous plans. As a result, required contributions of employers, including Metropolitan, toward unfunded accrued liabilities, and as a percentage of payroll for normal costs, are expected to increase. The following table shows the funding progress of Metropolitan's pension plan.

The following table shows the funding progress of Metropolitan's pension plan.

Metropolitan Pension Plan Assets
(dollars in billions)

				Funded (Unfunded)		Funded Ratios	
Valuation Date	**Accrued Liability**	**Actuarial Value of Assets**	**Market Value of Assets**	**Actuarial Value**	**Market Value**	**Actuarial Value**	**Market Value**

Source: California Public Employees' Retirement System.

Effective July 1, 2014, Metropolitan implemented Governmental Accounting Standards Board Statement No. 68, *Accounting and Financial Reporting for Pensions – an amendment of GASB Statement No. 27* (GASB 68), affecting the reporting of pension liabilities for accounting purposes. Under GASB 68, Metropolitan is required to report the Net Pension Liability (*i.e.*, the difference between the Total Pension Liability and the Pension Plan's Net Position or market value of assets) in its financial statements.

For Metropolitan's fiscal year ended June 30, 2016 financial statements, the Net Pension Liability reported for the Miscellaneous Plan was $479.6 million (an increase of $72.8 million over the prior year), representing a Total Pension Liability as of such date of $2,038.6 million (an increase of $69.2 million over the prior year) less the Plan Fiduciary Net Position as of such date of $1,559.0 million (a decrease of $3.5 million over the prior year). For fiscal year 2016, the Miscellaneous Plan Net Pension Liability as a percentage of covered-employee payroll was 231.10 percent and the Plan Net Position as a percentage of the Total Pension Liability was 76.48 percent. The Net Pension Liability for Metropolitan's Miscellaneous Plan for the year ended June 30, 2016 was measured as of June 30, 2015, and the Total Pension Liability used to calculate the Net Pension Liability was determined by an annual actuarial valuation as of that date.

For the fiscal year ended June 30, 2015 financial statements, Metropolitan reported a Net Pension Liability of $406.8 million (a decrease of $118.1 million over the prior year), representing a Total Pension Liability as of such date of $1,969.3 million (an increase of $86.3 million over the prior year) less the Plan Fiduciary Net Position as of such date of $1,562.5 million (an increase of $204.4 million over the prior year). For fiscal year 2015, the Miscellaneous Plan Net Pension Liability as a percentage of covered-employee payroll was 200.53 percent and the Plan Net Position as a percentage of the Total Pension Liability was 79.34 percent. The Net Pension Liability for Metropolitan's Miscellaneous Plan for the year ended June 30, 2015 was measured as of June 30, 2014, and the Total Pension Liability used to calculate the Net Pension Liability was determined by an annual actuarial valuation as of that date.

For more information on the plan, see APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC

FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Metropolitan currently provides post-employment medical insurance to retirees and pays the post-employment medical insurance premiums to PERS. On January 1, 2012, Metropolitan implemented a longer vesting schedule for retiree medical benefits, which applies to all new employees hired on or after January 1, 2012. Payments for this benefit were $23.1 million in fiscal year 2015-16. Under Governmental Accounting Standards Board Statement No. 45, Accounting and Financial Reporting by Employers for Post-employment Benefits Other Than Pensions, Metropolitan is required to account for and report the outstanding obligations and commitments related to such benefits, commonly referred to as other post-employment benefits (OPEB), on an accrual basis.

The actuarial valuation dated June 30, 2015, was released in June of 2016. This valuation indicates that the Annual Required Contribution (ARC) in fiscal years 2016-17 and 2017-18 will be $29.3 million and $30.1 million, respectively. The ARC was based on the entry-age normal actuarial cost method with contributions determined as a level percent of pay. The actuarial assumptions included (a) a 7.25 percent investment rate of return, (b) a general inflation component of 3.0 percent and (c) increases to basic medical premiums of 7.0 percent for non-Medicare plans for 2017, grading down to 5.0 percent for 2021 and thereafter. As of June 30, 2015, the date of the OPEB actuarial report, the unfunded actuarial accrued liability was estimated to be $258.8 million. The unfunded actuarial accrued liability is amortized over a fixed 30-year period starting with fiscal year 2007-08 and ending in 2037. Changes to assumptions, actuarial gains and losses, and plan changes are amortized over a fixed 15-year period.

In September 2013, Metropolitan's Board established an irrevocable OPEB trust fund with an initial deposit of $40.0 million. During fiscal year 2013-14, the Board approved funding of an additional $100.0 million which was deposited into the irrevocable OPEB trust fund. As part of its biennial budget process, the Board approved the full funding of the ARC for fiscal years 2016-17 and 2017-18.

Governmental Accounting Standards Board Statement No. 75, *Accounting and Financial Reporting for Postemployment Benefits Other than Pensions*, was issued in June 2015, relating to accounting and financial reporting by state and local governments for OPEB. This statement establishes standards for measuring and recognizing liabilities, deferred outflows and deferred inflows of resources, and expenses. For defined benefit OPEB, this statement identifies the methods and assumptions that should be used to project benefit payments, discount projected benefit payments to their actuarial present value, and attribute that present value to periods of employee service. Note disclosure and required supplementary information requirements about OPEB also are addressed. This statement is effective for Metropolitan for 2018. Major changes would be: (i) the inclusion of net OPEB liabilities on Metropolitan's Statement of Net Position (they are currently included as notes to Metropolitan's financial statements); and (ii) more variable OPEB expense as it will now be based on the net OPEB liability change between reporting dates, with some sources of change recognized immediately and others spread over years, instead of being based on actual contributions.

HISTORICAL AND PROJECTED REVENUES AND EXPENSES

The "Historical and Projected Revenues and Expenses" table below provides a summary of revenues and expenses of Metropolitan prepared on a modified accrual basis. This is consistent with the adopted biennial budget for fiscal years 2016-17 and 2017-18. The table does not reflect the accrual basis of accounting, which is used to prepare Metropolitan's annual audited financial statements. The modified accrual basis of accounting varies from the accrual basis of accounting in the following respects: depreciation and amortization will not be recorded and payments of debt service will be recorded when due and payable. Under the modified accrual basis of accounting, revenues are recognized in the fiscal year in which they are

earned and expenses are recognized when incurred. Thus water sales revenues are recognized in the month the water is sold and expenses are recognized when goods have been received and services have been rendered. The change to modified accrual accounting is for budgeting purposes and Metropolitan will continue to calculate compliance with its rate covenant, limitations on additional bonds and other financial covenants in the Resolutions in accordance with their terms.

The projections are based on assumptions concerning future events and circumstances that may impact revenues and expenses and represent management's best estimates of results at this time. See footnotes to the table below entitled "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" and "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" for relevant assumptions, including projected water sales and average annual increase in the effective water rate, and "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES" for a discussion of potential impacts. Some assumptions inevitably will not materialize and unanticipated events and circumstances may occur. Therefore, the actual results achieved during the projection period will vary from the projections and the variations may be material.

Metropolitan's resource planning projections are developed using a comprehensive analytical process that incorporates demographic growth projections from recognized regional planning entities, historical and projected data acquired through coordination with local agencies, and the use of generally accepted empirical and analytical methodologies. See "METROPOLITAN'S WATER SUPPLY–Integrated Water Resources Plan" in this Appendix A. Metropolitan has conservatively set the water sales projections in the following table. Due to the variability of supplemental wholesale water sales and unpredictability of future hydrologic conditions, sales projections are based on long-term average forecasts consistent with Metropolitan's latest Board adopted Integrated Resources Plan, the 2015 IRP Update.

Nevertheless, Metropolitan's assumptions have been questioned by directors representing SDCWA on Metropolitan's Board. Metropolitan has reviewed SDCWA's concerns and, while recognizing that assumptions may vary, believes that the estimates and assumptions that support Metropolitan's projections are reasonable based upon history, experience and other factors as described above.

Metropolitan's water sales projections are the result of a comprehensive retail demand, conservation, and local supply estimation process, including supply projections from member agencies and other water providers within Metropolitan's service area. Retail demands for water are estimated with a model driven by projections of relevant demographics provided by SCAG and SANDAG. Retail demands are adjusted downward for conservation savings and local supplies, with the remainder being the estimated demand for Metropolitan supplies. Conservation savings estimates include all conservation programs in place to date as well as estimates of future conservation program goals that will result from regional 20 percent reductions by 2020 conservation savings. See "CONSERVATION AND WATER SHORTAGE MEASURES" in this Appendix A. Local supplies include water produced by local agencies from various sources including but not limited to groundwater, surface water, locally-owned imported supplies, recycled water, and seawater desalination (see "REGIONAL WATER RESOURCES" in this Appendix A). For example, water sales projections for fiscal year 2016-17 assumed that local projects such as groundwater recovery and desalination projects (see "REGIONAL WATER RESOURCES–Local Water Supplies" in this Appendix A) would become operational and produce local supplies in 2017. For additional description of Metropolitan's water sales projections, see "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

The water sales projections used to determine water rates and charges assume an average year hydrology. Actual water sales are likely to vary from projections. As shown in the *Historical Water Sales* chart below, sales can vary significantly from average and demonstrates the degree to which Metropolitan's commitments to meet supplemental demands can impact sales. In years when actual sales exceed projections, the revenues from water sales during the fiscal year will exceed budget, potentially resulting in

an increase in financial reserves. In years when actual sales are less than projections, Metropolitan uses various tools to manage reductions in revenues, such as reducing expenses below budgeted levels, reducing funding of capital from revenues, and drawing on reserves. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. Metropolitan considers actual sales, revenues and expenses, and financial reserve balances in setting rates for future fiscal years.

Projections for fiscal year 2016-17 in the following table reflect actual financial results through December 31, 2016 and revised projections for the balance of the fiscal year. The financial projections for fiscal year 2017-18 reflects the adopted biennial budget that was approved by the Board on April 12, 2016, with revised preliminary water sales projections as of February 2017, but with no adjustments for lower expenses that can accompany lower water sales. Financial projections for fiscal years 2018-19 through 2020-21 are reflected in the ten-year financial forecast provided in the adopted biennial budget. This includes the projected issuance of $320 million of bonds in fiscal years 2017-18 through 2019-21 to finance the CIP. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES–Water Sales Revenues" and "CAPITAL INVESTMENT PLAN–Capital Investment Plan Financing" in this Appendix A.

Water sales were 1.62 million acre-feet in fiscal year 2015-16. Water sales are projected to be 1.60 million acre-feet in fiscal year 2016-17 and 1.50 million acre-feet for fiscal year 2017-18, and 1.75 million acre-feet for fiscal years 2018-19 through 2020-21. Rates and charges increased by 1.5 percent on January 1, 2015 and January 1, 2016, and by 4.0 percent on January 1, 2017. On April 12, 2016 the Board adopted average increases in rate and charges of 4.0 percent, which will become effective on January 1, 2018. Rates and charges are projected to increase an average of 4.5 percent annually thereafter. Actual rates and charges to be effective in 2019 and thereafter are subject to adoption by Metropolitan's Board. The projections were prepared by Metropolitan and have not been reviewed by independent certified public accountants or any entity other than Metropolitan. Dollar amounts are rounded.

(Footnotes on next page)

(Footnotes to table on prior page)

(a) Unaudited. Prepared on a modified accrual basis. Projected revenues and expenses in fiscal year 2016-17 are based on preliminary financial results through December 31, 2016, and revised projections for the balance of fiscal year 2016-17. Projections for fiscal year 2017-18 are based on assumptions and estimates used in the adopted biennial budget for fiscal years 2016-17 and 2017-18 and revised for water sales of 1.5 million acre-feet. Projections for fiscal years 2018-19 through 2020-21 are based on assumptions and estimates used in the adopted fiscal years 2016-17 and 2017-18 biennial budget and reflect the projected issuance of additional bonds.

(b) During the fiscal years ended June 30, 2013 through June 30, 2016, annual water sales (in acre-feet) were 1.86 million, 2.04 million, 1.905 million and 1.62 million, respectively. See "METROPOLITAN REVENUES–Water Sales Revenues," the table entitled "SUMMARY OF WATER SOLD AND WATER SALES" in this Appendix A. The water sales projections (in acre-feet) are 1.60 million acre-feet for fiscal year 2016-17, 1.50 million acre-feet for fiscal years 2017-18, and 1.75 million acre-feet for fiscal years 2018-19, 2019-20 and 2020-21. Projections reflect Board adopted rate and charge increases of 4.0 percent, effective on January 1, 2017 and January 1, 2018. Rates and charges are projected to increase an average of 4.5 percent per fiscal year thereafter, subject to adoption by Metropolitan's Board. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES."

(c) Includes receipts from water standby, readiness-to-serve, and capacity charges. The term Operating Revenues excludes *ad valorem* taxes. See "METROPOLITAN REVENUES–Other Charges" in this Appendix A.

(d) Water Transfer Costs are included in operation and maintenance expenses for purposes of calculating the debt service coverage on all Obligations.

(e) Includes on- and off-aqueduct power and operation, maintenance, power and replacement costs payable under the State Water Contract. See "METROPOLITAN EXPENSES–State Water Contract Obligations" in this Appendix A.

(f) May include lease and rental net proceeds, net proceeds from sale of surplus property, reimbursements, and federal interest subsidy payments for Build America Bonds.

(g) Reflects transfers from the Water Management Fund, the Water Stewardship Fund, and the Water Rate Stabilization Fund, of $142 million in fiscal year 2014-15, $222 million in fiscal year 2015-16, and projected transfers of $46 million in fiscal year 2016-17 to fund a like amount of costs for conservation and supply programs. See "MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES."

(h) Includes CRA power sales.

(i) Does not include interest applicable to Bond Construction Funds, the Excess Earnings Funds, other trust funds and the Deferred Compensation Trust Fund. Fiscal year 2012-13 included Fair Value Adjustment of $(13.8) million, as per modified accrual accounting

(j) Adjusted Net Operating Revenues is the sum of all available revenues that the revenue bond resolutions specify may be considered by Metropolitan in setting rates and issuing additional Senior Revenue Bonds and Senior Parity Obligations and Subordinate Revenue Bonds and Subordinate Parity Obligations.

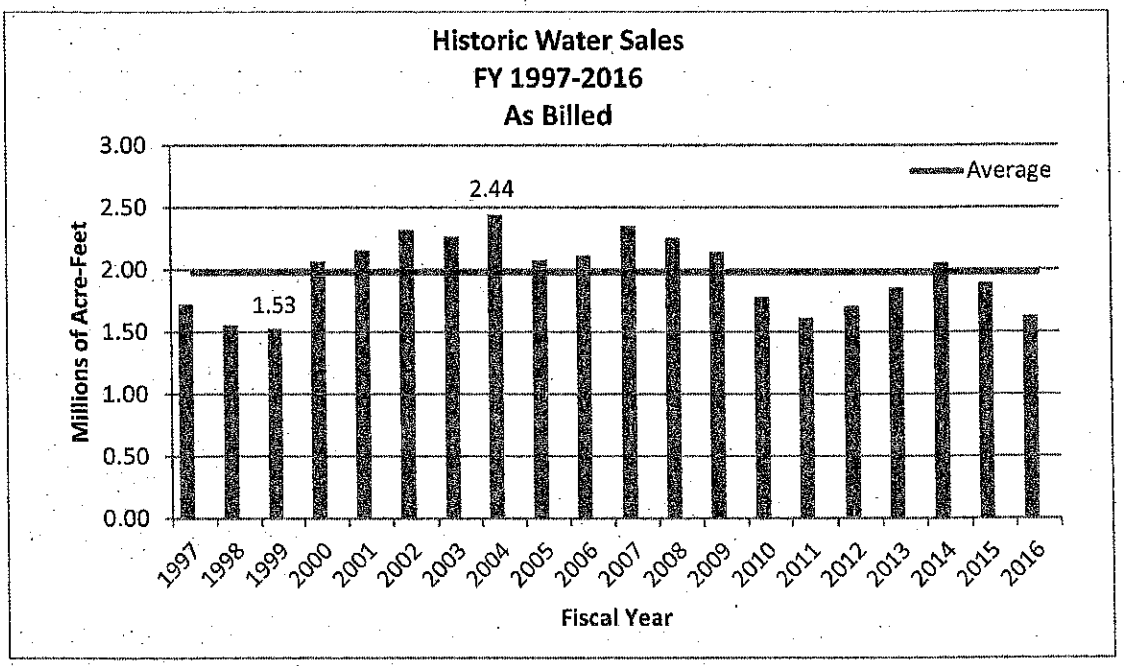
(k) Includes debt service on outstanding Senior Revenue Bonds, and additional Senior Revenue Bonds (projected). Assumes issuance of $80 million annually in additional Senior Revenue Bonds as provided in budget assumptions for the adopted biennial budget for fiscal years 2016-17 and 2017-18 and as projected for fiscal years 2018-19, 2019-20, and 2020-21. For fiscal years 2013-14 and 2014-15, reflects the defeasance of the 2004 Series B Water Revenue Refunding Bonds, payable on July 1, 2014, through a payment of $33.7 million to an escrow account on May 29, 2014. Fiscal year 2015-16 debt service increased $7.0 million for debt service paid on June 30, 2016, rather than July 1, 2017 and fiscal year 2016-17 debt service was therefore reduced by $7.0 million. See "CAPITAL INVESTMENT PLAN–Capital Investment Plan Financing" in this Appendix A.

(l) Consisting of subordinate lien California Safe Drinking Water Revolving Fund Loan and Subordinate 2016 Series A Bonds.

(m) Adjusted Net Operating Revenues divided by the sum of debt service on outstanding Senior Revenue Bonds and additional Senior Revenue Bonds (projected).

(n) Adjusted Net Operating Revenues, divided by the sum of debt service on outstanding Senior Revenue Bonds, Senior Parity Obligations, Subordinate Revenue Bonds and Subordinate Parity Obligations, including the subordinate lien California Safe Drinking Water Revolving Fund Loan and projected Revenue Bonds. See "METROPOLITAN EXPENSES–Outstanding Subordinate Revenue Bonds and Subordinate Parity Obligations" in this Appendix A.

(o) Adjusted Net Operating Revenues, divided by the sum of State Water Contract capital costs paid from current year operations and debt service on outstanding Revenue Bonds, the subordinate lien California Safe Drinking Water Revolving Fund Loan, Subordinate 2016 Series A Bonds and additional Revenue Bonds (projected).



(p) For Fiscal Year 2012-13, includes amounts that were transferred prior to June 30, 2013: $25 million to the Water Transfer Fund, $25 million to a trust to pre-fund Metropolitan's unfunded liability for other post-employment benefits, and $25 million for pay-as-you-go Construction. For Fiscal Year 2013-14, includes amounts transferred prior to June 30, 2014: $100 million to a trust to pre-fund Metropolitan's unfunded liability for other post-employment benefits; $100 million for pay-as-you-go Construction, $232 million to the Water Management Fund, for water purchases to replenish storage and funding drought response programs. For Fiscal Year 2014-15, includes amounts transferred prior to June 30, 2015: $160 million to the Water Management Fund, for water conservation programs. For fiscal year 2015-16, Metropolitan used $264 million for acquiring properties in Riverside and Imperial Counties, funded by $160 million from the Replacement and Refurbishment Fund Reserves and the balance from unrestricted reserves. This land purchase is reflected as a pay-as-you-go expenditure for fiscal year 2015-16.

(q) The financial projection for fiscal year 2017-18 reflects the revised preliminary water sales projection of 1.50 million acre-feet and a corresponding reduction in projected water sales revenues. It does not take into account any potential reduction in expenses that may accompany such reduced water sales. As discussed, Metropolitan uses its financial reserves and budgetary tools to manage the financial impact of the variability in revenues due to fluctuations in annual water sales. See also "METROPOLITAN REVENUES–Financial Reserve Policy."

MANAGEMENT'S DISCUSSION OF HISTORICAL AND PROJECTED REVENUES AND EXPENSES

Water Sales Projections

Water sales forecast in the table above for fiscal year 2016-17 is 1.60 million acre-feet, 100 thousand acre-feet under budget. The updated water sales forecast is 1.50 million acre-feet for fiscal year 2017-18, and 1.75 million acre-feet for fiscal years 2018-19 and 2019-21, consistent with the biennial budget and ten-year financial forecast. For purposes of comparison, Metropolitan's highest water sales during the past 20 fiscal years was approximately 2.44 million acre-feet in fiscal year 2003-04 and the lowest was 1.53 million acre-feet in fiscal year 1998-1999. The chart below shows the last 20 fiscal years of water sales.

Water Sales Revenues

Metropolitan relies on revenues from water sales for about 85 to 90 percent of its total revenues. In adopting the budget and rates and charges for each fiscal year, Metropolitan's board reviews the anticipated revenue requirements and projected water sales to determine the rates necessary to produce the required revenues to be derived from water sales during the fiscal year. Metropolitan sets rates and charges estimated to provide operating revenues sufficient, with other sources of funds, to provide for payment of its expenses. See "HISTORICAL AND PROJECTED REVENUES AND EXPENSES" in this Appendix A.

Metropolitan's Board has adopted annual increases in water rates each year beginning with the rates effective January 1, 2004. See "METROPOLITAN REVENUES–Rate Structure" and "–Classes of Water Service" in this Appendix A. On April 10, 2012, Metropolitan's Board adopted annual water rate increases of 5.0 percent, which became effective January 1, 2013 and January 1, 2014. On April 8, 2014, Metropolitan's Board adopted 1.5 percent average water rate increases effective January 1, 2015, and January 1, 2016, and on April 12, 2016, Metropolitan's Board adopted an average 4.0 percent water rate increase, effective January 1, 2017, and an additional average 4.0 percent water rate increase effective January 1, 2018.

Projected Fiscal Year 2016-17 Results

Projections for fiscal year 2016-17, in the table above, are based on preliminary financial results through December 31, 2016, and revised projections for the balance of fiscal year 2016-17. The financial

projection for fiscal year 2017-18 reflects the adopted biennial budget for this fiscal year as approved by the Board on April 12, 2016, with revised preliminary water sales projections. Financial projections for fiscal years 2018-19 through 2020-21 are reflected in the ten-year financial forecast provided in the adopted biennial budget. The fiscal year 2016-17 and 2017-18 biennial budget and rates set the stage for predictable and reasonable rate increases over the ten-year planning period, with Board adopted rate increases of 4.0 percent annually in both fiscal years 2016-17 and 2017-18, and projected average increases of 4.5 percent per year thereafter. Actual rates and charges to be effective in fiscal year 2018-19 and thereafter are subject to adoption by Metropolitan's Board as part of the biennial budget process, at which point the ten-year forecast will also be updated as well. Increases in rates and charges reflect the impact of reduced water sales projections, increasing operations and maintenance costs, and increasing State Water Project costs, when compared to prior fiscal years.

Metropolitan's revenues exceeded expenses during fiscal year 2014-15, resulting in a significant increase in unrestricted reserves. On May 29, 2015, Metropolitan's Board approved the use of $160 million of unrestricted reserves over the target reserve level, $50 million from the Water Stewardship Fund, and $140 million from the Water Management Fund to fund conservation incentives. As of June 30, 2015, Metropolitan's unrestricted reserves were $476 million, on a modified accrual basis. On July 14, 2015, Metropolitan's Board approved $264 million to acquire various properties in Riverside and Imperial Counties, with $160 million funded from the Replacement and Refurbishment Fund and the remaining amount from unrestricted reserves. Unrestricted reserves, as of April 30, 2016, include $250 million drawn from Short-Term Revolving Credit Facilities with RBC Municipal Products, LLC, and U.S. Bank N.A, and deposited in Metropolitan's financial reserves. See "METROPOLITAN REVENUES–Financial Reserve Policy" and "METROPOLITAN EXPENSES–Outstanding Senior Revenue Bonds and Senior Parity Obligations – Senior Parity Obligations – Short-Term Revolving Credit Facilities" in this Appendix A.

In fiscal years 2014-15 and 2015-16, Adjusted Net Operating Revenues reflect the use of $142 million and $222 million respectively, from reserves to fund a like amount of costs for conservation and supply programs. In fiscal year 2016-17, $46 million of Adjusted Net Operating Revenues are projected to come from reserves to fund a like amount of costs for conservation and supply programs.

Financial projections for fiscal year 2016-17 reflect lower water sales revenues that are estimated to be $107.0 million, or 8 percent, below budget, based on the revised water sales projection of 1.60 million acre-feet, compared to the budgeted 1.70 million acre-feet, a reduction of 6 percent.

Operation and maintenance expenses in fiscal year 2016-17 are projected to be $1.01 billion, which represents approximately 63 percent of total costs. These expenses include the costs of labor, electrical power, materials and supplies of both Metropolitan and its contractual share of the State Water Project. Metropolitan's operation and maintenance expenditures are project to be on budget in fiscal year 2016-17. Metropolitan's State Water Project costs are projected to be $80.3 million lower than budgeted. Overall, projected expenditures for the twelve months ending June 30, 2017 are $1.6 billion. This is $89 million, or 5 percent, less than budgeted expenditures.

The combination of lower than budgeted water sales revenue and expenditures has resulted in projected fiscal year 2016-17 revenue bond debt service coverage to be 1.48x and fixed charge coverage to be 1.26x, compared to budgeted debt service coverage of 1.55x and budgeted fixed charge coverage of 1.27x. Fiscal year 2016-17 capital expenditures, currently estimated at $212 million, will be primarily funded by pay-as-you-go funding and the remainder from bond proceeds. Metropolitan's unrestricted reserves are projected to be approximately $378 million at June 30, 2017. See "METROPOLITAN REVENUES–Financial Reserve Policy" in this Appendix A. This amount does not include funds held in the Exchange Agreement Set-Aside Fund.

See also the "Management's Discussion and Analysis" contained in APPENDIX B–"THE METROPOLITAN WATER DISTRICT OF SOUTHERN CALIFORNIA INDEPENDENT AUDITOR'S REPORT AND BASIC FINANCIAL STATEMENTS FOR FISCAL YEARS ENDED JUNE 30, 2016 AND JUNE 30, 2015 AND BASIC FINANCIAL STATEMENTS FOR THE SIX MONTHS ENDED DECEMBER 31, 2016 AND 2015 (UNAUDITED)."

Subject: RE: Times Mirror Square - WSA Potential Land Use Revisions

Hi Kim,

Based on the revisions to the scope of the Times Mirror Square Project sent below, LADWP recalculated the project's water demand utilizing the updated restaurant and office floor areas. The revised project's total water demand would not increase the previous water demand of 220 acre-feet/year, as approved by the Board of Water and Power on September 19, 2017.

Per Water Code Section 10910(h), no additional water supply assessment is required for the revisions because the changes in the project does not result in a substantial increase in water demand for this project.

If the project has any additional scope changes in the future, please notify LADWP and City Planning to verify if the changes would impact the approved Water Supply Assessment and Environmental Impact Report.

Please let me know if you have any questions.

Thank you.

Subject: Times Mirror Square - WSA Potential Land Use Revisions

Hi Ryan,

As we discussed on the phone, potential land use revisions are being considered for the Times Mirror Square project. These land use revisions include replacing retail uses with restaurant uses in the North and South Towers and replacing restaurant uses on the 2nd floor of the Plant Building with office uses. These potential changes are highlighted in Table 4, Proposed Development Program, from the WSA below. There will be no change in overall square footage of the project site.

FW: Times Mirror Square - WSA Potential Land Use Revisions

William Lamborn <william.lamborn@lacity.org> Mon, Feb 5, 2018 at 2:21 PM
To: "Aghakhani, Ryan" <Ryan.Aghakhani@ladwp.com>

Hi Ryan,
The EIR for the project is still being prepared. The project description will be adjusted throughout the Draft EIR to account for this proposed shift in retail/office/restaurant space. This adjustment to the project description would not result in the need for a general plan amendment or zone changes, would not change the entitlement requests, and would not alter the proposed number of parking spaces.

Best,
Will

Depending on their number of assumed seats for the additional restaurant space, they may see a slight bump in water demand, but we don't believe it is significant enough at this time to trigger an additional WSA. The total sf for the project will remain the same.

With these changes to the project, does Planning foresee a need for any additional changes, such as to parking space, or zoning changes or an amendment? Would it still be consistent with the City's General Plan?

I will be out tomorrow, but my supervisor Theresa will be in.

Thank you.

Times Mirror Square Project
Construction Energy Analysis

Annual Fuel Summary

	Heavy-Duty Construction Equipment
868,836	Total Project Consumption
217,209	Annual Consumption
	Haul Trucks
158,470	Total Project Consumption
39,618	Annual Consumption
	Vendor Trucks
362,095	Total Project Consumption
90,524	Annual Consumption
	Workers
841,610	Total Project Consumption
210,402	Annual Consumption
520,565	Project Consumption of diesel for Haul Trucks and Vendors
130,141	Annual Consumption
1,389,401	Total Gallons Diesel (4 year estimated Project Construction Duration)
841,610	Total Gallons Gasoline (4 year estimated Project Construction Duration)

4.0	Estimated Project Construction Duration (years)
347,351	Annual Average Gallons Diesel
210,402	Annual Average Gallons Gasoline

Annual Fuel Savings Summary from Compliance with CARB Anti-Idling Regulation (13 CCR Section 2485)

65,974	Total Gallons Diesel Idling w/o CARB Anti-Idling Regulation (Trucks)
23,751	Total Gallons Diesel Idling w/ CARB Anti-Idling Regulation (Trucks)
42,224	Total Gallons Diesel Saved w/ CARB Anti-Idling Regulations (Trucks)
4.0	Estimated Project Construction Duration (years)
16,494	Annual Average Gallons Diesel Idling w/o CARB Anti-Idling Regulation (Trucks)
5,938	Annual Average Gallons Diesel Idling w/ CARB Anti-Idling Regulation (Trucks)
10,556	Annual Average Gallons Diesel Saved w/ CARB Anti-Idling Regulations (Trucks)

Project Construction Comparison to County Fuel Demand

Project	**Los Angeles County** [a]		**Percent of Annual Project Compared to Los Angeles County**
Source	**Fuel Type**	**Gallons**	
Workers	Gasoline	3,659,000,000	0.006%
Off-Road/Vendor/Haul Trucks	Diesel	590,000,000	0.059%

Notes:

a. Gasoline and diesel amounts from CEC, 2017. Available: http://www.energy.ca.gov/almanac/transportation_data/gasoline/2017_A15_Results.xlsx. Diesel is adjusted to account for retail (51%) and non-retail (49%) diesel sales.

Temporary Construction Trailer		
Land Use	**Square Feet**	**Energy Use per year (kWh)**
General Office	1,000	12,990
Note: CalEEMod 2016.3.2 used to estimate energy use for temporary construction office		

Electric-powered Construction Equipment

kWh/hp-hr
0.7457

Equipment	Number	Hours/Day	Horsepower	Load Factor	Number Days	Total hp-hr	kWh	kWh/yr
Cranes	3	12	231	0.29	944	2,276,588	1,697,652	424,413
Signal Boards	2	12	6	0.82	1485	175,349	130,757.60	32,689
Total	**-**	**-**	**-**	**-**	**-**	**2,451,937**	**1,828,409**	**457,102.35**

Notes:

1. Cranes horsepower and load factors taken from CalEEMod

2. Conversion factor taken from University of North Carolina Unit Conversion Dictionary; Source: http://www.unc.edu/~rowlett/units/dictH.html

Sources:

Electricity Intensity Factors - California Emissions Estimator Model (CalEEMod).

Estimated construction water use assumed to be generally equivalent to landscape irrigation, based on a factor of 20.94 gallons per year per square foot of landscaped area within the Los Angeles area (Mediterranean climate), which assumes high water demand landscaping materials and an irrigation system efficiency of 85%. Factor is therefore (20.94 GAL/SF/year) x (43,560 SF/acre) / (365 days/year) / (0.85) = 2,940 gallons/acre/day, rounded up to 3,000 gallons/acre/day. (U.S. Department of Energy, Energy Efficiency & Renewable Energy, Federal Energy Management Program. “Guidelines for Estimating Unmetered Landscaping Water Use." July 2010. Page 12, Table 4 - Annual Irrigation Factor – Landscaped Areas with High Water Requirements).

EMFAC2014 (v1.0.7) Emissions Inventory

Region Type: Air Basin
Region: South Coast
Calendar Year: 2018
Season: Annual
Vehicle Classification: EMFAC2011 Categories
Units: miles/day for VMT, trips/day for Trips, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

Haul Trucks (T7 Single Construction)			
VMT	Fuel Consumption (gal/day)	Annual VMT	Annual Fuel Consumption
374075	62351	136,537,218	22,758,087
gal/mi			
0.166680465			

Workers (LDA,LDT1, LDT2)

Times Mirror Square
Operational Energy Analysis
Project Trips
Fuel Usage from VMT

Annual VMT (All): 28,783,078 miles/year

(With trip and VMT reductions from land use characteristics and proximity to public transit.)

Fuel Type:[1]	GAS	DSL	ELEC	
Percent:	93.20%	4.18%	2.62%	
Miles per Gallon Fuel:	24.76	8.67	-	
Annual VMT by Fuel Type :	26,825,829	1,203,133	754,117	miles/year
Annual Fuel Usage :	1,083,434	138,818	-	gal/year
Annual Fuel Savings from Electric Vehicles:[2]	-	-	30,457	gal/year (assumed to be gasoline)

Notes:

1. California Air Resources Board, EMFAC2014, South Coast Air Basin; 2023; Annual; All vehicle types; Aggregate model year; Aggregate speed). https://www.arb.ca.gov/emfac/2014/
2. Assumes electric vehicles would replace traditional gasoline-fueled vehicles.

Times Mirror Square
Operational Energy Analysis
Existing Trips
Fuel Usage from VMT

Annual VMT (All): 8,400,914 miles/year

(With trip and VMT reductions from land use characteristics and proximity to public transit.)

Fuel Type:[1]	GAS	DSL	ELEC	
Percent:	95.86%	3.73%	0.41%	
Miles per Gallon Fuel:	22.60	8.25	-	
Annual VMT by Fuel Type :	8,053,116	313,354	34,444	miles/year
Annual Fuel Usage :	356,322	37,981	-	gal/year
Annual Fuel Savings from Electric Vehicles:[2]	-	-	1,524	gal/year (assumed to be gasoline)

Notes:

1. California Air Resources Board, EMFAC2014, South Coast Air Basin; 2017; Annual; All vehicle types; Aggregate model year; Aggregate speed). https://www.arb.ca.gov/emfac/2014/
2. Assumes electric vehicles would replace traditional gasoline-fueled vehicles.

Times Mirror Square
Operational Energy Analysis
Project without Trip Reductions
Fuel Usage from VMT

Annual VMT (All): 43,353,344 miles/year

(Without trip and VMT reductions from land use characteristics and proximity to public transit.)

Fuel Type:[1]	GAS	DSL	ELEC	
Percent:	93.20%	4.18%	2.62%	
Miles per Gallon Fuel:	22.60	8.25	-	
Annual VMT by Fuel Type :	40,405,317	1,812,170	1,135,858	miles/year
Annual Fuel Usage :	1,787,792	219,651	-	gal/year
Annual Fuel Savings from Electric Vehicles:[2]	-	-	50,258	gal/year (assumed to be gasoline)

Notes:

1. California Air Resources Board, EMFAC2014, South Coast Air Basin; 2017; Annual; All vehicle types; Aggregate model year; Aggregate speed). https://www.arb.ca.gov/emfac/2014/
2. Assumes electric vehicles would replace traditional gasoline-fueled vehicles.

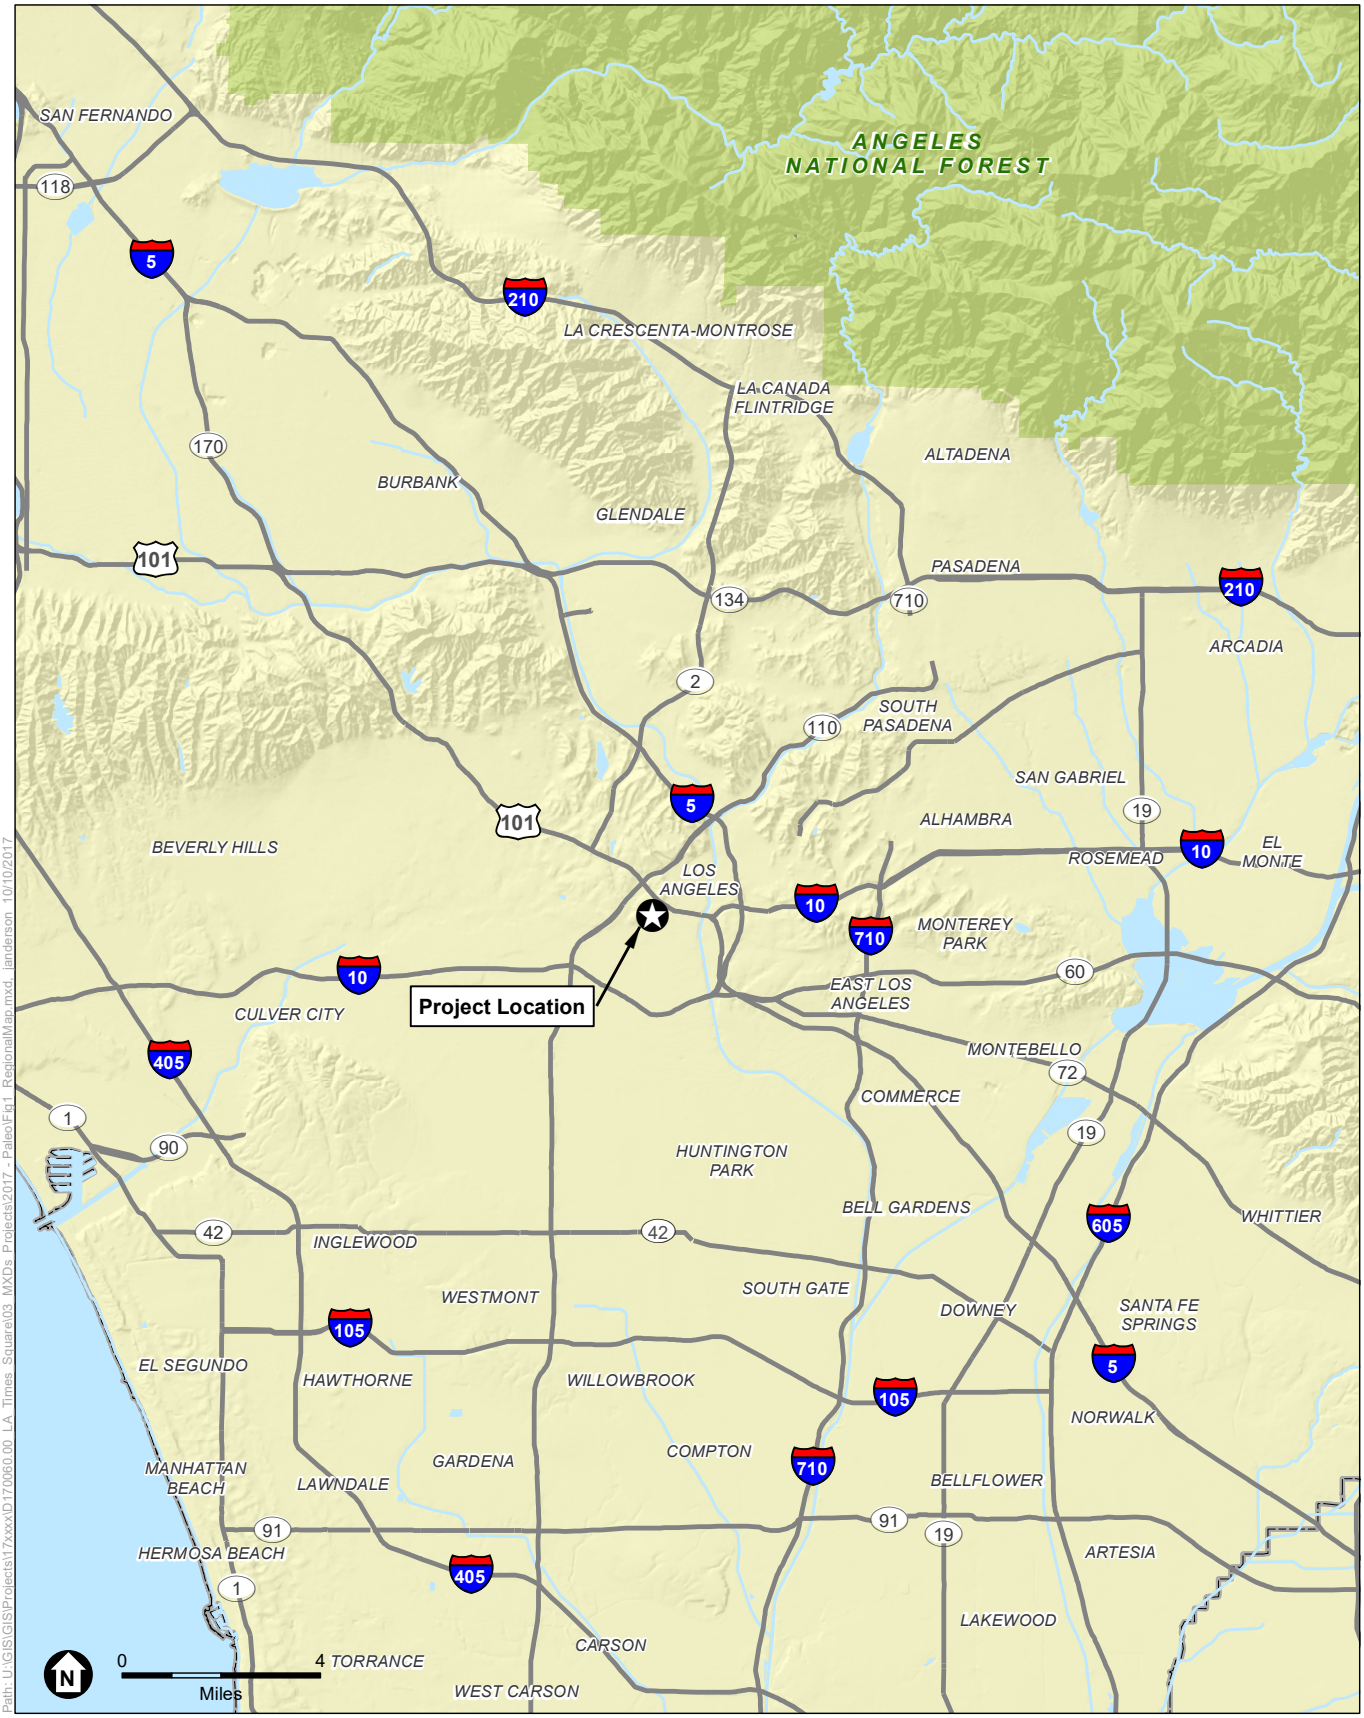
TIMES MIRROR SQUARE PROJECT

Assembly Bill 52 Consultation Summary Report



Introduction

Environmental Science Associates (ESA) has been retained by Onni Group (Applicant), to prepare this Assembly Bill 52 (AB 52) Consultation Summary Report for the Times Mirror Square Project (Project) in support of an Environmental Impact Report (EIR). The Applicant proposes to construct two new mixed-use towers along with rehabilitation of three existing buildings within the Times Mirror Square site (Project Site) in the City of Los Angeles. The Project Site is currently occupied by five structurally distinct but internally connected buildings occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings include the Times Building, the Plant Building, the Mirror Building, the Executive Building, and parking structure. The Project would include demolition of the Executive Building and parking structure, and would construct two mixed-used towers (North and South Towers) in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror Building. The City of Los Angeles (City) is the lead agency pursuant to the California Environmental Quality Act (CEQA).

ESA personnel involved in the preparation of this report are as follows: Monica Strauss, M.A., R.P.A., Project Director and Principal Investigator; Sara Dietler, B.A., Project Manager; and Michael Vader, B.A., report author. Resumes of key personnel are included in **Appendix A**.

Project Location

The 3.6-acre Project Site is located within the northern portion of downtown Los Angeles (**Figure 1**). Specifically, the Project Site is located in an unsectioned portion of Township 1 South, Range 13 West on the Los Angeles, CA USGS 7.5-minute topographic quadrangle (**Figure 2**). The Project Site comprises the city block bounded by W. 1st Street to the northeast, S. Spring Street to the southeast, W. 2nd Street southwest, and S. Broadway to the northwest (**Figure 3**).

Project Description

The Project Site encompasses five structurally distinct but internally connected buildings currently occupied by the Los Angeles Times offices, a bank, and other office uses. The buildings were constructed between the 1930s and 1970s and range from four to 10 stories in height. The buildings include the eight-story Times Building, the four-story Plant Building, the 10-story Mirror Building, the six-story Executive Building, and the six-story parking structure. The Project would include demolition of the Executive Building and parking structure, and would construct the two mixed-used North and South Towers in their place. The Project would also rehabilitate the Times Building, the Plant Building, and the Mirror Building.

The proposed 37-story North Tower and 53-story South Tower would be constructed in the west sector of the block, which is aligned with S. Broadway with frontages on W. 1st Street and W. 2nd Street. The North and South Towers, which would be constructed above a five-story parking podium (Podium), would contain a total of approximately 1,127 residential units, approximately 34,572 square feet of commercial floor area, and a combined floor area of approximately 1,135,803 square feet. The Podium would be an above-ground structure with street front new retail development on the first floor and four levels of above-grade parking, which forms the base for the residential towers. The space below the Podium would contain an additional nine levels of subterranean parking. An open-to-the sky pedestrian paseo (Paseo) leading from W. 1st Street to W. 2nd Street would bisect the block between the new towers and the rehabilitated Times, Plant, and Mirror Buildings, and would provide a visual connection to First and Broadway Civic Center Park. Ground level retail uses would be located along the base of the Podium facing W. 1st Street, S. Broadway, and W. 2nd Street, and the Paseo.

Setting

Ethnographic Setting

The Project Site is located in a region traditionally occupied by the Takic-speaking Gabrielino Indians. The term “Gabrielino” is a general term that refers to those Native Americans who were administered by the Spanish at the Mission San Gabriel Arcángel. Prior to European colonization, the Gabrielino occupied a diverse area that included: the watersheds of the Los Angeles, San Gabriel, and Santa Ana rivers; the Los Angeles basin; and the islands of San Clemente, San Nicolas, and Santa Catalina (Kroeber, 1925). Their neighbors included the Chumash to the north, the Juañeno to the south, and the Serrano and Cahuilla to the east. The Gabrielino are reported to have been second only to the Chumash in terms of population size and regional influence (Bean and Smith, 1978). The Gabrielino language is part of the Takic branch of the Uto-Aztecan language family.

The Gabrielino were hunter-gatherers and lived in permanent communities located near the presence of a stable food supply. Subsistence consisted of hunting, fishing, and gathering. Small terrestrial game was hunted with deadfalls, rabbit drives, and by burning undergrowth, while larger game such as deer were hunted using bows and arrows. Fish were taken by hook and line, nets, traps, spears, and poison (Bean and Smith, 1978). The primary plant resources were the acorn, gathered in the fall and processed in mortars and pestles, and various seeds that were

harvested in late spring and summer and ground with manos and metates. The seeds included chia and other sages, various grasses, and islay or holly-leafed cherry.

Community populations generally ranged from 50 to 100 inhabitants, although larger settlements may have existed. The Gabrielino-Tongva are estimated to have had a population numbering around 5,000 in the pre-contact period (Kroeber, 1925). Villages are reported to have been the most abundant in the San Fernando Valley, the Glendale Narrows area north of downtown, and around the Los Angeles River's coastal outlets (Gumprecht, 2001). The village of *Yaanga* was located approximately 0.25 miles from the location of the present-day Project Site (Morris et al., 2016). Of the approximately 100 known Gabrielino villages, *Yaanga* was one of the largest and leaders from other Gabrielino villages would regularly converge on *Yaanga* to hold councils (Rasmussen, 1997). The Gabrielino leaders would meet beneath the branches of a large sycamore tree known as the council tree, or *El Aliso*, which served as a regional landmark and meeting place. The 400-year old tree died and was cut down in 1892 as downtown Los Angeles's industrial expansion surrounded it (Rasmussen, 1997). Recent research indicates that El Aliso was located south of what is presently the Metropolitan Transit Authority's headquarters within the median of the Hollywood Freeway, located approximately 0.5 miles east of the Project Site (Rasmussen, 1997).

Based on baptismal records, *Yaanga* appears to have been occupied until at least 1813. But by the early 1820s, *Yaanga's* Gabrielino residents were displaced to an area south of the village site approximately 530 feet from the Project Site (Morris et al., 2016). By 1836, the displaced Gabrielino community was known as *Rancho de los Pablinos*, and Los Angeles residents began complaining about the Gabrielino bathing in the Zanjas (Morris et al., 2016). As a result of the complaints, the Gabrielino were once again displaced further to the east n approximately 0.44 miles from the present-day Project Site. By 1847, the Gabrielino from *Yaanga* were displaced once again and left without a space in which to form a new community. As a result, the Gabrielino dispersed throughout Los Angeles.

Regulatory Framework

State

California Environmental Quality Act

CEQA is the principal statute governing environmental review of projects occurring in the state and is codified at *Public Resources Code (PRC) Section 21000 et seq.* CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA (Section 21084.1), a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

The *CEQA Guidelines* (Title 14 California Code of Regulations [CCR] Section 15064.5) recognize that historical resources include: (1) a resource listed in, or determined to be eligible by the State Historical Resources Commission, for listing in the California Register of Historical Resources (California Register); (2) a resource included in a local register of historical resources,

as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record. The fact that a resource does not meet the three criteria outlined above does not preclude the lead agency from determining that the resource may be an historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

If a lead agency determines that an archaeological site is a historical resource, the provisions of Section 21084.1 of CEQA and Section 15064.5 of the *CEQA Guidelines* apply. If an archaeological site does not meet the criteria for a historical resource contained in the *CEQA Guidelines*, then the site may be treated in accordance with the provisions of Section 21083, which is as a unique archaeological resource. As defined in Section 21083.2 of CEQA a "unique" archaeological resource is an archaeological artifact, object, or site, about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or,
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If an archaeological site meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site is to be treated in accordance with the provisions of Section 21083.2, which state that if the lead agency determines that a project would have a significant effect on unique archaeological resources, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place (Section 21083.1(a)). If preservation in place is not feasible, mitigation measures shall be required. The *CEQA Guidelines* note that if an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment (*CEQA Guidelines* Section 15064.5(c)(4)).

A significant effect under CEQA would occur if a project results in a substantial adverse change in the significance of a historical resource as defined in *CEQA Guidelines* Section 15064.5(a). Substantial adverse change is defined as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired" (*CEQA Guidelines* Section 15064.5(b)(1)). According to *CEQA Guidelines* Section 15064.5(b)(2), the significance of a historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that:

A. Convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or

B. Account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in a historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or

C. Convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a Lead Agency for purposes of CEQA.

In general, a project that complies with the Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings (Standards) is considered to have mitigated its impacts to historical resources to a less-than-significant level (CEQA Guidelines Section 15064.5(b)(3)).

Assembly Bill 52 and Related Public Resources Code Sections

Assembly Bill (AB) 52 was approved by California State Governor Edmund Gerald "Jerry" Brown, Jr. on September 25, 2014. The act amended California PRC Section 5097.94, and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3. AB 52 applies specifically to projects for which a Notice of Preparation (NOP) or a Notice of Intent to Adopt a Negative Declaration or Mitigated Negative Declaration (MND) filed on or after July 1, 2015. The primary intent of AB 52 was to include California Native American Tribes early in the environmental review process and to establish a new category of resources related to Native Americans that require consideration under CEQA, known as tribal cultural resources. PRC Section 21074(a)(1) and (2) defines tribal cultural resources as "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe" that are either included or determined to be eligible for inclusion in the California Register or included in a local register of historical resources, or a resource that is determined to be a tribal cultural resource by a lead agency, in its discretion and supported by substantial evidence. A cultural landscape that meets these criteria is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape. Historical resources, unique archaeological resources, or non-unique archaeological resources may also be tribal cultural resources if they meet these criteria

On July 30, 2016, the California Natural Resources Agency adopted the final text for tribal cultural resources update to Appendix G of the CEQA Guidelines, which was approved by the Office of Administrative Law on September 27, 2016.

PRC Section 21080.3.1 requires that within 14 days of a lead agency determining that an application for a project is complete, or a decision by a public agency to undertake a project, the lead agency provide formal notification to the designated contact, or a tribal representative, of California Native American Tribes that are traditionally and culturally affiliated with the geographic area of the project (as defined in PRC Section 21073) and who have requested in writing to be informed by the lead agency (PRC Section 21080.3.1(b)). Tribes interested in consultation must respond in writing within 30 days from receipt of the lead agency's formal

notification and the lead agency must begin consultation within 30 days of receiving the tribe's request for consultation (PRC Sections 21080.3.1(d) and 21080.3.1(e)).

PRC Section 21080.3.2(a) identifies the following as potential consultation discussion topics: the type of environmental review necessary; the significance of tribal cultural resources; the significance of the project's impacts on the tribal cultural resources; project alternatives or appropriate measures for preservation; and mitigation measures. Consultation is considered concluded when either: (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached (PRC Section 21080.3.2(b)).

If a California Native American tribe has requested consultation pursuant to Section 21080.3.1 and has failed to provide comments to the lead agency, or otherwise failed to engage in the consultation process, or if the lead agency has complied with Section 21080.3.1(d) and the California Native American tribe has failed to request consultation within 30 days, the lead agency may certify an EIR or adopt an MND (PRC Section 21082.3(d)(2) and (3)).

PRC Section 21082.3(c)(1) states that any information, including, but not limited to, the location, description, and use of the tribal cultural resources, that is submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public without the prior consent of the tribe which provided the information. If the lead agency publishes any information submitted by a California Native American tribe during the consultation or environmental review process, that information shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public.

Archival Research

SCCIC Records Search

A records search for the Project was conducted on May 4, 2017 at the California Historical Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC) housed at California State University, Fullerton. The records search included a review of all recorded cultural resources and previous studies within the Project Site as well as a ½-mile radius.

Previous Cultural Resources Investigations

The records search results indicate that 152 cultural resources studies have been conducted within a ½-mile radius of the Project Site. Of these 152 previous studies, 98 included some form of field study including survey, excavation, or monitoring. (**Table 1**). Approximately 70 percent of the ½-mile records search radius has been included in previous cultural resources field studies. Of the 98 previous field studies, one (LA-10507) overlaps the Project Site. Approximately 90 percent of the Project Site has been included as part of this previous study.

Previously Recorded Cultural Resources

The records search results indicate that 15 resources have been previously recorded within the ½-mile records search radius (**Table 2**). These resources include 14 archaeological resources and one California Historic Landmark (CHL #744). Of the 14 archaeological resources, 13 are historic-period archaeological sites (CA-LAN-2741H, -3097H, -3129H, -3337H, -3347, -3566, -3588H, -3767H, -3862H, -4114H, -4171H, -4196H and P-19-004451), and one is a historic-

period isolate (P-19-100311). CHL #744 (P-19-174925) is the site of the first brick school house in Los Angeles, the Butterfield Overland Mail Company office and corrals, and the U.S. Army Quartermaster, which existed during the mid-19th century. The CHL is marked by a commemorative plaque affixed to the Mirror Building. Of the 14 previously recorded archaeological resources, one (P-19-004451) is located within 100 feet the Project Site. CHL #744 (P-19-174925) is located within the Project Site itself. Detailed descriptions of these resources are provided below.

TABLE 2
PREVIOUSLY RECORDED CULTURAL RESOURCES

Primary Number (P-19-)	Trinomial (CA-LAN-)	Description	Date Recorded
002741	2741H	Historic-period archaeological site: buried mortared red brick footing or wall.	1998
003097	3097H	Historic-period archaeological site: brick and concrete structural foundations and privies.	2002
003129	3129H	Historic-period archaeological site: four discrete refuse deposits dating to the late 19th and early 20th centuries.	2003
003337	3337H	Historic-period archaeological site: refuse deposit	2000
003347	3347H	Historic-period archaeological site: granite-block pavement	2004
003566	3566H	Historic-period archaeological site: Los Angeles's first cemetery and refuse deposits	2000
003588	3588H	Historic-period archaeological site: foundations and a refuse deposit.	2006
003767	3767H	Historic-period archaeological site: three structural foundations, basements, pads and associated historic refuse from the late 19th and early 20th centuries.	2007
003862	3862H	Historic-period archaeological site: brick alignment.	2009
004114	4114H	Historic-period archaeological site:11 structural features, seven refuse deposit features and isolated artifacts.	2008
004171	4171H	Historic-period archaeological site: refuse deposits and features from the mid-19th century to the mid- 20th century.	2007
004196	4196H	Historic-period archaeological site (Zanja Madre and associated artifacts)	2011
004451**	-	Historic-period archaeological site: privies, foundation walls, building foundations, and refuse deposits.	2014
100311	-	Historic-period isolate: one black glass bottle fragment.	1998
174925*	-	CHL# 744: Site of the first brick schoolhouse in Los Angeles, Butterfield Overland Mail Company, and U.S. Army Quartermaster	1979

*Indicates resource within Project site

**Indicates resource within 100 feet of Project site

P-19-004451

Resource P-19-004451 is a historic-period archaeological site that is comprised of nine features discovered during archaeological monitoring between 2013 and 2014 (Garrison, 2014). The features include privy deposits, foundations, and refuse deposits. The resource is located within 100 feet from the Project Site.

P-19-174925 (CHL #744)

Resource P-19-174925 includes CHL #744 which commemorates the site of the first brick school house in Los Angeles (1854 - 1855), as well as the site of the Butterfield Overland Mail Company office and corrals (1858 -1861), and the U.S. Army Quartermaster (1861). All of these structures were located in the eastern portion of the Project Site within the current footprint of the Mirror Building during the mid-19th century.

Sacred Lands File Search

The California Native American Heritage Commission (NAHC) maintains a confidential Sacred Lands File (SLF) which contains sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted by ESA on August 11, 2017 to request a search of the SLF. The NAHC responded to the request in a letter dated August 23, 2017. The NAHC's letter states that sites are known to be located within the Project Site, but did not provide specific information regarding these sites. The NAHC recommended that the Gabrieleno Band of Mission Indians - Kizh Nation be contacted for more information regarding the identified resource. All NAHC correspondence is attached as **Appendix B**.

Historic Map and Aerial Photograph Review

Historic maps and aerial photographs were examined to provide historical information from which to establish historic land uses for the Project Site from which to assess the Project Site's archaeological sensitivity and the potential for encountering as yet unknown archaeological resources. Available maps include the 1888, 1894, 1906, and 1950 Sanborn Fire Insurance Maps. The 1888 and 1894 Sanborn Fire Insurance Maps are reproduced in the Archaeological Resources Assessment Report in Appendix D-2, Figures 4 and 5. Historic aerial photographs of the Project Site from the years 1948, 1952, 1964, 1977, 1972, 1980, and 2012 were also examined (historic aerials.com 2017).

In sum, the historic map and aerial review indicates that the Project Site has been developed and used for residential and commercial purposes since the late 19th century. Beginning in the mid-20th century the eastern half of the Project Site was drastically changed as all of the multi-story buildings present since the late 19th century were demolished and replaced with the Times, Plant, and Mirror Buildings. Similarly, the multistory buildings in the western half of the Project Site were destroyed when the Executive Building and parking structure were constructed in the 1970s. The buildings that are currently present within the Project Site all contain basements, and the construction of these buildings likely destroyed any subsurface remnants associated with the multistory buildings that were constructed in the late 19th century. This is in alignment with the findings of the geotechnical studies conducted for the Project which indicate that the Project Site is underlain by artificial fill ranging from depths of 2 to 18 feet below the ground surface

(GEOCHON West, Inc., 2013; Kleinfelder, 2005; MACTEC Engineering and Consulting, 2003). This artificial fill may have been imported to the Project Site following the demolition of the multi-story buildings present since the late 19th century and the construction of the Times, Plant, and Mirror Buildings.

Assembly Bill 52 Tribal Consultation

Pursuant to the requirements of AB 52, requiring government-to-government consultation, the City as the lead agency sent consultation notification letters via certified mail to Native American groups affiliated with the Project Site on May 5, 2017 (**Table 3**). The letters included a description of the proposed Project, the Project location, and a notification of the type of consultation being initiated. The City received a response from the Gabrieleno Band of Mission Indians - Kizh Nation (Andrew Salas, Tribal Chair). The other Native American groups contacted by the City have not responded. All consultation materials are attached in **Appendix C**.

TABLE 3
SUMMARY OF AB 52 CONSULTATION

Contact	Tribe/Organization	Date AB 52 Notice Sent	Response Received	Date of AB 52 Consultation Initiation	Consultation Results

In a letter dated May 16, 2017, Andrew Salas, chairperson of the Gabrieleno Band of Mission Indians - Kizh Nation, initiated AB 52 consultation in response to the City's notification. On July 13, 2017, the City and Tribal Chairman Salas engaged in AB 52 consultation via telephone. Tribal Chairman Salas indicated that the Project Site is sensitive for the presence of tribal cultural resources citing its proximity to the Los Angeles River and the ethnographic village of Yangna. Tribal Chairman Salas also stated that present day Spring Street, which bounds the southeastern portion of the Project, was a historic trade route. During consultation the tribe indicated that due to the cultural sensitivity of the Project Site, the Gabrieleno Band of Mission Indians - Kizh

Nation has recommended that a Native American monitor be present on Site to observe all Project-related grading activities.

In an effort to provide substantial evidence for the cultural sensitivity of the Project Site, Tribal Chairman Salas provided a number of newspaper articles, electronic resources, and maps. PRC Section 21082.3(c)(1) states that any information, regarding the location, description, and use of a tribal cultural resources, that is submitted by a California Native American tribe during the environmental review process shall not be disclosed. Confidentiality, does not however apply to data or information that are publicly available. Many of the materials provided by Tribal Chairman Salas are comprised of public available internet resources and are described herein.

These digital documents include information regarding the village of Yaanga's possible locations and the Gabrielino trading route. These documents include the following: *Yangna - Early Los Angeles Community*; *From Site of Ancient Tribal Tree, the City of Angels Grew*; A *Visit to Old Los Angeles: Spring Street Part 1*; *Headquarters and Facility Project Archaeological Investigations at CA-Lan-1575/H*; *California's Gabrielino Indians*; *the Kirkman-Harriman Pictorial and Historical Map of Los Angeles County;* and *the Street Railway History of Los Angeles*. One of the sources provided by Tribal Chairman Salas (Headquarters and Facility Project Archaeological Investigation at CA-Lan-1575) contains information regarding the locations of archaeological resources and is therefore a confidential document. These sources provide information on potential locations of the Yangna which include locations approximately 0.20 and 0.70 miles from the Project Site.

The Kirkman-Harriman Map depicts a number of "Old Roads," or trails, converging on what is presently Downtown Los Angeles. One of these roads may correlate with the trading route indicated by Tribal Chairman Salas; however, the scale of the map makes it difficult to discern if one of the roads passed through or adjacent to the Project Site.

Summary

To identify tribal cultural resources within or adjacent to the Project Site, an SLF search was prepared by the NAHC, and the City sent notification letters to Native American groups requesting to be notified of City of Los Angeles projects. The SLF search indicated that tribal cultural resources are known to be located within the Project Site. The NAHC did not provide details regarding the resource, but recommended that the Gabrieleno Band of Mission Indians - Kizh Nation be contacted for additional information. At the request of Andrew Salas, the City engaged in AB 52 consultation with the Gabrieleno Band of Mission Indians - Kizh Nation on July 13, 2017. Mr. Salas has stated that the Project Site is sensitive for the presence of tribal cultural resources due to its proximity to the Los Angeles River and the ethnographic village of *Yangna*, as well as the presence of a historic travel route along what is present-day Spring Street. Due to the cultural sensitivity of the Project Site, the Gabrieleno Band of Mission Indians - Kizh Nation has recommended a Native American monitor be present to observe all Project-related grading activities.

The buildings that are presently on Site all contain basements that extend at least one story below grade. The construction of these buildings and their basements during the mid-20th century likely

destroyed any intact archaeological deposits that may have underlain the Project. However, the low archaeological sensitivity of the Project Site does not diminish its sensitivity for tribal cultural resources as indicated by the Gabrieleno Band of Mission Indians - Kizh Nation.

Conclusions

In conclusion, the documents and maps provided for the record indicated that the Project Site was once located within the general vicinity of the Native American village of *Yangna*; however, no villages are mapped or documented as overlapping with the Project Site or occurring immediately adjacent. The scales of the maps provided to describe the presence of trading routes did not contain the level of detail sufficient to determine whether the depicted road bypasses or intersects with the current Project area. Information provided by Mr. Salas, as described above, asserts that Indian villages known to have been present within Downtown Los Angeles and its vicinity moved around over time and may have overlapped. Specific evidence of village locations or trading routes located within or overlapping the Project Site was not provided. As such, materials provided do not provide substantial evidence of a tribal cultural resource within the Project Site. **Therefore, the Project would not cause a substantial adverse change in the significance of a tribal cultural resource,** as **defined in Public Resources Code section 21074, and impacts would be less than significant.**

While no tribal cultural resources are anticipated to be affected by the Project, the City has established a standard condition of approval under its police power and land use authority to address any inadvertent discovery of a tribal cultural resource. For purposes of this analysis, it is assumed the City would impose this condition on the Project as part of its land use approvals. Should tribal cultural resources be inadvertently encountered during Project construction, this condition of approval requires the temporarily halting of construction activities near the encounter and notification of the City and any Native American tribes traditionally and culturally affiliated with the geographic area of the Project. If the City determines that the potential resource appears to be a tribal cultural resource (as defined by PRC Section 21074), the City would provide any affected tribe a reasonable period of time to conduct a site visit and make recommendations regarding the monitoring of future ground disturbance activities, as well as the treatment and disposition of any discovered tribal cultural resources. The Project Applicant would then be required to implement the tribe's recommendations if a qualified archaeologist concludes that the tribe's recommendations are reasonable and feasible. The recommendations would be incorporated into a tribal cultural resources monitoring plan, and once the plan is approved by the City, ground disturbance activities would be permitted to resume. In accordance with this condition of approval, all related activities would be conducted in accordance with regulatory requirements.

Personnel

Monica Strauss, RPA

Director, Southern California Cultural Resources Group

Monica has successfully completed dozens of cultural resources projects throughout California and the greater southwest, where she assists clients in navigating cultural resources compliance issues in the context of CEQA, NEPA, and Section 106. Monica has extensive experience with archaeological resources, historic buildings and infrastructure, landscapes, and Tribal resources, including Traditional Cultural Properties. Monica manages a staff of cultural resources specialists throughout the region who conduct Phase 1 archaeological/ paleontological and historic architectural surveys, construction monitoring, Native American consultation, archaeological testing and treatment, historic resource significance evaluations, and large-scale data recovery programs. She maintains excellent relationships with agency staff and Tribal representatives.

Los Angeles Unified School District, Central Los Angeles High School #9. Los Angeles, CA. *Project Director.* ESA contributed to Data Recovery Report sections for Los Angeles Unified School District's Central High School #9, constructed in downtown Los Angeles. Between 2004 and 2009, Monica led a team of archaeological staff of ten who conducted archaeological monitoring and data recovery of archaeological materials in connection with the 19th century Los Angeles City Cemetery. She coordinated with the Los Angeles County Coroner and office of Vital Statistics to obtain disinterment permits and developed a mitigation plan incorporating components related to the future disposition of remains, artifact curation, and commemoration. She directed an extensive historical research effort to identify the human remains, and at the request of the client, participated in public outreach and coordination with media.

Alameda Street Improvement Archaeological Monitoring and Assessment. Los Angeles CA. *Project Director.* Monica directed archaeological monitoring conducted during the construction of roadway improvements in downtown Los Angeles. She responded to the discovery of historic resources including the *Zanja Madre* and the historic brick Alameda Street. She developed mitigation recommendations to address impacts to these resources from the project including an adaptive re-use of the recovered brick materials in the landscape design of the project. Monica provided oversight to laboratory analysts who catalogued the artifact collection.

City of Los Angeles, Department of Public Works, Public Safety Facilities Master Plan Phase I Archaeological Resources Evaluation. Los Angeles County, CA. *Project Director.* Monica directed a Phase I archaeological resources evaluation of an approximately five-square block area in downtown Los Angeles. Project work involved an extensive investigation of the area during the cities' early pueblo years and specifically the Zanja Madre irrigation system. Monica prepared a technical report with findings and recommendations for further work, pursuant to CEQA requirements.

Michael is cultural resources specialist with experience working on survey, data recovery, and monitoring projects. Michael has experience with project management, has led crews on multiple surveys and excavations, and is familiar with environmental compliance documents. He has worked on a variety of energy and water infrastructure projects throughout California, including projects in Riverside, San Diego, Imperial, San Bernardino, Los Angeles, Orange, Santa Barbara, San Luis Obispo, Kern, Fresno, Madera, and Inyo Counties, as well as in Clark County Nevada. Michael regularly works as part of a team, coordinating with field staff and agency leads.

Relevant Experience

San Gabriel River Confluence with Cattle Canyon Improvements Project, Los Angeles National Forest, Los Angeles County, CA. *Archaeologist*. ESA has been retained by BlueGreen Consultants to prepare a joint EIS/R for the San Gabriel River Confluence with Cattle Canyon Improvements Project. The Project consists of recreational improvements and ecological restoration opportunities to address resource management challenges resulting from high public use of a 2.5-mile reach of the East Fork of the San Gabriel River, near its confluence with Cattle Canyon Creek in the Angeles National Forest. Michael led the cultural resources survey and prepared the Phase I cultural resources study report in support of the EIS/R.

Ballona Wetlands Ecological Reserve Restoration Project, Los Angeles, CA. *Archaeologist.* The California State Coastal Conservancy retained ESA to conduct an Extended Phase I investigation at 20 previously recorded shell scatters and Phase II archaeological testing of four historic-period archaeological sites in support of an Environmental Impact Statement/Environmental Impacts Report being prepared for the proposed Ballona Ecological Reserve Restoration Plan Project which would restore native coastal wetland and upland habitats within the 600-acre Ballona Wetlands Ecological Reserve. Michael led the extended Phase I and Phase II fieldwork and assisted in the preparation of the technical report presenting the results and conclusions of the study.

City of Los Angeles Department of Water and Power, City Trunk Line Unit 3 Project, Los Angeles, CA. *Archaeologist.* ESA has conducted a Phase 1 cultural resources assessment for the Los Angeles Department of Water and Power (LADWP), City Trunk Line Unit 3 Project. LADWP plans replacing a portion of the City Trunk Line on Coldwater Canyon Avenue between Vanowen Street and Magnolia Boulevard, within the City of Los Angeles. The proposed Project would involve the installation of approximately 10,250 linear feet of 60-inch diameter water pipeline constructed of welded steel. Michael led the Phase 1 cultural resources survey of the Project area and prepared the technical report and the cultural resources ISMND section.

Subject: Sacred Lands File Search Request: Proposed Omni LA Times Square Project, Downtown Los Angeles, California.

Dear Native American Heritage Commission Representative:

ESA is preparing environmental documentation for the proposed Omni LA Times Square Project ("the Project").

The Project would involve the redevelopment of the Times Mirror Square site (Project Site) located in Downtown Los Angeles and bounded by West 1st Street, South Spring Street, West 2nd Street, and South Broadway. The Project would include the retention and renovation of the on-site Times, Plant and Mirror Buildings on the eastern half of the Project Site. The Project would also demolish the four-level Parking Garage and Executive Building located on the western half of the Project Site and construct two towers with residential units. The Project would provide nine new subterranean levels of parking and five above-ground podium levels.

To ensure that any areas containing previously recorded cultural resources and sacred lands are identified and considered, ESA is requesting a Sacred Lands File search of the Project Site. The Project Site is located in an unsectioned portion of Township 1 South, Range 13 West of the Los Angeles, CA United States Geological Survey 7.5' topographic quadrangle map (**Figure 1**, attached).

Thank you for your assistance with our efforts to address possible Native American concerns that may be affected by the proposed project. If you have any questions or need additional information, please contact me at (949) 753-7001 or via email at fclark@esassoc.com.

Sincerely,

Fatima Clark

RE: Proposed Omni LA Times Square Project, City of Los Angeles; Los Angeles USGS Quadrangle, Los Angeles County, California

Dear Ms. Clark:

Attached is a list of tribes that have cultural and traditional affiliation to the areas of potential project effect (APE) referenced above. I suggest you contact all of those listed, if they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult, as may be required under particular state statutes. If a response has not been received within two weeks of notification, the Native American Heritage Commission (NAHC) requests that you follow-up with a telephone call to ensure that the project information has been received.

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* (SLF) was completed for the area of potential project effect (APE) for the above referenced project. Sites have been located within the APE you provided that may be impacted by the project. Please immediately contact Gabrieleno Band of Mission Indians – Kizh Nation at (626) 926-4131 for more information about these sites.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions, please contact me at my email address: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.
Associate Governmental Program Analyst

CASE No.: ENV-2016-4676-EIR
Project Address: 100 S. Broadway[1]
Community Plan: Central City

Dear Tribal Representative:

This letter is to inform you that the Los Angeles Department of City Planning is reviewing the following proposed project:

The Project would involve the redevelopment of the Times Mirror Square site located in Downtown Los Angeles and bounded by West 1st Street, South Spring Street, West 2nd Street, and South Broadway. The Project proposes the retention and renovation of the on-site Times, Plant and Mirror Buildings on the eastern half of the Project Site. The renovated buildings would include ground floor commercial uses with office space on the upper levels. The Project proposes to demolish the four-level Parking Garage and Executive Building located on the western half of the Project Site and construct two mixed-use towers. The northern tower, oriented along 1st Street and Broadway, would be 37 stories and 465 feet in height with 450 residential units. The southern tower, oriented along Broadway and 2nd Street, would be 53 stories and 596 feet in height with 677 residential units. Combined, the towers would contain 1,127 residential units, 34,572 square feet of commercial uses and 1,135,803 square feet of floor area. Overall, with the existing buildings to remain, the Project proposes 1,511,908 square feet of floor area. The Project would provide approximately 1,744 parking spaces in nine new subterranean levels and five above-ground podium levels.

Per AB 52, you have the right to consult on a proposed public or private project prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. You have 30 calendar days from receipt of this letter to notify us in writing that you wish to consult on this project. Please provide your contact information and mail your request to:

CASE No.: ENV-2016-4676-EIR
Project Address: 100 S. Broadway[1]
Community Plan: Central City

Dear Tribal Representative:

This letter is to inform you that the Los Angeles Department of City Planning is reviewing the following proposed project:

The Project would involve the redevelopment of the Times Mirror Square site located in Downtown Los Angeles and bounded by West 1st Street, South Spring Street, West 2nd Street, and South Broadway. The Project proposes the retention and renovation of the on-site Times, Plant and Mirror Buildings on the eastern half of the Project Site. The renovated buildings would include ground floor commercial uses with office space on the upper levels. The Project proposes to demolish the four-level Parking Garage and Executive Building located on the western half of the Project Site and construct two mixed-use towers. The northern tower, oriented along 1st Street and Broadway, would be 37 stories and 465 feet in height with 450 residential units. The southern tower, oriented along Broadway and 2nd Street, would be 53 stories and 596 feet in height with 677 residential units. Combined, the towers would contain 1,127 residential units, 34,572 square feet of commercial uses and 1,135,803 square feet of floor area. Overall, with the existing buildings to remain, the Project proposes 1,511,908 square feet of floor area. The Project would provide approximately 1,744 parking spaces in nine new subterranean levels and five above-ground podium levels.

Per AB 52, you have the right to consult on a proposed public or private project prior to the release of a negative declaration, mitigated negative declaration or environmental impact report. You have 30 calendar days from receipt of this letter to notify us in writing that you wish to consult on this project. Please provide your contact information and mail your request to:

---

[1] Additional addresses associated with the proposed Project include: 100-142 South Broadway; 202-234 West 1st Street; 121-147 South Spring Street; 205-221 West 2nd Street.

Re: AB52 Consultation request for 100 S. Broadway Central City

Dear William Lamborn,

Please find this letter as a written request for consultation regarding the above-mentioned project pursuant to Public Resources Code § 21080.3.1, subd. (d). Your project lies within our ancestral tribal territory, meaning descending from, or a higher degree of kinship than traditional or cultural affiliation. Your project is located within a sensitive area and may cause a substantial adverse change in the significance of our tribal cultural resources. Most often, a records search for our tribal cultural resources will result in a "no records found" for the project area. The Native American Heritage Commission, ethnographers, historians, and professional archaeologists can only provide limited information that has been previously documented about California Native Tribes. This is the reason the Native American Heritage Commission (NAHC) will always refer the lead agency to the respective Native American Tribe of the area because the NAHC is only aware of general information and are not the experts on each California Tribe. Our Elder Committee & tribal historians are the experts for our Tribe and are able to provide a more complete history (both written and oral) regarding the location of historic villages, trade routes, cemeteries and sacred/religious sites in the project area. Therefore, to avoid adverse effects to our tribal cultural resources, we would like to consult with you and your staff to provide you with a more complete understanding of the prehistoric use(s) of the project area and the potential risks for causing a substantial adverse change to the significance of our tribal cultural resources.

Consultation appointments are available on Wednesdays and Thursdays at our offices at 901 N. Citrus Ave. Covina, CA 91722 or over the phone. Please call toll free 1-844-390-0787 or email gabrielenoindians@yahoo.com to schedule an appointment.

** Prior to the first consultation with our Tribe, we require all those individuals participating in the consultation to view a video produced and provided by CalEPA and the NAHC for sensitivity and understanding of AB52. You can view the video at: http://nahc.ca.gov/2015/12/ab-52-tribal-training/

With Respect,

Andrew Salas, Chairman

To: Gabrieleno Band of Mission Indians <gabrielenoindians@yahoo.com>, matt.teutimez@gmail.com

Dear Chairman Salas and Mr. Teutimez,

Thank you again for joining the call today for AB 52 Tribal Consultation. This is a follow-up and summary of our discussion of the Times Mirror Square Project.

The following information was provided to the City by the Tribe regarding the project site and vicinity:

- The Project Site is located within an Area of Potential Effects (APE), similar to the area around the Arts District near the LA River, which is a sensitive area.
- The Project Site is located in the vicinity of the Yangna village, a predominant village that extended through Civic Center, Little Tokyo, and the Arts District, for a total area of approximately 5 square miles in and around downtown Los Angeles.
- Spring Street was historically used as a trading route in the project vicinity .
- Cultural resources have been found from two construction sites near the 101-freeway and Hill/Spring Streets
- Topography of the downtown/Civic Center area is higher than some surrounding areas. Higher ground is often indicative of the location of past settlements/villages.
- The Tribe has requested that a monitor be continuously on site for grading activities during project construction.

Follow-up inquiries/requests:

1. Chairman Salas to provide a map and further information regarding historic trading route along Spring Street.
2. Chairman Salas to provide a map and further information regarding the location and history of the Yangna Village.
3. Chairman Salas to provide further information regarding excavation and resource finds from a recent/ongoing construction sites located near Hill Street/Spring Street by the 101 Freeway.
4. Chairman Salas/Mr. Teutimez to provide supporting academic/research articles regarding the above mentioned tribal history, or archaeological evidence of recent finds in the region.
5. The City to provide geotechnical information regarding the project site history and subsurface soil conditions once preliminary geotechnical reports become available.

Thank you very much. I look forward to your follow-up regarding the above inquiries.

A Visit to Old Los Angeles

5. Spring Street (Part 1).

by

Brent C. Dickerson

Copyright © Brent C. Dickerson

Index to Episodes (click here)

A Walk South down Spring Street to Fourth Street.

• The new post office and Temple Square, looking south, at the point where old Spring Street began, angling off of Main Street (Spring Street "straight ahead" at center, the larger Main Street at left; this "angled" portion of Spring Street cut diagonally across the block on which the new City Hall now sits; old original Plaza and Church about two blocks behind the viewer; this angled portion of Spring Street was all that remained of the line of the ancient Native American trail which skirted the base of the hills). That brick building facing us is the New Temple Block, Don Juan Temple's professional building, which we looked at more closely when we visited Main Street. The Post Office is on the site of Temple's general store, which was in a building known as the Old Temple Block (and subsequently, after Temple's death in 1866 brought new ownership, as the Downey Block, the new owner being former governor John G. Downey).

• Looking west on Temple to—nearer—its corner with Spring, and then—further— its corner with New High Street; we can see the Court House in the distance. We will get better acquainted with the Court House later!

• Just a few more steps, and the south face of the Post Office, at the head of Spring Street, opens out to us as we look west on Temple. Beyond, the building at Temple and New High St.

• I had my first packet of postcards and deathless prose ready to send you, dear; so I walked into the post office to do so while the others waited outside. It was spacious and quiet; I halfway expected to see plaques on the wall reading, "In Loving Memory..."

• Across the street, at the southwest corner of Spring and Temple, is the prosperous-looking International Savings and Exchange Bank Building. Banks—especially southwards on the street—are the characteristic businesses on Spring Street.

• Here's the rear of the same building as we look east from the Court House on Pound Cake Hill to the west. We can see a little of the east face of Main Street beyond the International Bank Building; the structure with the conical tower mid-way between the right edge of the view and the edge of the International Bank Building would be the Amestoy Block at the corner of Main Street and Market Street. Mr. Amestoy started in Los Angeles as a Basque sheepherder in 1858, his wife meantime taking in washing to bolster the family income.

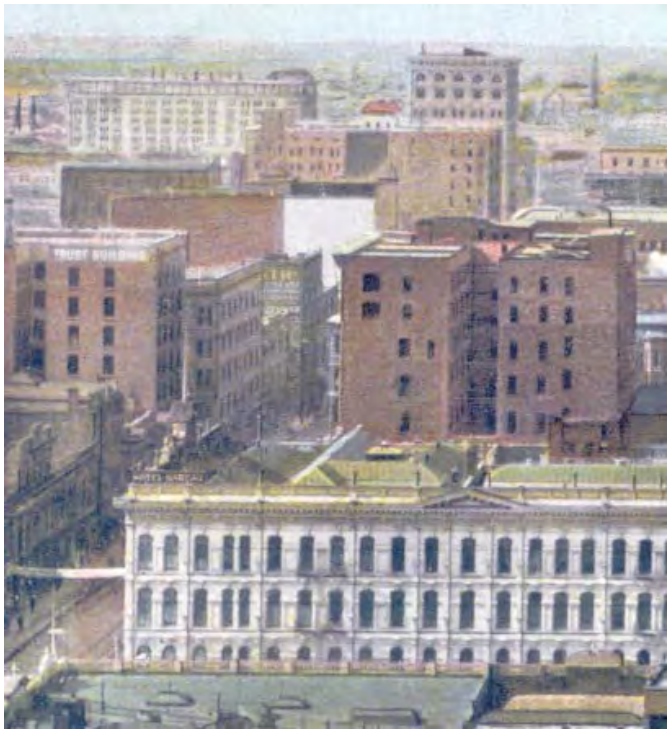
• South on Spring past the International Savings and Exchange Bank Building, we come to the corner of tiny Market Street, which goes connects Spring and Main streets, and look north on Spring towards Temple Street and the Post Office. In the distance are the towers of the Baker Block on Main Street.

• We look south on the diagonal portion of Spring Street, its junction with Temple Street a number of yards behind us. This view is from 1890; the building at extreme right would be demolished as part of the site for the International Savings and Exchange Bank Building. Seemingly blocking Spring Street in the distance is the Hotel Nadeau at First Street.

• Charley had a wry smile on his face. "Minnie, my darling sister," quoth he, looking into the distance, "would you say that you like salt?" She cocked her head and responded, "Brother Charles, many a fleeting hour have I spent pondering how things would be had you paid due attention to throwing salt over your left shoulder." "Did you say 'floating'?" "No, I said 'fleeting'." "And," continued Charley, "what of men and salt?" Minnie pursed her lips, and pondered for a moment. "I suppose enough would tend to preserve them." "Not always in a good way," added Mother, shooting a glance at Papa. Well, this dialectic was put an end to at this point by young Frederick Johan, who exclaimed, "He's talking about all the sailors, Minnie. Have a look!" Beyond the marching sailors, we see the west side of Spring Street south of the International Savings and Exchange Bank, of which we can see just a bit of its wall-sign in the upper right corner.

• Another half-block, and we turn and look at the Phillips Block. Mother, however, gazed aloft. "Why, may I ask, is there a creature above my head?" "Well, Mrs. S.," said Papa, "it appears to me that the Elks Lodge is having a sort of 'do', that's how it appears to me." Mother frowned. "The Elks may 'do' whatever they might want to 'do'; but they had best refrain from 'do'-ing it above my head!" Young Frederick Johan added, "It might not be the Elks. That thing looks more like a cross between a goat and a cow."

• We walk a block south, and turn and (left) look back up Spring Street from near First Street, seeing, on the left the back of the Int'l Savings & Exchange Bank Bldg., and then, just beyond it, the brick-red Post Office in the distance, showing its angled corner where Spring Street meets Main Street—the same necessary angling that we saw at the same site on Temple's old General Store in the previous episode, though from another direction; and here is the same scene in 1880 (right). The elaborate tower at the center of the older picture is that of the then-new Baker Block, looming over things from further north on Main Street. In the newer picture, the Baker Block is hidden by the new Post Office. At the extreme left in the newer picture is the Phillips Block, built in 1887, only the second four-story building in Los Angeles at the time it was built. This was the new home of the People's Store—most of the lettering of which you can see in a similar position in the old picture. The exterior of the Phillips Block would be painted white, becoming quite a landmark as the "Great White Store," better known as Hamburger's Department Store, a successful enterprise which made one more move in its commercial life, as we shall see in due course.



• Looking south on Spring from the corner of Franklin, showing the intersection with First. The building with the cupola, at the left, the southeast corner of Spring and First Sts., is known as the Wilson Block, and was built in 1889.

• The Hotel Nadeau, said to be the first four-story building in Los Angeles, at the south-west corner of Spring Street and First Street. In the old Spanish days, this site was a flat stretch of ground which Angelenos would make use of on the occasion of a community fandango (it is now the site of the Los Angeles Times Building). Off to the right, we see the south face of First Street west to its corner with Broadway.

• We look down at the First Street face of the Hotel Nadeau, and, at the left, the east side of the 100s and 200s blocks of Spring Street.

• We reverse and look up from the point on Spring Street at which we were just looking down. The Nadeau to our left, we look towards Spring's intersections with First Street and Franklin Street, just beyond which we see the Phillips Block, housing Hamburger's Department Store.

• Suddenly, the smell of food wafted over us, and I could see Minnie's nose following the scent. "Mother," said she, "we really must keep our strength up!" And with that, she took a step towards a nearby cafe...only to have Papa ward her off with "I do not think we will die of hunger at 10:30 in the morning, no I don't think so, I don't think so at all."

• Between the banks and hotels are shops and restaurants without end! This one is "Mosgrove's Importers," claiming to be "the oldest cloak and suit house in the city." Young Frederick Johan wondered how a shop that specialized in very old cloaks and suits could stay in business; "after all, who would buy them?". All I did was to gesture towards Mother, Minnie, and Anna, who were looking intently through the doorway.

• The successful and generous Mr. Hollenbeck built the Hollenbeck Hotel on the southwest corner of Spring and Second. We shall meet Mr. Hollenbeck's doings once or twice again when we visit the environs of Los Angeles! To the right, we look up Second Street to its corner with Broadway. At the extreme left, we can see a bit of the building known as the Brode Block, at addresses 217-219. At the extreme right, we see the corner of the Bryson Block.

• I thought I'd peek into the Hollenbeck Hotel's lobby.

• We look back at the east face of the south 100s block of Spring. All those wires! The corner of the Bryson Block looms darkly at extreme left.

• We are momentarily granted the power to fly, and wing our way out the tower of the Hollenbeck across the street and south down the block a number of yards, alight, and turn again to the north, now focusing on the west face of the south 100s block. That's the Hollenbeck Hotel in the immediate foreground to the left, beyond which we can see the full majesty of the Bryson Block. The Bryson Block, built in 1889, is on the site of an early public school, and an early City Hall. In the distant background on the left, we can see some of the houses on Bunker Hill close by to downtown. Suburbia just a block or two away from stark downtown! The tall towered building in the distance is the Court House.

• Our wings suddenly disappear, and we plummet safely to the ground to a bench, where we see that, during our flight, city workers have been preparing for a civic celebration by hoisting flags over the street—lucky we didn't get tangled up in the lines! Between trolley-transits, young Frederick Johan darts into the middle of the street to take in the view. "Go out there and stand with him," said Papa to Charley; "People might hesitate to run over the both of you."

• The streetcars not deigning to slaughter young FJ and Charley, they return and we continue walking south a bit, then turn and look back north up Spring Street from between Second and Third. The building we see at the right edge of this view is the Wilcox Building.

• The Wilcox Building, at the southeast corner of Spring and Second Sts., was completed in 1896.

• From mid-block, we look north towards the western corner of Spring and Second Streets, over which the Bryson Block and the Hotel Hollenbeck preside. The large awning at left, at 221 S. Spring Street, belongs to the Parisian Cloak & Suit Co. I looked at Minnie. "No snappy banter?". She sniffed and said, "It doesn't suit me." Young FJ took the occasion to ask, "Does anyone have a watch? I'd like to know what o'cloak it is." Mother sighed, "We must make allowances for the young..."

• And then we turn around and look south down Spring Street towards its corner with Third. The old-fashioned building with a tower at center is the Ramona Hotel, located at the southwest corner of Spring and Third Sts.; the more modern five-story building just this side of the Ramona, at the northwest corner, is the Douglas

Block. At the extreme right in this view is the Los Angeles Theater, formerly Turnverein Hall, one of the earliest theaters in Los Angeles.

• We continue to, and just past, the corner with Third Street, and turn once again to look back north up Spring Street. "All of this turning," said Minnie, "is much better suited to the dance floor than the street." Papa frowned. "I shall bear that in mind, Minnie," said he. The building with the cupola, at the center of the picture, is the Lyceum theater, formerly the Orpheum Theater. We shall see a newer Orpheum Theater when we visit Broadway.

• The same scene just a few years earlier, when horses still dominated the streets. The shadows tell us that it's wintertime. Note, in comparison to the previous picture, that many of the conical roofs were taken down between the time of the earlier picture (below) and the later picture (above).

• Just around the corner, to the west on Third Street, is The Metropolitan Barber Shop, "the largest and finest in the world." Young Frederick Johan pursed his lips in thought. "Let's have it," said I. He cocked his head and said, "There must be a regular mountain of hair coming out of there every day, wouldn't you say? Couldn't you use it to stuff quilts and things?" Mother frowned in consternation; "The very thought!—sleeping with the hair of every man in town all around you!" FJ began to protest, "Well, but..." Minnie stopped him in mid-protest. "'Well, but' nothing. I'm blushing down to the tips of my toes just thinking about it," she said, shaking her head in disgust. Now FJ got a blank look on his face, pursed his lips again, and floated, "But isn't your long underwear made of wool? You'd rather . . . " Minnie covered her ears and shrieked, "Oh, Mother—now he's talking about our underwear!". Even Anna chimed in: "Honestly, Frederick Johan—out on a public street. What next?". Papa laughed to himself and took FJ under his wing; "Young man," quoth he, "when will you learn not to try to reason with the ladies?" "Not with these ladies, anyway," I added.

• Having re-sized his head at the barber shop, a man could conveniently cross the street and buy a new hat at Ye Hattery. Anna looked through the window at the shop's offerings. "But . . . but they're all the same . . . " Mother snorted and said, "Men are all the same!" "Just keep smiling," whispered Papa to young FJ.

• We admire the smooth lines of the handsome Douglas Block. The tower of the Ramona Hotel edges into the picture at left, while we can vaguely see the Phillips Block in the distance at the right margin.

• A wider view of the same intersection, angling towards the northeast. That's the Ramona Hotel next to us at the left of this view. The large pinkish building dominating the right half of the picture is at the northeast corner of Spring and Third Sts., and is the Stimson Block, the first six-story building in Los Angeles; it houses the American Savings Bank, formerly the National Bank of California. Not to be outdone, at the right margin of this view is the first seven-story building in Los Angeles, the Lankershim Building.

• We found Charley peering into a window a few doors down, at 326 S. Spring. "Look, Papa! 'James Jeffries' Gentleman's Cafe'," he said. "Beer hall," said Mother; "I've never known anything in a city that had 'Gentleman' on its sign that wasn't a beer hall. Or worse. And this one's run by a prize-fighter too! Oh! Just move along, Minnie; don't give the patrons false hopes." Papa said to Anna and me, quietly, "Well, then I guess I won't go in." Charley whispered, "I should think a prize-fighter would be just the one to handle Minnie."

• We go a little farther south down the street, halfway to Fourth Street, turn north again (much to Minnie's distress), and take in a wider view of Spring Street and its activities from the middle of the 300s block.

• Happy throngs of pedestrians shopping Spring Street! This is towards the middle of the west face of the 300 block of S. Spring Street; the jewelry shop S. Nordlinger & Sons, an old and respected Angeleno business, can be seen, its address being 323 S. Spring Street. This particular business moved every few years, following the slow migration south and west of what was considered a more prestigious location. The dark building taking up the right-hand quarter of the view is the Ramona Hotel again at the corner of Spring and Third Sts.

• Young Frederick Johan is trailing a block behind, examining every this and that he can find. From the middle of the 200s block, he turns to look south past the corner of Third Street. A proud city of imaginative hope and busy activity every way one looks! It's about here, at Third Street, that the character of the buildings changes. North of Third Street, the buildings evoke the 1880s and 1890s; as we go south, there's a more modern look to the streetscape. The Union Trust Building looms a block away...

• Halfway down the 300 block of Spring St., looking south.

• I noticed a frustrated look on Charley's face. He sighed, "It's hard to see the pretty girls on the other side of the street with all this traffic...", at which Minnie sighed—a little too theatrically, if you ask me—"But think what bliss they're in!"

• We reach the corner of Spring Street and 4th Street. In this view, the street light is at the corner as we look north up the west face of the 300s block. Note the "F" on the sign at the top corner of the building behind the street light. At the extreme left is the Hotel Angelus at the southwest corner.

• Now we turn and look east up 4th back towards Main Street (which is off to the right). Prominent in the foreground is the H.W. Hellman Building on the northeast corner of Spring and 4th; farther, to the right looking east on 4th, we see two buildings which we saw from another perspective in our walk down Main—that's the Westminster Hotel in the distance at the corner of 4th and Main; and the Van Nuys Hotel is the lighter building a little closer on 4th. Now note the building jutting into the lower left-hand corner of our view, there's the same "F" again which we saw from another angle in the previous picture.

• Turning around, we look now to the west up 4th to the distant Fremont Hotel with its towers looming at Olive and 4th; in due course, we shall visit the Fremont and look back at where we're standing now. The cupola barely peeking over the Fremont is that of the home of L.J. Rose located at the southeast corner of Grand Avenue and Fourth Street, which we shall see close-up in due course. Dominating our foreground is the Angelus Hotel at the southwest corner of Spring and 4th, beyond which we can see 4th's corner with Broadway. "All of this is very well," Mother declared; "but 'tis time to eat, is it not?".

• The handsome Union Trust Building is at the southeast corner of Fourth and Spring (left); it's also known as the Braly Building (yes, that's my hand at the bottom of the picture). Harkening to the hungry, peaked looks of the womenfolk in our party—I must admit to having felt a bit peckish myself—we stopped at the Cafe Bristol at Fourth and Spring to refresh ourselves before going on...(right).

Return to Main Street part 2; or onwards to Spring Street part 2...

CITYSCAPES / CECILIA RASMUSSEN

From Site of Ancient Tribal Tree, the City of Angels Grew

April 12, 1997 | CECILIA RASMUSSEN

It was already ancient when it was chopped down more than a century ago, the sycamore tree that forever fixes in time and place the village that existed for three millenniums--the earliest site of what became Los Angeles.

While Christopher Columbus was setting foot on the shores of the West Indies in the fall of 1492, a seedling began to grow near the Pacific shores that Juan Rodriguez Cabrillo would discover half a century later.

In its 400 years, the tree would provide shelter for the highest councils of an Indian nation, serve as a landmark to the Spanish soldiers and become ground zero for the city of Los Angeles.

And now a historian has used the tree to settle a century-old debate over the exact site of Yangna, the central village of the Gabrielino Indians, and the seed of the settlement that became Los Angeles.

---

*

Centuries before the Mexicans arrived and christened the huge sycamore tree "El Aliso," more than 200 Gabrielinos lived in Yangna, the largest of the 100 or so villages that 5,000 Gabrielinos called home. Chiefs from these lesser villages would travel to meet under the spreading branches of the "council tree."

The precise location of Yangna has always been a mystery, one that local historians and anthropologists have sought to solve. Some placed it variously at City Hall, Union Station, Pershing Square and the Los Angeles Children's Museum.

But now, John Crandell, a Sunland landscape architect/urban designer and vice president of the L.A. Millennium Project, has discovered what he believes to be the exact location of the village--along what is now a center divider on the 101 just south of the Metropolitan Transportation Authority headquarters.

His judgment may have been confirmed two years ago when excavations for elevator shafts for handicapped access near Olvera Street unearthed hundreds of artifacts, the oldest from a 3,000-year-old Gabrielino settlement at the edge of current-day downtown, then "a vast matrix of alders, cottons, sycamores and ash interspersed with tules or wetlands," as Crandell described it.

In searching for Yangna, Crandell believes he may have solved another historical dilemma: fixing the site of the second Spanish settlement that became Los Angeles. (The first is still a mystery.) It was next to Yangna, he said, and existed for about 10 years.

The second settlement "was wiped out in the Great Flood of 1815, a flood that the tree survived and which then forced the pueblo dwellers to seek higher ground, where the central [historic] plaza is located today," Crandell said. (The Gabrielinos, accustomed to living with flood cycles, routinely burned their wickiups and moved a few yards away.)

Historian Doyce Nunis Jr. speculates that the first Spanish settlement may have been built about half a mile from the site of the tree, and high up--on a 50-foot bluff on North Broadway, where St. Peter's Italian Catholic Church sits today.

Nunis, editor of the journal of the Historical Society of Southern California, said an 1847 drawing by pioneer William Rich Hutton shows abandoned ruins on a very high bluff. "My suspicion is that the original pueblo site was north of the Yangna village. This drawing is probably the best clue we've ever had," Nunis said.

Crandell agrees and points out the sycamore tree in the distance in the drawing. "Maybe the city's first settlers got tired of carrying everything up the bluff and decided it would be easier to live on the flatlands."

*

There is nothing left of Yangna, which Gaspar de Portola and his jolly friars, Juan Crespi and Francisco Gomez, chanced upon on their way to close escrow on Alta California for the king of Spain in 1769.

The Mexican city rulers who followed the Spaniards did to the Gabrielinos much of what the U.S. government would do to other tribes--took over their land and left them with smaller and smaller parcels.

Over the years, locals chipped away at Indian property. In June 1835, French immigrant and vineyard owner Jean-Louis Vignes took over the land on which the six-story-tall sycamore stood; he valued the tree at $20.

In the mid-1830s, the city council, or ayuntamiento, shrunk Yangna to a 100-vara-long triangle (one vara equals about 2 feet 9 inches). But even that only lasted little more than a decade. In 1846, the city rescinded that altogether, moving the tribe to the far side of the river.

Two years later, after 26 residents complained of noise generated by "disorderly gatherings" when American soldiers visited the village for unauthorized R & R, the military commander ordered the city to eliminate the village, "or else."

Townsfolk contributed all of $24 to assist the remaining Gabrielinos--their numbers ravaged by decades of opium, liquor, disease and violence--to move their belongings to wherever they could find refuge.

But the tree remained. By the 1870s, the Philadelphia Brewery surrounded "El Aliso." New brewery buildings encroached upon the sycamore, with its branches spreading 200 feet in diameter. By 1892, the Yangna council tree was dead.

Little Charles Gibbs Adams, who would become one of Los Angeles' first landscape architects, watched as the tree was cut down. He counted its annual rings of growth and recorded its life span--400 years.

Crandell, who is working on a book called "Porciuncula" (Los Angeles River) has written to Mayor Richard Riordan and the owner of the land where the "council tree" once grew, suggesting that another sycamore be planted there to commemorate what once was, as well as the arrival of a new millennium here in Los Angeles.

THE STREET RAILWAY HISTORY OF LOS ANGELES began on July 3rd, 1873, when the City Council passed the first franchise ordinance, the opening clause of which reads as follows:

> AN ORDINANCE granting franchise to D. V. Waldron"—and provided for a franchise for the period of five years, for the purpose of laying down and maintaining two iron railroad tracks and to run cars thereon, to be propelled by horses or mules, and to carry passengers thereon, commencing at a point on North Main Street at Alameda Street south on Main Street to the City limits, which was a point just south of the present corner of Jefferson and Main.

The second chapter opened on December 8, 1873, when J. R. Toberman, Mayor approved a franchise, for a street railway, the opening clause of which reads as follows:

> "AN ORDINANCE granting a franchise for a street car railroad in the City of Los Angeles to R. M. Widney"—and provided for a franchise for a period of twenty years, commencing at Temple and Spring Streets, and along Spring to First; First to Fort Street, (now Broadway); Fort Street to Fourth Street, Fourth to Hill Street, on Hill to Fifth Street; on Fifth to Olive Street; on Olive to Sixth Street; and thence along Sixth Street to Figueroa Street. Fare ten cents.

This franchise also provided that in the event D. V. Waldron, to whom the first franchise was issued, should forfeit his rights, then the Widney franchise would extend from Temple and Spring Streets via Main to Alameda Street. Waldron forfeited his rights, therefore, Widney's franchise was thus extended.

Widney assigned his franchise to a company known as the SPRING AND SIXTH STREET RAILROAD CO. and this company completed the line and put it in operation in the spring of 1874.

The next or third franchise issued, was approved on September 14, 1874, by J. R. Toberman, Mayor, and provided for the extension of the SPRING AND SIXTH STREET RAILROAD from North Main and Alameda Streets via Alameda and private right-of-way to a point in front of the Old River Station of the Southern Pacific, then known as the upper depot grounds.

The fifth franchise issued, was approved March 24, 1875, by P. Beaudry, Mayor, and provided for ninety days extension to the SPRING & SIXTH STREET RAILROAD COMPANY to complete their line to the Southern Pacific Station.

The ninth franchise issued, also in connection with the SPRING & SIXTH STREET RAILROAD COMPANY, approved Dec. 3, 1875, granting a renewed right to extend this line from North Main and Alameda Streets, via Alameda and private right-of-way to a point in front of the Southern Pacific Station.

Evidently the company had not found it expedient to construct the line under previous franchise grants. These franchises contained some very general description as to routes. For instance, one franchise is for a line from Main and Alameda to the Southern Pacific Station, and reads in part:

> "—that on and along such portion of said route as the track of the Southern Pacific Railroad runs, the track of the street railroad shall be laid from the center line of Main Street to a point six foot easterly of the telegraph pole standing by the willow stump in the swamp; thence in a straight line to the westerly sidewalk of the street, and thence over the gutter along the: sidewalk to such point as may be necessary to cross (and across) the sidewalk on to private property to reach the depot."

In the ordinance approved December 3, 1875, being the ninth franchise issued, it is recited that the route shall be as follows:

> "—along Alameda Street, or the extension thereof to a point in said street, distance sixteen feet east of the eastern rail of the line of the Southern Pacific Railroad Company; running southerly and connecting

> with the line of road known as the Los Angeles and San Pedro Railroad Company; which said point is opposite to and west of a large but topped near the junction of said street with another street running in a southeasterly direction; running thence along said Alameda Street, or the extension thereof, northerly and crossing in the most convenient way that line of track of said Southern Pacific Railroad Company curving easterly and running to Spadra and other points east of this city, to a point twenty-five feet east of the eastern rail of the road of the Southern Pacific Railroad Company at the point south of the new depot where the several lines of the tracks of said company connect; running thence in a straight line northerly to a point opposite to the northwest corner of the lot belonging to the Los Angeles Infirmary, and known as the Hospital grounds of the Sisters of Charity,"

The fourth franchise issued, was approved September 28, 1874, by J. R. Toberman, Mayor, the opening clause of which reads as follows:

> "AN ORDINANCE granting a franchise for street car railroad in the city of Los Angeles to John C. Downey, O. W. Childs and John M. Baldwin. "—and provided for a franchise for a period of twenty years. The route covered commenced at Temple Block; south on Main to Washington Street; westerly on Washington to Figueroa Street; thence southerly on Figueroa to the city limits, which is a point about the center of what is now Exposition Park.

The sixth franchise issued was approved March 31, 1875, by P. Beaudry, Mayor, the opening clause of which reads as follows:

> "AN ORDINANCE granting a franchise for a street railroad in the city of Los Angeles to R. M. Widney and his assigns. "—and provided for a franchise for a period of thirty years. The route covered commenced at First and Los Angeles Streets and thence along a very tortuous route over many streets whose names are not now known, running past the Southern Pacific Station, terminating on Downey Avenue (now North Broadway) at the end of that street— (no statement as to where that was.) Fare, ten cents.

The seventh franchise issued was approved June 26, 1875, the opening clause of which reads as follows:

> "AN ORDINANCE granting a franchise for street railroad in the City of' Los Angeles to William H. Workman and A. H. Judson and their assigns. "—and provided for a franchise for a period of thirty years, for a single track horsecar line. Route, from Arcadia and Main Streets, via Arcadia, Aliso Street, Aliso Avenue to Soto Street. This road was put in operation sometime in 1876.

The builders of this road were

- W. H. Workman,
- W. H. Perry,
- J. B. Hollenbeck, first President of the First National Bank, and
- E. F. Spence, then Cashier and later President of the First National Bank

The track was a narrow gauge; used twenty-pound rail; one horsecar was operated; trip every one and a half hours.

Routing the line, as it would read today would be Arcadia, Aliso Street, Pleasant Avenue, First to Soto. At that time Aliso Street started at Los Angeles and continued along this route east to the city limits on First Street. This line was extended a few months later on Main Street to Temple Block to connect with the Spring and Sixth Street line and the Main Street and Agricultural Park Line.

First Street was not opened at this time.

At Easter Week in 1884, floods destroyed the Aliso Street Bridge and the Downey Avenue Bridge and left the Macy Street bridge—these being the only bridges across the Los Angeles River at that time.

For months after the flood the passengers from the Aliso Street car line walked over improvised gangplanks to cross the river and were thus transferred from car to car. This was the second line put in operation in Los Angeles. The Main Street and Agricultural Park line being the third.

The framework of the Macy Street Bridge today is the original bridge construction, but at that time it was covered. This covering was removed a few years ago.

The eighth franchise issued, to be found in the city archives, Volume 10, Page 201, (for the session of November 19, 1875) —date of approval not given in copy at hand—the opening clause of which reads as follows:

> "AN ORDINANCE granting a franchise for a street railroad in the City of Los Angeles to John S. Griffin and to his assigns" — and provided for a franchise for a period of twenty—five years. This route started at the point where the last franchise granted to the SPRING & SIXTH STREET RAILROAD COMPANY terminated at the Southern Pacific Station, and followed what is now San Fernando and Olympic Streets and across the Los Angeles River to Downey Avenue (now North Broadway.)

The description locates the route as follows: "Thence in a straight line along the said street northerly to a point opposite and east of second upper switch of said S.P.R.R. and distant not more than twelve feet east of the eastern iron rail of track of said Company; thence northerly to junction of the new street running east; thence along the same easterly and in the center thereof and across the Los Angeles River to Downey Avenue (now North Broadway) in East Los Angeles; thence along the same by the most convenient route over the streets in East Los Angeles to the workshop grounds of the S. P. Railroad."

The tenth franchise issued, approved January 5, 1876 by P. Beaudry, Mayor; the opening clause of which reads:

> "AN ORDINANCE amendatory of and supplementary to an ordinance entitled 'An ordinance granting a franchise for street car railroad in the city of Los Angeles to John G. Downey, O. W. Childs and John M. Baldwin', approved September 28th, 1874,

This extends the period of the franchise for one year for the completion of the building of the line granted on the previous franchise. This line was placed in operation to Washington and Main Streets previous to the granting of this last franchise, and the building of the line was completed under the new extension of time.

The eleventh franchise issued, approved May 26th, 1876; S. B. Coswell, Clerk of the Council; the opening clause of which reads:

> "AN ORDINANCE granting a franchise for street railroad in the City of Los Angeles to J. F. Ward, John S. Thompson and John Haley and to their associates and assigns."

There is no evidence that any portion of this line was ever built under this franchise.

P. Beaudry, Mayor approved the twelfth franchise issued, on October 9, 1876. The opening clause of which reads;

> "AN ORDINANCE granting a franchise for a street railroad in the City of Los Angeles to C. E. Beane and J. S. Crawford and to their associates and assigns."

The route covered was on Main from Washington south to Jefferson, and on Jefferson west to Figueroa and was used in connection with the Main Street Line.

The sixteenth franchise issued, was approved by F. A. MacDougall, Mayor, on January 12th, 1877; the opening clause of which reads:

> "AN ORDINANCE granting franchise for a street railroad to J. W. Potts

"AN ORDINANCE granting franchise for a street railroad to J. W. Potts and others, and to their assigns." The others consisted of H. J. Crow, Thomas A. Garey, Ivar A. Weid and P. Beaudry.

The route covered by this franchise, described as follows: "From a point in the space north of Temple Block, between the junction of Spring and Main Streets, said terminus not to exceed within five feet of the prolongation of the eastern line of Temple Block***Thence along Temple Street to Pearl Street (now Figueroa); thence along the extension of Temple Street, as laid out by M. Kelleher, City Surveyor, to the City Limits, on the western side of the city, (Hoover Street)."

This was to be a horsecar line.

E. F. Spence, Mayor approved the thirtieth franchise issued, on March 14th, 1885. The opening clause of which reads:

> "AN ORDINANCE granting a franchise for the construction and operation of a cable street railroad in the city of Los Angeles, to C. H. Howland and his assigns." Route described as follows:

"Commencing at the intersection of Second Street with the westerly line of Spring Street, and running thence westerly along said Second Street on each side of the center line thereof, to Lake Shore Avenue; thence westerly along said Lake Shore Avenue on each side of the center line thereof to Diamond Street; thence westerly along said Diamond Street on each side of the center line thereof to the west boundary of said city."

This is the franchise under which the West Second Street Cable Railroad was eventually built.

Diamond Street and what is now (1921) known as West First Street are the same street.

The construction of this line was started in the spring of 1885, when Isaac W. Lord turned a spade-full of earth at the corner of Second and Spring Streets, and in a few months the line was in full operation to First and Belmont, and continued in operation until the Fall of 1888, when it was closed down and the entire property scrapped, the INVESTMENT BEING A TOTAL LOSS.

The thirty-third franchise issued was approved September 7th, 1885, by D. E. Miles, Mayor pro tem, and W. W. Robinson, Clerk of the Council. The opening clause reading as follows:

> "AN ORDINANCE granting a franchise for the construction and operation of a street railroad in the City of Los Angeles to W, H. Workman and his assigns."

This provided for the building of a car line from First and Spring Streets east on First to the junction of First and Aliso Avenue (which is now First Street and Boyle Avenue); thence along Aliso Avenue (now First Street) to First and Indiana. For a period of thirty years, cars to be "propelled by cable wire."

This ORDINANCE was amended by another ORDINANCE which was approved on the 28th day of April, 1886, by E. F, Spence, Mayor, and provided that the cars may be "propelled by electricity, horse or cable wire."

This line was constructed to First and Evergreen Avenue, being completed in the Spring of 1886, by W. H. Workman and J. B. Hollenbeck. It was broad gauge. They only operated it a short time when they sold out to the Los Angeles Cable Railway Company for Twelve Thousand ($12,000,00) Dollars.

The company built a bridge across the river on First Street; it was a wooden affair and was washed away by the floods in the winter of l887-l888, and the operation of the line was discontinued; the Boyle Heights region being served by the Aliso Street Line. No cars were operated on First Street between Main and Boyle Avenue from the time of this discontinuance until the cable started in August, 1889.

From 1873 to January 1st, 1887, there were issued by the City Council of the City of Los Angeles, and approved by the various Mayors, forty-three (43) streetcar franchises. Many of these are trivial in their nature to correct errors in previous franchises, or slight changes of routes.

In 1887 the LOS ANGELES CABLE RAILWAY COMPANY was organized;

- J. F. Crank, President;
- S. P. Jewett, Secretary and Treasurer;

- Chas. Forman, General Manager, who were also Directors.
  The other Directors of this Company were:
- I. W. Hellman and
- S. C. Hubbell, who was also attorney for the Company.

The Los Angeles Cable Railway Company purchased a number of the then existing lines and built some others, until on the first day of August, 1888, it operated the following lines, with horses and mules as motive power;

BUENA VISTA STREET LINE: From First and Main Streets, via Main, Marchessault, Bellevue Avenue (now Sunset Blvd,); Buena Vista (Now North Broadway) to College Street.

ALISO STREET LINE: From the east side of Main Street on Arcadia, Aliso Street, Pleasant Avenue, First Street to 1st and Evergreen. Single track narrow gauge.

BLUE LINE: From Temple Block via Main to First Street; First to Spring; Spring to Ninth Street; Ninth to Pearl Street (now Figueroa,); Pearl to Pico Street; where the name changed from Pearl to Figueroa, via Figueroa to Washington; thence along Washington to Vermont Avenue where the car barn was located; double track; broad gauge.

OLIVE STREET LINE: From Pritchard Street and Downey Avenue (now North Broadway); along North Broadway; Olympia Street, San Fernando Street, Alameda Street, Main Street, First Street, Spring Street, Fifth Street, Olive Street, Twelfth Street, Figueroa Street, Washington Street to Vermont Avenue. Double track, broad gauge.

WEST NINTH STREET LINE: From Sixth and Pearl Street (new Figueroa) along Sixth Street, to Hill, to Fourth, to Broadway, to First, to Spring, to Main to Marchessault to Upper Main (now North Spring Street); to San Fernando, to Olympia to Downey Avenue (now North Broadway) to Chestnut Street (now Avenue 20) to Pasadena Avenue to Daly Street and thence to Avenue Thirty-Three. Single track, narrow gauge.

The operation of this line was extended from Sixth and Figueroa Streets by way of Figueroa and West Ninth Street to Ninth Street and Grand View Avenue in the last week of August l888.

KUHRTS STREET LINE: From Plaza North by way of Main Street to the River, crossing River on the bridge, and by way of Kuhrts (now East Main Street) to Mission Street Road and along Mission Road to a point near where the big cut is now (1921) opposite the Selig Zoo.

Number of cars in operation on all lines Thirty-eight (38).

There were also in operation, on the first of August, 1888, the following lines, which were each operated by separate Companies.

TEMPLE STREET CABLE RAILWAY: Single track cable railway line on Temple Street from the West side of Spring Street via Temple to Belmont Avenue.

This Company was incorporated on November 3, 1885; and the contract was let for the construction of the line, on November 1st, 1885, to what was then known as Texas Street (now Union Avenue). The line was completed and started operation on July 4th, 1886, distance being l.6l miles. The line was extended, the last week in August, 1888, from Union Avenue west to Hoover Street via Temple Street. About January, l889, work was started to double track the line from Spring to Union Avenue which was completed and the double track section was put in operation in August, 1889. This line was sold under foreclosure proceedings on February 28th, 1898. Previous investment being a complete loss.

Another cable line in operation on August 1st, 1888, was the WEST SECOND STREET CABLE RAILWAY. It started at Second and Spring Streets and routed west via Second, Lake Shore Avenue, First to Belmont Avenue.

At First and Belmont Avenue a dummy line connected with the cable road and ran to what is now Hollywood. Its route was: Belmont Avenue to Temple Street, Temple to Coronado Street thence south over private right-of-way to First Street; on First and private right-of-way to Western Avenue at the point where Temple Street now (1921) crosses Western Avenue; thence north along Western Avenue to Hollywood Boulevard; west on Hollywood Boulevard, and private right-of-way over the present (1921) line of the Pacific Electric tracks to a point near Gardner Junction, where it terminated in the midst of gardens.

The Hollywood Line was discontinued when the Pacific Electric line was built to Hollywood; they having purchased this dummy line.

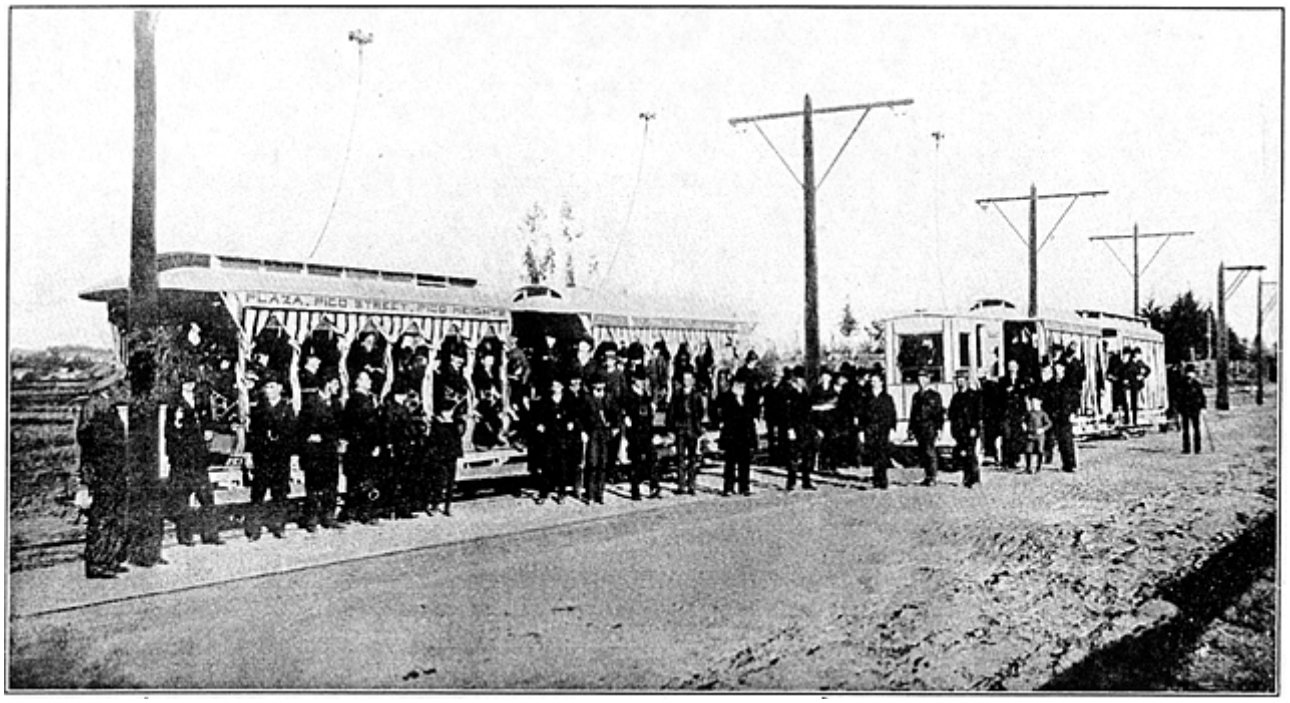
MAIN STREET AND AGRICULTURAL PARK LINE: Temple Block south to Jefferson; to Wesley Avenue (new University Avenue) and to Agricultural Park (new Exposition Park), thence to a point just south of the present site of the Museum, where the car barn was located.

Another branch of this line routed from Washington and Main Streets via Washington, Figueroa to Jefferson Street. One-half of the service was operating each way.

The route from Washington and Main Streets via Washington to Figueroa to Jefferson was discontinued in 1892, and the franchise abandoned on account of the expense entailed by the paving of Figueroa Street.

ELECTRIC RAILWAYS

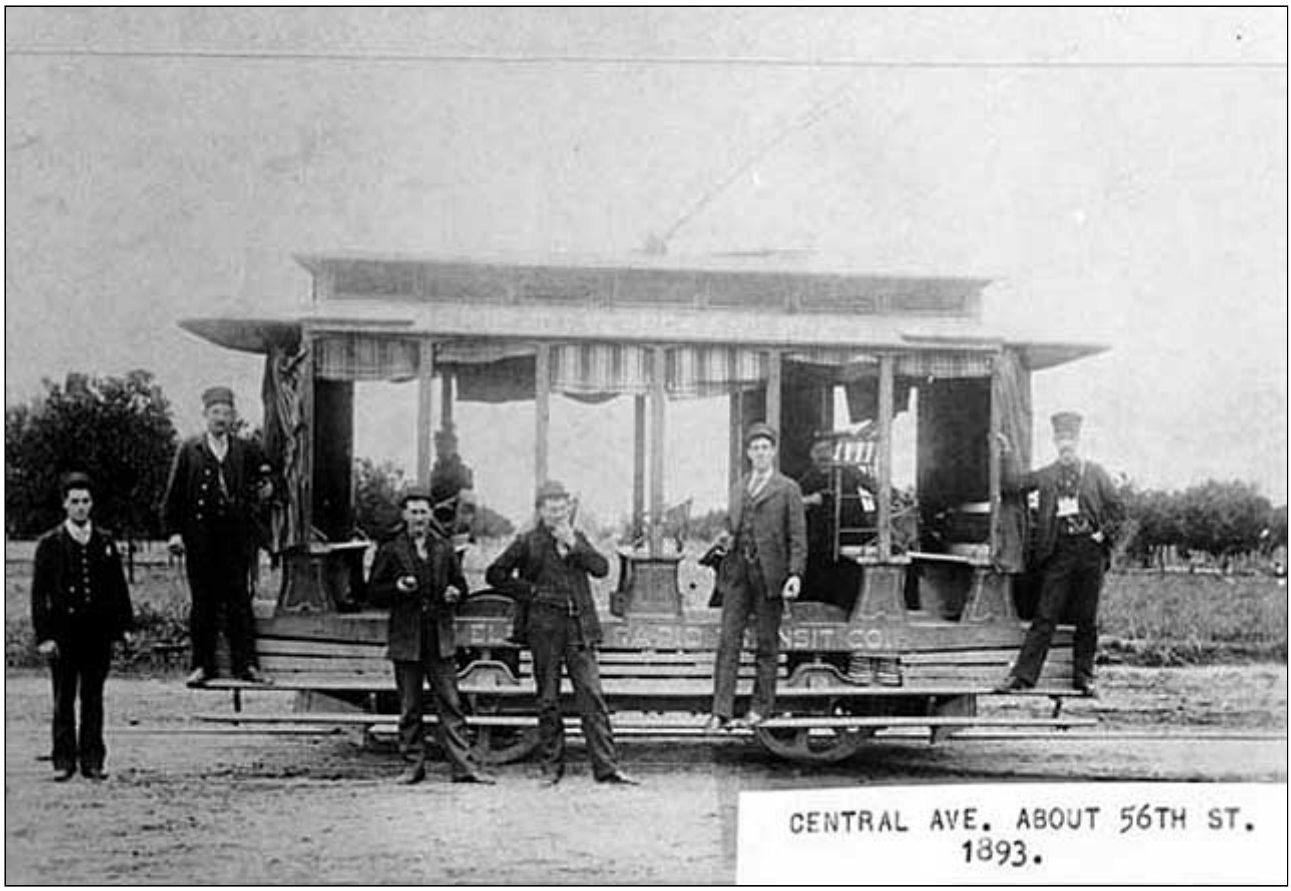
PICO STREET ELECTRIC RAILWAY, known as the LOS ANGELES ELECTRIC RAILWAY



Commenced on Los Angeles Street at the Plaza; south on Los Angeles to Third Street; east on Third to San Julian; south on San Julian to Seventh; west on Seventh to Maple Avenue, Maple Avenue to Pico Street and thence west on Pico to Lorde Street (now Harvard Boulevard)

Another branch continued south on Maple Avenue to West Adams Street, terminating in the center of an orange grove, (trees being grubbed up to make way for the rails.) The Los Angeles Electric Railway Company built this line in 1886 and 1887 – Chas. H. Holland being President and General Manager, and W. H. Best, Superintendent. (Col. Holland is now deceased. Mr. Best is living (1921) in Brooklyn, N.Y.; he visited Los Angeles in 1915.)

These lines were being operated only intermittently and frequently one had to wait two hours for a car. Operation was discontinued in the Fall of 1888.



From "The Science of Burning Liquid Fuel ~ Introduction"

"The author of this book began the study of liquid fuel while Master Mechanic and Superintendent of the Los Angeles Electric Railway in the year 1887. We use the Daft system of electricity. This system had previously operated an electric railway in Boston, Mass. They, however, did not have the overhead wire, but used the third rail system. Ours was the first overhead system of electric railroad in the United States, if not in the world. A view of the electric motor car then used on the system is here given. You can also see the first electric locomotive with two trailers attached.

It may be of interest to here state that after building the Myrtle Avenue branch of this road (which was a branch of the main line to Pico Heights), I reported to the Board of Directors that we should purchase motor cars for the branch line and not use the electric locomotive and trailers, because the latter was more costly to operate, but I also made the statement that in a few years electric locomotives would be used instead of steam locomotives in certain branches of work and for that service they would be better than electric motor cars. This portion of my report caused considerable merriment as there were grave doubts in the minds of many as to the fulfillment of this prophecy."

Mr. William Newton Best Los Angeles, CA 1913

In 1890 the LAERy Co. was acquired by the Electric Rapid Transit Company which attemped to rebuild the lines and acquire new electric cars. Sixteen new cars were ordered, 10 motors and six trailers. When the cars arrived in Los Angeles the investors could not pay the freight bill and so turned to General Sherman for help. For his $56,000 investment he received one-half interest in the ERTCo. By September 1st 1890 he had secured full ownership.

Sherman had the unfinished powerhouse completed, purchased the West 2nd Street cable route and proceeded to have the rails electrically bonded. Sherman also kept the 3'-6" cable car gauge and reduced the Pico line from standard 4'-8½" thus establishing the narrow gauge for Los Angeles city streetcars until the end came in 1963.

On July, 1st 1891 the first sucessful electric railway began operations covering a circuitous route beginning at 2nd and Spring Streets. Sherman called it The Belt Line Railway Company, and it was the immediate predecessor to The Los Angeles Consolidated Electric Railway Company.

Mr. James Walker Jr. Los Angeles, CA 1977

VERNON LINE: From Plaza south on Los Angeles Street to First, thence on San Pedro Street to Third; Third to Wolfskill (now Central Avenue) then via Central to Seventh; private right-of-way to Eighth; Central Avenue to Slauson. This was single track; frequent turnouts. Horses.

EAST SECOND STREET LINE -- known locally as DAVIES LINE. Second and Spring east to Santa Fe Station, via Second, Stephensen Avenue, Third, Santa Fe Avenue, back to Alameda Street Via Second Street making a loop at the Santa Fe Station.

MATEO STREET LINE: From First and Santa Fe Avenue South via Santa Fe Avenue to Fourth, private right-of-way to Mateo, Mateo to Ninth Street. Narrow gauge, horses.

In September 1888, the LOS ANGELES CABLE RAILWAY COMPANY, being in financial difficulties, the controlling interest was sold to C. B. Holmes, and associates, of Chicago, Ill. They organized a new Company, known as the PACIFIC RAILWAY COMPANY, capitalized at $5,000,000.00 and finished the construction of the cable lines, which when completed covered the following streets, with double tracks:

Commencing at Grand Avenue and Jefferson Streets, on Grand Avenue to Seventh Street; Seventh to Broadway; Broadway to First; First to Spring; Main; Marchessault; San Fernando to Upper Main (now North Spring Street); North

Spring to College and then over a viaduct over the Southern Pacific tracks to San Fernando Street; on San Fernando to Olympia; Olympia to the Los Angeles River and over the present bridge as it stands now (1921); to Downey Avenue (now North Broadway); to Pritchard Street; also, from Seventh Street and Alvarado east on Seventh to Grand Avenue; and, from First and Spring Streets east on First to First and Evergreen Avenue, at the southwest corner of Evergreen Cemetery.

The principal power station was at Seventh Street and Grand Avenue, the site where J. W. Robinson's Dry Goods store now (1921) stands.

The east Los Angeles Power House was at the corner of North Broadway and Workman (the southwest corner.)

The Boyle Heights Power House was at First and Chicago Streets, on the land now occupied by the Public Library and the little Park; First Street having been cut through the site since then,

1. The first section of the cable road was put in operation on June 8th, 1889, and routed from Seventh and Grand Avenue, via Seventh; Broadway; First; Spring; Main to Requena and Main Streets.

2. The second section of the cable road was placed in operation from First and Spring Streets to First and Chicago Streets on Saturday, August 3, 1889. (A big banquet was served at the Power House at First and Chicago for all the members of a very extensive Reception Committee consisting of most all the residents of Boyle Heights.)

3. The third section was opened from Main and Requena Streets to North Broadway and Workman Streets, Nov. 1, 1889; from Seventh Street and Grand Avenue to Jefferson Street and Grand Avenue, in November, 1889; and from Seventh Street and Grand Avenue to Seventh and Alvarado Streets, December 9, 1889.

The cable railway proved to be a financial disaster and was closed out at public auction on October 19, 1893, less than four years after the investment had been made. The millions of dollars invested from Chicago being a total loss. The following item, quoted from the Los Angeles Evening Express of October 19, 1893, might well be termed the obituary of the Los Angeles Cable Railway Company.

> "Judge Van Dyke has confirmed the sale of the cable railroad to the electric company and to Clark John Dunsmore falls the task of canceling 173,000 bonds and coupons, representing about $5,000,000 in value. For this the county will be paid $165."

This investment absorbed the entire wealth of C. B. Holmes of Chicago, the promoter, who was considered a wealthy man, and caused him to lose his position as leading Traction Financier in the United States. He was thrown out of every company he had any connection with and died a few years later a poor and broken man.

Also J. F. Crank, S. P. Jewett and others were heavy losers in these lines.

In October, 1890, the Los Angeles City Council, consisting of the following members;

- Bonsall,
- Brown,
- McClain,
- Shaffer,
- Summerland,
- Wirsching, (new President of the Board of Public Utilities),
- Van Dusen and
- Frankenfield, the President,

passed an ordinance over the veto of the Mayor, H. T. Hazard, with one dissenting vote - Theo. Summerland - granting a franchise for an electric railway to B. O. Carr and his assigns over numerous streets of the city, which later were used by the CONSOLIDATED ELECTRIC RAILWAY COMPANY. The promoters were: M. H. Sherman, J. P. Clark, now of Los Angeles, financial backer, the McDonalds who operated the Pacific Bank and the Home Savings Bank of San Francisco, and James Fair, of the Union Iron Works of San Francisco.

The financing of this road resulted eventually in the failure, in 1893, of the Pacific Bank and the Home Savings Bank of San Francisco, controlled by the McDonalds.

The company who built this road and operated it, was organized in Phoenix, Arizona;

- General M. H. Sherman, President;

- E. P. Clark, Vice President and Manager,
- F. V. McDonald, Cashier of the Pacific Bank of San Francisco, Secretary
- Directors:
    - General Sherman;
    - F. V. McDonald;
    - Col. B. O. Carr, Cashier of Peoples' Home Savings Bank of San Francisco;
    - R. H. Pratt, Assistant General Superintendent of the Southern Pacific Railroad, San Francisco;
    - Col. J. M. C. Marble, president California National Bank, Los Angeles;
    - D. A. Dorn, Attorney, San Francisco;
    - J. A. Muir, Assistant Division Superintendent Southern Pacific Railroad, Los Angeles;
    - Captain A. W. Barrett was Superintendent, and
    - Fred Eaton, Chief Engineer.

Construction was commenced December 17, 1890, by tearing up all the old cable line on Second Street between Spring and Olive Streets. The line was constructed to Westlake Park, terminating at Seventh and Alvarado Streets, and routed as follows — mostly through virgin territory, no streets graded, and where there were no streets there were cuts and heavy fills:

From Second and Spring to Olive; to First; to Bonnie Brae; to Ocean View Avenue; to Westlake Avenue; to Sixth Street, to Alvarado; to Seventh Street. The line was placed in operation July 1, l891.

This Company soon acquired title to the DAVIES line to the Santa Fe Station, to the VERNON line, to the old PICO STREET ELECTRIC LINE and with the new and extensive franchises which had been granted them were in a position to proceed with the work and soon constructed what is now known as the UNIVERSITY line. Construction gradually extending up North Broadway to the River, across the River, on Pasadena Avenue to Pasadena Avenue and Daly Street; from Second Street and Spring by way of Spring, Fourth, San Pedro, and Fifth Street to Southern Pacific Station at Central Avenue.

The fast moving electric cars were serious competitors to the slow moving cable cars and drained the financial resources of this Company to such an extent that it was soon in serious financial difficulties. Foreclosure of the property on October 19, 1893 resulted, and the purchase of same by the Consolidated Electric Railway Company, who took over all the cable lines & the horsecar lines. There were being operated at this time 31 cable cars and 19 horsecars, a total of 49 cars.

Street railways in Los Angeles in those days were anything but a safe investment, and although we find that almost all the lines of the city are now (1921) under one control they still were not successful financially.

On March 24th, 1895, M. H. Sherman and associates turned the property over to the care of Morris Tremble, a broker of Chicago, Ill. of the firm of Peabody, Houghtaling & Company, for the benefit of the bondholders. Mr. Trumbull was only in charge of the road a short time and the property was placed in the hands of Mr. F. W. Wood on April 4th, 1895. In August 1895, the property of this Company was sold under foreclosure proceedings and was purchased by the bond holders, who organized a new Company called the LOS ANGELES RAILWAY COMPANY to take over the properties. Mr. F. W. Wood was continued as General Manager.

W. S. Hook came here from Illinois in 1895 and organized the LOS ANGELES TRACTION COMPANY, and commenced to build a system of car lines. The first line starting at the Santa Fe Station, then by way of Third Street to Hill Street, Hill to Eighth Street; Eighth to Figueroa Street; Figueroa to Eleventh Street; Eleventh to Georgia Street; Georgia to Sixteenth Street; Sixteenth to Burlington Avenue; thence on Burlington Avenue, Hoover, Twenty-fourth and Vermont Avenue to Vermont Avenue and Thirty-ninth Street. This line was put in operation from the Santa Fe Station to Sixteenth Street and Burlington Avenue on the 29th day of August, 1895. The construction continued and in a few months the line was completed and in operation to Vermont Avenue and Exposition Boulevard and a year later was extended to Thirty-ninth Street.

Franchises were obtained by the Los Angeles Traction Company, as follows:

From Eighth Street, Lake, Seventh and Commonwealth Avenue to First and Virgil Streets.

From Twenty-fourth Street and Vermont Avenue by way on Twenty-fourth, Normandie and West Adams to Western Avenue.

From Jefferson and Wesley Avenue (now University Avenue) west on Jefferson to Fourth Avenue.

On East Fourth Street and connecting streets from Third and Stephenson Avenue to First and Fresno Streets,

All these lines were built and in operation by 1898.

The Hooks sold their interests in the Los Angeles Traction Company to the Southern Pacific Company who continued to operate these lines until 1910 when they were transferred to the LOS ANGELES RAILWAY.

In January 1896, a Committee representing the Bank of California, William Alvord, Houghtaling & Co, of Chicago, and the Pacific Rolling Mills, Purchased the controlling interest in the MAIN STREET & AGRICULTURAL PARK RAILROAD COMPANY from W. J. Brodrick and Francisco Jesurun, and built a line on San Pedro Street from Fifth south to Thirtieth Street.

The Main Street rolling stock and rails were scrapped and the line entirely rebuilt, and new cars purchased and operation by electricity started on April 1, 1897.

The line built on San Pedro Street was placed in operation on August 1, 1898.

Both the Main and San Pedro Street Lines were transferred to the LOS ANGELES RAILWAY October 1, 1898.

The Los Angeles Railway purchased the Mateo Street Line in April, 1901.

The operation of the cable lines was discontinued in 1896 to be put into operation as electric lines.

Mr. H. E. HUNTINGTON acquired the stock of the Los Angeles Railway Company and took possession of the property on October 1st, 1898. He proceeded at once to re-construct the entire system. In fact, scrapped it all, tearing out all cable lines and the road-bed of all the electric lines, replacing them with new rails and ties and new cars throughout; and extended the lines in every direction where needed and built new lines, and new car houses.

In the meantime, Mr. Huntington had also developed The Pacific Electric Railway Company. In 1910 he disposed of his interests in the Pacific Electric Railway Company and the Redondo Railway Company south of Hawthorne and Vermont Heights, to the Southern Pacific Company; and he acquired the Los Angeles Traction lines within the city and the Temple Street line.

Numerous extensions of lines have been made; a cross-town line built; new car barns constructed; extensive plans of rerouting carried out, in order to keep pace with the demands of the growing population of Los Angeles.

The number of cars in daily operation on January 1st of various years gives a striking illustration of the investment this has required.

TOTAL NUMBER OF CARS OPERATED BY LOS ANGELES RAILWAY on dates shown.

Yangna - Early Los Angeles Community

According to research by Dr. Harry Kelsey of the Los Angeles County Museum of Natural History, **Governor de Neve,** six months prior to the establishment of the Los Angeles pueblo in 1781, had undertaken preliminary diplomacy with the Gabrielino Indians at the ***Yangna*** settlement (located on what is now the Los Angeles Civic Center). This was to develop friendly relations with the local people before Spanish settlers began moving into the area. *Yangna* was a favorite native trading center. Governor de Neve arranged for the baptisms of dozens of *Yangna* residents and even assumed the role of *padrino* (godparent) for 12 persons. One of the couples sponsored by de Neve, being baptized and remarried, even assumed the names Felipe de Neve and Felipa de Neve. Dr. Kelsey believes that de Neve might have been grooming this couple to serve as a nucleus family for a Christian Indian settlement that he had envisioned. This was not to happen, however, when de Neve was replaced by **Pedro de Fages** later that year. Sadly, in 1828, a German immigrant purchased the land upon which *Yangna* lay and, with the help of Mexican officials, evicted the entire community that had been living there for perhaps two to three thousand years.

MIRROR TIMES SQUARE
ALTERNATIVES SIGNIFICANT IMPACTS SUMMARY

Scenario	Number of Impacts		Notes
	Existing + Project	Future + Project	
Project	1	6	Original project
Alternative 1	0	2	**No Project: existing site to 100% occupancy** No impacts in Existing plus Project Two impacts in Future plus Project, V/C increase is less than original project
Alternative 2	1	6	**Reduced density: 20% reduction from original project description** One impact in Existing plus Project, V/C increase is less than original project Six impacts in Future plus Project, all V/C increase is less than original project
Alternative 3	1	6	**All office and residential** One impact in Existing plus Project, V/C increase is greater than original project Six impacts in Future plus Project, five intersections V/C increase greater and one intersection V/C less than original project
Alternative 4	1	5	**Partial Preservation: Remove one tower, 40-50% reduction, existing site to 100% occupancy** One impact in Existing plus Project, V/C increase greater in AM and lower in PM than original project Five impacts in Future plus Project, AM and PM impacted peak hours V/C increase and decrease compared to the original project
Alternative 5	1	2	**Full Preservation: remove both towers, rehabilitate existing site, existing site to 100% occupancy** One impact in Existing plus Project, V/C increase less than original project Two impacts in Future plus Project, V/C increase less than original project

Notes:

[a] Source: Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition, 2012.

[b] Internal capture represents the percentage of trips between land uses that occur within the site. This percentage is informed by the Trip Generation for Mixed-Use Development calculation methodology described in Chapter 6 of the ITE *Trip Generation Handbook*, 3rd edition, 2014. Internalization percentages are derived from *NCHRP Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*, Transportation Research Board, 2011. See Attachment B for detailed calculation tables. The daily credit is assumed to be 75% of peak hour credits taken.

[c] The transit credit is based on LADOT's *Transportation Impact Study Guidelines*, December 2016. The guidelines state that up to 25% transit/walk credit may be taken for projects adjacent to a transit station or RapidBus Stop. Projects within 1/4 mile walking distance of a transit station or of a RapidBus stop may take up to a 15% transit/walk credit. The Metro Red/Purple Line Civic Center Station is one block from the project site, and RapidBus routes provide service on Broadway, Spring Street, and 1st Street immediately adjacent to the project site. The future 2nd St/Broadway Regional Connector Station will be located directly adjacent to the project site. The daily credit is assumed to be 75% of peak hour credits taken.

[d] The pass-by credit is based on Attachment D of LADOT's *Transportation Impact Study Guidelines*, December 2016.

[e] For flexibility, the trip generation analysis uses the most conservative (highest) rates for high-rise apartments versus high-rise condominiums: ITE code 222 (high-rise apartment) for daily trips and ITE code 232 (high-rise condominium) for peak hour trips. Since the high-rise residences in the ITE database are generally in urban areas with transit service, no additional transit credit was taken to provide a conservative estimate.

[f] 60% of the existing 559.863 ksf floor area (335.918 ksf) is currently occupied. 7.5 ksf of the occupied space is a bank. The remaining 328.418 ksf is office uses. Source: Onni Group.

[g] Daily and AM peak hour rates not available for Walk-In Bank (ITE code 911). Rate for Drive-In Bank (ITE code 912) was used instead.

[h] AM Peak Hour directional distribution not available. Used directional distribution for High-Turnover Restaurant.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition, 2012.

[b] Internal capture represents the percentage of trips between land uses that occur within the site. This percentage is informed by the Trip Generation for Mixed-Use Development calculation methodology described in Chapter 6 of the ITE *Trip Generation Handbook* , 3rd edition, 2014. Internalization percentages are derived from *NCHRP Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments* , Transportation Research Board, 2011. See Attachment B for detailed calculation tables. The daily credit is assumed to be 75% of peak hour credits taken.

[c] The transit credit is based on LADOT's *Transportation Impact Study Guidelines* , December 2016. The guidelines state that up to 25% transit/walk credit may be taken for projects adjacent to a transit station or RapidBus Stop. Projects within 1/4 mile walking distance of a transit station or of a RapidBus stop may take up to a 15% transit/walk credit. The Metro Red/Purple Line Civic Center Station is one block from the project site, and RapidBus routes provide service on Broadway, Spring Street, and 1st Street immediately adjacent to the project site. The future 2nd St/Broadway Regional Connector Station will be co-located with the project site. The daily credit is assumed to be 75% of peak hour credits taken.

[d] The pass-by credit is based on Attachment D of LADOT's *Transportation Impact Study Guidelines* , December 2016.

[e] For flexibility, the trip generation analysis uses the most conservative (highest) rates for high-rise apartments versus high-rise condominiums: ITE code 222 (high-rise apartment) for daily trips and ITE code 232 (high-rise condominium) for peak hour trips. Since the high-rise residences in the ITE database are generally in urban areas with transit service, no additional transit credit was taken to provide a conservative estimate.

[f] 60% of the existing 559.863 ksf floor area (335.918 ksf) is currently occupied. 7.5 ksf of the occupied space is a bank. The remaining 328.418 ksf is office uses. Source: Onni Group.

[g] Daily and AM peak hour rates not available for Walk-In Bank (ITE code 911). Rate for Drive-In Bank (ITE code 912) was used instead.

[h] AM Peak Hour directional distribution not available. Used directional distribution for High-Turnover Restaurant.

Notes:

[a] Source: Institute of Transportation Engineers (ITE), Trip Generation, 9th Edition, 2012.

[b] Internal capture represents the percentage of trips between land uses that occur within the site. This percentage is informed by the Trip Generation for Mixed-Use Development calculation methodology described in Chapter 6 of the ITE *Trip Generation Handbook*, 3rd edition, 2014. Internalization percentages are derived from *NCHRP Report 684: Enhancing Internal Trip Capture Estimation for Mixed-Use Developments*, Transportation Research Board, 2011. See Attachment B for detailed calculation tables. The daily credit is assumed to be 75% of peak hour credits taken.

[c] The transit credit is based on LADOT's *Transportation Impact Study Guidelines*, December 2016. The guidelines state that up to 25% transit/walk credit may be taken for projects adjacent to a transit station or RapidBus Stop. Projects within 1/4 mile walking distance of a transit station or of a RapidBus stop may take up to a 15% transit/walk credit. The Metro Red/Purple Line Civic Center Station is one block from the project site, and RapidBus routes provide service on Broadway, Spring Street, and 1st Street immediately adjacent to the project site. The future 2nd St/Broadway Regional Connector Station will be co-located with the project site. The daily credit is assumed to be 75% of peak hour credits taken.

[d] The pass-by credit is based on Attachment D of LADOT's *Transportation Impact Study Guidelines*, December 2016.

[e] For flexibility, the trip generation analysis uses the most conservative (highest) rates for high-rise apartments versus high-rise condominiums: ITE code 222 (high-rise apartment) for daily trips and ITE code 232 (high-rise condominium) for peak hour trips. Since the high-rise residences in the ITE database are generally in urban areas with transit service, no additional transit credit was taken to provide a conservative estimate.

[f] 60% of the existing 559.863 ksf floor area (335.918 ksf) is currently occupied. 7.5 ksf of the occupied space is a bank. The remaining 328.418 ksf is office uses. Source: Onni Group.

[g] Daily and AM peak hour rates not available for Walk-In Bank (ITE code 911). Rate for Drive-In Bank (ITE code 912) was used instead.

[h] AM Peak Hour directional distribution not available. Used directional distribution for High-Turnover Restaurant.

Subject: RE: Times Mirror Square - Traffic Alternatives

Follow Up Flag: Follow up
Flag Status: Flagged

Hi Jessie,

Here is the transit information for the Alternatives

Alternatives	AM Net Trips (without Transit Credit)	PM Net Trips (without Transit Credit)	Total Transit Trips	Total Transit Trips
Alternative 1	337	338	118	118
Alternative 2	267	298	93	104
Alternative 3	474	389	166	136
Alternative 4	476	485	167	170
Alternative 5	102	252	36	88

Let me know if you need anything else with this!

-Amanda
