INITIAL STUDY MITIGATED NEGATIVE DECLARATION

Project Title: 1180 Main Street Office Project

Project Description: Premia Capital is proposing to develop the 1180 Main Street Office Project in the City of Redwood City, California. The proposed project would be developed on two adjacent parcels identified as Assessor Parcel Numbers 053-147-060 and 053-147-070 (located at 1180 and 1190 Main Street) near the City's downtown area. The project site is approximately 1.31 acres and partially developed with a concrete foundation and a vacant one-story commercial building. The proposed project would demolish the existing structures and construct a three-story commercial office building of 109,375 square feet with a two-level underground parking garage and on-site amenities including a stacked shipping container café and a 10,000 square feet publicly accessible park space.

Name of Lead Agency:
City of Redwood City
Community Development Department, Planning and Housing Division
1017 Middlefield Road
Redwood City, CA 94063

Lead Agency Contact Information:
William Chui, Associate Planner
Phone: (650) 780-5916
Email: wchui@redwoodcity.org

Determination: The City of Redwood City has determined that a) all potentially significant or significant impacts required in the Initial Study Mitigated Negative Declaration have been identified and analyzed; and b) with respect to each significant impact on the environment, either of the following apply: 1) changes or alterations have been required or incorporated into the project that avoid or mitigate the significant impacts to a level of less than significant; or 2) those changes or alterations that are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency. The ISMND and supporting documents are available at the City of Redwood City Community Development Department, Planning and Housing Division, located at 1017 Middlefield Road, Redwood City, California 95688, and online by searching the project name at: https://www.redwoodcity.org/city-hall/current-projects/development-projects?id=90

By: _____ Date: April 24, 2019

1.0 INTRODUCTION

Premia Capital (applicant) is proposing to develop the 1180 Main Street Office Project (proposed project) in the City of Redwood City (City), California. The proposed project would be developed on two adjacent parcels identified as Assessor Parcel Numbers (APNs) 053-147-060 (currently 1180 Main Street) and 053-147-070 (currently 1190 Main Street) near the City's downtown area. The project site is approximately 1.31 acres and partially developed with a concrete foundation and a vacant one-story commercial building. The proposed project would demolish the existing structures and construct a 40-foot high three-story commercial office building of 109,375 square feet with a two-level underground parking garage and on-site amenities including a stacked shipping container café and an on-site publicly accessible park space of 10,000 square feet.

1.1 PROJECT TITLE

1180 Main Street Office Project

1.2 LEAD AGENCY

City of Redwood City
Community Development Department, Planning and Housing Division
1017 Middlefield Road
Redwood City, CA 94063

1.3 LEAD AGENCY CONTACT

William Chui, Associate Planner
Phone: (650) 780-5916
Email: wchui@redwoodcity.org

1.4 PURPOSE

The purpose of the proposed project is to allow for the development of a 40-foot high (three-story commercial office building of 109,375 square feet with associated parking and on-site amenities on the 1.31-acre project site located at 1180 Main Street in the City of Redwood City. This Initial Study Mitigated Negative Declaration (ISMND) has been prepared to evaluate the proposed project for potential environmental effects in compliance with the California Environmental Quality Act (CEQA). The City is the lead agency under CEQA and has the principal responsibility for carrying out or approving a project which that may have a significant effect on the environment. This ISMND has been prepared in anticipation of determining that all potentially significant impacts from implementing the proposed project can be mitigated to less than significant levels. This document has been prepared in accordance with CEQA, Public Resources Code (PRC) Section 21000 et seq., and the State CEQA Guidelines, California Code of Regulations (CCR), Title 14, Section 15000 et seq.

1.5 PROJECT LOCATION

The 1.31-acre project site is located at 1180 Main Street near the City's downtown area. The project site is adjacent to Elm Street, Lathrop Street, Maple Street, Main Street, and the Caltrain corridor. The project site is approximately 0.5 miles east of the Redwood City Caltrain station on James Avenue. Regional access is provided by U.S. Highway

101 (US-101), approximately 1 mile north of the project site, State Route 82 (SR 82, El Camino Real) located approximately 0.1 miles south of the project site, and SR 84 located approximately 0.5 miles east of the project site.

1.6 EXISTING SITE CONDITIONS

The project site is partially developed with a concrete foundation in the northwest portion of the site and a vacant one-story commercial building in the southeast corner of the site. There is also a concrete drainage channel that extends across the western portion of the project site. As part of a previously started, but not completed, development project at the site, bridge abutments and foundations were constructed on either side of the concrete drainage channel to allow for the construction of a bridge crossing. However, the previous development project did not complete the bridge crossing. The remaining portions of the project site are vacant and covered with disturbed ruderal vegetation.

1.7 SURROUNDING LAND USES

The project site is adjacent to Elm Street to the southeast, Lathrop Street to the southwest, Maple Street to the northwest, and railroad tracks owned by Caltrain to the northeast (Caltrain corridor tracks). Development surrounding the project site consists of a mix of uses including, commercial uses to the north, high-density residential uses to the west, commercial and residential uses to the east, and automobile sales and service centers to the south.

1.8 GENERAL PLAN DESIGNATION AND ZONING

The project site is within the City's El Camino Real Corridor Plan Area, which includes goals, policies, and strategies for street improvements to support walking, bicycling, and economic development (Redwood City 2017). According to the City of Redwood City 2010 General Plan, the project site has a general plan designation of Mixed-Use Live/Work and is within the Mixed-Use Live/Work zoning district.

The intent of the Mixed-Use Live/Work general plan designation is to provide a mix of residences and low-intensity workplaces in the same building space. Typical uses include artist lofts, studio spaces, small offices, and similar low-intensity uses. Creative industrial workspace areas are also permitted, provided that activities limit or confine noise, dust, and vibration impacts. Stand-alone residential development is not permitted (Redwood City 2010a).

Similarly, the intent of the Mixed-Use Live/Work zoning district is to provide opportunities for a mix of live/work, light industrial, technology, creative industry, and limited office, and complementary uses. Typical uses include artist lofts, studio spaces, small offices, and similar low-intensity uses. Residential uses are permitted only as live/work (stand-alone residential development is not permitted), either in new developments or as adaptive reuse of existing structures. Stand-alone commercial or industrial workspace areas are permitted, provided that activities limit or confine noise, dust, and vibration impacts; are low impact in nature; and are compatible with any nearby existing or allowed residential uses. Development generally is low to moderate in scale (Redwood City 2010a).

1.9 CEQA AND PUBLIC AGENCY REVIEW

CEQA requires that project proponents disclose the significant impacts to the environment from proposed development projects. The intent of CEQA is to foster good planning and to consider environmental issues during the planning process. The City is the Lead Agency under CEQA for the preparation of this ISMND. The CEQA Guidelines (Section 21067) define the Lead Agency as: "the public agency which has the principal responsibility for carrying out or approving a project which may have a significant effect upon the environment." Approval of the proposed project is

considered a public agency discretionary action; therefore, the proposed project is subject to compliance with CEQA. The City has directed the preparation of an analysis to comply with CEQA.

Stantec Consulting Services Inc. (Stantec) has prepared this document at the direction of the City. The purpose of this document is to disclose the environmental consequences of implementing the proposed project to decision-makers and the public. The public, City residents, and other local and state resource agencies will be given the opportunity to review and comment on this document during a 30-day public-review period. Comments received during the review period will be considered by the City prior to certification of this ISMND and project approval.

The public review period will commence on April 26, 2019 and end on May 27, 2019 pursuant to CEQA Guidelines Section 15105. If you wish to send written comments (including via e-mail), they must be received by 5 p.m. on May 27, 2019. Written comments should be addressed to:

William Chui, Associate Planner
Community Development Department, Planning and Housing Division
1017 Middlefield Road
Redwood City, CA 94063
Phone: (650) 780-5916
Email: wchui@redwoodcity.org

1.10 REQUIRED PERMITS AND APPROVALS

This ISMND would be used by the City as the Lead Agency to evaluate the potential environmental impacts of the proposed project. The applicant is requesting approval of the following applications: (1) Tentative Parcel Map; (2) Conditional Use Permit (CUP); and (3) Architectural Permit. Other anticipated project approvals/actions may include, but are not limited to, the following:

- Design Review: City of Redwood City
- Tree Removal Permit: City of Redwood City
- Adoption of the Mitigated Negative Declaration: City of Redwood City

Additionally, all work related to improvements and project grading would be subject to the Redwood City Municipal Code, including the Zoning Ordinance, Building Code, and Fire Code.

1.11 SCOPE OF THIS INITIAL STUDY

As the Lead Agency under CEQA, the City is responsible for compliance with the environmental review process prescribed by the CEQA Guidelines. This Initial Study focuses on the environmental issues identified as potentially significant in the CEQA Appendix G Environmental Checklist Form and by the CEQA Guidelines. This ISMND evaluates the potentially significant effects on the environment and identifies revisions in the project site plans (presented as mitigation measures) to mitigate the effects to a level at which no significant effect on the environment would occur. A complete project description is included in Section 2.0. Evaluations of the CEQA Appendix G Environmental Checklist Form questions are analyzed in Section 3.0 and references are included in Section 4.0 of this document.

The following technical studies were conducted and/or reviewed in preparing this ISMND: air quality modeling outputs, biological resources assessment, geotechnical study, cultural resources study, preliminary engineering study, phase I environmental site assessment (ESA), traffic impact study, and noise study. These studies and

supporting data are included as appendices to this ISMND and referred to where appropriate throughout this document.

1.12 DOCUMENT ORGANIZATION

This ISMND is organized as follows:

Section 1.0: Introduction. This section introduces the proposed project and describes the purpose and organization of this document.

Section 2.0: Project Description. This section provides a detailed description of the proposed project.

Section 3.0: Environmental Checklist and Environmental Evaluation. This section presents an analysis of the range of environmental issues identified in the CEQA Environmental Checklist and determines for each topic whether the proposed project would result in no impact, a less than significant impact, a less than significant impact with mitigation incorporated, or a potentially significant impact. If impacts are determined to be potentially significant after incorporation of applicable mitigation measures, an Environmental Impact Report (EIR) would be required. For this proposed project, however, mitigation measures have been incorporated, where needed, that would reduce all potentially significant impacts to a less than significant level.

Section 4.0: References. This section lists the references used in preparing this ISMND.

Section 5.0: List of Preparers. This section identifies the report preparers.

2.0 PROJECT DESCRIPTION

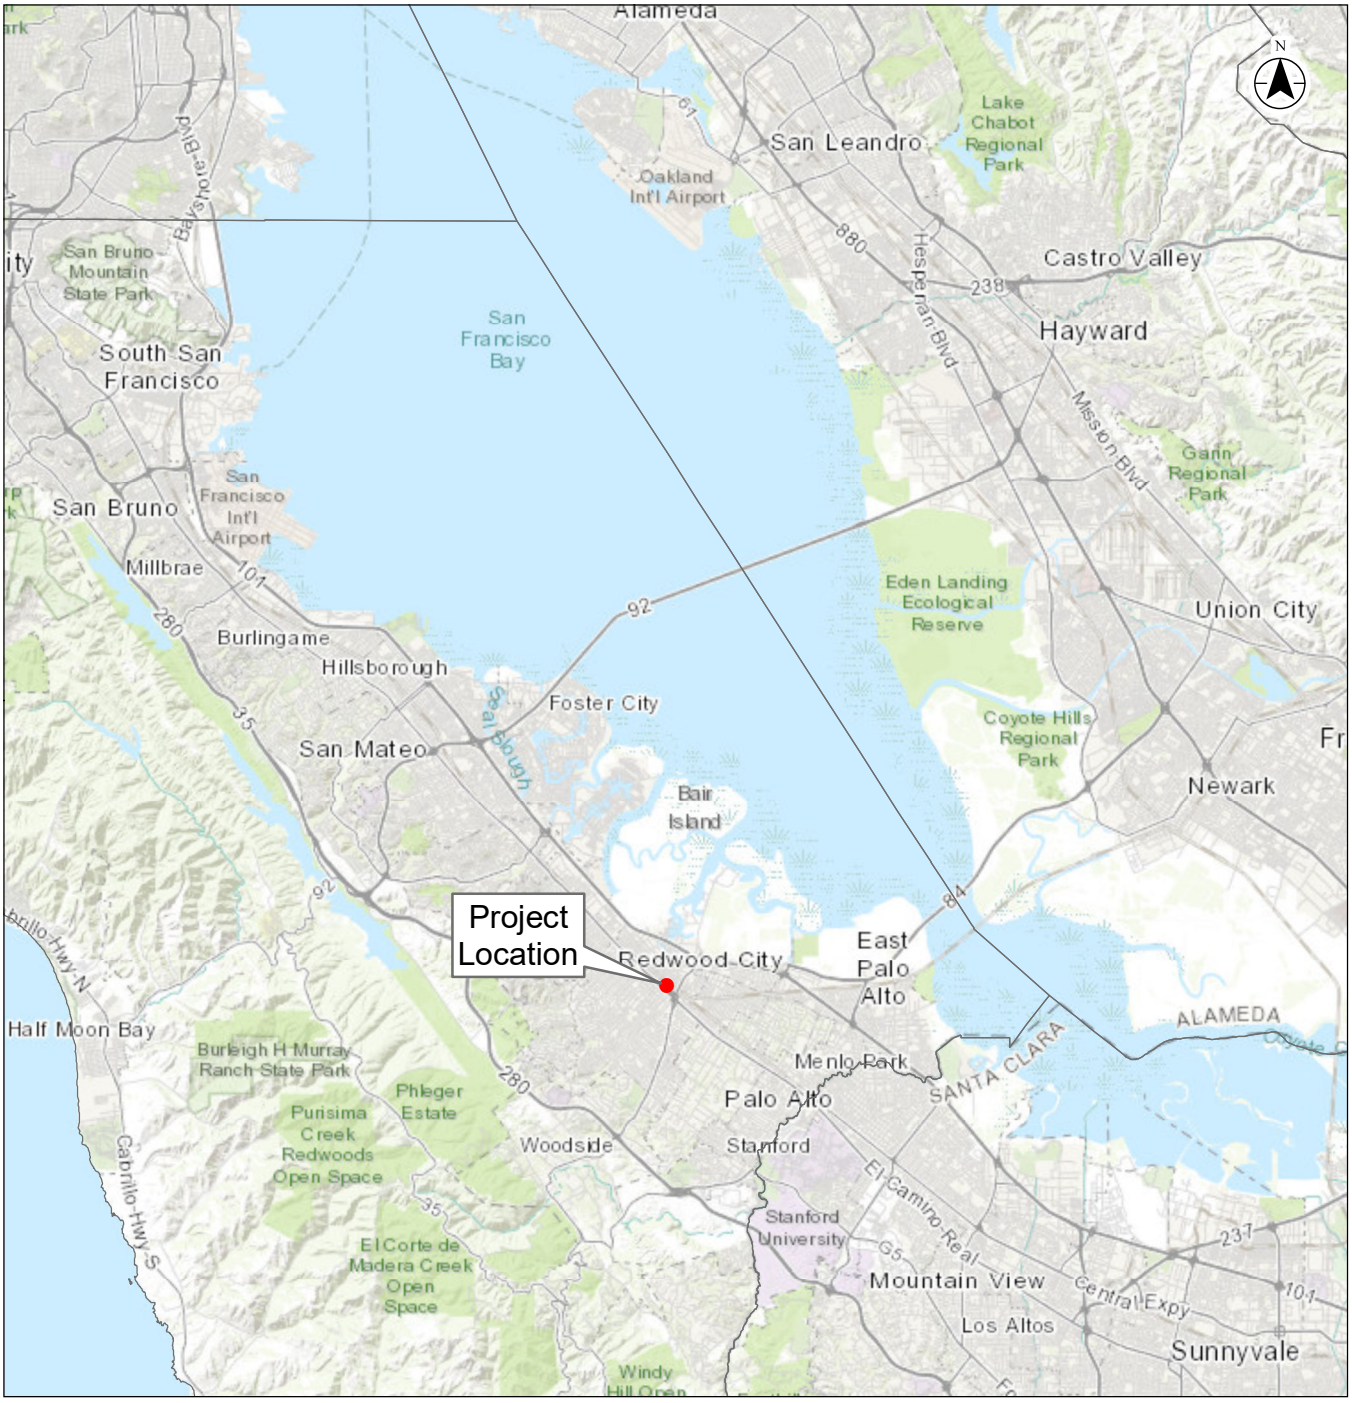
2.1 PROJECT OVERVIEW

The proposed project would be located at 1180 Main Street in Redwood City, California (Figure 2.0-1 and Figure 2.0-2). The proposed project would demolish the existing vacant one-story commercial building and a concrete foundation totaling approximately 7,623 square feet. The proposed project would redevelop the site with a 40-foot high three-story commercial office building of 109,375 square feet with a two-level underground parking garage of 75,653square feet. In addition, the proposed project would complete the existing bridge crossing with the construction of a 64-foot-wide bridge over the drainage channel. The proposed bridge would provide access to the building's main entrance and include a publicly accessible park space of 10,000 square feet. The proposed project would also include an on-site stacked shipping container café of 325 square feet.

2.2 PROJECT COMPONENTS

2.2.1 Office Building

The proposed three-story commercial office building would be approximately 40 feet in height with a gross floor area of 109,375 square feet. The proposed building's main entrance would be located on Maple Street with additional entrances located on Main Street at the southeast corner of the project site and on the northwest side of the building to access the proposed project's proposed on-site walkway along the Caltrain corridor. Access to each floor of the proposed building would be available from the elevators and stairwell located within the center of the building.



The first floor of the building would be divided as two office spaces of 6,107 square feet and 18,975 square feet, each, totaling 25,082 square feet. The first floor would also include a lobby area at the main entrance, bicycle storage room, and shower facilities. The second and third floors would each consist of one office space. The second floor would provide 34,217 square feet of office space and the third floor would provide 32,037 square feet of office space. Restroom facilities would be provided on each floor of the building. Figure 2.0-3 through Figure 2.0-6 show the preliminary conceptual site plan and floor plans, and the building elevations are shown in Figure 2.0-7 through Figure 2.0-12.

The proposed project would include 11,195 square feet of public open space including a 10,000 sq. ft. public park on the west side of the project site and a 1,195 sq. ft. exterior stair terrace on the north corner of the building. The stair terrace would provide amphitheater seating and would be accessible from outside the building at the ground level and lead to the building's second floor Private open space would include 2,569 square feet of terrace space on the first floor and 1,276 square feet of terrace space on the third floor.

The building would have a modern industrial architectural style with a sawtooth roof and exposed industrial interior. Building materials would include a mix of brick, metal, concrete, and glass. The proposed project would include exterior lighting to illuminate the building entrances, pathways, landscaping, public park, and underground parking garage for on-site safety and security. All exterior lighting would be compliant with Title 24 Cal Green Requirements. The proposed project would be required to comply with the development standards of the Mixed-Use Live/Work zoning district, including the Façade Composition and Architectural Regulations as discussed in in Section 55.8 of the Redwood City Zoning Ordinance (Redwood City 2018a).

This page left intentionally blank.

Section 55.8 of the Redwood City Zoning Ordinance (Redwood City 2018a). In addition, the proposed project would be required to obtain an Architectural Permit pursuant Article 45 of the Redwood City Municipal Code to ensure the design and appearance of the proposed project conforms to the general character other structures surrounding the project site (Redwood City 2018).

2.2.2 Open Space and Landscaping

Bridge Crossing and Park Space

The proposed project would complete the existing bridge crossing and construct a 64-foot-wide bridge over the drainage channel to provide access to the building's main entrance on Maple Street. The proposed bridge crossing would provide a 27-foot-wide clearance to allow Fire Apparatus Access to cross the bridge and access the main entrance of the office building. The proposed bridge would also provide publicly accessible park space with landscaping and seating areas (Figure 2.0-4).

The proposed bridge would connect to the existing bridge abutments and foundations on each side of the concrete drainage channel and would not require construction activities within the drainage channel. The main bridge deck structure would be constructed from 18-inch-thick, pre-cast, pre-stressed, hollow core planks. The planks are fabricated in 4-inch-wide sections and would be placed side by side and tied together with a 5-inch-thick concrete topping slab. The deck would be designed in accordance with the American Association of State Highway and Transportation Officials (AASHTO) HB-17 provisional standards to support standard heavy traffic loading of HL-93 designation and fire apparatus. In accordance with California Code of Regulations, Title 19, Division 1, Section 3.05(a) fire apparatus access roads must be at least 20 feet in width to provide fire access and egress. The proposed project would comply with these standards and provide adequate access for emergency vehicles.

Landscaping

The proposed project would plant approximately 8,600 square feet of landscaping. Landscape plantings would be placed in bioretention planters and along the proposed public walkway between the project site and the Caltrain corridor, and planting pockets along the concrete drainage channel and within the publicly accessible park space. The proposed project would install seven street lights in between new street trees planted along the frontages of Elm Street and Maple Street. The street lights would be consistent with existing street lights in the vicinity of the project site (or equivalent as determined by the Planning Manager), which consists of the City's "Twin Head Acorn light model" and are approximately 12 feet tall. The proposed project would also include a green roof with up to approximately 560 square feet of landscaping. Landscaped areas and planters would incorporate a combination of drought tolerant plants and shrubs that meet the requirements of California's Water Efficient Landscape Ordinance. The proposed project would also plant approximately 100 trees along the sidewalks and the concrete drainage channel.

The NPDES permit also includes section C.3j (Green Infrastructure Planning and Implementation) which includes requirements for early implementation of green infrastructure projects or "no missed opportunities." With the alterations to the project frontages on Elm Street and Lathrop Street, it was determined that there was an opportunity to include green infrastructure for the treatment of the right-of-way runoff tributary to the frontages. The frontages were designed to direct the runoff to treatment facilities, which were sized based on the sizing criteria of Provision C.3.d of the NPDES permit.

Public Art

The proposed project would comply with Section 45.090 of the Redwood City Municipal Code by providing publicly accessible artwork at the corner of Lathrop Street and Elm Street, and near the bridge entrance at Maple Street and Lathrop Street. Public art selected for the proposed project would be required to comply with the standards outlined in Section 45 of the Redwood City Municipal Code. The City's Civic Cultural Commission would review the proposed public art to determine that it is placed in an appropriate location, proportional in scale of the development, and compatible with the immediate environment of the site in terms of materials, colors, and design. If the value of the artwork is determined to not fully meet the requirements of Section 45.090, the applicant would pay an additional in-lieu fee to the City's Art in Public Places Fund.

2.2.3 Shipping Container Café

The proposed project would include two 20-foot shipping containers at the southwest corner of the project site near the intersection of Elm Street and Lathrop Street. The two shipping containers would be stacked and are intended to contain a café on the first level with public seating provided on the second level. Public seating would also be provided in front of the café along Elm Street. The shipping container café would be approximately 325 square feet and 16 feet to 18 feet tall and would be painted in a complementary color scheme as the office building.

2.2.4 Access, Parking, and Circulation

Pedestrian Access and Circulation

The proposed project would include on-site pedestrian improvements consisting of installing a sidewalk along Main Street, widening the existing sidewalk on Elm Street from 10 feet to 12 feet, and constructing a public walkway between the proposed office building and the Caltrain corridor. Bulb-outs would be added at the corners of Elm Street/Lathrop Street and Elm/Main Street on the project side of the street.

The proposed project would include off-site pedestrian improvements to access the project site and the surrounding area (Figure 2.0-3). Such off-site design improvements would include the installation of marked crosswalks at the following:

- Elm Street/Lathrop Street (north crosswalk)
- Elm Street/Main Street (south crosswalk)
- Lathrop Street/Maple Street (all crosswalks)

In addition, the proposed project would make the intersection of Lathrop/Maple/Franklin Streets an all-way stop and add a side-street stop at Elm Street/Lathrop Street

Caltrain tracks are located immediately north of the project site. Pedestrians may cross the Caltrain corridor tracks on the east side of Main Street or on either side of Maple Street.

Vehicle Parking

The proposed project would construct a two-level underground parking garage of 75,653 square feet (Figure 2.0-13 and Figure 2.0-14). Access to the underground parking garage would be available from a driveway off Elm Street. The underground parking garage would provide a total of 160 parking spaces, of which 26 spaces are designated for low-emitting and carpool vehicles. In addition, to meet the City's parking requirements per Article 30 of the Redwood City Municipal Code and provide one space for every 300 square feet of gross floor area, which equates to 374

parking spaces, the proposed project would use a valet service to provide an additional 215 parking spaces in the two levels of underground parking. Therefore, the proposed project would accommodate 375 vehicles total.

While business hours have not yet been established for the proposed project, at a minimum use of the underground parking garage would be available to the public after business hours on Monday through Friday from 5:00 p.m. to 12:00 a.m., and on weekends and holidays from 8:00 a.m. to 12:00 a.m. These hours and public use of the underground parking garage would be subject to City approval. The Applicant would be required to submit a shared parking agreement as part of the project's Conditions of Approval.

Bicycle Parking

The proposed project would comply with Section 55.6.D.3 of the Redwood City Zoning Ordinance and include 72 bicycle rack spaces for building tenants and 26 bicycle rack spaces for visitors. The 72 bicycle spaces would be vertical wall-mounted racks and located in a dedicated bike storage room near the building's main entrance. The 26 bicycle rack spaces for visitors would be placed near the building's main entrance.

Emergency Access

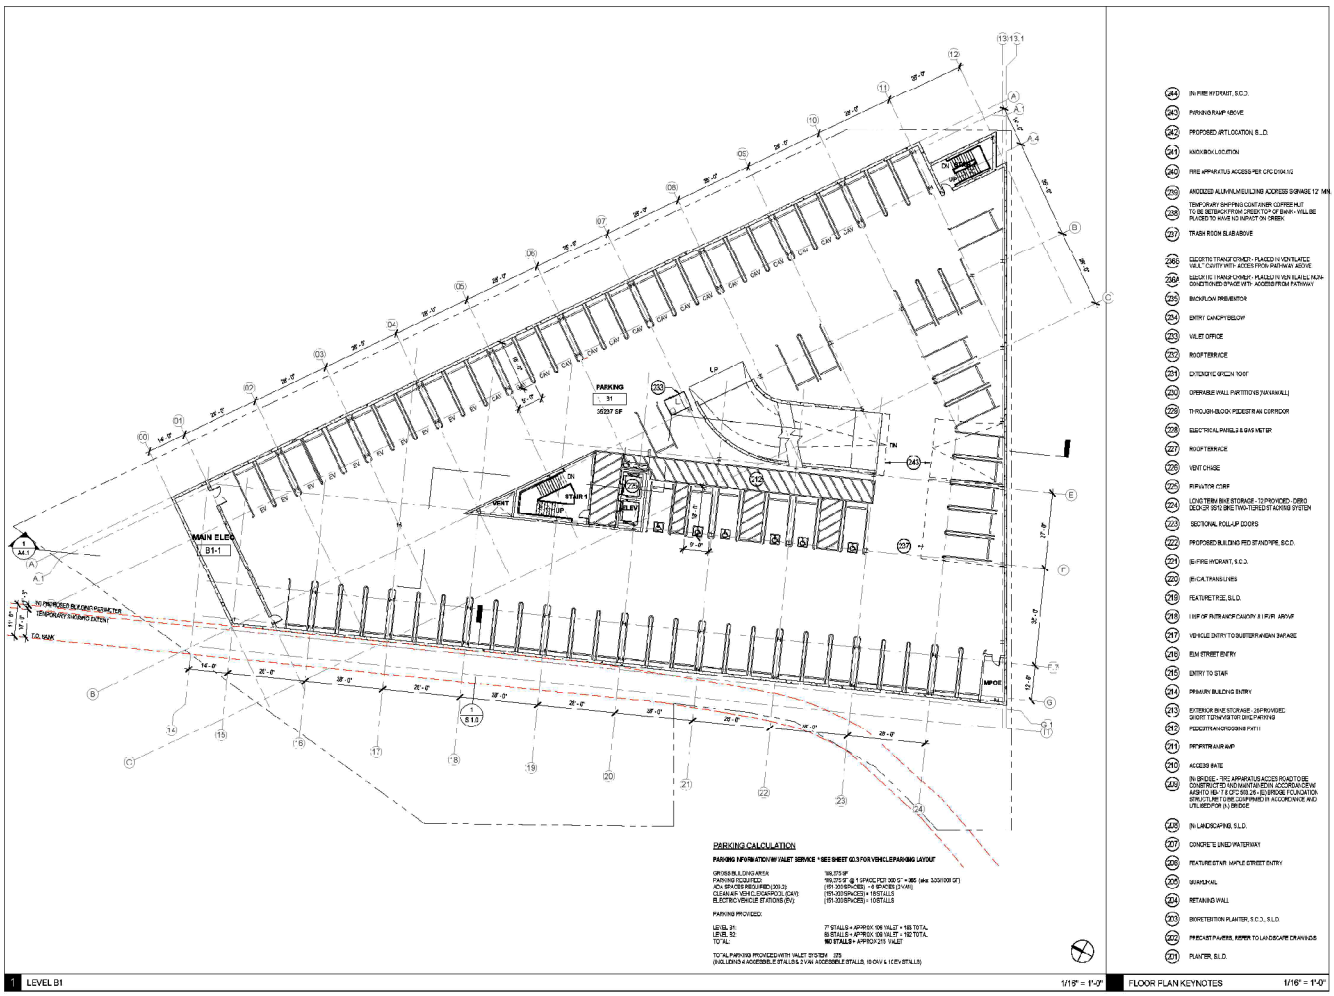
The proposed bridge would be designed in accordance with the AASHTO standards and provide a 27-foot-wide clearance to allow Fire Apparatus Access to cross the proposed bridge and access the office building's main entrance. A designated fire access zone would be provided on the south side of the project site along Elm Street.

2.2.5 Utility Infrastructure

A Preliminary Engineering Study has been prepared by BKF Engineers to evaluate the preliminary utility, grading, and stormwater design of the proposed project. The preliminary study found that the existing public infrastructure is adequate to serve the proposed project (BKF Engineers 2019). The results of the Preliminary Engineering Study are summarized in the following subsections and the full report is provided in Appendix A.

Water

Domestic Water



Approximately 250 gallons of water per day (gpd) is currently provided to the project site by an existing 4-inch water main in Elm Street and an 8-inch water main in Maple Street. However, the existing 4-inch water main in Elm Street does not currently meet the City's minimum size requirements for providing domestic water. Therefore, the proposed project is proposing to abandon the existing 4-inch water main in Elm Street and replace it with a new 8-inch water main to serve the proposed project. It is expected the proposed project's water demand would be 14,737 gpd resulting in a net increase of 14,487 gpd (14,737 gpd minus 250 gpd) (BKF Engineers 2019).

Recycled Water

In accordance with Municipal Code Chapter 38, Article VIII (Recycled Water Use), the proposed project would be required to use recycled water for landscape irrigation and building plumbing. The proposed project would comply with this ordinance by providing dual plumbing system for toilets, trap primers, and landscaping. However, infrastructure to provide recycled water at the project site has not yet been extended to this portion of the City. Therefore, the proposed project's plumbing and landscaping irrigation systems would not be connected to the City's domestic water system until recycled water is available (BKF Engineers 2019).

Title
Preliminary Parking Plan - B2 Floor Plan

This page left intentionally blank.

Fire Water Hydrants

There is one existing fire water hydrant located along the project frontage on Lathrop Street, and three existing fire water hydrants on opposing frontages on Elm Street and Maple Street. The proposed project would install two new fire hydrants--one on Elm Street and one on Maple Street—and a new wharf hydrant along the northern side of the office building.

Wastewater

The average daily flow of wastewater at the project site is currently 268 gpd. The project site is served by three existing sewer laterals that are connected to a 8-inch sanitary sewer main in Elm Street and a 10-inch sanitary sewer main in Maple Street (BKF Engineers 2019). The proposed project would remove the existing sanitary sewer laterals and connect a new sanitary sewer lateral to the 8-inch sanitary sewer main in Elm Street, which conveys sewer flows to the 6-inch sanitary sewer main in Lathrop Street and eventually to the 10-inch sanitary sewer main in Maple Street. It is expected the proposed project would generate an average daily flow of 14,006 gpd and resulting in a net increase of 13,738 gpd (14,006 gpd minus 268 gpd) (BKF Engineers 2019). The applicant would be required to pay a sewer impact fee toward the City's Capital Improvements Projects.

Stormwater Treatment

The proposed stormwater management treatment strategy includes using a flowthrough planter along the Caltrain side of the proposed building to treat runoff collected from the building roof. A second flow-through planter would be provided adjacent to the stair terrace at Maple Street to treat runoff from the stair and terrace area. The proposed bridge area and pathway connection to Lathrop Street would be directed to adjacent landscape areas and would be considered self-retaining areas. For storms larger than the treatment storm, stormwater would flow through the media filter vault, bypassing the filter cartridges, and into Redwood Creek.

Stormwater runoff at the project site is collected by a 12-inch outfall that releases to the on-site concrete drainage channel. The proposed project would involve the removal of approximately 7,623 square feet of impervious surface consisting of the existing commercial building and the concrete foundation. These impervious surfaces would be replaced following completion of the proposed project, which would include approximately 48,646 square feet of impervious surface. The proposed project would install a new 12-inch stormwater drain line and connect it to the existing 12-inch outfall that drains to the concrete drainage channel. In addition, to meet the C.3 requirements of the San Mateo County Municipal Regional Permit, the proposed project would incorporate traditional low impact development treatment measures such as flow-through planter boxes along the northeastern and northwestern sides of the project site, and self-retained landscaped areas.

The NPDES permit also includes section C.3j (Green Infrastructure Planning and Implementation) which includes requirements for early implementation of green infrastructure projects or "no missed opportunities." With the alterations to the project frontages on Elm Street and Lathrop Street, it was determined that there was an opportunity to include green infrastructure for the treatment of the right-of-way runoff tributary to the frontages. The frontages were designed to direct the runoff to treatment facilities, which were sized based on the sizing criteria of Provision C.3.d of the NPDES permit.

Electricity and Gas

Pacific Gas and Electric Company (PG&E) provides electricity and natural gas service to the project site. The proposed project would install a new underground joint trench in Elm Street to connect to the existing overhead electric, communication, and phone lines along Lathrop Street and the existing gas line in Elm Street.

2.3 PROJECT CONSTRUCTION

2.3.1 Construction Schedule

It is anticipated construction of the proposed project would start May 2019 with the demolition of the existing on-site structures and the construction of the underground parking area. The proposed project would be constructed over 23 months with full buildout of the proposed project completed by March 2021. Construction of the proposed project would include the following three phases:

- Phase 1 – Demolition of existing building and concrete foundation (approximately 1 month)
- Phase 2 – Shoring/mass excavation for underground parking garage (approximately 3 months)
- Phase 3 – Construction of proposed office building and on and off-site improvements (approximately 19 months)

The proposed project would temporarily require up to 100 construction workers during the peak construction phase. It is anticipated that the construction workforce would be available from nearby areas. Project construction and grading activities would be consistent with Section 9.50 of the Redwood City Municipal Code and would occur between 7:00 a.m. and 8:00 p.m., Monday through Friday. Project construction and grading activities would not occur on Saturdays, Sundays, or holidays unless a special work permit is acquired from the Building Division.

2.3.2 Construction Equipment and Staging

The proposed project would require the use of heavy equipment at various stages of construction such as excavation and concrete installation. The largest pieces of equipment anticipated on-site would include rubber-tired dozers, tractors/loaders/backhoes, graders, scrapers, excavators, cranes, and forklifts. Project construction equipment and materials would be staged on-site and potentially off-site in the paved 0.18-acre parking lot across from the project site at the intersection of Maple Street and Lathrop Street. All construction staging activities would be required to stay outside of the concrete drainage channel's zone of influence which the City would confirm during the building permit plan check.

Construction Activities

Construction of the proposed project would require demolition of the vacant one-story commercial building in the southeast corner of the project site and the removal of on-site vegetation and impervious surfaces. Construction activities would involve grading of the entire project site and the permanent disturbance of the 1.31-acre site. The project site would be excavated approximately 25 feet below grade and approximately 35,000 cubic yards of soil (4,375 truck trips) would be exported from the site for construction of the two-level underground parking garage. Exported soil would be disposed off-site at a location determined by the project construction contractor during construction.

3.0 ENVIRONMENTAL CHECKLIST AND ENVIRONMENTAL EVALUATION

The environmental factors checked below would be potentially affected by this project, involving at least one impact that requires mitigation to reduce the impact from "Potentially Significant" to "Less Than Significant" as indicated by the checklist on the following pages.

☐ Aesthetics	☐ Agriculture Resources	☒ Air Quality
☒ Biological Resources	☒ Cultural Resources	☒ Geology/Soils
☐ Greenhouse Gas Emissions	☐ Hazards/Hazardous Materials	☒ Hydrology/Water Quality
☐ Land Use/Planning	☐ Mineral Resources	☒ Noise
☐ Population/Housing	☐ Public Services	☐ Recreation
☒ Transportation/Traffic	☐ Mineral Resources	☐ Utilities/ Service Systems
☒ Mandatory Findings of Significance	☒ Tribal Cultural Resources	

Evaluation of Environmental Impacts

Section 3.0, Environmental Checklist and Environmental Evaluation presents the environmental checklist form found in Appendix G of the CEQA Guidelines. The checklist form is used to describe the impacts of the proposed project. A discussion follows each environmental issue identified in the checklist. Included in each discussion are project-specific mitigation measures recommended as appropriate. For this checklist, the following designations are used:

Potentially Significant Impact: An impact that could be significant and for which mitigation has not been identified. If any potentially significant impacts are identified, an EIR must be prepared instead of an ISMND.

Less Than Significant with Mitigation Incorporated: This designation applies when applicable and feasible mitigation measures previously identified in prior applicable EIRs or in the General Plan EIR have reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact" and, pursuant to Section 21155.2 of the PRC, those measures are incorporated into the ISMND. This designation also applies when the incorporation of new project-specific mitigation measures not previously identified in prior applicable EIRs or in the General Plan EIR has reduced an effect from a "Potentially Significant Impact" to a "Less Than Significant Impact."

Less Than Significant Impact: Any impact that would not be considered significant under CEQA, relative to existing standards.

No Impact: The proposed project would not have any impact. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a Lead Agency cites following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project would not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

This page left intentionally blank.

3.1 AESTHETICS

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☒	☐
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?	☐	☐	☐	☒
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	☐	☐	☒	☐
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☒	☐

3.1.1 Environmental Setting

Visual Character of the Project Site

The project site is in an area of the City that is developed with a mix of building types, including older one-story commercial buildings and more recent four-story apartment complexes. The commercial buildings on smaller developed parcels have minimal architectural detail, ground-level parking, and minimal landscaping. The residential buildings on Maple Street have stucco and concrete tile roofs, typical of modern apartment complexes. The streetscapes are lined with overhead power lines, broken and narrow sidewalks, and minimal to no landscaping. The Caltrain corridor tracks north of the project site and concrete drainage channel that extends across the western portion of the project site are other manmade visual elements in the project area.

Scenic Resources and Scenic View Corridors

Scenic vistas are in the southern and western portions of the City within the elevated hillside neighborhoods. (Redwood City 2010a). Public views of scenic resources from the project site are limited to distant views of the Santa Cruz Mountains to the south/southwest. The General Plan identifies El Camino Real, Woodside Road, and Middlefield Road street corridors with the most visible pathways in the City. None of these corridors are connected to the project site physically or visually. The nearest officially designated state scenic highway, Interstate 280 (I-280), is approximately 3.5 miles southwest of the project site (DOT 2019).

Light and Glare Conditions

No substantial light and glare sources exist on-site. The existing one-story commercial building is vacant and does not generate any light or glare. Nighttime lighting immediately surrounding the project site is limited to security lighting as majority of the businesses are auto related and closed in the evening. The multi-family apartment complex to the west and the Caltrain corridor to the north are other sources that generate some night lighting. There are no electrical signs, billboards, or flashing or oscillating light sources in the project area.

3.1.2 Methodology

Analysis of the proposed project's visual impacts is based on an evaluation of the changes to the existing visual resources that would result from implementation of the proposed project. In determining the extent and implications of the visual changes, consideration was given to: the existing visual quality of the affected environment; specific changes in the visual character and quality of the affected environment; the extent to which the affected environment contains places or features that provide unique visual experiences or that have been designated in plans and policies for protection or special consideration; and the sensitivity of viewers and their activities and the extent to which these activities are related to the aesthetic qualities affected by the proposed project.

3.1.3 Environmental Impact Analysis

This section discusses potential impacts on aesthetics associated with the proposed project and provides mitigation measures where necessary.

Impact AES-1 Have a substantial adverse effect on a scenic vista?

Impact Analysis

A scenic vista is defined in this analysis as a viewpoint designated by a local, state, or federal entity that provides a rare, unique, or in other ways special viewpoint for the benefit of the general public. The General Plan EIR indicates that the City's scenic resources include the San Francisco Bay and its associated baylands, slough, and marshes, the views of which are available primarily from four points in the western hills of the City—Easter Cross, Easter Bowl, Cañada College, and Edgewood County Park (Redwood City 2010b). These viewing points are located over 3.5 miles to the southwest and west of the project site, and the project site is not visibly recognizable from these public viewpoints. The proposed project would not significantly alter this viewshed as these views would continue to be available. The proposed project would appear as part of the existing urban setting and would be consistent with existing land uses. Therefore, the proposed project would not have a substantial adverse effect on a scenic vista and impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact AES-2 Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway?

Impact Analysis

The nearest officially designated state scenic highway, I-280, is approximately 3.5 miles southwest of the project site and is not visible from the project area. Furthermore, the project site is minimally developed with a concrete foundation and a vacant one-story commercial building and does not contain vegetation, rock outcroppings, or historic buildings other than four small trees. As such, the proposed project would have no impact on scenic resources within a state scenic highway.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact AES-3 Substantially degrade the existing visual character or quality of the site and its surroundings?

Impact Analysis

The proposed project would demolish existing on-site structures and develop a three-story commercial office building, café, bridge crossing, and publicly accessible park space. Figure 2.0-7 through Figure 2.0-12 show the building elevations. The office building would have a modern industrial architectural style with a sawtooth roof and exposed industrial interior. Building materials would include a mix of brick, metal, concrete, and glass. The stacked shipping container café would be painted in a complementary color scheme as the office building. The proposed project would be required to comply with the development standards of the Mixed-Use Live/Work zoning district, including the Façade Composition and Architectural Regulations as discussed in Section 55.8 of the Redwood City Zoning Ordinance (Redwood City 2018a). In addition, the proposed project would be required to obtain an Architectural Permit pursuant to Article 45 of the Redwood City Zoning Ordinance to ensure the design and appearance of the proposed project conforms to the general character of other structures surrounding the project site (Redwood City 2018a).

The project site is within the Mixed-Use Live/Work zoning district, which has a maximum height of 40 feet (Zoning Code Section 55.7). The office building would be 40 feet in height and the café would be 16 feet to 18 feet in height, neither of which would exceed the allowed standards. While most of the surrounding structures are one-story, the multi-family residential development west of the project site is four stories. Therefore, the proposed project would be visually compatible with the surrounding development.

The proposed project would also provide landscaping, as described in Section 2.0, Project Description, to create an inviting public space and walkable environment. In addition, the proposed project would either provide publicly accessible artwork at the corner of Lathrop Street and Elm Street and near the bridge entrance at Maple Street and Lathrop Street, or the applicant would pay an additional in-lieu fee to the City's Art in Public Places Fund. Public art selected for the proposed project would be required to comply with the standards outlined in Section 45 of the

Redwood City Municipal Code. The City's Civic Cultural Commission would review the proposed public art to determine that it is placed in an appropriate location, proportional in scale of the development, and compatible with the immediate environment of the site in terms of materials, colors, and design.

The proposed project would alter the existing visual character of the project site by developing the primarily undeveloped parcel into an office space that would provide both live and work opportunities. The proposed project would be subject to City review to ensure high-quality design and construction, and that the visual change would not be considered an adverse change. Therefore, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact AES-4 Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

Impact Analysis

The project site does not contain any substantial light sources. The nighttime lighting sources include security lighting from the adjacent commercial and residential buildings, sporadic light from Caltrain operations and other vehicles. However, the project site and the surrounding area are classified as urban, which is an environment more susceptible to impacts of spill lighting. The proposed project would likely increase the number of and intensity of lighting in the project site. The proposed project would include exterior lighting to illuminate the building entrances, pathways, landscaping, publicly accessible park space, and underground parking garage for on-site safety and security. Additionally, the proposed project would install seven street lights in between new street trees planted along the frontages of Elm Street and Maple Street. The street lights would be consistent with existing street lights (or equivalent as determined by the Planning Manager), which consists of the City's "Twin Head Acorn light model" and are approximately 12 feet tall. All exterior lighting would be compliant with Title 24 Cal Green Requirements. The City's lighting standards require non-residential uses to be appropriately located and designed to shield residential uses in the development and adjacent areas (Zoning Ordinance Section 53.3). As such, impacts related to light and glare would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.2 AGRICULTURE AND FORESTRY RESOURCES

	Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
e)	Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☒
f)	Conflict with existing zoning for agricultural use or a Williamson Act contract?	☐	☐	☐	☒
g)	Conflict with existing zoning for, or cause rezoning of, forestland (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	☐	☐	☐	☒
h)	Result in the loss of forestland or conversion of forestland to non-forest use?	☐	☐	☐	☒
i)	Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forestland to non-forest use?	☐	☐	☐	☒

3.2.1 Environmental Setting

The California Department of Conservation (DOC) administers the Farmland Mapping and Monitoring Program (FMMP), California's statewide agricultural land inventory. Within the General Plan area lands are designated by the FMMP as "Urban and Built- Up Land" or "Other Land," which is defined as non-agricultural land surrounded by urban development (DOC 2016). There are no areas of Prime Farmland, Unique Farmland, or Farmland of Statewide or Local Importance within the City or the plan area boundaries (Redwood City 2010a).

3.2.2 Methodology

The following analysis is based on a review of documents pertaining to the project site, including the General Plan, General Plan EIR, and the DOC Important Farmland map.

3.2.3 Environmental Impact Analysis

This section discusses potential impacts on agriculture and forestry resources associated with the proposed project and provides mitigation measures where necessary.

Impact AG-1	**Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?**

Impact Analysis

According to the City's Zoning Map, the project site is zoned Mixed-Use Live/Work. Agricultural land uses are not allowed in this zoning designation and the proposed project would not result in zoning changes that would allow for agricultural land use. As such, the proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to a non-agricultural use and no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact AG-2	**Conflict with existing zoning for agricultural use or a Williamson Act contract?**

Impact Analysis

The project site is not enrolled in a Williamson Act contract and is not designated or zoned for agricultural use (Redwood City 2010a). Therefore, the proposed project would not conflict with existing zoning or with a Williamson Act contract. No impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact AG-3	**Conflict with existing zoning for, or cause rezoning of, forestland (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?**

Impact Analysis

The project site does not contain forestland (as defined in PRC Section 12220[g]), or timberland (as defined by PRC Section 4526). Furthermore, the project site is not zoned Timberland Production (as defined by Government Code section 51104[g]). The project site is zoned Mixed Use Live/Work and would not be rezoned to allow forestland or

timberland production. As such, the proposed project would not convert forestland or timberland to a non-agricultural use and no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact AG-4 Result in the loss of forestland or conversion of forestland to non-forest use?

Impact Analysis

There are no forestlands on or adjoining the project site, or within the general vicinity of the project site. As such, the proposed project would not result in the loss of forestland or the conversion of forestland to non-forest use. No impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact AG-5 Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forestland to non-forest use?

Impact Analysis

The project site does not contain lands with Prime Farmland, Unique Farmland, Farmland of State Importance, or Farmland of Local Importance, and is not enrolled in a Williamson Act contract. The project site is not zoned for forestland or timberland production and would not be rezoned for agricultural use. Therefore, the proposed project would not result in the conversion of farmland or forestland to a non-agricultural use. No impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.3 AIR QUALITY

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☒	☐	☐
b) Violate any air quality standard or contribute to an existing or projected air quality violation?	☐	☒	☐	☐
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☐	☒	☐	☐
d) Expose Sensitive Receptors to substantial pollutant concentrations?	☐	☒	☐	☐
e) Create objectionable odors affecting a substantial number of people?	☐	☐	☒	☐

3.3.1 Environmental Setting

Redwood City is in San Mateo County, which is within the boundaries of the San Francisco Bay Area Air Basin (Air Basin) and under the jurisdiction of the Bay Area Air Quality Management District (BAAQMD) and the California Air Resources Board (CARB). The regional climate within the San Francisco Bay Area is driven by a summertime high-pressure cell centered over the northeastern Pacific Ocean that dominates the summer climate of the West Coast. The persistence of this high-pressure cell generally results in negligible precipitation during the summer and meteorological conditions are typically stable with a steady northwesterly wind flow. This flow causes upwelling of cold ocean water from below the surface, which produces a band of cold water off the California coast. The cool and moisture-laden air approaching the coast from the Pacific Ocean is further cooled by the presence of the cold-water band, resulting in condensation and the presence of fog and stratus clouds along the Northern California coast. In the winter, the Pacific high-pressure cell weakens and shifts to the south, resulting in wind flows offshore, the absence of upwelling, and an increase in the occurrence of storms. Winter stagnation episodes are characterized by nocturnal drainage wind flows in coastal valleys. Drainage is a reversal of the usual daytime air-flow patterns; air moves from the Central Valley toward the coast and back down toward the Bay from the smaller valleys within the Air Basin.

3.3.2 Methodology

Construction and operational emissions for the proposed project were modeled using the California Emissions Estimator Model (CalEEMod) version 2016.3.2. For detailed information on the assumptions please refer to Appendix B.

3.3.3 Environmental Impact Analysis

This section discusses potential impacts on air quality associated with the proposed project and provides mitigation measures where necessary.

Impact AIR-1 Conflict with or obstruct implementation of the applicable air quality plan?

Impact Analysis

The BAAQMD 2017 Clean Air Plan is the regional air quality plan (AQP) for the Air Basin. It identifies strategies to bring regional emissions into compliance with federal and state air quality standards. The BAAQMD Guidance provides two criteria for determining if a plan-level project is consistent with the current AQP control measures. However, the BAAQMD does not provide a threshold of significance for project-level consistency analysis. Therefore, the following criteria is used for determining a project's consistency with the AQP.

- Criterion 1: Does the project support the primary goals of the AQP?
- Criterion 2: Does the project include applicable control measures from the AQP?
- Criterion 3: Does the project disrupt or hinder implementation of any AQP control measures?

Criterion 1

The primary goals of the 2017 Clean Air Plan, the current AQP, are to:

- Protect public health through the attainment air quality standards; and
- Protect the climate

As discussed in impact discussions AIR-2, AIR-3, AIR-4, AIR-5, the proposed project would not create a localized violation of state or federal air quality standards, significantly contribute to cumulative nonattainment pollutant violations, expose sensitive receptors to substantial pollutant concentrations, or create objectionable odors affecting a substantial number of people after implementation of Mitigation Measure AIR-1 and Mitigation Measure AIR-2. Therefore, the proposed project is consistent with criterion 1 with incorporation of Mitigation Measure AIR-1, which would require all construction contractors to implement the basic construction mitigation measures recommended by the BAAQMD to reduce fugitive dust emissions and Mitigation Measure AIR-2, which would require Tier 4 emission standards for much of the off-road construction equipment.

Criterion 2

The 2017 Clean Air Plan contains 85 control measures aimed at reducing air and climate pollutants in the Bay Area. For purposes of consistency with climate planning efforts at the state level, the control strategy in the Clean Air Plan is based upon the same economic sector framework used by the CARB for its Climate Change Scoping Plans. The sectors are as follows:

- Stationary Sources
- Transportation
- Energy
- Buildings
- Agriculture
- Natural and Working Lands
- Waste Management
- Water
- Super greenhouse gases (GHGs) Pollutants

Of the 85 measures aimed at reducing air and climate pollutants, only the transportation control measure TR2 Trip Reduction Program would apply to any future land use at the project site that has more than 50 employees

The applicant would be required to conform to the energy efficiency requirements of the California Building Standards Code, also known as Title 24. Specifically, the proposed project must implement the requirements of the most recent Building Energy Efficiency Standards, which is the current version of Title 24.

In summary, the proposed project would comply with all applicable rules and regulations and the project would not impede attainment because its emissions fall below the BAAQMD regional significance thresholds. Table 3.3-1, Table 3.3-2, and Table 3.3-3 show that the proposed project does not exceed the BAAMQD thresholds of significance for construction, daily operations, and annual operations respectively.

Criterion 3

If the approval of a project would not cause a disruption, delay, or otherwise hinder the implementation of any clean air plan control measure, it would be considered consistent with the 2017 Clean Air Plan. Examples of how a project may cause the disruption or delay of control measures include a project that precludes an extension of a transit line or bike path or proposes excessive parking beyond parking requirements. The proposed project would not preclude extension of a transit line or bike path, propose excessive parking beyond parking requirements, or otherwise create an impediment or disruption to implementation of any AQP control measures.

Conclusion

The proposed project would be consistent with the criteria of the AQP with incorporation of Mitigation Measure AIR-1 and Mitigation Measure AIR-2. As such, with the incorporation of these mitigation measures, this impact would be less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM AIR-1 **Implement Construction Best Management Practices.** The applicant shall require all construction contractors to implement the basic construction mitigation measures recommended by the BAAQMD to reduce fugitive dust emissions. Emission reduction measures shall include, at a minimum, the following measures. Additional measures may be identified by the BAAQMD or contractor as appropriate:

a) all exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered two times per day;
b) all haul trucks transporting soil, sand, or other loose material off-site shall be covered;
c) all visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. The use of dry power sweeping is prohibited;
d) all vehicle speeds on unpaved roads shall be limited to 15 miles per hour;
e) all roadways, driveways, and sidewalks to be paved shall be completed as soon as possible. Building pads will be laid as soon as possible after grading unless seeding or soil binders are used; and
f) idling times shall be minimized either by shutting equipment off when not in use or by reducing the maximum idling time to 5 minutes (as required by the California Airborne

Toxics Control Measure Title 13, Section 2485 of CCR. Clear signage shall be provided for construction workers at all access points.

g) all construction equipment shall be maintained and properly tuned in accordance with manufacturer's specifications. All equipment shall be checked by a certified visible emissions evaluator.

h) a publicly visible sign shall be posted with the telephone number and person to contact at the City regarding dust complaints. This person shall respond and take corrective action within 48 hours. The BAAQMD phone number shall also be visible to ensure compliance with applicable regulations.

MM AIR-2 **Implement Construction Emissions Reductions.** The applicant shall require the following construction equipment to meet CARB Tier 4 emission standards: Cranes, Excavators, Forklifts, Generator Sets, Graders, Rubber Tired Dozers, Tractors/Loaders/Backhoes, Trenchers, and Welders.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact AIR-2 Violate any air quality standard or contribute to an existing or projected air quality violation?

Impact Analysis

This impact relates to localized criteria pollutant impacts. Potential localized impacts would be exceedances of state or federal standards for particulate matter (PM_{10}), or carbon monoxide (CO). PM_{10} are of concern during construction because of the potential temit fugitive dust during earth-disturbing activities (construction fugitive dust). CO emissions are of concern during project operation because operational CO hotspots are related to increases in on-road vehicle congestion. Each pollutant is discussed separately below.

Construction Fugitive Dust

During construction (grading), fugitive dust (PM_{10}) would be generated from site grading and other earth-moving activities. Most of this fugitive dust would remain localized and be deposited near the project site.

The BAAQMD does not have a quantitative threshold for fugitive dust. The BAAQMD Air Quality Guidelines recommend that projects determine the significance for fugitive dust through application of best management practices (BMPs). Mitigation Measure AIR-1 requires the implementation of fugitive dust control measures that are consistent with BMPs established by the BAAQMD, which reduce the proposed project's construction-generated fugitive dust impacts to a less than significant level.

Operational CO Hotspot

Localized high levels of CO (CO hotspot) are associated with traffic congestion and idling or slow-moving vehicles. The BAAQMD recommends a screening analysis to determine if a project has the potential to contribute to a CO hotspot. The screening criteria identify when site-specific CO dispersion modeling is necessary. The proposed project

would result in a less than significant impact to air quality for local CO if the following screening criteria are met:

- The project is consistent with an applicable congestion management program established by the county congestion management agency for designated roads or highways, regional transportation plan, and local congestion management agency plans; or
- The project traffic would not increase traffic volumes at affected intersections to more than 44,000 vehicles per hour; or
- The project traffic would not increase traffic volumes at affected intersections to more than 24,000 vehicles per hour where vertical and/or horizontal mixing is substantially limited (e.g., tunnel, parking garage, bridge underpass, natural or urban street canyon, below-grade roadway).

A review of the 2017 Congestion Management Program for San Mateo County indicates that the proposed project is consistent with the applicable congestion management plan. According to the Traffic Impact Study prepared for the project by Kimley-Horn, the proposed project would generate approximately 105 new net trips during the a.m. peak hour and 97 new net trips during the p.m. peak hour and would not substantially increase traffic volumes on nearby roadways above 44,000 vehicles per hour. Furthermore, the adjacent roadways are not located in an area where vertical and/or horizontal mixing, or the free movement of the air mass, is substantially limited by physical barriers such as bridge overpasses or urban or natural canyon walls. Therefore, the proposed project would not significantly contribute to an existing or projected CO hotspot. Impacts are less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure AIR-1 is required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact AIR-3	**Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?**

Impact Analysis

In developing thresholds of significance for air pollutants, the BAAQMD considered the emission levels for which a project's individual emissions would be cumulatively considerable. If a project exceeds the identified significance thresholds, its emissions would be cumulatively considerable, resulting in significant adverse air quality impacts to the region's existing air quality conditions. Project construction and operational impacts are assessed separately below.

Construction Emission

Emissions from construction-related activities are generally short-term in duration but may still cause adverse air quality impacts. The proposed project would generate emissions from construction equipment exhaust, worker travel, and fugitive dust. These construction emissions include criteria air pollutants from the operation of heavy construction equipment.

As discussed in the Project Description, the proposed project would be constructed over 23 months with full buildout

completed by March 2021. Construction would include the following phases:

- Phase 1 – Demolition of existing building and concrete foundation (approximately 1 month)
- Phase 2 – Shoring/mass excavation for underground parking garage (approximately 3 months)
- Phase 3 – Construction of proposed office building and on- and off-site improvements (approximately 19 months)

The construction schedule utilized in the analysis represents a "worst-case" analysis scenario since emission factors for construction equipment decrease as the analysis year increases, due to improvements in technology and more stringent regulatory requirements. Therefore, construction emissions would decrease if the construction schedule moves to later years. The duration of construction activity and associated equipment represent a reasonable approximation of the expected construction fleet as required pursuant to CEQA guidelines.

Table 3.3-1 provides the construction emissions estimated for the proposed project. The construction emissions in each year are well below the recommended thresholds of significance. The proposed project would implement Mitigation Measure AIR-1 as recommended by the BAAQMD and Mitigation Measure AIR-2. The emissions from construction would be less than significant.

Table 3.3-1. Annual Construction Emissions

Year	Units	ROG	NOx	PM_{10}	$PM_{2.5}$

Source: CalEEMod Output (Appendix B)

Operational Emissions

As presented in Table 3.3-1, the pollutants of concern include ROG, NOx, PM_{10}, and $PM_{2.5}$. The BAAQMD Criteria Air Pollutant Significance thresholds were used to determine impacts.

Operational emissions would occur over the lifetime of the proposed project and would be from two main sources: area sources and motor vehicles, or mobile sources. It was assumed that the entire proposed project would be operational in 2021 to provide a conservative estimate of operational emissions. If a later buildout year were used,

the emissions would be lower due to cleaner vehicles from increasing regulations. Therefore, using an earlier year to consider full buildout of the proposed project would provide a worst-case scenario of emissions. The operational emissions were modeled for summer and winter seasons. The results for winter were the highest and are presented in Table 3.3-2. The unmitigated daily operational emissions would be less than significant.

Table 3.3-2. Daily Operational Emissions

Emissions Source	Pounds per Day			
	ROG	NO_x	PM_{10}	$PM_{2.5}$
Area	2.34	<0.01	<0.01	<0.01

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure AIR-2 is required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact AIR-4 Expose sensitive receptors to substantial pollutant concentrations?

Impact Analysis

This discussion addresses whether the proposed project would expose sensitive receptors to construction-generated fugitive dust (PM_{10}), naturally occurring asbestos (NOA), construction-generated diesel particulate matter (DPM), operational related toxic air contaminants (TACs), or operational CO hotspots. Some land uses are considered more sensitive to air pollution than others due to the types of population groups or activities involved. Heightened sensitivity may be caused by health problems, proximity to the emissions source, and/or duration of exposure to air pollutants. Children, pregnant women, the elderly, and those with existing health problems are especially vulnerable to the effects of air pollution. Accordingly, land uses that are typically considered to be sensitive receptors include residences, schools, childcare centers, playgrounds, retirement homes, convalescent homes, hospitals, and medical clinics. The project site itself is not considered a sensitive receptor.

The nearest existing sensitive receptors are the residential homes located across the Caltrain tracks off Pennsylvania Avenue (approximately 200 feet away).

Construction Emissions

Fugitive Dust PM_{10}

As discussed in Impact AIR-2, fugitive dust (PM_{10}) would be generated from site grading and other earth-moving activities. Most of this fugitive dust would remain localized and would be deposited near the project site. However, the potential for impacts from fugitive dust exists unless control measures are implemented to reduce the emissions from the project site. The proposed project would implement Mitigation Measure AIR-1 requiring fugitive dust control measures that are consistent with BMPs established by the BAAQMD, to reduce the project's construction-generated fugitive dust impacts to a less than significant level.

Naturally Occurring Asbestos

Construction in areas of rock formations that contain naturally occurring asbestos could release asbestos in to the air and pose a health hazard. BAAQMD enforces CARB's ATCMs at sites that contain ultramafic rock. The ATCM for Construction, Grading, Quarrying and Surface Mining Operations were signed into state law on July 22, 2002, and became effective in the Air Basin in November 2002. The purpose of this regulation is to reduce public exposure to

naturally occurring asbestos. A review of the map with areas more likely to have rock formations containing naturally occurring asbestos in California indicates that there is no asbestos in the immediate project area (USGS 2011). Therefore, it can be reasonably concluded that the proposed project would not expose sensitive receptors to naturally occurring asbestos. Impacts would be less than significant.

Diesel Particulate Matter (DPM)

Construction activities have the potential to generate DPM emissions related to the number and types of equipment typically associated with construction. Off-road, heavy-duty diesel equipment used for site grading, paving, and other construction activities result in the generation of DPM. The project site is in an urban area and within 100 feet from existing residential uses that could be exposed to diesel emission exhaust during the construction period. To estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust (including DPM), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (e.g., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using CARB exposure methodology with the air dispersion modeling performed using the United States Environmental Protection Agency (EPA) dispersion model AERMOD. The model provides a detailed estimate of exhaust concentrations based on-site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data from the San Carlos Airport. Results of the analysis are shown in Table 3.3-4 (Unmitigated) and Table 3.3-5 (Mitigated) and indicate construction of the proposed project would not expose nearby sensitive receptors to substantial pollutant concentrations. Therefore, with the implementation of Mitigation Measure AIR-2, impacts would be less than significant.

Table 3.3-4. Unmitigated Health Risks from Project Construction to Off-Site Receptors

	Carcinogenic Inhalation Health Risk in One Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index	Annual $PM_{2.5}$ Concentration (µg/m3)
Maximum Exposed Individual Location (Residential)	105	7.99E-02	0.0	0.38
Maximum Exposed Individual Location (Worksite)	4.76	1.80E-01	0.0	
Threshold	10.0	1.0	1.0	0.30

Table 3.3-5. Mitigated Health Risks from Project Construction to Off-Site Receptors

	Carcinogenic Inhalation Health Risk in One Million	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index	Annual $PM_{2.5}$ Concentration (µg/m3)
Maximum Exposed Individual Location (Residential)	8.42	6.34E-03	0.0	0.03
Maximum Exposed Individual Location (Worksite)	0.4	1.43E-02	0.0	
Threshold	10.0	1.0	1.0	0.30

Operational Emissions

Carbon Monoxide Hotspots

Traffic congestion and idling or slow-moving vehicles could create a potential CO hotspot. As discussed in Impact AIR-2, the proposed project would generate a less than significant impact for operational CO.

Toxic Air Contaminant Emissions

Two scenarios have the potential for exposing sensitive receptors to TACs. The first is when a project includes a new or modified source of TACs and would be located near an existing or proposed sensitive receptor. The second scenario involves a residential or other sensitive receptor development locating near an existing or planned source of TACs.

For project-level analysis, BAAQMD specifies both individual and cumulative-level thresholds of significance for risks and hazards. For projects that are considered new sources of TACs or $PM_{2.5}$ (such as stationary sources, industrial sources, or roadway projects), it is generally appropriate to use both the project-level and cumulative-level thresholds because the project-level threshold identifies said project's individual contribution to risk, while the cumulative threshold assesses said project's cumulative contribution to risk.

To address potential risk and hazard impacts, a Health Risk Assessment (HRA) was conducted for the proposed project. The HRA evaluates construction period health risk to off-site receptors and stationary and mobile source emissions and their related health risk impacts for future receptor of the project. According to the BAAQMD, a project would result in a significant impact if it would individually expose sensitive receptors to TACs resulting in an increased cancer risk greater than 10.0 in 1 million, an increased non-cancer risk of greater than 1.0 on the hazard index (chronic or acute), or an annual average ambient $PM_{2.5}$ increase greater than 0.3 micrograms per liter (µg/m^3).

A significant cumulative impact would occur if the project, in combination with other projects located within a 1,000-foot radius of the project site, would expose sensitive receptors to TACs resulting in an increased cancer risk greater than 100.0 in 1 million, an increased non-cancer risk of greater than 10.0 on the hazard index (chronic), or an ambient $PM_{2.5}$ increase greater than 0.8 µg/m^3 on an annual average basis.

Stationary Sources

The stationary source analysis evaluated the risk levels from permitted sources in the project vicinity, using the toxic air contaminant emissions reported to the BAAQMD by the stationary sources identified in the project vicinity. The BAAQMD indicates five sources of emissions that are within 1,000 feet of the project site; including three gas

stations, one generator, and one auto body shop. Following BAAQMD guidance, the stationary sources were scaled for distance using the BAAQMD Diesel Internal Combustion (IC) Engine Distance Multiplier Tool. The results of the stationary source analysis are presented in Table 3.3-6. As shown in Table 3.3-6, the highest risk would be 5.37 in 1 million, which would not exceed the BAAQMD cancer risk threshold of 10.0 in 1 million. The hazard index would be 0.02, which is below the threshold of 1.0. The results of the analysis also indicate that $PM_{2.5}$ concentration would not exceed the BAAQMD significance threshold of 0.3 µg/m^3. The BAAQMD cumulative threshold of cancer risk greater than 100.0 in 1 million, an increased non-cancer risk of greater than 10.0 on the hazard index (chronic), or an ambient $PM_{2.5}$ increase greater than 0.8 µg/m^3 on an annual average basis would not be exceeded.

Table 3.3-6. Stationary Sources

Plant ID	Stationary Source	Distance (feet)	Adjusted Adult Carcinogenic Risk (in one million)	$PM_{2.5}$ (µg/m^3)	Hazard
13509	Pacific Bell	738	4.33	0.110	0.022

Maximum Single Source Risks			5.37	**0.11**	**0.02**
BAAQMD Single Source Threshold			10 in 1 million	0.30	1.000
Exceeds Threshold?			No	No	No
Total Risk			9.70	0.14	0.04
BAAQMD Cumulative Threshold			100 in 1 million	0.80	10.0
Exceeds Threshold?			No	No	No

Mobile Sources

To estimate the potential cancer risk associated with the proposed project from diesel vehicle exhaust, the BAAQMD Screening Calculator was used. The Screening calculator estimates risk for a 70-year period. Since the proposed project has a mix of offices and public area risk for both areas were estimated. This was done by calculating the percent contribution each age bin contributes to the overall 70-year risk. Table 3.3-7 below provides the contribution each age bin has to the overall risk by age bin. These percentage were then used to adjust the 70-year risk provide the screening tool.

Table 3.3-7. Percent Contribution by Age Group

	3rd Tri.	0<2 yrs	2<9 yrs	2<16 yrs	16<30 yrs	16–70 yrs
Exposure Duration (years)	0.25	2	7	14	14	54
Age Sensitivity Factor	10	10	3	3	1	1
% Contribution (70 yr)	2.11	16.88	17.72	35.44	11.81	45.57
% Contribution Worker (25 / 40 yr)					21.10	33.76

Table 3.3-8. Mobile Sources

Street Name	# of Vehicles	Distance from Site (ft)	Risk (Screening Tool) (70 yr)	Worker Adjusted Risk	PM 2.5 (ug/m3)
Maple Street	3,746	20	3.48	0.73	0.081
Beech St	3,835	359	0.6	0.13	0.013
Main St	7,143	20	3.26	0.69	0.074
El Camino Real	36,000	505	5.7	1.20	0.129

Cumulative Risks and Hazards

The cumulative analysis sums all sources of emissions in the vicinity of the project site including stationary source and mobile sources. The cumulative cancer risk, hazard index, acute index and $PM_{2.5}$ concentrations are shown in Table 3.3-9. Results of the cumulative analysis indicate the proposed project would not expose future residents of the project site to significant cumulative health risks.

Table 3.3-9. Cumulative Risk from All Sources

Source	Carcinogenic Inhalation Health Risk	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index	$PM_{2.5}$

Level of Significance Before Mitigation

Potentially Significant Impact.

Mitigation Measures

Mitigation Measure AIR-2 is required.

Level of Significance After Mitigation

Less Than Significant Impact with Mitigation.

Impact AIR-5 Create objectionable odors affecting a substantial number of people?

Impact Analysis

As stated in the BAAQMD 2017 Air Quality Guidelines, odors are generally regarded as an annoyance rather than a health hazard and the ability to detect odors varies considerably among the populations and overall is subjective.

Project Construction

Diesel exhaust and ROGs would be emitted during construction of the project, which are objectionable to some; however, emissions would disperse rapidly from the project site and, therefore, not create objectionable odors affecting a substantial number of people. As such, construction odor impacts would be less than significant.

Project Operation

Land uses typically considered associated with odors include wastewater treatment facilities, waste-disposal facilities, or agricultural operations. The proposed project does not contain land uses typically associated with emitting objectionable odors.

The potential for the proposed project to create objectionable odors affecting a substantial number of people during construction and operation would be considered less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

This page left intentionally blank.

3.4 BIOLOGICAL RESOURCES

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?	☐	☒	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations, or by the California Department of Fish or U.S. Fish and Wildlife Service?	☐	☐	☐	☒
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☒	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☒	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☒	☐
f) Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan?	☐	☐	☐	☒

3.4.1 Environmental Setting

The 1.31-acre project site is vacant, except for an existing one-story commercial building no longer in use. All parcels surrounding the project site are completely developed and include apartment buildings, houses, businesses, and parking lots. There are Catrain tracks running northwest-southeast, directly to the east of the project site. The following three habitat types exist within the project site as reported in the Biological Survey Memorandum (Appendix C).

Developed: There is one vacant one-story commercial building on the southeast corner of the project site and a concrete building foundation in the northern portion of the project site.

Wild oats grassland: The majority of the project site consists of non-native grassland plant cover. Dominant species include wild oats (*Avena* sp.), black mustard (*Brassica nigra*), fennel (*Foeniculum vulgare*), and yellow star thistle (*Centaurea solstitialis*).

Redwood Creek: There is a concrete lined portion of Redwood Creek running through the western portion of the project site. There were several inches of water in the creek at the time of the survey conducted on November 14, 2018. The canal measures approximately 25 feet between banks and is at least 10 feet deep.

The project site does not include designated critical habitat, and there is no critical habitat within 2 miles.

Wildlife Movement Corridors

The project site is highly disturbed and does not contain any trees or sensitive native vegetation or connectivity to suitable habitat that would be conducive to terrestrial wildlife movement. The project site is located within a heavily urbanized area that does not provide suitable, connected habitats to function as a wildlife corridor. The canal running through the western portion of the project site may provide a movement corridor for fish species that are not considered special-status (as defined in Section 3.4.2, below).

3.4.2 Methodology

Stantec reviewed existing information on biological resources known in the vicinity of the project site. The following sources were reviewed:

- California Department of Fish and Wildlife (CDFW) BIOS Natural Diversity Database (CNDDB) (CDFW 2018a) within 2 miles of the project site;
- CDFW RareFind 5 Natural Diversity Database (CNDDB) (CDFW 2018b) within 2 miles of the project site;
- U.S. Fish and Wildlife Service (USFWS) Information for Planning and Consultation (IPaC) (USFWS 2018); and
- California Native Plant Society (CNPS) online version of the Inventory of Rare and Endangered Plants of California (CNPS 2018) within 2 miles of the project site.

A 2-mile buffer around the project site included portions of the following U.S. Geological Survey (USGS) quadrangles: Palo Alto, Woodside, Redwood Point, and San Mateo.

Based on the results of the database queries, Stantec compiled a list of the special-status species that would be evaluated for potential to occur in the project site (Appendix C).

Additionally, a reconnaissance-level field survey was conducted by a Stantec biologist on November 14, 2018, to assess the existing habitat suitability for special-status species. The field survey was conducted within a Study Area that included the proposed project site plus a 250-foot buffer. The results of this survey are reported in the Biological Survey Memorandum (Appendix C) and is summarized below.

Special-Status Plants

Special-status plant species are defined in accordance with the CEQA Guidelines, Section 15380, and the *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2018c), and includes species that are:

- Federally or state-listed, or proposed for listing, as rare, threatened, or endangered (CDFW 2018d);
- Special Plant as defined by the CNDDB (CDFW 2018d); or

- Listed by the California Native Plant Society in the online version of its Inventory of Rare and Endangered Plants of California as California Rare Plant Rank List 1 through 4 (CNPS 2018).

The CNDDB and IPaC query returned a list of eight special-status plant species. Due to the disturbed and developed nature of the project site, and prevalence of non-native grassland habitat on the project site, there is a low or no potential for any special-status plant species to occur (Appendix C).

Special-Status Wildlife

Special-status wildlife species were defined in accordance with the CEQA Guidelines, Section 15380, and included species that are:

- Listed, proposed for listing, or candidates for listing as threatened or endangered under the federal Endangered Species Act;
- Listed or candidates for listing as threatened or endangered under the California Endangered Species Act;
- Designated as Species of Special Concern by the CDFW;
- Included on the CDFW "Special Animals" list (CDFW 2018e); or otherwise meet the definition of rare, threatened, or endangered, as described in the CEQA Guidelines, Section 15380.

The CNDDB and IPaC search performed as part of the Biological Resources Assessment returned a list of 15 special-status wildlife species. The Biological Survey Memorandum (Appendix C) analyzed the potential for these species to occur within the project site and determined that all the species have a low or no potential to occur in the project site due to lack of suitable habitat characteristics within the project site.

3.4.3 Environmental Impact Analysis

This section discusses potential impacts on biological resources associated with the proposed project and provides mitigation measures where necessary.

Impact BIO-1	**Have a substantial adverse effect, either directly or through habitat modifications on any species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?**

Impact Analysis

Special-Status Plant Species

The project site does not contain habitat suitable for special-status plants (Appendix C). Therefore, no special-status plant species would be expected to occur within the project site.

Special-Status Wildlife Species

During the biological field survey of the project site on November 14, 2018, no special-status wildlife species were observed on-site. Additionally, there is a low or no potential for special-status wildlife species to be present due to a lack of suitable habitat characteristics within the project site (Appendix C).

The project site consists of ruderal vegetation that could provide marginal potential nesting and marginal foraging habitat for nesting birds protected under the Migratory Bird Treaty Act and Sections 3503 and 3513 of the California Fish and Game Code. Potential nesting habitat is present in two of the four trees on the project site, the existing vacant commercial building, as well as throughout the project site for ground nesting species. Construction of the

proposed project has the potential to directly impact nesting birds by clearing of on-site vegetation, including the two on-site trees where potential nesting habitat is present, and removing the existing commercial building. The proposed project would also reduce the amount of on-site foraging space. However, the project site and vicinity are not prime habitat since the area contains limited nesting habitat and provides only marginal foraging habitat. However, trees on adjacent properties also provide suitable nesting habitat that may indirectly be impacted by construction noise and increased activity. Though birds nesting in the area are likely acclimated to levels of disturbance similar to the proposed project, including urban noise and human activity, given the existing urban environment, implementation of Mitigation Measure BIO-1 would reduce potential impacts to nesting birds. As such, impacts to nesting birds would be less than significant with mitigation.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM BIO-1 **Avoid Disturbance of Nesting Birds.** If project activities occur during the nesting season for native birds (February 1 to August 31), the following measures shall be implemented to avoid or minimize the potential for adverse impacts on nesting migratory birds and raptors:

A pre-construction nesting bird survey for species protected by the MBTA and California Fish and Game Code shall be conducted by a qualified biologist within a 250-foot radius of proposed construction activities for passerines and a 500-foot radius for raptors no more than two weeks prior to the start of construction activities.

If active nests are found a qualified biologist shall determine the size of the buffer based on the nesting species and its sensitivity to disturbance (e.g., a buffer measuring from 50 to 100 feet for passerine species and a buffer of 300 feet for raptor species). These buffers may be reduced at the discretion of a qualified biologist, but no construction activities shall be permitted within the buffer if they are demonstrated to disturb nesting birds. Active nest sites shall be monitored periodically to determine time of fledging.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact BIO-2	**Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?**

Impact Analysis

The project site does not contain riparian habitat or any other sensitive natural communities; therefore, there would be no impacts as a result of the proposed project. The concrete lined section of Redwood Creek running through the western portion of the project site does not contain any vegetation and would not be impacted by the proposed project. The proposed project would not impact any other sensitive natural communities as identified in local or regional plans, policies, and regulations, or by the CDFW and USFWS. Therefore, there would be no impact to sensitive natural communities as a result of the proposed project.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact BIO-3	**Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?**

Impact Analysis

A concrete lined portion of Redwood Creek flows through the western portion of the project site. The proposed project would involve the installation of a 64-foot-wide bridge over the creek using existing bridge abutments and foundation and would, therefore, not impact Redwood Creek. In addition, all construction staging activities would be required to stay outside of the concrete drainage channel's zone of influence which the city would confirm during the building permit plan check.

Construction activities would include the refueling of construction equipment and storage of hazardous materials (e.g., fuel, oil, hydraulic fluid) on location. As a result, minor fuel and oil spills may occur with a risk of larger releases. Without rapid containment and clean-up, these materials could be potentially toxic depending on the location of the spill in proximity to Redwood Creek. If any accidental spills or site erosion enter Redwood Creek, there could be adverse impacts to the aquatic environment. The proposed project would be required to implement a SWPPP and associated BMPs, per the requirements of Redwood City's Stormwater Pollution Prevention Program, to reduce potential water quality impacts. Adherence to applicable water quality regulations, preparation of a Stormwater Pollution Prevention Plan (SWPPP), and compliance with the Redwood City Municipal Code would ensure that water quality standards are not violated during construction. Therefore, potential impacts associated with water quality during construction would be less than significant

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact BIO-4 Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

Impact Analysis

Movements of wildlife generally fall into three basic categories: (a) movements along corridors or habitat linkages associated with home range activities such as foraging, territory defense, and breeding; (b) seasonal dispersal movements—typically one-way movements (e.g., juvenile animals leaving their natal areas or individuals colonizing new areas); and (c) temporal migratory movements— generally seasonal and involving a return to the place of origin (e.g., deer moving from winter grounds to summer ranges and fawning areas).

The project site contains no designated terrestrial wildlife corridors within its boundaries. The concrete lined portion of Redwood Creek within the project site may provide a suitable movement corridor for non-special-status fish species should the water levels be high enough to support fish species. However, the proposed project would not impact this water feature as the proposed bridge would be constructed using the existing abutments. In addition, all construction staging activities would be required to stay outside of the concrete drainage channel's zone of influence which the city would confirm during the building permit plan check. Furthermore, the project site is located within a heavily urbanized area, containing four small trees, and no sensitive native vegetation, or water features that would be conducive to wildlife movement. As such, the proposed project would not interfere substantially with the movement of any native resident or migratory fish, wildlife species, established native residents, migratory wildlife corridors, or impede the use of native wildlife nursery sites. Therefore, this potential impact is considered less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact BIO-5 Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Impact Analysis

Four trees within the project site would be removed as part of the proposed project. City code requires applicants to apply for a Tree Removal Permit for projects requiring removal of any trees with a single trunk of a circumference of 38 inches or more measured at any point between six inches and 36 inches above ground level (Redwood City 2018a). This would correspond to trees with a diameter of 12 inches measured at breast height (DBH). City code also requires a Tree Removal Permit should any 'heritage trees' require removal. The Park and Recreation Commission may declare any tree, regardless of size, to be a heritage tree if said tree is healthy and has adapted well to the climatic conditions of the area, if said tree is visually accessible from a public right-of-way and if the Park and Recreation Commission finds that at least one of the following conditions exist (Redwood City 2018a):

- That said tree has historical significance,
- That said tree is indigenous to the area, and/or

- That said tree is one of a group of trees and that each is dependent on the other tree for survival.

None of the four trees to be removed fit the definition of a heritage tree and only one of the trees (palm tree) is greater than 12 inches DBH. Therefore, a Tree Removal Permit from the City for the removal of this tree would be required as part of the development and impacts to trees would be a less than significant impact. Additionally, the proposed project includes plans for planting approximately 100 trees and other landscaping vegetation, which would provide a net increase of vegetation on the project site. Therefore, the proposed project would not conflict with any local policy or ordinance protecting biological resources, and it would be consistent with goals and policies outlined in the Natural Resources Element of the General Plan (Redwood City 2010a). Thus, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures

No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact BIO-6	**Conflict with the provisions of an adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or State habitat conservation plan?**

Impact Analysis

The project site is located within the PG&E Bay Area Operation and Maintenance Habitat Conservation Plan (HCP) area. However, this plan only applies to PG&E maintenance activities and would not impact the proposed project. There are no other adopted HCPs, Natural Community Conservation Plans (NCCP), nor other similar approved conservation plan within or in close proximity to the plan area. The next closest HCP to the plan area is the San Bruno Mountain HCP, located approximately 9 miles northwest of the project site. The closest NCCP to the plan area is the Santa Clara Valley NCCP, approximately 25 miles to the southeast in the Coyote Valley. Therefore, there would be no impact to any adopted conservation plans.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.5 CULTURAL RESOURCES

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Cause a substantial adverse change in the significance of a historical resource as identified in Section 15064.5?	☐	☒	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?	☐	☒	☐	☐
c) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☒	☐	☐

3.5.1 Environmental Setting

Natural Setting

Redwood City is located within California's Coastal Ranges Geomorphic Province, which consists of northwest-southeast trending mountain ranges and valleys extending from beyond the northern California border to the Transverse Ranges in Southern California. The project site, which is located southwest of US-101 and northeast of El Camino Real, is a gently sloping plain draining northeast to the tidal marsh (Redwood City 2010a).

The geology encompassing Redwood City and the project site is mainly unconsolidated sedimentary deposits underlain by sedimentary rock and Franciscan bedrock west of Alameda de las Pulgas. The City's west border is underlain by the Cretaceous age Franciscan Complex which consists mainly of greywacke sandstone, conglomerate and shale western hills and flatland deposits. The lowland deposits, which underlie most of Redwood City, consist mostly of the deposits of Holocene age alluvium (less than 11,000 years old) consisting of a mix of clay, silt, sand, and gravel. (WSA 2017:2).

Cultural Resources

The following cultural resources discussion is modified from the Cultural, Biological, and Paleontological Resources Assessment Report, 1180 Main Street Project, Redwood City, San Mateo County, California (WSA 2017), unless otherwise referenced. Additional information regarding cultural resources can be found in the Cultural Resources Inventory and Evaluation Report (Appendix D) prepared for this document.

Prehistoric Background

The project site is in an area that was environmentally favorable for aboriginal use. In the precontact era, Native Americans often set up camp or a village near a freshwater source on the Bay margins. The resources of the San Francisco bayshore (e.g., shellfish, fish, waterfowl, tule) and the foothills (e.g., acorns seed, game, stone) would have been easily exploited, while nearby Redwood Creek would have provided a year-round source of water and riparian resources.

Ethnographic Background

The aboriginal inhabitants of the region belonged to a group known as the Costanoans (from the Spanish *Costanos* or "coastal people") who occupied the area from the central California coast inland to the approximate boundary of the Mount Diablo Range. The project site is situated within the Ramaytush subdivision of the Costanoan, which included much of present-day San Mateo and San Francisco counties (Levy 1978:485). Within the Ramaytush area, the Costanoan population was further divided into tribelets. Tribelet territories, defined by physiographic features, usually had one or more permanent villages surrounded by a number of temporary camps used to exploit seasonally available floral and faunal resources (Levy 1978:485, 487).

The project site was likely situated at or near a primary settlement of the Lamsin (Las Pulgas) tribelet (Levy 1978:485, #13) (also known as the Lamchin [San Carlos Area]) (Milliken 1995:229, Map 5, 246-247). The Lamchin tribelet occupied the bayshore and interior valleys from Belmont through Redwood City (Milliken 1995:246-247).

Historic Background

In 1835, a land grant from Mexico established Rancho de las Pulgas, an area that included all of modern-day Redwood City. The area was originally owned and managed by Don Jose Dario Arguello, a commander of the Presidio of San Francisco (1787 to 1791) and Governor of Alta California (1814-1815). Following the Mexican-American War, the 1851 Land Act required Arguello to defend his land claim. As part of this process, Arguello deeded the land to his lawyer, Simon Mezes. Mezes surveyed, planned, and established “Mezesville” on a portion of the Rancho de las Pulgas. In 1852, the County of San Mateo was created, and in 1856, Redwood City became the first County’s government seat. In 1867, the City of Redwood City was officially incorporated.

During the Hispanic period and into the American Period, the nearby redwoods were recognized as an important natural resource. The lumber industry focused on the mountainous area south of the project area and, at first, relied on San Francisquito Creek and the Santa Clara Embarcadero for transportation on and across San Francisco Bay. After its discovery in 1851, however, Redwood Creek, a deep-water channel that ran inland to what is now Redwood City, was primarily used to ship wood and logs from the redwood forests in the peninsula hills to San Francisco (Redwood City Local History 2019).

During the second half of the 19th century, the Main Street and Broadway area served as a business center for Redwood City, where lumber, shipping, tannery, warehouse, and retail uses thrived. Records from the 1870s and 1880s show a concentration of businesses along Main Street and Broadway (Redwood City 2010a).

In the early-mid 20th century, marsh-side industries such as sea-salt harvesting and cement production resulted in the creation of a modern deep-water port. In the 1940s–1950s, a new center of economic activity developed in the new residential areas west of El Camino Real, as well as south along the Bayshore Highway, and later, along the Bayshore Freeway (now US-101). In the latter half of the 20th century, the Peninsula became home to a thriving technological sector, which continues to the present day (Redwood City 2010a).

Sanborn Fire Insurance maps of the project area (1897, 1919, and 1950) primarily depict land use consisting of light industry/retail, with some houses constructed along Elm Street. The Southern Pacific Railroad (now Caltrain) (RR) runs alongside the eastern edge of the property, which would have been ideal for commercial interests (WSA 2017).

3.5.2 Methodology

To determine the presence of cultural resources within the project location and vicinity, an assessment of the project site was conducted that included the project location and areas within 0.25 miles. A records search at the Northwest Information Center (NWIC) of the California Historical Resources Information System (CHRIS), Native American outreach, a buried site sensitivity analysis, and a pedestrian field survey was conducted for this project. The records search and cultural resources survey were completed in accordance with the CEQA guidelines as follows: 1) identifying all cultural resources within the project site; 2) offering a significance evaluation of the identified cultural resources; 3) assessing resource vulnerability to effects that could arise from project activities; and 4) offering suggestions designed to protect resource integrity, as warranted. Appendix D provides the Cultural Resources Inventory and Evaluation Report that includes detailed discussion of the methods used to identify cultural resources and the findings of the records search and surveys.

Records Search and Literature Review

Stantec conducted a records search of the project location and a surrounding 0.25-mile radius at the NWIC (NWIC File No. 18-0981) on November 27, 2018. As an affiliate of the State of California Office of Historic Preservation (OHP), the NWIC is the official state repository of cultural resource records and reports for the region that includes San Mateo County. The records search included a review of previous studies, records, and maps on file at the NWIC, as well as the following resources:

- California Inventory of Historic Resources (California Department of Parks and Recreation) for San Mateo County;
- California Historical Landmarks (California OHP);
- Historic Property Data File (California OHP) for Redwood City;
- The Redwood City Historic Resources Inventory.

The records search identified seven previous cultural resource studies conducted within or adjacent to the project location and an additional 16 archaeological studies conducted within 0.25 miles of the project location.

The NWIC did not identify any previously recorded cultural resources in or adjacent to the project location. However, 41 resources have been recorded within 0.25 miles of the project location. Two of these resources (P-41-000506/CA-SMA-358/H and P-41-002293/CA-SMA-397H) are archaeological sites, and the remaining 39 are historic-era buildings, structures, and/or elements of the Stambaugh-Heller Historical Residential District (SHHRD) (P-41-002422).

P-41-000506/CA-SMA-358/H was first recorded in 2001 as part of a telecommunications project (Brown 2001). The resource was described as a large scatter of historic and prehistoric/protohistoric artifacts and contained both a surface and subsurface component (Brown 2001). Artifacts encountered included chert debitage, nails, glass fragments, butchered (mammal) bone, and marine shell. It was noted that the entire site has been disturbed by historic and modern construction activities, possibly as early as the 1850s; however, the possibility of intact subsurface deposits “is still possible” (Brown 2001).

The site was revisited in 2010 during an archaeological survey conducted for the San Francisco to San Jose segment of the proposed California High-Speed Train project (Martinez et al. 2010). Martinez et al. (2010) recommended CA-SMA-358/H as eligible for listing on the National Register of Historic Places (NRHP) under Criterion D as it is likely to yield information regarding important questions in prehistory and history.

P-41-002293/CA-SMA-397H consists of a historic-era debris scatter containing ceramic and glass fragments and construction debris, indicating a date range spanning from the 1840s–1920s. It has not been evaluated for NRHP or California Register of Historical Resources (CRHR) eligibility.

The SHHRD (P-41-002422) is a roughly six-block area in Redwood City containing wood frame residences and a church built between approximately 1860 and 1915. The western boundary of the SHHRD extends to approximately 180 feet east of the project location; the project location is not located in the SHHRD. The 21 contributing buildings to the SHHRD located within 0.25 miles of the project location are primarily one- and two-story homes of fairly modest size and detail. Integrity of the contributors to the district is moderately high (WSA 2017).

The results of the NWIC records search are confidential and not for public distribution. The full records search results, including lists of all studies and resources within 0.25 miles of the project location, are provided as an appendix to the Cultural Resources Inventory and Evaluation Report (Appendix D).

Review of Additional Documentation

In addition to the formal records search, Stantec reviewed the following resources:

- Nationwide Environmental Tile Research (NETR) database for available aerial imagery and topographic maps of the project location (NETR 2019);
- USGS historic topographic maps, Palo Alto Quadrangle (USGS 2019).

These resources provided additional context for researching and evaluating the built-environment resource recorded during the field survey (see the Field Survey discussion, below) and the results of this map and aerial imagery review can be found in that discussion.

Stantec also reviewed the Cultural, Biological, and Paleontological Resources Assessment Report, 1180 Main Street Project, Redwood City, San Mateo County, California (WSA 2017). This report, provided to Stantec by the client (Premia), was prepared as part of the due diligence efforts in advance of environmental documents for the present project. The archaeological assessment included an archival and records search of the proposed project area and a surrounding 0.25-mile radius at the NWIC, a Sacred Lands File search at the Native American Heritage Commission (NAHC), and a pedestrian archaeological survey (WSA 2017). The data provided in that report served as a confirmation of the data obtained independently for the present study. The results of the NWIC records search completed for that project were nearly identical to the results received for the present study (several more built environment resources have been recorded within 0.25 miles of the project area since then; but no resources were identified within the project area). No new or previously recorded archaeological resources were encountered within the project area during the pedestrian survey completed for that project (WSA 2017). The conclusions and recommendations provided later in this report reflect those provided in this study.

Native American Correspondence

As required under CEQA, and as part of the due diligence efforts in advance of environmental documents for the present project, WSA contacted the NAHC on July 20, 2017, to request information on known Native American traditional or cultural properties within the project location, and to request a list of individuals or groups with cultural affiliation to the project location (WSA 2017). The NAHC responded by letter on July 31, 2017, stating that a record search of the Sacred Lands File for the project location yielded negative results, but that the area is sensitive for cultural resources (NAHC 2017).

A list of five Native American contacts was included in the response. WSA sent certified letters to the five individuals on August 1, 2017, requesting comment on this project. Follow-up phone calls were made on August 15, 2017, and two of the five contacts were reached. A second round of phone calls to the remaining three individuals who could not be reached was made on August 22, 2017. Appendix D contains the documents related to consultation with the NAHC and the tribal representatives. Two individuals, Irene Zwierlein and Andrew Galvan, recommended an archaeological and Native American monitor to be present on-site during ground disturbing activities (WSA 2017).

Field Survey

On November 13, 2018, Stantec Archaeologist, Joanne Grant, conducted an intensive archaeological pedestrian survey of the project location (see Figure 2). The survey covered the entire project area and consisted of walking roughly parallel 10-meter-wide transects in an east-west direction. During the field survey, the entire project area was examined for the presence of historic or prehistoric site indicators. The archaeologist investigated rodent burrows for any indicators of color/texture changes that could indicate buried deposits and employed periodic trowel and boot scrapings to clear small patches of vegetation in areas with poor ground visibility.

The project area consists of primarily level, vacant terrain, surrounded by a cyclone fence. However, the parcel contained several features, including a concrete pad, a standing structure, and a concrete-lined canal. These features are discussed below. No prehistoric or historic-era archaeological resources, or indicators of buried cultural deposits, were identified during the archaeological field survey.

An irregular shaped, rebar reinforced concrete foundation is situated along the eastern side of the channelized creek, at the northernmost point of the project location, close to Maple Street. This foundation is modern and not studied as part of the effort. According to the property owner, this pad was constructed approximately 10 years ago (pers. comm. Artega November 14, 2018).

1190 Main Street

A one-story building, 1190 Main Street, is located on the southeast corner of the project site, at the intersection of Elm and Main Streets. Research indicates that it was constructed in 1952 (WSA 2017). It appears to have been used as a commercial space, with a showroom space facing Main Street (the building is now vacant). This building is slated for demolition as part of this project. Although the building is over 50 years of age, it has not been evaluated, due to the City's policy of not evaluating post-war buildings. Should the historic eligibility of the building need to be determined, it would be done under a separate task.

Channelized Section of Redwood Creek

A channelized, concrete-lined segment of Redwood Creek flows along the western end of the presently-vacant parcel. No additional features or artifacts were found in association with this resource. The channelized creek is gunite concrete-lined, with angled sides at roughly 45 degrees. The gunite concrete-lined banks exhibit cracking, with weeds growing in some areas. A large palm bush is growing alongside the canal at the point where it travels beneath Lathrop Street. Outside of the project boundaries, the canal flows under Maple Street to the north, and flows under Lathrop Street to the southwest. A two-rail, wood fence is located along the canal crest. The modification changing Redwood Creek from a natural waterway to an engineered, concrete lined channel occurred between 1961 and 1968 (NETR 2019). The original concrete lining has been replaced periodically over the years as routine maintenance. Due to the age of the channelized, concrete lined creek, it was recorded on a Department of Parks and Recreation (DPR) form as 1180RC-1 (see Appendix D in the Cultural Resources Inventory and Evaluation Report [Appendix D]).

Redwood Creek is an approximately 10-mile-long perennial stream that discharges into South San Francisco Bay. In 1851, it was discovered that the creek emptied directly into a naturally deep channel of water that, in turn, flowed into San Francisco Bay. Shortly afterwards, logging companies started using the creek to move the redwood logs (hence the name Redwood Creek) from the peninsula hills down to this deep-water channel. From this channel, the logs were transported to San Francisco, where they were ultimately milled into lumber (Redwood City Local History 2019; Redwood City History 2017).

Historically, the 1897 Sanborn map, as well as the 1897 USGS topographic map, shows Redwood Creek as flowing partially through the project location, from approximately 40 feet southwest of Maple Street, and exiting the project location at the intersection of Maple Street and Elm Street (Sanborn Map and Publishing Company 1897, USGS 1897). The 1897 Sanborn map also shows a foot bridge crossing the creek on Elm Street (Sanborn Map and Publishing Company 1897). By 1919, an additional wooden bridge was built across Redwood Creek at Maple Street (Sanborn Map and Publishing Company 1919). The creek and crossing remained relatively unchanged until the late 1940s, when a concrete bridge was identified as crossing over Redwood Creek at Lathrop and Maple Streets in 1950 (Sanborn Map and Publishing Company 1950). In 1960, the creek remained largely as it had been; however, by 1968, the creek had been improved with concrete lining and channelized (NETR 2019). Redwood Creek continues to flow through Redwood City; however, throughout much of this urban area, it is through underground pipes (Kyle 2002), including south of the project location at El Camino Real, and north of the project location at Maple Street.

The channelized canal appears ineligible for the CRHR under Criteria 1, 2, 3, and 4. Research has not uncovered any evidence to suggest that the channelized canal is associated with a significant event or individual (CRHR Criteria 1 and 2), embodies distinctive characteristics of type, period, region, or method of construction, has high artistic value, or represents the work of a master (CRHR Criterion 3), or has recognized data potential (Criterion 4). Although Redwood Creek played an important role in the exportation of lumber and other products (such as grains and livestock) in the mid-late 1800s, the channelization of the canal in the mid-1960s occurred well outside of this potential period of significance. The channelized canal's features appear to be a standardized design for concrete-lined, channelized creeks. It appears to have been maintained and modified regularly since it was originally constructed in the 1960s. Although the channelized creek retains its integrity of location, setting, feeling, and association (the canal is in the same location, and its primary purpose as supporting a natural drainage network through an urban area remains), the canal has lost integrity of design, workmanship, and materials, as it has been subject to modifications and maintenance over the years, including the replacement of its original concrete lining. In all, the resource appears to lack significance of all criteria and is, therefore, ineligible for the CRHR.

For additional information regarding 1180RC-1, please see the Cultural Resources Inventory and Evaluation Report (Appendix D).

Buried Site Sensitivity

The records search did not identify previously recorded cultural resources within the project location. Additionally, the current pedestrian surface survey did not identify any new resources within the project location. The soils in the project location consist of Urban Land Orthents on nearly level to gently sloping land. These soils can be poorly drained to well-drained and are present on alluvial plains, fluviomarine terraces, and foothills (USGS 2018).

The geologic age of the project location is Quaternary alluvium and marine deposits (Pliocene to Holocene) (USGS 2018). This fairly recent age (approximately 5 million years ago to present), combined with the presence of a perennial water source (Redwood Creek) that flows through the project location, suggests that there is a moderate potential to encounter buried resources.

3.5.3 Environmental Impact Analysis

This section discusses potential impacts on cultural resources associated with the proposed project and provides mitigation measures where necessary.

Impact CUL-1 Cause a substantial adverse change in the significance of a historical resource as identified in Section 15064.5?

Impact Analysis

The archival research and the NWIC records search completed as part of the cultural resource analysis indicated that there are no known historical resources, as identified in Section 15064.5, within the project location. Although the building located in the southeast corner of the project site is over 50 years of age, due to the City's policy of not evaluating post-war buildings, this building does not require documentation and/or evaluation.

During the field survey, the channelized, concrete-lined segment of Redwood Creek that flows along the western end of the project location was recorded. As discussed earlier, the channelized segment of Redwood Creek does not appear to meet the criterion for listing in the CRHR.

However, there is a potential for encountering previously undiscovered historical resources as identified in Section 15064.5 during project implementation, due to the proximities of Redwood Creek and a combined prehistoric/historic resource to the project location, along with the former businesses and residences that were once present in the project location. Additionally, the NAHC indicated that the area is sensitive for cultural resources (NAHC 2017), and two of the Native American contacts recommended an archaeological and Native American monitor to be present on-site during ground disturbing activities (WSA 2017).

If an inadvertent discovery were to occur, it could result in damage to the resource that would cause a substantial adverse change in its significance, thereby constituting a significant impact. Prehistoric resources might include obsidian and chert flaked-stone tools (e.g., projectile points, knives, scrapers) or toolmaking debris; culturally darkened soil ("midden") containing heat-affected rocks, artifacts, or shellfish remains; and stone milling equipment (e.g., mortars, pestles, handstones, or milling slabs); and battered stone tools, such as hammerstones and pitted stones. Historic-period resources might include debris scatters of ceramic, glass, or metal containers; household or personal items; privy pits; or building foundations or other structural remains. The implementation of Mitigation Measure CUL-1 and Mitigation Measure CUL-2 would reduce to a less than significant level any potential impacts from an inadvertent discovery of a historical resource.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM CUL-1 **Pre-Construction Cultural Resource Awareness Training and Cultural Resource Construction Monitoring.** Prior to the start of construction, all construction personnel shall receive a worker's environmental awareness training on cultural resources by a qualified archaeologist. The training, which may be conducted with other environmental or safety trainings, shall provide a description of cultural resources that may be encountered during construction and outline the steps to follow if a discovery is made.

MM CUL-2 **Cultural Materials Discovered During Construction.** The cultural resources study identified the project area as having a likelihood for buried cultural deposits and requires construction monitoring during all ground disturbing activities by a qualified archaeologist and an Ohlone tribal monitor. If evidence of any prehistoric or historic-era subsurface archaeological features or deposits are discovered during excavation or other earth-moving activities, the archaeological and Native American monitors can assess the significance of the find(s) and determine the appropriate treatment. Appropriate treatment may include recordation and/or additional excavation. A monitoring report shall be completed by the archaeological monitor at the end of construction. This report shall include a brief summary of the pre-construction cultural resource awareness training and the results of monitoring. The monitoring report shall be kept on file at Redwood City.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact CUL-2 Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?

Impact Analysis

The archival research, the NWIC records search, and the archaeological field survey completed as part of the cultural resource analysis did not identify any known archaeological resources pursuant to Section 15064.5 within the project location. However, there is a potential for encountering previously undiscovered unique archaeological resources during project implementation, due to the proximities of Redwood Creek and a combined prehistoric/historic resource to the project location, along with the former businesses and residences that were once present in the project location. Additionally, the NAHC indicated that the area is sensitive for cultural resources (NAHC 2017), and two of the Native American contacts recommended an archaeological and Native American monitor to be present on-site during ground disturbing activities (WSA 2017).

If an inadvertent discovery were to occur, it could result in damage to the unique archaeological resource that would cause a substantial adverse change in its significance, thereby constituting a significant impact. The implementation of Mitigation Measures CUL-1 and CUL-2 would reduce any potential impacts from inadvertent discovery of a unique archaeological resource to a less than significant level.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

Mitigation Measures CUL-1 and CUL-2 are required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact CUL-3 Disturb any human remains, including those interred outside of formal cemeteries?

Impact Analysis

There are no known human remains within the project area, and no indications that the project location has been used for burial purposes in the past. Therefore, it is unlikely that human remains would be encountered during construction. However, ground disturbance and subsurface construction activities such as trenching, and grading associated with the proposed project could potentially disturb previously undiscovered human burial sites. Therefore, Mitigation Measure CUL-3 would be implemented to reduce impacts to a less than significant level by ensuring compliance with Section 7050.5 of the California Health and Safety Code and PRC 5097.98.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measure

MM CUL-3 **Procedures for Human Burials Encountered During Construction**. If ground-disturbing activities uncover previously unknown human remains, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed:

There shall be no further excavation or disturbance of the area where the human remains were found or within 100 feet of the find until the San Mateo County Coroner and the appropriate City representative are contacted. Duly authorized representatives of the Coroner and the City shall be permitted onto the project site and shall take all actions consistent with Health and Safety Code Section 7050.5 and Government Code Sections 27460, et seq. Excavation or disturbance of the area where the human remains were found and an area within 100 feet of the find shall not be permitted to re-commence until the Coroner determines that the remains are not subject to the provisions of law concerning investigation of the circumstances, manner, and cause of any death. If the Coroner determines the remains are Native American, the Coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the "most likely descendant" (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in PRC Section 5097.98. If the MLD does not make recommendations within 48 hours, the landowner shall reinter the remains in an area of the property secure from further disturbance. If the landowner does not accept the MLD's recommendations, the owner or the MLD may request mediation by NAHC.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

3.6 GEOLOGY AND SOILS

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:	☐	☒	☐	☐
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☐	☒
ii) Strong seismic ground shaking?	☐	☒	☐	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☒	☐	☐
iv) Landslides?	☐	☐	☐	☒
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☒	☐
c) Be located on strata or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?	☐	☒	☐	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code, creating substantial risks to life or property?	☐	☒	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?	☐	☐	☐	☒
f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☒	☐	☐

3.6.1 Environmental Setting

The City is located within a seismically active region and earthquakes have the potential to cause ground shaking of significant magnitude in the area. The California Geological Survey defines an active fault as one that has had surface displacement in the last 11,000 years or has experienced earthquakes in recorded history. The project site does not contain an active fault system. The major active faults in the area include the San Andreas, Monte Vista-Shannon, San Gregorio, Hayward, and Calaveras faults located approximately 6.9 miles west, 5.4 miles southwest, 21 miles west, 24 miles northeast, and 33 miles east respectively (Langan 2018). The California Geological Survey defines an active fault as one that has had surface displacement in the last 11,000 years or has experienced earthquakes in recorded history. In a fact sheet published in 2003, the USGS estimated that there was a 62 percent

probability that between 2003 and 2032, a 6.7 or greater magnitude earthquake will occur in the San Francisco Bay Region. The probability of a 6.7 magnitude or greater earthquake occurring along individual faults was estimated to be 21 percent along the San Andreas Fault, ten percent along the San Gregorio Fault, 27 percent along the Hayward-Rodgers Creek Fault, and 11 percent along the Calaveras Fault (Redwood City 2010a).

Ground shaking from an earthquake can result in ground failure, including liquefaction, ground-induced landslides, and subsidence. Most of Redwood City is in an area where historic occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacement. (Redwood City 2010a). Additionally, the project site consists of flat topography and is not located in a landslide hazard zone (Department of Conservation 2015). The soils at the project site are classified as Urban Land Orthents, which consist mostly of urban land, and deep and very deep, nearly level gently sloping, poorly drained to well drained soils on alluvial fans.

3.6.2 Methodology

The following analysis is based on a review of documents pertaining to the project site, including the General Plan, General Plan EIR, and United States Department of Agriculture Natural Resources Conservation Service soil reports.

Paleontological Resources

Paleontological resources are the fossilized remains of plants and animals, including vertebrates (animals with backbones), invertebrates (e.g., starfish, clams, ammonites, and coral marine), and fossils of microscopic plants and animals (microfossils). The age and abundance of fossils depend on the location, topographic setting, and particular geologic formation in which they are found. Fossil discoveries not only provide a historic record of past plant and animal life; they may also assist geologists in dating rock formations.

The potential for fossils to be preserved in a particular rock formation depends on the environmental conditions under which it formed. For example, sedimentary rocks formed in marine environments are more likely to preserve the remains of organisms than metamorphic rocks, which form under intense heat and pressure. Unit descriptions in geologic maps may explicitly describe the paleontological potential of a particular rock unit, though more often, a review of fossil locality records and published literature is required.

To determine the potential for paleontological resources in the project area, geologic units from maps of the area were analyzed for their potential paleontological sensitivity based on existing literature and known localities. The paleontological database at the University of California, Berkeley's Museum of Paleontology (UCMP) was consulted, and the Society of Vertebrate Paleontology (SVP) guidelines were followed while conducting the paleontological review.

Society of Vertebrate Paleontology's Guidance for Assessing the Paleontological Potential of Rock Units

The SVP have identified two phases for identification of potential for paleontological resources: 1) assess the potential that nonrenewable paleontological resources could be directly or indirectly impacted or destroyed by the proposed project activities, and 2) generate and implement measures to mitigate any potential impacts from proposed project activities.

The SVP classifies the potential for paleontological resources within rock units as units having high, undetermined, low, or no potential for containing paleontological resources. High potential is described as "rock units from which vertebrate or significant invertebrate, plant or trace fossils have been recovered, including but not limited to

sedimentary formations, some volcaniclastic formations, some low-grade metamorphic rocks which contain significant paleontological resources anywhere within their geographical extent, sedimentary rock units temporally or lithologically suitable for the preservation of fossils, rock units which contain potentially datable organic remains older than late Holocene, and rock units which may contain new vertebrate deposits, traces, or trackways" (SVP 2010). Underdetermined potential is described as "rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment" (SVP 2010). Low potential is described as "poorly represented by fossil specimens in institutional collections, or where fossils are only preserved in rare circumstances" (SVP 2010). Rock units with no potential to contain paleontological resources include high-grade metamorphic rock (gneisses, schists) and plutonic igneous rocks (granites, diorite) (SVP 2010).

Known Resources

The UCMP database search did not identify any paleontological resources within the project location. The closest vertebrate fossil site to the project is an assemblage located approximately 10 miles southeast, known as the "Mountain View Dump". The soils in the project location are comprised of Quaternary alluvium and urban land fill. These recent soils do not contain strata known to be geologically sensitive for the presence of paleontological resources (e.g., Plio-Pleistocene age sedimentary rock). Combined with the fact that no vertebrate fossils have been recovered from in or near the project location, the project area has a low potential for paleontological resources.

3.6.3 Environmental Impact Analysis

This section discusses potential impacts on geology and soils associated with the proposed project and provides mitigation measures where necessary.

Impact GEO-1	**Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death, involving:**
i)	**Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.**
ii)	**Strong seismic ground shaking?**
iii)	**Seismic-related ground failure, including liquefaction?**
iv)	**Landslides?**

Impact Analysis

i. Fault Rupture

Surface rupture is associated with being located close to an active fault. The City is not located within an Alquist-Priolo Earthquake Fault Zone. An Alquist-Priolo zone is located about 0.5 miles west of the plan area (approximately 6.9 miles from the project site), roughly paralleling and west of I-280. The City is subject to several other potential seismic hazards, as discussed under Impact GEO-1 in the following paragraphs, but the likelihood of damages resulting from fault rupture within the City are considered remote (Redwood City 2010a). Due to the lack of Alquist-Priolo fault zones at the project site, the risk of surface rupture near the project site is low and no impact would occur.

ii. Ground Shaking

The project site is in a seismically active region and earthquake-related ground shaking is expected to occur during the design life of the proposed project. The major active faults in the area include the San Andreas, Monte Vista-Shannon, San Gregorio, Hayward, and Calaveras faults located approximately 6.9 miles west, 5.4 miles southwest, 21 miles west, 24 miles northeast, and 33 miles east respectively (Langan 2018). In addition, other faults in the San Francisco Bay Area may cause strong seismic ground shaking at the project site. The proposed project would be constructed in conformance with the latest edition of the California Building Code, which includes engineering standards appropriate to withstand anticipated ground accelerations at the project site. Conformance with the earthquake design parameters of the California Building Code would be subject to City review as part of the building site plan and permit review process. Furthermore, the proposed project would be required to comply with the City's Municipal Code and General Plan Policies PS-6.1 through PS-6.3 and PS-9.1-a, which require new development to prepare site-specific soil reports and incorporate the recommendations and findings of these reports into the project's engineering and geotechnical analysis (Redwood City 2010a). The recommendations and findings identified in the site-specific geotechnical analysis would be incorporated into the proposed project as part of Mitigation Measure GEO-1. Therefore, impacts related to ground shaking at the project site would be less than significant with implementation of Mitigation Measure GEO-1.

iii. Liquefaction

According to Figure 4.6-3 in the General Plan EIR, there is potential for liquefaction to occur on the project site (Redwood City 2010b). The project design would be required to conform to the latest edition of the California Building Code, Redwood City Municipal Code, and General Plan Policies PS-6.1 through PS-6.3 and PS-9.1-a, which requires site-specific soil reports to be prepared for all new developments in the City (Redwood City 2010a). The recommendations indicated in the site-specific geotechnical investigation would be incorporated into the project design as part of Mitigation Measure GEO-1. Therefore, impacts related to liquefaction would be less than significant with Mitigation Measure GEO-1 incorporated.

iv. Landslides

The lower elevations in the eastern and northeastern portion of Redwood City (which includes the project site) are mapped as "flatland" with no landslides. (Redwood City 2010a). Therefore, the potential for a landslide to occur is low. No impact would occur.

Level of Significance Before Mitigation

Potentially Significant Impact.

Mitigation Measures

MM GEO-1 Implement Geotechnical Report Design Measures. Prior to issuance of grading permits, the applicant shall incorporate all design specifications and recommendations contained within the site-specific soils report into relevant project plans and specifications. These specifications shall pertain to, but are not limited to, building foundations, backfill of excavations, soil subgrade preparations, design of below-grade walls, and grading activities. In addition, the proposed project shall implement the following measures pertaining to dewatering and shoring:

- **Dewatering Activities**. The construction contractor shall implement a dewatering system prior to and throughout excavation activities that maintains groundwater levels at least three feet below the bottom of the excavation, including excavation for waterproofing or subgrade stabilization. The dewatering system shall meet the following minimum performance standards:

- Stable excavation walls and bottom shall be provided;
- A reasonably dry base of excavation shall be provided;
- Native soils shall be filtered and loss of ground from dispersion or erosion shall be prevented;
- Piping (boiling) of the excavation bottom shall be prevented;
- All dewatering and shoring systems shall be installed and removed in accordance with governing (e.g., City, state) requirements; and
- The contractor shall allow for the controlled release of groundwater to its static level in a manner that prevents disturbance of bottom soils and prevents flotation or movements of structures or pipelines.

The contractor shall be prepared to implement alternative systems should the initial dewatering system fail to achieve these minimum performance requirements. The contractor shall be prepared to locally dewater or modify construction excavations, if and where needed, to provide stable and reasonably dry excavations. The dewatering system shall be localized, targeted, and short-term (days) in order to prevent consolidation and subsidence from prolonged dewatering. The project contractor shall submit the dewatering system plans to Caltrain for review and approval prior to start of excavation activities to determine if any dewatering restrictions need to be implemented due to the project site's proximity to the Caltrain tracks and corridor.

- **Shoring During Excavation Activities.** The contractor shall be required to shore the estimated 25-foot excavations with soldier piles, timber lagging, and tiebacks in accordance with Caltrain's 2003 Engineering Standards for Excavation Support Systems, California Division of Occupational Safety and Health regulations, and all other recommendations provided in the site-specific Geotechnical Report (Appendix F). All shoring plans shall be submitted to Caltrain for review and approval prior to the start of excavation activities within 15 feet of the centerline of the Caltrain corridor tracks.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact GEO-2 Result in substantial soil erosion or the loss of topsoil?

Impact Analysis

Project construction activities would involve the removal of vegetation, grading, and excavation of soils on approximately 1.31 acres. These activities could expose unprotected soils to stormwater runoff causing erosion and loss of topsoil. Projects that disturb 1 acre or more of soils during construction are required to comply with the National Pollutant Discharge Elimination System (NPDES) permitting program and implement a SWPPP that identifies BMPs to control the discharge of sediment and other pollutants during construction. The proposed project would be required to implement a SWPPP and associated BMPs, per the requirements of Redwood City's Stormwater Pollution Prevention Program, to reduce potential erosion impacts. Therefore, soil erosion impacts associated with construction impacts would be less than significant.

Completion of the proposed project would result in approximately 48,646 square feet of impervious surface at the project site. The San Mateo Countywide Water Pollution Prevention Program is a partnership of the City/County Association of Governments (C/CAG), each incorporated city and town in the county, and the County of San Mateo, which share a common NPDES permit (C/CAG 2015). New development projects in the City are required to comply

with the San Mateo County Erosion and Sediment Control Plan requirements per the Municipal Regional Permit issued by the San Francisco Regional Water Quality Control Board (RWQCB). Also, the City's Municipal Code (Chapter 27A – City of Redwood City Stormwater Management and Discharge Control Program Ordinance) identifies specifications to minimize potential post-construction erosion impacts. In accordance with the City's Stormwater Management and Discharge Control Program Ordinance the proposed project would be required to incorporate permanent stormwater control measures during operation of the proposed project to reduce water quality impacts of stormwater runoff from the entire site. Therefore, soil erosion impacts during operation of the proposed project would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact GEO-3	**Be located on strata or soil that is unstable, or that would become unstable as a result of the Project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?**

Impact Analysis

The project site and surrounding area soil types are classified as Urban Land Orthents on nearly level to gently sloping land. These soils can be poorly drained to well-drained, and are present on alluvial fans, flood plains, and stream terraces (Redwood City 2010a). Construction of the proposed two-level underground parking garage would require the excavation of the project site to approximately 25 feet below grade. During the geotechnical site investigation groundwater was encountered at the project site between 10 feet to 12 feet below ground surface (bgs). However, high groundwater at the project site has historically been reported at 5 feet bgs and therefore groundwater could be encountered. Excavation activities near or below the groundwater table has potential to expose surrounding roadways, utilities, and the Caltrain corridor tracks to unstable soils due to vertical movement and settlement. Therefore, excavations would require shoring and dewatering to protect the surrounding improvements (Langan 2018). The proposed project would be required to implement Mitigation Measure GEO-1 and comply with the shoring and dewatering methods identified in the site-specific Geotechnical Report (Appendix F). In addition, due to the project site's proximity to the Caltrain corridor tracks (within 15 feet of the Caltrain tracks centerline) all shoring would be constructed in accordance with Caltrain's 2003 Engineering Standards for Excavation Support Systems. The project contractor would also be required to submit the proposed dewatering and shoring system plans to Caltrain for review and approval prior to the start of construction activities.

Additionally, implementation of the Mitigation Measure GEO-1 would require groundwater levels to be maintained at least three feet below the bottom of excavation, including excavation for waterproofing or subgrade stabilization. If dewatering methods are used, groundwater would be pumped out of the excavation to the surface and then discharged to the sanitary sewer. Water extracted during dewatering may contain chemical contaminants (either from pre-existing sources or from equipment) or may become sediment-laden from construction activities and would be monitored and managed in accordance with applicable regulations of the RWQCB. Impacts related to unstable soils would be less than significant with Mitigation Measure GEO-1 incorporated.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure GEO-1 is required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact GEO-4	**Be located on expansive soil, as defined in Table 18 1 B of the Uniform Building Code, creating substantial risks to life or property?**

Impact Analysis

The soils at the project site are classified as Urban Land Orthents, which consist mostly of urban land, and deep and very deep, nearly level gently sloping, poorly drained to well drained soils on alluvial fans. Shrink and swell movements occur in fine-grained sediments containing expansive clays. Soils containing high clay content often exhibit a moderate to high potential to expand when saturated, and contract when dried out. There is potential for soils to shrink/swell at the project site. The proposed project would be required to comply with the latest edition of the California Building Code, Redwood City Municipal Code, and General Plan Policies PS-6.1 through PS-6.3 and PS-9.1-a, which requires site-specific soil reports to be prepared for all new developments in the City. The recommendations indicated in the site-specific soil report would be incorporated into the project design as part of Mitigation Measure GEO-1. Therefore, impacts to expansive soil would be less than significant with Mitigation Measure GEO-1 incorporated.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure GEO-1 is required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact GEO-5	**Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?**

Impact Analysis

The proposed project would connect directly to the City's existing municipal sewer system and would not require septic tanks or any other alternative wastewater disposal system. Therefore, no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact GEO-6 Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Impact Analysis

The UCMP database search did not identify any paleontological resources within the project area (UCMP 2018). The Quaternary alluvium and marine deposits found throughout the project area do not contain strata known to be geologically sensitive for the presence of paleontological resources (e.g., Plio-Pleistocene age sedimentary rock or various marine sediments). Therefore, it is unlikely that paleontological resources would be encountered during construction.

However, subsurface construction activities such as trenching and grading associated with the proposed project could potentially damage or destroy previously undiscovered paleontological resources. Therefore, Mitigation Measure GEO-2 would require implementation of standard inadvertent discovery procedures to reduce potential impacts to previously undiscovered paleontological resources. With the implementation of Mitigation Measure GEO-2, potential impacts would be reduced to a less than significant level.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measure

MM GEO-2 **Procedures for Paleontological Resources Discovered During Construction.** If any paleontological resources are encountered during ground disturbing or subsurface construction activities (e.g., trenching, grading), all construction activities within a 50-foot radius of the identified resource shall cease and the City shall immediately be notified. The applicant shall retain a qualified paleontologist (as approved by the City) to evaluate the find and recommend appropriate treatment of the inadvertently discovered paleontological resource. The appropriate treatment of an inadvertently discovered paleontological resource shall be implemented to ensure that impacts to the resource are avoided, in conformance with SVP guidelines (SVP 1996, 2010).

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

3.7 GREENHOUSE GASES

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	☐	☐	☒	☐
b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases?	☐	☐	☒	☐

3.7.1 Environmental Setting

The issue of combating climate change and reducing GHG emissions has been the subject of State legislation (AB 32 and Senate Bill 375). The Governor's Office of Planning and Research has adopted changes to CEQA Guidelines, and the environmental checklist, which is used for Initial Studies such as this one. The changes to the checklist, which were approved in 2017, are incorporated below in the two questions related to a project's GHG impact.

Emissions Inventories and Trends

California uses the annual statewide GHG emission inventory to track progress toward meeting statewide GHG targets. The inventory for 2016 shows that California's GHG emissions continue to decrease, a trend observed since 2007. In 2016, emissions from routine GHG emitting activities statewide were 429 million metric tons of CO_2 equivalent ($MMTCO_2e$), 12 $MMTCO_2e$ lower than 2015 levels. This puts total emissions just below the 2020 target of 431 million metric tons (CARB 2018).

Potential Environmental Impacts

For California, climate change in the form of warming has the potential to incur/exacerbate environmental impacts, including, but not limited to, changes to precipitation and runoff patterns, increased agricultural demand for water, inundation of low-lying coastal areas by sea-level rise, and increased incidents and severity of wildfire events (IPCC 2014). Although certain environmental effects are widely accepted to be a potential hazard to certain locations, such as rising sea level for low-lying coastal areas, it is currently infeasible to predict all environmental effects of climate change on any one location.

Emissions of GHGs contributing to global climate change are attributable in large part to human activities associated with the industrial/manufacturing, utility, transportation, residential, and agricultural sectors. Therefore, the cumulative global emissions of GHGs contributing to global climate change can be attributed to every nation, region, and city, and virtually every individual on earth. Although, a project's GHG emissions are at a micro-scale relative to global emissions but could result in a cumulatively considerable incremental contribution to a significant cumulative macro-scale impact.

Regulatory Requirements

California has adopted statewide legislation addressing various aspects of climate change and GHG emissions mitigation. Much of this legislation establishes a broad framework for the state's long-term GHG reduction and climate change adaptation program. The governor has also issued several executive orders related to the state's evolving

climate change policy. Of particular importance are AB 32 and Senate Bill 32, which outline the state's GHG reduction goals of achieving 1990 emissions levels by 2020 and a 40 percent reduction below 1990 emissions levels by 2030.

In the absence of federal regulations, control of GHGs is generally regulated at the state level and is typically approached by setting emission reduction targets for existing sources of GHGs, setting policies to promote renewable energy and increase energy efficiency, and developing statewide action plans.

In 2013, the City approved its Climate Action Plan (CAP), which targets reductions of 15 percent below 2005 GHG levels by 2020. The Climate Action Plan addresses several strategies to reduce GHG emissions and implement environmental programs. The CAP includes city-wide goals and strategies, but not a project-specific threshold for determining the significance of GHG emissions.

3.7.2 Methodology

BAAQMD provides multiple options for project-level GHG thresholds in its 2017 CEQA Guidelines. BAAQMD does not presently provide a construction-related greenhouse gas generation threshold but recommends that construction-generated greenhouse gases be quantified and disclosed. BAAQMD also recommends that lead agencies (in this case, the City of Redwood City) make a determination of the level of significance of construction-generated greenhouse gas emissions in relation to meeting AB 32 greenhouse gas reduction goals. The lead agency is also encouraged to incorporate BMPs to reduce GHG emissions during project construction, as feasible and applicable.

The proposed project is located within the BAAQMD; therefore, the BAAQMD thresholds are the most appropriate to use for the project. The thresholds suggested by BAAQMD for project-level operational greenhouse gas generation are as follows:

- Compliance with a qualified GHG Reduction Strategy, or
- 1,100 $MTCO_2e$/year, or
- 4.6 metric tons of CO_2 equivalent per service population (employees plus residents).

The BAAQMD CEQA Guidelines state that if annual emissions of GHG exceed the thresholds, the proposed project would result in a cumulatively considerable significant impact to global climate change. Therefore, if the proposed project is less than any one of the thresholds identified above, then the project would result in a less than significant cumulative impact to global climate change.

The proposed project's GHG emissions were quantified using CalEEMod version 2016.3.2 with the same assumptions used for the air quality analysis (see Appendix B). The analysis in this section is based, in part, on the findings of the CalEEMod analysis completed by Stantec. The modeling data is provided in its entirety in Appendix B.

3.7.3 Environmental Impact Analysis

This section discusses potential impacts concerning greenhouse gases associated with the proposed project and provides mitigation measures where necessary.

Impact GHG-1 Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Impact Analysis

Constructions Emission Inventory

The proposed project would emit GHG emissions during construction from the off-road equipment, worker vehicles, and any hauling that may occur. As previously indicated, BAAQMD does not presently provide a construction-related GHG generation threshold but recommends that construction-generated GHGs be quantified and disclosed. The construction phases include, site preparation, demolition, excavation and shoring, site grading, paving, building construction, and architectural coating. $MTCO_2e$ emissions during construction of the proposed project are shown in Table 3.7-1.

Table 3.7-1. Construction Greenhouse Gas Emissions

Construction Year	MTCO2e
2019	404
2020	419
2021	136
BAAQMD Operational significance threshold	1,100 per year
Exceed Threshold?	**No**

Source: CalEEMod Output (Appendix B)

As shown in Table 3.7-1, the proposed project's estimated maximum yearly construction emissions would be 419 $MTCO_2e$, which is well below the BAAQMD operational threshold of 1,100 $MTCO_2e$ per year. Some air districts (Sacramento Air Quality Management District, South Coast Air Quality Management District, and San Luis Obispo County Air Pollution Control District) recommend amortizing construction emissions over the life of the project. Commercial projects are typically amortized over a 30- to 40-year lifespan. To provide a conservative estimate, the 30-year period was used. The amortized construction emissions are expected to be 32 $MTCO_2e$ per year. The proposed project would not have a significant GHG impact during construction.

Operational Emission Inventory

Long-term, operational GHG emissions would result from project-generated vehicular traffic, on-site combustion of natural gas, operation of any landscaping equipment, off-site generation of electrical power over the life of the project, the energy required to convey water to and wastewater from the project site, the emissions associated with the hauling and disposal of solid waste from the project site, and any fugitive refrigerants from air conditioning or refrigerators.

Operational GHG emissions by source are shown in Table 3.7-2. The total annualized project emissions are estimated to be 1,076 $MTCO_2e$. Emissions analysis includes compliance with City and state standards. Because the CalEEMod module used to estimate reductions for certain existing regulatory requirements is termed "mitigation" within the model, the mitigated output from CalEEMod is used; however, those modeling components are not considered mitigation under CEQA but, rather, are treated as part of the baseline conditions because these measures are City and state requirements for development projects.

As shown in Table 3.7-2, the project's emissions would be below the BAAQMD threshold of 1,100 $MTCO_2e$ per year.

Table 3.7-2. Operational Greenhouse Gas Emissions

Source Category	$MTCO_2e$
Area	0.01
Energy Consumption	633
Mobile (Vehicle)	372
Solid Waste Generation	26
Water Usage	13
Subtotal Operational Emissions	1,044
Amortized Construction Emissions	32
Total Project GHG Emissions	1,076
BAAQMD Operational Threshold	1,100 $MTCO_2e$/year
Significant Impact?	**No**

Notes:

a. Includes CalEEMod "mitigation" for locational features (diversity of uses, distance to downtown, distance to transit), compliance with regulatory measures (Green Building Code, traffic demand management, and solid waste recycling).

b. Construction emissions annualized over an anticipated 30-year project lifespan.

Source: CalEEMod Output (Appendix B)

Level of Significance Before Mitigation

Less Than Significant Impact.

Mitigation Measures

No mitigation is necessary.

Level of Significance After Mitigation

Less Than Significant Impact.

Impact GHG-2 Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Impact Analysis

The City's CAP is focused on implementing strategies to reduce GHG emissions through energy, transportation and land use, and solid waste. The CAP has been developed to address GHG emissions resulting from both municipal operations and communitywide emissions. The CAP includes a goal of reducing GHG emissions by 15 percent below 2005 GHG levels by 2020. State of California has adopted regulations that apply to the proposed project that would help the City achieve its reduction goal. The proposed project would be subject to Title 24 energy efficiency standards. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The proposed project would comply with the California Green Building Standards Code, which includes requirements to increase recycling, reduce waste, reduce water use, increase bicycle use, and other measures that would reduce GHG emissions. Motor vehicle emissions associated with the proposed project would be reduced through compliance with state regulations on fuel efficiency and fuel carbon content. The regulations include the Pavley fuel efficiency standards that require manufacturers to meet increasing stringent fuel mileage rates for vehicles sold in California and the Low Carbon Fuel Standard that requires reductions

in the average carbon content of motor vehicle fuels. Emissions related to electricity consumption by the proposed project would be reduced as the electric utility complies with the Renewable Portfolio Standard, which requires utilities to increase its mix of renewable energy sources to 50 percent by 2030. The proposed project would not conflict with the City's CAP and regulations adopted by the State of California to reduce GHG emissions; therefore, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.8 HAZARDS AND HAZARDOUS MATERIALS

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	☐	☐	☒	☐
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☒	☐
c) Emit hazardous emissions or handle hazardous or acutely-hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☒	☐
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to *Government Code Section 65962.5* and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☐	☒
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☒
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☒	☐
h) Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☐	☐	☐	☒

3.8.1 Environmental Setting

Hazardous materials, as defined by the CCR, are substances with certain physical properties that could pose a substantial present or future hazard to human health or the environment when improperly handled, disposed, or otherwise managed. Hazardous materials are grouped into the following four categories, based on their properties:

- Toxic – Causes Human Health Effects
- Ignitable – Has the Ability to Burn

- Corrosive – Causes Severe Burns or Damage to Materials
- Reactive – Causes Explosions or Generates Toxic Gases

Hazardous waste is any hazardous material that is discarded, abandoned, or slated to be recycled. The criteria that define a material as hazardous also define a waste as hazardous. If improperly handled, hazardous materials and hazardous waste can result in public health hazards if released into the soil or groundwater or through airborne releases in vapors, fumes, or dust.

California Government Code, Section 65962.5 requires the California EPA to compile, maintain, and update specified lists of hazardous material release sites. The required lists of hazardous material release sites are commonly referred to as the "Cortese List," which are contained on internet websites, including the online EnviroStor database from the Department of Toxic Substances Control (DTSC) and the online GeoTracker database from the State Water Resources Control Board (SWRCB). These two databases include hazardous material release sites, along with other categories of sites or facilities specific to each agency's jurisdiction. A search of EnviroStor and GeoTracker databases in January 2019 revealed there is record of a historic underground storage tank at the site (DTSC 2018, SWRCB 2018). The project site was previously an auto repair shop and is listed as a historic gasoline leaking underground storage tank (LUST) cleanup site closed in 1995. According to the EDR Radius Map Report compiled in 2017, as included in the 2017 Phase I ESA prepared by AEI Consultants (Appendix E), the site was cleaned up and the status is now "completed", and the case was closed by San Mateo County in 1995 (AEI Consultants 2017, SWRCB 2018).

Federal regulations and regulations adopted by the BAAQMD apply to the identification and treatment of hazardous materials during demolition and construction activities. Failure to comply with the regulations respecting asbestos and dust control may result in a Notice of Violation being issued by the BAAQMD, civil penalties under state and/or federal law, and possible action by the EPA under federal law. Federal law covers several different activities involving asbestos, including demolition and renovation of structures (40 CFR § 61.145). The California Department of Conservation, California Geologic Survey, and USGS map naturally-occurring asbestos (NOA) areas throughout the State of California for research purposes.

The closest airport to the project site is San Carlos Airport, which is approximately 2.6 miles northwest and is a public airport. There are no private airports in San Mateo county (Tollfree 2018). According to the California Department of Forestry and Fire Protection, the City is not located in or adjacent to a local or state fire hazard severity zone (CAL FIRE 2019).

3.8.2 Methodology

The following analysis is based on a review of documents pertaining to the project site, including the General Plan, General Plan EIR, and online regulatory compliance databases.

3.8.3 Environmental Impact Analysis

This section discusses potential impacts concerning hazards and hazardous materials associated with the proposed project and provides mitigation measures where necessary.

Impact HAZ-1	Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Impact Analysis

The proposed project would involve the development of an office building. During the construction phase, limited amounts of hazardous materials would be used, including standard construction materials such as concrete, paints, solvents, and heavy construction equipment that would contain diesel fuels and oils. The project contractor would be required to comply with all applicable federal, state, and local regulations related to the transport, use, or disposal of hazardous materials, as overseen by the California EPA and DTSC.

Development of the proposed project includes demolition of an existing structure that may contain asbestos or lead. Demolition of the building may, therefore, expose workers to asbestos and lead. Chapter 9 of the Redwood City Municipal Code requires that these materials be properly removed and disposed of by a certified contractor prior to demolition activities, and in accordance with applicable BAAQMD requirements for building demolition.

During operation of the proposed project, the use of hazardous materials would be limited to those commonly found at an office facility such as, solvents, cleaners, paints, and pesticides for landscape maintenance activities. These common household hazardous materials would be used in limited quantities and would not create a substantial hazard to the public or the environment. Therefore, impacts related to the routine transport, use, and disposal of hazardous materials during project construction and operation would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures

No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HAZ-2	Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Impact Analysis

The proposed project would involve the development of an office building. The proposed project would also include demolition of an existing structure that may contain asbestos or lead; Chapter 9 of the Redwood City Municipal Code requires that these materials be properly removed and disposed of by a certified contractor prior to demolition activities, and in accordance with applicable BAAQMD requirements for building demolition.

As discussed in Impact HAZ-1, project construction and operation activities would involve limited use of hazardous materials, including paints, solvents, fuels, oils, cleaners, and pesticides. The use of these substances is not expected to create a significant hazard to the public or the environment through reasonably foreseeable upset or accident. Furthermore, the proposed project would be required to comply with applicable federal, state, and local laws pertaining to the safe handle, storage, and transport of hazardous materials. In addition, during construction the applicant would be required to implement a SWPPP to prevent contaminated runoff from leaving the project site, per

the requirements of Redwood City's Stormwater Pollution Prevention Program. As such, impacts related to the release of hazardous materials into the environment would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HAZ-3 Emit hazardous emissions or handle hazardous or acutely-hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?

Impact Analysis

The project site is not located within 0.25 miles of an existing or proposed school. The nearest school is Hoover Elementary School, which is approximately 0.7 miles east of the project site. Furthermore, use of heavy equipment and activities involving potentially hazardous materials would be limited to the construction phase and confined to construction areas and within existing roadways. The use of potentially hazardous materials would be regulated by health and safety requirements under federal, state, and local regulations, including handling, storage, and disposal of the materials, as well as emergency spill response. Additionally, the proposed project would not involve the development of a use that would emit hazardous materials, substances, or waste during operation. As such, the proposed project would have a less than significant impact related to the emission or handle of hazardous materials near a school.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HAZ-4 Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?

Impact Analysis

The project site is included on GeoTracker as a historic gasoline LUST site closed in 1995 (SWRCB 2018). According to the 2017 EDR Radius Map Report included in Appendix E, the site was cleaned up and the status is now "completed", and the case was closed in 1995 (AEI Consultants 2017, SWRCB 2018). The EDR Report identified two other LUST site properties within the project vicinity. This includes the Cook's Auto Body identified as an open LUST case currently undergoing site cleanup. This property is located 0.4 miles north of the project site and topographically down-gradient of the project site; therefore, is not suspected to present and environmental concern to the project site. The other property, 135 Maple Street, located directly west of the project site, is identified as a closed LUST facility as

of 2002. This property has since been redeveloped with the present multi-family apartment complex and is not considered to be of environmental concern (AEI Consultants 2017). There are no other properties in the project vicinity identified as a hazardous materials site. Additionally, the Caltrain corridor tracks adjacent to the project site to the north are not identified on GeoTracker or EnviroStor. The proposed project would not create a significant hazard to the public or the environment and no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact HAZ-5	**For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?**

Impact Analysis

The project site is not located within 2 miles of a public airport. The nearest public airport to the project site is the San Carlos Airport, located approximately 2.6 miles northwest of the project site and there are no private airports in San Mateo County (Tollfree 2018). As such, the project site does not fall within an airport land use plan and would not result in a safety hazard for people residing or working in the project area. No impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact HAZ-6	**For a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?**

Impact Analysis

The project site is not located within the vicinity of a private airstrip. There are no private airports in San Mateo County (Tollfree 2018). As such, the proposed project would not result in a safety hazard for people residing or working in the project area. No impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact HAZ-7	**Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?**

Impact Analysis

The proposed project would not involve permanent modification of existing roadways. During the construction phase, temporary and/or partial street closures may be needed. However, access to the project site and the surrounding area would be maintained in accordance with a Traffic Control Plan (TCP). The TCP would identify all detours, appropriate traffic controls, and ensure adequate circulation and emergency access are provided during the construction phase. Therefore, project construction and operation activities would not interfere with an emergency evacuation or response plan and a less than significant impact would occur.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HAZ-8	**Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?**

Impact Analysis

The California Department of Fire and Forestry Protection does not identify the City in a local or state very high fire hazard severity zone (CAL FIRE 2019). According to the General Plan EIR, the highest fire hazard areas are in the southern and western hillsides of the plan area, which is marked by steep terrain and large areas of potentially combustible “fuel” vegetative materials (Redwood City 2010b). The project site is in very near the downtown area and located in an urban area near other commercial uses. As such, the proposed project is not expected to be exposed to risks associated with wildland fires. No impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.9 HYDROLOGY AND WATER QUALITY

	Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Violate any water quality standards or waste discharge requirements?	☐	☐	☒	☐
b)	Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there should be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	☐	☒	☐	☐
c)	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	☐	☐	☒	☐

3.9.1 Environmental Setting

The project site would be developed with a 40-foot high three-story commercial office building of 109,375 square feet with associated parking and on-site amenities on the 1.31-acre project site located at 1180 Main Street in Redwood City. The project site is in the San Francisco Bay Hydrologic Region, specifically within the Cordileras Creek-Frontal San Francisco Bay Estuaries Hydrologic Unit (EPA 2017). The project site is in the Atherton Channel Watershed. The Bayfront Canal and Atherton Channel collect stormwater within the area before discharging the stormwater flows to the San Francisco Bay. Drainage patterns in the region primarily include a northeast flow from the Santa Cruz Mountains to the San Francisco Bay. Other surface waters in the vicinity of the project site include bay channels, tidal waters, streams, and creeks.

The NPDES permit program regulates municipal and industrial discharges to surface waters of the United States. In California, the NPDES permit program is administered by the SWRCB and the nine Regional Water Quality Control Boards. The City lies within the jurisdiction of the San Francisco RWQCB and is subject to the Waste Discharge Requirements (WDRs) of the MS4 Permit (Order Number R2-2015-0049, NPDES Permit Number CAS612008). Provision C.3 of the MS4 Permit requirements apply to all new development or redevelopment projects that create or replace 10,000 square feet of impervious surfaces and specific land use projects that create or replace 5,000 square feet of impervious surfaces (e.g., auto service facilities, retail gasoline outlets, restaurants, and/or uncovered surface parking). Provision C.3 of the MS4 Permit also mandates that new development projects meet certain criteria: 1) incorporate site design, source control, and stormwater treatment measures into the project design; 2) minimize the discharge of pollutants in stormwater runoff and non-stormwater discharge; and 3) prevent increases in runoff flows as compared to pre-development conditions. Low-impact development (LID) methods are the primary mechanisms for implementing such controls. New development projects must treat 100 percent of the calculated runoff (based on the sizing criteria described in the C.3 provisions of the MS4 Permit) with LID treatment measures that include harvesting and reuse, infiltration, evapotranspiration, or biotreatment/bioretention (Redwood City 2010a).

The NPDES permit also includes section C.3j (Green Infrastructure Planning and Implementation) which includes requirements for early implementation of green infrastructure projects or “no missed opportunities.” With the alterations to the project frontages on Elm Street and Lathrop Street, it was determined that there was an opportunity to include green infrastructure for the treatment of the right-of-way runoff tributary to the frontages. The frontages were designed to direct the runoff to treatment facilities, which were sized based on the sizing criteria of Provision C.3.d of the NPDES permit.

3.9.2 Methodology

The evaluation of potential hydrologic and water quality impacts was based on a review of City documents including the General Plan and General Plan EIR, Geotechnical Investigation by Langan Engineering and Environmental Services, Inc. (Appendix F), and the Preliminary Engineering Study prepared by BKF Engineers (Appendix A). Mapping tools provided by the Federal Emergency Management Agency (FEMA) were also reviewed. The information obtained from these sources are summarized to establish existing conditions and to identify potential environmental effects.

3.9.3 Environmental Impact Analysis

This section discusses potential impacts on hydrology and water quality associated with the proposed project and provides mitigation measures where necessary.

Impact HYD-1 Violate any water quality standards or waste discharge requirements?

Impact Analysis

Construction

Construction of the proposed project would require demolition of the vacant one-story commercial building in the southeast corner of the project site and the removal of on-site vegetation and impervious surfaces. Construction activities would involve grading and permanent disturbance of the 1.31-acre site. The project site would be excavated approximately 25 feet below grade and approximately 35,000 cubic yards of soil (4,375 truck trips) would be exported from the site for construction of the two-level underground parking garage. Exported soil would be disposed off-site at a location determined by the project construction contractor during construction. These activities have the potential to generate stormwater runoff and to discharge pollutants such as fuel, solvents, oil, paints, and trash into the City's storm drain system. The proposed project would comply with the NPDES General Construction Permit. The NPDES General Construction Permit includes the preparation of a SWPPP and incorporation of BMPs to control sedimentation, erosion, and hazardous materials from contacting stormwater, with the intent of keeping all products of erosion from moving off-site into receiving waters. The proposed project would be required to implement a SWPPP and associated BMPs, per the requirements of Redwood City's Stormwater Pollution Prevention Program, to reduce potential water quality impacts. Adherence to applicable water quality regulations, preparation of a SWPPP, and compliance with the Redwood City Municipal Code would ensure that water quality standards are not violated during construction. Therefore, potential impacts associated with water quality during construction would be less than significant.

Operation

The proposed project would change the vacant lands at the project site with construction of an office building, open space park area, and a café. Stormwater runoff at the project site is collected by a 12-inch outfall that releases to the on-site concrete drainage channel. The proposed project would involve the removal of approximately 7,623 square feet of impervious surface consisting of the existing commercial building and an existing (currently un-used) concrete foundation. These impervious surfaces would be replaced following completion of the proposed project, which would result in approximately 48,646 square feet of impervious surface. The proposed project would install a new 12-inch stormwater drain line and connect it to the existing 12-inch outfall that drains to the concrete drainage channel. In addition, to meet the C.3 requirements of the San Mateo County Municipal Regional Permit the proposed project would incorporate traditional LID treatment measures such as flow-through planter boxes along the northeastern and northwestern sides of the project site, and self-retained landscaped areas. As such, operation of the proposed project would have a less than significant impact related to water quality degradation.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures

No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-2	**Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there should be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?**

Impact Analysis

The proposed project would not use groundwater supplies for construction or operation. Historically high groundwater at the project site has been reported at 5 feet bgs (Langan 2018). However, based on the preliminary investigations and previous borings at the project site, groundwater is estimated to be at a depth of 10 to 15 feet bgs (Langan 2018). The project site would be excavated approximately 25 to construct the two-level underground parking garage. Therefore, groundwater could be encountered during excavation activities and require dewatering. The proposed project would be required to implement Mitigation Measure GEO-1 and comply with the shoring and dewatering methods identified in the site-specific Geotechnical Report (Appendix F), and in accordance with Caltrain's 2003 Engineering Standards for Excavation Support Systems and California Division of Occupational Safety and Health regulations.

As discussed in the Geotechnical Report, excavation activities would require groundwater levels to be maintained at least three feet below the bottom of excavation, including excavation for waterproofing or subgrade stabilization. If dewatering methods are used, groundwater would be pumped out of the excavation to the surface and then discharged to the sanitary sewer. The applicant would comply with the groundwater discharge requirements and regulations of the RWQCB to prevent any discharge of contaminated dewatered groundwater into the sanitary sewer or storm drain system. Water quality would be screened using laboratory analyses as needed and extracted groundwater would be disposed in compliance with the RWQCB requirements. The proposed project would replace approximately 7,623 square feet of impervious surface with 48,646 square feet of impervious surface. The project site is in a highly urbanized area and there are no groundwater supply wells on-site and the project site is not a source for municipal uses (RWQCB 2017). The proposed project would comply with the dewatering methods recommended in the site-specific Geotechnical Report and would meet the minimum performance standards as outlined in Mitigation Measure GEO-1 to ensure groundwater levels are maintained. As such, the increase of impervious surfaces would not deplete the groundwater supplies from the deeper aquifer recharge areas and the proposed project would not affect groundwater resources. Therefore, impacts related to groundwater recharge would be less than significant with the incorporation of mitigation.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure GEO-1 is required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact HYD-3 **Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?**

Impact Analysis

Construction of the proposed project would not include ground disturbing work within the drainage channel. The project would require grading or soil exposure during construction. If not controlled, the transport of these materials into local waterways could temporarily increase suspended sediment concentrations. To minimize this impact, the proposed project would be required to comply with all of the requirements of the City's Municipal Code. The proposed project would be required to implement a SWPPP and associated BMPs, per the requirements of Redwood City's Stormwater Pollution Prevention Program. The SWPPP would include BMPs, which would be implemented during construction activities to reduce the potential of erosion. Therefore, erosion impacts during construction activities would be less than significant.

Given the nature of the proposed project, there is limited potential for erosion or siltation to occur once the proposed project has been constructed. In addition, the C.3 requirements of the MS4 Permit include source control measures and site design measures that address stormwater runoff and would reduce the potential for erosion or siltation. Additionally, the proposed project would be required to implement construction phase BMPs, post-construction design measures that encourage infiltration in pervious areas, and post-construction source control measures to help keep pollutants out of stormwater. Stormwater treatment measures are required post-construction, as well, for projects that create or replace 10,000 square feet or more of impervious surface. Therefore, erosion and siltation impacts associated with operation of the proposed project would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-4 **Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?**

Impact Analysis

The proposed project would take place within the boundaries of a partially developed site that is currently connected to the City's storm drain system. The redevelopment does not involve the alteration of any natural drainage channels or any watercourse. The proposed project would add approximately 41,000 square feet of new impervious surface that may increase the amount of surface runoff. Stormwater runoff at the project site is collected by a 12-inch outfall that releases to the on-site concrete drainage channel. To manage additional runoff, a new 12-inch stormwater drain line would be installed that would connect to the existing 12-inch outfall that drains to the concrete drainage channel. In addition, to meet the C.3 requirements of the San Mateo County Municipal Regional Permit, the proposed project would incorporate traditional LID treatment measures such as flow-through planter boxes along the northeastern and

northwestern sides of the project site, and self-retained landscaped areas. Therefore, the proposed project would not result in on- or off-site flooding, and the impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-5 Create or contribute runoff water which would exceed the capacity of existing or planned storm water drainage systems or provide substantial additional sources of polluted runoff?

Impact Analysis

During construction activities, the proposed project would conform to the requirements of the NPDES General Construction Permit, which involves the preparation and implementation of a SWPPP. The SWPPP would specify BMPs to incorporate during construction to prevent, control, and reduce polluted runoff from entering the City's storm drain system and waterways per the requirements of Redwood City's Stormwater Pollution Prevention Program. Additionally, the C.3 requirements of the MS4 Permit include source control measures and LID measures that address stormwater runoff and would reduce the potential for erosion or siltation, as well as require the proposed project to implement stormwater treatment measures to treat site runoff.

The proposed project would also install a new 12-inch stormwater drain line and connect it to the existing 12-inch outfall that drains to the concrete drainage channel. BMPs would be implemented to reduce the amount of stormwater entering the City's storm drain system. Furthermore, implementation of these BMPs would prevent and minimize the potential for sediment, debris, and other pollutants to enter the City's storm drain system. Therefore, the proposed project would not generate stormwater runoff that would exceed the capacity of existing or planned stormwater drainage systems or generate a substantial amount of polluted runoff. The impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-6 Otherwise substantially degrade water quality?

Impact Analysis

Implementation of BMPs during construction would be in accordance with the provisions of the SWPPP, as per the requirements of Redwood City's Stormwater Pollution Prevention Program. These BMPs would minimize the release

of sediment, soil, and other pollutants. As described above, the proposed project would comply with the C.3 provision of the MS4 Permit and incorporate BMPs during operation of the proposed project to prevent, control, and reduce stormwater runoff resulting from the increase in impervious surfaces at the project site. Construction of the landscaped areas would control the volume and rate of stormwater runoff and would treat stormwater before it enters the City's storm drain system. With the implementation of the requirements of Redwood City's Stormwater Pollution Prevention Program and MS4 Permit compliance, the proposed project would not result in degradation of water quality. Therefore, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is required.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-7	**Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?**

Impact Analysis

According to FEMA's Flood Insurance Rate Map, the project site is in Zone X, an area that has 0.2 percent annual chance of a flood hazard, and areas of 1 percent annual chance flood with average depth less than one foot or with drainage areas of less than 1 square mile (FEMA 2019). Construction within flood plains is governed by the City's Municipal Code Chapter 41, Floodplain Management. Section 41.18 sets forth construction requirements for development that would minimize flood hazard risks, including anchoring, elevation, and flood-proofing, and standards for utilities, subdivisions, residential and non-residential construction. As part of the City's involvement in the National Flood Insurance Program, all new developments within designated flood hazard zones, including both the 100-year and 500-year floodplains, would be required to meet specific flood damage avoidance requirements that may include, raising the elevation of habitable space above anticipated flood heights, creating 'freely communicating' structures that allow flood waters to pass through lower levels of buildings; and, ensuring that site design does not result in a reduction of floodplain areas, which could result in increasing flooding conditions downstream (Redwood City 2010a). Furthermore, the proposed project does not include housing. Therefore, there would be no residential buildings subject to flooding impacts and the impact would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-8 Place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Impact Analysis

The project site is in flood Zone X, an area with 0.2 percent or 1 percent annual chance of a flood hazard. As stated above, compliance with the City's Municipal Code Chapter 41, Floodplain Management and requirements established by the City's National Flood Insurance Program, would ensure that the proposed project would not impede or redirect flood flows. Therefore, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-9 Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Impact Analysis

The project site is not mapped in an area protected from 100-year floods by a levee (DWR 2019). The project site is located within the outermost boundaries of the Emerald Lake dam inundation area, which could increase flood hazards at the project site. As part of the City's involvement in the National Flood Insurance Program, all new developments within designated flood hazard zones, including both the 100-year and 500-year floodplains, would be required to meet specific flood damage avoidance requirements. These requirements may include, but not be limited to, raising the elevation of habitable space above anticipated flood heights, creating 'freely communicating' structures that allow flood waters to pass through lower levels of buildings, and ensuring that site design does not result in a reduction of floodplain areas, which could result in increasing flooding conditions downstream (Redwood City 2010a). The proposed project site is at the far north-eastern boundary of the Lower Emerald Lake potential dam inundation area (San Mateo County 2005; Redwood City 2010a). As such, likelihood of flood waters reaching the project site are minimal. Additionally, the General Plan policies and implementation programs within the Public Safety Chapter introduce flood prevention methods to further reduce impacts associated with flooding and flooding hazards in the plan area. Specifically, Policies PS-7.2 and PS-7.4 prioritize improvements to the City's storm drain system that are prone to flooding and consult with upstream jurisdictions to reduce runoff into these areas. Programs PS-27, PS-32, PS-35, PS-48, PS-49, and PS-57 further reduce impacts associated with flooding by requiring new development to be designed to provide protection from impacts of flooding (Redwood City 2010a). The proposed project would comply with the requirements set out in the General Plan EIR and as such project level specific impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact HYD-10 Inundation of seiche, tsunami, or mudflow?

Impact Analysis

The project site, primarily because of its location and topographical characteristics, would not be susceptible to a seiche, tsunami, or mudflow. A seiche affects locations adjacent to larger water bodies such as lakes or reservoirs. The project site is not located near any such water body. Therefore, development of the proposed project would not place people or structures at risk from these types of flooding, and there would be no impact.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.10 LAND USE AND PLANNING

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Physically divide an established community?	☐	☐	☐	☒
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☒	☐
c) Conflict with any applicable habitat conservation plan or natural communities' conservation plan?	☐	☐	☐	☒

3.10.1 Environmental Setting

The project site is partially developed with a concrete foundation in the northwest portion of the site and a vacant one-story commercial building in the southeast corner of the site. There is also a concrete drainage channel that extends across the western portion of the project site. As part of a previously started, but not completed, development project at the site, bridge abutments and foundations were constructed on either side of the concrete drainage channel to allow for the construction of a bridge crossing. However, the previous development project did not complete the bridge crossing. The remaining portions of the project site are vacant and covered with disturbed ruderal vegetation. Development surrounding the project site consists of a mix of uses including, commercial uses to the north, high-density residential uses to the west, commercial and residential uses to the east, and automobile sales and service centers to the south. Caltrain corridor tracks lie to the northeast.

3.10.2 Methodology

Evaluation of potential land use impacts are based on a review of documents pertaining to the proposed project, including the General Plan, General Plan EIR, El Camino Real Corrido Plan, Redwood City Municipal Code, and Zoning Ordinance.

3.10.3 Environmental Impact Analysis

This section discusses potential impacts concerning land use and planning associated with the proposed project and provides mitigation measures where necessary.

Impact LU-1 Physically divide an established community?

Impact Analysis

The proposed project would redevelop an underutilized site, which consists of an unoccupied commercial building. The proposed development would be confined on two contiguous parcels and would not change the overall arrangement of the neighborhood's street network or otherwise prevent movement through the area. The proposed project includes a publicly accessible park space that would facilitate a visual and physical connection between

adjacent uses. This enhanced connection represents a beneficial impact related to community cohesion. No impact related to division of established communities would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact LU-2	**Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the Project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?**

Impact Analysis

General Plan and Zoning Consistency

The primary land use planning documents that govern the project site are the General Plan and Zoning Code. The project site's General Plan land use designation is Mixed-Use Live/Work. The project site's zoning designation is Mixed-Use Live/Work. The proposed project is consistent with both the General Plan and zoning land use designations that allow for development of an office. However, offices with a gross floor area of 2,500 square feet or more in the Mixed-Use Live/Work zoning district require a CUP. The proposed project includes development of a 109,375 square feet office building and therefore would be subject to approval of a CUP. The proposed project would comply with all applicable regulations for its land use and zoning designations. Structures in the Mixed-Use Live/Work zoning district must comply with both the maximum height in stories (3-stories) and in feet (40 feet in height). The proposed office building is three stories and 40-feet high . Maximum height is identified by the start of the rooftop (40 feet for the proposed project). Additionally, the stacked shipping container café would be 16 feet to 18 feet in height and does not exceed maximum height requirements. Therefore, the proposed project would comply with the zoning district guidelines.

The multi-family residential structures to the west of the project site are similar in height to the proposed project. The proposed project meets the maximum height of the MULW zoning district and would not vary from the zoning code requirements relative to height, the proposed height would be consistent with the existing development in the project area. For the reasons described above, the proposed project would not conflict with applicable land use plans, policies, or regulations adopted for the purpose of avoiding an environmental effect, and impacts would be less than significant.

El Camino Real Corridor Plan Consistency

The project site is within the City's El Camino Real Corridor Plan Area, which includes goals, policies, and strategies for street improvements to support walking, bicycling, and economic development. To facilitate walking and biking, the proposed project would include new and improved sidewalks, public walkways, a park, and shared bicycle lanes. Publicly accessible artwork would also be installed at the corner of Lathrop Street and Elm Street, and near the bridge entrance at Maple Street and Lathrop Street. The proposed project would also help in City's economic

development by providing employment spaces for businesses. For these reasons, the proposed project would be compatible with the El Camino Real Corridor Plan.

Plan Bay Area

The project site is located within the El Camino Real Mixed-Use Corridor Priority Development Area (PDA) and is also within the Transit Priority Area (MTC 2018). PDAs are areas within existing communities that local city or county governments have identified and approved for compact development and are served by transit. The proposed project is consistent with the overall regional policy framework of Plan Bay Area because it would redevelop an existing underutilized site within an urban footprint and locate jobs near housing and transit. Therefore, no impact would occur.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact LU-3 Conflict with any applicable habitat conservation plan or natural communities conservation plan?

Impact Analysis

The project site is located within the PG&E Bay Area Operation and Maintenance HCP area. However, this plan only applies to PG&E maintenance activities and would not impact the proposed project. There are no other adopted HCPs, NCCP, nor other similar approved conservation plan within or in close proximity to the project site. Therefore, there would be no impact to any adopted conservation plans.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.11 MINERAL RESOURCES

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Result in the loss of availability of a known mineral resource classified MRZ-2 by the State Geologist that would be of value to the region and the residents of the State?	☐	☐	☐	☒
b) Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?	☐	☐	☐	☒

3.11.1 Environmental Setting

The DOC Division of Mine Reclamation identifies sites with mineral resource potential. The City is not identified as having significant mineral resources and the City's General Plan does not identify any lands zoned or designated for mineral extraction (DOC 2015; Redwood City 2010a). In addition, the Division of Mine Reclamation Assembly Bill 3098 list does not identify any operating mines in the City (DOC 2019).

3.11.2 Methodology

The following analysis is based on review of the General Plan, General Plan EIR, and the DOC Division of Mine Reclamation mineral lands classification map.

3.11.3 Environmental Impact Analysis

This section discusses potential impacts on mineral resources associated with the proposed project and provides mitigation measures where necessary.

Impact MIN-1	**Result in the loss of availability of a known mineral resource classified MRZ-2 by the State Geologist that would be of value to the region and the residents of the State?**

Impact Analysis

According to the DOC Mineral Lands Classification map of Aggregate Resources, the project site is in an area designated Mineral Resource Zone-1, indicating that it is an area in which adequate information indicates that no significant mineral deposits are present, or where it is judged that little likelihood exists for their presence (DOC 1982). No mineral extraction operations exist on or near the project site, and mineral extraction is not included as part of the proposed project. Therefore, the proposed project would not result in the loss of availability of a known mineral resource and no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact MIN-2 Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan?

Impact Analysis

As mentioned under Impact MIN-1, the project site is not identified in the General Plan or by the DOC Division of Mine Reclamation as containing valuable mineral resources. Therefore, the proposed project would not result in the loss of availability of a locally important mineral resource recovery site and no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.12 NOISE

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Result in exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☒	☐	☐
b) Result in exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels?	☐	☐	☒	☐
c) Result in a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☒	☐
d) Result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☒	☐	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport of public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☒

3.12.1 Environmental Setting

The information in this section is summarized from the Noise Technical Memorandum included as Appendix G in this document.

Existing Ambient Noise Levels

The City of Redwood City is exposed to several sources of noise, including traffic on major highways, such as US-101, SR 84, and SR 82, and noise from railways, such as the Caltrain tracks. Traffic noise depends primarily on traffic speed (tire noise increases with speed), proportion of medium and large truck traffic (trucks generate engine, exhaust, and wind noise in addition to tire noise), and number of speed control devices, such as traffic lights (accelerating and decelerating vehicles and trucks can generate more noise).

The loudest source of noise at the project site is the Caltrain tracks, which border the northeast edge of the site (along Pennsylvania Avenue). The total number of trains passing the site is approximately two per hour, except for morning and evening rush hour times, when the total train count can be up to four per hour. Noise from the trains

includes general noise from the interaction of the train wheels on the tracks, warning horns from the train engine, and alarms from the traffic control bars.

Traffic noise in the area is sparse with Main Street being the busiest street. The traffic on Main Street is comprised of primarily vehicles, but also contains medium trucks, company trucks, and construction vehicles. There is very little traffic on Elm and Maple Streets. Other sources of noise at the project site include intermittent construction activity on Lathrop Street, including one backhoe, one truck, two workers, sidewalk activity, and nature-based noises.

A noise survey was conducted between Tuesday, November 20, and Wednesday, November 21, 2018, to establish the existing baseline condition for the proposed project and the results are included in Appendix G.

Sensitive Receptors

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are considered to be more sensitive to noise intrusion than are commercial or industrial activities. Ambient noise levels can also affect the perceived desirability or livability of a development.

The project site is surrounded by a mix of land uses, including commercial spaces and a church to the north, high-density residential uses to the west, commercial and residential uses to the east, and automobile sales and service centers to the south. The sensitive receivers are considered to be the San Jose Obrero Catholic Church across Pennsylvania Avenue to the north and the Franklin Street Apartments across Maple Street to the west.

3.12.2 Methodology

Results from the long-term site measurements were used to provide baseline noise conditions at nearby sensitive receptors and within the project vicinity. For the purpose of this analysis, potential sensitive receptors were determined by reviewing current aerial photography and by walking the project site.

Impacts from future project-related traffic were estimated using predicted traffic counts from the Transportation Impact Analysis report prepared by Kimley-Horn, dated December 2018 (Appendix H).

Short-term site noise data were used as an input to the Federal Highway Administration Roadway Construction Noise Model (RCNM) as the existing ambient noise level input. The RCNM is used as the Federal Highway Administration's national standard for predicting noise generated from construction activities. The RCNM analysis includes the calculation of noise levels (Lmax and Leq) at incremental distances for a variety of construction equipment. The spreadsheet inputs include acoustical use factors, Lmax values, and Leq values at various distances depending on the ambient noise measurement location. For this analysis, it was assumed that a worst-case noise scenario for construction activity would entail the operation of three noisiest pieces of equipment (grader, dozer, and compactor) simultaneously. Noise modeling outputs are included in Appendix G.

3.12.3 Environmental Impact Analysis

This section discusses the potential impacts on noise associated with the proposed project and provides mitigation measures where necessary.

Impact NOI-1 Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Impact Analysis

Exterior Traffic Noise Level Impacts

To describe future noise levels due to traffic added from the peak hour project, a.m. and p.m. peak hour traffic counts with and without the proposed project provided by Kimley-Horn (Appendix H) were used to determine the percentage increase of traffic on the roads adjacent to the project site and adjacent sensitive receivers.

Table 3.12-1 shows the cumulative peak hour counts associated with traffic on the local roadway network both with and without the proposed project. The last columns in the table show the overall percentage change and the estimated difference in peak hour noise level.

Table 3.12-1. Traffic Peak Hour Counts and Estimated Noise Increase

Roadway	Cumulative Peak Hour Traffic Count	Cumulative Peak Hour Traffic Count with Project	Percentage Change	Estimated dB(A) Change
Maple Street	386 (519)	433 (572)	12% (10%)	0.5 (0.4) dB(A)
Lathrop Street	145 (250)	204 (314)	41% (26%)	Still 1 dB(A) or Less
Main Street	475 (703)	506 (727)	7% (3%)	0.3 (0.1) dB(A)
Elm Street	58 (76)	89 (98)	53% (29%)	Still 1 dB(A) or Less

Notes: Numbers in parenthesis are p.m. peak hour traffic volumes.

The proposed project is expected to minimally increase traffic counts along the busiest roads surrounding the project site; Maple Street and Main Street. There would be essentially no change in traffic noise expected along these streets and there would be no impact.

Peak hour traffic counts are expected to significantly increase with the proposed project along Lathrop and Elm Streets. Even though the percentage of traffic is expected to increase, the future noise levels on Lathrop and Elm Streets with the proposed project are not expected to significantly increase over the current conditions, as shown in the table. Therefore, the proposed project would not cause increased traffic noise levels over the baseline conditions at the neighboring sensitive receptors and this would be a less than significant impact.

Interior Traffic and Train Noise Level Impacts

The June 27, 2018, Planning Application drawing set indicates the proposed project would involve a new three-story commercial office building with two levels of below-grade parking. The 2016 California Green Building Standards Code (CalGreen) states if the building is exposed to a noise level of 65 dB(A) Leq-1-hr during any hour of operation, the exterior façade design shall incorporate noise reduction features. Exterior ambient noise measurements indicate the façades of the building facing the Caltrain tracks and corridor would be exposed to 1-hr Leq noise levels up to 78.7 dB(A) and would be subject to this requirement.

In particular, exterior wall and roof-ceiling assemblies exposed to the noise source should meet a composite Sound Transmission Class (STC) rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30) shall be used in all affected areas or wall and roof-ceiling assemblies exposed to the noise source making up the

building or addition envelope or altered envelope shall be constructed to provide an interior noise environment attributable to exterior sources that does not exceed an hourly equivalent noise level (Leq -1Hr) of 50 dBA in occupied areas during any hours of operations.

Therefore, proposed project would incorporate Mitigation Measure NOI-1 for the exterior façade design of the building to be designed to reduce noise levels on the interior of the building to a maximum of 50 dB(A) Leq during normal operating hours.

Project Fixed-Source Noise

Typical commercial building construction involves new rooftop mechanical equipment, air handling units, exhaust fans, and potentially chillers and cooling towers. This equipment generates noise that could radiate to the neighboring properties. Chapter 24 “Noise Regulation” does not currently have any specific noise restrictions for exterior mechanical equipment to neighboring properties. The code section only addresses noise from an assembly of three or more people between the hours of 8:00 p.m. and 7:00 a.m. on weekdays or anytime on weekends and holidays and noise from construction. Therefore, the impact of fixed-source noise to the neighboring properties would be less than significant.

Short-Term Construction Noise Impacts

Two types of short-term noise impacts could occur during construction of the proposed project. First, construction crew commutes and the transport of construction equipment and materials to the project site would incrementally increase noise levels on access roads leading to the project site. This increased traffic would be composed of vehicles, medium trucks, and heavy trucks.

Existing traffic on Main Street and Maple Street already includes a component of construction vehicles and trucks to service the existing commercial facilities, such as PRENAV, Inc. and Cooks Collision. Noise levels along these streets are not expected to increase due to project-related construction traffic.

The second type of short-term noise impact is related to noise generated during construction. Construction activities would include excavation activities and grading, foundation work, building construction, and paving. Each construction stage has its own mix of equipment and, consequently, its own noise characteristics. These various construction operations would change the character of the noise generated at the project site and, therefore, the ambient noise level as construction progresses. The loudest phases of construction include excavation, building construction, and grading phases, as the noisiest construction equipment is earthmoving and grading equipment. Table 3.12-2 below lists types of construction equipment that may be used throughout construction and the maximum and average operational noise level as measured at 100 feet from the operating equipment. The 100-foot distance represents the distance between the northwest edge of the project site and the existing Franklin Street Apartment buildings across Maple Street to the west.

Table 3.12-2. Summary of Federal Highway Administration Roadway Construction Noise Model at Existing Apartment Receiver

Source	Distance to Nearest Sensitive Receptor	Sound Level at Motel		
		Lmax, dB(A)	Acoustical Use Factor (%)	Leq, dB(A)
Backhoe	100 feet	71.5	40	67.6
Compactor (ground)	100 feet	77.2	20	70.2
Crane	100 feet	74.5	16	66.6
Concrete Mixer Truck	100 feet	72.8	40	68.8
Compressor (air)	100 feet	71.6	40	67.7
Bulldozer	100 feet	75.6	40	71.7
Excavator	100 feet	74.7	40	70.7
Front End Loader	100 feet	73.1	40	69.1
Flat Bed Truck	100 feet	68.2	40	64.3
Generator	100 feet	74.6	50	71.6
Grader	100 feet	79.0	40	75.0
Paver	100 feet	71.2	50	68.2
Pickup Truck	100 feet	69.0	40	65.0
Pneumatic Tools	100 feet	79.2	50	76.1
Welder / Torch	100 feet	68.0	40	64.0
Tractor	100 feet	78.0	40	74.0

Source: FHWA 2006, AQ/GHG assumptions (Appendix B)

A reasonable worst-case noise condition for general construction activity is that a grader, pneumatic tools, and a tractor would operate simultaneously at the same location. This represents a conservative scenario, as it assumes that all three pieces of equipment would be operating at the same time and same place. Construction would occur in sequential phases, thus in reality, it is not likely the three loudest pieces of equipment would be operating simultaneously at the exact location of the project site closest to the nearest noise-sensitive receiver. Nevertheless, the RCNM calculated that this scenario would result in a combined noise level of 83.5 dB(A) Lmax and 79.9 dB(A) Leq at the existing apartments 100 feet from the project site.

Although noise levels could range into the “clearly unacceptable” ranges, as defined in the General Plan, construction activities and increases in noise levels from construction activities would be temporary and construction activities would be limited to the restrictions set by Chapter 24 “Noise Regulation”, Division 3 “Construction” of the Redwood City Municipal Code.

In addition to the restrictions listed in the Redwood City Municipal Code, Program PS-63 in the General Plan and the Federal Transit Administration offers construction mitigation measures listed in Section 12.1.3 “Mitigation of

Construction Noise" in the Transit Noise and Vibration Impact Assessment document (FTA-VA-90-1003-06 May 2006). In conclusion, construction noise would be short-term and intermittent. Furthermore, implementation of Mitigation Measure NOI-2 would ensure compliance with the City's construction noise standards; therefore, impacts would be less than significant with mitigation incorporated.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM NOI-1 **Interior Noise Reduction.** Prior to issuance of building permits, the City shall ensure through design review that all facades of the building which have exposure to the rail lines shall be constructed to meet the requirements of the 2016 CalGreen Code, Section 5.507 "Environmental Comfort". In particular, exterior wall and roof-ceiling assemblies exposed to the rail line shall meet a composite STC rating of at least 45 (or OITC 35), with exterior windows of a minimum STC of 40 (or OITC 30). Or, the services of a qualified acoustical consultant may be obtained to conduct a detailed noise study to help design the exterior façade such that the interior noise environment attributable to exterior sources that does not exceed an hourly equivalent noise level (Leq -1Hr) of 50 dBA in occupied areas during any hours of operations.

MM NOI-2 **Construction Noise Reduction.** Implementation of the following multi-part mitigation plan is required to reduce the potential construction period noise impacts.

- Follow all construction noise requirements listed Section 24, Division 3 "Construction" of the Redwood City Municipal Code and Program PS-63 "Enforcing Construction and Maintenance Noise Regulations" in the General Plan.
- Minimize noise from construction activities by enforcing construction hours, including vehicle start-up and preparation.
- Limit construction to the hours of 8:00 a.m. to 5:00 p.m. on weekdays and 9:00 a.m. to 5:00 p.m. on Saturdays, with no noise-generating construction on Sundays or holidays.
- Control noise from construction worker's radios to the point where they are not audible at existing residences that border the project site.
- Equip all internal combustion engine-driven equipment with intake and exhaust mufflers that are in good condition and appropriate for the equipment.
- Locate stationary noise-generating equipment as far as possible from sensitive receptors when sensitive receptors adjoin or are near a construction area.
- Utilize "quiet" air compressors and other stationary noise sources where technology exists.
- The construction contractor would prohibit unnecessary idling of internal combustion engines.
- Notify residents adjacent to the project site of the construction schedule in writing.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact NOI-2 Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels?

Impact Analysis

During construction of the proposed project, equipment such as cranes, excavators, graders, loaders, backhoes, and bulldozers may be used as close as 100 feet from the nearest sensitive receptor. Construction equipment that would

be used during project construction would generate vibration levels between 0.003 peak particle velocity (PPV) and 0.089 PPV at 25 feet, as shown below in Table 3.12-3. All the groundborne vibration levels are below the FTA vibration threshold at which human annoyance could occur of 0.10 PPV. Additionally, construction activities would be temporary in nature and would occur during normal daytime working hours as per the General Plan. Therefore, construction vibrations are not predicted to cause damage to existing buildings or cause annoyance to sensitive receptors, and impacts would be less than significant.

Table 3.12-3. Vibration Source Levels for Construction Equipment

Type of Equipment	Peak Particle Velocity at 25 Feet	Peak Particle Velocity at 50 Feet	Peak Particle Velocity at 100 Feet	Threshold at which Human Annoyance Could Occur	Potential for Project to Exceed Threshold
Large Bulldozer	0.089	0.031	0.011	0.10	None
Loaded Trucks	0.076	0.027	0.010	0.10	None
Small Bulldozer	0.003	0.001	0.000	0.10	None
Auger/Drill Rigs	0.089	0.031	0.011	0.10	None
Jackhammer	0.035	0.012	0.004	0.10	None
Vibratory Hammer	0.070	0.025	0.009	0.10	None

Source: FTA 2006

Impacts due to vibration from the adjacent Caltrain tracks and corridor are addressed in the February 23, 2018 “1180 Main St, Redwood City Vibration Study” report prepared by Mei Wu Acoustics. The study measured ground vibration levels on the foundation of the existing building on the eastern corner of the site; approximately 41 feet from the centerline of the nearest Caltrain corridor track, for a minimum of 24 hours. All measurements were then compared to the limits in the Federal Transit Administration (FTA) “Transit Noise and Vibration Impact Assessment” document FTA-VA-90-1003-06, Table 8.1 as a guideline to assess vibration impacts. The Mei Wu Study concluded all measured events were considered acceptable by the FTA guidelines, except for two very short intermittent events that exceeded 83 dB and only one of these events occurred during the day when the building would be occupied. Therefore, the impact from rail line vibration would be less than significant and no further mitigation measures were recommended. Please refer to the report for further discussion of the vibration measurements and results (Appendix G).

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact NOI-3	A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Impact Analysis

As discussed in the long-term operational impact discussion in Impact NOI-1, it is not anticipated that implementation of the proposed project would expose future employees and visitors to significant increases in noise levels. Additionally, the proposed project's contribution to traffic noise would not permanently result in a perceptible permanent increase in ambient noise levels at the project site. Therefore, noise levels with implementation of the proposed project would result in a less than significant impact.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact NOI-4	A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Impact Analysis

Please refer to the "Short-Term Construction Noise" discussions under Impact NOI-1. Noise levels with implementation of the proposed project would result in a less than significant impact with the incorporation of Mitigation Measure NOI-2.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measure NOI-2 is required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact NOI-5	For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Impact Analysis

The nearest public airport to the project site is the San Carlos Airport, located approximately 2.6 miles northwest of the project site. The project site falls well outside the 55 dBA CNEL contour line for the San Carlos Airport as shown in Figure PS-9 in the General Plan (Redwood City 2010a). Therefore, no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact NOI-6	**For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?**

Impact Analysis

No private airstrips or helipads are located within the proximity of the project site (Tollfree 2018). Therefore, no impacts would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.13 POPULATION AND HOUSING

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☒	☐
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒
c) Displace substantial numbers of people necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☒

3.13.1 Environmental Setting

According to the U.S. Census, the City's population has grown from 76,815 in 2010 to 86,685 in 2017, an approximate 12.8 percent increase (U.S. Census Bureau 2019). The City is currently the third largest city in San Mateo County (State of California Department of Finance 2018). Population is projected to increase to 92,400 people by 2030, an approximate 21.4 percent increase and San Mateo County population is projected to increase by 17.6 percent (Redwood City 2010a).

3.13.2 Methodology

The evaluation of potential population, housing, and employment impacts of the proposed project is based on review of the General Plan, General Plan EIR, and population data compiled by the California Department of Finance. The following impact discussions consider the effects of the proposed project related to employment, population, and housing in the City.

3.13.3 Environmental Impact Analysis

This section discusses potential impacts on population and housing associated with the proposed project and provides mitigation measures where necessary.

Impact POP-1 **Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?**

Impact Analysis

The project site and surrounding area are designated Mixed Use Live/Work by the General Plan, which provides opportunities for a mix of live/work, light industrial, technology, creative industry, and limited office, and complementary uses. According to the City's General Plan, stand-alone commercial or industrial workspace areas are permitted, provided that activities limit or confine noise, dust, and vibration impacts, are low impact in nature, and are compatible with any nearby existing or allowed residential uses (Redwood City 2010a). The proposed project is a

commercial office building. Since the project does not include any housing there is no direct impact on population growth in the area. There is a potential for indirect impacts to population once the project construction is complete and the commercial office building is in use (discussed below).

The proposed project would require up to 100 construction workers during the peak construction phase. It is anticipated that the construction workforce would be available from nearby areas and that the proposed project would not affect the population of the City. In addition, the project site is within commuting distance of the greater San Francisco Bay Area, so construction workers are not expected to relocate. Temporary construction activities are not expected to increase the demand for housing, and the impacts would be less than significant.

Operation of the proposed project could potentially create new jobs and increase the demand for new employees. The growth that would occur from the proposed project is accounted for in the City's General Plan and General Plan EIR. The potential increase in employment opportunities associated with the proposed project would not directly or indirectly induce substantial population growth; therefore, the proposed project would result in a less than significant impact.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact POP-2 Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?

Impact Analysis

There are no residential dwelling units on-site. As such, the proposed project would not displace any existing housing and therefore, no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact POP-3 Displace substantial numbers of people necessitating the construction of replacement housing elsewhere?

Impact Analysis

The project site is mostly undeveloped (except for a vacant one-story commercial building) and does not contain any on-site residential dwelling units. As such, the proposed project would not result in the displacement of people or require the construction of replacement housing. No impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.14 PUBLIC SERVICES

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:				
• Fire protection?	☐	☐	☒	☐
• Police protection?	☐	☐	☒	☐
• Schools?	☐	☐	☐	☒
• Parks?	☐	☐	☐	☒
• Other public facilities?	☐	☐	☐	☒

3.14.1 Environmental Setting

Fire Protection

The Redwood City Fire Department (RCFD) provides fire suppression, fire prevention, and emergency medical service within the City. The project area is within fire response area 31 and the closest fire station to the project site is Fire Station 9, which is approximately 0.5 miles north of the project site at 755 Marshall Street. Fire Station 10 is approximately 0.95 miles southwest of the project site at 2190 Jefferson Ave. The RCFD includes seven fire stations and provides service to residents and businesses within City limits.

Police Protection

The Redwood City Police Department (RCPD) provides police protection services for the City. The RCPD is located at 1301 Maple Street, which is approximately 0.9 miles from the project site. The RCPD is comprised of 96 sworn officers, 36 civilian employees, 4 reserve officers, and 25 volunteers. The established response time goal of five minutes or less for all emergency calls was met during the 2007-2008 fiscal year (data that was available at the time that the General Plan EIR was written) (Redwood City 2010b). The RCPD collaborates with the RCFD, the Redwood City Emergency Operations Center, and the San Mateo County Office of Emergency Services to provide emergency services in accordance with the Emergency Services Organization (ESO). The ESO is an interagency agreement outlining the various roles and functions each agency assumes when a large-scale emergency or area-wide disaster strikes. These roles are well defined in order to maintain a steady and secure response and recovery (Redwood City 2010a). The project site is located within Beat-3.

Schools

The City is served by three public school districts: Redwood City School District, Belmont-Redwood Shores School District, and Sequoia Union High School District. The project site is within the Redwood City School District and the

school attendance zone is Hoover Elementary School. The nearest school is Hoover Elementary School, located approximately 0.7 miles east of the project site.

Parks

The City's Parks, Recreation, and Community Services Department manages the 23 parks, various recreational facilities, and open space areas within the City (Redwood City 2019). Additionally, San Mateo County manages Edgewood Park & Natural Preserve, which is within City limits and approximately 3.25 miles away from the project site. The nearest park to the project site is Roselli Mini-Park, which is less than one block away on Pennsylvania Avenue. There is also a dog park, Main Street Dog Agility Park, located just south east of the project area on the opposite side of Main Street.

Other Facilities

There are five libraries within Redwood City limits. The closest library to the project site is the Downtown Library which is approximately 0.25 miles away at 1044 Middlefield Road. There are two community centers within 1 mile of the project site: Red Morton Community Center and Fair Oaks Community Center.

3.14.2 Methodology

The following analysis is based on a review of documents pertaining to the proposed project, including the General Plan, General Plan EIR, and the Redwood City Municipal Code.

3.14.3 Environmental Impact Analysis

This section discusses potential impacts on public services associated with the proposed project and provides mitigation measures where necessary.

Impact PUB-1	**Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for any of the public services:** **Fire protection?** **Police protection?** **Schools?** **Parks?** **Other public facilities?**

Impact Analysis

Fire Protection

Fire service is currently provided to the project site by RCFD. Development of the proposed project could result in an increased demand for fire protection. As required by the California Fire Code, the proposed project would be required

to include site-specific design features such as ensuring appropriate emergency access and requiring structures to be built with approved building materials. Conformance with this code reduces the risks associated with fire hazards. Site access would allow entry to the building via several entry points. The proposed 64-foot-wide bridge over the drainage channel, which would provide access to the building's main entrance on Maple Street, would be designed and built to appropriately provide clearance for Fire Apparatus Access to the main entrance.

The proposed project is not expected to result in substantial adverse impacts to fire protection services and emergency services. With two existing fire stations within 1 mile of the project site (as described above), the increase in potential services needed would not require significant expansion or construction of a new fire station. In addition, the proposed project would comply with the current fire codes, building codes, and the City's Municipal Code. Therefore, there would be no need for new or expanded fire department facilities to serve the proposed project. Impacts would be less than significant.

Police Protection

Police service is currently provided to the project site by RCPD. Development of the project could result in an increased demand for protection services. However, the proposed project is not expected to result in substantial adverse impacts on police services. As described above, the City's existing police department is within 1 mile of the project site, which would allow timely access to calls generated at the site. Therefore, impacts would be less than significant.

Schools

The proposed project does not include residential uses that would induce population growth or increase student enrollment in the project area. The proposed project would not require the construction of new or expansion of existing school facilities. Therefore, the proposed project would have no impact on school facilities.

Parks

As discussed in the recreation section of this ISMND the proposed project would not substantially increase the use of nearby recreation facilities. The project would include a 10,000 square feet on-site publicly accessible park space. Having this park at the project site would reduce use of nearby parks. Therefore, the proposed project would not create adverse physical impacts to nearby parks and there would be no impact.

Other Public Facilities

The proposed project would not include residential uses that would induce population growth in the project area. It is anticipated that construction workers already live in the local area and commute to the project site. No significant increase to use of public facilities would occur and the proposed project would not require the construction or expansion of other public facilities. Therefore, there would be no impact to other public facilities.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.15 RECREATION

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☒	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☒

3.15.1 Environmental Setting

The City's Parks, Recreation, and Community Services Department manages the 23 parks, various recreational facilities, and open space areas within the City (Redwood City 2010a). Additionally, San Mateo County manages Edgewood Park & Natural Preserve, which is within City limits and approximately 3.25 miles away from the project site. The nearest park to the project site is Roselli Mini-Park, which is less than one block away on Pennsylvania Avenue. There is also a dog park, Main Street Dog Agility Park, located just south east of the project area on the opposite side of Main Street.

The proposed project would comply with Section 55.6.D.2 of the City's Municipal Code and include indoor, ground floor parking for 72 bikes and outdoor parking for 26 visitor bikes (Redwood City 2018a). The proposed project would also include a 10,000 square feet on-site publicly accessible park space. The proposed project would include landscaping and public seating areas at the building's main entrance on Maple Street.

3.15.2 Methodology

The following analysis is based on a review of the General Plan and the General Plan EIR and the Redwood City Municipal Code.

3.15.3 Environmental Impact Analysis

This section discusses potential impacts related to recreational facilities associated with the proposed project and provides mitigation measures where necessary.

Impact REC-1	**Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?**

Impact Analysis

The proposed project would involve the development of a commercial office building. The project would not include a residential component and would not permanently increase the City's residential population. It is expected that employees that work at the proposed office building would already reside in or near the City and would not

substantially increase the use of nearby recreation facilities. The proposed project would include a 10,000 square feet on-site publicly accessible park space. Therefore, the proposed project would not result in the deterioration of City recreational facilities, and there would be a less than significant impact.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact REC-2	**Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?**

Impact Analysis

The proposed project would involve the development of 10,000 square feet on-site publicly accessible park space, a portion of which crosses over the concrete drainage channel. As discussed in Section 3.4, Biological Resources, no work would occur in the channel. Therefore, there would be no adverse physical effect on the environment related to recreation facilities.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

3.16 TRAFFIC AND TRANSPORTATION

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	☐	☒	☐	☐
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways	☐	☐	☒	☐
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that result in substantial safety risks?	☐	☐	☐	☒
d) Substantially increase hazards to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☒	☐	☐
e) Result in inadequate emergency access?	☐	☐	☒	☐
f) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?	☐	☒	☐	☐

3.16.1 Environmental Setting

The information in this section is summarized from the Traffic Impact Analysis Report prepared by Kimley-Horn in December 2018. The complete report is included as Appendix H in this document.

Existing Roadway Network

The proposed project would generate new vehicular trips that would increase traffic volumes on the nearby street network as described below.

El Camino Real is a four-lane north-south boulevard. El Camino Real runs parallel to US-101 and connects multiple cities in the Bay Area from Daly City to the north and Santa Clara to the south. The posted speed limit on El Camino Real within the study area is 35 miles per hour.

Bay Road begins as a residential two-lane roadway to the west at Beech Street and continues east as a four-lane industrial street, serving commercial and industrial land uses within the study area. The speed limit on Bay Road is 30 miles per hour.

Beech Street is a two-lane local road with on-street parking. Within the study area, Beech Street begins at El Camino Real and terminates just south of the Caltrain corridor tracks serving industrial land uses. Beech Street continues north of the Caltrain corridor tracks and serves residential land uses. Within the study area, the speed limit on Beech Street is 25 miles per hour.

Broadway is an east-west industrial street, which runs between Hopkins Avenue and Fifth Avenue. Between Hopkins Avenue and El Camino Real, Broadway is a two-lane roadway with bicycle lanes that serves residential land uses. Within the downtown area, between El Camino Real and Woodside Road, there are two to four lanes along Broadway with either on-street parking or bicycle lanes. East of Woodside Road, Broadway is a four-lane road with a two-way left-turn lane (TWLTL) and shared bicycle lanes (sharrows) or bicycle lanes. West of Woodside Road, the posted speed limit is 25 miles per hour on Broadway and 30 miles per hour east of Woodside Road.

Chestnut Street is a two-lane, local street with on-street parking. There is an at-grade crossing with the Caltrain corridor tracks near the Pennsylvania Avenue. Within the study area, Chestnut Street, serves industrial land uses and serves residential and commercial land uses north of the Caltrain corridor tracks. Chestnut Street connects with Veterans Boulevard to the north and El Camino Real to the south. Within the study area the speed limit on Chestnut Street is 25 miles per hour.

Elm Street is a two-lane local street with on-street parking. Elm Street runs between Lathrop Street and Main Street. Left turns from Elm Street onto Main Street are prohibited. Entrance to the proposed project's garage is located off Elm Street. The speed limit on Elm Street is 25 miles per hour.

Franklin Street is a two-lane local street with on-street parking that serves residential uses. Franklin Street begins at Jefferson Avenue and becomes Lathrop Street at Maple Street. The speed limit on Franklin Street is 25 miles per hour.

Jefferson Avenue is a connector street that connects the residential and downtown area in Redwood City. West of Middlefield Road, Jefferson Avenue is a four-lane roadway with on-street parking and shared bicycle lanes and a speed limit of 30 miles per hour. East of Middlefield Road, Jefferson Avenue becomes a two-lane roadway with on-street parking and a speed limit of 25 miles per hour.

Lathrop Street is a two-lane local roadway with on-street parking that serves industrial land uses. Lathrop Street connects with El Camino Real and turns into Franklin Street at Maple Street. The speed limit on Lathrop Street is 25 miles per hour.

Main Street is a two-way roadway that runs between El Camino Real and Veterans Boulevard. Within the study area, Main Street is designated as a local street with on-street parking and serves industrial land uses. North of Middlefield Road, Main Street is designated as a pedestrian street with on-street parking and a TWLTL in some segments. There is a median island on Main Street from the Caltrain corridor tracks towards Elm Street to prevent cars heading downtown from accessing the tracks when the gate arms are down. Within the study area the speed limit on Main Street is 30 miles per hour. There is an at-grade crosswalk with the Caltrain corridor tracks, just north of Elm Street.

Maple Street is north-south roadway that runs from Redwood Creek to El Camino Real. Within the study area south of Main Street, it is designated in the General Plan as a two-lane pedestrian street and as a Neighborhood Main

Street in Redwood City Moves (RWCMoves). Maple Street has Class II bike lanes and a speed limit of 25 miles per hour that serves residential purposes. North of Main Street, Maple Street is predominantly a two-lane street with on-street parking, and a speed limit of 25 miles per hour. From Main Street to Middlefield Road, Maple Street is one-way in the southbound direction with on-street parking. North of Marshall Street, there is no on-street parking and the posted speed limit is 30 miles per hour.

Middlefield Road is an east-west connector street that connects the residential and downtown areas. East of Maple Street, Middlefield Road is a two-lane roadway with a two-way left-turn lane, on street parking, and Class II bicycle lanes with a speed limit of 30 miles per hour. West of Maple Street, Middlefield Road is primarily a two-lane roadway with on-street parking and a speed limit of 25 miles per hour.

Woodside Road is a north-south, designated boulevard that connects to Interstate 280 and US-101. Within the study area, Woodside Road is a four to five-lane roadway. South of US-101, Woodside Road is designated as SR 84. The posted speed limit is 35 miles per hour.

Existing Transit Facilities

SamTrans Bus Services

SamTrans has multiple bus routes near the project site. Routes 79, 274, 275, 278, 296, and 397 service the nearby area of the proposed project. Route ECR RAPID is a rapid bus service that runs along El Camino Real from the Daly City BART station to the Palo Alto Transit Center. In the vicinity of the project site, Route ECR RAPID runs on El Camino Real along Jefferson Avenue and Woodside Road, with the nearest bus stop at the Redwood City Transit Center, located less than 0.5 miles from the project site.

Caltrain

Caltrain provides commuter-heavy rail services between San Francisco County and Santa Clara County. The Redwood City Caltrain station is located on James Avenue, approximately 0.5 miles west of the project site. During the weekday a.m. peak, the station is served by three northbound limited-stop trains, two northbound baby bullet trains, six southbound limited-stop trains, and two southbound baby bullet trains. During the weekday p.m. peak, the station is served by four northbound limited-stop trains, three northbound baby bullet trains, three southbound limited-stop trains, and two southbound baby bullet train. Those taking Caltrain may transfer to SamTrans bus routes ECR, 95, 274, 275, 276, 278, 295, 296, 397, 398 and RAPID.

Existing Pedestrian Facilities

Sidewalks and crosswalks are mostly provided throughout the project area in Redwood City to allow pedestrians to access nearby transit stops, residential uses, and commercial uses. There are existing sidewalks present for the majority of the area surrounding the project site, except adjacent to the project site along Lathrop Street and Maple Street. There are no marked crosswalks directly adjacent to the project site.

Caltrain tracks are located immediately north of the project site. Pedestrians may cross the Caltrain corridor tracks on the east side of Main Street or on either side of Maple Street.

Existing Bicycle Facilities

Class II bicycle lanes are located throughout the City. The following is a list of the Class II bicycle lanes near the study area:

- Brewster Avenue between Perry Street and Main Street
- Broadway between Chestnut Street and Woodside Road
- Main Street between Convention Way and Veterans Boulevard
- Maple Street between El Camino Real and Pennsylvania Avenue
- Marshall Street between Arguello Street and Walnut Street
- Middlefield Road between Marshall Street and Veterans Boulevard and between Cassia Street and Woodside Road
- Veterans Boulevard between Whipple Avenue and Chestnut Street
- Walnut Street from Bradford Street to Veterans Boulevard
- Winslow Street from Broadway and Howland Street

Class III bicycle routes are located throughout the City. The following is a list of the Class III bicycle routes near the study area:

- Arguello Street between Brewster Avenue and Broadway
- Broadway between Winslow Street and Marshall Street and between Woodside Road and Charter Street
- Charter Street between Broadway and Middlefield Road
- Jefferson Avenue between Alameda de las Pulgas and El Camino Real
- Maple Street between Pennsylvania Avenue and Main Street
- Middlefield Road/Winslow Street between Broadway and Cassia Street
- Middlefield Road between Woodside Road and Douglas Avenue
- Roosevelt Avenue between Upton Street and El Camino Real

Existing Intersection Level of Service

Traffic operations were evaluated at the study intersections under existing traffic conditions. Results of the analysis are presented in Table 3.16-1. As shown in the table and presented in Appendix H, all study intersections function within acceptable Level of Service (LOS) standards under this scenario, except for the following intersections:

- #3 – El Camino Real / Beech Street (a.m. Peak Hour)
- #14 – Main Street / Pine Street – SR 84 Ramps (p.m. Peak Hour)
- #17 – Woodside Road (SR 84) / Middlefield Road (a.m. and p.m. Peak Hours)
- #19 – Woodside Road (SR 84) / Broadway (a.m. and p.m. Peak Hours)

Table 3.16-1. Existing Intersection Level of Service Summary

#	Intersection	LOS Criteria	Jurisdiction	Control	Existing			
					a.m. Peak		p.m. Peak	
					LOS	Delay (sec)[1]	LOS	Delay (sec)[1]
1	El Camino Real / Jefferson Avenue	D	City / Caltrans	Signal	D	51.8	D	48.5
2	El Camino Real / Maple Street	D	City / Caltrans	Signal	A	6.1	A	9.5
3	El Camino Real / Beech Street	D	City / Caltrans	SSSC	**E**	**35.3**	D	28.0
4	El Camino Real / Chestnut Street	D	City / Caltrans	Signal	B	14.7	B	19.5
5	Franklin Street-Lathrop Street / Maple Street	D	City	SSSC	B	11.9	C	15.6
6	Lathrop Street / Elm Street[2]	D	City	-	Uncontrolled Intersection			

#	Intersection	LOS Criteria	Jurisdiction	Control	Existing			
					a.m. Peak		p.m. Peak	
					LOS	Delay (sec)[1]	LOS	Delay (sec)[1]
7	Lathrop Street / Beech Street	D	City	SSSC	B	10.4	B	10.7
8	Lathrop Street. Chestnut Street	D	City	SSSC	B	11.6	B	13.9
9	Elm Street / Project Driveway (Future)	D	City	SSSC	Future Intersection			
10	Main Street / Maple Street	D	City	SSSC	B	10.8	B	10.6
11	Main Street / Elm Street	D	City	SSSC	A	9.1	B	10.4
12	Main Street / Beech Street	D	City	SSSC	B	10.5	B	12.4
13	Main Street / Chestnut Street	D	City	Signal	B	16.3	B	19.6
14	Main Street / Pine Street-SR 84 Ramps	D	City	SSSC	C	21.0	**F**	**62.3**
15	Middlefield Road / Main Street	D	City	Signal	C	29.2	C	34.9
16	Middlefield Road / Chestnut	D	City	Signal	B	15.3	B	19.0
17	Woodside Road (SR 84) / Middlefield Road[3]	E	City / Caltrans	Signal	**F**	**99.2**	**F**	**112.9**
18	Woods ide Road (SR 84) / Bay Road	D	City / Caltrans	Signal	D	37.7	D	39.0
19	Woodside Road (SR 84) / Broadway	D	City / Caltrans	Signal	**E**	**74.6**	**F**	**81.6**

Note:
SSSC – Side-Street Stop Control
Intersections that are operating below acceptable levels are shown in **BOLD**.
[1] The average control delay is reported for signalized intersections. The delay for the worst movement is reported for SSSC intersections.
[2] Intersection #6 – Lathrop Street / Elm Street is an uncontrolled intersection and removed from analysis.
[3] Intersection #17 – Woodside Road (SR 84) / Middlefield Road is a Congestion Management Program intersection with a LOS threshold of E.

3.16.2 Methodology

Analysis of significant environmental impacts at intersections and freeway segments was based on the methodology of LOS. The LOS of an intersection is a qualitative measure used to describe operational conditions. LOS ranges from A (best), which represents minimal delay, to F (worst), which represents heavy delay and a facility that is operating at or near its functional capacity. The LOS standard for City of Redwood City intersections is LOS D except for City/Council Association of Governments of San Mateo County designated Congestion Management Program (CMP) intersections, which allows for a minimum LOS E. Project impacts at City of Redwood City signalized intersections would be considered significant if one of the following criteria is met:

1. If the intersection operates at an acceptable LOS (e.g., LOS A, B, C, or D for City intersections and LOS A, B, C, D or E for CMP intersections) without the project and degrades to an unacceptable LOS (e.g., LOS E, or F) with the project; or
2. If the intersection operates at an unacceptable LOS (e.g., LOS E, or F for City intersections or LOS F for CMP intersections) without the project and the project increases the delay by five (5) or more seconds.

Project impacts at City of Redwood City unsignalized intersections would be considered significant if one of the following criteria is met:

1. If the intersection operates at an acceptable LOS (e.g., LOS A, B, C, or D) without the project and degrades to an unacceptable LOS (e.g., LOS E, or F) with the project and the traffic volumes at the intersection satisfy the California Manual of Uniform Traffic Control Devices Peak Hour Volume warrant for traffic signal installation; or
2. If the intersection operates at an unacceptable LOS (e.g., LOS E, or F) without the project and the project increases the delay by five (5) or more seconds and the traffic volumes at the intersection satisfy the California Manual of Uniform Traffic Control Devices Peak Hour Volume warrant for traffic signal installation.

The scenarios analyzed in the analysis are as follows:

- **Existing Conditions** – Based on traffic counts taken in March 2016, April 2017, and May 2018 and existing roadway geometry and traffic control in 2018.
- **Existing Plus Project Conditions** – Based on traffic generated by the proposed project added to existing traffic volumes. Existing roadway geometry with proposed project roadway improvements and traffic controls are assumed for this scenario.
- **Background Condition** – Based on traffic from approved projects in the study area (provided by City staff and dated June 2018) added to existing traffic volumes.
- **Background Plus Project Conditions** – Based on traffic from approved projects in the study area and traffic generated by the proposed project added to existing traffic volumes.
- **Cumulative Conditions** – Based on traffic from approved and pending projects in the study area (provided by City staff and dated June 2018) added to existing traffic volumes.
- **Cumulative Plus Project Conditions** – Based on future cumulative year traffic projections and traffic generated by the proposed project.

The following 19 intersections were selected for traffic analysis to evaluate the a.m. and p.m. peak hour traffic. Intersection #9 is the future intersection pursuant to proposed project construction.

1. El Camino Real / Jefferson Avenue
2. El Camino Real / Maple Street
3. El Camino Real / Beech Street
4. El Camino Real / Chestnut Street
5. Franklin Street-Lathrop Street / Maple Street
6. Lathrop Street / Elm Street
7. Lathrop Street / Beech Street
8. Lathrop Street / Chestnut Street
9. Elm Street / Project Driveway
10. Main Street / Maple Street
11. Main Street / Elm Street
12. Main Street / Beech Street
13. Main Street / Chestnut Street
14. Main Street / Pine Street-SR 84 Ramp
15. 15 Middlefield Road / Main Street
16. Middlefield Road / Chestnut Street
17. Woodside Road (SR 84) / Middlefield Road
18. Woodside Road (SR 84) / Bay Road
19. Woodside Road (SR 84) / Broadway

3.16.3 Environmental Impact Analysis

This section discusses potential impacts on traffic and transportation associated with the proposed project and provides mitigation measures where necessary.

Impact TRANS-1 Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?

Impact Analysis

Construction

The proposed project would be completed over a period of 23 months and would result in construction traffic on nearby roadway network. As noted in Section 2.0, Project Description, 100 workers are estimated during the peak construction phase. Assuming all workers are driving solo to the project site, there would be 100 two-way trips. Since construction traffic would be temporary and spread across the construction duration, the proposed project would not cause streets in the project area to exceed LOS thresholds. Additionally, the proposed project would include preparation of a traffic control plan (TCP) as part of encroachment permits from the City that would include detours, emergency access, and appropriate traffic controls during construction. Therefore, construction impacts would be less than significant.

Operations

Project Trip Generation

Trips generated by the proposed project were based on the average rates for ITE Land Use 710 (General Office Building). Since the project site is within 0.5 miles from the Redwood City Caltrain station, a transit reduction was applied. The proposed project is also located close to downtown and mixed land uses; therefore, an MXD (mixed-use development) reduction was also applied. Table 3.16-2 presents the trip generation for the proposed project. As shown in the table, the proposed project would generate 105 vehicle trips in the a.m. peak hour and 97 vehicle trips in the p.m. peak hour.

Table 3.16-2. Project Trip Generation Summary

ITE Land Use Code	Land Use	Size	Units	Daily Trips	a.m. Peak			p.m. Peak		
					Total	In	Out	Total	In	Out
710	General Office Building	112.113	KSF	1,092	130	112	18	129	21	108
Transit Reduction[1]				-73	-9	-8	-1	-7	-1	-6
Mixed-Use Reduction[2]				-229	-16	-14	-2	-25	-4	-21
Total External Project Trips				**1019**	**105**	**90**	**15**	**97**	**16**	**81**

Notes:

[1] Utilized transit reduction rate from Redwood City Downtown Precise Plan of 7.3% for the a.m. peak and 6.0% for the p.m. peak. Transit reduction rate for daily trips 6.66% (average of a.m. and p.m. reduction).

[2] Utilized mixed-used reduction rate from Redwood City Downtown Precise Plan of 12.3% for the a.m. and 19.1% for the p.m.

Existing Plus Project Level of Service

Traffic operations were evaluated at the study intersections under existing conditions plus traffic generated by the proposed project. Results of the analysis are presented in Table 3.16-3. As shown in the table, all study intersections would function within acceptable LOS standards under this analysis scenario, except for the following intersections:

- #3 – El Camino Real / Beech Street (a.m. Peak Hour)
- #14 – Main Street / Pine Street – SR 84 Ramps (p.m. Peak Hour)
- #17 – Woodside Road (SR 84) / Middlefield Road (a.m. and p.m. Peak Hours)
- #19 – Woodside Road (SR 84) / Broadway (a.m. and p.m. Peak Hours)

This impact would be less than significant as proposed project would not increase the delay by five (5) or more seconds at the intersections operating unacceptably without the proposed project.

Table 3.16-3. Existing Plus Project Intersection Level of Service Summary

#	Intersection	LOS Criteria	Jurisdiction	Control	Existing Plus Project					
					a.m. Peak			p.m. Peak		
					LOS	Delay (sec)[1]	Delay Var	LOS	Delay (sec)[1]	Delay Var
1	El Camino Real / Jefferson Avenue	D	City / Caltrans	Signal	D	52.0	0.2	D	49.0	0.5
2	El Camino Real / Maple Street	D	City / Caltrans	Signal	A	6.5	0.4	A	9.8	0.3
3	El Camino Real / Beech Street	D	City / Caltrans	SSSC	**E**	**36.0**	**0.7**	D	32.3	4.3

7	Lathrop Street / Beech Street	D	City	SSSC	B	10.6	0.2	B	10.8	0.1
8	Lathrop Street. Chestnut Street	D	City	SSSC	B	11.6	0.0	B	13.9	0.0
9	Elm Street / Project Driveway (Future)	D	City	SSSC	A	8.9	-	A	9.1	-
10	Main Street / Maple Street	D	City	SSSC	B	11.1	0.3	B	11.0	0.4
11	Main Street / Elm Street	D	City	SSSC	A	9.2	0.1	B	10.5	0.1

#	Intersection	LOS Criteria	Jurisdiction	Control	Existing Plus Project					
					a.m. Peak			p.m. Peak		
					LOS	Delay (sec)[1]	Delay Var	LOS	Delay (sec)[1]	Delay Var
12	Main Street / Beech Street	D	City	SSSC	B	10.8	0.3	B	12.9	0.5
13	Main Street / Chestnut Street	D	City	Signal	B	16.6	0.3	B	19.5	-0.1
14	Main Street / Pine Street-SR 84 Ramps	D	City	SSSC	C	21.1	0.1	**F**	**63.8**	**1.5**
15	Middlefield Road / Main Street	D	City	Signal	C	29.7	0.5	D	35.1	0.2
16	Middlefield Road / Chestnut	D	City	Signal	B	15.5	0.2	B	19.3	0.3
17	Woodside Road (SR 84) / Middlefield Road[4]	E	City / Caltrans	Signal	**F**	**101.4**	**2.2**	**F**	**115.3**	**2.4**
18	Woodside Road (SR 84) / Bay Road	D	City / Caltrans	Signal	D	38.2	0.5	D	38.9	-0.1
19	Woodside Road (SR 84) / Broadway	D	City / Caltrans	Signal	**E**	**75.2**	**0.6**	**F**	**82.4**	**0.8**

Notes:
SSSC – Side-Street Stop Control
AWSC – All-Way Stop Control
Intersections that are operating below acceptable levels are shown in **BOLD**.
[1] The average control delay is reported for signalized intersections. The delay for the worst movement is reported for SSSC intersections.
[2] Intersection #5 – Franklin Street-Lathrop Street / Maple Street becomes an all-way stop control intersection with the proposed project.
[3] Intersection #6 – Lathrop Street / Elm Street is an uncontrolled intersection becomes a side-street stop control intersection with the Project.
[4] Intersection #17 – Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

Background Level of Service

Intersection LOS was evaluated at the study intersections for both Background and Background Plus Project scenarios and are presented in Table 3.16-4. As shown in the table, all study intersections function within acceptable LOS standards under these scenarios, except for the following intersections:

- #3 – El Camino Real / Beech Street (a.m. Peak Hour for Background Scenario; and a.m. and p.m. Peak hours for Background Plus Project scenario)
- #14 – Main Street / Pine Street – SR 84 Ramps (p.m. Peak Hour for both scenarios)
- #17 – Woodside Road (SR 84) / Middlefield Road (p.m. Peak Hour for both scenarios)
- #18 – Woodside Road (SR 84) / Bay Road (p.m. Peak Hour for both scenarios)
- #19 – Woodside Road (SR 84) / Broadway (a.m. and p.m. Peak Hours for both scenarios)

The proposed project would not increase the delay by five (5) or more seconds at most of the intersections operating unacceptably without the proposed project. The p.m. peak hour LOS for El Camino Real / Beech Street intersection would increase by 5 seconds. However, this intersection is unsignalized and volumes do not satisfy peak hour

volume signal warrant as discussed below in Table 3.16-6. Intersection # 14 Main Street / Pine Street-SR 84 Ramps meets the signal warrant analysis as per Table 3.16-6, however, the increase in LOS is less than 5 seconds. Therefore, this impact would be less than significant.

Table 3.16-4. Background Intersection Level of Service Summary (With and Without Project)

#	Intersection	LOS Criteria	Background				Background Plus Project					
			a.m. Peak		p.m. Peak		a.m. Peak			p.m. Peak		
			LOS	Delay (sec)[1]	LOS	Delay (sec)[1]	LOS	Delay (sec)[1]	Delay Var	LOS	Delay (sec)[1]	Delay Var

19	Woodside Road (SR 84) / Broadway	D	**F**	**148.5**	**F**	**162.6**	**F**	**149.5**	**1.0**	**F**	**163.7**	**1.1**

Notes:
SSSC – Side-Street Stop Control
AWSC – All-Way Stop Control
Intersections that are operating below acceptable levels are shown in **BOLD**.
[1] The average control delay is reported for signalized intersections. The delay for the worst movement is reported for SSSC intersections.
[2] Intersection #5 – Franklin Street-Lathrop Street / Maple Street becomes an all-way stop control intersection with the proposed project.
[3] Intersection #6 – Lathrop Street / Elm Street becomes a side-street stop control with the Project.
[4] Intersection #17 – Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

Cumulative Level of Service

Under Cumulative conditions, the following lane geometry improvements were assumed:

- Intersection #9 – Elm Street/ Project Driveway: Northbound approach as the driveway for Block D of the proposed 1601 El Camino Real project.

Intersection LOS was evaluated at the study intersections for both Cumulative and Cumulative Plus Project scenarios and are presented in Table 3.16-5. As shown in the table, all study intersections function within acceptable LOS standards under these scenarios, except for the following intersections:

- #1 – El Camino Real / Jefferson Avenue (a.m. and p.m. Peak Hours for both scenarios)
- #3 – El Camino Real / Beech Street (a.m. and p.m. Peak Hours for both scenarios)
- #5 – Franklin Street-Lathrop Street / Maple Street (p.m. Peak Hour for Cumulative scenario)
- #13 – Main Street / Chestnut Street (p.m. Peak Hour for both scenarios)
- #14 – Main Street / Pine Street – SR 84 Ramps (a.m. and p.m. Peak Hours for both scenarios)
- #17 – Woodside Road (SR 84) / Middlefield Road (a.m. and p.m. Peak Hours for both scenarios)
- #18 – Woodside Road (SR 84) / Bay Road (a.m. and p.m. Peak Hours for both scenarios)
- #19 – Woodside Road (SR 84) / Broadway (a.m. and p.m. Peak Hours for both scenarios)

The proposed project would not increase the delay by five or more seconds at most of the intersections operating unacceptably without the proposed project. However, Intersections #3 El Camino Real / Beech Street, #13 Main Street / Chestnut Street, and #14 Main Street / Pine Street – SR 84 Ramps would increase the LOS by more than five seconds for the p.m. peak. Therefore, this impact would be potentially significant.

Table 3.16-5. Cumulative Intersection Level of Service Summary (With and Without Project)

#	Intersection	LOS Criteria	Cumulative				Cumulative Plus Project

Notes:
SSSC – Side-Street Stop Control
AWSC – All-Way Stop Control
Intersections that are operating below acceptable levels are shown in **BOLD**.
[1] The average control delay is reported for signalized intersections. The delay for the worst movement is reported for SSSC intersections.
[2] Intersection #5 – Franklin Street-Lathrop Street / Maple Street becomes an all-way stop control intersection with the proposed project.
[3] Intersection #6 - Lathrop Street / Elm Street becomes a side-street stop control intersection with the Project.
[4] Intersection #17 – Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a LOS threshold of E.

Signal Warrant Analysis

A signal warrant analysis conducted for the intersections is shown in Table 3.16-6. As shown in the table, eight intersections do not meet the signal warrant analysis. Intersections #3 El Camino Real / Beech Street, and #14 Main Street / Pine Street-SR 84 Ramps satisfy peak hour signal warrant, however, other considerations such as other signal warrants and its proximity to the existing signal at Intersection # 13 – Main Street / Maple Street should be evaluated before installing a signal.

Table 3.16-6. Unsignalized Intersections Signal Warrant Analysis

Intersection Vehicle Queuing

As congestion increases, it is common for traffic at intersections to form lines of stopped (or queued) vehicles. Queue lengths were determined for each turn lane and the distance that vehicles will back up in each direction approaching an intersection was measured (Appendix H). The City does not have specified standards for queuing in its policy guidelines. Thus, for purposes of this analysis, queuing deficiencies were considered to occur under conditions where the proposed project traffic causes the queue in a left turn pocket to extend beyond the turn pocket by 25 feet or more (e.g., the length of one vehicle) into adjacent traffic lanes that operate (e.g., move) separately from the left turn lane. Where the vehicle queue already exceeds that turn pocket length under pre-project conditions, a queuing deficiency would occur if project traffic lengthens the queue by 25 feet or more. The analysis showed that several existing turn bay storage lengths already exceed under existing conditions and the proposed project does not add to the existing queuing lanes by 25 feet or more. Therefore, impacts would be less than significant.

There is a median on the southbound approach at the intersection of Main Street / Elm Street which restricts vehicles from making an eastbound left turn from Elm Street onto Main Street. Vehicles traveling from the project site to downtown would need to utilize the Maple Street / Franklin Street-Lathrop Street intersection to the west or head south towards the Main Street / Beech Street intersection. This median at Main Street / Elm Street also extends into the intersection, making the northbound left from Main Street onto Elm Street a more difficult maneuver, however existing counts show that vehicles (13 trips in the a.m. peak hour and 9 trips in the p.m. peak hour) still make this maneuver. It is anticipated that 13 trips in the a.m. peak hour and 2 trips in the p.m. peak hour would make this maneuver, resulting in less than 10 seconds of delay for the northbound left-turn movement and less than 5 feet of queuing during the peak hours. Therefore, impacts would be less than significant.

Impact Summary and Mitigation

Based on the results of the traffic analysis, the proposed project impacts are summarized in Table 3.16-7. In the Cumulative Plus Project scenario, the intersection of El Camino Real / Beech Road would operate at an unacceptable LOS F with a worst movement delay of 158.2 seconds in the p.m. peak hour and would increase the delay by more

than 5 seconds. The intersection satisfies the peak hour volumes signal warrant and installing a signal would result in the intersection operating at LOS B with an average intersection delay of 11.0 seconds. However, other considerations such as other signal warrants and its proximity to an existing signal at Intersection #2 –El Camino Real / Maple Street would need to be evaluated before installing a signal. Additionally, installing a signal would require approval from Caltrans. Therefore, Mitigation Measure TRANS-1 requiring left-turn restrictions from Beech Street is the most feasible mitigation. The westbound left-turn movement should be prohibited at least during the peak times when there are high volumes on El Camino Real. This would result in the intersection operating at LOS D with a worst movement delay of 28.4 seconds. The redistribution of traffic due to prohibition of left turn was evaluated and was found not to degrade the operation of adjacent intersections to unacceptable levels.

In the Cumulative Plus Project scenario, the intersection of Main Street / Chestnut Street would operate at an unacceptable LOS F with a worst movement delay of 84.4 seconds in the p.m. peak hour and an increase in delay by more than 5 seconds. This is a significant impact. Mitigation Measure TRANS-2 requires signal timing optimization would result in LOS D with an average intersection delay of 50.8 seconds. Therefore, the impact would be less than significant with the mitigation.

In the Cumulative Plus Project scenario, the intersection of Main Street / Pine Street-SR 84 Ramps would operate at an unacceptable LOS F with a worst movement delay of 169.9 seconds in the p.m. peak hour, increase the delay by more than 5 seconds, and volumes satisfy the peak hour volume signal warrant. This is a significant impact. Mitigation Measure TRANS-3 requires installation of a signal or stop signs along Main Street to convert the intersection control to an all-way stop control. This would result in LOS D with an average intersection delay of 50.8 seconds. Therefore, the impact would be less than significant with mitigation.

Table 3.16-7. Intersection Impact Summary

Impact Type	Location	Scenarios	Impact Significance
LOS	#3 – El Camino Real / Beech Road	Cumulative Plus Project p.m. Peak Hour	Mitigated to Less than Significant
LOS	#13 – Main Street / Chestnut Street	Cumulative Plus Project p.m. Peak Hour	Mitigated to Less than Significant
LOS	#14 – Main Street / Pine Street-SR 84 Ramps	Cumulative Plus Project p.m. Peak Hour	Mitigated to Less than Significant

Vehicle Miles Travelled Analysis

Senate Bill 743 (Steinberg, 2013) required changes to the guidelines implementing CEQA Guidelines (Cal. Code Regs., Title 14, Div. 6, Ch. 3, § 15000 et seq.) regarding the analysis of transportation impacts. Office of Planning and Research proposed changes to the CEQA Guidelines that identify vehicle miles traveled (VMT) as the most appropriate metric to evaluate a project's transportation impacts. Regulatory changes to the CEQA Guidelines that implement SB 743 were approved on December 28, 2018. July 1, 2020 is the statewide implementation date and agencies may opt-in use of new metrics prior to that date. Redwood City has not adopted any thresholds for evaluating VMT. Therefore, the analysis here is limited to a qualitative evaluation.

The project site is a 0.5-mile walk from the Redwood City Caltrain station located on James Avenue, west of the project site. The project site is also well served by bus service. The proposed project is located in a Transit Priority Area and a Priority Development Area (MTC 2018). These areas have been identified as appropriate for additional compact development by Plan Bay Area. CEQA Guidelines Section 15064.3, subdivision (b)(1), states that "generally, projects within 0.5 miles of either an existing major transit stop, or a stop along an existing high-quality

transit corridor should be presumed to cause a less than significant transportation impact". Appendix M of the CEQA Guidelines defines a "major transit stop" as "a site containing an existing rail transit station". Based on the location of the project site, 0.5 miles from the existing Redwood City Caltrain station, the proposed project can be presumed to cause a less than significant transportation impact.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM TRANS-1 **Restrict Left Turns.** Prior to issuance of building occupancy permits, the City shall ensure that the westbound left-turn movement from Beech Street onto El Camino Real should be prohibited at a minimum during the peak times when there are high volumes on El Camino Real. The applicant shall pay the fair share for installing the appropriate signage as determined by the City.

MM TRANS-2 **Signal Optimization.** Prior to issuance of building occupancy permits, the City shall ensure that the signal timing at the intersection of Main Street / Chestnut Street is optimized. The applicant shall pay its fair share for this improvement as determined by the City.

MM TRANS-3 **Install Signal or All-Way Stop Control.** Prior to issuance of building occupancy permits, the City shall ensure a signal is installed at the intersection of Main Street / Pine Street-SR 84 Ramps to convert the intersection control to signal control or install stop signs along Main Street to convert the intersection control to an all-way stop control. The applicant shall pay its fair share for this improvement as determined by the City.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact TRANS-2 Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?

Impact Analysis

Intersection #17 Woodside Road (SR 84) / Middlefield Road is a CMP intersection with a standard set to LOS E or better. The proposed project would not change the LOS at this intersection under any of the scenarios discussed above and therefore, it would not conflict with the LOS standards established by the Redwood City/Council Association of Governments of San Mateo County CMP.

The CMP requires new development projected to add 100 or more peak hour trips to the CMP roadway network to implement Transportation Demand Management (TDM) measures that would reduce project impacts. Based on the trip distribution shown in Appendix H, the proposed project would add a total of 56 peak hour trips to Intersection #17 Woodside Road (SR 84) / Middlefield Road and does not require preparation of a TDM. However, the Citywide Transportation Plan requires preparation of a TDM for new commercial uses more than 10,000 square feet (Redwood City 2018b). The proposed project includes a TDM plan (Appendix I) that identifies trip reduction methods to be implemented in order to reduce the number of new a.m. and p.m. peak hour single occupant vehicle trips by shifting

project trips to alternative modes of transportation. Therefore, the proposed project would not conflict with any applicable CMP and would have a less than significant impact.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact TRANS-3 Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that result in substantial safety risks?

Impact Analysis

The nearest public airport to the project site is the San Carlos Airport, located more than two miles northeast. The proposed project is not located within the airport safety zones identified in the airport land use compatibility plan for any airport. The proposed project would be developed with three floors, which would not disrupt air traffic patterns. Therefore, no impact would occur.

Level of Significance Before Mitigation
No Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
No Impact.

Impact TRANS-4 Substantially increase hazards to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Impact Analysis

During construction, the proposed project would use heavy construction equipment on local roadways and major arterials. The use of roadways by heavy construction equipment can increase the risk to drivers, cyclists, and pedestrians in the project area. The proposed project would require replacement of existing utilities resulting in construction activities in the roadways. An encroachment permit would be obtained from the City for any staging/construction-vehicle parking on adjacent streets. Notices regarding closure to the public of street parking would be posted in compliance with City regulations in advance of use. Any disturbed or staging areas in the City's right-of-way would be returned to pre-construction conditions upon project completion. Therefore, project construction would not create a transportation hazard and the impact would be less than significant.

The proposed project would be compatible with the kind of traffic generated by the surrounding commercial developments in the project vicinity. The proposed project does not propose to make changes to a roadway that would create road hazards or alter design features developed to mitigate such hazards.

The project site is located within walking distance to the Redwood City Caltrain Station as well as the downtown area. As discussed in Section 2.0, Project Description, the proposed project would include on-site and off-site pedestrian improvements consisting of new sidewalks and crosswalks on nearby roads. The proposed crosswalks would be equipped with pedestrian warning devices. In addition, the intersection of Lathrop/Maple/Franklin Streets would be changed to an all-way stop and a side-street stop at Elm Street/Lathrop Street would be added. Caltrain tracks are located immediately north of the project site. Pedestrians may cross the Caltrain corridor tracks on either side of Main Street or on either side of Maple Street using the at-grade pedestrian crossing. While implementation of the project's pedestrian improvements would promote walkability and connectivity, the Traffic Impact Analysis identified that there are still missing pedestrian facilities surrounding the project site such as no marked crosswalks at the intersection of Maple Street/Franklin Street-Lathrop Street or signage for the pedestrian crossings at Maple Street and Main Street. Therefore, the proposed project would be required to construct these pedestrian facilities prior to issuance of building occupancy permits as discussed in Mitigation Measure TRANS-4. As such, the proposed project would not create a hazard to pedestrian facilities and this impact would be less than significant with implementation of Mitigation Measure TRANS-4.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measure

MM TRANS-4 **Pedestrian Crossing Improvements.** Prior to issuance of building occupancy permits, the City shall ensure that the applicant has constructed the following pedestrian improvements:

- Update the site plan to include marked crosswalks and install accessible curb ramps on all legs of the intersection of Maple Street/Franklin Street – Lathrop Street.
- Add signage (e.g., R15-8 LOOK) for the pedestrian railroad crossing at Maple Street and Main Street.
- Install two-stage pedestrian crossing at Maple Street/Main Street and improve sidewalks on the east side of Maple Street between Main Street and the railroad.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

Impact TRANS-5 Result in inadequate emergency access?

Impact Analysis

The proposed bridge would be designed in accordance with the AASHTO standards and provide a 27-foot-wide clearance to allow Fire Apparatus Access to cross the proposed bridge and access the office building's main entrance. A designated fire access zone would be provided on the south side of the project site along Elm Street. The Redwood City Fire Department and Redwood City Community Development Department coordinate the review of building permits. All access driveways would be designed in accordance with City's standards and would have to be reviewed and approved by the fire department prior to construction. The proposed project plans would include approved fire and emergency access through all phases of construction and operation per the provisions of the City's Fire Code, which regulates emergency access. Therefore, the proposed project would not result in inadequate emergency access and a less than significant impact would occur.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact TRANS-6 Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus turnouts, bicycle racks)?

Impact Analysis

The proposed project includes bicycle racks, pedestrian improvements, and bicycle improvements that would encourage other modes of transportation. The citywide transportation plan RWCMoves identifies several bicycle improvement projects along El Camino Real, Main Street, Maple Street, and Lathrop Street to encourage more bicycle usage in the area. The proposed project includes construction of some of these improvements adjacent to the site such as the Class III bicycle route signage and shared bicycle lanes along Lathrop Street, however, it would still conflict with the with City's plans and policies as it does not include improvements on Maple Street as required by RWCMoves. Mitigation Measure TRANS-5 would ensure that the proposed project pays its fair share towards the bicycle cycle tracks on Maple Street and improvement projects near the project site. In addition, the proposed project should maintain 35.5 feet of space in the traveled way on Maple Street to accommodate the planned cycle tracks and required fire access as noted in the traffic study (Appendix H). Based on the review of site plans dated June 7, 2018, Maple Street has a total right-of way of 60 feet and would be able to accommodate both bike lane and sidewalk. Impacts would be less than significant with mitigation.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures

MM TRANS-5 **Fair Share for Bicycle Improvements.** Prior to issuance of building occupancy permits, the City shall ensure that the applicant has paid its fair share towards bicycle cycle tracks on Maple Street and improvements projects near the project site.

MM TRANS-6 **Maple Way Improvements.** Prior to issuance of grading permits, the City shall review the final site plans to ensure that 35.5 feet of space in the traveled way is maintained on Maple Street to accommodate the planned cycle tracks and required fire access.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

This page left intentionally blank.

3.17 TRIBAL CULTURAL RESOURCES

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined by Public Resources Code section 21047 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
i. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	☐	☒	☐	☐
ii. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	☐	☒	☐	☐

3.17.1 Environmental Setting

Refer to Section 3.5, Cultural Resources, for the ethnographic contextual information.

3.17.2 Methodology

The cultural resources investigations carried out for the proposed project included background research conducted at the NWIC of the CHRIS (Appendix D), consultation with Native American Tribes (see Section 3.5, Cultural Resources), and a review of historic maps and ethnographic documents.

The record search included a review of all cultural resources and reports within 0.25 miles of the project area (Section 3.5). The records search was conducted by reviewing the Office of Historic Preservation (OHP) records, base maps, historic maps, and literature for San Mateo County on file at the NWIC. Other sources reviewed included the OHP Historic Properties Directory, California Inventory of Historical Resources, and ethnographic information. No information regarding potential tribal cultural resources in or near the project location were identified through these efforts.

As required under CEQA, and as part of the due diligence efforts in advance of an environmental document, WSA contacted the NAHC on July 20, 2017 to request information on known Native American traditional or cultural

properties within the project location, and to request a list of individuals or groups with cultural affiliation to the project location (WSA 2017). The NAHC responded by letter on July 31, 2017, stating that a record search of the Sacred Lands File for the project location yielded negative results, but that the area is sensitive for cultural resources (NAHC 2017).

A list of five Native American contacts was included in the response. WSA sent certified letters to the five individuals on August 1, 2017 requesting comment on the proposed project. Follow-up phone calls were made on August 15, 2017, and two of the five contacts were reached. A second round of phone calls to the remaining three individuals who could not be reached was made on August 22, 2017. Appendix D contains the documents related to consultation with the NAHC and the tribal representatives. Two individuals, Irene Zwierlein and Andrew Galvan, recommended an archaeological and Native American monitor to be present on-site during ground disturbing activities (WSA 2017).

3.17.3 Environmental Impact Analysis

This section discusses potential impacts on tribal cultural resources associated with the proposed project and provides mitigation measures where necessary.

Impact TRIB-1	**Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined by Public Resources Code Section 21047 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:**
i)	**Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or**
ii)	**A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe?**

Impact Analysis

The archival research, the NWIC records search, and the archaeological field survey performed as part of the cultural resource analysis did not identify any known tribal cultural resources (TCR) as defined by PRCs 21047 or 5020.1(k) within the project location. However, there is a potential for encountering previously undiscovered tribal cultural resources during project implementation, due to the proximities of Redwood Creek and a prehistoric archaeological resource to the project location. Additionally, the NAHC indicated that the area is sensitive for cultural resources (NAHC 2017), and two of the Native American contacts recommended an archaeological and Native American monitor to be present on-site during ground disturbing activities (WSA 2017).

The proposed project is not anticipated to have an impact on any known or potential TCRs. However, ground disturbance and subsurface construction activities such as trenching, and grading associated with the proposed project could potentially damage or destroy previously undiscovered TCRs. Mitigation Measures CUL-1 and CUL-2 require cultural resource awareness training and construction monitoring by a qualified archaeologist and Ohlone tribal monitor (Mitigation Measure CUL-1) and the implementation of standard inadvertent discovery procedures

(Mitigation Measure CUL-2) to reduce potential impacts to previously undiscovered TCRs. With the implementation of Mitigation Measure CUL-1 and Mitigation Measure CUL-2, potential impacts would be reduced to a level of less than significant.

Level of Significance Before Mitigation
Potentially Significant Impact.

Mitigation Measures
Mitigation Measures CUL-1 and CUL-2 are required.

Level of Significance After Mitigation
Less Than Significant Impact with Mitigation.

This page left intentionally blank.

3.18 UTILITIES AND SERVICE SYSTEMS

Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☐	☐	☒	☐
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental impacts?	☐	☐	☒	☐
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental impacts?	☐	☐	☒	☐
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	☐	☐	☒	☐
e) Result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	☐	☐	☒	☐
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?	☐	☐	☒	☐
g) Comply with federal, State, and local statutes and regulations related to solid waste?	☐	☐	☒	☐

3.18.1 Environmental Setting

Existing potable water lines, sanitary sewer lines, and stormwater system facilities are maintained by the Redwood City Public Works Services Department. The City purchases all of its potable water from the San Francisco Public Utilities Commission (SFPUC) Regional Water System. Redwood City's recycled water system provides non-potable water supply. Recycled water infrastructure is not currently available at the project site. The proposed project would be designed to comply with Municipal Code Chapter 38, Article VIII (Recycled Water Use) by providing dual plumbing system for toilets, trap primers, and landscaping would be connected to the City's domestic water system until recycled water is available.

The proposed project would be provided with water service by the City of Redwood City using existing water mains. To accommodate planned development at the project site the proposed project is proposing to abandon the existing 4-inch main on Elm Street and replace it with a new 8-inch water main to serve the proposed project. It is expected that the proposed project's water demand would be 14,737 gpd (BKF Engineers 2019). In accordance with state law, the City has adopted an Urban Water Management Plan (UWMP), which compares projected water use to available water supply sources over the next 20 years. The UWMP is updated every 5 years. The most recent UWMP is dated

June 2016. The UWMP evaluates the past, current, and projected water use along with water supply projections through 2040 for normal, single-dry, and multi-dry years. According to the 2016 UWMP, future water supply would be adequate to offset future water demands during all three scenarios through 2040 (Redwood City 2016).

Silicon Valley Clean Water's Wastewater Conveyance System takes wastewater from Redwood City's collection system and pumps the wastewater to its wastewater treatment plant, South Bayside System Authority treatment plant (SBSA) (Silicon Valley Clean Water). Once treatment is complete effluent is used for landscape irrigation (recycled water system) or pumped into the San Francisco Bay. Wastewater flows are defined as average dry weather flow (ADWF) and peak wet weather flow (PWWF). ADWF is the average flow that occurs on a daily basis with no evident reaction to rainfall. PWWF is the highest measured hourly flow that occurs during wet weather. Wastewater flows can vary with precipitation levels, insofar as rainwater can enter the wastewater collection system through infiltration and inflow (I/I) during significant rain events. The SBSA treatment plant has an operating capacity of 29 million gallons per day (mgd) average dry weather flow (ADWF). The plant is permitted by the RWQCB to discharge 29 mgd ADWF into San Francisco Bay. The current permitted peak wet weather capacity of the SBSA facility is 71 mgd (Redwood City 2016).

Recology of San Mateo County is the City's selected contractor to handle all solid waste collection for the City (Redwood City 2016). Collected solid waste at the project site would be transported to the South Bayside Transfer Station (SBTS), located in the City of San Carlos.

3.18.2 Methodology

The following analysis is based on a review of documents pertaining to the project site, including the General Plan, General Plan EIR, City of Redwood City 2015 Urban Water Management Plan, and Section 2.0 Project Description of this ISMND.

3.18.3 Environmental Impact Analysis

This section discusses potential impacts on utilities and service systems associated with the proposed project and provides mitigation measures where necessary.

Impact UTIL-1 Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?

Impact Analysis

Wastewater generated by the proposed project would be treated by the WWTP, which operates according to the regulations of the San Francisco Bay RWQCB and the Clean Water Act. Redwood City has water conservation policies in place, including the Water Shortage Contingency Plan and the Water Conservation Plan, which would minimize the amount of wastewater generated. Compliance with these regulations would ensure that the proposed project would not exceed the SVCW and RWQCB wastewater treatment requirements; therefore, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact UTIL-2 Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental impacts?

Impact Analysis

The proposed project would generate additional wastewater required to be treated at the WWTP. Currently, wastewater needs for the site are estimated at 268 gallons per day for the existing on-site commercial building (Appendix A). The proposed project is estimated to produce 14,006 gallons of wastewater per day (Appendix A). The WWTP currently operates below its designed flow capacity of 29 mgd of sanitary base flow (SBF) ADWF and 71 mgd during PHWWF. According to the Urban Water Management Plan, Redwood City has maximum capacity rights of 11.4 mgd ADWF and 30.5 mgd PHWWF at the SVCW treatment plant (Redwood City 2016). As of April 2010, the City had purchased about 12.3 mgd of its total ADWF allocation. Between 1995 and 2006, Redwood City's total average annual dry weather inflows to the SBSA ranged from 7.5 to 9 mgd. During the summer of 2008, the average dry weather flow from Redwood City was about 7.3 mgd. All of these figures are well below the City's purchased ADWF capacity (Redwood City 2010a). The proposed project would generate 14,006 gpd or 0.014 mgd of wastewater, which would be a fraction of the available capacity. Since the WWTP is operating well below its maximum capacity, the project would not result in the WWTP exceeding wastewater treatment requirements; therefore, impacts would be less than significant.

As stated in the project description, approximately 250 gallons of water per day (gpd) is currently provided to the project site by an existing 4-inch water main in Elm Street and an 8-inch water main in Maple Street. However, the existing 4-inch water main in Elm Street does not currently meet the City's minimum size requirements for providing domestic water. Therefore, the proposed project is proposing to abandon the existing 4-inch water main on Elm Street and replace it with a new 8-inch water main to serve the proposed project. It is expected the proposed project's water demand would be 14,737 gpd (BKF Engineers 2019).

The 2016 UWMP calculates the City's past, current, and projected water use and water supply through 2040. According to the UWMP, future water supply would be adequate to offset future water demands from planned development during normal, single-dry, and multi-dry years through 2040 (Redwood City 2016). The proposed project would, therefore, be adequately served by the City's water supply and would not require the construction of new water treatment facilities or expansion of existing facilities; therefore, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact UTIL-3 Require or result in the construction of new stormwater drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental impacts?

Impact Analysis

Stormwater runoff at the project site is collected by a 12-inch outfall that releases to the on-site concrete drainage channel. The proposed project would install a new 12-inch stormwater drain line and connect it to the existing 12-inch outfall that drains to the concrete drainage channel. Low impact development treatment measures such as flow-through planter boxes and self-retained landscape areas would be incorporated. Since the stormwater improvements would take place on-site and connect to the existing outfall, there would be no significant environmental impact and impacts would be a less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact UTIL-4 Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?

Impact Analysis

The 2016 UWMP calculates the City's past, current, and projected water use and water supply through 2040. According to the UWMP, the future water supply would be adequate to offset future water demands from planned development during normal, single-dry, and multi-dry years through 2040 (Redwood City 2016). The UWMP contemplated the build out of the uses and densities that were envisioned in the City's General Plan and, thus, a project-specific water supply analysis is not required. Additionally, the proposed project would be required to comply with the water conservation requirements codified in Chapter 38 of the Municipal Code. Therefore, the impact would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact UTIL-5	**Result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?**

Impact Analysis

The WWTP has a permitted treatment capacity of 29 mgd. As discussed above, Redwood City has been allocated about 11.4 mgd ADWF and 30.5 mgd PHWWF at the SBSA treatment facility. According to the General Plan population projections and employment base projections, the City estimates that the General Plan would account for a population increase to 116,732 by the year 2030. The total estimated average dry weather flow for the plan area in 2030 would be 8.17 mgd, which is well below the City's average dry weather capacity allocation of 11.4 mgd (Redwood City 2010a; Redwood City 2016). The proposed project would generate 14,006 gpd or 0.014 mgd of wastewater, which would be a fraction of the available capacity. Considering the projections included in the General Plan and the amount of wastewater that would be generated by the proposed project, impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact UTIL-6	**Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?**

Impact Analysis

Based on the CalEEMoD default estimates, the proposed project would generate no more than 1-ton per day of solid waste that would be disposed at the South Bayside Transfer Station in San Carlos. Ninety percent of the solid waste from Redwood City is then sent to the Ox Mountain Sanitary Landfill, located east of Half Moon Bay (Redwood City 2010a). The landfill is currently at 37 percent of its total capacity (as of December 2015), is permitted to accept 3,598 tons of waste per day and has a remaining capacity of 22 million cubic yards. Due to the substantial amount of available capacity remaining at Ox Mountain Sanitary Landfill, sufficient capacity would be available to accommodate the proposed project's solid waste disposal needs. Therefore, a less than significant impact related to solid waste would occur.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

Impact UTIL-7 Comply with federal, state, and local statutes and regulations related to solid waste?

Impact Analysis

The proposed project would include solid waste and recycling facilities at a readily available location. State Assembly Bill 939 requires diversion of 65 percent of construction waste materials generated during the project. Municipal Code Chapter 9, Article XI (Recycling and Salvaging of Construction and Demolition Debris) also requires the construction contractor to divert a minimum of 60 percent of the total construction and demolition debris. The applicant would prepare and submit a Waste Management Plan (WMP) for approval by the City prior to the issuance of building permits. The WMP shall identify the types of construction and demolition debris materials that would be generated for disposal and recycling. The proposed project would comply with all applicable local, state, and federal statutes and regulations related to solid waste. Therefore, the impacts would be less than significant.

Level of Significance Before Mitigation
Less Than Significant Impact.

Mitigation Measures
No mitigation is necessary.

Level of Significance After Mitigation
Less Than Significant Impact.

3.19 MANDATORY FINDINGS OF SIGNIFICANCE

	Would the Project:	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
a)	Have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?	☐	☒	☐	☐
b)	Have impacts that are individually limited, but cumulative considerable? ("Cumulative considerable" means that the incremental impacts of a project are considerable when viewed in connection with the impacts of past projects, the impacts of other current projects, and the effects of probable future Projects)?	☐	☒	☐	☐
c)	Have environmental impacts which will cause substantial adverse impacts on human beings, either directly or indirectly?	☐	☒	☐	☐

a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

Impact Analysis

As evaluated in this ISMND, the proposed project would not substantially degrade the quality of the environment; substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; reduce the number or restrict the range of an endangered, rare, or threatened species; or eliminate important examples of the major periods of California history or prehistory. Mitigation Measures BIO-1, CUL-1, CUL-2, CUL-3, and GEO-2 have been included herein to reduce potential impacts to special-status species and habitats, and inadvertent discovery of cultural resources to a less than significant level.

b) Does the project have impacts that are individually limited, but cumulative considerable? ("Cumulative considerable" means that the incremental impacts of a project are considerable when viewed in connection with the effects of past projects, the impacts of other current projects, and the impacts of probable future projects)?

Impact Analysis

The General Plan EIR evaluated the cumulative effects associated with growth and development in the City. The proposed project would not result in any new cumulative impacts not previously identified in the General Plan EIR. All cumulative impacts resulting from the proposed project related to air quality, geology, hydrology, noise, and traffic would be mitigated with implementation of Mitigation Measures AIR-1, AIR-2, GEO-1, NOI-1, NOI-2, TRANS-1, TRANS-2, TRANS-3, TRANS-4, TRANS-5, and TRANS-6.

c) Does the project have environmental impacts which will cause substantial adverse impacts on human beings, either directly or indirectly?

Impact Analysis

An air quality analysis and an HRA were performed for the proposed project. All environmental impacts which would cause substantial adverse impacts on human beings, either directly or indirectly would be mitigated with the implementation of Mitigation Measures AIR-1 and AIR-2.

ENGINEERS . SURVEYORS . PLANNERS

1. INTRODUCTION

BKF has prepared a Tentative Map for the 1180 Main Street development as part of the planning application for the project. The project comprises 1.30 acres bounded by Elm Street to the South, Lathrop Street to the Southwest, Maple Street to the Northwest, Peninsula Corridor Joint Power Board to the Northeast and Main Street to the Northeast. The proposed development includes construction of a 3 story commercial building and a 1 level subterranean parking garage. Surface improvements surrounding the development include replacement of the sidewalk, curb, and gutter along Maple Street, Lathrop Street, Elm Street, and Main Street. New utility laterals will also be installed to serve the new development.

2. EXISTING & PROPOSED BOUNDARY CONDITIONS

The existing project site consists of 2 lots. Lot 1 is APN 053-147-060. Lot 2 is APN 053-147-070. The Tentative Map has proposed merging these 2 lots into a single parcel. Proposed easements for public access and emergency vehicle access are included on the proposed boundary sheet.

3. DOMESTIC & RECYCLED WATER

3.1 Domestic Water

The existing site is served by water services connected to an existing 4" main in Elm Street and to an existing 8" main in Maple Street. Water demand for the existing commercial building was estimated using Attachment Q from the City of Redwood City Engineering Standards, which is included as an attachment to this narrative. The existing indoor water demand is estimated at 250 gallons per day (gpd).

The water demand for the proposed project was also estimated using Attachment Q. Based on a total gross square footage of 110,000 the estimated project demand is 14,737 gpd.

Proposed Project Water Demand = 14,737 gallons per day (gpd)
Existing Water Demand = 250 gallons per day (gpd)
Net Increase in Water Demand = 14,487 gallons per day (gpd)

There is an 8" asbestos-cement pipe (ACP) water main in Main Street, an existing 4" cast iron pipe (CIP) water main in Elm Street, an 8" polyvinyl chloride pipe (PVC) water main in Maple Street and an 8" cast iron pipe (CIP) water main in Lathrop Street. The project site is currently served by water laterals connected to the 4" main in Elm

Street and to an existing 8" main in Maple Street. The 4" water main in Elm Street does not meet City requirements for minimum size of domestic water mains. For this reason, the project is proposing to abandon the 4" main along the project frontage on Elm Street from the intersection of Lathrop Street to where the project's new water lateral connects to the main. This section of the water main will be upgraded to a new 8" domestic water main. The proposed development will be served by a new 8" domestic water main on Elm Street.

3.2 Recycled Water

City Ordinance No. 2335 requires the use of recycled water for landscape irrigation and building plumbing. The proposed building will provide dual plumbing that will include a separate plumbing system for water closets, urinals, trap primers, and landscaping irrigation. Because recycled water service has not been extended to the vicinity of the project site, both building plumbing systems will be connected to the domestic water system until recycled water is available. At the time when recycled water is available, the building's dual plumbing will be disconnected from the City's domestic water main, and connected to the recycled system to serve the eligible plumbing fixtures, with separate backflow prevention and meters.

4. FIRE SERVICE

4.1 Fire Code Requirements

A fire protection engineer will need to be consulted to determine required fire flow requirements for the project. However, for planning purposes BKF has performed a preliminary review of the fire code as it relates to the proposed development of the site. The commercial building has a required fire flow of 4,750 gpm as determined by total square footage. Summarized below is the required fire flow, as determined by Table B105.1 of the 2016 California Fire Code.

Construction Type: II-A
Total Floor Area: 110,000 sf
Required Fire Flow: 4,750 gpm for 4 hours
Required Fire Flow (assuming 50% flow reduction for sprinklers): 2,375 gpm.

Based on a water flow test provided by the City of Redwood City on May 19, 2016, the flow available from the City's domestic water system at the existing hydrant at the corner of Main and Elm Streets is 2,871 gpm. A second flow test for the existing hydrant at the corner of Lathrop and Elm Streets provided a flow of 1,780 gpm at 20

psi. There generally appears to be adequate flow in the area. However, the project will need to work with a fire consultant and the fire department to confirm the existing available flow is adequate for the building, since the second test resulted in a flow less than that required by preliminary fire code calculations.

The required number of fire hydrants for a fire flow of 2,375 gpm is 3 hydrants with an average spacing of 450 feet, according to Table C102.1 of the 2016 California Fire Code. There are 3 existing hydrants along the project frontages. As part of the development, the project will install a new fire hydrant on Elm Street, a new fire hydrant on Maple Street, and a new wharf hydrant along the northern side of the proposed building, providing a total of 6 hydrants. This exceeds the required total of 3 hydrants to serve the proposed project.

4.2 Fire Access

Based on Section D104 and D105 of the 2016 California Fire Code, the site requires two aerial fire apparatus access roads. According to section D105.3, at least one of these roads must be positioned parallel to one entire side of the building. Elm Street and Maple Street provide the required 2 means of fire access to the building, with Elm Street being positioned parallel to one entire side of the building.

5. SANITARY SEWER

5.1 Existing Sanitary Sewer

There are existing sanitary sewer facilities in Elm Street, Lathrop Street, Main Street and Maple Street. There is an 8" vitrified clay pipe (VCP) sanitary sewer main in Main Street, a 6" vitrified clay pipe (VCP) sanitary sewer main in Elm Street (size is assumed, as it is not shown on City Base Map G08), 8" VCP sanitary sewer main in Lathrop Street, and a 10" VCP sanitary sewer main in Maple Street. The project site is currently served by a sewer lateral connecting to the 6" sanitary sewer main in Elm Street and to the 10" sanitary sewer main in Maple Street.

Existing sewer generation has been calculated using Attachment L of the City of Redwood City Engineering Standards and is included as Attachment 3 to this narrative. The existing average daily flow for the site is 268 gallons per day (gpd). The peak hourly flow during business hours is 0.88 gallons per minute (gpm) and the peak hourly flow during off-hours is 0.38 gpm.

5.2 Proposed Sanitary Sewer and Existing System Capacity

The proposed project will install a new sanitary sewer lateral connecting to the existing 6" main in Elm Street, which conveys sewer flows to the 8" main in Lathrop, and eventually to the 10" main in Maple Street. Proposed sewer generation for the project has been calculated using Attachment L from the City of Redwood City Engineering Standards. The proposed average daily flow is 14,006 gpd, which represents an increase of 13,738 gpd over existing conditions. The peak hourly flow during business hours is 48.6 gallons per minute (gpm) and the peak hourly flow during off-hours is 19.5 gpm.

BKF reviewed the City of Redwood City's 2008 Sanitary Sewer Master Plan (2008 SSMP) and the 2013 Sanitary Sewer Master Plan Update (2013 SSMP) to determine if capacity deficiencies were identified for the City's Sanitary Sewer collection system in the vicinity of the site. The only sanitary sewer main along the project frontage modeled as part of the master plans was the 10" sanitary sewer main in Maple Street. This is due to the fact that the mains in Elm and Lathrop Streets are smaller pipes. The 2008 Sanitary Sewer Master Plan identified a Capacity Improvement Project for this 10" sanitary sewer main in Maple Street (CIP #11 in the 2008 SSMP). However, review of Figures 7-12 of the 2013 SSMP indicate that the Maple Street sanitary sewer main is capable of conveying peak wet weather flows for the 10 year-24 hour design storm under future build-out conditions with a flow depth to pipe diameter ratio (d/D) between 0.76 and 1.00. Since the pipe is able to convey anticipated peak wet weather sanitary sewer flows without surcharging, it would appear that there is capacity for the expected project flows.

In order to mitigate the increase in sewer generation associated with the project, the City requires that the Project pay a fee that goes toward funding the City's Capital Improvements Program (CIP). The fee is based on sanitary sewer line remediation costs to reduce rainfall dependent inflow and infiltration (RDI/I) equal to the additional sewage generated by the project. This reduction in RDI/I offsets the increased sewage generation created by the project, resulting in a net-zero impact to the City's sanitary sewer system.

The City's Sewer Master Plan (dated 2008, including the 2013 update), Figures 7 & 8 show that the pipes downstream of the project will have a flow depth to pipe diameter ratio (d/D) less than 0.5 for the existing and future Peak Dry Weather Flows. Figures 9 & 10 show that the downstream pipes have a d/D ratio of 0.51-0.75 for the existing and future Peak Wet Weather Flows for the 5 year, 8-hour design storm.

Figures 11 & 12 show that several downstream pipes have d/D ratio of 0.76-1.00 for the existing and future Peak Wet Weather Flows for the 10 year, 24-hour design storm. It is our understanding that when the Maple Street Pump station constraint is considered, the downstream pipe d/D ratio is 0.51-0.75 for the future Peak Wet Weather Flow at the 5 year, 8-hour event, and 0.76-1.00 for the 10 year, 24-hour future Peak Wet Weather Flow. It is our understanding that the project will contribute a sewer impact fee to the City, which is meant to offset the wet weather flow effects from inflow and infiltration into the sewer system (by Capital Improvement Project implementation to limit inflow and infiltration), with the intent that the projects impact on the system would be mitigated by that I/I improvement. Additionally, it is our understanding that the CEQA process and future evaluation of the project sewer generation will be formally analyzed to determine impacts and condition of the downstream sewer mains.

6. STORM DRAINAGE

6.1 Site Drainage

The existing site consists of an existing building, a lined concrete drainage channel (within a 32' existing Storm Drain Easement), and existing structural slab adjacent to the drainage channel. The site is approximately 14% impervious. Most of the storm runoff infiltrates into the pervious ground surface. The storm runoff from the impervious surfaces is collected by a 12" outfall that releases to the concrete drainage channel. Some runoff sheet flows towards the Peninsula Corridor Joint Powers Board Caltrain track at the Northern side the property.

The proposed project will increase the amount of impervious areas, which will result in an increase in stormwater runoff. The proposed building and onsite hardscape will be drained by an onsite storm drain line, connecting to the 12" outfall that drains to the drainage channel. Before discharging to the City storm drain, runoff from the site will flow through detention and treatment measures as discussed below in sections 6.2 and 6.3.

6.2 Detention Sizing

The City of Redwood City requires detention of project stormwater so that the flow rate of stormwater leaving the site under proposed conditions during the 30-year storm event does not exceed the 10-year flow rate under existing conditions. The stormwater detention sizing for this project is estimated by using the City's Engineering Design Standard Attachment O. The methodology includes the

calculation of runoff coefficients based on the amount of impervious surfaces in the pre-development and post-development conditions.

Preliminary calculations indicate that the volume of storm water required for detention is 1,329 cubic feet (cf). This volume of stormwater will be detained within an oversized portion of the onsite storm drain line. Based on the required detention volume of 1,329 cf, 195 LF of 42" diameter storm drain pipe at the downstream end of the onsite system would provide adequate storage. A total volume of 1,433 cf of storage is provided by onsite pipes, which exceeds the minimum detention volume per City standards. The last onsite manhole will include a weir, with orifice to restrict flows to no more than the existing 10-year flow rate.

6.3 Stormwater Treatment

In accordance with the Clean Water Act regulations, the development is required to review and implement permanent post-construction storm water Best Management Practices (BMPs) in accordance with the Provision C.3 permit and San Mateo Countywide Storm Water Pollution Prevention Program requirements. To meet the C.3 requirements, the Project would have to incorporate traditional Low Impact Development (LID) treatment measures in the system design. These LID measures typically include bioretention areas or flow-thru planter boxes that would occupy approximately 4% of the project site.

The proposed stormwater management treatment strategy involves using a flow-through planter along the Caltrain side of the building to treat runoff collected from the building roof. A second flow-through planter is provided adjacent to the grand stair at Maple Street to treat runoff from the stair and terrace area. The bridge area and pathway connection to Lathrop Street will be directed to adjacent landscape areas and will be considered self-retaining areas. For storms larger than the treatment storm, stormwater will flow through the media filter vault, bypassing the filter cartridges, and into Redwood Creek.

6.4 Flood Protection - FEMA

The site is classified as "Zone X" – Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood according to FEMA Map number 06081C0301E Panel 301 of 510, dated October

16, 2012. The drainage channel flowing through the project site is classified as "Zone A" - 1% annual chance flood discharge contained in channel.

Since the project is not inside the 100-year and 500-year flood zones, processing with FEMA will not be required for development on the site.

7. CONCLUSIONS

BKF has provided preliminary utility, grading and stormwater design for this proposed development and has found that the site is capable of supporting the proposed development. It is our determination that based on the information available at this time, the existing public infrastructure is adequate to serve the proposed development. The site can be readily served by all required utilities and public services and will have a less than significant impact on the existing sanitary sewer, domestic water, and storm drain systems. The Tentative Parcel Map contains the proposed site work, utility infrastructure and mapping that facilitates the installation of this project and is included for reference.

Area Calculations and Detention Sizing

1180/1190 Main Street

Table 1

Site Hydrology Calculations

Table 1.1 - Design Rainfall Intensities

Storm Drain Facilities Design Storm Intensities

Calculated per Attachment G, City of Redwood City Engineering Standards

Tc =	10	min	(min Tc per Attachment G)
$i_{10\text{-year}}$=	1.7	in/hr	per Attachment G
$i_{30\text{-year}}$=	2.1	in/hr	per Attachment G
$i_{100\text{-year}}$=	2.5	in/hr	per Attachment G

C.3 Treatment Storm Intensity (for sizing of flow-based treatment measures)

Per San Mateo County C.3 Technical Guidance Manual

$i_{(C.3)}$= 0.20 in/hr

Table 1.2 - Pre-Development Hydrology

Surface	Area (SF)	Coefficient	C*A
BUILDING ROOFS	2,279	0.95	2,165
ASPHALT PAVEMENT	-	0.90	-
CONCRETE PAVEMENT	5,344	0.90	4,810
LANDSCAPE AREA	47,118	0.30	14,135
TOTAL	54,741	0.39	21,110

Rational Method Q=CiA

$Q_{(10\text{-YEAR-EX})}$=	0.82	CFS
$Q_{(30\text{-YEAR-EX})}$=	1.02	CFS
$Q_{(100\text{-YEAR-EX})}$=	1.21	CFS

Table 1.3 - Post-Development Hydrology

Surface	Area (SF)	Coefficient	C*A
BUILDING ROOFS	40,920	0.95	38,874
ASPHALT PAVEMENT	7,726	0.90	6,953
CONCRETE PAVEMENT	-	0.90	-
LANDSCAPE AREA	6,095	0.30	1,829
TOTAL	54,741	0.87	47,656

Rational Method Q=CiA

$Q_{(10\text{-YEAR-PD})}$=	1.86	CFS
$Q_{(30\text{-YEAR-PD})}$=	2.30	CFS
$Q_{(100\text{-YEAR-PD})}$=	2.74	CFS

Table 1.4 - Detention Sizing

Redwood City Engineering Standards: Attachment O - Post Development Stormwater Storage

Detention Volume, V_{DET} (CF) = $(Q_{PD} - Q_{EX})_{REQ'D} * 3/2 * T_C$

$Q_{EX\ (10\text{-}YEAR)}$=	0.82	cfs
$Q_{PD\ (30\text{-}YEAR)}$=	2.30	cfs
$(Q_{PD}-Q_{EX})$=	1.474	cfs
T_C=	10	min
Required Detention Volume=	**1326**	**cu-ft**

Storage Provided in Onsite Storm Drain Pipes:

	Length (LF)	Volume (CF)
42" Pipe (see note below)	195	1,433
	Total	**1,433**

Note: The effective detention area of the pipe cross section is calculated as the height of water below the top of weir in the outlet manhole. The top of weir is set 12" below the inside top of pipe, which provides an effective pipe cross sectional area for detention of 7.35 SF.

Note: Flow Through Planter Sizing is shown on attached Combination Flow and Volume Worksheets.

FLOW THROUGH PLANTER
BETWEEN BUILDING AND
CALTRAIN RIGHT-OF-WAY

Worksheet for Calculating the Combination Flow and Volume Method

Instructions: After completing Section 1, make a copy of this Excel file for each Drainage Management Area within the project. Enter information specific to the project and DMA in the cells shaded in yellow. Cells shaded in light blue contain formulas and values that will be automatically calculated.

1.0 Project Information

1-1	Project Name:	**1180/1190 Main Street**
1-2	City application ID:	
1-3	Site Address or APN:	**1180/1190 Main Street**
1-4	Tract or Parcel Map No:	
1-5	Rainfall Region	**4**
1-6	Region Mean Annual Precipitation (MAP)	**14.60**
1-7	Site Mean Annual Precipitation (MAP)	**19.10**

The calculations presented here are based on the **combination flow and volume sizing method** provided in the Countywide Program's C.3 Technical Guidance, Version 4.0. The steps presented below are explained in Section 5.1 of the Guidance, applicable portions of which are included in this file, in the sheet named "Guidance from Chapter 5".

Click here for map

1-8 ***MAP adjustment factor is automatically calculated as:*** **1.31**

(The "Site Mean Annual Precipitation (MAP)" is divided by the MAP for the applicable rain gauge, showin in Table 5-3, below.)
Refer to the map in Appendix C of the C.3 Technical Guidance to identify the Rainfall Region for the site.

2.0 Calculate Percentage of Impervious Surface for Drainage Management Area (DMA)

2-1 Name of DMA: **DMA #1**

For items 2-2 and 2-3, enter the areas in square feet for each type of surface within the DMA.

	Type of Surface	Area of surface type within DMA (Sq. Ft.)	Adjust Pervious Surface	Effective Impervious Area
2-2	Impervious surface	**40,920**	**1.0**	**40,920**
2-3	Pervious surface	**0**	**0.1**	**0**
	Total DMA Area (square feet) =	**40,920**		

2-4 ***Total Effective Impervious Area (EIA)*** **40,920** **Square feet**

3.0 Calculate Unit Basin Storage Volume in Inches

Table 5-3. Unit Basin Storage Volumes in Inches for 80 Percent Capture Using 48-Hour Drawdowns, based on runoff coefficient

Region	Station, and Mean Annual Precipitation (Inches)	Runoff Coefficient of 1.0
1	Boulder Creek, 55.9”	2.04"
2	La Honda, 24.4”	0.86"
3	Half Moon Bay, 25.92”	0.82"
4	Palo Alto, 14.6”	0.64"
5	San Francisco, 21.0”	0.73"
6	San Francisco airport, 20.1”	0.85"
7	San Francisco Oceanside, 19.3”	0.72"

3-1 ***Unit basin storage volume from Table 5-3:*** **0.64**
(The coefficient for this method is always 1.0, due to the conversion of any landscaping to effective impervious area.)

3-2 ***Adjusted unit basin storage volume:*** **0.84** **Inches**
(The unit basin storage volume [Item 3-1] is adjusted by applying the MAP adjustment factor [Item 1-8].)

3-3 ***Required Capture Volume (in cubic feet):*** **2,855** **Cubic feet**
(The adjusted unit basin sizing volume [Item 3-2] is multiplied by the DMA EIA [Item 2-4] and converted to cubic feet)

4.0 Calculate the Duration of the Rain Event

4-1	Rainfall intensity	**0.2**	**Inches per hour**
4-2	Divide Item 3-2 by Item 4-1	**4.19**	**Hours of Rain Event Duration**

5.0 Preliminary Estimate of Surface Area of Treatment Measure

5-1	4% of DMA EIA (Item 2-4)	**1,637**	**Square feet**
5-2	Area 25% smaller than Item 5-1 (i.e., 3% of DMA EIA)	**1,228**	**Square feet**
5-3	Volume of treated runoff for area in Item 5-2	**2,141**	**Cubic feet** (Item 5-2 * 5 inches per hour * 1/12 * Item 4-2)

6.0 Initial Adjustment of Depth of Surface Ponding Area

6-1	Subtract Item 5-3 from Item 3-3	**714**	**Cubic feet** (Amount of runoff to be stored in ponding area)
6-2	Divide Item 6-1 by Item 5-2	**0.58**	**Feet** (Depth of stored runoff in surface ponding area)
6-3	Convert Item 6-2 from feet to inches	**6.98**	**Inches** (Depth of stored runoff in surface ponding area)

6-4 If ponding depth in Item 6-3 meets your target depth (recommend 6"), skip to Item 8-1. If not, continue to Step 7-1.
(Note: Overflow outlet elevation should be set based on the calculated ponding depth.)

7.0 Optimize Size of Treatment Measure

7-1	Enter an area larger than Item 5-2	**1268**	**Sq.ft.** (enter larger area if you need less ponding depth.)
7-2	Volume of treated runoff for area in Item 7-1	**2,212**	**Cubic feet** (Item 7-1 * 5 inches per hour * 1/12 * Item 4-2)
7-3	Subtract Item 7-2 from Item 3-3	**643**	**Cubic feet** (Amount of runoff to be stored in ponding area)
7-4	Divide Item 7-3 by Item 7-1	**0.51**	**Feet** (Depth of stored runoff in surface ponding area)
7-5	Convert Item 7-4 from ft. to inches	**6.09**	**Inches** (Depth of stored runoff in surface ponding area)

7-6 If the ponding depth in Item 7-5 meets target, stop here. If not, repeat Steps 7-1 through 7-5 until you obtain target depth.
(Note: Overflow outlet elevation should be set based on the calculated ponding depth.)

8.0 Surface Area of Treatment Measure for DMA

8-1	Final surface area of treatment	**1,268**	**Square feet** (Either Item 5-2 or final amount in Item 7-1)

FLOW THROUGH PLANTER
AT TERRACE/GRAND STAIR

Worksheet for Calculating the Combination Flow and Volume Method

Instructions: After completing Section 1, make a copy of this Excel file for each Drainage Management Area within the project. Enter information specific to the project and DMA in the cells shaded in yellow. Cells shaded in light blue contain formulas and values that will be automatically calculated.

1.0 Project Information

1-7	Site Mean Annual Precipitation (MAP)	**19.10**

The calculations presented here are based on the **combination flow and volume sizing method** provided in the Countywide Program's C.3 Technical Guidance, Version 4.0. The steps presented below are explained in Section 5.1 of the Guidance, applicable portions of which are included in this file, in the sheet named "Guidance from Chapter 5".

Click here for map

1-8 ***MAP adjustment factor is automatically calculated as:*** **1.31**

(The "Site Mean Annual Precipitation (MAP)" is divided by the MAP for the applicable rain gauge, showin in Table 5-3, below.)
Refer to the map in Appendix C of the C.3 Technical Guidance to identify the Rainfall Region for the site.

2.0 Calculate Percentage of Impervious Surface for Drainage Management Area (DMA)

2-1 Name of DMA: **DMA #4**

For items 2-2 and 2-3, enter the areas in square feet for each type of surface within the DMA.

	Type of Surface	Area of surface type within DMA (Sq. Ft.)	Adjust Pervious Surface	Effective Impervious Area
2-2	Impervious surface	**2,600**	**1.0**	**2,600**
2-3	Pervious surface	**0**	**0.1**	**0**
	Total DMA Area (square feet) =	**2,600**		

2-4 ***Total Effective Impervious Area (EIA)*** **2,600** **Square feet**

3.0 Calculate Unit Basin Storage Volume in Inches

Table 5-3. Unit Basin Storage Volumes in Inches for 80 Percent Capture Using 48-Hour Drawdowns, based on runoff coefficient

Region	Station, and Mean Annual Precipitation (Inches)	Runoff Coefficient of 1.0
1	Boulder Creek, 55.9”	2.04"
2	La Honda, 24.4”	0.86"
3	Half Moon Bay, 25.92”	0.82"
4	Palo Alto, 14.6”	0.64"
5	San Francisco, 21.0”	0.73"
6	San Francisco airport, 20.1”	0.85"
7	San Francisco Oceanside, 19.3”	0.72"

3-1 ***Unit basin storage volume from Table 5-3:*** **0.64**
(The coefficient for this method is always 1.0, due to the conversion of any landscaping to effective impervious area.)

3-2 ***Adjusted unit basin storage volume:*** **0.84** **Inches**
(The unit basin storage volume [Item 3-1] is adjusted by applying the MAP adjustment factor [Item 1-8].)

3-3 ***Required Capture Volume (in cubic feet):*** **181** **Cubic feet**
(The adjusted unit basin sizing volume [Item 3-2] is multiplied by the DMA EIA [Item 2-4] and converted to cubic feet)

4.0 Calculate the Duration of the Rain Event

4-1	Rainfall intensity	**0.2**	**Inches per hour**
4-2	Divide Item 3-2 by Item 4-1	**4.19**	**Hours of Rain Event Duration**

5.0 Preliminary Estimate of Surface Area of Treatment Measure

5-1	4% of DMA EIA (Item 2-4)	**104**	**Square feet**
5-2	Area 25% smaller than Item 5-1 (i.e., 3% of DMA EIA)	**78**	**Square feet**
5-3	Volume of treated runoff for area in Item 5-2	**136**	**Cubic feet** (Item 5-2 * 5 inches per hour * 1/12 * Item 4-2)

6.0 Initial Adjustment of Depth of Surface Ponding Area

6-1	Subtract Item 5-3 from Item 3-3	**45**	**Cubic feet** (Amount of runoff to be stored in ponding area)
6-2	Divide Item 6-1 by Item 5-2	**0.58**	**Feet** (Depth of stored runoff in surface ponding area)
6-3	Convert Item 6-2 from feet to inches	**6.98**	**Inches** (Depth of stored runoff in surface ponding area)

6-4 If ponding depth in Item 6-3 meets your target depth (recommend 6"), skip to Item 8-1. If not, continue to Step 7-1.
(Note: Overflow outlet elevation should be set based on the calculated ponding depth.)

7.0 Optimize Size of Treatment Measure

7-1	Enter an area larger than Item 5-2	**88**	**Sq.ft.** (enter larger area if you need less ponding depth.)
7-2	Volume of treated runoff for area in Item 7-1	**153**	**Cubic feet** (Item 7-1 * 5 inches per hour * 1/12 * Item 4-2)
7-3	Subtract Item 7-2 from Item 3-3	**28**	**Cubic feet** (Amount of runoff to be stored in ponding area)
7-4	Divide Item 7-3 by Item 7-1	**0.32**	**Feet** (Depth of stored runoff in surface ponding area)
7-5	Convert Item 7-4 from ft. to inches	**3.81**	**Inches** (Depth of stored runoff in surface ponding area)

7-6 If the ponding depth in Item 7-5 meets target, stop here. If not, repeat Steps 7-1 through 7-5 until you obtain target depth.
(Note: Overflow outlet elevation should be set based on the calculated ponding depth.)

8.0 Surface Area of Treatment Measure for DMA

8-1	Final surface area of treatment	**88**	**Square feet** (Either Item 5-2 or final amount in Item 7-1)

LEGEND

- PROPOSED ROOF (IMPERVIOUS)
- PROPOSED ON-SITE PAVEMENT (IMPERVIOUS)
- PROPOSED LANDSCAPING (PERVIOUS)
- PROPOSED BIORETENTION (PERVIOUS)
- EXISTING CHANNEL AREA OF REDWOOD CREEK (NOT INCLUDED IN CALCULATIONS)
- STORMWATER MANAGEMENT AREA BOUNDARY

NOTES

1. THIS STORMWATER MANAGEMENT PLAN HAS BEEN CREATED TO SHOW COMPLIANCE WITH PROVISION C.3 OF THE SAN MATEO COUNTYWIDE STORM WATER POLLUTION PREVENTION PROGRAM.
2. THE OFFICE BUILDING IS TREATED BY AN AT-GRADE FLOW THROUGH PLANTER. THE REQUIRED TREATMENT AREA WAS CALCULATED USING THE COMBINATION FLOW/VOLUME METHOD.
3. AREA ON THE WESTERN SIDE OF REDWOOD CREEK IS DESIGNATED AS A SELF-RETAINING AREA.
4. THIS PROJECT WILL IMPLEMENT STORMWATER DETENTION MEASURES TO MITIGATE THE INCREASE IN IMPERVIOUS AREA FROM EXISTING CONDITIONS.
5. CHANNEL AREA OF REDWOOD CREEK ON THE PROJECT SITE WEREN'T INCLUDED. THE 11% PROPOSED PERVIOUS SURFACES AT THE SITE DOES NOT INCLUDE THE CHANNEL AREA OF REDWOOD CREEK.

DESIGN RAINFALL INTENSITIES

T_C = 10 MIN

$i_{10\text{-YEAR}}$ = 1.70 in/hr

$i_{30\text{-YEAR}}$ = 2.10 in/hr

$i_{100\text{-YEAR}}$ = 2.50 in/hr

PRE-DEVELOPMENT HYDROLOGY				
SURFACE	AREA (SF)	AREA (AC)	COEFF.	C*A
BUILDING ROOFS	2,279	0.05	0.95	0.048
ASPHALT PAVEMENT	–	–	–	–

C.3 Checklist – San Mateo County

SAN MATEO COUNTYWIDE Water Pollution Prevention Program

CITY/COUNTY OF Redwood City

Community Development-Public Works **Dept.**

C.3 and C.6 Development Review Checklist

Address 1017 Middlefield Road, Redwood City
Phone 650-780-7000
Website www.redwoodcity.org

Project Information

I.A Enter Project Data (For "C.3 Regulated Projects," data will be reported in the municipality's stormwater Annual Report.)

Project Name: 1180/1190 Main Street — Case Number:
Project Address & Cross Street: 1180/1190 Main Street, Redwood City & Elm Street & Lathrop Street & Maple Street
Project APN: 053-147-060/053-147-07(— Project Watershed: Redwood Creek
Applicant Name: Premia 1180 Main, LLC — Project Phase No.
Applicant Phone: (650) 600-7430 — Applicant E-mail: michael@premiallc.com

I.A.1 Development Type: (check all that apply)

- ☐ Single Family Residential: A stand-alone home that is not part of a larger project.
- ☐ Single Family Residential: Two or more lot residential development.[1] # of units:
- ☐ Multi-Family Residential # of units:
- ☑ Commercial
- ☐ Industrial, Manufacturing
- ☐ Mixed-Use # of units:
- ☐ Streets, Roads[2], etc.
- ☐ Redevelopment' as defined by MRP: creating, adding and/or replacing exterior existing impervious surface on a site where past development has occurred.
- ☐ 'Special land use categories' as defined by MRP: (1) auto service facilities[3], (2) retail gasoline outlets, (3) restaurants, (4) uncovered parking area (stand-alone or part of a larger project)
- ☐ Institutions: schools, libraries, jails, etc.
- ☐ Parks and trails, camp grounds, other recreational
- ☐ Agricultural, wineries
- ☐ Kennels, Ranches
- ☐ Other, Please specify

Project Description (Also not any past or future phases of the project.)[4]: Redevelopment of a site that currently consists of a vegetated lot, concrete foundation, and existing office building. The proposed project includes a 3 story 110,000 GSF office buidling with 2 levels of below grade parking.

I.A.2 Total Area of Site: 1.26 acres

I.A.3 Total Area of land disturbed during construction : 1.26 acres (include clearing, grading, excavating and stockpile area)

I.A.4 Site slope: 1% %

I.A.5 Certification:

I certify that the information provided on this form is correct and acknowledge that, should the project exceed the amount of new and/or replaced impervious surface provided in this form, the as-built project may be subject to additional improvements.

☑ Attach Preliminary Calculations ☐ Attach Final Calculations ☐ Attach copy of site plan showing areas

Name of person completing the form: Patrick Connors, PE — Title: Project Engineer

Signature: — Date: 4/26/2018

Phone Number: (650) 482-6453 — E-mail: pconnors@bkf.com

1 Common Plans of Development (subdivisions or contiguous, commonly owned lots, for the construction of two or more homes developed within 1 year of each other) are not considered single family projects by the MRP.
2 Roadway projects creating 10,000 sq.ft. or more of contiguous impervious surface are subject to C.3 requirements if the roadway is new or being widened with additional traffic lanes.
3 See Standard Industrial Classification (SIC) codes here: www.flowstobay.org/documents/business/new-development/Notice_to_Applicants-LID_FINAL.doc
4 Project description examples: 5-story office building, industrial warehouse, residential with five 4-story buildings for 200 condominiums, etc.

I.B Is the project a "C.3 Regulated Project" per MRP Provision C.3.b?

I.B.1 Enter the amount of Impervious surface Retained, Replaced and/or Created by the project:

Table I.B.1 Impervious[5] and Pervious Surfaces

Type of Impervious Surface	I.B.1.a Pre-Project Impervious Surface (sq.ft.)	I.B.1.b Existing Impervious Surface to be Retained[6] (sq.ft.)	I.B.1.c Existing Impervious Surface to be Replaced[6] (sq.ft.)	I.B.1.d New Impervious Surface to be Created[6] (sq.ft.)	I.B.1.e Post-Project Impervious Surface (sq.ft.) (=b+c+d)
Roof area(s)	2,279	0	2,279	38,011	40290
Impervious[5] sidewalks, patios, paths, driveways, streets	5,344	0	5,344	3,012	8356
Impervious[5] uncovered parking[7]					0
Totals:	7623	0	7623	41023	48646
I.B.1.f - Total Impervious Surface Replaced and Created: ***(sum of totals for columns I.B.1.c and I.B.1.d):***			**48646**		

Type of Pervious Surface	Pre-Project Pervious Surface (sq.ft.)				Post-project Pervious Surface(sq.ft.)
Landscaping	47,118				6,095
Pervious Paving				**I.B.1.e.1**	
Green Roof					
Totals:	47118				6095
Total Site Area (Total Impervious + Total Pervious)	54741				54741

I.B.2 Please review and attach additional worksheets as required below using the Total Impervious Surface (IS) Replaced and Created in cell **I.B.1.f** from Table **I.B.1** above and other factors:

	Review Steps	Check One Yes	Check One No	Attach Worksheet
I.B.2.a	Does this project involve any earthwork? If YES, then Check Yes, and Complete Worksheet A. If NO, then go to I.B.2.b	✓		A
I.B.2.b	Is **I.B.1.f** greater than or equal to 2,500 sq.ft? If YES, then the Project is subject to Provision C.3.i. - complete Worksheets B, C & go to I.B.2.c. If NO, then Stop here - go to I.A.5 and complete Certification or ask municipal staff for Small Project Checklist.	✓		B, C
I.B.2.c	Is the total Existing IS to be Replaced (column **I.B.1.c**) 50 percent or more of the total Pre-Project IS (column **I.B.1.a**)? If YES, site design, source control and treatment requirements apply to the whole site. Continue to I.B.2.d If NO, these requirements apply only to the impervious surface created and/or replaced. Continue to I.B.2.d	✓		
I.B.2.d	Is this project a Special Land Use Category (**I.A.1**) and is **I.B.1.f** greater than or equal to 5,000 sq.ft? If YES, project is a C.3 Regulated Project. Fill out Worksheet D. Then continue to I.B.2.f. If NO, go to I.B.2.e		✓	D
I.B.2.e	Is **I.B.1.f** greater than or equal to 10,000 sq.ft? If YES, project is a C.3 Regulated Project - complete Worksheet D. Then continue to I.B.2.f. If NO, then skip to I.B.2.g.	✓		D
I.B.2.f	Is **I.B.1.f** greater than or equal to 43,560 sq.ft? If YES, project may be subject to Hydromodification Management requirements - complete Worksheet E then go to I.B.2.g. If NO, then go to I.B.2.g.	✓		E
I.B.2.g	Is **I.A.3** greater than or equal to 1 acre? If YES, check box, obtain coverage under CA Const. General Permit & submit Notice of Intent to municipality - go to I.B.2.h. If NO, then go to I.B.2.h. For more information see: www.swrcb.ca.gov/water_issues/programs/stormwater/construction.shtml	✓		
I.B.2.h	Is this a Special Project or does it have the potential to be a Special Project? If YES, complete Worksheet F - then continue to I.B.2.i. If NO, go to I.B.2.i.		✓	F
I.B.2.i	Is this project a High Priority Site? (Determined by the Municipality. High Priority Sites can include those located within 100 ft. of a sensitive habitat, an Area of Special Biological Significance, a body of water, or **starting 7/1/16** on sites disturbing >=5,000 sq.ft. with slopes >=15% **(see I.A.4)** [or per municipal criteria/map.] Subject to monthly inspections from Oct 1 to April 30.) If YES, complete section G-2 on Worksheet G - then continue to I.B.2.j. If NO, then go to I.B.2.j		✓	G
I.B.2.j	For Municipal Staff Use Only: Are you using Alternative Certification for the project review? If YES, then fill out section G-1 on Worksheet G. Fill out other sections of Worksheet G as appropriate. See cell **I.B.1.e.1** above - Is the project installing 3,000 square feet or more of pervious paving? If YES, then fill out section G-3 on Worksheet G. Add to Municipal Inspection Lists (C.3 and C.3.h)			G

5 Per the MRP, pavement that meets the following definition of pervious pavement is NOT an impervious surface. Pervious pavement is defined as pavement that stores and infiltrates rainfall at a rate equal to immediately surrounding unpaved, landscaped areas, or that stores and infiltrates the rainfall runoff volume described in Provision C.3.

6 "Retained" means to leave existing impervious surfaces in place; "Replaced" means to install new impervious surface where existing impervious surface is removed anywhere on the same property; and "Created" means the amount of new impervious surface being proposed which exceeds the total existing amount of impervious surface at the property.

7 Uncovered parking includes the top level of a parking structure.

Worksheet A

C6 – Construction Stormwater BMPs

Identify Plan sheet showing the appropriate construction Best Management Practices (BMPs) used on this project:
(Applies to all projects with earthwork)

Yes	Plan Sheet	Best Management Practice (BMP)
☑		Control and prevent the discharge of all potential pollutants, including pavement cutting wastes, paints, concrete, petroleum products, chemicals, wash water or sediments, rinse water from architectural copper, and non-stormwater discharges to storm drains and watercourses.
☑		Store, handle, and dispose of construction materials/wastes properly to prevent contact with stormwater.
☑		Do not clean, fuel, or maintain vehicles on-site, except in a designated area where wash water is contained and treated.
☑		Train and provide instruction to all employees/subcontractors re: construction BMPs.
☑		Protect all storm drain inlets in vicinity of site using sediment controls such as berms, fiber rolls, or filters.
☑		Limit construction access routes and stabilize designated access points.
☑		Attach the San Mateo Countywide Water Pollution Prevention Program's construction BMP plan sheet to project plans and require contractor to implement the applicable BMPs on the plan sheet.
☑		Use temporary erosion controls to stabilize all denuded areas until permanent erosion controls are established.
☑		Delineate with field markers clearing limits, easements, setbacks, sensitive or critical areas, buffer zones, trees, and drainage courses.
☑		Provide notes, specifications, or attachments describing the following: ■ Construction, operation and maintenance of erosion and sediment controls, include inspection frequency; ■ Methods and schedule for grading, excavation, filling, clearing of vegetation, and storage and disposal of excavated or cleared material; ■ Specifications for vegetative cover & mulch, include methods and schedules for planting and fertilization; ■ Provisions for temporary and/or permanent irrigation.
☐		Perform clearing and earth moving activities only during dry weather.
☑		Use sediment controls or filtration to remove sediment when dewatering and obtain all necessary permits.
☑		Trap sediment on-site, using BMPs such as sediment basins or traps, earthen dikes or berms, silt fences, check dams, soil blankets or mats, covers for soil stock piles, etc.
☑		Divert on-site runoff around exposed areas; divert off-site runoff around the site (e.g., swales and dikes).
☑		Protect adjacent properties and undisturbed areas from construction impacts using vegetative buffer strips, sediment barriers or filters, dikes, mulching, or other measures as appropriate.

Worksheet B

C3 – Source Controls

Select appropriate source controls and identify the detail/plan sheet where these elements are shown.

Yes	Detail/Plan Sheet No.	Features that require source control measures	Source Control Measures (Refer to Local Source Control List for detailed requirements)
☑		Storm Drain	Mark on-site inlets with the words "No Dumping! Flows to Bay" or equivalent.
☑		Floor Drains	Plumb interior floor drains to sanitary sewer [or prohibit].
☑		Parking garage	Plumb interior parking garage floor drains to sanitary sewer.[8]
☑		Landscaping	■ Retain existing vegetation as practicable. ■ Select diverse species appropriate to the site. Include plants that are pest- and/or disease-resistant, drought-tolerant, and/or attract beneficial insects. ■ Minimize use of pesticides and quick-release fertilizers. ■ Use efficient irrigation system; design to minimize runoff.
☐		Pool/Spa/Fountain	Provide connection to the sanitary sewer to facilitate draining.[8]
☑		Food Service Equipment (non-residential)	Provide sink or other area for equipment cleaning, which is: ■ Connected to a grease interceptor prior to sanitary sewer discharge.[8] ■ Large enough for the largest mat or piece of equipment to be cleaned. ■ Indoors or in an outdoor roofed area designed to prevent stormwater run-on and run-off, and signed to require equipment washing in this area.
☑		Refuse Areas	■ Provide a roofed and enclosed area for dumpsters, recycling containers, etc., designed to prevent stormwater run-on and runoff. ■ Connect any drains in or beneath dumpsters, compactors, and tallow bin areas serving food service facilities to the sanitary sewer.[8]
☐		Outdoor Process Activities[9]	Perform process activities either indoors or in roofed outdoor area, designed to prevent stormwater run-on and runoff, and to drain to the sanitary sewer.[8]
☐		Outdoor Equipment/ Materials Storage	■ Cover the area or design to avoid pollutant contact with stormwater runoff. ■ Locate area only on paved and contained areas. ■ Roof storage areas that will contain non-hazardous liquids, drain to sanitary sewer[8], and contain by berms or similar.
☐		Vehicle/ Equipment Cleaning	■ Roofed, pave and berm wash area to prevent stormwater run-on and runoff, plumb to the sanitary sewer8, and sign as a designated wash area. ■ Commercial car wash facilities shall discharge to the sanitary sewer.[8]
☐		Vehicle/ Equipment Repair and Maintenance	■ Designate repair/maintenance area indoors, or an outdoors area designed to prevent stormwater run-on and runoff and provide secondary containment. Do not install drains in the secondary containment areas. ■ No floor drains unless pretreated prior to discharge to the sanitary sewer.[8] ■ Connect containers or sinks used for parts cleaning to the sanitary sewer.[8]
☐		Fuel Dispensing Areas	■ Fueling areas shall have impermeable surface that is a) minimally graded to prevent ponding and b) separated from the rest of the site by a grade break. ■ Canopy shall extend at least 10 ft. in each direction from each pump and drain away from fueling area.
☑		Loading Docks	■ Cover and/or grade to minimize run-on to and runoff from the loading area. ■ Position downspouts to direct stormwater away from the loading area. ■ Drain water from loading dock areas to the sanitary sewer.[8] ■ Install door skirts between the trailers and the building.
☑		Fire Sprinklers	Design for discharge of fire sprinkler test water to landscape or sanitary sewer.[8]
☑		Miscellaneous Drain or Wash Water	■ Drain condensate of air conditioning units to landscaping. Large air conditioning units may connect to the sanitary sewer.[8] ■ Roof drains from equipment drain to landscaped area where practicable. ■ Drain boiler drain lines, roof top equipment, all wash water to sanitary sewer.[8]
☐		Architectural Copper Rinse Water	■ Drain rinse water to landscaping, discharge to sanitary sewer[8], or collect and dispose properly offsite. See flyer "Requirements for Architectural Copper."

8 Any connection to the sanitary sewer system is subject to sanitary district approval.

9 Businesses that may have outdoor process activities/equipment include machine shops, auto repair, industries with pretreatment facilities.

Worksheet C

Low Impact Development – Site Design Measures

Select Appropriate Site Design Measures *(Required for C.3 Regulated Projects; all other projects are encouraged to implement site design measures, which may be required at municipality discretion.) Projects that create and/or replace 2,500 – 10,000 sq.ft. of impervious surface, and stand-alone single family homes that create/replace 2,500 sq.ft. or more of impervious surface, must include* ***one of Site Design Measures a through f*** *(Provision C.3.i requirements).*[10] *Larger projects must also include applicable Site Design Measures g through i. Consult with municipal staff about requirements for your project.*

Select appropriate site design measures and Identify the Plan Sheet where these elements are shown.

Yes	Plan Sheet No.	
☐		a. Direct roof runoff into cisterns or rain barrels and use rainwater for irrigation or other non-potable use.
☑		b. Direct roof runoff onto vegetated areas.
☑		c. Direct runoff from sidewalks, walkways, and/or patios onto vegetated areas.
☐		d. Direct runoff from driveways and/or uncovered parking lots onto vegetated areas.
☐ ☐		e. Construct sidewalks, walkways, and/or patios with pervious or permeable surfaces.Use the specifications in the C3 Technical Guidance (Version 4.1) downloadable at www.flowstobay.org/newdevelopment.
☐		f. Construct bike lanes, driveways, and/or uncovered parking lots with pervious surfaces.Use the specifications in the C3 Technical Guidance (Version 4.1) downloadable at www.flowstobay.org/newdevelopment.
		g. Limit disturbance of natural water bodies and drainage systems; minimize compaction of highly permeable soils; protect slopes and channels; and minimize impacts from stormwater and urban runoff on the biological integrity of natural drainage systems and water bodies;
☐		h. Conserve natural areas, including existing trees, other vegetation and soils.
☐		i. Minimize impervious surfaces.

Regulated Projects can also consider the following site design measures to reduce treatment system sizing:

Yes	Plan Sheet No.	
☑		j. Self-treating area (see Section 4.2 of the C.3 Technical Guidance)
☑		k. Self-retaining area (see Section 4.3 of the C.3 Technical Guidance)
☐		l. Plant or preserve interceptor trees (Section 4.1, C.3 Technical Guidance)

10 See MRP Provision C.3.a.i.(6) for non-C.3 Regulated Projects, C.3.c.i.(2)(a) for Regulated Projects, C.3.i for projects that create/replace 2,500 to 10,000 sq.ft. of impervious surface and stand-alone single family homes that create/replace 2,500 sq.ft. or more of impervious surface.

Worksheet D

C3 Regulated Project - Stormwater Treatment Measures

Check all applicable boxes and indicate the treatment measure(s) included in the project.

Yes

☐ Attach Worksheet F and Calculations

Is the project a **Special Project**?[11]
If yes, consult with municipal staff about the need to evaluate the feasibility and infeasibility of 100% LID treatment. Indicate the type of non-LID treatment to be used, the hydraulic sizing method , and percentage of the amount of runoff specified in Provision C.3.d that is treated:

Non-LID Treatment Measures:	Hydraulic sizing method[12]			% of C.3.d amount of runoff treated
☐ Media Filter	☐ 2.a	☐ 2.b	☐ 2.c	_____ %
☐ Tree well Filter	☐ 2.a	☐ 2.b	☐ 2.c	_____ %

☐

Is the project using infiltration systems? The MRP no longer requires the use or analysis of the feasibility of infiltration, but infiltration systems are encouraged and may be beneficial depending on the project. Indicate the infiltration measures to be used, and hydraulic sizing method:

Infiltration Measures:	Hydraulic sizing method[12]			
☐ Bioinfiltration[13]	☐ 1.a	☐ 1.b	☐ 2.c	☐ 3
☐ Infiltration Trench	☐ 1.a	☐ 1.b		
☐ Other (specifiy):				

☐

Is the project harvesting and using rainwater?
The MRP no longer requires the use or analysis of the feasibility of rainwater harvesting, but it rainwater harvesting and use is encouraged and may be beneficial depending on the project.

Rainwater Harvesting/Use Measures:	Hydraulic sizing method[12]	
☐ Rainwater Harvesting for indoor non-potable water use	☐ 1.a	☐ 1.b
☐ Rainwater Harvesting for landscape irrigation use	☐ 1.a	☐ 1.b

☑

Is the project installing biotreatment measures?

Indicate the measures to be used, and the hydraulic sizing method:

Biotreatment Measures:	Hydraulic sizing method[12]	
☐ Bioretention area	☐ 2.c	☐ 3
☑ Flow-through planter	☐ 2.c	☑ 3
☐ Other (specifiy):		

A copy of the long term Operations and Maintenance (O&M) Agreement and Plan for this project will be required. Please contact the NPDES Representative of the applicable municipality for an agreement template and consult the C.3 Technical Guidance at www.flowstobay.org for maintenance plan templates for specific facility types.

11 Special Projects are smart growth, high density, or transit-oriented developments with the criteria defined in Provision C.3.e.ii.(2), (3) or (4) (see Worksheet F).
12 Indicate which of the following Provision C.3.d.i hydraulic sizing methods were used. Volume based approaches: 1(a) Urban Runoff Quality Management approach, or 1(b) 80% capture approach (recommended volume-based approach). Flow-based approaches: 2(a) 10% of 50-year peak flow approach, 2(b) 2 times the 85th percentile rainfall intensity approach, or 2(c) 0.2-Inch-per-hour intensity approach (recommended flow-based approach - also known as the 4% rule). Combination flow and volume-based approach: 3.
13 See Section 6.1 of the C.3 Technical Guidance for conditions in which bioretention areas provide bioinfiltration.

Worksheet E
Hydromodification Management

E-1 Is the project a Hydromodification[14] Management (HM) Project?

E-1.1 Is the total impervious area increased over the pre-project condition?

- ☑ Yes. Continue to E-1.2
- ☐ No. The project is NOT required to incorporate HM Measures. Go to Item E-1.4 and check "No."

E-1.2 Is the site located in an HM Control Area per the HM Control Areas map (Appendix H of the C.3 Technical Guidance)?

- ☐ Yes. Continue to E-1.3
- ☑ No. Attach map, indicating project location. The project is NOT required to incorporate HM Measures. Skip to Item E-1.4 and check "No."

E-1.3 Has an engineer or qualified environmental professional determined that runoff from the project flows only through a hardened channel or enclosed pipe along its entire length before emptying into a waterway in the exempt area?

- ☐ Yes. Attach map of facility. Go to Item E-1.4 and check "Yes."
- ☐ No. Attach map, indicating project location. The project is NOT required to incorporate HM Measures. Skip to Item E-1.4 and check "No."

E-1.4 Is the project a Hydromodification Management Project?

- ☐ Yes. The project is subject to HM requirements in Provision C.3.g of the Municipal Regional Stormwater Permit.
- ☐ No. The project is EXEMPT from HM requirements.

► If the project is subject to the HM requirements, incorporate in the project flow duration control measures designed such that post-project discharge rates and durations match pre-project discharge rates and durations.

► The Bay Area Hydrology Model (BAHM) has been developed to help size flow duration controls. See www.bayareahydrologymodel.org. Guidance is provided in Chapter 7 of the C.3 Technical Guidance.

E-2 Incorporate HM Controls (if required)

Are the applicable items provided with the Plans?

Yes	No	NA	
☐	☐	☐	Site plans with pre- and post-project impervious surface areas, surface flow directions of entire site, locations of flow duration controls and site design measures per HM site design requirement
☐	☐	☐	Soils report or other site-specific document showing soil type(s) on site
☐	☐	☐	If project uses the Bay Area Hydrology Model (BAHM), a list of model inputs and outputs.
☐	☐	☐	If project uses custom modeling, a summary of the modeling calculations with corresponding graph showing curve matching (existing, post-project, and post-project with HM controls curves), goodness of fit, and (allowable) low flow rate.
☐	☐	☐	If project uses the Impracticability Provision, a listing of all applicable costs and a brief description of the alternative HM project (name, location, date of start up, entity responsible for maintenance).
☐	☐	☐	If the project uses alternatives to the default BAHM approach or settings, a written description and rationale.

14 Hydromodification is the change in a site's runoff hydrograph, including increases in flows and durations that results when land is developed (made more impervious). The effects of hydromodification include, but are not limited to, increased bed and bank erosion of receiving streams, loss of habitat, increased sediment transport and/or deposition, and increased flooding. Hydromodification control measures are designed to reduce these effects.

Worksheet F
Special Projects

Complete this worksheet for projects that appear to meet the definition of "Special Project", per Provision C.3.e.ii of the Municipal Regional Stormwater Permit (MRP). The form assists in determining whether a project meets Special Project criteria, and the percentage of low impact development (LID) treatment reduction credit. Special Projects that implement less than 100% LID treatment must provide a narrative discussion of the feasibility or infeasibility of 100% LID treatment. See Appendix J of the C.3 Technical Guidance Handbook (download at www.flowstobay.org) for more information.

F-1

"Special Project" Determination (Check the boxes to determine if the project meets any of the following categories.)

Special Project Category "A"

Does the project have ALL of the following characteristics?

- ☐ Located in a municipality's designated central business district, downtown core area or downtown core zoning district, neighborhood business district or comparable pedestrian-oriented commercial district, or historic preservation site and/or district;
- ☐ Creates and/or replaces 0.5 acres or less of impervious surface;
- ☐ Includes no surface parking, except for incidental parking for emergency vehicle access, ADA access, and passenger or freight loading zones;
- ☐ Has at least 85% coverage of the entire site by permanent structures. The remaining 15% portion of the site may be used for safety access, parking structure entrances, trash and recycling service, utility access, pedestrian connections, public uses, landscaping and stormwater treatment.

☐ No (continue)

☐ Yes – Complete Section F-2 below

Special Project Category "B"

Does the project have ALL of the following characteristics?

- ☐ Located in a municipality's designated central business district, downtown core area or downtown core zoning district, neighborhood business district or comparable pedestrian-oriented commercial district, or historic preservation site and/or district[15];
- ☐ Creates and/or replaces more than 0.5 acres of impervious area and less than 2.0 acres;
- ☐ Includes no surface parking, except for incidental parking for emergency access, ADA access, and passenger or freight loading zones;
- ☐ Has at least 85% coverage of the entire site by permanent structures. The remaining 15% portion of the site may be used for safety access, parking structure entrances, trash and recycling service, utility access, pedestrian connections, public uses, landscaping and stormwater treatment;
- ☐ Minimum density of either 50 dwelling units per acre (for residential projects) or a Floor Area Ratio (FAR) of 2:1 (for commercial projects) - mixed use projects may use either criterion. **Note Change on 7/1/16**[16]

☐ No (continue) ☐ Yes – Complete Section F-2 below

Special Project Category "C"

Does the project have ALL of the following characteristics?

- ☐ At least 50% of the project area is within 1/2 mile of an existing or planned transit hub[17] or 100% within a planned Priority Development Area[18];
- ☐ The project is characterized as a non-auto-related use[19]; and
- ☐ Minimum density of either 25 dwelling units per acre (for residential projects) or a Floor Area Ratio (FAR) of 2:1 (for commercial projects) - mixed use projects may use either criterion. **Note Change on 7/1/16**[16]

☑ No (continue) ☐ Yes – Complete Section F-2 below

15 And built as part of a municipality's stated objective to preserve/enhance a pedestrian-oriented type of urban design.

16 **Effective 7/1/16**, the MRP establishes definitions for "Gross Density"(GD) & FAR. GD is defined as, "the total number of residential units divided by the acreage of the entire site area, including land occupied by public right-of-ways, recreational, civic, commercial and other non-residential uses." FAR is defined as," the Ratio of the total floor area on all floors of all buildings at a project site (except structures, floors, or floor areas dedicated to parking) to the total project site area.

17 "Transit hub" is defined as a rail, light rail, or commuter rail station, ferry terminal, or bus transfer station served by three or more bus routes. (A bus stop with no supporting services does not qualify.)

18 A "planned Priority Development Area" is an infill development area formally designated by the Association of Bay Area Government's / Metropolitan Transportation Commission's FOCUS regional planning program.

19 Category C specifically excludes stand-alone surface parking lots; car dealerships; auto and truck rental facilities with onsite surface storage; fast-food restaurants, banks or pharmacies with drive-through lanes; gas stations; car washes; auto repair and service facilities; or other auto-related project unrelated to the concept of transit oriented development.

F-2 LID Treatment Reduction Credit Calculation

(If more than one category applies, choose only one of the applicable categories and fill out the table for that category.)

Category	Impervious Area Created/Replaced (sq. ft.)	Site Coverage (%)	Project Density[16] or FAR[16]	Density/Criteria	Allowable Credit (%)	Applied Credit (%)
A			N.A.	N.A.	100%	
B				Res ≥ 50 DU/ac or FAR ≥ 2:1	50%	
				Res ≥ 75 DU/ac or FAR ≥ 3:1	75%	
				Res ≥ 100 DU/ac or FAR ≥ 4:1	100%	
C				**Location credit (select one)[20] :**		
				Within ¼ mile of transit hub	50%	
				Within ½ mile of transit hub	25%	
				Within a planned PDA	25%	
				Density credit (select one):		
				Res ≥ 30 DU/ac or FAR ≥ 2:1	10%	
				Res ≥ 60 DU/ac or FAR ≥ 4:1	20%	
				Res ≥ 100 DU/ac or FAR ≥ 6:1	30%	
				Parking credit (select one):		
				≤ 10% at-grade surface parking[21]	10%	
				No surface parking	20%	
				TOTAL TOD CREDIT =		0%

F-3 Narrative Discussion of the Feasibility/Infeasibility of 100% LID Treatment:

If project will implement less than 100% LID, prepare a discussion of the feasibility or infeasibility of 100% LID treatment, as described in Appendix K of the C.3 Technical Guidance.

F-4 Select Certified Non-LID Treatment Measures:

If the project will include non-LID treatment measures, select a treatment measure certified for "Basic" General Use Level Designation (GULD) by the Washington State Department of Ecology's Technical Assessment Protocol – Ecology (TAPE). Guidance is provided in Appendix K of the C.3 Technical Guidance (download at www.flowstobay.org). [22]

20 To qualify for the location credit, at least 50% of the project's site must be located within the ¼ mile or ½ mile radius of an existing or planned transit hub, as defined on page 1, footnote 2. A planned transit hub is a station on the MTC's Regional Transit Expansion Program list, per MTC's Resolution 3434 (revised April 2006), which is a regional priority funding plan for future transit stations in the San Francisco Bay Area. To qualify for the PDA location credit, 100% of the project site must be located within a PDA, as defined on page 1, footnote 3.

21 The at-grade surface parking must be treated with LID treatment measures.

22 TAPE certification is used in order to satisfy Special Project's reporting requirements in the MRP.

Worksheet G
(For municipal staff use only)

G-1 **Alternative Certification:** Were the treatment and/or HM control sizing and design reviewed by a qualified third-party professional that is not a member of the project team or agency staff?

☐ Yes ☐ No Name of Reviewer: _____

G-2

High Priority Site: High Priority Sites can include those located in or within 100 feet of a sensitive habitat, an Area of Special Biological Significance (ASBS), a body of water, or **starting 7/1/16** on "hillside projects" disturbing >=5,000 sq.ft. of land and with steep slopes (of >=15% - see cell **I.A.4** - or as identified by municipal criteria or map). These sites are subject to monthly inspections from Oct 1 to April 30. See MRP Provision C.6.e.ii.(2).

☐ Yes ☐ No If yes, then add site to Staff's Monthly Rainy Season Construction Site Inspection List

G-3

Inspections of Sites with Pervious Paving: **Starting 7/1/16**, Regulated projects that are installing 3,000 sq.ft. or more of pervious paving (see cell **I.B.1.e.1**) (excluding private-use patios in single family homes, townhomes, or condominiums) must have the paving system inspected by the jurisdiction upon completion of the installation and the site must be added to the jurisdiction's list of sites needing inspections at least once every five years – see provision C.3.h. Pervious pavement systems include pervious concrete, pervious asphalt, pervious pavers and grid pavers etc. and are described in the C3 Technical Guidance (Version 4.1) downloadable at: www.flowstobay.org/newdevelopment.

☐ Yes ☐ No If yes, then add site to Staff's Lists for Construction and O&M inspections (C.3 and C.3.h)

Operations and Maintenance (O&M) Submittals

G-4 Stormwater Treatment Measure and/HM Control Owner or Operator's Information:

Name: _____

Address: _____

Phone: _____ Email: _____

► Applicant must call for inspection and receive inspection within 45 days of installation of treatment measures and/or hydromodification management controls.

The following questions apply to C.3 Regulated Projects and Hydromodification Management Projects.

		Yes	No	N/A
G-4.1	Was maintenance plan submitted?	☐	☐	☐
G-4.2	Was maintenance plan approved?	☐	☐	☐
G-4.3	Was maintenance agreement submitted? (Date executed: _____)	☐	☐	☐

► *Attach the executed maintenance agreement as an appendix to this checklist.*

G-5 **Annual Operations and Maintenance (O&M) Submittals (for municipal staff use only):**

For C.3 Regulated Projects and Hydromodification Management Projects, indicate the dates on which the Applicant submitted annual reports for project O&M:

_____

G-6 **Comments (for municipal staff use only):**

G-7 NOTES (for municipal staff use only):

Project Info Notes: _____

Worksheet A Notes: _____

Worksheet B Notes: _____

Worksheet C Notes: _____

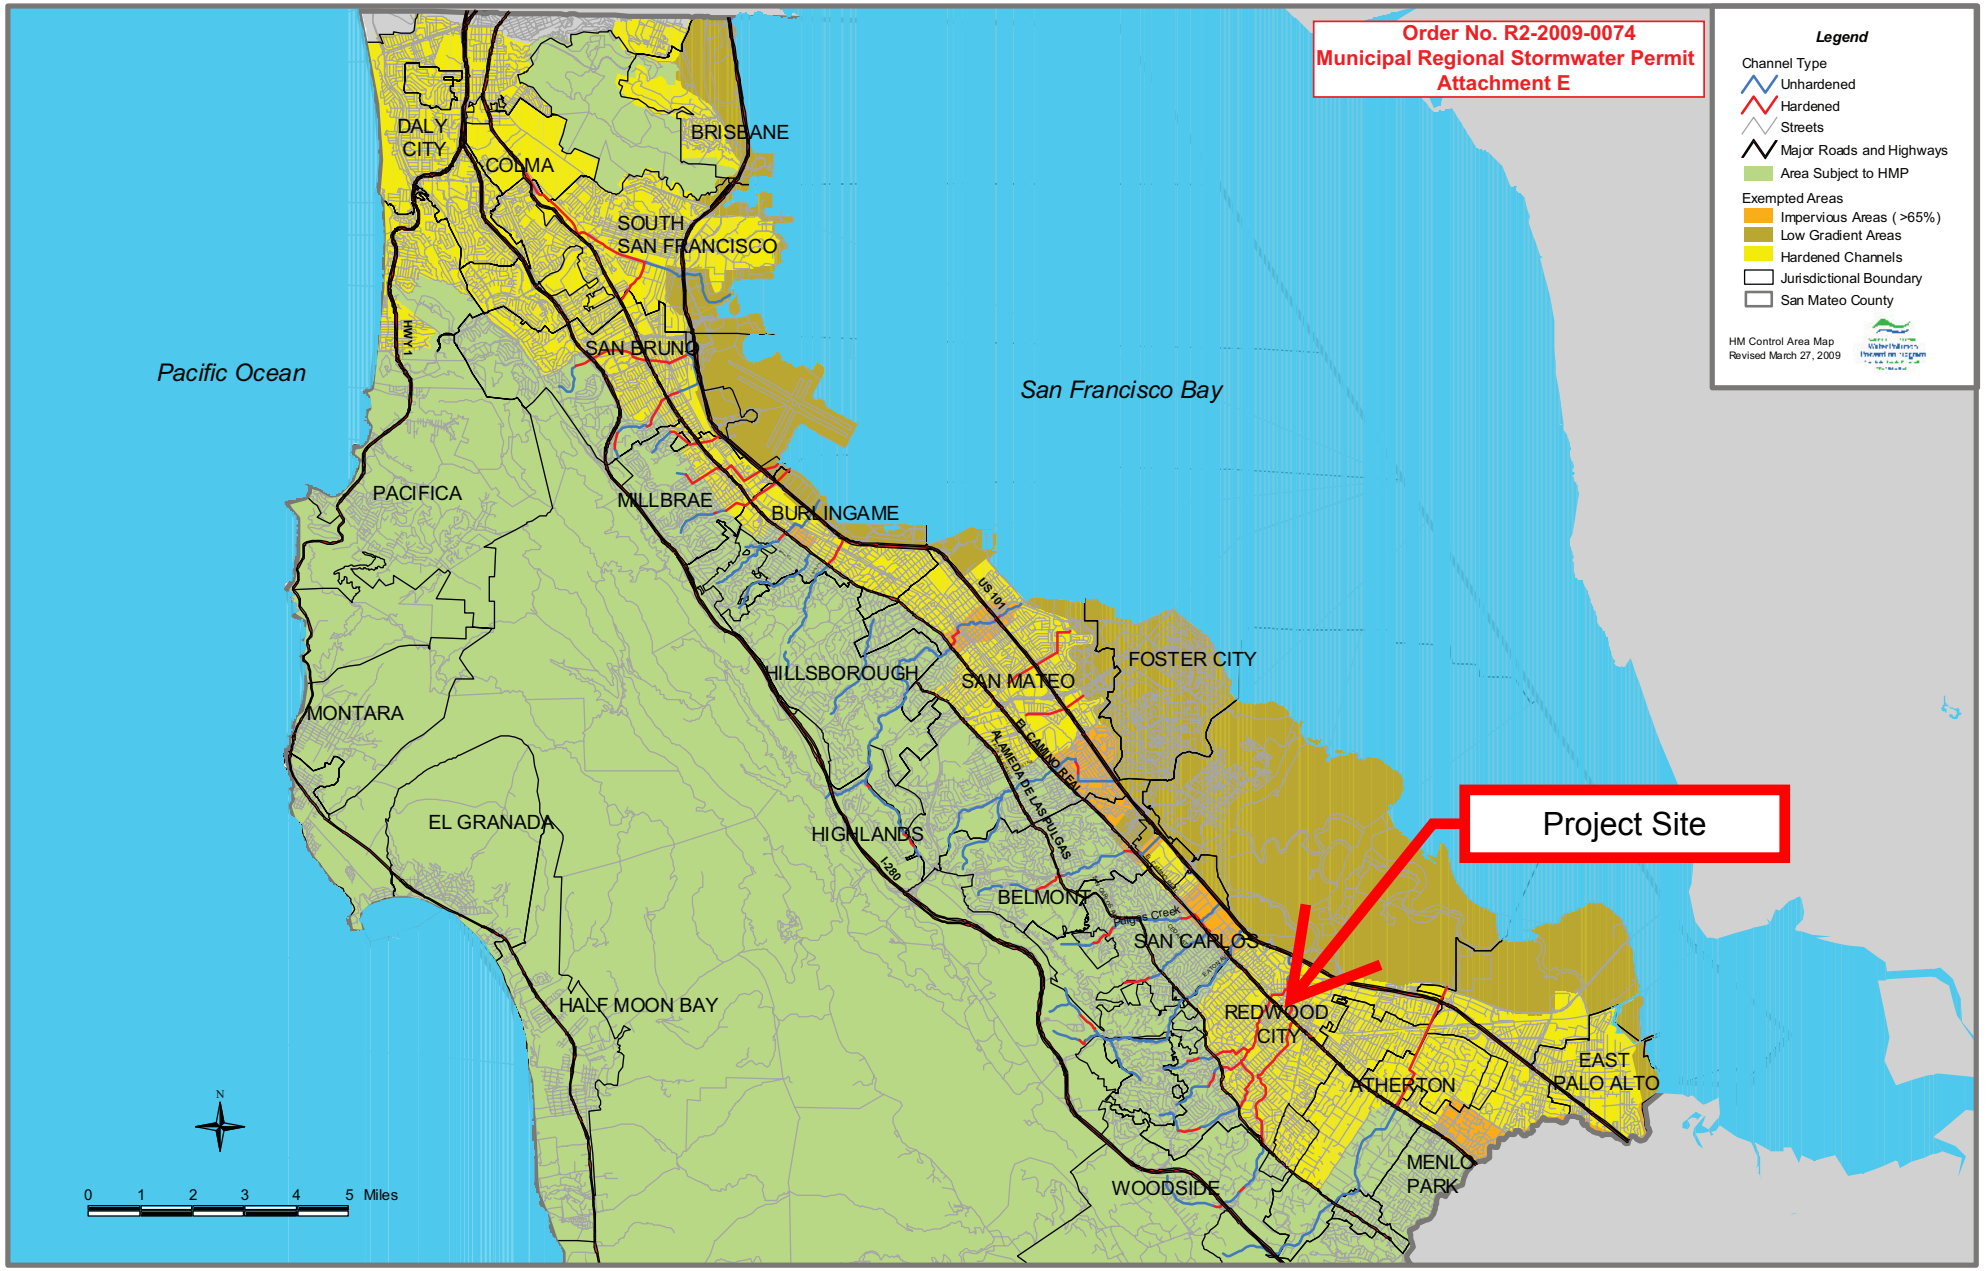
Worksheet D Notes: _____

Worksheet E Notes: _____

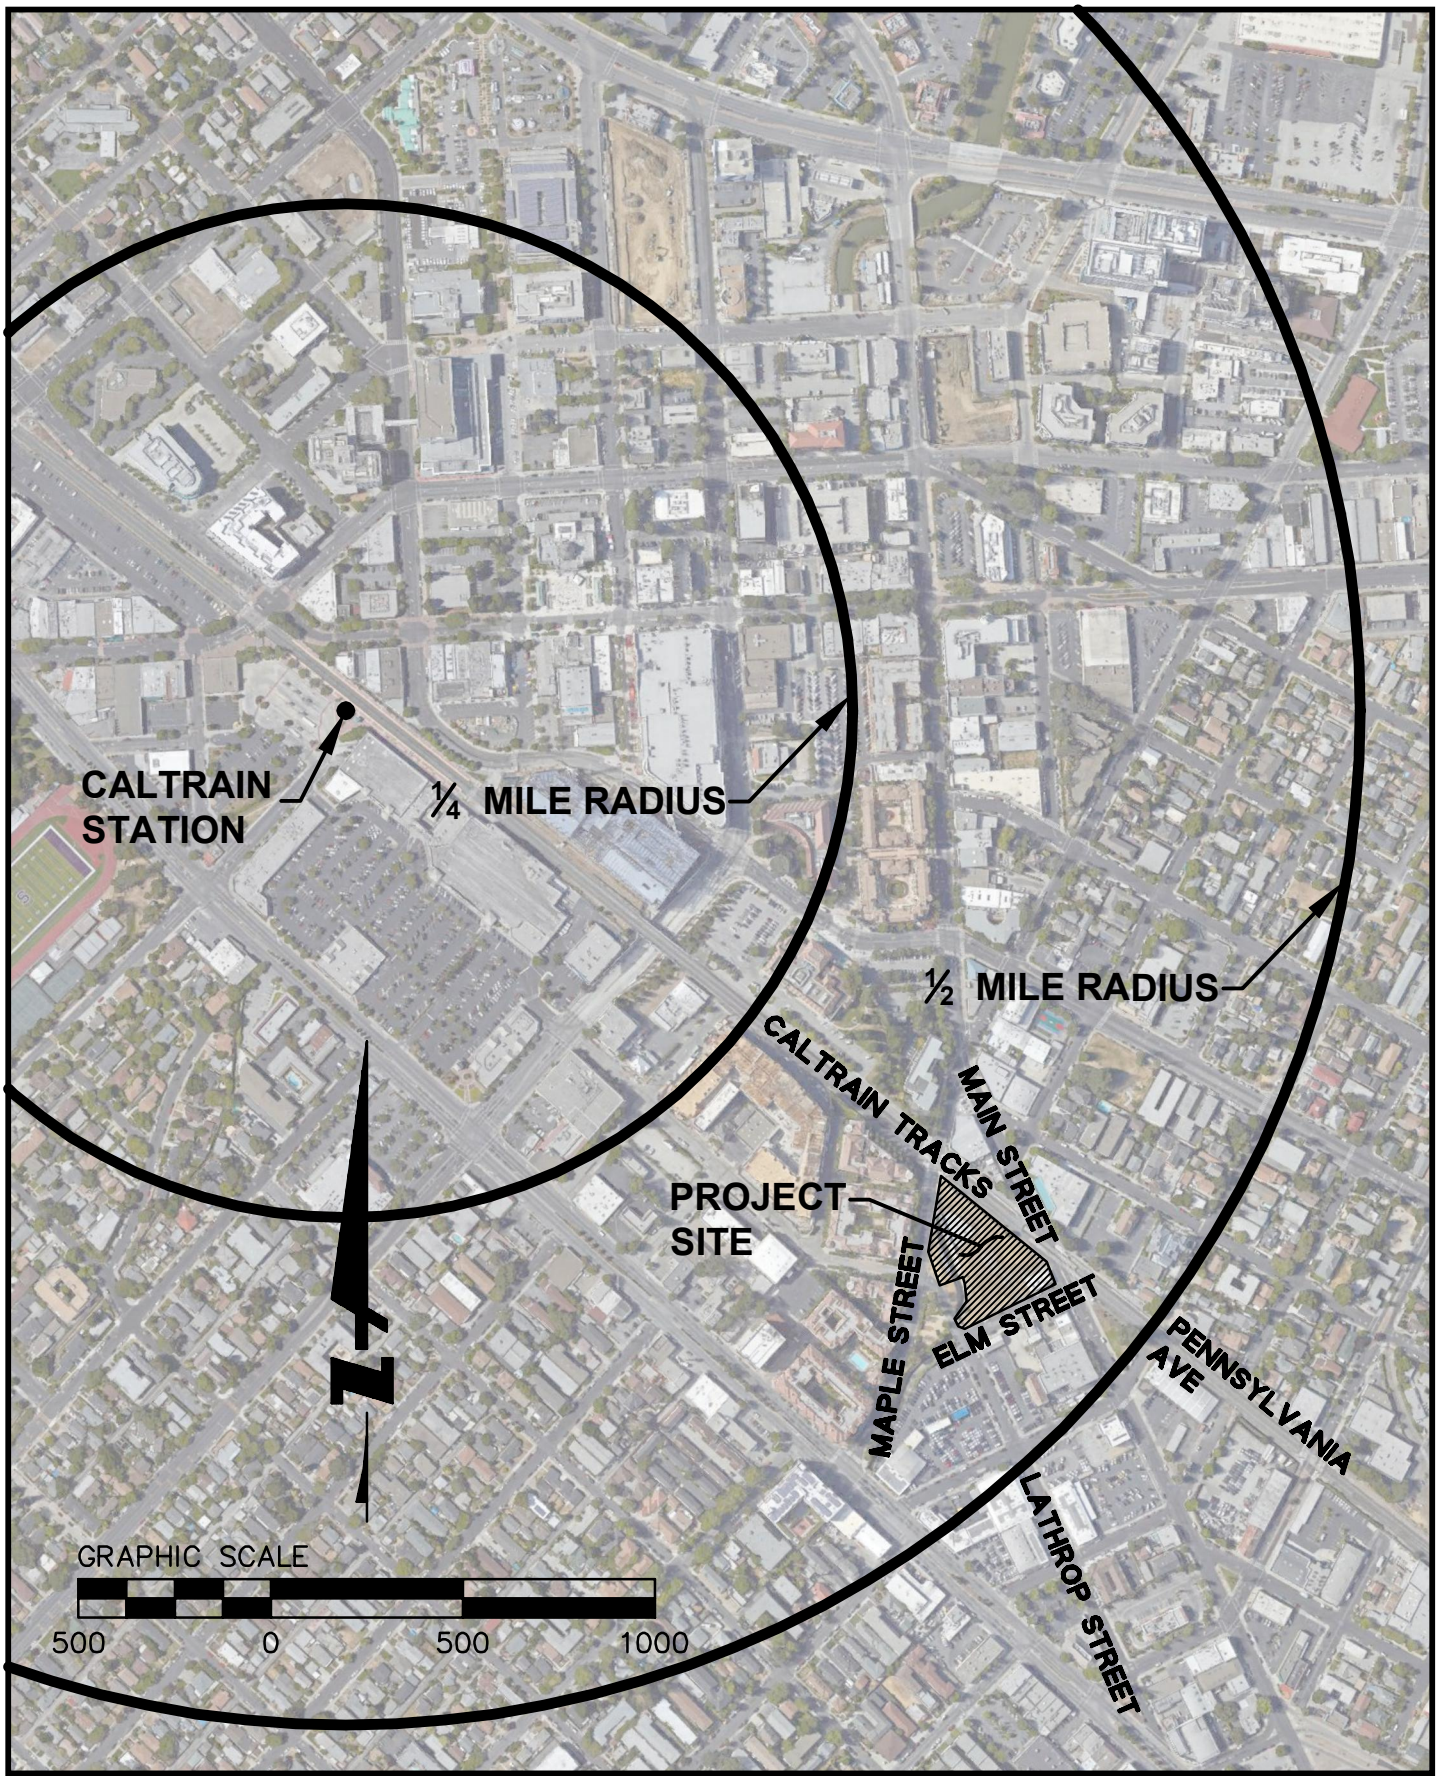
Worksheet F Notes: _____

G-8 Project Close-Out (for municipal staff use only):

		Yes	No	N/A
8.1	Were final Conditions of Approval met?	☐	☐	
8.2	Was initial inspection of the completed treatment/HM measure(s) conducted? (Date of inspection: _____)	☐	☐	☐
8.3	Was maintenance plan submitted? (Date executed: _____)	☐	☐	☐
8.4	Was project information provided to staff responsible for O&M verification inspections? (Date provided to inspection staff: _____)	☐	☐	☐



G-9 Project Close-Out (Continued -- for municipal staff use only):



Name of staff confirming project is closed out: _____

Signature: _____ Date: _____

Name of O&M staff receiving information: _____

Signature: _____ Date: _____

FEMA Maps

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations tables in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations tables should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures**. Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was Universal Transverse Mercator (UTM) zone 10N. The **horizontal datum** was NAD 83, GRS80 spheroid. Differences in datum, spheroid, projection or UTM zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of this FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum**. For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC-3, #9202
1315 East-West Highway
Silver Spring, Maryland 20910-3282
(301) 713-3242

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713-3242**, or visit its website at http://www.ngs.noaa.gov.

Base map information shown on this FIRM was provided in digital format by the USDA National Agriculture Imagery Program (NAIP). This information was photogrammetrically compiled at a scale of 1:24,000 from aerial photography dated 2005.

This map reflects more detailed and up-to-date **stream channel configurations** than those shown on the previous FIRM for this jurisdiction. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations. As a result, the Flood Profiles and Floodway Data tables in the Flood Insurance Study Report (which contains authoritative hydraulic data) may reflect stream channel distances that differ from what is shown on this map.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information on available products associated with this FIRM visit the **Map Service Center (MSC)** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the MSC website.

If you have **questions about this map**, how to order products or the National Flood Insurance Program in general, please call the FEMA Map Information eXchange (FMIX) at **1-877-FEMA-MAP** (1-877-336-2627) or visit the FEMA website at http://www.fema.gov/business/nfip.

LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equaled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V, and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X — Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X — Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D — Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D Boundary
- CBRS and OPA Boundary
- Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

*Referenced to the North American Vertical Datum of 1988

- A — A: Cross section line
- 23 — 23: Transect line
- Culvert, Flume, Penstock or Aqueduct
- Road or Railroad Bridge
- Footbridge
- 97° 07' 30", 32° 22' 30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83), Western Hemisphere
- $^{4}76^{000}$E — 1000-meter Universal Transverse Mercator grid values, Zone 10
- 600000 FT — 5000-foot grid ticks: California State Plane coordinate system, Zone II (FIPSZONE 0402), Lambert Conformal Conic Projection
- DX5510 — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

NOTES TO USERS

For information and questions about this map, available products associated with this FIRM including historic versions of this FIRM, how to order products or the National Flood Insurance Program in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the FEMA Map Service Center website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website. Users may determine the current map date for each FIRM panel by visiting the FEMA Map Service Center website or by calling the FEMA Map Information eXchange.

Communities annexing land on adjacent FIRM panels must obtain a current copy of the adjacent panel as well as the current FIRM Index. These may be ordered directly from the Map Service Center at the number listed above.

For community and countywide map dates refer to the Flood Insurance Study report for this jurisdiction.

To determine if flood insurance is available in this community, contact your Insurance agent or call the National Flood Insurance Program at 1-800-638-6620.

Base map information shown on this FIRM was derived from USGS LiDAR dated 2010 and Coastal California digital imagery dated 2011. USDA NAIP imagery dated 2012 is used in areas not covered by the Coastal California digital imagery.

BENCHMARK

BENCH MARK BM60

BEING A BRASS DISC IN THE TOP OF CURB, LOCATED AT MAIN STREET AND MAPLE STREET, MID-POINT OF CURVE OF CENTER MEDIAN, IN FRONT OF 410 MAPLE STREET, REDWOOD CITY.

ELEVATION = 15.310 FEET, BASED ON CITY OF REDWOOD CITY DATUM.

BASIS OF BEARING

THE BEARING NORTH 81°13'49" WEST OF THE CENTER LINE OF FRANKLIN STREET, BETWEEN THE FOUND MONUMENTS, AS SHOWN ON THAT CERTAIN PARCEL MAP ENTITLED "PARCEL MAP NO. 2010-01" FILED FOR RECORD ON MARCH 22, 2011 IN BOOK 79 OF PARCEL MAPS AT PAGES 74 THROUGH 76 INCLUSIVE, SAN MATEO COUNTY RECORDS, WAS TAKEN AS THE BASIS OF BEARINGS FOR THIS SURVEY.

MAPPING STATEMENT

1. THIS PROJECT WILL BE A MERGER OF 2 PARCELS INTO 1 PARCEL.
2. PROJECT WILL BE VACATING EXISTING EASEMENTS ON THE PROPERTY.
3. PROJECT WILL BE DEDICATING NEW EASEMENTS ON THE PROPERTY.

ENGINEER & SURVEYOR'S STATEMENT

THIS TENTATIVE MAP SUBMITTAL HAS BEEN PREPARED BY ME OR UNDER MY DIRECTION IN ACCORDANCE WITH STANDARD SURVEYING PRACTICE.

GENERAL NOTES

1. TENTATIVE MAP: THIS TENTATIVE MAP IS BEING FILED IN ACCORDANCE WITH CHAPTER 3, ARTICLE 2, SECTION 66452 AND CHAPTER 4.5 OF THE SUBDIVISION MAP ACT.
2. PARCEL MAP: ONE SEPARATE PARCEL MAP WILL BE FILED FOR THIS PROJECT.
3. BOUNDARY: BOUNDARY INFORMATION IS BASED ON SURVEY DATA PREPARED BY BKF.
4. SOURCE OF TOPOGRAPHY: EXISTING TOPOGRAPHY SHOWN IS BASED ON A FIELD TOPOGRAPHIC SURVEY PREPARED BY BKF ENGINEERS DATED JULY 24, 2017 BY JOHN KOROYAN P.L.S. #8883.
5. RECORD INFORMATION: RECORD OWNERSHIP AND EASEMENT INFORMATION WAS TAKEN FROM THE FOLLOWING TITLE REPORTS:
   A. TITLE REPORT 1: ORDER NO. 0227019645-MP ISSUED BY OLD REPUBLIC TITLE COMPANY (APN 053-147-060 & 053-147-070 1180 & 1190 MAIN STREET), DATED MAY 10, 2017 AT 7:30 AM.
6. GRADING: SITE GRADES AND BUILDING / GARAGE FINISHED FLOOR ELEVATIONS ARE SUBJECT TO FINAL ENGINEERING DESIGN AND GEOTECHNICAL ENGINEER'S REVIEW AND APPROVAL.
7. UTILITIES: UTILITY SIZING, LOCATIONS, AND GRADES ARE SUBJECT TO FINAL ENGINEERING DESIGN, GEOTECHNICAL ENGINEERING AND RESPECTIVE UTILITY AGENCY REVIEW AND APPROVAL.
   A. EXISTING UTILITIES SHOWN ARE FROM FIELD OBSERVATION AND RECORD DRAWINGS AND ARE NOT MEANT TO BE A FULL CATALOG OF ACTUAL CONDITIONS.
   B. EXISTING ON-SITE UTILITIES SHOWN ARE TO BE REMOVED UNLESS OTHERWISE NOTED ON THE PLANS.
   C. THE WATER DISTRIBUTION SYSTEM WILL BE DESIGNED AND CONSTRUCTED PER REDWOOD CITY STANDARD SPECIFICATIONS & DETAILS, WHERE APPLICABLE.
   D. THE SANITARY SEWER SYSTEM WILL BE DESIGNED AND CONSTRUCTED PER REDWOOD CITY STANDARD SPECIFICATIONS AND DETAILS, WHERE APPLICABLE.
   E. THE STORM DRAIN SYSTEM WILL BE DESIGNED AND CONSTRUCTED PER REDWOOD CITY STANDARD SPECIFICATIONS AND DETAILS, WHERE APPLICABLE.
8. FEMA DESIGNATED FLOOD ZONE: THE PROJECT IS OUTSIDE THE 100 YEAR FLOOD ZONE ACCORDING TO FEMA MAP NUMBER 06081C0301E PANEL 301 OF 510, DATED OCTOBER 16, 2012. THE PROJECT SITE IS CLASSIFIED AS "ZONE X" – AREAS OF 0.2% ANNUAL CHANCE FLOOD; AREAS OF 1% ANNUAL CHANCE FLOOD WITH AVERAGE DEPTHS OF LESS THAN 1 FOOT OR WITH DRAINAGE AREAS LESS THAN 1 SQUARE MILE; AND AREAS PROTECTED BY LEVEES FROM 1% ANNUAL CHANCE FLOOD. THE DRAINAGE CHANNEL FLOWING THROUGH THE PROJECT SITE IS CLASSIFIED AS "ZONE A" – 1% ANNUAL CHANCE FLOOD DISCHARGE CONTAINED IN CHANNEL.
9. LANDSCAPE PLAN: LANDSCAPE PLAN SHALL BE SUBMITTED UNDER SEPARATE COVER.
10. GEOTECHNICAL REPORT: A GEOTECHNICAL REPORT SHALL BE SUBMITTED UNDER SEPARATE COVER.

NOTES:

1. THE ELEVATIONS SHOWN ON THIS GRADING PLAN ARE BASED UPON CITY OF REDWOOD CITY DATUM (NAVD 88).
2. THE PROJECT IS OUTSIDE THE 100 YEAR FLOOD ZONE ACCORDING TO FEMA MAP NUMBER 06081C0301E PANEL 301 OF 510, DATED OCTOBER 16, 2012. THE PROJECT SITE IS CLASSIFIED AS "ZONE X" – AREAS OF 0.2% ANNUAL CHANCE FLOOD; AREAS OF 1% ANNUAL CHANCE FLOOD WITH AVERAGE DEPTHS OF LESS THAN 1 FOOT OR WITH DRAINAGE AREAS LESS THAN 1 SQUARE MILE; AND AREAS PROTECTED BY LEVEES FROM 1% ANNUAL CHANCE FLOOD. THE DRAINAGE CHANNEL FLOWING THROUGH THE PROJECT SITE IS CLASSIFIED AS "ZONE A" – 1% ANNUAL CHANCE FLOOD DISCHARGE CONTAINED IN CHANNEL.
3. GRADING ELEVATIONS, FINISHED FLOOR ELEVATIONS, AND SAWCUT LIMITS ARE PRELIMINARY AND SUBJECT TO FINAL ENGINEERING DESIGN AND GEOTECHNICAL ENGINEER REVIEW AND APPROVAL.
4. EXISTING UTILITY STRUCTURES REMAINING IN PLACE TO BE ADJUSTED TO FINAL GRADE.

LEGEND

- PROPOSED ROOF (IMPERVIOUS)
- PROPOSED ON-SITE PAVEMENT (IMPERVIOUS)
- PROPOSED LANDSCAPING (PERVIOUS)
- PROPOSED BIORETENTION (PERVIOUS)
- EXISTING CHANNEL AREA OF REDWOOD CREEK (NOT INCLUDED IN CALCULATIONS)
- STORMWATER MANAGEMENT AREA BOUNDARY

NOTES

1. THIS STORMWATER MANAGEMENT PLAN HAS BEEN CREATED TO SHOW COMPLIANCE WITH PROVISION C.3 OF THE SAN MATEO COUNTYWIDE STORM WATER POLLUTION PREVENTION PROGRAM.
2. THE OFFICE BUILDING IS TREATED BY AN AT-GRADE FLOW THROUGH PLANTER. THE REQUIRED TREATMENT AREA WAS CALCULATED USING THE COMBINATION FLOW/VOLUME METHOD.
3. AREA ON THE WESTERN SIDE OF REDWOOD CREEK IS DESIGNATED AS A SELF-RETAINING AREA.
4. THIS PROJECT WILL IMPLEMENT STORMWATER DETENTION MEASURES TO MITIGATE THE INCREASE IN IMPERVIOUS AREA FROM EXISTING CONDITIONS.
5. CHANNEL AREA OF REDWOOD CREEK ON THE PROJECT SITE WEREN'T INCLUDED. THE 11% PROPOSED PERVIOUS SURFACES AT THE SITE DOES NOT INCLUDE THE CHANNEL AREA OF REDWOOD CREEK.

DESIGN RAINFALL INTENSITIES

T_C = 10 MIN

NOTES:

1. SUMMARIZED BELOW IS THE REQUIRED FIRE FLOW, AS DETERMINED BY TABLE B105.1 OF THE 2016 CALIFORNIA FIRE CODE.

   CONSTRUCTION TYPE: II–A
   TOTAL FLOOR AREA : 110,000 SF
   REQUIRED FIRE FLOW: 4,750 GPM FOR 4 HOURS
   REQUIRED FIRE FLOW (ASSUMING 50% FLOW REDUCTION FOR SPRINKLERS): 2,375 GPM

2. THE REQUIRED NUMBER OF FIRE HYDRANTS FOR A FIRE FLOW OF 2,375 GPM IS 3 HYDRANTS WITH AN AVERAGE SPACING OF 450 FEET, ACCORDING TO TABLE C102.1 OF THE 2016 CALIFORNIA FIRE CODE. THERE ARE 3 EXISTING HYDRANTS ALONG THE PROJECT FRONTAGES. AS PART OF THE DEVELOPMENT, THE PROJECT WILL INSTALL A NEW FIRE HYDRANT ON ELM STREET, A NEW FIRE HYDRANT ON MAPLE STREET, AND A NEW WHARF HYDRANT ALONG THE NORTHERN SIDE OF THE PROPOSED BUILDING, PROVIDING A TOTAL OF 6 HYDRANTS. THIS EXCEEDS THE REQUIRED TOTAL OF 3 HYDRANTS TO SERVE THE PROPOSED PROJECT.

Appendix B AIR ASSUMPTIONS/MODELING

1180 Main - San Mateo County, Annual

1180 Main

San Mateo County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	109.38	1000sqft	1.06	109,375.00	0
Enclosed Parking with Elevator	375.00	Space	0.00	70,610.00	0
Other Non-Asphalt Surfaces	0.03	Acre	0.03	1,306.80	0
City Park	0.22	Acre	0.22	10,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	70
Climate Zone	5			**Operational Year**	2021
Utility Company	Pacific Gas & Electric Company				
CO2 Intensity (lb/MWhr)	641.35	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Description

Bridge - Other Non-Asphalt Surfaces

Construction Phase - Project Description construction schedule

Off-road Equipment - Added trenchers for offsite work

Off-road Equipment - Added Excavators

Trips and VMT - Peak construction period

Demolition -

Grading -

Architectural Coating - low VOC paints

Vehicle Trips - Zero trips for park - local use

Trip rate from TIS and no Sat or Sun trips

Water And Wastewater - From Engineering calculations

Construction Off-road Equipment Mitigation - mitigation

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - low voc

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project Description

Bridge - Other Non-Asphalt Surfaces

Construction Phase - Project Description construction schedule

Off-road Equipment - Added trenchers for offsite work

Off-road Equipment - Added Excavators

Trips and VMT - Peak construction period

Demolition -

Grading -

Architectural Coating - low VOC paints

Vehicle Trips - Zero trips for park - local use

Trip rate from TIS and no Sat or Sun trips

Water And Wastewater - From Engineering calculations

Construction Off-road Equipment Mitigation - mitigation

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation - low voc

Energy Mitigation -

Water Mitigation -

Waste Mitigation -

1 Introduction

A completed a health risk assessment (HRA) and air pollutant emission analysis for the proposed commercial building project located at 1180 Main Street in the City of Redwood. The project location and a detailed vicinity map are shown in Figure 1.

1.1 Project Understanding

Premia Capital (applicant) is proposing to develop the 1180 Main Street Office in the City of Redwood City, California. The proposed project would be developed on two adjacent parcels identified as Assessor Parcel Numbers (APNs) 053-147-060 and 053-147-070 located at 1180 and 1190 Main Street near the City's downtown area. The project site is approximately 1.31 acres and partially developed with a concrete foundation and a vacant one-story commercial building. The proposed project would construct a three-story commercial office building of 109,375 square feet with a two-level underground parking garage and on-site amenities including a shipping container café and a public park of 10,000 square feet. The Proposed Project is located (refer to **Figure 1**).

This HRA includes an assessment of the project's construction emission and a screening level analysis of stationary sources emissions from land uses in the vicinity of the project site using tools provided by the Bay Area Air Quality Management District (BAAQMD). The analysis also includes an air dispersion analysis of the railroad emission. This HRA considered the site-specific meteorological conditions and the proximity of the project site to the adjacent railway and local roadways to determine the potential risk to future workers at the project site from emissions, including diesel particulate matter (DPM). Figure 2 shows a conceptual site plan for the proposed project.

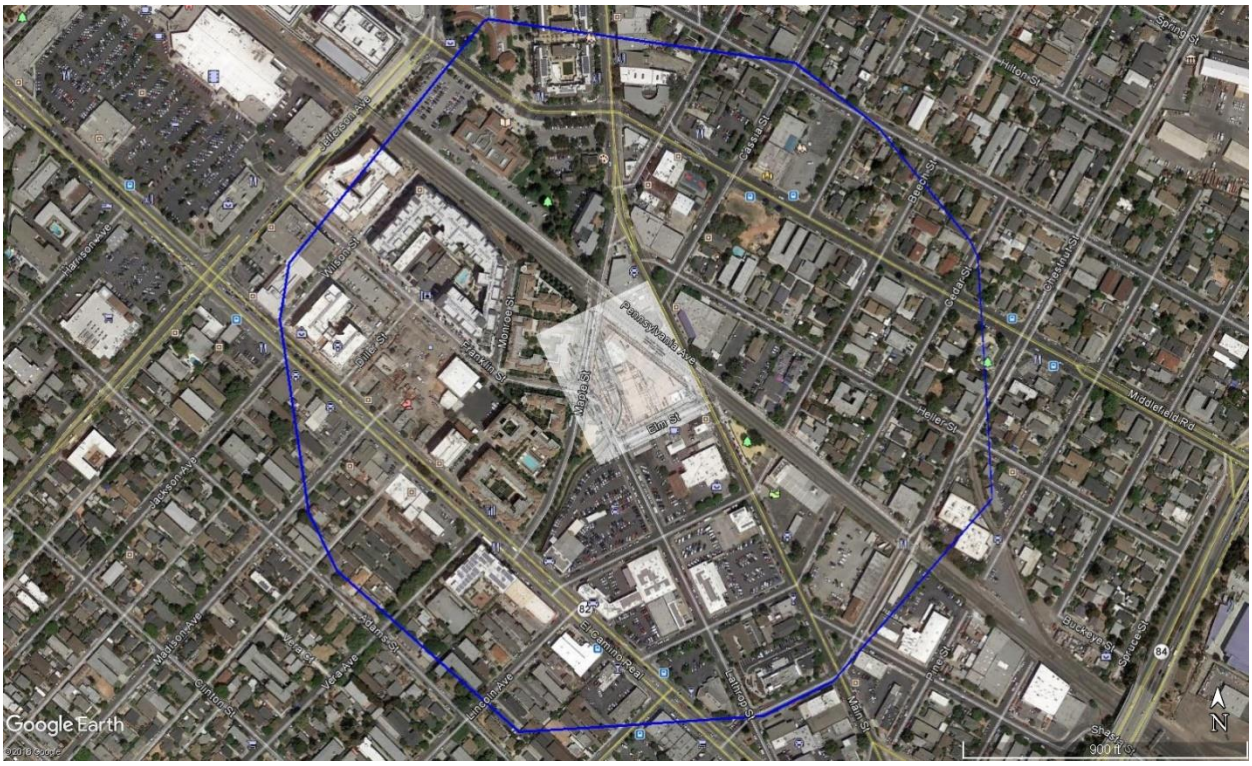

Figure 1 - Project Vicinity & 1000ft Buffer

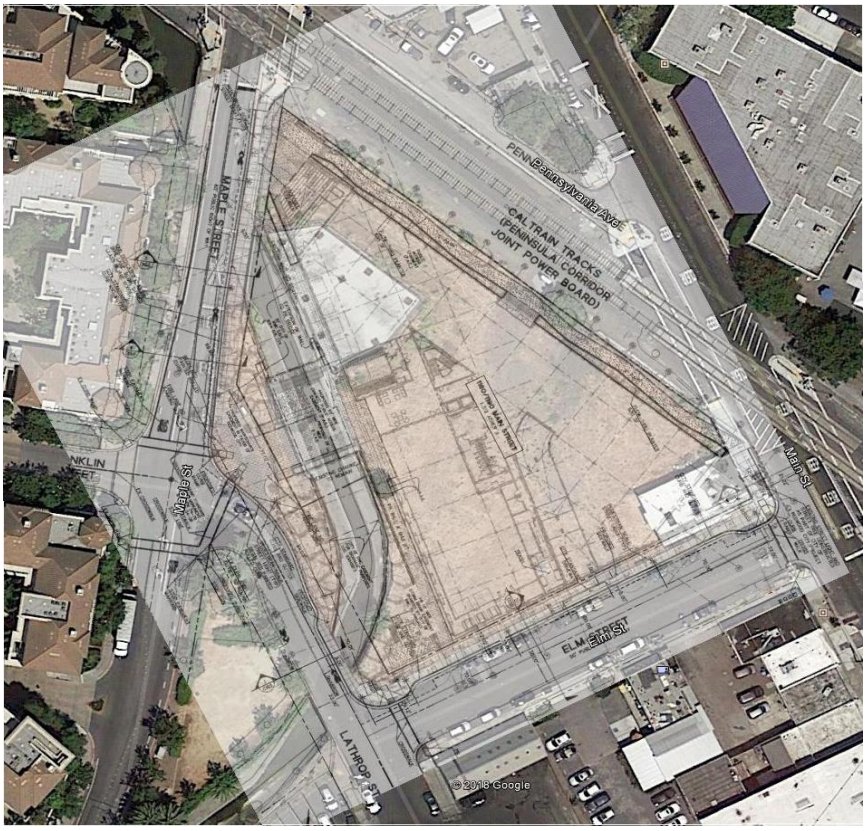

Figure 2 - Site Plan

1.1.1 Construction

The proposed project would demolish the existing structures and construct a three-story commercial office building of 109,375 square feet with a two-level underground parking garage and on-site amenities including a shipping container café and a public park of 10,000 square feet.

Construction would occur over a consecutive two year period (~24 months), with approximately 530 working days[1] during which construction activities using off-road and onroad equipment would be conducted.

1.1.2 Operations

The Proposed Project is not proposed to have stationary equipment, at this time. If any stationary sources is proposed it would be permitted with the Bay Area Air Quality Management District (BAAQMD) and would have to comply with applicable Best Available Control Technology (BACT) and BACT for Toxics requirements (BAAQMD 2010 Project operations are expected to begin in May 2021 ("Project build-out").

1.2 Objective

The purpose of the air quality analysis is to assess potential criteria pollutant and health impacts that would result from construction and operation of the Proposed Project, consistent with guidelines and methodologies from the BAAQMD, California Air Resources Board (ARB), California Office of Environmental Health Hazard Assessment (OEHHA), and the US Environmental Protection Agency (USEPA). Consistent with the methods recommended in those guidelines, the HRA evaluated the estimated excess lifetime cancer risk and particulate matter less than 2.5 microns in aerodynamic diameter ($PM_{2.5}$) concentrations associated with diesel exhaust that would be emitted by on-site construction activities and diesel exhaust emitted from vehicles associated with operational traffic.

1.3 Significance Criteria

The BAAQMD has established a maximum threshold for land use projects that have the potential to expose sensitive receptors (including residential areas) or the general public to substantial levels of toxic air contaminants.

The BAAQMD thresholds of significance for toxic air contaminants for single sources are:

- Probability of contracting cancer for the Maximally Exposed Individual (MEI) exceeds 10 in one million; or
- Ground-level concentrations of non-carcinogenic toxic air contaminants would result in a Hazard Index greater than 1 for the MEI.

The BAAQMD thresholds of significance under cumulative conditions (all sources) are:

- A cancer risk level greater than 100 in a million;
- A non-cancer risk (chronic or acute) hazard index greater than 10.0; or
- Annual average PM2.5 of greater than 0.8 micrograms per cubic meter.

1.4 Methodology

Determining how hazardous a substance is depends on many factors, including the amount of the substance in the air, how it enters the body, how long the exposure lasts, and what organs in the body are affected. One major way hazardous substances might enter the body is through inhalation of either gases or particulates. Many gases and very small particles that penetrate deeply into the lungs are potentially harmful and can contribute to a variety of health problems. Exhaust from diesel engines is a major source of harmful airborne particles. The inhalation of diesel exhaust particulates is associated with both cancer and non-cancer health effects.

California's Office of Environmental Health Hazard Assessment (OEHHA) has determined that long-term exposure to diesel exhaust particulates poses the highest cancer risk of any toxic air contaminant (TAC) it has evaluated. Exposure to diesel exhaust can also have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat, and lungs, and it can cause coughs, headaches, lightheaded-ness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

Fortunately, improvements to diesel fuel and diesel engines have already reduced emissions of some of the contaminants. When fully implemented these improvements result in a 75 percent reduction in particle emissions from diesel-powered trucks and other equipment today as compared to year 2000 levels and an 85 percent reduction is expected by 2020. Similarly, improvements have been made to significantly reduce TAC emissions from gasoline-powered vehicles. These improvements are anticipated to continue into the foreseeable future.

The Proposed Project will have off-road construction emissions and operational traffic DPM emissions. Consistent with the following guidance documents below the cancer risks from Diesel Particulate Matter (DPM), in addition to $PM_{2.5}$ concentrations were estimated.

The HRA was conducted consistent with the following guidance:

- Air Toxics Hot Spots Program Risk Assessment Guidelines (OEHHA 2015);
- BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (BAAQMD 2012a);
- BAAQMD CEQA Air Quality Guidelines (BAAQMD 2012b);
- California Air Pollution Control Officer's Association (CAPCOA) Health Risk Assessment for Proposed Land Use Projects (CAPCOA 2009).

2 EMISSIONS ESTIMATION METHODS

As detailed below, the Proposed Project construction emissions for off-road sources were calculated using the California Emission Estimator Model (CalEEMod), respectively. Sources of construction emissions include off-road equipment exhaust and on-road equipment exhaust. Sources of operational emissions include traffic and other nearby sources. The Proposed Project Construction and operational

TAC emissions, discussed below, analyzed in this report are consistent with the BAAQMD CEQA Guidelines.

2.1 Construction Emissions

For construction, only DPM is considered as all construction equipment are assumed to be diesel-fueled. All DPM emissions are conservatively assumed to be equal to Respirable Particulate Matter Less than 10 Micrometers in Aerodynamic Diameter (PM_{10}) and Respirable Particulate Matter Less than 2.5 Micrometers in Aerodynamic Diameter ($PM_{2.5}$).

During construction, short-term degradation of air quality may occur due to the release of particulate matter emissions generated by demolition, excavation, grading, hauling, and other activities. Emissions from construction equipment are also anticipated and would include criteria pollutants, and TACs such as diesel exhaust particulate matter.

2.1.1 Off-road Equipment

Construction emission were provided by Stantec for both Unmitigated and Mitigated scenario, refer to Table A and B respectively. CalEEMod output is included in Appendix A.

Table A - Unmitigated Construction Emissions

Year	PM_{10} tons-yr.	Lbs.-yr.
2019	0.0906	181.2
2020	0.1192	238.4
2021	0.0341	68.2

Table B - Mitigated Construction Emissions

Year	PM_{10} tons-yr.	Lbs.-yr.
2019	9.46E-03	18.92
2020	7.00E-03	14
2021	3.75E-03	7.5

2.2 Operational Emissions

2.2.1 Mobile Sources

Vehicles on the roadway emit TACs from the combustion of fuel and were evaluated in the risk assessment to on-site receptors. Based on the BAAQMD CEQA Guidance, traffic of less than 10,000 vehicles per day is considered a low-impact source (BAAQMD 2012a). Only one surface street within 1000ft of the project site is equal to or exceeds this level. However, to ensure a complete evaluation was performed other nearby surface streets were included in the evaluation. The BAAQMD Screening Calculator[1] was used along with ESRI's online traffic count layer to estimate the impact from traffic near the project site

[1] http://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/ceqa-tools

3 AIR CONCENTRATIONS ESTIMATION METHODS

The methodologies used to evaluate emissions for the Proposed Project construction and operations were based on the most recent BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (BAAQMD 2012a).

3.1.1 Model Selection and Parameters

Consistent with the BAAQMD, near-field air dispersion modeling of DPM and $PM_{2.5}$ from Proposed Project construction and operational sources was conducted using the USEPA's atmospheric dispersion modeling system (AERMOD). At each receptor location, the model generated average air concentrations (or air dispersion factors as unit emissions) that result from emissions from multiple sources.

Air dispersion models such as AERMOD require a variety of inputs including source parameters, meteorological parameters, topographical information, and receptor parameters.

Meteorological data: Air dispersion modeling applications require the use of meteorological data that ideally are spatially and temporally representative of conditions in the immediate vicinity of the site under consideration. For this HRA, CARB's San Carlos meteorological data for year 2009-2014 was used
Terrain considerations: Elevation data was imported from the National Elevation Dataset (NED) maintained by the United States Geological Survey (USGS). The Project site graded elevation was used for all on-site receptors. An important consideration in an air dispersion modeling analysis is the selection of rural or urban dispersion coefficients. Based on the urban area in which the Project site is located, urban dispersion coefficients were used.
Emission rates*:* Emissions were modeled using the χ/Q ("chi over cue") method, such that each phase had unit emission rates (i.e., 1 gram per second [g/s] for volume sources or 1 g/s per square meter [m_2] for area sources), and the model estimated dispersion factors (with units of microgram per cubic meter [$\mu g/m_3$]/[g/s]). For the HRA, the annual average ambient air concentrations were determined by multiplying the annual average dispersion factors from AERMOD ($\mu g/m_3$) by the annual average emission rates (g/s). For simplicity, the model assumed a constant emission rate for every day of the year.
Source parameters: Source location and parameters are necessary to model the dispersion of air emissions. Construction emissions, a polygon area source was used to outline the construction area. For Operational, emissions from the nearby railway was modeled as line volume and the offsite traffic used BAAQMD's Screening Calculator.

3.2 Modeled Sources

For construction, the duration of the construction period is anticipated to be 24 months. At any given time there will be multiple emission sources associated with construction equipment within the construction zone. The construction area was modeled as an area source encompassing the entire Project site. The Project boundary is shown in Figure 2. Figure 1 shows the modeling extent. A release height of ~3.5 meters was used, with an initial vertical dimension of 1.5 meters.

Operational traffic was modeled as adjacent volume sources. The release height and initial vertical dimension was assumed to be 0 meters and the lateral dimensions were used based on actual roadway width. Operational traffic, based on data provided by ESRI, was modeled up to 1,000 Feet from the Project site.

***Receptors*:** In order to evaluate health impacts to on-site and off-site receptors, For both construction operational, receptors were modeled at a height of 0 meters above terrain height which will provides the max concentration. As discussed previously, maximum average annual dispersion factors were estimated for each receptor location. Figure 3 shows the off-site sensitive receptors modeled for construction phases. Figure 4 shows the off-site non-residential receptors modeled for construction phases. Figure 5 shows the on-site receptors modeled for operational phases.

The AERMOD modeling files for the Proposed Project construction and operation are included in Appendix B.

Figure 4 – Non-Residential Receptors

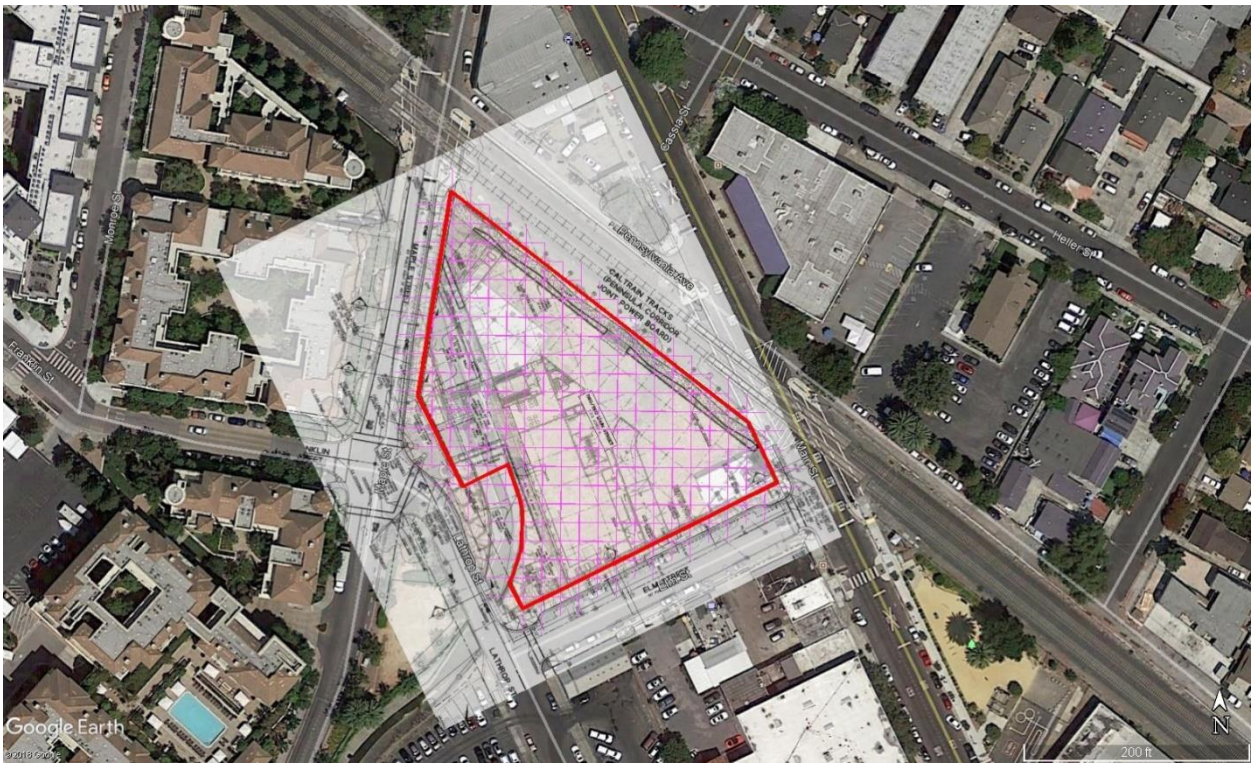

Figure 5 - Onsite Receptors

4 RISK CHARACTERIZATION METHODS

In February 2015, OEHHA released the updated Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2015), which combines information from previously-released and adopted technical support documents to delineate OEHHA's revised risk assessment methodologies based on current science. This updated Guidance Manual supersedes the 2003 Guidance Manual (OEHHA 2003) that previously provided methodologies for conducting health risk assessments under the Air Toxics Hot Spots Program (AB2588). Details of this methodology are discussed below.

4.1.1 Sources Evaluated

Evaluation of the excess lifetime cancer risks and $PM_{2.5}$ concentrations were estimated for the listed emission sources, which reflect the largest estimated impacts from Proposed Project construction and operations.

- Use of diesel construction equipment.
- Nearby stationary sources and operational traffic.

4.2 Exposure Assessment

The methodology under OEHHA 2015 Hot Spots Guidelines is as follows:

***Potentially Exposed Populations*:** This analysis evaluated off-site resident children commencing at the time of Proposed Project construction and on-site 25-year worker commencing at the time of Proposed Project operations based on OEHHA 2015 Hot Spots Guidelines.

***Exposure Assumptions*:** The exposure parameters used to estimate excess lifetime cancer risks for all potentially exposed populations for the construction scenario and operation only scenario for this analysis were obtained using risk assessment guidelines from OEHHA (2015) and BAAQMD (2016a), unless otherwise noted.

***Calculation of Intake*:** The dose estimated for each exposure pathway is a function of the concentration of a chemical and the intake of that chemical. The intake factor for inhalation, IF_{inh}, can be calculated as follows:

$$IF_{inh} = [DBR * FAH * EF * ED * CF]/ AT$$

Where:
IF_{inh} = Intake Factor for Inhalation (m_3/kg-day)
DBR = Daily Breathing Rate (L/kg-day)
FAH = Frequency of time at Home (unitless)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
AT = Averaging Time (days)
CF = Conversion Factor, 0.001 (m_3/L)

The chemical intake or dose is estimated by multiplying the inhalation intake factor, IF_{inh}, by the chemical concentration in air, C_i. When coupled with the chemical concentration, this calculation is mathematically equivalent to the dose algorithm given in the current OEHHA Hot Spots guidance (OEHHA 2015).

4.3 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure. For purposes of calculating exposure criteria to be used in risk assessments, adverse health effects are classified into two broad categories – cancer and non-cancer endpoints. Toxicity values that are used to estimate the likelihood of adverse effects occurring in humans at different exposure levels are identified as part of the toxicity assessment component of a risk assessment.

4.4 Age Sensitivity Factors

The estimated excess lifetime cancer risks for a resident child were adjusted using age sensitivity factors (ASFs) that account for an "anticipated special sensitivity to carcinogens" of infants and children as recommended in the OEHHA Technical Support Document (TSD) (Cal/EPA 2009) and OEHHA 2015 Hot Spots guidance (OEHHA 2015). Cancer risk estimates were weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from two years through 15 years of age. No weighting factor (i.e., an Age Sensitivity Factor [ASF] of one, which is equivalent to no adjustment) was applied to ages 16 and older.

4.5 Risk Characterization

4.5.1 Estimation of Cancer Risks

Excess lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF).

The equation used to calculate the potential excess lifetime cancer risk for the inhalation pathway is as follows:

$$Risk_{inh} = C_i \times CF \times IF_{inh} \times CPF_i \times ASF$$

Where:

$Risk_{inh}$ = Cancer Risk; the incremental probability of an individual developing cancer as a result of inhalation exposure to a particular potential carcinogen (unitless)
C_i = Annual Average Air Concentration for $Chemical_i$ ($\mu g/m_3$)
CF = Conversion Factor (mg/µg)
IF_{inh} = Intake Factor for Inhalation (m_3/kg-day)
CPF_i = Cancer Potency Factor for $Chemical_i$ (mg chemical/kg body weight-day)$^{-1}$
ASF = Age Sensitivity Factor (unitless)

4.6 Cumulative Risk and $PM_{2.5}$ Concentration

A cumulative cancer risks and $PM_{2.5}$ concentrations from the Proposed Project and the background sources in the surrounding area at the on-site and off-site Project MEISR's was also conducted.

4.6.1 Background Source Contributions to Cumulative Risks and $PM_{2.5}$

Sources to be included in the cumulative assessment are permitted stationary sources and emissions from major roadways. As defined by BAAQMD, roadways with traffic greater than 10,000 vehicles per day and within 1000 feet of the project site should be included, refer to Table C. The BAAQMD also provided the screening cancer risks for stationary sources and tool used to adjust those risk values based on distance, refer to Table D.

Table C – Nearby Surface Streets

Street Name	# of Vehicles	Distance (ft)
Maple Street	3746	20
Beech St	3835	359

17462	City of Redwood City #5546

5 RESULTS FROM PROJECT ANALYSIS

This HRA evaluates construction period health risk to off-site receptors and stationary and mobile source emissions and their related health risk impacts for future receptor of the project. According to the BAAQMD, a project would result in a significant impact if it would individually expose sensitive receptors to TACs resulting in an increased cancer risk greater than 10.0 in 1 million, an increased non-cancer risk of greater than 1.0 on the hazard index (chronic or acute), or an annual average ambient PM2.5 increase greater than 0.3 micrograms per liter (µg/m3).

A significant cumulative impact would occur if the project, in combination with other projects located within a 1,000-foot radius of the project site, would expose sensitive receptors to TACs resulting in an increased cancer risk greater than 100.0 in one million, an increased non-cancer risk of greater than 10.0 on the hazard index (chronic), or an ambient PM2.5 increase greater than 0.8 µg/m3 on an annual average basis.

5.1 Construction

The project site is located in an urban area within 100 feet from existing residential uses that could be exposed to diesel emission exhaust during the construction period. To estimate the potential cancer risk associated with construction of the proposed project from equipment exhaust (including diesel particulate matter), a dispersion model was used to translate an emission rate from the source location to a concentration at the receptor location of interest (i.e., a nearby residence and worksites). Dispersion modeling varies from a simpler, more conservative screening-level analysis to a more complex and refined detailed analysis. This refined assessment was conducted using CARB exposure methodology with the air dispersion modeling performed using the United States Environmental Protection Agency (EPA) dispersion model AERMOD. The model provides a detailed estimate of exhaust concentrations based on site and source geometry, source emissions strength, distance from the source to the receptor, and meteorological data from the San Carlos Airport. Results of the analysis are shown in Table E (Unmitigated) and Figures 6, 7, and 8. Table F (Mitigated) and Figures 9, 10, and 11 indicate construction of the project would not expose nearby sensitive receptors to substantial pollutant concentrations.

Table E - Unmitigated Health Risks from Project Construction to Off-Site Receptors

	Carcinogenic Inhalation Health Risk in One Million	**Chronic Inhalation Hazard Index**	**Acute Inhalation Hazard Index**	**Annual $PM_{2.5}$ Concentration ($\mu g/m^3$)**
Maximum Exposed Individual Location (Residential)	105	7.99E-02	0.0	0.38

5.2 Stationary Sources

The stationary source analysis evaluated the risk levels from permitted sources in the project vicinity, using the toxic air contaminant emissions reported to the BAAQMD by the stationary sources identified in the project vicinity. The BAAQMD indicates five sources of emissions that are within 1,000 feet of the project site; including three gas stations, one generator, and one auto body shop. Following BAAQMD guidance, the stationary sources were scaled for distance using the BAAQMD Diesel Internal Combustion (IC) Engine Distance Multiplier Tool. The results of the stationary source analysis are presented in Table G. As shown in Table G, the highest risk would be 5.37 in one million, which would not exceed the BAAQMD cancer risk threshold of 10 in one million. The hazard index would be 0.02, which is below the threshold of 1.0. The results of the analysis also indicate that PM2.5 concentration would not exceed the BAAQMD significance threshold of 0.3 µg/m3. The BAAQMD's cumulative threshold of cancer risk greater than 100.0 in one million, an increased non-cancer risk of greater than 10.0 on the hazard index (chronic), or an ambient PM2.5 increase greater than 0.8 µg/m3 on an annual average basis would not be exceeded.

Table G - Stationary Sources

Plant ID	Stationary Source	Distance (feet)	Adjusted Adult Carcinogenic Risk (in one million)	$PM_{2.5}$ ($\mu g/m^3$)	Hazard
13509	Pacific Bell	738	4.33	0.110	0.022

Exceeds Threshold?			No	No	No
Total Risk			**9.70**	**0.14**	**0.04**
BAAQMD Cumulative Threshold			100 in one million	0.80	10.0
Exceeds Threshold?			No	No	No

5.3 Mobile Sources

To estimate the potential cancer risk associated with the proposed project from diesel vehicle exhaust, the BAAQMD Screening Calculator was used. The Screening calculator estimates risk for a 70-year period. Since the proposed project has a mix of offices and public area risk for both areas were estimated. This was done by calculating the percent contribution each age bin contributes to the overall 70-yr risk. Table H below provides the contribution each age bin has to the overall risk by age bin. These percentage were then used to adjust the 70-yr risk provide the screening tool.

Table H - Percent Contribution by Age Group

	3rd Tri.	0<2 yrs	2<9 yrs	2<16 yrs	16<30 yrs	16-70 yrs
Exposure Duration (years)	0.25	2	7	14	14	54
Age Sensitivity Factor	10	10	3	3	1	1
% Contribution (70 yr)	2.11	16.88	17.72	35.44	11.81	45.57
% Contribution Worker (25 / 40 Yr)					21.10	33.76

Table I - Mobile Sources

Street Name	# of Vehicles	Distance From Site (ft)	Risk (Screening Tool) (70yr)	Worker Adjusted Risk	PM 2.5 (ug/m3)
Maple Street	3,746	20	3.48	0.73	0.081
Beech St	3,835	359	0.6	0.13	0.013
Main St	7,143	20	3.26	0.69	0.074
El Camino Real	36,000	505	5.7	1.20	0.129

6 CUMULATIVE ANALYSIS

6.1 6.1 Cumulative Risks and Hazards

The cumulative analysis sums all sources of emissions in the vicinity of the project site including stationary source and mobile sources. The cumulative cancer risk, hazard index, acute index and PM2.5 concentrations are shown in Table J. Results of the cumulative analysis indicate the proposed project would not expose future residents of the project site to significant cumulative health risks.

Table J - Cumulative Risk from All Sources

Source	Carcinogenic Inhalation Health Risk	Chronic Inhalation Hazard Index	Acute Inhalation Hazard Index	$PM_{2.5}$
Maple Street	3.48			0.081
Beech St	0.6			0.013
Main St	3.26			0.074

Appendix C BIOLOGICAL SURVEY MEMO

Stantec

Memo

To:	William Chui, City of Redwood City	From:	Andrew Sorci 1340 Treat Blvd. Suite 300, Walnut Creek, CA 94597
File:	1180 Main Street Biological Survey Memo	Date:	January 17, 2019

Reference: 1180 Main Street Biological Survey Memo

Stantec conducted a reconnaissance-level biological survey for the proposed 1180 Main Street Office Project (project) in northeast Redwood City, San Mateo County, California (Figure 1). The site is located between Maple Street, Lathrop Street, Elm Street, Main Street, and the Caltrain railroad alignment (Figure 2). The site is currently a vacant lot containing an incomplete building foundation, a concrete culvert, and a concrete channel containing Redwood Creek. The proposed project involves the construction and operation of a 109,375 square-foot commercial office building of three-stories, two levels of underground parking, and landscaped open spaces. The project site would combine two parcels, at 1180 Main Street and 1190 Main Street, for a total of 57,111 square feet (1.312 acres).

The evaluation included database queries and a field survey conducted to evaluate the potential for special-status wildlife or plants to occur on the site and concluded that although the site is within the range of several special-status species, the site does not contain suitable habitat and those species would not be likely to occur.

1 Methods

Stantec reviewed existing information on biotic resources known in the vicinity of the project site. The following sources were reviewed:

- California Department of Fish and Game (CDFW) BIOS Natural Diversity Database (CNDDB) (CDFW 2018a) within 2 miles of the project site;
- CDFW RareFind 5 Natural Diversity Database (CNDDB) (CDFG 2018b) within 2 miles of the project site;
- U.S. Fish and Wildlife Service (USFWS) Information for Planning and Consultation (IPaC) (USFWS 2018) within 2 miles of the project site; and
- California Native Plant Society (CNPS) online version of the Inventory of Rare and Endangered Plants of California (CNPS 2018) within 2 miles of the project site.

A 2-mile buffer around the project site included portions of the following U.S. Geological Survey (USGS) quadrangles: Palo Alto, Woodside, Redwood Point, and San Mateo.

Based on the results of the database queries, Stantec compiled a list of the special-status species that would be evaluated for a potential to occur in the project site.

A reconnaissance-level field survey was conducted by Stantec biologist Andrew Sorci on November 14, 2018, to assess the existing habitat suitability for special-status species. The field survey was conducted within a Study Area that included the proposed project site plus a 250-foot buffer.

2 Land Cover Types

The project site is vacant, except for an existing office building no longer in use. All parcels surrounding the project site are completely developed, and include apartment buildings, houses, businesses, and parking lots. There are train tracks running northwest-southeast, directly to the east of the project site.

Developed: There is one vacant building on the southeast corner of the project site, and a concrete building foundation in the northern part of the parcel.

Wild oats grassland: The majority of the project site consists of non-native grassland, plant cover. Dominant species include wild oats (*Avena* sp.), black mustard (*Brassica nigra*), fennel (*Foeniculum vulgare*), and yellow star thistle (*Centaurea solstitialis*).

Redwood Creek: There is a concrete lined canal running through the western portion of the project site. There were several inches of water in the canal at the time of the survey. The creek measures approximately 25 feet between banks and is at least ten feet deep.

3 Special-status Plant Species

A list of special-status plant species documented or with suitable habitat within 2 miles of the project site was compiled by conducting a search of the CNDDB and reviewing the USFWS IPaC (Table 1). Suitable habitat for those species identified would be typified by low disturbance. Due to the disturbed and developed nature of the project site, and prevalence of non-native grassland habitat on the project parcel, there is a low or no potential for any special-status plant species to occur.

Table 1. Special-status plant species with potential to occur within the Project Site.

Scientific Name	Common Name	Status[1] (Federal, State, CNPS)	Blooming Period	Communities	Elevation (ft.)	Potential[2] to Occur in the Project Site
Acanthomintha duttonii	San Mateo thorn-mint	FE, SE, 1B.1	April –June	• Chaparral • Valley and foothill grassland	150 – 900	**Low potential to occur.** Project site is highly disturbed, consisting of non-native grassland habitat.
Amsinckia lunaris	bent-flowered fiddleneck	1B.2	March – June	•Chenopod scrub •Cismontane woodland •Valley and foothill grassland	10 – 1,500	**Low potential to occur.** Project site is highly disturbed, consisting of non-native grassland habitat. Nearest CNDDB occurrence likely extirpated due to development.
Chloropyron maritimum ssp. *palustre*	Point Reyes salty bird's-beak	FE, SE, 1B.2	June-October	• Marshes and swamps	0-30	**No potential to occur.** Project site is highly disturbed and no suitable aquatic habitat is present.
Cirsium fontinales var. *fontinales*	fountain thistle	FE, SE, 1B.1	May-Oct	• Meadows and seeps • Chaparral (openings) • Cismontane woodland • Valley and foothill grassland	100-525	**Low potential to occur.** Project site is highly disturbed, consisting of non-native grassland habitat. Nearest CNDDB occurrence located 1.8 miles southwest of the project site within Stulsaft Park.
Eriophyllum latilobum	San Mateo woolly sunflower	FE, SE, 1B.1	May-June	• Cismontane woodland (often serpentinite, on roadcuts) • Coastal scrub • Lower montane coniferous forest	145-1,085	**No potential to occur.** Project site is highly disturbed and no suitable woodland habitat is present.

Table 1. Special-status plant species with potential to occur within the Project Site.

Scientific Name	Common Name	Status[1] (Federal, State, CNPS)	Blooming Period	Communities	Elevation (ft.)	Potential[2] to Occur in the Project Site
Hesperolinon congestum	Marin dwarf flax	FT, ST, 1B.1	April-June	• Chaparral • Valley and foothill grassland	15-1,110	**Low potential to occur**. Project site is highly disturbed, consisting of non-native grassland habitat. Nearest CNDDB occurrence located 1.9 miles southwest of the project site within Stulsaft Park.
Pentachaeta bellidiflora	white-rayed pentachaeta	FE, SE, 1B.1	March-May	• Cismontane woodland • Valley and foothill grassland (often serpentinite)	100-2,000	**Low potential to occur.** Project site is highly disturbed, consisting of non-native grassland habitat.
Trifolium amoenum	showy Indian clover	FE, 1B.1	April-June	• Coastal bluff scrub • Valley and foothill grassland	15-1,245	**Low potential to occur.** Project site is highly disturbed, consisting of non-native grassland habitat.

Notes:

[1.] Conservation status definitions are as follows:

USFWS designations:

- FE Endangered: any species in danger of extinction throughout all or a significant portion of its range
- FT Threatened: any species likely to become endangered within the foreseeable future

CDFW designations:

- SE Endangered: any species in danger of extinction throughout all or a significant portion of its range
- ST Threatened: any species likely to become endangered within the foreseeable future

CNPS designations:

- 1A Species presumed extinct in California
- 1B Plants rare, threatened or endangered in California and elsewhere
- 2 Plants rare, threatened or endangered in California, but more common elsewhere

CNPS threat categories:

- .1 Seriously endangered in California
- .2 Fairly endangered in California

Table 1. Special-status plant species with potential to occur within the Project Site.

Scientific Name	Common Name	Status[1] (Federal, State, CNPS)	Blooming Period	Communities	Elevation (ft.)	Potential[2] to Occur in the Project Site

.3 Not very endangered in California.

[2] The likelihood of occurrence (low, moderate, high) is based on habitat requirements (such as, substrate, hydrology, vegetation community, and disturbance factors) and range, applied by using the following general guidelines:

Low: Habitat within the Study Area and/or project vicinity satisfies very few of the species' requirements and/or the range of the species overlaps with the vicinity of the Study Area, but not with the Study Area itself. The species' presence within the Study Area is unlikely.

Moderate: Habitat within the Study Area and/or Study Area vicinity meets some of the species' requirements, and known locations for the species are found in the vicinity of the Study Area. Presence of the species within the Study Area is moderately likely.

High: Habitat within the Study Area and/or Study Area vicinity meets most or all of the species' requirements, and known locations for the species are found within proximity to the Study Area. Presence of the species within the Study Area is highly likely.

4 Special-status Wildlife Species

Special-status wildlife species were defined in accordance with the CEQA Guidelines, Section 15380, and included species that are:

- Listed, proposed for listing, or candidates for listing as threatened or endangered under the federal Endangered Species Act;
- Listed or candidates for listing as threatened or endangered under the California Endangered Species Act;
- Designated as Species of Special Concern by the CDFW;
- Included on the CDFW “Special Animals” list (CDFW 2018c); or otherwise meet the definition of rare, threatened, or endangered, as described in the CEQA Guidelines, Section 15380.

Special-status wildlife species documented or with suitable habitat within 2 miles of the project site are summarized in Table 2. The project site does not include designated critical habitat, and there is no critical habitat within 2 miles.

Table 2. Special-status wildlife species with potential to occur in the Project Vicinity.

Scientific Name	Common Name	Status[1] Federal, State	Habitat Requirements	Potential[2] to Occur in the Study Area
Insects				
Callophrys mossii bayensis	San Bruno elfin butterfly	FE	Found on rocky outcrops and cliffs in coastal scrub habitats where its larval food plant (stonecrop, *Sedum spathulifolium*) is present.	**No potential to occur.** Project site is highly disturbed and does not provide habitat for host plant.
Euphydryas editha bayensis	Bay checkerspot butterfly	FT	Relies on habitat found on serpentine soils, where its primary host plant, dwarf plantain (*Plantago erecta*), and secondary host plant, purple owl's clover (*Castilleja densiflora*) *grow*.	**No potential to occur.** Project site is highly disturbed and does not contain any serpentine soils that support the host plants.
Fish				
Hypomesus transpacificus	Delta smelt	FT, SE	Found in the Sacramento–San Joaquin Delta, seasonally in Suisun Bay, Carquinez Strait and San Pablo Bay. Seldom found at salinities > 10 ppt. Most often occurs at salinities < 2ppt.	**No potential to occur.** No suitable aquatic habitat in the project site. Project site is located outside of the range for this species.
Amphibians				
Ambystoma californiense	California tiger salamander	FT, ST	Vernal pools and/or seasonal water sources; requires underground refuges in adjacent upland areas, especially ground squirrel burrows.	**No potential to occur**. There is no suitable aquatic breeding habitat within the project site. The project site does not have ground squirrel activity nor active burrow systems which would provide suitable upland habitat for this species.
Rana draytonii	California red-legged frog	FT, SSC	Breeds in ponds and pools in slow-moving streams with emergent vegetation; adjacent upland habitats are often used for temporary refuges or dispersal movements.	**Low potential to occur.** The canal located on the western portion of the project site is concrete-lined with steep, high walls, providing no suitable habitat for this species. There is also no suitable upland habitat present in the vicinity of the canal.

Table 2. Special-status wildlife species with potential to occur in the Project Vicinity.

Scientific Name	Common Name	Status[1] Federal, State	Habitat Requirements	Potential[2] to Occur in the Study Area
Reptiles				
Thamnophis sirtalis tetrataenia	San Francisco garter snake	FE, SE, FP	Prefers freshwater marshes and low gradient streams. Has adapted to drainage canals and irrigation ditches. This is the most aquatic of the garter snakes in California.	**Low potential to occur.** The canal running through the project site may provide limited dispersal opportunity, however, given the restricted channel and lack of vegetated banks, the urban development of the surrounding area, and a lack of suitable upland habitat, it is highly unlikely that this species will occur in the project site.
Birds				
Brachyramphus marmoratus	Marbled murrelet	FT, SE	This species has been known to roost in redwood and Douglas fir forested areas. It requires dense, mature forests where it nests in tall trees, building nests of moss and lichen.	**No potential to occur.** There is no suitable breeding habitat or nesting habitat present in the project site.
Charadrius nivosus nivosus	Western snowy plover	FT, SSC	This species nests in flat open areas with sand or saline substrates, including sparsely vegetated sand beaches, dry salt flats in lagoons or similar habitat.	**No potential to occur**. The project site is highly disturbed and isolated from any potential nesting or foraging habitat. Nearest CNDDB occurrence 1.6 miles north of the project site in the Smith Slough area.
Coccyzus americanus	Yellow-billed cuckoo	FT, SE	This species uses wooded habitats with dense cover and water nearby. This could include woodlands with low, scrubby vegetation, overgrown orchards, abandoned farmland, and dense thickets along streams and marshes. Nests are placed on horizontal branches or in the forks of trees from 3 – 90 feet above the ground.	**No potential to occur.** The project site is highly disturbed and does not provide suitable forested, riparian habitat.

Table 2. Special-status wildlife species with potential to occur in the Project Vicinity.

Scientific Name	Common Name	Status[1] Federal, State	Habitat Requirements	Potential[2] to Occur in the Study Area
Coturnicops noveboracensis	Yellow rail	SSC	This species requires sedge marshes and meadows with shallow standing water, with dense vegetation for breeding. They are known to overwinter in wet meadows and tidal marshes.	**No potential to occur.** There is no suitable marsh habitat in the project site. Nearest CNDDB occurrence is located 0.9 mile northeast of the project site.
Falco peregrinus anatum	American peregrine falcon	FP	They breed in woodland, forest, and coastal habitats. Riparian areas and coastal and inland wetlands are important habitats s yearlong, especially in nonbreeding seasons. It will breed near wetlands, lakes, rivers, or other water on high cliffs, banks, dunes, and mounds. Peregrine falcons will also nest on human structures, and occasionally use trees or snag cavities or old raptor nests.	**No potential to occur.** There is no suitable nesting or foraging habitat in the project site.
Melospiza melodia pusillula	Alameda song sparrow	SSC	This species inhabits tidal salt marsh habitat, with adequate riparian vegetation for nesting sites, song perches and concealment from predators.	**No potential to occur.** The project site is highly disturbed, does not contain suitable marsh habitat and is isolated from any suitable habitat by urban development. Nearest CNDDB occurrence 1.3 miles north of the project site, in the Smith Slough area.
Rallus obsoletus obsoletus	California Ridgeway's rail	FE, SE, FP	This species inhabits saltwater marshes, with dense vegetation, consisting of pickleweed and cordgrass.	**No potential to occur**. The project site is highly disturbed, does not contain suitable marsh habitat and is isolated by urban development from any suitable habitat. Nearest CNDDB occurrence 1.5 miles north of the project site in the Smith Slough Area.
Sterna antillarum browni	California least tern	FE, SE, FP	Typically found nesting in colonies on open beaches, free of vegetation. This species primarily forages in near shore ocean waters.	**No potential to occur.** The project site is highly disturbed and there is no suitable coastal habitat present. Nearest CNDDB occurrence located 2 miles northeast of the project site, in the Don Edwards SF Bay National Wildlife Refuge.

Table 2. Special-status wildlife species with potential to occur in the Project Vicinity.

Scientific Name	Common Name	Status[1] Federal, State	Habitat Requirements	Potential[2] to Occur in the Study Area
Mammals				
Reithrodontomys raviventris	Salt-marsh harvest mouse	FE, SE, FP	Prefers dry open stages of most shrub, forest, and herbaceous habitats. Requires sufficient food (feeds mostly on burrowing rodents), friable soils and open, uncultivated ground.	**No potential to occur.** Lack of suitable habitat within the project site as there is little-to-no ground squirrel activity or other burrowing rodents in the area.

Notes:

[1]. Status designations:

Federal

FE	Listed as Endangered under the federal Endangered Species Act
FT	Listed as Threatened under the federal Endangered Species Act
BCC	Birds of Conservation Concern

State of California

FP	California Fish and Game Code Fully Protected Species
SE	California Fish and Game Code Endangered Species
SSC	California Fish and Wildlife Species of Special Concern

[2] The likelihood of occurrence (low, moderate, high) is based on habitat requirements (such as, substrate, hydrology, vegetation community, and disturbance factors) and range, applied by using the following general guidelines:

Low: Habitat within the project site and/or project vicinity satisfies very few of the species' requirements and/or the range of the species overlaps with the vicinity of the project site, but not with the project site itself. The species' presence within the project site is unlikely.

Moderate: Habitat within the project site and/or project site vicinity meets some of the species' requirements, and known locations for the species are found in the vicinity of the project site. Presence of the species within the project site is moderately likely.

High: Habitat within the project site and/or project site vicinity meets most or all of the species' requirements, and known locations for the species are found within proximity to the project site. Presence of the species within the project site is highly likely.

5 Recommendations

The project site is highly disturbed by previous development and provides no suitable habitat for special-status plants or wildlife; no special-status species were observed during the November 2018 site visit. There was no burrowing mammal activity, or burrows, observed during the site visit, which eliminates the potential refuges that some special-status species in the Bay Area require as a habitat feature. Sparse trees and shrubs within the project site may provide suitable nesting habitat for birds, so nesting bird surveys are recommended prior to construction if construction occurs within the nesting bird season, typically February 15 to August 31.

1.0 PROJECT DESCRIPTION

Premia Capital (applicant) is proposing to develop the 1180 Main Street Office Project (proposed project) in the City of Redwood City, California (City). The proposed project would be developed on two adjacent parcels identified as Assessor Parcel Numbers (APNs) 053-147-060 and 053-147-070 located at 1180 and 1190 Main Street near the City's downtown area (see Appendix A; Figures 1, 2, and 3). The project site is approximately 1.31 acres and is partially developed, with a concrete foundation and a vacant one-story commercial building. The proposed project would demolish the existing structures and construct a three-story commercial office building of 109,375 square feet with a two-level underground parking garage and on-site amenities, including a shipping container café and a public park of 10,000 square feet.

The project is located near the City's downtown area; adjacent to Elm Street, Lathrop Street, Maple Street, Main Street, and the Caltrain corridor. It is approximately 0.5 mile west of the Redwood City Caltrain station on James Avenue. Regional access is provided by U.S. Highway 101, approximately one mile north of the project site, and Highway 84, approximately 0.5 mile east of the project location.

2.0 RECORDS SEARCH AND LITERATURE REVIEW

2.1 RECORDS SEARCH

Stantec conducted a records search of the project location and a surrounding ¼-mile radius at the Northwest Information Center (NWIC) (NWIC File No. 18-0981) of the California Historic Resources Information Center (CHRIS) on November 27, 2018 (Appendix B). As an affiliate of the State of California Office of Historic Preservation (OHP), the NWIC is the official state repository of cultural resource records and reports for the region that includes San Mateo County. The records search included a review of previous studies, records, and maps on file, as well as the following resources:

- California Inventory of Historic Resources (California Department of Parks and Recreation) for San Mateo County;
- California Historical Landmarks (California OHP);
- Historic Property Data File (California OHP) for Redwood City;
- The Redwood City Historic Resources Inventory.

The records search identified seven previous cultural resource studies conducted within or adjacent to the project location (see Table 1), and an additional 16 archaeological studies conducted within ¼-mile of the project location (see Table 2).

Table 1: Previous Cultural Resources Studies Conducted within the Project Location

Report No.	Author(s)	Year	Report Title	Study Notes
S-11396	BioSystems Analysis, Inc.	1989	Technical Report of Cultural Resources Studies for the Proposed WTG-WEST, Inc., Los Angeles to San Francisco and Sacramento, California: Fiber Optic Cable Project	Covered the entire project area. No resources were identified in the project area as a result of this study.
S-17993	Woodward-Clyde Consultants	1995	Cultural Resources Inventory Report for the Proposed Mojave Northward Expansion Project	Covers the northeast half of the project area. No resources were identified in the project area as a result of this study.
S-23064	Basin Research Associates, Inc.	1999	Archaeological Resources Review for Initial Study, Franklin Street Project, City of Redwood City, San Mateo County, California	Adjacent to western edge of project area. No resources were identified in the project area as a result of this study.
S-23065	Basin Research Associates, Inc.	1999	Historic Architectural Evaluation Report, Franklin Street Project, City of Redwood City, San Mateo County, California	Adjacent to western edge of project area. No resources were identified in the project area as a result of this study.

Report No.	Author(s)	Year	Report Title	Study Notes
S-26045	Mooney & Associates	2000	Cultural Resources Reconnaissance Survey and Inventory Report for the Metromedia Fiberoptic Cable Project, San Francisco Bay Area and Los Angeles Basin Networks	Covers the northeastern project area. No resources were identified in the project area as a result of this study.
S-39604	Far Western Anthropological Research Group, Inc.	2012	Archaeological Survey Report for the Dumbarton Rail Corridor Project, San Mateo and Alameda Counties, California	Adjacent to northeastern edge of project area. No resources were identified in the project area as a result of this study.
S-43525	JRP Historical Consulting Services	2002	Draft Inventory and Evaluation of Historic Resources, Caltrain Electrification Program, San Francisco to Gilroy (MP 0.0 to 77.4)	Adjacent to northeastern edge of project area. No resources were identified in the project area as a result of this study.

Table 2: Previous Cultural Resources Studies Conducted within ¼-mile of the Project Location

Report No.	Author(s)	Year	Report Title	Study Notes
S-11881	Basin Research Associates, Inc.	1990	Historic Property Survey Report, Chestnut Street Reconstruction Project, El Camino Real and Veterans Boulevard, Redwood City, San Mateo County, California	Inventoried built environment resources approximately 1000 feet southeast of the project area.
S-24244	Archaeological Resource Management	2001	Archaeological Mitigation Program for the Irvine Apartment Communities Project on Franklin Street in Redwood City, California	Provided a mitigation program for an area approximately 50 feet west of the project area; no resources were identified.
S-25174	Pacific Legacy, Inc.	2002	Cultural Resources Report for San Bruno to Mountain View Internodal Level 3 Fiber Optics Project in San Mateo and Santa Clara Counties	Linear study along El Camino Real; no resources were identified within ¼-mile of the project area.
S-29657	Far Western Anthropological Research Group, Inc.	2002	Archaeological Inventory for the Caltrain Electrification Program Alternative in San Francisco, San Mateo, and Santa Clara Counties, California	Linear study along the Caltrain Corridor; no resources were identified within ¼-mile of the project area.
S-30602	Basin Research Associates, Inc.	2004	Culvert Project - in Support of Proposed Downtown Retail/ Cinema Project, City Hall Vicinity, Redwood City, San Mateo County, Archaeological Monitoring Closure Report (letter report)	Linear study approximately ¼-mile north of the project area; no resources were identified.
S-30603	Basin Research Associates, Inc.	2004	Underground Parking Project, in Support of Proposed Downtown Retail/Cinema Project, City Hall Vicinity, Redwood City, San Mateo County, Archaeological Monitoring Closure Report (letter report)	Monitored an area approximately ¼-mile northwest of the project area; historic-area debris was identified but not formally recorded.

Report No.	Author(s)	Year	Report Title	Study Notes
S-33061	SWCA Environmental Consultants	2006	Cultural Resources Final Report of Monitoring and Findings for the Qwest Network Construction Project, State of California	Monitored an area approximately 400 feet north of the project area; no resources were identified within ¼-mile of the project area.
S-33188	Basin Research Associates, Inc.	2006	Archaeological Assessment -- Mental Health Association Project, 104 Cedar Street (APN 053-188-050) and 112 Cedar Street (APN 053-188-060), City of Redwood City, San Mateo County (letter report)	Inventoried an area approximately 700 feet south of the project area; no resources were identified.
S-38063	LSA Associates, Inc.	2009	Smart Corridors Geoarchaeological Sensitivity Research (letter report)	Inventoried an area approximately ¼-southeast of the project area; no resources were identified.
S-39104	Far Western Anthropological Research Group, Inc.	2012	Archaeological Investigations for the State Route 82 Signal Interconnect and Intersection Modification Project, San Mateo County, California, 04-SMA-82 PM 0.0/15.9, EA 04-24992	Inventoried areas approximately ¼-mile west and southeast of the project area. P-41-002293 was recorded during this study.
S-39469	LSA Associates, Inc.	2012	Historical Resources Compliance Report for the San Mateo County SMART Corridors Project, Segment III, Redwood City, Atherton, Menlo Park, East Palo Alto, and Palo Alto, San Mateo County & Santa Clara County	Inventoried a linear area approximately ¼-mile north of the project area. No resources were identified within ¼-mile of the project area.
S-39666	Michael Brandman Associates	2012	Cultural Resources Records Search and Site Visit Results for T-Mobile West LLC Candidate SFO3612A (SF612 Security Public Storage), 1451 El Camino Real, Redwood City, San Mateo County (letter report)	Inventoried an area approximately 550 feet southwest of the project area. No resources were identified.
S-40363	Archives and Architecture	2013	Report Reviewing the Impacts of Demolition, 28 Diller Street, Redwood City, San Mateo County (Assessor's Parcel 053-176-150)	Reviewed impacts to the demolition of a property at 28 Diller Street (P-41-000504).
S-46250	R. Brandi	2015	Documentation of 103 Wilson Street, Redwood City, California, Mitigation of the Jefferson Street Project	Documented 103 Wilson St (P-41-000501).
S-47794	C. Losee	2016	Cultural Resources Investigation for AT&T Mobility CCL01089 "Jefferson - El Camino" 1121 Jefferson Avenue, Redwood City, San Mateo County, California 94063 (letter report)	Investigated 1121 Jefferson Avenue (P-41-002468) for a cellular tower. No archaeological resources were identified.
S-47904	S. De Shazo	2016	Historic Resource Evaluation of the Property Located 508 Chestnut Drive, Redwood City, San Mateo County	Evaluated 508 Chestnut Drive (P-41-001353).

The NWIC did not identify any previously recorded cultural resources in or adjacent to the project location. However, 41 resources have been recorded within ¼-mile of the project location (Table 3). Two of these

resources (P-41-000506/CA-SMA-358/H and P-41-002293/CA-SMA-397H) are archaeological sites, and the remaining 39 are historic-era buildings, structures, and/or elements of the Stambaugh-Heller Historical Residential District (SHHRD) (P-41-002422).

P-41-000506/CA-SMA-358/H was first recorded in 2001 as part of a telecommunications project (Brown 2001). The resource was described as a large scatter of historic and prehistoric/protohistoric artifacts and contained both a surface and subsurface component (Brown 2001). Artifacts encountered included chert debitage, nails, glass fragments, butchered (mammal) bone, and marine shell. It was noted that the entire site has been disturbed by historic and modern construction activities, possibly as early as the 1850s; however, the possibility of intact subsurface deposits "is still possible" (Brown 2001).

The site was revisited in 2010 during an archaeological survey conducted for the San Francisco to San Jose segment of the proposed California High-Speed Train project (Martinez, Moore, and Zelazo 2010). Martinez, Moore, and Zelazo (2010) recommended CA-SMA-358/H as eligible for listing on the National Register of Historic Places (NRHP) under Criterion D as it is likely to yield information regarding important questions in prehistory and history.

P-41-002293/CA-SMA-397H consists of a historic-era debris scatter containing ceramic and glass fragments and construction debris, indicating a date range spanning from the 1840s-1920s. It has not been evaluated for NRHP or California Register of Historical Resources (CRHR) eligibility.

The SHHRD (P-41-002422) is a roughly six-block area in Redwood City containing residences and a church built between approximately 1860 and 1915. The western boundary of the SHHRD extends approximately 180 feet east of the project location. The 21 contributing buildings to the SHHRD presented below (Table 3) are primarily one- and two-story homes (WSA 2017).

Table 3: Cultural Resources within ¼-mile of the Project Location (Resources Associated with the SHHRD)

Primary Number/ Trinomial	Time Period	Description	Evaluation
P-41-000750	Historic	Building, contributor to district 406 Stambaugh St.	Contributor to NRHP-eligible SHHRD
P-41-000751	Historic	Building, element of district 1503 Middlefield Rd.	Contributor to NRHP-eligible SHHRD
P-41-000752	Historic	Building, element of district 1417 Middlefield Rd.	Contributor to NRHP-eligible SHHRD
P-41-000753	Historic	Building 414 Heller St. (probably 402 Heller St. in district forms)	Contributor to NRHP-eligible SHHRD
P-41-000765	Historic	Building, element of district 403 Stambaugh St	Contributor to NRHP-eligible SHHRD
P-41-000766	Historic	Building, element of district 418 Stambaugh St	Contributor to NRHP-eligible SHHRD
P-41-000767	Historic	Building, element of district	Contributor to NRHP-eligible SHHRD

Primary Number/ Trinomial	Time Period	Description	Evaluation
		427 Stambaugh St	
P-41-000768	Historic	Building, element of district 504 Stambaugh St	Contributor to NRHP-eligible SHHRD
P-41-000769	Historic	Building, element of district 1405 Middlefield Rd	Contributor to NRHP-eligible SHHRD
P-41-000770	Historic	Building 1304 Middlefield Rd, Dr. Ross Residence	Contributor to NRHP-eligible SHHRD
P-41-000771	Historic	Building, element of district 446 Heller St	Contributor to NRHP-eligible SHHRD
P-41-000772	Historic	Building, element of district 423 Beech St	Contributor to NRHP-eligible SHHRD
P-41-000785	Historic	Building, element of district 397 Stambaugh St	Contributor to NRHP-eligible SHHRD
P-41-000786	Historic	Building, element of district 424 Stambaugh St	Contributor to NRHP-eligible SHHRD
P-41-000787	Historic	Building, element of district 439 Stambaugh St.	Contributor to NRHP-eligible SHHRD
P-41-002422	Historic	District	Form for the entire SHHRD
P-41-002424	Historic	Building, element of district 420 Heller St	Contributor to NRHP-eligible SHHRD
P-41-002425	Historic	Building, element of district 1511 Middlefield Rd	Contributor to NRHP-eligible SHHRD
P-41-002426	Historic	Building, element of district 1519 Middlefield Road	Contributor to NRHP-eligible SHHRD
P-41-002427	Historic	Building, element of district 1520 Middlefield Rd	Contributor to NRHP-eligible SHHRD
P-41-002428	Historic	Building, element of district 411 Stambaugh St	Contributor to NRHP-eligible SHHRD
P-41-002462	Historic	Building 411 Stambaugh St	Contributor to NRHP-eligible SHHRD

The following table presents the 20 resources identified within ¼-mile of the project location that are not components of the SHHRD.

Table 4: Cultural Resources within ¼-mile of the Project Location (Resources Not Associated with the SHHRD)

Primary Number/ Trinomial	Time Period	Description	Evaluation
P-41-000421	Historic	San Francisco & San Jose Railway	Not eligible for NRHP/CRHR listing.
P-41-000501	Historic	Building 103 Wilson St.	Not eligible for the CRHR under Criteria A, B, and C.
P-41-000502	Historic	Building 111 Franklin St.	Not eligible for NRHP/CRHR listing.
P-41-000503	Historic	Building 127 Franklin St.	Not eligible for NRHP/CRHR listing.
P-41-000504	Historic	Building 28 Diller St.	Not eligible for NRHP/CRHR listing.
P-41-000505	Historic	Building 1445-47 El Camino Real	Not eligible for NRHP/CRHR listing.
P-41-000506/ CA-SMA-358/H	Historic/ Prehistoric	A multi-component site with shell, glass, and ceramic fragments; also nails and bone	Recommended as eligible for NRHP listing under Criterion D.
P-41-000758	Historic	Building 901 Main St, Holmquist Hardware Building	Appears eligible for NRHP as an individual property through survey evaluation

2.2 LITERATURE REVIEW

In addition to the formal records search, Stantec reviewed the following resources:

- Nationwide Environmental Tile Research (NETR) database for available aerial imagery and topographic maps of the project location (NETR 2019);
- United States Geologic Survey (USGS) historic topographic maps, Palo Alto Quadrangle (USGS 2019).

These resources provided additional context for researching and evaluating the built-environment resource recorded during the field survey (see Section 3.0, Field Survey) and the results of this map and aerial imagery review can be found in that section.

Stantec also reviewed the *Cultural, Biological, and Paleontological Resources Assessment Report, 1180 Main Street Project, Redwood City, San Mateo County, California* (WSA 2017). This report, provided to Stantec by the client (Premia), was prepared as part of the due diligence efforts in advance of environmental documents for the present project. The archaeological assessment included an archival and records search of the proposed project area and a surrounding ¼-mile radius at the NWIC, a Sacred Lands File search at the Native American Heritage Commission (NAHC), and a pedestrian archaeological survey (WSA 2017). The data provided in that report served as a confirmation of the data obtained independently for the present study. The results of the NWIC records search completed for that project were nearly identical to the results received for the present study (several more built environment resources have been recorded within ¼-mile of the project area since then; but no resources were identified within the project area). No new or previously recorded archaeological resources were encountered within the project area during the pedestrian survey completed for that project (WSA 2017). The conclusions and recommendations provided later in this report reflect those provided in this earlier study.

3.0 FIELD SURVEY

3.1.1 Methods

On November 13, 2018 Stantec Archaeologist Joanne Grant conducted an intensive archaeological pedestrian survey of the entire project location (see Figure 4). The project location is roughly triangle-shaped and is bounded by the Caltrain Railroad (RR) tracks along the northeastern edge, Main Street along the southeastern edge, Elm Street along the southern edge, Lathrop Street along the southwestern edge, and Maple Street along the northwestern edge.

The survey consisted of walking roughly parallel 10-meter-wide transects in an east-west direction, beginning at the northern tip of the parcel (near Maple Street and the RR tracks). During the field survey, the entire project location was examined for the presence of historic or prehistoric site indicators. Historic site indicators include, but are not limited to, glass and ceramic fragments, metal objects, milled and split lumber, and the remnants of structures or features such as building foundations, fence posts, and discrete trash deposits such as wells, privy pits, or dumps. Prehistoric site indicators include, but are not limited to, obsidian or chert flakes, grinding and mashing implements (i.e. groundstone, mortars, pestles, handstones, and millingstones), bone, and discolored soils, which could contain lithics, bone, shell, other organics, and/or fire-affected rocks (burned or unburned); shell, flaked stone, ground stone, or human bone. The archaeologist investigated rodent burrows for any indicators of color/texture changes that could indicate buried deposits and employed periodic trowel and boot scrapings to clear small patches of vegetation in areas with poor ground visibility.

Documentation of the site included digital photographs of the entire survey area, the surrounding neighborhood, and ground surface. Appendix C of this report contains photographs taken during the field survey.

Vegetation in the project location consisted primarily of non-native grassland and plant cover. Dominant species include wild oats (*Avena* sp.), black mustard (*Brassica nigra*), fennel (*Foeniculum vulgare*), and yellow star thistle (*Centaurea solstitialis*). Ground visibility was generally good (approximately 75%), with dried grasses and low-lying shrubbery obscuring portions of the surface, particularly in the southern portion of the project area. Trowel and boot scrapes revealed the soil to be dry and crumbly silt, with approximately 20% gravelly inclusions. The soil color throughout the project area was dark yellowish brown, and the Munsell readings were either 10YR 4/4 or 10YR 4/6. Modern trash such as food/plastic wrappers, various bottles/bottle fragments, and concrete/construction debris were observed throughout the project area.

An irregular shaped, rebar reinforced concrete foundation is situated along the eastern side of the channelized creek, at the northernmost point of the project location, close to Maple Street. This foundation is modern and not studied as part of the effort. According to the property owner, this pad was constructed approximately 10 years ago (Arteaga personal communication November 14, 2018).

3.1.2 Findings

No prehistoric or historic-era archaeological resources, or indicators of buried cultural deposits, were identified during the archaeological field survey. The built environment resources on the project parcel are discussed below:

1190 Main Street

A single-story building, 1190 Main Street, is located on the southeast corner of the property, at the intersection of Elm and Main Streets. Research indicates that it was constructed in 1952 (WSA 2017). It appears to have been used as a commercial space, with a showroom space facing Main Street (the building is now vacant). This building is slated for demolition as part of this project. Although the building is over 50 years of age, it has not been evaluated, due to the City's policy of not evaluating post-war buildings. Should the historic eligibility of the building need to be determined, it will be done under a separate task.

Channelized Section of Redwood Creek

A channelized, concrete-lined segment of Redwood Creek flows along the western end of the presently-vacant parcel. No additional features or artifacts were found in association with this resource. The channelized creek is gunite concrete-lined, with angled sides at roughly 45 degrees. The gunite concrete-lined banks exhibit cracking, with weeds growing in some areas. A large palm bush is growing alongside the canal at the point where it travels beneath Lathrop Street. Outside of the project boundaries, the canal flows under Maple Street to the north, and flows under Lathrop Street to the southwest. A two-rail, wood fence is located along the canal crest. The modification changing Redwood Creek from a natural waterway to an engineered, concrete lined channel occurred between 1961 and 1968 (NETR 2019). The original concrete lining has been replaced periodically over the years as routine maintenance. Due to the age of the channelized, concrete lined creek, it was recorded on a Department of Parks and Recreation (DPR) form as 1180RC-1 (Appendix D).

Redwood Creek is an approximately 10-mile long perennial stream that discharges into South San Francisco Bay. In 1851, it was discovered that the creek emptied directly into a naturally deep channel of water that, in turn, flowed into San Francisco Bay. Shortly afterwards, logging companies started using the creek to move the redwood logs (hence the name Redwood Creek) from the peninsula hills down to this deep-water channel. From this channel, the logs were transported to San Francisco, where they were ultimately milled into lumber (Redwood City Local History 2019; Redwood City History 2017).

Historically, the 1897 Sanborn map, as well as the 1897 USGS topographic map, shows Redwood Creek as flowing partially through the project location, from approximately 40 feet southwest of Maple Street, and exiting the project location at the intersection of Maple Street and Elm Street (Sanborn Map and Publishing Company 1897; USGS 1897). The 1897 Sanborn map also shows a foot bridge crossing the creek on Elm Street (Sanborn Map and Publishing Company 1897). By 1919, an additional wooden bridge was built across Redwood Creek at Maple Street (Sanborn Map and Publishing Company 1919). The creek and crossing remained relatively unchanged until the late 1940s, when a concrete bridge was identified as crossing over Redwood Creek at Lathrop and Maple Streets in 1950 (Sanborn Map and Publishing

Company 1950). In 1960, the creek remained largely as it had been; however, by 1968, the creek had been improved with concrete lining and channelized (NETR 2019). Redwood Creek continues to flow through Redwood City; however, throughout much of this urban area, it is through underground pipes (Kyle 2002), including south of the project location at El Camino Real, and north of the project location at Maple Street.

CRHR Determination of Eligibility

Under the California Environmental Quality Act (CEQA), public agencies must consider the effects of their actions on both "historical resources" and "unique archaeological resources." In addition to assessing whether historical resources potentially impacted by a proposed project are listed or have been identified in a survey process (Public Resources Code [PRC] 5024.1 [g]), lead agencies have a responsibility to evaluate them against the CRHR criteria prior to making a finding as to a proposed project's impacts to historical resources (PRC Section 21084.1 and California Code of Regulations (CCR) Section 15064.5 [a][3]). Following CCR Section 15064.5 (a) a historical resource is defined as any object, building, structure, site, area, place, record, or manuscript that:

Is historically or archeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political or cultural annals of California; and meets any of the following criteria:

1. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

2. Is associated with the lives of persons important in our past;

3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

4. Has yielded, or may be likely to yield, information important in prehistory or history.

To be considered a historical resource for the purpose of CEQA, the resource must also have integrity, which is the authenticity of a resource's physical identity evidenced by the survival of characteristics that existed during the resource's period of significance. Resources, therefore, must retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. Integrity is evaluated with regard to the retention of location, design, setting, materials, workmanship, feeling, and association. It must also be judged with reference to the particular criteria under which a resource is eligible for listing in the CRHR (CCR 14 Section 4852[c]).

The channelized canal appears ineligible for the CRHR under Criteria 1, 2, 3, and 4. Research has not uncovered any evidence to suggest that the channelized canal is associated with a significant event or individual (CRHR Criteria 1 and 2), embodies distinctive characteristics of type, period, region, or method of construction, has high artistic value, or represents the work of a master (CRHR Criterion 3), or has recognized data potential (Criterion 4). Although Redwood Creek played an important role in the exportation of lumber and other products (such as grains and livestock) in the mid-late 1800s, the channelization of the canal within the project location in the mid-1960s occurred well outside of this potential period of

significance. The channelized canal's features appear to be a standardized design for concrete-lined, channelized creeks. It appears to have been maintained and modified regularly since it was originally constructed in the 1960s. Although the channelized creek retains its integrity of location, setting, feeling, and association (the canal is in the same location, and its primary purpose as supporting a natural drainage network through an urban area remains), the canal has lost integrity of design, workmanship, and materials, as it has been subject to modifications and maintenance over the years, including the replacement of its original concrete lining. In all, the resource appears to lack significance of all criteria and is therefore ineligible for the CRHR.

4.0 CONCLUSIONS AND RECOMMENDATIONS

No prehistoric or historic-era archaeological resources, or indicators of buried cultural deposits, were identified in the project location. The City does not require documentation and/or evaluation of 1190 Main Street, the building on the property. The channelized creek appears to be ineligible for the CRHR under all criteria.

There is the possibility, however, that subsurface prehistoric or historic-era resources could be identified during project implementation. Prehistoric resources could be associated with nearby CA-SMA-358/H, as the boundaries for this resource could extend beyond what has previously been documented. Historic-era resources could be associated with the previous buildings and structures, including Redwood Creek, that once stood in the project location.

Although the project is not anticipated to have an impact on any known or potentially buried archaeological resources, subsurface construction activities such as trenching and grading associated with the proposed project could potentially damage or destroy previously undiscovered historical resources and/or unique archaeological resources. Stantec proposes the following inadvertent discovery procedures be followed if cultural resources are encountered during project-related construction activities.

4.1 INADVERTENT DISCOVERY PROCEDURES

4.1.1 Archaeological Deposits

If cultural resources (e.g., sites or artifacts) are encountered during ground disturbance or subsurface construction activities (e.g., trenching, grading), all construction activities within a 100-foot radius of the identified resource shall cease until a, archaeologist who meets the Secretary of the Interior's Standards and Guidelines for Professional Qualifications in archaeology and/ or history evaluates the resource for its significance and records the resource on the appropriate State DPR 523 series forms. If the qualified archaeologist determines that the cultural resource appears eligible for inclusion on the CRHR, the archaeologist shall develop a plan for the treatment of the resource. This shall contain appropriate mitigation measures, including avoidance, preservation in place, data recovery excavation, or other appropriate measures outlined in PRC Section 21083.2.

4.1.2 Human Remains

There are no known human remains within the project area, and no indications that the project location has been used for burial purposes in the past. Therefore, it is unlikely that human remains would be encountered during construction. However, ground disturbance and subsurface construction activities such as trenching and grading associated with the proposed project could potentially disturb previously undiscovered human burial sites. If ground-disturbing activities uncover previously unknown human remains, Section 7050.5 of the California Health and Safety Code applies, and the following procedures shall be followed.

There shall be no further excavation or disturbance of the area where the human remains were found or within 100 feet of the find until the San Mateo County Coroner and the appropriate City representative are contacted. Duly authorized representatives of the Coroner and the City shall be permitted onto the project site and shall take all actions consistent with Health and Safety Code Section 7050.5 and Government Code Sections 27460, et seq. Excavation or disturbance of the area where the human remains were found or within 100 feet of the find shall not be permitted to re-commence until the Coroner determines that the remains are not subject to the provisions of law concerning investigation of the circumstances, manner, and cause of any death.

If the Coroner determines the remains are Native American, the Coroner shall contact the NAHC within 24 hours, and the NAHC shall identify the person or persons it believes to be the "most likely descendant" (MLD) of the deceased Native American. The MLD may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in PRC Section 5097.98. If the MLD does not make recommendations within 48 hours, the landowner shall reinter the remains in an area of the property secure from further disturbance. If the landowner does not accept the MLD's recommendations, the owner or the MLD may request mediation by NAHC.

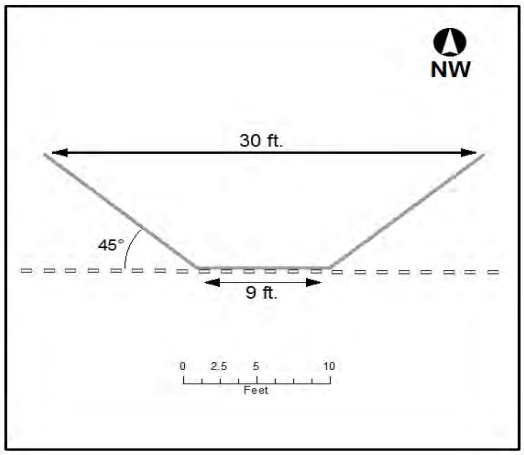
(This space reserved for official comments.)



L1. Historic and/or Common Name: None

L2a. Portion Described: □ Entire Resource × Segment □ Point Observation **Designation:** 1180RC-1

b. Location of point or segment: The canal flows through the western end of the vacant parcel located at 1180 Main Street, Redwood City, Assessor Parcel Number (APN): 053-147-060. UTM: Zone, 10N North End: 568406mE/ 4148646mN South End: 568424mE/ 4148561mN

L3. Description: The resource consists of a channelized, concrete-lined segment of Redwood Creek that flows along the western end of the presently-vacant parcel located at 1180 Main Street, Redwood City. No additional features or artifacts were found in association with this resource. The channelized creek is gunite concrete-lined, with angled sides at roughly 45 degrees. The gunite concrete-lined banks exhibit cracking, with weeds growing in some areas. A large palm bush is growing alongside the canal at the point where it travels beneath Lathrop Street. A two-rail, wood fence is located along the canal crest. The modification changing Redwood Creek from a natural waterway to an engineered, concrete lined channel occurred between 1961 and 1968 (NETR 2019). The original concrete lining has been replaced periodically over the years as routine maintenance. Outside of the project boundaries, the canal flows under Maple Street to the north, and flows under Lathrop Street to the southwest.

L4e. Sketch of Cross-Section

L4. Dimensions:

a. Top Width 30 feet **b. Bottom Width** 9 feet

c. Height or Depth 9 feet **d. Length of Segment** 275 feet

L5. Associated Resources: None observed.

L6. Setting: The channelized creek is located on a 1.31 acre-parcel south of downtown Redwood City in a developed urban setting. It is situated with Elm Street to the southeast, Lathrop Street to the southwest, Maple Street to the northwest, and Caltrain railroad tracks to the northeast. Development surrounding the project site consists of mixed uses, including commercial to the north, high-density residential to the west, commercial and residential to the east, and automobile sales and service centers to the south.

L8a. Photograph, Map or Drawing

L7. Integrity Considerations: The channelized creek is in use, maintained, and modified. It retains its original use, appearance, and function as a channelized creek and has historic integrity in terms of setting, feeling, association, and location. (see Continuation Sheet)

L7. Integrity Considerations (continued):

Redwood Creek is an approximately 10-mile long perennial stream that discharges into South San Francisco Bay. In 1851, people discovered that the creek emptied directly into a naturally deep channel of water that, in turn, flowed into San Francisco Bay. Shortly afterwards, logging companies started using the creek to move the redwood logs (hence the name Redwood Creek) from the peninsula hills down to this deep-water channel. From this channel, the logs were transported to San Francisco, where they were ultimately milled into lumber (Redwood City Local History 2019; Redwood City History 2017).

Historically, the 1897 Sanborn map, as well as the 1897 United States Geological Survey (USGS) topographic map, shows Redwood Creek as flowing partially through the project location, from approximately 40 feet southwest of Maple Street, and exiting the project location at the intersection of Maple Street and Elm Street (Sanborn Map and Publishing Company 1897; USGS 1897). The 1897 Sanborn map also shows a foot bridge crossing the creek on Elm Street (Sanborn Map and Publishing Company 1897). By 1919, an additional wooden bridge was built across Redwood Creek at Maple Street (Sanborn Map and Publishing Company 1919). The creek and crossing remained relatively unchanged until the late 1940s, when a concrete bridge was identified as crossing over Redwood Creek at Lathrop and Maple Streets in 1950 (Sanborn Map and Publishing Company 1950). In 1960, the creek remained largely as it had been; however, by 1968, the creek had been improved with concrete lining and channelized (NETR 2019). Redwood Creek continues to flow through Redwood City; however, throughout much of this urban area, it is through underground pipes (Kyle 2002), including south of the project location at El Camino Real, and north of the project location at Maple Street.

California Register of Historical Resources (CRHR) Determination of Eligibility

The channelized canal appears ineligible for the CRHR under Criteria 1, 2, 3, and 4. Research has not uncovered any evidence to suggest that the channelized canal is associated with a significant event or individual (CRHR Criteria 1 and 2), embodies distinctive characteristics of type, period, region, or method of construction, has high artistic value, or represents the work of a master (CRHR Criterion 3), or has recognized data potential (Criterion 4). Although Redwood Creek played an important role in the exportation of lumber and other products (such as grains and livestock) in the mid-late 1800s, the channelization of the canal in the mid-1960s occurred well outside of this potential period of significance. The channelized canal's features appear to be a standardized design for concrete-lined, channelized creeks. It appears to have been maintained and modified regularly since it was originally constructed in the 1960s. Although the channelized creek retains its integrity of location, setting, feeling, and association (the canal is in the same location, and its primary purpose as supporting a natural drainage network through an urban area remains), the canal has lost integrity of design, workmanship, and materials, as it has been subject to modifications and maintenance over the years, including the replacement of its original concrete lining. In all, the resource appears to lack significance of all criteria and is therefore ineligible for the CRHR.

AEI Project No. 374905

Dear Gloria Arteaga:

AEI Consultants is pleased to provide the Phase I Environmental Site Assessment (Phase I ESA) report of the above referenced address. This assessment was authorized and performed in accordance with the scope of services outlined in the proposal, the scope and limitations of ASTM Standard Practice E1527-13, and the Environmental Protection Agency Standards and Practices for All Appropriate Inquiries (40 CFR Part 312).

We appreciate the opportunity to provide services to you. If you have any questions concerning this report, or if we may assist you in any other matter, please contact me at (678) 279-2820 or syekich@aeiconsultants.com.

Sincerely,

EXECUTIVE SUMMARY

AEI Consultants (AEI) was retained by Premia Capital to conduct a Phase I ESA in conformance with the proposal and the scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) for the property located at 1180 and 1190 Main Street, Redwood City, San Mateo County, California. Any exceptions to, or deletions from, this practice are described in Sections 1.4, 1.5, and 1.6 of this report.

PROPERTY DESCRIPTION

PROPERTY INFORMATION	
Property Name	Vacant Commercial
Street Address(es)	1180 and 1190 Main Street
City	Redwood City
State	California
Location	In the middle of the intersections of Elm Street, Maple Street, Main Street, Pennsylvania Avenue and Lathrop Street
Vicinity Characteristics	Mixed commercial, residential and industrial
Approximate Site Acreage/Source	1.33/Assessor's Office
Property Type	Commercial/vacant
Subject Property Use(s)	Vacant commercial building and vacant land
Assessor Parcel Number(s)	053-147-060 and 053-147-070
SITE AND BUILDING INFORMATION	
Number of Buildings	One
Year(s) of Construction	Current building constructed in 1952
Number of Floors/Stories	One
Basement or Subgrade Area(s)	None identified
Number of Units	One
Building Area (SF)/Source	1,920/Mr. Louis Deziel, Property Owner
Building Description(s)	A single-story vacant commercial building
Building Occupant(s)	None identified
Additional Improvements	Vacant land, a building foundation, and a creek
Current On-site Operations	None identified
Current Use of Hazardous Substances	None identified
UTILITY PROVIDER INFORMATION	
Natural Gas Provider	PG&E
Electricity Provider	PG&E
Heating System Fuel Source	Natural gas
Cooling System Power Source	Electricity
Potable Water Provider or Source	City of Redwood City
Sewage Disposal Provider or Treatment System	City of Redwood City
REGULATORY INFORMATION	
Regulatory Database Listings	HAZNET (4), RGA LUST (2), SAN MATEO CO. BI (2), RCRA-SQG, LUST, HIST CORTESE, SWEEPS UST, FINDS, ECHO, EDR HIST AUTO; Refer to Section 5.1.
Institutional Controls	None identified
Engineering Controls	None identified

DRAFT

Environmental Liens	None identified

Based on a review of historical sources, the subject property was identified to consist of the following: a commercial building occupied by Redwood City flour mill, two auxiliary buildings, and a slough in 1884; a commercial building occupied by WJ Bunn's feed mill containing a grain warehouse and an engine shop, as well as part of a creek in 1888 to 1897; a commercial building occupied by Cullen Company's grain warehouse, three dwellings, a hen house, auxiliary structures, and part of a creek in 1907; a commercial building occupied as a feed and fuel warehouse, as well as part of a creek, three dwellings, and auxiliary structures from 1919 to 1950. In 1952, the current commercial building was constructed and was occupied by the following tenants: a bail bonds company (1955), a dairy supply company (1960 to 1965), and No Draft Co, a window and door supply company (1976-2001). Since 2011, the building has remained unoccupied. In 1955, an auto repair building was constructed and remained on-site until 2011. The feed and fuel facility remained on-site until 1962, and in 1974, an additional commercial building was constructed and was occupied by Marcelli Lighting until it was demolished in 2011. A foundation for a new medical building was constructed in 2011, but the project was never finished and thus the subject property has remained vacant since that time.

The following historical addresses were associated with the subject property: 5-17, 602-620 Pennsylvania/Railroad Avenue; 12-22, 101-139, 608-610 Elm Street; 19 Mound Street; 120, 632, 1150 Main Street; 134-162 Maple Street; 144 Lathrop Street. These addresses were also researched as part of this assessment.

The immediately surrounding properties consist of the following:

Direction from Site	Tenant/Use (Address)	Regulatory Database Listing(s)
Northeast	Pennsylvania Avenue followed by: Cooks Collision (1104 Main Street) Unmarked commercial building (1112 Main Street)	EDR HIST AUTO, SAN MATEO CO. BI, RCRA-SQG (2), ENVIROSTOR, LUST, FINDS, ECHO (1104 Main Street)
East	Pennsylvania Avenue followed by: Wings Learning Center (1201 Main Street) San Jose Obrero (400 Heller Street)	RCRA-SQG, FINDS, ECHO, SAN MATEO CO. BI (1201 Main Street)
Southeast	Elm Street followed by: Main Street Park (no listed address) ATA Reprographics (1202 Main Street) Main & Elm Restaurant (112-150 Elm Street) Unmarked commercial building (101 Lathrop Street)	SAN MATEO CO. BI, EDR HIST AUTO (112-150 Elm Street)

DRAFT

Direction from Site	Tenant/Use (Address)	Regulatory Database Listing(s)
Southwest	A creek canal (no listed address) Lathrop Street followed by: Vacant land/a creek canal (no listed address) Apartments (1-49 Maple Street)	None identified
Northwest	Maple Street followed by: Apartments (99-149 Maple Street) Apartments (1090 Main Street)	SAN MATEO CO BI., LUST, EDR HIST AUTO (99-149 Maple Street)

If the surrounding properties are listed in the regulatory database, please refer to Section 5.1 for discussion.

Based on groundwater monitoring data for a nearby site at 25 Maple Street (located approximately 0.08 mile southwest of the subject property) obtained from GeoTracker, the direction of groundwater flow beneath the subject property is inferred to be to the north and groundwater is presumed to be present at an estimated depth of 7 to 10 feet bgs.

FINDINGS

Recognized Environmental Condition (REC) is defined by the ASTM Standard Practice E1527-13 as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

- AEI did not identify evidence of RECs during the course of this assessment.

Controlled Recognized Environmental Condition (CREC) is defined by the ASTM Standard Practice E1527-13 as a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

- AEI did not identify evidence of CRECs during the course of this assessment.

Historical Recognized Environmental Condition (HREC) is defined by the ASTM Standard Practice E1527-13 as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls.

- According to agency records, a 1,000 gallon diesel UST and a 580 gallon gasoline UST were removed from the subject property on September 9, 1994. Both USTs appeared to be in good condition. A shallow trench was also excavated along the route of the pipeline

DRAFT

which lead to the dispenser location. 30 cubic yards of excavated soil were stockpiled. One soil sample was collected from beneath the fill end of the gasoline UST and two soil samples were collected from beneath the diesel UST. These samples were collected at depths of 8 feet. A soil sample was also collected from the location of the fuel dispenser at a depth of three feet. Two soil samples were also collected from the stockpiled soil. All of the samples were non-detect, with the exception of the sample collected from the dispenser area, which detected 30 mg/kg TPHd. The stockpiled samples were all non-detect with the exception of 0.0088 mg/kg toluene, 0.0058 mg/kg ethylbenzene and 0.027 mg/kg xylene. Because low concentrations of petroleum hydrocarbons were detected in the stockpiled soil, that soil could not be used as backfill. The stockpiled soil was spread out and allowed to aerate for two months. Resampling of the stockpiled soil occurred, which did not detect any BTEX and thus it was re-used as backfill. The SMCEHD stated that no additional excavation was required because the concentrations were relatively low and the piping and USTs looked in good shape, and issued an official closure letter in 1994.

- According to agency records, the subject property formerly had a 1,000 gallon waste oil UST and a 1,000 gallon gasoline UST that were removed from the property on January 14, 1994. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons. One of the two soil samples collected for the waste oil UST was found to contain 810 ppm TPHd in addition to 17 ppb dichloromethane by EPA Methods 5030/8010. Re-analysis by EPA Method 8240 showed no detectable hydrocarbons. On February 9, 1994, the waste oil UST pit was overexcavated. A soil sample collected at the end of the overexcavation was found to contain no detectable hydrocarbons. Water was present in the pit and was sampled, with analysis showing only 530 ppb of TPHd, described by the laboratory as not typical of diesel. No TPHg, BTEX, oil and grease, or chlorinated hydrocarbons were detected in the water sample. The pit was pumped dry and no water recharged. The SMCEHD requested construction and sampling of a monitoring well. Groundwater sampling was conducted until 1995. The final "after cleanup" groundwater concentrations were listed as non-detect for TPHg, TPHd, BTEX, and 1,600 ppb of oil and grease in the case closure letter. On June 21, 1995 the SMCEHD and the RWQCB granted the site case closure with no further action required.

Additionally, four hydraulic lifts were removed from the interior of the former Chub's Auto Repair shop in 1994 and 1995. One of the lifts was reportedly leaking and therefore was removed before the other three. A soil sample was collected from the excavation pit, and a second sample was collected from the stockpile generated by the excavation, both of which detected elevated levels of oil and grease. Multiple sampling events and additional overexcavation of the pit were conducted. Groundwater was eventually encountered in the pit, and groundwater monitoring well MW-2 was installed. Multiple sampling events from MW-2 showed maximum levels of 12,000 ppm oil and grease in soil and 1,700 ppb oil and grease in groundwater. Approximately 800 gallons of groundwater were purges from MW-2. Sampling from MM-1 indicated that there was no perceptible gradient between MW-1 and MM-2 and thus no lateral migration of contaminants. The former lift release case was addressed in the 1995 case closure letter for the two USTs, although closure was specific to the USTs. However, the SCMEHD did cite the consultant's statement that the hydraulic lift release case should be closed.

Other Environmental Considerations warrant discussion, but do not qualify as RECs as defined by the ASTM Standard Practice E1527-13. These include, but are not limited to, de minimis conditions and/or environmental considerations such as the presence of ACMs, LBP, radon, mold, and lead in drinking water, which can affect the liabilities and financial obligations of the client, the health and safety of site occupants, and the value and marketability of the subject property.

- From September to December 2011, TRC conducted multiple soil sampling events to evaluate the current soil conditions at the site for potential reuse or landfill disposal related to future redevelopment activities. It was TRC's understanding that approximately 4,500 cubic yards of soil was to be excavated during construction activities at the site. The site was divided into three soil sampling areas. Area I was at the northernmost portion, with Area II in the center and Area II on the southern portion of the site. The analyses performed by TRC did not detect pesticides, VOC's, including gasoline-range hydrocarbons, BTEX nor MTBE in any of the samples analyzed. Analysis on the one composite soil sample collected from Area II detected Motor Oil Range Organics ranging from 59 to 1100 mg/Kg, and the Total Threshold Level Concentrations (TTLC) for lead was detected from 9.3 to 50 mg/Kg. Analysis of soil samples from Area III detected diesel and motor oil concentrations (190 mg/kg and 670 mg/kg respectively). The metal concentrations detected appear typical of naturally occurring background concentrations and are below Total Threshold Level Concentrations (TTLC), except for chromium and lead. The chromium and lead concentrations were reported at 130 mg/kg and 52 mg/kg respectively. Based on field observations during sampling, it appeared that the soil of Area III is similar to the Area II soil. TRC concluded that the site history and therefore the detected anomalous compounds and concentrations, are similar between the two site development sections and no additional soil quality characterization appeared to be required.
- Due to the age of the subject property building, there is a potential that LBP is present. AEI understands that renovation and/or demolition activities of the subject property buildings are planned. It should be noted that lead testing was previously performed, and discussed in Section 6.3. AEI recommends that the property owner consult with a certified Lead Risk Assessor to determine options for control of possible LBP hazards. Stringent local and State regulations may apply to LBP in association with building demolition/renovations and worker/occupant protection. It should be noted that construction activities that disturb materials or paints containing any amount of lead may be subject to certain requirements of the OSHA lead standard contained in 29 CFR 1910.1025 and 1926.62.
- According to the Mr. Deziel, demolition of the subject property building is planned for the near future. Regardless of building construction date, the EPA's NESHAP requires that a thorough asbestos survey be performed prior to demolition or renovation activities that may disturb ACMs. It should be noted that a NESHAP survey was previously performed, discussed in Section 6.3. This requirement may be enforced by federal, state and local regulatory agencies, and specifies that all suspect ACMs be sampled to determine the presence or absence of asbestos prior to any renovation or demolition activities which may disturb them to prevent potential exposure to workers, building occupants, and the environment. Similarly, OSHA regulations require that specific work practices be implemented when handling construction materials and debris that contain asbestos and/or lead-containing materials.

CONCLUSIONS, OPINIONS, AND RECOMMENDATIONS

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) of 1180 and 1190 Main Street, Redwood City, San Mateo County, California, the *subject property*. Any exceptions to, or deletions from, this practice are described in Sections 1.4, 1.5, and 1.6 of this report.

AEI did not identify evidence of RECs or CRECs in connection with the subject property during the course of this assessment. AEI recommends no further investigation for the subject property at this time.

DRAFT

1.0 INTRODUCTION

This report documents the methods and findings of the Phase I ESA performed in conformance with the proposal and scope and limitations of ASTM Standard Practice E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) for the property located at 1180 and 1190 Main Street, Redwood City, San Mateo County, California (Appendix A: Figures and Appendix B: Property Photographs).

1.1 SCOPE OF WORK

The purpose of the Phase I ESA is to assist the client in identifying potential RECs, in accordance with ASTM E1527-13, associated with the presence of any hazardous substances or petroleum products, their use, storage, and disposal at and in the vicinity of the subject property. Property assessment activities focused on: 1) a review of federal, state, tribal, and local databases that identify and describe underground fuel tank sites, leaking underground fuel tank sites, hazardous waste generation sites, and hazardous waste storage and disposal facility sites within the ASTM approximate minimum search distance; 2) a property and surrounding site reconnaissance, and interviews with the past and present owners and current occupants and operators to identify potential environmental contamination; and 3) a review of historical sources to help ascertain previous land use at the site and in the surrounding area.

1.2 ADDITIONAL SERVICES

Other Environmental Considerations such as ACMs, LBP, lead in drinking water, radon, mold, and wetlands can result in business environmental risks for property owners which may disrupt current or planned operations or cash flow and are generally beyond the scope of a Phase I assessment as defined by ASTM E1527-13. Based upon the agreed-on scope of services this ESA did not include subsurface or other invasive assessments, business environmental risks, or other services not specifically identified and discussed herein.

1.3 SIGNIFICANT ASSUMPTIONS

The following assumptions are made by AEI in this report. AEI relied on information derived from secondary sources including governmental agencies, the client, designated representatives of the client, property contact, property owner, property owner representatives, computer databases, and personal interviews. AEI has reviewed and evaluated the thoroughness and reliability of the information derived from secondary sources including government agencies, the client, designated representatives of the client, property contact, property owner, property owner representatives, computer databases, or personal interviews. It appears that all information obtained from outside sources and reviewed for this assessment is thorough and reliable. However, AEI cannot guarantee the thoroughness or reliability of this information.

Groundwater flow, unless otherwise specified by on-site well data or well data from the subject property or nearby sites, is inferred from contour information depicted on the USGS topographic maps. AEI assumes the property has been correctly and accurately identified by the client, designated representative of the client, property contact, property owner, and property owner's representatives.

DRAFT

1.4 LIMITATIONS

Property conditions, as well as local, state, tribal, and federal regulations can change significantly over time. Therefore, the recommendations and conclusions presented as a result of this assessment apply strictly to the environmental regulations and property conditions existing at the time the assessment was performed. Available information has been analyzed using currently accepted assessment techniques and it is believed that the inferences made are reasonably representative of the property. AEI makes no warranty, expressed or implied, except that the services have been performed in accordance with generally accepted environmental property assessment practices applicable at the time and location of the assessment.

Considerations identified by ASTM as beyond the scope of a Phase I ESA that may affect business environmental risk at a given property include the following: ACMs, radon, LBP, lead in drinking water, wetlands, regulatory compliance, cultural and historical resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, mold, and high voltage lines. These environmental issues or conditions may warrant assessment based on the type of the property transaction; however, they are considered non-scope issues under ASTM Standard Practice E1527-13.

If requested by the client, these non-scope issues are discussed herein. Otherwise, the purpose of this assessment is solely to satisfy one of the requirements for qualification of the innocent landowner defense, contiguous property owner or bona fide prospective purchaser under CERCLA. ASTM Standard Practice E1527-13 and the United States EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312) constitute the "all appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice" as defined in:

1. 42 U.S.C. § 9601(35)(B), referenced in the ASTM Standard Practice E1527-13.
2. Sections 101(35)(B) (ii) and (iii) of CERCLA and referenced in the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312).
3. 42 U.S.C. § 9601(40) and 42 U.S.C. § 9607(q).

The Phase I ESA is not, and should not be construed as, a warranty or guarantee about the presence or absence of environmental contaminants that may affect the property. Neither is the assessment intended to assure clear title to the property in question. The sole purpose of assessment into property title records is to ascertain a historical basis of prior land use. All findings, conclusions, and recommendations stated in this report are based upon facts, circumstances, and industry-accepted procedures for such services as they existed at the time this report was prepared (i.e., federal, state, and local laws, rules, regulations, market conditions, economic conditions, political climate, and other applicable matters). All findings, conclusions, and recommendations stated in this report are based on the data and information provided, current subject property use, and observations and conditions that existed on the date and time of the property reconnaissance.

Responses received from local, state, or federal agencies or other secondary sources of information after the issuance of this report may change certain facts, findings, conclusions, or circumstances to the report. A change in any fact, circumstance, or industry-accepted procedure upon which this report was based may adversely affect the findings, conclusions, and recommendations expressed in this report.

DRAFT

AEI's limited radon screening, if included, is intended to provide a preliminary screening to evaluate the potential presence of elevated radon concentrations at the site. The proposed scope is not intended to define the full extent of the presence of radon at the subject property. As such, the results should be used for lending purposes only. The recommendations and conclusions presented as a result of the limited preliminary radon screening apply strictly to the property conditions existing at the time the sampling was performed. The sample analytical results are only valid for the time, place, and condition of the site at the time of collection and AEI does not warrant that the results will be repeatable or are representative of past or future conditions.

1.5 Limiting Conditions/Deviations

The performance of this Phase I ESA was limited by the following:

- Due to the size of the subject property, AEI performed a site inspection of the property utilizing a field technique of traversing the site in an attempt to provide an overlapping field of view. Due to the size of the property and the vegetation present on site, isolated areas of the site may have not been accessible for direct observation during AEI's inspection. Based on the vacant nature, this limitation is not expected to significantly alter the Findings of this assessment.
- The User did not complete the ASTM User Questionnaire or provide the User information to AEI. AEI assumes that qualification for the LLPs is being established by the User in documentation outside of this assessment.

1.6 Data Gaps and Data Failure

According to ASTM E1527-13, data gaps occur when the Environmental Professional is unable to obtain information required by the Standard, despite good faith efforts to gather such information. Pursuant to ASTM E1527-13, only significant data gaps, defined as those that affect the ability of the Environmental Professional to identify RECs, need to be documented.

Data failure is one type of data gap. According to ASTM E1527-13, data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met. Pursuant to ASTM E1527-13, historical sources are required to document property use back to the property's first developed use or back to 1940, whichever is earlier, or periods of five years or greater.

DRAFT

1.6.1 DATA FAILURE

The following data failure was identified during the course of this assessment:

Data Failure	The earliest historical resource obtained during this assessment was a Sanborn map from 1884 indicating that the subject property was developed, as discussed below. The lack of historical sources for the subject property dating back to first developed use represents historical data source failure. In the 1884 Sanborn map, the subject property was developed with a commercial building occupied by Redwood City flour mill, two auxiliary buildings, and a slough . Thus, it is assumed that prior to 1884, the subject property would have been used for similar purposes, if not undeveloped. Therefore, this data failure is not expected to significantly alter the Findings of this assessment.
Information/Sources Consulted	City directories, Sanborn fire insurance maps, aerial photographs, agency records, previous reports, interviews

1.6.2 DATA GAPS

AEI did not identify significant data gaps which affected our ability to identify RECs.

1.7 RELIANCE

All reports, both verbal and written, are for the benefit of Premia Capital. This report has no other purpose and may not be relied upon by any other person or entity without the written consent of AEI. Either verbally or in writing, third parties may come into possession of this report or all or part of the information generated as a result of this work. In the absence of a written agreement with AEI granting such rights, no third parties shall have rights of recourse or recovery whatsoever under any course of action against AEI, its officers, employees, vendors, successors, or assigns. Reliance is provided in accordance with AEI's proposal and Standard Terms and Conditions executed by Premia Capital on July 8, 2017. The limitation of liability defined in the Terms and Conditions is the aggregate limit of AEI's liability to the client and all relying parties.

DRAFT

2.0 SITE AND VICINITY DESCRIPTION

2.1 SITE LOCATION AND DESCRIPTION

PROPERTY INFORMATION	
Property Name	Vacant Commercial
Street Address(es)	1180 and 1190 Main Street
City	Redwood City
State	California
Location	In the middle of the intersections of Elm Street, Maple Street, Main Street, Pennsylvania Avenue and Lathrop Street
Vicinity Characteristics	Mixed commercial, residential and industrial
Approximate Site Acreage/Source	1.33/Assessor's Office
Property Type	Commercial/vacant
Subject Property Use(s)	Vacant commercial building and vacant land
Assessor Parcel Number(s)	053-147-060 and 053-147-070
SITE AND BUILDING INFORMATION	
Number of Buildings	One
Year(s) of Construction	Current building constructed in 1952
Number of Floors/Stories	One
Basement or Subgrade Area(s)	None identified
Number of Units	One
Building Area (SF)/Source	1,920/Mr. Louis Deziel, Property Owner
Building Description(s)	A single-story vacant commercial building
Building Occupant(s)	None identified
Additional Improvements	Vacant land, a building foundation, and a creek
Current On-site Operations	None identified
Current Use of Hazardous Substances	None identified
UTILITY PROVIDER INFORMATION	
Natural Gas Provider	PG&E
Electricity Provider	PG&E
Heating System Fuel Source	Natural gas
Cooling System Power Source	Electricity
Potable Water Provider or Source	City of Redwood City
Sewage Disposal Provider or Treatment System	City of Redwood City
REGULATORY INFORMATION	
Regulatory Database Listings	HAZNET (4), RGA LUST (2), SAN MATEO CO. BI (2), RCRA-SQG, LUST, HIST CORTESE, SWEEPS UST, FINDS, ECHO, EDR HIST AUTO; Refer to Section 5.1.
Institutional Controls	None identified
Engineering Controls	None identified
Environmental Liens	None identified

Utility provider information listed in the table above is provided by Mr. Louis Deziel, Property Owner, unless otherwise noted above.

DRAFT

2.2 SITE AND VICINITY CHARACTERISTICS

The immediately surrounding properties consist of the following:

Direction from Site	Tenant/Use (Address)	Regulatory Database Listing(s)
Northeast	Pennsylvania Avenue followed by: Cooks Collision (1104 Main Street) Unmarked commercial building (1112 Main Street)	EDR HIST AUTO, SAN MATEO CO. BI, RCRA-SQG (2), ENVIROSTOR, LUST, FINDS, ECHO (1104 Main Street)
East	Pennsylvania Avenue followed by: Wings Learning Center (1201 Main Street) San Jose Obrero (400 Heller Street)	RCRA-SQG, FINDS, ECHO, SAN MATEO CO. BI (1201 Main Street)
Southeast	Elm Street followed by: Main Street Park (no listed address) ATA Reprographics (1202 Main Street) Main & Elm Restaurant (112-150 Elm Street) Unmarked commercial building (101 Lathrop Street)	SAN MATEO CO. BI, EDR HIST AUTO (112-150 Elm Street)
Southwest	A creek canal (no listed address) Lathrop Street followed by: Vacant land/a creek canal (no listed address) Apartments (1-49 Maple Street)	None identified
Northwest	Maple Street followed by: Apartments (99-149 Maple Street) Apartments (1090 Main Street)	SAN MATEO CO BI., LUST, EDR HIST AUTO (99-149 Maple Street)

If the surrounding properties are listed in the regulatory database, please refer to Section 5.1 for discussion.

2.3 PHYSICAL SETTING

Geology: Based on a review of the USDA Soil Survey for the area of the subject property, the soils in the vicinity of the subject property are classified as Urban Land. The Urban Land designation indicates that more than 85 percent of the original soils have been disturbed or covered by paved surfaces, buildings or other structures. Due to the variability of the soil material, on-site investigation would be required to determine the specific soil composition at the subject property.

USGS Topographic Map:	Palo Alto, California Quadrangle

DRAFT

Nearest surface water to subject property:	Redwood Creek/0.5 mile north
Gradient Direction/Source:	North/GeoTracker
Estimated Depth to Groundwater/Source:	7 to 10 feet bgs/GeoTracker

Note: Groundwater flow direction can be influenced locally and regionally by the presence of local wetland features, surface topography, recharge and discharge areas, horizontal and vertical inconsistencies in the types and location of subsurface soils, and proximity to water pumping wells. Depth and gradient of the water table can change seasonally in response to variation in precipitation and recharge, and over time, in response to urban development such as storm water controls, impervious surfaces, pumping wells, cleanup activities, dewatering, seawater intrusion barrier projects near the coast, and other factors.

DRAFT

3.0 HISTORICAL REVIEW OF SITE AND VICINITY

3.1 HISTORICAL SUMMARY

Reasonably ascertainable standard historical sources as outlined in ASTM Standard E1527-13 were used to determine previous uses and occupancies of the subject property that are likely to have led to RECs in connection with the subject property. A chronological summary of historical data found, including but not limited to aerial photographs, historical city directories, Sanborn fire insurance maps, and agency records, is as follows:

Date Range	Subject Property Description/Use	Source(s)
1884	Developed with a commercial building occupied by Redwood City flour mill, two auxiliary buildings, and a slough	Sanborn maps
1888-1897	Developed with a commercial building occupied by WJ Bunn's feed mill containing a grain warehouse and an engine shop, as well as part of a creek	Sanborn maps
1907	Developed with a commercial building occupied by Cullen Company's grain warehouse, three dwellings, a hen house, auxiliary structures, and part of a creek	Sanborn maps
1919-1950	Developed with a commercial building occupied as a feed and fuel warehouse, as well as part of a creek , three dwellings, and auxiliary structures	Sanborn maps, city directories, aerial photographs, previous reports
1952	Further developed with the current commercial building	Agency records
1955	Further developed with the auto repair building	Previous reports
1955-1962	Developed with a commercial building occupied as a feed and fuel warehouse, the auto repair building, the current commercial building, as well as part of a creek	Sanborn maps, city directories, aerial photographs, previous reports, agency records
1968-1974	Developed with the auto repair building, the current commercial building, as well as part of a creek	Sanborn maps, city directories, aerial photographs, previous reports, agency records
1974-2011	Developed with a commercial building occupied by Marcelli Lighting, the former auto repair building, the current commercial building, as well as part of a creek	City directories, aerial photographs, previous reports, agency records
2011-Present	Developed with the current commercial building, which remained vacant, and a portion of the creek. The other two buildings are no longer present	City directories, aerial photographs, previous reports, agency records

Based on a review of historical sources, the subject property was identified to consist of the following: a commercial building occupied by Redwood City flour mill, two auxiliary buildings, and a slough in 1884; a commercial building occupied by WJ Bunn's feed mill containing a grain warehouse and an engine shop, as well as part of a creek in 1888 to 1897; a commercial building occupied by Cullen Company's grain warehouse, three dwellings, a hen house, auxiliary structures, and part of a creek in 1907; a commercial building occupied as a feed and fuel warehouse, as well as part of a creek, three dwellings, and auxiliary structures from 1919

DRAFT

to 1950. In 1952, the current commercial building was constructed and was occupied by the following tenants: a bail bonds company (1955), a dairy supply company (1960 to 1965), and No Draft Co, a window and door supply company (1976-2001). Since 2011, the building has remained unoccupied. In 1955, an auto repair building was constructed and remained on-site until 2011. The feed and fuel facility remained on-site until 1962, and in 1974, an additional commercial building was constructed and was occupied by Marcelli Lighting until it was demolished in 2011. A foundation for a new medical building was constructed in 2011, but the project was never finished and thus the subject property has remained vacant since that time.

The following historical addresses were associated with the subject property: 5-17, 602-620 Pennsylvania/Railroad Avenue; 12-22, 101-139, 608-610 Elm Street; 19 Mound Street; 120, 632, 1150 Main Street; 134-162 Maple Street; 144 Lathrop Street. These addresses were also researched as part of this assessment.

Environmental concerns associated with the former auto repair shops are further discussed in Section 4.1.

3.2 Aerial Photographs

AEI reviewed aerial photographs of the subject property and surrounding area. A search was made of the EDR collection of aerial photographs. Aerial photographs were reviewed for the following years:

Year(s)	Subject Property Description	Adjacent Site Descriptions
1943	Due to the poor quality of the image, detailed observation of site features was not possible; however, the subject property appears developed with buildings and with a creek	NORTHEAST: Railroad tracks and Pennsylvania Avenue followed by commercial buildings EAST: Railroad tracks and Main Street followed by commercial buildings SOUTHEAST: Elm Street followed by a parking lot, commercial buildings, and vacant land SOUTHWEST: A creek followed by residential and commercial buildings and vacant land NORTHWEST: Maple Street followed by vacant land and residential and commercial buildings
1948	Developed with multiple commercial buildings, vacant land, and a creek	NORTHEAST: Railroad tracks and Pennsylvania Avenue followed by one of the current commercial buildings and additional buildings EAST: Railroad tracks and Main Street followed by residential buildings SOUTHEAST: Elm Street followed by a parking lot, commercial buildings, and vacant land SOUTHWEST: Lathrop Street followed by a creek, commercial buildings and vacant land NORTHWEST: Maple Street followed by vacant land, residential and commercial buildings, and storage yards

DRAFT

Year(s)	Subject Property Description	Adjacent Site Descriptions
1958	Developed with a large warehouse building next to a field and the current commercial building and a creek	NORTHEAST: No significant changes EAST: Railroad tracks and Main Street followed by a parking lot and small commercial building in the center SOUTHEAST: Elm Street followed by commercial buildings and vacant land SOUTHWEST: No significant changes NORTHWEST: Maple Street followed by commercial buildings and storage yards
1968	Developed with additional commercial buildings	NORTHEAST: No significant changes EAST: No significant changes SOUTHEAST: No significant changes SOUTHWEST: No significant changes NORTHWEST: No significant changes
1974, 1981	Due to the poor quality of the image, detailed observation of site features was not possible; however, there appears to be no significant changes	Due to the poor quality of the image, detailed observation of site features was not possible; however, there appears to be no significant changes
1991	Developed with two commercial buildings and the current commercial building with parking lots and a creek	NORTHEAST: Pennsylvania Avenue and railroad tracks followed by the current commercial buildings and parking lot EAST: Railroad tracks and Main Street followed by the current commercial buildings SOUTHEAST: Elm Street followed by the current commercial buildings and park SOUTHWEST: Lathrop Street followed by vacant land and a creek and commercial buildings NORTHWEST: Maple Street followed by the current residential building, commercial buildings and vacant land
1998	Due to the poor quality of the image, detailed observation of site features was not possible; however, there appears to be no significant changes	Due to the poor quality of the image, detailed observation of site features was not possible; however, there appears to be no significant changes
2005 2009 2010	No significant changes	NORTHEAST: No significant changes EAST: No significant changes SOUTHEAST: No significant changes SOUTHWEST: Lathrop Street followed by vacant land and a creek and the current residential building NORTHWEST: Maple Street followed by the current residential buildings
2012	Developed with the current commercial building, a building foundation, a creek and vacant land	NORTHEAST: No significant changes EAST: No significant changes SOUTHEAST: No significant changes SOUTHWEST: No significant changes NORTHWEST: No significant changes

AEI did not identify potential environmental concerns in association with the historical use of the subject property during the aerial photograph review.

DRAFT

If available, copies of historical aerial photographs are provided in the report appendices.

3.3 Sanborn Fire Insurance Maps

Sanborn Fire Insurance maps were developed in the late 1800s and early 1900s for use as an assessment tool for fire insurance rates in urbanized areas. A search was made of the EDR collection of Sanborn Fire Insurance maps.

The following maps were reviewed:

Year(s)	Subject Property Description (Listed Address)	Adjacent Site Descriptions
1884	Developed with a commercial building occupied by Redwood City flour mill, two auxiliary buildings, and a slough	NORTHEAST: The South Pacific Railroad followed by a wagon shop, a dwelling, and two auxiliary buildings EAST: Mound Street followed by three sheds and five dwellings and a wagon shop SOUTHEAST: Area not depicted SOUTHWEST: Area not depicted NORTHWEST: Area not depicted
1888	Developed with a commercial building occupied by WJ Bunn's feed mill containing a grain warehouse and an engine shop, as well as part of a creek	NORTHEAST: Pennsylvania/Railroad Avenue and railroad tracks followed by four dwellings and auxiliary structures EAST: Railroad tracks and Mound Street followed by a blacksmith and wagon shop, a carriage warehouse, sheds and five dwellings, and a baptist church SOUTHEAST: Are not depicted SOUTHWEST: A portion of a creek (remaining area not depicted) NORTHWEST: Main Street and a creek followed by two dwellings and a shed
1891	Developed with a commercial building occupied by WJ Bunn's feed mill containing a grain warehouse, engine shop and office, as well as a dwelling, an auxiliary structure with an elevated tank, and a creek (15-17 Pennsylvania/Railroad Avenue, 19-22 Elm Street)	NORTHEAST: Pennsylvania/Railroad Avenue and railroad tracks followed by four dwellings, a grocery and storage room,and auxiliary structures EAST: No significant changes SOUTHEAST: Elm Street followed by vacant land, a dwelling, a well, woodworking warehouse, and an elevated water tank SOUTHWEST: Area not depicted NORTHWEST: No significant changes

DRAFT

Year(s)	Subject Property Description (Listed Address)	Adjacent Site Descriptions
1897	No significant changes (1-18 Pennsylvania/ Railroad Avenue, 19-22 Elm Street)	NORTHEAST: No significant changes EAST: Pennsylvania/Railroad Avenue and railroad tracks followed by a blacksmith and wagon painting shop with a furnace, two sheds, three dwellings, a grocery store, auxiliary structures, Elm Street and a baptist church SOUTHEAST: No significant changes SOUTHWEST: Lathrop Street followed by a creek, commercial buildings occupied by "H. Beeger's D.", and Main Street NORTHWEST: Main Street followed by two dwellings, auxiliary structures and a Chinese wash house
1907	Developed with a commercial building occupied by Cullen Company's grain warehouse containing two sheds and an old boiler, as well as three dwellings, a hen house, auxiliary structures, and part of the Branch Redwood Creek (5-8 Pennsylvania/ Railroad Avenue, 608, 610 Elm Street, 19 Mound Street)	NORTHEAST: Pennsylvania/Railroad Avenue and railroad tracks followed by four dwellings, a phonograph shop, and auxiliary structures EAST: Pennsylvania/Railroad Avenue and railroad tracks followed by a blacksmith shop, multiple dwellings, two sheds, Elm Street and a baptist church SOUTHEAST: Elm Street followed by a shed, a vacant dwelling, and a park SOUTHWEST: Part of the Redwood Creek, a tennis court, a dwelling, and vacant land NORTHWEST: Main Street and a wooden bridge followed by two dwellings, auxiliary structures, and a Chinese laundry with drying planks
1919	A commercial building occupied as a Feed and Fuel warehouse, as well as part of Redwood creek, three dwellings, auxiliary structures, and a parking garage (602-620 Pennsylvania/Railroad Avenue, 120/632 Main Street, 101-139 Elm Street, 162 Maple Street)	NORTHEAST: Pennsylvania/Railroad Avenue and railroad tracks followed by four dwellings and an auto shop EAST: Pennsylvania/Railroad Avenue and railroad tracks followed by a blacksmith shop, an auto repair shop, a baptist church, Elm Street, six dwellings, and auxiliary structures SOUTHEAST: Elm Street followed by a dwelling and parking garage and a park with a hose building SOUTHWEST: Part of Redwood creek followed by a dwelling and vacant land NORTHWEST: Redwood creek followed by a dwelling and a Chinese laundry

DRAFT

Year(s)	Subject Property Description (Listed Address)	Adjacent Site Descriptions
1950	Commercial buildings occupied as Ridgeway Feed and Fuel warehouse containing wood and coal shop, feed and grain warehouse, and hay. All other areas are vacant land in addition to a creek (620 Pennsylvania/ Railroad Avenue, 1150 Main Street, 139 Elm Street, 144 Lathrop Street)	NORTHEAST: Pennsylvania/Railroad Avenue and railroad tracks followed by a storage warehouse, a gas station, and a dwelling EAST: Pennsylvania/Railroad Avenue and railroad tracks followed by four dwellings and a methodist church SOUTHEAST: Elm Street followed by two dwellings and a park with an unmarked building SOUTHWEST: A portion of the creek, a concrete bridge, rooming house, and various auto repair shops and other industrial buildings NORTHWEST: Maple Street and a wooden bridge followed by three dwellings and a Chinese laundry
1962	Commercial buildings occupied as the Palmer Supply company warehouse containing a feed and grain warehouse, a wood shop and store, as well as an auto repair shop with concrete floors, spray painting, and a parking lot. The currrent commercial building is present and is depicted as a store. The creek is still present as well. (620 Railroad Avenue, 1180-1190 Main Street, 139 Elm Street, 144 Lathrop Street)	NORTHEAST: Pennsylvania/Railroad Avenue and railroad tracks followed by an auto service shop, a produce warehouse, a gas station and a store EAST: Pennsylvania/Railroad Avenue and railroad tracks followed by used auto sales lot, an office, auto washing building, Elm Street, a dwelling and a methodist church SOUTHEAST: Elm Street followed by a storage building, and three stores SOUTHWEST: A creek, a concrete bridge and Lathrop Street followed by vacant land and and various auto repair shops and other industrial buildings NORTHWEST: Maple Street followed by a sand and gravel storage, one dwelling, an office, a carburetor repair shop, auto repair with concrete floors, and an auto sales lot
1968	A commercial building occupied as an auto repair shop with concrete floors, spray painting, and a parking lot, as well as the current commercial building occupied as a store (1180-1190 Main Street, 139 Elm Street, 160 Maple Street)	NORTHEAST: No significant changes EAST: Pennsylvania/Railroad Avenue and railroad tracks followed by a gas station, a used auto sales lot with associated office and car washing area, Elm Street and a methodist church SOUTHEAST: No significant changes SOUTHWEST: No significant changes NORTHWEST: No significant changes

According to Sanborn maps, a Chinese Laundry facility occupied a northwestern adjacent property (1090 Main Street) from at least 1897 through 1950. This site was not listed in the EDR report as a release case. No other information was found regarding this business other than the Sanborn map listings and, as a result, it is not known whether dry cleaning was performed on site. Typically, Chinese laundry operations were hand-wash laundry facilities which did not operate dry cleaning machines. However, the potential still exists that chlorinated solvents, such

as PCE could have been applied for spot removal. This type of application can reduce the potential for significant impacts when compared to typical PCE-dry cleaning operations. Based on the lack of a documented release and the direction of groundwater flow, this site is not expected to represent a significant environmental concern.

According to Sanborn maps, a gas station was located on one of the northeastern adjacent properties (1104 Main Street) from at least 1950 to 1968. This site is listed as a closed LUST case and is further discussed in Section 5.1.

According to Sanborn maps, a gas station was located on one of the eastern adjacent properties (1201 Main Street) in at least 1968. This site was not listed on the regulatory database as a current or former UST site; however, based on the former use, it is apparent that USTs were located on site. The location of the former USTs at this site are unknown. Assessment of the subject property does not indicate that the subject property would be investigated as a source of this contamination, and therefore, it is unlikely that the subject property owner would be responsible for any cleanup costs associated with a release at this site. Based on the proximity of this site to the subject property, the inferred direction of groundwater flow, and the lack of a documented release, this site is not expected to represent a significant environmental concern.

If available, copies of historical Sanborn maps are provided in the report appendices.

DRAFT

3.4 CITY DIRECTORIES

A search of historical city directories was conducted for the subject property utilizing Redwood City Library. The following table summarizes the results of the city directory search.

139 Elm Street

Year(s)	Address - Occupant Listed
1922	105 Elm Street - Residential tenant
1929-1930	105 Elm Street - Residential tenant 111 Elm Street - Vacant

1960-1961	160 Maple Street - Palmer Supply feed and fuel
1965	160 Maple Street - Vacant
1976	Addresses not listed
1980, 1985, 1990, 1995, 2001	134 Maple Street - Marcelli Electric
2006, 2010, 2016	Addresses not listed

620 Railroad Avenue

Year(s)	Address - Occupant Listed
1922, 1929-1930, 1933, 1939, 1941-1942, 1946, 1950, 1955, 1960-1961, 1965, 1976, 1980, 1985, 1990, 1995, 2001, 2006, 2010, 2016	Addresses not listed

If listed above, XXXX indicates that the address is valid but there is no occupancy information available.

Environmental concerns associated with the former auto repair shops are further discussed in Section 4.1.

3.5 Historical Topographic Maps

In accordance with our approved scope of services, historical topographic maps were not reviewed as a part of this assessment.

3.6 Chain of Title

In accordance with our approved scope of services, a chain of title search was not performed as part of this assessment.

DRAFT

4.0 REGULATORY AGENCY RECORDS REVIEW

Local and state agencies, such as environmental health departments, fire prevention bureaus, and building and planning departments are contacted to identify any current or previous reports of hazardous substance use, storage, and/or unauthorized releases that may have impacted the subject property. In addition, information pertaining to AULs, defined as legal or physical restrictions, or limitations on the use of, or access to, a site or facility, is requested.

4.1 LOCAL ENVIRONMENTAL HEALTH DEPARTMENT AND/OR STATE ENVIRONMENTAL AGENCY

On July 12, 2017, AEI contacted the San Mateo Environmental Health Department (SMCEHD) via email for information on the subject property. Files at this agency may contain information regarding hazardous substance storage and use, underground storage tanks, unauthorized releases of petroleum hydrocarbons or other contaminants that may affect the soil or groundwater in the area, wells and/or septic systems.

According to Ms. Jean De Tar, the following information was on file for the subject property:

134 Maple Street

Date	Occupant	Document Type	Document Notes/Violations
1996	Five Star Development	Internal document	No relevant information listed
1996, 1997	Five Star Development	Hazardous Waste Generator Inspection Report	Facility produced waste oil, waste thinner and waste solvent, no major violations noted
1997	Five Star Development	Standard Stormwater Facility Inspection Report Form	No violations noted
2004	Five Star Development	Official Inspection Report	Facility closed
1994	Marcelli Lighting	Application for Permit to Close USTs	Remove on 500 gallon gasoline UST and one 1,000 gallon diesel UST, both installed in 1979
1994	Nick Marcelli	Environmental Health Permit	Permit to removed two USTs

DRAFT

Date	Occupant	Document Type	Document Notes/Violations
1994		Laboratory Results	A 1,000 gallon diesel UST and a 580 gallon gasoline UST were removed from the property on September 9, 1994. Both USTs appeared to be in good condition. A shallow trench was also excavated along the route of the pipeline which lead to the dispenser location. 30 cubic yards of excavated soil were stockpiled. One soil sample was collected from beneath the fill end of the gasoline UST and two soil samples were collected from beneath the diesel UST. These samples were collected at depths of 8 feet. A soil sample was also collected from the location of the fuel dispenser at a depth of three feet. Two soil samples were also collected from the stockpiled soil. All of the samples were non-detect, with the exception of the sample collected from the dispenser area, which detected 30 mg/kg TPHd. The stockpiled samples were all non-detect with the exception of 0.0088 mg/kg toluene, 0.0058 mg/kg ethylbenzene and 0.027 mg/kg xylene. Because low concentrations of petroleum hydrocarbons were detected in the stockpiled soil, that soil could not be used as backfill. The stockpiled soil was spread out and allowed to aerate for the months. Resampling of the stockpiled soil occurred, which did not detect any BTEX and thus was re-used as backfill. The SMCEHD stated that no additional excavation was required because the concentrations were relatively low and the piping and USTs looked in good shape.
1994	Marcelli Lighting	Permanent Tank Closure Inspection Sheet	Two USTs marked as closed
1994	Nick Marcelli	Closure Letter for USTs	This letter confirms the closure of two USTs. No further action is required.

DRAFT

Date	Occupant	Document Type	Document Notes/Violations
1994	Chub's Auto Repair	Hydraulic Lift Sampling Results	A hydraulic lift was removed from the subject property. The lift was reportedly installed in 1984, and was formerly removed because it was noted to be leaking. A soil sample was collected from the excavation pit, and a second sample was collected from the stockpile generated by the excavation. Multiple sampling events and additional overexcavation of the pit were conducted. Groundwater was eventually encountered in the pit. Soil sampling showed a concentration of 12,000 ppm oil and grease in soil and 1.7 ppm oil and grease in groundwater.
1994	Larry Chubick	Environmental Health Permit/Redwood City Fire Department Permit	Permit to remove one UST and one UST discovered during excavation
1994	Chubick	Work Plan	Work plan to remove a waste oil UST. During excavation and removal of the known waste oil UST, an additional gasoline UST was discovered. Both tanks were removed on January 14, 1994. The waste oil tank was noted to have several holes. Soil sampling indicated that samples from the gasoline tank excavation were non-detect for the three samples collected. The waste oil tank samples showed elevated levels at the fill end of 810 mg/kg diesel as does the excavated materials. All other analysis of metals were non-detect. HVOCs were also sampled for, and all were non-detect with the exception of a soil sample from the waste oil tank pit, which showed 17 ug/kg dichloromethane. It was proposed that the fill end of the waste oil tank pit would be overexcavated. After excavation, a confirmation sample would be collected and analyzed for TPHd.

DRAFT

Date	Occupant	Document Type	Document Notes/Violations
1994	Chub's Auto Repair	Monitor Well Construction, Development and Sampling	The subject property formerly had a 1,000 gallon waste oil UST and a 1,000 gallon gasoline UST that were removed from the property on January 14, 1994. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons. One of the two soil samples collected for the waste oil UST was found to contain 810 ppm TPHd in addition to 17 ppb dichloromethane by EPA Methods 5030/8010. Re-analysis by EPA Method 8240 showed no detectable hydrocarbons. On February 9, 1994, the waste oil UST pit was overexcavated. A soil sample collected at the end of the overexcavation was found to contain no detectable hydrocarbons. Water was present in the pit and was sampled, with analysis showing only 530 ppb of TPHd, described by the laboratory as not typical of diesel. No TPHg, BTEX, oil and grease, or chlorinated hydrocarbons were detected in the water sample. The pit was pumped dry and no water recharged. The SMCEHD requested construction and sampling of a monitoring well.
1994	Chub's Auto Repair	Tank Removal Report	Documents tank removal, which is further discussed above
1994	Chub's Auto Repair	Monitor Well Construction Report	On May 5, 1994, a ground water and soil sample were collected from the newly constructed monitoring well MW-1. The soil sample did not contain any detectable TPH or BTEX. The groundwater sampling did not contain any TPHg, TPHd, BTEX or volatile organics.
1994	Chub's Auto Repair	Monitor Well Sampling Report	A second round of groundwater sampling was conducted on August 4, 1994. The sample from MW-1 did not contain any TPHd or BTEX.

DRAFT

Date	Occupant	Document Type	Document Notes/Violations
1994	Chub's Auto Repair	Monitor Well Sampling Report	A third round of groundwater sampling was conducted on November 3, 1994. The sample from MW-1 did not contain any TPHd or BTEX.
1995	Chub's Auto Repair	Monitor Well Sampling Report	A fourth round of groundwater sampling was conducted on February 2, 1995. The sample from MW-1 did not contain any TPHd or BTEX. Based on these results, the consultant recommended case closure for the USTs.
1995	Chub's Auto Repair	Monitor Well Sampling Report for MW-2	On March 13, 1995, MW-2 was sampled and showed a concentration of 1.5 mg/L of oil and grease. Additionally, a total of 779 gallons were pumped from MW-2 with discharge to the sanitary sewer. Based on these results, the consultant recommended case closure for the lift.
1995	Chub's Auto Repair	Horizontal Hydraulic Gradient	Three hydraulic lifts were removed from the site on April 8, 1995. Soil samples were collected from beneath the lifts as part of their closure. Based on the sampling efforts, there is no perceptible gradient at the site.
1995	Chub's Auto Repair	Monitor Well Sampling Report for MW-1	On June 1, 1995, MW-1 was sampled and was non-detect for oil and grease. Based on these results, the consultant recommended case closure for the lift.
1995	Chub's Auto Repair	Case Closure Memorandum	This memo documents removal and sampling activities for the UST and the hydraulic lift. The case closure statements apply to the UST but the SMCEHD cited the consultant's statement that the hydraulic lift release case should be closed.
1995	Chub's Auto Repair	Monitor Well Sampling Report for MW-2	On May 5, 1995, MW-2 was sampled and showed a concentration of 1.6 mg/L of oil and grease. Based on these results, the consultant recommended case closure for the lift.

DRAFT

Date	Occupant	Document Type	Document Notes/Violations
1995	Chub's Auto Repair	UST Case Closure Letter	This letter, dated June 21, 1995, confirms the completion of site investigation and remedial action of the 1,000 gallon waste oil UST and 1,000 gallon gasoline UST. No further action related to the USTs is required.

A 1,000 gallon diesel UST and a 580 gallon gasoline UST were removed from the property on September 9, 1994. Both USTs appeared to be in good condition. A shallow trench was also excavated along the route of the pipeline which lead to the dispenser location. 30 cubic yards of excavated soil were stockpiled. One soil sample was collected from beneath the fill end of the gasoline UST and two soil samples were collected from beneath the diesel UST. These samples were collected at depths of 8 feet. A soil sample was also collected from the location of the fuel dispenser at a depth of three feet. Two soil samples were also collected from the stockpiled soil. All of the samples were non-detect, with the exception of the sample collected from the dispenser area, which detected 30 mg/kg TPHd. The stockpiled samples were all non-detect with the exception of 0.0088 mg/kg toluene, 0.0058 mg/kg ethylbenzene and 0.027 mg/kg xylene. Because low concentrations of petroleum hydrocarbons were detected in the stockpiled soil, that soil could not be used as backfill. The stockpiled soil was spread out and allowed to aerate for two months. Resampling of the stockpiled soil occurred, which did not detect any BTEX and thus was re-used as backfill. The SMCEHD stated that no additional excavation was required because the concentrations were relatively low and the piping and USTs looked in good shape, and issued an official closure letter in 1994. Based on this information, these former USTs represent a HREC.

The subject property formerly had a 1,000 gallon waste oil UST and a 1,000 gallon gasoline UST that were removed from the property on January 14, 1994. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons. One of the two soil samples collected for the waste oil UST was found to contain 810 ppm TPHd in addition to 17 ppb dichloromethane by EPA Methods 5030/8010. Re-analysis by EPA Method 8240 showed no detectable hydrocarbons. On February 9, 1994, the waste oil UST pit was overexcavated. A soil sample collected at the end of the overexcavation was found to contain no detectable hydrocarbons. Water was present in the pit and was sampled, with analysis showing only 530 ppb of TPHd, described by the laboratory as not typical of diesel. No TPHg, BTEX, oil and grease, or chlorinated hydrocarbons were detected in the water sample. The pit was pumped dry and no water recharged. The SMCEHD requested construction and sampling of a monitoring well. Groundwater sampling was conducted until 1995. The final "after cleanup" groundwater concentrations were listed as non-detect for TPHg, TPHd, BTEX, and 1,600 ppb of oil and grease in the case closure letter. On June 21, 1995 the SMCEHD and the RWQCB granted the site case closure with no further action required.

Additionally, four hydraulic lifts were removed from the interior of the former Chub's Auto Repair shop in 1994 and 1995. One of the lifts was reportedly leaking and therefore was removed before the other three. A soil sample was collected from the excavation pit, and a second sample was collected from the stockpile generated by the excavation, both of which detected elevated levels of oil and grease. Multiple sampling events and additional overexcavation of the pit were conducted. Groundwater was eventually encountered in the pit, and groundwater

monitoring well MW-2 was installed. Multiple sampling events from MW-2 showed maximum levels of 12,000 ppm oil and grease in soil and 1,700 ppb oil and grease in groundwater. Approximately 800 gallons of groundwater were purges from MW-2. Sampling from MM-1 indicated that there was no perceptible gradient between MW-1 and MM-2 and thus no lateral migration of contaminants. The former lift release case was addressed in the 1995 case closure letter for the two USTs, although closure was specific to the USTs. However, the SCMEHD did cite the consultant's statement that the hydraulic lift release case should be closed. Based on this information, the former USTs and hydraulic lift release cases represent a HREC.

Although hazardous substances and petroleum products were likely associated with the former auto repair operations conducted on the subject property from at least 1972 to 2006, no evidence of improper storage or handling of these materials was reported to the local regulatory agencies. The former auto repair building was demolished between 2010 and 2011. The subject property is not listed for any spills or releases in connection with the use or handling of these materials. Based on this information and the previous subsurface investigations conducted at the subject property, the former auto repair shops are not expected to represent a significant environmental concern.

4.2 Fire Department

On July 12, 2017, AEI contacted the Redwood City Fire Department (RCFD) via fax for information on the subject property to identify any evidence of previous or current hazardous substance usage, and/or for any historical information available for the subject property.

AEI spoke with Ms. Theresa Maluia, who indicated that there were no records on file for the subject property with the Redwood City Fire Department (RCFD).

4.3 Building Department

On July 26, 2017, AEI contacted the Redwood City Building Department (RCBD) via office visit for information on the subject property in order to identify historical tenants, features of concern and property use.

Please refer to the following table for a listing of permits reviewed:

1180-1190 Main Street

Year(s)	Owner/Applicant	Description of Permit and Building Use
1952	Russ Denney	Garage building addition
1955	R Denney	Addition to an office building
1959	HH Wadler	Addition to an existing commercial building and alteration, new milk sign
1973	John Burke	Application for a license to operate an auto repair cannot be given until the illegal spray booth under construction is resolved
1973	Cambridge Auto Repair Sales & Service Inc	BAAQMD permit for an auto spray booth
1986	Chubs Auto Repair	Install new tar and gravel roof
2001	Chubbs Auto	Remove existing lentil
2001	Steven Brugman	Building repair
2007	W.L. Butler	Tree removal

DRAFT

Year(s)	Owner/Applicant	Description of Permit and Building Use
2011	Archbold Electric	Electrical service change
2011	Lathrop Parc Redwood City	Facade change to building

134-160 Maple Street

Year(s)	Owner/Applicant	Description of Permit and Building Use
1974	Rj Pierce	Proposed plan for Waterproof Chemicals Inc to occupy a building at 160 Maple Street. Waterproof's operations involve bringing in solvents and detergents by tank truck for underground storage. These materials are blneded only and filled into containers under 60 gallons and all combustible or flammable products are Paint Stores. There is no bulk sale of handling or any products. All solvent storage would be confined to the USTs or in a specific storage room. - **No other RWBD permits verify this tenant ever occupied the subject property**
1978	Marcelli	New office building/warehouse
1986	Jerry Heth	New brick wall
1966	JM Ridgeway	Demolish a commercial/warehouse building
2010	Lathrop Parc Redwood City	New building, bridge and resurface parking
2011	Lathrop Parc Redwood City	New skilled nursing facility, expired
2012	Lathrop Parc Redwood City	Lathrop PARC offsite improvements, utilities, etc., not finaled

Environmental concerns associated with the former auto repair shop are further discussed in Section 4.1

4.4 Planning Department

On July 26, 2017, AEI contacted the Redwood City Planning Department (RCPD) via office visit for information on the subject property in order to identify AULs associated with the subject property.

Evidence indicating the existence of AULs was not on file for the subject property with the Redwood City Planning Department (RCPD).

4.5 County Assessor Office

On July 26, 2017, AEI contacted the San Mateo County assessor's office via telephone for information on the subject property in order to determine the earliest recorded date of development and use.

According to the San Mateo County assessor's office, the current building at 1190 Main Street was constructed in 1952.

DRAFT

4.6 Oil and Gas Wells/Pipelines

On July 27, 2017, AEI reviewed the Department of Oil and Gas & Geothermal Resources (DOGGR) maps and the National Pipeline Mapping System (NPMS) Public Map Viewer concerning the subject property and nearby properties. The maps contain information regarding oil and gas development.

According to the Department of Oil and Gas & Geothermal Resources (DOGGR) map, oil or gas wells are not located within 500 feet of the subject property. AEI did not identify evidence of environmental concerns during the map review.

According to the NPMS Public Map Viewer, pipelines are not located within 500 feet of the subject property. AEI did not identify evidence of environmental concerns during the map review.

4.7 Other Agencies Searched

On July 12, 2017, AEI contacted the **Bay Area Air Quality Management District (BAAQMD)** via email for information on the property. The BAAQMD maintains records related to permitted air emissions.

According to Ms. Rochelle Reed, no information was on file for the subject property.

On July 27, 2017, AEI accessed the **California Department of Toxic Substances Control (DTSC) Hazardous Waste Tracking System (HWTS)** online database for information pertaining to hazardous waste disposal associated with the subject property. The HWTS generates reports on hazardous waste shipments for generators, transporters, and treatment, storage or disposal facilities (TSDFs).

The following information was on file for the subject property:

Date	Occupant	Document Notes/Violations
1989	Chubs Auto Rpr	Produced less than 1.6 tons per year of unspecified organic liquid mixture from 1993 to 2000
1993	Chub's Auto Repair	Produced 0.41 tons of unspecified oil-containing waste and 1 tons of other empty containers
1994	Nick Marcelli	Produced less than 4 tons per year of unspecified oil-containing waste and other empty containers in 1993 and 1994
1995	Chubs Auto Repair	Produced less than 1.4 tons per year of unspecified organic liquid mixture from 2002 to 2007
2011	Marcelli Lighting	No detailed information listed
2012	Lathrop Park	No detailed information listed
2012	Lathrop Park Redwood City LLC	Produced 0.005 tons of other organic solids/lead waste in 2012

No release of any of these materials was reported to the regulatory agencies. No evidence of a hazardous material release or of interior potential subsurface conduits was observed during the property inspection. Based on the relatively short duration of time that these wastes were reported to be generated in the HWTS database which were disposed of off-site under waste manifest control and regulatory oversight, as well as the lack of observed interior potential

DRAFT

subsurface conduits, the former use of these materials is not expected to constitute a significant environmental concern.

On July 27, 2017, AEI accessed the **California Department of Toxic Substances Control (DTSC) EnviroStor** database, which contains information of investigation, cleanup, permitting, and/or corrective actions that are planned, being conducted or have been completed under DTSC oversight.

No information was on file for the subject property.

On July 27, 2017, AEI accessed the **Regional Water Quality Control Board (RWQCB) GeoTracker** database, a data management system for managing sites that impact groundwater, especially those requiring groundwater cleanup [USTs, Department of Defense, Site Cleanup Program] as well as permitted facilities such as operating USTs and land disposal sites.

The subject property was listed as a closed release site in the GeoTracker database, which is further discussed in Section 4.1.

4.8 State Environmental Superliens and Property Transfer Laws

In accordance with our approved scope of services, AEI did not assess whether the subject property is subject to any state environmental superliens and/or property transfer laws.

DRAFT

5.0 REGULATORY DATABASE RECORDS REVIEW

AEI contracted Environmental Data Resources, Inc. (EDR) to conduct a search of publicly available information from federal, state, tribal, and local databases containing known and suspected sites of environmental contamination and sites of potential environmental significance. Data gathered during the current regulatory database search is compiled by EDR into one regulatory database report. Location information for listed sites is designated using geocoded information provided by federal, state, or local agencies and commonly used mapping databases with the exception of "Orphan" sites. Due to poor or inadequate address information, Orphan sites are identified but not geocoded/mapped by EDR, rather, information is provided based upon vicinity zip codes, city name, and state. The number of listed sites identified within the approximate minimum search distance from the federal and state environmental records database listings specified in ASTM Standard E1527-13 is summarized in Section 5.1, along with the total number of Orphan sites. A copy of the regulatory database report is included in Appendix C of this report.

The subject property was identified in the regulatory database report as follows: HAZNET (4), RGA LUST (2), SAN MATEO CO. BI (2), RCRA-SQG, LUST, HIST CORTESE, SWEEPS UST, FINDS, ECHO, EDR HIST AUTO. See Section 5.1 for additional discussion.

In determining if a listed site is a potential environmental concern to the subject property, AEI generally applies the following criteria to classify the site as lower potential environmental concern: 1) the site only holds an operating permit (which does not imply a release), 2) the site's distance from, and/or topographic position relative to, the subject property, and/or 3) the site has recently been granted "No Further Action" by the appropriate regulatory agency.

5.1 RECORDS SUMMARY

Database	Search Distance (Miles)	Subject Property Listed	Number of Listings within Search Distance	Recognized Environmental Condition or Other Environmental Consideration (Yes or No)
NPL	1	No	0	
DELISTED NPL	0.5	No	0	
SEMS (formerly CERCLIS)	0.5	No	1	No
SEMS-ARCHIVE (formerly CERCLIS NFRAP)	0.5	No	1	No
RCRA CORRACTS	1	No	1	No
RCRA-TSDF	0.5	No	2	No
RCRA LQG, SQG, CESQGs, VGN, NLR	SP/ADJ	**Yes**	3	Yes; the subject property and two other sites are further discussed below
US ENG CONTROLS	SP	No	0	
US INST CONTROLS	SP	No	0	
ERNS	SP	No	0	
STATE/TRIBAL HWS	1	No	44	No; one site is further discussed below

Database	Search Distance (Miles)	Subject Property Listed	Number of Listings within Search Distance	Recognized Environmental Condition or Other Environmental Consideration (Yes or No)
STATE/TRIBAL SWLF	0.5	No	0	
STATE/TRIBAL REGISTERED STORAGE TANKS	SP/ADJ	No	0	
STATE/TRIBAL LUST	0.5	**Yes**	72	Yes; the subject property and three other sites are further discussed below
STATE/TRIBAL EC and IC	SP	No	0	
STATE/TRIBAL VCP	0.5	No	4	No
STATE/TRIBAL BROWNFIELD	0.5	No	2	No
ORPHAN	N/A	No	5	No; none of the identified orphan sites are located in the immediate vicinity (500-feet) of the subject property, and/or based upon the distance and relative gradient, the sites are not expected to represent a significant environmental concern.
ADDITIONAL ENVIRONMENTAL RECORD SOURCES	SP/ADJ	**Yes**	25	Yes; the subject property and four other sites are further discussed below

Facility Name: CHUBS AUTO RPR, CHUB'S AUTO REPAIR, LATHROP PARK REDWOOD CITY LLC, FIVE STAR DEVELOPMENT
Database(s): HAZNET (4), RGA LUST (2), SAN MATEO CO. BI (2), RCRA-SQG, LUST, HIST CORTESE, SWEEPS UST, FINDS, ECHO, EDR HIST AUTO Address: 1180-1190 Main Street, 134 Maple Street Distance: Subject Property Direction: Subject Property
Comments: According to the EDR report, the subject property is listed as a closed LUST case under Chub's Auto Repair, which is further discussed in Section 4.1. Additionally, the subject property is listed as being occupied by various auto repair facilities from 1972 to 2006, which is further discussed in Section 4.1. Chub's Auto Repair and Lathrop Park Redwood City LLC are listed as producing hazardous wastes, which is further discussed in Section 4.7. Five Star Development is listed under 134 Maple Street as an inactive facility for generating <27 gallons per year of hazardous wastes and having a UST, which is further discussed in Section 4.1.

Facility Name: J&JS AUTO, LS TRUCKING, ROTARY PERFORMANCE MOTORS
Database(s): SAN MATEO CO. BI, EDR HIST AUTO Address: 112-150 Elm Street Distance: Adjacent (0.016 mile) Direction: Southeast (hydrologically cross-gradient)

DRAFT

Comments: According to the EDR report, this site is listed as an auto repair shop from 1991 to 1998 and as inactive facility for generating hazardous wastes. Based on the lack of a documented release, groundwater gradient and relative distance, the review of regulatory files was not deemed necessary and therefore this listing is not expected to represent a significant environmental concern at this time.

Facility Name: COOKS AUTO BODY & PAINT SHOP, COOKS COLLISION OF REDWOOD CITY, COOKS AUTO BODY

Database(s): EDR HIST AUTO, SAN MATEO CO. BI, RCRA-SQG (2), ENVIROSTOR, LUST, FINDS, ECHO
Address: 1104 Main Street
Distance: Adjacent (0.027 mile)
Direction: Northeast (hydrologically cross-gradient)

Comments: According to the EDR report, this site is listed as a closed LUST case. AEI reviewed information on file on the GeoTracker database.

Cook's Auto Body has leased the site since 1979 for a vehicle repair operation. The site had previously been occupied by another auto body facility since 1969. A concrete dispenser island 18 feet in length by 3 feet in width (east-west orientation) is located approximately 13 feet north of the central north side of the building structure. Based on recorded observations of the product and vent piping removed beneath the northern portion of the site, it is evident that at least three USTs were once present at the property prior to Cook's Auto Body's initial occupancy in 1979. In February 2002, EnviroVision, Inc. drilled exploratory borings SB-1, SB-2 and SB-3 to a depth of 15 feet to assess the potential impact to soil and groundwater from reported fuel dispensing activities at the site. Golden Gate Tank Removal Incorporated (GGTR) excavated the soil surrounding the GPR anomalies to determine if abandoned USTs were present and collected soil sample PL[2'] beneath Product Line 1 because residual product was observed in the line. No USTs were encountered and Sample PL[2 '] contained low concentrations of hydrocarbons. The excavations were backfilled with the excavated soil. GGTR removed the abandoned product and vent lines and collected soil confirmation samples beneath the product piping. Low to moderate hydrocarbon concentrations were reported in the soil and groundwater samples collected from the investigation (up to 110 mg/kg TPHg; 709 mg/kg TPHd; 1,490 mg/kg TPHmo; 0.172 mg/kg benzene and 800 ug/L TPHg; 395 ug/L benzene; and 42 ug/L MTBE). However, elevated metal concentrations were reported in near surface soil samples (up to 1, 140 mg/kg lead and 1,260 mg/kg zinc). In 2012, the San Mateo County Groundwater Protection Program (GPP) concluded that the on-site hydrocarbon conditions satisfied the low risk criteria defined by the San Francisco Bay Region's RWQCB's standards. No remedial activities were required or performed to address the hydrocarbon concentrations reported in soil and groundwater. GPP staff closed the case with regards to the hydrocarbons and referred the metals contamination to DTSC.

The site is listed as an open "inactive - action required as of 1/31/2013" in the EnviroStor database. No additional sampling information was on file on EnviroStor. According to site maps from the SMCEHD's closure letter, the contamination plume is approximately 200 feet northeast of the subject property. Based on the direction of groundwater flow and the relative distance, this site is not expected to represent a significant environmental concern at this time.

Facility Name: B P S BAKER GRAPHICS REDWOOD CITY

Database(s): RCRA-SQG, FINDS, ECHO, SAN MATEO CO. BI
Address: 1201 Main Street
Distance: Adjacent (0.03 mile)
Direction: East (hydrologically cross-gradient)

Comments: According to the EDR report, this site is listed as a small quantity generator of hazardous wastes in 1992 with no violations found. The facility was also listed as generating and recycling waste oil/solvent and storing hazardous materials. The site is also registered under the Facility Index System/ Facility Registry System and the Enforcement and Compliance History Online database, with no environmental concerns noted. Based on the lack of a documented release, groundwater gradient and relative distance, the review of regulatory files was not deemed necessary and therefore this listing is not expected to represent a significant environmental concern at this time.

Facility Name: TOWNE FORD, HUDSON PROPERTY, AUTO ELECTRIC & CARBURETOR CO
Database(s): SAN MATEO CO BI., LUST, EDR HIST AUTO Address: 135 Maple Street Distance: Adjacent (0.045 mile) Direction: Northwest (hydrologically cross-gradient)
Comments: According to the EDR report, this site is listed as a closed LUST case. AEI reviewed information on file with the SMCEHD and on the GeoTracker database. Historically, this site has been used as a carburetor and auto repair shop. In March 1997, soil and groundwater sampling took place in four areas of concern: the grease trap/sewer connection (sump in the floor of the back room formerly used for carburetor cleaning; the hydraulic hoist in the south shop area; the dyno-pit outside the north shop area; and the waste oil and other automotive fluids storage area outside and beside the south end of the building. Soil and groundwater investigations revealed contaminant plumes at the property. Additionally, 2,108 cubic yards of contaminated soil were removed from the property from 2000 to 2001. The "after cleanup" concentrations listed in the closure letter were noted as: 22 ppm TPHg, 790 ppm TPHd, 0.045 ppm benzene, 0.10 ppm toluene and ethylbenzene, 0.11 ppm xylenes, 0.023 ppm PCE, 0.051 ppm TCE, 0.012 ppm cis-12-DCE, and 0.12 ppm chlorobenzene in soil and 97 ppb TPHd, 3.5 ppb MTBE, 1.4 ppb toluene, 0.6 ppb ethylbenzene, 5.4 ppb PCE, 250 ppb TCE, 93 ppb cis-12-DCE, and 1.6 ppb chlorobenzene in groundwater. In 2002, the SMCEHD granted the case closure with no further action required. Based on the direction of groundwater flow, the regulatory status, and the time elapsed since closure was achieved, this listing is not expected to represent a significant environmental concern at this time.

Facility Name: TOWNE FORD SALES
Database(s): SAN MATEO CO. BI, HIST CORTESE, LUST, HIST UST, NOTIFY 65 Address: 1601 El Camino Real Distance: 0.107 mile Direction: South (hydrologically up-gradient)
Comments: According to the EDR report, this site is listed as a closed LUST case. AEI reviewed information on file with the SMCEHD and on the GeoTracker database. In 1986 a waste oil UST was removed from the property. A pipeline also ran from the UST to inside the building. The responsible party stated that the pipeline had apparently leaked and the only way to clean up contamination was to remove the pipeline in addition to a sump underneath it. Contamination was detected and therefore soil and groundwater sampling was conducted through 1994. The "after cleanup" concentrations noted in the closure letter are 24 ppm TPHg in soil and 33 ppb TCE in groundwater. All other constituents were non-detect. In 1995 the SMCEHD granted the case closure with no further action required. Based on the relative distance, the regulatory status, and the time elapsed since closure was achieved, this listing is not expected to represent a significant environmental concern at this time.

DRAFT

5.2 VAPOR MIGRATION

AEI reviewed reasonably ascertainable information for the subject and nearby properties, including a regulatory database, files for nearby release sites, and/or historical documentation, to determine if potential vapor-phase migration concerns may be present which could impact the subject property.

Based on a review of available resources as documented in this report, AEI did not identify significant on-site concerns and/or regulated listings from nearby sites which suggest that a vapor-phase migration concern currently exists at the subject property.

DRAFT

6.0 INTERVIEWS AND USER PROVIDED INFORMATION

6.1 INTERVIEWS

Pursuant to ASTM E1527-13, the following interviews were performed during this assessment in order to obtain information indicating RECs in connection with the subject property.

6.1.1 INTERVIEW WITH OWNER

The subject property owner, Mr. Louis Deziel, was contacted in person on July 26, 2017. Mr. Louis Deziel has been associated with the subject property since 2010. Mr. Louis Deziel stated that the current foundation on the northern portion of the subject property was part of a redevelopment project in 2011 that was never completed. Mr. Louis Deziel was asked if he was aware of any of the following:

	Yes	No
Any knowledge of USTs, clarifiers or oil/water separators, sumps, or other subsurface features.		✔
Any knowledge of previous environmental investigations conducted on site.	✔	
Any knowledge of current or past industrial operations and/or other operations which would involve the use of hazardous substances and/or petroleum products.	✔	
Any known plans for site redevelopment or change in site use.	✔	
Any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property.		✔
Any pending, threatened or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the property.		✔
Any notices from any governmental entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products.		✔
Any incidents of flooding, leaks, or other water intrusion, and/or complaints related to indoor air quality.		✔
Comments: **Mr. Deziel stated that there were former USTs removed from the subject property related to a former auto repair shop. Additionally, the subject property is being sold to a developer to construct a mixed use project.**		

6.1.2 INTERVIEW WITH KEY SITE MANAGER

The property owner, Mr. Louis Deziel, is also the key site manager. Refer to Section 6.1.1.

6.1.3 PAST OWNERS, OPERATORS, AND OCCUPANTS

AEI did not attempt to interview past owners, operators, and occupants of the subject property because information from these sources would likely be duplicative of information already obtained from other sources.

DRAFT

6.1.4 Interview with Others

Information obtained during interviews with local government officials is incorporated into the appropriate segments of this section.

6.2 User Provided Information

User provided information is intended to help identify the possibility of RECs in connection with the subject property. According to ASTM E1527-13 and the EPA Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), certain items should be researched by the prospective landowner or grantee, and the results of such inquiries may be provided to the Environmental Professional. The responsibility for qualifying for LLPs by conducting the inquiries ultimately rests with the User, and providing the information to the Environmental Professional would be prudent if such information is available.

The User did not complete the ASTM User Questionnaire or provide the User information to AEI. AEI assumes that qualification for the LLPs is being established by the User in documentation outside of this assessment.

6.2.1 Environmental Liens

In accordance with our approved scope of services, AEI contracted AFX Research, LLC (AFX) to perform an environmental lien search for the subject property.

According to AFX, environmental liens were not identified during the review of historical ownership documentation. Copies of the AFX reports are provided in the appendices.

6.3 Previous Reports and Other Provided Documentation

Documentation was provided to AEI by Premia Capital during this assessment. A summary of this information follows:

NESHAP Asbestos Survey and Lead-Based Paint Inspection (134 Maple Street & 1180 Main Street, Redwood City, California 94063), prepared by AEI Consultants (November 11, 2010)

AEI Consultants (AEI) was retained by Lathrop PARC Redwood City, LLC (Client) to conduct a NESHAP Asbestos Survey and Lead-based Paint Inspection for the structures located at 134 Maple Street and 1180 Main Street in Redwood City, California. The survey was performed on November 5, 2010. The purpose of the survey was to locate, identify, sample and assess the condition of interior and exterior building materials suspected of containing greater than one percent (1%) asbestos and to perform a lead paint inspection. The survey included the assessment and characterization of suspect friable and non-friable ACM and lead content in painted surfaces.

The subject property at 134 Maple Street is located on the east side of Maple Street in a mixed residential and commercial area of Redwood City, California. The property is improved with a concrete warehouse/retail facility that was vacant at the time of this investigation.

The subject property at 1180 Main Street is located on the south side of Main Street in a mixed residential and commercial area of Redwood City, California. The property is improved with two

DRAFT

structures: a stand-alone office building at the southeast corner of the property, as well as a warehouse/retail facility along the north side of the property; both properties were occupied at the time of this investigation. The warehouse/retail facility is the only structure involved under the scope of this survey.

A total of thirty-two (32) samples of suspect ACM were collected from the subject property buildings during the survey. RACM was detected in the materials collected from 134 Maple Street in the form of tan vinyl floor sheet in the hallway and bathroom. No asbestos-containing materials were detected from the sampling conducted at 1180 Main Street.

A total of ninety-seven (97) samples of suspect paint were taken from the painted surfaces of components throughout the subject property buildings. None of the painted surfaces sampled registered above the action level of ≥1.0 mg/cm² (0.5% wt and 5,000 ppm).

Phase I Environmental Site Assessment (134 Maple Street, Redwood City, California), prepared by Dominion Due Diligence Group (D3G) (January 28, 2011)

This assessment included three parcels which were developed with a vacant commercial building (formerly Marcelli Lighting) which was constructed around 1974, one auto repair building (formerly Chub's Auto Repair) constructed around 1955, and one vacant office building constructed between 1950 and 1962. In addition, the property was noted to be developed with Redwood Creek (a concrete-lined culvert) and an exterior storage yard. There were plans to demolish two of the buildings in order to build a new medical facility.

D3G noted the former generations of USTs and hydraulic lifts at the subject property and stated that they are not an environmental concern to the subject property. Based on the condition of the removed USTs, the analytical data, remediation of the soils from the UST tank pit, and regulatory status, D3G believes that a vapor encroachment condition does not exist or is not likely to exist at the subject property from the previous USTs and lifts.

D3G also cited the former ACM and LBP investigations conducted by AEI in 2010, which are further discussed below.

In conclusion, D3G identified HRECs for the former USTs and lifts and associated investigations and "environmental concerns" for likely ACM/LBP materials in the 1180 Main Street building.

Soil Sampling Services (Lathrop Parc, Redwood City, California), prepared by TRC (September 23, 2011)

TRC evaluated the current soil conditions at the site for potential reuse or landfill disposal. It was TRC's understanding that approximately 4,500 Cubic Yards of soil will be excavated during construction activities at the site. As requested, to evaluate the quality, TRC will collect 5 four-point composite samples from the planned excavation area. A four-point composite sample consists of four individual, discrete soil samples that will be mixed or composited by the selected laboratory for one chemical analysis. Based on the site history, TRC recommends testing the five soil composite soil samples for total petroleum hydrocarbons in the diesel and motor oil range (EPA Method 8015B), 17 California Assessment Manual (CAM) metals (EPA Test Method 6010/7000); (EPA Test Method 8270), and organochlorine pesticides (EPA Test Method 8081). Additionally, prior to compositing, 5 discrete samples (one from each composite batch) will be

DRAFT

selected and analyzed for volatile organic compounds (VOCs) including gasoline range petroleum hydrocarbons (TPHg) (EPA Test Method 8015); benzene, toluene, ethylbenzene, and xylenes (BTEX) (EPA Test Method 8260).

Soil Sampling Services (Lathrop Parc, Redwood City, California), prepared by TRC (October 11, 2011)

The analyses performed by TRC did not detect pesticides, VOC's, including gasoline-range hydrocarbons, BTEX nor MTBE in any of the samples analyzed. The metal concentrations detected appear typical of naturally occurring background concentrations and are below Total Threshold Level Concentrations (TTLC), except for chromium, nickel and lead. Of these only lead in the near-surface sample with a detected concentration of 54 mg/kg appeared anomalous and above the hazardous waste TTLC level of 50 mg/kg.

The detected chromium concentrations in samples collected at a depth of 1.5, 3.0, 4.5 and 6.0 feet, although above the hazardous waste TTLC level of 50 mg/kg, appear consistent with naturally occurring levels for soils known from the area. Nickel concentrations are also elevated, but exceeded the hazardous waste TTLC concentration only in one soil sample.

As with chromium, the detected nickel levels appear consistent with natural occurring background concentrations. Elevated chromium and nickel concentrations are typical of ultramafic bedrock, naturally occurring and common in the area of the investigation. However, since the concentrations were above the hazardous waste levels, additional solubility tests (STLC) were completed on all soil samples with TTLC exceedances. Results of the solubility tests demonstrated that none of the samples exceeded the hazardous STLC waste levels and therefore the soil can be safely disposed off as non-hazardous waste.

Furthermore, laboratory analysis detected motor oil, diesel and low-level pesticide concentrations in samples collected from the upper 4.5 feet. But only the near-surface sample produced motor oil concentrations that exceeded the ESL established by the State Regional Water Quality Control Board for residential site use and beneficial use of groundwater.

Based on the chemical analytical data, TRC stated that the soil appears non-hazardous and should be acceptable for offsite disposal at any Class II landfill. Furthermore, if selective excavation and disposal is considered, based on the analytical results, soil below a depth of 1.0 ft, did not exceed established ESLs for residential site use, and therefore this soil does not appear to pose a risk to human health or the environment. Consequently, the soil below 1.0 foot can be considered for residential reuse, or alternatively, for appropriate disposal at a Class III landfill. The near-surface soil (0-1.0 ft), due to the detected above ESL motor oil concentrations is not recommended for re-use and should be disposed off at an appropriate Class II landfill.

Soil Sampling Services (Lathrop Parc, Redwood City, California), prepared by TRC (December 16, 2011)

On October 25, 2011, TRC collected soil samples for laboratory evaluation of the in-place soil at the Area II of the site. The top 1-foot of soil in this area is being considered for potential reuse or landfill disposal. TRC stated that approximately 200 Cubic Yards of soil will be excavated during construction activities at the site.

Analysis on the one composite soil sample collected from Area II detected Motor Oil Range Organics ranging from 59 to 1100 mg/Kg. Total Threshold Level Concentrations (TTLC) for lead was detected from 9.3 to 50 mg/Kg. The lead concentration of 50 mg/Kg detect in one sample was equal to the minimum hazardous waste TTLC level.

Due to the exceedances of lead, the soil appears hazardous and a Class II landfill will likely require STLC analysis prior to acceptance. Because the concentrations did not exceed ESLs or CHHSLs the top 1.0- foot of soil can be considered for on-site residential or commercial reuse.

Additional Soil Sampling Services (Lathrop Parc Redwood City, California), prepared by TRC (December 21, 2011)

On September 27, 2011, TRC collected representative soil samples at the northern portion of the site where the foundation elements of the proposed building were to be excavated. Subsequently the site was divided into three soil sampling areas. Area I was at the northernmost portion, with Area II in the center and Area II on the southern portion of the site. On October 25, 2011, TRC collected one four point composite sample from the top foot of Area II. On December 2, 2011, TRC collected one four point composite sample from the top foot of the Area III.

Soil Sampling Services (Lathrop Parc, Redwood City, California), prepared by TRC (December 23, 2011)

On December 2, 2011, TRC collected soil samples for laboratory evaluation of the in-place soil at the Section 3 Area of the site. The top 1-foot of soil in this area is being considered for potential reuse or landfill disposal.

The analyses performed did not detect pesticides, VOC's, including gasoline-range hydrocarbons, BTEX nor MTBE in the composite sample analyzed. Detected diesel and motor oil concentrations (190 mg/kg and 670 mg/kg respectively) exceeded the concentrations of the ESL established by the State Regional Water Quality Control Board for residential site use and beneficial use of groundwater. Therefore this soil is not suitable for residential on-site use unless it is capped by low permeable pavement (roadways, vehicle parking areas) reducing the risk of direct exposure. However in areas of surface exposure (landscaped areas) this soil needs to be removed and appropriately disposed off site.

The metal concentrations detected appear typical of naturally occurring background concentrations and are below Total Threshold Level Concentrations (TTLC), except for chromium and lead. The chromium and lead concentrations were reported at 130 mg/kg and 52 mg/kg respectively, which are above the hazardous waste TTLC level of 50 mg/kg for both. However chromium concentration appears consistent with naturally occurring levels for soils from the area. Subsequent STLC analysis detected a soluble lead concentration of 1.4 mg/L which is significantly below the hazardous waste level and therefore appears acceptable at either a Class II or possibly, a Class III landfill.

Based on field observations during sampling, it appears that the soil of Section 3 is similar to the Section 2 soil. Also site history and hence, the detected anomalous compounds and concentrations, are similar between the two site development sections and no additional soil quality characterization appears required.

DRAFT

Copies of the reports are included in the appendices.

Note: If the above report(s) were not prepared by AEI, the information obtained was not verified for accuracy and a critique of the report(s) is beyond the scope of this assessment.

DRAFT

7.0 SITE RECONNAISSANCE

Site Reconnaissance Date	July 26, 2017
AEI Site Assessor(s)	Megan Nolet
Property Escort(s)/Relationship(s) to Property	Mr. Louis Deziel, Property Owner
Units/Areas Observed	Representative portions of the interiors of the building as well as the vacant land
Area(s) not accessed and reason(s)	Due to the size of the subject property, AEI performed a site inspection of the property utilizing a field technique of traversing the site in an attempt to provide an overlapping field of view. Due to the size of the property and the vegetation present on site, isolated areas of the site may have not been accessible for direct observation during AEI's inspection. Based on the vacant nature, this limitation is not expected to significantly alter the Findings of this assessment.
Weather	75° Fahrenheit and sunny

7.1 SUBJECT PROPERTY RECONNAISSANCE FINDINGS

Yes	No	Observation
	✔	Regulated Hazardous Substances/Wastes and/or Petroleum Products in Connection with Property Use
	✔	Aboveground/Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)
	✔	Hazardous Substance and Petroleum Product Containers Not in Connection with Property Use
	✔	Unidentified Substance Containers
	✔	Electrical or Mechanical Equipment Likely to Contain Fluids
	✔	Interior Stains or Corrosion
	✔	Strong, Pungent, or Noxious Odors
	✔	Pools of Liquid
✔		Drains, Sumps, and Clarifiers
	✔	Pits, Ponds, and Lagoons
	✔	Stained Soil or Pavement
	✔	Stressed Vegetation
	✔	Solid Waste Disposal or Evidence of Fill Materials
	✔	Waste Water Discharges
	✔	Wells
	✔	Septic Systems
	✔	Biomedical Wastes
✔		Other

The subject property is currently unoccupied.

DRAFT

Drains, Sumps, and Clarifiers

One covered storm drain was observed in the vegetated area of the subject property. AEI did not observe evidence of hazardous substances or petroleum products in the vicinity of the drain. Based on the use of the drain solely for storm water runoff, the presence of the drain is not expected to represent a significant environmental concern.

Other

Approximately 20-gallons of maintenance products (paints, paint related products, WD-40) were observed in the building. The containers were properly labeled and stored. No signs of spills or leaks were observed in conjunction with the containers. No significant staining or evidence of release of any of the materials was observed during the site reconnaissance. Based on the relatively small quantities observed and the lack of evidence of the mismanagement of these materials, the use of these materials on site is not expected to represent a significant environmental concern.

7.2 Adjacent Property Reconnaissance Findings

Yes	No	Observation
	✔	Hazardous Substances/Wastes and/or Petroleum Products in Connection with Property Use
	✔	Aboveground/Underground Hazardous Substance or Petroleum Product Storage Tanks (ASTs/USTs)
	✔	Hazardous Substance and Petroleum Product Containers Not in Connection with Property Use
	✔	Unidentified Substance Containers
✔		Electrical or Mechanical Equipment Likely to Contain Fluids
	✔	Strong, Pungent, or Noxious Odors
	✔	Pools of Liquid
	✔	Drains, Sumps, and Clarifiers
	✔	Pits, Ponds, and Lagoons
	✔	Stained Soil or Pavement
	✔	Stressed Vegetation
	✔	Solid Waste Disposal or Evidence of Fill Materials
	✔	Waste Water Discharges
	✔	Wells
	✔	Septic Systems
✔		Other

Electrical or Mechanical Equipment Likely to Contain Fluids

Toxic PCBs were commonly used historically in electrical equipment such as transformers, fluorescent lamp ballasts, and capacitors. According to United States EPA regulation 40 CFR, Part 761, there are three categories for classifying such equipment: <50 ppm of PCBs is considered "Non-PCB"; between 50 and 500 ppm is considered "PCB-Contaminated"; and >500 ppm is considered "PCB-Containing". Pursuant to 15 U.S.C. 2605(e)(2)(A), the manufacture, process, or distribution in commerce or use of any polychlorinated biphenyl in any manner other than in a totally enclosed manner was prohibited after January 1, 1977.

DRAFT

Transformers

The management of potential PCB-containing transformers is the responsibility of the local utility or the transformer owner. Actual material samples need to be collected to determine if transformers are PCB-containing.

Multiple pole-mounted transformers were observed on the adjacent sites during the site reconnaissance. No spills, staining, or leaks were observed on or around the transformers. Based on the good condition of the equipment, the transformers are not expected to represent a significant environmental concern.

OTHER

The railroad tracks located adjacent to the northeast of the subject property are surrounded by concrete and gravel. Based on the presence of gravel, the use of oils, arsenic, and herbicides associated with weed or pest control is expected to be minimal, and therefore does not represent a significant environmental concern.

DRAFT

8.0 OTHER ENVIRONMENTAL CONSIDERATIONS

8.1 ASBESTOS-CONTAINING BUILDING MATERIALS

Asbestos is the name for a group of naturally occurring silicate minerals that are considered to be "fibrous" and through processing can be separated into smaller and smaller fibers. The fibers are strong, durable, chemical resistant, and resistant to heat and fire. They are also long, thin and flexible, so they can even be woven into cloth. Because of these qualities, asbestos was considered an ideal product and has been used in thousands of consumer, industrial, maritime, automotive, scientific, and building products.

At the federal level, asbestos is primarily regulated by the United States EPA primarily through the EPA's NESHAP (Standard 40 CFR Chapter 61, Subpart M), the OSHA through the General Industry Standard, and the Construction Industry Standard (29 CFR 1926.1101 and 29 CFR 1910.1001). Many states have regulations in place for the inspection, management, and remediation of asbestos including company and individual licensing requirements for all activities relating to asbestos. Under both federal and state regulations building owners and employers may be required to perform certain activities related to the in-place management of asbestos, and prior to renovations or demolition activities (i.e. asbestos inspections or remediation) that may disturb building materials suspected of containing asbestos.

The information below is for general informational purposes only and does not constitute an asbestos survey. In addition, the information is not intended to comply with federal, state, or local regulations in regards to ACM.

Due to the age of the subject property building, there is a potential that ACMs are present. A limited list of typical suspect ACMs is included in the following table:

Material Type	Location
Plaster (Acoustical and Smooth)	Walls and Ceilings
Ceiling Tile	Ceiling Systems
Thermal Systems Insulations, Packings, Gaskets	Heating Systems, Cooling Systems, Domestic and Heating and Cooling Piping, Ductwork, Other Equipment
Floor Tile and Associated Mastics, Flooring Felts, Papers (under hardwood/other)	Floors
Vinyl Sheet Flooring and Adhesives	Floors
Cove Base and Associated Mastics	Walls
Ceramic Tile Adhesives and Grouts	Walls, Floors, and Ceilings
All Adhesives	Mirrors, Wall Coverings, Construction, etc.
Grout and Caulking	Windows and Doors
Gypsum Board, Tape, and Joint Compound	Wall and Ceiling Systems
Insulation Materials	Walls, Ceilings, Attic Spaces
Roofing Materials (Felts, Rolled, Shingle, Flashings, Adhesives, Tar, Insulations)	Roof and Parapet Wall Systems
Brick and Block, Mortars	Walls

DRAFT

According to the Mr. Deziel, demolition of the subject property building is planned for the near future. Regardless of building construction date, the EPA's NESHAP requires that a thorough asbestos survey be performed prior to demolition or renovation activities that may disturb ACMs. It should be noted that a NESHAP survey was previously performed, discussed in Section 6.3. This requirement may be enforced by federal, state and local regulatory agencies, and specifies that all suspect ACMs be sampled to determine the presence or absence of asbestos prior to any renovation or demolition activities which may disturb them to prevent potential exposure to workers, building occupants, and the environment. Similarly, OSHA regulations require that specific work practices be implemented when handling construction materials and debris that contain asbestos and/or lead-containing materials.

8.2 LEAD-BASED PAINT

LBP is defined as any paint, varnish, stain, or other applied coating that has ≥1 mg/cm² (5,000 µg/g or 5,000 ppm) or more of lead by federal guidelines; state and local definitions may differ from the federal definitions in amounts ranging from 0.5 mg/cm² to 2.0 mg/cm². Section 1017 of the Housing and Urban Development (HUD) Guidelines, Residential Lead-Based Paint Hazard Reduction Act of 1992, otherwise known as "Title X", defines a LBP hazard as "any condition that causes exposure to lead that would result in adverse human health effects" resulting from lead-contaminated dust, bare, lead-contaminated soil, and/or lead-contaminated paint that is deteriorated or present on accessible, friction, or impact surfaces. Therefore, under Title X, intact LBP on most walls and ceilings would not be considered a "hazard", although the paint should be maintained and its condition monitored to ensure that it does not deteriorate and become a hazard. Additionally, Section 1018 of this law directed HUD and EPA to require the disclosure of known information on LBP and LBP hazards before the sale or lease of most housing built before 1978. Most private housing, public housing, or federally owned or subsidized housing is affected by this rule.

LCP is defined as any paint with any detectable amount of lead present in it. It is important to note that LCP may create a lead hazard when being removed. The condition of these materials must be monitored when they are being disturbed. In the event LCP is subject to abrading, sanding, torching, and/or cutting during demolition or renovation activities, there may be regulatory issues that must be addressed.

The information below is for general informational purposes only and does not constitute a lead hazard evaluation. In addition, the information is not intended to comply with federal, state, or local regulations in regards to LCP.

In buildings constructed after 1978, it is unlikely that LBP is present. Structures built prior to 1978 and especially prior to the 1960s should be expected to contain LBP.

Due to the age of the subject property building, there is a potential that LBP is present. AEI understands that renovation and/or demolition activities of the subject property buildings are planned. It should be noted that lead testing was previously performed, and discussed in Section 6.3. AEI recommends that the property owner consult with a certified Lead Risk Assessor to determine options for control of possible LBP hazards. Stringent local and State regulations may apply to LBP in association with building demolition/renovations and worker/ occupant protection. It should be noted that construction activities that disturb materials or

paints containing any amount of lead may be subject to certain requirements of the OSHA lead standard contained in 29 CFR 1910.1025 and 1926.62.

8.3 Radon

Radon is a naturally-occurring, odorless, and invisible gas. Natural radon levels vary and are closely related to geologic formations. Radon may enter buildings through basement sumps or other openings.

The United States EPA has prepared a map to assist National, State, and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three radon zones, with Zone 1 being those areas with the average predicted indoor radon concentration in residential dwellings exceeding the EPA Action Limit of 4.0 pCi/L. It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the EPA recommends site specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures.

Radon sampling was not requested as part of this assessment. According to the California Department of Health Services Radon Database, 19 tests were conducted for radon levels in the subject property zip code (94063) in 2010. Only two of the tests exceeded the action level of 4.0 pCi/L set forth by the US EPA. Based on the commercial nature of the property and the lack of subsurface areas, radon does not appear to be a concern. However, radon sampling would be required to determine site-specific radon levels.

8.4 Drinking Water Sources and Lead in Drinking Water

The City of Redwood City supplies potable water to the subject property. The most recent water quality report states that lead levels in the area's water supply were well within standards established by the US EPA and the State of California.

8.5 Mold/Indoor Air Quality Issues

Molds are simple, microscopic organisms, which can often be seen in the form of discoloration, frequently green, gray, white, brown, or black. When excessive moisture or water accumulates indoors, mold growth will often occur, particularly if the moisture problem remains undiscovered or is not addressed. As such, interior areas of buildings characterized by poor ventilation and high humidity are the most common locations of mold growth. Building materials including drywall, wallpaper, baseboards, wood framing, insulation, and carpeting often play host to such growth. Mold spores primarily cause health problems through the inhalation of mold spores or the toxins they emit when they are present in large numbers. This can occur primarily when there is active mold growth within places where people live or work.

Mold, if present, may or may not visually manifest itself. Neither the individual completing this inspection, nor AEI has any liability for the identification of mold-related concerns except as defined in applicable industry standards. In short, this Phase I ESA should not be construed as a mold survey or inspection.

DRAFT

AEI observed interior areas of the subject property building in order to identify the potential presence of mold. AEI did not note obvious visual or olfactory indications of the presence of mold, nor did AEI observe obvious indications of significant water damage. As such, no bulk sampling of suspect surfaces was conducted as part of this assessment and no additional action with respect to suspect mold appears to be warranted at this time.

This activity was not designed to discover all areas which may be affected by mold growth on the subject property. Rather, it is intended to give the client an indication if significant (based on observed areas) mold growth is present at the subject property. Additional areas of mold not observed as part of this limited assessment, possibly in pipe chases, HVAC systems, and behind enclosed walls and ceilings, may be present on the subject property.

DRAFT

9.0 SIGNATURE OF ENVIRONMENTAL PROFESSIONALS

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR Part 312.

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

RGA LF ---------- Recovered Government Archive Solid Waste Facilities List

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

SEMS: SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the SEMS list, as provided by EDR, and dated 02/07/2017 has revealed that there is 1 SEMS site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
DUOLITE INTERNATIONA	***800 CHESTNUT ST***	***ENE 1/4 - 1/2 (0.393 mi.)***	***AH205***	***308***

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless

DRAFT

information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 02/07/2017 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
PRICE COMPANY	2110 MIDDLEFIELD RD	ESE 1/4 - 1/2 (0.402 mi.)	AK209	332

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
DUOLITE INTERNATIONA	***800 CHESTNUT ST***	***ENE 1/4 - 1/2 (0.393 mi.)***	***AH205***	***308***

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 12/12/2016 has revealed that there are 2 RCRA-TSDF sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 11 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/30/2017 has revealed that there are 22 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the LUST list, as provided by EDR, has revealed that there are 71 LUST sites within approximately 0.5 miles of the target property.

SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the SLIC list, as provided by EDR, has revealed that there are 19 SLIC sites within approximately 0.5 miles of the target property.

State and tribal voluntary cleanup sites

VCP: Contains low threat level properties with either confirmed or unconfirmed releases and the project proponents have request that DTSC oversee investigation and/or cleanup activities and have agreed to provide coverage for DTSC's costs.

A review of the VCP list, as provided by EDR, and dated 01/30/2017 has revealed that there are 4 VCP sites within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

HIST Cal-Sites: Formerly known as ASPIS, this database contains both known and potential hazardous substance sites. The source is the California Department of Toxic Substance Control. No longer updated by the state agency. It has been replaced by ENVIROSTOR.

A review of the HIST Cal-Sites list, as provided by EDR, and dated 08/08/2005 has revealed that there

DRAFT

is 1 HIST Cal-Sites site within approximately 1 mile of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 11 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 12/12/2016 has revealed that there are 2 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

A review of the EDR MGP list, as provided by EDR, has revealed that there is 1 EDR MGP site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
PG AND E GAS PLANT R	E MARSHALL, WASHINGT	NNW 1/4 - 1/2 (0.313 mi.)	185	241

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station,

DRAFT

service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 18 EDR Hist Auto sites within approximately 0.125 miles of the target property.

FINDS:

Registry ID: 110002907310

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

DRAFT

COOKS AUTO BODY (Continued) **1000272042**

Site History: Extracted from Golden Gate Environmental's March 31, 2010 Report of Groundwater Monitoring & Additional Site Characterization, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The subject property lies on the west side of Main Street and south of the intersection of Main and Maple Streets in Redwood City, California. The Site is approximately 0.4 mile south of the San Francisco Bay (Redwood Creek Inlet). The elevation of the property ranges between 11.70 and 12.38 feet above mean sea level. The property is relatively flat lying with the local topographic relief generally directed towards the north-northeast. The 0.3-acre property is roughly triangular in shape. The adjacent property to the west (1090 Main Street) is a multi-residential apartment/townhouse complex. Directly to the northeast across Main Street is the former upholstery facility for Cooks Auto Body (1101\\% Main Street; currently vacant) and Bobs Auto Repair facility (415 Cassia Street). A 9,000 square foot office and warehouse structure occupies the central portion of the subject property and a small office structure (625 square feet) is situated along the southeastern portion of the Site. The northernmost portion of the Site is where the former fueling station was historically located and is the subject of this evaluation. County Assessor Recorders Parcel No. 053-138-010). Cooks Auto Body has leased the Site since 1979 for a vehicle repair operation. The Site had previously been occupied by another auto body facility since 1969. Reportedly, Cooks Auto Body has never dispensed fuel from the property since 1979. A concrete dispenser island 18 feet in length by 3 feet in width (east-west orientation) is located approximately 13 feet north of the central north side of the building structure. A hydraulic lift was formerly located approximately 7 feet north of the central north wall of the building structure. Based on recorded observations of the product and vent piping removed beneath the northern portion of the Site (May 2004), it is evident that at least three USTs were once present at the property prior to Cooks Auto Bodys initial occupancy in 1979. Historic businesses that formerly operated at the Site include: Strand and Brain garage (1931-1933), Strand and Furger Autos (1937), Tacoma Distributing Company/Brewers Agents (1939), and Ferris Miles Inc Wholesaler (1953). A Redwood City Tribune article titled Miles Selling Car Agency dated May 10, 1969, describes business operations conducted across the street at 1101 Main Street from the years 1939 to 1969 by the late Ferris Miles (deceased 1982). Miles apparently co-owned the property at 1104 Main Street during the time interval spanning from 1939 to 1969 and Ferris-Miles Dodge occupied the Site in the mid 1960s. Based on review of Sanborn Fire Insurance Maps, the northern portion of the property was historically occupied by a fuel dispensing station from 1932 through 1962. In February 2002, EnviroVision, Inc. drilled exploratory borings SB-1, SB-2 and SB-3 to a depth of 15 feet. The purpose of the drilling was to assess the potential impact to soil and groundwater from reported fuel dispensing activities at the Site. In letters dated May 20 and June 4, 2002, the GPP identified Woods Limited Partnership as the responsible party (RP). On August 28 and November 18, 2002, EnviroVision submitted their Work Plan for Additional Site Characterization and Groundwater Monitoring and addendum that was approved by the GPP in a letter dated December 30, 2002. On January 10, 2003, EnviroVision in collaboration with Norcal Geophysical Consultants, Inc. conducted a geophysical survey to both trace the

Draft

COOKS AUTO BODY (Continued) **1000272042**

lateral extent of subsurface vent and product lines using line-locating equipment and locate any abandoned USTs using ground penetrating radar. EnviroVision identified several subsurface anomalies largeenough to represent potential underground storage tanks located in the sidewalk of the Maple Street frontage. In March and April 2003, EnviroVision drilled one additional soil boring SB-4 and installed three 2-inch groundwater monitor wells MW-1, MW-2 and MW-3. In May 2004, Golden Gate Tank Removal, Inc. (GGTR) excavated five shallow locations where the previous geophysical survey by EnviroVision had indicated potential underground storage tank (UST) locations. No USTs were discovered in the exploratory excavations. A metal product line was uncovered in excavation area A and one soil sample was recovered from beneath the product line at two feet below grade for laboratory analysis. In September 2004, GGTR traced the lateral extent of the subsurface product and vent lines by hand digging. GGTR collected soil samples PLA[2], PL2B[2], PL2C[2], PL2D[2], PL2D[3.5], PL3A[2], and PL3B[2] beneath the exposed product lines and subsequently removed exposed piping from the trenches. Approximately 70 feet of product pipe and 50 feet of vent pipe were removed from the property for disposal at the Circosta Iron & Metal Company. Excavated soil was returned to the product line trenches as backfill. GGTR drilled five (5) soil borings SB-5 through SB-9 to a depth of 20 feet at the property. Borings SB-7 and SB-9 were converted to respective 2-inch groundwater monitor wells MW-5 and MW-4. Three additional soil borings SB-PL2A, SB-PL2D, and SB-PL3B were drilled to 12 feet to assess the vertical extent of soil contamination beneath the former product lines. No abandoned USTs were located during the exploratory drilling. In February 2007, GGTR drilled exploratory boring SB-13 to approximately 28 fbg. Soil samples were collected continuously in the boring between 5 and 24 fbg. The boring encountered silty clay to a depth of 15 feet, silty sand from 15 to 20 feet, and sandy gravel from 20 to 28 feet. New slotted well casing was temporarily installed in boring SB-13 and a grab groundwater sample collected after 20 minutes of recharge at a depth of 8.2 feet. A series of four separate Hydropunch borings were then drilled northward of the SB-13 location to obtain grab groundwater samples at 15, 20, 27 and 35 feet below grade. In February 2007, GGTR submitted a traffic control plan to the City of Redwood City for temporary closure of the roadway and re-routing of vehicular traffic, and on March 29, 2007, GGTR drilled boring SB-12 to a depth of 27 fbg. Soil samples were collected continuously in the boring between 5 and 24 fbg. Boring SB-12 encountered silty clay to a depth of 15 feet, silty sand from 15 to 19 feet, and sandy gravel from 19 to 27 feet. Hydrocarbon odor was recognized in the 10 foot soil sample only. Two soil samples from depths of 10 and 15 feet were submitted for analysis of TPH as gasoline and BTEX. The boring was terminated in heaving sands that prevented sample recovery below 24 feet. New slotted well casing was temporarily installed in boring SB-12 and a grab groundwater sample collected after 15 minutes of recharge at a depth of 11.5 feet. A series of four separate Hydropunch borings were then drilled northward of the boring SB-12 location to obtain grab groundwater samples at 15, 20, and 27 feet below grade. In the 4th Hydropunch boring, no groundwater was recovered at the 35 foot target depth. New slotted well casing was temporarily installed in boring 4. However, no groundwater was recovered in the casing after 45 minutes and the sampling was abandoned due to time constraints for the temporary roadway closure.

DRAFT

COOKS AUTO BODY (Continued) **1000272042**

On February 27, 2007, GGTR drilled new monitor well MW-6 to approximately 20 fbg, using 8-inch diameter, continuous flight, hollow-stem augers. Monitoring well MW-6 was constructed of standard 2-inch diameter, flush-threaded, Schedule 40 Polyvinyl Chloride (PVC) factory slotted (0.010 inch) well screen (@ 5 to 20 fbg) and blank riser casing (@ 0.5 to 5 fbg). On March 14 and 30, 2007, GGTR continued thelateral and vertical delineation of the extent of soil contamination in the vicinity of former product/vent lines and the dispenser island. Handaugured borings were used to collect the soil samples at locations SB-11, SB-PL2A-E, SBPL2A- S, and SB-PL2D. Soil samples were collected from the borings for the laboratory analysis of lead, zinc, SVOCs, and TPH as Motor Oil. Due to difficult subsurface conditions, percussion drilling equipment was subsequently used to collect soil samples from borings SB-10, SBPL2A-NW, SB-PL2D-NW, and SB-PL2D-S. Boring SB-11 was proposed to a depth of five feet but encountered drilling refusal on concrete debris just below collection of the two foot soil sample. Between April 2003 and February 2004, EnviroVision conducted four consecutive quarterly monitoring and sampling events for the three onsite wells MW-1, MW-2, and MW-3. Additional details of each monitoring event are provided in respective reports issued by EnviroVision. Based on review of the EnviroVision March 2004 Groundwater Monitoring Report, the GPP in a letter dated May 17, 2004, requested that the quarterly monitoring and sampling frequency be reduced to semi-annual events (first and third quarters). Upon completing the installation of monitoring wells MW-4 and MW-5, GGTR conducted semiannual monitoring and sampling events for the five monitor wells between September 2004 and September 2006. GGTR in conjunction with Dysert Environmental, Inc., conducted semi-annual groundwater monitoring and sampling activities on March 27, 2007 for all six monitor wells at the Site. On March 14, 2007, Golden Gate Tank Removal, Inc. (GGTR) recovered five discrete soil samples using hand auger equipment from the former product/vent line removal trenches. The concrete surface was cored to allow hand-auger equipment to drill a 6-inch deep hole. Soil samples were recovered from a depth of 6-12 inches at each location using a slide hammer and brass sample liners. Between December 2007 and October 2008, Golden Gate Tank Removal, Inc. (GGTR) conducted semi-annual monitoring and sampling events for the six monitor wells. A gap in groundwater monitoring occurred from the end of 2008 through 2009. Semi-annual groundwater monitoring resumed at the Site during the first quarter of 2010, and was performed on January 27, 2010 by GGE. GGE submitted the Risk Assessment for Lead in Soil dated December 30, 2009, to address the residual lead-contaminated soil. The majority of the Site is characterized by lead concentrations within the range of expected background values for urban soils. Groundwater is not impacted by dissolved lead and the groundwater does not appear threatened by the residual lead. Two hotspots of lead contamination in soil exist above the residential ESL value of 200 mg/kg and one of the hotspots (at the building corner) exceeds the industrial ESL value of 750 mg/kg. The extent of lead contamination is not completely defined by existing soil sampling and the southern extent of lead in soil contamination beneath the building is not known. Three soil samples contain total lead concentrations above 1000 mg/kg (and elevated soluble lead) and could be considered a hazardous waste if excavated and transported offsite. As noted by the GPP in their April 23, 2008 letter, other areas of the Site with elevated lead concentrations above 100 mg/kg may also contain elevated soluble lead

DRAFT

COOKS AUTO BODY (Continued) **1000272042**

concentrations and upon excavation and profiling for offsite disposal, these soils could be classified as a California hazardous waste requiring special handling/disposal practices with significant increased cost. The Site is in commercial use as an automobile body repair shop and the area of lead impact is completely covered by asphalt/concrete. The current commercial land use at the Site is unlikely to present a complete pathway for the ingestion or inhalation of lead contaminated soil. The elevated concentrations of total lead in soil present a health hazard to children under future redevelopment scenarios involving sensitive land use such as residential, school, etc., where the contaminated soil may be exposed at the surface. Excavation and transport of the contaminated soil offsite to a sensitive land use would also present opportunities for exposure to children. Although no future redevelopment is planned at the Site by the current property owner, management of the lead contaminated soil appears necessary to prevent these potential future exposures, should there be a change in property ownership or redevelopment plans. GPP has indicated it will notify the Redwood City Building Department of the lead in soil condition to inhibit improper management and use of this soil from future re-development activities. GGE also recommended the owner implement a Soil Management Plan to track and manage the contaminated soil during future utility installation or other excavation activities.

FINDS:

Registry ID: 110001168888

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
AIR EMISSIONS CLASSIFICATION UNKNOWN

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Potential Media Affect: Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern: Gasoline
Site History: Extracted from SAIC's June 13, 2007 Work Plan for Additional Soil and Groundwater Investigation, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The Site is a triangular-shaped parcel comprised of approximately 0.5 acres of relatively level land and is developed with two commercial buildings that are separated by an asphalt-paved area. According to the SMCHD correspondence dated November 28, 2005, the Site was used as a Texaco service station during the 1950s and as a Mohawk Petroleum Corporation service station in the 1960s. According to SMCHD Ownership notes (August 29, 2005 file review) and an Oil Heat Engineering invoice (No. 1827), three underground storage tanks (USTs) at the site were removed, and excavated soil was used for backfilling. During development, three 1,200-gallon USTs, used to store gasoline and then filled with grout, were apparently uncovered and subsequently removed on March 25, 1987 by Mr. Feiner. The construction and age of the USTs at the time of removal are not known. 1987 UST Removal: Five soil samples from the former UST pit were collected by Blaine Tech Services, Inc. (Blaine) on March 25, 1987. The UST pit, according to the sample location map prepared by Blaine, extended to the edge of the sidewalk along the east side of Main Street at a location south of the intersection of Middlefield Road and Main Street. This location does not coincide with the location of the excavated area that was hand written on the survey. The soil samples were collected at an approximate depth of 8 feet below ground surface (ft bgs) from the sidewalls of the excavation. Two samples were collected from the eastern sidewall of the excavation. Three samples were collected from the excavation sidewalls corresponding to the fill ends of the USTs. The soil samples were analyzed by Sequoia Analytical Laboratory for total hydrocarbons as gasoline (TPHg) and benzene, toluene and xylenes (BTX) using Environmental Protection Agency (EPA) methods 8015 and 5020, respectively. Notations regarding the occurrence of groundwater during sample collection are not present in Blaines March 26, 1987 Sampling Report. Soil sample analytical results indicated TPHg concentrations ranging from 5.7 to 450 parts per million (ppm) in all five samples, with three samples reporting detectable BTX. TPHg soil impact was reported at 200 ppm and 450 ppm along the eastern wall of the UST pit and at 200 ppm for the most northerly sample from along the western UST pit wall. Detectable benzene was reported in two samples at 0.38 ppm and 6.5 ppm. Detectable toluene was reported in three samples at 0.99 ppm, 1.0 ppm and 13 ppm. Detectable xylene was reported in three samples at 6.3 ppm, 18 ppm and 36 ppm. 2006 Subsurface Investigation: On November 15, 2006, SAIC advanced five soils borings, B-1 through B-5, to collect soil samples at discrete intervals and shallow groundwater samples. Borings B-1, B-4 and B-5 were advanced to depths ranging from approximately 12.5 feet below ground surface (bgs) to 13.5 feet bgs, allowing collection of grab groundwater samples. Borings B-2 and B-3 were advanced to depths of 7.5 feet bgs, where hand auger refusal was met due to encountered gravels and cobbles. Soil samples were analyzed by Lancaster Laboratories (Lancaster), a California-certified analytical laboratory, for total hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX), total lead, methyl tertiary butyl ether (MTBE), 1,2 dichloroethane (1,2 DCA), and 1,2

DRAFT

PHIL FINER REFRIGERATION INC (Continued) **U001594593**

dibromoethane (1,2 DBA). Analysis of soil samples collected from borings B-1 through B-5 detected TPHg in 11 of the 12 samples at concentrations of up to 130 milligrams per kilogram (mg/kg). The highest TPHg concentrations were detected in borings B-4 and B-5 at depths of 8 feet to 8.5 feet bgs, with concentrations of 110 mg/kg and 130 mg/kg, respectively. Benzene was detected in boring B-5 at concentrations of 0.006 mg/kg and 0.007 mg/kg. Other BTEX constituents were detected in each boring at concentrations of up to 0.006 mg/kg toluene, 0.022 mg/kg ethylbenzene and 0.034 mg/kg total xylenes. MTBE, 1,2-DBA and 1,2-DCA were not detected above the reported detection limits in any soil sample analyzed. Lead was detected in each soil sample at concentrations ranging from 5.16 mg/kg to 41.0 mg/kg. The results of soil sample analysis are included as Table 1. Analysis of groundwater samples collected from borings B-1, B-4 and B-5 detected TPHg in each sample at concentrations of 490 micrograms per liter (ug/l), 370 ug/l and 9,600 ug/l, respectively. The highest TPHg concentration was detected in boring B-5, located near the former dispenser island along Middlefield Road. Benzene was detected in the groundwater samples collected from B-1 and B-5 at a concentration of 6.0 ug/l. The other BTEX constituents were detected in the sample collected from B-5 at concentrations of 2.0 ug/l toluene, 33 ug/l ethylbenzene and 15 ug/l total xylenes. MTBE was detected in the groundwater sample collected from B-1 at concentration of 3.0 ug/l. Lead was detected in each groundwater sample at concentrations ranging from 22.0 ug/l to 70.2 ug/l. The groundwater sample, however, was not field filtered. As a result, the concentrations of total lead may be elevated due to the high sediment content present in the groundwater sample. Ethanol, 1,2-DBA, 1,2-DCA and the fuel oxygenates DIPE, ETBE, TAME and TBA were not detected above the reported detection limits in any groundwater sample, with the exception of 0.8 ug/l 1,2-DBA in the sample collected from boring B-5. To define the magnitude and extent of hydrocarbon impact in the area around and down-gradient from boring B-5 and from the former northern pump island, SAIC proposes the installation of two additional borings.

FINDS:

Registry ID: 110002671859

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Local Agency: SAN MATEO COUNTY LOP
RB Case Number: Not reported
LOC Case Number: 338207
File Location: Not reported
Potential Media Affect: Soil
Potential Contaminants of Concern: Heating Oil / Fuel Oil
Site History: Extracted from Green Environment's April 28, 2009 Report of Expanded Excavation, Soil and Groundwater Sampling, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. On March 26, 2009, an approximate 300 gallon metal underground storage tank (UST) that once contained fuel oil was removed from a residential property located at 824 Arlington Road in Redwood City, California (subject property). The subject property is owned by Mr. James Joyce, and is in contract for sale. The UST was removed by Golden Gate Tank Removal of San Francisco, California. The removal was witnessed and documented by Mr. Darrell Cullen of the San Mateo County Health System (SMCoHS). Per Mr. Cullens Report, approximately 1 to 1.5 cubic yards of soil were excavated with the UST, and stockpiled onsite. Mr. Cullen noted no evidence of a release, but did note a slight odor and soil discoloration. The UST pit was not over-excavated. No groundwater was encountered in the excavation. One (1) discrete soil sample (sample 9072-E-7) was collected from the floor of the excavation, at an approximate depth of seven (7) feet below ground

DRAFT

PRIVATE RESIDENCE (Continued) **S109521360**

surface (bgs). One (1) discrete soil sample (sample 9072-SPD) was collected from the stockpiled soil. One (1) composite soil sample (sample 9072-SP (AD)) was collected from the stockpiled soil. The soil samples were submitted to Accutest Laboratories (Accutest) of Santa Clara, California. Accutest was directed to hold sample 9072-SP (A-D) and analyze samples 9072-E-7 and 9072-SPD for Total Petroleum Hydrocarbons as diesel (TPHd), benzene, toluene, ethyl benzene, xylenes and methyltertiary butyl ether (BTEX/MTBE). TPHd and BTEX/MTBE were reported as not detected in the discrete stockpile soil sample (9072-SPD). The discrete soil sample (sample 9072-E-7) collected from the floor of the excavation floor reportedly contained 5920 milligrams per kilogram (mg/kg) of TPHd, 21.2 micrograms per kilogram (ug/kg) of benzene, 115 ug/kg of toluene, 203 ug/kg of ethylbenzene, and 1010 ug/kg of xylenes. MTBE was not detected at a reporting limit of 130 ug/kg. In April 2009, Mr. Joyce contracted with Green Environment inc. (GEI) to develop awork plan to investigate the extent of the fuel oil release. Mr. Joyce reported to GEI that the UST had been emptied and not used since circa 1987. Based upon this information, the observations of Mr. Cullen of the SMCoHS, and the results of the soil sampling and analyses conducted by Golden Gate Tank Removal, GEI developed a Work Plan to: overexcavate the UST pit; collect confirmation sidewall and floor samples from the expanded excavation; collect a deeper soil or groundwater sample from below the floor of the expanded excavation; collect a composite sample from the stockpile created by the expanded excavation; and submit the samples to a California-certified analytical lab for analyses.1 GEIs Work Plan was submitted to the SMCoHS on April 3, 2009, along with a Subsurface Drilling Permit Application and permit fee. The SMCoHS reviewed GEIs Work Plan and documentation in the Countys file for the subject property, and approved GEIs Work Plan in a letter to Mr. Joyce dated April 16, 2009 with the following conditions: &#56256;&#56451; a statistically valid number of discrete soil samples be collected from the excavated soil if the excavated soil was planned to be used for backfilling the excavation; &#56256;&#56451; consideration be given to segregating soil excavated from approximately five feet and above; &#56256;&#56451; soil sampling be based on soil texture, stratigraphy, sample screening and depth of hydrocarbon impact; &#56256;&#56451; additional soil samples be collected for analyses from the bottom and sidewalls of the excavation below any potentially impacted soil; &#56256;&#56451; groundwater be sampled using a method that would ensure the sample not be cross-contaminated from soil sloughinginto the borehole; and &#56256;&#56451; samples be additionally analyzed for Total Petroleum Hydrocarbons as gasoline (TPH-gas).

Potential Media Affected: Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern: Stoddard solvent / Mineral Spriits / Distillates
Site History: Extracted from Green Environment's January 21, 2008 Status report on Subsurface Investigation, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. In February 2003, Bay Area Geotechnical Group (BAGG) conducted an investigation for the City of Redwood City (City) to evaluate subsurface soil and groundwater conditions along and near the new culvert alignment for the Jefferson Branch of the Redwood Creek Storm Drainage Culvert Relocation Project. Borings B-1, B-2, B-3 and B-4 were completed along the new culvert alignment to develop geotechnical criteria for the design and construction of the new culvert. Boring B-2 was completed in the alignment for the new box culvert in the City parking lot, approximately 60 feet east of the 821-831 Jefferson Building. Borings B-1, B-3 and B-4 were completed along other segments of the new box culvert alignment located farther away from the subject properties. Boring B-1 was completed on Jefferson Avenue, approximately 250 feet southwest of the 821-831 Jefferson Building. Boring B-3 was completed in an alleyway approximately 250 feet southeast of the 821-831 Jefferson Building. Finally, Boring B-4 was completed off Middlefield Road, approximately 650 feet southwest of the same building. The boring locations and investigation results were documented in a technical report by BAGG dated March 10, 2003. The February 2003 investigation by BAGG included the collection of soil and groundwater samples from the borings and analyses for total extractable petroleum hydrocarbons as diesel (TEPHd), motor oil (TEPHmo) and kerosene (TEPHk) by Environmental Protection Agency (EPA) Method 8015 with silica gel cleanup; total petroleum hydrocarbons as gasoline (TPHg) with benzene (B), toluene (T), ethylbenzene (E), xylenes (X) and methyl tert butyl

DRAFT

CULVERT REALIGNMENT (Continued) **S103620505**

ether (MTBE) distinction by EPA Methods 8015/8020F; and volatile organic compounds (VOCs) by EPA Method 8260. In addition, the grab groundwater sample from Boring B-4 off Middlefield Road was analyzed for semi-volatile organic compounds (SVOCs) by EPA Method 8270 and polychlorinated biphenyls (PCBs) by EPA Method 8082A. One soil sample from each of the four (4) borings was analyzed for CAM 17 Metals by EPA Method 6010B/7471. The investigation results of Boring B-2 are most relevant to the present investigation because of the proximity of this boring to the subject properties. The analytical results of the grab groundwater sample from Boring B-2 (Sample B-2, 02/19/03) indicated 152 micrograms per liter ("g/L) of TPHg with traces of MTBE (6.4 "g/L) and xylenes (1.2 "g/L). The laboratory reported traces of the following EPA 8260 VOCs: naphthalene (3 "g/L), n-propylbenzene (n-PB: 2 "g/L), 1,2,4-trimethylbenzene (1,2,4-TMB: 1 "g/L) and 1,3,5-trimethylbenzene (1,3,5-TMB: 1 "g/L). In October 2003, chemically impacted soil and water were allegedly discovered during excavation for the installation of the final segment of the new box culvert in the City parking lot to the east of the 2075 Broadway Building. According to BAGG, the analytical results of a soil sample taken on October 7, 2003 from soil stockpiled next to the excavation indicated 47.1 milligrams per kilogram (mg/kg) TPHg with 0.343 mg/kg xylenes and 0.037 mg/kg ethylbenzene. The EPA 8260 analytical results of the same soil sample identified traces of VOCs, namely 22.2 mg/kg acetone, 0.807 mg/kg naphthalene, 0.517 mg/kg 1,2,3-trichlorobenzene (1,2,3-TCB) and 0.332 mg/kg 1,2,4-trichlorobenzene (1,2,4-TCB). The analytical results of a grab water sample taken from the excavation on October 9, 2003 indicated 1.31 milligrams per liter (mg/L) TPHg and 5 mg/L of total oil and grease. In December 2003, BAGG completed three (3) borings in the City parking lot near the culvert reconnection excavation and submitted soil and groundwater samples for laboratory analyses. Up to four soil samples, and one grab groundwater sample, were collected from each boring and submitted for laboratory analyses for TEPHd, TEPHmo and TEPHss by EPA Method 8015; TPHg with BTEX and MTBE distinction by EPA Method 8015/8020F; and VOCs by EPA Method 8260. The maximum concentrations of petroleum hydrocarbons in both soil and groundwater were reported in Boring EB-3 located next to the culvert reconnection excavation, approximately 90 feet east of the 2075 Broadway Building. BAGG reported up to 1,040 mg/kg of TEPHss, 958 mg/kg TEPHd and 792 mg/kg of TPHg in soil samples collected from 6 to 13 feet bgs. The soil data indicated hydrocarbon concentrations in soil attenuated with depth and were not detectable in soil sampled from 19 feet bgs. The analytical results of the grab groundwater sample from Boring EB-3 (Sample 3-W) indicated 317 "g/L TPHg with 38 "g/L naphthalene, 2.1 "g/L xylenes and 1.1 "g/L ethylbenzene, plus 310 "g/L TEPHd and 300 "g/L L TEPHss. By letter dated July 13, 2004, SMCoGPP informed the City that the site of the culvert reconnection and the City parking lot was to be added to the countys regulatory oversight case list based on the elevated hydrocarbon concentrations reported by BAGG in soil and groundwater sampled from Boring EB-3. At the time, the City was named as the Primary Responsible Party because the City owned the parking lot where the contamination was discovered. The case was assigned by SMCoGPP Case No. #339207. In a follow-up letter dated July 14, 2004, SMCoGPP requested that the City investigate and take remedial action to address the chemically impacted soil and groundwater identified below the City parking lot, Case No. 339207 site. In August 2004, the City contracted GEI to further investigate

CULVERT REALIGNMENT (Continued) **S103620505**

the historical occupancy and use history of the City parking lot and surrounding parcels southeast of the intersection of Broadway Street and Jefferson Avenue. The main purpose was to evaluate potential sources for the contamination identified by BAGG at Boring EB-3 and vicinity. GEI reviewed historical aerial photographs dating to the 1940s and Sanborn Fire Insurance Maps dating to the late 1800s with coverage of the area. GEI also reviewed historical documents in the City Building Department, City Fire Department, and City Public Library. GEI reported that a commercial paint store operated at 837 Jefferson Avenue in the 1950s and 1960s and possibly up until 1996, and concluded that historical paint products distribution and storage practices may have contributed to the contaminants identified below the City parking lot and vicinity. In April 2006, GEI completed a subsurface investigation of the parking lots east of the 2075 Broadway and 821-831 Jefferson Buildings. A conduit study and soil and groundwater sampling were performed pursuant to a GEI work plan dated July 21, 2005, and requests by SMCoGPP in letters dated November 16 and March 7, 2005. The conduit study identified an abandoned underground box culvert below the 2075 Broadway Building and adjoining parking lots. The abandoned box culvert and the spatially associated, former west branch of Redwood Creek were listed as a potential preferential pathway for groundwater-borne contaminants in the vicinity of the Broadway and Jefferson intersection. The underground concrete box culvert is approximately 18 feet in width and 7 feet in height, and the bottom is estimated at 9 to 10 feet bgs. The abandoned box culvert extends from the east side of Jefferson Avenue east below the 2075 Broadway Building to terminate at the new box culvert alignment below the City parking lot, approximately 90 feet east of the 2075 Broadway Building. Below Jefferson Avenue west of the building and sidewalk, the box culvert was removed by the City. The April 2006 investigation by GEI included the drilling of seven (7) Geoprobe borings in the parking lots east of the 2075 Broadway and 821-831 Jefferson Buildings. The borings included four shallow borings each to approximately 12 feet depth and designated B-1A, B-3A, B-4A and B-5; one deeper boring to approximately 32 feet depth and designated B-1B; and two additional deeper borings each to approximately 24 feet depth and designated B-3B and B-4B. In addition, GEI installed a shallow groundwater monitoring well, designated MW-1, to approximately 12 feet depth in the City parking lot. Although a limited number of soil samples were submitted for laboratory analyses, the maximum concentration of hydrocarbons and VOCs in soil was reported in a soil sample collected from Boring B-5 . Soil Sample B5d 11.0 from approximately 11 feet bgs contained 2,700 mg/kg TPHg, 700 mg/kg TEPHss and 570 mg/kg of TEPHd, plus 10,000 "g/kg secbutylbenzene (sec-BB), 2,700 "g/kg iso-propylbenzene (iso-PB) and 2,300 "g/kg npropylbenzene (n-PB). Groundwater analytical results for April 2006 identified elevated concentrations of hydrocarbons and VOCs in groundwater sampled from the 12-feet deep Boring B-1A, Boring B-5 and Well MW-1 on the south side of the abandoned box culvert, east of the 2075 Broadway Building. The maximum hydrocarbon concentrations were reported in Boring B-1A (Sample B1d12) with 540,000 "g/L TEPHss, 490,000 "g/L TEPHd and 7,300 "g/L TPHg. VOCs in the groundwater samples included up to 34 "g/L secbutylbenzene (sec-BB), 19 "g/L chloroform, 14 "g/L iso-propylbenzene (iso-PB), 5.5 "g/L tert-butylbenzene (tert-BB), 4.8 "g/L n-propylbenzene (n-PB), 4.8 "g/L 1,2,4-trimethylbenzene (1,2,4-TMB), 4.8 "g/L 1,3,5-trimethylbenzene (1,2,3-TMB), 1.4 "g/L of

CULVERT REALIGNMENT (Continued) **S103620505**

each of dichlorobromomethane (DCBM), ethylbenzene, xylenes and MTBE, and 1.3 "g/L naphthalene. Pursuant to comments and conditions by SMCoGPP presented in letters dated April 10 and May 15, 2007, GEI proposed in July 2007 to collect and analyze additional soil and groundwater samples in the vicinity of the abandoned box culvert. Addendums to the proposed sampling were subsequently issued because of access, safety and underground utilities.

Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	Extracted from EarthTech's July 12, 2005 Soil and Groundater Investigation Work Plan, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The former USTs were located on three formal parcels recognized by San Mateo County for tax purposes. The parcels have or had the following street addresses: 923 Jefferson Avenue, 1020 Middlefield Road, and 1036 Middlefield Road. The City of Redwood City currently uses and manages the three contiguous parcels as a City employee parking lot (923 Jefferson Avenue and 1020 Middlefield Road) and the Redwood City Main Public Library (1036 Middlefield Road). The site is largely covered by an asphalt-paved parking lot with small areas of landscaping, and the Redwood City Main Public Library building is on the eastern part of the site. A driveway/alleyway, railroad tracks, and commercial development across the railroad tracks are immediately to the southwest of the site. Jefferson Avenue and commercial and retail development across Jefferson Avenue are immediately northwest of the site. Middlefield Road and the Redwood City City Hall across Middlefield Road are immediately northeast of the site. Commercial and retail development are immediately southeast of the library building. 923 Jefferson Avenue. Prior to the current use as a parking lot, the land area comprising the 923 Jefferson Avenue parcel was occupied by a large commercial-type building, a U.S. Geological Survey (USGS) topographic base map dating from 1973. The previous business and activity housed within the former 923 Jefferson Avenue building are not known, and the building was demolished some time after 1973. A portion of a 750-gallon UST was encountered in June 1996 during trenching for a Pacific Bell utility relocation project associated with the grade separation project of the railroad tracks and Jefferson Avenue. The UST installation date is unknown. The UST was removed and soil overexcavation was conducted beneath the UST on June 27, 1996. Soil excavation northwest of the former UST location was also conducted as part of the Jefferson Avenue grade separation project in the late 1990s. No additional environmental work has been done at this location since the UST removal and grade separation project. 1020 Middlefield Road. Prior to the current use as a parking lot, the land area comprising the 1020 Middlefield Road parcel was

GRADE SEPARATION (Continued) **S107410884**

occupied by a City of Redwood City municipal building that at various times housed the City Police Station and later the temporary City Hall. In January 1997, a 10,000 gallon, double-walled, fiberglass, unleaded gasoline UST, its associated piping, and the product dispenser pump and island were removed from the property. This 10,000 gallon UST was located approximately 120 feet southwest of the 1020 Middlefield Road building and had been in use at the property since approximately 1986. The 1020 Middlefield Road municipal building was demolished sometime after 1997 and the property has been used as a parking lot since that time. No other environmental work has been done at this location since the UST removal. 1036 Middlefield Road. Prior to the current Redwood City Main Public Library use, the building at 1036 Middlefield Road occupied a much smaller footprint and housed the Redwood City Main Fire Department. This smaller, older building was first expanded in approximately 1975 for the Fire Department, and then was expanded again and converted into the library in 1986. As part of the 1986 expansion and conversion to the library, two USTs were removed from this site, a 1,000-gallon UST previously located along the western exterior wall of the fire station and a 10,000-gallon UST previously located southwest of the original fire station building. Although the 1,000-gallon UST is identified on old architectural drawings as a gasoline UST, a March 1986 San Mateo County field observation record describes soil and water analytical testing results for a 1,000-gallon diesel UST removal. The 10,000 gallon UST removed in 1986 was a gasoline UST. No additional environmental work has been done at the 1036 Middlefield Road property since the UST removals.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

File Location:	Local Agency
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	Extracted from Stantec's FEBRUARY 9, 2010 ADDITIONAL SITE ASSESSMENT REPORT AND SITE CONCEPTUAL MODEL, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The site is located at the southern corner of the intersection of Chestnut Street and Middlefield Road in Redwood City, California. The site is currently developed as a retail ARCO service station with an approximately 1,500-square foot, one-story station building, a fuel dispenser island, and an underground storage tank (UST) complex comprised of four 10,000-gallon gasoline USTs. The site and vicinity currently have eleven groundwater monitoring wells (A-1 through A-4, A-6 through A-8, and A-10 through A-13), three groundwater extraction wells (EW-1, EW-5, and EW-11), two tank cavity wells (TCW-1 and TCW-2), and six shallow soil vapor wells (SV-1 through SV-6). The adjacent property east of the site (1726 Middlefield Road) had a shallow irrigation well on their property. A soil and groundwater investigation status report by PEG dated September 2, 1988, indicates that an investigation was performed in response to the discovery of over one foot of floating product or separate phase hydrocarbons (SPH) in the irrigation well. At an undetermined time, San Mateo County was contacted by the property owner to investigate petroleum hydrocarbon vapors in the cellar at the property. Subsequently, San Mateo County investigated the complaint and did not detect any hydrocarbon vapors at the residence. San Mateo County requested the property owner to abandon the unpermitted irrigation well. The well construction details, and installation and/or abandonment dates are unknown. A subsequent well survey conducted by SECOR in 1999

DRAFT

ARCO #0306 (Continued) **S101438021**

indicated that the well had been abandoned. A 550-gallon waste oil UST was reportedly removed from the site prior to 1988. In July 1988, a soil and groundwater investigation was performed that included installation of four groundwater monitoring wells (A-1 through A-4). Laboratory analysis of soil and groundwater samples collected during the assessment indicated petroleum hydrocarbon impacts to the subsurface. Concentrations of low boiling point hydrocarbons (calculated as gasoline), and high boiling point hydrocarbons (calculated as diesel and oil) were reported in the samples collected. A laboratory note indicates that high boiling hydrocarbons calculated and reported as diesel appeared to be the less volatile constituents of gasoline. In November 1989, a soil gas survey was performed at and in the vicinity of the site utilizing sixteen temporary vapor sample points (VP-1 through VP-16). The soil gas survey confirmed the presence of petroleum hydrocarbon vapors in the subsurface at the site. The highest soil vapor concentration of Total Hydrocarbons as gasoline and benzene, toluene, ethylbenzene, and xylenes was detected in vapor point VP-5, located adjacent to the former gasoline UST cavity. Groundwater monitoring wells A-5 through A-10 were installed during this phase of investigation. In June 1990, monitoring well A-9 was destroyed to allow Redwood City to install a water main in the intersection of Middlefield Road and Chestnut Street. On August 15, 1990, excavation work by the Redwood City Department of Public Works revealed approximately two-inches of SPH and gasoline odors in an excavation located near the intersection of Middlefield Road and Chestnut Street. SPH and groundwater were reportedly removed from the excavation before it was backfilled. Conductor casing was placed in the excavation before backfilling to allow for installation of a future extraction well. In September 1990, GeoStrategies Incorporated (GSI) performed two aquifer tests including a step-down test and constant-rate yield test using EW-5 (formerly A-5) as the extraction well, while measuring aquifer drawdown in A-3 and A-4. The aquifer tests were performed to facilitate selection of an effective remedial technology for the site. The groundwater table elevation was reported to have been influenced in all onsite and offsite monitoring wells during the aquifer tests. Transmissivity values using the Cooper-Jacob Method ranged from 370 gallons per day per foot (gpd/ft) to 8,123 gpd/ft with an average transmissivity value of 5,341 gpd/ft. The average transmissivity value calculated using the Theis method was 5,724 gpd/ft. Between November 1990, and January 1991, three 6,000-gallon gasoline USTs were removed from the site. These tanks were replaced with the four current 10,000-gallon USTs in a location farther to the west of the former USTs. Soil samples collected during the UST removal were analyzed and reported with concentrations of volatile petroleum hydrocarbons as gasoline (VPHg), and BTEX. Due to space constraints at the site, the lateral extent of hydrocarbon-impacted soil was not completely characterized. The former UST cavity was excavated to approximately 9.5 feet bgs and backfilled with clean, imported soil. In preparation for installation of the new USTs, the current gasoline UST cavity was excavated to approximately 25 feet wide by 50 feet long by 15 feet deep to the north of the former gasoline UST cavity. During UST replacement activities, approximately 1,550 cubic yards of petroleum hydrocarbon-impacted soil and approximately 35,000 gallons of hydrocarbon-impacted groundwater were removed and disposed offsite. In August 1991, ten soil borings (SB-1 through SB-10) were advanced along Chestnut Street. Soil samples were

ARCO #0306 (Continued) **S101438021**

collected at multiple depths from the borings and were all reported with TPHg concentrations below the laboratory method reporting limit. In November 1991, a groundwater extraction and treatment (GET) system, consisting of extraction pumps and product skimmers placed in EW-5 (formerly well A-5) and EW-11 (installed in 1991) was installed and operated at the site. The CEW Groundwater Extraction System Start-up Testing and Monitoring Report dated May 8, 1992(b) indicates that as of January 24, 1992, approximately 60 gallons of SPH were removed through the skimmers at the site. During operation of the GET system from November 1991 to October 3, 1995, approximately 8,105,456 gallons of hydrocarbon-impacted groundwater were extracted, treated, and discharged at the site (SECOR, 1995a). An additional 27,113 gallons of groundwater were reported to have been extracted between October 3 and October 10, 1995 for a total of approximately 8,132,569 gallons. The GET system was shutdown on October 10, 1995 to evaluate system performance and has not been restarted. Based on a review of available historical site remediation data, it does not appear that well EW-1 was used in GET system operations. In May 1992, Environmental Bio-Systems Incorporated advanced one soil boring at 1726 Middlefield Road. Soil samples were reportedly collected at approximately 8 and 9 feet bgs. According to the SECOR document, TPHg was reported at concentrations of 290 mg/kg and 410 mg/kg, respectively. Benzene was not detected at or above the laboratory detection limits in either soil sample collected. In March 1993, two wells (A-11 and A-12) were installed north-northeast of the site to characterize the lateral extent of dissolved petroleum hydrocarbons downgradient of the site. Wells A-11 and A-12 were installed to depths of 20 and 22 feet bgs, respectively. The wells were subsequently incorporated into the quarterly monitoring and sampling program . On May 6, 1993, eight soil borings were advanced at 1726 Middlefield Road. Soil borings SB-1 through SB-3 and WP-1 through WP-5 were advanced to total depths of approximately 14 to 16 feet bgs. Five of the eight borings were completed as temporary well points and groundwater samples collected from these points were analyzed for TPHg and BTEX compounds. The data collected during the sampling activities indicated that petroleum hydrocarbons exist in soil and groundwater beneath the property. In June 1993, two air sparging wells (ASW-1 and ASW-2) and one extraction well (EW-1) were installed. Soil vapor extraction and air sparging pilot tests were performed at the site on June 15 and 16, 1993. The pilot test was performed to: 1) gather data on subsurface characteristics of the site; 2) use these data to evaluate the potential to remediate the site using soil vapor extraction and air sparging; and 3) maximize hydrocarbon mass removal during the test. Wells EW-1 and A-5 (later renamed EW-5) were used as soil vapor extraction wells during the pilot test. Optimum soil vapor extraction flow rates from the two wells were estimated to be approximately 23 standard cubic feet per minute (SCFM) at 46 to 80 inches of water column vacuum (H2O). Optimum air sparging flow rates varied at each sparging well. A lower flow rate and higher pressure was observed while sparging at well ASW-2 indicating a less permeable subsurface formation in the area. A higher flow rate with lower pressure was observed while sparging at well ASW-1 indicating a more permeable subsurface formation. In the report, CEW concluded that soil vapor extraction may be effective at removing hydrocarbons from the subsurface and that air sparging appeared to increase extracted hydrocarbon vapor concentrations. Based on their review of the 1993 CEW pilot test data, a vapor

DRAFT

ARCO #0306 (Continued) **S101438021**

extraction (VE) flow rate of 10 to 15 cubic feet per minute (CFM) was achieved by CEW at a vacuum of approximately 50 H2O vacuum. Using the induced vacuum data collected during CEWs pilot test, SECOR estimated an effective VE radius of influence of approximately 25 feet. Soil vapor TPHg concentrations during the CEW pilot test before air sparging (AS) ranged from 5,500 micrograms per liter ("g/L) to 9,000 "g/L. With the addition of AS, soil vapor TPHg concentrations were 14,000 "g/L, 2,200 "g/L, and 14,000 "g/L. SECOR noted that due to the sporadic nature of the concentrations during the CEW pilot test, it was difficult to determine the effectiveness of AS at the site. Therefore, SECOR conducted a VE/AS pilot test on December 13, 1994, using well A-3 as the VE well and well ASW-1 for AS. Well A-3 was selected as the VE well because it was constructed with the largest available screen interval from 5 to 25 feet bgs. The optimum VE flow rate from well A-3 during the test was approximately 1.2 CFM at 80 H2O vacuum. At higher VE flow rates, significant upwelling occurred that shut down the internal combustion (IC) engine used during the pilot test. The optimum AS injection rate for ASW-1 was approximately 4.4 CFM at a maximum pressure of 5 pounds per square inch (PSI). The AS injection rate was higher than the VE flow rate indicating that full contaminant capture may not been achieved. A significantly lower VE flow rate of approximately 1 CFM and lower soil vapor TPHg concentration of 24 "g/L was observed during the SECOR VE/AS pilot test. The AS radius of influence was conservatively estimated to be approximately 12 feet. In review of radius influence data, SECOR noted the predominantly clay soil type beneath the site had low permeability while the more permeable sandy soil appeared to be relatively thin and laterally discontinuous resulting in the possible creation of local areas of preferential flow. SECOR concluded that VE/AS may be effective at removal of hydrocarbons in both the unsaturated and saturated zones. SECOR submitted a Well Survey Results report dated February 1, 1999. The well survey area encompassed a 1,405-foot radius to characterize the downgradient areas and a 200-foot radius for the upgradient areas. SECOR received a total of 44 responses to 536 well survey questionnaires distributed. In addition to the questionnaires received, SECOR also received 24 verbal responses. Fourteen wells were discovered in the survey area. Five of the fourteen wells were either not in use or were of unknown use to the occupants and the other nine wells were used for irrigation. No domestic drinking water wells were discovered. On October 28, 2000, a five-day (120-hour) dual-phase extraction (DPE) event using high vacuum extraction was initiated at the site. The average influent flow rate measured approximately 150 SCFM while extracting from EW-5 and EW-11. During the 120-hour DPE event, approximately 17 pounds (2.86 gallons) of petroleum hydrocarbons were removed from the subsurface. Approximately 18,000 gallons of groundwater were removed during the DPE pilot test. On May 5, 2003, all dispensers and related double-walled fiberglass piping were removed and replaced by B&M Construction. Results of soil sample analyses reported concentrations of TPHg ranging from <0.3 parts per million (ppm, D4-3) to 5.5 ppm (D2-3) and benzene ranging from <0.0015 ppm (D4-3) to 0.56 ppm (D2-3). On February 10, 2006, Gregg Drilling installed two soil vapor wells (SV-1 and SV-2) onsite in order to characterize shallow soil vapor south and west of the former UST complex. The soil vapor samples collected from soil vapor wells SV-1 and SV-2 reported TPHg at concentrations of 32,000 parts per million by volume (ppmv) and 2,600 ppmv, respectively; and benzene

DRAFT

ARCO #0306 (Continued) **S101438021**

concentrations of 320 ppmv and 7.2 ppmv, respectively. None of the samples analyzed contained concentrations of MtBE, TBA, DIPE, EtBE or TAME above laboratory reporting limits. However, MtBE was reported at a concentration of 1.1 ppmv in the SV-1 duplicate sample. In a letter dated May 17, 2007, the San Mateo County Health Department directed submittal of a Feasibility Study/ Corrective Action Plan (FS/CAP). In response, SECOR prepared a Corrective Action Plan and Site Conceptual Model dated July 16, 2007(b). In the CAP, SECOR concluded Given that the site is an active service station and is anticipated to remain an active station for the foreseeable future, SECOR believes that monitored natural attenuation is the best course of action until land use changes. At that time, shallow soil impacted with gasoline at the site can be excavated to remove any residual source material. In a letter dated January 3, 2008, GPP noted their review of the SECOR CAP and directed submittal of an addendum to the Corrective Action Plan and Site Conceptual Model. In response, Stantec (formerly SECOR) submitted a Revised Corrective Action Plan and Site Conceptual Model (Revised CAP/SCM) dated March 12, 2008. In a letter dated December 17, 2008, the GPP noted their review of the Revised CAP/SCM and directed submittal of a revised SCM and workplan for additional site assessment. Stantec submitted an Addendum to Workplan for Additional Site Characterization dated March 25, 2009. GPP reviewed the Stantec Addendum to Workplan for Additional Site Characterization dated March 25, 2009, and approved the scope of work in a letter dated May 13, 2009. Additional site assessment work conducted per the GPP directive is documented in this report.

Environmental Interest/Information System
AIR EMISSIONS CLASSIFICATION UNKNOWN

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and

FINDS:

Registry ID: 110000784125

Environmental Interest/Information System

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110001153787

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS AIR POLLUTANT MAJOR

Local Agency:	SAN MATEO COUNTY LOP
RB Case Number:	41S0195
File Location:	Local Agency
Potential Media Affected:	Not reported
Potential Contaminants of Concern:	Diesel, Gasoline
Site History:	The site is a former automotive repair facility with a gas station/fueling facility located next to a dry cleaning operation. Total petroleum hydrocarbons, predominantly in the kerosene range, are present in soil and groundwater. Assessments conducted in 2012 to 2013 attributed the source of the petroleum hydrocarbon contamination to a release of Stoddard solvent from the neighboring drycleaner. No further action was required to address the residual petroleum hydrocarbons at the former Motloch Parcel under current land use conditions.

File Location:	Local Agency
Potential Media Affect:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Gasoline
Site History:	Extracted from Blue Rock Environmental's November 18, 2005 Compilation of Historical Data report and Workplan Addendum, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The site is known in this context as the Former Broadway Produce & Flowers. It is located at 1870 Broadway in Redwood City, California. The location is near the center of downtown area of Redwood City, where property use is almost exclusively commercial in nature. Use of the adjoining properties includes (1) Grocery Outlet to the south, (2) Wells Fargo Bank to the west, and (3) Kaiser Permanente medical facility to the north and east. The site is a triangular shaped property, with Broadway forming the base on the southern border, Walnut Street forming the height on the western border, and Spring Street forming the hypotenuse on the northern border. The site was previously used as a gasoline service station. Later it was redeveloped into a two-story office building. The office building is rectangular in shape and is located along Walnut Street. A parking lot is located in the center of the property, with entrances both on the north and south sides. A large planted area occupies the eastern side of the site. In May 1988, five USTs were removed from the former service station. The USTs included three 2,000-gallon gasoline USTs and one 8,000-gallon gasoline UST in a common pit located near the southwest corner of the site, and one 400-gallon used oil UST in a separate pit located north of the former service station building. Photographs of the site in GPP files for the site in 1990 show the former building, but the dispensers islands have been removed. Based on the orientation of concrete cuts observed in the photograph, it appears the former dispensers were located south of the former station building and east of the former fuel USTs. In July 1988, approximately 100 cubic yards of backfill material were excavated presumably from the gasoline UST pit, allowed to aerate, then returned to the pit. In January 1994, approximately 2,400 cubic yards of soil was overexcavated from the north and east sides and from beneath the former fuel UST pit, and stockpiled onsite. The stockpiled soils were transported to and disposed at a Class I1 landfill (Forward) and a Class I11 landfill (Vasco). The depth of excavation was approximately 13 to 14 feet bgs, and with

DRAFT

BROADWAY PRODUCE & FLOWERS, FORMER (Continued) **S100179784**

dimensions of approximately 55 feet by 70 feet. Verification soil samples were only collected from the north and east sidewalls at a depth of approximately 9 feet bgs (i.e. -depth of water table). The excavation verification soil samples contained TPHg concentrations ranging from 180 to 2,300 mg/kg. The overexcavation was lined on the bottom and sides with filter fabric and then backfilled with drain rock to depth of approximately 7 feet below grade. A layer of filter fabric was then laid over the top of the drain rock fill. Imported cohesive backfill material was then placed over the filter fabric and compacted up to grade. In April 1994, an additional 594 cubic yards of soil created from redevelopment related excavation was reportedly suspected to contain hydrocarbons and was stockpiled. Later in 1994 it was transported to and disposed at the Vasco landfill. Remediation work consisted of the aforementioned dig and haul work. In addition, during the backfill of the overexcavation, piping and wells were installed into the backfill for potential remediation use. Wells EW-1 and EW-2 consist of the following construction: a 4-inch diameter PVC drainpipe was placed horizontally in the backfill at depth of approximately 12 feet below grade, and coupled to a 6-inch diameter PVC riser. The drainpipe is approximately 55 feet long runs diagonally at a northwest strike in the backfill. It does not appear these backfill wells were ever used for pilot testing or remediation. A two-story office building and a parking lot were built on the premise in 1994 and this remains the site configuration today. In August 1988, monitoring- well MW-1 was installed north of the former gasoline USTs. Low concentrations of gasoline constituents were detected in a soil sample collected from a depth of 8.5 feet bgs . Low concentrations of TPHg were detected groundwater samples subsequently collected in four quarterly events from MW-1. In May 1992, two additional monitoring wells, MW-2 and MW-3 were installed and five soil borings (SB-1 through SB-5) were advanced. It appears that the casing elevations for MW-1, MW-2, and MW-3 were surveyed in June 1992, but no horizontal coordinates were obtained, as was the common practice at the time. In preparation for the remedial excavation and site redevelopment work, MW-I was properly destroyed in September 1993. In December 1994, nine more borings (B-1 t rough B-9) were drilled around the site and monitoring well MW-4 was installed. The casing elevations for MW-2, MW-3, MW-4, EW-1 and EW-2 were resurveyed in December 1994, but, again, no horizontal coordinates were obtained. In July 1998, an additional five borings were drilled in a north-south line, also designated SB-1 through SB-5, but located east of the original set of soil borings called SB-1 through SB-5 In September 1998, five more monitoring wells (MW-5 throug MW-9) were installed. Surprisingly, it does not appear that either casing elevations or horizontal coordinates for these wells were ever surveyed. Soils are predominately fine-grained, mostly clay but some clayey sand and fine-grained sand have been logged below approximately 14 feet bgs. The depth to groundwater is relatively shallow at approximately 8 feet bgs. Previous consultants have reported groundwater flow directions ranging from the northwest to northeast, with relatively shallow groundwater gradients of approximately 0.001 ft/ft. The last groundwater sampling event was conducted in October 1999, which included all wells except MW-1 (which was previously properly destroyed) and EW-2 (status unknown). TPHg concentrations ranged from 60 ug/L (MW-6) through 1,400 ug/L (MW-3), MTBE concentrations ranged from 0.5 (five wells) to 20 ug/L (MW-3), and benzene concentrations ranged from <0.5 (seven wells) to

BROADWAY PRODUCE & FLOWERS, FORMER (Continued) **S100179784**

12 ug/L (MW-3), in water samples collected from the wells.

File Location: All Files are on GeoTracker or in the Local Agency Database
Potential Media Affect: Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern: Gasoline
Site History: Borings advanced onsite. Based on soil and groundwater analytical there appears to have been a release to both from the former service station. Additionally, solvents PCE/TCE were detected in groundwater and may be from upgradient dry cleaner.

Potential Media Affect: Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern: Gasoline
Site History: Extracted from ERI's December 12, 2007 Evaluation of Case Closure Criteria report in Geotracker, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. 1951 One 500-gallon single-walled used-oil tank and one 6,000-gallon single-walled UST were installed at the subject site. 1955 One 2,000-gallon single-walled UST and three 6,000-gallon single-walled USTs were installed at the subject site. There are no records available that indicate whether or not the 500-gallon used-oil tank

DRAFT

GRANT CORPORATION YARD (Continued) **U001594561**

and 6,000-gallon UST tank installed in 1951 were removed. February 1999 The County oversaw the removal of four USTs on February 16, 1999. One 2,000-gallon and three 6,000-gallon tanks were removed as a result of upgrading the fueling system. There were no visible holes or leaks apparent in the USTs. Soil samples were collected from the UST excavation sidewalls prior to and following over-excavation, and from beneath the former dispensers, fuel pipelines, and vent line locations. Laboratory analytical results of the soil samples collected from beneath the former dispensers and associated piping indicate the presence of total petroleum hydrocarbons as diesel (TPHd) at concentrations up to 14 milligrams per kilogram (mg/kg), total petroleum hydrocarbons as gasoline (TPHg) up to 2.0 mg/kg, methyl tertiary butyl ether (MTBE) up to 0.65 mg/kg, and total lead up to 19 mg/kg. Benzene, toluene, ethylbenzene, and total xytenes (BTEX) were not present above laboratory reporting limits in the samples collected from beneath the former dispensers and associated piping. Soil samples collected from the sidewalls of the UST excavation indicate the presence of TPHd up to 1,500 mg/kg, TPHg up to 79 mg/kg, MTBE up to 42 mg/kg, benzene up to 0.61 mg/kg, and total lead up to 17 mg/kg. Approximately 800 cubic yards of soil generated during the UST excavation was transported to County property (APN 095-220-140) located north of the San Mateo County Airport in San Carlos, California pending characterization for disposal andfor reuse as fill. October 2000 Atlas Engineering Services, Incorporated (Atlas) observed the installation of eight soil borings (B1 through B8) to evaluate the extent of hydrocarbon-impacted soil and groundwater adjacent to the former USTs. Concentrations of TPHd and TPHg were detected in soil samples collected from these borings at 1,500 mg/kg and 1,300 mg/kg, respectively. Concentrations of MTBE were detected in these samples up to 0.42 mg/kg. Concentrations of BTEX were detected in soil samples up to 3.4 mg/kg, 2.6 mg/kg, 43 mg/kg, and 150 mg/kg, respectively. March 2002 Atlas observed the installation of three groundwater monitoring wells (MW-1 through MW-3) to evaluate the lateral extent of dissolved-phase petroleum hydrocarbons in groundwater, the groundwater flow direction, and the hydraulic gradient of groundwater underlying the site. Quarterly monitoring of these wells began during first quarter 2002. February 2003 Groundwater monitoring well MW-4 was installed on site near the former dispensers. November 2003 ERI collected soil samples from the stockpile located at the Airport for analyses. The results of the analyses indicated that the total lead concentrations precluded acceptance for disposal at select landfills. June 2006 ERI observed the drilling of soil boring B9 at the subject site. Soil boring B9 was advanced to 20 fbgs to assess groundwater north of the former USTs and in the vicinity of previous soil borings B5 and B6. Groundwater monitoring has been conducted episodically at the site since March 2002. Since February 2005, monitoring has been performed annually, during the first quarter of each year. ERI performed a file review at the County, a well completion records search at the DWR, and a thorough review of ERI records and archives. ERI was unable to gather any information on the history of the 1951 and 1955 USTs other than the date of installation.

RB Case Number: 41-1178
File Location: Regional Board
Potential Media Affected: Under Investigation
Potential Contaminants of Concern: * Solvents, Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History: THIS SITE IS NOW PART OF THE SEQUOIA STATION SHOPPING CENTER, A 13 ACRE SITE MADE UP OF A NUMBER OF FORMERLY SEPARATE PARCELS. A LARGER PCE PLUME FROM THE ROY'S DRY CLEANER SITE (41S0103) EXTENDS FROM EL CAMINO REAL ACROSS THE SOUTHER PORTION OF SEQUOIA STATION. RITZ CLEANERS IS ON THE NORTHERN SIDE OF SEQUOIA STATION. PCE CONTAMINATED SOIL WAS REMOVED TO THE EXTENT PRACTICAL FROM THE RITZ SITE IN 1993. SOME CONTAMINATED SOIL BELOW THE VADOSE ZONE COULD NOT BE EXCAVATED DUE TO THE THREAT OF UNDERMINING A LARGE CULVERT FOR REDWOOD CREEK.

Case Type: Cleanup Program Site
Case Worker: Not reported
Local Agency: SAN MATEO COUNTY LOP
RB Case Number: Not reported
File Location: All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected: Under Investigation
Potential Contaminants of Concern: Dichloroethene (DCE), Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History: The information below is from the 2/25/14 workplan prepared by Responsible Party's consultant. The San Mateo County Local Oversight Agency makes no representation as to the accuracy of the information. In 2014 Tetra Tech performed a Phase I Environmental Site Assessment (Phase I ESA) of five adjacent parcels of land located at the northeast corner of the intersection of Middlefield Road and Marshall Street in downtown Redwood City. Findings of the Phase I ESA were presented in a report dated August 12, 2014. The property assessed consisted of assessor parcel numbers (APNs) 052-347-050, -040, -030, -130, and -140, with corresponding present-day street addresses of 611 Middlefield, 621 Middlefield, 627 Middlefield, 655 Middlefield / 611 Marshall, and an asphalt parking lot east of the 601 Marshall building with no present-day address (formerly 650 and 660 Jefferson Avenue), respectively. The Phase I ESA was prepared in connection with the potential acquisition and redevelopment of the property with an 11-story office building. The office building will cover the entire footprints of four of the parcels, with the single family home at 611 Middlefield Road (APN 052-347-050) not part of the redevelopment project. Based on findings of the Phase I ESA, a Screening Level Phase II ESA was performed in the parking lot east of the 601 Marshall Street building, in the former location of a building at 660 Marshall Street that historical records indicated was the site of a printed circuit board manufacturing facility in the 1960s. The business name was identified as Circuitron in Redwood City Building Department files, with a Use Permit No. 61-05 dated January 24, 1961 for the purpose of electro plating of electrical printed circuit boards. The business was identified with a notation of Electronics Lab on 1962 and 1968 Sanborn Insurance maps. Findings of the Phase II ESA were presented in a report dated November 3, 2014. The Phase II ESA report summarized the findings of the Phase I ESA and presented the results of the soil and groundwater investigation. The former Circuitron building measured approximately 40 feet by 40

DRAFT

660 JEFFERSON (Continued) **S117338940**

feet, and the parking lot parcel measures 100 feet by 100 feet. The Phase II ESA revealed shallow groundwater underlying a portion of the parking lot area to be impacted by trichloroethene (TCE), and to a lesser extent other volatile organic compounds (VOCs) including tetrachloroethene (PCE, or perc) and cis-1,2-dichloroethene (cis-1,2-DCE). The shallow groundwater was first encountered at approximately 21 to 24 feet in depth. Soil samples showed sporadic detections of VOCs at low concentrations, below corresponding agency screening levels, with one exception of an isolated benzene detection above screening levels. The location of sanitary sewer laterals on and near the Property was assessed by reviewing a portion of a public works sewer diagram; a copy of the drawing is provided in Appendix A (Note: the yellow highlighting on the sewer laterals closest to the Property was added by Tetra Tech for clarity). The lateral locations are also shown on Figure 3. The location of sewer piping can be important, as discharge of wastewater to the sanitary sewer may have been a common practice in the 1960s at plating operations. In this case, the Circuitron building was quite small as compared to other printed circuit board manufacturing and plating operations in the Silicon Valley area; a sewer lateral leaves the Property north and west of the former Circuitron building. Presumably, a sewer line ran from the building to one or both of the lateral locations to the north or west of the former building location. City files were reviewed on two occasions in attempts to discern the location of sanitary sewer lines exiting the former Circuitron building, but neither design drawings nor as-built drawings of the former building are on-file at the City. Submittal of the Phase II ESA report to the County resulted in theCounty opening up a case under the Countys Voluntary Cleanup Program.

Event date: 09/22/2003
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

DRAFT

DUOLITE INTERNATIONAL INC. (Continued) **S104493980**

Local Agency:	Not reported
RB Case Number:	41S0019
File Location:	Regional Board
Potential Media Affected:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Other Chlorinated Hydrocarbons, Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History:	The groundwater plume has co-mingled with downgradient plumes. Onsite contamination has been remediated; long-term monitoring of offsite plume. Site has been completely redeveloped into an office park since ~2001. Despite listing on some databases, this was never a Superfund or NPL site.

Lead Agency:	SAN MATEO COUNTY LOP
Lead Agency Case Number:	339235
Latitude:	37.48724
Longitude:	-122.22307
Case Type:	Cleanup Program Site
Case Worker:	DGM
Local Agency:	SAN MATEO COUNTY LOP
RB Case Number:	Not reported
File Location:	All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected:	Other Groundwater (uses other than drinking water), Soil, Soil Vapor
Potential Contaminants of Concern:	Dichloroethene (DCE), Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History:	Investigation conducted at 1800 Broadway downgradient of this site reported the presence of PCE and daughter products in the groundwater. 1800 Broadway was historically occupied by a gas station. Investigation was requested of this property to determine if it is the source of the contamination detected downgradient.

File Location:	All Files are on GeoTracker or in the Local Agency Database
Potential Media Affected:	Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern:	Diesel, Gasoline
Site History:	On April 3, 2015, Bureau Veritas North America Incorporated submitted to San Mateo County Groundwater Protection Program (GPP) staff the data obtained from the drilling of Borings BV-1 and BV-2 on the subject site. Up to 1,600 mg/kg of TPH as gasoline was reported in saturated zone soil and up to 11,000 ug/l of TPH as gasoline, 150,000 ug/l of TPH as diesel, and 73,000 ug/l of TPH as motor oil were reported in groundwater near the sump. These concentrations significantly exceed the Table F-1a Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) for beneficial groundwater use. Although contaminant concentrations exceeding ESLs do not necessarily indicate an unacceptable risk to human health and the environment, they do indicate further investigation is warranted to evaluate the extent and potential impact of the contamination. Therefore, GPP staff have opened an environmental oversight case under our voluntary cleanup program in accordance with California Health and Safety Code (CH&SC) Sections 101480 and 25260.

Potential Contaminants of Concern:	Gasoline
Site History:	Extracted from Green Environment's March 3, 2010 SITE CLOSURE SUMMARY REPORT, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The property consists of a rectangular parcel identified as San Mateo County Parcel No. 053-205-040. The parcel of approximately 6,000 square-feet measures fifty (50) feet wide and one-hundred-and-twenty (120) feet long. The parcel is relatively flat and surface elevation is at approximately nine (9) feet above mean sea level. In a predominantly commercial area of Redwood City, the property is improved with a two-story building of concrete construction. The ground floor is commercial office space, and the second floor is residential. The north end of the subject property consists of a concrete surfaced yard, approximately 50 feet by 30 feet in area, used for parking and building access from Marshall Street. Historical documents indicate the building and other property improvements were constructed in the late-1950s. An ambulance service firm, Peninsula Ambulance, occupied the premises from the late-1950s to mid-1970s. The northeast portion of the buildings ground floor was used for office space, and the northwest portion served as a garage for vehicles. From the mid-1970s to 2000s, the subject property was occupied by a flower sales business, Aloha State Flowers, Inc. (Aloha Flowers). Since then, the building has been leased out to various commercial firms for office and storage space. The buildings second floor has been used as a residential dwelling. In March 1986, one (1) 550-gallon capacity UST was excavated and removed along with the dispenser from the north end of the subject property. The UST system was used for the storage and dispensing of gasoline until approximately the mid-1980s. The tank pit measured approximately 10 feet by 7 feet in area. On March 12, 1986, after the tank was removed, Blaine Tech reportedly collected soil and groundwater samples from the tank pit. The analytical results of two (2) soil samples taken from the pit sidewalls indicated, respectively, 130 and 290 milligrams per kilogram (mg/Kg) of total petroleum hydrocarbons as gasoline (TPHg) as quantified via Environmental Protection Agency (EPA) Method 8015M. The analytical results of a grab groundwater sample taken from the tank pit indicated 38,000 micrograms per liter ("g/L) of TPHg. By letter dated

ALOHA STATE FLOWERS, INC. (Continued) **S104161770**

October 3, 1990, the San Mateo County LUFT Enforcement Program requested Aloha Flowers to implement investigation and remedial action to address the release of petroleum hydrocarbons from the former UST system. June 1992 to November 1993: In May and June 1992, Brunsing Associates, Inc. (BAI) completed three (3) exploratory borings (B-1, B-2 and B-3) adjacent to the east, south and west sides of the former UST pit, respectively. A groundwater monitoring well (MW-1) was installed in June 1992 on the north side of the former UST pit. From June 1992 to November 1993, Well MW-1 was gauged for depth-towater and sampled on a quarterly frequency. January 1994 to May 1997: In January 1994, BAI completed an additional boring (B-4) east of the former UST pit, and installed two (2) groundwater monitoring wells. Well MW-2 was installed on-site near the former fuel dispenser at the northwest corner of the subject property. Well MW-3 was installed off-site on Marshall Street to the north of the subject property. From February 1994 to May 1997, BAI conducted quarterly groundwater monitoring of Wells MW-1, MW-2 and MW-3. The results were presented in technical reports by BAI. In July 1995, BAI completed six (6) borings (B-5 to B-10) to evaluate soil and groundwater impact off-site and in the vicinity of underground utilities. Boring B-5 was completed northwest of the former dispenser on the adjoining property at 1738-1740 Broadway Street. The remaining borings (B-6 to B-10) were completed to the north of thesubject property on Marshall Street. In December 1995, a Site Conceptual Model (SCM) and risk assessment was completed by BAI that identified a potential building soil-gas intrusion concern with the subject property building. The risk assessment concluded that potable well water, recreational use, and sensitive ecological habitat exposure pathways were not significant for the subject case. March 1998 to June 2001: In 1998, SMCoGPP approved a reduction in the groundwater monitoring frequency from quarterly to semi-annual. Based on depth-to- water and well survey data for 1994 to 2001, groundwater flow was inferred by BAI to be predominantly north-northeast to north-northwest with a gradient ranging from 0.001 to 0.003 ft/ft. Groundwater monitoring results for 1998 to 2001 were presented in technical reports by BAI. In March 1998, BAI performed a soil vapor extraction (SVE) pilot test in the former UST area, the pilot test included one (1) temporary vacuum probe (SVE-1) and three (3) temporary soil vapor probes (P-1, P-2 and P-3). BAI concluded SVE to be a feasible remediation technology, and estimated the radius of vapor-extraction influence to exceed twenty-five (25) feet. A remedial action plan for soil vapor extraction was prepared by BAI. Between April and August 2000, BAI installed a soil vapor extraction and treatment system that included two (2) soil vapor extraction wells (SVE-1 and SVE-2) in the former UST area. The remediation system operated intermittently from August 2000 until May 2001 when the system was shut down. July 2001 to December 2001: In response to a request by SMCoGPP (July 11, 2001) for further site characterization, BAI completed Boring B-11 in December 2001 southwest of the former UST pit, and Boring B-12 in April 2002 northeast of the former dispenser. Based on a well and sensitive receptor survey completed in December 2001, BAI reported no potential water wells within three-hundred (300) feet of the subject property, and no municipal water wells within the city limits of Redwood City. The nearest surface waters were identified as Redwood Creek, approximately 1,350 feet to the northwest, and the San Francisco Bay approximately 500 feet to the northeast, of the subject property.

ALOHA STATE FLOWERS, INC. (Continued) **S104161770**

October 2002 to November 2004: In a work plan dated October 24, 2002, BAI proposed remedial excavation in the area of the former dispenser, the dismantling of the vapor extraction and treatment system, and the permanent destruction of the vapor extraction and groundwater monitoring wells. In May 2003, Borings B-13 to B-16 were completed to further characterize subsurface conditions near the former dispenser. Groundwater monitoring Wells MW-1 and MW-2, and vapor extraction Wells SVE-1 and SVE-2 were destroyed in March 2004. Groundwater monitoring Well MW-3 was destroyed in October 2004. In November 2004, the area around the former dispenser was excavated by BAI to approximately 5.5 feet depth. Soil beneath a gas, electrical and telecommunication utilities corridor that crossed the area of excavation was reportedly left in-situ so as to maintain the integrity of the utilities servicing the subject property building. Approximately thirty (30) cubic yards of soil were removed and off-hauled to a landfill for disposition. Confirmation soil samples for laboratory analyses were taken from the floor and sidewalls of the excavation. The excavation was backfilled and compacted with imported fill. April 2005 to October 2005: By letter dated April 5, 2005, SMCoGPP requested a work plan for further soil and groundwater characterization around Boring B-12, and south of Borings B-11 and B-14. In a letter response dated May 3, 2005, BAI argued for no further work and regulatory case closure. By letter dated September 9, 2005, BAI similarly petitioned the Regional Board for case closure. The petition for case closure was denied by SMCoGPP by letter dated September 12, 2005, with greater discussion presented in a follow-up letter dated October 20, 2005. In February 2006, the Regional Board followed suit and agreed with SMCoGPPs recommendation for additional work before closure could be granted . SMCoGPP denied case closure for the following reasons: (i) the potential for NAPL at Boring B-12 had not been evaluated; (ii) dissolved-phase hydrocarbons south of Borings B-11 and B-14 had not been sufficiently assessed; and (iii) site data remained to be entered into the State's Geotracker database. However, SMCoGPP suggested at the time that 1260 Marshall Street met most of the low risk criteria for case closure. July 2006 to November 2006: In July 2006, GEI took over from BAI the project and prepared a work plan to address the issues identified by SMCoGPP. In August 2006, a sub-slab soil-gas sample was collected via a soil-gas sampling probe (SV-1) in the former garage area inside the subject property building. In September 2006, two (2) borings (B-17A and B-17B) were completed near Boring B-12, and Boring B-18 was completed next to Probe SV-1. Soil and groundwater samples were collected from the borings for laboratory analyses. The results of the August-September 2006 investigation were presented in GEI. Elevated concentrations of fuel hydrocarbons were detected in the soil and groundwater sampled from Borings B-17B and B-18. Fuel hydrocarbons (TPHg, BTEX, MTBE) were not detected in soil gas sampled at Probe SV-1, suggesting vapor intrusion into the buildings garage space may not be significant. July 2007 to November 2007: In July 2007, GEI advanced three (3) borings (B-19, B-22 and B-23) to the west, south, and east of Boring B-18, respectively, to further evaluate groundwater impact below the buildings footprint. Following the recommendation of SMCoGPP, GEI conducted in November 2007 a utilities assessment to identify the location and depth of underground utilities and evaluate the potential for preferential pathways for groundwater-borne contaminants along utility trench backfill. The utilities assessment concluded that on-site sewer,

Draft

ALOHA STATE FLOWERS, INC. (Continued) **S104161770**

water, and other utilities were set within less than three (3) feet depth. The municipal water, natural gas, electrical, and telecommunication lines below Marshall Street were also estimated to be buried within less than three (3) feet depth. Because these utility alignments were above the static water table, preferential pathway for groundwater movement was not considered to be significant along these shallow utilities. Municipal storm and sanitary sewers north and downgradient of the subject property were set deeper, about or below the water table, and were identified as potential preferential pathways for groundwater below Marshall Street: (i) A twenty-four (24) inch diameter, reinforced concrete pipe (RCP) storm water sewer extends east-west below Marshall Street, approximately eighteen (18) feet north of the subject property. Set at between five (5) and seven (7) feet depth, the 24-inch RCP pipe slopes and drains to the west. (ii) A ten (10) inch diameter vitrified clay pipe (VCP) sanitary sewer extends eastwest below Marshall Street, parallel to the 24-inch RCP and approximately thirty (30) feet north of the subject property. Set at between seven (7) and eight (8) feet depth, the sanitary sewer slopes and drains to the west. December 2007 to December 2008: In December 2007, GEI submitted a work plan to address SMCoGPP's letter of October 4, 2007. Following work plan approval, GEI completed in September 2008 Boring B-24 off-site to the east of the former UST on the adjacent property at 1718 Broadway Street; Boring B-25 off-site to the southwest of the former dispenser on the adjacent property at 1738-1740 Broadway Street; and five (5) borings (B-26, B-27, B-27B, B-28 and B-29) adjacent to municipal storm and sanitary sewers on Marshall Street to the north of the subject property. The results of the investigation found no significant hydrocarbon impact below Marshall Street, suggesting that municipal sewers did not serve as significant preferential pathways for migration of groundwater-borne hydrocarbons from the subject property. In November 2008, GEI installed a groundwater monitoring well (MW-4) next to Boring B-18 in the buildings former garage area. The well construction and initial groundwater sampling event were presented along with the results of the off-site borings (B-24 to B-29) in a technical report by GEI dated December 20, 2008. Well MW-4 was subsequently gauged for depth-to-water and sampled for laboratory analyses in February and May 2009. By letter dated August 3, 2009, SMCoGPP recommended cessation of groundwater sampling of Well MW-4, and reducing the depth-to-water monitoring frequency to once annually. According to SMCoGPP, case closure of 1260 Marshal Street may be appropriate based on the level of investigation completed since September 2006.

BRADFORD STREET PARCELS (Continued) **S106916473**

Case Type:	Cleanup Program Site
Case Worker:	Not reported
Local Agency:	SAN MATEO COUNTY LOP
RB Case Number:	Not reported
File Location:	Local Agency
Potential Media Affected:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	Other Solvent or Non-Petroleum Hydrocarbon
Site History:	Extracted from Green Environment's April 17, 2006 Report On Additional Evaluation of Soil and Groundwater, San Mateo County does not take responsibility for the accuracy of the statements made or any professional interpretations made in the referenced report. The subject property is bound to the north by a fuel service station at 990 Veterans Boulevard and an office building with an attached parking structure at 900 Veterans Boulevard; to the south by Bradford Street, a gravel covered parking lot at the northwest corner of Bradford and Main Streets and a city owned storm water pump station; to the east by Main Street and a gravel covered parking lot at the northeast corner of Bradford and Main Streets; and to the west by an office building and attached parking lot at 707 Bradford Street. In June-October 2004, GEI completed a Phase I Environmental Site Assessment (Phase I ESA) of the subject property. The Phase I ESA identified the following conditions that were considered to pose an environmental risk concern: Petroleum hydrocarbons releases from the adjacent property at 900 Veterans Boulevard (fuel service station site) may have impacted groundwater and groundwater-saturated soils beneath the subject property. Fill material was imported to the subject property during the relocation of Redwood Creek. Because the fill placed on the subject property was not characterized at the time, there was the possibility that the fill was not clean virgin material and may have included recycled or reused soil impacted with contaminants. Based on these findings, Redwood City contracted with GEI to investigate the subsurface conditions at the subject property. Redwood City informed GEI that they were considering constructing a child day care and/or senior housing facility on the subject property. In October 2004, GEI completed a Phase II Environmental Site Assessment of the subject property. The assessment included advancing six (6) soil borings (B-1 through B-6) and collecting soil and groundwater samples for laboratory analyses. The sampling and analytical results indicated concentrations of petroleum hydrocarbons in the oil- to diesel-range, and semivolatile organic compounds (SVOCs) in some of the soil and groundwater samples collected during this investigation. The maximum concentrations of petroleum hydrocarbons and SVOCs were reported in soil samples collected from Boring B-3. SVOCs detected in the suite of soil samples included phenol and various polynuclear aromatic compounds (PNAs), namely acenaphthylene, anthracene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(g,h,i)perylene, benzo(a)pyrene, chrysene, fluoranthene, fluorene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene and pyrene. Except for the groundwater sample collected from Boring B-4, SVOCs were not detected in the groundwater samples taken in October 2004. Analytical results identified the following PNAs in the groundwater sample from Boring B-4: acenaphthene, benzo(g,h,i)perylene, benzo(a)pyrene, fluoranthene, indeno(1,2,3-cd)pyrene and pyrene. Minor amounts of oil- to diesel-range petroleum hydrocarbons were reported in solution in the groundwater samples from Borings B-2 and B-4. The concentrations of CAM 17 metals in soil samples collected in October 2004 were found to

BRADFORD STREET PARCELS (Continued) **S106916473**

be comparable to background when the sample metal data are compared with background levels reported in the scientific literature, e.g. Scott (1995), Shacklette and Boerngen (1984), Bradford et al (1996), among others.

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Preliminary Assessment/Site Inspection Report (PA/SI)
Completed Date: 06/06/2001
Comments: The USEPA Preliminary Assessment was approved by USEPA. A release of petroleum product from an underground storage tank (UST) was investigated and remediated under San Francisco Regional Water Quality Control Board (RWQCB) oversight in the early 1990s. Volatile organic compounds detected in onsite groundwater were determined to have originated from an upgradient offsite source (Rohm & Haas facility; 800 Chestnut Street). RWQCB determined that no further action related to the UST release was required in 1995.

FINDS:

Registry ID: 110002833408

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Alternate Address:	2480 MIDDLEFIELD ROAD
Alternate City,St,Zip:	REDWOOD CITY, CA 94063
Background Info:	This property was owned by Johns Manville Corporation prior to 1965 for manufacture of asbestos insulation. It was then owned and occupied by Eichrome, which was a hardware and building supply company. Eichrome consisted of two slab-floor buildings, a storage yard, and a parking area. The whole structure's underlying soils were contaminated with asbestos. DTSC oversaw the site characterization and cleanup of the Site. Construction of the Safkeep self storage facility subsequently followed in September 1986.

Comments: DTSC performed a site screening for Pressure Vessel Services, Inc. to determine whether any release of hazardous substances or wastes have occurred at the site that require corrective actions.
Commercial/industrial ESLs were deemed to be protective of future users of the site; it is currently under construction to become a corrective center. Cadmium, benzen, lead, and PCE were found at

DRAFT

PRESSURE VESSEL SERVICE INC (Continued) **U001594594**

levels exceeding their residential ESLs but were under their commercial ESLs. Methane was in soil gas at concentrations up to 294,000 ppmv. A sublsab venting system is being built onsite. The site status has been set to No Further Action; San Mateo County is currently overseeing the project and building and corrective center on top.

Annual Waste Handled:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs):	5478.2
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs):	46699.9
Waste code:	D004
Waste name:	ARSENIC

transported off-site.

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

HAZARDOUS WASTE BIENNIAL REPORTER

STATE MASTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

CA BOND EXP. PLAN:
Reponsible Party: RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: DHS and Willard Products signed a settlement agreement October 22, 1984. DHS has budgeted $70,000 for oversight activities.
Site Description: Willard Products is an active chemical storage, repackaging and mixing firm. The firm has been operating at the site since 1967. The site is built on fill deposited on bay muds and is located 1,200 feet southeast of Redwood Creek and two miles southwest of San Francisco Bay.
Hazardous Waste Desc: Pentachlorophenol (PCP), acetone, xylene and polynuclear aromatics (PNAs) have been detected in soil samples. The ground water has been contaminated with xylene, methyl ethyl ketone, methanol, acetone and PNAs.
Threat To Public Health & Env: The ground water table has been contaminated. However, there are no public wells in Redwood City, and it is extremely unlikely that the ground water could be developed into a potable water supply.
Site Activity Status: The RAP for this site is being finalized. The responsible parties will be implementing the RAP which consists of a ground water extraction and treatment systems, ongoing ground water monitoring and capping of the site.

Completed Document Type: Land Use Restriction - Site Inspection/Visit
Completed Date: 05/30/2012
Comments: DTSC conducted its annual site visit to check the condition of the asphalt cap over contaminated soil and to verify compliance with the restrictions and requirements of the Land Use Covenant. Numerous cracks were observed during the inspection and two areas in the cap have significant deterioration/cracking. However, repair may not be necessary due to the development that is planned on the site. There was no evidence of any activities prohibited by the Land Use Covenant.

Comments: DTSC conducted its annual site visit to check the condition of the asphalt cap over contaminated soil and to verify compliance with the restrictions and requirements of the Land Use Covenant. Numerous cracks were observed during the inspection and two areas in the cap have significant deterioration/cracking. However, repair may not be necessary due to the development that is planned on the site. There was no evidence of any activities prohibited by the Land Use Covenant.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/05/2017

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

DRAFT

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/05/2017

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

DRAFT

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 03/02/2017

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

DRAFT

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water board?s review found that more than one-third of the region?s active disposal pits are operating without permission.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

EDR Hist Cleaner: EDR Exclusive Historic Dry Cleaners

EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Re: 1180 Main Street, Redwood City

Dear Gail:

Please find enclosed the workplan for the above mentioned property.

Mr. Chubick is in a bit of a hurry to get this completed, so any help in expediting this workplan would be appreciated.

If you have any questions, please give me a call.

Sincerely,

Chuck Kiper

DRAFT

WORK PLAN FOR OVER-EXCAVATION
AT 1180 MAIN STREET, REDWOOD CITY
FEBRUARY 2, 1994

1.0 BACKGROUND

SEMCO was contracted by Larry Chubick, property owner of 1180 Main Street, Redwood City, to remove one underground waste oil storage tank at the referenced addressed (see site map for location)

2.0 SITE HISTORY

The site is a commercial property and is the process of change of ownership. Mr. Chubick has also contracted with SEMCO for the required remedial work.

2.1 During excavation and removal of the known waste oil tank, an additional gasoline underground storage tank was discovered. Both tanks were removed on January 14, 1994. The tanks were transported to Erickson, Inc. by RHT, under manifest # 92885656. Tank # 12816 and 12817 were assigned to these two UST's. Please see enclosed sample map for location of samples collected from each tank excavation. Samples were collected and observed in the presence of Teresa Belasco of San Mateo County Environmental Health.

2.2 The condition of the tanks were noted by SEMCO and Teresa Belasco as follows:
Tank # 12816 (waste oil) had several surface holes with several hole at the end seam at the 11:00 position and no apparent holes in the tank bottom.
Tank # 12883 (regular gasoline tank) had pitting, but no holes were observed.

3.0 ANALYTICAL PROTOCOLS AND RESULTS

Tank # 12816- TPH GAS/DIESEL, BTXE, TOG CLHC, ICAP 5 METALS
Tank # 12883- TPH AS GAS, BTXE, TOTAL LEAD

4.0 CONCLUSIONS AND RECOMMENDATIONS

Upon receipt of the analytical, it appears the regular gasoline tank excavation is non detected on all three samples. However, the waste oil tank has elevated levels at the West end (fill end) of diesel as does the excavated material. All other analysis except metals were non-detected.

SEMCO proposes to overexcavate the fill end approximately 10 cubic yards or 2' in all directions. All previously excavated materials will be excavated. graded, transported and disposed of a Certified State Recycle Center. After excavation, a confirmation sample will be collected and requested to be analyzed for TPH as diesel.

The Excavation will be backfilled with approved material and compacted grade for resurfacing.

ASE
APPLIED SCIENCE AND ENGINEERING INC.

March 30, 1994

SAN MATEO COUNTY
ENVIRONMENTAL HEALTH

MAR 31 1994

RECEIVED

Ms. Michele Shoemaker
Department of Health Services
County of San Mateo
590 Hamilton
Redwood City, CA

SUBJECT: Workplan
Monitor Well Construction, Development, and Sampling
Chub's Auto Repair
1180 Main Street
Redwood City, California

Dear Ms. Shoemaker,

Applied Science and Engineering, Inc. (ASE) respectfully submits the following workplan for construction of a monitor well at Chub's Auto Repair, 1180 Main Street in Redwood City, California (Figure 1). The proposed scope of work includes construction, development, and sampling of one monitor well, and preparation of a report documenting the activities completed.

1.0 Introduction

Reportedly, the above-referenced site formerly contained two underground storage tanks (USTs) used for waste oil and gasoline (Figure 2). The USTs were removed from the ground on January 14, 1994. The gasoline UST did not have any holes, but the waste oil UST was noted to have several holes at the end seam at the 11:00 position. Verification soil samples collected for the gasoline UST were found to contain no detectable hydrocarbons (Table 1). One of the two soil samples collected for the waste oil UST was found to contain 810 ppm of Total Petroleum Hydrocarbons (TPH) as diesel (Table 1). In addition, the laboratory reported 17 ppb of dichloromethane by EPA Methods 5030/8010, but re-analysis by EPA Method 8240 showed no detectable hydrocarbons.

On February 9, 1994 the waste oil UST pit was over-excavated. A soil sample collected at the end of overexcavation was found to contain no detectable hydrocarbons (Table 1). Water present in the pit was sampled, with analyses showing only 530 ppb of Total Petroleum Hydrocarbons (TPH) as diesel, described by the laboratory as not typical of diesel. No TPH as gasoline, benzene, toluene, ethylbenzene, xylenes (BTEX), oil and grease (O&G), or chlorinated hydrocarbons were detected in the water sample. The pit was pumped dry and no water recharged.

Regardless, the San Mateo County Department of Health Services (SMCDHS) requested construction and sampling of a monitor well. This workplan is designed to address the SMCDHS request.

DRAFT

2.0 Permit, Health and Safety Plan, and Utilities

Prior to initiation of field activities ASE will obtain a drilling permit from SMCDHS, notify Underground Service Alert (USA) for public utility clearance, and prepare a written health and safety plan.

3.0 Drill and Construct One (1) Monitor Well

25 Maple St

Based on data from other nearby sites (RMC Lonestar, Chevron), the groundwater gradient is generally towards the northeast, towards the San Francisco Bay. A monitor well (MW-1) will be drilled at a location to the east-northeast and within 10 feet of the former waste oil UST (Figure 2). The purpose of the monitor well is to determine whether the waste oil UST has impacted groundwater.

1501 El Camino

The well will be drilled by advancing a nominal 8-inch diameter boring using a hollow stem auger drilling rig operated by HEW Drilling, a licenced well driller in the State of California. Soils will be visually logged and samples collected every five feet. In addition, olfactory and visual observations of petroleum hydrocarbons will be noted on the logs. One soil sample from a depth of approximately 10 feet, just above the estimated depth of the water table, will be retained for subsequent laboratory analyses. Because only TPH as diesel was detected in the pit groundwater, the soil sample will be analyzed only for TPH as diesel, benzene, toluene, ethylbenzene, and xylenes (BTEX).

X

X no run for the full scan, 2/17 sample results were from over-pumped PIT.

Based on an assumed groundwater depth of approximately 10 feet at the site, it is anticipated that the boring will be terminated and the monitor well constructed at a depth of approximately 20 feet below ground surface. The final choice of screened interval will be selected by the site engineer on the basis of geologic field observations during drilling.

The well casing and screen for the monitor well will be constructed with 2-inch diameter, Schedule 40, flush-joint threaded material. The PVC screen will consist of factory-milled 0.020 inch slots. The screen will be installed at the interval from approximately 5 to 20 feet below ground surface. A sand pack of clean, washed, Lonestar #3 sand will be placed adjacent to the entire screened interval, extending one foot above the top of the screen. A one foot thick bentonite pellet seal will be placed above the sand pack. The annulus above the bentonite seal will be grouted with a cement/bentonite grout. Well completion will consist of a locking PVC cap. The well will be covered with a metal stove pipe or traffic-rated valve box set at or slightly above grade in concrete.

DRAFT

The drilling equipment will be steam-cleaned at the site following well construction. Soils generated by drilling and water generated by cleaning will be stored on site in 55-gallon drums pending analytical results.

4.0 Develop and Sample Monitor Well

After the concrete and cement/bentonite grout have set for a minimum of 24 hours, the well will be developed by bailing to prepare the well for collection of a representative groundwater sample. A minimum of five casing volumes will be purged from the well, or until the water is relatively clear. Electrical conductivity (EC), pH, and temperature will be measured periodically to ensure that these parameters stabilize during the course of development. The monitor well will be sampled immediately after the water level has re-equilibrated from development.

Because only TPH as diesel was detected in the excavation water, the groundwater sample will only be analyzed for TPH as diesel and BTEX. Water generated during development will be stored separately, on-site, in labelled 55-gallon drums pending analytical results.

5.0 Reporting

A report will be prepared which documents the investigation including boring logs, well development and sampling field notes, chain of custodies, and laboratory reports. The report will include recommendations for additional investigation or remedial actions, if applicable.

Please call me at (415) 363-2445 if you have any questions or require additional information. Field activities will not begin until this workplan has been approved by SMCDHS.

Sincerely,

Frederick A. Yukic, MS, PE
Principal Engineer

cc: Mr. Larry Chubick

1.0 INTRODUCTION

In this report, we are presenting a detailed account of the tank removal activities at Chub's Auto Repair, located at 1180 Main Street, Redwood City, California. All work was performed by SEMCO, San Mateo and was done ~~in compliance~~ with the County of San Mateo and the Redwood City Fire Department. Tank preparation, excavation and removal occurred on January 14, 1994. Re-excavation activities occurred on February 9, 1994.

2.0 EXCAVATION AND TANK REMOVAL

On January 14, 1994, SEMCO excavated the site for the removal of one 1000 gallon Waste Oil tank. Upon arrival to the site and preparation for the removal, another tank was discovered, which was determined to be a 1000 gallon gasoline tank.

Both tanks were voided of their residual product, which was placed into barrels for disposal. It was later disposed of by Allied Petroleum on Manifest # 93267128. The tanks were then inerted by washing them with a hot water detergent wash, followed by solid carbon dioxide (dry Ice) until acceptable levels of oxygen and lower explosive limits were reached..

The tanks condition were noted as follows:

1) 1000 gallon waste oil was unwrapped steel with several 1/8" holes in surface and 2-3 1/4" holes at the East end. The piping had many holes.
2) 1000 gallon gasoline tank was unwrapped steel with pitting, but no holes were observed.

The inerted tanks were hauled by Rich Hamilton Trucking on Manifest # 92885656.

After the tanks were removed, it was noted that the soil beneath the waste oil tank was discolored, with a slight solvent odor. The soil in both excavations had a clayey/sandy consistency. The soil beneath the gas tank had no discoloration or odor.
At this time, soil samples were collected.

3.0 SOIL SAMPLING

Soil samples were retrieved out of the excavation by use of the backhoe bucket. Clean brass sample tubes were used by pushing them into the soil until a full sample was obtained. All samples were sealed with teflon tape, plastic end caps and sealed with masking tape, labeled and entered onto a chain of custody form. Samples taken to Superior Precision Analytical, a State certified laboratory.
Samples were collected from the waste oil excavation from the East end of the excavation at 8 feet and the West end at 8.5 feet. A four tube composite sample was collected from the excavated waste oil soil.

DRAFT

These samples were to be analyzed for TPH as Gasoline, Diesel, BTXE, Oil and Grease, 8010, 8240 and ICAP 5 Metals.

Samples were collected from the gasoline tank excavation from the North end at 8 feet and the South end at 9.5 feet. A four tube composite was also collected from the excavated soil. These samples were to be analyzed for TPH as Gas, BTXE and Total Lead.

Analytical results demonstrated that the gasoline excavation had no detectable traces of the analyzed constituents, except for 8ppm lead in the North sample, 7ppm lead in the South sample and 30 ppm Lead in the Excavated spoils. The analytical for the waste oil tank demonstrated Non detectable levels in the East end of the excavation. The West end however, had 810 ppm Diesel with non detectable levels in Gasoline, BTXE and Oil and Grease. The excavated soil had 4 ppm TPH as gas, 1100 ppm Diesel, No Benzene, 0.048 ppm Toluene, 0.036 ppm Ethyl Benzene, 0.28 ppm Xylenes and no Oil and Grease.

Based on the analytical, it was determined that additional excavation work would be necessary for the Waste Oil tank excavation.

5.0 RE-EXCAVATION ACTIVITIES

After assessing the analytical results, it was decided in conjunction with the various lead agencies to re-excavate the site down to a level in which there would be no detectable traces of contaminants.

A workplan was submitted to San Mateo County on February 2, 1994, to over excavate the West end (fill end) by approximately 10 cubic yards. Upon approval of the workplan, the job was scheduled for February 9, 1994 with San Mateo County Environmental Health inspector ~~Michelle Shomarker~~. Michele Shoemaker

SEMCO arrived on site and excavated the West end laterally approximately 5 feet and removed the soil to the 8 foot level. The water table was reached at the 9 foot level. The water in the excavation was pumped and allowed to recharge. (This water was placed in barrels to be disposed of at a later date) A soil sample was collected at the 8 foot level, and a water sample was collected. The soil sample was analyzed for TPH as gas and diesel, BTXE and TOG. The water sample was to be analyzed for the same constituents, but not enough water was collected, so Oil and Grease was the only analysis run. Initially, San Mateo County Environmental Health Dept. had stated that this water sample, due to the inadequate amount, and obvious floating product, would not need to be analyzed. But it was later decided by San Mateo County to run the analysis.

DRAFT

Another water sample still needed to be collected, so an appointment was scheduled for February 17, 1994 with San Mateo County Environmental Health Department. A water storage tank (swing tank) was delivered to the site for the receiving of water from the excavation. The water was pumped and allowed to recharge. Three (3) amber liters and three (3) voas of water were collected and analyzed for TPH as gasoline, diesel, BTXE, TOG and 8240.

Analytical results demonstrated non detected levels in TPH as gas, BTXE, TOG and 8240. The analysis for TPH as Diesel had a level of 530 ppb, but was noted as not matching the typical diesel pattern.

The excavation was backfilled and compacted to prepare for resurfacing. The water from the original pumping of the excavation, was pumped from the barrels and was placed into the holding tank for disposal.

The water in the holding tank was then sampled on March 9, 1994 for TPH as gasoline, Diesel,BTXE, TOG and 8240, to determine how the disposal would be handled. The analysis demonstrated only 110 ppb diesel, while all other analysis were non detected.

Based on this information, the analytical was presented to South Bay Sewer Authority for pumping the water into the Sewer. On March 16, 1994, SBSA approved the discharge of the water into the sewer. (see attached permit) On March 17, 1994, the water was pumped from the tank into sewer.

The concrete was replaced on March 28, 1994

This report is for your files. If you have any questions, please give me a call.

SOIL/GROUND WATER SAMPLING DATA FORM

Underground Storage Tank Site Address: 1180 MAIN STREET, REDWOOD CITY

Business Site Name: _____

Description Sample ID (Specify location; i.e., tank, pipe, stockpile) and number	Sample Depth (Indicate depth of sample from grade)	Media (soil/water)	Date (Date sample was collected)	Soil Type (specify if sand, clay, fill, etc.)	Laboratory Results*, express in mg/kg unless otherwise specified									
					TPHg	TPHd	B	T	E	X	Lead	TOG	Cl HC	~~Other~~ 8240
(Example) Tank #1, east end, #T1-E12.5	12.5 feet	soil	2/29/93	sand	14		0.003	0.01	ND	ND	2.2			
#1-PT-1420		WATER	2/17/94		ND	*530 PPB	ND	ND	ND	ND		ND		ND
						* NOT TYPICAL DIESEL PATTERN								

TPHg = Total Petroleum Hydrocarbon as Gasoline
BTEX = Benzene, Toluene, Ethylbenzene, Xylene
Cl HC = Chlorinated hydrocarbon compounds

TPHd = Total Petroleum Hydrocarbon as Diesel
TOG = Total Oil and Grease
Other = Semivolatile organic compounds, heavy metals, etc.

List additional analytical results and/or additional samples on a separate sheet

Submit this form as part of the closure final report. Attach soil/ground water sampling location map.
